Fred Kirby (B. & O.) stated that between 225 and 250 stokers are in use on his road. They have found that the efficiency of the locomotives has been increased 15 to 20 per cent on account of the mechanical stoker. A smaller number of firemen will be required for the stoker engines and a better grade of men may be obtained. A cheaper grade of coal can be used on stoker engines which, of course, means economy in fuel. The best results are obtained with a gas coal. On the second division of the Baltimore & Ohio, where there are a large number of stoker engines in service, there was a period of 45 days in which the trains were not delayed over five minutes on account of the stoker locomotives. The stoker engine makes the work much lighter for the fireman and gives him the opportunity and training to better prepare himself for the position

of engineer. On this railroad the stoker engines are pooled.

Regarding the economy in fuel, Mr. Kirby believed that the stoker engines used no more coal than the hand fired engines, and E. A. Averill, Standard Stoker Company, quoted from tests showing that the stoker engine maintained an evaporation of about 6.5 lb. of water per pound of dry coal, whereas a hand fired engine of the same dimensions and working under the same conditions showed an evaporation of 6.37 lb. of water per pound of dry coal.

EFFICIENT OPERATION OF LOCOMOTIVES

The committee, in view of the broadness of the subject, has considered it under nine heads which will be taken up separately.

Assignment of Power.—It is self-evident that to obtain maximum efficiency at minimum cost the matter of assigning power should be made with due consideration from both operating and mechanical points of view, observing not only the physical condition of the road bed and bridges, the capacity and fitness of terminal facilities for the care, up-keep and turning of the power assigned, but also its adaptability to meet the requirements of service, in either freight or passenger, taking into consideration the weight and schedule of trains.

Shopping Engines.—The most profitable time for shopping of power depends very largely upon local conditions. Density of traffic in some localities with many high class freight trains, and other important traffic with an increasing public demand for better service, would not warrant the working of power in other than first class condition, while branch lines, unimportant freight or switch service, may provide suitable places to obtain additional wear from locomotives between shoppings. Power received from the general repair shops after overhauling should be known to be in perfect condition before being returned to the operating department for service. Mr. Adams, of the Cotton Belt, has said that power overhauled for the first time should be in better condition than when received from the builders, and in a measure justifies this statement by adding that power once in service usually develops certain weak points that should be changed and strengthened at the first shopping.

Injectors, Lubricators and Boiler Attachments.—Location of all boiler attachments for safety, accessibility and convenience of operation and repairs, is a matter which may appear to some to be of small importance yet may involve great expense if not properly placed. An injector or lubricator placed beyond the convenient reach of the engineer does not receive the attention and fine adjustment that economical service would demand, or that the device might receive if properly placed. Sander valves, hydrostatic flange oilers and other boiler attachments are equally important.

Terminal Inspection and Maintenance.—Modern equipment renders careful inspection a matter of increasing importance, and whether done by engineers or inspectors is an item worthy of close attention. A record should be maintained of the assignment of work, with a view to fixing responsibility for improper repairs, oversights, etc., which should be guarded against as an item possible of destroying efficient service and producing increased cost of operation. Terminal care for all locomotives is essential to good service, and beyond doubt has greater bearing on locomotive performance than any other one item. Periodical inspection should be made of all draft appliances and a perfect measurement maintained of the sizes of the exhaust nozzles, location of draft sheets, etc.

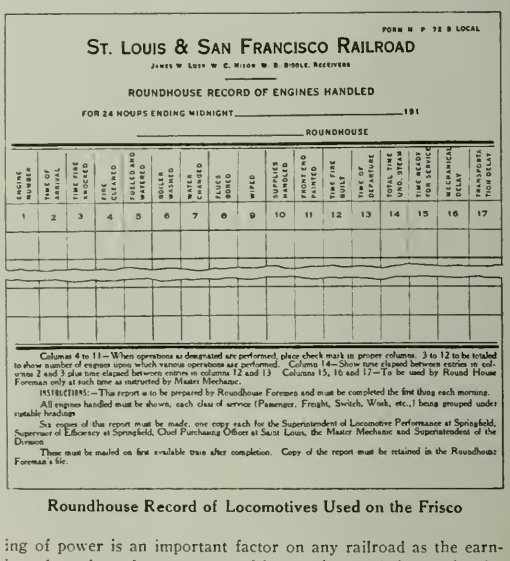
The cost of maintenance and up-keep of power can be greatly reduced with an increasing benefit and training to enginemen by the enforcement of strict rules requiring close inspection and properly defined work reports from them. Double inspection should make the engineer more careful in reporting work, especially if his attention is called to oversights on his part. Engineers should be in a better position to locate and report necessary work than an inspector who catches an engine at rest.

Proper record of the time that engines are at terminals should be maintained, this for the purpose of checking mechanical or transportation delays to power terminal fuel consumption, etc. For such purposes the accompanying form will be found very convenient.

Superheaters and Brick Arches.—The advantages derived from high degree superheated steam, are many, and with proper handling and care superheater locomotives will produce remarkable results in increased efficiency and economy over saturated steam power of equal size and similar build. Brick arches when used should be kept in perfect condition in order to insure maximum efficiency from their use. Locomotives drafted with the use of an arch will, as a rule, be more severe on fuel should the arch fail and the locomotive be run without it.

Engine Crews.—In selecting, promoting and employing new firemen, care should be exercised to secure men of good habits and possessing at least a common school education. Many railroads are now using the first, second and third year progressive examination questions for the edification and advancement of their firemen. Such examinations as a rule stimulate general interest, not only among firemen but among engineers as well. Coaching and training enginemen is an important factor in paving the way for skillful and efficient service and should be encouraged by all officials. Employees should be encouraged to take an interest in this work, to organize clubs and hold meetings at stated intervals for the discussion of subjects relating to their work.

Terminal Facilities.—The matter of prompt handling and turning of power is an important factor on any railroad as the earnings depend on the movement of locomotives and the service delivered. Terminal facilities suitable for prompt handling and up-keep of power are therefore correspondingly important. There should be co-operation between yardmasters, despatchers and roundhouse foremen, in order to get best results in turning power quickly. Another item of importance is the prompt placing of supplies, delivering coal to the coal chute, pulling cinder cars out of the way, etc.



FORM M P 72 B LOCAL

ST. LOUIS & SAN FRANCISCO RAILROAD

JAMES W. LUCE W. C. NIXON W. B. BIDDLE, RECEIVERS

ROUNDHOUSE RECORD OF ENGINES HANDLED

FOR 24 HOURS ENDING MIDNIGHT _____ 191

_____ ROUNDHOUSE

ENGINE NUMBER	TIME OF ARRIVAL	TIME FIRE KNOCKED	FIRE CLEANED	FILLED AND WATERED	BOILER WASHED	WATER CHANGED	FLUES BLOWED	WIPED	SUPPLIES HANDLED	FRONT END FLUES	TIME FIRE BUILT	TIME OF DEPARTURE	TOTAL TIME UNDER STEAM	TIME RECDT FOR SERVICE	MECHANICAL DELAY	TRANSPORTATION DELAY
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17

Columns 4 to 11—When operations as designated are performed, place check mark in proper column. 3 to 12 to be totaled to show number of engines upon which various operations are performed. Column 14—Show time elapsed between entries in columns 2 and 3 plus time elapsed between entries in columns 12 and 13. Columns 15, 16 and 17—To be used by Round House Foreman only at such time as instructed by Master Mechanic.

INSTRUCTIONS:—This report is to be prepared by Roundhouse Foremen and must be completed the first thing each morning.

All engines handled must be shown, each class of service (Passenger, Freight, Switch, Work, etc.,) being grouped under suitable headings.

Six copies of this report must be made, one copy each for the Superintendent of Locomotive Performance at Springfield, Supervisor of Efficiency at Springfield, Chief Purchasing Officer at Saint Louis, the Master Mechanic and Superintendent of the Division.

These must be mailed on first available train after completion. Copy of the report must be retained in the Roundhouse Foreman's file.

Roundhouse Record of Locomotives Used on the Frisco

Handling and Firing Locomotives.—The most poorly designed locomotive is made better by special care and handling, while the best designed locomotive will not do well if improperly handled or fired. Railroad operating costs are great, and the fuel bill is the largest single item of this expense. It is not unusual for a locomotive to burn from $20 to $40 worth of coal per trip, or per day, or from $600 to $1,200 per month, and all locomotives on some divisions burn from 20,000 to 50,000 tons of coal per month. Of this vast amount of fuel burned in locomotive operation, considerable of it does not come under the control of engineer or fireman. At least 10 to 25 per cent of

all fuel used by any one locomotive is consumed in the terminals. Close co-operation should prevail between the heads of the transportation and the mechanical departments in the matter of ordering power and firing up before needed.

In conclusion, the committee has endeavored to review this subject in a general way without regard to equipment. In doing this we are not unmindful of other possible losses through lack of proper car or train loading. Locomotives may be kept in perfect condition at great cost, may be operated and fired in a manner 100 per cent perfect, loaded to full tonnage capacity, yet fail in good returns. The matter of hauling empty or half-loaded cars of great weight and size, increases operating expenses and proportionately reduces net returns, therefore, should be a matter of mutual concern to every railroad in the land.

The report is signed by J. R. Scott, chairman; P. J. Miller, J. J. McNeil, W. L. Robinson, C. W. Hyde, F. W. Edwards, M. H. Haig and W. G. Tawse.

Discussion.—The unnecessary stopping of trains does not permit of good locomotive performance, tests with an ordinary passenger train with a superheater engine showing that an average of 300 lb. of coal and 2,100 lb. of water are consumed at each stop in addition to the wear of the brake shoes and equipment. The question of pooled engines versus regularly assigned engines was thoroughly discussed. The members were strong in their approval of the system of regularly assigned engines. A member from the St. Louis & San Francisco stated that with regularly assigned engines there was an average of 18,000 miles per engine failure in a recent six-months period, as against an average of 6,000 miles per engine failure when the pooled system was in effect. He also stated that by changing from the pooled system to the regularly assigned engines there had been a decrease of 6 per cent in fuel used with an increase of 2.33 per cent in tonnage hauled. It was believed that in most every case the engineers would take better care of their engines and numerous cases were mentioned where the mileage between shoppings had been increased by adopting the regularly assigned engine plan. While more engines are needed than with the pooled system it was believed that the additional investment would be warranted.

Superheater engines must be carefully maintained in order to obtain the full benefit of the device. One road keeps a record of the date when the flues were last cleaned in order that the roundhouse foreman may know when to clean them again, no matter on what part of the road the engine may be. The water in the boiler of a superheater locomotive should not be carried too high, as the temperature of the steam at the cylinders will not then be as high as it should be. It is believed by many that the use of a special grade of oil for the lubrication of the cylinders is not necessary, but when drifting the throttle should always be opened slightly.

Some roads give particular attention to the arrangement of the engine cab, seeking to have everything as convenient for the engineer as possible. This was believed to be good practice. If the engineers were required to make thorough inspection reports the terminal inspectors would be greatly assisted, for oftentimes a defect may be more readily detected while the engine is running than when standing.

Several members spoke of very marked success with the use of flange oilers on locomotives that had previously given considerable trouble from worn flanges. Instances were mentioned where the mileage of the driving wheel tires had been tripled by the use of the flange oiler and in some cases derailment troubles have been entirely eliminated.

SPEED RECORDERS

Frederick S. Kerby (Baltimore & Ohio) presented a paper on this subject, in which he briefly described the different kinds of speed recorders in service on the railroads replying to a circular he sent out in preparation for this paper. He also mentioned the use of an electric annunciator that can be attached to the speed recorders of any type for the purpose of ringing a bell when a certain definite speed has been reached. If the rate of speed is more than two miles above the limit the bell will ring until the decreasing speed reaches and passes below the limit at which the device is set. This has been tested out on six different engines and has proven successful. If the recording gage should become broken or for any reason is out of service the bell will operate just the same, which is a great advantage.

The chief advantage derived from the use of the speed recorder is the factor of safety. It can also be used to advantage for checking the speed of trains, and with those recorders provided with the time curve, the time at stops is readily ascertained. The speed recorder is also a great factor in settling disputes in regard to the speed at times of accidents and the speeds at which the engines run by slow orders. By thus controlling the speeds it has been stated that the roads using them are not as liable to have over-heated bearings. It also gives an engineer a better idea as to the speed he is running and helps him to make better time without the necessary spurting. Some roads claim that the fuel consumption has been increased on account of the speed restriction on descending grades, as a higher rate of speed will have to be maintained on the ascending grades. The cost of maintaining speed recorders has only been estimated. One road states the cost is from $120 to $140 a year, while another road estimates $75 a year.

Discussion.—Those roads using the speed recorders reported favorably as to their use, believing that derailments have been materially reduced. It has also been found that the number of hot boxes was decreased. The enginemen like them as it gives them a guide by which they are better able to maintain schedule speed. A leeway of five miles per hour was believed fair before disciplining an engineer for a violation. The El Paso & Southwestern test the recorders in case of a violation of the speed limit before the engineers are disciplined as the gages do not always register in accord with the record. All recorders should be carefully maintained, and on some roads the engineers are required to check the reading of the gage by taking the time between mile posts.

OTHER BUSINESS

A paper was read by Alonzo G. Kinyon, supervisor of locomotive operation, Seaboard Air Line, on the "Practical Chemistry of Combustion," which describes methods similar to those used on the Northern Pacific, a description of which was published in the *Railway Age Gazette* of May 1, 1914, on page 976. W. H. Corbett, chairman of the committee on the Revision of Progressive Examination for Firemen for Promotion and New Men for Employment, reported that a new book of rules has been made and will be distributed in the near future. The following is the list of subjects for 1915:

What effect does the mechanical placing of fuel in fire boxes and the lubrication of the locomotive have on the cost of operation?

Recommended practices for the employment and training of new men for firemen.

The advantages of the use of superheaters, brick arches and other modern appliances on large engines, especially those of the Mallet type.

How can the road foreman of engines improve the handling of the air brakes on modern trains?

The electro-pneumatic brake.

The effect of properly designed valve gear on locomotive fuel economy and operation.

Scientific train loading; tonnage rating.

The constitution and by-laws of the association were amended to include a fourth and fifth vice-president. The following officers were elected for the ensuing year: President, J. C. Petty (N. C. & St. L.); first vice-president, J. R. Scott (St. L. & S. F.); second vice-president, B. J. Feeny (Ill. Cent.); third vice-president, H. F. Henson (N. & W.); fourth vice-president, W. L. Robinson (B. & O.); fifth vice-president, G. A. Kell

(G. T.); treasurer, D. Meadows (Mich. Cent.); secretary, W. O. Thompson (N. Y. C. & H. R.). Mr. Thompson was paid special tribute by being elected to the office of secretary for life. He is one of the three living charter members of the association.

At the close of the convention the secretary reported a total membership of 1,137, of which nearly 50 per cent were registered at this convention. The treasurer reported a cash balance of $3,190. Chicago received the greatest number of votes for the next place of meeting.

NEW PASSENGER STATION AT POCATELLO, IDAHO

The Oregon Short Line has recently let a contract for the construction of a new passenger station at Pocatello, Idaho, to the Lynch-Cannon Engineering Company, Salt Lake City, Utah.

The main portion of the building is 77 ft. by 89 ft. in area, and is three stories high, with a two-story wing on each end 60 ft. by 68 ft. The building is of fireproof construction throughout. The first story is of gray stone, and the second and third stories are of dark red brick laid in ornamental patterns, with cut stone trim. The roof is of asbestos shingles.

The first floor contains the usual facilities for the accommodation of passengers and for handling baggage and express. The main entrance is from the south. To the left of the outer and inner vestibules, are the women's rest room and the secondary stair hall. On the right is the men's smoking room. The space on the opposite side of the general waiting room is devoted to the ticket office, with an exit to the tracks on each side. A newsstand and toilet room are located on the right, and the main stair hall and depot master's room on the left. The general waiting room is 41 ft. by 89 ft., with a balcony around it on the second floor. The left wing of the first floor is devoted to a lunch room on the track side, and a dining room, pantry and kitchen on the street side. In the right wing adjoining the general waiting room, are an emigrants' waiting room, a public space and the mail clerk's office. Next to these is the baggage room which is 30 ft. wide and 60 ft. long and extends over the entire width of the wing. At the end of the wing is the express room and express office. The floors in the general waiting room, public space, inner vestibule, rest and smoking rooms, stair hall and dining room are of tile, all others being of cement.

The second floor is devoted entirely to the railroad company's offices, those of the Montana division occupying the left half of the floor and those of the Idaho division, the right half. There is also a file room and a vault in each wing, and a telegraph room in the right wing. The building will be heated with a hot water system. The interior of the building will be decorated with a color scheme of chocolate red and gray stone color.

This station was designed by Carrere & Hastings, New York, and will be built under the direction of Carl Stradley, chief engineer. All endeavor will be made for its completion in time to handle the travel during the Panama-Pacific Exposition.

PACKAGE DELIVERIES AT BOSTON FREIGHT HOUSES

The subject for discussion at the meeting of the New York Railroad Club, September 18, was the delivery and handling of miscellaneous freight at the Boston freight terminals, a paper being presented by Harold Pender, H. F. Thomson and C. P. Eldred, who made a study of this matter on behalf of the electrical engineering department of the Massachusetts Institute of Technology. Most of the work was done about a year ago. The paper was read by Dr. Pender, who is now a member of the faculty of the University of Pennsylvania; and the discussion was closed by Mr. Thomson.

This investigation was undertaken because of complaints on the part of shippers, consignees and teamsters, of delays due to the methods employed in delivering freight and in sending out notices of arrival. The institute had already made an investigation of the use of motor trucks, in Boston, in the place of horses, for moving freight in the street. The New York, New Haven & Hartford and the Boston & Maine contributed between them the sum of $2,000 toward the expenses of the investigation and it was chiefly the freight houses of these roads which were investigated. The New Haven road has in Boston 11 freight houses and 2 piers, and the Boston & Maine has 35 freight houses.

As the result of a large number of observations, it was found that the average team spent about one-third of its time each day in the railroad yard. The studies were confined to package freight, brought to or taken from the doors of the freight houses. It was found, incidentally, that teamsters lose more time at the store doors than at the railroad yards. The average time spent by a wagon at an inward freight house was found to be 46.7 minutes; of which 10.3 minutes was spent in moving in the yard; 8.5 minutes at the cashier's office; 4.1 minutes searching for freight, including searches when nothing was found; 16.2 minutes loading; 2.2 minutes with the delivery clerk, 1.0 helping other drivers, 2.3 minutes roping, etc., and so on. The total includes 3.5 minutes charged to loafing.

Another observation showed a larger percentage of time spent

Street Front of Proposed Oregon Short Line Station at Pocatello, Idaho

in searching for freight, and Dr. Pender said that during the time that his men were making their observations, there was a marked improvement in this matter; the freight agents saw that the goods were more systematically placed in the house so that a teamster could find his shipment more readily.

In one set of observations it was found that about one-fifth of the calls of wagons at the doors were ineffective, the man got no freight. A part of the time shown in this calculation is due to going to the wrong door, and then having to go to another one. This delay was due to errors on the part of the clerks in making out the delivery checks, and also to mistakes by the drivers.

It was found that complaints by drivers of delays because of waiting for their turn at doors were largely without any real basis in fact. The average at inward freight houses was only 1.5 minutes, and at outward freight houses 4 minutes. The figures include the congested morning and evening hours. Figures quoted from reports of studies at Chicago, Detroit and New York City, show that Boston makes a much better record in this matter than the places referred to.

In all of the studies it was found that, on the average, wagons carry only about one-half their normal capacity. Studies in other cities have given results about the same as this.

Part second of this paper deals with the time elapsed between arrival of train in yard and delivery of freight. Excluding certain traffic, the conditions of which were not quite normal, it was found that the average time between the arrival of a train and the minute when the freight was ready for delivery was about 8 hours. In some, perhaps many, cases shipments were ready for delivery from one to two hours before the delivery checks were in the clerk's hands ready to be delivered to the teamster. The average time required to unload a car was from 30 to 45 minutes.

While large quantities of freight are taken away promptly, it was found that, on the average, at the terminal of the Portland division of the Boston & Maine, freight was not taken away until 18 hours after it was ready. This average, however, seems to refer to what may be called the active freight; for, outside of this, there were 1,027 consignments, amounting to 476 tons, which were not called for until after the third day. It is the rule to charge storage on goods left more than 72 hours. Again, it was found that large quantities of freight were left in the house for 24 hours or more after the teamster had taken his delivery check from the clerk.

Most of the cars coming into Boston with L. C. L. freight were loaded far below their full capacity; and the average of the cars examined was, at the New Haven Terminal 6 tons, and at the Boston & Maine 4 tons.

The authors of this paper profess to make no recommendations; first, because they were engaged only to report facts, and second, because they lacked the time and money to go further into the subject. They do, however, offer a number of observations which have the effect of recommendations. One of these is that, in curing wagon delays, the prime factor is the driver. Some estimates also are given of possible reductions in the time taken by the teamsters in making inquiries, searching for freight, and in moving about in the yard. They think that with the cooperation of the railroad the teamster who spends 67 minutes at the inbound freight house might possibly reduce this to 54 minutes and that the time at outbound houses, 39 minutes, might be reduced to 33 minutes. But, though it is held that these reductions could be made by the railroad, the reasons for this conclusion are not very fully set forth. One road has put on sorting gangs, whose duty it is to keep freight properly sorted in the houses, and to move forward, each night, all uncalled for consignments.

The recommendations deal only with the conditions as they are. To make improvements in the houses or in the general system would cost much money, and it is beyond the scope of this study to estimate these costs.

In regard to the time lost between the arrival of a train and having the goods ready for delivery in the house, the obvious recommendation is made that delivery checks ought always to be ready as soon as the goods are ready. It appears that at the New Haven terminal, the majority of the waybills do not arrive in advance of the freight; and some of the studies also showed that the preparation of delivery checks was not begun until the freight arrived, even if the waybills were in hand before. Delivery checks cannot be given to the teamster until the freight is unloaded, as the clerk must first mark on the check the number of the door where the goods may be found.

At one New Haven terminal freight was available on the floor of the freight house on the average two hours before the delivery checks were ready. At the Boston & Maine this time was about one hour.

DISCUSSION

In the discussion D. B. Rushmore, an engineer of the General Electric Company, commending the Massachusetts Institute of Technology for making this scientific study of a branch of industry which has been largely neglected, called for co-operation by engineers generally. Why should not the large number of manufacturers who make devices for use in handling freight in freight houses combine to promote their common cause? It is a shame that so little progress is made. Recently, in New York, a pier has been built costing a million dollars and it has no devices for handling freight more modern than were in use fifty years ago. The General Electric Company has made numerous studies and experiments, but as yet has not got anywhere. The time is ripe for doing something, and all interested should get together. Several men have set up as consulting engineers in this line, but no progress is reported as yet. Possibly the government should take a hand and try to correlate the efforts of men in different fields. However, the railroads should be wise enough to forestall the government.

S. G. Thompson, consulting engineer of the Public Service corporation of New Jersey, thought the railroads should feel flattered at the record shown in this paper, which refutes the charges of those critics who say that freight yards are not well managed. The paper shows that the best possible saving that could be made would save teamsters only 7 per cent of their time; and this 7 per cent, which is equal to 38 minutes a day, is not enough to enable them to make another trip. Therefore, the teamster would not be helped. Mr. Thompson thought that the "loafing" time shown in the records ought not to be charged to the teamsters. They were warming themselves or taking reasonable rest and were making good use of their time.

William McCellan commended the Boston railroads for having, as in this case, called in trained minds to study a problem which for so long a time has been left to those who use only rule of thumb methods. Scientific facts like these will demolish the allegations of those who have adjured the railroads to practice more economy, but have not told them how the advice could be carried out.

Mr. Thomson, replying to Mr. Thompson, observed that the average of 7 per cent to be saved by teamsters did not mean 38 minutes for each teamster; it meant rather a much longer time for some of them and much less for others. In many cases the time saved could, no doubt, be profitably used. He said that the time shown in the records as loafing time meant time really wasted, as where teamsters were found engaged in conversation for a half hour. The freight congestion in West street, New York City, having been referred to Mr. Thomson said that that was a place where the experiment of keeping freight houses open 24 hours a day might be hopefully tried. It would be necessary, of course, in any such plan, for a considerable number of shippers and consignees to co-operate.

A KOREAN LIGHT RAILWAY.—From the graphite mine at Denksu Dong, in North Choong-Chung province of Korea, a light railway, 13 miles in length, runs to Whang-Kan, a station on the Seoul-Fusan Railways.

RAILWAY SIGNAL ASSOCIATION

The Railway Signal Association opened its nineteenth annual convention at Hotel Champlain, Bluff Point, N. Y., on Tuesday morning of this week, President F. P. Patenall in the chair.

Mr. Patenall in his opening address complimented the committees on their arduous and successful labors, referring especially to the Manual of the association, which is a monument marking a great amount of valuable work done during the past few years. This manual now contains 150 standard designs; and the association, through it, is a real power in the railroad world, and in the commercial world as affected by signal work.

The financial standing of the association is good, but the speaker reminded the members that it is a voluntary association and that members must constantly work to increase its influence. There are now 1,250 members; this ought to be increased within the next 12 months to 2,500. There are large numbers of railroad men who are eligible, and who ought to be brought in.

The work of the signal engineer is expanding, and this must continue in spite of hard times. He is called upon more and more each year to devise means of checking the human equation; and this means more expensive and more delicate apparatus. The use of alternating currents in automatic signaling has now become extensive, and even much larger installations of this kind may be expected in the near future.

To be thoroughly up-to-date the signal engineer of today must be ready to meet the demand for operation of single track railroads safely by signal indications alone, for this demand now appears in many places. The successful accomplishment of this improvement will defer the expenditure of considerable sums of money otherwise thought to be necessary for double tracking.

Continuing, Mr. Patenall said:

"Other signal engineers tell me that to complete their lines from a standpoint of complete signaling will require expenditures in the future equal to the total amount spent in the last 20 years; so that there is left a vast amount of work for us to do. . . . Signal engineers of the present day are supposed to know the physical as well as all other characteristics of their roads, and very properly so if they expect to aspire to other important positions in the operating field. Their position in the engineering and operating department is becoming more important all the time, and they must know how, when and where to spend money that will insure the best returns. Congress has deemed it necessary to obtain a physical valuation of our railroads and it is estimated that the cost will be at least fifty million dollars. This amount must be earned, as well as the dividends. Some of our best railroad men have taken service with the government in this work, and I hope when this is completed, we shall be able to get a similar amount assigned for signaling purposes.

"Investigations are frequently being made by the railroads of the many automatic train control devices brought out, and assistance is being rendered the inventors, both technically and financially. . . . Taking into consideration the variable conditions on our railroads, a most difficult task has been placed before us; but the work is being prosecuted with diligence and we expect to surmount these obstacles. . . .

" . . . The time has arrived for me to step down but not out. I again assure you all of my appreciation of your hearty support during my term of office."

The treasurer's report showed transactions during the eleven months since the last meeting of over $10,000, and cash now on hand $2,245. The assets of the association are about $5,000 above the liabilities.

The report of the board of directors, reviewing the year, recommended that for the more efficient conduct of committee work, which is the life of the association, regional committees be formed; this would facilitate full and regular attendance.

On recommendation of Committee No. 1 the meeting after brief discussion adopted and ordered to letter ballot, the disk indicator, "Take Siding," for use at non-interlocked switches, as reported and discussed at the last meeting.* The committee proposes that at night this indicator be illuminated by reflected light. This committee reported a code of requisites for switch indicators, to be used as switches on roads having automatic block signals, which after explanations of a number of clauses by the chairman was adopted and ordered sent to letter ballot; and it was voted that if the letter ballot should be favorable, the code should be sent to the American Railway Association for its information. The meeting adopted as "correct information" a code of requisites for automatic train control, corresponding to those of the American Railway Association, as reported by this committee.

The forms of blanks for reports of trains stopped or improperly delayed by signals and for summarizing the records of signal performance, as discussed at several previous meetings and as further revised by a special committee, W. N. Manuel, chairman, were adopted for submission to letter ballot for inclusion in the manual of standards.

The committee on storage battery, R. B. Ellsworth, chairman, reported specifications for a concrete storage battery box which, after slight modifications were ordered to letter ballot.

This committee reported a code of specifications for nickel iron alkaloid storage batteries, which after a long discussion was disapproved as a standard, because certain paragraphs referred to an exclusive design; but the whole was approved to be printed as information. A code of specifications for electrolyte for lead type storage battery, after slight modifications was adopted and ordered to letter ballot.

Letter ballots were also ordered on plans No. 1,340 1,241, 1,343 and 1,342, which were fully discussed at the March meeting; and a glass jar (plan 1,224) and a storage battery separator (plan 1,341) presented at this meeting were likewise adopted; but the kind of wood for the separator was not specified. The afternoon of the first day was taken up with long and detailed discussion of lightning arresters and of insulation for wires. Concerning arresters there were so many differences that the subject was recommitted, to be taken up again on the second or third day. This committee, E. G. Hawkins, chairman, has done much original work, on a difficult subject, and the questions of members were varied and almost innumerable. All of the three codes of specifications—air gap, vacuum gap, and choke coil—were finally accepted as progress reports, the sentiment of the meeting being that the committee had made the best beginning possible in a work of this nature.

The wire committee, W. H. Elliott, chairman, had to answer about a hundred questions. Its code of specifications for galvanized messenger wire were finally, with a number of changes, ordered to letter ballot. It was the sense of the meeting that inches (decimals) should be the only terms in which diameters of wire should be expressed, the time-honored names "B. W. G.", etc., being abandoned. A table of recommended sags was accepted and ordered to letter ballot. Specifications for rubber insulating tape, after a number of changes, including a clause making the use of tin foil wrappers for packages optional, were ordered to letter ballot. The same action was taken concerning friction tape.

C. C. Anthony and six other prominent members of the association presented three amendments to the constitution which were adopted and sent to letter ballot. These broaden the qualifications for active membership in the association so that members and engineers of national and state commissions, editors, college professors and others, not engaged in the supply business, may be active members; establish a new class of "life members" so that old members may be kept on the roll without requiring them to pay dues; and provide for a variable date for the annual meeting. The board of direction are to be free to fix the time of the meeting, or to change the place, when necessary without going through the formality of a letter ballot. This amendment also entitles the board of direction to call special meetings.

The remaining sessions of the convention will be reported in next week's issue.

Methods of Artificial Lighting for Railroad Offices

Four Requirements of Artificial Lighting Almost Universally Demanded. Advantages of Indirect Lighting

By John A. Hoeveler
Illuminating Engineer, Chicago.

Practically the only difference between railroad offices and the offices of any large corporation lies in the greater scope and wider range of activities carried on in the former. A railroad office building houses a large clerical force, a statistical department, an engineering department, a drafting department, telegraphers', despatchers' and numerous executive offices, and in many instances, a city ticket office. The illumination problems encountered are manifold and quite different in their essential

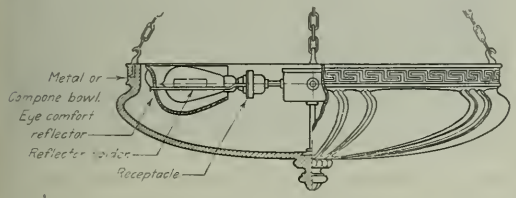

Fig. 1—A Shallow Type Indirect Bowl Equipped with X-Ray Silvered Glass Reflectors

features. However, they are not characteristic of the railroad business only, but are the same that countless other concerns in other lines of business must solve. Hence, the railroad may readily benefit by the experiences of others.

The standard of lighting is rising continuously, and from observation one is led to believe that the rise is inversely proportional to the decrease in the cost of light per unit of lumin-

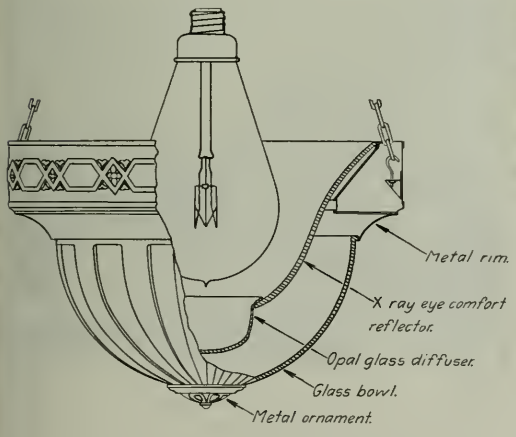

Fig. 2—A Luminous Bowl Indirect Fixture Equipped with a Silvered Glass Reflector and an Opal Glass Diffuser

ous energy, resulting from the ever increasing efficiency of the incandescent lamp. In the days of the carbon lamp, localized lighting at each desk and table or file with comparatively little general illumination, was the order of things. With the coming of the more efficient lamps in larger sizes, however, general overhead illumination, with its decided advantages, became more generally used. However, the highly efficient tungsten lamp, with its greatly increased intrinsic brilliancy, brought with it the evils of eye strain and rapid fatigue when working under this light. It was necessary to resort to the use of deep bowl reflectors totally enclosing glassware, semi-indirect lighting and totally indirect lighting, and of these the latter results in the greatest measure of relief. In fact, recent investigations show that indirect lighting has the qualities of well diffused daylight, and causes practically as little fatigue of the eye, as the result of several hours' work, as daylight. The consequence is very greatly improved lighting conditions, which merely demonstrates that constantly increasing lamp efficiencies are an incentive to more and better lighting. The standards of today are far in advance of what they were a few years ago; today we believe in plenty of well-diffused light everywhere. Good lighting is cheap and yet the benefits it bestows are vast. Poor lighting is expensive even when obtained for nothing.

Four requirements for the artificial lighting of offices are now almost universally demanded: First, sufficiently low brilliancy of the lighting units to avoid uncomfortable and injurious glare in the eyes from the light source; second, the elimination, as much as possible, of the irritating glare of specular reflection from the glossy surfaces, particularly of books and papers;

Fig. 3—A Large General Office Illuminated by Indirect Fixtures

third, the elimination of sharply defined shadows, which make vision difficult; and fourth, the use of correctly designed, scientific and efficient lighting equipment.

The first three of these are the most important, while the fourth is usually essential to the attainment of the others. In this article, the writer will show how the application of indirect lighting meets these demands of good lighting.

Taking up the requirements in order, with indirect illumination the light flux of the lamps is directed to the ceiling rather than directly to the desks. A relatively large area of the ceiling in this manner is made luminous. The extremely brilliant tungsten lamps are completely concealed, and the only source of illumination visible to the eye is the low brilliancy ceiling. The enlarged effective source of light, the ceiling, produces a very diffuse illumination in the room. This minimizes the bad effects of glare, due to specular reflection, since even with very glossy surfaces, there can be no specular reflection when there are no specular sources of light. The more nearly perfect the diffusion of the light from the ceiling, the more nearly completely will glare from paper be eliminated. Deeply defined shadows are

annoying and harmful to the eyes for two reasons: the density of the shadow in contrast to the surrounding bright area makes vision difficult, and sharp edges magnify this effect. With indirect lighting, there are no sharp shadows. There are what might be called shaded areas, i. e., shadows with indiscernible edges. Shaded areas merge so gradually into the lighter areas that vision is comfortable, even with the most densely shaded areas it is possible to obtain ordinarily with indirect lighting. It has been demonstrated that a shaded area of 50 per cent density, with indirect lighting, causes no difficulty of vision, whereas with direct lighting, it makes comfortable vision impossible.

In order that the light flux may be directed to the ceiling in the proper manner, so that the first three requirements may be attained, it is necessary to design the reflectors scientifically for the special conditions encountered in indirect lighting practice. For economy, they should be efficient. Up to the present, the silvered mirror reflectors have been most widely applied for indirect lighting purposes. A complete line of reflectors, distributing and concentrating, for all sizes of lamps, and interior supporting equipment have been standardized for the lighting of interiors of all types and sizes.

Fig. 1 shows a typical opaque bowl, whereas Fig. 2 shows a

Fig. 4—A Private Office of the Canadian Northern at Winnipeg

luminous bowl indirect fixture. The latter requires some additional explanation.

There exists a considerable demand for fixtures of the semi-indirect type due chiefly to the ornamental features of a lighted glass bowl. However, semi-indirect is only modified direct lighting and does not have the advantages of low brilliancy, reduction of specular reflection and elimination of sharp shadows to as great a degree as is desirable. Therefore the luminous bowl indirect fixture has been developed. It produces truly indirect illumination, and at the same time has a softly illuminated bowl. In the fixture of Fig. 2, a small portion of the light flux of the lamp passes through the opening at the bottom of the reflector, in which the opal glass cup rests. This glass diffuser cup redirects the light rays against the side of the outer glass bowl. The diffuser cup is designed of varying thickness to insure a uniform illumination of the bowl. The percentage of light flux utilized for illuminating the bowl is so small that the brilliancy of the latter does not exceed that of the ceiling.

OFFICE LIGHTING.

As an example of general office lighting which satisfies the four requirements of good illumination, Fig. 3 is shown. This is not a railroad office, but the conditions are similar. The size is 150 ft. by 170 ft., making a floor area of 25,500 sq. ft., which is illuminated by two hundred eighty-eight 100-watt tungsten lamps, equipped with silvered mirror reflectors, supported in inexpensive metal receptacles, hung from lamp cords. A remarkable uniformity of illumination is obtained, and the diffusion is such that glare from paper is practically eliminated and the shaded areas characteristic of indirect lighting are of such light density as to be barely noticeable.

What may be accomplished in the illumination of private

Fig. 5—A Large Drafting Room Illuminated by Indirect Lighting

offices by indirect means is illustrated in Fig. 4. The single central fixtures furnish ample illumination to all portions of the working area. The diffusion is good. The fixtures are ornamental and especially appropriate, since they have a monogram of the railroad incorporated in the design of the bowl. In fact, this is one of the important advantages of indirect lighting. The fixture may be designed to suit the fancy, but good lighting need not be sacrificed, since the same efficient reflectors and lamps

Fig. 6—The City Ticket Office of the Canadian Northern at Winnipeg

may be employed as are used with the most utilitarian and inexpensive fixtures.

DRAFTING ROOM LIGHTING.

The conditions to be satisfied in the illumination of a drafting room are somewhat more exacting than those ordinarily encountered in offices. The illumination must be exceptionally diffuse, and intense. Sharp shadows cause no end of trouble and eye-strain to the draftsman, making the exact setting of the T-square, triangle and other instruments very difficult, and

frequently causing errors which require laborious erasing. Therefore, the diffusion must be such as to completely eliminate any sharp deep shadows. The intensity must be sufficient to make it possible to see pencil lines through tracing cloth.

At the present time, the practical and economical means of producing a highly diffuse illumination is by making the entire ceiling of the interior the luminous source. This usually means a closer spacing of fixtures than is ordinarily required for office lighting. Fig. 5 illustrates a large drafting room in which some 40 draftsmen are accommodated, and which is lighted by means of twenty-eight 250-watt fixtures, equipped with silvered glass reflectors. This installation was planned to insure the best of diffusion. As a result, shaded areas on the plane of the tables are so very light and blend so gradually into the lighter areas as to be scarcely noticeable. The intensity of illumination on the table is eight foot-candles and proves ample for tracing.

All of these factors combined with the total absence of great brightness, contrasts, make the illumination most comfortable and satisfactory. From the practical standpoint, this installation has the advantages that every square foot of working space is adequately illuminated; changes in arrangement of office equipment entail no shifting or changing of the locations of lighting units; lighting units are overhead and out of the way, and lighting units are constructed with detachable arms permitting the reflector to swing free and facilitating cleaning, without the need of removing the lamp or reflector from the bowl.

CITY TICKET OFFICE LIGHTING

The general requirements for the lighting of a city ticket office are about the same as for general office lighting, with the possible exception that the lighting fixtures should be more ornamental and attractive in character. They present an appearance of elegance and unquestionably the lighting fixtures add to this effect. The cause of this appears to be the fact that even in the sale of transportation it is necessary to meet competition. Fig. 6 shows a ticket office of the Canadian Northern, in which the novel idea of incorporating the monogram of the railroad in the design of indirect fixtures has been applied. The fixtures are ornamental in appearance, harmonize with the interior and have a considerable advertising value. All of the above illustrations shown are night views, taken by the light of the indirect fixtures alone.

FREIGHT TRAIN HANDLING

An interesting paper on the proper handling of freight trains was presented at the January meeting of the Western Railway Club, by F. B. Farmer, of the Westinghouse Air Brake Company, St. Paul, Minn. Mr. Farmer presented a number of instructions for freight train engineers that were compiled after many years' study of the break-in-two question. In presenting these rules to the club Mr. Farmer spoke in part as follows:

The instructions are not self-enforcing, and habits are hard to

break. Therefore, while an improvement may be expected by placing copies of the instructions in the hands of engineers and conductors, yet the possibilities of betterment will not be approximated until the traveling engineers and the trainmasters thoroughly understand and enforce them, and until their superiors keep in touch with the results. There has been too much instruction car work, and too little service instructions and supervision. Some roads have wisely closed these cars, so far as regular and general instructions to the enginemen and trainmen are concerned, using the instructors in the field to co-operate with and instruct the division officials whose duties are to see that the enginemen and conductors perform their work properly.

Break-in-twos is the best measure of the quality of train handling. Without reasonably accurate and complete records of every break-in-two, division officers are working largely in the dark, and accurate and complete reports are impossible without suitable forms. The conductor and engineer must be shown by such forms just what information is wanted. The best de-

signed forms, one for the conductor and one for the engineer, are those used by the Duluth, Missabe & Northern, and are shown herewith. The engineer is the man most concerned, and the one who is usually assumed to have caused the damage. Therefore justice to him demands his report before attempting to place responsibility. Both trainmaster and traveling engineer get copies of these reports. They are the men on "the firing line." Both need the same information and promptly. If reports are too numerous for them to read carefully, and take action on, it is certainly time for a special and general investigation.

The superintendent should receive a monthly tabulation of break-in-twos, and should compare months on a train-mileage basis so as to note promptly and take action on any decrease in efficiency. This tabulation is made up easily by the receiving clerk making an entry on a suitable form as each report passes through his hands. A copy of these tabulations sent to the general superintendent allows him to compare months for each division and different divisions. On one large road the general manager takes personal interest in the monthly tabulations.

It is manifest extravagance of time and money to start out of a terminal with a modern freight train any cars of which have draft rigging defects, which, with fair handling, are quite liable to result in break-in-twos. The logical preventatives are, first, a careful inspection of incoming trains and the immediate repairing of any defects found or sending the defective cars to the repair tracks; second, as some of the defects on incoming trains will not be found, and as others will be made in switching, an equally thorough inspection of out-going trains at terminals where much switching is done, especially at the main or originating terminals. While it is quite undesirable to have to set out or switch to the rear a car or cars after a train is made up, yet is should invariably be done where a defect discovered is one that is liable to cause a break-in-two. The general tendency on the part of conductors, despatchers and trainmasters is to avoid the immediate delay, and "chance" the probable one. To an extent this may be justifiable, but the line should be drawn well beyond the point of almost certain failure.

In one investigation each of the two Westinghouse men was accompanied by a first-class car inspector, who made a record of any draft rigging which should not have been allowed to pass the previous terminal without repairs. This investigation was the result of excessive break-in-twos, following the introduction of heavier power and greater tonnage. Some engineers claimed the trouble was due mainly to defective draft gear. Some car men said it was due mainly to rough handling by the engineers. In 34 trains of from 40 to 69 cars there were three trains having no seriously defective draft rigging. Of the remaining 31 trains two had each one draft gear that was not in fit condition for service, 22 had from 2 to 5 each, 3 had 6 each, 1 had 7, 1 had 9, 1 had 14, and 1 had 17. While this apparently proved that the engineer's contention was right, yet as none of these trains was broken-in-two while the inspecting and instructing men were present (one man always on the engine directing the engineer or demonstrating for him), the proof was equally good that the car men's contention was right. It was a case of honors even and need for both to improve, the usual condition. The fundamental idea in the following instructions on freight train handling is control of the slack, on how to prevent it from running harshly. The fact that if this end is accomplished no damage will follow where draft rigging is in fair to good condition emphasizes its importance. The successful engineer is the one who by study, observation and intuition knows at all times how the slack is, recognizes the different factors that will change it, and so uses the steam, the brakes and the sand as to avoid sudden and harsh changes.

DISCUSSION

G. H. Wood, general air brake instructor of the Santa Fe, spoke highly in commendation of the rules as presented by Mr. Farmer, and stated that they had been used on the Santa Fe with a few minor exceptions, with the resultant effect of the reduction of 1,000 break-in-twos. The Santa Fe has also found the practice of stretching trains just before leaving the terminals to be highly satisfactory. This is done by setting the hand brakes in the last five or eight cars, and giving the train a good stretch, then setting the air brakes and disconnecting the engine. The inspectors then pass along the train looking for "long-necks" and any other defects that might possibly tie up the train on the road.

Mr. Wood also stated that the Santa Fe has discontinued the use of the instruction car in scheduled service, finding that much better results could be obtained by sending the air brake inspectors out on the road, giving practical instructions on the engines, and sending the instruction cars around to various division points for the benefit of those men who desire, of their own volition, to improve themselves in air brake construction and manipulation. Other members attending the meeting spoke highly of the rules, and believed that their adoption would tend to relieve a large number of break-in-twos.

AMERICAN PASSENGER SERVICE*

By E. E. Clark
Interstate Commerce Commissioner

I congratulate you on the part you have played in building up the most comfortable and luxurious passenger service in the world, and when quality of service is considered, it is the cheapest in the world. The reckless freedom with which free passes were granted in the years gone by and the liberality with which cheap excursion fares were accorded, led some, perhaps many, to think that passenger service on railroads cost the railroads nothing, or that the cost was very much below the compensation received from those who were unfortunate enough to pay full fare.

The ticket scalper thrived, assisted in his transactions, in many instances, by representatives of the road. Even the clergyman's wife boasted of riding under an assumed name on a contract ticket belonging to another. The feeling seemed to be entertained quite generally that it was no wrong to defraud a railroad company.

And so grew up a general expectation that every exposition, convention, fair or other gathering was to be made a success through cheap railroad fares, while those who clamored most loudly for low, and still lower fares, spent their evenings marking up the prices on the things which they expected to sell to the excursionists, and filled the hallways with cots for the use of which they charged advanced bedroom prices.

The railroad business is necessarily done in a hurry. Nearly everything except safety is subordinated to expedition, and unfortunately sometimes safety is given second place. The questions that must be decided are multitude in number. Frequently they must be decided quickly to make room for others that are treading on their heels.

Our railroads were not built to serve sections of developed country or of established towns and industries. They have, as a rule, been projected into undeveloped territory upon the faith of the resources to be developed. Government, states, counties and municipalities often extended aid. The great part which railroads were to play in development of our vast domain was recognized and the advent of a new road was hailed with joy.

For a long time it seems to have been the generally accepted idea that the railroad had the transportation to sell and that, like a private concern, it could sell it to whom it chose and at any price it chose. Each railroad sought to encourage and assist development along these lines. Efforts, sometimes overdone, were made to afford the shippers on its line access to widely separated competitive markets. Naturally, discriminations grew up and having sprung into being, grew apace. Finally it became necessary for the government to put forth a restraining hand and to assume regulation to some extent of these arteries of communication upon which the industrial and commercial life of the nation depends, and which serve in every walk and phase of private life.

The railroads were created and exist by virtue of grants of authority extended by organized government. They never could have been built without the right of eminent domain. From the beginning they and their operations were subject to the constitutional provision that the jurisdiction of Congress over commerce between the states is plenary. Certain powers to be exercised within definite limits are delegated by the Congress to an administrative commission. There are many angles to the many questions that are presented, or that present themselves, in connection with the administration of the act to regulate commerce, and yet the fundamental principles of the law and its requirements are few and simple.

All charges for services rendered by the carrier must be reasonable and just, that is, they must be reasonable and just to the carrier and to the carrier's patrons. Unjust discrimination in any form or through any device is prohibited. There can be but one lawful charge for a given service and that charge must be collected alike from all for whom that service is rendered.

The reasonableness and justice of a charge and the discriminatory or non-discriminatory character of a charge, rule or practice are questions of fact upon which widely divergent views might, and probably would be, entertained by those whose interests are involved on either side. Hence the necessity for a form in which such controversies may fully be presented and decided. The Supreme Court of the United States has said that the uniformity required by law would be destroyed if the several courts in different jurisdictions were to pass upon findings of fact by the commission and that, therefore, the finding of the commission on a question of fact is not reviewable by the courts if there is substantial testimony in the records to support the finding.

In some quarters we are accused of being unduly friendly to the railroads. In other quarters, at the same time, we are accused of being bitterly hostile to the railroads. As is generally true of all declarations coming from extremists on either side, neither of these accusations is true and neither of them is in any sense accurate. The term and principles of the law and our own sense of justice and right under the facts disclosed by the investigations are our guides. In so far as we exercise our judgment, we do it in a judicial spirit, and having satisfied our conscience as to what is right, just and lawful, we are free from worry as to whether or not the decision will be popular.

Among the terms which are frequently used to describe man's dispositions or natures is the word "conservative."

If, however, you ask those who use that description to define it, you find that the word means one thing to one and another thing to another. There is a conservatism which means to get in a rut and stay there. There is a conservatism which means nothing but laziness. Another form of conservatism is nothing short of cowardice. And still another form of conservatism means to move along with and help the progress of the age approaching important and far-reaching changes in such a way as to reach the desired end by degrees, never losing sight of the goal sought, but avoiding precipitate steps, which, if taken, will work unnecessary destruction or do irreparable injury. I am that kind of a conservative and of such conservatives the Interstate Commerce Commission is composed.

Some of the extremists on one side suggest freely that a commission composed of others than experienced railroad officials cannot be competent to deal with these questions. And yet we have the satisfaction of knowing from the mouths of railroad officials that our work is and has been helpful in many ways to the railroads.

A captain of a steamboat on the Mississippi river found himself without a pilot. A native approached the captain and tendered his services as pilot. The captain asked him if he knew where the sand bars were, to which the native replied, "Nope." "Then," said the captain, "how do you expect to be of service as a pilot?" The native answered, "I know where they a'int." It is far better to expend energy trying to find where frictions and obstructions "a'int," than to hunt them up and then face the necessity of removing them. It was because, after years of trial of the plan of leaving all these matters in the hands of the railroads, it was found to be generally unsatisfactory and in some directions, intolerable, that the government employed a new pilot and drew some new charts for his guidance.

We desire to assist you and other officers of the railroads in making the railroad service of the United States the safest, the best, the cleanest, the fairest and the most efficient in the world, and to render that service to your patrons at charges that are as low as possible, commensurate, with fair and liberal returns to the owners of the railroads. We know full well that the American people demand and will demand efficient railroads. Every one knows that the railroads' revenue must come from selling transportation. Every one should be willing, and if he

*Address before the annual convention of the American Association of General Railway Passenger and Ticket Agents, Boston, September 16, 1914.

is not willing he can be compelled, to pay what the service is worth, including a reasonable profit. On the other hand, the railroad being a public servant, operating and existing under public franchise, has no right to expect, and should not be permitted to extort more than, a reasonable return upon the investment in the property devoted to the public service.

Some day we will have better understandings between the railroads and the public, between the railroads and the commission and between the commission and the public. When that day comes, it will be generally realized that much apprehension was based entirely on misunderstandings or on lack of understandings as to facts, intentions, inclinations and policies. We desire to do a constructive, not a destructive work. We hope to help in bringing about these better understandings.

Sometimes the whole school is deprived of recess because the teacher is unable to locate the guilty one or two scholars, but the great majority are good boys, nevertheless. All criminal laws are necessitated by a small minority who have criminal tendencies. All civil law is necessitated by a minority who are unwilling to do right or by the necessity for a common rule of action. A custom recognized by a community as representing the right and just course often becomes a rule of law. There is, in the railroad business, a law of competition that, in some ways, to some extent, is inexorable. The most direct way to the poor-house would be an effort to charge more on desirable competitive business than is asked by competitors. All railroads cannot be equally profitable to their owners. Differences of location, development, capitalization, management and physical condition all have their effect.

The effort of every loyal officer and employee is to make a success of the operation of his road. The law requires only that all patrons shall be accorded just and equal treatment under similar conditions of service rendered by the same carrier. If we can be helpful in bringing about conditions satisfactory to the great majority of their patrons, and satisfactory to the owners of those roads that are operated and capitalized upon sound business principles and not as stock-jobbing concerns, we shall feel that the world will be better for our having lived, and so shall be content.

MUDGE-PEERLESS VENTILATOR

The new Mudge-Peerless ventilator, which is made and sold by Mudge & Company, Chicago, is being applied on a large order for equipment now being built by the Pullman Company, at Chicago. This ventilator, as shown in Fig. 1, is box-like in shape with the air ramming faces arranged transversely to the line of car travel. These faces are pressed in the form of a *V* at each side of the center line and at right angles to the ventilator opening of the car, the *V* shaped surfaces being inclined toward the exhaust outlets from the interior. The purpose of this formation is to prevent the air displaced by the ventilator from escaping around the side of the monitor type roof or over the top of the arch type roof.

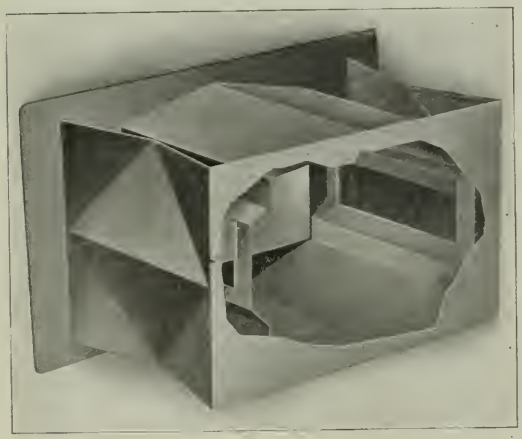

Fig. 1—Type 4 Mudge-Peerless Ventilator Showing Interior Arrangement

The sectional view, Fig. 2, shows the action of the outside air as it passes over and under the exhaust openings, drawing the vitiated air from the car body through the ventilator opening. The greater the velocity of the air passing over these openings the greater will be the efficiency of the ventilator. On the arch or turtle back car roofs the operating principle is identical except that the vacuum pockets are formed at the exhaust opening on the sides of the ventilators. An illustration of the ventilator for these types of roofs is shown in Fig. 3. The interior construction of this ventilator is hexagonal in form, the rear end fitting tightly over the opening into the car while the front is solidly joined to the outside wall. Protecting exhaust outlets are provided for practically the full length on both sides directly behind the air ramming faces. The angular baffle plates which virtually form the roof prevent rain or other elements from dropping down into the interior, and the outside ventilator face prevents down drafts being caused by side winds. Two small openings are provided in the bottom plate to discharge the condensation in case the atmosphere contains a great deal of moisture.

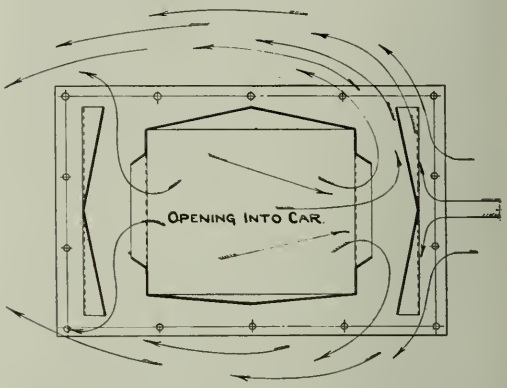

Fig. 2—Sectional View of the Mudge-Peerless Ventilator Showing the Action of the Air Currents

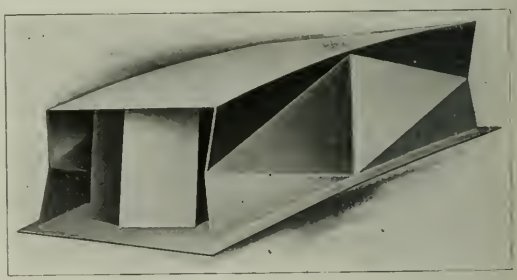

Fig. 3—Ventilator for Arch Type Roof

The efficiency of this ventilator and the ratio of the exhaust to train speed is shown in Fig. 4. This chart was compiled

from anemometer readings taken on a wooden frame car with all doors and windows closed during the test. Tests have also shown a strong exhaust action with the trains standing, if side

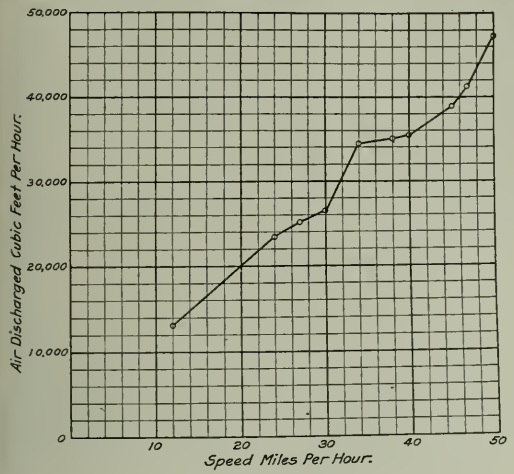

Fig. 4—Exhaust-Speed Curve of Mudge-Peerless Ventilator

winds are blowing from any angle. With a side wind blowing at a velocity of 4.25 m. p. h., an exhaust of 3,600 cu. ft. per

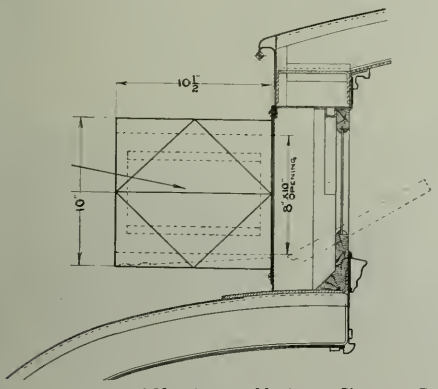

Fig. 5—Application of Ventilator to Monitor or Clerestory Roof

hour was obtained and at 7.5 m. p. h., 6,480 cu. ft. was obtained, the same car being used as mentioned in the running test.

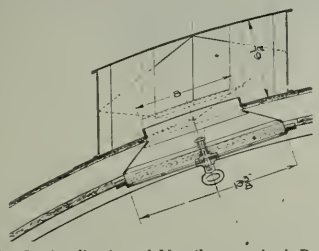

Fig. 6—Application of Ventilator to Arch Roof

The application of the monitor roof type ventilator is shown in Fig. 5. It is made in one standard size and design requiring no soldering or fitting, as it is simply bolted or screwed to the screen board. The standard deck sash behind the ventilator is then used for regulating the flow of air. The arch or elliptical roof type ventilator is shown in Fig. 6. It is applied in a different manner, since it is made to conform to the curvature of the roof. A 1½ in. flange is provided for soldering it to the roof sheets to insure water tight connections. Ventilation with this type of ventilator is controlled individually by operating registers applied to the headlining beneath each ventilator.

Fig. 7 shows the application of this ventilator in conjunction

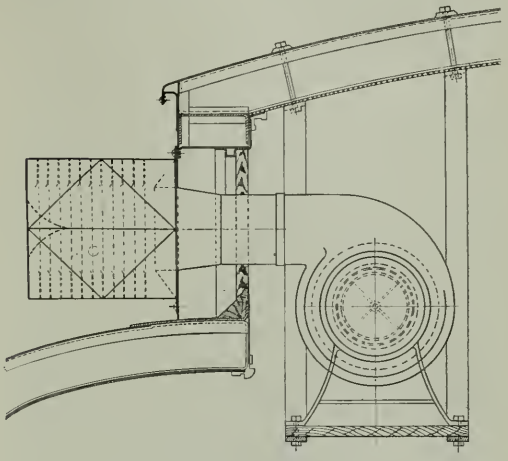

Fig. 7—Combined Ventilator and Blower

with an electric blower making a complete combination for the ventilation of dining cars which require the expulsion of fumes, smoke and kitchen odors while the car is standing. This type is provided with louvres as shown by the dotted lines. Its outside application to the screen board in the monitor roof car is the same as the type previously described. Simplicity has been carefully sought in both the construction and application of these various types of ventilators with a view to reducing the first cost and cost of maintenance.

ENGINEMEN'S EXPERIENCES*

Teaching the Fireman.—When you get a green fireman be fair to him, patient. Tell him what he can digest. Don't tell him about lap, lead, etc., as he cannot digest that just yet, but talk to him about the foundation of his work, which is: *How to burn coal and how to keep from burning coal;* in other words, an intelligent and economical system of firing. Impress upon him the importance of economy with fuel, as well as other supplies. Let him know that this coal is charged up to you as well as himself, and that you have an average coal record, and don't want him to spoil it; besides, he is wasting his energy if he puts in two scoops of coal when one is sufficient. Let him know that it is poor fuel economy to put in a fire at certain points, or under certain conditions, and then hear her "pop" for ten or fifteen minutes; let him know that it takes coal and water to keep a pop valve open, and both represent money which is being wasted and never will be recovered; let him know that fuel represents more cash than any other article the company buys,

*This is one of a half dozen aticles to be printed in these columns, made up of useful hints to locomotive runners, which were written in connection with the recent prize competition. These will give not only different views of topics treated in the articles printed last winter but also interesting experiences not before touched upon.

except labor, and that he can save or waste much by the way he handles it.

When you take coal get enough, but do not heap it up on your tender so that you will lose a hundred pounds before you have gone ten miles. The company I work for coals about 1,000 engines a day. If there is 50 pounds of coal wasted from each one of these tenders each day, and the coal costs two dollars a ton to put on the tender, it will amount to twenty-five tons a day, which equals fifty dollars a day, or $18,250 annually. This sum would pay the interest on $450,000 bonds at four per cent. From these figures we can see the importance of keeping the fireman and the coal chute men, as well as ourselves, lined up for fuel economy. When you show your fireman these things he will make an effort to help you maintain your coal record.—*M. C. Glenn.*

A Sobering Experience.—I was called to double head passenger train 136 (at 8 p. m.) from Paducah to Princeton, Ky. Mine should have been the second engine, but to save the delay of switching the engines, mine was put in the lead. The train was about 40 minutes late. We received several orders before leaving, one of which read: "No. 136 engines 1,200 and 1,198 will meet No. 51 engine 16 at Clarks." No. 51 was a second class train, and as we only checked the register against first class trains we, of course, did not know how many overdue second class trains were on the road. On arriving at Clarks I whistled for the station and discovered a train in the side track, without signals. The fireman took his lantern and held it out the cab window to see the engine number of the train in the siding. He said it was engine number 16, therefore I was convinced it was train 51. I called for the block signal and got a clear block to Stiles, the next station. Just after passing the block office the second engineer whistled me to stop. He came over and asked me if the train in the siding was No. 51. I told him the fireman got the engine number and it corresponded with the one on the order. It was our custom to rely on the fireman, in case the siding was on his side, for this information. We came to the conclusion that the train referred to was No. 51, and proceeded to the next block office, where we found a red board and No. 51, engine 16, going into the siding for us. The train we met at Clarks was No. 71 engine 36, seven hours late. The investigation disclosed the fact that since we did not check the register against second class trains it was our duty to stop and ask the crew of the train we met if they were No. 51. Had this been done we should have remained at Clarks until No. 51 arrived; had it not been for the block signal a disastrous collision would surely have occurred. Both engine crews, also the conductor, were dismissed from service for their concern in the affair; but were all reinstated a year later.—*J. H. Glenn.*

Be Sure You're Right.—One rule that I have adopted is not to accept signals unless I positively know they are for me. It is no use to have a vigilant lookout unless it is an intelligent lookout. One New Year's night at C——— there was a passenger train on siding giving proceed signals as we were rounding the curve on fireman's side. The fireman called out: "All right; high ball." I knew no one had a right to give me such signals, as every train should have been in the clear; I was the superior train and had no meet orders. So I set my brakes in emergency and turned on the sand. I barely got stopped in the clear. The rear coach of their train was just on the frog, and in the rearmost part where, had I not stopped I should have struck, was a happy family of mother and children. The conductor was giving desperate signals to his engineer to pull in to clear, for he had no flag out. The engineer, however, had coupled into other cars on the siding and could not move. The thought of what might have happened has greatly influenced me in being careful and keeping a constant lookout, even where everything could be expected to be clear. Once I had an excursion train of over 1,000 passengers, and my engine struck a bad place in the track and made a double lunge. How the engine regained its equilibrium I cannot tell, but it held to the rails, and nothing happened except the effect upon me. Since then I must be satisfied the track is good for the speed I am making. The idea of putting 1,000 people down the embankment for the sake of a good run would be no pleasant memory. Thus a constant lookout to know where you are is requisite even where there are no obstructions to encounter.—*William A. Murphy.*

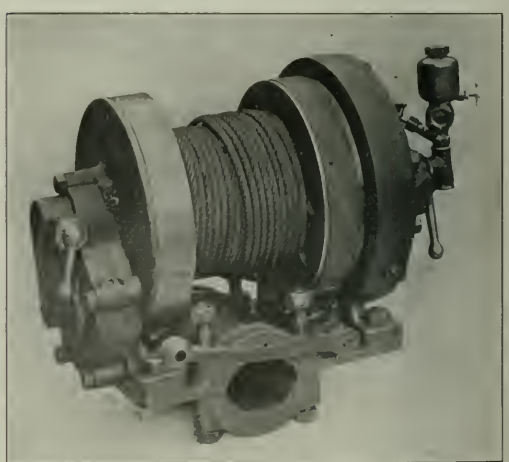
Give Whistle Signals with Care.—It is a great help in acquiring the habit of keeping a perfect lookout ahead to take care in giving correct crossing, station and block signal whistles, as provided by the rules. This is being done by only a very few engineers. To go on and on merely looking ahead and whistling now and then as an especially dangerous crossing is approached is the worst possible habit.—*C. H. Purcell.*

A Word to the Wise Is Sufficient.—As a young engineer I made a study of two or three older runners whom I knew to be successful. This, with a word of advice from a train director on one occasion—and it always pays to listen to older heads—has helped keep me out of trouble, so far. The admonition from the train director was very simply done. He stopped me one day and said: "Young man, you came into this yard too fast." I ran slower afterward. We are often tempted to disregard distant signals, but it is a bad habit to get into, and is sure to lead to trouble sooner or later. One may think the block is long or the grade is in favor of a short stop, and keep pulling the train. In the meantime your attention is taken up with other duties, when all at once you are face to face with a stop signal. In such a case you make a very rough stop at least, and possibly something more serious happens.—*Wolter J. Propert.*

COMPACT PORTABLE HOIST

A portable hoist which has a lifting capacity of 1,000 lb., and weighs less than 300 lb. complete, has recently been introduced by the Ingersoll-Rand Company, 11 Broadway, New York. The base is arranged so that it may be bolted to a timber foundation or clamped to a circular member such as a column, shaft bar or pipe, to which it may be quickly attached.

The dimensions of the hoist are 21¼ in. by 16½ in., the height



Portable Hoist for Attachment to a Column or a Timber Foundation

being 20⅛ in. The drum is 6 in. in diameter with a space between flanges of 7 in. This will accommodate 700 ft. of ¼ in. rope or 450 ft. of 5/16 in. rope. The capacity of 1,000 lb. is obtained at a rope speed of 85 ft. per minute and a steam or air pressure of 80 lb. per sq. in.

The motor is of the reversible square piston type giving four impulses per revolution of the engine. There are no dead cen-

ters and the hoist will start in any position. The drum is mounted independent of the motor shaft and is operated through a clutch and gears. Safety is provided by a powerful worm-operated band brake lined with Raybestos. All moving parts with the exception of the drum are enclosed, thus insuring against accidents to workmen who might be in danger of catching their clothing in the gears.

Due to its light weight this hoist is adapted to a wide range of service wherever loads within its capacity are to be handled. In manufacturing and power plants it is very handy for moving light machinery, for hoisting ashes and other waste material, for loading trucks, etc. It is particularly suited for service in foundries in lifting flasks and ladles. In ship yards, railroad shops and on construction work it can be put to a variety of uses.

GENERALSHIP IN THE YARD

By E. E. Swergal

Executive Office, Southern Pacific, San Francisco.

The question of efficient results in a given standard of yard facilities and traffic, depends almost wholly upon the ability of the men directly in charge to conceive and skillfully execute plans of operation suited to current and contingent conditions in the yard. The active operations should be under the direction of experienced men who are capable of clear thinking and prompt action. Operating a yard is playing chess in another form. When conditions are complicated openings will occur that are opportunities if the yardmaster is sufficiently alert to recognize and take advantage of them.

The duties of the terminal trainmaster or general yardmaster should be administrative in character with a view of co-ordinating all activities. The condition of the power and its assignment, the employment of men, the administration of discipline, the accounting of records, and the management of the relations between the yard and the division at large or connecting lines, are matters of such importance that his thought should be given chiefly to them. In other words he should hold himself in reserve as a commanding general; sufficiently poised in mind so that he may correctly analyze all the phases of operation and dispose his men and materials accordingly. When operations become extremely complicated because of extraordinary conditions he should then take active charge and encourage and direct the men in such a way as will arouse enthusiasm and greater activity; there is an element of psychology in this as important as are the elements of a material nature.

One of the principal causes of failure in yard operation is a lack of a realization of the value of time. The failure of plans shrewdly conceived, in-yard or other active operations, is often due to tardiness in putting them into execution. Briefly stated, a few minutes, or even a minute, wasted or made use of after plans are formulated may largely contribute to the success or failure of final results.

As all operations in the yard are interdependent, all employees should be cognizant in a general way of what the plan of operation will be during the shift. While night yardmaster at a junction yard in the southwest, it was my custom to go to the yard office early enough in the evening to enable me to study the transfer book and to obtain from the division despatchers a lineup showing the trains of all character that would arrive during the night. The freight traffic was largely manifest, of which there was a large volume, and there were several trans-continental passenger and mail trains in each direction that required considerable switching in addition to other coincident duties. After reviewing all information obtainable I condensed it and added thereto a tentative plan of operation for the night, showing particularly the standing of tracks. I made 10 or 12 sheets of this by manifold, giving copies to the engine foremen, the roundhouse foreman and the call boy, posting one in the yard office and keeping the original. By this method every man in the yard became generally familiar with conditions as a whole, and it was easier for them to co-operate, and easier for me to harmonize them with the various problems.

For example when a crew working at one end of the yard heard signal calls or saw a train entering the other end of the yard at 3.30, the program indicated that, in all probability, it was Extra 1652 and that the men at that end were heading it onto track 4. They knew the character of the train and the relation of their duties to it if it was of direct concern. As I altered plans or decided upon new ones it was my practice to make everyone familiar with them as soon as I could. Closely allied with this feature, is the necessity for rapid communication throughout the yard. Telephones should be located at all strategic points. The possibility of good results to be obtained from rapid means of communication is so apparent that division officers are inexcusably short-sighted when they do not provide or recommend provision for such facilities.

There are many yardmasters and line officers too, who would profit themselves and the interests they serve if they would try to develop within themselves those personal qualities which largely made for success in the lives of men who have been historically prominent in successfully directing the operations of an organization of men. The yardmaster should learn the value of a kindly smile and an encouraging word at trying times. The men must be made to feel that their good will and co-operation is necessary for success in the yard, and in order to instill this in their minds they must be dealt with as men and fellow workers—not as mere wage earners, for in the yard, as in all other endeavors, men are dependent upon each other either directly or indirectly, regardless of position. When I was in charge of yard work, if occasion required me to write our officers regarding conditions, unless there were reasons of policy to the contrary, I took the interested men into my confidence, allowing them to examine letters and reports regardless of their educational qualifications. This pleased them, as it indicated I had respect for their opinions regarding the work. Occasionally, when conditions permitted, I would relieve a man long enough to enable him to go to the eating house or loiter about for a little recreation, or if a train was due in during supper hour I personally relieved the switch tender at the end of the yard so that he might eat with the crowd.

We cultivated friendly relations with the train and enginemen working into our terminal, and I personally resorted to political methods with a view of harmonizing them. It had been the rule, rather than the exception, that trains could not get into the yard because of congestion primarily due to the heavy traffic of the then prosperous times, but partially due to lack of studious effort upon the part of the yardmasters and the crews. We established the rule of taking the trains into the yard with the least possible delay, and generally with no delay, hurried cabooses to the assigned track near the eating house, and frequently, if the power along the road was dragging because of failures or heavy trains, we ran outside the yard and helped trains in. In return for this treatment, the road men often picked up cars or threw out bad order cars as conditions developed at such times as the yard crews were rushed with work. Whenever I was confident of the result, rather than wait for extras to come up and signal for switches or inquire by wire, I wired them briefly that certain switches would be open for them, and they were usually safe in inferring from this that an engine would promptly switch their caboose. I suppose Webster would define endeavors of this character as the gentle art of dissimulation, politicians would say it was practical politics, conservatives would say it was something radical, while cynics would apply to it a less respectful term. Whatever they may call it, the fact remains that history is replete with evidence that mankind generally is responsive to it in a generous measure. I believe that a tactful policy under conditions such as I have described will accomplish very much more for good than a policy of aggression, or in other words the yardmaster, or any man in charge of men, can obtain good results if he works with his men upon a basis of frankness and fair dealing.

INCREASING THE CAR LOAD*

By J. Fred Townsend
Traffic Manager, National Tube Company

Rapid strides have been made during the last decade in rehabilitating railway property generally—reduction of grades, eliminating the curves, reconstructing the roadbed, replacing bridges and structures with larger and stronger material, and laying heavier steel rails, to care for the motive power and rolling stock that has been doubled in capacity, building second and third tracks and making extraordinary improvements in terminal yard facilities.

About 35 years ago, the maximum freight carload was 24,000 lb. The New York, Chicago & St. Louis Railroad was constructed at that time. It was built and equipped upon the most advanced ideas, which prompted some one to suggest its popular name, "Nickel Plate," and its new freight cars were all of 40,000 lb. capacity. This car would carry nearly double the load of the cars then generally in use.

All railroads throughout the country commenced enlarging their equipment, and during the next 10 years the 50,000 and 60,000 lb. capacity cars appeared. Today we have the 100,000 and the 140,000 lb. capacity cars, and it would be hard indeed to convince some people that the limit has not been reached.

However, when such a bulky commodity as coke can be loaded to the highest limit in the modern freight car, i. e., to 10 per cent. above marked capacity in the 100,000 lb. cars, it would seem to a layman that the unit of transportation should be increased, and instead of going through the slow and expensive changes of raising the limit 10,000 or 20,000 lb. at a time, a 200,000 or a 300,000 lb. capacity car should be adopted.

And it seems to me the railroads' opportunity to increase their net revenue irrespective of increased wages and expenses is here, and that they can accomplish this by following the example of the iron and steel manufacturers in increasing their facilities and then making the best use of them. This can be accomplished by doubling the capacity of freight cars, making the limit 300,000 lb. per car with six-wheel trucks. The gross weight of such cars loaded would not be as much as the new Mallet locomotives that are being very generally adopted.

During the last 20 years, the maximum freight car capacity has increased only 100 per cent., while the locomotive capacity during the same period has increased 400 per cent. The wide difference between the increase in the capacity of the locomotives as compared with the carrying capacity of the freight cars has necessitated the very long freight trains in order to give the heavy locomotives an economical load. This has resulted in an enormous increase in the maintenance of the small freight cars.

The question will naturally be raised as to why the railroads do not adopt a very much more substantial car of 150 tons capacity. The answer can be found in the records of all railroads in this country, which show that during the last ten years over 60 per cent. of the increased capacity of the freight cars has been unused in practice, while the extra cost of hauling the greater dead weight and the extra cost of maintenance have been incurred.

The fact is that everybody is complaining. Engineering experts who study these questions, as well as the railroad executives and operating officers, are surprised and disappointed because big engines and big cars have apparently failed to accomplish expected economies. Shippers whose business has been disturbed by periodical increases in minimum weight requirements are disposed to complain because the railroads disregard commercial conditions, which demand the small carload unit; while the railroad traffic managers, pressed on one side by their operating and executive officers to get bigger loads for the bigger cars, and on the other hand meeting shippers' protest against further increase in the minimum weight conditions of the tariffs, are discouraged and almost desperate.

*Abstract of a paper presented before the American Iron & Steel Institute, New York City, on May 22, 1914.

The demand for a small carload unit would not enter into the shipment of such commodities as coal, coke, iron ore, grain, building material and other commodities which are sold and handled in large quantities, under conditions which would make the shipper indifferent as to whether they moved in carloads of 20 or 100 tons, assuming the cost of loading and unloading to be the same.

The attitude of the shippers toward the big carload does not depend entirely upon the capacity or the cost of loading or unloading, but rather upon the way in which it is bought and sold —whether sold by a man who has a large quantity to sell or bought by a man who wants a large or small quantity—the desire of the retail merchant to get the minimum carload of flour, because of the original investment, interest in insurance cost of carrying the stock, depreciation in quality, chance of falling market, and so on. The same thing is true of sugar, canned goods, beans, and everything in the list of goods handled by small jobbers or very large retailers. In fact, when you get outside of the limited list of very large jobbers, nearly every buyer wants the smallest quantity on which he can get the minimum delivered price. If the railroads expect such people to buy a large quantity and co-operate in the loading of cars to capacity, their freight tariffs must not only offer indemnity for the greater cost of handling such larger quantities; and to get complete co-operation on the part of shippers, the tariffs should offer some material inducement to trade in large quantities, thereby loading cars to capacity.

SHOULD NOT THE "WHOLESALE" PRINCIPLE APPLY?

It would seem that any remedy must involve some practical application of the wholesale principle to the transportation business; and for the same reason that the price paid for the most commodities is in the inverse ratio to the amount purchased, the railroads should, within the limit of their maximum car capacity, give the lowest rate to the man who makes the largest shipment.

The freight tariffs of the European railways are based on the wholesale principle, all rates, generally speaking, being graduated according to the quantity shipped. The American railroads have made what seems to be the mistake of limiting their rates to two base units—the carload, which is anything more than 36,000 lb., or whatever may be the prescribed minimum weight, and the less-than-carload, which is anything under 36,000 lb. and within the limit of the money charge which would be made for the minimum carload shipment.

To have only the two units for rate making, the carload lot and the less-than-carload lot, was not advisable even 25 years ago, when the minimum was 20,000 lb. and the carload rate was applied upon relatively small quantities. Under the present day conditions, when the shipper is expected to furnish full loads for cars of 40 and 50 tons capacity and requested to load not less than 18 or 20 tons in order to get the carload rate, there is still less justification for the failure of the carriers to work out some graduated scale of rates, according to the weight of such consignments, or in some other way make freight tariffs which would permit the forwarding of any shipment, however large or small, at a rate which would bear some consistent relation to the cost of service.

Grain tariffs generally provide that the rates will apply only when cars are loaded to capacity. In other words, the minimum weight is the marked capacity of the car in case of corn, wheat, etc., while the minimum weight for oats or other bulky grain is based upon cubical capacity of cars used. Railroads are not building cars of capacity less than 80,000 lb. Therefore a shipper could not get the car load rate, which we will say is 15 cents per 100 lb., unless he forwarded 80,000 lb., or is able to get a smaller car. But it is difficult to get cars of 60,000 or 70,000 lb. capacity, and almost impossible to get cars of capacity less than 60,000 lb.

The question has been raised as to why the present method of rate making is considered better than the European method, or if not better, why the European method is not to a greater or

less extent observed in making American railroad tariffs. The average railroad traffic manager is usually obliged to say that any tariff which would fairly meet requirements of small carload shippers, and offer due encouragement to those who would load cars to capacity, would be altogether too complicated. And the same traffic manager is also likely to say that it is difficult, if not imposible, to change rules and practices which have obtained for long periods of time and on which business has been organized and built up. He will further say that the graduation of rates on carload shipments according to weight loaded, could not be made without loss of gross revenue, because the carload rates are now subject to minimum weights, which usually represent about 50 per cent. of the average car capacity, and any attempt to increase the rate on small carload shipments would meet the protest of shippers and the veto of state and federal authorities. It would be possible to encourage maximum loading only by offering rates considerably less than the present carload rates. And since the railroads are now able, in one way or another, to get a large proportion of their carload shipments on a capacity loading basis, any attempt to graduate the rates on a consistent basis would certainly result in a loss of revenue.

Nevertheless, this principle has been to some extent recognized in railroad freight tariffs in this country. The most numerous examples of such rate making are found in tariffs of the so-called transcontinental roads. In the case of canned salmon and several commodities which are commonly carried eastbound, these roads make two rates. For example, the rate on canned salmon from Seattle to eastern common points is 85 cents, subject to minimum weight of 40,000 lb., and 70 cents, subject to minimum weight of 60,000 lb.

A similar differentiation of rates according to minimum weights has been made to some items in the westbound tariffs of the transcontinental roads with result that nearly all of the tonnage moves under the lower rate, subject to the higher weight, thus proving that shippers can and will accommodate themselves to increased minimum weight requirements if there is any incidental saving in the rate.

Except as the trainload unit may be employed, the carload unit is the only useful basis for estimating railroad transportation cost. When any attempt is made by the railroads to measure the net revenue arising from any traffic, they consider the earnings per car. If the load is 80,000 lb., the revenue will be twice as much as it would be if the load was only 40,000 lb. But who will say whether it costs more to transport the 80,000 lb. load, and how much more?

Engineering experts have furnished various rules for determining the tractive resistance, or what is commonly called "the drawbar pull" of cars carrying different loads. With knowledge of conditions as to grades, curvature, wind resistance, and so on, these experts can estimate the weight resistance, wheel friction, and all other items to be considered in determining the relative cost of moving a car loaded with 20 tons of freight, and the cost of moving the same car loaded with 40 tons of freight, between two given points under the same conditions. But it has been impossible to state any rule or formula which may be commonly used with confidence. We know only in a very general way that the cost per ton of transporting freight in cars loaded to capacity is very much less than the cost per ton of carrying the same freight in cars half loaded.

Consider what the shippers of the Pittsburgh district generally could accomplish in the way of creating a car supply by increasing the average load per car. Based on the total Pittsburgh district tonnage for the year 1912, an increase in the average carload of, say, two tons per car, would have resulted in the same tonnage moving in 409,524 fewer cars.

While the Pittsburgh district tonnage is merely used for a basis of computation, there can be no question but that even a more remarkable showing could be made in increasing the average carload throughout the country generally, if the railroads would bring this subject before the shipping public. Shippers and consignees will be convinced that it is to their best interest to go to additional expense, if necessary, both in loading and unloading heavier cars, when they are made to realize that it means increased car supply; for there is nothing that interferes more with the general business of the country than a shortage of cars.

A SUGGESTION TO RAILROADS

It seems to me that the traffic officials of the railroads have it in their power to improve the situation in a very simple manner, by issuing graduated commodity rates based on increased carload minimum weights, i. e., commence on the present basis of rates with the present minimum weight and have a table of higher minimums with lower rates.

For instance, from Seattle to New York, the table of rates on lumber could be made as follows:

Minimum weight	Rate
20,000 lb.	$1.25 per 100 lb.
30,000 lb.	.85 per 100 lb.
40,000 lb.	.75 per 100 lb.
60,000 lb.	.60 per 100 lb.
80,000 lb.	.50 per 100 lb.

The present freight rate on lumber from the Pacific coast to New York is 75 cents per 100 lb., with 25 or 30 minimum carload weights that are based upon the cubical capacity of the car. The same method could be used by establishing graduated rates in the opposite direction, westbound. Take, for instance, the iron and steel commodities that are produced in large quantities in the East and needed along the Pacific coast.

Objections might be raised to the large number of carload minimum weights and various rates. To avoid this, the suggestion has been made by Henry S. Prichard to use, for instance, the same minimum weights and basis of rates that are in effect today, charging for the excess weight over the prescribed minimum carload weight, say, one-fifth of the tariff rate. Applied to the above example, under the Prichard method, $1.25 per 100 lb. would be charged for the minimum of 20,000 lb., and 25 cents per 100 lb. for the excess over the minimum, and the total resulting revenue would be the same as in the graded table above.

A similar schedule of graduated rates could be established between any other points and upon any other class of traffic, and perhaps even better examples could be made with flour and grain rates that are in effect today.

TRANSCONTINENTAL TRANSPORTATION

All will agree that the method of making all-rail rates to the Pacific coast must be entirely changed if eastern manufacturers are to enjoy any share of the Pacific coast trade. To see this clearly, it is only necessary to bear in mind the recent large reductions in import duties and ocean freights, and the near approach of the opening of the Panama canal, which will, if present all-rail rates of freight are maintained, shortly deliver the entire business to British, German and Belgian manufacturers. Very much of the business has already been delivered to them because of the causes named. But it seems to me that the railroads, by promptly adopting some such plan of making rates as I have illustrated, can hold the business for themselves and for American manufacturers and do so at a substantial direct profit. This will further have the beneficial effect of equalizing their traffic east and west.

Some people may reach the conclusion that this is a drive to lower freight rates. But if it does lower rates it spells increased net earnings for the railroads, because every buyer in the land would specify the very largest carload in every instance, hence heavy loads. The result would be an actual saving in freight costs to the shippers that would compensate them for building up the heavier loads, and, at the same time, result in a marked increase in net earnings to the railroads.

With a graduated schedule of rates to select from, the low minimum carload shipments would become the exception, and the small capacity cars would disappear entirely. There would be three of the present minimum carload shipments forwarded in one car.

To fully appreciate the value of this saving in equipment, consider the following items:

First. The more desirable traffic to the railroads means lower

cost of transportation and naturally lower basis of freight rates.

Second. The saving in switching expenses, avoiding congestion in the freight yards and expediting the movement of cars, both for the shippers and the railroads.

Third. The value to the railroads in having an enormous increase in the car supply without the investment of any additional capital.

Fourth. The actual saving to the railroads, in dollars and cents, of the cost of a large number of cars, and the additional saving in operating and maintenance expenses, and the valuable track room in terminal yards. The heavier loading of cars will, in itself, really create increased terminals without the expenditure of a dollar by the railroads.

For months past we have all, I have no doubt, been watching with a great deal of interest the effort being made by the railroads generally to secure permission from the Interstate Commerce Commission to charge rates of freight that would give them sufficient revenue to operate their properties properly, and give the public the service that the public is entitled to, and demands. The strongest argument that has been made in opposition to the views of the railroads has brought forward the fact tbat the railroads could themselves largely increase their net earnings by the practice of various economies. And while I am not here to argue the rate case pro and con, I know of nothing that has been advanced in the field of economics that would do more to stop the present waste of our transportation facilities, than some such basis of rate making as enumerated above. There are untold values of railroad equipment today that are not being utilized to their capacity or greatest efficiency because we are bound by an antiquated system of rate making.

Seriously, I believe that the members of the American Iron and Steel Institute can do a great deal toward greater car efficiency by taking up the campaign for heavier loading of cars that will naturally encourage the railroads to build cars of very much heavier capacity, and I ask your co-operation in this movement, which, viewed from the standpoint of transportation, commerce, economies or efficiency seems to spell progress.

DISCUSSION

Delos W. Cooke, vice-president and general traffic manager of the Erie, discussed this paper as follows:

The movement toward cars of larger capacity undoubtedly originated in a desire to economize in transportation cost. Whether this was the desire of the prosperous line to increase its profits or was forced on the weaker lines, as a clever lawyer once said, "By the scourge of crass necessity," is of little consequence; it was sound business policy.

With it, however, came the building of heavier power. The old-style car with the wooden underframe and weak draft gear connections passed out because it would not stand the strain of the hundred-car train. The car that took its place is of steel or steel frame construction. The most natural thing in the worl was to increase its capacity since the structural strength was there of necessity.

If the master minds of the earlier day who decided upon and built the large car were disappointed that the carload did not increase in proportion to the increased capacity, the truth may here be stated that when they built the large car they probably gave commercial conditions little or no consideration. They knew that if they had the car so constructed that it could be hauled in the longest possible train, somebody would be very busy trying to find a load for it no matter what its capacity might be. This had to do chiefly with the box car, which probably sees the greatest variety of service, but encouraged by the co-operation of shippers we are now building cars of 70 tons capacity for the iron and steel trade without a block of wood in them. The railroads must carry everything from feathers to pig lead, and, as Mr. Townsend says, commercial conditions—and it might be added the character of the commerce—govern the load.

The car of large cubic capacity is of great service to the railroads in enabling them to increase the load of light and bulky articles, which the varied character of commerce compels them to transport. It is practically impossible to secure a rate that will compensate for the light load on such traffic, but large cars will do much toward helping the situation in cases like:

	Average carload		Average carload
Automobiles	12,000 lb.	Agricultural implements	33,000 lb.
Excelsior	20,000 lb.	Apples	26,000 lb.
Hay, Straw, Canteloupes	22,000 lb.	Grapes, Cabbage, Tobacco	29,000 lb.
Rags and waste paper	23,000 lb.	Oranges	28,500 lb.
Sisal	24,000 lb.	Onions	30,000 lb.

Progress is being made, however, in securing heavier loading. On one trunk line the average loading on brick is 70,180 lb., where the average minimum is 40,000 lb., and on the same line the average on wheat is 71,463 lb., the average minimum being 60,000 lb. The average load of iron and steel on another trunk line which handles most of that traffic is 60,000 lb., showing that there is still room for improvement.

If the carload unit were the universal basis of commercial transactions it might be less difficult, even in these times, to endorse Mr. Townsend's suggested basis of scaled rates for increased loading; but the fact that in all big business the carload unit has little to do with the basis of sale, makes it seem that the already unjustifiable spread between carload and less-than-carload ratings is as far in rate reduction as the railroads can be expected to go.

There can be no doubt of the soundness of Mr. Townsend's suggestion, that the scaled rate would induce heavier loading in many lines of traffic, but this is by no means free from danger, especially in the mixed carload. The Supreme Court has decided that a railroad has no right to question the ownership of the goods in the application of carload ratings. This is developing the so-called forwarder or scalper to an extent that is positively startling, and it must be in some way corrected. Recent instances show that these forwarders by consolidating less-than-carload shipments of miscellaneous merchandise into carloads, and thus securing the carload rate, have a margin of 45 cents per 100 lb.. New York to Chicago, to divide with their patrons, making the railroad losses in many instances, as compared with their less carload rates to which they are entitled, over $100 per car. The loading secured by the forwarders is more than double the average merchandise loading of the trunk line railroads, and the scaled weight basis applied to this traffic would simply increase the profits of the scalper and diminish those of the railroad. In this situation we have the anomalous condition of the railroad being required by law to publish and maintain rates for certain quantities, while the scalper with no investment and absolutely no responsibility is able to make rates as much as 50 per cent. less than the railroad over the same line and divide his profits with the shipper. This, too, under a decision of the Interstate Commerce Commission sustained by the Supreme Court.

The four items of value to the railroads which Mr. Townsend gives as resulting from the saving in equipment are convincing, except as to the first, in which it could not be wholly agreed a reduction in rates naturally followed a reduction in transportation cost.

In the steel business it has been said that there is a bottom but no top. The top on railroad rates is so securely fastened as to make it absolutely necessary to keep any margin of profit intact, if any such thing exists. The railroads cannot afford to reduce their rates even to secure heavier loading, and we must appeal to you to continue your good work in helping us in this direction if for no other reason than it is to your interest to do so.

It needs no argument following Mr. Townsend's paper to show that we *must* get the heavier load, and it is likewise true that the heavier car must be built for the heavier load. The great importance to the iron and steel industry of co-operation in this direction is almost too manifest to permit suggestion, but let it be said that every part of the heavier car, from axle to running-board, calls for an increased use of metal and that metal is steel. The heavy train and the big car call for the big locomotive. A line I know has just built one containing 853,000 lb.

of steel, which is capable of hauling a train of loaded freight cars four and three-quarters miles long, *if the cars would stand it.* Bridges have been strengthened to the extent of 30 per cent. axle-load capacity in the past ten years, which means that most of them have been renewed with steel.

Heavier rails and fastenings call for steel, steel.

Have we not found in this, therefore, the ideal basis for co-operation between our great industries? You have only to do your part. We *must* do ours.

NEW D. L. & W. FREIGHT STATION AT UTICA, N. Y.

The new Delaware, Lackawanna & Western inbound freight house at Utica, N. Y., embodies a number of advanced features of design for this type of building. It is 51 ft. 4 in. wide and 402 ft. 4 in. long, the frame work being of reinforced concrete with the panels filled in with brick. The main floor contains a freight room 382 ft. 8 in. long and 48 ft. wide, and a public lobby, cashier's office, and locker and lunch rooms occupying 20 ft. of space for the entire width in one end of the building. A second story covers 82 ft. 4 in. of the length, containing private offices for the freight agent and the chief clerk, a general clerk's office, and a file room. A basement is provided under the office portion of the building, in which the heating and lighting plants are located. A new house, identical in most of the details, has also been built in Syracuse, N. Y.

The basement walls are of concrete, 1 ft. 8 in. thick with spread footings to keep the bearing pressure on the soil within the allowable maximum. The walls above the main floor level are 1 ft. thick with pilasters at 20 ft. intervals. The outer surface of the concrete walls is bush hammered. A timber floor is used in the freight room laid directly on a cinder fill. It consists of a ¾-in. maple wearing surface on creosoted planks running diagonally over creosoted sleepers. The wearing surface will be replaced when it has worn down ½ in. This floor is pitched ¼ in. to 1 ft. towards the street side to assist in moving freight. A scale is provided in the floor of each bay. A concrete floor is used for both the first and second stories in the office portion of the building, interior column supports being provided in line with the pilasters.

The freight doors along both sides of the building are counter-balanced and are equipped with the Wilcox horizontal bearings. They are 10 ft. wide and 8 ft. high, and are covered by canopies 9 ft. 4 in. wide, consisting of a steel frame supporting a concrete slab. In order to improve the lighting in the freight room the roof is raised high enough to provide for a row of Lupton steel sash above the canopy on each side of the house. Ventilation is also secured by the installation of the Pond operating device for a portion of the sash. The higher roof allows the use of a deeper and correspondingly lighter steel roof truss. The clear height under the trusses is 10 ft., and their depth at the walls is 6 ft., this being increased by the roof pitch of ¾ in. per foot to 7 ft. 6¾ in. at the ridge. Timber purlins over these trusses carry the 2 in. plank roof which is covered with a surface coat of tar and gravel. The roof on the office portion consists of a concrete slab carried by reinforced concrete beams and girders. An 8 ft. concrete platform on the track side is carried on the house foundation and a 12 in. wall under the outer edge.

The freight room is divided by three fire walls of brick with tin covered doors equipped with the Wilcox fixtures. The building is fitted with both gas and electric light. The offices on the second floor are well lighted by windows on three sides and are ample in size to care for all requirements. The record room is fitted with cases in which can be filed all records for seven years. A dumb waiter connects the two floors for the transfer of bills, receipts, etc., between the clerk's office and the cashier. The portion of the freight room under the offices is kept warm in the winter by the steam pipes under the platform on the car side and perishable freight is stored in this bay.

New Inbound Freight Station on the Lackawanna at Utica, N. Y.

Adequate fire protection, viz., a hydrant and hose stored in a rack, is provided in each bay. Toilets and wash room are also installed for the freight handlers, on the house floor, and separate toilets, locker rooms and lavatories for the male and female help in the offices.

Three tracks parallel the house and team tracks with a total capacity of about 74 cars join one end of the house. The driveways between the team tracks and along the house are paved with granite blocks.

This freight house was designed and built under the general direction of G. J. Ray, chief engineer, F. J. Nies, formerly architect, and C. E. Wickham, division engineer.

RAILROADS EARN LESS FROM MAILS THAN FROM EXPRESS

Ralph Peters, chairman of the railroads' committee on mail pay, commenting on the report of the joint congressional committee on railway mail pay, recently published, wherein it is found that the railroads are better paid for serving the express companies than for serving the government in carrying the mails, says:

"The committee has reported to Congress that the mail service costs the railroads more and yields them less than the express service; that the comparison of mail and express receipts furnishes no basis to support the claim that the railroads have been overpaid for carrying the mails, and that the express payments have been responsive to the growth in traffic, while the mail payments clearly have not.

"The evidence before the committee showed that in a typical passenger train the express car earned $6 while the mail car was earning $5.

"The report says:

"'Railway employees help to load and unload mail but not express matter, except where employees are jointly paid by the railroad and express companies. Express cars are cheaper than equipped mail cars. Railroad companies are liable for injuries to mail clerks but not for injuries to express employees. Express matter is handled at all times by express company employees. A railroad company not only handles the mail at and in stations, but in a great many instances bears the expense of transporting mail between the station and the postoffice. Mail must be carried on all trains, including the fast trains, while express matter is limited in frequency and speed of service.

"'Postal employees are carried free on railroads while on official business, whether connected with railroad mail service or not. Transportation of express employees is reciprocated by free services rendered by the express companies for the railroads.

"'Certainly there is no warrant in the oft-repeated assertion that the government is being robbed in its mail payments by comparison with what the express companies pay. There has been an amazing amount of reckless assertion on this subject.'"

V. J. Bradley, general supervisor of mail traffic of the Pennsylvania Railroad, presented a comparative statement of the differences between the two services. This, says Mr. Peters, shows the following facts:

DIFFERENCES IN THE REQUIREMENTS IMPOSED UPON THE RAILROADS

Subject	*Post Office Department*	*Express Companies*
1. Contracts	Post Office Department seeks to stipulate all the conditions and reserves the right to change many of them at will without consultation.	Express companies formally contract with railroad companies, the railroad companies being the controlling party and reserving important power.
2. Differences	Differences with Post Office Department not subject to arbitration as in England.	Arbitration would be naturally resorted to, and many contracts so provide.
3. Pay adjustments...	Post Office Department weighs the mails and adjusts the pay every four years and practically gives itself a rebate on the increased business for the intermediate period.	Express pay to railroad companies is automatically adjusted on the actual daily business.
4. Transp'n facilities.	Post Office Department demands unlimited frequency—practically on every train.	Express companies strictly limited to certain train movements.
5. Car space.....	Post Office Department requires excess car space for sorting the mails en route far beyond what the load requires.	Express traffic loads more compactly and therefore more economically.
6. R. P. O. cars.....	The railway post office cars are largely occupied by pigeon-holes and iron racks and are not available for general railroad use when not occupied by the mails.	Express traffic does not require specially equipped cars. Baggage cars serve the purpose and are available for general use.
7. Construction; maintenance	The law requires steel railway post office cars, and the Post Office Department prescribes the interior fittings and special sanitary fixtures and requirements. Light (electric or gas) is especially expensive, so much being needed. Hence high cost of construction and maintenance.	The express company accepts the cars that the railroad company can supply and is content with ordinary service and very little artificial light. Hence low cost of construction and maintenance.
8. Loading	The railroad companies pay for loading and unloading mail cars.	The express companies bear this expense themselves.
9. Employees in cars.	Probably three or four times as many railway postal clerks are carried for sorting the mails en route. The railroad companies are responsible for their lives and safety. Substantial amounts are paid annually on account of accidents.	Express companies relieve the railroad company from any responsibility for injury or death of their employees.
10. Station room.....	If the Post Office Department requires room for transfer clerks at stations, the railroad companies provide them without special charge and also furnish them and sunnly heat, light, iced water, etc.	The express company pays rent for any space occupied in stations, or builds its own structures.
11. Messenger service.	Post Office Department requires railroad companies to carry the mails between the station and the post office at many places.	No such service is performed for the express company.
12. Reciprocal service.	Post Office Department makes no concessions to railroad companies.	The express company usually carries free, money, tickets, valuable packages, etc., for the railroad company, not only on the contracting railroads, but also over the connecting lines over which the express company operates.
13. Mail cranes.....	Post Office Department requires railroad companies to erect and maintain these devices at several thousand places throughout the country.	No such requirement exists in connection with the express service.
14. Advance loading.	Post Office Department expects cars to be placed in terminals several hours before leaving time for distribution in addition to loading, and thereby avoids renting space in post offices for that purpose.	Express companies own or rent their own unloading or loading warehouses and pay all costs and expenses.
15. Handling traffic...	Post Office Department pays nothing extra to train baggagemen nor to station baggagemen for handling the mail traffic.	Express company contributes to the salary of railroad employees acting in the joint capacity.
16. Loss or damage..	The Post Office Department has not, so far as known, asserted the claim that the railroad companies are pecuniarily responsible for the general mails, but has imposed fines to cover the loss of registered mail or of mail bags or locks lost or destroyed as in railroad wrecks.	Express company accepts all responsibility for loss or damage to express traffic.
17. Penalties	Post Office Department imposes fines and deductions in many cases, some of which are dependent upon the idea that the particular mail (perhaps relatively unimportant) must be given preference over passenger and other traffic.	Express company accepts the railroad company's standard of efficiency and has no superior privileges of supervision.

PROTECTING THE FORTH BRIDGE OF SCOTLAND.—Special precautions are being taken to guard the Forth Bridge, and passengers are not allowed to take any hand luggage in the compartments while crossing the bridge.

General News Department

In connection with the buy-a-bale-of-cotton movement which has been discussed in the newspapers, the Nashville, Chattanooga & St. Louis has announced that it will buy 125 bales of cotton at 10 cents a pound.

On September 1 the Illinois Central acquired from the Central Fruit Despatch, a subsidiary company, all its refrigerator cars and such cars not already lettered "I. C. R. R." will be relettered, to be operated hereafter by the railroad company direct.

The legislative committee of the Order of Railroad Conductors in Pennsylvania has recommended an employers' liability law to the legislature which will meet next January. The legislative committee of the Brotherhood of Locomotive Engineers has declined to take any action.

The diary of a certain general superintendent shows that in one year he spent 101 days conferring with railroad commissions, committees of organized employees, city and town officers and officers of the courts; he was traveling over the road 155 days and spent 109 days at headquarters transacting business connected with the administration of the railroad.

The railroad companies have formally accepted the city ordinance governing the project for a new $65,000,000 union station and yards in Chicago to be used by the Pennsylvania, the Burlington and other roads, and to be completed within five years. In return for closing certain streets and alleys the city will receive $825,805 from the Union Depot Company.

On Tuesday of this week the Henry M. Flagler, the car-ferry which was built for the Florida East Coast for service between Key West and Cuba, was launched at the Cramp ship yards at Philadelphia. The ferry is built to accommodate 30 freight cars. It is 351 ft. long with 57-ft. beam. Its speed when loaded with 2,300 tons will be, it is estimated, about 12 knots.

In the derailment of passenger train No. 2 on the Alabama Great Southern near Livingston, Ala., on the morning of September 18 about 3 o'clock, eight passengers and two trainmen are reported to have been killed and 30 persons were injured. The wreck was due to a misplaced switch and the reports indicate that the switch had been tampered with. An investigation by the Interstate Commerce Commission has been asked by the railroad company.

The engineer and conductor of a Philadelphia & Reading train were killed by suffocation when the train stopped in a tunnel near Phoenixville, Pa. The train had run down and killed a woman at the entrance to the tunnel and was brought to a stop by the emergency application of the brakes, and the train crew and some of the passengers got out, but were overcome by smoke, and when a rescue party were later able to go forward they found the engineman and conductor both dead.

General Manager C. W. Galloway has issued a circular to the effect that telegraphing be done only where necessity requires the use of wires. Next to train orders, such messages as relate to car service to shippers and other messages of equal importance must take precedence. Abbreviating proper names is suggested. On the Baltimore & Ohio 30,000 messages are handled each day and the importance of being brief is obvious. As a substitute for the telegraph the railroad has adopted a "mailgram" service, messages of this character being handled by train with great despatch.

The New York, New Haven & Hartford reports that its plan for reducing the number of forest fires on Cape Cod by clearing wide strips along its right of way has met with marked success. This year from May to August inclusive there were only eleven fires attributable to sparks from locomotives and the territory burned over amounted to not more than 6¼ acres. In the same period last year there were 150 forest fires which burned over an area estimated at about 2,000 acres. Through all the wooded parts of Barnstable county a strip varying in width from 60 ft. to 130 ft. has been cleared on either side of the railroad's right of way. Pine trees have been left standing in these strips, as their leaves act as a screen. The areas cleared will be kept in that condition by the section gangs.

The Louisville & Nashville and the Nashville, Chattanooga & St. Louis have entered suits in the United States Court of Claims at Washington for $184,204 and $46,739, respectively, sums claimed to be due from the Government for carrying the mails since the parcel post was established. The petitions presented set forth the conditions of the contracts under which the roads carry the mails and allege that by the addition of the parcel post the Government has made an unreasonable addition to the quantity of matter carried in the mail cars and therefore has violated the spirit of the contracts under which the mails are carried.

At the regular monthly meeting of the board of directors of the New York, New Haven & Hartford, held in New York on September 17, the officers were authorized by the board to purchase power from the New York Edison Company. This purchased power, together with that now obtained from the power plant of the New York Central and that of the New Haven at Cos Cob, will enable the road to increase the number of trains operated electrically between New York and New Haven from 37 per cent to 70 per cent of the total. In order to have 100 per cent of electrical operation it will be necessary to purchase additional electrical equipment and additional power for the eastern section of the electric zone between New York and New Haven. At the present time all of the important passenger trains and a number of the important freight trains running between the two cities are hauled by electric locomotives.

Figures recently compiled show that the number of stockholders of the New York, New Haven & Hartford is rapidly increasing under the management of Chairman Elliott in spite of investigations and scandals growing out of acts of the old management. While the average increase from 1901 to 1912 was 1,194, the increase from 1912 to 1913 was 1,162, and from June 30, 1913, to August 31, 1914, was 2,305. The totals, with the number of women stockholders, about 43 per cent, are as follows:

	Total	Women
June 30, 1901	9,667	.....
June 30, 1906	12,627	.....
June 30, 1912	22,806	9,710
June 30, 1913	23,968	10,474
August 31, 1914	26,373	11,184

Street Car Disaster at Memphis

On the Illinois Central near Memphis, Tenn., on the evening of September 17 an electric car, run into by a freight train at a crossing, was overturned and many persons—reported from 10 to 30—were killed and 10 or more were injured. The wrecked car, a trailer, was thrown down a bank and the foremost freight cars toppled over on it. The motor car drawing the trailer cleared the railway tracks ahead of the engine. The accident occurred at a time when two freight trains were switching over the crossing. The street car conductor, it is said, gave his motorman the signal to go ahead after the first train passed and the car and its trailer were on the crossing when struck by the second train coming from the opposite direction.

A Device Which Records Telephone Messages

The "Telescribe" is an instrument recently perfected by Thomas A. Edison and his staff, capable of reproducing on the wax cylinder of the ordinary dictating machine both sides of an ordinary telephone conversation. The apparatus is in two essential parts; one is an amplifying device which intensifies the

sound from the regular telephone receiver, the latter during the conversation being merely placed in a rest on the amplifier and not electrically or mechanically connected with it, the speaker meanwhile hearing through an additional receiver cut-in on the telescribe. The sounds are then, in reality, telephoned to the other part of the device, a micro-recorder attached to the ordinary dictating machine, and are recorded on the cylinder of the latter to be preserved on the wax or copied in typewritten form as may be desired. The telescribe has not yet been placed on the market, so its possibilities in railway work are yet to be determined.

Air Brake Story Prizes

The judges in the Westinghouse Air Brake Company prize story contest have made their decision, awarding the first prize of $1,000 to James Cain, engineer of the Wabash Railroad at Peru, Ind. The second prize of $500 was awarded to H. C. Woodbridge, general manager's special representative, Buffalo, Rochester & Pittsburgh, Rochester, N. Y.; the third prize of $200 to Alexander M. Stewart, engineer, Illinois Central, McComb, Miss.; the fourth prize of $150 to D. Oxenford, road foreman of engines, Lehigh Valley, New York City; the fifth prize of $100 to Carl H. Fuller, chief engineer, Macon Railway & Light Company, Macon, Ga., and the sixth prize of $50 to Millard F. Cox, assistant superintendent machinery, Louisville & Nashville, Louisville, Ky. Considerably over 300 contributions were entered in this contest, the judges being W. E. Symons, consulting mechanical engineer, Chicago; Willard Smith, editor of the Railway Review, Chicago, and Roy V. Wright, managing editor of the *Railway Age Gazette*, New York City.

Foreign Electrification Projects

Among the many large and important engineering improvements which will undoubtedly be seriously delayed because of the war are the electrifications of steam railroads in Germany, France and other countries. The greatest delay may be expected in Germany, partly because of the diversion of government funds to war purposes and partly because of the fact that the latest electrification, that in Silesia, is close to the Russian border. In any event, the railroads will be so overcrowded because of troop and supply transportation that no such interruptions as are incident to a change from steam to electricity would be permitted. It is doubtful also whether the state railway electrification will be furthered in a time of such financial stress.

New York State Barge Canal

The engineers of the western division of the New York Barge Canal are preparing plans for the construction of sections of the canal under six railroad crossings each of Rochester and six west of that city. The work on this part of the canal has been postponed because of litigation as to the right of the State to take the land occupied by the railroads. A recent court decision affirms the right of the State to exercise eminent domain in these cases; but the State must build and maintain the bridges necessary for the crossing of the railroads. State engineer Bensel reports that the terminal facilities for the canal in Rochester, Syracuse, Oswego and other cities will be ready by the time the canal is finished. About 70 per cent of the work on the canal between Buffalo and Albany has been turned over by the contractors to the State.

Old Construction Data

The valuation committee of the Central of New Jersey and Philadelphia & Reading, has sent the following bulletin to all employees and former employees:

In order to co-operate with the Interstate Commerce Commission, under the federal valuation act, in the preparation of an inventory of the properties embraced in the "Central of New Jersey system," representatives of the railroad will accompany the government survey parties to point out the nature, locality, extent and corporate ownership of such properties. In addition to being familiar with the maps, profiles, plans and schedules of the properties, these representatives should have knowledge of all obscure and extraordinary items, quantities and costs that are not readily visible or determinable upon a field inspection.

A few examples of such special features of construction are: Sunken embankments. Old excavations filled up. Trestles and other structures which have been filled with earth embankment. Sink holes. Cuts which were wet during construction and therefore caused extraordinary costs, but which are now dried out. Disintegrated or earth covered rock cuts, which might now be classified as earth at a low price when compared to the original cost of rock excavation. Temporary roads, trestles, tracks, embankments, dams, and other structures required during construction, traces of which have disappeared. Excessively costly foundations of bridges, buildings and other structures. Unsuspected drains and culverts. Conduits, sewers, catch basins, water pipes, dikes, dams, cribbing, retaining walls, flumes, ditches, riprap, mattresses, etc., not readily discovered, and especially those which are outside of the right of way. Roads, channels and streams which have been diverted, but knowledge of which cannot be had from mere inspection. Materials which were originally ballast, but which have settled below the subgrade. Items incident to eliminating grade crossings, elevating, depressing or changing tracks, particularly under traffic, and similar extraordinary construction costs. Penalties paid contractors for delay in furnishing material or facilities. Extra cost of work owing to extraordinary weather and labor conditions, strikes, etc., or on account of suspension and later resumption of the construction. Curbing, paving, drainage, etc., of streets, and other improvements of various kinds off the right of way, paid for wholly or in part by the railroad companies. Special assessments levied against the railroad companies for general public improvements, etc., etc.

It is evident that information concerning such items as these can, in many cases, best be ascertained from: *A personal recollection and knowledge of conditions attendant upon the construction, improvement and operation of the property.* Therefore, in order that a comprehensive investigation and study of the construction records may be made, any person having information of the nature desired is earnestly requested to communicate in regard thereto with

Carl Tombo,
Principal Assistant Valuation Engineer,
143 Liberty street, New York.

It is important that such communications should give, if possible, the description and location of old field books, maps, profiles, plans, final estimates, vouchers, reports of engineers, "authority for expenditure" reports, and any other records containing information of the nature above described which may be in the general, division or other offices of the company or in the possession of contractors or others who have had connection with the construction, extension and improvement of the road, but who are not now in the employ of the company; also the names and addresses of retired or former officers and employees and others who may have knowledge of the construction, extension and improvement of the property.

The San Francisco Fair

An army of men is now busily engaged in completing the landscaping of the Panama-Pacific International Exposition. The era of construction on the exhibit palaces has passed and the installation of exhibits has begun. Within a few weeks thousands of exhibitors, with their army of attendants, will be installing their displays. Altogether more than 70,000 tons of exhibits will be brought to the grounds, the freight charges on which, it is estimated, will entail an outlay of more than $4,000,000. The traffic department of the exposition estimates that more than 1,000,000 people will cross the Rocky Mountains to the Pacific coast next year.

Railway Fire Protection Association

The second annual meeting of the Railway Fire Protection Association will be held at the Hotel Raleigh, Washington, D. C., on Tuesday and Wednesday, October 6 and 7. The program for the meeting is as follows:

Tuesday Morning Session 10 A. M.—Roll Call, Reading of Minutes of Last Meeting, Address of President, Report of Executive Committee.

Afternoon Session 2 P. M.—Report of Committee on Fire Hazards.

Wednesday Morning Session 10 A. M.—Report of Committee

on Statistics and Forms, Report of Committee on Fire Fighting Organization.

Afternoon Session 2 P. M.—Report of Committee on Fire Fighting Apparatus, Unfinished Business, New Business, Election of Officers and Executive Committee.

It is announced that if necessary the meeting will be continued on Thursday, October 8.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

AIR BRAKE ASSOCIATION.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—A. G. Thomason, Demurrage Commissioner, Boston, Mass. Annual convention in April.

AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next convention, October 22-24, Washington, D. C.

AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 21-24, 1915, Richmond, Va.

AMERICAN ASSOCIATION OF GENERAL PASSENGER AND TICKET AGENTS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, Room 101, Union Station, St. Louis, Mo.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 29 W. 39th St., New York. Annual convention, October 12-16, Atlantic City, N. J.

AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—H. G. McConaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Semi-annual meeting, November 18, Chicago.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 20-22, 1914, Los Angeles, Cal.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1915.

AMERICAN RAILWAY SAFETY ASSOCIATION.—L. F. Shedd, C. R. I. & P., Chicago. Next meeting, November, Chicago.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—A. R. Davis, Central of Georgia, Macon, Ga. Annual meeting, July, 1915.

AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except, June, July and August, 220 W. 57th St., New York.

AMERICAN SOCIETY OF ENGINEERING CONTRACTORS.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 1-4, 1914, New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Atlanta, Ga.

ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Annual meeting, second Tuesday in October, New York.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, 3d week in May, 1915, Galveston, Tex.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual convention, October 26-30, 1914, Chicago.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 22-25, 1915, Rochester, N. Y.

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York. Next meeting, December 8-9, 1914, Richmond, Va.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

CIVIL ENGINEERS' SOCIETY OF ST. PAUL.—Edw. J. Dugan, P. O. Box 654, August and September, Old State Capitol Bldg., St. Paul.

ENGINEERS' SOCIETY OF PENNSYLVANIA.—Edw. R. Dasher, Box 75, Harrisburg, Pa. Regular meetings, 1st Friday after 10th of each month, except July and August, 31 So. Front St., Harrisburg, Pa.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

FREIGHT CLAIM ASSOCIATION.—Warren P. Taylor, R. F. & P., Richmond, Va. Annual meeting, June 16, 1915, Chicago.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

INTERNATIONAL RAILWAY CONGRESS.—Executive Committee, 11, Rue de Louvain, Brussels, Belgium. Next convention, June 23 to July 6, 1915, Berlin.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 829 W. Broadway, Winona, Minn. Next convention, July 14-17, 1915, Sherman House, Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D., Lima, Ohio.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. J. Goodwin, C. R. I. & P., Eldon, Mo. Next convention, November 17-19, 1914, Detroit, Mich.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May, 1915.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1915.

NATIONAL RAILWAY APPLIANCES ASSOCIATION.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

RAILROAD MASTER TINNERS, COPPERSMITHS AND PIPEFITTERS' ASSOCIATION.—U. G. Thompson, C. & E. I., Danville, Ill. Annual meeting, May, 1915.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December 10, 1914, Waldorf-Astoria Hotel, New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Annual meeting, October 6-7, 1914, Hotel Raleigh, Washington, D. C.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, L. S. & M. S., Box C, Collinwood, Ohio. Annual meeting, May, 1915.

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders and Master Mechanics Associations.

RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SALT LAKE CITY TRANSPORTATION CLUB.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, C. R. I. & P., La Salle St. Sta., Chicago.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. Ry., Atlanta Ga.

SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7122 Stewart Ave., Chicago. Annual meeting June 15, 1915, Minneapolis, Minn.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Consolidated Music Hall, Salt Lake City.

WESTERN CANADA RAILWAY CLUB.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

The Western Classification Committee has announced a hearing in Chicago on October 2, on electric fans.

A merchant in Winnipeg, Man., has received a shipment of 26 carloads of apples direct from Nova Scotia.

The semi-annual convention of the Railway Development Association is to be held at the Hotel La Salle, Chicago, on November 10 and 11.

The committee on relations between railroads of the American Railway Association reports that the total freight car surplus on September 15 was 136,049 cars, a decrease of 27,277 cars from September 1. The total shortage was 2,059 cars, an increase of 141.

The Boston & Maine announces that not more than two mileage books will be sold to a single customer. Since the announcement that the cost of mileage books is to be advanced on October 1, traveling men are said to have been buying up large quantities of books at the present rate of two cents a mile.

At a conference last week between representatives of the transcontinental railways and the Interstate Commerce Commission it was decided to extend the agreement covering reparation on shipments affected by the Spokane rate case to cover shipments made to and from intermediate points between Chicago and Spokane, made between July 15, 1912, and August 1, 1913.

The live stock exhibit at the Panama-Pacific International Exposition in San Francisco will last throughout the period of the exposition, from February 20 to December 4, 1915. Competitions in the department of live stock will take place in October and November of next year. In addition to $175,000 which has been set aside for cash premiums, other sums have been appropriated by interested live stock associations, bringing the total to $227,000. A like amount is offered in prizes for trotting races.

A remarkable record for regular and fast freight service has been made recently by the fast freight train No. 51 from Chicago to Atlanta, Ga., over the Illinois Central and the Nashville, Chattanooga & St. Louis. The train leaves Chicago at 11 p. m. and is scheduled to arrive at Atlanta at 12:30 a. m. the third day. From August 26 to September 6 its arriving time at Atlanta was 2 a. m., 12:10 a. m., 12:40 a. m., 2 a. m., 1:20 a. m., 12:50 a. m., 1:25 a. m., 5:30 a. m., 6:30 a. m. and 12:50 a. m., and with the exception of only two days the distance of 850 miles was made in 49 to 51 hours.

A preliminary hearing of the Official Classification Committee for the benefit of western shippers was held in the rooms of the Central Freight Association, Chicago, on Thursday, September 17, for the consideration of a large number of subjects enumerated in docket No. 20, including a large number of recommendations of the committee on uniform classification respecting uniform classification provisions and other matters. Among the items on which changes were proposed, based on recommendations of the committee on uniform classification, were acids, boats, boilers, furnaces and heaters, locomotive parts, machinery and machines, oils, ores, clay, coffee, fiber, fish, furniture, honey, rice, rubber goods, sugar cane, fire-fighting apparatus, glassware, and ice making or refrigerating machinery.

The largest cargo of merchandise that ever entered the harbor of San Francisco arrived from China and Japan on the Pacific Mail liner "Manchuria" on September 17 and was sent eastward in bond to New York on five special Southern Pacific trains. The cargo consisted of 270 tons of raw silk and silk pieces, and 2,700 tons of tea, matting and other Oriental merchandise; the total shipment requiring over 165 cars, 15 of which are of an especially constructed design to meet the requirements of the silk. For a week, the Southern Pacific had been obtaining every available car of the highest type of equipment in the neighborhood of San Francisco. These were lined up near the Pacific Mail dock, with several switch engines assigned to the duty of handling them preparatory to the departure of the trains on the transcontinental. Special train and freight handling crews were likewise held in readiness. The Southern Pacific is trying to make San Francisco the main point for the routing of Oriental freight destined to the East. Great Britain has barred the vessels of belligerent nations from the use of the Suez canal, and this means that the great bulk of Oriental merchandise consigned to New York and other eastern points must come to the Pacific Coast, here to be unloaded and re-shipped by rail. In this connection, the Southern Pacific and the Pacific Mail want to make San Francisco the transshipment point.

Traffic Club of New York

The next regular meeting of the Traffic Club of New York will be held at the Waldorf-Astoria on Tuesday evening, September 29. Addresses will be made by Charles S. Whitman, district attorney, on current events, and Alex. C. Humphreys, president of Stevens Institute of Technology on National Economic Conditions.

Illinois Manufacturers' Association for Higher Freight Rates

John M. Glenn, secretary of the Illinois Manufacturers' Association, is quoted as follows:

"The Illinois Manufacturers' Association is in favor of any movement which will mean better business conditions. We opposed former efforts on the part of railroads to obtain higher rates, because we did not believe that conditions in the country warranted the changes and because we would be the ones to suffer.

"We still want to ship our goods just as cheaply as possible, but we want them shipped. Conditions are now such that they cannot always be shipped, partly because there is no market and partly because the railroads cannot afford to supply the needed equipment.

"The railroads are in trouble, and because they are in trouble we are in trouble also. The railroads are the agencies for delivering our goods. There is no sentimental desire on our part to aid the 'poor railroads' for themselves alone, nor are we taking this attitude out of sympathy to the widows and orphans who own the securities. It is simply a business proposition."

American Association of Traveling Passenger Agents

The forty-second annual convention of the American Association of Traveling Passenger Agents is to be held in San Francisco on October 12 and 13. It is expected that this convention will have the largest attendance in the history of the association, as acceptances have already been received from 350 members. Special trains will be run from Chicago over the Chicago & Northwestern, Chicago, Milwaukee & St. Paul, and possibly the Chicago, Rock Island & Pacific, and it is expected that there will be two specials out of St. Louis over the Missouri Pacific. The members will be entertained by the officials of the Panama-Pacific International Exposition and will be afforded an opportunity to inspect the fair grounds and buildings. Following the convention a tour of California will be made. Among the subjects to be discussed at the convention are the following: "Of what value will the Panama-Pacific International Exposition and the opening of the Panama Canal be to the World?" and "Why is the Traveling Passenger Agent of more importance today than he was during the old days of rate cutting?" A special train will be provided by the Atchison, Topeka & Santa Fe for the return trip from San Diego to Chicago.

The Towing Locomotives on the Panama Canal.—Forty three-phase towing locomotives have been built for the Panama Canal, having tractive effort up to 47,500 lb. Four of these, two on each side, will propel steamships through the locks. No vessel is allowed to go through the locks under her own power. Each locomotive is propelled by a rack rail while towing at a speed of two miles per hour; when running idle the rack pinion is released and the speed increased to five miles per hour. The locomotive is driven by two 75 h. p. motors; in the center there is a vertical windlass with drum, the capacity of which is 800 ft. of one-inch steel hawser cable.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission has announced that it will begin hearings on October 19 in relation to the petition of 112 carriers in official classification territory, asking a modification of the recent findings in the Five Per Cent Case.

The New Orleans Cotton Exchange has filed a complaint with the Interstate Commerce Commission against 30 railroads, charging discrimination against New Orleans in favor of other southern and eastern ports in the failure to publish through rates to New Orleans from local cotton-producing points.

The railroads that were defendants in the San Francisco and Los Angeles switching cases, in which the Interstate Commerce Commission issued an order requiring them to cease making and collecting charges for switching cars placed on industrial spur tracks when incidental to the line haul of the delivering carrier, have filed a petition for a rehearing before the Interstate Commerce Commission announcing that they propose to demonstrate that the switching charges imposed by the carriers for transporting freight to and from industries are lawful and reasonable, and that the carriers are entitled to collect charges for performing these services in addition to the rates collected for the main line service. Particular stress is laid upon the decisions in the industrial railways case and on the statement made by the commission in its opinion in the 5 per cent rate advance case. The petition includes the following: "It is therefore respectfully submitted that these defendants should be permitted to introduce evidence in support of their contentions that this industrial switching service is separate and distinct from the main line service; that this service is in the nature of a special and ancillary service for which reasonable charges should properly be made, so that these defendants may conform their practice to the policy approved by the commission, thereby removing the discrimination which will be engendered against the team track shippers and the unjust preference and advantage which will be given industrial shippers if the charges are not imposed; and that, to this end, the cases should be reopened and a rehearing granted."

STATE COMMISSIONS

The New Hampshire Public Service Commission has refused permission to the Boston & Maine and Grand Trunk to increase mileage book rates from 2 to 2¼ cents per mile.

The California Railroad Commission has rendered a decision authorizing the Southern Pacific, Western Pacific and Atchison, Topeka & Santa Fe to make certain increases in their freight rates between San Francisco and Stockton. At the same time, the commission denied the railroads authority to increase their rates between San Francisco, San Jose, Niles, Oakland, Berkeley, San Leandro, Crockett, Benicia, Bay Point, South Vallejo and numerous other points west of Stockton.

The New York State Public Service Commission, Second district, has decided to suspend for another six months, to March 20, 1915, the tariffs filed by the railroads making a charge of $2 a car for "spotting" cars on private sidings and industrial railroads. Protest was immediately made by large numbers of shippers, and as a result the commission suspended the proposed rates pending a hearing and decision of their necessity. The commission is expected to delay action until the federal commission decides the cases, embodying the same question, which affect New York shippers.

As briefly noted in last week's issue the Missouri railways on September 15, filed with the state public service commission a petition for an increase of passenger fares from two to three cents per mile, and four cents on branch lines. At the same time they asked for a general advance in freight rates, for which they submitted tariffs, and a restoration of the old excess baggage rate, which the commission had reduced from 16⅔ to 12½ per cent of the passenger fare for each 100 lb. The petition was filed in accordance with the recent decision of the Missouri Supreme Court in the Missouri Southern case, holding that the provision in the public service commission law authorizing the commission to prescribe reasonable rates in effect repealed the maximum rate laws passed by the legislature.

The Maine Public Utilities Commission

The voters of Maine in the referendum held with the recent September election have approved the act of the legislature creating the public utilities commission and the provisions of the act are now effective. Governor William T. Haines is expected to appoint Samuel W. Gould, a former congressman, as the democratic member of the board, succeeding the late Joseph Williamson; and he will name a chairman in the place of Luere B. Deasey, of Bar Harbor, who declined to serve. William B. Skelton, of Lewiston, is the other member of the commission. Mr. Gould's appointment will carry with it a salary of $4,000 a year. He is one of the leading lawyers of the state and a graduate of the University of Maine, holding the position of president of the board of trustees of that institution at the present time. He has been prominent in democratic politics, having been candidate for governor on that ticket and elected to Congress in 1910. It is understood that George F. Giddings, of Augusta, the present clerk of the state board of railroad commissioners, which is abolished under the new act, is to be appointed clerk of the commission at a salary of $2,500 a year. This law was passed in 1913 and would have gone into effect on July 12 of that year but for the fact that a petition was presented calling for a referendum. The Statute is Chapter 129 of 1913. The law contains in general all of the stringent and sweeping provisions which have been embodied in recent state statutes of this kind such as Massachusetts and West Virginia. An abstract of it was printed in the *Railway Age Gazette*, July 11, 1913. The salary of the chairman is to be $5,000 a year and of the other commissioners $4,500 each. The objectors said that the new law would cost the state $100,000 a year and that this would be an unnecessary expense, the present state of affairs being satisfactory.

PERSONNEL OF COMMISSIONS

M. E. Wells, who is now engaged on the appraisal of the Pere Marquette for the Michigan Railroad Commission, has been appointed senior inspector of motive power, division of valuation, Interstate Commerce Commission, for the Southern district, with headquarters at Chattanooga, Tenn., effective on October 1.

K. E. Kellenberger, whose appointment as senior signal engineer, central district, division of valuation, Interstate Commerce Commission, was reported in the *Railway Age Gazette* of September 11, was superintendent of signals of the Chicago & North Western, not the Chicago Great Western, as stated.

Frank M. Patterson has been appointed field engineer of the central district, division of valuation, Interstate Commerce Commission, with headquarters at Chicago. Mr. Patterson was educated at the University of Iowa, and has been connected with the Chicago, Burlington & Quincy in various capacities, from 1887 until his recent appointment, having been assistant engineer on construction of the St. Louis terminal; resident engineer in Chicago; resident engineer at Hannibal, Mo.; roadmaster on the Missouri lines; engineer in charge of construction on the Chicago & Alton and Burlington joint line from Mexico to Old Monroe, Mo.; assistant to the engineer of the Illinois district, and later engineer of the Missouri district.

COURT NEWS

Judge John G. Slate, of Jefferson City, Mo., last week overruled the demurrer of the Missouri Pacific to the suit brought by the attorney general of Missouri for the recovery of overcharges in passenger rates while the state two-cent fare law was under injunction, and appointed W. S. Hoke as master in chancery to receive and pass upon all claims for overcharges which may be filed. The ruling sustained the right of the attorney general to sue for the shippers and passengers collectively.

Railway Officers

Executive, Financial, Legal and Accounting

Edward D. Robbins, general counsel to the board of directors of the New York, New Haven & Hartford, with headquarters at New Haven, Conn., has resigned.

C. L. Sivley has resigned as general attorney of the Illinois Central and the Yazoo & Mississippi Valley, at Chicago, Ill., to engage in the general practice of law at Memphis, Tenn.

Farrar L. McCain has resigned as judge of the Superior Court of Muskogee county, Oklahoma, to become general counsel of the Midland Valley Railroad for Oklahoma and Arkansas, with headquarters at Muskogee, Okla.

Frank Scott, vice-president and treasurer of the Grand Trunk and the Grand Trunk Pacific, with headquarters at Montreal, Que., has been appointed vice-president, in charge of finances, also of the Central Vermont, succeeding M. M. Reynolds, deceased.

David Van Alstyne has been appointed assistant to the vice-president in charge of operation of the New York, New Haven & Hartford and the Central New England, with headquarters at New York. Mr. Van Alstyne will have charge of the test and store departments, and of handling scrap; he will also have supervisory authority over the mechanical department in regard to organization, shop practice, approval of design, standards and requisitions.

Operating

W. F. Martin has been appointed inspector of operation of the Erie at Cleveland, O.

John B. Glasgow, night chief despatcher on the Northern Pacific, has been appointed trainmaster at Jamestown, N. D.

M. A. Mulligan, trainmaster of the Lehigh Valley at Jersey City, N. J., has been appointed general yard inspector with office at South Bethlehem, Pa.

C. H. Hinton, formerly agent of the Frisco lines at Newton, Tex., has been appointed superintendent of the Orange & Northwestern, with headquarters at Orange, Tex.

John L. Terry, general manager of the Denver, Laramie & Northwestern at Denver, Colo., has resigned to go to the Rail Joint Company, New York, effective October 1.

Traffic

W. B. Wells has been appointed general agent of the Frisco Lines at Dallas, Tex.

F. P. Jeffries has resigned as general agent of the Chicago & Eastern Illinois at Evansville, Ind.

B. L. Abberger has been appointed soliciting freight agent of the Atlanta, Birmingham & Atlantic, with office at Tampa, Fla.

H. A. Willie has been appointed traveling freight and passenger agent of the Wabash, with headquarters at Salt Lake City, Utah.

H. F. Garrett has been appointed soliciting freight agent of the Queen & Crescent Route, with headquarters at Jacksonville, Fla., succeeding L. F. Malum, resigned.

W. H. Kinard, traveling freight agent of the Georgia Railroad at Macon, Ga., has been promoted to commercial agent, with headquarters at Spartanburg, S. C., and H. A. Ansaldo, soliciting freight agent at Charleston, S. C., succeeds Mr. Kinard.

E. J. Naylor, general agent traffic department of the Chicago & Alton at San Francisco, Cal., has been transferred to Peoria, Ill., in a similar capacity, succeeding E. C. Coffee, deceased, whose title was assistant general freight agent. The latter position has been abolished. Frank Carnahan has been appointed commercial agent at Peoria.

J. R. Shannon, commercial agent of the Minneapolis & St. Louis at Cincinnati, Ohio, has been appointed general agent at Chicago, succeeding E. L. Dalton, resigned to take service with the Chicago & Alton, and R. N. Golden has been appointed general agent of the traffic department of the Minneapolis & St. Louis, with office at Cincinnati, Ohio.

Samuel Wilson, assistant general freight agent of the Chicago, Milwaukee & St. Paul at Seattle, Wash., has been transferred to Tacoma, Wash., in a similar capacity. R. J. Daniels, commercial agent at Tacoma, has been appointed division freight and passenger agent at Butte, Mont., and the former position has been abolished. A. J. Hillman, whom Mr. Daniels succeeds, has been appointed general agent freight department at Seattle.

George M. Henry, whose appointment as general passenger agent of the Detroit, Toledo & Ironton, with headquarters at Detroit, Mich., has already been announced in these columns, was born September 3, 1876, at Toledo, Ohio. He began railway work in May, 1893, with the Wheeling & Lake Erie at Toledo, and was successively clerk and chief clerk in the passenger department until 1898, when he went to the Detroit & Lima Northern at Detroit, Mich., as chief clerk in the passenger department. From 1900 to 1902 he was general freight and passenger agent of the Rapid Railway, an electric line, and the following two years was general passenger agent of the Detroit Southern. He was then engaged in the coal business at Detroit for one year, returning to railway service in 1905 as general freight and passenger agent of the Detroit, Monroe & Toledo. For three years from 1906 he was in the advertising business, taking up railway work again in 1909 as chief clerk in the passenger department of the Ohio Electric Railway at Springfield, Ohio. Mr. Henry became connected with the Detroit, Toledo & Ironton in 1910 as assistant general passenger agent, and was appointed general passenger agent on August 1.

Engineering and Rolling Stock

William V. Wicks has been appointed road foreman of engines of the Northern Pacific, at Jamestown, N. D.

W. H. Seward has been appointed assistant engineer of the Chicago, Burlington & Quincy, with headquarters at St. Joseph, Mo., succeeding E. H. Peck.

William Schmalzried, foreman of car shops of the Texas & Pacific at Ft. Worth, Tex., has been appointed master car builder, with office at Marshall, Tex., succeeding W. D. Minton, resigned.

Frank L. Fox has been appointed general foreman, car department, of the Pere Marquette, with headquarters at Detroit, Mich. Mr. Fox will have jurisdiction over all matters pertaining to the car department.

George Searle, formerly for seven years general roundhouse foreman of the Atchison, Topeka & Santa Fe, at San Bernardino, Cal., has been appointed master mechanic of the Los Angeles division of the San Pedro, Los Angeles & Salt Lake, with headquarters at Las Vegas, Nev., succeeding W. A. Rogers, resigned.

J. Q. Anderson, roadmaster of the Atlantic Coast Line at Florence, S. C., has been transferred to Petersburg, Va., in a similar capacity. W. M. Funk, roadmaster at Darlington, S. C., has been transferred to Florence, succeeding Mr. Anderson, and B. E. Haley, roadmaster at Kissimmee, Fla., has been transferred to Darlington, succeeding Mr. Funk.

A. G. Trumbull, mechanical superintendent of the Erie at New York, has been appointed assistant to the general mechanical superintendent, with headquarters at New York; E. S. FitzSimmons, mechanical superintendent of the Ohio division, at Cleveland, Ohio, has been appointed mechanical superintendent of the Erie division, with headquarters at New York; Charles James, master mechanic at Jersey City, N. J., succeeds Mr. FitzSimmons; F. H. Murray, master mechanic at Port Jervis, N. Y., succeeds Mr. James; George Thibaut, general foreman at Susquehanna, Pa., succeeds Mr. Murray; T. S. Davey, master mechanic at Stroudsburg, Pa., has been appointed shop superintendent at Buffalo, N. Y., car shop, and W. H. Snyder, general foreman at Stroudsburg, succeeds Mr. Davey.

Purchasing

G. A. Secor, storekeeper of the Minneapolis & St. Louis, at Minneapolis, Minn., has been appointed general storekeeper of the Chicago & Alton, with headquarters at Bloomington, Ill., succeeding Daniel Downing, resigned.

C. M. Wester has been appointed storekeeper of the Baltimore & Ohio, with office at Parkersburg, W. Va., succeeding D. L. Donaldson, transferred, and J. V. Mayhall has been appointed assistant storekeeper, with office at Parkersburg, succeeding W. D. Stone, promoted.

J. H. Sanford, purchasing agent of the New York, New Haven & Hartford, at New Haven, Conn., has been appointed purchasing agent of the Connecticut Company, and will also buy for the Rhode Island Company, the Housatonic Power Company, the Berkshire Street Railway, the New York & Stamford Railway, the Westchester Street Railroad, and the Westport Water Company. Mr. Sanford will have his headquarters at New Haven. In line with the policy the New Haven is now pursuing of curtailing expenses in every way possible, it is thought that H. A. Fabian, director of purchases, can handle the business without Mr. Sanford's assistance. The appointment of an independent purchasing agent for the trolley companies is the last step in giving those companies a complete organization of their own, entirely independent in every way of the New Haven management.

OBITUARY

Charles A. Pettibone, general agent of the Wabash at Portland, Ore., died on September 16, aged 53 years.

William S. Crane, formerly car accountant of the Missouri Pacific at St. Louis, Mo., died on September 20, at his home in that city.

John G. Haun, supervisor of bridges and buildings of the Virginia & Southwestern, with headquarters at Bristol, Tenn., was killed in an accident on that road on September 14. A motor car in which he was traveling was derailed while crossing a trestle near Bluff City, causing his death.

J. D. M. Hamilton, claims attorney of the Atchison, Topeka & Santa Fe, with headquarters at Topeka, Kan., died at a hospital in Kansas City on September 20. He was born on July 18, 1851 at Pittsburgh, Pa., and was educated at Knox College and at the St. Louis law school. From 1879 to 1898 he was local attorney for the Chicago, Burlington & Quincy at Fort Madison, Iowa, and was for a time mayor of the city. From 1881 to 1890 he was also attorney for the Fort Madison & Northwestern. He entered the service of the Santa Fe as assistant attorney and in June 1898 was made claims attorney. He has been a leader in the safety first movement.

Frank W. Chaffee, general car inspector of the New York Central & Hudson River, with headquarters at Albany, N. Y., died on September 15. He was born on December 17, 1850, at Springfield, Mass., and began railway work in 1868, as car repairer on the Connecticut River Railroad, now a part of the Boston & Maine. From September, 1870, to December, 1872, he was with the Wason Car Manufacturing Company, and then to June, 1881, was in the car building department of the Boston & Albany. He was then for three years in the service of the Baltimore & Ohio at Camden station, Baltimore, and on June 1, 1884, left that company to go to the New York Central & Hudson River as general foreman of the West Albany, N. Y., shops. He remained in that position until March, 1895, when he was promoted to master car builder at the same shops, and since February 1, 1901, Mr. Chaffee was general car inspector of the same road.

F. W. Chaffee

Equipment and Supplies

LOCOMOTIVE BUILDING

The Atchison, Topeka & Santa Fe has ordered one locomotive for exhibition purposes from the Baldwin Locomotive Works.

The Southern Pacific has ordered one Mikado type locomotive for exhibition purposes from the Baldwin Locomotive Works.

The Reed Construction Company, Mishawaka, Ind., has ordered one Shay geared locomotive from the Lima Locomotive Corporation.

CAR BUILDING

The Georgia Railroad is in the market for 500 40-ton box cars.

The New York Central & Hudson River has ordered 2,000 underframes from the Merchants Despatch Transportation Company.

The Nashville, Chattanooga & St. Louis is in the market for 500 to 1,000 40-ton single sheathed box cars, or 500 to 1,000 40-ton double sheathed box cars.

The Northwestern Pacific reported in the *Railway Age Gazette* of August 14, as being in the market for 11 coaches, 3 mail and express, 4 baggage, 3 smoking and 4 chair cars has ordered 25 all-steel passenger cars from the Pullman Company.

The Cincinnati, Hamilton & Dayton is in the market for 12-all steel coaches, 8 all-steel passenger and baggage cars, 4 all-steel baggage and mail cars, 5 all-steel baggage cars, one dining car and 2 wrecking cranes. The same company is also planning to build 105 caboose cars in its own shops.

IRON AND STEEL

The Paducah & Illinois has ordered 137 tons of steel in form of I-beams and girders for use at Paducah, Ky., from the American Bridge Company.

The Chicago, Rock Island & Pacific has ordered 600 tons of material for a highway bridge at Des Moines, Iowa, from the American Bridge Company.

The Louisiana Railway & Navigation Company has ordered 215 tons of steel for a bridge over Tunica Bayou, La., from the American Bridge Company.

SIGNALING

The Texas & Pacific is installing automatic block signals on its line between Addis, La., and Donaldsonville, 24 miles.

Fuel Economy on the Egyptian Railways.—When the news was received at Cairo that a general European war had broken out the various railway administrations at once took steps to examine their supplies of coal. The results were satisfactory as far as the amounts on hand were concerned, but in view of the uncertainty of the future all the companies began to cut down their service. The Egyptian State Railways led the way with a diminished time-table which came into effect on August 7. Four of the Cairo-Alexandria expresses—two each way—have been withdrawn, also the night service in each direction between those places, and six of the main line trains on the Upper Egypt section. Thirty trains a day on the Cairo (Port Limoun)-Mataria suburban line have been taken off, thereby reducing that service by one-third. In order further to save the coal bill, all lights at the Cairo main station are being put out at 8 p. m., while many stations are not being lit at all.

Supply Trade News

R. L. Brown was elected a director and vice-president of the M-C-B Company, Chicago, at a special meeting of the board of directors.

John L. Terry, general manager of the Denver, Laramie & Northwestern, has resigned from that position, effective October 1, to become connected with the Denver office of the Rail Joint Company, New York.

The Ogle Construction Company, Chicago, has been awarded a contract for the erection of a 340-ton all-steel balanced bucket type coaling station at Hollow Rock Junction, Tenn., by the Nashville, Chattanooga & St. Louis.

The U. S. Metal & Manufacturing Company, New York, has been appointed resident purchasing agent in America for the following companies: Underground Electric Railways of London, Ltd., the London General Omnibus Company, Ltd., the Metropolitan District Railway, the London Electric Railway, the Central London Railway and the City & South London Railway.

TRADE PUBLICATIONS

Southern Pacific.—The passenger department has issued a folder on San Francisco, describing the principal points of interest of the city and of the Panama-Pacific exposition to be held next year.

Sectional Buildings.—The Chicago Pneumatic Tool Company, Chicago, general sales agents for the Ruby Manufacturing Company, Jackson, Mich., has recently issued a bulletin descriptive of Ruby all-steel sectional buildings for railroad purposes.

Pacific Type Locomotives.—The Baldwin Locomotive Works, Philadelphia, Pa., has recently published its record No. 79, which describes and gives dimensions of the recent Pacific type locomotives which have been built by this company. The booklet is well illustrated.

Sand Blasting.—The De La Vergne Machine Company, Mott Sand Blasting Department, New York, has issued in pamphlet form a paper read by H. D. Gates, sales manager, at a recent meeting of the Associated Foundry Foremen of New York and vicinity, entitled "The Sand Blast from the Users' Viewpoint."

Pneumatic Tools.—The Independent Pneumatic Tool Company has just issued circular V, descriptive of the lines of Thor roller bearing piston air drills, pneumatic chipping, calking and flue beading hammers, turbine drills, staybolt drivers, air hose and couplings manufactured by that company. This circular will be sent free on request.

Automatic Train Stop.—The Automatic Railroad Appliance Company, Inc., Rochester, N. Y., has issued an 18-page pamphlet descriptive of the Lawn-Ryan automatic train stop for steam and electric roads. Illustrations of the mechanism are shown, and the description, with references to these illustrations, explains the method of operation and installation.

Furnace Heats.—The W. S. Rockwell Company, New York, has issued a card, 9 by 11 inches in size, on which is printed a comparative scale of Fahrenheit and Centigrade degrees and tables of temperature conversion factors, and hardening and tempering heats. The card is meant to be hung in laboratory or furnace rooms and to be used in connection with heating operations.

Appliances for Burning Fuel Oil.—Tate, Jones & Company, Inc., Pittsburgh, Pa., have recently issued a catalogue having this title which aims to show the reasons why oil is the most economical fuel and to name all and illustrate some of the types of furnaces and industries in which oil burners can be used to advantage. The first part of the catalogue in addition, illustrates and describes various types of oil burners produced by the company. The second part likewise describes and illustrates the company's systems for pumping, heating and regulating oil flow to burners.

Railway Construction

Alberta Central.—See Canadian Pacific.

Altus, Lubbock & Roswell.—Announcement has been made that work on the section from Memphis, Tex., southwest to Lubbock, 86 miles, will be pushed to completion and will probably be put in operation this year. This work was started in 1911. The plans call for building an extension from Lubbock west to Roswell, N. M. An extension is also projected east to Altus, Okla. E. Kennedy, president, Houston, Tex.

Canadian Pacific.—The Alberta Central is now open for traffic from Red Deer, Alta., west to Rocky Mountain house, 64.8 miles. The new route from Montreal, Que., via Glen Tay, Trenton and Agincourt, to Toronto, 182.6 miles, is now known as the Lake Ontario Shore Line. This new line has ruling gradients of only 0.4 per cent each way and the maximum curvature is 4 deg.

Florence & Huntsville Interurban.—An officer writes that the plans call for building from Florence, Ala., east to Huntsville, about 75 miles, and about 12 miles of spur lines. A branch is also projected from Killen, northeast via Lexington to Pulaski, Tenn. Surveys are to be started at once on the line. The same interests have organized the Allentown Power Company to develop the water power on Cypress creek and to build two hydro-electric power plants. Surveys have already been made of the various water powers, and the plans for dams and power stations are now being prepared. T. H. Allen, president, and M. S. Bingham, chief engineer, Florence, of the railway company.

Marble Creek Valley (Electric).—Incorporated in Idaho with $100,000 to build an electric line from Clarkia, Idaho, northeast to Pocono, about 20 miles, also to build a line south to a point in Clearwater county. F. Herrick, Lac du Flambeau, Wis., may be addressed.

New York Subways.—The New York Public Service Commission, First district, opened bids on September 15 for the construction of Section No. 2 of Route No. 48, the William street part of the Park place, William and Clark street subway. This section begins at a point under Beekman street, in the borough of Manhattan, about 62 ft. west of William street, curves thence southerly under private property into William street and runs southerly under William street and easterly under Hanover Square to a point about opposite the easterly building line of Pearl street. The contract has been let to Smith, Hauser & McIsaac, Inc., the lowest bidder, who offered to do the work for $2,254,670. (August 28, p. 408.)

The New York Public Service Commission, First district, has approved a contract made by the New York Municipal Railway Corporation with the Empire Construction Company, the lowest bidder, at $115,987, for the installation of tracks and line equipment on the Liberty avenue extension of the elevated railroad in the borough of Brooklyn and on the elevated connection between the Lutheran Cemetery line and the Myrtle avenue elevated railroad.

North Georgia Mineral.—Application has been made for a charter in Georgia by this company with $1,250,000 capital, and office at Atlanta. The plans call for building from Atlanta, Ga., northwest through Fulton, Cobb, Cherokee and Bartow counties, about 50 miles. The incorporators include J. Spalding, J. Morris, D. Macdougald, A. E. Thornton, H. Spalding, W. J. Morrison and J. S. Floyd.

Rocky Ford & Southwestern.—Plans have been made, it is said, to build a line from Rocky Ford, Ga., which is on the Central of Georgia and the Sylvania & Girard southwest to Portal about 12 miles. Henry B. Griffin, formerly of Hamlet, N. C., is said to be interested.

Rosston, Grand Rapids & Protection.—We are told that this company, which was recently organized in Oklahoma, has a survey finished on ten miles. It is thought that money can be raised locally to build the line from a point on the Wichita

Falls & Northwestern at or near Rosston, Okla., east to Doby Springs. The line may eventually be extended further east. L. A. Walton, president, Alva, Okla. (September 11, p. 494.)

Tampa & Gulf Coast.—This company has completed work, it is said, on the extension from Clearwater south along the west coast of Florida to Davista, thence east to St. Petersburg, 22 miles. (July 24, p. 190.)

Verde Tunnel & Smelter Railroad.—An officer writes that this company has finished work on a line from Clarksdale, Ariz., on the Atchison, Topeka & Santa Fe, to Hopewell tunnel of the Verde Copper Company's mine, 14 miles. T. C. Snider was the contractor. The ruling grade on the line is 4 per cent, and the maximum curvature 24 deg. The line was built to carry ore from the mines of the Verde Copper Company to the new smelter just erected at Clarksdale. W. L. Clark, president, Jerome, Ariz., N. E. Bailey, general superintendent, and R. D. Perkins, consulting engineer, Los Angeles, Cal.

RAILWAY STRUCTURES

Greenville, Ala.—Plans for a viaduct to be built on Commerce street in Greenville have been submitted by the Louisville & Nashville to the city officers of Greenville. The proposed structure is to be of steel, concrete and stone construction.

Lebanon, Tenn.—An officer of the Nashville, Chattanooga & St. Louis writes that work is now under way by the company's forces putting up a passenger station 116 ft. long, to cost $14,412, also a freight house 125 ft. long to cost $17,896, on Gay street in Lebanon. The structures are to have wood frames with stuccoed walls.

Philadelphia, Pa.—Plans are being made for a steel and concrete bridge to be built on the line of Glenwood avenue, near Seventh street, Philadelphia, over the tracks of the Richmond branch of the Philadelphia & Reading. It is understood that contracts will soon be let for the work which is to be carried out to eliminate a dangerous grade crossing. The cost of the improvements will be about $40,000.

Richmond, Va.—The Southern Railway has given a contract to P. J. White & Son, Richmond, Va., for the construction of a yard office at South Richmond, and a contract to J. H. Campbell & Brother, Richmond, for the installation of a steam heating system in the new freight house at Richmond.

The Nigerian Railways in 1913.—The report for the year 1913 of the Nigerian Railways shows that, while the receipts increased from $2,440,530 in 1912 to $3,461,096 in 1913, the expenses only rose from $1,717,056 to $1,867,780, so that the ratio of expenses to receipts was but 53.97 per cent in 1913, as against 75.52 per cent in 1912. The growth of traffic has been so great that additional rolling stock has had to be obtained from English equipment companies. Tenders were also asked for locomotives, but the orders for these had to be sent to this country because British makers were unable to promise early delivery.

Diesel Electric Motor Coaches Introduced in German State.—The Saxon State Railways have had constructed two Diesel electric motor coaches, which they propose to try on the line between Dresden, Coswig, and Meissen, for passenger traffic. The Diesel motor is of the six-cylinder type and develops 200 to 250 horsepower at 400 to 450 revolutions per minute. Coupled direct with the motor is a direct current dynamo of about 190 horsepower, which supplies energy to the motors, of which there are two, each wound for 300 volts. The car is on two trucks, one of which has three axles and the other two axles. The Diesel motor and the dynamo are carried on the three-axle truck and the working motors on the two-axle one. At each end of the car are third class compartments with accommodation for ninety passengers, as well as cabs for the driver. The car weighs about 70 tons. It is able to run at a speed of 43.4 miles per hour on the level, or to haul a trailer at a lower speed. The car is fitted with the Westinghouse two-cylinder air brake. For electric lighting a battery is provided, charged from the dynamo. The Diesel motor cylinders are water-cooled, the heated water being discharged in summer, but in winter passed through tubes to heat the car.

Railway Financial News

Baltimore & Ohio.—Felix M. Warburg has been elected a director, succeeding Paul M. Warburg, resigned to become a member of the federal reserve board.

Chicago, Rock Island & Pacific.—The joint committee, of which James N. Wallace is chairman and the members are James Brown, Bernard M. Baruch, Henry Evans and Frederick Strauss, announces that about $18,000,000 of the Railroad collateral trust bonds have been deposited in this country and $7,000,000 in Holland, with a committee which is co-operating with the Wallace committee, and that the trustee for the bonds has brought proceedings for the foreclosure and sale of the collateral. The committee says that no distribution of the pledged stock to bondholders is possible except through purchase under foreclosure. The committee is engaged in the preparation of a plan to buy at foreclosure sale this Railway company stock. The committee says in conclusion:

"The committee desires to make it perfectly plain to the bondholders that such a plan will require for its successful carrying out the concurrence of practically all the bondholders, who on the acquisition and distribution pursuant to the plan, of the pledged stock, will, as stockholders, be entitled to full voting rights and to take action as they may deem best, for future financing. The plan above referred to is under preparation and its formal announcement may be expected next week."

Erie.—J. P. Morgan & Co., New York, are offering to exchange one-year 5 per cent notes at 97½ for the $4,550,000 notes maturing October 1. The new notes will be secured by $7,000,000 first mortgage bonds and will be ready for delivery October 1.

International & Great Northern.—The committee which asked for the deposit of the $11,000,000 3-year 5 per cent notes which fell due on August 1 announces that a large majority of the notes have been deposited and that further deposits will be accepted to October 22.

Kansas City, Mexico & Orient.—Application has been made to the Texas railroad commission for authority to issue $1,458,000 bonds on the new completed line between Alpine and Girvin. This is at the rate of $16,000 per mile.

San Antonio, Uvalde & Gulf.—The receiver has asked permission from the court to issue $145,000 receiver's certificates for improvements.

Taxi-cabs Popular in India.—It is said that taxi-cabs have proven so popular in Colombo and Calcutta that in the latter city every man and woman who manages to save enough to buy a second-hand motor "that has some pretensions to style" will hire it out; and times are indeed dull when a car fails to bring the owner a clear profit of 300 rupees ($100) a month.

Swedish-Danish Power Cable.—An interesting project is at present under execution by which Sweden will be able to sell to Denmark a considerable part of the electric energy obtainable from her numerous waterfalls. The Sound, which divides the two countries, is only 3½ miles in width at its narrowest point, and the electric power cable crossing it at this point has just been completed and will shortly come into use. According to the project, current produced at the Swedish power stations will be transmitted by overhead cable at a pressure of 50,000 volts, to Helsingborg, where it will be transformed to 25,000 volts and transmitted by an underground cable three miles long to the Swedish coast. The submarine cable above mentioned will convey the current across to the Danish coast and this current will then be transmitted by an underground cable one mile long to Helsingör (Elsinore), where it will again be transformed to 50,000 volts. From Helsingör the current will be carried to Copenhagen by overhead connections. For the most part the cable rests on the bottom of the sea, except at the coast at each end, where it is embedded in the earth.

Railway Age Gazette

Published Every Friday and Daily Eight Times in June by the
SIMMONS-BOARDMAN PUBLISHING COMPANY
Woolworth Building, New York.

CHICAGO: Transportation Bldg. CLEVELAND: Citizens' Bldg.
LONDON: Queen Anne's Chambers, Westminster.

E. A. Simmons, *President*
L. B. Sherman, *Vice President.* Henry Lee, *Sec'y & Treas.*
The address of the company is the address of the officers.

Samuel O. Dunn, *Editor*
Roy V. Wright, *Managing Editor*

W. E. Hooper, B. B. Adams, E. T. Howson, H. H. Simmons, H. F. Lane, R. E. Thayer, A. C. Loudon, C. B. Peck, C. W. Foss, F. W. Kraeger, K. L. Van Auken, E. G. Zack, George L. Fowler

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico.....$5.00
Canada 6.00
Foreign Countries (excepting daily editions)..... 8.00
Single Copies.....15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention daily issues, North America, $1; foreign, $2.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue 8,900 copies were printed; that of these 8,900 copies 7,429 were mailed to regular paid subscribers to the weekly edition, 250 were provided for counter and news companies' sales, 1,099 were mailed to advertisers, exchanges and correspondents, and 122 were provided for samples and office use; that the total copies printed this year to date were 374,950, an average of 9,374 copies a week.

Mr. Acworth on the Rate Advance Decision

One of the most interesting of the discussions which have appeared regarding the Interstate Commerce Commission's decision in the Eastern rate advance case is that by W. M. Acworth, which is published elsewhere in this issue of the *Railway Age Gazette*. Mr. Acworth is well known to American readers as the highest foreign authority on railway affairs in the United States, and, therefore, his criticism of the decision will carry much weight and should be given the most serious consideration by the commission. In our issue of last week we published an editorial expressing the view that the commission should not deal with railway rates as if it were a court, but should deal with them as an administrative body charged with the duty of solving a great problem of public policy. Mr. Acworth's article was not received until after that editorial was published, and in view of the position he occupies in the railway world, it is highly gratifying to us, and probably is not without significance, that his criticism of the commission's attitude is based on exactly the same ground as ours. We pointed out, and Mr. Acworth now points out in his article, that commissions were created to deal with the problem of railway regulation because the legislatures, and especially the courts, had demonstrated their unfitness to solve it. Mr. Acworth, as he recalls in his article, had accepted the commission scheme of regulation as adopted in the United States with hope and recommended it for imitation in Great Britain, but the attitude assumed by the Interstate Commerce Commission in its opinion in the five per cent case was so different from that which he thinks such a commission should assume to cause him to express apprehension lest regulation by commission may prove a failure because of a disposition on the part of the commissioners to forget that they are not courts.

Activity in Automatic Stops

The propaganda of the automatic train stop makes very slow and halting progress—if, indeed, it is not, a part of the time, moving backwards. Still, "the world do move." The American Railway Association, in its last deliverance, served notice that it would have perfection or nothing. On the other hand, the railroads of France, prodded by the government, showed, by the papers read at Paris three months ago, that they have pretty definitely committed themselves to the doctrine that the engineman's lookout is not an all-sufficient safeguard against collisions. The Railway Signal Association has dutifully adopted as its own the view of the American Railway Association. But individual roads continue to encourage experimenters here and there. The Horne & Crane speed-control stop (described in *The Signal Engineer* last January) is being exhibited this week on the Central of New Jersey. A prominent western road is going to have installed on its lines one of Dr. Wooding's devices which has been exhibited in Denver, Colo., and in New York City, and also the stop patented by Gollos and tried in October, 1912, on the Chicago Great Western. Some inventors go into eclipse; but others rise; and all seem to have persistent vitality. And, lastly, we have the conservative British Board of Trade coming out on the side of the stop. With its last annual review of train accidents the Board of Trade issues a memorandum, signed by the three inspectors, Colonel von Donop, Major Pringle and Colonel Druitt, in which those collisions of the year which were due to overrunning signals are reviewed, with special reference to their causes; and after some general observations on cab signals and automatic stops, the inspectors say that they "hold that some system of this description should be generally adopted in the future." And they call on the railways to go forward with the experiments necessary to clear up doubtful points. Incidentally, American railway officers will be interested in the Board of Trade's statement, in this review, that track circuits, for locking levers at interlockings, are now in use at 1,500 places in Great Britain.

Frisco Reclamation Plant

A little more than a year ago, August 15, 1913, we described the extensive plant for reclaiming scrap which had been established at Corwith, Ill., on the Atchison, Topeka & Santa Fe. It was estimated at that time that half a million dollars' worth of material had been reclaimed for the year ending June 30, 1913. At the time that the article was written it was the most extensive plant of its kind in the country, and possibly still is. Within the last year, however, the Frisco has established a similar plant at Spring-

field, Mo., which is giving an excellent account of itself, as described in another part of this issue. It is somewhat more compact in arrangement than the plant at Corwith and the buildings are of a more substantial nature, as it was found possible to make use of the shops which were formerly operated by the Kansas City, Fort Scott & Memphis, and which had been practically abandoned by the Frisco. A very noticeable feature about the installation is the neat and orderly way in which the plant is maintained. Of even more importance than this is the thorough check which is being kept on each class of material which is reclaimed, to make sure that the work is being done at a profit and that time and effort are not wasted on useless material. Thus far these two plants have attracted so much attention from other railroads that the practice of installing central reclamation plants may possibly be extended more or less generally to other large roads throughout the country.

Protest Against Advance in Mileage Rates

The secretary of the Illinois Commercial Men's Association has sent a circular letter to 100,000 traveling salesmen, bitterly criticizing the steps being taken by the railways to increase the rates on mileage books, and urging the traveling men to protest against the action to the Interstate Commerce Commission. The circular says: "We want you to sign this letter and mail it immediately to the Interstate Commerce Commission, Washington, D. C. We want all the letters to reach them, if possible, at about the same time, so as to make as good an impression as possible (it would be best to write your own letter, wording it as you like, and sending it instead of the copy I am enclosing, but be sure and send in something and do it at once)." Those to whom the letter is addressed are also advised to write letters of protest to their representatives and senators. No exception whatever could be taken if the association should duly appear by proper representatives before the commission and present valid arguments, if there be any, against the proposed advance in rates on mileage books. But can the members of the Illinois Commercial Men's Association themselves indorse the very raw method of agitation suggested by their secretary? The Interstate Commerce Commission, in its opinion in the Eastern rate advance case, protested against the use of alleged improper methods to influence it to decide in favor of higher freight rates. Certainly, neither the railways nor anybody else ever tried to influence it in any coarser, balder or more disreputable way than that outlined by the secretary of this commercial men's organization. If the commercial men carry out their secretary's plan consistency will demand that the commission make a few well-chosen remarks regarding their conduct which will prevent a repetition of it.

THE FREIGHT CAR SURPLUS

THE latest statistical bulletin issued by the Committee on Relations Between Railroads of the American Railway Association, giving the figures for car surpluses and shortages for September 15, affords grounds both for pessimism and for optimism. The business situation, of which it is one of the most valuable indexes, is shown as deplorable, but it is gradually improving. The total surplus on September 15 was 138,108 cars, which is greater than for the corresponding period of any year since 1908, when the total on September 16 reached 175,000. For the corresponding date in recent years it has been as follows: 1907, 17,251; 1908, 173,587; 1909, 78,798; 1910, 54,890; 1911, 70,722; 1912, 27,380, and 1913, 61,753.

The size of the surplus for this year cannot be explained by the fact that there are more freight cars this year than in the past. The car location bulletin of the American Railway Association for September 1, showed a total of 2,408,466 cars owned, as compared with 2,343,091 on September 1, 1913, an increase of 65,375. But cars in shop, while included in figures for cars owned, are not included in statistics of car surpluses; and in taking the car surplus as an index of business conditions, it must be noted that the number of cars in shop on September 1 was 222,868, or 9.25 per cent of the total, an increase of 42,586 over September 1, 1913, and of these 197,538 were home cars in home shops. As the surplus this year is about 75,000 greater than it was a year ago the number of cars actually in service for which there was no demand was about 117,000 more this year than last year.

The total shortage on September 15 was 2,059 cars, practically negligible, whereas on September 15, 1913, it was 21,594. Although the peak of the demand for cars, according to precedent, will hardly be reached for about a month yet, a study of the current figures gives little indication that the annual predictions of a car shortage, made only a few weeks ago, will be borne out. These predictions, made at a time when the surplus stood at a higher figure than at any time since 1909 (240,000 on July 1) were, of course, based on the unprecedented figures of the government crop reports. Since that time the European war and the failure of the railways to receive a general advance in freight rates has kept general business at a minimum, and cars which otherwise would have been used for merchandise traffic have become available for grain loading, while the grain movement has been delayed by the fact that farmers have been holding their shipments for higher prices.

However, this grain is yet to be moved, and that the situation is improving is shown by the fact that the surplus on September 15 represents a reduction of 27,136 cars since September 1, the largest decrease reported since that for the last two weeks in July. The box car surplus decreased approximately 19,000, practically all in the states west of the Mississippi river and in Canada. This is attributable, of course, to the increase in the grain movement since the lifting of the embargoes on export shipments at the Gulf ports, where thousands of loaded cars stood on the tracks for the last two or three weeks in August. There was also a heavy reduction in the surplus of coal cars in the eastern states, where the total number of surplus cars was reduced one-half, or from 17,262 to 9,522, and the number of surplus coal cars from 11,343 to 5,232.

From March 15 to July 15 there was little change in the total surplus, which varied from 213,324 to 228,384. Since July 15, however, there has been a steady decline, averaging about 10,000 cars a week, or slightly greater than that usually shown for this season of the year.

NEW CLEARING YARD

THE completion of the new transfer yard of the Belt Railway at Chicago marks a significant step in the solution of the problem of handling interchange traffic. The three belt lines around Chicago are well adapted to handle transfer freight between the trunk lines entering the city, and it is probable that if they were used to the best advantage in connection with break-up and classification yards on all the roads well outside the built-up portions of the city, the through freight could be entirely removed from the congested area. This ideal has never been even approximated, partly because many of the roads do not have outer yards and especially because of the lack of co-operation between the roads.

The failure of the first Clearing project, which was promoted by a private company, demonstrated that the provision of ample yard facilities without the co-operative support of the trunk lines will not solve the problem. In the new project greatly improved facilities are provided by a company which is assured the support of the twelve owning roads and which will probably also have the co-operation of a number of non-owning roads having large amounts of transfer business to handle. The result will be closely watched, for if a joint yard on so large a scale can be operated with satisfaction, the plan would have much to recommend it at numerous other transfer points.

The new Clearing yard is conspicuous for its magnitude. It represents an investment of about $10,000,000. It has the great-

est car standing capacity, the largest number of tracks over a single hump, the largest number of classification tracks leading from a single hump, and therefore the greatest hourly capacity over the hump of any yard in the country. It contains one of the largest push-button electro-pneumatic interlocking installations in the country for operating the switches along the ladders at the receiving ends of the classification yards. It will require an unusual organization for the maintenance of track and for the repairs to cars in the four light repair yards, as well as the heavy repair yard at the adjoining shop.

Aside from the size of the yard, its design has many interesting features. The use of a single hump for classification in both directions has here the advantages of facility of operation due to the ease with which car riders and hump engines can be interchanged, of economy of operation in combining the plant for the mechanical operation of switches at one point, and of relatively low first cost, since the site of the yard is flat and all filling material had to be brought in from a distance. The yard is compact in its arrangement and the layout is such that all cars, except possibly bad order equipment, move through without reversing direction.

The care with which the design was worked out is evidenced by the compensation in the eastbound hump grade for the prevailing winds, which are from the west. As the general direction of the wind is parallel to the axis of the yard, the eastbound hump was made one foot lower than the westbound, and the four per cent accelerating grade in the former case was made eight feet shorter than the other. The car velocity at the foot of the four per cent grade is estimated to be between 12 and 13 miles per hour, which is somewhat higher than usual for similar conditions, but this is offset by the lower rate of grade through the ladders and body tracks of the classification yard. It is expected that changes in the elevation of the hump tracks will be made on account of variations in conditions throughout the year, if necessary. The entire elimination of slip switches in the track layout, the general use of No. 9 turnouts, manganese steel frogs and guard rails and of stone ballast on all important tracks are noteworthy details, all of which will have an important bearing on the maintenance of the yard.

Operating officers recognize that ample standing capacity and proper construction details will not make a yard successful without a well thought out plan of operation and an arrangement of facilities that fits in with this operating plan. So far as it is possible to foresee before the yard is actually operated, the plan proposed for handling cars to and from and through the Clearing yard seems well adapted to conditions. The road engines of owning roads can bring solid trains of transfer cars to the receiving yard and take back solid trains to their lines from the adjacent departure yards, operating over the Belt Railway tracks. This will eliminate entirely the switching charges, and allow these trains to be handled directly from the road's break-up yards to one central classification yard instead of being transferred to the Belt at the junction point for movement by its power to a number of small classification yards, as is done now. By this method a reduction will be effected both in the delay to cars in moving through Chicago and in the cost of transferring such cars between trunk lines. Non-owning roads which so desire can turn over trains of transfer cars to the Belt as at present, paying the standard charge for such transfers, and will gain the advantage of decreased delay which will naturally result from such an improvement in the Belt facilities.

The operation of the yard will be paid for by the owning roads on a car basis, and it is expected that some plan of charging for the use of the portions of the Belt Line over which these roads operate in moving trains to and from the yard will also be worked out on a similar basis. The provision of engine facilities at convenient points to eliminate the delay to road engines, the two approach tracks for each hump track to secure the maximum capacity over the hump, and other features of the yard contributing to the efficiency of its operation are covered in the description published elsewhere in this issue.

THE SIGNAL ENGINEERS' STANDARDS

THE Railway Signal Association deals with vital questions affecting large expenditures. The results of the work of the association have in some cases been realized rather slowly because of ineffective committee work (due largely to the long distances to be traveled and the difficult nature of the problems encountered) and by lack of money; but still, important progress is recorded every year.

These things are called to mind by President Patenall's statement, at the recent annual meeting, that the association's manual of standards now contains drawings dealing with 150 subjects. Every year committees, reporting on their work in connection with standard drawings and uniform specifications, find it necessary to emphasize the need of prompt action, by making the statement that railroad companies are deferring purchases of material or the adoption of improved practice, pending the action of the association in establishing standards. The signal departments of the railways now expend many millions of dollars yearly, and their work deals directly with two vital questions—safety of passengers (and property) and economical use of tracks—and the importance of the points set forth in Mr. Patenall's address cannot be overestimated. These standards affect practice on many thousands of miles of railway.

To the signal engineer, studying the details of his problems, the question of standards presents two difficulties. First, there is the case of materials embodying qualities which are the exclusive property of a single manufacturer by reason of his patent right or secret process. As was pointed out at the meeting last week, there is little of value to the railroads and nothing of credit to the association in making an association standard out of a design or a process which already has a name and a settled reputation. The committees can be employed more usefully in other directions.

Secondly, there is a demand, and perhaps a need, for standards where, possibly, by reason of the complicated nature of the work, the formulation of standards must cost more than the result will be worth. Needs, in such cases, must be forcibly modified to suit conditions. The report of the committee on automatic block signaling brought out this question. In plans for single track operation, the arrangement of the apparatus, and the decision as to how far it is practicable to go in furnishing the refinements which are demanded for theoretically perfect service, involve questions at once so numerous, so perplexing and so costly that the committee found itself unable to make any progress. In this dilemma the sub-committee having the matter in charge took the wise course of laying its case before the association in a minority report. This report commanded the closest attention of every signal engineer in the room. The question whether automatic block signals, with all conceivable refinements, are demanded on single-track railroads is one on which there is still such a variety of sentiment that the throwing of the subject open to general discussion was not only wise but necessary. Not only all signal engineers but all operating officers should take an interest in this broad question. There was a general feeling at Bluff Point that at the next meeting of the association (in Chicago next March) there should be allotted to this subject a whole day.

The minority report presents a circuit plan designed to produce a series of automatic block signals embodying as many electric and mechanical safeguards as are to be found in the controlled manual system when arranged for single track operation.* The authors of the report desire to have all critics make frank comparisons between the merits of this plan and those of the controlled manual system. And as was pointed out at the meeting, there is the further question, constantly before the eyes of the practical railway manager, whether any automatic or unattended block signal apparatus or system whatever, is to be accepted as fully equivalent to a system which, like the controlled

*A single-track controlled manual system was described in the *Railway Age Gazette*, September 11, page 475.

manual, has always on duty the signalman to check possible defects or failures. The theory of the controlled manual system is that both a man and a machine must go wrong before anything can happen with the signals which will endanger a train.

CHICAGO, MILWAUKEE & ST. PAUL

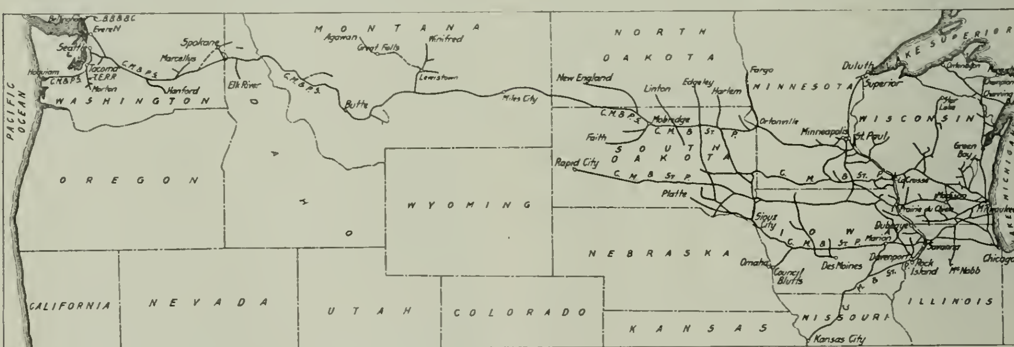
The St. Paul, in 1914, largely through increasing its freight trainloading, was able in part to offset a loss of $2,300,000 in operating revenue by a saving in transportation expenses of $1,100,000. While maintenance of way expenses increased in 1914 over 1913, and may be expected to further increase from year to year for some years as the materials used in the Pacific coast extension require renewal there was a considerably smaller expenditure for maintenance of equipment. The final result was that the company has operating income of $26,607,000 in 1914 as against $27,551,000 in 1913.

The Chicago, Milwaukee & St. Paul operates 9,613 miles of road, 73 miles having been added to the average in the fiscal year ended June 30, 1914. This system includes the old Chicago, Milwaukee & St. Paul east of Mobridge, with its mass of branch lines, operating in well-settled territory and with a large passenger business, and the Pacific coast extension, which is largely main line, running from Mobridge, S. D., west through Montana and Washington to Seattle and Tacoma. The first year in which the operations of the Pacific coast extension were combined with those of the old St. Paul, was 1913, and in 1914 the details of the consolidation were further carried through, the Chicago, Milwaukee & St. Paul now owning and operating the entire system. The Pacific coast extension has been in operation for about four years. For the first three years of its operation each year, of course, showed very large gains in traffic. In 1914, however, the entire road carried less traffic than in 1913. The St. Paul has a very diversified traffic, 10 per cent of the total tonnage being furnished by bituminous coal, 11 per cent by products of forests other than lumber, 7 per cent by lumber, 5 per cent by wheat, 4 per cent by corn and 17 per cent by manufactures. The total tonnage of products of forests in 1914 was 6,038,000 tons, and in 1913, 6,186,000 tons. The annual report shows a considerably smaller tonnage of lumber, laths and shingles, and a considerably larger tonnage of other forest products. This may, however, be simply a change in classification. There is a falling off in the tonnage of most other commodities with the exception of a considerable gain in the tonnage of stone, sand, etc., which tonnage in 1914 amounted to 2,319,000, and in 1913 to 1,961,000. The gain in this low grade traffic would in some measure help to explain the increase in trainload, but this traffic must, of course, be short-haul business, and therefore although the tonnage is over 7 per cent of the total tonnage, the ton mileage is undoubtedly a very much smaller percentage of the total ton mileage, so that the effect on the average trainload is probably but slight.

The average revenue trainload in 1914 was 380 tons, as against 357 tons in 1913, and the total tonnage, including company freight, was 454 tons in 1914 as against 415 tons in 1913. This gain in trainloading was made despite a smaller carload of revenue tonnage which was barely offset by a larger tonnage of company freight per loaded car, the total tons of freight per loaded car being 19.72 in 1914 and 19.52 in 1913. On the other hand, there were on an average 23 loaded cars per train in 1914 as against 21 in 1913, and 9 empty cars as against 7 in the year before. This made the average freight train nearly four cars, or about 14 per cent longer. The increase in trainload and the decrease in traffic resulted, of course, in a materially smaller mileage run by freight trains. This mileage in 1914 amounted to 19,700,000, and in 1913 to 22,280,000.

Detailed operating expenses reflect quite strikingly this change. Fuel for road locomotives cost $7,752,000 in 1914 as against $8,119,000 in 1913, a saving of $368,000 in this item alone. The saving in wages of road enginemen and road trainmen amounted to more than $500,000. There was also either a very considerable gain made in the efficiency of yard operation, or else a change in traffic conditions which necessitated less switching, since the wages of yard conductors and brakemen amounted to $2,075,000 in 1914 as against $2,177,000 in 1913, and the wages of yard enginemen to $1,197,000 in 1914 and $1,288,000 in 1913.

Besides the saving in transportation expenses there was less spent for repairs of locomotives and repairs of freight cars. In 1914 repairs of locomotives cost $5,492,000, or $218,000 less than in 1913, and repairs of freight cars, $4,929,000, or $555,000 less than in 1913.



The Chicago, Milwaukee & St. Paul

Apparently, insofar as possible the St. Paul undertook no new work during 1914 and carried on only such work as had already been begun and was uneconomical to discontinue. In 1913 the company spent about $40,655,000 on new equipment and additions and betterments; in 1914 the company spent $34,435,000. The principal part of this difference is accounted for by a smaller expenditure for new equipment. In 1913 $12,415,000 was spent on this account, and in 1914, $2,979,000, and at the end of the year authority had been given for the purchase of five locomotives and 39 passenger-train cars, while at the end of the previous year authority had been given for the purchase of 41 locomotives, 4,062 box cars and a small number of passenger-train cars. Apparently some of the authorities for new purchases given at the beginning of the year had been withdrawn, since but 33 locomotives were bought during 1914. In 1914 as in 1913 the largest expenditure for additions and betterments, exclusive of equipment, was for second main track, on account of which $10,573,000 was spent in 1914 and $12,558,000 in 1913. Construction work planned or under way is mentioned in the construction news columns of this issue.

During the year the St. Paul sold $17,500,000 general and refunding mortgage 4½ per cent bonds, $9,741,000 general

mortgage 4½ per cent bonds and $1,193,900 convertible 4½ per cent bonds. The total amount of bonds outstanding in the hands of the public increased during the year by $33,753,000. With operating income, therefore, of $26,607,000 in 1914 as compared with $27,551,000 in 1913, net corporate income, after the payment of rentals and interest charges, amounted to $15,476,000 in 1914 as against $18,141,000 in 1913. At the beginning of the year the company had on hand $17,361,000 cash, and at the end of the year $16,746,000. At the beginning of the year there were no loans and bills payable, and total working liabilities amounted to $10,299,000, while at the end of the year there was $5,030,000 bills payable, and total working liabilities amounted to $14,221,000.

As was previously mentioned, the purchase and consolidation of the Pacific coast extension, which had been built by separate companies and consolidated into the Chicago, Milwaukee & Puget Sound, were carried out and $154,489,500 Puget Sound 4 per cent bonds which were in the St. Paul's treasury were exchanged for a like amount of general and refunding 4's of the St. Paul. The profit and loss account of 1913 shows a charge of $1,816,000 as adjustment by reason of the acquisition of the property and accounts of the Chicago, Milwaukee & Puget Sound. The 1914 profit and loss account shows a further charge of $1,144,000. There was nothing on the 1913 balance sheet to show that there would be a still further profit and loss adjustment required, nor is there anything on the 1914 balance sheet to show that any further sums will have to be charged to profit and loss.

In 1914 as in 1913 the St. Paul paid 7 per cent on its $115,846,000 and 5 per cent on its $115,941,000 common stock. After the payment of the preferred dividend the company earned in 1914 6.2 per cent on its common stock.

The following table shows the principal figures for operation in 1914 compared with 1913:

	1914	1913
Average mileage operated	9,684	9,613
Freight revenue	$65,266,420	$67,964,161
Passenger revenue	18,961,225	18,457,136
Total operating revenue	91,782,691	94,084,055
Maint. of way and structures	10,704,519	10,648,785
Maint. of equipment	13,112,978	13,871,985
Traffic expenses	1,799,610	1,894,343
Transportation expenses	33,960,582	35,065,842

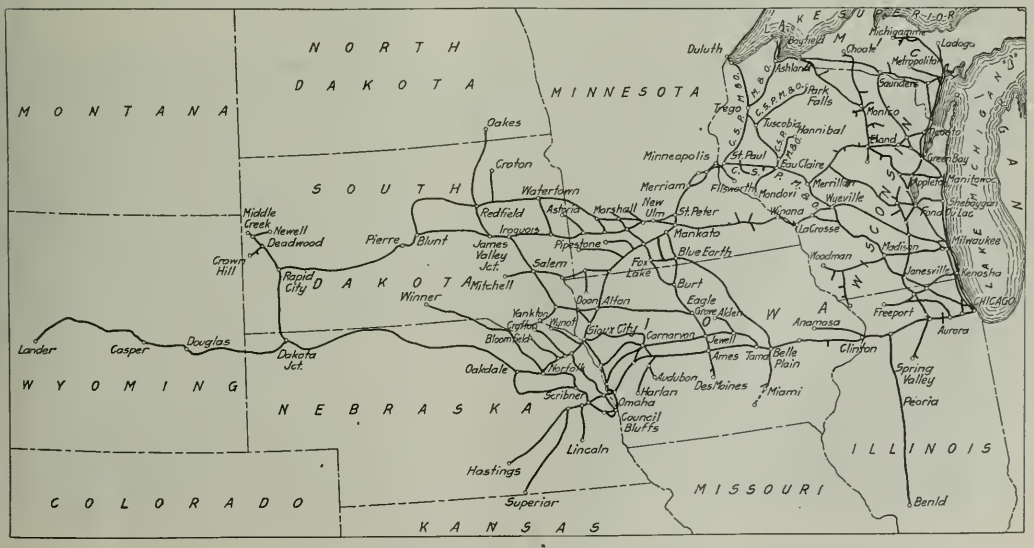
Surplus	1,547,309	4,228,211

CHICAGO & NORTH WESTERN

PASSENGER business is a far more important source of revenue on the Chicago & North Western than on the majority of western railroads. In the fiscal year ended June 30, 1914, although there was a decrease of a little more than 1 per cent in freight revenue as compared with the year before, there was an increase of 4.78 per cent in passenger revenue, with some increase in other transportation revenue, so that total operating revenues amounted to $83,677,000 as compared with $83,036,000 in 1913. There was an increase in operating expenses of $1,152,000, the total in 1914 being $59,405,000. But the remarkable thing about the North Western's operations in 1914 was that with the substantial increase in passenger business on a road where nearly a third of the revenue is derived from the operation of passenger trains, there was a decrease in transportation expenses. In recent years it has been the almost universal rule for any increase in passenger revenue to be accompanied by a disproportionately large increase in passenger train mileage, with, of course, a corresponding increase in transportation expenses. On the North Western in 1914 the passenger mileage increased 5.35 per cent, and the mileage of revenue passenger and mixed trains but 0.74 per cent; in other words, the average number of passengers per train-mile increased from 52 to 54.5. With a decrease of 0.84 per cent in ton mileage there was a decrease of 0.74 per cent in freight and mixed train mileage. It will be seen, therefore, that the total train mileage was less in 1914 than in 1913 by only a small fraction of 1 per cent.

The total wages paid by the North Western amounted to $33,871,000. This is an increase over 1913 of $959,000, of which little more than half was due to higher rates paid, and a little less than half to increased time worked. With almost no reduction in train mileage and with some increases in wage scales it is evident that the decrease in transportation expenses must have come about from economy in the use of fuel or other materials. As a matter of fact, the economy was in the expenses for fuel. Fuel for yard locomotives cost $1,126,000 in 1914, a decrease of $267,000, and fuel for road locomotives cost $6,047,000, a decrease of almost $800,000, so that the reduction in transportation expenses would have been even greater than it was if it had not been for increases in wages of station employees, the total increase being $152,000, and increases in amounts paid for loss and damage to freight and injuries to persons, the increases being $222,000 and $223,000 respectively.



The Chicago & North Western and the Chicago, St. Paul, Minneapolis & Omaha

An increase in the wages of station employees is one of the few increased expenses which railroad security holders ought to be willing to cheerfully meet. Station employees are one of the very few classes of railway labor which are now underpaid.

A part of the saving in fuel is probably due to the use of heavier engines; but there is another factor which is very important in this fuel saving, that is, the opening of the St. Louis, Peoria & North Western, which was built for the Chicago & North Western from Peoria into the Illinois coal fields where the North Western owns mines. Previous to the fall of 1913 fuel coal from these mines was carried by foreign roads and the cost of fuel included, of course, the foreign roads' freight charges. Since the company has its own line the cost to the North Western of the transportation of the coal from the mines to the point of delivery has undoubtedly been very much cut down. If a considerable part of this fuel is hauled in regular revenue trains it may be that the company is charging against the cost of fuel a very small part of the train expenses; but if this is the case there have been economies in other ways in transportation expenses to offset it, since the final point is that the North Western is getting its fuel delivered with a much smaller charge against the fuel and no increase in other transportation expenses which would be caused by the North Western's doing the hauling of the coal instead of some foreign line.

In 1914 the North Western spent substantially larger sums for maintenance of both roadway and equipment than in 1913, the principal increases in roadway being for ties, rails, and roadway and track labor. In respect to ties especially considerably more replacement work was done in 1914 than in 1913. The total spent on this account last year was $1,762,000, or $364,000 more than in the previous year, and 3,042,000 new ties were put in track as against 2,718,000 in 1913. In maintenance of equipment the principal increases were due to a considerably larger amount being spent for repairs of freight cars—$4,271,000 in 1914 as against $3,956,000 in 1913—and apparently a more liberal policy in charges for depreciation, although the increased depreciation charges may be entirely accounted for by the larger amount of equipment in service at the end of the year than at the beginning—1,830 locomotives as against 1,722, 1,918 passenger cars as against 1,796, and 65,950 freight cars as against 61,263.

Besides making larger expenditures for maintenance the North Western spent $12,912,000 for additions and betterments and additional new equipment in 1914, which compares with $7,832,000 spent on property account in 1913. The company also took over the St. Louis, Peoria & North Western, as mentioned above, a 115-mile road from near Peoria to the coal fields in Macoupin county, Ill. The cost of this road to the North Western in 1914 was $9,897,000, and in addition the North Western guaranteed $10,000,000 first mortgage 5 per cent bonds of this company, which bonds were issued to the North Western by the construction company to reimburse the North Western for its advances. These bonds were, of course, sold by the North Western.

At the end of the year the Chicago & North Western had $19,459,000 cash as against $9,647,000 at the beginning of the year, and total working liabilities amounted to $9,079,000 at the end of the year, as against $10,420,000 at the beginning of the year The principal reduction in working liabilities was in audited vouchers and wages unpaid, which amounted at the beginning of the year to $5,245,000, and at the end of the year to $3,924,000. This decrease is presumably indicative of greater efficiency and economy in the accounting department, in fact the whole report reflects remarkable gains in good railroading on a road that was already one of the best run in the country.

The table shows the principal figureys for 1914 and 1913.

	1914	1913
Average mileage operated	8,071	7,974
Freight revenue	$53,989,475	$54,661,588
Passenger revenue	21,540,543	20,557,623
Total operating revenues	83,677,051	83,035,921
Maint. of way and structures	12,179,690	11,501,186
Maint. of equipment	12,187,123	11,568,496
Traffic expenses	1,357,643	1,348,982
Transportation expenses	31,941,194	32,241,258
General expenses	1,739,491	1,592,858
Total operating expenses	59,405,142	58,252,780
Taxes	4,252,790	3,597,160
Operating income	20,004,969	21,197,277
Gross income	22,925,730	24,660,796
Net income	12,306,142	14,875,013
Dividends*	11,099,606	11,100,088
Surplus	3,775,408	1,206,055

*Includes $200,473 in 1914 and $199,991 in 1913 appropriated to sinking funds.

CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA

THE Chicago, St. Paul, Minneapolis & Omaha is a subsidiary of the Chicago & North Western. It operates 1,748 miles of road, much of which might be called branch line mileage in an agricultural territory. In the fiscal year ended June 30, 1914, the road carried 2.47 per cent more ton mileage and 13.70 per cent more passenger mileage—the freight revenue being greater by 5.25 per cent and the passenger revenue by 8.65 per cent than in 1913—but after the payment of dividends, showed a slight deficit, $65,000, as against a small surplus, $192,000, the year before. The principal factors in this showing of a deficit as against a surplus with considerably larger business were the expenditure of $404,000 more on maintenance of way and structures, the total in 1914 being $2,613,000, and an increase in taxes of $141,000. The increase in taxes was out of all proportion to the increase in business and the amount of earnings that are required for taxes on the Omaha is out of all proportion to its earnings or its mileage. In 1914 5.41 per cent of total operating revenue was consumed by taxes, the total amount paid being $973,000. The increase in maintenance of way expenditures was the result of extraordinarily large appropriations for ties and a considerably larger amount spent for bridges, trestles and culverts and for track labor. The table at the end of these remarks shows the comparison between the income accounts for 1914 and 1913.

Transportation expenses in 1914 amounted to $6,940,000, an increase of but $193,000 over 1913, the largest single item of increase being that for injuries to persons, on which there was spent $312,000 in 1914 as against $180,000 the year before. The fact that this subsidiary of the North Western as well as the North Western itself showed very considerably heavier charges for injuries to persons in 1914 suggests that probably the company is settling new claims more promptly and is cleaning up old claims. Eliminating this increase of $132,000 for injuries to persons, transportation expenses increased but $63,000, or less than 1 per cent. The total number of tons carried amounted to 8,467,000, an increase of 3.18 per cent over the previous year, and the passengers carried 4,882,000, or 8.47 per cent over the previous year. This is a good showing.

The average revenue trainload increased by 11 per cent, being 307 tons, and the lading per loaded car, 1.26 per cent, the total being 19.23 tons in 1914. The gross earnings per ton-mile were 8.8 mills in 1914, a decrease of 2.33 per cent. The average haul for freight was 153 miles in 1914 and 154 miles in 1913. On the other hand, the average passenger journey was 54.63 miles in 1914 and 52.11 miles in 1913, an increase of 4.84 per cent.

In 1914 a total of $2,097,000 was spent for property account, of which $939,000 was for extensions or additions and betterments, and the remainder, $589,000 net, for new equipment. The company sold $1,700,000 debenture bonds of 1930, and at the end of the year had on hand $1,016,000 cash, as compared with $2,413,000 at the beginning of the year. Total working liabilities amounted to $1,939,000 as against $2,771,000 at the beginning of the year.

The following table shows the principal figures for operation in 1914 as compared with 1913:

	1914	1913
Average mileage operated	1,748	1,747
Freight revenue	$11,427,563	$10,857,207
Passenger revenue	5,415,710	4,984,595
Total operating revenue	17,992,371	16,993,005
Maint. of way and structures	2,612,610	2,208,294
Maint. of equipment	2,283,926	2,188,946
Traffic expenses	353,956	348,515
Transportation expenses	6,939,604	6,746,792
General expenses	442,474	394,915
Total operating expenses	12,632,571	11,887,461
Taxes	973,283	832,263
Operating income	4,402,684	4,268,469
Gross income	4,636,089	4,504,272
Net income	2,021,615	2,278,933
Dividends	2,086,910	2,086,910
Surplus	65,295*	192,023

*Deficit.

Reclaiming Material on the St. Louis & San Francisco

The Extensive Plant Established at Springfield (Mo.) for This Purpose Is Developing Surprising Results

The reclamation plant of the St. Louis & San Francisco, established at Springfield (Mo.) a little less than a year ago, has many features of special interest. In the first place, it is housed in what might be termed "scrap buildings on scrap property." This, however, is not nearly as bad as it sounds for the buildings, at least the two main ones, are of substantial construction and were originally built as the main shops of the Kansas City, Fort Scott & Memphis, but were practically abandoned when the new Frisco shops were built on the other side of the town several years ago. The plant is ticularly in a plant of this kind, cannot but be felt in the results which are obtained from its operation as a whole.

The scrap which is collected from the various divisions and shops is delivered to the reclamation plant at the rate of about 4,000 tons a month. The force required for handling and sorting it and carrying on the work of reclamation consists of about 255 employees. These are in direct charge of a superintendent, who reports direct to the chief purchasing officer, and include a general foreman, a dock foreman, an office staff of six men, a machine shop and air room force of

A General View of the Reclamation Plant of the St. Louis & San Francisco at Springfield (Mo.)

located about one-quarter mile south of the passenger station at Springfield. That part of the yard which is used for the unloading and storage of scrap formerly consisted in large part of the low, uneven and eroded slope of a creek. This has been leveled and filled except for the channel bed and serves its purpose admirably, as indicated in the general views of the plant.

The buildings are kept well painted and a more or less successful attempt has been made to keep the plant in a neat and orderly condition. From the very nature of things this is a difficult task, but the moral effect upon the force, par-

15 men; 14 men in the bolt shop, 37 in the blacksmith shop, five in the track material and frog shop, 14 in the carpenter shop, eight in the Oxweld department and about 150 in the miscellaneous force.

As the cars containing scrap arrive they are unloaded by a Brown hoist equipped with an electric magnet. The sorting is done by small gangs of men under the supervision of a foreman who thoroughly understands material. A large part of the scrap is of no use as far as re-application to cars and locomotives or roadway is concerned and this is merely sorted into piles according to the class and grade and is

General View of Scrap Yard and Reclamation Plant

again loaded on cars by the hoist and shipped and sold to scrap dealers. The remainder, possibly from 20 to 25 per cent of the total, furnishes the basis of the reclamation plant's profitable operation.

In developing this work of reclamation, it was recognized that it might easily be overdone and thus neutralize all of the gain which could be made if the efforts were concentrated on that part which might be reclaimed with profit. To guard against mistakes of this kind each item is carefully studied and analyzed and where there is any question as to the strength or durability of the part for the purpose for which it is intended, efforts are made to follow it into service. As all of the reclaimed metal parts are dipped in an asphaltum mixture before they are sent to the shops and storehouses, it is easy to spot them in the storehouse stock and to recognize them when they are replaced on cars and locomotives. It is thus possible to more or less readily locate any breakage or failure on a large scale of parts which have passed through the reclamation plant. The mechanical department officers are constantly on the lookout for possible cases of this kind.

As may be seen from the photographs, the main buildings which house the machinery are located at one end of the scrap yard. The other smaller buildings, which have been constructed at a comparatively small cost from scrap lumber and old metal car roofs, are so located as to facilitate the movement of the various classes of material which they handle, cutting down lost motion and wasteful moves to a minimum.

BOLT AND NUTS

All the bolts which are sorted from the scrap are sent to one of the smaller buildings, which is equipped with a shear and three small air operated hammers. The damaged ends are cut off and the bolts are straightened under the hammers. They are then sorted by diameters and lengths and are sent to the machine shop, where they are re-threaded. There is provided for this purpose one single-head bolt cutter, three double-head machines and one triple-head machine. The scrap nuts are first annealed and are then placed in a rattler and cleaned; they are then sorted in sizes and retapped on four tapping machines, each of which is equipped with seven spindles. In all cases nuts are screwed on the newly threaded

Unloading Scrap With a Three-Ton Hoist Equipped With an Electric Magnet

A Group of Bolt Cutters in the Machine Shop

Two of the Multiple-Spindle Nut Tappers Which Were Reclaimed from Scrap

bolts before they are sent to the storehouse. It is true that before the establishment of the reclamation plant, many of these bolts and nuts were reclaimed. It was a more expensive process, however, because the machines were scattered at the different shops and were not worked as efficiently as is possible where they are grouped together in one department and have a sufficient amount of work to keep them working to capacity at all times. In all cases it has been found possible to speed up the machines and thus increase the output. Practically all of the work in the reclamation plant is done on a piece work basis.

Good Material Which Has Been Picked from Scrap for Future Use

A large number of new bolts and pins are also made from round iron which is taken from the scrap, straightened and cut to proper lengths. For the heading of these bolts two machines are used which were reclaimed from scrap. Practically all of the bolts which are required on the railroad are now being reclaimed or made at the reclamation plant. During one month 157,082 machine bolts were reclaimed or made from scrap or new material at an estimated saving of $1,953.50 as compared to the value of new bolts. This is on the basis of direct labor and material cost, plus a proper allowance for supervision and overhead expense.

AIR BRAKES AND AIR HOSE

The main building, which contains the machine shop and the bolt and nut machinery, also has a section for repairing and cleaning air brake apparatus and for working over air and steam hose. The hose and fittings are first stripped with home-made devices; about 90 per cent of the fittings are practically as good as new when they have been cleaned and new gaskets have been applied. The greater part of the hose is useless, although a certain proportion of it is fit for splicing and using on work equipment or for working over for dummy hose. In one month, for instance, 230 steam heat hose were overhauled, the old fittings being applied to new hose in most cases. In the same way 2,505 air hose were overhauled, 706 air hose were spliced and 53 dummy hose were fitted up.

A Pile of Shovels with Broken Handles and Bent Blades is Shown at the Right and a Number of Repaired Shovels at the Left

In this department triple valves, angle cocks, relief valves and various other pipe and air fittings are overhauled and placed in a serviceable condition, often at a comparatively small expense. A typical month shows the overhauling and reclaiming of 247 angle cocks, 29 cut-out cocks, and 283 globe valves.

A large portion of this same building is used for the repairing of damaged lanterns, markers, gage lamps, classification lamps, switch lamps, oil cans and other locomotive supplies. The item of locomotive supplies will probably not

Reclamation Plant Machine Shop

amount to a very large factor, however, because of the steps which are being taken by the mechanical department to standardize and give special attention to the proper use and maintenance of this material, as will be described in a later article of this series.

ROADWAY MATERIAL

A large part of the main shop is used for the rebuilding of damaged hand and push cars which are picked up and sent

Pneumatic Spike Straightening Machine

to the reclamation plant as scrap. In some cases where the cars are badly damaged it may require the good parts from two or three cars to make a new car. When this has been done and the car has been properly painted it is usually difficult to tell it from a new car. This is also true of baggage

Part of Carload of Reclaimed Material Ready for Shipment to the Store Department

trucks, track drills, jacks, track levels and station skids. As an example, one month showed the reclaiming of 23 track jacks, 45 hand cars, 6 baggage wagons, 48 warehouse trucks, 8 push cars, and 5 station settees, with an estimated saving of approximately $1,000.

Another part of the shop, which is of more than ordinary interest, is that in which the shovels, scoops and scythes are re-handled and straightened up. This portion of the shop

Crane and Vat for Immersing Reclaimed Material in Mixture of Asphaltum

is shown in one of the photographs. The 12 in. shovels are cut back a maximum of 2 in. About 90 per cent of the shovels which come to the reclamation plant in the scrap may be reclaimed in this way. A typical month shows the reclaiming of 418 track shovels with a saving of between $90 and $100.

Another special feature is that of cable repairs. A large

The Oxweld Station at the Reclamation Plant

amount of valuable material of this sort is lost on many roads because of the lack of an expert in splicing and repairing the cables. Realizing this, the superintendent of the reclamation plant deliberately set out to locate a competent man to

do this sort of work, preferably with experience in the navy. The result has been most gratifying.

BLACKSMITH SHOP

The blacksmith shop works over a large number of parts which come to it more or less damaged, and manufactures a considerable amount of material from scrap. It is showing a profit of from $1 500 to $1,800 a week. Track tools of all

Welding Car Bolsters with the Oxy-Acetylene Process

kinds, including adzes, spike mauls, clay picks, claw bars, lining bars and tamping bars are straightened and re-dressed. Broken coil springs are heated and drawn out with an air machine and are then made into jack bars, lining bars, drift pins and similar parts. A large shear is provided for shearing the coupler yoke rivets and the good parts are reclaimed. A shear is provided for cutting bars and rods to length. A

Repairing Car Bolsters, a Journal Box and a Coupler with Oxy-Acetylene

considerable number of brake rods are straightened and in many cases new ends are welded on.

The manufacture of material from scrap relieves the blacksmith shops at the different shop plants of much of this work. For instance, round iron is cut into suitable sizes and headed for bolts and made into pins; bar iron which comes to the plant as scrap is worked up into drawbar shims, carrier irons and other locomotive and car parts. One end of the smith shop is used for relining journal brasses. Exceptional results have been obtained by welding carbon steel points on picks. These have given excellent service and are said to be even better than the new tools.

TRACK SPIKES

Hundreds of track spikes are annealed and reclaimed each day. As these are sorted out from the scrap pile they are transferred to a small building which is fitted with a pneumatic hammer and is used only for the straightening of spikes. Such spikes as do not come up to a certain standard are, of course, scrapped, but the large number that can be reclaimed is surprising. Scrap washers after being rattled with the spikes, nuts, air hose couplings, etc., are treated in the same way.

CEMENT SACKS

Cement sacks used in connection with construction work are carefully gathered and forwarded to the reclamation plant.

A Broken Coupler and a Similar One Which Has Been Repaired by the Oxy-Acetylene Process

Usually these are torn and damaged from rough handling in opening; an old box car has been fitted up for handling these, and one of the older employees gives all his time to sorting and repairing them. As many as 1 365 sacks were reclaimed in one month, resulting in a net saving of about $84.

OIL AND WASTE

One of the smaller buildings is equipped with electrically driven centrifugal separators which thoroughly clean the

Broken Signal Post and Relay Box Awaiting Repairs

soiled and oil soaked waste which has been taken from journal boxes, and also reclaims the oil. The net return from this department runs from $200 to $300 a month.

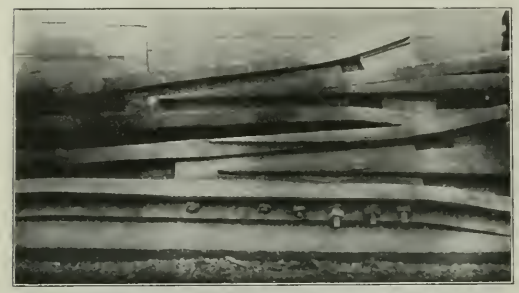
BRASS SCRAP

Special attention is given to the brass scrap because of its value, even as scrap. A small house has been built from old car timbers and metal car roofs which has a number of bins

for the different classes of brass, a scale being placed at the entrance to the building in order to accurately keep a check on all of this material.

BRAKE BEAMS

The reclaiming of brake beams is segregated in a small building because of the danger of flying rivet heads in stripping. All brake beams which are not too badly twisted or damaged are straightened in a bulldozer and are refitted with new heads and fulcrum castings if necessary. Truss rods for these beams are made in the blacksmith shop from scrap material. Brake hangers which have been damaged or distorted are straightened and fitted for further use. In one month 1,692 brake beams were reclaimed with a saving of almost a dollar a beam, and 456 brake hangers were reclaimed.



A Worn Crossing Frog and a Similar One Repaired by the Oxy-Acetylene Process

OXWELD PLANT

Probably the most interesting part of the plant and that in which the most spectacular savings are made is that in which the oxy-acetylene process is used, either for welding or for cutting. The generating apparatus and the oxygen tanks, as well as the supply of carbide, are housed in a small building centrally located. In all essentials the plant is similar to that which was described in the article on oxy-acetylene welding and cutting on the Frisco, September 11, page 467. The piping at the reclamation plant is entirely underground and consists of about 1,000 ft. each of pipe for oxygen and for the acetylene gas. There are 12 outlets or stations on this line and at present a force of eight welding operators is kept steadily at work.

Cutting a Scrap Underframe, Thus Saving the Usable Parts and Securing a Higher Price for the Scrap

The Shop in Which Frogs and Switches Are Repaired and Reassembled

CASTINGS

One of the most interesting classes of work reclaimed by the oxy-acetylene process is that of castings, whether of cast iron, cast steel, brass or other alloy. Many brake cylinders

or air reservoirs with broken lugs are repaired at a very small expense where otherwise it would be necessary to scrap the entire casting; even if the part which was broken off is not available it is possible in many cases to build up the casting with new material or to break a similar piece off of another scrap casting and weld it in place. An important development which has been made necessary is a campaign of education among shop and engine house employees to emphasize the necessity of tying broken pieces of castings, which may be reclaimed, together so that time may be saved at the reclamation plant in supplying the missing parts.

Old Boilers and Fireboxes are Cut with the Oxy-Acetylene Burners Into Pieces Convenient for Handling

The illustrations show typical jobs in the reclaiming of castings. As may be understood, the possibilities in this line are practically unlimited. Many cracked or broken car bolsters are welded and reinforced so that they are as good as new, and in some cases, even better. In possibly as many as 25 per cent of these cases the good ends of two badly damaged bolsters have been cut off and combined into one perfect bolster. Many couplers have been reclaimed which were cracked on the face or in the neck of the shank, or which have had broken knuckle pin bosses or lugs; in some cases repairs have been successfully made by filling in worn contours. One of the illustrations shows repairs being made to two bolsters, a journal box, a coupler and a center plate casting.

Locomotive buffer castings which have been broken or in which the holes have been worn out of round are reclaimed at a comparatively small cost. Many cast iron signal posts and relay boxes used in connection with the block signal system are repaired, the cost of welding usually varying between $2 and $3 per casting as compared to from $16 to $24 for a new part. A broken signal post and relay box which may easily be repaired is shown in one of the illustrations.

SWITCH AND CROSSING FROGS

A separate building, the interior of which is shown in one of the illustrations, is used for the repairing and reassembling of switch and crossing frogs. Ordinarily when these become worn they are rebuilt at a high cost. With the oxy-acetylene process the broken points and worn rails are built up to the original standard at a very small expenditure. As a typical

Old Locomotive Tanks Which Have Been Cut to Sizes Convenient for Handling

case, a frog which costs $45.25 new was reclaimed with an expenditure of $7.50, making a net gain of $37.75. One of the illustrations shows a frog which had become badly worn and a similar frog which had been just as badly worn, but which had been repaired with the oxy-acetylene process. In building up the rails and points the metal is applied over a small area at a time and is hammered down while hot, thus avoiding the necessity of subsequent machining.

REDUCING SCRAP

Several of the illustrations show large parts, such as old boilers, fireboxes, tender tanks and car frames, being cut up with the oxy-acetylene cutting burner. This class of scrap commands a very low price, not more than $2.50 a ton. When it is cut into sizes for convenient handling it will bring at least double that amount; the cost of cutting is comparatively slight, so that there is a net gain of several hundred per cent.

THE SAVING

That the best results may be obtained at the reclamation plant it is necessary for the mechanical department officers over the entire system to understand the work which is being carried on there and to realize the possibilities of co-operation. It is proposed to have all of the master mechanics, road-masters, general foremen and others who handle material, pay periodical visits to the plant to study its workings and its possibilities. By seeing that parts broken from expensive castings are wired to them when they are forwarded to the reclamation plant they can help to increase the saving; in many cases they will send parts for repair direct to the plant rather than to let them take the roundabout method of going forward mixed up with a miscellaneous lot of scrap.

A careful record is being kept of all the work which is done at the plant with the idea of determining as accurately as possible the saving which results. Of course, these savings are not in all cases net, for much of the material, if it were not forwarded to the reclamation plant, would be reclaimed at the other shops on the system. There is little question, however, but that with the special organization at the reclamation plant the work can be carried on more economically and more thoroughly than it can at the other plants, allowing for the cost of transporting the material to and from the plant.

Statements are issued monthly showing the number of different parts reclaimed, the value of the new material used, the value of the scrap material used, the total labor cost, a charge for supervision and overhead expense, and miscellaneous shop expense. This in each case is compared with the cost of similar material purchased new and a column is added showing the total saving for each item and the saving per unit. The officers of the road have given the matter careful attention and thorough study, and are emphatically in favor of the plant. Started as an experiment, it was watched more or less critically with the idea that after all most of the saving might prove to be on paper; that this has not proved true is indicated by the fact that the work is gradually and steadily being extended and enlarged, although in many cases practices have been discontinued because it was found that it did not pay to try to reclaim certain parts. In making out the monthly performance sheet those items which do not show a saving indicate the loss in red and thus attention is focused on them. Needless to say an item showing up on the wrong side more than once or twice means either that prompt attention will be given in the attempt to reduce the cost of reclamation, or no further work will be done on such parts. The plant is in charge of Superintendent R. F. Whalen.

English Railway Employees Enlist.—Up to the present over 9,000 men have either left or are about to leave the London & North-Western for active service. The figures are as follows: Army Reservists, 2,328; Naval Reservists, 398; Territorials, 2,532, and Volunteers, 4,097; total, 9,265.

AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICIALS

The annual convention of the American Association of General Passenger and Ticket Agents was held in Boston on September 15 and 16. It was decided to change the name of the association to the American Association of Passenger Traffic Officials.

A complete report was presented by the committee on Economies in the Distribution of Folders, and the committee, with H. J. Phelps, general passenger agent of the Illinois Central, as chairman, was continued with instruction to carry on its investigation. The committee recommended a continuance of the present method of distributing folders by distributing agencies in a modified form, recommended the discontinuance of placing folder boxes in hotels in cities of less than 50,000 inhabitants, closer co-operation between the Official Railway Guide and the railways in disseminating information of this character, and the discontinuance of the distribution of folders on trans-Atlantic steamships for the reason that the Official Guide will answer the requirements.

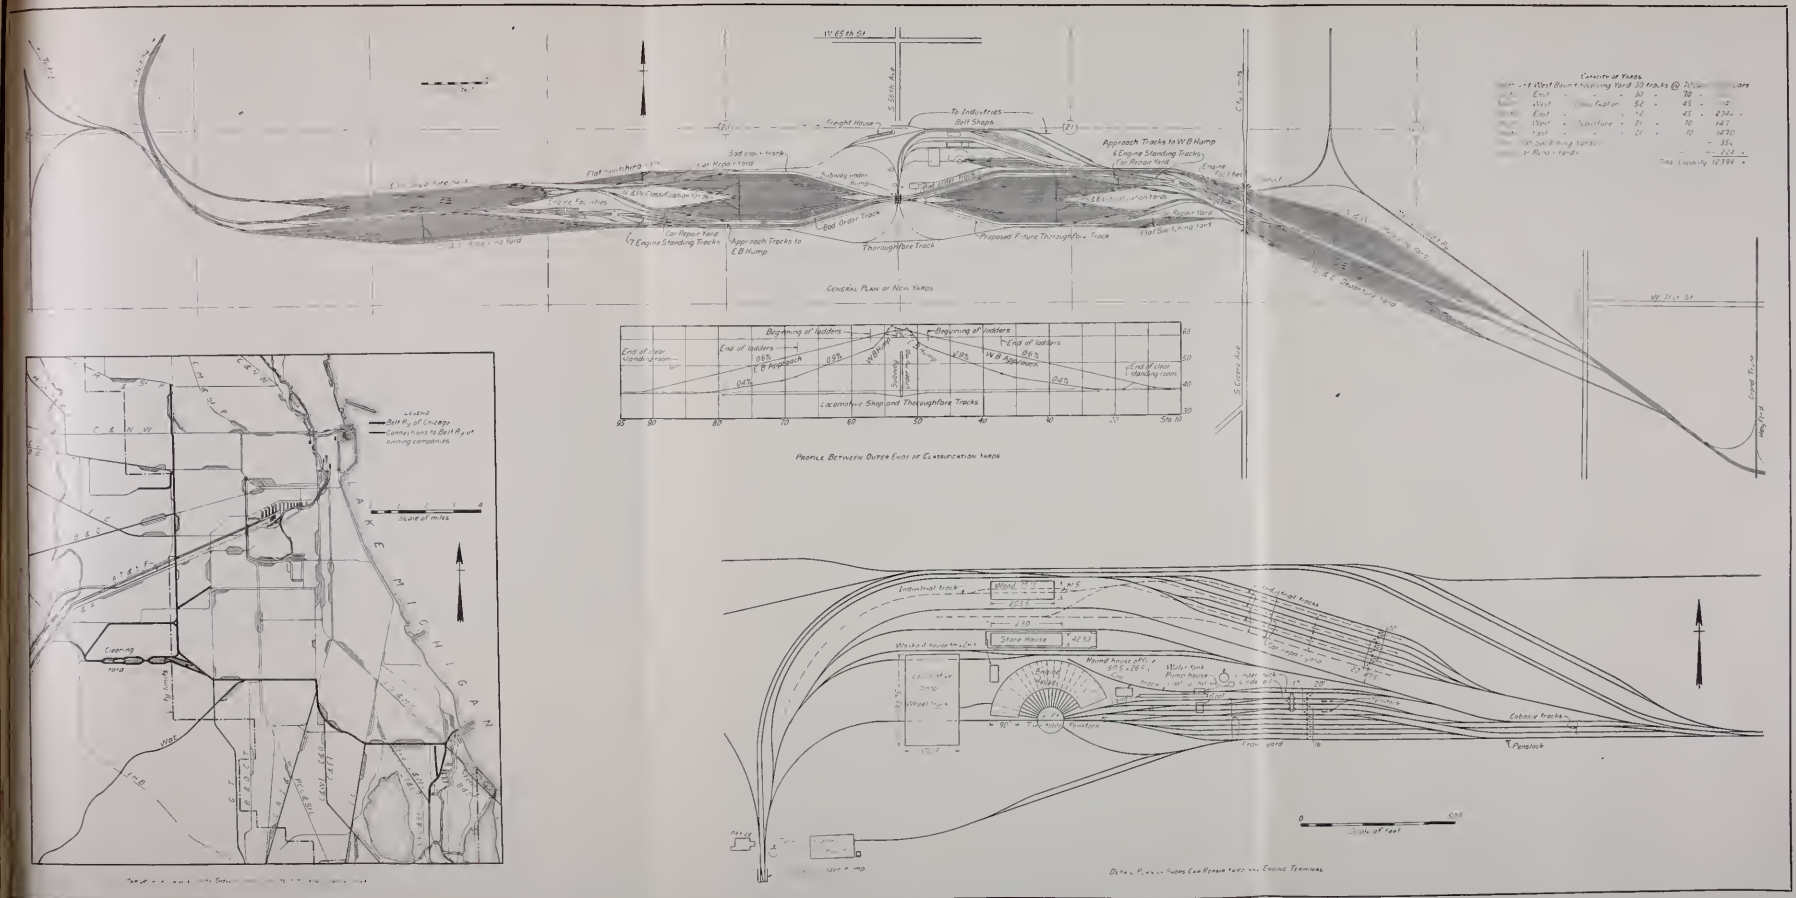
The committee on Digest of Fares and Divisions was continued, and this publication has now become a permanent feature of the association work. It was decided to discourage the practice of furnishing business colleges and commercial schools with samples of tickets.

The question of curtailment of expenses in maintaining city ticket offices in foreign territory where the lines do not have initial rails was the subject of a thorough discussion, and a committee was appointed to continue further investigation of this subject. It was believed that a great saving could be made in this direction.

The committee on Limitations of Local Tickets made a complete report, which was endorsed and referred to the different territorial associations for action. The new multi-route tickets of horizontal and vertical forms have now received the endorsement of the association and a number of lines are experimenting with these forms with a view of determining which of the two forms will be most convenient and effective. It is hoped by the use of these forms to reduce coupon ticket form representation by 33⅓ per cent. The committee on Telegraph Code for the Handling of Association Matters reported progress and is expected shortly to be able to complete its work.

Addresses were presented by the representatives of other associations, as follows: A. J. Gillingham, auditor of passenger traffic, Pennsylvania Railroad, representing the American Association of Accounting Officers; George A. Morton, general baggage agent, New York, New Haven & Hartford, representing the American Association of General Baggage Agents; George J. Alexander, president of the Canadian Ticket Agents' Association; Frank J. Burke, ticket agent at the Union Station, Chicago, representing the International Association of Ticket Agents, and H. M. Fletcher, passenger agent, Atchison, Topeka & Santa Fe, representing the American Association of Traveling Passenger Agents. An address was also presented by E. E. Clark of the Interstate Commerce Commission on "American Passenger Service," which was published in last week's issue. Howard Elliott, chairman of the New York, New Haven & Hartford, also presented an address on the Natural Advantages and Summer Traffic of New England. Those in attendance at the convention were taken on an inspection trip over the electrified zone of the New York, New Haven & Hartford, between New York and New Haven, accompanied by General Manager Bardo and Consulting Engineer Murray, who explained the principal features of the work.

Officers were elected as follows: President, Gerrit Fort, passenger traffic manager, Union Pacific, Omaha, Neb.; vice-president, Alexander Hilton, passenger traffic manager, St. Louis & San Francisco, St. Louis; secretary, W. C. Hope, general passenger agent, Central Railroad of New Jersey, New York. The next convention will be held at San Francisco in 1915.



MAP, PROFILE AND PLAN OF NEW INTERCHANGE YARD BUILT BY BELT RAILWAY OF CHICAGO AT CLEARING

Clearing Interchange Yard for Chicago District

Reconstruction of Big Hump Yard by Belt Railway to Relieve Downtown Terminals of Transfer Freight

[With an Inset]

The operation of a large yard in the vicinity of Chicago to handle all or a large part of the interchange of through carload freight in order to decrease the switching within the city and reduce the congestion in the downtown district has been more or less seriously considered since 1899 when the Chicago Transfer & Clearing Company was organized to build such a yard at Clearing, about 10 miles southwest of the center of the city. The yard built by that company and rebuilt in 1898 by the Chicago Union Transfer Company has remained practically unused, but early in 1912 an agreement was reached by 12 railways entering the city, under which they became joint owners of the Belt Railway with the understanding that the Chicago & Western Indiana would buy the old yard, rebuild and enlarge it, and lease its Belt divisions, including the yard, to the Belt Railway as formerly. This reconstruction work has now been practically completed, and it is expected that the yard will be put in operation in the near future.

General View of West Half of Clearing Yard from the Hump, with the Four Eastbound Approach Tracks on Left, and Two Hump Tracks Leading to Classification Yards on Right

The Problem and the Proposed Solution

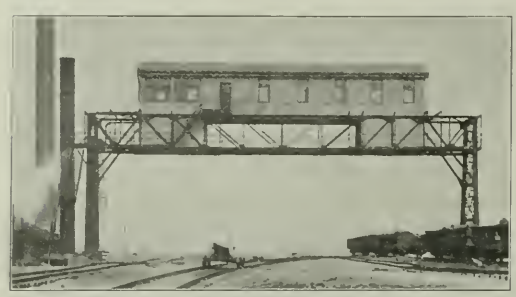
Since more freight is interchanged between roads at Chicago than at any other point in the country, the need for a comprehensive plan of handling such transfers promptly and economically is felt most keenly there. This heavy interchange of business is caused by the fact that 24 trunk line railways enter the city, practically all of which terminate there. In addition there are 14 terminal, switching and industrial roads in and around the city, originating and delivering large amounts of freight which is received from or transferred to the trunk lines. The total freight car movement into the city excluding empties, is approximately 260,000 cars per month and about the same number of loaded cars are taken out of the city. On the assumption that the number of empty cars bears the same relation to the number of loaded ones as the average for roads in this district, the total car movement is approximately 390,000 in and the same number out. Practically half of the loaded cars are for Chicago delivery, and half for points beyond, so that applying this ratio to the total car movement, about 195,000 cars must be transferred from one road to another at Chicago every month, or 6,500 cars every day. At present about 30 per cent of these cars are handled by belt lines and the remaining 70 per cent, or about 4,500 cars a day, are hauled into the congested district of the city to be delivered by direct switching to the connecting roads.

The clearing yard in its reconstructed form is adapted by location and design to become a central "clearing house" for all railways entering the city and will thus solve this most difficult interchange problem, if satisfactory operating agreements can be made to enable its advantages to be realized to the fullest extent. It is owned by the Atchison, Topeka & Santa Fe, the Chesapeake & Ohio, the Chicago & Eastern Illinois, the Chicago, Burlington & Quincy, the Chicago, Rock Island & Pacific, the Chicago, Indianapolis & Louisville, the Erie, the Grand Trunk, the Illinois Central, the Minneapolis, St. Paul & Sault Ste. Marie, the Pennsylvania and the Wabash. The line of the Belt Railway makes direct connections with every trunk line entering the city and extensive improvements now under way will give it ample capacity to handle the interchange business of the other roads as well as the owning companies. The fact that some roads not interested in the control of the Belt have been giving it large amounts of transfer freight indicates that even more will be received from such roads after the new yard is put in operation.

The yard lies between the Belt and the Indiana Harbor Belt, making it possible for the roads interested in the latter line to send their transfer business to Clearing by that route if they

prefer. This line is owned by the Lake Shore & Michigan Southern, the Michigan Central, the Chicago, Milwaukee & St. Paul, and the Chicago & North Western, so that with the exception of the Baltimore & Ohio, the Chicago & Alton, the Chicago Great Western, and the Pere Marquette, every trunk line entering the city is interested either through ownership or affiliation in one or the other of the belt lines and three of these exceptions, the Baltimore & Ohio, the Chicago & Alton, and the Pere Marquette, have direct connections of their own to the new yard.

The design of the yard provides a standing capacity of about 12,400 cars and makes it possible to handle 400 cars an hour over



Interlocking Tower on Bridge Spanning the Hump Tracks

the hump. This would mean a daily capacity of 8,000 to 10,000 cars which is in excess of present demands and ample property is available for the addition of similar units if the capacity of the present yard should ever become insufficient. The yard is centrally located with respect to the breakup yards of the various through lines, resulting in a minimum average haul on transfer business. The distance from Clearing to the farthest break-up yard is approximately 20 miles.

REVISED DESIGN OF YARD

The old facilities consisted of a single hump between two classification yards with two tracks over the hump, one leading in each direction. The receiving yards were located alongside the hump requiring reverse movements. No departure yards were provided, although two five-track overflow yards at the outer end of each classification yard were intended to serve the same purpose. This old layout was inadequate for the proposed method of operation, requiring the enlargement and rearrangement of the facilities.

The new design retained the old hump between the two classification yards, its width being increased to allow four tracks to be operated simultaneously, two in each direction. The classification yards are each divided into two units of 26 tracks, each unit being served normally by one of the hump tracks, although provision is made for either of the tracks in one direction to serve either of the corresponding yard units. The classification tracks have a capacity of 45 cars each, making the total capacity in the classification yards 4,685.

The receiving and departure yards are designed for 70-car trains. The former will ultimately contain 30 tracks each and the latter 21, although only 16 and 12 tracks, respectively, are being laid at present, with a view to adding the others as the capacity is needed. The present capacity of these yards will be 2,240 cars for the receiving and 1,680 for the departure and the ultimate capacity will be 4,200 cars and 2,940, respectively. The receiving and departure yards for opposite directions are located side by side at the extreme ends of the layout, eliminating reverse movements. Thoroughfare tracks are provided along both sides of the yard with Y-connections under the hump, allowing movements to be made easily between any portions of the yard.

Two flat switching yards of 176 cars capacity each are provided near the end of each classification yard with direct leads into the departure yards. These are designed primarily to handle the business originating in the industrial district around Clearing, which will be brought in in small lots by switch engines. The Corn Products Refining Company's plant is the largest single industry in this district at present, although numerous smaller plants are grouped near the yard and further development in this territory is probable. The four car repair yards adjacent to the classification yards have a total capacity of 224 cars and are equipped to make light repairs only. Cars requiring heavy repairs will be switched to the heavy repair yard at the shops north of the hump. A bad order track leads from the hump to each repair yard and tracks for bringing back car riders to the hump will be located just outside these bad order tracks.

As the main line of the belt crossed the site of the proposed receiving and departure yards at the east end, a new double track line was built along the north side of the yard location extending from the Grand Trunk crossing at Hayford to a connection with the old location at about Sixty-seventh street. In order to provide a direct connection to the west end of the yard, a new double track line 4½ miles long was built west from the old line on Fifty-ninth street and south to the yard.

The yard facilities are duplicated on the two sides of the hump. It is expected that in general trains from southern and eastern roads will be brought into the yard from the east end and depart for northern and western connections at the west end and that cars from the latter roads will move through the yard in the opposite direction. The trains will be brought to the yard by road engines of the respective companies running over the Belt tracks. The road engines will pull into one of the receiving yards, cut off, and go to the corresponding engine facility layout to coal, clean fires, and take water and sand. The engine can there be turned and the same crew can pick up a train destined for its road from the adjacent departure yard. Engine facilities are provided at both ends of the yard and the proximity of these facilities to the receiving and departure yards will reduce the delay to road crews to the minimum.

The operation of classifying the incoming trains and making up outgoing trains will be performed by the Belt Railway. A four-track lead is provided from each receiving yard to a point about 200 ft. from the hump where the four tracks merge into the two leading over the hump. This arrangement allows two trains to be pushed up almost to the hump, while two other trains are being classified on the other tracks so that they are in position to begin classification immediately when the others have finished. This will effect an important saving in time

Panorama of the Belt Railway Shops Located Just North of the Hump

over the usual system under which the hump engine has to run back to the receiving yard for another train before work can proceed.

The grade on the approach tracks to the hump is 0.6 per cent. The profile on the other side of the hump includes a short accelerating grade of 4 per cent, 0.9 per cent through the ladders, and 0.4 per cent through the body of the classification yard. The westbound hump is 1 ft. higher than the eastbound to compensate for the force of the prevailing winds. The switches along the ladder track leading into the classification yard will be operated by an electro-pneumatic interlocking system from a tower on the hump.

RECONSTRUCTION OF THE YARD

The design of the new yard made it possible to utilize the sand fill in the old hump, a portion of the old track material, the power house, freight house and office building, the sewer system, and a portion of the water system. The first work undertaken was the raising of the outer ends of the classification tracks on a sand fill to bring them up to the new level. The old hump fill was then widened for the additional classification and approach tracks, the old tracks being shifted to the new sired height above the yard track and a locomotive crane was then used to shift the dumping track to make room for the next plowing. In addition to the sand fill, 177,000 cu. yd. of earth removed from miscellaneous excavations was placed in the fill.

A steam shovel was used in making the cut for a single track connection to Argo, passing under four tracks near the west entrance to the yard, and a team outfit graded part of the new connecting line. These portions of the work were contracted to Andrew Ward & Sons, Chicago. The grading on the change in the old line and the new connection totaled 117,300 cu. yd.

In making the cut through the hump for the new subway, a 25-ton locomotive crane rigged with a clam shell bucket was used, operating on a track laid from the face of the excavation back parallel to the hump to a point where the fill was needed. This crane handled 9,000 yd. at a price less than the contractors' estimate.

The new yard contains 134 miles of track, of which 22 miles is old track shifted into the proper position and the remainder is new track, or old track relaid. The old yard was laid with soft wood ties and 75-lb. rail, and was well ballasted with cin-

Locomotive Shop, Roundhouse and Storehouse Nearing Completion

ders, gravel and slag. It contained 11 miles of lateral drain pipes, so that no additional provision for sub-drainage was required. The old ties that were suitable were used in the new yard in less important tracks with tie plates. All new ties are hard wood, those on curves being tie-plated. The old ballast was reclaimed whenever possible. Stone ballast was used for all ladder and important running tracks with cinders on the other tracks. A total of 112 miles of cinder ballast and 22 miles of stone was placed. All of the 94 miles of 75-lb. rail in the old yard was used in the reconstruction and 80-lb. new or relaying rail was laid on ladders and running tracks. There were 353 turnouts and 58 double slip switches in the old yards, and there are 845 turnouts in the new yard, all double slips having been eliminated. No. 9 turnouts are standard throughout. The frogs from the old yard have been placed in the caboose yards, shop tracks, repair yards and the less important tracks. The new frogs are of solid manganese of a special design by the Chicago & Western Indiana. The guard rails are Ajax one-piece manganese; the switch points are 15 ft. long and the switch stands are Economy for yard tracks and Mansfield for main lines.

locations and new ones laid as the filling progressed. The construction of the new departure yard of 12 tracks at the west end was pushed in order to provide a place for receiving large quantities of sand for filling which was brought in over the Indiana Harbor Belt from Dune Park.

As soon as switch material could be secured, two switch laying gangs were started on the ladder tracks, the classification yard switches at the hump being laid first in order to give the interlocking contractor an opportunity to start his work. The thoroughfare tracks were then laid to provide connections between the ends of the yard without going over the hump, making it possible to rebuild the hump subway, which had been designed only for foot and team traffic and was enlarged to carry two tracks.

A total of 1,051,500 cu. yd. of sand was placed in the yard fill. This material was handled in Haskell & Barker cars using a plow and spreader to unload and place it. In making the fill for the approach tracks to the hump which have a maximum difference in elevation of 8 ft. above the body of the yard, the wing of the spreader was elevated to build up the fill to the de-

South Cicero avenue is carried over the yard on a ten-span viaduct of concrete piers and through steel girders encased in concrete. The spans vary from 38 ft. 2 in. to 69 ft. 8½ in. The approaches are made of sand fill with a street grade of 3.5 per cent. The sand fill at each end of the viaduct will be restrained from overflowing the tracks by crib walls built up of concrete moulded in pieces about the size and shape of cross ties and laid in the same manner as ordinary tie cribs. A similar viaduct will probably be built next year to carry Crawford avenue over the east approach.

The subway under the hump is a double-track structure with a clear opening 30 ft. wide and 17 ft. high from top of rail to clearance line. It consists of re-enforced concrete abutments and transverse girders encased in concrete. The total yardage of concrete placed in the yard work was about 2,250.

The two-story interlocking tower which houses the yard plant is set up on a structural steel bridge spanning the hump. The walls of the tower are of metal lath and cement mortar, and the roof is of asbestos shingles. Two machines of 72 levers, each operating 65 switches and two signals, control the two classification yards. The machines are located on the upper floor of the tower in operating rooms at the ends of the building, facing the yards they control. The space between the operating rooms is occupied by a clerical office and the lower floor of the tower contains the relay rooms.

The machines are of the Union Switch & Signal Company standard push button electro-pneumatic type and the switches are operated by motion plate type switch and lock movements. The track circuits controlling the indicators in the machines use 220-volt, 60-cycle a. c. power. The signals controlling movements over the hump tracks are mounted on the lower chord of the bridge.

The low voltage control current for the machines, switches and signals is furnished by a 400 a. h. storage battery at the power house which is charged by two motor-generator sets. The a. c. power for the track circuits is fed from a separate transformer at the power house. The compressed air is supplied by the same compressor that serves the shops.

NEW LOCOMOTIVE AND CAR SHOPS

As the track elevation work now under way will make necessary the abandonment of the Belt shops at Eighty-third street, and the completion of the yard will effect important changes in operating methods on the Belt it seemed best to provide adequate shop facilities at the new yard. These shops were located just north of the hump and not far from the existing power house. The principal new buildings include a locomotive shop, roundhouse, storehouse and wood-mill.

The locomotive shop is of the transverse lift-over type with six pits; the blacksmith and boiler shops being included in the same building. It is a steel frame structure, 172 ft. 8 in. by 293 ft. 9 in., with brick walls and a composition roof on wood sheathing. It is unusually well lighted by side and monitor windows, which are equipped with David Lupton steel sash and the Pond operating device. The building is divided into three bays, the heavy machine, 60 ft. wide, the light machine, 40 ft. wide, and the erecting, 70 ft. wide. A 150-ton crane is provided in the heavy machine bay and 10-ton cranes in the light machine and the erecting bays. The building is heated by warm air, the circulation being secured by Sirocco blowers through ducts, part of which are overhead and part under the floor. A track connection is provided through the locomotive shop which passes directly over the turntable at the roundhouse and connects to the wye tracks under the hump allowing an engine to be brought in from either side. A track also leads into the shop from the center drop-pit in the roundhouse for bringing wheels to the shop.

The engine house has 20 stalls, with three drop-pits. It is of timber frame construction, 90 ft. deep, with brick walls, concrete footings, tar and gravel roof, cast iron jacks and balanced sash, those on the inner circle being equipped with the Pond operating device. The National boiler washout system was installed, and a 90-ft. turntable is provided, operated by a Nichols electric tractor. The capacity of the roundhouse is not as large as would ordinarily be necessary for the number of locomotives used by the Belt, but in the majority of cases, the engines will not go into the house, when out of service temporarily. A four-track storage yard is provided for such engines, only those requiring work to be done on them going into the house.

The storehouse is a brick building, 230 ft. long by 42 ft. 10 in. wide, with a material platform surrounding it. A second story is provided across one end of this building for the master mechanic's office, and the oil storage room is located in the basement. The Bowser system of oil handling is used, with square tanks instead of round ones in order to economize space.

The wood mill is 203 ft. 6 in. long by 61 ft. 6 in. wide, having brick walls, steel roof trusses, a Brooks roof and wood block floor. The rough lumber will be stored west of the wood mill and after finishing will be run out into the car repair yard east of the building on industrial tracks.

The engine facilities east of the roundhouse include a 400-ton Roberts & Schaefer concrete coaling station with provision for locomotives to take coal and sand on four tracks; three 100,000-gal. conical bottom steel tanks of the Chicago Bridge & Iron Works design, supplying penstocks and service lines; and cinder pits of the receiving-hopper type under three tracks.

The improvements to the old powerhouse and its equipment include a new 450-h. p. Babcock & Wilcox boiler, Green automatic stokers, the reconstruction of the headers and breeching and the construction of a new Wiederholdt tile and reinforced concrete chimney, 200 ft. high and 8 ft. in diameter.

ORGANIZATION

Practically all of the work on the yards except the interlocking installation was handled by company forces in charge of the engineering department of the Belt Railway, of which E. H. Lee is vice-president and chief engineer. The construction of the shop was handled under contract by George B. Swift & Company, Chicago. The interlocking system was installed by the Union Switch & Signal Company, Swissvale, Pa., under the supervision of F. E. Jacob, signal engineer of the Belt. F. E. Morrow, principal assistant engineer, was in charge of the preparation of plans and the office work connected with construction operations. V. R. Walling, first assistant engineer, was in direct charge of the work in the field and was assisted by an engineer for the yard work, and one for the shops. The track work was directed by a supervisor of track and the concrete work by a supervisor of bridges. Excellent co-operation between the assistant engineers, the supervisors, the chief clerk and material agent and the car-tracer, was secured by holding daily meetings at 1 o'clock, at which all of these men suggested plans for improving methods and discussed their various requirements for the following day's work. The cost of supervision was reduced by the free use of motor cars, as the work extended over a distance of five miles, exclusive of the Fifty-ninth street line. Four cars were used, one for the first assistant engineer, one for the supervisor of track, and the other two running on a regular schedule each way from the hump.

A maximum force of about 1,200 men was required in 1913, and about 800 in 1914. Labor was very scarce in 1913, but by authorizing the work early, enough men were secured before they shipped out in large numbers. The supply was irregular throughout the season, however, as many as 900 time checks being issued in one month for men leaving. Conditions were much better in 1914 and no difficulty was experienced in getting enough good men. A camp was maintained for the laborers at the yard, the contract for boarding being let to the Consolidated Boarding & Supply Company, Chicago. This camp was described in the *Railway Age Gazette* of May 16, 1913. In addition, a daily work train was run from the Dearborn street station.

What the Press Thinks About the Rate Case

Welcome Prospect of Advance in Charges; Recognize Carriers' Needs and Demand Prompt Action

The announcement that the Interstate Commerce Commission has granted the petition of the railways in Official Classification Territory for a reopening of the advanced freight rate case, decided on August 1, and the setting of the date for a rehearing on October 19, have aroused widespread editorial comment in the press of the country. With a remarkable approach to unanimity the daily newspapers are supporting the position of the railways in the emergency which has come upon them, and are demanding not only that the commission accede to their request for higher rates, but that it act promptly in reaching its decision. Following are some extracts from the editorial utterances on the case which have come to our exchange desk in the last few days from all parts of the country. No attempt has been made to select those favorable to the railways. It is significant that but one paper comes out squarely in opposition to higher rates. Several are non-committal and two or three express regret that rates apparently are to be increased, but the great majority demand immediate relief for the railways in the form of higher revenues in the interest of the commerce of the country.

AS EARLY AS COMPATIBLE WITH JUSTICE

[From the Cleveland Plain Dealer]

It will be agreed that to give the roads another chance to present their case was just, though friends of the roads' demands are likely to complain because the matter is not to be attended to more promptly. Though the date of the opening hearing has been set later than one might believe wise, under the emergency condition, the commerce commission ought to be able to proceed with its full inquiry with reasonable speed. The delay in rendering the other decision was widely criticized. But in this new investigation the commission will necessarily go over much of the same ground covered before. It will be to the interest of all to have a decision reached as early as compatible with justice, which presupposes thoroughness.

IF THEY NEED IT, THEY NEED IT NOW

[From the Chicago Herald]

The hearings should be speedy. No nine months, nor six months, nor even one month, should be consumed in reaching a decision. Especially there should be no time wasted in reviewing ancient history, nor in considering theories about how railroads might be run, under government ownership, or any other plan different from that under which the railroads have been created. In the well-known words of a late president of the United States, "a condition, not a theory," confronts the railroads, and with them the whole country. It is a plain business proposition that the country cannot prosper if the railroads are squeezed into bankruptcy. The railroads say they are being suffocated by iron rings around their throats—by governmental power limiting the price of the only thing they have to sell. They should be able to prove it easily, or it should be easily disproved if they are not telling the truth. It's all a matter of plain figures, already collected or easily obtained. If the railroads need a pulmotor, and they are visibly gasping for breath, they need it now, not in nine months, or six months, or even one month hence, but NOW!

COMMISSION SHOULD GRANT RELIEF

[From the Daily Oklahoman, Oklahoma City, Okla.]

The consensus of intelligent opinion throughout the country is that the roads are entitled, in common fairness to the greatest single line of business, to an increase in rates; perhaps not to five per cent, as demanded, but to some per cent which will represent the difference between prosperity and bankruptcy. We have seen drastic economies practiced on the part of the roads in the past year or so in order to make both ends meet; trains have been discontinued, employees reduced in number, and betterments postponed. But notwithstanding these economies, the roads generally claim that they are still unable to keep their heads above water owing to the increasing cost of everything they have to buy, the advancing wage scale, and the reduced passenger rate. No fair-minded citizen desires to see the roads hampered by regulation in such degree as to destroy their prosperity. We must display the live-and-let-live spirit toward them, the same as toward the humblest citizen of the land. If it can be disclosed that their rates, both freight and passenger, have been regulated to the degree that they are no longer capable of yielding a fair return upon the money invested in them, then it is obvious that the Interstate Commerce Commission should grant some measure of relief and the public accept the same uncomplainingly.

WIDESPREAD HOPEFULNESS

[From the Milwaukee Evening Wisconsin]

There is widespread hopefulness over the announcement from Washington that the Interstate Commerce Commission has decided to reopen the freight rate case and will begin hearings October 19.

MORE SUBSTANTIAL JUSTICE

[From the Kansas City Journal]

The reopening of the eastern railroad rate cases by the Interstate Commerce Commission holds out the hope that more substantial justice will be rendered than was accorded in the recent decision. The increase granted in the previous decision was proved to be nominal rather than helpful or fair. The more the experts studied the so-called "assistance" doled out by the commission, the more hollow and unsatisfying it appeared. The net result was a pittance, when there should have been generous concessions if very serious consequences were to be averted. It is nonsense to regard justice to the railroads or the big business interests of the country as injustice to the people generally or to so-called "small business." "Big business" cannot be cudgeled into financial insensibility without destroying general prosperity, and it is earnestly hoped that the new conditions which have arisen will bring about a new fairness that will ameliorate the situation all along the line. The Interstate Commerce Commission has the opportunity to do on a comparatively small but helpful scale what ought to be done by the legislative authority of the government and of the several states on a much larger scale.

ENTITLED TO A FAIR HEARING

[From the Chicago Tribune.]

It really should be a work of supererogation to urge a fair and unbiased consideration of the carriers' application on its merits. The sentiments expressed by the President in his letter to Chairman Trumbull are the sentiments which every unprejudiced and enlightened man of business must share fully. The railroads are not asking for special or preferential treatment; they are not resisting or belittling the reforms which the commerce commission advised in its decision of July last. The recommendations that were then made with regard to retrenchment, abolition of favors, and correction of abuses are being carried into effect. But the direct claim made is that a more material increase in revenue is needed than all the reforms pointed to by the commission are capable of yielding. The railroads have assumed the burden of proof, and they are asking merely for a sympathetic and fair hearing. To this they are entitled. To this the great body of investors in railroad securities is entitled. To this the interests and welfare of the na-

tion are entitled. Private industry is free to advance rates or charges; the railroads are not free. However adversely affected by the war and loss of freight, they cannot take a single step in the direction of revenue increase without the consent and sanction of the commission. The commission is independent and in a position to take a large, judicial, fair view of the question.

PROBLEMS CALL FOR IMMEDIATE SOLUTION

[From the New York Evening Post]

Two of the seven commissioners dissented on grounds which were carefully and vigorously set forth, from the decision of the majority of their colleagues. At best, the decision rested on certain presumptions whose correctness could be established only by experiments, and on certain suggestions of economies whose effectiveness could be tested only by time. But months of time and experiment, in doubtful and disputed questions, where the facts may eventually not bear out the commissioners' contention, are precisely what cannot be awaited, in the present extraordinary juncture. And if they could, there would still remain the immense dislocation which has been brought upon the financial world by the European war—some of the urgent problems arising from which call for immediate solution.

MOVING TOWARD HIGHER RATES

[From the Lincoln, Neb., Daily Star]

When the Interstate Commerce Commission recently ordered a reopening of the rate case involving the application of more than 50 eastern railways seeking a five per cent increase of freight rates, its action was some evidence that forces are at work for more liberal treatment of railways that are hard to overcome. Notice is given that the associations of shippers who have contested the application of the eastern railways for higher freight rates will continue their protest at the new hearing, which means that it will not be an ex parte affair, but all the circumstances indicate that we are moving toward a period of higher railroad rates, excuse for which is to be found in conditions created by the war abroad. These conditions will be urged as justification for an increase that could not be justified to the satisfaction of the Interstate Commerce Commission before the war began. Thus there will accrue to the American people another war tax arising from the bloodthirstiness of other countries.

GIVE THE COMMISSION TIME

[From the Manufacturers' News, Chicago]

It is perhaps unfair to jump upon the Interstate Commerce Commission because that body did not render a satisfactory decision—to anybody—regarding freight rates. Conditions have been altered materially in this country, as in other countries, by the European war. The "near decision" made by the commerce commission was based upon conditions as they existed a year or two ago, about the time the commission, as a body, went into hibernation. Now that the commission has been advised that there is a war in Europe and the railroads are unable to obtain any money for improvements the commission, no doubt, will be glad to bring its decision up to date. The commission undoubtedly means well. Give it a chance. It has at least two members, those in the confidence of President Wilson, who know what is going on. Commissioners McChord and Daniels might with perfect propriety tell the other commissioners that conditions alter decisions. The freight decision of the Interstate Commerce Commission needs revision. The commissioners should not let pride, or ethics, or even politics, stand in the way of the welfare of this country.

NO EXCUSE FOR DELAY

[From the Brooklyn Eagle]

There will be hearings, of course. As usual, volumes of testimony will be taken, but little or nothing not already known will be developed. What is already known to a certainty is that the railroads are carrying burdens which constantly increase, thanks to such legislation as the full-crew law and to higher taxes. Equally certain is it that it is useless for them to try to raise money by any means other than through an increase of rates, but the commission will want to be told things of that sort over again. Fortunately, however, the President is taking a hand in the performance. He has a habit of inducing results.

A CONDITION, NOT A THEORY

[From the St. Louis Globe-Democrat]

The discussion of the needs of American railroads has passed the stage of the question of fairness. The interest of the public is now vitally involved. Past sins and the responsibility therefore can no longer be regarded as the issue. In the language of Grover Cleveland, a condition and not a theory confronts us. The railroads are not making money and have not been for some time. The public is vitally concerned in more ways than one. Nothing would be more immediately disastrous than such a paralysis of our transportation system as would seriously impair the service to which American business has been accustomed. We have grown so used to excellent service that it is almost impossible to conceive how business was done in ox-team days. Should our transportation system break down it would spell ruin for general business. Putting our railways on a paying basis is not simply an act of justice. It is a consummation that is vital to the entire public. It should be with a full realization of this fact that the applications for increased rates are considered.

CRISIS IS OBVIOUS

[From the New York Tribune]

The Interstate Commerce Commission should approve without delay the railroads' renewed request for a five per cent increase in freight rates. There is fortunately no occasion for the long investigation which preceded the commission's denial of the request when it was first presented. The commission went into the matter exhaustively at that time. It has all the facts, except the new facts which the railroads offer in their latest letter, and these recent developments are patent. They need no study or long consideration. The crisis is obvious. If the Interstate Commerce Commission is not utterly blinded by pride of opinion it will enable the railroads to face it at once.

STILL AFTER FREIGHT RATE INCREASE

[From the Omaha Bee]

Not content with the substantial victory won in the ruling of the Interstate Commerce Commission on their petition for five per cent freight rate increase, 112 railroad companies, comprising 35 railway systems operating in the territory affected, have come back for a further modification to accord with their original demands. There is no doubt the railroads have been encouraged in this procedure by the knowledge that the commission was divided over the merits of their showing, and that its decision was rendered by a majority with a vigorous dissent from the minority. Taken altogether, it seems to us that in asking a reopening of their case thus early the railroads are, to use a colloquial phrase, trying to rush things, as if fearing a more deliberate experiment might lose to them the force of the argument.

NO ROOM FOR DOUBT

[From the Salt Lake Tribune]

If there was room for doubt as to the necessity of an increase three months ago, there can be little doubt on that point now. The war has supervened to still further reduce railroad revenues. If the Interstate Commerce Commission had acted generously in the first instance the railroads would not be reduced to their present plight. Jugglers of statistics were able to demonstrate with astounding facility that the railroads should be in a prosperous condition, but, strange to say, the actual condition confounded the theorists. Now that the petition of the railroads has been renewed they may look forward with more

confidence to a favorable issue, inasmuch as their financial reports absolutely demonstrate that while their operating revenues have been constantly decreasing for months, their operating expenses have just as constantly increased.

VERDICT MUST BE EXPEDITIOUS

[From the Philadelphia Press]

The Interstate Commerce Commission has again before it the case of the railroads. It has the solving of the problem of whether it will do real and substantial justice, or whether it will again be led astray by theory and chimerical schemes of economy. It has the opportunity to act promptly and well, and so save financial conditions in the United States. It will not be sufficient to decide right after a long interval of time; the verdict must be expeditious if a disastrous situation is to be avoided. This is not a time for the commission to go into the history of railroad financiering and to dig up and exploit any errors of the past. There is far too much at stake in the present. It is time to realize to the full how many different elements are involved in the case of the railroads, and that the question of doing justice to them extends even to the protection of the small depositors in the savings banks of the country. It is to be hoped that in this new case before them the commission will not sit at the feet of Mr. Brandeis, of Boston, and seek from him the path to take. It is a crisis that needs no oracular advice from any apostle of a theoretical economy. The commission has a duty to perform. That duty it should meet in square man fashion, fearless alike of the clamor of the mob and the pleading of the advocate. And first of all it should recognize the extent of the question that is before it.

SHOULD BE EX-BRANDEIS

[From the Albany Journal]

More light has come to the Interstate Commerce Commission. It has granted, with unusual promptness, the appeal of the eastern railroads for a reopening of the rate case which was decided mostly against them shortly before the war began. There is a report that the organizations of shippers which opposed the original application will again make opposition. If they do, they will show themselves even more unreasonable than before, since now there is constant effort to advance the prices of most things that are shipped. The rehearing should be before the commission minus Brandeis, and the decision should be such as will meet the requirements of a condition embarrassing to the railroads, which is now more or less aggravated by the indirect effects of the war.

THE COMMISSION ON TRIAL

[From the New York World]

The president's letter on the railroad situation showed that he was personally convinced of the need of higher rates. . . . But what then? Another year or more of figuring and argument and fiddling around to no certain consequence this way or that? Another year of uncertainty among shippers and in the markets for railroad securities? Another year of that colossal exhibition of administrative vacillation which month after month preceded the inane decision rendered a few weeks ago?

One thing is evident. The railroads are entitled to greater elasticity in the control of their income. They are subjected to quick changes in traffic and credit conditions, as from this unforeseeable war. They should be enabled to adjust themselves to these changes with equal rapidity.

If through the Interstate Commission the roads are not so enabled readily to readjust themselves, it is no body to exercise the rate-fixing power. It should know from month to month what are the just needs of the roads or their unjust charges. If it does not know, or if it is not able to decide promptly on what it does know, it is out of place where it is. The present commission is on trial before the country as a body competent to perform the duties imposed upon it.

COMMISSION SHOULD FACE ABOUT

[From the Philadelphia Public Ledger]

Europe's war has driven European investors to the necessity of selling billions of American railroad securities provided our exchanges open and give them the opportunity to do so. This means that for years to come it will be impossible for American railroads to procure one dollar of capital anywhere in Europe. . . . The hour has come in this war-troubled day when the Interstate Commerce Commission should face about and advance freight rates without argument. Nothing that the president could do, nothing that congress could do, nothing that all our bankers and trades bodies combined could do, would so instantly lift every business to a higher plane of prosperity as a quick rise in rates. It would be notice to the whole world that the United States means in this crisis to preserve its institutions intact and to permit them to live in prosperity. Such notice would do what nothing else will be able to do toward persuading Europe to keep our securities. The Interstate Commerce Commission can now deliver a fatal blow to American trade, or it can by an act of patriotic duty in one day start a thousand industries to humming and send back to work many thousand idle men.

COMMISSION SHOULD ACT AT ONCE

[From The Economist, Chicago]

Thirty-five railroad systems have asked the Interstate Commerce Commission for a rehearing on the application for a five per cent increase in rates. What they want is not the half-loaf that the commission gave them in its recent decision, but the whole thing. They are entitled to it, and failure to give it to them is likely to entail on the whole country a great deal of trouble. There was reason enough for the increase before the European war came on, and that reason has been doubled, or more likely multiplied by 10, for one cannot measure the possible difficulties that the roads will have in their finances. As to the operation of the properties the roads say that for the year ending June 30, 1914, as compared with the year ending June 30, 1913, there was a decrease in total operating revenues of $44,700,000, while operating expenses increased $23,300,000, and a decrease in operating income of approximately $73,700,000, notwithstanding an increased property investment. In addition to these facts is the certainty that high rates for money will have to be paid for a long time yet, and the roads have obligations of over $500,000,000 maturing in the next 15 months. The president has spoken for the roads, the public is beginning to see the merits of the case, and the Interstate Commerce Commission should act at once.

INCREASE SHOULD GO TO RAILWAYS

[From the Houston Post]

The possibility that an advance in rates may have to be made is reason enough why the added burden of a tax on freights should not be laid upon railroads and shippers. One of the immediate causes of business depression throughout the country is the plight of the transportation lines. They have abandoned hundreds of trains and otherwise reduced their service. They have curtailed operations in their shops and offices, halted betterments and laid off tens of thousands of employees. It is a condition confronting them, not a theory. Their credit is badly impaired because of the lack of earnings to meet their financial engagements. Their tonnage has decreased. If there must be any increase of freight rates, it should by all means go to the companies so that they may resume as far as possible the operation of their properties to the limit of efficiency and re-employ as many of their idle men as possible.

NECESSITY FOR RELIEF EXISTS

[From the Iron Age, New York]

The necessity exists, as admitted by President Wilson on September 9 to a committee of railroad executives, of some measure affording relief to the railroads of the country at this time of contraction in railroad revenues. The proper way in

which to afford such relief would be by giving them permission to advance their freight rates. It is to be hoped that the hearing will be granted and that an early and favorable decision will be rendered. The railroads are in practically as serious a condition as the government so far as revenues are concerned and imperatively need to have their interests considered. It would have been most unfortunate indeed if such a complication had been injected into the situation as the imposition of a tax on freights.

THE COMMON LOT

[From the San Antonio Express]

It is the common lot of all enterprise at present in this country to have to contend with the question of capital, credits and commercial interruption. We take it that the eastern roads will have to produce overwhelmingly powerful proof that their credit largely depends on the grant of the desired increase before they can persuade the commission to alter its ruling, which—it is remembered—called the roads' attention to the remedy that lies in cutting out useless extravagances of operation and in increasing passenger rates. For it is not unreasonable to remind that the tightness is but temporary, that it is agreed on all hands that the current stringency will be succeeded by a record era of trade prosperity—an era in which, of necessity, the roads would have a tremendous share. Thus if there is any possible way out of this tight situation for the roads, if there is any way to tide over the straitness until the wheels of commerce shall turn in this country more freely than ever before, without asking the people to supply the funds at this time, certainly the roads should adopt that more just and patriotic expedient.

A NEW CASE

[From the Dallas News]

While the press despatches use the word "rehearing" in speaking of the decision of the Interstate Commerce Commission to grant the latest request of the eastern railroads, the proceeding intended is not, strictly speaking, a rehearing. It does not intend, evidently, to reopen the case adjudicated. What it does intend is to determine whether conditions coming on since that decision was made render it necessary to afford these railroads further relief. The chief and most immediate problem confronting the railroads is that of refunding bonds about to mature. In the present state of the money market, as well as in the state that is to be expected for some time to come, they will have to pay a higher price for financial accommodation than it would have been necessary to pay a few months ago. This will add to their annual expenses just as certainly as an increase of wages would. But what probably chiefly gives rise to the anxieties of the railroads is the greater reluctance to lend to them. Lenders knowing, as of course they do, the increasing predicament of the railroads, feel less certain of the security which their bonds offer. It is the fear of receiverships, and it will undoubtedly be the object of the railroads to show that a further advance in rates is necessary to remove this fear. The commission will hear a new case, and not rehear an old one.

BRANDEIS SHOULD BE ELIMINATED

[From the Salt Lake Tribune]

The Interstate Commerce Commission has decided to reopen the eastern advance rate case. The shippers' organizations, which have previously fought the increases, will be represented by counsel, and the question of right or wrong will be thoroughly ventilated. Both sides are entitled to a hearing before the commission finally makes up its mind as to the necessity of granting the increases asked. This time, however, Lawyer Brandeis should be eliminated and the controversy settled upon its merits, without taking into consideration the fads, fancies and foibles of the Boston reformer. The railroads have been hard hit by the depression of the past year or two and the European war has put the finishing touches upon an already deplorable condition in the business of the carriers. The shelving of the railroad securities bill was an indication that the administration feared disaster would follow, placing the railroads at a still further disadvantage. The fact that the rate cases are to be reopened may be taken as proof that President Wilson believes that the railroads are justified in making their request and that he will not be disappointed if the request is granted.

A LOOK INWARD

[From the Cleveland Leader]

Important representations must have been made to the Interstate Commerce Commission to induce it to consent to a rehearing of the plea of the railroads for permission to increase their freight rates by five per cent. That the ultimate consumer would in the end be compelled to pay the increase is well understood by the commissioners. The railroads will not be permitted, nor do they expect, to go again over the ground covered in the last hearing, despite the fast-growing impression that the commission has borne down upon them with undue severity. They will be limited to the presentation of facts and circumstances which have arisen since the last proceedings—since the democratic tariff law went into effect and before the war in Europe had begun to produce much effect upon this country. One of the facts newly ascertained is an immense falling off in railroad net earnings. In spite of an increase in property investment it amounted to $73,700,000 for the eastern railroads alone. It would have been much greater if drastic economies had not been enforced. And the stockholders have not suffered alone. Purchases of supplies have been cut down, affecting the concerns producing them even to the extent of suspending dividends and confessing bankruptcy. Trains have been withdrawn and men have been laid off work because they could not be employed without loss. All this affects the general public. If the railroads are suffering other branches of industry must be suffering also. What is the cause? The chances are that the forthcoming rate hearing before the Interstate Commerce Commission will have a strong and peculiar political interest for every citizen of the United States.

ADVICE REPUDIATED

[From the Albany Journal]

When the Interstate Commerce Commission some weeks ago handed down its long delayed decision on the application of the eastern railroads for permission to increase freight rates, it granted little of what was asked but gave a great deal of advice as to how by other means revenue could be increased. Among other things, it suggested that charges should be made for "spotting" cars; that is, for placing cars on tracks maintained by shippers.

Having received this advice, the railroads had reason to believe that if they acted upon it, their action would be forthwith sanctioned by the commission. Accordingly, they promptly filed a schedule of charges for "spotting" of cars, expecting that the commission would approve it. Instead, the commission received protests from shippers and then suspended the operation of the schedules filed upon its advice, until next March. In the meantime the protesting shippers are to be heard. Eventually, the schedules may be approved, or not. In view of this development, one is more than ever before at a loss to understand the mental processes of the commission. When advice is given in definite form, it is to be believed that the adviser is convinced that action upon it is in order; that there remains no doubt in his mind as to the merit of his suggestion. Yet the commission, having told the railroads what they ought to do, does not permit them to do it, but decides that the proposed action shall be debated during a long time between those who have accepted the commission's advice and those who are moved by self-interest to offer opposition. Such methods of the commission enable it to keep the railroads indefinitely on the anxious seat, while their financial condition is steadily deteriorating. At the same time, when the administration sees that it needs additional revenue because its "tariff for revenue only" is proving to be a tariff for deficit, a bill is promptly prepared which imposes a tax upon everything in sight. No opportunity is given for protest. "The government needs the money," is offered as

a sufficient reason for the imposition of extraordinary taxes aggregating $105,000,000. That the railroads, too, need more money to give the service that is expected and demanded from them, and to keep their credit sound, is not regarded as an impressive argument.

GOVERNMENT SHOULD UNDO THE WRONG

[From the Buffalo Courier]

The roads east of the Mississippi last year petitioned for authority to raise their freight rates. These had remained stationary while literally everything related to operation and maintenance had largely increased in cost. For an inexcusably long time the Interstate Commerce Commission dwelt with this application, extending investigation in uncalled-for directions, then finally giving a decision disappointing to the transportation companies and condemned by such of the people as have an intelligent understanding of the conditions. . . . Instead of impartially judging the merits of the request and its bearing on public welfare, the majority of the commissioners, no one of them a practical railroad man, assumed to lecture the managers on how the roads should be run with impracticable and illogical suggestions. The transportation interests and the interests of business at large are so interdependent that unless the railroads prosper no general prosperity can exist. The government should consider this incontestible proposition at once. It should undo the wrong committed by its blundering agent, the Interstate Commerce Commission. . . .

TONIC SHOULD BE ADMINISTERED AT ONCE

[From the St. Joseph, Mo., Gazette]

The Gazette is in hearty sympathy with the effort being made by American railway men to have justice done the transportation lines of the country. For years now we have been fighting the railroads. Their every act has been closely scrutinized by government agents, and no forward step has been made by any one of them without having first gained the consent of the government to the proposed action. This period of investigation was, perhaps, necessary in order to place the roads in a proper light before the public, but in our enthusiasm to see that justice was done there is grave question whether we have gone too far. This newspaper does not believe that any country can be prosperous for long while its transportation lines are in the condition now occupied by American railways. Permit them to charge rates sufficiently high to make them prosperous, to enable them to meet their just obligations, and to go on with their improvement plans, and every line of business in the country will immediately feel the impulse of their good fortune. If, however, the request of the roads is not granted we shall see conditions go from bad to worse until business becomes paralyzed, the trust funds of the people invested in railroad securities greatly depreciate in value, and millions of men be thrown out of employment. The tonic needed by the roads should be administered at once.

CRISIS OF THE RAILWAYS

[From the Independent[

The railways of the United States are facing a crisis. It is a crisis not brought on by the great war, but rendered immeasurably more acute by it. It is more than a crisis for the railways, it is a crisis for the American people as a whole. In the words of President Wilson, "the interest of the producer, the shipper, the merchant, the investor, the financier and the whole public in the proper maintenance and complete efficiency of the railways is . . . manifest. They are indispensable to our whole economic life." In the prosperity of the railways we all share. In their ill fortune we all suffer. It is a time for the Interstate Commerce Commission to consider gravely whether it shall not reopen the just-decided rate case and, in its reconsideration, give the railways the benefit of every doubt on behalf of their plea for increased revenue. It is a time when, in the words of President Wilson, "we must all stand as one to see justice done and all fair assistance rendered and rendered ungrudgingly."

COMMISSION CONTROL ON ITS TRIAL

By W. M. Acworth

I am invited to say what I think of the recent 5 Per Cent Rate Advance Case. Let me begin by making my own personal attitude clear. Three or four years ago I started to write a continuation of my little book, "Elements of Railway Economics." Several of its chapters as they were written appeared in the *Railway Age Gazette*. One chapter concluded in these words: "A law court is not the proper body to decide questions of railway rates. On the other side of the Atlantic they seem to be gradually working out a system of regulation much more logical in theory, and likely in the long run to be much more satisfactory in practice." I then held the belief—justified I think by the then evidence—that commission control was going to afford a satisfactory solution of the problem. And I accordingly went on to sketch its gradual development in the United States, showing how commissions and legislators had sown their wild oats, and how the railroads had come, first reluctantly to submit to, and then almost to welcome, reasonable regulation.

And then two years ago my writing abruptly stopped; for the facts unfortunately ceased to fit the theory on which I was proceeding. Legislators refused to be guided by experts, and passed two cent fare laws, full crew laws, and the like, by scores, for reasons quite other than those of general public interest. Commissions failed to become more expert. They still regarded it as their duty to establish, not just and reasonable rates, but low rates. Some of them even, in defiance of the spirit of the Constitution, which forbids any state to lay any imposts or duties on imports, manipulated local rates so as to prejudice the freighters outside their own state. There remained still the Interstate Commerce Commission. And to that commission, strengthened in authority, in numbers, and in personnel, one could surely look to uphold the credit of commission control. And now comes the decision of that commission in a case, not only the most important that has ever been submitted to it, but surely the most important in the magnitude of the interests involved that ever has been submitted in the world's history to any tribunal. That the decision will be a landmark in the story of the relations between railways and governments, I have no doubt. That it will inspire confidence in commission control as a system—can anyone hope?

I am not going to attempt to criticize the decision in detail; as it seems to me details are out of place in a case going down to the whole financial basis of the railroads of America. Three years before the commission inquired into the same question, whether an advance of rates was required. Though they came, as I believe, to a wrong conclusion, they dealt with the matter in a broad and statesmanlike manner. They based their judgment that an increase was not required on the view that new net revenue was not then needed, and on the expectation that neither wages nor cost of supplies would much advance; and added that, if they were proved wrong, they would not hesitate to give their sanction to increases that would be reasonable. In 1914 the commission finds that the expectations of its predecessors of 1911 were wrong Wages and fuel costs have largely increased, and "the net operating income of the railroads in official classification territory, taken as a whole, is smaller than is demanded in the interests of both the general public and the railroads." But thereupon the commission decide that the railroads in official classification territory, taken as a whole, shall not receive at their hands any increase of income whatever.

The commissioners of 1911 were bad prophets. But fate was at least kinder to them than to the prophets of 1914, who—on the very day on which the stock exchanges in New York and London closed their doors, and two days before Germany declared war on France and Russia—put out the opinion, "Shortly after the commencement of this proceeding there began another period of depression from which we

appear now to be recovering." . . . "Subsequent developments have shown that there was little foundation for any such view" as that "carriers would encounter great difficulty in renewing their maturing short term notes and other obligations. With the growing ease in the money markets this difficulty has largely disappeared."

But in truth this was not a case either for detail or for prophecy. In England our courts take judicial cognizance, as it is called, of certain facts that do not need to be proved. They take it for granted, for instance, that the sun goes around the world; that New York time is always five hours behind London; that the United States since 1776 has been an independent nation, and other similar facts that are part of our common consciousness. And so, it seems to me, the commission might have taken judicial cognizance of the elemental facts of the railway situation. We all know, for example, that American railways have been built and operated hitherto with an economy unknown in older countries; but that of recent years the standard of construction, and the standard of operation have been rapidly raised, implying the expenditure of vast additional capital and a much larger proportion of income. We know that freight rates the lowest in the world have gone down rather than up of recent years. We know that operating costs have increased faster owing to increased prices than could possibly be offset by increased economies. We know, to put it in the broadest possible way, that it cannot in the long run be possible, in a country where $1 purchases less than almost anywhere else in the world, to give the European standard of service at the old American standard of price. We—including the commission—cannot help having all these things at the back of our heads, and 1,000 pages of statistical tables do nothing more than confirm—though they do abundantly confirm—our pre-existing impressions. And yet the answer of the commission is a refusal, and ten items of paternal advice.

One would have thought the natural course of the commission, having found the net revenue inadequate, would have been to go on to say: "Take then, as an interim measure, this 5 per cent increase for which you ask, for you have abundantly discharged the burden of proof laid upon you that your rates as a whole are too low. But the general increase must of course be subject to the right of any individual complainant to show that his case is an exception; and, if that is proved, the money must of course be refunded. But we do not think that a general 5 per cent increase is the best thing that can be done. Let us all get together, commission, railroads and freighters, and see if we cannot work out a better scheme, it being understood that the commission has made up its mind, on the one hand, that the railroads must have increased revenues, and therefore increased rates; and, on the other hand, that no trade and no locality must be unjustly discriminated against."

But, far from taking this course, the commission have intrenched themselves in a semi-judicial dignity against "the general impropriety" of what they call "the campaign of publicity." Why there was any impropriety in the action of the Traffic Association which "offered to deluge the commission's offices with thousands of telegrams"—presumably to declare that, in the opinion of the members of the association, the proposed increases were just and reasonable—it is difficult to understand. I had always hitherto believed that the great advantage of a commission of the American type over our purely judicial commission in England was precisely that with you the commission was responsive to public opinion, both guiding it and being guided by it in turn; and was not confined to the consideration of sworn evidence produced in court. In our procedure there is no method by which the interests of the public at large can be brought before the court. But, if with you the public at large, who are expressing their opinion through hundreds of leading articles or through thousands of telegrams, are to be refused a hearing, what is the advantage in the commission being only "semi-judicial"?

I have long thought that the proper method of control over railway rates is that a body of experts, such as the commission, should consider the question, and, instead of deciding it, should publicly give their advice to a cabinet minister, and that he should then act on his own responsibility, being himself in turn responsible to Parliament. Under our form of government in England there is no difficulty in establishing machinery of this kind. But it would, I imagine, be impossible under your constitution with its rigid limitations of the spheres of legislative, executive and judicial action. But you will, I think, have to face the question, how the statesmanship of the country can be brought to bear on the railway problem; for this question the Interstate Commerce Commission by their latest decision has raised in so acute a form that it cannot now be evaded.

RAILWAY SIGNAL ASSOCIATION

The annual meeting of this Association was held at Bluff Point, N. Y., on Lake Champlain, last week, and the proceedings of the first day were reported in the *Railway Age Gazette*, September 25, page 564. On the second day, Wednesday, the first business was the report of Committee No. 3, on power interlocking, F. B. Wiegand, chairman. This committee presented a code of specifications for incandescent electric lamps, which, after brief discussion, was accepted as in the nature of a progress report. A code of specifications for vitrified clay conduit, presented by the committee, was approved and ordered submitted to letter ballot. A standard cartridge enclosed fuse was ordered to letter ballot.

The report of Committee No. 4, on automatic block signalling, was presented by A. R. Fugina, vice-chairman. A code of specifications for caustic soda primary battery, after a very brief discussion, was accepted for reference to letter ballot.

Committee No. 4 presented revisions of a number of paragraphs of the Association's standard specifications for highway crossing bells. The views of the committee expressed in this report were criticised and were discussed at some length; but the specifications were finally accepted as presented.

On the subject of typical circuit plans for automatic block signalling, this committee was unable to agree upon a recommendation, wide differences of opinion developing among the members. A sub-committee, of which G. H. Dryden is chairman, made a thorough study of the subject and prepared typical circuit plans for single track automatic signalling. These were not acted on by the whole committee, but Mr. Dryden presented to the meeting a minority report, accompanied by a plan for single-track signalling, which differs materially from that of any system now in service. There was no discussion of this report, members generally expressing the desire to read it again before expressing themselves on the views of the sub-committee. The subject will be discussed at the March meeting (in Chicago).

Committee No. 6, on standard designs and nomenclature, J. C. Mock, chairman, presented standard drawings for mounting mechanism cases on bracket posts; mechanical dwarf signals; switch rod insulation; a double lever stand to be used on table or wall in offices, and other details; also a number of designs which had been presented at the March and the May meetings. All of these were accepted and ordered to letter ballot, except that the spectacle of the dwarf signal was referred back to the committee for certain alterations, and except also that the handles of the lever stand (drawing No. 1197) were ordered to be made two inches longer than shown in the plan presented by the committee. Eight existing standard designs which had been

slightly modified by the committee were accepted and ordered to letter ballot.

On a number of other designs this committee proposes to send out letter ballots for information before making final recommendations.

This committee again presented its report, embodying an elaborate system of symbols and nomenclature for use in the preparation of working drawings, which was very briefly discussed at the meeting last May. This code of symbols introduces a radical change in the general practice on all railroads; but, evidently, it had been carefully examined by the members, and after very brief discussion it was adopted unanimously, to be sent to letter ballot.

Committee No. 8, C. H. Morrison, chairman, presented descriptive accounts of installations of automatic block signals on railroads where trains are propelled by electric power, these descriptions filling about 40 pages. These were accepted by the association as historical data to be embodied in the proceedings; and also perhaps, to be printed, with similar matter presented before now, in a separate volume.

Specifications for transformer oil, for petrolatum for use in impedance bonds and for alternating current electric generator, after slight corrections, were accepted and ordered to letter ballot. The association endorsed the view of the committee that oil should not be used in impedance bonds.

In connection with the specifications for a generator the committee was authorized to make additions, before publication, to make the specifications correspond with those adopted, or to be adopted, by the American Institute of Electrical Engineers.

The meeting approved certain slight changes which are to be made in the specifications for overhead crossings of electric wires. Changes in the specifications for track relays, after correction of typographical errors, were adopted and ordered sent to letter ballot.

THIRD DAY

On Thursday the meeting took up the report of Committee No. 2, on mechanical interlocking, C. J. Kelloway, chairman. Standard Drawing No. 1207, for leadouts from towers, with low bearings, was adopted and ordered to letter ballot. The same action was taken on six proposed standards for derails, which had been presented at the May meeting. These, however, are treated as examples of good practice, not standards to be printed in the manual.

The changes which had been made in the specifications for mechanical interlocking construction were approved, after a large number of errors in details had been corrected.

This report presented a list of requirements for the proper installation of interlocking at drawbridges, embodying a number of additions to what had been presented on this subject at former meetings. After a long discussion these requirements were accepted as a progress report.

A special committee, J. B. Latimer, chairman, which had been directed to prepare a form of contract to be used in establishing signals at junctions, crossings or other places where two roads are interested, reported that, before anything useful could be done, it would be necessary to adopt a better standard table of operated units and the values to be assigned to each, than is now available; and a list prescribing such values was presented. Objection was made to the list presented on the ground that it went too much into detail. In the great majority of cases where there is a joint interlocking the division of the cost on the basis of one-half to each company would not be far out of the way, and this simple plan has a great advantage over the complications of a set of values based on distinctions carried out to the last small detail. After a long discussion, however, the report was accepted, the word "points" being substituted for "units" as the name to be used in assigning the values as prescribed by the committee. The table will be referred to letter ballot.

Committee No. 3, on manual block signalling, Geo. S. Pflasterer, chairman, presented revisions of the rules governing maintenance of block signals, which were adopted and ordered to letter ballot.

It was voted to recommend to the American Railway Association certain rules, discussed at a previous meeting, relative to the use of caution cards for moving trains past interlocked signals when apparatus is out of order.

The report of the committee on signalling requirements for electric railways was accepted as a progress report. Further conferences with Committee No. 1, on signalling practice, will be necessary before decisive action can be taken by this committee.

The committee on selection of place for the next meeting, R. E. Trout, chairman, named Salt Lake City as the place, and the date September 21, 1915; and this report was unanimously adopted by the meeting.

The election of officers for the ensuing year, which was by letter ballot, resulted as follows: For president, Thomas S. Stevens, Atchison, Topeka & Santa Fe; for second vice-president (the present second vice-president, W. J. Eck, becomes first vice-president), C. A. Dunham, Great Northern; for secretary (eighth year), C. C. Rosenberg, Bethlehem, Pa.

REPORT ON DERAILMENT AT ATTICA, IND.

The Interstate Commerce Commission has issued a pamphlet, not dated, giving the conclusions of Chief Inspector H. W. Belnap on the derailment of eastbound passenger train No. 4, of the Wabash Railroad, at Attica, Ind., April 5, last, when three persons were killed. As reported at the time, this derailment was caused by running the train on to a bridge which had been weakened by a previous derailment. This first derailment occurred at a frog, and the present report gives a view of the track, in which this frog is seen, but there is no study or explanation of the cause. The train, a freight train, was moving west. The car derailed in this train, the twelfth car, ran against the left or south batter post of the bridge and weakened it seriously. Subsequently the freight engine had been backed over the bridge; and as this engine went over safely, and as the passenger engine was lighter than the freight, the passenger train was allowed to move over the bridge at about four miles an hour; but it broke through when on the span of which the weakened end post was a part.

James E. Howard, engineer of the commission, examined the bridge, and he says that, while the passenger engine was lighter than the freight, it, with its adjacent car, caused a greater stress on the weakened post than did the freight engine and one car, because it was headed eastward. He calculates that when the passenger engine was on the weakened span the load on the end post was 186,800 lb. and that when the freight engine was on the same span, this stress was 147,800 lb.

It was reported at the time that the responsibility for allowing the passenger train to enter upon the weakened bridge was chargeable to the track supervisor, but Mr. Belnap says that, "while this man was apparently in charge, he did not personally notify the despatcher that it was safe for the passenger train to proceed over the bridge." After reviewing the testimony, Mr. Belnap says that, owing to the conflict in the evidence, responsibility for permitting the bridge to be used in its weakened condition cannot be definitely placed. The conductor of the freight, the station telegrapher and others testified at the inquiry, but the discrepancies in their testimony are not cleared up in the report.

Engineer Howard says that the weakened condition of the bridge was clearly manifest and of a nature so serious that its dangerous condition should have been realized and traffic

immediately suspended. This opinion appears to be based on the evidence of a photograph showing ruptures and distortion of the batter post, but this photograph is not reproduced. There is a halftone reproduction of a view of the bridge, but the details are not sufficiently distinct to enable the observer to form an intelligent opinion.

The abstract of the testimony of the track supervisor indicates that he looked at the batter post and saw that it was "bent about 6 in. to the south," and yet he seems to have been so much influenced by the fact that the freight engine had passed over the bridge in safety that he took no measures to forbid the passage of the passenger train.

ENGINEMEN'S EXPERIENCES—MAN FAILURES*

By Joseph D. Clyde

I learned a lesson when I had been running about two and a half years that has made me watch my hand ever since. I was running a little ten-wheeler on the Parral branch of the old Mexican Central, and was called one afternoon for an extra south. When we left Parral I had thirty minutes to go to Aristole for No.. 412, the northbound passenger train, and as we had about seven kilometers (4½ miles) of pretty good grade right out of Parral, our thirty minutes allowed just about time to go to Aristole (which is fourteen kilometers from Parral) without exceeding speed restrictions.

We had made about ten kilometers when I sighted a bunch of horses on a road crossing. When I blew for the crossing the horses started to run; but one of them jumped into a cattle guard and got fast between the slats. I stopped all right, before striking him; and it took the whole crew to pry him out. We used 12 minutes doing this and getting under way again.

All of us forgot No. 412 in the meanwhile; and we proceeded on down the hill. Just about a mile from Aristole I came to my senses and saw I was on 412's time. I set the air in emergency and blew for brakes; and just at that moment 412 shot out of a cut and into us. The outcome was about $20,000 damage to the engines and equipment, and the loss of three lives, a man, a woman and a little girl, all of them passengers on No. 412.

It also made both myself and the conductor fugitives from the rather questionable justice that was dealt out in Mexico at that time. I don't think that either one of us—the conductor or myself—has ever overlooked his hand since.

To show that I profited by the foregoing incident I will relate another. I was working for the old National out of Mexico City about ten months after my trouble on the Parral branch, and was on a passenger run that left the main line at Tolucca Junction and went to Acambaro. We made each way a day. I was coming south one night and was running about fifty minutes late. About one mile out of Tolucca the track swung around a curve on to about half a mile of straight line. As I came around this curve I reached up to blow for the town and just glanced at the track as the engine took the straight line, and saw an object lying on the right hand rail. I shot the works into her and got stopped with the pilot just touching an old style coupler knuckle (the kind that has the slot cut in the middle) which had been driven down over the rail, forming a derailer. The track at this point was on a fill about 75 ft. high; so you can see what would have taken place if I had been thinking about my past life, or something besides the job I was on. I can't take all the credit, though, because I had an electric headlight.

This was found to be a deliberate attempt to ditch the train, and the perpetrators were caught and dealt with according to the quickest method; that was, letting the rurales in for a little cheap target practice.

So just make a resolve, brothers, when you register out, that "Safety First" is all you are going to think about till your trip is completed.

*This is the second of a series of articles, made up of useful hints to locomotive runners, which were written in connection with the prize competition of several months ago. The first of this series was printed in the issue of September 25, 1914, page 571.—Editor.

RAILWAY AFFAIRS IN OTHER COUNTRIES

The annual Corean consular report states that during 1913 133.2 miles of railway were opened in Corea, making the total length of line now open to traffic about 970 miles. A new line is to be opened in October or November, and some extension work is now being planned. During 1913 the Corean railways carried 4,143,803 passengers and 1,425,246 tons of freight, an increase of 1,695,075 passengers and 293,474 tons over 1912. A large railway hotel is being erected at Seoul.

* * *

The Journal des Transports, in making a study of the effects of syndicalism on French railway labor problems, has compiled the following table, giving the total number of employees on the various railways of France, with the number and percentage of those who are members of the National Railway Syndicate:

Railway	Number of syndicalists	Total number of employees	Percentage of syndicalists
State	8,783	73,127	9 per cent
Est	1,139	51,471	2.2 per cent
Midi	802	26,268	3.1 per cent
Nord	2,347	56,546	4 per cent
Orléans	1,083	49,600	2.2 per cent
Paris-Lyons-Mediterranean	2,349	86,124	2.7 per cent

It will be noted that both the number and the proportion of syndicalists are considerably greater on the State railway than on the lines of private ownership, but that even in this instance the proportion of syndicalists is far too small to exercise a controlling influence. It is stated, moreover, that the majority of the syndicalists are shop employees or newcomers to the service.

* * *

The first electrification of a steam railway within the polar zone has been practically completed by the Swedish government on the Kiruna-Riksgraensen section of the line from Lulea, Sweden, on the Gulf of Bothnia, across the Scandinavian peninsula, to Narvik, Norway, on the Atlantic ocean, 293 miles. Electrification was determined upon for the section from Kiruna, which is about 87 miles north of the Arctic circle, to Riksgraensen, on the border line between Sweden and Norway, a distance of 80 miles, for the purpose of increasing the capacity of the line in preference to double-tracking. Practically the only freight business is the transportation of iron ore, of which 3,000,000 tons was hauled in 1913 by steam. It was desired to increase the capacity to 5,000,000 tons a year and electricity was adopted to permit heavier trains and an average increase of about 25 per cent in speed. The large amount of available water power and the scarcity of coal were also important factors. The electrified line is through an uninhabited country where temperatures of from 25 to 35 deg. below zero are common in January and February. Although two years was allowed in the contract for completing the work the actual time available for work, on account of weather conditions, was only seven months. The power station is located at Porjus Falls, 74 miles south of Kiruna, and power is transmitted at 80,000 volts by a tower transmission line to four substations where the potential is stepped down to 15,000 volts for the contact trolley line. Electric locomotives hauling passenger trains of 200 metric tons and ore trains of 1,855 tons will be used, and the contract specifies speeds of 31 miles an hour over level track and 18.6 miles an hour on 1 per cent grades. The equipment will include 2 passenger and 13 freight locomotives.

* * *

It will be remembered that the railways of Great Britain are now being operated by the government under a board of control consisting of several general managers, headed by H. A. Walker of the London & South-Western, the latter being responsible to the government rather than to the directors and stockholders. The method of compensation for operation under this plan is shown by the following announcement issued by the Board of Trade:

"The Regulation of the Forces Act, 1871, under which His Majesty's Government have taken possession of most of the railroads of Great Britain, provides that full compensation shall be

paid to the owners of the railroads for any loss or injury they may have sustained thereby, the amount of such compensation to be settled by agreement, or, if necessary, by arbitration.

"His Majesty's Government have agreed with the railway companies concerned that, subject to the undermentioned condition, the compensation to be paid them shall be the sum by which the aggregate net receipts of their railways for the period during which the government are in possession of them fall short of the aggregate net receipts for the corresponding period of 1913. If, however, the net receipts of the companies for the first half of 1914 were less than the net receipts for the first half of 1913, the sum payable is to be reduced in the same proportion. This sum, together with the net receipts of the railway companies taken over, is to be distributed among those companies in proportion to the net receipts of each company during the period with which comparison is made.

"The compensation to be paid under this arrangement will cover all special services, such as those in connection with military and naval transport, rendered to the government by the railway companies concerned, and it will therefore be unnecessary to make any payments in respect of such transport on the railways taken over."

The Statist, of London, a leading authority, is under the impression "that the net earnings guaranteed to the railways by the government during the time the railways are worked by the state will not be much less than were the net earnings in 1913, and that, consequently, railway shareholders will not suffer any serious loss of dividend."

HOW CAN ENGINEERS BEST UTILIZE THE TECHNICAL JOURNALS?*

By John W. Alvord
Consulting Engineer, Chicago

That we cannot keep abreast of the times without reading the engineering journals is obvious. That if we carefully read all the engineering journals in our chosen specialty we shall have no time left to earn a living is easily capable of demonstration. What, then, is the proper attitude to adopt toward this ever increasing flood of information that pours in upon us so relentlessly? It we look about to see how our fellow engineers solve this matter we shall find a great variety of attitudes toward the problem. Some engineers simply do not take engineering journals, reading one occasionally here and there as opportunity offers. Others take all they can afford and let them pile up around the office, often unopened, and unused. Others still limit themselves to a select few, which they carefully bind and shelve. Still others read journals when they can, and throw them away when they move on.

The problem of the engineer with his technical paper is much affected by his age, station, and aim in life. To the man who is engineering only to get money and more money, the engineering journal is a newspaper, in which he may notice mainly where there are better jobs than his own that may be sought after and perhaps obtained. To the man who is anxious to fit himself for something better, it is an opportunity for a great variety of study. To the young engineer the engineering journal, properly read and noted, is a part of a post-graduate course in engineering. To the middle-aged man, it is a mine of data, bearing in all sorts of ways on his work. To the mature specialist only does it begin to become burdensome by its repetition of experience and its volume of matter on subjects which have already, to him at least, been well digested.

The young engineer and the college graduate need, most of all, practical experience. It is safe to say that engineering literature will never have any proper perspective for him until he has been connected in some capacity with engineering work himself, be it in ever so modest a capacity. With the actual doing of engineering work, however, should come contemporaneously the reading of technical journals, particularly along the lines in which he is working. Nothing can be more instructive, broadening and enlightening to a man doing a particular kind of work than reading about similar work at the same time. It follows, therefore, that the young engineer should, as early as possible, take at least one good, first-class engineering journal, and own it himself; bind it, if he can afford to, but lay it away in an orderly manner, in any event. If he can afford two journals so much the better, especially if they are selected so as to widen his outlook.

In the matter of indexing for the young engineer, much must be left to the judgment and taste of the individual. The engineering indexes are very complete and useful in these modern days. The mind itself is a wonderful indexer. It is safe to say that the average intelligent man reading an article which impresses him as useful and valuable can, without effort, remember for many years after the name of the journal and the approximate year in which the article appeared.

It is probably not wise for the young engineer to indulge extensively in card indexes and filing systems for topically arranging his available engineering journal articles. Few men know very early in life where fate and interest will land their future attention. Filing systems and special indexes are expensive and time consuming, and when indulged in without definite aim nearly always quickly become too voluminous and thereby useless.

If any suggestions are made along this line, it would be to start a loose leaf letter size (8½ in. x 11 in. page) notebook, and note in it, with separate pages for separate subjects, only what appears to be extremely useful, either in exceedingly brief abstracts from engineering articles or diagrams, costs, etc. These notes will be most useful if they are confined to that kind of work in which the compiler is immediately engaged, and has on his mind at the time, or at the most, work very similar to his own, which has perhaps had his personal inspection.

To the man in early middle life, actively engaged in his profession, the problem with the technical journal is the lack of time. Absorbed in a multitude of responsibilities, how shall he derive any useful good from the multitude of journals which his more ample income can readily afford, but which pile high on his table after every brief absence from the office. The average editor can judge of a technical article with only a brief inspection. The working engineer who has had some experience with technical literature can form the same habit, and save much time.

Much light is thrown on engineering literature by personal or general acquaintance with the author. One can more fully appreciate what an author says when he knows fairly well what the author's experience has been. All men have their high strong ground, their less trodden side slopes, and their twilight zone of knowledge, and they should not be blindly accepted as authority in all of the fields in which they sometimes venture an opinion.

What shall the engineer do with his special selection of material when once he thinks he has separated it from the flood of raw material? Several courses are open to him: He may rely on his memory and the published index to his bound volumes. It is safe to say, however, that few engineers really make much practical use of this method. He may keep a special card index of important data and reference to valuable articles. This at once involves labor and attention, which few busy men can give, and which, if done by assistants or librarians, largely loses its personal value to the one who needs it. He may abstract important data in a limited way on loose leaf transparent paper, standard letter size, and he may remove or detach articles of special value from his journals, to be filed in regular office file system, like correspondence.

The writer has tried all of the above methods at considerable cost in time and patience, and has, for many years, settled upon the third method outlined. With all its admitted limitations it seems to be the best for an office which is expected to find out information on a great variety of subjects in a limited time and with the least amount of effort.

*Abstract of a paper presented before the ninth annual convention of the Federation of Trade Press Associations, Chicago, September 25, 1914.

General News Department

The Canadian Pacific announces that within the next two months 6,000 extra men will be employed by the company, the object being to relieve distress brought about by the war in Europe.

The White Audit System of checking passenger fares was adopted on October 1 by the Florida East Coast, the Louisville & Nashville, the Nashville, Chattanooga & St. Louis and the Mississippi Central.

On account of decreased passenger revenues due apparently to uncertainties occasioned by the European war, the Southern Railway has temporarily reduced the number of ticket collectors employed on its passenger trains.

It is reported from Mexico that the constitutional government, now in control of most of the railways of the country, has announced that none of the official positions are to be filled by Americans. Most of the American employees and officers have already been replaced by Mexicans.

In the federal court at Birmingham, Ala., September 22, the Alabama Great Southern was fined $300 for violation of the Safety Appliance law, and the Central of Georgia $100 for a similar offense. At Louisville, Ky., on the 25th, the Illinois Central pleaded guilty in three cases of the same kind and was fined $300. Both of these courts also imposed heavy prison sentences, under the federal law, for stealing from freight cars.

Vice-President W. R. Scott of the Southern Pacific has issued, through the division superintendents, an appeal to all employees of the company, especially train and yard crews, for the benefit of passengers in sleeping cars. He asks them to increase their efforts to eliminate all unnecessary nocturnal noises, and furthermore, calls for suggestions for improvement of the service in this regard. He wants renewed attention given to the problem of doing away with the clanging of bells, tooting of whistles, hissing and sputtering of locomotives and shouting of trainmen in the vicinity of sleeping cars.

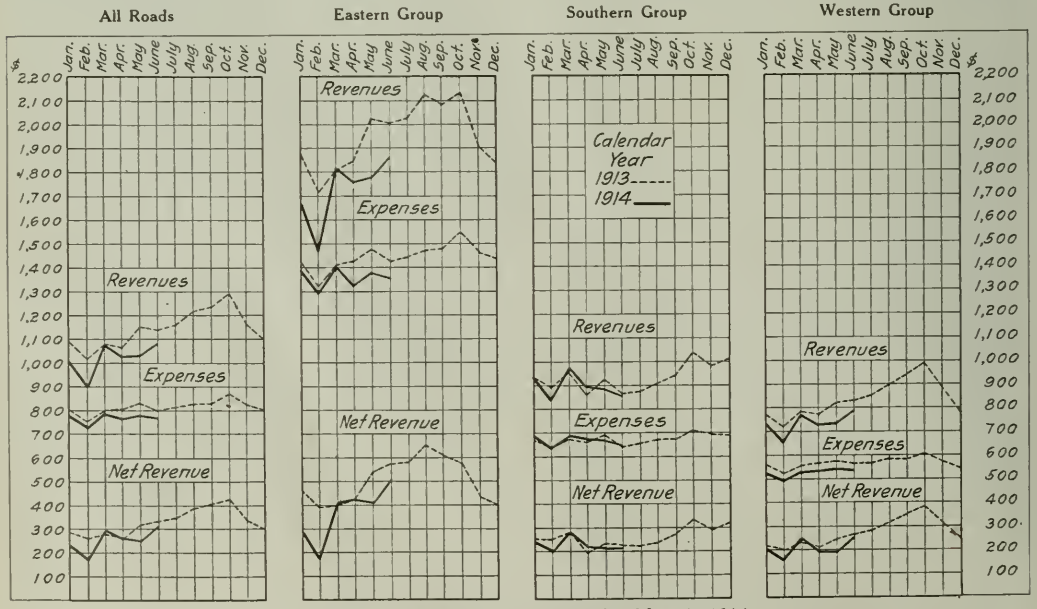
A recent statement issued by the New York Public Service Commission, First district, reports that the total number of tickets sold for passage in the Broadway and Lenox avenue subways operated by the Interborough Rapid Transit Company during the year ended June 30, 1914, was 340,413,103, an increase for the year of 12,941,593. As the commission treats Sundays as half days, the daily average for the first time in the history of the subway exceeds 1,000,000 passengers, the average having been 1,001,215. The daily average for the previous year was 963,152.

Representative Rupley, of Pennsylvania, introduced on Wednesday a bill to amend the interstate commerce law, providing that after the physical valuation of the railroads has been completed by the Interstate Commerce Commission the government may buy such lines at the price set as the actual value of the roads as may in the opinion of the commission be desirable, and that if at the expiration of 90 days from the offer to the railways the companies decline to sell, the government may enter the open market to buy such securities as may be necessary to obtain control. The price to be paid, however, must not exceed that set by the physical valuation. An initial appropriation of $250,000,000 is to be provided by a bond issue.

Summary of Revenue and Expenses of Steam Roads

The Bureau of Railway Economics' summary of revenues and expenses and comments thereon for June, 1914, are as follows:

Railways operating 226,224 miles of line are covered by this summary, or about ninety per cent. of all steam railway mileage in the United States. Their operating revenues for the month of June, 1914, amounted to $244,123,428. This amount includes revenues from freight and passenger traffic, from carrying mail and express, and from miscellaneous sources connected with rail operation. Compared with June, 1913, total operating revenues show a decrease of $10,309,159. Total operating revenues per mile averaged $1,079 in June, 1914, and $1,135 in June, 1913, a



Monthly Revenues and Expenses per Mile of Line in 1914

decrease of $56, or 5.0 per cent. There was a decrease of 5.7 per cent in freight revenue per mile, and a decrease of 4.7 per cent in passenger revenue per mile.

Operating expenses, which include all the costs of maintaining track and equipment, operating trains, securing traffic, and of administration, amounted to $173,747,857. This was $5,728,228 less than for June, 1913. These operating expenses per mile of line averaged $768 in June, 1914, and $801 in June, 1913, a decrease of $33 per mile, or 4.1 per cent.

Net operating revenue, that is, total operating revenues less operating expenses, amounted to $70,375,571, which was $4,580,931 less than for June, 1913. Net operating revenue per mile of line averaged $311 in June, 1914, and $334 in June, 1913, a decrease of $23 per mile, or 7.0 per cent.

Taxes for the month of June amounted to $12,333,210, or $55 per mile, an increase of 9.3 per cent. over June, 1913.

Operating income, which is net revenue from rail and auxiliary operations, less taxes, averaged $256 per mile of line, and in June, 1913, $284, tbus decreasing $28, or 9.8 per cent. Operating income for each mile of line for each day in June averaged $8.54, and for June, 1913, $9.47. Operating income is that proportion of their operating receipts which remains available to the railways for rentals, interest on bonds, appropriations for betterments, improvements, new construction, and for dividends.

The operating ratio for June, that is, the per cent of total operating revenues absorbed in operating expenses, was 71.2 per cent, which is comparable with 70.5 per cent in June, 1913, and 68.5 per cent in June, 1912.

The railways of the eastern district show a decrease in total operating revenues per mile of line as compared with June, 1913, of 6.9 per cent, the railways of the southern district a decrease of 0.2 per cent, and the railways of the western district a decrease of 3.9 per cent. Operating expenses per mile decreased 5.1 per cent in the East, increased 1.3 per cent in the South, and decreased 4.4 per cent in the West. Net operating revenue per mile decreased 11.5 per cent in the East, decreased 4.5 per cent in the South, and decreased 2.7 per cent in the West. Taxes per mile show a decrease of 4.6 per cent in the East, an increase of 41.6 per cent in the South, and an increase of 13.4 per cent in the West. Operating income per mile decreased 12.0 per cent in the East, decreased 14.1 per cent in the South, and decreased 5.9 per cent in the West.

When the returns for the six months of the calendar year 1914 are compared with those of the corresponding months of 1913 they show a decrease in total operating revenues per mile of 6.4 per cent, a decrease in operating expenses per mile of 4.0 per cent, and a decrease in net operating revenue per mile of 13.1 per cent. This net operating revenue per mile decreased 21.1 per cent. in the East, as compared with the corresponding period of the previous year, decreased 4.2 per cent in the South, and decreased 8.3 per cent in the West.

The following table shows the per cent of operating revenues consumed by each class of expenses:

Per Cent of Total Operating Revenues

	June		Fiscal year ending June 30		
	1914	1913	1914	1913	1912
Freight revenue	67.2	67.7	68.9	69.8	68.7
Passenger revenue	23.9	23.8	22.8	22.2	23.2
Other transportation	7.5	7.3	7.1	6.9	7.1
Non-transportation	1.4	1.2	1.2	1.1	1.0
Maintenance of way and structures	15.6	14.9	13.6	13.3	12.7
Maintenance of equipment	16 6	16.2	17.5	16.4	15.9
Traffic expenses	2.2	2.2	2.1	2.0	2.1
Transportation expenses	33.9	34.4	36.2	35.2	35.9
General expenses	2.9	2.8	2.6	2.4	2.5
Total operating expenses (excluding outside operations and taxes)	71.2	70.5	72.0	69.3	69.1

Fire Prevention on the Mobile & Ohio

General Manager R. V. Taylor of the Mobile & Ohio has set aside Friday, October 9, as "Fire Prevention Day" on that road. The purpose of this day is to make a fall clean-up of premises before the setting in of winter. All concerned are instructed to observe the day in the following manner:

Remove rubbish, grass and all other inflammable material from under and around buildings, platforms and bad order cars.

Give the interior of all buildings a thorough house cleaning.

Examine carefully fire apparatus, hydrants, hose, couplings, water barrels, buckets, etc., to insure efficient service in case of emergency.

Inspect stoves, stove pipes and flues and remedy all defects.

Remove birds' nests from eaves of buildings to prevent engine spark fires.

Remove accumulation of old straw, hay, etc., from stock yards and pens.

Provide metal boxes for storage of matches.

Post "No Smoking" signs, as called for in Insurance Rule No. 5.

Thoroughly clean out all bunk cars.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

American Association of Demurrage Officers.—A. G. Thomason, Demurrage Commissioner, Boston, Mass. Annual convention in April.

American Association of Dining Car Superintendents.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next convention, October 22-24, Washington, D. C.

American Association of Freight Agents.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 21-24, 1915, Richmond, Va.

American Association of General Passenger and Ticket Agents.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.

American Association of Railroad Superintendents.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next meeting, May 20-21, 1915, San Francisco, Cal.

American Electric Railway Association.—E. B. Burritt, 29 W. 39th St., New York. Annual convention, October 12-16, Atlantic City, N. J.

American Electric Railway Manufacturers' Association.—H. G. McConnaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

American Railway Association.—W. F. Allen, 75 Church St., New York. Semi-annual meeting, November 18, Chicago.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 20-22, 1914, Los Angeles, Cal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1915.

American Railway Safety Association.—L. F. Shedd, C. R. I. & P., Chicago. Next meeting, November, Chicago.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga. Annual meeting, July, 1915.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except, June, July and August, 220 W. 57th St., New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 1-4, 1914, New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Atlanta, Ga.

Association of Manufacturers of Chilled Car Wheels.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Annual meeting, second Tuesday in October, New York.

Association of Railway Claim Agents.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, 3d week in May, 1915, Galveston, Tex.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual convention, October 26-30, 1914, Chicago.

Association of Railway Telegraph Superintendents.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 22-25, 1915, Rochester, N. Y.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York. Next meeting, December 8-9, 1914, Richmond, Va.

Bridge and Building Supply Men's Association.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

Freight Claim Association.—Warren P. Taylor, R. F. & P., Richmond, Va. Annual meeting, June 16, 1915, Chicago.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

International Railway Congress.—Executive Committee, 11, Rue de Louvain, Brussels, Belgium. Next convention, June 23 to July 6, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 W. Broadway, Winona, Minn. Next convention, July 14-17, 1915, Sherman House, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, C. H. & D., Lima, Ohio.

Maintenance of Way and Master Painters' Association of the United States and Canada.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next convention, November 17-19, 1914, Detroit, Mich.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May, 1915.

Master Car and Locomotive Painters' Association of the United States and Canada.—A. P. Dane, B. & M., Reading, Mass.

Master Car Builders' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1915.

National Railway Appliances Association.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railroad Master Tinners, Coppersmiths and Pipefitters' Association.—U. G. Thompson, C. & E. I., Danville, Ill. Annual meeting, May, 1915.

Railway Business Association.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December 10, 1914, Waldorf-Astoria Hotel, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Railway Electrical Supply Manufacturers' Association.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

Railway Fire Protection Association.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Annual meeting, October 6-7, 1914, Hotel Raleigh, Washington, D. C.

Railway Signal Association.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa.

Railway Storekeepers' Association.—J. P. Murphy, L. S. & M. S., Box C, Collinwood, Ohio. Annual meeting, May, 1915.

Railway Supply Manufacturers' Association.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders and Master Mechanics Associations.

Railway Telegraph and Telephone Appliance Association.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake City Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Signal Appliance Association.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

Society of Railway Financial Officers.—Carl Nyquist, C. R. I. & P., La Salle St. Sta., Chicago.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. Ry., Atlanta Ga.

Southern and Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7122 Stewart Ave., Chicago. Annual meeting June 15, 1915, Minneapolis, Minn.

Transportation Club of Detroit.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

The Western Classification Committee has announced hearings at its office in Chicago on October 8, 9 and 13.

Illinois roads have announced the cancellation of tariffs filed last year with the Illinois railroad commission providing for an advance of 1 cent per 100 lb. in grain rates. The advance was suspended by the old commission and again by the new Illinois Public Utilities Commission.

According to advices received by the Canadian Pacific, 21,195,857 bushels of wheat had been marketed on all lines west of Winnipeg to September 16, as against 9,445,400 bushels on the same date last year, showing an increase of 11,750,457 bushels. Western Canadian farmers have already received approximately $20,000,000 for this, or about $14,000,000 more than the amount realized last year at the same date.

The Southern Pacific has issued a new lumber tariff naming through rates by way of the Northern Pacific and Southern Pacific from points in Washington on the Portland-Tacoma line and the Gray's Harbor and Willapa Harbor lines to points in California, Nevada and New Mexico. This places the Northern Pacific points on the same basis as those on the Oregon-Washington Railroad & Navigation Company and makes an important reduction below the former combination of local rates.

Car Surpluses and Shortages

Arthur Hale, chairman of the committee on relations between railroads of the American Railway Association, in presenting statistical bulletin No. 175-A, giving a summary of car surpluses and shortages by groups from May 15, 1913, to September 15, 1914, says:

The total surplus on September 15, 1914, was 138,108 cars; on September 1, 1914, 165,244 cars, and on September 15, 1913, 61,753 cars.

The surplus reported for this period totals 138,108 cars, a decrease of 27,136 cars since September 1.

Box car surplus decreased approximately 19,000; this decrease is practically all in states west of the Mississippi river and in Canada.

There is also a heavy reduction in coal cars in the eastern states (group 2), where the surplus is reduced more than one-half.

The total shortage on September 15, 1914, was 2,059 cars; on

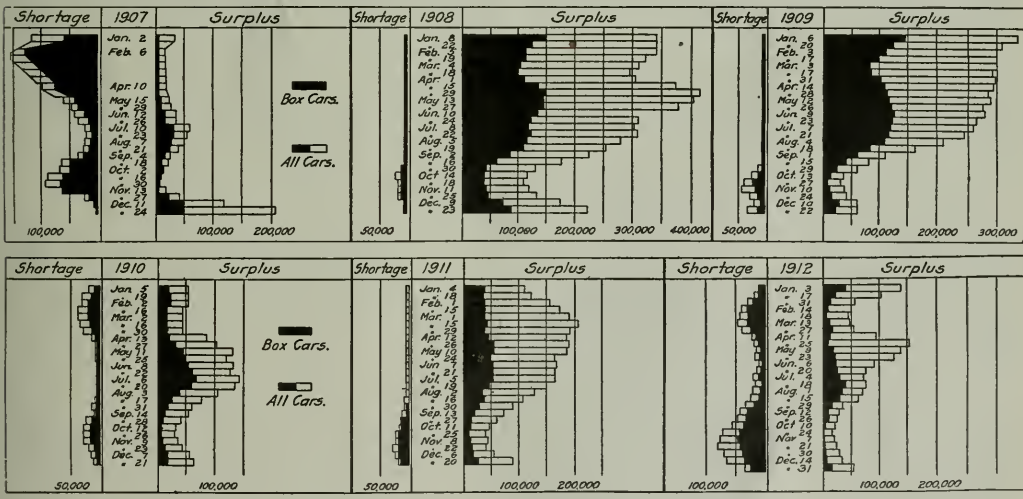
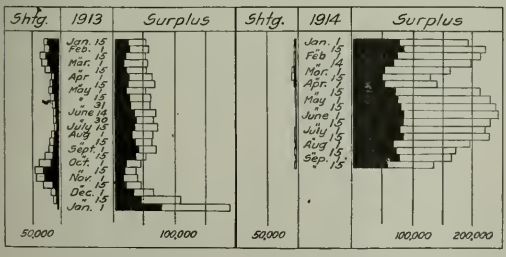
*Group 1 is composed of New England lines; Group 2—New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania lines; Group 3—Ohio, Indiana, Michigan and Western Pennsylvania lines; Group 4—West Virginia, Virginia, North and South Carolina lines; Group 5—Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida lines; Group 6—Iowa, Illinois, Wisconsin and Minnesota lines; Group 7—Montana, Wyoming, Nebraska, North Dakota and South Dakota lines; Group 8—Kansas, Colorado, Missouri, Arkansas and Oklahoma lines; Group 9—Texas, Louisiana and New Mexico lines; Group 10—Washington, Oregon, Idaho, California, Nevada and Arizona lines; Group 11—Canadian lines.





Car Surpluses and Shortages, 1907 to 1914

September 1, 1914, 1,918 cars, and on September 15, 1913, 21,594 cars. A very slight increase is noticeable in the shortage.

The table on the previous page gives car surplus and shortage figures by groups for the last period covered in the report, and the diagram shows total bi-weekly surpluses and shortages from 1907 to 1914.

Commercial Travelers Protest Increased Mileage Rate

The Illinois Commercial Men's Association is sending out a letter to 100,000 commercial travelers protesting against the action of the eastern railways in advancing the rates for mileage books to 2¼ cents a mile. The letter says: "This is a direct slap at the commercial traveler and should not be submitted to without a good, hard fight. They are striking at your bread and butter, at your very existence, and it is time we rose en masse and showed them what it means to get 500,000 live wires after them." With the letter is enclosed a form of a protest to the Interstate Commerce Commission, which the recipients are asked to fill out and mail immediately so that all the letters will reach the commission about the same time. It is suggested, however, that it would be best to write individual letters, and also to write to United States senators and representatives. The form letter to the commission says: "If this increase is permitted the burden will fall almost entirely upon the shoulders of the commercial traveler, because it is only the commercial traveler who uses the mileage book, and I do not believe that your honorable body will sanction the railroads doing an act which will place this unjustifiable burden upon it. It may be true that the railroads would be justified in increasing the rate on single trip tickets or round trip tickets in certain localities, but mileage books containing 1,000, 2,000 or more miles, should be sold at the price they are now selling at, and have sold at for more than 35 years. The commercial traveler is entitled to be designated the advance agent of business, and just now what this country needs more than anything else is more business." The letter states also that if such an increase is granted it is not the manufacturer or jobber who will pay it, but the commercial traveler.

Car Location

The accompanying table, which was taken from bulletin No. 22 of the American Railway Association, gives a summary of freight car location by groups on September 1, 1914:

*Denotes deficiency.

The San Francisco Fair.—The traffic department of the Panama-Pacific International Exposition has received word from eastern freight forwarding agents that the interruption of transatlantic travel caused by the European war will not interfere with the shipment from Holland of the hundreds of thousands of bulbs for the exposition gardens. Orders for the bulbs in great quantities were placed with Dutch nurserymen by the landscape department of the exposition. As the tulips, iris and other flowers included in the order will form an essential part of the landscape decoration considerable apprehension was felt over the possibility that Holland growers would be unable to export the bulbs. The shipment will be the largest of the kind ever received in this country.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The Omaha Grain Exchange has filed a complaint with the commission asking a reduction in the rates on wheat and corn to Omaha, South Omaha and Council Bluffs.

The National Industrial Traffic League has protested to the Interstate Commerce Commission against reopening the California switching cases, as asked recently by the California roads.

The commission has suspended from October 1 to January 1 tariffs of the Atchison, Topeka & Santa Fe and other western railroads proposing to withdraw the concentration rates on eggs, butter and poultry at Omaha, Neb., and other western points.

The Nebraska Railroad Commission has filed a complaint with the Interstate Commerce Commission asking a readjustment and reduction of rates on wheat and corn from Nebraska and other middle western points to St. Joseph and Kansas City, Mo., and Atchison and Topeka, Kan.

The commission has announced that a hearing will be held in Chicago on January 20, 1915, for the purpose of inquiring into the question of embargoes, the conditions under which they are established and the manner in which notice is given, it having been alleged that certain coal roads have established embargoes which resulted in discrimination against certain shippers.

Western railways are filing with the commission supplements to their demurrage tariffs imposing higher rates on refrigerator cars, when used for perishable freight shipments, effective on October 15. The proposed charge is $2 per car for each of the first two days after free time and $3 per day for each succeeding day. It was recommended by the American Railway Association.

The commission has entered a long and short haul order affecting the class and commodity rates of New York, Philadelphia, Baltimore and related points to Norfolk, Port Norfolk, Pinners Point, Portsmouth and Old Point, Va., granting the carriers authority to continue charging lower rates to the Virginia cities named than to intermediate points; but it is directed that on and after December 1, the rates to the Virginia cities shall not be any lower than the rates from the northern points north of Cape Charles, Va.

A hearing will be held at Reno, Nev., on October 23, on the complaint of the Nevada Railroad Commission against tariffs filed some time ago by the western railways requiring the payment of two full fares for passengers having the exclusive use of a drawing room and one and one-half fares for a compartment. The Canadian railway commission has recently sustained a complaint against a similar tariff filed by the Canadian roads, sug-

gesting as a compromise that drawing rooms and compartments may be reserved for two or more persons, but that no extra charge be made for one person if the compartment or drawing room would otherwise be vacant.

STATE COMMISSIONS

The California Railroad Commission has ordered a hearing on November 30 in its investigation of the rates, practices and regulations of the Pullman Company.

The Idaho Public Utilities Commission has granted the application of the Pacific Northwest Demurrage Bureau for permission to increase demurrage charges on refrigerator cars.

The Tennessee Railroad Commission is taking measures to compel the Illinois Central to reduce all passenger fares in that state to the basis of 2½ cents a mile. All of the other principal roads in the state have complied with the wishes of the authorities by making reductions to this basis. The Illinois Central is expected to contest in the courts the order issued, or to be issued, by the commission.

The New Hampshire Public Service Commission, in refusing the request of the Boston & Maine and the Grand Trunk for approval of a proposed increase in mileage ticket rates in that state from 2 to 2¼ cents a mile, quotes the statute which requires the issuance of 500-mile tickets at a rate of two cents a mile, and holds that "we should not enter upon a long and expensive hearing to determine whether the rate fixed is compensatory until it has been determined by the Supreme Court that it is our duty to do so."

The Railroad Commission of Louisiana has issued an order that no regular freight or passenger station, or flag station, shall be closed or discontinued by any railroad operating in the state without the consent of the railroad commission, except for causes beyond control of the railroad. No railroad telegraph office shall be closed, abandoned or discontinued without the consent of the commission, except for causes beyond control. In case any station or telegraph office is closed for causes beyond the control of the railroad, a full report of the causes shall be made to the commission immediately and arrangement to reopen it must be made within 15 days. The commission has also ordered that wherever through trains are operated in the state through tickets shall be sold from any agency station to any agency station at which the train stops. When passenger trains are scheduled to make connections at junction points with trains of other railroads through tickets shall be sold between points on the different railroads.

PERSONNEL OF COMMISSIONS

R. F. Peters, mechanical engineer of the San Antonio & Aransas Pass, has been appointed senior mechanical engineer, division of valuation, of the Interstate Commerce Commission, with headquarters at Kansas City, Mo.

COURT NEWS

The Southern Pacific was fined $100,000 in the United States District Court at Los Angeles on September 21, on a charge of rebating in offering a Redlands, Cal., orange growers' association preferential rates from St. Louis to Chicago.

The attorney general of Missouri has filed a suit in the state court at Jefferson City to enforce a statute requiring the railroads to transport the Missouri National Guards at a flat rate of one cent a mile. The railroads are contending that the statute in question was repealed by implication by the act creating the commission and empowering the state railroad commission to fix just reasonable rates.

French Train Services Resumed.—It is reported from Paris that the Northern railways are about to resume their train services to places previously occupied by Germans. On the Northern line trains which already travel to Plerrifitte, Pontoise, Argenteuil, and Sevran-Livry will soon be run as far as Chantilly, Crecy in Valois, and Dammartin. On the Eastern line trains go to Lagny. On the Belfort line the service is normal.

Railway Officers

Executive, Financial, Legal and Accounting

L. A. Farquhar has been appointed auditor of the Norfolk Southern, with office at Norfolk, Va., succeeding W. L. Bird, resigned.

J. R. McCoy has been appointed assistant auditor for the receivers of the Denver, Laramie & Northwestern, with office at Denver, Colo.

W. C. Bowhay has been appointed freight claim agent of the Cincinnati, Hamilton & Dayton, with office at Cincinnati, Ohio, succeeding B. M. Waldron, resigned to accept service with the Baltimore & Ohio.

H. L. Utter, assistant secretary and assistant treasurer of the Missouri Pacific at New York, has been elected secretary and treasurer, with headquarters at New York, and S. N. Rice, assistant to Mr. Utter, has been appointed assistant secretary and assistant treasurer, with headquarters in New York, succeeding Mr. Utter.

J. A. D. Vickers, who has recently been acting vice-president and general manager of the American Express Company, at Chicago, has been elected vice-president and general manager, succeeding George C. Taylor, who recently was elected president. Mr. Vickers was until recently general manager of the National Express Company.

Thomas Hackney, of the firm of Thomas & Hackney, of Carthage, Mo., has been appointed general attorney for the Missouri Pacific and the St. Louis, Iron Mountain & Southern for Jackson County, Mo., with headquarters at Kansas City, Mo. The firm has represented the system at Carthage since 1903. Thomas L. Phillips, assistant to the general solicitor, has been appointed valuation attorney, with headquarters at St. Louis.

Operating

F. J. McKee has been appointed superintendent of the Port Huron, Mich., terminals of the Grand Trunk, succeeding J. F. Jones, resigned, on account of ill-health.

George A. Hoag, whose appointment as superintendent of car service of the Canadian Northern, Eastern lines, with headquarters at Toronto, Ont., has already been announced in these columns, was born on May 31, 1866. He was educated in the Kingston public schools and at the Kingston Business College. On June 8, 1884, he began railway work as a switchman on the Grand Trunk, serving in the same capacity at various places until May 3, 1886, when he was appointed night operator. He remained in that position until January, 1888, and then was promoted to day operator and relief agent. In 1899 he was appointed agent at Trenton, Ont., and from 1901 to 1905 he was yardmaster at Belleville. He then entered the service of the Central Ontario, a Canadian Northern line, and from October, 1905, to March, 1908, was trainmaster on that road. He was promoted to superintendent on March 1, 1908, and in July, 1914, was appointed superintendent of car service of the Canadian Northern, Eastern lines, as above noted.

G. A. Hoag

T. F. McCarthy, general yardmaster of the Lehigh Valley at Jersey City, N. J., has been appointed trainmaster, with office at Jersey City, succeeding M. A. Mulligan, promoted.

George P. Johnson, general manager of the Chesapeake & Ohio, at Richmond, Va., has resigned, and at present no successor will be appointed, the work being divided among other officers.

H. C. Grout, assistant general superintendent of the Canadian Pacific at St. John, N. B., has been appointed general superintendent of the Atlantic division, with headquarters at St. John, succeeding William Downie, retired.

Traffic

W. S. Smith, traveling freight agent of the Frisco Lines at Houston, Tex., has been appointed assistant general freight agent of the St. Louis, Brownsville & Mexico, at Kingsville, Tex.

Claude P. Wilson, commercial agent of the Missouri, Oklahoma & Gulf at Houston, Tex., has been appointed general agent at Dallas, Tex., succeeding F. S. Sleight, resigned on account of ill health.

W. T. Webster, division freight agent of the Chicago, Indianapolis & Louisville at Bedford, Ind., has been appointed general freight agent, with office at Chicago, succeeding O. C. Carter, resigned.

F. R. Darby, traveling passenger agent of the Western Maryland, at Cumberland, Md., has been promoted to the new position of district passenger agent, with headquarters at Pittsburgh, Pa., and William E. Zirckel has been appointed traveling freight agent, with headquarters at Cleveland, Ohio.

Engineering and Rolling Stock

George Strasding has been appointed roadmaster of the Pasco division of the Northern Pacific, at North Yakima, Wash.

O. E. Shaw has been appointed general car foreman of the Chicago & Eastern Illinois at Danville, Ill., succeeding Harry G. Love, resigned.

W. H. Snyder, whose appointment as master mechanic of the Erie, with headquarters at Stroudsburg, Pa., has been announced in these columns, was born on July 14, 1874, at Ashley, Luzerne county, Pa. He began railway work on March 18, 1894, as machinist apprentice in the Central of New Jersey shops at Ashley, remaining with that road until July, 1901, when he went to Stroudsburg as a machinist in the Erie shops. In October, 1903, he was promoted to tool room foreman, and in November, 1905, was appointed assistant to general foreman. He remained in that position until January, 1912, when he was promoted to general foreman, which position he held at the time of his appointment on September 1, as master mechanic of the same road, as above noted.

OBITUARY

George L. Rhodes, formerly assistant general passenger agent of the Chicago, Rock Island & Pacific, died on September 23 at his residence in Chicago, aged 65 years.

E. B. Gilbert, formerly superintendent of motive power of the Bessemer & Lake Erie, died at his home in Greenville, Pa., on September 7. Mr. Gilbert was born at Windsor, N. Y., on December 13, 1843. He took up the trade of machinist, and later was employed on the Erie Railroad, both at Youngstown, Ohio, and at Galion, in the latter place holding the position of foreman. He went to Greenville about 28 years ago, and entered the service of the Pittsburg, Shenango & Lake Erie, now the Bessemer & Lake Erie. He was promoted from machinist foreman to master mechanic, and later to superintendent of motive power, which position he held until his resignation in 1909.

An English Employee's Revenge.—On September 10 in a London court a foreman on the London, Brighton & South Coast was sentenced to 12 months' imprisonment for having cut electric wires connected with signaling apparatus on his railroad. The prisoner declared that his motive was revenge on the company for not allowing him to work overtime.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Nashville, Chattanooga & St. Louis is considering the purchase of 10 Mikado and 7 Pacific type locomotives.

CAR BUILDING

The hearing on the application of the receivers of the Cincinnati, Hamilton & Dayton, for authority to issue certificates for purchase of additional equipment as mentioned recently in the *Railway Age Gazette* has been indefinitely postponed. This action was taken in view of the financial situation, the receivers believing that too high a rate of interest would have to be paid at this time.

IRON AND STEEL

The Denver Union Terminal has ordered 703 tons of steel for a new Union station at Denver, Colo., from the American Bridge Company.

The Chicago & Western Indiana has ordered 465 tons of material for a bridge over Little Calumet river, near Dalton, Ill., from the American Bridge Company.

Pass Privileges for Wives of Enlisted English Railwaymen.—The various railway companies of England have announced that they will continue to grant passes and privilege tickets to the wives and families of Reservists or Territorials who have been called out from the service to join the colors, exactly as though the men were still in railway employ.

British Locomotive Exports Decline Because of War.—The value of locomotives exported from the United Kingdom in August decreased sharply as compared with like business for previous months. The value of the engines shipped was $1,019,760, as compared with $1,460,335 in August, 1913, and $559,568 for August, 1912. Depression in Argentina has greatly reduced the demand for British locomotives in that quarter and engines to the value of only $44,100 were shipped in August as compared with $436,650 and $106,456. There was a good demand for British locomotives in Australia in August, but the value of the engines despatched to India during the month declined to $241,360 as compared with $483,089 in August, 1913. The aggregate value of the locomotives exported during the first eight months of the present year, on the other hand, was $12,811,702 as compared with $8,672,823 in the first eight months of 1913 and $6,427,750 in the first eight months of 1912.

Trespassing Reduced to a Science.—When a locomotive makes its first trip along the rails in an out-of-the-way place the natives look upon it with awe. The Chinese, for example, would not allow the "fire devil" to move until Li Hung Chang mounted beside the driver. After a while, on the other hand, this feeling of dread is changed to one of overwhelming confidence, especially on the part of men employed on the line and of people living close to it. The familiarity thus engendered leads to most of the fatalities among maintenance of way employees, trespassers, people at grade crossings and others walking along the line. It is said that in India the right of way is a favorite resting place of cowherds in particular and that the space between the rails has been proved many times to be quite safe to lie down in. When women and children are employed to unload ballast from a train they are fond of sleeping with their heads on the rails during the dinner hour, and it is necessary to walk along the train and awake them before it is moved in order to avoid wholesale decapitation. A recent incident occurred on the Eastern Bengal State Railway in which three natives engaged in maintenance of way work who had been set to watch the line by which the governor was to travel laid their ears on the rails, the better to hear the approaching train, went to sleep and were run over.

Supply Trade News

F. J. O'Brien has been appointed general sales agent of the Globe Seamless Steel Tubes Company, Chicago, effective October 1.

The Chicago & Alton has contracted with the Hupp Automatic Exchange system for the installation of its mail exchange system on mail cars, and at 33 stations between Chicago and St. Louis.

The Central Trust Company of Illinois has been appointed receiver of the Crawford Locomotive & Car Company at Streator, Ill. An involuntary petition in bankruptcy was filed against the company last week.

The Monarch Steel Castings Company, Detroit, Mich., announces the opening of an exhibit of Lion and Monarch couplers, Lion coupler pockets for locomotives and Lion cast steel yokes in the office of H. F. Wardwell, their Chicago representative at 548 Railway Exchange, Chicago.

Wellington B. Lee will henceforth handle the Superior rail anchor for the Track Specialties Company, New York, in eastern territory. It is also announced that the Sargent Company, 1418 Fisher building, Chicago, will represent the Track Specialties Company in the Chicago district.

Al H. Hoffman, president of the Wimo Supply Company, 304 Oriental building, Seattle, Wash., the representative of the Indianapolis Switch & Frog Company, Springfield, Ohio, in Seattle and vicinity, has also been appointed to cover the territory formerly handled through representatives at Spokane and Portland.

The general sales offices of the Cambria Steel Company, now located at Johnstown, Pa., are to be removed within a few weeks to Philadelphia, it being the desire of the company to have the general sales offices and the executive offices in the same place. It is expected that not later than November 1 the entire sales offices will be located on the seventeenth floor of the Morris building in Philadelphia. It is also the intention of the company to establish sales offices in the near future in Rio de Janeiro, Brazil; Mexico City, Mexico; Buenos Aires, Argentina, and London, England. The company proposes to seek foreign trade vigorously, and in this the location of the sales offices in Philadelphia is expected to prove advantageous.

Ellis F. Muther, eastern sales manager of the Gisholt Machine Company, Madison, Wis., with headquarters in New York, has been appointed general sales manager of the company, with office at Madison. It is also announced that J. E. Brandt, hitherto representative in Philadelphia and vicinity, has become associated with the Swind Machinery Company, which has been appointed a Gisholt agency in that city. J. L. Osgood has been appointed exclusive agent in Buffalo and Rochester, N. Y. R. D. Heflin, formerly representative of the company in New England, has been placed in charge of the New York office, and will henceforth attend to the interests of Gisholt customers and users in the entire eastern territory.

TRADE PUBLICATIONS

Highway Crossing Signals.—The Hall Switch & Signal Company, New York, has issued a 16-page pamphlet, 6 in. x 9 in., describing, with illustrations, its "audible-visible" highway crossing signal. This signal is an enclosed disk, like the well known Hall block signal, with a bell added. By day a red disk, and by night a red light furnishes a warning for the automobilist, even if he be deaf. An interesting installation of this type of signal at a crossing on the Lehigh Valley was described in the *Railway Age Gazette*, June 19, last, page 1522. The Lehigh Valley has 47 crossings protected by these signals. The pamphlet calls attention to the fact that this signal is time-tested, the design of the apparatus being substantially the same as that which has proved eminently successful in block signals in all parts of the country for forty years.

Railway Construction

Alabama Great Southern.—A contract is reported let to H. C. Elkins, Baltimore, Md., for 11 miles of double-track work between Birmingham, Ala., and Mobile Junction. (August 14, p. 310.)

Bellingham & Northern.—A contract is reported let to Henry & McFee, Seattle, Wash., to build a three-mile extension from Bellingham, Wash., to Whatcome lake. This company is a subsidiary of the Chicago, Milwaukee & St. Paul, and operates 44 miles of railway from Bellingham, Wash., north to Sumas, thence southeast to Glacier.

Canadian Pacific.—The Railway Commission of Canada has authorized the Canadian Pacific to open for traffic a single track diversion of the Moose Jaw subdivision, from Indian Head, Sask., mileage 50 to Qu'Appelle, mileage 59.8; and new second track from mileage 59.8 to 67.7 near McLean, Sask.

Chicago, Milwaukee & St. Paul.—The report of this company for the year ended June 30, 1914, shows that construction work has been in active progress during the year on the second main track and grade reduction work on the Chicago and Council Bluffs division in Iowa, also on the Hastings and Dakota division, and it is expected to have the improvements finished and the new tracks open for operation before the coming winter between Green Island, Iowa, and Manilla, 270 miles. Work is now under way depressing the tracks on about three miles along the Hastings and Dakota division, in the city of Minneapolis, Minn., which will eliminate 37 grade crossings. About 35 per cent of the work has been completed, and it is expected that all the work will be finished early in 1916. The elevation of the tracks along the Bloomingdale road in the city of Chicago on 2.4 miles is under way, and when completed will eliminate 35 grade crossings. Elevation of tracks in the city of Milwaukee, Wis., is now under way on 1.4 miles, and is about 15 per cent completed; the work will be continued over a period of two years, and when finished this improvement will eliminate 14 grade crossings. Work was begun in February of this year on the elevation of tracks on the Chicago and Evanston division, from Montrose avenue to Howard avenue, Chicago, on 4.4 miles, and this work is now about 15 per cent completed. The work will extend over a period of three years, and will eliminate 36 grade crossings. Work on the extension from Crystal Falls, Mich., to Iron River is about finished, and the main line and connections with the various iron mines have been completed and are in operation. The line from Lewistown, Mont., to Great Falls, 137 miles, is also finished, and will be opened for operation in September. Construction of the Choteau line from Great Falls, Mont., to Agawam, 70 miles, has been temporarily suspended, and will not be completed before next season. The lines from Hilger, Mont., to Roy; from Roy Junction to Winifred; from Lewistown to Grass Range, and from Colorado Junction to Cliff Junction have been completed and are in operation. The line into Spokane, Wash., has been completed and is in operation, the C. M. & S. P. having entire ownership of the line from Plummer, Idaho, to Bell, Wash., 21 miles, and joint use with the Oregon-Washington Railroad & Navigation Company of that company's line from Bell to Spokane. In the city of Spokane the terminal tracks and buildings and freight house have been completed and are in operation. Work on the Newwood River line, a logging road extending 17 miles northwesterly from Merrill, Wis., was started in October, 1913, and up to June of this year the grading was completed on about 8 miles, and the track was laid on about 4 miles. The construction of the Snoqualmie tunnel, at the summit of the Cascade mountains, is nearing completion, the work being carried on from both portals, and it is expected that the tunnel will be open for traffic early in 1915. This improvement will provide a route 3.6 miles shorter than the existing line; it will also avoid all trouble caused by snow slides on the Coast division, and the heavy grades will be eliminated.

Chicago & North Western.—The report of this company for the year ending June 30, 1914, shows that work on the elevation

of the six main tracks on the Galena division in the village of River Forest, Ill., 0.6 miles and the construction of an elevated yard with a capacity for 300 cars is now under way, and it is expected that the improvements will be completed during 1914. At Milwaukee, Wis., the company has undertaken the elevation of the main tracks and certain yard tracks on the Wisconsin division on 1.04 miles and on the Madison division on 0.77 miles. In connection with the elevation of the existing tracks, provision has been made for the construction of two additional tracks on the Wisconsin division. These improvements include the construction of two subways on the Wisconsin division and two on the Madison division. The total miles of main, yard and side tracks to be elevated are equivalent to 14.81 miles of single track railway. Work is now under way on important revisions of grade between Nelson, Ill., and Peoria. During the year substantial progress has been made in the filling, and a protection crib has been completed in connection with the filling in and occupying with additional tracks, about ten acres of submerged lands east of the company's present holdings on the shore of Lake Michigan in Milwaukee, Wis. The Macoupin County Extension Railway, organized to build from a connection with the Macoupin County Railway near Benld, south about nine miles to coal fields under development in Macoupin and Madison counties, Illinois, was finished during the year from Benld to Staunton, 4.36 miles, and the Iowa Southern, organized to build from a connection with the C. & N. W., in Monroe county, Iowa, southwest for about 25 miles, was completed during the year from a connection with the C. & N. W., at Miami, Iowa, to the company's coal fields in Monroe county, 12.25 miles.

Chicago, St. Paul, Minneapolis & Omaha.—The report of this company for the year ended June 30, 1914, shows that during the year work was finished on the extension from Kaiser, Wis., to Park Falls, 5.99 miles, and the line is now in operation. Work on second track was also completed and is now in operation between Truax, Wis., and Northline, and on additional yards at Hazel Park and at Minneapolis, Minn. Filling for a new coach yard at Minneapolis, Minn., has been finished, and a new yard for the interchange of traffic between the Eastern and Northern divisions was constructed at Northline, Wis., containing 2.98 miles of track. The net increase in sidetracks and in yard tracks during the year was 12.01 miles.

Georgia Roads.—Plans are being made to build a line from Homer, Ga., northwest to Lula on the Southern Railway about 15 miles. In addition about 3 miles of sidings are to be constructed also a 40-ft. span bridge. Prices are now wanted by D. G. Zeigler & Sons, Lula, for supplying rails, switches, frogs, spikes, etc.

Kentucky Roads (Electric).—A franchise has been granted by the city of Middlesboro, Ky., to Godfrey Hunter to build about 5.5 miles of electric lines to connect Middlesboro with adjoining towns.

Lorain, Ashland & Southern.—An officer writes that in addition to the line in operation from Custaloga, Ohio, northwest to Ashland, 23 miles, a section of 24 miles on the extension building from Ashland north via Wellington to Lorain has been completed and was opened for business on September 5. A total of 67 miles of track has been laid, and it is expected that the remaining section to Lorain will be opened for business at an early date.

Louisville & Nashville.—This company is securing rights of way, it is said, for building an extension from the line now ending at Cartersville, Ga., southeast to a connection with the line ending at Marietta, thence to Atlanta. It is thought that the Louisville & Nashville is back of the North Georgia Mineral, recently incorporated to build from Atlanta northwest about 50 miles.

Minneapolis, St. Paul & Sault Ste. Marie.—An officer writes that track will be laid in October on an extension from a point four miles west of Makoti, N. D., on the Plaza line, west to Van Hook in Mountrail county, 23 miles. The line is eventually to be extended further west to Fairview, Mont. Foley Brothers, Welch & Stewart, St. Paul, Minn., had the contract for the grading work, which involved handling about 37,000 cu. yd. to the mile.

Murphysboro & Southern Illinois (Electric).—This company has prepared plans for an 8-mile electric railway to be built between Murphysboro, Ill., and Carbondale. Edward Flad & Co., De Menil building, St. Louis, Mo., engineers.

North Georgia Mineral.—See Louisville & Nashville.

South Florida & Gulf.—Work is now under way, it is said, on a line from Kenansville, Fla., to a point on the Kissimmee river, about 37 miles. The construction work is being carried out by the company with day labor, and about 6 miles of track has been laid. C. H. Armstrong, president, Kenansville, Fla.

RAILWAY STRUCTURES

Albert Lea, Minn.—The Minneapolis & St. Louis has awarded a contract for the erection of a passenger station at Albert Lea, Minn., to C. F. Mayer & Co., Humboldt, Ia. The structure is to be of brick with a red tile roof. The cost is estimated at $30,000.

Elkins, W. Va.—The Western Maryland has given a contract to the Enterprising Construction Company, Elkins, it is said, to rebuild the freight house at Elkins recently damaged by fire.

Hawkinsville, Ga.—The Southern Railway has given a contract to R. V. LaBarre, Birmingham, Ala., for building a new frame passenger station 31 ft. by 88 ft., with tile roof, at Hawkinsville. The present combined passenger station and freight house will be remodeled and used exclusively as a freight house. Some track changes and paving are also included in the work to be carried out.

Huron, S. D.—The report of the Chicago & North Western for the year ended June 30, 1914, shows that the more important additions and betterments carried out during the year include the following: A brick passenger station, also a two-story brick freight house and six additional parallel yard tracks were constructed at Huron, S. Dak. Modern brick passenger stations were completed or are nearing completion at Rochelle, Barrington, Woodstock, Des Plaines and Crystal Lake, Ill.; De Pere and Jefferson, Wis.; Iron River, Mich.; and at Rapid City, Sturgis and Redfield, S. Dak. Combined freight houses and office buildings of brick construction are nearing completion at Green Bay, at Manitowoc, Wis., and at Ironwood, Mich. Other improvements were completed at Green Bay, Wis., consisting of a 40-stall brick engine house, power house, machine shop, store and oil house, and other structures, also additional trackage. Work is now under way at South Pekin, Ill., and at Norfolk, Neb., putting up two-story brick office buildings. Additions were also made during the year at the Chicago shops. The machine shops, power house and store and office buildings at Clinton, Iowa, under construction last year have also been completed, and at Escanaba, Mich., the company's coal dock has been extended 300 ft., and two bridges, each consisting of one truss span 163 ft. long, and connected with present towers, have been installed.

Lexington, Ky.—A building permit has been issued to the Louisville & Nashville for the construction of a 12-stall roundhouse and repair shops in the yard at Lexington, and work on these improvements is now under way.

North Toronto, Ont.—The Railway Commission of Canada has approved the plans submitted by the Canadian Pacific and the Canadian Northern for a proposed subway to be built at Dovercourt road, North Toronto.

Wayne, Neb.—The report of the Chicago, St. Paul, Minneapolis & Omaha for the year ended June 30, 1914, shows that a brick passenger station was built at Wayne, Neb.; new frame passenger stations were constructed at Woodville and Solon Springs, Wis., and combined passenger and freight stations were built at Nicols, Minn., and at Wilder. A number of new structures were also put up at Park Falls, Wis. Improvements to the enginehouse facilities at Altoona, Wis., were completed, and a 4-stall brick enginehouse was built at Duluth, Minn. Work is now under way on an 8-stall brick enginehouse, also on a water tank, sand house, cinder pit and turntable at Sioux Falls, S. D. During the year work was finished on the viaduct at Earl street, St. Paul, Minn., and work has been started on a viaduct at Nicholas street, Omaha, Neb., jointly with the Missouri Pacific and the Omaha Bridge & Terminal Railway companies. This work is expected to be finished in the fall of 1914.

Railway Financial News

Central of New Jersey.—Frederick G. Bourne, of the Singer Sewing Machine Manufacturing Company, has been elected a director of the Central of New Jersey, succeeding H. C. Fahnestock, deceased.

Chicago, Rock Island & Pacific.—N. L. Amster, holding $350,000 of the railroad collateral 4's, has asked by advertisement that bondholders send him their names and that a meeting of the bondholders be called to select a committee other than the Wallace committee, the new committee to be empowered to co-operate in securing the deposit of bonds as promptly as possible for the purpose of procuring the sale of the stock and its acquisition by the present bondholders; to enforce and receive the distribution of the railway stock represented by their bonds and its deposit with the new committee; to adjust the charges properly payable as their share of the expenses incurred by the trustee in securing the return of their stock; to procure the election of a new board of directors of the railway company that will represent exclusively their interests; to enforce the recovery for their benefit of $7,500,000 which is claimed to have been improperly paid from the funds of the railway company to the holding company, and which is largely responsible for the present plight of the railway company; to inaugurate a drastic investigation of the accounts and transactions of the past management with a view of further recoveries wherever warranted by the facts; and to provide a plan for financing the future money requirements of the railway company.

Erie.—Holders of a substantial part of the $4,550,000 notes matured October 1 accepted 3-year 5 per cent notes in exchange, and the remainder of the new 3-year notes, it is understood, have been sold.

The Erie has asked the New York Public Service Commission, Second district, for permission to issue $900,000 4½ per cent car trust certificates, series BB. Arrangements have been made for the sale of the notes to Drexel & Company, Philadelphia, at 97.

Maine Central.—As shown by the annual report this company, operating 1,207 miles, in the fiscal year ended June 30, 1914, had net income after the payment of expenses, rentals, taxes and interest of $1,348,061 as compared with $1,118,544 in 1913. There was a slight increase of 1.43 miles in mileage operated. The road operates a main line from Portland, Maine, to Vanceboro, which is part of the route from Boston to the provinces via the Boston & Maine, the Maine Central and the Canadian Pacific. There are also lines to St. Johnsbury, Vt., Lime Ridge, Que., and Kineo, Rockland, Belfast, Calais and other points in Maine. For some time this road has been controlled by the Boston & Maine, but in April an arrangement was made as noted below whereby the Boston & Maine stock was purchased by Maine Central interests. During the fiscal year just closed the road earned a freight and passenger revenue per mile of $6,166 and $3,374 respectively, comparing with $5,912 and $3,361 for the previous year. The freight revenue, constituting 63.66 per cent of the total, increased from $7,126,071 to $7,440,035. The ton mile rate in 1914 was 1.050 cents, as against 1.086 in 1913, but the ton mileage increased from 656,351,489 to 708,894,306. The tonnage was made up principally of potatoes, coal, lumber, pulp wood, pulp and paper. The passenger receipts showed little change, there having been a slight increase from $3,511,171 to $3,517,583. The passenger mileage decreased, but there was an increase in the revenue per passenger mile from 2.083 to 2.184 cents to compensate. The average trainload of revenue freight in 1914 was 271 tons, and in 1913 259. The company in 1914 paid dividends of 6 per cent, which called for $1,491,797. The net income, however, was but $1,348,061, so that $143,736 had to be carried to the contingent fund. The funded debt on June 30, 1914, was $4,000,000 greater than in 1913, $6,000,000 of 5-year 5 per cent coupon bonds having been issued on May 1, 1914, to provide funds for the payment of the 5-year coupon notes amounting to $2,000,000 maturing April 1, 1914; to provide funds for various corporate purposes, and to pay a note of $3,000,000 issued to permit the company to pay for the entire $3,000,000 capital stock at par of the Maine Railway Companies formed to purchase from the Boston & Maine its entire holdings of 159,601 Maine Central shares. At the end of the year the Maine Central had on hand $704,778 cash, a considerable decrease from the $1,929,902 of the year before.

Muscatine North & South.—Charles N. Voss and E. H. Ryan have been appointed receivers of this road. The road runs from Muscatine, Iowa, to Burlington, 53 miles.

New York Central & Hudson River.—This company has asked J. P. Morgan & Co., New York, to manage a syndicate to take $40,000,000 notes, of which half are to be 5 per cent six-months notes and the other half one-year coupon notes. The Wall Street Journal says that the railroad company will secure its money probably, at approximately 7 per cent.

New York, New Haven & Hartford.—William Rockefeller, George F. Baker, Charles F. Brooker and James S. Elton have resigned as directors of the New York, New Haven & Hartford, and J. Horace Harding, of C. D. Barney & Co., New York, has been elected a director.

New York, Ontario & Western.—This company, operating 568 miles in the fiscal year ended June 30, 1914, had net income, after the payment of expenses, rentals, taxes and interest, of $663,692, as against $1,211,633 in the previous year. There was no change in the mileage operated, and the decreased net was due to a loss of 4.37 per cent in gross, an increase of 2.98 per cent in expenses, and a slight loss in other income offset by slightly lower interest charges due to the payment of maturing equipment trust notes. The New York, Ontario & Western is controlled by the New York, New Haven & Hartford. Its main line runs from Weehawken, N. J., opposite New York city, to Oswego, N. Y., with two important branches, one to Scranton, Pa., and the other to Utica, N. Y. In 1914 the road earned $12,109 from freight and $3,480 from passenger per mile, comparing with $12,926 and $3,470 per mile in 1913. Of the total earnings from freight—$6,893,176—in 1914, $4,334,679 was from coal traffic and $787,339 from milk, with $1,013,462 from local freight. The falling off in freight revenue was due to a falling off in all classes of freight tonnage, and the slight gain in passenger revenue was due to a higher average passenger-mile rate because of a larger proportion of local passenger business. The ton-mile rate in 1914 was 7.84 mills, as against 7.83 mills in the previous year, the total ton mileage carried being 878,519,133 in 1914, as against 933,144,824 in 1913. The average passenger receipts per passenger-mile in 1914 amounted to 1.970 cents, and in 1913 to 1.934 cents. The average trainload of revenue freight in 1914 was 301, and in 1913 308. The company had been paying two per cent dividends, which called for $1,162,130. No dividend, however, was declared in 1914, so that the $663,482 net income was available as working capital, no new securities being sold during the year. At the end of the year the company had on hand $513,204 cash, with loans and bills payable of $149,855. The expenditures for additions and betterments in 1914 totaled $264,179, and for necessary addition to equipment, $1,016,977.

Old Colony Railroad.—James Hustis, president of the Boston & Maine, has resigned as a director of the Old Colony, and has been succeeded by Frank A. Farnham.

Pere Marquette.—The first mortgage bondholders have withdrawn their appeal against Judge Tuttle's order in the United States district court permitting the issue of $4,000,000 receiver's certificates, of the proceeds of which $2,000,000 was to be used to pay taxes in Michigan and thus avoid a tax penalty of $5,000 a month. Arrangements for the sale of the certificates have not as yet been made.

The Railway Mileage of Great Britain.—The preliminary returns of the British railways for the year 1913 show that in that year there were 40,689 miles of line open for operation. Of this but 23,718 miles, or 59 per cent, was single track. The prelimary return does not divide this into English and Welsh, Scottish and Irish, but taking the returns for 1912, where it is divided as a basis, it is found that 33 per cent of the English and Welsh, 58 per cent of the Scottish and 80 per cent of the Irish are single-track lines.

ANNUAL REPORTS

CHICAGO AND NORTH WESTERN RAILWAY COMPANY

REPORT OF THE BOARD OF DIRECTORS

To the Stockholders of the Chicago and North Western Railway Company:

The Board of Directors submit herewith their report of the operations and affairs of the Chicago and North Western Railway Company for the fiscal year ending June 30, 1914.

Average number of miles operated, 8,070.61.

OPERATING REVENUES:		
Freight Revenue	$53,989,475.43	
Passenger Revenue	21,540,542.79	
Other Transportation Revenue	7,028,438.19	
Non-transportation Revenue	1,118,594.38	
Total Operating Revenues		$83,677,050.79
OPERATING EXPENSES (70.99 per cent. of Operating Revenues)		59,405,141.53
Net Revenue—Rail Operations		$24,271,909.26
OUTSIDE OPERATIONS—Net Deficit		14,149.85
Net Railway Operating Revenue		$24,257,759.41
RAILWAY TAX ACCRUALS (5.08 per cent. of Operating Revenues)		4,252,790.29
Railway Operating Income		$20,004,969.12
OTHER INCOME:		
Rental Income	$198,540.63	
Dividend Income	1,579,236.39	
Income from Funded Securities	5,650.00	
Income from Unfunded Securities and Accounts, and Other Items	1,137,333.77	
Total Other Income		2,920,760.79
Gross Income, carried forward		$22,925,729.91
DEDUCTIONS FROM GROSS INCOME:		
Rental Payments	$1,265,866.98	
Interest Deductions for Funded Debt	9,239,007.59	
Other Deductions	114,713.13	
Total Deductions		10,619,587.70
Net Income		$12,306,142.21
DISPOSITION OF NET INCOME:		
Sinking Funds	$200,472.61	
Dividends—		
8% on Preferred Stock	1,791,600.00	
7% on Common Stock	9,108,015.00	
Total		11,100,087.61
Balance Income for the year		$1,206,054.60

The results as compared with the preceding fiscal year were as follows:

Passenger Revenue increased		$982,919.54
Non-transportation Revenue increased		394,196.19
		$1,377,115.73
Freight Revenue decreased	$672,112.80	
Other Transportation Revenue decreased	63,873.22	
		735,986.02
Total Operating Revenues increased		$641,129.71
Operating Expenses increased	$1,152,361.31	
Railway Tax Accruals increased	655,630.49	
Operating Expenses and Railway Tax Accruals increased	$1,807,991.80	
Net Deficit from Outside Operations increased	25,446.20	
		1,833,438.00
Railway Operating Income decreased		$1,192,308.29

Of the Operating Expenses for the current fiscal year $33,871,483.08, or 57.02 per cent., was paid employes for Labor, as compared with $32,911,995.31, or 56.50 per cent., paid during the preceding fiscal year. The increase of $959,487.77 in the amount paid is accounted for as follows:

Increase account higher rates of compensation	$534,506.41
Increase account more time worked	424,981.36
	$959,487.77

MILES OF RAILROAD

The total number of miles of railroad owned June 30, 1914, was 7,945.50 miles

In addition to which the company operated:

THROUGH OWNERSHIP OF ENTIRE CAPITAL STOCK—		
Wolf River Valley Railway (Junction east of Elton to Van Ostrand, Wis.)	1.98	"
UNDER LEASE—		
De Pue, Ladd & Eastern Railroad (Ladd to Seatonville, Ill.)	3.25	miles
Belle Fourche Valley Railway (Belle Fourche to Newell, S. D.)	23.52	"
James River Valley and North Western Railway (Blunt to Gettysburg, S. D...)	39.55	"
Macoupin County Extension Railway (Benld to Staunton, Ill.)	4.36	"
	70.68	"
UNDER TRACKAGE RIGHTS—		
Peoria & Pekin Union Railway (in the city of Peoria, Ill.)	2.02	"
Chicago, Indiana & Southern Railroad (Churchill to Ladd, Ill.)	2.80	"
Union Pacific Railroad (Broadway Station, Council Bluffs, Iowa, to South Omaha, Neb.	8.73	"
Missouri Valley and Blair Railway and Bridge Company's track	3.36	"
Chicago, St. Paul, Minneapolis & Omaha Railway:		
Blair to Omaha, Neb.	24.70	"
Elroy to Wyeville, Wis.	22.79	"
In Sioux City, Iowa	2.28	"
Illinois Central Railroad (Sioux City to Wren, Iowa)	10.10	"
	76.78	"
Total miles of railroad operated June 30, 1914	8,094.94	"

The above milcage is located as follows:

In Illinois	824.53	miles
In Wisconsin	2,170.03	"
In Michigan	519.88	"
In Minnesota	650.30	"
In Iowa	1,620.26	"
In North Dakota	14.28	"
In South Dakota	1,063.15	"
In Nebraska	1,102.05	"
In Wyoming	130.46	"
Total	8,094.94	"

FREIGHT TRAFFIC

The details of Freight Traffic for the year ending June 20, 1914, compared with the preceding year, were as follows:

	1913	1914	Decrease—Amount	Decrease—Per Cent.
FREIGHT REVENUE	$54,661,588.23	$53,989,475.43	$672,112.80	1.23

	1913	1914	Percentage of Increase or Decrease
TONS OF FREIGHT CARRIED	44,839,071	43,309,643	3.41 Decrease
TONS OF FREIGHT CARRIED ONE MILE	6,282,916,222	6,229,944,171	.84 Decrease
AVERAGE REVENUE RECEIVED PER TON	$1.22	$1.25	2.46 Increase
AVERAGE REVENUE RECEIVED PER TON PER MILE	.87 of a cent	.87 of a cent	....
AVERAGE DISTANCE EACH TON WAS HAULED	140.12 miles	143.85 miles	2.66 Increase
MILEAGE OF REVENUE FREIGHT AND MIXED TRAINS	18,055,815	17,932 137	.74 Decrease
AVERAGE NUMBER OF TONS OF REVENUE FREIGHT CARRIED PER TRAIN MILE:			
East of Missouri River	375.38	377.64	.60 Increase
West of Missouri River	148.68	152.26	2.41 Increase
Whole Road	347.97	347.61	.10 Decrease
AVERAGE NUMBER OF TONS OF REVENUE FREIGHT CARRIED PER LOADED CAR MILE	18.38	18.44	.33 Increase
AVERAGE FREIGHT REVENUE PER TRAIN MILE	$3.03	$3.01	.66 Decrease

PASSENGER TRAFFIC

The details of Passenger Traffic for the year ending June 30, 1914, compared with the preceding year, were as follows:

	1913	1914	Increase—Amount	Increase—Per Cent.
PASSENGER REVENUE	$20,557,623.25	$21,540.542.79	$982,919.54	4.78

	1913	1914	Percentage of Increase or Decrease
PASSENGERS CARRIED	32,441,450	33,389,428	2.92 Increase
PASSENGERS CARRIED ONE MILE	1,113,831,352	1,173,435,140	5.35 Increase
AVERAGE FARE PAID PER PASSENGER	63 cents	65 cents	3.17 Increase
AVERAGE RATE PAID PER PASSENGER PER MILE	1.85 cents	1.84 cents	.54 Decrease
AVERAGE DISTANCE TRAVELED PER PASSENGER	34.33 miles	35.14 miles	2.36 Increase
MILEAGE OF REVENUE PASSENGER AND MIXED TRAINS	21,378.704	21,537.781	.74 Increase
AVERAGE PASSENGER-TRAIN REVENUE PER TRAIN MILE	$1.23	$1.26	2.44 Increase

MAINTENANCE OF WAY AND STRUCTURES

The total Operating Expenses of the Companyy for the year ending June 30, 1914, were $59,405,141.53; of this amount $12,179,689.85 was for charges pertaining to the Maintenance of Way and Structures. Included in these charges is a large part of the cost of 82,741 tons of steel rails, the greater portion of which was laid in replacement of rails of lighter weight in 600.62 miles of track; also the cost of 3,041,197 new ties.

The charges for Maintenance of Way and Structures also include a portion of the cost of ballasting 89.51 miles of track with crushed stone,

343.75 miles with gravel, and 16.92 miles with cinders; the erection, in place of wooden structures, of 42 new steel bridges on masonry aggregating 3,846 feet in length and containing 3,858 tons of bridge metal; and the replacement of other wooden structures with masonry arch and box culverts and cast-iron pipes, the openings being filled with earth. The wooden structures replaced by permanent work aggregate 11,396 feet in length.

The charges on account of Maintenance of Way and Structures for the year ending June 30, 1914, compared with the preceding year, were as follows:

	1913	1914	Increase or Decrease
Cost of Rails:			
New steel rails	$1,608,212.85	$1,212,258.90	$395,953.95 Dec.
Usable and re-rolled rails	589,407.15	996,460.61	407,053.46 Inc.
	$2,197,620.00	$2,208,719.51	$11,099.51 Inc.
Less value of old rails and other items	1,582,238.40	1,484,363.53	97,874.87 Dec.
Net charge for rails	$615,381.60	$724,355.98	$108,974.38 Inc.
Cost of Ties	1,398,359.45	1,762,313.18	363,953.73 Inc.
Cost of Ballast	193,644.46	227,056.25	33,411.79 Inc.
Cost of Other Track Material	525,805.53	539,118.33	13,312.80 Inc.
Roadway and Track Labor and Other Expenses	4,949,338.52	5,073,539.12	124,200.60 Inc.
Total Charges for Roadway and Track	$7,682,529.56	$8,326,382.86	$643,853.30 Inc.
Other Charges Account Maintenance of Way and Structures were as follows:			
Bridges, Trestles and Culverts	854,794.52	945,128.70	90,334.18 Inc.
Road Crossings, Fences, etc.	325,226.84	331,200.62	5,973.78 Inc.
Signals and Interlocking Plants	444,175.32	451,960.43	7,785.11 Inc.
Buildings, Fixtures and Grounds	1,175,886.10	1,229,244.45	53,358.35 Inc.
Docks and Wharves	214,950.50	53,975.41	160,975.09 Dec.
Superintendence	483,468.65	489,352.50	5,883.85 Inc.
Roadway Tools and Supplies	139,863.67	150,540.57	10,676.90 Inc.
Sundry Miscellaneous Charges	180,291.27	201,904.31	21,613.04 Inc.
Total Charges Account Maintenance of Way and Structures	$11,501,186.43	$12,179,689.85	$678,593.42 Inc.

The above charges for Maintenance of Way and Structures for the current year amount to 20.50 per cent. of the total Operating Expenses, as compared with 19.74 per cent. for the preceding fiscal year.

MAINTENANCE OF EQUIPMENT

The charges on account of Maintenance of Equipment for the year ending June 30, 1914, compared with the preceding year, were as follows:

	1913	1914	Increase or Decrease
Locomotives	$4,688,207.05	$4,831,466.36	$143,259.31 Inc.
Passenger-Train Cars	1,088,442.30	1,070,046.73	9,395.47 Dec.
Freight-Train Cars	5,016,122.00	5,445,489.09	429,367.09 Inc.
Work Equipment	132,975.41	143,446.64	10,471.23 Inc.
Shop Machinery and Tools	229,505.27	229,921.15	415.88 Inc.
Superintendence	335,106.49	358,660.57	23,554.08 Inc.
Sundry Miscellaneous Charges	78,137.67	99,092.63	20,954.96 Inc.
Total Charges Account Maintenance of Equipment	$11,568,496.09	$12,187,123.17	$618,627.08 Inc.

The above charges for Maintenance of Equipment for the current year amount to 20.52 per cent. of the total Operating Expenses, as compared with 19.86 per cent. for the preceding fiscal year.

RESERVE FOR ACCRUED DEPRECIATION ON EQUIPMENT

At the close of the preceding fiscal year there was a balance to the credit of the Equipment Reserve Accounts of		$4,665,712.28
During the year ending June 30, 1914, there was credited to the Equipment Reserve Accounts on account of charges to Operating Expenses and Profit and Loss, and for salvage		3,336,032.63
		$8,001,744.91
And there were charged during the year against the above amount the original cost of Equipment retired and other items, as follows:		
17 Locomotives	$148,486.01	
7 Passenger-Train Cars	28,610.67	
2,467 Freight-Train Cars	1,360,288.60	
172 Work Equipment Cars	31,141.18	
Other Items	343,979.08	
		1,912,505.54
Leaving a balance to the credit of the Equipment Reserve Accounts on June 30, 1914, of		$6,089,239.37

TRANSPORTATION EXPENSES

The Transportation Expenses of the Company for the year ending June 30, 1914, were $31,941,194.36, or 53.77 per cent. of the total Operating Expenses. Of this amount $19,862,352.33, or 62.18 per cent., was charged for labor; $6,905,727.12, or 21.62 per cent., was charged for fuel for locomotives; and $5,173,114.91, or 16.20 per cent., was charged for supplies and miscellaneous items. The decrease in the Transportation Expenses for the year ending June 30, 1914, as compared with the preceding fiscal year, was $300,063.32 or .93 per cent., distributed as follows:

Increase in amount charged for labor	$236,274.32	
Decrease in amount charged for fuel for locomotives	1,020,161.01	
Increase in amount charged for supplies and miscellaneous items	483,823.37	
		$300,063.32

CAPITAL STOCK

There was no change during the year in the Capital Stock and Scrip of the Company.

The Company's authorized Capital Stock is Two Hundred Million Dollars ($200,000,000.00), of which the following has been issued to June 30, 1914:

Common Stock and Scrip held by the Public		$130,117,028.82
Common Stock and Scrip owned by the Company	2,338,502.15	
Total Common Stock and Scrip		$132,455,530.97
Preferred Stock and Scrip held by the Public	$22,395,120.00	
Preferred Stock and Scrip owned by the Company	3,834.56	
Total Preferred Stock and Scrip		22,398,954.56
Total Capital Stock and Scrip, June 30, 1914		$154,854,485.53

FUNDED DEBT

At the close of the preceding fiscal year the amount of Bonds held by the Public and in Sinking Funds was		$193,259,000.00
The above amount has been decreased during the year ending June 30, 1914, as follows:		
Bonds Purchased:		
C. & N. W. Ry. 5% Sinking Fund Debentures of 1933	$4,000.00	
Equipment Taust Certificates Redemed:		
C. & N. W. Ry. 4½% Equipment Trust Certificates of 1912, Series B	300,000.00	
Bonds Redeemed with Sinking Fund Payments:		
C. & N. W. Ry. Sinking Fund of 1879, 6%	$37,000.00	
C. & N. W. Ry. Sinking Fund of 1879, 5%	93,000.00	
	130,000.00	
Total Bonds Purchased or Redeemed		434,000.00
		$192,825,000.00
And the above amount has been increased by Bonds and Equipment Trust Certificates sold and assumed during the year, as follows:		
C. & N. W. Ry. General Mortgage Gold Bonds of 1987, 4%, sold to reimburse the Company for past expenditures made for construction and in redeeming matured bonds	$8,054,000.00	
C. & N. W. Ry. 4½% Equipment Trust Certificates of 1912, Series C, sold	4,000,000.00	
St. Louis, Peoria and North Western Ry. 5% First Mortgage Bonds assumed	10,000,000.00	
		22,054,000.00
Total Bonds held by the Public and in Sinking Funds, June 30, 1914		$214,879,000.00
Net Increase during the year in Bonds held by the Public and in Sinking Funds		$21,620,000.00

BONDS IN THE TREASURY AND DUE FROM TRUSTEE

At the close of the preceding fiscal year the amount of the Company's Bonds in its Treasury and due from Trustee was		$7,519,000.00
The above amount has been increased during the year ending June 30, 1914, as follows:		
C. & N. W. Ry. 5% Sinking Fund Debentures of 1933, Purchased	$4,000.00	
C. & N. W. Ry. 4½% Equipment Trust Certificates of 1913, Series D, Issued	4,000,000.00	
C. & N. W. Ry. General Mortgage Gold Bonds of 1987, Due from Trustee in Exchange for Bonds Retired, viz:		
C. & N. W. Ry. Sinking Fund of 1879, 6%	$41,000.00	
C. & N. W. Ry. Sinking Fund of 1879, 5%	94,000.00	
M. L. S. & W. Ry. Extension and Improvement Sinking Fund Mortgage, 5%	11,000.00	
	146,000.00	
C. & N. W. Ry. General Mortgage Gold Bonds of 1987, Due from Trustee on Account of Construction Expenditures Made During the Year	1,000,000.00	
		5,150,000.00
		$12,669,000.00
The Bonds on hand and due from Trustee have been decreased during the year, as follows:		
C. & N. W. Ry. General Mortgage Gold Bonds of 1987, 4%, sold to Reimburse the Company for Past Expenditures Made for Construction and in Redeeming Matured Bonds	$8,054,000.00	
Southern Iowa Ry. First Mortgage, 3½% Bonds, Canceled	431,000.00	
M. L. S. & W. Ry. Extension and Improvement Sinking Fund Mortgage 5% Bonds Retired	11,000.00	
		8,496,000.00
Total Bonds in the Treasury and due from Trustee, June 30, 1914		$4,173,000.00
Net Decrease during the year in Bonds in the Treasury and due from Trustee		$3,346,000.00

CONSTRUCTION

The construction charges for the year ending June 30, 1914, were as follows:

ON ACCOUNT OF ELEVATING TRACKS, VIZ.:		
In River Forest, Illinois	$124,384.93	
Greenfield Avenue north, Milwaukee, Wis.	61,161.83

TRACK ELEVATION

The elevation of the Company's six main tracks on the Galena Division in the Village of River Forest, Illinois, from the overhead crossing of the Minneapolis, St. Paul & Sault Ste. Marie Railway to the Des Plaines River, a distance of 0.6 miles, and the construction of an elevated yard with a capacity for 300 cars, are in progress and it is expected will be completed during the present calendar year.

At Milwaukee, Wisconsin, the Company has undertaken the elevation of the main tracks and certain yard tracks of its Wisconsin Division, from the Kinnickinnic River to the Milwaukee River, a distance of 1.04 miles, and also the elevation of the main tracks and certain yard tracks of its Madison Division from Kinnickinnic Avenue north to a connection with the Wisconsin Division, near Mineral Street, a distance of 0.77 miles. In connection with the elevation of the existing tracks, provision has been made for the construction of two additional tracks on the Wisconsin Division. This work includes the construction of subways on the Wisconsin Division at Washington Street and National Avenue, and on the Madison Division at Greenfield Avenue and Washington Street. The total miles of main, yard and side tracks to be elevated are equivalent to 14.81 miles of single track railway.

SUNDRY ADDITIONS AND BETTERMENTS

Among the more important sundry additions and betterments to the property of the Company during the fiscal year are the following:

Modern brick passenger stations have been completed, or are nearing completion, at Rochelle, Barrington, Woodstock, Des Plains, and Crystal Lake, Illinois; De Pere and Jefferson, Wisconsin; Iron River, Michigan; and at Rapid City, Sturgis, and Redfield, South Dakota.

At Huron, South Dakota, a commodious brick passenger station, two-story brick freight house 40 feet x 212 feet, and six additional parallel yard tracks have been constructed.

At Green Bay, Wisconsin, a brick freight house 40 feet x 250 feet with two-story office portion 40 feet x 50 feet; at Manitowoc, Wisconsin, a brick freight house with two-story office portion 40 feet x 180 feet; and at Ironwood, Michigan, a brick freight house 41 feet x 131 feet with office portion at one end, are nearing completion.

At South Pekin, Illinois, and at Norfolk, Nebraska, two story brick office buildings are being constructed.

At Chicago Shops the following additions to the plant have been completed:

Enlargement of Wisconsin Division engine house.
Brick extension to locomotive tank shop 30 feet x 324 feet.
Enclosing of space 66 feet x 300 feet between Car Shops 1 and 2.
Brick extension to coach paint shop 14 feet x 300 feet.
Installation of two 70-foot electric transfer tables for coaches, and one 38-foot electric transfer table for locomotives.

Also at Chicago shops, a considerable expenditure has been made for the installation of a sprinkler system, the erection of fire walls and the rearrangement and enlargement of the facilities for supplying water, in order to provide for additional fire protection and thereby reduce the cost of insurance.

At Green Bay, Wisconsin, the improvements consisting of a 40-stall brick engine house, power house, machine shop, store and oil house, ice house, coal and water facilities, and additional trackage, to which reference was made in the last annual report, have been completed.

At Clinton, Iowa, the machine shops, power house and store and office buildings under construction at the close of the previous fiscal year, have been completed. The installation at this station of a car repair yard with suitable shop and other buildings is in progress.

At Escanaba, Michigan, the Company's coal dock has been extended 300 feet and two bridges, each consisting of one truss span 163 feet lang, and connected with present towers, have been installed.

Between Nelson and Peoria, Illinois, important revisions of grade, to permit a material increase in the train tonnage on this line, are in progress.

Reference was made in the last annual report to the stockholders, to an agreement with the City of Milwaukee, Wisconsin, by which this Company acquired the right to fill in and occupy with additional tracks, approximately ten acres of submerged lands east of its present holdings on the shore of Lake Michigan in that city. During the year covered by this report substantial progress has been made in the filling, and a protection crib has been completed.

The installation of automatic block signals has been completed during the year, or is nearing completion, as follows:

Evansville to Madison, Wisconsin	22.5 miles
Baraboo to Elroy, Wisconsin	37.3 "
Fond du Lac to Duck Creek, Wisconsin	69.0 "
Missouri Valley to Sioux City, Iowa	74.7 "
Ames to Des Moines, Iowa	34.0 "

Between Clybourn and Mayfair, Illinois, and between Elmhurst and West Chicago, Illinois, new upper quadrant semaphore signals are being installed in place of disc signals. Upon completion of the work now in progress, 1,135 miles of the Company's railway will be protected by automatic signals.

NEW RAILWAYS

The ST. LOUIS, PEORIA AND NORTH WESTERN RAILWAY COMPANY, organized in the interest of this Company and owning a railroad from near Peoria to the Company's coal fields in Macoupin County, Illinois, a distance of 114.64 miles, conveyed its entire property to the Chicago and North Western Railway Company on December 15, 1913, subject to an indebtedness consisting of $10,000,000 First Mortgage 5% Gold Bonds, payable July 1, 1948, which were assumed by the Chicago and North Western Railway Company.

THE MACOUPIN COUNTY EXTENSION RAILWAY COMPANY, organized in the interest of this Company to construct a railway from a connection with the Macoupin County Railway near Benld, in a general southerly direction for a distance of about 9 miles, to reach certain coal fields under development in Macoupin and Madison counties, Illinois, has been completed during the year from Benld to Staunton, a distance of 4.36 miles. This railway was leased to the Chicago and North Western Railway Company for a term of twenty-five years beginning January 1, 1914.

The IOWA SOUTHERN RAILWAY COMPANY, organized in the interest of this Company, to construct a railway from a connection with this Company's railway in Monroe County, Iowa, in a general southwesterly direction in that county, for a distance of about 25 miles, has been practically completed during the year from a connection with the Chicago and North Western Railway at Miami, Iowa, to the Company's coal fields in Monroe County, a distance of 12.25 miles. This railway was leased to the Chicago and North Western Railway Company for a term of twenty-five years beginning July 1, 1914.

LANDS

During the year ending June 30, 1914, 8,809.93 acres and 8 town lots of the Company's Land Grant lands were sold for the total consideration of $245,862.52. The number of acres remaining in the several Grants June 30, 1914, amounted to 330,434.65 acres, of which 18,030.19 acres were under contract for sale, leaving unsold 312,404.46 acres.

Appended hereto may be found statements, accounts and statistics relating to the business of the fiscal year, and the condition of the Company's affairs on June 30, 1914.

By order of the Board of Directors.

WILLIAM A. GARDNER,
President.

CHICAGO, SAINT PAUL, MINNEAPOLIS AND OMAHA RAILWAY COMPANY

REPORT OF THE BOARD OF DIRECTORS

To the Stockholders of the Chicago, Saint Paul, Minneapolis and Omaha Railway Company:

The Board of Directors submit herewith their report of the operations and affairs of the Chicago, Saint Paul, Minneapolis and Omaha Railway Company for the fiscal year ending June 30, 1914.

Average number of miles operated, 1,748.39.

OPERATING REVENUES.		
Freight revenue		$11,427,563.24
Passenger revenue		5,415,710.19
Other transportation revenue		1,036,609.69
Non-transportation revenue		112,487.47
Total operating revenue		$17,992,370.59

Operating Expenses (70.21 per cent of operating revenues)		12,632,570.52
Net revenue—Rail Operations		$5,359,800.07
Outside Operations (net revenue)		16,166.40
Net Railway operating revenue		$5,375,966.47
Railway Tax Accruals (5.41 per cent of operating revenue)		973,282.83
Railway operating income		$4,402,683.64
Other Income.		
Rental income	$134,921.94	
Dividend income	46,351.00	
Income from funded securities	12,060.00	
Income from unfunded securities and accounts, and other items	40,072.08	
Total other income		233,405.02
Gross income		$4,636,088.66
Deductions from Gross Income.		
Rental payments	$515,184.10	
Interest deductions for funded debt	2,052,901.43	
Interest deductions for unfunded debt	32,735.53	
Other deductions	13,652.25	
Total deductions		2,614,473.31
Net income		$2,021,615.35
Disposition of Net Income.		
Dividends:		
7% on preferred stock	$787,976.00	
7% on common stock	1,298,934.00	
Total dividends		2,086,910.00
Net deficit for the year		$65,294.65

As compared with the previous year, the results were as follows:

Freight revenue increased	$570,356.31	
Passenger revenue increased	431,114.88	
Non-transportation revenue increased	18,149.03	
		$1,019,620.22
Other transportation revenue decreased		20,254.31
Total operating revenue increased		$999,365.91
Operating expenses increased	$745,109.24	
Railway tax accruals increased	141,019.56	
Operating expenses and railway tax accruals increased	$886,128.80	
Net revenue from outside operations increased	20,978.02	
		865,150.78
Railway operating income increased		$134,215.13

The operating expenses for the current fiscal year include $6,895,806.12 paid employes for labor, as compared with $6,720,074.48 paid during the preceding fiscal year, being an increase of $175,731.64, accounted for as follows:

Increase account higher rates of compensation	$51,924.14
Increase account more time worked	123,807.50
Total increase	$175,731.64

MILES OF RAILROAD

The total number of miles of railroad owned June 30, 1914, was 1,683.22 miles

In addition to which the company operated:

Under Trackage Rights—		
Northern Pacific Railway (Superior, Wis., to Rices Point, Minn.)	1.59	miles
Great Northern Railway (St. Paul to Minneapolis, Minn.)	11.40	"
Minneapolis & St. Louis Railroad (Minneapolis to Merriam, Minn.)	27.00	"
Illinois Central Railroad (LeMars to Sioux City, Iowa)	25.20	"
Sioux City Bridge Company (bridge across Missouri River and tracks at Sioux City, Iowa)	3.90	"
Chicago and Northwestern Railway (Sioux City to Sioux City Bridge Company's track)	.50	"
	69.59	"
Total miles of railroad operated June 30, 1914	1,752.81	"

The above mileage is located as follows:

In Wisconsin	781.14	miles
In Minnesota	473.04	"
In Iowa	102.04	"
In South Dakota	88.20	"
In Nebraska	308.39	"
Total	1,752.81	"

In addition to the foregoing, the company owned and operated 183.03 miles of second track, located as follows:

In Wisconsin	157.09	miles
In Minnesota	24.23	"
In Nebraska	1.71	"
Total	183.03	"

FREIGHT TRAFFIC

The details of freight traffic for the year ending June 30, 1914, compared with the preceding year, were as follows:

	1913	1914	Increase Amount	Increase Per Cent
Freight revenue	$10,857,206.93	$11,427,563.24	$570,356.31	5.25

	1913	1914	Percentage of Increase or Decrease
Tons of freight carried	8,205,947	8,466,632	3.18 Increase
Tons of freight carried one mile	1,262,998,028	1,294,143,291	2.47 Increase
Average revenue received per ton	$1.32	$1.35	2.27 Increase
Average revenue received per ton per mile	.86 of a cent	.88 of a cent	2.33 Increase
Average distance each ton was hauled	153.91 miles	152.85 miles	.69 Decrease
Mileage of revenue freight and mixed trains	4,575,954	4,212,289	7.95 Decrease
Average number of tons of revenue freight carried per train mile	276.01	307.23	11.31 Increase
Average number of tons of revenue freight carried per loaded car mile	18.99	19.23	1.26 Increase
Average freight revenue per train mile	$2.37	$2.71	14.35 Increase

PASSENGER TRAFFIC

The details of passenger traffic for the year ending June 30, 1914, compared with the preceding year, were as follows:

	1913	1914	Increase Amount	Increase Per Cent
Passenger revenue	$4,984,595.31	$5,415,710.19	$431,114.88	8.65

	1913	1914	Percentage of Increase or Decrease
Passengers carried	4,500,947	4,881,961	8.47 Increase
Passengers carried one mile	234,545,623	266,685,999	13.70 Increase
Average fair paid per passenger	110.75 cents	110.93 cents	.16 Increase
Average rate paid per passenger per mile	2.125 cents	2.031 cents	4.42 Dec ease
Average distance traveled per passenger	52.11 miles	54.63 miles	4.84 Increase
Mileage of revenue passenger and mixed trains	4,489,183	4,510,639	.48 Increase
Average passenger train revenue per train mile	$1.31	$1.39	6.11 Increase

MAINTENANCE OF WAY AND STRUCTURES

The total operating expenses of the company for the year ending June 30, 1914, were $12,632,570.52; of this amount $2,612,609.99 was for charges pertaining to maintenance of way and structures. Included in these charges are $168,965.84 for rails, $525,024.76 for ties, and the cost of re-ballasting 70 miles with gravel and cinders, also part cost of replacing 1,514 feet of wooden bridging with permanent work.

During the year 12,393 tons of new steel rails and 6,188 tons of usable and re-rolled steel rails were laid in track, a greater portion of which replaced rails of lighter weight; 843,544 ties of all descriptions were laid in renewals.

The details of the charges to maintenance of way and structures for the year, compared with the previous year, were as follows:

Cost of Rails.			
New steel rail	$398,243.49	$392,057.11	*$6,186.38
Usable and re-rolled rail	279,678.91	143,572.52	*136,106.39
	$677,922.40	$535,629.63	*$142,292.77
Less value of old rails and other items	474,185.06	366,663.79	*107,521.27
Net charge for rails	$203,737.34	$168,965.84	*$34,771.50
Cost of Ties	326,294.47	525,024.76	198,730.29
Cost of Ballast	34,448.52	51,996.80	17,548.28
Cost of Other Track Material	99,577.84	89,442.67	*10,135.17
Roadway and Track Labor and Other Expenses	788,989.71	860,749.04	71,759.33
Total charges for Roadway and Track	$1,453,047.88	$1,696,179.11	$243,131.23
Other Expenses Account of Maintenance of Way and Structures were as follows:			
Superintendence	89,095.57	108,713.97	19,618.40
Bridges, Trestles and Culverts	228,478.02	295,994.49	67,516.47
Road Crossings, Fences, Etc.	54,627.14	70,010.91	15,383.77
Signals and Interlocking Plants	20,629.17	30,288.21	9,659.04
Buildings, Fixtures and Grounds	239,467.58	243,322.66	3,855.08
Docks and Wharves	1,043.85	2,636.23	1,592.38
Roadway Tools and Supplies	23,742.77	23,742.73	*.04
Sundry Miscellaneous Charges	98,161.62	141,721.68	43,560.06
Total charges account of Maintenance of Way and Structures	$2,208,293.60	$2,612,609.99	$404,316.39

*Decrease.

The foregoing expenditures for maintenance of way and structures for the current year amount to 20.68 per cent of the total operating expenses, as compared with 18.58 per cent for the preceding fiscal year.

MAINTENANCE OF EQUIPMENT

The charges on account of maintenance of equipment for the year ending June 30, 1914, compared with the preceding year, were as follows:

	1913	1914	Inc. or Dec.
Locomotives	$897,790.57	$920,442.73	$22,652.16
Passenger-train cars	263,636.58	273,896.38	10,259.80
Freight-train cars	870,962.72	924,113.26	53,150.54
Work equipment	33,649.40	33,067.42	*581.98
Shop machinery and tools	29,937.33	33,788.02	3,850.69
Superintendence	59,815.81	62,988.77	3,172.96
Sundry miscellaneous charges	33,153.65	35,629.63	2,475.98
Total charges account of Maintenance of Equipment	$2,188,946.06	$2,283,926.21	$94,980.15

*Decrease.

The above charges for maintenance of equipment for the current year amount to 18.08 per cent of the total operating expenses, as compared with 18.41 per cent for the preceding fiscal year

RESERVE FOR ACCRUED DEPRECIATION ON EQUIPMENT

At the close of the preceding fiscal year there was a balance to the credit of the equipment reserve accounts of $1,321,312.99

During the year ending June 30, 1914, there was credited to the equipment reserve accounts on account of charges to Operating Expenses and Profit and Loss, and for Salvage..		757,580.72
		$2,078,893.71
There was charged during the year against the above amount the original cost of equipment retired as follows:		
9 Locomotives	$85,500.00	
7 Passenger-train cars	39,792.00	
661 Freight-train cars	379,428.89	
		504,720.89
Leaving a balance to the credit of the equipment reserve accounts on June 30, 1914, of		$1,574,172.82

TRANSPORTATION EXPENSES

The transportation expenses for the year were $6,939,604.01, or 54.93 per cent of the total operating expenses. Of this amount $3,825,879.76, or $5.13 per cent, was for labor; $2,044,091.93, or 29.46 per cent. was for fuel for locomotives; and $1,069,632.22, or 15.41 per cent. was for supplies and other items.

