PUBLISHED EVERY FRIDAY AND DAILY EIGHT TIMES IN JUNE BY THE
SIMMONS-BOARDMAN PUBLISHING COMPANY
WOOLWORTH BUILDING, NEW YORK

CHICAGO: Transportation Bldg. CLEVELAND: Citizens' Bldg.
LONDON: Queen Anne's Chambers, Westminster.

E. A. SIMMONS, *President*
L. B. SHERMAN, *Vice-President.* HENRY LEE, *Sec'y & Treas.*
The address of the company is the address of the officers.

EDITORS
SAMUEL O. DUNN, *Editor*
ROY V. WRIGHT, *Managing Editor*

W. E. HOOPER	H. F. LANE	R. H. WHITE
B. B. ADAMS	R. E. THAYER	C. W. FOSS
E. T. HOWSON	A. C. LOUDON	F. W. KRAEGER
H. H. SIMMONS	C. B. PECK	GEORGE L. FOWLER

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico	$5.00
Canada	6.00
Foreign Countries (excepting daily editions)	8.00
Single Copies	15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention Daily issues, North America, $1.00; foreign, $2.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue 9,000 copies were printed; that of these 9,000 copies, 7,462 were mailed to regular paid subscribers to the weekly edition, 250 were provided for counter and news companies' sales, 1,173 were mailed to advertisers, exchanges and correspondents, and 115 were provided for samples and office use; that the total copies printed this year to date were 252,700, an average of 9,359 copies a week.

VOLUME 57 . JULY 3, 1914 NUMBER 1

Contents

*Illustrated.

On Monday of last week the Supreme Court put its stamp of disapproval on one of Mr. Brandeis' theories, namely, that the Interstate Commerce Commission did not have the power to prescribe a general scheme of rates. On Thursday the failure of the Claflin company contradicted in a quite dramatic way one of the fundamental assumptions on which Mr. Brandeis made his argument in the rate case.

Mr. Brandeis Wrong Again

What is the explanation of this remarkable fact that in other businesses, subject alike with the railroads to increase in wages and governmental regulation, increase in taxes and increase in cost of money, and increased supplies and increased cost of coal, there is blooming health, and with the railroads there is said to be a condition of morbidity?

The blooming health of other business is not very well demonstrated by the largest commercial failure in the history of the United States, but the particular point which railroad men are especially interested in is the demonstration of Mr. Brandeis' inability to draw correct conclusions from the indications in the business outlook. Almost patronizingly Mr. Brandeis assured the assembled railroad presidents that they were being stampeded into a panic by their friends in Wall street, that there was no immediate necessity for an increase in rates, even allowing that the railroad managers were right in that something would eventually have to be done to increase railroad revenues as well as decrease their expenses. Month by month the earnings of the roads demonstrate more clearly that Mr. Brandeis was wrong.

Minority stockholders of the Lake Shore & Michigan Southern are trying to block the consolidation of the New York Central & Hudson River and the Lake Shore & Michigan Southern by an appeal to the New York Public Service Commission, Second district, to refuse their approval of the merger. If newspaper accounts of the argument before the commission are correct, the minority holders claim first, that by giving collateral bondholders a 4 per cent. bond in place of a 3½ per cent. bond the railroad company is offering them an illegal consideration for their consent to the consolidation, and, secondly, that the extension of the present New York Central mortgage over the Lake Shore works a detriment in some way to the minority stockholders of the Lake Shore. The two arguments from a common sense point of view, regardless of the legal niceties involved, are inconsistent, as is also the argument that the New York Central is in effect mortgaging the property of the Lake Shore to purchase the stock of the Lake Shore. It is not a question of buying the stock of the Lake Shore, but of buying the property itself by the issue of new 4 per cent. bonds and of canceling the stock, and it would certainly appear to be legitimate to place property bought outright under a mortgage by means of which the needs of both the Lake Shore and New York Central for the permanent refunding of very large issues of notes are to be carried out.

New York Central Merger Plans

Twenty-four papers were received in the contest on The Operation of Large Classification Yards which closed June 1. These papers were turned over to A. M. Schoyer, vice-president of the Pennsylvania Lines; A. C. Ridgway, vice-president of the Chicago, Rock Island & Pacific, and H. O. Dunkle, assistant to the president and general manager of the Erie, who awarded first prize to A. M. Umshler, general yardmaster of the Illinois Central, Centralia, Ill., and second prize to C. A. Pennington, supervisor of terminals of the Cleveland, Cincinnati, Chicago & St. Louis and the Chesapeake & Ohio, Louisville, Ky. Other papers accepted for publication were contributed by R. M. Baker, Bellwood, Pa.; D. F. Stevens, trainmaster, New York, New Haven & Hartford, New York; Fred P. Grossman, general yardmaster, Chicago, St. Paul, Minneapolis & Omaha, Minneapolis, Minn.; G. O. Sarvis, assistant trainmaster, Philadelphia & Reading, Philadelphia, Pa.; I. T. Tyson, assistant trainmaster, Philadelphia & Reading, Philadelphia, Pa.; E. W. Brown, assistant superintendent, Lake Shore & Michigan Southern, Chicago; H. T. Murray, general yardmaster, Chicago, Burlington & Quincy, Galesburg, Ill.; J. B. Warrington, division superintendent, Phila-

Awards in Yard Operation Contest

delphia & Reading, Philadelphia; G. F. Garrison, general yardmaster, Baltimore & Ohio, Martinsburg, W. Va.; F. Lincoln Hutchins, Baltimore, Md.; W. B. Henricks, superintendent of terminals, Chicago, Milwaukee & St. Paul, Milwaukee, Wis.; J. D. Schaefer, city passenger agent, Chicago, Milwaukee & St. Paul, Pittsburgh, Pa., and Nelson J. Flocker, Bessemer & Lake Erie, Pittsburgh; Geo. C. Duffy, general yardmaster, Boston & Albany, West Springfield, Mass.; F. E. Ramsdell, freight trainmaster, Pittsburgh & Lake Erie, McKees Rocks, Pa.; J. L. Coss, assistant chief despatcher, Chicago, Rock Island & Pacific, Haileyville, Okla.; O. C. Hill, assistant superintendent, Chicago, Burlington & Quincy, Kansas City, Mo.; J. P. Kavanagh, assistant superintendent, Baltimore & Ohio, Baltimore, Md., and E. C. Tucker, general yardmaster, Norfolk & Western, Portsmouth, Ohio. Because of the intention of inaugurating a similar contest on The Operation of Large Terminal Yards, with their industry, interchange and team track problems, at a later date, all references to these problems were eliminated from the papers received in this contest, and it was limited purposely to the operation of large classification yards for the purpose of concentrating attention at this time upon this subject. The two prize-winning and a number of other papers are published in this issue, and others will appear in the paper at an early date.

Cincinnati, Hamilton & Dayton Default

The Cincinnati, Hamilton & Dayton has defaulted the July 1 interest payments on $1,677,000 unguaranteed first and refunding mortgage bonds, $4,727,000 Cincinnati, Indianapolis & Western first and refunding 4's, and $3,162,000 Indiana, Decatur & Western 5's. This means that the Cincinnati, Hamilton & Dayton will go back into receivership and that the Baltimore & Ohio will have to wait through the slow process of reorganization for the $50,000,000 which is supposed to represent roughly that company's investment in Cincinnati, Hamilton & Dayton. But at least it will mean that the Baltimore & Ohio will no longer be called upon to make advances, except its guarantee of interest on the $7,500,000 first and refunding 4 per cent. bonds which are outstanding in the hands of the public with the Baltimore & Ohio's guarantee on them, and will lose the interest on the, approximately, $18,000,000 4 per cent. bonds held in the Baltimore & Ohio treasury. A receivership and reorganization have been inevitable ever since the floods of last year. The floods, however, were a contributing cause only. Ever since the Cincinnati, Hamilton & Dayton took over the Pere Marquette and guaranteed interest on about $10,000,000 Pere Marquette bonds it was estimated that the only things that would avert a thorough scaling down of capital securities would be a purchaser for the Pere Marquette and a long period of uninterrupted prosperity and good luck for the Cincinnati, Hamilton & Dayton itself. The now defunct firm of Hollins & Co., New York, after experimenting in Cincinnati, Hamilton & Dayton and burdening it with the Pere Marquette guarantee, transferred it to J. P. Morgan & Company, who were on the point of transferring it to the Erie when the true condition of affairs became apparent. This was in 1905. After holding it for four years, during which time it went through a receivership, Morgan & Company sold their interest in the reorganized company to the Baltimore & Ohio, and at that time it was probably hoped that the Canadian Pacific would buy the Pere Marquette. This hope never materialized. The trouble with the Cincinnati, Hamilton & Dayton reorganization, like the trouble with a number of other reorganizations under the auspices of Morgan & Company, was that everybody's interest was so well kept in mind and preserved that the underlying and fundamental difficulties of the company involved were merely glossed over instead of being entirely eradicated.

THE ROCK ISLAND REORGANIZATION PLAN

THE Rock Island reorganization plan, if carried through, will wipe out $141,000,000 nominal railroad capitalization, outstanding in the hands of the public exchange $71,000,000 collateral trust bonds for stock, and raise $30,000,000 new capital—actual money for investment in new physical property—through the issue of 7 per cent. preferred stock. To effect this much needed reform the holding company stockholders are asked to put up all or part of the new money, and the collateral trust bondholders are asked to give up part of the securities for their bonds and take possession of the remainder.

The question of whether or not the debenture bondholders are being fairly treated under this tentative plan hinges upon the worth of the Railway stock which forms the collateral for these bonds. The Railroad collateral trust 4 per cent. bondholders collectively hold a mortgage on nearly all the stock of the Chicago, Rock Island & Pacific Railway Company, which is the operating and owning company of the 8,048 miles of line. These bondholders are asked under the reorganization plan to give without direct compensation 37½ per cent. of the Railway company stock to be used in raising new capital. A new preferred stock is to be created which is to be sold at par, a bonus of the common stock being given with the new preferred stock, the bonus being provided not by the company but by the collateral bondholders.

The justification for this scheme is that were the collateral bondholders required to furnish all of the new capital, estimated at $30,000,000, which the company is in need of, they would have to pay an assessment of 40 per cent., and that there is no earthly possibility of any very large proportion of them subscribing 40 per cent. to a new issue of preferred stock; neither, it is argued, could an issue of 7 per cent. preferred stock of the Chicago, Rock Island & Pacific Railway Company be sold to the general public at par. The collateral bondholders are, therefore, asked in lieu of a compulsory cash assessment to give up more than a third of their collateral, with the privilege, however, of buying back a part of this collateral, together with new preferred stock, on the same terms at which the preferred stockholders of the holding company are to have the privilege of subscribing, namely, par for the preferred, with the common thrown in. If it is strictly accurate to say that the Rock Island property is in imperative immediate need of $30,000,000, then the debenture bondholders have made as good a bargain as they well could have expected to make. They will receive $62.50 par value of Railway common for each $100 face value of bonds and will not be required to put any cash into the property. They will, however, not only have the face value of their security scaled down 37½ per cent., but will also have a 7 per cent. preferred stock placed ahead of the common which they are left. If new capital is to be raised, however, something has got to be placed ahead of the common stock of the Railway company, and it might better be preferred stock than debentures. The very fact that the holding company stockholders have lost heavily and their only chance of getting back any of this loss is through the investment of more money in the property gives the collateral bondholders a club which they have apparently used to compel the holding company stockholders to furnish the new capital which is needed for the property.

The Chicago, Rock Island & Pacific Railway Company earned a surplus of a little over $4,000,000 in the fiscal year ended June 30, 1913, after the payment of fixed charges, interest and rentals. If the property could be run in such a way as to necessitate capital expenditures for the next five years of not more than $4,000,000 a year, in addition to the necessary purchase of equipment—which it would seem could be financed through the sale of equipment trust notes—there would seem to be no reason why the collateral bondholders, who are really the Railway company common stockholders, should give up any of their collateral. The experts, however, who have examined the property have placed the minimum capital requirements for the next five years at $30,000,000. The stockholders of the holding companies, on

the chance that they can recoup themselves to some extent for former losses, are offering to provide this $30,000,000, asking, however, that the collateral holders give them in exchange 37 per cent. of the common stock.

Unless this money is provided there is, of course, the possibility of a receivership for the Railway company; but from the earnings and from the physical condition of the property this possibility does not appear to be imminent. Still as a possibility it has unquestionably a strong effect upon the attitude of mind of the security holders of the old Railway company. Their paramount concern is that some plan shall be devised by which new capital shall be put into the property and their own equity strengthened. They do not care at all as to whether the holding company stockholders or collateral bondholders provide the money. Their feeling presumably is that the collateral bondholders have no moral right to jeopardize the Railway company; that they themselves may preserve intact the collateral securing their bonds. They might well argue that the collateral bondholders have already been receiving for four or five years interest through the payment of dividends on the Railway company stock which property should have been put back into the strengthening of the equity of the other security holders.

There is another way to look at this question, however. The collateral bondholders are the owners of a potentially very valuable railroad. Phelps, Dodge & Company were willing to pay $65 for holding company preferred stock not many years ago, with no prospect of any interest at all on their investment, and simply in order to have a share in the management of the Rock Island and, of course, to promote advantageous relations between their own road—the El Paso & Southwestern—and the Rock Island. Times have changed, of course, very much since the Phelps, Dodge purchase, and it may be perfectly true that were it not for the incentive to recoup themselves—which the holding company stockholders have, an issue of preferred 7 per cent. stock of the Chicago, Rock Island & Pacific Railway Company, which might conceivably carry voting control of the property, could not be sold for par; still it would seem that part of it might be taken by the collateral bondholders, and therefore, it narrows itself down to a question of how immediate and how pressing are the needs for the entire $30,000,000 new capital. Despite many arguments to the contrary, it does not appear as if the holding company stockholders and the collateral trust bondholders should be classed as in the same boat. This is arguing that the railway company stock—the collateral for the bonds—is worthless unless the full $30,000,000 new capital is raised immediately.

The scheme which has been suggested for the reorganization has nothing in it that is against sound public policy insofar as the security holders of the Railway company are concerned, or of the general public served by the road. There will be under this plan a very large scaling down of the par value of securities outstanding; new money will be put into the property through the issue of non-cumulative stock, and the two holding companies will be entirely wiped out. This is a drastic and commendable reorganization plan, and a very shrewd one.

LOCKING THE STABLE BEFORE THE HORSE IS STOLEN

"SAFETY-FIRST" is a term, comparatively new, which has been used mostly in connection with precautionary measures which have been recommended to employees with reference solely to their own acts, as related to their own lives and limbs; but it has a wider application, of course. The most comprehensive safety scheme in the railway service is that which has to do with the safety of trains—the prevention of collisions and derailments of trains running at speed. In this aspect "safety-first" has no novelty; it has always been the watchword. But in this field, as in the other, we are not beyond the need of learning. Vice-president W. L. Park, of the Illinois Central, has done a notable thing in this connection; he has had reprinted for the employees of his road a circular or bulletin on safety-first, as related to the management of trains, which has been issued by the Nashville, Chattanooga & St. Louis. We would not say that railway officers are narrow and short-sighted, or slow to learn from others; but it is a fact that Mr. Park, in thus borrowing, bodily, an important circular from another road, is doing a thing which is quite unusual. How much good do we miss by neglecting to investigate with care the practices of our neighbors? Mr. Park, if we remember correctly, did a similar thing when he was on the Union Pacific several years ago; he reprinted entire the lessons concerning the causes of collisions and derailments as they were set forth, in concise form, in one of the government's quarterly accident bulletins.

The Nashville, Chattanooga & St. Louis bulletin is in some respects unique. Parts of it are reprinted on another page. In the first place, this matter of safety in train movement, which, in other words, is the education of the men to intelligent knowledge of and obedience to the train rules, is made the whole business of one officer, the train-rule examiner. He is not distracted by other important duties. Not only that; this officer is given a free hand. He does not have to have some other officer's name appended to his deliverances. He must take the responsibility for his own mistakes, and he is entitled to the full credit for what is useful in his work. As in his book, "Rights of Trains," this examiner does not hesitate to admit that he is "lecturing." Lecturing is liable to be too much like preaching and too little like teaching, and for that reason has fallen into disrepute; but, properly treated, a lecture has its uses. Often, it can accomplish things that an oral or written examination, in the usual formal way, could not accomplish, provided only that it is followed up, to make sure that it has been understood. A lecture frankly deals with the future. In that from which we quote, there are numerous passages beginning with a postulate which assumes that there are or have been bad practices on the road; but the lecture does not deal with the past. The practice on the Nashville, Chattanooga & St. Louis is not worse than on other roads. Judging by the reports, its record for safety is high. The lectures are given for the purpose of keeping it high, and making it better. They are preventive measures in the real sense. No road can count or measure the accidents which have been prevented in a given time; but the officers of the Nashville, Chattanooga & St. Louis can find satisfaction in two facts: (1) the number of train accidents has decreased and (2) the methods adopted for prevention are based on principles universally accepted as the best.

These written lectures are to be commended because, on the one hand, they avoid the brevity and the stilted language of ordinary rules and examination papers, while, on the other, they are far superior to the impromptu lecture or informal talk which otherwise would be employed with men whose knowledge of or obedience to the rules needs freshening. It is well to acknowledge, definitely, that many of our rules are too brief. The fault acknowledged, it is more surely cured. Informal talks, usually so informal as to be inexact in many particulars, always call for great caution on the part of the trainmaster or other officer who deals with the matter. The best way to exercise the necessary caution is to write things down in black and white, as does Mr. Forman. Our extracts are fragmentary. We have not space for the whole lecture. Neither are we endorsing everything that is said in it. It is the idea embodied, and the general style of the work, that it is desired here to emphasize. We cannot warrant every superintendent that he will find Mr. Forman's lectures exactly fitted to his own needs; but it is clear that they are based on very careful and thorough study of every possible contingency; and that, in them, any American superintendent can find the fundamentals of that kind of teaching which will put the rules that are in the book into the heads of the men, so far as words can do it.

This method of correcting bad practices is in decided contrast to that exemplified in the government reports on train accidents. The government investigators must set out to cure some one particular sore spot and must deal mainly with the past; the railroad officer deals with the present and future, and he can address the whole force of his argument to the individual

employee. He makes use of constructive criticism, designed to correct the whole of the employee's conduct, as related to all of his duties. A report on a train accident is useful as showing the need of better instruction of trainmen; the actual giving of that instruction is another matter. The accident lectures of Commissioner McChord and Inspector Belnap, like those of Mr. Brandeis in another field, are useful to arouse the indifferent railway officer; but the officer who wishes definitely to improve the safety of his train operations, and who wants aid in carrying out his purpose, will find much more useful assistance in lectures like Mr. Forman's. These lectures, *with the record of the responses which he gets,* mark real progress.

IS GOVERNMENT OWNERSHIP INEVITABLE?

WIDELY different views have been expressed recently by a number of prominent railway men regarding the prospects of the adoption of government ownership of railways in this country. E. P. Ripley, president of the Santa Fe, and Newman Erb, president of the Minneapolis & St. Louis, have said that they believe that government ownership is likely to come within a comparatively few years. Daniel Willard, president of the Baltimore & Ohio, takes a decidedly opposite view. In a recent letter to the Philadelphia *Public Ledger* Mr. Willard said: "I do not agree with Presidents Ripley and Erb that the time has arrived for government ownership and operation of railroads in this country; neither do I believe that at the present time there is any general demand or desire on the part of the public for such a radical change. If the only alternative to government ownership were private ownership and management as exemplified in certain notable instances in recent past, I might agree that the time for government ownership had arrived, but fortunately that is not the situation. There are very many large railroad systems in this country wisely, honestly and ably managed, among which number is the Santa Fe, of which President Ripley is at the head, and I can think of no good reason for substituting government ownership and control for private ownership and control of that character."

When such eminent doctors disagree so widely it is manifestly hazardous for others to express opinions. Nevertheless, the *Railway Age Gazette* ventures to believe that Mr. Willard reads the signs of the times better than Messrs. Ripley and Erb. If there should continue to be mismanagement of railways, here and there, which should lead to other scandals as bad as some of those that recently have been aired, and if government regulation should continue to be as prejudiced and unjust as it generally has been for some time, government ownership doubtless would be the result. It would come because regulation would disable the railways from performing their functions satisfactorily and because the investors in their securities and their owners would be so disgusted that they would enlist among the advocates of government ownership.

But it cannot be assumed that developments are going to take this course. The people of this country have a strong tendency to look with disfavor and fear on projects for state socialism. The number of railways in whose management the dictates of honor, sound business sense and public opinion are disregarded is rapidly becoming smaller, while the realization on the part of railway financiers and executive officers of the imperative need for action on their part to make all railway managements conform to a high standard is becoming keener. Evidences multiply that the public and the regulating authorities are beginning to realize that the story of the man who fed his horse on sawdust has its application to railway regulation. It will be recalled that just as the horse got used to living on the sawdust he died. The public and the regulating authorities are awakening to the fact that similar dieting of the railways must have similar consequences. This we believe is especially true of the federal authorities, including the Interstate Commerce Commission; and the Shreveport decision apparently has given the federal government all the power that it needs to control not only the managements of railways, but all who seek to regulate them. All these influences are operating to arrest the drift toward government ownership.

It is probable that the decision of the commission in the rate advance case will have a very great influence on the discussion of this subject. If the decision should be entirely adverse to the railroads it would intensify the feeling of discouragement among railway managements. If it should demonstrate in a practical way a disposition on the part of the commission to recognize the great difficulties with which the managements of the railroads are confronted and to help to cope with those difficulties, it probably would tend greatly to reduce the feeling that government ownership is inevitable. What is needed is evidence that the commission is determined not only to eradicate abuses in the railway business and protect the rights and interests of the public, but that it is equally determined to see that every honestly and prudently managed road gets a square deal. We confidently believe that such evidences will be forthcoming.

SUPERVISION IN YARD OPERATION

IT is instructive to note that the one point most frequently emphasized in the contributions to the contest on The Operation of Large Classification Yards, the first of which are published in this issue, was the importance of sufficient intelligent supervision, and the fact that this was referred to so often is an indication that the men in charge of the operation of large freight terminals are awake to its importance. With the elaborate network of tracks and the multiplicity of movements of cars it is not surprising that some are occasionally lost sight of. As one writer states, the problem of car movement is not so much that of the 90 per cent. of the cars which move regularly through the yards as with the 10 per cent., or less, which move out of the regular channels to the repair tracks or other parts of the terminal. Here is one place where supervision is important to keep *all* the cars moving, for as another contributor states, a yard is not intended as a place to store cars, but rather as a place to move cars out of.

Attention is also frequently given to the loaded car to the detriment of the car moving empty, especially in times of heavy business and consequent car shortage. While not detracting in the least from the importance of keeping loaded cars moving to their destination, it must also be remembered that each day an empty car is delayed in returning for a load is a day's less revenue derived from that car.

Aside from the importance of the prevention of delays to cars, supervision is essential to secure economical operation. When one considers that the annual cost of operation of a switch engine is equal to the fixed charges on an investment of $250,000, he can realize the necessity of so arranging the operation of the yard as to cause the least interference and delay to all movements, thereby keeping the number of engines required to the minimum. As in all other branches of railway operation, money spent to secure sufficient supervision is economy in the end.

Another point brought out in these papers which deserves special emphasis is that of the personnel of the yard forces. If each clerk, messenger and switchman is imbued with the idea that he is in training to become a yardmaster he will do better work. The yardmaster who exercises care in the selection of his employees, endeavoring to secure those who will be eligible for promotion, and who then develops each employee to bring out the best that is in him, is not only increasing the efficiency of his organization for the present, but is creating a corps of men upon which he can draw when filling positions of greater responsibility in the future.

The problem of securing more movement from cars is essentially one of reducing the time spent by these cars in the large terminals. It is in this feature that one of the greatest opportunities for increased economies exists today. With the concentration of attention at this point during the last two or three years important improvements have been made, but even greater advances can still be made.

The Operation of Large Classification Yards

Prize Winning and Other Papers Received in Contest; A Practical Discussion of This Important Subject

FIRST PRIZE—THE OPERATION OF LARGE YARDS

By A. M. Umshler

General Yardmaster, Illinois Central, Centralia, Ill.

There are many details in the successful operation of a classification yard which can be included in two divisions, i. e., organization and facilities. By organization I include not only the direct head of the yard, but all departments forming the organization on which successful operation is dependent. This includes not only the general yardmaster of the yard with his assistants and the engine foremen and switchmen, but comprises as well the organization of other departments on which successful yard operation is directly dependent, prominent among which are the mechanical department; the transportation department; other yards on the division, and the train despatchers and trainmen.

It has been my observation in years of service as a trainman, a mechanical employee, and a yardman that a great deal is dependent on a yardmaster. He must be a man with a personality who can handle men and who understands all details and branches of railroading and he must be thoroughly conversant with the official as well as the practical side of the work. In other words, he must be a man of education and one who knows how to get the most out of a man. In order to do this he must have the good will of every employee under him, and he must, above all, enjoy the good will and the support of the officers in all his undertakings.

In his organization he must be the head. A mistake is made by many railroad officers in ignoring the head of the yard in handling investigations and discipline. All correspondence should be addressed to and handled by him. All investigations should be conducted by him and his recommendations should be acted upon in yard matters.

It is a mistake to have too many semi-officials presiding over a yard or any part of it. While a general yardmaster cannot preside over any large yard and cover all details of the work, he should limit his assistants to the lowest possible number and still have the proper supervision over each part of the work. These men should possess all the qualifications of a general yardmaster and above all must be absolutely loyal to the general yardmaster and consult him frequently in the daily operation of a yard.

While the yard may be so large that a general yardmaster cannot govern it as he should, he should have a competent organization in his yard office to handle that part of the work and enable him to go about the yard frequently and keep in touch with what is going on. Each of his assistants should preside over a designated part of the yard and wherever possible should have charge of the movement of a designated traffic in a certain direction so that there will not be a division of responsibility.

He should use care in selecting his switchmen, ever keeping his organization in mind and the fact that each man forms a link in his chain and that the chain is no stronger than the weakest link. He should have a satisfactory system of discipline. He should impress upon his subordinate employees, particularly his engine foremen, the necessity of doing their work promptly and properly and should not allow them to lose sight of the absolute necessity of handling all equipment carefully. It is an established fact that considerable damage to equipment occurs in a yard, not always of such consequence that a car must be sent to a repair track before it is in condition to go forward, but the draft gear may be so weakened in handling that it cannot carry its part of the weight and sooner or later the weakened part will give way. This is one of the paramount questions of successful yard operation, as a great deal of the delay to cars is directly due to the manner in which they are handled, and as a result considerable time is lost by each car in the course of repairs.

In a successful yard organization a great deal is dependent upon the office where the records and way bills are handled. This is an organization in itself, which must be presided over by a competent chief clerk, who should be a man of detail and who should be competent to handle men. He must use care in picking his employees, as a great deal is dependent upon a yard clerk who is accurate and quick in his work. The chief clerk should arrange for the various yard clerks to take a daily check of the yard and to report to him all cars which are being delayed in their respective yards or districts for any reason, so that he can follow them up to ascertain what is delaying them and make necessary arrangements to move them forward with the least possible delay.

The general yardmaster should keep in close touch with the chief despatcher regarding the time of arrival of trains, and should outline the work with his yardmasters so that they will be prepared to handle them promptly on arrival. It has been my custom in handling through time freight trains where the cars are not properly switched to the outgoing track to require the engine foreman to mark the car from the switch list showing the station for which it is destined, the date of arrival, and where the shipment contains live stock or perishable freight he should note this on the side of the car. In this way not only the engine foreman carrying the switch list, but anyone else may be fully conversant with the nature and importance of the shipment contained so that it may not be lost sight of and unnecessarily delayed.

A great deal is also dependent on the facilities. These include not only the tracks and their location, but the motive power and other conveniences for the prompt handling of trains through the yard. Important among these are the facilities for repairing bad order cars and for the prompt inspection of incoming and outgoing trains. Much depends upon the co-operation of the mechanical department. That means not only furnishing first class power, but also an organization of inspectors who can be depended upon to do their work thoroughly and expeditiously and with enough men to inspect each train promptly on arrival while the switch list and way bills are being checked in the yard office. The yard should be equipped with a system of air lines so that prompt inspection of the trains can be made while they are being made up. This greatly expedites the movement of fast trains through the yard.

The facilities for repairing bad order cars should be up-to-date and complete in every particular. I have always found it convenient to have a track adjacent to the train yard arranged for making quick repairs, such as applying yoke bolts and making minor draw head and safety appliance repairs which cannot be made in the yard, and for the changing of wheels under loaded cars. I have also found that having designated repair tracks for the various running repairs with an assigned force of men on each has enabled me to handle cars more expeditiously than to have the cars placed on one or two tracks where they are handled as they come.

Certain tracks in the train yard should be designated for receiving bad order cars, the time freight cars requiring quick repairs being promptly switched to the quick repair tracks by the yard engine while switching the train. A yard engine should be assigned to serving the repair tracks and it should be required to remove all bad order cars from the train

yard to the shop tracks and do all spotting and switching of mechanical department tracks.

While, of course, a great deal depends on the size of the yard and the manner in which it is laid out, I have always designated certain tracks to receive a particular kind of freight for a given destination or district, separating the tracks as between time freight, dead freight and empties where they do not go forward on connecting trains.

A great deal depends upon local conditions as to the movement of empty cars, which are the ones that generally meet with more delay. In many cases equipment must be held to protect coal, stock or cotton loading, depending upon the class of business served. Practically every railroad yard has some special kind of equipment to hold, for which ample provision should be made in the way of storage tracks. In switching a train, storage cars should be thrown to a designated track and moved to the storage yard, where they can be classified and made ready to send out on orders.

The prevention of terminal overtime is largely dependent upon the yardmaster and the engine foreman. The yardmaster should know the amount of work required for each train and the length of time it will take to do that work and a first class yardman can generally tell within a very few minutes the approximate time required and should govern himself accordingly in the ordering of trains. It has been my practice not to order dead freight trains, or trains of minor importance, until they are made up so, nearly that there is no possibility of a failure to have them ready before the time called to leave. A yardmaster must also work in conjunction with the train despatcher, calling trains at a time when there will be no interference with incoming or outgoing trains.

It has been my idea to assign engines in a classification yard to a special service or part of the yard and to look to the engine foremen and yardmasters to handle their part of the work, always keeping it lined up with all cars in their proper place. The practice of leaving work until business is slack has proved a mistake, as in the railroad of today the slack time seldom comes and conditions then go from bad to worse.

The handling of bad order loads which require heavy repairs is another question which should never be lost sight of. Where a car is shopped for such defects that repairs cannot be made promptly, or where transfer is required, there should be no delay in promptly switching the car to the transfer track, together with a suitable empty car into which to make the transfer, and a designated force should be maintained for this purpose, although, of course, the size of this force should be regulated with the amount of business.

It should be borne in mind by the general yardmaster and thoroughly impressed by him upon all subordinates that each day's delay to an empty or loaded car represents a certain loss to his employers, who are always entitled to his best services. Furthermore, they should be made to appreciate that every car made bad-order by them causes several times the amount of work in handling that car that it would had the proper care been exercised in handling it in the first place. We must also be ever alive to the fact that the more room we have in the yard the less work there is in handling cars and the less liability there is of cars being overlooked or delayed, and to this end the general yardmaster himself is the one to whom the officials of the railroad company look for the prompt despatch and movement of trains through the yard.

We use a switch list in handling trains over the hump at Centralia, the foreman keeping the original list as a check. As an assistant to the hump foreman we have assigned a clerk, whose duty it is to mark switch lists as well as keep a record of the individual cars and rides made by each rider so that if any damage results or any questions come up regarding any special car ridden from the hump it is easy to find out who rode the car from the hump to the classification yard. We also use this check sheet to determine whether the riders are riding their proportion of cars passing over the hump, and if we find they are not keeping up their riding average, it is an easy matter to discipline the party at fault. At the end of each month a statement is compiled showing the number of rides made by each rider and their daily average for the month. We find that this causes a great deal of interest among the men, as they know that they are being checked up and each man is anxious to keep his average up to the standard. This clerk's duties include also the reporting of all damage done to cars while being humped, seeing that proper "478" and "903" reports are made by all parties concerned in any accident resulting in car damage. We have also two yard clerks in the northbound and southbound yards whose duty it is to inspect all seals and to make a record, as well as to apply new seals when cars are found unsealed, and to inspect cars of merchandise and other perishables when found unsealed to ascertain whether there is any shortage in the cars. This enables the claim department to locate the point and the division on which pilfering was done.

Terminal overtime is a live subject at Centralia. When I took charge some 15 months ago this terminal was one of the worst offenders on the system in this regard, the average terminal overtime being from 30 to 55 hours daily. I immediately started a campaign, and in the course of 60 days this terminal overtime was cut down very much. For March, 1914, which is an average month, we ran 1,200 freight trains with a total of 18 hours' terminal overtime. This reduction was brought about by personal supervision and impressing upon the assistant yardmasters, engine foremen and switchmen that the making of terminal overtime was entirely uncalled for, and that by the proper listing of trains and having them made up they could eliminate this annoying feature of yard operation. I also talked personally with outgoing enginemen and trainmen on this subject, with the result that they now take as much interest in the matter as any of the yard force. What little terminal overtime we have is caused by unavoidable accidents, which are the fault neither of the crew nor of the yard force.

I have received the best results in regard to switch engine mileage by making the matter as nearly a personal one as I can between the different yardmasters, pointing out to them which engines were doing the most work and where I thought they could get better results from them. By going over the details of the work they have to perform, I am getting much more work out of the engines at the present time than heretofore.

With the surplus of power that we find on nearly every railroad in the country at the present time, the blockading of large yards seems to me to be entirely uncalled for. The majority of blockades are caused by the chief train despatchers and general yardmasters not looking far enough ahead in order to anticipate any congestion at least 24 hours in advance. A great many blockades are also caused by the general yardmaster not working enough switch engines to handle the extra heavy run of business through his yard promptly. This is poor economy.

SECOND PRIZE—ESPRIT DE CORPS IN YARD OPERATION

By C. A. Pennington

Supervisor of Terminals, C. C. C. & St. L. and C. & O., Louisville, Ky.

The framing of a set of rules to suit operating conditions in all yards would be a task compared to which the feats of the demigods of Greek mythology pale to insignificance. However, despite the many differences, there are some things common to all terminals and some operating principles that can be applied in general.

Most terminals are (and all should be) constructed so that the inbound and outbound business can be handled with little interference and it is important that yardmasters see that such

interference does not exist, or at least exists only to the least extent consistent with the yard layout. Where several divisions of a road reach one terminal this problem is a serious one, and co-operation among the heads of the different sections of a yard is essential to satisfactory operation. Many short cuts are possible when a man thoroughly understauds what the other fellow will do with a string of cars when they reach his territory. Ten minutes additional time consumed in one yard may mean a saving of 30 minutes or more in another.

The outbound freight must be kept bunched, with the manifest, of course, separated from dead freight. If the tracks are of different length the shortest should be used for the business running lightest between trains. When the elevation and curvature of tracks in a non-gravity yard are different, a careful selection of tracks should be made so that those most easily used will be applied to handling the classifications that run the heaviest.

Attention should be given to the lowest classes of dead freight. Manifest loads with their car cards and colored bills demand attention from yard clerks, switchmen, and yardmasters, but the low grade freight is like an actress without a press agent. As an example of what is done to dead freight, a train will be given perhaps 40 dead freight cars out of a 50-car track, and the remaining ten cars will be covered with a "cut" of new freight. This may be done three or four times and delay will ensue, whereas a few minutes spent in placing the old cars ahead or "doubling over" the contents of several partly filled tracks of old freight would result in the prompt movement of such freight with a corresponding increase in the reputation of the road. This need not be carried to extremes, but should receive more attention than is usually given.

As a rule shippers haven't the speed mania, although our freight solicitors insist on inoculating them. Leaving out of consideration livestock and highly perishable freight, the greater number of shippers do not care whether freight is received in three days or four, but the demand is that the movement be reasonably regular so that dependence can be placed on its approximate arrival. Possibly some day less attention will be given to the manifest freight which demands light tonnage trains, speedy runs and other net revenue killing features, and more attention will be given to moving the general business with more regularity. Such a condition would lessen the difficulties in some yards and would doubtless result in a better general handling of business in all yards. However, now is the time for superintendents, agents, yardmasters, yard clerks and yardmen to watch the dead freight and see that unnecessary delays do not occur.

Shop tracks should be closely watched and pulled regularly, and so far as possible cars for heavy repairs should be separated from the light repair cars. If a superintendent has his repairmen and yard force working in close co-operation, the total number of bad order cars can be kept down and much per-diem saved. If cars are thrown into shop tracks indiscriminately and are repaired the same way the number of cars moved will be decreased and many times important cars for a manifest train will be marooned behind a jacked up "cripple," when by a little foresight delay to such freight could have been avoided.

In transferring cars from one yard to another or between connections (if such work is done) reciprocal arrangements should be made, when possible, to avoid light mileage. However, prompt movement of through business must not be sacrificed.

If the classification yard is located in a large city, the operation of that yard can be seriously handicapped by the failure of consignees to promptly handle team track business in the bulking yard. Leaving out of consideration the extra work in the team track yard, if such tracks are not being operated to a high degree of efficiency and cars accumulate this condition is bound to re-act on the classification yard which must take care of the accumulation and the work incident to keeping old and important business cut ahead. A few terminals have put into effect a team track storage charge which in some instances trebles the ordinary car service charge and acts as a penalty on consignees doing business on speculation and using box cars as warehouses. It is the consensus of opinion that this charge will increase the efficiency of valuable team track facilities and in turn improve conditions in the inbound yards. During a recent rather heavy perishable season one road with a team track yard of about 200 cars capacity was holding back in its working yard from 25 to 100 cars, while the average number of cars unloaded daily amounted to about 30. Officials who have not considered this question should give it some investigation.

Yardmasters should keep in close touch with despatchers and be prepared to receive inbound trains promptly. While terminal overtime is important it is not the only thing to be considered. It is just as important to give road men fair treatment. Men will sometimes work like Trojans to reach a terminal on time, not only because they may be actuated by a desire to expedite the movement of the company's business, but on account of some personal reason such as a desire to attend a ball game or a matinee, or to reach their hotel before meal time is over. Under such conditions failure to be taken into the yard promptly is often taken as a personal affront. This may seem inconsequential but it is a factor in handling the business. A friendly road crew can do many little things to help a yardmaster, and incidentally the road he represents, while a crew with a grouch can do many little mean things without violating any rule.

In small yards it is impossible to avoid all delays. With equal facilities, however, there can be a wide difference as between different types of yardmasters—the type that is wide awake and ready to take advantage of every possible move to get the best out of the available facilities and the type that operates in a more or less haphazard manner, depending on the lack of facilities as a stock-in-trade excuse. It is also important to have outbound trains ready on time. Crews are sometimes called on a guess figure. The freight should be in some shape before crews are called and despatchers should be given definite figures.

By far the most important feature in considering economic and satisfactory yard operation is that of organization. Consider first the yard clerks—a class whose importance is often underestimated. A few minutes' conversation with the various yard clerks of a terminal will reveal the standard of efficiency in that terminal. That is rather a broad statement but try it out. See how much each man knows about his work and the interest he takes in that work—but more important still see what he knows about the other fellow's work and what interest he takes in the general business of keeping cars moving. Interest and careful teaching on the part of the department head begets interest and knowledge on the part of the staff. It may be that the personnel is of rather low grade despite all the head of the department may be trying to do, but that will not disprove the fact that the standard of efficient yard operation is usually measured by the general ability of the staff of yard clerks.

Unfortunately in some instances rates of pay have fallen so low that it is extremely difficult to get men with experience and proper character to accept clerkships. Young boys of questionable ability at times have to be employed, without any assurance that they will not desert and waste several months of patient and careful teaching.

The yard clerks should be under the jurisdiction of the yardmaster rather than the agent, as the former is vitally dependent on the work of the clerks. There is a difference of opinion on this question, but assuming the position to be a correct one without extensive argument, what can the yardmaster do to obtain the best results from the available timber? To begin with, the general yardmaster and chief yard clerk must follow up every error and make that error worth something as a lesson in prevention—not only so far as the man interested is concerned but with respect to the entire staff. The yardmaster is in close touch with all cases of loose work and feels the effect and he must not assume an indifferent attitude unless he wants that attitude reflected in the yard clerks' actions.

A highly important and almost universally neglected feature of high class yard operation is a yard clerks' school. I mean by

that, meetings at convenient times of as many yard clerks as can be present in the yardmaster's office to discuss with him and the chief yard clerk new features of the work and new phases of old features. At such schools yard clerks can get some idea of work other than their own and they can also be taught to handle their specific duties in a satisfactory manner. Here can be discussed the proper methods of marking and listing trains with regard to destination of the cars, the disposition of empty equipment in line with orders from the car distributors, the best methods of checking foreign cars and securing home routes showing specific delays that have occurred, with a rough comparison taken from daily checks, showing the degree of efficiency in different sections of the yard; in short, by personal contact the men can be taught to drop a mechanical attitude and handle their work in a positive manner. If the yard clerks are not "on the job" all the time not only will delays occur and unnecessary per diem be paid, but some already overburdened switch engine will do double work owing to the fact that cars are not properly listed when first handled. Teach the boys to think, explain to them the "why" of the thing, solicit suggestions and create interest. Some yardmasters may think this impracticable, but it isn't a theory; it has been tried out and found valuable. Let me repeat—keep everlastingly drilling the yard clerks! It costs something but it is worth the price. A well trained yard clerk often means a future A-1 yardmaster and he certainly means a present source of considerable satisfaction.

Now as to the switchmen. Terminal officials must know their men—their habits, peculiarities, likes and dislikes, and something of their outside interests. A speaking acquaintance with a man isn't knowing him. Individual attention and the application of methods peculiarly fitted to the man under consideration are necessary to produce satisfactory results in handling the yardmen to the end that a high standard may be maintained both as to quantity and quality of the work. A plain command may produce results but an order couched in terms that appeal especially to the individual often strikes a responsive chord that results in double effort. This is especially true during periods when facilities are taxed to the utmost and yards are fighting off congestion. An appeal to a conductor's pride, a challenge to an engineer as to the ability of his locomotive, encouraging some men to think of the work somewhat in the nature of a sporting contest rather than in plain terms of box cars and trains—these things will often work wonders on days when a terminal is about "swamped" with business.

It should also be borne in mind that a little pleasant conversation has the same effect on a grouch that sunshine has on disease germs. A yardmaster should not forget that a hungry man can't be very efficient and a man who breakfasts at 5 a. m. is hungry at noon. The better men will not kick about missing a meal occasionally when necessity demands, but they are rather discriminating judges of what constitutes a necessity. Physical discomfort often prevents an ordinarily loyal man from "playing fair." In the matter of granting short leaves of absence preference should not be given the regular loafers to the extent of placing a penalty on ability.

A yardmaster should not lose sight of the fact that it is human nature to follow a leader and to pattern after that leader to some extent. A quiet, courteous man, but with plenty of fighting spirit is the one best fitted to hold his organization intact and to instill confidence into the men during times when confident fighting men are needed.

The yardmen should be taught an interest in their territories and then that interest broadened until a co-operative spirit exists with respect to the general business of the company. Conductors should be encouraged to explain the yard work to the switchmen. A man cannot be highly interested in his work when he has only a hazy idea of what it is all about. Not only will the men be better switchmen when they understand just why they do certain things, but the yardmaster is entitled to have the conductor's work understudied. This does not mean that there should be two or three men trying to run one crew, as that always results disastrously, but the conductor can boss the job and explain things if the yardmaster will see that it is done.

A terminal official should certainly run the job and not let it run him. Discipline is absolutely necessary but should be given careful study. It isn't a bad thing to think a little from the other fellow's standpoint, and if he doesn't reciprocate, he is a good one to drop at the first opportunity. If possible to create the "family spirit," the men will help weed out the undesirables, although they might not be willing to acknowledge it openly. The esprit de corps has carried many a man through a period of trying times and such times have a tendency to bob up in a railroad yard. There are times when it is necessary to impress some lesson on the mind of a young conductor or engineer, but it is doubtful whether suspensions have the desired effect. As a rule in a terminal organization best results are secured when the men understand that they are to be judged by their general ability and conduct, and a disposition to further the company's interests, and that a tendency to get out of a walk in doing the work is not apt to be followed by punishment for some trifling error. It should be equally well understood that an employee who does not care to observe the rules and do his full share of the work will be quickly dropped from the organization, as unfair to the company and unfair to the men with whom he is associated. Instill the proper spirit into the yardmen, start them thinking along the right lines with respect to the question of discipline, show them where they are personally interested, and they will help maintain a high standard and assist in the elimination of the "bad actors."

There are many short cuts and methods of operation peculiarly fitted to local conditions and terminal officials are usually prompt in the adoption of such methods, but the success of any plan of operation depends primarily on the constant teaching and training of the men in the ranks. Where clerks and yardmen are cooperating to move cars promptly, safely, and economically, backed up by proper supervision on the part of the yardmasters, such a terminal will show results, and while the class of traffic and number of trains run may prevent a very low *average* car delay, there will be a minimum of specific delays that are annoying, costly and of considerable influence in establishing the reputation of the road.

PRACTICAL HINTS ON YARD OPERATION AND SUPERVISION

By R. M. Baker
Bellwood, Pa.

If the most optimistic view which can be taken of the transportation situation shows the average freight car moving only 2½ hours out of each 24, and that during the other 21½ hours its value as a revenue producer is zero, one-half of which dead time is spent in yards, we are certainly forced to the conclusion that our old friend Atlas as a monopolizer of responsibility has nothing on the present day yardmaster, and that the prompt movement of cars through yards forms a problem beside which the speed of trains on the road sinks into insignificance.

While extensive changes in yard layouts are not practicable at present, any changes in methods of operation which tend to economy are attractive to everybody. The first consideration for the yardmaster to consider is whether or not his office is properly located in the yard. Each yard has its busy point, possibly that at which the crews go on and off duty, the gauntlet between classification tracks or the track scales; if located at such a point he can give much personal supervision to his work without going beyond call of his desk. Further than this, he should have telephones in booths or boxes located at each end of his yard, at or near the switches leading from the main track to the receiving or forwarding tracks, and at such intermediate switches or points as will make it possible for his subordinates to get into quick communication with him. Being

so equipped he should not go beyond call of his desk without leaving a substitute capable of directing the work in his place. I wish to particularly emphasize this latter point: Instructions to a crew do not always work out smoothly, and it frequently becomes necessary to quickly communicate with the general, if much valuable time is not to be lost, in which case he should not be "At Winchester, 20 miles away."

The three steps in the operation of a classification yard are receiving, classifying and forwarding, which steps of course double themselves where it is necessary to handle the traffic in both directions.

Upon receipt of a train the first object is to clear the main track as promptly as possible. If any instructions are necessary regarding the putting away of the train they should be issued to the conductor at some office en route so that he may have a chance to issue the necessary instructions to his crew without detention. If at all possible the switches leading from the main track to the receiving yard should be set up by the operator, switchman or other employee whose duties require him to be at or near that point; more than the overtime of the crew is saved if an extra stop by a heavy train can be avoided.

After the train is put away all time made by the crew is non-revenue producing, and for this reason the cabin track and the point at which the enginemen are relieved should be as near the loaded receiving yard as possible, and the time of relief should be certified to by the yardmaster or a subordinate located at or near this point where the crews are so relieved. The manifests, time cards, etc., should be delivered to their proper destination by a messenger, rather than by the conductor, which latter plan sometimes means that the entire train crew is paid to deliver them.

In this connection, next to the yardmaster himself one of the most important members of a successful yard organization, and possibly the one who produces the biggest return on the money invested is the messenger; be careful that high priced employees, possibly the yardmaster himself, are not doing work that could be done quicker and better by a $20 messenger who expects to be a yardmaster himself some day. Don't have any other kind.

The question of the proper classifications to be made at each point should be thoroughly thrashed out at meetings in which the several yards are competently represented, after which the entire system should be blue printed, and a copy placed in the hands of each yardmaster with the understanding that suggestions from him regarding improvements in the system will be given careful consideration, and within proper time replied to, whether favorably acted upon or not. I believe that many yardmasters are too slow in making suggestions to their superiors regarding all matters in which they have an interest—not half-baked suggestions upon subjects of which they have no knowledge, but suggestions which have been carefully thought out, and which, after being viewed from all standpoints look good.

The same comments regarding standardizing of classifications apply to the blocking of cars in trains forwarded; no more of this work should be done than is necessary, nor should any be avoided that can be done to advantage, the entire question being that of where the work can be done with the least delay and expense.

As much advance information as possible should be given the roundhouse and train despatchers as to when trains will be ready. This statement may be thought superfluous, but how often there is a lack of team work between the road and yard people. This lack of team work applies also to work between connecting divisions and roads at junction points. Why has not the receiving division a right to expect fairly accurate information as to amount of tonnage which will be delivered and the time of its arrival, at least some little time in advance of actual delivery? Expecting this they must be willing to give as good as they receive.

One money and time saver under present methods of operation is an air line to the head of the forwarding yard by which trains may be pumped up and tested, and defective equipment repaired by inspectors before the road crew takes charge, materially cutting down the time consumed in getting out of yards.

How to keep stray cars from being delayed is a question upon which both time and money have been spent with not as good results as could be desired. A system of car records which provides for a record of every car moved costs perfectly good money, and usually accumulates more stray records than it moves stray cars. In every yard upon possibly 90 per cent. of its trackage a car could not be lost if it wanted to, and possibly the same percentage of cars moved through the yard do not leave those tracks. What is the use in a car record force spending 90 per cent. of its time and accumulating a mass of unnecessary information in looking after individual cars which cannot help but get the normal movement through the yard, and only 10 per cent. in looking after those which may be delayed. The cars on hold and stub tracks, and those awaiting loading and unloading are the ones which must be looked after, and this must be done daily; "last weekly" is about the best one can expect of the average system of car records. For this reason I feel that for the use of the yardmaster daily checks of hold tracks and duplicate "put" cards for cars placed at industries, or memoranda in smaller yards, secures the best results; in other words a system which patrols the banks and keeps the logs moving in midstream.

As a check on the normal movement nothing which I have seen equals periodical audits; that is, taking a bunch of possibly 200 cars and timing their actual movement through the yard, first eliminating cut out cars. It is sometimes possible to time them at several intermediate points, and easily locate just where the delay if any is occurring. Such audits should be made as often as possible, and the results given careful study by the yardmaster, not forgetting to commend where commendation is due, as well as to reprimand.

Are there any particular traits of character which can be developed by the yardmaster himself which will help him to success in this most responsible and trying of positions? I believe there are. First is that described by that good old comprehensive word "rectitude," which Webster says means in its broadest sense "absolute conformity to the rule of right in principle and practice." After this comes courtesy, already referred to, but get the first one first, and the second will not be so hard to practice. If these two elements are conscientiously striven for—not rubbed on the outside, but rather taken inwardly and sweated out—a yardmaster will have the respect of both those above and below him.

In the successful operation of their yards the railroads might learn much from a study of army rules and methods, for there the control and direction of large forces from one central point sees its most perfect example. In the selection of yardmasters it has been the custom to some extent to place local knowledge ahead of other qualifications, whereas I believe executive ability and practical experience in any yard easily rank ahead of local knowledge, which can be gotten in a short time. In fact the advancement of yardmasters and assistants from one yard to another has its definite advantages in bringing into the organization new ideas, and at the same time furnishing the incentive to faithful work by deserved promotion.

REDUCING CAR DETENTION

By Geo. C. Duffy

General Yardmaster, Boston & Albany, West Springfield, Mass.

During the month of January, 1910, 63,829 cars were handled through the yard of the Boston & Albany at West Springfield, Mass., at a cost of 12.5 cents per car. During the month of March, 1914, 90,895 cars were handled at an expense of 10.9 cents per car, an increase of 27,066 cars handled, and a decrease of 1.6 cents per car in cost of handling, and this notwithstanding the fact that a general increase in wages was granted to all employees effective April 1, 1910, with one increase in wages to

enginemen and two increases to conductors and trainmen since, together with the increases granted to the other yard forces at different times, which of course are reflected in the operating expenses of the yard.

The following methods are employed in reducing car detention to other than perishable and high class freight: Any car of merchandise requiring repairs must be transferred and forwarded within 12 hours if the car cannot be repaired within that time. Ordinarily this has to be done at the freight house, but on several occasions, with the assistance of one or two trackmen, and perhaps a yardmaster and clerk and myself, this has been accomplished at the yard, mainly through the spirit of co-operation and harmony that exists between the maintenance of way and the operating departments at this yard. With other freight not considered quite as important 24 hours is allowed for repairs to be completed, and cars delivered to the yard, or a transfer will be made.

A track is assigned for cars requiring light or minor repairs in the eastbound receiving yard and also in the eastbound classification yard, and the same arrangement is made for westbound cars in their respective yards. The necessity for the prompt placing of cripple cars on their respective tracks is impressed upon yardmasters and yard conductors by frequent get-together talks with the conductors, and by personal meetings with the yardmasters. I consider these meetings one of the main factors in the efficient handling of this particular branch of the service. Of course it is understood by all concerned that perishable and high class freight requiring repair attention will be given immediate consideration, and if necessary contents will be transferred at once and properly ventilated or iced cars used as the occasion may require.

We have a normal average of 26 eastbound and 30 westbound trains daily, although this has run as high as 45 trains eastbound and 48 westbound in 24 hours during different busy periods. We classify 14 separate groups eastbound, and 12 distinct groups westbound, and any delay to any loaded car that shows as high as 10 hours, has to be explained to the superintendent. With the exception of six fast freight trains in each direction, these trains will average 20 switches each, so the necessity of close supervision by all concerned at all times can readily be seen.

Every card manifest is time stamped on the arrival of the car which it accompanies, and these cars are constantly under the supervision of the yardmaster or his clerk, and the manifest can be readily examined by the general yardmaster, or by the trainmaster, which occurs frequently. I think this open inspection has a great tendency to keep the car detention down to a minimum.

PRACTICAL HINTS ON YARD OPERATION

By J. B. Warrington

Division Superintendent, Philadelphia & Reading, Philadelphia, Pa.

One of the chief factors in the successful operation of large yards designed for the classification and breaking up of trains is organization, combined with the efficiency of those who compose it. The next factor is the method of applying that organization to the various tasks, and the measure of discipline that must be administered to maintain its power.

All classification yards should be so arranged that cars inbound and outbound are handled at different ends to keep the traffic moving in its proper direction, and to prevent delay by reason of the first cars in being the first out. Sufficient trackage should be provided outside of the yard proper to permit road crews to set out their trains when for any reason they cannot be handled promptly in the yard, and at the same time to keep open the main tracks to handle the perishable and fast freight trains, which take preference over the usual run of business.

The repair of bad order cars is an important feature of all yards. I find it more advantageous in times of congestion to transfer the contents of bad order cars, as this prevents delay and the handling is practically the same, for a loaded car requires preference over empty equipment at the repair shop, and it has to be handled again after repairs are completed. Cars containing fragile material should not be transferred if avoidable, as a claim for breakage usually follows. A place to dump hopper bottom cars that require reloading is a necessary feature of a large yard. Shop cars should be put on separate shop tracks and repaired in the yard or sent to the nearest shop, loaded cars being given preference. At any point where large numbers of cars are required daily for loading purposes there should be shop men to make light repairs, and to keep all cars possible out of the shop.

In my opinion the prevention of blockades depends on the efforts made by those in charge to avoid same. The use of good judgment is most essential. Quite often the same old method of handling in vogue years before is being used, which is no doubt entirely unsuited to present day conditions. The men or man in charge must be up to date. When a blockade exists no set rule or method can apply, other than some man with a definite knowledge of what is required must get on the job and stay there, and make the movements fit in with the existing conditions. Prevent blockades by close attention to the business, and this trouble cannot occur. The trainmaster should be on hand in person as much as possible and center the power there, if necessary sending cars to other yards for classification. A very important element in connection with this is to try to get the foreign road, which connects with you, to move its traffic more promptly.

An on-time movement of scheduled trains and drafts of cars must be insisted upon. The reduction of switching to a minimum in classification yards and elsewhere should be the constant endeavor on the part of the yard force handling. The matter of car distribution should be thoroughly supervised to avoid any unnecessary handling and movement of cars. Personal supervision of these varied details of operation by the officers in charge, together with educational meetings for the dissemination of knowledge necessary to promote efficiency, and also to profit from errors, will materially assist in attaining desired results.

To secure efficiency, however, organization is necessary with some one in authority to see that there should be intelligent interpretation and rigid enforcement of the instructions. Of course while all the various problems pertaining to tonnage, power, inadequate facilities, failure to keep pace with modern conditions, etc., will have to be met, it must be recognized that efficiency failure may be due to weakness in the human element, as well as to the lack of facilities to keep pace with heavier power and largely increased train tonnage. It should be the aim of operating officials to give the rank and file such treatment by personal touch as will stimulate the employee to such efforts as will bring out the best that is inherent, and redound to the railway company's welfare and best interests. Another method to attain human efficiency is to require strict compliance with total abstention from intoxicating liquors.

Successful terminal operation would therefore seem to rest upon adequate facilities, vigilant supervision on the part of operating officials combined with loyalty of the employee, and the highest human efficiency attainable to both employee and official.

KEEPING CARS MOVING IN A LARGE YARD

By H. T. Murray

General Yardmaster, Chicago, Burlington & Quincy, Galesburg, Ill.

The problems presented in the successful operations and handling of large yards are many, and are governed by traffic conditions, track facilities, and the geographical location of the yards. An outline of the C. B. & Q. yard at Galesburg, Ill., will possibly be of interest in this connection.

We have two humps and two flat yards built parallel with each other, and connected with interchange tracks. With smaller auxiliary yards serving the passenger station, etc., there is a total car capacity of 8,979 cars.

The lines leading out of Galesburg in four directions are double track, while one line has three tracks, and one a single track. Also a double track freight cut off leads out for the West. Crews of four divisions run in and out of Galesburg

yard. All trains except merchandise and meat trains come into Galesburg, with the cars mixed. Time and expedite cars come in on the head or rear end of the trains. Galesburg yard has 72 classifications to switch against, and all trains leave the yard with cars in station order in the train.

We have 76 regular passenger trains daily, and when freight traffic is normal we average 130 freight trains per day, with an average train movement every seven minutes. When business is normal 32 engines a day are worked in the yard. We have handled 7,300 cars in 24 hours, and have maintained a record of 6,800 cars per day for 90 days.

Trains are blue flagged, and gone over by the car inspectors. Car markers make out car tags from the list, way bills are left by incoming conductors, and a card is put on each car showing the destination. A carbon copy of the list of the train is tacked on the head car for the hump foreman's information. Cars are pushed up on the hump, and the track number is put on the head end of the car with chalk. The number of the track for the next cut is put on the rear end of the last car of each draft for the information of the switch tenders. The divide switch tenders give the track signal to the lead switch tenders who line the switchers for the cars.

Both hump yards and the flat yard are equipped with air pipe lines supplied from one main air compressor operated by electric power with an automatic starter and shut off. The air pipe lines are provided with upraisers between the tracks so that the air pressure can be cut in on the train lines to locate leaks. If a broken train line is found the car is reported, and switched out of the train to the shop tracks. When the train is made ready with the way car on, it is ordered. Bill clerks check out the train from the car checker's list, then copy it, retain the original list in the office for file, and place the way bills and a carbon copy of the list of train in way car.

Hump engine foremen cut the cars off, and work from 10 to 14 hump riders, with one switch tender at the divide, one at the crossover, and one on each lead on the lower tracks. The rules for hump riders require that cars must be stopped at least two feet from cars standing on tracks they ride in on. This saves damage to cars and contents when carried out to the letter. The yard is provided with sufficient light 50 lb. skid shoes to catch cars that get away from the riders.

Time and expedite freight are handled in separate groups, and are allowed to be mixed with dead freight. Time and expedite bad order cars are given special handling to the repair yards, and are placed and pulled from time freight tracks in the repair yard to make the first connection out. Bad order dead freight loads are given preference movement to the repair yard, with foreign empties next, and home empty cars next. Bad order cars are moved from the bad order tracks in the train yards to the repair track district four times a day, and between 4 a. m. and 6 a. m., by the night crews. The dead freight tracks in the repair yard are pulled at noon and at night. Loads set out of out-going tracks in bad order are given time freight handling to and from the repair yard, and are marked time freight. A dead freight car which is 24 hours from time in until time out is charged as an old load, with 6 hours for time freight, and 12 hours for expedite freight.

All way bills are stamped with a time stamp. The yard is checked for old loads, for cars out of line and for foreign empties. The old load clerk verifies the yard check, and checks the bill boxes each morning for old loads, and the assistant yardmasters are given a list of old loads. Bill clerks check over the bill boxes when coming on duty to see that no way bills are out of line or in the wrong boxes. They also check all time, stock and expedite freight on a list for each direction, and see that they are on checks of trains brought to the office so not to lose the first connection out.

We make a 5 a. m., an 8 a. m., and a 4 p. m. check of cars on hand for all directions from an accurate check of bill boxes, and also check the engine and train crews on hand and ready. This check is necessary to keep the cars on hand moving, and when pounded constantly the cars on hand in yards will be kept down to the lowest possible number, and there will be no lost engine power.

TRAIN DESPATCHERS' ASSOCIATION

The twenty-seventh annual convention of the Train Despatchers' Association of America met at the Hotel Seminole, Jacksonville, Fla., on Tuesday, June 16, and was called to order by H. W. Purvis (S. A. L.), chairman of the entertainment committee. After the usual courtesies President J. P. Finan took the chair and appointed a credentials committee, which reported sixty-eight members present. Fourteen members have withdrawn during the past year and 55 applications for membership and reinstatement were approved. Later there were other applications, and in all 61 members were added. The report of the executive committee showed a total membership of 1,155. The total receipts during the year were $3,603, and total disbursements $3,814.

The principal business of the convention was the discussion of the report of the Train Rules Committee, the same that was discussed by the American Association of Railroad Superintendents last August, at Chicago, and printed in the superintendents' proceedings. This was noticed in the *Railway Age Gazette*, August 29. The Jacksonville discussion, which filled two days, was too detailed for reproduction in this place.

On Tuesday, the convention was addressed by W. L. Stanley, general claim agent of the Seaboard Air Line, on the subject, "Does the prosperity of the railroads interest me personally?" The address evoked great applause. On the same day W. H. Potter, superintendent of telegraph of the Southern Railway, addressed the convention on the subject of telephone train despatching. On Thursday the convention completed its discussion of the Train Rules Committee report and elected C. A. O'Connor (Boston & Albany), Springfield, Mass., president; T. W. Fitzgerald (Southern Pacific), Sparks, Nevada, vice-president, and O. L. Taylor (Atlantic Coast Line), Sanford, Fla., member of the executive committee for four years. J. F. Mackie was re-elected secretary-treasurer and editor for the term of two years. Minneapolis, Minn., was selected as the place of meeting for 1915, and June 15 the day. A proposed constitutional amendment providing for the raising of a fund of $1,000 to be used for the relief of disabled members was defeated.

Numerous entertainments were provided between sessions and for the ladies, and on Friday there was a special train over the Florida East Coast Railway to St. Augustine. The visitors from the north were agreeably surprised to find that the prevailing temperatures in Jacksonville and vicinity were no higher than they had experienced at their homes before starting for the convention.

FREE TRANSPORTATION ON THE EGYPTIAN STATE RAILWAYS — At the present time there is much talk of extending the pass privileges on the railways of Egypt. It is said that the government intends to grant free passes for railway travel to all members of the legislative assembly and that in addition, the provincial members are asking for passes for their wives and families. In the next place, the editors of the vernacular newspapers have revived an old agitation for free passes for themselves and half fare tickets for their sub-editors and reporters. At the present time Sheikhs and Ulemas (Mohammedan religions) are entitled to travel at half fare, as are also officers of the army of occupation (on some lines), military nursing sisters, while the Egyptian army travels at quarter fare. In addition the half fare privilege is granted to practically all recognized Christian clergy of all denominations and wives of high government officials travel free. The company's lines also give free passes to the press. In the aggregate, all these concessions must cost the combined railways of the country many thousands of dollars annually.

Pennsylvania Mikado and Pacific Type Locomotives*

The Design Follows the Lines Employed in Developing the Latest Atlantic Type; Many Parts Interchangeable

During the past few years there has arisen a need for a larger freight locomotive for use on the main line of the Pennsylvania Railroad between Altoona and Pittsburgh. The employment of such a locomotive is desirable in order to reduce double heading to a minimum and to avoid the necessity of breaking up trains which arrive at Altoona and Pittsburgh and sending them forward over the Pittsburgh division in sections. At the same time it was thought desirable to experiment with a heavy Pacific type locomotive for passenger service on this division. There has accordingly been designed and built a Mikado type locomotive which bears the railway company's classification L1s and a Pacific type designated as class K4s.

Pennsylvania Mikado Type Locomotive

It was necessary to keep the locomotives within certain limits and to make the revolving and reciprocating parts as light as possible consistent with the necessary strength because of restrictions in road clearance and because the weight per pair of driving wheels is limited to 65,000 lb. with a 5 per cent. margin for scale variations; there is also a limitation for dynamic augment due to counterbalance for reciprocating weights of 30 per cent. of the weight on drivers, at 70 miles an hour for passenger locomotives and at 294 revolutions per minute for freight locomotives. Interchangeability of parts between the two locomotives has been carried out as far as possible, as well as the use of many of the parts which are embodied in the class E6s Atlantic type locomotive.‡

BOILER

The boilers of the Pacific and Mikado locomotives are interchangeable, and an interesting feature is the flanging of the throat sheet in an integral piece with the lower half of the rear barrel sheet. This has permitted of lowering the boiler 1⅞ in. and at the same time allows sufficient clearance for the rear driving wheels. The boiler is of the Belpaire type and has 237 2¼ in. tubes and 40 5½ in. superheater flues, all of which are 19 ft. long The firebox is 126 in. long by 80 in. wide and is fitted with a combustion chamber; the grate area is 70 sq. ft. The inside diameter of the boiler at the forward end is 78½ in. with an inside diameter of 87 in. at the dome course. The dome is flanged in one piece. The design of smokestack employed is the result of much study and as will be seen from the engraving, an inside extension is used extending below the center line of the smoke box.

Latest Development of Pacific Type Locomotive on the Pennsylvania

FRAMES AND RUNNING GEAR

The frames are of cast steel, 6 in. wide, and reinforced to 8 in. over the driving boxes. Heat treated steel has been used wherever possible, following the same lines in this respect as in the E6s Atlantic type locomotive previously referred to; among the parts in which this material has been employed are the driving axles, crank pins and piston rods

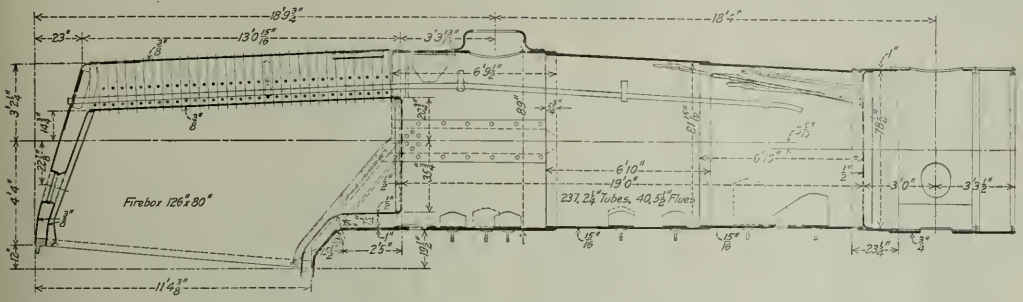
*A brief description of the Pennsylvania Mikado and Pacific type locomotives, classes L1s and K4s, was published in the *Daily Railway Age Gazette* for June 15, 1914, page 1411. Some of the data given in this article were approximations, which were all that could be obtained at that time and will be found to differ slightly from the present figures, which are correct.

‡For description of the Pennsylvania class E6s Atlantic type locomotive see *Railway Age Gazette*, February 20, 1914, page 356.

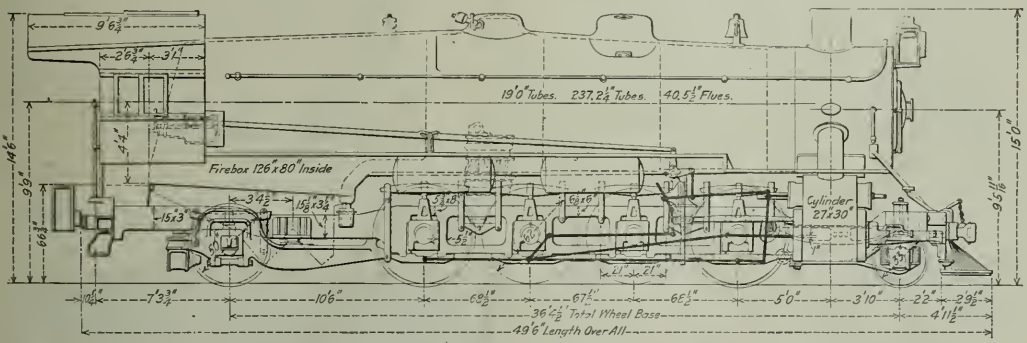
as well as the main and side rods.† In order to reduce the weight as much as possible and at the same time facilitate the heat treatment, the axles, crank pins, wrist pins and piston rods are bored through at the center.

The piston rods are of the extended type and are 4½ in. in diameter with a 2½ in. hole through the center except at the points where the rods are reinforced for the piston and crosshead fits. The driving axles have a 3 in. hole through the center and the journals are 11 in. by 15 in. The main rods are of I-section, 8¼ in. deep at the rear end and 7¾ in. at the forward end, the flanges tapering from 1⅜ to 1⅛ in. The depth of 5½ in. for the milled section of the rod is maintained throughout and the flanges are 3⅜ in. wide, while the web is 7/16 in. thick. The side rods of the Mikado are of I-section, 5 in. deep with a 2½ in. by ⅝ in. flange and a ⅜ in. web.

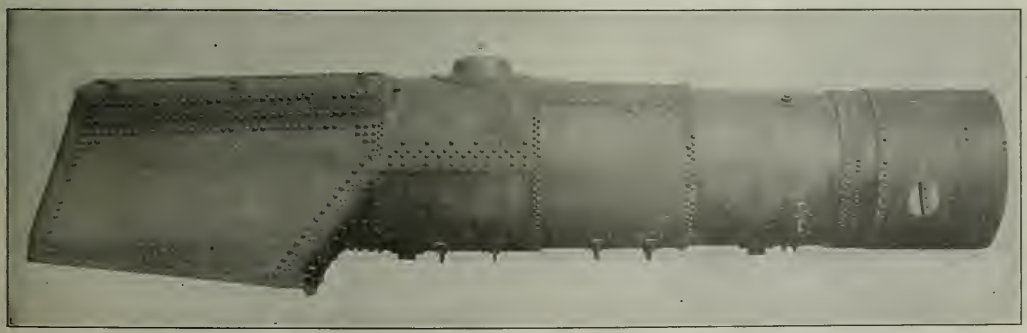
The arrangement of the valve gear is similar to that employed on the Atlantic type locomotive and the crosshead of the Pacific type is also very similar, but a two-bar arrangement of guides with an alligator crosshead is employed on the Mikado. The same design of trailer truck is employed on all three locomotives, the trailing spring gear being equalized with that of the two rear pairs of drivers on the Mikado and Pacific types. The trailing truck frame is a substantial steel casting, all in one piece, and constitutes the trailing equalizer as well as the truck frame.



The Boilers of the Pacific and Mikado are Interchangeable



Side Elevation of the Pennsylvania Mikado Type Locomotive



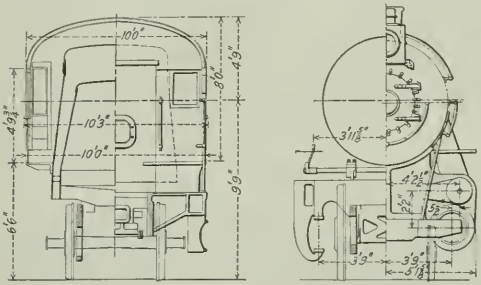
Boiler of the Pennsylvania Pacific and Mikado Type Locomotives

†The methods employed in connection with the crank pins and piston rods were described in the article on the Pennsylvania Atlantic type locomotive in the issue of February 20, 1914, page 357.

One of the illustrations shows the arrangement of the driver brake cylinders. It was found necessary to use two 16 in. cylinders and because of space limitations the arrangement shown was employed.

OTHER DETAILS

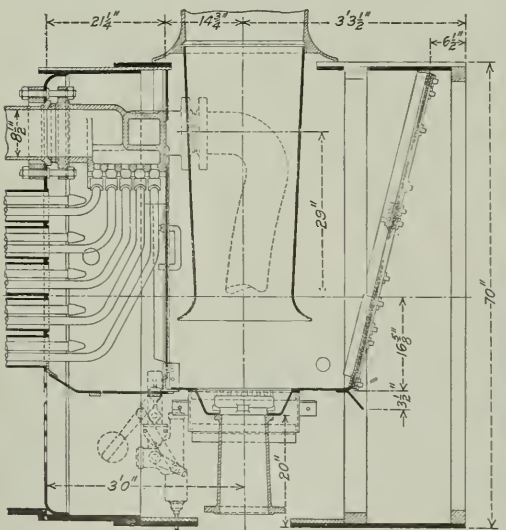
The locomotives are equipped with Schmidt superheaters and Security brick arches. Screw reverse gear is used and because of its not being necessary to provide space to move



End Elevations and Cross Sections of the Mikado Type

the reverse lever the cab has been considerably shortened. It is also believed that the shorter cab will give the engine crews a better opportunity to observe signals. The tender truck is of the same design as that used on the E6s Atlantic type locomotive. The tank is of the water bottom type with 36 in. wheels and 5½ in. by 10 in. journals. The water capacity is 7,000 gal. and the coal capacity 12½ tons.

These locomotives, as well as the latest design of Atlantic



Front End Arrangement

type, were designed in the office of the mechanical engineer of the Pennsylvania Railroad at Altoona and built in the Juniata shops. The E6s class Atlantic type locomotives are now hauling very heavy trains on most exacting schedules and the service results are amply justifying the design. It is expected that equally satisfactory results will be obtained from the new Mikado and Pacific types.

Tabular comparisons are given below between the Mikado type and the Pennsylvania consolidation type of the H9s class, as well as between the new Pacific type and the E6s Atlantic type:

CONSOLIDATION AND MIKADO TYPES

*Total equivalent heating surface = total evaporative heating surface + 1.5 times superheater surface.

Railway Construction in India.—The Darjeeling-Himalayan Railway is planning to construct a line connecting Kishungung with Siliguri. This extension will give the people of Bihar a short cut to Darjeeling and Kurseong, in the neighborhood of which lies one of the spots under consideration for the future summer residence of the Bihar government.

THE VALUATION OF RAILWAY PROPERTY AND THE DISTRIBUTION OF EARNINGS AND EXPENSES ACCORDING TO USE

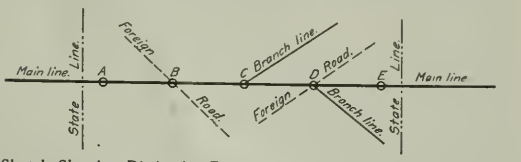
Because of the passenger rate case, and in accordance with the instructions of the Corporation Commission and the law department of the state of Oklahoma, the railroads of that state have endeavored to separate their properties and accounts according to the uses made of them, in this way also carrying out the suggestion made by Justice Hughes in the Minnesota rate case. After elaborate studies the roads have worked out a method by which the separation of property and revenues has been accomplished with a fair degree of accuracy. During the past year the various roads have prepared valuations and have made divisions of earnings and expenses based upon this method, which findings will be reviewed by the court this year. Many railway men have maintained that it is impossible to separate freight and passenger facilities and likewise to differentiate between state and interstate traffic and between "line" and "terminal" property. While the method outlined in Oklahoma is subject to revision in many details, it is an attempt to separate the property and accounts according to use, and in this respect it is a distinct mark of progress.

The plan provides for the allocation of property and accounts as between states; the separation of state property and accounts between terminal and line; the apportionment of both line and terminal property and accounts between freight and passenger; the separation of main line and branch line property and accounts, showing the data for each main and branch line separately, both as to line and terminal; and the apportionment of main and branch line freight and passenger accounts, both line and terminal, between intrastate and interstate.

The accompanying sketch shows the distinction which has been made between line and terminal facilities and those common to both. By line facilities are meant those which are used in the transportation of traffic from the place of receipt (one terminal) to the point of delivery (another terminal). Any facilities required in, or expenses incident to, the movement of traffic between these termini are line facilities and accounts. Terminal facilities and charges are those which are connected with, or occasioned by, securing, receiving, loading or otherwise preparing traffic for movement, and the unloading, delivery and other outlay incident to the disposition of the traffic after arriving at the destination terminal.

As an example, the facilities required in making up a passenger train at a terminal are line facilities because they are required for the movement of passengers throughout the entire route and would be necessary even if no passengers were moved from this terminal. Likewise, the facilities required at any station to let passengers on or off constitute a terminal expense because they serve the public at that station. The facilities required for the switching, distribution and collection of freight cars at any station are a terminal outlay occasioned by the existence of that station. The facilities at a junction with a foreign line are considered terminal facilities because such a station is the terminal for such freight as is received or delivered to the connecting road. On the other hand, the facilities required to handle traffic through a station which is a junction with a branch line of the same road are line facilities, since they would be required if there were no station at this point.