The total increase in the charges as compared with the previous year was $192,812.47, distributed as follows:

Increase in amount charged for labor	$31,645.45
Increase in amount charged for fuel for locomotives	17,659.88
Increase in amount charged for supplies and other items	143,507.14
Total increase	$192,812.47

CAPITAL STOCK

No stock was issued or sold during the year. The company's authorized capital stock is fifty million dollars ($50,000,000), of which the following has been issued to June 30, 1914:

Common stock and scrip held by the public	$18,559,086.69	
Common stock and scrip in treasury	2,844,206.64	
		$21,403,293.33
Preferred stock and scrip held by the public	$11,259,911.63	
Preferred stock and scrip in treasury	1,386,921.66	
		12,646,833.29
Total		$34,050,126.62

FUNDED DEBT

At the close of the preceding fiscal year the amount of bonds held by the public was		$37,547,000.00
The above amount has been increased by bonds sold during the year ending June 30, 1914, as follows:		
Chicago, Saint Paul, Minneapolis and Omaha Railway Consolidated Mortgage Bonds of 1880, 6%	$90,000.00	
Debenture Golds Bonds of 1930, 5%	1,700,000.00	
		1,790,000.00
Total bonds held by the Public, June 30, 1914		$39,337,000.00

In addition to the foregoing, Chicago, Saint Paul, Minneapolis and Omaha Railway Consolidated Mortgage 6% Bonds of 1880 were issued for a like amount of the following underlying bonds retired:

Chicago, Saint Paul and Minneapolis Railway First Mortgage of 1878, 6%	$55,000.00	
North Wisconsin Railway First Mortgage of 1880, 6%	9,000.00	
		$64,000.00

BONDS IN THE TREASURY

On June 30, 1913, the amount of the company's bonds and scrip in the treasury was		$51,046.02
The amount of bonds and scrip was increased during the year as follows:		
Chicago, Saint Paul, Minneapolis and Omaha Railway Consolidated Mortgage Bonds of 1880, issued at the rate of $15,000 per mile on the extension of the line from Kaiser to Park Falls, Wis., a distance of 5 5135/5280 miles		89,588.07
Total		$140,634.09
The above amount was decreased by bonds sold during the year, as follows:		
Chicago, Saint Paul, Minneapolis and Omaha Railway Consolidated Mortgage 6% Bonds of 1880		90,000.00
Total bonds and scrip in treasury, June 30, 1914		$50,634.09

CONSTRUCTION

The construction charges for the year ending June 30, 1914, were as follows:

Balance cost of second track Truax to Northline, Wis.		$360,360.80
Account of extension of line Kaiser to Park Falls, Wis.		208,903.99
Sundry Construction:		
Account cost of terminal improvements at Minneapolis, Minn.	$178,058.43	
Balance cost of terminal improvements at Altoona, Wis.	98,434.10	
Balance cost of Earl St. viaduct, St. Paul, Minn.	34,294.07	
Account Nicholas Street viaduct, Omaha, Neb.	11,913.37	
Automatic block Signals	111,160.72	
Permanent bridges (cost of new over old)	101,758.06	
Betterments of roadway and track	145,132.33	
Sidings and spur tracks	76,019.60	
Terminal yards	29,725.27	
Buildings	41,559.36	
Machinery and tools	75,076.72	
Miscellaneous charges	35,578.14	
		938,710.17
Equipment:		
Equipment acquired (22 locomotives, 1 steel dining, 2 combination mail and baggage, 6 baggage, 14 steel first class, 5 steel second class and 15 caboose cars)	$1,058,108.45	
Improvements to equipment	35,849.16	
	$1,093,957.61	
Less equipment retired	Cr 504,720.89	589,236.72
Total		$2,097,211.68

EXTENSION OF LINE

The line was extended from Kaiser to Park Falls, Wis., a distance of 5.99 miles, and placed in operation April 1, 1914.

SECOND MAIN TRACK

The work on the second track between Truax and Northline, Wis., mentioned in the two previous years' reports, was completed, and the final portion placed in operation on October 30, 1913.

SUNDRY ADDITIONS AND BETTERMENTS

New frame passenger depots were constructed at Woodville and Solon

GENERAL BALANCE SHEET, JUNE 30, 1914

Springs, Wis., and a brick passenger depot at Wayne, Neb., replacing structures now used exclusively as freight houses. Passenger and freight depots were constructed at Nicols and Wilder, Minn., to replace similar structures destroyed by fire.

Wooden water tanks on steel towers were erected at Altoona, Wis., Adrian, Minn., and Craig and Omaha, Neb., those at Adrian and Craig replacing tanks worn out.

The improvements in the enginehouse facilities at Altoona, Wis., mentioned in the previous report were completed. Work is in progress on an 8-stall brick enginehouse, water tank, sand house, cinder pit and turntable at Sioux Falls, S. D. A 4-stall brick enginehouse was built at Duluth, Minn., to replace one destroyed by fire, and the old enginehouse at Minneapolis was abandoned and torn down.

There was constructed at Park Falls, Wis., a frame passenger and freight depot, coal house, water tank, pump house, brick-lined enginehouse, wye and cinder pit.

An electric interlocking plant, joint with the C. & N. W. Ry., was constructed at Wyeville, Wis.

The viaduct at Earl Street, St. Paul, mentioned in the last report, has been completed and work has been started on a viaduct at Nicholas Street, Omaha, Neb., joint with Missouri Pacific and Omaha Bridge and Terminal Railway Companies, which will be completed in the fall of 1914.

The additional yards at Hazel Park and Minneapolis, Minn., mentioned in the previous report, were completed during the year and a 100-ton Howe track scale is now being installed at Hazel Park. The filling has been completed for a new coach yard at Minneapolis. A new yard for the interchange of traffic between the Eastern and Northern divisions was constructed at Northline, Wis., containing 2.98 miles of track.

The net increase in sidetracks and yards was 12.01 miles.

Electric headlights were applied to 184 locomotives to comply with state regulations.

The length of wooden bridging was decreased 1,514 ft. as follows:

By construction of permanent bridges	1,076 feet
By construction of iron pipe culverts	49 feet
By construction of concrete pipe culverts	343 feet
By filling	46 feet
Total	1,514 feet

LAND DEPARTMENT

The net receipts from all grants were $834.03.

3,500.06 acres were disposed of, leaving 75,390.50 acres unsold June 30, 1914.

Appended hereto may be found statements, accounts, and statistics relating to the business of the fiscal year, and the condition of the company's affairs on June 30, 1914.

By order of the Board of Directors.

WILLIAM A. GARDNER,
President.

THE FIFTIETH ANNUAL REPORT OF THE DIRECTORS OF THE CHICAGO, MILWAUKEE & ST. PAUL RAILWAY COMPANY TO THE STOCKHOLDERS

FOR THE FISCAL YEAR ENDING JUNE 30TH, 1914.

The Directors submit to the Stockholders the following report of the operations of the Company for the year ending June 30, 1914, and of the condition of its property and finances at the close of that year.

The operations for the year show the following results:

Operating Revenues		$91,782,690.74
Operating Expenses		61,330,061.17
Net Operating Revenue		$30,452,629.57
Net Revenue—Outside Operations		260,483.24
Total Net Revenue		$30,713,112.81
Taxes Accrued		4,106,557.41
Operating Income		$26,606,555.40
Other Income:		
Interest on Bonds	$234,841.80	
Dividends on Stocks	51,143.00	
Interest on Other Securities, Loans and Accounts	2,065,327.68	
Rents—Received	402,547.04	
Hire of Equipment	272,635.87	
Miscellaneous	448,605.43	3,475,100.82
Gross Corporate Income		$30,081,656.22
Deductions:		
Interest Accrued on Funded Debt	$13,254,822.89	
Rents—Paid	765,362.80	
Miscellaneous	585,184.62	14,605,370.31
Net Corporate Income		$15,476,285.91

MILES OF TRACK, JUNE 30th, 1914.

Owned solely by this Company:		
Main track	9,578.48	
Second main track	924.95	
Third main track	21.72	
Fourth main track	13.11	
Connection tracks	45.13	
Yard tracks, sidings and spur tracks	3,083.07	13,666.46
Owned jointly with other Companies:		
Main track	102.90	
Second main track	5.59	
Third main track	1.94	
Fourth main track	1.93	
Connection tracks	4.98	
Yard tracks, siding and spur tracks	165.67	283.01
Used by this Company under contracts:		
Main track	305.92	
Second main track	64.81	
Third main track	1.14	371.87
Total miles of track		14,321.34

Average miles of main track in operation during the year:		
Owned solely	9,279.24	miles
Owned jointly	102.90	"
Used under contracts	301.81	"
Total average miles operated	9,683.95	miles

The lines of road of this Company are located in the following States:

Wisconsin	1,805.34	miles
Illinois	415.04	"
Iowa	1,867.17	"
Minnesota	1,233.39	"
North Dakota	379.93	"
South Dakota	1,794.87	"
Missouri	140.27	"
Michigan	179.97	"
Montana	1,051.86	"
Idaho	197.59	"
Washington	615.95	"
Total length of main track owned solely and jointly	9,681.38	miles

EQUIPMENT.

During the year thirty-three locomotives and two thousand eight hundred and thirty-one cars of various classes have been purchased or built as follows:

33 Locomotives	2732 Box Cars
3 Dining Cars	69 Cinder Dump Cars
10 Postal Cars	2 Pile Drivers
2 Office Cars	1 Track Scale Test Car
10 Mail and Baggage Cars	2 Bridge Derrick Cars

During the year sixteen locomotives and one thousand six hundred and eighty-three cars of various classes were destroyed by wreck or fire, sold or taken down on account of small capacity, as follows:

16 Locomotives	32 Ore Cars
3 Passenger Cars	32 Refrigerator Cars
1 Dining Car	9 Vegetable Cars
1 Baggage Car	15 Ballast Cars
7 Mail and Express Cars	18 Cahoose Cars
1257 Box Cars	15 Cinder Dump Cars
69 Stock Cars	41 Work Train Cars
183 Flat and Coal Cars	

The original cost of the equipment retired has been credited to Property Investment—Road and Equipment.

PROPERTY INVESTMENT—ROAD AND EQUIPMENT.

Equipment	$2,978,916.21
New Branch Lines adn Extensions	9,228,615.60
Construction of Second Main Track	10,573,229.72
Reducing Grade and Improving Line	1,336,633.08
Yard Improvements	762,778.97
Shop Improvements	544,540.79
Other Additions and Betterments	9,776,549.35
	$35,201,263.72
Credit—Property retired or converted	766,311.90
Total as shown by detailed statement on page 35 of this report	$34,434,951.82

IMPROVEMENTS AUTHORIZED.

EQUIPMENT

Authority has been given for the purchase or building of additional equipment as follows:

5 Locomotives, 10 Passenger Coaches, 16 Sleeping Cars, 1 Dining Car, 4 Parlor Cars, 2 Observation Parlor Cars, 2 Cafe Observation Cars, 2 Passenger and Baggage Cars, and 2 Mail and Baggage Cars.

ADDITIONAL MAIN TRACKS

Construction work has been in active progress during the year on the second main track and grade reduction work on the Chicago and Council Bluffs Division in Iowa, and on the Hastings and Dakota Division. Between October 1st, 1913, and July 1st, 1914, the unfavorable financial conditions caused a suspension of a large part of the work on the Hastings and Dakota Division and a portion of that on the Chicago and Council Bluffs Division in Iowa. Since July 1st, 1914, track laying has been resumed, and it is expected to have the Chicago and Council Bluffs Division in operation before winter between Green Island and Manilla, Iowa, a distance of 270 miles.

On June 30th, 1914, the following new sections of second main track were completed and are now in operation:

CHICAGO AND COUNCIL BLUFFS DIVISION IN IOWA—		
Green Island to one mile east of Delmar Junction	19.42	miles
Lost Nation to Elheron	80.31	"
Capron to Coon Rapids	86.02	"
Total	185.75	miles
HASTINGS AND DAKOTA DIVISION—		
Hennepin Ave., Minneapolis, to Hopkins	6.17	miles
Cologne to Glencoe	18.88	"
Hector to Bird Island	8.79	"
Wegdahl to Montevideo	3.12	"
Milbank to Aberdeen	99.98	"
Total	138.94	miles

AUTOMATIC BLOCK SIGNALS

Authority was given for the installation of automatic block signals on the line between Chicago and Minneapolis, and a portion of the line between

Minneapolis and Aberdeen, also on the line between Chicago and Manilla, Iowa, on the Chicago & Council Bluffs Divisions in Illinois and Iowa. About 60% of this work was completed during the fiscal year. It is expected that the balance will be completed by the close of the calendar year.

The installation of block signals heretofore authorized on the Puget Sound line and as set forth in the annual report of 1913, was completed and placed in operation during the year.

ELIMINATION OF GRADE CROSSINGS

The depression of tracks, for a distance of about three miles along the Hastings and Dakota Division, in the City of Minneapolis, extending from Hiawatha Avenue to Hennepin Avenue, contemplates the elimination of thirty-seven grade crossings. The work is now in progress, and is about 35% completed. It is expected to be entirely completed early in 1916.

The elevation of the tracks along the Bloomingdale Road, in the city of Chicago, a distance of about 2.4 miles, is progressing satisfactorily. When completed it will eliminate thirty-five grade crossings.

Elevation of tracks in the City of Milwaukee is in progress. This work which extends from Kinnickinnick Avenue to Fowler Street, and from Clinton Street to First Avenue, a distance of 1.4 miles, is about 15% completed, and will be continued over a period of two years. When completed, fourteen grade crossings will be eliminated.

The elevation of tracks on the Chicago and Evanston Division, from Montrose Avenue to Howard Avenue, Chicago, the northern city limits, a distance of about 4.4 miles, was begun in February of this year and is now about 15% completed. This work will extend over a period of three years, and will eliminate thirty-six grade crossings.

NEW LINES AND EXTENSIONS

The work on the extension from Crystal Falls to Iron River, Michigan, is practically completed. The main line and connections with the various iron mines have been completed, and are in operation.

The line from Lewistown to Great Falls, Montana, a distance of 137 miles, is practically completed, and will be opened for train service early in September.

Construction of the Choteau Line, extending from Great Falls to Agawam, Montana, a distance of 70 miles, has been temporarily suspended, and will not be completed before next season.

The lines from Hilger to Roy, Montana; from Roy Junction to Winifred, Montana; from Lewistown to Grass Range, Montana, and from Colorado Junction to Cliff Junction, Montana, have been completed and are in operation.

The line into Spokane, Washington, has been completed, and is in operation, this company having entire ownership of the line from Plummer, Idaho, to Bell, Washington, a distance of 21 miles, and joint use with Oregon-Washington Railroad & Navigation Co. of that Company's line from Bell to Spokane, Washington. In the City of Spokane, the terminal tracks and buildings and freight house are completed and in operation.

Work on the Newwood River Line, a logging road extending 17 miles northwesterly from Merrill, Wisconsin, was commenced in October, 1913. On June 30th, 1914, the grading was completed for about 8 miles and the track laid for about 4 miles.

TERMINAL YARDS

All of the improvements on the terminals and yards mentioned in last year's report were completed during the past year, and are now in operation.

TUNNELS

The construction of the Snoqualmie Tunnel, at the summit of the Cascade Mountains, is nearing completion, the work being carried on from both portals. At the present rate of progress the tunnel should be open for traffic shortly after the close of the calendar year. When completed, the line will be shortened 3.6 miles, practically all trouble caused by snow slides on the Coast Division will be avoided, and heavy grades will be eliminated.

ELECTRIFICATION

The work on the electrification of the Puget Sound Line was started in April, 1914, and on June 30th, 1914, thirty miles of poles were set and ready for wiring. It is expected that the work of stringing the wires from Three Forks to Deer Lodge will be completed by July 1st, 1915.

RESERVE FOR ACCRUED DEPRECIATION.

At the close of the fiscal year, ending June 30th, 1913, there was at the credit of Reserve for Accrued Depreciation the sum of $5,649,820.07.

A certain percentage of the total cost of equipment, aggregating $961,233.64, has been credited to this Reserve for accrued depreciation of locomotives, passenger train cars, freight train cars and work train cars.

There has been charged to this Reserve an amount of $212,263.81, representing the accrued depreciation, previously credited, on locomotives and cars destroyed, sold or taken down.

The balance of this Reserve, June 30th, 1914, as shown on page 22, is $6,398,789.90, which represents the estimated depreciation of rolling stock subsequent to June 30th, 1907.

FUNDED DEBT.

At the close of the last fiscal year the Funded Debt of the Company was $455,849,966.30.

It has been increased during this fiscal year by $154,489,500.00 General and Refunding Mortgage Bonds, issued in exchange for a like amount of Chicago, Milwaukee & Puget Sound Railway Company 4% Bonds, and by the issue of the following bonds for the acquisition of additional lines of railway and for additions and improvements to property: $16,424,000.00 General and Refunding Mortgage Bonds; $8,138,988.36 Chicago, Milwaukee & Puget Sound Ry. Co. 4% Bonds; $1,149,200.00 Convertible 4½% Gold Bonds; and $5,319,000.00 Twenty-five Year 4% Gold Bonds.

It has been decreased during this fiscal year by $154,489,500.00 Chicago, Milwaukee & Puget Sound Railway Co. 4% Bonds exchanged for a like amount of General and Refunding Mortgage Bonds.

The amount of bonds at the close of the year is $486,881,154.66, of which $153,572,500.00 are in the Treasury of the Company and $333,308,654.66 are outstanding.

TREASURY BONDS.

At the close of the last fiscal year the amount of the Company's bonds in its treasury was $156,295,211.64.

This has been increased during the year as follows:

General and Refunding Mortgage bonds issued in exchange for a like amount of Chicago, Milwaukee & Puget Sound Ry. Co. 4 per cent bonds	$154,489,500.00
Bonds issued for acquisition of additional lines of railway and for additions and improvements to property as follows:	
General and Refunding Mortgage bonds	$16,424,000.00
Chicago, Milwaukee & Puget Sound Ry. Company 4 per cent bonds	8,138,988.36
Convertible Gold 4½ per cent bonds	1,149,200.00
Total increase	$180,201,688.36

It has been decreased as follows:

Chicago, Milwaukee & Puget Sound Ry. Company 4 per cent bonds exchanged for a like amount of General and Refunding Mortgage Bonds	$154,489,500.00
General and Refunding Mortgage 4½% bonds sold	17,500,000.00
General Mortgage 4½ per cent bonds sold	9,741,000.00
Convertible Gold 4½ per cent bonds sold	1,193,900.00
Total decrease	$182,924,400.00
Net decrease	$2,722,711.64

At the close of this fiscal year, June 30th, 1914, bonds in the treasury amount to $153,572,500.00 as follows:

General and Refunding Mortgage	$153,413,500.00
General Mortgage 4 per cent	159,000.00
	$153,572,500.00

OPERATING REVENUES.

The Operating Revenues for the year were $91,782,690.74—a decrease of $2,301,363.95 compared with the previous year.

The revenue from freight traffic was $65,266,420.18—71.11% of total revenue—a decrease of $2,697,740.92 or 3.97%.

The number of tons of freight carried was 33,007,277—a decrease of 1,798,214 tons, or 5.17%.

The following classes of commodities show a decrease compared with the previous year: Products of Agriculture, 128,881 tons; Products of Animals, 6,940 tons; Products of Mines, 812,650 tons; Products of Forests, 148,321 tons, and Manufactures, 739,048 tons. There was an increase in Commodities Not Specified of 37,626 tons.

The number of tons of all agricultural products carried during the year was 7,162,250 tons—a decrease compared with the previous year of 1.77%. Agricultural products comprised 21.70% of the total tonnage carried, compared with 20.95% of the total tonnage of last year.

The number of tons of commodities other than agricultural products carried during the year was 25,845,027 tons—a decrease compared with the previous year of 1,669,333 tons, or 6.07%—the per cent of the total being 78.30% against 79.05% last year.

The number of tons of revenue freight carried one mile was 8,079,689,505—a decrease of 490,371,906, or 5.72%. The revenue per ton per mile was .8078 cent—an increase of .0148 cent, or 1.87%. The average miles each ton of revenue freight was carried was 244.79 miles—a decrease of 1.44 miles, or .58%.

The number of tons of revenue freight carried per loaded car was 16.498, against 16.776 last year—a decrease of 1.66%. The number of tons of revenue freight per freight and mixed train mile was 379.78, against 356.95 last year—an increase of 6.40%. The revenue from freight per freight and mixed train mile was $3.0678, as against $2.8308 last year—an increase of 8.37%.

The revenue from passenger traffic during the year was $18,961,224.58—20.66% of the total revenue—an increase of $504,089.07 compared with the previous year, or 2.73%.

The number of passengers carried was 16,426,016, an increase of 302,541 or 1.88%. The number of passengers carried one mile was 912,375,815—an increase of 50,146,132, or 5.82%.

The revenue per passenger per mile was 2.078 cents—a decrease of .063 cent, or 2.94%. The average miles each passenger was carried was 55.54 miles—an increase of 2.06 miles, or 3.85%.

OPERATING EXPENSES.

The Operating Expenses for the year were $61,330,061.17, a decrease of $1,553,906.43 compared with the previous year.

The expenses of Maintenance of Way and Structures were $10,704,519.01; Maintenance of Equipment, $13,112,977.98; Traffic Expenses, $1,799,609.65; Transportation Expenses, $33,960,581.52; and General Expenses, $1,752,373.01.

There was an increase in Maintenance of Way and Structures of $55,733.95 and in General Expenses of $349,361.09.

There was a decrease in Maintenance of Equipment of $759,007.49, in Traffic Expenses of $94,733.49 and in Transportation Expenses of $1,105,260.49.

During the year 43 steel bridges, aggregating 4,009 feet in length and 6 masonry bridges, aggregating 676 feet in length, were built—replacing 3,430 feet of wooden bridges, 1,013 feet of iron bridges and 242 feet of embankment; and 13,568 feet of wooden culverts were replaced with iron and concrete pipe. About 3.9 miles of pile bridges were filled with earth 90 bridges having been completely filled and 70 reduced in length by filling.

SUBSIDIARY COMPANIES.

The operations for the fiscal year ending June 30th, 1914, of the Subsidiary Companies named below—all of the Capital Stock of which is owned by this Company—show the following results:

These Companies are operated independently and their Revenues and Expenses are not included in the statement of the Chicago, Milwaukee & St. Paul Railway Company, shown on page 7 of this report.

TACOMA EASTERN RAILROAD COMPANY.

Operating Revenues		$581,265.64
Operating Expenses		442,703.72
Net Operating Revenue		$138,561.92
Taxes Accrued		39,473.10
Operating Income		$99,088.82
Rents Received	$18,174.02	
Hire of Equipment	27,858.13	46,032.15
Gross Corporate Income		$145,120.97
DEDUCTIONS:		
Interest Accrued on Funded Debt	$44,200.00	
Interest paid Chicago, Milwaukee & St. Paul Ry. Company	109,363.48	
Rents Paid	1,218.75	
Miscellaneous	1,717.22	156,499.45
Net Corporate Deficit		$11,378.48

BELLINGHAM & NORTHERN RAILWAY COMPANY.

Operating Revenues		$331,205.22
Operating Expenses		196,009.44
Net Operating Revenue		$135,195.78
Taxes Accrued		25,880.75
Operating Income		$109,315.03
Rents Received		3,297.90
Gross Corporate Income		$112,612.93
Deductions:		
Interest Accrued on Funded Debt	$30,303.87	
Sinking Fund	18,220.00	
Hire of Equipment	32.97	
Rents Paid	565.00	
Miscellaneous	780.00	49,901.84
Net Corporate Surplus		$62,711.09

GALLATIN VALLEY RAILWAY COMPANY.

Operating Revenues		$107,376.64
Operating Expenses		83,795.10
Net Operating Revenue		$23,581.54
Outside Operations—Net		1,812.32
		$25,393.86
Taxes Accrued		9,922.47
Gross Corporate Income		$15,471.39
Deductions:		
Interest paid Chicago, Milwaukee & St. Paul Ry. Company	$54,621.41	
Hire of Equipment	10,439.11	65,060.52
Net Corporate Deficit		$49,589.13

MILWAUKEE TERMINAL RAILWAY COMPANY.

Operating Revenues		$92,733.28
Operating Expenses		86,699.36
Net Operating Revenue		$6,033.92
Taxes Accrued		8,956.22
Operating Deficit		$2,922.30
Rents Received		25.00
Gross Corporate Deficit		$2,897.30
Deductions:		
Interest paid Chicago, Milwaukee & St. Paul Ry. Company	$33,064.36	
Rents Paid	1,040.56	
Hire of Equipment	210.00	34,314.92
Net Corporate Deficit		$37,212.22

BIG BLACKFOOT RAILWAY COMPANY.

Operating Revenues		$63,211.31
Operating Expenses		43,380.85
Net Operating Revenue		$19,830.46
Taxes Accrued		1,525.00
Operating Income		$18,305.46
Income from Non-Operating Property		50.00
Gross Corporate Income		$18,355.46
Deductions:		
Interest paid Chicago, Milwaukee & St. Paul Ry. Company	$20,166.24	
Hire of Equipment	14,867.84	
Rents Paid	5,306.54	40,340.62
Net Corporate Deficit		$21,985.16

IDAHO & WASHINGTON NORTHERN RAILROAD.

During the year, this Company acquired approximately 83% of the capital stock and all of the outstanding bonds and notes of the Idaho & Washington Northern Railroad, with the exception of sixty thousand dollars of first mortgage bonds, in exchange for its four per cent bonds.

The railroad of that company extends from a connection with this Company's Coeur d' Alene branch at McGuire, Idaho, to Metaline Falls, Washington, a distance of 106 miles, with a branch extending from Coleman to Clagstone Junction, a distance of about 7 miles. Its equipment consists of 13 locomotives, 9 passenger cars and 448 freight cars. Its railroad shops and equipment were built during the years 1907, 1908 and 1909, and are all of modern construction.

For details of operation, reference is made to the statements of the General Auditor, appended hereto.

By order of the Board of Directors.

August, 1914.

A. J. Earling, *President.*

GENERAL BALANCE SHEET.

ASSETS—June 30th, 1914.

Property Investment:		
Road and Equipment		$553,243,345.05
Reserve for Accrued Depreciation—Cr.		6,398,789.90
		$546,844,555.15
Securities:		
Securities of Controlled Companies—		
Unpledged:		
Stocks	$9,033,502.34	
Funded Debt	5,480,000.00	14,513,502.34
Other Investments:		
Advances to Controlled Companies for Construction, Equipment and Betterments	$31,971,333.27	
Miscellaneous Investments:		
Physical Property	482,833.18	
Investment Securities—Unpledged	51,082.05	32,505,248.50

Railway Age Gazette

Published Every Friday and Daily Eight Times in June by the
SIMMONS-BOARDMAN PUBLISHING COMPANY
Woolworth Building, New York

CHICAGO: Transportation Bldg. CLEVELAND: Citizens' Bldg.
LONDON: Queen Anne's Chambers, Westminster.

E. A. Simmons, *President*
L. B. Sherman, *Vice-President.* Henry Lee, *Sec'y & Treas.*
The address of the company is the address of the officers.

EDITORS
Samuel O. Dunn, *Editor*
Roy V. Wright, *Managing Editor*

W. E. Hooper, B. B. Adams, E. T. Howson, H. H. Simmons, H. F. Lane, R. E. Thayer, A. C. Loudon, C. B. Peck, C. W. Foss, F. W. Kraeger, K. L. Van Auken, E. G. Zack, George L. Fowler

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico.....$5.00
Canada.....6.00
Foreign Countries (excepting daily editions).....8.00
Single Copies.....15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention daily issues, North America, $1; foreign, $2.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue 8,950 copies were printed; that of these 8,950 copies 7,395 were mailed to regular paid subscribers to the weekly edition, 250 were provided for counter and news companies' sales, 1,101 were mailed to advertisers, exchanges and correspondents, and 204 were provided for samples and office use; that the total copies printed this year to date were 383,900, an average of 9,363 copies a week.

Trade Opportunities in South America

At the request of the *Railway Age Gazette*, F. Lavis has written an article on Trade Opportunities in South America, which is published elsewhere in this issue. The article is especially intended to show what are the openings for the sale of American railway supplies in the markets of South America, what difficulties must be overcome in winning these markets and how this may be done. Mr. Lavis is well fitted to discuss this subject, for until quite recently he was engaged in railway engineering work in Argentina, and his thorough knowledge of conditions in that country, especially, was shown by his articles on the railways of Argentina, published in the issues of the *Railway Age Gazette* for March 27 and April 3, 1914. Mr. Lavis is not entirely optimistic regarding the opportunities for the early development of a large market for American manufacturers in South America, but with respect to the general subject neither is he at all pessimistic. He believes there is a large potential market to the south of us which our manufacturers of railway supplies and other articles can capture if they will undertake to do so systematically and persistently, and can secure the co-operation and support of the large financial interests of this country. Mr. Lavis' article is one of the best discussions of the subject that have appeared, and will well repay a careful reading by those interested in the matter.

Safety First in Motion Pictures

On the New York Central, the Lackawanna, the Santa Fe and the Burlington "Safety-first" is henceforth to be taught by means of a love story, embellished with a suitable percentage of smiles and kisses to produce the proper effect, according to the latest efficiency tables of Taylor and Emerson. It is to be done by a motion-picture exhibition, which has been prepared by Mr. Dow of the New York Central, and a description of which the reader will find on another page. At first thought this might seem to be a rather light and questionable treatment of a very serious subject; but love and tragedy are skilfully combined, and no one who sees Mr. Dow's pictures will question their effectiveness. Surely, no one who has noticed the romances and the very readable pages of domestic fiction which fill some of the brotherhoods' monthly magazines can doubt that railway employees appreciate matters of "human interest." The safety-first movement is essentially one which depends on exhortation and appeal, rather than on systematic commands and instruction; and arguments addressed to the emotions, rather than to the intellect alone, are wholly legitimate. And the men who can derive the most benefit from this movement are, probably, the freight train men; those from whose everyday life the lessons here shown have been taken. For women and children and for general audiences, some of the scenes are of a pretty startling character, bordering on the class which, in ordinary shows, has been condemned in some quarters as too harrowing; but for men who work about trains and in freight yards the lessons are none too vivid. For, in sober truth, most of these men, for some reason or other, do not fully realize what a considerable percentage of their fellow-workmen are killed or injured by carelessness each year.

Increase in Mileage Book Rates

That the members of the Illinois Commercial Men's Association are not unanimous in opposing the advance in rates for passenger mileage books, and that the secretary of that organization apparently is individually responsible for the circular letter containing blank forms of protest to be filled out and sent to the Interstate Commerce Commission, which was discussed in our last week's issue, is indicated by another letter on the subject by Lorenzo Norvell, of Fairbanks, Morse & Co., which is published elsewhere. In the meantime, moreover, the Interstate Commerce Commission has allowed the increase to go into effect on October 1, without suspension, subject to investigation on any complaint that may be filed. This was no more than fair, since the suggestion for increasing passenger rates came from the commission itself. Mr. Norvell enters a most emphatic protest against the attempt to incite the commercial travelers into a movement against the increase, and proposes to institute a counter-campaign by sending copies of his letter to the press and to other large firms that he feels are in accord with him on this subject. His action suggests

an opportunity for those who believe that the prosperity of the country will be enhanced by improving the condition of the railways. Mr. Norvell cites some very strong reasons why commercial houses and traveling salesmen, instead of considering that they are to be the victims of the increased cost of mileage books, should be among the first to aid in placing the railway passenger service on a paying basis. He says, "Our great need today is service. We want trains in plenty to enable traveling men to get over their territory quickly without loss of time. We also want our freight handled promptly, and when we get service we should be fair enough to pay for it." That sums up the whole argument. He adds that he cannot see why traveling salesmen should get a better rate on transportation than individuals, especially when in nine cases out of ten their firms pay their expenses. It is often said that mileage books should be sold at a lower rate than single tickets, on the principle that wholesale prices should be less than retail, and this idea is still recognized in the new rate. While the mileage book rate has been advanced from 2 to 2¼ cents the roads are preparing to advance their ordinary rates to 2½ cents, so that the mileage book rate will still represent a 10 per cent discount. But the principle of wholesale rates is based on the fact that the cost of wholesale service is less than that of retail service. In the case of mileage books the only reduction in cost to the railways lies in the sale of a book at one time instead of numerous tickets, and in the prepayment. The service rendered to those travelers making use of mileage books is in all other respects a retail one.

THE YARDMASTER AN EXECUTIVE

ONE fact which deserves special emphasis, and which is brought out by several contributors to the discussion of the Operation of Terminal Yards, some of whose papers are published elsewhere in this issue, is that the general yardmaster in charge of an important terminal is an executive officer who should be freed of petty details and clerical duties to a large extent, so that he will be able to spend a large portion of his time out in the yard, where the work is being done and the money spent.

It is only by being free to go from one point of local congestion or difficulty to another that he can direct operations most intelligently, and it is only in this way that he is able to secure a first-hand knowledge of the exact conditions in the yard and is able to improve practices to the end that a high standard of efficiency may be maintained. The yardmaster who permits himself to be tied to his desk continuously by clerical duties reduces himself very largely to the rank of a clerk, while the railroad company which requires him to devote a large portion of his time to such work is paying a yardmaster's salary for no more than a clerk's work.

It is generally observed that the yard is best operated in which the yardmaster appears to have the least to do with the handling of routine business. By this it is not meant to imply that he should have no actual duties, but it is distinctly to his credit if he so organizes his forces that routine work requires only his casual attention. It has been said of the late E. H. Harriman that he considered that a man who would allow his deck to become stacked up with papers was not fit for an important executive position since, in allowing himself to be buried in a mass of details, he overlooked the larger opportunities. The same criterion can be applied to the work of a yardmaster. If he is engrossed in a multitude of routine details, he will not observe a congestion arising in some portion of his yard until it has become so serious as to affect the operation of the entire yard.

The analogy drawn by one contributor between a yard and a stream of water is pertinent. Let any facility of a yard, even one classification track, become congested and the effect is soon felt in all other parts of the yard. The serious blockade of 1907 in the terminal district of Chicago was caused by the inability of two or three roads to accept interchange traffic from connecting lines because of lack of facilities, and the ultimate result was that practically every road in that district was blocked with traffic which it was unable to deliver to other lines.

The larger the yard the greater is the necessity for the general yardmaster to be free to observe conditions. Entirely aside from the advantage discussed above, close supervision is a most potent factor in the elimination of expensive switching practices and the introduction of economical methods.

HANDLING LESS THAN CARLOAD SHIPMENTS THROUGH THE FREIGHT HOUSE

IN a recent issue of the *Railway Age Gazette* a description was published of an investigation of freight house conditions in Boston. Other cities have encountered many problems pertaining to the handling of merchandise shipments through the local freight houses, and our attention has been called to a method of improving conditions in this respect which has proved successful in St. Louis.

A few years ago complaints from shippers concerning the handling of less-than-carload shipments at the local freight houses became so numerous that the Traffic Bureau of the Business Men's League of St. Louis made an investigation. It was found that it was the custom of all the carriers to compel shippers to peddle their outbound shipments from door to door at each freight house so that the freight might be trucked across the platform as directly as possible, to the car into which it should be loaded in station order, and to wait indefinitely for a receipt. In some cases this required resetting of a wagon from eight to ten times in order to dispose of a single wagon load for a single station.

The shippers felt that this was an unreasonable burden and that it would be mutually advantageous if the carriers would provide arrangements for discharging entire wagon loads at some door designated for the purpose. A standing committee was appointed representing all of the local agents of the railways at St. Louis and East St. Louis, to work with a like committee representing the shippers in connection with the bureau.

As a result of the joint work of this joint committee there was established at all freight houses what is termed the "one-dump" system; that is, the shippers are permitted to discharge their entire wagon loads at a door designated by the freight house foreman. The freight is immediately checked and receipt given, thus avoiding delay to the drayage facilities of the shippers. Through the committee from time to time all of the various details with respect to receiving, checking, loading, issuing receipts, and other incidentals to the handling of freight shipments which might cause friction or controversies, have been thrashed out.

As an aid to the committee in determining from day to day the conditions at the freight houses, the Traffic Bureau of the Business Men's League has a station service inspector who reports daily the general conditions so that the standing committee may be called together if necessary.

It is stated that the system is now working so smoothly that the standing committee has had very little to do for the past two years; and the results obtained have been due to the practical and earnest co-operation of the shippers and carriers through representatives having an intimate knowledge of all the details and conditions. This is but another example of the advantages to be derived from such co-operation between the railways and the shippers, which is rapidly taking the place of the old condition of protracted controversy. The results obtained in the city of St. Louis may perhaps prove an object lesson to many other cities that have been struggling with the freight house problem.

DENVER & RIO GRANDE

INSTEAD of the usual rather perfunctory thanks to officers and employees with which so many annual reports close, Mr. Bush concludes his letter of transmittal accompanying the Denver & Rio Grande annual report for the fiscal year ended June 30, 1914, by saying: "The company and its officers have undertaken to warrant the confidence of the peoples served so that the relations between all are established on sound, substantial principles." This was not always the attitude of the management of the Denver & Rio Grande, and it is, therefore, all the more noteworthy. The figures in an annual report cannot, of course, directly reflect progress in the undertaking "to warrant the confidence of the peoples served"; nevertheless, it has been the pretty general rule, especially in recent years, that good operating results have gone hand in hand with better service. There are plenty of theoretical exceptions to this, but in practice the economically managed road gives good service and any number of examples could be cited—the Delaware, Lackawanna & Western, the Chicago & North Western, the Buffalo, Rochester & Pittsburgh, the Union Pacific, the Burlington, etc.

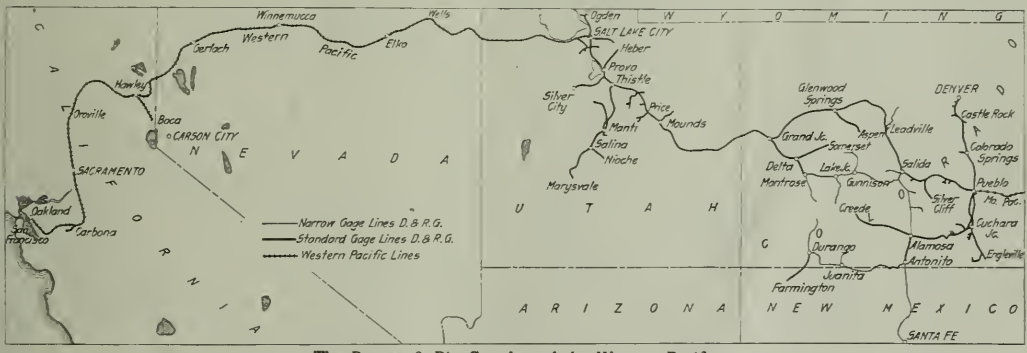
In 1914 the Denver & Rio Grande's earnings amounted to $23,167,000, or 5.26 per cent less than in 1913. This was the result of a reduction of 4.80 per cent in passengers carried one mile and 6.23 per cent in tons carried one mile. The falling off in business, however, was accompanied by a decrease of 8.19 per cent in passenger-train miles and 17.04 per cent in freight-train miles. Notwithstanding, therefore, unusually heavy snow, followed later in the year by unusually heavy rains, transportation expenses amounted to $7,249,000, a decrease of $489,000, or 6.32 per cent, from the corresponding expenses of 1913. The saving in transportation expenses was in greater part directly due to a saving in train mileage. The saving in train mileage, disproportionately larger than the falling off in business, was the result of a larger revenue trainload—337 tons in 1914 as against 305 tons in 1913, a gain of 10.57 per cent—and 66 passengers on an average per train as against 64 in 1913, a gain of 2.50 per cent. In addition to the larger revenue trainload there was also more company freight—52 tons as against 40 tons—carried per train, so that the total trainload was 390 tons in 1914 as against 345 tons in 1913. All of the gain in trainload was made in adding cars, the carloading per loaded car being about the same in each year—23 tons. The average number of loaded cars per train was 17, as against 15, and the empty cars 7.6 as against 6.7. The percentage of loaded car-miles to total car-miles was 66.23 in 1914 and 66.35 in 1913. In view of all the conditions this is certainly a very creditable record.

The Denver & Rio Grande operates a total mileage of 2,585 miles, of which approximately 1,795 miles is standard gage and 769 miles narrow gage. There is in all about 197 miles of second-track and 700 miles of sidings and spur tracks.

The Denver & Rio Grande forms a connecting link in the Gould transcontinental system between the Missouri Pacific, with its western terminus at Pueblo, Col., and the Western Pacific, with its eastern terminus at Salt Lake City, Utah. The part of this route formed by the Denver & Rio Grande and Western Pacific is, however, a very mountainous one. On competitive business, therefore, both passenger and freight, the Denver & Rio Grande is at a disadvantage when compared with the Union Pacific, Northern Pacific and Great Northern on the north, and with the Southern Pacific on the south, although, of course, the Grand gorge scenery is a real asset insofar as passenger business is concerned. On the other hand, the Denver & Rio Grande taps resources of the wonderfully rich state of Colorado, which no other railroad has access to. The local business in precious ores, fruit and vegetables is expensive to handle, but is the real backbone of the Rio Grande's earnings.

Of the total 11,230,397 tons of freight carried in 1914, 38 per cent was precious ore and 29 per cent bituminous coal, 5 per cent was products of agriculture and fruit, and 6 per cent manufactures. Because of the nature of the traffic the ton-mile rate on the Denver & Rio Grande is good—1.201 cents in 1914. The passenger rate, however, is low—2.04 cents in 1914.

The Denver & Rio Grande used its credit in helping to build the Western Pacific. The Western Pacific was opened in July, 1911. It was built avowedly, because in competition with the Union Pacific the Denver & Rio Grande was at a disadvantage for California business. This ambition to share in through transcontinental business was the hope of a traffic man rather than an operating man. It is one thing to be able to solicit through business and quite another to be able to handle it economically and expeditiously. With its grades and location the Denver & Rio Grande is at a disadvantage wholly regardless of its relations with roads to the east and west of it. The following table shows the percentage of each class of traffic in 1911 to 1914:



The Denver & Rio Grande and the Western Pacific

	1914	1913	1912	1911
Products of agriculture	5.3	5.4	4.9	3.9
Products of animals	1.6	1.4	1.2	1.1
Products of mines	80.9	79.9	82.6	84.2
Products of lumber	2.2	2.8	2.3	3.9
Manufactures	5.9	6.3	5.5	5.5
Merchandise	1.7	1.7	1.6	1.3
Miscellaneous	2.4	2.5	1.9	1.6

Neither the percentages of the various classes of traffic nor the actual tonnage figures would indicate that the Western Pacific had brought a great deal of through business to the Denver & Rio Grande. The tonnage of fruit shows a steady increase from 106,000 tons in 1911 to 146,000 in 1913, with a slight falling off in 1914; but no great part of this fruit tonnage is furnished by California, most of it being Colorado fruit shipped east, and the growth in traffic is due to the growth in production in the state of Colorado, the falling off in 1913, when there was a bad fruit year in Colorado, bearing out this assumption.

This brings us back to President Bush's statement about the establishment of confidence between the people served and the railroad. The Denver & Rio Grande is essentially a local and originating and distributing road. It originates traffic for the Missouri Pacific and distributes traffic delivered to it by the Missouri Pacific; but its success depends very largely on the

prosperity of Colorado, and to a less extent on that of Utah. The recognition of this fact by the present management of the road is a significant and hopeful sign.

The Denver & Rio Grande in 1914 spent $1,938,000 for additions and betterments. No bonds were sold and the funded debt was decreased by $321,000 through the redemption of a small block of first and refunding 5's and the payment of $150,000 maturing equipment trust obligations. No dividends were paid on either the preferred or common stock, so that the entire $1,056,000 surplus from income account was credited to profit and loss. The cash on hand at the end of the year amounted to $2,607,000, $258,000 more than at the beginning of the year, and the amount loaned to the Western Pacific by the Rio Grande increased from $593,000 to $2,420,000. In addition there is now $3,125,000 interest due on the Western Pacific's second mortgage bonds, all held by the Rio Grande, which is unpaid. There were no Denver & Rio Grande loans and bills payable at the end of the year, and total working liabilities amounted to but $3,677,000, $240,000 less than at the beginning of the year.

The Western Pacific earned $6,100,000 in 1914, or $74,000 less than the previous year, and had operating expenses of $4,996,000, or $517,000 more than the previous year. After the payment of taxes the company had $322,000 available for interest charges as against $1,040,000 the year before. It will be seen, therefore, that the Denver & Rio Grande had to advance the Western Pacific about $2,200,000 to pay the interest charges on the Western Pacific's $50,000,000 first mortgage 5 per cent bonds.

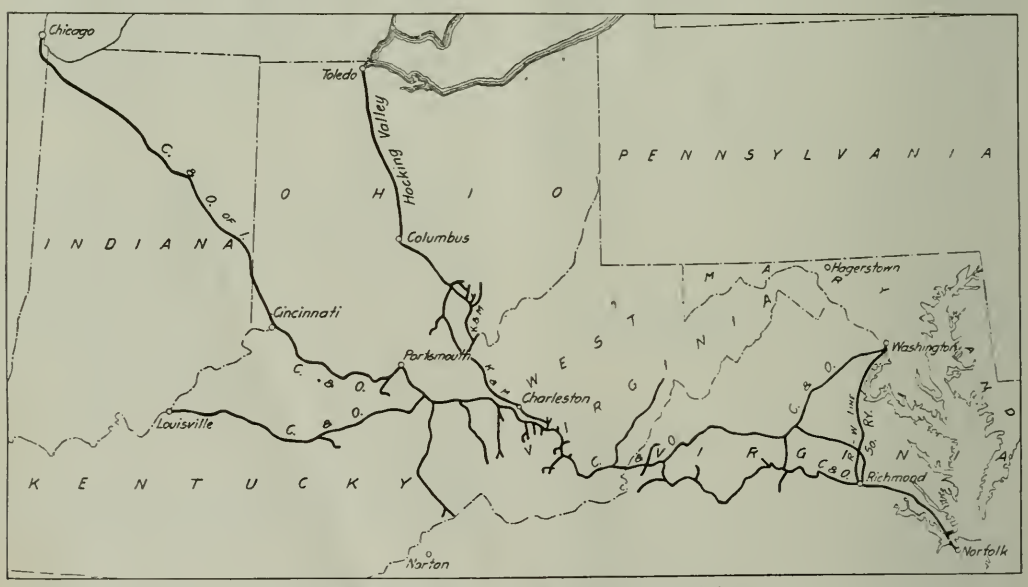
The following table shows the principal figures for operation in 1914 and 1913:

	1914	1913
Average mileage operated	2,583	2,555
Freight revenue	$17,058,080	$18,078,140
Passenger revenue	5,077,408	5,299,081
Total operating revenues	23,167,051	24,452,965
Maint. of way and structures	3,393,968	3,545,938
Maint. of equipment	4,245,325	4,538,231
Traffic expenses	497,431	546,432
Transportation expenses	7,249,240	7,738,496
General expenses	632,231	678,055
Total operating expenses	16,018,196	17,047,172
Taxes	1,009,144	948,739
Operating income	6,123,564	6,450,560
Gross income	7,386,498	7,698,498
Net income	1,400,375	2,094,180
Appropriations to sinking funds	263,889	247,808
Appropriations for additions and betterments	80,928	389,000
Surplus	1,055,559	1,457,372

CHESAPEAKE & OHIO

WHEN control of the Chesapeake & Ohio was bought in 1909 it was figured that the property could earn on an average of about 10 per cent on its stock. Since 1910 unforeseeable increases in wages and taxes accumulated until they now aggregate about 4½ per cent a year on the stock. If, therefore, the estimate of 1909 of the investors in Chesapeake & Ohio stock was correct, the company would have earned approximately 5½ per cent on its stock in the fiscal year ended June 30, 1914, and the fact that it actually earned but 4.73 per cent would indicate either that the original 1909 estimate was a little too high or that there were temporary causes adversely affecting net income which may under ordinary circumstances be expected to be no longer effective.

Operating revenue was greater in 1910 than in 1905 by 50 per cent, or an average increase of a little less than 10 per cent per year. From 1911 to 1914 the average yearly increase in operating revenues was only between 3 and 4 per cent. Total operating revenues in 1914 amounted to $36,690,000, an increase of 4.57 per cent over 1913. The question then is as to whether the 4½ per cent increase in gross in 1914, which is slightly larger than the average since 1911, but only half of the average from 1905 to 1910, may be considered normal in estimating future earning power.*



The Chesapeake & Ohio System and the Kanawha & Michigan

During the years 1911 to 1914, because of particular problems and circumstances, the Chesapeake & Ohio has not shared to the extent that it ought in the increase in general business, especially in coal business. It did not share in the increase in tidewater coal business, which has apparently been so profitable to the Norfolk & Western, because the Virginian's competition cut into this business and because both the Virginian and the Norfolk & Western had far better facilities for dumping coal into vessels at tidewater than had the Chesapeake & Ohio; and, furthermore, the Chesapeake & Ohio could not keep its coal cars on its own lines at the very times that it needed them most when there was the largest amount of coal pressing for shipment to tidewater. The Chesapeake & Ohio could not share in the full increase in the lake coal movement partly because of

*A break is made in this comparison between 1910 and 1911 because 1911 is the first year in which the earnings and expenses of the Chicago line are included. By comparing 1910 with 1905 and 1914 with 1911, like is compared with like.

congestion on western connections, especially the Cincinnati, Hamilton & Dayton at Cincinnati; partly because its own Chicago line, which was bought to develop general business rather than coal business, probably was not in physical shape to economically handle much coal business, and partly because of the uneconomical way in which the Chesapeake & Ohio had to route coal to Toledo. Shortage of cars also prevented the company from fully sharing in the increase in coal business in its territory. With these disabilities removed it appears quite safe to say that 4 per cent increase in operating revenues is very materially less than a normal increase.

The company has been building and put in operation on June 1, 1914, a new all-steel dumping pier at Newport News. This pier cost about $1,630,000, and has a capacity of 5,000 tons per hour. The completion of this pier not only removes the disability under which the Chesapeake & Ohio had been laboring in regard to tidewater coal business, but gives it facilities that are even more modern and of greater capacity than either of its competitors. On the other end of the line a project has just been started which should give the road an economical outlet for lake coal that will both make it independent of the congestion on connections at Cincinnati and give it a far better division of the rates than it is now getting on coal which moves over the Kanawha & Michigan to the Hocking Valley. During the past two years the Chesapeake & Ohio has also added very largely to its equipment.

The new outlet to the lakes is to be furnished by a line which is being built from Portsmouth, Ohio, on the main line of the Chesapeake & Ohio, to Columbus, Ohio, on the main line of the Hocking Valley. This line is being built under the direct supervision of M. J. Caples, who built the Carolina, Clinchfield & Ohio, which argues well, therefore, for its being an economical line to operate.

Total operating expenses on the Chesapeake & Ohio in 1914 amounted to $25,654,000, an increase over 1913 of $1,202,000. This is an increase of 4.92 per cent, with an increase of 9.2 per cent in passenger mileage and 5.5 per cent in revenue ton mileage, with, however, an increase of but 0.2 per cent in passenger-train mileage and 2.3 per cent in freight-train mileage. The greater part of the increase in expenses was in transportation. These expenses in 1914 amounted to $12,168,000, an increase over 1913 of $787,000, the largest increases being $132,000 in payments for loss and damage to freight, $99,000 in fuel for road locomotives, $96,000 in station employees and $74,000 in yard conductors and brakemen. These increases are by no means necessarily permanent; in fact, with the exception of station employees, it would seem as if the company might reasonably expect to increase transportation expenses only slightly more than in proportion to the increase in revenue train-mileage.

Maintenance of way expenses amounted to $4,138,000 in 1914, a reduction of $205,000, largely because of a smaller rail renewal and smaller expenditures on track labor, tie renewals having increased, however. Maintenance of equipment cost $7,693,000, an increase of $417,000. Maintenance of equipment expenses were extraordinarily high because up till about a year ago there was so large and pressing a demand for cars, especially coal cars, and so many cars were off the line, that as soon as the demand became more normal and cars began to return from the west, an extensive repair program was entered on.

If the above conclusions are right, the Chesapeake & Ohio had a smaller gross and larger expenses in 1914, because of particular circumstances and conditions which have been or are being changed. Just how much difference this would make in the net income available for dividends, it is, of course, impossible to say. It ought to be more than one per cent on the stock. The faith of the owners in the property is shown by their willingness to postpone dividends in order that the surplus which belongs to them may be invested in betterment of the property.

Interest charges in 1914 were more by $615,000 than in 1913. Part of this increase was due to the refunding of $28,000,000 notes, of which $25,000,000 were 4½ per cent and the remainder 5 per cent, by the sale of $33,000,000 5 per cent notes and by the interest charges on equipment contracts. The interest on the new $33,000,000 notes began in March, whereas the interest on the notes retired did not cease until June 1. There was, therefore, an overlapping of interest charges, so that in 1915 interest charges ought not to be any higher, if as high, as in 1914, despite the fact that interest for the full year will, of course, be called for on the new notes.

There has been a great deal of money spent on expansion and betterment of the Chesapeake & Ohio since 1909. On the other hand, the financing of this expansion and betterments, that is, the issue and sale of securities against this new investment in property, has been notably conservative. In the five years since 1909 the property has been extended through the purchase of stocks of other companies, principally the Chesapeake & Ohio of Indiana (the Chicago line), the Hocking Valley and a part interest in the Kanawha & Michigan, at a cost of $21,506,000, to which should be added the cost of the bonds of the Chicago line and of the Elkhorn & Beaver Valley, $6,381,000, and other properties bought outright, $4,193,000. In addition, during these five years $15,692,000 has been spent for additions and betterments, including 173 miles of second-track, and $16,875,000 net for new equipment. This is a total of $64,646,000. Against this expenditure there has been issued net, including the new $33,000,000 5 per cent collateral notes, but $54,888,000.

The company had falling due on June 1, 1914, $28,500,000 notes. In March an arrangement was made for refunding these notes through the sale of $33,000,000 5-year 5 per cent notes. The company pledged itself to spend out of net income $17,000,000 during these five years for additions and betterments, this expenditure to be made prior to any dividend payments. In other words, the stockholders agreed to, if necessary, sacrifice a part or all of their 4 per cent dividend (the rate paid in 1914) in order to make a further investment in the property as an added margin of safety behind the first lien and improvement mortgage bonds which are the collateral security for the $33,000,000 notes.

At the time of the purchase of the majority stock of the Hocking Valley the Chesapeake & Ohio also bought a half interest in the majority stock of the Kanawha & Michigan. The Lake Shore & Michigan Southern owned the other half interest. The cost to the Chesapeake & Ohio of its Kanawha & Michigan stock was $2,901,000. This purchase was the subject of litigation, and in March, 1914, the United States district court held the ownership of the Kanawha & Michigan control by the Lake Shore and the Chesapeake & Ohio as a violation of the Sherman anti-trust law. Valuable as is the Kanawha & Michigan, control of the half interest in it, except as an investment, was not particularly advantageous to the Chesapeake & Ohio, and rather than fight the suit through to the Supreme Court, the company agreed to sell its Kanawha & Michigan stock to the Toledo & Ohio Central, which is controlled by the Lake Shore & Michigan Southern. During the time that the Chesapeake & Ohio held this stock it had appreciated materially in value and the company sold it for $4,029,000, realizing a profit of $1,100,000. This stock was pledged under the first lien and improvement mortgage, and the proceeds of the sale will, therefore, be available for additions and betterments or other capital purposes permitted by the mortgage securing these bonds. With the building of the connection between the Chesapeake & Ohio and the Hocking Valley the necessity for a voice in the management of the Kanawha & Michigan will have entirely disappeared.

At the beginning of 1914 the company had on hand $2,928,000 cash, with total working assets, including this cash, of $6,468,000. There were $95,000 loans and bills payable, and a total, including the bills payable, of $5,228,000 working liabilities. On June 30, 1914, the company had $1,793,000 cash, total working assets being $5,979,000, the same $95,000 loans and bills payable, with total working liabilities of $5,774,000. As of June 30, 1914, however, the sale of the Kanawha & Michigan

stock had not been consummated. Payment for this stock is to be made $2,000,000 in cash and the remainder by note maturing September 1, 1915.

The table shows the principal figures for 1914 and 1913:

	1914	1913
Average mileage operated	2,346	2,319
Freight revenue	$28,866,516	$27,549,696
Passenger revenue	6,098,059	5,858,138
Total operating revenues	36,690,021	35,085,278
Maint. of way and structures	4,138,092	4,342,745
Maint. of equipment	7,692,748	7,275,439
Traffic expenses	669,283	669,016
Transportation expenses	12,167,906	11,380,998
General	985,909	783,362
Total operating expenses	25,653,937	24,451,560
Taxes	1,330,935	1,375,863
Operating income	9,705,149	9,257,855
Gross income	11,859,681	11,483,392
Net income	2,971,816	3,298,503
Dividends	2,511,264	3,139,080
Surplus	460,552	159,423

ATCHISON, TOPEKA & SANTA FE

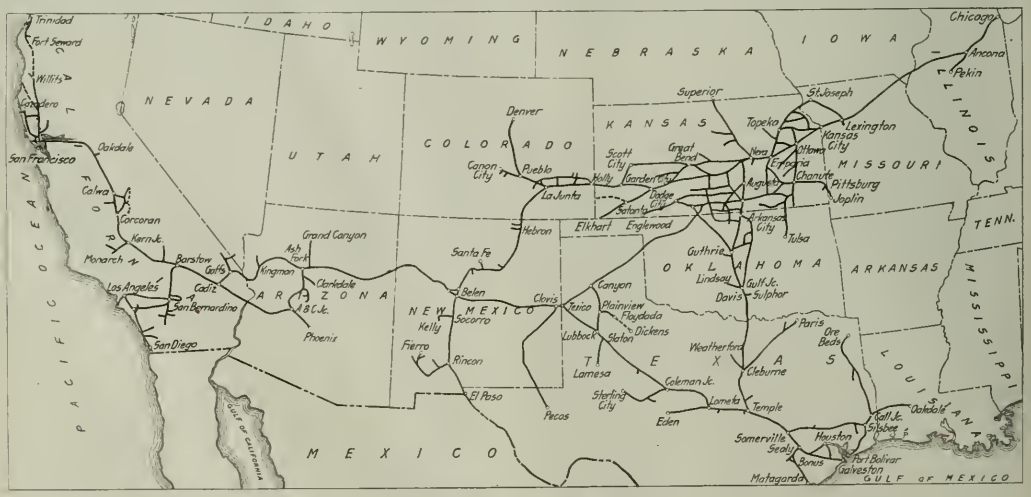
THE Atchison, Topeka & Santa Fe has been one of the few railroad companies which have continued expenditures for extensions in the past few years as well as expenditures for additions and betterments. This was so because the Santa Fe had very extensive work in hand when the present period of depression in the railroad business began and it was of utmost importance that this work should be carried to completion so that a return might be had on investment already made. Even in the fiscal year ended June 30, 1914, $2,673,000 was spent for construction and acquisition of new mileage, in addition to $13,284,000 spent for additions and betterments and additional equipment. The net increase in the property account after making adjustments for reduction in book values was $11,165,000. In President Ripley's opinion it has now become prohibitively difficult to borrow new capital for a railroad company such as the Atchison, Topeka & Santa Fe. President Ripley says in his annual report to stockholders: "Under these conditions it is the intention of your directors to make no additions or betterments, however desirable, which cannot be paid for out of current earnings, and to continue the policy of incurring no floating debt." In 1914 the surplus current earnings available for expenditure on additions and betterments or extensions, after the payment of interest charges and dividends, was $2,719,000. It will be seen, therefore, how radical and drastic would be the change in the course of the Santa Fe if increased earnings do not make available a larger sum than $2,700,000 for additions and betterments, or if there is no change for the better in money conditions which will warrant a change of policy on the part of the management.

The Atchison, Topeka & Santa Fe operates 10,909 miles of road and the increase in mileage from 1913 to 1914 was 190 miles. During the years from 1897 to 1914 the average earnings per mile of road operated have grown from $4,752 in 1897 to $10,186 in 1914.

If one will stop to think what this development of the Santa Fe has meant to the territory which it serves it will be easy to see how vastly important it is to the future development of this country that a continuation of development of this and other great railroad properties may be made possible. As President Ripley says, the development of the Atchison, Topeka & Santa Fe business and of its efficiency has been due principally to the very large expenditures (over $298,000,000) which have been made in the extension and improvement of the property since January 1, 1896.

The 1914 annual report of the Santa Fe contains a very striking table showing the property investment, income applicable to bond interest, dividends, improvement of property and strengthening of credit, and the per cent of this income to property investment. In 1897 the total property investment, excluding working capital, amounted to $387,957,000, and the income for that year amounted to 1.57 per cent on this investment. By 1907 property investment had increased to $519,004,000 and the income to an amount equal to 6.31 per cent on this investment. In 1909 total property investment was $548,251,000 and income $33,535,000, or 6.11 per cent. In 1914 property investment was $651,429,000, an increase of more than $100,000,000 since 1909, while income was but $33,070,000, or slightly less than in 1909 and represented but 5.08 per cent on the investment.

The fiscal year 1914 was not a prosperous one for the Santa Fe. Total operating revenues amounted to $111,110,000, a decrease of $5,786,000 from the revenues of 1913. Operating expenses amounted to $73,469,000, a decrease of $4,173,000. By far the greater part of the decrease in revenues was caused by a falling off in freight business. The total tonnage carried in 1914 was 25,034,000 tons, or only a comparatively small number of tons less than in 1913 (25,062,000 tons). On the other hand, the average length of haul was but 292 miles in 1914 as against 311 miles in 1913. The tonnage of products of mines in 1914 was 10,244,000 tons; in 1913, 9,334,000 tons. This tonnage is comparatively short-haul business. The tonnage of products of agriculture amounted to 5,000,000



The Atchison, Topeka & Santa Fe

tons in 1914, or 19.97 per cent of the total tonnage, and in 1913 to 5,237,000 tons, or 20.90 per cent of the total tonnage. Lumber and forest products furnished 2,164,000 tons in 1914, or 8.64 per cent of the total tonnage, and in 1913, 2,627,000 tons, or 10.48 per cent of the total tonnage. The proportionate amount of l. c. l. tonnage of merchandise on the Santa Fe is large. In 1914 1,499,000 tons, or 5.99 per cent of the total tonnage, was merchandise; in 1913, 1,563,000 tons, or 6.24 per cent of the total tonnage.

It was impossible to reduce operating expenses to an amount that would offset the decrease in business. The reduction in operating expenses of $4,173,000 was effected through a smaller expenditure for maintenance of way by $2,746,000, and a reduction in transportation expenses of $1,317,000. Detailed expense accounts show that the principal reductions in maintenance of way were in the amount spent for track labor, for bridges, trestles and culverts, and for buildings, for fixtures and grounds.

The economies in transportation expenses were due, apparently, to a reduction in freight-train mileage, which reduction, however, was not quite commensurate with the falling off in ton mileage. The decrease in ton mileage was 8.07 per cent; the decrease in freight-train mileage, 6.98 per cent. The average trainload in 1914 was 420 tons and in 1913, 425 tons; the average carload per loaded car, 18.75 tons in 1914 and 19.14 tons in 1913.

No additional securities were sold by the Atchison, Topeka & Santa Fe in 1914 and interest charges were reduced by $939,000 through the conversion of $4,975,000 4 per cent bonds into stock. At the beginning of 1914 there was $30,096,000 cash on hand, with, of course, no loans or bills payable and total working liabilities of $13,024,000. At the end of the year there was $20,063,000 cash, with total working liabilities of $10,413,000. If the income statement of the Santa Fe were as satisfactory as its balance sheet there would be no need for President Ripley's warning to stockholders. The Santa Fe is in a sounder position, insofar as the relation of the amount of its debt to its stock is concerned, than most other roads. At the end of 1914 there was $309,985,000 stock outstanding and $313,194,000 bonds.

The following paragraph in President Ripley's letter of transmittal of the annual report is worthy of most careful consideration:

"Your directors feel that heavy responsibilities devolve on them in the present state of governmental activities directed at the railroad industries. It has been found almost impossible to make even an approximate estimate of the cost of 'regulation' which has been imposed on us by the state and national governments. Without criticizing the policy of proper supervision, it is fair to say that many of the laws are not only expensive, but in the opinion of your officers unnecessary and superfluous. Constant whittling of rates, plus constant legislation which adds to your expenses without adding to revenue, have had their inevitable effect. Your own company has been less crippled by these conditions than some of those less fortunate, but by reference to page 14 [income account] it will be seen on how narrow a margin we have been working. There are some evidences of a disposition on the part of those in authority to realize that great injustice has been done in the guise of regulation and that it is time to call a halt, but the relief which the railroads need cannot come until this disposition shall be transmuted from mere expressions of friendliness into positive remedial measures. General words of sympathy will accomplish nothing if governmental agencies continue in each specific instance to impose additional burdens or to find excuses for not granting specific relief. Hence your directors deem it their duty again to warn stockholders that their interests are more endangered by the various governmental regulations than from any other source."

The following table shows the principal figures for operation in 1914 as compared with 1913:

	1914	1913
Average mileage operated	10,909	10,751
Freight revenue	$73,638,388	$78,190,923
Passenger revenue	28,497,233	29,425,922
Total operating revenues	111,109,770	116,896,252
Maint. of way and structures	15,308,780	18,054,413
Maint. of equipment	19,100,725	19,415,225
Traffic expenses	2,521,453	2,455,785
Transportation expenses	33,818,433	35,135,649
General expenses	2,719,943	2,581,463
Total operating expenses	73,469,334	77,642,535
Taxes	5,525,585	4,662,152
Operating income	32,114,851	34,591,565
Gross income	34,289,204	37,107,189
Net income	20,183,965	22,153,734
Dividends	17,400,440	16,107,470
Appropriations for additions and betterments and sinking fund	2,783,525	6,046,264

HOCKING VALLEY

THE majority stock of the Hocking Valley is owned by the Chesapeake & Ohio, and besides the great importance of the Hocking Valley as an outlet for lake coal for the Chesapeake & Ohio, the investment as an investment is a good one. This fact was as clearly demonstrated in 1914 as in previous years when net earnings of the Hocking Valley were very much larger. In 1914 there was a coal miners' strike in the Hocking district which resulted in the almost entire suspension of coal mining in April, May and June. Since the Hocking depends on coal for about 70 per cent of its tonnage, this caused a material reduction in operating revenues. Total operating revenues in 1914 amounted to $7,021,000, which is less by $796,000, or 10 per cent, than the revenues in 1913. No corresponding increase was made in operating expenses, which in 1914 amounted to $4,804,000, or but $180,000, or 4 per cent, less than in 1913. Nevertheless, after the payment of expenses, interest charges and rentals, there was a net income available for dividends of $956,000, the regular 8 per cent dividends calling for $880,000.

Of the total 10,487,000 tons of coal carried in 1914, 40 per cent originated on the Hocking Valley and 60 per cent was received from connections. Of the total tonnage 78 per cent was products of mines and 11 per cent manufactures. The average haul was 125 miles in 1914 as against 130 miles in 1913. There was, therefore, a decrease in the revenue ton mileage of 9.5 per cent, the total in 1914 being 1,315,000,000. With this falling off of 9.5 per cent in ton mileage there was a decrease of 10.6 per cent in freight-train mileage, the total freight-train mileage in 1914 being 1,316,000, and a reduction in locomotive mileage of 13.3 per cent, the total locomotive mileage in 1914 being 1,513,000. The average revenue trainload in 1914 was exactly 1,000 tons, and including company freight, 1,036 tons. This is an increase of 13 tons, or 1.3 per cent, over the trainload in 1913. The showing per locomotive mile was even better, 901 tons in 1914 as against 862 tons in 1913, an increase of 4.5 per cent. The greater part of the gain was made in length of train, carloading per loaded car being 36.9 tons in 1914 and 36.3 tons in the year 1913.

The Hocking Valley had on hand at the end of the year $973,000 cash, with a total of $1,844,000 working assets, exclusive of materials and supplies. There were loans and bills payable amounting to $1,400,000, which are included in total working liabilities of $3,057,000. In this connection it should be pointed out that the company has just finished building a new dock and terminal at Toledo, which is described elsewhere in this issue, and which cost about $1,450,000. The new dock is across the river from the old dock which the Hocking Valley owned, and this old dock is to be sold to the Pennsylvania, and a very considerable sum will be realized from this sale.

The following table shows the principal figures for operation in 1914 as compared with 1913:

	1914	1913
Average mileage operated	352	352
Freight revenue	$5,601,382	$6,365,735
Passenger revenue	910,311	929,991
Total operating revenues	7,021,145	7,817,644
Maint. of way and structures	668,455	781,109
Maint. of equipment	1,460,653	1,595,266
Traffic expenses	107,576	106,384
Transportation expenses	2,391,640	2,332,475
General	175,422	168,609
Total operating revenues	4,803,747	4,983,843
Taxes	451,136	477,900
Operating income	1,766,262	2,355,901
Gross income	2,215,182	3,128,379
Net income	955,741	1,916,403
Dividends	879,960	1,264,943
Surplus	75,781	651,461

INVESTMENT BANKERS' ASSOCIATION TO TAKE PART IN RATE CASE

In a letter addressed to the members of the Investment Bankers' Association of America George B. Caldwell, president of the association and chairman of the special railroad bond committee, urges an expression of opinion to be submitted by the bond committee to the Interstate Commerce Commission. Mr. Caldwell's letter is as follows:

"President Wilson, in a letter recently published, has called attention to the fact that it is of paramount importance in the present crisis to maintain the credit of the railroad industry in the United States.

"The clientele of the members of the Investment Bankers' Association embraces almost the entire investing public of the country. A very large proportion of this clientele owns railroad securities. It is therefore of particular importance to the membership of the association that the value of railroad securities should remain as far as possible unimpaired.

"For several years a situation has been developing in the United States which vitally affects every owner of a railroad bond or share. We refer to the steadily decreasing margin of net earnings of the railroads, which has already resulted in placing corporations with over $500,000,000 of outstanding securities in the hands of receivers.

"For the purpose of placing before the proper tribunal the broad facts as they have developed, and are developing, your committee has asked that you write them a letter which may be considered a composite representation of the opinions of your own clients to whom you have in times past sold securities (especially railroad securities) and which will state their impressions as to the safety of their investments—say 10 years ago—and at the present time. If such statements show an increasing lack of confidence in the intrinsic safety of these securities, has this lack of confidence been brought about through the various increases in labor cost enforced by arbitrations sanctioned by the government through the reduction in rates enforced by state legislatures and commissions acting independently and by the Interstate Commerce Commission? Are these the principal causes? If not, what others are stated?

"Your committee believes that statements of this character, representing the opinion of hundreds of thousands of individuals in the country who have in times past furnished money for extensions and improvements of the roads and from whom the money must come to provide for future extensions and improvements, will be of great value in considering the merits of the situation.

"The following questions are submitted with a view of outlining some phases of the situation which the committee believes should be covered:

"1. During the last 10 years have you noticed any change in the requirements of your clients in the matter of preferences for municipal, industrial or public utility bonds or stocks where previously they have purchased steam railroad bonds? Give their reasons.

"2. Has there been a growing reluctance on the part of your clients to the purchase of the newer, and therefore junior, securities of steam railroads and a growing preference for underlying issues? Give their reasons.

"3. What expressions of opinion have you had from your clients in regard to the necessity of an increase in the rates of well-managed, conservatively capitalized railroads, as being necessary for the protection of their investments? Give their reasons.

"4. Has there been, to any great extent, a disposition to exchange steam railroad securities for other classes of corporate issues, for any other reason than possibly a larger return on the investment?

"5. What effect do you believe the European war will have on the attitude of your clients toward the purchase of railroad bonds?

"6. Do you anticipate that unless there is an increase of rates, or some other method devised, which will stem the tide of declining earnings of the steam railroads, it will be possible to place with your clients the large amounts of securities which must necessarily be floated to cover maturing obligations, amounting to over $500,000,000 prior to January 1, 1916, and should be floated to provide added facilities for the increased business which will be necessary if this country continues to grow in wealth and population?

"The Investment Bankers' Association of America has been accorded a hearing before the Interstate Commerce Commission at Washington, October 19, 1914.

"The demand for quick action is urgent and your answer, to be of value, must be submitted promptly."

The Special Railroad Committee representing the association is as follows: George B. Caldwell, president Investment Bankers' Association, chairman; John E. Blunt, Jr., Merchants' Loan & Trust Company, Chicago; Frederick Strauss, J. & W. Seligman & Co., New York; Moritz Rosenthal, Ladenburg, Thalmann & Co., New York; S. L. Fuller, Kissel, Kinnicutt & Co., New York; A. G. Hoyt, N. W. Halsey & Co., New York; Lawrence Chamberlain, Kountze Brothers, New York; Warren S. Hayden, Hayden, Miller & Co., Cleveland; Stedman Buttrick, Estabrook & Co., Boston; R. B. Young, E. H. Rollins & Sons, Boston; Howard Graham, Graham & Co., Philadelphia; R. Lancaster, Williams, Middendorf, Williams & Co., Baltimore; J. R. Edwards, Fifth-Third National Bank, Cincinnati; W. R. Compton, Wm. R. Compton Company, St. Louis; R. T. Field, Field, Richards & Co., Cincinnati; B. B. Veech, United States Trust Company, Louisville; Lynn H. Dinkins, Interstate Trust & Banking Company, New Orleans; W. G. Lackey, Mississippi Valley Trust Company, St. Louis; J. Herndon Smith, Smith, Moore & Co., St. Louis; John A. Prescott, John A. Prescott & Co., Kansas City; Gardner P. Stickney, Wisconsin Trust Company, Milwaukee; Eugene M. Stevens, Stevens, Chapman & Co., Minneapolis.

An English Railway's Battalion.—To meet the case of men who would prefer to enlist among those whom they know, the directors of the North-Eastern Railway of England have asked Lord Kitchener's authority to enroll a North-Eastern Railway battalion for his new army. One thousand one hundred men are required, and a sufficient number are willing to join. Already over 4,000 of the company's employees from all departments have enlisted as Regulars and Territorials. The directors have undertaken to make adequate provision for dependents of men who enlist, to keep their positions open, and to make the arrangements for equipping and clothing the battalion

Brake Levers on English Railway Cars.—The English Board of Trade by authority of the act of 1901 ordered on November 7, 1911, that a brake lever be provided on each side of all freight cars, and established time limits varying with the number of cars owned. For those companies or persons owning under 3,000 cars ten years was given; for those with over 3,000 cars and under 20,000, 15 years, and for those over 20,000 cars the limit was 20 years. It will therefore be seen that it is possible that not until the end of the year 1931 will every car be so fitted. The companies to whom the twenty years' limit applies are the Caledonian, Great Central, Great Eastern, Great Northern, Great Western, Lancashire and Yorkshire, London and North-Western, Midland, North British and North-Eastern. The railway companies are, however, making good progress with their equipment, and it is most unlikely that they will take advantage of their powers. It is, generally, the private owner who is hindering progress, and he has until the end of the year 1921—seven years hence—to get his work finished.

Our Trade Opportunities in South America

Extent of Openings There for American Goods, Especially Railway Supplies and How Markets May be Gained

By F. Lavis
Consulting Engineer*

During the past few years there has been an ever increasing interest by the people of the United States in the countries to the south of us, and a great deal has been said and written about South America, which term, for the purpose of the present article may generally be understood to include all the countries to the south of the United States or at any rate south of Mexico. It is probably quite generally understood that there is here a vast area, mostly as yet undeveloped, but still at the same time supporting in the aggregate large numbers of people as highly civilized as ourselves and with needs for manufactured products on the whole very large, and which they are obliged to supply by imports from foreign countries. Heretofore these needs have been met almost wholly by European manufacturers, and it has been assumed that there must have been something radically wrong with the manufacturers of the United States that they have not secured a share of this business, in some degree proportionate to the relative importance of the United States as one of the foremost manufacturing countries of the world.

Speaking generally, it may be said that there are no manufactured articles produced anywhere south of the United States. South America, therefore, needs all kinds of manufactured products of iron and steel, from locomotives and steel bridges to pins and needles; cement for masonry, coal, structural timber, all kinds of wearing apparel, etc., etc.; in short, all kinds of manufactured articles. The classes of goods we have been able to supply so far, in spite of the many disadvantages under which we have labored, as compared with European manufacturers, are principally rolled steel products, such as rails, structural steel for buildings, bridges, etc., which, in spite of our high labor costs, are sold in competition with European manufacturers largely, owing to the aggressive policy of the United States Steel Products Company, and the specialties, such as agricultural machinery, sewing machines, typewriters, phonographs and articles of a similar nature, which the native inventive genius of the American has produced, which are necessary to modern methods of working and doing business, and which could not be obtained elsewhere. All other classes of manufactured products have been most generally bought in Europe.

South America has to offer in exchange the products of the soil, agricultural, pastoral and mineral, the latter, however, not including coal or iron. It will be seen, therefore, that what they have to offer in trade is mostly the things we ourselves have in abundance, but which are required in Europe, especially in England, France, Germany, Belgium, Holland, etc., all of which are importers of food stuffs and have a large and continuous excess of manufactured products to offer in exchange, and for which they have for many years had to find markets outside of their own countries. It may be noted that owing to the almost entire absence of coal and iron, at any rate in sufficiently close relation and proper quality to build up a successful manufacturing industry of steel products, it is entirely probable that South America will always continue to be a market for steel products.

NEED FOR STUDY OF SOUTH AMERICAN CONDITIONS

Many reasons have been advanced to account for the fact that the United States has failed to obtain any large amount of the business of South America. These are usually, that American salesmen are incompetent, that they do not speak the language (all Spanish, except in Brazil, where Portuguese is spoken), that catalogs and circulars are printed in English or translated into poor Spanish, that the needs of the people are not studied, that we will not or cannot adopt the metric dimensions, which are almost universally used throughout South America, that goods are not properly packed to withstand the rough handling of ocean transport and frequent transshipment, or in small packages for pack trains, that we have no banking facilities for exchange except through London, that we have no ships of our own and have to depend on foreign bottoms, and so on.

Now, it is true that all these things and many other minor details have been neglected either wholly or in part, that they must be attended to, and that the lack of attention will prevent the development of business, but all these things have been overcome either wholly or in part by at least some American manufacturers, and on the whole they are really unimportant and may in a sense be said to be almost trivial, compared to the real underlying causes which have compelled the Latin Americans to do their trading in Europe rather than with us. In saying this, the point should be emphasized that these matters are only unimportant *by comparison*. They must on no account be overlooked or neglected, nor must we think that we can force the Latin Americans to do business our way, simply because it is our way, or to buy what we offer, whether it is what they want or not. Our manufacturers must study the needs of the countries and the people, they must employ competent salesmen if they want to do business at all, and deliver the goods in the shape in which they can be handled and in the kind of packages which are required. Perhaps many of these things apply more particularly to ordinary merchandise for what may be called household consumption, than to railway supplies, the matter which the editor has especially asked me to refer to, but the general situation is much the same for any lines of manufactured articles, and of course, in the small space of a single article little more than generalities can be attempted.

American manufacturers, except in the special lines previously referred to, have had no occasion to really attempt to consistently develop foreign markets for their products. When times have been good, as they usually have been with only comparatively infrequent intervals until the last few years, there has been a market here at home for all they could produce. We have been busy developing our own country, we have been opening up new areas and our problem has been, not to find markets for our goods in order to keep a dense population busy and earning, but to find sufficient laborers to do our work. We have had a surplus of food products, and these we have been able to export to pay our debts abroad.

There is no question, however, that we are now about at the turning point. We are finding it necessary to import such food products as corn (maize) and beef—very little, it is true, but little as it is, a beginning, and one which unless we materially change our farming methods, is bound to grow. We have a larger and ever increasing proportion of our population employed in factories and rolling mills and our manufacturers have expanded their plants to such an extent that, with only the requirements of our own domestic needs to supply, they are finding it increasingly difficult to keep them running at full time, and must necessarily look for other markets. The proportion of consumers of food products to producers is, therefore, becoming all the time relatively greater, we are consuming more and more of our own food products, we shall export less and we shall import more; this must, therefore, be offset by the sale of our manufactured products in foreign countries, and the most logical market is naturally the nearest, namely, that of our neighbors in South America. That this expansion of our foreign

*Mr. Lavis' address is 50 Church street, New York City.

trade is bound to come in the not far distant future, and that we must develop it in South America, is as sure as is the fact that we must continue to progress. But that the present European war is going to help in this matter, is extremely doubtful, and to the writer it seems much more likely that it will tend at least temporarily to retard it rather than help.

WHY OUR SOUTH AMERICAN TRADE IS SMALL

The principal reasons why the manufacturers of the United States have not done more business with South America are:

Because the development and exploitation of the resources of these countries have been carried out almost entirely by European capital.

Because of the extensive system of credits granted by Europeans and the co-operation of the bankers with the merchants.

Because of the higher cost of production in the United States.

Because of the lack of incentive heretofore for American merchants to continuously seek foreign markets—and further—

Because of the direct shipping lines, banking connections, and facilities of intercourse both for passengers and mail.

South America has been and for quite a long time will continue to be almost entirely dependent on foreign capital for the exploitation and development of its resources, and not only this, but it has been necessary to employ foreigners, i. e., Europeans and some Americans to supervise this development, that is to say, as builders and managers of its railways, mines and other commercial enterprises. The capital has been supplied by European bankers, they naturally have a great deal to say as to the selection of both the European and resident managers of the enterprises thus financed, and therefore, not only exercise a strict control over the necessary supplies, but aside from this it is only natural that a British, French or a German manager of a railway, for instance, should prefer materials with which he has been accustomed to work and which he has been trained to believe are best. The railways of the Argentine, for example, the country in which the greatest railway development in South America has taken place, are controlled very largely by British interests, and it is a fact beyond dispute *that as a rule* neither the managers in the Argentine, the directors in London, nor their engineers or purchasing agents care to even hear anything about railway supplies or other materials not made in England. There are exceptions, of course, but they are only frequent enough to cause surprise when they happen. It must be remembered, also, that both the Argentine and Brazil, principally the former, have been built up very largely by the immigration of Europeans, and a large part of their people naturally lean towards and sympathize with their mother countries.

Another phase of the situation is, of course, the extensive system of credits which has been developed by European banks, working with the manufacturers, and which has been largely the cause of the great over-extension in Brazil and the Argentine which has almost brought them to bankruptcy within the last year or so. The Germans especially have been willing to sell to anyone who had any kind of reasonable security, whether convertible into cash or not, they have added anywhere from 20 per cent to 200 per cent to their bills, the notes in payment have been discounted by the banks, and the manufacturers have been free to go ahead and manufacture more goods to be sold on the same terms. It is needless to tell an American manufacturer how fruitless it would be, or at least has been, to get a New York bank to discount any kind of a note on South America, except on the personal security of the firm offering it.

The Germans particularly have also maintained at all important points in South America agents, bright young men working for what we should consider almost meager salaries, who have kept close watch on the financial situation and who have made it their business to make collections at such times as the money has been available. Without a man like that on the ground, thoroughly well posted as to what is going on, and able and ready to take advantage of any turn to get a payment on account, they would have made very few collections, and as a result they have now what must be in the aggregate a very large outstanding account. The British financing has been much more generally of enterprises managed by themselves, and therefore, their goods have been sold under credit conditions more nearly resembling the practice in England, and practically to their own representatives abroad.

Another very important consideration governing the possibility of our being able to sell to South America is, that, speaking generally, the cost of production in the United States, due principally to the very much higher wage scale, makes it difficult and in many cases almost impossible for us to compete with Europe. The writer believes he has no prejudices in regard to either political party and does not pretend to understand the intricacies of the tariff, but it does seem that we must necessarily enter the world's markets with our manufactured products and he does not see how that is going to be possible with the continued artificial maintenance of a very high wage scale as compared with that of the rest of the world.

The question of the effect of the lack of American owned ships on our trade with South America is one which it is difficult to answer. So long as there was general peace, of course, it apparently had little effect on the business and the shippers had little difficulty in finding bottoms. Now, when nearly all the available ships belong to one or other of the belligerents there is a great cry for American owned ships. So far as the writer can see, however, the effect of this on our prospects of future trade with South America cannot be very great one way or the other.

The question of the establishment of branches of American banks in South America is also on a somewhat similar basis to that of shipping. If we are to develop our trade it is undoubtedly to be desired that we should be able to do business through our own banks, but it seems no more reasonable to ask the bankers to be pioneers in the establishment of banks before there is any business for them to do than it is to ask our merchants to tie up their capital in extended credits to compete with Europeans merely as a matter of sentiment, and just so that we as a great nation may do as much business in South America as other great nations do. As a matter of fact, the two must be pushed along together, and one bank at least has already taken steps in the right direction by the establishment of branches in Buenos Aires and Rio. It has been stated within the past few days that the government is seriously considering two-cent postage and direct exchange of postal money orders. This is desirable, but almost everyone who does business would rather pay five cents and have frequent and prompt service, say two direct mails a week to each coast and by reasonably fast boats, than a cheaper rate. The postal money order feature is a desirable step in the right direction, as up to the present, if my memory serves, all this business has been done through Belgium.

THE QUESTION OF RAILWAY SUPPLIES

Turning now to the question of railway supplies, these have been very largely furnished heretofore by England, Germany, Belgium and France, probably about in the order named, and I should think with England very largely in the lead. Germany and Belgium are, of course, practically eliminated by reason of the war. Just how long they will be kept out of the markets of the world depends on the length of the war, and the decimation of the laboring classes due to death, wounds, etc. It seems probable, though, that the decline of their influence will be felt for some time to come, even if the war should stop at once. The same may probably be said of France, to some extent, though there is no embargo on French shipping.

There seems to be no reason, however, to expect that England is not, and will not continue to be, able to supply all or nearly all the demands made on her for practically all lines of manufactured products, and in view of the greatly decreased purchasing power of the South American nations, it would seem that England alone could easily supply all the demands which may be made by South America in the immediate future and for quite some time to come.

It must be borne in mind that not only is the demand for the products of South America by Europe decreased to the lowest

point and is for only the most necessary articles of food supply, but also that the ability and desire of Europe to lend money or extend credit has been practically entirely suspended for at least a year now, and of course will so continue not only until the end of the present war, but until most of its depressing effects on the general financial situation of the world have been overcome.

The purchasing power of South America has, therefore, been decreased, first by reason of the fact that it is largely indebted to Europe and there is, therefore, an actual dearth of real money; second, by the fact that its credit has been strained by over-speculation and too rapid development (too rapid only in relation to the supply of the world's capital); third, entire suspension of European ability to make loans; and fourth, decreased demand for South America's products. This latter, however, is to some extent offset so far as some sections are concerned by an increased demand for food products at higher prices, tempered by some lack of transportation facilities.

In estimating the possibility that American manufacturers may take advantage of the present war situation to introduce their goods into South America, and especially so far as regards railway supplies, the factors which seem to the writer most important are, that Great Britain will not have to materially curtail her production, that while the shipping facilities of the world are considerably decreased by the practical withdrawal of all the German boats, and the use of some commercial vessels for the purposes of war, yet with the largely decreased volume of business of all kinds throughout the world, the available shipping will probably be able to take care of it, that South Americans have been quite generally educated to and have developed the habits of trading with Europe and that so far as regards England and France they have little reason to change now, and most important of all, due to the quite universal financial depression which has existed in southern South America for the past 18 months and which has been greatly accentuated by the present war, the purchasing power of these countries is very largely decreased, or almost entirely destroyed for the moment, unless at extremely long credits.

The writer recently received a letter from a friend in Buenos Aires dated early in August, which contains the following: "All the railways in the Argentine have reduced their train services by about 50 per cent in the last few days, due to lack of traffic and shortage of coal. The Buenos Aires & Pacific has cut out thirty-two daily trains in its local service alone. The banks opened yesterday after being closed for ten days, but all managed to come out well except one which cannot pay its claims and remains shut."

FINANCIAL SITUATION OF SOUTH AMERICAN RAILWAYS

For the last financial year ending June 30, 1914, the gross receipts of the Argentine Railways were somewhere near fifteen million dollars less than for the year previous, only three lines out of fifteen showing any increase. Both the Argentine and Brazil have suffered greatly during the past year, owing to the necessary curtailment of credits by Europe, due first to the Balkan war and also to the fact that previous to that time they were greatly over-extended and there has been considerable over-speculation.

In Brazil the practical failure of the valorization scheme to sustain the price of coffee and the great drop in the price of rubber due to the great competition of plantation rubber, has accentuated the financial difficulties, while the Argentine has greatly suffered from over-speculation in lands. Credits have been strained to nearly the limit everywhere. In regard to Chili, the writer is not very well posted, but that country is at least equally a sufferer from the necessary curtailment of their credit in Europe.

Brazil has about 12,000 miles, of which about half is controlled by a company incorporated in the United States, but of which the capital has been supplied by English, French and Belgium banks. The rest of the mileage is mostly British, with quite a little owned and operated by the government.

The Argentine has some 20,000 miles of railway owned as follows:*

	Length	Capital invested
British	22,908 km.	$875,000,000
French	3,770 km.	112,000,000
Argentine	269 km.	9,000,000
Argentine government	5,907 km.	122,000,000
	32,854 km.	$1,118,000,000

The Argentine government has always bought freely of American railway supplies whenever money has been available, but of course the British and French companies look to their own countries.

In Chili where there are a little over 4,000 miles, the lines are mostly owned and operated by the government or by British interests. In the rest of South America, with a total of about 4,500 miles of railway, the lines are largely British, with some few under local control, though the Guayaquil & Quito in Ecuador is at least partly controlled by American interests.

The 1,500 miles of railway of Central America are controlled quite largely by interests associated with the United Fruit Company, are operated by American methods and their supplies are generally bought here.

Summing up the situation, therefore, it seems to the writer that the time has come when the manufacturers of the United States must find the means of extending their business with foreign countries in spite of, rather than because of the war. This is an economic necessity which is beginning to be realized by all those who are in any degree far-sighted. We must extend our foreign trade in manufactured products because we must progress, because the proportion of consumers to producers of food products within our own borders is continually increasing, because our exports of food products are becoming a less and less proportion of the values of our imports, and there must necessarily be some compensation.

A PLAN OF CAMPAIGN FOR TRADE

The campaign to secure this business, or a greater proportion of the business of South America, will be a long and expensive one and large results will probably only come slowly. It will probably be generally desirable for manufacturers of similar lines of goods to combine together and send down one or two thoroughly well posted and equipped representatives rather than to attempt to each send its own more or less mediocre man, and be prepared to continue the campaign for several years before there can be any hope of very substantial results. It may be desirable to select men of different types, one to first cover the ground carefully and fully to investigate the possibilities of the sale in any particular locality of a particular line or lines, he to be followed later by men more of the salesmen type to prosecute the campaign in certain specified localities.

Dependence can hardly be placed on the ordinary commission houses or export agents to carry on a really aggressive campaign or to make the investment it would require. This can only be accomplished by direct representatives having a definite object in view. Immediate or quick results cannot possibly be hoped for, as only the long continued, persistent campaign will get final results, and the expense will not be small.

During the initial period if orders are obtained, every care must be taken to see that they are filled to meet the requirements of the customers, even at considerable expense to the manufacturers, and possibly, even probably, with little or no margin of profit. Above all there must be some means of determining that the goods (especially any kind of machinery) shipped are reasonably sure to meet the requirements, and even further, that they are properly used. It will be far better to refuse orders than to sell goods that will not be useful to the buyer, and of course, this is one of the phases of the campaign where exceptionally good judgment will be required. There must be absolutely no attempt to foist left-overs and unsuitable goods on the people of South America. The fact must be remembered that these people are generally able and intelligent, and the higher classes almost always highly educated. They have not

*For more particulars see article in *Railway Age Gazette* of March 27 and April 3, 1914.

usually the genius for persistent attention to details, or the business ability which makes the Anglo-Saxon the successful manager of commercial enterprises; but they are by no means foolish or ignorant, as has been too often assumed. Many of them have been educated either in Europe or the United States, and are well posted in regard to the affairs of our times and in modern progress in the arts and sciences.

As already indicated, the writer believes there is very little prospect of the immediate extension of American trade with South America, owing to the generally prevailing financial depression and the great curtailment of the purchasing power of all these countries. Above all, it is no time to send a flock of young salesmen to South America with big trunks of samples, who will return with nothing but expense accounts bigger than their sample cases. It is, however, a time when a properly organized campaign may well be started, as it will be much easier now to obtain a hearing in many places heretofore more or less inaccessible than it was when the South Americans would only listen to those who were lending them money.

Gradually with the extension of our trade, which must and can only be built up hand-in-hand with our bankers and with the assistance and effective co-operation of the government, and with our more intimate knowledge of the people and their countries, it should be possible to build up and establish a reasonable credit system on a satisfactory basis, that is, that payment must be made promptly at the time specified, though not necessarily as now, cash against bill of lading. The long extended credit system now prevalent is probably the result quite as much of too great a desire to sell goods under any conditions, as of desire on the part of the South Americans to buy goods they could not pay for. It is to be remembered also that after this war the European nations will be in no better position than we are to extend credits, and that from now on, or as soon as our banking and financial machinery is adapted to it, we shall be in quite as advantageous a position as they are in this respect.

INVESTMENTS UNDER AMERICAN MANAGERS NEEDED

Any serious campaign for the extension of our trade must eventually contemplate a considerable investment of American capital in South American enterprises, under the direction of American managers, but in view of the fact that we ourselves always have been and still are (or would be) borrowers of European capital for the development of our own resources, it is not easily apparent just now how this is to be accomplished. There have been, however, certain recent indications that it may not be altogether impossible in the not too far distant future in spite of our own great needs. It will, of course, only come with the co-operation of our bankers after they realize from the direct information received through the agency of their own branches, ultimately to be established it is hoped in all the most important centers, what the needs and resources of South America are. Heretofore, of course, European capital which could only count on very low returns at home, has been obliged to seek foreign investments for greater returns. We ourselves could earn as much from investments in our own country as we could obtain abroad and without the additional risk. The war is going to change many of these conditions.

The financial depression now existing in South America is bound to be only more or less temporary, in spite of the war. It is possible that even now the worst of it may nearly be over, especially in those countries which produce the staple foods the world must have and which it must pay for. There may be some little difficulty for a while in regard to transport, but this also will quite likely be only temporary and the chances are that the increased prices which will be received for the cereals and cattle will partially make up for other losses, so that sooner or later the purchasing power will be restored, and if we are to be in a position to take advantage of it, we must begin now to make our preparations and lay our lines.

POSTOFFICE DEPARTMENT ECONOMY

J. E. Sexton, general manager of the Eureka-Nevada Railway, declares that the postoffice department in refusing to send the mails over his road is imposing on the citizens along the line a gross injustice; and he has written a letter of protest to President Wilson. In this letter, dated Palisade, Nev., September 20, he says, in part:

"Dear Sir:—Is the postmaster general of the United States honest? I respectfully submit this question to you, firmly convinced from the facts following that you cannot answer in the affirmative.

"I submit that with the knowledge and through the unfairness of the postoffice department the United States is being robbed; its taxpayers being unreasonably discriminated against as well as having the grossest character of injustice imposed upon its citizens residing at Eureka, Nev.

"I am the general manager of a little narrow gage railroad (that has been twice in the hands of a receiver in the last 15 years) operated semi-weekly between Palisade and Eureka, a distance of 84 miles. Alongside of this railroad is operated a mule-drawn vehicle carrying the United States mail, route No. 75,148, tri-weekly between the points indicated in 33 hours for the sum of $5,970 per annum; while our line makes the run in eight hours, and the postoffice department contend that they cannot under existing statutes, according to their interpretation, pay us more than $1,795.

"We are willing to perform the service tri-weekly in eight hours, or with 300 per cent more efficiency, for $5,300, and in addition perform the service of route No. 175,023, for which the department is paying about $875; or in other words, saving the United States more than $1,500 per year.

"Under date of January 12, 1914, I submitted a bid to perform service on both routes, and to serve two additional postoffices that have since been discontinued, for the sum of $6,269, as against the present combination price of $6,845, in eight hours as compared with 33 hours, but my offer was refused.

"I submit that the difference between what is now being paid for a 33-hour service and what the service could be performed for in eight hours is being taken from the Treasury of the United States wrongfully and amounts to robbery, and when our railroad can and will perform the service for more than $1,500 per annum less and with 300 per cent more efficiency the case presents an instance of unwarranted and offensive discrimination, to say nothing of the injustice imposed on the people whom we could and would serve, and who have petitioned the department and members of congress with sufficient frequency to have impelled the department, if it were honestly conducted, to have found a means to have met the prayer of said petitioners. . . .

"What excuse can a person, having taken an oath to support the constitution and perform the duties of any office, offer to justify sitting in silence and administering a law that robs its treasury? . . .

"Assume that a condition existed where the postoffice department had contracted the two routes referred to herein for $6,800 per annum service to be performed in 33 hours, and for some reason the statute were to forbid any consideration of a bid by a member of a labor organization in excess of $1,795, although the means of conveyance he would employ would perform the service 300 per cent more efficiently. How long do you suppose there would be any tranquillity around the postoffice department or the homes of members of congress? . . .

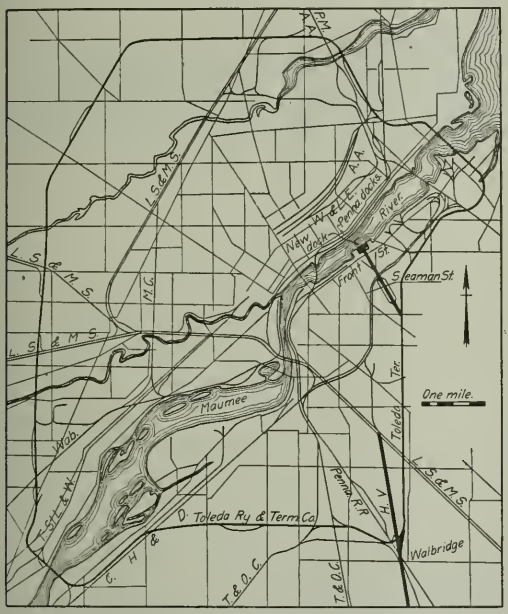
"Can you do anything in this case to see that we are permitted to enjoy the equal protection of the law? . . .

"Those who administer the affairs of the postoffice department are, as you can see, too narrow between the eyes to initiate anything that will free a railroad from abuse."

New Hocking Valley Coal Dock at East Toledo, Ohio

Providing Two Tipples, Each With a Capacity of 40 Cars Per Hour, and a 3,000-Car Yard and Approaches

The Hocking Valley Railway has had under way for some time a comprehensive improvement on the east bank of the Maumee river, at East Toledo, Ohio, to replace the coal and ore handling facilities formerly owned and operated by this company on the west bank of the river and reached over the tracks of the Pennsylvania Lines. The new terminal includes 1½ miles of running track approaching the dock, a 3,000-car storage yard, a coal-loading dock with two tipples, each having a capacity for handling 40 cars per hour, and an ore-loading dock, although the operating machinery for the latter dock has not been placed.



Map of Toledo and Vicinity Showing Hocking Valley Entrance and the Belt Line Used to Reach the New Dock

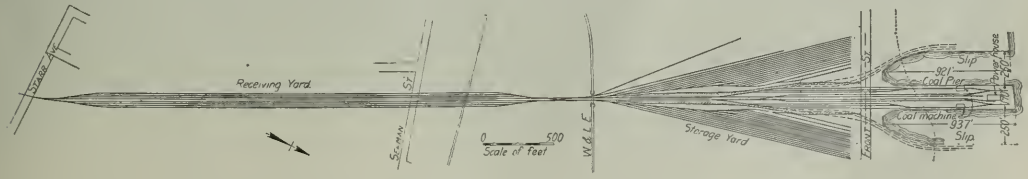
The Hocking Valley has been operating into Toledo over the Pennsylvania tracks since 1877. Until recently all of this company's freight trains crossed the Pennsylvania bridge over the Maumee river and used the Summit street yard and the adjacent dock frontage. Passenger trains entered by the same route until 1896, using a station located near the freight yard. In the last few years the passenger traffic has been diverted to reach the Union station over the Lake Shore & Michigan Southern. All freight, except coal, has also been diverted from the Pennsylvania tracks and is now routed to the Clover Leaf terminals.

The present improvements, comprising new docks with independent approaches, is the last step in the removal of the Hocking Valley trains from the tracks of the Pennsylvania Company in order to reduce the congestion on the latter road. The contract between the two companies, covering the trackage agreement, contemplated the abandonment of the Hocking Valley dock and machinery to the Pennsylvania Company when the trains of the former road should cease to use the line and Summit street yard of the Pennsylvania, and the present dock development is in fulfillment of this agreement.

The coal trade for the Northwest, which is handled over the Hocking Valley to Toledo and loaded on lake boats at that point, is very important and it was essential in the design of the new dock that ample facilities be provided for the economical handling of increasing quantities of this business. The coal originates at about 95 mines along the Hocking Valley, the Kanawha & Michigan and the Norfolk & Western in the southern Ohio and West Virginia fields, requiring a haul of from 200 to 500 miles. The maximum tonnage handled at Toledo by the Hocking Valley during a single navigation season has been 2,700,000 tons, with a daily loaded car movement into the terminal running as high as 458 cars. The new dock facilities will make possible the loading of about 10,000,000 tons in a season, a vessel of 12,500 tons cargo, which is about the largest in use on the lakes, being filled in 6¼ hours by one machine. In addition to more than doubling the rated dock capacity, the improvement provides a much more direct line from the company's northern freight terminal at Walbridge, five miles south of Toledo, and a much improved yard serving the dock. The long, high crossing of the Maumee river is also avoided.

CONNECTING LINE AND YARDS

As shown in the accompanying map, the new dock will be reached from Walbridge by using about 3½ miles of the line of the Toledo Terminal railroad, an interchange belt line encircling the city, and 1½ miles of new line extending from the belt line to the river. This new line passes through a thinly settled section of the suburb of East Toledo, and on account of the commercial advantages of the location of the new dock in this portion of the city, the company was allowed to occupy certain streets with the understanding that other necessary streets be donated to the city. No grade crossings are involved in the new work, one street being carried under the tracks and one street and the tracks of the Wheeling & Lake Erie being carried overhead. In order to handle the additional traffic over the belt line between Walbridge and the dock connection, this portion of the road has been double-tracked.



General Plan of the New Coal Pier, Yards and Approaches

The economical separation of grades at the crossings with the two streets and the Wheeling & Lake Erie was one of the principal problems in the location of the dock. The country adjoining the river near the dock is generally level with an abrupt river bank about 28 ft. high. In order to approach the dock at

the proper grade a cut with a maximum depth of 21 ft. near the river was required, running out to the ground surface about one-half mile from the river. As Front street is parallel to, and only a short distance from the river, it was only required to be elevated about four feet to secure the necessary clearance over the new tracks. At the crossing of the Wheeling & Lake Erie the new cut is only about four feet deep, requiring the elevation of the Wheeling tracks about 16 ft. This fill was made of earth taken from the excavation made for the dock approach tracks, involving, in addition to the structure carrying the old line over the new dock connection, a subway to carry Seaman street under the elevated line.

A short distance beyond the Wheeling crossing the new line crosses a ravine 600 ft. wide and 35 ft. deep. This ravine is skirted on the south by Seaman street. A subway was built to carry this street under the tracks, and a reinforced concrete box culvert was constructed in the bottom of the ravine to the north of the street. This ravine afforded a convenient point to waste the material excavated from the adjacent cut.

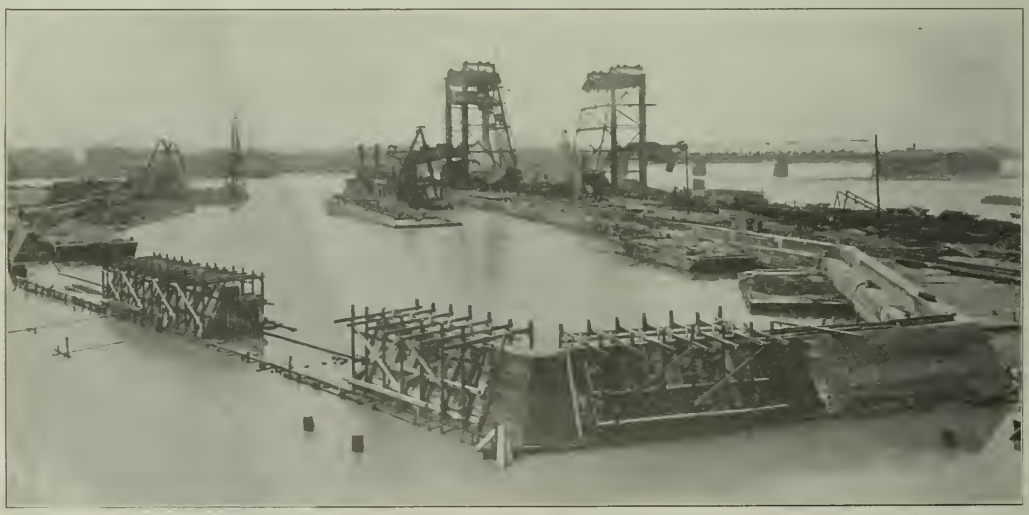
A receiving yard occupies practically the entire distance between the Terminal belt line connection and the crossing of the Wheeling, and a storage yard extends from the latter crossing to Front street. Two running tracks extend through the center of these two yards to the dock. The receiving yard contains 8 tracks and the storage yard will ultimately have 60 stub tracks, although the development of this yard will depend somewhat on the growth of the business. The receiving yard has ladder connections with the running tracks at both ends, but the storage yard is fan-shaped, with ladders only at one end, this layout being necessary in order to lay the yard tracks practically on the original ground surface, while the running tracks are on a lower grade in the cut. The ultimate capacity of the yard will be 3,000 cars. The yard tracks are laid with 67-lb., relay rail, with 80-lb. rail on the running tracks and ladders. No. 8 rigid frogs are used on ladders of No. 7 angle. Manganese guard rails and frogs are used throughout.

NEW DOCKS

The water frontage along the river is 1,600 ft. in length, of which 1,200 ft. will be occupied by the new coal and ore docks. The middle of the frontage is occupied by the coal pier, which is 170 ft. wide and about 900 ft. long. On either side of this coal pier is a slip 250 ft. wide and about 850 ft. long, in each of which four vessels can be docked. These slips are dredged to a depth of 23 ft. The down stream slip is only being finished to a width of 125 ft. at present, the remaining width to be completed when the ore dock on that side is required.

The dock wall surrounding the coal pier is founded on four rows of 45-ft. white oak piling, with a row of 30-ft. Lackawanna steel sheet piling driven just inside the second row of supporting piles, to retain the wet sand fill which forms the body of the dock. The dock wall is of concrete, reinforced in both directions, extending 4 ft. below mean water level and 10 ft. above it. The maximum width of the wall over the heads of the piles is 16 ft. 6 in. The side walls of the coal pier are anchored together by 2¼-in. tie rods, and the end wall is similarly anchored to pile clusters driven in the fill. The face of the concrete along the dock line is protected from damage of boats by the insertion of three 10-in., 25 lb. I-beams, flush with the surface of the concrete. Eye-bolts and rings for attaching guard timbers are located in recesses along the face of the dock. Cast iron mooring posts are spaced 50 ft. center to center along the dock face securely anchored to the concrete wall.

The Front Street Viaduct Before the Tracks Were Laid Under It



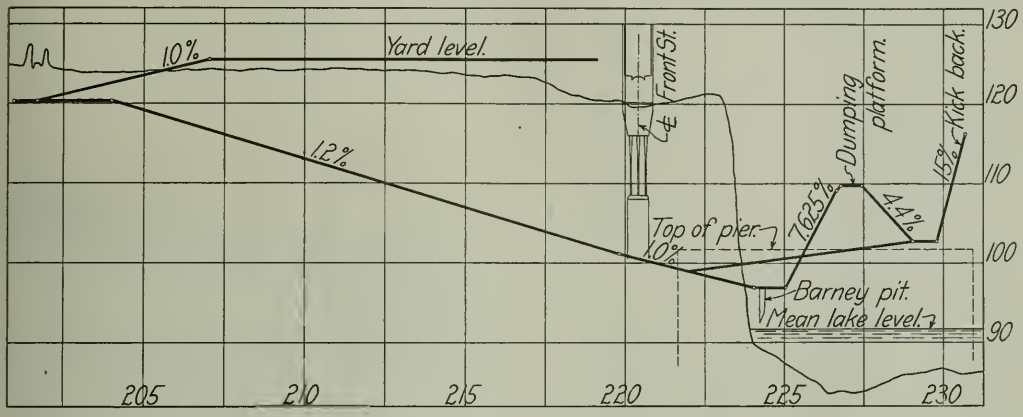
General View of New Dock Showing the Two Dumpers and Slip Wall Under Construction

The wall enclosing the ore dock on the up stream side of the coal pier and across the slip is supported on cribbing. After the dredging had been done, heavy timber cribs built up of 2-in. by 10-in. and 2-in. by 12-in. timbers were floated into position and sunk. They were anchored in position by piling driven in the

inside corners and were subsequently filled with sand. On these cribs as a foundation a reinforced concrete wall, similar in general design to the coal pier wall, was built.

The two tipples located on opposite sides of the pier about midway of its length are of structural steel, occupying a ground area 40 ft. by 60 ft., and having a height of 100 ft. They are designed to handle any type of coal cars up to 52 ft. in length and 270,000 lb. in weight at a rate of 40 cars per hour. The

The power for the operation of the dock is generated in a power house, 42 ft. by 112 ft. in size, located near the end of the pier between the two switchbacks. It is divided by a fire wall into a boiler room and combined engine room and machine shop. The boiler room contains three Scotch marine boilers, 12 ft. 6 in. in diameter by 16 ft. in length, with a rated capacity of 375 h.p. each. Automatic stokers, suspended ferro-inclave coal hopper, feed water heater, pumps, and force draft under automatic control

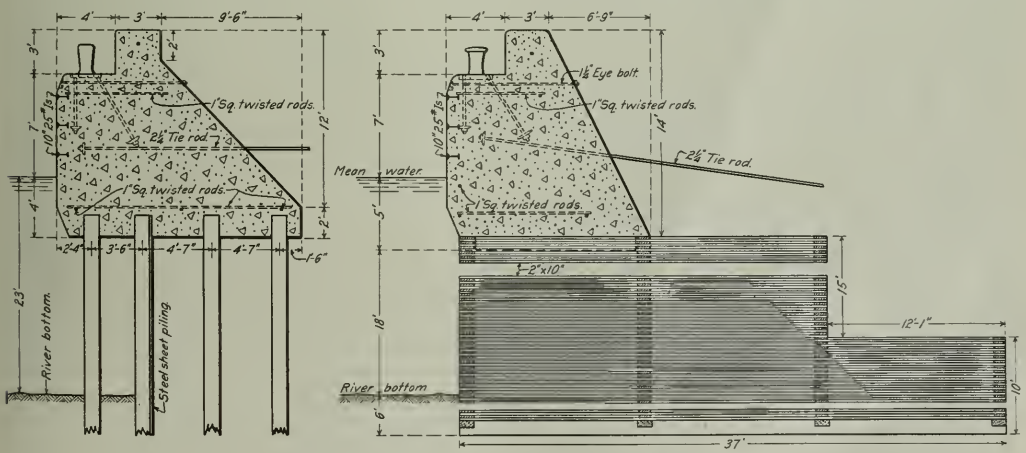


Profile of Tracks on the Dock and its Approaches

loaded cars are set down a grade of 1.2 per cent from the storage yard into three 20-car tracks for each dumper, the cars running singly by gravity from these tracks down to the foot of the tipple track incline. This incline has a grade of 7.625 per cent, reaching an elevation on the cradle 18 ft. above mean water level. The empty car run-off track on the other side of the dumpers has a grade of 4.4 per cent, ending in a switchback from

are provided. A separate spur track connecting with one of the empty tracks is used to deliver coal to a hopper serving these boilers.

The machine shop contains shop tools, lathes, planers, etc., necessary for making quick repairs. The engine room contains two 75-k.w. d.c. generators which supply electric current for lighting the dock and for operating the telescopic spouts on the



Typical Cross Sections of Dock Walls on Piles and Cribbing

which the cars go down an easy grade to two 30-car empty tracks for each dumper located between the tipples. A switch engine is able to place 20 loads and pull out 30 empty cars. The weight of each tipple complete is approximately 1,500,000 lb., the concrete footings being designed to stand this loading under the most severe strain.

dumpers. The steam required for the operation of the large steam engines, located within the framework of the two dumpers, is carried through large steam pipes in a 5-ft. by 6-ft. reinforced concrete tunnel about 260 ft. long. The power house is a brick structure with a 125-ft. concrete stack. The operation of each machine requires five operators, one oiler and 14 laborers. It is

estimated that 25 tons of slack will operate the power plant for a day when both dumpers are in operation.

STRUCTURES

The Seaman street bridge, carrying 12 tracks, is a two-span, trough floor structure, designed to harmonize with a proposed boulevard development contemplated by the city. The floor troughs are 19½ in. wide and 21 in. deep, spanning from the abutments to the center support parallel with the tracks which cross the street at a slight skew. Concrete facia girders are provided along the ends of the structure and the end columns of the center support are also encased in concrete to give the structure the appearance of a concrete bridge. The floor troughs are filled with concrete, with the exception that a line of 12-in. vitrified tile is laid in each trough to effect a saving in the amount of concrete and to reduce the dead load on the structure. The reinforced box culvert at the bottom of the ravine is 300 ft. long and has a 10-ft. by 12-ft. opening.

The bridge carrying the two tracks of the Wheeling & Lake Erie over the Hocking Valley is a through girder structure, a center girder being provided in order to allow the use of a shallow floor of 15-in. I-beams, spaced 16 in. center to center. The rails are fastened directly to these I-beams by Ritter adjustable rail clamps. The Front street viaduct is a steel structure encased in concrete, being 380 ft. long and 66 ft. wide. It is designed to span 16 tracks on the lower level and to carry a double-track street railway in a 40-ft. roadway with 11-ft. sidewalks on each side. Three-column steel bents with collision piers enclosing the bottoms of the columns support transverse steel girders, on which are supported the I-beams encased in concrete which comprise the bridge floor. An ornamental concrete balustrade is provided along the faces of the bridge to prevent pedestrians from falling over and to shut out the view of the yard below.

The grading work for this improvement required the handling of 400,000 yd. of material, most of which was a hard, tenacious, blue clay, which was very difficult to excavate and distribute. Explosives had practically no effect on it and steam shovels were able to make but slow progress. The dredging in the slips and channels out into the river involved the handling of 650,000 cu. yd. of material. The concrete in the bridge abutments, footing and piers amounted to about 7,600 cu. yd., and in the dock walls 25,000 cu. yd. All concrete on the work was mixed in the proportion of 1:3:5.

This improvement work has been carried on under the direction of W. Michel, chief engineer of the Hocking Valley; D. W. Smith, assistant engineer, and W. L. Roller, resident engineer. The Great Lakes Dredge & Dock Company, Cleveland, Ohio, had the contract for the construction of the dock and the power house and for the dredging. The Fritz-Rumer-Cooke-Grant Company, Columbus, Ohio, placed the bridge masonry, and the Toledo Bridge & Crane Company, Toledo, Ohio, and the Mt. Vernon Bridge Company, Mt. Vernon, Ohio, fabricated the bridge superstructures. The erection of the bridge was done by company forces. The grading was done by J. T. Adams, Columbus, Ohio, and the car dumpers were designed and erected by the Brown Hoisting Machinery Company, Cleveland, Ohio. The work was started in December, 1912, and the first dumper was ready for operation at the expiration of the company's contract with the Pennsylvania on July 1, 1914.

Peat as Fuel on the Swedish Railways.—The question of employing pulverized peat as fuel for locomotives has been under consideration by the Swedish railway authorities since 1909, and several experiments have been made with a view to ascertaining the cost of the material as compared with coal, and also its suitability for the various types of engines. One of the State Railway locomotives has been altered so as to employ the new fuel. This engine has now for some time past been used in regular traffic between Stockholm and Upsala with favorable results, both from the technical and economic points of view.

RAILWAY AFFAIRS IN OTHER COUNTRIES

For rather obvious reasons hardly anything has been allowed to leak out thus far regarding the railway activities on the European continent in connection with the present war. It is only possible, therefore, to obtain facts about the part that the railways are playing by correlating various items of information that may have appeared in the daily papers. The reports agree that the various administrations are performing the emergency duties put upon them remarkably well. The German railways, in particular, seem to have done some remarkable work. The railways of Belgium and France have not had similar burdens put upon them, but the engineers of the latter are now engaged in a reconstructive work of great importance. The French possess a very efficient and enthusiastic force whose duty it is to rebuild the damaged railways and bridges as the army moves forward. The organization of the body appears to be excellent. Particulars of all the destroyed structures, for instance, are known and arrangements have been made for the restoration of these structures as soon as the invaders have moved clear of them. The rebuilding of the Belgian railways may very likely also form part of the work to be accomplished by the French military engineers. It will be remembered that the Belgians despatched a considerable number of locomotives and cars for safety into France some weeks ago. The Germans also appear to have brought many of their troops across the frontier in their own cars.

Railway Bridge Destroyed by Germans at Battle of the Marne

* * *

The Northwestern Railway of India has recently completed a new locomotive repair plant which ranks among the largest of its kind in the world. The Northwestern of India operates about 5,000 miles of 5 ft. 6 in. gage track, and the new shops at Moghalpura near Lahore have been designed to handle the heavy repairs on about 800 engines. The pay-roll numbers 5,000 men. The shops are laid out on either side of a 45 ft. transfer pit 1,160 ft. in length and will accommodate 80 locomotives, the output being 36 repaired engines per month. The principal building of the plant is 537 ft. 4 in. wide by 703 ft. long, parallel to the transfer pit, and is divided into 12 transverse bays. It contains the tender shop, erecting shop, fitting shop, machine shop, wheel shop, millwright shop, tool shop and brass finishers' shop. In a separate building near one end of the main building is located a foundry where both gray iron and brass castings are made. The iron foundry has four cupolas, the aggregate capacity of which is 20 tons of metal. Near the other end of the main building is the locomotive paint shop, a small building which will house six locomotives and tenders. On the opposite side of the transfer pit are located the stripping pit, the boiler

shop, the copper and tin shop, the smith shop and the locomotive material stores.

The arrangement of this shop differs from that followed in this country, where a transfer table is used. Intsead of arranging the erecting shop in a bay parallel to the transfer table, with individual pits each served by the table, the erecting shop occupies three bays extending entirely across the building, the moving of engines within the shop requiring the services of overhead cranes. Locomotives pass over the transfer table only when entering the shop. After the repairs have been completed the engine and tender leave their respective shops from the side opposite to the transfer pit, where the engine is fired up and tested in a shed provided for that purpose. After receiving a trial trip the locomotive is run into the paint shop for finishing.

CORRECT THEORIES OF AUTOMATIC BLOCK SIGNAL CONSTRUCTION*

Sub-committee No. 5 of Committee No. 4, having in hand the work of designing circuits for single track automatic block signaling, has . . . made a careful study of the various schemes in use on the railroads of the United States.

In our study of single track blocking, we find that no automatic system compares favorably with the "Lock and Block" or "Controlled Manual" systems, and in the design of the circuits submitted at this meeting the sub-committee has endeavored as far as possible to embody the same characteristics as those of the latter, omitting, of course, the manual control features.

Controlled manual systems, each differing from others in minor details, have been used on a number of our principal railroads for the past 20 years, and notwithstanding the differences in matters of detail, all are designed to prevent the clearing of opposing signals between passing sidings.

The system that appeals to us as being the safest and best provides:

(a) Continuous track circuit between passing sidings, controlling electrically locked traffic levers and semi-automatic signals.

(b) Traffic levers in adjacent towers, located at passing sidings, each equipped with normal electric locks.

(c) Electric locks controlled (a) by all track circuits between opposing signals governing from passing sidings, (b) by circuit breakers, closed only when the signals between passing siding outlets indicate "stop," and (c) by an operator in the next tower working in conjunction with the operator at the home station.

(d) Traffic levers controlling direction relays, wired in such a manner as to cause the signals in both directions to indicate "stop" if for some unknown reason both traffic levers should be unlocked at the same time.

(e) Semi-automatic signals, controlled by the direction relays, and arranged to permit trains to follow one another as in double track signaling.

This system provides an absolute check on each track circuit section and on each signal mechanism between passing sidings, whenever the direction of traffic is changed; and it is this feature, the equivalent of indication locking, which makes controlled manual systems safer than straight automatic systems. The direction of traffic cannot be changed if the section between passing sidings is occupied by a train, or if one of the signals should be stuck at clear, when the traffic lever which was reversed is put normal. The controlled manual system requires seven line wires between passing sidings, viz.: Lock, traffic in each direction, home in one direction, and distant, serving both directions, combined bell and telephone, and common. This number is increased within the passing siding limits in proportion to the number of units directly controlled from the home station.

In comparing automatic systems now used, with the controlled manual system already explained, we find that equal safety is not provided, and seeing that the average single track railroad has not sufficient business to afford a controlled manual system, the question arises: Is it possible to design circuits for single track automatic blocking, following the general principles of controlled manual, or the equivalent?

In single-track automatic signaling we have electrically controlled apparatus, governed by track circuit relays, and, with signals in both directions usually indicating proceed, block sections are usually from one to three miles in length. Signal motors and slots are in all cases controlled by line relays, the latter being governed by all track relays throughout the block section. Line wire is generally located on telegraph poles and below telegraph wires.

The single control with common return system is in general use; but as we are compelled to depend for our signal indications, both opposing and following, upon the making and breaking of line relays which are susceptible to crosses and grounds, resulting too frequently in the relay coils remaining energized and either following or opposing signals indicating "proceed" when the block is occupied, we believe that it is important that something be done to produce greater safety, even if not the equivalent of that obtained through the use of a controlled manual system. . . .

When the oldest types of signal apparatus now used, such as fuse shunt and open-faced relays, clock-work and disk banner signals, were first introduced, many of us felt that the day of perfection had arrived. This apparatus was good, but not good enough. Progress has been made because there were men who, recognizing the faults, set out to remedy them. If the first trial proved too costly or ineffective, they tried again, and kept on trying until today it can be truly said that the signal system is second to no other branch of transportation service.

Notwithstanding this fact, however, we are doing some things today which must be improved upon. We must have greater protection against opposing trains than our present systems afford. The single control automatic system is identical with that of the interlocked power apparatus, without indication locking; and there is not a signal engineer present who would depend for his signal indications at interlocking plants entirely upon the making and breaking of circuits by the controlling lever. A check or indication lock, checking the position of the signal against that of the controlling lever is demanded, for neither the power apparatus nor the controlling circuits are entirely immune from mechanical or electrical defects. We have recently heard of one road which, at interlocking plants, now requires both the positive and the negative sides of signal circuits to be broken by the controlling lever, in addition to the indication locking, unless cross protection of some description is provided.

As to the patent situation, no one seems to know what is claimed by the different manufacturers. However, the research made by this sub-committee leads us to believe that no individual or company can broadly claim a system wherein the direction of traffic is automatically established by trains.

The nomenclature and method of drawing employed in our plans now presented show present practice, but are subject to change whenever this association adopts a standard system; but we earnestly recommend that no set of plans be accepted as final which does not clearly show the location of each wire terminal, each lightning arrester, each fuse, ground plate, wire location, relay box and junction box; in fact, every part that goes to make up the complete plan. Using a complete plan, we are enabled, first, to reduce the cost of construction, by having the details worked out by competent engineers, and, second, to better maintain the apparatus, and with men of less experience than would be required if the plans were not complete. . . .

Progress in the art of signaling enables us to accomplish today that which was formerly considered unsafe, viz.: to meet and pass trains on a single track railroad without issuing written orders to trainmen. On the Baltimore & Ohio we do this through the use of a controlled manual system. It is the ideal system for handling heavy traffic over a single track railroad, and in the design of circuits for automatic blocking, the question which naturally arises is: How can we, through the use of an automatic system, obtain protection equal to that provided by the controlled

*Report of sub-committee No. 5 of Committee No. 4 of the Railway Signal Association. Presented at Bluff Point meeting, September 23. The proceedings of this meeting were reported September 25, page 564, and October 2, page 612.

manual system? We do not claim to have succeeded in all that we have set out to accomplish, but we do claim to have improved the circuit requisites, and to the best of our ability we have designed plans covering those requisites. . . .

The circuit requisites on which the plans now offered are based are as follows.

(a) Signals so located as to provide adequate spacing and protection against opposing movements. At a meeting of the full committee in Buffalo it was agreed by a majority of the members present that outgoing signals from passing sidings should be located at or near the fouling of the passing siding, rather than beyond the main switch. At interlocking plants, and where controlled manual systems are in service, signals are always located at the foulings. The same location system should be used whether in manual or automatic territory. The location of signals in single-track territory should be so arranged that trains, where meeting, will be separated a sufficient distance apart to allow for a slight over-run without resulting in a collision; the incoming signal at passing sidings 50 ft. from the switch point, and the outgoing signals at the fouling. This affords a safe stagger, and at the point where needed; at the point where it will allow the incoming train to take siding. At intermediate signals between siding outlets, the signaling arrangement should provide that opposing trains be stopped by signals not less than 1,000 ft apart.

(b) The control of signals to be such as to provide (1) positive block indications against opposing trains between passing sidings; (2) whether in terminal territory or on the line-of-road, the giving of a signal at the entrance of a block should depend upon the opposing signal governing into the same block indicating stop; (3) stop, caution, or clear indications for following movements, as on double track; (4) that two trains meeting at a passing siding shall each first receive a caution indication before reaching a stop signal; (5) protection for switches and switching movements as on double track; (6) cross and ground protection, such that neither a single cross nor any combination of grounds will cause the energization of the controlling or signal operating devices.

This requisite is, I believe, principally responsible for the division of opinion in Committee No. 4. However, if requisite "b" is correct, if the control of signals should be such as to afford positive block indications against opposing trains, then it is essential that the control of the opposing signal shall be as positive as can be made.

Under the controlled manual system, we have, through the electric locking, a physical check against the opposing block signal indicating stop, and under the system used on the Baltimore & Ohio we have a further check through the controlling circuits being arranged so as to require joint operation between traffic levers. Without this joint operation the signals in both directions will indicate stop.

This means that in case the electric locking should fail, so as to enable the levermen to each secure traffic combinations at the same time, the signals controlled by the traffic levers, instead of indicating proceed, as is the normal condition in automatic territory, must indicate stop in both directions, because the controlling circuits are open.

In automatic blocking the safest scheme would be to break the control wire through opposing signals, and a tracing of this character was prepared by the sub-committee, of which I am chairman, and presented to the full committee, but as the number of line wires required is excessive, the plans now offered are considered best suited to meet general conditions.

We have shown that under the single control system a cross between the control wire and any other wire carrying battery will result in a false clear indication being displayed, with the block occupied. We have also shown that almost any combination of grounds will cause a false clear indication with the block occupied; and if the false clear signal is one for movements opposite to the direction of traffic, something other than the signal system must be looked to to prevent a butting collision. It is important that we avoid having false clear signals, particularly in single track territory, and if practicable we must design our signal system so that when every other safety factor has failed the signal may be relied upon. Good maintenance is not, of itself, sufficient to obviate false clear indications caused by grounded circuits. How many signal repairmen are there today who possess the knowledge or who have the necessary instruments for measuring the insulation resistance of a circuit? Grounded circuits cannot be foreseen unless the circuits are arranged in such a way that certain combination of grounds will cause a stop signal.

The question may now be asked: Is it possible to design signal circuits so that no combination of grounds will cause the energization of the controlling or signal operating devices? And, if so, is the scheme practicable? And what is the additional cost?

In double-track signaling, the direct control of both sides of the signal motor through the track relay affords reasonable insurance against the effect of crosses, and this practice is followed on the principal railroads.

In semi-automatic territory the indication or back check provides the safety features desired. In single track automatic signaling we must have direct control through a breaker on the opposing signal, closed only when the signal indicates stop; or else double control, as shown in plans now presented, must be provided. This is the only solution known to this sub-committee.

Two other points must be considered. These will be numbered 7 and 8.

(7) That two opposing signals governing into the same block shall not display the proceed indication simultaneously, authorizing trains to move opposing each other.

The sub-committee has recently checked and criticised plans that are so arranged that the overlapping sections are ineffective under certain conditions. This is unsafe. It is desirable to avoid stopping trains unnecessarily; but safety must not be sacrificed.

(8) That two opposing signals governing into the same block shall not display the proceed indication simultaneously, authorizing two trains to move from passing sidings opposing each other.

There are in service several hundred miles of signaling wired under what is known as the A. P. B. system, some with, but mostly without what is known as the "siding overlap in one direction." Under the A. P. B or traffic assigning system we have short blocks for following movements, and long blocks extending from one passing siding to the next for opposing movements.

Paragraph No. 8 refers to the long opposing block. This system of signaling enables us to place signals opposite, under certain conditions, thus cheapening the cost of construction. But requisite No. 8 is not covered except where the siding overlap is used. This serves as an overlap for trains in one direction only and is sometimes referred to as a provisional overlap. The wiring of the traffic-assigning stick relay is more complicated than at points where the signal circuit breaker is used as a timing element. However, on account of trains meeting at the passing siding and the necessity for incoming trains flagging past signals indicating stop, it is essential that the traffic-assigning stick relays at sidings shall operate for incoming trains whether or not the signal indicates proceed.

The improvements added over present methods (in the drawings now presented) are: First, double control as against single control. The latter requires three line wires between passing sidings and the former four line wires and two extra relay contacts. The added cost per signal (spaced one mile apart between passing siding outlets) is $35. Second, the use of a siding overlap. This sub-committee contends that the siding overlap, fulfilling requisite "b" to the letter, is necessary in single track signaling, and, therefore, should not be classed as an addition. Third, the placing of outgoing signals from passing sidings at the fouling point instead of beyond the main switch conforms to general principles in signaling used elsewhere and is therefore a correction, the cost of which should not be considered. . . .

We advocate the use of a separate and distinct signal indication for the government of trains going out of passing sidings. We should forget what is being done on the X Y Z Railroad and confine our thoughts, first, to providing correct single track circuit requisites, and, second, to the design of circuits properly meeting those requisites. . . .

Practical Hints on Operation of Terminal Yards

First Set of Contest Papers in Which Operating Men Discuss All Phases of This Very Important Problem

Twenty-nine papers were received in the contest on the Operation of Terminal Yards, which closed on September 15. These papers were turned over to the following judges: W. J. Jackson, receiver and general manager, Chicago & Eastern Illinois; H. G. Hetzler, president of the Chicago & Western Indiana, and F. C. Batchelder, president, Baltimore & Ohio Chicago Terminal. The judges awarded the first prize to the paper submitted by William L. Burt, assistant freight trainmaster, Pennsylvania Railroad, Jersey City, N. J., and the second prize to that prepared by F. L. Hutchins, Baltimore, Md. The judges were very favorably impressed with a number of other papers and felt that special mention should be given to those submitted by D. S. Farley, division superintendent, Atchison, Topeka & Santa Fe, Kansas City, Mo., and F. H. Garner, transportation inspector, Union Pacific, Omaha, Neb.

Other contributors to this contest were: W. T. Sutphen, general yardmaster, Southern Railway, Macon, Ga.; W. B. Hinrichs, superintendent of terminal, Chicago, Milawukee & St. Paul, Milwaukee, Wis.; Fred P. Grossman, general yardmaster, Chicago, St. Paul, Minneapolis & Omaha, Minneapolis, Minn.; C. A. Pennington, superintendent of terminals, Cleveland, Cincinnati, Chicago & St. Louis, Louisville, Ky.; V. R. C. King, division superintendent, Atlantic Coast Line, Wilmington, N. C.; H. H. Larson, yardmaster, Union Pacific, Council Bluffs, Transfer, Ia.; Richard Brooker, yardmaster, Canadian Pacific, Portage la Prairie, Man.; Z. Middlebrook, trainmaster, Atlantic Coast Line, Florence, S. C.; M. A. Mulligan, trainmaster, Lehigh Valley, Jersey City, N. J.; James M. Fox, yardmaster, Southern Railway, Winston-Salem, N. C.; E. C. Tucker, yardmaster, Norfolk & Western, Portsmouth, Ohio; G. G. Butler, Southern Railway, Washington, D. C.; W. C. Copley, freight trainmaster, Pennsylvania, Altoona, Pa.; I. T. Tyson, assistant trainmaster, Philadelphia & Reading, Port Richmond, Philadelphia, Pa.; R. M. Baker, Pennsylvania Railroad, Bellwood, Pa.; O. C. Hill, assistant superintendent, Chicago, Burlington & Quincy, Kansas City, Mo.; J. E. Campbell, freight agent, Pittsburgh & Lake Erie, Bessemer, Pa.; J. R. Hamilton, terminal trainmaster, Delaware, Lackawanna & Western, Buffalo, N. Y.; G. B. Schrand, trainmaster, Chicago & North Western, Chicago; G. D. Brook, division superintendent, Baltimore & Ohio, Chillicothe, Ohio; W. L. Derr, superintendent, Chicago Great Western, Clarion, Ia.; J. H. Hopkins, Pennsylvania Lines West, Columbus, O.; J. W. Roberts, superintendent of car service, Vandalia, Terre Haute, Ind., and R. R. Farmer, trainmaster, Missouri, Kansas & Texas, Parsons, Kan. The first prize paper is published below and other papers will appear in later issues.

FIRST PRIZE—PRACTICAL CONSIDERATIONS IN THE OPERATION OF A LARGE TERMINAL YARD

By Wm. L. Burt

Assistant Freight Trainmaster, Pennsylvania, Jersey City, N. J.

While there are many things in common in the methods of operation of a purely classification yard and of a terminal yard, the latter presents many complications which do not exist in a classification yard, not the least of which are the receiving and despatching of trains through the same throat of the yard; the placing of loaded cars at various parts of the terminal for unloading and the placing of empty cars for loading; the serving of the station, individual sidings, warehouses and industries, many of which demand the most exacting switching service. At tide water terminals the despatching of cars on floats to various destinations and the assembling of cars from floats for despatching in road trains is also a very important feature.

PERSONNEL

As no system or organization can be more proficient than those responsible for its operation, it necessarily follows that great care should be exercised in selecting employees for the various positions in the organization of a large terminal yard. The selection of a suitable yardmaster is of course of paramount importance. Experience has proven that no established rule of succession can be followed in this respect. It does not necessarily follow that a man who has given satisfaction as an assistant yardmaster possesses the proper qualifications for a yardmaster. Some may be able to execute faithfully and satisfactorily the work allotted to them and manifest a high degree of subordinate efficiency and at the same time be entirely lacking in the administrative ability required of a yardmaster. He should be a man whose predominating characteristic is the obtaining of results with the least amount of friction and confusion. Other than the regular qualifications for the position there should also be taken into consideration, age, physical condition, regularity in attendance to duty, capacity for management and administration, intelligence and judgment in the handling of men, education and moral deportment.

Too much care cannot be exercised in selecting assistant yardmasters as this is the usual line of succession to the position of yardmaster. As in the selecting of a yardmaster, there should be no established grade from which to choose. In some localities it is the practice to use only trainmen for these positions, but this has many decided objections, not the least of which is the element of doubt as to their loyalty to the company's interests. In selecting assistant yardmasters from various positions in the organization it stimulates all to a spirit of emulation which naturally redounds to the benefit of the company in the increased efficiency resulting from this method.

As yardmasters and assistant yardmasters are developed largely from clerks, trainmen, etc., it is important to exercise care in their initial employment. The practice of requiring satisfactory references from former employers has become universal. This should also be augmented by an educational test and physical examination in order to eliminate all those who may not be fitted, either physically or intellectually, for advancement to a higher grade of the service. All applicants for employment in any grade whatever should be interviewed personally by the trainmaster or assistant trainmaster. They should be cautioned to avoid the use of intoxicants, to observe the rules of safety, to avoid the company of those showing a tendency to violate the rules of the company and to report such violations, and to become conversant with the orders and instructions displayed on bulletin boards. At the end of 90 days they should be given an examination as to their knowledge of the book of rules, regulations covering the handling of explosives, rules of safety, special instructions, etc. Failing to pass a satisfactory examination, they should be given 30 days for further preparation for a second examination and an additional 30 days in case they fail to pass the second examination. Failing to pass the third examination, they should be dropped from the service.

RECEIVING, CLASSIFYING AND DESPATCHING

It is necessary for a terminal yardmaster to have a detailed report of every train destined to his yard as it is despatched from the other end of the division and to be advised when it is within a certain distance of the terminal in order that preparations may be made to receive it without delay. Several passing sidings just beyond the limit of the terminal will be found to be of great advantage in permitting trains of live stock and other high class freight to pass around those of less importance when there is

not sufficient room in the receiving yard to accommodate all of the trains without delay. Upon arrival at the terminal the air hose should be uncoupled between each car of all trains of mixed classifications before the train is classified. This can be done quickly with an uncoupling fork without going between the cars —a good position for a crippled trainman.

Upon the arrival of the train in the yard the conductor should send his waybills and mail to the yardmaster's office at once together with a list of the initials and numbers of the cars in the order in which they stand in his train. This list and waybills are then checked for any diversions, hold for orders, changes in destination, etc., after which the train is ready to be marked for classification. Every yardmaster's office should keep a classified car record which provides for the entry of a certain car number in but one place in the book. When orders are received in advance of the arrival of a car for diversion, hold for order, change in destination, etc., the number of the car should be entered in this particular space in red ink in order that the instructions may be brought to the immediate attention of the car record clerk in checking up the train. While this work is in progress the car inspectors should be inspecting the train in order to have the inspection completed by the time the train is marked for classification. The date of arrival should be placed in numerals at the corner of each car. This will be found to be valuable information in avoiding delays to cars, as every car in the yard will then have the date of arrival marked in plain view and save considerable time in checking the yard for delayed cars.

The writer has long been an advocate of equipping large yards with pneumatic tubes, having stations located at each end of the yard connected with the main office. This will permit the immediate despatching of all waybills, mail, etc., to the main office from incoming trains, effect a saving of at least one-half hour in the checking and classifying of every train taken into the yard and avoid the delays incident to the wanderings of messenger boys or some member of the train crew discovering the mail in his pocket several hours after arrival at his home miles away from the terminal. Where this tube system has been installed it has effected a saving estimated at approximately $500 per day in the handling of about 175 trains. In marking cars for classification the following method will be found to be of considerable advantage: If the first draft consists of four cars for "A yard" "A 4" should be written in chalk on the front of the first car where it can be plainly seen by the switchman. The last car in each draft should also show the classification and number of cars in the next draft. For instance: If the second draft consists of three cars for "B yard" the notation "B 3" should be made in chalk on the back of the last car of the first draft and also on the front of the first car in the second draft. This method will enable the switchman or leverman to read on the last car of each draft what the next classification will be before it reaches him. All yards should be well lighted so as to give a good volume of light for all operations.

The clerk at the hump or the car cutter should keep a list of all cuts ridden by each car dropper. This record is beneficial in many ways and serves a threefold purpose. First: It discourages any inclination on the part of car droppers to "soldier" as with proper supervision any tendency in that direction is quickly detected and corrective measures taken. Second: A notice posted on the bulletin board at the end of the month showing the number of cuts ridden by each car dropper will incite rivalry to attain the top of the list, resulting in greater activity on their part. Third: It is of considerable assistance in placing responsibility for cars damaged during classification. It is possible if car droppers are placed on a piece work basis it might result in quicker handling and at the same time in a greater number of damaged cars, although this fact could only be determined by experiments along that line.

A positive rule should be established and observed in all yards requiring trainmen to report immediately all cases of damage to cars and to call at the yardmaster's office at the close of their tour of duty to give a statement in connection with the same. In cases where they attribute the damage to defective equipment such as slack chain or inoperative brake they should call a car inspector and have him determine at once whether or not the alleged defect exists. Failure to call a car inspector should be considered as an acknowledgment of responsibility and proper discipline imposed. If this rule is strictly observed it will result in a decided decrease in the number of cars damaged. Brakes should always be tested before the cars are classified over the hump and where defects are discovered another car should be added to the draft with the defective brake in order to ride it safely to its proper track. Care should be exercised, however, to see that the additional car is returned to its proper classification as soon as the cars in the draft have been classified.

A list of all cars traveling under refrigeration should be sent to the ice house attendant who should make a prompt inspection of all such cars, keeping a detailed record of the amount of ice found in the bunkers upon arrival and the amount of ice added daily until the cars are finally unloaded by consignee. A similar practice should obtain with cars traveling under ventilation. A record should be kept of the position of ventilators, weather conditions, etc., until the final disposition of the car. A full and complete icing and ventilation record is invaluable in contesting or defending claims for alleged damage when it can be shown that such damage was not due to lack of protection given by representatives of the railroad company. A complete seal record should be taken of all inbound loaded cars. In the case of inbound cars it is well to have the conductor accompany the seal clerk around his train in order to check or explain any discrepancy in their respective seal records. This practice has a tendency to create greater watchfulness on the part of conductors while trains are in their possession enroute over the road.

The shifting of cars to and from team tracks, stations, warehouses, piers, docks, etc., should be controlled by the issuance of drill orders prepared by the agent or his representative. All drill orders should be numbered consecutively and a receipt obtained from the assistant yard master or conductor to whom delivered, who places the time he receives it on the back of the order and also the time he completes the work or makes a notation explaining his failure to do so. These drill orders should be sent to the office of the yardmaster or trainmaster at the close of each tour of duty and carefully examined. They will show in detail all the internal shifting performed and call immediate attention to any work left undone.

The interchange of cars with foreign lines should be conducted according to a prescribed schedule. The sending of shifting engines for work on connecting lines should be discouraged or reduced to a minimum. Wherever possible interchange tracks should be placed at junction points and where conditions will permit certain tracks should be assigned for the delivery and other tracks for the receipt of cars. Designate certain hours for interchange with the understanding that stock and perishable shipments may be interchanged at all hours, sufficient notice being given in advance of such deliveries. Where it is necessary for shifting engines to work a portion of the time on connecting lines a spirit of reciprocity on the part of interested operating officials together with special reports of detentions and work performed from conductors of the engines while so engaged will permit of close supervision of their movements.

Arrangements for the interchange of cars by float movement depend entirely upon the number of cars so interchanged. Where one or two floatbeds daily will provide for the interchange an arrangement of the schedule is a simple matter, but where the interchange amounts to 35,000 cars or over monthly the closest supervision is necessary over the yard, transfer bridge and float operations to secure the best results. Modern yard facilities are of course necessary for the satisfactory handling of such a volume of business. The most satisfactory results are obtained by having a system of "gridiron" tracks located immediately in front of each transfer bridge, each track having a holding capacity of one float load. There should be sufficient room for at least five tracks in front of each bridge. With this arrangement of tracks floats

can be handled in about one-half the time required when the float yards are located some distance from the transfer bridges. As in all other operations a closing hour should be established between all lines for the receipt and delivery of cars for certain train connections.

MARKET FREIGHT

The schedules for the movement of market freight consisting of vegetables, peaches, berries, etc., are of course so arranged that trains arrive at the terminal in sufficient time to have the cars placed on team tracks or floated to the market pier stations before the opening or closing of the market hour. The greatest despatch is, therefore, necessary in the handling of these trains both in the road movement and after their arrival at the terminal in order to avoid claims for delays. When cars are shipped from the far south the revenue billing forwarded by United States mail will arrive at destination in sufficient time to have the delivery receipts prepared before the arrival of the cars, but when shipments originate within a radius of about 200 miles the billing must accompany the cars as market trains run at such speed as to arrive at destination ahead of the billing when the latter is forwarded by United States mail.

Some scheme must, therefore, be adopted to avoid the delay incident to the preparation of delivery receipts after the arrival of the cars at destination, as while this work is in progress the time for the market to open has arrived, the truckmen and consignees are clamoring for their freight and confusion and chaos reign until the identity of the various shipments have been established with the result that a number of shipments miss the market, shippers and consignees are disgruntled, claims are presented, and life for all becomes a wearisome burden. The remedy is to send messengers out to meet the incoming trains, preferably at the last yard through which they pass for changing engines and crews. Have them secure the billing, prepare delivery receipts and all terminal papers and hasten to the home station by passenger train if there is one available that will arrive at the terminal in advance of the market train, otherwise continue to destination on the market train with all necessary papers prepared. The result is that when the market opens consignees and truckmen know the exact location of their cars and chaos and confusion are changed to system and order, unloading begins at once, the shipments are placed on the market in satisfactory time, all empty cars are removed from the yard, room is made on the team tracks for the early morning merchandise traffic and everybody is in a happy frame of mind.

The floating of market products to a pier station presents a different proposition from that of delivery on team tracks for the reason that the shipments are unloaded from cars on floats to various assigned locations on the pier by longshoremen wherein enters the labor proposition. For reasons of economy the force engaged in unloading should not be too great and for reasons of efficiency should not be too small. This can be regulated to a nicety by a system of advice quickly and accurately transmitted to the terminal and station organizations of the number of cars en route in each train and the probable time of arrival at destination. This advice not only enables the pier agent to bring his force of longshoremen on duty at the proper time, but also enables the terminal operating department to make proper arrangements for the yarding and floating of cars without delay. Under this system it is not an uncommon practice for market trains to run the last one hundred miles of their journey, be yarded, loaded on floats and placed at the pier for unloading within a period of from three to four hours.

OPERATING DETAILS

Every officer in charge of details of operation should perfect a system of advice whereby he will receive accurate reports at least every six hours showing the cars on hand for various destinations; the amount of traffic en route to the terminal; the cars ready and to be available for movement during the next six-hour period; the power, crews and floating equipment available, and the number of cars on hand and en route to and from connecting lines and private terminals. After a close study of such advice he should map out a campaign of action, having in mind always the requirements of the next six-hour period with all branches of the organization working in harmony for the accomplishment of the campaign outlined. A telephone selector system at the terminal will be found invaluable; in fact, indispensable to accomplish this purpose. A selector system should be located at every vital point in the terminal wherever there is located a yardmaster, assistant yardmaster, freight station, float bridges, etc., or where any certain part of the terminal work is concentrated. Make it imperative that a call on the selector shall be answered at once. Many embarrassing and complicated situations are avoided by this quick means of communication and many prompt and important moves accomplished, which would otherwise be impossible. It also offers means for the closest supervision of operations and for complete harmony of action throughout the terminal. While discussing this particular feature of the terminal proposition it might be well to suggest that the official in direct charge of the operating details should not carry the outline of his plans around in his head, but rather keep it in two places clearly outlined, both in his mind and on paper. One does not know at what moment he may be called from the office either for a brief or extended period and his organization should be such that an assistant may be able to take up the reins and see at a glance the work in hand and continue along the plan outlined.

An invaluable adjunct to a trainmaster's organization is a hustling young man to make daily checks of the terminals. The dates of arrival shown in chalk marks on all cars enable him to spot immediately any cars which may show an inclination to form a permanent part of the landscape of the terminal and he takes immediate steps to have them forwarded. He also searches for delayed foreign cars and starts them via the proper home route. He examines all card waybills of loaded cars held in the terminal to ascertain from the time stamped on the back the date of arrival of the cars and any which show a delay are immediately reported for movement. He makes a notation of all his findings, reports the same to the yardmaster and also the trainmaster. When he makes his trip the next day he is careful to see that his findings of the previous day have received proper attention. He is also used as an efficiency inspector and makes a note of any violations of the rules of safety, book of rules and special instructions.

It is at the terminals that the company's representatives come in contact most with the public. Hundreds of inquiries are received daily by letter, telephone and personal call in regard to shipments en route, changing destinations, holding cars for orders, etc. This feature has grown to such magnitude at large terminals that an organization is necessary to handle it satisfactorily. All such inquiries should be referred to a car-tracing clerk in order to centralize and systematize the work. This clerk should be furnished with a system which will enable him to locate messages or other business at once when consignees or others are telephoning for information. Courtesy on the part of this clerk is of course imperative as patrons are not always in a pleasant frame of mind when making inquiries as to delayed cars and tact, judgment and diplomacy are necessary in dealing with them. If an active interest is taken in their troubles and a disposition shown to assist them he is gaining friends and business for the company. Shifting crews and employees at stations are also in constant touch with the public, the former in the shifting operations at various industries and the latter in their dealings with the public at the stations. The conduct and attitude of these employees are a large factor in securing business for the company.

Economy of operation consistent with a proper degree of efficiency is always to be desired. It should not be necessary to await a call for a reduction in expenses before shifting power is curtailed. This should work automatically with the car movement, which should be made a matter of record and advantage taken of any decided reduction in car movement to secure a corresponding reduction in shifting service. With a proper system of reports or advice the opportunities for reductions may be fore-

seen at least 48 hours before being made effective. The labor forces at stations may be similarly regulated where it is of a transient character by the incoming billing indicating the probable tonnage sufficiently in advance of arrival to regulate the force of laborers.

CO-OPERATION

It has been well said that co-operation is like faith: "The substance of things hoped for and the evidence of things unseen." This is one of the greatest contributing elements to the successful operation of a terminal or any other organization. Without it the best of organizations, personnel, equipment and facilities are doomed to failure. It should prevail not only within the terminal organization, but with every interest with which it comes in contact. Where a terminal forms a separate division it is of the utmost importance that a spirit of co-operation should exist between the connecting divisions. Each should be familiar with the troubles of the other and the energies of both centered in the accomplishment of one purpose. Have a frequent consultation and exchange of ideas between the traffic department and operating officials. Make freight solicitors feel that the latch string is hanging on the outside of the door of the trainmaster's office and that considerable is to be gained by both in team work between these two important branches of the household.

HORNE & CRANE'S AUTOMATIC STOP

Horne & Crane, 114 Liberty street, New York City, on September 30, before a large party of railroad officers, gave an exhibition at Cranford Junction, N. J., on the Central of New Jersey, of their automatic train stop, an apparatus which works without requiring physical contact between the roadside and the train-carried elements, and which includes speed control adjustments, by which enginemen can be compelled to graduate their speed from the caution to the stop signal according to any predetermined rate.

The tests were made with Central of New Jersey locomotive No. 528, on a side track; and, because of the impossibility of moving the engine on this track at high speed, the speed control apparatus was adjusted to apply the brakes in case it exceeded a speed of 12 miles an hour. The brakes were applied in satisfactory shape. Running past the brake-applying points at 11½ miles an hour, the stopping apparatus remained unaffected.

The apparatus was described in *The Signal Engineer* in January, 1914. Briefly, it consists, on the locomotive, of a valve in the air brake system, controlled by a dashpot adjusted to cause the opening of the air valve, and the application of the brakes, after a predetermined interval of time following the opening of an electric circuit. This electric circuit is controlled by an electro-magnet carried in a box about 20 in. long, suspended from the right hand equalizer of the front truck, and adjusted so as to be less than an inch above the rail. The condition of the electro-magnet is constantly affected by this nearness to the rail. The magnet box is immediately behind the front wheel, and of the same width as the wheel tread; so that the wheel serves constantly as a guard to prevent the magnet from being damaged or disturbed by obstructions on the track. Normally, the brakes of the train are held off by air pressure, the integrity of which pressure depends on the fact that the steel of the rail attracts the armature of the magnet.

On the ground, the first element is a piece of rail, in the track, right hand side, which is composed in part of manganese, and which, because of this, is practically non-magnetic. It has no appreciable effect on the engine-carried magnet. When the engine truck passes over this rail the magnet is released from the influence of the steel rail and the timing circuit is broken.

The manganese rails are inserted in the track in pairs. At Cranford Junction the second rail of the pair was 123 ft. in advance of the first; and the timing dashpot on the engine was set for a time element of seven seconds. When the engine was run faster than 12 miles an hour, it passed over this distance in less than seven seconds, and the air valve opened, on reaching the second manganese rail, and the brakes were applied. When the speed was below the prescribed rate and the period of seven seconds expired before the second rail was reached the dashpot had restored the circuits so that the brakes were not applied.

To limit the speed to 24 miles an hour the non-magnetic rails (the time element on the engine remaining unchanged) would be placed 246 ft. apart; for 36 miles, 359 ft. To control speed between a distant and a home signal a pair of rails would be installed at the distant signal, with, say, a space of 359 ft. between them; another pair half way between the distant and the home spaced 246 ft., and a third pair close to the home signal spaced close enough together to insure a stop, whatever the speed. For higher speeds the rails can be placed farther apart or the timing dashpot can be made to operate in shorter time.

When the line ahead of the home signal is clear, and the speed of the train is not required to be reduced, the effect of the manganese rail is neutralized by the action of an electro-magnet fixed in a brass box at the side of the rail. In such a case, this electro-magnet, energized by a current controlled by the track relay of the track section to which this brake-applying section appertains, practically puts the track into the same condition, so far as it affects the stopping apparatus, as though the rail were continuous steel.

Since the publication in *The Signal Engineer* the inventors have made some slight changes in the magnet parts. The locomotive magnet formerly comprised a movable core or pole, which was adapted to open the circuit controlling the valves in passing over the manganese rail. The device is now arranged so that the poles and core of the locomotive magnet swing at right angles to the rail.

The track magnets have been simplified and considerable electrical energy is saved by placing them alongside of the head of the rail. In this position a light armature, carried in the locomotive magnet case, is attracted toward them, and this closes a parallel circuit (when the track is clear) so as to prevent the magnet valves from responding to the condition produced by the absence of the ordinary steel rail. The entire device is designed on the "closed circuit" principle, and a failure of electric energy, the breaking of any spring or wire, or a cross on any of the leads, would at once cause an automatic application of the brakes. The proprietors are planning to install manganese sections suitable for maximum speeds up to 90 miles an hour, and when this is done and the necessary adjustments are made, will conduct another test, at a location where much higher speeds can be demonstrated.

Russian Railway for China.—It is reported that the Russian minister at Pekin has received the consent of the Chinese government to the construction by Russian capitalists of a railroad from the island of Sakhalin along the right bank of the Amur river to a point opposite Blagoveshchensk, and thence to Harbin with a branch to Tsitsihar.

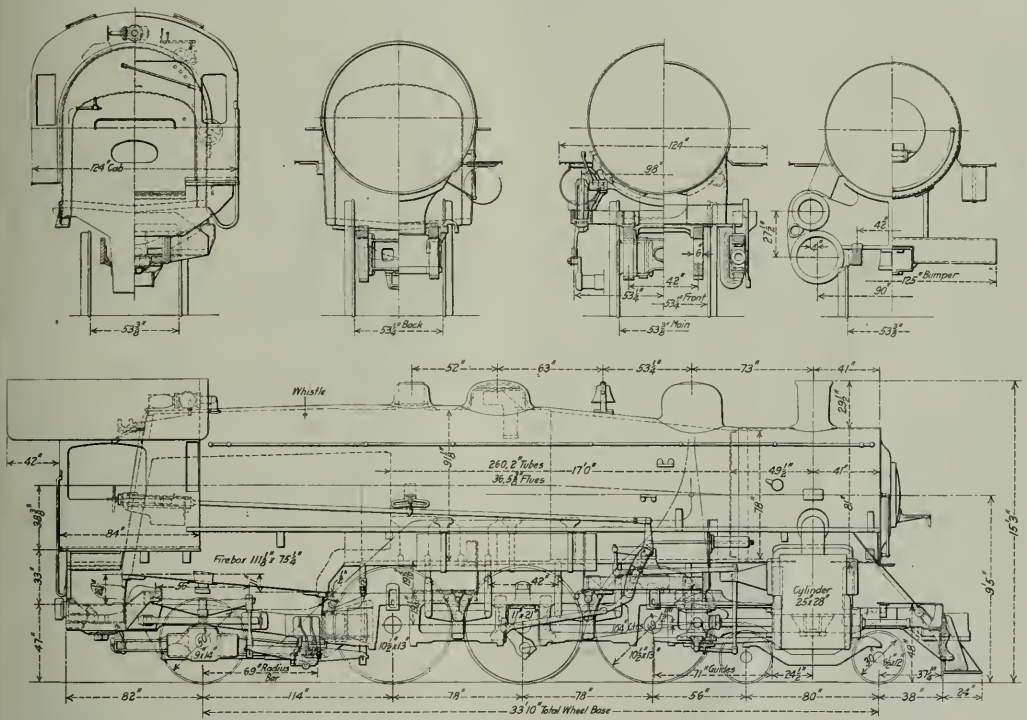
Russian Railway Ties.—Before the war ties in Russia cost about 71 cents, which is double the price they cost twenty years ago. Say they cost 75 cents each laid in the road, the amount works out at about 9½ cents a year, as they only last, on an average, eight years. Steel ties are not favored, and it is maintained that their use in Germany is not due to their actual merits and that, moreover, they are not used on the Austrian railways. Possibly one reason for the disfavor shown in Russia towards steel ties is that the track is poor and the ties will not, therefore, remain in position. Neither are ferro-concrete ties liked, but if a reliable one could be found they would probably be extensively used, particularly on the lines in Central Asia. About 180 million ties are required a year. No attempts would appear to have been made to lengthen the life of wooden ties by first treating them, although it is computed that one-fifteenth of the known forest wealth of Russia would suffice for its tie requirements.

Lackawanna Pacific Type Freight Locomotive

Second Order of These Engines for Freight Service; Cylinders Include New Type of By-pass Drifting Valve

The Delaware, Lackawanna & Western has recently received 14 Pacific type locomotives for fast freight service which were designed under the supervision of H. C. Manchester, superintendent of motive power and equipment, and built by the Lima Locomotive Corporation. This is the second lot of Pacific type service and the same general design has been followed in the new engines.

The principal change in the new engines is the introduction of a 36-in. combustion chamber in the boiler with a consequent reduction in the length of tubes from 20 ft. to 17 ft. This



Elevation and Sections of Delaware, Lackawanna & Western Fast Freight Locomotive

locomotives to be placed in freight service by the Lackawanna. The original locomotives which have been in service for about one year, were described in the *Daily Railway Age Gazette*, June 14, 1913. They have proven very satisfactory for this change has necessitated the enlargement of the boiler at its greatest diameter and has slightly increased the weight with a decrease in total evaporative heating surface of 432 sq. ft. The superheater heating surface has been increased, however, and

Delaware, Lackawanna & Western Pacific Type Locomotive for Fast Freight Service

the total equivalent heating surface is only 234 sq. ft., or a little over 4 per cent less than that of the former engines. The better distribution of the heating surface should benefit the steaming qualities and add slightly to the locomotives' hauling capacity in the service for which they are designed.

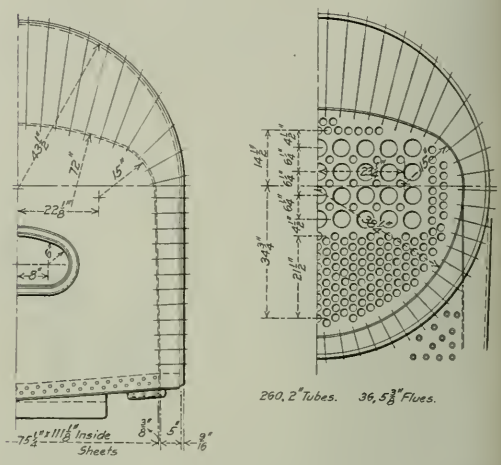
The boilers are provided with auxiliary manhole domes. These offer a clear opening 16 in. in diameter so that the boiler may be entered and inspected without the removal of the throttle valve from the main dome. The cab turret is a special form of the single manifold type, so arranged that it can be removed for repairs with the full steam pressure on the boiler.

The cylinders are provided with the Lackawanna standard by-pass drifting valve arrangement recently developed and patented by H. C. Manchester, superintendent of motive power and equipment, and S. S. Riegel, mechanical engineer. It provides for the automatic delivery of steam directly from the boiler into the cylinders during periods of coasting, and also performs the ordinary function of a by-pass valve. The valves are of the piston type operating in chambers opening from the cylinder ports, the two ports on each cylinder being connected by a 5 in. wrought iron pipe, which serves as a by-pass. A sectional view through one of the valves and its chamber, slightly distorted for the sake of clearness, is shown in one of the engravings. Live steam from a globe valve in the cab is conducted through a 13/16 in. copper pipe into the annular chamber surrounding the valve. When the throttle is open and the engine is using steam, steam chest pressure is communicated to the chamber at the outer end of the valve through a pipe under the cylinder jacket leading from the live steam cavity at the center of the valve chamber. This pressure, acting against the end of the valve, holds it in the closed position as shown while the engine is working. As soon as the throttle is closed, however, the pressure is removed and the live steam pressure, acting on an effective area equal to the difference in the area of the smaller and larger pistons, forces the valve to the open position. In opening, the packing rings on the smaller or inner piston travel over grooves leading from the annular chamber, thus admitting live steam directly into the entire cylinder space in sufficient quantities to maintain the temperature of the cylinder walls and to break up the vacuum. This prevents an inrush of air with the attendant carbonization of lubricating oil and damage to the cylinder walls. Engines equipped with this device are very free coasters and its use is claimed to have effected a considerable increase in the life of both cylinder and piston rod packing.

The main driving boxes used on these locomotives are 21 in. in length. The main pedestals are increased in width by means of steel castings between the frames. The engines are provided with the Woodard self-centering engine truck and the Miner friction draft gear has been included on the front end. Economy type grate shaker brackets, which insure against dropping of fuel through the deck, and low type tank wells are also used. The valves for these wells are operated from the ground and when closed permit blowing the water in the hose back into the tank, thus providing against freezing. Vanadium cast steel has been used in the frames. The principal dimensions and weights are given in the following table:

General Data

Gage	4 ft. 8½ in.
Service	Freight



Backhead and Section Through the Boiler, Showing the Rear Tube Sheet

Fuel	Bit. coal
Tractive effort	43,200 lb.
Weight in working order	291,000 lb.
Weight on drivers	188,000 lb.
Weight of engine and tender in working order	456,500 lb.
Wheel base, driving	13 ft. 0 in.
Wheel base, total	33 ft. 10 in.
Wheel base, engine and tender	66 ft. 4 in.

Ratios

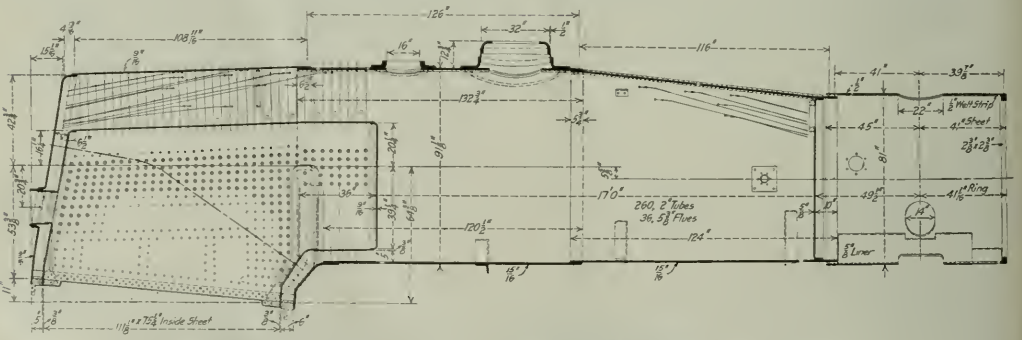
Weight on drivers ÷ tractive effort	4.35
Total weight ÷ tractive effort	6.74
Tractive effort × diam. drivers ÷ total equivalent heating surface*	589.3
Total equivalent heating surface* ÷ grate area	87.2
Weight on drivers ÷ total equivalent heating surface*	37.2
Total weight ÷ total equivalent heating surface*	57.5
Volume of both cylinders	15.9 cu. ft.
Total equivalent heating surface* ÷ vol. cylinders	318.0
Grate area ÷ vol. cylinders	3.7

Cylinders

Kind	Simple
Diameter and stroke	25 in. by 28 in.

Valves

Kind	Piston
Greatest travel	6½ in.
Outside lap	1 1/16 in.



Boiler for the Delaware, Lackawanna & Western Fast Freight Pacific Type Locomotive

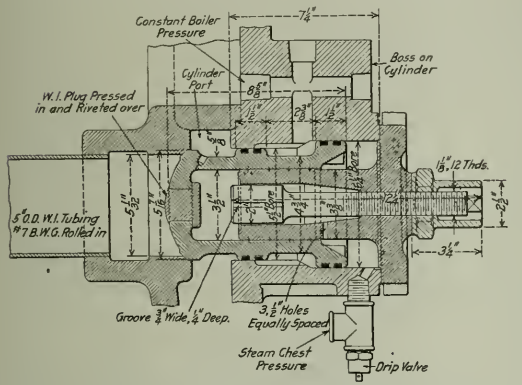
Inside clearance	3/16 in.
Lead in full gear	3/16 in.

Wheels

Driving, diameter over tires	69 in.
Driving journals, main, diameter and length	11 in. by 21 in.
Driving journals, others, diameter and length	10½ in. by 13 in.
Engine truck wheels, diameter	30 in.
Engine truck journals	6½ in. by 12 in.
Trailing truck wheels, diameter	50 in.
Trailing truck journals	9 in. by 14 in.

Boiler

Style	E. W. T.
Working pressure	200 lb.
Outside diameter of first ring	78 in.
Firebox, length and width	111⅛ in. by 75¼ in.
Tubes, number and outside diameter	265—2 in.
Flues, number and outside diameter	36—5⅜ in.
Tubes, length	17 ft. 0 in.



Section Through By-Pass Drifting Valve Chamber

Heating surface, tubes and flues	3,279 sq. ft.
Heating surface, firebox and combustion chamber	279 sq. ft.
Heating surface, total	3,558 sq. ft.
Superheater heating surface	about 1,000 sq. ft.
Total equivalent heating surface*	5,058 sq. ft.
Grate area	58 sq. ft.

Tender

Tank	Water bottom
Weight	165,500 lb.
Water capacity	9,000 gal.
Coal capacity	10 tons

*Total equivalent heating surface = total evaporating heating surface + 1.5 times the superheater heating surface.

INCREASE IN MILEAGE BOOK RATES FAVORED

Although, as mentioned in last week's issue, the secretary of the Illinois Commercial Men's Association has sent out circular letters to 100,000 traveling salesmen, asking them to fill out a blank form of protest to the Interstate Commerce Commission against the increase in rates for mileage books on the eastern railways, it is apparent that there is some division of opinion on this subject among the members of the association. Lorenzo Norvell, manager of Fairbanks, Morse & Co., at St. Louis, Mo., has addressed a letter to R. A. Cavenaugh, secretary and treasurer of the Illinois Commercial Men's Association, in which as a member of the organization he enters an emphatic protest against the attempt to incite the members of the organization to take up this movement. Mr. Norvell concludes his letter by saying that unless he is accorded the same privilege that the secretary has used in sending out his letter broadcast, by having circular copies of it printed and sent to each member, he will solicit the aid of the press of the country, having reason to believe that it will willingly join in a protest against the movement. He states that he will also send copies of his letter to the managers of many large firms with which he is acquainted, and solicit their assistance, which he feels will be willingly given.

Mr. Norvell says in his letter:

"I deny that there is any disposition on the part of railway officials to antagonize traveling men as a class. I further deny that their attempt to secure increased rates is in any way striking at the bread and butter of traveling salesmen. On the contrary, they are making a last effort to conserve their properties and I share the opinion of a great many business men that the men who are now handling our great railroad properties are to be commended for their magnificent courage against such overwhelming odds and that they should receive the united support of commercial houses and traveling salesmen throughout the country. They are our natural allies, and their mission is just as important as that of the traveling salesmen.

"Our great need today is service. We want trains in plenty to enable traveling men to get over their territory quickly without loss of time. We also want our freight handled promptly and when we get service we should be fair enough to pay for it. You have stated that the railroads have not increased their mileage rates for a period of 30 years, and I submit to you in all fairness that it is time for an increase, as there is no comparison between the service of the present day and 30 years ago. You have stated that there will be no objection to raising passenger rates on single-trip tickets. Why look at the question from your side only? As a matter of fact, I cannot see why traveling salesmen should get a better rate on transportation than individuals, particularly when in nine cases out of ten the firm for whom the man is traveling pays the bill.

"We are now facing a very grave condition—not a theory—and if there ever was a time for the doctrine of 'live and let live,' it is before us now, as the railroads throughout the country are losing money every day they operate, regardless of their utmost efforts to economize in every direction.

"You propose to ask the Interstate Commerce Commission to fix a price on a service without any reference whatever to their gross income and expenses, and yet there isn't a man in our entire organization that would consider it anything but an outrage if the same doctrine were applied to any commercial institution in this country.

"There has been entirely too much agitation against railroads and the cause for this agitation which originated long ago has passed, but the railroads are still reaping the results, and I submit to you that any traveling salesman in this organization knows of many railroad towns where the shop forces and maintenance forces have been cut down to such an extent as to seriously impair the business of the merchants with whom that salesman does business in that town.

"According to your theory, you would cut down their forces and keep the salaries of their employees at a minimum in order to put bread and butter into the mouths of traveling salesmen, and I submit that you would be fooling yourself all the time because the salesman's welfare is indissolubly connected with that of the railroad man.

"You would appeal to the Interstate Commerce Commission for relief in this matter, and yet you have lost sight of the fact that 30 years ago we did not have an Interstate Commerce Commission and that the existence of the Interstate Commerce Commission at this time has made it necessary for the railroads to spend hundreds of thousands of dollars, in fact millions, for the purpose of keeping records in order that the commission may supervise their business methods for the benefit of the people of the United States.

"I also desire to call your attention to the fact that railroad bonds are largely held by our leading insurance companies and a depreciation of their value is a blow at the integrity of the insurance policies held throughout the country.

"It is my understanding that the Illinois Commercial Men's Association was organized for the purpose of conducting a mutual accident insurance business among its members. You should, therefore, be debarred from making any such campaign at the probable expense of leading insurance companies in which nearly all of your members have policies."

General News Department

The Boylston street subway, in Boston, which has been under construction for the past two years, was opened for traffic October 3. This subway is about 1½ miles long, extending from the north-and-south subway near the Public Garden westward toward Brookline.

The Delaware, Lackawanna & Western has just finished, at Hoboken, N. J., as a part of its wireless telegraph equipment, a steel tower, 402 ft. high. The Hoboken office now has a five kilowatt Marconi apparatus, and messages have been sent from Hoboken to Buffalo, 410 miles. The wave length is 2,250 meters.

The president of the Old Time Telegraphers' and Historical Association for the present year is Andrew Carnegie; and the annual meeting next year is to be held in New York City. No meeting was held this year, the decision to omit it having been due to the disturbances caused by the European war, and the election of officers was by the executive committee. The secretary of the association is F. J. Scherrer, 30 Church street, New York City.

Members of the Switchmen's Union of North America have filed suit at Dallas, Tex., against the Missouri, Kansas & Texas, the Texas & Pacific, the Houston & Texas Central, the International & Great Northern, the St. Louis Southwestern, the Gulf, Colorado & Santa Fe, and the Brotherhood of Railroad Trainmen, to cancel contracts by which the roads are said to employ only members of the trainmen's union to the exclusion of members of the Switchmen's Union.

The management of the Pennsylvania Railroad has begun a campaign to keep passengers from standing on the platforms of moving passenger cars. Letters have been sent to the various industries around Pittsburgh, requesting them to post notices in their factories warning their employees (hundreds of whom ride on Pennsylvania trains daily, going to and from their work) of the danger of standing on the platforms of moving cars; and a general notice to passenger trainmen has been posted on the bulletin boards calling for a concerted effort on the part of trainmen to keep passengers from riding on platforms or steps of cars between or approaching stations.

C. H. Hudson, a passenger conductor on the Georgia & Florida, running between Augusta and Valdosta, proposes that railways and street railways aid the cotton growers, in their financial distress, caused by the cessation of the European demands for cotton, by ordering the general use of cotton cloth (khaki) for uniform suits for employees. By prompt action a supply of this material could be provided in time for use for summer uniforms in 1915. Mr. Hudson calls attention to the fact that the Buy-a-Bale movement, by which individuals relieve the market by buying and storing cotton, does not afford permanent and final relief; the cotton is likely again to come on the market; whereas his plan would use it up.

Samuel O. Dunn, editor of the *Railway Age Gazette*, addressed the Chicago Engineers' Club at its weekly luncheon in Chicago on October 1, on "Government Ownership of Railways." Charles Evans, commissioner of the Queensland (Australia) government railways, was present, and added a brief, informal discussion. Mr. Evans said he would not care to dispute any of the arguments made against government ownership of railways in the United States, but that the situation was different in his country, where it was necessary for the government to undertake railway construction in order to develop its territory, because the state could not depend on private enterprise to do so. He also remarked that with all the regulating commissions in the United States the American railways have all the government control they can stand without government ownership, and that actual ownership by the government would be "too much of a good thing." He thought the problems were too big and complex for the government to undertake. He added that competition under private ownership had developed a luxuriousness of passenger traffic, both in the United States and in Great Britain, which would not be afforded by government owned railway systems; and that if he were to criticize our railways he would say there are too many millions spent on "brass work and marble halls."

The University of Pittsburgh has arranged to establish an evening school of engineering this fall, giving graduate courses under the direction of Dean Bishop, in which men who are properly prepared and who have received their bachelor of science degree may obtain an engineering degree. Courses will be offered in the valuation of public utilities, and mechanical, civil, electrical, sanitary, mechanical railway and concrete engineering. The faculty will include Paul N. Lincoln, professor of electrical engineering at the university and president of the American Institute of Electrical Engineers; Louis E. Endsley, professor of mechanical railway engineering at the university; D. F. Crawford, general superintendent of motive power, Pennsylvania Lines West, who will co-operate with Professor Endsley in the work of mechanical engineering; Prof. R. T. Stewart, head of the department of mechanical engineering at the university; Prof. J. Hammond Smith, head of the department of civil engineering, and Professor Morris Knowles, director of the department of sanitary engineering, who with Prof. G. W. Case and William F. Moorehead will give the course in the valuation of public utilities.

The Firemen's Comprehensive Program

At a meeting of the Illinois legislative committee of the Brotherhood of Locomotive Firemen and Enginemen at Springfield last week, it was decided to advocate a change in the federal hours of service law, to reduce the maximum hours of trainmen from 16 to 10 hours a day. Other legislation is to be advocated which would provide for a limitation on the number of cars in a train, a uniform code of signals, giving trainmen a right to vote when they are away from home on election day, standardization of overhead and side clearances, and giving the Interstate Commerce Commission power to specify the type of steel cars to be used in passenger trains.

Armspear Lenses

The Armspear Manufacturing Company, New York City, has published a record of tests of lenses of signal lamps showing the superiority of the Armspear spheroidal lens, over the ordinary signal lenses, when the measurement is taken at any point other than on the axis of the lens. For example, at a point on the axis 575 ft. from the light the stellar magnitude of an inverted lens is 5.75; and of the spheroidal lens 5.00. At a point 2,260 ft. from the light and 2¾ deg. from the axis, both lenses measure 3.00; in other words, the ordinary lens has lost 48 per cent, while the Armspear has lost only 40 per cent. At 900 ft. from the light and 15 deg. from the axis, the inverted lens measures 0.50 and the spheroidal 4.25. At 1,890 ft. from the lamp and 15 deg. from the axis the light from the inverted lens is entirely lost, while the Armspear at that point measures 3.00. These tests were made on a clear night (August 31) with the moon seven-eighths full.

A Safety-First Motion-Picture Play

Marcus A. Dow, general safety agent of the New York Central Lines, has recently had produced a rather remarkable motion-picture play entitled "Steve Hill's Awakening" for use in connection with the safety-first work now being conducted by the Central. The picture, a brief description of which is given below, is one of the first produced under railroad auspices for this purpose, telling a story of human interest with its principal parts played by professional actors. The scheme was carried out with the idea of departing from stereotyped methods, Mr. Dow, who some time ago introduced the safety exhibit car on the New York Central Lines (*Railway Age Gazette*, August 8, 1913, p. 228), having seen the necessity of introducing a feature

OPERATING REVENUES, EXPENSES AND TAXES, AND RATIO OF THE VARIOUS OPERATING EXPENSE ACCOUNTS TO TOTAL OPERATING REVENUES

that would create sufficient interest among the employees to bring them into the safety meetings willingly. And, of course, a "human interest" story will leave on their minds a more lasting impression than the ordinary didactic lecture. It is the intention of the company to show the "movie" in a specially equipped car, to be run over all of the Central lines, as has been done with the safety exhibit cars, stopping at the principal points. The pictures will also be used at large safety meetings conducted in halls or theaters in the various cities on the line.

The story is in brief as follows:

Henry Hill, a trainman, at the end of his run, coming in to the yard and jumping off the caboose, starts, against the advice of a fellow employee, to take a short cut along the tracks to his home, and is struck by an engine and killed, leaving a widow and two children, a boy and a girl. Soon after this the family is dispossessed, the widow later dies in poverty and the two children are sent to an orphan asylum. Fifteen years later, the son, Steve Hill, becomes a brakeman in the yard where his father was killed. He is of careless habits and is shown on the screen taking the usual risks, such as kicking a drawbar with his foot and jumping on the front of a moving yard engine. For this conduct he is reproved by the yardmaster, Jack Warren. The "human interest" of the story comes in when "Steve" meets Mary, the yardmaster's daughter, and courts her. The father's consent to marriage is withheld because of Steve's careless habits in his work. Steve, nevertheless, does not take the lesson to heart, and a short time after, disregarding a blue flag, he causes a slight collision on a repair track, and knocks a car body off its supporting horses, thereby causing serious injury to a car repairer. He is then discharged, at once; and is also repudiated by Mary. Going home in a disconsolate mood, he throws himself on his bed, falls asleep and has a dream, in which he sees himself taking all sorts of chances. For instance, he crosses the track between two cars and barely escapes being crushed. He is hurled from a side ladder by a car which stands out beyond the fouling point. Walking across a track without looking where he is going, he is almost run over by an engine. Finally, however, he takes one chance too many and loses his leg. He awakes from his dream with a start, overjoyed, to be sure, to find that his leg is not gone; but taught a lesson that makes him begin anew with "Safety First" as his motto. He is reinstated in his job, and marries the girl. The scene then passes to thirty years later showing him and his wife, both gray haired, in their happy home. "Steve" is telling a party of friends that his policy of Safety-First has made him a successful railroad man.

The picture is in two reels, and takes about half an hour to show. It is well done, and is to be classed as better than the average. Mr. Dow says that the Atchison, Topeka & Santa Fe; the Chicago, Burlington & Quincy, and the Delaware, Lackawanna & Western have made arrangements to use the film.

National Association of Railway Commissioners

A call has been issued for the twenty-sixth annual convention of the National Association of Railway Commissioners to begin in Washington, D. C., on November 17, and to continue for four or five days. The program provides for two special addresses, one by Chairman Harlan, of the Interstate Commerce Commission, and one by C. A. Prouty, director of valuation of the commission. The time of the convention will be largely devoted to the presentation and discussion of reports of 19 committees with 9 subcommittees. It is hoped that all the reports will be completed and sent to the secretary for printing and distribution at least 30 days in advance of the meeting. The committees to report include the following: Amendment of Act to Regulate Commerce; Car Service Demurrage; Reciprocal Demurrage; Storage Rules and Charges; Express Service and Express Rates; Grade Crossings and Trespassing on Railroads; Legislation; Powers, Duties and Work of Railway Commissions; Railroad Taxes and Plans for Ascertaining Fair Valuation of Railroad Property; Rates and Rate-Making; Railway Capitalization; Railway Service and Railway Accommodations; Safety Appliances; Statistics and Accounts; Shippers' Claims; Statistics and Accounts of Electric Railways; Telephone and Telegraph Rates and Service; Uniform Classification and Simplification of Tariffs; Rails and Equipment, and Physical Valuation.

Master Mechanics' and Master Car Builders' Associations

The executive committees of the American Railway Master Mechanics' Association, the Master Car Builders' Association and the Railway Supply Manufacturers' Association will hold a meeting at the Hotel Biltmore, New York, at 10 a. m. on October 22. It is very urgent that all members of these committees attend because the place for the 1915 meeting will be decided and arrangements made in relation thereto.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

American Association of Demurrage Officers.—A. G. Thomason, Demurrage Commissioner, Boston, Mass. Annual convention in April.

American Association of Dining Car Superintendents.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next convention, October 22-24, Washington, D. C.

American Association of Freight Agents.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 21-24, 1915, Richmond, Va.

American Association of General Passenger and Ticket Agents.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.

American Association of Railroad Superintendents.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next meeting, May 20-21, 1915, San Francisco, Cal.

American Electric Railway Association.—E. B. Burritt, 29 W. 39th St., New York. Annual convention, October 12-16, Atlantic City, N. J.

American Electric Railway Manufacturers' Association.—H. C. McConnaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

American Railway Association.—W. F. Allen, 75 Church St., New York. Semi-annual meeting, November 18, Chicago.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 20-22, 1914, Los Angeles, Cal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1915.

American Railway Safety Association.—L. F. Shedd, C. R. I. & P., Chicago. Next meeting, November, Chicago.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga. Annual meeting, July, 1915.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 1-4, 1914, New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Atlanta, Ga.

Association of Manufacturers of Chilled Car Wheels.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Annual meeting, second Tuesday in October, New York.

Association of Railway Claim Agents.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, 3d week in May, 1915, Galveston, Tex.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual convention, October 26-30, 1914, Chicago.

Association of Railway Telegraph Superintendents.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 22-25, 1915, Rochester, N. Y.

Association of Transportation and Car Accounting Officers.—C. P. Conard, 75 Church St., New York. Next meeting, December 8-9, 1914, Richmond, Va.

Bridge and Building Supply Men's Association.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meetings, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

Freight Claim Association.—Warren P. Taylor, R. F. & P., Richmond, Va. Annual meeting, June 16, 1915, Chicago.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

International Railway Congress.—Executive Committee, 11, Rue de Louvain, Brussels, Belgium. Next convention, June 23 to July 6, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 W. Broadway, Winona, Minn. Next convention, July 14-17, 1915, Sherman House, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, C. H. & D., Lima, Ohio.

Maintenance of Way and Master Painters' Association of the United States and Canada.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next convention, November 17-19, 1914, Detroit, Mich.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May, 1915.

Master Car and Locomotive Painters' Association of the United States and Canada.—A. P. Dane, B. & M., Reading, Mass.

Master Car Builders' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1915.

National Railway Appliances Association.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railroad Master Tinners, Coppersmiths and Pipefitters' Association.—U. G. Thompson, C. & E. I., Danville, Ill. Annual meeting, May, 1915.

Railway Business Association.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December 10, 1914, Waldorf-Astoria Hotel, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Railway Electrical Supply Manufacturers' Association.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

Railway Fire Protection Association.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala.

Railway Signal Association.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa.

Railway Storekeepers' Association.—J. P. Murphy, L. S. & M. S., Box C, Collinwood, Ohio. Annual meeting, May, 1915.

Railway Supply Manufacturers' Association.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders and Master Mechanics Associations.

Railway Telegraph and Telephone Appliance Association.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake City Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Signal Appliance Association.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

Society of Railway Financial Officers.—Carl Nyquist, C. R. I. & P., La Salle St. Sta., Chicago.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. Ry., Atlanta, Ga.

Southern and Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7122 Stewart Ave., Chicago. Annual meeting June 15, 1915, Minneapolis, Minn.

Transportation Club of Detroit.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

The Canadian railways generally have made a rate of one fare for the round trip on the certificate plan to Calgary from all Canadian points for the International Irrigation Congress, which opened its sessions there on October 5.

The Southern Railway has applied to the Corporation Commission of North Carolina for authority to temporarily suspend the operation of a number of passenger trains, including the second sections of Nos. 37 and 38 on the main line; Nos. 15 and 16 on the Danville division and 145 and 146 on the Durham & Raleigh division. This request is made because of a falling off, in both passenger and freight business, on account of conditions due to the war in Europe.

The increase in the price of mileage tickets on the first of October led to very large sales, at many places, on the last day of September, of tickets at the old rate of two cents a mile. At Pittsburgh, Pa., one large corporation bought 1,500 books paying $30,000. At Winchester, Va., one man bought $10,000 worth. The receipts of the Boston & Maine for September were $400,000 above those of last year, and it is to the extra sales of mileage tickets that the increase is principally attributed. The Public Utility Commissioners of New Jersey on September 30 decided not to suspend the new tariffs filed by the railroads in that state advancing the price of mileage tickets.

A conference of the chief traffic officers of the St. Louis railways was held on September 28, at St. Louis, to consider the controversy that has arisen over the payment of the bridge tolls on through traffic crossing the Mississippi river. For many years all traffic between eastern and western roads had been interchanged at the east bank of the river. In 1906 a municipal commission prevailed on the eastern roads to make rates from St. Louis the same as those from East St. Louis. The western roads now demand that the eastern roads take the freight at St. Louis instead of at East St. Louis; by which action they would have to absorb the bridge toll. At the meeting the eastern roads unanimously declined to do so and no adjustment was reached.

A conference which had been called for last week between industrial traffic managers of Cleveland, Cincinnati, Columbus, Toledo, Dayton, Springfield and other Ohio cities, with the traffic officers of the Ohio railroads before the Ohio Public Utilities Commission to discuss the 5 per cent advance in freight rates in Central Freight Association territory recently allowed by the Interstate Commerce Commission, has been postponed because of the decision of the commission to reopen the case. Many representatives of the Ohio shippers had opposed the application of the 5 per cent advance to the Ohio intrastate rates and complained that the decision of the Interstate Commerce Commission constitutes a discrimination against shippers in Central Freight Association territory as compared with those outside of that territory.

The traffic department of the Chicago & North Western, in cooperation with the Upper Peninsula Development Bureau, has aided greatly in the development of the potato growing industry in the Cloverland district of Michigan during the past year. The railway paid all the expenses in establishing five potato patches, consisting of 1,000 hills in each patch, on its right of way in Menominee county, Delta county and Marquette county. This ground was prepared, cultivated and plowed by the section men at the respective stations. The seed was purchased by the railway and a liberal amount of commercial fertilizer was purchased and applied. The care and culture of the potatoes have been under the supervision of the roadmaster, and the service has been rendered by the section men. Each patch has been located on a different variety of soil, and the crops at all five stations have far exceeded many of the adjacent potato fields that have not been benefited by the same amount of cultivation and care. The object, of course, was to prove to the farmers residing in each locality that their efforts would be crowned with greater success if they would adopt more careful methods.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The Interstate Commerce Commission has suspended tariffs filed by the Union Pacific closing the Ogden gateway after October 1, to through traffic from eastern points via the Gould lines to certain points on the Union Pacific system in Idaho and other northern territory.

Examiner Thurtell began a hearing at Chicago on October 6 on the application of the transcontinental railways for a modification of the commission's order in the intermountain rate case as to 107 commodities, which are especially subject to water competition at the Pacific coast and as to which the roads desire to make low rates to the coast without making corresponding reductions to intermediate points.

The chambers of commerce of Alexandria and Shreveport, La., have filed a complaint with the Interstate Commerce Commission against the Alabama & Vicksburg, and other carriers participating in traffic to Shreveport, attacking the class rates from St. Louis, Memphis and Kansas City to Alexandria and Shreveport, which were advanced on April 1 from one to five cents per hundred pounds on the first six classes. The complaint is that the through rates from the gateways mentioned are in many instances higher than the combination of intermediate rates.

The Sioux City Commercial Club has filed a complaint with the Interstate Commerce Commission which raises questions similar to those recently decided by the Supreme Court and the Interstate Commerce Commission in the Shreveport rate case. The Sioux City club complains against new rates included in a general reduction of about 20 per cent in the state rates of Nebraska, which became effective on September 6, under order of the Nebraska Railroad Commission, on the ground that the new rates in Nebraska are lower than rates charged for like distances from Sioux City to points in Nebraska, and that this constitutes a discrimination against Sioux City merchants in favor of those in Lincoln, Omaha, Fremont, Norfolk and other jobbing centers; and that Sioux City firms cannot compete with them in north Nebraska territory, except by sacrificing a part of their profits to overcome the disparity in rates. The commission is asked to issue an order requiring the railroad defendants to cease the alleged discriminations and to publish and maintain rates, rules and specifications which will be fair to Sioux City. This will give the roads a chance to plead before the Interstate Commerce Commission that they have reduced their rates within Nebraska under compulsion by the state commission.

Rates on Starch from Cedar Rapids, Ia.