Thus, property classed under line would include main and passing tracks, tracks at division or train terminals used exclusively or almost exclusively in the making up and breaking up of trains, and in reclassifying and storing through cars and through trains, coach-cleaning tracks, tracks used for storing caboose cars and wrecking outfits, tracks to and from coal chutes, engine houses and turntables at points where no regular switching service is maintained, and a suitable proportion of such tracks at points where switching service is maintained, based on the relative use made thereof, bridges, trestles, culverts, signals, and other property outside of station grounds, etc. Property classified as terminal includes depots, house, storage, industry, team, transfer and scale tracks, as well as tracks used exclusively for classifying station and transfer cars, loading platforms, stockyards, elevators, coal and ore docks, etc.



Sketch Showing Distinction Between "Line" and Terminal Property and Accounts

A. Local station.
B. Junction with foreign road. Interchange point.
C. Junction with branch line.
D. Junction with both foreign road and branch line.
E. Divisional terminal. Local.

Facilities and expenses for train orders, crossing flagmen, passenger switching and interlockers are "Line." Otherwise all facilities and expenses at "A" station are "Terminal." All facilities and expenses at "B" station are "Terminal." All facilities and expenses required for or attaching to traffic *passing through* "C" station going to and coming from branch line points are "Line." All other, i. e., those which originate or terminate at this station, are "Terminal." All facilities and expenses required for or attaching to traffic *passing through* "D" station to or from branch line points are "Line." All others, including those incident to going to or from the connecting foreign road, are "Terminal." All facilities and expenses required for or attaching to traffic *passing through* "E" station are "Line." All others are "Terminal."

Before undertaking the valuation or the separation of accounts it was necessary for all tracks to be classified between (a) line tracks and facilities; (b) terminal tracks and facilities; (c) tracks and facilities used in common. Each of these three groups is further sub-divided between (1) exclusive freight tracks and facilities; (2) exclusive passenger tracks and facilities, and (3) tracks and facilities used in common in freight and passenger service. In making these classifications the primary use of the facilities governed and the exceptional or occasional use of other classes of service was ignored. In distributing the expenses all charges were distributed on the basis of the Interstate Commerce Commission system of accounts as far as possible, divided under the classifications referred to above.

Before apportioning the various classes of common expense it was necessary to secure a large amount of information, including the number of intrastate and interstate tickets sold and the pieces of baggage checked; the number of intrastate and interstate consignments of freight received and forwarded, including that interchanged with connecting lines; the number of cars handled and the method of handling by local or other trains; the number of passengers taken on or put off through and local trains, etc.

The scheme worked out for dividing expenses* was comprehensive and based not on theory but on a desire to let the facts develop the theory on which the accounting should be done.

DIVISION BETWEEN STATES

In the first place all expenses were allocated as between the states. Maintenance of way expenses are apportioned directly wherever possible, and in general, common expenses, such as superintendence, are apportioned on the basis of the assigned charges for all the maintenance of way accounts. Supervision, ballast, etc., across state line is apportioned on a mileage basis, and telegraph and telephone lines are apportioned on the basis of railroad and joint wire mileage in each state, while electric power transmission is apportioned on the basis of power transmission wire mileage in each state. Buildings, fixtures and grounds are all allocated direct, except that general office ex-

*The division between states and between line and terminal only are described here; the division between freight and passenger will be described in a later issue.

penses and general shops and all stores are on the basis of total maintenance of equipment. Maintaining joint tracks and yards are allocated direct where possible, and common expenses are apportioned on the basis of allocated labor charges to facilities involved.

The theory on which the allocation of maintenance of equipment expenses is based is shown by the instructions for steam locomotive repair costs. These costs are assigned to states on the basis of the mileage of the individual locomotives in the current month and the cost of the general repairs of locomotives is assigned to states on the basis of the mileage of the individual locomotives since the last general repairs. The costs of repairing damage caused by collision and derailment or similar accidents are charged to the state in which they occur. Renewals and depreciation are charged on exactly the same basis. Repairs, renewals and depreciation of passenger and freight cars, with the exception of Pullman cars, are on the same basis as locomotives, as is also electric equipment and work equipment. Shop machinery and tools, injuries to persons, stationery and printing, and other expenses are allocated in the same proportion as the total of locomotive and car repairs.

Traffic expenses are divided as between states only after the division has been made between freight and passenger expenses, and then apportioned on the basis of revenue net ton miles and revenue passenger miles.

Transportation expenses are all allocated direct wherever possible, and common expenses, such as superintendence, are divided on the basis of directly allocatable expenses. Despatching trains is allocated direct to state on the basis of the smallest available territorial operating unit. Overlapping units are subdivided on the basis of the total train mileage of such units in each state. Station employees and expenses, docks, yards, interlocking, crossing and joint tracks and facilities are allocated according to location, while such expenses as road enginemen, fuel for road locomotives, etc., are allocated direct where the run is within a state, and on the basis of locomotive mileage where the run is across state lines. Engine house expenses—road are apportioned on the basis of total road locomotive mileage by states. Train supplies and expenses are first divided as between freight and passenger, and then apportioned to states on the basis of the respective car mileage of each class in each state. Clearing wrecks, loss and damage to freight, property, and stock on right-of-way, and injuries to persons are in general divided on the basis of the states in which the wreck, loss or injury occurs. General expenses, except such as law, insurance and valuation expenses, and general administration of joint tracks, are divided proportionately to all expenses other than general expenses. The exceptions are assigned directly where this is possible, and valuation expenses which are common are apportioned on the basis of track mileage.

DIVISION BETWEEN LINE AND TERMINAL

All expenses are divided as between line and terminal expenses. The greater part of the maintenance of way expenses are, of course, easily directly assignable to line or terminal, tracks being grouped as (a) train tracks, consisting of main and passing tracks; (b) station tracks, consisting of all station service tracks not used for train or engine service; (c) yard tracks, consisting of classification tracks and storage tracks; (d) shop tracks, consisting of tracks to and about shops, also storehouse and repair tracks; and (e) engine house turntable, wye, fuel and water tracks. *A* and *C* are allocated direct to line and *B* direct to terminal. *D* is divided between line and terminal on the basis of repair charges assigned to line and terminal of locomotive passenger and freight car cost. *E* tracks are treated separately for each train terminal and apportioned on the basis of respective engines handled at such terminals.

Repairs, renewals and depreciation of locomotives and of cars are apportioned as between line and terminal after the division has been made between freight and passenger, and the freight in the ratio the time in line service and the time in switching service bears to the total time on road for road locomotives. For passenger locomotives, in the same proportion as determined for passenger cars, and for switching locomotives on the basis of the time employed in switching line and terminal cars respectively. "The amount of repairs to passenger train cars attributable to line or terminal service (except accident repairs) is wholly a matter of opinion which must be determined by experts who, because of their experience, are properly qualified to make such estimates. It is therefore recommended that the question be submitted by letter ballot by the chairman of the General Managers' Association to its members as to the proportions properly chargeable to line and terminal, the average of such expressed opinions to be used in the assignment under these two classes. The submission of the question should be accompanied by a full explanation of exactly what, under this formula, constitutes line and terminal service respectively."

Traffic expenses are all assigned to terminal.

Transportation expenses are assigned on an analysis of each account, road enginemen being typical. Apportionment of these expenses between line and terminal is made on the basis of the ratio that the time devoted by passenger locomotives and by freight locomotives respectively to station service bears to the total time of such locomotives on the road.

General expenses are apportioned as between line and terminal in the same way as general expenses are apportioned as between states.

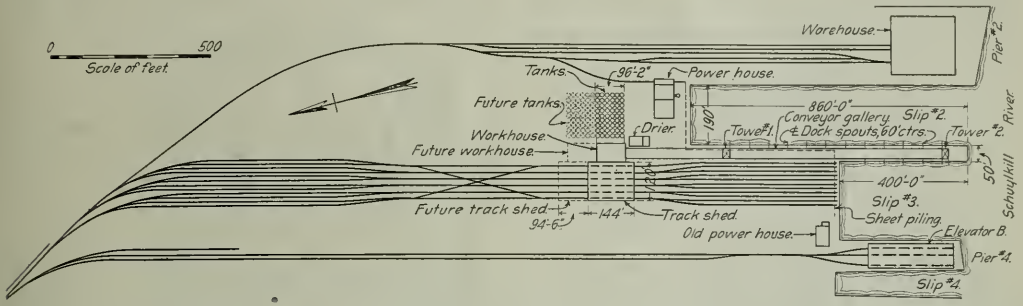
In a state such as Oklahoma, where the lines are practically all single track and where there are no large cities or important terminals, a very large proportion of the facilities are common to freight and passenger traffic. However, the method adopted which was worked out in much detail would apply also in more highly developed eastern states, with their separate freight and passenger tracks and with their large terminals devoted exclusively to the one class of traffic. While this separation of properties and accounts according to use has involved considerable additional work, this will be reduced materially by the decision to pro rate the valuations and accounts from year to year on the basis of the original or modified valuation, so that it will not be necessary to determine anew the exact use of the property each year.

Russian Railways and Foreign Material.—The ministry of ways of communication has approached the council of ministers on the subject of allowing the railway department to order reserve parts of rolling stock abroad, such parts to consist of locomotive wheels, wheel centers, axles and tires, in case these cannot be had in the national factories for one reason or another during the years 1914, 1915 and 1916, or if the terms offered by the national producers should prove to be unacceptable owing to high prices or absence of guarantee in respect to time of delivery. The necessity for granting this right to the railway department, says the memorandum of the ministry, has been obvious since May, 1913, owing to the difficulties in delivery, and also because of the trouble respecting tenders that obtained last year for reserve parts to be supplied in 1914. The railway department experienced particular difficulty at the time, which, in the opinion of the ministry will become greater still as the present year advances, when it will be necessary to order, besides the ordinary goods for current exploitation purposes in 1914, the parts required for new rolling stock, consisting of 98 locomotive wheels, 330 tender wheels and 4,556 pairs of freight car wheels, which will make a total costing about $700,000, while the total productivity of the Russian factories is already fully occupied, excepting some of the factories to which the department cannot give the orders because of their exorbitant prices. Finally, the measures taken by the manufacturers for the extension of their producing plant according to information received by the minister of ways of communication, have been delayed, and advantage cannot be taken of them before a year or two hence, and only then in the event of an increase in the productivity of the metallurgical works.

New Pennsylvania Elevator at Philadelphia

Export Shipping Plant with Storage Capacity of 1,000,000 Bu. and Loading Capacity of 60,000 Bu. Per Hour

A large amount of American and Canadian wheat for export is hauled by the Pennsylvania from connecting railroad lines reaching the western wheat belt and from Buffalo and Erie, where it is received from lake steamers, to Girard Point at the mouth of the Schuylkill river near Philadelphia. This grain is there loaded directly on ocean going vessels or stored temporarily in the new reinforced concrete elevator which was put in service this week, replacing an old frame elevator which had been in use about 30 years. The unloading and storage facilities are similar to those provided in the large fireproof elevators built in recent years at the ports at the head of the Great Lakes. In contrast, however, to those plants, which are usually arranged to load the boats directly from the workinghouse bins, the Girard Point layout provides a loading gallery extending from the workinghouse to the end of a long pier. This allows the loading of the ship to be completed without moving and also admits of better track facilities and more stable foundations for the building.

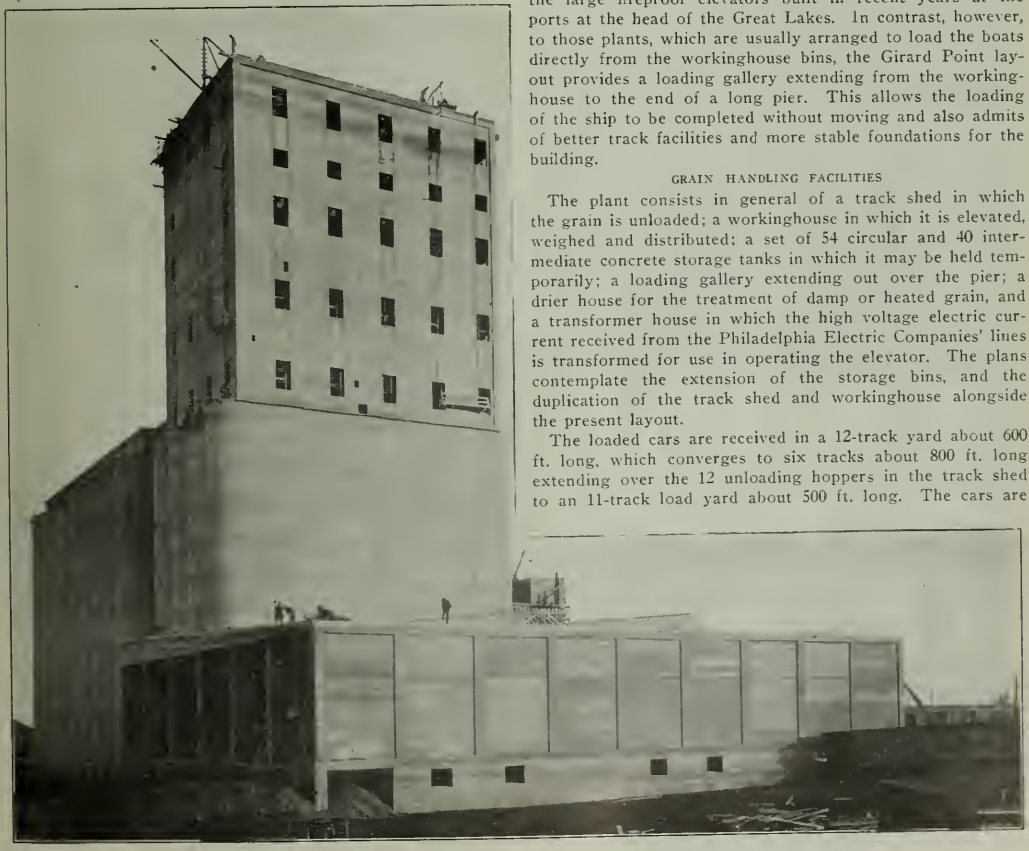


Layout of the New Pennsylvania Elevator Showing Track Arrangement, Piers and Slips

GRAIN HANDLING FACILITIES

The plant consists in general of a track shed in which the grain is unloaded; a workinghouse in which it is elevated, weighed and distributed; a set of 54 circular and 40 intermediate concrete storage tanks in which it may be held temporarily; a loading gallery extending out over the pier; a drier house for the treatment of damp or heated grain, and a transformer house in which the high voltage electric current received from the Philadelphia Electric Companies' lines is transformed for use in operating the elevator. The plans contemplate the extension of the storage bins, and the duplication of the track shed and workinghouse alongside the present layout.

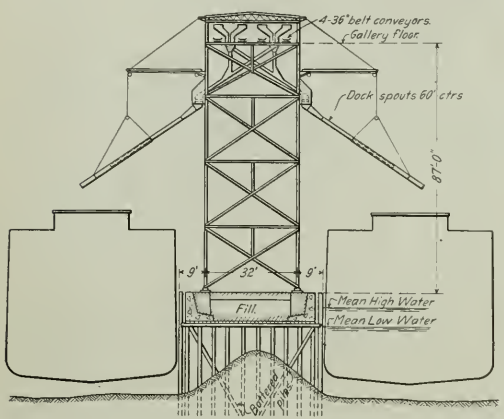
The loaded cars are received in a 12-track yard about 600 ft. long, which converges to six tracks about 800 ft. long extending over the 12 unloading hoppers in the track shed to an 11-track load yard about 500 ft. long. The cars are



General View of New Elevator Nearing Completion, Track Shed in the Foreground

pushed through to the load yard south of the track shed by a locomotive and are pulled back, as required for unloading, by a six-drum Webster car puller. After unloading, the cars are given a kick by the puller which starts them down the two per cent. grade to the main yard. A double set of cross-overs with double slip switches between the track shed and the yard allows the empties from any unloading track to be set in on any yard track.

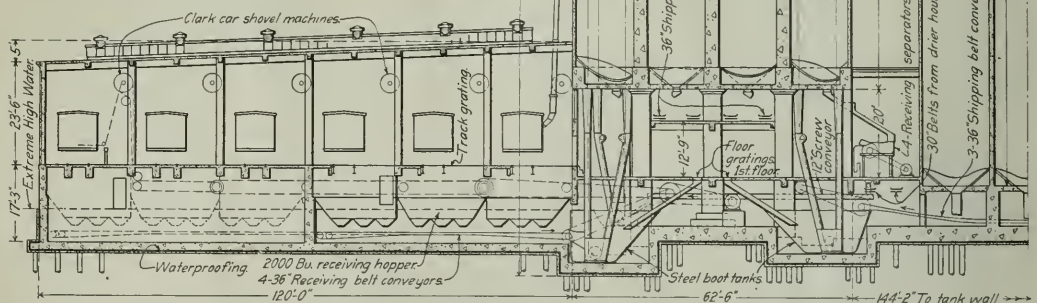
The track shed consists of a reinforced concrete slab roof 120 ft. by 144 ft. in size covering six unloading tracks spaced 20 ft. center to center, and supported at an elevation of 23 ft. 6 in. on the low side, by rows of concrete columns between



Cross Section of Loading Pier Showing Conveyor Gallery and Dock Spouts

the tracks. Each of the six tracks passes over two unloading hoppers in the track shed into which the grain is dumped by Clark car shovel machines. The track hoppers are arranged in four transverse rows of three each, served by four belt conveyors in the basement below the hoppers. The unloading facilities are designed to handle 250 cars in 10 hours.

The workinghouse is a concrete building 62 ft. 6 in. by 94 ft. 6 in. adjacent to the track shed. It is 202 ft. 6 in. high

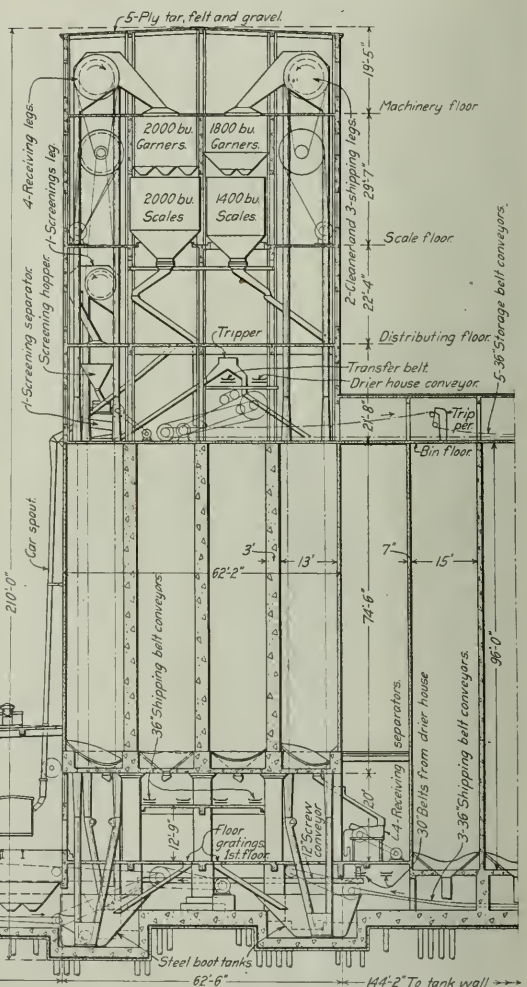


Cross Section Through Track Shed, Working House and One of the Storage Bins, Showing All Conveying Machinery

and contains a basement, first floor, working bins 74 ft. 6 in. high, and a four-story cupola. Each of the receiving conveyors dumps the grain into a steel boot tank, from which it is elevated by one of the four receiving legs to the top of the workinghouse at a maximum rate of 15,000 bu. per hour for each leg. All elevating legs are operated by rope drive from electric motors.

The receiving legs empty into 2,000 bu. concrete garners at the level of the top floor in the cupola, which deliver the grain to 2,000 bu. hoppers on 60-ton standard scales. After weighing, the grain may be distributed to the storage bins, to the drier house or the separators, to a car for reshipment, or to the workinghouse bins for loading on boats.

Five belt conveyors on the bin floor carry grain from the workinghouse out over the storage tanks. If the distributing spout under any particular scale hopper will not reach the conveyor serving the bin which it is desired to fill, a reversible transfer belt just below the distributing floor may be used to transfer the grain to the proper conveyor. Self-



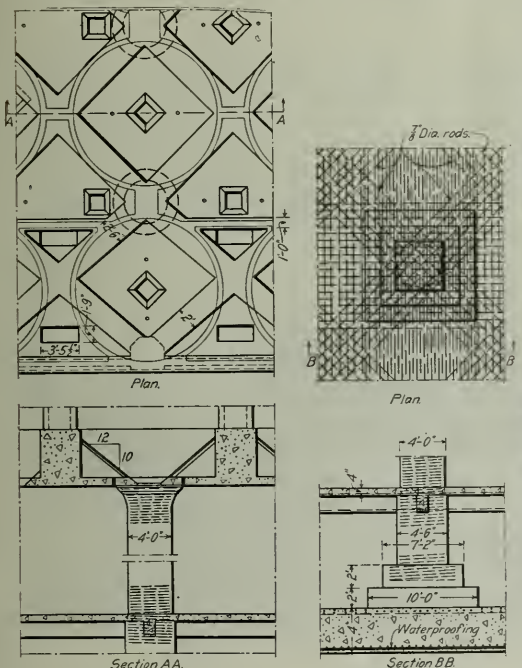
propelled trippers dump the grain from the conveyor belts into the desired tanks.

In shipping from storage, the tanks are emptied on one of three belt conveyors in the basement under the storage annex, which dump into the boots at the bottom of the three shipping legs. These shipping legs and the two cleaner legs, located on the same side of the workinghouse, empty into 1,800 bu. garners over 1,400 bu. scale hoppers. The distributing spouts under these hoppers may be set to direct

the grain to the drier house or the separators, directly to cars, or into the workinghouse tanks for loading on boats.

Wet or heated grain can be taken from any of the spouts on the distributing floor of the workinghouse on a conveyor belt to the driers or coolers located in a separate building alongside the workinghouse, which also contains the main switchboard. The drying and cooling installations are each designed to handle about 3,000 bu. per hour. The grain is returned from the drier house by a conveyor reaching the basement under the workinghouse.

Grain that requires cleaning is dumped into certain tanks in the workinghouse from which it can be drawn off to four separators on the first floor, which make five separations according to grade. Each machine will clean 5,000 bu. per hour. The cleaned grain is elevated again by the two cleaner legs, each having a capacity of 11,000 bu. per hour, and the screenings are transferred to the other side of the working-



Part Plans and Sections Showing Reinforced Concrete Construction in the Working House

house by a screw conveyor and elevated in a screening leg having a capacity of 3,000 bu. per hour.

Grain intended for reshipment by car is chuted directly from the distributing pipes to the car spout, which ends in a bifurcated Sandmeyer car loader serving the first track in the track shed. In loading boats, certain workinghouse tanks are filled, from which the grain can be drawn onto four belt conveyors on the first floor of the workinghouse which extend out over the pier. By filling all of the tanks which serve these belts it is possible to weigh 100,000 bu. of grain and ship it at any time without elevating again. The four shipping conveyors have a total capacity of 60,000 bu. per hour.

The conveyors are carried up from the first floor of the workinghouse on a steel frame gallery 300 ft. long to a level gallery on the pier 700 ft. long. This supporting structure is 32 ft. wide, the belts being 87 ft. above the pier deck. Self-propelled trippers are provided to dump the grain at any desired point and it is conveyed into the boat by telescoping spouts spaced 60 ft. center to center along both sides of the shipping gallery. The pier is 895 ft. long and 50 ft. wide with 1,260 ft. of docking space on the two sides, allowing three boats to be loaded at once. The largest vessel ever loaded at this point had a capacity of about 400,000 bu.

CONSTRUCTION OF BUILDINGS AND TANKS

The Girard Point plant was made both fireproof and permanent by the use of concrete throughout. The few necessary windows have metal sash and wire glass and the gutters and cornice are of galvanized iron. Great care was taken to secure a stable foundation as the load to be carried when the tanks are full is very great. The adopted design, involving a solid four-foot concrete slab on piles under the entire structure is conservative, but was considered justifiable under the circumstances. The surface soil at the site is black mud to a depth of about 50 ft., the underlying strata being

A Portion of the Storage Annex, Showing Yokes Carrying Circular Forms

sand and still lower gravel. More than 5,000 yellow pine piles 60 ft. to 70 ft. long were driven on 2 ft. 3 in. centers under the workinghouse and storage bins and on 5 ft. centers under the track shed. These piles were designed to carry 16½ tons each, although tests showed that a load of 54 tons would not cause a perceptible settlement.

The piles were cut off at the elevation of the bottom of the slab and earth was packed around their heads. After laying the lower 9 in. of the slabs over the pile heads, a six-ply felt and pitch waterproofing membrane was laid, on which the remainder of the 4 ft. slab was placed. This waterproofing membrane was carried up the outside of the walls well above high water level and was protected by a single course brick wall laid in cement. The slab under the workinghouse was reinforced by ⅞ in. bars laid parallel to both edges and also diagonally, crossing under the column footings.

The intermediate columns supporting the bins and upper floors of the workinghouse are 4 ft. in diameter with spiral reinforcement. The diagonal girder system of supporting the working bins, which was developed by James Stewart &

Company in 1905, and has been adopted for several of the new elevators, was used. This arrangement of girders has the advantages over the more common rectangular construction that the unsupported length of girder is decreased, thus reducing the section; the walls of the intermediate bins can be supported continuously and the interspace can be more fully utilized for grain storage and elevator legs. The standard beams are 2 ft. 6 in. wide by 5 ft. deep. The working bins are arranged in four rows of six each, the internal diameter of each tank being 13 ft. and the thickness of walls for the inside tanks 6 in. All of the interspaces are used either for storage or elevator legs, the space being divided in some cases by a wall so that one interspace may carry a leg and also accommodate some grain. As one of the circular tanks is occupied by a freight elevator, spiral stairway and ticket elevator, 23 circular bins with a capacity of 7,400 bu. each are available for storage. Five interspaces have a capacity of 5,400 bu. each, and ten, 4,400 bu., making a total storage capacity in the workinghouse of 241,200 bu.

dumped from this conveyor into separate stock piles and cement was stored in a shed 28 ft. by 100 ft. Two mixer plants equipped with two ¾ yd. Smith mixers were installed between these stock piles and the building. A 140 ft. distributing tower at one of the plants was used to place the storage tanks and a 230 ft. tower served the workinghouse bins and cupola. The concrete had to be hauled about 100 ft. in buggies to the base of this tower.

The jacking method of handling forms was used throughout except for the drier house and the track shed. Steel yokes, patented by R. H. Folwell and W. R. Sinks, of James Stewart & Company, were raised by hollow screw jacks on five 1 in. rods set vertically in the tank walls in 15 ft. sections and made continuous by sleeves at the joints between the sections. These yokes carry 4 ft. sections of forms with a working platform over the top. This working platform serves as a form for the floor over the tanks when the full height is reached. All tank walls were built continuously to eliminate joints in the concrete. By the use of the special

Contractor's Material Unloading Plant, Belt Conveyor to Storage Piles and One of the Distributing Towers

The storage tanks are 15 ft. in inside diameter and 96 ft. high with 7 in. walls. They are supported on rectangular concrete piers resting on the continuous slab. The walls are reinforced with steel hoops and vertical rods. The total capacity of these storage tanks, including interspaces, is as follows:

27 circular tanks at 12,900 bu.	348,300 bu.
27 circular tanks at 13,200 bu.	356,400 bu.
24 interspaces at 3,400 bu.	81,600 bu.
16 interspaces at 3,200 bu.	51,200 bu.
Total	837,500 bu.

The tanks are covered by a concrete slab forming the floor of the cupola in which the conveyors from the workinghouse are located. The roof is a 5½ in. concrete slab covered by a four-ply tar and felt coating.

The contractor shipped in the sand and gravel used for concrete in barges, which were unloaded in the slip opposite the site by a clam shell bucket, the material being loaded on a belt conveyor carried on a temporary frame trestle reaching nearly to the new building. The sand and stone were

form jacks it was possible to raise the forms as soon as desired, in contrast to the system in which each course of concrete is allowed to set to serve as a bearing for jacking up the forms. In some cases concrete was uncovered in 12 hours after pouring. The 54 storage tanks were poured in 14 working days of two ten-hour shifts each; the working bins in seven days and the cupola in 20 days. The storage tanks required 51 cu. yd. of concrete per vertical foot.

This elevator was designed and built by James Stewart & Company, Chicago, with J. C. Johnson, superintendent, under the direction of the engineering department of the Pennsylvania. A. C. Shand, chief engineer; E. B. Temple, assistant chief engineer; W. H. Cookman, architect, and J. F. Cullen, assistant engineer. The actual construction work above the pile foundations was started in February, 1913.

Railways in German Africa.—The budget commission of the Reichstag has approved the vote of $7,750,000 for the Tabora-Ruanda Railway in German East Africa.

"SAFETY-FIRST" IN TRAIN MOVEMENT*

By H. W. Forman

One of our conductors wrote me as follows: "This thing of trusting to Providence on a railroad will not work. The fact that men exercise poor judgment, or none at all, is because they do not think, in advance, of their troubles. Good judgment is not always born with one; generally it is the result of experience, careful observation, investigation, thought and discussion with others." Quite often I have a caller, who, after reciting a case of neglect or risk, of course on the part of some other employee, remarks, "*Something* must be done." When I ask if he reported the facts to the proper officer, or talked with and corrected the erring one at the time, I am usually answered in the negative. Men seem to think that officers can always be at the place where rules are violated, and at that particular moment. Employees are not helping out, as they should, by keeping us posted concerning irregularities needing attention, particularly such as come to their notice during the absence of an officer. It is a fact that rules are better respected when an officer is present, and this often misleads him. It is equally true that if men would report violations of certain important rules the service could be greatly improved. In so reporting, employees are doing no more than their plain duty. To enable officers to positively identify the offending parties, reports must be made promptly, giving date, location, names, trains, engines, etc.

The words "Safety First" are far more important than may be at once realized. . . . As applied to rules, they closely relate to the ordinary risks and chances some men are taking almost daily, such as failing to respect fixed signals, fusees and torpedoes; running too fast through yards; approaching obscured stations and certain water tanks at unsafe speed, more especially during fog; indulging in the unnecessary and foolhardy practice of following a train too closely; rounding obscured curves, or approaching stations too rapidly, when an order is held giving notice that a train will run ahead; exceeding the limit of speed as prescribed by time-table; failing to flag promptly and efficiently; and disregarding the clearance prescribed by the rules. The time-clearance rule is of vital importance since watches never have and probably never will keep absolutely correct time. . . .

Do not blame me for dim, poorly written, improperly worded orders if not sent to me by conductors after using, as required by Rule 387. When you decline to act on such imperfect orders, operators will discontinue offering them to you. I cannot prevent operators from giving you a signal to come to the office on the main track, when you should go on the siding to meet a train at his station, unless you report such incidents and give me an opportunity to find out why these unsafe and unauthorized practices are being indulged in.

I have seen trains running after sunset, or in dense fog, without having up their night signals, both front and rear. Certainly you know that this is unsafe, and that you should not neglect this important requirement. Put them up too early, rather than too late.

We try to keep fixed signal lights burning brightly. When found smoking, or otherwise in bad shape, or not burning at all, and you are standing nearby and can, without much inconvenience, adjust the light, or call the attention of some employee to its condition, you should do so. You should report the absence of lights, or dim lights, more especially those noticed in that condition oftener than once.

Rule 93.—Are enginemen of third class and extra trains so approaching and moving within yard or station-limit signs that they can, if necessary, stop within a few car lengths—within the distance that is seen to be clear?

Electric Headlights.—When you have stopped your train at a meeting point, the electric headlight, on both passenger and freight trains, must be reduced until it is not more brilliant than an oil headlight. This must be done without regard to whether it be a freight or passenger train you are to meet. Should you take the siding and the opposing train is seen approaching, at once reduce your headlight; do not wait until you reach the end of siding and stop before doing so. Should boiler pressure increase after having stopped, the dynamo will speed up and cause the light to again burn brightly. It may be necessary to cut it back a second time. I recall one case of an unnecessary delay of seventeen minutes to a passenger train meeting a freight. The passenger electric headlight so blinded the freight engineman that he could not definitely locate the switch where he was required to take siding, and he had to approach it at a snail's pace. Another case: Nos. 2 and 94 were ordered to meet No. 5 at Fosterville, and No. 2 to back in behind No. 5 to permit No. 94 to pass. No. 5 on siding, headlight burning brightly. No. 94 was delayed because the engineman was unable to locate No. 2. Their rear might have been just beyond No. 5's engine, although they actually were on the siding. Should the engineman of No. 94 have assumed that No. 2 was out of the way, and not greatly reduced speed, he would have been considered an unsafe man. In this circumstance, failing to turn down a headlight delayed three passenger trains. It is impossible to see markers, flagmen or persons who may be on the track beyond so brilliant a light.

Torpedoes and Fusees.—It is impracticable to prescribe the exact number of torpedoes and fusees that should be kept on hand; much depends upon what experience in the past has demonstrated that you may require. Generally speaking, more are ordered than are needed, and this results in loss, as they soon become unserviceable. Local freights need more than other freights. Branch crews do not require as many as main line crews. Passenger crews do not need green fusees. Engine boxes are supplied with six torpedoes and four red fusees, to be used when necessary to send a man ahead, or to enable a red fusee to be thrown off when the engineman discovers that he must soon stop on account of engine trouble, when the engineman should take the initiative. Keep four torpedoes attached to all lanterns, not excepting the red lanterns kept on engines. Many fusees and torpedoes which have been on hand for some time are found to be in bad condition. Place waste about them, and they will not so soon be rendered unfit for service. Passenger signal-cases and torpedo and fusee boxes on engines must be checked up at least twice a year. Do not order or keep on hand more torpedoes and fusees than you actually need. They will deteriorate, and no one has yet discovered a way to prevent. Do not place wet flags with fusees or allow them to become damp from other causes. If you have never lighted a fusee do so at once. Do not wait until an emergency arises, and then discover that you do not know how. If the cap is missing try lighting by placing end against fire box door or scraping on rail. Hold the end to be lighted away from you. Know that the fusee is burning well before throwing it on the ground. Place torpedoes against the angle bar or rail splices; then they will not be knocked off when a wheel strikes them. It is of course better practice to place torpedoes on the engineman's rail and fusees on his side of the track, but they must be respected without regard to this, except on double track an engineman should not be governed by a fusee seen on the engineman's side of the opposing track.

Report all enginemen who do not at once get their trains under proper control when a caution fusee is seen, or caution torpedoes are exploded by them. When an engineman observes a burning fusee, he at least knows that a train may have passed that point less than ten minutes before, and it is his duty to observe Rule 11. When he explodes torpedoes, he is not permitted to assume anything beyond what is prescribed by Rule 15.

Rule 99.—Were we to meet in convention and discuss this one matter for a week I doubt if every condition could be anticipated and provided for any better than in the rule itself.

*Extracts from a lecture by the Train-Rule Examiner of the Nashville, Chattanooga & St. Louis, printed for circulation among the road's employees.

Broadly speaking, it has been my experience that flagmen too often look upon the wrong side of the proposition; instead of going back when there is doubt or a reasonable possibility of their trains being struck, they hesitate too long, hoping that they will soon start. In many cases enginemen do not promptly blow back flagmen when they alone know that their train must soon stop, or be delayed. They do not always signal flagmen to return to their trains, although they have every reason to believe that one has gone back.

Flagmen have been found on obscured curves so near their trains that emergency application was necessary to avoid a collision. Fusees have been displayed in like manner. Flagmen must continue back until they reach straight track, or until they reach a point where they can be plainly seen for a reasonable distance by an approaching train.

If every man, who may hereafter be required to protect a train by flag, is as conscientious and energetic in the performance of this duty as John Cooper, flagman on Nos. 48 and 49 between Dalton and Chattanooga, there will be no more rear collisions that can be charged to inefficient flagging.

Investigation has often shown that the flagman was riding in the smoker, instead of the last car in train, and had to travel 450 feet to reach the rear of train. Ride in the rear car whenever possible, instead of from four to seven cars from the rear.

Perhaps there are no more efficient flagmen anywhere than those to be found on the Georgia Railroad. When one of their passenger trains stops the flagman hurries back to rear and secures his flagging outfit. If delayed a minute or more, and there is not a clear view for a safe distance to rear, he goes back, running rapidly. When ready to start, engineman calls in flagman, and waits until he knows he has returned to the train before starting.

On the Missouri Pacific passenger trains the flagman gives one air signal to advise that he has returned to his train. Conductor and engineman then look back, if not already looking, and when conductor sees his flagman he, and not the flagman, gives the proceed signal.

A constant lookout must be maintained in the direction in which a train or engine is moving; this also refers to switch engine movements. Firemen must constantly look ahead, except when firing. There is no reason why front brakeman cannot look ahead on the fireman's side practically at all times. It is highly important that a constant lookout be kept on both sides of the engine when a train is given a caution block signal, or holds an order that an inferior train may run ahead of it.

No excuse should be offered for failure to observe and call fixed signals before reaching them, not even the excuse that it was necessary to at that time shovel in coal.

While rules do not so instruct, men on the caboose should call fixed signals to each other as they come into view.

Conductors.—Freight conductors should ride in cabooses except when necessary to go forward to get orders, or for other reasons. Under no circumstances may conductor ride elsewhere than in caboose unless it is positively known that an experienced and dependable brakeman, and one who is employed on the train, is on the rear, and that he is awake and in condition to protect the train in case of need. It is better practice to have two men on the rear. While running, keep a lookout ahead.

Do you not know that it is unsafe to permit any freight train to pass a station without stopping, unless "Proceed" signal is given from rear? Conductors, are you seeing to it that this signal is given? Enginemen, are you looking back or having some one do so, and invariably getting it? If not received, what action do you take? Do you appreciate the necessity of receiving a proper start signal after having stopped at a station?

Conductors, brakemen and firemen, should you be on engine and have reason to believe that your engineman is approaching a switch, where you must take siding for an opposing train, at a speed that creates doubt as to whether or not he will be able to stop in time, do you take the necessary action at that moment to insure against his not passing such switch?

When you find a switch unlocked do you lock it and report the fact?

When directed to display signals, are you seeing that they are put up before you give the start signal? When given Form 28, are you personally delivering a copy to your engineman, as heretofore instructed?

Are you *conductor* in the fullest sense of the word? For instance, do you assume full responsibility for the proper government and protection of your train at all times and under all circumstances? When an employee on your train neglects his duty or violates a rule, do you appreciate that you owe it to the company, as well as the public, to yourself then and there remedy the matter, or if unable to do so, promptly report such employee to the proper officer?

THE BEST RAILROAD SERVANT*

A railroad is first of all a public servant. It follows that the success of a railroad as a business enterprise depends, in very large measure, not only upon the efficiency of the transportation it affords, but upon the personal treatment which those doing business with the railroad receive at the hands of the officers and employees. Therefore, in addition to doing everything in his power to promote the physical efficiency of our service, each officer and employee, whatever may be his rank or duty, must at all times consider the moral efficiency, and this means first of all that he should treat all patrons of the company and others with whom he may come into contact with politeness and courtesy. This is a primary rule of management of the Southern Railway Company, but it is no more than each officer or employee himself expects of every one from whom he buys. This rule should be observed regardless of the amount of business that the individual may give to the company, not only because that is the part of a gentleman, but from self interest, for the occasional traveler or the small shipper of today may be the constant traveler or the large shipper of tomorrow. A nursed grudge growing out of a surly answer has been responsible for many of the troubles of the railroads. Let us then all try to please the public.

The station agent should remember that at his station he is the Southern Railway Company and that public opinion regarding the company in his community is very largely his responsibility. In addition to maintaining the highest efficiency at his station, he should see to it that he and his subordinates maintain pleasant and agreeable manners in meeting the public and that all questions, even unreasonable questions, are answered with politeness and courtesy.

It is equally important that trainmen shall observe the rule of courtesy and politeness, giving full, responsive and intelligent information to those passengers who solicit it about anything that may happen on the road. The operation of a railroad is interesting to every intelligent man, and the more information such a man has about actual conditions the more he will understand the difficulties encountered in operation and so contribute to sound public opinion.

I am proud to believe that the general average of courtesy and politeness in the Southern Railway organization will compare most favorably with that of any railroad in the United States. Good manners are traditional in the South and our men are southern men. This is attested by many letters which are received by the management commending individual employees for conspicuous acts of courtesy and painstaking efforts to serve our patrons.

Occasionally, however, letters are received complaining of instances of discourtesy. These may be entirely eliminated if each officer and employee will adopt as his rule of conduct the declaration by the late President Finley that "He serves the railroad best who serves the public best."

*A circular on politeness and courtesy, issued June 23, by Fairfax Harrison, president of the Southern Railway, addressed to "all officers and employees" of the company.

TRANSPORTATION AND CAR ACCOUNTING OFFICERS

The summer meeting of the Association of Transportation and Car Accounting Officers was held at the Hotel Chalfonte, Atlantic City, N. J., June 18 and 19, with 116 members in attendance.

The meeting was called to order at 10:30 a. m., by F. Price, president, following which the association listened to an address by Ivy L. Lee of the Pennsylvania Railroad. Mr. Lee referred to the present political unrest prevailing not only in the United States, but all over the world, due to the demand by all classes of labor for a more general distribution of wealth, and dwelt for a time upon the difficulty of so adjusting the various situations as to preserve equity in the distribution of wages for service performed. He referred to the unfair and confiscatory legislation which is being continually directed at the railroads by the various legislatures, tending to increase the cost of operation and decrease efficiency. The general public must be convinced of the honesty and sincerity of railroads before much relief can be expected, and every railroad man should be a missioner to retrieve the good name of the profession before the public.

The association did not approve the recommendation of the Committee on Car Service that per diem rule 5 be amended so as to eliminate the five days' limitation for per diem switching reclaims at present prescribed by this rule; and after the addition of the clause limiting the reclaim to five days, the recommendation of the committee was adopted for submission to the American Railway Association. This recommendation provides for having the reclaim determined by the roads directly interested for each local switching territory; and also, would permit reclaims in connection with intermediate switching movements of cars, which is at present prohibited by Rule 5.

The association adopted for submission to the American Railway Association proposed amendment to per diem rule 13, to provide that per diem reclaims under Rule 5, or on account of special conditions, shall be presented within one year, the same as reclaims presented under rules 14 and 15. A proposed amendment to per diem rule 14 was also adopted for submission to the American Railway Association. This provides that where a road fails to take promptly from a connection cars on which it has laid no embargo, the responsibility of the receiving line for per diem shall, subject to local agreement, continue over midnight when the hour of resumption of receipt of cars does not permit of delivery by midnight of cars held. The proposed rule also provides that the holding road shall, in such manner as may be agreed upon locally, notify the delinquent line each day of the cars which it is holding.

The committee is of the opinion that a regulated pool of car equipment would offer substantial relief in the handling of car equipment as between railroads, but recognizes certain obstacles which will have to be overcome before a pool can be made workable, viz.:

(1) The manifest necessity that equipment be controlled by neutral parties, where now the responsibility for such control rests with the executive of each owning road.

(2) A large proportion of the equipment has been placed in service under car trust obligations that should be adequately conserved in any transfer of control.

(3) The variation in age, design, condition, capacity and dimensions of each class of equipment.

(4) Special equipment necessitated by variety of traffic peculiar to various sections of the country.

(5) The necessity for each carrier to provide its quota of equipment.

The committee suggested the following possible features of a pool as points for discussion:

(1) Carriers to form a holding company empowered to purchase or lease equipment.

(2) Ownership or car trust obligation to be indicated by plates attached to car.

(3) Pool to be started with so-called legal tender box cars.

(4) Special equipment to be handled strictly in accordance with Car Service Rules.

(5) A per diem charge to be determined upon which shall defray the recognized costs of car ownership, plus an amount that will cover all overhead and general expenses incident to pool operation.

(6) Operation of the pool to be divided into zones, under local management, the general manager reporting to the executive committee of the holding company.

(7) Pool storage and repair yards to be located at convenient points.

(8) Surplus and bad order cars to be delivered to nearest storage yard, per diem ceasing upon such delivery. All cars leaving storage yard to be in first class, serviceable condition.

(9) All repair and maintenance chargeable to owners to be assumed by holding company. Repairs due to unfair usage to be charged as at present.

(10) Movement of cars empty from storage yards to be paid for at tariff rates by the holding company.

These were thoroughly discussed and the subject returned to the committee for further consideration.

The list of accepted assignments of reporting marks for cars of private ownership, presented by the Committee on Office Methods and Accounting, was adopted for submission to the American Railway Association. Approximately 365 owners of private cars have accepted assignments.

The committee is also engaged in assigning reporting marks to cars of railroad ownership, with a view to preventing duplicate marks. Assignments of marks have been made to every standard gage railroad in the United States, Canada and Mexico, and, in due time, it is expected that all cars will be stenciled with the assigned reporting marks. The marks are limited to three letters, except in certain instances, where the short "&" is used to enable car owners to use reporting marks which correspond to the corporate initials of the owner. Up to date 350 railroads have accepted the marks assigned, and will apply them to their cars as they pass through shops.

The Master Car Builders' Association (at the request of the Transportation Association) having designated a location on each car for the application of reporting marks and car numbers, viz., the lower left hand corner of each car, it is believed that the assignment by the committee of separate and distinct reporting marks for cars of each ownership in operation on American railways will prove of inestimable value in preventing errors and confusion.

The association approved the action of the committee in recommending to the American Railway Association the elimination of the footnote reference to per diem rule 1. It is now understood that reporting roads shall have six months from the last day of the month in which the per diem is earned to report the same to car owner, failing in which the per diem rate shall be increased five cents per car per day.

The association adopted for submission to the American Railway Association the form recommended by the committee for use by the holding road in reporting cars held under per diem rule 14. The amended form of "summary of per diem reports," presented by the committee, was adopted for submission to the American Railway Association with a slight amendment. It was also decided to recommend to the American Railway Association that per diem rule 11 be amended to provide that the use of A. R. A. prescribed form "G" shall be mandatory in reporting per diem to car owner.

The Committee on Conducting Freight Transportation reported that several roads which have taken advantage of the recommendations of the committee with reference to methods for reducing delays to cars in yards, have obtained very gratifying results; one road reporting a net saving in per diem alone of $2,494 in two weeks, in a single yard, and an increase in the average miles per car per day for the division of 48.1 per cent. over the same month of the previous year.

The Committee on Conducting Passenger Transportation re-

ported a proposed code of rules to govern the interchange of passenger cars, which was referred to letter ballot.

The Committee on Joint Interchange and Inspection Bureaus reported that it is ready to furnish assistance to any railroad in making surveys of junction points with a view to the establishment of joint interchange and inspection bureaus. It also reported that to date joint interchange and inspection bureaus have been established at Chicago (stock yards district), Denver, Des Moines, Dallas, Peoria, Pueblo, also at Shreveport

The election of officers for the ensuing year resulted as follows: President, J. M. O'Day (Illinois Central); first vice-president, J. T. King (Atlantic Coast Line); second vice-president, F. E. Higbie (Central of New Jersey); secretary, G. P. Conard, 75 Church street, New York City; treasurer, F. M. Luce.

It was decided to hold the next meeting at Richmond, Va., December 8 and 9, 1914.

THE RAILWAY CLAIM AGENT*

By W. B. Spaulding

Claims Attorney, St. Louis & San Francisco

The Railway Claim Agents' Association has passed through a quarter of a century of life and experience. Beginning with a membership of 27, representing nine western and southwestern railroads, in a few years it expanded into a membership of 865, representing 107 of the railway systems of United States and Canada. This body of men is unsurpassed in energy, ability or any other of the virile qualities of manhood by any group of men anywhere. The importance to the vast systems of transportation to which you are attached of efficient and intelligent service in the positions you occupy makes this so necessarily.

In the past 25 years a great change has come about in the manner and method of carrying on the railroad business, and no body of railroad men better represent this transition than the claim agents. Under the old view the railroad business was regarded as a private business in the same sense that any other business was private and its internal affairs closed to inquiry by any but the owners and managers. Under the new view the concern of the public is admitted and full information freely furnished.

In former years the claim agent strove to make settlements as cheaply as possible; in recent years his effort has been to make settlements that would stand the test of fairness; fairness to the claimant—fairness to his company. His insistence has been for the "square deal." Having no arbitrary power by which his wishes might be enforced, as was possessed to a greater or less degree by other officers in respect to the exercise of the functions of their office, being under the necessity of winning the consent of claimants to his proposals that he might perform the duties of his position, the claim agent made greater speed along the road of progress from the old to the new view than any other railroad officer, because he sooner learned (if he was capable of learning anything) that his most valuable asset—his most powerful ally—was a reputation for the consideration of the rights of others and a willingness to be just as he had the light to see justice.

The genuinely successful claim agent, the man who is recognized as of real value to his company, is ever ready to declare the facts in this possession; to seek for and give just consideration to the claimant's side of the story and be straightforward with those with whom he deals. It is true there may have been from time to time claim men who pursued the opposite course and by doing so effected unconscionably low settlements for a time, boasted of their achievements and thought themselves entitled to the praise of the managing officers. There may be some such claim men still, but I think them very few in number. If praise was ever given under such circumstances, it was not sincere and it is only praise that is sincere—approbation that is based on worthy acts—that is of ultimate benefit to any man.

It must be remembered that the men in the chief executive positions of our big railroads have attained those positions because they were themselves big men, both morally and intellectually. The world does not afford examples of higher types of character than can be found at the head of the great transportation systems, and, naturally, such men endeavor to select, as their aids in the immediate management of the property, men of like character. Unfair settlements of claims are repugnant to men of this type and the man responsible for such settlements cannot retain their respect. Therefore, in my judgment, the claim agent who is satisfactory to his company and who is of real value to it is the man who is always willing to accord justice to those with whom he deals and who can secure just treatment for his company from them. The claim agent who once establishes a reputation for the former will in the majority of cases find little difficulty in obtaining the latter. As for the minority of cases he should have the ability and energy to fight valiantly for the right like a good soldier.

An incident came to my knowledge a few weeks ago that illustrates the value to a railroad of having its claim agents possess reputations for honest dealing. A man was killed in a train accident; his widow resided in a distant city; at an appropriate time the claim agent called upon her. The first thing she said to him was to ask what he thought of the case. He replied that in his judgment his company was legally responsible for the death of her husband, but if they could agree on reasonable terms for settlement they could both keep out of court. She said that was what she wanted. A proposition was made. She took overnight to consult a woman friend in whose business judgment and acumen she placed great reliance and to consider the matter for herself. She went to the office next day and accepted the proposition. After the money was paid (a moderate sum) she handed the claim agent a letter she had received from the coroner who held the inquest, telling her, in confidence he said, that she had a good case; that claim agents and lawyers would call upon her; that he wanted to see that the company did her justice; that he wrote her, though a stranger to him, because he knew the way they did business. She also said attorneys had solicited her case by letter and in person; that one of them told her she would have to have a lawyer if she got more than funeral expenses out of it: that the claim agent would not pay her hardly anything, to which she said she answered, "Why the claim agent has already told me the company is responsible. Don't you think he will do as much for me as he will for you?"

It is obvious this lady had at some time heard favorable reports of some claim agent and was inclined to believe all of them were governed by the same standard of business principles. What if the claim agent had denied the responsibility of his company or made an evasive answer to her direct question? Would he have gotten this settlement? Would she have trusted herself to deal with him? I do not believe so, because she told him after the settlement he had dealt with her exactly as she had thought he would do.

Many years ago the president of a railroad, on learning I was to take the position of claim agent on his railroad, said to me—The only advice I have to give you is: "Be firm and keep your promises. If you make a bad promise, keep it." You can see in that remark that this president recognized that a claim agent was a potent molder of public opinion toward the railroad with which he was connected and his advice was based on what he believed was to the best interest of the railroad company, because it was in harmony with honor. I have never known an executive officer of any railroad who

*President's address at the twenty-fifth annual convention of the Association of Railway Claim Agents, St. Paul, Minn., on May 20.

expected or desired his claim department to do more than to prevent the company being imposed upon in claim settlements.

Claim agents, as a class, are not paid salaries commensurate with the importance and value of their work to their companies, nor in reasonable proportion to the responsibilities placed upon them. I think this is, largely, perhaps almost wholly, due to the status the claim agent has gotten into officially. There is hardly any subordinate officer who does not assume to outrank a claim agent. This fact was recognized by this association many years ago and it was agreed that strong efforts should be made to bring the claim agent out of the official obscurity into which he had been consigned by his ambitious and forward associates in business and secure for him the official recognition to which the importance of his work justly entitles him. I do not believe the claim agent's compensation will be what it should be until this recognition is secured. I believe if every claim agent within and without this association will live and act in accordance with the high code of business ethics and honor his chief executive officer would wish him to do and insist on all other persons taking cognizance of that fact the day of such official recognition will be greatly hastened.

Radical, indeed, have been the changes during the life of this association in the laws governing the liability of railroads for damages for injury and death of their employees in the course of their employment. These changes were brought about largely by the instrumentality of a class of lawyers whose chief business it was and is to foment litigation between employer and employee in such cases for their own profit. So greatly did these men enrich themselves that a class of business theretofore regarded with disfavor by reputable lawyers has been eagerly sought in recent years by the most of them.

So corrupting is the love of money that any defenses left the railroads to such actions are commonly sworn away by witnesses procured and drilled for the purpose, or are ignored by judges more concerned about their own political future than about the administration of the law they were sworn to uphold. The worst feature of this damage suit industry (for it has attained the proportions of an industry) is not that it despoils the companies of their money of which the victims of the accident get but a small part, but that it despoils the companies of the loyalty and allegiance of their employees and creates a hostility which indirectly causes much greater pecuniary loss to the companies and is disastrous to efficient service to the public.

A southern lawyer of ability and force who obtained, because of his success, a monopoly on the damage suit business arising in his vicinity against three railroads sensed this latter effect many years ago and said to me at the time that his experience had convinced him that when once an employee had brought a damage suit against his employer the relation that must exist between employer and employee was so greatly strained as to render the man unfit to return to his former employer's service and that such a man ought not be taken back.

The evil effects of this system on the courts of the country; its sinister and insidious influence on the judges is notorious everywhere. General recognition of these facts has served the purpose of developing the idea strongly and widely that a system of liability, as between employer and employee, based on fault was fundamentally wrong and inimical to the interest of the employee and his family and the public. That production was carried on for the benefit of society. That society in general should pay the cost of production and included in that cost should be the reasonable compensation, on a fixed and predetermined scale, of those who are injured and the dependent ones of those who are killed in industrial pursuits.

The inherent justice and soundness of this idea; the glaring defects of the old system and the intolerable conditions it was creating; the humanity in the system proposed and based as it is on a common and well-settled principle of business, has appealed so strongly to legislative bodies that it has crystallized into law in nearly one-half the states of the Union and is being considered in many others, as well as in Congress. It is true most of the workmen's compensation acts passed by the states are limited in their scope and in the opinion of political and social economists of high standing and others who have made exhaustive study of the subject are open to other vital criticism, yet these laws constitute a beginning—the first step as it were in bringing in a new and better system.

I wish, in closing my remarks, to speak of the recent movement for the prevention of injuries and the phenomenal rapidity of its spread among the railroads of the country, as well as among the big industrial plants. The results it has already achieved are equally phenomenal—the best proof that the idea underlying it is correct and has stood the test in practice. The salient idea is that injury prevention is the work of the men who are the victims of these occurrences, because they control the majority of the causes of accidents; that in this work they should have the sympathetic support and active co-operation of the companies by which they are employed and of every one of its officers. For obvious reasons the initiatory steps in the inauguration of this movement have had to be taken by the companies and the co-operation has thus far been from the men, but I am sure the men who do the work of the railroads are beginning to realize that the protection of themselves and their associates in work from death and injury is of vastly more consequence to them and their families than any matter of higher wages or change in working conditions can possibly be; that considerations of their own safety have higher and more urgent demands on them than can be urged by any reckless member of their labor order who invokes their aid to save him from discharge, because of the violation of safety rules by which he has imperiled the life and limbs of others, and since they control (substantially speaking) the causes of injury they should control and dominate the movement for the elimination of those causes.

It is my firm belief that the greatest success in the prevention of injury and death of railroad men will not be attained until the men take actual charge of the "Safety First" movement, being given, of course, at all times the active support and co-operation of their companies and everyone of their officers.

THE RELATIONS OF THE YARDMASTER AND DESPATCHER

By J. L. Coss

Assistant Chief Despatcher, Chicago, Rock Island & Pacific, Haileyville, Okla.

If there are any two persons connected with a railroad who should work together at all times they are the despatcher and yardmaster. There always has been and no doubt to a certain degree there always will be more or less conflict between them. Why, we cannot explain, unless it be ignorance.

A yardmaster should possess higher qualifications than the average switchman. He should have a fair education and some executive ability to enable him to handle his correspondence intelligently; to maintain an organization among his men and to command their respect. He must be able to show his men that he has confidence in them and their work and that he relies on their ability to perform the work mapped out for them. It should not be necessary for the yardmaster to give a foreman a job and then feel that he must personally check him up to see that it has been done.

The yardmaster should be paid approximately $150 per month. His pay should at least be more than that of an engine foreman. It does not look right for an engine foreman

to draw a check for $130 and the yardmaster one for $125 or perhaps less. He should devote a portion of his time each day to personally going over the yard records with the clerk to see that foreign cars are being promptly moved according to instructions, that old loads and empties are not allowed to lie around the yard and get buried and that the rip track, roundhouse and storehouse switching is being cared for. In a first class yard he is a busy man, and his responsibilities are great. He is sometimes handicapped for room, especially during a brisk run of business, the clerical force may not be up to the requirements and many other things of an aggravating nature confront him. Therefore, he should be given all the support possible by the despatcher and other officials as well. It's one thing to tell how to run a yard and another to run it. Consists of incoming trains as well as pick-ups made on the road should be given preference by the telegraph department so that they will reach the yardmaster at the earliest possible moment in order that he may figure on the break-up and make-up of trains in the yard. Without this advance information he is badly handicapped.

The despatcher is also a busy man with possibly two or three yards and from 200 to 500 miles of main track to cover. Terminal overtime is an item of expense without any returns whatever; therefore, it should have the closest watching by all concerned and the greatest reduction can be made by the despatcher and yardmaster. A train should not be ordered unless the yardmaster is satisfied beyond any doubt, barring accidents, that he can have it ready at the appointed time, and the despatcher must know he can move it. However, the despatcher must go a little further and be sure that by taking the train at the time specified he will not block incoming trains to such an extent that they will run into road overtime. The simple matter of moving a train out of a terminal is not all by a great deal; of course, if the yard is blocked this is another question, but men who keep in touch with the situation will guard against blocked yards.

Here is where the hard feeling starts. The average yardmaster thinks that when he gets ready to run a train it should be moved at once. He does not figure on what it will encounter out on the line. Many do not care just so they get the train out of the yard and make a showing for themselves. Some despatchers, on the other hand, think that when they want a train all they have to do is to whistle at the yardmaster and the train and engine crew will assemble in front of the yard office in a few moments. I have known cases where the call boy had been instructed to call a crew with an engine and caboose and run out of the yard without even telling the yardmaster that it was wanted.

It takes time to make up a train in the yard. If an extra is wanted by a despatcher at a given time he should be willing to give the yardmaster time to get it and not rush him. If he has not been given reasonable advance notice it may be that his engines are engaged on other important work that he cannot well leave at the time or that some of the engines have turned in for the meal hour. He must be given an opportunity to keep down yard overtime and expense. Above all things, give the yardmaster advance notice concerning what is wanted. Don't have him at work making up a train for the west and decide the next moment that you want one east in preference; this will mix everything up and nothing is gained. Above all things avoid having him tear up a train after it is built. Outside of regular scheduled trains there should not be such a rush about other trains that all concerned cannot have time enough to do properly the necessary work in connection therewith. When a train is thrown together hurriedly nine times out of ten something is found wrong which will result in an hour or two of terminal overtime for the road crew. Then each blames the other.

The yardmaster should realize that the conditions on the road have something to do with the handling of outgoing trains and the despatcher should understand that the yard conditions have something to do with expediting the movement of cars through it. The yardmaster should be so situated that he can go to the despatcher's office and talk over the line-up in advance, and the despatcher should not be so burdened with work that he cannot take a few moments to go over the situation with him and arrange to cover any loop holes that may crop out. Then if any of the plans fail, on either's part, or by accident, each should take it as in the general course of business and not censure the other. Just as soon as these two officials become more closely associated in a business way and work in absolute harmony we will see better work done all around.

WAREHOUSE TRUCKS MADE BY OXY-ACETYLENE WELDING

A striking example of the application of the oxy-acetylene welding process to manufacturing operations is shown in the steel truck made by the Standard Improved Truck Company of Chicago.

Trucks of the type shown in the accompanying illustration were previously made by drilling and riveting all the joints. Welding by the Oxweld process was proposed and a test truck made by this method. The results were so much in favor of this system that it was adopted.

Welding not only produces a one piece truck with great

Truck with Oxy-Acetylene Welded Joints

strength at the joints, but has increased the output per man about 20 per cent. with a saving of over 30 per cent. of the previous cost of manufacture. Comparative tests of three methods of connection were made by Robert W. Hunt & Company, engineers. Connection *A* was the oxy-acetylene welded joint. Connection *B* was riveted with two ¼ in. diameter rivets in double shear, one in the stringer tube and one in the cross tube. Connection *C* was riveted with a ¼ in. rivet in double shear through the cross tube and a ¼ in. riveted reduction of inserted plug through the stringer tube, the head being in tension.

Tested to destruction connection *A* failed at the weld under a maximum load of 25,460 lb. Connection *B* failed by shearing the rivet in the stringer tube under a load of 4,740 lb. At a load of 5,800 lb. connection *C* failed by shearing the rivet in the cross tube and pulling through the rivet connection in the stringer tube.

General News Department

Daniel Willard, president of the Baltimore & Ohio, is now Doctor of Letters, that degree having been conferred upon him by the University of Maryland in Baltimore, June 1.

Wells Fargo & Company have declared a semi-annual dividend of 3 per cent., making their annual dividend rate 6 per cent. instead of 10 per cent., which has been paid for the last seven years.

E. Moody Boynton and his monorail project are still alive; and in the lower House of the Massachusetts Legislature last week a bill to aid him with the credit of the state to the extent of several million dollars was passed by a vote of 105 to 98.

Senator Works of California has introduced in Congress a bill forbidding the payment of tips to porters and waiters on interstate railroad rains and steamboats. Mr. Works proposes to compel employers to pay wages high enough to make tips unnecessary.

The New York, New Haven & Hartford has raised the price of the dinners served on its dining cars from $1 to $1.25. For luncheon the price will still be $1. On the Federal Express, the Boston-Washington train, breakfasts are served at 50 cents, 75 cents and $1.

The Pennsylvania Railroad has issued instructions that the rule forbidding the hiring of men for the service of the road without evidence of satisfactory physical condition, as shown by a physician's examination, is to be observed even in the case of temporary employees, when practicable.

Francis F. Flagg, vice-president of the American Express Company, has been elected president of the National Express Company, succeeding J. C. Fargo, resigned. George C. Taylor, president of the American Express Company, has been elected also president of the Westcott Express Company.

Statements to the effect that the Southern Railway purposes to dispense with ticket collectors on its passenger trains are without foundation; though collectors have been taken off some of the trains on which traffic does not justify their retention. Collectors are to be continued on the important trains on the main line, and no further reductions are contemplated.

The New York State Civil Service Commission announces examinations July 25 for the position of inspector of track installation, under the Public Service Commission of the First district; salary $1,500 to $1,800 yearly. Applicants must have had five years' experience as foreman, supervisor or otherwise in responsible charge of the installation and construction of special track work on steam railroad terminals or high speed electric lines.

W. P. Warner, assistant general passenger and freight agent of the Chicago, Milwaukee & St. Paul at Spokane, Wash., was elected president of the "Milwaukee Puget Sound Pioneer Club" at the annual meeting of the club at Seattle June 24. This club was organized last year, and is composed of men who were identified with the construction of the St. Paul from Mobridge, S. D., to Seattle and Tacoma. The secretary is E. H. Foster, Deer Lodge, Mont.

The Baltimore & Ohio has taken on several hundred men in its shops to repair freight cars in preparation for the expected heavy autumn traffic—regular employees who have been on furlough for a considerable time. The Pennsylvania also has ordered that every available freight car be made ready for use. The Atchison, Topeka & Santa Fe has increased its forces in the shops at San Bernardino and at other places, and made the working hours per week 55 instead of 40.

The Northern Pacific has just finished at Seattle a new commissary building. With equipment it has cost approximately $30,000. A large trade mark, in the shape of a baked potato, 40 ft. long and 18 ft. in diameter, surmounts the roof. The potato is electric lighted and its eyes, through the electric mechanism, are made to wink constantly. A cube of butter thrust into its split top glows intermittently. The potato can be seen from the windows of all transcontinental trains entering Seattle.

The New York State Workmen's Compensation Law went into effect on July 1. By this law employers of men engaged in so-called hazardous occupations—which term, under this law, includes most outdoor work on railroads—are required to pay compensation in all cases of deaths and injuries occurring to employees in the course of their work, disregarding the question of blame or responsibility. Employers are required either to insure themselves, so as to provide sums for payment of claims to which they may become liable, or else to give to the State Workmen's Compensation Commission satisfactory evidence of ability to pay any probable claim or claims; but it is said that all of the railroad companies of the state have thus far refrained from taking action. It is understood that probably some one or more railroads will test the law in the courts. An accident to an employee engaged in interstate commerce must be dealt with according to the provisions of the federal compensation law and the question of whether or not an employee, in a given situation, should be classed as engaged in intrastate commerce, and therefore subject to the New York law, is likely to be a complicated one.

A Correction

G. E. Sisco, assistant engineer of motive power of the Pennsylvania Lines West, advises that the statement made in his discussion of the paper on Front End Design and Air Openings of Grates and Ash Pans, before the International Railway Fuel Association, and reported in the *Railway Age Gazette*, May 22, 1914, page 1150, giving the evaporation per hour for the locomotive with elliptical nozzle as 58,882 lb., should have been 53,882 lb.

A Non-Stop Journey of Twelve Hundred Miles

According to a press despatch from Berlin June 29, a German aviator, Landmann, flying in a military biplane, has remained on the wing 21 hours 49 minutes, traveling in that distance about 1,200 miles, or at an average rate of 55 miles an hour. This flight was begun at 8:30 p. m. June 27. Another German aviator recently remained on the wing 18 hours 10 minutes. In France, according to a report published the same day, a dirigible balloon belonging to the army made a flight of 35 hours 39 minutes without a stop. The balloon flew steadily at a height of about a mile and a half. It was equipped with wireless telegraph apparatus and was in frequent communication with the station in the Eiffel tower.

British Railway Employees

The Bureau of Railway News and Statistics has issued a statement showing that, according to the British Board of Trade, there were 643,135 wage earners employed on the railways of the United Kingdom on December 31, 1913. Of these 594,088 were classed as adults and 49,047 as boys, i. e., under 18 years of age. The total is 44,385 more than in 1910, but only 21,794 over the number reported in 1907. The figures do not include the salaried staff. In the United States in 1913 the total was 1,714,603, also exclusive of general and other officers.

The compensation of British railway employees between 1901 and 1912, for which figures are available, increased from £29,354,000 to £34,912,000, or 19 per cent., where the number of persons increased 11 per cent. During the same period the compensation of American railway employees, exclusive of general and other officers, increased from $588,517,000 to $1,227,933,000, or 108.5 per cent., against an increase of 61.5 per cent. in numbers.

The average pay of British railway men in 1901 was approximately $255 a year and $271 in 1912; that of American railway employees in 1901 was $555 and $716 in 1912. These figures are exclusive of salaried officers in both cases.

Charges of Conspiracy in Connection With the Hampden Railroad

In the Middlesex County Court at Cambridge, Mass., June 29, the grand jury reported indictments against 18 persons in connection with the sale of notes of the Hampden Railroad, the connection between the Boston & Maine and the New York, New Haven & Hartford, which was built in 1913, but which has never been put in operation. The persons indicted are Frederick S. Moseley, banker; Charles S. Mellen, who was president of the New York, New Haven & Hartford; Ralph D. Gillett, who was president of the Hampden Railroad Corporation, but who is now dead, and members of the committees of two savings banks who bought the notes of the railroad corporation. It is charged that the indorsement by the Hampden Investment Company, on the notes of the railroad corporation, was not a substantial security.

The Hampden Railroad, about 15 miles long, cost over $4,000,000. The Massachusetts Public Service Commission has refused to approve more than $3,300,000 in securities and has refused to authorize the lease of the Hampden to the Boston & Maine; and because of the resulting delay in the opening of the road, and for other reasons, the financial burdens of the company and its bankers are becoming pressing. The Massachusetts legislature has discussed a bill designed for the relief of the company and to facilitate the plans of the Boston & Maine for opening the line to business, but has thus far done nothing. The objectors to the bill—declaring that there have been gross frauds and that the applicants do not come into court with clean hands—have succeeded in preventing all action. Ten counts in the indictment charge Mellen, Moseley and Gillett with stealing.

Summary of Revenues and Expenses of Steam Roads in April

The Bureau of Railway Economics summary of revenues and expenses and comments thereon for April, 1914, are as follows:

Railways operating 225,821 miles of line are covered by this summary, or about 90 per cent. of all steam railway mileage in the United States. Their operating revenues for the month of April, 1914, amounted to $230,534,172. This amount includes revenues from freight and passenger traffic, from carrying mail and express, and from miscellaneous sources connected with rail operation. Compared with April, 1913, total operating revenues show a decrease of $7,970,644. Total operating revenues per mile averaged $1,021 in April, 1914, and $1,065 in April, 1913, a decrease of $44, or 4.1 per cent. There was a decrease of 5.2 per cent. in freight revenue per mile, and a decrease in passenger revenue per mile of 0.2 per cent.

Operating expenses, which include all the costs of maintaining track and equipment, operating trains, securing traffic, and of administration, amounted to $172,231,630. This was $7,556,970 less than for April, 1913. These operating expenses per mile of line averaged $763 in April, 1914, and $803 in April, 1913, a decrease of $40 per mile, or 5.0 per cent.

Net operating revenue, that is, total operating revenues less operating expenses, amounted to $58,302,542, which was $413,674 less than for April, 1913. Net operating revenue per mile of line averaged $258 in April, 1914, and $262 in April, 1913, a decrease of $4 per mile, or 1.5 per cent.

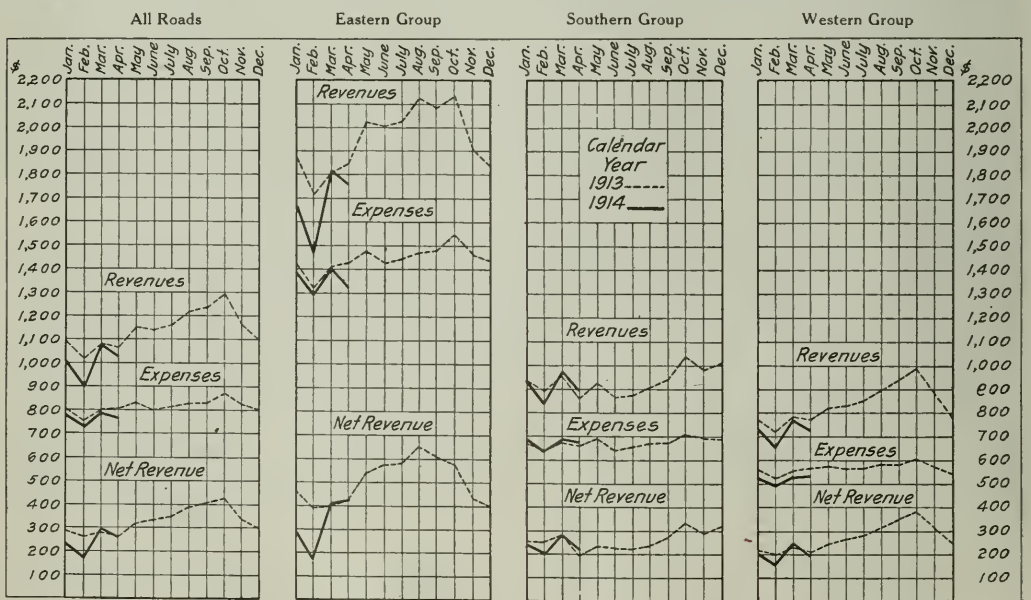
Taxes for the month of April amounted to $11,465,060, or $51 per mile, an increase of 9.3 per cent. over April, 1913.

Operating income, which is net revenue from rail and auxiliary operations, less taxes, averaged $206 per mile of line, and in April, 1913, $214, thus decreasing $8, or 3.5 per cent. Operating income for each mile of line for each day in April averaged $6.88, and for April, 1913, $7.14. Operating income is that proportion of their operating receipts which remains available to the railways for rentals, interest on bonds, appropriations for betterments, improvements, new construction, and for dividends.

The operating ratio for April, that is, the per cent. of total operating revenues absorbed in operating expenses, was 74.7 per cent., which is comparable with 75.4 per cent. in April, 1913, and 73.6 per cent. in April, 1912.

The railways of the Eastern district show a decrease in total operating revenues per mile of line as compared with April, 1913, of 5.1 per cent.; the railways of the Southern district an increase of 4.6 per cent., and the railways of the Western district a decrease of 5.9 per cent. Operating expenses per mile decreased 6.8 per cent. in the East, increased 1.9 per cent. in the South, and decreased 5.0 per cent. in the West. Net operating revenue per mile increased 0.9 per cent. in the East, increased 13.6 per cent. in the South, and decreased 8.3 per cent. in the West. Taxes per mile show an increase of 3.7 per cent. in the East, an increase of 16.1 per cent. in the South, and an increase of 13.3 per cent. in the West. Operating income per mile increased 0.9 per cent. in the East, increased 12.8 per cent. in the South, and decreased 12.7 per cent. in the West.

Comparison of returns for ten months of the current fiscal year with those of the corresponding months of the previous fiscal



Monthly Revenues and Expenses per Mile of Line in 1914

year reveals a decrease in total operating revenues per mile of 2.5 per cent., an increase in operating expenses per mile of 1.6 per cent., and a decrease in net operating revenue per mile of 11.6 per cent. This net operating revenue per mile decreased 18.8 per cent. in the East as compared with the corresponding period of the previous year, increased 0.3 per cent. in the South, and decreased 8.5 per cent. in the West.

When the returns for the four months of the calendar year 1914 are compared with those of the corresponding months of 1913, they show a decrease in total operating revenues per mile of 5.7 per cent., a decrease in operating expenses per mile of 3.4 per cent., and a decrease in net operating revenue per mile of 12.4 per cent. This net operating revenue per mile decreased 22.8 per cent. in the East as compared with the corresponding period of the previous year, decreased 2.9 per cent. in the South and decreased 6.4 per cent. in the West.

The diagram shows the variations in operating revenues, operating expenses, and net operating revenue per mile for the separate months of the calendar year 1913 and of the calendar year 1914 to date. The following table shows the per cent. of operating revenues consumed by each class of expenses:

SELECTED PERCENTAGES AND AVERAGES

(Roads having annual operating revenues above $1,000,000)

	April		Fiscal year ending June 30		Ten months ending April 30	
Account	1914	1913	1913	1912	1914	1913
Per cent. of total operating revenues:			Account			
Freight revenue	69.5	70.3	69.8	68.7	69.1	70.0
Passenger revenue	22.1	21.3	22.2	23.2	22.8	22.1
Other transportation	7.3	7.3	6.9	7.1	7.0	6.9
Non-transportation	1.1	1.1	1.1	1.0	1.1	1.0
Maintenance of way and structures	14.1	15.5	13.3	12.7	13.2	13.0
Maintenance of equipment	18.2	17.8	16.4	15.9	17.5	16.3
Traffic expenses	2.1	2.1	2.0	2.1	2.1	2.0
Transportation expenses	37.4	37.4	35.2	35.9	36.4	35.2
General expenses	2.9	2.6	2.4	2.5	2.6	2.4
Total operating expenses (excluding outside operations and taxes)	74.7	75.4	69.3	69.1	71.8	68.9
Averages per mile per day:						
Operating revenues per mile per day	$34.03	$35.48	$37.76	$34.78	$36.74	$37.67
Operating expenses per mile per day	25.42	26.75	26.17	24.05	26.37	25.95
Net operating revenue per mile per day	8.61	8.73	11.59	10.73	10.37	11.72
Operating income per mile per day	6.88	7.14	10.08	9.28	8.70	10.24

Association of American Railway Accounting Officers

The annual convention of the Association of American Railway Accounting Offices was held at the Hotel Radisson, Minneapolis, Minn., on June 24, 25 and 26, with an attendance of about 150 members. Because the report of the Standing Committee on Corporate, Fiscal and General Accounts was acted upon at a special meeting in New York in March there was little but routine business to come before the meeting. Reports were received from the Executive Committee, the Standing Committee on Freight Accounts and the Standing Committee on Passenger Accounts, and were discussed, and all of the committees of the association presented memorials to the memory of the late C. G. Phillips, who had been secretary of the association since its organization. J. A. Taylor, comptroller of the Central of New Jersey, presented an informal address on the subject of "Loyalty."