Douglas & Co. v. Illinois Central et al. Opinion by Commissioner Harlan:

The commission is of the opinion that corn starch is not to be deemed a like kind of traffic with corn meal, hominy, grits, brewers' grits, corn flour and other uncooked product of corn. It therefore holds that the railroads in refusing transit privileges on that commodity at Cedar Rapids, Iowa, do not discriminate against the complainant. It is held, however, that certain of the rates on corn starch from Cedar Rapids are unreasonable. It is therefore ordered that the rates to St. Paul and Duluth be not in excess of 17½ cents; to St. Louis, 10½ cents; to Texas common points, 66 cents, and that the all rail rates to Galveston and Houston, Tex., be not in excess of the all rail rates contemporaneously maintained from Keokuk.

The present rates to destinations in Kansas and Oklahoma, to points in Arizona and New Mexico and to California terminals and North Pacific coast destinations are not found unreasonable. It is also found that the rates from Cedar Rapids and Ohio river crossings to southeastern and Mississippi valley destinations are not unreasonable nor discriminatory.

The commission also finds that the rates on corn oil from Cedar Rapids to Chicago, Peoria, St. Louis, St. Paul and Winona are unreasonable, and it is ordered that these rates be not in excess of 11, 9½, 12, 17 and 17 cents respectively. No change is ordered in the rates to Omaha and Kansas City.

The complainant will be awarded reparation on past shipments of starch and corn oil. (31 I. C. C., 587.)

STATE COMMISSIONS

The Missouri Public Service Commission on Tuesday of this week refused to grant the petition of the railroads for permission to increase intrastate passenger rates to three cents a mile and freight rates by various percentages.

The Boston & Maine has filed with the Massachusetts Public Service Commission tariffs, to become effective November 1, making increases in the rates of fare on many classes of commutation tickets. The Public Service Commission will hold a hearing October 13, at which remonstrances will be heard.

The Montana Railroad Commission has given permission to the railroads of the state to increase the demurrage rate on refrigerator cars loaded with perishable freight to two dollars a day for the first two days after the expiration of free time and three dollars daily thereafter, effective on November 15.

The Michigan Railroad Commission has issued an order permitting the railroads of the state to make a 5 per cent advance in commodity rates, with exception of plaster, ore, iron, starch, coke, clay, tile, cement, brick and sugar beets. An increase is also allowed in lumber rates, but less than the railroads had asked. The commission withheld its decision on class rates.

The Illinois Public Utilities Commission has issued a notice to all railways in the state that at a hearing in Chicago on October 12, it will take up and consider the matter of industrial switching at all points within the state. The commission will hear all facts and statements that may be presented pertaining to the subject, and will adopt a rule to be used in lieu of canceled rule No. 23 of the Illinois Railroad and Warehouse Commission to govern the rates, rules and regulations pertaining to industrial switch movements within the state.

The four principal railways of Massachusetts have asked for approval of an increase in mileage ticket rates from 2 cents a mile to 2¼ cents. At a public hearing before the Public Service Commission in Boston on Monday they said that under the present conditions they were unable to meet expenses. The petitioners were the Boston & Maine, the Boston & Albany, the New York, New Haven & Hartford, and the Central Vermont. William J. Hobbs, vice-president of the Boston & Maine, testified that in the year ended June 30, 1914, his road showed a corporate loss of $2,014,742; and that during July and August of this year the company ran $46,022 short of the amount needed to pay charges.

The California Railroad Commission has denied the application of the railways of the state for permission to increase the present rates to passengers occupying drawing rooms and compartments. The railways contended that when a single person occupied such accommodations he received an additional service and should be required to pay an additional fare. The commission holds that passengers occupying accommodations mentioned do receive an additional service, but that such service is paid for in the cost of Pullman tickets, and that if the carriers do not receive additional compensation their contract with the Pullman Company is at fault, and that the passengers should not be required to pay in addition to the increased cost of Pullman tickets the increased fares applied for.

The Boston & Maine Railroad has notified the New Hampshire Public Service Commission that it will not accept the tariff of freight rates framed by the commission, which has been on trial by the railroad. By the terms of the act of the legislature of 1913 the Public Service Commission was to frame such a tariff, the railroad was to try its operation until October 1, and then either accept it or return to the rates in force prior to the consolidations of roads in 1883 and 1889. The determination of the railroad to return to the old rates is based upon the decision of the Supreme Court in the case of Clough and Martin against the railroad whereby the road is allowed to fix such rates upon any commodity as in the aggregate shall not be higher than the aggregate of rates charged upon that commodity prior to the consolidations.

Railway Officers

Executive, Financial, Legal and Accounting

John Leslie, assistant controller of the Canadian Pacific at Montreal, Que., has been appointed controller, with headquarters at Montreal.

T. J. Kennedy has been elected president and general manager of the Algoma Central & Hudson Bay and the Algoma Eastern, with headquarters at Sault Ste. Marie, Ont.

J. B. Wagner, acting auditor of the Toledo & Ohio Central, has been appointed auditor of the company, with headquarters at Toledo, Ohio, succeeding John Landgraff, Jr., deceased.

Herbert L. Utter, who has been elected secretary and treasurer of the Missouri Pacific, with headquarters at New York, as has been announced in these columns was born on May 1, 1868, at Morrisville, N. Y. He was a student at Wayland Academy, Beaverdam, Wis., until 1886, and later was graduated from the Canandaigua (N. Y.) High School, and from Eastman's Business College, Poughkeepsie, N. Y. On April 4, 1891, Mr. Utter entered the service of the Missouri Pacific, and has been in the continuous service of that road ever since. In 1908 he was appointed assistant secretary, and in 1911 was promoted to assistant secretary and assistant treasurer, which position he held at the time of his recent election as secretary and treasurer of the same road as above noted.

H. L. Utter

Edward J. White, whose appointment as general solicitor of the Missouri Pacific and the St. Louis, Iron Mountain & Southern has already been announced in these columns, was born February 11, 1869, at St. Louis, Mo. He attended public school at Springfield, Mo., and Joplin later; from 1883 to 1885, was a student at the University of Arkansas, Fayetteville, Ark., and in 1888 entered the University of Missouri at Columbia, Mo., graduating in 1891. He was admitted to the bar that year and commenced the practice of law at Aurora, Mo. He entered railway service in 1903 as assistant attorney for the Missouri Pacific, with jurisdiction over counties in southwestern Missouri, retaining his headquarters at Aurora. In April, 1911, he was appointed general attorney, with office at Kansas City, with jurisdiction over Jackson county, Missouri. Mr. White held the latter position at the time of his recent promotion to general solicitor, with headquarters at St. Louis, as above noted.

E. J. White

A. D. Lightner, chief officer, operating and traffic, of the New Orleans, Texas & Mexico, and the Louisiana Southern, has been appointed general manager for the receiver, having jurisdiction over all departments, with headquarters at New Orleans, La.

B. I. Spock, counsel of the New York, New Haven & Hartford for Connecticut, has been appointed general solicitor of the company, with headquarters at New Haven, Conn. Mr. Spock was born on December 31, 1872, at New Haven, and was graduated from Yale University, academic department in 1895, and from Yale Law School in 1897. He entered the service of the New York, New Haven & Hartford on September 1, 1903, as claims attorney for New York, Connecticut and western Massachusetts, with headquarters at New Haven. He subsequently served successively as assistant attorney and attorney, and at the time of his recent appointment was counsel for the state of Connecticut for the same road, as above noted.

John A. D. Vickers, whose election as vice-president and general manager of the American Express Company, with headquarters at Chicago, has already been announced in these columns, was born May 22, 1858, at Toronto, Ont. He entered the express business in Canada under his father, who was the founder of Vickers' Express Company, and became superintendent of the company in 1882. Upon the absorption of Vickers' Express Company by the American Express Company in 1889, Mr. Vickers was appointed superintendent of the Canada division of the latter company. In 1891 he was made superintendent of the National Express Company's lines in the West, with headquarters at Chicago. Later he was promoted to general superintendent and subsequently became general manager of the Western department. Upon the recent election of Mr. George C. Taylor as president of the American Express Company, Mr. Vickers was made acting vice-president and general manager of the Western lines, and on September 28 he was elected to that office, as above noted.

J. A. D. Vickers

Operating

D. Dale has been appointed superintendent of the Bevier & Southern, with headquarters at Bevier, Mo. This road has taken over the operation of the Missouri & Louisiana.

Joseph H. Butler, assistant to the general manager of the National Express Company, has been appointed superintendent, Western department, with headquarters at Chicago.

O. E. Linn, trainmaster of the Michigan division of the Vandalia at Logansport, Ind., has been transferred to Decatur, Ill., as trainmaster and road foreman of engines of the Peoria division.

D. B. Lantry, superintendent of the Superior division of the Great Northern at Superior, Wis., has been transferred to Sioux City, Iowa, as superintendent of the Sioux City division, succeeding W. D. Mason, who has been appointed trainmaster at Willmar, Minn. The Superior and Mesaba divisions have been combined and G. E. Votaw, superintendent of the Mesaba division at Superior, Wis., will have charge of the consolidated division.

M. J. Foley, assistant division superintendent of the Chicago, Burlington & Quincy at Greybull, Wyo., has been appointed superintendent of the Casper division, with headquarters at

Casper, Wyo., effective October 1. This is a new division comprising the line between Billings, Mont., and Orin Junction, Wyo., including the Cody branch; and commencing October 18 the track between Orin Junction and Hartville Junction will be leased from the Colorado & Southern and operated and maintained by the Casper division.

B. C. Byers, superintendent of the Cairo division of the Cleveland, Cincinnati, Chicago & St. Louis, has been appointed superintendent of terminals at Indianapolis, Ind. E. H. Zeigler, trainmaster at Terre Haute, Ind., succeeds Mr. Byers at Mt. Carmel, Ill., as division superintendent, and F. Jones succeeds Mr. Zeigler. The headquarters of J. V. Kennedy, division superintendent, have been removed from Cleveland, Ohio, to Bellefontaine. P. T. White, trainmaster at Cleveland, has been appointed superintendent of Cleveland terminals also.

A. M. Acheson, chief engineer of the Missouri, Kansas & Texas at Dallas, Tex., has been appointed superintendent of the Trinity district, with headquarters at Trinity, Tex., to succeed W. P. Danforth, assigned to other duties, and the former office is abolished. C. A. Thanheiser, engineer maintenance of way at Dallas, has been appointed superintendent of the Smithville district, with office at Smithville, Tex., succeeding J. F. Hickey, who has been appointed superintendent of the McAlester district, with headquarters at Muskogee, Okla., in place of F. Ringer, transferred. (See Engineering and Rolling Stock.)

Traffic

E. E. Wieland has been appointed general agent of the Chicago & Eastern Illinois at Evansville, Ind., succeeding F. P. Jeffries, retired.

J. M. Ball, general cotton agent of the International & Great Northern, has been appointed assistant general freight agent, with headquarters at Houston, Tex.

C. E. Bode has been appointed general freight agent, and W. P. Potter, general passenger agent, of the Illinois Traction system, both with headquarters at Springfield, Ill. The position of traffic manager is abolished.

C. W. Westbury, assistant general agent of the traffic department of the Southern Railway at Washington, D. C., has been promoted to general agent, with office at Washington, succeeding L. S. Brown, deceased.

S. MacClurkan, district freight agent of the Chicago, Milwaukee & St. Paul at Chicago, has been transferred to Milwaukee, Wis., as commercial agent, succeeding A. A. Wilson, who has been appointed division freight and passenger agent at Davenport, Iowa.

Engineering and Rolling Stock

C. H. Blackman has been appointed principal assistant engineer of the Louisville & Nashville, with headquarters at Louisville, Ky., succeeding J. Werness, deceased.

William R. McMunn has been appointed general car inspector of the New York Central & Hudson River, with headquarters at Albany, N. Y., succeeding F. W. Chaffee, deceased.

Paul A. G. Tilmot, assistant roadmaster of the Northern Pacific at Tacoma, Wash., has been appointed roadmaster of the South Bend and Grays Harbor branches, with headquarters at Tacoma.

J. H. Wood has been appointed supervisor of locomotive operation of the Oklahoma and Panhandle divisions of the Rock Island, with headquarters at El Reno, Okla., succeeding C. S. Yeaton, transferred.

W. S. Johns, Jr., supervisor of the Pennsylvania Railroad at East Brady, Pa., has been appointed supervisor of division No. 21, with office at Tyrone, succeeding J. D. Lovell, transferred, and N. A. Camera, assistant supervisor at Mifflin, has been appointed supervisor of division No. 34, with office at Irvona, succeeding H. S. Trimble, transferred.

L. F. Lonnbladh, engineer maintenance of way of the Missouri, Kansas & Texas at Parsons, Kan., has been appointed engineer maintenance of way of the Texas lines, with headquarters at Dallas, Tex., succeeding C. A. Thanheiser, assigned to other duties. F. Ringer, division superintendent at Muskogee, Okla., succeeds Mr. Lonnbladh at Parsons. The office of chief engineer at Dallas is abolished. (See Operating Officers.)

Harold Knight, division engineer of the Erie at Jersey City, N. J., has been appointed signal engineer, with headquarters at Jersey City, succeeding W. H. Willis, resigned. O. F. Barnes, trainmaster of the Delaware and Jefferson divisions at Susquehanna, Pa., has been appointed division engineer of the New York division, with office at Jersey City, succeeding Mr. Knight; J. W. Foote, division engineer of the Allegheny and Bradford divisions at Salamanca, N. Y., has been appointed trainmaster, with office at Susquehanna, Pa., succeeding Mr. Barnes; Arthur B. Caldwell, division engineer of the New York, Susquehanna & Western at Jersey City, N. J., succeeds Mr. Foote, and Ransom L. Dyke, assistant engineer of the Erie at Hornell, N. Y., succeeds Mr. Caldwell.

Purchasing

O. C. Wakefield, supply agent of the Northern Pacific at St. Paul, Minn., has been appointed general storekeeper, in charge of materials and supplies, with headquarters at St. Paul. S. H. Robson, supply agent at South Tacoma, Wash., has been appointed assistant general storekeeper at that place. The titles of supply agent are abolished.

OBITUARY

J. P. McCuen, formerly superintendent of motive power of the Queen & Crescent Route, died at his home in Avondale, Cincinnati, O., on October 2, aged 70 years. He was connected with the mechanical department of that system for 30 years, retiring about three years ago.

William Stewart, formerly from 1892 to 1897 freight traffic manager of the Pennsylvania Lines West of Pittsburgh, at Pittsburgh, Pa., died on October 3. He was born in July, 1833, in Ireland, and began railway work in May, 1852, as a clerk in the freight and passenger office of the Cleveland & Pittsburg at Pittsburgh, and his entire service was with that and other lines now included in the Pennsylvania Lines West of Pittsburgh. From 1858 to 1864 he was agent of the same road and the Pittsburg, Columbus & Cincinnati; he was then for four years general freight agent of the Pittsburg & Cleveland, and during the following three years was superintendent and general freight agent of the same road. From 1871 to 1892 he was general freight agent of the Pennsylvania Company and the Pittsburg, Cincinnati & St. Louis, and then to April, 1897, was freight traffic manager of the Pennsylvania Lines West of Pittsburgh.

Marshall E. Johns, superintendent of terminals of the New York, Susquehanna & Western and the Wilkesbarre & Eastern, with office at Jersey City, N. J., died on September 30, at his home in Paterson, N. J. He was born on April 17, 1860, at Washington, D. C., and was educated in the public schools of New York City. He began railway work in July, 1876, as a brakeman, and was later train baggage master and conductor on the Montclair & Greenwood Lake, now a part of the Erie. In July, 1880, he went to the New Jersey Midland, now the New York, Susquehanna & Western, as brakeman, and was then consecutively to September, 1894, freight conductor, passenger conductor and yardmaster. During the following ten years he was trainmaster on the Wilkesbarre & Eastern. In September, 1904, he was appointed superintendent of the New York, Susquehanna & Western and the Wilkesbarre & Eastern, which form a part of the Erie system, and on January 1, 1914, was appointed superintendent of terminals of the same roads.

New Line in German South-West Africa.—An English consular report for 1913 states that a railway was constructed in German South-West Africa, from Kolmans Kuppe to Bogenfels, a distance of 66 miles, during the year. It runs through diamondiferous country practically all the way, and will facilitate the exploitation of the Deutsche Diamant Gesellschaft claims, as well as many which it passes en route. The Pomona mine is traversed by the line. The report also states that the locomotives employed on the line will be driven by electricity generated on the engines with benzol as fuel.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Pilsen Lumber Company, Chicago, is in the market for one 50-ton locomotive.

CAR BUILDING

The Illinois Central has ordered 4 gas-electric cars from the General Electric Company.

SIGNALING

The Union Switch & Signal Company has taken an order for the material for a mechanical interlocking plant at Dollar Bay, Mich., on the Copper-Range Railroad.

The Chicago, South Bend & Northern Indiana electric line has contracted with the Union Switch & Signal Company for A.C. automatic block signals, to be put up on its lines in Northern Indiana, 64 signals in all. They will be Style "B," upper left hand quadrant semaphores, operating in two positions between 0 deg. and 45 deg. The signals will be controlled by continuous A.C. track circuits, and the materials and construction will be similar to the installation already in service on that road, recently installed by the Union company.

Railway Construction in South Africa.—A bill has recently been passed providing for the construction of a light railway in the Cape Colony from Prieska to Upington, a distance of about 150 miles. The line, which is intended primarily for the transportation of produce and other freight, will be of 3 ft. 6 in. gage, and its estimated cost is $1,687,500.

The Ways of Train Thieves in India.—The following remarkable story is being told by Indian papers: At the instance of the commissioner in Sind, a practical demonstration of the methods of expert train thieves was arranged for by the superintendent of the North-Western state railway police, for the purpose of illustrating to the traffic officers of the railway the ease with which closed "wagons" could be opened and despoiled of their contents while a train was in motion. Three expert thieves were stationed on the line about 100 yards from the spectators. A train consisting of an engine and about a dozen open "trucks" and closed "wagons" was then run into the city station yard at a speed of from 15 to 20 miles an hour. Before the train had proceeded 100 yards from the point where the thieves were stationed three closed "wagons" had been boarded and entered. Three closed "wagons" without any kind of foothold were then selected for trial. The train steamed in at the same speed as before and the above-mentioned performance was repeated with amazing ease.

English Railways and Recruiting.—The toll placed upon the English railway company, first by the loss of those who were enrolled in the territorials who had to take up arms at mobilization and second, by the loss of those who have since enlisted has been very heavy. As the London & North Western turned in 4,736 of the former and the Great Western 6,000, it has been estimated that over 50,000 railway men must have left the service when war was declared, and yet these figures are independent of those that have since enlisted in large numbers. As there are only about 650,000 men in the British railway service, such a withdrawal, even if the number be less than is estimated, would be inconvenient to the railway administration, especially as it has adopted the motto of "Business as Usual," and it might even seriously affect the military traffic. It is said, therefore, that some companies have tried to prevent wholesale enlistment. One of the Scottish railways was so depleted of its staff that representation had to be made to the government and a body of men who had enlisted sent back.

Supply Trade News

The name of the Canton Culvert Company, Canton, O., has been changed to the Canton Culvert & Silo Company.

W. E. Jenkinson, formerly western railroad representative of S. F. Bowser & Co., Fort Wayne, Ind., has resigned from that position, effective September 30.

Charles M. Schwab, president of the Bethlehem Steel Company, has resigned as a director of the American Locomotive Company. Andrew Fletcher has been elected a director to succeed him.

Jesse C. Bader has been placed in charge of the western sales branch of the McMyler Interstate Company, Cleveland, Ohio, with offices at 1503 Fisher building, Chicago, effective September 15.

T. B. Van Dorn, first vice-president of the Van Dorn Iron Works Company, Cleveland, Ohio, has been elected president of the company, succeeding his father, J. H. Van Dorn, who died recently.

W. T. Kyle has joined the sales force of The Okonite Company at their general office, 253 Broadway, New York. Mr. Kyle for the past six years has been connected with the Duplex Metals Company, Chester, Pa., as district sales manager.

F. N. Rumbley and J. W. Stjernstedt, of the Western Engineering Sales Company, Rialto building, San Francisco, Cal., have been appointed representatives of the Track Specialties Company, New York, in that city and vicinity. E. C. Gaumitz, of the Washington-Alaska Purchasing Bureau, Mutual Life building, Seattle, Wash., will represent the Track Specialties Company in that territory.

Charles W. Allen, formerly vice-president and sales manager of the Reading Specialty Company, and manager of the railway department of the Reading-Bayonne Steel Casting Company, Reading, Pa., has become connected with the Q & C Company, New York, effective October 1. Although Mr. Allen's office will be at 90 West street, New York, he will continue to reside as at present in Reading. A sketch of Mr. Allen's life and a photograph were published in the *Railway Age Gazette* of December 12, 1913, p. 1146.

National Railway Appliances Association.

The National Railway Appliances Association has issued a bulletin on the exposition to be held at the Coliseum and First Regiment Armory at Chicago on March 15 to 19, 1915, in connection with the sixteenth annual convention of the American Railway Engineering Association. The bulletin states that applications for space at this time are the same as last year. An increase of space has been asked for by some firms, and there seems to be no question in the minds of the past exhibitors as to the advisability of exhibiting in the coming year.

Westinghouse Air Brake Company

The Westinghouse Air Brake Company in the fiscal year ended July 31, 1914, had net earnings of but $3,482,994, a decrease of $2,851,785 from the $6,064,779 of 1913. The company's plants are now valued at $6,069,862. This amount has been increased from last year's total of $5,048,776, partly because of new construction and equipment and partly because of adjustments amounting to $550,165 made as a result of recent appraisals and inventories. The company, which formerly charged off depreciation on the basis of net earnings has now created a special reserve for contemplated extensions and betterments, and plans in the future to charge off depreciation at a predetermined rate as a part of the cost of production. This reserve, now amounting to $1,850,165, includes also a former reserve to cover inventory adjustments and will be held to provide for renewals, replacements, for adjustment of inventories and for extraordinary losses by fire, etc.

The company on July 31, 1914, had total assets of $30,145,827.

This amount includes the item of $6,069,862 for factories, already mentioned; real estate other than for factories of $1,870,000; patents and good will valued at $2,785,896 and investments in subsidiary companies of $8,126,329. The cash on hand as compared with that on July 31, 1913, had decreased from $4,050,495 to $4,479,096, and the accounts and bills receivable from $4,865,762 to $3,132,723. Inventories, however, had increased from $4,307,505 to $5,625,024. The company's capital stock on the same date was $17,638,467; there are no bonds outstanding. The accounts payable, amounting to $942,490 in 1913 were but $427,377. The liabilities also included the reserve of $1,850,165 above noted; a contingent liability on account of sales of $797,615, a surplus of $5,648,865 and a contingent surplus of $1,750,000 covering the excess of the par value of the capital stock of subsidiary companies over the value shown on the company's books.

The company's pension fund has now been charged off the balance sheet. On July 31 it amounted to $229,779, and $59,961 has been paid from it since its inception in October, 1908.

TRADE PUBLICATIONS

Despatchers' Selector System.—The General Railway Signal Company, Rochester, N. Y., has issued pamphlet 2024, an advance notice of the company's despatchers' selective signaling system.

Overhead Tramrail Equipment.—The Whiting Foundry Equipment Company, Harvey, Ill., has recently issued catalog No. 111, descriptive of the company's line of overhead tramrail equipment.

Ties.—The National Steel Tie Company, Harrisburg, Pa., recently issued a 16-page booklet devoted to illustrations and the description of steel ties. It also contains a brief discussion on steel ties versus wood ties.

Monorail Cranes.—The Sprague Electric Works of the General Electric Company, New York, has issued bulletin No. 48,700 relating to the Sprague Electric monorail crane. The booklet contains descriptions, views and illustrations of the various monorail cranes manufactured by the company. There are also several views of typical installations showing the cranes in actual use.

Snow Flangers.—The Railway Appliance Company, Chicago, has recently issued an elaborate 16-page booklet in which are described and illustrated, various types of improved Ray snow flangers. A change has been made as to the method of operating the flanger. Formerly it was raised and held up in the clear position by means of an operating rod or air pressure, and allowed to fall to the operating position by virtue of its own weight. The new flanger is forced down to the operating position by air pressure, and when air is shut off a spring raises it to the clear position.

Pneumatic Drills and Hoists.—The Ingersoll-Rand Company, New York, has recently issued Forms No. 8,207, 8,013 and 4,033, descriptive respectively of "Little David" Drills for metal and wood flooring, "Little David" Pneumatic Chipping, Calking and Scaling Hammers and the "Little Tugger" Air Hoist for mines, contractors, manufacturing and power plants. Each bulletin contains excellent illustrations of the tool to which it relates. It also contains views showing the method of using the latter, and in each case a few pages are devoted to showing wherein these Ingersoll-Rand tools are best adapted for the work for which they are intended.

Structural Steel, Rails, and Track Accessories.—The 1915 edition of the Lackawanna Steel Company's handbook has just appeared. This is one of the most valuable handbooks for railway men published by steel manufacturers, as in addition to the data on standard structural shapes it contains considerable information on rails, angle bars, track bolts, spikes, etc. It also contains the usual mathematical and structural tables for use in designing and the manufacturer's standard specifications for structural steel, boiler steel, open hearth steel blooms, billets and slabs, concrete reinforcement bars and the standard practice of sampling for check analysis. The book is well printed and bound in flexible leather, the size being that commonly adopted for handbooks which is readily adapted to desk, drafting table or field use. The book is sold at $2 a copy by the Lackawanna Steel Company, Buffalo, N. Y.

Railway Construction

Alabama Roads Electric.—Work will be started soon, it is said, on the electric line from Opelika, Ala., southwest to Auburn, about 10 miles. F. Pace is chief engineer, and W. S. Lounsbury, Opelika, is interested. (April 24, p. 966.)

Atchison, Topeka & Santa Fe.—The report of this company for the year ended June 30, 1914, shows that the Minkler Southern, which was under construction at the close of the previous year, extending from Minkler, Cal., to Exeter, with a branch line connecting with the Visalia branch at Cutler, a total of 40 miles, has been completed to Exeter since the close of the year. The Northwestern Pacific, which is owned jointly with the Southern Pacific Company, is building from Willits, Cal., north to Shively, 105.64 miles, and had completed up to the first of the year 64.47 miles; during the year 29.10 additional miles were completed, leaving only about 12.07 miles still to be constructed, and at the end of the year the grading work on this remaining section was nearing completion. The company has secured 30 acres of land at Oakland, Cal., with extensive water frontage, and is now putting up necessary facilities for the handling of the increasing business. The extension of the Coleman-Lubbock line from Lubbock, Tex., to Texico, N. Mex., was completed during the year, and was opened for traffic on March 1, 1914. The mileage of second track in operation on June 30, 1914, was 974.65 miles, an increase of 76.33 miles as compared with 898.32 miles in operation at the close of the previous year.

Atlanta & St. Andrews Bay.—See St. Andrews Bay Railway & Terminal.

Branchville & Bowman.—See Savannah Western.

Bruce Mines & Algoma.—See Lake Huron & Northern Ontario.

Eastern Maine.—Final location is now being made and construction work is to be started soon, it is said, on the section from Houlton, Maine, south to Bancroft, 32 miles. The company was incorporated in Maine and started survey in 1911, for a line from Bangor northeast to Great Pond, thence north to the head of Nicatous lake and via Carroll, Prentiss, Bancroft and Haynesville to Houlton, 108 miles. G. W. Maxfield, president, Bangor.

Goodyear Logging Company's Line.—We are told that this company is building with its own forces a 5-mile standard gage logging line from West Clallam, Wash., on Clallam bay to timberlands. About two miles of the grading work is finished and another mile is nearing completion. The company expects to begin track laying soon. James Manary, manager, and L. C. Tobias, purchasing agent, Clallam Bay, Wash.

Grand Trunk Pacific.—A contract has been given to Cavicchi & Pagano, Ottawa, Ont., it is said, for constructing a wye track at Cape Rouge, Que., and the completion of the St. Malo line for the National Transcontinental Railway.

Great Northern.—This company has resumed work in Dawson county, Mont., and is laying track on its Newlon branch, from Newlon to Lambert, a distance of 22 miles. It is hoped to complete this work by November 1. No other construction work is contemplated in that territory during the present season.

Lake Huron & Northern Ontario.—A contract for the extension of the old 17-mile line, formerly the Bruce Mines & Algoma, from Bruce Mines, Ont., on Lake Huron, northerly, has been let, it is said, to the Ontario Northern Construction Company. The plans call for a line having a total length of 325 miles. G. P. McCallum, president; H. Appleton, vice-president and general manager, Bruce Mines, Ont.

Monongahela Valley Traction.—A franchise has been granted this company, it is said, to build a branch from Rivesville, W. Va., northeast to Morgantown, 15 miles.

Mountain Central.—Plans are being made, it is said, to build a 12.5 mile line from Campton Junction, Ky., east to Campton. The company has a capital of $25,000, and may use both steam

and electricity as the motive power. The incorporators include F. Day, Winchester, Ky., and E. B. McGlone.

Nashville-Gallatin Interurban.—This company has under consideration the question of building a branch line, it is said, to Springfield, Tenn., from a point on the line now in operation between Nashville and Gallatin, 28 miles.

Rocky Ford & Southwestern.—An officer is quoted as saying that the plans call for building from Rocky Ford, Ga., southwest to Portal, 12 miles, and that a bridge about three-quarters of a mile long will be built over the Ogeechee river. The plans also include putting up two or three stations. H. B. Griffin, president, Rocky Ford, Ga. (September 25, p. 587.)

St. Andrews Bay Railway & Terminal.—An officer writes that work is now under way building from St. Andrews, Fla., to a point on the Atlanta & St. Andrews Bay about one mile north of Panama City. Money has been secured to complete the line, which will be about 3.5 miles long, including a wye. J. M. Willis has the contract for the grading and track laying. There will be about 25,000 cu. yd. of excavation and 15,000 cu. yd. of embankment work. The maximum grades will be 1 per cent. There will be a pile trestle 125 ft. long on the line, and a wharf is to be constructed at St Andrews. J. H. Drummond, St. Andrews, is furnishing most of the funds, and will own personally some of the trackage at the St. Andrews terminal. The main line will be operated by the Atlanta & St. Andrews Bay. A. B. Steele, president, Atlanta, Ga., and E. L. Wood, chief engineer, St. Andrews, Fla. (August 14, p. 310.)

Savannah Western.—This company, which was recently incorporated in South Carolina, to build from Estill, northeast to St. Paul, about 90 miles, has started construction work, it is said, at Bowman. It is understood that the company has an option on the Branchville & Bowman, operating a ten-mile line from Branchville northeast to Bowman, and this road may form part of the through line. The incorporators include G. H. Milligan, Charleston, S. C.; V. Walker and A. M. Rea, Newbern, N. C. (August 28, p. 408.)

RAILWAY STRUCTURES

Clearwater, Fla.—The Atlantic Coast Line has given a contract to E. W. Parker, Tampa, Fla., it is said, for putting up a brick, stone and concrete passenger station, with tile roof and floors, at Clearwater.

Montreal, Que.—The plans for the temporary station to be built by the Canadian Northern on Lagauchetiere street, Montreal, call for a three-story building, 100 ft. by 150 ft., one story to be below the street level. The new station is to be of steel and concrete construction. (July 3, p. 40.)

New York.—The New York Public Service Commission, First district, recently opened bids for the construction of the diagonal station under Forty-second street and the connecting link between the existing subway in Park avenue and the new Lexington avenue subway. The station includes a connection with the Steinway tunnel as well as the Hudson river tube and an entrance to the Grand Central Terminal. The lowest bidder was the Rapid Transit Subway Construction Company, at $3,097,000. (September 18, p. 550.)

Portland, Maine.—Bids are wanted until November 2, by the Cumberland county commissioners at Portland, Maine, for building a bridge connecting Portland and South Portland over Fore river, Portland Terminal Company Railroad and Commercial street. The proposed bridge is to be 3,527 ft. long, and there will be a short connecting viaduct 303 ft. long. It will be of reinforced concrete and structural steel construction, and will carry double tracks for the operation of street railways.

Van Buren, Maine.—The Railway Commission of Canada has approved the location plans for the line of the Van Buren Bridge Company from the terminus of the International Railway of New Brunswick, St. Leonard, N. B., to the international boundary in the middle of the St. John river, one mile. The state of Maine has already approved the location plans for the bridge and approach on the Maine side of the river in Van Buren, and for its connection with the Bangor & Aroostook. R. Payson, president, Portland, Maine. (October 17, 1913, p. 728.)

Railway Financial News

Erie.—The New York Public Service Commission, Second district has authorized the $900,000 4½ per cent equipment trust notes mentioned in these columns last week, and the notes have been taken by Drexel & Company, Philadelphia, at 97. E. H. Gary, chairman of the United States Steel Corporation, has resigned as a director of the Erie.

New York, New Haven & Hartford.—This company has begun a suit to recover $3,900,000 from John L. Billard, a former director; Edward D. Robbins, former general counsel; Samuel C. Morehouse, Charles F. Linsley, Henry Whipple and Samuel Hemmingway.

St. Louis & San Francisco.—An arrangement has been made between the receivers and the protective committee representing the Ozark & Cherokee Central by which the first mortgage 5 per cent bonds of the latter are to be extended at 5 per cent for six months and at 6 per cent for six additional months.

Southern Railway.—E. H. Gary, chairman of the United States Steel Corporation, has resigned as a director of the Southern Railway.

Toledo, Peoria & Western.—This railway, operating 248 miles, in the fiscal year ended June 30, 1914, had a net deficit after the payment of expenses, rentals, taxes and interest of $187,842 as compared with a net income of $37,672 for the year before, the change from net income to net deficit being due to a decrease in freight revenue from $826,586 to $723,351 combined with an increase in operating expenses from $1,135,248 to $1,236,155. A large part of the stock of this company is owned by the Pennsylvania Company and the Chicago, Burlington & Quincy, but it is operated independently of either. Its main line is in two sections, the eastern extending from Effner, Ill., where connection is made with the Pittsburgh, Cincinnati, Chicago & St. Louis to Peoria and the western from Hollis, Ill., eight miles from Peoria, to the Keokuk bridge, connection between the two sections being made by trackage rights over the Peoria & Pekin Union. The company also has a branch to Iona Junction, Ill., and trackage rights over the Chicago, Burlington & Quincy to Burlington, Iowa. In 1914 the company earned passenger revenue per mile of $1,963, comparing with $1,942 in 1913. The freight revenue per mile, on the other hand, dropped decidedly from $3,337 in 1913 to $2,920 in 1914, a decrease of 12.49 per cent. This revenue constitutes 56 per cent of the total and the tonnage is made up mainly of grain and bituminous coal, both of which showed decided decreases. The ton-mile rate in 1914 was 1.23 cents as against 1.28 cents in 1913, the total ton mileage being 58,649,413, as against 64,532,455 for the previous year. The average passenger receipts per passenger mile in 1914 amounted to 1.95 cents, as against 1.97 cents in 1913. At the end of the year the company had on hand working assets of $284,972; $87,990 of this being cash and $96,181 material and supplies. The working liabilities, on the other hand were $1,446,201, of which more than half, $738,000 was loans and bills payable.

A New Railway in the Federated Malay States.—A new railway line extending from Bukit Mertajam, a railway junction near the town of Penang to Alor Star, the capital of Kedah, 56 miles north of Bukit Mertajam, has recently been opened to traffic in the Federated Malay States. The line is part of the government railways and one of several extensions now under construction. This particular branch traverses nearly the entire length of the state of Kedah, its northern terminus being at the river of that name. It passes through a still slightly developed territory, and it is believed will have a very advantageous influence on the progress and opening up of that native state. The connecting up of this branch line brings the railway still closer to the Siamese frontier, the distance from Alor Star via Perlis to the frontier being 30 miles. Further progress with the view of ultimate connection with the Royal Siamese Railway, thereby forming a line from Penang to Bangkok, is looked forward to with considerable interest.

ANNUAL REPORTS

THE DENVER AND RIO GRANDE RAILROAD COMPANY

ST. LOUIS, Mo., September 10, 1914.

To the Stockholders of

THE DENVER AND RIO GRANDE RAILROAD COMPANY:

The Board of Directors submit the following report for the fiscal year ended June 30, 1914.

The results were as follows:

	1914.	1913.	Increase or Decrease Amount.	Per Cent.
Average Mileage Operated	2,583.27	2,555.00	28.27	1.11
OPERATING REVENUES:				
Revenue from Transportation—				
Freight	$17,058,080.21	$18,078,140.01	—$1,020,059.80	5.64
Passenger	5,077,407.62	5,299,080.89	—221,673.27	4.18
Passenger—Other	99,604,16	111,951.77	—12,347.61	11.03
Mail	308,938.97	296,454.47	12,484.50	4.21
Express	312,464.04	368,297.48	—55,833.44	15.16
Miscellaneous	194,391.11	177,122.93	17,268.18	9.75
Total Revenue from Transportation	$23,050,886.11	$24,331,047.55	—$1,280,161.44	5.26
Revenue from Operation Other than Transportation	116,165.23	121,917.31	—5,752.08	4.72
Total Operating Revenues	$23,167,051.34	$24,452,964.86	—$1,285,913.52	5.26
OPERATING EXPENSES:				
Maintenance of Way and Structures	$3,393,968.31	$3,545,938.45	—$151,970.14	4.29
Maintenance of Equipment	4,245,325.39	4,538,250.98	—292,925.59	6.45
Traffic Expenses	497,431.40	546,432.39	—49,000.99	8.97
Transportation Expenses	7,249,240.29	7,738,495.55	—489,255.26	6.32
General Expenses	632,230.60	678,054.64	—45,824.04	6.76
Total Operating Expenses	$16,018,195.99	$17,047,172.01	—$1,028,976.02	6.04
Net Operating Revenue	$7,148,855.35	$7,405,792.85	—$256,937.50	3.47
Net Deficit from Outside Operations	16,148.22	6,494.54	9,653.68	148.64
Total Net Revenue	$7,132,707.13	$7,399,298.31	—$266,591.18	3.60
RAILWAY TAX ACCRUALS	$1,009,143.53	$948,738.67	$60,404.86	6.37
Operating Income	$6,123,563.60	$6,450,559.64	—$326,996.04	5.07
OTHER INCOME:				
Hire of Equipment—Credit Balance	$82,218.36	$91,652.69	—$9,434.33	10.29
Rent	200,524.78	188,427.44	12,097.34	6.42
Dividend Income	800,000.00	819,000.00	—19,000.00	2.32
Interest	180,061.58	148,842.83	31,218.75	20.97
Miscellaneous Income	129.57	14.97	114.60	765.53
Total Other Income	$1,262,934.29	$1,247,937.93	$14,996.36	1.20
Gross Income	$7,386,497.89	$7,698,497.57	—$311,999.68	4.05
DEDUCTIONS FROM GROSS INCOME:				
Rent	$360,088.16	$359,877.89	$210.27	0.06
Interest	5,626,034.44	5,244,440.02	381,594.42	7.28
Total Deductions	$5,986,122.60	$5,604,317.91	$381,804.69	6.81
Net Income	$1,400,375.29	$2,094,179.66	—$693,804.37	33.13
DISPOSITION OF NET INCOME:				
Appropriations to Sinking and Renewal Funds	$263,888.82	$247,807.92	$16,080.90	6.49
Appropriations for Additions and Betterments	80,927.52	389,000.00	—308,072.48	79.20
Total Appropriations	$344,816.34	$636,807.92	—$291,991.58	45.85
Income Balance Transferred to Credit of Profit and Loss	$1,055,558.95	$1,457,371.74	—$401,812.79	27.57
Operating Revenue per Mile of Road	$8,968.11	$9,570.63	—$602.52	6.30
Operating Revenue per Revenue Train Mile	3.10.167	2.87.153	.23.014	8.01
Operating Expense per Mile of Road	6,200.74	6,672.08	—471.34	7.06
Operating Expense per Revenue Train Mile	2.14.456	2.00.186	.14.270	7.13
Net Operating Revenue per Mile of Road	2,767.37	2,898.55	—131.18	4.53
Net Operating Revenue per Revenue Train Mile	.95.711	.86.967	.08.744	10.05
Ratio of Operating Expense to Operating Revenue	69.14%	69.71%	—0.57%	....

CAPITAL STOCK.

There has been no change in the Capital Stock.

FUNDED DEBT.

The funded debt decreased $321,000, as exhibited in detail on page 17.

NEW LINES.

Under contract of purchase a line from Helper to Storrs, 5.09 miles, and called Spring Canyon Branch, has been acquired and was placed in operation July 15th, 1913. It serves an important coal property. By virtue of contracts there is included in the operated mileage the Southern Utah Railroad and the Castle Valley Railroad, aggregating 22.5 miles, extending from Price to Mohrland, serving extensive coal mines. Details of changes in mileage operated are recorded on page 35.

ADDITIONS AND BETTERMENTS.

A detailed list of addition and betterment charges, aggregating $1,937,570.33, appears on page 18. The following are the more important items:

There were purchased and laid in track, 1,368 tons of 90-pound section rail and 7,180 tons of 85-pound section rail, the 90-pound rail being applied to the "Detour Line" Soldier Summit to Detour; the balance was employed in replacing worn rail of similar section, or displacing lighter sections, and rail thus released was laid on less important main, branch, or narrow gauge lines.

Details of composition of track as to rail as constituted at the end of the year are shown on page 28.

Approximately 388,000 tie plates and 25,000 rail anchors were installed.

The main line roadbed was widened to standard dimensions between Littleton and Larkspur (32 miles on Colorado Lines), and between Ruby Tunnel and Utaline (11 miles on Utah Lines), which latter improvement included the riprapping of the widened roadbed at various points along the Grand River.

Rectifications of grade were made at several places, but particularly between Thistle and Castella Springs, Utah, where a ruling grade of .65 per cent was established on eastbound traffic with no adverse westbound grade.

New steel bridges aggregating 1,719 lineal feet in length were installed, replacing inadequate ones and 4,372 lineal feet of wooden bridges were eliminated by permanent filling.

The Fourth South Street Viaduct in Salt Lake City was completed and opened for traffic on January 27th, 1914.

The City of Denver, by ordinance, requires the erection of a steel structure to be known as the "Colfax-Larimer Viaduct," over freight, main line and yard tracks. This Company's proportion of the aggregate cost is estimated at $81,000. Construction was begun in the latter part of the fiscal year and $1,830.00 expended.

An ordinance also requires rearrangement of tracks and laying of brick pavement on Wynkoop Street, Denver, estimated to cost $50,400.00; expended to date, $4,500.00.

At Ogden a new freight depot and more centrally located freight terminals were completed in January.

Changes were made in the shop and terminal facilities at Salida, including installation of modern coal chutes and ash pit. Coaling facilities at Malta, Minturn and Thistle were enlarged and improved.

A new 24-stall brick engine house with 100-foot turntable, together with modern coal chutes, were constructed at Grand Junction.

A new 6-stall frame engine house with turntable was erected at Thistle, made necessary by introduction of Mallet locomotives.

New tools and machinery were installed at various shops.

Second main tracks between Castle Gate and Kyune (7.7 miles) and between Detour and Thistle (15.5 miles) were completed.

The double track detour line from Soldier Summit to Detour (a new station), intersecting the existing main line at a point about one mile west of Tucker, commenced in February, 1913, was placed in operation November 16, 1913, distance 13.96 miles. Continuous double track now extends from Helper to Thistle, 54.6 miles.

Construction of second main track from Thistle to Provo (21 miles), begun in August, 1913, is about 92 per cent completed. This is the property of the Utah Railway Company, but will be operated by this Company under the provisions of a contract dated November 1, 1913.

To facilitate operations new passing tracks were installed at two places, involving construction of 1.1 miles, and existing passing tracks were extended at various other points, involving the building of 4.5 miles of track.

Industrial sidings and yard tracks were constructed and extended to serve new industries or to make provision for growing traffic involving the building of 13 miles.

A telephone train dispatching system was installed between Grand Junction and Ogden at a cost of $37,800.

Approximately 43 miles of additional right of way fence was constructed.

OPERATION.

The total Operating Revenues were $23,167,051.34, a decrease of $1,285,913.52, or 5.26 per cent under the previous year.

The revenue from freight traffic decreased $1,020,059.80, or 5.64 per cent, largely attributable to the protracted coal strike in Southern Colorado, fruit crop failure on the Western Slope in Colorado and inactivity in the building industry reducing the demand for lumber from Southern Colorado and New Mexico territory.

The number of tons of revenue freight handled declined less than 3 per cent, although the resulting tons-one-mile decreased 6.23 per cent, due to shorter average haul of 4.43 miles.

Reference is made to the comparative commodity statement on page 33.

The revenue from passenger traffic decreased $221,673.27, or 4.18 per cent—about equally apportioned between local and through travel. The number of passengers carried decreased 1.24 per cent; the number carried one mile decreased 4.80 per cent; the average revenue per passenger per mile was 2.04 cents.

Complete details of Operating Expenses with comparisons are recorded on pages 25 and 26, the total exhibiting a decrease of $1,028,976.02, or 6.04 per cent.

Continued progress has been made in improving the condition of track and particularly as to bridges. The total charge to Maintenance of Way and Structures was $3,393,968.31, and equalled $1,314.00 per mile of road operated.

The decrease in total charges to Maintenance of Equipment amounted to $292,925.59, or 6.45 per cent. Power and cars have been well kept up, and satisfactorily met the demands of traffic.

Based upon the equipment list as it stood July 1st, 1913, the maintenance charges this year, per locomotive have equalled $2,493.20; per passenger car (exclusive of those leased to other companies), $570.76; per freight car, $84.86.

Traffic Expenses were reduced $49,000.99, or nearly 9 per cent.

Unprecedented falls of snow during the winter months, followed by unusual rain-falls later in the year, resulted in many interruptions and consequent added expense in moving traffic; likewise the strike of coal miners in Southern Colorado necessitate the purchase and long haul of a large tonnage of Utah coal for locomotive consumption in Colorado, and abnormally added to operating costs, but notwithstanding these disadvantages the total charges against Transportation Expenses were decreased $489,255.26, being in a greater ratio than the decline in Operating Revenues, i. e., 6.32 per cent versus 5.26 per cent.

The number of tons of revenue freight per freight train mile averaged 337.44 against 305.18 previous year. Freight train mileage declined 15.2 per cent. The reduction of 7.11 per cent in passenger train mileage contributed to the decrease in Transportation charges.

General Expenses present a reduction of $45,824.04, and include the first charges against "Valuation Expenses," which amount to $4,180.41.

OPERATING INCOME.

Operating Income, after sustaining an increase of more than 6 per cent in direct taxes (with a decline of 5.26 per cent in Operating Revenues), exhibits a decrease of 5.07 per cent compared with the previous year.

Net Income, distinguished from Operating Income in that it represents final results after all deductions, amounted to a decrease of 33.13 per cent against last year, but an increase of 22.33 per cent compared with two years ago.

Appropriations from Net Income were:

For contributions to the Renewal Fund and Sinking Fund under First and Refunding Mortgage	$263,888.82
For Additions and Betterments	80,927.52
Total	$344,816.34

leaving a credit brought down to Profit and Loss for the year of $1,055,558.95

With the exception of ordinary current accounts the Company has no floating debt.

In addition to the items already mentioned, the Denver and Rio Grande, in common with almost all American railroads, was adversely affected as to its tonnage and revenues by the shrinkage in the demand for manufactured and miscellaneous commodities in the general markets, and the full burden of forced revisions in tariffs in the previous year, including also some made within the year, materially reduced earnings.

At the close of the year the general crops throughout the territory, especially as to fruit, were particularly encouraging, practically guaranteeing to the growers, mainly in Colorado, splendid returns. The future augurs well also for the State of Utah, the constant development of whose coal industry, along with its horticulture and agriculture, makes for prosperity in that rapidly growing state.

The Company and its officers have undertaken to warrant the confidence of the peoples served, so that the relations between all are established on sound, substantial principles.

WESTERN PACIFIC RAILWAY.

A summary of the operations of this property for the fiscal year ending June 30th, 1914, compared with preceding year is presented:

	1913-14	1912-13	Increase or Decrease
Operating Revenue	$6,099,573.37	$6,173,628.29	—$74,054.92
Operating Expenses	4,995,891.64	4,478,835.06	517,056.58
Net Operating Revenue	$1,103,681.73	$1,694,793.23	—$591,111.50
Outside Operations—Deficit	27,152.26	11,635.28	15,516.98
Total Net Revenue	$1,076,529.47	$1,683,157.95	—$606,628.48
Taxes	379,259.40	278,096.13	$101,163.27
Operating Income	$697,270.07	$1,405,061.82	—$707,791.75
Net Debit to Income	375,763.12	364,731.75*	11,031.37
Surplus without making deductions therefrom for interest	$321,506.95	$1,040,330.07	—$718,823.12

*The figures presented in the report last year were subsequently adjusted by increasing the Net Debit to Income $19,145.76, to comply with the regulations of the Interstate Commerce Commission.

The extent to which the Company suffered in earnings by reason of the business situation in general is best indicated in the figures giving the results of its interchange with the Denver & Rio Grande, in that the combined revenue of the latter road from freight and passenger traffic to and from the Western Pacific reflects a decrease slightly in excess of 5 per cent.

The increase in total Operating Expenses was entirely attributable to necessarily heavier expenditures for maintenance both of roadway and equipment. There was a substantial decrease in Transportation Costs, in Traffic and in General Expenses.

By order of the Board of Directors.

B. F. BUSH,
President.

CONDENSED GENERAL BALANCE SHEET.

THE CHESAPEAKE AND OHIO RAILWAY COMPANY—THIRTY-SIXTH ANNUAL REPORT

To the Stockholders: Richmond, Va., September 17, 1914.

The Thirty-sixth Annual Report of the Board of Directors, for the fiscal year ended June 30, 1914, is herewith submitted.

The average mileage operated during the year by the Chesapeake and Ohio Lines was 2,345.8 miles, an increase over the previous year of 26.8 miles. The mileage at the end of the year was 2,362.4 miles, an increase of 29.7 miles over mileage on June 30, 1913. See schedule on page 12.

Unexpected increases in wages and taxes since 1910 now aggregate about 4½% per annum on the Company's stock, and to that extent the sum available for dividends or for improvements of the physical or other assets of the Company has been diminished.

RESULTS FOR THE YEAR.

Operating Revenues were (Increase $1,604,742.79, or 4.57%.)		$36,690,021.11
Operating Expenses were (Increase $1,202,376.47, or 4.92%.)		25,653,936.78
Net Operating Revenue was (Increase $402,366.32, or 3.78%.)		$11,036,084.33
Taxes were (Decrease $44,928.00, or 3.27%.)		1,330,934.89
Operating Income, Taxes deducted, was (Increase $447,294.32, or 4.83%.)		$9,705,149.44
Miscellaneous Income was (Decrease $71,005.49, or 3.19%.)		2,154,531.31
		$11,859,680.75
Rentals and Other Payments were (Increase $87,487.02, or 10.11%.)		953,217.12
Income for the year available for interest was (Increase $288,801.81, or 2.72%.)		$10,906,463.63
Interest (72.75% of amount available) amounted to (Increase $615,489.40, or 8.41%.)		7,934,647.84
Net Income for the year, equivalent to 4.73% on capital stock outstanding, amounted to (Decrease $326,687.59, or 9.90%.)		$2,971,815.79
Dividends paid during the year: Four dividends of 1% each, aggregating		2,511,264.00
Remainder		$460,551.79

FINANCIAL.

The changes in funded debt in the hands of the public during the year were as follows:

	Sold	Retired
5 per cent. Five Year Secured Gold Notes	$33,000,000.00	
4 per cent. Coal River Ry. First Mortgage Bonds		Retired
4 per cent. Raleigh & Southwestern Ry. First Mortgage Bonds	649,000.00	$36,000.00
4½ per cent. Equipment Trust Certificates, Series N	510,000.00	1,000.00
Equipment Trust Obligations	1,700,000.00	
4 per cent. Big Sandy Ry. First Mortgage Bonds		1,629,392.00
4 pepr cent. Greenbrier Ry. First Mortgage Bonds		32,000.00
4½ per cent. Three Year Secured Gold Notes		20,000.00
5 per cent. One Year Secured Gold Notes		25,000,000.00
		3,500,000.00
Net Increase	$35,859,000.00	$30,218,392.00
Other changes in obligations shown under funded debt on Balance Sheet of June 30, 1914, were:	5,640,608.00	

	Increase	Payments
5 per cent. First Lien and Improvement Mortgage Bonds	$4,293,000.00	
6 per cent. Equipment Contracts — General Equipment Co.		$19,300.00
5 per cent. Equipment Contract — Standard Steel Car Co.	45,500.00	
5 per cent. Equipment Contract—Central Locomotive and Car Works	3,190,000.00	130,852.81
6 per cent. Equipment Contract—American Locomotive Co.	95,250.00	
	446,590.00	
Net Increase	$8,070,340.00	$150,152.81
	7,920,187.19	

The five per cent. First Lien and Improvement Mortgage Bonds were issued during the year for additions and betterments and other capital purposes. The entire issue of these bonds, $37,123,000 face amount, is pledged as collateral for your Company's Five Year 5% Secured Gold Notes, of which Notes $33,000,000 were sold to provide funds for the retirement of the Notes which matured June 1, 1914, and for new equipment, improvements and other acquisitions. Coal River Railway Company and Raleigh and Southwestern Railway Company bonds were sold to reimburse the Company's treasury for expenditures previously made.

In March and April, 1910, your Company purchased certain shares of stock of The Kanawha and Michigan Railway Company from the Lake Shore and Michigan Southern Railway Company and others, at a cost for the 40,292 shares now owned by your Company of $2,901,024, upon the par value of which dividends have been received at the rate of five per cent. per annum, with an additional one per cent. paid during the fiscal year 1913. Under a decree handed down March 14, 1914, by the circuit judges in equity, in the United States District Court for the Southern District of Ohio, Eastern Division, in the case of United States of America vs. Lake Shore and Michigan Southern Railway Company, et al., the sale of this stock was ordered. The Lake Shore and Michigan Southern Railway Company owned a like amount of this stock, and the court held that this ownership by the two companies of a majority of the stock of The Kanawha and Michigan Railway Company was in violation of the Federal anti-trust law. Accordingly, your Company has sold its holdings of stock of The Kanawha and Michigan Railway Company to the Toledo and Ohio Central Railway Company as of June 1, 1914, and is to receive therefor $4,029,200 with interest from June 1, 1914, to the date of consummation of the sale and transfer of the stock, payment to be made $2,000,000 in cash and the remainder in a note of The Toledo and Ohio Central Railway Company maturing September 1, 1915, guaranteed by the Lake Shore and Michigan Southern Railway Company, and otherwise fully secured. This represents a profit to your Company of about $1,100,000. Inasmuch as this stock of The Kanawha and Michigan Railway Company has been deposited under your Company's First Lien and Improvement Mortgage, the proceeds of this sale will be deposited with the Trustee under that mortgage, and can be expended for improvements and investments which are permitted under the terms of that mortgage.

During the past five years your Company's increase in capital liabilities in hands of the public, its principal acquisitions of stocks and bonds of other companies, and its expenditures for equipment, branch line construction, second track, and other additions and betterments have been as follows:

Capital Obligations Issued or Assumed:	Par Value	
General Mortgage 4½% Bonds	$3,716,000.00	
First Consolidated Mortgage 5% Bonds	2,000,000.00	
Convertible 4½% Debentures	31,390,000.00	
Three Year 4½% Collateral Trust Notes	25,000,000.00	
One Year 5% Collateral Trust Notes	3,500,000.00	
Five Year 5% Collateral Trust Notes	33,000,000.00	
Coal River Railway Co. First Mortgage 4% Bonds	3,000,000.00	
Raleigh and Southwestern Railway Co. First Mortgage 4% Bonds	860,000.00	
Big Sandy Railway Co. First Mortgage 4% Bonds	229,000.00	
Virginia Air Line Railway Co. First Mortgage 5% Bonds	900,000.00	
Equipment Trust Certificates Series N	1,700,000.00	
Equipment Contracts	3,777,340.00	
Realizing	$109,072,340.00	
Less:		$103,489,665.00
Capital Obligations Paid or Purchased:		
Peninsula Division First Mortgage 6% Bonds maturing January 1, 1911	$2,000,000.00	
Greenbrier and New River Railroad Co. First Mortgage 5% Bonds redeemed February 1, 1911	339.000.00	
General Funding and Improvement Mortgage 5% Bonds	7,302,000.00	
Greenbrier Railway Co. First Mortgage 4% Bonds retired November 1, 1911	2,000.00	
Three Year 4½% Collateral Trust Notes	25,000,000.00	
One Year 5% Collateral Trust Notes	3,500,000.00	
Equipment Trust Payments	9,673,392.00

Miscellaneous	12,300.00	
Costing	$21,276,000.00	
		$21,506,146.39
Bonds of:		
The C. & O. Railway Co. of Indiana First Mortgage 5%	$6,700,000.00	
Elkhorn and Beaver Valley Railway Co. First Mortgage 5%	980,000.00	
Costing	$7,680,000.00	
		6,380,500.00
Properties of:		
Coal River Railway Co.	$2,304,359.88	
Raleigh and Southwestern Railway Co.	816,562.42	
Virginia Air Line Railway Co.	1,071,947.12	
Costing		4,192,869.42

Construction of:		
Extensions of Branch Lines, costing	$1,548,551.64	
Second Track (173.1 miles) and Additions and Betterments, costing	14,143,025.86	
(Excluding $2,119,704.98 expended on Chicago Line to April 30, 1914, for which securities have been acquired.)		15,691,577.50
Equipment:		
Additional equipment acquired (less retirals)		16,875,111.91
(Excluding $44,236.77 expended on Chicago Line to April 30, 1914, for which securities have been acquired.)		
Costing		$64,646,205.22

Your Company acquired during the year additional shares of stock of White Sulphur Springs, Incorporated of Logan and Southern Railway Company and of Gauley and Meadow River Railroad Company, and exchanged a part of its holdings of common stock of Elkhorn and Beaver Valley Railway Company for a like amount of preferred stock which was later surrendered for first mortgage bonds at par. Additional first mortgage bonds of Elkhorn and Beaver Valley Railway Company were acquired at par in reimbursement for advances made that Company for construction purposes. Further shares of stock and first mortgage bonds of The Chesapeake and Ohio Railway Company of Indiana were issued in respect of the cost of certain additions and betterments made to that line, and were pledged under your Company's First Lien and Improvement Mortgage.

A statement of charges to property accounts will be found on page 16, showing a net addition of $17,058,584.66, that is, $1,834,867.10 was added to cost of road, and $15,223,717.56 was added to cost of equipment. This includes equipment represented by securities of The Chesapeake and Ohio Equipment Corporation heretofore carried in securities owned account but transferred to cost of equipment this year, amounting to $11,166,743.30.

A schedule of securities owned June 30, 1914, will be found on page 17.

GENERAL REMARKS.

The equipment inventory as of June 30, 1914, was as follows:

Locomotives owned	586	Inc.	50
Locomotives leased	239	Dec.	36
Total	825	Inc.	14
Passenger train cars owned	366	Inc.	18
Passenger train cars leased	29	..	..
Total	395	Inc.	18
Freight train and miscellaneous cars owned	22,308	Inc.	652
Freight train cars leased	22,322	Inc.	267
Total	44,630	Inc.	919

The changes during the year in the accrued depreciation of equipment account were as follows:

Balance to credit of account June 30, 1913			$3,503,348.90
Amount credited during year ended June 30, 1914, by charges to:			
Operating expenses	$797,888.28		
Outside operations expenses	19,474.74		
		$817,363.02	
Charges to account for:			
Accrued depreciation on equipment retired during year—			
20 locomotives, 4 passenger, 1,521 freight and work cars and 1 tug	$103,584.37		
Accrued depreciation on cars changed in class during year	4,585.62		
		108,169.99	
			709,193.03
Balance to credit of account June 30, 1914			$4,212,541.93

	1914	1913	Increase
Operating Revenues amounted to	$36,690,021.11	$35,085,278.32	$1,604,742.79
Net Operating Revenue	$11,036,084.33	$10,633,718.01	$402,366.32
Operating Ratio	69.9%	69.7%	.2%
Tons of Revenue Freight carried one mile	7,064,650,082	6,694,879,287	369,770,795
Revenue train load, tons	870	843	27
Revenue tons per loaded car	30.9	29.8	1.1

At Newport News, Virginia, the Atlantic tidewater terminus of your Company, an all steel dumping pier has been constructed, one side of which was completed and put into operation June 1, 1914. This pier is electrically operated and equipped with every modern appliance for the expeditious loading of coal into cargo vessels and bunkers. The cost of this pier, with its accompanying facilities, is about $1,630,000, nearly all of which has been expended at the close of the fiscal year. The pier has a rated capacity of 5,000 tons per hour when both sides are in operation, the road cars being dumped into conveyor cars which are lifted to the top of the pier by electric elevators, and the service which your Company can give at this pier promises a record for fast transferring of coal from the railway car to vessels.

In view of the desirability of providing a connection from your Company's main line at or near Portsmouth, on the Ohio River, to the main line of The Hocking Valley Railway Company at or near Columbus, Ohio, in order to facilitate the constantly increasing shipments of coal to the Lakes and the northwest, The Chesapeake and Ohio Northern Railway Company has been incorporated in Kentucky.

Extensions of the Gauley Branch, and of Logan and Southern Railway and construction of Elkhorn and Beaver Valley Railway aggregating 31.6 miles have been completed.

The revenue coal and coke tonnage was 19,251,488, an increase of 17.7 per cent.; other freight tonnage was 8,470,527, a decrease of 3.9 per cent. Total tonnage was 27,722,015 tons, an increase of 10.1 per cent. Freight revenue was $28,866,516.16, an increase of 4.8 per cent. Freight train mileage was 8,119,349 miles, an increase of 2.3 per cent. Revenue ton miles were 7,064,650,082, an increase of 5.5 per cent. Ton mile revenue was 4.09 mills, a decrease of 0.7 per cent. Revenue per freight train mile was $3.555, an increase of 2.4 per cent. Revenue tonnage per train mile was 870 tons, an increase of 3.2 per cent.; including Company's freight, the tonnage per train mile was 927 tons, an increase of 2.9 per cent. Tonnage per locomotive, including Company's freight, was 827 tons, an increase of 4.7 per cent. Revenue tonnage per loaded car was 30.9 tons, an incerase of 3.7 per cent. Tons of revenue freight carried one mile per mile of road were 3,011,617, an increase of 4.3 per cent.

There were 6,491,256 passengers carried, an increase of 10.8 per cent. The number carried one mile was 291,653,817, an increase of 9.2 per cent. Passenger revenue was $6,098,058.96, an increase of 4.1 per cent. Revenue per passenger per mile was 2.091 cents, a decrease of 4.7 per cent. Number of passengers carried one mile per mile of road was 124,330, an increase of 8.0 per cent. Passenger train mileage was 5,230,376, an increase of 0.2 per cent. Passenger revenue per train mile was $1.166, an increase of 3.9 per cent.; including mail and express, it was $1.369, an increase of 4.4 per cent. Passenger service train revenue per train mile was $1.401, an increase of 3.9 per cent.

There were 13,645.5 tons of new rails (4,280.4 tons 100-lb. and 9,365.1 tons 90-lb.), equal to 93.5 track miles, used in the renewal of existing main tracks.

The average amount expended for repairs per locomotive operated was $2,738.18; per passenger train car, $802.74; per freight train car, $73.83.

The Board takes this occasion to make appreciative acknowledgment of efficient services of officers and employes during the year.

By order of the Board of Directors.

GEO. W. STEVENS,
President.

FRANK TRUMBULL,
Chairman.

THE HOCKING VALLEY RAILWAY COMPANY—FIFTEENTH ANNUAL REPORT

Columbus, Ohio, September 17, 1914.

To the Stockholders:

The Fifteenth Annual Report of the Board of Directors, for the fiscal year ended June 30, 1914, is herewith submitted.

The average mileage operated during the year was 351.5 miles. The mileage at the end of the year was 351.5 miles. See schedule on page 8.

RESULTS FOR THE YEAR.

Operating Revenues were		$7,021,145.07
(Decrease $796,498.79 or 10.19%.)		
Operating Expenses were		4,803,746.51
(Decrease $180,096.61 or 3.61%.)		
Net Operating Revenue was		$2,217,398.56
(Decrease $616,402.18 or 21.75%.)		
Taxes were		451,136.27
(Decrease $26,763.73 or 5.60%.)		
Operating Income, Taxes deducted, was		$1,766,262.29
(Decrease $589,638.45 or 25.03%.)		
Miscellaneous Income was		448,919.90
(Decrease $323,558.67 or 41.89%.)		
		$2,215,182.19
Rentals and other payments were		110,938.43
(Increase $13,133.02 or 13.43%.)		
Income for the year available for interest was		$2,104,243.76
(Decrease $926,330.14 or 30.57%.)		
Interest (54.58% of amount available) amounted to		1,148,503.05
(Increase $34,333.05 or 3.08%.)		
Net Income for the year amounted to		$ 955,740.71
(Decrease $960,663.19 or 50.13%.)		
Dividends paid during the year:		
Four dividends of 2% each, aggregating		879,960.00
Remainder		$ 75,780.71

FINANCIAL.

The changes in funded debt shown by balance sheet of June 30, 1914, as compared with June 30, 1913, consisted in the retirement of $14,000 par amount of The Hocking Valley Railway Company First Consolidated Mortgage 4½% Bonds through the sinking fund; in the annual payments of $316,000 on equipment trusts; in the retirement of $4,000,000 face amount two-year 4½% gold notes by the issue and sale of $4,000,000 face amount one-year 5% gold notes maturing November 1, 1914; and in the sale of $1,800,000 face amount of equipment trust obligations to provide funds for the purchase of 2,000 steel gondola cars of 115,000 pounds capacity, 6 Mikado freight locomotives, and 2 ten-wheel passenger locomotives.

Your Company acquired 3,872 shares of The Toledo Terminal Railroad Company capital stock under an agreement with other interested companies providing that the companies holding the stock will be responsible (severally but not jointly) for any deficiency in working expenses and in interest on $4,000,000 First Mortgage 4½% Bonds of The Toledo Terminal Railroad Company in the proportion which the stock held by each company bears to the total stock outstanding, your Company's proportion being 9.68%.

An analysis of the property accounts will be found on pages 12 and 13, by reference to which it will be seen that additions and betterments were made during the year to the amount of $2,966,061.09, of which $1,122,490.87 was added to cost of road, and $1,843,570.22 was added to cost of equipment.

During the past five years your Company's expenditures for equipment and other additions and betterments have been as follows:

Additional equipment acquired (less retirals)	$2,931,182.75
Additions and Betterments	3,259,745.68
	$6,190,928.43

GENERAL REMARKS.

The equipment in service June 30, 1914, consisted of:

Locomotives owned	148	Decrease	1
Locomotives leased under equipment trusts	8	Increase	8
Total	156	Increase	7
Passenger train cars owned	86	Decrease	2
Freight train and miscellaneous cars owned	9,655	Increase	227
Freight train cars leased under equipment trusts	4,556	Increase	1,206
Total freight train cars	14,211	Increase	1,433

The prolonged strike by coal miners in the Hocking district, causing almost entire suspension of mining during April, May and June in the territory covered by your line, resulted in a heavy loss of freight traffic and earnings sa follows:

	1914.	1913.	DECREASE.
Tons of revenue freight carried one mile	1,315,425,895	1,453,682,875	138,256,980
Operating revenues	$7,021,145.07	$7,817,643.86	$796,498.79
Net operating revenue	$2,217,398.56	$2,833,800.74	$616,402.18

The revenue train load increased from 988 to 1,000 tons, and revenue tons per loaded car from 36.3 to 36.9 tons.

Steel water tanks were built at Marion, Upper Sandusky and Toledo and modern water softening plants were erected at Carey, Marion, Hyatts and Linworth. The work of separating grades at South Columbus, required by the city authorities of Columbus, was completed and the South Columbus freight station remodeled. At Marion a suitable site was purchased for engine house.

The operation of the new coal dock and terminal yard on the east side of the Maumee River at Toledo, undertaken last year, was commenced on June 17, 1914. The dock is equipped with two car dumpers, which are operated by steam power, the maximum capacity of the dumpers being 8,000 tons per hour, which is about double the present needs of the Company. The coal is dumped directly from the road cars into vessels. The terminal yard tributary to the dock has fifteen and one-half miles of track with a working capacity of 1,500 cars, and is capable of considerable enlargement. The cost of the new dock and terminal, exclusive of a large part of the real estate which has been owned by your Company for many years, is about $1,450,000, nearly all of which has been expended at the close of the fiscal year, this expenditure forming the major part of the additions and betterments, except equipment, for the past two years. It was necessary to change the grade of two important streets in the city of Toledo; Front street being elevated over and Seaman street being carried under tracks of your Company. It was also necessary to elevate tracks of Wheeling and Lake Erie Belt Railway at the entrance to the terminal yard. The new dock is directly across the river from the dock heretofore used and is better located than any other railroad dock in Toledo, being nearer the mouth of the river, and is readily accessible to your Company's line over the double track of the Toledo Terminal Railroad, an interest in which has been acquired by your Company, as hereinbefore stated. Your Company is under contract to sell the old location to the Pennsylvania Company, which owns the adjoining water front, and it is expected that a very considerable sum will be realized from the sale of this valuable dock property.

The coal and coke tonnage was 7,323,139 tons, a decrease of 8.1%; other freight tonnage was 3,163,909 tons, a decrease of 1.6%. Total tonnage

GENERAL BALANCE SHEET, JUNE 30, 1914.

This Company, jointly with the Toledo and Ohio Central Railway Company, guaranteed in 1901 5% First Mortgage Bonds of the Kanawha and Hocking Coal and Coke Company due 1951 ($2,878,000 outstanding), and in 1902 5% First Mortgage Bonds of the Continental Coal Company due 1952 ($1,604,000 outstanding). The Ohio courts, in quo warranto proceedings in which bondholders were not represented, have pronounced these guaranties *ultra vires*.

was 10,487,048 tons, a decrease of 6.2%. Freight revenue was $5,601,381.91, a decrease of 12%. Freight train mileage was 1,315,637 miles, a decrease of 10.6%. Revenue ton miles were 1,315,425,895, a decrease of 9.5%. Ton mile revenue was 4.26 mills, a decrease of 2.7%. Revenue per freight train mile was $4.258, a decrease of 1.6%. Revenue tonnage per train mile was 1,000 tons, an increase of 1.2%; including Company's freight, the tonnage per train mile was 1,036 tons, an increase of 1.3%. Tonnage per locomotive, including Company's freight, was 901 tons, an increase of 4.5%. Revenue tonnage per loaded car was 36.9 tons, an increase of 1.7%. Tons of revenue freight carried one mile per mile of road were 3,742,321, a decrease of 9.5%.

There were 2,156,150 passengers carried, a decrease of 5.3%. The number of passengers carried one mile on steam trains was 49,193,241, a decrease of 6.5%. Passenger revenue was $910,310.72, a decrease of 2.1%. Revenue per passenger per mile of steam trains was 1.804 cents, an increase of 4.8%. The number of passengers carried on steam trains one mile per mile of road was 139,952, a decrease of 6.5%. Passenger train mileage of steam trains was 778,581, a decrease of 4.5%. Passenger revenue per train mile of steam trains was $1.14, an increase of 2.6%; including mail and express it was $1.296, an increase of 1.5%. Passenger service train revenue per train mile was $1.35, an increase of 1.7%.

There were 2,268 tons of new 100-lb. rails, equal to 14.4 track miles, and 1,603 tons of new 90-lb. rails, equal to 11.3 track miles, used in the renewal of existing main tracks.

The average amount expended for repairs per locomotive was $1,968.67; per passenger train car $436.14; per freight train car $62.20.

Appreciative acknowledgment is hereby made of efficient services during the year of officers and employees.

By order of the Board of Directors:

GEO. W. STEVENS,
President.

FRANK TRUMBULL.
Chairman.

NINETEENTH ANNUAL REPORT OF THE ATCHISON, TOPEKA & SANTA FE RAILWAY COMPANY

OFFICE OF
THE ATCHISON, TOPEKA & SANTA FE RAILWAY SYSTEM,
No. 5 Nassau Street, New York City.

SEPTEMBER 15, 1914.

To the Stockholders:

Your Directors submit the following report for the fiscal year July 1, 1913, to June 30, 1914, inclusive.

The Lines comprising the Atchison System, the operations of which are embraced in the following statements, are as follows:

	June 30, 1914.		June 30, 1913.	
Atchison, Topeka & Santa Fe Railway	8,339.72	miles.	8,237.55	miles.
Rio Grande, El Paso & Santa Fe Railroad	20.22	"	20.21	"
Gulf, Colorado & Santa Fe Railway	1,595.89	"	1,595.77	"
Pecos & Northern Texas Railway	569.79	"	481.79	"
Pecos River Railroad*	.....	"	54.24	"
Panhandle & Santa Fe Railway†	179.16	"	124.92	"
Texas & Gulf Railway	125.49	"	125.49	"
Gulf & Interstate Railway of Texas	71.33	"	71.33	"
Concho, San Saba & Llano Valley Railroad	59.63	"	60.15	"
	10,961.23	"	10,771.45	"

*Operated by Panhandle & Santa Fe Railway under lease effective July 1, 1913.

†Formerly known as Southern Kansas Railway of Texas.

Increase during the year 189.78 miles.

The average mileage operated during the fiscal year ending June 30, 1914, was 10,908.52 miles, being an increase of 158.21 miles as compared with the average mileage operated during the preceding fiscal year.

In addition to lines covered by this report there were completed on June 30, 1914, 39.26 miles of additional line, all of which will be ready for operation on October 1, 1914.

The Company also controls, through ownership of stocks and bonds or purchase contract, other lines aggregating 228.92 miles, and is interested jointly with other companies in 593.85 miles.

For detailed statement of present mileage and of changes in mileage since last Annual Report, see pages 42 to 46.

INCOME STATEMENT.

The following is a summary of the transactions of the System for the years ending June 30, 1913 and 1914.

	1913.	1914.
Operating Revenues	$116,896,251.98	$111,109,769.86
Operating Expenses	77,642,534.73	73,469,333.68
Net Operating Revenue	$39,253,717.25	$37,640,436.18
Taxes	4,662,152.38	5,525,585.30
Operating Income	$34,591,564.87	$32,114,850.88
Other Income	2,515,623.96	2,174,353.12
Gross Corporate Income	$37,107,188.83	$34,289,204.00
Rentals and Other Charges	1,128,129.10	1,218,827.08
	$35,979,059.73	$33,070,376.92
Interest on Bonds, including accrued interest on Adjustment Bonds	13,825,325.40	12,886,412.23
Net Corporate Income (representing amount available for dividends and surplus and for necessary but unproductive or only partially productive expenditures)	$22,153,734.33	$20,183,964.69

From the net corporate income for the year the following sums have been deducted:

DIVIDENDS ON PREFERRED STOCK—		
No. 31 (2½%) paid Feb. 2, 1914	$2,854,345.00	
No. 32, (2½%) paid Aug. 1, 1914	2,854,345.00	
		$5,708,690.00
DIVIDENDS ON COMMON STOCK—		
No. 33 (1½%) paid Sept. 2, 1913	$2,914,732.50	
No. 34 (1½%) paid Dec. 1, 1913	2,916,637.50	
No. 35 (1½%) paid Mar. 2, 1914	2,925,877.50	
No. 36 (1½%) paid June 1, 1914	2,934,502.50	
	11,691,750.00	
Appropriation for Fuel Reserve Fund	51,485.83	
California-Arizona Lines Bonds Sinking Fund	12,721.10	
Appropriated for Additions and Betterments	2,719,317.76	
		$20,183,964.69
Surplus to credit of Profit and Loss June 30, 1913		$20,569,800.81
Profit and Loss Adjustments		.....
Surplus to credit of Profit and Loss June 30, 1914		20,569,800.81

Income from sources other than earnings from operation consisted of interest on cash in banks and sums collected as interest and dividends upon bonds and stocks of companies, the operations of which are not included in the System accounts.

During the fiscal year the sum of $120,000 in cash was received as the net proceeds of sales of land embraced in the Santa Fe Pacific Land Grant, but this was directly written off the book value of Railroads, Franchises and Other Property, and the transaction does not appear in the Income Account.

CAPITAL EXPENDITURES AND REDUCTION OF BOOK VALUES.

The total charges to Capital Account, as shown by the General Balance Sheet, page 26, at June 30, 1914, aggregated $651,428,708.11 as compared with $640,263,756.10 at June 30, 1913, an increase during the year of $11,164,952.01, which analyzes as follows:

Construction and acquisition of new mileage, including the acquisition of bonds and stocks of other railway and terminal companies:		
California, Arizona & Santa Fe Ry.	$ 7,462.57	
Concho, San Saba & Llano Valley R. R.	17,952.50	
Dodge City & Cimarron Valley Ry.	114,984.07	
Eastern Ry. of New Mexico	515,696.54	
Ft. Worth Union Passenger Station Co.	533.02	
Grand Canyon Ry.	14,633.62	
Gulf, Beaumont & Kansas City Ry.	702,500.00	
Joliet Union Depot Co.	10,000.00	
Minkler Southern Ry.	845,606.30	
Union Passenger Depot Co. of Galveston	360,000.00	
Union Terminal Co. of Dallas	3,000.00	
Verde Valley Ry.	80,483.24	
Western Arizona Ry.	170.13	
		$2,673,021.99
Additions and Betterments—System Lines:		
Right of Way, Station Grounds and Real Estate	$ 290,158.15	
Widening Cuts and Fills, including Protection of Banks	315,666.39	
Grade Reductions and Changes of Line	117,651.55	
Bridges, Trestles and Culverts	461,976.65	
Ballast, including cost of spreading and putting under track	356,140.15	
Increased Weight of Rail	210,584.33	
Frogs, Switches, Track Fastenings and Appurtenances	435,338.48	
Additional Main Tracks	951,524.83	
Sidings and Spur Tracks	718,279.10	
Terminal Yards	418,982.97	
Track Elevation, Elimination of Grade Crossings, and Improvements of Over and Under Grade Crossings	*4,921.09*	
Interlocking, Block, and Other Signal Apparatus	470,291.61	
Telegraph and Telephone Lines	79,627.99	
Buildings, Shops, Dock and Wharf Property	1,594,440.34	
Shop Machinery and Tools	220,932.81	
Additional Equipment	6,437,635.13	
Betterments to Equipment	49,913.75	
Other Additions and Betterments	159,530.24	
		$13,283,753.38
Fuel Lands and Other Properties:		
Real Estate held for future use	$ 139,060.41	
Tie and Timber Lands	19,706.49	
Miscellaneous Items	59,811.11	
		$ 218,578.01
Other Investments		684,317.52
Total Charges		$16,859,670.90
Reduction of Book Values:		
Gulf, Beaumont & Kansas City Ry.	$ 702,500.00	
Santa Fe Pacific R. R.—Land Sales	120,000.00	
Texas & Gulf Ry.	2,250.00	
Ice Plant, Belen	9,950.00	
Ice Plant, San Bernardino	75,798.28	
Santa Barbara Tie & Pole Co.	21,455.98	
Fuel Lands	1,050,000.00	
Reserve for Accrued Depreciation	3,712,764.63	
		$ 5,694,718.89
Net Increase in Capital Account during the year		$11,164,952.01

Credits in italics.

The item of $6,437,635.13 for "Additional Equipment" analyzes as follows:

35 Locomotives		$ 999,603.63
122 Passenger-Train Cars		1,626,492.68
3,334 Freight-Train Cars		4,434,301.55
487 Miscellaneous Cars		174,041.64
		$7,234,439.50
Less—Value of equipment retired during the year as follows:		
43 Locomotives	$171,336.85	
21 Passenger-Train Cars	84,528.23	
1,310 Freight-Train Cars	531,118.26	
31 Miscellaneous Cars	9,821.03	
		$ 796,804.37
		$6,437,635.13

MAINTENANCE OF EQUIPMENT.

The following statement shows the sums charged to Operating Expenses for Maintenance of Equipment during each year since July 1, 1896:

Year ending June 30.	Average Operated Mileage.	Total Expenditure.	Expenditure Per Mile.
1897	6,443.81	$3,443,884.82	$534.45
1898	6,936.02	4,659,277.99	671.75
1899	7,032.62	4,810,795.64	684.07
1900	7,341.34	5,267,832.40	717.56
1901	7,807.31	6,257,456.57	801.49
1902	7,855.38	7,864,951.25	1,001.22
1903	7,965.13	8,510,543.09	1,068.48
1904	8,179.59	10,006,135.41	1,223.31
1905	8,305.40	10,914,864.47	1,314.19
1906	8,433.99	10,720,040.43	1,271.05
1907	9,273.15	11,779,846.64	1,270.32
1908	9,415.01	14,246,621.44	1,513.18
1909	9,794.86	13,903,897.37	1,419.51
1910	9,916.33	15,560,047.44	1,569.13
1911	10,350.13	16,686,145.45	1,612.17
1912	10,627.92	16,521,231.41	1,554.51
1913	10,750.31	19,415,224.63	1,806.02
1914	10,908.52	19,100,724.51	1,750.99

For the year ending June 30, 1914, maintenance charges, including renewals and depreciation, averaged as follows:

Per locomotive	$4,463.93
Per locomotive mile	.1737
Per passenger car, including mail and express	1,174.63
Per passenger car mile	.0137
Per freight car	120.32
Per freight car mile	.0124

The foregoing average maintenance charges include a proportion of unlocated expenditures for Maintenance of Equipment charged to Superintendence, Shop Machinery and Tools, Injuries to Persons, Stationery and Printing, Other Expenses, and Maintaining Joint Equipment at Terminals. Repairs to motor equipment of motor coaches, which are chargeable to repairs of locomotives, are excluded in determining the locomotive averages. Refrigerator cars are not taken into consideration in arriving at freight car averages, such cars being operated by the Santa Fe Refrigerator Despatch Company, which bears the expense of their maintenance.

A statement of the locomotives in service and of their tractive power will be found on page 41.

MAINTENANCE OF WAY AND STRUCTURES.

The following statement shows the sums charged to Operating Expenses for Maintenance of Way and Structures during each year since July 1, 1896:

Year ending June 30.	Average Operated Mileage.	Total Expenditure.	Expenditure Per Mile.
1897	6,443.81	$6,282,923.15	$975.03
1898	6,936.02	8,281,397.88	1,193.97
1899	7,032.62	7,672,107.62	1,090.93
1900	7,341.34	6,354,372.10	865.56
1901	7,807.31	6,433,840.36	824.08
1902	7,855.38	6,141,466.39	781.82
1903	7,965.13	9,304,892.04	1,168.20
1904	8,179.59	9,170,234.07	1,121.11
1905	8,305.40	11,385,418.33	1,370.85
1906	8,433.99	12,475,407.97	1,479.18
1907	9,273.15	15,286,062.66	1,648.42
1908	9,415.01	14,120,828.02	1,499.82
1909	9,794.86	12,884,406.81	1,315.43
1910	9,916.33	17,807,136.20	1,795.74
1911	10,350.13	16,059,786.90	1,551.65
1912	10,627.92	16,076,833.75	1,512.70
1913	10,750.31	18,054,413.03	1,679.43
1914	10,908.52	15,308,780.25	1,403.38

COMPARISON OF OPERATING RESULTS.

The following is a statement of revenues and expenses of the System for the fiscal year ending June 30, 1914, in comparison with the previous year:

	Year Ending June 30, 1914.	Year Ending June 30, 1913.	Increase or Decrease.
OPERATING REVENUES:			
Freight	$73,638,388.01	$78,190,923.18	—$4,552,535.17
Passenger	28,497,232.68	29,425,922.44	—928,689.76
Mail, Express and Miscellaneous	8,974,149.17	9,279,406.36	—305,257.19
Total Operating Revenues	$111,109,769.86	$116,896,251.98	—$5,786,482.12
OPERATING EXPENSES:			
Maintenance of Way and Structures	$15,308,780.25	$18,054,413.03	—$2,745,632.78
Maintenance of Equipment	19,100,724.51	19,415,224.63	—314,500.12
Traffic Expenses	2,521,452.94	2,455,784.69	65,668.25
Transportation Expenses	33,818,432.83	35,135,649.15	—1,317,216.32
General Expenses	2,719,943.15	2,581,463.23	138,479.92
Total Operating Expenses	$73,469,333.68	$77,642,534.73	—$4,173,201.05
Net Operating Revenue	$37,640,436.18	$39,253,717.25	—$1,613,281.07
Ratio of Operating Expenses to Operating Revenues	66.12	66.42	—.30

The following averages are deduced from tables set forth on pages 36 and 39.

The average tons of freight (revenue and company) per loaded car mile decreased from 19.14 to 18.75, or 2.04 per cent.

The average tons of freight (revenue and company) carried per freight-train mile (freight, mixed, and company-supply) decreased from 425.41 to 420.45, or 1.17 per cent.

The average freight revenue per revenue freight-train mile increased from $3.48 to $3.55, or 2.01 per cent.

The average passenger revenue per revenue passenger-train mile decreased from $1.24 to $1.17, or 5.65 per cent.

The average passenger train revenue per revenue passenger-train mile decreased from $1.54 to $1.45, or 5.84 per cent.

The tons of freight carried one mile (revenue and company) decreased 782,191,703, or 8.07 per cent., while miles run by freight cars (loaded and empty) in freight, mixed, and company-supply trains decreased 33,993,215, or 4.75 per cent., and the mileage of such trains decreased 1,591,321, or 6.98 per cent.

The number of passengers carried one mile decreased 14,824,376, or 1.12 per cent., while miles run by passenger cars in passenger and mixed trains increased 40,066, or .03 per cent., and the mileage of such trains increased 657,069, or 2.77 per cent.

The following is a consolidated statement of the business of the System for each fiscal year during the period since January 1, 1896:

Fiscal Year Ending June 30.	Average Miles Operated.	Gross Revenues, Including Income from Other Sources.	Expenses, Including Taxes, Rentals and Other Charges.	Interest on Bonds.	Net Corporate Income.
1897 (18 mos.)	6,443.81	$44,532,628.99	$36,038,455.30	$8,440,387.91	$53,785.78
1898	6,936.02	39,396,126.41	30,513,553.17	7,045,988.30	1,836,584.94
1899	7,032.62	40,762,933.47	29,332,964.11	7,241,972.00	4,187,997.36
1900	7,341.34	46,498,899.04	29,414,427.56	7,345,166.50	9,739,304.98
1901	7,807.31	54,807,379.78	34,502,039.87	7,830,810.83	12,474,329.08
1902	7,855.38	60,275,944.33	36,272,432.45	8,438,985.00	15,564,526.88
1903	7,965.13	63,668,390.99	40,635,576.48	9,134,485.24	13,898,329.27
1904	8,179.59	69,419,975.41	44,641,434.10	9,418,770.00	15,359,771.31
1905	8,305.40	69,189,739.65	47,835,883.50	9,611,510.09	11,742,346.06
1906	8,433.99	79,390,749.05	51,035,355.71	10,622,184.22	17,733,209.12
1907	9,273.15	94,436,574.68	61,779,916.16	11,487,934.70	21,168,723.82
1908	9,415.01	91,289,770.61	65,031,582.67	12,579,301.77	13,678,886.17
1909	9,794.86	95,424,091.89	61,458,019.13	13,548,081.93	20,417,990.83
1910	9,916.33	107,543,250.16	75,133,314.54	11,984,151.36	20,425,784.26
1911	10,627.92	110,322,328.13	77,001,227.38	13,660,859.50	19,660,241.25
1911	10,350.13	109,772,481.69	75,689,094.83	12,712,319,31	21,371,067.55
1913	10,750.31	119,411,875.94	83,432,816.21	13,825,325.40	22,153,734.33
1914	10,908.52	113,284,122.98	80,213,746.06	12,886,412.23	20,183,964.69

The following statement shows the gross operating revenues of the System (exclusive of income from other sources) per mile of road operated for each fiscal year since July 1, 1896:

Year Ending June 30.	Gross Operating Revenues.	Average per Mile of Road.
1897	$30,621,230.10	$4,752.04
1898	39,214,099.24	5,653.69
1899	40,513,498.63	5,760.80
1900	46,232,078.23	6,297.49
1901	54,474,822.61	6,977.41
1902	59,135,085.53	7,527.97
1903	62,350,397.28	7,827.92
1904	68,171,200.18	8,334.31
1905	68,375,837.25	8,232.70
1906	78,044,347.25	9,253.55
1907	93,683,406.91	10,102.65
1908	90,617,796.38	9,624.82
1909	94,265,716.87	9,624.00
1910	104,993,194.67	10,587.91
1911	107,565,115.62	10,392.63
1912	107,752,359.91	10,138.61
1913	116,896,251.98	10,873.75
1914	111,109,769.86	10,185.60

The following statement shows the development of the freight and passenger revenues of the System since July 1, 1896:

Year Ending June 30.	Freight Revenue.	Passenger Revenue.
1897	$22,067,686.77	$5,574,288.31
1898	28,588,716.76	7,347,361.59
1899	29,492,586.65	8,126,141.85
1900	33,729,332.83	9,334,661.57
1901	39,052,557.43	11,678,017.25
1902	41,815,607.05	13,439,384.57
1903	44,622,438.71	13,469,985.78
1904	47,762,653.23	15,433,773.63
1905	47,408,982.36	16,045,380.27
1906	54,598,902.82	18,013,988.56
1907	65,500,309.42	21,171,629.08
1908	61,848,638.51	21,643,427.49
1909	64,212,638.10	22,734,505.32
1910	71,194,055.59	25,437,181.98
1911	71,787,200.89	27,204,867.66
1912	71,529,467.67	27,453,525.41
1913	78,190,923.18	29,425,922.44
1914	73,638,388.01	28,497,232.68

PROPERTY INVESTMENT AND RATE OF RETURN.

The development of the Company's business and of its efficiency have been due principally to the very large expenditures (over $298,000,000) which have been made in the extension and improvement of the property since January 1, 1896. In order to make such expenditures, your Company has raised since 1896 over $217,000,000 of "new money" by the sale of bonds which are now outstanding or which (in the case of many of the Convertible Bonds sold) are represented by Common Stock now outstanding.

The following statement shows, for each year, the amount of investment, the amount of net income applicable to bond interest, dividends, improvement of property and strengthening of credit, and the rate of return which such net income represents on the amount of the investment.

Year Ending June 30th.	Property Investment.*	Income Applicable to Bond Interest, Dividends, Improvement of Property and Strengthening of Credit.†	Per Cent. Income of Property Investment.
1896 (6 months)	$372,104,262.77	$2,432,870.06	.65
1897	387,957,477.68	6,070,364.45	1.57
1898	392,169,842.02	8,871,947.26	2.26
1899	399,527,444.30	11,409,315.36	2.86
1900	407,187,811.22	17,064,850.91	4.19
1901	419,541,440.17	21,196,714.38	5.05
1902	439,911,035.33	23,921,018.14	5.44
1903	454,290,057.89	23,032,814.51	5.07
1904	466,273,139.34	24,778,541.31	5.31
1905	473,020,998.79	21,353,856.15	4.51
1906	496,782,342.35	28,355,393.34	5.71
1907	519,004,129.48	32,724,274.07	6.31
1908	541,727,328.96	25,633,510.34	4.73
1909	548,251,270.97	33,523,437.28	6.11
1910	579,793,768.23	32,387,712.39	5.58
1911	609,287,764.18	34,102,511.86	5.59
1912	621,869,989.29	33,321,100.75	5.36
1913	640,263,756.10	36,078,744.55	5.63
1914	651,428,708.11	33,070,376.92	5.08
Annual Average	$495,810,135.11	$24,288,073.19	4.90

*The amounts above shown as "Property Investment" do not include anything for necessary working capital such as materials and supplies and cash. Ordinarily such necessary working capital considerably exceeds $35,000,000.

In the years 1901 to 1908 the "Property Investment" was reduced by "writing off" sums aggregating $21,066,685.78, which sums are excluded from the "Property Investment" as above stated.

In the years 1910 to 1914, sums ranging from $8,211,433.32 in the former year to $19,790,186.11 in the latter year, representing depreciation of equipment accrued pursuant to the rulings of the Interstate Commerce Commission, have been deducted from the amounts shown as "Property Investment" and are excluded in the above statement.

†The "Income" shown above is determined after allowing for adjustments made through profit and loss.

The foregoing statement emphasizes the striking fact that the total net income is now barely in excess of five per cent. per annum upon the investment, and of course not all of this income can be distributed in the way of interest and dividends since it is desirable to appropriate a substantial amount of net income each year to Additions and Betterments for the due preservation of the credit of the Company.

The ability of your Company, under the conditions reflected by this statement, to pay six per cent. on the common stock is explained by the fact that it pays an average of very little more than four per cent. on its bonded debt, much of the bonded debt having been created when money could be borrowed at or near four per cent. But for several years it has been impracticable to borrow large amounts of money for railroad purposes at as low a rate or even as low as four and one-half per cent., and under present conditions it is believed the rate of interest which would have to be paid would be substantially greater.

CAPITAL STOCK AND FUNDED DEBT.

The outstanding Capital Stock (deducting stock in treasury) on June 30, 1913, consisted of:

Common	$190,836,500.00	
Preferred	114,173,730.00	
		$305,010,230.00

Issued during the year:

Common Stock issued in exchange for Convertible Bonds retired	4,975,000.00

Capital Stock outstanding June 30, 1914:

Common	$195,811,500.00	
Preferred	114,173,730.00	
		$309,985,230.00

The outstanding Funded Debt of the System (deducting bonds in the treasury) amounted on June 30, 1913, to.....$319,146,148.50

The following changes in the Funded Debt occurred during the year:

Obligations Purchased or Retired:

Serial Debenture 4% Bonds,		
Series K	$ 5,000.00	
Series L	270,000.00	
Convertible 4% Bonds	4,975,000.00	
Miscellaneous Divisional Bonds	702,500.00	
		5,952,500.00
Total System Funded Debt outstanding June 30, 1914		$313,193,648.50

Interest charges for year ending June 30, 1915, will be approximately $12,809,000 or an average monthly charge of about $1,067,417. In making this approximation, exchanges of Convertible Bonds for Common Stock made since June 30, 1914, aggregating $364,000, are considered.

TREASURY.

Neither this Company nor any of its auxiliaries has any notes or bills outstanding.

The Company held in its treasury on June 30, 1914, $20,062,758.99 cash, and had available $3,780,000 General Mortgage Bonds, including bonds not yet certified by the Trustee. The Company also has in the treasury unpledged a large amount of stocks and bonds of other companies, of which part are carried in the balance sheet as Investments and part are included under Railroads, Franchises and Other Property.

FUEL RESERVE FUND.

The fund has been increased during the year by appropriations of income, as follows:

Amount to credit of Fund June 30, 1913	$1,726,846.19
Added during the year	51,485.83
In Fund June 30, 1914	$1,778,332.02

KANSAS SOUTHWESTERN RAILWAY COMPANY.

During the year your Company acquired from the Receivers of the St. Louis & San Francisco Railroad Company that company's interest in the stock and notes of The Kansas Southwestern Railway Company (the stock of which company has heretofore been owned jointly by your Company and the St. Louis & San Francisco Railroad Company). However, under the terms of the transfer the St. Louis & San Francisco Railroad Company and its successors have the option of re-acquiring such securities within five years from April 17, 1914, upon payment to your Company of one-half of the sums expended by it in the maintenance, operation and improvement of the property.

MINKLER SOUTHERN RAILWAY.

This line, which was under construction at the date of the last annual report, extending from Minkler to Exeter, California, with branch line connecting with the Visalia Branch at Cutler, a total of about 40 miles, has been completed to Exeter since the close of the year and will be opened for traffic October 1, 1914.

NORTHWESTERN PACIFIC RAILROAD COMPANY.

Reference was made in the last annual report to the construction of the line of this company (whose capital stock is owned, one-half by your Company and one-half by the Southern Pacific Company) from Willits to Shively, a distance of 105.64 miles. Of this mileage 64.47 miles had been constructed at the beginning of the year, 29.10 miles were completed during the year, leaving only 12.07 miles still to be constructed, the grading for which was nearing completion at June 30, 1914.

OAKLAND WHARF PROPERTY.

In order to provide for the increasing business of your Company at San Francisco Bay points, 30 acres of land with extensive water frontage, situated at Oakland, California, have been acquired, upon which your Company is at present erecting necessary facilities for the handling of business offered it.

WEST TEXAS CONSTRUCTION.

The extension of the Coleman-Lubbock Line from Lubbock, Texas, to Texico, New Mexico, was completed during the year and was opened for traffic March 1, 1914. The completion of this line closes the gap between the lines of The Pecos and Northern Texas Railway and the Gulf, Colorado and Santa Fe Railway Companies running southeast to the Gulf of Mexico and the lines of your Company extending west from Texico to the Pacific Coast, and places in service the shortest line between Galveston, Texas, and San Francisco, California. It is expected that through passenger service over this line between the Gulf of Mexico and the Pacific Coast will be inaugurated during the current year.

ST. LOUIS, ROCKY MOUNTAIN AND PACIFIC RAILWAY.

On August 1, 1913, your Company took possession of this line under an agreement with the St. Louis, Rocky Mountain and Pacific Company (the owner of all of the capital stock of the St. Louis, Rocky Mountain and Pacific Railway Company) under a contract of purchase, provided transfer can be made free of all liens, the consideration being $3,000,000 of 4 per cent. fifty-year bonds of your Company secured by a mortgage on the St. Louis, Rocky Mountain and Pacific Railway. This line is 106.04 miles in length, extending from Des Moines, New Mexico, to Ute Park, New Mexico, with two branches, one to Raton and one to Koehler, New Mexico. This line serves a coal mining territory, a large part of the product of which is used for company fuel and the balance of which is distributed chiefly to points on your Company's lines.

ADDITIONAL MAIN-TRACK MILEAGE.

The mileage of second track in operation on June 30, 1914, was 974.65 miles as compared with 898.32 at the close of the preceding year, being an increase of 76.33 miles.

TAXES.

Special attention is called to the menacing increase in the taxes imposed upon railroad property. Your Company's taxes for the year 1914 were $5,525,585.30. This represents more than 14¼% of the total net income which the Company had available for the payment of taxes, interest, dividends, etc.

Your Company's taxes have increased 188% in the last ten years, although the investment in the property has increased in that time less than 40% and although the net income available for taxes, interest and dividends has increased in that time less than 45%.

In the last five years the Company's taxes have increased over 83%, although the investment has increased less than 19% and the net income available for taxes, interest, dividends, etc., has increased less than 5%.

While there are various contributing causes to this condition (including the expiration of some tax exemptions in Arizona and New Mexico), the principal cause, which continues in apparently increasing force, is the disposition to increase public expenditures shown by practically all governmental agencies of the States, cities, counties and taxing districts (not to mention the Federal Government, whose tax burdens to a large extent fall on the railroads indirectly and therefore are not fully reflected in the amount of railroad taxes paid). Governmental agencies generally counsel the railroads to increase their economies and to improve their efficiency, and stern necessity, even if there were no other motive, has forced the railroad companies to do this; but there is nothing to indicate that the governmental agencies themselves have practiced what they have preached in this respect. The evidences of extravagance in all grades of governmental activity are very numerous and the evidences of governmental economies are exceedingly rare. The result is proving dangerously burdensome to the railroad properties of the country.

The movement which has for its aim the assessment of all property at full value has indirectly largely contributed to the prevailing extravagance. Rarely have tax rates been reduced in the same measure that assessments have been increased. Even where State bodies have increased assessments of all property two and three fold it has been exceedingly difficult to bring about any reduction of local rates. Although still in its infancy the good roads movement has already received large appropriations. Expenditures for this purpose are likely to assume large proportions in the near future.

GENERAL.

Your Directors feel that heavy responsibilities devolve on them in the present state of governmental activities directed at the railroad industries. It has been found almost impossible to make even an approximate estimate of the cost of "regulation" which has been imposed on us by the State and National governments. Without criticising the policy of proper supervision, it is fair to say that many of the laws are not only expensive but in the opinion of your officers unnecessary and superfluous. Constant whittling of rates, plus constant legislation which adds to your expenses without adding to revenue, have had their inevitable effect. Your own Company has been less crippled by these conditions than some of those less fortunate, but by reference to page 14 it will be seen on how narrow a margin we have been working. There are some evidences of a disposition on the part of those in authority to realize that great injustice has been done in the guise of regulation and that it is time to call a halt, but the relief which the railroads need cannot come until this disposition shall be transmuted from mere expressions of friendliness into positive remedial measures. General words of sympathy will accomplish nothing if governmental agencies continue in each specific instance to impose additional burdens or to find excuses for not granting specific relief. Hence your Directors deem it their duty again to warn stockholders that their interests are more endangered by the various governmental regulations than from any other source.

But in making the foregoing statement the threatening attitude of the labor organizations must not be lost sight of as a vigorous second in the menace of the times. Your Company has always shown the utmost consideration for its employes, and as a class they are a credit to themselves and to the road. Left to themselves there would be little of which to complain, but the organizations as a body have been aggressively demanding increased wages for their members with no regard for the ability of their employers to pay, and have been steadily demanding, and frequently with success, many varieties of legislation, such as full-crew bills, designed to increase operating expenses. Between the repressive forces of Government and the demands of organized labor it is evident that the sum remaining as the share of invested capital is in serious danger.

Under these conditions it is the intention of your Directors to make no additions or betterments, however desirable, which can not be paid for out of current earnings, and to continue the policy of incurring no floating debt.

It is the sorrowful duty of your Board to record the death on March 22, 1914, of Byron L. Smith, a member of the Board of Directors since November 14, 1900. His active interest in the affairs of your Company and his knowledge of the territory served by it made him a most valuable counselor. He was a man who realized his responsibilities as a director and discharged his full duty in serving the interest of others in all his business affiliations. It is appropriate that there be placed before the stockholders this expression of appreciation of his services in their behalf, and of the loss which has been sustained by his death.

Your Directors take pleasure in acknowledging the faithful and efficient services of the Company's officers and employes during the year.

EDWARD F. RIPLEY,
President.

Vanadium in Rail Steel

Vanadium has become favorably known through its use as an alloy in rolled and cast steel and to a limited extent in cast iron. The principal application of this metal in the railway field has been in wheels, axles, locomotive frames and tires, main rods and piston rods, crank pins and springs, in all of which it has been in service long enough to demonstrate its ability to improve the quality of the steel either by reducing the breakage, increasing the wear, or both. This success has prompted an experiment in the application of this alloy to rail steel. On account of the service required of a rail and the differences inherent in the manufacturing process, particularly the impracticability of heat treating rails as commonly practiced for locomotive parts, the result of this experiment will be looked forward to with much interest. The laboratory tests reported elsewhere in this issue show favorable comparisons with untreated open hearth rails rolled at the same time, but the service of these rails in the track will be the ultimate measure of their value. The reduction in the cost of vanadium, which has amounted to more than sixty per cent, is the important feature at present, as this makes it commercially possible for this alloy to enter the rail field and insures further tests, which will increase the number of possibilities of solving the rail problem.

Is This Petty Politics?

October 19 has been set as the day for a rehearing in the eastern rate case. Now comes the announcement by the Interstate Commerce Commission that the investigation into the Chicago, Rock Island & Pacific has been set for October 16, with J. W. Folk, of the New Haven investigation notoriety, as counsel. Just before the commissioners announced their refusal to grant an increase of freight rates in the last investigation, they made public a report on the New York, New Haven & Hartford affairs which, regardless of the accuracy of the facts, was presented in a yellow manner wholly unworthy of the Interstate Commerce Commission. For years every right-thinking railroad man and banker has deplored the Rock Island situation. The holding companies scheme, which vested control of the Chicago, Rock Island & Pacific Railway in the hands of Daniel G. Reid and Judge Moore, was and is indefensible. It has fallen to the ground through its own inherent defects. Is it possible that the Interstate Commerce Commission is going to permit the confusing, either in its own deliberations or, still worse, in the public mind, of the questionable practices of a few men a dozen years ago and the broad, vitally important economic question of the present straits of the transportation system of the United States? We venture to predict that every important fact which the Interstate Commerce Commission is going to "discover" about Rock Island affairs has been made public already, and the subject has been fully discussed in the *Railway Age Gazette*. Is it possible that the commissioners take such a small view of the tremendous responsibilities resting on them at present that they will let this particular stale scandal cloud the minds of even the least thinking people in connection with the reopening of the rate advance case?

Yard Maintenance and Standards

One of the serious drawbacks to efficient yard operation is a lack of appreciation of the importance of high standards of track construction and maintenance and the necessity for good locomotives. New 100-lb. rail and rock ballast on yard tracks could not be justified, but on the other hand 65-lb. rail and no ballast are not economical on yard ladder tracks which frequently carry more cars than the main line, and the same locomotives, although at reduced speeds. The importance of better track construction in yards is being realized on a number of roads

which are laying heavier rail and using better ballast. At the same time the condition of the tracks in the average yard is far below what it should be. As a result there is too much repairing of tracks after derailments have occurred and not enough upbuilding to prevent derailments. A derailment not only results in the destruction of track and equipment, but, more important, it interferes with and ties up the operation of that portion of the yard until the damage is repaired. Fully as important is the question of proper switching locomotives. When road locomotives which require overhauling are assigned to switching service for a time to secure a greater mileage before making repairs or locomotives too light to haul tonnage trains on the main line are sent into the yard, the yard operation suffers. Worn drivers increase the number of derailments and are destructive of track, while defective locomotives in general are inefficient in operation in a yard the same as on a main line. Likewise, engines too light to handle a full cut of cars delay operation through the entire yard. It is coming to be the more general practice to equip yards with engines designed especially for switching service, which is in line with economical operation. The old feeling that as long as the track and motive power will stand up they will do for the yard is fast disappearing. As about forty per cent of the total time of the average loaded freight car is spent in yards, an entirely disproportionate part of a railway company's total operating expense is in its terminals, and as the freight yards are always the first points of congestion, at least the same effort should be made to provide facilities necessary for the economical operation and proper handling of railroad traffic in the yards as on the main line.

Circular or Rectangular Engine Houses

Rectangular engine house designs are not new, but the one adopted by the Algoma Central at Sault Ste. Marie, Ont., and described elsewhere in this issue, is unique and furnishes a good illustration of proper adaptation of uncommon designs to local conditions. In most cases where such houses have been built, as on European railways, and in a few instances in this country, the considerations governing their choice have been a desire to economize space or to eliminate the turntable with its possibility of tying up all engines in the house when it is out of commission. Neither of these advantages is secured by the Algoma Central design, for the turntable is retained in the center of the house, and by the use of radial tracks the economy of space inherent in parallel track arrangements is sacrificed. The controlling factor in this case was the severe climatic conditions prevailing during the winter months, making it extremely desirable to place all facilities for handling engines under cover and to provide for the economical heating of this enclosed space. In view of the improvements in turntable design and standards of construction, and the fact that the table will always be protected from the weather, the danger of tying up the house by a turntable failure is not worth considering. The slight disadvantage which the house possesses as to the space occupied is also unimportant for the required engine capacity was small, the available space was ample and the radial arrangement of tracks with the consequent wide spacing at the outer ends contributes to economy in working on the engines in the house. The size of the building was practically fixed by the standard roof truss span adopted for the adjacent shops, since by using this standard truss on the engine house as well, at least as large a saving was effected as could have been secured by reducing all dimensions to the allowable minimum. The use of steel for the frame of the engine house is also uncommon enough to attract attention. Reliance is being placed on an English product which is reported to have the ability to preserve the structural steel against injury by corrosion. If such protection can be demonstrated to be entirely adequate for this purpose, it is quite probable that steel construction will be more generally adopted in buildings of this nature.

THE USE OF TORPEDO MACHINES IN ENGLAND

THE Railway Inspecting Officers of the British Board of Trade have recommended the general use of automatic train control (stopping apparatus actuated from outside the train), as noted in the *Railway Age Gazette* two weeks ago. Not only that; they realize the likelihood of delay in reaching an agreement as to what type of apparatus should be used, and under what conditions, and they go on, therefore, to "strongly recommend an extended use" of torpedo placers, controlled by the signals or the signalman, "as a temporary expedient." (These devices are already used in England to a very limited extent.) The inspectors summarize their recommendations as follows:

That railway companies should be urged (1) to take all possible steps to ensure that their regulations are strictly adhered to by their employees, and that the conditions under which the latter work admit of their so doing; (2) to extend the use of track circuit in connection with the control of signals or block instruments; (3) to carry out combined experiments with different systems of cab-signaling and automatic control, with the object of supplementing the present system of semaphore signaling; and meanwhile to extend the use of detonator-placing machines.

The significance of these recommendations lies in the fact that in matters affecting safety on railways, these three inspectors, when agreed, come pretty near to being the mouthpiece of the British government. They are not the Board of Trade, and the Board of Trade takes no radical action without specific authority from Parliament; but the inspectors' opinions are, in effect, the government's guide in legislation. And these conservative officers of the Royal Engineers seem to be not in the least worried about the dangers of "open circuit" schemes. A torpedo machine might be out of order and inoperative, and the failure not be discovered till a train was wrecked; but here we find the machine recommended without qualification. Torpedoes, in enormous numbers, have been and are used in England to repeat the indications of distant signals in time of dense fog; but here the inspectors call for their use in clear weather as well. Moreover, they say nothing about a proceed or "all-right" indication, though the all-right signal of the fogman who attends to the torpedoes, which is given by hand or hand-lamp, is an important element in the "fogging" as practiced in England for the last forty years.

American signal engineers have turned the cold shoulder to the torpedo machine for the reason—or for one main reason—that it is not sure to disclose its own failures. The conservative Englishman is apparently not so conservative as the progressive American. But this is not saying that our British friends are wrong. It is not for an American to criticize them if, instead of looking to this young country, they take their lesson from their near neighbor, France, where one large road, as was recently noticed, has used torpedo machines for fifty years and claims a record of 100 per cent efficiency. This does not mean that the machines have never got out of order; the French officer's statement means, we assume, that they have never failed when needed. The whole system of train running, of which the torpedo apparatus is a part, has never failed in this particular feature; there is no record of an engineman running past a stop signal.

Why is the British government taking this advance step? It can hardly be said that there has been any very marked change in the safety record of the English roads, as regards passengers' lives and limbs. Are enginemen found to be less careful than formerly? Some English railway officers say that they are. Whatever the reason, or motive, this systematic effort or purpose to prevent *all* collisions is in every way commendable. Of the three recommendations formulated by the inspectors, the first one—the one which, as a preventive of enginemen's errors, the American Railway Association seems to deem sufficient—is, evidently, held to be adequate to meet only a part of the troubles that need to be remedied. To what extent the conditions on the

best American roads are different from those in England cannot perhaps be told with precision; but there will be no dissent from the proposition that perfect conduct in the locomotive cab is as much needed here as anywhere, and as greatly desired. When we get perfect conduct in the cab, or when American railways generally shall have come as near to it as have the Interborough and Hudson Terminal subways in New York, or as near to it as appears to be the case on the Orleans Railway, of France, we can purge our rule-books of that perennial source of perplexity, the flagging rule. At the same time we shall relieve passengers from the annoyance of unnecessary torpedoes and from the midnight whistle that calls in the flagman.

WHAT WE ARE TRYING TO DO

WE published in a recent issue a brief abstract of a paper by John W. Alvord, an eminent consulting engineer, on the subject, "How Can Engineers Best Utilize the Technical Journals?" One answer to Mr. Alvord's question is that neither engineers nor any class of readers can utilize technical papers at all unless they are so edited as to make them really useful. It is a proper function of all classes of periodical publications to publish matter regarding current affairs which has merely the purpose and effect of satisfying the curiosity of their readers as to what is going on. But the trade and technical press has more important functions and to be really useful they must perform those functions.

Their main functions, the functions without which they would have no excuse for their existence are: First, to aid in establishing and maintaining good relations between their constituencies and the rest of the public; and, second, to help their readers to do their work better, and thereby contribute toward increasing the efficiency of industrial and commercial operations.

The *Railway Age Gazette* ventures at this time, with more or less modesty, to say to its readers, that it is trying as hard as it can to perform in the field of railway transportation all of the proper functions of a technical paper. It is trying to satisfy the curiosity of its readers regarding the developments taking place in their field by publishing current railway news. Not only do we have a large department devoted solely to current railway news, but it is seldom that we publish an article, either short or long, which does not possess the element of timeliness. But what we are trying most to do is to accomplish the other two great purposes above mentioned.

A publication devoted to the interests of any class of large concerns cannot at the present time set for itself any more difficult or important task than that of helping them to establish and maintain good relations with the general public. Large concerns of all kinds are under fire; and their future will depend very largely on the kind of treatment they shall receive from the public. Of no class of concerns is this more true than of the railways. It is essential to the establishment of satisfactory relations between the roads and the public that the public shall be to the largest extent possible supplied with all the facts which tend to show how well managed the railways are and what they are doing to promote the interests of the public. But the relations of railways and large concerns to the public are not going to be made and kept satisfactory merely by telling the people how virtuous and well-managed they are. There have been so many disclosures of shortcomings in the management of large concerns of various kinds in recent years that the public knows that the way in which many of them have been managed has been far from perfect, and it is not going to be fooled by partisan attempts to defend what is indefensible. Therefore, publications intelligently devoted to the interests of classes of business concerns which are the subjects of popular discussion realize that they would not render their constituencies the best possible service, to say nothing of doing their duty to the public, if they told merely the good things their constituencies did or tried to defend everything that they did, or even if they told and defended only what they did that was defensible and passed over in silence the things that they did which were not defensible. If a publication devoted primarily to the interests of a particular class of concerns is to be of any real service in establishing satisfactory relations between its constituency and the public, it must frankly and courageously criticize its constituents when it thinks they do wrong, as well as defend them when it thinks they are unjustly attacked.

Intelligent and friendly criticism from such a source is, or ought to be good for those who receive it, and probably it also tends to cause the general press and public to respect and be convinced by what publications having expert knowledge say in extenuation or defense of the methods and policies of the concerns with which they are closely identified.

It is for these reasons that the *Railway Age Gazette* follows the policy of not only defending railway managements when it thinks they are unjustly criticized, but also of criticizing them when it thinks they deserve it. There have been cases where railway men have found fault with this paper, because they have thought either that things which it has said were unjust to the railways or were things that should have been left to be said by other publications if they were to be said at all. But it has been a cause of satisfaction and encouragement to us that apparently a large majority of railway officers have endorsed our policy of saying at all times what we have honestly thought, and there can be no question that if this paper is contributing toward establishing better relations between the railways and the public, it is chiefly because it does follow this policy.

As important as is the work of a trade or technical paper in helping to establish good relations between industries with which it is identified and the public, of yet greater importance is its work of helping to increase the efficiency of the management and operation of the concerns in its special field. The *Railway Age Gazette* has decided that it may best do this in its field, by keeping in close touch with the problems of those actively engaged in practical work for railways and railway supply concerns, and then making its columns a clearing house for the exchange of the best ideas and the most illuminating experiences of these practical men; and this is the chief thing that we are trying to do. For example: One of the main problems of railway operating officers is to get more effective service out of freight cars. The ton miles per freight car per day and year are too small, and one of the principal reasons is that cars are not handled expeditiously enough in classification and terminal yards. It seemed, therefore, that the handling of cars in classification and terminal yards was a subject needing thorough discussion, and it was to secure this that we advertised sometime since for papers on the handling of cars in classification yards, and that we later advertised for papers on the handling of cars in terminal yards. Articles on the handling of cars in classification yards were published sometime ago, and, it is hoped and believed, proved of much value. More recently a large number of very able papers on the handling of cars in terminal yards has been received. The first of them was published last week, and the rest will follow in later issues. It was to contribute what we could toward increasing efficiency in railway mechanical departments that our *Mechanical Editian* was established; and it was to contribute toward increasing the efficiency of maintenance of way work that our monthly *Maintenance of Way* section was established. We believe the various discussions of means of increasing efficiency have accomplished their objects because they have been participated in by railway men who are among the best equipped in the country to deal with the subjects on which they have written.

The extent to which a publication such as this can be made of real practical value depends, however, very greatly on the extent to which it secures the confidence, support and co-operation of its readers. We have the co-operation of our readers to such an extent as to encourage the hope and belief that we have their confidence. But, we venture to confide to them that if they are satisfied with the *Railway Age Gazette* and what it is doing they think better of it than its editors do. We think we are getting out a good and useful paper; but we are but too well aware that it can be made much better and more useful, if the railway men of the country will help us. The best way they can help us, and

thereby help themselves, is to make the *Railway Age Gazette* more and more a clearing house for their own ideas and experience.

Gentle reader, we are doing our level best for you, but you can help us do better for you. If you have any suggestions to offer or any criticisms to advance, which you think might tend to help us to make this paper more useful to railways and railway men, don't hesitate to communicate them to us. What we are trying to do is to make every issue of the *Railway Age Gazette* such that it will be of *real practical service* to men in every rank and branch of the railway organizations of America.

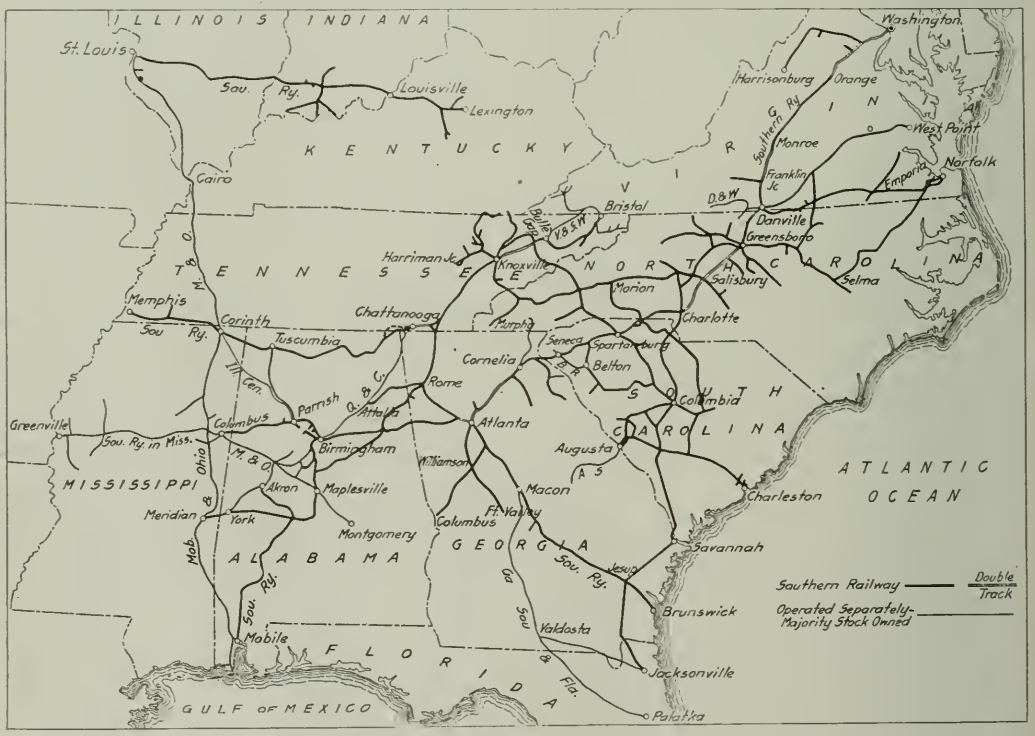
SOUTHERN RAILWAY

THE south is at present seriously affected by the European war principally, of course, because of the difficulties of financing and selling the cotton crop. While the prosperity of the rest of the country has had both ups and downs since 1907, the prosperity of the south has grown steadily during these years and this growth has been sound as well as rapid. One of the most, if not the most, important factors in this growth in prosperity has been the improvement, both in aims and ideals and in actual quality and quantity of service, of the transportation system of the South. Even in the fiscal year ended June 30, 1914, there was no serious interruption to the Southern Railway's progress. Total operating revenues amounted to $69,534,000, an increase over the previous year of 1.47 per cent; expenses amounted to $18,963,000, an increase of 6.38 per cent over the previous year; and after the payment of taxes and interest there was available for dividends $4,840,000 as against $7,079,000 the year before.

The actual tonnage of cotton carried by the Southern Railway is not a large percentage of its total tonnage. In the fiscal year ended June 30, 1914, it was but 2.48 per cent, and the tonnage of seed, hulls, meal and cake, and oil was an additional 2.73 per cent. Since, however, the price received for the cotton crop represents a large proportion of the income of a great number of people in Southern Railway territory, the loss in revenue to the railway from the inability of the cotton planters to sell their cotton is by no means measured by the loss that would result from the non-movement of 5 per cent of the total tonnage. On the other hand, since the growth in prosperity, both of the Southern Railway and the people served, has been sound, the problem presented by the cotton situation is one which, if met in the proper spirit, should entail but a temporary loss and may in the long run have actually beneficial results, in that it may lead to more diversified agriculture in the South. How the situation is being met cannot be better expressed than in President Fairfax Harrison's own words in the annual report to his stockholders:

> The loss in revenue since the beginning of the European war and the outlook for the immediate future have demanded a strict policy of retrenchment, always a disagreeable duty. The consequent reduction of service of employees means a reduction of the opportunity of many men to earn the livelihood to which they have been accustomed, and it has seemed fair to the officers that they too should share the sacrifice, so that as a temporary measure the salaries of all officers earning in excess of $2,500 per annum have been voluntarily and loyally reduced in fair proportions. Under these circumstances the board has deemed that it was fair also for the preferred stockholders to share the necessities of the situation. Accordingly, although the full 5 per cent on the preferred stock was safely earned for the year before the current acute conditions were apparent, the dividends declared for the year were reduced from 5 per cent to 4½ per cent. Furthermore, the dividend for the second half of the year was declared payable not in cash but in scrip, redeemable in five years and meanwhile bearing interest at the rate of 4 per cent per annum.

To judge adequately of the results of operation of a great railway property like that of the Southern in one year as compared with another it is essential that a general picture of the property, the requirements of its service and the sources of its



The Southern Railway System

income be kept vividly in mind. The company operates 7,010 miles of road, the greater part of which is a network of branch lines connecting one community with another, built originally in the majority of cases irrelevantly to any general scheme of transportation. To have operated this great mass of intersecting mileage as separate local lines would have not only been impossibly expensive if any kind of service were to be given, but it would have failed utterly to develop the natural resources of the country and of its people. The line running from Washington to Atlanta naturally forms a main artery of traffic on which the movement of both freight and passengers must be uncongested and performed so economically as to offset the cost of running trains on branch lines where traffic conditions make such operation unprofitable, although such operation is necessary to meet the requirements of public service. The old main line of the Southern Railway was single-track, 60 and 70-lb. rail, with an almost constant ascending or descending grade of 1 per cent. The Washington-Atlanta line now is about two-thirds of it double-track, the total road mileage being 649 miles, of which about 400 miles has double-track. The double-track is stone ballasted, laid with 90-lb. rail, and has a maximum grade of 0.5 per cent. Arrangements have been made for the completion of this double-track work and the company has available for sale to pay for this work $20,000,000 Atlanta & Charlotte Air Line bonds. This capital expenditure on betterment of the main line, although the most expensive single piece of work, is typical of the policy of improvement which, however, must of necessity proceed only so rapidly as can be justified by increasing business as a whole.

Mounting expenses have been one of the great problems of the Southern Railway as of other railways. One source of increased expense deserves special mention. Taxes in 1914 amounted to $2,679,000, an increase of 8 per cent over the previous year. This is out of all proportion to the increase in railway revenues or increased land values in the South and shows a shortsighted attitude on the part of the public authorities that in time public opinion ought to correct. Nevertheless, the management has consistently stuck to its conviction that the growth of the railway property and the growth of the prosperity of the people served were so intimately connected that nothing which adversely affected the one could fail to be reflected in adversity to the other. A retrenchment which meant a saving in dollars and cents directly to the railway company, but which adversely affected the ability of the people served to make the most of their opportunities was a shortsighted economy.

This is rather strikingly illustrated in the train and traffic statistics for the fiscal year ended June 30, 1914. It is axiomatic that the shipper does not suffer, but that the railway does gain in economy in proportion to the reduction in train-miles of freight trains necessary to handle the total freight business.* This statement, however, does not apply to passenger business. Frequency of service, especially in local passenger service, may be of even greater importance to the community than the speed of trains. It is not enough that all the people who desire within the week to go from Athens, Ga., to Lula should within the week have a train provided for them. It is this fact that the Interstate Commerce Commission, apparently, ignores in its theoretical dictum that each branch of the service should bear its share of the total expenses. Where extra passenger-train mileage is the result of competition, a reduction in this mileage is generally a profitable economy for the railroad and not a loss to the public; but a reduction in passenger-train mileage which represents an impairment of service, even where the service is unprofitable, or a failure to increase passenger-train mileage to meet a reasonable increased demand for it, even where such additional train mileage is not profitable, is an uneconomical economy. This at least is the view that the Southern Railway management takes and it might be called the statesmanlike way of regarding rates and service as contrasted with the Interstate Commerce Commission's leaning theoretically toward making each branch of the service pay its own way.

*This is assuming, of course, that there is no undue delay in handling commodities moving to market. There was no such delay on the Southern.

As an illustration of what the Southern Railway is doing, the number of passengers carried one mile was 888,300,000 in 1914, an increase over 1913 of 5.15 per cent. Passenger-train mileage was 18,362,000 in 1914, an increase of 5.63 per cent, with, however, a considerable decrease in mixed-train mileage—887,000 mixed-train miles in 1914 as against 999,000 in 1913. The total number of ton-miles handled was 4,584,000,000 in 1914, an increase of 0.15 per cent. The freight-train mileage in 1914 was 15,756,000, a decrease of 5.31 per cent, with a decrease also, it must be remembered, in mixed-train miles; and an even better showing is made by the decrease in freight-train locomotive mileage, the total in 1914 being 16,586,000 miles, which is less by 5.81 per cent than in 1913. In this connection the fact pointed out by President Harrison that passenger train-miles for the year aggregated over 52 per cent of the total revenue train-miles and exceeded the total freight-train mileage by 2,607,000, while revenue from passengers was but 27.62 per cent of the total revenue from transportation, is striking. It will be seen, therefore, that the proportion of trains to travelers was maintained in 1914, the average number of passengers per train being 46 in both 1914 and 1913. On the other hand, the trainloading of freight was materially increased. The revenue freight-trainload in 1914 was 275 tons as against 260 tons in 1913, an increase of 6.14 per cent, and the total trainload, including company freight, was 339 tons in 1914 as against 321 tons in 1913. The trainload is not small when we consider the proportion of train-miles run on main line to the proportion of train-miles run on branch lines.

The total tonnage carried in 1914 was 29,650,000; in 1913, 29,450,000. The average length of haul was 155 miles in both years. The average ton-mile rate was 9.83 mills in 1914 and 9.82 mills in 1913.

The economies in the handling of freight would have been in 1914 more clearly reflected in comparative transportation expenses were it not for two principal factors—increases in wage scales and the addition of passenger trains and passenger train-mileage—which offset these economies.

Total transportation expenses in 1914 amounted to $25,052,000, an increase of $1,447,000 over 1913; but of this increase $566,000 was an increase in payments for injuries to persons, so that leaving out this probably abnormal factor, transportation expenses increased but 3 per cent.

Maintenance of way was $8,780,000 in 1914 as against $9,040,000 in 1913. In addition there was spent for what the Interstate Commerce Commission classifies as additions and betterments, but which the Southern Railway management considers expenditures for upkeep, $2,540,000 in 1914 as against $2,083,000 in 1913.

The Southern Railway is particularly fortunate in having financed its immediate needs before the European war began. At the end of the year the company had on hand $15,393,000 cash, with total working liabilities of $13,892,000, which included but a nominal amount—$455,000—of loans and bills payable. During the year the company sold $10,000,000 3-year 5 per cent collateral notes and $1,250,000 first consolidated mortgage 5 per cent bonds. The net increase in outstanding bonds and notes was $11,226,000, and in equipment trust obligations, $3,238,000.

The following table shows the principal figures for operation in 1914 as compared with 1913:

	1914	1913
Average mileage operated	7,033	7,036
Freight revenue	$45,077,048	$44,943,748
Passenger revenue	19,004,783	18,220,489
Total operating revenues	69,533,697	68,529,490
Maint. of way and structures	9,098,912	9,275,553
Maint. of equipment	11,974,090	11,290,337
Traffic expenses	2,243,556	2,094,010
Transportation expenses	25,051,780	23,605,046
General expenses	2,202,836	2,008,977
Total operating expenses	50,571,175	48,273,924
Taxes	2,679,390	2,480,387
Operating income	16,310,958	17,855,715
Gross income	19,578,364	21,221,686
Net income	4,839,706	7,078,625
Dividends	2,700,000*	3,000,000
Appropriations for additions and betterments	91,929	48,660
Surplus	2,047,777	4,029,965

*The semi-annual dividend on the preferred was reduced in second half of the year from 2½ per cent to 2 per cent and was paid in scrip and not in cash.

Practical Hints on Operation of Terminal Yards

Second Series* of Papers Discussing This Subject from Standpoint of Yardmaster and Superintendent

SECOND PRIZE—REGULARITY THE FIRST ESSENTIAL IN THE OPERATION OF A TERMINAL

By F. Lincoln Hutchins
Baltimore & Ohio, Baltimore, Md.

The basic principles of terminal operation are simple, but their application is difficult because of lack, or inconvenient layout, of tracks and warehouses; irregularities in road service; unfavorable power conditions; orders for special services; or lack of support on the part of superior officers.

The most important requirement is order and regularity. Run of business settles into a rut in which it continues with but few and infrequent interruptions, season fluctuations here being considered as regular. All yard work should follow its regular routine until some irregular occurrence makes necessary the master's direction. That terminal is necessarily inefficiently operated and is most easily disorganized and thrown into confusion, where the directing head has to give orders for details of ordinary routine. The criterion by which to judge of the qualifications of a superintendent of terminals or of a yardmaster, is in the minimum of direct attention he is obliged to give to the ordinary details of operation.

At the outset conditions must be made to secure the greatest degree of order and regularity. Patrons must be made to understand that yard work, to be effective, must be in regular routine, that their requests for cars, switching, or forwarding, may not be attended to at any time to suit their convenience, but that they must anticipate their needs and give such timely notice as will permit of doing their work in the regular order laid down for the guidance of the switching crews, with the assurance that only in this way can they be best served all of the time. Interference by traffic, or other, officials with such orderly procedure leads to a demoralization of the work, and prevents adherence to schedule performance, if indeed it does not prevent the adoption of any schedules for the work. Such interference greatly increases the terminal costs; increases which cannot be located in any item and consequently are undiscoverable in any analysis of costs.

In all railroad operation time is almost the most important element and particularly so in all yard work; hence a good yard superintendent will know by actual study the standard time for all the different operations and hold his subordinates as closely thereto as may be possible. It is entirely practicable to determine the average time for breaking up trains, making deliveries to each particular siding, switching at houses, industrial layouts, private tracks, stock yards, icing, weighing, and to secure the actual time used in each of these services with the number of cars handled in each.

Records are necessary to the efficient operation of any terminal. Its superintendent should have placed upon his desk at regularly stated times a tabulation showing not only the work done as a whole, but the efficiency of each switching crew. Unit records, made contemporaneously with the work, are simple and feasible, while tabulations are cheaply made by sorting and entering upon properly prepared tables. The use of tickets, similar to the transfer slips used by trolley car conductors, provide a cheap and effective means for the making of such records.

Employment of men is a matter of the greatest importance, yet one which has received scant attention. Because a man has two arms and two legs is no sign that he will make a good yard man. There are certain simple tests which will very clearly determine a man's characteristics and these should be applied before setting the man at work. The personal injury column would be largely reduced were men of careless disposition eliminated, to say nothing of avoidance of rough handling and errors of other kinds.

The foundation of discipline is found in an even observance of justice as between man and man. The man who allows his digestion to affect his treatment of those under him, or who does not recognize their individuality, cannot secure that discipline that is requisite in all railroad work. Treatment of men as though they had sold their individuality for a per diem is a most expensive method, while interested consideration of the welfare of subordinates pays large dividends.

The qualifications necessary for the efficient control of any terminal are: a thorough knowledge of conditions and requirements of operation; love of order and regularity; love of justice and the "square deal"; tact in handling men, both employees and patrons; resourcefulness in emergencies, and ability to secure and use records, and men with all these qualifications are entitled to adequate remuneration.

Upon large systems it is not enough to have competent men in charge of its terminals. There should be a staff of men familiar with conditions and methods at all terminals. A competent man with good observing powers, having the all-round information which a study of all the terminals would give him, would be able to suggest efficiencies now undreamed of and to reduce the unit costs which have grown to such large proportions during the past decade. He could formulate a code of best practices and assist in establishing schedules and standards of operation.

The breaking up of trains should proceed as fast as the trains arrive, if that be possible, so that the receiving tracks may always be open for incoming trains. The neglect of this has been a fruitful cause of special orders to make quick delivery of cars arriving upon different trains at different times, when they have been allowed to accumulate upon the receiving tracks. A regular order for handling all rush cars containing perishable, or immediate demand, freight should be adopted and no interference with it tolerated. This is particularly true if prompt delivery of all such business is to be maintained. An order for special service for one consignee will seriously interfere with the orderly delivery of all other similar consignments, even if it does not affect materially other routine.

As it takes no longer to marshal cars before, rather than after they are loaded, all cars for outbound freight houses should be put in order for forwarding before being placed in the houses. This provision adds to the surety of proper loading, as the cars for certain points will always be at the same berths. The freight house men soon learn the location of these cars and misloading naturally diminishes. It also permits of the localizing of receiving doors, so that shipments may be received at points nearest the cars in which they are to be forwarded. These houses and perhaps warehouses are the only ones which should have stub tracks.

Cars should flow regularly from the breaking up tracks into the tracks leading to inbound freight houses, which should have a slight downward grade so that freight house men can bar them along as needed, thus saving the attendance of a switching locomotive and crew; the only requirement being the removal of all empties before they block the house tracks.

Switching upon team tracks should be done at definite times, even if two, three, or more pullings should be established during the 24-hour day. Such times should synchronize with the business habits of the community so that the disturbance of cars upon these tracks may come at times when least used by patrons and also at such times as loading, or unloading, naturally finishes. Switching at other times leads to waste of car time in that it increases the time of empty cars upon these tracks, prevents the opportune setting of other cars and reduces the time of customers for loading and unloading.

*The first prize article submitted in the recent contest on this subject was published in the *Railway Age Gazette* of October 9.

At junction points there should be reciprocal relationship with the head of the connecting terminal in order to secure an efficient transfer of cars. Frequent consultations will do much to smooth out the little frictions before they become large enough to interfere with the orderly flow of traffic. Much may be gained by both roads if their respective terminal heads will endeavor to so deliver cars as to make it easier for "the other fellow."

In marshaling trains for forwarding we again have the necessity for regularity as it results in trains being made up and ready for the regular calling of the crews and the elimination of costly delays in the yard. Yard and despatching forces need to work in harmony in this respect. Fifteen minutes waiting for crew is very much more economical than crew waiting 15 minutes for train.

In transferring heavy freight there must be co-operation between the freight house and yard forces, and a man should be put in charge of this work who can bring about such co-operation. Exact records of costs of this work, put up to the proper official, often lead to a cure of the causes making such transfers necessary, especially when the cause is bad loading.

In conclusion, the efficient operation of any yard can be determined only by intelligent study of that yard, the introduction of schedules with standards of performance, and the setting up of unit records of actual results to compare with the standards. Supplementing this there is need for some one to be familiar with all terminals, whose whole duty is to secure the most efficient yard operation throughout the road's territory.

THE ADVANTAGES OF A CAR DESPATCHER

By D. S. Farley

Division Superintendent, Atchison, Topeka & Santa Fe, Kansas City, Mo.

The operation of a large terminal yard is very similar to flowing water. If obstructions are placed in the stream the water dams back immediately, and if there are enough obstructions, disaster occurs. If business is well handled and the system perfect, cars move through without delay or confusion; the shipping public is satisfied and the management is pleased. But let the system be poor and the organization bad, cars go wrong, and delays follow, the stream is dammed, confusion ensues and then follow bad feeling, diversion of business and a generally deplorable condition. The two most essential things to obtain the best results are organization and system.

ORGANIZATION

To get the best results the superintendent in charge of a terminal must surround himself with loyal and competent men. Once having formed an organization he must outline his policy to his subordinate heads and then leave it to them to obtain the results. No two men can run the same job at the same time and no two men ever do things in the same way. By placing the responsibility squarely up to the individual, it tends to make him use his own head at all times, and he will manage to overcome difficulties that otherwise would stall him. A man that cannot or will not assume responsibility should be dispensed with, not only for the good of the service, but also of the man himself.

A system of reports, daily, weekly and monthly, can easily be arranged which will keep the superintendent advised of what is being accomplished, leaving him time for more important things. The superintendent who tries to handle detail places himself in the class of cheaper help, or, in other words, he is being paid a superintendent's salary for doing work that the messenger or a clerk could do, leaving the office of superintendent vacant.

Frequent meetings of all heads of departments, preferably weekly, should be held in the superintendent's office to discuss matters of importance and a free discussion should be indulged in by all. The superintendent can well afford to have his department heads understand that he is having such meetings in order to get the benefit of their ideas, and any new ideas advanced should be given careful consideration. Such meetings do much to bring about harmony and good feeling, eliminating the old and erroneous departmental feeling, and help the service wonderfully. They make each man feel that he has a personal interest in the welfare of the company and that he should remove all obstacles that make it hard for another department to do business. Once such a feeling exists among the heads of departments, it will permeate the lower classes and business will be handled with the least expense. In other words, through a good organization of loyal men, economy of operation can be reached and through no other way.

The superintendent should be very careful in his discipline, to be sure that he has all the facts before him before he assesses discipline. A kind talk to a loyal and well-meaning employee, pointing out his error, will make a better and more loyal man, while a harsh letter of reprimand may destroy his loyalty. Habitual carelessness should not be tolerated, but no man who can be made into a good man should be dismissed, unless the case is so grievous that it would be bad policy to retain the culprit in the service.

SYSTEM

So far as possible there should be a time for doing everything and a set way of doing it, that is; a regular time should be made for transfers from one yard to another, deliveries to connecting lines, setting of the house, pulling and setting team tracks or handling industries. Emergency cases of course will occur which will necessitate some variation, but it is surprising how few exist when a regular system has once been adopted. When a time is set for doing work and all understand the work to that time, it eliminates special runs, leaving the power that would be so occupied, to do its regular work. This reduces overtime and moves the business with regularity.

Each yardmaster should be assigned a yard or territory, over which he has control so far as the handling of the business is concerned, and he must understand that he will be held personally responsible for the proper handling of all business through that particular yard or territory. The yards should then again be divided into yard clerk's or yard checker's territories, and they should understand that they must keep a complete check of their territory and not allow cars to be delayed for any cause. They will make reports as directed by the offices and work directly with the offices on the telephone, or with the yardmaster in their locality.

In the superintendent's office there should be a car despatcher, who will keep a check from reports sent him, of all movements. On inbound business, the bills or their equivalents should be kept on the inbound carload desk, for every car until some disposition is given for it. As soon as disposition is given, the bills should be removed from the case and the car ordered and carded. At regular intervals, a report of all cars ordered, showing the number, initial, contents and destination, should be given to the car despatcher in the superintendent's office, who will copy these onto a sheet which he keeps constantly before him, until the car reaches its destination. If a car does not reach its destination, be it an industry, a connecting line, house or team track, the despatcher should consult his last location of the car, and reach the yard clerk by telephone, in whose territory it was last reported, keeping on until he locates it, and then keeping after the yardmaster until it is moved. A delayed car should be given preferred attention. The yard clerk's reports must go to the car despatcher in the superintendent's office where delays, movements of cars, etc., can be checked, and reports should be made frequent enough to permit of every car ready to move, being traced by the despatcher quickly enough to prevent serious delays.

Under normal conditions 95 per cent of all cars in a terminal move with regularity, but the 5 per cent are the ones which become lost, placed on sidings, overlooked or delayed, causing complaints, claims, correspondence, bad feeling and diversion of business. Let one car be delayed or poorly handled, and it will cause more hard feeling than can be offset by the perfect handling of 99 other cars. The yard checks turned in to the despatcher makes it possible for him to keep after delayed cars and keep them moving before they have caused trouble. By this plan it will be noted that every car, regardless of its contents or importance, has a

tracer after it. The same plan should be followed on outbound cars.

Each day's reports when completed should be closed up and filed for future reference. These records will give a complete history of the movement of every car through the terminals, and will furnish valuable information in handling claims and other correspondence, as well as eliminate a vast quantity of unnecessary correspondence. The completion of these daily sheets consists of showing every car at its destination, the time ordered, time set and the average time in moving. If bad order, the time consumed in getting to and from the repair track and the time on this track; if held for any purpose, the time and reason therefor. This furnishes the superintendent immediately, information concerning delays which otherwise might go on for a long time and do much damage before being corrected. Also, these reports are totaled and averaged, which gives him a correct idea of the average time consumed in switching the entire terminal or any part thereof.

The cost of maintaining the despatcher's force is more than offset by the elimination of expense in other directions. As all cars move promptly and in regular connections, the old plan of making special moves to get some delayed car to its destination is eliminated. The prompt moving of all business stops correspondence, not only with the public, but among the employees. In special cases where the detailed handling of a car is asked, the information can be given immediately from the despatcher's sheets, as they show the entire handling of the car from the time it is ordered until set, and the cause for any delays it may have encountered.

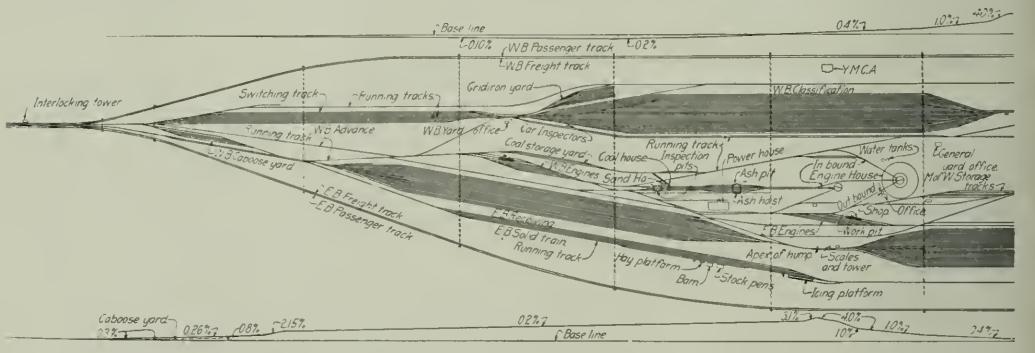
the resourcefulness and alertness of the officers in charge.

2. That under normal conditions it takes about as long to move a car of freight through one terminal as to haul it 100 miles in road movement. Were it not for this condition, thousands of freight cars would be available in times of shortage which are now tied up in their snail's pace movement through our terminals, and thousands more would need never have been built.

3. That approximately 70 per cent. of the total freight transportation expenses pertain to the direct cost of yard and road movement which represent about 35 per cent. of the total operating expenses chargeable to freight. In view of the strategical position of our yards in the movement of traffic, this percentage has added significance and becomes worthy of equally as much careful research and highly trained thought as is devoted either to the maintenance of way or motive power departments. On how many railroads is this attention given to the science of transportation—to road and yard operations? It should be noted by comparison that M. W. & S. expenses run about 20 per cent. and M. P. expenses 25 per cent. of the total operating expenses.

While we cannot, then, prescribe a formula for yard practice, there are a number of controlling factors that deserve special emphasis, and which demand as much training and thoughtful study as each of our organizations can acquire.

Road Power and Engine Terminals.—The necessity for adequate road power and engine terminal facilities is of first importance if a yard is to be kept open and receiving tracks clear for the free entrance of incoming trains. One will frequently hear the yardmaster say "Take the trains from me as fast as made up, and I can classify all that arrive without holding them out." To do this we must have ample power for outbound movement, and, equally as important, engine facilities that will insure the prompt handling and preparation of the locomotives. It is wasteful to have an excess of power to offset the unnecessary delays in preparing engines for service. The design of engine terminals should provide for such water, coal, ash pit, inspection pit and turntable facilities, and track arrangements that engines will move through in minimum time and with least interference to traffic.



A Suggested Design for a Large Classification and Terminal Yard at the Junction of Four Main Line Divisions

ANALYTICAL STUDY OF YARD DESIGN AND OPERATION

By J. H. Hopkins

Pennsylvania Lines West, South West System, Columbus, Ohio.

To the practical man in railway transportation the operation of terminal yards is a factor too variable to fall within the scope of those phases of the railroad problem for which "plans and specifications" may be drawn up and a standard practice adopted with higher efficiency as its aim. Each location of a terminal yard, each breaking-up point for through traffic has its own difficulties for solution dependent upon a variety of influences.

So we find every yard becomes an individual study in transportation efficiency, and as has been suggested, in public service. That this involves a vital factor in our transportation problem we need only be reminded:

1. That terminal yards are the gateways through which the entire volume of our freight traffic must pass and when we allow any of these gateways to become clogged, the whole train of traffic on one division, or as frequently happens, on a number of adjoining divisions, becomes affected, perhaps completely paralyzed, depending upon the severity of the blockade and.

Yard Power.—Yard power, more frequently proving inadequate as to quality than quantity, is a feature too often neglected, resulting in locomotives unsuited to the work required, and in frequent interruptions to classification as well as industrial work, a loss which is always permanent, offset by no advantages whatever. The amount of time lost in switching with old and wornout power frequently breaking down in service, or with engines too light for quick movements with average loading, is more than we often realize. Using such power at busy points is a false economy, too commonly practiced. More particularly should this be guarded against at outlying points or intermediate yards through industrial districts where shop facil-

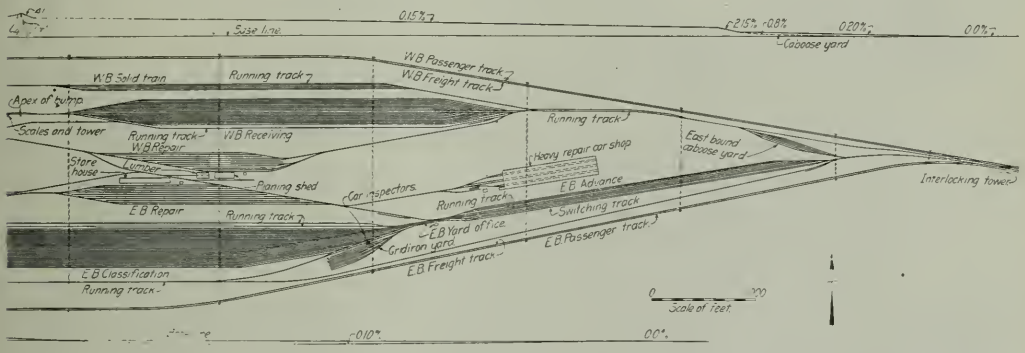
ities are lacking and engines must be run to the nearest terminal for light repairs of almost any nature. Inconvenience to manufacturer, interruption to work and loss of crews' time are, in such instances, aggravating and costly to all concerned.

Yard Design.—The design of a yard, like its operation, is dependent on too many indeterminate factors to allow of a standard plan, even for yards of the same type. In the accompanying diagram, drawn to typify an ideal arrangement for a large classification yard at the junction of four divisions, some salient features may be mentioned as applicable to any terminal of this character or of less extensive proportions.

Attention is called to the arrangement of engine terminal and running track facilities to avoid conflicting movements and the crossing of traffic wherever possible. The grade of receiving yards, while depending often on the contour of site selected, should approximate, where possible, the ruling grade of the division over which incoming trains arrive. In this way the road engine performs a good share of the work of lifting the cars up to the summit for gravity switching. The yard power then required to shove trains over the hump will be considerably less than were the receiving yard level with a sharp rise to the summit. The apex of the hump should be placed sufficiently high to give an effective fall through the ladder tracks to the classification yard, and thence a continuing grade which will carry cars as far along as desired. The hump profiles shown on the accompanying diagram have been designed to give this pulling out tracks from the classification or advance yard so as to facilitate movements to the main line and clear the yard as rapidly as possible after road engines are coupled on and air tested. Advance tracks should be provided to allow for emergency room where trains cannot be taken promptly by despatcher, for classification tracks must be cleared to avoid blocking operations at the hump.

Where road engines get their trains from the classification yard it is not necessary to have yard power to haul the cars to a departure yard. At large yards this will save two engines at each classification yard. This plan requires that classification tracks be of 50 per cent greater capacity than that required to hold the maximum train, and the grade of tracks must be such that cuts will run freely and couple up to cars ahead. While it is true that with this practice the engine provided for returning car droppers will be needed often to make couplings and shove down cuts, and that a road engine will occasionally meet some delay in throwing out shop cars or the like, it is doubtful whether these drawbacks offset the saving of yard power that can be effected where the classification yard can be designed with the proper grade and sufficient capacity for this method.

Where yards are located on single or double track railroads, it is important that freight running tracks should be provided at either end of the yard that outbound trains may get away promptly and the throat not be congested by holding trains for



A Suggested Design for a Large Classification and Terminal Yard at the Junction of Four Main Line Divisions

ideal condition as nearly as possible, though it is realized that such factors as loaded and empty cars, difference in rolling resistance, and the season of the year are important influences to be reckoned with. With this design a second hump engine should be unnecessary under normal conditions where the train of a single road engine is to be handled.

The grouping of ladders to the classification yard in the double fan style here shown enables the cars to reach the clearance point at a minimum distance from the hump, insuring more rapid classifying and avoiding the danger of blocking the ladders, a frequent trouble where cars must run long distances to clear, and the short, steep grades near the summit cannot be carried with safety a greater distance.

The gridiron yards shown at the ends of classification yards afford a place to classify local cars in station order after having first drilled them indiscriminately onto one or more classification tracks. It will be noted that this work can proceed without interruption to trains pulling from the classification yard, or to other movements to advance tracks located each side of the two pulling out tracks.

The caboose has long been the yardmaster's annoyance, and often will take more time to "classify" than the whole train which it follows. The scheme shown on accompanying plan provides a simple, effective means of disposing of the cabin car at entrance of receiving yard as the arriving train pulls in.

An essential feature in yard design is the arrangement of movement on the passenger tracks where any appreciable amount of this class of service is encountered. The length of such outbound freight tracks will depend largely on the grades, railroad crossings, or other interfering factors that tend to retard road movement. Freight tracks to take care of inbound movements are not so important where the humps can keep clear receiving tracks at all times, and this in turn will depend largely on the prompt despatch of outbound trains, which is the keynote to efficient handling of any terminal.

Industrial Yards.—The value of regularity in switching at industrial plants may be realized as often in the increased business diverted to the line affording most reliable and efficient service, as in the freedom from blockades and congestions which run switching costs away up, with reduced capacity for service, and lowered efficiency of the plants both of railroad and manufacturer. A little foresight on the part of a yardmaster and adequate supervision from division headquarters would often avert such paralyzing of business as has too frequently occurred during periods of heavy traffic. Yards serving industrial territory should never be too crowded for the most expeditious handling and disposing of cars, and the heavier the business the more care should be exercised that the switching work is not hampered. The reverse is too commonly true, so that as business increases, the facilities for doing it are reduced or worked at a disadvantage, with the effect of increasing the congestion until an embargo is called or freight is set off at intermediate points.

to the interference of other operations and adding much to the expense of final delivery.

The loss in claims, detention of equipment, providing of extra switching power, interruption of road movements, and actual losses of business will run into thousands of dollars in an amazingly short period by failure to act quickly and decisively at the strategic time.

In conclusion, it might be said that the four factors most essential to the efficient operation of terminal yards are:

1. Adding to the services of the practical yard man that exhaustive study and special training which have accomplished so much in the maintenance and mechanical departments.

2. Providing adequate motive power and facilities for caring for it, that our yards may be free from congestion and able to take trains as fast as they arrive.

3. Giving design in each instance the subject of all possible care and study, with a view to providing track facilities commensurate with the business, and so arranged that movements across or against the traffic will be avoided wherever possible, and switching will not be interfered with by trains arriving or departing or by other operations within the yard.

4. Assuring regular and adequate service to industrial plants, that their deliveries may be made as fast as they can be prevailed upon to take them, at all times guarding against a surplus of cars that will cause congestion, reducing the capacity of switching power, and thereby threatening a blockade, the thing most to be avoided if we are to look for high efficiency in operation and give reliable service to the public.

SYSTEMATIZING YARD OPERATION

By F. H. Garner

Transportation Inspector, Union Pacific, Omaha, Neb.

Many things enter into the successful operation of any large industrial terminal. The first and most important essential is to have the proper man at the head of the terminal organization. The general yardmaster in charge of a large freight terminal should not only be a man who can handle men and who thoroughly knows every detail of the operation of his yard, but he must also be an executive, and a diplomat in the handling of the patrons of the line. In order to operate a large yard successfully a general yardmaster must have absolute charge of operation. I find that in yards where the general yardmaster reports direct to the superintendent the results are much better than in yards where he reports to a local agent or to a trainmaster. The interference and supervision of a trainmaster in large terminals has never helped anyone, but, on the other hand, has tended to disorganize the organization.

The yard clerks should all report to the general yardmaster. A mistake is made at some terminals by having the clerical force report to the local agent. A yardmaster should have sufficient clerical help to properly keep his office records and should have a chief clerk who is competent to relieve him of all clerical work. In nearly all yards the clerical force is watched closer than are the noon hours and the engine house. A good yardmaster can save enough every day by getting out and looking after his engines to pay the salary of two or three clerks.

A number of systems are being used in large terminals, not one of which perhaps could be applied to all yards on account of the difference in operating conditions. A system in office work must be instituted so that the general yardmaster can keep an accurate check on his yard work from the office. The yardmaster should know at all times how much work has been done, how much there is to do and when it will be done.

A few years ago I was connected with one of the largest terminal yards on the Pacific coast and one of the first things I had to work out was a system of office records that would be so complete and kept so nearly up to the minute that at any time, day or night, my switching clerk would be able to answer almost any question on the handling of any industrial car in the yard. To do this we made a regular switch order for all industrial cars immediately on arrival and for cars as soon as they were released from the hold track. These orders were numbered consecutively with a Bates numbering machine and for ready reference the car number and the switch order number were entered up in a terminal number book, so that after the orders were completed they could be located quickly after being filed away. We had the switching territory divided into districts, each engine foreman having a certain district to serve and he was held responsible for the switching in his territory, as well as for any delay that might occur to loads or empties in and out of any industry tracks located on his territory. This engine foreman kept a record, on a switch list of the car numbers, where placed or taken out, which list was turned into the office at noon and night for the information of the switching clerk and to enable him to complete his record on the switch orders which were always kept in the office.

Every morning the engine foreman of each district was handed a switch list made up by the switching clerk showing all the cars in the yard for his territory, with the date of their arrival, together with the track location, so that he would know just where to find his cars and also so that he could, unless otherwise ordered, place the oldest cars first. I had a track assigned in the yard for the reception of industry cars for each district, and as the trains were broken up the cars were put on the different tracks which were reserved for industry cars.

In addition to the switching clerk, I had a clerk, whom I called the industry clerk, who was, in fact, a trainmaster over this switching territory. It was this man's duty to watch the industry switching, riding over the different districts watching for delayed cars, and calling on the patrons to see that work was being handled to their satisfaction. As the engines left the yard in the morning and at noon, this man would take a check of all the cars each engine handled out, sending this check to the switch clerk at the general yard office for his information, so that he would be in a position to say just what cars would be spotted that morning or afternoon. I found out that if one is in a position to tell a shipper when he will get his cars, and if he makes him any particular promise on the delivery of a car, and keeps that promise he is making a friend for the railroad.

There are several different tagging systems in effect in large terminals. I believe the best system is a tag made of different colors, or a combination of colors, each color representing a switching district. This tag can be seen for some distance and helps to expedite switching. Another important thing is for industry engines to leave the yard on time, so that the patrons along each man's route will know what time to expect to have his switching done.

One of the bad features, in all large yards, is the holding of cars for disposition. One of the best ways to eliminate delays to "hold" cars is to have a track set apart for these cars only, and this track should be switched on schedule. In one yard we switched this track at 5 a. m., 11 a. m., and 5 p. m. This assured that the "hold" cars which had been released would get into the industry drag, morning, noon and night. The handling of special request cars, that is, cars that have been delayed en route, or which for some special reason the shipper wants rushed to his track, is a problem in every yard. In order to keep down the yard expense the general yardmaster does not like to cut off an engine, and make a special run with some car to an industry, on which patrons of the line are given regular switches about the same time every day and where all cars which are in the yard at the time the industry engine leaves are delivered to them. Whenever I had a shipper who was continually asking for special switching I sent the industry clerk over to explain how it disorganized our good service to make this special run, and also to tell him about the good service he was getting. I found that as an operating man this clerk could do more good with the patrons of the line than our traffic department could.

I have also found that much benefit can be derived from a weekly staff meeting in the general yardmaster's office, which should be attended by the assistant yardmasters. It pays when possible to have the industry engine foreman attend this meeting, where yard operating problems are talked over, and schemes and systems worked out for better and cheaper operation.

Eight-Wheel Steel Caboose for the Pennsylvania

Another Step Taken by This Road Toward Providing Equipment of Steel Construction; Design Not Standard

The Pennsylvania Railroad has recently designed and built at Altoona an all-steel cabin car or caboose designated as class N-5. This car has not been made standard, but is a tentative design and will be thoroughly tried out on different parts of the road before a decision is made as to its suitability. The severe conditions to which the car will be subjected made it necessary that the construction be as strong as that of heavy steel freight cars, and very careful consideration has been given to each feature of the design, including those which tend to add to the comfort and convenience of the trainmen.

So far as can be learned, this is the first all-steel caboose ever built, the inside lining, the flooring through the passageway, the platform floor and the window sash being the only parts for which wood is used. The car weighs 38,000 lb., and is 31 ft. long from face to face of drawheads, 14 ft. 9½ in. high over the cupola lamp, and 10 ft. 2½ in. wide over handholds. There is a 30 in. platform on each end, with a 1¾ in. floor and side box steps. Ratchet hand brakes are used.

First All-Steel Caboose Built for Service on the Pennsylvania

UNDERFRAME

The center sill construction of the underframe is similar to that used on the Pennsylvania's steel freight cars, being composed of two 10 in. 25-lb. channels, a 21 in. by ½ in. cover plate riveted the full length of the center sills, and a 4 in. by 4 in. by ¾ in. angle riveted to the bottom of each channel on the inside, and extending continuously between back draft lugs, the total area being 36 sq. in. This construction is reinforced by a striking plate at each end, a center plate reinforcing casting above the center plate, and pressed steel spreaders between the diaphragms. The front and back draft lugs are cast integral with the striking plate and the center plate reinforcing castings. Two dished diaphragms ⅜ in. thick are located 3 ft. 7 13/16 in. on either side of the center line of the cupola, which is 12½ in. off the center line of the car, and are riveted to the center and side sills. The usual body bolster has been eliminated and the body side bearings are supported by steel cantilever castings, which are riveted to the center sills and to a ½ in. tie plate, which extends across the bottom of the center sills and outward to the ends of the side bearing castings.

The side sill, or side floor supporting member, is a 4 in. by 4 in. by ⅜ in. angle, with the back turned outward. This angle is continuous between the side and end sill connecting castings, which form the side supports of the platforms and connect the side sills, the diagonal braces and the end sills, and are shaped at the outer ends to form corner push-pole pockets. The diagonal braces are of U-shaped section, 6 in. wide and ⅜ in. thick, with 3 in. flanges turned downward. They are flattened out at either end and riveted to the top flange of the center sills and the side and end sill connection.

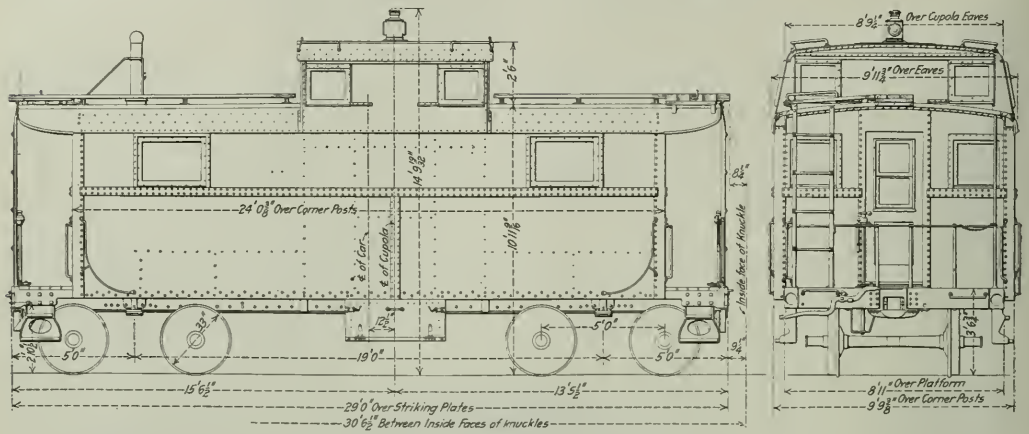
The end sill is also a pressed U-shaped section, which is fastened to the striking plate and the side and end sill connecting casting. The entire underframe, with the exception of the platform, is covered with ¼ in. steel plate, which extends from the center sill cover plate to the side sill angle. The brake rigging supports and the equipment box, which is 4 ft. long, 23 in. deep, and 21⅞ in. high, are secured to this floor sheet. The equipment box is made of ⅛ in. sheets, with a door at the front which swings down.

SUPERSTRUCTURE

There are no posts used in the superstructure, the transverse stiffness being obtained through the end construction and bulkheads, which form the sides of the lockers at the center of the

car. These bulkheads are so located that they are directly above and riveted to the diaphragms of the underframe, thus forming four stiffeners at the center of the car each 3 ft. deep. The sides and ends of the car are made up of ⅛ in. sheets and a 4 in. by

is of the same general design, the sheets being fastened to the underframe by a 2 in. by 2 in. by ¼ in. angle, as well as riveted beneath the corner cover plate, the belt rail and the end door frame. The end is further supported by two 4 in. channels, which act as

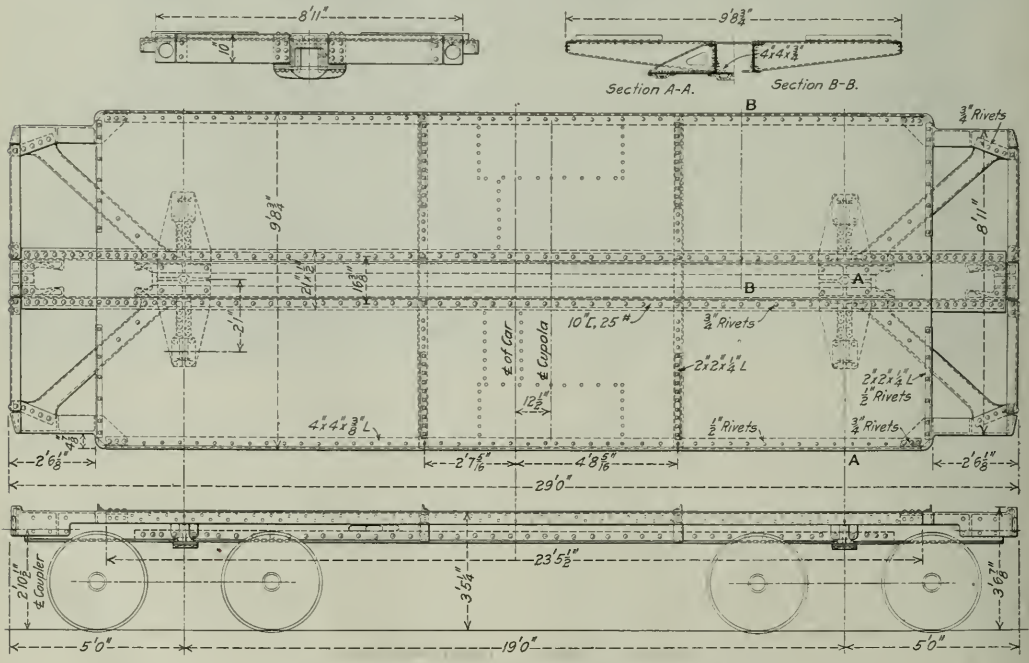


Elevations of the Pennsylvania Steel Caboose

½ in. belt rail. The bottom panel is composed of two sheets, joined on the center line of the cupola by a butt strip, and butting against the top side sheets beneath the belt rail, which is 4 ft. 2 in. from the bottom of the side sill angle. The top panel is com-

door posts. These channels are fastened at the bottom to a cast steel threshold plate and the underframe, while at the top they are secured to the roof sheets.

On the inside of the belt rail, and at the eaves, extending from



Underframe Construction Used on the Pennsylvania Steel Caboose

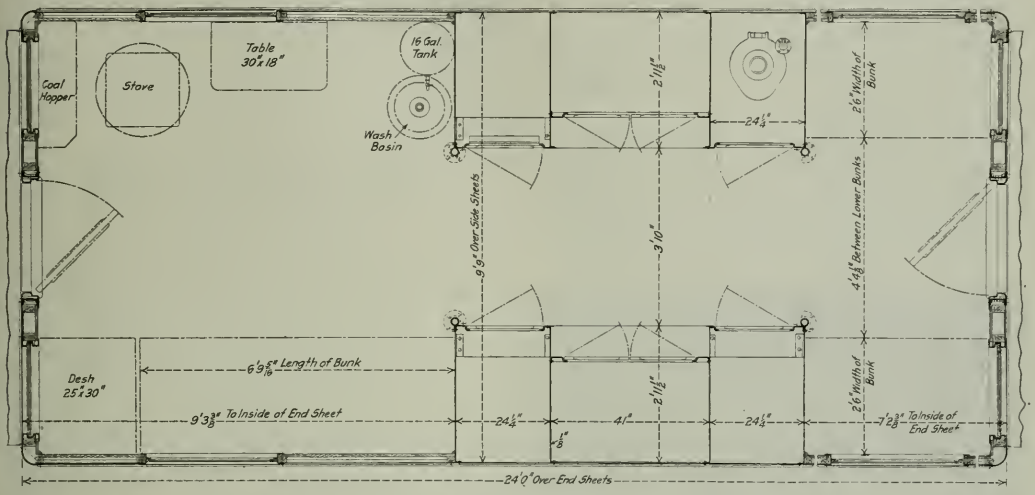
posed of three sheets, which are connected by the window frames. At the corners, the side and end sheets are connected by a 3/16 in. cover plate, which acts as a corner post. The end construction

end sheet to bulkhead, is a U-shaped section, which stiffens the sides of the car at these points and also provides a means of securing nailing strips for the support of the lining.

The side window frames, which are riveted to the outside of the side sheets, are 3/16 in. thick. A ½ in. by 3/16 in. filler extends along the top of the side sheets, between the window frames, so that it is possible to extend them up under the roof sheets, making the construction waterproof and at the same time forming a straight surface to which the roof sheets can be attached. outside is to leave the interior smooth. The sides of the cupola are inclined towards the center line of the car to allow for tunnel clearance.

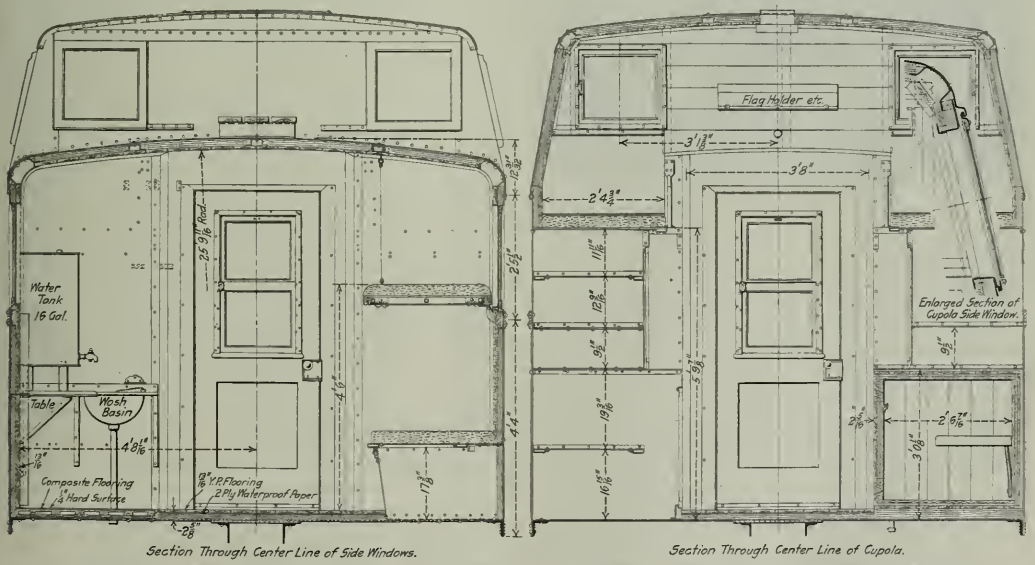
ROOF

The roof sheets, which are 3/32 in. thick, extend lengthwise of the car in three panels, two of which, forming side panels, ex-



Floor Plan Showing the Location of the Different Interior Fittings

The cupola extends 2 ft. 6 in. above the body of the car and is of the same general type of construction. The side and end windows of the cupola are all hung on the outside, a top guide tend down over the sides of the car and fasten to the side sheets and eaves; a central panel, which overlaps the two side panels, is secured with ¼ in. rivets spaced 1½ in. apart. Tar paper is



Cross Sections Through the Pennsylvania Caboose

rail being incorporated with the eaves, while the window sill forms the bottom guide. This construction is such that when the window is pushed up against the end projection strip it forms a weathertight construction. The object in placing the windows placed between the lap of the center and side sheets, to insure a watertight joint. The main roof is supported by U-shaped purlins, which extend from the end sheets of the car to the cupola end sheets. The cupola roof is of the same construction.

These purlins answer the double purpose of supporting the roof and providing a means of securing nailing strips for the ceiling.

The main roof extends over the platform 2 ft. 2½ in., and has a 2 in. by 2 in. by ¼ in. angle extending around the edge, which lends stiffness to the structure and also acts as a weather strip for leading the water away from above the platform.

INTERIOR ARRANGEMENT

Convenience, comfort and safety were given great consideration in fitting up the inside. The car is equipped with a stove for heating and cooking purposes, a drop table, water cooler, washstand, refrigerator, desk and hopper, as well as lockers, drawers and cupboards for the men's personal belongings. Three pairs of bunks, upper and lower, are located along the sides, one at the stove end and two at the opposite end. The lower bunks are of a box type, 6 ft. 10 in. long and 2 ft. 5 in. wide, and are arranged for the storing of equipment necessary to the car in the bottom. The upper bunks, which are of the same dimensions, are attached to the belt rail by means of a cast steel hinge bracket, and when not required may be lowered and used as a back for the lower

Interior of the Pennsylvania Caboose

bunk when used as a seat. The upper bunks, when raised, are held in position by chains secured to the roof purlins, and hooked to the side of the bunk frame, which is composed of 1¾ in. by 1¾ in. by ¼ in. angles, to which wooden nailing strips are secured for tacking down the canvas top. Including cupola seats, the car has sleeping facilities for eight men, the cupola seats being the same width and length as the bunks.

The lockers, which are located between the bulkheads and the lower cupola seats, contain the refrigerator in the lower center section, on the side opposite the stove and the hopper in one of the end lockers on the other side. The arrangement is such that there is ample room for dishes, food, lamps, oil and waste. All locker doors, drawers, shelves, etc., are 1/16 in. thick.

The side and end windows are above the belt rail, so that the light is not cut off when the upper bunk is raised. The side windows are fixed, while those at the end, including the end door windows, may be dropped. All locks or catches, with the exception of the refrigerator door lock, are flush, thus eliminating projections against which a man might be thrown by a sudden lurch of the car. The cupola is also equipped with a safety rail, extending between the end sheets of the cupola on the center line of the car, which is of convenience as a handhold when descending from the cupola seat.

TRUCKS

The car is equipped with specially designed arch bar trucks of 5 ft. wheelbase, having axles with 3¾ in. by 7 in. journals. The usual column castings are replaced by a malleable casting which serves as a column casting, brake hanger support, spring seat, and spring plank extension. The bolster is of the inverted U-shaped type, with malleable iron stiffening castings, spring seats and bolster guides. The springs are full elliptical, 34 in. long, and there are three in each group. The spring plank is U-shaped, ⅜ in. thick and 8 in. wide, with 1½ in. vertical legs turned upward. It extends across the truck 45⅝ in. beyond the center line of the arch bars, and is flattened at either end and bolted to the bolster guide spring seat and brake hanger support.

EFFECT OF THE WAR ON PRICES OF AMERICAN RAILROAD BONDS*

By Lewis B. Franklin

Vice-President of Guaranty Trust Company of New York

The normal factors governing the prices of securities are to a large extent rendered ineffective by the present war and the consequent international financial situation, and any discussion of the trend of prices of American railroad securities involves a consideration of the economic effects of the conflict. In the effort to determine what this effect will be, it is natural to refer back to other occurrences of similar nature and endeavor to forecast from them something of the future.

Upon careful analysis we find that no war in history is comparable in its effect upon financial transactions with the present upheaval.

The Balkan wars involved no nation of importance in commerce or finance, and the theatre of war was strictly localized. Neither Russia nor Japan was a large factor in international business and their operations were confined to the far east. The war between Russia and Turkey in 1876-7 was of similar nature. The Boer war was carried on entirely in South Africa and had no large immediate effect on international business relations, while our conflict with Spain scarcely caused a ripple in the waters of finance. During all these conflicts, communication between the great capitals of the world remained open and international trade was not disturbed. It must not be understood, however, that these wars did not have their effect on the finances of every civilized country. Such a destruction of capital as was involved in even the least of these conflicts has a deep underlying effect on the finances of the world that may take years to overcome, even though no immediate change is apparent.

Not since 1870 have two nations which might be ranked as among the leaders in commerce and finance been engaged in war, and for this reason it is natural to review the effect of the Franco-Prussian war upon international finance in general and American finance in particular.

War was declared by France on July 15, 1870. Prior to and after the declaration there was a rapid fall in prices of securities on the London stock exchange, such American stocks as were listed there sharing in the decline, while in our market there was no great excitement and only a moderate fall. This was followed here by a considerable rise during the progress of hostilities and immediately thereafter. During this period our money market remained undisturbed, except for a seasonal stringency at the end of the year, due to internal causes, while foreign exchange with the leading capitals of Europe continued normal, except with Paris during the siege of that city. The amount of our securities sold to us by Europe was inconsiderable and it was not necessary to resort to any extreme expedients, such as the closing of the stock exchange. It may seem strange that any such upheaval involving, as it did, some 1,700,000 men engaged in

*Address before the Society of Railway Financial Officers, September 16, 1914.

warfare and costing over $2,500,000,000, should have such a limited effect on our markets, in comparison with the effect of the present struggle, and yet the reason is not hard to find. During the calendar year 1869 our total imports were valued at $463,424,421, and our exports at $394,731,999, a total foreign commerce of $858,156,420, while for the year 1913 our imports were $1,892,168,000 and our exports $2,638,593,000, making a total of $4,530,761,000, or an increase of about 500 per cent over 1869. The interchange of credits involved in transactions of such magnitude is enormous, and this interchange has through the disturbance of financial systems been seriously deranged in some cases and entirely stopped in others. With Germany alone our foreign commerce in 1913 amounted to the stupendous total of $520,647,283, which is now at an absolute standstill, while our commercial relations with other countries are heavily restricted.

In 1870 our country was just emerging from the chaos of the civil war, our currency was depreciated to the extent of over 10 per cent, and we had practically no stock of gold in our banks. On June 9, 1870, our national banks reported liabilities subject to reserve of $406,140,873, against which there was held in the reserve, specie to the extent of only $2,912,275, or less than 1 per cent. On June 30, 1914, our national banks reported gold or gold certificates in their reserve of $626,000,000.

These facts demonstrate that whereas in 1870 we were financially weak and unimportant, we are now among the leaders in international finance. In the middle ages, the merchant trader sent out his ships with gold in their strong boxes or domestic products in their holds, and they returned from their voyages laden with the products of foreign countries. From this primitive method of barter commerce has progressed until the present complex system of international credits has been established, a system far more intricate than that in existence even in 1870, and it is evident that no consideration of the effects of that conflict can be of value at the present time. We have, therefore, in the past no safe guide to point the way to the solution of the problems which have arisen and will arise on account of the crisis. A study of the probable effects of the war leads naturally to a division of these into two classes, namely: those of a temporary or artificial nature and those of a permanent or basic nature.

We have already experienced most of the immediate results. We have seen the system of international credit relations disrupted at the first blow. Moratoria have been generally declared throughout Europe, and payments due us are held up, while we, as a neutral country, are expected to meet our obligations at maturity. American securities held abroad have been dumped into our markets in such volume that self preservation compelled us to call a halt by the closing of our principal stock exchange and the cessation, by agreement, of the sale of all unlisted securities. Our enormous exports of gold and the consequent strain of our banking facilities have forced us to resort to the expedients of clearing house certificates and emergency currency.

Our foreign commerce, except in foodstuffs, is almost at a standstill. The bureau of agriculture in its recent report gives promise of one of the largest cotton crops in the history of the country. Normally we export approximately 60 per cent of this crop, and at the present time, through the shutting down of foreign mills on account of scarcity of labor, lack of demand for the finished product or inability to finance, hardly a bale of export cotton is moving, and extreme measures are being taken to care for the surplus which is sure to exist.

Despite the fact that the stringent measures already adopted have prevented panic and to some extent opened the channels of trade, we have still to face the problem of meeting the wave of foreign liquidation which is likely to break upon us upon the reopening of our markets. It has been estimated that American securities to the extent of from four to seven billion dollars are held in Europe, and while it is evident that a large part of these are not for sale at any price, it is quite certain that the drain on the resources of the belligerent nations will be so tremendous as to necessitate enormous liquidation. Their own securities are due to suffer more than ours and our markets are therefore likely to be the most available. This problem must wait until our international credit and commercial relations have been placed on a more normal footing. We cannot buy securities unless we can sell commodities.

If we are unable to take care of our securities now offered for sale by Europe how can we expect to find a market for the additional securities which corporations are so anxious to sell to provide for maturing obligations and necessary improvements and extensions? The prospect is indeed not a favorable one. There is no market for bonds now, and it is hard to say when there will be one and what prices bonds will command when the market opens. In any event, our railroads on the average have now an overproportion of bonded debt compared with the investment represented by capital stock, and it should be by additional issues of stock that present necessities should be financed. How this can be done under present business conditions and the public prejudice against railroad securities is a difficult problem.

Against such an array of unfavorable factors as the immediate result of war, what have we that may be of benefit? In a few lines of business increased activity is indeed noted on the expectation of increased exports of goods to neutral countries heretofore supplied by belligerents, but here again we are confronted with the difficulty of financing any such shipments and the lack of neutral ships to act as carriers. In one respect only is there an immediate benefit and that is in the larger demand at increasing prices for our food supplies, and despite the difficulty of transportation and payment, such shipments are being made in quantity.

It is probable that this abnormal demand for foodstuffs will continue long after the war has ceased. The farmer of Europe has been turned into a soldier, and while his place has been taken to some extent by the women and children, it is evident that the output of the agricultural districts will be greatly reduced both this year and next.

In this emergency, our executives, legislators and business men have been co-operating with a single purpose, to solve some of the intricate problems now presented, and I am hopeful that this close relationship may lead to a better understanding on the part of each and be productive of a more liberal attitude on the part of the government toward our great railroad and industrial corporations.

Having discussed in a very general way the immediate effects of the conflict, let us delve deeper into the situation and see if we can determine the basic factors and the permanent results upon our economic condition.

The first and foremost factor of an unfavorable nature is the enormous destruction of fixed capital which is occurring, and the consequent expectation of higher rates for its use, as there will be an enormous demand to make good the ravages of war. Just let us consider for a moment the difference between fixed and liquid capital. To reduce this to the simplest distinction, fixed capital is wealth represented by permanent plant, such as factories, rails, cars, steamers, etc., while liquid capital is wealth represented by cash, bank balances, loans and other readily convertible items.

Much has already been written on the cost of the present war and its effects on money rates and the supply of capital, but the mistake has frequently been made of confounding currency with capital and expenditures with waste. From an economic standpoint, the waste of capital incident to war is not the total *expense* of the nations involved, but is made up chiefly of the destruction of *productive* property, such as merchant ships, factories, houses and harvests and the tem-

porary loss in the productive capacity of the nations engaged through the enlistment of such a large proportion of their producing population and the permanent loss in productive capacity by death and mutilation.

In a recent article Roger W. Babson points out that the destruction of battleships and fortifications is not in *itself* a destruction of capital, as such property is not productive.

The destruction of capital in this case took place when the fortifications and battleships were built. It is usual to allude to the tremendous loss which will take place if a super-dreadnought, costing upwards of $10,000,000, is destroyed. The loss has taken place, but not then. The date of the loss from an economic standpoint was the date on which her builders turned her over a completed engine of destruction. She has never produced or helped to produce a single dollar of wealth, she has been a constant drain on the resources of her owner to keep her running and her destruction is a gain rather than a loss to mankind in general. Another loss will occur when she is replaced, but to this I will refer later.

Neither is the feeding and clothing of an army a waste of capital, as these men must be fed and clothed even in times of peace. The enormous loss in capital which is taking place comes from neglected harvest fields, idle factories, deserted mines and wasted towns and villages, and in the killing and maiming of hundreds of thousands of citizens who have heretofore been producers, and many of whom through wounds and illness are destined to become charges upon the commonwealth. In the aggregate this actual consumption of capital is enormous, but we must not be deceived by some of the figures now being published. Professor Charles Richet, of the university of Paris, in discussing the possibility of a war such as is being carried on today, estimated that it would cost $50,000,000 a day, but of this amount, $25,050,000 is made up of the items of food, pay to soldiers and workmen and the support of helpless poor, none of which can be considered as capital destruction. The item of transportation, amounting to $6,300,000 per day, should probably be divided as being a partial economic waste, while he estimates an actual expenditure for munitions of war of $11,000,000 per day, which is an actual waste of capital, in so far as such munitions are being replaced. In all, his estimate shows a capital loss of over $20,000,000 per day. No attempt, however, to make an *exact* estimate of either the expenses of the conflict or the amount of the economic waste is of any great value to us, but we may rest assured that the whole world is sure to feel the effects for a long while to come. Capital which for the past few years has been difficult to obtain will be in still greater demand to make good the losses of war, and it is reasonable to look forward to a long period of higher interest rates on fixed investments, a small supply of new capital and lower prices for investment securities unless we can discover off-setting factors of a sufficiently favorable nature.

Let us look then and see what we have on the other side of the picture. Possibly there may be a ray of sunshine somewhere.

One of the first results of a condition of affairs such as we are now experiencing is increasing economy on the part of practically every class of society.

I believe that the generally prosperous condition of this country during the last twenty years has led to a gradual reduction in the *proportionate* amount of savings which has in the last few years contributed to our higher cost of living and our higher cost of capital. It is generally conceded that the maximum of saving does not take place in periods of great prosperity and an upheaval such as the present crisis is often the signal for a return to a simpler scale of living and an increased proportion of saving. It will not take a very large increase of savings per capita to make a radical increase in the amount of capital available yearly. In this connection, it is interesting to note that our people in general are far behind those of other countries in the habit of saving. It has recently been stated that the ten leading nations of Europe boast of 373 savings bank depositors per thousand of population, while in the United States the proportion is only 99 to the thousand. Here is room for improvement. The increase or decrease in the wealth of a person or a nation is the difference between income and expenditure.

I have already referred to increased activity in certain lines of business as one of the immediate results of the war, and there are likely to be permanent results of a similar nature. Efforts are already being made looking to the restoration of our merchant marine to its former place of prominence in the commerce of the world, which, if successful, will result in many millons of dollars per annum formerly paid to foreign carriers remaining in this country.

Our imports of drugs, dyes, chemicals, toys, gloves, clothing, etc., from Germany have been stopped and supplies of these articles are diminishing and prices rising. American ingenuity is already at work in an effort to manufacture in this country much that we have heretofore imported. If this effort is crowned with success, our productive capacity will be permanently increased and our trade balance benefited. Markets heretofore held by belligerents, principally Germany, whose foreign trade is now at a standstill, are now open to our manufacturers, and if our opportunities in this respect are not neglected our export business should be permanently benefited. The favorable factors just mentioned redound to our benefit as a neutral nation and although of importance can scarcely offset the effect which the general destruction of capital will have on the civilized world and in which we must suffer with the rest. Is there any result of the conflict which may in any way counteract the evil influences upon the general economic condition? I believe there is, but to discover what it is we must consider carefully the underlying causes which led to the outbreak of the war.

It is generally conceded that the massacre of Archduke Francis Ferdinand of Austria and the consequent ultimatum from Austria to Servia was the *pretext* for the war and not its *cause*. It has been held by some that Germany's ambition to extend her influence through the Balkans to the Aegean sea, to control the Dutch and Belgian harbors, and to further extend her colonial possessions was at the bottom of the trouble. Russia, of course, has always had a jealous eye on the Balkans, and hope for the ultimate possession of Constantinople, and apparently it was the probable increase of German and Austrian influence in southeastern Europe in case of the overthrow of Servia that lead the Czar into the present struggle. France was bound by treaty obligations to support Russia, and her people saw an opportunity of regaining the beloved territory lost in 1870. England and Belgium stepped in upon the violation of the latter's neutrality. With the prospect of an absolute upsetting of the balance of power, self-preservation demanded that Great Britain take a hand in the struggle.

The *immediate* cause of the general outburst seems to have been the support offered by Germany to Austria in her demands upon Servia and Russia's protest against this action, but we must look below the surface and see if we can discover a motive for this radical move on the part of the German statesmen.

Germany's appropriation for the year ended April 1, 1913, for the maintenance of her army and navy amounted to the equivalent of $285,000,000, an increase of approximately $85,000,000 over 1911. This is equal to about $7.32 per capita on the entire population. This enormous sum and a still greater amount proposed for the year 1914 could only be met by the imposition of an onerous direct tax. This rapid increase in military appropriations was apparently forced upon Germany by the action of Russia, who increased her military budget from $335,555,000 in 1911 to $463,690,000

in 1913. Both Germany and France have also recently increased the term of compulsory military service.

Such a competition in expenditures and in military service could not continue indefinitely. Germany, in addition to the protests against the heavy taxes, was confronted with an evergrowing wave of socialism. The socialist has always been arrayed against war and in favor of peace, and this movement was of sufficient strength to threaten even the established form of monarchical government. Something had to be done to stop or justify the mad competition of military expenditures to quiet the socialistic element, and to re-establish the "divine right of kings." Germany was ready; her enemies not so ready as they would be in a few years. War was the only solution and a pretext was not hard to find. In other words, I believe that Germany's action was inspired by causes internal rather than external.

Granting if you will that this hypothesis is correct, what bearing has it upon the subject of capital and interest rates?

There seems to me to be three possible terminations to the struggle:

1st—Mediation before complete victory by either side.