Officers were elected as follows: President, C. B. Seger, vice-president and comptroller Union Pacific System, New York; first vice-president, R. A. White, general auditor New York Central & Hudson River, New York; second vice-president, L. A. Robinson, comptroller Chicago & North Western, Chicago. New members of the Executive Committee, Mr. Robinson, B. A. Dousman, general auditor, Chicago, Milwaukee & St. Paul, Chicago; H. H. Laughton, auditor Southern Railway, Washington, D. C. H. G. Foster, assistant general auditor, Chicago, Burlington & Quincy, Chicago, and W. G. Johnson, assistant comptroller, Northern Pacific, St. Paul. E. R. Woodson, of Washington, D. C., was appointed permanent secretary.

Through the courtesy of Mr. Dousman, the Chicago, Milwaukee & St. Paul furnished a special all-steel train of 13 cars for the accommodation of members and their families, leaving Chicago on Tuesday evening and arriving in Minneapolis the following morning. The entertainment program included a ball, a trolley excursion to Lake Minnetonka, and a steamboat ride on the lake.

American Railway Tool Foremen's Association

The sixth annual convention will be held in Chicago, July 20-22, at the Hotel Sherman. The following is the program: July 20, 9:30 a. m.—Opening address; Standardization of Reamers for Locomotive Repairs; Machine Tool Repairs.

July 21.—Special Tools for Drilling, Reaming and Milling; Tool Room Grinding; address: Safety First in Grinding.

July 22.—Distribution of Tools for Shop Use; Dies for Cold Work, Press and Special Punching.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

AIR BRAKE ASSOCIATION.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 5-8, 1915, Hotel Sherman, Chicago.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—A. G. Thomason, Boston, Mass.

AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next convention, October, Washington.

AMERICAN ASSOCIATION OF GENERAL PASSENGER AND TICKET AGENTS.—W. C. Hope, 143 Liberty St., New York.

AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, I. C. R. R., East St. Louis, Ill.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next convention, August 20 and 21, New York.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 29 W. 39th St., New York. Annual convention, October 12-16, Atlantic City, N. J.

AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOC.—H. G. McConnaughy, 165 Broadway, New York. Meetings with Am. Elec. Ry. Assoc.

AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 20-22, 1914, Los Angeles, Cal.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, Karpen Building, Chicago.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—A. R. Davis, Central of Georgia, Macon, Ga. Next convention, July 20-22, Hotel Sherman, Chicago.

AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa. Next annual meeting, June 30 to July 4, Hotel Traymore, Atlantic City, N. J.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. W. Hunt, 220 West 57th St., New York; 1st and 3d Wed., except June, July and August, New York.

AMERICAN SOCIETY OF ENGINEERING CONTRACTORS.—J. R. Wemlinger, 11 Broadway, New York; 2d Thursday of each month, at 2 P. M., 11 Broadway, New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, 1300 Pennsylvania Ave., Washington, D. C.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—C. W. Egan, B. & O., Baltimore, Md.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Annual convention, October 19-23, Chicago.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—P. W. Drew, 112 West Adams St., Chicago.

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York.

ASSOCIATION OF WATER LINE ACCOUNTING OFFICERS.—W. R. Evans, Chamber of Commerce, Buffalo, N. Y.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meeting with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk Ry., Montreal, Que.; 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que.; 1st Thursday, October, November, December, February, March and April, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawler Ave., Chicago; 2d Monday in month, except July and August, Lytton Bldg., Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York; 2d Fri. in Jan., May, Sept. and Nov. and 2d Thurs. in March, Hotel Statler, Buffalo, N. Y.

CIVIL ENGINEERS' SOCIETY OF ST. PAUL.—Edw. J. Dugan, P. O. Box 654, St. Paul, Minn.; 2d Monday, except June, July, August and September, Old State Capitol Bldg., St. Paul.

ENGINEERS' SOCIETY OF PENNSYLVANIA.—Edw. R. Dasher, Box 75, Harrisburg, Pa.; 1st Friday after 10th of each month, except July and August, 31 So. Front St., Harrisburg, Pa.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, Oliver Bldg., Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

Freight Claim Association.—Warren P. Taylor, Richmond, Va.

General Superintendents' Association of Chicago.—A. M. Hunter, 605 Grand Central Station, Chicago; Wed. preceding 3d Thurs., Transportation Bldg., Chicago.

International Railway Congress.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, 922 McCormick Bldg., Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 West Broadway, Winona, Minn. Next convention, July 14-17, Hotel Sherman, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, Lima, Ohio. Next convention, third Tuesday in August.

Maintenance of Way and Master Painters' Association of the United States and Canada.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next convention, November 17-19, 1914, Detroit, Mich.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York.

Master Car Builders' Association.—J. W. Taylor, Karpen Building, Chicago.

Master Car & Locomotive Painters' Assoc. of U. S. and Canada.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 8-11, Nashville, Tenn.

National Railway Appliances Association.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15 to 19, 1915, Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass.; 2d Tuesday in month, except June, July, Aug. and Sept., Boston.

New York Railroad Club.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill.; 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

Railroad Master Tinners, Coppersmiths & Pipefitters' Association.—U. G. Thompson, C. & E. I., Danville, Ill.

Railway Business Association.—Frank W. Noxon, 30 Church St., New York.

Railway Club of Pittsburgh.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

Railway Development Association.—W. Nicholson, Kansas City Southern, Kansas City, Mo.

Railway Electrical Supply Manufacturers' Assoc.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Asso. Ry. Elec. Engrs.

Railway Fire Protection Association.—C. B. Edwards, Mobile & Ohio, Mobile, Ala. Annual meeting, October 6, Washington, D. C.

Railway Gardening Association.—J. S. Butterfield, Lee's Summit, Mo.;

Railway Signal Association.—C. C. Rosenberg, Bethlehem, Pa. Annual meeting, Bluff Point, N. Y., September 22-24.

Railway Storekeepers' Association.—J. P. Murphy, Box C, Collinwood, Ohio.

Railway Supply Manufacturers' Association.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with M. C. B. and M. M. Associations.

Railway Telegraph & Telephone Appliance Association.—G. A. Nelson, 50 Church St., New York. Meetings with Assoc. of Ry. Teleg. Supts

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va.; 2d Monday in month, except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill. Next convention, September 8-10, 1914, Chicago.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and Aug., St. Louis.

Salt Lake City Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah; 1st Saturday of each month, Salt Lake City.

Signal Appliance Association.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

Society of Railway Financial Officers.—Carl Nyquist, La Salle St. Station, Chicago.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. Ry., Atlanta, Ga. Next meeting, July 16, Chattanooga, Tenn.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga.; 3d Thurs., Jan., March, May, July, Sept., Nov., 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—J. S. Marks, Agent, Interstate Despatch, Toledo, Ohio; 1st Saturday in month, Boody House, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillsburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York; last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa.; meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Building, St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7122 Stewart Ave., Chicago.

Transportation Club of Buffalo.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

Transportation Club of Detroit.—W. R. Hurley, Supt.'s office, L. S. & M. S., Detroit, Mich.; meetings monthly, Normandie Hotel, Detroit.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Next meeting, September 15-18, Hotel Sherman, Chicago.

Utah Society of Engineers.—Frank W. Moore, Newhouse Bldg., Salt Lake City, Utah; 3d Friday of each month, except July and August, Consolidated Music Hall, Salt Lake City.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Building, Chicago; 3d Tuesday of each month, except June, July and August, Karpen Building, Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago; regular meeting 1st Monday in month, except January, July and, August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

The Western Classification Committee held a meeting at San Francisco, Cal., on June 30, for the hearing of petitioners on a large docket of subjects.

The California terminal lines have announced that during the expositions to be held in California next year special cars or special trains will not be parked at Los Angeles, San Diego, or San Francisco, or anywhere within 50 miles of those points.

President O. L. Dickeson, of the White Pass & Yukon, announced in Seattle June 24 that the new tariffs equalizing the St. Michael gateway rates from Seattle and Puget Sound ports to Fairbanks and all points on the Tanana river, and to Hot Springs via Skagway, would become effective July 1.

The United States Express Company went out of business on the night of June 30. Of the 32,860 miles of lines operated by this company about 14,000 miles will now be operated by the American Express and about 12,000 by Wells Fargo & Company The Adams Express will operate the remainder.

Since August 7 last, the Minnesota railroads have refunded $1,500,000 to passengers and shippers of freight, in the form of reparation, as a result of the decision of the Supreme Court in the state rate cases. Claims are still arriving at the office of the state railroad commission at the rate of nearly a hundred a day.

Governor Spry of Utah has advised the Salt Lake City Commercial Club Traffic Bureau that he has found that no law has been violated by the declaration of the Union Pacific special dividend, and that the state will, therefore, take no action in the matter. The Governor's answer quotes a long opinion from the attorney general of the state, who holds that on the statement of facts the company has not violated any of its charter provisions. The bureau petitioned the governor on June 2 to investigate the matter with a view to preventing the distribution of the dividend, on the ground that it was illegal and would mean increased freight rates.

A committee of the Denver Chamber of Commerce has invited representatives of the Denver & Rio Grande and the Pullman Company to appear at meetings of the committee to explain the reasons for alleged discrimination against Denver in their rates. The Denver Convention Association has complained that fares from points in the southwest are higher to Denver than to Colorado Springs and Pueblo, that lower round-trip rates are made from Denver to Colorado Springs and other cities than from those cities to Denver, and that the combination of Pullman fares from Chicago to Denver, $6, and from Denver to San Francisco, $9, is higher than the combination on Salt Lake City, $8.50 plus $5.

The Department of Agriculture has issued revised regulations governing the interstate movement of live stock, embracing changes designed to facilitate the movement of stock from quarantined areas. Cattle that have been dipped once under state or federal supervision may be shipped from an area quarantined for ticks to a market center where there are proper dipping facilities and the Department of Agriculture maintains an inspector. After a second dipping the cattle may be sold for any purpose. Under certain strict conditions, the transportation of hogs from public stock yards is now permitted, this because of the discovery by government scientists of a serum which renders swine immune to hog cholera. Hogs which have been treated with the serum and which show no symptoms of suffering from any form of disease may now be shipped. As a result of this it is expected that thousands of lightweight hogs will be sent from the stock yards to the country for feeding and fattening and that the country's total production of pork will be greatly increased.

Representatives of the Texas railways affected by the Shreveport decision appeared at a hearing before the Texas Railroad Commission on June 19, and asked the approval of the commission for a tariff of rates applying from Dallas and Houston to East Texas points, equalized with the interstate rates from

Shreveport, La., westward to the same points, as ordered by the Interstate Commerce Commission in the decision which has been upheld by the Supreme Court. The new tariff, which it is proposed to make effective on August 1, advances the Texas rates which were fixed by the Texas Railroad Commission. The railroad representatives asked the Texas commission to agree to the new rates and place them in a position where they could act without offense to either the Texas commission or the Interstate Commission. The Texas commission declined to state that it would not prosecute the railroads for violating state tariffs in making the new adjustment, and Commissioner Williams said he did not think the rates should be raised from Texas points towards Shreveport, but that the situation should be compromised by a partial advance in the Texas rates and a partial reduction in the Shreveport rates. The roads announced that they would file the new tariff at once.

The refusal of the St. Louis Southwestern Railway to deliver beer at Lufkin, Tex., is to be made the basis of a court proceeding to test the Allison liquor law. Smith & Jones some time since ordered a cask of beer from Kansas City, Mo. Upon the arrival of the beer at Lufkin, the agent refused to deliver and intended to return it to Kansas City; but Messrs. Smith and Jones sued out a writ of injunction. The railroad company has consistently refused to deliver intoxicating liquors.

Car Surpluses and Shortages

Arthur Hale, chairman of the committee on relations between railroads of the American Railway Association, in presenting statistical bulletin No. 169-A, giving a summary of car surpluses and shortages by groups from February 15, 1913, to June 15, 1914, says: The total surplus on June 15, 1914, was 232,994 cars; on June 1, 1914, 242,572 cars; on June 14, 1913, 71,126 cars; on June 20, 1912, 73,464 cars; on June 21, 1911, 165,934 cars, and on June 22, 1910, 125,644 cars.

CAR SURPLUSES AND SHORTAGES

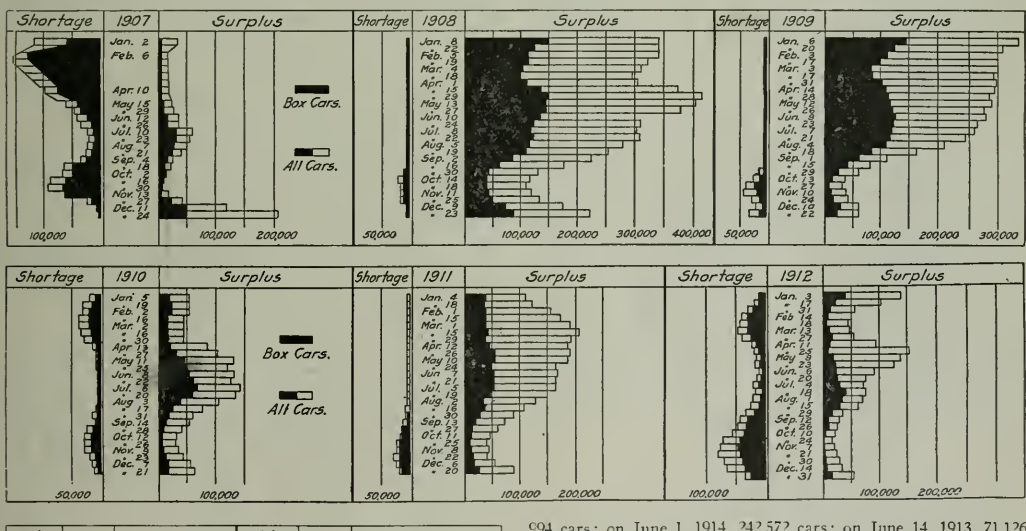
*Group 1 is composed of New England lines; Group 2—New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania lines; Group 3—Ohio, Indiana, Michigan and Western Pennsylvania lines; Group 4—West Virginia, Virginia, North and South Carolina lines; Group 5—Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida lines; Group 6—Iowa, Illinois, Wisconsin and Minnesota lines; Group 7—Montana, Wyoming, Nebraska, North Dakota and South Dakota lines; Group 8—Kansas, Colorado, Missouri, Arkansas and Oklahoma lines; Group 9—Texas, Louisiana and New Mexico lines; Group 10—Washington, Oregon, Idaho, California, Nevada and Arizona lines; Group 11—Canadian lines.



Car Surpluses and Shortages, 1907 to 1914

The principal reduction of surplus is in central freight association territory (group 3), with smaller reductions in the central part of the southeastern district (group 5), and in the Nebraska, Wyoming, etc. (group 7), while the surplus continues to increase in trunk line territory (group 2).

The total shortage on June 15, 1914, was 660 cars; on June 1, 1914, 770 cars; on June 14, 1913, 7,199 cars; on June 20, 1912, 5,746 cars; on June 21, 1911, 2,764 cars, and on June 22, 1910, 2,729 cars.

The total shortage of 660 cars remains negligible.

The table on the preceding page gives car surplus and shortage figures by groups for the last period covered in the report and the diagram shows total bi-weekly surpluses and shortages from 1907 to 1914.

Cleveland Traffic Club

At a meeting of the Traffic Club of Cleveland, held on June 22, the following officers were elected: President, D. F. Hurd, traffic commissioner, Cleveland Chamber of Commerce; first vice-president, John W. Clark; second vice-president, J. G. Masterton; secretary, Martin F. Doyle; treasurer, C. M. Andruss.

Car Location

The accompanying table, which was taken from bulletin No. 19 of the American Railway Association, gives a summary of freight car location by groups on June 1, 1914.

* Denotes deficiency.

New Mississippi River Barge

A steel barge which has just been built at New Orleans by J. H. Bernard for use on the Mississippi is expected by its sponsors to reduce the cost of transportation on the river. Under the auspices of the Inland Navigation Bureau, the barge will leave New Orleans, July 6. The barge is one of several producer gas propelled flat bottom craft with large freight-carrying capacity. The cost of moving freight by them, even under existing unfavorable conditions, is expected to be more than half a mill per ton mile, while the cost under ideal conditions may be cut down to one-fourth or one-eight of a mill per ton mile. These barges, unlike the old are plain iron and steel from stem to stern. They are so shaped as to hold every possible ton of freight. The crew needed to navigate a loaded 1,000-ton barge consists of seven men all told.

On the trip to St. Paul, 1,000 tons of Louisiana lumber will be taken up, and 1,000 tons of export flour and other commodities will be brought back to New Orleans.

GERMAN LOCOMOTIVES FOR GREAT BRITAIN.—On May 19 the South-Eastern & Chatham received five engines in section on its order recently placed with a German locomotive firm.

AUSTRALIAN RAILWAY TIES.—The West Australian government, which undertook the contract for the supply of ties for the transcontinental railway is finding some difficulty in complying with the terms of delivery, as delays have taken place in the construction of saw mills and in shipping logs out of the forest. The engineer in chief in charge of the railway construction says, in regard to the relative merits of the Karri and Jarrah ties which are being used, that while Jarrah ties are known to have an average life of about 14 years, it is anticipated that treated Karri ties will last nearly 30 years. The Jarrah tie has the unfortunate peculiarity of sinking away from the spikes so that in time the latter become loose. The Karri, on the other hand, closes around the spike and holds it tight.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Examiner Henderson held a hearing at Duluth, Minn., on June 20 on an application for a reduction in the rates on apples from Missouri to Duluth and Ashland.

Examiner Gibson held a hearing at Duluth, Minn., on June 23 on an application of shippers for a reduction in the freight rate on pulp wood from points in Minnesota.

Examiner Berry held a hearing at Chicago on June 22 on reshipping rates on grain and grain products from Omaha, Neb., and other points to Chicago & Alton stations in Illinois and Missouri.

The commission has further suspended from July 1 to October 29 tariffs filed by the eastern carriers imposing charges for switching cars to and from points on private sidings and industrial tracks.

The Interstate Commerce Commission has scheduled a hearing to be held on July 14 at Peoria, Ill., on the application of the Chicago, Ottawa & Peoria Traction Company for an order compelling steam railways to join it in making through rates.

Examiner Pugh held a hearing at San Francisco last week on the application of the cities of Santa Rosa, Santa Clara, San Jose and Marysville and others for terminal rates. The commission some time ago issued an order that Santa Rosa should be given terminal rates if they were accorded the other three cities, whereupon the railways withdrew them from the other three. These cities then protested that they were entitled to the rates if a large number of other cities were given them. The railways then announced that terminal rates would be restricted to San Francisco, Oakland, Los Angeles and San Diego.

Rates on Fresh Meats and Packing-house Products from Mason City, Ia.

Jacob E. Decker & Sons v. Chicago, Milwaukee & St. Paul. Opinion by Commissioner Daniels:

The commission finds that the rates of 18 and 16 cents per 100 lb. respectively on fresh meats and packing-house products from Mason City, Ia., to Chicago are not unreasonable *per se* nor discriminatory as compared with the rates from competing points. It is also held that the fact that Mason City pays different rates on fresh meats and packing-house products, whereas no difference in charge on the two is made from competing points, is not in itself evidence of discrimination as against Mason City and that identity of ratio between commodity rates

and the corresponding class rates is not indispensable to disprove absence of discrimination, especially where the divergence is moderate in amount. (30 I. C. C., 547.)

Malt Rates to New Orleans

Opinion by Commissioner Daniels:

The commission finds that the carriers have justified a proposed increase from 25 to 30½ cents per 100 lb. in the rate on malt in carloads from Minneapolis, Minn., and other points to New Orleans, La. Complaint is chiefly made that the proposed rate will give malsters of Chicago an advantage over competitors in Milwaukee, but the commission holds that there is nothing in the record which clearly shows that the total cost to the former of getting the grain to this plant, malting it in transit and forwarding it to New Orleans is less than the cost to the Milwaukee malster. (30 I. C. C., 587).

Transit Privileges on Hay at St. Albans, Vt.

American Hay Company v. Central Vermont et al. Opinion by Commissioner Daniels:

The complainant, owning a hay shed at St. Albans, Vt., had the privilege of reshipping hay to various destinations on old billing. To obtain this privilege it should have written "own billing" on the bill of lading, but complainant's agent wrote "new billing" and, therefore, in accordance with the custom the carrier charged the local rate from St. Albans. It is claimed that this was incorrect and reparation is asked for the difference between the through rate and the rate paid. The commission holds, however, that where the option of a transit privilege exists, the duty rests primarily on the shipper who elects to make use of it to make clear affirmatively to the carrier his right and intention to do so, failing which the carrier, especially when following written instructions, may fairly assume that the shipment is intended to be made without the benefit of the transit privilege. The complaint is therefore dismissed. (30 I. C. C. 562.)

Coal Car Distribution Rules

McCaa Coal Company et al v. Coal & Coke Railway. Opinion by Commissioner McChord:

The complainants, six coal mining companies operating on the line of the defendant contend that in the distribution of coal cars they are discriminated against in favor of the Davis Colliery Company, a company owned and controlled by substantially the same interests as the defendant. Cars are distributed to the mines involved on the basis of their physical and commercial capacity. The former is added to the latter as figured for the preceding 12 months, and the result divided by two, and if the resultant figure obtained is greater than the tipple or haulage capacity the lesser of these is taken as the basis of the mine rate.

It is the practice of the defendant to require the mines on its road to furnish quarterly, on blanks supplied by it, detailed information concerning the physical and operating conditions of the mine, such as the coal loaded during each of the months for the 12 months' period prior; average thickness of coal seam; number of working places available; number of miners working; number of miners that could be worked to advantage; average capacity of each miner; whether or not machines are used in mining; number of miners' houses occupied; haulage capacity; and tipple capacity. With this information before it, however, the defendant disregards all of it except the reported number of working places; in each working place it imagines two miners working with a capacity per miner as reported, and with this calculation the physical capacity is determined, no regard being given to the fact that the places may never have been worked, tracks may never have been laid into them, or that the working places may have been exhausted. Nor is consideration taken of the use of machines, the thickness of the seam nor of the men that could be housed.

The commission believes that the best that can be said for these calculations as to physical capacity is that they are arbitrary inflations, which furnish nothing real or tangible. From the results obtained under the system of car distribution employed it seems that it must have been devised and prosecuted with a view to furnishing the mines which are owned by the same interests as the defendant railroad all the cars required during periods of car shortage and high prices. The discrimination permitted by this system, as indicated, is of the most insidious character, calling for drastic action by the commission.

It is therefore held that the distribution of coal cars based on the element of physical capacity is wholly unsatisfactory and unjust. It is suggested that the proper basis should be the total shipments of each mine, taken for the two-year period prior to January 1, 1913, divided by the number of 10-hour days the mine actually operated during such period. This will furnish the average daily output over a two year period during car shortage as well as during free car supply and will reflect the operations and possibilities of each mine as truly as they can be ascertained.

Cars must be supplied to all operators as of 7 a. m. of the day charged. Where the mine's percentage is not high enough to entitle it to one car in the distribution for the day its order shall go over to the next day and such mine shall be supplied before any other on the next day's distribution. In the case of a new mine or a mine that did not operate during period above described, an arbitrary allotment shall be made upon request, which shall bear due relation to other operating mines of similar proportions. It is recommended that the defendant continue to require the mines to report quarterly, as now, concerning their operations, and the mine operators are cautioned that these reports hereafter must not be padded. By reason of the relation existing between the defendant company and the Davis Colliery Company, in complying with the views expressed herein the strictest impartiality will be required. The defendant is given until August 1, 1914, to follow the foregoing suggestions. (30 I. C. C., 531.)

STATE COMMISSIONS

Philip D. Laird has resigned as chairman of the Maryland Public Service Commission to take effect August 1.

The Nebraska Railway Commission has announced that it is considering a reduction in freight rates throughout the state which will amount to approximately 20 per cent. on the average.

The Pennsylvania Water Supply Commission has granted the applications of the Pennsylvania and the Erie railroads to make fills along the Allegheny river. The Pennsylvania has applied for permission to build a bridge at Pottsville.

The Missouri Public Service Commission held a hearing at Kansas City on June 22, on the application of the Kansas City Connecting Railroad for authority to build terminals in connection with the Kansas City stock yards. The application was opposed by the principal railways.

The Arizona Corporation Commission has issued an order reducing lumber and timber rates from Northern Arizona to Southern Arizona points, effective July 5. Most of the reductions are between 20 and 50 per cent. The carload minimum on lumber is reduced from 40,000 to 30,000 lb.

The Ohio Public Utilities Commission has ordered 44 railroads operating in Ohio to establish joint rates and through routes between points on their lines in Ohio and points on the lines of the Newburg & South Shore and the Lake Terminal railways. These short roads, since the Interstate Commerce Commission's recent order, have been classed as "plant facilities."

COURT NEWS

The application of the Terminal Railroad Association of St. Louis for a modification of a decree of the district court ordering it to refrain from switching from one industry to another on its tracks, was denied on June 20, by Judges Hook, Sanborn and Smith of the United States district court at St. Paul. Permission was granted to appeal to the Supreme Court.

Tariffs of the Egyptian State Railways.—Although Egypt has been occupied by Great Britain for more than 30 years and the administration of the railway system is entirely in British hands, the Egyptian State Railways are said to have no good tariff in the English language, the tariffs being given only in French and Arabic. It is said also that practically the same freight tariff, without alteration, has been in use for 20 years.

Railway Officers

Executive, Financial, Legal and Accounting

George W. Wiley has been appointed assistant treasurer of the Lehigh Valley, with office at Philadelphia, Pa.

Benjamin F. La Rue, claims attorney of the Lehigh Valley, has been appointed assistant general solicitor, with headquarters at New York.

James E. Kelby has been appointed general attorney of the San Pedro, Los Angeles & Salt Lake, with office at Los Angeles, Cal., succeeding P. Cherrington, deceased.

Benjamin A. Brown has been appointed auditor and assistant secretary of the Colorado, Kansas & Oklahoma, with headquarters at Scott City, Kan. The office of traffic manager is abolished.

J. P. O'Malley, assistant auditor of merchandise receipts of the Baltimore & Ohio, has been appointed auditor of merchandise receipts, with office at Baltimore, Md., succeeding William McGowan, assigned to other duties.

John W. Everman, who on July 1 became first vice-president and general manager of the St. Louis Southwestern, with headquarters at Tyler, Tex., as has been announced in these columns, was born February 1, 1861. He graduated from the public schools at Philadelphia, Pa., in 1876, and during 1877 and 1878 was engaged in mining pursuits in Venezuela, South America. He began railway work in 1879 in the ticket department of the Pennsylvania Railroad. From January 28, 1880, to May 10, 1892, he filled various clerical positions with the Texas & Pacific, including that of chief clerk and a private secretary to a superintendent. He was then made assistant general superintendent of that road, and two years later became assistant general manager, with headquarters at Dallas, holding the latter position until May, 1911, when he was appointed general superintendent at Dallas. He now resigns from the Texas & Pacific to go to the St. Louis Southwestern as first vice-president and general manager, as above noted.

J. W. Everman

Operating

Mark H. Reasoner has been appointed assistant supervisor of stations of the Minneapolis, St. Paul & Sault Ste. Marie, with headquarters at Minneapolis, Minn.

W. B. Causey has resigned as superintendent of the Northern division of the Chicago Great Western at St. Paul, Minn., to engage in coal business at Des Moines, Iowa.

R. S. Marshall has been appointed superintendent of the Virginia division of the Seaboard Air Line, with headquarters at Richmond, Va., succeeding J. H. Witt, resigned.

A. B. Copley, superintendent of the Arkansas division of the Rock Island Lines at Little Rock, Ark., has been appointed assistant general manager of the Third district, with headquarters at El Reno, Okla.

J. N. Haines, assistant superintendent of the Buffalo division of the Lehigh Valley at Sayre, Pa., has been appointed superintendent of the new Seneca division, with headquarters at Sayre. The new division was formerly the part of the old Buffalo division between Manchester, N. Y., and Athens, Pa.

W. A. Whitney, superintendent of the Sacramento division of the Southern Pacific, has been appointed general superintendent of the Oregon Short Line, with headquarters at Pocatello, Idaho, succeeding E. C. Manson, who has been appointed superintendent of transportation, with office at Salt Lake City. The position of car service agent, now held by W. S. Anderson, and that of B. F. Frobes, superintendent of telegraph, have been abolished, and the duties of those offices will be performed by the superintendent of transportation.

C. W. Miller, formerly superintendent of the Southern division of the Chicago & Alton, and whose position was abolished June 1, has been appointed superintendent of terminals at Chicago, a newly created position. W. R. McCullom, terminal trainmaster at Chicago, has been appointed assistant superintendent of terminals at Chicago. C. W. Bearden, assistant superintendent at Bloomington, Ill., has been appointed chief despatcher, in place of E. E. Sutton, and the former position is abolished. Mr. Sutton has been appointed assistant chief despatcher.

James R. Kearney, superintendent of transportation of the Baltimore & Ohio, the Baltimore & Ohio Southwestern and the Cincinnati, Hamilton & Dayton, with headquarters at Baltimore, Md., has been appointed general superintendent of transportation of those lines, also of the Staten Island and the Sandy Valley & Elkhorn lines of the Baltimore & Ohio. Mr. Kearney was born on March 29, 1859, and was educated in the common schools at Altoona, Pa. He began railway work in 1876, as a clerk in the car record office of the Pennsylvania Railroad at Altoona. From March, 1880, to May of the following year, he was in the car record office of the Illinois Central, and then to the following November was car accountant of the Illinois Midland, now a part of the Vandalia Railroad. He then returned to the car record office of the Illinois Central, remaining in that position until May, 1882, and subsequently to May, 1899, was successively clerk and chief clerk of the car record office of the St. Paul, Minneapolis & Manitoba and its successor, the Great Northern, at St. Paul, Minn. In May, 1899, he entered the service of the Baltimore & Ohio as superintendent of car service. In September, 1910, he was appointed superintendent of transportation of the same road and of the Baltimore & Ohio Southwestern and later also of the Cincinnati, Hamilton & Dayton, which position he held at the time of his recent appointment as above noted.

J. R. Kearney

Traffic

J. H. Ginet, Jr., has been appointed western immigration agent of the Chicago, Milwaukee & St. Paul, with headquarters at Seattle, Wash.

B. W. Robbins has been appointed assistant general freight agent of the Denver & Rio Grande and the Rio Grande Southern, with office at Denver, Colo., effective July 1.

F. N. Hait, commercial agent of the Lehigh Valley at Cleveland, Ohio, has been appointed commercial agent, with office at Pittsburgh, Pa., succeeding T. L. Painter, deceased; and E. R. Bardgett, succeeds Mr. Hait.

W. O. Sydnor, division freight agent of the Chesapeake & Ohio, at Charleston, W. Va., has been appointed assistant general freight agent with headquarters at Charleston, and his former position has been abolished.

E. B. Boyd, hitherto manager of the transportation department of the Chicago Board of Trade, and formerly assistant to the vice-president of the Gould Lines, has been elected chairman of the Western Trunk Line Committee, with office at Chicago.

S. G. Langston, general immigration agent of the Missouri, Kansas & Texas, has been appointed division passenger agent at St. Louis, Mo. The former office is abolished and the duties of that department will be assumed by R. W. Hockaday, industrial commissioner, St. Louis.

Charles K. Duncan, soliciting freight agent of the Tennessee Central, has been appointed traveling freight agent, with office at Chicago, succeeding W. D. Jones, resigned to accept service with another company, and Walter J. Dill has been appointed soliciting freight agent, succeeding Mr. Duncan.

Engineering and Rolling Stock

John Horan, road foreman of the Northern Pacific at Minneapolis, Minn., has been appointed acting master mechanic at the same place, succeeding J. B. Neish, who has been granted leave of absence. R. E. Hammond has been appointed acting road foreman in place of Mr. Horan. F. B. Costello has been appointed acting supervisor at Spokane, Wash.

Purchasing

E. L. Fries has been appointed general storekeeper of the Union Pacific, with headquarters at Omaha, Neb., vice J. H. Stafford, retired under the pension rules of the company; effective July 1.

Henry Orville Hukill, purchasing agent of the Pennsylvania Lines West of Pittsburgh, with headquarters at Pittsburgh, Pa., was retired on June 1, under the pension rules of the company.

H. O. Hukill

He was born on May 25, 1844, at Steubenville, Ohio, and was educated in the public schools of his native town. At the age of 16 he entered the service of the Steubenville & Indiana, now a part of the Pittsburgh, Cincinnati, Chicago & St. Louis as a messenger in the superintendent's office. In 1863, he was appointed an assistant operator, and in April of the following year entered the service of the Pittsburgh, Fort Wayne & Chicago and the Cleveland & Pittsburgh, now part of the Pennsylvania Lines West of Pittsburgh, as telegraph operator and clerk in the office of the purchasing agent at Pittsburgh. He was promoted on January 1, 1877, to chief clerk to the purchasing agent, and ten years later was appointed assistant to purchasing agent. He remained in this position until January 1, 1894, when he was appointed purchasing agent of the Pennsylvania Lines West, from which position he now retires after a service of over 54 years on the Pennsylvania Lines. At the time of the retirement of Mr. Hukill, the directors of the Pennsylvania Company adopted the following minute: Mr. Hukill's long service in the purchasing department was noted for the sound judgment and business principles which governed him in all his official relations. The contracts made by him for materials and supplies aggregated enormous sums of money, but his constant study of market conditions and his knowledge of values enabled him to make these purchases under terms that were advantageous to the company, and at the same time fair to the manufacturers. The integrity of his character and the genial and winning nature of his personality won the esteem and friendship of his associates, and the board of directors takes great pleasure in expressing its appreciation of his able and faithful service and wishes for him many years of happiness and health.

OBITUARY

E. C. Coffey, assistant general freight agent of the Chicago & Alton at Peoria, Ill., died in that city on June 26.

Franklin Harvey Head, formerly a director of the Toledo, Peoria & Western, died recently at Maplewood, N. H., at the age of 79.

Marvin S. Chase, formerly from 1885 to May, 1901, assistant general freight agent of the Lake Shore & Michigan Southern, died at his home in Chicago on June 27, aged 70 years.

Russell Pardee Orcutt, from 1909 to 1911 division engineer of the Rochester division of the Erie, and a son of George N. Orcutt, assistant to president of that road, died on June 28, at Hot Springs, Ark., at the age of 29.

William Harder, for 20 years general agent of the freight department of the Great Northern at Portland, Ore., died suddenly at his home in the latter city on June 18, aged 70 years. He had been associated with the Hill lines continuously for 23 years, previous to which time he was assistant traffic manager of the Canadian Pacific at Winnipeg.

Alexander Stewart, general superintendent of motive power and equipment of the Southern Railway, with office at Washington, D. C., died suddenly at the Hotel Continental in Paris, France, on June 28. Mr. Stewart had been in bad health for several months and, on June 16 accompanied by Mrs. Stewart and their only daughter, sailed on the *Mauretania* for Bad Nauheim, Germany, where it was hoped he would fully regain his health. Mr. Stewart was 46 years old and widely known in the railroad world as one of the most capable and experienced men of his profession. He was born at Fort Wayne, Ind., and began at an early age to prepare for the railroad business. He entered the service of the Union Pacific as machinist's apprentice, and after serving his apprenticeship, worked consecutively as machinist, chief foreman, general foreman, general division foreman and then as master mechanic at Cheyenne, Wyo. In 1903 he left the service of the Union Pacific to go to the Southern Railway as division master mechanic at Knoxville, Tenn. A little later he was promoted to general master mechanic of the Western district, and on April 1, 1904, he was appointed mechanical superintendent of the same road. Two years later he was promoted to general superintendent of motive power and equipment, with headquarters at Washington, D. C., and also chairman of the Committee on Mechanical Standards of the Southern Railway and the following affiliated lines: Alabama Great Southern; Cincinnati, New Orleans & Texas Pacific; Mobile & Ohio and Georgia Southern & Florida railroads, which positions he held at the time of his death. In 1910 he attended the International Railway Congress at Berne, Switzerland, as a delegate, and in 1911 was elected president of the Master Car Builders' Association; he was also a member of the Master Mechanics' Association. There was no man who was held in higher esteem than Mr. Stewart by his associates, as well as those who served under him, and he was widely known in fraternal and club circles.

A. Stewart

SIGNALMAN'S ARREST IN NEW ZEALAND.—The Court of Inquiry into the collision between an express from Wellington and a freight train 40 miles from Auckland has found that the cause of the disaster was the defective working of a signal due to an unauthorized alteration by a signal maintainer named Donaldson, who has been arrested on the charge of manslaughter.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Chicago, Milwaukee & St. Paul has ordered 5 mikado type locomotives from the American Locomotive Company.

The Calcasieu Long Leaf Lumber Company, Lake Charles, La., has ordered one prairie type locomotive from the Baldwin Locomotive Works.

CAR BUILDING

The Wabash has requested bids on 1,500 40-ton steel underframe box cars.

The Pittsburg & Shawmut is in the market for 25 30-ton steel underframe box cars.

The Chicago Elevated Railways have ordered 122 all steel cars from the Cincinnati Car Company.

The Delaware, Lackawanna & Western is in the market for 500 steel underframe box cars in addition to 200 automobile cars previously reported.

IRON AND STEEL

The St. Louis & San Francisco has ordered 32,000 tons of rails from the Tennessee Coal, Iron & Railroad Company.

The Great Northern has ordered 1,150 tons of material for a mail and express building at Minneapolis, Minn., from the Milwaukee Bridge Company, Milwaukee, Wis.

SIGNALING

Electro-Pneumatic Signaling at Jersey City

The Union Switch & Signal Company has just completed the second of the three electro-pneumatic interlocking plants installed by it at the enlarged terminal of the Central Railroad of New Jersey at Jersey City, N. J., and is now at work on the third, tower A, which is the largest one and which is nearest the train shed. The three towers together will have capacity for 297 levers as follows: Tower A, a 179-lever frame; tower B, 47-lever frame and tower C, 71-lever frame. Tower A will have 145 working levers, which will operate 340 units, including nine check lock circuits between towers. From the terminus to the outer limits of the interlocking of tower C, there are 18 automatic block signals.

The entire system is equipped with three-position upper quadrant signals arranged for speed signaling. In the terminal, where speed is restricted the signals are two-arm. The upper arm in each case governs all routes fully equipped with track circuits, and is semi-automatic for all routes. The lower arm governs all routes not fully equipped with track circuits, but is semi-automatic for the portion of its route equipped with track circuits. The lower arm may also be used as a calling-on arm to govern low-speed movements into any occupied section of track by the manipulation of a push button after the signal lever has been reversed. At Tower "C," which has no speed restrictions for the main line, the signals are arranged for high speed, intermediate speed and low speed indications.

All track circuits have alternating current, using the vane type relay. The track circuits for the automatic block signals are "polarized" and have Model "12," three-position polyphase track relays. There will be a total of 250 track circuits. Alternating current will be delivered by the railroad company's own power house, but there will be an emergency connection with the Public Service Corporation of New Jersey.

The Union Switch & Signal Company is also installing at Jersey City a train starting system, using indicator lights for communication between the ferry master's office, the gatemen, conductors and tower directors.

Supply Trade News

C. M. Means, electrical engineer, of Pittsburgh, Pa., has been appointed consulting electrical engineer with the United States Bureau of Mines.

John F. Wallace, consulting engineer, has moved his Chicago office from the New York Life building to 859 Insurance Exchange building.

The American Hoist & Derrick Company, St. Paul, Minn., has moved its Seattle office from 613 Western avenue to 1512 L. C. Smith building.

Dudley O. Johnson has been appointed branch manager of the Chicago office of the Joseph Dixon Crucible Company, succeeding the late Sam Mayer.

W. G. Willcoxson has been appointed representative in the railway department of the Garratt-Callahan Company, with office at 27 South Clinton street, Chicago, Ill.

The Ogle Construction Company, Chicago, has recently been awarded a contract by the Illinois Central for the construction of a 500-ton wood coal chute at Jackson, Miss.

L. H. Shoemaker has been appointed division engineer of the Pittsburgh division of the American Bridge Company, succeeding Richard Khuen, Jr., transferred to the erecting department.

H. W. Green, for the past ten years district sales agent for the American Steel Foundries in Pittsburgh, has been elected vice-president of the Lawrence Steel Casting Company, Pittsburgh, Pa.

The Taylor-Wharton Iron & Steel Company, High Bridge, N. J.; Wm. Wharton, Jr., & Company, Inc., Philadelphia, Pa., and the Tioga Steel & Iron Company, Philadelphia, Pa., have removed their Seattle office to 1604 L. C. Smith building.

The Niles-Bement-Pond Company was recently awarded a first prize of $20,000 in the contest announced last year by the Chilean government for the best designs for a general railroad shop. The awards were made the first week in June, the second prize of $10,000 going to a combination Belgium and English concern. It is expected that the shops will cost $3,000,000.

The Titanium Alloy Manufacturing Company, Niagara Falls, N. Y., has organized a bronze department for the manufacture of titanium-bronze specialties under its various patents. Wm. M. Corse, formerly works manager of the Lumen Bearing Company, Buffalo, and lately general manager of the Empire Smelting Company, Depew, N. Y., will be made manager of the new department.

Mason safety tread, manufactured by the American Mason Safety Tread Company, Lowell, Mass., has been selected by the Boston Transit Commission for use in the stations of the new Boylston street subway, and the company has already received an initial order for about 2,000 sq. ft. of tread for the Massachusetts and Copley Square stations. The same company has also furnished since January 1, 1914, over 10,000 sq. ft. of safety tread to the Interborough Rapid Transit Company, New York, for the stairs and platforms of its subway and elevated stations.

The American Car & Foundry Company

The net earnings of the American Car & Foundry Company in the fiscal year ended April 30, 1914, were $5,810,889, $271,060 greater than for the year before, but slightly less than the $6,240,324 of 1911. There was sent for renewals, replacements, repairs, etc., $2,052,918, so that the balance available for dividends was $3,757,918. Dividends of $2,100,000, or 7 per cent., were paid on the preferred stock as usual, leaving a balance of $1,657,971, equal to 5.52 per cent. of the common stock as compared to an amount equal to 4.09 per cent. earned on the same stock in 1913. Two per cent. dividends were paid on the common stock, or $600,000, which included with $704,000 charged for maintenance and improvements left a surplus for the year

of $357,971, so that the total surplus has now reached the large total of $25,613,140.

The company's balance sheet shows it to be in a strong financial position. The value of the properties is given at $66,782,532. Stocks and bonds of other companies are held to a value of $682,219. On April 30 there was material on hand worth $7,551,777 and there were accounts and bills receivable of $12,099,353. The cash balance was $4,251,577. There were also $2,000,000 worth of bank certificates on deposit. The company's capital stock amounts to $60,000,000, of which one-half is common and one-half preferred. The other liabilities are as follows: audited vouchers and payrolls, $3,899,999; insurance reserve, $1,000,000; reserve for improvement, maintenance, etc., $905,011; reserve for steel car plant $674,310, and reserved for common and preferred dividends, $1,275,000. The surplus, as noted above, is now $25,613,140, nearly $2,000,000 greater than in 1911.

President F. H. Eaton in presenting the report says in part: "The gratifying result of the operations of your company during the fiscal year ended April 30, 1914, is not to be ascribed altogether to any improvement in general business conditions occurring during the year just ended. It is due in large measure to the fact that at the close of the fiscal year 1912-13 your company had on its books contracts for cars in number sufficient to assure the continuous operation of your plants for a number of months.

"The number of cars under contract at the close of the fiscal year was appreciably less than it was at the close of preceding period. Since then, however, there has been some improvement in this regard, and buying has been somewhat more free and inquiries more numerous.

"It is a matter of general belief that the facilities of the railroads for the prompt and proper handling and moving of such a crop as is now indicated are more or less inadequate; if this be so, it is entirely likely that the above noted improvement in the demand for your products, both for the construction of new and the repair of old equipment, will continue and become more accentuated if the favorable crop conditions indicated by the government forecasts are realized by the actualities.

"It goes without saying that any condition which makes for the prosperity of the railroads will redound to the benefit of your company; and it is, therefore, earnestly to be hoped that the current year will see such a further clarifying and settling of the great problems affecting transportation as will result in the resumption of buying activity on the scale and with the regularity so much to be desired by those industries which are in any degree dependent for their own prosperity upon the welfare of the railroads."

TRADE PUBLICATIONS

HEADLIGHTS.—The Esterline Company, Indianapolis, Ind., has issued a catalog descriptive of its "Golden Glow" headlights for street railway service.

LUMBER CRAYONS.—The Walter A. Zelnicker Supply Company, St. Louis, Mo., has issued a leaflet giving the story of Zelnicker lumber crayons.

WELDING AND CUTTING OUTFITS.—The Macleod Company, Cincinnati, Ohio, has issued a catalog illustrative of the Buckeye oxy-acetylene welding and cutting outfits. The booklet contains views of the apparatus and statements of its advantages for various kinds of work. Views are also given showing the process of welding in different kinds of operations.

ELECTRIC LIGHTING FIXTURES FOR RAILWAY CARS.—The Safety Car Heating & Lighting Company, New York, has recently issued a remarkably good catalog entitled "Electric Fixtures," with the object of showing a comprehensive selection of electric lighting fixtures adapted for railway cars. The catalog contains slightly less than 100 pages. It is 9 by 12 in. in size and is printed on a fine grade of paper. Almost all of it is occupied by simple but tasty half tone engravings, very well reproduced, showing a great variety of designs selected from the company's wide experience as best suited to the tastes of the majority and most serviceable in all classes of railway car lighting requirements. The exceeding simplicity of the catalog and its very pleasing arrangement make it rank with the best that have been issued in the railway supply field for some time.

Railway Construction

CENTRAL OF GEORGIA.—An officer writes that a new yard is being constructed at West Macon, Ga., and will occupy about 65 acres. It is approximately 2.5 miles in length, and contains 25 miles of track, with the following capacity: Westbound departure yard, 6 tracks, 315 cars; classification yard, 18 tracks, 554 cars; repair yard, 7 tracks, 146 cars; receiving yard, 5 tracks, 345 cars; caboose and hold yard, 7 tracks, 218 cars, and eastbound departure yard, 7 tracks, 441 cars. The excavation work involving the handling of about 225,000 cu. yd. has been completed. The west end of the classification yard will be operated by an electro-pneumatic plant, and the west end of the receiving yard by a mechanical plant. Two public roads, formerly crossing the tracks, one at grade and the other by short span over a single track are replaced by one 150 ft. steel span over the receiving yard, and the other grade crossing across a wider section of the yards is replaced by a 365 ft. bridge consisting of four spans. The girders are supported on steel bents, which are encased in concrete for a height of 9 ft., and one reinforced concrete span over main tracks 2 ft. 3 in. deep and flared to meet the approaches on the east end of the bridge. These approaches are built at right angles to the bridge and are of reinforced concrete; there being 24 spans of 30 ft. each supported by reinforced concrete columns.

GLEASONTON & PADDY'S RUN.—A contract has been given to Peter Cillo, Williamsport, Pa., for the grading and track laying and to the American Bridge Company for the bridges on a narrow gage mountain line from Gleasonton, Pa., via North Bend. Grading work has been finished on two miles. The maximum grade will be about 6 per cent., and there will be one steel bridge and two trestles on the line. I. W. Gleason, president, Gleasonton, Clinton county, Pa.; H. S. Sleicher, treasurer, and E. C. Wakefield, chief engineer.

LAKE ERIE & EASTERN.—See Pittsburgh & Lake Erie.

LEHIGH VALLEY.—The new Cayuga cut-off from Cayuga, N. Y., west to Seneca Falls, 8 miles, has been completed and put in operation. By the new cut-off the Lehigh Valley has a direct route from Cayuga to Buffalo. (May 15, p. 1118.)

MONTREAL & SOUTHERN COUNTIES (Electric).—An officer writes that a contract has been given to Grant Campbell & Company, Montreal, Que., for building a 15-mile extension to Granby, Que. (October 24, p. 805.)

NEW YORK SUBWAYS.—The New York Public Service Commission, First district, will open bids on July 24, for the construction of Section No. 5 of Routes Nos. 4 and 36, the crostsown portion of the Broadway-Seventh avenue and Fifty-ninth street subway, in Fifty-ninth and Sixtieth streets between Seventh and Second avenues, in the borough of Manhattan. Bids for the making of borings along the lines of proposed rapid transit railroads in the boroughs of Manhattan, Brooklyn, Queens and the Bronx will be opened on July 10 by the commission. This contract will include both land and river borings. The commission has given the contract for the construction of Section No. 1 of Route No. 12, the Eastern Parkway subway, in Flatbush avenue between the terminus of the existing subway and St. Marks avenue, borough of Brooklyn, to the Cranford Company, the lowest bidder, for $2,195,296. (June 26, p. 1606.)

PITTSBURGH & LAKE ERIE.—Announcement is made that the Lake Erie & Eastern, a subsidiary of the P. & L. E., and the Lake Shore & Michigan Southern, which is being built through Youngstown, O., will be put in operation next fall. The present plans call for a line from Struthers, Ohio, northwest to a point west of the Brier Hill Steel Company's plant in Youngstown, thence to Niles Junction. It is planned to ultimately extend the line west to Brady's Lake near Ravenna.

PITTSBURG, SHAWMUT & NORTHERN.—An officer of the Pittsburg & Shawmut writes that construction work is now under way from Kittanning, Pa., to Freeport, along the west bank of the Allegheny river, on about 15 miles. The J. H. Corbett Co., Kittanning, Pa., has the contract to build the line, and the Amer-

ican Bridge Company, Pittsburgh, Pa., is carrying out the bridge work. The work on cuts involves handling about 20,000 cu. yd. to the mile. There will be three bridges of 24 ft., 35 ft. and 55 ft. long respectively. E. E. Tait is president, Bradford, Pa., Dwight C. Morgan, vice-president and general manager, and W. W. Henshey, chief engineer, Kittanning, of the Pittsburg & Shawmut. (December 5, p. 1099.)

Pittsburg & Shawmut.—See Pittsburg, Shawmut & Northern.

Quebec Central.—An officer writes that a contract has been let to P. J. Wolfe, Sherbrooke, Que., for building the first section of ten miles on the extension from St. Sabine, Bellechasse county, Que., northeast to Lac La Frontier, Montmagny county, 25 miles. Five miles of the extension have already been finished. The company expects to have five miles additional completed by September, 1914, and the entire line completed by December, 1915. On the first ten miles now under contract, there will be one steel bridge; the maximum grade will be 1 per cent., and the maximum curvature 5 deg. The company expects to develop a traffic in lumber, pulpwood and other forest products. (May 15, p. 1118.)

Seattle, Port Angeles & Lake Crescent.—This company has completed work on 25 miles of the line, on which work was started last year. The plans call for building from a point near Oak Bay, Wash., west via Irondale, Chimacum valley, Sequim, Dungeness valley and Port Angeles to the Lyre river, thence west past Lake Crescent into the Olympic timber district. C. J. Erickson, president, Seattle, and C. C. Donovan, division engineer, Port Angeles. (September 19, p. 542.)

Southwestern Pacific.—This company has applied for incorporation in Utah with $2,200,000 capital. The plans call for building from Denver, Colo., west to San Diego, 2,200 miles. D. C. Collier, president, San Diego, Cal.; H. A. Parkyn, first vice-president; A. H. Bunge, second vice-president; S. Sherman, secretary and treasurer; C. C. Carnahan, general counsel, all of Chicago; J. E. Carnahan, Canton, Ohio; H. B. Rettie, Chicago; E. Fletcher, San Diego, Cal., and T. Morinaux, Salt Lake City, Utah, are directors. (May 29, p. 1216.)

Southern Railway.—This company plans to carry out double tracking work during the next five years, on 139 miles between Washington, D. C., and Charlotte, N. C., and on 218 miles between Charlotte and Atlanta, Ga.

Williston & Northern (Electric).—An officer writes that the prospects of building are good and that contracts will be let in about 30 days for a line from Williston, N. Dak., on the Great Northern north to Crosby, about 60 miles. A. H. Brown, president, J. C. Field, chief engineer, Williston.

RAILWAY STRUCTURES

Charleston, S. C.—The Carolina, Clinchfield & Ohio has entered into an agreement with the city council of Charleston, S. C., for the construction of terminals on Cooper river in Charleston. Land has been secured and the Holston Corporation has been organized to carry out the work on the terminals and coal handling facilities. It is understood that contracts are to be let at once, and that the work will be started before September 1.

Dallas, Tex.—A contract for a union station and terminals, re-arrangement of terminal tracks and a bridge over Trinity river at Dallas, has been let to John W. Thompson, St. Louis, Mo. The estimated cost of the work is $3,000,000.

Griffin, Ga.—An officer of the Central of Georgia writes that bids will be asked for at once, to build a one-story brick and stone station at Griffin. The new building is to be 38 ft. x 125 ft., with concrete platform and shelter shed 16 ft. x 250 ft. The estimated cost of the improvements is $25,000. (June 5, p. 1257.)

Macon, Ga.—See Central of Georgia under Railway Construction.

Montreal, Que.—According to press reports the Canadian Northern will put up a new building on Lagauchetiere street, Montreal, at a cost of $250,000, to be used temporarily as a station. It is understood that as soon as the permanent station on Dorchester street is finished, the Lagauchetiere station will be used for express and other offices.

Railway Financial News

Atchison, Topeka & Santa Fe.—Final arrangements have been made, in compliance with the special law passed by the last Texas legislature, for merging with the Gulf, Colorado & Santa Fe the following subsidiary roads: the Concho, San Saba & Llano Valley, the Texas & Gulf, the Gulf & Interstate and the division of the Pecos & Northern Texas south of Sweetwater. The several different separate general offices are abolished. The Gulf & Interstate is 75 miles long, connecting Galveston and Beaumont; Texas & Gulf 126 miles, Longview to Center, and a branch connecting Gary and Grigsby; Concho, San Saba & Llano Valley 56 miles, Paint Rock to Miles; and San Angelo to Sterling City; Pecos & Northern Texas, Sweetwater to Coleman, being a part of the "Coleman cutoff."

Cincinnati, Hamilton & Dayton.—See editorial comments in regard to default in interest.

Colorado, Wyoming & Eastern.—This company has taken over, as of June 1, the railroad and property of the Laramie, Hahns Peak & Pacific.

Laramie, Hahns Peak & Pacific.—See Colorado, Wyoming & Eastern.

National Railways of Mexico.—It is said that the requirements for interest maturing July 1 for this company and for its subsidiary companies are the subjects of negotiations with the Mexican government. The negotiations look toward an arrangement similar to that made for interest requirements earlier this year.

New York, New Haven & Hartford.—In addition to the passing of the New York, Ontario & Western's dividends mentioned elsewhere, the Rhode Island Company and the Housatonia Power Company have also passed their dividends. Approximately the loss to the New Haven annually will be $1,000,000. The New England Navigation Company declared a dividend of 2¾ per cent. as compared with 3½ per cent. in the previous year.

The syndicate which underwrote the New York, New Haven & Hartford, Harlem River & Port Chester and New England Navigation Company note sale has been dissolved. All of the $20,000,000 New Haven notes were sold; from 75 per cent. to 80 per cent. of the Harlem River & Port Chester notes were sold, and about half of the New England Navigation notes were sold.

Northern Central.—See Pennsylvania Railroad.

Northern Pacific.—The directors have approved the creation of a refunding and improvement mortgage to be dated July 1, 1914, securing bonds maturing July 1, 2047. The directors have authorized the executive committee to sell $20,000,000 bonds under this mortgage. Of these bonds, which it is thought will be 4½ per cent. bonds, $10,000,000 will pay notes maturing July 9, and the remainder will be used to reimburse the company for advances for additions and betterments.

Pennsylvania Railroad.—The directors have approved the lease of the Northern Central, which lease has been approved by the great majority of Northern Central stockholders. Under the terms of this lease the stock of the Northern Central is to be increased by 40 per cent., the additional stock to be paid out as a stock dividend. The Pennsylvania is to continue to guarantee 8 per cent. dividends on the stock and the lease is to run for 999 years.

Union Pacific.—The executive committee has extended the date of payment of the extra dividend, consisting of Baltimore & Ohio stock and $3 in cash, to common stockholders from July 1 to July 20. The court of appeals, which heard the so-called Equitable case to restrain the payment of the dividend, meets on July 14.

Williamsville, Greenville & St. Louis.—On July 7 this road is to be sold under foreclosure by Charles Morsey, special master at St. Louis, Mo.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico.....$5.00
Canada 6.00
Foreign Countries (excepting daily editions)..... 8.00
Single Copies.....15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention daily issues, North America, $1.00; foreign, $2.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue 9,000 copies were printed; that of these 9,000 copies, 7,461 were mailed to regular paid subscribers to the weekly edition, 250 were provided for counter and news companies' sales, 1,173 were mailed to advertisers, exchanges and correspondents, and 116 were provided for samples and office use; that the total copies printed this year to date were 261,700, an average of 9,347 copies a week.

VOLUME 57 JULY 10, 1914 NUMBER 2

Contents

*Illustrated.

The *Railway Age Gazette Mechanical Edition* recently held a competition on draft gear, a prize of $100 being awarded for the best article showing which type of draft gear should be used. The prize was awarded to E. W. Newell, of Pittsburgh, and Mr. Newell's article, together with two of the three other articles which were used in the July Mechanical Edition, are reproduced elsewhere in this issue. Of the twelve papers which were recommended by the judges for publication, ten favor the friction draft gear. There can be no question as to the necessity of more care on the part of the mechanical department in providing the best type of draft gear and of seeing that it is maintained in good condition.

The Draft Gear Problem

On the other hand, and Mr. Wells brings this out clearly and forcefully, the cars are now seriously abused in switching service and it is squarely up to the operating department officers to see that the careless and rough handling of cars at terminals is stopped. Mr. Umshler, general yardmaster of the Illinois Central at Centralia, Ill., in the first prize article on "The Operation of Large Classification Yards" in the *Railway Age Gazette* of July 3, directed attention to this as "one of the paramount questions of successful yard operation." The damage done to the cars by this rough handling is serious enough, but when the cost of delays to traffic, shortage of equipment, damage to freight and the effect on the organization are considered it is imperative that the roads study carefully the draft gear problem with the idea of using only the best, because that will be the cheapest in the end, and that more care be used in handling the cars by the operating department.

In the establishment of the parcel post the Government has entered into competition with the railroads and the express companies in the business of transporting merchandise—freight. Mr. Peters puts emphasis on this point in his latest appeal to Congress, which is printed in another column. It is important to remember this when considering the prices that the postoffice department ought to pay the railroads. The original purpose or theory of the national postal service was that of disseminating information, and weight was not a chief factor. For letters weighing fractions of an ounce the payment by the Government of an arbitrary rate was not intolerable. The irrational plan of fixing the price in the halls of Congress, without consultation with the carrier, could be peacefully submitted to. But when to ounces of letters are added wagon-loads—tons—of merchandise, the unreasonableness of the arrangement becomes apparent to everybody—except to the blind statisticians of the postoffice department. Mr. Peters says that the railroads object to being paid wholly by space. The question of space versus weight, however, is not so important as that of getting some method of paying according to actual service, instead of by four-year periods on a one-month average. Space-rates might possibly be made tolerable, though inequitable, for the same reason that per diem rates for freight cars, though not always equitable, are tolerable; their simplicity and the facility with which they can be accounted for outweigh any small injustice involved. Competition, the rules for which are formulated by one only of the competitors, is hardly fair. Not the least of the problems before the Congressmen, therefore, is the preliminary problem suggested by Chairman Bourne—whether the postal laws are to be formulated by Congress or by a bureau of the executive department.

Mail Pay Rates Still Unsettled

On two divisions of the St. Louis & San Francisco the wife of every employee has received a pass, good for six months, over the whole division; this by way of recognizing the excellence of the division from the standpoint of "Safety-First." The arrangement is described on another page of this paper. The influence of wives and mothers over their husbands and sons in the matter of these men's habits, as related to personal safety, has been recognized from the first, and ladies have been invited to safety-first meetings everywhere; but what is a picture-show lecture, even with band concerts and ice cream thrown in, compared with a piece of cardboard which can be valued in dollars, perhaps scores of dollars? For the time being the shopman's or the section master's wife is on a level with the directors' wives. Mr. Nixon has been exceedingly liberal with his passes; but, evidently, he wished to make his advertisement loud enough to be heard by all; and a little excess can do no great harm. He can hereafter vary the terms of the grant as circumstances may indicate that they ought to be varied. As we suggested in commenting on the motion pictures, variety and novelty are impor-

Season Passes for the Wives of Employees

tant elements in the safety-first movement. Making all calculations on the basis of statistics of results, which is only a crude measure of men's carefulness, the keeper of the accident records cannot expect to determine very accurately who deserves a prize; but, nevertheless, if he can arouse general interest he may do a great deal of good.

A New Experience

The Texas Railroad Commission is taking with very bad grace the recent decision of the Supreme Court in the Shreveport rate case, in which the railways were authorized to advance rates in Texas to correct a discrimination against Shreveport, La., shippers who had to pay higher interstate rates into Texas. It was perhaps not to be expected that they should be overjoyed at the prospect of having their rates subjected to somewhat the same kind of regulation that the railways have had. The Texas commission has heretofore been inclined to consider itself as rather above the laws. Therefore, it was a new experience when the railways submitted to it a new tariff of advanced rates from Dallas and Houston to East Texas points, backed by the authority both of the interstate commission and the highest court of the law, with a request that the Texas commission approve it, as a matter of form and in the interest of harmony. This the commissioners declined to do at the hearing and at present writing they have not yet signified any intention of graceful acquiescence, although the tariffs have been filed. Commissioner Williams even argued for a compromise based on a slight advance in the Texas rates and a slight reduction in the interstate rates, although the latter had been pronounced reasonable by the interstate commission. Apparently an interesting situation has been created, for if the rates from Dallas and Houston are advanced, those cities will be at a disadvantage unless the rates from other points in the state to East Texas are also advanced. Chairman Mayfield is quoted as complaining that every time the Interstate Commerce Commission touches Texas rates it is to raise them. Of course, Chairman Mayfield could not be expected to discuss the reason for this, but to many others the statement is rather significant that there has been something the matter with Texas rates. The Texas commission undoubtedly has the power to make things rather disagreeable for the railways in retaliation but the present time affords an unusual opportunity for observation of the handwriting on the wall.

THE AUTOMATIC TRAIN STOP—I

IN the report of the committee on automatic train stops, laid before the American Railway Association at its last meeting and printed in the *Railway Age Gazette*, May 29, page 1192, there is presented for the first time a clear cut official declaration *against* the use of automatic stops; and setting over against this the demand of the Interstate Commerce Commission that a safeguard of this kind shall be introduced on our principal railroads, we may say that we have a more definite issue than has existed at any time in the past; the problem is measurably simplified. It will be worth while to look for a moment at the grounds on which is based this conservative opinion of the committee. With these grounds clearly defined we can the more intelligently compare the opposing views.

The committee says that our present system of visual signals, if properly installed and maintained, is so nearly perfect that both the railroads and the public authorities should direct their efforts towards the enforcement of obedience to signals rather than the installation of additional devices. Reading a little between the lines, one concludes that the members of the committee regard the whole automatic stop proposition as so difficult and costly that it ought to be put aside as unworthy of attention. The committee wisely omits the old argument that an automatic stop impairs discipline; that with it the enginemen will be less vigilant. It has been demonstrated that stops stimulate vigilance rather than the opposite.

The committee must, of course, take for its main groundwork the very high percentage of safety to be found in the present records of the best roads. When a road carrying twenty million passengers yearly goes ten years without a fatal passenger train collision, that good record must be due to something more than good luck. Whatever may be said of individual disasters, the fact remains that under the best conditions, the *percentage* of failures is so small that we are justified in saying that those failures really are accidents, not constitutional faults of the system of operation. To produce such a very high percentage of perfect operations the *system* must have merit. Railroading is a dangerous business, and, in its development, innumerable risks have been met and overcome. The records for safety of train movements which are made year after year on our busiest lines, such, for example, as those between New York and Philadelphia, constitute a really great achievement. A similar history of long continued, well-directed efforts and high standards of operation is to be found on numerous suburban lines and at the great passenger terminals. These records testify to the high efficiency of American locomotive runners (it is to be borne in mind that the automatic train stop is designed to do only one thing; to provide against the failure of enginemen to see and obey signals).

The committee is justified in basing its opinion on what can be done, not under average, but under the best conditions. If each road had put forth proportionately the effort, the knowledge and the money which have made the best American safety records, the train-accident record would have been smaller than it is by a very large percentage. Moreover, by any rational theory, it is a duty to improve existing practices, methods and standards, regardless of what may be done about new safeguards. The report is inadequate at this point, for it seems to be designed simply to head off those governmental busybodies who ignorantly think that a complicated machine can accomplish impossible wonders, when logically, the committee, to carry out the spirit of its declaration, ought to sound a "clarion appeal" to the members of the association to take vigorous action to perfect their practice with the ordinary visual signals. But, whatever the shortcomings of the report, there is no gainsaying that if every railroad officer were to do his very best, and if all were guided by a strong and energetic national committee, the safety of trains could be much more securely insured than it is at present, *without* resorting to the automatic stop.

Secondly, the committee could point to much progress in this direction already accomplished. For a road to carry all passengers safely for ten years may not be conclusive evidence that all its appliances and methods are the best, but the records of surprise checking, of improved attention to the bodily and mental health of enginemen, and other improvements that have been made during the past five years by numerous prominent roads, afford tangible evidence that correct practice is being constantly studied. Moreover, those who believe in improving present methods, in preference to making a change which introduces new difficulties and greatly increases cost, can point to the fact that a large proportion of the notable collisions which would have been prevented by automatic stops have been due to faults of enginemen which may be very easily cured. For example, Corning: total abstention from intoxicants. Stamford: adequate instruction of new runners. At Western Springs and North Haven the responsibility of the company was greater; but most students of the subject believe that with suitable distant signals these collisions would not have occurred; a very simple remedy compared with automatic stops. There are plenty of other examples.

But the third and strongest claim of the committee is that the difficulties connected with the use of automatic stops would be almost insuperable; not quite insuperable (though, that,

no doubt, is the view of the most pronounced conservatives), but presenting such all-pervasive and constant difficulties that the perfection so confidently promised by the theorists would never be achieved. These difficulties were the subject of an article by Mr. Rudd, signal engineer of the Pennsylvania, printed in the *Railway Age Gazette*, June 6, 1913, page 1211. For fast trains there must be an overlap of 4,000 ft. to give stopping space; a costly sacrifice of capacity. For slow trains this necessitates unnecessary stops, which bring in new dangers. The "stop-and-proceed" rule, in automatic territory, is troublesome enough already, and it would be made more troublesome; for if trains were kept further apart they would the more frequently approach occupied blocks. With long freights this consumes valuable time. This waste of 4,000 ft. must be borne at every crossover and every diverging track—every place where the automatic apparatus is to be used. An engineman with a light train (and often with a heavy one) having been stopped, could then proceed, increase speed and run into the train ahead. In other words, the stops cannot in practice be located close enough together to provide against all careless running. If the special apparatus gets out of order on the road, the train may have to run a hundred miles with it out of service, which introduces a difficulty in discipline. With two or more engines on a train all but the leading one must be cut out—another chance for neglect on the part of trainmen to cause trouble.

Certain desirable characteristics of a workable stop have not yet been developed to any satisfactory degree. With everything in good order, the apparatus should be self-detecting—revealing its own failures—but to maintain this condition without causing frequent undesired stops, is a detail yet to be learned. To guard against the tricks and the laziness of the occasional engineman who lacks conscience, and against anything that will discourage instead of encourage a vigilant habit, a device to record every operation of the stopping apparatus is desirable; so much so that most inventors include this as one of the elements supporting their claim to infallibility; but such a device introduces a new train of annoyances which as yet no one has thoroughly studied. It may be said that the railroad profession ought before now to have solved some of these problems, but it cannot be said that they continue to exist because no one has tackled them. The trouble is that they are very hard to deal with. No experiments to explore the difficulties with snow and ice have yet been satisfactorily completed. None of the experimenters, so far as we know, have gone thoroughly into the question of automatic application of brakes on very long freight trains. In short, the whole problem is so complicated and makes demands in so many directions, and every solution leaves so many things unsettled, that the wisest heads are nonplussed.

It will be said that all difficulties could be solved if sufficient money were forthcoming. Accepting this dictum as correct, theoretically, there are limits to its application. The Pennsylvania might easily spend $5,000 a mile for automatic stops; but it is a grave question whether it could rightfully use its money in that way. Everyone admits that the automatic stop is an adjunct only. The system of visual signals should be perfected in advance of the adoption of refinements. The Pennsylvania, says Mr. Rudd, needs to spend $3,000,000 a year to improve its present signal system. To go beyond that and spend additional millions for stops would be using money which very likely would do the public more good if used in other directions—removing grade crossings, making safer cars, giving employees better training, etc. Moreover, the problem in some situations is so troublesome, as Mr. Rudd shows, that the use of stops would so reduce the capacity of the road that additional tracks would at once become necessary, and additional tracks cost many millions of dollars for very short distances.

The other side of this problem, the accomplishments and the hopes of those who advocate stops, and the points on which they dispute the conservatives, must be left for discussion in a future issue.

AMERICAN SOCIETY FOR TESTING MATERIALS

THE meeting of the American Society for Testing Materials, which was held in Atlantic City last week, was the largest in the history of the society and held the interest of the members well sustained to the end. In commenting on the proceedings of this society at the close of the convention a year ago, attention was called to the fact that the adoption of standards to the extent that prevails did not carry the weight and respect that it ought, owing to the manner in which these specifications were voted upon. This was frankly recognized in an unofficial paper this year by the secretary, in which he called attention to the fact that many standards for specifications were adopted on a vote of less than one hundred out of a total membership of the society of more than sixteen hundred. A number of suggestions were made as to the best means of getting an intelligent vote on questions submitted, but it is acknowledged that the problem is a very difficult one. The trouble lies in the wide diversity of interests and specialities that are represented. All classes of materials come under review with the result that there are a comparatively few members that are competent to sit in judgment on the value of any one set of specifications. Evidently it has been realized that the society has been going too fast in some particulars and has jumped to the adoption of standards and specifications without due consideration, for the whole tenor of the meeting this year was to go slow, though the tendency was violated in some particulars.

The handicap of the widely diversified interests that are involved made itself apparent this year, as it has before, in the meagerness of the discussions. It is safe to say that there was not a paper or report, of the 59 presented, that received the discussion which it deserved. When discussion was progressing freely it was frequently found necessary to curtail and cut it off because of the limited time available for the work. With 64 items on the program to be presented and discussed in nine sessions, averaging about two hours and a half each, the actual time allowable for each item would not be more than about 20 minutes, and it often happened that quite as much time as that was required for the presentation alone.

While, as a whole, the society may be getting more conservative in the adoption of standards and specifications, it still shows spasmodic tendencies in the other direction. There are some of the specifications that have been referred to letter ballot at this meeting that appear to be useless. If an article is of general use and must be made for a large number of consumers by a large number of manufacturers, the specification may be necessary, but when the work is limited to a few makers or to makers who are themselves the consumers, it is difficult to see where the usefulness of the standard comes in. Take, for example, the specification for the cast iron to be used in locomotive cylinders. It is doubtful if the few large locomotive builders of the country would allow their methods of foundry practice to be modified by the specifications of the society, nor is it conceivable that any railroad making its own cylinders would consider itself bound to use these specifications for its own work simply because it has been adopted as a standard by this society. It would have seemed better, then, to have simply put this out as a committee report that makers of locomotive cylinders could use or not as suited their own ideas and foundry practices. In fact, when it comes to the last analysis, all of the work of the society resolves itself down to committee reports that the society has adopted without the majority of the members being able to judge as to whether the reports are solidly founded or not.

Of course, the society could not have obtained the prestige that it has unless its committees had been composed of men who are expert in the lines of investigation and report assigned to them. But, while there may be every confidence in the ability

of these men, great care should be taken that there is no suspicion of the domination of any particular interest in their decisions. Piazza talk sometimes is a far better indication of what men are really thinking than the discussion on the floor, and at Atlantic City last week there was more than one hint thrown out that the committee reports are getting to be dominated by the manufacturing interests. This may or may not be true, and one can only be convinced one way or the other by a careful consideration of the reports in the fullest detail. But the point is that there should be no suspicion of such a thing.

Then, there is the attitude of the society towards other organizations that more truly represent the manufacturers or consumers along special lines. It should always be borne in mind that it comes as a suppliant, as it were, to the manufacturers and users, and must present its specifications with hat in hand. It cannot enforce their use, and they must appeal to these outsiders before they can be made worth the paper that they are printed upon. This was promptly recognized on two occasions during the recent meeting. When the subject of steel springs was up for consideration, the original specifications included the springs for automobiles. These were unsatisfactory to the automobile builders, and so all reference to that branch of the art was canceled from the report as it will be submitted to letter ballot, and the matter was referred back to the committee for further consideration. Again, it was stated on the floor in connection with a matter in which the Master Car Builders' Association was interested, that that association was recognized in Washington and that it would be necessary to conform strictly to its ideas of what was wanted before the specifications could be presented.

It was rather difficult to understand, then, the reversal of this attitude in the matter of heat-treated axles as applied to the motor axles of electrically driven cars. The Electric Railway Association sent a representative to the meeting to protest against the adoption of the specifications as presented for motor axles and simply asked that these axles be excepted from the specifications. The request was refused in a manner so emphatic as to be quite dumbfounding. If the Electric Railway Association is equally emphatic in its decision as to what it wants, and at the fall meeting votes to discard the specifications of the Society for Testing Materials as unsatisfactory, it will be difficult to see what may be the value of those specifications. As to which of the two associations are correct in this particular case, there is no place for discussion here. But it does seem that the promulgation of the specification as a standard had better have been delayed until an agreement with the users was reached.

But back of any differences of opinion that may exist as to the value of the specifications for use and their desirability in the abstract, there is one thing that stands out pre-eminent, and that is the great amount of work and interest that has been done and displayed by the several committees. There is hardly a report submitted that cannot be called a masterpiece. It is to be regretted, however, that there are not more papers giving the results of the personal research work of the members. Many of them are engaged in work of this character all of the time and it is regrettable that more of it does not come to the light of day at these meetings. Diversity of interest is, of course, partly responsible for this, as men do not like to present the results of work in which they are vitally interested to a meeting, in which their own presentation must be limited to a few minutes and the discussion thereon to seconds.

There will be universal disappointment at the outcome of the paint experiments on the Havre de Grace bridge of the Pennsylvania Railroad. According to the committee, no conclusions or statements can be made as to what was accomplished because of the lack of data concerning the materials used. Engineers all over the country have been waiting patiently for years to learn what might be a good practice as based on these results, and now to be told that "the king of France marched up the hill only to march down again," with nothing but his exertions to show for it, is discouraging and the action of the society in referring the matter back to the committee with the plea that it make a final attempt to tell what it all means, if it means anything, was certainly a move that will meet with universal approval; and it is to be hoped that the manufacturers who supplied the paints will also now furnish the information needed to compile a report of value. In like manner the much-talked-of and widely-heralded Atlantic City panel tests are concluded, but here it is expected that a full report will be submitted next year and the results of these years of trial will be made public in a manner that will be of value to all who have to do with the making and using of paints.

THE DELAWARE & HUDSON

With the sale recently to Kuhn, Loeb & Company of $4,500,000 first and refunding mortgage 4 per cent. bonds the Delaware & Hudson rounded out the operations which belong to the calendar year 1913. In March of that year the New York Public Service Commission approved the issue of these bonds to be sold at 95 or better; but contrary to the expectations of both the road's management and its bankers the company was unable to dispose of them at that price during 1913. The company had begun 1913 with a floating debt of $3,500,000, and this had been increased during the year by $1,000,000 through expenditures for additions and betterments covered by the first and refunding mortgage and for advances to subsidiary companies for which the parent company is to be, or has been since the last of the year, reimbursed. The present sale, therefore, presumably permanently finances these expenditures that had been previously temporarily financed through loans and bills payable.

The Delaware & Hudson Company's income is principally from two sources, from the mining and sale of coal and from the operation of its railroad. In 1913 the company had larger gross income and larger net income than in 1912, both from its coal mining department and from its railroad department, and while it is true that during 1912 there was a strike in the coal fields which adversely affected both revenue from coal operations and revenue from railroad operations, 1913 was not entirely free from labor troubles. There were ten strikes in all during 1913, despite an agreement entered into the previous year by which a method of adjustment of differences without strike and without a lockout had been agreed upon by the men and by the company. In 1913 the gross revenue from the coal mining department was $16,045,000, and net after the payment of expenses and taxes $1,188,000. This compares with $13,398,000 gross and $1,024,000 net in 1912.

In the railroad department the company was able to hold down its transportation ratio to almost the same figure as in 1912, despite large increases in rates of pay due to the apparently inevitable compromise by arbitrators under which organized railroad employees get something more than they had previously been getting and something less than they had the audacity to ask for. The ratio of railroad expenses to railroad revenue was 62.97 in 1913 and 62.57 in 1912. The company was able to maintain this operating ratio, despite the wage increases, first, because of economies which would naturally result from a larger gross business; second, through an apparently actual more efficient use of the plant itself, and third, through a reduction in maintenance of way expenses which in part offset increases in maintenance of equipment expenses.