2nd—Complete victory for Germany and Austria.

3d—Complete victory for the Allies.

In case the war is settled before a decisive victory, it seems to me that while there may be important adjustments in the map of Europe, no radical changes of an economic nature will result. Europe will continue to be an armed camp, and it is not unlikely that the struggle would be renewed some years later. Military equipment, battleships, forts and guns destroyed in the conflict would have to be replaced and military appropriations would continue on an even heavier scale. In this connection, it must be remembered that Europe is even now staggering under a load of national debt approximating, for the five principal nations, only $20,000,000,000, demanding at 3½ per cent $700,000,000 per annum for interest alone. The world, already suffering under its present load of debt and useless expenditure, and with the ravages of war to be paid would indeed be in a bad way, while the condition of Europe, from a financial standpoint, would be appalling.

Under such circumstances what can we expect the effect to be upon *our* securities and upon the future financing of *our* great corporations. Europe until recently has been a constant and heavy purchaser of our stocks and bonds and has been of immense assistance in developing the natural resources of the country, but if her burdens are to be increased to the extent that I have outlined, we need look for no more help from that quarter and would indeed be compelled to repurchase many of our securities now held abroad. With such a prospect before us we cannot but anticipate higher interest rates for fixed investments, greater difficulty in selling securities and a consequent period of retrenchment.

In case of a complete victory for Germany and Austria, the result is also easy to forecast. Germany has been created, enlarged and solidified by the "blood and iron" policy enunciated by Bismarck in 1863. Her military organization again justified by victory, is it reasonable to suppose that she would agree to abandon the sword which has brought her into power? And if Germany retains her army and navy in undiminished strength, can others afford to adopt a different policy? We think not.

The third possible outcome presents a different aspect. In case of complete victory for the Allies, it seems evident that England will have a predominant position in the making of terms. She wants little or nothing in the way of territory and desires chiefly the prosperity of her people and the peace of Europe. England only a short time before the war is reported to have made, without result, a suggestion to Germany for a mutual reduction of the naval program. This indicates that England, despite her small standing army, has felt the strain of military expenditures even in times of peace, and the attitude of her diplomats prior to the outbreak clearly demonstrated her desire to prevent the conflict. France, with all her warlike history, is a peaceful nation at heart, while Belgium desires only reparation for damages and an effective guaranty of neutrality. Servia and Japan cannot be considered as important factors in the making of terms of peace. Every nation involved has felt the enormous strain of military expenditures, and in the event of an ultimate victory for the Allies, is it a wild dream to expect that as the only remedy the practical disarmament of Europe, nay, of the whole world, may be the outcome? Germany beaten, with its military organization unjustified, would hardly be in a position to protest or even to persuade her own people to rebuild the organization, if such a thing were to be allowed under the terms of settlement.

Russia, with its monarchical government, seems to be the key to the problem, yet it must not be forgotten that, whatever his motives, it was from the present Czar, even then disturbed by the growth of military expenditure, that there came in the year 1898 the first tentative proposition for universal disarmament. If this could be accomplished, what would it mean to Europe and to the world?

During the last fiscal year for which figures are available the estimated expenditures of the principal nations of Europe for military purposes amounted to the huge total of $2,000,000,000. Imagine, if you can, what it would mean if this sum were to be diverted from the support of the destructive forces and used in the development of the natural resources of the world. Such a sum added to the present amount available annually for investment would mean an abundance of capital for industrial development, both here and abroad, lower interest rates and probably lower cost of living. Add to this the transfer of some 4,500 000 men which make up the standing armies of Europe on a peace footing, from a life of economic waste to productive pursuits, and it is not hard to believe that Europe would require very few years to recover from the ravages of war and enter upon a long period of prosperity from which we would be one of the greatest beneficiaries. Under such conditions, capital would accumulate with surprising rapidity, and Europe would soon be a heavy buyer of our securities, and we would witness in the country an era of expansion and prosperity such as we have never before experienced. If disarmament can be accomplished, the outlook is indeed bright, but under no other conditions can I feel that there is anything to look forward to except a long period of retrenchment, lack of capital, high interest rates and general business depression in which Europe will be the principal sufferer, but in which America is bound to share.

The United States, as the greatest neutral nation, with nothing at stake except the progress of humanity is in a position to exert her strongest influence with her friends on the other side of the water that permanent good may result from this awful catastrophe.

Under such circumstances, is it not the patriotic duty of every American, regardless of his present sympathies, to work unceasingly to the end that public opinion both here and abroad may be so united and strengthened in the resolve for complete disarmament that it can be disregarded by neither Congress nor Parliament, Czar nor Emperor?

In making these suggestions as to the possible outcome I do not want to be understood as taking a partisan attitude or violating the injunction of our president as to strict neutrality, in thought, word and deed. It is surely not partisan but Christian to hope that the outcome may be such as to relieve the world of its burden of militarism and usher in an abiding era of peace, prosperity and happiness.

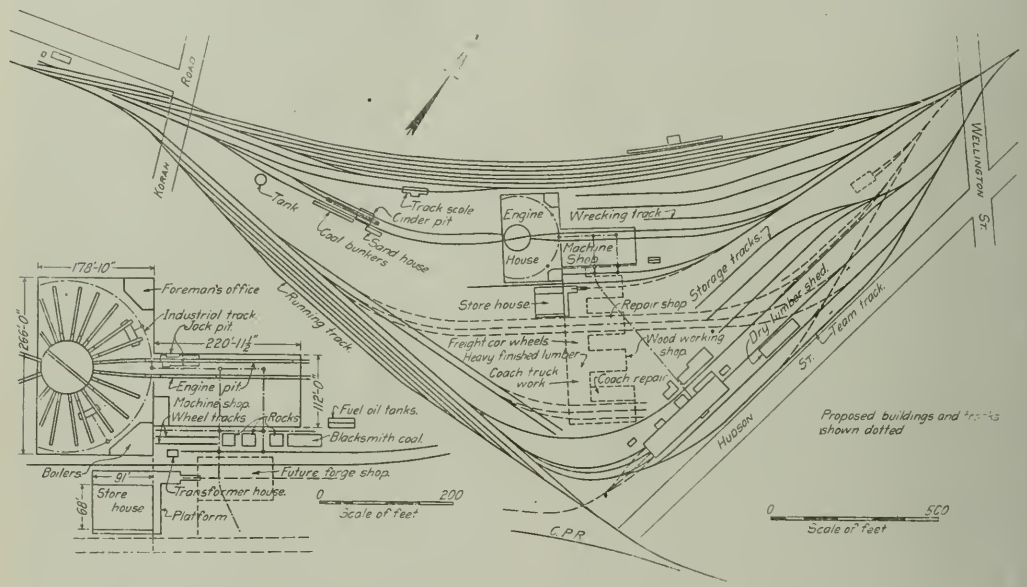
English Railway Employees to Assist in Railway Operation in France.—The British war office has recently called for 1,000 special railway men to proceed to France to assist in the operation of the French railways. Several enginemen, telegraphers, inspectors and officers have volunteered from Crewe. They are all experts in their particular branch of work. It is stated that the officers who go will rank as officers in the army and the inspectors as non-commissioned officers.

The New Algoma Central Engine House and Shops

Novel Features Designed to Meet Climatic Conditions Characterize the Terminal at Sault Ste. Marie, Ont.

The Algoma Central Railway recently completed extensive terminal facilities in Sault Ste. Marie, Ont., which include an engine house, shop layout and miscellaneous facilities embodying a number of unusual features of design. The terminal is comparatively small but it was essential in the design of the buildings that unusual precautions be taken to insure its satisfactory operation throughout the winter weather which is severe and is accompanied by almost continuous heavy snow. As the exposed turntable is one of the greatest sources of expense and delay under such climatic conditions, it was determined to enclose the turntable in the engine house. This necessity naturally led to the consideration of a square house as the most economical form of building, and since the number of doors in such a house could be cut down to two, thus greatly reducing the difficulty of heating the house, and the structural features of the building could be readily standardized with the machine shop, storehouse and proposed car shop, this type was finally adopted.

The house is designed to contain 24 stalls, but as this capacity is not required at present, a portion of the building covering 14 pits has been built, with provision for extending this to the full size when desired. The pits are kept close to the turntable, for with the comparatively few radial tracks only about 12 ft. is re-



General Plan of Algoma Central Terminal at Sault Ste. Marie, Ont., with Detail of Engine House and Shops

New Rectangular Engine House at Sault Ste. Marie, Ont., Showing Typical Winter Conditions

quired between the end of the 80-ft. table and the 70-ft. pit to secure the necessary clearance. These dimensions would require a house at least 250 ft. square to cover the complete circle, and in order to allow space around the ends of the pits for an industrial track and to enable the roof construction to be arranged in 44 ft. units, which was desirable for the shop buildings, the sides of the engine house were made 266 ft. The present width is 178 ft. 10 in., and the front wall is so constructed that it can be easily removed and the material used in the corresponding wall of the complete house when it is desirable to make the addition of 88 ft. and provide the remaining 10 pits of the complete circle. The triangular spaces in the corners of the building are utilized for a foreman's office and locker room, and the boiler equipment for heating the buildings.

The foundations are of concrete, which is carried up to a height of 5 ft. 6 in. above grade, for the outside walls, above which brick is used, with 3-ft. pilasters spaced 22 ft. center to center. The long spans, the advantage of fireproof construction, and the ability to use the same details as in the other buildings of the group led to the adoption of steel roof trusses supported on the brick walls and on latticed steel channel box columns. Monitors 22 ft. wide are provided over each bay running parallel with the direction of the prevailing wind in order to reduce the accumulation of snow on the roof. The monitors are all equipped with Pond continuous steel sash hinged at the top for ventilation. The roof trusses carry steel purlins on which is laid 2-in. wood sheathing covered by a 5-ply Barrett specification roofing, finished at the edges with a graveled copper guard. The steel roof trusses are protected from corrosion by a special preservative paint known as "Ferro-Rubron," an English product, and the additional precaution of allowing ample metal in all trusses was taken.

The turntable is 80 ft. long, has a capacity of 200 tons, and is operated by a pneumatic tractor. The center pier is of concrete, liberal in size, being 11 ft. 6 in. square at the base. The concrete pit floor is 5 in. thick pitched to drain to a circular gutter 14 ft. from the center of the pit, which carries the drainage to a large sump connected with the sewer. The pits under the engine stalls are 70 ft. long and 3 ft. 11 in. wide, varying in depth from 2 ft. 8 in. to 3 ft. 2 in. The 80-lb. pit rails are spiked to 6 in. by 8 in. by 1 ft. 4 in. creosoted cross ties, anchored in the concrete walls of the pit. The floor consists of paving brick laid on a 6-in. concrete base. A driving wheel drop pit is provided under two tracks and a truck wheel drop pit under two other tracks. These drop pits have a 24-in. gage track from end to end for transferring wheels, which, when lifted to the floor level, can be run out on a narrow gage track connected to the circular industrial track at the ends of the stalls.

Interior View of Rectangular Engine House

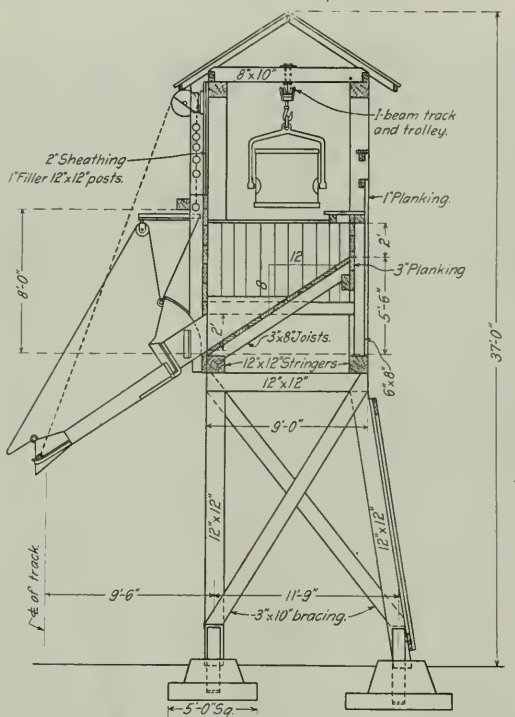
The smokejacks are of sectional cast iron construction, furnished by the Paul Dickinson Co., Ltd.

The building is heated by the indirect system, consisting of a steam driven fan and Green "Positivflow" horizontal heater coils. The hot air is forced through underground concrete tunnels and vitrified tile ducts to the turntable pit and all engine pits. The heating provisions are somewhat in excess of standard practice. Steam is supplied by three internally fired boilers of 150 h. p. each. The building is lighted with large capacity Tungsten units and flaming arc lamps. Electric power for the shops is purchased from a local hydro-electric company.

The machine shop is 112 ft. wide and 221 ft. long, connecting directly with the engine house. Two tracks extend through both buildings passing over engine pits in the machine shop, served by a 10-ton electric crane and an electrically operated locomotive screw jack. A space 54 ft. wide extending practically the full length of the shop is devoted to the machine tools and black-

smith shop, the foreman's office, tool room and toilet room occupies one end of this space.

The foundations and walls of the machine shop are of the same type as in the engine house. The building is divided into two bays, one 44 ft. wide and one 66 ft. wide. The former is covered by a single pitch steel truss roof supported by steel columns at each end, with a clearance above the floor of 18 ft. 2 in. The 66-ft. bay is covered by double steel trusses with steel monitor framing extending the full length of the building. Steel sash and Pond operating devices are used throughout. The roof consists of reinforced cement tiles 1¼ in. thick, cast in slabs about 5 ft. 6 in. long and 2 ft. wide. These slabs bear directly on the steel purlins and on the walls, and are covered with 5-ply Barrett specification roofing finished in the same



Typical Cross Section Through the Coaling Station

manner as on the engine house. The floor of the building consists of 5 in. of concrete covered with a 1-in. sand cushion on which are laid 3-in. creosoted maple paving blocks. The building is heated in the same manner as the engine house, except that the hot air is partially distributed through overhead galvanized sheet metal ducts.

The storehouse, which is 68 ft. by 91 ft. in size, is located with reference to a proposed development of freight and passenger car repair shops arranged along a covered runway for a traveling crane and the storage of material so that in severe weather all work can be handled between the various portions of the shop under cover. The central connecting passage with shops extending at right angles to it allows any desired expansion to be made in the size of the individual shops without affecting the general plan as long as a longitudinal shop is not objectionable.

The coaling station is of an unusual type, similar in general details to a number of stations that have been developed for use in the northern portions of the country where the operating conditions are very severe during the winter. The building is entirely of timber well over-sized to allow for deterioration, and all posts rest on concrete footings with heavy steel plate anchor straps. The supply of coal for the winter months must be purchased during the summer when it can be delivered in lake boats, and it is stored on the ground adjacent to the coaling station. Only a limited storage is provided in the 13 inclined bottom coal pockets in the house, the supply being conveyed from the storage pile to the dock in quantities to meet the daily demand. The coal is loaded into one-ton steel buckets with bales which are moved to the ends of the coal dock. The buckets are then hoisted to a trolley track extending longitudinally over the elevated delivery bins by a plain inverted pneumatic hoist operating in conjunction with a jib crane to allow the buckets to be swung around and the bale hooked on a plain I-beam trolley on the runway track. The hoist is then released by the operator, who pushes the loaded bucket along the track directly over the pocket to be filled, and, by releasing an automatic catch on the bale, the bucket empties the coal into the pocket and is then conveyed back to the storage pile for refilling. The delivery pockets are designed to deliver predetermined amounts of coal to locomotive tenders, the capacity ranging from two tons to eight tons. Each pocket is equipped with an Ogle delivery gate and spout which is said to be frost-proof. The entire structure is covered with a wood-sheathed roof and composition roofing.

This work has been carried out under the general direction of R. S. McCormick, chief engineer. The plans were made by The Arnold Company, Chicago, who were also the constructors of the entire plant. P. L. Battey, vice-president of the Arnold company, supervised the work and construction was carried out under the direction of H. H. Dickinson.

RAILWAY AFFAIRS IN OTHER COUNTRIES

Financial conditions in Brazil were not of the best during 1913, and this state of things is reflected in the recently issued report of the Brazil Railway for that year. This company, which was incorporated in 1906, operates directly some 3,280 miles of railway in southern Brazil, and has a large interest in the Paulista and Mogyana Railways, which own 1,795 miles of line in the state of São Paulo. It has a large interest in the Madeira-Mamore Railway and the Uruguay Railway, and in subsidiary enterprises, which are expected eventually to produce a profit in themselves and also to bring new traffic. An all-rail connection between São Paulo and Montevideo was established during the year by the completion of the bridge over the River Uruguay and of the connection with the Central Uruguay at Sant' Anna.

From the lines in southern Brazil directly operated by the company, gross receipts were secured in 1913 of $14,479,920, representing an increase of $1,422,228, or 10.89 per cent. Operating expenses ($9,200,534) were, however, higher by $1,716,639, or 22.94 per cent, leaving net receipts lower by $261,074, or 5.28 per cent. Receipts show increases under nearly all headings, because of the stimulus given to low-grade traffic by reductions in tariffs and because of improved train facilities. The higher percentage of operating expenses (63.54 against 57.31) is due partly to the greater mileage of line in operation, 154 additional miles having been opened during the year. There was also a heavier renewal of ties, and an increase in tonnage and train-mileage, consequent on the better service given both for passengers and merchandise, which entailed a heavier coal consumption and a larger wages bill.

In spite of the commercial crisis in Brazil the receipts of the Paulista and Mogyana Railways, in which the Brazil Company is largely interested, showed a steady expansion, and the same dividends of 12 and 10 per cent, respectively, as in the previous year, were declared by each company, and their reserves further augmented. This was done in spite of the increase in working expenses.

The earnings of the Madeira-Mamore Railway, on the other hand, were affected by the severe depression in the Amazon valley following a severe crisis in the rubber industry.

Effect of the Panama Canal on Coast-to-Coast Traffic

Improved Service and Reduced Rates Take Business from Rail Lines. Ask Relief from Fourth Section

Interesting testimony showing the effect of the Panama canal on water rates from the Atlantic to the Pacific coasts was presented at a hearing before Special Examiner Thurtell of the Interstate Commerce Commission in Chicago on October 6, 7, 8, 9 and 10, on the application of the transcontinental railways for relief from the recent fourth section order of the Interstate Commerce Commission, to enable them to make reduced rates to the Pacific coast terminals on 107 commodities sufficiently low to meet water competition without making a reduction in the rates on these commodities to the intermediate points.

The hearing was held pursuant to a petition filed by the carriers with the commission on July 9, following the decision of the Supreme Court sustaining the commission's order in the Intermountain rate case, in which the roads submitted to the commission three schedules of rates. Schedule A is a list of commodities on which the rates to Pacific coast terminals will apply as maxima to intermediate points and on which no relief is requested. Schedule B consists of commodities subject to water competition at the Pacific coast terminals, but on which the rates from the Missouri river to the Pacific coast by rail are generally not less than $2 for less than carload lots and $1 for carload lots, and as to which the carriers will observe the fourth section rule of the commission, applying only such percentages over the through rates at the intermediate points as were designated for the respective zones in the original order of the commission, 7 per cent from Mississippi river and Chicago territory, 15 per cent from the Buffalo-Pittsburgh and Cincinnati-Detroit territories, and 25 per cent from New York territory. Tariffs are now being compiled by the carriers of the rates on commodities named in schedules A and B to become effective on November 15. Schedule C is a list of 107 commodities covering generally manufactured articles subject to the most severe water competition, on which the rates to the coast are less than $1 in carloads and $2 in less than carloads, which rates the carriers consider subnormal to a marked degree, measured by any recognized standard that has been fixed by the commission as reasonable, but which are necessary to move a share of this water competitive traffic by rail, also to enable manufacturers and shippers at points of production not located directly on the Atlantic seaboard to share in the trade of the Pacific coast. These rates are so low that the carriers consider they should not be used as a basis for rates to interior points. As to these rates the carriers asked permission to present to the commission such evidence as in their opinion would completely justify a greater degree of relief from the provisions of the fourth section than was granted in the order.

THE CONTENTION OF THE RAILWAYS

An opening statement outlining the position of the railways was made by Charles Donnelly, assistant general counsel of the Northern Pacific. Mr. Donnelly said that the order of the commission, which was sustained by the Supreme Court, provided only for a relation of rates, and the carriers might have complied with it literally by advancing all terminal rates to the level of the intermediate rates complained of. In the meantime, the conditions existing at the time when the order was entered had changed radically. The carriers were confronted, therefore, with the necessity of adopting that method of compliance with the order which would best conserve their revenue. Their position is that upon the commodities in schedule C the existing rates to intermediate territory tried by the standards afforded by the decisions of the commission in other cases involving rates into the intermountain territory are just and reasonable for the service performed, and that the roads ought to be allowed to make rates to the terminals without reference to the existing intermediate rates. The general justification which has always existed for the maintenance of lower rates to the Pacific coast terminals is that they were necessary primarily to enable rail carriers moving traffic from the Atlantic coast to the Pacific coast to get any of that traffic in competition with other carriers who were moving it to the same destination by cheaper means of transportation. The proposition of the carriers has always been that if this traffic can be given to a boat in New York, and carried to San Francisco for 50 cents they ought to be allowed to charge a rate of 60 cents for the movement of the traffic to that destination, if such a rate would yield something in excess of the out-of-pocket expense, and to charge it without in any way affecting those rates which were at the same time collected to intermediate territory. The carriers maintained that that was true not only of traffic originating in New York, but as well of traffic originating in territory immediately adjacent.

They also contended that if in point of fact railways having their eastern termini in the Middle West could find that same commodity produced or manufactured there, they ought to be permitted to pick it up at that point and deliver it at the Pacific coast upon rates which would enable them to do so in competition with the rates established by the water carriers upon the same traffic originating at the Atlantic seaboard, and that they ought to be permitted to do so without any reference to the rate to the intermediate points. He cited, for example, that at the present time 15,000 lb. of wrought iron pipe was moving from Youngstown, Ohio, to a Pacific coast destination upon the combination rate of 18 cents from Youngstown to New York plus 35 cents from New York to the Pacific coast, or a total of 53 cents, while the existing rail rate is 65 cents. The rate cannot move the business in competition with the rate established by the rail and water route. Can any conceivable reason be assigned, he asked, why, if the carriers can under existing operating conditions move the same traffic from point of origin to the same destination at rates only slightly in excess of this combination they ought to be penalized by the depression of rates otherwise just and reasonable to intermediate territory? No conceivable reason can be assigned, he said, why, as the condition of allowing carriers to compete for such traffic, they should be compelled to forego what they might otherwise lawfully and reasonably ask for the service they render to interior points. The question also involves, he said, the interests of the Middle West. The interests of the interior communities are no more affected if the carriers are allowed to pick up the same traffic in the interior and move it to the Pacific coast on rates which will allow them to compete with water carriers than they would be if the carriers are allowed to compete from the Atlantic seaboard. The question involved, therefore, is: Shall the transcontinental carriers, in view of the conditions existing now as the result of the construction of the Panama Canal, be compelled to go out of the business of moving to the Pacific coast traffic which, if they move it at all, they must move in competition with the water carriers?

NEW CONDITIONS CREATED BY THE CANAL

The first witness for the carriers was P. P. Hastings, assistant general freight agent of the Atchison, Topeka & Santa Fe coast lines, at San Francisco, Cal. Mr. Hastings said that the sea competition within the past few months has been increasing by leaps and bounds, particularly because of the opening of the Panama Canal. The opening of the canal has resulted in much better service by water; the time is shorter and the dates of sailing are more frequent on the lines which were doing business across the isthmus either of Panama or of Tehuantepec, prior to the opening of the canal, and new lines have gone into the business and are still going in, which make the sailings from

the ports on both the east and west very much more frequent than they were before. Moreover, water lines are loading vessels at additional ports, principally gulf ports, and there is no longer the necessity of trans-shipment from sea to rail and from rail to sea again in crossing the isthmus with the intervening rail haul between trans-shipments. Whether entirely because of the opening of the canal or of the new lines entering the service, there has also been a very radical reduction in the rates of the water lines since the opening of the canal, and the roads are daily receiving reliable information about further reductions being made. These things have served very materially to increase the tonnage moving by water lines, not only on schedule C commodities, but also on other commodities. Advice had been received within the last day or two from railroad representatives at both New York and San Francisco and Los Angeles, and on the north coast, of a reduction announced on October 1, on from 300 to 400 commodities, these reductions being either further reductions or reductions on commodities not formerly announced. Even prior to these reductions by the water lines the rail rates did not, in most instances, fully meet the sea competition, but the rail lines were able to obtain a considerable share of the traffic because of their better service. Pending the decision in this case the rail carriers did not feel at liberty to make any changes in their terminal rates to meet the new conditions. Most, if not all, of the rates on the schedule C commodities must be reduced if the railroads are to continue to share in the traffic at the terminal points.

RATES VIA THE CANAL

Mr. Hastings then presented an exhibit showing the water rates prior to the opening of the canal and the rates quoted as of September 5, 1914, and also the movements by sea for the first put out only on the heavier articles, or those which moved in largest quantity, is now applied to the iron list generally by the water lines in carloads. Wine has been quoted at 30 cents in carloads. Wire fencing, formerly 65 cents, is now quoted at 30 cents. In addition there have been a great many reductions on schedule B commodities. Even before the opening of the canal there was a considerable movement from points west of the Pittsburgh-Buffalo territory, which is very materially increasing, but at the time the shipments moved, the movement by sea was largely from those territories. There is also a great amount of traffic by water of practically all commodities from New York City. There are also shipments from Boston, Charleston, S. C., and Gulfport, Miss.

Mr. Hastings introduced a statement showing the tonnage of freight handled westbound by water lines from the Atlantic seaboard to Pacific coast ports, for the years 1907-13, inclusive, compared with that moving through the Panama Canal in September, 1914, the first full month since the canal has been open for business. The total tonnage to American Pacific coast ports, excluding that via the Straits of Magellan and Cape Horn, which was not available, has been as follows: 1907, 139,448; 1908, 141,484; 1909, 254,387; 1910, 290,122; 1911, 397,974; 1912, 451,582; 1913, 434,115. For the month of September 1914, the Emery Steamship Company carried 8,400 tons; the Panama Railroad Steamship Company, 444 tons; the Atlantic & Pacific Steamship Company, 13,482; the American-Hawaiian Steamship Company, 43,312; the Luckenbach Steamship Company, 12,277, making a total of 77,915 tons. This, multiplied by 12, equals 934,980 tons, which would be over twice the tonnage moving by water in any previous year. The figures for September do not include any business via two of the new lines from the South Atlantic and Gulf ports. Mr. Hastings explained that as the canal was

Summary of Service via Water Lines Between Atlantic and Gulf Ports and Pacific Coast Ports Since Opening of Panama Canal

Steamship line	Number of vessels	Total tonnage capacity	Ports from	Ports to	Frequency of sailings	Time in transit to San Francisco	Remarks
American Hawaiian S.S. Co.	26	260,000	New York	San Diego Los Angeles Harbor San Francisco Portland Seattle Tacoma	5 days	23 days	Have declared intention to make Gulf ports, eastbound, and Charleston, S. C., westbound, soon.
Luckenbach S.S. Co.	8	40,500	New York *Philadelphia	Los Angeles Harbor San Francisco (Cargo for North Pacific Coast ports transshipped at San Francisco)	10 days	27 days	Will make Gulf ports early in October, both directions.
W. R. Grace & Co. (Atlantic & Pacific S.S. Co.)	4	30,000 to 40,000	New York	Los Angeles Harbor San Francisco Puget Sound	15 days to 20 days	20 days	
Emery S.S. Co. (Boston & Atlantic S.S. Co.)	2	17,000	Boston	Los Angeles Harbor San Francisco	35 days to 40 days	27 days	
Swayne & Hoyt	3	15,000	New York	Los Angeles Harbor San Francisco	30 days	23 days	
Sudden & Christianson	6	27,000	New York	Los Angeles Harbor San Francisco	15 days	24 days	Announce will make Gulf ports, including Mobile, New Orleans and Galveston.

*Effective October 8.

year 1913, on the items covered by schedule C. These rates were quoted by the American-Hawaiian Steamship Company. Since September 5 many other reductions have been announced. For example, the carload rate on calcium chloride, which before the opening of the canal was 45 cents per 100 lb., has been reduced to 35 cents in carloads; on canned goods from 55 and 60 cents to 45 cents; coffee, 55 to 45; telegraph line material, 55 to 35; window glass, 75 to 60; ink 90 to 75; a large number of iron and steel articles, from rates ranging from 45 to 60 cents to 30 cents; nails, from 50 cents to 30 cents; oils from 60 to 50; paints, 65 to 50; white lead, 55 to 50; paper and articles of paper, 75 to 60; roofing materials 75 to 65; tin 55 to 50; wire and wire goods, 55 to 30; rail fastenings, from 50 to 30. The general item of hardware, formerly quoted at $1, both l. c. l. and carloads, is now quoted at 80 to 85 cents. Pipe fittings and connections have recently been reduced from 40 to 30 cents; cast iron pipes from 40 to 35 cents. On iron and steel articles the 30-cent quotation, opened on August 15, and was in complete operation during the last half of August, any freight that was held back awaiting the opening might reasonably be supposed to have got through before September, so that the figures for September should indicate a normal month, except for the fact that rates are going down and new lines and new ports are entering into the traffic, so that it may be reasonable to expect an increase, unless there should be a change in the rate situation.

SERVICE VIA THE CANAL

Another exhibit showed the lines which are now engaged regularly, or will be within the coming month, in the traffic through the canal, and some information regarding the proposed service. This exhibit is shown in the accompanying table. From this table Mr. Hastings estimated a monthly capacity of 111,600 tons. Moreover, he had just received an announcement of the inauguration of a fleet by the Panama-Pacific Line, to begin

operations between San Francisco and New York in May, 1915, with two boats of 4,000 tons each.

PROPOSED RATES

Another exhibit showed the tonnage of schedule C commodities moving by rail from the east to Pacific coast terminals during the year 1913, with a column showing the movement of the same commodities by sea. Another showed the commodities covered by schedule C, with the rates now in effect to California terminals, and the suggested disposition of schedule C items in terminal rates under which the rail carriers might hope to hold a reasonable portion of the traffic. The publication of the tariff which will become effective on November 15, under the commission's more recent order, will cancel a considerable number of the commodity rates which have formerly been carried to the terminals only, 460 items in less than carloads and 151 in carloads. These rates were eliminated on business where it was thought that the volume of the movement was not sufficient to justify their continuation. He said that this would improve the relationship of the rates from the standpoint of the intermediate points, because the commodities will then take the class rates, and the class rates are no lower to the coast than to any intermediate points, and are lower to Phoenix, Reno and many other points than they are to the terminals. Schedule B also will include 58 less than carload and 389 carload items, on all of which the rates from the Missouri river will be the maxima at intermediate points with the percentages added from points further east. These rates will in most instances materially reduce the rates to Reno and other interior points, probably on 85 to 90 per cent of the commodities.

RATES COVER OUT-OF-POCKET COST

Mr. Hastings then explained that, taking the basis used by the commission in the southeastern fourth section case, for the purpose of roughly computing the out-of-pocket cost of transporting traffic, it had been figured that the out-of-pocket cost on the Santa Fe for transporting the commodities in schedule C would average 3.28 mills per ton per mile, and that the rates suggested by the carriers would all yield a greater revenue than that amount. If the carriers are enabled to participate in this traffic to the Pacific coast terminals, he said, on a basis by which they will earn something over the out-of-pocket cost, it will contribute that much to the overhead expenses and other items of expense which are not included in out-of-pocket cost, and so contribute to the total earnings of the road, so that the burden will not be laid entirely upon the other traffic hauled by the transcontinental carriers, that is, the traffic left to them if they were forced to discontinue participation in the terminal business. Moreover, the rail rates to the interior would be reduced by the combinations on the terminals if the roads are allowed to put in the rates which will meet this competition; and this will not only reduce the actual volume of the rates, but will also establish a different, and for the interior man a better, relation of rates as compared with the terminals. The interior man could also have the advantage of water service and water rates by trans-shipment at the Pacific coast ports; but if the rail carriers are permitted to carry these rates to the terminals on a basis which they can afford, the interior man will have the same combination on the terminals at a very much better service by the rail line than he would were he dependent on trans-shipment at Pacific coast ports. If the carriers cannot be given relief and are forced to abandon the terminal traffic to the sea carriers, no possible advantage would accrue to the interior points.

RATES TO THE NORTH COAST

J. B. Baird, freight traffic manager of the Northern Pacific Railway, gave supplementary testimony applying to the northern lines. Mr. Baird introduced an exhibit showing the present rates to the Pacific coast terminals on schedule C commodities, and the rates which it is thought necessary for the carriers to establish as to the terminals. These are substantially the same as the rates to the California terminals, although there are some slight variations. The class rates which were lower to the coast than to Spokane at the present time grade normally from the east to the west coast. Mr. Baird said that as to the north Pacific coast terminals, the tonnage of schedule C commodities would be somewhere in the neighborhood of 45 per cent of the total traffic. He introduced a number of exhibits as to the rates to the North Pacific coast terminals and intermediate points, similar to those presented by Mr. Hastings. He said that a number of commodity rates had been eliminated from the terminal tariff because the tonnage was so small that the carriers thought they could better afford to eliminate the rates and surrender the business to the water carriers, than to make those rates the basis of their rates to the intermediate territory.

He also produced a statement showing the movement of empty cars over the Northern Pacific from January 1 to August 31, 1914, showing a great preponderance of empty car movement westbound, to show that the Northern Pacific could handle a very much larger tonnage of westbound traffic to Pacific coast territory than it is handling, without materially increasing its transportation expense. The cars could be moved westbound fully loaded, he said, without materially changing the present engine mileage, and with very little additional cost, except such as would be involved in the consumption of fuel. Passing Billings, Mont., this table showed about 24,000 empties in excess of the loads for the period of eight months, so that the Northern Pacific could increase its loaded westbound tonnage to the extent of about 100 cars per day without a considerable increase in operating expense. Mr. Baird said it was not believed that the reduction in the terminal rates would involve any reduction in the revenue because it was expected to get business under those rates that could not be secured at the present time. Many of the present terminal rates secure practically no business now. This preponderance of eastbound movement has prevailed for at least 10 years.

MR. PLAISTED'S TESTIMONY

F. H. Plaisted, assistant director of traffic of the Southern Pacific, explained how the opening of the Panama Canal had changed the conditions affecting transcontinental rates. Mr. Plaisted said that the water service had now been extended to apply not only to New York territory, but to the South Atlantic and Gulf ports, so that these ports are now placed in the same status as the territory adjacent to New York. Water service has also been extended to some of the Missouri river territory, including Galveston and New Orleans. He cited an example of a shipment of pipe and pig iron from Birmingham to the Pacific coast at a rate of 15 cents for the rail haul from Birmingham to New Orleans, and 35 cents for the water haul from New Orleans to San Francisco, making a through rate of 50 cents. The all-rail rate is 65 cents. Such traffic has previously moved by rail in large quantities, but the roads are now unable to hold that traffic against the water competition at that rate, and it is proposed to make a rate of 55 cents if it can be done without reducing the intermediate rates, in order to share in the traffic. Mr. Plaisted took the position that the low rates proposed by the carriers to meet water competition would have no effect in the intermediate points, because if the railroads do not meet the rates the traffic will go by water.

For example, he cited a shipment of paper bags from Sand Hill, N. Y., via the canal at a rate of 55 cents. The former rate by water was 65 cents and the rail rate is $1. Formerly there was no water service from Boston to the Pacific coast. On August 25, the steamship Atlantic sailed from Boston carrying 2,500 tons of nails, 4,500 tons of structural iron originating in Pennsylvania, 10 000 tons of wire fencing originating in Pennsylvania, 5 cars of automobile tires from Massachusetts, 1 car of paper from Maine, 8 cars of electrical machinery from Lynn, Mass., Schenectady, N. Y., and Pittsfield, Mass., 20 cars of printers' ink from Massachusetts, 1 car of canned goods from Massachusetts and 4 cars of boilers from Massachusetts. He also cited a shipment of 1,200 tons of rails from Lorain, Ohio, to San Francisco, which moved by water at a rate of 30 cents from New York to San Francisco, a reduction of 50 cents under the former rate. In 1913, the total tonnage of rails shipped by water was 609. He also cited a shipment of wrought iron pipe

from Wheeling, W. Va., at a rate of 30 cents from New York to San Francisco and 16 cents from Wheeling to New York. This business has moved almost exclusively by rail in the past. He also cited shipments from Youngstown, Ohio, which had formerly always moved by rail. He also mentioned a company which formerly supplied San Francisco from its Milwaukee branch. Shipments are now made from the New York branch by the Panama Canal. The Sherwin-Williams Paint Company, he said, having plants at Newark, N. J., and Cleveland, Ohio, now ships from Newark. Paper oyster pails, formerly moving from Chicago by rail to the coast, are now moving by the canal. It makes no difference to the interior points whether this traffic goes by sea or by rail, even if the rail rates are lower than those available to the interior points. Referring to the rails from Birmingham, he said that the 55-cent rate proposed by rail was not considered as fairly remunerative, nor did it actually meet the water competitive rates, but it was believed the rail service was worth 5 cents more, and that the railroads could get 55 cents, but no more. He said that if he was figuring on a rate that would meet all expenses and a return on the investment he would have to make the rate higher than 55 cents, but that this would meet the out-of-pocket cost. He said that the boat lines can make rates without notice, while the railways cannot change their rates except on 30 days' notice and the approval of the Interstate Commerce Commission. The roads, of course, do not expect to be able to fully meet the water competition for this reason, but desire to have the restrictions imposed by the long-and-short-haul clause removed as to this traffic, in order to obtain a share of it. If the boat lines reduce their rates too low, of course, the rail lines cannot follow them. Mr. Plaisted said the question of castbound rates by the canal would have to be taken up, but that it had not been included in this case. However, the same principle would apply. The roads would have to meet water competition at the points of origin, but not at the points of destination. Mr. Baird, on cross examination, said that out of the rates from Chicago to Seattle, 15 per cent would go to the lines between Chicago and St. Paul, out of the rate from New York to Seattle 25 per cent would go to the eastern lines.

Representatives of the state railway commissions of Nevada, Arizona, New Mexico, Idaho, Kansas, Nebraska, Montana and Minnesota were present and cross-examined the witnesses for the railways. Representatives of the chambers of commerce and other commercial organizations were also present from the principal commercial centers of the United States, including both eastern cities and terminal and intermountain cities in the west. The Nevada, Arizona, New Mexico, Idaho and Montana commissions, and shippers from the intermountain territory, opposed the plan of the railways, arguing that to make lower rates to the coast would be discriminatory against their shippers. Representatives of shippers' organizations in the middle western cities appeared in support of the railroads' position. H. C. Barlow, traffic director of the Chicago Association of Commerce, said that unless the commission allows the railways to make lower rates to the coast the entire mid-western section of the country will lose its business with the coast to the Atlantic seaboard cities. It is much cheaper at present, he said, to send goods by rail to New York and thence by water to San Francisco, than to ship across the continent by rail and the eastern cities therefore have an advantage over the middle west.

Mr. Barlow submitted the following exhibit, comparing the water-and-rail rates from Chicago to San Francisco since the opening of the canal with the transcontinental rail rate:

	Combination rate, C. L.	Rail rate, C. L.
Cotton piece goods	$1.55	$1.60
Starch	.85	1.00
Pickles	1.20	2.45
Shoe findings	1.50	1.90
Tinware	1.55	*1.70
Paper articles	1.40	*1.90
Leather	1.35	1.95
Iron and steel	.60	.80
Paints	.90	.95
Hardware	1.35	1.90
Earthenware	1.40	1.50
Twine	1.10	2.45

*L. C. L.

TESTS OF VANADIUM STEEL RAILS

Convinced from results along other lines that the use of vanadium in rail steel will reduce rail failures and increase the wearing quality of the rails, the manufacturers of this alloy recently had several heats of basic open hearth vanadium steel rolled into rails for test purposes by the Cambria Steel Company. Although the price of vanadium until the past year has been too high to make it commercially practicable in rails, it is now possible to sell rails with this alloy for about $40 a ton.

Three heats of vanadium steel were made to the following chemical specifications:

Heat	1	2	3
Carbon	.45 to .65 per cent	.40 to .52 per cent	.60 to .75 per cent
Manganese	1.10 to 1.40 per cent	1.00 to 1.30 per cent	.75 to 1.00 per cent
Silicon	Under .20 per cent	Under .20 per cent	Under .20 per cent
Phosphorus	Under .05 per cent	Under .05 per cent	Under .05 per cent
Sulphur	Under .05 per cent	Under .05 per cent	Under .05 per cent
Vanadium	4 lb. to ton	4 lb. to ton	4 lb. to ton

In the first two heats, the manganese specified is higher than usual, as previous investigations have shown that with manganese somewhat higher than usual the effect of the vanadium on the physical properties of the steel is still further increased. The third heat, however, conforms to the usual specification for rail steel.

The chemical compositions of the heats were as follows:

Heat	1	2	3
Carbon	.55 per cent	.51 per cent	.558 per cent
Manganese	1.51 per cent	1.11 per cent	.78 per cent
Silicon	.17 per cent	.12 per cent	.158 per cent
Phosphorus	.015 per cent	.010 per cent	.017 per cent
Sulphur	.019 per cent	.029 per cent	.025 per cent
Vanadium	.148 per cent	.146 per cent	.156 per cent
Actual per cent vanadium added	.168 per cent	.16 per cent	.177 per cent

The manganese in the first heat is higher than called for due to the percentage of loss in manganese addition not being nearly as great as allowed for in usual practice. The percentage of carbon in the third heat is about 5 points below the limit called for due to various mill delays.

The following chemical specifications were used for the carbon steel rails with which the vanadium rails were compared:

Carbon	Manganese	Silicon	Phosphorus
.62 to .75 per cent	.60 to .90 per cent	Under .20 per cent	Under .04 per cent

The production percentage of the vanadium steel or yield of rails per ton of ingots was higher than usual, as shown thus:

Heat	1	2	3
Ingots, weight	121,000 lb.	104,400 lb.	108,000 lb.
Rails, weight	89,500 lb.	79,900 lb.	82,000 lb.
Rails, number	77—1st; 5—2nd	73—1st; 1—2nd	73—1st; 2—2nd
Rails—Scrap	None	None	None
Per cent yield	74.0	76.9	75.9

All three vanadium steel heats rolled perfectly, and the blooms were all clean and free from seams and cracks. The standard gages were used, indicating that the shrinkage of the steel is the same as for standard carbon steel and that no change in this respect is necessary. Nothing developed in the heating and rolling to indicate that the mill output would be in any way reduced by the use of vanadium steel. The top portion of some of the ingots from the first heat was a little soft or green when bloomed, and they were cropped heavily on this account.

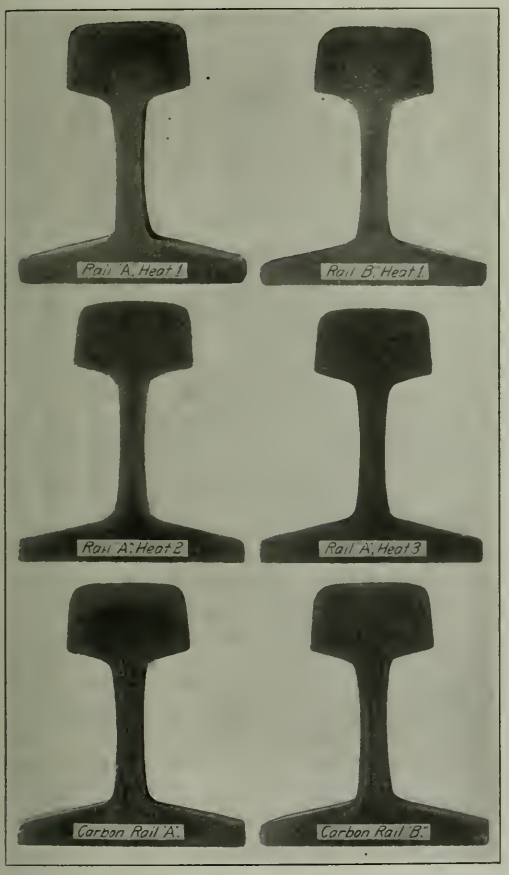
DROP TESTS

When the first heat was made, it was arranged to make drop tests on crop ends from both the "A" and "B" rail of three ingots, representing the beginning, middle and end of the pouring. Through misunderstanding this was not carried out on the second heat, and only three drop tests were made from this heat, one being from a "C" rail crop, as the top blooms from the ingots were rolled into three-rail lengths. The arrangement for two drop tests from the beginning, middle and end of the third heat was carried out, excepting that the tests were made on "C" rail crops instead of "B" rail, on account of the top blooms all having been rolled into three-rail lengths.

The usual requirements for the drop test were followed, the height of the drop being 15 ft. for the carbon rails and 18 ft. for all but two of the vanadium rails. One vanadium rail was tested with the flange up. All the others were tested in the usual manner with the head up. Six one-inch spaces were laid off on

the bottom of the flange in order to determine the ductility or stretch after each blow of the drop, the requirements being 5 per cent or 5/100 in. stretch in two adjacent inch spaces.

The vanadium steel met the ductility requirements in all of the 15 tests and in all but one of the 12 tests made with the 18-ft. drop, the requirement was met under the first drop. The deflection in inches under the first drop in the two cases in which a 15-ft. height was used was 0.7 and 0.9 in., respectively. The similar figures for the 18-ft. drop are 1.0 in four cases, 1.1 in seven cases and 1.2 in one case. The carbon rails in three such drop tests also met the requirement as to ductility, the deflection in two cases under the first drop of 15 ft. being 1.0 and in the third case 1.1. The fractures of the vanadium steel test pieces showed sound interior metal in all cases but one in which a small



Etched Cross Sections of Vanadium and Carbon Steel Rails

indication of piping which showed on one side of the wedge-shaped piece was broken out when the rail was fractured under the drop.

In addition to drop tests, one full length "A" rail from each of the three vanadium heats was broken into ten pieces and the fractures carefully examined. Every fracture was found to be free from any evidence of piping.

PHYSICAL TESTS

Tensile tests, alternating impact, and bend tests and also wear and hardness tests were made from rail crops from each heat. The crops from the "A" rails were taken from the top end of the rail. Tensile tests were also made from the middle section of each of the vanadium steel rails which were broken under the gag press. Corresponding tests for comparison were made from an "A" and "B" 100-lb. section carbon steel rail. Due to the more rapid cooling of the rail crops, the tests from these show a little higher in elastic limit than the tests from the mid section of the three rails broken in the gag press, as these rails cooled much more slowly on the hot bed.

The average elastic limit of the vanadium steel as shown in 61 tests was 95,000 lb. per sq. in., the corresponding figure for 16 carbon steel tests being 65,000 lb. per sq. in. The tensile strength of the 61 vanadium specimens averaged 129,000 lb. per sq. in., and of the 16 carbon steel specimens 119,000 lb. per sq. in. The ratio of the elastic limit to tensile strength was 70 per cent or more for the vanadium steel as compared with about 57 per cent for the carbon steel. The per cent elongation in two inches averaged 12.1 for 57 vanadium steel specimens and 10.9 for the 16 carbon steel specimens. The per cent reduction of area was 29.2 for the vanadium and 15.9 for the carbon steel.

The bend tests were made on rectangular pieces about 8 in. long. The load was supplied 6 in. from the fixed end of the test piece. The radius of the jaws holding the bend specimen was not over ⅛ in., and the edges of the specimens were not rounded. The alternating impact tests were made on bars turned to ⅜ in. diameter. The bar was held firmly in a vise and the upper end moved backwards and forwards by means of a slotted arm, through a total distance of ¾ in. at the rate of 600 movements per minute. The distance from the vise to the slotted arm was 4 in. Each movement was accompanied by an impact or blow on the bar by the slotted arm.

The results of these tests show that the vanadium steel compares favorably with the carbon steel in these respects.

The hardness tests were made by the Brinell method. This consists of measuring the impression made by a standard steel ball under a standard load. The tests were made on sections from the same rail crops from which the other tests were made. The sections from the first heat showed an average hardness of about 340; from the second heat about 302, and from the third heat about 293; carbon rail "A" about 248, and carbon rail "B" about 269.

The wear test was made by rotating a test piece 1 in. long by 1 in. diameter between three manganese steel rollers of 3 in. diameter. The two bottom rollers were driven by gears with a different number of teeth, giving the rollers different speeds and causing the test piece to slip as well as rotate, imitating the action of a car wheel on the rail. The test pieces were all taken from the head. A direct load of 110 lb. was applied to the test piece by loading the top roller. In previous tests a load of 220 lb. was used, but owing to the great tendency of soft rails like carbon rail "A" to flow and form a fin or bead the weight was reduced to 110 lb. It was found that the abrasion of the test piece was better with this weight than with the heavier load. The test pieces were weighed before and after test. The loss in weight in milligrams was divided by the original weight of the test piece in order to obtain comparative figures and allow for variations in weight of test pieces. The tests were all run 50,000 revolutions. The relative loss for all specimens was as follows:

Heat		
1	"A"—Crop	16.3
1	"B"—Crop	13.1
2	"A"—Crop	12.8
3	"A"—Crop	12.2
Carbon	"A"	28.8
Carbon	"B"	21.1

CHEMICAL ANALYSES

Chemical analyses were made of rails from each of the vanadium heats to determine whether there was any tendency to segregation and how the vanadium steel compared in this respect with the carbon steel. For this purpose drillings were taken from two locations in the head of the rail. One sample was taken from the top corner of the head, corresponding to the outer portion of the ingot, and the other sample was taken from the junction of the head with the web, corresponding to the axial

center of the ingot where any segregation present would be most certain to be found. No segregation was found in the case of the vanadium steel rails, the results all being within the limit of analytical error.

Sections from the rails tested were polished and etched in boiling dilute sulphuric acid and photographed. Rail "A" of the first heat showed a small amount of piping at the top of the web and in the web. The appearance of the center of the head of this etched section would indicate that the center of the top of the ingot was a little soft or green when bloomed. A few of the ingots from this heat were heavily cropped at the bloom shears on this account. Rail "B" of the first heat showed a few small streaks in the web. Rail "A" of the second heat showed a perfectly uniform, dense structure with no evidence of residual piping. Rail "A" of the third heat showed a uniform, dense structure, with only the very slightest indication of residual piping. Carbon rail "A" is typical of most "A" rail structures and is really better than many because more than the usual discard was made from the top of the ingots in rolling this lot of rails. Carbon rail "B" shows evidence of residual piping, more marked on the left side of the etching.

The time required for etching the vanadium steel rail sections was several times longer than for the carbon rails. The average time required was about 30 minutes, as against about 5 minutes for the "A" carbon steel rail and about 15 minutes for the "B" carbon steel rail. The difference in length of time of etching is a very good indication of the comparative resistance to wear.

CONCLUSIONS

From the results of the tests made on these three heats, the American Vanadium Company recommends the following chemical specification for vanadium steel rails:

Carbon	.45 to .60 per cent
Manganese	1.00 to 1.25 per cent
Silicon	Over .10 per cent
Phosphorus	Not over .05 per cent
Sulphur	Not over .05 per cent
Vanadium	4 lb. added per gross ton

BRITISH AND GERMAN EXPORTS OF RAILWAY MATERIAL

The British Board of Trade has recently compiled statistics regarding British and German exports of railway supplies and equipment to the principal markets of the world, which should be of great interest at this time to American railway supply companies that are now studying the possibility of extending their business in foreign markets.

During the year 1912 the total value of railway material exported by Germany to all destinations amounted to $29,490,200. Of this $6,844,200 consisted of railway wheels and axles and parts of railway wheels, hubs, tires, frames, etc., and $22,656,000 of other railway material. British exports in the year 1913 amounted to $6,050,000 for railway wheels, axles and their parts, and $25,948,000 for other railway material, making a total of $31,998,000. Exports from Austria-Hungary in 1913 amounted to $194,350, of which $7,000 was for railway wheels, axles, hubs, tires, and parts, and $187,350 was for other equipment.

The value of exports of railway material, other than rolling stock and railway wheels, tires and axles, exported to all destinations from Germany, United Kingdom and Austria-Hungary, are shown in the following table:

Exported from Germany (1912)

Rails, including tramrails	$14,503,000
Sleepers of iron	3,819,000
Fishplates and bedplates	1,646,300
Fishplate screws and wedges, bolts for sleepers, gage bars, clamp plates, hooked nails	1,250,000
Railway carriage metal fittings, railway buffers	377,000
Parts of railway switches, parts of signals	596,000
Railway carriage springs, buffer springs	464,500
Total	$22,656,000

Exported from Austria-Hungary (1913)

Rails for railways, pierced or not	$178,300
Other railway material, including fastenings, frogs, buffers, etc.	9,050
Total	$187,350

Exports from United Kingdom (1913)

Rails, new perfect rails, for use on steam or electric railways, and conductor rails for electric traction	$17,289,000
Tram rails, with grooved heads	782,500
Chairs and sleepers (of iron or steel)	3,724,500
Railroad iron or steel, unenumerated	4,052,000
Total	$25,948,000

The values of railway axles, railway wheels and parts, hubs, tires, frames, etc., exported from Germany to all destinations in the year 1912 to the United Kingdom and to the principal neutral markets of the world were as follows:

To United Kingdom	$200,000	To Italy	$1,375,000
" British India	300,000	" Turkey	60,000
" Canada	450,000	" Egypt	65,000
" Australia	995,000	" Dutch East Indies	160,000
" Norway	70,000	" China	310,000
" Denmark	140,000	" Japan	440,000
" France	200,000	" Argentina	80,000
" Spain	195,000	" Brazil	315,000
" Portugal	50,000	" Chile	70,000

British exports of railway wheels and parts, including tires and axles to the various colonial and foreign markets, in the year 1913, were as follows:

	Railway wheels and axles complete	Tires and axles	Total
To British India	$1,975,000	$330,000	$2,305,000
" Canada	60,000	130,000	190,000
" Australia	345,000	1,075,000	1,420,000
" Norway	.....	5,000	5,000
" Denmark	.....	.....	.....
" France	2,500	23,000	25,500
" Spain	30,000	10,000	40,000
" Portugal	2,500	7,500	10,000
" Italy	.....	1,000	1,000
" Turkey-in-Asia	2,500	2,500	5,000
" Egypt	5,000	55,000	60,000
" Dutch East Indies	.....	3,500	3,500
" China	115,000	35,000	150,000
" Japan (and Formosa)	20,000	35,000	55,000
" Argentina	510,000	415,000	1,425,000
" Brazil	175,000	75,000	250,000
" Chile	80,000	25,000	105,000
Total	$3,822,000	$2,227,500	$6,050,000

The total of British exports to the above markets exceeds those of Germany, but while the United Kingdom easily takes the first place in supplying this material to British India and Argentina, Germany has taken the bulk of the trade in the other markets specified. The Board of Trade memorandum reports that competition from Germany with British manufacturers of railway axles, wheels and tires during the last few years has been extremely keen. In many foreign and colonial markets, large contracts have been placed with German manufacturers. A number of the contracts which were under execution, or which had just been placed in Germany before the war cannot now be fulfilled in that country.

The table on the following page shows for the year 1912 the values of the principal descriptions of railway material other than rolling stock and railway wheels and axles exported from Germany to the United Kingdom and the principal neutral and colonial markets.

The following statement shows for the year 1913, the exports of certain classes of railway material from the United Kingdom to the colonial and neutral markets principally served by Germany:

Exported to:	Rails	Chairs and sleepers	Miscellaneous
British India	$4,063,000	$2,700,000	$1,297,500
British East Africa	94,000	55,000	13,500
British South Africa	2,138,000	42,500	474,500
Australia	4,595,000	16,500	555,500
Norway	5,500	.....	.....
Sweden	20,500	.....	.....
Denmark	.....	.....	1,000
Netherlands	22,500	129,000	3,500
Belgium	86,500	.....	3,500
France	162,500	.....	4,000
Switzerland	.....	.....	.....
Spain	78,500	.....	10,500
Portugal	36,500	.....	8,000
Italy	28,500	.....	2,000
Greece	1,000	.....	500
Servia	.....	.....	.....
Roumania	.....	.....	500
Russia	327,000	.....	60,000
Turkey	34,000	.....	6,500
Egypt	652,000	19,500	191,000
Siam	1,000	.....	.....
Portuguese East Africa	641,500	387,500	121,000
Portuguese West Africa	2,000	500	2,000
Morocco	.....	.....	.....
Dutch East Indies	.....	.....	13,500
China	3,500	.....	11,500

Exported to:	Rails	Chairs and sleepers	Miscellaneous
Japan	4,000	500	1,000
Brazil	319,500	40,000	132,500
Argentina	1,942,000	27,500	555,500
Chile	87,500	500	77,000
Uruguay	76,000	.....	11,000
United States	.....	.....	.....
Mexico	120,000	.....	57,500
Total to above markets	$15,542,000	$3,419,000	$3,604,500
Total to all destinations	$18,071,500	$3,824,500	$4,052,000

Austrian exports of railway material are insignificant when compared with those of Germany or the United Kingdom. The bulk of the exports were rails and were sent mainly to Roumania, $153,050, and Servia, $24,350.

Germany's principal market for railway material in 1912 and the aggregate amounts sent to each, were as follows: Dutch East Indies, $2,594,500; Turkey, $2,366,000; Argentina, $1,595,500; Sweden, $1,516,500; Switzerland, $1,440,000; Netherlands, $1,488,000; Chili, $969,500; Brazil, $905,500; United Kingdom, $900,500; Japan, $834,500; and Denmark, $752,000. The most important item exported was rails, the exports of rails accounting for fully one-half of the total.

The following particulars are given as to the special requirements of some of these markets:

CANADA

The British trade commissioner in his last annual report for Canada, stated that of the gross imports of railway material the British imports represented the proportion of 7.6 per cent, but over 90 per cent of the railway material has been classed as non-competitive, including rails, etc., which for various reasons British firms do not normally supply to the Canadian market. Of the balance, consisting of axles and parts, springs and parts, switches and crossings, and tires for locomotives, tenders and cars, the imports show a proportion for the United Kingdom of 11½ per cent, while Germany secured 20.18 per cent. During the year ended March 31, 1913, the imports of axles and parts into Canada from all countries amounted to $775,130, including $33,139 worth from the United Kingdom and $713,848 worth from the United States. The imports of springs and parts from all countries amounted in value to $108,381 including $783 worth from the United Kingdom and $107,203 worth from the United States. The imports of tires for locomotives, tenders, and cars from all countries amounted to $548,148, including $134,916 worth from the United Kingdom, and $87,150 worth from the United States. Imports of axles and parts, and tires for locomotives, tenders and cars from Germany amounted in value to $27,678, and $326,082 respectively.

AUSTRALIA

There is said to be a large demand for wrought steel, axles in Australia, the American pattern being preferred. A firm in Sydney reported that instead of ordering 500 sets from the United Kingdom, as at present, they would order 3,000 sets if British manufacture would closely follow the American pattern and quote a lower price. At present the difference in price is said to amount to about 30 per cent in favor of the American axle. The trade in light springs is mostly with the United States. The trade in heavy axles and springs is very largely with the United Kingdom.

The following were the values of rails, fish plates, fish bolts, tie-plates, and rods, switches, points, crossings, and intersections for railways and tramways, imported into Australia from the undermentioned countries in 1910, 1911, and 1912:—

	1910	1911	1912
United Kingdom	$1,997,735	$2,498,145	$4,223,665
Germany	169,320	1,053,785	438,665
All countries	4,103,385	5,399,640	6,500,425

INDIA

The following table shows the values of railway cars and parts imported into British India from the United Kingdom, Germany and Belgium in the years 1910-1911, 1911-1912, and 1912-1913:

	1910-11	1911-12	1912-13
United Kingdom	$4,845,860	$4,419,940	$7,474,890
Germany	57,085	91,490	322,985
Belgium	94,765	37,830	108,490

The values of the imports from Germany show large increases during the three years under view as compared with those from the United Kingdom. In 1910 and 1911, according to consular reports, the German exports of tires amounted to 3,700 metric tons, and railway axles to 1,400 metric tons. Wheels are said to be imported for the most part from the United Kingdom.

GERMAN EXPORTS, 1912

Exported to:	Rails	Steel ties	Fish-plates, tie plates	Fishplate screws and wedges, holts, gage-bars, clamp plates, hooked nails	Metal car fittings, buffers	Switch and signal parts	Car springs, buffer springs
United Kingdom	$649,500	$80,000	$85,000	$13,000	.....	.....	$69,500

EGYPT

The following were the values of iron and steel rails imported into Egypt from the undermentioned countries in 1912 and 1913:

	1912	1913
United Kingdom	$176,885	$532,115
Germany	301,635	99,900
All countries	583,250	924,900

The position of the United Kingdom improved greatly in 1913 at the expense mainly of Germany.

THE INCREASE IN MILEAGE BOOK RATES

E. B. Leigh, president of the Chicago Railway Equipment Company, has sent the following letter to all company representatives directing attention to the recent circular letter from the secretary of the Illinois Commercial Men's Association urging members to protest to the Interstate Commerce Commission against the proposed increased price of mileage books already granted by the commission subject to revision.

"This ill directed move on the part of the Illinois Commercial Men's Association (voiced by its secretary) is not only illogical but manifestly unfair; to say nothing of being directly opposed to the view now almost universally held by industrial and commercial interests of the country, which are substantially a unit in the belief that railways are in sore need of increased revenue, and to which end they are now lending their aid. Furthermore, we look upon this effort as being most presuming on the part of the secretary of the Illinois Commercial Men's Association, who seems to overlook the very pertinent fact that in the case of probably over 90 per cent of the firms and corporations employing traveling salesmen, *employers pay their bills,* and are consequently the interested parties, *not* the individual members of the Illinois Commercial Men's Association or similar organizations, and any independent action of such employees is manifestly unwarranted.

"One of the first and foremost duties of the selling representative is to stand by the policy of his employer, and, knowing as you do, our views on the railroad rate question, we feel it wholly unnecessary to more than call your attention to this matter, in full belief you will lend your hearty aid to overcoming any recognition of, or action upon, this attempted undertaking.

"On the other hand, we are equally confident of your active co-operation with us in making the railroad situation better understood, and in your efforts to do all possible within the radius of your personal acquaintance and influence to bring about general business prosperity."

In last week's issue there was published a letter written by Lorenzo Norvell, of Fairbanks, Morse & Co., to the secretary of the Illinois Commercial Men's Association, protesting against his action in attempting to incite the members of that organization to protest to the Interstate Commerce Commission against the increase in mileage book rates on the eastern roads. Among other similar letters sent to Secretary Cavanaugh is the following by C. R. Wescott, president of the M-C-B Company:

"Your favor of the 18th inst. captioned 'Attention, Traveling Men!' has reached me and after reading, as you suggest, have arrived at the conclusion that the Illinois Commercial Men's Association is drifting in decidedly hazardous territory.

"It is certainly to be regretted that the management should have so far forgotten the objects of the association as to permit its good name to be dragged into and its resources dissipated in scattering broadcast a document notable only for the extremely low tone in which it is pitched and the suggestion contained that the membership be further humiliated by being made the cat's-paw of politicians.

"The Illinois Commercial Men's Association, as an accident insurance company, has interest in transportation only, so far as it relates to *safety*—its membership and travelers in general, in securing *safe, comfortable and expeditious service.* Such service, however, costs money to produce and can be reasonably expected only when a fair margin of profit is derived from its rendering.

"If your appeal to the membership was warranted it should have been accompanied by something material—data showing that American railroads are performing a less safe, a less comfortable, or a less expeditious service than is given for a like amount in other parts of the civilized world, that American railroads collectively are at present rates earning a fair return on passenger service rendered. In the absence of such evidence, why should the membership, blindly following your lead, attempt to deny railroads that which is claimed for itself, namely, the right to do business on a fairly remunerative basis? The latest authentic information the writer has been able to locate on the subject of passenger rates is found in report of the Interstate Commerce Commission recently issued, after exhaustive research, and is so widely at variance with your ideas as to make a protest based purely upon self-interest, prejudice and unsupported generalities highly presumptuous.

"When railroads, *the largest individual purchasers of material in America,* are denied the privilege of earning sufficient money to buy material with which to keep pace with absolute maintenance requirements, to say nothing of carrying forward contemplated and much needed improvements, a condition anything but healthy is created, a condition that promises anything but safe, comfortable and expeditious service to the traveling public.

"One of the most hopeful signs of the present depressed time is the rapid change taking place in public sentiment, and indicates that the American business man is beginning to realize that upon the prosperity of American railroads his success is, to a marked degree, directly or indirectly dependent.

"The writer is not attempting to justify or apologize for the many indiscreet acts of railroad officials, either past or present, and believes that there are many methods of handling now in force that can, should and will ultimately be improved upon, resulting in substantial economies. These changes, however, will result from intelligent effort rather than by muck-raking methods which appeal only to the vicious and unsophisticated."

PRIVATE RAILWAYS EXCEL IN RUSSIA

The Bureau of Railway News and Statistics has issued the following: "Had Russia's government railways been operated as economically in 1910 as were her private lines the saving in operating expenses would have exceeded $37,000,000. Such a discrepancy in comparative efficiency of state and private railway operation in Russia is brought out in the annual report for 1910.

"Private companies in European and Asiatic Russia operate 13,256 miles of railway against 28,366 miles operated by the state. In 1910 these companies paid out $59 to operate, for every $100 received in gross revenues. Against this showing the state railways spent $70. Moreover, whereas in 10 years since 1901 the private companies effected a reduction in operating expenses from $68 for every $100 revenue to $59, a saving of over 13.2 per cent, the state railways in the same time contracted their expenses only 1.4 per cent, from $71 to $70. With over $342,000,000 in gross business the government railways would have saved exactly $37,644,903 had they equalled the private companies' performance.

"Overstaffing of the government railways is largely responsible for this unfavorable showing. Whereas the private companies handle a relatively larger traffic, $12,989 per mile against $12,426 on the government roads, they accomplished the work with only 169 employees for every 10 miles against 203 for every 10 miles on the state railways. Even more striking than this discrepancy is the gap between Russia's most efficient roads and railways of the United States, which in 1910 operated with only 70 employees for every 10 miles of line.

"Comparison of rates charged in the two countries likewise demonstrates the efficiency of the United States railway system, for with higher cost of materials, wages four times those paid to Russian railway employees, and with the value of the cent correspondingly higher in Russia than in this country, United States railways received only 0.75 cents per ton mile against 0.94 cents received by Russian carriers. Average receipts per passenger mile were only one-third ours, but 91.5 per cent of the travel was third and fourth class against ½ of 1 per cent first class. One day's wage, 70.5 cents, will buy 103 miles of this third and fourth class travel in Russia against 124 miles of first class travel for a day's wage in the United States."

General News Department

The Grand Central station at Houston, Tex., was damaged by fire on October 5, the loss being estimated at between $10,000 and $15,000.

The Kansas City Commercial Club is planning a two-day celebration on October 30 and 31, in connection with the opening of the Union station of the Kansas City Terminal Railway.

An unfinished pier of the Philadelphia & Reading Railway at Delaware avenue and Catharine street, Philadelphia, was destroyed by fire on the night of October 14; estimated loss $250,000.

The Agricultural Department at Washington reports that fines imposed on railroads during the month of August for the violation of the 28-hour law regulating the transportation of cattle amounted to $25,000. In July the aggregate of the fines was $9,001, and in June $4,972. More than half the penalties collected in August came from three roads, the Chicago, Rock Island & Pacific, the Chicago & North Western and the Chicago, Milwaukee & St. Paul. For violation of the live stock quarantine law the Fort Worth & Denver City was fined $100. The company was convicted of moving cattle affected with scabies from one state to another.

Supplementing the fire notice recently issued the Baltimore & Ohio has furnished trainmen with blanks to notify trackmen of the existence of minor fires. When a trainman discovers a small blaze in the grass along the right of way which is not sufficiently dangerous to justify stopping the train, he is instructed to fill out a printed form, locating the blaze, and throw it off to the first track gang or trackwalker or station agent passed. The blank is marked conspicuously "Go Back and Put Out Fire."

J. Pierpont Morgan has informed the Secretary of the Interior that the owners are willing to sell or lease to the United States the Copper River & Northwestern Railroad in Alaska. It is the desire of his firm and others interested to co-operate with the government in building the government railroad by placing the Copper River property at the government's disposal. The Copper River road is 196 miles long and extends from Cordova, its southern terminus on Prince William Sound, in a northeasterly direction to Kennicott, the location of copper mines. It passes within thirty miles of rich coal fields.

A hearing in the government suit to terminate the Southern Pacific's ownership of the Central Pacific was held in Chicago on October 7 and 8, before Special Master Frank R. Hanna. W. H. Connor, general agent of the Union Pacific at Cincinnati, and formerly general agent of the Southern Pacific at Cincinnati, testified regarding present and former competition between the Union Pacific and Southern Pacific. J. A. Munroe, vice-president, in charge of traffic of the Union Pacific, also testified regarding competitive conditions. The hearing was postponed to a later date on account of the illness of an important witness. Further hearings will be held in San Francisco.

Wells Fargo & Company report gross express receipts for the year ended June 30, 1914, of $31,862,932, a decrease of $3,071,881 compared with the previous year. Operating income after taxes was $1,072,161, a decrease of $596,587. Other income of $1,272,432, brought the year's surplus up to $2,344,595, which is equal to 9.78 per cent on $23,967,400 capital stock, against 12.71 per cent earned on the same stock the previous year. President Caldwell, speaking of the new rates which went into effect February 1, 1914, said that they had not been in operation long enough to determine to what extent the reductions may be expected to stimulate traffic. The lower rates have influenced a return to the express companies of some of the business which had been previously diverted to the parcel post.

President Fairfax Harrison of the Southern Railway, announcing a reduction, from 5 per cent to 4¼ per cent in the dividend on the company's preferred stock, says that the officers of the company have also been asked to make a sacrifice. He has reduced his own salary 20 per cent, and has asked all the other officers receiving annual salaries in excess of $2,500 to accept temporary reductions on a descending scale. A man receiving a salary of $2,700 will be reduced 2 per cent. The officers affected have all accepted the situation with loyal appreciation of the necessity of a spirit of mutual sacrifice. While the actual saving to the company on this account is relatively small, the principle of common interest of all those who draw their livelihood from the railway company has been the controlling motive. Many hundreds of the employees are earning less than before the depression.

Watch the Details; "Trifles Make Perfection"

On the Pittsburgh division of the Pennsylvania Lines West, conductors of trains that pick up cars labeled "inflammable" or "explosive," whether empty or loaded must make the fact known to every member of the train crew, including the engineman. At terminals the yardmaster must give such notice on a prescribed form.

Evening Engineering Courses at University of Pittsburgh

An evening school of graduate courses in engineering will be a new feature introduced at the University of Pittsburgh this fall by the Dean, F. L. Bishop. It is stated that in the Pittsburgh district there are more engineering graduates than in any other district of equal size in the United States, and the University will provide for men who do engineering work during the day an opportunity to study engineering in the evening. Courses will be offered in the valuation of public utilities; civil, electrical, sanitary, mechanical, railway and concrete engineering. The faculty will include Paul M. Lincoln, professor of electrical engineering; Louis E. Endsley, professor of railway engineering; R. T. Stewart, head of the department of mechanical engineering; J. Hammond Smith, head of the department of civil engineering, and Morris Knowles, director of the department of sanitary engineering, all of the University of Pittsburgh. Professor G. W. Case and William S. Moorehead will also assist in the course in the valuation of public utilities, and D. F. Crawford, general superintendent of motive power of the Pennsylvania Lines West of Pittsburgh, will co-operate with Professor Endsley in the work of mechanical railway engineering.

Twelve-ton Pacific Type Engines

The Panama-Pacific International Exposition at San Francisco next year is to have on the grounds a steam passenger railroad. Electricity is not absolutely supreme and all-pervasive. However, the track is to be of 19-inch gage and the locomotives are only 17 ft. long. As in the case of the Centennial Exposition at Philadelphia in 1876, the little railroad is designed not only to ride over but also to be looked at. There will be 2½ miles of road and 5 miles of track, work on which has just been begun. There will be eight or ten Pacific type locomotives equipped with air brakes, standard couplers and electric headlights. Each little giant will haul a train of ten miniature passenger coaches, and running on regular schedules on a double-track system. Each of the coaches, with a width of 42 in. and a length of 20 ft., will contain ten transverse seats, and will seat twenty passengers. With ten coaches to each train and eight trains in operation, 1,600 people can be put in motion at once.

The route, commencing at the terminal at the southeast corner of the Palace of Machinery, will be northerly across the plaza of the exposition ferry slips, to the water front, thence west along the Marina, around three sides of the Yacht Harbor, diagonally across the gardens of the California building, and thence by way of the bayshore and the many state buildings to the race track. The main loading station, at the beginning of the line at the Machinery Palace, will be 300 ft. in length, with five tracks; between which will be elevated loading platforms. The entire line will be double tracked, with rails weighing 39 lb. per yard.

Canadian Ticket Agents' Association

The twenty-eighth annual convention of the Canadian Ticket Agents' Association was held in Chicago on October 6, 7 and 8, and was attended by about 250 members, with members of their families. Addresses of welcome were delivered on behalf of city officers and by W. K. Pattison, president of the British Empire Association. As one feature of the program William P. Leffingwell delivered a stereopticon lecture on the routes to the Pacific coast and features of the Panama-Pacific Exposition to be held next year. The program also included a lake trip, an inspection of the elevated railroad system of the city, and an inspection of the new passenger terminal of the Chicago & North Western, following a luncheon in the dining room of the terminal, at which the members were the guests of the North Western.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

American Association of Demurrage Officers.—A. G. Thomason, Demurrage Commissioner, Boston, Mass. Annual convention in April.

American Association of Dining Car Superintendents.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next convention, October 22-24, Washington, D. C.

American Association of Freight Agents.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 21-24, 1915, Richmond, Va.

American Association of General Passenger and Ticket Agents.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.

American Association of Railroad Superintendents.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next meeting, May 20-21, 1915, San Francisco, Cal.

American Electric Railway Association.—E. B. Burritt, 29 W. 39th St., New York. Annual convention, October 12-16, Atlantic City, N. J.

American Electric Railway Manufacturers' Association.—H. C. McConnaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

American Railway Association.—W. F. Allen, 75 Church St., New York. Semi-annual meeting, November 18, Chicago.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 20-22, 1914, Los Angeles, Cal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1915.

American Railway Safety Association.—L. F. Shedd, C. R. I. & P., Chicago. Next meeting, November, Chicago.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga. Annual meeting, July, 1915.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 1-4, 1914, New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Mt Royal Sta., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Atlanta, Ga.

Association of Manufacturers of Chilled Car Wheels.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Annual meeting, second Tuesday in October, New York.

Association of Railway Claim Agents.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, 3d week in May, 1915, Galveston, Tex.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual convention, October 26-30, 1914, Chicago.

Association of Railway Telegraph Superintendents.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 22-25, 1915, Rochester, N. Y.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York. Next meeting, December 8-9, 1914, Richmond, Va.

Bridge and Building Supply Men's Association.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meetings, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

Freight Claim Association.—Warren P. Taylor, R. F. & P., Richmond, Va. Annual meeting, June 16, 1915, Chicago.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

International Railway Congress.—Executive Committee, 11, Rue de Louvain, Brussels, Belgium. Next convention, June 23 to July 6, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 W. Broadway, Winona, Minn. Next convention, July 14-17, 1915, Sherman House, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, C. H. & D., Lima, Ohio.

Maintenance of Way and Master Painters' Association of the United States and Canada.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next convention, November 17-19, 1914, Detroit, Mich.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May, 1915.

Master Car and Locomotive Painters' Association of the United States and Canada.—A. P. Dane, B. & M., Reading, Mass.

Master Car Builders' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1915.

National Railway Appliances Association.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railroad Master Tinners, Coppersmiths and Pipefitters' Association.—U. G. Thompson, C. & E. I., Danville, Ill. Annual meeting, May, 1915.

Railway Business Association.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December 10, 1914, Waldorf-Astoria Hotel, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Railway Electrical Supply Manufacturers' Association.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

Railway Fire Protection Association.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala.

Railway Signal Association.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa.

Railway Storekeepers' Association.—J. P. Murphy, L. S. & M. S., Box C, Collinwood, Ohio. Annual meeting, May, 1915.

Railway Supply Manufacturers' Association.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders and Master Mechanics Associations.

Railway Telegraph and Telephone Appliance Association.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake City Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Signal Appliance Association.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

Society of Railway Financial Officers.—Carl Nyquist, C. R. I. & P., La Salle St. Sta., Chicago.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. Ry., Atlanta, Ga.

Southern and Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7122 Stewart Ave., Chicago. Annual meeting June 15, 1915, Minneapolis, Minn.

Transportation Club of Detroit.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

The Augusta-Aiken electric road has requested the South Carolinia State Railroad Commission to authorize the increase of the passenger rates on the road from one cent a mile to two cents.

The southwestern railroads have filed tariffs with the Interstate Commerce Commission, to become effective December 1, making an advance of 10 cents a ton in the freight rates on coal from points in Arkansas, Oklahoma, Louisiana, Mississippi, New Mexico and Texas to all destinations in the southwest and south. A similar advance both on coal and coke is proposed from southern Illinois points and Mississippi river transfer points, including Cairo and East St. Louis, Memphis, Vicksburg and New Orleans to all destinations in Texas.

Practically complete tariffs have been filed with the Interstate Commerce Commission by the railroads in Central Freight Association territory, making an advance of five per cent in the rates as allowed by the commission in the Eastern rate case decision.

P. H. Burnett, industrial commissioner of the Lehigh Valley, has been named by the governor of New York as a representative of the state to the 34th session of the Farmers' National Congress, which is being held this week in Fort Worth, Tex. Mr. Burnett expects to gather at Fort Worth many bits of information which will be of benefit to the farmers along the line of the Lehigh Valley.

After several conferences, the traffic officers of the eastern and western lines at St. Louis have decided to submit to the Interstate Commerce Commission the controversy regarding whether bridge tolls between St. Louis and East St. Louis on through freight shall be paid by the eastern or the western lines. A complaint is to be filed on behalf of the western lines asking for an order by the commission. For many years the east bank of the river has been recognized as the point of interchange at St. Louis, and the western lines have been absorbing the bridge tolls in the through rate, but they wish to discontinue doing so.

Car Surpluses and Shortages

Arthur Hale, chairman of the committee on relations between railroads of the American Railway Association, in presenting statistical bulletin No. 177, giving a summary of car surpluses and shortages by groups from June 1, 1913, to October 1, 1914,

Car Surpluses and Shortages

Date	No. of roads.	Surpluses: Box.	Flat.	Coal, gondola and hopper.	Other kinds.	Total.	Shortages: Box.	Flat.	Coal, gondola and hopper.	Other kinds.	Total.

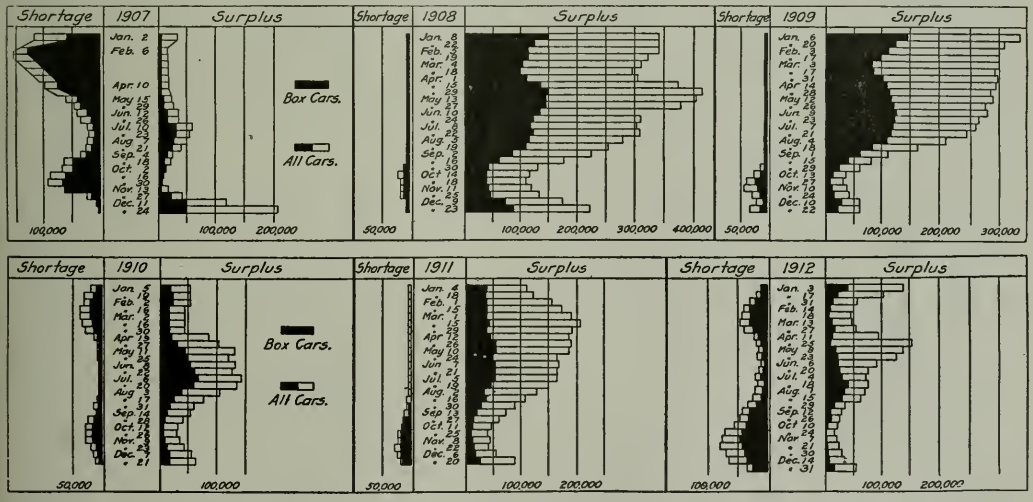
*Group 1 is composed of New England lines; Group 2—New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania lines; Group 3—Ohio, Indiana, Michigan and Western Pennsylvania lines; Group 4—West Virginia, Virginia, North and South Carolina lines; Group 5—Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida lines; Group 6—Iowa, Illinois, Wisconsin and Minnesota lines; Group 7—Montana, Wyoming, Nebraska, North Dakota and South Dakota lines; Group 8—Kansas, Colorado, Missouri, Arkansas and Oklahoma lines; Group 9—Texas, Louisiana and New Mexico lines; Group 10—Washington, Oregon, Idaho, California, Nevada and Arizona lines; Group 11—Canadian lines.



Car Surpluses and Shortages, 1907 to 1914

says: The total surplus on October 1, 1914, was 133,382 cars; on September 15, 1914, 138,108 cars, and on October 1, 1913, 41,994 cars.

The reduction in surplus is about equally divided between box, coal and miscellaneous cars. There is very little change in the flat car surplus.

The total shortage on October 1, 1914, was 2,355 cars; on September 15, 1914, 2,059 cars; on October 1, 1913, 31,620 cars.

The total shortage shows an increase of 304 cars since our September 15 report.

The table on the preceding page gives car surplus and shortage figures by groups for the last period covered in the report, and the diagram shows total bi-weekly surpluses and shortages from 1907 to 1914.

Car Balance and Performance

Arthur Hale, chairman of the committee on relations between railroads of the American Railway Association, in presenting statistical bulletin No. 172, covering car balances and performances for June, 1914, says:

The committee presents herewith statistical bulletin No. 178, covering car balance and performance for June, 1914.

The miles per car per day were 22.7, compared with 22.2 for May. This figure for June, 1913, was 24.3.

Ton miles per car per day for June were 345, compared with 320 for May. This is a decrease of 8.5 per cent compared with the figure for June, 1913, which was 377.

The proportion of home cars on line was 69 per cent, compared with 68 per cent in May. This is an increase of 13 points over June, 1913.

The per cent of loaded car mileage decreased from 68.0 per cent in May to 67.6 per cent in June. This figure for June, 1913, was 69.0 per cent.

The average car earnings per car per day for all cars on line increased 28 cents to $2.46 in June. This figure for June, 1913, was $2.47.

The table on the following page gives car balance and performance in the month covered by the report, and the diagram shows the earnings and car mileage and different car performance figures monthly from June, 1907.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

A hearing was held at Toledo, Ohio, on October 9, before Examiner Carmalt on the relations between the trunk lines and the industrial roads.

Storage-in-Transit Rates on Cotton

The commission has issued the following statement:

For the purpose of assisting the cotton people and carriers in meeting the extraordinary demand for the storage of cotton occasioned by the European war, and for the purpose of providing temporary warehousing space under arrangements approved by the secretary of the treasury and the federal reserve board; and for the purpose of permitting the carriers to recognize the warehouses as points for the storage of cotton in order that such points should be given the benefit of transit privilege, the commission has authorized the carriers to publish tariffs establishing regulations and charges governing storage during the cotton year ending August 31, 1915, in substance as follows:

1. Cotton shipped for warehousing must be consigned to the warehousing point and freight thereto paid on basis of the full local rate.

2. Upon reshipment the shipper will be required to surrender to the agent of the line bringing the cotton into the warehousing point the paid freight bill covering that identical cotton. The number of bales, marks and weights, as forwarded from the warehousing point, must conform to the paid freight bill, and in addition the shipper will be required to certify on the back of the paid freight bill that the cotton tendered is the identical cotton received thereunder. The shipper will also be required to surrender to the railway agent at the time of reshipment the bill of lading covering the movement of the cotton into the warehousing point, unless the bill of lading for such shipment shall have been previously surrendered to the railway.

3. Thereupon the agent will issue a through bill to the further final destination at the through rate from the point of origin to such final destination in effect at the time of the original shipment into the warehousing point, plus three cents per 100 lb., provided such final destination is a point to which there are established through rates in effect from the original point of shipment via the warehousing point (provided, that at the option of any interested line the minimum through rate will be that from the warehousing point plus the stoppage charge of three cents per 100 lb.).

Shipments will be waybilled out of the warehousing point at the balance of the rate, plus the stoppage charge of three cents.

STATE COMMISSIONS

The application of the Illinois railroads for permission to increase grain rates five per cent has been denied by the Illinois Public Utilities Commission.

The Missouri Public Service Commission has suspended tariffs recently filed by the western railways canceling the concentration privilege on poultry and dairy products.

The commissions of both North Carolina and South Carolina have given approval of the discontinuance of certain trains on the Southern Railway, as applied for by the company, on the ground that income had been seriously diminished by the dullness of general business.

The Kansas Public Utilities Commission has filed complaints with the Interstate Commerce Commission against the proposed advance of five cents per 100 lb. in the rates on codfish goods from points east of the Mississippi river to points in Kansas; also against new tariffs filed by the western roads incrasing the demurrage charges for refrigerator cars.

Citizens of East Berlin, Adams county, Pennsylvania, have appealed to the Public Service Commission of that state to compel W. G. Leas to show cause why he does not operate the East

Berlin Railroad. This road extends from East Berlin south about 7 miles to a junction with the Western Maryland, between Hanover and Gettysburg. The property was bought at receivers' sale in July, and on September 9 its operation was discontinued. Now the residents of East Berlin have no railroad facilities and the nearest railway station is New Oxford, seven miles distant.

The Illinois Public Utilities Commission at a hearing in Chicago on October 12, which was attended by a large number of shippers and railroad officials, announced its intention of formulating a new set of switching rules and regulations for the state. The present rules, reached by agreement of a committee of railroad men and shippers about three years ago, have been the subject of many complaints, and the commission has decided to make an investigation of the entire subject. Two committees, one representing the shippers, and another representing the railroads, will be appointed to meet with one of the commissioners to draft uniform rules.

The Missouri Public Service Commission, on October 6, issued an order denying the application of the Missouri railways to put into effect increased passenger, freight and excess baggage rates which were filed with the commission on September 15. The commission said that the roads were without authority to change rates fixed by statutes by simply filing tariffs without first obtaining authority to do so from the commission. The commission declined to issue any such order without a protracted investigation, and therefore denied the petition. It announced, however, that it would consider the application of the roads for increased rates at a hearing to begin at Jefferson City on October 27, when it will undertake a detailed investigation.

The New York State Public Service Commission, Second district, has received petitions from large numbers of citizens asking the commission to forbid the discontinuance of passenger and freight trains on the line of the Buffalo & Susquehanna Railway between Buffalo and Wellsville, which has been announced to take effect November 1. It is said that milk to the amount of 6,000 gallons is brought into Buffalo each day by this road. Justice Charles H. Brown of the State Supreme Court tells the commission that "consternation seems to have swept the whole of the Genesee Valley" because of the proposed suspension of traffic, which is looked upon as a calamity. It is said that the Pennsylvania Railroad has made a proposition to operate the line in question, which is 90 miles long.

PERSONNEL OF COMMISSIONS

F. H. Bagley, signal supervisor of the L. C. & L. division and the Louisville terminals of the Louisville & Nashville, has taken a position as senior signal engineer with the valuation department of the Interstate Commerce Commission of the southern district. His headquarters are at Chattanooga, Tenn.

COURT NEWS

The appellate court of Kentucky has sustained the decision of a lower court imposing a fine of $1,900 on the Nashville, Chattanooga & St. Louis for failure to make reports of values required by the state auditor under the taxing laws of the state.

Judge Adams of the United States Circuit Court at St. Louis, in charge of the receivership of the Wabash, has ordered the receiver to apply to the Interstate Commerce Commission and the various state Public Service Commissions for authority to increase passenger and freight rates. The order was issued after Receiver Pryor had submitted the annual report showing that with the second largest gross earnings in the history of the road, it was unable to pay its fixed charges.

The United States Department of Agriculture announces that a railroad company and two individuals have been fined in court for shipping lumber from an area quarantined by the government on account of the gipsy and brown-tail moths. The fines were imposed as follows: Boston & Maine Railroad Company, five violations, $125; L. M. Perkins, agent for the B. C. Jordan estate, Alfred, Me., $75; L. L. Clark, Hollis, Me., $50. The quarantine became effective on November 25, 1912, and was designed to prevent the spread of the injurious insects named.

Railway Officers

Executive, Financial, Legal and Accounting

G. F. Buskie has been appointed auditor of the Missouri, Kansas & Texas, with headquarters at St. Louis, Mo., succeeding E. B. Pierce, resigned.

E. W. Grice, assistant general manager of the Chesapeake & Ohio at Richmond, Va., has been appointed assistant to president, with headquarters at Richmond.

G. K. Wecks has been elected president of the San Francisco-Oakland Terminal Railways, with headquarters at Oakland, Cal., succeeding W. A. Bissell, resigned.

George P. Johnson, who resigned recently as general manager of the Chesapeake & Ohio, has been elected president of the Virginia-Carolina and the New River, Holston & Western, succeeding W. E. Mingea, resigned.

Bryan Snyder, secretary and traffic manager of the Marshall & East Texas, has been elected vice-president and general manager, with headquarters at Marshall, Tex., in place of J. E. Votaw, resigned. Mr. Snyder will have charge of all departments and the position of traffic manager is discontinued.

J. W. Comiskey has been appointed car accountant of the Galveston, Harrisburg & San Antonio, the Texas & New Orleans, the Houston & Texas Central, the Houston East & West Texas and the Houston & Shreveport, with headquarters at Houston, Tex., succeeding D. B. Keiser, retired under the pension regulations. Mr. Comiskey has been chief clerk in the office of Mr. Keiser.

L. A. Farquhar, whose appointment as auditor of the Norfolk Southern, with headquarters at Norfolk, Va., has been announced in these columns, was born on July 17, 1880, near Hempstead, Tex., and graduated in 1896 from the Hempstead high school. He began railway work on August 1, 1900, as a clerk in the local office of the Houston & Texas Central, at Hempstead, Tex., and subsequently was cashier in the same office. In November, 1905, he was appointed joint station ticket agent of the Houston & Texas Central and the Missouri, Kansas & Texas at Austin, and in August of the following year became chief clerk to division superintendent of the Houston & Texas Central. From June 9, 1909, to November 18, 1911, he was in the service of the Sunset-Central Lines consecutively as chief clerk in the general accountant's office, traveling and general office accountant, chief clerk to auditor, and accountant in the auditor's office at Houston. He was then special accountant on efficiency work in the controller's office of the Union Pacific and Southern Pacific Systems at New York until January 31, 1913, and then became special accountant on efficiency work in the controller's office of the Union Pacific System at New York, which position he held at the time of his recent appointment as auditor of the Norfolk Southern as above noted.

Operating

W. T. Tyler has been appointed division superintendent of the Northern Pacific, with headquarters at Pasco, Wash.

E. C. Penn has been appointed chief despatcher of the Virginian Railway, with headquarters at Princeton, W. Va., succeeding A. A. Owen, deceased.

R. T. Arthur has been appointed trainmaster of the Missouri, Kansas & Texas at Denison, Tex., succeeding A. N. Williams, resigned, to take service with another company.

E. D. Hogan has been appointed superintendent of transportation of the New Orleans, Mobile & Chicago, with office at Laurel, Miss., succeeding D. W. Davis, assigned to other duties.

J. B. Purkheiser, trainmaster of the Baltimore & Ohio Southwestern at Cincinnati, Ohio, has been transferred to Seymour, Ind., as trainmaster of the Cincinnati & Louisville district, and E. J. Lampert has been appointed trainmaster of the Cincinnati terminals.

T. S. Mahoney, superintendent of the New Orleans division of the Texas & Pacific, has been appointed superintendent of the Transcontinental division, with headquarters at Texarkana, Tex., succeeding R. B. Ayres, resigned. Mr. Ayres has been with the Texas & Pacific continuously since 1880.

C. C. Walker, assistant to general manager of the Chesapeake & Ohio at Richmond, Va., has been appointed superintendent of passenger transportation, and E. P. Goodwin, superintendent of transportation at Richmond, has been appointed superintendent of freight transportation, both with headquarters at Richmond, Va.

Traffic

Robert W. Dowe has been appointed live stock agent of the International & Great Northern, with headquarters at Eagle Pass, Tex.

Gordon Alexander, traveling freight agent of the Cleveland, Cincinnati, Chicago & St. Louis at New York, has been appointed general eastern freight agent, with headquarters at New York.

W. P. Hinton, assistant passenger traffic manager of the Grand Trunk Pacific at Winnipeg, Man., has been appointed assistant passenger traffic manager also of the Grand Trunk, and his headquarters have been transferred to Montreal, Que.

Stuart A. Allen, general agent, freight department, of the Baltimore & Ohio Southwestern and the Cincinnati, Hamilton & Dayton at Cincinnati, Ohio, has been appointed general manager of the Continental Line and Central States Despatch, to succeed T. H. Noonan, deceased.

O. P. Bennett, general agent, freight department, of the Chicago & Alton at Minneapolis, Minn., has been appointed general agent, traffic department, at Kansas City, Mo. C. R. Murray, district passenger agent at Detroit, Mich., has been appointed western passenger agent at Kansas City. W. C. Mueller, general agent, passenger department, at Kansas City, has been appointed general agent, traffic department, at Milwaukee, Wis. W. J. Dibble, commercial agent at Kansas City, has been appointed general agent, traffic department, at Minneapolis.

William T. Grier, general coal and freight agent of the Lehigh Valley at New York, has been appointed to the new position of general traffic manager in charge of passenger and freight business, with headquarters at New York. He was born on April 8, 1886, at Philadelphia, Pa., and was educated in the common schools. He began railway work in August, 1883, and was office boy and stenographer in the coal traffic department of the Philadelphia & Reading until 1888. He was then to August, of the following year, assistant chief clerk in the freight department of the same road. From August, 1889, to November, 1895, he was chief clerk in the coal, freight and passenger departments of the Beech Creek Railroad, now a part of the New York Central & Hudson River, and was then to June, 1906, general manager of the Delaware River & Union. In June, 1906, he was appointed coal freight agent of the Lehigh Valley, and in January, 1912, was appointed general coal and freight agent, which position he held at the time of his recent appointment, as general traffic manager of the same road as above noted.

W. T. Grier

Engineering and Rolling Stock

G. F. McKenzie, section foreman on the Houston & Texas Central, has been appointed roadmaster at Corsicana, Tex.

R. F. Morkill, signal engineer of the Grand Trunk Railway System, has been gazetted a lieutenant in the Engineers' Corps, Canadian Contingent, and has left with his company for active service in England and France.

C. S. Yeaton, supervisor of locomotive operation of the Chicago, Rock Island & Pacific at El Reno, Okla., has been appointed road foreman of equipment at that place, succeeding O. F. Covalt, assigned to other duties.

Harold Knight, whose appointment as signal engineer of the Erie, with headquarters at Jersey City, N. J., has been announced in these columns, was born in October, 1881, at Stockport, Pa., and was graduated from Lawrenceville school in 1901, and from Yale university in 1904. In August of the latter year he began railway work as a rodman on the Susquehanna division of the Erie. The following March he went to the Pennsylvania Railroad as rodman at Elmira, N. Y., and in July, 1905, returned to the service of the Erie as transitman on the Susquehanna division. Shortly afterward he was appointed assistant engineer on the same division, and in June, 1908, he was made division engineer of the Allegheny division. On November 1, 1912, he was appointed division engineer of the New York division, which position he held at the time of his recent appointment as signal engineer of the same road as above noted.

OBITUARY

C. J. Drury, division master mechanic of the St. Louis & San Francisco at Sapulpa, Okla., died on September 30, at the age of 36.

George N. Mills, who had been real estate and tax agent of the Missouri district of the Chicago, Burlington & Quincy since 1897, died at his home in St. Louis, Mo., October 7.

Oliver S. Lyford, vice-president of the Chicago & Eastern Illinois, died at the home of his son, W. H. Lyford, at Wheaton, Ill., on October 12, aged 91 years. He had been connected with the Chicago & Eastern Illinois since January, 1878, and had been in railway service 68 years.

George A. Goodell, general manager of the Northern Pacific lines east of Paradise, Mont., with headquarters at St. Paul, Minn., died on October 3, aged 59 years. Mr. Goodell had been in railway service since July, 1868, when he began as messenger boy for the Chicago, Burlington & Quincy. He was successively telegraph operator, station agent and train despatcher of that road until July, 1876, when he became ticket agent of the Toledo, Peoria & Warsaw at Burlington, Iowa. The following October he went to the Burlington, Cedar Rapids & Northern, and was consecutively telegraph operator, station agent, train despatcher, superintendent of telegraph, assistant superintendent and superintendent, until March, 1902, when he was appointed general superintendent of the Chicago Great Western at St. Paul. He left that road in December, 1907, to become general superintendent of the Central district of the Northern Pacific, and in November, 1909, he was promoted to general manager of the lines east of Paradise.

George A. Clark, president of the Tennessee, Kentucky & Northern, died at the Hyde Park Hotel, Chicago, on October 11, aged 45 years. He began railway work in 1880 with the Chicago, Milwaukee & St. Paul as messenger, and subsequently was employed with that road, the Chicago, St. Paul, Minneapolis & Omaha, the Atchison, Topeka & Santa Fe, the St. Paul & Duluth, the Chicago Great Western, the Great Northern and the "Soo" Line successively as clerk, agent, telegraph operator, train despatcher and trainmaster. From 1895 to January, 1903, he was with the Illinois Central as trainmaster, superintendent of the Omaha division at Ft. Dodge, Iowa; superintendent of the Springfield division at Clinton, Ill., and superintendent of the Tennessee division at Fulton, Ky. He then became general manager of the Tennessee Central, and subsequently was vice-president and general manager until December, 1905, at which time he went to the New Orleans, Texas & Mexico as vice-president. In July, 1908, Mr. Clark returned to the Tennessee Central as general manager, and in October, 1909, he was appointed receiver of the Cincinnati-Nashville Southern, which office he held until he became president of the Tennessee, Kentucky & Northern in September, 1912.

Equipment and Supplies

LOCOMOTIVE BUILDING

Mitsui & Company, New York, are in the market for 3 0-4-2 type locomotives.

The Richmond, Fredericksburg & Potomac is in the market for 5 Pacific type locomotives.

The New Zealand Government Railways are inquiring for a number of Pacific type locomotives.

The United States Gypsum Company, Chicago, is in the market for one six-wheel switching locomotive.

The Citizens' Gas Company, Indianapolis, Ind., is in the market for one six-wheel switching locomotive.

The Hoboken Manufacturers' Railroad has ordered one switching locomotive from the Baldwin Locomotive Works.

The Cuban-American Sugar Company, New York, has ordered one Mogul type locomotive from the Baldwin Locomotive Works.

The Randolph MacDonald Company, Toronto, Ont., has ordered one four-wheel switching locomotive from the American Locomotive Company.

The Cranford Company, Brooklyn, N. Y., is reported to have ordered one four-wheel switching locomotive from the American Locomotive Company. This item has not been confirmed.

The Nashville, Chattanooga & St. Louis, reported in the *Railway Age Gazette* of October 2 as being in the market for 7 Pacific and 10 Mikado type locomotives, is now reported to have postponed its inquiries until after the first of the year.

CAR BUILDING

The Nashville, Chattanooga & St. Louis is in the market for 6 steel passenger and 2 steel postal cars.

Okura & Company, New York, are asking prices on 1,000 30 and 40-ton standard gage cars for export.

The Southern Pacific is in the market for 16 coaches, 6 combination passenger and smoking cars, and 2 combination passenger and express cars.

The Louisville & Nashville has ordered 1,000 underframes which it will apply in its own shops. The same road is also planning to place an order for 870 cars in the near future.

IRON AND STEEL

The Union Terminal Company has ordered 1,285 tons of steel for the Union station at Dallas, Tex., from the American Bridge Company.

The Missouri Pacific has ordered 228 tons of material for a viaduct at Atchison, Kan., from the Morava Construction Company, Chicago.

SIGNALING

The Northern Pacific has given the Union Switch & Signal Company a contract for a mechanical interlocking plant at Steilacoom Creek lift bridge, Washington.

The Queensland Government Railway Shop.—The principal shops of the government owned railways of Queensland, Australia, are at Ipswich. These shops were established about 1869 and over $2,500,000 has been expended on them. The employees number 1,700. The locomotives and other rolling stock of the railways are built and repaired here, and the yearly output has recently been about 16 large locomotives, 50 passenger cars and 500 freight cars. There are, it is claimed, no car shops in the world in which native timbers of such great variety and beauty of grain and color are utilized as at Ipswich.

Supply Trade News

Spencer Van Cleve, president of the Erie Foundry Company, died on September 29.

I. H. Case, railroad representative of the Dearborn Chemical Company, Chicago, has resigned from his position with that company.

The Independent Pneumatic Tool Company, Chicago, has appointed V. W. Robinson its representative in Michigan, with headquarters at Detroit. F. J. Passino, the former representative in Michigan, has been appointed representative in the southwest to succeed H. F. Finney, promoted to a position in the general sales office at Chicago.

Frank W. Skinner, for many years senior associate editor of the Engineering Record, has opened consulting offices at 45 Broadway, New York, and in the Crabtree Annex, St. George, Staten Island, and is associated with C. E. Fowler, of Seattle, Wash. Mr. Skinner will continue in the field of bridge and structural steel work, foundations and general civil engineering field construction methods, operations and plant with which he has long been extensively identified, and will also specialize in the preparation of engineering cases for litigation, expert witness research and testimony, preparation and mediation of cases in controversy, and in the preparation of technical, commercial, popular and miscellaneous descriptions of engineering construction.

TRADE PUBLICATIONS

Cranes and Hoists.—The Canton Foundry & Machine Company, Canton, Ohio, has issued a leaflet descriptive of the new Canton back geared portable floor crane and hoist.

Fire Shovels.—The National Malleable Castings Company, Cleveland, Ohio, has recently issued circular No. 53, descriptive of the company's line of malleable iron fire shovels.

Electrical Appliances.—The Sprague Electric Works of the General Electric Company, New York, has issued bulletin No. 48701, descriptive of Sprague Electric Dynamometers.

Pneumatic Tools.—The Monarch Pneumatic Tool Company, East St. Louis, Ill., has issued bulletin No. 18-A, illustrating a large number of the Monarch line of pneumatic tools.

Pumping Machinery.—The American Well Works, Aurora, Ill., has issued a folder illustrating and treating of the advantages of the American deep well turbine centrifugal pumps.

Railway Signal Apparatus.—The Union Switch & Signal Company has recently issued bulletins Nos. 79 and 80 descriptive, respectively, of the Model 14 Electric Crossing Gate and the Model 13 Low Voltage Direct Current Switch Movement.

Iron.—The American Rolling Mill Company, Middletown, Ohio, has recently issued a booklet, the idea of which is well expressed by the quotation from Thackeray that is printed on the cover: "Next to excellence is the appreciation of it." The booklet contains 28 pages of letters from persons and companies who have used Armco-American ingot iron and have desired to express their appreciation of it.

Electrical Apparatus.—The General Electric Company has recently issued bulletins No. 48014, 42800 and 46390. The first deals with mine hoist equipment, takes up the question of the economy of electric drive, and treats of the general subject of underground hoists, their operation and control. Bulletin No. 46390 describes the Thomson direct current test meter, type CB-5, which combines in one standard several capacities covering a range from light load to full load, and thereby makes possible rapid testing, since no time is lost in changing standards. Bulletin No. 42800 is a reprint of an article on air compressors for foundry use which appeared in the General Electric Review. This article compares centrifugal compressors with the ordinary fan blower and the positive pressure blower. It aims to show the superiority of the centrifugal compressor for foundry work. All three bulletins are profusely illustrated.

Railway Construction

Campbellford, Lake Ontario & Western.—See Canadian Pacific.

Canadian Pacific.—Plans have been made for extending the Georgian Bay & Seaboard from Bethany Junction, Ont., to Belleville, also for an extension of the Campbellford, Lake Ontario & Western from Shannonville to Kingston. The extensions have been surveyed, but the company has no intention of extending these lines in the near future.

The route map for a projected line from Dunelm, Sask., southwest to Instow has been approved by the minister of railways, but the company does not expect to start the construction work in the near future. Dunelm is nine miles south of Swift Current, on the line to Vanguard, and Instow is about 28 miles south of Gull Lake.

The Coronation sub-division of the Alberta division has been extended from Monitor, Alta., east to Kerrobert, Sask., 74.6 miles. The Suffield sub-division has been extended from Retlaw, Alta., west to Lomond, 27.1 miles, and the Columbia Valley subdivision of the British Columbia division has been extended from Spillimacheen, B. C., south to Edgewater 18.5 miles.

Cedar Rapids & Iowa City.—The Mt. Vernon division has been extended from Mt. Vernon, Iowa, to Lisbon, two miles.

Fourche River Valley & Indian Territory.—This road has been extended from Bellevue, Ark., to Thornburg, 5.6 miles.

Georgian Bay & Seaboard.—See Canadian Pacific.

Jonesboro, Lake City & Eastern.—This company, which operates a 63-mile line from Jonesboro, Ark., to Barfield, is planning to build two extensions, it is said, to timber lands.

McKinney, Bonham & Paris Interurban.—Preliminary surveys have been made, it is said, and rights of way are being secured to build a 60-mile line in Texas. L. A. Scott, president, and J. F. McReynolds, director, McKinney, Tex.

Missouri Roads.—Preliminary work is now under way, it is said, for a line to be built from Springfield, Mo., southeast to Mountain Home, Ark., about 80 miles. E. C. McAfee, Woodruff building, Springfield, is interested.

New York Subways.—Bids were recently opened by the New York Public Service Commission, First district, for the section of the Park Place, William and Clark street subway from the Seventh avenue subway in West Broadway through Park Place and under the postoffice building and Beekman street to William street in the borough of Manhattan. The contract was given to Frederick L. Cranford, Inc., the lowest bidder, who offered to do the work for $1,571,363.

The commission has approved the award by the New York Municipal Railway Corporation to the Thomas Crimmins Contracting Company at $197,442, of the contract for the installation of the third-rail, etc., in the Fourth avenue subway, borough of Brooklyn, between the Manhattan bridge and Eighty-sixth street. It has also approved the award made by the same corporation to the Terry & Tench Company, Inc., the lowest bidder at $321,306 of the contract for the construction of additional tracks on the Broadway elevated railroad in the borough of Brooklyn between Havemeyer street and Myrtle avenue.

Niagara River & Eastern.—Under this name a company has been incorporated in New York with $1,500,000 capital, it is said, to build a railroad. The incorporators include F. C. Conette, Buffalo; C. Hickey, Lockport, and F. A. Dudley, Niagara Falls.

Oil Belt Terminal.—Incorporated in Oklahoma, with headquarters at Jennings, Okla., to build from Jennings, south to Drumright, thence west to Cushing, about 25 miles. It is understood that the line is eventually to be extended south into Lincoln county. Surveys are now being made. C. N. Haskell, Tulsa, former governor of Oklahoma, is back of the project, and H. Fulton is chief engineer.

Seaboard Air Line.—An officer writes that it is undecided when the construction work will be carried out to complete the 22-mile line from Bartow, Fla., east via Alturas, and a point north of Lake Wales, to about 1.6 miles east of Hard Luck lake. A grading contract was let in the early part of this year to A. F. Langford, Valdosta, Ga., and track has been laid on about 35 per cent of the line.

Southern Pacific.—The Susanville sub-division of the Salt Lake division has been extended from Susanville, Cal., to Westwood, 29.4 miles.

Uvalde & Northern.—Arrangements are now being made, it is said, to resume construction work on this line, which was suspended on account of the financial stringency. Several miles have been graded on the first section under contract from Uvalde, Tex., north to the kaolin mines near Leakey. It is understood that the line is to be extended north to San Angelo, about 200 miles. L. J. Hurd, president, Kansas City, Mo.; F. H. Dillon, chief engineer, Sansom, Tex. (June 5, p. 1257.)

Waycross & Western.—This road has been extended from Sirmans, Ga., to Newgrade, two miles.

RAILWAY STRUCTURES

Bentley, Iowa.—The Chicago Great Western is contemplating the construction of a small passenger station at Bentley, Iowa. This company has also under construction a passenger station at Mason City, Iowa, which is of brick, hollow tile and stucco construction with a green tile roof. It is 107 ft. 6 in. by 32 ft. 6 in. in area and one story high. D. L. Stratton, Mason City, Iowa, is the contractor. The work is expected to be completed in about a month. At Conception, Mo., the Chicago Great Western and the Wabash are jointly building a passenger station. At this point the Wabash is elevated, while the Chicago Great Western runs below grade. The station is placed between the two elevations and will be used by both roads. T. S. Leake & Co., Chicago, is the contractor. Small passenger depots are also being built at Randolph, Minn., and at Dewar, Iowa. John Jacobs, Marshalltown, Iowa, is doing the work. The work completed by this railroad company consists of three 100-ton Holmen type coaling stations at the following points: Carroll, Iowa; St. Joseph, Mo., and Kenyon, Minn., and a wooden 50-ton coaling plant, Holmen type, at Red Wing, Minn. Roberts & Schaefer, Chicago, were the contractors. At Kansas City, Kan., four additional grain tanks have just been added to the company's grain elevator at that point. These tanks are of concrete construction and are 28 ft. in diameter and 85 ft. high, each, and have a total added capacity of 86,500 bu.

Carthage, N. Y.—Contracts have been let by the New York Central & Hudson River for the elimination of the present grade crossings at West End avenue, at John street and at Pannery street, in Carthage, as follows: For the sub-structures to W. M. Ballard, for the superstructures to the Fort Pitt Bridge Works and for the waterproofing to Bird & Son, New York.

Jacksonville, Fla.—A contract is reported let by the Atlantic Coast Line to E. W. Parker, Tampa, Fla., for putting up a storage building, 130 ft. by 267 ft. The proposed structure is to have retaining walls, foundations and floors of reinforced concrete with a wood superstructure. The cost of the improvements will be about $45,000.

Jane Lew, W. Va.—The station at Jane Lew, W. Va., on the West Virginia & Pittsburgh division of the Baltimore & Ohio, which was recently destroyed by fire, will be rebuilt by the railroad company's forces. Work will be started at once.

New York.—The New York Public Service Commission, First district, has given the contract to the Rapid Transit Subway Construction Company at their bid of $3,097,312 for building the diagonal station under Forty-second street and the connecting link between the existing subway and the new Lexington avenue subway, in the borough of Manhattan. (October 9, p. 671.)

Philadelphia, Pa.—The Public Service Commission of Pennsylvania has approved the track elevation contract entered into between the officers of the city of Philadelphia and the Philadelphia & Reading. The contract provides for the opening of Emerald and Tulip streets, which are to pass under the P. & R. elevated tracks between Lehigh avenue and Somerset street. The cost of the work, about $1,000,000, is to be equally divided between the city of Philadelphia and the railroad company.

Waycross, Ga.—Work is now under way by the Atlantic Coast Line, it is said, on the foundations for an addition to the machine shops at Waycross.

Railway Financial News

Atlantic Coast Line.—See Florida Central.

Baltimore & Ohio.—The following is an abstract of a circular sent to stockholders:

At the stockholders' meeting to be held on November 16, 1914, the stockholders will be asked to consider a plan for a general refunding and improvement mortgage, which will provide in a comprehensive way for present needs and future financial requirements of the company. This company has now outstanding bonds secured by its several mortgages as follows: Prior lien bonds $75,000,000, maturing July 1, 1925; first mortgage bonds $81,000,000, maturing July 1, 1948; redeemable on and after July 1, 1923; Pittsburgh junction & middle division bonds $6,125,280, maturing November 1, 1925; Southwestern division bonds $45,000,000, maturing July 1, 1925; Pittsburgh, Lake Erie & West Virginia system refunding mortgage bonds $43,441,500, maturing November 1, 1941, redeemable on and after November 1, 1925. This company has also outstanding its convertible bonds $63,250,000, maturing March 1, 1933, redeemable on and after March 1, 1923. In addition there are outstanding bonds secured by underlying mortgages on railroads forming a part of the system and subsidiary lines aggregating $30,781,000 and maturing at different dates.

The market for other securities not having been favorable in the recent past it became necessary for the company to issue short-time notes for its requirements; the issue of such notes at present outstanding amounts to $35,000,000, maturing June 1, 1915.

With the exception of the first mortgage, which provides for a further issue of $1,000,000 of bonds each year for nine years, the several mortgages of the company afford no provision for future requirements. Consequently, there has been under consideration for some time past a plan for making a mortgage covering the entire system and subsidiary lines, under which bonds may be issued to retire existing indebtedness as it matures, and to provide funds needed from time to time for additions to and extension of the company's railroad and property, necessary for the further development of the important territory occupied by your lines and to care for the constantly expanding traffic.

The stockholders will be asked to consider a plan to meet the financial requirements of the company as above indicated and, if approved, to authorize the execution of a mortgage covering the entire system and subsidiary lines, under which bonds may be issued in series from time to time for refunding and other corporate purposes. Each series as issued will bear such rate of interest and generally be in such form as to best meet then existing conditions; but all will be equally secured by the same mortgage. It is proposed to limit the amount of bonds which may be issued under the mortgage to $600,000,000, unless the stockholders should later give further consent to additional issue, but at no time shall the amount outstanding, together with all prior debt, exceed three times the capital stock of the company.

Chicago, Rock Island & Pacific.—Judge Mayer, in the federal district court, has denied the application of some of the railroad collateral bondholders to delay the sale of the collateral under the Railroad 4's, and has ordered this collateral sold. The protective committee, of which James N. Wallace is chairman, has announced the plan which this committee has for the purchase of the collateral. The plan provides for the purchase by the committee of the Railway company stock which is collateral for the Railroad bonds, and the distribution of this stock to depositing bondholders on the basis of ten shares of stock to each $1,000 bond. If all the bondholders do not assent to the plan it will be necessary to raise cash to pay off the non-depositing bondholders. This is the only cash to be called for.

Holders of certificates of deposit for the bonds, who shall have complied with the conditions of the plan and the deposit agreement, and paid their proportionate share of the cash requirements, are to receive, on the completion of the plan and surrender of their certificates, for each $1,000 bond represented: (1) ten shares of stock of the Chicago, Rock Island & Pacific Railway, the operating company; (2) their proportionate part of so much of the pledged stock acquired by the committee as shall be in excess of the face amount of the deposited bonds, and that shall not have been disposed of by the committee as provided toward meeting the cash requirements; (3) a certificate entitling the holder to $1,000 face amount of deposited bonds when stamped as required in the foreclosure suit to indicate the payment of the amounts paid or credited thereon out of the proceeds of sale of the pledged stock.

Erie.—Robert W. Pomeroy, of Buffalo, N. Y., and M. D. Follansbee, of Chicago, have been elected directors, succeeding Charles A. Peabody and H. P. Davidson.

Florida Central.—This road, running from Thomasville, Ga., to Fanlew, Fla., 47 miles, has been sold under foreclosure to the Atlantic Coast Line for $22,000, subject to a mortgage which the Atlantic Coast Line holds for $200,000.

New York Central & Hudson River.—Of the $40,000,000 4½ per cent bonds which were offered by bankers in April at a price to yield 4.70 per cent, about $8,000,000 remain unsold and these bonds are being offered at a price to yield 5.03 per cent.

The New York Public Service Commission, Second district, has unanimously approved the plan of consolidation of this company and of the Lake Shore & Michigan Southern. In part the commission says:

"We find nothing to indicate any intent on the part of the petitioners to over-capitalize either in stocks or bonds. The proposed stock issue of about $250,000,000 by the new company is some $50,000,000 in amount less than the combined capital stock of the constituents; while the outstanding bonded indebtedness of the new company on account of the New York Central-Lake Shore collateral trust bonds can at no time exceed the precise amount at that time unpaid of the original debt, whether represented by the original bonds or by the new 4's." The commission approves heartily of the system of financing to be adopted under the merger, and says that the consolidation of the properties would inure to the advantage of the general public.

In settling the question raised by opponents of the merger, as to whether or not an increase in the interest rates from 3½ per cent on Lake Shore collaterals to 4 per cent on new bonds to be issued in exchange therefore, constitutes a violation of the state railroad law in connection with the issue of additional securities, "in connection" or "in consideration for" consolidation, the commission is of the opinion that if the law were interpreted as argued by the objectors to the consolidation it would effectually prevent the issue of all refunding bonds in consolidation proceedings.

New York, Ontario & Western.—F. L. Lovelace has been elected a director.

Ohio River & Columbus.—This road, which runs from Ripley, Ohio, to Sarginia, 22 miles, has been placed in the hands of Charles J. Finger, general manager, as receiver. The receiver was appointed on the application of the minority stockholders.

Southern Railway.—See comments on the annual report and the reduction of dividends in the editorial columns; also reduction in salaries noted in general news columns.

Dr. Edwin A. Alderman, president of the University of Virginia; John Kerr Branch, a banker of Richmond; Dr. John C. Kilgo, bishop of the Methodist Episcopal Church and a resident of Durham, N. C., and Robert Jemison, of Birmingham, Ala., have been elected directors, succeeding W. W. Finley and H. C. Fahnstock, both deceased, and George F. Baker, Jr., and E. H. Gary, resigned. Charles Steele, of J. P. Morgan & Co., was re-elected, as were the other directors.

Union Pacific.—The monthly statement of revenues and expenses for August contains the announcement that "in order to save the expense of issuing these statements monthly they will be discontinued, and hereafter a statement of operating revenues and operating expenses will be enclosed with the quarterly dividend check."

The Swiss State Railways.—A press despatch states that the federal railways of Switzerland in August of this year, the month in which as a rule their earnings are largest, had traffic receipts of only $2,002,000, showing a falling off of $2,036,185 as compared with August, 1913—more than 50 per cent. The operating expenses, on the other hand, amounted to very little less than in 1913—$1,963,400 as compared with $2,199,288.

ANNUAL REPORT

TWENTIETH ANNUAL REPORT—SOUTHERN RAILWAY COMPANY

RICHMOND, VA., October 13, 1914.

To the

Stockholders of Southern Railway Company:

The Board of Directors submits the following report of the affairs of the Company for the year ended June 30, 1914:

This is the twentieth annual report of the Company and concludes the record of the administration under the Voting Trust, which was created on its organization in 1894. It is, therefore, a fitting time for retrospect, and the Board of Directors deems it appropriate to submit again to the stockholders, as a part of this report, the circular issued by the Voting Trustees under date of June 30, 1914, announcing the surrender of their trust. It will be found at page 12. This circular is not only a history of what this Company has accomplished, but, as it illustrates the growth of the industrial South during the past twenty years, serves also as an earnest of the future which may reasonably be expected for this Company.

The actual result of the operations for the year, and the financial condition of the Company at the close of the year, will appear by reference to the Income Statement (page 30) and the General Balance Sheet (pages 34 and 35), which are part of this report. It will be observed that the operating revenues continued to increase during the year, but that the rate of such increase (1.47 per cent.) was less than in recent years, while the rate of increase of operating expenses (4.76 per cent.) continued undiminished. The slackening in the general volume of business done in the United States, which has been so marked during the past year, was felt last of all in the South, but had become part of the problem of management of this Company with the opening of the calendar year 1914. The high level of expense of operation is maintained not so much by any natural economic law, not by any deliberate intention or neglect of management, as by general social tendencies which are in substantial measure abnormal and beyond control of management. It can hardly be expected that the operation of an American railroad shall be again on a normal basis unless, and until, the question of the railroads shall cease to be a factor in American politics. To state this fact is but to repeat the statement of the contemporary plight of the railroads which has been so frequently ureged upon the American public in recent years. It is mentioned here simply to illustrate its application to the fortunes of Southern Railway Company.

An intelligent appreciation of what is meant by the Income Statement of a railway company is obscured for many people by the very size of the figures which make it up. To talk in millions, even of expenses and debts, seems to some to be riches. It is, therefore, illuminating to reduce the results of such a company as this to a smaller and more comprehensible unit, such as that applied to their own affairs by many of those who do business with a railway company. To that end we have adopted for the following statement the unit of $100., and submit it here to show what have been the results for the year just closed and in order to demonstrate general tendencies. There are added similar units for the two three-year periods included in the past six years of the history of the Company.

OPERATING RESULTS REDUCED TO BASIS OF $100.

	Three Years Ended June 30,		Year Ended June 30,
	1911.	1914.	1914.
Income:			
From Operations	$94.77	$95.18	$95.51
From Interest, Dividends, Rents, Privileges, etc.	5.23	4.82	4.49
Gross Income	$100.00	$100.00	$100.00
Disposition of Income:			
For Operating Expenses	$64.20	$67.22	$69.44
For Taxes	3.41	3.59	3.68
For Rents of Roads Leased, Trackage Rights, Equipment, Privileges, etc.	4.24	4.72	5.22
For Interest on Bonds, Notes, Equipment Obligations, etc.	18.70	15.62	15.02
For Discount on Securities Sold, charged to Income	.52	.04	...
For Additions to Property through Income	.11	.09	.12
Surplus	8.82	8.72	6.52
	$100.00	$100.00	$100.00
Investment in Property:			
Per $100 of Revenue	$592.41	$528.68	$518.48
Average return on Investment in Property	1.49%	1.65%	1.36%
DIVIDENDS PAID:			
Per $100 of Income	$0.67	$3.96	$3.71
Average Rate of Dividends	0.67%	4.67%	4.5%
DISCOUNT CHARGED TO PROFIT AND LOSS:			
Per $100 of Income	$5.02	$0.92	$0.26

The most significant item in this statement is the marked decrease in the average return on the investment in property, accompanied by constant additions to property through income and through new capital. This has resulted despite an increase in operating revenue and a decrease in the fixed charges and discount, and has been brought about chiefly by the increase in operating expenses and taxes.

TAXES.

It may be assumed that the stockholders and those of the intelligent public who may read this report are generally familiar with the causes and conditions which have contributed to the increase in operating expenses, but it seems appropriate to say a word here on the subject of the increase in taxes.

For the year the Company paid out for taxes $2,679,389.67, an increase of $199,002.39 over the previous year, or 8.02 per cent., as compared with an increase of 1.47 per cent. in operating revenues. Special attention would not under ordinary circumstances be called to the question of taxes, but the growth of the item is becoming serious. The nature and use of railroad property make its earning power the obviously fair test of its duty to contribute to the support of government. It is expected that reasonable increases may be looked for as the revenues increase, but the current practice of arbitrary assessment of nominal value upon railroad property for the purpose of taxation and the ease with which such assessed values can be increased have made such property a main source of securing additional governmental revenue for purposes upon which the owners of railway property are not consulted. That the taxes of this Company have been increased out of proportion to the increase in its revenues will be apparent from the following statement of a ten year tendency:

Increase in revenue 1914 over 1905.....44.42 Per Cent.
Increase in expenses 1914 over 1905.....50.06 Per Cent.
Increase in taxes 1914 over 1905.....93.90 Per Cent.

THE ADDITIONS TO CAPITAL ACCOUNT AND TO PROPERTY INVESTMENT.

The investment in Road and Equipment, exclusive of depreciation, increased $4,137,859.79, of which $3,000,698.08 was in Roadway and Structures and $1,137,161.71 in Equipment. This increase represents net additions made during the year. (See pages 36 and 37.)

There was an increase of $11,225,700 in outstanding Mortgage and Collateral Trust Bonds and Notes and $3,238,000 in Equipment Trust Obligations. (See pages 39-41.)

On February 13, 1914, there were sold $1,250,000 Southern Railway Company First Consolidated Mortgage Five Per Cent. Bonds, theretofore held by the Company.

On March 2, 1914, there were sold $10,000,000 Southern Railway Company Three-Year Five Per Cent. Collateral Gold Notes, issued, pending a market for the sale of long term bonds, to provide funds for Additions and Betterments, chiefly terminals.

There were retired, at maturity, July 1, 1913, $34,300 Charlottesville and Rapidan Railroad Company First Mortgage Six Per Cent. Bonds and $5,000 Franklin and Pittsylvania Railroad Company First Mortgage Six Per Cent. Bonds; $39,400 First Consolidated Mortgage Five Per Cent. Bonds were drawn on account thereof and placed in the treasury. By reason of these and previous drawings for similar purposes, and the sale of $1,250,000 Southern Railway Company First Consolidated Mortgage Five Per Cent. Bonds, there remained free in the treasury on June 30, 1914, $154,200 of these bonds.

During the year there were drawn and taken into the treasury $5,000,000 Development and General Mortgage Four Per Cent. Bonds, which, under the terms of that mortgage, could be drawn for the calendar year 1914 for Additions and Betterments. There were also drawn and taken into the treasury $1,131,000 of such Bonds representing the proportion of Equipment Trust Obligations paid during the year and charged to capital account.

The total amount of Development and General Mortgage Four Per Cent. Bonds owned by the Company on June 30, 1914, was $32,123,000, of which $16,667,000 are pledged as collateral under Southern Railway Three-Year Five Per Cent. Collateral Trust Indenture, dated March 2, 1914, leaving $15,456,000 free in the treasury.

Double Track:

Negotiations were concluded during the year with The Atlanta & Charlotte Air Line Railway Company by which that Company undertook to issue its First Mortgage Bonsd to the authorized amount of $20,000,000., of which $5,500,000. of 4½ per cent. bonds were issued and sold on July 1, 1914, to retire a like amount of outstanding bonds of that Company heretofore acquired and pledged under the First Consolidated Mortgage of Southern Railway Company, but subject to call, as they were called, by the obligor. The proceeds of the Atlanta & Charlotte Air Line bonds so sold thus made available to this Company a sum sufficient to complete the additional track on all of the main line between Washington and Atlanta (except the Atlanta & Charlotte Air Line), and this work is now in progress. The remainder of the $20,000,000. of bonds authorized by the Atlanta & Charlotte Air Line mortgage are available for sale at any time and the proceeds will be applied to complete the double track on the Atlanta & Charlotte Air Line. With the completion of the work for which this plan makes financial provision, the entire main line from Washington to Atlanta, 649 miles, will be double track.

The total double track in operation at the close of the year was 402.64 miles, of which 17.25 miles were put in operation during the year, viz.: between Amherst and Monroe, Va., Cross Keys and Armour, Ga., between 27th Street, Birmingham, and east end of the Finley Yard at North Birmingham, Ala., and short stretches elsewhere.

Yards and Terminals:

Substantial progress was made during the past year in the construction of important and long needed additional terminal yards at Richmoud, Va., at Spencer and Winston-Salem, N. C., at Mobile and at Finley (near Birmingham), Ala., and at Forrest (near Memphis), Tenn. Other work of this character is planned and will be undertaken with the proceeds of the note issue made during the year. New and additional spur and side tracks, aggregating 42.70 miles, were constructed.

Automatic Block Signals:

Electrical automatic block signals were completed and put in operation on the main line between Cameron Run and Orange, Va., a distance of 75 miles, making a total of 189.5 miles of such signals in operation at the close of the year. Similar signals are under construction on all other double track.

OPERATING CONDITIONS.

The effort has been made to supply in the report of the Vice-President and General Manager, and in the tables making up the report of the Comptroller, which are hereto attached, all the details which are necessary for a comprehension of the problem arising in current operations, but it is fitting to call attention here to some of the more salient facts. The most striking item in the year's accounts is the adverse balance in the item of hire of equipment. The increase of the debit to this account was $606,786.79 as compared with the previous year. For several years past the account of hire of equipment has contributed to the income of the Company, but, beginning with September, 1913, the balance began to turn against us and so continued throughout the year. This is explained by two conditions:

(*a*) The actual reduction in the items of freight car equipment owned by the Company and by it contributed to the general car pool of the United States; such decrease resulting from retirement of old freight cars which had passed the stage of economical maintenance or, by reason of their original standards of construction, had become of obsolete type. This accounts for the fact that the average number of freight cars in service decreased 2.93 per cent., while the average capacity of freight cars in service increased 2.52 per cent. The result is that while the carrying capacity of the Company's equipment has not been materially diminished, the car hire account, which is based on a per diem per unit of equipment without regard to capacity, has suffered;

(*b*) The heavy movement throughout the year of empty foreign cars on the home route. Such a movement is always an acute symptom of a general business depression and is a measure of self defense to which every railroad has recourse under such circumstances. Its effect is felt most heavily by the lines like those of this Company which in times of prosperity have handled large numbers of cars originating their ladings in other territories.

With steady confidence that the prevailing business depression is temporary, the Board of Directors has dealt courageously during the year with the first item of this condition. To keep up and refresh the car supply normally required by the Company and so to balance the car hire account, orders were placed for 5,945 items of new freight cars, as well as for additional power and passenger equipment. The total cost of this equipment was $7,828,688, a figure actually large but representing an investment at a most fortunate time for the purchaser, for, because of lack of other business, the equipment manufacturers made unprecedented prices. The result was that for the same money the Company secured a largely increased number of items of equipment as compared with any previous purchase, and, as the new equipment is of contemporary type and construction, was so enabled to make substantial progress in raising the general level of its equipment to modern standards.

The constant and unremitting effort of management under existing conditions of operation is, of conrse, to check the current tendency of encroachment of operating expenses upon operating revennes by the practice of greater efficiency, without too great demands for new capital. This is the most difficult, as, when successful, it is the most admirable, achievement in the operation of a railroad to-day. This Company's results have shown steady improvement and warrant cordial approval by the stockholders of the faithful and resourceful work of the technical operating officers.

The elements of efficiency gained in operations during the past six years, by reason of increased operating efficiency, as well as by what it has been possible to do in the way of elimination of grades and curves, enlargement of yards, construction of double track, additions to and lengthening of passing tracks and the substitution of heavier power, may be briefly stated as follows:

Comparing 1914 with 1908:

Increase in ton miles	36.3 per cent.
Decrease in freight-train miles	8.3 "
Increase in freight car miles	25.6 "
Increase in net tons per train mile	48.6 "
Increase in tons per loaded car	8.2 "
Increase in locomotive tractive power	12.3 "
Decrease in coal consumed per 100 ton miles	31.4 "

By reason of its many branch lines over which, of necessity, arbitrary train service must be maintained, the average tons per freight-train mile is relatively low. This disability, however, is being largely overcome through the systematic rating of engines and loading of trains between termini on the main lines. Substantial progress has been made during the year in this respect, as will be noted from the following comparison:

Gross tons per train mile:	October November, 1913.	July, 1914.
In the direction of heavy traffic	1,301 tons	1,442 tons
Per cent. of locomotive efficiency utilized	92.1	97.4
In the direction of light traffic	721 tons	881 tons
Per cent. of locomotive efficiency utilized	65.4	73.4
In both directions	1,017 tons	1,163 tons
Per cent. of locomotive efficiency utilized	80.7	86.7

While the tonnage transported during the year was practically the same as that transported during the preceding year, the mileage made by freight trains decreased 5.31 per cent. and the tons handled per train mile increased 5.74 per cent.

Maintenonce:

The maintenance accounts reflect the continuance of the policy of keeping the physical condition of the property up to a constantly increasing standard. The management would be glad to apply more money than has ever yet been spent on these accounts. The actual appropriations have been liberal, considering the revenues from which the funds are derived, and a review of what has been accomplished during the year brings the comforting assurance of substantial progress. There is great need of a reliable unit for measuring the efficiency of maintenance of railway property. The accepted units, based on dollars alone, may mean efficiency, or, when compared with the similar units of other companies having different physical conditions and maintenance equipment, they may mean parsimony or they may mean extravagance, but in no event do they reveal any of these things. It may be said that the management of this Company believes that under its conditions it has got a dollar's worth of work for most of the dollars disbursed in these accounts, and with that statement the following figures are submitted, viz.:

Cost to Maintain:

(Exclusive of renewals and depreciation.)

	1913.	1914.
A mile of track	$1,413.68	$1,387.86
A locomotive	2,621.17	2,729.58
A freight-train car	64.29	76.44
A passenger-train car	739.11	786.20
The ratios of the total of such expenses to revenues have been		
Maintenance of Way and Structures	13.54	13.09
Maintenance of Equipment	16.48	17.22
Total Maintenance ratios	30.02	30.31

While the charge to expenses on account of Maintenance of Way and Structures showed a nominal decrease of 1.90 per cent., the actual expenditures for upkeep, as shown in detail in the Vice-Presideot and General Manager's report, were $197,696.85 greater than for the previous year. This is explained by a modification of the technicality of accounting.

TRAFFIC CONDITIONS.

It will be noted from the statistics that while the revenue derived from the transporation of passengers increased $784,293.27, or 4.30 per cent., the passenger-train miles increased 5.63 per cent. This increase in the Company's passenger trains reflects its policy and desire to provide adequate passenger train service. This policy has been liberal to the point of daring and it has accomplished much for the upbnilding of the South. It has, however, an effect on income which should not be overlooked. Passenger train miles for the year aggregated over 52 per cent. of the total revenue train miles and exceeded the mileage made by freight trains by 2,607,216 miles, while revenue from passengers was only 27.62 per cent. of the total revenues from transportation.

The general depression in business conditions that prevailed throughout the United States and more particnlarly during the last six months of the fiscal period, while less acute in the South than in other parts of the country, was responsible for decreases in important items of this Company's freight traffic, as follows:

Pig Iron, Steel Rail and Fastenings, Manufactured Iron and Structural Steel	108,698 tons
Cement, Brick, Lime and Fire Clay	48,527 tons
Lumber, Shingles, Staves, Headings, etc	99,466 tons
	256,691 tons
Abundant grain crops in Southern Railway territory resulted in a decrease in the movement of grain, grain products and hay, principally from the West, of	228,489 tons
The failure of the Georgia peach crop resulted in a decrease in the movement of that commodity of	45,013 tons
Total	530,193 tons

That there should have been an increase of 200,867 tons in the total movement, and an increase of $133,300.02 in revenue from Freight Traffic, regardless of the heavy decreases in these five important items, indicates the rapid development of diversified industry and general business throughout the South, and the strong position of the Southern Railway with relation to it.

BUSINESS CONDITIONS.

The effect upon business in the United States of the European war, coming on top of a period of general business hesitation, has been apparent in the revenues of the Company since the close of the fiscal year. The South particularly has been hard hit, for it is peculiarly dependent upon the stability of the price and market for its cotton crop. While the tonnage of this staple represents a comparatively small percentage of the total tonnage hauled by this Company, any disturbance which affects its sale has far reaching influence on business generally, as it limits the purchasing power of the producer.

While the Company may be expected to suffer alike with other forms of industry in the South, it behooves it to set an example of patience and fortitude, which qualities, together with faith in the future, are most needed in this period of distress.

In snch a crisis, when more than ever it is apparent that the interests of the Railway Company are identical with those of the public it serves and that it can prosper only as the communities which it serves develop and grow, it is gratifying to be able to state that it has never been a time within its history when the relations of Southern Railway Company were more close and cordial with the people of the South than now. The determination of the management at all times to deal frankly and fairly with the public has been instrumental in bringing about this condition. The era of suspicion and distrust on the part of the pnblic seems to be nearing an end, and the purposes and ideals of the Company are beginning to be understood and approved. No better omen for the futnre of the Company can be found than that discernible in the growing good will in the public mind.

DIVIDENDS.

The loss in revenue since the beginning of the European war and the outlook for the immediate future have demanded a strict policy of retrenchment, always a disagreeable duty. The consequent reduction of service of employees means a reduction of the opportunity of many men to earn the livelihood to which they have been accustomed, and it has seemed fair to the officers that they too should share the sacrifice, so that as a temporary measure the salaries of all officers earning in excess of $2,500. per annum have been voluntarily and loyally reduced in fair proportions. Under these circumstances the Board has deemed that it was fair also for the preferred stockholders to share the necessities of the situation. Accordingly, although the full five per cent. on the preferred stock was safely earned for the year before the current acute conditions were apparent, the dividends declared for the year were reduced from 5 per cent. to 4½ per cent. Furthermore, the dividend for the second half of the year was declared payable not in cash but in scrip, redeemable in five years and meanwhile bearing interest at the rate of 4 per cent. per annum.

SERVICE OF EMPLOYEES.

The faithfulness, loyalty and ability of its officers and employees constitute one of the prime assets of Southern Railway Company. In tendering its thanks to each officer and employee for the faithful and intelligent service rendered during the past year, the Board desires to express its gratification at the high morale that obtains among the great number of individuals in the rank and file, and to record its confidence in, and its appreciation of, the men making up the organization. Not only departmental unity but individual loyalty exists. As a result co-operation among the officers and the men and between the men themselves has been developed to an extraordinarily high degree. This growing spirit of cohesiveness and unity of purpose is a source of pride to the management and foretells for the future better results both for the public and the Company. Individual membership in an organization of such generally recognized ability and high character may well be, as it is, considered a badge of honor.

ACCOUNTS AND STATISTICS.

Statements of the accounts and statistics of the Company in detail will be found in the tables hereto annexed.

The accounts have been examined, as usual, by Certified Public Accountants, Messrs. Patterson, Teele & Dennis, and their certificate is made a part of this report.

Appended to this report is a minute of the resolution adopted by the Board on December 1, 1913, following the death at his home in Washington, D. C., on November 25, 1913, of William Wilson Finley, late President of this Company.

It has also been the sad duty of your Directors to record the death, which occurred at his home in New York, on June 4, 1914, of their esteemed associate, Mr. Harris C. Fahnestock, who had been a faithful and valuable member of the Board since the organization of the Company.

Respectfully submitted, by order of the Board,

FAIRFAX HARRISON,
President.

TABLE 4.

GENERAL BALANCE SHEET, JUNE 30, 1914, AND JUNE 30, 1913.

ASSETS.			LIABILITIES.		
June 30, 1913.		June 30, 1914.	June 30, 1913.		June 30, 1914.

Air Brake Instruction for Trainmen

The Canadian Northern has issued an air brake instruction book designed especially for conductors and brakemen, leaving out those intricacies which have to do with the engineman's or inspector's work, and which do not concern the trainmen back of the tender. This is a sensible idea. In the progress of developing and perfecting the air brake the equipment has been constantly becoming more complicated, until now there are few men in railway work, aside from those whose duty it is to look after its maintenance, who have more than an elementary knowledge of the details of its operation. It is even doubtful if enginemen in any great number are thoroughly acquainted with the apparatus in all its intricacies. The trainmen must, of course, know well the foundation principles of the brake, and also, in some detail, those parts with which they have to deal directly; but to obtain this knowledge it is not necessary to wade through the mass of material which generally is found in instruction books on the air brake in general. There is no need for a trainman to be such an authority on air brake matters as a general air brake inspector, or even to have as much detailed information concerning it stored away in his head as the engineman needs. The Canadian Northern's book was developed on the Toronto division, is of vest pocket size, and is made up of questions and answers. It gets away almost entirely from the complications of engine equipment and its management. It cannot be doubted that the use of similar methods would prove satisfactory on almost any road; certainly this comparatively small book, with its 28 pages and 114 questions, should prove encouraging to trainmen. A careful study of it should do away with the disheartenment that sometimes follows the poor results obtained in endeavoring to pick out the necessary information from the general instruction books. If a trainman desires a more extensive knowledge of the air brake there is, of course, nothing to prevent his obtaining it but lack of time or energy on his part.

The Lack of Operating Literature

The president of a large eastern road made the remark some time ago that while the engineering and mechanical departments of the railroads were well supplied with literature regarding their respective problems, there was very little literature available relating to the operating department. A study of railway literature confirms this statement to a surprising degree. Several papers are devoted in part or wholly to railway engineering, mechanical and signaling, while the number of books written on these subjects is large. On the other hand, with the exception of the *Railway Age Gazette*, there are almost no publications devoting any considerable space to the study of the problems of operation, and good books on these problems, such as Droege's "Freight Terminals and Trains," are few. This is surprising, in view of the fact that the main business of a railway is to operate trains and the engineering and mechanical departments are subsidiary to this. One important reason for this condition doubtless is the methods of development and the lines of promotion of the men in these various departments. Many of those in the engineering and mechanical departments have received technical educations in universities where they were taught to study their problems from a scientific standpoint and to put their information and ideas in writing. On the other hand, in the transportation department a large majority of the officers began work in the train service and similar branches. Their early work did not tend to train them to analyze their problems in the same manner or to discuss them in writing. It may be largely owing to this that there is only a small amount of railway literature dealing with the handling of cars, engines and trains. There is, however, no more important field for thorough investigation and study and for the exchange of ideas than in the conduct of railway transportation; and it is to be hoped that the next few years will see the production of more literature along this line, for it is along the lines where there is the freest exchange of ideas that the greatest develop-

ment is likely to occur. The *Railway Age Gazette* is trying to do its part in the development of a literature of this kind. The contest on the handling of cars in large classification yards, which we conducted a short time ago, and the later one on the handling of cars in large terminal yards, have called out numerous excellent discussions of some exceedingly important transportation problems; and the more discussions these problems receive the farther their solution will be advanced.

Foreign Criticism of the Rate Decision

Elsewhere in this issue is published a criticism of the Interstate Commerce Commission's recent eastern freight rate decision by the official journal of the German Railway Association, the Zeitung des Vereins Deutscher Eisenbahn-verwaltungen, which compares the commission's report to a "not too weighty scientific treatise." In a recent issue (October 2, page 611) there was also published a discussion of the decision by W. M. Acworth, the eminent English railway authority. It is somewhat remarkable that these two foreign views should so closely coincide with the most critical opinions of the commission's work that have been expressed in this country. If criticism of the attitude assumed by the commission by those most qualified to discuss the situation here may be open to the charge of not being wholly disinterested, or at least of prejudice in favor of the railways, certainly the utterances of an English economist and of an official publication from the land of the most pre-eminent example of government ownership cannot be so characterized. The German publication finds that "thorough treatment of the results of actual inquiries is conspicuous for its absence," and that "the arguments of the commission make no lasting, convincing impression," such as might have been expected from "so high and, because of its power, so very respected a body." Most thoroughly in accord with the American opinion of the decision perhaps, is the following: "Throughout there is a certain irritable tone which in a more or less judicial decision is not in place. Repeated introduction of the misdeeds of individual enterprises and the vehement rejection of suggestions made to it from outsiders were better left out." It would seem that the unanimity of the opinions expressed regarding the decision in this case by those best qualified to discuss it might well lead the members of the commission to a searching of hearts and a recognition of the fact that the commission itself has a responsibility in the matter that cannot be properly evaded, and which nobody but five members of the commission seems to think is being satisfactorily borne.

"Gilded Stairs and Marble Halls"

In a brief impromptu talk to the Chicago Engineers' Club some days ago Charles Evans, chief commissioner of the state railways of Queensland, Australia, paid a high tribute to the railways of the United States. He had traveled quite widely on the railways of Europe, he said, but he had not seen any lines equal in many ways to those of this country. He deprecated the idea of government ownership here on the ground that the task of taking over and managing such an enormous system of railways as ours would be too great for the government. But he had one criticism to offer regarding our railways. This he expressed by saying that they go in too much for "gilded stairs and marble halls"; in other words, that they spend too much money in providing the luxuries of transportation. This criticism, which applies, of course, only to passenger stations and passenger train service, is entirely valid. The railways of the United States have gone mad on the subject of providing enormous marble passenger stations with immense amounts of waste space in them, observation cars, buffet smoking cars, valets, maids, barbers and barber shops, stenographers, unnecessarily duplicated passenger train service and scores of other luxuries which cost money and which are unknown on the railways of any other country. Our railways handle freight cheaper than any other railways in the world; and then they turn around and waste more money in expenditures for elegancies and luxuries in passenger service in proportion to the amount of their passenger business than any other railways in the world. If the public were willing to pay for these things the situation would be different; but it is not willing to pay for them and does not do so. Our good sleeping car and parlor car service is far superior to the first class service of any railways in Europe; but the first class rates in Europe probably average more than our passenger rates plus our sleeping car or parlor car rates; and the European first class rate plus the sleeping car rate is far higher than the similar combination of rates in this country. The passenger service of the United States is usually unprofitable. If it is ever to be made profitable—as it clearly ought to be—it will be necessary to get the rates for it on a substantially higher basis and reduce the number of expensive and extravagant luxuries. The duplication of passenger service on competing lines ought to be reduced; the number of trains carrying observation, buffet smoking and other similar cars, and stenographers, maids and so on ought to be reduced; it ought to be made a rule to charge excess fares on trains on which such special equipment and service are provided, and the competitive rivalry in building mammoth magnificent passenger terminals should be moderated. Passenger service should be made convenient, comfortable, regular and safe; but the "gilded stairs and marble halls" business is being carried entirely too far all over the country.

WHY THE RAILWAY CASE IS UNIQUE

THERE can be no doubt that the public opinion of the nation overwhelmingly supports the appeal of the railways for permission to advance their rates. But in some quarters there is opposition, and one of the arguments made by the opposition is that all of the business interests of the country are suffering from the effects of the war in Europe, and that to allow the railways to increase their rates would be to permit them to shift their share of the burden to the shoulders of other classes of concerns.

But the case of the railways for action that will give them relief is unique. There are numerous important circumstances which differentiate it from the cases of all other classes of business concerns. In the consideration of the rate question it is vitally important that all these circumstances be given proper weight. Among these circumstances are the following:

1. During both good and bad times most other classes of concerns have been free to adjust their charges or prices according to changes in conditions. When the demand for their commodities was large they were able to raise their prices as much as the market would stand, and did so. When the demand for their commodities became relatively smaller they in many cases reduced their prices or charges; and they were comparatively able to do so because of the fact that they had been able to make relatively high prices or charges before. Even since the war began many concerns and producers have been enabled to make heavy advances in their prices. On the other hand, for years the rates of the railways have been stationary. They have not been permitted by public authorities to make any considerable advances in them, and today their average rates are lower than they have been at any time since the period of depression following the panic of 1893.

2. It may be said, as Louis D. Brandeis did say in his brief in the original rate advance case, that public utilities, like railways, have been unable to advance their rates, they also being subject to regulation. But the conditions under which public utilities have operated have been widely different in two important respects from those under which railways have operated. One of these is that each public utility usually is a monopoly, and therefore is not subject to the competition in service which has been such an important factor in increasing railway expenses, especially passenger expenses, year by year. Still more important is the fact that while the rates of

..e railways have been kept stationary by public regulation, their traffic, and therefore their earnings, have undergone the widest fluctuations. Their earnings were large in 1907, and were $300,000,000 less in 1908. They were large in 1910 and were badly off again in 1911 and 1912. They were large in 1913 and underwent a heavy slump in 1914. In consequence, while their rates have been stationary, they have been under the necessity of incessantly readjusting their expenses to their traffic and earnings. On the other hand, it is characteristic of public utilities of almost every kind that their business and earnings usually steadily increase year by year, and that if they decrease it is to such a small extent as not to render necessary any very important readjustments in operating expenses. These differences between the conditions with which railway managements and the managements of public utilities have had to deal have been very important. A concern the increase in whose earnings and expenses is uniform and predictable can adjust itself to stationary rates far better than one whose business and earnings undergo wide fluctuations.

3. The railway business has been carried on with an average percentage of return on capitalization smaller than that with which any other important class of business concerns has been carried on. It is often replied to this statement that one reason for this is that the railways have been enormously overcapitalized. Well-informed students of railway problems repeatedly have given their reasons for disputing this charge. It is true that there are many railways that are overcapitalized, but there are still more that are under-capitalized. Suppose, however, it be conceded for the sake of argument that the railways as a whole are overcapitalized to the extent of 50 per cent; what then has been their *maximum* annual net return on actual investment? Not over 6 per cent. Suppose it be conceded for the sake of argument that they are overcapitalized to the extent of 100 per cent: what then has been their *maximum* annual net return on actual investment? Less than 8 per cent. For on their total actual capitalization the railways have never earned an average in any year of more than 4 per cent. Every man who is interested in or familiar with some other line of business, will, if he be honest, concede that the average return earned by concerns in that other line far exceeds the average earned on the capitalization and actual investment represented by railways. All the talk of overcapitalization of railways comes with poor grace from the publishers, the manufacturers, the bankers, the farmers, and every other classes of business men in the United States. When it comes to the art of capitalizing business concerns in excess of original investment the railway managers of America are mere amateurs compared with the publishers, manufacturers, farmers, bankers and other business men of this country. With their narrow margin of return most railways are less able to stand such conditions as the present than most concerns in other lines.

4. The conditions with which the railways have had to deal have been unique in respect to the increases in wages paid by them. Unlike almost all other business concerns, they have been unable, because of the nature of their business and the attitude of the public towards it, to allow wage disputes with their employees to go to the length of strikes. Unlike other business concerns, they have had applied a federal law which, with the backing of public opinion, has made it almost compulsory for them to submit such disputes to arbitration by government boards. The consequence has been that while in many other lines of business the power of the labor organizations has been reduced or broken, in the railway business the power of labor organizations has increased day by day. With the increase of their power has gone an increase in their demands. In every case where a railway wage dispute has been submitted to arbitration the award has resulted in increases in wages. Consequently, practically under government compulsion the railways have made increases in the wages paid to their employees which during the last ten years probably have been greater in proportion than those made to any other classes of working men; and for the same reasons they would now find it most difficult to reduce wages.

5. Unlike most classes of business concerns, the railways have been subjected, through government regulation, to many other increases in their expenses besides the advances in wages resulting from arbitration. Among the different kinds of regulation which have caused increases in their expenses have been legislation relating to the hours of service of employees, to the number of men employed in train crews, to the kind of safety appliances to be used, to the kind of locomotive headlights to be used, to the periods at which employees should be paid their wages, and so on.

6. The railways have been subjected to an unique increase in their taxes. The taxes paid by them advanced from $57,849,000 in 1903 to $129,052,922 in 1913. No other class of property has had to bear such an enormous addition to its burden of taxes, an addition out of all proportion to the increase either in the value or in the earning capacity of the property.

7. Again, the railway situation is unique because of all the securities of American business concerns held abroad and directly affected by the present war, the securities of American railways constitute an overwhelming majority. In consequence, if, when the stock exchanges are opened, European investors begin to dump their American securities on our markets, the railways will be the first of our business enterprises to be subjected to the attack, and they will be subjected to the most severe attack of all. The effect produced upon general business in this country by this dumping process will be determined mainly by the way in which the railways stand up under it; and the way in which they will be able to stand up under it will depend largely on what action is taken by the government authorities to increase their earning capacity either by relieving them of some of the burdens now imposed upon them or by letting them increase their rates, or by both.

In view of the numerous and important conditions which make the position now occupied by the railways entirely unique, it is absurd to talk about them trying to shift their share of the burden of the war on the shoulders of other American industries. The railways were carrying such burdens as no other American industry was carrying before the European war began. That war has imposed heavier burdens in proportion on them than on perhaps any other industry in America, except the cotton-growing industry, because it has reduced their traffic without their being able to make any advances in their rates, and because a larger amount of their securities is held abroad than is true of any other class of American industries. It is because the situation of the railways is unique that they ask relief; and it is because the regulation to which they are subjected is unique that it is necessary for them to appeal to the Interstate Commerce Commission for that relief.

THE NEW ARGUMENT AGAINST THE RATE ADVANCE

THE commission refused the rate advance in 1910 because it was held that the railroads did not need increased revenues; in 1913, because although the roads did need additional revenue, there were other and better ways of obtaining it than a 5 per cent advance in rates; and now it is argued in opposition to the renewed demand that although circumstances have changed, the stockholders of the roads now paying dividends should forego a return on their investment to enable the roads to meet war conditions. The argument as it was developed in the cross-examination of Mr. Willard and Mr. Shriver on Monday has a superficial plausibleness about it that is apt to mislead. The argument appears to be this: The Baltimore & Ohio has been paying 6 per cent dividends on its stock since 1906. To enable the company to do this it has twice been necessary to pay a small part of the dividend from previously accumulated surplus. To enable the company to maintain the 6 per cent rate it was also necessary to cut down expenses to meet increased operating costs by various economies,

including the deferring of maintenance of equipment in the last year. Now there comes a time of emergency. All business men are feeling the effect of this emergency. It is being met on all sides by retrenchment and sacrifice. Why should not the railroad stockholder sacrifice his dividends as business men are sacrificing their profits? If the only change that has taken place since the 1913 rate case was decided is the change caused by the war, is it not fair for the owner of railroad stock, that is, the owner of the business, to take his loss just as other owners are doing in other lines of business?

The argument is fallacious. In the first place, not all of the 38 roads asking for relief are paying dividends; in the second place, no governmental agency is limiting the profits of business men either now or in good times; and there is the point. If the economic law of supply and demand—of charging for a commodity what some one is willing to pay for it—is to hold, there should be no limitation on the owner of a railroad property to make the profits which business conditions will permit of; but if the government is to limit these profits in this one business because the capital invested in it is engaged in public service, then by every law of equity capital invested in public service should be treated differently in a time such as this than capital invested in private business.

All this, however, is academic discussion. The railroads might have all the theoretical justice in the world on their side and still might fail to get their rate advance from the Interstate Commerce Commission, because the commission apparently feels that its duty under the law is to protect the public against the railroads. But this is really not the question that is involved in the present rate advance case. The question is so much larger, so much more momentous and so grimly practical that the one hope of a satisfactory outcome in the present case, probably, is that the commission will grasp, either through the railroads' presentation of the case or through their own study of general conditions, some comprehension of the responsibility which they are now arguing about in so theoretical a way.

Take the question of dividends alone. The savings bank laws of the various states generally contain a clause which forbids the investment of savings bank funds in mortgage bonds of railroad companies which are not paying a certain rate of dividend on their stock and which have for a series of years been paying this or a higher rate. In 1913 the savings banks of the United States held $794,000,000 railroad bonds and stocks. Imagine for a moment what would happen if dividends were to be suspended on roads like the Baltimore & Ohio, the New York Central and the Pennsylvania, necessitating not only a closing of the savings bank market for additional railroad securities, but the transfer of savings bank funds now invested in railroad bonds to other forms of investment, with the consequent dumping on the market of the great volume of securities now held at the time that Europe is demanding that this country buy back a considerable part of the enormous volume of railroad securities which have over a series of years been sold abroad by American railroads. To find a market for their holdings at a time like this the savings banks would have to accept a loss that cannot be viewed with anything but alarm.

This is one of the ways in which a blow to railroad credit would be a disaster, reacting on the community as a whole.

The commission cannot for a moment delude itself into the belief that after all the years in which it has reiterated time and again in its opinions the axiom that although it will not permit a state of affairs by which public service—a natural monopoly—will afford an opportunity for excessive profits to capital, neither will it do anything to make the investment of capital in public service securities less attractive than in other lines of business. What the commission has continually implied in its decisions is, that although the railroad stockholder cannot expect large profits which might be the reward of risk in an industrial enterprise, on the other hand investment in railroad stocks has an element of security which is lacking in the more speculative industrial business. To deny this now would be to deal an unbearable blow to railroad credit.

Letters to the Editor

ANOTHER EXAMPLE OF SAFETY LAST

Seattle, Wash., September 17, 1914.

To the Editor of the Railway Age Gazette:

In your issue of September 11 there is a short article entitled "Think of the Engineman." Cases such as that which was there described are frequent enough. Only last week our road (the Great Northern) came near having a dozen or more law suits on its hands, under the claim that "the engineman was to blame." I was pulling the "Flier" which runs from Seattle, Wash., to Vancouver, B. C. I rounded a curve at a speed of perhaps 50 miles an hour, over which was a crossing at grade—the "Pacific Highway." I always give this crossing a particularly long and loud crossing whistle for the reason that I can see the crossing but a short distance, and a driver on the highway also has a short view of a train approaching.

On the day to which I refer I whistled as usual. As I came in sight of the crossing I saw a cloud of dust rapidly approaching; I threw on the brakes and whistled again, long and loud. But an auto stage loaded with 20 or 25 people reached the crossing at the same time I did. The driver had approached the crossing at a terrific speed, either with the intention of "beating me to it" or else he did not hear my first whistle. He made an emergency stop, pulling up not more than one foot from the train, as I whisked by, my brakes not being able to bring my train to a stop under a half mile, owing to a slight down grade. The engine bell had been ringing from the time I first whistled till I had passed the crossing.

Had there been a smash up, the survivors undoubtedly would have sworn that neither did the bell ring nor the whistle sound.

F. H. George.

CRITICISM OF THE SIXTEEN HOUR LAW

Albany, N. Y., October 13, 1914.

To the Editor of the Railway Age Gazette:

The half dozen proposed new laws suggested by the locomotive firemen's union, as noticed in your issue of October 9 certainly cover a broad field. To the distant observer it looks as though the Illinois scheme must be simply a peg to be used as a convenient support for political wires. As we all know, wire pulling is the life of the politician who has no legitimate issues to promote, and as the firemen have no real need for further legislation at the present time their hired politicians naturally cook up every sort of scheme which promises to be useful in dickering with idle-minded legislators. What sense is there in the firemen's agents' proposal to stir up the legislators on the subjects of uniform signals, the proper number of cars in a train, and the other things mentioned? The legislatures will pass enough useless or harmful laws without the help of the firemen.

But what I want more particularly to call to your notice is the proposal to limit trainmen's work to ten hours a day. Is this a serious proposition, or merely a convenient postulate for use in bargaining for something else? Do they really want shorter hours, or only to get legal approval of a scheme to get more "overtime" pay? It is understood that there is always a considerable percentage of trainmen—firemen, engineers, conductors and brakemen—who are not only willing but anxious to stay on duty 12, 14, 16, or even 20 hours at a time, if only they can get good pay for it. Does this legislative committee propose to override the wishes of such an important element of its constituency? It is hard to believe that this proposal will be soberly pushed, when it comes to definite action.

But, with proper limitations and qualifications, *it ought to be pushed.* In other words, this committee, wisely or unwisely, with good intentions or otherwise, has touched a live issue. The 16-hour law is a great fraud. It has elements of good, for with-

out it men would work 18 hours, and occasionally 24 hours; but its main effect, combined with the provisions for eight hours' rest, is to foster the utterly irrational working-hour schemes which now prevail all over the United States. The arrangement of working hours of men on freight trains constitutes the most absurd, unreasonable, unhealthful scheme for the regulation of personal habits that anybody ever heard of. The plan is worse than the customs on shipboard, where men sleep only four hours at a time. To plan deliberately to make men's rest hours as irregular as it is possible to make them would be justifiable only (1) in case of dire necessity, or (2) regardless of necessity, where their work is so easy or so unimportant that it does not make any difference whether they do or do not come on duty fresh and rested. No such conditions exist on the railways of America.

The plea of the labor-union law-makers is that railroading is such a dangerous business that trainmen, with their delicate responsibilities, must take extra good care of their health. As a matter of fact the 16 hour rule, combined with the "chain gang" list—"first in first out"—is used to make the hours of freight trains as irregular as possible; to *impair* the men's health so far as rules for working hours can be made to impair it. The only reason that these very irregular hours do not do more harm than they do, is that the men can and do rest a good deal while they are on duty. For conductors and brakemen this is quite easy. For the fireman the situation generally is bearable if he is able to get the assistance of a friendly brakeman occasionally. Even the engineman can get a little relief now and then, especially when waiting on a side track, by entrusting the engine to the fireman.

The establishment of a ten-hour work day by law would be a good thing, if in connection with it, it were possible to establish a 14-hour rest day, and if proper provision were made for emergencies when longer hours were necessary, temporarily. Regulation of this matter by statute is difficult at best; but let us be rational in whatever legislation is enacted. The legitimate reason for reducing hours of labor is to increase the hours of rest. A law, however, cannot compel a man to rest when he prefers to go to the theater or to work to excess in his garden. The most useful thing that any legislature could do for the trainmen would be to enact that ordinary common sense should apply in the arrangement of their hours—as it does in the preparation of work-hour schedules in most other employments. It is reasonable for a man to work ten hours a day, six days in the week. This implies that he should rest six nights in the week. The man who works six nights should rest six days. This principle is so axiomatic that I would not use the ink and paper to state it, but for the idiotic violation of it which so widely prevails. To work 16 hours, rest 8 hours, work 10, rest 28, work 16, rest 12, and so on, never recognizing either night or day, is so absurd that we should ourselves laugh at the scheme if once we examined it soberly. Why does the government tolerate it?

The ten-hour day would be a very attractive idea if its administration were put into the hands of the right kind of men. The railroad superintendent (making proper reports to the government) should have extensive leeway to provide for unforeseen difficulties. Twelve hours a day does no harm for a week at a time, if circumstances are favorable. Sixteen hours is unobjectionable, on occasion, with proper safeguards. The main thing to keep in view is to have the matter controlled by a man—the superintendent or trainmaster—who *desires* and aims to have the men work normal, healthful hours.

A rational plan would be opposed. Some men would make less money. But regularity frequently costs money. Some would have to sleep away from home an ordinary night's rest instead of sleeping five hours (calling it eight) and rushing back home regardless of health. This would require the substitution of good sleeping rooms for many which now are so poor that a trainman is actuated by an abnormal desire to get home. But that substitution is called for, anyway.

Our present law merely sets a maximum—16 hours. In any rational rule the first element is not the maximum day but the normal day—say 10 hours. This being settled, the desideratum is to provide regulations for keeping always as close as possible to the normal. H. R.

A SIGNIFICANT PROTEST

St. Louis, Mo., October 5, 1914.

To the Editor of the Railway Age Gazette:

I have before me the October 2 issue of the *Railway Age Gazette,* and note with particular interest the editorial on page 590 protesting against the action taken by the secretary of the Illinois Commercial Men's Association.

As one member of this organization, I made an immediate protest to Mr. Cavenaugh, the secretary, and in addition to this have addressed a letter to the Interstate Commerce Commission calling their attention to the agitation that is being raised by Mr. Cavenaugh, and mentioning that this does not represent the attitude of all and probably not the majority of the members of this organization. To the writer's personal knowledge, there have been a great many protests made by members of the Illinois Commercial Men's Association to Mr. Cavenaugh, the secretary, regarding his action, and I am very glad to know that you found the subject of sufficient importance to mention it in the terms which you have on a prominent page of the *Gazette.* F. V. Roy.

THE FOLK-LORE OF ROCK ISLAND

New York, October 19, 1914.

To the Editor of the Railway Age Gazette:

"'What is truth?' said jesting Pilate, nor stayed for an answer." Such is the volatile vague vanishing volplaning conduct by Joseph W. Folk of the Interstate Commerce Commission's inquiry into Rock Island. He starts 20 trains of thought per minute, but nary a one does he despatch to destination.

James Bryce has never said, thus enabling us to beat him to it, that the trouble with democracy is that too many second-string men get into first-string places. The position of chief counsel to the commission is of the first magnitude. Of its occupant's rating, may this narrative eloquently tell!

Let us first nail the lie, repeatedly told from Washington, that this investigation was instituted by a resolution of Congress. It was not. Neither Congress nor the Senate, nor the House ever adopted the resolution proposed by Green of Audubon, Iowa—a name and habitat suggestive of the open air, not of hot air—nor did the House Committee on Interstate Commerce ever report it favorably. Instead, the committee dodged the issue by passing a "resolution" of its own, an action utterly devoid of legal status or dignity. This "resolution" its chairman mailed to the commission. The commission entered an order which mentioned the above "resolution" in its preamble. But the order rests solely upon the commission's authority to investigate "carriers," and the responsibility for making the order is squarely upon the commission. So it alone must be held blameworthy for the investigation itself and, as well, for dragging it out on the Friday and Saturday just preceding Monday's rehearing of the eastern rate case.

Here is specimen No. 1 of Folk's arithmetic and love of truth. He could hardly contain himself until witness Sharood, a fair and capable examiner, had stated that the aggregate capitalization of the two holding companies was $350,000,000, thus enabling Folk to mouth the phrase, "swimming in water five times its volume." Now, bad as is the Rock Island's corporate overhang, it is not so bad as that. Folk computes:

New Jersey Company preferred	$49,000,000
New Jersey Company common	90,000,000
Iowa Company stock	145,000,000
Iowa Company bonds	71,000,000
	$355,000,000

But he declines to admit that *all* the Iowa company stock is held by the New Jersey company, unsold and unsalable, thus reducing his total by $145,000,000, or to $210,000,000. This

method of treating stocks of subsidiaries is not only sanctioned but required by the commission's own rules of accounting. It would be fair also, we venture, to deduct some $20,000,000 of New Jersey company stock issued solely upon the acquisition of the *Frisco,* thus leaving a total of $190,000,000. There was $71,000,000 of old Railway stock exchanged, so instead of five times its volume, the "water" is less than 2¾ times its volume, or about half what Folk's question asserted.

At this point we might inquire, What is water? In the curious Rock Island structure, no one paid any money; and the very thing he surrendered was held intact to support what he took in exchange. Call it inflation of par values, if you like, but not "water." Watering, ever since Daniel Drew drove his intentionally thirsty kine to the trough, has meant that the investor paid for something that was not there, for aqueous sirloins. But the Rock Island stockholders neither paid a cent nor lost any values they possessed. If they held till today what they got in 1902, they are entitled to receive their old *railway* stock back. Indeed—and here is a really reprehensible feature, often sharply criticized—they could have sold their New Jersey company stock and still retained, through the Iowa company bonds, their rights in the old *railway* stock up to $100 per share. As events have turned out, it is worth less than par, a result presumably never dreamed of in 1902, and the Iowa company bondholders will get *all* the old *railway* stock, the New Jersey stock thus becoming valueless. It is idle to say that this result was inherent in the situation, or that bankers, brokers and financial writers invariably pointed out this possibility. The fact that the stock was created and made purchasable, so that unthinking investors could pay money for it in the belief that it controlled (as it did while the sun shone) the earning power of the old *railway,* is much to be deplored. Still more deplorable were certain restrictions in the fundamental documents of the two holding companies, notably the right of the New Jersey preferred stock to elect a majority of the New Jersey board, and the covenant in the Iowa bonds never to increase the old railway stock. This latter feature was financial hari-kari. A corporation which as late as 1912 could sell mere debentures on a 5.3 basis, could certainly have sold preferred stock in the years preceding and thus have obviated the stringency resulting from its unwisely limited annual bond issue for improvements and new property. This stock financing should have been easy for the Rock Island, as it has less than one-third as much stock outstanding as the Burlington has, or the Milwaukee or the Santa Fe, or the North Western.

Far—but not too darned far—be it from me to suggest that critic Amster and critic Folk ever confer. Indeed, there were a few minutes when patriot Folk urged that the Iowa bondholders refrain from enforcing their collateral for a few years, so that something might be left for the New Jersey stockholders, this being a paramount issue which patriot Amster has thus far overlooked. But let a plain chronicle suffice. Late Saturday afternoon, James N. Wallace was put on the stand, and quizzed about the plans of the Iowa bond committee. Folk actually read from Samuel Untermyer's brief on behalf of Amster, and used the arguments of Amster's counsel to support Folk's claim that the old railway stock ought not to be sold at the present time, despite the fact that a federal court—not Mr. Wallace's committee—has already ordered it sold. And now observe a further curious coincidence. Counsel for the Rock Island read a passage from Amster's own petition, which he swore to and from which brief-writer Untermyer deviated for devious reasons, to the effect that the *immediate* sale of the old railway stock is *imperatively necessary.* Late Saturday afternoon there was served in New York a further Amster petition amended, *inter alia,* to conform to brief-writer Untermyer's belated convictions, and on Monday morning Amster's advertisements flared forth the iniquity of early sale of the stock! I do not say that this is other than a coincidence; but do say that, if it were other, then the commission would be in pretty poor business.

The *Railway Age Gazette* said last week that Mr. Folk would not disclose a single new important fact. Nor did he. The companies themselves reported the 1909 Frisco transaction in their next ensuing annual reports in the fall of 1910, and were then and thereafter soundly castigated in the public prints. The loss, it is true, was only some $7,300,000, though Folk unblushingly endeavored to create the impression that it was $35,000,000. To do this, he used the book entry in the property account of the Iowa company, which was made up by adding together its $17,000,000 or so of "Frisco 5s," and the $18,000,000 of New Jersey common stock delivered to former Frisco stockholders. But these are obviously par values only, mere counters. The New Jersey stock cost nothing in cash, and against the $17,000,000 of Frisco 5s the Iowa company received from Yoakum and associates $10,850,000 cash, which (adding to the bonds their premium and interest paid on redemption) left the Iowa company $7,300,000 to pay to redeem its bonds, which is the sum total of the loss on Frisco. Yet Governor Folk would stamelessly foist upon the public a mere book entry, made up, as the commission requires, on the basis of par values, to lead us to believe that the Frisco loss, bad as it was, was 400 per cent bigger.

The loss on the Alton transaction has long been generally known and denounced. But it also was made to appear greater than the facts warrant. It will be recalled that the Rock Island sold most of its Alton stock to the Clover Leaf, receiving the latter's bonds. The stock cost some $9,000,000, against which Counsel Folk allows the proceeds of Clover Leaf bonds sold, but does not allow any value whatever for the unsold $5,447,000 of these bonds, beyond the value of the pledged Alton stock. Despite the fact that the Clover Leaf stock has a market quotation, the commission's witness declined to concede that its promise to pay, though senior to the stock, has any value whatsoever! He excused this by claiming that the trust agreement gives no recourse beyond the pledged stock, which is his opinion and unfortunately is mistaken.

This witness acknowledged that books had been thrown open to him and every facility afforded, and his testimony showed that he had dusted every cranny, and yet under Brother Folk's guidance we find him taking these strenuous measures to make a loss greater than it can conceivably be. What can it profit a corporation to acknowledge its fault and own that its sins are ever before it, if its penitent candor is to be abused by stretching plain figures beyond recognition?

Throughout the hearings ran the claptrap that the public is "taxed" to pay interest and dividends on the mass of watered Rock Island securities. If so, the rate of taxation has been very light. The New Jersey common has never paid a dividend, the preferred has paid none since 1905; and the Iowa bonds, par for par of the old railway stock, paid 4 per cent to and including November 1, 1913. Not heavy taxation for some 8,000 miles of railroad. In fact, the Rock Island is an excellent illustration of the circumstance that no railroad whose securities have ever been called "watered" is paying any returns whatever on the water. The Rock Island never has claimed and never could have claimed that rates should be fixed so as to allow dividends on the stock of its overlord, the New Jersey company. Yet these sessions were replete with suggestions that this capitalization is the basis for a plea for higher rates. If the commission had ever for a moment considered fixed charges in determining rates, or if the commission were not now engaged in physical valuation in order to escape from security standards and stock market values, there would be a shred of merit in these suggestions. As the facts stand today, however, they are the silliest buncombe. Railway Bondholder.

Notes from Chili.—The Howard Syndicate notified the Chilian government that it would make delivery of the Southern Longitudinal Railway on August 1. It is stated that there was danger of a general railway strike in Chili owing to the dismissal of a number of employees on the state railways.

The Rehearing on the Rate Advance Case

Daniel Willard's Opening Statement is Given in Full and a Summary of the Cross-Examination is Also Given

At the hearings in the reopened rate advance case at Washington on Monday, Mr. Willard, president of the Baltimore & Ohio, presented the following statement on behalf of the railroads:

MR. WILLARD'S STATEMENT

The railroads operating in Official Classification Territory, and parties to the so-called "Five Per Cent Case," now appear before this commission as petitioners and respectfully require that such modification be made of the report and order of July 29, 1914, as will enable the carriers to put into effect the rates which were therein directed to be canceled.

Subsequent to the filing of the report and entry of the order of the commission in the cases known as Docket No. 5860 and I. & S. Docket No. 333, facts and circumstances have arisen which could not possibly have been foreseen upon the date when the order was entered. A war of unprecedented proportions has broken out, and this, taken in connection with the facts already in the record, with such additional information as the carriers are now able to furnish, clearly indicates such a situation as your petitioners believe fully justifies the relief now prayed for.

The tariffs above referred to were originally filed by the railroads in October, 1913, and are intended to provide for a general advance, with some exceptions, of approximately 5 per cent. of all freight rates in Official Classification Territory. In support of the advanced tariffs the carriers pleaded, among other things, inadequacy of revenues and the commission in its report on July 29 used these words:

"In view of a tendency towards a diminishing net operating income as shown by the facts described, we are of opinion that the net operating income of the railroads in official classification territory, taken as a whole, is smaller than is demanded in the interest of both the general public and the railroads, and it is our duty and our purpose to aid, so far as we legally may, in the solution of the problem as to the course that the carriers may pursue to meet the situation."

It should be kept in mind that the words just quoted were written previous to the 29th of July, 1914, and before it was possible to foresee or weigh the great events which have transpired since that date. However, with such facts before it as were developed in the original record, and in furtherance of its announced purpose to aid so far as it legally might in the solution of the problem then confronting the railroads, the commission approved of certain rate advances in Central Freight Association Territory, and suggested the propriety of other advances and changes of practices which, if found practicable, would inure in varying degree to the advantage of all of the roads involved in this proceeding.

The carriers are not unmindful of the great significance of the words just quoted from the commission's report in this case, and they do not doubt that, with the assistance of the commission, additional net revenue may eventually be obtained along the lines suggested, and definite action has already been taken concerning many of the subjects referred to, and all are receiving earnest consideration, but the needs of the carriers are pressing and immediate, and the measures of relief proposed by the commission will not in our opinion adequately meet the existing situation.

In order that the commission may intelligently consider the whole subject as affected by present conditions, it would seem necessary to supplement the original record with such additional facts and figures as are now available, showing operating results of these carriers since the case was submitted on May 29. The railroads, in support of their claim of inadequate revenue, filed statements showing the result of their operations for a term of years to June 30, 1913, and in its report the commission considered also the monthly statements of the railroads up to and including the first eleven months of the year ended June 30, 1914. The carriers are now able to furnish complete reports for the entire fiscal year of 1914, and we desire to offer this additional and supplementary evidence, believing it to be essential to a proper determination of the case.

The combined statements of all the railroads involved in this proceeding for the fiscal year ended June 30, 1914, show roundly that the total operating revenues during that year were approximately $48,000,000 less than during the previous year, while the operating expenses during the same period were approximately $22,000,000 greater. The net operating income of these companies for the same period amounted to $260,000,000, or approximately $76,000,000 less than was earned during the previous year, and equal to but 3.98 per cent upon the property investment, a lower return than was shown at any time in the preceding fifteen years. The income, applicable to interest, dividends and surplus during the fiscal year just closed, was $265,700,000, or 4.06 per cent upon the total capital obligations, this return also being lower than any in fifteen years. The operating figures for July and August have been tabulated and will be presented to the commission, and they also serve to emphasize the tendency towards diminishing net income, which the commission found in the facts in the record as originally submitted.

The carriers by documentary evidence and witnesses, if desired, are prepared to support the general statements just made.

While the additional figures now submitted clearly establish a continuation of the recognized tendencies toward a diminishing net income, the actual situation which confronts the railroads today, as revealed by the information now available, and because of the unforeseen and unprecedented events which have taken place since July 29, has become extremely critical. The problem is no longer one of tendencies, but has become instead one of actual reality.

A war such as that now raging causes great and immediate disturbance to industry, commerce and finance. It causes contraction of credit and great restriction, if not the actual stoppage of international trade as well as serious disturbance to domestic commerce, and as we have seen, it has thrown the security markets of the world, first into panic and then into suspension of operations. These have in fact been the immediate, direct and clearly apparent consequences of the war which began less than three months ago; but the ultimate and more lasting consequences are almost as plainly to be seen and will certainly follow, if they do not accompany, the conditions mentioned. These are: enormous destruction of wealth, with great diversion of labor and capital to unproductive employment, thus causing a check to the world's accumulation of new capital, and a serious and prolonged rise in the rate of interest, and the effect of such higher interest rates will continue long after the present emergency has passed, because they will be reflected in the basis upon which the new securities will be issued from time to time as required for refunding and other purposes; and in so far as the war and its consequences tend, as I have just shown, to change the conditions surrounding the enlistment of new capital, they tend to change the fundamental relation between railroad and shipper.

The cost of capital is one of the important elements of the cost of transportation.

It is known that the railroads of the United States have over $520,000,000 of outstanding obligations which will mature and must be met within the next twelve months alone, and it was shown in the original record in this case that the railroads in Official Classification Territory only, had spent approximately $200,000,000 per annum upon their properties for improvements and extensions during the last ten-year period, and it will be necessary to continue such expenditures if the roads are to

maintain their standard of service and provide for the growing needs of the future. Further, as nearly as can be ascertained, there are more than $3,000,000,000 par value of American railroad securities held abroad as investments. The demands for cash in Europe, growing out of the present situation, will doubtless result in large selling of such securities when the markets or exchanges are again opened, and the possible effect of such selling upon railroad credit and related subjects is causing much concern.

With all of this in mind it will readily be seen that the available supply of and probable demand for new capital, as well as the interest rates thereon, are matters of great importance, not only to the railroads, but also to those who depend upon them for transportation, and in our opinion a proper determination of this case cannot be made unless these matters as affected by existing conditions be given full consideration. I shall not dwell further upon this important phase of the question, however, because others who are deeply interested in the subject have asked to be heard in that connection.

The case of the railroads, as so frequently pointed out, is quite unlike that of a private undertaking. The railroad, because of its public character and the terms of the charter under which it is permitted to operate at all, is subject to governmental regulation, not only as to the charges which it shall impose, but also as regards many of the details of operation, and on that account is unable, like the private enterprise, to readjust its rates and practices to meet such a situation as now exists unless and until the necessary approval is obtained.

Finally, it is respectfully submitted that whatever the outcome as concerns these railroads might have been, had there been no war, as a matter of fact there is a war and a grave emergency now exists. It is hardly necessary to suggest that if the commission in view of the present situation, should now conclude, after consideration of all the facts, to approve the tariffs as requested, and should it at any time later on appear that the situation had changed and the emergency had passed, and should it further appear that the carriers involved in this proceeding were then, taken as a whole, in such condition as to earnings, maintenance charges and return on capital obligations as to justify a reconsideration of the action now prayed for, this commission would have ample power to order at any time such reductions as might be fair and reasonable, and I am of opinion that the carriers would not oppose such action by the commission when conditions such as I have enumerated shall have been established.

Following the presentation of the above statement, Mr. Shriver, vice-president of the Baltimore & Ohio, offered a number of statistical exhibits, after which Mr. Willard returned to the stand for cross-examination.

Commissioner Clark began the cross-examination of Mr. Willard by asking him if all the roads in the case showed up like the Delaware, Lackawanna & Western; whether there would be any justification for the advance in rates.

"I would not think so," replied Mr. Willard.

Mr. Willard said that on the Baltimore & Ohio there had been a large retrenchment in expenses and he believed that a similar step had been taken on other roads both before the war and since.

Louis D. Brandeis then questioned Mr. Willard as to the necessity for additional revenue for the Baltimore & Ohio. Mr. Willard said among other things that the railroad needed additional money to meet $35,000,000 of notes which are to mature in June next. These notes bear 4½ per cent interest. He said the road had 30,000 stockholders and the last dividend was partly out of surplus, $2,000,000 being taken, which left about $32,000,000 surplus still. He added that he still adhered to the contentions made by him at the hearing of the case last spring.

"The effect of the war," said he, "has been that it has accentuated the falling off in business."

He said the Baltimore & Ohio was able to get money at 4½ per cent in June last, but that this was now changed, and he pointed to the fact that the city of New York recently paid what amounted to 7 per cent for money.

"Is not this situation an argument for a reduction of your dividend?" asked Mr. Brandeis.

Mr. Willard replied that in July last when he recommended the continuance of the 6 per cent dividend, he felt justified in the hope that conditions might get better and he intimated that the subject would receive consideration.

Mr. Brandeis then said that the figures showed that the Baltimore & Ohio and other carriers had reduced maintenance charges, equipment charges, discharged employees, but had not reduced dividends. He criticized the former connection of the Baltimore & Ohio with the Cincinnati, Hamilton & Dayton, and asked Mr. Willard if this connection had not cost the Baltimore & Ohio $22,000,000 in actual money and possibly obligations amounting to more than $20,000,000.

Mr. Willard said that the Baltimore & Ohio had a tangible surplus of more than $32,000,000 today, and he declared that on the last quotation the Baltimore & Ohio holdings of Reading showed a profit of $13,000,000 which had not been included in this surplus. He insisted there was nothing in the record to prove that the Cincinnati, Hamilton & Dayton obligations would have to be taken up.

"Is it not a fact that you are asking this commission to levy a war tax in favor of the railroads?" asked Mr. Brandeis.

"No, sir, I do not think so," replied Mr. Willard.

Mr. Willard was asked by Commissioner Clements as to the significance of his statement that $3,000,000,000 of American road securities were held abroad. He replied that it was believed that when the stock exchanges here are opened the demands for cash in Europe will result in a very large selling of these securities and make the condition of the railroads worse. Mr. Willard said that if the railroads were permitted to increase rates it would serve to reassure the holders of these securities and stabilize matters.

"If this commission will allow an increase the foreigners will get a bigger price than now," suggested Mr. Brandeis.

Mr. Willard contended that when the stock exchanges were opened if this country were obliged to take back a flood of American securities held in Europe it would be impossible for the railroads to raise money for needed improvements.

Commissioner Hall suggested that perhaps favorable action by the commission along Mr. Willard's line of thought might result in still larger dumping of securities on the market by foreigners.

"Now, I want to ask you," said Commissioner Clements, "is this application for the purpose of getting more out of the proposed rates for net revenue or for the purpose of establishing credit?"

"Replying to that question," said Mr. Willard, "I reply simply as chief executive of the Baltimore & Ohio. In my opinion the Baltimore & Ohio is a going property, is fairly capitalized, well worth its outstanding obligations and much more. If we are to judge the future by the past it will be necessary for us to spend about $15,000,000 a year for some years to come. I would like to be in a position to recommend to people who write me the purchase of securities, but I cannot conscientiously at the present time recommend to any one to purchase under present circumstances and I therefore think that we ought to have the rates advanced. I think the rates ought to be increased so we can make the necessary improvements to meet the conditions presented."

Then Commissioner Clements, addressing Mr. Willard, said:

"Many industries, large industries, well managed, are now standing still to see what is going to happen; that however bad we think our situation is, it is better than any one else's in the world. Export commodities are being stored and the cotton people are in distress. This condition applies to many lines of business and affects many industries. Is that a situation which should be left out of view when you come to consider an in-

crease of railroad rates, particularly to keep up long standing dividends?"

"The railroad is a semi-public institution," said President Willard. "It cannot close its shop; for instance, 30 per cent. of our passenger mileage does not pay for the running."

Commissioner Meyer then asked: "Do you mean that conditions since July 29, when the commission handed down its decision, have changed, or is it that you want to shift the burden from the shareholders to those who pay the freight?"

"I do not think it will have that effect," said Mr. Willard.

"You propose an increase of 5 per cent," said Commissioner McChord, "which is, roundly speaking, $50,000,000 additional revenue. Will that not be enough?"

"I do not think so," replied Mr. Willard.

"Now," continued Mr. McChord, "the idea then is that this $50,000,000 will put the railroads on their feet and improve business in the country."

"I have not spoken of the country," President Willard replied.

"The country seems arguing for this," said Mr. McChord. "I see it in petitions and in the press and from reports from different portions of the country."

President Willard quoted the commissioner's words in its recent decision: "The public interest demands not only the adequate maintenance of existing railroads but a constant increase of our transportation facilities to keep pace with the growth and requirements of our commerce."

"I simply wish to be recorded as having stated under oath," added Mr. Willard, "that in my opinion with the understanding which I have of the railroads involved in this proceeding they are not as a whole today being adequately maintained; they are not conforming to that condition which the commission set up as a desirable standard, nor are they making proper provisions for the constant growth which they may expect.

"I wish also to state that in my opinion, based upon such knowledge as I have of the business and of the conditions of these carriers, when we shall again be confronted with a condition of business activity, as we may reasonably expect in the not distant future, the railroads in this territory, unless they are in some way put in such position as to justify them to begin immediately to provide facilities, will fall short of being able to take care of the business to a much greater extent than occurred in 1907.

"It should be kept in mind all the time that if the railroads are not adding to their facilities they are going backward. It is a matter of common knowledge today that the railroads are not buying freight cars, they are not buying locomotives, they are not providing additional facilities, and that constantly locomotives and freight cars are wearing out."

Charles A. Conant was then called to the stand. He said in part:

"The cost of the war, if it lasts approximately a year, will not be materially less than $15,000,000,000. The demand for capital for purely war purposes and for the settlements which succeed the war will be so great as to absorb an amount equal to the entire savings for investment made in all civilized countries for a period of several years. The effect of this abnormal demand for capital, which is being consumed without economic profit, will be to raise the rate of interest on investment securities higher than it has been for many years.

"The fact that such enormous sums to pay the costs of the war are sought almost exclusively by means of Government loans will make it impossible to obtain capital for other purposes, except at a rate of interest considerably higher than that paid by Governments. The financial disturbances which will occur during the process of distribution of these Government loans to investors, extending over several years, will involve the sale on the American market of railway and industrial securities now outstanding to an amount which will in itself absorb so much of the new capital available in the United States that it will be extremely difficult to obtain any for new enterprises.

"If, therefore, American railways and industrial enterprises are to obtain any new capital whatever during the next few years, it will be necessary to make issues of securities very attractive, not only in respect to the rate of interest but in respect to the evidence that the interest and dividend payments are absolutely secured by adequate earnings."

Mr. Conant quoted authorities indicating that the world's new capital normally available for investment amounts to about $4,000,000,000 per year. He then concludes:

"If the cost of the war for one year has to be paid out of the amount of annual savings indicated by these figures, then every dollar of new capital for approximately four years will be absorbed in government loans, and there will not be a penny available in any financial market for building a railway spur, putting up a new station or terminal out of capital account, adding a bobbin to the equipment of woolen and cotton mills, or making a single public improvement in the city of New York or any other municipality, except out of current revenue.

"What part the railways will be able to play in wresting a portion of the world's savings from the outstretched hands of the powers which have been blowing away thousands of millions in powder and ball becomes an interesting consideration. They must come into the open market and bid against the greatest states in the world for some scanty portion of the supply of investment capital.

"Leaving aside the question of averting panic, the most important question involved in the return of American securities held abroad is the manner in which it will diminish the fund of capital which is normally available for new investments. In this direction the effect of the European war loans will be acutely felt in this country, even if not a dollar of American money appears as a bidder for the new loans.

"The newer states of the West could never have been equipped with railways, banks, grain elevators, barns and homes, if foreign capital had not been poured into them in hundreds of millions after our Civil War. What will be involved, in effect, if European investors undertake to market a large part of their holdings of American securities in New York, will be the conversion of this gigantic time loan, payable only over long terms of years, into a call loan, payable as rapidly as the securities can be sold on the New York Stock Exchange. It would hardly be within the range of the capacity of the banking system of the country to absorb the entire amount of $6,000,000,000, estimated by Sir George Paish to represent foreign investments in the United States.