Railroad operating revenues in 1913 amounted to $24,153,000 as against $22,480,000 in 1912, representing the revenues received for carrying 20,470,000 tons and 9,029,000 passengers in 1913 and 19,319,000 tons and 7,950,000 passengers in 1912. The average haul per ton of freight in 1913 was 148 miles, and in 1912 was 146 miles, and the average passenger journey 17.39 miles in 1913 and 18.82 miles in 1912. The average ton-mile rate was exactly the same in the two years, namely, 6.6 mills, and the rate per passenger per mile was 2.02 cents in 1912 and 2.05 cents in 1913. It will be seen, therefore, that the percentage of increase in operating revenue just about represents the increase in the percentage of business handled, the slight difference due to the shorter aver-

age passenger journey and slightly larger revenue per passenger per mile being negligible.

Transportation expenses, which include only the wages, of trainmen, station employees, etc., and the cost of fuel and other materials incident to the actual movement of traffic, amounted to $8,585,000 in 1913, an increase of $606,000 over 1912, which is about 7½ per cent., or almost exactly the same percentage of increase as is shown by the business handled and the revenues earned. Since the rate of wages was higher and the cost of fuel per ton also higher in 1913 than in 1912 this means a movement of traffic per man-hour and per ton of coal considerably greater in 1913 than in 1912.

The revenue train load in 1913 was 543 tons, and the total train load, including company freight, which is the better measure of operating efficiency, was 585 tons, an increase of 52 tons, or more than 9 per cent. over 1912. The average number of all cars, excluding cabooses, per train was 31 in 1913, an increase of over two cars; the average number of loaded cars per train was 20.76, an increase of 1.23. The average number of passengers per train mile was 54.88 in 1913, an increase of 2.78 over 1912.

Maintenance of way, which includes the wages and cost of material used in maintaining the railroad plant exclusive of the rolling stock, was $1,788,000 in 1913, as against $1,940,000 in 1912. Maintenance of way, of course, under ordinary circumstances would not increase anywhere near in proportion to an increase of 7 or 8 per cent. in traffic handled, and the actual decrease in expenditures on this account in 1913, is explained in the annual report as being due to heavy charges in 1912 on account of maintenance charges incidental to the strengthening of bridges and other additions and betterment work then under way. This addition and betterment program was carried on in 1913, as well as in 1912, and $1,041,000 was expended on this account in 1913.

The Delaware & Hudson is a short road, 904 miles, having a heavy freight density, with coal forming a large percentage of its total tonnage. Of the total 904 miles of road, 341 have second track and about 20 third and fourth track, with a total of 634 miles of yard tracks and sidings. The freight density—ton miles per mile of road—was 3,616,000 in 1913 and the passenger mileage per mile of road, 186,000. Of the total 22,269,000 tons carried in 1913, 1,800,000 tons were company freight. Of the remainder 63.93 per cent. was products of mines, 13.97 per cent. manufactures, 7.99 per cent. miscellaneous car load freight, 5.08 per cent. products of agriculture, 4.86 per cent. lumber, 3.13 per cent. merchandise (L. C. L.) and 1.04 per cent. meats and products of animals. The tonnage of all classes of commodities, with the exception of grain, bituminous coal, lumber and bar and sheet metal, and certain other negligible exceptions, increased, the most notable increases being in coal, cement and merchandise.

The Delaware & Hudson is a rather lightly capitalized property; the total outstanding securities, including the $4,500,000 of floating debt which has just been permanently financed, amounted at the end of 1913 to $104,923,000. Subtracting from this the book value of unmined coal owned and advances on unmined coal and the book value of stocks and bonds, we find outstanding about $65,000 of securities per mile of road operated. This is probably very much smaller than the actual investment per mile in the property. Since the credit of the Delaware & Hudson is so high as to permit of the sale of 4 per cent. bonds at a reasonable figure, and since the volume of the securities issued against its investments is so conservative, and further, since nearly two-thirds of its securities are represented by funded debt, the final return on the stock representing the ownership of the company is high. In 1913 the company earned 14.53 per cent., and paid 9 per cent. in dividends on its stock, and in 1912 it earned 12.95 per cent. and paid 9 per cent. It must be remembered, of course, that these figures represent the earnings from all sources, including the profits on coal mined and the dividends on stocks and the interest on bonds of electric railway companies and other companies in which the Delaware & Hudson has a considerable investment. The net railroad income amounting to $4,927,000 is at the rate of a little over 8 per cent. on our estimated capitalization against the railroad property—$65,000 per mile.

Letters to the Editor

STEEL CAR INSULATION

NEW YORK, July 3, 1914.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

In order to correct impressions or conclusions that might be reached after reading the article appearing in your issue of June 26, "Heat Transmission Tests on Steel Mail Car Section," we desire to submit the following:

As stated in the article, these tests were limited. They do not cover or give results that would aid in determining the correct steel car insulation. In the first place, before making laboratory tests it is customary to secure only material first class in every respect; it will be noted in Fig. 2 that almost all the four panels show the insulation torn, damaged or pieced together, and on one side of the box the insulating material is cut into two sections. This would allow an open joint, which would not be the case with insulation as applied in a car, as it would be cut in one sheet, eliminating radiation through open joints.

It would also seem that the best results would be obtained if all sides of the test box were of exactly the same construction, instead of having one side of steel and the others of wood. The study of steel car insulation problems is one that has been given considerable thought ever since the inception of the all-steel design, and there are certain conditions which must be considered but which appear to have been overlooked entirely in the tests conducted by Prof. Willard. Steel car insulation should have the following properties:

1. Highest insulation efficiency.
2. Correct sound absorbing properties.
3. Flexibility, ease of application and adaptability to irregular surfaces.
4. Light weight.
5. Moisture repelling or absorbing qualities.
6. Combustion resistance.

The test in question has eliminated almost all of the above with the exception of insulation efficiency. A great many insulation tests have been made by almost all the large laboratories as well as testing laboratories of different universities, but one report that has been given considerable prominence is that prepared by Prof. J. A. Moyer, in charge of the thermal testing plant of the Pennsylvania State College, read before the Third International Congress of Refrigeration, Chicago, 1913. One of the largest and most elaborate thermal testing plants in the country is installed at this college. The efficiency of granulated cork shown in Mr. Willard's paper does not agree with Prof. Moyer's, as the latter shows 1 inch granulated cork to have a B. t. u. transmission per square foot per hour per degree Fahrenheit difference in temperature of air as .479 and of 1 inch hair insulation as .31.

Prof. Moyer's test also brought out a 5 per cent. increase in B. t. u. transmission per 100 feet per minute velocity over 200 feet per minute; at 20 miles per hour this means an increased transmission due to increased air velocity amounting to 75 per cent. This clearly shows the difference existing between a test made in still air and one made under actual operating conditions on a railroad. Insulation efficiency depends upon dead air spaces, and under Item 3, "Object of Tests," in Mr. Willard's article, there is a statement that the space between the inside and outside plates would be filled with a granular or fibrous material which would render that space dead. Those familiar with steel car construction will readily agree that it would be almost impossible to make a dead air space, owing to the openings between riveted joints, around windows, etc. The only possible way to obtain dead or entrapped air spaces is by the use of a material that will actually give this.

The article in question does not clearly describe the kind of

granulated cork used, but from the extremely light weight, six pounds per cubic foot, we assume it is made of large granules of baked cork and its insulation efficiency would be greatly questioned, as this particular material is the sawdust from pure cork sheets, trimmings, broken sheets ground up, etc., after the cork has been baked; and unless the interstices existing between the granules of the cork were filled with a fine re-granulated material the insulation value would not be very high in actual practice. Granulated and re-granulated cork is sometimes used in cold storage work, but it has been found that the material tends to pack and in building work a space is usually left so that additional material may be added upon settlement of the original quantity. It would be almost impossible to take care of this condition in steel cars; and unless the insulation was continuous it would allow uninsulated portions of the steel plates to exist, which would be liable to cause condensation, thus further reducing the efficiency of the insulation. Nor would very fine re-granulated cork answer the purpose in attempting to obtain the required insulation efficiency in all-steel cars, as it would filter down into the interior of the car body over window curtains, etc.

In regard to cork insulation showing a 28 per cent. saving in weight: This amount is so small it is hardly worth notice, for when it is considered that a steel postal car weighs approximately 100,000 lb., figuring on the basis of 3,000 sq. ft. of insulation per car at an average weight of eleven ounces per square foot, it would mean a saving of only about 580 lb. per car, approximately one-half of one per cent. of the total weight of the entire car, which is really not of enough importance to warrant serious consideration.

It would seem from the tests that the insulation was of the well known Salamander brand. Such is not the case, however, as it was a special material known as "Nycinsul." Three-quarter-inch three-ply Salamander steel car insulation weighs only eleven ounces per square foot, whereas ¼-inch and ½-inch Nycinsul weigh eleven and sixteen ounces, respectively, making a weight of twenty-seven ounces per square foot of material for both courses. Figuring on using two courses of ¾-inch three-ply Salamander, we would have a weight of twenty-two ounces per square foot for both, or a saving that would offset the use of granulated cork in the entire air space.

There is nothing new in the suggestion to fill the wall spaces of the car solid with an insulating material. This has been tried on one or two occasions by large railroads, and it has been found to increase the insulation efficiency by 20 per cent.; but by the correct use of double insulation and combinations thereof, almost exactly the same results can be obtained.

The question of sound-deadening is one of prime importance in steel car design; and it has been ascertained that with the Salamander form of hair insulation, cars are much less noisy than is the case with those insulated with a harder and more dense material. This type of material is used in remedying the acoustics in offices, auditoriums, schoolhouses, court houses, etc., the treatment being worked out along purely scientific lines, hair being found to reduce the reverberations of sound to a minimum.

In regard to the test showing that by eliminating the use of the Agasote fibrous blocks between the steel posts and the inside and outside steel plates: This does not seem to be reconciled by other results or good engineering practice, as it has been long recognized that it is better to break the continuity of the steel plates by the use of ¼-inch asbestos felt, cork board or Agasote. This also tends to reduce radiation through steel post sections. If this is not done the steel sheets have a tendency to sweat, the same as cold water pipes running through a hot room.

A number of the largest railroads in the country have made operating insulation tests that have proved clearly the correct insulation material to be used; and we know the development of this part of the all-steel car has kept pace with other parts of the design and is really one of the things that have done much to facilitate the adoption of the steel passenger equipment car.

H. W. Johns-Manville Company.

New York, July 7, 1914.

To the Editor of the Railway Age Gazette:

Referring to the article appearing in your issue of June 26, under the heading, "Heat Transmission Tests on Steel Mail Car Section." Comparing tests 2-A and 2-B with 3-A, 3-B and 3-C, the former with the fibre insulation between the posts and inside sheets, and the latter with the fibre insulation separations omitted, the fibre insulation combination is shown to have an insulating efficiency of 40 per cent., while, by omitting the fibre insulation, the efficiency is increased to 47 per cent. This is diametrically opposed to any heretofore known facts of heat transmission. It may develop that in tests 3-A, 3-B and 3-C the plates were not firmly in contact, as a casual reader might be led to infer that heat transmission through ⅜-in. rivets does not seem sufficient explanation for the difference.

It seems to me quite unusual that agasote should be subjected to such a comparison, when it has long been known to possess insulation values practically equal to wood, as demonstrated in actual service and through exhaustive laboratory tests conducted by Prof. Pryor, of Stevens Institute, and others. For the comparative test between agasote and wood Prof. Pryor selected three-ply poplar veneer, 5/16 in. in thickness, and thoroughly seasoned, as he believed thoroughly dried poplar to have the highest thermo-insulation properties. This material, being a veneer, had higher insulation properties than a single thickness, where the grain runs in only one direction throughout the board, as, in a veneer, the grain runs in various directions, thus breaking the direct transfer of heat units. The results of his test are as follows:

Three boxes, cubes of equal size, were made of different materials, one of No. 20 gage steel, one of Agasote, and one of 5/16 inch 3-ply veneer poplar. Each of these boxes was made with a removable cover.

The tests consisted of determining the amount of heat that had to be supplied to the air inside of the box in order to keep the internal temperature about forty degrees higher than the temperature of the room. That is, heat was supplied to offset the heat lost through the walls of the box when there was a difference of temperature of forty degrees between the outside and inside temperature.

The boxes were set up in the still air of a room having a temperature of about 85 F. A number of incandescent lamps and a slow moving circulating fan were placed inside of the box to maintain a uniform temperature, approximately forty degrees higher than the room temperature. The amount of heat furnished by the lamps was regulated by an adjustable resistance placed outside. Calibrated instruments were used to find the electrical energy that was supplied to the boxes, and this quantity was transformed mathematically to heat units. The temperature inside the box was noted and maintained by observing thermometers that were inserted through the side walls. The outside temperature was also obtained by thermometers hung about the boxes. The boxes were sealed as tight as possible in order to keep down the air filtration.

It was found in the tests that the transmission value of the materials used, based on steel being 100, as follows:

Steel	100.0
Agasote	62.5½
Wood, three-ply poplar	51.2 5/16

The detailed figures of the tests, showing the actual temperatures and heat transmissions, are given in the following table:

Boxes in Still Air

Designation of material	Steel	Agasote	Wood
Radiating box surface, sq. ft.	38.5	39.4	39.2
Heat supplied per hour, watts	553.9	366.2	295.2
Heat supplied per hour, B. t. u.	1896.7	1249.5	1007.2
Average inside air temperature, deg. F.	126.5	121.8	126.3
Average temperature of external air, deg. F.	87.2	81.3	86.3
Difference in temperature between inside air and external air, deg. F.	39.3	40.5	40.0
Radiation per hour in B. t. u.'s per deg. F. difference between inside air and external air, B. t. u.	48.3	30.8	25.2
Radiation per hour in B. t. u.'s per deg. F. difference between inside air and external air, per sq. ft. (based on box surface), B. t. u.	1.253	0.783	0.642
Ratio of performance (based on box surface)	100.0	62.5	51.2

The Pantasote Company.

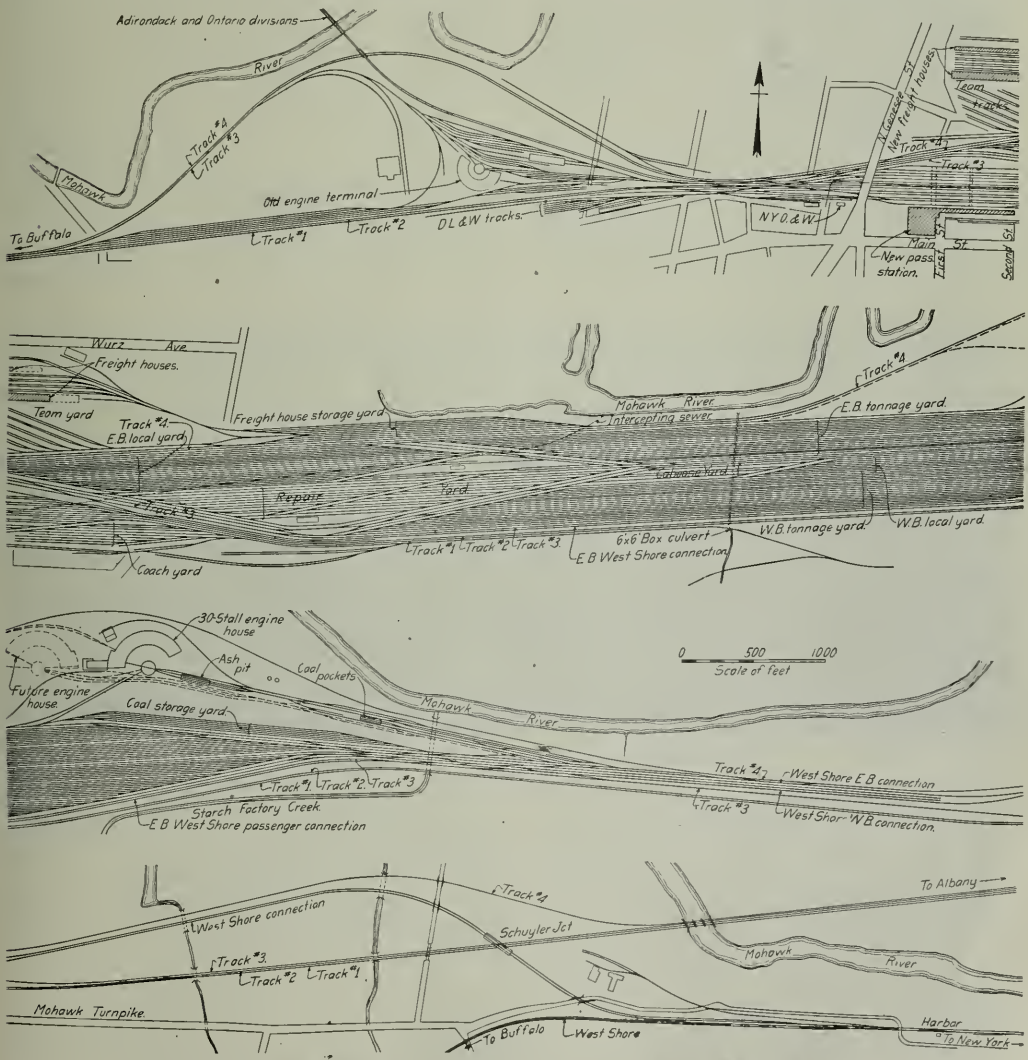
Railway Construction in Russia.—The Vladikavkaz Railway of Russia is at present considering the construction of a new line for the purpose of connecting up the Ekaterininsky system with the Vladikavkaz Railway. The project will involve a capital expenditure of about $1,000,000. The company is also proposing certain improvements and extensions at Novorossisk to cost about $750,000.

The New York Central's Improvements at Utica, N. Y.

Construction of New Passenger Station, Freight Houses, Classification Yards and Engine Terminal

The New York Central & Hudson River's new passenger station at Utica, N. Y., opened on May 24, is one of the important features of the extensive improvement work that this company has been carrying out in Utica for several years and which, when completed, will represent an estimated investment of $6,000,000. Utica is an important point, both for freight and passenger traffic, on account of its location on the main line between Albany and Buffalo at the junction with the West Shore, the Ontario and the Adirondack divisions. About 30 passenger trains are operated in each direction daily from Utica on the main line and about 12 on the other lines. The total daily car movement into and out of the Utica freight yard was shown by a check made last summer to exceed 1,100 cars. The distribution of this freight business is shown in the accompanying traffic diagram.

As the West Shore is electrified and operated by a separate company west of Utica, all freight except for points in electrified territory is handled over the main line west of that point. East of Utica either the main line or the West Shore may be used for freight traffic, connections at Utica, Hoff-

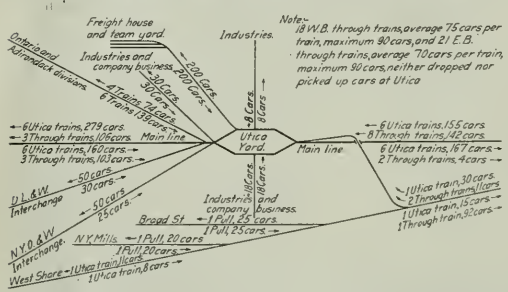


General Layout of the Ultimate Yard Development at Utica, Only a Portion of Which Has Been Built

mans, and Carmen making the operation quite flexible. A large amount of business between New York and Montreal also passes through Utica. Practically no classification of through freight is made at Utica, but all local business and all transfer freight from the West Shore, the Watertown line, the Adirondack division and foreign roads must be classified there.

NATURE OF THE IMPROVEMENTS

As substantially all of the city lies to the south of the main line, the company negotiated with the city for the straightening of the channel of the Mohawk river immediately adjacent to the old layout on the north, to remove that obstruction to development of the terminal facilities. An agreement was finally reached under which the city constructed a new river channel about 2,000 ft. north of the main line and the New York Central purchased the excavated material at a fixed unit price to be used in refilling the old channel. A large outfall or intercepting sewer was necessary in order to carry out this agreement, running under the passenger and freight yards to the river about one mile east of the station.



Diagrammatic Daily Car Movement Into and Out of Utica Yards

The next step was the elimination of grade crossings in the vicinity of the station. This involved the closing of Park avenue east of the station, the construction of a new street along the north side of the proposed new layout to connect Genesee street with the extension of Park avenue, and the elevation of Genesee street on a viaduct crossing the main tracks. This viaduct consists of one 40 ft. girder span and five truss spans, varying in length from 70 ft. to 87 ft. Three lines of girders and pony trusses are used in these spans, carrying a roadway 45 ft. 6 in. wide in which are laid two street railway tracks. Two 8 ft. sidewalks are supported outside of the outer trusses. Three-column steel bents on concrete footings, with reinforced concrete collision piers connecting the lower ends of the columns, carry the trusses. The plate girder floor beams and I-beam stringers support reinforced concrete slabs on which the pavement is laid. All steel work with the exception of the girders above the curb is encased in concrete. Concrete facia girders are provided along the outer edges of the sidewalks.

The new local freight facilities are grouped north of the passenger terminal east of and easily accessible from Genesee street. Separate inbound and outbound freight houses of brick construction are provided, the former being 50 ft. wide and 760 ft. long and the latter 30 ft. wide and 500 ft. long. Room for additions of 200 ft. to the length of both houses is provided at the east end of the layout. Eight tracks serve the houses. The team yard contains 14 tracks with a total capacity of 171 cars. These tracks are arranged in pairs with 30 ft. paved driveways between the pairs. There are two additional team tracks of 20 cars capacity each outside of the north station driveway, supplied with a platform and ramps for handling automobiles.

As the new passenger station covers the site occupied by the old station, it was necessary to provide a temporary building for use during the erection of the new station before the old building was torn down. This was located along the north side of the proposed station platform layout with a temporary framed trestle ramp connecting with the Genesee street viaduct. The three northerly platforms serving six station tracks and the north half of the passenger subway were also built before the old station was abandoned.

During the construction of the new passenger facilities, work was being pushed on the construction of a "jump-over" connection between the West Shore and the main line about 3½ miles east of the passenger station, and on the new classification yard and engine terminal located between that jump-over connection and the passenger terminal. This work involved the construction of a number of minor structures and the handling of large quantities of excavation. The following table indicates the magnitude of the operations that were undertaken:

A Portion of the Team Track Yard and East-Bound Local Yard

Items	Old terminal	Present construction	Ultimate development
Right of way	310 acres	728 acres	.....
Grading excavation	700,000 yd.	6,400,000 yd.	7,500,000 yd.
Masonry culverts	2,400 yd.	13,200 yd.	.....
Cast iron pipe	75 tons	365 tons	370 tons
Main track	18 miles	18.5 miles	22.8 miles
Yard tracks	11.3 miles	27.1 miles	57.8 miles
Total trackage	29.3 miles	45.6 miles	80.6 miles

JUMP-OVER CONNECTION AND YARDS

The old single track connection between the West Shore and the main line at Harbor, where the two lines are only about 600 ft. apart, required freight trains to pass over a heavy grade and to drag through crossovers on the two-passenger tracks which are on the south side of the four-track main line. To improve this condition, a double track jump-over connection has been built leaving the West Shore just west of Harbor, crossing the main line overhead and swinging around parallel with the main line east of the main freight yard. The maximum grade on this new connection is 0.25 per cent. compensated. Track 4 is diverted to the north a short distance east of the jump-over connection and is carried north of the entire yard development and engine terminal. Track 3 has been relocated to separate it somewhat from tracks 1 and 2 and place it on a grade which will allow easy connections with the yard. Tracks 1 and 2 are diverted to the south of the yard layout and are carried on a separate embankment for the greater part of their changed length.

The ultimate yard development as planned at present, includes nine yards of the following capacities:

	Tracks	Capacity
Eastbound tonnage yard	20	2,200 cars
Westbound tonnage yard	20	2,200 cars
Eastbound local freight yard	19	1,000 cars
Westbound local freight yard	8	640 cars
Repair yards		380 cars
Freight house and team track storage yard		300 cars
Coal storage yard		300 cars
Coach yard		78 coaches
Caboose yard		90 cabooses
Total capacity		7,188 cars

This capacity is in excess of the present demands and it is expected that sections of the yard will be built as required and if conditions change the plans will doubtless be altered before the completion of the development. Ample room has been left for extensions and changes wherever the possibility of such changes could be foreseen. The yards are served by an ample number of both thoroughfare and engine running tracks.

A large portion of the filling material for the yard and jump-over connection was obtained by hydraulic dredging. Two field towers, one 95 ft. high and one 65 ft. high, operating drag line buckets were used to throw up a dike behind which the hydraulic fill was made. A 20 in. suction dredge with a 40 ft. by 138 ft. hull, equipped with a 750 h. p. engine, a 1,000 h. p. boiler and a 50 ft. ladder, was used on this work. This dredge pumped through pipe lines 800 ft. to 4,600 ft. in length against a maximum head of 35 ft. The material handled contained from 18 to 22 per cent. of solids. This dredge was able to handle 19,400 cu. yd. in 24 hours. A size "B" Lidgerwood dipper dredge was also used for portions of the work, its maximum record being 18,000 yd. in three 8-hour shifts. This dredge was equipped with a 2½ yd. bucket and an 80 ft. boom. A 65-ton Bucyrus steam shovel and team outfits were used for making the high fill under the jump-over connection and other miscellaneous grading work.

Starch Factory creek which crossed the yard site, has been diverted to the east in order to shorten the length of the required culvert. This creek is carried under the yard in a 24 ft. concrete arch culvert. A 6 ft. by 6 ft. concrete arch has also been built near the middle of the yard. A three-story frame yardmaster's office and four interlocking towers are also provided. An electric transmission line which crossed the site of the yard had to be relocated to keep it north of the new development and a new crossing has been constructed on steel towers with a maximum height of 98 ft.

The tracks in the main yard are laid on 12 ft. centers with a 16 ft. space in the middle of each of the tonnage yards and between adjacent yards, for piling material, rubbish, etc. An 18 ft. to 20 ft. spacing is standard along ladder tracks, leads and thoroughfares. The tracks in the repair yards are spaced alternately 16 and 20 ft., with two adjacent ladders through the center of the yard, dividing it completely. No. 8 frogs on No. 7 ladders are used for all of the principal yards and No. 10 frogs are the sharpest used on running tracks and main line connections. Main line tracks are laid with 105 lb. rail and yard tracks with 80 lb. relaying rail. Creosoted ties and gravel or cinder ballast are used.

At present the only main line trains that change engines at Utica are tonnage freights and local passengers. For these trains and for the Ontario and the Adirondack trains about 54 engines per day are turned at Utica.

The engine house consists of 30 stalls built on a 70-stall circle with provision for the addition of the same capacity in a separate house adjacent to the present one. The depth of 25 of the stalls is 100 ft., and of five, 125 ft. Three drop pits are provided in the long stalls, making it possible to remove any wheel from any engine using the house. A 7-ton electric hoist handles the wheels from these drop pits. The house is a brick structure on concrete footings, similar in type to the generally adopted New York Central standard. The engine terminal also includes a machine shop power house, fan house, two double track ash pits 200 ft. long, two inspection pits 80 ft. long, a gravity coal trestle, sand house, two 50,000 gal. wooden storage tanks and four penstocks.

The power house is a brick building 75 ft. by 89 ft. in size. The machine shop is located in an annex building connecting with the long stalls over the drop pits. The coaling trestle is arranged to coal engines on two tracks directly from the pockets and by means of a bridge reaching over to track No. 4 engines can also receive coal on that main track. Clearfield coal is used for freight engines and Pittsburgh coal for passenger engines, provision being made in the pockets to keep these grades separate. The pockets are 160 ft. long and are reached by a trestle on a .5 per cent. grade.

General View of the 30-stall Roundhouse

The Recently Completed Passenger Station

NEW PASSENGER STATION

The new passenger station is a three-story building 192 ft. by 204 ft. in plan, facing on Main street and on First street, one block east of Genesee street. First street ends at the tracks and provides an entrance to the trucking space alongside the baggage and express building, which extends from the passenger station east to Second street. The front of the station is set back from the street line 18 ft. There are two main entrances on the front covered by heavy marquises. Auxiliary entrances are also provided on both sides of the

The Main Waiting Room in the New Station, Showing Vaulted Ceiling Over Passageway and Beam and Skylight Ceiling Over Seating Lobbies

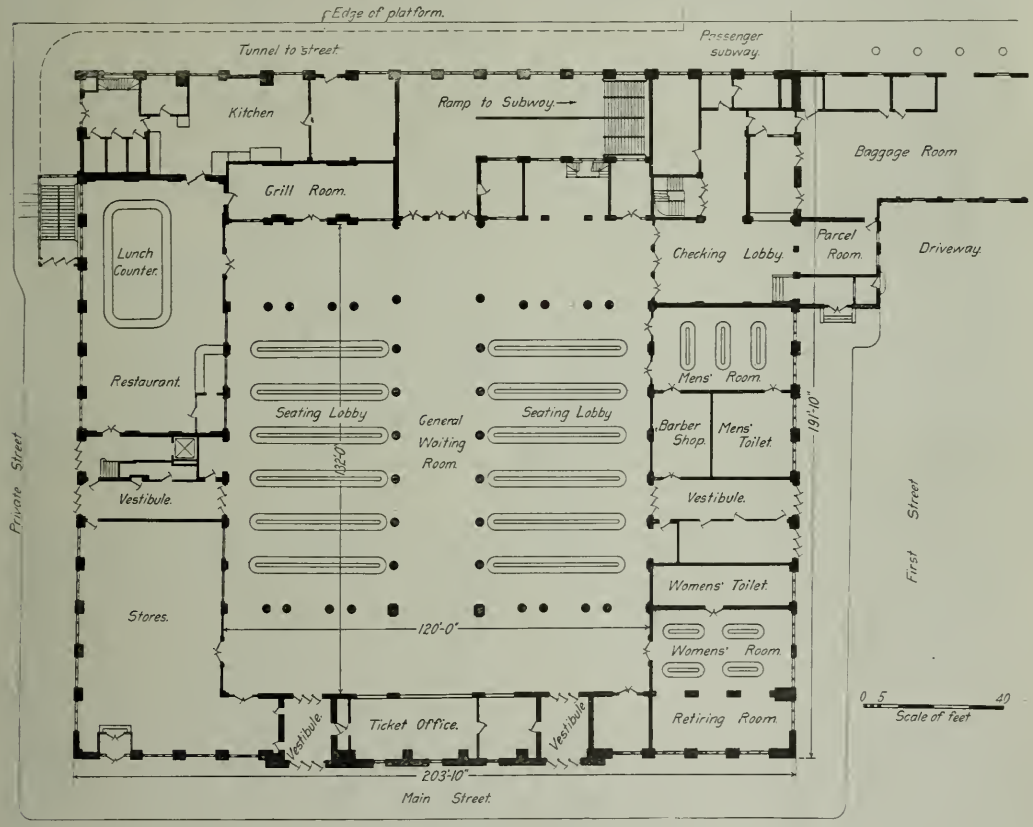
building. Structurally the station has a steel frame with Bedford stone facing up to the first office floor and grayish rough textured brick for the remaining height. Limestone trim is used throughout. Architecturally the building is of the Tuscan order with only enough ornamentation to relieve the severity of the lines. The first story supports a colonnade of Tuscan columns, between which are placed the window openings for the second and third stories. The colonnade is surmounted on the Main street side by a clock 6 ft. 6 in. in diameter supported on either side by cut stone eagles.

The building was designed to rest on spread footings without piles, but as a water-bearing sand was encountered in the excavation, it was decided to use piles under all foundations. A Thew steam shovel was used in excavating for the building and subways, and by rigging a set of leads on this machine it was also used for driving piles. As the street in front of the station and the new track level are at approximately the same grade, the main floor of the station on which all public facilities are grouped is kept at approximately the same elevation, and access to the train platforms is provided by a subway under all the tracks connecting by a ramp and a short flight of stairs, with the main waiting room in the station and to the street at the west side of the building, allowing incoming passengers to reach the street without passing through the station, if desired.

The two main entrances on the south front of the building open through enclosed vestibules directly into the main waiting room, which is 120 ft. by 132 ft., divided by rows of marble columns into a central and two end passageways and two seating lobbies. The central passageway continues to the north wall of the building where a connection is made with the passenger subway. Each seating lobby contains six double seats. The total capacity is about 400 people. All facilities for handling passenger business are grouped around this main waiting room, including the ticket office, information booth, the women's rooms, barber shop, men's rooms, parcel room and baggage check room, news stand, grill room, restaurant and lunch room. A large rental space, which will be occupied by a store, is located in the southwest corner. The floors in the main waiting room, men's rooms and restaurant are of terrazzo, in the vestibules and ramp leading to the subway of paving tile, in the women's rooms of cork tile, and in the grill room of quarry tile.

The effect of ornamentation has been secured in the interior of the building chiefly by the skilful treatment of permanent materials. Vermont marble of soft gray and green veining has been used throughout for wall facing and columns. The vaulted ceiling over the main isles and the paneled ceiling over the seating lobbies are tinted with a grayish green shade to harmonize with the marble, the relief ornamentation being picked out in dull Roman gold. The woodwork is of oak throughout. The building is heated by steam furnished by three 150 h. p. boilers, located under the baggage house.

The building contains two main office floors, and provision has been made for two elevators, one of which has been in-



Ground Floor Plan of New Passenger Station at Utica, N. Y.

stalled. The floors in the office portion of the main building are of steel and concrete construction, the corridor floors being finished with a cement surface and the offices with wood. The partitions are of gypsum blocks and the structure is made fireproof throughout.

The baggage house is a brick building with limestone trim. It is 604 ft. long and 36 ft. wide. It includes a baggage room, mail room and offices and storeroom for the National and American Express Companies.

The track layout at the passenger station includes 12 station tracks served by six platforms, 20 ft. wide and with a maximum length of 1,200 ft. Two through tracks for fast freight and passenger trains which do not stop at Utica are carried through the middle of the layout and are not adjacent to any platforms. The platforms are covered with canopies, 600 ft. long, with provision for extension over the full length of the platforms. Each platform is reached by two stairways from the passenger subway below and by an elevator from the baggage subway.

The passenger subway is 30 ft. 5 in. wide and 8 ft. high with a center row of columns supporting the roof. The walls are of concrete founded on piles and faced with hard burned face brick. The roof consists of concrete slabs under the platforms and I-beams supporting transverse concrete slabs under the tracks. The ceilings under the solid slabs are of sheet steel painted white. The subway is provided with seats along both walls where passengers can wait until trains are called, and if desirable, two rows can be added between the center columns. Heat is supplied by direct radiation under these seats. The electric lights are suspended from wall brackets.

This entire improvement work was carried out under the direction of the engineering department of the New York Central & Hudson River, G. W. Kittredge chief engineer; C. J. Parker principal assistant engineer; J. W. Pfau, engineer of construction, exterior zone; E. B. Menuez, district engineer; B. C. Martin and G. F. Chism, resident engineers, and R. T. Horton, assistant district engineer, had resident charge of the work at various times. James H. Dawes (New York State Dredging Corporation), Philadelphia, had the contract for all grading work on the general improvement. The high fill under the jump-over connection was let to the Walsh-Kahl Construction Company, Davenport, Iowa. Henry R. Beebe, Utica, had the contract for the construction of subways, platforms, canopies, temporary passenger stations and numerous details. The passenger station was designed by Stem & Fellheimer, New York, and was built under contract by J. Henry Miller, Inc., Baltimore, Md. The freight houses were built by Mosier & Summers, Buffalo, N. Y., and the engine house by James Stewart & Company, New York. All tracks were laid with company forces.

Fast Trains on a German Rack Railway.—On the Höllentalbahn (Hellvale Railway), between Freiburg, in Baden, and Donaueschingen, international through cars are now run at relatively high speed for the service between Mülhausen, in Alsace, and Ulm and Munich. Freiburg is situated in the low plains of the middle Rhine, not far from Basle, where the Rhine makes a bend, just at the foot of the Schwarzwald; the Höllental rack railway leads into the highest part of the Black Forest mountains, which there rise to 5,500 ft. The length of the Höllental section of the railway is 22 miles, and the rack line itself has a length of 4.3 miles, and passes over gradients of 55 in 1,000, and curves of 240 ft. radius. Since 1908, through trains of 62 tons maximum weight have been run over this section. Since the summer of 1912, trains of 121 tons weight have been run on the rack at a speed of 19 miles an hour, while the speed over other parts of the Höllental line is 32 miles. The trains are hauled by tender engines of 63.5 tons weight, fully equipped, and special rack locomotives act as helper engines on the rack section.

SOUTHERN RAILWAY PROGRESS

The trustees of the voting trust certificates of the common and preferred stock have sent a letter to stockholders in which they comment on the growth of the property during the life of the voting trust. The following figures are taken from this letter:

	1913	1895	Increase	Per cent.
Mileage	7,037	4,392	2,645	60
Gross revenue	$69,676,720	$17,114,792	$52,561,928	307
Gross revenue per mile	9,903	4,135	5,768	139
Gross income	21,221,685	5,141,615	16,080,070	319
Gross income per mile	3,016	1,242	1,774	142
Ded. from inc. (exc. divs.)	14,191,721	4,245,870	9,945,851	234
Ded. per mile	2,017	1,025	992	96
Net income	7,029,965	895,745	6,134,220	684
Net income per mile	999	216	783	361
Ton m., revenue fr	4,577,486,801	1,098,932,884	3,478,553,917	316
Ton ms. per ms	650,617	265,479	385,138	145
Fr. revenue per mile	6,388	2,613	3,775	144
Pass. miles	844,801,198	178,015,925	666,785,273	374
Pass. ms. per ms	120,075	43,005	77,070	179
Pass. tr. revenue per m.	3,118	1,349	1,769	131
Double track in	385	.....	.....	...
Locomotives	1,632	623	1,009	161
Pass. train cars	1,157	487	670	137
Freight train cars	49,512	18,924	30,588	161

Expenditures have been made for additions to the company's property from 1894 to 1913 to the extent of over $124,000,000 as follows:

New equipment	$35,539,829
Double track, terminals, yards, heavier rails, etc	44,263,176
Real estate—right of way	3,869,041
New lines and extensions	10,731,421
Betterments through inc., approximately	30,000,000
Total	$124,403,465

Growth of the investment and of the financial resources of the company is indicated by the following figures:

Property investment:	1913	1895
Road	$307,962,970	$228,639,979
Equipment	65,502,224	6,010,803
Securities	68,151,367	7,609,801
Materials and supplies	5,744,876	919,430
Advances to proprietary cos	408,235	.....
Total	$447,769,673	$243,180,013
Per mile of road owned	$103,481	$85,565
Per mile road owned, controlled and leased	67,331	55,992

During the period the company has paid aggregate dividends on its preferred stock amounting to $30,758,904, equal to an average of 2.76 per cent. per annum.

Records of the company's land and industrial department show that from 1900 to 1913, inclusive, 8,337 new manufacturing plants of various kinds, representing an investment aggregating $500,000,000, were located on the lines of the Southern Railway. During the same period additions were made to 2,486 existing factories amounting to $100,000,000.

The states principally served by the Southern Railway are nine in all—Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Kentucky and Tennessee. In 1910 the population of the South as so defined was 17,554,840, an increase in twenty years of 4,471,933 or 34.18 per cent.

The last available census figures of the value of property in the South compare 1904 with 1890, and show an increase in wealth in those fourteen years in these southern states of $2,373,242,026 or 38.12 per cent. Farm property in the same states increased in value, comparing 1910 with 1890, in the amount of $2,505,340,373 or 128.08 per cent., while the capital invested in manufactures in the same states in 1909 shows an increase over the year 1889 of $1,075,325,534 or 278.71 per cent.

Value of farm crops in the South in 1909 was $1,199,424,319, an increase of $605,580,746 or 102 per cent. over 1899. Value of products of manufactures in 1909 was $1,455,927,000, an increase in the same period of $939,113,553 or 181.71 per cent. Comptroller of the Currency reports bank deposits in the South in 1910 as $677,483,913, an increase of $435,316,983 or 179.76 per cent. over 1900.

"The share which Southern Railway Company has had in this prosperity is notable," says the trustees' letter.

The Draft Gear Problem from Various Viewpoints

First Prize Article and Two Others Presented in the Railway Age Gazette Mechanical Edition Competition

FIRST PRIZE—THE DRAFT GEAR PROBLEM

By E. W. Newell
Mechanical Engineer, Pittsburgh, Pa.

Draft gear—the real meaning of which is "an apparatus used for drawing a load"—when applied to railway equipment becomes not merely a pulling mechanism, but a shock absorber as well, and owing to the limited space allotted for its installation and the short movement through which it performs its work, the design, principle of operation and installation make it one of the most important, if not the greatest problem, confronting the engineer and designer of railway equipment.

The demands of modern railroading require the stopping of a heavy, high speed train in about one-quarter of one minute, but the draft gear is expected to protect from injury the coupler, the car and its lading, in one-sixth of one second at the very low speed of one mile per hour and in proportionally less time at higher speeds.

It is not our purpose to go into elaborate statistics regarding the number of cars continually out of service on account of defective draft gears and attachments, or to give figures showing the high stresses to which the draft gear is subjected, but to describe the different methods which have been used to meet these conditions and to give results of laboratory and road tests, together with car repair records in order to show which principle, in the designing of draft gears, has proved to be the most efficient.

Various means, including the compression of liquids and air, have been employed to dissipate the shocks on railway vehicles, but the only devices which have been found practical are compression springs and a combination of springs and metallic frictional members, known as friction draft gear; the comments which follow will be confined to the merits of the spring and friction draft gears.

SPRING DRAFT GEAR

Since the discovery of metals, springs of different forms have been used as a cushioning medium and it was natural that they should have been selected for draft gear purposes in the early days of railroads. So long as railway equipment was of light construction, the trains short, and the speeds moderate, spring draft gears were satisfactory, but as these conditions changed, the light springs were found inadequate and those of higher capacity were substituted.

The increased capacities and weights of railway equipment, together with the general use of air brakes on freight trains, permitting higher speeds and longer trains, necessitated a still further increase in the capacity of the springs, and to such an extent that disastrous results occurred from recoil. If it were not for the reactive effect, the use of springs as a shock absorber would be an ideal arrangement on railway trains, because the power required to compress a spring is in direct proportion to its movement, and this is about the rate shock stresses should be dissipated to give the best results.

The damages resulting from the recoil of draft springs is most severe on cars in transit, not only to the lading, but to couplers and attachments and other parts of the car. The danger of parting long trains equipped with spring draft gears and running at slow speeds is so great if the throttle is opened immediately after placing the handle of the brake valve in release position, before all brakes are fully released, that locomotive engineers rarely attempt it and some roads issue instructions forbidding it.

The capacity of draft springs is limited to their safe recoil effect, which is also the capacity of the springs to resist buffing stresses; it has been found to be only about one-third the capacity of a friction gear which does not have the damaging recoil results of the springs.

SERVICE RESULTS

The limited capacity of draft springs gives but a comparatively slight protection to heavy equipment in buffing; this fact was very forcibly brought to the writer's attention a few years ago, when inspecting a lot of cars at the request of a railroad official. Three years previously the road had purchased five hundred cars, alike in every respect except that one-half were equipped with spring draft gears and the other half with friction gears. After having been in the same service for the above length of time, all the cars were reported to be in excellent condition. The railroad was about to purchase additional cars and contemplated using spring draft gears, as the cars equipped with this device were apparently in just as good condition as those fitted with the more expensive friction device. The cars referred to were steel hoppers and their use was confined to ore service. The steel end sills were strengthened on the outside by a very heavy steel casting extending the full width of the car, the casting being so arranged as to take the final blow of the coupler horn. An inspection of many of the cars with both types of draft gears showed them to be in excellent condition, but a visit, the following day, to the repair tracks (the best place to obtain practical draft gear information) revealed a condition which proved conclusively the superiority of the friction gears over the spring gears.

From the repairmen the writer learned that the 250 cars equipped with friction gears were still using the couplers which were applied when the cars were built. On the 250 cars equipped with spring gears all the original couplers had been broken, as well as a complete renewal of another make and at the time of the investigation all of the spring draft gear cars which came in for coupler failures were being equipped with still another make, in the hope that the last type of coupler would be better than the other two. They failed to realize that the trouble was due to the end sills being so strong and the capacity of the spring draft gears so low that the coupler head was continually being driven against the end sill until it broke.

If railroads would keep accurate and systematic records of expenditures and replacements of repairs to freight cars, separating the cost of draft gear maintenance from general repairs, there would be many revelations similar to this.

From experience in car design and inspection of failures of different parts of railway equipment, together with the information obtained from reading railway literature and papers before our railway clubs, there is no question (and it seems to be corroborated by all published reports) that the enormous expense of car maintenance, damage to lading, delays from break-in-twos, etc., would be materially reduced if friction draft gears, properly applied and maintained, were standard on all railways. To be more emphatic, the universal use of friction gears would show as great improvement in conditions as the change from link and pin connection to the present M. C. B. coupler.

LABORATORY TESTS OF DRAFT GEARS

Much time and space could be taken by presenting figures and charts of tests of draft springs on static testing machines and under falling weights, from the early tests under the M. C. B. drop of 1,640 lb. to the present schedule of drop and rivet shearing tests under a 9,000 lb. weight, but these results have been published so generally and are so well known that a rehearsal of this data is unnecessary. Drop test efficiencies of spring and friction gears may be briefly summed up by the following statements, which are results of demonstrations made at various

times, under the auspices of railroad officers, and which are matters of common knowledge among railroad mechanical men:

(a) A 9,000 lb. weight falling 5½ in. closes the most powerful draft gear spring solid.

(b) A 9,000 lb. weight is required to drop from 15 to 20 in. to close solid a friction draft gear of ordinary capacity.

(c) The above draft gear springs placed upon a follower, supported by two standard draft lugs, attached to channels by nine 9/16 in. rivets in each draft lug, required 15 blows of a 9,000 lb. weight falling 6 in., and one blow from a height of 9 in., to shear the rivets.

(d) A friction draft gear, under the same conditions, before shearing the same number of rivets, required:

15 blows of a 9,000 lb. weight falling 6 in.
15 blows of a 9,000 lb. weight falling 9 in.
15 blows of a 9,000 lb. weight falling 12 in.
15 blows of a 9,000 lb. weight falling 15 in.
12 blows of a 9,000 lb. weight falling 18 in.

ROAD TESTS OF DRAFT GEARS

There are many who do not consider laboratory tests of much importance, because of the conditions being so different from service. For this reason there have been made, in different parts of the country, several draft gear demonstrations, with fifty car trains equipped with spring and different forms of friction gears. The two most important tests of this kind were the Santa Fe tests at Ft. Madison, Ia., in 1906, and those on the Los Angeles division of the Southern Pacific in 1908. In order to illustrate the comparative service operation of spring and friction draft gears, a few results of the demonstrations on the Southern Pacific (see report published in serial form in the *Railway Age Gazette*, and the *Railway and Engineering Review*, December, 1908) are given below.

Jerk Test

Set 10 rear brakes by air, take slack with full throttle and throw reverse lever ahead; engine worked on sand. (Train: 50 cars, dynamometer car the 41st.)

Spring Gear	Friction Gear
260,000 lb. jerk	120,000 lb. jerk

Buff Test

Emergency application of the brake at a speed of 9½ miles an hour, steam shut off just previous to use of brake valve. (Dynamometer car 41st.)

Spring Gear	Friction Gear
550,000 lb. buff	155,000 lb. buff
(One broken coupler)	(No damage)

Release Test

Accelerate train to 20 miles an hour, then apply brakes in service application and when speed has been reduced to 13 miles per hour open throttle of engine. (Dynamometer car 26th in train.)

Spring Gear	Friction Gear
285,000 lb. jerk	156,000 lb. jerk
(Train parted)	(No damage; train kept moving)

BUMPING POST TESTS

In 1905-1906 a series of very interesting tests were made by a large railroad; the method employed showed in the best possible manner the inefficiency of spring draft gears. At the foot of a grade a substantial bumping post was erected, against which was anchored a dynamometer car. To the yoke of the coupler on the opposite end of the dynamometer car from the bumping post was attached a slide, containing the record paper, the buffing stresses from the striking cars being registered upon the paper, through the dynamometer, in the usual manner, the movement of the paper being coincident with the travel of the coupler. The diagrams showed the actual operations of the gears in the same manner that an indicator card illustrates what takes place inside of a steam engine cylinder.

During these bumping post demonstrations, tests were made with loaded cars to about 3 m. p. h. and with an empty car to 7 m. p. h. and the records showed the low cushioning effect of spring gears more accurately and clearly than any laboratory or road tests could do.

FRICTION DRAFT GEAR

The preceding comments relating to the inefficiency of spring draft gears disclose, in comparison, the superiority of the friction gear, which is admitted by all who have thoroughly and conscientiously investigated the draft gear question to be founded upon the best principle yet devised for dissipating the stresses to which railway equipment is subjected. The design of friction gears and the methods of operation have taken several forms, but unless some better principle than friction is discovered, friction draft gears, with possibly some modifications in design, will be used for many years to come.

Railroad mechanical men are often skeptically inclined towards the claims made by the makers of railway appliances, but it would seem that the friction draft gear manufacturers have done their part well in furnishing a device of such high efficiency, when it is considered that the spaces allowed for the apparatus are very limited and the travel (length of time for performing the work) is much less than it should be for dissipating shocks of such magnitude; and also to make it of sufficient strength, and at the same time as light as possible, so as not to increase the dead weight of the car.

The draft gear question today is one of close co-operation between the manufacturers of friction draft gear and the railroads, with especial care given to the proper installation upon cars, periodical inspections and renewal of repair parts when necessary. These suggestions, if put into practice, will undoubtedly result in more efficient service from draft gears and better protection to railway equipment and will assist greatly in answering that vital question which is worrying railroad officials so much today as to "how to reduce the cost of car repairs."

A REMEDY FOR DRAFT GEAR TROUBLES

By George Thomson
Master Car Builder, Lake Shore & Michigan Southern, Englewood, Ill.

What is draft gear and what is it used for? This may seem a very useless question, yet if the truth is to be acknowledged we must admit that the draft gear is one of the least understood and most abused appliances on railroad equipment. The draft gear is, to state it plainly, the cushion between the back end of the coupler and the car, and is put there to protect the car from hard knocks; therefore, the better the cushion we use the more protection we give the car, which means a reduction in freight car trouble and the cost of maintenance. At present draft gear is distinctly divided into two kinds—friction draft gear and spring draft gear—there being different designs of each kind.

Until, probably, twelve to fifteen years ago the draft gear commonly in use consisted of one or two springs having a capacity of 19,000 lb. each. These springs were attached to the coupler and car in different ways. With the old type of link and pin coupler this type of gear proved fairly satisfactory, but with the advent of the automatic coupler came the rougher and more severe handling of cars in switching service, so that it was found that a more powerful gear or cushion was needed; then springs having a capacity of 30,000 lb. were brought into use. The attachments for applying the draft gear to the cars were also improved and made stronger. While these springs gave more protection to the car, it was also found that they had a very destructive recoil, which caused a great amount of coupler trouble, such as broken knuckles, knuckle pins and coupler locks; in addition, this rougher handling of cars also entailed a vast amount of trouble in the draft gear attachments themselves, such as broken yokes, yoke rivets, center sills, draft sills, end sills, buffer blocks and broken draft timber bolts. On box cars came an increase in bulged or broken ends, leaking and damaged roofs and side doors damaged and missing—all this increase of damage due to the more severe handling of equipment. A large amount of these troubles could have been prevented by the use of a draft gear giving more adequate protection.

Then came the steel underframe and all-steel car. On an all-wooden car the cars had some "give" to them when hit hard enough, and, while this may have helped out the draft gear, it was pretty hard on the car. With a properly designed steel underframe, or steel car, these conditions changed and the draft gear had to take the humps, as there is no "give" to the steel car. The capacity of the cars and the number of cars per train

were also increased. Heavier and more powerful locomotives came into use, so that in addition to the damage to cars and lading in switching yards came an increase in difficulties in handling long trains, such as break-in-twos, which is a very serious matter. A break-in-two means that not only the train itself is delayed while the damaged car is being switched to a side track, but it may also delay other trains, and very often cause wrecks. Men studying this question came to the conclusion that a more powerful draft gear was needed; but, while they wanted more draft gear capacity, it was preferable to obtain this without any increase in recoil; in fact, it was found highly desirable to reduce the recoil of draft gears. Therefore, this additional capacity could not be obtained by the use of springs alone for the very reason that every pound of energy used to close a spring is returned in the form of a "kick-back" or recoil.

After a great deal of experimenting, the friction draft gear was devised. In this type of gear the springs are not called upon to do all the work, as the frictional resistance is brought into use. This causes a large part of the energy delivered to the coupler by cars striking together to be used in overcoming the frictional resistance of the draft gear friction parts. Thorough tests show that, while it would take a large amount of energy to close a friction draft gear, it also has very little recoil. Friction draft gears have been tested in different ways and have proved their superiority over any and all forms of spring draft gear, this not only in laboratory tests but also in road and service tests.

Several railroads have at times fitted out test trains, equipping them with different types of draft gear, both spring and friction, and conducting a series of tests. These experiments proved beyond a doubt that the trains equipped with a good friction draft gear could be handled with greater despatch and with far less liability of break-in-twos than trains equipped with any form of spring draft gear. The shocks to which these trains are subjected due to train handling were accurately recorded by means of a dynamometer car.

The tractive effort of the locomotive has increased from the 50,000 or 60,000 lb. of several years ago to as high as 160,000 lb. on a large Mallet engine just built. A locomotive having a tractive effort of only 60,000 lb. is sufficient to close a spring draft gear solid, which leaves no cushion in the gear to take care of emergencies. All these facts tend to prove the need for a draft gear giving more protection.

The original friction draft gears had a travel of 2½ in., whereas the spring draft gears have only 1¾ in. This increase in travel alone was of great benefit, and, added to the other desirable qualities of a friction draft gear, helped to solve a large number of the draft gear troubles. Since then various designs of draft gear have been placed on the market, some of them being widely used today, while others had only a short life.

Manufacturers are constantly endeavoring to improve their devices until now there is at least one make of draft gear having a travel of 3¼ in., an increase of 1½ in. over the travel of the spring draft gear. This manufacturer realized that a long travel was not only desirable but very effective in destroying hard blows to which the cars are subjected.

The friction draft gear has solved many troubles and it remains to be decided which make is most desirable. The friction draft gear should have some means to compensate for slack which may occur due to wear of the parts of the device. This provision to compensate for slack should preferably be some form of adjustment which will accomplish this without reducing the length of travel, as reduction in travel means reduction of efficiency. The design of draft gear should be such that it will exclude small parts which may be easily broken or damaged. The design should not be complicated, thus making it easy for the average repair man to handle it when necessary.

The draft gear is fully as important to a car as the air brake and it would be to the railroads' advantage if they would maintain as systematic an inspection of draft gear as they do of air brakes. If air brakes were applied to the car and never looked after, how long do you suppose they would give good, efficient service? Other parts of the car are regularly inspected, so why not the draft gear, and thereby keep it working at maximum efficiency? A preferable design of draft gear would be one that is easy to inspect and maintain. Some designs of friction draft gear are so constructed that if anything is damaged or broken the gear is a complete loss, while in others the broken or damaged parts can be replaced and the draft gear put in working condition.

Railroads which have made a fair and impartial investigation of various draft gears have never failed to find the friction draft gear far more efficient than any form of spring draft gear ever made. Statistics of the cost of car maintenance show that cars equipped with good friction draft gears cost far less to maintain than cars equipped with spring draft gears. Some roads, in keeping the cost of maintenance covering repairs due to draft gear performance, do not go far enough, as the cost of repairs to the draft gear does not cover everything. The cost of replacing broken couplers, broken sills, yokes, yoke rivets and attachments should also be included; in fact, it is hard to tell just where to stop, as a good friction draft gear protects the whole car, while a poor draft gear causes more or less damage to the entire car, particularly in case of a box car, where it is not only destructive to the car but also to the lading. It also puts a car out of service while necessary repairs are being made, thus reducing the earning capacity of the car.

A number of roads which have had wooden cars equipped with spring draft gear that were a constant source of trouble, are at present stopping this trouble by removing the old obsolete draft gear and applying either steel underframes or cast metal draft arms to the cars and equipping them with good friction gear. The roads doing this have made a study of draft gear conditions and find that, while a spring gear is probably cheaper than the friction as to initial cost, it costs far more money in the long run in paying for repairs necessary because of poor protection.

While some of the roads have looked into the draft gear question, there are a number of them which have paid very little or no attention to it. They cannot realize what inadequate draft gear is costing them until they get right down and analyze the cost of repairs due to inferior draft gear and take into consideration the total cost necessary to put a car back into service after it has been hammered to pieces by not having the necessary protection. A number of roads have kept records of these costs and after doing it there has always been one result: they have quit using inadequate draft gear and have put on the best draft gear they could buy, with the result that instead of having cars on the repair track all the time and having congested tracks, they are keeping their cars in service, where they are earning revenue instead of helping to swell the expense account.

Another question. Why do not all railroads, when buying draft gear, make an investigation as to the merits of the different draft gears and have certain requirements covering draft gear? They will inspect various articles going into the manufacture of the car, but when it comes to the question of draft gear they generally do not pay very much attention to it. There are draft gear testing laboratories in this country where the railroads are at liberty to conduct any laboratory test they care to. These laboratories have been put up at great expense by the draft gear manufacturers, and there are at least two companies which are willing to offer their laboratories to any railroad at any time in order that they may conduct draft gear investigations. It seems, however, that some of the railroads do not realize the importance of a draft gear and what it means to them in dollars and cents. When the selection of a draft gear is left to the purchasing agent, as it sometimes is, he will generally buy the cheapest sort of draft gear, regardless of the fact that this same cheap draft gear is going to cost a whole lot of money for repairs later on. Again, the selection of draft gear is often made by some superior officer who is not acquainted with the different

devices, and who will often go against the recommendations of his mechanical men who have made a study of the subject.

The M. C. B. Association has made many and thorough investigations of various articles used in car building, but for some reason or other has done very little along the lines of draft gear investigation. I will grant that it has made some investigations and has gathered some valuable data, but it has merely scratched the surface and has not gone deep enough. Within the past two years it has conducted a long investigation into the manufacture and design of couplers with the idea of making a stronger coupler and thus reducing the enormous number of broken couplers occurring every day. At the M. C. B. convention held in Atlantic City in 1913, various types of couplers were on exhibition, illustrating ideas of strengthening them and eliminating some of the present troubles. The weight of the coupler was increased from 300 lb. to 500 lb. to overcome coupler troubles. Again we ask the question, why do not they also investigate the draft gear and see if something cannot be done there and thus help the coupler troubles by using an efficient cushion back of the coupler?

Railroads which have followed it up know that fewer couplers are broken when used in connection with friction draft gear than when used with spring draft gear. These facts are also more forcibly brought out when the records include steel cars, for, as above stated, a steel car has no "give" to it, to help out the poor draft gear, as is the case with a wooden car. The steel car is here to stay, so why not use all the draft gear protection possible and reduce draft gear and coupler troubles to a minimum?

THE SO-CALLED DRAFT GEAR PROBLEM

By Myron E. Wells
Ann Arbor, Mich.

From an economic standpoint the draft gear problem is certainly most important. W. E. Symons, before the Western Railway Club, made a very reasonable estimate of the annual cost of repairs to freight cars that occur through the draft gear alone, and placed the figure at approximately ninety million dollars. This does not take into account the loss and damage claims, the cost of switching bad order cars to and from the repair track, the delays to traffic and the consequent overtime. It is also a most important factor in keeping the average daily mileage of freight cars down to the very low figure of twenty-five miles a day. This, to my mind, is a great source of lost efficiency, and one not usually taken into account.

The combined effect of all these handicaps results in greatly reducing the efficiency of the railroads. When all these matters are carefully considered and taken into account, the recent estimate quoted by the *Railway Age Gazette* of two hundred and fifty million dollars' damage per annum caused by draft gear troubles is not far wrong. At any rate, any efforts to solve the problem are certainly worth while, and I am very glad to add my mite, because I have for a good many years held some very positive ideas on the subject.

It is already well known that the modern type of friction draft gear is the best and most efficient so far produced. Understand, I am speaking of the type in general, and not any particular make. And with this improvement in friction draft gears we have advanced some, but the problem of reducing the expense of car repairs is still unsolved.

I want to ask, in this connection, why is there this distrust as to the work of our mechanical men along the lines of improved draft gears? No one is offering prizes for data to show that the locomotives and cars of the present day are an improvement over what we had ten and twenty years ago, because that fact is beyond question; so, also, is the fact of the present improved friction draft gears. Our railroad mechanical men are a valiant lot. They are usually equal to any emergency. They have made wonderful strides in improving locomotives and cars generally, but their work on improved draft gears is questioned and in grave doubt, so much so that it is now asked, What have they done? *Is* there any real improvement, and what is now the most efficient type of draft gear?

On the improvement of any particular mechanical problem the effort put forth, and the improvement made, is usually in proportion to the necessity for improvement; and of all the important necessities in modern railroading none has called louder, or been more persistent than the one that has asked for an improved draft gear. My private opinion is that this has been well met by our mechanical men, and, considering the limitations under which they have been compelled to work, they have done nobly in producing the present friction draft gears, and their efforts are to be commended rather than questioned and criticized. If there is anyone who doubts the efficiency of the present friction draft gears I would ask him to not only read, but study carefully, first, the tests of a committee of the Master Car Builders' Association reported in 1908. Second, the actual road tests on the Southern Pacific Railroad, published in the *Railway Age Gazette* of January 8, 1909. Third, the facts and figures presented by J. C. Fritts on this subject at the September, 1913, meeting of the Central Railway Club.

If they will take the trouble to go over this evidence carefully, I do not understand how they can still continue to doubt. As for myself, I am thoroughly convinced, not only from the facts cited, but from personal experience, that modern friction draft gears *do* absorb shock; and the Master Car Builders' tests show that draft gears after from one to five years' actual service were equally efficient with the new in absorbing the shock.

Perhaps a large share of the distrust in friction draft gears comes from the fact that the method of absorbing the shock by friction is sort of paradoxical and hard to understand. It is also most clearly shown that these modern friction draft gears do away with practically all of the shocks from recoil, and if they did only this one thing they would still be enough better than the old spring gears to warrant their substitution. That, in a general way, they are stronger and more efficient is shown most clearly and emphatically by Mr. Fritts' figures. It must be remembered that our mechanical men, in dealing with the draft gear problem, have had to stay within the limitation of 2½ in. or 3 in. travel, and have had to build the drawbars inside of the limitation of one square foot. With these limitations they have done as well as could reasonably be expected. If you could give them a 5 in. or 6 in. movement instead of 2½ in. or 3 in., they could make the friction plates take up much more shock. Also if they had five or six square feet instead of one square foot, they could build a stronger drawbar. But this first is out of the question because you could not then keep the air hose coupled, and in the second case you would complain of the increased expense.

Is there then a solution of this problem? Surely there is. But it is not to be found, in my opinion, along the lines of your suggested competition, nor in finding the most efficient type of draft gears. The solution of the problem is not mechanical. The remedy lies with the operating official in stopping the outrageous and unwarranted destruction of cars in our switching yards.

BETTER OPERATION NEEDED—NOT BETTER DRAFT GEARS

Mr. Fritts, of the Lackawanna, in classifying the damage done to draft rigging, places it in the following order: First, damage on the road because of the introduction of heavier power and larger trains; second, the switching of light and heavy cars together; third, and he says the most important, is the starting of trains and taking slack. Under this head he mentions as a suggestion that cars are sometimes damaged in switching yards. I do not like this classification, and I am going to put the switching of cars in yards as the one great cause of most of our drawbar trouble. Cars are damaged in yards 20 to 1 for those damaged on the road, and my proof for this is the difference in the trouble in maintaining the draft gears on yard and road locomotives.

In road work practically all of the work is done on the tender

drawbar. Any roundhouse foreman can tell how long an average tender draft gear will last in the average switching yard. The fact of the matter is that they do not last at all; and for this reason you will find all yard locomotives doing the work with the front end. Not only this, but you will find that the front ends of yard locomotives have been wonderfully strengthened beyond anything possible on an average tender or car. The extension frames have been shortened and made much heavier; in some cases a large cast steel filling piece is placed between the frames to add strength. Then it has been found that the ordinary front-end timber is entirely inadequate, and this has been replaced by a cast steel member, and even then the roundhouse foreman's troubles are not over in maintaining it.

The necessity for switching from the front end of yard locomotives is so great that in some cases the reverse lever has been changed to the left side of the locomotive in order that the engineer may be on the inside of the curve in some yards where a large amount of switching is done. And while there is all this trouble with yard switching engines the roadmen are going along day after day doing all the work with the drawbar on the tender, with very little drawbar trouble.

During a six months' period recently I rode thousands of miles on freight trains on a trunk line railroad; and in that time no train I was on pulled out a drawbar, and I received but one severe shock, and this did not damage the drawbars to make a delay. In a large majority of cases where drawbars are pulled out on the road the initial damage was done in some switching yard. In this connection I want to speak of the work done by the Air Brake Association and the Traveling Engineers' Association in reducing the shocks in road work. They are entitled to a great deal of credit for the work that has been done; and yet practically nothing has been done to decrease the shocks in switching yards. In fact I sometimes think that the stronger and more efficient the draft gears become, the harder the switchman persists in throwing the cars together.

Mr. Fritts in his report says that from 70 to 80 per cent. of the drawbar damage was due to shock, and he further adds: "If this monster shock is responsible for so great an expense to the railroads in general, *and we all know that it is,* what should be done to relieve the equipment of the ravages of this demon?" Do we all know that this "monster shock" is responsible? For myself I have known it for years, and I believe with Mr. Fritts that every railroad man in this country knows it also, and if this is true, and we have the courage of our convictions, why can not the problem be solved?

Operating officials have side-stepped it long enough by making themselves believe it was a mechanical problem. So far as I am concerned, the whole object of this paper is to answer Mr. Fritts' one question, and the answer is very simple. The solution of this so-called draft gear problem does not depend upon any particular type of draft gear. It is a matter of stopping the present methods of switching in our yards. A solution of a very large percentage of the trouble will be accomplished when operating officials cut the speed of switching operations in yards. I know on practically all the railroads in this country that the switchmen are supreme in the matter, but the officials must take a stand and stop the destruction.

To back this argument I want to cite that the Pennsylvania Railroad some five or six years ago issued an order limiting the speed of switch engines to two miles an hour, and it is well known that the Pennsylvania road is leading in this matter, and that it has some very rigid rules, and that it is actually stopping in a great measure rough switching in yards. In most yards five miles an hour is considered slow switching, and four cars cut off at one time is a reasonable average. These four cars, loaded, weighing approximately 600,000 lb., striking other cars at five miles an hour, develop over a million foot pounds of energy, and this shock is more than any draft gear can possibly be made to stand, friction or otherwise.

Locomotive boilers are built on a factor of safety of four. What would you think of the sanity of a man who would allow 800 lb. of steam put on a boiler that was made to carry 200 lb.? This seems a very silly question, yet you are allowing your draft gears on cars to be mistreated as badly as this every hour of the day and night. If there is a general manager who doubts my statement he can convince himself by spending a few days and nights in some switching tower watching the actual work. To get his full money's worth he must make sure his presence in the tower is not known to the switchmen.

I believe you will all agree with me that any time now gained in *hurry-up* switching is more than lost in the extra switching of the bad order cars produced by the *hurry-up* methods. But whether this is true or not makes little difference, because cars cannot be made to withstand the shocks they get, and I know of no solution but to cut out the shock.

All of this expense and destruction to the freight cars does not take into account the millions of damage claims paid annually on account of rough switching. The Santa Fe has a special committee working to reduce the damage claims, and it is spending much time on methods of loading and schemes of fastening freight in cars so that it cannot move, etc. This is all very good in a way, but if it really wants to accomplish much in a short time, I would suggest that it join forces with the mechanical officials, and go in a body to the operating officers and persuade them to issue some kind of an order that will stop the rough switching in yards. It will save them millions annually in both freight car repairs and in freight claims, even after they have put on a few more switch engines and crews.

Most railroads handle their passenger equipment in a reasonable manner, and I have maintained for a good many years that no general manager would go wrong if he ordered all freight cars switched in the same way that passenger cars are usually handled. If we are really convinced that this problem is no longer mechanical, and that the large amount of money spent annually for car repairs and freight claims can be reduced by stopping the outrageous switching methods in our yards, then will the so-called draft gear problem be solved.

A COMMISSION ON RAILROAD ETHICS

Frederic A. Delano, president of the Chicago, Indianapolis & Louisville, has issued a circular entitled "Some Suggestions for the Owners of Railway Securities and Railway Officials." The circular contains a reprint of an editorial on the railroad situation published in the Chicago *Tribune* of May 31, a letter to the editor of the *Tribune* commenting on it, which was published in the *Railway Age Gazette* of June 19, page 1516, and the following appeal to investors and officials:

"I have been inspired by the foregoing editorial in the Chicago *Tribune* to address you, first, to call your attention to the editorial and then to some comments upon it addressed to the editor of the *Tribune*, and, lastly, to ask your consideration and perhaps your co-operation in an effort to bring about a better condition of affairs.

"As pointed out in my letter to the *Tribune*, railway undertakings are on a totally different economic basis from other undertakings. A railway project, however ill conceived it may have been or however bad the judgment of the original promoters, must continue to be operated, and this obligation makes many a railway or branch line a liability to its owners rather than a valuable asset.

"There is a theory prevalent—unfortunately among men who ought to know better—that the so-called book value put upon a railway property by its owners in capitalizing it is the basis upon which rates for transportation have been established. As a student of the subject for 29 years, I consider that the valuation of railways has about as little to do with the rates as the value of property at State and Washington streets in Chicago has to do with the price of handkerchiefs. In my judgment, there has been great confusion in the public mind between the meaning of the words 'cost' and 'value.' Because a railroad or

any piece of property costs a given sum does not prove that it is worth it, and it must never be forgotten that the government does not guarantee a return upon the *cost* of a railway. Whether the estimates of the government experts and engineers shall prove the value of the railroads to be more or less than the book values now claimed by the corporations will in no way pledge the federal authorities to giving the railroads any certain return on that valuation; and, in fact, if we are honest with ourselves, we must admit that the only advantage which can possibly accrue to the public from an expenditure of some ten to fifteen millions of dollars in the preparation of the figures, will be that, presumably at least, it will settle for all time the mooted but somewhat academic question as to whether the railroads are over-capitalized or not. My own judgment on the matter is that some railroads are over-capitalized regardless of whether the capital is more or less than the actual cost, while other railroads are under-capitalized equally regardless of that fact. In other words, it is clear to my mind that the value of a piece of property is determined by the use to which it is put; and in the case of property permanently dedicated to a public use, it is determined solely and wholly by that use, so that unless there is some possibility or serious intent of allowing a railroad's real estate to revert to its original condition of lots and blocks, or farms, it is silly to talk of the value of it as bearing any relation to the value of adjacent property. *It necessarily follows that the value of railroad property today lies wholly in the hands of the legislative authority of the state and federal governments or in the hands of those commissions to whom the legislatures have delegated authority and administrative powers. The value of railroad property can be increased by increasing earning capacity, and can be diminished even to extinction by decreasing it*

"From the foregoing it is evident that private investment in railroad construction is and has been a hazardous one, and inasmuch as the government gives no guarantee to the investor in the unfortunate enterprises, it should not deprive the investor in the wisely located and well conducted enterprises of not only a fair return, but something more than an average return on the investment. The public can properly demand that railroads as a whole shall not be allowed to earn an exorbitant return on the cost of their original construction plus the improvements and betterments since made; but this being based upon averages, it necessarily means that some properties will earn only a small return on their cost, while others are entitled to earn a very considerable return.

"It is manifestly to the interest of investors in railway securities and of every honest railroad man—and surely a very large proportion of them are honest—that the public shall understand the true situation. On the one hand, the railroad investor has been entirely unorganized and unrepresented, while on the other, the railway official has been entirely misrepresented by a few notorious examples of men who have gone wrong. There is need of organization among the investors and there is also need of organization among railway officials. Small investors must organize so that at every stockholders' meeting they will be intelligently represented just as they are in an English stockholders meeting. The railroad officials must organize so that they may establish on some firm foundation such a system of practices, business ethics and methods as will prevent their being discredited by ignorant, reckless or unprincipled men who are bringing to discredit an honorable profession.

"In short, then, my statement is that, however it has come about, the investor in railway securities and the railway official are today being done a cruel injustice by the public; that this is because these two interests either have not been represented at all or been grossly misrepresented. What is the remedy? Is it not evident that the time has come for effective, constructive work? Far-seeing men, be they bankers, railway officials, publicists or whoever they be, must aid in the solution of this great problem. We must form a commission of our own which, by correcting evils justly complained of, will put railway management in a proper light before the public. We want a commission which not only will not countenance the methods which have recently come to light in the New Haven investigation, but which will set such a standard of business morals and ethics as to make such methods impossible. Such a body should be more than simply critical; it should point out effective remedies for uneconomical methods, wasteful practices and the like. Government supervision is necessary, but after 26 years of experience with it, it is evident that the railway problem needs something more; it needs effective co-operation among men of sufficient experience and knowledge to set things right."

AMERICAN SOCIETY FOR TESTING MATERIALS

The American Society for Testing Materials held its seventeenth annual convention at Atlantic City, N. J., June 30 to July 3, with a registered membership in attendance of 473. In the four days devoted to the convention, nine technical sessions were held at which fifty-nine papers and reports were presented.

President Arthur N. Talbot of the University of Illinois delivered the annual address, taking for his subject the "Relation Between Research and the Activities of the Society." He reviewed the growth in research work that has taken place during the life of the society and outlined the various activities of the several agencies at work along those lines and urged that the society should co-operate with them in the undertakings that came before it. He was especially solicitous that it should work in harmony with the other technical societies so that the results should be properly co-ordinated. He asked that the members encourage the making of larger appropriations for national, state and semi-public laboratories and said that they might properly ask manufacturers and consumers to support liberally research work in all lines on engineering materials.

TEST FOR METALLIC PROTECTIVE COATINGS

In the proposed test metallic protective coatings are exposed to an atmosphere saturated with salt water. The articles to be tested are placed in any convenient chamber into which there is projected an atomized spray of water saturated with common salt in solution, care being taken to avoid placing the test specimens directly in the path of the jet. The spray is produced by a jet of compressed air lifting the water to the nozzle, whence it is projected as a cloud. This apparatus is the common atomizer used in the household. For testing bare metals it is better to use a plain saturated atmosphere, as the salt solution is apt to be too severe. Failure is indicated by the development of red rust.

RELATION OF BRINNELL AND SCLEROSCOPE HARDNESS TESTS

A paper was presented to show the relationship of the Brinnell and the scleroscope readings for hardness and the factor connecting the two was placed at 6.67. That is to say, the readings of the scleroscope multiplied by 6.67 will give the Brinnell readings.

PROCEDURE GOVERNING THE ADOPTION OF STANDARDS

A paper by Prof. Marburg, entitled "A Review of the Procedure Governing the Adoption of Standards," cited the regulations applicable to the constitution of technical committees and the by-laws and regulations pertaining to the procedure governing the adoption of standards. The author expressed the opinion that it would be difficult to suggest wherein the former might be materially improved, but in connection with the latter he presented critical arguments as to:

1. The amendment of a committee report by vote at the annual meeting; and

2. The requirement of a letter ballot of the society for final approval of proposed standards.

Concerning (1) he discussed the present policy by which amendments may be made by a majority vote of those voting, and an alternative policy under which the meeting would not be empowered to amend a committee report, but would have

the power only to refer the report to letter ballot of the society or back to the committee. He concluded that neither of these alternative courses is free from potential evils, and suggested for consideration a compromise policy by which the meeting would be empowered to amend a committee report only by a vote of substantial unanimity—say a nine-tenths vote of those voting—whereas a two-thirds vote would suffice to determine whether recommended standards shall be referred without change to letter ballot of the society, or back to the committee for further consideration.

As to the prescribed letter ballot of the society at large for the final adoption of standards, the author asked whether an experience of 14 years had not shown such a ballot to be almost meaningless, and whether it is not time that it should be abolished.

Discussion.—The discussion of this paper was extended. Attention was called in the first place to the low estimate in which many of the specifications of the society were held by the users of materials, on the ground that they were voted upon by men who had no knowledge or experience to guide them in their decisions and it was suggested that members should be requested not to vote upon subjects for which they had no qualifications. It was generally acknowledged that the ballot system as used did not give convincing results. Various suggestions were made to overcome the difficulty, one being the division of the society into groups and of confining the voting for any particular specification to the members of the group to which it was assigned. It was insisted that the specifications were always drawn by men of experience and that they deserved endorsement on that ground, but that there must be some means by which matters could be referred back to committees where the members were dissatisfied with the reports as presented.

STANDARD SPECIFICATIONS FOR STEEL

These specifications were passed and referred to letter ballot without discussion in every instance except one. In that case the American Electric Railway Association sent a representative to protest against the adoption of the specification for quenched-and-tempered carbon-steel axles, shafts and other forgings for locomotives and cars. Objection was made to the specification for elongation and reduction of area as applied to axles that are used for the driving axles of electric motor cars on the ground that this reduction in the requirements would not insure the care in the heat treatment of the material that was desired. The association asked that the title of the specification be made to read "Quenched-and-Tempered Carbon-Steel Axles, Shafts and Other Forgings for Locomotives and Trailer Axles for Cars." This would have left the driving axles for electric cars out of the specification. There was considerable discussion on the subject, in which the representative of the Electric Railway Association maintained his position and the advocates of the specifications attempted to show that they would give a better axle than that obtained under the present specifications with which the Electric Railway Association was content. When the matter was referred to vote, the answer was very positive to retain the specifications unchanged and to include the driving axles of electric cars in them.