"The amount in such securities which is returned to the American market will influence directly the amount of investment capital remaining in the United States available for other purposes. It is at this point that the problem comes directly home to American railway managers and their bankers.

"If the country is subjected to a severe strain, in order to take back from European holders an amount of securities representing the fund usually available for investment for one year or for several years, there will be practically no surplus left for investment in new railway issues."

Moritz Rosenthal, representing the Investment Bankers' Association of America, submitted the proposition that in fixing rates the commission take into consideration factors other than the railroads and the shipper and receivers of freight.

Mr. Rosenthal said he did not assert or propose to discuss the question as to whether the government, either Federal or state, was actually antagonistic to the railway systems. The question is, said he: Does the investor believe that the government is antagonistic to the railroads? To the extent and during the time it exists, railroad credit must pay the penalty. The argument concluded by quoting the words of President Wilson:

"We must all stand as one to see justice done and all fair assistance rendered and rendered ungrudgingly."

Frederick Strauss, of J. & W. Seligman, representing the investment bankers, was the next witness.

Questioned by Mr. Brandeis as to his apprehension over the

probable outflow of gold, Mr. Strauss pointed out that exports showed a much larger falling off than imports. In order to extend to any extent trade in Japan, China and South America, it would be necessary to advance long time credits, and, in his opinion, this country is not now ready to do that. Those who look for large increases in export trade, other than in staples and munitions of war, he thought would be disappointed. Exports of manufactured articles to belligerents are bound to decrease, because they will all try to supply their needs at home. Germany, for instance, will do everything possible to keep her own manufacturers going.

Commissioner Meyer said he had heard of no proposal to start a "buy a share of railway stock" movement. He asked Mr. Strauss if the statement of witnesses for the railway as to the prospects for railway securities were in his opinion calculated to make such a movement popular.

"Have you been accustomed," asked Commissioner Meyer, "to have the head of a great concern come to your office and offer you $20,000,000 of an issue of securities, at the same time stating he would not invest in them himself? In your opinion, how would that affect the credit of his company?"

"Undoubtedly it would tend to shake confidence," the witness replied.

Reverting to the question of dividends, Mr. Meyer asked if the witness did not believe a clientage of stockholders could be built up who would look upon property improvements as a part of their legitimate dividends. Mr. Strauss thought not.

"Then the average stockholder, in your opinion," said the commissioner, "buys income, not property?"

"He has little personal pride in the property," was the reply. "It is too remote from him. He is interested in what he gets out of his investment."

A GERMAN VIEW OF THE RATE DECISION

The Bureau of Railway News and Statistics has issued the following extract from a commentary published in Zeitung des Vereins Deutscher Eisenbahnverwaltungen, the official journal of the German Railway Association, on the recent decision of the Interstate Commerce Commission in the rate advance case:

"Thorough treatment of the results of actual inquiries is conspicuous for its absence. For months, witness after witness and expert after expert were examined. From them a mass of facts for and against the case of the railways must have been brought out. In the decision there is as good as nothing covering all this. The new statistics on capital, traffic, receipts and expenses could have been secured easily from figures already on file with the commission or from reports which could have been made in the shortest time. There was no necessity of spending many months.

"Since there is a lack of concrete foundation the arguments of the commission make no lasting, convincing impression. One would think he was reading a not too weighty scientific treatise, instead of the decision of so high and, because of its power, so very respected a body.

"The occasion surely was important enough for exceptional handling. . . . Yet there is lacking adequate grounds . . . for the sepaartion of the territory into one part where the increase was granted and another where it was refused. The few figures on average rates charged on individual roads in the affected areas are insufficient as a basis for a discrimination so seriously disturbing and cutting so deeply into the industrial structure.

"The impression is given, involuntarily, that the commission had been driven most unwillingly to a decision favoring the increase; and, to please both sides, railroads and shippers, had found no other way out than this, so to speak, local division of spoils.

"Concerning the gratuitous advice given as to how the railways may find relief, there is not much to be said beyond what railroad men have said already. But through the thoroughly impracticable proposal for an increase in passenger rates the commission has opened itself very seriously to attack. . . . The objection can be made with justice that great difficulties stand in the way of raising passenger tariffs, wholly aside from the fact that in a large number of states passenger rates for intrastate traffic are fixed by law, and that from a technical as well as an economic standpoint it is inadvisable to raise interstate fares higher than state fares.

"Throughout there is a certain irritable tone which in a more or less judicial decision is not in place. Repeated introduction of the misdeeds of individual enterprises and the vehement rejection of suggestions made to it (from outsiders) were better left out."

The review closes by contrasting the experience of German roads in a similar petition 40 years ago, when they were granted an increase of 20 per cent to offset higher costs and wages.

EDUCATING THE PUBLIC IN "SAFETY FIRST"

The Southern Pacific, during the past ten months, has given instruction in "safety first" to many thousands of people, not employees—citizens in the larger towns on its lines; and at the same time has advertised its own efforts in the same line by exhibiting models of semaphore signals, hiring rooms for the purpose and employing a regular lecturer. The visual instruction in cautiousness is conveyed by means of large photographs, about a hundred of them displayed in a booth; and whatever urging may be necessary to induce people to walk in and examine the pictures is accomplished by means of the semaphores which are so manipulated as to be an attraction even to the careless.

The pictures illustrate those accidents commonly involving the public, such as trespassing on tracks, automobile drivers approaching crossings not under control, and passengers unnecessarily assuming dangerous positions on trains in motion. In addition to these the results accomplished by the company's "safety-first" organization are illustrated by views of machinery before and after safeguarding and other well known precautions.

All of the pictures, together with statistical accident charts, are displayed in a portable booth 24 ft. long, 15 ft. wide and 14 ft. high. The booth is a counterpart of the one used for the Southern Pacific display at the International Exposition of Safety and Sanitation, held in New York last year. The exhibit travels on an itinerary similar to those of theatrical companies. Advance press notices are published, giving the date and purpose of the exhibition. After the installation of the exhibit, accounts showing accident statistics and other interesting narratives are published in the newspapers. It requires but a day to install and a half a day to dismantle the booth. Where available a vacant store in the business district of each town is selected for displaying the exhibit.

The display of the miniature model of the automatic block and interlocking signals is popular. The public generally is interested in learning the manner in which signals operate and the demonstrations attract many. At the conclusion of each signal demonstration attention is directed to the accident pictures and a brief statement of the purpose of the exhibit is made by the demonstrator in charge. Few people leave the booth without studying the pictures and descriptive data.

A chart setting forth statistics relevant to the carelessness of the great majority of people when crossing tracks at grade is also displayed. These figures, compiled from tests made last year by the Southern Pacific, show, as has been shown elsewhere, that exceedingly few persons stop and look in both directions before crossing tracks, 69 per cent of automobile drivers observed took no precautions whatever, neither stopping nor looking in either direction. Emphasis is given to the fact that the greater proportion of trespassers killed are wage earners and not hoboes, as is commonly supposed.

The exhibit has been en tour since January of this year and with the fulfilment of the itinerary it will have been displayed in all the larger towns on the Southern Pacific system, and will have been attended by 100,000 people; and approximately $5,000 will have been expended in its management.

The Design of Injector Steam Pipe Connections

Recommendations Covering the Design and Material for Brazing Rings, Beaded Rings, Coupling Nuts and Flanges

By Strickland L. Kneass

The report of the chief inspector of locomotive boilers of the Interstate Commerce Commission covering the period from August, 1911, to April, 1913, includes references to certain failures of the copper pipe connection between the turret steam valve and the injector. In the opinion of the inspectors some of these failures might have been prevented if proper care had been used in brazing, or if a better quality of material or an

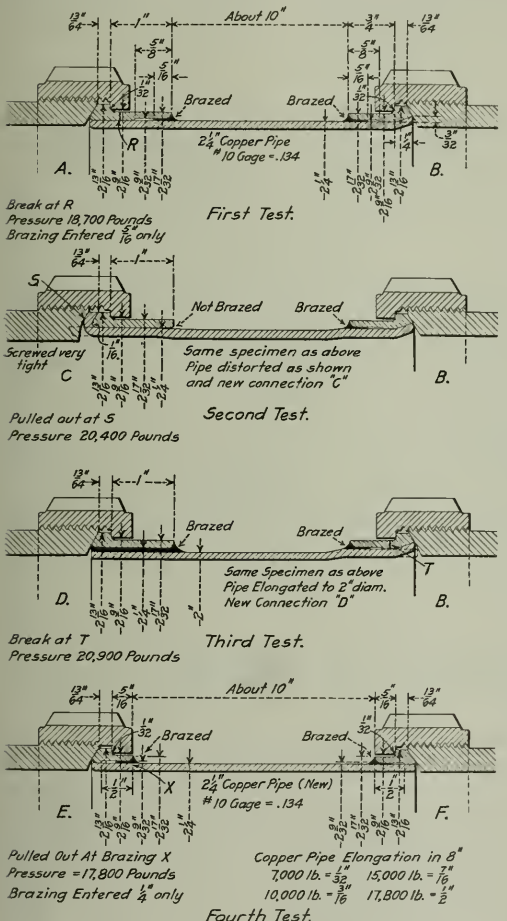

Fig. 1—Tests Made on Brazed Connections by Wm. Sellers & Company, Inc.

improved design of connection had been supplied. These questions were brought to the attention of the locomotive builders, and manufacturers of locomotive injectors were invited by Wm. Dalton, chief engineer, American Locomotive Company, to meet at Schenectady, N. Y. After an informal discussion, a subsequent meeting was called, and held at Atlantic City during the 1913 convention of the American Railway Master Mechanics' Association. A committee was there appointed, consisting of S. L. Kneass, chairman, F. L. Edwards, L. Kassander and B. T. Williston, to report on the subject. The following is taken from a report on the subject by the chairman:

The usual method of supplying steam to the injectors of locomotives is by a copper pipe brazed at each end to ball joint rings and held to the turret steam valve and to the injector branch by threaded coupling nuts. This method has been in use since the injector was introduced in this country in 1860 by Wm. Sellers & Company, and follows the general practice of the railroads and injector manufacturers of the continent; on certain foreign railroads brazed flanges are substituted for the threaded nuts. The questions to be discussed cover methods of brazing, its use, the design of coupling nuts and the advantages of other means of holding the pipe connection to terminal branches.

An investigation was made of the strength of brazed connections without change of existing design of the brazing rings. The strain to which the steam connection is subjected in service depends upon the steam pressure carried, the relative change of position of the injector and the steam valve, expansion and contraction of the copper pipe and the vibration of the locomotive when running rapidly. Tensile tests were preferred to hydrostatic pressure as approaching more closely to service strains. The actual strain due to the pressure of the steam is easily calculated, but the other elements are variable and indeterminable, depending upon the bending and fitting of the pipe and the rigidity of the attachment of the injector to the boiler bracket. The strain, due to the steam pressure on a 2¼ in. copper pipe carrying 200 lb. steam is about 600 lb., while the tensile strength of a well brazed joint is 18,000 to 20,000 lb. A brazed joint, supported by the collar of a screw coupling nut, is rigid, so that the strain of bending due to the motion of the locomotive, is borne by the unsupported part of the copper pipe; as this pipe is more or less flexible it yields without damage. Within the connection the brazing material forms a chemical weld between the copper of the pipe and the metal of the ring, and has a higher elastic limit than the copper pipe itself.

Tensile tests were made upon short lengths of 2¼ in. copper pipe with brazed connections at each end held against concave ball seats by standard coupling nuts, using a 100,000 lb. Emery testing machine at the works of Wm. Sellers & Company, Inc. The results, as well as the design of brazing ring, the location of the brazing material and the point of failure are shown in Fig. 1. These connections failed under the following tensile strains:

A	18,700 lb.
B	20,900 lb.
C	Over 19,000 lb.*
D	Over 20,900 (not broken)
E	Copper pipe broke, 17,800 lb.
F	Not broken

*Specimen consisted of the usual type of union with the copper pipe beaded over the ball joint, but without internal grooves in the ring, and not brazed to it. The specimen failed by the copper pipe pulling from ball joint even though the coupling nut was frequently tightened.

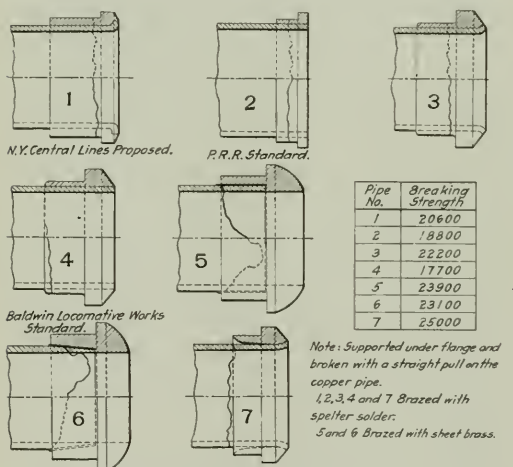
In each of the above cases the copper pipe showed a marked elongation, reducing in diameter under the tensile strain from 1/8 in. to 3/16 in. before failure of the points. Further, the failing pressure was many times in excess of the strain due to service steam pressure. The coupling nuts showed no indication of the strain to which they had been subjected.

The results of a similar series of tests, conducted by the testing department of the Baldwin Locomotive Works, are shown

in Fig. 2. A variety of joints is shown, including cylindrical and taper brazed connections, with and without beads, as well as a reduced length of ring, so that the brazing material would penetrate as far as the collar. The minimum breaking strength was 17,700 lb., and the maximum, 25,000 lb. These tests were made on a Riehle machine, the collar resting loosely on a collet, and the copper pipe held in clamping jaws. They show conclusively the strength of a properly brazed copper joint.

There is no doubt but that the method of brazing and the care with which it is done play an important part in the results. Experiments show the advantage of recessing and shortening the ring so that the strain may not come upon the lighter part of the sleeve, which in many cases is thinner than should be; the real brazed joint between the ring and the copper pipe should be at the ball joint collar, which is held by the coupling nut. The preferred method of brazing is by means of radial jets of the Bunsen type, which can be regulated so as to prevent overheating. This method is superior to the charcoal or coke fire, more easily handled and less liable to burn the metal.

Temperature tests were also conducted by Wm. Sellers & Company upon standard rings of injector manufacturers, to determine the action of these rings when subjected to the heat required to melt brazing material. Two sets of 2¼ in. rings were placed in non-oxidizing atmosphere in a steel crucible;



Pipe No.	Breaking Strength
1	20600
2	18800
3	22200
4	17700
5	23900
6	23100
7	25000

Note: Supported under flange and broken with a straight pull on the copper pipe.
1, 2, 3, 4 and 7 Brazed with spelter solder.
5 and 6 Brazed with sheet brass.

Fig. 2—Tests Made on Injector Steam Pipe Fittings by the Baldwin Locomotive Works

the crucible was then immersed in a lead bath and the temperature raised to 1,850 deg., measured by an electric pyrometer. The rings were then removed and showed no deterioration; each was flattened in a vise from 2¼ in. to 1¼ in. One of these rings fractured at the ball joint; the others stood the test without change. The melting temperature of the brazing wire was found to be 1,400 deg. to 1,450 deg. These tests proved that as now supplied the rings will stand both the melting temperature of the brazing material and the destructive service stresses to which they may be later subjected.

The Interstate Commerce Commission submitted to the committee a list of failures of injector steam connections due either to defective brazing or material covering a period of 21 months from August, 1911, to April, 1913, inclusive. In each case of brazing failure, the work had been obviously done most carelessly. The failure of the coupling nuts was due in one case to poor material, and in the second, to the thread being of too fine pitch.

Each of the 63,000 locomotives under the control of the commission is equipped with two injectors, and each injector has two terminal connections to steam valve and injector, making a total of 252,000 connections. Of these connections, 30 have been reported to have failed during a period of 21 months, an average of 18 per year; this is seven thousandths of one per cent per year, a factor so small as to be negligible compared with the more serious causes of accidents, and one which raises a doubt as to the necessity or advisability of forcing any change of method or design of connection which may destroy accepted interchangeable standards. It is considered desirable rather that more stringent regulations be adopted for methods of brazing and for the composition of the alloy used in rings and nuts. Every effort, however, should be made to reduce the chance of failure and to test any practical suggestions. It is probable that the present brazing ring may be modified so as to insure a more positive chemical weld between it and the copper pipe. Tests have shown that shortening the ring and brazing it directly to the collar of the ring make for security. These changes are shown in Fig. 3 for certain sizes.

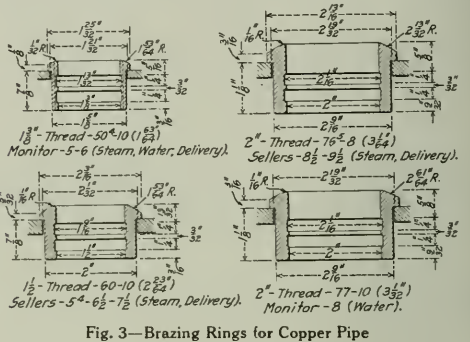


Fig. 3—Brazing Rings for Copper Pipe

A substitute for the brazed joint is a mechanical connection consisting of beading the copper pipe into internal grooves in the ring and flanging it over the lower face to form the ball joint seat. This operation presents no difficulties to locomotive builders or large railroad shops. The flange is set or rolled over the face of the ring without special tools, but care is required to form a true ball joint. The cost of the operation probably does not exceed that of brazing and from data furnished by the American Locomotive Company after using a special form of pipe beading machine the cost may be somewhat less. This form of mechanical connection has the distinct advantage of a direct joint between the copper steam pipe and the injector or valve. This method is comparatively new as applied to locomotive injectors; it is of undoubted value for stationary or fixed joints, but should be thoroughly tested in locomotive injector service before recommendation for general adoption by railroad or locomotive builders.

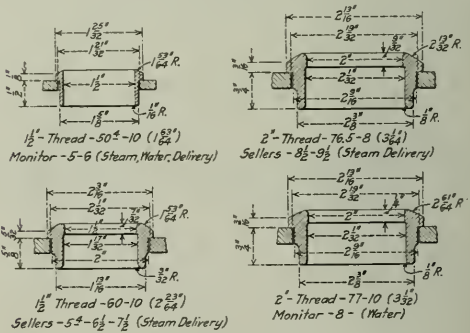

Fig. 4—Unions for Beaded and Flanged Copper Pipe

There are certain objections to this type of injector connection;

liability of damage to the ball joint during the removal or re-application of the injector; the difficulty of reaming or refacing a fixed ball copper seat without special tools; the difficulty of removing and renewing such mechanically connected ring or ball seat in case of destructive injury; the necessity of shortening or replacing the copper steam pipe in case of replacement of the ring. These several operations can be more easily handled in large shops, but the value of this type of connection can only be determined by extensive service tests on a number of railroads and under a variety of operating conditions.

This mechanical joint can be used with standard injector branches and coupling nuts, and manufacturers of locomotive injectors hold themselves in readiness to supply either form. The dimensions for four sizes are shown in Fig. 4.

The accepted practice of the railroads in the United States and most foreign countries for attaching connecting pipes to injectors and steam valves has been by threaded coupling nuts. There are

This method has an advantage over fine thread nuts in view of their occasional failure and stripping. As it is not necessary to remove the flange when detaching the injector from the locomotive there is practically no wear on the threaded branches. Designs of flanges which are applicable to standard injector connections, giving diameters of bolt circles interchangeable for the several manufacturers, are shown in Fig. 5.

The following recommendations were made by the committee:

Brazing Rings.—To be made shorter; counterbored or tapered internally to permit brazing material to form a joint with ball collar. The end of the copper pipe should be beaded tightly into bevel of ball collar. The composition of brazing rings should be within the following limits:

Copper	87 to 90 per cent
Zinc	8 to 12 per cent
Lead	1 to 1½ per cent
Tin	Not to exceed .4 per cent, and to replace zinc

Beaded Rings.—Rings may have one or more internal grooves

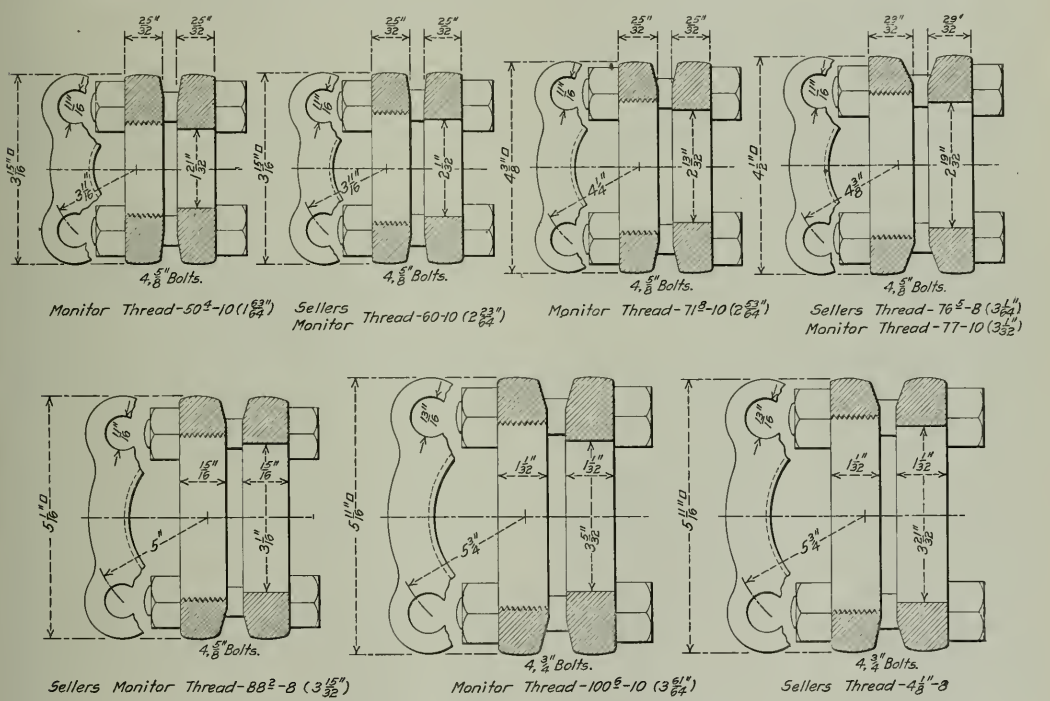

Fig. 5—Connecting Flanges for Iron and Copper Pipe

two accepted standards of injector threaded branches, their diameter and pitch, and their relative position. In view of the acknowledged advantage of retaining these standards, it would be a backward step to make any change that might affect the present interchangeability of injectors unless there were a marked gain in efficiency or in safety to the operatives. As the same ends can be obtained without such change, existing standards should not be discarded.

As a substitute for the threaded coupling nut, a method employing a pair of flanges for each connection is now being tested with lifting and non-lifting injectors, and valves. This method includes one flange screwed on the injector branch, the other bored to fit the collar or ring surrounding the connecting pipe; the two flanges are drawn together by four bolts, holding the flange of the copper pipe or its brazed ring against the ball seat of the injector branch.

about ¼ in. wide and at least 1/32 in. deep. Composition of metal may be left to choice of manufacturer. Rings should be firmly held in split collet fitting closely to outside diameter. Copper pipe may be rolled into grooves by bevel prossering tool or any special device preferred. Flanged ball joint, preferably rolled.

Coupling Nuts.—Diameter and pitch of two accepted standards, Sellers and Nathan, should be maintained. No threaded coupling nuts should be used or recommended having a pitch less than 1/10 in. for diameters over 2½ in.; or less than ⅛ in. pitch for 3 in. or over. Metal should be strong but not brittle, preferably left to choice of the manufacturer. It is considered advantageous to have a different and somewhat harder mixture than that used for the bodies.

Flanges.—It is considered advantageous to use in any future tests, style, form and dimensions of flanges now applied to

Hancock injectors, except that the diameter, pitch and thread may be varied to suit accepted standards of the manufacturer. Material of the same composition as in injector body may be used, but preferably drop forging or cast steel.

Copper Steam and Delivery Pipes.—Pipes connecting turret steam valve or operating valve with injectors should be provided with one or more easy bends of as long radius as admissible, and the total length should be much greater than the minimum distance between the terminal joints. Steam pipes should be designed so as to allow easy flexure during expansion and contraction. Bends should be made so that the outer radius is not strained or flattened and delivery pipes should be attached to the boiler with due allowance for creeping, yet sufficiently firm to prevent distortion of alinement under pressure.

ANNUAL MEETING OF THE AMERICAN ELECTRIC RAILWAY ASSOCIATION

The American Electric Railway Association held is thirty-third annual meeting at Atlantic City from October 12 to 16 inclusive. In the engineering section of the association there were a number of reports and papers presented that possessed matters of interest to the officers of steam railways though they dealt primarily with those pertaining to the electric railway. The papers were presented were as follows: Constitution and By-laws; Power Distribution; Standards; Electrolysis; Accident Prevention; Block Signals; Transportation Engineering; Equipment; Buildings and Structures; Life of Railway Physical Property; Engineering Accounting; Power Generation; Way Matters; and Heavy Electric Traction. The following is an abstract of those papers that contained matters of particular interest to steam railway officers.

BLOCK SIGNALS

The use of light signals for daylight indication on high-speed interurban lines is of comparatively recent origin; a trial of the apparatus of the General Railway Signal Company on the Michigan United Railways showed that, with the sun shining directly into the face of the signal, the red light could be seen about 1,500 ft. and the green light about 1,000 ft.

Discussion.—The discussion was limited to that pertaining to the acceptance of the various recommendations of the committee as to the adoption of standards. To this may be added the statement made that in the formulation of these recommendations it was seen that there were many things that had been successfully worked out in steam railway practice that could be successfully applied to that of electric railways, and that, before any recommendations were made in these particulars it would be well to consult with the engineers of the steam roads and adapt their results to electric railway practice. A number of these engineers had been added to the American Electric Railway Association committee membership, and it is the intention of the committee to embody their experiences in next year's report.

EQUIPMENT

In dealing with the solid wrought carbon steel wheels, the committee stated that, while the number of wheels included in the reports was not large enough to serve as a basis for any general conclusions, a surprising lack of positive evidence on this point was manifest and the figures seemed to show, so far as they showed anything, that there was not sufficient justification for a strong insistence on mating by carbon content.

In the case of air brake hose, it was found that the life was reduced to one-third the normal when oil was present.

With this in view, the committee endeavored to formulate a specification that would provide a hose of sufficient flexibility and strength to meet the severe strains imposed by the sharp curvature of track. Such hose to have also an oil resisting inner tube. It was finally decided that an oil resisting tube should be provided for service where the hose is subject to oil from a motor-driven air compressor, such as in the reservoir line of trains operated by multiple-unit control equipment, and straight air emergency line in city trailer operation. In order to obtain the oil resisting qualities of the tube, the fact was recognized that strength and flexibility of the hose must to some extent be sacrificed, and it was therefore decided that the specification should provide for two classes by grades, i. e., one for use where hose is subject to oil, and the other for general use where these conditions do not exist.

Upon investigation, however, it was found that very little data are available at the present time, with respect to an oil resisting tube on which a specification could be based, and it was, therefore, recommended that the subject be continued next year for further investigation with a special view of investigating requirements and tests for oil resisting inner tube, and to consider such changes as may be found necessary or desirable after putting the proposed specification in effect.

The treatment of car lighting in so far as it relates to the lamps used is quite as applicable to steam railway cars as to those of electric railways. The committee report on lamps says in part:

"The regulation of a carbon lamp is very poor, the intrinsic brilliancy of the filament varying considerably with slight changes in the current passing through it. With varying voltages at the lamp, the intrinsic brilliancy of the filament is constantly varying, and therefore the amount of light obtained from the lamp is also varying, as the amount of light varies directly in proportion to the brilliancy of the filament. The character of the carbon filament is such that its electrical resistance varies with its temperature. As the carbon is heated, its resistance gradually drops, permitting more current to flow through it, this change in resistance occurring only through a limited range, but sufficiently to materially affect regulation. As the voltage on the lamp drops, the current through the lamp drops also, reducing the temperature of the filament. The filament on cooling increases in resistance, and thus causes an even greater reduction in the current passing through it, which explains the fact that with a slight change in voltage there is a great change in the amount of light emitted by the lamp.

"The efficiency of the carbon lamp is low, but until the advent of the tungsten lamp, the efficiency of the carbon lamp was as good as could be obtained.

"The life of the carbon lamp is of a more or less indeterminate length, depending largely upon the definition of life. A carbon lamp will often continue burning for an indefinite period, during which the filament is undergoing changes which materially reduce the amount of light obtained from the lamp. Among other things, the carbon from the filament is gradually oxidized and deposited on the inside of the bulb in such a way as to cloud the glass and cut down the amount of light emitted to a considerable extent. After the carbon lamp has been in service from 1,000 to 1,500 hours, it has usually depreciated to such an extent as to warrant discarding.

"The Mazda lamp utilizes a tungsten filament, which does not vary in resistance with temperature changes to any such degree as does the carbon filament. In fact through a certain range of temperature, there is a slight increase in resistance with increase in temperature, consequently the light obtained from the lamp does not change as much with changes in voltage as is the case with the carbon lamp. This is a great advantage under variable voltage conditions, as the illumination of the car can be maintained more constant.

"The Mazda lamp is a more expensive article to buy than the carbon lamp, but the saving in current to be obtained may compensate for the increased cost of replacements. The life of the Mazda lamp is assumed to be 1,500 hours of burning, as after this point is reached the light produced drops below 80 per cent of normal, which value has been determined as the economical point to discard a lamp.

"There are two important reasons given for using reflectors in

car lighting work, one of which is that by means of proper design a reflector can be made to hide the lamp filament from the eyes of passengers, and the other is that the efficiency of the lamp may be increased from 50 per cent to 100 per cent, depending upon the type of reflector used. Either reason by itself appears sufficient to warrant the use of reflectors, the main requirements of which are as follows in order of importance:

1. Hiding lamp filament.
2. Correct distribution of light.
3. High efficiency.
4. Good appearance.
5. Economy.

"The principal types of reflectors are:

1. Prismatic clear glass.
2. Heavy density opal glass.
3. Medium density opal glass.
4. Light density opal glass.

"Prismatic clear glass reflectors are the most efficient, as with them it is possible to redirect the light in any direction desired, which permits of accurately meeting each lighting requirement. Their first cost is comparatively high, but is quite often justified where efficiency is of first consideration.

"Opal reflectors vary in efficiency, the heavy density being the most efficient and productive of the best light control.

"The following table shows the efficiency that may be expected from these various types of reflectors:

Table I—Efficiency of Various Types of Lighting Units

Equipment	Foot candles per watt per sq. ft.	Watts per candle
Bare carbon lamp	0.44	3.75
Bare Mazda lamp	1.43	1.16
Light density opal reflector with Mazda lamp..	2.22	....
Medium density opal reflector with Mazda lamp	2.60	....
Heavy density opal reflector with Mazda lamp.	3.16	....
Prismatic clear reflector with Mazda lamp.....	3.20	...."

Discussion.—In the matter of air brake hose the statement of the committee to the effect that the desirable feature of hose, namely, that of the resistance to oil, was emphasized. It was stated that it was a practical impossibility to avoid the presence of oil in the air system where motor-driven pumps are used, and that there was no specification that would provide a hose which was resistant to the action that followed. It was found that the best means of securing a hose that would give satisfactory service was to buy by brand, using one that gave the best results. This had been the practice on one large system for a number of years, and though the cost of hose had been high, it seemed at present to be the most satisfactory solution of the difficulty.

The detail of the report that received the greatest amount of attention was that relating to car lighting. In it the electric light was the only thing considered, and it was repeated several times that it had been found that the high wattage lamp was much more economical than the low. While photometric tests showed that the distribution of the light was fully as good with a few high wattage lamps as with a greater number of low ones.

In this distribution of the light the color of the side walls and the head lining has a great influence on the efficiency of the light. The case of the Interborough and the Brooklyn Rapid Transit railroads was cited as an example of what can be accomplished. The Interborough cars that were built several years ago were green up to the advertising line, and a light buff above it. The cars are 50 ft. long, and are lighted with 56-watt lamps on six circuits. In the case of the Interborough cars it is the present intention to have them white from the top of the seat backs upward. But, if they cannot be kept clean down as low as that, they will be white from the tops of the windows up. Elaborate photometric tests have been made, extending over several months, and it has been found that these cars can be lighted on three circuits of 56-watt lamps, and these cars are 67 ft. long and 1 ft. wider than the Interborough. The lamps are to be shaded with the Soudan globe.

As for the arrangement of the lamps, it was thought to be difficult to have a standard arrangement, but it seemed to many as though a standard would be worth while.

Another point suggested was the use of indirect lighting with which experiments are being made. It has been found that the system makes it possible to reduce the number of lamps, which reduces the power consumption and at the same time possesses the great advantage of keeping the direct rays of the light out of the eyes of the passengers.

There are indications that in some places the civic betterment societies are planning a regular campaign against the railways in the matter of better car lighting, and it was suggested that it would be advisable to forestall any action of this sort by the railways taking the matter up on their own initiative and doing all that is possible beforehand instead of being forced into it by outside action.

Among other suggestions leading to the better lighting of cars without extra expense was the use of frosted back globes, while for general economy it was recognized that the Mazda lamp was much superior to the carbon filament.

As an item contributing to a lessening of the expense of maintenance, the use of holders of larger diameter for globes and reflectors was suggested. It had been found on one road that where holders of 2¾ in. diameter had been substituted for those of 2¼ in. a considerable reduction of maintenance expenses had followed.

WAY MATTERS

The report gives a comprehensive statement of the present condition of track matters, and shows how the experience of street railways has led to the development of a roadbed that is near of kin to that used on steam railways, especially in the matter of the use of ballast. Many city roads are, however, still constructed with the ties resting directly on the subgrade. But in these cases careful attention is paid to proper drainage. A table is given of the bearing value of various soils taken from the report of the 1914 convention of the American Concrete Institute. It is as follows:

Material	Safe load in tons per sq. ft.
Quick sands and wet soils	0.1 to 1.0
Dry earth according to depth below surface	1.0 to 3.0
Moderately dry clay, confined	2.0 to 4.0
Dry, stiff clay	4.0 to 6.0
Sand, confined	2.0 to 6.0
Sand, compact and cemented	4.0 to 8.0
Gravel, cemented	8.0 to 12.0
Rock	25.0 to 200.0

As to ballast materials they vary about as they do on steam roads, and include crushed stone, gravel, cinders, slag and sand with a preference for crushed stone, which is also most extensively used.

There is one statement that differs somewhat from the published reports on the subject of rail and track deflection of steam railways. It is that neither headway nor speed has much influence on foundation excepting that where joints are poor or corrugation is present in rails the speed undoubtedly adds to the damage resulting from such conditions. Experiments with a deflectometer in Chicago show that there was no appreciable difference in deflection under car load whether the speed was constant, accelerated or retarded (Second Annual Report, Board of Supervising Engineers, Chicago Traction, 1909, page 184). The report definitely states that "only the actual weight of the car seemed to affect deflection and no wave motion in rail existed for no deflection could be discovered except when the car was actually over the point of reading."

In considering the subject of alloy steel rails, the data given were almost entirely those obtained from the steam railways. At the outset attention was called to the fact that the tonnage of alloy steel being rolled into rails of all sections has been declining for the last three years. The table on the following page shows the tonnage produced of the various kinds of steel rails in recent years and the total for each year.

TONNAGE OF STEEL RAILS ROLLED

Year	Alloys of Titanium	Alloys of Manganese copper nickel	Alloys of Total alloy	Electric	Total open-hearth	Total Bessemer	Total tons
1897...	.....	.....	.....	.....	500	1,644,520	1,647,982
1906...	.....	.....	.....	.....	186,413	3,791,459	3,977,887
1909...	35,945	13,450	49,395	.....	1,256,674	1,767,171	3,023,845
1910...	256,759	565	257,324	.....	1,751,359	1,884,442	3,636,031
1911...	152,990	999	153,989	462	1,676,923	1,053,420	2,822,790
1912...	141,773	7,494	149,267	3,455	2,105,144	1,099,926	3,327,915
1913...	47,655	11,864	59,519	2,436	2,527,710	817,591	3,502,780

The following table gives the production by processes of alloy-treated steel rails since 1903, in gross tons:

	Open-hearth and electric	Bessemer	Total
Total for 1909	13,696	35,699	49,395
Total for 1910	27,389	229,935	257,324
Total for 1911	38,539	115,450	153,989
Total for 1912	40,393	108,874	149,267
Total for 1913	33,567	25,952	59,519

These figures taken from the published records of the American Iron & Steel Institute show that the production of Bessemer steel rails has been steadily declining, while the production of open-hearth steel rails has been increasing at a nearly corresponding rate. The first separation of production records to show the amounts of alloyed steel made into rails was in 1909, and since 1910 the tonnage produced has been declining. A plat of these figures is given in the report to illustrate graphically the point that as use of open-hearth rails has increased the tonnage of alloyed steel rolled into rails has decreased until it is now quite insignificant as compared with the total tonnage of rails rolled. This condition is no doubt a natural one, for with the cost of open-hearth rails $2 per ton more than the cost of Bessemer, purchasers probably have some reluctance over having the extra prices for alloyed steels added to the already increased rate for the open-hearth. In other words, the indisputable tendency is toward the increasing use of open-hearth rails, which, from the records, indicate greater wearing qualities than Bessemer rails, and as open-hearth rails cost seven per cent more than Bessemer rails, purchasers are loath to add to this the extra cost demanded for the alloyed steel. In the case of open-hearth steel made with the usual addition of 0.1 per cent metallic titanium, the cost is roughly 12 per cent more than the cost of plain Bessemer steel, while with manganese steel at $80 per ton, the cost is 186 per cent more. The first cost of alloyed steel rails therefore may be not only prohibitive in some instances, but in others so high as to render return on the investment extremely slow, especially when a large sum is involved. These matters have doubtless militated against the production of alloyed steel rails and purchasers have contended themselves with the adoption of open-hearth steel on the reasoning that for 7 per cent greater first cost, 50 per cent longer life for the rails might follow.

Under special conditions of quick wearing track, sufficient benefits may ensue to warrant the adoption of an alloy steel rail, and for such purposes particularly the demand for alloy rails seems to emanate. The question then of what alloy to use is an important one, and eliminating matters of cost entirely the purchaser has ferro-titanium, manganese, nickel, high silicon and electric steel to choose from. The fact that rail sections are of an intricate and unbalanced character, the girder and high T-rails being especially so, is indeed unfortunate; for these odd shapes quite preclude opportunity for successful heat treatment—a process for increasing strength and wearing qualities in which direction much progress has been made in recent years on such articles as axles, rail joints, bolts and sundry automobile parts. However, some attention has been given to the heat treatment of rails, and while no results have been published, it is within reason to expect that a satisfactory method will eventually be found for overcoming the difficulties encountered.

This review is therefore confined to the experience with those alloy steels mentioned, all of which are more or less readily obtainable in any section for street and interurban railway work.

It must be appreciated that experience with alloyed steels is dependent on a number of factors in addition to the metal itself. The mere fact of adding 0.1 per cent of metallic titanium or 13 per cent of manganese, for example, to the steel will not in itself effect a panacea for the ills to which track and rails are subject, and reported results of breakage and wearing qualities therefore are inclined to show divergent results in many cases, and even average results for any particular kind of steel may be greatly exaggerated. The best tests are those of individual character where different kinds of steel are laid in line on the same type of roadway and subjected to equal conditions and maintenance. Results from such experimental track afford good comparison, but the tendency even then is to often measure the rail wear by the eye rather than by the accurate, though delicate instruments, so that misleading figures may readily follow.

The only American records published showing the results of rail failures, and in some instances wearing qualities, are those of the American Railway Engineering Association. But very little accurate data were obtained by the committee as to the efficiency of alloy rails for street railway service, other than that the wear of manganese steel rails was about one-fifth that of ordinary steel rails.

Notwithstanding this paucity of data the statement is emphasized that girder and high T-rails, as well as standard sections, can be easily rolled from the following special steels possessing the general characteristics mentioned:

Kind	Steel containing	General properties anticipated
Titanium	0.1 per cent metallic titanium.	Less segregation, cleaner metal, hence longer life.
Nickel	3.5 per cent nickel.	Increased life.
Nickel chrome	Containing varying percentages—nickel and chromium.	Increased life by being tough and hard.
Manganese	About 12 per cent manganese.	Very tough and hard, cannot be easily cut or drilled, wears slowly.
Electric	Made in electric furnace.	Very clean steel, free from impurities, thus adding life.
High silicon	About 0.35 per cent silicon.	Increased life. Much used in England.

Discussion.—The discussion was devoted almost exclusively to the movement of rails in urban tracks and in the methods of paving.

HEAVY ELECTRIC TRACTION.

This report dealt for the most part with overhead clearances, which were placd as follows, for:

Trainman with lantern	25 ft. 0 in.
Trainman without lantern	24 ft. 0 in.
Without trainman on cars	18 ft. 0 in.
High voltage wires	16 ft. 10 in.
Minimum for 600 volt overhead contact	16 ft. 0 in.

As third rail clearances it was recommended that the subject be continued for another year. The same recommendation was made in the matter of electric locomotives, because of the number of varied designs now in process of development.

No Discussion.

ELECTION OF OFFICERS

At the annual election the following officers were elected in the engineering section: President, L. P. Crecilius, electrical engineer, Cleveland Ry. Co.; first vice-president, John Lindall, superintendent rolling stock and shops. Boston Elevated; second vice-president, B. F. Wood, chief engineer, United Gas & Electric Engineering Corporation of New York; third vice-president, F. R. Phillips, superintendent equipment, East Pittsburgh Railway; secretary and treasurer, E. B. Burritt; executive committee, J. P. Barnes, general manager, Syracuse and Suburban; G. W. Palmer, electrical engineer, Bay State; H. F. Merker, engineer maintenance of way, East St. Louis & Suburban; W. G. Gore, superintendent equipment, Brooklyn Rapid Transit.

VENEZUELAN IMPORTS OF RAILWAY MATERIAL.—In 1912 Venezuela imported railroad material having a total value of $164,000, $23,000 of this representing supplies from Germany.

Mechanical Stokers for Locomotives*

Essential Features to Be Considered in Designing Machines for This Work; Increase in Tonnage Obtainable

By Clement F. Street†

The firing of a locomotive with a shovel is the most crude operation being performed on our railways to-day, as is shown by the almost continuous series of experiments which have been carried on during the past twenty years, with a view of producing a successful locomotive stoker. When these experiments were first begun, it was with the idea that the stoker would be, primarily, a fuel-saving device, and its labor-saving features were considered as secondary. With the advent of the large locomotive this view has changed, as the limit of the size of the locomotives which could be built has been fixed by the capacity of a man to shovel coal. With the advent of the successful stoker, this limit has been removed, and it is now possible to build locomotives to burn any quantity of coal which may be desirable. In addition to this, the use of the stoker has increased the capacity of many locomotives already in service. The question of capacity is to-day the first consideration, and any question of fuel saving, although important, has become secondary.

Locomotive stokers in substantial numbers, about 850, are now in regular daily successful operation and are considered an essential part of the equipment of the largest locomotives being built. The Baltimore & Ohio has just placed in service 30, and the Chicago, Burlington & Quincy 25 locomotives of the 2-10-2 type, which have a tractive effort of about 71,000 lb. and which would never have been built had it not been known that a stoker could be secured which would fire them properly. The Norfolk & Western has 105 Mallet locomotives fitted with stokers, which could not be shovel-fired in the service in which they are used.

It is not at all a difficult matter to fire a locomotive with a stoker and it does not seem to be generally known that practically every stoker ever applied to a locomotive has fired it and done a very good job. The actual firing of a locomotive is only the beginning, and a very small beginning, of the solution of the problem of producing a successful stoker. A locomotive stoker of the scatter type in order to be a successful and a commercial machine must do, if not all, at least most of the following:

It must not break down.

It must do at least 90 per cent of all manual labor in taking coal from the tender and distributing it over the grate.

It must distribute coal evenly over the grate and provide means for firing heavy on any one section or zone in case the locomotive does not burn an even fire.

It must be constructed so that the fireman can at any time inspect the fire, rake it, and do shovel-firing without shutting off the stoker.

It must have several definite and marked rates of feed, have a capacity in excess of the maximum requirements, and feed coal continuously at any definite rate at which it is set and maintain that rate regardless of variations in steam pressure or grade amount, or condition of the coal fed to it.

It must be constructed so that feeding to it bolts, spikes, rocks and any other foreign matter which may be in the coal will not result in a breakage and so that such matter or articles can be removed without taking the machine apart, in case they cause a clog.

It must have all parts easy of access for making inspection, repairs and lubrication.

The cost of inspection and running repairs must not be in excess of 75 cents per 100 locomotive miles.

It must be so simple in construction that the average fireman can understand the function of each part and be able to operate it successfully, after having received instructions during only one or two trips over a division.

It must have the opening through which coal is admitted covered with a screen which will reduce to a minimum the liability of the admission of foreign matter which will cause clogs.

It must handle wet coal.

It must keep a locomotive hot under all conditions with a lower grade of coal than is required for shovel-firing.

The first requirement of a successful stoker is reliability. The machine must not break down, and any machine which is liable to frequent break-downs is foredoomed to failure. The fire carried by a stoker is much lighter than with shovel-firing; the exhaust nozzle is larger for a stoker-fired locomotive, and a fireman who has been trained to stoker-firing, finds it very difficult indeed to take up hand-firing, or, if he has formerly been hand-firing, go back to it. Consequently, it is of vital importance that a stoker be reliable, and not subject to failure.

Very few locomotives will burn a fire evenly all over the grate and a successful stoker must, therefore, be constructed to meet this characteristic and feed continuously and steadily a larger proportion of the coal to that section where it is burning heavy than to the section where it is burning light.

A successful stoker fireman will at all times know just what condition his fire is in and he can do this only by making frequent inspections of it. If it is so hot he cannot see it he will put the hook in and feel it. With the best of machines and under the most favorable conditions it may be found that a few shovels of coal added at a certain place will help out materially, and conditions are liable at any time to arise which make this absolutely essential for securing the best operation. In order to secure the best results the fire should be thoroughly inspected at least every thirty minutes, and the stoker should be constructed so that this can be done without interfering in any way with its operation and certainly without shutting it down.

The driving engine of a stoker, under normal conditions, is working at not more than four or five horse power. A piece of slate, or large lump of coal, or some foreign substance entering the machine, will immediately double or treble the load on the stoker engine. There must be some sort of an automatic governor on this engine, which will take care of these wide fluctuations in the load. Without this, a fireman will never know the rate at which coal is entering the firebox, and is working entirely in the dark.

One of the things a stoker designer has to figure on is the fact that it is impossible to keep foreign matter out of a stoker. The properly designed machine should be able to withstand without breakage the feeding to it of an obstruction which will stop it instantly. In order to do this, all of the different parts of the machine must have more strength than the engine, and the only result of a clog of this nature must be that the machine will stop.

One of the most important characteristics of a stoker is that it shall be easy to inspect and lubricate. A machine should be built so that an inspector can start it up, inspect all its working parts and see that it is in operating condition, in not more than ten to fifteen minutes.

Some of the coal being used in stokers contains so much dirt that when it becomes wet it forms a sticky paste, which will not run and which plasters onto anything it comes in contact with, and forms a hard cake as it dries. This is about the hardest proposition the stoker has to contend with, but the successful machine *must* handle it.

One of the first things to be discovered in experimenting with the stoker, was the fact that it was possible, with it, to burn a

*Abstract of a paper read before the Western Railway Club, October 20, 1914.

†Vice-president, Locomotive Stoker Company, New York.

poorer grade of coal than could be used with shovel-firing. One of the problems which the railways are always up against is that of poor coal, and a properly designed locomotive stoker will eliminate practically all complaints of poor coal.

With a scatter type of stoker, the tendency is for a considerable proportion of the dust and finer particles to be carried out of the stack by the heavy draft, and in order to secure the best results from this type of machine, some provision should be made to prevent this. One of the methods, which has been successfully employed is to provide a screen, which takes out the dust and finer particles, and deposits them across the back end of the bridge. This is considered a very important feature of a stoker of this type, and while a machine not having it will undoubtedly fire locomotives successfully, it will certainly not give as good fuel economy as a machine having this feature. If, therefore, the best results as to fuel economy are to be obtained something of this nature must be provided.

It is very evident that in the near future all locomotives in main line train service will be fitted with stokers, but the question to-day is where to begin, and to which class should they be applied first. It can be confidently stated that, under average conditions, any locomotive, freight or passenger, which has a maximum tractive effort of 50,000 lb. or over, should be fitted with a stoker and any freight locomotive, which burns 4,000 lb. or over, of coal per hour, continuously, for periods of one hour or over, should be fitted with a stoker. In passenger service there are very few locomotives of over 50,000 lb. tractive effort which are not fitted with stokers, and they all should be, if it is expected to work them to their full capacity, as it is out of the question to do so with shovel-firing. A fireman in passenger service, however, can shovel a much larger amount of coal per hour than he can in freight service, because the length of time which he must work is so much shorter that he is not liable to become exhausted before reaching the end of a division.

The primary object of applying a stoker to a locomotive is to enable the operation of that locomotive to its full capacity at all times and under all conditions, and this object is being attained wherever stokers have been applied. On one division of a railroad, with Mikado type locomotives having a tractive effort of 54,000 lb., the tonnage rating, without superheaters, and with shovel-firing, was 4,750 tons. Superheaters were applied and the rating was made 5,000 tons. Stokers were applied and the rating was made 5,250 tons; then 5,500 tons, 5,750 tons, and it is now 6,000 tons. At the same time the rating of the shovel-fired superheater locomotives, was pushed up to 5,500 tons. It was found, however, that it was not practical to run shovel-fired and stoker-fired locomotives on the same division, as even with the less tonnage, the speed of the former was so much less than that of the latter that they could not keep out of the way, were continually delaying traffic, and now all trains on this division are being hauled by stoker-fired locomotives.

On another division of the same road, before stokers were applied, these locomotives were hauling 5,000 adjusted tons. After the stokers were applied, this tonnage was gradually increased to 6,500 tons, and at one point on the division, with a river grade, they are hauling 85 to 115 all-steel, 70-ton coal cars, giving a tonnage of from 8,600 to 8,900 tons. At another point on this same road, fast freight trains are being run over two divisions—a total distance of 187 miles—with the same engine crew. Before the stokers were applied, the firemen were always changed at an intermediate point, and sometimes the enginemen.

The reason that the increase in tonnage is possible is from the fact that the fireman can secure and maintain the maximum steam pressure on the boiler at all times and under all conditions. It is not an uncommon occurrence, on heavy freight trains hauled by the locomotives referred to above, for the engineman to work his cylinders at full stroke, with the throttle wide open, both injectors on and maintain a speed of 18 miles an hour. There is no difficulty in maintaining full steam pressure under these conditions and at this speed.

Another advantage which follows the use of stokers is in that the time required for cleaning fires, both at terminals and on the road, is very much reduced. A stoker fire clinkers much less than a shovel fire, and statistics show, as a result of this, that it requires less than one-half as much time to clean a stoker fire as it does a shovel fire.

The actual results show very clearly that, under average conditions, with an equal grade of coal, a stoker-fired locomotive will not burn any more coal than a shovel-fired, in proportion to the amount of work done. It is, however, an invariable rule, that stoker-fired locomotives are worked harder than the shovel-fired locomotives, and are also given a poorer grade of coal. On many roads using stokers, they are giving the locomotives fitted with them a grade of coal which is so poor that it cannot be used successfully for shovel-firing at all.

This same thing applies to the amount of water evaporated per pound of coal. The boiler of a stoker-fired locomotive is, as a rule, not worked at as economical a point as one which is shovel-fired, and the rate of evaporation is, therefore, not so good. I regret very much to have to say that there are no absolute figures to demonstrate this. On all roads which are using any appreciable number of stokers, the question of fuel saving has been given very little, if any, consideration, as the advantage to be gained by the increased tonnage and increased speeds is so great that any questions of fuel economy sink into insignificance in comparison with it.

It has been stated that one of the objections to a stoker on a locomotive is that it makes it too easy to waste steam through the safety valve. My reply to this is that a fireman who will waste steam through the safety valve with a stoker will do the same thing with a shovel.

In order to secure the best results from stoker-firing a locomotive with bituminous coal, the physical characteristics are more important than the chemical analysis, and better results are often secured from coal of inferior quality, in proper physical form, than from that of a better grade, in improper size. The ideal coal for stoker-firing is secured by passing run of mine coal over a screen with about two-and-one-half inch square openings. When coal of this character is spread over the grate by means of the scatter type stoker, it gives a uniform, even fire, and produces very rapid combustion. If coal is to be burned at the rate of from 100 to 150 pounds of coal per square foot of grate per hour, it is vital that it be very nearly of a uniform size, as any lumps of 3, 4, 5 or 6 inches applied to a stoker fire will result in uneven burning of that fire, and in unsatisfactory results.

In conclusion I wish to emphasize the importance of at all times maintaining a large view of the subject and not allowing any detail to acquire undue importance. Each of the points touched on has its own importance, but they are all secondary to the one large reason for applying a stoker to a locomotive.

A railroad is built for the purpose of earning money, which must be earned by its locomotives. The only reason for applying a stoker to a locomotive is to enable it to earn more money. Railroads no longer control the amount of compensation which they can receive for service performed. They are continually confronted by increased cost of operation, increased taxes and legislative requirements; in order to live they must increase the earning power of their locomotives.

Statistics show that the application of a stoker to many of the large locomotives now in use will result in increasing the earning power of those locomotives from 10 to 20 per cent. The use of the stoker makes it possible to build new locomotives having from 20 to 30 per cent more earning power than those commonly in use at the present time.

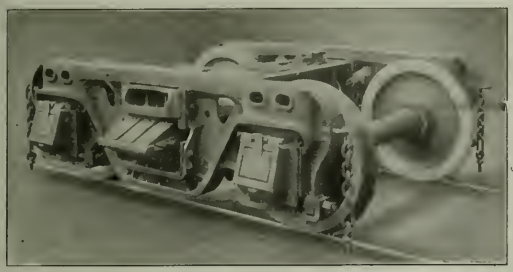
DISCUSSION

It was brought out in the discussion that there has been about $1,250,000 spent for stokers up to the present. The use of the stoker, it was stated, has lessened the maintenance cost for fireboxes and tubes. The Burlington is now using coal for stoker-

fired locomotives, which costs about 75 per cent as much as that used for hand-fired engines and has 90 per cent of the heating value of the latter. It was also stated that special men are necessary for proper inspection and repairs to the stokers and that firemen must watch the fire carefully in order to obtain the best results. A stoker will do much better work than two firemen. No trouble has been experienced from plugged tubes when a brick arch is used and by the use of the stoker a greater locomotive capacity is obtained. The use of the scoop was recommended in order to fill holes in the fire. One road has a record of 3,000,000 locomotive miles with stoker failures averaging one in 54,000 miles. It was also claimed that stoker-fired locomotives will maintain a more uniform speed over a division.

IMPROVED DESIGNS OF ENGINE AND TENDER TRUCKS

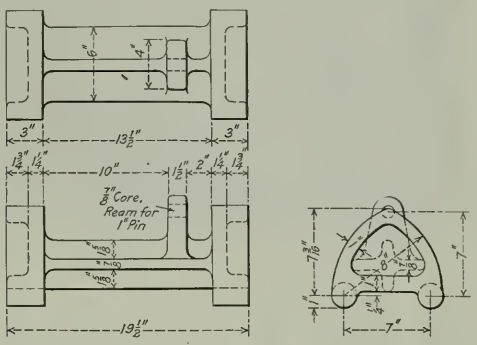
The change in wheel arrangement, together with the increased size and weight of the modern locomotive, has imposed a duty upon the leading truck of the prevailing design out of all proportion to its guiding capacity. As a consequence the work



Economy Tender Truck

which should devolve upon the truck consistent with the load carried at the centerpin has been, to a considerable extent, taken up by the leading drivers, resulting in lack of stability on tangents and excessive wear of the flanges of leading driving wheel tires.

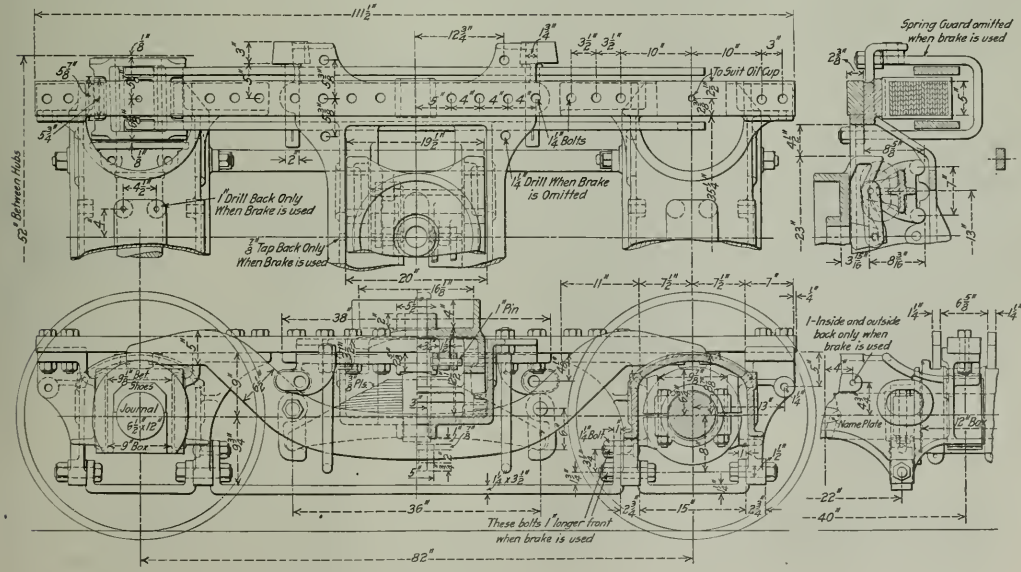
These conditions have led to the development of a lateral motion bolster device for locomotive trucks which, it is claimed, will meet these exacting requirements more fully than the three point link suspension which heretofore has been almost universally used. In principle it provides a constant resistance regardless of the lateral displacement of the bolster instead of a low initial resistance increasing with the lateral displacement, as



Rocker Used in the Engine Truck

is obtained with the three point suspension links. Variations, such as high initial resistance, with a constant resistance following a predetermined bolster movement, can be obtained by slight modification of the surfaces in contact. One of the illustrations shows the heart shaped rocker in detail. The swing bolster bears directly on these rockers which are connected to it by links to insure their remaining in the proper position.

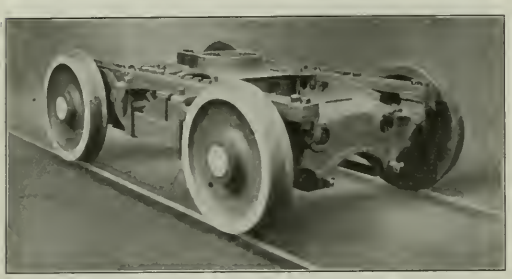
Service results with this truck show a marked reduction in the flange wear on leading drivers, a steadying action while running on straight track, an absence of jerky motion on curves and withal a better riding engine under all track conditions. This bolster arrangement, on account of its doing more work in guid-



Arrangement of the Economy Constant Resistance Engine Truck

ing the engine, requires a high duty truck frame. The design here shown eliminates the separate, bolted-on pedestals, combining the four pedestals at each end of the truck in a single cast steel transom with renewable shoes. The use of axle collars having been found desirable, this arrangement enables the cellars to be packed without removing the pedestal tie bars.

The aim in the design of the Economy tender truck, illustrations of which are also included, was to secure an easy riding truck having flexibility combined with the ability to remain square, in conjunction with either a lateral motion or rigid centering arrangement. Easy riding qualities have been obtained by the use of the pedestal type of frame with coil springs resting on an equalizer centrally located over each box, in combination with elliptic bolster springs. The coil springs arranged in the manner shown will accommodate any axle load that it is possible to utilize, with the idea of always providing surplus capacity to obviate breakage.



The Economy Engine Truck is Designed to Provide Constant Resistance Regardless of the Lateral Displacement of the Bolster

The spring plank arrangement provides for the flexibility that ordinarily obtains with the arch bar truck, permitting the truck to accommodate itself to uneven track conditions without causing undue stresses upon any of the coil springs, or unequal bearing pressures. The riveted connections between the truck frame and the spring plank are of such ample proportions, and the spring plank of so great a width as to insure the truck remaining square.

The bolster arrangement to provide for lateral motion consists of an auxiliary bolster located within the main bolster and resting upon three point rockers. The rocker bearing surfaces can be so arranged as to provide for a resistance curve identical with that obtained with the use of two point offset hangers. This arrangement eliminates the use of cross transoms. The curve of resistance can be changed by changing the contour of the bearing surfaces. If lateral motion arrangement is not desired a plain bolster can be substituted for the swing motion bolster without any alteration. It will be noted that few parts are used in providing for a pedestal type truck having a swing motion bolster. The side frames are designed to give ample lateral as well as vertical strength, and brake hanger bosses are arranged to use U shaped hangers, without offset.

Both these trucks are the product of the Economy Devices Corporation, 30 Church street, New York.

Adventures of a French Railway Carriage—The parlor car courteously placed by the French government at the disposal of Baron von Schoen, the German Ambassador, when he left Paris on August 3, has found its way back to France, after various vicissitudes. It reached Berlin on the morning of Wednesday, August 5, where it was seized by the authorities. After a day's arrest it was released, and sent to Munich, which it reached on the following Friday morning. Thence it was sent on to Lindau, where it was seized for the second time, and for a second time set free. From Lindau it reached Neufchatel by way of Constance, and finally, somewhat wayworn, it came to rest at a siding of the Gare de Lyon at Paris.

Maintenance of Way Section

Wrought Iron and Steel Pipe

Difficulty is often experienced in securing genuine wrought iron pipe, as mentioned in the committee report on Water Pipe of the Bridge & Building Association, abstracted elsewhere in this issue. In this connection it may interest users of pipe to know that 87½ per cent of all iron and steel pipe manufactured in this country is steel and only 12½ per cent wrought iron, as shown by a recent statistical bulletin of the American Iron & Steel Institute. These figures have changed from 68½ and 31½, respectively, since 1905, and it is only 27 years since the first steel pipe was made. Undoubtedly a very large part of this steel pipe is used under conditions much less severe than are common in railway work, which would render the superior qualities of wrought iron less important. But, this rapid growth and present preponderance of steel emphasize two things; first, the desirability of investigating each installation to see whether the more expensive material, wrought iron, is justified; and second, if it is found to be justified, the necessity of specifying the material very carefully and then taking steps to see that the desired quality is furnished.

Bond Strength of Reinforcing Steel

Deformed bars are used as the reinforcing material in reinforced concrete structures on 17 of the 25 important roads reporting on this point to a committee of the American Railway Bridge & Building Association. Of these 17 roads, 8 did not use any other form of reinforcement. In contrast to this showing for the deformed bars, only 8 roads allow the use of plain bars and only 1 of these 8 uses them exclusively. Further, a comparison of the values assumed for the adhesion of steel and concrete in designing the structures shows a marked difference between plain and deformed bars in favor of the latter. The A. R. E. A. manual of recommended practice gives the bond strength of a plain bar as 80 lb. per sq. in. and of a deformed bar as 100 to 150 lb. per sq. in., but the difference as shown by the tabulation of actual practice is even greater than this, for the plain rods are credited with a strength of only 50 to 80 lb. per sq. in., with the average about midway between those values, while deformed bars range all the way from 50 to 200 lb. per sq. in., with the average between 100 and 150. If recent tests, referred to in the committee's report, which show that plain bars develop a bond strength fully as great as the special shapes, are to be accepted, these assumptions in favor of deformed bars should be carefully considered with a view to revision, even though other considerations, such as resistance to vibration, may warrant the continued use of deformed bars.

Accurate Records of Construction Work

The designs of foundations for bridges, buildings, tanks, walls, etc., are always subject to modification in construction on account of unforeseen conditions affecting the work. Even when comparatively accurate information as to the nature of the material, the amount and level of the ground water, etc., has been secured before the design is made, expediency in handling the work, or limitation of available construction plant, may make advisable some changes in the plans. Ordinarily, little effort is made to record accurately the changes that are made and after the completion of the work the original plans are filed. This lack of an accurate record of the details of a structure as actually built is often responsible for unnecessary expenditures in later years when improvements or alterations are required, or when adjacent work is under way. Also, in many cases of accidents involving structures such records of construction would be very valuable in fixing the responsibility or determining the cause. A noteworthy example of practice in direct contrast to the common method was furnished recently by a large eastern trunk line in the construction of a considerable amount of concrete trestle. A record sheet was made up for each of the nearly 300 piers. As practically all of these had been built to one standard plan it was possible to reproduce the same drawing of plan, side and end elevations for all the piers of one design, filling in on the individual sheets the data referring to that particular pier. This information included the elevations of the top and bottom of the foundation masonry, of the heads and points of the supporting piles, and approximate depth that the piles sank under the weight of the hammer, the number of blows required for the last foot of penetration, and a complete record of the date of beginning and ending of each portion of the work. In addition, the names of the inspectors on the work and special notations covering any defects that appeared during construction and the method of correcting them were added. The inspectors kept the notes for these records in connection with their other duties, and a draftsman in the field construction office made the record sheet. Handling the matter in this way, the expense of preparing the record was trivial, and one occasion to use the data thus made available would more than compensate for the time and trouble of keeping it.

The Standardization of Manganese Track Construction

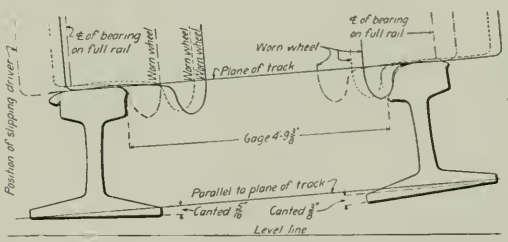
Railway engineers have been familiar in a general way with the use of manganese in frog, crossing and other special track construction for several years The first cost of manganese is considerably higher than that of standard open hearth or Bessemer construction, and this has naturally been a serious detriment to its general adoption. This objection has led to an endeavor on the part of the manufacturers to reduce the amount of manganese to the minimum consistent with the service required in order to reduce the cost. The purchasing agents of the railroads, and in most cases the engineers as well, have had no definite knowledge of the principles of design of manganese track work or of the problems connected with its manufacture. These conditions have gradually led to the partial demoralization of the manganese industry. Relying on the lack of standards on the part of the roads, some few manufacturers have reduced the amount of metal in their designs below the safe limit in order to underbid their competitors and secure the business. In most instances the railroad men have had to rely on the statements of the manufacturers, and as a result a low first cost has been the main consideration. This has forced other manufacturers to reduce the amount of manganese in their designs in order to secure any of this business, and has led to many failures of manganese track work in the past few years which have tended to prejudice engineers against its use. In an attempt to check this tendency several manufacturers of manganese track work, controlling over 80 per cent of the output, have recently organized the Manganese Track Society for the purpose of standardizing manganese track construction. This organization has already prepared standard designs for solid and rail-bound frogs and for solid crossings and is now engaged on other track work units. These standards have been submitted to the American Railway Engineering Association for investigation and approval and are now being considered by a committee of that association. Stand-

ards prepared in this way by the manufacturers and the users should be practical from the standpoint of both, and once adopted they should provide standards on which the roads can secure bids knowing that the material obtained will be in accordance with the best knowledge available. Manganese track construction is of direct economy in numerous forms of track work and this action of the manufacturers to improve and standardize their product deserves commendation.

ACCURATE MAINTENANCE OF GAGE

THE maintenance of track to accurate gage on tangents and curves is not receiving the attention from track men today that its importance deserves. While no one will intentionally allow rails to spread until there is danger of the wheels dropping onto the ties, small inequalities are not considered of sufficient importance to demand regaging the track and they are permitted to increase until considerable work is required to bring the track back to its proper condition.

This problem is of increasing importance on curves, and it is here that it is neglected to the greatest extent. In the first place, there is a wide divergence of opinion regarding the degree of curvature at which the gage should be widened. Practice in this regard is now passing through a transition, partly because of improvements in locomotive truck design providing greater flexibility, but mainly as a result of greater study of actual track conditions. Five or ten years ago it was considered good practice to begin widening the gage on curves of 4 deg. and over. Later practice has shown this to be unnecessary and the recommended practice of the American Railway Engineering Association now provides that curves of 8 deg. and under should be maintained to standard gage, while curves sharper than 8 deg. should be increased ⅛ in. for each 2 deg. or fraction thereof. Some believe



Wheel and Rail Contours on a 10-Deg. Curve with Wide Gage

that this limit is still too low and that no curve of less than 10 deg. should be widened, supporting their conclusions with considerable corroborative data. While theoretically the point at which the gage should be widened to accommodate a certain type of locomotive is capable of accurate determination, the conclusions reached by theoretical reasoning have not always been borne out in practice. Greater dependence should therefore be placed on the results which have been secured on several roads which have given this subject careful attention than on the various theoretical analyses.

The evil results of wide gage are evident in several ways. In the first place, while track in accurate gage tends to hold the trucks in their proper course, irregular or uniformly wide gage permits them to shift back and forth laterally, giving the effect of swinging or rough riding track. This has been shown strikingly by the track inspection instrument used in making periodic track inspections on the Pennsylvania Railroad, in which wide gage, with the resulting more or less pronounced lurch of the car, is indicated by the movement of a pendulum.

More important, however, is the influence of wide gage on derailments. Contrary to what might be expected, wide gage aids rather than prevents derailments. This is illustrated by an experience on the Santa Fe. Several years ago a number of new locomotives were distributed over several divisions. After a short time there were numerous complaints about the difficulty of keeping these locomotives on the track, especially on 10-deg. curves, on all divisions on which they were operated except one. Investigation showed that while the curves on all the other divisions had been laid with the increased width of gage required by the standards, the rail was laid on the one division to the standard gage of 4 ft. 8½ in. when screw spikes were inserted with the expectation that the gage would increase slightly under traffic. However, this had not occurred. Since the locomotives were passing over these curves without difficulty the curves on the other divisions were brought to this same gage, after which no further difficulty was encountered. The standard practice of this road now provides that no curves 10 deg. or under shall be widened. This seems reasonable when one considers that track laid to tight gage holds the wheels in their proper position, preventing their lateral motion and decreasing the liability to climb over the rail when striking it at a slight angle.

One phase of this problem frequently lost sight of is the increased destruction of material resulting from wide gage. The same lateral movement of the truck which gives the effect of rough riding track causes a wear on the rail and wheel flange whenever they come in contact which is more severe when the flange engages the rail at an angle. Especially on curves where rail wear is normally more severe it has been found that decreasing the extra gage allowance has had a marked effect in increasing the life of the rail. On one 10-deg. curve on the Santa Fe records showed that the life of rail was increased from 18 to 26 months by eliminating the additional width of gage. Aside from accelerating the grinding wear on the side of the gage head, wide gage contributes materially to the flowing of rail as shown by the accompanying sketch. As the wheels, and particularly the heavy engine drivers, are allowed to slide laterally over the top of the rail, they force the metal to the sides of the head, creating the lip commonly found. The effect of the false flange is also shown in this sketch which was made from actual wheel and rail contours taken on a 10-deg. curve and 1.85 per cent grade after the rail had been in service 12 months. In numerous instances where the rail has flowed badly this difficulty has been alleviated or removed by bringing the track to standard gage. This destruction of material is not confined to the rail alone. As the gage is widened the trucks are allowed more play and therefore deliver heavier lateral blows to the rail, which in turn are transmitted to the spikes and the tie, causing the wood fiber supporting the spike to crush and contributing materially to the spike killing of the tie.

NEW BOOKS

Handbook of Construction Plant. By Richard T. Dana, consulting engineer. Size 5 in. by 7 in., 702 pages, 312 illustrations. Bound in flexible leather. Published by the Myron C. Clark Publishing Company, Chicago. Price $5.

The author of this volume has set himself a difficult task in presenting complete data on the performance and cost of all types of construction plant. On account of the wide variety of equipment and devices required for special work many users of the book will undoubtedly discover shortcomings. The aim, however, is commendable and the information included will undoubtedly be of service to many contractors and engineers. The purchase prices of equipment quoted in the book are in general bona fide bids made to the author and often represent averages of many such bids. The fluctuation in the price of materials makes many of these figures subject to question, but for purposes of estimating, the accuracy is probably as great as necessary. The statements as to the capacity of plant have been carefully checked and a large part of the material contained in the book has been subject to daily use in the author's office for some time. In order to facilitate the securing of bids on material where more accurate prices are needed a list of dealers in construction plant is included in an appendix, and in most cases dealers' names are omitted through the text. The subjects are arranged alphabetically with a view to easy reference and, in addition, a very complete index is supplied.

Recent Developments in Track Construction*

A Review of the Increases in Loading of Track and the Improvements in Details of Its Construction

By Elmer T. Howson

It is frequently stated that steam railroad tracks are not sufficiently strong to carry the loads which are placed upon them with the proper factor of safety, and that the design of the track structure has not kept pace with the increase in these loads in recent years. While this is by no means the consensus of opinion, this subject is one of great importance at the present time, and the question of the relative strength of our present track construction is giving many railroad men cause for grave concern today.

INCREASE IN WHEEL LOADS AND SPEED

In discussing the present strength of the track, the first step is to determine the extent to which the service demanded of it has increased in recent years. The two most important factors affecting the stresses in the track are the weight of the trains and their speeds.

The weights of locomotives built in the past two or three years have not increased as much as in earlier periods, but this is due in very large measure to the fact that designers have been able to meet the demands for increased train loading on the part of the operating department by the adoption of the superheater, the brick arch, the mechanical stoker, and other important improvements. Developments of this nature cannot be expected to continue indefinitely, and it seems reasonable to expect that the weight of locomotives will soon increase again. The two most important developments in locomotive designing in the past year are the Atlantic type passenger engine of the Pennsylvania Railroad, weighing 240,000 lb., with 133,100 lb. on the drivers, or 66,500 lb. per axle, and the triplex type locomotive recently completed by the Baldwin Locomotive Works for the Erie, which weighs 853,050 lb. complete, with 24 drivers spaced 5 ft. 6 in. between axles and 61,900 lb. on each axle. The average weight, exclusive of tenders, of the locomotives in service in 1911 was reported by the Interstate Commerce Commission to be 150,800 lb., or 33 per cent heavier than in 1902. The average load on drivers for the more recent locomotives now ranges between 50,000 and 60,000 lb. per axle.

Of almost equal importance with the increase in the weight of motive power is the corresponding increase in the weight and capacity of freight and passenger cars. The freight car of 100,000 lb. capacity has now largely replaced those of 60,000 and 80,000 lb. capacity, which were standard a few years ago. Cars of 115,000 lb. capacity have been largely adopted by the eastern roads for coal, coke and ore traffic. Only a few months ago the Chesapeake & Ohio ordered 1,000 cars of 140,000 lb. capacity, while the Norfolk & Western built 750 gondola cars last year with a rated capacity of 180,000 lb. These cars weigh 263,000 lb. with the allowable 10 per cent overload, and although provided with six-wheel trucks, the axle loads reach 43,900 lb., or almost as much as on a locomotive. The Chesapeake & Ohio cars will weigh 210,500 lb. with overload and, as this will be distributed between four axles only, it will give axle loads of 52,625 lb. When it is considered that these cars will probably be run in solid trains, the tremendous burden on the track can be realized.

This tendency to increase the weight of equipment extends to passenger cars also, in whose construction steel is rapidly replacing wood. Although the steel passenger car has come into use only within the past seven years, practically no wooden cars are now being built, and all new equipment of this character is being built of steel or with steel underframes. On January 1, 1914, 227 roads reported to the Special Committee on Relations of Railway Operation to Legislation that they owned 58,660 passenger cars, of which 9,492 were all steel and 4,608 had steel underframes. Of the passenger cars ordered in 1913, 2,765 were of all steel construction and 171 were provided with steel underframes, while only 177 were of wood. When it is remembered that the steel cars weigh from 10 per cent to 25 per cent more than wooden cars of the same design, it can readily be seen that they will result in greater loads upon the track, especially as they are operated in solid trains and on the fastest runs. Recent extensive tests made on the Canadian Pacific and the Pennsylvania have shown that the steel passenger equipment has created as high stresses in the track as many of the locomotives.

While the weights of all classes of equipment are thus seen to be increasing, the statement is occasionally heard that we have now reached the limit of this development because of clearance conditions. It is true that on some roads the clearances now form the limitations, especially in the East. However, it is on the Pennsylvania Railroad, operating through one of the oldest and most congested parts of the country, that these new passenger locomotives with the heaviest axle loads in the country are now operating. Also the present indications are that clearance legislation of a more or less radical nature will be quite generally enacted, in which case many of these narrow clearances will be removed. It should not be assumed, therefore, that clearances will present a permanent barrier, especially in the large area of prairie country west of Chicago.

Not only have the weights of the various units of equipment increased greatly, but the amount of traffic and therefore the frequency of application of the load on the track have also multiplied. The ton-miles of freight hauled per mile of main track increased from 509,348 in 1892 to 938,313 in 1911, or 84 per cent in 19 years. The passenger service rendered has likewise increased from 77,134 passenger miles per mile of main track in 1892 to 122,756 in 1912, or 70 per cent. A more accurate comparison, however, is secured from five-year periods. Taking the five-year period ending with 1911 as compared with that of 1892-96 inclusive, the ton-miles per mile of main track increased 90 per cent. Likewise the passenger density per mile of main track increased 60 per cent.

Speed is an important factor in any discussion of the stresses in track. Here conditions are more nearly stationary. In some instances schedules for freight as well as passenger trains have been shortened. However, it is safe to say that, with the necessity for economy and retrenchment, during the past few years at least an equal number of schedules have been lengthened. The days of ruinous speed wars for passenger traffic seem to be almost over, while, with the growing realization of the economy of operation of heavy tonnage trains, freight schedules are being lengthened and more cars added wherever the traffic will permit. Thus the effect of speed has not been to increase the burden upon the track to any appreciable extent.

DEVELOPMENTS IN THE RAIL

As shown above, the weights of the motive power and equipment and the density of traffic have steadily increased while the speeds have remained practically constant. The net result has been, therefore, an increased burden on the track. The rail is the portion of the track which receives this load directly, and its function is to distribute it to the supporting ties. The rail has been materially improved within the past ten years

*Abstracted from Bulletin No. 167 of the American Railway Engineering Association.

in composition, in section, in weight and in methods of manufacture. This development has been especially pronounced during the last two years, following the deluge of broken rails during the severe winter of 1911-12.

The most important improvement has been in the character of the metal. Bessemer steel rails were first manufactured in this country about 1866 and with the rapidly increasing wheel loads they rapidly replaced the iron rails until a maximum of 3,791,459 tons were rolled in 1906. Increasing wheel loads, however, caused signs of distress and the exhaustion of the high-grade Bessemer ores made it impossible to maintain the previous standards of material. To supply this deficiency open-hearth rails were adopted. Although only appearing first in any appreciable quantity in 1903, they have already passed the Bessemer rails in point of tonnage produced and reached the high figure of 2,527,710 tons in 1913, while the production of Bessemer rails has declined until last year it was only one-third this amount. On January 1, 1912, the open-hearth rails in track were 11.43 per cent of the total as compared with 87.47 per cent of Bessemer and 1.10 per cent of special alloy rails.

Considerable attention has been given to the use of alloy rails as a substitute for Bessemer steel. Prominent among the alloy metals used are nickel-chromium, manganese and ferro-titanium. Nickel-chromium rails have been used in limited quantities on the Central Railroad of New Jersey, the Baltimore & Ohio, and other eastern roads. The tests on the Central Railroad of New Jersey did not prove entirely satisfactory, while those on the Baltimore & Ohio are still in progress. Although these rails have shown considerably increased resistance to wear, the number of breakages has been high. Without further improvement in composition, it seems probable therefore that this alloy will not meet with general adoption.

Manganese steel has come into wide use for frog, switch and crossing construction within the past ten years and to a limited extent for rails in certain locations of very heavy traffic. The advantage of manganese is its great resistance to wear. The most serious objections are its high cost, about $90 per ton, and the difficulty of drilling or cutting it in the track. It is in service in a number of places of heavy wear where it is showing considerable economy. While originally cast, it is now rolled, improving the quality and decreasing the liability of breakage.

Although not properly termed an alloy, as it does not appear in the finished product but passes out with the flux, ferro-titanium has been largely used in recent years. It acts as a scavenger in the molten steel, collecting the impurities and leaving a more sound and homogeneous metal. It met with wide adoption about 1909 when there was so much difficulty with segregation and other allied troubles and the tonnage of ferro-titanium rails reached 256,759 tons in 1910. With the change from Bessemer to open-hearth and with the more strict supervision and improved methods of rail manufacture, however, the use of titanium has decreased.

Although of doubtful value, small quantities of copper alloy rails have been rolled at intervals for different roads, the latest being an order for the Chicago, Milwaukee & St. Paul last year. The basis for the use of this alloy is the composition of some old rails imported from England many years ago which gave excellent service and which were found on analysis to contain a small quantity of copper.

Closely related to the change from Bessemer to open-hearth steel are the new specifications of the American Railway Engineering Association and of several individual railroads requiring more frequent and careful tests of the finished product as well as more careful attention to the methods of manufacture in the mills. The various measures adopted under these specifications have not brought the metal up to the highest point desirable, but they have nevertheless resulted in great improvement. It is unfortunate that defective practices may be detected frequently only after extended service and the remedies are then difficult to apply. In the same way the full benefits of recent improvements in material and in improved mill practice will not be evident for some time.

One of the most important developments in rails during the past ten years has been in section. The American Society of Civil Engineers standard sections were generally used and gave satisfaction until a few years ago, when the deterioration in the Bessemer ores combined with the heavier wheel loads resulted in a large number of base failures in these rails with their thin flanges. To increase the strength of these flanges a number of roads then designed their own sections which they are still using, while the American Railway Association designed two sections which have been adopted on many roads. One is a high section for use where great stiffness is desired, as in high-speed passenger tracks, while the other is a lower section with a heavy head for use in tracks carrying a very heavy, slow-freight traffic. Both of these sections have now been used for five or six years and have shown a great improvement over the earlier sections. There is a feeling among some engineers that the sections can be still further improved but there is at present a stronger sentiment that no more changes should be made until the American Railway Association sections have received a more thorough trial.

It would be assumed that the weight of rails has increased during the past decade with the increase in wheel loads, and an examination of the statistics shows this to be the case. In 1897, 20 per cent of the rails rolled were of 85-lb. sections and over, while 75 per cent were between 45-lb. and 85-lb. section. Five years later these percentages were 22 and 70, respectively. In 1907, 49 per cent of the rails rolled were of 85-lb. section or larger, while in 1913, 64 per cent were of 85-lb. section and over and 28 per cent were between 45-lb. and 85-lb. A summary of the weights of rail in track on January 1, 1912, shows the following percentages:

100-lb. and over	5.85 per cent
90-99-lb.	8.32 per cent
80-89-lb.	32.94 per cent
75-79-lb.	12.81 per cent
70-74-lb.	8.56 per cent
60-69-lb.	18.16 per cent
Less than 60	13.36 per cent

As shown by the percentages of the various weights of rails rolled during 1913, the proportions of the heavier sections, especially between 85-lb. and 100-lb., have increased considerably during the intervening two years so that it is safe to assert that over half the rail now in the track is 85-lb. or heavier. A recent canvass of the sentiment of railway men regarding the proper weights of rail and the advisability of adopting heavier sections showed that it was the consensus of opinion that rail lighter than 80 lb. should not be rolled, but that for the present it was not considered advisable to go to heavier sections than 100 lb. because of the frequent unfavorable results with these heavier sections.

THE TIE

Next to the rail, the tie has received the most attention in recent years. Efforts have been directed principally along the lines of timber treatment to increase the resistance to decay, of the more extended use of tie plates and of screw spikes to reduce the mechanical destruction of the timber and the development of substitute ties of steel or concrete. The greatest progress has been made with the treatment. Starting in this country about 1875 and growing slowly at first, this industry resulted in the erection of 12 treating plants by 1900. Since that time the growth has been especially rapid until now there are nearly 100 plants in operation and several under construction. The number of ties treated annually likewise increased until over 39,500,000 were thus prepared in 1913. Aside from increasing the life of any timber, the great advantage resulting from timber treatment lies in the practicability of using the so-called inferior woods which, without treatment, would not offer a resistance to decay sufficient to justify their insertion in the track.

The cost of treatment varies with the process and with the

amount of preservative injected into the timber. However, the cost of creosote treatment, injecting 10 lb. of creosote per cu. ft., averages about $0.40 per tie, of zinc chloride $0.17 and of the Card process with a combination of zinc chloride and creosote $0.25, according to Forest Service Bulletin No. 118, by Howard F. Weiss.

With the increased expenditures now being made for timber preservation, it may be assumed that more attention is being given to the selection of the treatment best adapted to the particular locality in which the ties are to be placed. Little definite and accurate information of this character is now available, but many roads are now collecting detailed information from test sections placed at representative points on the system and containing ties treated in various manners. At the present time the tendency is distinctly towards the adoption of the creosoting process. At first this did not meet with general favor because of the higher cost of treatment, and W. F. Goltra has estimated that up to 1900, only 500,000 of the 15,000,000 ties treated up to that time had received this treatment as compared with 14,500,000 treated with zinc chloride. However, in 1912 over twice as many ties were treated with creosote as with zinc chloride.

The increasing use of creosote has produced a very severe shortage of this material with a resulting rapid increase in price. The quantity of creosote consumed in the preservation of ties has increased from 56,000,000 gal. in 1908 to 108,373,359 gal. in 1913, over 62 per cent of which was imported. The shortage of high-grade creosote oil was so severe last summer as to force a number of treating plants to close down. To alleviate the shortage somewhat, a practice originating about five years ago of mixing refined coal-tar with the poorer grades of creosote oil to improve their quality, is fast gaining ground. If this is done under proper supervision and with no intention of adulteration, it appears to be justified as a commercial expedient where the high-grade oils cannot be secured.

Intimately associated with the treatment of ties as a protection against decay is the use of tie plates to protect them against mechanical wear. The adoption of tie plates has been very rapid within the past decade, owing to the increasing value of the ties, the heavier wheel loads, and the use of the softer woods. The early tie plates were of small area and only about ⅜ in. thick. As a result they soon broke or buckled, or were forced deep into the tie by the increasing wheel loads. To eliminate these conditions, the size of the plate has been increased to provide a bearing area on the tie sufficient to distribute the load without any serious breaking down of the wood fiber beneath. This has required plates up to 7 in. by 9 in. on many roads. The thickness of the plate has likewise been increased until ½ in. is now regarded as minimum good practice and ⅝ in. is standard on several roads.

The mechanical adzing of ties before insertion in the track is meeting with increasing adoption. There is secured in this way, a uniform bearing on the tie for the tie plate, and therefore, the rail. While most of the adzing is now done at the treating plants previous to treatment, some ties are adzed without treatment. This practice will undoubtedly become more common as its merit becomes evident.

Next to the rail cutting, spike killing is the most destructive mechanical agent tending to shorten the life of ties. The common chisel-pointed spike is universally recognized as being very destructive to timber. This has led to the experimental use of screw spikes, which are not only far less destructive to the fiber of the wood, but also give considerably greater rigidity and strength to the track. Many tests have been made of the relative resistance offered to displacement by cut and screw spikes, which show that the screw spike binds the rail more securely to the tie, and gives a stronger track construction. Over 800 miles of screw-spike track is now in service in this country, all of which has been installed since 1905, and 95 per cent of which has been placed within the past five years.

The principal objections raised to the use of screw spikes are the increased first cost and the greater difficulty of making track repairs and renewals requiring the removal of the spikes. On the other hand, the advantages claimed are the increased life of the ties, the decreased cost of maintenance and greater strength and stability of the track. At the present time screw-spike construction is not practical for lines of light traffic where the maintenance charges are relatively low and the economy is greatest where the maintenance expenditures are high and a higher first cost is justifiable.

In addition to these various measures for the protection of the timber tie a great deal of study is now being given to the development of substitute ties of concrete or steel, and many hundreds of such ties have been designed. Studies along this line are prompted not only by the desire to arrest the continually increasing cost, but also to secure a tie which will give greater strength to the track.

Any substitute tie must combine in large measure the elasticity of the wooden tie with the requisite strength. It must also be of such form as to be manufactured readily and must have a strong and easily-applied fastening for holding the rail and with the increase in automatic block signal mileage, it must also be readily insulated. Nearly all the ties developed so far have failed in one or more of these requirements. Concrete ties do not possess the first requirement of elasticity and break or disintegrate under the severe hammering of the moving wheels. Because of its inherent characteristics, it is doubtful if any concrete tie can be made practical, at least for high-speed main tracks.

While some of the ties now undergoing test will probably prove practical, and others will undoubtedly be designed, the only one which has stood all tests satisfactorily so far and which is being used in any considerable quantities is the Carnegie steel tie. This is an unsymmetrical I-beam section to which the rail is held by bolts and clips. Over 2,000,000 of these ties are now in service. The Bessemer & Lake Erie is the largest individual user, having over 900,000 in track. By 1915 this road expects to have its 300 miles of main tracks entirely equipped with these ties. They have been in service on the Bessemer road over nine years and the present indications are that they will have a life of over 20 years. They cost about $2.50 each, complete with fastenings and have a scrap value of about $0.75.

With the increasing attention now being given to the protection of the wooden tie and to the intelligent conservation of our forest resources, it is doubtful if the timber tie will disappear as rapidly as the conservationists would have us believe. The adoption of a substitute tie will therefore be a gradual process, brought about more by the increasing price of timber than by the absolute shortage of it, and also by the demand for a stronger track structure.

TRACK FASTENINGS

While the rail joint is a very important factor in determining the strength of the track as well as in protecting the rail from battering at the ends, there has not been a radical change in this detail of track construction in the past few years. The base-supported joints of the Continuous, Weber and similar types, which were very generally adopted for main line use about ten years ago, are still widely used. Several types of joints with depending flanges, such as the Bonzano and "100 Per Cent" are also used in large numbers. During the past two or three years, however, there has been a tendency to return to the anglebar strengthened to carry the increasing loads. The anglebar generally adopted has a heavy, reinforced head and to enable higher carbon to be used is heat-treated and oil tempered in most cases to secure the requisite strength. One condition prompting the adoption of the anglebar is the practice on a few roads of laying rail without respacing the ties in which case a non-slotted joint without base supports or depending flanges is necessary.

The track bolt has undergone no important change within the past decade except in the nature of the metal used. A track-

man with the ordinary 33-in. wrench will stretch a ⅞-in. bolt beyond its elastic limit, making it impossible to keep joints tight. To eliminate this difficulty, a bolt is meeting with wide adoption during the past three years, which is made of special steel with an elastic limit of 75,000 lb. instead of 45,000 lb. This not only eliminates the difficulty with stretching but in some instances allows a smaller bolt to be used. Vanadium is also being used experimentally in bolts, while high-carbon steel bolts oil quenched are used in large quantities. Nut locks are being generally used with joint bolts.

The increase in the density of traffic referred to above has increased the stresses developed in the track in another way, not previously mentioned. As this traffic has increased, second, third and fourth tracks have been added and the traffic on each track is all in one direction. As a result, the creeping of the rails found occasionally on heavy grades on single track, becomes severe on double track and frequently introduces very high stresses in the rails and fastenings. This condition has called for another track appliance known as the rail anchor or anti-creeper, whose adoption has received its greatest impetus during the past three or four years, one road of 2,000 miles ordering as many as 225,000 at one time and another over 600,000. Several designs are on the market, and most of which are generally efficient. Their use does not increase the strength of the track in any way, except as they prevent the addition of stresses due to rail movement. They are, however, economical in reducing maintenance expenses.

FROG, SWITCH AND CROSSING CONSTRUCTION

No other elements of track construction receive more severe wear than frogs, switches and crossings and with the rapid increase in the density of traffic there arose a demand for some form of construction which would give a longer life than the ordinary Bessemer or open-hearth construction. While these latter steels are still generally used in locations of light or medium traffic, there has been a rapid development in the manufacture and use of manganese steel at these points of heavy wear. At first considerable difficulty was encountered from the breakage of the manganese castings in service. Within the past two or three years, however, this danger has largely disappeared. As a result this material is now meeting with wide adoption wherever the life of the adjoining rails is 2 or 2½ times that of a Bessemer frog.

The Pennsylvania and several other eastern roads are using full-length switch points made of this metal. Other roads are using short points of manganese, fastened to the main switch rail and absorbing the severe wear at the point.

Another detail of track construction in which manganese is coming into use is in guard rails and within the past two years two or three different types have been introduced which are meeting with ready adoption. Considerable improvement has also been made in the design of clamps and filler blocks to hold the guard rails rigidly in position, thereby giving greater protection to the frog. The Conley frog with a raised wing to guard the wheel flanges in their proper course, thereby eliminating the necessity for a guard rail, is also being more widely used. This frog has recently been made of manganese and has also been designed as a spring frog.

BALLAST AND ROADBED

While the ballast and roadbed are more properly the foundation for the track construction than essential elements of it, the same general increase in strength is found here. As the wheel loads and the traffic have become heavier, there has been a gradual but continuous movement from the unballasted or mud section to the sand, gravel, slag, or cinder ballast and finally to crushed stone. On those roads with the heavier traffic the depth of stone ballast has been steadily increased until on the Pennsylvania it has reached a standard of 18 in. Extensive laboratory tests show that an approximate depth of 24 in. of good ballast is necessary to distribute the wheel loads evenly. Considerable attention is now being given to the feasibility of using a bottom layer of gravel, cinders or other less expensive material, covered with broken stone to secure the desired depth at less expense and to provide a more easy-riding track, while at the same time preventing the stone from cutting into the subgrade.

The same general situation exists with reference to the roadbed. With the lighter loads, banks 14 ft. and 16 ft. wide were common. Increasing maintenance charges have made it economical to widen these banks to 18 ft., 20 ft., or 22 ft., and also to give more attention to their drainage.

THE PRESENT SITUATION

From the above it can be seen that the development in all details of track construction has been marked during the past decade. In spite of all these improvements there is a prevalent impression among railway men that even more money should be spent for heavier rail, more and better ballast, wider banks, etc., to secure a still stronger track. It will be instructive to endeavor to ascertain to what extent this impression is sustained by the facts, and also to what extent the track is showing fatigue as compared with former years. Two measures by which the relative strength of the track can be estimated roughly with reference to the traffic it carries, are the trend of maintenance expenditures and the number of derailments due to defects of roadway and track.

The average annual expenditure for maintenance of way and structures per mile of line has increased from $877 for the five-year period 1892-96, inclusive, to $1,451 for the five years ending with 1911, the last year for which the complete statistics of the Interstate Commerce Commission are available, showing an increase of 66 per cent in 15 years. Since these figures are on the "per mile of main line" basis, the increase in main line mileage has already been taken into account. However, during this period the percentage of other main and side tracks has risen from 31 to 45 per cent of the first main track mileage. Therefore, while the proportion of other than first main tracks has risen 14 per cent in this time, since these tracks only require about 40 per cent of the expenditure of first main tracks, it may be assumed that 6 per cent of the increase in expenditures per mile of the line has been due to this cause.

Likewise, the growth in traffic has contributed to this increased cost of maintenance, although it is difficult to determine the exact extent. Some items such as repairs to fences and buildings are independent of the traffic. Others such as ties and ballast are affected to some extent, while still others such as rail are affected almost directly. In his monograph describing the studies made on the Union Pacific prior to its reconstruction, J. B. Berry has estimated that 37.3 per cent of the charges for maintenance were affected directly by the

Distribution of Maintenance Expenditures

Maintenance of Way and Structures	Per cent of total expenses	Per-centage affected	Net increase for traffic
Superintendence	0.963	0	0.00
Ballast	.423	25	0.106
Ties	2.992	25	0.748
Rail	.897	100	0.897
Other track material	1.021	70	0.715
Roadway and track	7.023	60	4.214
Removal of snow, sand and ice	.217	0	0.00
Tunnels	.049	0	0.00
Bridges, trestles, culverts	1.565	10	0.157
Over and under grade crossings	.068	0	0.00
Grade crossings, fences, cattle guards and signs	.348	0	0.00
Snow and sand fences and snowsheds	.021	0	0.00
Signals and interlocking plants	.550	40	0.220
Telegraph and telephone lines	.183	10	0.018
Electric power transmission	.026	0	0.00
Buildings, fixtures and grounds	1.778	0	0.00
Docks and wharves	.165	10	0.017

number of trains. In the accompanying table, showing the distribution of maintenance expenditures for 1911 for class A roads comprising 88 per cent of the entire mileage of the country, as reported by the Interstate Commerce Commission, together with an estimate of the extent to which each item is affected by traffic, 38.8 per cent of the expenditures for maintenance are shown to vary with the traffic.

The wear upon the track is dependent upon the tonnage and also upon the number of trains. It is evident that in view of the large increase in the average train load during the past 20 years, the wear on the track has increased more than 8 per cent, which is the increase in train miles. On the other hand, the average load per car and the percentage of revenue to dead load have so increased that the wear on the track has not increased the 98 per cent that the revenue ton-miles have, since 1892. The increased wear due to traffic lies somewhere between the 8 per cent increase in train-miles and the 98 per cent increase in ton-miles. Simply as an approximation and with a desire to be conservative, we will assume that the increase in the wear of the track is influenced two-thirds by the revenue ton-miles and one-third by the revenue train-miles. This is equivalent to an increase of 68 per cent in those maintenance charges directly affected by traffic. Upon the basis of the two analyses made above, 38 per cent of this increase will be reflected in increased maintenance charges and is equivalent to a net increase of 26 per cent in these expenditures.

The average rate paid for labor increased 18 per cent in this period. As approximately 60 per cent of all maintenance expenditures are for labor, this accounts for 11 per cent more of this total increase.

While it is impossible to determine accurately the extent to which the expenditures for maintenance materials have increased in unit costs, the increased wear having been accounted for under the increase in traffic, it will be ample to place this at 25 per cent (ties having increased perhaps 60 per cent and rails less than 10 per cent). As only 40 per cent of maintenance expenditures are for materials, this is equivalent to an increase of the total of 10 per cent.

Deducting 6 per cent for the increased proportion of secondary track mileage, 26 per cent for the increase in traffic, 11 per cent for the increased cost of labor and 10 per cent for the increased cost of material, or a total of 53 per cent from the total increase of 66 per cent, there still remains 13 per cent or practically one-fifth of the total increase unaccounted for. From the necessarily approximate nature of some of the assumptions made, it cannot be said with absolute certainty that the remaining increase of 13 per cent is due either to higher standards of track maintenance or to the necessity of spending more money to maintain the tracks to their proper standard. However, such is the natural and reasonable conclusion, especially in view of the wide margin of increase otherwise unaccounted for.

A close check upon the trend of maintenance expenditures is given by the number of men required to maintain a unit of track. The above conclusion is borne out by the fact that the number of men employed per 100 miles of line has increased 45 per cent in 15 years. Deducting the same increase of 6 per cent for increased track mileage and 26 per cent for increased traffic, we have a net increase of 13 per cent in the number of men required to maintain the tracks, checking the 13 per cent increase in expenditures.

Turning to the record of derailments due to defects of roadway and track, the quarterly accident bulletins of the Interstate Commerce Commission classify all derailments resulting in personal injuries or damages in excess of $150 under certain general heads. This record shows that those derailments due to defects of roadway and track were 257 per cent more numerous in 1913 than in 1902, when these accidents were first published in tabular form, while those due to defects of equipment increased 174 per cent and the total number increased 149 per cent in the same period. It is not fair to assume that the increase of 149 per cent in the total number of derailments in this period fairly represents the total number of derailments in these years, for undoubtedly a considerable portion of this increase is due to greater completeness and accuracy of the derailment reports as a result of increased attention to this subject on the part of the Interstate Commerce Commission and the railways. However, the relative proportions of this total due to defects of track and of equipment, with reference to each other and to the total, should not be materially affected.

Analyzing these derailments due to defects of roadway and track for the ten-year period and eliminating those due to bad ties and sun kinks, which combined form less than five per cent of the total, it is seen that those due to irregular track have increased 253 per cent, those due to soft track 215 per cent, those due to spread rail 100 per cent, and those due to broken rails 93 per cent. Thus there are three classes of derailments which are increasing faster than broken rails, all of which are due to a very large extent to lack of labor rather than material. The logical conclusion is that the track is not as strong relatively as it was 20 years ago, and that it should be strengthened in design and materials to decrease the number of failures, and to reduce the ultimate cost of maintenance.

Unlike other engineering structures, the track is capable of analytical design only to a limited degree. The only practical way by which this subject can be intelligently studied is by making an elaborate series of tests, carefully planned, to secure information under a wide variety of conditions. It is therefore highly gratifying to know that a joint committee of the American Railway Engineering Association and the American Society of Civil Engineers has been formed within the past six months to study this subject and that sufficient funds have been placed at its disposal to insure a thorough investigation. The results of this, the first elaborate study of its kind, should go a long way towards securing a track construction based on scientific principles and of sufficient strength properly to carry the loads placed upon it.

CONCLUSIONS

(1) The loads imposed on the track by locomotives and cars have materially increased within the past few years and bid fair to increase still further.

(2) Almost every part of the track has been materially strengthened or improved within the past few years.

(3) It would appear that the cost of maintenance has increased faster than the traffic, while the number of derailments due to defects of roadway has materially increased at the same time.

(4) One is therefore forced to conclude that development in the construction of track has not been and is not keeping pace with the increase in the service demanded of it.

A COMBINATION POCKET RULE AND LEVEL

The Lufkin Rule Company, Saginaw, Mich., is manufacturing a 2-ft. folding boxwood rule fitted with a spirit level on which patents are pending. The three 8-in. rule sections are each 1 in. wide, 3/16 in. thick and united by substantial brass joints. The rule is fully graduated for its entire length on both sides, one side in inches to eighths, and the other side to sixteenths. The spirit level is neatly set into and flush with the upper edge of the middle section of the rule where it is most convenient for use and securely protected by the two outer sections of the rule which fold against it on either side when closed for carrying in the pocket. Closing pins especially designed for the purpose hold the sections of the rule in proper alinement insuring a perfect bearing surface.

ABSTRACT OF ENGINEERING ARTICLES

The following articles of special interest to engineers and maintenance of way men, and to which readers of this section may wish to refer, have appeared in the *Railway Age Gazette* since September 18, 1914:

Practical Considerations in Design of Large Stations.—The features which should be studied in planning a large passenger terminal to reduce the operating costs were very carefully considered by the officers of the Kansas City Terminal Railway in designing the new union station. A discussion of these features as applicable to all large stations, written by A. H. Stone, assistant engineer, Kansas City Terminal, was published in the issue of September 25, page 555.

New Passenger Station at Pocatello, Idaho.—A short illustrated description of the passenger station which the Oregon Short Line is building at Pocatello, Idaho, was published in the issue of September 25, page 562.

Methods of Artificial Lighting for Railroad Offices.—A discussion of the requirements of artificial lighting and the advantages of indirect lighting in offices and drafting rooms by John A. Hoeveler, an illuminating engineer, was published in the issue of September 25, page 565.

New D. L. & W. Freight Station at Utica, N. Y.—An illustrated description of a modern inbound freight house recently built by the D. L. & W. at Utica, N. Y., was published in the issue of September 25, page 577.

Clearing Interchange Yard for Chicago District.—The important features of design and construction of the new clearing hump yard at Chicago, the largest gravity yard in the world, were described and illustrated in the issue of October 2, page 603.

An editorial discussion of this design was published in the same issue, page 590.

How Can Engineers Best Utilize the Technical Journals?—An abstract of a paper by John W. Alvord, consulting engineer, Chicago, containing useful suggestions as to methods of retaining for future use, data from current periodicals, was published in the issue of October 2, page 615.

New Hocking Valley Coal Dock at East Toledo, O.—An illustrated description of the new coal dock of the Hocking Valley at East Toledo, Ohio, providing two tipples, each with a capacity of 40 cars per hour, and a 3,000-car storage yard, was published in the issue of October 9, page 647.

New Algoma Central Engine House and Shops.—A rectangular engine house of steel frame construction has recently been built by the Algoma Central at Sault Ste. Marie, Ont., the design being adopted principally on account of climatic conditions. The reasons for this design and the details of construction were included in an illustrated article in the issue of October 16, page 698.

An editorial comment on this rectangular engine house was published in the same issue, page 682.

Tests of Vanadium Steel Rails.—A description of laboratory tests on the first steel rails ever rolled with vanadium alloy was published in the issue of October 16, page 704.

An editorial comment on this new development in rail manufacture appeared in the same issue, page 681.

MAINTENANCE OF WAY MASTER PAINTERS' CONVENTION

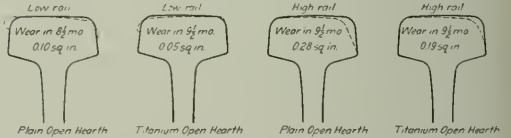
The eleventh annual convention of the Maintenance of Way Master Painters' Association will be held in the Hotel Tuller, Detroit, Mich., November 17-19, inclusive. The program includes the following papers: Proper Glazing, by Fred Rieboldt, general paint foreman, C. M. & St. P., Milwaukee, Wis.; Interior Finish and Painting of Concrete, by W. R. Parker, John Lucas & Co., Inc., Chicago; Bridge Staging, by C. H. Plummer, foreman painter, C. R. I. & P., Topeka, Kan., and H. B. Wilson, B. & L. E., Garric, Pa.; Fire Retardant Paint (illustrated by stereopticon) by H. A. Gardner, Institute of Industrial Research, Washington, D. C.; Paint Defects, Their Cause and Cure, by J. H. Wykes, National Lead Company, Chicago, and the Economy of Skilled Mechanics, by William H. Brown, Painters' Magazine, New York. In addition to the regular program the following open questions will be discussed: Does It Pay to Use Good Paint on Stations; Best Methods of Enameling Woodwork; Sanitary Conditions and Cleanliness Around Bunk Cars; Priming and Patchwork Done by Carpenter Gangs; Making Estimates on Bridge Painting; Is it Economy to Use Putty on Roundhouse Windows; Safety First as Applied to Handling Bunk Cars; Does Painting Roofs Act as Fire Protection; Is it Economy to Have Switch Stands and Targets Done by Section Forces; The officers of this association for the past year include, C. H. Plummer, president, C. R. I. & P., Topeka, Kan., and T. I. Goodwin, secretary-treasurer, C. R. I. & P., Eldon, Mo.

THE PRESENT STATUS OF FERRO-TITANIUM IN RAIL MANUFACTURE

In the widespread investigations of the rail problem during the past few years one of the defects most frequently encountered has been that of segregation. So common has this condition become that it was stated on the floor of the convention of the American Railway Engineering Association a year ago that 50 per cent of the rail failures would be eliminated by securing sound metal of comparatively even composition. As a result attention has been directed very largely toward the making of sound metal, free from segregation, and various methods have been advanced, prominent among which has been the addition of titanium to the metal in the ladle previous to pouring. When used in moderate quantities the commercial alloy, ferro-carbon titanium, is a powerful deoxidizer, which liquefies the slag and assists in removing the oxides and other impurities, passing off with the slag and leaving but slight trace of its presence in the finished product.

Titanium was first used commercially as a scavenger of steel in 1907, since which time it has been widely adopted in the manufacture of steel for a wide variety of uses. Naturally, one of its early applications was in rail steel. At the time of its introduction into this field the production of Bessemer rails had reached its high point and had started on its rapid decline, being replaced by open hearth steel. However, the tonnage of Bessemer rails produced still exceeded that of open hearth rails until 1911, so that the first applications of ferro-titanium were with Bessemer steel.

A number of difficulties were encountered here. In the first



Typical Comparisons of Rail Wear on Low Rails Selected from One Road and High Rails from Another

place, the specifications governing the use of ferro-titanium in Bessemer steel require that the steel shall be allowed to stand in the ladle three minutes after the alloy has been added before pouring, to enable the titanium to permeate the entire charge, and that the slag from the ladle shall be dumped after each pouring. As the mill men are paid on a tonnage basis, and this delay tended to decrease the output of steel, this requirement met with their opposition and they disregarded it as far as possible. Furthermore, as the application of ferro-titanium to rail steel was a new departure later developments have shown that certain errors were made by the manufacturers of the alloy in the amount of titanium recommended for use and in other details. These conditions, encountered at the time when the Bessemer ores were rapidly deteriorating, gave rise to several failures, which have seriously retarded the more general adoption of this alloy. However, numerous other orders rolled at this time have given very satisfactory results.

With the rapid substitution of open hearth for Bessemer rail steel, and the prospects that the production of Bessemer rails will continue to decrease, efforts directed toward the more general introduction of ferro-titanium have now been concentrated on open hearth steel. Here the reception has naturally been slow, although the tonnage of titanium open hearth rails in the track has been increasing steadily. With the adoption of open hearth rails with the consequent increase of about $2 per ton in cost, there was a natural hesitancy on the part of the railroads about incurring further expense for titanium until there was an opportunity to see to what extent the substitution of open hearth steel alone would accomplish the desired improvement. It was soon found that

open hearth steel presented the same problems of segregation that were present before. Accordingly, a number of roads have used titanium with open hearth rails in considerable quantities since 1910.

The advantages claimed for the ferro-titanium treatment are increased resistance to wear and a reduced number of breakages. With the desire of ascertaining to what extent these results are accompanying the addition of titanium to rail steel, the manufacturers are conducting careful and extensive investigations in the laboratory, and at the same time are watching closely the service of these rails in the track. Beginning with last year, samples of A-rails have been secured from each rolling of titanium-treated rails, accompanied, wherever possible, by similar samples of untreated rails rolled under the same specifications in the same mill order, and under as nearly as possible the same general conditions. These samples are selected by the inspectors at the mills at the time of rolling, and are sent to the laboratory, where unusually thorough investigations have been conducted. Seventeen such comparisons have already been completed and made public by the manufacturers through a series of seven rail reports. These tests include not only the ordinary chemical analyses and physical tests for elastic limit, ultimate strength, elongation and reduction of area, but in addition four special physical tests, including the Brinnel hardness test, an impact resistance test, the White-Souther test, whereby a specimen is subjected to a reversal of stresses at the rate of 2,600 reversals per minute, until failure or a maximum of 40,000,000 reversals, and the Landgraf-Turner endurance test, in which a specimen is bent backward and forward through a small angle at the rate of 400 blows per minute. As the complete results of all of these tests have already been made public through the series of rail reports, the results will not be discussed here other than to point out the more uniform character of the material and the greater endurance of the treated rail.

In actual practice the importance attached to segregation is shown by the clause inserted in the tentative specifications of one important eastern road requiring that the percentage of carbon in the web shall not exceed that in the head of the rail over 12 per cent. To determine the influence of titanium in reducing the segregation within these limits, 79 heats of plain open hearth and 31 of titanium-treated open hearth rails with the standard percentage of 0.10 per cent of titanium were rolled recently under the same conditions and with the standard discard of 9 per cent at one of the eastern steel mills for three eastern roads as a part of larger commercial orders and analyses of the A-rails were made in compliance with these proposed specifications. The average variation in the carbon content of the samples from the heads and webs of the specimens rolled from untreated steel was 17 per cent and the maximum variation 40 per cent, while only 29 of the 79 heats were under the required maximum limit of variation of 12 per cent. On the other hand, the analyses taken from the 31 heats to which 0.1 per cent of titanium had been added showed an average variation of 3.1 per cent and a maximum variation of 11.5 per cent, the one heat with this maximum being the only one which failed to comply with the specifications.

Owing to the limited time that titanium-treated open hearth rails have been in the track, no conclusive data can be secured at this time, either regarding decreased rail failures or increased wear. However, as these rails have now been in service up to a maximum of four years, considerable data are available for comparative purposes.

With reference to breakage, the records of the Chicago & Alton, while limited, are perhaps the most accurate. This road purchased 22,000 tons of 90-lb. open hearth A. R. A. type-A rail in 1913 from five different mills, 6,000 tons of which were treated with 0.1 per cent of titanium. These rails have now been in the track from 15 to 18 months and up to September 15 there have been 14 failures in the untreated rails and none in the titanium rails.

However, the greatest attention has been directed towards titanium-treated rails because of the claims made for increased wear. Wherever possible, the manufacturers have endeavored to have experimental sections of rail so laid that direct comparisons may be made with other rails rolled in the same year, under the same specifications and at the same mill and carrying the same traffic under the same conditions of grade and curvature. In most cases this has not been realized in its entirety and since the rails are laid by the railroad companies with their forces, it has been found that where titanium-treated rails have been laid on curves, the entire curves have been relaid, making a direct comparison impossible. As a result, it has been necessary to compare the wear of these rails with that on other rails on similar curves carrying similar, but not the same traffic. Measurements of the wear of the rails in these test sections in the various locations have been made from time to time by R. W. Hunt & Co., acting for the manufacturers, and the results of several such tests so far as they have now progressed are given below.

The tests of longest duration are those on the Boston & Maine, the Boston Elevated, the Delaware & Hudson and the Lehigh Valley. Although recent measurements have been made of these rails on some of these roads, the results are not yet available and since the data secured at the last previous measurement have already been published it will not be repeated here.

One of the more recent measurements is that made on the Chicago, Milwaukee & St. Paul during the past summer. Titanium rails of 90-lb. A. R. A. type-A section were laid on an 8-deg. curve and two per cent grade near Grace, Mont., in August, 1913. After 9½ months' service, measurements showed a total average loss of head of 0.0717 sq. in., or 0.018 sq. in. per million tons moving over them. The closest comparison that could be made on any curve laid with standard open hearth rail was a 10-deg. curve on a 1.7 per cent grade near Garcia, Wash., where 90-lb. open hearth A. R. A. type-A rails were laid in September, 1913. After 8½ months' service these rails showed a loss by wear of 0.14 sq. in., or 0.0639 sq. in. per million tons of traffic. This gives a ratio of wear of 1:3.55 in favor of the titanium, although the differences in the location of these curves introduce an element of inaccuracy. Similar comparisons of the wear per million tons on all 10-deg. curves on the Rocky Mountain, Columbia and Coast divisions of the St. Paul showed the following ratios: Titanium 1.00, open hearth rails on Rocky Mountain and Columbia divisions 1.52 and open hearth rails on the Coast division 2.72.

Measurements have also been taken on 10 ferro-titanium open hearth rails with 0.1 per cent of titanium, and two standard open hearth rails in the eastbound track of the Atchison, Topeka & Santa Fe between Morely, Colo., and Wootton. These rails were laid in 10-deg. curves on a 3.5 per cent compensated grade descending. The titanium rails were laid in the track in August, September and October, 1912, while the standard open hearth rails were laid in September, 1913. Calculated upon the basis of one million tons moving over the rails, the average wear of the 0.1 titanium-treated rails was 0.0335 sq. in. and of the standard open hearth rails 0.12 sq. in. Assuming the wear on the 0.1 per cent titanium-treated rails as 1.0, the relative wear on the untreated rails was 3.58.

Because of the small number of standard open hearth rails measured in the eastbound track, three rails of this same character were measured in the westbound track after having been in service from August, 1913, to March, 1914. Again assuming the loss per million tons for the 0.1 per cent titanium-treated open hearth rails as 1.0, the wear of the standard open hearth rails in the westbound track is 3.43. While the service demanded of the rails at this point on the Santa Fe is unusually severe, the small number of standard open hearth rails measured for comparison renders the result somewhat inconclusive.

CARE IN UNLOADING MATERIAL

By Chas. L. Van Auken

Consideration of the fact that the cost of handling freight at terminals is frequently greater than the cost of transportation between the terminals, and also that the demoralization to a track gang when material has to be redistributed, shows that while unloading track material cheaply and with the least amount of labor is a problem of great importance, it is of equal or greater importance that the correct quantities of materials be unloaded, and that these quantities be correctly spaced along the right-of-way. Economy in unloading track material may be very easily offset by the increased cost of track laying if there is too much or too little material, or if it is not placed conveniently. This is especially true when relaying rail, building double track or putting in new switches. If track is being laid with a track laying machine, the materials are used immediately as distributed in order to provide a track on which to move the machine forward; thus the distribution of rails and angle bars is correct, the ties are usually handled correctly by the machine, and the problem narrows itself to the proper loading of the material, and to the distribution of the finishing material behind the machine. Again, even if there is poor distribution of spikes, bolts, etc., behind a track laying machine, the "dumpy" may be used advantageously to redistribute the material, and anything lacking is easily obtained from frequently passing material trains.

When building a second track the material is usually distributed by a work train, which necessarily uses a track on which there is more or less traffic, and the problem of proper distribution of materials becomes a serious one, requiring the best of supervision. The material is generally distributed far ahead of the track gang; in fact, the work train may have been taken off the work entirely when track laying begins; then if there is a shortage of rail the track gang will be forced to transport rails by hand or "dumpy" until a work train can be procured to distribute more rails. It is better for the track laying gang if there are too many rails and ties rather than too few. However, all surplus material must afterwards be loaded, which is an unnecessary expense. Shortage of ties tends to temporarily break up the organization of the track layers, for if the men are properly placed to handle the work when the ties are properly distributed some part of the gang will be underworked or overworked when there is a shortage of ties. Also when fill-in ties arrive, after the track is laid, the organization must be broken up to go back and finish up the track.

When distributing rails with a work train on a track under regular traffic, the train is frequently run to a siding to let another train pass. In these intervals the gang should be kept busy setting up the rails end to end on the shoulder of the grade. If there is time to set up all the rails in this manner, the distribution will be absolutely correct, giving a corresponding advantage when laying or relaying track.

If just enough rails and ties are unloaded, and yet they are not properly placed, i. e., if they are unloaded in bunches, the redistribution must be made with a "dumpy" on the main track, and the "dumpy" must usually be protected by flagmen, which again means the breaking up of the rail gang organization.

All of these arguments may not be necessary to prove that track material should be properly distributed; that fact is apparent, but nevertheless it is true that many times track material is not properly distributed. Correct distribution from the main track can be obtained by noting the standard length of track rails, spotting the material train with respect to the rail joints, and unloading spikes, angle bars, ties, etc., in the proper proportion. If it is desired to keep the train in motion while distributing any material or materials (such as is frequently done in distributing bolts, spikes, angle bars, etc.), an easier method is to gage the distribution by the position of telegraph poles, which are spaced at standard distances and can be seen without trouble by the men on the cars.

It is important to have the proper amount of switch material on the work train and to see that the complete material for each switch is unloaded. While advisable, the distributing of the different parts is not so important as in track laying.

The importance of having on hand all the material required before starting a job cannot be over-estimated. Lack of material causes loss of money while a gang is being delayed, and causes a demoralization of the gang organization. The men soon find out that there is a delay, and become indolent on the work which the foreman improvises in order to kill time. Then when real work starts again, it is a hard task for the foreman to get the laborers in the habit of working.

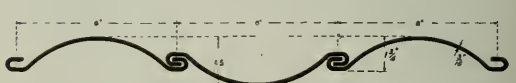
It is easy to obtain tables which show the number of spikes and track bolts per keg, and nut locks are also furnished in boxes containing a certain number. These materials and angle bars or joints can be unloaded while the train is in motion. It is necessary, of course, to exercise care on high embankments, for if a keg falls on its side, it will roll to the bottom. In general, however, it is possible to drop the keg so it will fall on end and will not roll. The writer once distributed spikes, bolts, nut locks, angle bars and joint ties for four miles of relaying, without stopping the train more than two or three times. The gang was composed of American hobos, who are more easily handled on work of this kind than foreigners.

Trainmen who have seen much construction work and who are willing to constantly assimilate new ideas, make the best men for work trains. It is advisable to keep the same crews on the same kinds of work as far as practicable. Spotting cars carefully is necessary in loading and unloading track material. For this reason the engineer should use the air consistently, so that the trainmen can estimate just when to give the stop signals. Some engineers never make two stops the same, and they are the despair of the foreman, and of the conscientious trainman. Too great emphasis cannot be laid upon the importance of spotting unloading trains systematically by reference either to rail joints or to telephone poles, and then having exactly the same amount of materials unloaded at each spot.

A NEW TYPE OF SHEET PILING

A new type of steel sheet piling which is cold rolled from steel plates has recently been placed on the market by the Lackawanna Steel Company, Buffalo, N. Y. This section has a width of eight inches between joints, the metal is 3/16 in. thick and the completed wall 2 9/16 in. thick. The weight per sq. ft. of wall is 11.5 lb., and the weight per lineal foot of section is 7.66 lb.

This sheet piling is particularly adapted to use as a cut-off



The Lackawanna Plate Sheet Piling

wall in levee construction, a core wall in an earth dam or a cut-off wall around a masonry foundation in saturated soil. The advantages under these conditions are its low weight and cost per sq. ft. of wall, the higher resistance offered to the passage of water and its immunity from attack by the teredo and natural decay which would affect timber. It is claimed that its method of manufacture insures uniformity in all sections and that the form of interlocks used gives free driving as well as great resistance against the passage of water.

Wood Preserving Industry May Suffer From War

Suggestions for Avoiding Possible Injury Resulting from a Shortage in the European Creosote Supply

By Clyde H. Teesdale

In Charge of Wood Preservation Forest Products Laboratory, Madison, Wis.

The present European situation has had a very serious effect upon the wood preservation industry in this country. At the beginning of 1914, there were 94 treating plants in the United States, with an aggregate annual capacity of over 300,000,000 cu. ft. of timber. Actually 153,613,888 cu. ft. were treated in 1913. Of this, over 106,000,000 cu. ft. were treated with creosote, 36,000,000 cu. ft. with zinc chloride, and 8,000,000 cu. ft. with a mixture of creosote and zinc chloride. A total of over 108,373,000 gal. of creosote was consumed. Of this, 41,700,000 gal. was produced in this country, and over 66,673,000 gal., or 62 per cent of the total used, was imported, principally from Germany and England. The present crisis in Europe has cut off entirely the supply of oil from Germany, and much of that from England, and consequently a very serious shortage is imminent.

It would seem possible for the United States to be wholly independent of Europe for its wood preservatives, and it should not be necessary to shut down a single treating plant, or to reduce the amount of timber now being treated because of the threatened creosote shortage. There appear to be seven possibilities of solving the question:

1. An increased use of zinc chloride.
2. The use of the so-called empty cell processes.
3. The use of mixtures of creosote and zinc chloride.
4. The use of water-gas-tar creosote.
5. Mixing creosote with crude oil.
6. The use of wood-tar creosote.
7. The use of sodium fluoride.

1. *Zinc Chloride.*—The best known preservative that could be substituted for creosote is zinc chloride. The value of this preservative has been thoroughly tested out during the past 80 years. In some situations, it does not add as much to the life of timber as creosote, and with the prices which have prevailed the annual charge against a creosoted crosstie has been less than for one treated with zinc chloride. The following table (from Forest Service Bulletin 118) gives the estimated saving due to the treatment of crossties with preservatives:

Species	Estimated life			Cost of ties			Annual charge in track			Annual saving of treated over untreated ties	
		Treated			Treated			Treated		Treated	
	Untreated	10 lb. creosote per cu. ft.	½ lb. $ZnCl_2$ per cu. ft.	Untreated*	10 lb. creosote per cu. ft.	½ lb. $ZnCl_2$ per cu. ft.	Untreated	10 lb. creosote per cu. ft.	½ lb. $ZnCl_2$ per cu. ft.	10 lb. creosote per cu. ft.	½ lb. $ZnCl_2$ per cu. ft.

* In most cases, prices quoted were taken from report on "Crossties Purchased 1909," Bureau of Census.
† Prices quoted based on general observations..

In this table, creosote was assumed to cost about 8 cents a gallon, placement in the track 15 cents a tie, and tie plates 25 cents a tie with interest charges at .5 per cent. Should the present situation result in a material increase in the price of creosote, it is obvious that the annual charge for ties treated with zinc chloride would become the lower, and its substitution for creosote, to a large degree, would be warranted on the basis of cost.

2. *Empty Cell Treatments.*—A large amount of timber has been treated with creosote by the so-called empty cell processes. Usually ties, bridge timbers, etc., are treated with 10 or 12 lb. of creosote per cu. ft. By the empty cell process, however, this can be reduced to 5 or 7 lb. per cu. ft.

3. *Mixtures of Creosote and Zinc Chloride.*—In 1913, 8,000,000 cu. ft. of timber was treated with a mixture of creosote and zinc chloride. In this case, about 3 lb. of creosote is usually injected into each cu. ft. of timber. Both of the above processes possess merits, and in the last few years have been used widely. It seems likely that the present situation can be partially relieved by an increased use of such methods, in which a smaller amount of creosote is required to treat a given volume of timber.

4. *Water-gas-tar Creosote.*—Further relief could also be had by utilizing creosote from water-gas-tar. A large amount of the water-gas-tar produced is now burned or thrown away. Much has been used for treating timber, usually in mixtures with coal-tar creosote. In composition it is very similar to the latter, but probably has less value in preventing decay. In experiments now being made by the Forest Products Laboratory, untreated specimens of southern pine were destroyed, after nine months' exposure in the Gulf of Mexico. Specimens treated with water-gas-tar creosote and coal-tar creosote were practically sound, however, after two years and are still in service. A pile was removed from Pensacola bay, Florida, after 33 years of service and was in fairly good condition. An analysis of the oil in this pile showed that it was very similar in composition to much of the water-gas-tar creosote now being made. It seems possible, therefore, that piling for service in salt water could be treated with water-gas-tar creosote with excellent results. Certainly it would pay much better to use this product than to drive piling that has not been protected from the borers.

5. *Creosote and Crude Oil Mixture.*—One of the important qualities of a wood preservative is its toxic property, or its power to poison the food supply of the organism that causes decay. In experiments made at the Forest Products Laboratory by the so-called "Petri dish" method, 0.55 per cent of a coal-

tar creosote prevented the growth of *Fomes annosus,* and 0.225 per cent prevented the growth of *Fomes pinicola,* both of which are wood-destroying fungi. If these figures could be applied directly to the case of treated wood, only 0.343 and 0.140 lb. of creosote per cu. ft. respectively would be required to prevent attack. These data indicate that the amount usually injected into wood is from 20 to 50 times greater than the amount actually required to prevent attack. In the case of zinc chloride, 0.50 per cent was required to prevent the growth of *Fomes annosus,* and 0.75 per cent for *Fomes pinicola.* This corresponds to 0.312 and 0.468 lb. per cu. ft. respectively. Usually 0.5 lb. of zinc chloride is injected into the wood, and excellent service results have been obtained. It would seem obvious, therefore, that in comparison with zinc chloride, much more creosote is being introduced into timber than is required to prevent decay.

Petroleum oils tested by the petri dish method appear to be without toxic properties. They have been used to some extent in timber preservation, and with a certain degree of success, because of their property of excluding water from the timber, water being essential to the growth of fungi. In view of the highly toxic properties of coal-tar creosote why could this not be mixed with petroleum oils and still successfully preserve the timber? If the above toxic limits of these preservatives would hold when applied to treated timber, 0.5 lb. of creosote per cu. ft. of timber should preserve it better than a similar amount of zinc chloride. Why should not, therefore, a mixture of high grade coal-tar creosote and crude oil be used, in proportions even as low as 10 per cent of the former, with excellent assurances of success?

Had all of the timber treated with creosote in the United States in 1913 been treated with a mixture of 10 per cent creosote and 90 per cent crude oil, the consumption of creosote would have been 10,837,000 gal. Since 41,700,000 gal. of domestic oil was used, there would have been a surplus of over 30,000,000 gal. There are, of course, many situations where the use of such a mixture should not be considered, for example, the treatment of piling for salt water, or the brush treatment of telephone poles. Should such a mixture be used for ties alone, however, this country could produce a large surplus of creosote oil.

6. *Wood-tar Creosote.*—A further source of wood preservatives in this country may be found in the tars produced by the destructive distillation of wood. These are of two kinds, those from hardwoods and those from coniferous woods. At present, these tars are a nuisance to the plants producing them, and are either burned or thrown away. In the crude state they are absolutely unsuited for wood preservation. It is possible, however, to refine them and produce oils comparing very favorably with coal-tar creosote. One sample of creosote produced from hardwood tar was submitted to the Forest Products Laboratory that was more toxic than the coal-tar creosote mentioned above. Its toxic limit in the case of the fungus *Fomes annosus* was between 0.12 per cent and 0.24 per cent. Its specific gravity, range of distillation, specific viscosity, ease of penetration into wood, and volatilization from wood were about the same as the creosote used for comparison, the latter being a commercial product of good quality. It was much more corrosive in its action on flange steel than the coal-tar creosote, although this was but little greater than the corrosive action of a 3 per cent zinc chloride solution. It would seem possible to further refine this oil, and remove this objection.

Several concerns are now prepared to manufacture refined hardwood creosotes, and it seems likely that at least 10,000,000 gal. could be placed on the market annually.

7. *Sodium Fluoride.*—One of the most promising of the new preservatives that are now being experimented with is sodium fluoride. This is a water soluble salt, and can be produced very cheaply in this country. At least one company is now prepared to produce it in large quantities. Its principal advantage compared with zinc chloride is its high toxic properties, and its low solubility in water. In the petri dish experiments at the Forest Products Laboratory, 0.225 per cent prevented the growth of *Fomes annosus,* and 0.15 per cent prevented the growth of *Fomes pinicola.* In these cases it was from 2 to 5 times as toxic as zinc chloride, and about the same as the coal-tar creosote. Zinc chloride is soluble in water in all proportions, while only 3½ to 4 per cent of sodium fluoride can be dissolved in water. Furthermore, it is only about 10 per cent as corrosive in its action on flange steel as zinc chloride.

Very good results have been obtained from the use of fluorides in Europe, especially in Austria, where several thousand telephone poles have been treated. The excellent prospects of the successful application of this preservative led the Forest Products Laboratory to institute service tests of timber treated with it. Several hundred mine ties treated with fluorides were installed in January, 1914, in the Birmingham, Ala., district, and 300 ties treated with sodium fluoride are about to be installed in a test track on the Baltimore & Ohio.

Many preservatives have been tested by the Forest Products Laboratory, and the results of these experiments will be published as a bulletin of the Department of Agriculture about January 1, 1915.

TRACK INSPECTION ON THE PENNSYLVANIA

The annual award of premiums for the maintenance of roadbed on the Pennsylvania Railroad, amounting to $5,400, was made on September 22 after an annual inspection made by General Manager S. C. Long and a party of about 300 operating officers.

As in the past, these awards are based on monthly inspections made by a committee of maintenance of way officers consisting of W. G. Coughlin, engineer maintenance of way, chairman; A. B. Clark, assistant engineer maintenance of way, in charge of roadway and track; J. J. Rhoads, superintendent of the Media division, and E. J. Cleave, superintendent of the Cresson division. The prizes were awarded as follows:

The first premium, that of $1,200, of which $800 goes to the supervisor and $400 to the assistant supervisor having the best line and surface between New York and Pittsburgh and Philadelphia and Washington, was awarded to C. M. Wisman, supervisor, and H. M. Grimm, assistant supervisor, who have charge of the track between Tullytown, Pa., and Deans, N. J. The other prizes were:

Four premiums of $800 each, $600 for the supervisor and $200 for the assistant for the best line and surface on a main line superintendent's division between New York and Pittsburgh and Philadelphia and Washington, awarded as follows: C. Z. Moore, supervisor, C. L. P. Russell, assistant supervisor, in charge of track between Dillerville and Harrisburg, Pa. W. T. Hanley, supervisor, J. B. Baker, assistant supervisor, in charge of track from west of Rockville bridge to Thompsontown, Pa. W. S. Wilson, supervisor, C. W. Barwis, assistant supervisor, in charge of track between Altoona and Portage, Pa., including the Horseshoe Curve. G. H. B. English, supervisor, C. M. Hursh, assistant supervisor, in charge of track between Wilmington, Del., and Perryville, Md.

A special improvement premium of $1,000, $700 to the supervisor and $300 to the assistant, for the greatest improvement made in line and surface on the main line between New York and Pittsburgh and Philadelphia and Washington, was awarded to A. W. McClellan, former supervisor, and H. L. Pierce, assistant supervisor, for the section of track between Donohue and Wilmerding, Pa.

Through Train Service Between Argentina and Chile Suspended.—In view of the fact that no passenger trains had been able to pass over the Chilian section of the Transandine Railways since the end of May, the National Direction of Railways Office has authorized the suspension of the international train to and from Buenos Ayres until further notice.

FATIGUE OF RAILS

By Paul Kreuzpointner*

In recent issues of the *Railway Age Gazette* the phenomena of transverse fissures in rails and their causes have been ably discussed by high authorities, the conclusion being drawn that their origin must be sought in improper mill work rather than in the overloading of rails due to the rails being too light for the present weight of rolling stock and speed of trains. If the origin of these interior transverse fissures, with subsequent fracture of the rail, or rails, is due to mill work then the cause would be either slag inclosure, segregation with the resulting lack of homogeneity of structure, or internal strains due to irregular cooling. Upon the other hand, if overloading of the rails produces transverse fissures, breakage of rails would be due to fatigue of the metal with all the characteristics of fatigue fractures.

The peculiarities of the fractured surfaces of broken rails would then materially help us to draw safe conclusions as to whether the cause was improper mill practice or fatigue due to overloading of the broken rails. During all the discussions on the subject of transverse fissures the writer has

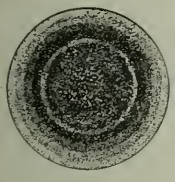

Fig. 1

Fig. 2

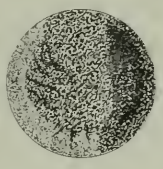

Fig. 3

not seen any mention of the difference in appearance of fractures of structural material due to improper mill practice alone, or to improper heat treatment and fatigue, or to fatigue alone with an otherwise properly treated metal of uniform structure. Frequent comparisons of fractures of the same class of structure, and subject to the same forces of destruction, will furnish us with sufficient proof that there are characteristic differences in the appearance of fractures of structural material indicative of the physical condition of the metal when it went into service, thus strengthening the observations made in other directions.

If we claim that overloading of the rails is the cause of present vexatious troubles in railroading we then assume that the metal was in a normal physical condition, free from the disturbing influences of segregation or internal stresses and therefore the fracture of the rail, broken in service, should exhibit all the characteristics of a detail fracture due to fatigue induced by overloading.

Leaving out of consideration the possibility of the design of the rail being so faulty and weak as to cause sudden fracture under overloading without fatigue, we should find the fracture of a rail broken through overloading exhibiting two or more elliptically-shaped lines of greater or less distinction, either in the head or in the foot, and, beginning at the surface, the texture or grain of the broken area included between each two lines, varying from very fine in the first of these areas to the well known coarseness of a sudden fracture, the texture being uniform without being marred or broken by slight or heavy creases. In Fig. 1 we have an example of the characteristic fracture of an overloaded structure, in this case the detailed fracture of an axle.

It must be remarked here that the shape or outline of the structure does not influence the characteristic feature of a fatigue or detail fracture. The shape may, and often does, influence the configuration of the lines of individual breaks, but it does not alter the character of the break, hence the appearance of the fracture in Fig. 1 is as representative of a detail fracture of an overloaded structure of wrought iron or steel as may be found. Nor is this appearance influenced much by the degree of hardness of steel below the hardness of tool steel; there may be no distinct lines indicative of individual breaks with a slightly different texture of the break from lower grade steel, but the character remains the same. Neither does the speed at which the structure is broken seemingly change the general character of the fracture caused by fatigue. The general character of the detailed fracture of a firebox sheet, ruptured by the slow pulsations of the sheet, does not differ from the general character of a fatigue fracture of a fast running axle. Any deviation then from these general and uniform characteristics of a fatigue fracture of a physically sound steel structure indicates a disturbed physical condition of the metal, producing a variety of results destructive in their nature and due to improper treatment of the steel in its fluid or subsequent solid state.

How mill practice affects the nature of the fracture of a steel structure as revealed by its appearance is shown in the following illustrations. Fig. 1 is an ideal detail, or fatigue, fracture with a number of well-defined concentric rings, the axle breaking little by little and the journal having dropped off into the box without doing any damage. Fig. 2 illustrates the influence of a mechanical defect upon the nature of the fracture, the break starting at a seam or elongated blowhole and the metal being good otherwise. Fig. 3 started to break in detail, but was interrupted by segregation, producing sudden fracture of two different types, the segregated portion coarse and open with a closer grain for the rest. Fig. 4 shows a seam formed by a succession of blowholes joining each other and their walls, tearing on being stretched under the forging process, united into one continuous seam. In Fig. 5 we have a combination of seam and internal transverse fissure, extending outward with segregated spots in the center. Fig. 6 presents a well-defined internal fissure due to internal stresses caused by improper heat treatment. That the shape of the fissure is round and not oval as in a rail may be accounted for by the shape of the structure and the uniform

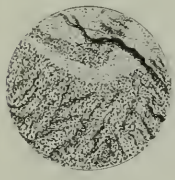

Fig. 4

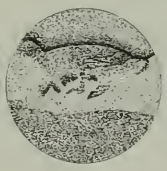

Fig. 5

Fig. 6

distribution of the vibrations caused by shocks and vibrations. The "creases" are indicative of internal stresses due to improper heat treatment. "Creases" of this kind are always a sign of a disturbed condition of the steel, acting wedge-like in forcing the steel apart.

Causes of difference in fractures

In the foregoing we have seen how an overloaded steel structure breaks slowly in detail due to fatigue without showing transverse fissures, provided the physical condition of the metal is good, that is, free from the admixture of impurities from too much segregation, from spongy center, and is of uniform texture and without internal stresses due to incomplete heat treatment. We find the causes for this difference in fractures of structural steel in good condition or disturbed by defective treatment in the plastic and elastic properties of iron and steel, the former permitting the metal to flow under the application of extraneous forces and the latter allowing it to recover from the destructive influences

*Mr. Kreuzpointner was connected with the physical laboratory of the Pennsylvania Railroad for 31 years, and was in charge of the physical testing of materials during that time.

of shocks, vibrations or excessive strains. This ability to recover is greater in structural steel than in wrought iron and is the reason for steel being given the preference over wrought iron for structural purposes. Elasticity, which is inherent in all metals, and varies in degree only, but not in kind, possesses the peculiar quality of recovering, at least partly, the ground it loses when the metal is subjected to strains and stresses, producing the so-called elastic reaction in metals, this elastic reaction being more pronounced and of longer duration in steel than in iron. This elastic reaction tries to establish an equilibrium when the limit of strength and of elasticity has been lowered by overstrains, establishing new limits of strength and elasticity. If forces deforming a metal act quickly and are released quickly, the elastic reaction is slight. If, however, the forces act slowly, reaction then becomes effective, trying to counteract the effects of the destructive forces by establishing a new equilibrium. Hence large forces acting quickly are less destructive than many small forces acting more or less continuously, the reaction in the latter case not having completed its cycle before its effects are required in another direction, as it were. In other words the metal has not had time to come to rest, the first reaction being diminished by the second one following. If, then, the metal is in good structural and thermal condition the plasticity will permit uniformity of flow, while the uniformity of the structure, uniformity as to size of crystals and uniformity of the nature of each individual crystal, will permit uninterrupted transmission of the elasticity throughout the mass of crystals with consequent uniform reaction producing a detail fracture, if fracture does take place, of the kind shown in Figs. 1 and 2.

If, however, slag inclosures prevent close cohesion of the crystals in any part of the cross-section of the structure, or if the center of the ingot is spongy, producing similar effects, or if segregation should produce a variety of physical conditions of the crystals in size and chemical composition, or if thermal conditions have induced internal stresses with consequent unstableness and unpreparedness for resisting extraneous destructive forces, there will be different degrees of plasticity in different parts of the structure, the flow of the metal caused by shock and pressure will be irregular and jerky, as a consequence of which there will be impaired transmission of the elastic wave, and the intensity of elasticity will vary in different parts of the metal counteracting each other, while elastic reaction can assert itself but imperfectly, if at all. It is obvious that under such circumstances and conditions the separation of the crystals will take place in a variety of form and manners, altered, or modified by the nature of the forces trying to destroy the structure, with any chance condition influencing the final result. Thus we perceive why and how the appearance of the fracture is an indication of the treatment of the steel in the mill, the frequency of internal fissures in rails and their similarity in form pointing to an unstable thermal condition and not to overloading. If overloaded with good conditions of steel a true detail fracture would result.

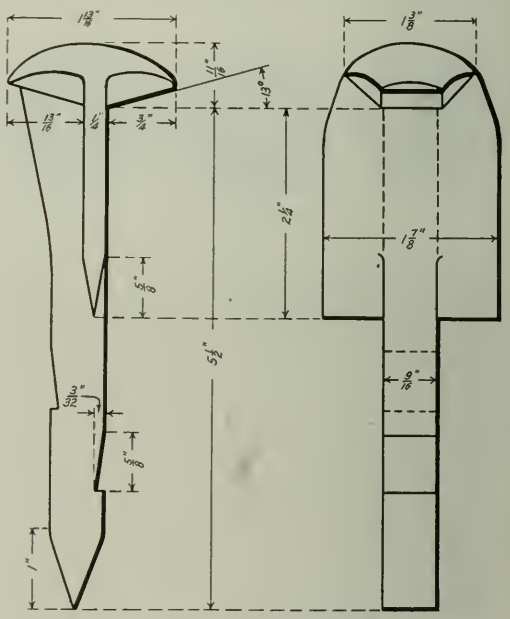
Argentine Railway Employees' Pensions.—A press report states that the Argentine Chamber of Deputies now has under consideration legislation relating to pensions for railway employees. The nature of this legislation is not given out in the report, but it is stated that representatives of the Great Southern, the Buenos Ayres Western, the Argentine, the Central Argentine and the Pacific Railway companies have visited the vice-president of the republic to present a petition asking the government to withhold its immediate sanction to the law. The railway representatives referred to the unsatisfactory economic situation now prevailing, and to the heavy decline in freight receipts experienced by most of the companies. The vice-president has replied that the government has already communicated its favorable opinion as to the proposed law, but he has promised to consult with the minister of public works regarding the present petition.

A NEW TRACK SPIKE

The "safety" track spike, designed to present a greater resistance to side thrust and vertical pull than the ordinary spike, has received a maximum test of nearly one year and is now being tried by a number of important roads, including the Chesapeake & Ohio, the Richmond, Fredericksburg & Potomac, the Seaboard Air Line, the Carolina, Clinchfield & Ohio, and the New York, New Haven & Hartford.

The distinguishing features of this spike are the two projecting wings on the sides of the body to increase its resisting power to the lateral movement of the rail, and the notches on the front and back edges below the wings to increase its resistance to an upward pull. It is stated that the displacement of fiber by this spike is only .012 cu. in. greater than that of the ordinary track spike, and that the resistance to lateral movement is increased more than 300 per cent.

The new spike is made of low carbon steel, ranging from .12 to .20 per cent of carbon, and having a tensile strength of 5,500 to 6,500 lb. per sq. in. The spikes are made by the drop forge process, giving uniform strength, particularly at the throat where the common spike is apt to be weak on account of its manufacture by the upsetting process. The throat is reinforced by additional metal on the back just under the head, giving it added strength when reversed to be used in the slot of an anglebar.



A Sketch of the Safety Track Spike

It is thought that the advantages of the new spike will be most fully realized on curves and at switches where rail spreading is most common. It is declared that the use of these spikes will allow rail-braces to be eliminated at such points, saving the cost of these devices and reducing the number of spikes about 60 per cent. The spike can be applied with a maul and pulled with a clawbar, in the same manner as an ordinary spike.

A special tie plate has been designed, also, by the Railway Safety Spike Company, Richmond, Va., which is placing the new spike on the market, for use with those spikes if tie plates are desired on curves. The punching in this plate is designed

to allow the use of the new spikes with five different sections of rails between 80 lb. and 100 lb.

The Richmond, Fredericksburg & Potomac placed a keg of these spikes in its track on a 4 deg. curve with a grade of 0.5 per cent, on its James River branch, in September, 1913. The track is laid with 85-lb. rail and carries a heavy traffic. With rail-braces on this curve, it had previously been necessary to regage the track once or twice a year. Up to the present time the new spikes have held the track to true gage without special attention from the maintenance force. The test on the Seaboard Air Line is being made in the Brown street yard, in Richmond, Va., on a 7 deg. curve near a water tank, where the ties are wet and the rails are therefore more likely to spread. Although tie plates and three ordinary spikes have failed to hold this track to gage, the two safety spikes have held the rails to proper gage for seven months. Tests on other roads are also proving satisfactory, although they are not of sufficient length to furnish absolute proof as yet.

A COMPLICATED CROSSING RENEWAL

It was recently necessary to renew a set of crossings known as the Chattanooga Belt Railway crossings at the East End avenue entrance to the Chattanooga passenger station without interference with a very heavy and almost continuous movement over these crossings. Because of a back-up movement, all passenger trains of the Alabama Great Southern and of the Memphis division of the Southern approaching or leaving the station, pass over these crossings twice. The passenger trains of the N. C. & St. L., the C. N. O. & T. P., the Chattanooga Southern, and the Knoxville and Atlanta divisions of the Southern also pass over these crossings in going to or from the station, while all passenger locomotives have two additional movements over these crossings in going to or from their respective engine houses. With the additional freight and switching business there is an average of 400 movements over these crossings daily.

The Four Crossings (in the Foreground) After Renewal

The renewal of this crossing was made by the C. N. O. & T. P., on which road considerable study has been given to the subject of the drainage and proper foundations for crossings. The method of procedure in this regard at this point conforms to the general practice of this road.

In renewing the crossings the foundation was first removed around the old ties, and they were blocked up just enough to insure safety to trains operating under slow orders. The old ties were then replaced with new ones, one at a time, and spiked sufficiently to maintain the correct gage of the track. The four crossings were then replaced, one at a time, with 85 lb. solid manganese crossings. After the new crossings were in place and were surfaced up on blocks, a foundation consisting of iron borings mixed with sal-ammoniac, was placed under and around the new ties and well tamped. This "rust bed," as this foundation is termed, extends 6 in. below the base of the ties, and is brought up to about the level of their upper surfaces, giving a solid block 14 in. in thickness, and extending to the ends of the ties for the full length of the crossing.

This type of foundation eliminates water pockets and reduces the noise, while at the same time it does not give as rigid a foundation as concrete, thereby decreasing the impact of wheels, and increasing the life of the crossing. Actual experience at other crossings has shown that the frog points do not wear down any more rapidly here than on ballasted foundations. When it becomes necessary to renew a crossing on this foundation, all that is required is to loosen and remove the "rust bed" sufficiently so that the tie can be turned at a slight angle and lifted out, the track having, of course, first been raised slightly on track jacks. By inserting ties of the same dimensions the "rust bed" proper is then left undisturbed.

OPERATION OF A GRAVEL PIT*

By H. O. Whitney

Roadmaster, Canadian Pacific, Medicine Hat, Alta.

There is no way that money can be wasted or saved faster in the maintenance of way department than in work train service. The high wages paid train and engine men, the mechanical charges and fuel and other expenses connected with the present day work train, all contribute to the opportunity for efficient management. Where in service for any length of time, the principal uses of work trains are in gravel or dirt moving service, and such work affords a greater opportunity for proper planning and organization than where work trains are put on for a short period to do odd jobs.

Before work trains are started the roadmaster usually knows just what work he is to do, the amount of money allowed and the equipment he can expect to receive. If traffic is heavy he cannot expect to secure the best power and he has to be satisfied with what he can get. However, this can be overcome to a certain extent by a little personal talk with the master mechanic. An explanation of the conditions and length of haul, the class of equipment to be used and other details will help him to assign the best available power for those conditions. And last, but not least, he should confer with the master mechanic about assigning good engineers, firemen and watchmen to these positions. An engineer who can keep his engine in shape for a week or two without seeing the roundhouse and who is always ready to go when he receives signals or orders and a willing fireman contribute a large share to successful work.

It is a practice on some roads to appoint a trainmaster to work train service exclusively where there are a number of these trains in service, but on the average work this does not apply. If there is no work train trainmaster appointed it is well to confer with the regular trainmaster regarding the assignment of crews and it is a good practice to ask him to come out on the work for a few days when starting. A good conductor in charge of each train is absolutely necessary. I have found that it works out well to appoint the oldest experienced conductor pit foreman with full charge over all crews in the pit and giving him a small gang of men in charge of a good foreman to look after pit tracks, coal engines, assist car repairers and do any odd jobs around the pit.

Never start work trains until the equipment is collected and in shape for service unless it is absolutely unavoidable. To start with half enough cars not properly equipped not only means high cost on the start but often will be the cause of poor equip-

*Received in the contest on The Proper Handling of Work Trains which closed December 27, 1913.

ment for the whole season. Cars, plows, Lidgerwoods, spreaders and other equipment should be collected and put in condition before the work starts. With a plant in first class shape good work can be done from the start and running repairs can be kept up.

The pit staff should have two or more car repairers, one of whom should act as inspector and all equipment should be kept in good repair, to save long delays on the road. I have always kept a blacksmith and a forge in a pit and have found plenty of work to keep them busy. The foreman in charge of tracks should have a sufficient gang to keep the tracks and switches in condition, as a derailment in a pit means delays, not only to the pit train but to all trains dependent on its output. I have always made it a practice to lay tracks behind a steam shovel, instead of throwing the old loading track, when the shovel is ready to move back, thereby avoiding all delays to work trains and also always having a strong track. The ordinary gang in the pit lays this track each day as the shovel moves ahead, thereby making it unnecessary to move in an extra gang for this work.

Besides loading tracks pits should have a long storage track for loads and one for empties to avoid any delays to hauling crews. Considerable delay is often caused through coaling engines in districts where no coal shutes are available. I have made it a point to build a short depressed track in pits and stand engines there at night when tied up giving them a full tank of coal. Keeping a car or two of coal at convenient points on the road where engines can fill up while waiting to meet trains or while engine crews are eating will practically avoid delays from this cause.

If a cable gang is necessary the best foreman available should be in charge and his gang should be picked men. A foreman must see that his unloading equipment is always in shape and must be ready to unload day or night. He should know beforehand just where ballast or dirt is wanted and in what quantities, leaving his finishing work for daylight unloading. A good foreman can save many delays by watching trains and not allowing them to become bunched up.

THE LAWRENCE SNOW AND ICE FLANGER AND BALLAST SPREADER

As its name indicates, the Lawrence snow and ice flanger and ballast spreader is designed for use either as a flanger for removing snow and ice from the track in the winter or for widening the shoulder of the roadbed and spreading ballast in the summer. It consists of two blades designed to remove the snow or ballast to the desired level and by means of the side wings to push it out onto the shoulder. Although only one set of wings is shown in the accompanying photograph, the cars are now built with two complete sets of wings so that they may be operated in either direction.

The Lawrence Snow Flanger and Ballast Spreader with Blades Lowered Ready for Action

The flanger blades with their raising and lowering mechanism can be mounted on any car of suitable construction, either open or closed. The flanger blades are curved similar to an ordinary plow so that when lowered in position for operation the edges project under the snow or ballast, lifting it and crowding it outside the track. The blades are provided with removable flanger tips which can be renewed when worn. They are so designed that they are free to recede backward and upward if they should strike a frog, crossing or other obstruction, dropping back to the normal position after passing the obstruction. When flanging ice or leveling heavy ballast material, the blades can be held rigidly in their lower operating position by the application of air through a four-way valve if desired. It is claimed for this device that it is cheap in construction while it is durable and the cost of maintenance is small; its combined use enables it to be used throughout the entire year; it can be run in either direction and it is operated by air taken from the train line without interference with the brakes, thereby eliminating extra connections on the engine.

View Showing the Condition of the Track After Leveling Heavy Ballast with the Lawrence Spreader

This car has been used on the South Buffalo Railway for the past three years, during which time it has been given severe tests. It has not been necessary to use a snow plow on the tracks of this road at any time during this interval. It has also cleared the ash pit tracks of ice and frozen cinders, while it has spread five cars of heavy ballast on a track in less than five minutes. One of the accompanying photographs shows a track cleared of heavy brickbats with this spreader. It has been designed by the B. F. Lawrence Co., Buffalo, N. Y.

A METALLIC TAPE THREADER

The Lufkin Rule Company, Saginaw, Mich., has just put out a patented measuring tape attachment known as a "threader," which will hereafter be furnished with its "metallic" woven tapes without extra charge.

The "threader" is a loop and stud arrangement, by means of which the tape, though securely fastened to the winding drum of the case when in use, can be readily detached from it and a new tape as readily attached, without manipulation of the case, case screw or drum.

Woven tapes are sometimes torn by accident or through long use often become soiled and worn in such a way that they must be replaced while the case is yet in very fair condition. As the case represents approximately half the value of the outfit it is of considerable importance that it be possible for any one to insert a new tape in the old case as often as necessary, and thus get the fullest measure of use out of the case as well as the tape. Metallic tapes without cases are quite generally kept in stock by hardware stores, etc., and can always be easily obtained.

Convention of Bridge and Building Association

Abstract of Committee Reports and Discussions at Twenty-fourth Annual Meeting at Los Angeles, Cal.

The twenty-fourth annual convention of the American Railway Bridge and Building Association was held at the hotel Alexandria, Los Angeles, Cal., October 20-22. A special train was run over the Santa Fe from Chicago to Los Angeles to carry members and guests to the convention. This train brought nearly 100 and the total registration was 140 members. The officers for the past year were: President, J. N. Penwell, Lake Erie & Western, Tipton, Ind.; first vice-president, L. D. Hadwen, Chicago, Milwaukee & St. Paul, Chicago; second vice-president, G. Aldrich, New York, New Haven & Hartford, Boston, Mass.; third vice-president, G. W. Rear, Southern Pacific, San Francisco, Cal.; fourth vice-president, C. E. Smith, Missouri Pacific, St. Louis, Mo.; secretary, C. A. Lichty, Chicago & North Western, Chicago; treasurer, J. P. Canty, Boston & Maine, Boston, Mass.

OPENING BUSINESS.

President Penwell called the convention to order at 10 o'clock Tuesday morning.

Reverend Charles Edward Locke opened the sessions with prayer. The convention was welcomed to Los Angeles by H. V. Platt, assistant general manager of the Southern Pacific, and W. H. Whalen, division superintendent of the Southern Pacific; and Vice-President Hadwen responded for the association. The reports of the secretary and treasurer were then read and showed a balance of $1,100 and a membership of over 600. The secretary, in addition, reported 38 new members.

The committee reports and discussions presented at the business sessions follow:

ICE HOUSES

The type of construction that can economically be adopted for ice houses depends on the cost of construction, maintenance and operation of the house and on the loss suffered through shrinkage of the ice. The percentage of shrinkage in stored ice is dependent on the efficiency of the insulation of the house and can be reduced, but not entirely eliminated. In some cases it has been considered sufficient to store ice directly on the ground and build four walls and a roof over it, decreasing the shrinkage by covering the ice with hay, sawdust, or similar material. The loss suffered by such practice depends on the cost and supply of ice and the condition of its use. The cheapest type of construction may suffice at northerly points immediately adjoining large lakes that freeze over every winter where the cost of ice is very small, while in hot southern countries where natural ice must be hauled in during the winter or artificial ice manufactured at all times, very expensive types of construction are justified.

The problem of providing better insulation cannot be solved by merely changing from a wood frame to brick or concrete construction, for in either case insulation must be provided. When it is considered that brick and concrete houses cost from $4 to $6 per ton of ice storage capacity, as compared with $2 to $3 per ton for well constructed and insulated wooden houses, it is questionable if under all conditions the more expensive type of construction is justified. At the present time the wood frame house is used almost universally.

A feature that has been given but slight consideration is the insulation of the floor. A great majority of designers have thought that it would be sufficient to level off the ground and place the ice directly upon it, sometimes covering the surface with cinders, boards or concrete. Heavy losses due to shrinkage at the floor line in a number of houses indicate that the stored ice will not overcome the ground heat which continually rises to the surface and melts the ice. In more recent houses the shrinkage from this cause has been largely reduced by providing air spaces between the ice and the ground usually by placing joists and covering them with a slat floor for the support of the ice. These air spaces are from 6 in. to 12 in. deep.

The foundation for the walls can be of the usual types, including concrete, brick, wood blocking, posts, and pile studs. Especially where masonry foundations are used, care must be taken to secure proper insulation. In porous soil the water from the melted ice is permitted to go directly into the ground, but at other points drains must be installed. Such drains must be trapped to prevent air currents entering the house through them. The air entering a room through a 4-in. pipe can easily melt 1,000 tons of ice in a single season.

Ice storage rooms vary in capacity from 50 to 1,500 tons, the average being about 1,000 tons. The usual dimensions are 30 ft. wide, 40 ft. deep and 30 ft. high. Although many different arrangements, thicknesses and designs of wall construction are used, the general trend is towards vertical studs 6 in. to 12 in. wide, covered on both sides with wood sheeting, building paper, etc. The best construction requires double sheeting inside and out, with waterproof building paper between the layers, the spaces between the sheeting from stud to stud being filled with insulating material.

Air spaces have been considered to afford excellent insulation, but it is necessary to prevent circulation in the air space to secure the best results. This can be done by proper framing to cut such spaces into smaller spaces or by filling them with suitable porous insulating material which will fill the space but yet leave the greater part of it, consisting of pores in the material, full of air so separated as to prevent circulation. The sawdust and ground cork which have been largely used to fill these spaces decay rapidly on account of the continual dampness and start decay in the timber walls. At present various materials are used which are specially treated and manufactured for this purpose, principally from flax, cork and limestone. Flax is made up into blankets enclosed by sheets of waterproof paper. Cork is made up into cakes pressed together and cemented with asphaltum or other waterproof cement. Limestone is heated to 3,500 deg. and when liquefied is blown into shreds, making a sort of rock wool, enclosing a large percentage of air bubbles. Partitions are insulated somewhat similar to the walls, but, as the difference in temperature on the two sizes is not so great, the same care is not justified.

The two principal objections to wood frame ice houses are the danger of fire and the decay of the timber. As timber lends itself well to ice house construction, safety against fire can be obtained by covering the exterior walls with expanded metal and stucco and covering the roof with a fireproof material. Any openings into which birds might enter and build their nests should be covered with a galvanized iron mesh. Decay can be postponed for many years by treating the timber.

There is very little difference in the types of roofs used. Steel trusses are seldom or never used on account of the rapid corrosion that would result from the dampness. Wooden trusses are usually so built that the roof covering can be applied to the top chords, while the ceiling for the ice chambers can be applied to the bottom chords. This affords an air chamber between the roof and the ceiling of the house through which air can circulate, resulting in a good insulating air cushion. The height of this attic space is usually not less than 3 ft. and varies up to 8 or 10 ft., as in some cases machinery is located in this space. The insulation of the ceiling must be just as effective as that of the walls and practically the same type of construction is used. Great care must be taken at the connections of the walls

to the foundation, and also of the ceiling to the walls and partitions in order that no opening will be left through which air can enter.

The doors are usually of ordinary refrigerator construction with several sections separated by air spaces which are sometimes filled with insulating material. In some houses the doors extend vertically from the top to the bottom of the house in each chamber, although in such construction there is more likelihood of the entrance of warm air and greater difficulty in keeping the joints between the doors tight.

In storing the ice the individual rooms should be filled entirely between walls with ice laid in contact and filled up as close to the ceiling as possible. It is necessary to use some means to keep the ice apart in order that the cakes will not melt together. The former practice of using sawdust to fill all crevices has practically been abandoned on account of the shrinkage resulting when the ice is washed. Recent experiments have been tried in the use of waterproof paper to separate the layers of ice, which effectually prevent the cakes from freezing together and also prevent the circulation of air between layers. When ice must be stored for many months for rapid use when demand arises, it is well to cover it with a thick layer of some insulating material such as hay or straw.

The length and width of the platform for handling ice between the cars and the house depend upon the requirements, but as a rule when conveyors are not used and ice is handled in buggies, a platform 16 ft. wide will be found very convenient, although narrower platforms have been successfully operated. Where a comparatively small number of cars are iced, short platforms are sometimes built in front of the house, long enough to accommodate 5 to 10 cars, a switch engine being required to handle the cars when there are more than can be placed at one time. Where many trains require icing, it is of considerable advantage to have an icing platform the full length of the train, so that it can be iced at one spotting, especially at engine terminals where such trains do not need to be broken up otherwise. Where many trains have to be iced and the platforms are long, it is of advantage to use continuous platform conveyors to carry the ice from in front of the house to the point where it is put in the cars. The report included abstracts from replies received from a number of railways, detailing at considerable length, the practice in the construction and operation of ice houses.

Committee: C. E. Smith (Mo. Pac.), chairman; A. Ridgway (D. & R. G.), W. A. Pettis (N. Y. C. & H. R.), G. A. Manthey (M. St. P. & S. S. M.), G. S. Kibbey (M. & St. L.), and J. F. Parker (A. T. & S. F.).

This report was accepted without discussion.

WARNINGS FOR OVERHEAD AND SIDE OBSTRUCTIONS

There is no doubt as to the necessity and value of giving warning to men on the top and sides of cars when a train is approaching some structure or tunnel with less than the requisite clearance. In general, some appliance is suspended or swung across the track near the obstruction so as to strike the man a light blow and thereby warn him. Different systems are employed to accomplish this end. The one in most extensive use, known as the vertical rope system, consists of light ropes or wires known as tell-tales, whipcords, ticklers or danglers, suspended over the track from a rigid horizontal wooden or iron bar, or a flexible wire or cable, the latter being suitably supported on the outside of the track by upright posts set in the ground and properly braced and back-stayed. For single track an arm is extended from a counterweighted or braced post and the same style of warning can be used. The ropes are generally spaced from 3 to 10 in. apart for a distance of 5 to 8 ft. across each track, the lower end being about 6 in. below the lowest point of the overhead structures for which they are to give warning.

One of the important essentials is to prevent the rope from becoming entangled or thrown over the support by the wind, engine exhaust, or more particularly, by the trainmen when a car is temporarily stopped under the warning. The warning should not be too far from the structure, certainly not more than 200 ft., and in yards where much switching is done immediately under the structure, the location should be closer, probably 100 to 150 ft. The warnings should be used at all overhead obstructions with clearance less than 21 ft. The advantage of using a cable is that it can span a number of tracks, but it has the disadvantage that it is liable to sag and require a good truss cable with turnbuckles so that it can be tightened up from the ground. The post requires good back-staying or else must be made strong enough to avoid the necessity of a back-stay. In many locations there is not sufficient room to use stays.

It is also important from a maintenance standpoint to arrange the drops so that they can be repaired easily if torn off, tied up or otherwise damaged. A number of roads use galvanized wire screens from which are suspended wire or rope drops. Although this is a good warning, it is expensive to maintain on account of the rusting of the screen. Wire drops are sometimes used, but are very easily bent, making them dangerous. Iron rods are also used, to which rope drops are attached, the latter being not longer than the rods to prevent their catching and hanging over the top of the cable or crossarm.

The committee believes the vertical rope system to be the best under most circumstances and recommends its adoption for general use. Where two or more tracks are to be spanned, steel poles not less than 8 in. in diameter at the bottom and 5 in. at the top, set in a concrete base, should be used. The supporting cable of ⅜-in. solid copper, copper covered pliable steel (six-strand) or galvanized wire rope, should span between these poles at a height of not less than 21 ft. Wooden heads should be fastened to the cable with hanger clamps. On the lower side of these heads, dished washers should be provided, held in place by eye-bolts, to which are attached ¼-in. rods. The washers prevent the drops from being thrown over the top of the truss cable. To the lower end of the rods can be fastened ½-in. or ⅝-in. manila rope drops, the length of which is governed by the least clearance of the obstruction. The truss cable should be supported by saddle caps on top of the poles and should extend down the back side of the pole to a point about 5 ft. above the ground and there attached to a turnbuckle fastened to the pole by means of a clamp. This allows the truss cable to be tightened while standing on the ground.

The approximate cost of a warning for one approach over four tracks is $127 for material, $48 for labor, or a total of $175. For single track the same style of pole may be used by having a longer wooden head and a 2-in. wrought iron pipe for a brace. The approximate cost of such a warning for one approach is $58 for material, $28 for labor, or a total of $86.

For side clearance warnings, several roads use an iron post to which are fastened a number of wooden blades with rubber ticklers on the ends. These blades are fastened to a rod which is operated by springs on both sides so that when struck it will swing either way and come back to the proper position. Another style of side warning consists of an iron post around which is fastened several rings of rubber garden hose, forming a cylinder about 3 ft. in diameter which is free to revolve when it is hit.

The report included detailed descriptions of the warnings used on a number of roads, with drawings and prices.

Committee: E. G. Storck (P. & R.), chairman; F. E. Schall (L. V.), T. E. Thomas (B. & O.), M. M. Barton (P. R. R.).

Discussion

G. Aldrich (N. Y., N. H. & H.) stated that his road used tarred rope instead of plain manila rope for telltales, as it lasted longer. F. A. Taylor (B. & O.) urged the placing of the turnbuckle up out of reach of mischievous boys. E. G. Storck (P. & R.) stated that he places turnbuckles in reach of men on the ground and sends two men to tighten them every two weeks. He also said that he finds low turnbuckles more convenient and has had no trouble. F. E. Schall (L. V.) suggested placing a

small sheet iron box with a key over the turnbuckle. C. W. Richey (Penn.) stated that he has several hundred such warnings and likewise has found no trouble. He criticised the side warning proposed in the report as being almost as dangerous as an obstruction. A. S. Markley (C. & E. I.) has tried rattan strips, but was unable to keep them from warping. The committee was continued another year and instructed to pay special attention to side clearances and to tabulate the present requirements of the various states.

REINFORCED CONCRETE BRIDGES

The committee canvassed the railways of the United States and Canada to determine to what extent reinforced concrete is used for bridges, the types developed and in most general use and the practice of different roads regarding standard types and specifications for designs. The accompanying table shows a brief summary of the results of this canvass. It is likely that if full information could be had an even larger proportion of roads would be found on which reinforced concrete is not in use, as some of the roads failed to send in reports because they had no structures of this kind.

The two types of structure most in favor are the box culvert and the deck slab. On two large systems the deck slab is the only type of reinforced structure in use. Following these are the retaining wall and the trestle. These four leading types are far ahead of any of the others in the number of roads on which they are used and in the mileage of those roads. If measured by the total aggregate of structures, their lead over the other

	TYPES OF REINFORCED CONCRETE STRUCTURES IN USE									
	ARCHES BARREL TYPE	CULVERTS (RECT. BOX TYPE)	CULVERTS (ARCH TYPE)	ABUTMENTS SOLID	ABUTMENTS (OPEN BENT)	PIERS	TRESTLES	DECK SLABS	RETAINING WALLS	CITY SUBWAYS
Number of Roads on which type is reported in use	16	30	15	18	13	15	17	28	23	15
Mileage of Roads on which type is reported in use	61270	106972	48559	67580	52992	55932	76808	104776	81120	10864
Total number of Roads reported										54
Total mileage of Roads reported										163 449
Number of Roads reporting no reinforced concrete structures										13
Mileage of Roads reporting no reinforced concrete structures										24664

Tabulation Showing Use of Reinforced Concrete Structures

types would probably be even greater. For instance, the C. M. & St. P. alone has approximately seven miles of the deck slab on a single track basis.

There is a considerable diversity among the roads in specifications, design and details of practically every type in use. On only a few points is there anything like uniformity. A 1:2:4 mixture and a moduli ratio of 15 appear to be quite generally accepted as correct for fully reinforced structures.

Three types of reinforcing bars are in quite general use, plain round bars, square bars straight and twisted, and deformed bars. Many roads use all three types, the latter two being generally preferred to the plain round bars. Unit systems of reinforcement appear to be very little used for railroad bridge work as none of the reports showed this type in use. There are marked differences in the arrangement of the bars in the structures and this is apparently due more to methods of construction than design. Some roads use only straight bars, or bars simply with short bends at the end, while others do not hesitate to use bars with four to six bends. It is quite generally accepted that bent bars if made true to form and properly placed in the structure will fulfil the requirements of design better than a combination of straight bars. There are, however, other considerations that enter into the selection of reinforcement, such as methods of handling, shipping and placing bars, facilities for bending bars in the field and the skill and training of the men on the work. Manifestly a road with a good organization of well trained foremen and men and ample facilities for bending and handling bars would be less restricted in the type of reinforcement than a road dependent on contractors or with a less effective organization of its own. Only one road reported that it includes re-rolled deformed bars in its specifications and added that none has been used because they have never yet been available.

A considerable variation exists in the allowable working stresses of both steel and concrete which cannot be fully accounted for by the differences in the materials used in the concrete and to the impact allowances in the load. They must be attributed in part to the confidence, or lack of it, that designing engineers have in the strength of the material and in their ability to analyze the conditions of the structure under load. It is not to be expected that the working stresses for reinforced concrete can be brought even near the uniformity that obtains in the working stresses specified for steel structures and the uncertainties in both analysis and construction can best be covered by a liberal excess of strength in the design.

Tests recently conducted at the Engineering Experiment Station of the University of Illinois, and published in Bulletin No. 71, covering the strength of the bond between concrete and steel, show a very creditable record for the plain round bars. The bond resistance per unit of surface for square twisted bars was only 88 per cent of that developed by plain round bars. If the cross section of the bar be made the basis of comparison, it will be found that the square twisted bars developed practically the same bond resistance as round bars of the equivalent section. In the light of these tests it is concluded that, "the results found with the twisted square bar does not justify its present popularity as a reinforcing material." These tests also prove that under ordinary laboratory conditions the deformed bar is no more efficient in developing bond resistance than the plain round bar. However, the fact should not be overlooked that vibration, which is so large an element in working conditions, could not enter into the results of these laboratory tests. The designing engineers may feel that the deformed bar offers a security against vibration and against initial failures that fully justifies its use in spite of the excellent showing made by the plain round bar in the laboratory test.

Committee: O. F. Dalstrom (C. & N. W.), chairman; I. L. Simmons (C. R. I. & P.), L. D. Hadwen (C. M. & St. P.), J. A. Bohland (G. N.), A. Montzheimer (E. J. & E.), C. J. Scribner (C. B. & Q.), and D. C. Zook (P. L. W.).

Discussion

In a letter O. F. Dalstrom (C. & N. W.) called attention to the wide variation in the specifications for reinforcing steel ranging from soft rivet steel to high carbon steel.

CARE OF HIGHWAY TRAFFIC WHILE CONSTRUCTING BRIDGES TO ELIMINATE GRADE CROSSINGS.

When the volume of traffic on a railway requires more than two tracks, the ordinary safeguards at grade crossings are inadequate and in order to reduce the menace to safety it is necessary to eliminate the grade crossing. In many cases early railroad promoters and locating engineers selected lines which would allow grade crossings in preference to over or under crossings. As much as such locations may be regretted at present when contemplating the cost for eliminating grade crossings, it must be recognized that such construction was necessary in the start in order to secure a development of traffic which will today produce income sufficient to pay for the elimination of these grade crossings.

The high value of land in cities is in the majority of cases the ruling consideration in the method to be adopted when planning to eliminate grade crossings. Under such circumstances it is frequently necessary to build trestles or retaining walls with solid filling between the walls in addition to the bridges required at street crossings. The performance of construction work and the maintenance of traffic within such restricted limits create involved problems for the solution of which it is necessary to have an intelligent plan well studied and worked out in advance and a well organized and properly directed working force equipped with all necessary machinery

and appliances. The continuance of regular traffic necessarily increases the difficulties of accomplishing the work and it should be considered in planning such work that sufficient money must be provided to pay for the increases above ordinary unit costs.

As an illustration of the method used in handling traffic in a complicated problem of eliminating grade crossings, the chairman describes the work on the Boston division of the New York, New Haven & Hartford, performed in 1910-11, with which he was familiar. This work consisted of eliminating 10 crossings in a thickly populated section of Boston on the Third district between Savin Hill and Neponset on the main line and between Harrison Square and Field's Corner on the Shawmut branch. The train service on these lines was very frequent, the main line handling as many as 133 passenger trains and 9 freight trains in each direction in 24 hours with occasional extras. The construction service required the following trains: One train for shifting and delivering of material to contractors, one for the extra gang on track work and three gravel trains for hauling filling material for a distance of about 11.5 miles. Two of these gravel trains were worked day and night for a period of about three months, hauling a total of 611,000 cu. yd. of filling.

The control of all gravel and construction trains was placed in the hands of a traveling yardmaster who assigned their work and saw to it that all work trains were properly employed and also were kept within safe limits. Engineers, contractors, supervisors and construction foremen explained their needs to this traveling yardmaster when switching service was desired. Work trains were not allowed on the main track at the scheduled time of any first-class train. On this account no work trains could use the northbound main track from 7 to 9 a. m., nor the southbound main track from 4 to 6 p. m., the period when trains to and from the city were most frequent. Work trains were given rights on the main track up to the scheduled time of second-class trains by faithful and proper protection with flags or lanterns, according to the book of rules.

A complete set of standard signals was installed for all tracks used as main track in each temporary location as well as for permanent tracks and all switches in main line track were protected by mechanical interlocking plants.

On the main line the general plan adopted was to keep two main tracks for regular traffic at all times. In the first temporary position the two tracks were laid on the original low grade as near the west property line as practicable, leaving the east portion of the right of way available for the construction of one new track at the new elevated grade and for the widening of the elevated roadbed for a second track, the building of one-half of the length of each of the masonry bridge abutments and the placing of the steel work of bridges for two tracks on these abutments. As the bridges were plate girders in all cases, the second half of these bridges could be added with economy and convenience. The steel bridge work on the main line was erected on tracks which did not have regular traffic on them at the time, an advantage of no mean importance in the cost of the work. When the two tracks on the new high grade were available, regular main line traffic was turned over them and the two tracks in the first temporary position on the low grade were abandoned to allow filling, masonry and bridge work to be completed at the new high grade on the west side, completing the work for a four-track permanent roadbed for the entire distance.

On the branch line, regular traffic in both directions was handled over a single track during construction work. At the first temporary move the northerly track was continued in service at the original level, making the southerly part of the right of way available for the construction of one track on the new high level. A timber trestle was required to support this track for a considerable length, as the right of way width was too narrow to allow earth filling to be made at first. The narrowest width, 30 ft., was near the street which had the greatest volume of traffic, and as the adjoining property was so closely built over and so valuable that it was not economical to purchase land for widening the right of way, it was necessary to place niches in the back of the south retaining wall to receive bents of the temporary trestle which supported the track at a high grade.

The highways which were crossed at grade by any of the tracks, temporary or permanent, were protected at all times by lawful safety appliances. The crossing signs and gates were maintained and the latter operated for the full 24 hours. At the passenger stations, proper platforms were always kept available for the use of patrons. It was necessary at times to have temporary platforms at different stages of the work, and while the temporary buildings were not always up to the track level, they were safely accessible to the platforms, and none of them remained below grade for any great length of time.

W. F. Strouse, assistant engineer, Baltimore & Ohio, presented a discussion of the method used on that road for handling such work. In building a 30-ft. concrete arch, the tracks were carried on pile bents until the excavation was finished and the masonry work completed to the elevation of the springing line of the arch. The bents were then cut down, and plate girder spans of 64 and 66 ft., respectively, were substituted for the purpose of carrying the traffic while building the arch proper. As soon as the masonry was finished the space below the girders was back filled with cinders and other suitable material to approximately the under side of the girders. Cinders were then dragged out upon the track, filling the space to approximately the base of the rails. When the concrete was sufficiently hard, the girders were lifted out with wrecking cranes, one at each end, after which the track was restored and additional cinders added. Both girders were removed the same day, the traffic on each track being cut out for a period of about two hours.

In constructing abutments for supporting steel girders, the piles are driven first, then the street is depressed, bracing being applied as this work progresses. This method, of course, cannot be utilized where rock is encountered above the foundation line. In cases of this kind it is customary to support the tracks by excavating trenches to the elevation of rock, in which timber bents are placed with the necessary stringers to carry traffic while removing the rock to a lower level. The new timber bents are then placed before the removal of the other bents for the purpose of removing the rock under the same. This process is repeated until the material is removed to the proper elevation. When possible, of course, detour lines are built to avoid the necessity of expensive trestle work.

Committee: G. T. Sampson (N. Y., N. H., & H.), chairman; R. H. Reid (L. S. & M. S.), J. P. Canty (B. & M.), W. F. Strouse (B. & O.), F. E. King (C. M. & St. P.), W. H. Wilkinson (Erie), H. V. Smith (W. & L. E.), and E. N. Layfield.

The report was accepted without discussion.

WATER PIPE.

Cast iron pipe is preferable to either wrought iron or steel pipe for underground water mains because of its greater resistance to corrosion. There are considerable data which go to show that cast iron pipe is good for 100 years when properly coated under almost any soil conditions. The following table gives the approximate cost of laying pipe, as determined by actual railroad practice:

Diameter of pipe.....	4 in.	6 in.	8 in.	10 in.	12 in.	14 in.
Pipe at $30 per ton.....	$0.36	$0.54	$0.78	$1.06	$1.38	$1.53
Yarn at $0.07 per lb....	.0012	.002	.003	.0035	.004	.005
Lead at $0.05 per lb....	.031	.0425	.05	.07	.08	.09
Loading and handling...	.01	.015	.02	.025	.03	.04
Trenching and refilling (4 ft. cover).....	.11	.15	.16	.18	.20	.22
Laying, caulking, etc....	.05	.07	.10	.12	.15	.17
Total per lin. ft....	$0.56	$0.82	$1.11	$1.46	$1.84	$2.06

The above figures are based on class "C" pipe for a 300-ft. head and 130-lb. pressure, with the exception of the 14-in. pipe, which is class "B" for a 200-ft. head and 86-lb. pressure. Pipe of this size is usually installed only for penstock lines with a comparatively low head.

Joints in cast iron pipe may be made with lead, cement, lead-

ite, lead wool, or rust. In making a lead joint the packing should be twisted to form a rope a trifle larger than the joint space and cut so that the ends will meet when driven home. Care should be taken that the packing is driven up evenly so that a uniform lead space of about one-third the length of the bell is left. Tarred jute can be driven tighter than plain packing, but as it is much harder to handle, the latter is usually given the preference. The lead roll should be carefully placed around the pipe so that it fits firmly against the hub to avoid leakage of the lead. A break in the pouring to stop a leak usually leaves a seam in the joint where the lead has cooled so that it is never as good a joint as one continuously poured. The bottom of the joint should be caulked first, working up each side of the pipe, leaving the top for the last. The joint should be driven up until the caulking tool rebounds slightly from the lead.

A cement joint is much cheaper than lead and more rigid. A pipe laid with cement joints will not come and go as much as one using lead joints under excessive expansion and contraction, vibration or settling. Settling of the pipe will cause a fracture when cement joints are used, and for that reason they cannot be recommended for general use. A cement joint is made with neat Portland cement by driving a roll of dry jute tightly to the bottom of the bell, then filling evenly with cement to a point about half the depth of the bell and then adding another roll of jute driven against the cement until the moisture shows on the jute. The bell should then be filled evenly with cement to the face of the hub.

Leadite is a composition in the form of a black powder, the base of which is sulphur, and which is used in the same manner as lead with the exception that no caulking is required. Great care is necessary in handling it, as too high a temperature thickens it so that it cannot be run into the joint and the sulphur will ignite if allowed to get too hot. Leadite is 25 to 30 per cent cheaper than lead. A small leak in a leadite joint will soon be filled by rust, as part of the composition is iron.

Lead wool is used in the same manner as jute and is useful in water and where it would not be convenient to pour a joint. It is also useful in making repairs to leaking or blown out lead joints. The cost is about 25 per cent greater than joints made with pig lead.

Rust joints made of iron chips, sal ammoniac and water are seldom used now, although in former years they were used frequently for low pressure cast iron steam and hot water lines.

Wood stave pipe is constructed of staves, machined to a circle and held together with a flat, soft steel band wound spirally around the pipe, the finished pipe being coated with asphaltum and rolled in sawdust or wood shavings. The use of this pipe developed very rapidly on the Pacific coast where the cost of transportation of cast iron pipe made its use almost prohibitive and an abundance of suitable timber was close at hand. For many installations wood stave pipe will not answer the purpose as well as cast iron, although where the pressure is constant or the water is highly charged with acid, it should give satisfaction.

The term "wrought iron pipe" as generally used designates both wrought iron and steel pipe, while as a matter of fact there is a wide distinction between the two. Genuine wrought iron pipe is rarely furnished unless so specified and purchased on analysis. The advantage of genuine wrought iron pipe is chiefly in its greater resistance to corrosion, although it will be found to cut and thread more easily than steel pipe. Its cost is about 20 per cent more than steel. As in many instances the cost of the pipe is a comparatively small item in the total cost of conduit, wrought iron pipe would seem to be justified regardless of the first cost. One of the most severe usages to which pipe may be put is roundhouse service, either for overhead steam, water, or air line, or for heater pipes in pits, since the coal gases quickly attack the overhead lines and the moisture corrodes the pipes in the pits. Wrought iron pipes will easily last 50 per cent longer than steel under these conditions.

Steel pipe is stronger than wrought iron, and where the pipe is not subject to excessive corrosion, common merchantable steel pipe will answer for general service above ground, but wrought iron pipe is preferable for underground work. A cheap and effective method of protecting pipe laid underground is to coat it with asphaltum or pitch and wrap it with burlap. Where the water is used for drinking or other sanitary purposes, galvanized or tin-lined pipe should be used as certain waters are affected by contact with iron. Suction lines for pumps are subject to more or less vibration and the importance of keeping such lines tight necessitates the use of a threaded pipe, which should be wrought iron in preference to steel. Steel well casings are subject to rapid decay and the increased life of wrought iron pipe would justify its use for this purpose. Aside from suction lines and well casing the use of either steel or wrought iron pipe larger than three inches would not be justified for underground service.

In laying underground water pipes it is necessary to consider the soil conditions as affecting the life of the pipe as well as the quality of the pipe itself. It is well known that clay forms the best possible covering for underground pipe, and cinders the worst. When laying pipe through cinders, an effective protection can be secured at a small expense by flooring the ditch and covering the pipe with clay. Although it is not always possible to find favorable soil conditions, in many cases slight changes in the location of the pipe line may double the life of the pipe through securing a better soil. In preparing the trench, the bottom should be uniform so that the joints will not be cramped. Pipe laid along the right of way or near tracks should be as far from the tracks as possible on account of the effect of vibration from passing trains and the possibility of track changes throwing the pipe under the tracks. The trench should be deep enough to permit laying the pipe below the frost line.

All leaks in water mains may be classed under one of the following causes; settling of the pipe; expansion and contraction; deterioration through corrosion; electrolysis, and poor joints. In general, little trouble will be experienced from settling unless the pipe is laid in new-made fill or very soft ground. Whenever it is possible to avoid it, pipe should never be laid in a new fill until it has had time to settle thoroughly. Where pipe is laid through soft soil the ditch should be well floored or piling driven. Little trouble will be experienced with underground mains from expansion and contraction where cold water is used, but where hot and cold water are alternately pumped through the line, as is the case at some mechanical terminals, trouble from leaks due to expansion and contraction of the pipe is unavoidable. Leakage in mains laid under or near tracks may be reduced by burying the pipe to the maximum depth and placing as few joints as possible under the track. The trouble may sometimes be eliminated by bridging over the pipe with heavy timbers to support the ties.

Leakage from corrosion in a cast iron pipe is very remote and is hardly worth considering, except that caused by electrolysis. Electrolysis caused by the passage of stray current from power lines or electric railways along the underground pipe occurs only at the points where the current leaves the pipe. At such points corrosion of the iron from electrolysis will take place, which, theoretically, will amount to a loss of 20 lb. of iron per year for every ampere of electric current leaving the iron. Experiments have shown that this theoretical corrosion is at least equalled and sometimes exceeded. For a given current leaving the pipe there is practically no difference in the amount of iron destroyed between cast iron, wrought iron and steel. The electrical resistivity of cast iron is, however, about 10 times as great as that of wrought iron or steel, and the usual lead joint cast iron pipe also has a resistance 20 times greater than the screw coupling joints usual with wrought iron and steel pipes. For these reasons a given voltage drop will cause a much smaller current to flow on a cast iron pipe than on a wrought iron or steel pipe, thus making cast iron pipe practically much less subject to electrolysis than wrought iron or steel.

The principal cause of leaks is poor joints. Proper attention to joints will always pay, the only safe course when leaks develop being to stop them at once. Wherever possible, joints

should be tested to the maximum pressure before being covered.

Incrustations and deposits in water pipe seriously affect the carrying capacity of the pipe and by increasing the friction very materially increase the cost of pumping. The frictional loss in dirty water mains is far in excess of the actual reduction in area due to the roughness of the pipe. As a matter of fact, the interior coating of new pipe may affect the carrying capacity as much as 20 per cent due to the care and smoothness with which it is applied.

The question of water hammer caused by stopping the flow in a water pipe is of great practical importance, as the shocks frequently bursts the pipe. The simplest method of protecting pipes from water hammer is to use slow closing gates. The duration of closure should be proportional to the length of the pipe line. Air chambers of adequate size placed near the valves and gates eliminate almost entirely the hydraulic shock and do not allow the pressure wave to pass through them, but they must be very large and it is difficult to keep them supplied with air. Safety valves allow pressure waves with only such intensity as correspond to the elasticity of the springs of the safety valves to pass through them.

Committee: C. R. Knowles (I. C.), chairman; J. B. White (C. & N. W.), James Dupree (C. T. H. & S. E.), John Ewart (B. & M.), C. F. Warcup (G. T.), and M. G. Manning (C. G. W.).

Discussion

The figures relative to the cost of laying pipe aroused considerable discussion. James Dupree (C. T. H. & S. E. Ry.) expressed the opinion that the figures were too low, especially those in reference to leading joints. He said that he used two pounds of lead per inch diameter of pipe. Several members thought that there was practically no difference in the cost of excavating for pipe from four to twelve inches in diameter. In discussing cemented joints for steel pipe Mr. Dupree said that he always found them unsatisfactory. A. H. King (O. S. L.) reported the same experience. J. B. Sheldon (N. Y. N. H. & H.) said that he overcame the difficulty in maintaining tight joints in water pipes subject to water hammer by the substitution of flanged joints for leaded joints. J. S. Robinson (C. &. N. W.) said that he had found the gaskets wearing in the flanged joints thereby causing leaks. A. A. Wolf (C. M. & St. P.) said that he overcame this difficulty by using metal gaskets. R. Henderson (B. & O.) reported that he had laid three miles of pipe with flanged joints satisfactorily by placing a wood block under each joint. In discussing the water hammer several members reported satisfactory results following the installation of air chambers or slow closing valves, while others reported these practices ineffective. W. C. Frazier (S. P. L. A. & St. L.) described an installation of wood stave pipe lines ranging from four to eighteen inches in diameter at Las Vegas, Nev., with redwood staves one inch thick which proved unsatisfactory because of the difficulty in keeping the bands on. He stated that it requires three or four men working continuously to replace the bands and that galvanized iron bands were found but little better than common iron bands. J. F. Fisher (S. P.) reported trouble with root growths in wood pipe. A. H. King (O. S. L.) said that he had had difficulty with alfalfa and other roots entering at joints and that it was necessary to take the pipe apart to clean it. He never found any mossy growth inside. A. A. Wolf (C. M. & St. P.) on the other hand, said that he had had to remove pipe clogged by moss. In laying iron pipe under tracks he has placed the pipe in a larger conduit of concrete culvert pipe, thereby eliminating leaky joints.