STANDARD SPECIFICATIONS FOR WROUGHT IRON

This was a short report and related almost entirely to a slight change in the specifications for stay-bolt iron. This change simply allows, in the case of retests, a reduction of 2 per cent. in elongation and 3 per cent. in reduction of area from that previously specified. During the past year the committee has conducted experiments with a view to establishing a standard vibratory requirement for stay-bolt iron. Comparative series of tests made on the several types of machines in use finally demonstrated that it would be impossible, on account of their widely different construction, to formulate a standard method of testing that could be strictly adhered to on any two types of machines. As a result of this condition the committee is of the opinion that until such a time as it can see sufficient merit in any particular machine to warrant the adoption of a vibratory requirement based on that or a similar type of machine, the reinsertion of a vibratory requirement in the "Standard Specifications for Stay-bolt Iron" will have to be held in abeyance.

OTHER BUSINESS

The report on "Methods of Sampling and Analysis of Coals" treated in an extensive and thorough manner the methods of sampling and the chemical processes to be followed in the determinations of the various elements in the coal.

At the annual election the following officers were elected for the ensuing year: President, A. W. Gibbs; vice-president, A. A. Stevenson; secretary-treasurer, Edgar Marburg; members of the executive committee, Robert Job, F. W. Kelley, A. Marston, S. S. Vorhees.

EUROPEAN FREIGHT CONGESTION AND AMERICAN TRAIN DESPATCHING

BY ARTHUR HALE
General Agent, American Railway Association

"Lingering Congestion." Is not that an eloquent term? Does it not remind you of that time in the winter of 1903 when the congestion which began on the Jinntown division lingered on into the lap (only the first lap) of spring? But J. Hansen, state councillor and member of board of works at Frankfort-on-the-Main, who invented the term and "proposes it" in the International Railway Congress Bulletin, does not apply the term to congestions that linger toward a conclusion, but to congestions that are lingering in their beginning.

When there is a landslide or derailment in Germany it seems, naturally enough, that the "main traffic office" of the railway is notified promptly and "special measures . . . are necessary to restore order." When, however, some slight delay to one freight train involves another, and perhaps still others, it seems that a German railway may "linger" into a congestion without anyone knowing it except the "assistant station master" and presumably the train crews and the shipping public.

Mr. Hansen takes more than three pages of the bulletin with the help of "sidings *A, B, C,*" etc., and "goods trains 1, 2, 3, etc.," to prove without a possible shadow of doubt that "for some exceptional reason, for instance . . . because an unusual amount of time is required for the operations on the loading sidings . . ." freight trains can, may and do delay each other. Small delays, he says, are unimportant, but there is a "danger point," and that danger point comes at "the moment in which the second goods train begins to wait" after schedule time "in order to be overtaken." "It is important to understand clearly," he says, "that this condition of beginning congestion, harmless though it may appear, is exceedingly dangerous to the regular operation of the science, as it forms a starting point for further development." And he goes ahead for several more pages in an exceedingly logical discussion of proper methods of avoiding this "danger point," for, as he truly states, "congestions of this kind cannot occur if the 'danger points' are eliminated."

Perhaps some young American may here inquire, "Why doesn't the train despatcher make a new passing point?" To him I reply, "My dear young friend, don't you know that in Germany, and in other countries for that matter, there are no train despatchers? How can the train despatcher make a new passing point if there is no train despatcher?" And further I could explain that there are no train sheets, no train reports, no train wire—nothing but a block-wire. And I could conclude that I have been informed that on foreign roads no such expensive system is necessary, their move-

ments being so regular, that all trains can be run as per schedule.

Even when there is a landslide or derailment and the "main traffic office" is notified it seems that the "special measures" taken are apt to be "changes in the time-table." Great—isn't it?

American railway men are curious as to how their European friends, operating as they do without train despatchers, manage to get on with their traffic in case of accident. Mr. Hansen's article dealing with this subject would seem to indicate that according to our standards, in time of accident, the European railways' freight service at least does not get on at all.

American railway men are also curious as to the European arrangement under which they are told the transportation department is made a part of the traffic department, and not allied with the two engineering departments. If we may judge by Mr. Hansen's article this is simply arranged by absolutely eliminating any form of organization such as we could term a transportation department.

But to return to "lingering congestions." They do not occur on single track lines. As Mr. Hansen states, "congestion produced by the blockade of the section is . . . a trouble to which single track railways are very much exposed." In other words, congestions on single track are apt to result in complete blockade.

It seems that no special instructions exist to deal with "lingering congestions." The whole matter is in the hands of the "assistant station masters," who appear to have absolute power over the movements of the train crews in adjoining blocks. The assistant station master is at liberty to allow a delayed freight train to come ahead, but if he has one already at his station he must run the risk of putting the second train on an unusual siding or on the opposite running track. In practice "he does not do this because it would give him a lot of trouble, besides he would run the risk of having to delay a passenger train." He will, as a rule, refuse to allow trains to enter his block unless he is absolutely sure he has sidings where he can readily place them in any event.

The result of this decentralization of authority is that as many as three or four goods trains may be "put in wrong places and all the assistant station masters concerned . . . in a 'state of great uncertainty.'" It is difficult for the assistant station masters involved "to come to a mutual understanding as . . . there are no special rules specifying which train is to have precedence. It gradually becomes more and more difficult to get trains through. . . Locomotives and crews perhaps arrive at their destination so late that the time at which their return trains start has already expired and consequently the return trains are also late. The result is an ever growing confusion . . . the crew of individual trains which are standing still must leave their train or else the hours of work become too long . . . the final result is such a state of chaos that one is quite powerless to cope with the circumstances particularly as it is impossible to obtain a general survey of the state of affairs."

Mr. Hansen admits that "in most cases . . . there are . . . intervals in which individual trains can be pushed forward . . . this . . . depends . . . on the zeal and ability of the different assistant station masters."

Apparently, as above, a lingering congestion of this kind may go on for some time without anyone in authority knowing about it. Mr. Hansen states "a lingering congestion is particularly dangerous . . . because its pressure and its dangers are not recognized in good time. It is true that one notices that trains are late . . . but the ordinary assumption is that this is due to increased traffic for which existing installations no longer suffice. Either no attention is paid to the matter or auxiliary trains are run in order to deal more quickly with the traffic." In other words, when there are too many trains on the road the ordinary method to deal with the situation is to start more trains running.

He goes on, "It is quite possible for a number of goods trains to be standing still and for several stations to be overcrowded before the authorities become aware of the fact. It is only when it becomes nearly impossible for goods trains to be sent on that it is recognized that it is a case of congestion. . ."

When a congestion is recognized, it appears that the traffic manager does take a hand, and Mr. Hansen evidently has had experience in clearing blockades. For instance, he offers this undeniable fact, ". . . it seems advisable to begin with clearing those passing-places where, according to the time-table, trains have to overtake each other." But it is only when there is a very bad congestion that anything like train despatching is resorted to, and then under extreme difficulties. Mr. Hansen says, "If a congestion has already assumed larger dimensions before the traffic manager is informed . . . it becomes exceedingly difficult to cure it and sometimes takes much time, as it is impossible to ascertain with certainty the probable results of any measures proposed." In this case it seems advisable that the traffic manager should in the first place obtain a general survey of the train movements and ascertain which trains are held up at the different stations. For this purpose it is advisable to issue orders that within the whole of the district affected certain definite stations should report by telegraph to the traffic manager the actual time of arrival and time of departure of each goods train.

In other words, a train despatcher system has to be improvized to clear the blockade. To use Mr. Hansen's words, "With the help of this information the traffic manager would enter (record) the real movements of the trains . . . and could proceed to work out the prospective future movements just as one can work out the movements of the figures on a chessboard. With the help of the information acquired in this way, it would then be possible to give the stations any orders necessary." Mr. Hansen admits that "in exceptional cases this procedure could be adopted beforehand," but in general he appears to distrust the train despatcher system, because "the adoption of this system would involve an entire revolution of all our traffic arrangements, and as there is the fear that great difficulties would arise, seeing the density of our traffic, the author thinks that this would be inadvisable."

It can hardly be thought our foreign friends are fully advised as to the adaptation of the train despatcher system to our double track and four track roads of heavy traffic density, or Mr. Hansen would hardly propose the half-way plan which follows as a cure to the "lingering congestion" which he so clearly analyzes and of which he so bitterly complains. After showing that no "lingering congestion" could occur if all "danger points" were avoided and after showing that many danger points could be avoided if assistant station masters were given more discretion, especially in the way of delaying passenger trains somewhat and of taking certain liberties with freight trains, he comes to the conclusion that as assistant station masters will err, the traffic department should be *in position* to supervise them, both day and night.

As he puts it, "It is necessary for the traffic management to exercise a continual supervision over the assistant station masters." With this object in view, the following rules are proposed:

"1. The traffic management must always—day and night—be ready for work.

"2. Any lateness of goods trains, greater than a certain amount (yet to be fixed), is at once to be reported by wire. . .

"3. Any special incidents affecting the traffic, such as accumulations of wagons, . . . are at once to be reported by wire."

The management will take no action on these reports unless

it considers that a "danger point" is imminent. In such a case the traffic management will take the matter up with the assistant station master, "will ask him what he intends to do, will authorize him to do what is advisable or will give him instructions." It is confessed that "a certain time will always elapse after the disturbance of the service has begun before the traffic manager will be in position to intervene." But the author does not consider this a serious objection, "as a lingering congestion only develops slowly."

One material concession is made: ". . . In principle it might seem better if the traffic manager were able to intervene at once." This, however, involves a wholesale adoption of the train despatcher system, and as above stated, "there is the fear that great difficulties would arise, seeing the density of our traffic." Is it possible that the author has compared the density of his traffic with that, say, of the main line of the Pennsylvania Railroad?

Mr. Hansen's article is answered in the same issue of the bulletin by a gentleman who signs "H. T.," who thinks the proposition too radical and that it is very doubtful whether it would succeed. "H. T." continues: "If the traffic management is to control the movement of the trains not from the spot, but from a distant office, on the receipt of telegraphic news, it must not be left out of consideration that the state of affairs may in the meantime have become so much changed by other circumstances which have arisen (e. g., shortness of engines, etc.) that the orders of the traffic management can no longer be carried out." It seems quite clear that "H. T." knows much less about train despatching than Mr. Hansen. H. T.'s idea seems to be in favor of giving the assistant train masters more discretion, although he agrees that "if the traffic congestion extends over a large district . . . then it is, of course, necessary for the head office to intervene," and ends with the hope "that this work will be carried out successfully by the recently established train management offices."

Mr. Hansen does not refer to these recently established offices. Possibly they are the beginning of a train despatching system which will doubtless have to work its way gradually before it is adopted. Indeed, it seems probable that the American system never will and never should be adopted in all its detail on the other side.

Our train despatcher system was worked out before our signal system, while the signals have come first on the other side, and it would not be surprising if they found that the train despatcher's orders should not be sent direct to "conductor and engineer," but to the tower man, or some functionary at the station like the German "assistant station master" who could transmit them to the engine driver and crew, probably by signal.

There is much that is instructive in Mr. Hansen's article in regard to car supply and its relation to congestion, and there is another point which should not be lost sight of.

If it is true that congestion on continental railways is ordinarily attributed to lack of facilities without investigation as to whether the transportation management is good or not, it is impossible to escape from the conclusion that many facilities have been provided which would not be necessary with improved transportation methods. Possibly this throws some light upon the enormous capitalization of the European railroads.

EQUIPMENT ORDERS OF THE SOUTH AFRICAN RAILWAYS.—The South African Railways in 1913 placed orders in England and other countries for passenger cars having a total value of $1,400,345; for freight cars having a value of $4,940,000 and for locomotives having a total value of $6,660,000. Very often large orders are placed abroad simply because of the quick deliveries which can be obtained. The English and other shops can deliver the equipment in from 9 to 12 months, whereas the local shops require from 18 to 20 months.

THE FEDERAL EMPLOYERS' LIABILITY ACT*

BY J. B. SHEEAN

General Solicitor, Chicago, St. Paul, Minneapolis & Omaha Railway.

The federal employers' liability act has effected a revolution in the law as it existed prior to 1908, and is for you the supreme law of the land. It is as remarkable for the laws it abolishes as for the law it prescribes. It is of vital concern to you and must be considered whenever an employee's claim is presented. It is developing from day to day as its various provisions are construed by the courts, and you will find its study as full of interest to yourselves as of benefit to the interests that you represent.

Expressed generally, this act regulates those relations of common carriers by railroad and their employees which have a substantial and direct connection with interstate commerce and while both carrier and employee are engaged in such commerce. It creates a new cause of action and establishes a uniform rule of liability. It introduces a new public policy applicable to railroads and their employees and radically changes the existing law. It supersedes the laws of the several states, in so far as the latter cover the same field, and is supreme within its sphere of action. It must be construed by itself and cannot be pieced out by state legislation. If no liability arises under the act, none can arise from state legislation on the same subject. It probably conflicts with one or more laws of every state and supersedes all such laws. It establishes a liability for the acts of all servants, whether they be engaged in work involving special railroad hazards or in state or interstate commerce. It abolishes the defense of contributory negligence. When a federal law enacted for the safety of employees is involved, contributory negligence can be considered for no purpose. Where no such law is involved, contributory negligence may be considered for the purpose of apportioning the damages. When such a law is involved, the act also abolishes the defense of assumption of risk. In all other cases this defense may exist and must be ascertained and applied in accordance with the decisions of the federal courts. The act also removes the death limit, prescribes to whom the proceeds shall go in case of death, requires a jury to assess the pecuniary loss of each beneficiary, limits the commencement of actions to two years, and requires no preliminary notice to the carrier before suit is commenced. Under this act no one can bring suit except the legal representative of the deceased, and only one action can be maintained. Damages are limited to the pecuniary loss sustained by the beneficiary; that is, the pecuniary assistance which the beneficiary had reasonable expectation of receiving from the continued life of the deceased. Except in the case of a minor child, no damages are recoverable for loss of society or companionship; none are recoverable for the grief or wounded feelings of the beneficiaries, and probably none for the expenses incurred or suffering endured by the deceased before death.

The act removes all of the foregoing questions from the control of the states and is exclusive and supreme within its sphere of action.

The question presented for consideration today is, "What is this sphere of action or when are railroad employees engaged in interstate commerce?"

The act provides that every common carrier by railroad, while engaged in commerce between any of the states, shall be liable in damages to any person suffering injury while he is engaged by such carrier in such commerce, if such injury be caused by the negligence of any of its officers, agents or employees, or by reason of any defect, due to its negligence, in its cars, engines, appliances, machinery, track, roadbed, works, boats, wharves or other equipment. The injury, therefore, must occur while the carrier is engaged and the employee is employed by the carrier in interstate commerce, and the test always is whether the work

*Address presented at the annual convention of the Association of Railway Claim Agents, at St. Paul, Minn., on May 21, 1914.

in question was a part of the interstate commerce in which the carrier was in fact engaged.

Commerce between the states begins when a shipment is delivered to a carrier for transportation to another state and ends with its delivery at destination. It embraces all acts necessarily incident to the receipt and delivery of such a shipment. Cars containing one or more shipments or containing mail, express matter or passengers moving into or out of one state or across or in and out of the same state are engaged in interstate commerce. Trains or cars containing shipments, mail, express or passengers so moving are likewise so engaged, although they only move between points within a state. Empty cars moving across state lines are also engaged in such commerce. Inasmuch as commerce is done by the labor of men and with the help of things, these men and these things are the agents and instruments of such commerce. The act, therefore, applies to every agent and instrumentality by which interstate commerce is carried on and extends to all moving matters having a real or substantial relation to such commerce. An employee engaged in repairing instrumentalities used in interstate commerce, or in moving such commerce, is engaged therein, and if an employee acting within the scope of his employment is engaged in such commerce, it follows that the carrier for whom he works is so engaged.

Whether an employee is so engaged must depend in each case upon the special facts of that case. Courts have had no difficulty in agreeing upon the definitions and general principles involved. They have differed widely, however, in applying these definitions and principles to the cases presented. Since the last meeting of this association, the Supreme Court of the United States has rendered a number of decisions directly bearing on the question under consideration. It is now possible to name with assurance many of the employees to whom the act applies.

In the light of these decisions, it may be stated that the following employees are within the act:

(1) All employees working on or about or assisting in the movement of trains which cross state lines or contain cars loaded, in whole or in part, with mail, freight, express or passengers moving into or out of one state or across or in and out of the same state are admittedly within the act.

(2) All employees engaged in making up, breaking up or performing any necessary work in connection with such trains, or cars at terminals, are within the act. In the Seale case the court held that a yard clerk killed while on his way through the yards to take the numbers, check the seals and tag certain interstate cars was performing work directly connected with interstate commerce and that the interstate transportation was not ended merely because the train had arrived at a terminal and the cars therein were not going to another station. Irrespective of their final destination, it was necessary that the cars be switched for the making up of outgoing trains or for the unloading of freight, and this was as much a part of interstate commerce as was their movement across the state line. You will note that this man was not actually at work when injured, but was on his way through the yards to his place of work and was within the act. From the rule so announced it follows that enginemen, trainmen, yardmen, repairmen and inspectors engaged in making up, breaking up or performing any necessary work in connection with interstate cars are within the act.

(3) All employees while at work in preparing engines or cars for use in interstate commerce are within the act. In the Zachary case the court held that the acts of a fireman in oiling, firing, inspecting and preparing his engine soon to start on a trip within the state, done before two interstate cars ordered to be attached to his train had been so attached, and before his engine had been coupled on to his train, were acts performed as a part of interstate commerce. When killed, the fireman was on his way, within the yards, to his boarding house for a brief visit and was held to be within the terms of the act. Applying the rule thus announced, it follows that all enginemen, engine wipers, hostlers and inspectors engaged in preparing engines and trainmen, yardmen and inspectors engaged in preparing cars for immediate service in interstate commerce are within the act.

(4) All employees engaged in the work of maintaining and repairing instrumentalities in proper condition after they have become and during their use in interstate commerce are engaged in that commerce, although such instrumentalities are used indiscriminately in both state and interstate commerce.

In the Pederson case the Supreme Court held that it would not undertake to separate such service into its elements, and that an ironworker injured while carrying bolts from a tool car to a bridge, to be used in the repair thereof, which bridge was being used indiscriminately in both state and interstate commerce, was within the act; that it was necessary to the repair of the bridge that the materials be at hand and the act of taking them there was a part of that work. Excepting for the phrase "during their use in interstate commerce," the principle announced in this decision would clearly apply to the repair and maintenance of all instrumentalities used indiscriminately in state and interstate commerce. Text-book writers and other courts, however, construe this decision as applying generally to all instrumentalities so used, whether actually in use or temporarily withdrawn from use for the purpose of repair.

It has accordingly been held that all employees engaged in repairing or maintaining tracks, switches, bridges or roadbeds used in both kinds of commerce are within the act, and it follows that all employees engaged in repairing or maintaining cars, engines, appliances, machinery, works, boats, wharves or other equipment used in interstate commerce, or used indiscriminately in state and interstate commerce, are within the act. It should be noted that employees engaged in the original construction of such instrumentalities are not within the principle announced and probably not within the terms of the act. Such, at least, is the reasonable construction to be placed upon the language of the court.

Applying the principles announced by the Supreme Court in the foregoing cases, the district courts have held the following employees to be within the act:

A truckman injured by a truck while loading interstate freight into a car.

A trainman injured while weighing an empty car last used in interstate commerce for the purpose of ascertaining the net weight.

A brakeman injured while making a flying switch to set out a car loaded with state traffic, although taken from a train carrying both state and interstate traffic.

It has also been held that an employee injured while at work in the construction of a new tunnel intended for use in state and interstate commerce was not within the act and that non-resident alien beneficiaries are not entitled to the benefits of the act.

It will thus be noted that the greater part of the work performed by railroad employees is connected with the instrumentalities or movements of interstate commerce. This is due to the fact that the liability act embraces the repair of all instrumentalities used indiscriminately in both kinds of commerce and all movements connected wholly or in part with interstate commerce. If any shipment or passenger in a car or train is moving interstate, the entire car or train is engaged in that commerce, even though the car or train may only move between points within a state. The general opinion has prevailed that this act would be construed to apply to every employee over whom the power of Congress could be exercised. Within the past 30 days, however, the Supreme Court has decided to the contrary and, in the case of I. C. Ry. v. Behrens, has made it clear that Congress intended to limit the act to injuries occurring when the particular service in which the employee was engaged was a part of interstate commerce.

In that case, a switching crew was engaged in yard work, moving state and interstate cars indiscriminately, frequently both at once, and at times turning directly from one to the other. At the time of the injury the crew was moving several cars loaded

only with intrastate freight and after completing that movement intended to switch certain interstate cars. It was held that the particular service in which the crew was engaged at the time of accident was no part of interstate commerce and that the fireman was not within protection of the act. The principle therein announced is an important one and the case should receive your careful consideration. It puts at rest the contention that the act applies to all employees and substantially increases the number of employees not within the act; it emphasizes the necessity of analyzing every car or train movement, and gives assurance that the act will not be unduly extended beyond its terms.

From the foregoing considerations it follows that the act does not embrace instrumentalities used exclusively in state commerce and does not apply to employees engaged in moving trains or cars which are disconnected from interstate commerce. The act does not apply to employees exclusively engaged in moving state cars, although the employees may be engaged in the indiscriminate movement of both state and interstate cars. The act, however, does apply to employees injured when repairing or maintaining instrumentalities used indiscriminately in state and interstate commerce. It does not apply to employees while at work in the original construction of such instrumentalities and should not apply to general office employees whose work is not directly or substantially connected with interstate commerce or its instrumentalities.

Within the limits of this presentation I have given you the controlling definitions and tests for determining what employees are within the act and have named the employees certainly included within and those certainly excluded from its operations. Between these limits are employees whose status is uncertain and in such cases the question may be one of fact to which no answer can be given until after the verdict. The act, no doubt, will continue to be liberally construed and in case of doubt or disputed facts you will be wise in assuming that the act applies.

MAIL-PAY RATES

Congress appears at present to be doing nothing at all to correct the continuing injustice of the present arrangements for paying the railroads for carrying the mails; but as the Bourne committee has not presented its report and as the Moon bill is the only important proposition on the calendar, nothing better than inaction could, perhaps, be hoped for. In the meantime Mr. Peters, speaking for the railroads' committee, has written to Mr. Moon a letter, again calling attention to the inconsistencies of the present arrangement.

In this letter he says:

"The Committee on Railway Mail Pay appeals for fair treatment in fixing any basis of compensation for the handling of the mails.

"A personal effort was made by members of this committee to secure from you a hearing on the bill recently introduced in Congress by your committee, but without success; therefore we submit this open letter.

"We desire to protest against the method of paying the railroads for the valuable service rendered the Government as contemplated in House Bill No. 17042. This question is now pending before a Joint Congressional Committee, which has had the whole subject under most careful consideration, continuously, for more than two years, and has announced that it is about ready to make its report.

"The introduction of bill No. 17042, in effect, forestalls the report of this Joint Committee, and commits Congress before the results of that investigation are made known.

"The Joint Committee of Congress is a bi-partisan body, and the Post Office Department has had the fullest opportunity of presenting the views of its officials before it, many of them having appeared as witnesses. The railroad companies have been called upon at great expense to furnish complete detailed information. . . . The passage of House Bill No. 17042 would practically ignore the action of your own Joint Committee.

"This is the fourth bill which the Post Office Department has framed and recommended on this subject within the past two years, each differing materially from the others. . . .

"The railroad companies do not favor the adoption of any space basis for ascertaining what is proper compensation for carrying the mails. The mails are freight and they are becoming more and more so as the weight of the parcel post increases and the Government enters more and more into competition with the railroads of the country in the business of carrying commercial freight.

"Space in cars under complete control of officials of the Post Office Department as a basis of payment for this service is an anomaly; it will not fit your mail service; and, in our opinion, it will tend to the reduction of facilities and general inefficiency. In this service the Government is a shipper, and no other shipper demands the right to fix his own rates. It uses the facilities of the companies in competing with their own service, and in view of the published intimations of greatly added revenue from the carriage of parcel post, common fairness would seem to demand that the railroad companies should be permitted to share in the increased revenues that the Government collects from the people for the use of these facilities.

"The wiser policy, it seems to us, will consist in modifications and improvements of the existing system, based, as that system is, upon the method of compensating railroads for carrying freight that is universally recognized as sound; such modifications to be an annual weighing of the mails, payment for the use and haulage of apartment post office cars, relief from the messenger service, and other reforms. . . . Congress should at least hear the complete testimony, giving the reasons for the position taken by the railroads, as well as the conclusions of your Joint Committee. . . ."

Mr. Peters has issued a circular containing editorials from thirty newspapers, published in many States, and most of them prominent papers, condemning the unfair attitude of the Post Office Department.

The presidents of the prominent roads west of Chicago on June 30 sent to Mr. Moon a protest similar in tone to that of the Mail-Pay Committee, and requesting that no action be taken by Congress or by its committees until the Bourne report shall have been received.

Ex-Senator Bourne is speaking his mind quite freely concerning the postal service. "In its persistent efforts to secure dictatorial power, the Post Office Department," says Mr. Bourne, "has broken all records. The department bill, H. R. 17042, provides that 'not exceeding' certain rates shall be paid to steam railroads for transportation of the mail. The same bill also contains a clause compelling the railroads to carry mail.

"It is claimed that 'not exceeding' is but a continuance of existing law; but heretofore the railroads have not been compelled by law to carry mail. They are supposed to have accepted the rates as a voluntary act, which in itself was assumed to be sufficient guarantee that rates would not be too low; and it was thought necessary only for Congress to fix maximum rates. But this assumption was not sound, as a railroad would hardly dare to refuse to carry mail; such action would considerably irritate the community along the road.

"The Interstate Commerce Commission is now authorized to fix maximum freight rates, it being left to the railroads to fix the minimum. It would be considered preposterous for the commission to fix the maximum rates at which railroads must carry freight and leave the shippers to fix the minimum. Yet this is the very thing that the Post Office Department in the Departmental bill, proposes for mail pay. Congress is to fix the maximum rates and the shipper—the Post Office Department—is to fix the minimum rates, and the railroads are to be compelled to carry the mail. This is a proposition without parallel in the history of rate regulation. It is bureaucracy run mad."

The General Office Clerk—A Neglected Factor

Bureaus Suggested to Specialize in Appliances and Methods and in Selection of Men for this Department

By George A. Clark

The army of general office clerks represents to a greater or less degree in every railroad organization, certain neglected opportunities for direct economy of expenditure and opportunities for more efficient service to the entire organization. The relative and absolute importance of the work of this group of railroad employees has increased tremendously during recent years. The latest figures covering expenditures for this purpose are those published in the statistical report of the Interstate Commerce Commission for 1911. In that year the railroads of the United States reporting to the commission paid out in the form of compensation to "General Office Clerks" a total of $61,971,046. This amount represents an increase of 149 per cent. over the amount similarly expended ten years before. As contrasted with this, the amount expended as compensation for "general officers" and "other officers" increased during the same period but 48 per cent. It appears that in 1901 the pay of clerks exceeded that of officers but 11.9 per cent., while in 1911 the difference amounted to 88 per cent.

In so far as these comparisons indicate tendencies in railroad development, two striking factors appear—the contention of the editors of the *Railway Age Gazette* that one of the crying needs of present day railroad organizations is more men to act as supervisors, the other that in the total of the amount paid to clerks when considered with the increase during the past decade, a condition exists which should challenge the attention of railroad officials alert to every opportunity to make each factor in their department and organization fully productive. The amount expended as compensation for clerks represents an important and rapidly growing expenditure which under the most favorable conditions can only be made productive in part. It is one of the many factors which have brought the railroads of the country to their present position.

Although the general office clerks have become an increasing burden in railroad organizations, few of the men so employed are in a position much better than that of ten years ago. Most of this work is of such a character that effective organization for purposes of bettering conditions of work and pay is not practical. In many instances men in this kind of work are contending with difficulties from which other classes of employees escaped twenty years ago. The increase of 149 per cent. in the compensation of "general office clerks" is largely one of bulk —additional clerks taken on to perform additional clerical labor.

For the purpose of this discussion the work of this class of employees may be grouped into two principal classes, the first that of preparing and keeping the records necessary properly to carry on the work of the company, the second, the rendering of personal service for the purpose of facilitating the work of individual officers. The first item is of principal importance, although it is essential that some attention be given to the second factor, as it is a time and expense consumer in every railroad organization.

A railroad organization must maintain records for one or more of three purposes: These are (1) to preserve the essential information having to do with the corporate and fiscal affairs of the company; (2) to meet the requirements of federal and state laws and regulating bodies; (3) to facilitate the work of administrative and executive officers in better performing their duties with respect to the operation of the property.

Without doubt there has been in the past ten years a very marked development with respect to the detail in which each class of the above kinds of records are kept. The requirements of each have in many instances interworked in making it necessary to keep more elaborate and detailed accounts of every phase of railroad operations.

Complexity in intercorporate relationships is one of the most striking features in the organization of an American railway system. A property that presents a rather simple operating organization may be maintained as to its legal and financial existence through records of from fifty to one hundred corporations. During the past ten years there has been a growing respect for the value of accurate legal and fiscal records. It is a development that is on the whole highly desirable, as it insures to both the stockholder and the public, data which may be essential in determining the relative rights of each.

The largest single factor, however, which has contributed to the increase in the expense of the railroads through compensation of general office clerks arises from the constantly growing demands of various public bodies for reports of one kind and another bearing upon the operations of the railroad property. A railroad system operating through a number of states, many of which require different kinds of records and reports, places upon every railroad organization the burden of a heavy, and at times oppressive, amount of clerical labor. It is possible that there will be more sense and less insatiate desire for volume in future demands along this line. In the past too many reports required by governmental bodies have had for their principal purpose the employment of additional clerical labor, the vexation of railroad auditors and the increased frequency of pay day for public printers.

Although it is reasonable to expect that there will not be so much required by public bodies in the future, it is probable that the development and use of statistical records by administrative and executive officers is as yet in its infancy. In certain organizations, and with certain types of executives, this represents already an important item in the work of general office clerks. It is quite probable, however, that the volume of the right kind of data could be very materially increased for the right executive. It is also probable that an increased appreciation and demand for this type of records will be one of the interesting developments in railroad organizations during the next few years. This is the one kind of general office work which, if material be properly compiled and intelligently used, can be considerad almost as productive as the moving of a car of coal over the property.

This situation obtains generally; a very considerable volume of records is essential in maintaining the fiscal, legal and operating efficiency of American railroad organizations. Whatever development there will be in the future will be in the direction of a greater volume than now exists. Records will be kept and considered of value for reasons to which we give little attention at this time. The problem involving any consideration of the relation of the expenditure for this class of labor to other railroad expenses is to get back into the processes by which the records are compiled.

Before taking up this point, however, it is important to consider one additional service which consumes the time of a considerable number of employees classed as general officer clerks. I refer to the various types of personal service which secretaries, confidential clerks, etc., are called upon to render, types of service which are generally considered as proper in that they serve to materially increase the efficiency and effectiveness of the work of their superiors.

In this type of service there is a very considerable amount of waste—time which is taken by the interested officers for needs semi-personal and semi-official. There is no means by which this expenditure can be regulated other than the conscience and common sense of the officer interested. With advancement and opportunities many men have an unconscious tendency to

shift their point of view with reference to fine distinctions as to "mine and thine" in matters of company time. If the wife of the boss wants a box of peaches for dinner it is not an uncommon thing for the office boy to be despatched both to purchase the peaches and deliver them. If, on the other hand, the private bank account is at an inconvenient location it is not uncommon for the secretary to make regular trips for cash. Such items in themselves are of small consequence and considered without reference to the rest of an organization not worthy of notice, but when magnified by the imagination of a none too ambitious office force, they become consciously and unconsciously the justification for a variety of petty delinquencies on the part of the rank and file. The idea that "the king can do no wrong" is more diligently fostered in a railroad organization than in many lines of business and commercial life. There are, of course, requirements in discipline that demand the implicit obedience of employees, but in general office work, at least, there are many situations where one of the best experiences that could happen to the head of an office would be to take a certified copy of the honest opinion of those nearest to him among his subordinates.

Wastes of the character just described, although worthy of mention in this connection, are not of first consequence, however. Of far greater importance is a consideration of the various factors which enter actively into the great part of the time for which the railroad companies of the country expend more than $60,000,000 per annum. In an analysis of the wastes that appear most conspicuously it is most convenient to group them about two principal propositions, the first, that a great deal of office work is poorly organized and more inadequately supervised, the second, that the railroads of the country have done little or nothing toward selecting the best qualified men for this class of work, and having once taken them into the organization have considered each employee as a potential executive.

A peculiar situation exists with reference to the physical conditions which surround much of the general office work of the railroads of the country. In many instances methods have been reduced to a thoroughly scientific basis and from the point of view of appliances, efficiency, organization and adequate supervision, the organization is all that could be desired. More frequently, however, it will be noted that the improvement in physical appliances has come about primarily at the behest of commercial organizations interested in pushing particular machines. Frequently a situation will be found in a department where a certain section of the organization works smoothly and efficiently and where adequate supervision can be found. Speaking generally, there are these three phases of the work constituting the elements of weakness of general office work.

The difficulty in adequately utilizing resources which are available in mechanical appliances arises from a lack of knowledge as to methods employed elsewhere, and from inertia. It frequently happens that machines are purchased after a desultory examination by officials who in many cases have not used and never expect to use, the machine themselves. Often to add to the difficulty, there has been no general test. Each department head, frequently each stenographer, is a law unto himself as to standards.

To overcome this difficulty it would seem that it would be profitable for every large railroad organization to create a bureau which specializes in standards and methods. Such a bureau would insure that every change or improvement which was considered, with reference to a given appliance, would be adequately tested. In short, such a bureau could insure that the proposed improvement would realize the results which should be expected. Of even greater importance, however, than the proper selection of the appliances used in general office work is the effectiveness of the plan of organization. A great deal of general office work involves the handling of a vast volume of routine material. In many offices there is a tremendous amount of waste due to improper routing and arrangement.

Here again it would appear that in the reorganization of a department, the experience of other individuals in a similar kind of work would be of the utmost value. In order to secure this, a corporation should maintain a library and a staff competent to pass intelligently upon questions of this kind.

One of the most conspicuous services which the *Railway Age Gazette* has rendered to the American railway service, has been by placing emphasis upon the necessity of more adequate supervision of the work of the rank and file of the organization. This is just as applicable to the work of a $35 clerk in the office of the auditor of freight receipts as to the work of a section hand. In the neglect of this factor of supervision arises probably the largest single item of waste which may be found in the $60,000,000 expended annually for salaries for general office work. Improvement in supervision is a problem; first, as to methods, and second, as to personnel. Better methods could be acquired through a more extensive and intimate study of the accumulated experience of others engaged in the same kind of work. Improvement in the personnel is largely a problem of finding an individual suitable for the work to be done. This, without question, is the foremost problem before those responsible for the management of the railroads at the present time.

Roughly, the history of railway development in the United States might be divided into four periods. Thees are, first, period of construction; second, period of consolidation and system building; third, period of perfecting the physical plant; fourth, period of complete utilization of the talents of the individuals comprising the organization.

The railways are just entering into the fourth of these periods of development. In the last analysis all of the acute problems of organized railway labor and the incidental evils which have arisen are due to lack of appreciation of this factor of railway organization.

Certain classes of labor have overcome, at least from their individual points of view, certain of the difficulties inherent in their position. Certain other classes, notably general office clerks, have been unable to assert themselves in this manner. The result has been that one of the best places for the acquisition of a certain type of experience is regarded as a grave yard for ambitious railroad men. This is a most regrettable situation, for with the increased complexity and difficulty of the problem which confronts the present day railroad executive the ability to understand and interpret representative data is imperative.

As already indicated, general office clerks as a class are not organized; the conditions surrounding their work covering compensation and advancement have not materially changed during a long period of years, and quite generally promising talent is uniformly neglected, as has been the case in the past.

There are two classes of individuals which must make up every organization—first, the large group including those whose possibilities of growth and development in the organization have rather fixed limitations; second, a very considerable group of individuals who give every promise of large usefulness if properly developed.

The methods of handling work which prevail in most organizations, are such as to preclude all but individuals possessing the most extraordinary initiative and ability from asserting themselves and attracting favorable attention to their possibilities.

Scores of industrial organizations have found it tremendously profitable to specialize in the human element in the business. This involves more particularly an acquired estimation of the possibility of the individual who is taken into the organization and a consistent appraisal of the development which that individual makes as a member of the organization. Until recently there were but two of the large railways of the United States which maintained bureaus which specialized in employment conditions.

There is a very exceptional opportunity for those in charge of general office clerks in this direction. Employees of this class should be selected with reference to their fitness for the particular positions for which they apply, and second, with reference to the promise which they indicate for future development. It is impossible under present conditions to expect that every individual chief clerk can be a specialist along these lines. It

is essential that he receive the co-operation and assistance of a bureau, which is able to devote its specialized attention to this particular problem.

In summary, we have noted that the railways of the country are spending a tremendous sum of money for work of this character, that the amount expended has increased with rapidity during the past decade, that a very considerable portion of this is represented in uneconomic appliances, improper methods of organization and inadequate supervision, and that more particularly there is imperative need for more intelligent attention to the problem and possibilities latent in the personnel of the organization. Such a result can best be accomplished by creating two bureaus; one to specialize in appliances and methods, the other to specialize in men. Such a development would pay its way in any organization.

THEODORE VAIL ON GOVERNMENT OWNERSHIP

The following are a series of extracts from the American Telephone & Telegraph Company's annual report for 1913, which although the report itself relates specifically to public ownership of telephones are of general character and apply also to the question of government ownership of railroads:

Should government operation be self-sustaining in its full significance, entirely maintained and operated out of its own revenue, or should such properties be operated at a charge on general revenue at the cost of the whole public for the benefit of a part? Should they be regulated as to *efficiency* and *sufficiency* as private utilities are regulated, or should each department or utility regulate itself? If utilities are to be subsidized, that is, maintained entirely or in part out of public revenue for the benefit of the users, then the tendency toward government ownership is strong. There may be some things which should be made free and convenient for the whole public even at the expense of the public revenues, but the telegraph and telephone are not of them.

The power or right of the government to own and operate utilities need not be discussed. If such power is to be exercised it becomes of the greatest importance that a right decision, based on an exhaustive study and a thorough understanding of facts, conditions and possible results, should be reached.

The greatest embarrassment in dealing with many public or quasi-public questions is the difficulty of establishing a clear understanding unaffected by prejudice or partisanship; of offsetting erroneous impressions, created by mistaken or misleading statements and disputable and controvertible statistics, particularly when such statements are made by those who have the public ear.

Dickens said, when a parliamentary reporter: "Night after night I record predictions that never come true, professions that are never fulfilled, explanations that are only meant to mystify." It was so then, is now and probably ever will be the same.

The functions of government and the causes of its being are *"Control"* and *"Regulation"*—control of the individual and regulation of the community so far as is necessary to secure the enjoyment of life, liberty and happiness by all, and "control" or "regulation" of anything that might in any way become a menace to the social organization or to its individual members.

To the extent that anything *is a necessity* in its absolute sense to the enjoyment of life and health—the absence of which would endanger the community as a whole—it is a proper function of the government either to provide it or to see that it is so provided as to bring it within the reach of every individual member of society: even to provide it for all at the cost of the general revenue.

To the extent that anything of a utilitarian nature is adopted by or assimilated into the habits of the public and contributes to their comfort, convenience, or even generally to their profit, it should become an object of *sufficient government regulation to prevent the public convenience being made the cause of private exaction;* the distinction between what should be furnished in whole or in part by the government and what should be regulated by the government being whether *the necessity is absolute* and the thing indispensable to the life, health and well-being of the individual and consequently of the community, or whether it be something contributing to or even important, but not indispensable, to the comfort, convenience and profit of the community or of the individual.

A sufficient supply of potable water available to all is a necessity. The street car, the electric light, the telephone or telegraph are conveniences of the highest importance but are not necessities in the foregoing sense.

The control, and later the operation, of the mails and posts, for the interchange and dissemination of intelligence—letters, books, periodicals—have by general acceptance become a proper governmental function. The conveyance of packages and parcels has by custom been included with the mails.

The step from government control and regulation to government ownership and operation is radical and fundamental; one which absolutely changes the character of government organization and functions. In this country there is no organization or function of the government that in any sense approaches ownership or operation in the real, large way.

There are no sound reasons given or real advantages promised for government ownership and operation which do not apply to or cannot be secured by government regulation. Most of the "advantages" promised and arguments used are purely hypothetical, theoretical and uncertain, they are not vindicated by the experience either of this or of any other country.

Governments have in the past taken over or constructed and operated all kinds of utilities where political, national or strategic exigency made it necessary. Such operations, other than those to meet national crises, have properly been confined, wholly or in part, to such as were of a national character and where the risks and uncertainties or magnitude placed such operations beyond private initiative, enterprise and capital.

There is, however, no reason for government ownership and operation where private initiative and enterprise are not only competent to develop, but have actually developed, these utilities to the fullest extent. The government never has taken the initiative in the introduction of any new and untried utilities, nor any interest in them except so far as it has encouraged their development in private hands through the provisions of the "patent," "copyright" and "trade mark" laws; and there is no reason why it should unless such utilities have become of such general use that their regulation is necessary.

The general stock arguments put forth for government ownership and operation are:

Extension of benefits to a larger public;

Abolition of selfish exploitation;

Control of monopoly;

Pecuniary advantages to the public through lower cost and consequently lower charges;

Greater efficiency;

Saving to general public rewards of private initiative.

Private enterprise is rightly said to be based on personal interest. There is no doubt as to this, but incentive to achievement along individual lines could not be suppressed without great detriment to the community at large. What would be the result if government restrictions reduced the reward or profit on initiative and enterprise to that of certain and secure business ventures? Where would be the incentive to assume risk and uncertainty, or the larger profit necessary to recoup the individual and the community for the unsuccessful ventures?

The pecuniary reward to those who take the initiative and the risks of new enterprises must correspond to the labor and to the risk, but this reward cannot exceed the advantage to the public using the service, for the user must get in service, in some way at least, the equivalent of its cost to him. Private initiative, invention, enterprise, risk, spurred on by the incentive of reward,

have changed the face of the world, and the resulting unearned increment largely constitutes the wealth of nations; without it many of the great scientific industrial developments would have remained scientific curiosities, even if they had been evolved at all.

The general tendency in this country is to the "one system" idea of public utilities under regulation. Every one knows the evil of duplication, no one wants two gas, water or electric lighting systems, and there is a general acquiescence in the "single system" in each community. In no one of the utilities except the telephone, and the street cars to a slight degree but for a very different cause, does the fact whether A, B or C residing in the same community is on the same or different "systems" make the slightest difference as to service, nor does it matter whether systems in different communities are connected or not.

With the telephone exchange the question of those connected is vital; your service depends upon one system connecting all telephone subscribers in the same community and upon all communities being connected with each other.

A telegraph system reaching all telegraphic points avoids physical transfers from one system to another, with the incidental delays and obstructions to good service.

Telephone and telegraph systems operated under common control can avoid duplication by making use of the same wires.

For practicability of management, economy of operation or efficiency of service there should be one combined telephone and telegraph system. This has been the Bell contention and this is the conclusion reached by the post office committee and by Congressional advocates of government ownership, who say in substance that the *telephone and telegraph should constitute one system and that a monopoly.*

Government regulation can effectually curb "monopoly" and "selfish exploitation" and make them useful without destroying them, by subordinating them to the public for the public advantage. Government ownership and operation would destroy individual initiative; they would create monopoly and increase and strengthen its evils by placing it in the control of officials and servants, responsible only to themselves as a political party, and parts of the organization which made or unmade the chief executives.

Operation, economical and efficient, requires high organization continuously maintained, superior methods and efficient service. There must be supervision by able executives assisted by experts, all of long experience as executives as well as in the particular industry. They must have large discretionary powers, assume responsibility, and have undisputed directive authority over subordinates. It is purely administrative and executive in its nature.

There is a very narrow margin between efficient economical operation and waste. It is possible to have efficiency accompanied by waste, but never possible to have efficiency without responsible organization and the individual initiative, watchfulness and continuing interest which only accompany permanency and expectation of reward.

Regulation is in the nature of a review, consideration, determination. It is judicial and advisory, not administrative or executive; a commission of regulation is analogous to a board of direction representing the public as well as the corporation, having no other object than the conservation and protection of the interests of all.

Operation is a methodical action upon lines of a determined policy, requiring expert knowledge, experience, training, and individual interest.

Regulation is common sense, intelligent review and decision, based on presentation and examination of facts and conditions.

Theoretically there may be no reason why government operation should not be as economical and efficient as private operation, but actual constructive performance runs up against actual conditions and tangible difficulties which only experience shows how, and responsibility develops the ability, to deal with.

Departmental officers taken from walks of life affording neither experience nor knowledge of the duties and responsibilities they are to assume, are expected to perform the various duties of their departments and also to incidentally look after their political obligations. As a rule their training better fits them for advocates than for executives, for judicial positions or as commissioners of regulation than directors of operation.

Every new head of a department is of necessity a reformer; his average incumbency is less than four years; there is seldom any continuity of departmental policy, and never any continuity of departmental staff. The important assistants come and go with the head. A review of the operations of his department shows much that could be changed to advantage; to eliminate all that is unsatisfactory and bring about effective results under the conditions and in the time available is impossible for the ablest. He starts in finding an incomplete attempt at accomplishment along a certain line of policy, and goes out leaving an uncompleted attempt along a different line of policy. The inevitable tendency is towards promise, not performance.

The departments are run by the minor officials and the clerical force who under ordinary conditions are permanent. The officials have no responsibility in the selection of and little directive control over their subordinates. There is a premium on that *finished mediocrity* which leaves much to be desired and furnishes nothing upon which to base effective reprimand, enforce discipline, or cause for removal. Lack of responsibility is a handicap in the development of men; lack of accountability is a handicap on thorough efficiency; lack of opportunity is a handicap on initiative and enterprise.

A full average of the minor heads and clerks would normally have capacity, initiative, enterprise and ambition. If any one of them develops extraordinary efficiency, initiative or enterprise, he is either elbowed out of the way as disturbing the quiet, complacent habitude of the organization, or, if sufficiently masterful, develops to a point where he can go no farther, and is soon taken up by outside organizations. The higher positions, honorable as they may be, are not sufficiently compensated and do not afford the permanent and remunerative positions to be had in private enterprises for similar occupations and ability.

In European countries, where even the minor office holders and government employes have a certain official distinction which also attaches to their families, there is something higher than the mere remuneration, something that does not attach to private occupation, and is not attached to government subordinate positions in this country.

Government administration is more or less a game of politics, and while with government operation it may sometimes be possible to have efficiency, it will always be impossible to have economy.

RAILWAY EXTENSION IN AUSTRALIA.—The New South Wales and Australian governments have arrived at an agreement respecting the construction of proposed railways from Moama to Moulamein; from Euston inland about 50 miles and from Wentworth inland, about another 50 miles. These lines, when constructed, will be operated by the Victorian Railway department, on the Victorian gage under an interstate agreement.

ELECTRIC RAILWAYS IN AUSTRIA.—Statistics issued for 1913 show that in Austria, Bosnia and Herzegovina there is a total of 73 direct-current railway systems, of which 25 operate at 750 volts or more; and six single-phase systems. Twenty-four of the railways are operated on standard gage and 55 on narrow gage. The length of the direct-current lines is about 723 miles, and of the alternating current lines about 150 miles, or 873 miles in all. During the year the increase in the number of direct-current lines was 12 and single-phase lines three. The increase in the length of direct-current lines was 92 miles, and single-phase lines 106 miles.

General News Department

The Grand Trunk roundhouse at West Forty-ninth street and South Kedzie avenue, Chicago, was destroyed by fire on July 5, and 18 locomotives were damaged.

The New York, New Haven & Hartford has just pensioned 13 employees, making 51, altogther, retired within three months. One of those who have just been pensioned is George C. Crocker of Hyannis, Mass., a crossing man, 82 years old, who has been in the service 59 years.

The Pennsylvania Railroad, since January 1 last, has sold 100 pieces of real estate for approximately $1,000,000. The directors have voted to sell, as fast as purchasers can be found, all of the real estate owned by the company which is not needed for its uses, of which there are 647 separate parcels. Station agents of the company will give all desired information.

Engineers and firemen of the railroads west of and including the main line of the Illinois Central who have been taking a strike vote in connection with their demand for increased wages and important changes in working conditions, which were denied by the railways some weeks ago, are reported to have voted overwhelmingly to empower the leaders to declare a strike. Conferences between the representatives of the men and the general managers' committee are to be resumed in Chicago on July 14.

According to press reports from Portland, Ore., about a dozen passenger conductors on the Oregon-Washington Railroad & Navigation Company have been dismissed in the last few weeks as the result of the discovery of numerous irregularities in collecting cash fares. A rigid investigation is said to have disclosed evidence against 38 conductors. The Order of Railway Conductors and the Brotherhood of Railway Trainmen are said to have issued a circular on the subject warning the men against such practices.

The *Railway World*, studying the last annual report of the Interstate Commerce Commission, finds that in June, 1913, the number of persons employed was 852. The list includes 10 chiefs of divisions, 32 attorneys, 75 examiners and 501 clerks. This statement evidently was made before many persons were engaged in the valuation division, as only the five engineers are mentioned under that head. The appropriations made by Congress for the work of the commission for the last fiscal year amounted to $1,853,629. In 1888 the number of persons employed by the commission was 33 and the expenditures in that year were $113,008.

The New York State Workmen's Compensation Commission reports that the railroads are no longer opposing the application of the workmen's compensation law. They are insuring their risks, some having taken out policies in the state fund while others have given their business to the stock insurance companies. Still others insure their own risks. The distinction between intrastate and interstate employees in applying the law to the railroads is still an unsettled question, and decision in the matter probably will be held in abeyance until the first claims are filed. Four hundred claims for compensation had been filed up to July 8. It was found that only four of these were death claims.

Officers of the shop craft unions which struck on the Illinois Central and Harriman lines in 1911 are gathering a large amount of evidence, in connection with the strike, with a view to presenting it to the United States commission on industrial relations. The committee says it is the intention to show that this was not a strike but a "lockout," resulting from the refusal of the roads to recognize their federation. An effort is being made to locate all of the men who struck, and question blanks are being sent out to ascertain how many have lost homes on account of inability to make payments, whether children have been obliged to go to work, whether any of the strikers or members of their families have committed suicide, etc.

The Indian Railway Board has recently placed orders for two shipments of railway ties to be shipped from the Pacific coast. One is of creosoted Oregon pine at a cost of $1.44 per tie delivered Calcutta, and the other of uncreosoted Californian redwood at $1.20 per tie. The dimensions are 9 ft. by 10 in. by 5 in., and are for the state broad-gage railways. The reasons given for going to the United States for ties are that the cost of Australian jarrah has gone up to $2.80 per tie, and that these orders have been given after satisfactory experiments with Pacific coast timbers to see that they resist the ravages of white ants and do not show undue deterioration from the tropical climate. It is also stated that the Indian government requires between 500,000 and 1,200,000 ties a year for the state railways of the country.

Cash Investment of the Railways During Six Years

During the six fiscal years 1908 to 1913, inclusive, the steam railways of the United States of Class I invested in their road and equipment cash to the amount of $4,010,385,303. Railways of Class 1, so designated by the Interstate Commerce Commission, are those with annual operating revenues of over $1,000,000. They include about 90 per cent. of the mileage, receive more than 96 per cent. of the revenues, and handle more than 98 per cent. of the traffic.

This cash investment of the operating railways of Class I of the eastern district during the six years was greater than the amount of capital securities issued by them during this period, and was 19.9 per cent. of the aggregate of their capital securities outstanding June 30, 1913; of the railways of the same class of the southern district it was 21.1 per cent., and of the railways of the same class of the western district it was 23.2 per cent. of the aggregate of their capital securities outstanding June 30, 1913. That is, the cash actually expended by these railways during the last six years upon their properties used in transportation amounts to more than one-fifth of their total capitalization at the close of the last fiscal year. This is at the rate of $668,397,551 per year.

These figures are obtained through a compilation made by the Bureau of Railway Economics from the reports of the railways to the Interstate Commerce Commission, and have not heretofore been collated.

Extensive Under-Studying on the Baltimore & Ohio

To broaden the knowledge of its division officers and give them the benefit of a thorough training with respect to the methods of administering the affairs of the company in the general offices at Baltimore, the Baltimore & Ohio is putting its division officers through a course of employment which will better equip them for promotion to positions of greater responsibility. Assistant superintendents, trainmasters and, in some instances, their subordinates, are transferred to Baltimore and set at work where they can study the problems of operation from the viewpoint of the general officers. While the staff officials are thus engaged their subordinates discharge the regular duties of the office. The plan, therefore, has the added advantage of equipping the men lower in rank to qualify when vacancies occur.

The men who take the course in the general offices are employed for a period in the transportation department; then in maintenance of way work, in the motive power office, the accounting and statistical departments, and in the tonnage, discipline, employment, station service, rates of pay and other bureaus, so that when they return to their respective divisions it will be with a general knowledge of the relation of their work to the operation of the property as a whole. Several of these men are in the Baltimore offices constantly, and when they go back to their regular duties others are brought in.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF MAY, 1914

Name of road.	Average mileage operated during period.	Operating revenues: Freight.	Passenger.	Total, inc. misc.	Operating expenses: Maintenance: Way and structures.	Maintenance: Of equipment.	Traffic.	Transportation.	General.	Total.	Net operating revenue (or deficit).	Outside operations, net.	Taxes.	Operating income (or loss).	Increase (or decr.) comp. with last year.

Season Passes for Employees' Wives

As a result of the safety records made by the Western and the Ozark divisions of the St. Louis & San Francisco, for the year ending May 31, one woman in every employee's family on these divisions will receive a pass good for six months over the division on which she is located. These pass prizes are also awarded to one woman in every employee's family at the St. Louis and the Memphis terminals, the winners being allowed, in this instance, to designate over which division they wish to have their passes extend. The idea of awarding passes for prizes originated with Mr. Nixon, the chief operating officer, and the incentive thus provided has resulted in a remarkable decrease in the number of casualties.

The pass prizes are awarded on two different plans: One, for the division making the greatest number of train miles per casualty; the other, for the division showing the best gain in this respect for the year ending May 31, as compared with the year ending May 31, 1913. The western division made a reduction of 46 per cent. from its record for the previous year, showing 9,146 train miles for each casualty, as compared with 5,588. The Ozark division—which has been a consistent prize winner—shows 10,112 train miles per casualty, which is the best record of all the Frisco divisions; but, because of its being a prize winner the previous year, it does not show the large gain made by the western division.

The Memphis terminal—which has won the prize three times in succession—reports 790 switching hours per casualty, the best of all the terminals; but the St. Louis terminal shows the best gain this year over last—523 switching hours per casualty, as compared with 345. The basis of computation for the terminals on the road is the greatest number of switching hours made per casualty.

The receiver and chief operating officer awards a semi-annual pass to all female employees and to the female head of the family of all employees on the division and at the terminal making the best record on the basis indicated.

Chicago Commission to Study European Terminals

The Chicago Railway Terminal Commission, which was recently appointed by the city council committee on railway terminals, as provided for in the ordinance for the new Union station, to make a comprehensive study of the terminal problem in Chicago, and to make a special preliminary report on January 1, 1915, left Chicago on Wednesday of this week for a trip of several weeks to study the principal railway terminals of European cities, as well as several in this country. E. C. Carter, who recently resigned as chief engineer of the Chicago & North Western, has been retained by the presidents of the Chicago railways to accompany the commission, at its request that the railways be represented. The commission includes John F. Wallace, consulting engineer retained by the committee; Bion J. Arnold, engineer representing the Citizens' Terminal Committee; Walter L. Fisher, also representing the Citizens' Terminal Committee; E. H. Bennett, architect of the Chicago Plan Commission; and Alderman Geiger, chairman of the council committee on terminals. A number of aldermen will also accompany the committee. The commission will visit Toronto, Montreal, Boston and New York, sailing on the *Lusitania* on July 14. While abroad they will visit Liverpool, Manchester, London, Paris, Vienna, Buda Pesth, Berlin, Frankfort, Kiel, Copenhagen and Stockholm. They expect to return to Chicago in September.

International Railroad Master Blacksmiths' Association

The twenty-second annual convention of the International Railroad Master Blacksmiths' Association will be held on August 18, 19 and 20 at the Hotel Wisconsin, Milwaukee, Wis. The subjects to be considered at the meeting are: Flue Welding; Making and Repairing Frogs and Crossings; Carbon and High Speed Steel; Tools and Formers; Electric Welding; Drop Forging; Spring Making and Repairing; Piece Work and Other Methods; Locomotive Frame Making and Repairing; Oxy-Acetylene Process for Cutting and Welding; Case Hardening; What New Subjects Can Be Brought Up to Benefit the Association; Heat Treatment of Metals; and Shop Kinks.

Society of Railway Financial Officers

The annual meeting of the Society of Railway Financial Officers for the year 1914 will be held at the Hotel Aspinwall, Lenox, Mass., from September 15 to 17, inclusive. Announcement of the business of the meeting will be made later.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 5-8, 1915, Hotel Sherman, Chicago.

American Association of Demurrage Officers.—A. G. Thomason, Boston, Mass.

American Association of Dining Car Superintendents.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next convention, October, Washington.

American Association of General Passenger and Ticket Agents.—W. C. Hope, 143 Liberty St., New York.

American Association of Freight Agents.—R. O. Wells, 1. C. R. R., East St. Louis, Ill.

American Association of Railroad Superintendents.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next convention, August 20 and 21, New York.

American Electric Railway Association.—E. B. Burritt, 29 W. 39th St., New York. Annual convention, October 12-16, Atlantic City, N. J.

American Electric Railway Manufacturers' Assoc.—H. G. McConnaughy, 165 Broadway, New York. Meetings with Am. Elec. Ry. Assoc.

American Railway Association.—W. F. Allen, 75 Church St., New York.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 20-22, 1914, Los Angeles, Cal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915.

American Railway Master Mechanics' Association.—J. W. Taylor, Karpen Building, Chicago.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga. Next convention, July 20-22, Hotel Sherman, Chicago.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa. Next annual meeting, June 30 to July 4, Hotel Traymore, Atlantic City, N. J.

American Society of Civil Engineers.—Chas. W. Hunt, 220 West 57th St., New York; 1st and 3d Wed., except June, July and August, New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York; 2d Thursday of each month, at 2 P. M., 11 Broadway, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., Washington, D. C. Annual convention, April 28, 1915, Atlanta, Ga.

Association of Railway Claim Agents.—C. W. Egan, B. & O., Baltimore, Md.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Annual convention, October 19-23, Chicago.

Association of Railway Telegraph Superintendents.—P. W. Drew, 112 West Adams St., Chicago.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York.

Association of Water Line Accounting Officers.—W. R. Evans, Chamber of Commerce, Buffalo, N. Y.

Bridge and Building Supply Men's Association.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meeting with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk Ry., Montreal, Que.; 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que.; 1st Thursday, October, November, December, February, March and April, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago; 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York; 2d Fri. in Jan., May, Sept. and Nov. and 2d Thurs. in March, Hotel Statler, Buffalo, N. Y.

Civil Engineers' Society of St. Paul.—Edw. J. Dugan, P. O. Box 654, St. Paul, Minn.; 2d Monday, except June, July, August and September, Old State Capitol Bldg., St. Paul.

Engineers' Society of Pennsylvania.—Edw. R. Dasher, Box 75, Harrisburg, Pa.; 1st Friday after 10th of each month, except July and August, 31 So. Front St., Harrisburg, Pa.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, Oliver Bldg., Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

Freight Claim Association.—Warren P. Taylor, Richmond, Va.

General Superintendents' Association of Chicago.—A. M. Hunter, 605 Grand Central Station, Chicago; Wed. preceding 3d Thurs., Transportation Bldg., Chicago.

International Railway Congress.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, 922 McCormick Bldg., Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 829 West Broadway, Winona, Minn. Next convention, July 14-17, Hotel Sherman, Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, Lima, Ohio. Next convention, August 18-20, Hotel Wisconsin, Milwaukee, Wis.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. J. Goodwin, C. R. I. & P., Eldon, Mo. Next convention, November 17-19, 1914, Detroit, Mich.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, Karpen Building, Chicago.

MASTER CAR & LOCOMOTIVE PAINTERS' ASSOC. OF U. S. AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 8-11, Nashville, Tenn.

NATIONAL RAILWAY APPLIANCES ASSOCIATION.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15 to 19, 1915, Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass.; 2d Tuesday in month, except June, July, Aug. and Sept., Boston.

NEW YORK RAILROAD CLUB.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, Union Station, Peoria, Ill.; 2d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

RAILROAD MASTER TINNERS, COPPERSMITHS & PIPEFITTERS' ASSOCIATION.—U. G. Thompson, C. & E. I., Danville, Ill.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

RAILWAY DEVELOPMENT ASSOCIATION.—W. Nicholson, Kansas City Southern, Kansas City, Mo.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOC.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Asso. Ry. Elec. Engrs.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Mobile & Ohio, Mobile, Ala. Annual meeting, October 6, Washington, D. C.

RAILWAY GARDENING ASSOCIATION.—J. S. Butterfield, Lee's Summit, Mo.;

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Bethlehem, Pa. Annual meeting, Bluff Point, N. Y., September 22-24.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, Box C, Collinwood, Ohio.

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with M. C. B. and M. M. Associations.

RAILWAY TELEGRAPH & TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 50 Church St., New York. Meetings with Assoc. of Ry. Teleg. Supts.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va.; 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Next convention, September 8-10, 1914, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and Aug., St. Louis.

SALT LAKE CITY TRANSPORTATION CLUB.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah; 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, La Salle St. Station, Chicago. Annual meeting, September 15-17, Hotel Aspinwall, Lenox, Mass.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. Ry., Atlanta, Ga. Next meeting, July 16, Chattanooga, Tenn.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga.; 3d Thurs., Jan., March, May, July, Sept., Nov., 10 A. M., Candler Bldg., Atlanta.

TOLEDO TRANSPORTATION CLUB.—J. S. Marks, Agent, Interstate Despatch, Toledo, Ohio; 1st Saturday in month, Boody House, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillsburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York; last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Erie R. R., Pittsburgh, Pa.; meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Building, St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7122 Stewart Ave., Chicago.

TRANSPORTATION CLUB OF BUFFALO.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Supt.'s office, L. S. & M. S., Detroit, Mich.; meetings monthly, Normandie Hotel, Detroit.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Next meeting, September 15-18, Hotel Sherman, Chicago.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, Newhouse Bldg., Salt Lake City, Utah; 3d Friday of each month, except July and August, Consolidated Music Hall, Salt Lake City.

WESTERN CANADA RAILWAY CLUB.—W. H. Rosevear, B. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Building, Chicago; 3d Tuesday of each month, except June, July and August, Karpen Building, Chicago.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago; regular meeting 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

The Illinois Central has begun a suit in Kentucky to test the legality of the recent law of that state reducing passenger fares from three cents a mile to 2½ cents.

The Interstate Commerce Commission has tentatively approved the new code of weighing rules formulated by the American Railway Association and the National Industrial Traffic League.

The Southern Pacific, in accordance with a recent order of the Interstate Commerce Commission, has published both east and westbound freight rates through the Ogden gateway for traffic to points south of Portland, Ore. The westbound rates are already in effect and the eastbound rates become effective July 10.

Tariffs have been filed with the Interstate Commerce Commission, effective August 1, providing for storage charges at the railroad warehouses in Superior, Wis., and Duluth, Minn. The tariff provides a charge of 20 cents a ton between April 15 and December 1, the season of open navigation, and 50 cents a ton for the closed season, December 1 to April 15.

The General Managers' Association of Texas is urging the adoption of a new form of livestock contract, making the railroads responsible only for physical damage to livestock caused by derailments and collisions, and eliminating the market prices as factors in settlements between shippers and the railroads. Under this new form of contract the railroads would not be responsible for shrinkage en route.

The Denver & Salt Lake on June 29 put into effect new tariffs of local freight rates on its lines, making a considerable reduction in both class and commodity rates, in some cases amounting to as much as 50 per cent. For example, the first-class rate from Denver to Craig, the terminus of the line, was reduced from $1.70 to $1.09 per 100 lb. The rate on nails between the same points was reduced from 86 cents to 35 cents. It was announced that the reductions were made in order to develop the territory of the road. Nearly all commodities are affected by the reduction.

No more low price, one-way colonist tickets to the West and Northwest will be sold by the Southern Railway. This announcement is in accordance with the policy of President Fairfax Harrison to do everything possible to discourage the movement of people from the South. For a number of years the Southern has endeavored to discourage the offering of low colonist rates from the South and has only sold them at points where it was felt necessary to meet competition. From this time on, however, no such rates will be offered by the Southern Railway; this regardless of any action that may be taken by other lines. The Southern will continue to offer home-seekers' rates into the South.

Traffic officers of the Union Pacific, the Southern Pacific, the Atchison, Topeka & Santa Fe, the Chicago, Milwaukee & St. Paul, the Northern Pacific and the Great Northern, have been in Washington during the past week conferring with the Interstate Commerce Commission concerning the changes to be made in transcontinental freight tariffs as a result of the confirmation of the commission's decision, of 1911, by the recent opinion of the Supreme Court. The commission's order expired by statutory limitation in 1913 and the question now is whether the same order shall be reissued. There have been changes in conditions which may be used to support a claim on the part of the roads that different bases should now be applied.

A. M. Mortensen, traffic manager of the Panama-Pacific International Exposition estimates that the visitors to the exposition will number 2,132,500. This includes from points in the United States east of the Rocky mountains, 1,000,000; west of the Rocky mountains, exclusive of California, 250,000; from Europe and Africa, 50,000. Mr. Mortensen thinks that the attractions of California outside of the exposition will largely offset the disadvantage of being situated so far from the centers of population. The city of San Francisco has voted a bond issue of $3,500,000 for electric car lines to convey passengers between the center of the city and the exposition grounds, the existing lines being inadequate.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Examiner Brown held a hearing in Chicago on July 1 on the complaint of the National Association of Ice Cream Manufacturers against the express companies on account of the rates for express shipments of ice cream, which went into effect February 1, 1914, in connection with the general revision of express rates made by the Interstate Commerce Commission at that time. In the new rates ice cream was changed from first to second class at the request of the shippers, but the express companies provided a minimum of 49 cents for five gallons. The ice cream men want a 40-cent minimum, which prevails in some states. They also ask a reduction in the rates for returned empty cans from 15 cents to 10 cents for five-gallon sizes or under, and from 25 cents to 15 cents for sizes over five gallons.

Switching at Baltimore, Maryland

Opinion by Commissioner McChord:

The commission finds that the carriers have not justified proposed increases in the rates for the transportation of carload freight from the connection between the Northern Central Railway and the Western Maryland in Baltimore to and from certain points on the "block route" in that city. (30 I. C. C., 581.)

Rates on Flour and Grain Products Between Virginia Points

Page Milling Company et al v. Norfolk & Western. Opinion by the commission:

The commission finds that the rates on flour and grain products in carloads from milling points on the Shenandoah division of the Norfolk & Western in Virginia and West Virginia to points on the Pocahontas division and Clinch Valley extension in Virginia and West Virginia are not unreasonable or discriminatory (30 I. C. C., 605).

Tanbark Rates to North Carolina Points

Hans Rees' Sons v. Southern Railway. Opinion by Commissioner Clements:

The commission finds that a rate of six cents per 100 lb. on tanbark from Delrio, Tenn., to Asheville, N. C., is not discriminatory. It is also held that the carriers have justified a proposed cancellation of the application of the North Carolina intrastate mileage scale of rates on tanbark from stations on the line of the defendants in South Carolina to North Carolina tanning points, and the placing of that commodity on the same rate basis as lumber and other forest products. (30 I. C. C., 585.)

Rates on Iron Ore from Points in New York State

Ontario Iron Ore Company v. New York Central & Hudson River et al. Opinion by Commissioner Meyer:

The commission finds that the present rate of $1.10 per gross ton on iron ore in carloads from Fruitland and Ontario, N. Y., to Emporium, Pa., and the present rate of $1.60 per gross ton on the same traffic to Earlston, Saxton and Riddlesburg, Pa., are not unreasonable or unjustly prejudicial. The rate of $1.60 per gross ton to Curtin, Milesburg and Bellefonte, Pa., however, is found unreasonable to the extent that it exceeds $1.40. (30 I. C. C., 566.)

Passenger Fares on the Washington-Virginia Railway

Virginia Highlands Citizens' Association v. Washington-Virginia Railway. Opinion by Commissioner Harlan:

The commission finds that defendant's charge for 25-trip family tickets for use between its Washington terminal at Twelfth and D streets, northwest, and Addison and Virginia Highlands in Virginia is discriminatory as compared with the commutation fares to other points on the Mount Vernon division. It is also held that as defendant provides a 52-trip monthly commutation ticket between Washington and Alexandria, New Alexandria and other points on the Mount Vernon division it should also provide a similar ticket for Addison and Virginia Highlands and that the rate on this ticket should not exceed $3. The one way and round trip fares are not found unreasonable. (30 I. C. C., 593.)

Dunnage Allowances

Opinion by the commission:

The commission finds that the carriers in southwestern territory have justified a proposed cancellation of the allowance for actual weight of dunnage not in excess of 500 lb. used by shippers and furnished at their expense to protect freight in carloads shipped in box, stock or refrigerator cars. There can be no doubt that the primary and most important purpose of the dunnage used in varying forms by the shipping interests is to make the load safe for transportation and to obviate injury to the goods, the prevention of damage to the carriers' equipment being a minor consideration. Under these circumstances and in view of the fact that the substitution of dunnage for the more expensive boxes and crates and other packing material is of advantage to the shipper and reduces the gross weight upon which freight charges must be paid, it is held not inconsistent that the carriers should receive revenue for the total weight hauled. Following the findings in the case entitled *In the Matter of the Suspension of Western Classification No. 51*, the continuance of the allowance for shipments on open cars is upheld. (30 I. C. C., 538.)

Richmond Switching Charges

Richmond Chamber of Commerce v. Seaboard Air Line et al. Opinion by Commissioner McChord:

The Atlantic Coast Line, Seaboard Air Line and the Southern Railway, southern carriers serving Richmond, Va., have a rule whereby they have for some time absorbed connecting line switching charges on carload traffic at Richmond, Va., only when the carrier performing the transportation service was in competition for the traffic with the switching line. The Chesapeake & Ohio and the Richmond, Fredericksburg & Potomac which also serve the city, absorb connecting line switching on all carload traffic from and to other than local points on their respective lines. The result in general is that the arrangements affecting the absorption of switching charges at Richmond are quite different as far as the various receivers and shippers of freight at that point are concerned. The commission finds, therefore, that the refusal of the defendants to absorb switching charges on some carload shipments at Richmond, while absorbing such charges on other carload shipments to and from that point is discrimination against the shippers who are required to pay such charges. It is also found that the refusal of the defendants to absorb switching charges on some carload shipments at Richmond, while absorbing such charges on like shipments at Norfolk is discrimination against Richmond on traffic transported to and from that point. The defendants are therefore required to desist from such discrimination in the future. A complaint with respect to unreasonable and discriminatory charges on trap, peddler and station-order cars, however, is not sustained. (30 I. C. C., 552.)

Omaha Grain Rates

Omaha Grain Exchange v. Northern Pacific et al. Opinion by Commissioner Daniels:

On grounds similar to those in the case of *Omaha Grain Exchange v. C. B. & Q.*, it is held that the Northern Pacific and the Chicago, Burlington & Quincy should establish joint rates on grain in carload lots from points in Montana on the line of the Northern Pacific west of Billings to Omaha, South Omaha and Council Bluffs, which will not exceed the rates contemporaneously maintained from the same points of origin to Minneapolis via the Northern Pacific. The points west of Billings are substantially equi-distant from Minneapolis and Omaha and although the routes to the latter involve a two line haul, this is not an important consideration because the distances involved are so great. The commission finds that the essential disparity in the distance traversed over the Chicago, Milwaukee & St. Paul and between points of origin in Montana, North Dakota and South Dakota and Minneapolis on the one hand, and between these points of origin and Omaha on the other, warrants a difference in the

rates. It is held, however, that the present difference of five cents in favor of Minneapolis is discriminatory and that except where at present equal rates apply as in the Judith Basin territory between Roundup, Hilger and Twodot, the Chicago, Milwaukee & St. Paul should establish to Omaha, South Omaha and Council Bluffs, a rate not to exceed by more than two cents per 100 lb., the rate contemporaneously charged from the points of origin involved to Minneapolis. (30 I. C. C., 572.)

Pig Iron Rates from the South

Sloss-Sheffield Steel & Iron Company et al. v. Louisville & Nashville et al. Opinion by Commissioner McChord:

Operators of blast furnaces in Alabama and Tennessee complain that the existing rates on pig iron from the south to Ohio river crossings, to points north and east thereto all rail, and to New England, all rail and rail and water, are unreasonable and discriminatory. The rates from Chattanooga, Tenn., are made certain differentials under Birmingham and as these differentials have not been questioned, the entire southern situation can be dealt with by considering only Birmingham, which district is representative of the Alabama operations. Louisville is representative of Ohio river crossings, as Chicago and Boston are illustrative of central freight association territory and the east respectively.

The commission finds that the rates from Birmingham to Louisville, St. Louis, Chicago and to Boston via water and rail are unreasonable and should not exceed the following per gross ton: to Louisville, $2.65; to St. Louis, $3.40; to Chicago, $4.00, and to Boston, rail and water, $4.25.

The present differentials between the southern furnaces are to be maintained, as is also the relation of rates now obtaining to the Ohio river, to points in central freight association territory, and to the east. No change will be ordered in the proportional rates to the Ohio river at this time for the reason that this would throw the entire reduction upon the southern lines. The proportional rates to and from the Ohio river should be so revised as to make the through rate to Chicago, for example, not in excess of $4 per gross ton.

It is also held that the rates from the New England ports to interior New England points are unreasonable as applied to through traffic and it is prescribed that the rate from Birmingham to Springfield and Portland should not exceed $5.25; and to Lowell, $5, with like reductions in the rates to other interior New England points. No opinion is expressed as to the reasonableness of the present differentials between the all-rail and rail and water rates to New England, but this is not to be taken as justification for any increase in the differentials.

No reparation is awarded. (30 I. C. C., 597.)

STATE COMMISSIONS

The Illinois Public Utilities Commission has entered an order further suspending, until October 15, the proposed increase of one cent per 100 lb. in the rates on grain in Illinois.

The Texas railways on June 30 filed with the Texas Railroad Commission the new tariff increasing the rates from Dallas and Houston to points in East Texas to correspond with the interstate rates from Shreveport, La., to the same points, in accordance with the decision of the Interstate Commerce Commission which was recently sustained by the Supreme Court. The Texas commission has not yet indicated whether it would approve or make opposition to the new rates, although at a hearing the week before the commission suggested that the railroads make a compromise by raising the Texas rate somewhat and reducing the Shreveport rate somewhat.

PERSONNEL OF COMMISSIONS

E. L. Adams, hitherto assistant signal engineer of the Lake Shore & Michigan Southern, has been appointed senior signal engineer of the division of valuation of the Interstate Commerce Commission for the southern division (Chattanooga).

COURT NEWS

See mention of the New York, New Haven & Hartford dissolution suit in Financial News.

Railway Officers

Executive, Financial, Legal and Accounting

The office of F. A. Healy, secretary and treasurer of the Ohio Electric, has been removed from Cincinnati, Ohio, to Springfield.

B. Lancaster has been appointed auditor of disbursements of the Union Pacific, with headquarters at Omaha, Neb., in place of E. L. Fries, transferred.

W. Scott Hancock has been appointed assistant general attorney of the Missouri Pacific and the St. Louis, Iron Mountain & Southern, for lines in Missouri, with headquarters at St. Louis, succeeding James F. Green, promoted. Mr. Hancock has been assistant attorney in the vice-president's office.

Albert J. Stone, general manager of the Erie at New York, has been elected vice-president, in charge of the operating department, with headquarters at New York, effective July 15. A portrait of Mr. Stone and a sketch of his railway career were published in the *Railway Age Gazette* of December 26, 1913, page 1244.

James H. Hustis, president of the New York, New Haven & Hartford, with headquarters at New Haven, Conn., has been elected president of the Boston & Maine, effective August 15, succeeding Morris McDonald, who resigned last February. A portrait of Mr. Hustis and a sketch of his career were published in the *Railway Age Gazette* of August 1, 1913, page 179.

Operating

A. H. Ehlers, superintendent of the Copper Range at Houghton, Mich., has been appointed general superintendent.

H. E. Allen has resigned as superintendent of the Trinity & Brazos Valley at Teague, Tex., to go to the St. Louis Southwestern.

E. A. Gould has resigned as assistant to the general manager of the Cincinnati, Hamilton & Dayton at Cincinnati, Ohio, and the office is abolished.

R. A. Pierce, yardmaster of the Oregon Short Line at Ogden, Utah, has been appointed superintendent of the Ogden Union Railway & Depot Company.

C. P. Torrey, acting superintendent of transportation of the Hocking Valley, has been appointed superintendent of transportation, with headquarters at Columbus, Ohio.

C. R. Duncan, trainmaster of the Illinois Southern at Sparta, Ill., has been appointed superintendent, succeeding J. C. Collins, resigned to engage in other business, and L. V. Combs succeeds Mr. Duncan.