CONCRETE POSTS AND POLES

Concrete Posts.—At the present time wooden posts are as cheap and in many instances cheaper in first cost than any substitute which has been brought forward, but because of their short life and liability to destruction by fire, there is a question whether any wooden post with the exception of one or two kinds of wood, is as cheap as a well designed and well manufactured concrete post. Many persons have studied concrete as a suitable substitute for wood in posts, and naturally some errors in design have been made, many posts have been poorly manufactured, and a good many failures have resulted. Also, as is usual in a new field, there have been some whose enthusiasm outran their judgment and extravagant claims which could not be backed up were made. The posts were found to be difficult to handle on account of their weight and were easily broken. Considerable difficulty was experienced in finding a satisfactory method of fastening the fence to the post, especially as many of the earlier designs were straight or had a very slight taper. Notwithstanding these drawbacks, concrete posts have established themselves permanently and as the supply of wooden posts continues to diminish, their use will rapidly increase.

Any fence post, to secure extended use, must fulfil the requirements of stability, durability, efficiency and economy. Experience has shown that the concrete post is as stable as the wooden one. The very quality, weight, which makes it difficult to handle during manufacture and while being distributed, is a marked advantage in securing stability after it has been set. Again, when used in low, wet places and in localities subject to overflow, the advantages of the concrete post are apparent.

Concrete posts have not been in use a sufficient length of time to enable accurate data to be secured as to their life, but judging by the performance of concrete under other circumstances it is felt that a life of 40 years may be safely predicted for a properly designed and manufactured post.

Experience shows that the concrete post is as efficient as the wooden one. It has the further advantage of not being subject to destruction by fire. As to economy, the weight of evidence is in favor of the concrete post. Wooden posts cost from $0.10 to $0.30, depending on the kind of wood used and the locality. The average for those most commonly in use is conservatively $0.16 to $0.17 and their average life from 12 to 15 years. Concrete posts cost from $0.16 to $0.20, with the average for the heavier posts about $0.18. It therefore requires no complicated calculation to determine the relative economy of wooden and concrete posts. They have the further advantage that they can be made near the point where they are to be used.

Many ideas as to the best designs of concrete posts have been advanced. The shapes vary from square and rectangular to round or triangular. There are also T-shaped posts and semi-circular, or rather semi-elliptical and rectangular sections with one end semi-circular. In size they vary from 3 in. to 6 in. at the top and from 4 in. to 8 in. at the bottom. In some instances the posts are spread at the bottom. Many of the early posts were made straight or with a very light batter. The committee believes that in general those sections having the smaller perimeter for any given section will prove more satisfactory.

Experience has shown that straight posts or those with a very slight batter are apt to heave with the frost. In these designs it is also difficult to prevent the fence slipping down on the posts. For these reasons posts are now generally made with a decided batter, and the committee believes the taper should be uniform from top to bottom. It has been found that the lighter posts could not always be depended on to resist the strain to which they are subjected, especially in those sections of the country where stock is plentiful, and the recent tendency seems to be toward the use of a heavier post. The advantages of the lighter post are the small decrease in cost due to less material used and the lighter weight of the post, which is some advantage in handling and shipping. The latter advantage is offset somewhat by the fact that greater care must be used to prevent breakage. The committee recommends that the minimum diameter at the top should be 4 in. and at the bottom 5½ in.

The methods of reinforcing are nearly as numerous as the shapes of the sections. They can be divided into two general

classes those reinforced with core reinforcing and those in which the reinforcing is placed near the circumference. Reinforcing material consists of plain round or square rods, hoop steel, steel wire, sheet steel cut and pressed into required shapes, twisted or corrugated bars, and in some instances a combination of two of the above. In some instances the rods are wound with wire and in others crimped wires are used. The committee believes that reinforcement should be placed near the circumference of the post where the greatest stresses are likely to occur and where it is reasonable to expect the tendency to crack is the greatest. The critical section of the post is near the surface of the ground and frequently extra reinforcing is placed at this point. The committee does not believe that this is called for, but it may be found desirable under special conditions where posts are subjected to unusually hard service.

In general, concrete for posts is made of crushed rock or screened gravel, though bank gravel is frequently used. The latter material usually is not as clean as the screened gravel and under these conditions as good results cannot be expected. Better proportioning of the materials can also be obtained with the stone or screened gravel and sand. The concrete should be as dense as possible. This adds somewhat to the strength of the post, since by decreasing the amount of absorption it decreases the chances of corrosion of the reinforcing and to a considerable extent prevents deterioration of the posts due to the action of frost. For this reason posts should be made of a comparatively rich mixture. The cost of the cement is a small proportion of the total cost of the post and the cost of the additional cement which makes the difference between a lean and a rich mixture is negligible.

On account of the comparatively small section of a fence post and the placing of the reinforcement, it is undesirable that the coarser aggregate should be of a large size. Experience has shown that the gravel or crushed rock should not exceed ½ in., nor be less than ¼ in. in size. The committee recommends a mixture consisting of one part of cement, two parts of clean, sharp sand and four parts of broken stone or screened gravel. When bank gravel is used, a mixture of one part cement and four parts of gravel is recommended.

While reinforcement should be placed near the outer surface it is necessary that it be protected by the concrete. On this account it is recommended that it be placed ½ in. below the surface. It is also recommended that the reinforcing material be long enough to permit turning it down at the end. Recent experiments develop the fact that slightly rusted reinforcement gives a decidedly stronger bond with the concrete than does the clean, bright metal, or metal with the mill scale on.

Wherever possible, concrete for posts should be mixed in a batch mixer. Machine mixed concrete is recognized as superior to hand mixed, as the cement is more thoroughly incorporated with the sand and stone and the stone itself is more uniformly distributed. All materials should be measured. The amount of water added should produce a quaking mixture. This consistency will be wet enough to cause the concrete to settle around the reinforcing and produce a smooth surface. If it is made wetter there is danger of part of the cement being washed off the sand and stone and rising to the top. This results in an inferior product which will give a larger percentage of breakage and a shorter life.

Posts should never be made during freezing weather. On account of the small volume of a post it is more easily affected by low temperatures than concrete in large volumes. For the same reason the concrete in posts is apt to dry out rapidly in hot or very dry weather. It is therefore essential that they be kept moist for the first week or ten days and during this time they should not be exposed to the sun. Posts should be retained in the mold for three days after it is cast and it is better to allow four days. As soon as the concrete is set, water should be poured over it and the post kept thoroughly wet until removed from the molds. After removal it should be stored under cover and in such manner that it can be kept moist for the period specified. Great care must be exercised in handling the posts at this period as they are very easily broken. They should be stored upright with the larger end down. Concrete gains rapidly in strength and the bond between the concrete and reinforcing increases rapidly up to 30 days and only slightly less rapidly during the next 30. At the end of 90 days this strength has developed so that the post can safely be used if care is taken in handling. No post should be used earlier than 90 days after it is made. Difficulty is frequently experienced in casting posts on account of the concrete sticking to the molds. For this reason it is customary to oil the surface of the mold or to brush it with a solution of soap. Either oil or soap should be used sparingly. The molds should be scrubbed and cleaned with a stiff broom frequently. In general, it is desirable to have a plant equipment sufficient for a daily output of at least 400 posts. This will require molds for 1,200 to 1,600 posts, depending on whether they are left in the molds three or four days.

The handling and shipping of concrete posts are fully as important as the actual manufacture. Wooden posts can be thrown about, piled in cars or on the ground and handled very roughly without impairing their value. This cannot be done with concrete posts. When shipped, the posts should be carefully packed in straw or sawdust. In unloading, they should not be thrown on the ground, particularly if it is hard or uneven.

Concrete posts are set in the same manner as wooden ones and under normal conditions a man can set as many concrete as wooden posts. Many methods of fastening the fence to the posts have been devised. Small holes were made through the posts at stated intervals and nails or wire run through them to be bent around the fence wires. Wooden blocks were inserted and anchored in the posts during manufacture. In some instances staples were placed in the posts while the concrete was green. None of these methods proved satisfactory. Holes or staples could not be located where the fence wire would come, as it is seldom possible to set the posts at exactly the same depth. Irregularities in the ground also caused difficulties with this type of fastening. Again, this type of fastening sooner or later rusts out and cannot be replaced. Holes and wooden inserts weaken the posts and are in every way unsatisfactory. The most satisfactory method of attaching the fence is to use tie wires around the posts, attaching them to the fence wire by means of the "Western Union twist." Care must be exercised to have the tie wires tight and the fence wire drawn up snug to the fence post, otherwise the fence will slip down on the post and stock running against it or trying to get through will raise or press the fence down. This method of fastening the fence to the post will be most satisfactory where the post is made with a taper.

Concrete Poles.—In considering concrete as a substitute for wooden poles, a quite different situation is found. While the concrete posts can be easily manufactured and handled substantially the same as the wooden posts, the concrete pole is expensive, the handling of the forms is troublesome, and the erection of the pole requires radically different methods from the wooden one on account of its great weight. In spite of these drawbacks there are a number of points in favor of these poles. A number of telegraph lines have been put in service with concrete poles, notably on the Pennsylvania, where it is understood that they proved very satisfactory during the unprecedented winter of 1913-14. The extra expenditure for a concrete pole may be justified in order to safeguard heavy and important lines, but the committee does not believe it can be justified for lighter and less important lines.

Committee: George E. Boyd (D. L. & W.), chairman; A. S. Markley (C. & E. I.), C. W. Wright (L. I.), F. J. Conn (C. N. O. & T. P.), and W. E. Elder (C. B. & Q.).

Discussion

A. S. Markley (C. & E. I.) thought it unnecessary to hold posts 90 days before using them. He also thought the prices

given in the report were too low. He has found reinforcing separators detrimental to the strength of the posts.

CLOSING BUSINESS

At the closing business session the following officers were elected for the coming year: President, L. D. Hadwen, engineer of masonry construction, Chicago, Milwaukee & St. Paul, Chicago; first vice-president, G. Aldrich, bridge supervisor, New York, New Haven & Hartford, Boston, Mass.; second vice-president, G. W. Rear, general inspector, Southern Pacific, San Francisco, Cal.; third vice-president, C. E. Smith, assistant chief engineer, Missouri Pacific, St. Louis, Mo.; fourth vice-president, E. B. Ashby, chief engineer, Lehigh Valley, New York; secretary, C. A. Lichty, general inspector, Chicago & North Western, Chicago; treasurer, F. E. Weise, chief clerk, engineering department, Chicago, Milwaukee & St. Paul, Chicago.

Detroit was selected as the place for next year's convention. The subjects selected for next year's committee work include: (1) Locomotive Cranes in Construction Work and Handling Material; (2) Conditions Under Which Pile and Timber Bridges Should Be Repaired, Reinforced, Renewed or Replaced; (3) Railway Water Tanks; (4) Coaling Plants for Small Stations; (5) Compilation, Analysis and Value of Cost Data; (6) Efficient Methods for Handling Work. The following committees for this year also were continued: (2) Warning for Overhead and Side Obstructions; (4) Reinforced Concrete Bridge Work; (5) Station Buildings for Passenger Service Only, and (9) Concrete Culvert Pipe and Concrete Piles.

On Tuesday evening, 234 members and guests attended a banquet in the Alexandria Hotel. G. W. Rear (S. P.) was toastmaster, and the speakers included W. H. Whalen, division superintendent of the Southern Pacific at Los Angeles; E. A. Baley, who described the Los Angeles aqueduct; H. B. Titcomb, engineer maintenance of way of the Southern Pacific; President Penwell and others. Late Wednesday afternoon there was a trip to Ocean Park, where the party remained for the evening. On Thursday evening there was a trip up Mount Lowe. There were also various other rides arranged for the ladies.

SUPPLY ASSOCIATION

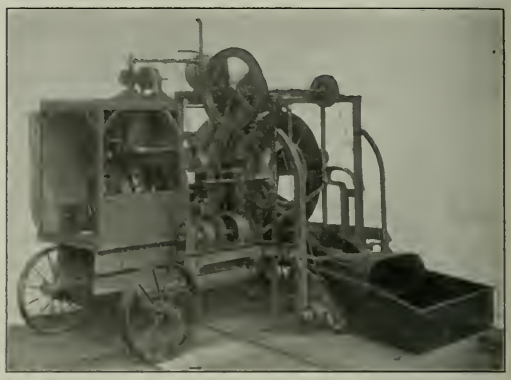
On account of the excessive cost of sending exhibits and representatives to Los Angeles, very few of the supply firms that hold membership in the Bridge and Building Supply Men's Association were represented at the convention. It was agreed before the convention that no meeting would be held at the convention and that the existing officers would continue their duties for another year. These officers are: President, J. A. Meaden, Paul Dickinson, Inc.; vice-president, D. A. Bonitz, National Roofing Company; treasurer, H. A. Neally, Joseph Dixon Crucible Company; secretary, L. D. Mitchell, Detroit Graphite Company; members of the executive committee, C. E. Ward, U. S. Wind Engine & Pump Company, and W. A. Hemenway, Asphalt Ready Roofing Company.

THE SMITH-CHICAGO CONCRETE MIXER

An improved type of the Chicago mixer formerly sold by the Chicago Concrete Machinery Company, Chicago, will be handled in the future under the name of the Smith-Chicago mixer by the T. L. Smith Company, Milwaukee, Wis. In distinction to the other Smith mixers, the new type has a non-tilting discharge.

The cylindrical drum has a centrally located ring encircling it, which combines the main driving gear and the main roller track in one substantial casting, the rollers being protected by the overhanging drum heads. No movable parts are located in the drum where they can come in contact with the mix. The mixing action is secured by large scoop blades with deep converging sides which pour the batch to the center of the drum. The action of these blades combined with the action of the drum itself, produces a movement in the mass which distributes the loads evenly and produces an efficient mixture without splashing.

The external discharge chute is pivoted above the discharge opening, projecting two-thirds of the way through the drum. The length and steep angle of this chute are made possible by the concave face of the drum. This discharge chute can be used to measure small quantities of concrete with accuracy or to discharge the entire batch rapidly. When the discharge chute is not in the discharging position, it



The Smith-Chicago Mixer with Gasolene Engine, Power Charger and Enclosed Water Tank

swings out and up, draining back into the drum. In this position it does not interfere with the wheelbarrows or hoisting buckets. On self-loading machines this spout can be operated either from the feed or discharge side of the machine.

The new type of mixer can be equipped with a standard feed chute, a vertical acting power charger, or a gated batch

The Smith-Chicago Mixer with Steam Engine, Boiler, Power Charger and Enclosed Water Tank. The Chute is Shown in Discharging Position

hopper. The power charger consists of a skip carried by four rollers traveling on curved guides. The skip is hoisted by cables, the wide nose projecting well into the drum in the discharging position. These chargers are equipped with a device automatically to disengage the clutch when the skip has reached its highest position, forming an effectual safeguard against accidents.

General News Department

The new union station of the Illinois Central, the Yazoo & Mississippi Valley, the Chicago, Rock Island & Pacific, and the St. Louis & San Francisco, at Memphis, Tenn., was opened on October 21.

The freight house of the Northern Pacific at Duluth, Minn., sustained considerable damage from fire on the night of October 11. The loaded cars in the shed were all saved. The damage is estimated at $20,000.

November 9 has been set as the date for the beginning of hearings at Chicago in the arbitration proceedings on the demands of the enginemen and firemen of the western railways, although the board of arbitration is not yet complete. The two arbitrators representing the employees and the two representing the railroads have been selected, but they have not yet agreed upon the two neutral members.

The Interstate Commerce Commission has postponed to March 31, 1915, the date on which carriers must have complied with its order under the transportation-of-explosives act, requiring gas cylinders to be supplied with certain safety devices. Owners of such cylinders placed orders in Europe for the required devices, but now have informed the commission that their orders cannot be filled within the time limit fixed.

The voters of Roseburg, Ore., last week voted to authorize a $500,000 bond issue to assist in the construction of a proposed railroad from Roseburg to Coos Bay, Ore., in order to secure rail communication with the Pacific ocean, which has been projected for nearly 40 years. The town elected a railroad commission of 10 members to represent the people's interest in the matter. The money is not to be expended until the people are assured by a sufficient bond that a standard gage road will be constructed between Roseburg and Coos Bay to be operated for a term of years under conditions satisfactory to the members of the commission. In that case the $500,000 will be appropriated to assist in the work. The proposed line has been surveyed and a part of the grading has been completed under a former project.

J. W. Everman, general manager of the St. Louis Southwestern, who took that position on July 1, after 33 years' service with the Texas & Pacific, was presented with a silver service of 186 pieces, costing $1,200, by a committee representing the 10,000 employees of the Texas & Pacific, at a luncheon at Dallas on October 13. The committee was composed of 40 of the Texas & Pacific employees, and the presentation was made by George Thompson, general attorney for the Texas & Pacific. In addition to the Texas & Pacific men the principal officers of the St. Louis Southwestern were present at the luncheon, including President F. H. Britton, Vice-president H. E. Farrell, General Solicitor S. H. West, Chief Engineer C. D. Purdon, Purchasing Agent Ernest Baxter, General Attorney E. B. Perkins, Superintendent F. J. Hawn and W. C. Connor, president of the Dallas Terminal Railway & Union Depot Company.

The Baltimore & Ohio, in order to "see itself as others see it," has ordered W. E. Lowes, assistant general passenger agent, to make a tour of its lines on an inspector's gasolene tricycle to collect first-hand information. Accompanied by a photographer and a supervisor of track, Mr. Lowes has already covered a portion of the main line and some of the branches of the eastern divisions. In the Shenandoah Valley, along the south branch of the Potomac river and in eastern Ohio, a number of exquisite photographs of historical interest and scenic beauty have been taken and will be used in advertising. Up to this time Mr. Lowes has traveled from fifty to sixty miles a day, stopping to talk over business conditions with agents at small stations, as well as with farmers in the fields and workmen in industries along the route. From farmers he obtains information concerning the fertility of soil and its adaptability to particular phases of farming, learns the yield per acre in the community and the amount of fertilizer, farming machinery and articles shipped in, and gives and receives information about markets.

Disastrous Collision in France

A press despatch from Pas-de Calais, France, October 19, says that between forty and fifty passengers were killed and eighty injured in a butting collision on the 17th at Marquise, between Calais and Boulogne. The trains carried soldiers and refugees. The cause of the collision is given as a broken signal wire, which allowed a signal to change from "stop" to "proceed."

Repeal the "Full-Crew" Laws!

The following appeal, issued by the Pennsylvania Railroad, has been posted in all the stations along the company's lines, and also on trainmen's bulletins:

"It is in the interest of the public—whose chief concern is good service and safety—that the extra crew law now on the statute books of Pennsylvania, New Jersey and New York be repealed. This law causes a waste of $1,100,000 annually in the employment of unnecessary men on the Pennsylvania system alone. No one is more concerned than the Pennsylvania Railroad Company in securing maximum safety on its lines. Every train on this railroad has a full crew, and this extra expenditure adds nothing to safety or public convenience. The same money had much better be spent to remove grade crossings, improve tracks, signals and bridges and buy steel cars.

"This extra crew law, which compels unnecessary expenditures, is one of the factors which menaces the ability of this company to pay present rates of wages to that great body of employees whose activities are needed. The Public Service Commission should see to it that all trains are properly manned. Such action would amply protect employees and the public. We appeal to the people in their own interest, we appeal to our employees in their best interest, to ask their representatives in the next Pennsylvania, New Jersey and New York legislatures to repeal the extra crew law."

Trespassing Reduced*

In New York state we have a definite law prohibiting trespassing on railroads and making it a punishable offense. We have within the past year employed a special man to personally visit the judges of all courts having jurisdiction in trespassing cases along the entire road, to obtain their co-operation in the enforcement of the law. Not only in New York but all other states through which our lines run the editors of newspapers were personally visited and their aid procured in giving wide publicity to our campaign. We posted at frequent intervals warning notices in various languages along the entire right-of-way, warning the public that arrest or injury would be the probable penalty for track walking. We prepared graphic maps indicating the number and location of trespass, death and injury cases, which we displayed in prominent store windows in important cities along our lines. We distributed pamphlets and circulars to the superintendents of schools and heads of industrial plants, enlightening them and obtaining their co-operation. And, because we did all of these things in a persistent manner, thereby educating and warning the public against the dangers of trespassing, there were during the year ending June 30, 1914, on the four principal roads of the New York Central Lines 109 fewer trespassers killed and 83 fewer trespassers injured than during the previous twelve months.

Let us, then, make education our watchword as well as safety our creed. Let us light the torch of prudence and hold it aloft that its rays may penetrate the remotest corners of the land, eradicating the darkness of ignorance which cloaks the chance

*Extract from an address by Marcus A. Dow, general safety agent of the New York Central, before the annual convention of the National Council for Industrial Safety, at Chicago, October 15.

REVENUES AND EXPENSES OF RAILWAYS

Month of July, 1914

Name of road.	Average mileage operated during period.	Operating revenues			Operating expenses							Net operating revenue (or deficit).	Railway tax accruals.	Operating income (or loss).	Increase (or decr.) comp. with last year.

taker, and those who are careless, thoughtless or indifferent to safety. Let us spread the gospel of safety broadcast and train our citizens, both present and future, to think before they act and not go mechanically and irresistibly into certain danger where danger is known to exist.

American Association of Railway Surgeons

The eleventh annual meeting of the American Association of Railway Surgeons was held at the Hotel Sherman, Chicago, on October 14, 15, and 16. In addition to a large number of technical medical and surgical papers the following were presented: "Lighting as a Preventive of Accidents in Car Shops," by J. R. Cravath, consulting engineer, Chicago; Lantern demonstration of special qualities of glass used in railway signaling and worn for protection of employees, by Dr. Nelson Miles Black, of Milwaukee, Wis.; "Why a Railway Surgeon," by M. C. Murphy (I. C.) Morgantown, Ind.; "The Company Surgeon," by Charles Blickensderfer (C. R. I. & P.) Shawnee, Okla.; "Ethics of the Railway Surgeon," by William Reid (M. St. P. & S. S. M.) Deerwood, Minn.; "The Railway Surgeon at Terminal Points," James M. Miller (C. & E. I.) Villa Grove, Ind.; "Prevention as Applied to Railway Surgery," M. J. Kenefick (C. M. & St. P.) Algona, Iowa; "Advisability of Repeated Examinations of Employees Connected with the Operating Department of a Railway System," by F. M. Crain (C. & N. W.) Redfield, S. D.; "Railway Sanitation," D. J. McGurren (M. St. P. & S. S. M.) Devil's Lake, N. D.; "Psychology of Railway Accidents," by J. H. Sealy (C. & N. W.) Freeport, Ill. At the concluding session Dr. John B. Murphy of Chicago, consulting surgeon of the Soo Line and Illinois Central, presented a paper on "Management of Joint Injuries in Railway Accidents," and the safety first movement was discussed by R. C. Richards, general claim agent of the Chicago & North Western; Peter M. Hoffman, coroner of Cook county; L. F. Shedd, safety supervisor, Rock Island Lines, and H. L. Brownell, safety inspector, Chicago surface lines.

Officers were elected as follows: President, Dr. G. F. Beasley, surgeon for the Chicago, Indianapolis & Louisville and the Cleveland, Cincinnati, Chicago & St. Louis at Lafayette, Ind.; vice-president, Dr. J. P. Kaster, Toledo, Ohio; secretary-treasurer, Louis J. Mitchell, Chicago.

Association of Railway Electrical Engineers

The annual convention of the Association of Railway Electrical Engineers is to be held at the Hotel La Salle, Chicago, on October 26-30. An exhibit of supplies will be held on the nineteenth floor of the hotel in connection with the convention. At the first session on Tuesday morning President C. R. Gilman, illuminating engineer of the Chicago, Milwaukee & St. Paul, will present the opening address, which will be followed by reports of the committee on Loose Leaf Binders for Filing Specifications and to Keep Specification Standards to Date, the committee on Reciprocal Relations, the committee on Specifications for Wire Crossings for Potentials above 100 Volts, and the committee on Data and Information. On Wednesday reports will be presented by the committees on Standards, Electric Headlights, Industrial Trucks, Electric Traction and Wire Specifications, and at the morning session Dr. F. H. Milner, experimental engineer of the Union Pacific, will present a paper on "Communication to and between Trains by Telegraph Wireless, Telephone Wireless and Telephone." At the session on Thursday reports will be presented by the committees on Axle Equipment, Head End Equipment and Standard Rules for Car Wiring, Outside Construction and Yard Lighting, Illumination and Shop Practice, and Yard Facilities. At the Friday session reports will be presented by the committee on Yard Facilities for Charging.

National Council for Industrial Safety

At the third annual safety congress of the National Council for Industrial Safety held at the Hotel LaSalle, Chicago, on October 13, 14 and 15, one session on Thursday afternoon was devoted to transportation and public service. Martin J. Insull, vice-president of the Middle West Utilities Company, Chicago, acted as chairman of the session and presented an address on "Safety as a Means of Bettering the Relation Between the Public and Public Service Corporations." W. B. Spaulding, chairman of the central safety committee of the St. Louis & San Francisco, St. Louis, Mo., also presented an address on "The Safety Problem of the Railroads." This was discussed by R. H. Newbern, superintendent of the insurance department of the Pennsylvania Lines, who described the methods of keeping accident statistics on the Pennsylvania, and by M. A. Dow, general safety agent, New York Central Lines, who explained the necessity for the education of the public concerning the danger of careless habits, particularly in connection with highway crossing accidents. He said that out of observations of 7,779 persons crossing the tracks at various places on the lines of the New York Central during one day last December, only 359, or less than 5 per cent, looked in both directions before crossing.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

American Association of Demurrage Officers.—A. G. Thomason, Demurrage Commissioner, Boston, Mass. Annual convention in April.

American Association of Dining Car Superintendents.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next convention, October 22-24, Washington, D. C.

American Association of Freight Agents.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 21-24, 1915, Richmond, Va.

American Association of General Passenger and Ticket Agents.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.

American Association of Railroad Superintendents.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next meeting, May 20-21, 1915, San Francisco, Cal.

American Electric Railway Association.—E. B. Burritt, 29 W. 39th St., New York.

American Electric Railway Manufacturers' Association.—H. C. McConnaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

American Railway Association.—W. F. Allen, 75 Church St., New York. Semi-annual meeting, November 18, Chicago.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1915.

American Railway Safety Association.—L. F. Shedd, C. R. I. & P., Chicago. Next meeting, November, Chicago.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga. Annual meeting, July, 1915.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 1-4, 1914, New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Atlanta, Ga.

Association of Manufacturers of Chilled Car Wheels.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Annual meeting, second Tuesday in October, New York.

Association of Railway Claim Agents.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, 3d week in May, 1915, Galveston, Tex.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual convention October 26-30, 1914, Chicago.

Association of Railway Telegraph Superintendents.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 22-25, 1915, Rochester, N. Y.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York. Next morning, December 8-9, 1914, Richond, Va.

Bridge and Building Suffly Men's Association.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meetings, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

Freight Claim Association.—Warren P. Taylor, R. F. & P., Richmond, Va. Annual meeting, June 16, 1915, Chicago.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

International Railway Congress.—Executive Committee, 11, Rue de Louvain, Brussels, Belgium. Next convention, June 23 to July 6, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 W. Broadway, Winona, Minn. Next convention, July 14-17, 1915, Sherman House, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, C. H. & D., Lima, Ohio.

Maintenance of Way and Master Painters' Association of the United States and Canada.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next convention, November 17-19, 1914, Detroit, Mich.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May, 1915.

Master Car and Locomotive Painters' Association of the United States and Canada.—A. P. Dane, B. & M., Reading, Mass.

Master Car Builders' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1915.

National Railway Appliances Association.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railroad Master Tinners, Coppersmiths and Pipefitters' Association.—U. G. Thompson, C. & E. I., Danville, Ill. Annual meeting, May, 1915.

Railway Business Association.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December 10, 1914, Waldorf-Astoria Hotel, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Railway Electrical Supply Manufacturers' Association.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

Railway Fire Protection Association.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala.

Railway Signal Association.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa.

Railway Storekeepers' Association.—J. P. Murphy, L. S. & M. S., Box C, Collinwood, Ohio. Annual meeting, May, 1915.

Railway Supply Manufacturers' Association.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders and Master Mechanics Associations.

Railway Telegraph and Telephone Appliance Association.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill.

St Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Signal Appliance Association.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

Society of Railway Financial Officers.—Carl Nyquist, C. R. I. & P., La Salle St. Sta., Chicago.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. Ry., Atlanta, Ga.

Southern and Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7122 Stewart Ave., Chicago. Annual meeting June 15, 1915, Minneapolis, Minn.

Transportation Club of Detroit.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

The Illinois railways on October 16 filed tariffs with the Illinois Public Utilities Commission increasing freight rates in the state by 5 per cent, effective on November 15.

Plans are being made by the Atchison, Topeka & Santa Fe for establishing through passenger train service between Galveston and California points about November 1, via the Texico-Coleman cutoff.

The Panama Canal was closed to traffic five days, October 15-20, by a landslide in Culebra Cut. Fifteen ships were detained one or more days each, and will have claims on the government for demurrage.

Agents of the Grand Trunk Pacific are taking measures to get Belgian settlers for the territory opened by the company's lines in western Canada. It is expected that the European war will result in a rush of settlers to Canada. Belgian farmers are very thrifty people. It is hoped to settle a large tract in the Stuart river district.

The Boston & Maine has notified the governor of New Hampshire that it will enter suit in the Federal Court to resist the enforcement of the law of New Hampshire requiring the railroad to sell 500 mile books of tickets for $10. The Public Service Commission of that state has refused to approve the proposed increase of the mileage rate of 2¼ cents a mile.

The executives of the principal Missouri railroads held a conference on Monday, at Jefferson City, with Governor Major on the financial condition of the railroads in connection with the application of the roads for increases in rates. Among those present were President B. F. Bush of the Missouri Pacific, E. B. Pryor, receiver of the Wabash; W. C. Nixon, receiver of the St. Louis & San Francisco; F. H. Britton, president of the St. Louis Southwestern, and C. E. Schaff of the Missouri, Kansas & Texas.

For the first time in several years the railroads of Texas are able to take care of the autumn traffic without experiencing blockades of loaded cars of cotton at Galveston and at interior concentrating points. There is no complaint of car shortage. The traffic departments of the principal railroads of the state report that notwithstanding the absence of any general cotton movement a good business is being done. The marketing of this year's cotton crop will be so gradual and cover such a long period that, it is expected, there will be no burden on general traffic.

The production of explosives in the United States during the calendar year 1913, as reported by the United States Bureau of Mines, on the basis of figures received from manufacturers, was 231,757 tons, as compared with 244,696 tons in 1912. The total for 1913 is made up as follows: Black powder, 194,146,747 lb.; "high" explosives other than permissible explosives, 241,682,364 lb., and permissible explosives, 27,685,770 lb. How much of this enormous quantity of dangerous stuff was transported by railroad is not stated. The total amount of explosives used for the production of coal in 1913 was 209,352,938 lb.

Railroads leading from Richmond and Norfolk, Va., into North Carolina have reduced their interstate rates on potatoes and other vegetables. This reduction was made at the combined request of the Chambers of Commerce of Richmond, Norfolk and Petersburg. The former rates are restored. Two months ago the roads increased the rate by nearly 50 per cent. Producers and commission merchants immediately began to complain. The green vegetables particularly included are cabbage, potatoes, onions and turnips. The former rate from Richmond to Raleigh was 21 cents per 100 lb., and this was increased to 32 cents. Other changes were of similar character.

At the convention of the American Bankers' Association held at Richmond, Va., last week, a resolution was adopted declaring: "A prompt and liberal increase in railroad rates throughout the United States is essential in order to enable the railroads

to finance their maturing obligations. Such increase in rates must be made before we can hope to secure the confidence of the investing public both at home and abroad in railroad securities." The Interstate Commerce Commission was urged to act promptly and favorably upon pending applications for an increase of railroad rates, and to take such action as may produce a general and adequate increase in railroad revenues of this country.

The Illinois Manufacturers' Association has adopted resolutions to be placed before the Interstate Commerce Commission, endorsing the principle that the transcontinental railways should be allowed to put into effect such freight rates to the Pacific coast as will enable the central western territory to do business with the coast by rail, in competition with the industries of the eastern states. The resolution says: "The opening of the Panama canal has largely reduced the all-water rates between the [Atlantic] seaboard and adjacent territories and Pacific coast terminals. The Panama canal was built by public taxation, borne equally by all parts of the country. All parts of the country should therefore share equally in the benefits of the canal."

The Southern Pacific reports that during the period of colonist rates to California this year, from September 24 to October 8, over 10,000 people took advantage of the low rates. The tickets were all one-way tickets, which means that in the majority of cases the newcomers remained in California and had gone with the intention of remaining. That the newcomer may not be at a loss as to which way to turn upon arrival the company maintains a colonization bureau where information about every locality on the Pacific coast and the various agricultural, industrial and commercial opportunities is dispensed. The company's record of the colonist movement shows that the greatest travel was through the Ogden gateway.

Many complaints are being received by the North Carolina Corporation Commission that the intrastate freight rates recently put into effect in that state in accordance with the legislative action following the passage of the "Justice act" have worked serious disturbances in freight routes because of the rigidity of the long and short haul clause of the act. A number of short railroads are said to have been deprived of so much business that they will have difficulty in earning operating expenses. Following the adoption of the new class rates as agreed to under the Justice act, which agreement covers interstate rates, the principal roads filed tariffs discontinuing a large number of intrastate commodity rates; but the Corporation Commission refused to allow these new tariffs to go into effect.

Beginning November 1, shippers of grease, tallow and certain other inedible animal products who do an interstate or export business, must file certain declarations with the Secretary of Agriculture in Washington, and must furnish transportation companies with a shipper's certificate. The blanks for filing the required declarations may be procured from the Chief of the Bureau of Animal Industry in Washington. The regulations apply to grease-rendering establishments which prepare products unfit for human food, which are derived from cattle, sheep, swine or goats. Many of these products, though intended only for industrial use, cannot be denatured. In such cases the regulations provide that they may be transported in interstate or foreign commerce if both ends of the containers are painted white and conspicuously stenciled or burned with the true name of the product and the word "Inedible" in letters not less than two inches high.

California wine shippers will be saved thousands of dollars annually as the result of a new San Francisco-New York wine rate just announced by the Southern Pacific to go into effect November 15. The new rate gives the shipper a barreling-in-transit privilege that will enable him to ship in bulk in large tank cars to New Orleans, there transferring the wine into barrels for further shipment to New York by the Southern Pacific steamers. Under the old way, the shipper either sent the wine through by rail all the way in tank cars at 75 cents per 100 lb., or by rail and steamer in barrels at 55 cents per 100 lb. But to take advantage of the lower rate he had to pay the cost of transporting his cooperage products from the Middle West states to San Francisco. The new rate, which is also 55 cents per 100 lb., enables him to make use of the all-wood or steel and glass lined tank cars to New Orleans, at which point the shipment is transferred to barrels.

The transportation committee of the Cleveland Chamber of Commerce, through Traffic Commissioner D. F. Hurd, has submitted a report making an analysis of the Interstate Commerce Commission's decision allowing a 5 per cent advance in rates in Central Freight Association territory, as it affects Cleveland shippers. The report states that "the commercial relationships heretofore existing between Cleveland and many competing markets will be disturbed in a manner which it is quite evident will be unfavorable, if not detrimental, to Cleveland and other cities similarly affected." It is also stated that the carriers have construed the decision as giving permission to increase rates in Central Freight Association territory to apply in traffic destined to and from points west of the Mississippi river to the gulf of Mexico and the Great Lakes, exclusive of points covered by transcontinental tariffs, and that if rates to and from the western territory are made on the combination of locals based on Chicago and Mississippi river, or other established points, any increase in the rates from Cleveland and the other Central Freight Association points to those basing points will increase the total transportation cost. The report, therefore, objects to the increase in rates from Cleveland to Central Freight Association territory points while there are no increases from trunk line territory to those points.

American Association of Traveling Passenger Agents

The annual convention of the American Association of Traveling Passenger Agents was held on October 12, 13 and 14, at the Palace hotel in San Francisco, with over 300 members in attendance, the record for any convention of this association. Eighty-eight new members had been received during the past year. The principal topics of discussion at the meeting were: "Of what value will the Panama-Pacific International Exposition and the opening of the Panama Canal be to the world," and "Why is the traveling passenger agent of more importance today than he was during the old days of rate-cutting, rebating, etc." Thornwell Mullally addressed the meeting on behalf of the Panama-Pacific International Exposition, and Charles S. Fee, passenger traffic manager of the Southern Pacific, also addressed the meeting. On Tuesday afternoon a trip was made to Mount Tamalpais, and one day was spent inspecting the terminals on the bay and in going through the exposition grounds. On Friday the party left on special trains for a tour of southern California, stopping at Del Monte, Monterey, Los Angeles and San Diego. Those returning east planned to spend a day inspecting the new Union station at Kansas City. Officers were elected as follows: President, S. W. Manning, general New England agent, Atchison, Topeka & Santa Fe, Boston, Mass.; vice-president, W. D. Wood, traveling passenger agent, Wabash, St. Louis; secretary and treasurer, Elliott Monett, general western passenger agent, New York, Ontario & Western, Chicago (re-elected). Next year's convention will be held in Boston.

Railway Development Association

The annual convention of the Railway Development Association will be held in Chicago on November 10 and 11. The program includes an address of welcome by Mayor Harrison of Chicago, with a response by F. H. LaBaume, president of the association. "Personal Work with Farmers" will be discussed by M. V. Richards of the Southern, and H. M. Rainer of the Atchison, Topeka & Santa Fe. "Diversified Farming and Its Relation to the Cotton Grower" will be discussed by J. C. Clair of the Illinois Central, and J. F. Jackson of the Central of Georgia. H. B. Fullerton of the Long Island will present an address on plans for increasing the tonnage of agriculture for railroad transportation, illustrated with lantern slides. F. A. Spink, traffic manager of the Chicago & Western Indiana and the Belt Railway of Chicago, will discuss "The Relation of Railway Terminals to Industrial Development," and R. W. Cook of the Pennsylvania Lines West will discuss the "Advertising and Exploiting of Industrial Advantages." The semi-annual dinner of the association will be held on Tuesday evening, November 10, at which addresses will be made by W. L. Park, vice-president of the Illinois Central; George A. Blair, assistant freight traffic manager of the Chicago, Milwaukee & St. Paul, and Samuel O. Dunn, editor of the *Railway Age Gazette*.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Special Examiner George N. Brown, of the Interstate Commerce Commission, held a hearing at Kansas City on October 14, on rates on iron and steel products from Pittsburgh and Chicago and Missouri river points to Kansas, Oklahoma, Arkansas, Colorado and Utah.

On the petition of the Shreveport, La., Chamber of Commerce, Commissioner Hall, of the Interstate Commerce Commisison, will hold a hearing at Shreveport on October 27, on details of the Shreveport rate case which have not proved entirely satisfactory. One purpose of the hearing is to obtain a supplemental ruling to the original order to make it apply to all lines, instead of only to the Texas & Pacific and the Houston, East & West Texas.

Refrigeration Rates from New Orleans

Opinion by Commissioner McChord:

The commission finds that the carriers were justified in making a proposed increase in less than carload refrigeration charges from New Orleans and other points on the Illinois Central and Yazoo & Mississippi Valley to Chicago of 5 cents per 100 lb., minimum weight 10,000 lb., the service in this case being in charge of the Central Fruit Dispatch, a private car line, owned by the Illinois Central and furnishing refrigeration cars and service over the lines of the two defendants. (31 I. C. C., 637.)

Rice Rates from Helena, Ark.

Opinion by Commissioner Clark:

The commission finds that the carriers have justified proposed increases in rates on rice and rice products from Helena, Ark., to New Orleans and Vidalia, La., and Natchez, Miss., from 10 cents to 20 cents per 100 lb. in carloads, and from 15 cents to 25 cents per 100 lb. in less than carloads. For a number of years the carriers have maintained blanket rates on rice from points in the rice producing section of Arkansas, limited substantially in the territory extending about 140 miles north of Helena, and about the same distance south and west, of 20 cents per 100 lb. on carload and 25 cents on less than carload lots; there seems to be no reason why the rate from Helena should not be the same as the blanket rate. (31 I. C. C., 614.)

Hide Rates to Los Angeles, Cal.

Opinion by Commissioner Clark:

The commission finds that the carriers are justified in increasing to $1.20 a rate of 80 cents on hides to Los Angeles, Cal., from Lordsburg, N. Mex., and Southern Pacific main-line points west thereof; and also from Phoenix, Ariz., and points intermediate on the Arizona Eastern; and a rate of $1 from points on the main line of the Southern Pacific east of Lordsburg to and including El Paso, Tex., and from Nogales, Ariz., and points between Benson and Nogales. These rates were established to permit or facilitate concentration of hides at Los Angeles, from which shipments of that commodity are made to eastern manufacturing points. It was found, however, that competition at El Paso and Phoenix was put at a disadvantage by comparison. (31 I. C. C., 633.)

Rates on Flour from the Valley of Virginia

Stuarts Draft Milling Company et al. v. Southern Railway et al. Opinion by Commissioner Clark:

The commission finds that the present rates on flour and other grain products from mills at points on the Southern, Baltimore & Ohio, Chesapeake Western and Norfolk & Western in the valley of Virginia to Carolina territory, are not unreasonable, it being of the opinion that the present rate adjustments which are of long standing are apparently fairly adapted to the needs of the communities and interests affected. The commission likewise holds that the higher rates applying on flour than on wheat are not discriminatory to the former commodity. It being held that the present rates are reasonable, it is found inadvisable to sanction the establishment of carload and less than carload rates in place of the any-quantity rates, because the result would be increased less than carload rates. The commission is also of the opinion that the any-quantity rates are entirely suited to the traffic on which they apply. (31 I. C. C., 623.)

Export Rates on Grain from Kansas City

Re expart rates on grain and grain products from Kansas City, Mo., and Kansas City, Kan., to Port Arthur, Tex. Opinion by Commissioner Clark:

The Kansas City Southern, operating a direct line from Kansas City to Port Arthur, Tex., now maintains proportional rates on export grain and grain products from the former to the latter city of 18½ cents per 100 lb. on wheat and products of wheat, and 17½ cents on corn and products of corn regardless of point of origin. The commission finds that the carrier would be justified in establishing varying proportional rates, ranging from 13.6 to 18 cents on wheat, and from 12.1 to 17.72 cents on corn, dependent upon the point of origin on traffic originating at named points north of, but not including, the main line of the Union Pacific extending west from Kansas City. The tariff proposed, in reality, to establish through combination rates from the points of origin named to Port Arthur, which are equal to available through rates from the same points to Galveston, Tex., via other lines, whether the rates via the latter were jointly or were made on combinations. The commission finds, however, that certain unlawful features contained in the present tariff must not be permitted to become effective. It is ordered that certain violations of the fourth section contained must be avoided and that the tariff should contain a statement that the rates therein shall not be applicable to grain or grain products other than that which moves from point of origin subsequent to its effective date. The tariff should also specifically state that grain and grain products transported under the rates shall be governed by the rules and regulations prescribed in transit and reconsigning circulars of the Kansas City Southern. The tariff under consideration is to be cancelled, but another fulfilling the above requirements filed within three months of October 6 will be allowed to become effective upon not less than five days' notice. (31 I. C. C., 616.)

STATE COMMISSIONS

The Illinois Public Utilities Commission held a hearing at Chicago on October 20, on complaint from shippers at Granite City and East St. Louis that the railways have established a spotting charge of $2 per car at those points in addition to the usual switching charge.

At the request of the railways the Missouri Public Service Commission has changed from October 27 to December 1 the date for its hearing on the carriers' application for authority to increase freight, passenger and excess baggage rates throughout the state. The postponement was granted to give the roads more time in which to prepare data in support of their application.

The Arkansas Railroad Commission has issued a decision that claims for the payment of money under the commission's order providing a penalty of $5 per day for failure of railroads to transport freight at least 50 miles every 24 hours, must be prosecuted by the complainants in the courts and not before the commission. The ruling of the commission was handed down over the protest of Chairman McKnight, who contended that the commission had the power to hear such complaints and to assess the penalties.

The State Corporation Commission of Virginia has ordered the adoption, November 1, by the express companies, of a new tariff and classification for the transportation of merchandise. A "block system" of dividing the territory of the state has been adopted. It is like that of the Interstate Commerce Commission, but with modifications. The new tariff will make considerable reductions from the rates now in effect. On large packages of food products the rates are made in many instances considerably less than are those of the Interstate Commerce Commission for equal distances.

The California Railroad Commission has rendered a decision denying the application of the Southern Pacific to advance the trans-bay commutation fares between San Francisco and Oakland, Berkeley, Alameda and other Alameda county points. The commission stated, however, that the Southern Pacific should not be compelled to further extend the present 10-cent single fare and $3 commutation zone. The commission held that the company's apportionment of its investment and expenses as between main line service and suburban service was erroneous, taking the view that the suburban trans-bay service was in the nature of an auxiliary service, and that the commutation rates must necessarily be in the nature of wholesale rates. "Suburban traffic," said the commission, "is essentially a wholesale traffic; therefore, it is violative of fundamental rules of rate-making to apply units of expense and enforce divisions of property on an equality with a service which is essentially different and essentially retail." The commission also held that many of the Southern Pacific lines were built for competitive purposes and that where unnecessary duplication of investment has been made the burden should fall upon the Southern Pacific and not upon the patrons. "We do not think," said the commission, "that under the circumstances under which certain suburban lines were constructed in Oakland and Berkeley, this company has any right to impose upon its patrons a rate sufficient to return it the amount which otherwise should be returned on the ground that it has constructed facilities in excess of the necessity of the patrons." The case was originally instituted by the residents of one of the suburban communities, who filed a complaint for the purpose of compelling a reduction in the fares from San Francisco. The company presented evidence showing that on the 877 suburban trains operated daily out of the Oakland and Alameda moles in connection with the trans-bay ferry service, carrying nearly 14,000,000 passengers per year, the loss for the fiscal year ended June 30, 1913, approximated $364,000, without taking into consideration interest on the investment, the valuation of which was placed at $46,209,560.

PERSONNEL OF COMMISSIONS

A. J. Cunningham, general foreman of the Atchison, Topeka & Santa Fe at Barstow, Cal., has been appointed inspector of motive power for the Pacific district, division of valuation, Interstate Commerce Commission, with headquarters at San Francisco, Cal.

W. J. Thomas has been appointed inspector of car equipment for the Pacific district, division of valuation, Interstate Commerce Commission, with headquarters at San Francisco, Cal. Mr. Thomas recently has been employed in the United States Interior Department at Los Angeles, and formerly was in railway service.

COURT NEWS

Charles J. Spencer, of Elizabeth, N. J., filed suit in the United States Court of Appeals at Cincinnati, on October 1, to enjoin the proposed consolidation of the Lake Shore & Michigan Southern and New York Central & Hudson River.

The Ann Arbor Railroad has applied to the United States District Court at Detroit for an injunction restraining the state authorities from interfering with the road in case it advances its passenger fare from 2 cents to 3 cents a mile.

Judge Dyer of the United States District Court at St. Louis, Mo., has rendered a decision that the federal courts have no jurisdiction in the cases of the state against the Atchison, Topeka & Santa Fe and the Chicago, Burlington & Quincy, involving the return of alleged overcharges on state freight and passenger rates for the time during which the state rates were under injunction. The decision sustained the contention of the Attorney-General of Missouri, that the cases be remanded to the state courts, from which they had been taken by the railroads.

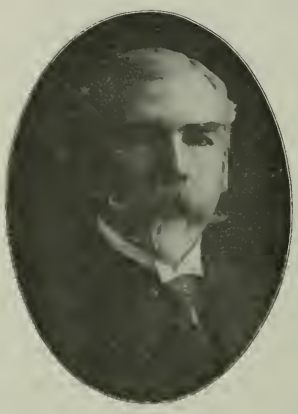
RAILWAY EXTENSION IN ARGENTINA.—The government of the Argentine province of Entre Rios has given its sanction to a project for the construction of a light railway between the port of Parana and the irrigated zone of the Las Conchas river.

Railway Officers

Executive, Financial, Legal and Accounting

A. R. Wood has been appointed assistant auditor of the San Antonio & Aransas Pass, with headquarters at San Antonio, Tex.

Thomas John Kennedy, whose election as president and general manager of the Algoma Central & Hudson Bay, and the Algoma Eastern, with headquarters at Sault Ste. Marie, Ont., has already been announced in these columns, was born at Campbellford, Ont., and was educated in the high school at Port Hope. He began railway work in 1874, on the engineering staff of the Canadian Pacific, and in 1881, became engineer for contractors at work on a section of the same road. In 1885 he was appointed roadmaster on the Lake Superior division of the Canadian Pacific; in 1892 he was appointed superintendent at Chapleau, Ont., and in 1899 was transferred as superintendent to the North Bay division of the same road. He was then consecutively general superintendent and traffic manager of the Algoma Central & Hudson Bay and the Algoma Eastern; manager of the International Transit Company and the Trans.-St. Mary's Traction Company, with headquarters at Sault Ste. Marie, Ont., and was president of the Superior Construction Company, Ltd., at Sudbury, Ont., at the time of his recent election as president of the Algoma Central & Hudson Bay, and the Algoma Eastern as above noted.



T. J. Kennedy

Thomas A. Clarkson, for the past seven years secretary to E. C. Lewis, chairman of the board of directors of the Nashville, Chattanooga & St. Louis, has been elected secretary of that company, with headquarters at Nashville, Tenn. Mr. Clarkson has been in railway service for 26 years, having begun railway work as a clerk in the accounting department.

T. A. Clarkson

W. N. Jones has been appointed claim agent of the Western division of the Chicago & Alton at Mexico, Mo., succeeding B. A. Sturdevant, who has been transferred to Bloomington, Ill., as claim agent of the Northern division, in place of H. S. Simpson, resigned.

Arthur S. Pierce, assistant treasurer and assistant secretary of the Chicago & North Western at New York, has been elected treasurer and assistant secretary, succeeding Milton B. Van Zandt, deceased. The following appointments have also been announced: T. W. Arundel, assistant treasurer and secretary, and H. W. Rush, assistant treasurer and assistant secretary. All will have their headquarters at New York.

J. W. Everman, general manager of the St. Louis Southwestern of Texas, has been elected first vice-president and general manager, and first vice-president of the Stephensville North & South Texas, with headquarters at Tyler, Tex.

Fred Zimmerman, general freight agent of the Lake Shore & Michigan Southern at Cleveland, Ohio, has been elected vice-president in charge of traffic of the Chicago, Indianapolis & Louisville, with headquarters at Chicago, effective November 1. A photograph of Mr. Zimmerman and a sketch of his railway career were published in the *Railway Age Gazette* of March 20, 1914, page 700.

Operating

T. E. Coyle has resigned as superintendent of the Pasco division of the Northern Pacific at Pasco, Wash.

R. M. Johnson has been appointed superintendent of transportation of the Coal & Coke, with headquarters at Gassaway, W. Va., succeeding C. S. Wilkins, resigned.

L. M. Dooley, inspector of transportation of the Texas & Pacific, has been appointed superintendent of the Rio Grande division, with headquarters at Big Spring, Tex., succeeding W. M. Lynch, who has been transferred to the New Orleans division as superintendent, with office at New Orleans, in place of T. S. Mahoney, transferred. R. B. Ayres, superintendent of the Trans-Continental division at Texarkana, Tex., who has been assigned to other duties, is succeeded by T. S. Mahoney.

Traffic

A. D. Pinkerton has been appointed commercial agent of the International & Great Northern at Galveston, Tex.

Frank Koch has been appointed general agent, freight department, of the International & Great Northern at New Orleans, La.

Logan A. Mizener, commercial agent of the Chicago, St. Paul, Minneapolis & Omaha at Minneapolis, Minn., has been appointed general agent at Sioux City, Iowa, succeeding H. G. Wiringer.

W. T. Webster, whose appointment as general freight agent of the Chicago, Indianapolis & Louisville, with headquarters at Chicago, has already been announced in these columns, was born August 21, 1872, at Jackson, Mich., and was educated in the public schools at Jackson and Kalamazoo. He began railway service in 1886 with the Chicago, Kalamazoo & Saginaw, and for four years was employed in the accounting and traffic departments of that road at Kalamazoo. From 1890 to May, 1896, he occupied various positions in the freight departments of the Grand Trunk, the Michigan Central and the Pere Marquette, including that of chief rate clerk in the general freight department of the latter road at Grand Rapids, Mich. Mr. Webster then went to the Chicago, Indianapolis & Louisville as Michigan representative, and subsequently was for 15 years commercial agent at Grand Rapids. In July, 1911, he was appointed general agent at Chicago, and one year later became division freight agent at Bedford, Ind., from which position he was promoted to general freight agent on October 1, as above noted.

W. T. Webster

E. P. Vernia, agent of the Chicago, Indianapolis & Louisville at New Albany, Ind., has been appointed division freight agent, with office at Bedford, Ind., succeeding W. T. Webster, promoted.

G. M. Schaefer, traveling freight and passenger agent of the Wabash, with headquarters at Portland, Ore., has been appointed general agent at that place, succeeding C. A. Pettibone, deceased.

C. D. Thompson has been appointed general agent of the Great Northern at Spokane, Wash., in place of D. G. Black, who has been transferred to St. Louis, Mo., succeeding R. K. Pretty, who has been appointed agent at Seattle, Wash.

Frank B. Humston, city passenger and ticket agent of the Chicago, Indianapolis & Louisville at Bloomington, Ind., has been appointed district passenger agent at Indianapolis, Ind., succeeding H. G. Alexander, resigned to engage in other business.

H. F. Harden, traveling freight agent of the Cincinnati, New Orleans & Texas Pacific and the Alabama Great Southern at Jacksonville, Fla., has been appointed commercial agent of both roads, with headquarters at Indianapolis, Ind., succeeding S. A. Williams, resigned.

C. E. Stone, president of the Kaslo & Slocan Railway, Land Grant Development Company, Limited, of St. Paul, Minn., and formerly general passenger agent of the Great Northern, has been appointed general traffic manager of the Great Northern Pacific Steamship Line, with headquarters at San Francisco, Cal.

E. P. Cockrell, assistant general passenger agent of the Chicago, Indianapolis & Louisville at Chicago, has been appointed general passenger agent, with office at Chicago, succeeding Frank J. Reed, who requested relief from the responsibilities of that position on account of illness, after 29 years' service, and has been appointed a special representative of the passenger department. Charles M. Woodman, chief clerk in the passenger department, succeeds Mr. Cockrell. Effective January 1.

Engineering and Rolling Stock

The statement published in our issue of September 25, announcing the resignation of W. D. Minton, master car builder of the Texas & Pacific at Marshall, Tex., was in error. Mr. Minton still retains the position mentioned.

J. D. Lovell, supervisor of the Pennsylvania Railroad at Tyrone, Pa., has been transferred as supervisor to East Brady, succeeding W. S. Johns, Jr., transferred. R. R. Nace, supervisor at Buffalo, N. Y., has been transferred as supervisor to the office of the valuation engineer at Philadelphia, Pa. J. S. Considine, supervisor at Driftwood, Pa., succeeds Mr. Nace. H. S. Trimble, supervisor at Irvona succeeds Mr. Considine, and R. A. Klein, supervisor of the Camden Terminal division and the West Jersey & Seashore at Camden, N. J., succeeds Mr. Pitcairn. A. E. Preble, supervisor of the Cumberland Valley at Chambersburg, Pa., succeeds Mr. Klein, and N. B. Pitcairn, supervisor at Verona succeeds Mr. Preble.

Joseph Billingham, whose appointment as superintendent of motive power of the Grand Trunk Pacific, with headquarters at Transcona, Man., has already been announced in these columns, began railway work as machinist apprentice on the Great Northern Railway of England, and subsequently was a machinist in the shops of the Chicago & North Western. He served later as a locomotive engineer and road foreman of engines on the Chicago, Milwaukee & St. Paul. In December, 1890, he was appointed road foreman of engines of the Gulf, Colorado & Santa Fe. He was subsequently master mechanic and general master mechanic on the same road, and the division master mechanic on the Baltimore & Ohio. In January, 1904, he was appointed representative of the Galena Signal Oil Company at London, Eng., and at the time of his recent appointment as superintendent of motive power of the Grand Trunk Pacific, was general inspector of the American Locomotive Company at Schenectady, N. Y.

OBITUARY

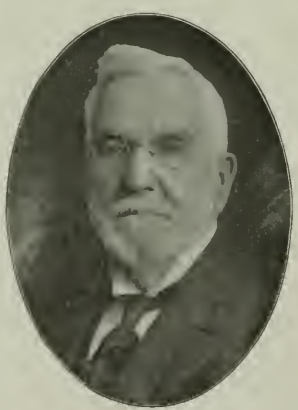
Stephen W. White, formerly assistant secretary of the Pennsylvania Lines West of Pittsburgh and secretary of the Northern Central at Philadelphia, Pa., died on October 16, at his home in Philadelphia, at the age of 74. He entered the service of the Northern Central in 1875 as assistant secretary; two years later he was appointed secretary of the same road, and from 1881 was also assistant secretary of the Pennsylvania Lines West until his retirement in 1910 under the pension rules.

Charles Otey Gwatkin, who in recent years had been engaged in special work for the Northern Navigation Company and the Grand Trunk Railway, died at Sarnia, Ont., October 9, at the

age of 64 years. He was born at Lynchburg, Va., November 9, 1850, and began railway work in 1880 as agent for the Great Western Despatch Fast Freight Line at Binghamton, N. Y. In October, 1885, he was made traveling freight agent of that line at Boston, Mass., and subsequently was with the Wisconsin Central Lines as New England agent, commercial agent at Boston, and general eastern agent at New York, until May, 1900. Later for a period of two years he was general manager of the Guatemala government railways, and previous to his connection with the Grand Trunk and the Northern Navigation Company he was employed as traffic manager for an industrial concern in the east.

Charles J. Drury, master mechanic of the Atchison, Topeka & Santa Fe, whose death was noted in our issue of October 16, was 36 years of age. He was born at Chicago Junction, Ohio, and began railway work in July, 1895, as machinist apprentice for the Atchison, Topeka & Santa Fe. After completing his apprenticeship in July, 1899, he was employed as machinist for that road, the Southern Pacific, the Kansas City Southern, the El Paso & Southwestern, the Chicago, Rock Island & Pacific and other roads for seven years, becoming roundhouse foreman for the Santa Fe at La Junta, Colo., in July, 1906. He remained with the Santa Fe until February, 1913, filling the positions of general foreman at Albuquerque, N. M.; bonus supervisor of the Western Grand division; master mechanic of the Oklahoma division at Arkansas City, Kan., and master mechanic of the Plains division at Amarillo, Tex. He then became master mechanic of the St. Louis & San Francisco at Ft. Smith, Ark., and the following February was appointed superintendent of shops at Springfield, Mo. Mr. Drury was promoted to division master mechanic at Sapulpa, Okla., on September 1, just prior to his illness of typhoid fever, from which he died on September 30. Mr. Drury's father, M. J. Drury, is superintendent of shops of the Santa Fe at Topeka, Kan.

Oliver S. Lyford, vice-president of the Chicago & Eastern Illinois, who died on October 12, after 68 years of railroad service, as mentioned in our issue of last week, was born June 19, 1823, at Mount Vernon, Maine. His record is one of the most remarkable in railroad history. He began work in January, 1846, with the Boston & Lowell, remaining with that road until February, 1851, successively as watchman, assistant baggage man, ticket agent and extra passenger conductor. He then went to the Erie as shop clerk at Dunkirk, N. Y., and from November, 1851, to October, 1855, was a passenger conductor. In October, 1860, he became joint station agent of the Erie and the Atlantic & Great Western at Salamanca, N. Y.; from November, 1863, to April, 1869, was division superintendent of the latter road, and then until November, 1871, was assistant general superintendent. The following eight months he was superintendent of the Buffalo and Rochester divisions of the Erie, leaving that road in July, 1872, to become general superintendent of the Hannibal & St. Joseph, where he remained until November, 1873. From December, 1874, to November, 1876, Mr. Lyford was general superintendent of the Kansas Pacific, and in January, 1878, he became connected with the Chicago & Eastern Illinois as superintendent. He was appointed general manager in February, 1886, and in November of the following year became vice-president and general manager. He relinquished the duties of general manager in February, 1890, but retained the office of vice-president until he was formally retired on July 1, 1913. Of recent years he had not been active in railroad service, but went to his office nearly every day until his retirement and occasionally afterward.



O. S. Lyford

Equipment and Supplies

LOCOMOTIVE BUILDING

The Union Pacific has ordered one snow plow 12 ft. cut, from the American Locomotive Company.

The Minneapolis & St. Louis has ordered 15 Mikado type locomotives from the American Locomotive Company.

CAR BUILDING

Atlantic Coast Line.—A report in the Advance Sheet of October 7 to the effect that this company was in the market for 500 freight cars, has been denied.

The Northern Pacific is in the market for 47 coaches and 18 combination mail and express, 4 combination mail and baggage, 17 baggage, 6 dining and 3 tourist cars.

The Louisville & Nashville, reported in the *Railway Age Gazette* of last week as having purchased 1,000 underframes, will use part of these underframes for the following cars to be built in its own shops: 450 50-ton drop bottom gondola cars; 200 40-ton box cars and 75 40-ton refrigerator cars. The underframes for 250 of the gondola cars were purchased from the American Car & Foundry Company, and the remainder from the Mount Vernon Car Manufacturing Company.

IRON AND STEEL

The Minneapolis & St. Louis has ordered 1,500 tons of 85-lb. steel rails from the Illinois Steel Company.

The Chicago, Milwaukee & St Paul has ordered 238 tons of steel for five 90-ft. deck girder spans, from the Wisconsin Bridge & Iron Company.

The International & Great Northern has ordered 852 tons of steel for bridges at Riverside and Long Lake, Tex., from the Wisconsin Bridge & Iron Company.

SIGNALING

The Buffalo, Rochester & Pittsburgh has put in service automatic block signals on its line between Buffalo and East Salamanca, about 63 miles. With this addition the company now has 215 miles of road equipped with automatic block signals.

The Central of Georgia has awarded the Union Switch & Signal Company the contract for installing an electro-pneumatic push-button switch apparatus at its classification yard, at West Macon, Ga.; also a mechanical interlocking plant at the west end of the receiving yard at Macon, and automatic block signals between Macon Junction and Terra Cotta. The semaphores will be style "S." The push-button machine will have 22 buttons.

A Russo-Persian Railway.—A party of Russian engineers which late in June reached Enseli for the purpose of surveying for the proposed railway route from Enseli to Resht and thence to Kasvin, must by this time have made considerable headway. The survey is being conducted under the guidance of the engineer Yarosh. The proposed line is to serve as an extension of that already selected from the station of Alyat, near Baku, to Astara, and thence along the shore of the sea to Resht. The Enseli-Resht-Kasvin route, the total length of which is 228 miles, will follow the existing paved road crossing the high Elburg mountain range near Kuin. The projected railway from Alyat station to Kasvin, about 400 miles long, is to connect Central Persia with Russia. There is a good paved road from Kasvin to Teheran—distance, 90 miles. The most important section is that connecting Enseli and Kasvin, as this gives an outlet to the sea from the richest provinces of Persia—Chamse, Kasvin and Hamadan. This line also will facilitate the transport of Russian goods into Persia.

Supply Trade News

The Q. & C. Company, New York, has taken over the exclusive license and control of the Ross-Schofield system of water circulation for locomotive boilers for the United States and Canada.

At the annual meeting of the American Locomotive Company in New York on October 20, retiring directors W. H. Marshall, A. H. Wiggin and A. W. Mellon were re-elected to serve for three years. The present officers of the company were likewise re-elected to serve for the following year.

Henry H. Westinghouse, brother of the late George Westinghouse, was elected president of the Westinghouse Air Brake Company at the annual meeting on October 15. Mr. Westinghouse has been associated with the company for over 40 years. He was born at Central Bridge, Schoharie county, N. Y., on November 16, 1853. He received his early education at Union High School, Schenectady, graduating in 1870. In 1871 he entered Cornell University to take up the study of mechanical engineering. In 1872 he went to Pittsburgh and became identified with the business of the Westinghouse Air Brake Company. He worked successively in the foundry, machine shop and drafting room, and occupied the positions of general agent, general manager, vice-president and acting president. He was also one of the founders of the firm of Westinghouse, Church Kerr & Company, and for many years was the guiding spirit in its management. Mr. Westinghouse is a man of quiet tastes and unostentatious manner. He is a member of the Grolier, Century, Engineers' and Cornell clubs of New York, and the American Society of Mechanical Engineers. He is also a trustee of Cornell University.

H. H. Westinghouse

John Steele Patterson, for the past 24 years resident manager of the Galena Signal Oil Company, Franklin, Pa., at Cincinnati, Ohio, died at his home in that city on October 13. Mr. Steele was born in Baltimore, Md., on February 13, 1839. He served his term as machinist's apprentice in the shops of the Baltimore & Ohio at Cumberland, Md., and was later general foreman in the Baltimore & Ohio shops at Portsmouth, Ohio. When he was 24 years of age he was appointed master mechanic of the Cincinnati, Indianapolis, St. Louis & Chicago, now the Big Four, at Cincinnati, and served in that position for 25 years. For the past 24 years he had been connected with the Galena Signal Oil Company as noted above.

TRADE PUBLICATIONS

Automatic Stokers.—The Sanford Riley Stoker Company, Ltd., Worcester, Mass., has recently issued a well illustrated catalog descriptive of the Riley Self-Dumping Underfeed Stoker, and showing some of the installations that have been made. This stoker is an improvement on many, in that there is a continuous movement of the fuel bearing surfaces, together with a continuous automatic cleaning. The reciprocating movement of the fuel bearing surfaces in it automatically gives a slicing effect in the fuel bed and tends to prevent the formation of clinker.

Enlistments of English Railway Employees.—The October number of the Great Western Railway's magazine states that the company has 7,595 of its men with the colors.

Railway Construction

Arizona Roads.—Announcement is made that the Gunn-Thompson Company will build a railroad from a connection with the Arizona Eastern at Webster, Ariz., northeast to its mines at Superior, about 20 miles.

Athabasca Valley.—Application is being made to the Alberta legislature for an extension of time in which to build this projected line from near Independence, Alta., on the Edmonton, Dunvegan & British Columbia northwest to Fort Assiniboine, about 75 miles. J. D. McArthur, Winnipeg, Man., is the principal promoter.

Canadian Northern.—A contract is reported let to the Northern Construction Company to build south from Macleod, Alta., and a contract has been given to the McArthur Construction Company to build a section of about 25 miles on a line to St. Paul de Metis.

Carmack Railway & Power Company.—Plans are being made to build a 7-mile line, it is said, from Opelika, Ala., southwest to Auburn, as soon as financial arrangements can be made. H. A. Bedell, president; W. L. Carmack, vice-president and general manager, and F. Pace, chief engineer, Opelika.

Horse Creek Land & Mining Company's Line.—We are told that this company is planning to build a line along Peter Cave Fork, in Lincoln county, W. Va., and that the work includes cuts and fills on about 2.2 miles. When completed the line is to be operated by the Chesapeake & Ohio. A report says that the line may be extended an additional 10 miles. L. E. Poteet, general manager, Charleston, W. Va.

Kinston Carolina Railroad & Lumber Company.—It is said that this company, which now operates a 20-mile line from Kinston, N. C., south to Pink Hill, will build an extension as soon as financial arrangements can be made. The projected route is from Pink Hill south to either Chinquapin, 20 miles, or to Maple Hill, 35 miles.

Lake Huron & Northern Ontario.—An officer writes that the contract has been let to the Ontario Northern Construction Company, with headquarters at Bruce Mines, Ont., on a percentage basis to build a 325-mile extension from Bruce Mines northerly. Work may be started in January on the heavier sections of the line, and the company expects that about 50 miles will be completed, by July or August of next year. The maximum grade north will be 1 per cent, and south 0.6 per cent, and the heaviest curves will be 6 deg. The principal commodity to be carried on the line for the first few years will be timber. G. P. McCallum, president; H. Appleton, vice-president and general manager, Bruce Mines. (October 9, p. 670.)

Mexican Roads.—Colonel Federico Montes, governor of the state of Queretaro, has adopted plans, it is said, for the construction of several hundred miles of railroad, in order to give employment to the many idle men in that state. Surveys are now being made for a line to be built from Queretaro, Mex., northeast to the port of Tampico, also for a line from Queretaro southwest to Acambaro.

Norfolk, Yorktown & Washington.—Surveys are now being made, it is said, to build the line projected last year from a point in Gloucester county, Va., north via Fairfax, about 160 miles. W. H. Edwards, Newport News, Va.; C. T. Hobart and W. W. Terry, of Norfolk, may be addressed.

Oregon Roads.—We are told that residents of Roseburg, Ore., on October 5, voted to issue $500,000 of bonds in aid of a projected railway from Roseburg west to a point on the Pacific coast, probably at Coos Bay, about 90 miles. The Roseburg Railroad Commission has been created to carry out the construction of the line and to sell the bonds. W. H. Richardson, secretary, Roseburg. (May 29, p. 1215.)

Orleans-Kenner Electric Interurban.—This company is building a line from New Orleans, La., west to Kenner, about 14 miles, and on completion of the work will build an extension, it is said, from Kenner, northwest. H. K. Johnson, president, New Orleans.

Pacific Great Eastern.—This company, which is building from Vancouver, B. C., north to Prince George, 480 miles, has been authorized to open for traffic the section from Lonsdale avenue, North Vancouver, to Horse Shoe Bay or Whitecliffe, 12.7 miles. The line is under construction from this point to Squamish, at the head of Howe Sound, and is in operation north of Squamish via Cheakamus on about 20 miles. The grading work is finished to Lillooet, 100 miles from Vancouver, and track laying is now under way. It is expected that track laying and ballasting on this section will be finished this year. The remaining section from Lillooet north to Prince George on the Grand Trunk Pacific is all under contract. (July 10, p. 80.)

Princeton Power Company's Line.—Construction work has been started at Princeton, W. Va., it is said, on an electric railway to be built to Bluefield, 12 miles. Walton & Company, Falls Mills, Va., are the contractors.

Swift Lumber Company's Line.—This company has under consideration the question of building a line, it is said, from Meigs, Ga., southeast via Coolidge to Pavo.

Van Horn Valley Land & Railway Company.—This company has awarded a contract to King & Runquist, Duluth, Minn., for the construction of a standard gage railway extending from Van Horn, Tex., up through the Van Horn Valley to a point near the New Mexico boundary. This line, when completed, will be 90 miles long and will tap a 350,000 acre tract of land owned by this company in the Van Horn valley in El Paso and Culberson counties, Tex. Construction work is to begin immediately.

West Penn Traction Company.—An officer writes that all the material has been bought to carry out work on an extension of its Oakdale and McDonald branch to Burgettstown, Pa.

Wilmington & Carolina Beach (Electric).—Residents of Wilmington, N. C., recently voted to grant a franchise to this company which proposes to build from Wilmington to Carolina Beach, 13 miles. In addition the company plans to build 11 miles of city lines. C. C. Chadbourn, president, and J. F. Heyward, chief engineer. (August 21, p. 370.)

RAILWAY STRUCTURES

Ludlow, Ky.—Plans have been made for building a new concrete viaduct at Elm street, it is said, over the tracks of the Queen & Crescent in Ludlow at an estimated cost of $34,600.

Louisa, Ky.—A contract has been given by the Chesapeake & Ohio, to the Virginia Concrete Company, Roanoke, Va., it is said, to build a bridge over the Levisa Fork of the Big Sandy river, about three miles from Louisa.

New York.—The contract for building the post office, express and office building for the New York Central & Hudson River in the Grand Central Terminal has been let to the John Peirce Co., New York, and the work will be started at once. The structure will cover an area of about 52,230 sq. ft., between Forty-fifth and Forty-sixth streets, Lexington avenue and Depew place, and will harmonize in architectural features with the adjacent terminal buildings. At the present time the building will not be erected above the fourth floor, though provision is made for future erection of eight additional floors. The floor at the Lexington avenue level will be arranged to accommodate increased express business handled at the terminal, and wagon-loading space, also drives to street and connections to the track level will be provided. The two next floors above will be occupied by the railway mail service and the New York post office in handling second class and parcel post matter. Wagon-loading space will be provided along the private street at the west side of the building, and a comprehensive system of mail conveying equipment will be installed to distribute the mail within the building and to and from the trains beneath. (September 4, p. 453.)

Ogden, Utah.—A contract has been given to C. F. Dinsmore, Ogden, Utah, it is said, for putting up a union station to be used by the Ogden Rapid Transit Company and the Salt Lake & Ogden Railway. The proposed structure is to be built on Twenty-fourth street, and will be 50 ft. wide by 270 ft. long. The cost of the work is about $25,000.

Railway Financial News

Cincinnati, Hamilton & Dayton.—Gordon Abbott, a director of the Old Colony Trust Company, Boston, has been added to the protective committee of the Cincinnati, Hamilton & Dayton, which consists of Charles H. Sabin, Harry Bronner, S. L. Fuller and J. H. McClement.

Baltimore & Ohio.—The Quemahoning branch, a subsidiary of the Baltimore & Ohio, has filed a notice with the Pennsylvania Public Service Commission of an increase in funded debt of $5,000,000.

Chesapeake & Ohio.—Frank Vanderlip has resigned as a director and as a member of the executive committee.

Denver & Rio Grande.—Edwin Gould has resigned as a director.

Hocking Valley.—This company has made arrangements through Kuhn, Loeb & Company and the National City bank, both of New York, for the refunding of $4,000,000 5 per cent notes, maturing November 1, 1914, through the sale of $4,000,000 one-year 6 per cent notes, due November 1, 1915.

New York Central & Hudson River.—The suit brought by minority stockholders to prevent the carrying out of the merger plans of the Lake Shore & Michigan Southern and the New York Central & Hudson River has been dropped by the consent of both parties and by consent of the United States district judge, before whom the suit was brought.

New York, New Haven & Hartford.—The final decree in the dissolution suit proceedings, the form of which was worked out by the various interests, has been signed by Judge Mayer, in the United States district court.

William Skinner and Morton F. Plant have resigned as directors

Wabash.—The organization committee last week notified the state public service commissions of Illinois and Missouri of the withdrawal of the plan of reorganization submitted last May, with the explanation that it is useless to attempt to carry it out. The committee explained the situation in part as follows:

"In reaching its decision to take the course now indicated the committee has not treated as a decisive condition of this matter the unparalleled catastrophe of the war which now devastates Europe."

"With the largest volume of business and the largest amount of gross earnings realized in any year, except one, in the history of the property, with completed expenditures of $10,500,000 in improvement and equipment, the operating income of the property was for the fiscal year just closed the smallest realized in any year, save two, during the period of 10 years last past.

"Increased operating costs, increased taxes and reduced rates have produced the result that for this year of large business the earnings of the property applicable to the payment of fixed charges fell over $375,000 short of providing for the interest on underlying mortgages, and provided no return whatever on the large capital expenditures made during the receivership.

"Since 1908 the taxes on the property have increased 44 per cent.

"Passengers are now carried on the Wabash Railroad at the rate of one-tenth of a cent per mile less than it costs the railroad to run its passenger service; freight is carried at a revenue of only a little over one-tenth of a cent per ton per mile over the cost of carrying it.

"There can be but one of two outcomes—disaster to the railways and all the railways represent in their relations to investments, savings, insurance and to general business, as well as to public requirements and convenience; or an intelligent reversal of the policy which has been carried so far beyond the interests and demands of the people and so far beyond the remedy for evils sought to be corrected."

Judge Mayer, in the United States district court, refused to grant a stay in the proceedings looking to the foreclosure of the mortgage, of which the Central Trust Company is trustee.

*Illustrated.

In the rate advance hearing before the Interstate Commerce Commission last week Commissioner Clark asked Daniel Willard whether if all the railways in the case showed up like the Delaware, Lackawanna & Western there would be any justification for an advance in rates. Commissioner Clements asked him whether the application was for the purpose of getting more out of the proposed rates for net revenue or for the purpose of establishing credit. Commissioner Meyer asked Mr. Strauss what effect he thought it would have on the credit of a great concern for its head to come to Mr. Strauss' office and offer him $20,000,000 of an issue of securities while at the same time stating that he would not invest in them himself? Commissioner Meyer also asked Mr. Willard whether he thought that conditions had changed since July 29, when the commission handed down its decision, or whether he simply wanted to shift the burden from the shareholders of the railways to those who paid the freight. The members of the Interstate Commerce Commission have been, presumably, appointed to their present positions on the assumption that they are peculiarly qualified for them by reason of their expert knowledge, their fairness of mind and their ability. How can the course of commissioners in asking such questions as the foregoing be reconciled with any such assumption? Were they joking, or are these questions to be taken seriously? If they were joking, their jokes were in very poor taste under existing conditions. If they were serious, what has got the matter with some members of the commission? They were hearing a case of the utmost seriousness, and therefore we must suppose they were serious. If they were serious these questions do no credit to their intelligence, fairness or dignity. They are such questions as we expect to emanate from the Clifford Thornes, the Charles Edward Russells and gentlemen of that stripe, but not from members of the Interstate Commerce Commission.

How Can They Ask Such Questions?

The feelings of disgust and desperation which the present system of regulation is arousing in the minds of railway men are illustrated by the address which President Ripley, of the Santa Fe, made at the dinner of the Knife and Fork Club in Kansas City on October 24. The address is published elsewhere in this issue. Mr. Ripley makes the interesting suggestions that steps shall be taken to reduce the wastes of railway competition, to have the government guarantee a minimum on investments in railways and to give it representation on their boards of directors. The main criticism of our present system of regulation is that it seeks to stimulate rather than to prevent wasteful competition and that it gives public officials great authority to regulate railways without imposing on them or the public any responsibility for the results. Mr. Ripley would eliminate the wasteful competition by combining various groups of competitive railways. He would give representatives of the government authority by putting them on the boards of directors where they would become active and influential in the direct management of the properties; and he would cause them and the public to feel responsibility for the results by the system of guarantees of profits which he suggests. Mr. Ripley's great reputation as an able, public spirited and eminently successful railway manager, together with the shock that the suggestion of such a scheme by a prominent railway man will give, will cause his plan to be widely discussed. A plan similar in some important respects has been proposed by W. W. Cook, the eminent authority on the law of corporations. Such expressions from men of such prominence show that many who are most competent to judge do not believe that our present system of regulation is bearing up under the crucial test of navigation in foul weather as well as in fair. A vessel which threatens to go to the bottom

President Ripley's Novel Proposals

in every storm can hardly be regarded as one in which it is safe to go to sea. Our present system of regulation must be improved or it is doomed.

The Personnel of Commissions

Numerous citizens of Maine have made a vigorous protest against the appointment of three lawyers as the three members of the new public utilities commission of that state. The story is told elsewhere in this issue. Lawyers should make the most capable public servants in many lines of governmental work. Their education and experience teach them what has been and is being done by governments; and this should aid them in forming sound opinions as to what governments ought to do. But the ordinary lawyer does not have much actual business experience. His relationship to business is usually that of one who advises what legally may or may not be done, rather than that of one who undertakes to solve practical problems of administration, and who has the opportunity of making profits if he solves them correctly, while taking the risk of incurring losses if he solves them incorrectly. Many lawyers have made successful administrators and business men; but this has been because they have had qualities not developed by the ordinary education and experience of the lawyer. Now, the problems presented to public utility commissions are partly legal, but preponderantly business problems. Therefore, the public utility commissioners should contain some lawyers, but they should also have some members with the knowledge, the experience and the point of view of business men and of public utility experts. The objectors to the appointment of three lawyers to the Maine commission demand the appointment of a lawyer, a business man and a practical railroad man. This is so obviously a reasonable and sensible demand that it is difficult to understand how anyone can fail to endorse it. In this connection, however, it should, of course, be borne in mind that even more depends on the character and ability of the men appointed than on their previous experience. Many men very successful in their own line of professional or business activity are yet extremely narrow and wholly unfit for public utility commissionerships. We need for public office above all things men who are high-souled and broad-minded, studious and energetic, public-spirited, courageous and foresighted. These things are of fundamental importance, however much we may and should strive to get men who are also acquainted with railroading, gas-making, telephones, trolley cars or tax laws.

THE YARDMASTER AND THE FREIGHT SOLICITOR

WITH the exception of the word efficiency, no term has been more abused in railroad parlance during the past few years than co-operation. In the universal endeavor to improve the standard of railway operation, emphasis has very properly been placed on the necessity for hearty co-operation between all departments. With the high degree of specialization of the modern railway organization, all departments are more or less inter-dependent, but it is probable that no officer comes in intimate contact with more branches of the service in the daily routine of his duties than the terminal yardmaster or superintendent. In reality, his activities are related directly to the traffic as well as the operating department, for in spite of all the arguments the traffic department can present, in the final analysis, service counts with the shipper. It is the yardmaster and his force who come in contact with the shipper in giving this service and who aid in securing or holding the traffic.

It might be said that if a yardmaster did not provide proper service for the industries within his jurisdiction, he would soon be replaced by another. This is true, but there is a wide zone between the maximum service and the low limit of efficiency resulting in discharge. It is to men within these limits that we emphasize the importance of this relation. In some cases a yardmaster may not be the means of losing any traffic or creating complaints, but he may be losing an opportunity of bringing more traffic to his road by giving service above the average. He should, therefore, acquaint himself fully with the needs of present and prospective shippers, and then endeavor to meet them.

On the other hand, the freight solicitor can further the interests of his road by exercising care in making promises or acceding to requests for special or expensive services. In the endeavor to secure traffic under highly competitive conditions, requirements are often imposed which are expensive and burdensome for the operating department. Traffic which cannot be handled at a fair profit had usually better be allowed to move over the other road. Within the category of these uneconomical services are frequent special services out of regular schedule, the "hold" or "reconsignment" privileges, etc. If the officers of the freight traffic department would familiarize themselves with the cost of such services and thus see that in many cases the evident gain is a final loss, they would not solicit such traffic so actively or insist on the operating department rendering such service. In the end, the interests of the yardmaster and traffic agent are identical and are best served when the revenues of the company are best conserved. A knowledge of each other's problems is the first and most important step towards this result.

LICENSES FOR ENGINEERS

ACCORDING to the terms of a bill approved in July, 1913, by the governor of the state of Pennsylvania, an act is being prepared by a commission provided for in the bill, to require the licensing of professional engineers. Although this is by no means the first time such a measure has been discussed, nor the first case in which the objections to such a measure have been set forth, it seems that the futility and disadvantages of such a law have been summed up as clearly and concisely as possible by D. F. Crawford, general superintendent of motive power, Pennsylvania Lines West. In a letter addressed to the members of the commission, Mr. Crawford shows, first, that the bill is unnecessary, and second, that it would result in hardship to large organizations, to the engineering profession and to individual engineers.

Two reasons are stated why the bill is unnecessary, first, since the capability of any engineer depends on his experience and common sense, it cannot be adequately judged by his ability to solve catch problems in an examination, and further, the tagging of a man as a professional engineer could not insure his use of correct judgment and the public would be much less secure than would be the case if proper laws were passed regulating details of construction affecting the safety and life of the people. Second, since a man's capability is measured entirely by the results of his work, and consulting engineers are employed or regular employees promoted according to the results secured, incapable engineers are automatically eliminated with greater accuracy than would be possible with any commission.

Three specific hardships are enumerated by Mr. Crawford that would result if such an act were put in force. First, since the bill includes specifically men engaged in the general supervision of the operation and maintenance of public and private works, it would prevent corporations from employing men of excellent business ability and no professional training, who have shown themselves capable of picking the proper men for handling various engineering problems incident to the work and securing results as good as, and in some cases better than, professional engineers. Second, the law would deprive large organizations of the services of capable and experienced men thoroughly competent to meet the specific requirements of the work in which they are engaged, but unable to satisfy a commission of nine men as to their professional ability. Third, since the members of the commission would be appointed by the governor and three of the nine would retire every two years, the commission would of necessity become a political body, and would be in position to refuse or withdraw certificates to satisfy petty grievances, or for political pull reasons having no reference to the merits of the case.

The above arguments are so clear and conclusive as to need no comment.

GOVERNMENT REGULATION ON TRIAL

IT is a question of great importance what effect the decision of the Interstate Commerce Commission in the pending rate advance case will have on the railway situation, and more especially on the general business situation. Of hardly less importance is the question what effect it will have on the future of government regulation of railways.

The nation is in the midst of a crisis. The railways are, of all industries, except the cotton-growing industry, the most acutely and directly affected. The present system of government regulation was not adopted merely to give some body, or bodies, authority to control railways. It was adopted as a means to an end, and that end was the promotion of the general welfare. The line taken by certain attorneys and members of the Interstate Commerce Commission in questioning witnesses who appeared at the hearings in Washington last week strongly suggests that they have confused the means employed with the end which it was adopted to accomplish.

Certain questions were asked of the witnesses for the railways which might be interpreted to imply that those asking them do not believe that the commission has any power to permit an advance in rates for the purpose of so increasing the revenues of the railways as to enable them successfully to meet the present emergency. The inference which might be drawn is that they hold that the commission is empowered only to regulate railway *rates* and not railway *earnings,* and that when the commission restricts the railways to reasonable rates it may not legally concern itself with the results, directly to the railways, or indirectly to the nation.

It surely is astounding that at this late day such a theory should be suggested by persons opposing an advance in rates and even, apparently, by members of the commission. From the inception of the present system of government regulation two theories as to the way rates should be regulated have been advanced. Railway men and others who concur in their point of view have contended that the sole function of the commission in the regulation of rates is, or should be, to see that rates are not made unreasonably high, and they have argued that the main criterion of what is reasonable should be the value of the service rendered—in other words, "what the traffic will bear." They have argued that the cost of the service and the net earnings received are factors to be considered, but that after all, the main factor is the value of the service—that if the rates exceed this they are unreasonable, even though the carrier make no profit at all, and that, on the other hand, if they do not exceed this, the fact that some or all railways make large profits is by no means conclusive proof that the rates are unreasonable.

Many persons have contended, on the other hand, that the chief measure of the reasonableness of rates is the net return on their investment received by the railways, and that if their net return becomes very large the rates should be reduced, no matter how low they may appear when tested by other standards.

This latter theory, in spite of all the efforts of those who have criticized and opposed it, has tended to prevail. It has been accepted by the commission to such an extent that that body has advocated a physical valuation as a basis for the regulation of rates, and by Congress and the public to such an extent that a law providing for such a valuation has been passed. Is it possible that, after having been accepted, when railway net earnings were relatively substantial the theory that net earnings are the main test of the reasonableness of rates and used it as a ground for causing reductions or refusing advances in rates, the commission is going to entirely abandon it now, because railway net earnings have reached the lowest ebb in years and in consequence the theory has become an argument for wholesale advances in rates? Such a reversal of attitude could be construed to mean only one thing, and that is that certain members of the commission are willing to act without any regard whatever to justice or consistency if by so doing they can find what may appeal to themselves or others as a defensible reason for denying the railways needed relief.

As a matter of fact, under present conditions railways are entitled on either theory, if correctly understood and applied, to general increases in their rates. The past 15 years have been a period of advancing wages and prices. Consequently, throughout this time it would have been possible for railway traffic to bear higher rates. At present the prices of some commodities, such as cotton, are relatively depressed, but on the other hand, the general level of prices and wages is much higher, compared with the general level of railway rates, than it was a decade ago. Therefore, on the value of the service theory the railways might make substantial advances in the rates on most of their traffic without rendering the rates unreasonable.

As to the other theory, the net return of the railways is the smallest now that it has been in years, while the demands on their net earnings are the greatest that they have been in years. Therefore, on that theory also, the railways are clearly entitled to make general advances in their rates. In fact, their net return has been heavily reduced while the current rate of interest has been heavily increased, so that even though we accepted the theory that they are entitled to earn only the current rate of interest, even on that theory they are entitled to make subsantial advances in their rates.

But it is said the present situation is an emergency, and the Interstate Commerce Commission has no authority to deal with emergencies. In other words, we have adopted a system of regulation which so ties the hands of the railway managers that they cannot meet emergencies, and which at the same time gives no one else the power to deal with them. What this means apparently, is, that every time anything out of the ordinary happens the Interstate Commerce Commission should placidly fold its hands over its diaphragm, lift its eyes to heaven, sit pat and pass the buck to Congress. And, of course, Congress will take such action at the time, not as business exigencies demand, but as the political exigencies of its members demand.

This is certainly a lovely theory. If it is correct it means that we have adopted a system of government regulation which is admirably adapted to preventing the railways from prospering when the rest of the country prospers, but which is incapable of giving them any aid or relief when they need it and which, therefore, in both good times and bad times, is a drag on the wheels of progress and a menace to the public welfare. It is the theory of a narrow, academic, hairsplitting, bureaucratic and imbecile system of regulation. It is a theory of ignorant meddlesomeness and not of helpfulness. It is a theory of cranky interference and not of progress. It is a theory of destruction and not of construction. If it is correct, those who have adopted the present system of regulation merit nothing but the curses and kicks of the public, and the sooner the system itself is cast into the scrap heap the better. If the theory is not correct, anybody who propounds it is utterly lacking in the qualifications for contributing toward the solution of a great question of public policy.

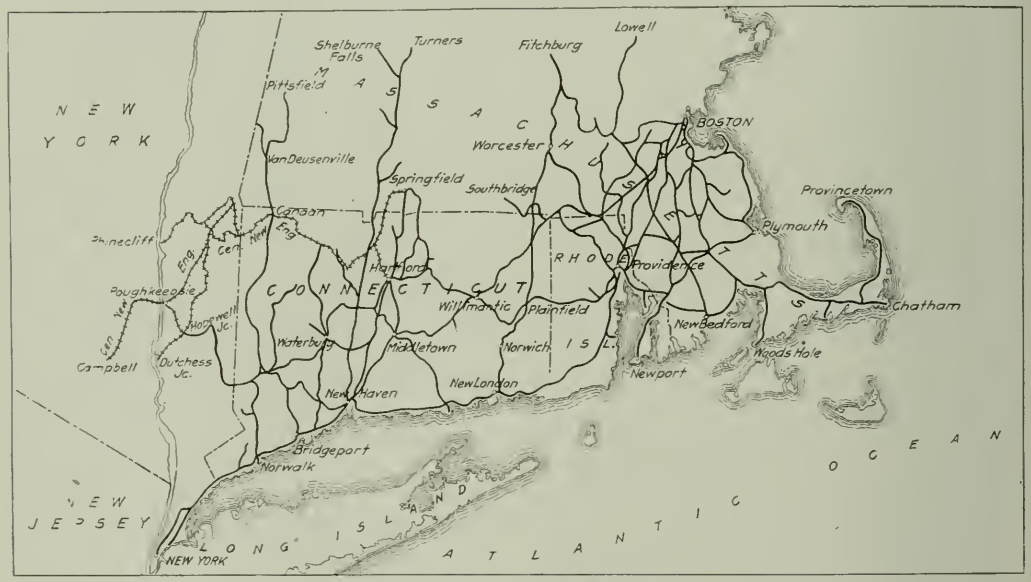
We do not believe that the public will accept the doctrine that the present system of regulation is merely a system for cranky, bureaucratic, wasteful, destructive meddling with business, and is not intended or adapted to be of any use in promoting the public welfare when the public welfare most needs promoting. We do not believe that the public will accept the doctrine that the theory on which railway rates are regulated should be constantly juggled about so as always to prevent them from being so changed as to maintain or increase railway net earnings. Furthermore, we still hope, in spite of certain questions asked by certain commissioners at the recent hearing, that the Interstate Commerce Commission will not accept any such doctrine.

One thing is certain, however, and that is, that while the acceptance by the commission of such a baneful and detestable principle would do great immediate harm to the railway and business interests, it would do still greater harm to government regulation of railways. The expressions of newspapers and business men all over the country show that the public is informed and aroused regarding the railway situation as it never has been before. Everywhere the question is being raised

whether the present system of regulation is not doing more harm than good. The Interstate Commerce Commission probably was astonished at the way in which its original decision in the 5 per cent case was received. If it acts in the present case on any such theory as the one we have been discussing it will be still more astonished at the way in which its decision in this case will be received. In the former case the railways were on trial. Probably the commission thinks the same thing is true now. If so, it is mistaken. This time regulation and the commission itself as at present constituted are before the bar of public opinion!

NEW YORK, NEW HAVEN & HARTFORD

NEVER, probably, in the history of American railroading has there developed quite so complicated a problem as that which faces the management of the New York, New Haven & Hartford. In the fiscal year ended June 30, 1914, the company earned gross $66,618,000, which is less than the earnings in 1913 by $1,996,000. Expenses amounted to $48,515,000, an increase of $1,288,000; and the net result of the year's operation was a profit to the owners of the property—the stockholders—of but $269,000 as against $8,654,000 in the previous year. It is only, however, was so easy for two or three of the directors to carry out, without opposition or advice, the vast plan of development in which the company was involved when Mr. Morgan died. The great majority of the stockholders of the New Haven neither have the means nor the knowledge of financial affairs to support their company in a time of very great financial stress. As long as the Morgan firm was the director of the policy of the New Haven, this mattered very little, since new capital for the refunding of maturing obligations was hardly a concern of the operating management, the bankers taking care of this end of the company's affairs. Now, however, the management of the company, instead of being able to rely on unlimited financial support from the greatest banking house in the country, is thrown completely on its own resources. Its credit and not that of the bankers must be used to sell securities to refund maturing obligations and to raise new capital; but its credit has been the subject of an extraordinarily bitter attack, and to add to this almost insurmountable difficulty, the company is forced to divest itself of its assets under governmental pressure. The stockholders, therefore, are a tremendous responsibility to the management without being a help. No wonder the widow, part of whose funds were invested in New Haven stock at 175, feels



The New York, New Haven & Hartford

in the light of the knowledge of the full situation that any intelligent study of the company's annual report for 1914 can be made.

The New Haven operates 2,046 miles of road. Only very slightly over half of its revenue is derived from freight, the remainder coming from the operation of passenger trains. The peculiar nature of the New Haven's business and its vulnerable position in regard to competition for both freight and passengers, have been pointed out before in the *Railway Age Gazette*. It was, of course, the desire to protect the business of the steam railroad that led the late J. P. Morgan and Charles S. Mellen, as his active agent, to use the New Haven's credit to buy trolley roads and steamship lines.

The stock of the New York, New Haven & Hartford is very widely distributed and a very large proportion of it is owned by small investors in New England, the great majority of whom, of course, are quite incapable of voting from their own knowledge on any question of railroad policy. This was one reason why it abused and bewildered under present circumstances; and there can be no doubt that the interests of this class of stockholder weigh as a fearfully heavy responsibility on the present management, despite the fact that it is in no way to blame for what has taken place.

The operation of the New Haven under the Mellen régime was left to subordinate officers. There was, however, at that time no imperative need for drastic economy. Now the most rigid economy is absolutely essential. Economy is always unpopular. To put it into effect now on the New Haven is particularly difficult and stirs up resentment both among the company's forces that feel the effect of this retrenchment and among the community served. The taking off of unprofitable passenger trains raises a storm of protest, all the louder because the company is in a bad strategic position to defend itself.

The management finds itself, therefore, without adequate financial support, with credit seriously impaired, without the backing of "big interests," with an organization which if it is not dis-

organized was at least on the verge of it, and has only been saved by the courage and skill of the present management, and with the grave responsibility of the small stockholder.

The 1914 annual report, therefore, is a record of housecleaning, of clearing the decks for action, and as such is particularly interesting. It must be remembered, however, that in setting forth so frankly the difficulties which the management of the New Haven now has to face it is not meant to imply by any means that their task is either hopeless or without possibilities of being rewarded in time by great success. Some of the English railways carry a very large proportion of passenger business; they are capitalized far higher than is the New Haven, and in many respects the fundamental conditions, not the particular problems just mentioned, are much like those of the New Haven, and they are notably successful both in giving satisfaction to the public served and returning a profit to their stockholders. The New Haven has what they have—a very dense business. The New Haven is, moreover, an originating road insofar as freight is concerned, and as such gets now and should continue to be able to get a high ton-mile rate, due to a good division of the through rate.

The company operates 2,046 miles, of which 841 miles has second-track and about 130 miles third and fourth-track. The total tonnage of freight carried in 1914 amounted to 24,997,000, a decrease of 1,269,000, as compared with 1913, the average haul being 92 miles, a decrease of 4.63 miles. This meant a falling off of ton-mileage in 1914, as compared with 1913 of 9 per cent. The freight density in 1914 was 1,152,000 ton-miles per mile of road, which means a very heavy density when we take into consideration the fact that there are a good many hundred miles of line on which there is no through freight business and only a small local freight business, and also bearing in mind the passenger density. Of the total tonnage carried in 1914, 31.23 per cent was products of mines, and of this about half was furnished by bituminous coal. The tonnage of manufactures furnished 20.18 per cent. of the total tonnage; merchandise, 16.29 per cent; lumber only about 5 per cent, and products of agriculture only about 9 per cent. An extraordinarily large proportion of l. c. l. freight adds very much to the expenses of handling the freight business, and also, of course, gives the New Haven a high average ton-mile rate. In 1914 this was 1.415 cents.

The total number of passengers carried was 87,184,000, an increase of 370,000 over 1913, and the average passenger journey was 18.36 miles. In part this very low average trip is due to the large commutation business which the New Haven does. In 1914 there were 13,025,000 commutation passengers carried, an increase of 686,000. The passenger density is 803,000 passengers carried one mile per mile of road. With this very dense passenger business the New Haven is able to get a high average number of passengers per train—96 in 1914, an increase of one over the year before.

Handling 9 per cent less freight business measured in ton-miles, the company reduced its freight-train mileage by 15 per cent, the total freight-train mileage in 1914 being 7,378,000. Handling a fraction of one per cent less passenger business measured in passenger miles, the company reduced its passenger-train mileage by a little over one per cent.

The average trainload in 1914 was 304 tons. This is low, but is a gain over 1913 of nearly 4 per cent, and there are particular circumstances in regard to the New Haven conditions which explain the light trainload. The large proportion of l. c. l. freight already mentioned is one; the small proportion of coal already mentioned is another; the very heavy passenger density is another and very important factor. Freight trains have to be run at high schedule speed to keep out of the way of passenger trains, and therefore cannot be very heavily loaded. It may well be on the New Haven that experience will show that gains in economy can be made without materially increasing the revenue freight-train load. When W. G. Besler went to the Central of New Jersey he inaugurated a program which resulted in smaller train-loads, but in more efficient and economical operation, and in some ways the density of traffic and frequency of passenger-train service on the New Haven is like that on the Central of New Jersey. Another important factor is the economies in handling this kind of business that may follow from complete electrification to New Haven.

Total operating expenses in 1914 amounted to $48,515,000, an increase of $1,288,000. All of the increase, however, was in maintenance expenses, maintenance of way costing $8,831,000, or $938,000 more than in 1913, and maintenance of equipment $10,389,000, or $789,000 more than in 1913. On the other hand, transportation expenses amounted to $26,869,000, a decrease of $335,000. With the large amount of passenger business and the fast freight service, it is of the utmost importance that maintenance of way expenditures on the New Haven should be liberal, and the substantial reduction in transportation expenses is a clear indication of effective economies.

The decrease in revenues and the more liberal expenditures for maintenance resulted in a net income amounting to $14,620,000, which is less by $3,697,000 than in 1913. This is not at all a bad showing. The remainder of the loss to the company in 1914 as compared with 1913 came as the result of a smaller return on the company's outside investments. There was but $3,522,000 dividends received on stock owned, a decrease of $2,966,000. The company's profit and loss surplus has now been reduced to $1,822,000. At the beginning of the year it was $7,916,000. The dividend paid on September 30 from profit and loss called for $2,357,000; the loss on the sale of the Merchants' and Miners' Transportation amounted to $3,595,000, and the unamortized loss on the New York, Westchester & Boston bond sale prior to 1914 was $1,265,000. At the end of 1914 the company had on hand $6,067,000 cash, or $6,208,000 less than at the beginning of the year. On the other hand, it had but $4,252,000 loans and bills payable, which is a reduction in this current liability of $38,347,000 from the 1913 figures. The net increase in the funded debt was $33,976,000. During the year the company spent $3,291,000 for additions and betterments.

The relations of the company to the government have been commented on at length in these columns at various times previously. It is to be hoped that with the signing of the dissolution decree a short time since, the worst of the New Haven's troubles in this respect are at an end.

There is a very interesting statement in President Elliott's report this year, showing the number of stockholders, their residences, etc. The total number of stockholders in 1914 was 26,386, as against 22,716 in 1913. Of the total in 1914, 46 per cent lived in Massachusetts, 22 per cent in Connecticut and 16 per cent in New York. Of the total number, 12,127 held 10 shares or less and 9,651 from 11 to 50 shares. Of the total, 10,920 were women, 3,551 trustees and guardianships, and 802 insurance companies and other corporations. President Elliott says: "Stockholders are urged most earnestly to inform themselves about the situation of the company, to explain the difficulties in their respective communities and to use their active influence to help the management in its efforts to reduce expenses and to increase rates slightly, and to obtain favorable consideration for the company at this time, when the help of everyone interested in the welfare of New England is needed in order to maintain efficiently the transportation system that is so closely interwoven with the industrial, financial and social life of this part of the country."

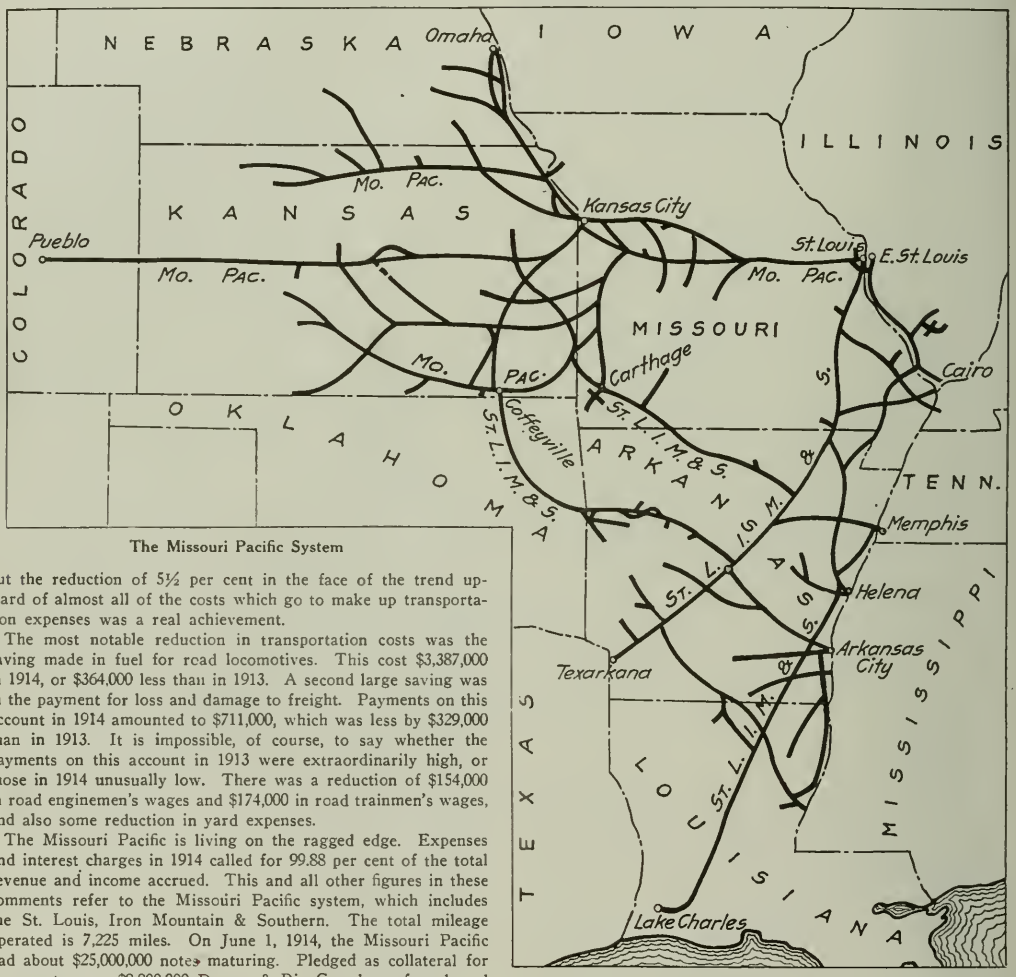
The following table shows the principal figures for operation in 1914 as compared with 1913:

	1914.	1913.
Mileage operated	2,046	2,092
Freight revenue	$32,476,373	$34,071,975
Passenger revenue	27,400,673	27,896,300
Total operating revenues	66,617,693	68,613,503
Maint. of way and structures	8,831,064	7,893,090
Maint. of equipment	10,389,458	9,600,669
Traffic expenses	502,020	582,310
Transportation expenses	26,868,688	27,203,271
General expenses	1,924,130	1,947,999
Total operating expenses	48,515,350	47,227,339
Taxes	3,568,219	3,714,756
Operating income	14,619,604	18,316,855
Gross income	21,867,594	28,380,640
Net income	268,663	8,922,238
Dividends	.....	13,486,563
[illegible]	268,663	4,564,325*

*Deficit.

MISSOURI PACIFIC

THE Missouri Pacific's financial condition and the results being obtained by the operating department are almost diametrically opposite. On the one hand the company escaped receivership last year only by the narrowest possible margin; on the other hand, with a very slightly smaller volume of business and with the full-crew law in effect for the whole year as compared with part of the previous year, the management was able to actually reduce transportation expenses by 5.49 per cent. Of course transportation expenses in the fiscal year ended June 30, 1914, might be expected to show some of the results of expenditures for additions and betterments in 1911, 1912 and 1913; but the reduction of 5½ per cent in the face of the trend upward of almost all of the costs which go to make up transportation expenses was a real achievement.



The Missouri Pacific System

The most notable reduction in transportation costs was the saving made in fuel for road locomotives. This cost $3,387,000 in 1914, or $364,000 less than in 1913. A second large saving was in the payment for loss and damage to freight. Payments on this account in 1914 amounted to $711,000, which was less by $329,000 than in 1913. It is impossible, of course, to say whether the payments on this account in 1913 were extraordinarily high, or those in 1914 unusually low. There was a reduction of $154,000 in road enginemen's wages and $174,000 in road trainmen's wages, and also some reduction in yard expenses.

The Missouri Pacific is living on the ragged edge. Expenses and interest charges in 1914 called for 99.88 per cent of the total revenue and income accrued. This and all other figures in these comments refer to the Missouri Pacific system, which includes the St. Louis, Iron Mountain & Southern. The total mileage operated is 7,225 miles. On June 1, 1914, the Missouri Pacific had about $25,000,000 notes maturing. Pledged as collateral for these notes was $9,800,000 Denver & Rio Grande preferred, and $15,000,000 Denver & Rio Grande common, besides $22,000,000 St. Louis, Iron Mountain & Southern 6 per cent series A bonds and various other collateral. The Denver & Rio Grande stock, although not of great market value, is an important factor in the Gould control of that company and of the Western Pacific. After prolonged negotiations the bankers finally consented to the renewal of these notes for one year at 6 per cent on the deposit of $3,000,000 additional Iron Mountain bonds as collateral. This arrangement amounted, of course, to a postponement of the company's financial difficulties rather than a solution of them. On June 30 the combined companies had $1,164,000 cash, with loans and bills payable of $825,000. The cash on hand was about the same as at the beginning of the year, but the loans and bills payable were increased by $400,000, and in addition the audited vouchers and wages unpaid amounted to $5,188,000, an increase of $411,000. This is not an abnormally high amount of audited vouchers and wages unpaid, nor would the increase of $400,000 in loans and bills payable be anything at all remarkable if the company had a strong working capital or any arrangement by which its extended notes which mature June 1 next could be met; but $1,164,000 is a very much smaller working capital than a company operating more than 7,000 miles of line needs.

In 1914 a total of $1,932,000 was spent for additions and betterments, including additions to equipment. No securities were sold by the Missouri Pacific, and although the St. Louis, Iron Mountain & Southern issued $4,144,000 series A bonds, these were not sold to the public, so that the total system funded debt, including equipment trust certificates outstanding in the hands of the public, was less at the end of the 1914 fiscal year by $500,000 than at the beginning of the year.

In the year ended June 30, 1914, the system earned $59,794,000, which is less by $2,362,000, or 3.80 per cent, than the gross earn-

ings in 1913. The falling off in freight earnings equaled 3.83 per cent, and in passenger earnings, 4.02 per cent. Of the total revenue about 74 per cent comes from freight and 19 per cent from passengers. There was very little falling off in the tonnage of freight, but, on the other hand, the average haul was shorter, so that the total ton mileage handled in 1914 was 5,505,000,000 ton-miles, which is less by 2.88 per cent than the ton-mileage in 1913. This, it will be noticed, compares with a falling off in freight revenue of 3.83 per cent, the average ton-mile rate received in 1914 being 7.99 mills as against 8.07 mills. The rate reductions which were held legal by the Supreme Court in the Missouri river rate case were put into effect in July, 1913. The effect on freight revenue does not appear to be very great, possibly because of changes in the proportion of the various commodities carried, which offset what would have otherwise been a larger reduction in the average ton-mile rate. In passenger business, however, the effect of the decision is striking. The total number of passengers carried one mile was 548,800,000 in 1914 as against 502,100,000 in 1913, an increase of 9.31 per cent in passenger business, while the revenue from passengers amounted to $11,160,000, a decrease of $468,000, or over 4 per cent.

Of the total tonnage of revenue freight, amounting to 23,281,000 in 1914, 35.59 per cent was furnished by products of mines, and 22.34 per cent by lumber and lumber products. Products of agriculture furnished 17.36 per cent, and manufactures 14.01 per cent.

Traffic statistics explain in part the decrease in transportation expenses. The average trainload in 1914 was 389 tons as against 373 tons the year before, an increase of over 4 per cent. The average carloading per loaded car was very slightly less in 1914 than in 1913, 17.99 tons as against 18.06 tons. The gain in average trainload is more of a gain than would appear from the percentage because of the very large increase in empty car mileage. Traffic conditions largely determine the proportion of empty to loaded car mileage, and, of course, last year the empty car mileage was very much increased by the general movement of cars returning to their home lines, the Missouri Pacific feeling the effect of this to a marked extent because it is an intermediary road. The total mileage of loaded freight cars on the system in 1914 was 305,900,000; in 1913, 313,900,000. The mileage of empty cars was 127,800,000 as against 103,400,000 in the previous year. In other words, loaded car mileage decreased 2.52 per cent, while empty car mileage increased 23.60 per cent. To show a gain in trainloading under such conditions is noteworthy.

The Missouri Pacific has been immensely improved in the last three years; but in 1914 there was, as already noted, comparatively little money available for additions and betterments, with no prospect of any more in 1915. It was, therefore, important that a liberal policy should be adopted in regard to maintenance. The amount spent for maintenance of way and structures in 1914 was $8,536,000, which was less by $727,000 than in 1913; but the amount spent on maintenance of equipment was $10,252,000, or $392,000 more than in 1913. In 1914, however, there were no extraordinary expenditures, President Bush says, for flood repairs or other adverse conditions, and nearly all of the smaller expenditure on maintenance of way is accounted for by a large decrease in the amount spent for track labor and for grade crossings, fences, cattle guards and signs, an extraordinarily large sum having been spent on this latter account in 1913.

From all this it would appear that if the company could get its financial difficulties adjusted, as well as its operating problems are being met, its security holders should feel much encouraged.

The table shows the figures for operation in 1914 and 1913:

	1914.	1913.
Mileage operated	7,285	7,257
Freight revenue	$43,995,027	$45,748,269
Passenger revenue	11,159,634	11,627,481
Total operating revenue	59,793,900	62,155,506
Maint. of way and structures	8,536,046	9,263,360
Maint. of equipment	10,252,256	9,860,188
Traffic expenses	1,330,087	1,425,168
Transportation expenses	21,292,357	22,528,447
General expenses	1,711,627	1,621,834
Total operating expenses	43,122,373	44,698,997
Taxes	2,513,432	2,314,349
Operating income	14,084,731	15,049,156
Gross income	16,532,511	17,512,255
Net income	74,692	1,562,734

ST. LOUIS SOUTHWESTERN

THE St. Louis Southwestern is a carrier largely of lumber and agricultural products and as such suffered severely in earnings in the fiscal year ended June 30, 1914, because, on the one hand, of the very poor market for lumber from the Southwest and, on the other, because of the extraordinarily bad weather conditions, especially in Texas. Not only would revenues suffer under these conditions, but transportation expenses were higher per unit of business handled, but not by any means to the extent that might be expected under the conditions which prevailed. In 1914 the company earned about half a million dollars less than in 1913 and its expenses were about half a million dollars greater; but almost the entire additional expense was for maintenance of equipment.

Total operating revenues in 1914 amounted to $12,745,000 as against $13,297,000 in 1913. This is an average on the 1,735 miles operated in 1914 of $7,346 per mile and on the 1,609 miles operated in 1913 the earnings in that year averaged $8,263 per mile. All of the falling off in revenue was due to a decrease of 4.44 per cent in the tonnage of freight carried and a decrease of a little less than one per cent in the ton-mile rate. The average length of haul of freight remained about the same in 1914 as in 1913 and is quite long—237 miles. The total ton mileage carried in 1914 was 830,000,000 tons, a decrease of 42,000,000 tons, or 4.81 per cent. Passenger revenue amounted to $2,662,000, an increase of 1.66 per cent over 1913. The number of passengers carried one mile was 113,600,000, an increase of 13,400,000, or 13.38 per cent; but the average receipts per passenger per mile fell to 2.34 cents from the 1913 average of 2.61 cents. This was the result of the Supreme Court's decision in the Missouri and Arkansas rate cases, which became effective in July, 1913. The company estimates that the loss in passenger revenue due to these decisions was $340,000, or enough to have in considerable part offset the effect of the adverse weather conditions and trade conditions on freight revenues.

It is a great pity that the people of the Southwest fail to appreciate their own railroad situation. In most of the sections served by the St. Louis Southwestern the people are prosperous; they are fond of travel, like luxury and good service when traveling, demand it and are able to pay for it. The St. Louis Southwestern passenger service is very good indeed. Its dining car service is excellent, and this dining car service is carried on at a dead loss for each diner served, simply as a part of the expense of giving good passenger service. If the Interstate Commerce Commission's conclusions in regard to the undue burden which passenger service puts on freight service in eastern territory where passenger density is heavy are correct, how much more true this is on a road like the St. Louis Southwestern where passenger density is light?

The St. Louis Southwestern has for some years tried wholeheartedly and intelligently to co-operate with the people whom it serves in building up the prosperity of the country. The road now needs the co-operation of its patrons to take the next step forward in its own development, and the reduction made in passenger fares in Missouri and Arkansas was a stupid and short-sighted failure to extend this co-operation.

There is another point analogous to this question of passenger rates. Texas laws are such as to very seriously discourage the expenditure by a railroad of any money at all for additions and betterments. It is so obvious that a road like the St. Louis Southwestern cannot sell securities bearing any reasonable rate of interest at par, that it seems almost unnecessary to mention the fact. Nevertheless, the discount on new securities, which is as much a cost of the additions and betterments which are paid for from the sale of these securities as is the salary of the engineer in charge of the improvements, cannot be charged to property account. In other words, all additions and betterments must be paid for, at least in part, from the earnings of the railroad company. If

the St. Louis Southwestern is successful in its efforts to materially increase the prosperity of its territory, it will, to a certain extent, share in increased earnings from this prosperity; but with the increase in prosperity of the people served will come new demands on the transportation plant. It is quite proper that some part of the additional earnings which would come under these conditions should be devoted to the payment of interest on an improved and more adequate plant. The people in the Southwest, prosperous as they are, are continually reinvesting their own capital in their own businesses and in improvement of their land. From their own point of view it is very desirable that outside capital should be invested in their transportation facilities; but the way in which such investment can be induced is to make it attractive.

After the payment of expenses and taxes the St. Louis Southwestern in 1914 had net income of $336,000. This compared with net income at the end of the 1913 fiscal year of $1,886,000; but 2½ per cent was paid on the preferred stock in 1914 as against 5 per cent in 1913; but even so, the 2½ per cent called for $497,000, which left, of course, a slight deficit as compared with a substantial surplus for the previous year after the payment of the full 5 per cent dividends.

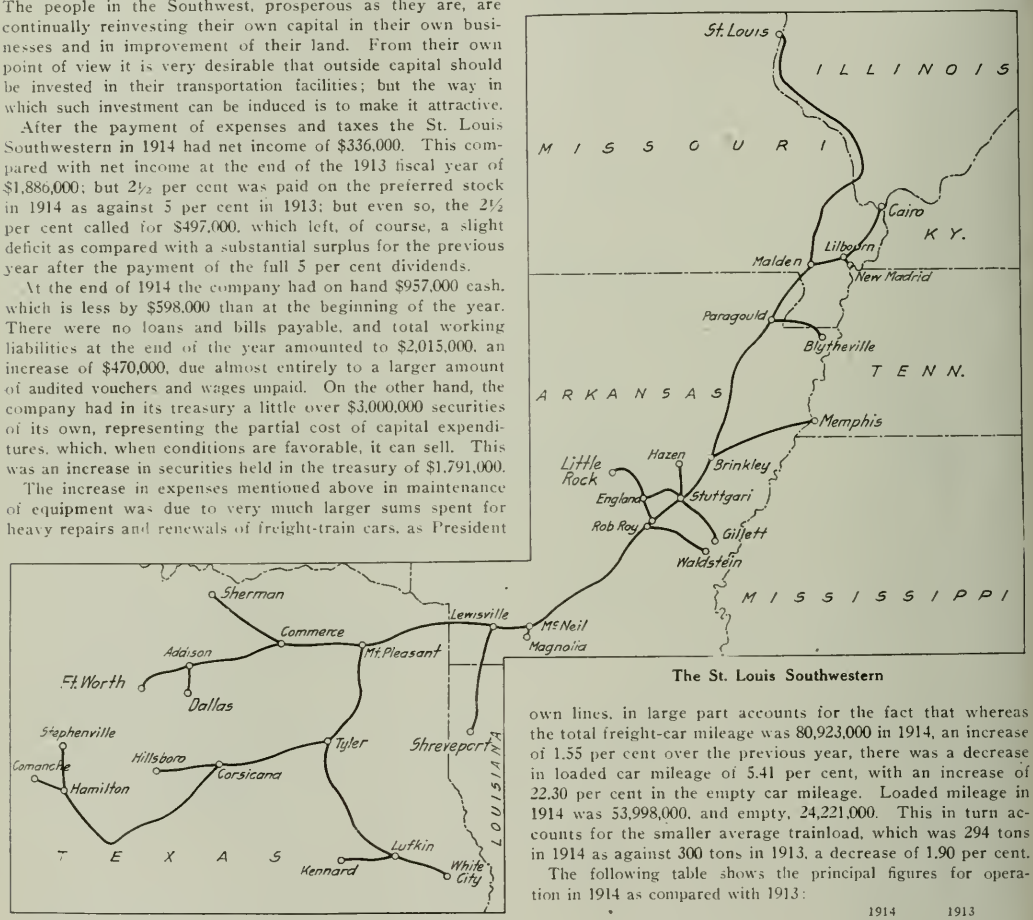
At the end of 1914 the company had on hand $957,000 cash, which is less by $598,000 than at the beginning of the year. There were no loans and bills payable, and total working liabilities at the end of the year amounted to $2,015,000, an increase of $470,000, due almost entirely to a larger amount of audited vouchers and wages unpaid. On the other hand, the company had in its treasury a little over $3,000,000 securities of its own, representing the partial cost of capital expenditures, which, when conditions are favorable, it can sell. This was an increase in securities held in the treasury of $1,791,000.

The increase in expenses mentioned above in maintenance of equipment was due to very much larger sums spent for heavy repairs and renewals of freight-train cars, as President Britton says, made necessary in a large measure by the age of such cars. Since June 30, however, the company has been receiving under the equipment trust of April 1, 1914, 1,500 steel underframe box cars, 400 steel underframe flat cars and 100 steel underframe and steel coal cars, and arrangements have been concluded for the rebuilding of all freight cars acquired under equipment trust agreements which were destroyed up to June 30, 1914. This means that the heavy expenditures for maintenance of equipment will continue, probably up to November 30, at which time it is expected that all of the replacements will be completed.

The following table shows the percentage of each class of expenses to total operating revenues in 1914 and 1913:

	1914	1913
Maintenance of way and structures	15.07	14.29
Maintenance of equipment	20.68	16.69
Traffic expenses	3.97	3.83
Transportation expenses	32.30	30.38
General expenses	4.62	4.12
Total	76.64	69.31

Of the total tonnage—3,496,000 tons—of freight carried by the St. Louis Southwestern in 1914, 37.06 per cent was furnished by lumber and lumber products, 21.75 per cent by products of agriculture and 25.06 per cent by manufactures and miscellaneous. The tonnage of lumber in 1914 was 1,295,000 tons, a decrease, as compared with 1913, of 168,000 tons, or 11.47 per cent. This falling off in lumber, combined with the very marked improvement of cars returning empty to their own lines, in large part accounts for the fact that whereas the total freight-car mileage was 80,923,000 in 1914, an increase of 1.55 per cent over the previous year, there was a decrease in loaded car mileage of 5.41 per cent, with an increase of 22.30 per cent in the empty car mileage. Loaded mileage in 1914 was 53,998,000, and empty, 24,221,000. This in turn accounts for the smaller average trainload, which was 294 tons in 1914 as against 300 tons in 1913, a decrease of 1.90 per cent.



The St. Louis Southwestern

The following table shows the principal figures for operation in 1914 as compared with 1913:

	1914	1913
Average mileage operated	1,735	1,609
Freight revenue	$9,295,143	$9,864,490
Passenger revenue	2,661,551	2,618,176
Total operating revenue	12,744,555	13,296,950
Maint. of way and structures	1,920,035	1,899,484
Maint. of equipment	2,633,700	2,219,390
Traffic expenses	505,802	508,894
Transportation expenses	4,116,729	4,039,413
General expenses	589,451	548,616
Total operating expenses	9,767,717	9,215,797
Taxes	601,886	468,697
Operating income	2,356,217	3,599,816
Gross income	3,354,886	4,644,141
Net income	335,771	1,886,191
Dividends	497,341	994,682
Appropriated for additions and betterments	.....	163,111
Surplus	161,570*	728,398

*Deficit.

MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE

PRESIDENT PENNINGTON, in his annual report for the Minneapolis, St. Paul & Sault Ste. Marie, expresses admirably the feeling of the majority, probably, of railroad presidents in the United States when he says, ". . . under the present gen-

eral financial and political complications prevalent throughout the world, superhuman wisdom and courage would be required to predict the business possibilities of the current year." Almost every railroad president is living from day to day and from hand to mouth. The Soo is in much better shape than a great many other roads, although it experienced a rather unprosperous year in 1914 as compared with 1913. The surplus after the payment of 7 per cent dividends on both preferred and common stock was $207,000 in 1914 as against $2,881,000 in 1913. The company had on hand, however, at the end of 1914, $4,479,000 cash, with no loans or bills payable, and with total working liabilities of but $4,784,000, and with no bonds or notes falling due, except installments on equipment trust certificates, before 1926.*

The Minneapolis, St. Paul & Sault Ste. Marie is a subsidiary of the Canadian Pacific, and itself owns and operates as its Chicago division the Wisconsin Central. The Soo proper operates 2,982 miles of road, and the Wisconsin Central 1,120. The table at the end of these comments gives the income account for the Soo only, the income which the Soo derives from the Wisconsin Central being included, of course, in gross income, but not in operating income. It will be seen that the Soo is a line of comparatively light traffic, the gross earnings per mile in 1914 being $6,276. The Wisconsin Central earned, in 1914, $9,425 per mile, but its operating ratio was 67.5 as against the Soo's 65.2 per cent. Furthermore, the Soo's operating ratio in 1914 was extraordinarily high for reasons mentioned later, whereas the Wisconsin Central's was only about normal.

The Soo carried, in 1914, 7,203,000 tons of freight as against 7,761,000 in 1913. The average length of haul was 225 miles last year as against 267 miles in the previous year, so that freight density, ton-miles per mile of road, was 543,000 in 1914 as against 711,000 in 1913. Of the total tonnage carried 31 per cent was lumber in 1914, and 27 per cent in 1913, and 20 per cent was grain in 1914, and 23 per cent in 1913. In 1914 10 per cent of the total tonnage was ores, and in 1913 about 8 per cent was ores. The average ton-mile rate in 1914 was 7.87 mills, and in 1913 7.40 mills.

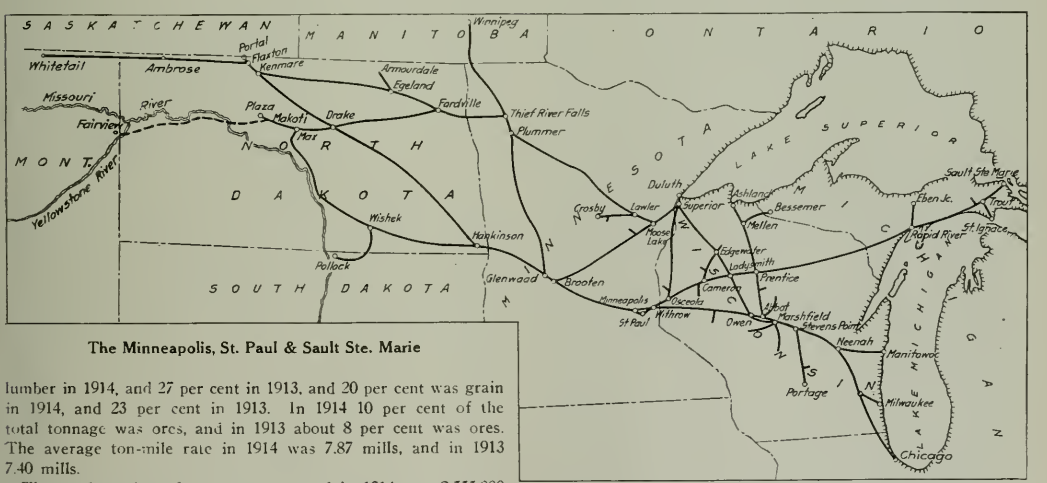
The total number of passengers carried in 1914 was 2,555,300 as against 2,249,000 in the previous year, and the average length of journey was 82 miles as against 88 miles the year before, the passenger density being 70,649 in 1914 and 67,978 in 1913. The average passenger-mile rate was 2.106 cents in 1914 as against 2.303 cents in 1913. With as low a ton-mile rate as the Soo gets, and with its comparatively light traffic and small proportion of coal and ore, its operation ratio in 1913—56.5 per cent—was remarkably low. The increase to 65.2 per cent in 1914 is not hard to explain. Apparently the refunds necessitated by the Minnesota rate case were debited to 1914 freight revenue and passenger revenue. This of itself would explain a bookkeeping higher operating ratio in part, although it would not mean more expensive operation to handle the same amount of business.

Expenses, however, were higher actually in 1914 than in 1913, but only for maintenance. Transportation expenses amounted to $5,664,000 as against $6,090,000 the year before. The average trainload in 1914 was 404 tons as against 422 tons in 1913, the falling off in trainloading being due, apparently, to a greater empty car mileage, the average number of empty cars per train being 7.18 in 1914 as against 6.67 in 1913. There was also some falling off in carloading, the average number of tons per loaded car-mile being 18.29 as against 19.23.

In 1914 the Soo spent $2,384,000 for maintenance of way as against $2,293,000 in 1913, and $3,071,000 for maintenance of equipment as against $2,604,000 in 1913. The principal increases in maintenance of way expenses were in the amounts appropriated for buildings, for bridges, for ties and for rails. President Pennington explains in part that these larger charges were due to the amounts chargeable to operating expenses for structures which were renewed with modern or more permanent structures. In 1914 the company spent a total of $3,229,000 on poperty account, which included $1,198,000 on the Ambrose extension and $1,465,000 for additions and betterments.

The company sold during the year $4,638,000 first consolidated mortgage bonds and $1,280,000 equipment trust notes, and $1,011,000 equipment trust notes were retired. At the beginning of the year there was carried on the balance sheet $372,000 unextinguished discount on securities. During the year $29,736 was charged to profit and loss for the extinguishment of discount, and at the end of the year there was $679,000 unextinguished discount carried on the balance sheet.

The Wisconsin Central had a net corporate income, after the payment of expenses and interest, of $518,000. Its 4 per cent dividend on the preferred stock called for $450,000, so that there was a slight surplus for the year.



The Minneapolis, St. Paul & Sault Ste. Marie

The table shows the figures for operation in 1914 and 1913.

	1914.	1913.
Mileage operated	2,982	2,915
Freight revenue	$12,748,506	$15,330,648
Passenger revenue	4,436,911	4,564,257
Total operating revenues	18,717,689	21,410,672
Maint. of way and structures	2,383,740	2,292,993
Maint. of equipment	3,070,671	2,603,669
Traffic expenses	375,815	357,518
Transportation expenses	5,664,285	6,090,411
General expenses	427,715	458,418
Total operating expenses	11,922,226	11,803,009
Taxes	1,182,367	1,298,968
Operating income	5,326,095	8,015,490
Gross income	6,409,338	8,886,540
Net income	2,853,502	5,537,415
Dividends	2,646,714	2,646,714
Surplus	206,788	2,880,701

*The Wisconsin Central has $776,000 divisional mortgage falling due in March, 1916.

Terminal Yard Operation Papers—Third Series

Four Papers Which Discuss System, Order of Placing Cars, Organization and Discipline in the Terminal Yard

EVERY CAR IN ITS PLACE ON TIME

By W. T. Sutphen

General Yardmaster, Southern Ry., Macon, Ga.

Among the problems and difficulties encountered in the operation of a terminal yard, the matter of handling cars for freight houses, team tracks, etc., is of primary importance. Perhaps the most important essential in the handling of such cars is that of having sufficient tracks upon which to classify them when they are first shoved over the hump (if a hump yard), or switched out from the trains and transfers in which they are received, thus reducing to a minimum the cost and work of classifying them into trains or cuts for the different routes or districts each outside engine works.

The freight houses should be "pulled" and "spotted" by the night crews, and nothing put in or taken out of the house during the day except that which is absolutely necessary. Trying to switch cars at the local house or transfer platforms that are only party loaded, causes trouble and confusion. Also nothing is more exasperating or discouraging to an agent than for him to go down in the morning and find his house not "spotted," and a big gang of men idle on this account. The freight houses should be "pulled" on a regular schedule, except where special package cars have to be gotten out to go on certain trains before the regular closing time of the house, and these package cars should be loaded in the head of one or more tracks, so that they may be taken out without moving the balance of the cars on such tracks. Team tracks should be worked, as far as possible, by the "house" engine, and handled in the same manner as "house" work. Where such tracks are isolated from the "house" yard, then they should be handled and worked the same as private industries.

As far as possible, a regular schedule should be maintained for working all industries. All cars for each of the outside runs should be assembled in the classification or train yard, so as to get each engine started as early as possible after the crew comes on duty, instead of having them go into the multifarious tracks and try to switch up their own trains, with the probability of blocking each other while doing so.

Each engine foreman should have a specific territory assigned to him. This tends not only to familiarize him with his work and increase his efficiency, but is a means of minimizing complaints. He should not have more work assigned to him than he is able to clean up each day, but he should be made to understand that when the work on his particular territory is finished, he is to come in and help out in some other place, if needed. Good assistants will insure the enforcement of such instructions. The foremen should also be instructed to telephone the chief clerk occasionally, while on their outside runs, to see if any special orders have come in which will be necessary for them to take care of. Each foreman should be required to book all cars put in or taken out of private sidings, showing the time the service was performed, and turn in the book, at the completion of each day's work, so that it can be copied into a permanent record.

The engines assigned to outside work should gather up all outbound loads and empties, and deliver them into the receiving yard, properly tagged, so that the foreman working that yard will know what to do with them. All cars received in trains or transfers should be tagged with a good, substantial tag, securely fastened, showing the date received, contents, consignee and home route of car; and if "order notify," it should be so stated on the tag. All "order notify" shipments should be kept in a "hold" track until the agent authorizes such cars to be delivered.

Where possible, there should always be a "roustabout" engine, that can go anywhere to take care of emergency and accommodation work, and also to help out any other engine which, for any reason, has gotten behind with its work. What all shippers want is prompt and dependable service, and if the railroads expect to keep down complaints, it is absolutely necessary to furnish such service.

A daily and systematic check of the entire terminal is absolutely essential, with a view of determining, at any time, if any of the cars are getting old or are being unnecessarily delayed. It is especially important to constantly scrutinize the "no-bill" list, and to keep after the agent for bills.

The chief clerk is a very important factor in a terminal organization, and can make himself almost invaluable, as he is, necessarily, the principal representative and reliance of the general yardmaster or terminal head in the handling of the office and answering the majority of the calls on the telephone. The head of the terminal, or his assistants, should endeavor to cover all of his territory daily, and see all of his foremen at least once a day, with view of satisfying himself that they are keeping up with the work. It is important, also, for him to get acquainted with all the shippers or heads of industries located on the terminal, and where possible, they should be personally visited every few days, or called over the telephone, with a view of ascertaining if their work is being properly taken care of, and if they are satisfied.

No organization is perfect, and the only way to have it anywhere nearly so is by constantly watching and trying to correct the mistakes that come up from day to day. Every man, of course, is expected to be loyal to the company and its officers, and any man found wanting in this respect should be dropped from the service.

Last, but of not least importance, is the feature of cost of operation, which the head of the terminal should closely watch each day, and make such changes, from time to time, as may be necessary to keep the expenses and cost per car down to a minimum. He should have, every morning, a complete report showing the number of cars handled on the terminal the previous 24 hours, ending at midnight, the number of men and engines worked, and the total money expended, including office expense, as well as the average cost per car; and thus be fully informed, at all times, as to what he is doing, and what it is costing him every day.

Summarized, terminal yard operation consists in having a place for every car, and putting every car in its place when one first takes hold of it.

SYSTEM IN YARD OPERATION

By W. L. Derr

Division Superintendent, Chicago Great Western, Clarion, Ia.

A modern yard has its receiving tracks, classification tracks, sorting tracks, and advance tracks, and any yard not so arranged must have certain tracks set apart for each of these functions. It may be that your yard consists of a set of parallel tracks only; if so, certain of them must be set aside as receiving tracks, others as classification tracks, and still others as advance tracks.

The modern development of railroading has rendered it necessary for a yardmaster to acquire an ever increasing burden of knowledge, so that to-day he is one of the hardest worked officers on a railroad. Whatever may have been his earlier training, the best training for yard men is yard work.

Every yard should contain a fair number of seasoned men who have had actual experience in yard work. Military experts understand the inestimable moral effect which the presence of vet-

erans has on untried recruits, and this condition holds good in railroading generally, and yard work in particular.

A yard cannot be handled successfully without a most complete record of each car entering the yard, its moves while in the yard, and its departure from the yard. There are numerous methods of keeping such records, but any method which does not show who had charge of the car and was responsible for its movements every minute of the period during which the car was in the yard, is defective.

The reason for putting a train into a yard is to classify the cars into lots for various points, and sometimes, but rarely, to classify the various commodities. To start with, the train must be received on certain tracks. Ahead of the receiving tracks are the classification tracks, and ahead means in the direction which the car lading is moving, for nothing so much indicates bad yard design as an arrangement of tracks making a backward car movement necessary. The blocking of even one classification track blocks the entire classification system of a yard, hence the necessity for promptly relieving a filled classification track. This can best be done by having a series of tracks in advance of the classification tracks—advance tracks—in which the classified cars can be placed, and from there sent onward in trains.

On a railroad the engine holds about the same position as the artillery does in an army—with plenty of it, you win, without it, you lose; therefore, the quick handling of engines is one of the most important functions in yard working. Yardmasters should keep in close touch with the roundhouse foreman and aid him in every way, especially seeing to it that engine coal is promptly placed at the pockets; and that cinder cars are handled quickly, for the cinder pit is the critical point in the locomotive terminal, especially during severe weather.

In closing, just a few words to the yard designer: Always provide a track holding eight to ten cars, at the outgoing end of a yard, upon which disabled cars can be placed. Keep in mind that some defect may be found in a car after it is placed on an advance track, or a drawbar may be pulled out just as a train is leaving the yard, making it necessary to set out the car and do it quickly. If left on the advance track the car often has to be handled over and over while waiting to be taken to a repair track.

THE ORGANIZATION OF INDUSTRIAL SWITCHING

By Fred P. Grossman

General Yardmaster, C. St. P. M. & O., Minneapolis, Minn.

The methods to be employed in taking care of the business in a terminal are, and have been, a live issue. The hardest problem is to perfect an organization which will run smoothly under all conditions, and when this has been done—to preserve it. This is specially difficult during a rush of business, when one is putting on more engines, and the old helpers are placed in charge with new crews.

The next important problem is the placing of cars at freight houses, team tracks, industries and for connecting lines. All cars containing perishable freight are given first preference, as the delivery of freight at the house is just as important as that for the team track, this rule also applying to such traffic for the industries, as well as the meat houses. A very important part in the handling of such traffic rests with the traffic department, as well as with the agent, and when those departments work in harmony with the general yardmaster, and give him the necessary information, there should be no fall-down. We are advised directly by our traffic department and solicitors, as well as by the agent, regarding promises which have been made in order to secure the business, and the prompt switching service required to hold it; we are given the car numbers and are told in what train the cars will arrive. The time of arrival is given us by the chief despatcher.

Should a car come in bad order, it is promptly removed to the repair track if heavy repairs are necessary. In this connection, where team track cars come in and are placed before inspection, especially fruit, our car repairers make the repairs on the team track, so as not to delay any car that may be diverted to a connecting line at the last moment, or re-consigned to some point on our line. These diversions are always made after 4 p. m., and the cars are delivered to the connecting line by 6 p. m. Team tracks are pulled twice every 24 hours, and kept free from all empties and diverted cars, giving us room for all inbound freight.

In the fall when receiving a rush of apples or other fruits and vegetables, the agent should make special arrangements with the consignor to warehouse them in private storehouses, after a reasonable length of time has elapsed, in order to release the cars and also to provide more room for other team track cars. This serves a double purpose by giving room on the team track, and also obviates the necessity of "round-housing" cars containing perishable freight to prevent damage by frost, while no additional help is required on team track to take care of the heaters for these cars.

The icing of refrigerator cars on team tracks must not be overlooked, and is attended to by our fruit inspector on the arrival of the cars. Therefore, when there is a diversion we know immediately if the car must be iced or not. As iced refrigerators are run in special schedule at the outbound freight house, we pay no further attention other than to keep a supply of refrigerators on hand to fill the demand.

We have regular hours for the handling of connecting line business, at which time all orders for empties are filled. As our business is principally the hauling of flour and grain, we furnish the empties. Inspection of flour and grain empties is made during the daylight hours, as the sun will shine through cracks that cannot be found by using a torch at night. Marks left by rain leaking through the side or roof of a car are also easily detected during the day.

In the fall when business is heavy, we call upon connecting line yardmasters and exchange orders. For instance, if we have an order for so many foreign cars for grain loading, and we have that number of cars being unloaded at one of our elevators, we call up the yardmaster and advise him that the order can be filled from cars being unloaded, which avoids handling cars unnecessarily, and keeps the yard free from surplus box cars. Every assistant yardmaster receives a copy of the empty order to be filled, and by keeping a careful check of his yard, can so handle his loads as to enable him to get the cars to fill the empty order. The chief clerk in the general yardmaster's office is kept posted by the assistant yardmasters regarding everything going on, and he in turn gives them the information which it is necessary for them to have, facilitating the handling of the business.

Engines must be assigned to each class of work, and the extra foremen are required to have a working knowledge of all parts of the yard. A meeting of our yardmasters is held every two weeks for the purpose of bettering our organization in every possible way. Each switch engine is worked but ten hours, thus cutting out the overtime.

During the fall when business is heaviest, our grain comes in between 8 p. m. and 8 a. m., which gives us the use of receiving tracks which would otherwise have to be held open. No grain is inspected after 8 a. m., as the inspectors have to get the samples to the Chamber of Commerce before 10 a. m. This also avoids any congestion that might be created by connecting lines pulling their transfers in during the day, and allows the switch engines to work more freely on account of not being blocked by trains pulling in at all hours. The grain business is the slowest moving of any handled in a terminal, as it changes hands more frequently than other commodities. This results in a large number of cars being held up, but this has been overcome to a great extent by pressing demurrage charges.

When possible to do so, all grain should be set for unloading in the opposite direction from the loading, which avoids the double handling of empty cars out of an elevator. Thus if you unload thirty cars of grain, you can immediately pick up these empties and set them on the loading track as they are already

coopered and do not need much attention, whereas new empties must be inspected and perhaps re-coopered. This also makes it possible to place just the kind of cars for unloading that the elevator wishes to load in most cases.

Our industries are all set during the night, consequently we only give them a switch at noon to offset the morning's unloading. All the day men are educated to line up all cars themselves; in fact, every man from the helper to the office man can tell any time of the day on just which track to look for any car, as we never deviate from the assigned tracks. Just as soon as disposition is given, the hold cars are carded. The hold tracks are pulled at 6 p. m. and at 12 noon.

Each foreman has been assigned to a certain territory and works on schedule time. Our patrons understand this, and if they are not ready when the engines come to do their work, they agree to wait until his schedule has been carried out before doing their switching. Our team tracks are seldom pulled during the day, as when one disturbs the unloading, the engine is idle while teams drive away from the cars, and freight is left in the cars in such shape that it is liable to fall and become damaged.

THE IMPORTANCE OF DISCIPLINE IN TERMINAL YARDS

By V. R. C. King

Division Superintendent, Atlantic Coast Line, Wilmington, N. C.

In a classification yard the yardmaster in immediate charge has a certain degree of visual supervision. In an industrial yard the yardmaster in charge of a specific territory is largely limited to checking the service rendered, after it has been performed. This difference in supervision is a very important feature which is not always grasped by superior officers. If it be fully recognized it will call for a careful organization, rigid discipline, and an even more careful selection of every class of yard employee, both office and field, than in the case of classification yards.

Any organization naturally starts from the head. The question of title depends largely upon the importance of a terminal yard, and it, and, incidentally the pay, should be commensurate with the responsibility. Regardless of title, the head of the yard should be given absolutely free rein, and made to feel that the fullest confidence is reposed in his ability. Besides being an exceptionally well qualified yard man, with ability to handle men, he must be a diplomat, as he has to deal directly with the public. His organization should be left free and untrammeled, subject only to the general policy of the road toward specific questions and discipline.

There is a wide difference between a disciplinarian and a martinet. It is possible to maintain high class discipline and yet meet the vagaries of human nature. All discipline should be firm and unbending, but it should be absolutely fair. When an organization has been outlined, and proper rules promulgated, the slightest deviation should be handled to a conclusion, and the case decided and closed to prevent recurrence. Punishment in some cases of error will do more harm than good, as they may possibly be due to lack of understanding, or even training, where advice would be better than discipline. The proper disposition of all cases, however, should rest upon the judgment of the head of the yard organization, and his wisdom in such matters will help make him a success or a failure. It is a grave mistake to ever discipline a yardmaster, particularly in these days of reluctant submission to authority upon the part of the yard man, as they must control other men, and should not be humiliated. If yardmasters make too many errors, or maintain poor supervision, they should be entirely removed, or reduced to yard conductors, if they are otherwise good men.

When every member of the organization of an industrial yard has been carefully selected for fitness, a long step has been taken toward successful operation. No member is too insignificant to be slighted, for even the call boy or messenger may be sent upon some errand which may bring him into contact with some patron. In a classification yard, conditions may be unsatisfactory to the management but not felt by the public. In an industrial yard a railroad makes the largest part of its true reputation with the very best section of the public. By reason of this intimate contact with the public the demeanor of each and every employee is of the very highest importance. The finest kind of service will be nullified by discourtesy. As a matter of fact, an industrial yard where discourtesy exists will almost invariably have other weaknesses which will prevent good service as a possible offset to discourtesy.

When the best fitted man has been chosen for each position, no opportunity should be neglected to constantly train and educate him in his special duties, and for promotion. Nothing is more destructive to the esprit-de-corps and personal interest in the company's work than the introduction of an outsider to fill a position which means a promotion. An industrial yard demands the personal interest of each member of the force, as it is a traffic proposition from a broad point of view, and an unlimited means of bringing additional business to the company.

The records in an industrial yard must be promptly and carefully made, and accurately filed for future reference. There is no failure for which a yard conductor should be more quickly and thoroughly disciplined, after he has once been instructed, than the keeping of inaccurate records in regard to the seals and placement of loaded cars. Any yardmaster who knowingly permits slackness of this kind should himself be removed. Yard conductors should not only keep a careful record of empty cars placed for loading, but also of loaded cars moved from industries. A glance at these records will readily disclose the amount of work being performed by any particular yard engine, but, if there is any complaint about the car supply, the yard conductor should turn in a summary of the car situation at any, or even all, industries which he serves, if the work does not warrant the record being taken by a clerk.

An industrial yard requires so many records and so much knowledge of the fundamental relations which should exist between shipper and carrier, and of the rules of track rental, car service, per diem, terminal warehouse, and interchange, that the head of such a yard must be well informed upon these practical matters, in addition to his other qualifications, in order that he may accurately transmit his own knowledge to every member of his force.

Local conditions govern the amount of work which each yard engine can perform, and the route which it can properly serve. It is clearly the duty of the executive, or general yardmaster, to apportion the work of the entire terminal in such a way that the various yard engine routes will produce a maximum efficiency for a minimum of crews, and consequently of cost. His personal grasp of the daily situation should be such that he should never be afraid of not being able to explain why he had to work an additional yard crew. He should be equally well informed to avoid cutting off a yard crew to the detriment of the service.

Overtime is excusable when made for a definite purpose. Two yard crews doubling up on an abandoned route, with a total of four hours' overtime, is cheaper than the cost of the crew formerly assigned. If the dinner hour coincides with that of a large steamer or industry, which may need a mid-day shift, it is inexcusable not to pay the yard crew for their dinner hour and make the shift, instead of keeping forty or fifty truckers idle for an hour later in the day.

One vital principle of organization applying to all industrial yards, regardless of their size or local conditions, is the relation between the agency and the yard. The yard force owes its existence to the agency, and is simply the humble servant of the agency. With the exception of placing and handling empty cars, strictly speaking, no service whatsoever should be performed unless by specific authority of the agency. Any well-regulated yard will have some simple system of acting upon all agency instructions, which should be in duplicate, and of acknowledging same by endorsing thereon the completion of the service when it has been rendered.

The car supply for vessels, industries, and storage warehouses requires a careful daily check for the car distributor or chief despatcher. That for the package warehouse is fairly constant, and the general business can usually be well estimated. Each loaded car being unloaded is a potential empty. A competent yard conductor will see that all cars on his route are kept moving, and will place all empty cars to the best advantage. He will also keep the yardmaster fully posted as to the car supply on his route. This prompt placing of empty cars, however, which have not passed an inspection force is a prolific cause of bad order loaded cars for movement, and hence delayed cars and business. The yard conductor, therefore, should use the utmost care in observing, as far as he can possibly do so, the condition of all cars which he places for loading. Whenever possible inspectors should make light accessible repairs while the car is placed for loading.

The larger the terminal, the greater the chance of higher money value of each facility. Delayed or slow moving cars mean larger per diem bills and loss of equipment. Ordinary car service does not pay for the use of valuable track space. The congestion on the storage tracks of other loaded cars waiting for track space for delivery slows down the yard work, and acts as a drag, in addition to increasing the risk of errors and possibly serious trouble.

To secure the most efficient use of terminal facilities, the question of demurrage must be given vigorous attention, and be closely followed up by the agency force. The question of track space is often more important on a terminal than the prompt handling of equipment. An energetic and business-like terminal force, both yard and agency, will have its effect upon the patrons. The principal objective of a railroad is to move freight, and not to store it. Not only the agency, but the central yard office should be conveniently located for the patrons.

Not much industrial service can be performed at night, unless the plants are working, but it naturally follows that whatever work can be done to advantage should be done. Rapid mobilization at the close of the day's work plays no small part in attaining the goal of quick, accurate yard service, but damaged cars or contents mean delays and claims so that a happy medium must be found between excessive speed and slovenly movement.

If the interchange business be heavy there should be sufficient adjacent trackage upon which to digest the receipts. It is simply impossible to handle a heavy interchange upon one track and there should be separate tracks for receipt and delivery. Bad interchange facilities are apt to lead to sharp practices between the respective local yard forces to the detriment of the interchange business and the ultimate disadvantage of each line interested. The clerical feature of interchange warrants careful organization and accurate records. A joint force is probably the most satisfactory solution when it is justified by the volume of business.

Chinese Railway Extension.—A recent British consular report states that the projected line from Kochiu to Pishihchai on the French railway continues to be the subject of negotiations; but neither the officials, nor the people are in favor of it, as the traffic is not considered to be sufficient to justify its construction. An agreement has recently been made with the Banque Industrielle of Tientsin, a Franco-Chinese institution, for a loan to build a railway from Ch'in Chou, west of Pakhoi in Kuangtung, to Yunnanfu; and, according to the Chinese press, the line will pass through Nanning, Poseh, Singyi and Lo ping. At Singyi it will, presumably, link up with the line from Shashih, the contract for which has been awarded to a British firm. The construction of these two lines, which will place Yunnanfu in railway communication with the Yangtze on the north and the ocean on the south, will be of great benefit to the trade of this province as well as that of Kweichow, for not only will the monopoly now held by the existing line be broken, but, as both these lines will be entirely in Chinese territory, the heavy transit dues in Tonkin will be avoided.

RAILWAY AFFAIRS IN OTHER COUNTRIES

The annual report for the government railway lines of the Union of South Africa for the 12 months ended December 31, 1913, recently issued by W. W. Hoy, the general manager, contains this significant remark: "Having regard to the industrial troubles and the season of drought during 1913, it is satisfactory that the tonnage of traffic and the number of passengers carried should show an improvement." On December 31, 1913, the mileage of the government lines totaled 8,281, of which 7,807 miles was of 3 ft. 6 in. gage and 474 miles of 2 ft. gage, during the year the mileage having been increased 433 or approximately 5.5 per cent. In 1913 there was carried a total of 12,402,526 tons of revenue freight, including 6,985,832 tons of coal, these being increases of 634,928 tons and 461,997 tons, respectively. Although the total tonnage thus showed an increase of 5.58 per cent, the total freight revenue decreased 2.03 per cent, mainly because of rate deductions made in 1912. The total freight revenues were $38,645,456, a decrease of $801,125, and the coal revenues were $9,208,190, a decrease of $381,725. The revenues from passenger traffic in 1913 were $16,447,173. This was an increase of $335,524 over 1912, or 2.08 per cent, but compares with increases in 1912 over 1911 of 7.47 per cent and 1913 over 1910 of 20.07 per cent. The gross earnings for the lines operated were $60,333,237. The gross expenditures were $43,658,040, thereby leaving a surplus of $16,675,197 as compared

Copyright by Underwood & Underwood, N. Y.

Ruins of a Red Cross Train Thrown Into the River Marne at a Wrecked Railway Bridge

with $21,299,836 in 1912 and $23,803,094 in 1911. The operating ratio was thus 72.36 per cent as compared with 64.97 per cent in 1913. The capital expenditure during the year amounted to $11,911,265, the total at the end of the year being $408,032,190, or $48,856 per mile. The report states that when all the lines under construction at present are completed the mileage operated by the South African Railways will be approximately 9,318 miles.

* * *

Lord Rosebery, former prime minister of England, has made a donation of $6,000 to the London School of Economics and Political Science for the endowment of a prize to be awarded annually in the department of railway transportation at that school of the University of London. Regulations giving the conditions for the award will shortly be drawn up by the advisory committee on railway subjects, which includes among its members Sir Samuel Fay, general manager of the Great Central; Sir George Gibb, formerly general manager of the London & South Western; Sir Charles Owens, director of the London & South Western; Francis H. Dent, general manager of the South Eastern & Chatham; Frank Potter, general manager of the Great Western, and H. A. Walker, general manager of the London & South Western.

TRAIN ACCIDENTS IN SEPTEMBER[1]

The following is a list of the most notable train accidents that occurred on the railways of the United States in the month of September, 1914:

		Derailments.				
Date.	Road.	Place.	Cause of Derailm't.	Kind of train.	Kil'd.	Inj'd.
1.	Grand Rapids & I....	Kalamazoo.	flood	P	0	5
1.	Missouri, K. & T....	Chase.	unx	P.	0	11
†15.	St. Louis & S. F....	Lebanon, Mo.	flood	P	28	27
†18.	Alabama G. S.....	Klondyke, Ala.	malice	P	11	42
19.	Balt. & Ohio.....	Woodlyn.	b. journal	P	0	6
25.	Louisville & N..	Turners	d. track	F.	2	1
†28.	Chicago G. W.....	Waverly.	d bridge	P	2	6

The train that was derailed near Kalamazoo, Mich., on the first, was a northbound passenger. Five passengers were slightly injured. The cause of the derailment was the weakening of a bridge abutment by a flood.

The train derailed near Chase, Tex., on the first, was southbound passenger No. 29, and two cars were overturned. Eleven passengers in these cars were injured. A bridge was badly damaged by the derailed cars, but the bodies of the cars were of steel and were not crushed. The tender was the first vehicle to leave the track. The cause of the derailment is reported as not discovered.

The derailment near Lebanon, Mo., on the 15th was reported in the *Railway Age Gazette*, September 18, page 541. Westbound passenger train No. 5 was derailed about 2:50 a. m., because of a weakness in the track due to a flood, the flood having been caused by a cloudburst. Twenty-seven passengers and one employee were killed, nearly or quite all being drowned, and 26 passengers and 1 employee were injured. The train had been running about 45 miles an hour, and had been nearly stopped before it struck the defective track. One coach fell into deep water. It was stated by residents that eight or nine inches of water had fallen within the space of three hours.

The train derailed at Klondyke, Ala., on the 18th was northbound passenger No. 2. Nine passengers and two trainmen were killed and 42 passengers were injured. The train ran over a misplaced switch about 3 a. m., and the engine and first three cars were thrown violently against a loaded freight car standing on a side track. The engineman was killed. M. J. McDonough, commercial agent of the St. Louis & San Francisco at Birmingham, was also among the killed. The switch had been maliciously misplaced immediately before the train reached it. A reward of $1,000 was offered for the capture of the perpetrator of the deed.

The train derailed at Woodlyn, Pa., on the evening of the 19th was a southbound passenger, and five cars left the rails. The train was running at about 50 miles an hour, and one car fell down a high bank. All of the passenger cars, however, were of steel and only six passengers are reported as injured. A bridge across a small creek was destroyed. The derailment was caused by the breaking of a journal.

The train derailed near Turners, Ky., on the 25th was fast freight No. 39. The engine and five cars ran off the track and knocked down five spans of a bridge. The engineman and fireman were killed and a brakeman was injured. It is supposed that the tender was the first vehicle to leave the track. The cause was not discovered; neither was there any evidence that the bridge had been weakened.

The train derailed near Waverly, Iowa, on the 28th was mixed train No. 92 on the Sumner-Waverly branch of the Chicago Great Western. A wooden bridge was being torn down to be replaced by a steel structure; and one span of this bridge collapsed after the engine passed over. The cause could not be ascertained with precision. A combination baggage and passenger car sank with the span, but did not go all the way down to the water. The engine was not derailed but the tender hung suspended, as did a coach. One passenger who was standing on the platform was killed; five others, who were inside of the cars, received slight injuries. One bridgeman at work underneath the structure was killed and one injured. The same engine and train passed over the bridge in the opposite direction about an hour previously. The train was moving about four miles an hour.

Electric Car Accidents.—Of the nine notable electric car accidents reported in the newspapers as occurring in the United States in the month of September six are charged with one or more fatalities each. At Memphis on the 17th a freight train ran into a car on a crossing and eleven passengers were killed, 24 others being injured. The car was struck by a northbound freight (of 90 cars) just after a southbound freight had cleared the crossing. The engineman saw the street car (as soon as the southbound freight had passed him) about 330 ft. before reaching the crossing. He saw that it was about to cross and applied the brakes, but could not stop; he reduced his speed from 16 miles an hour to about 10 miles an hour. In a similar accident at Bridgeton, N. J., on the 8th four persons were killed, and in a butting collision at Wenham, Mass., on the 16th, three were killed. Accidents at South Thomaston, Maine, at Mahanoy City, Pa., and at Wilkesbarre, Pa., caused the death of one each.

[1]Abbreviations and marks used in Accident List:
rc, Rear collision——bc, butting collision——xc, Other collisions——b, Broken——d, Defective——unf, Unforeseen obstruction——unx, Unexplained——derail, Open derailing switch——ms, Misplaced switch——acc. obst., Accidental obstruction——malice, Malicious obstruction of track, etc.——boiler, Explosion of locomotive on road——fire, Cars burned while running——P. or Pass., Passenger train——F. or Ft., Freight train (including empty engines, work trains, etc.)——Asterisk, Wreck wholly or partly destroyed by fire——Dagger, One or more passengers killed.

THE MAINE PUBLIC UTILITIES COMMISSION

As has been announced in these columns, the state of Maine has provided for a new commission to take the place of the railroad commission which has supervised railroad affairs in that state for the last 55 years. The new law was adopted last year, but it has only gone into effect this present month, because the voters of Maine have a referendum privilege, and the people had to wait till September, 1914, to settle whether those opposed to the new law were to have their way. The present status of affairs is set forth by a correspondent writing from Bangor, who says:

The voters of Maine have retained the act creating the Maine Public Utilities Commission by a vote of 67,365 in favor and 37,008 opposed. It is now pretty well determined that Governor Haines, despite vigorous opposition from all over the state, has made up his mind to create a board consisting of three lawyers. There is strong opposition to this procedure, but it appears certain that the chairman of the new board will be Associate Justice A. M. Spear, of the Supreme Court of Maine, who will resign his position on the bench to accept the new appointment. The other two members of the board, it is believed, will be Samuel W. Gould, of Skowhegan, ex-congressman—as previously announced in the *Railway Age Gazette*—and W. B. Skelton, of Lewiston, ex-state bank examiner. All three are lawyers, and this fact has led to the presentation of a large number of protests at the governor's office. Arthur Chapin, of Bangor, the president of the state board of trade, calls for the rational plan of a lawyer, a business man and a practical railroad man. "There should be a practical financier on the board," said he, "for the protection of all interests." A prominent railroad officer, who seconds Mr. Chapin's proposal for a lawyer, a business man and a railroad man on the new board, expresses similar sentiments: "If the governor appoints lawyers alone," said this officer, "all they will look after will be the legal end of the questions that come before them. They are trained to look at the law first, and that is their sole business. A business man of practical training should also be a member of the commission for the reason that the gas and electric coroporations, telephone companies, etc., are under its jurisdiction."

Before the referendum was taken upon the act creating the commission, Governor Haines had decided to appoint three lawyers, and it is the belief of many citizens that this fact was largely responsible for the referendum on the act.

A New Plan of Government Control of Railways*

Regulation Has Failed, and the Public Should Guarantee Securities and Have Representative Directors

By E. P. Ripley
President, Atchison, Topeka & Santa Fe

You all know how fashionable it has been to acquire notoriety by abuse of the railroads. You remember Louis Brandeis, Tom Lawson, Senator Cummins and LaFollette, to say nothing of our friends Murdock and Bristow, who, knowing but little, protested much and forcibly against granting to the railroads any relief. You remember that for many years the quack nostrums prescribed by such men were in favor, their misleading statistics accepted as facts, until it has now become apparent to all that the patient is seriously ill; that the patent medicines have wholly failed and that other methods must be followed.

The government has, so to speak, befouled its own nest—it has destroyed the confidence of the American investor in the securities of its own home roads. The attitude of Congress and of many of the state legislatures has been to regard the railroads as a criminal class—every statute has bristled with prohibitions and penalties and the most influential politicians have been those who could devise new means of torture for railroad stockholders and managers.

Unfortunately enough, there has been developed certain irregularities, perhaps dishonesties in the management of certain corporations, and these have been seized upon as a justification for putting a strait-jacket on the entire transportation business of the country.

I hope it is needless for me to say that I do not approve some of the methods that have been pursued, but these cases of corporate mismanagement or incompetency are the exception and not the rule. For seven years the books of the railroads have been open to the inspection of the Interstate Commerce Commission, and every facility offered to enable that body to ascertain the facts. I maintain that during the last ten years no other business has been conducted on any higher moral plane or with greater regard to economy or efficiency. To condemn all because of the shortcomings of a few is as unjust as to condemn all banks because some of them are badly managed. The crowning act of injustice as well as folly is the practical disfranchisement of railroad securities as a basis for asset currency. The railroad securities of this country have been regarded as "gilt-edged"; they have been favorite investments for savings banks and insurance companies—safeguarding the savings of the thrifty of our population, and they were beginning to be popular in Europe, also. An eminent authority on financial matters says:

"The exclusion of railroad and industrial securities as bases for emergency currency was not the result of wise and patriotic lawmaking, but was done in response to ignorant popular clamor against railroads and big business—to spite capital."

The government passes on and approves the investments of our fiduciary institutions—it says in effect that railroad securities are good enough to secure your money and mine, but not good enough for acceptance by government as basis for issuing currency, thus putting all the world on its guard against the securities of the largest industry of the country.

In the strained conditions that prevail in Europe it is altogether likely that as soon as our exchanges are open European investors will seek to return us large quantities of our securities. Who will buy them? Why should anybody buy them, since our own Congress has said in effect that they are secondary in security to bonds of municipalities or states? If there are no buyers there will be no price. Picture to yourself the result of a flood of securities on the market and no buyers. What will be the effect on savings banks, insurance companies, colleges—all fiduciary and benevolent institutions, whose assets consist largely in railroad securities? With a shrinkage of values of unknown size, they will be practically bankrupt.

I am not an alarmist, and I do not wish to paint a gloomy view of the situation, yet I do not think I have exaggerated the crisis to which hysteria and systematic muckraking have brought us.

It would be a foolish thing to prophesy disaster and to offer no remedy or palliative. The present system cannot last. It may almost be said to have broken down already, and talk of flying to government ownership as being the only recourse is getting more and more common. But the public knows too well what the operation of the railroads by government agencies would mean—the waste, the inefficiency, the political pull. No one can point to any business enterprise successfully and economically conducted by government, and to exchange the efficiency of present methods for those of a government bureau would be a bad bargain, indeed.

I said that no business had been well conducted by government, and I repeat it, but some people point to the post office and to the Panama canal construction as evidence that government can do things.

As to the post office, it is archaic in its methods, wasteful in its administration—such efficiency as it possesses comes mostly from the service rendered by the railroads, for which they are underpaid. I would guarantee to form a syndicate which would give a better service for less money and pay the railroads fairly at the same time.

As to Panama, the work has doubtless been done well and promptly, yet it may be permitted us to doubt if a private corporation might not have done it as well for much less money; and it should be remembered that the reason for such success as it has had lies in the fact of its entire divorcement from politics. We cannot trust Congress to keep its hands out of business matters. It interferes in our post office service, our diplomatic service, our navy and army matters and our Interstate Commerce Commission. What would the conditions be if government attempted railroad operation? I believe that there is not at present in this country any considerable sentiment in favor of government ownership in view of its probable consequences, and yet those who study conditions and who realize that the present system cannot stand have not as yet perceived any other alternative.

The proper settlement of this railroad question concerns every man, woman and child and is likely to have most important bearings on the future of the country. Shall we continue the policy of starving the railroads into inefficiency and semi-paralysis, or take them into the absolute ownership and control of government, or turn them loose to shift for themselves free of all restraint?

The first method is being tried and has gone far enough to demonstrate its impracticability; the second would, in the opinion of most of us, be disastrous. I do not favor the third, for I believe the public should be considered and should have a voice in railroad questions which concern its welfare.

The present system of so-called "regulation" is failing, if

*An address delivered before the Knife and Fork Club, Kansas City, Mo., on October 24.

it has not failed already. Is there no relief save in government ownership and operation? Why not try at least experimentally a middle course?

Every night five magnificent trains leave Chicago at practically the same hour for Kansas City. Each train carries every modern device for the comfort of passengers and not one of them is loaded to its capacity.

Six trains leave Chicago for Omaha nightly and five for St. Paul, and of all of them the same may be said.

Probably one of these trains—certainly two of them—would amply care for all the business and a great saving would result from discontinuing the other four. This is only one instance of what could be accomplished by co-operation—which, by the way, is forbidden by law.

Every one knows that if all the roads reaching Kansas City were under one management the business could be done better and cheaper.

Suppose the government should say to each of the lines serving certain territory, we will guarantee that your net earnings for the next five years shall not be less than the average for the last five, and you shall also be guaranteed six per cent on any additions and betterments which (with our consent) may be made on the property. In return we demand one or more seats on your board and the power of absolute veto upon any act or proposed act which we consider deleterious to the community or otherwise improper.

Would not this give us all the admitted benefits of common control, all the economies incident to common ownership, and at the same time protect the rights of the public? Would it not do away with the enormous waste of the competitive system and permit the business to follow the line of least resistance, with the result of lessened expenses and probably lower rates? Who would be injured by it? Would anybody lose by it?

Suppose the establishment of railway "groups" somewhat after the manner of "Regional Reserve Banks"—each group governed by a board of directors in which the government may be fully represented. Suppose all unnecessary train service be dispensed with, all ticket and freight solicitors and their offices eliminated, with the consequent expense. Would not net earnings be at once improved and the guaranty of the government at once rendered safe? Would not the result be the immediate restoration of confidence? I do not belittle the difficulty of such an arrangement, and I realize that everything would depend on the men selected for such control.

And further, I wish it understood that the suggestion is wholly that of an individual, and that I am not making it officially. I do not know that my own board of directors would approve it, still less what view others may take of it: it is simply a possible solution of a difficult problem, and it may perhaps serve as food for thought for abler minds than mine.

To me it seems perfectly clear that the present system under which private individuals are expected to furnish the cash, while a group of lawyers at Washington provide a management out of their own theories, cannot possibly continue. Something will certainly have to be done very soon.

In the celebrated case of Bardell vs. Pickwick we read that one Mr. "Phunky" was intrusted with the duty of "opening the case," and the chronicler adds that when opened the "case" appeared to have very little inside of it. If it shall appear to you that the same remark would suitably apply to what I have said remember that it was your worthy secretary who procured for you the affliction.

LOCOMOTIVE PERFORMANCE ON THE CHICAGO GREAT WESTERN

The Chicago Great Western has made a very interesting comparison of the performance of 10 Consolidation, 10 Mallet and 10 Mikado locomotives during the 12 months ending March 31, 1914, with a view of determining which class of engines proved to be the most efficient. These 30 engines were operated over the Eastern division between Stockton, Ill., and Oelwein, Iowa, under as nearly comparable conditions as possible throughout the 12 months. A careful record was kept of the mileage, tons hauled, operating expenses and repair expenses, together with the amount of coal consumed, these figures being included in the accompanying table.

Average Performance of Ten Locomotives in Each Class for 12 Months Ending March 31, 1914

Class of locomotive	Consolidation	Mallet	Mikado
Total mileage	20,609.8	14,035.8	33,764.8
Operating expenses*	9,170.42	7,463.73	13,944.64
Running repairs**	1,543.30	1,444.68	2,971.96
Shop repairs	1,196.86	2,568.34	1,944.67
Total repairs	2,740.16	4,013.02	4,916.63
Total operating expense and repairs	11,910.58	11,476.75	18,861.27
Coal consumed (tons)	3,124.5	2,509.9	4,746.4
Potential ton miles	34,045,358	27,296,555	71,565,805
Gross ton miles (incl. lading and cars)	24,819,920	22,876,360	62,195,000
Percentage of gross to potential ton miles	72.90	83.81	86.91
Gross tons per mile	1,204.3	1,909.5	1,842.0
Coal consumed per 100 gross ton miles (lb.)	24.11	19.79	15.22
Coal consumed per engine mile (lb.)	303.21	357.64	281.14
Cost per 100 gross ton miles (cents)	4.58	4.32	3.02
Cost per engine mile (cents)	57.79	81.77	55.86
Cost of maintenance—			
Per 100 gross ton miles (cents)	1.102	1.752	0.687
Per engine mile (cents)	13.30	28.60	14.55
Per work unit† (dollars)	2.85	3.52	2.65
Per road unit†† (dollars)	66.8	93.1	66.8

*Includes enginemen, enginehouse expenses, fuel, lubricants and other supplies.

**Includes running repairs made at Oelwein shops and at other points.

†Work unit equals tractive effort multiplied by locomotive miles, divided by 1,000,000.

††Road unit equals weight on drivers in pounds multiplied by locomotive miles and divided by 100,000,000.

Note.—The figure for shop repairs for the Consolidation engines is based on the average cost of the repairs of all Consolidation engines and divided between the 10 engines under consideration on the basis of mileage made by each engine against the total mileage made by all Consolidation engines.

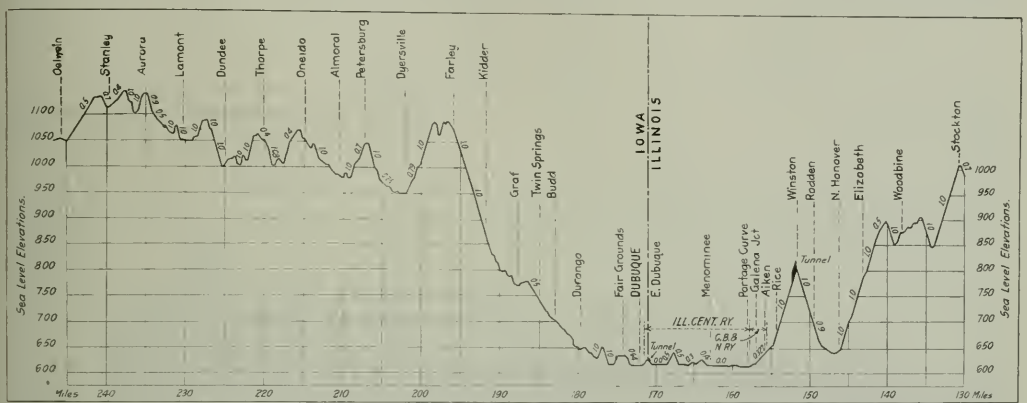
The locomotives used in each class were of the same dimensions and all three classes were equipped with brick arches. The Mikado engines were the only ones equipped with superheaters. The Consolidation engines weigh 198,850 lb. on drivers, and have

Chicago Great Western Mallet Type Locomotive

a tractive effort of 46,630 lb. The Mallet engines have a weight of 307,000 lb. on drivers, and a tractive effort of 81,175 lb. The Mikado engines have a weight on drivers of 218,000 lb. with a tractive effort of 55,000 lb. The general dimensions of the engines are given in the table at the end of the article.

It will be noted from the table showing the average performance of the different classes, that the Mikado type engines performed a greater mileage than either the Consolidation or the Mallet

It is surprising to note the relatively small amount of gross tons per mile for the Mallet locomotives with such a high percentage of gross to potential ton miles. This, of itself, would speak very favorably for the Mikado design for road service, especially with the designs of engines under consideration. The cost of maintenance per work unit and per road unit shows the Consolidation and the Mikado very nearly on a par, with the Mallet much more expensive to maintain. This, however, is to be



Profile of the Division of the Chicago Great Western Over Which the Locomotives Were Operated

engines. This may be accounted for by the fact that the Mikado engines were given the preference in fast freight runs. However, the number of gross tons per mile for them was very much greater than that handled by the Mallets in proportion to the power of the two kinds of engines. The cost for operating and repairs per 100 gross ton miles shows a marked efficiency for the Mikado type engine; but it should be remembered that the service in which the Mikado engines was used permitted of greater

expected of the Mallet locomotive. The general dimensions and proportions of the three types of locomotives follow:

General Data

	2-8-0	2-6-6-2	2-8-2
Type	Freight	Freight	Freight
Service	Bit. coal	Bit. coal	Bit. coal
Fuel	46,630 lb.	81,175 lb.	55,000 lb.
Tractive effort	222,650 lb	353,100 lb.	283,000 lb.
Weight in working order.	198,850 lb.	307,000 lb.	218,000 lb.
Weight on drivers	23,800 lb.	21,900 lb.	25,000 lb.
Weight on leading truck..	.....	24,200 lb.	40,000 lb.

Consolidation Type Locomotive in Service on the Chicago Great Western

economy in fuel. The cost of maintenance, that is, the running and shop repairs per 100 gross ton miles, also shows a material saving to the credit of the Mikado type engine. These two sets of figures show, perhaps, to better advantage the actual cost of operation of the different types of locomotives. Without a doubt, a large part of the savings made by the Mikado type engine is accounted for by the use of the superheater. However, credit must be given to the Mikado design, which has in so many cases proved to be a very economical design of engine for freight service.

Weight on engine and tender in working order...	434,000 lb.	502,100 lb.	371,650 lb.

*Total equivalent heating surface = total evaporative heating surface + 1.5 times the superheating surface.

SANTA FE LOSS AND DAMAGE COMMITTEE

On the Atchison, Topeka & Santa Fe, as was noted in an article by H. R. Lake in the *Railway Age Gazette* of August 7, the investigation of over-short and damage reports has been given to the operating department and is primarily in the hands of the chief clerks to the general superintendents. The co-operation of other departments, however, is secured by various loss and damage committees, the most important of which covers the entire system and meets semi-annually. At the last meeting of this committee, held at Pueblo, Col., on September 28, there were present 125 representatives of the operating, traffic, mechanical and accounting departments from all over the system and several reports were read that give interesting facts in addition to those published in Mr. Lake's article.

It was shown, for example, that the highest per cent of the total amount paid for loss and damage was on the following commodities: Fruit, 8.14 per cent; grain, 8.04 per cent; live stock, 5.02 per cent; oil, 4.15 per cent, and household goods, 3.17 per cent, responsibility for the various claims being placed as follows: defective equipment, 3.1 per cent; wreck, 0.5 per cent; delay, 1.4 per cent; fire, .05 per cent; concealed loss, mostly damage, 5 per cent; concealed damage, 10 per cent; loss from improper packing, 7.5 per cent; loss from bulk shipments, 7.5 per cent; freezing, 0.7 per cent.

The Santa Fe has a very large and important traffic in live stock. In the past five years the number of cars of stock which it has handled has increased more than 10 per cent, but at the same time there has been a reduction in the average payment on live-stock claims from $2.93 per car in the fiscal year ending June 30, 1910, to $1.25 in 1914, a decrease of 57 per cent.

The committee has planned to direct its efforts, between this and its next semi-annual meeting, towards the reduction in the damage account on less than carload shipments. Thus far, but little headway has been made in this direction, and whereas the payment for loss on less than carload shipments has been reduced 20 per cent in a year and for damage on carload shipments 35 per cent, the amounts paid for damage on less than carload shipments have been reduced but two per cent. As part of the campaign the committee has adopted a book illustrating the proper method of loading less than carload freight, which is to be placed in every freight house. An expert will also be sent out to lecture to freight handlers on the subject and he will be able to give point to his remarks by means of a display of miniature loaded cars which he will take with him.

That the officers of the company are taking great interest in this loss and damage work is shown by the following message from President E. P. Ripley which was read at the meeting:

"I am sending this to express my appreciation of the results already obtained in the loss and damage movement, and the hope that as much progress be made during the coming year. All these loss and damage payments are net reductions. We paid last year a little over $700,000 in such claims, and it should be remembered that in order to make a profit of a like sum we would have to add about two and a half million in earnings. Putting it in another way: The $700,000 paid out is more than half of one per cent of our common stock. When we consider that the cause of this payment is nearly all human carelessness it looks very large. The encouraging feature of it is that it is on the down-grade. Here's hoping that its pace can be accelerated."

The New Kansas City, Mo., Union Passenger Station

This Is One of the Largest in the Country, Providing Facilities for All Roads Entering the City

The opening for traffic of the new Union passenger station at Kansas City, Mo., next Sunday, November 1, marks the completion of the main unit in one of the most comprehensive railway terminal developments ever undertaken in this country. This project, involving an expenditure of over $40,000,000, not only provides a new, modern passenger station for all the roads entering the city, but also includes the construction of a belt line around the city with the reduction of grades on a portion of the existing line from 1.5 per cent to 0.9 per cent, the separation of all grades with streets within the limits of the improvements on the existing line, the building of two new freight yards for the interchange of traffic, the construction of four local freight houses and one new team track yard. Work on this project has been prosecuted actively for the past four years and it is now practically all completed with the exception of the construction of a double deck, double track bridge across the Kaw river and an 8,000 ft. double track steel viaduct, which, combined, provide a direct entrance to the station for the four roads entering from Kansas City, Kan., and which latter work has been delayed by negotiations with the city of Kansas City, Kan. The entire development was described in detail in the *Railway Age Gazette* of May 23, 1913. This article will, therefore, refer only to the passenger station.

Front View of the Station Building Showing Office Wings and Carriage Concourse

This project has been carried out by the Kansas City Terminal Railway Company, a corporation formed for this purpose. The stock is owned equally by 12 roads, the Atchison, Topeka & Santa Fe, the Chicago & Alton, the Chicago, Burlington & Quincy, the Chicago, Rock Island & Pacific, the Chicago, Milwaukee & St. Paul, the Missouri, Kansas & Texas, the Missouri Pacific, the St. Louis & San Francisco, the Union Pacific, the Wabash, the Chicago Great Western, and the Kansas City Southern, which, together with the Quincy, Omaha & Kansas City, a subsidiary of the Burlington, include all the roads entering the city. With the exception of the Kansas City Southern, the Chicago Great Western and the Quincy, Omaha & Kansas City, all the roads formerly used the old Union station, while the three roads mentioned occupied the Grand Central station at Second and Wyandotte streets. Certain trains of the Rock Island, St. Paul and Santa Fe also stopped at a third station at Grand avenue and Twenty-second street on their way in to the old Union depot. All of these stations have been badly congested for several years and they did not afford the modern facilities now demanded by the traveling public. These conditions led to the construction of the new Union station for the joint use of all the roads entering Kansas City.

There is no suburban traffic at Kansas City and a large proportion of the passengers are ticketed through, transferring from one road or train to another with the consequent waiting in the station between trains. With this very heavy transfer much greater space is required for waiting rooms and attendant facilities and for the handling of baggage, than is customarily found in modern terminals, especially in a city of 250,000 population. Over 260 scheduled trains, exclusive of extra sections and special trains, entered and departed from the Union and Grand Central stations daily. The maximum number of scheduled trains in one hour was 30. The number of passengers handled in 24 hours varies from 20,000 to 35,000, over 30 per cent of whom are ticketed through in addition to a large number who buy locally to Kansas City and then to destination. It was frequently necessary to accommodate 1,500 persons in the waiting room of the old Union station alone at one time.

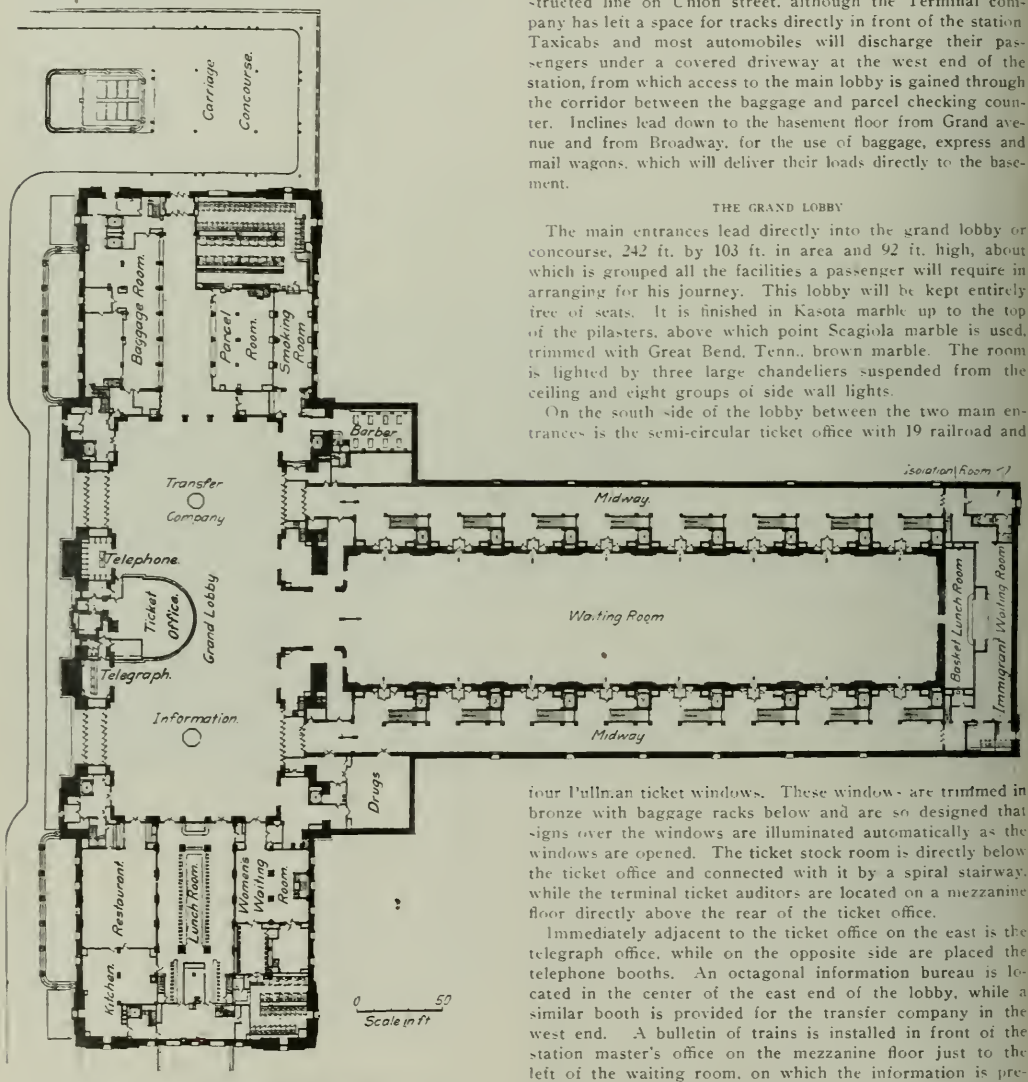
While most of the trains terminate here, the Santa Fe, the Rock Island and the Missouri Pacific operate a number of trains through Kansas City. Practically all of these trains require the inserting or cutting out of dining cars, connecting line sleepers, or other cars in the station with the minimum delay. This requires a flexible track layout, permitting switching to be done without interference with other trains.

THE NEW STATION

The new station is located at Twenty-third street between Grand avenue and Broadway, near the present Grand avenue station and about two miles southeast of the old Union station. It is thus situated midway between the business center of the city on the north and the principal residence district on the south. The station is a massive building of stone and concrete, costing $6,000,000, or with the land, tracks and other appurtenances, about $11,000,000. It is built in the shape of a "T" with the head house facing on a plaza fronting which

is a park area of about eight acres, which will be graded down and beautified by the city. The head house is 510 ft. long by 143 ft. wide and six stories high, the upper two floors in the wings of the building being devoted to offices for the terminal company and tenant roads. The stem of the "T" is 410 ft. long by 165 ft. wide and extends out over the tracks.

The new building is of steel construction with concrete walls up to the first story or plaza level. Above this, it is faced



Floor Plan of New Kansas City Union Station

with Bedford limestone trimmed with Maine granite on the prominent faces and bush-hammered concrete elsewhere. It is founded on rock throughout, except for a few piers in the trainshed, which are in an old creek bed and are carried on concrete piles driven to rock and capped by a concrete slab.

An 80-ft. driveway and a 20-ft. sidewalk have been provided in front of the station. Facing on this driveway are three large arched windows separated by massive columns. The main entrances lead from this driveway under the two end windows and are protected by canopies extending to the curb line. These main entrances to the station will be used by all passengers arriving on foot, on street cars or by private automobiles. Up to the present time the local street railway system has made no provision for street car service nearer than the existing line on Grand avenue and a recently constructed line on Union street, although the Terminal company has left a space for tracks directly in front of the station. Taxicabs and most automobiles will discharge their passengers under a covered driveway at the west end of the station, from which access to the main lobby is gained through the corridor between the baggage and parcel checking counter. Inclines lead down to the basement floor from Grand avenue and from Broadway, for the use of baggage, express and mail wagons, which will deliver their loads directly to the basement.

THE GRAND LOBBY

The main entrances lead directly into the grand lobby or concourse, 242 ft. by 103 ft. in area and 92 ft. high, about which is grouped all the facilities a passenger will require in arranging for his journey. This lobby will be kept entirely free of seats. It is finished in Kasota marble up to the top of the pilasters, above which point Scagiola marble is used, trimmed with Great Bend, Tenn., brown marble. The room is lighted by three large chandeliers suspended from the ceiling and eight groups of side wall lights.

On the south side of the lobby between the two main entrances is the semi-circular ticket office with 19 railroad and four Pullman ticket windows. These windows are trimmed in bronze with baggage racks below and are so designed that signs over the windows are illuminated automatically as the windows are opened. The ticket stock room is directly below the ticket office and connected with it by a spiral stairway, while the terminal ticket auditors are located on a mezzanine floor directly above the rear of the ticket office.

Immediately adjacent to the ticket office on the east is the telegraph office, while on the opposite side are placed the telephone booths. An octagonal information bureau is located in the center of the east end of the lobby, while a similar booth is provided for the transfer company in the west end. A bulletin of trains is installed in front of the station master's office on the mezzanine floor just to the left of the waiting room, on which the information is presented by means of small metallic letters placed in slots according to a system devised by the Commercial Sign Company, Ashtabula, Ohio. No train announcing system will be installed at present and all trains will be called by ushers.

THE WAITING ROOMS

Directly opposite the ticket office and opening from the grand lobby is the general waiting room, 352 ft. long by 78 ft. wide. This area is given up largely to seats, having 44

double mahogany seats with a capacity of 750 persons. This room is finished in terra cotta with a base of Great Bend marble and a paneled plaster ceiling. Natural illumination is provided by large triple windows over each train gate while large light clusters are placed along each side wall.

On each side of this room are eight train gates, directly back of which is an exterior concourse are stairways leading to the platforms below. Each gate is equipped with two National train indicators. In this way the passengers are enabled to remain seated in the waiting room until their trains are ready and by collecting in those seats adjacent to the train gates through which they must pass, they are advised at once when their trains are ready without the necessity of standing about the gate.

The concourse on each side outside the train gate is also used as an exit from trains by incoming passengers, who, however, do not pass through the main waiting room, but directly into the grand lobby through doors opposite the main entrance. In this way incoming and outgoing passengers are entirely separated except on the stairways leading to the track platforms, and the plans will permit the construction of escalators, which, if found necessary, will remove this conflict.

Just north of the main waiting room is a basket lunch room with a small lunch counter for the use of passengers carrying their own lunches. Beyond this in the extreme north end of the building is an immigrants' waiting room with seats for 150 persons and with access to the opposite side of this same lunch counter. An isolation room for convicts, persons with contagious diseases, etc., is also provided here. The isolation and immigrants' waiting rooms are connected directly with the concourse on each side, eliminating the necessity for this class of passengers passing through the main waiting room or coming in contact with the other passengers.

Leading off from the northeast corner of the grand lobby is the women's waiting room, 45 ft. by 45 ft. in area, attractively finished in molded plaster panels decorated in imitation tapestry with white trimmings. Connecting with this are the women's rest room and the lavatory, with free and pay toilets and a shoe shining stand. Directly over the lavatory on a mezzanine floor three private bathrooms are provided for the use of women passengers. Directly below the women's waiting room and accessible only from this room is a children's playroom, where children may be left in the care of the maid in charge. Connecting with this children's room is another small basket lunch room.

In a similar location in the west wing are located the men's smoking room, shoe shining stand and free and pay toilets. Leading off from the same corridor is a nine-chair barber shop, while directly above the barber shop and entered through it are five bathrooms.

The Grand Lobby Looking Down on the Semi-Circular Ticket Office

BAGGAGE AND EXPRESS FACILITIES

The baggage checking counter, 90 ft. long, is located at the west end of the grand lobby to the left of the taxicab entrance and is attractively finished in bronze. While hand baggage is checked directly at the counter, heavier pieces brought in by taxicabs are delivered at an entrance on the court at the west end of the building and immediately lowered to the basement or track level floor, where they are weighed. Baggage delivered by the transfer company is unloaded directly on the lower floor. Passengers may exchange taxicab

or transfer checks for baggage checks at the baggage counter on the main floor. All baggage is weighed as received and no checks are issued until the weight has been ascertained and any excess charges paid. While only hand baggage will be received and delivered on the main floor, the passenger is able to arrange for the checking of all baggage at this counter. It is also planned to weigh all baggage transferred from one train to another and to attach excess tags for collection at destination. Eleven Kron dial automatic scales of capacities ranging from 500 lb. to 10,000 lb. have been installed for this purpose.

The basement floor is devoted entirely to the handling of city baggage. All baggage transferred from one train to another will be assembled and held in the sub-basement. To move the city baggage to and from trains it is lowered to the sub-basement by elevators, from which floor a subway leads under the tracks near each end of the train shed, with elevators at each platform. In this way all trucking across tracks at grade is avoided, while city baggage is kept entirely separate from transfer. Ten Elwell-Parker electric motor trucks have been installed to transport the baggage. The baggage rooms on the main and basement levels have 2-in. maple floors laid diagonally over pine flooring on concrete.

Directly across the corridor from the baggage counter on the main floor is the parcel check room with a 45-ft. counter. Special attention was given to the design of this room to make it accessible to the public and convenient for the employees. The storage racks are of pipe with special racks for overcoats, umbrellas, etc. A storeroom with dumbwaiter connection is located directly above for the storage of unclaimed parcels.

All express and mail is handled in the three-story express building immediately west of the station. The east 160 ft. of all three floors is occupied by a branch railway postoffice and the remainder is divided between the American, Adams and Wells-Fargo express companies. As in the baggage room, the basement floor is devoted to the handling of city business, while all transfer traffic is kept in the sub-basement. The basement mezzanine floor is occupied by the clerical forces. Express and mail matter is taken to and from trains through the subways on the sub-basement level referred to above, while all city mail and express deliveries are made from the driveways on the basement level.

THE DINING FACILITIES

With the exception of the small lunch counter in the basket lunch room at the north end of the main waiting room, all the dining facilities are grouped at the east end of the grand lobby. Connecting directly with the lobby in the center is the lunch room, with a seating capacity of 75 at the counter, in addition to tables grouped along the wall on each side. Additional tables are also placed on a balcony over the east end of the lunch room for those passengers who desire a moderate priced dining room. This lunch room is finished in American Pavanazzo marble wainscot with a base and top of Verde antique marble with plaster above, stippled to secure a tapestry effect. The counter is equipped with solid bronze swivel seats with renewable cane backs and seats. All orders are transmitted to the kitchen by telautograph.

At the right of the lunch room and entered from the grand lobby is the main dining room, with a seating capacity of 142. This room is finished with tapestry glass on the lunch room side. Elsewhere it is finished in Italian Skyros marble wainscoting with plaster above. Semi-indirect lighting is adopted. A private dining room with a seating capacity of 20 is located over this main restaurant for the use of special and private parties. These dining facilities have all been designed in close co-operation with the Fred Harvey Company, which operates this concession.

Interior of the Main Waiting Room

THE STORES

Much study was given to the location and arrangement of the various stores in the station to provide those articles customarily desired by the traveling public and at the same time to bring the maximum rental to the terminal company. This business is expected to be especially remunerative here because of the large number of passengers waiting for some time between trains.

At the northeast corner of the grand lobby adjoining the women's waiting room is the drug store, with entrances from the lobby and the east midway. This store is elaborately finished in native walnut with bronze hardware and illuminated showcases. A soda fountain is provided of Travernelle Fleury marble trimmed in Belgian Black marble with a black glass top. In addition to carrying a complete line of drugs and sundries with a prescription counter on the balcony, a public postal substation is also located in this room.

Directly across the exit corridor is the news-stand, while on the opposite side across the main waiting room is the candy booth, both of which are finished in silver wood. A cigar stand is located at the west end of the lobby near the entrance to the smoking room and barber shop. All these concessions in the station except the barber shop and the parcel room are operated by the Harvey Company. The parcel room is operated directly by the Terminal company.

Other facilities in the station include a hospital over the main floor baggage room with separate wards for men and women, quarters for nurses and a small operating room; a special room on the track level floor for receiving funeral parties without the necessity of their passing through the main waiting room; a common office for the depot passenger agents of all the roads, located near the barber shop, and lounging and locker rooms with bathrooms for passenger trainmen, porters and station ushers on the basement mezzanine floor, lockers being provided for 250 conductors and 80 station ushers.

The Station Building, West Trainshed and Express Building

THE TRACK LAYOUT

Sixteen through tracks are provided under the train shed, each of which is of sufficient length to accommodate two trains, the trains pulling through the station so that the engines are at the far end. The tracks are spaced alternately 12.5 ft. and 31.5 ft. To give a greater flexibility of operation it is planned to install double crossovers between each two adjacent tracks in the center of the train shed, but this has been postponed temporarily. Provision has been made for eight additional station tracks on the north when traffic conditions demand, two of which tracks will be used for the present for the storing of sleeping cars en route and surplus equipment. Beyond these tracks are the two main freight tracks.

In addition to these through tracks, two stub tracks have been built east of the station for the loading of mail cars and one along the retaining wall of the Grand avenue incline for the unloading of theatrical scenery. At the west end of the station eight depressed stub tracks have been built for the loading of express cars. All tracks are laid with 90-lb. rails and plain angle bars on 8 in. of crushed stone ballast below the ties with 6 in. of sand or cinders below the stone. The platforms are of concrete with the surface 8 in. above the top of rail.

The train sheds are of an extended umbrella shed type connected by steel trusses extending over the track. The roof of the shed is of Federal cement tile with prism glass at regular intervals to illuminate the platforms below. Federal cement tile was also used on the main building, while prism glass was inserted in the platform above the trucking subways. The train shed is 1,370 ft. long and extends over eight platforms.

THE POWER HOUSE

The power house is located near the west end of the express building. The principal equipment includes three batteries of 1,016 h. p. high reverse-setting Babcock & Wilcox boilers, with space for a fourth battery when required; two 1,250 k. v. a., 2,300-volt, 60-cycle turbo-generator sets with exciters on the ends of the shafts; two Nordberg cross-compound Corliss air compressors with a capacity of 3,500 cu. ft. of free air per min.; one 60-ton and one 30-ton Carbondale exhaust system refrigerating plans for cooling the drinking water and serving the dining room and other concessions in the station. The exhaust steam vacuum system is used for heating the station and adjacent buildings. Over 85,000 sq. ft. of direct radiation is provided in the station alone in addition to an even greater amount of indirect radiation provided in all the larger public areas. All public rooms are artificially ventilated with air washed and tempered. Live steam is also furnished by the power house for heating up locomotives at the roundhouse.

PERSONNEL

This entire development has been designed and built under the direction of John V. Hanna, chief engineer, and his staff, consisting of A. C. Everham, assistant chief engineer; A. H. Stone and G. M. Walker, Jr., assistant engineers; J. Tuthill,

building engineer; S. O. Swenson, electrical engineer; G. E. Tebbetts, bridge engineer; G. E. Ellis, signal engineer, and J. M. Hammond, D. S. McCalman and E. P. Weatherley, division engineers. Jarvis Hunt, Chicago, was the architect for the station, working in co-operation with the engineering department. The George A. Fuller Construction Company, Chicago, was the general contractor for the station and auxiliary buildings, with E. S. Belden, engineer in charge.

CAMPAIGN AGAINST THE EXTRA CREW LAW IN MISSOURI

At the election on November 3, the voters of the state of Missouri will be called upon to vote upon the "full crew" law passed at the last biennial session of the Missouri legislature in 1912, which was by petition referred to the people in accordance with the referendum act. The railroads of the state have been conducting a campaign, aided by many of the commercial and other interests of the state, to defeat the bill by presenting to the people facts and arguments which show that such a bill is unnecessary and would in no way promote safety and that its only purpose is to create jobs for members of the Brotherhood of Railway Trainmen, at whose instigation the bill was introduced and passed.

The bill as passed prohibits the operation in Missouri of any freight train composed of less than 40 cars not equipped with a crew consisting of at least one engineer, one fireman, one conductor, one flagman and one brakeman, or any freight train composed of 40 cars or more not equipped with a crew consisting of at least one engineer, one fireman, one conductor, one flagman and two brakemen.

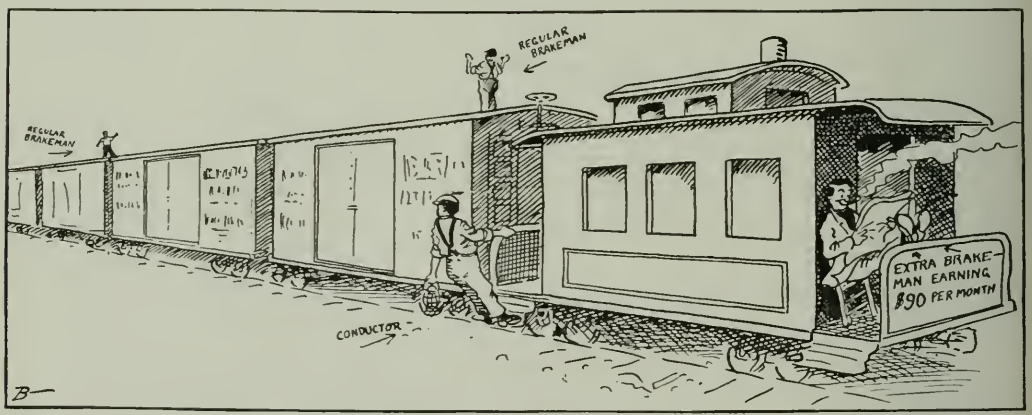
The status of this law and its liability to repeal by the people as a court of last resort is peculiar as relates to Missouri, as this is the second state in which an extra crew bill has been enacted which has a constitutional amendment providing for the initiative and referendum. In this respect the railways of Missouri may be considered as fortunate, for they are, by this means, able to appeal direct to the people for relief from legislation which they allege is unfair and discriminatory. While the bill was pending in the legislature the railroads endeavored to oppose it by presenting facts to show its true purpose, and that it was in no way a safety first measure, and when their efforts in this direction failed they immediately decided to take advantage of the referendum provision to endeavor to defeat the bill by the public sentiment.

Referendum petitions were circulated by employees of the roads and others immediately after the passage of the bill, and by the general assembly of 1912, and in a short time the signatures of 97,971 citizens were secured, many more than were required by the constitutional amendment. The invoking of the referendum by petition automatically suspended the enforcement of the bill until the voters could pass on it.

The railroads have been greatly handicapped in the efforts to obtain publicity for their arguments by a Missouri statute, which provides:

> It shall not be lawful for any corporation . . . to directly or indirectly . . . influence or attempt to influence the result of any election to be held in this state, or procure or endeavor to procure the election of any person to a public office by the use of money belonging to such corporation, or by subscribing any money to any campaign fund of any party or person, or by discharging or threatening to discharge any employee of such corporation for reason of the political opinions of such employees, or to use or offer to use any power, effort, or influence, or other means whatsoever to induce or persuade any employee or other person entitled to register before, or vote at any election, to vote or refrain from voting for any candidate, or on any question to be determined or at issue at any election.

Any violation of this law is punishable by forfeiture of charter or franchise. As the law applies only to corporations it does not militate against the labor unions, who are working for the full crew law and who are said to be expending large sums of money for publicity. Flaming posters and billboards in all the large cities inform the public that every seven minutes a trainman is killed because of the lack of safety appliances on the railways, posters placed in all saloons where there is a union bartender tell the patrons that the full crew bill is an aid to safety first. Posters are circulated illustrated with views of head-on and rear-end collisions to emphasize the necessity of a full crew law.



Everybody Works But Extra

Many of the newspapers of the state, however, and commercial and farmers' organizations have come to the aid of the railroads and have assisted greatly in publishing the arguments against the passage of the law. The railways of Missouri were the first to take advantage of the referendum to test public sentiment on legislation, and for this reason, in part, the newspapers have given a great deal of publicity to the campaign.

In all publicity issued by the railways it has been pointed out that the railways cannot afford to be forced to neglect or abandon safety first for their general plans for making travel more safe, and that a third brakeman on freight trains and a second on passenger trains is not in the interest of safety and that the state public service commission has full power to deal with the situation. In the first circular letter issued to the public there appeared the following:

"What the Law Will Cost the Railways

"Based on last year's business, this law, if made effective,

will cost the railways of Missouri more than $500,000 a year. This sum equals 5 per cent interest on $10,000,000. Ten million dollars would build 500 miles of additional railway at $20,000 a mile, or equip 6,666 miles of road with automatic block signals at $1,500 a mile, or purchase 1,000 steel coaches at $10,000 each, or eliminate 2,000 grade crossings at $5,000 each, or construct 1,000 new depots at $10,000 each. Five hundred thousand dollars a year taken from the railways of Missouri by the adoption of this law will reduce their borrowing capacity $10,000,000, and to that extent will prevent the physical improvement of existing lines of railways."

Naturally the railways are proceeding with caution, and yet with considerable energy to inform the people of the facts in the case. Extensive statistics have been prepared to offset the arguments of the labor leaders, which are in no way backed up with specific instances, that a full crew law is conducive to safety first, showing the number of accidents that occur on trains having less than 40 cars and those having more than 40 cars. It will be necessary to offset the large union labor vote of St. Louis, Kansas City, St. Joseph, Springfield, Joplin and Carthage by the votes of the farmers and there are many indications that the latter are now inclined to believe that the railways have been maltreated by legislators who have been under the spell of the union labor lobby at Jefferson City, and who apparently believe that their interests and those of the railways are closely allied, at least in this particular instance.

At the beginning of the campaign O. M. Spencer, general solicitor of the Chicago, Burlington & Quincy lines in Missouri, sent a circular letter to all attorneys for the Burlington in Missouri, asking their assistance in defeating the law. This letter quoted the statute regarding the use of money in elections and continued: "I am forced to ask you and such of you only as feel kindly enough disposed to give this company your services gratis in the work on election day, to advise me in reply if you are willing to attend the conference of all attorneys of the Burlington in Missouri in order to discuss and adopt the best means of informing the people of the purpose and effect of the law, with the hope that the same may be rejected at the election. I feel we can well afford to lend a hand to the company in this emergency, because we owe it to ourselves as good citizens of the state of Missouri to protect her commerce from the unjust burden which this law proposes without conferring the least benefit upon the public." The circular also included the principal arguments against the law, and quoted some statistics compiled by C. W. Kouns, general manager of the Atchison, Topeka & Santa Fe, which were presented to the joint railroad committee of the House and Senate of the Kansas legislature last winter to show that the long trains are no more liable to accidents than the short, local trains, and that therefore there is no necessity for a third brakeman to reduce the liability.

On September 22 an appeal to the shippers and passengers of Missouri was published in the St. Joseph Gazette, over the signatures of 50 of the most prominent farmers, livestock commission men, wholesalers and jobbers in St. Joseph and vicinity, as an advertisement set in large type and occupying with the signatures a full newspaper page. Among the arguments presented in this appeal were the following:

"At the present time, through and local freight trains are equipped as follows: One engineer to run the engine; one fireman to run the fire; one conductor to run the train; one flagman or brakeman to flag the train; one brakeman for such other services as emergencies may require. The above enumeration would seem to show enough men in the operation of any through train. To the above number the law proposes to add another brakeman. There would seem to be no room for another job on such a train, especially when it is remembered that all such trains are equipped with air brakes, and the brakes are set and released by the engineer on the engine.

"The best argument against this proposed law is, perhaps, the fact that at the same legislature a public service commission was created, which commission has full power to regulate the number of men to be employed on trains in exact proportion to the service necessary to the proper operation of such trains. This commission could make its requirements of certain companies whose road and character of freight might require a greater service and a greater number of brakemen for the protection of a train than it would of some other company with its train of an equal number of cars, because of the different conditions under which the two companies operate; hence it would seem to be the part of wisdom, instead of adopting a hard and fast rule like this law would prove to be for all time to come, to allow this question of regulating the number of employees on trains to rest with the tribunal created for the specific purpose of regulating the operation of railroads.

"We call the public's attention to this law and its purpose and effect. This extra expense, if imposed, must come to the railroad companies through increased rates. Rates are paid by the shippers and passengers; therefore, the shippers and passengers are asked by this law to vote this increased expense upon themselves. Can they afford to do it? We think not."

The tendency of many of the newspapers to give the railways a square deal was indicated at the forty-eighth annual meeting of the Missouri Press Association, held at the Planters' Hotel in St. Louis on September 16, 17 and 18, when resolutions were adopted, following an address to the 300 editors present by B. F. Bush, president of the Missouri Pacific, saying that it is essential for the future agricultural, commercial and industrial welfare of the nation that the railroads be permitted to receive sufficient remuneration to enable them to render high-class service and to make such betterments and improvements from time to time as the needs of different communities may require, and to re-establish American railroad securities as a highly respected and sound investment. These resolutions were general in character, but they were soon followed by many editorial utterances strongly condemning the full crew bill. For example, the Princeton Post pointed out that business men are just beginning to realize that the tendency of government by commission has spread from its original restrictions on the railways to other forms of business, and that the restrictions which were urged upon the transportation companies are now being turned against themselves, and are found exceedingly irksome as applied to their branches of commerce and industry. The editorial further says that Missouri farmers have resented with spirit and energy, legislation that might and would undoubtedly militate against them, Missouri manufacturers would be as quick and as keen to resent discriminatory legislation and Missouri railways are resenting the enactment of a bill which would entail an annual increased expenditure of $500,000 on their part, unless the business men and farmers of Missouri repeal it as a part of fair play and in the interest of justice, not only to themselves, but to the railways as well.

The Plattsburg Leader, in an editorial on safety first, pointed out that as the originators of the safety first movement the declaration of the railroads that the full crew bill is not conducive to safety first should carry weight and conviction to the public.

The Gallatin North Missourian pointed out that no farmer would be willing to have the farmers of the state assume the burden of an added $500,000 taxation annually on Missouri farm land, that they would resent any efforts to compel them to apply a hired man for every 10 acres of land owned by them, and that the $500,000 would, if used for betterment to stations, stock yards and service, give the farmer a benefit. "Hence the farmer and business man will serve his own interest by voting 'no' on referendum No. 9, and will also aid the railways to escape from legislation which had its origin at

the same source as did the obnoxious single tax amendment of two years ago."

The St. Joseph, Mo., Gazette, printed an editorial containing the following: "Profitable farming is not opposed to organized labor, but it can see no reason why organized labor should be so conducted as to compel the commerce of the state to pay it an unjust tribute. It is plain to the most simple minded that whatever added expense the railroads are put to in order to perform their daily service to the people of this state must, in the final analysis, be paid by the commerce of the state. The 'full crew' law adds an unnecessary expense to every railroad operating trains in this state, and ought to be voted out of existence by scratching Yes and leaving No."

At a meeting of the officers and directors of the Commerce Club of St. Joseph on October 16, resolutions were passed against the law. Similar resolutions were passed by the executive committee of the Federation of Missouri Commercial Clubs in an appeal to the farmers and business men of Missouri generally to vote against the law.

Forward St. Louis, the official organ of the Business Men's League of St. Louis, on October 19 published an article attacking the full crew law, saying in part: "The number of men who should compose a full crew is a technical question. It is exactly such a question as the Public Utilities Commission is expected to settle. The Public Utilities Commission was created and exists to decide, among other problems, matters like this. The number of men who should constitute a full crew is not a subject for legislation, but a question for determination by the state commission.

"Greater safety is not obtainable by increasing the number of train employees."

These and many other resolutions have been given wide circulation in the press of Missouri, and the railroads also have furnished the newspapers of the state from time to time with news letters containing items against the bill which have been generally published.

An interesting feature of the campaign is a cartoon depicting the arduous duties of the extra brakeman, which is reproduced herewith, which is accompanied by the following, a parody on "Everybody Works but Father":

1

Everybody works but Extra,
He rides in the caboose all day,
Reads the daily papers,
And smokes his pipe of clay.
He makes a full crew fuller.
He gets in everybody's way,
Everybody works but Extra
And the people have to pay.

Chorus

You must scratch YES,
If you want to VOTE NO.

2

The railroads can't do a "hooter"
When the Brotherhood has its say
As to how many men are needed
On trains that run all day,
With nothing to do but keep moving,
No cars to set out or in,
Everybody works but Extra,
And the people put up the tin.

3

What right have the owners to meddle,
With the way we run their road,
The stockholders have no duty,
Except to carry the load.
The managers don't know nothing
The Legislature holds the line,
Everybody works but Extra
If you overlook Amendment Nine.

BRITISH AND GERMAN EXPORTS OF LOCOMOTIVES

In the October 16 issue were presented some statistics on British and German exports of railway materials, compiled by the British Board of Trade. The following table from the same source gives a comparison of the British and German exports of railway locomotives to the principal neutral and colonial markets for the years 1912 and 1913, 1912 being the latest year for which official figures are available for Germany:

Principal Colonies and Neutral Countries to which exported	From Germany (1912)	From United Kingdom (1913)
British India	$55,500	$4,192,500
Norway	42,500	.....
Sweden	54,000	1,500
Denmark	167,000	450
Netherlands	178,000	311,000
Belgium	77,000	24,500
France	1,463,000	6,000
Spain	924,000	148,500
Italy	354,000	1,000
Greece	88,000	.....
Servia	234,000	.....
Roumania	203,000	.....
Russia	271,000	.....
Turkey	438,000	18,000
Tunis	50,500	.....
Morocco	46,500	.....
Egypt	149,500	72,500
Dutch East Indies	378,500	15,000
China	194,500	51,500
Japan	277,000	35,000
Korea	126,000	.....
Brazil	836,500	394,000
Argentina	383,000	3,478,000
Chile	1,051,500	368,000
Cuba	67,000	1,500
Total to above markets	$8,559,500	$9,120,250
Total to all markets	$9,287,500	$13,909,500

Some details regarding the market for locomotives in some of the principal countries are shown in the following paragraphs.

The imports of locomotives and parts into the Union of South Africa in 1912 and 1913 from the United Kingdom and Germany, and the total imports from all countries, were as follows:

	1912	1913
United Kingdom	$46,790	$277,610
Germany	15,100	22,605
All countries	61,905	300,740

A Belgian consular report for the year 1912 remarks that during the five preceding years the total number of locomotives imported into Egypt amounted to 113. Of this total the United Kingdom furnished 48 and Germany 53 locomotives.

The following figures, taken from an Austrian consular report from Barcelona, indicate the fluctuation which has taken place in recent years in the value of the imports of locomotives and tenders into Spain:

1909	$2,080,000
1910	980,000
1911	2,220,000

Locomotives weighing over 35 tons came principally from Germany, lighter engines from Great Britain.

English Railway Receives Suggestions from Employees.—Some time ago the Great Western Railway of England on the advice of its general manager, established a suggestion committee, to which proposals from the company's employees as to improved methods of operation, measures for greater safety to the public and staff, etc., were to be sent. Quite recently 20 awards—17 in the passenger department and 3 in the freight—were made in respect to suggestions submitted. About 1,500 suggestions, on the most diversified subjects, have been sent in since the committee was established, and it is stated that some of the most helpful proposals have been received from those least gifted with the art of fluently expressing their ideas. The committee has still about 300 suggestions under consideration.

INTERSTATE COMMERCE COMMISSION—RAILWAY RATES—GENERAL PROSPERITY

By E. B. Leigh

President, Chicago Railway Equipment Company

Railway rates, general prosperity, and the function of the Interstate Commerce Commission in connection therewith were the subjects of comment by the commission in its decision of July 29, 1914, in the "Five Per Cent Advance Case."

The commission held, "the law did not confer upon us power of aiding general prosperity." A propaganda, of which the commission disapproved, had proceeded "as if the commission had the legislative power in that form to stimulate business activity and promote the public welfare." The commission concluded: "We have no authority to approve rate increases with a view to stimulating business."

It is manifestly of the utmost importance that somewhere in our government, responsibility shall lie for that specific promotion of the general welfare which consists of protecting the railways against influences, governmental and otherwise, which tend to impoverish the roads, and with them, the whole people.

If the Interstate Commerce Commission does not perform that function, who will?

It is undoubtedly true that, as originally organized, the functions of the commission were largely confined to an administrative or semi-judicial consideration of complaints and alleged abuses, specifically referred to it for adjudication. Under these conditions the decisions and orders of the commission did not broadly affect the railroads' prosperity, or the general business of the country.

But with the enlargement of its powers, and particularly when Congress delegated the rate making power to the commission, that body was logically and inevitably vested with the responsibility of that which would naturally flow from its exercise of such sweeping powers, and not only in its effect upon the railroads themselves, but upon all collateral as well as general business interests.

Congress is unquestionably charged with promoting the general welfare. The general railway problem has been committed by Congress to the commission. Whatever the precise terms of the law, the commission clearly has the responsibility.

The decisions of the Supreme Court in the "Shreveport Case" and the "Inter-Mountain Rate Case" seem clearly to suggest not only this responsibility, but the broad inherent powers of the commission and the consequent necessity of its wise and prudent exercise of such authority.

As now constituted, with the broad scope and power delegated to it by Congress, and as suggested and virtually defined by the Supreme Court, is not the Interstate Commerce Commission today more of a legislative than a judicial body?

It would seem that the fundamental purpose of the creation of the commission, with its enormous, delegated power, must be that of conserving the good and benefit of the people as a whole, and not merely that of partisan or isolated interests.

As railway prosperity affects general prosperity (or the people as a whole), to just that extent is the commission responsible for such general prosperity.

Not only have the railways developed the agricultural, mining, manufacturing and commercial activities of this country; but because of their enormous requirements for the maintenance and extension of their own properties, have become the most potent single, contributing factor to general business prosperity.

The commission held, "The law did not confer upon us power of aiding general prosperity." It can hardly be claimed that the law conferred upon them the power (or right) of *impairing* or *retarding* general prosperity. If it gave the commission the power of legislating upon that which virtually affects general prosperity, may we not assume that the law (surely intended for good, and

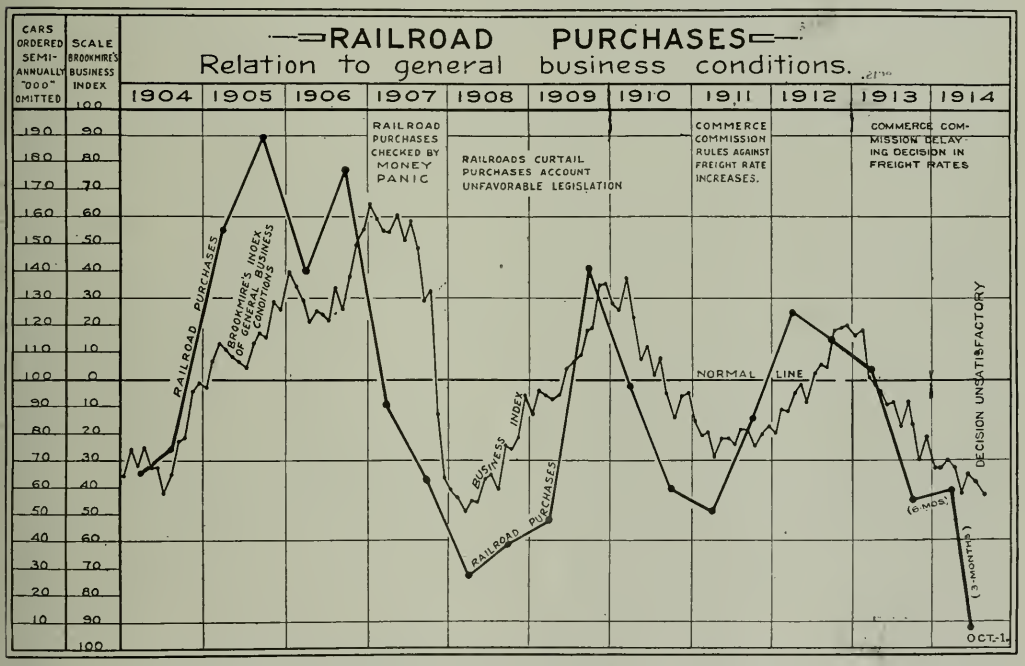


Chart Showing Relation of Railroad Purchases to General Business Conditions

not evil) *did* confer upon the commission not only the power, but the *obligation* of aiding prosperity?

Its now defined scope and authority make the commission the possible controlling factor not only in the measure of prosperity of the railways, but of the whole people. The commission is thus invested with the greatest power for the possible confiscation of private property the world has ever seen.

On the other hand, its authority carries with it the ability of the commission to be the greatest conservator of the public good, and the greatest direct contributor to stable, normal business conditions.

Is not the commission thus legally and morally bound to execute this sacred trust in the interest of not one or a few elements of our national activities, but in the interest, and for the benefit, of the people as a whole?

The necessities of the railways have not only been proven, but formally admitted by the commission. The necessities of the country are equally obvious, and more than proven.

For many months past a large number of the industries wholly dependent upon the railways have been practically prostrated, while others more or less dependent upon the railways have experienced most serious curtailment.

This is not due to the European war, but is a condition of steady growth from about the middle of 1913. The effect of this prostration upon business in general had been clear for many months—not only to those engaged in railway and cognate industries, and banking, but to the shippers and general public.

The commission in its decision of July mentions protests against the advance sought. But it is significant that not a single business organization located in "Official Classification Territory," where advances were sought, is listed as opposing a general advance. On the contrary the country today is almost a *unit* for an advance.

These facts sufficiently reveal the extent to which the people have been directly "touched in their pocketbooks" by the distress arising from the inability of the railways to operate and develop as they would under normal conditions.

The Interstate Commerce Commission is not only as good a place as any, but the logical place, for the United States government to begin applying the principle that encouragement and solicitude for the welfare of business are as vitally important as supervision and restriction.

Railway purchases as a measure of general business prosperity were discussed last December by the author of this article in an address which undertook to show from statistics covering a period of years, that general depression had uniformly followed a marked decrease in railway buying, while general business activity had regularly succeeded resumption of substantial outlays by the railways.*

What is the relation between railway prosperity and general business prosperity? How is it measured, and how can it be demonstrated?

The number of freight cars built each year taken as a unit, and termed "railway purchases," has been projected on the well known chart of the Brookmire Economic Service for the ten year period 1904, to October 1, 1914, inclusive, and the relation between "railway purchases" and the trend of "general business" clearly shown.

While it is not possible, within the limits of this article, to trace in graphic detail the relative movements from month to month during this ten year period, the chart clearly confirms the soundness of the doctrine that *railway purchases measure general business prosperity.*

It should be noted that up to 1908 these two factors ("railway purchases" and "general business") moved in normal relation; but in 1908 a new condition or factor appeared, due to the investment of the rate making power in the hands of the Interstate Commerce Commission.

*The article referred to was published in the *Railway Age Gazette*, December 19, 1913, page 1161.

Thus, for the first time were "railway purchases" controlled by *abnormal* rather than normal conditions, and have so continued, more or less, from 1908 to the present time.

The year 1908 was notably the leanest of business years, notwithstanding bumper crops, plentiful money and absence of disturbed political conditions—the three recognized elements making for good business. It likewise recorded the smallest number of cars ordered during the period, and the minimum of railway purchases for many years past.

In 1912 heavy purchases continued throughout the year, carrying general business to the high peak, at the end of the year.

Just here it is again illuminating to consider the effect of "railway purchases":

The year 1912 was a "presidential" year, proverbially and historically a poor business year, and fraught with more of those "uncertain" elements normally operating to check or hold back business than in almost any previous year.

The "Banking Index" throughout the year ranged at about "normal," with crop conditions "good." But it is believed neither of these fundamentals would have offset the drastic change in politics, early and clearly foreshadowed.

Just why was 1912 the one exceptional "presidential" year? Why were the political conditions and political policies almost ignored?

If there had been any doubt as to the *basic factor* of *railway purchases,* it was brought into bold relief in 1912, and that year furnishes the answer.

At this point it may be interesting to note a comparison of conditions prevailing in 1908 and 1912.

Economists recognize three great fundamental factors as foreshadowing and affecting business:

MONEY	CROPS	POLITICS
Let us apply this to the years		
1908		1912
Plethoric Reserves	Railroads *Not* Buying	Normal Reserves	Railroads *Buying*
Bumper Crops	Result:	Normal Crops	Result:
No Disturbing Political Conditions	Very low ebb of business	*Very* Disturbed Political Conditions	Business very nearly booming.

In 1913, the heavy purchases of new equipment continued during the first three months; but sharply declined at the beginning of the second half of the year—almost immediately sinking to the lowest level reached these several years.

The conditions clearly foreshadowed at the middle of the year eventuated, and have remained, not only throughout 1913, but in more accentuated form during the present year to date.

While it is true that the railway supply industry is logically the first to recognize, and to participate in, a revival of general business, and is likewise the first to detect the signs, and feel the effects, of its impending decline, nevertheless the *principle* holds good, and exerts itself throughout the entire fabric of general business.

The natural and conclusive deductions to be made from the foregoing are:

That while general financial conditions are essentially fundamental to all industry and commerce of every character, the railways, consuming, directly or indirectly, between 40 and 50 per cent of the production of the steel and iron industry—itself a basic industry—clearly are *the basic factor* in initiating a general business movement, and whose cessation of purchases (conversely) retards such movement.

In other words, and *regardless of favorable money conditions, crop conditions, political conditions, or any of the other fundamentally contributing factors to a sound business condition, unless the railways are placed in a position to make purchases,* and *do make purchases on a normal scale, normal prosperity is withheld from general business.*

It is this great, salient feature of the question which the Interstate Commerce Commission is urged to recognize, as it has been recognized by the industrial and commercial world.

General News Department

Announcement has been made by the Illinois State Board of Equalization that the assessments on railroad property in the state will not be decreased for 1914, as requested by a committee of railroad tax officers last week, but in some instances will be advanced.

The date for the beginning of arbitration proceedings in Chicago on the demands of the western engineers and firemen for advances in wages and changes in working conditions, has been changed from November 9 to November 30, because although four members of the arbitration board representing the railroads and their employees have been selected no agreement has yet been reached on the two neutral members of the board.

The New York State Civil Service Commission announces competitive examinations to be held November 14 for engineers under the Public Service Commission, First district. It is expected that a number of appointments will be made to positions in charge of the construction of the tunnels to be built under the East river between New York and Brooklyn. For the position of resident engineer, the salary will be from $3,000 to $4,200; junior engineer, grade 8, from $1,500 to $1,800, and grade 7 from $1,200 to $1,500. Applicants are wanted also for the positions of draftsman and of inspector of steel.

Officers of the National Tehuantepec Railroad say that the Mexican government has ordered the immediate rehabilitation of that line. New ties will be laid the entire length of the road, Salina Cruz to Coatzacoalcos, and this will be followed later by relaying the track with heavy steel. More than 100,000 cross-ties have arrived at Nonoalco station from the central part of Mexico. The traffic of the National Tehuantepec has fallen off considerably during the last few months, due partly to the opening of the Panama Canal, but chiefly to the unsettled condition of political and business affairs of the country.

A. A. Robinson, for many years chief engineer of the Atchison, Topeka & Santa Fe, later president of the Mexican Central Railway and one of the most prominent of the pioneer railway builders of America, was the guest of honor at a dinner given on October 21 at Topeka, in honor of his seventieth birthday, by a number of prominent officers of the Santa Fe and other men who had served with Mr. Robinson during his active career. Among those who responded to toasts were President E. P. Ripley of the Santa Fe; President H. U. Mudge of the Chicago, Rock Island & Pacific, and W. C. Nixon, receiver of the St. Louis & San Francisco; and the guests included about 150 prominent railway officers, including the principal officers of the Santa Fe.

Steel Corporation Reduces Quarterly Dividend

The United States Steel Corporation on October 27 reduced its quarterly dividend from 1¼ per cent to one-half of one per cent, thereby placing the common stock on a two per cent basis. It has been on a five per cent basis since June, 1910.

Protection for Innocents

The Union Pacific Bulletin publishes the following letter received by D. E. Burley, general passenger agent of the Oregon Short Line—the "innocent" writer demanding protection from a railroad he had attempted to defraud. It shows, however, that ticket manipulation is becoming a thing of the past:

"Last week while I was in Salt Lake I had an extra railroad ticket good from Salt Lake to Chicago which I did not have no use for. I tried to sell it to several people, including hotel runners, hack men, hotel clerks and porters who, I was told, made a business of handling railroad tickets. None of them wanted to pay me any cash for it, except if they could sell it to some one else. I finally gave it to one of the porters of the ——— hotel, who promised me he could sell it for me next day. When I asked him for the money he denied that he ever saw me. It is simply a case of robbing me of my ticket. Now, Mr. Burley, I think the railroad should protect innocent people against such crooks. This man told me his name was John Smith. He is about 5 ft. 5 in. tall and probably weighs about 140 lb. He is dark complected. I expect to be in Salt Lake some time next January and hope you will have some good news for me."

Defects in Government Regulation

E. P. Ripley, president of the Atchison, Topeka & Santa Fe, and Frank Trumbull, chairman of the board of the Missouri, Kansas & Texas and the Chesapeake & Ohio, were the principal speakers at the dinner of the Knife and Fork Club held at Kansas City on October 24. Mr. Ripley's address is published elsewhere in this issue. Mr. Trumbull's talk was impromptu. He said in part:

"For many years everybody seemed to be wanting to regulate the railways. We told you that if you went ahead indiscriminately you would soon find your own business regulated. The trade commission bill has this significant provision: 'Unfair competition shall be unlawful.' Business men may not know exactly what unfair competition means, but they know that this declaration means trouble. It also means a good deal of work for the lawyers.

"In the railway business, you must not only not do any wrong, but you must not make any mistakes. Such is the nature of the regulation to which we are subjected. And do you suppose that any railway company would have dared to spend $375,000,000 upon any such project as the Panama canal? That will cost you $500,000,000 before it makes returns and then it won't pay a profit. You people will have to foot the bills. Can you imagine what would be done to a railway company that had done as the government has in this instance?

"The rising tide of democracy expresses itself in the criticism of the individual and of the conduct of business. It used to be a matter of pride when a bank was so well managed that it could return a profit of 50 per cent, but if a bank now returns a profit of 25 per cent, it is at once assumed that there is something wrong and that there must be an investigation.

"But the bank legislation is much more intelligently planned in the United States than the railway legislation. We are punished if we attempt to co-operate. The banks who do not co-operate are punished. They are made to act together for the common good; we are forbidden to do so.

"The trouble with regulation of industries in the United States is a division of responsibility, which amounts to a lack of responsibility. The bank has but one master. The railway, for instance, has 50—the federal government, 48 states composing the nation, and that other great state—the state of mind.

"There are many strong men in the country who are now at great personal sacrifice attempting to work out solutions of this problem. We need more of them. We need more of that high patriotism which attempts to handle these matters intelligently for the good of all."

New Haven Annual Meeting

The annual meeting of the stockholders of the New York, New Haven & Hartford was held at New Haven on Wednesday of this week. The number of directors was reduced from 27 to 17, and the board was authorized to establish an executive committee of nine (a majority of the board). The agreement which had been made with the federal authorities at Washington for the relinquishment of the control of the Boston & Maine, in accordance with authority conferred by the stockholders, last April, was ratified by a vote of 899,877 shares to 14,097.

The new members of the board are Benjamin Campbell, vice-president of the road, in charge of traffic; Frank W. Mattison, of Providence; Joseph B. Russell, of Boston, who served on the Meyer minority stockholders' committee of a year ago; Eli

Whitney, of New Haven, also a member of the Meyer committee, and Harris Whittemore, of Naugatuck, Conn., whose father John H. Whittemore, was long a director. The old members re-elected and the dates of their first election are: F. F. Brewster and H. K. McHarg, 1907; T. DeWitt Cuyler, 1910; Francis T. Maxwell and Edward Milligan, 1911; John T. Pratt, 1913; W. Murray Crane, 1913; Howard Elliott, September 1, 1913; Arthur T. Hadley, September 18, 1913; James L. Richards, October 22, 1913; A. S. May, August 11, 1914, and J. H. Harding, September 29, 1914. The election of all directors was substantially unanimous. Among the members now retiring from the board are D. N. Barney, J. S. Hemingway, Robert W. Taft, A. H. Robertson and Samuel Rea. The Pennsylvania Railroad still has a representative on the board in the person of Mr. Cuyler.

President Howard Elliott, in his review of the year said:

"This board of directors for whom you have voted today, containing, as you know, some new names, will devote the best of their time and talents and ability to safeguarding this property. On this list of directors there are no men who participated in those transactions—most of them seven or eight years ago—which have been the subject of much discussion during the last two or three years. So that this board comes to the care of your property fully unprejudiced.

"I feel that if there is a little uplift in the volume of business, a little increase of various rates which we are asking the commissions to grant us, with more efficiency and economy, this road will weather the storm and start, perhaps, to rehabilitate itself and do better for its owners, whether they are bondholders or stockholders."

Annual Meeting of Boston & Maine

An adjourned annual meeting of the stockholders of the Boston & Maine was held at Boston Wednesday of this week. The number of directors was reduced from eighteen to fourteen, and the personnel of the board considerably changed. Five directors, Richard Olney, A. W. Sulloway, Lucius Tuttle, E. F. Greene and Alexander Cochrane, resigned and C. S. Cook, of Portland, Maine, and N. G. Eastman, of Exeter, N. H., were added to the board.

The five trustees agreed on by the federal authorities to manage the majority stock formerly held by the New York, New Haven & Hartford were also added to the directorate. One of the trustees, Frank P. Carpenter, belonged to the old board.

The new board is made up as follows: James H. Hustis, Frederic C. Dumaine, Samuel Carr, James M. Prendergast, Charles W. Bosworth, James D. Upham, George H. Prouty, Frank P. Carpenter, Marcus P. Knowlton, James L. Doherty, Henry B. Day, Charles P. Hall, Charles S. Cook and E. G. Eastman.

Former Chief Justice M P. Knowlton, one of the trustees, made a brief statement. He said

"The corporation is fortunate in its president lately chosen, whose ability and experience give the trustees great hope that, taking advantage of the improved external conditions, if we are favored with them, we shall see the dawn of a brighter day in the financial life of the company.

"With some hesitation, but in accordance with the expressed expectation of the parties to the suit in which they were appointed, the trustees have decided to vote for themselves for directors."

The election was unanimous, 315,513 shares out of 416,543 outstanding being voted.

Railway Electrical Engineers

The seventh annual convention of the Association of Railway Electrical Engineers was held at the LaSalle Hotel, Chicago, October 27 to 30, C. R. Gilman, chief electrical engineer of the Chicago, Milwaukee & St. Paul, presiding. A report of the convention will be published in next week's issue. The following is a list of the companies exhibiting at the convention:

Adams & Westlake Company, Chicago, Ill.—Adlake electric car lighting fixtures, Adlake unity roundhouse and factory lighting fixtures. Represented by G. L. Walters and C. B. Carson.

Benjamin Electric Manufacturing Company, Chicago, Ill.—"Safety First" reflectors for Type C Mazda lamps for yard, train shed and shop lighting; Benjamin lamp grip socket; lighting specialties. Represented by H. E. Watson, A. E. Lubeck, G. B. Weber and R. C. Mons.

Central Electric Company, Chicago, Ill.—Okonite wires, cables, tapes; D. & W. fuses and cut-outs, boxes, maxolite and alexalite lighting units; Abryl glassware; Raleo receptacles and plugs; Diehl fans. Represented by J. M. Lorenz, R. N. Baker, D. W. Woodhead and Allen McNeil.

Crouse-Hinds Company, Syracuse, N. Y.—Conduit fittings for cars, stations, roundhouse and shop requirements, panel boards, knife switches and battery charging outfits. Represented by A. F. Hills, F. F. Skeely, C. M. Crofoot, Walter Fagan, T. J. Fleischer, Charles Dembsky, Edward C. Otto, C. H. Bissell and E. G. Smith.

Geo. Cutter Company, South Bend, Ind.—Sollux lighting units, Mazda arc and Cutter cut-outs. Represented by Otis Duncan, Fred Duncan, C. A. Howe and C. Fuller.

Delta-Star Electric Company, Chicago, Ill.—Automatic and non-automatic train connectors for car lighting; axle generator; charging, welding and shop plugs and receptacles; high tension out-door sub-stations, disconnecting switches, bus-bar supports, choke coils, carbon-tetrachloride fuses, roof and wall entrance tubes, portable high tension testing equipments, cable fault finders. Represented by H. W. Young and A. S. Pearl.

Economy Fuse & Manufacturing Company, Chicago, Ill.—Renewable cartridge fuses. Represented by A. E. Tregenza, W. J. Guntz and J. B. Griffith.

Edison Storage Battery Company, Orange, N. J.—Battery plates in different stages of manufacture; three types of car-lighting cells; two types of signal batteries. Represented by H. G. Thompson, W. F. Bauer, F. V. McGinnis and C. A. Luckey.

Electric Storage Battery Company, Philadelphia, Pa.—Axle-lighting system, new farm lighting, self contained, mounted on skids, for shipment as one unit, Exide and Iron-Clad batteries, standard chloride battery for car lighting. Represented by J. L. Woodbridge, H. M. Beck, Godfrey H. Atkin, T. Milton, F. G. Beetene, O. R. Shortall, J. L. MacBurney and H. B. Marshall.

Federal Sign Company, Chicago, Ill.—Electrical signs, fixtures, lanterns, car inspectors' flashlights. Represented by F. T. Baird and Leonard Shepard.

Flexible Steel Lacing Company, Chicago, Ill.—Alligator bell fasteners and lacing machines. Represented by G. E. Purple.

General Electric Company, Schenectady, N. Y.—New 6-volt turbo-generator equipment for headlight and cab light on steam locomotives; complete conduit and wire arrangement for locomotive installation. Represented by C. C. Bailey, C. H. Jones, B. F. Bilsland, R. H. Parker and S. W. McCune, Jr.

Gould Coupler Company, New York.—Gould simplex system for lighting cars, new stoneware jars for replacing lead-lined wooden tanks. Represented by George G. Milne, G. R. Berger, John T. Dickinson, M. R. Shedd and W. F. Bouche.

Harter Manufacturing Company, Chicago, Ill.—Interior and exterior electric lighting for railway stations and buildings. Represented by W. N. Soffe, C. G. Fries and G. A. Harter.

Holophone Works of G. E. Company, Cleveland, Ohio.—New line of reflectors for series lamps, new prismatic refractor for high candle power wide angles, complete line of metal and glass reflectors, new nitrogen lamps for both out-door and in-door use. Represented by L. C. Doane.

Kerite Insulated Wire & Cable Company, New York.—Samples of insulated wires and cables. Represented by Azel Ames, B. L. Winchell, Jr., P. W. Miller, J. W. Young and G. A. Graber.

Main Belting Company, Philadelphia, Pa.—Reception booth for guests. Represented by W. E. Fawcett and F. A. Zimdars.

National Lamp Works of G. E. Company, Cleveland, Ohio.—All train lighting lamps, locomotive headlight lamps; regular 110-volt multiple lamps; nitrogen lamps, including multiple and street series; lighting units for 1000 watt lamps. Represented by C. W. Bender and L. C. Kent.

National Metal Molding Company, Pittsburgh, Pa.—Sherarduct conduit, completely wired metal molding board, flexible steel conduits, boxes, lock-nuts and bushings, conduit in different stages of manufacture, illustrations of buildings equipped with Sherarduct conduits. Represented by H. C. Moran and I. A. Bennett.

Oneida Steel Pulley Company, Oneida, N. Y.—Keystone axle pulley, corrugated steel bushing, special steel pulley with 2-in. flaring flange. Represented by N. G. Stark.

Okonite Company, New York.—See exhibit of Central Electric Company. Represented by L. G. Martin, Walter Candee and W. J. Kyle.

Peerless V Belt Company, Chicago, Ill.—Peerless V belt drive in connection with axle lighting systems. Represented by J. R. Shays, Jr., and J. E. Cagney.

Pyle-National Electric Headlight Company, Chicago, Ill.—Type E and S generators, improved headlight cases for road and switch engines. Represented by J. Will Johnson, William Miller, J. E. Kilker and C. W. Dabl.

Safety Car Heating & Lighting Company, New York.—Safety axle-lighting system, electric car lighting fixtures, distributing fan. Represented by A. C. Moore, J. H. Rodger, C. A. Pinyard and George E. Hulse.

Sangamo Electric Company, Springfield, Ill.—Meters, watt hour and ampere; meters for electrically lighted passenger cars. Represented by M. B. Southwick.

Western Electric Company, New York City.—Sunbeam lamps, Malin electric interphones, ever-ready flashlights. Represented by George Porter, P. W. Green and G. F. Kelly.

Westinghouse Lamp Company, New York.—Incandescent electric headlights; all forms of multiple Mazda lamps for railway, industrial and residential lighting; Type C Mazda lamps and fixtures for railway yard and station lighting for all forms of multiple and series lighting. Represented by A. J. Cole, W. H. Rollinson, A. M. Brown and J. G. Harvey.

June Mechanical Conventions

At a meeting of the executive committees of the American Railway Master Mechanics' Association, the Master Car Builders' Association and the Railway Supply Manufacturers' Association, held at the Hotel Biltmore, New York, October 22,

it was decided to hold the 1915 conventions at Atlantic City, N. J., June 9 to 16 inclusive. Everything went off very harmoniously, although the conventions missed going to the Pacific coast by a hair; the first test ballot was a tie between that place and Atlantic City as a first choice. Chicago came forward with a strong bid and had quite a number of supporters. It took several ballots to finally decide on Atlantic City. The convention hall will be enlarged about one-third and the entertainment features will probably be about the same as in 1914, the matter being left in the hands of the presidents of the three associations. Headquarters, as before, will be at the Marlborough Blenheim.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

American Association of Demurrage Officers.—A. G. Thomason, Demurrage Commissioner, Boston, Mass. Annual convention, 1915, Richmond, Va.

American Association of Dining Car Superintendents.—H. C. Boardman, D. L. & W., Hoboken, N. J.

American Association of Freight Agents.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 21-24, 1915, Richmond, Va.

American Association of General Passenger and Ticket Agents.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.

American Association of Railroad Superintendents.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next meeting, May 20-21, 1915, San Francisco, Cal.

American Electric Railway Association.—E. B. Burritt, 29 W. 39th St., New York.

American Electric Railway Manufacturers' Association.—H. C. McConnaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

American Railway Association.—W. F. Allen, 75 Church St., New York. Semi-annual meeting, November 18, Chicago.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June 9-11, 1915, Atlantic City, N. J.

American Railway Safety Association.—L. F. Shedd, C. R. I. & P., Chicago. Next meeting, November, Chicago.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga. Annual meeting, July, 1915.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 1-4, 1914, New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Atlanta, Ga.

Association of Manufacturers of Chilled Car Wheels.—George W. Lyndon, 1214 McCormick Bldg., Chicago.

Association of Railway Claim Agents.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, 3d week in May, 1915, Galveston, Tex.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago.

Association of Railway Telegraph Superintendents.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 22-25, 1915, Rochester, N. Y.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York. Next meeting, December 8-9,

Bridge and Building Supply Men's Association.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meetings, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

Freight Claim Association.—Warren P. Taylor, R. F. & P., Richmond, Va. Annual meeting, June 16, 1915, Chicago.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

International Railway Congress.—Executive Committee, 11, Rue de Louvain, Brussels, Belgium. Next convention, June 23 to July 6, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 W. Broadway, Winona, Minn. Next convention, July 14-17, 1915, Sherman House, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, C. H. & D., Lima, Ohio.

Maintenance of Way and Master Painters' Association of the United States and Canada.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next convention, November 17-19, 1914, Detroit, Mich.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May, 1915.

Master Car and Locomotive Painters' Association of the United States and Canada.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 14-17, 1915, Detroit, Mich.

Master Car Builders' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June 14-16, 1915, Atlantic City, N. J.

National Railway Appliances Association.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railroad Master Tinners, Coppersmiths and Pipefitters' Association.—U. G. Thompson, C. & E. I., Danville, Ill. Annual meeting, May, 1915.

Railway Business Association.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December 10, 1914, Waldorf-Astoria Hotel, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Railway Electrical Supply Manufacturers' Association.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

Railway Fire Protection Association.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala.

Railway Signal Association.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa.

Railway Storekeepers' Association.—J. P. Murphy, L. S. & M. S., Box C, Collinwood, Ohio. Annual meeting, May, 1915.

Railway Supply Manufacturers' Association.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders and Master Mechanics Associations.

Railway Telegraph and Telephone Appliance Association.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill.

St Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Signal Appliance Association.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

Society of Railway Financial Officers.—Carl Nyquist, C. R. I. & P., La Salle St. Sta., Chicago.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. Ry., Atlanta, Ga. Next regular meeting, January 21, 1915, Atlanta, Ga.

Southern and Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7122 Stewart Ave., Chicago. Annual meeting June 15, 1915, Minneapolis, Minn.

Transportation Club of Detroit.—W. E. Brierley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

The Chicago & North Western and the Chicago, Burlington & Quincy have announced a reduction of passenger fares in the state of Wyoming from 4 cents a mile to 3 cents a mile, applying between all stations in the state. A similar reduction was made several years ago by the Union Pacific.

The advance of approximately five per cent in freight rates in Central Freight Association territory allowed by the Interstate Commerce Commission went into effect on October 26. The increase applies to all interstate class rates and to most commodity rates, with the exception of heavy, low grade articles, such as coal, coke, iron ore, cement, plaster, etc.

will be advanced. The result as a whole will be a much more scientific and logical set of rates and a slightly higher basis. The freight tariffs will be filed with the proper commissions between now and January 1, and it is hoped that they will be approved."

Car Surpluses and Shortages

Arthur Hale, chairman of the committee on relations between railroads of the American Railway Association, in presenting statistical bulletin No. 177-A, giving a summary of car surpluses and shortages by groups from June 14, 1913, to October 15, 1914, says: The total surplus increased approximately 21,000 in the past two weeks, and stands at 154,342, the largest for the same period in any year since the publication of these bulletins.

The total surplus on October 15, 1914, was 154,342 cars; on October 1, 1914, 133,382 cars, and on October 15, 1913, 37,198 cars. The prior maximum record was on October 14, 1908, when the surplus was 115,036 cars.

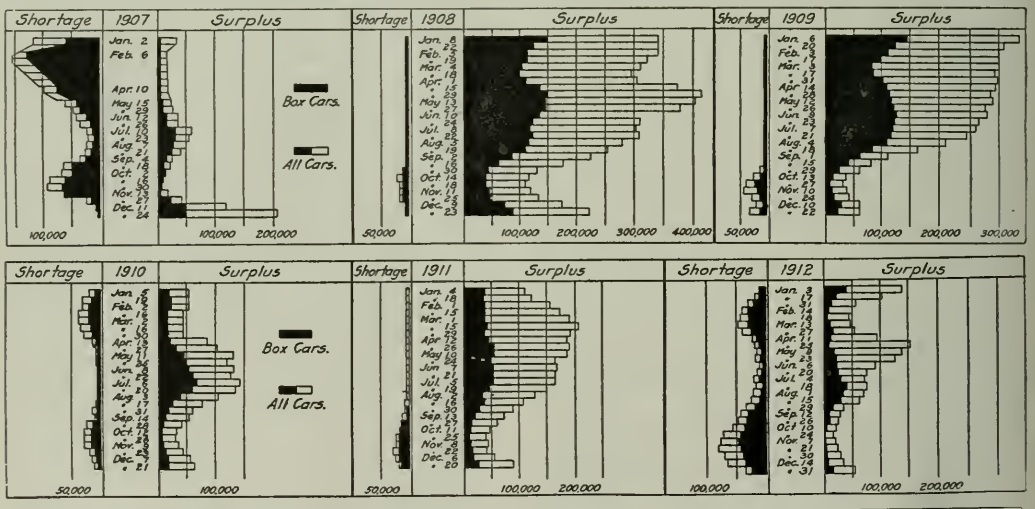
*Group 1 is composed of New England lines; Group 2—New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania lines; Group 3—Ohio, Indiana, Michigan and Western Pennsylvania lines; Group 4—West Virginia, Virginia, North and South Carolina lines; Group 5—Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida lines; Group 6—Iowa, Illinois, Wisconsin and Minnesota lines; Group 7—Montana, Wyoming, Nebraska, North Dakota and South Dakota lines; Group 8—Kansas, Colorado, Missouri, Arkansas and Oklahoma lines; Group 9—Texas, Louisiana and New Mexico lines; Group 10—Washington, Oregon, Idaho, California, Nevada and Arizona lines; Group 11—Canadian lines.



Car Surpluses and Shortages, 1907 to 1914

The Portland Commercial Club has issued a call for a meeting of the commercial bodies in the northwest to be held in Seattle on November 5, for the purpose of organizing a protest against the arbitrary of $17.50 which is to be charged by the Southern Pacific between San Francisco and North Pacific coast points. Transcontinental round trip fares to the Panama-Pacific Exposition next year for those who travel by the northern route will be $17.50 higher than the fare by the direct route.

The New York, New Haven & Hartford announce that a new tariff, adjusting the merchandise and class rates, is being prepared, and one adjusting the commodity rates. "Every effort has been made to eliminate discrimination and remove inequalities. Some rates in the new tariffs will be reduced and some

Almost one-half of the surplus increase is in coal cars. This class of equipment increased generally in all sections except group 1 (New England) and group 9 (southwest) where there is a slight decrease.

Surplus box cars show a large increase in group 6 (northwest) and lesser increases in eastern states, central freight association territory and on Canadian roads. There is also a considerable increase in surplus miscellaneous cars in the northwest.

The total shortage on October 15, 1914, was 2,360 cars; on October 1, 1914, 2,355 cars, and on October 15, 1913, 43,246 cars.

There is practically no change in the total shortage.

The accompanying table gives car surplus and shortage figures by groups for the last period covered in the report and the diagram shows total bi-weekly surpluses and shortages from 1907 to 1914.

Increased Illinois Intrastate Rates Opposed

The Chicago Association of Commerce has announced its intention of opposing before the Illinois Public Utilities Commission the putting into effect of the five per cent increase in intrastate freight rates, tariffs for which were recently filed by the roads. This association did not oppose the five per cent increase in interstate rates before the Interstate Commerce Commission, except as applied to lake and rail rates, but will oppose the Illinois rates on the ground that the situation is different, in that the Illinois rates are already considerably higher than the prevailing level of rates in Central Freight Association territory. The Illinois Manufacturers' Association has not yet announced its position.

Waste in Personal Injury Claim Payments

H. G. Askew, statistician for the Texas railways, reports that 35 of the companies in the fiscal year ending June 30 last, paid out for personal injury claims $2,846,117, an increase of $80,118 over the amount paid for the preceding year. Mr. Askew says:

"Those who have given the subject of personal injury payments the closest study aver that not over one-half of the vast total paid by railroads in settlement of personal injury cases reaches those injured or the heirs of those who are victims of accidents incidental to transportation. If this statement is to be accepted, it is apparent that for the last fiscal year 35 railroads paid out $1,423,058, which amount under any system of economics having standing can be denominated only as waste. At 10 cents a pound this wasted sum would be sufficient to purchase over 56,922 bales of cotton. At the average yield of cotton in Texas during the present year it would require almost 170,000 acres to produce the cotton that could have been purchased by the waste incidental to methods that prevail under legislative sanction for the handling of personal injury cases.

"This wastefulness is accounted for in many ways. It should be borne in mind that all expenses of railroads, except legal expenses, in handling personal injury cases, are by law charged to operating accounts. The prevailing contingent fees charged by attorneys for claimants will run from one-fourth to one-half of the sums recovered. The court and witness expenses of railroads and claimants will bring the total amount paid out by railroads to a figure that makes the estimate of 50 per cent reasonable—that is, those who have suffered the injuries, in the long run, receive but half the sums paid out by the railroads. Payments for personal injuries are by law made a part of the operating expenses of railroads. The higher these operating expenses are, necessarily the higher must be the freight rates, for railroads have but one way of collecting money that must be charged by them in payment of damages, and that is from the producers and consumers who pay the rates of freight that are fixed by agents of the people selected by the people. As long as this wasteful method of handling personal injury cases is permitted to prevail in the end, the people must themselves bear the entire burden thereof, either in depreciated service or in other inconvenience that necessarily follows lack of sufficient funds."

Railway Construction in Cuba.—Papers were recently signed in Havana for the organization of the Ferrocarril del Norte Occidental, with a capital of $60,000, which will build a railroad along the north coast of Cuba from Havana to Mantua, touching several important towns in the provinces of Havana and Pinar del Rio.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The Interstate Commerce Commission has adopted a conference ruling providing that on all claims accruing on and after November 1, 1914, for overcharges on freight, interest shall be awarded in connection with reparation granted on the informal docket in the same manner as it is now awarded in contested cases.

The Oklahoma Traffic Association has filed with the Interstate Commerce Commission a complaint charging discrimination in the rates on agricultural implements from St. Louis, Chicago, Moline and Rock Island, Ill., and other points to Oklahoma City, as compared with the rates to Kansas City, Joplin and Springfield, Mo., and other points.

Divisions Determined by Commission Order

In re rates on lumber and other forest products from points in Arkansas and other states to points in Iowa, Minnesota and other states. Opinion by Commissioner McChord:

In original report in this case given in 30 I. C. C., 371, and reported in the *Railway Age Gazette* of May 29, page 1210, the commission refused to sanction an increase of approximately one cent per 100 lb. on the rates of lumber and other forest products from points on the St. Louis Southwestern in Arkansas and other states to points in Iowa, Minnesota and other states proposed primarily as a result of a controversy concerning divisions. At the end of 60 days the carriers have been unable to determine the divisions of the existing rates with the result that the commission finds it necessary to prescribe divisions as follows: On lumber destined to points on the Chicago, Burlington & Quincy, the revenue is to be divided on the basis of 18 cents to East St. Louis and the balance to the lines beyond; on lumber shipped to Des Moines, Iowa, via the Wabash division will be made on the basis of 65.4 per cent to East St. Louis and 35.4 per cent beyond, the result being a division to the St. Louis Southwestern of 16.5 cents per cent, and to the Wabash of 8.5 cents. (31 I. C. C., 673.)

Sleeping Car Fares Upheld

Commercial Club of the city of Sioux Falls v. Pullman Company et al Opinion by Commissioner Daniels:

The commission finds that the sleeping-car rates of $2 for a lower and $1.60 for an upper berth between Sioux Falls, S. Dak., and St. Paul and Minneapolis, Minn., are not unreasonable. This service is performed by the Pullman Company, operating over the Chicago, St. Paul, Minneapolis & Omaha, and the Great Northern operating its own sleeping cars. The commission finds that although the rates to some nearby points are lower, principally because of competition, the service to some of them is actually operated at a loss. It was alleged that the berth-mile rate of 8 mills is unreasonable, but the commission in its report gives the following expression of opinion: "The value to the passenger of sleeping-car occupancy can not be gaged by exactly the same standards as passenger transportation by day. To the latter, mileage, in the absence of unusual conditions, may be applied as a fair rule of the value of the service. The bare service of transportation to the occupant of a sleeping car, however, has been covered in the first instance by the passenger fare paid. The value of the occupancy of a sleeping car over and above the value of being carried a certain distance is found primarily in obtaining a night's rest under as comfortable conditions as compatible with railroad travel, essentially a night's lodgings; and secondly, in the keeping intact for the transaction of business the daylight hours which otherwise would be spent in covering distance. If the physical conditions under which transportation is conducted were invariably the same, if the speed of sleeping cars were uniformly the same, if the traffic density on all sleeping-car lines were the same, and if detraining during the night imposed no discomfort, mileage might possibly be taken as a measure of the value of sleeping-car occupancy. But it then would be a fair test because it would roughly measure the advantage of a night's occupancy of the sleeper to the passenger

and the cost of service to the carrier. What the patron of a sleeper seeks first is a night's rest, and for this he pays as he would for a hotel room, for a unit service, and this service is approximately the same whether the car be hauled 200 or 300 miles during the sleeping hours. Whether a berth has been in use 4 hours or 10 hours, as a rule it can not again during the same night be made a source of revenue to the carrier. Hence, berth-mile rates are of little comparative value, and are not controlling in fixing rates for the occupancy of sleeping cars." (31 I. C. C., 654.)

Rates on Coal to Weatherford, Tex.

Weatherford Chamber of Commerce et al. v. Missouri, Kansas & Texas et al. Opinion by Commissioner Daniels:

The commission finds that the present carload rates of $2.50 per ton on lump coal and $1.70 per ton on slack coal from mines in Oklahoma and western Arkansas to Weatherford, Tex., are unjust and discriminatory, and it is ordered that rates not exceeding $2.25 per ton on lump and $1.65 on slack coal be established. (31 I. C. C., 665.)

The Eastern Rate-Advance Case

The application of the Easten railroads for further consideration of their request for authority to increase freight rates, with the testimony of Messrs. Willard, Conant, Strauss and others, before the commission at Washington, was reported in part last week, page 729.

On Wednesday the commission heard Lawrence Chamberlain, of Kountze Brothers, the New York bankers. Mr. Chamberlain appeared as the representative of the Investment Bankers' Association of America. He gave reasons why the commission should grant a 5 per cent increase in freight rates, if only, to keep up the credit of the carriers. The investment bankers believe it would be a wise thing for the commission to grant the increase even if it were solely for the purpose of renewing confidence in railroad securities. They wanted the increase for its psychological effect. For some years there had been an increasing reluctance to buy railroad bonds and this reluctance became so acute during the past year that American investors have refused to buy the highest grade of standard railroad bonds at better than panic prices. He mentioned a series of American railroads, with details, whose bonds were lower than at any time in 16 years. He had been informed by the committee which regulates transactions since the close of the Stock Exchange that no railroad securities have sold as high as on closing day.

Samuel Rea, president of the Pennsylvania, testified at length. He said that he considered the situation caused by the European war a sufficient reason for the commission to grant what the railroads ask. The commission in its report of July 29 recognized the need for more revenues for the carriers and the 1914 financial returns clearly indicate that this necessity has now become vital. The returns for July and August show a decline in gross earnings of about 6 per cent, as compared with a loss of less than 3½ per cent for the entire year 1913. The companies have been compelled by reason of this to continue the forced retrenchment in operating expenses. But the retrenchment policy and practice will not produce real savings in expenses or real increase in net profits, for sooner or later the property and equipment must be brought up to standard. It may be that since June 30 as the result of drastic retrenchments some railroads will show slightly better net operating results.

"Such apparent improvement is of little mutual benefit. It must also be remembered that the railroads are continually increasing their investment in road and equipment, on which increase they should earn an adequate return.

"Had the railroads before the war been in a sound, healthy condition it might have been claimed that in so far as their volume of business was temporarily affected thereby the burden was one which the railroads should have assumed. . . . The railroads, however, are subject to regulation by public authority covering not merely the rates they shall charge but many of the conditions affecting their operating costs and methods; they are and have been placed in a category entirely distinct from that of industries not subject to such regulation. They should be in such a position of health that they could withstand their proper burden during a period of general adversity such as this, so that with an improvement in business they might be in a position to render a proper and adequate service and earn a fair return on their property investment.

"The question here is not whether the commission shall advance rates merely in order to sustain security prices, or even to continue dividends; although important, that is but one phase of a big question. This petition is for an advance in rates, which it is hoped will result in enabling the carriers to provide the proper facilities, improvements and service needed by the public and earn an adequate return on property investment.

"The existence of a crisis in the affairs of these roads can no longer be questioned. Having earned a return of only 3.99 per cent in 1914 on the property investment, with operating revenue progressively diminishing since the close of the fiscal year, with practically all improvement work suspended, with forces largely reduced, with passenger and freight train service curtailed and maintenance of roadway and equipment deferred, this is a time for very definite and certain relief.

"In addition to whatever may be eventually realized from the methods for obtaining additional revenues suggested tentatively by the commission the situation is one that calls for positive and immediate treatment on the broadest scale within the powers of the commission."

Mr. Rea said that the Pennsylvania now had 35,000 freight cars in need of repairs and out of use on account of the inadequacy of revenue and that 329 locomotives were likewise tied up for the same reason.

Clifford Thorne made the final statement to the commission. "The railroads are asking for a sort of war tax," said Mr. Thorne. "They are asking the government to lift the burden off a part of the community and shift it over on to the shoulders of others. They ask the wage earner who has lost his job, the cotton planter who cannot sell his cotton and the manufacturer who has been compelled to close his shop to carry the burden of the railroads in addition to their own." He said that the present emergency could be met either by the use of accumulated surplus or by a slight reduction in dividend rates. The very purpose of allowing the railways to accumulate the large surpluses shown in their reports had been to meet just such a situation as now confronts the country.

STATE COMMISSIONS

The Michigan Railroad Commission after a number of hearings has authorized the railroads of the state to increase class rates approximately 5 per cent. The commission some time ago allowed a number of commodity rate increases asked by the railroads to go into effect, but in its decision on class rates made some modifications in the request of the railroads.

The Indiana Public Service Commission has suspended the freight tariffs of Indiana railroads on intrastate business, showing increased rates, which were to have gone into effect October 26 and November 16. The suspension order was for thirty days, to November 20, and it is expected that a hearing on the entire rate question will be held before that time and the controversy settled by the commission. It is said that some members of the commission are extremely busy in a political way just now.

The Illinois Public Utilities Commission has handed down a decision that the issue of transportation by railroads for advertising space is illegal. The commission declares that to authorize such an exchange would defeat the purpose of the law, which requires the filing of rates and schedules with the commission. The commission says that no information of real value would be obtainable where an effort was made to ascertain what rates and charges were being made for service rendered in the way of transportation. "If compensation for transportation may be paid by advertising in newspapers," said the commission, "then on the same principle transportation may be paid for under any arrangement of barter, exchange or trade on the same basis that property is transferred from one to another. Values of property other than money rest solely within the judgment of men. There is no fixed standard by which a certain quantity of property of any kind can be said to equal at all times a definite sum of money. Confusion, discrimination and inequality would certainly attend such contracts if permitted under the law."

PERSONNEL OF COMMISSIONS

W. B. Nantel, formerly minister of inland revenue in the Borden cabinet of the Canadian government, has been appointed a member of the Railway Commission of Canada, succeeding N. E. Bernier.

COURT NEWS

The Arkansas Supreme Court has sustained the validity of the extra crew law passed by the last legislature.

The state of Illinois on October 26, through the attorney-general, filed a petition in the circuit court for a writ of mandamus compelling the Board of Review to impose a tax on the Illinois Central on certain property which it is claimed the railroad has never filed for taxation, consisting of securities of other corporations and real estate, of a value estimated in the petition at $80,000,000.

Suit Against Atlantic Steamship Conference Dismissed

The United States circuit court at New York has handed down a decision in the suit instituted by the government on January 4, 1911, against the lines comprising the Atlantic Steamship Conference, charging conspiracy in restraint of trade, under the Sherman anti-trust law.

The decision dismissed all but one of the contentions made by the government. The court restrains the steamship lines in the conference from sending out "fighting ships" or steamers selected by the members of the conference to carry passengers at lower rates than competing lines, and thus drive the competing lines out of business. In all other respects the court gives a clean bill of health to the steamship conference which, according to the government, comprised steamship lines carrying upward of 90 per cent of all the steerage passenger traffic between Europe and North America at the time of the institution of the suit. The fixing of rates charged against the conference only appertained to steerage rates. The decision was reached by Judges Lacombe, Coxe, Ward and Rogers, sitting as an expediting court in order to eliminate the intermediate step in the appeal which is to be taken. Special Assistant Attorney General Henry A. Guiler has announced his intention of carrying the case to the United States Supreme Court.

Judge Lacombe was selected by his associates to write the decision. He applies the rules of reason established in the Standard Oil and Tobacco decisions by the Supreme Court. The Atlantic conference, he holds, is not an unreasonable monopoly, but has done much good in the way of insuring better service to the public. The defendants are not even required to defray the costs of court. The decision exempts the Canadian Pacific and the Allan Line from the "fighting ship" injunction, because those two lines desisted from the practice of using these vessels before the government's bill was filed.

In reference to the "fighting ships," Judge Lacombe says:

"Upon occasion when some steamship owner or charterer, not a member of the conference, has put a vessel on a berth adjoining the one from which vessels of the conference were about to sail and has offered to carry passengers at a lower rate than that asked by such member, an extra vessel has been put on, ostensibly by one of the lines of the conference, but really by the conference itself, at the same or a lower rate, and all have co-operated to furnish such a 'fighting ship,' and thereby keep out competition. This seems clearly to be within the prohibition of the act: the case is analogous to that presented in the United States versus the Eastern States Retail Lumber Dealers' Association."

The government claimed that the Russian volunteer fleet and the Uranium Steamship Company were driven out of business by the methods of the conference, and that the conference, after their annihilation, raised the steerage rates to artificial prices.

Judge Lacombe further states: "The testimony fails to satisfy us that the defendants, or any of them, have charged excessive or exorbitant rates for the transportation of passengers of any class, especially when it is considered that vastly more in the way of safety, speed, sanitary conditions, physical comforts, etc., is now given to the passenger than was given to him before the agreements and conferences were entered into."

The defendant companies were: The Hamburg-American Line; Allan Steamship Company; Canadian Pacific Steamship Company; the International Mercantile Marine; the International Navigation Company; Cunard Steamship Company, Ltd.; British and North Atlantic Steam Navigation Company, Ltd. (Dominion Line); Holland-American Line; North German Lloyd; Red Star Line; Russian East Asiatic Steamship Company, Ltd. (Russian-American Line); Oceanic Steam Navigation Company, Ltd. (White Star Line).

Railway Officers

Executive, Financial, Legal and Accounting

Walter L. Ross, president of the Toledo, St. Louis & Western, with headquarters at Toledo, Ohio, has been appointed receiver for that road by Judge John M. Killits.

W. H. Biggar, general counsel of the Grand Trunk and the Grand Trunk Pacific, with headquarters at Montreal, Que., has been elected vice-president and general counsel of the Grand Trunk Pacific.

James Moore, who has been paymaster of the Atchison, Topeka & Santa Fe for 43 years, will retire on account of ill health on November 1. He will be succeeded by W. C. Reichenbach, with headquarters at Topeka, Kan.

P. E. Clark, vice-president of the Tennessee, Kentucky & Northern, has been elected president, succeeding George A. Clark, deceased, and T. C. McCampbell, general auditor, succeeds P. E. Clark as vice-president; both with headquarters at Nashville, Tenn.

Operating

H. Adkins, general superintendent and chief engineer of the Tennessee, Kentucky & Northern, has been appointed general manager, with headquarters at Nashville, Tenn.

A. N. Williams, formerly trainmaster of the Missouri, Kansas & Texas at Denison, Tex., has been appointed trainmaster of the Chicago, Rock Island & Pacific at Estherville, Iowa.

John Malcolm Rapelje, assistant general manager of the Northern Pacific, at St. Paul, Minn., has been appointed general manager of the lines east of Paradise, Mont., succeeding E. A. Goodell, deceased, and the position of assistant general manager has been abolished. Mr. Rapelje was born on January 22, 1857, at Chippewa, Ont., and was educated in the common schools. He began railway work in August, 1879, as a brakeman on the Grand Trunk, and then became a fireman on the Atchison, Topeka & Santa Fe. From May, 1882, to November, 1887, he was conductor on the Canadian Pacific, and from January of the following year to June, 1898, was conductor on the Yellowstone division of the Northern Pacific. He was then appointed, trainmaster on the same division, and subsequently became conductor until June, 1902, when he again became trainmaster on the same division. From April, 1905, to July, 1908, he was superintendent of the same division at Glendive, Mont., and then to May, 1910, was superintendent of the Rocky Mountain division at Missoula, Mont. He was then superintendent of the Idaho division at Spokane, Wash., until April, 1912, when he was appointed general superintendent of the lines from Mandan, N. D., to Paradise, Mont., with headquarters at Livingston, Mont. In May, 1914, he was appointed assistant general manager at St. Paul, Minn., which position he held at the time of his recent appointment as general manager of the same road as above noted.

J. M. Rapelje

Traffic

H. L. Shepherd has been appointed foreign freight agent of the Rock Island Lines at Galveston, Tex.

H. C. Hamilton, assistant general freight agent of the Lehigh Valley, at Buffalo, N. Y., has been appointed general freight agent, with headquarters at New York, and S. A. Story, through freight agent at Buffalo, has been appointed assistant general freight agent, with office at Buffalo.

Engineering and Rolling Stock

A. C. Bradley has been appointed division engineer of the Oklahoma division of the Chicago, Rock Island & Pacific at El Reno, Okla., in place of Garrett Davis, who has been promoted to a position in connection with the valuation work, with office in Chicago.

W. P. Kimble, division engineer of the Erie at Marion, Ohio, with jurisdiction between Kent and Dayton, has been transferred to the Marion-Dayton division. R. H. Boykin, supervisor of the third division at Marion, with jurisdiction between Kent and West Salem, has been appointed division engineer with jurisdiction between Marion and Kent. K. W. Collister, supervisor of the fourth division at Marion, has resigned.

T. McHattie, master mechanic of the Grand Trunk at Montreal, Que., has been appointed master mechanic of the Eastern lines, with headquarters at Montreal; W. H. Sample, master mechanic at Ottawa, Ont., has been appointed master mechanic of the Western lines, with headquarters at Battle Creek, Mich., succeeding G. Vliet, deceased; J. Markey, master mechanic at Toronto, Ont., has been appointed master mechanic of the Ontario lines, with headquarters at Toronto; J. R. Donnelley, master mechanic of the Northern division at Allandale, has been appointed assistant master mechanic of the Ontario lines, with headquarters at Allandale, and the titles of master mechanic of the Ottawa division, and the Northern division, are abolished.

OBITUARY

J. Hull Browning, formerly president of the Northern of New Jersey, a subsidiary of the Erie, died on October 26, in New York, at the age of 72.

Brayton Ives, formerly from October, 1893, to 1896, president of the Northern Pacific, died on October 22, at his summer home in Ossining, N. Y. He was born in 1840, at Farmington, Conn., and was graduated from Yale University in 1861. He served in the United States army during the civil war and rose to the position of brigadier general of volunteers. Mr. Ives was president of the New York stock exchange from 1876 to 1880, and subsequently was president of the Western National bank of New York. He was then president of the Northern Pacific for about three years, and later served as president of the Metropolitan Trust Company. He also was a director and president of a number of industrial corporations.

Edward Francis Winslow, formerly president of the St. Louis & San Francisco, died on October 22, at Canandaigua, N. Y. He was born on September 28, 1837, at Augusta, Me., and began railway work in 1860. He then served in the United States army during the civil war and rose to the position of brigadier general of volunteers. From 1867 to 1868 he was the chief contractor engaged in the construction of the St. Louis, Vandalia & Terre Haute, now a part of the Vandalia. He was then to 1873 president during the construction of the St. Louis & Southeastern, now a part of the Louisville & Nashville, and during 1872 was also engaged as a contractor on the construction of the Cairo & Vincennes, now a part of the Cleveland, Cincinnati, Chicago & St. Louis. From 1875 to 1876 he was receiver of the Burlington, Cedar Rapids & Minnesota and then to November, 1879, was vice-president and general manager of the same road, which was reorganized as the Burlington, Cedar Rapids & Northern and is now a part of the Chicago, Rock Island & Pacific. He was subsequently vice-president of the Atlantic & Pacific, now a part of the Santa Fe System; vice-president and general manager of the Manhattan Elevated Railways of New York City, and in March, 1880, became president of the St. Louis & San Francisco. The following year he became president also of the New York, Ontario & Western and in addition was president of the North River Construction Company, the chief contractor engaged in the construction of the New York, West Shore & Buffalo, now the West Shore.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Russian Government Railways are inquiring for prices on a number of locomotives.

The Georgia Railroad has ordered three Mikado type locomotives from Lima Locomotive Corporation.

The Cardenas-American Sugar Company, New York, has ordered one switching locomotive from the Baldwin Locomotive Works.

The Cleveland, Cincinnati, Chicago & St. Louis has ordered 10 switching locomotives from the American Locomotive Company.

CAR BUILDING

The Russian Government Railways are reported in the market for 400 freight cars, to be used for carrying grain. This item has not been confirmed.

The Nashville, Chattanooga & St. Louis has ordered 500 freight cars from the American Car & Foundry Company, and 500 cars from the Mount Vernon Car Manufacturing Company.

The Great Northern is in the market for the following all-steel passenger equipment for the Spokane, Portland & Seattle: 3 70-ft. mail and express, 2 70-ft. baggage, 3 73-ft. smoking, 10 73-ft. first class coaches and 3 73-ft. parlor cars.

The Northern Pacific is in the market for 21 standard sleeping cars in addition to those reported in the *Railway Age Gazette* of October 23. The corrected list now stands: 21 standard sleeping cars, 3 tourist sleeping cars, 6 dining cars, 47 coaches, 7 baggage, 10 dynamo baggage, 4 dynamo mail and baggage and 18 mail and express cars, a total of 116 cars, all of which are to be of all-steel construction.

Swedish State Railways.—According to a report handed to the government by the Board of the Swedish State Railways, the receipts for last year amounted to $24,443,864, in addition to which there were state grants for new railways, etc., amounting to $5,308,339. The expenditure was $18,528,645, leaving a surplus on the working of $5,901,219. The right of way, rolling stock, etc., were estimated at the end of the year to be worth $169,452,600.

Equipment Orders Placed in Germany Cancelled.—A large number of orders placed in Germany before the war by railroads in England and its colonies have now been cancelled and bids asked from firms in the United Kingdom and, in some cases, from firms in this country. Included are the following: Railways of the Union of South Africa, 10 heavy locomotives and 34 passenger cars; South Indian Railways, 16 superheater freight engines and 178 all-steel freight cars, and others for the Assam-Bengal and the Taff Vale railways. An order for 50 freight cars for the Royal Siamese State Railways also has been transferred to an English firm.

Railway Construction in Salvador.—It is reported that work on the Salvador section of the International Railways of Central America is progressing satisfactorily. The surveys have now reached San Salvador and work has been taken up at Santa Ana on the same line. The Salvador Railway has continued its schedule train service between San Salvador, the capital, and the port of Acajutla and from the town of Sitio del Nino to the second city of the republic, a distance of 25 miles. The work of reconstructing the branch line from Ateos to Santa Tecla, which has not been in operation for several years is nearly completed. Another new project is the construction of a line from the port of La Libertad to San Salvador and Santa Tecla. This concession has already been granted, and it is planned to begin work on the road this fall and to complete the construction within two years.

Supply Trade News

The Warner-Reiss Sales Company, St. Louis, Mo., has recently been succeeded by the Warlic Heater Manufacturing Company of the same city.

Charles Hyland, for many years foreman boiler maker in the Jackson (Mich.) shops of the Michigan Central, has resigned to accept the position of boiler expert with the Flannery Bolt Company, Pittsburgh, Pa., succeeding Tom R. Davis, deceased.

Charles F. Pierce, formerly in charge of the railroad department of the Ross-Schofield Company, New York, has been appointed special representative of the Q & C Company, New York, which has taken over the exclusive license and control of the Ross-Schofield system of water circulation for locomotive boilers for the United States and Canada, as was noted in the *Railway Age Gazette* of last week.

The Buda Company, Chicago, Ill., has taken over the repair link for wrecking chains patented by John E. Buckley, former foreman blacksmith of the Illinois Central. This link is of special advantage in wrecking equipment where chains are often broken, and has been used on the Illinois Central for some time. Tensile tests have shown it to be stronger than the other links of the chain to which it is attached. This device is illustrated in the 1912 edition of the M. C. B. Dictionary on page 881.

The Roberts & Schaefer Company, Chicago, has been awarded a contract for the equipment for a 1,000-ton reinforced concrete Holmen type locomotive coaling plant at Nashville, Tenn., by the Louisville & Nashville. This company also received a contract from the Louisville, Henderson & St. Louis for the building of a 200-ton Holmen type coaling plant with weighing facilities at Henderson, Ky. The Illinois Central awarded a contract to this firm for a large barge loading plant to be built immediately at Harahan Incline, New Orleans.

The Smith Locomotive Adjustable Hub Plate Company, which was recently reorganized, still has its headquarters in suite 207-8 Commerce building, Pittsburg, Kan., but the personnel has been changed and is now as follows: A. J. Sams, president; A. H. McCormick, vice-president, and W. G. Wolfe, secretary and treasurer. The directors are A. J. Sams, A. H. McCormick, W. G. Wolfe, W. O. Van Pelt and C. W. Moore. The company is just completing an order for hub plates for 10 Mountain type locomotives for the Seaboard Air Line, and has an order for plates for 20 locomotives for an eastern line.

The Electric Storage Battery Company, Philadelphia, Pa., has supplied 100 type MV-19 "Ironclad-Exide" cells for a storage battery locomotive recently put in service at the Watertown arsenal, Watertown, Mass. The locomotive was built by the Baldwin Locomotive Works. It weighs 50,000 lb., and is of standard gage. The one hour performance on level track with clean dry rails will be a draw bar pull of 5,950 lb. at a speed of approximately two miles an hour based on the average discharge voltage of the battery. When hauling a trailing load of 100 tons on clean dry rails, the speed will be approximately 3.75 miles an hour on level track, and approximately 1.7 miles an hour on a 3 per cent grade. The maximum draw bar pull on level track with sand will be from 12,000 to 14,500 lb.

Tom R. Davis, mechanical expert of the Flannery Bolt Company, Pittsburgh, Pa., died at his home in Dravosburg, Pa., on October 12, 1914, after a long illness. Mr. Davis was born in Allegheny City, Pa., on July 13, 1854. He was educated in the public schools and began work in 1872 as a machinist apprentice in the shops of the Allegheny Locomotive Works (now the Pittsburgh plant of the American Locomotive Company). In 1875 he became a fireman on the Pittsburgh, Ft. Wayne & Chicago, and in the following year passed his examination for engineer. In 1877 he became a special salesman for the Crosby Steam Gage & Valve Company, Boston, Mass., but left in 1880 to accept the managership of the Monongahela Manufacturing Company at Monongahela City, Pa. In 1883, he returned to the Crosby Steam Gage & Valve Company and remained in its employ until 1893 when he became associated with the Garlock Packing Company at Pittsburgh as special agent. In 1898 he entered the employ of the Homestead Valve Manufacturing Company, leaving that company in June, 1904, to become mechanical expert of the Flannery Bolt Company, which position he occupied at the time of his death.

Charles Moulton Gould, vice-president and treasurer of the Gould Coupler Company and the Gould Storage Battery Company, New York, died at his home at Bayside, Long Island, on October 20. Mr. Gould had been associated with the Gould Coupler Company for many years. He was born in Buffalo, N. Y., on September 7, 1873, and received his education in the public schools of that city and in De Veaux College at Niagara Falls. In 1895, shortly after graduation, he entered the plant of the Gould Coupler Company at Depew, N. Y., founded by his father, Charles A. Gould, now the company's president. He served in the works for several years and had a large share in their development and the town of Depew which grew up around them, finally going to the New York office as vice-president and treasurer as noted above. Mr. Gould was very much interested in yachting, and was a prominent member of the New York Yacht Club and the Manhasset Bay Yacht Club.

C. M. Gould

TRADE PUBLICATIONS

Mine Jacks.—The Buda Company, Chicago, Ill., has recently issued bulletin No. 177, illustrating and describing the Buda No. 502-B and the Buda No. 504-B Ratchet Jacks.

Insulating Brick.—The Armstrong Cork & Insulation Company, Pittsburgh, Pa., has recently issued a booklet descriptive of nonpareil insulating brick for boiler settings. The booklet describes the brick, treats of its various merits, illustrates the method of application in connection with common brick and fire brick, and contains a number of views of actual installations.

Electric Railway Equipment.—The Westinghouse Electric & Manufacturing Company in connection with the convention of the American Electric Railway Association, held at Atlantic City on October 12 to 16, has recently issued a half dozen interesting pamphlets dealing with electrically operated railway lines. Railway Data Exchange No. 10 contains much information pertaining to the operation of street railways, dealing more particularly with such subjects as improvements of voltage on interurban lines, effect of voltage on performance of motors, cost of stops and trailer operation, etc. Circular 1549 entitled "Heavy Traffic Centers," contains several illustrations of the heavy traffic centers in various large cities throughout the country where surface lines are equipped with Westinghouse apparatus. Circular No. 1550 deals with the company's 1,500-volt Direct Current Sub-station Equipment, and gives description of a number of different roads throughout the country which are using this apparatus. Circular No. 1546, "Train Operation for City, Suburban and Interurban Service," contains a number of illustrations with brief notes showing the advantages to be derived from the use of multiple unit trains. Following its usual custom, the company has this year issued Progress Leaflet No. 1552, in which is outlined the progress made by the company in electric railway apparatus. Among the items included this year are the Philadelphia Terminal electrification of the Pennsylvania Railroad; the electrification of the Bluefield Division of the Norfolk & Western; the recent addition to the New York, New Haven & Hartford and a number of other steam railroad electrifications and surface, elevated and subway lines in cities both at home and abroad.

Railway Construction

Alabama Roads (Electric).—We are told that the Allentown Power Company, Decatur, Ala., has under consideration the question of building a line from a point on the projected Florence & Huntsville south to Decatur, about 15 miles. C. F. Thompson, president, Birmingham.

Canadian Roads Electric.—At a recent election, a by-law was carried in eleven municipalities, authorizing their respective councils to enter into contracts with the Hydro-Electric Power Commission of Ontario for the construction of a proposed line from Toronto, Ont., north to Newmarket, thence east to Port Perry, to be known as the Hydro-Electric Municipal Railway. F. A. Gaby, Toronto, chief engineer of the Hydro-Electric Commission.

The Hydro-Electric Power Commission of Ontario has been asked to make a report on a proposed electric line to be built in Ontario from a point on Georgian bay, through Guelph to Hamilton and to the Niagara peninsula. Mayor Carter of Guelph is quoted as saying that the line would be built.

Carolina, Atlantic & Western.—Track laying on the Charleston Northern, which is building from Andrews, S. C., south to Charleston, 57 miles, is nearing completion, it is said, and the bridges over the Santee and the Cooper rivers are expected to be finished so that the line can be opened for operation about November 1. A brick and stone passenger station has been completed at North Charleston, and work is nearing completion on brick freight terminals at the foot of Society street in Charleston. W. R. Bonsal, president, Hamlet, N. C. (May 8, p. 1055.)

Charleston Northern.—See Carolina, Atlantic & Western.

Cherry River Southern.—This company, which was incorporated last year to build a line in West Virginia, has completed the permanent survey, it is said, from Curtin in Nicholas county, W. Va., to Bay's Ferry, about 30 miles. It is expected that contracts will be let in the near future for carrying out the work. The proposed route is along the Gauley river and Hominy creek, also Angling creek to Meadow river, thence along that stream. The line is to be built to develop coal and timber lands. The incorporators include S. W. Richey, Cincinnati, Ohio; H. L. Kirtley; G. McClintic and W. G. Mathews, Charleston, W. Va. (December 5, p. 1099.)

Hiawassee Valley.—This company, which was organized last year, to build a 35-mile line, has given the general contract to R. L. Herbert, it is said, and a sub-contract for work on four miles near Andrews has been given to T. McFarland, Knoxville, Tenn. The plans call for building from Andrews, N. C., on the Southern Railway, southwest via Marble to Peach Tree, thence southeast via Hayesville to Hiawassee, Ga., 35 miles. R. E. Mason is superintendent of construction, and C. N. Matone, Asheville, is said to be interested.

Niagara River & Eastern.—Incorporated, in New York, to build a 20-mile line from Lockport, N. Y., west to the Niagara river. The company plans to use both steam and electricity as the motive power. The incorporators include F. A. Dudley, Niagara Falls; F. C. Conant, Buffalo, and C. Hickey, Lockport.

Northern Pacific.—This company has awarded a contract to W. J. Hoy Co., St. Paul, Minn., for grade separation work in Spokane, Wash. The work extends from Hilliard street west to Sixth avenue, a distance of two miles through the central portion of the city. For a large portion of the distance six tracks will be maintained. There are 19 separate street crossings where bridges will be required. Most of these will be of reinforced concrete. For a distance of about 15 blocks the fill for tracks between streets will be enclosed on all sides by concrete retaining walls of the gravity type. The average height will be 17 ft. from ground level to base of rail. The work will include new concrete concourses, stairways, etc., at the depot. The approximate quantities of material used are 80,000 cu. yd., plain concrete, 17,000 cu. yd., reinforced concrete and 120 tons reinforcing steel. Steel work and grading is not covered by the present contract.

Parker & Colorado River (Electric).—A franchise has been given to this company by the Department of the Interior, it is said, to build an electric line through the Colorado River Indian Reservation. The projected route is from Parker, Ariz., south to a point near Ehrenberg, where a ferry is to be established to receive freight from Palo Verde Valley, Cal. Grading for the railway is to be started at once. W. H. Tharpe, Parker, Ariz., is interested.

Quincy & Hamilton.—Incorporated in Illinois with $500,000 capital and headquarters at Hamilton, Ill. The plans call for building from Quincy, Ill., north to Hamilton, about 35 miles. The incorporators include C. S. Carscalion, New York; C. D. Warren, Toronto, Ont.; C. H. Petsche, St. Paul, Minn.; E. D. Parmelee, Chicago, and E. W. Wood, W. H. Orr and R. Wallace, Hamilton, Ill.

Texas Roads.—Plans are being made to build a railway from Austin, Tex., northwest to Big Springs, about 275 miles. The construction work will probably be started early next year. John D. Kinney, Austin, is back of the project.

RAILWAY STRUCTURES

Gallup, N. M.—The Atchison, Topeka & Santa Fe is preparing preliminary sketches for a combination station and hotel to be built at Gallup, N. M. This building will be of reinforced concrete with a brick facing construction. It will be 220 ft. by 140 ft. and two stories high.

Grand Canyon, Ariz.—The Atchison, Topeka & Santa Fe is preparing plans for a new hotel to be built at Grand Canyon, Ariz. The building will be of wood and will have a log house appearance. It is 180 ft. by 162 ft. in area and two stories high. Bids will soon be received by G. W. Harris, chief engineer of the Atchison, Topeka & Santa Fe Coast Lines, Los Angeles, Cal. It is planned to have this hotel completed in time to accommodate the tourists to the Panama-Pacific Exposition in 1915. The approximate cost will be $65,000.

New London, Conn.—An officer of the New York, New Haven & Hartford writes that a contract for improvements in the vicinity of the Thames river bridge, west of Hallam street, New London, and across Winthrop cove, has been let to Ryan & Keon, Boston, Mass. The work consists of a concrete culvert and fill across the cove in place of the existing timber trestle, together with certain street changes. Plans for the Thames river bridge have not yet been completed.

North Toronto, Ont.—The Railway Commission of Canada has issued an order for the removal of the grade crossing at Yonge street, in North Toronto. This is to be accomplished by the construction of a subway for highway traffic under the railway tracks of the Canadian Pacific.

Philadelphia, Pa.—Mayor Blankenburg has signed an ordinance, authorizing the city officers of Philadelphia to enter into an agreement with the Pennsylvania Railroad for the elimination of the grade crossing and elevation of the company's tracks on Lehigh avenue, Philadelphia. The estimated cost of the work is $300,000 for construction and $160,000 for right of way. It is expected that this work will be placed under contract in the near future.

St. Paul, Minn.—Plans have been made, it is said, for building a new single track bridge over the Mississippi river at St. Paul, to be used by the Chicago, St. Paul, Minneapolis & Omaha and the Chicago, Milwaukee & St. Paul. It is understood that work on the new structure will be started during the coming winter.

South Amboy, N. J.—An officer of the Raritan River Railroad writes that this company will build a steel and concrete bridge to have three spans each 30 ft. long, and a height of 30 ft. over Washington avenue at South Amboy. The railroad company will carry out the work with its own forces. The estimated cost is $9,000.

Wilkesbarre, Pa.—The Public Service Commission of Pennsylvania has approved plans for a viaduct at Kidder street in Wilkesbarre. The city officers are directed to enter into a contract with the various railroads. The city is to pay 40 per cent of the cost, the Lehigh Valley 25 per cent, and the Central of New Jersey and the Delaware & Hudson each 17:5 per cent. The improvements will cost about $87,000.

Railway Financial News

Central Vermont.—This company, the Grand Trunk's New England Line, operates a main line from New London, Conn., to Montreal, Que., with branches to Rouses Point, Vt., Waterloo, Que., etc., which bring the total mileage to 536 miles. In the fiscal year ended June 30, 1914, the road had gross operating revenue of $4,509,111 as compared with $4,577,590 in 1913. There was an increase in the freight revenue of $72,591 to $3,030,773, but the passenger revenue, on the other hand, decreased $112,616 and was $1,150,247. Operating expenses increased from $3,658,247 to $3,946,074, largely because of increased maintenance of way expenses due to the severe winter and because of increased charges for maintenance of equipment. The net operating revenues, accordingly, decreased from $919,343 to $554,038. In 1913 there was a net deficit of $9,796. In the fiscal year 1914, however, the company earned but $492,994 with which to pay fixed charges of $752,252, and had to draw upon the Grand Trunk under the latter's guarantee for the difference, $259,258. In 1914 the Central Vermont carried 4,187,550 tons of freight as compared with 4,323,512 tons in 1913—the total ton mileage being 331,141,087, as against 318,758,408 ton miles. The earnings per ton per mile fell from 9.3 mills to 9.2 mills. It was figured that the expenses per ton per mile were 7.9 mills and 7.7 mills respectively, the net earnings thus being 1.3 mills per ton mile in 1914 and 1.6 in 1913. The number of passengers carried on the other hand was 1,840,922, as compared with 2,115,889 in 1913. The earnings per passenger mile decreased from 2.32 cents in 1913 to 2.30 cents in 1914. The expenses per passenger mile, figured at 2.63 and 2.20 cents respectively, thus left a net loss per passenger mile of 3.3 mills in 1914, as against net earnings of 1.2 mills in the previous year. At the end of the year there was cash on hand of $246,331, and loans and bills payable of $5,881,978.

Chicago, Rock Island & Pacific.—Judge Mayer, in the United States district court, has granted a temporary stay in the sale of the *Railway* company stock pending an appeal from his decision refusing to grant a postponement of the sale. This was at the request of the protesting minority bondholders, who are headed by N. L. Amster.

Duluth, South Shore & Atlantic.—This company, operating 628 miles, in the fiscal year ended June 30, 1914, had a net loss, after the payment of expenses, rentals, taxes and interest of $550,989, as compared with a similar net loss of $537,520 in 1913. The Duluth, South Shore & Atlantic is controlled by the Canadian Pacific. Its main line, 409 miles in length, runs from Sault Ste. Marie, Mich., where it makes connection with the Canadian road, west along the southern shore of Lake Superior to Superior. There are also important branches to St. Ignace (43 miles) and to Houghton (48 miles). In 1914 the road earned freight revenue per mile of road of $3,335 and passenger revenue per mile of road of $1,948, as compared with $3,597 and $1,738 respectively in 1913. The total freight revenue in 1914 was $2,091,597, of which $204,403 was from the carriage of iron ore. As compared with 1913, there was a decrease in earnings from ore traffic of $65,432, but this was partly offset by increased traffic in forest products and other commodities. The ton mile rate in 1914 was 8.04 mills, as against 8.65 mills in 1913, the total ton mileage carried being 260,289,207, as against 260,406,913. The average receipts per passenger mile in 1914 amounted to 2.449 cents, and in 1913 to 2.460 cents. The average haul per ton of freight increased from 75.37 miles to 80.93 miles; and the average trainload of revenue freight was increased from 245 to 269 tons. The company has paid no dividends for several years, and its net loss this year is the greatest for some time. On June 30, 1914, the company had on hand cash to the amount of $32,204. At the same time it had working assets of $1,232,888 and working liabilities of $12,704,731; $950,000 of the latter representing loans and bills payable, $8,033,635 matured interest unpaid and $3,000,000 matured income certificates unpaid.

Hocking Valley.—The Public Utilities Commission of Ohio has approved of an issue of $4,000,000 6 per cent one-year notes dated November 2, 1914, to be sold at not less than 97¾, the proceeds to be used to refund $4,000,000 5 per cent notes maturing November 1, 1914.

National Railways of Mexico.—J. J. Hanauer and H. H. Wehrhane have been elected members of the New York board of directors, succeeding Felix M. Marburg and James H. Perkins, resigned. The executive committee of the company is now as follows: Carlos Bassave, Luis Cabrera, Modesto Rolland, Elia S. de Lima and Rafael Nieto.

Seaboard Air Line.—The regular quarterly dividend of 1 per cent on the preferred stock has been passed because of general industrial conditions. The company has outstanding $23,894,100 preferred stock, and has been paying dividends at the regular rate of 4 per cent on this stock for a year.

Toledo, St. Louis & Western.—W. L. Ross, president, has been appointed receiver on the application of creditors of the road. In regard to the receivership The Wall Street Journal says:

"Not long after the Rock Island people tired of holding it and in 1907 D. G. Reid, with characteristic facility, sold the Alton to the Clover Leaf, then under control of Edwin Hawley and his associates. In this transaction the Clover Leaf acquired $14,420,000 Alton common and $6,380,000 preferred, giving in exchange $6,480,000 series A 4 per cent bonds and $5,047,000 series B bonds to bear 2 per cent interest to July 31, 1912, and 4 per cent thereafter.

"In the year of this sale Alton paid 4 per cent on its preferred stock and 4 per cent on the prior lien participating preferred stock. In the following year an initial dividend of 1 per cent was paid on the common, 4 per cent on the preferred and 5 per cent on the prior lien stock, and subsequently dividends went up and down as follows: 1909, common, 4; preferred, 4; prior lien, 8; 1910, common, 2; preferred, 4; prior lien, 6; 1911, common, 0; preferred, 2; prior lien, 4, 1912, 2 on the prior lien and none on the others; none on any of them since.

"Inability of the Alton to maintain its dividends obliged the Clover Leaf in 1911 to pass the 4 per cent dividend on its preferred stock which had been paid regularly from 1907 to October, 1911. No dividend has been paid on the preferred since that time. The burden of carrying the Alton bag was too onerous.

"Clover Leaf has outstanding $9,995,000 common and $9,952,000 preferred. In addition to the bonds secured by the Alton stock the company has outstanding $9,550,000 prior lien mortgage 3½ per cent bonds due in 1925, $6,500,000 first mortgage 4 per cent bonds due in 1950 and redeemable after 1925 and about $1,000,000 equipment notes.

"The company defaulted interest on its series A and B gold bonds, secured by Alton stock, August 1, and a bondholders' protective committee was formed to protect their interest. This committee has been working on various plans to meet the situation, but to date has not arrived at any final conclusion. One suggestion was to make the bonds income bonds, and another contemplated the bondholders exchanging their holdings for Alton stock and a proportion of Clover Leaf stock. This last, it is said, was not seriously considered.

"By the terms of the bond issue, ninety days must elapse after the date of the interest default before any legal action can be taken by bondholders. The committee, including foreign holdings promised, but not delivered, has had deposited with it about 80 per cent of the outstanding bonds.

"For the fiscal year ended June 30, last, Clover Leaf showed a total income of $1,213,545 to apply to charges as compared with $1,150,561 the year preceding, when the surplus after charges was $63,762. In the year ended June 30, 1914, a deficit was shown, because of heavier charges due to the sale direct to car manufacturers during the year of about $1,000,000 equipment notes.

"Clover Leaf paid par for the $6,480,000 Alton preferred stock owned and $35 a share for the $14,420,000 par value common stock, paying in bonds. Alton preferred was quoted at 12, when the market closed last July and the common at 9. Thus, the investment in the preferred, which cost $6,480,000, is now worth only $777,600 at market prices, and the common, which cost $5,047,000, would be worth $1,297,800 on the same basis.

"It is not believed that the Clover Leaf interests would be at all loath to part with the Alton investment."

ANNUAL REPORTS

ST. LOUIS SOUTHWESTERN RAILWAY CO.

OFFICE OF
CHAIRMAN OF THE BOARD OF DIRECTORS.

NEW YORK, September 15, 1914.

To the Stockholders of the
St. Louis Southwestern Railway Company:

The Twenty-third Annual Report of your Company, for the fiscal year ended June 30, 1914, is herewith presented.

Detailed exhibits showing the traffic and operating results for the year, and the financial and physical condition of the property at the close of the year, will be found in the accompanying report of the President.

The physical condition of the property has been well maintained and substantially improved by additions and betterments to the roadway and track the treasury having been only partially reimbursed for such expenditures by the issuance of First Terminal and Unifying Mortgage Bonds), and also by the acquisition of additional rolling stock, mainly under equipment trust agreements, the deferred payments thereunder extending over a period of ten years from the dates of the agreements. Expenditures for additions and betterments to roadway and track and for terminal facilities, aggregating the sum of $522,721.06, have been advanced from the treasury, for which it has not yet been reimbursed, and which expenditures remained unfunded at the close of the year.

It is appropriate to state that, under existing Government regulations, carriers are unable to obtain reimbursement in full for expenditures made for additions and betterments to property. Bonds for additions and betterments can only be issued for the actual expenditures, excluding discount on the bonds as a charge against the property, and your company has not been able to dispose of its bonds and equipment trust obligations at par, thus making it necessary for it to assume and pay the discount on such securities. During the past five years the discount on funded debt charged off against "Profit and Loss" amounted to $2,276,249.76. In addition to this, it may be stated, as a matter of information, that equipment trust notes issued to acquire equipment represent only partial payment for the equipment, as the trust agreements, by their terms, require initial cash payments of about 15% of the value of the equipment; initial cash payments of this character during the past five years aggregated the sum of $921,027.40, which was paid out of current funds. There has also been paid out of the treasury, from current funds, on account of equipment trust notes matured during the past five years, the sum of $1,046,892.75—these payments having served to reduce the book liability on account of such notes. Thus, it will be noted, a large portion of the expenditures for additions and betterments to roadway and track and for additional equipment has not been capitalized.

Your company has no floating debt. At the close of the fiscal year its current assets were largely in excess of its current liabilities, as fully set forth in Exhibit "N" to be found on pages 38, 39 and 40.

Exhibit "O" on page 41 furnishes, in a condensed form, an analysis of all resources, showing, also, how the same were applied during the fiscal year.

CAPITAL STOCK.

No change has been made in the capital stock of your company during the current fiscal year.

FUNDED DEBT

As shown by the condensed balance sheet, the funded debt has been increased $4,345,000.00, as follows:

First Terminal and Unifying Mortgage Bonds issued:		
For reimbursement of treasury on account of expenditures for additions and betterments made by the St. Louis Southwestern Ry. Co., and advances made to Proprietary, Affiliated and Controlled Companies, covering similar expenditures made by them to December 31, 1913, viz.:		
St. Louis Southwestern Ry. Co.	$605,643.85	
St. Louis S.W. Ry. Co. of Texas	718,356.15	
Dallas Terminal Ry. & U. D. Co.	158,000.00	$1,482,000.00
To acquire a like amount of First Refunding and Extension Mortgage Bonds of the Gray's Point Terminal Ry. Co.		125,000.00
To acquire a like amount of First Mortgage Bonds of the Stephenville North and South Texas Ry. Co.		184,000.00
Equipment Trust Obligations issued:		
Series—Special Equip. Trust with The Phila. Trust, Safe Deposit and Ins. Co., dated June 1, 1913, covering:		
3 Steel underframe dining cars		
2 Steel underframe parlor cars		
200 General service steel underframe coal cars	$ [illegible]	
10 Consolidation locomotives		
10 Ten-wheeled locomotives		
Series "D" with U. S. Trust Co. of N. Y., dated February 1, 1914, covering:		
205 Gen'l service steel frame coal cars	349,000.00	
8 Gas-electric motor cars		
Series "E" with Guaranty Trust Co. of N. Y. dated April 1, 1914, covering:		
1500 Steel underframe box cars		
400 Steel underframe flat cars	1,700,000.00	
100 Steel underframe and steel frame coal cars		
Total		$2,750,000.00
Deduct:		
Equipment Trust Obligations matured and paid during year:		
Series—Penn. Co. for Insurances on Lives and Granting Annuities	$34,000.00	
Series "A" with U. S. Mort. and Trust Co. of N. Y.	46,000.00	
Series—Special Equip. Trust with The Phila. Trust, Safe Deposit and Ins. Co.	66,000.00	146,000.00 2,554,000.00
Net increase, this year		$4,345,000.00

The issuance of the securities, as above shown was authorized, after full hearing, by the Public Service Commission of the State of Missouri.

BONDS IN COMPANY'S TREASURY—UNPLEDGED.

Your company holds in its treasury, unpledged, the following mortgage bonds, subject to future sale or other disposition:

St. Louis Southwestern Railway Company:	
First Term. & Unifying Mtg. Bonds—5%—par value	$2,756,000.00
Southern Ill. and Mo. Bridge Company:	
First Mortgage Bonds—4%—par value	600,000.00
Paragould Southeastern Ry. Co.:	
First and Ref'g Mtg. Bonds—5%—par value	511,000.00
Total	$3,867,000.00

PARAGOULD SOUTHEASTERN RAILWAY COMPANY—LEASE.

Effective January 1, 1914, the railroad and property of the Paragould Southeastern Railway Company, a line beginning at a point in Paragould, Greene County, Arkansas, where it connects with the track of the St. Louis Southwestern Ry. Co., and thence extending in an Easterly direction a distance of 8.84 miles in Greene County, Arkansas, 20.46 miles in Dunklin County, Missouri, and 7.96 miles in Mississippi County, Arkansas, to the City of Blytheville, Arkansas, having a total main track mileage of 37.26 miles, was leased by the St. Louis Southwestern Ry. Co., for a period of thirty years, and on and after that date was merged with, and operated as a part of your company's lines. This lease was duly authorized by the Boards of Directors of both companies and approved by the Public Service Commission of the State of Missouri, in its order dated December 15, 1913. Your company has acquired all of the stock ($100,000 par value) and all of the bonds, $311,000 par value, issued by the Paragould Southeastern Ry. Co., which securities are now held in the treasury, unpledged.

DIVIDENDS ON PREFERRED STOCK.

Three quarterly dividends, aggregating 2½%, were declared by the Board during the fiscal year, payable as follows: 1% on October 15, 1913; 1% on January 15, 1914, and ½ of 1% on April 15, 1914. No dividend was declared for the last quarter of the fiscal year, as the Board did not feel justified in approving a dividend for that period in view of the results from operations and prevailing financial conditions.

William Hickok Taylor, Senior Vice-President and Director, died suddenly on February 7, 1914. The great loss sustained by your company and his associates was expressed by the Board of Directors in a resolution unanimously adopted at a special meeting, held on February 13, 1914, a copy of which will be found on page 6 of this report.

The Board acknowledges its appreciation of the faithful and efficient services of its officers and employes during the fiscal year under review.

For the Directors,
EDWIN GOULD,
Chairman.

"COTTON BELT ROUTE"

ST. LOUIS SOUTHWESTERN RAILWAY CO.

OFFICE OF THE PRESIDENT.

ST. LOUIS, MO., September 1, 1914.

MR. EDWIN GOULD,
Chairman of the Board of Directors

DEAR SIR—

I submit herewith the Annual Report of the Company for the fiscal year ended June 30, 1914, showing the results from operation during the year and the financial and physical condition of the property at the close of the year.

During the year the average main track mileage operated was 1,734 miles, an increase of 125.6 miles over the preceding year. The main track mileage operated at the close of the fiscal year, June 30, 1914, was 1,753.8 miles, an increase of 145.3 miles over the main track mileage as of June 30, 1913, which is due to acquisition, through leases, of the Stephenville North & South Texas Ry. Co., 106.9 miles, and the Paragould Southeastern Ry. Co., 37.3 miles, and adjustment of mileage figures heretofore used, of 1.1 miles.

A detailed exhibit of the mileage operated on June 30, 1914, showing main line and branches separately, as well as mileage in each of the states through which the company operates, will be found in table No. 1 of the appendix to this report.

In the condensed comparative statement, immediately following, will be found the financial results from operation for the year ended June 30, 1914.

FINANCIAL RESULTS FROM OPERATION—ENTIRE SYSTEM.
INCOME STATEMENT FOR FISCAL YEAR.

ITEM.	Year ended June 30, 1914.	Year ended June 30, 1913.	+Increase. —Decrease. This Year.
AVERAGE MILES OPERATED	1,734.9	1,609.3	+ 125.6
RAILWAY OPERATING INCOME:			
RAIL OPERATIONS:			
Revenues	$12,744,555.24	$13,296,949.59	—$ 552,394.35
Expenses	9,767,717.12	9,215,796.90	+ 551,920.22
Net Revenue	$ 2,976,838.12	$ 4,081,152.69	—$1,104,314.57
OUTSIDE OPERATIONS:			
Revenues	$ 47,349.20	$ 43,971.15	+$ 3,378.05
Expenses	66,083.49	56,610.21	+ 9,473.28
Net Deficit	$ 18,734.29	$ 12,639.06	+$ 6,095.23
Net Railway Operating Revenue	$ 2,958,103.83	$ 4,068,513.63	—$1,110,409.80
RAILWAY TAX ACCRUALS	601,886.34	468,697.19	+ 133,189.15
Railway Operating Income	$ 2,356,217.49	$ 3,599,816.44	—$1,243,598.95
OTHER INCOME	998,668.36	1,044,324.53	— 45,656.17
GROSS INCOME	$ 3,354,885.85	$ 4,644,140.97	—$1,289,255.12
DEDUCTIONS FROM GROSS INCOME	3,019,114.93	2,757,949.93	+ 261,165.00
INCOME BALANCE TRANSFERRED TO CREDIT OF PROFIT AND LOSS	$ 335,770.92	$ 1,886,191.04	—$1,550,420.12

PROFIT AND LOSS STATEMENT.

Item.	Year ended June 30, 1914.	Year ended June 30, 1913.	+Increase. —Decrease. This Year.

Balance, Credit, Carried to General Balance Sheet	*3,839,909.14*	*4,873,538.91*	— 1,033,629.77
Total	$ 5,267,119.23	$ 6,304,126.77	—$1,037,007.54

OPERATING REVENUES.

The total operating revenues for the current fiscal year amounted to $12,744,555.24, a decrease of $552,394.35, or 4.15% compared with the preceding year. On page 26, Exhibit "A," will be found a statement giving the detail of total operating revenues by the several revenue accounts.

Freight revenues decreased $569,346.42 or 5.77%. The general depression in business which prevailed throughout the entire country, in connection with unfavorable weather conditions in the southwest territory, adversely affected the freight traffic movement on these lines. Droughts, floods and early frosts occurred at intervals during the year, resulting in an almost complete failure of the fruit and vegetable crops in Eastern Texas and a decreased yield of other products of agriculture. The tonnage of lumber, and other forest products, which constitutes a large percentage of the company's traffic, decreased 11.47% as compared with the preceding year.

Passenger revenue increased $43,374.50 or 1.66%, which is attributable principally to an improved local passenger movement in Texas. The reduction in passenger rates in Missouri and Arkansas, following the decisions of the United States Supreme Court on June 16, 1913, resulted in a substantial decrease in the company's revenue. The volume of travel in those States shows its usual normal increase, due to the natural growth and development of the country, and had the rates inhibited by the Supreme Court decisions prevailed during the year, the company would have enjoyed a very material increase in its passenger revenue. The estimated loss to the company during the year by reason of the reduced passenger rates resulting from these decisions, is $340,000.00.

A decrease in express revenue of $18,470.65 or 6.18% resulted from an enforced reduction in express rates effective February 1, 1914, and to the increase made on the express business by the Parcels Post.

Non-transportation miscellaneous revenue decreased $45,527.42 or 75.06%, which is explained by the abnormally large receipts in the preceding fiscal year, for detouring trains of other carriers over this line during the high water troubles in the spring of 1913.

OPERATING EXPENSES.

During the fiscal year ended June 30, 1914, the total operating expenses show an increase of $551,920.22, or 5.99%, as compared with the preceding year. The per cent of expenses to revenues was 76.64 as against 69.31% for the preceding year, or an increase of 7.33%.

Notwithstanding the loss of revenues and the further burdens imposed by the steady increases, from year to year, in the railroad's "cost of living," on account of the increased cost of supplies, increased wages, and the flood of anti-railroad legislation, the management has felt in duty bound to maintain the property to the high standard demanded for safe and efficient operation.

The principal increase in operating expenses was due to the large outlay for heavy repairs and renewals of freight-train cars, made necessary, in a large measure, by the age of such cars, as indicated by the general account "Maintenance of Equipment."

In accordance with the rules prescribed by the Interstate Commerce Commission effective July 1, 1907, there has been included in "Maintenance of Equipment," during the current fiscal year, and also during the preceding six years, adequate charges for depreciation and obsolescence, based on the average life of the equipment.

The general operating expense accounts show increases and decreases, as compared with the preceding year, as follows:

Maintenance of Way and Structures	Increase	$ 20,551.35 or	1.08%
Maintenance of Equipment	Increase	416,310.59 or	18.76%
Traffic Expenses	Decrease	3,092.39 or	0.61%
Transportation Expenses	Increase	77,315.46 or	1.91%
General Expenses	Increase	40,835.21 or	7.44%

In Exhibit "B," on pages 28 and 29, will be found a comparison of operating expenses in detail, by primary, as well as by general accounts.

TRAIN AND CAR LOADING.

The following tables show the average load per freight train and per loaded freight car for the past ten years.

Average load, in tons, per loaded car (including company material).

Year ended June 30.	St. L. S-W. Ry. Co.	St. L. S-W. Ry. Co. of Tex.	Entire System.
1905	18.19	15.54	17.43
1906	18.79	16.63	18.13
1907	19.01	17.06	18.40

RATE LITIGATION.

In the annual report for the preceding year reference was made to the decision of the Supreme Court of the United States, on June 16, 1913, adversely affecting the passenger and freight tariffs of this company and other carriers operating in Missouri and Arkansas. In pursuance of this decision both the Missouri and Arkansas rate cases were remanded to the respective district courts, with instructions to dismiss the bills therein without prejudice.

In the Missouri rate case, the United States District Court for the Western District of Missouri dismissed the complaint and refused to appoint a Master in Chancery to hear the claims for alleged overcharges on intra-state traffic. The Attorney General of Missouri, in the name of the State, thereupon instituted suits against all carriers involved, seeking to recover the alleged overcharges both on freight rates and passenger fares, covering intra-state business, during the pendency of the injunction.

In the Arkansas rate case, the United States District Court for the Eastern District of Arkansas appointed a Special Master in Chancery to hear and report upon all claims for alleged overcharges on intra-state traffic, during the time the rates were enjoined, and fixed a time within which the claims should be presented. A large number of claims have been presented to the Master, who is now engaged in investigating the same, but he has not yet made a report to the Court.

The reduction in the intra-state tariffs has forced a reduction in inter-state tariffs, but the carriers will avail themselves of all proper means to secure a restoration of the tariffs previously in effect, or an increase in the present tariffs. In view of the expressions of the Interstate Commerce Commission relating to passenger fares, in its recent decision in the matter of the application of the Eastern lines for a 5% increase in freight rates, a petition has been presented to the Interstate Commerce Commission, which, if granted, will enable the carriers to increase inter-state fares in Missouri and Arkansas, and favorable action on this petition is anticipated. Negotiations are also pending with the Missouri Public Service Commission looking to an increase in Missouri intra-state passenger fares, and altogether the outlook for increased passenger fares is now more favorable than at any time since the United States Supreme Court's decision referred to was rendered.

AGRICULTURAL AND INDUSTRIAL.

During the current fiscal year, the agricultural development work has been continued along educational lines, including the improvement of home and living conditions, the methods of saving the waste products of the farms, the improvement of breeds of live stock and better cultural methods in growing of farm crops. In certain well adapted sections the dairy industry has been encouraged and special attention given to the matter of saving feeds for feeding live stock during the Winter months. As a result of this company's efforts, and those of the agricultural experiment stations, the Government Farm Demonstration Service, and the agricultural press, the farmers of the southwest have begun to adopt the silo as a means of preserving rough foods for Winter feeding. During the past year a great many silos have been built along this company's lines, and, in most cases, the results have been highly satisfactory.

An agricultural special train was operated over the entire system during the Winter months, 195 stations located on this company's lines were visited and approximately 90,000 people visited the train. The agricultural special train has proven a splendid means of reaching a large number of people for the purpose of disseminating agricultural information and instruction.

Considering the general business depression, the industrial conditions along this company's lines are fairly satisfactory. The lumber industry has suffered greatly during the past year, but it is hoped that general conditions may soon admit of a revival in that business.

EQUIPMENT.

The following equipment, contracted for under trust agreement with The Philadelphia Trust, Safe Deposit and Insurance Co., during the preceding year, was received during the current year: 10 consolidation locomotives, 10 ten-wheel locomotives, 200 general service steel underframe coal cars, and 2 steel underframe parlor cars.

During the fiscal year there was acquired from the Stephenville North and South Texas Ry. Co., 1 coach, 1 combination baggage and express car, 1 caboose car, 20 box cars, 3 flat cars and 2 wrecking cars; and from the Paragould Southeastern Ry. Co., 2 locomotives and 1 box car.

The following cars were rebuilt to replace cars destroyed or worn out from old age, and paid for from current funds: rebuilt at Company Shops, 4 furniture cars, 281 box cars, 28 flat cars, 7 coal cars and 1 boarding car: rebuilt by the American Car and Foundry Co., 500 box cars.

New equipment built at Company Shops, 4 combination caboose and coach cars.

The following equipment was contracted for during the fiscal year under Trust Agreements:

Agreement with the United States Trust Company, of N. Y., executed February 1, 1914, covering:

205 General service steel frame coal cars.
8 Gas-electric motor cars.

Of the foregoing equipment the 205 general service steel frame coal cars were received during the current fiscal year; none of the 8 gas-electric motor cars was received during the current fiscal year: however, 5 of them have been received since June 30, 1914, and the remaining 3 will be received soon.

Agreement with the Guaranty Trust Co. of New York, executed April 1, 1914, covering:

1500 Steel underframe box cars.
400 Steel underframe flat cars.
100 Steel underframe and steel frame coal cars.

None of the foregoing equipment was received during the current fiscal year; however, at date of this report the following has been received: 400 steel underframe flat cars; 100 steel underframe and steel frame coal cars; 716 steel underframe box cars; and delivery of the full complement will be completed at an early date.

Arrangements have been concluded for the rebuilding of all freight cars, acquired under equipment trust agreements, which were destroyed up to June 30, 1914. These replacement cars will all be delivered prior to November 30, 1914, and at that date, there will be no vacant numbers in any series of freight cars, covered by the company's outstanding equipment trust obligations, on account of cars destroyed prior to the close of the fiscal year under review.

ADDITIONS AND BETTERMENTS.

Expenditures for Additions and Betterments—Road, during the current year amounted to $896,079.16 and for Equipment, after allowing for value of equipment retired, $715,755.58, making the total amount expended for additions and betterments during the year $1,611,834.74.

The exhibit styled "Property Investment—Road and Equipment" on page 33, shows, in detail, the expenditures for additions and betterments during the current fiscal year.

NEW BRIDGE OVER THE MISSISSIPPI RIVER AT MEMPHIS, TENN.

In the last annual report announcement was made of the organization of the Arkansas & Memphis Railway, Bridge and Terminal Company for the purpose of constructing, maintaining and operating a double track railway and highway bridge over the Mississippi river at Memphis, Tenn. The capital stock of this company is owned equally by the Chicago, Rock Island & Pacific Ry. Co., St. Louis, Iron Mountain & Southern Ry. Co. and this company. Work has progressed on this bridge during the current fiscal year, and at the date of this report the substructure work is practically completed. The prevailing stringency in the financial market due to the disastrous European war, may result in temporarily suspending work on the bridge, but it is hoped that matters will be so adjusted that it can be completed without extended delay.

NEW PASSENGER TERMINALS AT DALLAS, TEXAS.

The work of constructing the new union passenger station and facilities of The Union Terminal Company at Dallas, Texas, is now under way.

As stated in the preceding annual report, the St. Louis Southwestern Railway Company of Texas owns a one-eighth proprietary interest in these new terminals and will make use of the facilities when completed.

FORTY-THIRD YEAR—GENERAL STATEMENT OF THE AFFAIRS OF THE NEW YORK, NEW HAVEN AND HARTFORD RAILROAD COMPANY

FOR THE YEAR ENDING JUNE 30, 1914.

INCOME ACCOUNT OF THE NEW YORK, NEW HAVEN AND HARTFORD RAILROAD COMPANY.

For the Year ending June 30, 1914, in	1914.	Comparison with Year 1913. Comparison with 1913. Increase.	Decrease.
	2046.29 miles operated.		46.20 miles.
OPERATING REVENUE:			
Freight Revenue	$32,476,323.26		$1,595,601.49
Passenger Revenue	27,400,672.89		495,627.40
All other Revenue from Transportation	4,772,208.85		4,655.76
Revenue from Operations other than Transportation.	1,968,437.82	100,074.39	
TOTAL OPERATING REVENUE	$66,617,692.82		$1,995,810.26
OPERATING EXPENSES:			
Maintenance of Way and Structures	$8,831,064.18	$937,974.14	
Maintenance of Equipment	10,389,458.10	788,789.54	
Traffic Expenses	502,019.87		80,290.35
Transportation Expenses	26,868,687.50		334,583.45
General Expenses	1,924,120.16		23,879.04
TOTAL OPERATING EXPENSES	$48,515,349.81	$1,288,010.84	
NET OPERATING REVENUE	$18,102,343.01		$3,283,821.10
NET REVENUE FROM OUTSIDE OPERATIONS	85,480.03		559,967.17
TOTAL NET REVENUE	$18,187,823.04		$3,843,788.27
RAILWAY TAX ACCRUALS	3,568,219.04		146,536.94
	$14,619,604.00		$3,697,251.33
INCOME FROM OTHER SOURCES:			
Dividends on Stocks	$3,521,760.93		$2,965,755.73
Interest on Bonds	273,243.58	31,899.46	
Income from Unfunded Securities	2,049,876.77		172,219.42
Rents Received	708,878.81	206,561.76	
Hire of Equipment	244,181.37	13,550.55	
Sinking and Other Reserve Funds	202,229.33		13,988.55
Income from Physical Property	163,609.60	90,185.98	
Miscellaneous Income	84,209.51		6,028.93
TOTAL INCOME FROM OTHER SOURCES.	$7,247,989.90		$2,815,794.88
TOTAL INCOME	$21,867,593.90		$6,513,046.21
DEDUCTIONS FROM INCOME:			
Interest on Bonds, Debentures and Other Liabilities.	$11,839,722.50	$810,593.41	
Rentals of Leased Lines	4,658,542.27	112,748.69	
Rentals other than above	2,684,177.22	293,034.17	
Separately Operated Properties: Loss Boston R. R. Holding Co. Guarantee	$1,118,756.00	615,487.51	
N. Y., W. & B. Ry. Co. Guarantee (Bond Interest)	864,000.00	86,250.00	
B. & A. R. R. Operating Guarantee	95,324.68	137,905.55	
	$2,078,080.68		
Miscellaneous Tax Accruals	92,690.95	10,307.47	
Miscellaneous	245,717.41	73,911.84	
TOTAL DEDUCTIONS FROM INCOME	21,598,931.03	2,140,528.64	
NET INCOME TRANSFERRED TO PROFIT AND LOSS ACCOUNT	$ 268,662.87		$8,653,574.85

NOTE. Dividend No. 136 for 1½%, paid Sept. 30, 1913, was charged to Profit and Loss Account....

The Operating Expenses were 72.83% of the Total Operating Revenue. Increase over 1913, 4.00%.

The Operating Expenses and Taxes were 78.18% of the Total Operating Revenue. Increase over 1913, 3.94%.

OPERATING RESULTS.

MILES OPERATED.

There was a decrease in average miles of road operated of 46.20 miles. The average miles of track maiotained was 4,397.75 compared with 4,452.55 the previous year, a decrease of 54.80 miles. These decreases were mainly due to giving up certain trackage rights on the Boston & Albany and Boston & Maine and to the Central New England assuming the operation of the line between Danbury, Connecticut, and Hopewell Junction, New York. Details of changes in mileage as of June 30, 1914, compared with June 30, 1913, will be found on page 60.

REVENUES AND EXPENSES.

The general business depression during the greater part of the fiscal year caused a decrease in the operating revenue of $1,995,810.26, while operating expenses increased $1,288,010.84, resulting in a decrease in net operating revenue of $3,283,821.10.

Freight revenue decreased $1,595,601.49, 4.7%, and passenger revenue $495,627.40, 1.8%. Express revenue fell off $307,378.75, 9.7%, due partly to reduced express rates ordered by the Interstate Commerce Commission, effective February 1st, 1914, and to the increase in shipments by Parcels Post, for which no adequate compensation has as yet been received. There was an increase of $198,177.34 in other passenger train revenue, mainly due to the inclusion of a full year's receipts from the Pullman Company and extra fares on Limited trains, the previous year's accounts having been credited with only six months' proportion, as the Pullman contract became effective January 1st, 1913. Net revenue from outside operations decreased $559,967.17, largely because the Pullman Company operated equipment formerly operated by the railroad. Revenues from operations other than transportation, after deducting decrease of about $100,000.00 account of falling off in revenue from discharging, wharfage, hoisting and car service; shows a net increase of $100,074.39, largely on account of additional rentals at Grand Central Terminal. In this connection, however, it should be noted that the net payment for entrance to and use of the passenger terminal at New York for the year ending June 30th, 1914, amounted to $3,150,947, as compared with $2,983,969 for 1913. The net charge against the Company during 1914 was equivalent to about 31 cents for each passenger into and out of the terminal.

MAINTENANCE OF WAY AND STRUCTURES.

This account increased $937,974.14, caused in part by higher wages and in part by the larger amount of renewals required because of work that was deferred in previous years.

There were 2,060,485 ties laid in renewals as compared with 1,814,190 in the previous year, an increase of 14%. This includes 137,907 creosoted ties with screw spikes and tie plates put in between New Haven and Woodlawn and on the Harlem River Branch, compared with 123,672 last year, an increase of 28%. There were 25,783 tons of new rail laid, an increase over the previous year of 3,173 tons, or 14%.

Removal of snow and ice cost $108,378.90 more than in the previous year, and the maintenance of the electric power transmission system cost $154,969.00 more. Much work was done on signals and interlocking plants.

The track, bridges and structures of the company are in safe and serviceable condition, but expenses for maintenance of way must be liberal because of the heavy equipment and the great number and speed of trains.

MAINTENANCE OF EQUIPMENT.

This account increased $788,789.54, due to some increase in wages, work on electric locomotives deferred in 1912, increase in repairs to freight cars of $351,985.82, and an increase in the charges for depreciation of $476,738.67.

Since July 1st, 1913, charges to depreciation have been made as required by the Interstate Commerce Commission, based on the original cost of equipment, as follows:

		Total charge for year
2 %	on Steam Locomotives	$ 298,633.94
2 %	on Electric Locomotives	" " " " .. 76,923.03
2 %	on Passenger Train Cars	" " " " .. 302,927.62
2½%	on Steel Freight Train Cars	
2½%	on Wood Freight Train Cars	" " " " .. 985,777.81
3 %	on Floating Equipment	" " " " .. 88,526.11
2½%	on Work Equipment, Steel	
2½%	on Work Equipment, Wood	" " " " .. 20,577.28
	TOTAL	$1,773,365.79

The equipment of the Company, other than the freight cars, is in good condition. In 1906-07-08 a large number of new freight cars were purchased, about 20,000, and heavy repairs are now needed on these cars and charges for this class of work will be heavy for several years to come. Because of the decreased volume of business this class of work was deferred and there are about 2,500 more bad order freight cars on the road than should be the case under normal conditions. Repairs are now being made more rapidly and the number of bad order cars is decreasing.

TRAFFIC EXPENSES.

This account decreased $80,290.35.

TRANSPORTATION EXPENSES.

This account decreased $334,583.45. The miles run by trains of all classes were 25,254,718, a decrease of 1,559,166. The cost per revenue train mile for transportation expenses was $1.12, compared with $1.07 for last year, an increase of 5 cents, or 4.7%. The average number of passengers per train was 96, an increase of 1, and the average number of tons of revenue freight per revenue train mile was 303.96, an increase of 13.81 tons, or 4.5%. There was an increase in wages, the greater part of which was the result of awards under Federal Arbitration Acts, and increases in forces at engine terminals so as to take better care of power and insure greater regularity of service.

The cost of fuel decreased $356,045.96.

Injuries to persons required the large sum of $1,181,735.59, an increase of $37,966.92, due to the settlements for the sad and disastrous accidents in 1912-1913. Of the $1,181,735.59, $318,324.93 was charged to the Accident and Casualty Operating Reserve, and the balance, $863,410.66 to Operating Expenses. There remains in the Accident and Casualty Operating Reserve $1,042,597.17, which will be used to take care of the unadjusted personal injury claims prior to the current fiscal year, so that the charges to Operating Expenses account personal injuries for the current fiscal year will probably be materially less than for the past fiscal year.

Loss and Damage accounts of all kinds amounted to $1,966,492.64, or 8 cents per train mile.

Very earnest efforts have been made during the year to reduce accidents and damage and to improve the practice in the consumption of fuel.

GENERAL EXPENSES.

This account decreased $23,879.04 although the Company had to sustain unusual burdens, the result of negotiations with the Federal Government and investigations by the Public Service Commission of Massachusetts, the Department of Justice of the United States and the Interstate Commerce Commission.

The Federal Act requiring valuation of railways increased expenses $24,176.77, and this expense will be more during the coming year. The Commissioners advise that they will begin to value the property of the Company April 1st, 1915, and by that date the Company expects to have completed the resurvey of 1,000 miles of road.

FINANCIAL.

CAPITAL STOCK.

Of the total authorized outstanding capital stock of 1,800,170 shares, 228,991 shares are in the treasury and 1,479 shares are owned by The Rhode Island Company. During the past fiscal year there has been no increase in the capital stock. A dividend of 1½% was paid Sept. 30, 1913, and charged to Profit and Loss Account.

TEMPORARY FINANCING.

In 1913 the Company had a large floating debt, because of the Massachusetts law prohibiting any funded debt exceeding in amount the paid in capital of the Company. This law was changed in July, 1913, so as to permit the issue of bonds to an amount equal to twice the amount of the capital stock.

In order to fund the floating debt under this new law and to provide tor the purchase of steel passenger cars and for other improvements the Directors in July, 1913, arranged for an issue of six per cent. convertible debentures to the amount of $67,552,000, to be offered to the holders of the stock and the outstanding convertible debentures of the Company. General financial conditions at that time were not favorable, and to make certain that the Company would get its money when needed the Directors caused this proposed issue of debentures to be underwritten. The stockholders approved this arrangement at a meeting August 22, 1913.

The issue of these debentures though opposed before the Public Service Commission of Massachusetts, was on October 14, 1913, finally approved by that Commission. An appeal was taken from this decision to the Supreme Court of Massachusetts, which on January 9th, 1914, decided that the proposed issue was not lawful.

There were $40,000,000 of notes maturing on December 1st, 1913 and $5,000,000 of bonds maturing February 1st, 1914. Therefore, it became necessary pending the decision on the application for the issue of the proposed six per cent. convertible debentures to borrow on November 18th, 1913, $45,000,000. to retire the notes maturing on December 1st, 1913 and the bonds maturing on February 1st, 1914. Later other amounts were borrowed to pay for new equipment and for improvements which could not be stopped or postponed, the whole amount to be provided aggregating nearly $54,000,000., all payable prior to July 26th, 1914. The decision of the Massachusetts Supreme Court made necessary an alternative plan of immediate financing, to take care of the maturing short term notes and to meet capital requirements until 1915.

With the assistance of Messrs. J. P. Morgan & Co., the First National Bank and the National City Bank of New York, and Messrs. Kidder, Peabody & Co., Lee, Higginson Co., of Boston, there were sold $50,000,000. of Notes dated May 1st, 1914, as follows:

$20,000,000. The New York, New Haven and Hartford Railroad Company One Year 5% Collateral Gold Notes, callable at 100-½%

$10,000,000. The Harlem River and Port Chester Railroad Company One Year 5% Gold Notes, Series "A," guaranteed by The New York, New Haven and Hartford Railroad Company as to principal and interest, callable at 100-½%.

$20,000,000. The New England Navigation Company Three Year 6% Collateral Gold Notes, callable at 101-½%, all dated May 1st, 1914.

The Bankers further agreeing to take within six months' time, at their option, $10,000,000. of One Year 6% Notes of The New York, New Haven and Hartford Railroad Company without collateral. The collateral pledged under the New Haven and Navigation Company notes, mentioned above, consisted of some of the securities in the treasuries of the companies.

It was expected to market some of the collateral and to retire the notes in part. From the proceeds of collateral sold, notes to the amount of $435,000 have been cancelled; but the war and general financial conditions made further sales of securities impossible.

Your directors have had in mind the urgent necessity for a broad plan for permanent financing, but the laws are conflicting and circumstances and conditions have not been favorable.

INCREASE IN DEBT.

The outstanding indebtedness of the Company and its leased lines in the hands of the public (not including that held in the treasuries of subsidiary companies) has been increased during the year by the amount of $4,522,250.00, as follows:

INCREASES.	
Five per cent. Collateral Gold Notes	$19,927,000.00
Providence Securities Company 4% gold debentures assumed as a direct instead of an indirect liability (heretofore an obligation of The New England Navigation Co.)	19,180,000.00
Six per cent. six months notes dated Nov. 18, 1913 (balance matured but notes not presented by holders)	40,000.00
Six per cent. three months note dated April 13, 1914	400,000.00
Five per cent. six months notes dated January 14, 1914	2,000,000.00
Five per cent. six months notes dated January 26, 1914	250,000.00
Four and one-half per cent. five year promissory notes dated May 7, 1914	222,000.00
Five per cent. six months notes dated June 26, 1914	550,000.00
Five per cent. four months note dated June 26, 1914	375,000.00
The Harlem River & Port Chester R. R. Co. one year 5% gold notes, guaranteed by The New York, New Haven & Hartford Railroad Company	10,000,000.00
	$52,944,000.00
DECREASES.	
New Haven St. Ry. 5% first mortgage bonds, paid in August, 1913	$599,000.00
Four per cent. non-convertible debentures, paid Feb. 1, 1914.	5,000,000.00
New Haven St. Ry. 5% convertible mortgage bonds, paid in June, 1914	229,000.00
Four and one-half per cent. notes, paid in July, 1913	2,375,000.00
Five per cent. notes, paid in November and December, 1913.	39,995,000.00
Note in favor of City of New Haven, paid September 16, 1913.	23,750.00
	$48,421,750.00
Total Increase	$4,522,250.00

MATURING DEBT.

There will mature between October 1st, 1914, and June 30th, 1915, the following obligations for which your Company is responsible:

October 26, 1914, five per cent. four months note	$375,000.00
December 1st, 1914, Middletown Horse R. R. 5% 1st Mortgage Bonds	150,000.00
December 26th, 1914, five per cent. six months note	550,000.00
January 14th, 1915, five per cent. six months notes	1,000,000.00
January 27th, 1915, five per cent. six months notes	200,000.00
May 1st, 1915, five per cent. one year Collateral Gold notes.	
Total issue $20,000,000.00	
Less, paid off 435,000.00	
	19,565,000.00
May 1st, 1915, The Harlem River & Port Chester Railroad Co. Five per cent. one year Gold Notes, Series "A"	10,000,000.00
Total	$31,840,000.00

A statement of your Company's Contingent Liabilities in the hands of the public is shown in this report. All of the companies therein mentioned were able to meet their obligations for interest and dividends without recourse to your Company's guaranty except the Boston Railroad Holding Company and the New York, Westchester and Boston Railway Company.

INSURANCE FUNDS.

As no appropriations have been made by the New Haven Company to the Fire Insurance and Coal Insurance Funds since June 30, 1911, the current losses being charged to Operating Expenses, it was thought unnecessary to continue these Funds, and they were cancelled and contracts for insurance placed; the securities and assets of the various Funds turned into the treasury of the New Haven Company, and the reserve in those funds credited to the Profit and Loss Account of the New Haven Company.

No appropriation has been made to the Accident and Casualty Fund since June 30, 1911, and it was cancelled. For the 1913 fiscal year there was charged to the Accident and Casualty Reserve $337,744.21, for the 1914 fiscal year $318,324.93, leaving $1,042,597.17, which has been set up as a reserve to take care of unadjusted personal injury claims prior to July 1, 1914.

The New England Steamship Company Marine Insurance Fund was cancelled and contracts for insurance placed, the securities and assets turned into the treasury of the Steamship Company and the reserve in the Fund credited to the Profit and Loss Account of the Steamship Company. The securities were subsequently sold to the New Haven Company.

MERCHANTS AND MINERS TRANSPORTATION COMPANY.

Because of the attitude of the Federal authorities and the very serious financial condition of this Company, the securities of the Merchants and Miners Transportation Company were sold in April, 1914. Additional Capital was needed to finance the Merchants and Miners Transportation Company which the New Haven Company was unable to furnish. On account of unfavorable conditions the sale resulted in a loss of $3,594,500.00.

These securities were held by The New England Navigation Company and their cost was reflected in the capital stock of that company. The capital stock of The New England Navigation Company was reduced by 35,945 shares, the New Haven Company's investment in the Navigation Company was reduced a like amount, and the amount of the reduction in value of the New Haven Company's investment in the Navigation Company was charged to the Profit and Loss Account of the New Haven Company.

PROFIT AND LOSS.

The Profit and Loss Surplus of $7,916,557.24 as of June 30th, 1913, has been reduced by transactions shown on page 39, to $1,822,246.14 as of June 30th, 1914.

EQUIPMENT TRUST.

Under date of April 1st, 1914, an arrangement was made with the Farmers' Loan & Trust Company for an Equipment Trust, under which the Company is to make semi-annual payments for fifteen years, when the title to the equipment will be vested in the Company.

NEGOTIATIONS WITH THE DEPARTMENT OF JUSTICE OF THE UNITED STATES.

On April 11th, 1914, a pamphlet was mailed to each stockholder giving some account of the negotiations with the Department of Justice for a peaceful solution of the so-called "New England Railroad Situation."

At a meeting of the stockholders on April 21st, 1914, the Directors were authorized to complete negotiations and to arrange for the segregation of the various properties that were under dispute. Since then there have been prolonged conferences with the Department of Justice.

The Department filed its petition in the District Court of the United States, Southern District of New York, on July 23, 1914, and the Company filed its answer on September 17, 1914.

An agreed decree is to be entered which produces the following results:

First. The New Haven Company transfers to Frank P. Carpenter, of Manchester, New Hampshire, Henry B. Day, of Newton, James L. Doherty, of Springfield, Charles P. Hall, of Newton, and Marcus P. Knowlton, of Springfield, all in Massachusetts, as trustees, 31,065 shares of the common stock and 244,939 shares of the preferred stock (being all of the common and all but 28,000 shares of the preferred stock) of the Boston Railroad Holding Company, the latter being the holder of 6,543 shares of the preferred and 219,189 shares of the common stock (a majority of all outstanding stock) of the Boston & Maine Railroad, in trust to sell the Boston and Maine shares under the order of the Court.

The trustees shall hold the shares and exercise all the powers the owners of the shares of the Holding Company are entitled to exercise, excepting the right to sell or dispose of them until otherwise ordered.

No order directing the sale of any of the shares of the Holding Company shall be made by the Court until after July 1st, 1915, unless the New Haven Company shall in writing consent thereto. If no sale is made before July 1st, 1915, the Court, on application of any party, and after a hearing at which the Commonwealth of Massachusetts shall be invited to appear, shall determine when a sale shall be made and fix the terms and conditions thereof.

The trustees shall also use their best efforts to complete the sale of the shares of the Boston & Maine Railroad before January 1st, 1917.

Second. The New Haven Company transfers to the same trustees, the following shares of corporations, the railroad lines of which are leased to the Boston & Maine or Maine Central Railroad Company:

922 shares of capital stock of the Northern Railroad (of New Hampshire),
1,015 shares of capital stock of the Connecticut River Railroad Company,
63 shares of capital stock of the Manchester & Lawrence Railroad,
246 shares of capital stock of the Hereford Railway Company,
2,469 shares of capital stock of the Concord & Montreal Railroad,
184 shares of capital stock of the Vermont & Massachusetts Railroad,
193 shares of capital stock of the Lowell & Andover Railroad Company,
412 shares of capital stock of the Boston & Lowell Railroad,
710 shares of capital stock of the Pemigewasset Valley Railroad,
1,464 shares of capital stock of the Connecticut & Passumpsic Rivers Railroad Company,
73 shares of capital stock of the Upper Coos Railroad,
18 shares of capital stock of the Concord & Portsmouth Railroad,
98 shares of capital stock of the Wilton Railroad Company,
86 shares of capital stock of the Peterborough Railroad,
84 shares of capital stock of the Nashua & Lowell Railroad and
354 shares of capital stock of the Massawippi Valley Railway Company.

The trustees shall hold these shares and exercise all the powers in the management of the corporations which the owners of the shares are entitled to exercise. They shall sell the shares, whenever in their judgment such sale or sales can be made to the best advantage, so long as they remain subject to sale and upon such terms as the New Haven Company shall request in writing signed by its President or Chairman of the Board of Directors and approved at a meeting by said Board.

The trustees shall exercise their best efforts to complete the sale of said shares before January 1st, 1917.

Third. The New England Navigation Company transfers to Lyman B. Brainerd, of Hartford, Charles Cheney, of South Manchester, George E. Hall, of Bridgeport, William W. Hyde, of Hartford, and Walter C. Noyes, of New London, all in Connecticut, as trustees, 400,000 shares being all of the capital stock of The Connecticut Company.

The trustees shall hold these shares and exercise all the powers in the management of The Connecticut Company which the owners of the shares therein are entitled to exercise.

The trustees shall sell said shares for such prices and upon such terms as shall be named by the New Haven Company and the Navigation Company in a writing signed by their respective President or Chairman of their Boards of Directors and approved at a meeting by their Boards.

The trustees shall exercise their best efforts to complete the sale of said shares before July 1st, 1919.

Fourth. The New Haven Company transfers to John O. Ames, John P. Farnsworth, Kathbone Gardner, Theodore Francis Green, and Charles C. Mumford, all of Providence, Rhode Island, as trustees, 96,855 shares, being all of the capital stock of The Rhode Island Company, and The New England Navigation Company transfers to the same trustees 9,132 shares in the capital stock of the Providence & Danielson Railway Company, bonds of said company to the par value of $600,000., 7,000 shares in the capital stock of the Sea View Railroad Company, and bonds of said company to the par value of $600,000.

The trustees shall hold said shares and bonds and exercise all the powers in the management of these trustees companies which the owners of shares therein are entitled to exercise.

The trustees shall sell said shares and bonds at such time or times as shall be named by the New Haven Company in a writing signed by its President or the Chairman of its Board of Directors and approved at a meeting by said Board.

The trustees shall exercise their best efforts to complete the sale of the said shares and bonds before July 1st, 1919.

Fifth. The 53,981 shares of the capital stock of the Berkshire Street Railway Company and the 6,500 shares of capital stock of The Vermont Company owned by the New Haven Company, shall be sold before July 1st, 1919; provided, however, such sale shall not be proceeded with until action shall have been taken by the Commonwealth of Massachusetts authorizing a sale of the shares of the Berkshire Street Railway Company or until the Court, on the application of any party, and after a hearing at which the Commonwealth of Massachusetts shall be invited to appear, shall by further order so direct.

Sixth. The New England Navigation Company shall sell on or before July 1st, 1917, the 15,000 shares of preferred and 20,000 shares of common stock in the Eastern Steamship Corporation and bonds of said corporation to the par value of $2,500,000., held by it, and pending such sale the New Haven Company and the Navigation Company are enjoined from voting upon the capital stock of said Eastern Steamship Corporation.

Seventh. The New Haven Company shall sell on or before July 1st, 1919, 5,000 shares of the capital stock of the New York & Stamford Railway Company and bonds of the said company to the par value of $678,000., also the rights to the capital stock and other securities of the Westchester Street Railroad Company now owned by it, and the Navigation Company shall sell on or before July 1st, 1919, the rights to the capital stock and other securities of the Shore Line Electric Railroad, a corporation of New York, when the same may be issued, and the gold notes of the New England Investment & Security Company, a voluntary association, to the par value of $13,709,000. now owned by it.

Eighth. The times within which the sales heretofore ordered shall be made may be extended in each case by the Court for good cause shown upon the application of any party or any body of liquidators or trustees, and if they are not sold by the Trustees 60 days before the last date fixed for the sale they shall be sold at public auction.

Ninth. None of the shares or other securities hereinbefore ordered sold shall be offered to the stockholders of the New Haven Company as a class either in proportion to their stockholdings or otherwise, or be sold to the New Haven Company or to any person or persons, corporation or corporations, to be held in its interests, directly or indirectly, or so as to re-establish in any manner the combination and control which it is the purpose of the decree to terminate.

There is now pending before the Interstate Commerce Commission an application of the New Haven Company, under Act of Congress approved August 24th, 1912, known as the Panama Canal Act, for authority to retain stocks and other securities and continue control of its steamship lines including The New England Steamship Company and The Hartford & New York Transportation Company. Similar applications are required by law from all railroad companies having an ownership in steamship lines.

The contract between the New York Central & Hudson River Railroad Company and the New Haven Company for sharing in the financial results of the operation of the Boston & Albany Railroad, has already been canceled, and the Company has also disposed of its interest in the Merchants & Miners Transportation Company.

The final papers giving effect to the agreement with the United States Government are now being drawn up by the Counsel of the Company and the Attorney General of the United States, and it is expected that the agreed decree will become effective in the near future.

In view of the present conditions and the policy of the Federal Government and its various departments, the Directors have felt that it was wise to agree with the Department of Justice and to divest itself of ownership in these various properties, and therefore, with the authority of the stockholders it made every reasonable concession towards a peaceful adjustment, but with the hope that the arrangement will not ruthlessly and unnecessarily sacrifice values and impair the service that the various properties can give to the public.

It is believed that in the time allowed the Company, if there is a return of prosperity to the country, with a more reasonable attitude on the part of the public toward railroad corporations, many of these properties will show a value much in excess of the estimates today, and that losses in carrying these properties will be reduced if patience is exercised and fair treatment accorded.

The report of the Interstate Commerce Commission of June 20th, 1913, said about these properties:

"They are for the most part of substantial value and in many instances are a kind of property the value of which should improve."

This is true, and within the past year each of the properties within the control of the New Haven Company has been improved physically, and in its organization and ability to serve the public.

A summary of the properties covered by the decree, and the book value thereof, including stock, bonds, notes and advances, as shown on the books of the New Haven Company and the Navigation Company is as follows:

	As carried on books of	
	New Haven Company.	*New England Navigation Company.*
Boston Railroad Holding Co.	$29,371,165.97	
Boston & Maine R. R. subsidiary lines	1,417,216.95	
The Connecticut Company	2,125,000.00	$40,000,000.00
The Rhode Island Company	27,852,336.41	1,266,379.37
Berkshire Street Railway Company	9,809,395.58	
The Vermont Company	1,477,164.31	4,200,000.00
Eastern Steamship Company		
New York & Stamford Railway	1,395,523.40	
The Westchester Street Railroad	1,152,150.84	
Shore Line Electric Railroad		117,000.00
New England Investment and Security Company		13,631,750.00
	$74,599,953.46	$59,215,129.37

From time to time it has been intimated that the present financial condition of the New Haven Company is due to these and similar investments. It is fair, however, to point out certain conditions which are national in their enect on railroad net income, conditions over which neither the New Haven Company, nor any other company, has any effective control.

Some of these conditions are:

1. Increase in rates of interest.
2. Increases in rates of pay.
3. Increased costs due to changes of working hours and working conditions.
4. The so-called Full Crew Law, which makes necessary the employment of extra and unneecessary men.
5. The federal valuation of railroads.
6. The great increase in accounting and special reports to numerous public authorities.
7. The increase in taxes.
8. The increased demands for luxurious passenger facilities, both train and station.
9. Stationary or falling rates.
10. Inadequate pay for mail and parcels post.

Increase in rates of pay and rates of interest as compared with 1903 shows an increased annual charge of more than $8,000,000. The various governmental requirements mean a charge of at least $300,000 a year. The taxes in 1914 were $1,182,829.52 more than in 1903. The underpay for carriage of mail matter represents more than $700,000. a yrr. in gross earnings. Much passenger train service is furnished far below any fair estimate of the cost for the particular service rendered. Without allowing for this loss on non-remunerative passenger trains, the foregoing additional burdens compared with 1903, represent a net loss of at least $10,000,000. a year; a loss greater than the annual interest on the cost of all outside properties acquired.

The same general causes reduce the income received by your Company from the transportation companies in which it is interested.

The attention of stockholders is called to what Mr. Commissioner Daniels, of the Interstate Commerce Commission, said in his dissenting opinion of July 29th, 1914, in the "Eastern Railroads Advance Rate Case," as follows:

"The world-wide phenomenon of rising prices is by this time no novelty. Since 1906 the average rise in the world's price level is estimated by competent statisticians at from 30 to 50 per cent. It has mirrored itself in the rising cost of living; it has evoked, and most properly, advances in wages and salaries; it has coincided with an increase in the nominal rate of interest where part of the interest so-called is but compensation for the anticipated depreciation of the capital sum later to be paid. This rise in the price level must eventually be reckoned with in railroading. For a time its effects may be masked by adventitious increases in the volume of traffic, but this temporary relief in its very nature is uncertain, and sooner or later the difficulty is sure to reappear. For a time it may be circumvented by extraordinary economies, but in its nature it is inexorable. It must be faced, not trifled with. It is hardly an adequate remedy to accord to carriers relief only when their returns have reached the well-nigh desperate level now shown in Central Freight Association territory. Even before this inadequate return is evidenced, higher rates are warranted. Such a solution of the present case would have done no less than justice to the carriers and would have promoted the welfare of the community they serve.

"A living wage is as necessary for a railroad as for an individual. A carrier without a sufficient return to cover costs and obtain in addition a margin of profit large enough to attract new capital for extensions and improvements cannot permanently render service commensurate with the needs of the public."

SPECIAL INVESTIGATIONS.

By the Company.

During the year, for the purpose of checking the methods and operations of the Company, special investigations of some of its affairs were made by order of the Chairman of the Board as follows:

(1) An expert in the purchase and handling of supplies made a critical examination of the methods of the Company in purchasing, storing and issuing of material. His report is being used by the officers of the Company as a basis for introducing such improvements and economies as are reasonable and practicable in this part of the Company's affairs.

(2) A committee of signal experts, one from the Pennsylvania Railroad, two from the New York Central and one from the Delaware, Lackawanna & Western Railroad, made a critical examination and report on the signals and signal practice of the Company. Their investigation, report and suggestions are being used as a basis for improving the New Haven's signal system and practice as rapidly as the financial conditions permit.

(3) The Stone & Webster Corporation, of Boston, made a critical examination of the financial condition, organization and methods of management of the various trolley properties, and an elaborate report which has been of considerable use to the Company in perfecting the details of its organization and in adopting the most advanced methods of trolley management.

(4) The firm of Price, Waterhouse & Company, Accountants, assigned one of its principals, who has been engaged since January 1st in a critical examination of the past history of the financial transactions of the Company. His work is not completed, but soon will be and his reports will be used during the current fiscal year as a basis for further simplification and improvement of the Company's corporate organization. All of his reports were transmitted promptly to the Interstate Commerce Commission.

(5) In order to obtain a complete and thorough history of the charters, mortgages, leases and the character of each security, of the Company, a thorough investigation was made of all these papers by a competent lawyer detailed from the Company's law department for that purpose. He has made the most complete history of this part of the New Haven system that has ever been prepared, which will be used during the coming year as a basis for drawing up a financial plan that will permit the refunding of the Company's floating debt if the necessary legislation can be obtained.

By the Public Service Commission of Massachusetts.

On Dec. 17, 1913, the Public Service Commission of Massachusetts began an investigation of the expenditures of the New Haven Company classified under the head of "Other Expenses." Certain sums of money have been spent in former years for advertising, legislative and miscellaneous expenses which it was thought should not have been spent. Prior to this investigation all expenditures of the character complained of had been stopped.

BY THE INTERSTATE COMMERCE COMMISSION.

In response to a resolution of the United States Senate of February 3rd, 1914, a prolonged investigation was made by the Interstate Commerce Commission of the financial transactions of the New Haven Company since 1903. Their report was published on July 11th, 1914. While statements to the contrary have been circulated, it is proper to point out that the Company co-operated to the fullest extent in furnishing information to the Commission, and no books, papers or documents in the possession of or within the control or jurisdiction of the Company were burned or destroyed, either before, during or since the investigation. The records of the Company have been preserved carefully and the general orders of the Commission applicable to the preservation of all records have been complied with. Explicit instructions were given and obeyed that the files of the Company should remain open at all times to the most complete investigation and inspection by the representatives of the Commission. The custodians of the records of the Company assisted the Commission's examiners, and the latter were granted every facility within the power and control of the Company to aid them in their investigations.

For nearly two years prior to this investigation in Washington, examiners and representatives of the Commission have been almost continuously at the offices of the Company,—at one time as many as sixteen. They have examined the books, documents and files of the Company, and no information has been kept from them and all information obtainable having a bearing on the subjects under investigation was furnished promptly and fully by the officers and employees of the Company.

The following is an illustration of the action taken to respond to requests for information:

Within a period of forty-eight hours, from Friday afternoon until Sunday afternoon, 504 clerks were taken from their regular duties and worked 6,220 hours, equivalent to 777 clerks for one day, at a cost of $1,400., in order to segregate certain records, which were then sent in a special car to Washington so as to be there Monday morning.

All of the suggestions made in the report of the Commission which are of a helpful nature and which will in any way aid the Company in sustaining itself under the present conditions, which are so adverse to all railroads, and particularly to those in New England, are now being made use of and steps are being taken to give effect to the various suggestions and recommendations.

Special counsel were assigned last Spring to an investigation of the affairs of the Billard Company as far as they affect the New Haven Company. Requests for information having proved ineffectual, orders have been given to institute judicial proceedings to compel an accounting.

Counsel are also carefully considering whether, in the testimoney obtained by the Commission or elsewhere, evidence can be found that will enable the Company to bring an effective suit against any other parties to recover funds alleged to have been improperly diverted from the Company's treasury.

ADDITIONS AND BETTERMENTS.

As shown in table on page 51, $3,290,549.97 was spent for additions and betterments and charged to Capital Account.

NEW EQUIPMENT: Under the new Equipment Trust (Farmers Loan & Trust Co., Trustee) there have been added during the year:

72 Steel Coaches.
28 " Smokers.
15 " Postal Cars.
12 " Multiple Unit Motors.
24 " " " Trailers.

and in addition:

NEW EQUIPMENT: (Not under the Equipment Trust.)

3 Electric locomotives,
34 Steel coaches,
1 Steel smoker,
20 Milk cars,
6 Steel postal cars,
1 Steam crane,
1 Rail unloader,
1 Transformer,
3 Steel car floats.

For this equipment, the conversion of certain cars from one class to another, providing safety appliances, also superheaters, pumps, flash boilers, etc., on locomotives, the Company paid $1,054,659.07, the entire amount of which was charged to the equipment account. There are also due on 1913 orders, ten steel smoking cars and four multiple unit cars and on 1914 orders, fifty steel baggage cars, thirty steel passenger coaches and twenty steel combination cars.

At the present time, with the exception of baggage cars and four dining cars, all of the regular express passenger train service is handled with all-steel or steel underframe cars between New York and Boston via the three routes, Shore Line, Springfield and Hartford-Willimantic. The same is also true of the New York-Springfield, New York-Winsted, New York-Pittsfield, New York-New Haven, and, with the exception of two trains, New Haven-Boston & Maine service.

As stated above, equiament is under order, the early receipt of which is expected; these cars and reinforcement of four dining cars now under way will complete the above trains with all-steel or steel underframe equipment.

ABANDONMENT OF NEW WORK: All construction and betterment work has been stopped except that which is so far advanced that its completion is required and that which the Company is compelled under legal orders to complete. This policy must of necessity continue until the Company can obtain money from increased earnings and through some plan that will permit financing its floating debt at lower rates of interest than are now current.

Therefore many improvements cannot now be undertaken, that would add to the comfort and convenience of the public and eventually produce economies in the operation of the railroad.

ELECTRICAL DEPARTMENT.

Between New York and New Haven, including all yards and sidings, and the Cedar Hill yard at the latter point, your Company has 518 miles of track equipped for electrical operation, excluding that part of the New York Central Company between Woodlawn and Grand Central Terminal used under lease but maintained by that Company. The volume of passenger and freight business moving between New Haven and New York is very heavy and the necessity for the most effective organization is very essential.

The investment in the electrification between New York and Cedar Hill in power, locomotive, transmission lines, distributing system, electrical shops, when all the business is handled electrically, will be about $20,000,000.

For the purpose of supervising closely and making the most effective use of these large investments and because the operation and maintenance of this extensive electrical installation is very technical, an Electrical Department was organized on March 18th, 1914, consisting of a Consulting Electrical Engineer, with necessary assistants, having advisory jurisdiction over matters pertaining to the engineering, construction and operation of the electrical system and equipment. Better results are being gradually obtained by having this new department acting in co-operation with the divisional operating officers.

THE TROLLEY COMPANIES.

During the past year a change has been made in the method by which the electric traction properties are operated. Heretofore the details of management have been largely centralized in the general offices of The New York, New Haven & Hartford Railroad Company in New Haven; but now the principal units have been given independent organizations separated from the New Haven, thus giving to the electric properties a complete staff of officials, all of whom give their entire time and attention thereto. It is expected that greater efficiency will be obtained by this change.

During the year the same high standard of maintenance of these properties has been continued and they are in better physical condition now than at any time since their purchase. In common with all transportation companies throughout the eastern part of the United States, the electric properties have not maintained the customary growth in gross revenue, and, coupled with very extensive requirements by the municipalities served by the various lines for improved street conditions and new pavement, the expense for operation has increased in much greater ratio than the gross revenue.

Large undertakings for improvements and betterments of the properties which were well under way at the beginning of the year have been carried to completion, so that these lines are now in very much better position to take care of any increase in business which may come to the transportation companies with a revival in general business and industrial conditions in the territory served.

BERKSHIRE STREET RAILWAY COMPANY.

This Company operates through ownership or lease 144.86 miles of track in western Massachusetts and southwestern Vermont.

The New York, New Haven & Hartford Railroad Company holds all the capital stock of the Company at a cost of $6,371,395.58, and all the stock of The Vermont Company at a cost of $571,164.31, a total of $6,942,559.89. It also holds bonds of the Berkshire and Vermont Companies and notes of the Berkshire Company amounting to $4,344,000.00.

During the year there was spent $681,823.89 for additions to the property, the principal item being for completion of an extension from Lee through East Lee to Huntington to a connection with the street railroad lines running westward from the city of Springfield, this line not as yet being in operation. In addition to this there were expenditures for track improvements necessitated by state highway construction and city road betterments.

During the year the net revenue of the Company was sufficient to provide interest on all underlying bonds and rentals of leased lines; but not sufficient to pay the total amount of interest due the New Haven Road, the defeit being $72,507.17.

THE CONNECTICUT COMPANY.

This Company operates through ownership, lease and trackage agreement 705 miles of track, all in the western half of Connecticut; in addition to which it owns 88.1 miles of track under lease to The Shore Line Electric Railway Company in New London, Norwich, Willimantic, Danielson and Putnam.

The New England Navigation Company owns all of the capital stock of the Company, at a cost of $40,000,000.00. The New Haven Company also holds the 6% demand notes of this company amounting to $2,125,000.00, all of which have been issued to provide funds for additions and betterments.

During the past year there was spent for additions to the property the sum of $1,214,535.70, by far the greater part of which was for track betterment and paving to meet the requirements of the various municipalities served by the company, other large expenditures having been made to improve power conditions at a number of points.

During the past year the Company earned sufficent to pay all operating expenses, taxes and interest and returned to the Navigation Company $1,500,000.00 as dividend and showed a surplus of $1,072.42. The following table shows the results of the operations of the company for the past four years:

	1911	1912	1913	1914
Operating Revenue	$7,565,512.49	$8,030,620.94	$8,454,624.90	$8,085,398.70
Operating Expenses and Taxes	5,656,400.74	5,561,547.31	5,868,526.09	5,767,388.57
Total Operating Income	1,909,111.75	2,469,073.63	2,586,098.81	2,318,010.13
Non-Operating Income	148,415.12	62,541.28	62,077.64	260,522.82
Gross Corporate Income	2,057,526.87	2,531,614.91	2,648,176.45	2,578,532.95
Deductions for Interest and Rentals	939,464.25	1,012,539.29	1,039,154.86	1,077,460.53
Net Corporate income	1,118,062.62	1,519,075.62	1,609,021.59	1,501,072.42
Dividends	1,000,000.00	1,500,000.00	1,500,000.00	1,500,000.00
Corporate Surplus	118,062.62	19,075.62	109,021.59	1,072.42

NEW YORK & STAMFORD RAILWAY COMPANY.

This Company operates through ownership or lease 37.51 miles of track in Westchester.

The New York, New Haven & Hartford Railroad Company owns all the capital stock of the Company at a cost of $610,643.40. It also owns property between the Mianus River and the State line between New York and Connecticut, which is leased to the New York & Stamford Railway Company at an annual rental of $20,000.00. The New Haven Company also owns first mortgage bonds of the New York & Stamford Railway Company carried at a cost of $599,880.00, and also holds 6% demand notes of the New York & Stamford Railway Company in the amount of $185,000.00, the notes all having been issued for additions and betterments, chiefly for double tracking a large portion of this line to care for the large distribution of commuting travel between New York and the various suburban points.

The amount spent for additions and betterments during the current year was $58,184.89, for new double tracking.

During the year the Company did not earn an amount sufficient to pay operating expenses, taxes and interest on the outstanding bonds, the deficit being $5,824.17.

THE RHODE ISLAND COMPANY.

This Company operates through ownership or lease 345.3 miles of electric railroad track, and 9.43 miles of steam operated trackage of the Narragansett Pier Railroad Company, all in the State of Rhode Island. This includes all of the electric railroad in the cities of Providence, Pawtucket and Woonsocket and the large industrial communities adjacent.

The New York, New Haven & Hartford Railroad Company owns the entire capital stock of the Company at a cost of $24,352,336.41, in addition to which it now holds 6% demand notes of the Company in the sum of $3,500,000.00, all issued to provide funds for expenditures for betterments and improvements of the property. The Rhode Island Company has also outstanding $1,000,000.00 in notes for monies borrowed from outside sources.

During the current year the Company has spent $1,568,914.21 for betterments and improvements, consisting of the following:

A tunnel under the hill to connect the business and residential portions of the city of Providence has been completed and put in operation, eliminating an expensive and cumbersome operation by gravity plane. A very large amount has also been spent for additions to the power house to meet the requirements of the Company for a number of years. An extension of 10 miles from Centerdale to Chepachet was built to provide transportation

facilities for territory heretofore without direct connection with the city of Providence.

The earnings of the Company were sufficient to take care of the operations and pay all interest, rentals and taxes, and leave a surplus of $347,642.94.

The Company leases the property of the Sea View Railroad Company and the Providence & Danielson Railway Company, owned by The New England Navigation Company and representing a total investment for stock and bonds of $1,266,379.37, on which The Rhode Island Company pays rental of $83,124.00 annually.

The following table shows the operating results for the past four years:

	1911	1912	1913	1914
Operating Revenue	$4,675,942.97	$5,045,006.29	$5,322,646.93	$5,379,148.55
Operating Expenses and Taxes	3,094,124.53	3,577,337.58	3,561,613.37	3,896,798.53
Total Operating Income	1,581,818.44	1,467,668.71	1,761,033.56	1,482,350.02
Non-operating Income	100,281.06	94,933.55	134,336.15	144,658.84
Gross Corporate Income	1,682,100.40	1,562,602.26	1,895,369.71	1,627,008.86
Deductions for Interest and Rentals	1,080,543.86	1,175,003.38	1,225,319.00	1,279,365.92
Net Corporate Income	601,556.54	387,598.88	670,050.71	347,642.94
Dividends	581,130.00	290,565.00	581,130.00	.....
Corporate Surplus	20,426.54	97,033.88	88,920.71	347,642.94

The Westchester Street Railroad Company.

This Company operates through ownership or lease 30.67 miles of track in Westchester County, New York.

During this year the Public Service Commission for the 2d District of New York authorized the Company to issue 7,000 shares of stock to represent the cost of the property to the New Haven Road. This is carried at a cost of $896,379.63, in addition to which the New Haven holds notes of the Westchester Company to the amount of $255,771.21 issued for capital improvements of the Company's property since acquisition.

The amount spent for additions and betterments during the current year was $56,625.54, for improvements of and additions to the track and line construction.

During the year the Company earned an amount sufficient to pay the interest on outstanding notes; but paid no dividends, the surplus from operations amounting to $4,883.99.

WATER LINES.

The causes that adversely affected the results on the steam and trolley lines had a somewhat similar affect on the various water lines owned and controlled by your Company.

The Hartford and New York Transportation Company.

The gross earnings of The Hartford & New York Transportation Company were $1,096,499.16 as compared with $1,157,337.82 for the previous year; but by careful operation the expenses were reduced so that the net income of this Company for the fiscal year just past was $85,965.42 as compared with $64,285.70 for the previous year.

This Company reduced its equipment by one barge which had become obsolete, but on account of the depression in business did not replace it.

The property of this Company is in good condition.

New Bedford, Martha's Vineyard & Nantucket Steamboat Company.

On account of considerable activity in Martha's Vineyard and Nantucket the earnings of the New Bedford, Martha's Vineyard and Nantucket Steamboat Company increased from $209,469.82 to $232,704.45; by careful operation the expenses were reduced somewhat, so that the net income of this Company for the year just past was $62,708.25 as compared with $25,630.17 for the previous year.

Just as soon as financial conditions permit this Company should add to its equipment a modern steamer to care for the growing business between the main land and the two islands.

The New England Steamship Company.

The gross earnings of The New England Steamship Company were $4,677,211.94, a decrease of $219,512.25. In spite of this decrease in gross earnings, by careful operation and rearrangement of work on some of the piers in New York, the deficit in meeting the fixed charges of this company of $355,070.50 for the year ending June 30th, 1913, was reduced to a deficit for this year of $77,802.62.

One steamer, the "City of Bridgeport," which was not needed, was sold for $100,000 in cash, and one transfer tug was dismantled and put out of service.

During the investigation of the Company's affairs by the Interstate Commerce Commission, some criticism was made upon the character of the steamships and the operation thereof. As a result, the Secretary of Commerce caused a very thorough investigation to be made by the Supervising Inspectors of New York and Boston. The United States Steamboat Inspection Service has prepared a very complete report on this steamship property and it is now a matter of record with the United States Government, open to the inspection of all interested parties. Space does not permit the publishing of this report, but the following extract summing up the Government's report will be of interest:

> "This office is therefore of the opinion in view of the nature of the safeguards placed upon these vessels and the excellent discipline that prevails, that danger from fire is a minimum, and that a menace to the lives of the patrons of this line does not exist."

REAL ESTATE.

Grand Central Terminal.

To utilize the real estate and "aerial rights" adjacent to the Grand Central Terminal in New York, the following buildings have been constructed: Biltmore Hotel, Merchants and Manufacturers Exchange, Adams Express Company and United Cigar Stores. The New Haven Company being a joint user of the Terminal and its approaching tracks joined with the New York Central in advancing money for the development of the property not required for railroad use.

The total amount advanced by your Company during the past fiscal year was $1,628,190.35, and its aggregate advances to June 30th, 1914, for these purposes, $4,153,161.75.

All of the advances made yield a satisfactory interest rate and the lessees of the buildings pay ground rents and taxes, which reduce the expenses of the Grand Central Terminal, and in addition the lessees pay annual sinking fund payments, which, together with accretions to the fund, will in about twenty-seven years return to the owning Companies the sums advanced.

The following buildings are now under construction:

Todd Building, for which the Company must advance	$325,000.00*
Yale Club, for which the Company must advance	250,000.00

*$40,000 of this amount has been paid since June 30, 1914.

Other buildings are projected, work upon which will begin in the near future, as follows:

Postoffice Building, between East 45th and East 46th Streets.
Apartment House, 50th Street and Park Avenue.
Apartment House, 51st Street and Park Avenue.

As to these the Company is under no present obligation to advance money but retains an option to participate at any time within two years.

The New Haven Company has also advanced $1,310,000.00, one-half of the cost of the office building located at the Grand Central Terminal, which amount is to be repaid with interest in annual instalments extending over a period of twenty-five years, and of which amount $104,800.00 has been repaid, leaving $1,205,200.00 to be repaid.

Increased Efficiency and Safety.

Last year's report referred to the effort of officers and employees to raise the railroad and service to a higher standard of efficiency, safety, discipline and economy. The North Haven accident of September 2d, 1913, following as it did other serious accidents, made it imperative that the rules and regulations of the Company be of such a character as to safeguard to the greatest extent possible the lives of the public and the employees.

For some time previous to this accident negotiations had been conducted with committees representing the engineers and firemen to revise rules which were not in accordance with modern railroad practice. The new management felt that it owed a duty to the public as well as to the employees to put the new rules into effect at once. The engineers and firemen felt aggrieved at this position of the Company and voted to strike. On October 18th, 1913, however, the matter was adjusted amicably with the employees, and rules containing the principles for which the management contended remained in effect.

These negotiations, in the judgment of your officers, tended to establish a better understanding and improved relations between the employees and the management, and have assisted materially in restoring confidence throughout the service. Every effort is being made by officers and men to promote a spirit of helpful co-operation, so necessary to maintain and operate the properties efficiently, safely and economically, and to give good service to the public.

Safety and Efficiency Bureau.

At the present time the Company has fully organized safety and efficiency bureaus as follows:

1 Central Committee.
7 Divisional Committees.
13 Shop, Engine House and Terminal Committees.
1 Telegraph Department Committee.
1 Electrical Department Committee.

Regular meetings are held and considerable has been accomplished in the way of removing obstructions, securing better clearances, eliminating unsafe practices, improving view at grade crossings, etc.

New Haven Railroad Club.

The New Haven Railroad Club was organized on February 26th, 1914, and is composed of officers, assistants, chief clerks, bureau foremen, or other employees of The New York, New Haven & Hartford Railroad Company, or affiliated companies, holding co-ordinate positions.

The object of the Club is to promote knowledge on all matters relative to the maintenance, operation and general administration of railroads, and to encourage social relations and a common understanding between departments.

Monthly meetings are held (except in June, July and August) in the Railroad Y. M. C. A. building at New Haven, preceded by a dinner at a nominal cost.

The average attendance at these meetings has been about one hundred and sixteen. There is much interest taken in the Club and its object, and good results are already being accomplished.

Rates.

During the year the passenger rate between Boston and New York, 229.15 miles, was increased from $4.75 to $5.00 with corresponding increases at intermediate points.

Tariffs have been filed increasing the rates for mileage books from 2c. to 2½c. a mile. Tariffs are now being prepared adjusting local passenger rates, outside of the commutation zones, to 2½c. a mile. A new tariff adjusting the merchandise and class rates is being prepared, and one adjusting the commodity rates. These tariffs are very complicated and in preparing the new schedules every effort has been to eliminate discrimination and remove unequalities. Some rates in the new tariffs will be reduced and some will be advanced. The result as a whole will be a much more scientific and logical set of rates and a slightly higher basis. The freight tariffs will be filed with the proper Commissions between now and January 1st, and it is hoped that they will be approved.

Service.

Every effort has been made to give regular and safe service, both freight and passenger, and to economize, some of the non-remunerative passenger trains have been discontinued with the result that 284,897 miles less were run by passenger trains this fiscal year than last.

Approximately 32% of all passenger trains operated by the Company earn less than 50c. and approximately 30% earn 50c. and less than $1.00 a mile, or 62% earn less than $1.00 per mile. The average cost of running all trains (passenger and freight) on the New Haven road for the last fiscal year for transportation expenses, maintenance of equipment and taxes, and not including anything for maintenance of way or administration expenses, or interest on the investment, was $1.69 per mile.

These figures emphasize the fact that the road is performing a large amount of service for the public at a loss and justify some increases in the passenger rates and some decreases in service.

STOCKHOLDERS.

The Company is pre-eminently one that is owned and controlled by stockholders living along the line of the road. There are only 77 stockholders living in Europe. There are 147 stockholders owning more than 1,000 shares with total holdings of 507,916 shares, and there are 26,239 stockholders owning 1,063,263 shares.

Stockholders are urged most earnestly to inform themselves about the situation of the Company, to explain the difficulties in their respective communities, and to use their active influence to help the management in its efforts to reduce expenses and to increase rates slightly, and to obtain favorable consideration for the Company at this time, when the help of everyone interested in the welfare of New England is needed in order to maintain efficiently the transportation system that is so closely interwoven with the industrial, financial and social life of this part of the country.

ORGANIZATION.

The past year has been a most trying one for the Company, the owners of its securities, employees, officers and directors. That the Company has been able to sustain itself under the very disturbed conditions is evidence of its inherent strength. It has had to meet great loss in revenues, large increases in expenses; it has been the subject of exhaustive investigations and of much hostile criticism, of which no complaint is now made, but instead an appeal for fair treatment and constructive aid.

Among the conditions necessary for the success of the Company are:

First: Freedom from disturbance and the opportunity for constructive work.

> "There is much truth," said the Interstate Commerce Commission in its report of June 20, 1913, on the New England situation, "in the claim of the carriers that they have been so occupied with investigations and so criticized by the public that no fair opportunity has been given for the operation of their railroad properties."

Second: The removal of restrictions and conflicts in the laws and policies of the various New England States which prevent the Company from adopting a comprehensive financial plan enabling it to meet its obligations by mortgage bonds.

Third: A readiness on the part of Commissions, both State and National, to permit a readjustment and increase in freight and passenger rates; and an increase in the pay received for the carriage of mail and parcels post.

Fourth: Adequate time for the Company to dispose of its investments in other companies. The Directors, as trustees for the stockholders, as well as in a large measure for the community served by the lines, should, for the protection of the property, its owners and the business of the New England States, not be forced to sacrifice these investments and at a time when values have been depressed by adverse criticism, controversy and generally poor business conditions.

The Directors and Officers are endeavoring most earnestly to conduct the affairs of the Company in a lawful, prudent and efficient manner, and are continuing to compact, improve, maintain and preserve the property in order to meet adequately the public demands and to benefit the stockholders. They will continue to strengthen its working organization, fully realizing that only with public confidence and support, and especially the co-operation of the various Commissions and governmental authorities, can the success of the Company be assured.

Your attention is directed to the tables hereto attached giving additional information about each of the properties in which your Company is interested.

The year opened with the staff of officers and the employees seriously disturbed and somewhat demoralized and discouraged because of the conditions and obstacles to be met and overcome. The efforts of the officers and employees have been directed to bringing about a better feeling towards the Company from the communities served, as well as to improving the operation of the various properties. The thanks of the owners of the property are due to the many loyal officers and employees who have rendered faithful service during the year under the most serious and most unusual conditions and obstacles.

Respectfully submitted by order of the Board of Directors.

HOWARD ELLIOTT,
Chairman of the Board and President of the Company.

STATEMENT OF CONTINGENT LIABILITIES.

JUNE 30TH, 1914.

Under the provisions of Section 4, Chapter 519, of the Acts of the General Court of the Commonwealth of Massachusetts, passed at its 1909 Session, The New York, New Haven and Hartford Railroad Company promises when they shall be sold, to guarantee the principal of, and the dividends and interest upon the capital stock, bonds, notes and other evidences of indebtedness of Boston Railroad Holding Company acquired by it. On June 15th, 1910, the General Court of the Commonwealth of Massachusetts passed an act authorizing the issue of preferred stock (without voting power) of Boston Railroad Holding Company, in exchange for its four per cent. fifty-year Debentures dated November 1st, 1909; and on January 10th, 1911, the $20,012,000 Debentures owned by The New York, New Haven and Hartford Railroad Company were exchanged for preferred stock. On June 30th, 1914, there were held by the public 28,000 shares of preferred stock of Boston Railroad Holding Company, on which the guaranty had been executed; and on the same date The New York, New Haven and Hartford Railroad Company held the following stock:

31,065 shares of Common Stock of Par Value...$3,106,500.00
244,939 shares of Preferred Stock of Par Value..24,493,900.00

THE NEW YORK NEW HAVEN AND HARTFORD RAILROAD COMPANY

Is liable jointly with other roads for any deficiency on foreclosure of bonds of the Boston Terminal Company.

Is liable by endorsement on $200,000 six per cent. demand notes dated May 1st, 1914, of the Central New England Railway Company deposited as Collateral under Indenture dated May 1st, 1914, securing $20,000,000 one year 5% Collateral Gold Notes of The New York, New Haven and Hartford Railroad Company.

Guarantees the payment of principal and interest of the four per cent. First Mortgage Gold Bonds of the Central New England Railway Company of the issue of January 1st, 1911, to the amount of $12,012,000.

Is liable by endorsement on $1,325,000 six per cent. demand notes dated May 1st, 1914, of The Connecticut Company deposited as Collateral under Indenture dated May 1st, 1914, securing $20,000,000 one year 5% Collateral Gold Notes of The New York, New Haven and Hartford Railroad Company.

Is liable by endorsement on $3,000,000 six per cent. demand notes, Series "E," dated May 1, 1914, of The Harlem River and Port Chester Railroad Company deposited as Collateral under Indenture dated May 1st, 1914, securing $20,000,000 one year 5% Collateral Gold Notes of The New York, New Haven and Hartford Railroad Company.

Guarantees the payment of principal and interest of The Harlem River and Port Chester Railroad Company one year 5% Gold Notes, Series "A," dated May 1st, 1914, to the amount of $10,000,000.

Is liable by endorsement on $819,781.71 five per cent. demand note dated September 22nd, 1911, of the Hartford and Connecticut Western Railroad Company (previously endorsed by the Central New England Railway Co.) deposited as Collateral under Indenture dated May 1st, 1914, securing $20,000,000 one year 5% Collateral Gold Notes of The New York, New Haven and Hartford Railroad Company.

Is liable by endorsement on $1,150,000 six per cent. demand notes dated May 1st, 1914, of Housatonic Power Company deposited as Collateral under Indenture dated May 1st, 1914, securing $20,000,000 one year 5% Collateral Gold Notes of The New York, New Haven and Hartford Railroad Company.

Guarantees the payment of principal of $300,000 and interest on the 6% one year Notes of the Housatonic Power Company dated March 31st, 1914.

Guarantees four per cent. dividends on preferred stock of the New England Investment and Security Company, $4,000,000, and payment of principal at one hundred five per cent. on liquidation; also guarantees the payment of principal, $5,000,000 and interest of the New England Investment and Security Company fifteen-year Funding Gold Notes dated April 1st, 1909.

Guarantees the payment of principal and interest of the Gold Debenture of The New England Navigation Company in case of termination of lease of the Old Colony Railroad Company, $3,600,000.

The New York, New Haven and Hartford Railroad Company and the Pennsylvania Railroad Company, jointly and severally, guarantee the payment of the principal and interest of the outstanding $16,000,000.00 First Mortgage four and one-half per cent. Gold Bonds dated August 1st, 1913, due August 1st, 1953, of the New York Connecting Railroad Company.

Guarantees the payment of principal and interest of the four per cent. fifty-year First and Refunding Mortgage Gold Bonds of the New York and Stamford Railway Company, of the issue of November 1st, 1908, to the amount of $925,000.

Is liable by endorsement on $185,000 six per cent. demand notes dated May 1st, 1914, of New York and Stamford Railway Company deposited as Collateral under Indenture dated May 1st, 1914, securing $20,000,000 one year 5% Collateral Gold Notes of The New York, New Haven and Hartford Railroad Company.

Guarantees the payment of principal and interest of the four and one-half per cent. First Mortgage Gold Bonds of The New York, Westchester and Boston Railway Company of the issue of July 1st, 1911, to the amount of $21,200,000.

Is liable by endorsement on $1,725,000 six per cent. demand notes dated May 1st, 1914, of The Rhode Island Company deposited as Collateral under indenture dated May 1st, 1914, securing $20,000,000 one year 5% Collateral Gold Notes of The New York, New Haven and Hartford Railroad Company.

Is liable by endorsement on $150,000 five per cent. demand note dated May 1st, 1914, of Rutland Railroad Company deposited as Collateral under Indenture dated May 1st, 1914, securing $20,000,000 one year 5% Collateral Gold Notes of The New York, New Haven and Hartford Railroad Company.

Guarantees four per cent. dividends on preferred stock of the Springfield Railway Companies, $3,387,900, and payment of principal at one hundred five per cent. on liquidation.

OF THE ABOVE CONTINGENT LIABILITIES THE FOLLOWING ARE IN THE HANDS OF THE PUBLIC THE INTEREST OR DIVIDENDS WERE ALL MET BY ISSUING COMPANIES UNLESS OTHERWISE NOTED.