Warren D. Shull, trainmaster of the Waynesburg & Washington at Waynesboro, Pa., has been appointed superintendent, succeeding C. E. Bower, who has been retired under the pension rules of the company.

H. R. Hanlin has been appointed general manager of the Dayton & Union, with office at Cincinnati, Ohio, succeeding E. A. Gould, resigned, and W. F. Stark, superintendent at Dayton, Ohio, having resigned, his former position has been abolished.

J. P. Houston, assistant superintendent of the Minneapolis & St. Louis at Fort Dodge, Iowa, has been appointed superintendent of the Eastern division, with office at Oskaloosa, succeeding R. S. Marshall, resigned, to accept service with another company.

T. H. Sears, division superintendent of the Atchison, Topeka & Santa Fe at Marceline, Mo., has been appointed general superintendent at Amarillo, Tex. R. H. Allison, trainmaster at Emporia, Kan., succeeds Mr. Sears, and C. L. Mason takes the place of Mr. Allison.

J. W. Mulhern, superintendent of the Chicago-Petoskey division of the Pere Marquette at Grand Rapids, Mich., has been appointed superintendent of the Northern division of the Chicago Great Western, with headquarters at St. Paul, Minn., succeeding W. B. Causey, resigned.

The statement in our issue of July 3, that C. W. Bearden, assistant superintendent at Bloomington, Ill., of the Chicago & Alton, had been appointed chief despatcher and that E. E. Sutton, chief despatcher, had been appointed assistant chief despatcher was an error. Both will remain in their former positions.

Otto Holstein, until recently superintendent of transportation of the Guayaquil & Quito Railway in Ecuador, and previously operating manager of the Central Railway of Peru, has been appointed superintendent of transportation of the San Antonio, Fredericksburg & Northern, with headquarters at Fredericksburg, Tex.

J. E. Taussig, superintendent of transportation of the Texas & Pacific, has been appointed general superintendent, with headquarters at Dallas, Tex., succeeding J. W. Everman, resigned to accept service with another company, and the former office is abolished. J. B. Chandler, car accountant, has been appointed superintendent of car service, with headquarters at Dallas, and the former position is abolished.

J. H. Dyer, superintendent of the Tucson division of the Southern Pacific at Tucson, Ariz., has been appointed superintendent of the Sacramento division, with office at Sacramento, Cal., succeeding W. A. Whitney, resigned to accept service with another company. T. H. Williams, assistant superintendent of the Tucson division at Sacramento, succeeds Mr. Dyer, and J. T. Bell, trainmaster at Sacramento, succeeds Mr. Williams.

J. B. Heafer, assistant general manager of the International & Great Northern, has been appointed superintendent of transportation, with headquarters at Houston, Tex., and the office of second assistant general manager is abolished. J. L. Burd, formerly assistant superintendent of the Gulf division, has been appointed superintendent of that division, with headquarters at Palestine, Tex., to succeed J. P. Burns, who has been appointed superintendent of terminals at Houston, with jurisdiction over the Columbia branch.

A. F. Brewer, superintendent of the Utah division of the Oregon Short Line, will have jurisdiction also over the Montana division, with headquarters at Pocatello, Idaho. C. E. Brooks, who has been acting superintendent of the latter division, has been appointed assistant superintendent of the Idaho division, with headquarters at Nampa, Idaho. H. J. Plumhoff, trainmaster at Pocatello, has been appointed assistant division superintendent at Pocatello, and M. A. Pond, trainmaster at Salt Lake City, has been appointed assistant division superintendent at that place.

Jasper N. Haines, whose appointment as superintendent of the Seneca division of the Lehigh Valley, with headquarters at Sayre, Pa., has been announced in these columns, was born on February 20, 1876, at Pleasant Dale, W. Va. He began railway work in 1892 as water boy and laborer on construction work and was then consecutively station clerk, yard clerk trainmaster's clerk and general manager's clerk on the Pittsburgh & Lake Erie at Pittsburgh, Pa.; the Cleveland Terminal & Valley and the Cleveland, Lorain & Wheeling, now a part of the Baltimore & Ohio, at Cleveland, Ohio. On August 8, 1898, he went to the Lehigh Valley and has been in the continuous service of that road ever since, first as stenographer in the superintendent's office of the Mahanoy & Hazleton division and then as chief clerk. He was transferred in July, 1903, in the same capacity to the office of the superintendent of the Wyoming division. In October, 1904, he was appointed clerk in the general manager's office and the following May became chief clerk to the general manager. He was promoted to inspector of transportation on November 18, 1907, and in August, 1909, was appointed trainmaster of the Auburn division. On January 1, 1910, he was promoted to assistant superintendent of the Buffalo division, which position he held at the time of his recent appointment as superintendent of the Seneca division of the same road, as above noted.

Dixon Fay Kirkland, whose appointment as general manager of the Georgia & Florida, with headquarters at Augusta, Ga., has already been announced in these columns, was born on June 1, 1866, in Lowndes county, Ga., and was educated in the common schools. He began railway work in 1883, as a laborer with a bridge gang of the Plant Investment Company, building the South Florida Railway. He was then consecutively work train conductor, locomotive fireman, and from the latter part of 1885 to 1887 telegraph operator at various points on the Savannah, Florida & Western, now a part of the Atlantic Coast Line. From 1887 to January of the following year he was copying operator in the despatcher's office at Savanah, Ga., and then was appointed a despatcher on the same road. He was appointed despatcher on the Georgia Southern & Florida in September, 1889, remaining in that position until April, 1891, when he was appointed despatcher on the Plant system. From July, 1898, to September, 1900, he was trainmaster, and then to December, 1905, was division superintendent of the same system which is now operated by the Atlantic Coast Line. From July to December, 1906, he was superintendent of transportation of the Georgia, Florida & Alabama, and from May, 1907, to April, 1911, was chief clerk to the superintendent of transportation of the Central of Georgia, and then, until the following October, was acting superintendent at Savannah, Ga. He was then trainmaster on the same road at Cedarstown, Ga., until January, 1912, when he became superintendent of the Georgia & Florida, and from April 15, 1913, to June 1, 1914, he was superintendent of the Atlanta, Birmingham & Atlantic, at Manchester, Ga., which position he held at the time of his recent appointment as general manager of the Georgia & Florida, as above noted.

Traffic

J. H. Barr has been appointed traveling freight agent of the Central of Georgia, with headquarters at Kansas City, Mo.

George A. Clifford, city passenger agent of the Canadian Pacific and the Minneapolis, St. Paul & Sault Ste. Marie at Cleveland, Ohio, has been appointed general agent at the same place.

D. J. Bill, commercial agent of the Lake Erie & Western at Buffalo, N. Y., has been transferred to New York City as general agent. E. J. Lewis is appointed commercial agent at Minneapolis, Minn.

G. C. Henderson has been appointed westbound agent, with headquarters at Kansas City, Mo., of the Central-Savannah Line, which is operated jointly by the Ocean Steamship Company and the Central of Georgia.

R. W. Wirt has been appointed traveling freight agent of the Cincinnati, New Orleans & Texas Pacific and the Alabama Great Southern, with headquarters at Chattanooga, Tenn., succeeding E. L. Hunt, transferred.

E. J. Pope has been appointed commercial agent of the Missouri, Kansas & Texas and the Wichita Falls & Northwestern at Wichita Falls, Tex., to succeed O. C. Thomas, who has been transferred to Oklahoma City, Okla., in a similar capacity.

W. T. Stevenson, chief of the tariff bureau of the Cleveland, Cincinnati, Chicago & St. Louis, with headquarters at Cincinnati, Ohio, has been appointed assistant general freight agent, with office at Cincinnati. Walter Nichols, division freight agent at St. Louis, Mo., succeeds Mr. Stevenson, and S. A. Townsend, commercial agent at Pittsburgh, Pa., takes the place of Mr. Nichols. W. F. Greaves, general agent at Nashville, Tenn., has been appointed general southern freight agent, a newly-created position, with headquarters at Birmingham, Ala. Brent Arnold, Jr., general agent of the Western Maryland at Cleveland, Ohio, has been appointed general agent of the Big Four at Cincinnati, succeeding C. H. King, transferred to Louisville, Ky., as traveling freight agent. The following are appointed commercial agents: J. A. Moore, Nashville, Tenn.; C. W. Smith, Dallas, Tex.; J. M. Breen, Pittsburgh; A. F. Meyer, Kansas City, Mo.; M. T. Yeaton, Minneapolis, Minn.; M. R. Markle, Milwaukee, Wis., and J. J. Fahey, Memphis, Tenn.

Engineering and Rolling Stock

F. C. Baluss has been appointed engineer of bridges and buildings of the Duluth, Missabe & Northern at Duluth, Minn.

G. H. Wion, assistant supervisor of signals of the Pennsylvania Railroad at New York, has been appointed assistant signal engineer of the Victorian Government Railways, with headquarters at Melbourne, Australia.

J. Hainen, superintendent of motive power of the Southern Railway at Washington, D. C., has been promoted to general superintendent of motive power and equipment, with headquarters at Washington, succeeding A. Stewart, deceased, and E. C. Sasser, master mechanic at Spencer, N. C., has been promoted to superintendent of motive power of the Northern and Eastern districts, with headquarters at Washington, succeeding Mr. Hainen.

Purchasing

A. A. Dawley has been appointed purchasing agent of the Denver & Salt Lake, with headquarters at Denver, Colo.

Ray F. Transue has been appointed storekeeper of the Lehigh & New England, with office at Pen Argyle, Pa., succeeding F. B. Arndt, resigned.

G. E. Scott, acting purchasing agent of the Missouri, Kansas & Texas, has been appointed purchasing agent, with headquarters at St. Louis, Mo.

George L. Mayer has been appointed purchasing agent of the Ohio Electric, with headquarters at Springfield, Ohio, succeeding Claude Burckmyer.

G. W. Saul, assistant purchasing agent of the Oregon-Washington Railroad & Navigation Company, has been appointed purchasing agent, with headquarters at Portland, Ore., succeeding R. Koehler, retired.

The office of J. F. Hoyer, purchasing agent of the New Orleans Great Northern, was abolished on July 1, and the purchasing of supplies is now handled through the office of R. H. Howard, general manager, at Jackson, Miss.

Ernest Baxter, whose appointment as purchasing agent of the St. Louis Southwestern, with headquarters at St. Louis, Mo., has already been announced in these columns, was born October 11, 1882, at Delmer, Ont. He received a public and high school education, and began railway work in March, 1903, as messenger in the local freight office of the Michigan Central. From May to September he was with the Algoma Central & Hudson Bay as a clerk at Sault Ste. Marie, Ont., and from October, 1903, to March, 1905, he was secretary to the superintendent of the Grand Trunk at London, Ont. Mr. Baxter was then employed successively in the operating departments of the Cincinnati, Hamilton & Dayton at Indianapolis, Ind., and the Missouri Pacific at St. Louis, Mo., until February, 1906, when he became secretary to the general manager of the St. Louis Southwestern at St. Louis. In May, 1909, he was made chief clerk to the president of the latter road, from which position he was promoted to that of purchasing agent on June 22, as above noted.

E. Baxter

OBITUARY

Guy Phillips, assistant secretary of the Missouri Pacific, and secretary and treasurer of the Richmond & Chesapeake Bay Railway, committed suicide by shooting himself at his office in New York on July 2.

Milton B. Van Zandt, treasurer and assistant secretary of the Chicago & North Western at New York, died on July 6 at his home in that city from a stroke of paralysis at the age of 66. He became general transfer clerk of the Chicago & North Western in February, 1872. He was promoted to be assistant treasurer in April, 1906, and was appointed treasurer of the same road on February 11, 1911.

Martin L. Clardy, vice-president and general solicitor of the Missouri Pacific-Iron Mountain system, with headquarters at St. Louis, Mo., died suddenly on July 5 in that city at the age of 68. He was born in St. Genevieve, Mo., and became connected with the Missouri Pacific in its legal department as assistant and later was general attorney of that road for Missouri and Illinois. In 1909 he succeeded Alexander G. Cochrane as general solicitor.

Equipment and Supplies

LOCOMOTIVE BUILDING

THE ERIE has ordered 5 Pacific type locomotives from the Baldwin Locomotive Works.

THE INTERCOLONIAL RAILWAY OF CANADA has ordered 3 switching locomotives from the Montreal Locomotive Works.

THE PHILADELPHIA SLAG COMPANY, Bethlehem, Pa., has ordered one six-wheel switching locomotive from the Baldwin Locomotive Works.

CAR BUILDING

THE WABASH is in the market for 7 postal cars.

THE MISSOURI PACIFIC is in the market for 25 caboose cars.

THE CHICAGO GREAT WESTERN is in the market for 500 40-ton box cars.

THE DELAWARE, LACKAWANNA & WESTERN has ordered 400 box cars from the American Car & Foundry Company, and 250 box and 200 automobile cars from the Western Steel Car & Foundry Company. The Lackawanna is also in the market for 500 gondola cars in addition to those previously ordered.

IRON AND STEEL

THE ILLINOIS TRACTION SYSTEM has ordered 498 tons of material for its terminal building, at Peoria, Ill., from the Decatur Bridge Company.

CHINESE TRADITION VERSUS THE NEED OF PROGRESS.—The railways of China in 1913 carried over 20,000,000 passengers and 16,000,000 tons of freight. Another striking thing showing the new appreciation of western methods and a change which struck at the very root of all that the Chinese held in the deepest respect and reverence, was the yielding to the necessity for the occasional removal of graves in order that a railway might be properly constructed. The aversion to such removal in the early days of railway construction in China very often resulted in giving the lines some of the most extraordinary alinements.

PORTUGUESE RAILWAY DEVELOPMENT.—It is reported that during the past few years the personnel of the state and privately-owned railways in Portugal have been showing better results. Notwithstanding restricted funds, improvements have been introduced in the technical and administrative departments and the structures and rolling-stock have been maintained in better condition. Hitherto the resources of the country have not been developed to full advantage. This is particularly noticeable in view of the headway the colonies are making as compared with the motherland. The development scheme proposed some time ago for carrying out railway extension, purchasing rolling-stock, etc., is now to be realized by the passing of an act dated April 13, 1913, which authorizes the government to raise nearly $5,000,000. With this more rolling-stock is to be installed, and among other things the line from Vidago to connect with the Spanish frontier at Verin is to be commenced at once. Extensions on the Minho-Douro line are also to be carried out. Some idea of the slow progress of railway construction in the republic, which is about seven-tenths the size of England, may be gathered from the fact that in 1877 the total system stood at 596 miles, and 37 years after the total mileage reached only 1,793 miles. Since 1906 the increase has been only 13 miles. For many years the work of extension was at a standstill and the structures and rolling-stock allowed to deteriorate. Expansion of trade and traffic in Portugal, as in Spain, is seriously handicapped by the original layout of the lines, which do not provide the fruit and other agricultural industries with sufficiently cheap and rapid transit to the ports. The break of gage, which isolates the peninsula from France and the rest of Europe, is another disadvantage.

Supply Trade News

G. K. MacEdward, advertising manager of the Detroit Lubricator Company, has resigned to join the advertising department of the Chalmers Motor Company.

The American Mason Safety Tread Company, Lowell, Mass, has received an orde for over eighty tons of its "Karbolith" sanitary fireproof car flooring for the new steel cars of the Southern Railway which are being built by the Pressed Steel Car Company

Harry C. Holloway, who was for several years representative of the Rail Joint Company, New York, resigned on July 1 and opened an office in the Railway Exchange, Chicago. He will handle railway supply accounts, representing among other companies the Keystone Grinder & Manufacturing Company, of Pittsburgh.

On June 19, the United States patent office issued to William R. McKeen, president of the McKeen Motor Car Company, Omaha, Neb., patent No. 352,725, covering all-steel box cars, including underframe, superstructure, the steel box, the steel bracing and the diagonal bracing. This patent has been in litigation since 1906 in two interference cases which have been passed on by the examiners in chief, the commissioner of patents and the court of appeals of the District of Columbia, sustaining practically every claim made by Mr. McKeen. The Union Pacific steel box cars built in 1906 and 1907 were built under this patent.

TRADE PUBLICATIONS

Steel Taped Cable.—The Simplex Wire & Cable Company, Boston, Mass., has recently issued a catalog descriptive of Simplex steel taped cable for city lighting and other circuits.

Concrete Ties.—The Percival Concrete Tie & Socket Company, New Orleans, La., has issued a pamphlet describing and illustrating the use and qualities of its reinforced concrete ties.

Belt Railway of Chicago.—This company has issued an attractive folder describing its service in the Chicago switching district and the plan of operation of the new clearing yards now under construction.

Car Heating Valves.—The Gold Car Heating & Lighting Company, New York, has recently issued bulletins Nos. 938 and 940, illustrative of Gold's Packless twin and quick opening supply valves, respectively.

Interphones and Accessories.—The Western Electric Company has recently issued a catalog descriptive of its line of interphones and accessories. The booklet contains illustrations and descriptions of the apparatus, the information concerning it being given in clear and concise form.

Milling Machines.—The Newton Machine Tool Works, Philadelphia, Pa., has recently issued catalog No. 48, descriptive of its line of horizontal milling machines. The booklet contains views of the various machines, specifications and brief descriptions of them and their accessories.

Ditchers, Pile Drivers and Buckets.—The Browning Company, Cleveland, Ohio, has recently issued folders devoted to the description and illustrations of its newly designed Browning ditchers, pile drivers and buckets. The illustrations clearly show the various conditions under which these devices work satisfactorily.

Jacks.—The Duff Manufacturing Company, Pittsburgh, Pa., has recently issued a very complete catalog of its various types of jacks. The catalog contains views of the jacks, specifications and statements naming the kind of work for which each is best adapted. Among the jacks included are Barrett trip or track jacks, Barrett automatic lowering jacks, Barrett automobile jacks, Duff ball bearing screw jacks, and Duff-Bethlehem hydraulic jacks. There are also sections on Dunn trench braces, jacks for special purposes and repair parts.

Railway Construction

Alabama Great Southern.—This company will start work at once on improvements at Tuscaloosa, Ala., putting in a new passing track north of the station and extending the switching lead. At Akron the track serving the station will be extended 200 ft. north and 2,417 ft. south. The passing track will be extended 1,403 ft. north and two storage tracks of 1,700 ft. and 1,518 ft. will be constructed, also 600 ft. of cinder pit track and a depressed track 400 ft. long.

Balsam Lake & Eastern.—Incorporated in Wisconsin with $100,000 capital to build from Balsam Lake, Wis., west to Centuria, about 8 miles. The incorporators include W. R. Taylor, J. W. Park and H. W. Radcliffe.

Bay City, Lynn Haven & Northern.—Capitalists of New York and Philadelphia are planning to build a railway between Montgomery, Ala., and St. Andrews Bay, Fla., about 160 miles. It is proposed to secure control of the Birmingham, Columbus & St. Andrews Bay, operating a line from Chipley, Fla., south to Southport, 38 miles, which is to form part of the through route. The first work to be carried out will be on the section from Chipley, Fla., north to Hartford, Ala., about 28 miles, from which point the projected route is via Enterprise and Troy to Montgomery. The plans call for the construction of terminals at Southport, Fla., to include docks, wharves and warehouses. The Montgomery Chamber of Commerce may be addressed.

Berks & Lancaster (Electric).—Incorporated in Pennsylvania to build from Lititz, Pa., north to Womelsdorf, about 18 miles. The incorporators include F. J. Duckett, W. Grimshaw, T. H. Paist and H. B. Longbottom, Philadelphia, and V. J. McGlesney, Phoenixville.

Chicago, Burlington & Quincy.—An officer writes that a contract has been let to Petersen & Company, Omaha, Neb., to build a cut-off from Yutan, Neb., southeast to Chalco. There will be a 300-ft. trestle on the line over Elkhorn river and a 1,700-ft. trestle over the Platte river.

The grading for the extension of this line from Casper, Wyo., to Orin Junction has been completed and the track is now being laid. This company is also building a new line connecting Wendover, Wyo., and Guernsey. The grading work is now being done by Kilpatrick Bros. & Collins Construction Company, Beatrice, Neb.

Illinois Central.—This company has awarded a contract to the J. O. Heyworth Construction Company, Chicago, for two concrete subways at One Hundred and Fifteenth street and Kensington avenue, Chicago.

Intermountain Railway.—An officer writes that contracts have been given to the Wasatch Grading Company and the Oregon Bridge & Construction Company for building from Boise, Idaho, east to Moores creek and Boise basin. Most of the work on the line will be canyon rock work, and the maximum grades will be 1 per cent. There will be one steel bridge with four 80-ft. girder spans and three 70-ft. girder bridges. The company expects to develop a traffic in lumber, logs, live stock, minerals and merchandise. C. A. Barton, president; C. N. Jacquette, chief engineer, and E. M. Hoover, treasurer, Boise, Idaho.

Kewanee, Bradford & Henry Interurban.—Plans are being made, it is said, to build an electric line from Kewanee, Ill., southeast via Osceola and Bradford to Henry, about 35 miles. C. G. Lampton, Cedar Rapids, Iowa, is interested. (See Illinois Roads, May 22, p. 1171.)

Lewisburg & Northern.—See Louisville & Nashville.

Louisville & Nashville.—An officer writes that a section of the Lewisburg & Northern between Brentwood, Tenn., and Athens, Ala., will be opened for freight traffic on July 15. The company does not intend to operate passenger trains over the line for some months or until the track and roadbed are in first class condition.

OGDEN RAPID TRANSIT COMPANY.—A contract is reported let to the Utah Construction Company, Ogden, Utah, to build a branch line east to Huntsville.

PACIFIC GREAT EASTERN.—This company, which is building a line from Vancouver, B. C., north to Prince George on the main line of the Grand Trunk Pacific, 480 miles, is now operating about 5 miles between North Vancouver ferry landing and West Vancouver and expects soon to open for traffic an additional section of 8 miles to Horseshoe Bay. The line is also open for traffic between Squamish at the head of Howe Sound and Cheakamus, 11 miles. Track laying is now being extended north from the latter section and grading work between the end of track and Lillooet, where the line crosses the Fraser river, 100 miles north of Vancouver, is finished. The unfinished bridges on this section will delay the completion of the track laying into Lillooet until next fall. The remaining section between Lillooet and Prince George is all under contract. The company expects that a force of about 6,000 men will be put to work on this section, and that the grading work will be finished to Prince George by the end of this year. (May 8, p. 1055.)

PENNSYLVANIA RAILROAD.—An officer writes that the elimination of grade crossings and track elevation work is being carried out through Wilkinsburg, Pa., from a point near Edgewood station through the boroughs of Edgewood, Wilkinsburg and the city of Pittsburgh to a point near the junction with the Brilliant branch, a total of about 2.25 miles. The maximum elevation of tracks above the present grade will be about 16 ft. The streets in Wilkinsburg are to be depressed about 5½ ft. below the present grade, and the grade crossings eliminated at the intersection of Penn avenue and Pitt street, at South avenue and Hay street, and at Wood street and Rebecca avenue, where undergrade bridges are to be constructed. In addition a 10-ft. pedestrian tunnel will be constructed on the line of Franklin avenue and an 8-ft. pedestrian tunnel on the line of Whitney avenue. The work of eliminating two grade crossings in Pittsburgh at Homewood avenue and Brushton avenue has already been completed. The plans for the new elevated line provide for the eventual construction and operation of a seven-track railroad, although only five tracks will be laid at the present time; also for the construction of a new station in the vicinity of South avenue and Hay street, with island platforms between tracks, and a passenger and baggage tunnel under the tracks with elevators and stairways leading to the platforms. The improvements also include the construction of a modern freight station and delivery yard on the south side of the tracks on the north side of Penn avenue. The masonry work is being done by the Dravo Construction Company, Pittsburgh, Pa., and the track raising by the Pennsylvania Railroad forces. (See Pennsylvania Roads, May 29, p. 1215.)

ST. JOHN & QUEBEC.—An officer of this company, which is building a line from Grand Falls, N. B., southeast following the St. John river to St. John, about 210 miles, writes that track laying has been finished on 110 miles. Contracts have been let to Kennedy & McDonald, Woodstock; the Hibbard Company, Ltd., and the Corbett Company, Inc., both of Fredericton. The work includes building 14 steel bridges. On completion the line is to be operated by the Intercolonial Railway. A. R. Gould, president, Presque Isle, Me., and S. B. Wass, secretary, Fredericton, N. B. (September 26, p. 586.)

SOUTHERN RAILWAY.—An officer writes that contracts for the construction of 19 miles of double track on the Washington division between Amherst, Va., and Elma have been let. C. W. Lane & Company, Atlanta, Ga., has been given the contract for eight miles from Amherst to Tye river and H. J. Dunavant, Chattanooga, Tenn., has been given the contract for 11 miles between Tye river and Elma. (July 3, p. 40.)

TEXAS ROADS (Electric).—It is understood that plans are under consideration for the construction of an electric railway from Mexia, Tex., northwest to Fort Worth, about 95 miles. E. N. Farris, Hillsboro, Tex., may be addressed.

TRI-STATE RAILWAY COMPANY OF MICHIGAN.—A contract is reported let to A. C. Lingebach & Company, Chicago, to build the 18-mile section from Hillsdale, Mich., south to Pioneer, Ohio. This is part of the projected line from Adrian, Mich., to Elkhart, Ind. (June 19, p. 1565.)

VICKSBURG, ALEXANDRIA & SOUTHERN.—A contract is reported let to Frank T. Constant, Alexandria, La., to build a section of 8.5 miles from Tioga, La., to Alexandria. The company was recently organized, with headquarters at Alexandria, to build a line across the State of Louisiana. John F. Shepley, of the Union Trust Company, St. Louis, Mo., is president. (June 26, p. 1607.)

WISCONSIN SOUTHERN (Electric).—Bids are being received, it is said, to build 32 miles of railway in the state of Wisconsin. The company was organized to build from Madison, Wis., northeast via Sun Prairie, Columbus, Beaver Dam, Juneau, Horicon, Mayville, Knowles, Lomira, Campbellsport, and Dundee to Plymouth; also from Knowles north via Brownsville and Oakfield to Fond du Lac. C. D. Smith, president and general manager, Fond du Lac, Wis.

RAILWAY STRUCTURES

CHARLESTON, S. C.—An officer of the Holston Corporation organized to carry out the work on new terminals for the Carolina, Clinchfield & Ohio writes that the contract for the dredging for Charleston terminals has been let to the Atlantic Gulf & Pacific Co., New York. The contract for the concrete dock and foundations has been let to McArthur Brothers, New York. (July 3, p. 40.)

CHARLESTOWN, W. VA.—An officer of the Norfolk & Western writes that a contract has been given to Wade & Graham, Roanoke, Va., for building a brick passenger station 27 ft. x 107 ft. 3 in. and a brick freight house 27 ft. x 100 ft. at Charlestown. The estimated cost of the improvement is about $25,000.

CLINTON, IOWA.—The Chicago & Northwestern is contemplating building a 180-car capacity repair yard at Clinton, Iowa. There will be a total of four buildings, one brick veneer mill building, 60 x 150 ft., one brick veneer shop building, 50 x 100 ft., one frame store building, 22 x 150 ft., and one frame lumber shed 22 x 100 ft. The contract for this work will be let in the next few days. The estimated cost is about $80,000.

FLORENCE, S. C.—A contract is reported let to D. J. Rose, Rocky Mount, N. C., for improvements at Florence, to include a roundhouse, a turntable, planing mill and machine shop for the Atlantic Coast Line.

JACKSON, TENN.—An officer of the Mobile & Ohio writes regarding the report that the company will put up new shops at the Claymore yard and will make repairs to the existing shops at Jackson, that no definite plans have been prepared for these improvements.

METROPOLIS, ILL.—The Paducah & Illinois Railway, a subsidiary of the Chicago, Burlington & Quincy, and the Nashville, Chattanooga & St. Louis, has let a contract for seven pneumatic piers for a double track bridge over the Ohio river at Metropolis, Ill., to the Union Bridge & Construction Company, Kansas City. These piers will be sunk about 90 ft. and will require about 84,000 yd. of concrete. The entire structure will be 5,630 ft. long, and will include one 722 ft., four 555 ft. and one 304 ft. spans. The estimated cost of the structure is $3,500,000, while the amount involved in this contract is $1,100,000. C. H. Cartlidge, of Chicago, is chief engineer.

NEW YORK.—The New York Public Service Commission, First district, will open bids on July 23 for the finish work in six stations on the extension of the Fourth avenue subway in the borough of Brooklyn between Fortieth and Ninetieth streets.

THE SPANISH LINES OF THE PARIS, LYONS & MEDITERRANEAN COMPANY.—The Paris, Lyons & Mediterranean has acquired the railways owned by the North-Eastern Company of Spain, a small company operating two or three subsidiary lines in the Barcelona district. The railways thus transferred are those running between Barcelona to Manresa, via Martorell, the Central Catalonia (from Martorell to Igualada) and the Manresa-Berga-Guardiola. Work has been re-started on the extension of the Martorell line to Manresa, and it is expected that this will be opened this summer as far as Olesa de Montserrat. Subsequently the continuation of the Manresa-Berga line will be undertaken with the object of linking up this to the Paris, Lyons & Mediterranean main system at the frontier via Puigcerdá.

Railway Financial News

Altus, Lubbock & Roswell.—This road, which runs from Altus, Tex., to Wellington, 60 miles, has been sold by E. Kennedy to J. M. West, E. C. Noble and Carey Shaw, of Houston, Tex., and O. L. Slayden and F. E. Wheeler, of Lubbock, Tex.

Baltimore & Ohio.—This company, through the Moorefield & Virginia, has taken over the Hampshire Southern, which runs from Romney, W. Va., to Petersburg.

Boston & Maine.—See New York, New Haven & Hartford.

Chicago Great Western.—This company has made arrangements with the Minneapolis, St. Paul, Rochester & Dubuque Electric for this road to take over the Great Western's passenger business between Randolph, Minn., and Mankato.

Cincinnati, Hamilton & Dayton.—Judson Harmon, formerly governor of Ohio and a receiver of the company when it was previously in the hands of a receiver, and Rufus B. Smith, have been appointed receivers of the Cincinnati, Hamilton & Dayton.

Hampshire Southern.—See Baltimore & Ohio.

Kansas City, Mexico & Orient.—On July 6 the property was sold under foreclosure to the reorganization committee for $6,100,000, the upset price.

The reorganization committee has also bought the assets of the Union Construction Company, the International Construction Company of Delaware and the International Construction Company of Texas.

Lake Erie & Northern.—See Canadian Pacific.

Missouri Pacific.—Representative Barton, of Nebraska, claiming that the Missouri Pacific owes the United States Government $4,000,000 on account of subsidiary bonds sold about 30 years ago and the proceeds loaned to this company. It is claimed that $1,600,000 bonds were authorized, the company having the proceeds of the sale and agreeing to pay back the government in full and until this debt was paid to carry the mail free on the 100-mile line which was in part built with the proceeds. The secretary of the treasury has been called upon for information.

New Orleans, Texas & Mexico.—Equipment trust certificates, amounting to $800,000 and to be issued to reimburse the company in part for equipment costing $1,000,000 bought by the receivers, are to be offered to the public within a few days.

New York, New Haven & Hartford.—The Massachusetts legislature passed a bill amending the charter of the Boston Railroad Holding Company permitting the sale by the New Haven of the Boston & Maine, with the proviso that each certificate of stock should be stamped with an agreement under which the purchaser must, at the option of the state of Massachusetts, sell this stock to the state. The New Haven refusing to sell its Boston & Maine stock under these conditions, Attorney General McReynolds has announced that he intends to proceed with a suit for dissolution of the New Haven.

New York, Ontario & Western.—No dividend was declared on the common stock at the regular annual meeting. In 1913 2 per cent. was declared; in 1912, none, and in 1906 to 1911 inclusive, 2 per cent.

Northern Pacific.—J. P. Morgan & Co., the First National Bank and the National City Bank, all of New York, have bought from the company and are offering to the public $20,000,000 of the new refunding and improvement mortgage 4½ per cent. bonds, series A, of July 1, 1914-2047. The offering price to the public is 97, yielding 4.64 per cent. interest on the investment. The bonds are redeemable at 110 after July 1, 1919. The mortgage securing them is a first lien on 847 miles of road and a junior lien on the balance of the 6,271 miles covered by the mortgage. The balance of the bonds under this mortgage may be issued for refunding prior debt and for a face amount equal to the cost of additional property and betterments. After a specified amount, however, is outstanding the bonds may be issued for additional property and betterments only to the extent of 80 per cent. of the cost thereof.

Peoria & Eastern.—John F. Wallace, chairman of Westinghouse Church Kerr & Co.; Lewis E. Waring, of Edward Sweet & Co.; Sydney S. Schuyler, of Schuyler, Chadwick & Burnham, and Thomas Nelson have formed a committee and are asking the deposit on or before September 1 of the income mortgage 4 per cent. bonds.

St. Louis & San Francisco.—Judge Sanborn has ordered the consolidation of the Bankers Trust Company suit against the St. Louis & San Francisco receivers with the general receivership proceedings.

San Antonio, Uvalde & Gulf.—This company has asked the Texas railroad commission to register $1,024,000 bonds to be issued on 43 miles of road recently completed.

Southern Railway.—Voting trust certificates representing the common and preferred stock, which were issued in 1894 and extended in 1902, are called in for July 31, and stock certificates are to be exchanged for them.

ANNUAL REPORT

THE DELAWARE AND HUDSON COMPANY—EIGHTY-FOURTH ANNUAL REPORT

GENERAL OFFICE.

NEW YORK, N. Y., April 2, 1914.

To the Stockholders of
The Delaware and Hudson Company:

The President and the Board of Managers submit the following statements of the affairs of the Company for the year ended December 31, 1913:

The results from operation of the Coal Mining Department were:

Year.	Coal Mined.	† Revenues.	‡ Expenses.	Net Revenue.
1913	.....7,170,553 tons.	$16,045,308.03	$14,748,615.71	$1,296,692.32
1912	.....6,438,555 "	13,397,557.48	12,811,520.34	586,037.14
Increase	731,998 tons.	$2,647,750.55	$1,937,095.37	$710,655.18

† Excluding dividends received from stock of Coal Companies owned.
‡ Excluding taxes.

Year.	Miles. Operated.	Operating Revenues.	‡ Operating Expenses.	Net Operating Revenues..	Percentage of Expenses to Revenues.
1913	903.99	$24,153,494.73	$15,210,306.85	$8,943,187.88	62.97
1912	†903.99	22,480,102.95	14,066,778.74	8,413,324.21	62.57

The results from operation of the Railroad Department were:

Increase		$1,673,391.78	$1,143,528.11	$529,863.67	.40

‡ Excluding taxes.
† This figure is 26.39 miles greater than shown in 1912, the figures having been recast on account of remeasurements, and also due to the inclusion of various short pieces of main line track, formerly treated as sidings and spur tracks.

RAILROAD DEPARTMENT.

REVENUES AND EXPENSES.

The general distribution of the Operating Revenues and of the Operating Expenses of the Railroad Department was as follows:

	1913.	1912.	Increase or Decrease.
REVENUES:			
From Coal Freight Traffic.....	$11,436,959.90	$10,346,094.92	$1,090,864.98
" Merchandise Freight Traffic (including switching)	8,794,428.57	8,476,850.69	317,577.88
" Passenger Traffic	3,277,928.68	3,076,507.07	201,421.61
" Express Traffic	334,279.74	305,119.40	29,160.34
" Transportation of Mails.	121,793.50	119,445.51	2,347.99
" Miscellaneous Sources ..	188,104.34	156,085.36	32,018.98
Total Operating Revenues..	$24,153,494.73	$22,480,102.95	$1,673,391.78
EXPENSES:			
For Maintenance of Way and Structures	$1,787,613.86	$1,940,352.37	—$152,738.51
" Maintenance of Equipment	3,753,963.16	3,230,742.16	523,221.00
" Traffic Expenses	305,965.69	289,754.01	16,211.68
" Transportation Expenses...	8,584,722.10	7,979,041.22	605,680.88
" General Expenses	778,042.04	626,888.98	151,153.06
Total Operating Expenses..	$15,210,306.85	$14,066,778.74	$1,143,528.11
Net Revenue from Operation..	$8,943,187.88	$8,413,324.21	$529,863.67
Percentage of Expenses to Revenues	62.97	62.57	.40

FINANCIAL.

CAPITAL STOCK AND FUNDED DEBT.

The Capital Stock of The Delaware and Hudson Company on December 31, 1913, was $42,503,000, no additional shares having been issued during the year.

The Debentures of 1914, outstanding at the close of the year were $100,000, having been reduced by the payment, on January 1, 1913, of $200,000, maturing as of that date.

The amount of First Lien Equipment Bonds of 1922, outstanding December 31, 1913, was $9,643,000, bonds aggregating $51,000, having been retired during the year through the operation of the Sinking Fund established in connection with their issue.

The First and Second Mortgage Bonds of the Saranac and Lake Placid Railroad Company aggregating $144,000, matured November 1, 1913, and the money was deposited with the Trustee to redeem them.

In March, 1913, the Company applied to the Public Service Commission, Second District, of the State of New York, for permission to issue $5,000,000, par value, of its First and Refunding Mortgage Four Per Cent Gold Bonds, the proceeds to be used in paying the floating debt incurred for additions and betterments, and to meet the cost of completing the work under way and of other contemplated improvements. On October 9, 1913, the Public Service Commission approved the issue of $4,500,000, at 95 or better, reserving approval of the remaining $500,000, pending the completion of an examination of the accounts of the Company. Approval, at an early date, is anticipated and the full issue of bonds desired will then be available. Although, when the application was filed with the Commission, the officers of the Company as well as the bankers who were consulted believed that the bonds could be sold at a price that would net the Company 95 or better, the subsequent change in market conditions has made it impossible, up to the present time, to realize the price fixed by the Commission.

FLOATING DEBT.

The Floating Debt of the Company amounted to $4,500,000, on December 31, 1913, having increased $1,000,000, during the year. This increase was largely necessary to finance, temporarily, addition and betterment work covered by the proposed issue of First and Refunding Mortgage Bonds; and, in part, was on account of advances to subsidiary companies (principally the Wilkes-Barre Connecting Railroad Company) for which this Company later will be reimbursed.

SINKING FUNDS.

During the year there was paid to the Trustee under the First and Refunding Mortgage the sum of $277,040, being one per cent of the par value of the First and Refunding Mortgage Gold Bonds outstanding May 1, 1913, making the total paid to date, $1,173,550. In accordance with the terms of the trust agreement, this sum has been expended in additions and betterments to the property covered by the mortgage.

A summary of the operations of the Sinking Fund under the First Lien Equipment Trust Indenture, from the date of its creation to December 31, 1912, follows:

RECEIPTS:

Annual payments to Trustees, years 1908 to 1913, both inclusive, $650,000 per year.....	$3,900,000.00	
Interest on cash balances and investments.....	174,446.12	
Total		$4,074,446.12
DISBURSEMENTS:		
Seventy-seven Locomotives acquired..	$1,916,821.71	
Five Milk Cars acquired.....	17,000.00	
One Gas-Electric Car acquired.....	25,217.46	
One Pintsch Gas Transport Car acquired	2,500.00	
Two Gasoline Tank Cars acquired....	1,700.00	
One Bridge Erecting Car and Trailer acquired	14,334.62	
One Steam Wrecking Crane acquired	13,000.00	
One Snowplow acquired	5,040.42	
Fifteen Cabooses acquired	10,500.00	
		$2,006,314.21
Three hundred fifty-seven (357) The Delaware and Hudson Company First Lien Equipment Bonds purchased and retired (including accrued interest)	362,896.77	
Securities and Cash in hands of Trustees.....	1,705,235.14	
Total		$4,074,446.12

In accordance with the ordinance passed May 9, 1899, and amended at the annual meeting of stockholders held on May 10, 1910, there was accumulated in the Coal Department Sinking Fund $216,972.39. This amount has been applied toward advances to The Schuylkill Coal and Iron Company and the Shanferoke Coal Company for the acquisition of anthracite lands in the Schuylkill section of Pennsylvania.

DIVIDENDS.

On December 31, 1913, a dividend for the year 1914, upon the outstanding $42,503,000, of Capital Stock of the Company, at the rate of nine (9) per cent upon the par value thereof, amounting in the aggregate to $3,825,270, was declared out of the earnings of the current and preceding years.

COAL MINING DEPARTMENT OPERATIONS.

During the year 1913 this Company mined 7,170,553 gross tons of anthracite, out of a total of 69,069,628 tons, including product of washeries, produced in the region. This is 731,998 gross tons more than in 1912, the production of that year having been reduced by the suspension of mining from April 1 to May 21, inclusive, due to the strike.

In the report for last year reference was made to an agreement between the Mine Workers and the Anthracite Operators, for a period of four years, to end March 31, 1916. Section "D" of this agreement provides, in detail, a method for the adjustment, without strikes or lockouts, of all differences, including provision for the arbitration of matters not otherwise settled. The Company has at all times observed both the letter and the spirit of this agreement. It is regretted that notwithstanding this agreement the employes continue to strike first and then to invoke the intervention of the machinery provided to prevent strikes, rather than to remain at work and have the differences adjusted in the orderly manner provided by the agreement. During 1913 there were ten separate strikes which caused the temporary idleness of one or more collieries, the total loss of time being equivalent to the closing of one colliery for 491 hours, or 54 5/9 working days of nine hours each.

This Company has endeavored to conduct its mining operations with adequate regard to protection against caving. Recent discussion of this general subject, particularly in the City of Scranton, has been accompanied by extreme demands which, if admitted, would greatly enhance the cost per ton of anthracite recovered and materially reduce the ultimate proportion of the total supply in the ground that could be made available for consumption. It is not believed that these demands will ever be sanctioned by statute or that any statute attempting to sanction them would be valid.

Effective June 28, 1913, the State of Pennsylvania imposed a so-called Ad Valorem Tax of 2½ per cent of the value of anthracite when prepared for market. No tax was imposed upon bituminous coal. This new tax is substantially equivalent to ten cents per ton on the domestic sizes, the only sizes not marketed in competition with bituminous coal, and, therefore, the only sizes from which it could be recovered. It became necessary, therefore, to add ten cents per ton to the market price of each of the domestic sizes.

The new colliery at Archbald, Pa., was completed during the year and placed in operation during April, 1913. At the same time, White Oak breaker was abandoned and dismantled, the coal from that district now passing through the new breaker at Archbald, along with coal from other lands now being developed. A new washery is under construction to reclaim coal from the culm bank at the Marvine colliery, situated in the northern part of the City of Scranton. Work is in progress to connect the underground operations at Plymouth No. 2 with Plymouth No. 5, with a view, upon completion, of abandoning Plymouth No. 2 breaker, and handling all of the output through Plymouth No. 5, thus combining the two operations.

During the year the enlargement of the electric plant at Coal Brook colliery, Carbondale, Pa., was completed and it now furnishes power and light for four collieries located between Jermyn, Pa., and Forest City, Pa. Work was continued on a large electric plant at Olyphant colliery, Olyphant, Pa., which, when completed, will furnish power and light to four collieries located between Scranton, Pa., and Archbald, Pa.

In the past three years about $140,000.00 has been expended for concrete barns in the mines replacing those made of wood; and for the installation of protective apparatus to guard the lives of employes and the Company's property against fire.

Development work was continued and facilities increased during the year, in order to maintain the output. The charges therefor, to Extraordinary Expenses of the Coal Mining Department, amounted to $970,535.80, against $857,975.42 in 1912.

The expenditures of $215,051.72 for new engines, new boilers, boiler houses and fittings; $63,646.07 for new pumps and pump rooms; and $23,840.81 for tracks, compressors, etc., were required mainly to make these facilities sufficient to maintain the present output and were made necessary by the augmented area of underground workings due to increased ages of mines. This is illustrative of expenses other than changes in the wages schedule, which tend to enhance the cost of producing coal from year to year.

RAILROAD DEPARTMENT.

Operating Revenues.

The increase in Operating Revenues over the year 1912 was $1,673,391.78. The revenue from Coal Freight traffic increased $1,090,864.98; the revenue from Merchandise traffic increased $317,577.88; the revenue from Passenger traffic increased $201,421.61; and the revenue from Miscellaneous sources increased $63,527.31.

Operating Expenses.

The increase in Operating Expenses over the year 1912 was $1,143,528.11. Maintenance of Way and Structures Expenses decreased $152,738.51; Maintenance of Equipment Expenses increased $523,221.00; Traffic Expenses increased $16,211.68; Transportation Expenses increased $605,680.88, and General Expenses increased $151,153.06.

The ratio of Operating Expenses to Operating Revenues in 1913 was 62.97 per cent, as compared with 62.57 per cent in 1912.

The decrease in expenses for Maintenance of Way and Structures was largely due to the heavy charges in 1912 on account of maintenance charges incidental to the strengthening of bridges and other additions and betterment work then under way.

The increase in the Maintenance of Equipment Expenses was due to an increase of $215,483.69 in Freight Train Car Repairs and an increase of $233,512.39 in Freight Train Car Renewals. The Freight Train Car Repairs resulted from an increase of 12,564,332 miles, or 7.74 per cent, by freight train cars. The increase in Freight Train Car Renewals was largely due to additions and betterment work. Freight Train Car Equipment is being rebuilt, applying thereto steel in place of wooden underframes. Under the accounting rules, insisted upon by the Interstate Commerce Commission, this rebuilding necessitates considerable charges to Operating Expenses, although its result is to place the Company in the possession of substantially new equipment of the best quality and efficiency at an expense very much lower than would be involved in obtaining it in any other way.

Increased traffic naturally required some increase in the Transportation Expenses. In addition there were large increases in wages, discussed in detail at another place in this report, which resulted from arbitrations, under the Acts of Congress known as the Erdman and Newlands laws, of differences with employes represented by the Brotherhood of Locomotive Engineers, the Order of Railway Conductors and the Brotherhood of Railroad Trainmen. Increases due to the so-called "full crew laws," requiring the payment of superfluous employes, are also discussed elsewhere.

Additions and Betterments—Road.

Work under the program of renewing and strengthening bridges on the main lines to make them capable of carrying E-5 consolidation engines, as mentioned in the Annual Report for 1912, was continued during the year 1913, resulting in charges to Additions and Betterments of $106,845.81 and to Operating Expenses of $40,319.32. This work will probably be completed during 1914. Strengthening the bridges on the line between Saratoga Springs and North Creek, to make them capable of carrying Consolidation Engines of classes E to E-3 inclusive, was undertaken and will be completed early in 1914. The bridge over the Hudson River at Waterford, N. Y., on the Troy Branch has been reconstructed and made capable of carrying heavier engines, in connection with the changes made necessary by the construction of the Barge Canal at that point. The bridge carrying the Troy Road and the tracks of the United Traction Company over the tracks of The Delaware and Hudson Company at Menands, N. Y., is being improved and lengthened so as to provide increased horizontal and vertical clearances and room for additional main tracks in connection with the reconstruction of the Troy Road as a State Highway. There had been expended to December 31, 1913, $43,471.04, of which $23,424.23 is chargeable to Additions and Betterments. A tract of quarry land near Cobleskill, N. Y., has been acquired, to provide material for reballasting the Susquehanna Division.

The installation of block signals between Plattsburgh and Rouses Point, N. Y., has been authorized, and will be completed during the year 1914. The estimated cost is $41,000. When this work is complete the entire line from Binghamton to Nineveh, and from Wilkes-Barre to Rouses Point, will be equipped with modern block signals. The elimination of grade crossings at Slingerlands, N. Y., and Robinson Street, Binghamton, N. Y., mentioned in the 1912 Annual Report, was completed during 1913, and that at Bainbridge, N. Y., will be completed during 1914.

A passing siding extending from West Chazy to Canada Junction, 80-car passing sidings at Wadhams, Crown Point and Montcalm Landing, N. Y., and additional yard tracks at Rouses Point were constructed during the year 1913. The enlargement of the freight house and provision of additional tracks at Green Island, N. Y., and the impovement of the station and yard facilities at Sidney, N. Y., mentioned in the 1912 Annual Report, were completed during the year. The construction of additional yard and car repair tracks, new 5-stall engine house, ash pit, turntable and locomotive coaling plant at Mechanicville, N. Y., was completed during the year. These facilities were necessary to handle the freight traffic interchanged with the Boston and Maine Railroad at that point. Similar improvements have been made by the Boston and Maine Railroad and each Company is now operating its own yard facilities in place of the former joint facilities. The Delaware and Hudson Company expended, to December 31, 1913, on this account $159,916.20. A program for the further development of yards at Carbondale, Pa., has been undertaken, and $24,483.08 has been expended thereon during the year. The work will be continued during 1914 and 1915, with an estimated expenditure of $130,000 each year.

An expenditure of $59,372 for bridge and track construction to reach the new washery and breaker plant to be known as Marvine Breaker No. 2, at Providence, Pa., has been authorized. On this improvement the sum of $26,856.33 was expended during the year, all chargeable to Additions and Betterments. Additional coal and ash facilities at Oneonta, N. Y., and a new coaling plant at Saratoga Springs, N. Y., were completed and put in operation during the year.

An expenditure of $776,000 for improvements at Albany, N. Y., including the purchase of additional lands, rearrangement of tracks, and the erection of a modern general office building and freight terminal, has been authorized. During the year a new passenger station has been constructed at Riverside, N. Y., and the old passenger station remodeled for use as a freight house, at a cost of $17,032.72, of which $15,280.72 is chargeable to Additions and Betterments. There are under way minor improvements to stations and freight facilities at Binghamton, Plattsburgh, Ticonderoga, and North Creek, N. Y.

Addition to power equipment at Oneonta, N. Y., shops, made necessary by the increased car repair work, was practically completed at the close of the year. To December 31, 1913, $46,483.05 was expended, all of which is chargeable to Additions and Betterments. The addition of four boilers and one blower at the Mechanicville power plant was commenced late in the year and will be completed during 1914.

Water facilities were enlarged during the year by the erection of 100,000-gallon tanks at Oneonta and Cobleskill, N. Y. A 50,000-gallon tank at Hudson, Pa., and improvement of the water facilities at Saranac Lake, N. Y., are now under way.

Additions and Betterments—Equipment.

The work of equipping with steel underframes, 200 box cars of 60,000 pounds capacity, 400 coal cars of 80,000 pounds capacity and 200 coal cars of 60,000 pounds capacity, mentioned in the 1912 Annual Report, was completed during 1913 at a cost of $336,872.99. This is a part of the general program of reconstruction, already referred to herein, under which the quality and capacity of this Company's equipment are being improved and increased.

During the year 10 baggage and mail cars were equipped with steel underframes and trucks. Arrangements have been made to equip 10 class E-5 consolidation locomotives with superheaters, thus effecting economy in fuel consumption. This is estimated to cost $25,000.00. There were received during the year 15 Class E15 Consolidation Locomotives, one (1) one-hundred ton wrecking crane and one (1) bridge erecting car and trailer with necessary equipment which were ordered in 1912, all of which were paid for from funds accumulated under the First Lien Equipment Trust Indenture.

The net changes, mostly charges but involving credits as indicated, during the year on account of Additions and Betterments to the Company's railroad (including expenditures on account of items mentioned above) amounted to $1,388,503.58, details of which are as follows:

ROAD:	
Right of Way	$124,368.58
Real Estate (Credit)	*3,200.00*
Protection of Banks and Drainage	14,337.02
Grade Reduction and Change of Line. (Credit)	*37,734.68*
Bridges, Trestles and Culverts	122,490.99
Increased Weight of Rail	32,150.62
Improved Frogs and Switches	3,021.35
Track Fastenings and Appurtenances	36,535.08
Sidings and Spur Tracks	95,078.77
Terminal Yards	54,009.84
Fencing Right of Way	898.56
Improvement of Crossings—Under and over	31,424.73
Elimination of Grade Crossings	12,284.56
Interlocking Apparatus	3,054.04
Block and Other Signal Apparatus	2,502.67
Telegraph and Telephone Lines	3,696.45
Station Buildings and Fixtures	65,482.34
Roadway Machinery and Tools	6,679.35
Shops, Engine Houses and Turntables	54,687.67
Shop Machinery and Tools	249,798.55
Water and Fuel Stations	67,363.55
Dock and Wharf Property	51.90
Other Additions and Betterments	19,306.87
Work in Progress	82,625.66
Total for Year	$1,040,914.47

EQUIPMENT:		
Steam Locomotives	$339,118.00	
Passenger Train Cars	1,170.05	
Freight Train Cars (Credit)	76,143.22	
Work Equipment	48,109.67	
Work in Progress	35,334.61	
Total for Year		347,589.11
Grand Total 1913		$1,388,503.58

Extensive station and yard improvements have been undertaken at Ticonderoga, N. Y., including a new passenger station, for which $45,128.82 had been expended to December 31, 1913. The cost of this work is being paid for from accumulations under contract with the Ticonderoga Railroad Company.

The organization of the Wilkes-Barre Connecting Railroad Company, to construct a railroad connection between the Pennsylvania Railroad and the lines of this Company near Wilkes-Barre, was noted in the Annual Report for 1912. The line has been surveyed, the necessary right of way acquired and the work of grading is nearing completion.

ALLIED STEAM RAILWAYS.

The Greenwich and Johnsonville Railway Company shows an increase in Operating Revenues for the year 1913 of $2,751.02 as compared with the previous year. The Operating Expenses decreased $5,710.89. The Net Income for the year was $26,303.66, an increase of $479.54. A dividend of 6 per cent. for the year ended June 30, 1913, was declared. During the year new abutments for seven bridges were constructed at an expense of $15,501.50, of which $7,909.50 was charged to Additions and Betterments and $7,592.00 to Operating Expenses. Extensive improvements at Greenwich, N. Y., consisting of the reconstruction of the yard, remodelling of the existing station for exclusive use as a freight station and construction of a new passenger station, were completed during the year.

The Quebec, Montreal and Southern Railway Company shows an increase in Operating Revenues of $13,847.50 for the year 1913, as compared with the previous year. The Operating Expenses increased $104,376.12. Income from the Hire of Equipment increased $58,231.84. The Net Income, not allowing for interest charges due to The Delaware and Hudson Company, amounted to $129,292.73, a decrease of $27,086.23. The increase in the Operating Expenses was largely due to the heavy floods in the spring, which carried away the bridges over the St. Francois river and caused serious damage to other property.

The Napierville Junction Railway Company shows an increase in Operating Revenues for the year 1913, of $32,934.88, as compared with the previous year. The Operating Expenses show a decrease of $2,923.12. The Net Income amounted to $52,873.13 or 8.81 per cent on the Capital Stock outstanding, an increase of $33,456.69 over the previous year. A dividend of 3½ per cent for the year ended December 31, 1913, was declared.

Contract has been entered into with the Grand Trunk Railway Company whereby The Delaware and Hudson Company will run one or more of its through Montreal passenger trains, each way daily, between the international boundary line and Delson Junction, Que., over the Napierville Junction Railway.

ALLIED ELECTRIC RAILWAYS.

Increases in Net Operating Revenues were as follows: United Traction Company, $36,652.14; Hudson Valley Railway Company, $10,551.07; Schenectady Railway Company, $41,318.20. The Net Operating Revenues of the Troy and New England Railway Company and the Plattsburgh Traction Company decreased $377.79 and $390.69, respectively. Dividends of 4 per cent for the year 1913 were declared on the Capital Stock of the United Traction Company; 6 per cent on that of the Schenectady Railway Company; 2½ per cent on that of the Troy & New England Railway Company, and 5 per cent on that of the Plattsburgh Traction Company.

The United Traction Company has reconstructed and repaved 2.09 miles of single track—1.52 miles on Pearl Street and Broadway in Albany, N. Y., and .57 mile on River Street in Troy, N. Y.; has re-surfaced, re-aligned and re-paved 5.34 miles of single track—2.44 miles on Hudson, Delaware and Central Avenues in Albany and 2.90 miles on Fourth Street and Second Avenue in Troy; and has constructed one mile of additional second track on Fourth Street between Burden Avenue and the Troy Union Railroad Crossing in Troy. During the year twelve new, double-truck, prepayment cars, each having a seating capacity of forty-six (46), were purchased by the Northern New York Development Company and leased to the United Traction Company, increasing the total number of prepayment cars operated by the Traction Company to seventy-two (72).

The Hudson Valley Railway Company has completed the work of paving Lawrence Street in Glens Falls, N. Y., reference to which was made in the Annual Report for 1912. Tracks on Main Street in the Village of Stillwater were reconstructed and paved for a distance of 5,782 feet in connection with the reconstruction of this street as a State highway. Various stretches of track between Fort Edward and Thomsons, between Glens Falls and Saratoga, and between Mechanicville and Waterford, formerly laid on dirt ballast, have been ballasted with cinders. A new concrete bridge has been constructed to carry the tracks over the barge canal at Ford Edward, N. Y. The high water during the latter part of March, 1913, caused a loss to the company in reduction of revenues and increase in operating expenses of approximately $11,000.00. This resulted principally from the destruction of the bridge over the Hudson River connecting Glens Falls with South Glens Falls, which was replaced by a temporary structure. Contract has been let for a new bridge of concrete construction, toward the cost of which the Hudson Valley Railway Company has agreed to contribute not to exceed $12,500.00, the balance of the cost to be borne by the municipalities. Three (3) new interurban cars each having a seating capacity of fifty-two (52) passengers have been purchased and put in service between Glens Falls and Troy.

ALLIED BOAT LINES.

The Operating Revenues of The Champlain Transportation Company show an increase of $1,033.07 and the Operating Expenses show an increase of $18,904.77 as compared with the year 1912, making a decrease in Net Operating Revenues of $17,471.70 for the year. The Operating Revenues of The Lake George Steamboat Company show a decrease of $820.68 and the Operating Expenses show an increase of $1,962.65 as compared with the year 1912, making a decrease in Net Operating Revenues of $2,783.33 for the year. The Operating Expenses of the Champlain Transportation Company increased by reason of the increased Maintenance of Vessels, $3,754.10; the increased Maintenance of Terminals, $6,267.08, caused by the extreme high water prevailing during the Spring of 1913; the increased price and quantity of fuel consumed, $5,482.89; the increased cost of food stuffs, and a longer operating season for the Steamer "Ticonderoga."

LITIGATION.

During the year, Katharine S. Weld, and others, brought action against the Company, claiming deficiency in royalties paid them, as successors to the interest of Henry B. Rockwell in the coal leased by him to this Company in 1859. This case is now pending.

CREATION OF PUBLIC SERVICE COMMISSION OF PENNSYLVANIA.

An Act of the Legislature of Pennsylvania, approved July 26, 1913, created a Public Service Commission and abolished the former Railroad Commission. The new Commission apparently has power to fix, reduce and regulate rates, to establish joint through rates and the divisions of such rates; to require the publication of rates and schedules; to prescribe and regulate distribution of cars, granting of switches, connections and sidings, and the safety and adequacy of facilities, plant and equipment; to determine and prescribe just, reasonable, safe, adequate and sufficient service, facilities, rules, regulations and practices, and to award reparation to persons injured by unreasonable rates and practices; to regulate crossings by railroads of highways, railroads and street railroads, and to require the relocation of existing crossings; to investigate issues of stocks, bonds, etc., to determine whether such issues are lawful (but approval is not required as a condition precedent to such issues); to establish systems of accounts and enforce compliances therewith; to regulate the sale, leasing and merger of powers, franchises, etc.

CAUSES ADVERSELY AFFECTING RAILROAD INCOME.

Those causes, some of them legislative, and all of them beyond the control of railway managers, which during recent years have continuously operated to enhance the difficulties attending the effort to maintain a reasonable margin between operating revenues and necessary expenses for taxes and for operation, were not less effective during the year covered by this report. Increases in rates of wages, consequent upon arbitrations under Federal statutes which, although nominally requiring the voluntary acquiescence of the railways really operate, under ordinary circumstances, with compulsory force, supplemented by reductions in the hours of labor and relaxations in the conditions necessary to secure from each unit of labor its maximum of reasonable efficiency, and increases in prices of materials and supplies, themselves mainly attributable to higher wages and lower efficiency of labor, have greatly augmented operating expenses. At the same time the taxing authorities have continued to impose upon the railways a heavier proportion of the steadily rising expenditures of government. Concurrently with these increases in necessary expenses, the process of attacking the rate schedules in detail, reducing here a single rate and there a group of rates, has operated to reduce the gross receipts on account of services rendered. While all these adverse forces have been in vigorous operation, the law has interposed to prevent, it is hoped but temporarily, recoupment from any source.

A—INCREASED WAGES AND DECREASED EFFICIENCY.

The award of the arbitrators in the case of the engineers, in effect during eight months of 1912, gave an advance of 4.34 per cent, and during 1913 cost this Company $33,030.92. The arbitrators to whom the demands of the firemen were referred, reported on April 23, 1913, their award taking effect on May 1, 1913. The increase awarded was 8.16 per cent and the cost to this Company, to December 31, 1913, was $27,308.53, or at the rate of $40,962.80 per year. The demands of the conductors and trainmen, under discussion by the General Managers' Association of New York at the close of last year, were submitted to arbitration on July 26, 1913; the Board of Arbitrators reported on November 10, 1913, and the award took effect on October 1, 1913. The increase in wages awarded amounted to seven per cent and the increased expense to this company, from October I to December 31, 1913, to $26,168.02, or at the rate of $104,672.08 per year. An Act of the Legislature of New York, which took effect on September 1, 1913, required the railways of the State to place an additional and unnecessary employe on the majority of their trains. These employes in no degree increase the safety of operation or serve any useful purpose, but from September 1 to December 31, 1913, the added cost to this Company was $40,832.88, or at the rate of $122,498.64 per year. A similar Act of the Legislature of Pennsylvania, in effect since July, 1913, caused this Company an unnecessary additional expense, in 1913, of $40,194.49. Together these items represent an increase in annual operating expenses of $341,358.93, which will, of course, become greater if the volume of traffic increases.

During the year which ended with June 30, 1913, the Railroad Department of this Company paid to its employes the sum of $8,508,673, which was $1,122,780, or 15.20 per cent, in excess of the sum that would have been paid for the same services at the rates of compensation that were in force on June 30, 1910. And this comparison takes no account of increases in wages that took effect after June 30, 1913.

B—INCREASES IN PRICES OF MATERIAL AND SUPPLIES.

There have also been many changes in prices of maetrial and supplies, and while there have been both increases and decreases, the former have affected the most important articles and the most extensive purchases and the latter have not been sufficient to offset them. An analysis of the changes since 1909 in prices of all material and supplies purchased by The Delaware and Hudson Company shows increases in the prices of twenty-eight out of fifty-nine articles of prime importance. The increased cost, on the basis of the purchases of 1912, due to changes in prices, was $326,603.16, being the difference between a total increase of $358,276.60 in the cost of the articles that have advanced and a total decrease of $31,673.44 in the cost of those reduced in price. The aggregate sum expended in 1912 for these materials and supplies was $5,239,288.35, or 6.65 per cent in excess of the sum that would have been necessary had the prices of 1912 been the same as those of 1909.

C—FEDERAL AND STATE REGULATIONS.

In addition to the foregoing burdens, in the shape of increased wages and higher cost of supplies, Federal and State regulation, in the form of hours of service laws for employes, full crew laws, requirements concerning the preparation, filing and posting of rate schedules and annual and periodical reports, locomotive regulations, such as those in regard to washing, testing and inspection, etc., employer's liability acts, elimination of grade crossings and other items of this character, has added the following sums to the operating expenses of The Delaware and Hudson Company:

1907	$78,716	1911	$247,736
1908	143,980	1912	293,329
1909	214,457	1913	325,497
1910	222,204	Total	$1,525.919

Without discussing the propriety of the large expenditures which have been made for safety and signal appliances, it is proper to note that the amounts spent for these purposes aggregated, in the last seven years, $1,509,805.

D—INCREASES IN TAXES.

Taxes have increased even more rapidly than other expenses. Comparing the year ended June 30, 1913, with the average for the past ten years, and also with the year ended June 30, 1910, it will be seen that the following increases have taken place:

	INCREASE.	
	1913 over ten-year average 1903-1912.	1913 over 1910.
TOTAL.	25.68%	7.40%
Property investment	47.56%	46.34%
Taxes	37.19%	21.06%
Operating revenues	43.30%	28.20%
Operating expenses		

Stated in amounts, it appears that there has been an increase from $237,539.55 in 1903 to $621,190.04 in 1913; or, in other words, The Delaware and Hudson Company paid $2.62 in taxes in 1913 for each $1.00 so paid in 1903, an increase of 162 per cent. An increase in taxes, paralleling the increase in property investment, might perhaps be anticipated, but here it will be noted that the increase in taxes is even more excessive, as compared with the increase in property investment, than the increase in expenses.

An Act of Congress of October 3, 1913, imposed an annual tax of one per cent per annum upon the net income of all corporations. Under the Corporation Tax law, previously in effect, they were required to pay one per cent upon net income in excess of $5,000 and were permitted to deduct, in arriving at taxable income, dividends received from other corporations subject to the tax. Under the new law a tax will be paid by companies from which The Delaware and Hudson Company receives dividends, and the latter will also pay on the same items, so far as they are included in its income. This double taxation and the removal of the $5,000 exemption will add about $15,000 to the tax payments of this Company.

The new Income Tax law has been construed by the Treasury Department as requiring one per cent upon interest payments to individuals to be retained by whoever makes the payment. Certain bonds issued or assumed by this Company were issued under mortgages providing for the payment of interest, "free from any tax which the Company may be required to pay thereon or retain therefrom." The Company has paid the interest on such bonds in full, thereby assuming the tax without prejudice however to its right to change its course should it seem proper to do so. The increased tax expense of this Company due to the assumption of the tax on these so-called "tax-free" bonds amounted, for the period covered (March 1 to December 31, 1913), to about $3,000.

E—Rates.

On July 24, 1913, the Interstate Commerce Commission made an order in the matter of express rates, practices, accounts and revenues requiring the express companies to adopt various rules and regulations, and prescribing an entirely new system and schedule of rates for all express services. The rates named by the Commission are materially below those formerly in effect. The application of certain railways to intervene in this proceeding and to be heard in defense of their rights under contracts with the express companies, was denied by the Commission. It is difficult to estimate the loss to this Company consequent upon this action of the Commission, largely owing to the fact that reductions in the revenues of the express companies were also caused by the orders of the Postmaster General increasing the maximum weight of packages carried by Parcel Post, which have undoubtedly resulted in the withdrawal of a large number of packages from the express companies.

The scope of the Federal mail service was extended on January 1, 1913, by the inauguration of the Parcel Post with a weight limit of eleven pounds and a greatly reduced scale of rates of postage. This involved a large addition to the volume of mail carried by the railways and the charge was very inadequately recognized by an addition of five per cent to the mail pay of certain railways. But the lines of this Company and all others on which the mails were weighed during the Spring of 1913 were excluded from the operation of this provision. This early weighing did not, however, provide adequately for the additional Parcel Post mail for the reason that it took place while the new service was in its earliest stage of development. Subsequent to the weighing there was a considerable increase in the number of packages within the eleven pound limit and, moreover, the weight limit has been twice increased, on August 15, 1913, and January 1, 1914, and important reductions in the rates of postage have been made. At present the limit of weight for the first two zones is fifty pounds and for all other zones it is twenty pounds. For these additions to the mail, neither The Delaware and Hudson Company nor any other railway has received any compensation whatever. The injustice thus resulting and the best means of relief therefrom have been carefully considered by the railways' Committee on Railway Mail Pay and the facts have been laid before the Joint Congressional Committee which now has the subject under consideration. The deliberations of this committee ought to lead to a recommendation to Congress, and to legislative action, that would establish a fairly compensatory basis of payment for the postal services rendered by the railways. It is not believed that Congress intended to bring about the present situation, under which the larger portion of the cost of the Parcel Post is borne by the railways to which the whole of that portion of the expense thus becomes a loss, or that its continuance will be contemplated with equanimity.

The investigation by the Interstate Commerce Commission of the rates, rules, regulations and practices governing the transportation of anthracite, which it was stated in the last Annual Report that body proposed making, was actively taken up toward the close of the year 1913, and the taking of testimony is now in progress.

F—Decrease in Net Corporate Income.

The encroachment upon the amount to which capital is fairly entitled as recompense for its share in the accomplishment of the railroad, and the insufficiency of the sums remaining after the payment of operating expenses, taxes, etc., to hold out to the investor adequate assurance of protection to his investment, are shown by the increasing proportion of the total income which they consume.

A study of the amount and proportion of the total annual income from 1903 to 1913, derived from all sources, and the amounts and percentages of such total income classified according to the purpose for which each was distributed, indicates that in 1903 wages and salaries consumed 73.30 per cent of such total income; in 1913 these expenditures had increased to 33.34 per cent. Materials and supplies consumed 18.68 per cent in 1903 and 22.31 per cent in 1913. Taxes consumed 1.59 per cent in 1903 and 2.27 per cent in 1913.

Comparisons of the total income received in 1903 and 1913 and its distribution in the two years are afforded by the following:

	Year Ended June 30			
	1903		1913	
Item.	Amount.	Per cent of total.	Amount.	Per cent of total.
Total income	$14,974,497	.....	$27,338,533	.....
Disposition:				
Wages and salaries	$4,087,442	27.30%	$9,113,657	33.34%
Materials and supplies	2,796,627	18.68%	6,100,427	22.31%
Outside operation expenses	4,315	.03%	144,931	.53%
Taxes	237,539	1.59%	621,190	2.27%
Rents	98,052	.65%	389,019	1.42%
Balance available for interest, dividends, etc.	7,750,522	51.75%	10,969,309	40.13%
	$14,974,497	100.00%	$27,338,533	100.00%

G—Difficulty of Obtaining Necessary Railway Capital.

From the conditions described it has resulted that, although the railways now represent a largely increased investment of capital, they have a smaller annual margin of gross income over necessary expenses and taxes than they enjoyed when the capital employed was much less than it is at present. With this situation, the pressure of traffic upon facilities and the public demand for increased comfort and safety of travel and transportation have continued, so that the railways are required to make large additions to their capital while their ability to attract new capital and even properly to recompense the capital already employed is steadily diminishing. Moreover, there has lately been a world-wide rise in rates of interest, which has affected all classes of American securities, with the exception of those of the great manufacturing corporations. The heavily increased borrowings of American municipalities have led to higher rates of interest on their bonds, which formerly yielded materially lower returns than railway securities. On the other hand, the "industrials," have become stronger competitors because these corporations have succeeded in convincing many investors of the substantial stability of the still higher rates they offer. Thus the difficulty of obtaining needed railway capital has been greatly enhanced by the competition of two classes of applicants for portions of the fund seeking investment, neither of which formerly appealed with much effect to those from whom railway capital must principally be derived.

H—Remedies.

In its earlier stages, the movement which has been set forth was met, more or less effectively, by economies in operation, principally secured by additions to the capital employed. Heavier and more efficient locomotives, larger cars, heavier rails, stronger bridges, additional main tracks, more sidings, passing tracks and yard tracks and facilities, and improved appliances of many kinds, all involved heavy permanent investments, but leading to more efficient performance. By such means, for example, the average freight train load of this Company and affiliated lines was increased from 339.92 tons during the year ended June 30, 1903, to 558.27 tons during the year ended June 30, 1913, and the average car load from 14.24 to 18.63 tons. It is now felt that the limit upon economies of this sort has been at least approximately attained. In other words, with the mechanical arts in anything like their present state, additional capital cannot longer be so economically employed to offset increased operating costs.

That the need of early readjustment, as between the operating expenses, taxes, etc., and the rates of charge from which those items must be defrayed, is widely recognized as is evidenced by an extract from the decision of the Board of Arbitrators, rendered on November 10, 1913, and fixing the rates of pay of conductors and trainmen, is especially pertinent. The arbitrators said:

"This Board has no authority to determine the passenger and freight rates to be paid in the Eastern Territory; neither is it in position to determine whether such an increase is justified, as a matter of fact, by all of the circumstances. This Board, however, believes that it must make its findings as to what is a proper rate of pay to be awarded to the conductors and trainmen as a result of this arbitration, without any reference to the dilemma to which railroads are evidently placed by the laws which make it impossible for them to increase passenger and freight rates without the authority of the Interstate Commerce Commission or of the Railroad Commissions of the various States. To take any other view of the question would be to decide that no increase of pay, while the laws remain as they are, can ever be made except voluntarily by the railroads. Such a decision would render arbitrations like this valueless; and it would be in effect to hold that railroad service in the Eastern Territory must continue to be rendered at existing rates of pay, even though this were to condemn the employes of the railroad to work for rates of pay which have been determined by the most careful inquiry to be inadequate. At the present time a ton of freight is moved in the Eastern Territory more than 3 miles for the value of a two-cent postage stamp. This is the cheapest railroad service to the shipper to be found on the face of the globe. In the face of such a fact, it would be unjust to say that railroad employes must continue to be satisfied only with what can be paid from freight rates as low as this."

Commenting further upon the immense additions to railway capital which they found to be desirable, the arbitrators said:

"Any policy that would make it impossible for the railroads to command this money would be a profound misfortune to the whole nation. Such a policy would be bad enough in its effect upon transportation, because it would reduce the efficiency of the railroads; but it would be criminal, in the sense that it would make the great army of railroad employes, who are numbered by the hundreds of thousands, follow their hazardous occupation under conditions more hazardous than are necessary, and indeed more hazardous than are justifiable in a country like this. The increasing safety of passengers is equally involved."

Impelled by these conditions, in March, 1913, the railroads in Official Classification Territory petitioned the Interstate Commerce Commission to reopen the proceeding, known as the Eastern Advanced Rate Case, in which that body, in 1911, prohibited certain proposed increases in rates, and, in that proceeding, to authorize an advance of 5 per cent in the rates to be charged on all freight. This reopening was denied on June 21, 1913, but on the same date the Commission instituted an inquiry upon its own motion into the matter of "Revenues of Rail Carriers in Official Classification Territory." New tariffs containing the new rates proposed were subsequently filed with the Commission. In view of the fact that the Interstate Commerce Commission had under way at the time an investigation of the rates, regulations and practices governing the transportation of anthracite it was not considered suitable to propose an advance in the rates on anthracite pending the determination of the inquiry then before the Commission. However, notice was filed with the Commission that this was not to be taken in any sense as conceding that the anthracite rates should not be included in the advance. The new tariffs were suspended by the Commission until September 15, 1914, and the proceeding on this suspension was combined with the general inquiry. The presentation of proof of the urgent need of the railroads for increased revenues and the reasonableness of the rates proposed was immediately undertaken. Prior to December 31, 1913, several hearings were had before the Commission, and a vast amount of data showing the situation of the railroads was filed with that body. The submission of testimony is still in progress.

By order of the Board of Managers,

L. F. LOREE,
President.

Note—The data in Sections D, F and H include the operations of this Company and affiliated lines submitted to the Interstate Commerce Commission for the fiscal years ended June 30, while the statistical tables in this report exclude the affiliated lines and cover the calendar years ended December 31. [The Balance Sheet is on p. 81.]

Popular clamor for the recall of a judicial decision prohibiting the granting of aid to a railroad company is the mixed situation in Colorado as the result of the decision by the state Supreme Court that the contract under which Denver was to furnish $3,000,000 for building the Moffat tunnel was not constitutional. Colorado's constitution prohibits a city lending its credit directly or indirectly in aid of any corporation or entering into a partnership with a corporation or of making a donation to a corporation. After the bankruptcy of the Denver, Northwestern & Pacific, Newman Erb undertook to reorganize the company as the Denver & Salt Lake, and persuaded the city of Denver to issue $3,000,000 bonds to pay for two-thirds of the cost of the tunnel which will make possible the extension of the Moffat road, which now runs from Denver to Steamboat Springs, to Salt Lake City. Denver has voted three times by a substantial majority to make a municipal bond issue to build a tunnel and to let railroad companies use the tunnel. The Supreme Court of the state, however, has held that this amounts to entering into a partnership agreement with a corporation and lending aid to the corporation. When this decision was announced there was a clamor for a recall, which is provided for in one of the amendments to the Colorado constitution. As it is pointed out, however, by Colorado lawyers commenting upon the decision, the recall provision may not apply to this particular case, and even if it should eventually be found to do so, the Denver city bonds, if issued immediately with the ban of the Colorado Supreme Court upon them, could not be sold. It may even be possible that the state of Colorado, in its effort to tie its own hands against aid or comfort to the enemy corporations, has very effectually done its utmost to prevent the entrance of a new railroad competitor into the transcontinental freight business with resulting loss to the rest of the United States.

Colorado and the Moffat Tunnel

The Interstate Commerce Commission has issued in abstract its customary statement, for the year ending June 30, 1913, of the total mileage, equipment, capital, and revenues of all roads in the United States earning more than $100,000 each, together with traffic statistics and the number of persons in the companies' service. The main features of this abstract are reproduced on another page. There has also been issued this week the "text" of the commission's final statistical report for the twelvemonth ending one year before that, or June 30, 1912. This is dated November 17, 1913. The term "text" is used to denote the statistician's introduction to the report, which embodies the tables that give aggregates for the whole country. This matter fills 65 pages. The final unabridged report—the bound volume, costing a dollar—may be expected some time in the future. The efforts of the statistical office of the commission to get out the annual statements as early as possible—while the facts which they give are still of some current value—are very commendable; but the task is one of such magnitude that evidently it is difficult to decide what to do first; and the effect is slightly bewildering. One who wishes to use the statistics needs a schedule of dates as elaborate as a court calendar. First comes the brief report of income account for roads having annual operating revenues of $10,000,000. This, for the fiscal year ending June 30, 1913, came out with the commission's annual report to Congress in December last. Next, revenues and expenses of roads of Class 1, those earning over $1,000,000 each. This also came in the December report. This is only a half-page statement, based on monthly reports. Next, a pamphlet of 179 pages giving full, but uncorrected, statistics of each road in Class 1. This contains all the different classes of statistics, but no totals for the country as a whole. This, for the fiscal year 1913, is dated January 1, 1914, and reached this office in April, 1914. Next, the totals for the country for the year of all roads having each an annual

Statistics of Varied Vintages

revenue of $100,000 or more (Classes 1 and 2). This, for 1913, filling a half dozen pages, is dated July 1, 1914, and is the one reprinted by us today. It deals with a variety of statistics, as noted above; but it gives no information about individual roads. It is "preliminary"—subject to correction—and also is incomplete in that it omits Class 3 roads, those earning less than $100,000 each. The final report for 1913, giving individual statements for all roads, and the corrected totals for the whole country, is yet to come. This final report for 1911 has been out several months. For 1912 a part of the final report (the "text" above referred to)—facts two years old—has just come out, and the remaining part may be expected within from six to nine months. This for 1912; the final report for 1913 will be due twelve months after that. As to the fiscal year 1914, which has just ended, all that can be said is that the year "has passed into history." But getting facts out of history is quite a different matter!

A New Leaf on the Western Maryland

Expenses for May on the Western Maryland were 114 per cent. of gross earnings. Carl Gray became president of the Western Maryland in March, and the very heavy expenditures and charges for maintenance in April and May are the result of a drastic policy of cleaning up deferred maintenance. June expenses are expected to be as heavy as those of May. In May, 1914, $181,000 was spent for maintenance of way as against $96,000 in May, 1913, and $266,000 for maintenance of equipment as against $107,000 in 1913. The management announces that part of the heavy maintenance for May is in extraordinary repairs to roadway and locomotives, but a considerable portion is due to an inventory shortage which was discovered at the time of the change in management. Previous to the change in management, the Western Maryland had been making a very poor showing, and it now appears that even this poor showing was better than the actual facts warranted. The improvement in the ratio of transportation expenses to revenue in the last few months is marked. The ratio in February was 58 per cent., in March 51 per cent., in April 43 per cent., and in May 41 per cent. The new management expects that June will be the last month of the extraordinary charges necessary to put the property in good physical shape, and to clean off deferred charges. The Western Maryland has been playing in hard luck ever since it was singled out to become the eastern outlet for the projected Gould transcontinental system. When this project fell through, the necessities as far as the Western connections of the Maryland road were concerned were met by the construction of the Connellsville line to connect with the Pittsburgh & Lake Erie, which it was thought would supply a very good outlet to the East for the shippers of steel and similar commodities along the line of the latter road and its connections. The advantages that should have followed the opening of this line have not as yet materialized, but it is beginning to appear as if this was due rather to serious mistakes of the old management than to the impossibility of securing large and important amounts of traffic from this connection. Apparently the newly elected management of the Western Maryland is going about bettering conditions in the proper way.

Safety at Grade Crossings

A simple and sensible method of dealing with one of the important factors in the highway grade crossing problem, which promises to produce immediate results, has recently been adopted by the Cook county public safety commission of Illinois. The grade crossing question has been constantly agitated in Illinois for several years, as in most other states, and the railways have already expended many millions of dollars for track elevation and other improvements, not only in the cities, but throughout the rural districts. The grade crossing committee of the safety commission, however, has hit upon a way of removing dangerous conditions at hundreds of highway crossings where the situation does not demand or warrant heavier expenditure, but which present serious possibilities to automobile and other vehicle drivers. This committee, accompanied by the county coroner, himself a former railroad man, has recently made a number of inspection trips over the lines running out of Chicago, and has discovered scores of places where the principal requirement is the removal of obstructions to the vision of pedestrians or drivers of vehicles on the highways approaching the crossing. In most instances the obstructions are not upon the property of the railway, but consist of trees or shrubbery that could easily be removed or trimmed to give a clear view of the railway track for some distance from the crossing. The committee has been accompanied on each of these trips by officers of the railway and by the mayors or other officials of the cities and townships through which the line passes, and both the railway men and the public officers have been easily persuaded to undertake the slight expense involved, or to co-operate wherever necessary to remove the dangerous obstructions at once. Thus the cause of safety has been promoted at the cost of very little money simply by bringing the right people together and pointing out to them how simply conditions may be remedied and at how little cost.

A SENSATIONAL REPORT ON A STALE SCANDAL

IT is significant that the report of the Interstate Commerce Commission in its investigation of the financial transactions of the New York, New Haven & Hartford, which is abstracted at some length elsewhere in this issue, is signed, not by any individual member of the commission, but, like the reports on overcharge claims amounting to $50 or thereabouts, "By the Commission." The facts brought out by this investigation should have been brought out, and if it is possible for the New Haven stockholders to recover any part of their money which has been spent illegally, court proceedings should be begun at once. But the method of bringing out these facts which has been followed in this report is so grossly improper that the only charitable assumption is that the commissioners were so taken up with the rate advance case that the preparation of this report was left to Mr. Folk or to others who took this occasion to make a play for popular attention at the expense of the common decency of the commission.

Frederick W. Whitridge, president of the Third Avenue Railway, of New York, in commenting on the New Haven report, is quoted as calling it the exposition of "a stale scandal." During the greater part of the time that this scandal was being actually enacted, the Interstate Commerce Commission was charged with the duty of regulating the management of the railroad companies of this country and clothed with plenary power, and during the time that the accounting irregularities, which quite properly are so bitterly commented on by the commission, were being carried on, the commission was accepting without comment the New Haven's monthly and annual statements showing its financial transactions. The commission had the legal power to make an investigation of these accounts at any time. The commission therefore lays itself open to the charge of being simply a destructive critic, where it might conceivably have prevented some of the waste and loss that has taken place.

It is unnecessary for the *Railway Age Gazette* to comment on the negligence of the directors of the New Haven, or on Mr. Mellen's ethical attitude toward the stockholders other than the late J. P. Morgan—most of the facts that the commission so sensationally blazons forth in this report were already public knowledge from the testimony at the hearings. On the other hand, it is entirely fair and pertinent to ask the commissioners whether or not, by giving their stamp of approval to the New Haven's annual reports for 1908-09-10-11 and 12, they are tarred at least in some measure with the same brush which they wield so vigorously against dummy directors.

THE AUTOMATIC TRAIN STOP—II

IN discussing in our issue for July 10 the report of the American Railway Association Committee on this subject, we rehearsed the arguments concerning the excellence of the train service on American railroads and those evidences of progress that the principal roads are making in safety measures, which tend to justify that committee in holding that automatic stops are not at present to be recommended; and we called attention to those difficulties connected with the stop problem which support the view that the general adoption of this safeguard would be so costly, compared with the value of the expected protection, that the expenditure would not be warranted.

But there is another side to the question. The safety of American railroad trains is excellent, but it is not perfect. There is progress in safety, yet collisions continue to occur often enough to keep fresh in the railroad manager's mind the fact that this progress is halting and in many cases slow and imperfect. Dependence on improved vigilance on the locomotive, which is a main feature in this committee's theory, is not a wholly satisfactory safeguard. Engine runners occasionally disregard signals because of defects or deficiencies of mind or body which, it is admitted, are incurable by any process within the control of the railroad superintendent, and the idea of perfecting some device outside the engine, to stop it when the runner fails to do his duty in that respect, has therefore appealed not alone to congressmen and to ambitious inventors in secluded laboratories, but to hard-headed railroad officers as well. And when the failure of an engineman results in a score of deaths, the public demands a cure of the evil at any cost (except at the cost of low speed—nobody proposes that as a remedy). The arguments in favor of automatic train stops therefore merit attention.

The main point in favor of automatic stops is that they are extensively used already, on the underground railroads. The Interborough (New York) has used them nearly 10 years and the officers of the company class them as a valuable safeguard. The differences between the Interborough subway and ordinary railways are matters of detail; very costly and troublesome details, perhaps, yet details. The public cannot be convinced that mere details should warrant a trunk line in ignoring the experience of the Interborough except after a thorough demonstration. After a five years' demonstration on the Interborough, the Hudson & Manhattan, the Pennsylvania tunnels and the London tubes adopted the stops. The system is no mere experiment. On these roads, it is true, the motorman has no companion in the cab (except on the Pennsylvania), but there is little force in the argument that a monitor makes the automatic stop unnecessary, for the reason that our fireman-monitors have so often failed. Two men will forget together. On freight trains eight men have coincidently forgotten a despatcher's order.

If anyone is disposed to argue that these city roads need stops because their motormen are not high grade men, like regular locomotive runners (and that roads employing firemen do not need them), he may as well dismiss the question, for it is not a practical issue. "High-grade" is an unreliable term. Mr. Rudd's appeal to the honor and the conscience of the engineers will not afford us any satisfaction. Not that the majority of runners are devoid of honor and conscience; the question is, can the superintendent be sure of the right qualities in the whole of his force? He, as an individual, is responsible for efficiency. Exhorting the units has no tangible effect. One of the hardest problems of the superintendent is to cultivate, in enginemen, that brand of conscience which will admit a mistake when the result of that mistake may mean dismissal. Again, the directors of a large railroad, when considering the problem of perfecting their enginemen, must recognize that their superintendents—perhaps a score of them—are far from perfect. They will not always get 100 per cent. out of their runners even if the making of the 100 per cent. is there. A big railroad is such a complicated machine that no one has yet got near the ideal in operation. For many of the elements of many of our good records we have to thank a benevolent Providence rather than scientific efficiency.

It is not all a question of discipline, however. The most perfect enginemen, under the best administration, may break down. Mr. Long, the general manager of the Pennsylvania, speaking at the meeting of the American Railway Association last year, mentioned collisions that he had heard of which were due to "preoccupation of the engineman." The man was awake, had his head out of the cab window, looked at the signals, saw them, but did not obey them. The sense of sight was not sufficient. Many people, said Mr. Long, think that cases like this are becoming so frequent that something ought to be done. Every one knows that enginemen sometimes go on duty with powers of mind or body impaired by sickness, or with minds burdened with debts, or divorce or other domestic difficulties, or the death of a friend. They have not the combined courage and discretion to lie off and lose a day's pay. The wisdom described by some of the writers of our articles, published last winter, on "How to Keep a Good Lookout" is not universal. With the mass of facts like the foregoing, it would be easy enough to show that automatic stops are desirable if only they were proved practicable and not unreasonably costly.

The Interborough not only uses the stops but recommends them. In the first year a very serious collision was undoubtedly prevented. On the Boston Elevated, where stops have been used 15 years, an officer gives the significant testimony that disregard of stop signals *has been done away with.* With its low speeds this road has not the most difficult problems, but it is noticeable that the fine results reported have been made without the aid of a recording apparatus. And here, as well as on all the subways mentioned, the stops are not self-detecting. It is possible for a stop to fail and the failure not be promptly discovered. But the improvement of discipline is such a pronounced benefit that the officers prize the system highly without demanding that it shall be ideally infallible. On the Interborough a satisfactory degree of certainty in operation is maintained by the ordinary inspection, such as is given other signal apparatus.

There are bold signal engineers ready to adapt automatic stops to trunk line railroad conditions. The Chicago & Eastern Illinois, as noted in the *Railway Age Gazette* June 5, page 1246, has equipped 90 engines, and proposes to protect trains on about a hundred miles of road. Unless some fairy can give assurance that no more collisions of the first magnitude are going to occur anywhere, it would seem to be the duty of railway officers generally to keep very close track of all such experiments as this; or, if those experiments are not in all respects of a satisfactory kind, to start something better. And when we see the underground roads satisfied with a device which theoretically is imperfect, and the French government requiring cab signals installed on thousands of miles of road, it may be claimed, with reason, that sticking forever at the difficulties of the automatic stop, is not the part of wisdom. One of the difficulties, the overlap, can be overcome by adding "speed control" apparatus. Why should not speed control be thoroughly tested? All troubles with snow and ice are supposed to be avoidable by the use of magnetic or induction apparatus, having no contacting parts. Should not this supposition be proved? If brake-applying apparatus is to be finally rejected as not usable, the fact ought to be settled, and the next best thing tried. Cab signals and Mr. Cade's audible roadside signal have well known drawbacks; but they involve no difficulty with brakes; and *if* automatic stops cannot be made satisfactory and

if the public is not going to be satisfied with our present system, it may become expedient to encourage some such device.

This, it seems to us, is the line of argument of the more level-headed of the automatic stop advocates; and these advocates are too numerous to be ignored. Congress and other public bodies blindly demand that the railroads do something. It is not fair to keep the public in the dark. It is not even consonant with enlightened self-interest to maintain a silence which is interpreted as indifference. Except as continued freedom from collisions may keep Congress in a somnolent condition, the fundamental issue still hangs over our heads.

Between the ideas of the advocates of stops, whose position we have here outlined, and those of the conservatives, recounted in our first article, there are some pretty radical differences, although at first thought it might seem that they differ only as to details. The opposing sides have never met each other in fair and free debate. But the importance of the parties, if not the importance of the subject, would seem to demand that this anomalous condition be brought to an end. This phase of the problem will be considered in a third article.

THE STOKER SITUATION

As to whether the mechanical stoker for locomotives is to be considered a success or not, in the present stage of its development, depends on the viewpoint of the person expressing the opinion. If the opinion is based purely on up-to-the-present performances insofar as coal consumption per unit of work done is concerned, the answer would probably be in the negative, for undoubtedly stoker-fired do burn more coal than hand-fired engines. But if the question is to be viewed from the standpoint of ability to maintain steam pressure, and of handling all the coal burned, then the stoker is a success. It was, however, remarked two years or more ago at the Master Mechanics' convention that it is, apparently, a comparatively simple matter to design a stoker that will maintain steam pressure under ordinary and even extraordinary working conditions.

It is, of course, of prime importance that an engine should be kept hot. That is the first task imposed upon the fireman, and for its accomplishment all other things must take second place, even to that of lookout for signals, because it would be a hazardous excuse to offer for a steam failure that the fire was neglected to call signals. Full steam pressure means relief to the engineer, as he can work his machine to its full capacity; he can make the time, and the despatcher knows that he can count on trains reaching meeting points at the estimated time. If to this we add a certainty as to steam pressure at all times, regardless of grade, loads, speed, length of run and weather conditions, we have eliminated many of the uncertainties of train operation and put confidence in the heart of the operating department. This can now be done by the stokers on the market. They can remove that factor, "the fatigue of the fireman," from consideration and give the despatcher confidence that a weary man at the end of a long division is not one to be reckoned with. It means that the engine can really be loaded to capacity without danger of steam failure and that it can be counted upon to work to its maximum efficiency to the end of the run. And, as a necessary consequence, its rating is increased. The engineer in this is relieved of the necessity of favoring his fireman. He can work the engine as he would like, regardless of the man. He is not called upon to trade water for steam, and lose time lest he lose pressure. In short, he can keep both eyes on the lookout instead of keeping one always on the steam gage. This the present stokers can accomplish.

If, then, the stoker burns more coal per engine mile or per ton mile, the question is, are not the results worth it? It is generally conceded by those railroad men who have been most successful in the use of stokers and have the largest number in service, that the engines so equipped do burn more coal than those that are hand-fired. But the comparison is apt to be made on the basis of the engine mile. Sometimes tonnage has been increased, but always operation has been improved, so that the actual increase of coal consumption is subject to a discount dependent upon the actual increase of tonnage and the value that may be put upon the improvement in operation. Hence the apparent extra fuel cost may be either entirely eliminated or, at least, greatly reduced, dependent on the modifying factors that may be used in making the calculation.

As for the extra fuel consumption, there is a very good reason for its present existence, but, apparently, none for its continued existence. As already stated, the first condition imposed on the fireman is that he should maintain his steam pressure. When he is firing by hand, and especially towards the end of a run, he favors his own back by using as little coal as he can, and so saves coal. With a stoker he has his eye on the steam gage, and takes no chances, and, as it requires no effort to put coal into the firebox, he makes sure that he is putting in enough, which means that he always puts in too much. But he holds the pressure. It is, then, a matter of the education of the fireman to train him so that he will put in enough and not too much coal, that he will watch his fire at all times, with even greater care than when hand firing, and that he will give the stoker operation his constant and unceasing attention. The work done by the locomotive on the road varies from minute to minute and almost from second to second, and if the best results are to be obtained with a stoker, its adjustments should follow each other with the same rapidity as the variations in the work done by the engine.

On general principles, there is no reason why a stoker-fired engine should burn more coal than one that is hand-fired, and many reasons why it should burn less. The firebox can be designed so as to secure the best conditions of combustion; the door need not be opened, and the air supply above and below the bed can be adjusted to secure the best results. But we still have the human element of indifference and carelessness to contend with, with every inducement towards an excessive fuel supply. How these can be overcome is a difficult problem. A fuel premium has been suggested as a proper and possible solution.

Based on the sentiments of the men using the stoker, it is a success. The men like it. After they have become accustomed to it, they have confidence in it and its labor-saving qualities recommend it. But it is new, and men have to be educated up to it. It frequently happens that a stoker will be a perfect failure on one run, and the men will declare it unfit for use, and then on the next run, without any work having been done on it, it will do a one hundred per cent. job of stoking with a different crew. In short, the personal equation is still an important factor in stoker operation.

Large engines with cylinders of 25 in. diameter or over can do a great deal of work if they are properly fired, but they must be supplied with large quantities of fuel and this means heavy labor for a man if the locomotive is to be worked to capacity. The man tires, the stoker does not. With the man, engine efficiency falls; with the stoker it can be maintained to the end of the division. The stoker does, and for some time probably will, burn more fuel than the man, but it is on the whole reliable. Its cost of maintenance is at present unknown, but will probably range from one-half to one cent a mile. The troubles which it will develop will probably increase with the number of stokers in use. It will require constant attention and supervision. It will add another element of care to be looked after by the mechanical department. But in spite of these added burdens, it looks very much to an outside observer as though its advantages outweighed its disadvantages, and that the time is not far distant when it will be considered an economical necessity.

NEW BOOKS

The Validity of Rate Regulations, State and Federal. By Robert P. Reeder, of the Philadelphia bar. 440 pages, 6 in. by 9 in. Bound in buckram. Published by T. & J. W. Johnson Company, 535 Chestnut street, Philadelphia.

This book is a treatise dealing with the principles of constitutional law which are involved in the various phases of rate regulation by the federal and state governments, and which are fundamental to an understanding of the many problems connected with rate regulation. Established principles are stated clearly, accompanied by many quotations from the decisions of the courts in the rate cases themselves, and many unsettled problems are discussed at length by going into a broader consideration of the purposes of those who placed in the federal constitution the provisions which bear upon rate regulation.

The treatment covers the contrast between state and federal power, the methods of making and enforcing regulations, the principles governing the valuation of property for rate-making purposes, the constitutional rate of return, discrimination in regulations, and the impairment of contracts. Especially valuable is the discussion on valuation of property and on the relation of the due process provision of the constitution to substantive law. The chapter headings are as follows: "The Commerce Clause," "The Distribution of Governmental Powers," "The Due Process Clauses—Position of Court," "Due Process Clause—Discussion," "Equal Protection Provision," "Just Compensation," "Impairment of Contracts," "Preferences to Ports," and "Limitations Upon Federal Judicial Power." The book contains four thousand citations, with parallel references.

Railroad Statistics. Published by Price, Waterhouse & Co., 54 William street, New York. 9 in. by 12 in. 70 pages.

This is a combination of statistics derived largely from the annual reports of the larger railroad companies to their stockholders, and in the case of rates conveying to their stockholders from December 31 of statistics reported to the Interstate Commerce Commission. Compiled by an accounting firm of international reputation, it may, of course, be relied upon for accuracy and some of the derived figures are unusually interesting and informing. The principal railroads of the country are divided among eight groups: eastern trunk lines, anthracite railroads, southern and southeastern lines, trunk lines west of Pittsburgh and Buffalo, middle west lines in the north, middle west trunk lines, mountain lines and Pacific lines. The figures cover from 1909 to 1913 inclusive. The units selected are used intelligently, for instance freight and passenger renewal is based on per mile of road operated, while rail renewals, tire renewals, etc., are based on mile of single track operated and maintenance of locomotives on the per locomotive per pound of tractive power per locomotive mile and per locomotive mile per thousand pounds of tractive power basis. The average figures for each group are given on an average for all groups.

List of Publications Pertaining to Government Ownership of Railways. Compiled by the Bureau of Railway Economics, Washington, D. C. 74 pages, 6 in. by 9 in. Bound in paper.

The Bureau of Railway Economics has compiled and issued a very comprehensive bibliography of the available literature on the subject of government ownership, whether good, bad or indifferent, or whether favorable to or against government ownership, which may be found in the principal libraries of the country. Sixty libraries are included in the list and all books and pamphlets listed are accompanied by key letters indicating in what library they may be found. The references are grouped under a general head and under the various countries, and in the case of the United States, under the separate states. There is also a separate list of authors. In view of the present keen interest in the subject of government ownership, this bibliography should be of great value to railway men and to all interested in the subject.

Letters to the Editor

THE POSITIVE MEET; FEWER ORDERS NEEDED

BOSTON, June 4, 1914.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I have been reading, in your issue of May 29, the letter of A. C. D., referring to the use on the New York, New Haven & Hartford of the positive meet, and maintaining, in effect, that in Oklahoma it would be impossible to carry out the practice which prevails on the New Haven.

I do not suppose that you care to give space in your columns to a controversy on this subject, and, indeed, I do not wish to waste time in contradicting; but A. C. D. has overlooked a few simple facts.

In the matter of operating lines where the telegraph offices are far apart, the New Haven is no better off than other roads. Sending out trains to turn around at some obscure industry track is as common here as elsewhere.

And the argument that men will make mistakes under one system the same as under another, which the writer repeats, has no force (or, rather, it is as favorable to the New Haven as to the other side) because, regardless of whether the men are well informed or ill informed, whether they have much knowledge or little knowledge, the simpler you make their train orders, and the smaller the number of orders issued, the less the liability to confusion and misunderstanding. With the positive meet, the despatchers issue a very much smaller number of orders.

Your correspondent also seems to have overlooked the fact that the despatchers who testify to the merits of the New Haven system have had experience under both systems.

NEW HAVEN.

TRANSVERSE FISSURES IN RAILS

NEW YORK, July 9, 1914.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The report of H. W. Belnap, general inspector of safety appliances, to the Interstate Commerce Commission, dated April 24, 1914, covering investigation of an accident which occurred on the New York, New Haven & Hartford near Westerly, R. I., on October 13, 1913, contains the general conclusion drawn by James E. Howard, engineer-physicist, that the cause of the so-called internal "transverse fissure" is the action of high wheel loads upon hard steel rail.

Owing to the publicity attending reports of this nature and the reliance which the general public may assume can be placed upon the findings of government investigators, it is well to enlarge somewhat upon this subject.

The subject of internal transverse fissures, although old (see article by Robert Job, *Railway Age Gazette*, February 6, 1914), has recently received renewed interest and investigation, principally because it has been brought into prominence by a report by Mr. Belnap to the Interstate Commerce Commission. In fact, it is being given undue prominence, since this type of failure, comparatively speaking, is of infrequent occurrence. This fact in itself is in contradiction to Mr. Howard's theory, for if fissures have been developed in normal rail by existing wheel loads, why have they not developed in adjacent rails of the same weight and manufacture which were laid at the same time and have necessarily carried the same tonnage? If Mr. Howard's theory were correct, the development of a fissure in any rail would roughly determine the service life of all rails of that or lighter weight laid at the same time or at any earlier date in track having like service, which, of course, is untenable.

Furthermore, all railroads with the same wheel loads and rails from any makers would show the same results as regards breaks due to transverse fissures.

As a matter of fact, under like operating conditions and the same rail specifications, some roads have had less trouble of this

character with all of their rails than have other roads and the output of some rail mills has proved better than that of other mills.

It appears that to date neither the rail experts of the railroads nor of the manufacturers have been able to definitely prove the primary cause of such fissures, although much progress has been made within the last few months, and all the evidence so far produced appears to indicate as the cause defective material in the rail.

It has been discovered that the so-called "transverse fissures" may be longitudinal, horizontal or inclined in any direction to the axis of the rail; they have been discovered in rail in which the carbon percentage is moderate and below the upper limit of the standard specifications for the section involved; there is no evidence of segregation in these rails; in no case reported have two or more adjacent rails shown transverse fissures, and several fissures have been found in a single rail.

It is true that this type of break is disclosed by traffic, as is every other form of break. It is also true that the lighter the traffic the less frequently are these and other rail breaks apt to occur. An unsound rail, no matter what may be its type of unsoundness, should and does give way under a load well within the limits of the carrying capacity of sound rails and a rail suffering from the deep-seated disease under discussion is no exception to this general rule.

It is to be hoped that the real cause of transverse fissures may be brought to light, but until such is the case it is not just to attribute such failures to assumed imprudent practices of the railroads. Such an attitude constitutes an illogical and unwarranted attempt to make capital by following the popular practice of ascribing all faults, without proof, to the railroads.

ENGINEER.

POOR OPERATORS AND THE TROUBLES OF THE DESPATCHER

HAILEYVILLE, Okla., June 26, 1914.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The paper on the training of telegraph operators, by Mr. Sheldon, of the Union Pacific, which was printed in the *Railway Age Gazette* of May 29, will be read with much interest by a great many railroad officers and employees.

Mr. Sheldon's somewhat optimistic views will lead many a despatcher to ask numerous questions. Looking at the subject broadly, and taking in the whole western country, the question frequently recurs whether there cannot be something done to improve the quality of the operators now entering the service on nearly all of the principal roads. It may be that, as Mr. Sheldon says, three or four months in a training school, with a few more months of training under some agent out on the road, will make an operator; but what is the percentage of failures?

The advent of the telephone has made a radical change in the problem of the education of operators. Many officers carelessly assume that anyone can operate the telephone. But as long as we use the telegraph, whether for long distance work or for anything, we need competent telegraphers. It requires just as much proficiency to operate the wire now as 20 years ago. It requires more, for the reason that we are working faster than at that time. It is too readily assumed that as soon as a man can receive 15 or 20 words a minute he is an operator. What about his sending? Has anyone ever passed on that? Is it not just as important, or more so, that he send well? The copying operator makes fewer mistakes with good sending than with bad. How many officers think of that feature?

As a general rule, the young operator, as soon as he secures a position, buys what they call a "bug"; and in the novice's opinion the proposition is solved. But it requires several weeks to learn how to operate the thing, and, in fact, some never learn; and during this time he works an imposition on everyone else, in trying to use the bug. This, with his other shortcomings, helps to make life a burden for all who deal with the new operator. A railroad company should not allow such instruments to be used. A good sender with his hand can send as fast as the average operator can put it down in good shape. Good hand senders are scarce. Add to this a half dozen beginners trying to handle their bugs and the despatcher certainly has his troubles.

Again, the average chief despatcher, who generally employs the operators, does not examine them on their sending or their receiving, or on wire testing. He gives the operator a note to the examining physician and if he passes the physical examination this seems about all that is necessary. He goes out on the road and is charged with the serious duty of handling train orders and the other business of the company. Then who has to worry with him? No one but the despatcher, who has his hands full already. Yet he is expected to make a good showing in expediting the movement of trains, with poor men as well as with good. Students are sometimes sent to a heavy train order position. Human lives are intrusted to these men. If the despatcher complains, he is put down as a kicker and a crank. The operator thinks he is abused if the despatcher loses his patience and criticizes him, but who wouldn't lose it? Some of the timber sent out on the line will justify any amount of anger.

The young operator, just setting out, usually can tell more about the operators' pay schedule than he can about the block or train order rules. If he works the meal hour or thirty minutes over his time, an overtime slip is sent in, and is referred to the trick despatcher by the chief with a big "Why" in boxcar letters. The student does not take into consideration that possibly you have let him off for a couple of hours a few nights before. And this is just as true of the old head as with the new. What would some of the operators of the present day have done 20 years ago when 12 hours was a day's work and no overtime, no lunch hour? In addition to this operators made themselves generally useful around the station as clerks to the agent and the section foreman, in the way of doing clerical work and handling the switch lamps. Nowadays, if an operator handles switch lamps, he gets paid for it, and it is a hard matter to get him to do the least bit of station work, to say nothing of sweeping out the office. In those days we received from 30 to 40 dollars a month; now it is a minimum of from 55 to 60 and overtime every time they turn around; and a nine-hour day.

Operators receive more solid training from the train despatcher in one week than from any other employee in a month. It is often noticeable that the despatcher will worry along with an operator for months trying to educate him up to the standard, thinking he will eventually make a good man. But in a large proportion of cases he fails, and all the time he is handicapping himself.

I have many times, in case of students, asked conductors to come to the telephone and get their orders on account of the operator being too slow; yet the operators are complaining today because the railroads are putting in emergency 'phones to facilitate business. Why shouldn't the 'phones be put in? The time is fast coming when if the telephone fails business operations will cease at some stations simply because the operators are not competent to operate the telegraph wire.

With the high salaries now paid there is no reason why we should not have a better class of operators. If schools are necessary to secure the right men, let us have them. As long as no more attention is given to the qualification of operators when hired than is usual at present, we shall continue to have poor service. With the increased responsibilities and increased territory the despatcher does not find much time to educate operators to enable them to hold their jobs. It is about all the despatcher can do to hold his own.

J. L. COSS.

SIMPLON TUNNEL BETWEEN ITALY AND SWITZERLAND FLOODED.—The Simplon tunnel was inundated on July 7 by a subterranean stream which burst through the retaining wall and flooded the tunnel to a depth of two feet. A train was derailed in the middle of the tunnel, but no one was hurt. The passengers, however, were obliged to walk several miles to Iselle. Trains had to be diverted via the St. Gothard route.

Results of the Electrification of a Congested Italian Line

A Line with Very Heavy Grades and Long Tunnels on Which the Capacity Was Increased 100 Per Cent

By L. Pontecorvo

One important economic reason which determines the electrification of a steam line is the necessity of increasing its capacity. Results of electrification brought about by conditions of congestion are, however, quite unknown, as nothing has been published in connection with such cases. An examination of all single phase trunk lines with heavy freight and passenger service shows no case where the electrification was determined by the necessity of increasing the capacity of the line.

All the tri-phase installations of the Italian State Railways,

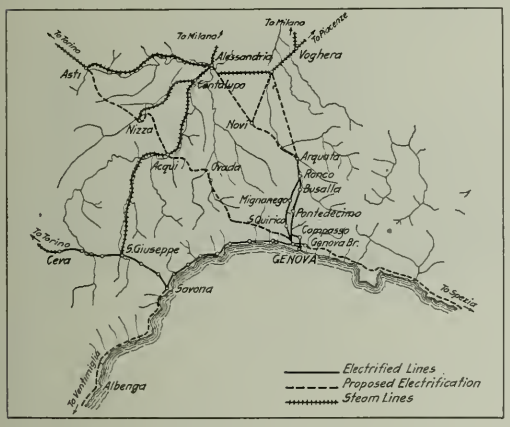

Fig. 1—Map of the Railway Lines Radiating from Genoa

with the exception of the Valtellina lines electrified 12 years ago for experimental purposes, were determined by the necessity of increasing the capacity of the line, and to this was certainly due the choice of the system, the Italian State Railways having found the three-phase system the most suitable for increasing the capacity of trunk lines with very heavy grades. We will, therefore, describe the actual results obtained on a line presenting the most difficult service conditions, and where the steam service had exhausted all its resources and could not be improved on.

The line referred to, the Giovi line in Italy, can be considered completely regenerated by the three-phase traction, having acquired, as regards freight service, which is the most important on that line, the same, if not a greater, capacity than the parallel line, the so-called "Giovi Subsidiary Line," which has grades half as steep and the most up to date block system.

To make these results better understood the electric railway system in Italy and its development, particularly as regards the Giovi line, which is one of the oldest trunk lines in Italy, will be briefly described.

Italian Electric Railway System

The Italian State Railways has a large number of electric lines which are situated in that part of Italy, where most of the industries are located, as shown in Fig. 1. Table A gives their most important characteristics.

The Milan-Porto Ceresio line, the first built, has a direct current of 600 volts, and the electric service is limited to passenger trains. All the others are three-phase 3,000-3,300 volts 15-16⅔ periods, with electric service both for passenger and freight trains. These railway lines are equipped with same system of traction, and are operated by the same type of locomotives, and constitute the most complete example of railway electrification in Europe.

The Valtellina line was electrified in 1902 for experimental purposes only. However, it has derived many advantages by the electrification, and has shown itself more economical than the steam service. In 1897 the operating expenses per axle with steam service were Lire .129 = (2.5 cents), and in 1902-3 with electric service were Lire .114 = (2.21 cents); that is, a reduction of 12 per cent., including interest and depreciation on the investment.

Of the other lines, the old Giovi line (double track) was electrified in 1910 to increase its capacity, and as were the Bassaleno-Modane line (partly single and partly double track) electrified in 1912-1914, and the Savona-San Giuseppe single track line. The electrification of the Monza-Lecco line was due to various reasons, chiefly the advantage of improving the service on a line which connects an important city like Milan with one of the most attractive valleys of the Alps.

The Traffic of the Giovi Line.

Considering now the Giovi line, and especially the Section Pontedecimo-Busalla, which offers the greatest difficulty to the operation. The tonnage in and out of the harbor of Genoa, which in 1878 amounted to less than a million tons a year, has been increasing rapidly, reaching 7,368,000 tons in 1912, of which 84 per cent. represents import and 14 per cent. export business.

There are five railway lines leading to Genoa which handle this traffic. The two Giovi lines, which constitute the direct connections between Genoa and the greatest manufacturing provinces of Italy—Piedmont and Lombardy—handle the most

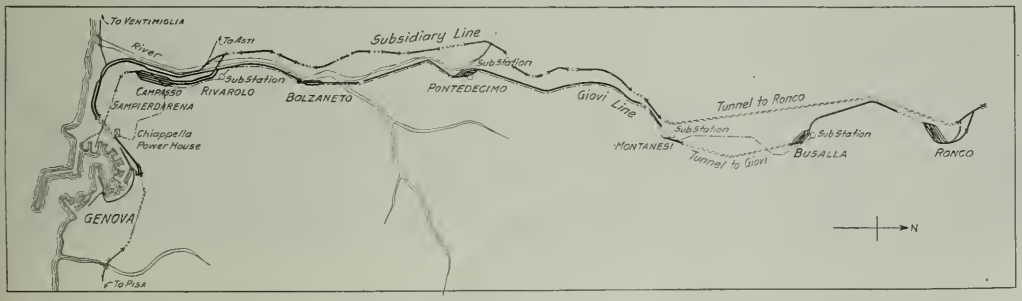

Fig. 2—Map Showing the Giovi Three-Phase Electric Lines

TABLE A—LINES ELECTRIFIED (a)

Lines	Year	Length of the line in miles single track	Maximum grade, per cent.	Line voltage	Current and frequency	Number of sub stations	Total capacity of substations in kws. or kva	Voltage of primary trans. line	Capacity of power house in h. p.	Energy produced at central station during 1912-1913, million "kw." hour	Number of locomotives	Miles run during 1912-13	Capacity of locomotives, h. p.
1—Milano-Varese	1901	70.2	1	650	Direct current	7	14,000, of which (2) 7,000 as standby	45,000	20,000, of which 5,000 as standby	8.5	47 (14)	1,380,000 (11)	18,200

(a) This table does not contain the Simplon three-phase line, as it is operated by the Swiss Federal Railway, although it runs for half of its length in Italian territory.
(1) To this number must be added a portable substation used as reserve.
(2) This line will be supplied by feeder from a substation of line No. 4.
(3) To these figures should be added 2 flywheel sets used to take care of the pick loads.
(4) These figures include the portable substation.
(5) At present the current on this line is supplied from a 50,000 volt, 50 cycles line and transformed. This is only a temporary arrangement.
(6) As above.
(7) Energy is supplied by power house of Negry Company, which reserves for this service 10,000 kw. with picks of 15,000.
(8) The electric service on the whole line was started only in October, 1913.
(9) These figures are for the period July-October, 1913.
(10) Estimated figures, as service is not started yet.
(11) Includes a branch line, Varese-Porto Ceresio.
(12) These substations are so equipped as to allow lines 2 and 6 to be connected and supplied with energy from either of the two power houses.
(13) Energy is supplied from power house of Edison Company, which reserves for this service 4,000 kw. with picks of 5,000 kw.
(14) Some of these are passenger motor-cars capable of hauling several passenger cars.
(15) On these lines the electric service will be started shortly.

of the freight traffic, approximately 80 per cent.; the Genoa-Spezia handles 8 per cent., the Genoa-Asti 7 per cent., and the Genoa-Ventimiglia the remaining 5 per cent. While the Genoa-Asti connects Genoa to the Piedmont it has a very limited service due to heavy grades, single track and poorly ventilated tunnels. At present the electrification of this line is under consideration.

The old Giovi line, opened to service in 1853, was proposed and built by the famous statesman Cavour, who early foresaw the importance of the harbor of Genoa in the industrial development of Italy. It is a mountain road which rises from

purpose as the old line, but offers considerably better service conditions, having uniform grades not exceeding 1.6 per cent., and reaching 1.16 per cent. in the longest tunnel. The total length from where it branches off is 13.7 miles, and the highest point is 1,060 feet above sea level.

In 1906-7 the maximum quantity of freight accumulating on the docks at Genoa amounted to 575,000 tons, and the average between October and January was 450,000 tons. To improve conditions, at the end of 1907, a new type of steam locomotive (Fig. 5), designed particularly for this service by the Italian

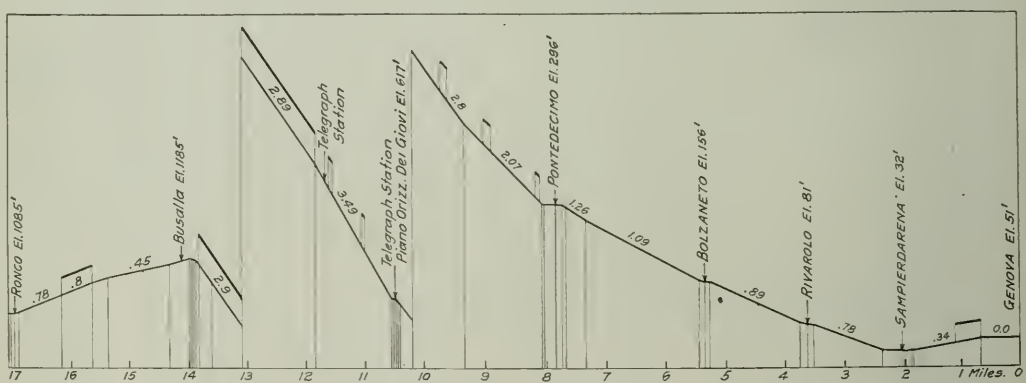

Fig. 3—The Profile of the Giovi Line

the sea level, crosses the Apennines, and descends in the valley of the river Po. It has maximum grades of 3.5 per cent., six tunnels, of which the longest, the Giovi tunnel, is 2.02 miles. These conditions make the operation with heavy and long freight trains most difficult. The line has a total length of 14.4 miles, and a difference in level of 1,150 feet between the lowest and the highest station. On account of the great difficulty of operation with steam locomotives, and in consideration of the continuous growth of the traffic in the harbor of Genoa, the Giovi Subsidiary line (double track) was built in 1889. It branches off the old Giovi line, and runs parallel to it on the other side of the valley, and crosses the mountain pass under a tunnel 5.15 miles long, and then joins the old line. It serves the same

State Railways, was put in service, producing a considerable improvement. These locomotives were of the compound 4-cylinder type, and had the following characteristics:

Number of coupled axles	5
Weight in working order	75 tons
Weight of tender, loaded	28 tons
Total heating surface	2,060 sq. ft.
Working pressure	229 lb. per sq. in.
Diam. of high pressure cylinders	14.7 in.
Diam. of low pressure cylinders	24 in.
Length of stroke	25.6 in.
Diam. of driving wheels (when new)	53 in.

During the official tests carried out by the Italian State Railways the following results were obtained.

(1) When hauling a train of 204 tons (exclusive of locomotive)

Speed on 2.5 per cent. grade	25 miles an hour
Drawbar pull on 2.5 per cent. grade	12,200 to 13,400 lb.
Indicated horsepower	1,200
Drawbar horsepower	800

(2) When handling a train of 272 tons (exclusive of locomotive)

Speed on 2.5 per cent. grade	15.5 miles per hour
Drawbar pull on 2.5 per cent. grade	16,600 lb.
Indicated horsepower	900
Drawbar horsepower	650

These new locomotives on the old Giovi line could haul the following loads at a speed of 15.5 miles per hour:

Single locomotive	170 tons
Double locomotive	310 tons
Triple locomotive	450 tons

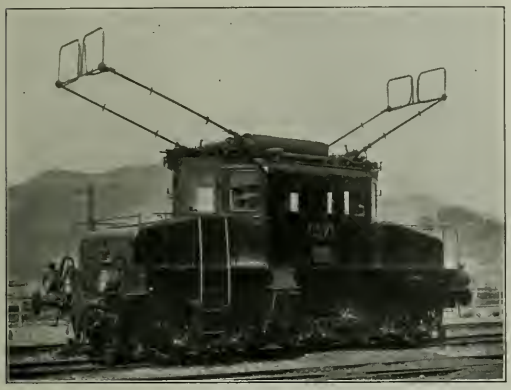

Fig. 4—Westinghouse Electric Locomotive (Type F. S. 050) Now Used on Italian Giovi Line

By the use of these more powerful locomotives it was possible in 1907-8 to reduce the quantity of goods accumulating on the docks at Genoa to a maximum of 430,000 tons, and to an average of 350,000 tons during the months from October to January. However, this improvement did not last long owing to the continuous increase in tonnage, and in 1909-10 the quantity of goods on the docks reached maximum and average amounts, respectively, of 545,000 and 484,000 tons. This condition, of course, represented an enormous loss due to the delay caused to trade in general, and the damage and deterioration of perishable freight.

ELECTRIFICATION OF GIOVI LINE

This state of affairs and the conclusions arrived at by the committee appointed by the government led to the decision of building another subsidiary line to take care of the natural and continuous growth of one of the most important harbors of Italy. This new line, called "the direct line," was to be a double track line with low grades, and cross the Apennines through a tunnel 11.8 miles long. The estimated cost was $30,000,000, and the necessary appropriation was voted by congress. However, the above mentioned committee in its report to the government, in consideration of the fact that the building of this new direct line with such a long tunnel would require many years, and having in mind the successful experiments of double traction carried out on the Valtellina and Simplon electric lines, suggested besides other improvements the electrification of the old Giovi line as the means of increasing its capacity.

In consequence of the satisfactory results obtained on the Simplon and Valtellina lines the three-phase, 15-cycle system was chosen for this electrification. It was also decided to increase the speed of the trains on this line to 28 miles per hour on the up grade, and to increase the power of the locomotives to the maximum amount allowed by the type of rolling stock.

Westinghouse locomotives (type F. S. 050), having two running speeds of 14 and 28 miles per hour, were chosen for the service. These locomotives (Fig. 4) were designed by Mr. de Kando, and built by the Italian Westinghouse Company at Vado Ligure, Italy. They are equipped with two slip ring induction motors, 3,000 volts. Their characteristics are as follows:

Number of coupled axles	5
Adhesive weight of locomotive	60 tons
Diameter of wheels (when new)	42.5 in.

The motors are connected to the wheels by a special triangular yoke.

With trains of standard composition (which is the maximum allowed by the draft gear of the cars, but which can be increased as far as the locomotives are concerned as shown by tests), when running at 28 miles an hour, the maximum horsepower developed is 1,770. When starting on a grade of 3.5 per cent., hauling the same train, there is developed 2,180 horsepower. The capacity of the locomotives on the Giovi line was fixed as follows:

Single locomotive	190 tons
Two locomotives	380 tons
Three locomotives	530 tons

The electric service was started in 1910.

Fig. 5—Steam Locomotive Formerly Used on the Giovi Line

SERVICE RESULTS OF ELECTRIFICATION

The increased capacity of the line is, of course, due to the greater power of the electric locomotives and the increase in speed. The peculiar condition of the line allows us to verify the calculated increase in the capacity of the line after the electrification. The steam locomotives had a maximum running speed of 15.5 miles per hour on the steepest grades. The electric locomotive runs at 28 miles per hour on the 3.5 per cent. grades.

Similarly on the down grades, owing to the electric braking, and to the constant speed and absence of shocks, it is possible to allow a speed of 28 miles per hour for passenger trains where the maximum speed allowed for the same trains with the steam service was 18.6 miles per hour. In addition with the steam trains a safety stop of all trains was made on a level section of the line about half way down the grade. This compulsory stop has now been done away with.

If we take into consideration the commercial speed of the trains on this section of the line it represents an increase of 88 per cent. and 75.5 per cent. on the up and down grades, partly due to the shorter time taken by the electric locomotive for acceleration. This increase is clearly shown by the time tables (Figs. 7 and 8) of the steam service on its last year 1910, and of the electric service now in operation.

With the steam service it was possible to run a maximum of 28 up trains and 23 down trains per day, spread over a period of 20 hours. However, the average number of trains per day was considerably lower. In the last year of the steam service, 1909-10, a total of 8,793 up and 7,792 down trains were run, or

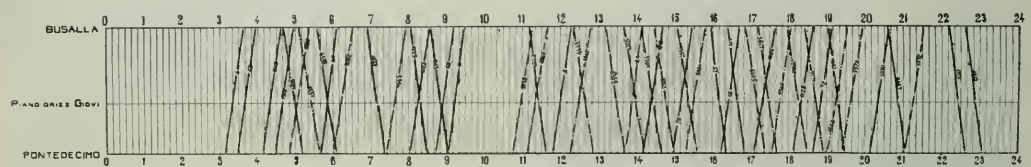

Fig. 6—Schedule of Steam Service in Summer of 1910

Fig. 7—Schedule of Electric Service in 1914

Extra fare trains.
Express trains.
Local trains.
Freight trains.

an average of 24 up and 21.3 down trains per day. With the electric service there were run in 1911-12 12,024 up and 8,050 down trains, or an average of 33 and 22, an increase of 37.5 per cent. in the number of up trains, constituting the increase in the capacity of the line. It was not necessary to increase the number of the down trains, the greater number of cars being empty on the down trip.

With operation by steam the above figures were not susceptible of appreciable increase, both because of the limited speed of the locomotive and the difficult work of ventilating the Giovi tunnel; the steam service shown in the schedule in Fig. 7 was only possible by strong artificial ventilation of the tunnel by means of a special blower driven by a 500 horsepower motor.

With the electric service the average figures given above refer to a schedule spread over a period of 17 hours per day (Fig. 8), and therefore they could be increased considerably. For instance, during the month of April, 1913, on the same section of the line referred to, 223 trains were run in addition to those shown in the schedule, corresponding to an average of 7.45 trains per day, of which 5.2 were up and 2.25 down trains. The maximum number of additional trains per day during the same month of April, besides the trains shown in the schedule, was 13, of which nine were up and four were down trains. Therefore, the average and maximum values for the month of April would be 38 and 42 respectively, which compared to the 28 of the steam service represents an increase of 36 and 50 per cent.; and if we consider that the electric service is limited to 17 hours instead of 20, the increase would amount to 61 and 77 per cent. The same results were obtained during certain days in the month of August when numerous extra trains were run for the purpose of testing the new electric locomotives.

These figures do not represent the maximum obtainable by the electric service. This maximum was determined when the project of electrification was being considered, and all the fixed installations, such as the central station, sub-stations and transmission lines were designed for a service having trains starting every 10 and 15 minutes. Such service, as has been shown experimentally, is possible both because of the size of the electric installations, and because of the block system existing on the line, as the time taken to cover the length of the tunnel is 9 minutes, and therefore with a train starting every ten minutes one train would leave the station at the entrance of the tunnel when the preceding had reached the telegraph station at the other end.

Assuming the utilization coefficient* of the Italian State Railways as .70, and assuming 20 working hours per day, as was the case with the steam service, the average number of daily trains with electric service would be:

Trains leaving every 15 min., .7 x 20 x 4 = 56
Trains leaving every 10 min., .7 x 20 x 6 = 84

These figures, as compared with 28 of the steam service, represent an increase of 100 and 200 per cent. respectively.

ELECTRIC LOCOMOTIVES

On account of the higher speed of the electric locomotives and their suitability for switching operations in the yard, it was possible with electric operation to make a rather large reduction in the number of locomotives, and therefore in the train crews. At present the service on this section is handled by ten locomotives of which eight are in actual service, one is held in reserve and one is under inspection. During 1909-1910 with steam service the average number of steam locomotives was 15. If we consider that with the electric service there are 34 trains to 28 with steam service, the number of steam locomotives was 82 per cent. greater than the number of electric locomotives. The daily service of the electric locomotive could easily be increased by increasing the working hours to 24, because the maximum temperature of the Westinghouse electric motors was only 73 deg. after 16 up and 16 down trips, hauling the normal weight of train and regenerating energy on the down trip, the last two trips having been made without forced ventilation of the motors.

TRACTIVE EFFORT AND COMPOSITION OF TRAINS

A comparison between the maximum weight of train permissible with the steam locomotive and the standard weight

*Utilization coefficient is the ratio between the average daily number of trains actually run and the number of trains given in the schedule.

of train prescribed for the electric locomotives, as allowed by the existing type of rolling stock, shows how much more powerful the electric locomotives are.

TABLE B

	Weight of train (exclusive of locomotive)	
	Steam traction	Electric traction
Single locomotive	170 tons	190 tons
Double locomotive (one locomotive pulling and one pushing)	310 tons	380 tons
Triple locomotive (one locomotive pulling and two pushing)	450 tons	530 tons

Considering that with electric traction an overload of 10 tons is permissible, there is an increase over steam operation of 17½, 26 and 20 per cent. respectively. However, as has already been pointed out, the tractive effort and the motor capacity of the locomotive are far greater, so that it is possible with two locomotives to haul on the same section of the line without any difficulty trains up to 450 tons at 28 miles per hour. As compared with the operation by steam, this means an increase in the drawbar pull of 45 per cent. without considering that the adhesive weight of the steam locomotives is 25 per cent. greater than the electric.

The make-up of the passeger trains on this line is not uniform, and varies from 200 to 370 tons. With operation by steam passenger trains left Genoa station hauled by one three-coupled locomotive. When this section of the line was reached two additional five-coupled locomotives were added, one pulling and one pushing. Very light trains were hauled by only two locomotives. With electric operation all passenger trains are hauled by two locomotives.

The freight trains were nearly all hauled by three locomotives, one pulling and two pushing. With electric service the freight trains have a uniform composition of 380 tons (being mostly freight cars of the same type loaded with coal), and are hauled by two locomotives, one pushing and one pulling. In the case of freight trains, if but one locomotive is used, it must be placed at the rear of an ascending or the front of a descending train, as the cars have no air brakes. If we refer to the last table, and consider that the Westinghouse electric locomotive, type 050, weighs 60 tons, while the steam locomotive 92 deg. 470 weighs (including the tender two-thirds loaded with water and coal) 97 tons, we find that the steam locomotive represents 57 per cent., 62.7 per cent. and 64 per cent. respectively of the hauled weight, while the electric locomotive represents only 30, 30.8 and 33.5 per cent. As compared to the total weight of the trains, the weight of the steam locomotive represents 36.3, 38.5 and 39.3, while the weight of the electric locomotive represents only 23.1, 23.5 and 25 per cent.

NUMBER OF CARS

From the preceding it follows that the number of cars delivered over the line after the electrification has been greatly increased. During the last year of the steam traction there was a total traffic of 109,963 cars (passenger and freight) on the up grade and 133,000 in the other direction. In 1911-12 after the electrification the number increased to 172,063 and 146,113, an increase of 56.5 and 10 per cent., respectively, without considering that the weight of the freight cars was also increased. And if we consider only the movement of the freight cars in the ascending direction there was an increase in their number of 109 per cent.

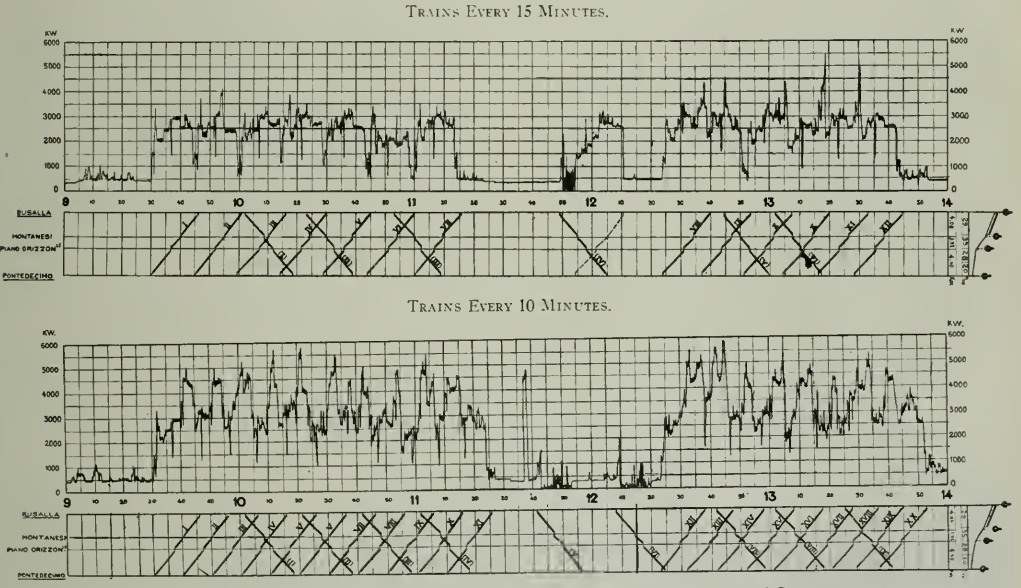

Fig. 8—Schedule of Intensive Electric Service and Load Diagram at Central Station

This would correspond to a daily service of 165 cars (steam traction) and 346 (electric traction). If we refer, however, to the electric service as developed experimentally during the month of August, 1913, for 17 hours daily, it represents an increase of 218 and 214 per cent. This, however, does not represent the maximum of the electric service.

CAPACITY OF THE LINE

We can now determine the capacity of the Giovi line after the electrification and compare it to that before. For the steam service we will refer to the service in the year 1909-10, the last of the steam traction, and to the maximum capacity as estimated by the above-mentioned government committee. For the results of the electrification we will refer to the first year of the service, 1911-12, to the service as tried experimentally during August, 1913, and to the maximum permissible service as estimated by the Italian State Railways.

We will consider only the traffic on the up grade, which is the one that determines the capacity of the line, and limit it to 20 working hours per day, although it should be understood that

with the electric traction this limitation to 20 hours is not requisite. It was necessary with steam traction to allow time for maintenance of the tracks in the tunnel, as on account of the smoke the men could not work in it during the service hours. Besides, we will consider only the hauled weight of trains, which is the most important.

Electric Service 1911-12.—As already stated, the total number of cars was 172,063, divided as follows:

45,927 passenger and baggage cars.
105,132 freight cars.
16,897 fast freight cars.
4,107 empty cars.

The weight of these cars can be assumed as follows:

Passenger and baggage cars	30 tons
Freight cars, mostly coal cars	21 tons
Fast freight cars	12 tons
Empty cars	8 tons

The total capacity then is:

Passenger and baggage cars	1,380,000 tons
Freight cars	2,210,000 tons
Fast freight cars	203,000 tons
Empty cars	32,800 tons
Total	3,825,000 tons

Electric Service as Experimented with in August, 1913.—The experiments carried out gave the following figures:

41 trains	13,640 tons	644 cars	17 hour service
40 trains	13,712 tons	636 cars	17 hour service

These figures reduced to a year give 5,000,000 tons for 17 hours' service per day.

Now, assuming the same weight of cars (which is in favor of the steam traction because the weight of the cars has been increased during the last few years), we find the following figures:

Steam traction—20 hours per day.

38,916 freight cars	840,000 tons
19,569 fast freight cars	235,000 tons
49,624 passenger and baggage cars	1,485,000 tons
1,854 empty cars	14,800 tons
Total	2,574,800 tons

Comparing this figure to that of the electric service reduced to 20 hours per day, we find that the service during the year 1911-12 represents an increase of 75 per cent., and the service, as experimented with during the month of August, 1913, an increase of 128 per cent.

In comparing this service with the steam service we will assume the maximum capacity of the steam service, as outlined by the government committee, and will consider double locomotive service throughout. With the 15-minute service during 20 hours, we would have 80 trains per day, of which 15 are passenger and 65 are freight. Assuming a utilization coefficient of .70, we have 65 x .7 x 380, or 17,300 tons daily, or 6,310,000 tons yearly. With service every 10 minutes, we would have 120 trains, of which the 105 freight trains equal 10,200,000 tons yearly.

The maximum steam service would amount to 22 trains of 310 tons, or 6,820 tons daily, or 2,490,000 tons yearly. Therefore, assuming that the passenger trains are the same in both cases, we have an increase in capacity of 153 per cent. with 15-minute service, and 310 per cent. with 10-minute service.

It will take many years before the traffic of the harbor of

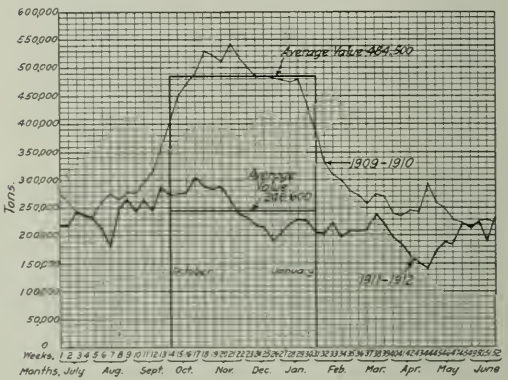

Fig. 9—Weekly Accumulations of Freight on the Docks at Genoa Awaiting Shipment by Rail

Genoa will be such as to require the maximum capacity of the Giovi line. Considering that on account of these results the Italian State Railways have electrified the subsidiary Giovi line and are considering the electrification of the Genoa-Asti line, it will be many years before the new "direct line" will be built.

The effect of the increase in capacity of the Giovi line on the quantity of freight accumulated in the docks may be easily seen from the diagram showing the freight accumulated on the docks

Fig. 10—Coal on the Docks at Genoa Awaiting Shipment

waiting shipment by rail. This compares the year 1909-10 (the last of the steam service) with the year 1911-12 (the first of the electric service). From this diagram we see that the maximum quantity of accumulated freight reached 540,000 tons in 1909 and 300,000 tons in 1911. If we consider the worst period of the year, October to January, the average quantity of the accumulated goods was 484,500 and 246,600; that is, a maximum of 80 per cent. and an average of 96.5 per cent. more freight accumulated during the steam service.

This shows that the electrification, besides solving a railway problem, increasing the capacity of a line so as to take care of the growth of the traffic for many years to come, has solved at the same time a serious problem of the excessive accumulation of freight at the docks during a part of the year; which accumulation caused great inconvenience and considerable loss. Thus the electrification has produced an increase in the capacity of the Giovi line and indirectly an increase in the capacity of the harbor of Genoa and very likely may do away with the building of the direct line with the tunnel which was estimated to cost not less than $30.000,000.

CONCLUSIONS

The Giovi line has been regenerated by three-phase operation. The line was of such importance to the traffic that the electrification was decided to improve existing conditions, even if that would mean an increase in operating expenses. However, the results from an economic point of view have been far better than expected, and constitute a very great success for the Italian State Railways. A detailed and careful examination made by the administration of the Italian State Railways has shown that the running expenses, including interest and depreciation on the investment, have been reduced 22.5 per cent., notwithstanding the fact that the electric energy is produced by a steam electric plant and that the central station capacity is not yet fully used. It has been realized in this electrification as Galileo Ferraris stated in 1904, in his speech on the transmission of electric energy, that electrification would render operation most economical in those cases where operation by steam was most expensive.

It is not our intention here to discuss the various systems of traction, especially as the Italian State Railways are satisfied with the three-phase system, and intend to extend it to all their lines as conditions require it. Having already in service 135 electric locomotives, of which 110 are of the Giovi type with a total capacity of 261,200 h. p., they are considering the electrification of new lines, not on theoretical calculations, but from actual results.

On account of the large increase in the capacity of the lines through the three-phase electrification, the Italian State Railways will be able to do away with double tracking single track lines where the traffic is getting too heavy and where the expenditure of double tracking is very high; besides, on account of smoke elimination, they will be able to greatly improve the service on lines with many tunnels, and most of the Italian lines are of that sort. There will also be the advantage of reduction in the running expenses, and by utilizing to a larger extent the hydraulic power not yet developed, importation of coal, which represents a heavy expenditure, may be reduced. But, if in this particular case there is no reason for a discussion of the systems of operation, we will, however, express the conviction that, although the results of the increase in the capacity of the Giovi line are due to electrification, it is also due to the choice of the three-phase system that the results were so striking. We do not mean to refer to the large savings due to characteristics of this system, such as the lightness of the locomotive and the regeneration of power, but to the characteristic of maintaining high speeds on the up grade with high tractive effort and high efficiency, which characteristic determines the capacity of the lines.

It is true that the section of the line referred to is specially suited for three-phase traction, but the electrification of the other sections of the line, which are nearly level and which are served by the same locomotives, has shown (as in the Valtellina lines) that the advantages of a light and powerful locomotive having few and fixed speeds can be felt even on level lines where the traffic is heavy enough to warrant electrification.

CHANGES IN BOILER INSPECTION RULES

The recommended changes and additions in the Boiler Inspection Rules, as published in the *Railway Age Gazette* of May 15, on page 1066, have been approved by the Interstate Commerce Commission, and made effective on and after July 9, 1914. In connection with this the Special Committee on Relations of Railway Operation to Legislation in Bulletin No. 62 has published the following additional interpretations and rules made by the sub-committee of mechanical officers:

Rule 2.—119. Application for extension of time under this rule to be made by individual railways affected.

Rule 10.—120. The removal of superheater tubes every three years will not be required provided the tubes are in good condition, and the boiler can be thoroughly cleaned and inspected without their removal.

Rule 21.—121. All work required to be done monthly should be done when the boiler is taken out of service for inspection. Staybolts should be tested the same day the boiler is washed or before it is returned to service.

122. If staybolts, which are behind brick work on oil burning locomotives or behind grate bearers, have a tell-tale hole three-sixteenths inch in diameter their entire length which is kept open at all times, the removal of the brick work or grate bearers each month for the purpose of hammer testing such bolts will not be required. This will not, however, relieve from making a thorough inspection each time the brick work is removed, nor will it relieve from removing the brick work for an inspection when necessary.

Rule 52.—123. This rule effective January 1, 1915. Until that date quarterly cards, Form No. 2, may be used if in stock. Cab cards need not be certified to.

Rule 54.—124. When any locomotive is condemned, scrapped or sold, a final report on Form No. 3 giving both locomotive and boiler number should be filed with the district inspector. This should be certified to by the chief mechanical officer, or mechanical engineer. Further reports for such locomotive need not be filed. If boiler only is scrapped, and locomotive continued in service with new boiler, report should so state.

Rule 52.—Interpretations 72 and 73 are withdrawn as obsolete.

RAILWAYS IN ASIA MINOR.—It was announced in Rome on May 19 that a definite agreement had been signed by an Italian syndicate and the English Smyrna-Aidin Railway Company regarding railways in Asia Minor.

RAILWAY CONSTRUCTION IN SPAIN.—At the present time there are several railway projects under consideration by the Spanish authorities. A line from Valencia to Calatayud has been built and in operation for some years. A contract and concession for an additional strategic railway from the latter point via Sorisa to Burgos will soon be let. This line is connected with the line from Burgos via Arconada and Monco to Ontaneda, a suburb of Santander, and will give a through route from Valencia to the north coast of Spain. The Ministerio de Fomento has recently approved a project for a strategic line from Ferrol to Gijon via Ribadeo. This line will receive from the government a five per cent. guarantee on the cost of construction; it will connect at San Esteban de Pravia with the line from Ujo to Pravia, thus connecting the latter, Oviedo, Santander, Bilbao, San Sebastian and Hendaye on the French frontier with the Noroeste de Espana Railway. The line will also connect at Ribadeo with the Ribadeo-Valladolid, a project which has also been approved by the government. It is also reported that work on the new line from Palanquinos, near Leon, via Valencia de Don Juan, to Medina de Rioseco is well advanced. A project has also been approved for a secondary railway from Cervera to Saragossa. There is under consideration a project for a line from Cervera to Tarragona, with a branch from Belumet to Igualada and for a line from Zamora to Orense, in northwestern Spain. A company has also been formed to construct and operate a railway from Ribadesella to Gijon, also in northwestern Spain.

MELVILLE E. INGALLS

Melville E. Ingalls, who pieced together the Cleveland, Cincinnati, Chicago & St. Louis, and who was also for twelve years president of the Chesapeake & Ohio, died on Saturday, July 11, at Hot Springs, Va. Mr. Ingalls was 72 years old, and had resigned as chairman of the board of the Big Four in 1912. He was a shrewd Yankee lawyer in good standing when he became president of the Indianapolis, Cincinnati & Lafayette in 1870. Without previous railroad training, he was nevertheless quick to pick up a general knowledge of both operation and traffic. He was a keen business man, and saw the possibilities of buying small railroad properties and combining them into a system. He managed the properties well, and the building up of such a system as the Big Four was probably of great benefit to the territory which the system now serves. On the other hand, Mr. Ingalls' genius did not comprehend a homogeneous railroad system. In part, of course, this was due to the fact that the nature of the territory and of the already existing short lines necessitated a rather patch-work railroad system, but in part also it was because Mr. Ingalls either could not or did not know how to acquire his properties outright. The Big Four, as he built it up, was a network of lines operated by one company, but held under a great variety of forms of tenure. On some there were trackage rights only; with others there was some form of operating agreement; on others an outright lease, and so on. With this system, in the tremendously highly competitive territory in which it is, Mr. Ingalls' administrations did remarkably well.

Melville E. Ingalls

Mr. Ingalls was president of the Chesapeake & Ohio from 1888 to 1900. During that time the mileage was increased from 931 miles to 1,476 miles. The gross operating revenue increased from $7,162,000 to $13,402,000. The coal and coke tonnage increased from 1,465,000 tons to 4,679,000 tons. It is no criticism to say that, as in the case of the Big Four, Mr. Ingalls could not foresee what the future developments of the Chesapeake & Ohio would be. The fact that the Chesapeake & Ohio is not as firmly intrenched today in the coal fields of West Virginia as is the Norfolk & Western is in part due to the difference in policy pursued by the management of the Norfolk & Western in the ten years 1890 to 1900, and that pursued by Mr. Ingalls' management of the Chesapeake & Ohio.

Melville Ingalls was born in 1842 in Maine. He became president of the Indianapolis, Cincinnati & Lafayette in 1870, and in the following year was made receiver. The company was reorganized in 1873 with Mr. Ingalls as president, but in 1876 the company had again got into difficulties, and went through another receivership under Mr. Ingalls, being reorganized in 1880 as the Cincinnati, Indianapolis, St. Louis & Chicago. Mr. Ingalls was president of this company up to June 27, 1889, when it was consolidated with the "Bee" Line, the Cleveland, Columbus, Cincinnati & Indianapolis. The consolidated company was the Cleveland, Cincinnati, Chicago & St. Louis, of which Mr. Ingalls was president until February 1, 1905, at which time he resigned to become chairman of the board, holding this office until November, 1912. From 1881 to 1883 Mr. Ingalls was president of the Kentucky Central, and, as previously mentioned, was president of the Chesapeake & Ohio from 1888 to 1900.

THE CAPE COD CANAL

The Cape Cod canal, connecting the waters of Cape Cod Bay with those of Buzzard's Bay, and separating Barnstable County from the rest of Massachusetts, is nearly finished, and it is announced that it will be opened for traffic on July 29. But it has not yet been dug for the full depth throughout its length, and at first no vessels will be admitted to the canal except those drawing 15 ft. or less. Larger vessels cannot pass through before September, when it is expected to have a depth of 25 ft.

The length of the canal is 8 miles, and the distance from deep water on the east to deep water on the west is about 13 miles. The width of the canal at the bottom is 100 ft., but at two places it is made twice as wide to provide meeting places. By this canal, the water route between Long Island Sound and Boston harbor is shortened about 70 miles; and it is calculated that the saving in time will be greater in proportion than the sailing distance because outside of Cape Cod fogs are more prevalent. In a given time the duration of fogs at Pollock Rip was 1,066 hours, as compared with 625 hours at the eastern entrance of the canal. The cost of marine insurance also is expected to be considerably less.

There is no lock in this canal, and the difference in the height of the tides at the east and the west ends is never greater than 5 ft. At the highest point of land the surface of the water in the canal is 29 ft. below the top of the cut. The canal is spanned by three drawbridges, two for highways and one for the tracks of the New York, New Haven & Hartford Railroad.

The canal has been dug by the Boston, Cape Cod & New York Canal Company, of which August Belmont, of New York, is president, and J. W. Miller, formerly at the head of the Fall River Line of steamers, is vice-president. The chief engineer is W. Barclay Parsons. The work has taken five years, and the cost of it is given as $12,000,000.

The Cape Cod Construction Company, with headquarters at 43 Exchange Place, New York City, acting as agent for the canal company, has issued the following tariff of tolls:

For Vessels Less Than 16 Gross Tons Based on Length Over All

	Class A*	Class B†	Class C‡ With cargo	Class C‡ Without cargo
Minimum less than 15 ft...	$3	..	..	.....
15 ft. to 19 ft.....	4	..	..	.....
20 ft. to 24 ft.....	6	..	..	.....
25 ft. to 29 ft.....	8	$8	$6	$3.00

30 ft. to 34 ft.	10	10	7	3.50
35 ft. to 39 ft.	12	12	8	4.00
40 ft. to 44 ft.	15	15	10	5.00
45 ft. to 49 ft.	17	17	12	6.00
50 ft. to 54 ft.	20	20	14	7.00
55 ft. to 59 ft.	22	22	15	7.50
60 ft. to 64 ft.	25	25	17	8.50
65 ft. and over and less than 16 gross tons	30	30	21	10.50
FOR VESSELS OVER 16 GROSS TONS				
16	25	25	17	8.50

850 to 899	96	96	..	.....
900 to 949	98	98	..	.....
950 to 999	100	100	..	.....

*Yachts, motor boats and vessels not engaged in commercial trade. Government vessels shown in government books under Gross Tonnage.
†Vessels engaged in commercial trade carrying passengers only, passengers and freight, and miscellaneous freight, or in ballast.
‡Vessels carrying crude material in bulk cargo lots.

For Class A and Class B vessels of over 1,000 gross tons the rate is ten cents per gross ton per single passage. In Class C vessels over 500 gross tons will be charged on the basis of their having on board 800 tons of cargo at 7 cents per cargo ton per single passage. Vessels over 500 gross tons without cargo, five cents per gross ton per single passage. The total tonnage of cargo in vessels in tow is to be computed as if on board a single vessel. Tolls include the towing tug provided by the owners of barges or schooners.

The officers of the canal company calculate that the saving in time and the increase in safety will draw to the canal route 7,000,000 tons of coal and lumber yearly—this is only about a third of the twenty or twenty-five million tons of freight carried through Vineyard Sound every year—and they also expect to attract passengers, as well as freight, for the summer resorts of the Cape Cod region. It does not appear that any of the large shippers have as yet made application for the privileges of the canal, or that the canal company has tested the acceptability of its rates, from the standpoint of the vessel owners; but attractive rates ought to be practicable even allowing for some exaggeration in the estimates of economies; for the average trip of coal schooners and barges around the cape is said to be four days longer than will be necessary by the direct route through the canal.

WESTERN MARYLAND CONSOLIDATION LOCOMOTIVE

The American Locomotive Company recently delivered 20 consolidation type locomotives, having a tractive effort of 61,300 lb. each, to the Western Maryland. These were built to give the greatest possible tractive effort obtainable within the axle load limitations.

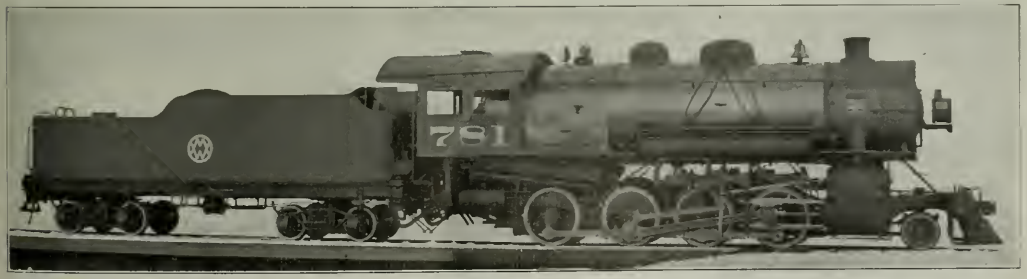
The mechanical department of the Western Maryland, after carefully studying the physical conditions of the division on which these locomotives are to be used, decided that the comparatively low factor of adhesion of 3.55 could be safely used. By the use of this factor of adhesion and driving wheels 51 in. in diameter, the tractive effort of 61,300 lb. was obtained without sacrificing boiler capacity. It is, therefore, interesting to note the work these locomotives are doing, showing the possibilities of this type with a relatively small driving wheel for service where speed does not become a factor.

After leaving Cumberland, eastbound, the line runs over an undulating profile, on which the maximum grade against eastbound traffic is 0.3 per cent. for 74 miles to Williamsport, Md. From here it rises on a one per cent. grade into Hagerstown, about six miles. On this division the railway estimated that these locomotives would haul 4,725 tons.

On May 20, 1914, one of the locomotives left Cumberland at 2:30 a. m. with 114 loaded cars, weighing 7,014 tons, and arrived at Williamsport at 9:18 a. m. At this point 15 loads were set off, and the train was given two Mallet helpers, leaving at 10:04 a. m., and arriving at Hagerstown at 11:05 a. m., the crew having been on duty 8 hr. 35 min. from the time they were called until released at Hagerstown. Many similar runs have since been made.

The boiler is of the straight top type, 82 in. in diameter at the front end and 87 in. at the largest course. There are 239 tubes, 2¼ in. in diameter, and 36 flues, 5½ in. in diameter and 15 ft. 3 in. long; the tube spacing is 13/16 in. The firebox is 110 in. long and 80¼ in. wide, and has a throat depth of 22 in., measurement being taken from the top of the grate to the center of the lowest tube.

According to the American Locomotive Company's new ratios, 25 in. cylinders with 200 lb. boiler pressure give 2,252 cylinder horsepower. One horsepower hour requires 20.8 lb. of superheated steam, and the total steam required per hour is 2,252 times 20.8, or 46,840 lb. The firebox and firebox water tubes give an evaporation of 55 lb. of steam per square foot of heating surface; tubes 2¼ in. in diameter, 15 ft. 3 in. long, spaced 13/16 in., give an evaporation of 10.605 lb. per square foot of heating surface; and flues 5½ in. in diameter, 15 ft. 3 in. long, spaced 13/16 in., give an evaporation of 11.625 lb. per square foot of heating surface. This boiler has a heating surface in the firebox and firebox water tubes of 228.5 sq. ft.; in the tubes, 2,133.7 sq. ft., and in the flues 785.6 sq. ft.; the evaporation for the firebox and water tubes is 228.5 x 55, or 12,570 lb.; for the tubes, 2,133.7 x 10.605, or 22,630 lb.; for the flues, 785.6 x 11.625, or 9,200 lb., giving a total evaporation of 44,330 lb. The evapora-



Western Maryland Consolidation Locomotive with 51 inch Drivers

tion of the boiler, 44,300 lb., divided by the evaporation required, 46,840 lb., indicates a 95 per cent. boiler.

Maximum cylinder horsepower would not be reached until this engine was running 31 miles an hour. As the service in which the engines are working will not require any such speed, a 95 per cent. boiler should have ample steam making capacity. H. R. Warnock, superintendent motive power of the Western Maryland, states that with the poorest quality of coal he has ever seen, the fireman had no trouble in opening the second safety valve.

This design was developed by the mechanical department of the Western Maryland in co-operation with the American Locomotive Company as a part of the program of this road in reducing operating costs. The details employed in the construction include the Baker valve gear, firebrick arch, superheater, outside steam pipes, Woodard engine truck, long main driving box, Foulder main rod and vanadium cast steel frames.

The principal dimensions follow:

General Data

Gage	4 ft. 8½ in.
Service	Freight
Fuel	Bit. coal
Tractive effort	62,500 lb.
Weight in working order	244,500 lb.
Weight on drivers	217,500 lb.
Weight on leading truck	27,000 lb.
Weight of engine and tender in working order	424,000 lb.
Wheel base, driving	16 ft. 8 in.
Wheel base, total	26 ft. 2 in.
Wheel base, engine and tender	68 ft. 0 in.

Ratios

Weight on drivers ÷ tractive effort	3.52
Total weight ÷ tractive effort	3.91
Weight on drivers ÷ total equivalent* heating surface	53.84
Total weight ÷ total equivalent* heating surface	60.53

Cylinders

Kind	Simple
Diameter and stroke	25 in. x 30 in.

Valves

Kind	Semi-plug
Greatest travel	6½ in.
Outside lap	1 in.
Inside clearance	Line and line
Lead	1/8 in.

Wheels

Driving, diameter over tires	51 in.
Driving journals, main, diameter and length	11 in. x 20 in.
Driving journals, others, diameter and length	9 in. x 12 in.
Engine truck wheels, diameter	30 in.
Engine truck, journals	6 in. x 12 in.

Boiler

Style	Straight top
Working pressure	200 lb.
Outside diameter of first ring	83¾ in.
Firebox, length and width	111 in. x 80¼ in.
Firebox plates, thickness	3/8 in.
Firebox, water space	4½ in. and 4 in.
Tubes, number and outside diameter	239—2¼ in.
Flues, number and outside diameter	36—5½ in.
Tubes, length	15 ft. 3 in.
Heating surface, tubes and flues	2,919.3 sq. ft.
Heating surface, firebox	202.0 sq. ft.
Heating surface, water tubes	26.5 sq. ft.
Heating surface, total	3,147.8 sq. ft.
Total equivalent* heating surface	4,039.4 sq. ft.
Superheater heating surface	594.4 sq. ft.
Grate area	61.3 sq. ft.

Tender

Tank	Water bottom
Wheels, diameter	33 in.
Journals, diameter and length	6 in. x 11 in.
Water capacity	9,500 gal.
Coal capacity	14 tons

*Total equivalent heating surface = total evaporative heating surface + 1.5 times the superheating surface.

ADDITIONAL ROLLING STOCK FOR THE SWISS RAILWAYS.—The directors of the Swiss railways have recently approved contracts for the delivery of 32 locomotives in 1915 and also contracts for the purchase of 142 passenger cars, 42 baggage cars and 390 freight cars. The project for the reconstruction of the Federal Railways power plant in the Rhone river at Brieg and the laying of high power transmission cables in the second Simplon tunnel has also been approved, as well as that for the erection of other transmission lines in that vicinity for which a total expenditure of $378,280 will be required.

RAILROAD STATISTICS TO JUNE 30, 1913

The Interstate Commerce Commission has issued its preliminary statement of the earnings, expense and traffic and financial statistics of *railroads having annual operating revenues of over* $100,000, and of subsidiary non-operating companies operated by them, but not including switching or terminal companies, for the twelve months which ended one year ago. The principal items of the statement are tabulated below, but some of the figures for the year preceding are taken from the statement issued last year, which was given in the *Railway Age Gazette* of August 1, 1913, page 180. Where statistics of operating companies include transactions which are reported also by owning companies, there is a duplication, at end of year the amount of which does not appear. Other items, such as capital stock of one road owned by another, make a fictitious element in the totals.

Statistics of Class 1 and Class 2 Railroads—Year Ending June 30, 1913

	Year ending June 30, 1913	Year ending June 30, 1912
Miles of line operated at end of year	244,418	240,239
Miles of trackage rights included in above	11,163	10,825
Average miles operated during year	242,657	238,220
Miles of track	369,580	360,952
Locomotives	63,378	61,276
Locomotives per 1,000 miles	259	255
Cars, passenger service	51,700	50,606
Cars, freight service	2,273,564	2,203,128
Cars, company's service	120,244	114,924
Cars, total	2,445,508	2,368,942
Cars, per 1,000 miles	10,005	9,860
Passenger miles per passenger locomotive	2,341,269	2,263,019
Ton miles per freight locomotive	7,843,663	7,077,428
Employees, June 30	1,815,239	1,699,941
Employees per 100 miles	743	707
Capital stock, *thousands*	$8,610,611	$8,469,561
Funded debt, *thousands*	$11,185,514	$11,064,190
Dividends declared	$368,606,327	$400,432,752
Dividends, average, per cent.	4.28	4.73
Dividends, average, per cent. on dividend-paying stocks	6.38	7.20
Cost road and equipment, *thousands*	$16,351,639	$15,874,579
Passengers carried, *thousands*	1,033,680	994,372
Passengers carried one mile, *thousands*	34,575,873	33,039,111
Passenger mileage per mile of road	143,067	140,393
Freight carried, *thousands* of tons	2,058,035	1,818,796
Ton miles, *millions*	301,399	263,780
Increase, *millions*	37,619	.....
Ton miles per mile of road	1,245,158	1,110,811
Average freight train load, tons	445	410
Average receipts per passenger mile, cents	2.008	1.985
Average receipts per ton mile, mills	7.29	7.43
Average receipts per passenger train mile	$3.36	...
Average receipts per freight train mile	$3.24	...
Average receipts per revenue train mile, freight and passenger	$2.45	$2.30
Average operating expenses per revenue train mile	$1.70	$1.60
Per cent. expenses	69.44	69.30
Passenger revenue, *thousands*	$695,988	...
Freight revenue, *thousands*	2,198,931	...
Total revenue, including miscellaneous, *thousands*	3,125,136	$2,826,958
Operating expenses, *thousands*	2,169,969	1,959,095
Operating expense details, *thousands*—		
Maintenance of way	421,232	363,496
Maintenance of equipment	511,561	448,304
Traffic	62,850	60,569
Transportation	1,096,253	1,013,341
General	78,072	73,254
Revenue per mile	12,873	11,881
Operating expenses per mile	8,939	8,234

The item, cost of road and equipment, in 1913 is $477,059,640 larger than in 1912. The changes are explained as follows:

	Expenditures for additions and betterments.	Expenditures for new lines and extensions.	
From cash or other working assets	$329,511,772	$54,819,241	
From special appropriations	48,079,165	473,281	
Through issue of securities	162,597,278	63,692,746	
Not assigned to any of the above classes	5,801,127	10,263,251	
Total	$545,989,342	$129,248,519	$675,237,861
Miscellaneous charges not classified			4,847,012
Total expenditures during year			$680,084,873
		Credits.	
Property retired or converted		*$79,495,571*	
Adjustments		*5,058,790*	
Difference between record value of grantor and purchase price of grantee in cases of roads sold, merged, consolidated, etc.		*118,470,872*	
Total			*203,025,233*
Net increase during year			$477,059,640

The capacity of freight cars is reported as follows:

	Number	Aggregate capacity. Tons
Box	1,032,585	35,607,134
Flat	147,541	5,151,054

	Number	Aggregate capacity. Tons
Stock	78,308	2,421,827
Coal	871,339	38,314,920
Tank	8,216	327,727
Refrigerator	43,389	1,357,403
Other cars in freight service	91,911	3,798,080
Total	2,273,289	86,978,145

CONDENSED INCOME ACCOUNT

Following is a condensed income account of the roads included in this list, below which is a similar statement for the controlled, non-operating companies, both incomplete because of the omission of a few unsatisfactory returns. The accounts of the operating roads include both operating and financial transactions, while the accounts of the non-operating roads are confined for the most part to receipts and payments under leases, contracts and agreements. For a number of items, such as dividends, taxes, etc., both statements must be taken into consideration in order to learn the aggregates of such items for the railways of the United States therein represented.

Thus the aggregate of dividends declared during the year, $368,552,632, includes those declared out of current income and those declared from surplus both by the operating roads and by the non-operating roads. This amount includes dividends declared on railway capital stock owned by other railway companies.

Other profit and loss items—credit balance	2,932,044	
Total		27,514,187
Balance credit June 30, 1913, carried to balance sheet		$43,288,426

THE LOUISVILLE & NASHVILLE PASS INVESTIGATION

The Interstate Commerce Commission has submitted a preliminary report to the Senate in compliance with Senate Resolution 153 relating to the financial relations, rates and practices of the Louisville & Nashville, the Nashville, Chattanooga & St. Louis and other carriers. The report is a response to paragraph 13, in particular, and contains what is considered by the commission to be startling information concerning the granting of passes by these roads. The results cover only one year, whereas the resolution requires the commission to investigate passes granted to the specified classes for a period of three years. The results for this one year apparently so fully reveal prevailing conditions in this respect that the commission doubts the necessity of covering 1912 and 1911.

During the year ending December 31, 1913, the Louisville & Nashville issued to or on account of members of legislative bodies and other public officials, attorneys, newspaper representatives, and various other persons, 11,805 free passes, involving 4,577,928 miles of travel, the value of which was $130,840.

These were distributed as follows:

Class	Number of passes	Mileage	Value
Members of legislative bodies and other public officials	6,578	2,155,465	$61,727
Attorneys	1,402	874,341	24,520
Newspaper representatives	2,631	1,119,060	32,247
Various other persons	1,194	429,062	12,346
Total	11,805	4,577,928	$130,840

The resolution made particular reference to passes issued to and at the request of members of legislative bodies or other public officials:

Total of all forms of passes	Number of passes	Mileage	Value
Issued to such members or officials	1,942	1,152,130	$32,632
Issued at their request	4,636	1,003,315	29,095
Total	6,578	2,155,465	$61,727

The passes shown above as issued on account of members of legislative bodies or other public officials were distributed as follows:

On account of	Number of passes	Mileage	Value
United States senators	1	...	...
United States representatives	2	204	$6
Other United States officials	139	56,558	1,676
State senators	1,556	390,383	11,324
State representatives	2,183	505,201	14,850
Other state officials	1,769	839,567	23,996
County officials	228	167,802	4,674
City officials	611	149,290	4,021
Judges	89	46,460	1,180
Total	6,578	2,155,465	$61,727

In the same period the Nashville, Chattanooga & St. Louis issued to or at the request of members of legislative bodies and other public officials, attorneys, representatives of newspapers, and various other persons 22,255 passes, involving 7,133,944 miles of travel, the value of which was $209,421.

These were distributed as follows:

Class	Number of passes	Mileage	Value
Members of legislative bodies and other public officials	16,580	5,573,135	$164,525
Attorneys	291	153,261	4,443
Newspaper representatives	1,310	348,738	10,096
Various other persons	4,074	1,058,810	30,447
Total	22,255	7,133,944	$209,421

Passes were issued to and at the request of members of legislative bodies and other public officials as follows:

Total of all forms of passes	Number of passes	Mileage	Value
Issued to such members or officials	1,247	613,420	$18,087
Issued at their request	15,333	4,959,715	146,438
Total	16,580	5,573,135	$164,525

The passes shown above as issued on account of members of legislative bodies and other public officials were distributed as follows:

On account of	Number of passes	Mileage	Value
United States senators	...	...	...
United States representatives	...	...	...
Other United States officials	151	37,757	$1,097
State senators	5,814	1,788,560	52,961
State representatives	8,439	2,969,038	87,713
Other state officials	1,086	444,158	13,089
County officials	388	130,540	3,700
City officials	532	143,125	4,165
Judges	170	59,957	1,800
Total	16,580	5,573,135	$164,525

The commission's comments on these figures are as follows:

It must be remembered that the passes here enumerated cover only passes held by classes of persons specified in the resolution. The list does not embrace, for instance, passes granted to officers and employees of railroad companies.

The examiners of the commission have reported only the amount of travel actually established through an examination of the companies' records. Due to the incompleteness of the reports of the conductors of passenger trains the exact amount of free travel on the part of the classes of persons embraced within the inquiry could not be correctly ascertained. It is doubtless substantially greater than what is here reported.

The examiners also compiled illustrative correspondence tending to show the motives which actuated recipients and givers in these pass transactions. These letters, as might be expected, reflect many varieties of states of mind on the part of the givers and of the seekers after favors from the timidly suggestive to the boldly intimidating and threatening.

In order to properly compile the required information lists of pass holders in the various classes were prepared. Such lists reveal the manner in which these carriers have dipped into practically every domain of public and private life through the instrumentality of the free pass. There is scarcely a walk of life which is not represented in this procession of recipients of passes from the federal bench to the local politician and the sheriff who summons the jury. The threads represented by these passes tie thousands of citizens to the carriers through improper relations. The lack of morality reflected by the facts here compiled is a menace to the institutions of a free people. These citizens who sell their influence quite as much as though they accepted money bribes seem to be as willing to be tied as the carriers are ready to tie them. Men pledge their influence quietly in the home or school or club, in the professions, in business, in city councils; in administrative boards, in courts of justice, in legislative halls and at the polls.

As shown by the above tables the aggregate value of the actual travel upon these passes which it was possible to establish statistically is $340,261. This is a substantial sum. If all the travel upon the passes in question could have been established the sum would doubtless have been materially increased; yet it is not an amount which can financially cripple any large system of railways. The financial magnitudes involved, however, are as nothing compared with the impairment of public and private morality shown to have resulted from this giving and receiving of passes. The lamentable features of the situation are so perfectly obvious that they scarcely require further characterization.

This investigation being pursuant to a resolution of the Senate is not one in which the commission can make an order. It states, however, that it has had in progress for some time a general investigation of free transportation, and that it is its intention in that investigation to issue an order dealing with that practice.

MOTION PICTURES OF RAILWAY MISHAPS

The use of motion pictures by the Pacific Electric Company for teaching the importance of certain regulations for the prevention of collisions and for inculcating other rules was noticed in the *Railway Age Gazette* of June 26, page 1567. Following are descriptions of some of the pictures used:

One reel represents a dangerous crossing. The track of a steam railroad, hugging the bank of a river, makes a sharp curve at this point, and the road of the electric line emerges from a maze of warehouses and other large buildings to enter upon a bridge beyond. The picture shows a crowded electric car approaching the crossing. The motorman stops the car a few yards short of the crossing track, and the conductor, stepping off and absently glancing at a newspaper held in his hand, which some passenger has handed to him, walks out in front of his car. Still absent-minded, he glances down the crossing track in one direction, and gives the signal to the motorman to proceed. The car begins to move. At the same instant, from the direction in which he failed to look, comes into view a noiseless but swiftly moving switching engine. It is rapidly nearing the crossing. The conductor, at last hearing the sound, drops his paper and stands for just a second, paralyzed with horror. Then he rushes in front of the electric car and begins to frantically wave his arms. But the motorman has already seen the danger, and has quickly shut off the current and applied the brakes. The passengers have in the meantime also observed the impending danger and are panic-stricken. The brakes are set, the wheels slide and the car comes to a stand within less than five feet of the crossing. The conductor scarcely has time to step to one side to safety as the switch engine goes whizzing by.

This constitutes the first scene. The companion picture shows the proper procedure for such situations.

Another set shows a car that has become stalled on a suburban track at night. It is a track used exclusively by fast trains, and the electric cars are scheduled to run only a few minutes apart. The line has a number of curves and traverses several deep cuts. A flagman is sent back to place torpedoes and to give a lamp motion signal to possible approaching trains. But he is tired and careless, and neglects to go back a sufficient distance. He waits for several minutes, and finally sits down on one of the rails with his lantern between his feet. Soon there is a flash of a headlight playing on the sides of the cuts, and the flagman jumps up and begins to swing his lantern. The approaching train comes on, traveling at perhaps forty miles an hour. The motorman of this train then sees the signal, and quickly applies his brake, but he passes the flagman with grinding wheels, while still going at uncontrollable speed; and, the distance allowed by the flagman being insufficient to overcome the momentum, crashes into the standing car.

Just such an accident actually occurred on one of the lines of this company several months ago, and several lives were lost.

A companion picture shows how the signaling should have been done, according to the rules.

As pedestrians persist in walking on railway bridges and trestles, most electric railways require their motormen to slacken speed when entering on a bridge or trestle, especially within city limits. One of the pictures shown in the instruction department of this Los Angeles company shows a pedestrian trespassing on a bridge, when a car swoops down upon him, and the car is only brought to a standstill just as the guard strikes the trespasser. The conductor escorts the careless pedestrian to one end of the trestle, and directs his attention to the warning sign.

Another reel constitutes a warning against the practice of alighting from one car, passing around behind it, and, without looking, stepping directly in front of another car moving in the opposite direction on the other track. The motorman of the moving car when passing a standing car from which passengers are alighting is supposed to slacken speed and ring his bell. Often, however, he is careless and fails to observe the rule. Pictures are shown to illustrate how accidents may be caused

in this way, and also how care should be exercised to avoid them.

The motion pictures are used also to inculcate habits of courtesy toward passengers. One shown by the Pacific Electric presents a more or less familiar and humorous episode—the conductor of an electric car, a handsome young fellow, standing and talking to a pretty young woman sitting in a seat at the front end. He is entirely oblivious to everyone except the girl. A fat old lady rises from one of the rear seats and approaches the exit. She has reached her street and wants to get off. Instead of stopping to permit her to do so, however, the car passes on, while the old lady waves her hands and yells to the conductor. Finally some other passenger directs the conductor's attention to the excited passenger, and after carrying her three or four blocks beyond her destination, he stops the car and lets her off.

These are only a few of the pictures used. They illustrate all phases of train management, including a portrayal of how trains should be handled through interlocking plants; the operation of electric train-staff machines; how to use crossover tracks on a four-track line in high-speed sections where the view is obstructed; what to do when unable to clear the leaving time of an opposing superior train, and proper procedure at steam railroad grade crossings; how to make tests of air brakes, how to couple and uncouple cars; picking up broken trolley wires; the necessity of complying with the rule when approaching curves protected by the "slow" sign; the danger of giving the back-up signal without ascertaining if it is safe to move backward; what to do when approaching a dangerous road crossing where there is no flagman or flagging device; hand and lamp signals; how to use fusees and set torpedoes, and numerous other things.

This method of instruction has proved to be not only effective in giving trainmen a clear, comprehensive knowledge of their duties, but, being highly interesting and entertaining, it eliminates the necessity of using coercive methods to get them to attend instructions. The advantage of being able to instruct a large class of men in much less time than formerly is important, as the company employs nearly 5,000 men, of whom nearly 2,000 have duties in connection with train operation.

The Pacific Electric Railway Company's system serves an area of approximately 2,500 square miles in the vicinity of Los Angeles, and operates over 1,067 miles of track. It has 650 passenger cars, 1,452 freight cars, of different kinds, and 66 electric locomotives of from 200 to 1,000 horsepower each. It carries approximately 97,000,000 passengers annually, or about 266,000 daily. A total of 7,172 passenger trains, of from one to three cars each, is despatched over the system daily. Although it is primarily a suburban system, being entirely independent of the system handling the city traffic of Los Angeles, 4,800 trains each day handle city traffic, principally in the small cities and towns surrounding Los Angeles. If all service on the system were to be suddenly stopped and re-started at one time, 50,000 horsepower of electrical energy would be required. The lines extend from sea level to a point 5,800 feet above sea level.

Railway Construction in Spanish Africa.—The chief engineer of public works in the colonial section of the department of state of Spain has submitted a project for a complete system of railways in the Spanish colony of Fernando Po. The total length of the proposed system when completed will be 115 miles, as follows: From Santa Isabel to San Carlos, 28 miles; from San Carlos to Ococo, 12 miles; from Santa Isabel to Concepcion, 44 miles; from Concepcion to Ureca, 12 miles, and from Rilaja to Moca, 19 miles. It is urged that the line from Santa Isabel to San Carlos, which will run through the richest and most popular section of the colony, should be first constructed, beginning at Santa Isabel. This line, in conjunction with the proposed line from Santa Isabel to Concepcion, will serve the north and the middle of the island while the line from Rilaja to Moca will give access to the healthy plateaus.

GENERAL FOREMEN'S CONVENTION

The tenth annual convention of the International Railway General Foremen's Association was held at the Hotel Sherman, Chicago, July 14-17, W. W. Scott, of the Delaware, Lackawanna & Western, at East Buffalo, N. Y., presiding. The meeting was opened with prayer by Reverend Peter J. O'Callaghan, after which an address of welcome was delivered by Leo N. Hornstein, on behalf of the mayor of Chicago. This was responded to by W. T. Gale, of the Chicago & North Western.

President Scott, in his address, said: "As far as the mechanical department is concerned our efforts have not been sufficiently brought to the light of public recognition." He then made the following recommendations: That the subjects presented at this convention for discussion be retained for next year except for the two subsidiary papers; that the number of members named on committees be increased to ten, and that their selection be from widely separated territory in order that all data due to climatic or any other unusual conditions may be observed; that subject 2 (valves, cylinders, crossheads, pistons and guides) cover erecting, bench and machine work; and that closer relationship be sought between the General Foremen's and the Tool Foremen's Associations, if possible a plan being worked out whereby the two organizations would meet during the same week.

F. A. DELANO ON SCIENTIFIC MANAGEMENT

F. A. Delano, president of the Chicago, Indianapolis & Louisville, in a brief address, referred to modern efficiency methods as a new application of old ideas. He gave the following definition of scientific management, which was developed by the members of the United States Commission on Industrial Relations from a number of definitions given before the commission by efficiency experts. Scientific management is essentially an effort to eliminate waste. More specifically, scientific management is that kind of management which aims at an accurate study, measurement and analysis of the various steps in any operation with a view to eliminating error, waste, false motions, etc. While scientific management does not carry with it any particular system of payment for work done, it does contemplate the essential necessity of complete cooperation between employer and employee and it has been generally assumed that this could not be obtained unless the employee shares with the employer in the benefits derived and thereby finds it to his interest to cooperate in attaining the results. With this object in view many and various systems have been devised, such as premium, bonus and others, but these are obviously only the methods adopted as an incentive to obtain the results, and are not to be confounded with the thing itself. Scientific management seeks to accomplish by improved methods what inventions of new machinery seek to accomplish, but the promoters of such methods, recognizing the necessity of cooperation, urge at all times the importance of giving the employee a share in the savings effected and not permitting the employer to take it all. In the best sense scientific management carries with it profit sharing by the employer with the employee; hence it is reasonable and proper that the employee should be consulted directly or through a representative shop committee in the fixing of price or wage schedules, bonuses, or premiums.

ENGINE HOUSE EFFICIENCY

The following is taken from a paper on this subject by W. W. Smith (C. & N. W.): In the report on engine house efficiency presented last year, the different phases of the subject were treated in a general way. The subject was continued so that new material could be added to stimulate discussion. The relation that good locomotive performance bears to railway earnings is now generally recognized, and hence new methods are constantly being devised to secure safety and efficiency of service. Strictly speaking, some of the items mentioned in this report do not come

under the head of engine house efficiency, but they have been included because of their important relation to the subject.

Engine Mileage.—An increase in engine mileage is equivalent to increasing the number of locomotives in through freight service. The operating department, by cooperating with the mechanical department, can do much to increase engine mileage. Trains are often too long on the road due to poor train despatching or overloaded engines; engines are delayed to and from the train yards and the engine house; they are delayed by yard forces not having trains made up; and often trains come in or are ordered out in bunches, so that the engine house organization cannot handle the engines in the way they could if the trains had been properly spaced.

Good judgment in shopping engines for repairs, and storing them during dull periods is an important item to be considered. While it is not economy to limit engines kept in service to a point that might delay freight, on the other hand it is uneconomical to have engines needlessly lying ready for service. In storing engines, those should be kept in service whose mileage comes nearest to entitling them to a shopping. If poorer engines are stored, the good ones are being worn out during the dull season.

There is undoubted economy in long runs for passenger engines, even though they are more conducive to engine failures. When locomotives in passenger service are on long runs, the running repairs are somewhat less per mile run and per car hauled, the oil and coal account is slightly less, and the cost of maintenance of the added number of engine houses is saved. In order to make long runs a success, locomotives must receive very careful attention at engine houses. By the use of stoker and oil fired engines, it is possible to make still longer runs.

Pooled or Assigned Power.—Whether it is best to pool power, or assign each engine to a regular crew, is an important consideration in engine house efficiency. When an engine is assigned to a regular crew, it is given more attention by the crew, there is less likely to be delay in getting away from the engine house, failures are less likely to occur, and the cost of maintenance is sure to be less. The assigned engine is always in better condition because the engine crew is continually reporting work, and following it up to see that it is done.

A system of regular assigned engines has been inaugurated on some of the divisions of the Chicago & North Western with gratifying results. With this system all engines in through freight service on one division must be of the same hauling capacity, and in equally good condition, so that they are suited for a fast freight one trip and a drag freight the next trip. The runs are pooled; that is, regular engines are not assigned to certain runs, but an engine crew with a regular engine will take any run that its turn on the board entitles it to. Of course with this system, more engines are required, as it is necessary to hold engines for the crew's rest, and one or two extra engines are required so that a regular crew can be furnished with a locomotive when the regular engine is held in for work.

Terminal Delay.—Out of each 24 hours the locomotive spends on an average, 6 hours in the engine house. The greater cost and earning power of recent locomotives makes it more necessary than ever to keep them in service. The question of turning engines promptly is one of system and supervision. It is not possible to reduce the time required for repairs to any great extent, so that any material saving effected must be in the handling. Ordinarily, the maximum period of delay occurs at the clinker pit, but where the piece-work system of cleaning and knocking fires has been introduced the delay has been cut down to a surprisingly low figure, and at the same time the cost has been greatly reduced.

In turning engines at terminals, the most valuable units of power should be given the preference; that is, when several different classes of engines are used in freight service. Also the ash pit tracks should be arranged so that engines not requiring washing out, or other heavy work, can be run around those requiring washing out. It often happens that engines are held in the engine house for work, or for other reasons, until they cool off, and thus considerable time is consumed in getting them steamed up again. Where a hot water fill-up line is provided, a considerable saving in time can be made by letting water out of the boiler and re-filling with fill-up water which is nearly at a boiling temperature. When it is the custom not to fire engines until they are ordered, this method is also of advantage, as it is sometimes difficult to get engines steamed up quickly with cold water.

The engine house foreman should always be in a position to quickly and accurately advise the transportation department when he expects engines to be ready for service. Then a definite prospective time should be given to the yardmaster two hours before the engine will be ready, from which time the engine should be ordered.

Engine Delays.—Delays in getting engines out of the house at the time for which they are ordered occur at times in spite of all efforts made to prevent them. When engines are ordered on prospective times, given before the engine is ready for service, initial delays may occasionally result, but this method actually saves about two hours delay to the engine. At busy terminals, where important trains are despatched, whenever possible an extra freight and an extra passenger engine should be fired and ready for service, so that in case of the unexpected happening, there will be an engine to fall back on. Delays sometimes result from the failure of either the day or night engine house foreman to notify the other concerning repairs that are left unfinished. When a running log book is maintained delays from this source are minimized.

Mileage Between Shoppings.—The aim of the engine house management should be to keep engines out of the shop as long as possible, having due regard to excessive lost motion and injury to track due to worn tires. It is probably best to compute locomotive costs on a ton mile basis so there will be a tendency on the part of master mechanics and others to keep engines in 100 per cent. efficiency as long as possible, and then when it proves impracticable for the engine house to further maintain them at their full hauling capacity, to shop them. As an average figure for all roads, freight locomotives do not make more than 40,000 miles between shoppings, and passenger engines not more than 80,000 to 100,000 miles. It costs on an average about $2,000 to give an engine a general overhauling so that a considerable saving is made by prolonging the time between shoppings. Occasional records of very high mileage have been made, and indicate what can be accomplished by care in construction, maintenance, and operation of locomotives.

Fuel Economy.—There are unlimited possibilities for saving fuel at the engine house. Cylinder and valves blowing, cylinder cocks and relief valves that do not seat, leaky whistle and pop valves, leaky boilers, steam leaks in the cab, improperly drafted front ends, bushed nozzles, etc., are all sources of waste that are caused by imperfect maintenance. The care of the boiler jacket and insulation and covering on steam pipes and cylinders, is also important, as the radiation from uncovered surfaces causes losses. Then there are direct losses of fuel at engine houses due to tanks being overloaded, to uneconomical methods of firing up engines, to engines popping off on the cinder pit track while waiting to have the fire cleaned, to engines fired too long before they are ordered, etc.

Engine Supplies.—There is spent annually in the United States between $4,000,000 and $5,000,000 for locomotive supplies alone, and nearly an additional million for labor in connection with the maintenance of this equipment. This means that the cost of upkeep per locomotive per year averages about $100. By close supervision at engine houses this high cost can be cut down. The list of tools carried should be cut down to the limit; then at each engine house there must be one or more good, reliable supplymen, or tool checkers to fill shortages, and see that damaged articles are repaired. Each engineman should have an individual tool box, which, together with the oil cans, should be removed from the engine at the end of the trip by

the supplyman. Engine cushions should be securely fastened to the seats, and suitable boxes or racks should be provided in the cab for lanterns, emergency signals, etc. In order that each fireman may have his own shovel, a suitable rack should be placed in the engine house to which shovels may be chained and locked.

Handling of Switch Engines.—The importance of effective switching service is often overlooked. When switch engines are delayed at the engine house, or are so poorly maintained that they cannot do effective work, the train service is correspondingly impaired. The engine house should make every effort to furnish switching power on time at the beginning of the day and when engines are in to have the fires cleaned. As an aid in doing this, the work at the cinder pit should be very closely supervised at noon and at midnight, when a number of engines are in at the same time to have the fires cleaned. Whenever possible a relief engine should be fired and ready for immediate service. Switch engines should be held in for inspection and repairs at stated intervals, and the grate rigging, etc., should be gone over carefully at this time, so there will be no occasion for a delay from that source when the fires are cleaned.

On several roads, at important terminals, a system of relief engines has been adopted. With this plan a relief crew is engaged in taking engines to and from the engine house and yard, and the regular yard engine crews do not come to the engine house with the engines. When an engine that is working needs to come to the engine house to have the fire cleaned or for work, the relief crew brings out a relief engine, and exchanges it for the other engine.

Co-operation.—The fundamental principle involved in getting good engine house service is the individual interest of every employee concerned, and the co-operation of all. Probably no other one thing can do quite as much to reduce the net earnings as friction or ill will between the operating and mechanical departments. The closer officials of the two departments get together, the better will be the results. The master mechanic or foreman should call up the the train despatcher the first thing in the morning, and help him to line up things, thereby heading off probable failures, and in return receiving valuable information for his department.

Then a friendly spirit of co-operation should exist between master mechanics and foremen of different divisions. It often happens that engines from one division run into the terminal of another division, and unless there is harmony between the men of the two divisions the best interests of the company must be sacrificed.

Terminal Facilities.—In order to efficiently handle the large engines of the Mallet, Mikado and Pacific types, now in general use, improved locomotive terminal facilities are absolutely necessary. The engine terminals used prior to the introduction of the heavy power are now entirely inadequate. The importance of up to date terminals has been quite generally recognized, as is shown by the care that has been taken in the design and construction of recent terminals.

Maintenance Costs.—Locomotive maintenance costs depend largely on the facilities provided and the cost and quality of the labor to be had. Then when the work is more liberal and thorough the costs are correspondingly increased. Of course large engines are more costly to maintain than smaller ones, and certain types and designs are more troublesome to keep up than others. For that reason it is uneconomical to run large engines on runs that can be handled by lighter power. Locomotive maintenance costs continue to increase, but when we make allowance for the increase in wages, the increased cost of material, and the added complexity of the modern locomotive, the cost of repairs per unit of work has been actually decreased. The practice of standardizing many parts of the locomotive, particularly those requiring frequent repairs or renewal, is general, and results in reduced maintenance costs. When parts and castings are arranged to be used either right or left the costs are still further reduced. Then, as far as possible, all parts should be so constructed and placed that they can be readily removed and replaced; otherwise repairs will be far more expensive than they would have been had the parts been more accessible.

As a further means of keeping down costs, all important engine houses should be furnished with an ample supply of spare parts, such as air pumps, lubricators, injectors, bell ringers, etc., which should be used to replace defective apparatus, whenever it will take less time to exchange than to repair. As a general proposition repairs to such accessories can be made to the best advantage at the shop, where special tools and machinist specialties are available.

Locomotive Inspection.—Rapid and accurate locomotive inspection is a matter of the greatest importance from a maintenance standpoint. Where the most satisfactory results are attained, inspection is made by a force of special inspectors who have been trained to inspect certain parts of the engine. This practice is followed at some of the important division points on the Pennsylvania Railroad.

DISCUSSION

W. F. Lauer, of the Illinois Central, stated that the greatest objection to assigned engines comes from the transportation department. On the Illinois Central the average time at terminals is less with assigned than with pooled. Engines and assigning power has reduced repair expenses and the number of mechanics required in engine houses. The consensus of opinion was against pooling. Mention was made of the advantage of a cold water line in engine houses to fill tenders before leaving and thus avoid delay if work is late on the engine. One member considered terminal delays mainly due to lack of organization. Mr. Smith stated that many engine failures could be prevented by careful study of failed parts, by proper discipline, and by periodical examinations and tests. One member claimed that most engine failures were due to lack of proper organization and inspection. Mr. Smith laid stress on the value of shifting shop and engine house men to give them all around training.

J. S. Sheafe, of the Baltimore & Ohio, made a brief address on the relationship of the general foreman to shop efficiency. An account of the Thursday and Friday sessions of this convention will appear in next week's issue.

RAILWAY EXTENSION IN CHINA.—The head office of the Chinese Eastern has received permission to begin the construction of a branch line from Pervaya Retchka (First River) to Churkin on the southern side of the Golden Horn Bay at Vladivostok. The line will be ten versts (6.7 miles) long and will include a tunnel 2,400 ft. in length. The total cost of construction will be $1,731,000, of which $250,000 is allotted for this year. The work will be finished in 1916.

RAILWAY PROGRESS IN THE CAUCASUS.—Last year was one of comparative activity in railway construction work in the Caucasus. The Armavir-Maikop-Tuapse Railroad is nearly completed and will soon be opened to traffic. The Kars-Sarikamish branch of the Transcaucasian State Railways was completed and opened to traffic toward the end of 1913. Surveys on the Sarikamish-Karaurgan section are in progress and the extension line will soon be commenced. Preliminary and survey work on the Black Sea Railroad was completed and the work of building the line will also soon commence. This road will extend south from Tuapse and it has been decided to have it join the Poti-Samtredi branch of the Transcaucasian State Railways at Kvaloni. The distance from Tuapse to Kvaloni is 213 miles. Progress was made on the Kakheti Railroad from Tiflis to Signakh and it is proposed to extend this line to Baku. The Djulfa-Tabriz Railway was begun and by the close of the year rails were laid for 8½ miles in Persian territory. The Vladikavkaz Railway completed two branch lines from Ekaterinodar in 1913, one to Yeisk and the other to Akhtari, both on the Sea of Azof; and a line from Krimskaya to Bataisk, near Rostoff-on-Don.

The Interstate Commerce Commission's Report on the New Haven

An Abstract of the Report with the Commerce Commission's Language Preserved, In So Far as Possible

In the present proceedings the commission has inquired into the financial affairs of the entire New Haven system. Since the former investigation there has been a change in the executive officers of the New Haven system. In justice to the present management, it is but fair to say that its chief executive officer and his special council have cooperated with the commission and rendered it substantial assistance throughout this investigation. The witnesses, other than the accountants for the commission, were in the main hostile, and with few exceptions their testimony was unwillingly given.

The result of our research into the financial workings of the former management of the New Haven system has been to disclose one of the most glaring instances of maladministration revealed in all the history of American railroading. In the course of the investigation many instances were uncovered of violation of the laws of different states. As these were not understood to be pertinent to our inquiry under the senate resolution we did not follow them into their details. As pointing to violations of state laws, we have turned over the evidence concerning local occurrences in New York City to the district attorney for the proper district, and the testimony relating to irregularities in Massachusets and Rhode Island have been laid before the proper authorities of those states. The commission has also furnished the Department of Justice with a complete record of the testimony.

The difficulties under which this railroad system has labored in the past are internal and wholly due to its own mismanagement. Its troubles have not arisen because of regulation by governmental authority. Its greatest losses and most costly blunders were made in attempting to circumvent governmental regulation and to extend its domination beyond the limits fixed by law.

The subject matter of this inquiry relates to the financial operation of a railroad system which, on June 30, 1913, had a total capitalization of approximately $93,000,000, of which $79,000,000 was stock and $14,000,000 bonds. In the ten years from June 30, 1903, this capitalization was increased from $93,000,000 to $417,000,000, exclusive of stock premiums, or an increase of $324,000,000. Of this increase approximately $120,000,000 was devoted to its railroad property and was expended for betterments and equipment. This leaves the sum of $204,000,000, which was expended for operations outside of its railroad sphere. Through the expenditure of this sum this railroad system has practically monopolized the freight and passenger business in five of the states of the Union. It has acquired a monopoly of competing steamship lines and trolley systems in the section which it serves. The financial operations necessary for these acquisitions, and the losses which they have entailed, have been skilfully concealed by the juggling of money and securities from one subsidiary corporation to another.

SIGNIFICANT INCIDENTS

Marked features and significant incidents in the loose, extravagant, and improvident administration of the finances of the New Haven as shown in this investigation are the Boston & Maine despoilment; the iniquity of the Westchester acquisition; the double price paid for the Rhode Island trolleys; the recklessness in the purchase of Connecticut and Massachusetts trolleys at prices exorbitantly in excess of their market value; the unwarranted expenditure of large amounts in "educating public opinion"; the disposition, without knowledge of the directors, of hundreds of thousands of dollars for influencing public sentiment; the habitual payment of unitemized vouchers without any clear specification of details; the confusing inter-relation of the principal company and its subsidiaries and consequent complication of accounts; the practice of financial legerdemain in issuing large blocks of New Haven stock for notes of the New England Navigation Company, and manipulating these securities back and forth; fictitious sales of New Haven stock to friendly parties with the design of boosting the stock and unloading on the public at the higher "market price"; the unlawful diversion of separate funds to political organizations; the scattering of retainers to attorneys of five states, who rendered no itemized bills for services and who conducted no litigation to which the railroad was a party; extensive use of a paid lobby in matters as to which the directors claim to have no information; the attempt to control utterances of the press by subsidizing reporters; payment of money and the profligate issue of free passes to legislators and their friends; the investment of $400,000 in securities of a New England newspaper; the regular employment of political bosses in Rhode Island and other states, not for the purpose of having them perform any service, but to prevent them, as Mr. Mellen expressed it, from "becoming active on the other side"; the retention by John L. Billard of more than $2,700,000 in a transaction in which he represented the New Haven and into which he invested not a dollar; the inability of Oakleigh Thorne to account for $1,032,000 of the funds of the New Haven intrusted to him in carrying out the Westchester proposition; the story of Mr. Mellen as to the distribution of $1,200,000 for corrupt purposes in bringing about amendments of the Westchester and Port Chester franchises; the domination of all the affairs of this railroad by Mr. Morgan and Mr. Mellen and the absolute subordination of other members of the board of directors to the will of these two; the unwarranted increase of the New Haven liabilities from $93,000,000 in 1903 to $417,000,000 in 1913; the increase in floating notes from nothing in 1903 to approximately $40,000,000 in 1913; the indefensible standard of business ethics and the absence of financial acumen displayed by eminent financiers in directing the destinies of this railroad in its attempt to establish a monopoly of the transportation of New England. The combination of all these has resulted in the present deplorable situation in which the affairs of this railroad are involved.

NEW YORK, WESTCHESTER & BOSTON

The Westchester is a story of profligate waste of corporate funds. The enormous sum of $36,434,173 was expended for a road only 18.03 miles in extent, which is being operated at an annual loss of approximately $1,250,000. The Westchester acquisition was planned and executed by a special committee of the board, consisting of Directors Morgan, Rockefeller and Miller, with President Mellen as chairman. The full board was not taken into the confidence of these directors, who wanted the securities of the two proposed competing lines purchased, and no report was ever made by this committee placing the situation as they found it before the board.

In a letter of October 30, 1906, to C. S. Mellen, from the attorney, Francis Lynde Stetson, who was representing all the parties in the deal; namely, J. P. Morgan & Co., the Millbrook Company, Perry and Thorne, and the New York, New Haven & Hartford, there was the following language, which is significant as to the course the committee was pursuing:

> Referring to the conversation this morning, between yourself, Mr. Thorne and myself, it has occurred to me that it is possible that Mr. Thorne's purchase and even his payments may have to begin before he shall have ascertained the validity of the two principal properties which he has acquired, and that in the event of the development subsequently of their invalidity, it might be that the money spent would be money lost.

The report of this committee, however, was unanimously approved, ratified and confirmed at a meeting of the board

of November, 1907, at which the following directors were present: Mellen, Rockefeller, Morgan, Milner, Thayer, Brooker, Brush, Warner, Cheney, Miller, Skinner, Barney, Taft, Wittemore, Elton, Hemingway, Robertson, Robbins and Parker.

The New Haven had now acquired two franchises with roads parallel to each other and its own line, at a distance of only a few hundred yards apart. There was conflicting litigation pending, and matters were necessarily in a most unsatisfactory state and at a tangled stand-still. The solution of the difficulties was the further expenditure of $1,524,072.77. This was arranged by having the New Haven, on June 15, 1908, transfer to its subsidiary the New England Navigation Company, 8,000 shares of its stock at $150 per share, which the Navigation company in turn transferred to Charles S. Mellen, the president of both corporations, who conducted the negotiations. On March 5, 1909, an additional 1,495 shares of New Haven stock at $158 per share was in like manner placed in Mr. Mellen's possession, and certain sums of money were also advanced to him from time to time.

In explaining how these negotiations were conducted, Mr. Mellen testified that it was intended that one share of New Haven stock would be exchanged for three shares of Westchester stock. When New Haven stock was not immediately at hand, he issued to the messenger who brought the Westchester stock a duebill, which was in terms an order on himself to pay on demand to the bearer a specified number of shares of New Haven stock, or its equivalent in cash, at $150 per share with accrued dividends.

No comment is necessary to make clear to the mind the corrupt and unlawful nature of these transactions, and it would seem that the amount illegally expended can be recovered from Mr. Mellen and the directors who authorized it.

When the details of this acquisition were exposed in this investigation it was urged in explanation that by reason of the heavy terminal charges exacted from the New Haven on passengers delivered at the Grand Central station, it was very desirable that the New Haven have another entrance into New York City, and that the Westchester provided such an entry. A very casual study, however, of the map of the Westchester and the New Haven lines into New York impeaches the reasonableness of any such explanation. The New Haven, over the lines of the Harlem River & Portchester, a route then owned by it, had an entrance into New York City via Second Avenue and Third Avenue elevated lines. The Westchester is not constructed to use the tracks of the Harlem River & Portchester from 174th street into New York via these elevated stations. The subway has been constructed as far as Westchester avenue, and is being extended to 180th street, where a transfer station will be established with the Westchester, the two being some 300 feet apart at this point. At 174th street, however, the subway is only two or three blocks removed from the Harlem River & Portchester. If the New Haven had wanted an entrance to New York City via the subway, it could have established a transfer station somewhere with this Harlem River line, just as it is preparing to do with the Westchester at 180th street. It should be noted here, however, that this subway line is to be extended through to Mt. Vernon, paralleling the Westchester to that point, and furnishing a through rapid service into New York City. Again, the Westchester has no feasible connection with the main line of the New Haven below New Rochelle, and it cannot relieve the New Haven of a larger part of its commuter traffic, on which the Grand Central terminal charges are so serious a burden, than could the Harlem River & Portchester.

RHODE ISLAND TROLLEYS

The purchase of the Rhode Island trolleys was another instance of Mellen's waste in acquiring properties that bring an annual deficit instead of a surplus, and constitute a liability instead of an asset in the New Haven system.

When the details had been worked out by Mr. Mellen for assuming this additional burden, the directors without question acquiesced. Mr. Mellen testified that in addition to the cost of the Rhode Island trolleys, the Connecticut trolleys represented a payment of about $10,000,000 more than their value.

The Rhode Island and Connecticut trolley ventures are further evidence of the prodigality in the expenditure of the money of the New Haven stockholders in carrying out an unlawful policy of transportation monopoly.

STEAMSHIP LINES

The New Haven from time to time had felt the competition from steamship lines. Restless of any limitation of this power, President Mellen proceeded to acquire the steamship lines and thereby stifle these interferences with the New Haven activities.

The Hartford & New York Transportation Company cost the New Haven $2,538,917; the Eastern Steamship Corporation, $4,200,000; the Merchants' & Miners', $5,774,500; the New Bedford, Marthas Vineyard & Pawtucket, $141,700; the New England Steamship Company, $12,100,000; the Maine Steamship, $17,300, or a total of $24,772,417. The testimony shows that the physical value of the properties acquired as a result of these outlays is something like $10,000,000. The New Haven advises that it has recently disposed of its holdings in the Merchants' & Miners' Transportation at a loss of $3,594,500.

When Mr. Mellen had obtained control of every boat line of any importance in New England he suddenly changed his attitude when the public discovered the real ownership. It was then he proposed and urged that they be disposed of, but in this was overridden by his board.

BOSTON & MAINE

Before the New Haven secured control of the Boston & Maine stockholders of the latter had realized substantial dividends for a period of more than fifty years. Its credit was high and its stock was in the year 1900 valued by the railroad commission of Massachusetts at $190 per share.

There is reason for belief that this railroad in the hands of its former management would have continued to pay dividends and serve its constituency of passengers and shippers with reasonable rates and adequate facilities. The New England Navigation bought 55,000 shares of stock of the Boston & Maine owned by the American Express Company, and other stock of the Boston & Maine was gathered in by the New England Navigation Company, acting on behalf of the New Haven, until the latter road had a controlling interest in the Boston & Maine. This move, disastrous as it was to prove to both roads, was illegal under the Massachusetts laws, and without doubt under the Federal Anti-Trust Law, but impolitic, unwise, illegal and disastrous as it was to prove, it was undertaken with the realization of the illegality of this control of the Boston & Maine stock. Then began a series of transfers, shifts and evasions by which it was made to appear that the New Haven had divested itself of the Boston & Maine stock, while all the time it was being retained in friendly hands and under the control of the New Haven.

It may be of interest to note the passage of a controlling number of shares of the Boston & Maine stock:

First, from the American Express Company and others to the New England Navigation Company.

Second, from the New England Navigation Company to John L. Billard, nominally.

Third, from John L. Billard to the National City Bank as collateral.

Fourth, from the National City Bank to the New Haven.

Fifth, from the New Haven to the New England Navigation Company.

Sixth, from the New England Navigation Company to the Boston Railroad Holding Company.

The management of the Boston & Maine by the New Haven was unwise. It began in illegality and in a lust for extended

monopoly, and has resulted in great depreciation and serious impairment of credit.

When the New Haven was ordered to sell its Boston & Maine stock it was transferred to John L. Billard, a coal merchant of Meriden, Conn., where he paid taxes on property listed at $30,000. The Navigation company took in payment $11,000,000 raised by Billard on a note on the National City Bank secured by the stock as collateral, and a note of Mr. Billard, unsecured, for $2,743,500.

The New Haven at once set in motion its agencies for influencing public opinion, which resulted in the incorporation of a bill in the Legislature of Massachusetts authorizing the creation of a company known as the Boston Railroad Holding Company. This company bought back the Boston & Maine stock at $150 per share, which resulted in Billard receiving credit for $2,748,700 more than he was charged originally for the stock.

It is quite evident that it was not the understanding of the board that Billard should receive a profit of $2,748,700 out of this transaction, but that at most he was to receive only a reasonable compensation, estimated at from $100,000 to $500,000. All the assets of the Billard company belong to the stockholders of the New Haven. All the money sunk in this operation belonged to the New Haven. A suit shonld be maintainable by the New Haven against Billard and all who have participated in this fraud upon stockholders.

MANIPULATION OF ACCOUNTS

Several transactions appear of record which show that by no stretch of imagination can the irregularity of recording be qualified as due to carelessness. In February, 1911, the New Haven bought 23,520½ shares of Rutland stock from the New York Central, giving in exchange therefor its check on the Farmers' Loan & Trust Company for $2,364,977. No entry can be found in the record of the New Haven company which reveals this transaction. The stock thus acquired was on the same day, with a check for $135,023, delivered to the New England Navigation Company in exchange for a note for $2,500,000. The fact of the recording of this transaction is that the sum paid to the New York Central for the stock shows as a cash advance to the New England Navigation Company.

PURCHASES WITHOUT BIDS

Purchases of cars and coal are two large expenditures that railroads make. The New Haven purchased cars almost exclusively from James B. Brady without competition and to the extent of some $37,000,000. Mr. Brady as a witness made no secret of his generosity to the officers with whom he did business. His methods were justified by him on the ground that the officers of the New Haven were old friends.

Locomotives were bought from a company in which a director of the New Haven was also a director. Many supplies obtained by the New Haven were from companies having directors who were also directors of the New Haven. Corporate economy is not practicable where gifts and obligations arising from friendship tend to obscure official duty.

INTERLOCKING DIRECTORATES

The practice of one man serving on many boards of directors cannot be too strongly condemned. The man who holds directors' positions in a dozen corporations may be thoroughly honest in his relations with each, but it is not practicable for him to give the stockholders of each corporation the full benefit of his ability and energy when, in truth, he can afford only a small fraction of his attention to each corporation. If he is not permitted to know of the real workings of the corporation and, when he serves on so many boards, that is in the nature of things impossible, the corporation gets an indorsement to which it is not entitled.

There are too many ornamental directors and too many who have such childlike faith in the man at the head that they are ready to indorse or approve anything he may do.

A director should be an active, not a passive, force. He should understand the affairs of the corporation to which he gives the prestige of his name, at least to the extent of knowing the integrity of its designs and the absence of law-breaking methods in its operation, and he should not accept positions which he cannot fill in this comprehensive way.

Through the control of voting strength resulting from stock ownership by other corporations, a few persons whose individual holdings were small in comparison with the volume of stock of the company were enabled to perpetuate their full control of the New Haven company.

While the Connecticut laws require the majority of the directors to be residents of that state, the selection of Connecticut directors depends entirely upon the choice of the controlling and dominating interests in the company. In a similar manner the control of other great corporations is maintained by means of interlocking directorates.

The handling of bank deposits and security sales of these corporations is massed in a few hands, carrying with them a power and domination over large amounts of banking capital as well as the control of great railroad systems. These and other evils as the result of interlocking directorates are now well recognized and known, and they have been emphasized by the disclosures of this investigation.

FUNDS TO BE RECOVERED ON BEHALF OF THE STOCKHOLDERS

From the facts developed in this investigation, it would seem that there is little question concerning the recovery of a substantial amount of the stockholders' money that has been wasted. Several items of this nature have already been suggested herein and will be briefly summarized:

Overpaid Perry and Thorne in commissions	$303,750.00
Illegally spent in obtaining Westchester franchise changes	1,524,072.77
In the Billard transaction	2,748,700.00

Note.—The money with which Billard acquired the 15,755 additional shares of common stock and 5,826 shares of preferred stock of the Boston & Maine Railroad Company was furnished by the New England Navigation Company. This stock was turned back to the Navigation Company for $3,370,082. It would seem that a suit by stockholders for the recovery of the profit, if any was made by Billard in the transactions involving these additional shares, could also be maintained.

If any expenditures were made in violation of the anti-trust laws of the United States, are not such expenditures *ultra vires*, and is it not the legal obligation of the directors to satisfy out of their own fortunes any loss which results to the company?

These are all pertinent questions in the light of the developments brought about by this investigation.

Only lawful expenditures are authorized.

All illegal disbursements are *ultra vires*.

Directors cannot without accountability deplete a corporate treasury in ventures which are in violation of the laws of the land.

DIRECTORS CONSCIOUSLY TRANSGRESSING ANTI-MONOPOLY LAWS

The evidence shows that in pursuance of the policy of transportation monopoly the New Haven purchased the Connecticut trolleys, the Rhode Islands trolleys, the Massachusetts trolleys, steamship lines, the Boston & Maine Railroad, and other means of transportation that were available and purchasable. That this plan was done in violation of the federal statute it seems quite clear, for competition was sought to be destroyed. That the directors were conscious they were proceeding along lines that were probably inhibited by law is evidenced by the testimony of Director Elton, that as each line was purchased some one would ask the question in the board of directors if it were not in violation of law, and that Mr. Robbins, general attorney for the New Haven, would state to the board that the New Haven charter permitted them to do anything.

It appears, therefore, that not only were these consolidations contrary to law, but these directors were cognizant of that fact.

and contented themselves with the advice of counsel that under the company's charter it could do anything it pleased.

THE QUESTION OF IMMUNITY IN SECURING EXPOSURE OF ABUSES

In the investigations the commission is required to make from time to time it has, in accordance with its usual custom, exercised due caution not to require the testimony of witnesses where immunity might result except when it is necessary in order to get at the truth. The purpose of the immunity statute, as the commission understands it, was to aid in the search for facts by removing the obstacle of witnesses refusing to testify on the ground of self-incrimination, and under the statute the commission has always endeavored to exercise a sound discretion in this regard. In carrying out the instructions of the Senate in this case the commission has therefore kept in mind the warning of the Department of Justice to carefully consider before placing a witness upon the stand the effect his testimony might have in the way of immunizing him from criminal prosecution. The commission has only used such witnesses as seemed necessary to fully answer the Senate's inquiry and has refrained from calling those witnesses whose evidence, while interesting, might be merely cumulative.

With respect to Mr. Mellen, former president of the New Haven system, it was the belief of the commission that his testimony was necessary in this investigation, and the result, in our opinion, fully justifies this position.

Evidence of wrongdoing such as was disclosed in this hearing is difficult to obtain. Men do not conduct such transactions in the open, but rather in secret and in the dark. Only those involved, as a rule, have direct information. So some of the evidence of necessity must come through participants.

The commission has proceeded upon the idea that it is better to expose wrongdoing, even if in doing so it would be necessary to use a few witnesses whose testimony might bring them immunity, than through fear of bestowing immunity on some, leave facts unknown and uncovered and thereby give immunity to all, not only as to prosecution, but to the stigma of exposure as well.

NEW HAVEN MONOPOLY CORRUPT

This investigation has demonstrated that the monopoly theory of those controlling the New Haven was unsound and mischievous in its effects. To achieve such monopoly meant the reckless and scandalous expenditure of money; it meant the attempt to control public opinion; corruption of government; the attempt to pervert the political and economic instincts of the people in insolent defiance of law. Through exposure of the methods of this monopoly the invisible government which has gone far in its efforts to dominate New England has been made visible. It has been clearly proven how public opinion was distorted; how officials who were needed and who could be bought were bought; how newspapers that could be subsidized were subsidized; how a college professor and publicists secretly accepted money from the New Haven while masking as a representative of a great American university and as the guardians of the interests of the people; how agencies of information to the public were prostituted wherever they could be prostituted in order to carry out a scheme of private transportation monopoly imperial in its scope.

DIRECTORS CRIMINALLY NEGLIGENT

It is inconceivable that these wrongs could have gone on without interference if the members of the board of directors had been true to the faith they owed the stockholders. A number of directors appear in many instances to have voted without knowledge and to have approved the expenditure of many millions without information. According to the testimony of some of the directors they merely approved what had been done by some committee or by some officer of the company. The directors' minutes reveal that it was largely a body for ratification and not authorization, as the law intended a board of directors should be. None of the directors would have been so careless in the handling of his own money as the evidence demonstrates they were in dealing with the money of other people. The directors actively or passively acquiesced in the efforts of the Mellen-Morgan-Rockefeller régime to extend the domination of this corporation over the whole transportation field in New England.

If these directors who were faithless to their stewardship were held responsible in the courts and at the bar of public opinion for the failure to do those things they should have done, the lesson to directors who do not direct would be very salutary.

Most of the directors of the New Haven accepted their responsibilities lightly. They failed to realize that their names gave confidence to the public and that their connection with the corporation led the public to invest. When these directors were negligent and serious losses resulted therefrom they were guilty of a grave dereliction of duty and a breach of trust that was morally wrong and criminal in its fruits.

Directors should be made individually liable to civil and criminal laws for the manner in which they discharge their trust. A corporation can be no better or worse than those who operate it. It should be just as grave a crime to plunder stockholders or the public through a railroad corporation as it is to personally rob an individual.

SUBSIDIARY CORPORATIONS CONDEMNED

It was found in the investigation of the New Haven system that there were 336 subsidiary corporations, and the books of the New Haven road proper reflect only a small part of the actual financial transactions of the railroad. Many of these subsidiary corporations served no purpose save an evil one. They were used to cover up transactions that would not bear scrutiny, and to keep from the eyes of public officials matters that were sought to be kept secret. The commission should have the power to examine not only the books, records, papers and correspondence of interstate carriers, but of subsidiary companies as well.

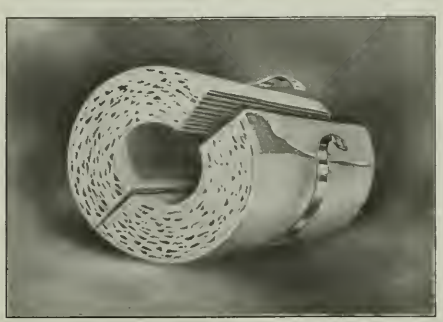
REMEDY IN PUBLIC CONSCIENCE AND LAWS

The insuring of honesty throughout the management of the great railroads of the country is a most important question before the people today, and only when through exposure of wrongdoing and an awakened public conscience coupled with effective laws this result is produced, may railroading be placed upon the high level that it should occupy. The revelations in this record make it essential for the welfare of the nation that the reckless and profligate financiering which has blighted this railroad system be ended, and until this is fully done there will be no assurance that the story of the New Haven will not be told again with the stockholders of some other railroad system as the victims.

DUST ON THE PARIS SUBWAY SYSTEMS.—Because of complaints received the Conseil d'Hygiène of Paris took in hand, about two years ago, some experiments as to the air on both the Métropolitain and the Nord-Sud and a report thereon has just been issued. This shows that the air on the former is much more vitiated than on the latter. The principal cause of the trouble is attributed to the rails. On the Métropolitain the wear is very pronounced, especially owing to braking, in the stations; but on the Nord-Sud the rails are, apparently, of harder steel, and the braking has had little effect. On the former line the brake-shoes are of cast-iron; on the latter they are faced with a tar-treated fabric, and, incidentally, the trains on the Nord-Sud stop much more smoothly and with less noise. The report refers to the fact that the floor of the coaches on the Métro has longitudinal strips along the upper surface, so cannot be swept clean, but on the Nord-Sud the floors are covered with a conglomerate material forming a uniform and non-slipping surface, which can be cleaned with sawdust. It is, therefore, proposed that in these matters the Métropolitain should follow the example of the Nord-Sud, also that the ballast in and near the stations be covered by tiles, so as to reduce the dust, and which can be swept.

STEAM PIPE COVERINGS

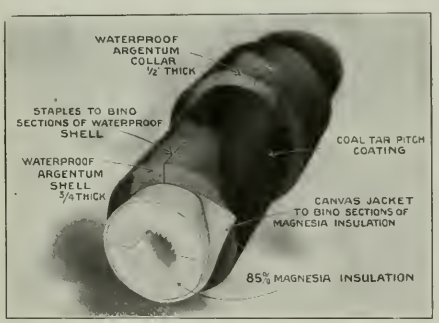
The Philip Carey Company, Cincinnati, Ohio, has placed on the market two new types of pipe covering, one for pipes used above ground, and another for underground installations. The first is termed the Carocel. It is made up of alternate layers of plain and corrugated pure asbestos paper, the corrugations measuring about ⅛ in. in depth. This construction has been used in order to provide as many dead air spaces as possible, which, of course, is one of the best insulating mediums to be had. With these layers pressed firmly together sufficient air space is left to give



Carey Carocel Sectional Pipe Covering

the necessary insulation and all chance of circulation is eliminated. The ends of the covering are so trimmed that all the air spaces are practically sealed. Another advantage is that there is no possibility of circulation around the pipe, thus preventing the opportunity for heat leakage at the point where the two halves come together. This insulation is of light weight, and yet firm enough to withstand the rough handling received in service. It is covered with pure asbestos fibre, and the sections are held together by brass bands, as shown in the illustration.

The underground insulation is known as the Carey Argentum-Magnesia sectional pipe covering. Its construction is clearly



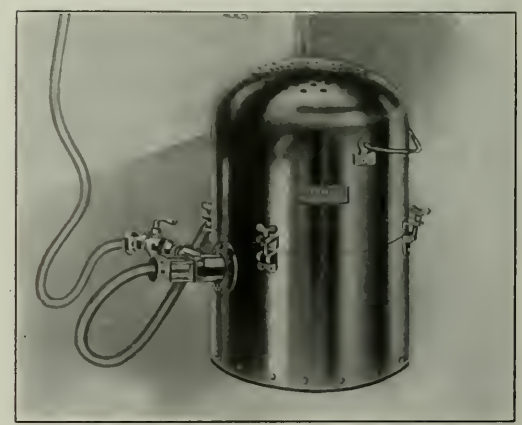
Carey Argentum-Magnesia Covering for Underground Pipes

shown in the illustration, being made up of the regular 85 per cent. magnesia covering, with the water-tight armor of Argentum applied over and thoroughly protecting the magnesia insulation. These Argentum shells are water-proof and strong enough to protect the insulation from injury, being made of a chemically treated wool felt. They are exceptionally tough and are furnished in sections 3 ft. long and ¾ in. thick. Collars 6 in. long and ½ in. thick, made of the same material, are furnished for each section to be applied over and seal the joints of butting Argentum shell sections. The purpose of this new type of insulation is to provide a water-tight insulation. For underground pipes the greatest trouble is had in the loss of heat through contact with water, which is very much greater than with contact with the air.

VACUUM CLEANER FOR PASSENGER CARS

A compressed air operated vacuum cleaner adapted to the cleaning of passenger cars is shown in the illustration. The equipment consists of an aspirator attached to a dust collector, and a ½ in. hose for connection to the source of compressed air supply. A 1 in. vacuum hose connects the tools with the aspirator. The complete outfit weighs about 35 lb., and is therefore easily portable.

The vacuum is produced in the aspirator by means of a small compressed air jet, about ⅛ in. in diameter. With 65 lb. air pressure the consumption is about 20 cubic feet of free air per minute, and the vacuum produced is equivalent to a 12 in. mercury column. With higher air pressure the vacuum may be considerably increased. In operating this machine the first part of the cleaning should be done by blowing the cinders and dust out of the ventilators and crevices with compressed air, the vacuum



Compressed Air Operated Vacuum Cleaner

tools not being effective where contact with the surface to be cleaned is impossible. After this is done the compressed air hose is attached to the apparatus, and the cleaning finished by the vacuum process.

This cleaner is in use on the Chicago & Alton, where it is claimed that one man can clean 14 standard railway plush seated coaches or chair cars per day. It is manufactured by the Thurman Vacuum Cleaner Company, St. Louis, Mo.

Railway Construction in Siam.—Plans are now being made for the new station buildings for the Siamese Southern at Bangkok Noi which will be necessary for the increased traffic which is expected on the completion of the extension of the railway, which when completed will be about 813 miles long. The line is now open for traffic from Potchaburi to Prang, about 147 miles. A further extension of 41 miles to Koh Lak was expected to have been opened the first of June of this year. It is expected that the line as far as Singora will be opened for traffic in 1916. Construction was started in 1909 at three places, namely: Potchaburi Singora and Prang, and at that time it was hoped that the whole system would be ready for traffic in 1915.

Maintenance of Way Section

One of the obstacles which have retarded the adoption of concrete for railway building construction where appearances were an important consideration, as in stations, has been the difficulty of securing a paint which would adhere permanently to the concrete without undue discoloration. Several early attempts along this line proved unsatisfactory, for which various reasons have been assigned. To solve this problem indirectly bush hammering and other practices have been adopted to provide a pleasing untreated concrete surface. There are, however, occasions where a paint treatment is to be desired, and the discussion of this subject elsewhere in this issue should therefore be of general interest in showing that it is entirely possible to secure permanent and satisfactory results with certain kinds of paints.

The Painting of Concrete

The point raised by Mr. Crites in his discussion of Uneconomical Track Economy on another page in this issue is one realized too frequently only in the abstract, if at all, when retrenchment is under way. It is common knowledge that maintenance of way expenditures are reduced first and to the greatest extent because it is felt that the results of such action will not be evident at once, although it is generally realized that larger sums will have to be expended in the end. The effect of poor track in reducing train tonnage and thereby increasing the cost of operation is not so generally realized. Only a few years ago most railroad men gave little credit to such a theory and some refuse to accept it even at this late date. However, the experience of numerous roads has shown conclusively that the adoption of heavier rail and more ballast and a higher standard of maintenance have enabled the tonnage of trains to be increased without any change in grades or motive power. Thus, when an order is given to reduce maintenance of way expenditures to a point where existing track standards cannot be maintained, it is equivalent to arbitrarily inserting heavier grades, the result of which will be reflected either in decreased train loads or in more delays and overtime, in this way increasing expenses, the very thing which the officers are trying to avoid.

Track Maintenance and Tonnage

The three primary qualifications of a foreman in charge of any class of maintenance work are, his knowledge of the methods of properly performing the work, his ability to prepare the proper time rolls and other records, and his ability to handle the men in his gang. As a laborer in the gang he secured his knowledge of the methods of performing the work, while the supervisor instructs him in the manner of preparing his reports. Unfortunately, in most cases, he receives little or no instruction regarding the way to handle the men in his gang to secure the maximum amount of productive work from them. Regardless of the fact that the men selected for foremen probably possess considerable natural ability along this line, there is no question but that the more experienced supervisor can give them valuable assistance in this regard. Probably as many foremen fail because of the lack of this qualification as because of the absence of either of the other two. Further than this, many foremen are only partially successful in securing the greatest returns for the company because they do not know how to handle their men to the best advantage. The really successful and valuable foreman is the one who combines the ability to handle men with the other necessary qualifications. It is to the interest of the road that the efficiency of all foremen be brought to the highest practicable level, and for this reason this subject is of sufficient importance to justify the serious consideration of every supervisor. There is much of merit in what Mr. Schott, who is himself a section foreman, says in another column regarding this phase of the training of foremen.

Instructing Foremen in the Handling of Labor

One road recovered over $50,000 worth of material by increasing the distance between extra rail posts from one to two miles; another road reclaims 50 per cent. of all maintenance scrap collected other than rails and angle bars. Similar savings are, or can be, made in the distribution of new material and the collection of scrap on other roads. The maintenance of way department is directly interested in the handling of its material to insure that it is received when needed, that a sufficient but not a surplus stock is available, that obsolete material is not allowed to accumulate, that second-hand or scrap material is collected as soon as released, and that no material suitable for further use is disposed of as scrap. Different roads have attacked the various phases of this important problem in different ways and with varying degrees of success. A thorough discussion of this subject, with descriptions of methods which have been worked out or suggested, will be of value to those roads which have already given this subject attention, and of greater value to the lines on which this important problem has been neglected. To secure as complete a discussion as possible we are conducting a contest on "The Distribution of New Material and the Collection of Scrap," for which we solicit the co-operation of all who have given this subject serious consideration. To stimulate interest in this contest we will pay $25 and $15 for the two best papers received and our space rates for all other papers accepted and published. The award will be based on the practicability of the methods described and the completeness with which the subject is covered. All contributions should be sent to the Engineering Editor of the *Railway Age Gazette*, 608 South Dearborn street, Chicago, to be received not later than July 25.

Handling New and Scrap Material

One of the most important advantages of concrete as a construction material is the fact that local materials can be very largely employed, and it is this fact which has led to its rapidly increasing use for a wide variety of purposes on maintenance work. With its very general adoption for small as well as large work, there arises an increased necessity for the careful instruction of the supervisors and foremen regarding the proper selection and inspection of the sand, gravel and stone used as the aggregate. In general the cement is properly inspected and tested before being shipped to the work. On large work the materials composing the concrete are in most cases carefully tested, frequently by the testing department itself. On smaller jobs where the material is secured adjacent to the work this is not practicable. It is important, for this reason, that the supervisor or foreman selecting these materials should be instructed regarding the ordinary objectionable materials which should be avoided in concrete. For all ordinary purposes this instruction need not be elaborate or in detail, but if the injurious ingredients commonly encountered are called to the attention of the supervisor he will be able to reject materials now sometimes incorporated in the concrete. It is almost universally true that whenever a failure of concrete occurs the cement is blamed. Careful analyses of such failures have shown in so many instances that the cement

Inspection of Concrete Aggregates

is not at fault, that the prominent cement companies maintain special departments to investigate such complaints, and to ascertain the real difficulty. In a paper presented before the American Society for Testing Materials a couple of weeks ago, several instances were cited where studies of failures of concrete showed the difficulty to rest primarily with the sand and gravel, and often with the water. One remedy is to select the aggregate from a few locations of known quality. A better way is to instruct the supervisors and foremen regarding the deleterious materials which may reasonably be expected.

The Magnitude of Railway Construction Work

There is an old saying that distance lends enchantment to the view. This applies equally well to such sordid matters as railway construction. Railway men close to their work are apt to lose sight of the real magnitude of many phases of the work which the roads are capable of doing, and are actually doing. The magnitude of the problems involved in the construction of the Panama Canal has been heralded around the world. While not intending to detract in the least from the credit due for this work, a few comparisons may give the railway man a higher impression of his own work. The last issue of the *Canal Record* gives the total wet and dry excavation since the United States assumed control of the Canal Zone as 220,826,656 cu. yd., spread over an interval of ten years, or an average of 22,082,657 cu. yd. per year. The highest individual year's record was 37,116,735 cu. yd. in 1908. By way of contrast a statement was published in the daily issue of the *Railway Age Gazette* of March 19, showing that the Chicago, Milwaukee & St. Paul alone moved 23,750,200 cu. yd. of material in 1912, and 24,553,411 cu. yd. in 1913. During those same years 30,269,349 and 27,177,960 cu. yd., respectively, were moved on the Canal Zone. In 1912 the St. Paul deposited 246,823 cu. yd. of concrete, and in 1913 316,989, or a total in the two years of 563,812 cu. yd. During the same years 1,040,158 and 337,419 cu. yd. of concrete, respectively, were placed in the Gatun, Pedro Miguel and Mira Flores locks. Thus the St. Paul alone handled over 75 per cent. as much earth work, and almost 45 per cent. as much concrete during those two years as the Isthmian Canal Commission, with comparatively little notoriety or advertisement. Furthermore, the railroad work was scattered over a wide area, making it more difficult to handle. Other railroads, including the Northern Pacific, the Erie and the Lackawanna, have made similar records in recent years. Such comparisons as this show the magnitude of the problems encountered from time to time in the regular railway routine.

RUSH THE MAINTENANCE WORK

UP to this time maintenance of way expenditures have been very seriously curtailed this year. However, all indications now point to a very material increase in traffic within the next two months, especially on the granger roads. This will result in an increased burden on the track which it is none too well prepared to carry. The conclusion is evident. Every effort should be exercised for the next 60 days towards getting the track into the best possible condition to carry a heavy traffic with the minimum delay to trains. To do this attention should now be concentrated on the tracks and structures directly concerned with the movement of trains. Work, such as the rebuilding of fences, should be deferred in favor of the laying of rail, the surfacing of track, and the necessary renewal of bridges. Then when the traffic is heaviest, and the resulting interference with maintenance forces the greatest, this deferred work can be resumed. In this way the track and structures will be brought up to their proper condition at the earliest date, and it will also be possible to do this work more economically now than later, because of the smaller amount of interferences caused by traffic.

More important than this, however, these forces will in turn cause less interference with traffic if work is handled in this way. The main business of a railway is to provide transportation. In times of heavy traffic when the public demands the maximum amount of service, all departments should co-operate with the operating department in handling the peak load. The maintenance department can assist very materially in getting trains over the road by maintaining the tracks in such condition that the number of derailments will be reduced to the minimum, and by creating the smallest practicable number of slow orders and other delays, all of which result in still further increasing the congestion.

Any work put on the track now will tend to reduce the number of derailments later. It is common knowledge that with each rapid increase in traffic the number of derailments increases faster than the traffic, indicating that the track is unable to keep up with the increased demands made on it. Every derailment tends to further increase congestion, and is therefore cumulative, the resultant congestion being in most cases of much greater consequence than the mere cost of the damage to the track and equipment.

This warning applies to yard, as well as to main tracks. In times of heavy traffic it is in the yards that the most serious congestion usually occurs. Under such conditions the taking of a track out of service not only decreases the capacity of a yard by that amount, but tends to disorganize the operation of the entire yard at a time when smooth running is most essential. Now is the time to prepare for the expected increase in traffic, and give the operating department a chance.

THE SYSTEMATIC TRAINING OF SUPERVISORS

THE practice of most roads is to recruit their supervisors from the ranks of the foremen. As a result, on those roads on which there now exists the greatest scarcity of high grade foremen, a shortage of material from which to create supervisors is also beginning to be felt. Numerous attempts have been made from time to time to recruit supervisors from technically trained college graduates, but for various reasons most of these plans have failed. As described in another column, the Pennsylvania has had in operation for many years a definite system whereby technically trained men are secured for supervisors, and there is no prospect of a shortage of material from which to recruit these supervisors, as it has at all times a sufficient number of men to fill its requirements for some time in advance.

It is not the intention at this time to discuss the relative merits and shortcomings of supervisors recruited from track foremen and technically trained men, except to state that if the course provided for the college graduate after he leaves school is so arranged that he can secure the requisite practical experience he should be the more valuable man because of his technical training. The difficulty with the various track apprentice systems which have been tried has been that they were in most cases local experiments of short duration, and with only a hazy and indefinite future for the student. On the Pennsylvania this practice has been so firmly established, and the methods of promotion so clearly outlined that a man knows that if he makes good his future is assured.

While it might seem at first glance that such a course of training would involve a considerable outlay for unproductive work while the student is in training, these men are all employed in work for which other men would be required if this course of training did not exist, and in fact the salaries in the classified service are somewhat lower than for similar positions in the unclassified service where there is no similar chance for advancement.

The success of the Pennsylvania's system has resulted from a carefully outlined plan of operation which has been in force a sufficient length of time to enable it to become firmly established. The practical results are indicated not only by the very large number of the Pennsylvania's officers who have risen through the maintenance of way department, but also by the many responsible officers of other roads who have received this same training. While this somewhat elaborate plan would not be practicable in all of its details on many other roads operating under other conditions, the underlying principles are sound, and are capable of application elsewhere. Three elements are necessary, a definite system, a supply of men and a sufficient reward.

The Magnolia Cut-off of the Baltimore & Ohio

This Road Is Building a 12-Mile Line Involving Very Heavy Work, and Costing Approximately $6,000,000

The Baltimore & Ohio is now building two additional tracks between Orleans Road, W. Va., and Little Cacapon, a distance of 12 miles, which involves some of the heaviest railway construction work now under way in this country. This line is known locally as the Magnolia Cut-off, and involves moving over 3,200,000 cu. yd. of excavation, over 90 per cent. of which is rock; the driving of four double-track tunnels with a combined length of 7,225 ft.; the construction of two crossings over the Potomac river, with a total length of 2,054 ft., and the building of 5,200 lineal feet of concrete retaining walls. This line is estimated to cost over $6,000,000, or $500,000 per mile, and will eliminate 5.95 miles of distance, and 877 deg. of curvature. It will also reduce the maximum grade against eastbound traffic from 0.5 per cent. to 0.1 per cent., eliminating a helper grade 2.8 miles long, and releasing two pusher engines.

This cut-off is located on the east end of the Cumberland division, Little Cacapon being 16.7 miles east of Patterson Creek, where the double-track line from Cincinnati and the West Virginia coal fields unites with that from Pittsburgh and Chicago. There are now three tracks from Patterson Creek to Little Cacapon, and also from Orleans Road east 25.4 miles to Cherry Run. At Cumbo yard, a short distance east of Cherry Run, a considerable amount of coal and other traffic is turned over to the Cumberland Valley road. The line between Patterson Creek and Cumbo yard carries a very heavy traffic and the two-track section between Little Cacapon and Orleans Road, with its pusher grade, has been the cause of serious congestion.

The two new tracks will be used for eastbound traffic, while the present double-track line will be used for westbound traffic, thus providing a four-track line between Little Cacapon and Orleans Road. Except at Doe Gully the old line closely follows the southerly bank of the Potomac river, and has a large amount of curvature with a maximum of 9 deg. of Kessler's curve. The maximum grade eastbound on the present line is 0.5 per cent., and westbound 0.55 per cent., leading up to the present Doe Gully tunnel in both cases. On the new line the maximum grade eastbound is established at 0.1 per cent., while the maximum westbound on the old line is being reduced to 0.4 per cent. by lowering the east end of Doe Gully cut about 12 ft. The maximum curvature on the new line is 5 deg.

Starting from a connection with the old line a short distance west of Orleans Road, the new line ascends on a 0.4 per cent. grade to the west end of the present Doe Gully tunnel, and is being built as a four-track road to reduce the existing 0.55 per cent. grade westbound. At Doe Gully tunnel the new line leaves the old and extends west generally parallel to it, but on a 0.1 per cent. descending grade, for two miles to Hansrote, and is located on a bench adjacent to, but considerably above the operated tracks. At Hansrote the new line turns abruptly into the hill and after passing through Stuart tunnel crosses the present line and the Potomac river, passes through Graham tunnel, and again crosses over the river and the existing line. It then continues parallel to the present road for over a mile, but on a bench about 40 ft. above it. It passes through the southerly limits of the town of Paw Paw, and joins the old line at Little Cacapon, the 0.1 per cent. grade being almost continuous from the summit at Doe Gully.

Map and Profile of Magnolia Cut-Off

DOE GULLY CUT

Starting from Orleans Road the first work of special interest is at Doe Gully. Here a double-track tunnel is being replaced by a four-track open cut with a maximum depth on center line of 195 ft., and requiring the removal of 1,350,000 cu. yd. of material, nearly all of which is rock, lying in strata tilted sharply on end. In addition to the amount and character of the material to be removed, the excavation of this cut was complicated by the necessity of keeping the present double-track tunnel in continuous service. As shown in one of the photographs, the material on the west side of the cut and over the tunnel was excavated by

steam shovels in the regular manner to within 10 ft. of the roof of the tunnel. A vertical ledge 16 ft. wide was then left west of the west wall, and the west half of the cut was taken out approximately to grade. A temporary double-track line was then laid through this cut for emergency use in case the tunnel should be blocked during its removal. A small steam shovel is now engaged in removing the remaining material from above the tunnel, after which it will be dismantled and the cut widened on the east. Five steam shovels

Looking East at West Portal of Old Doe Gully Tunnel

have been employed in this cut, while as many as 22 have been working at one time on the entire cut-off.

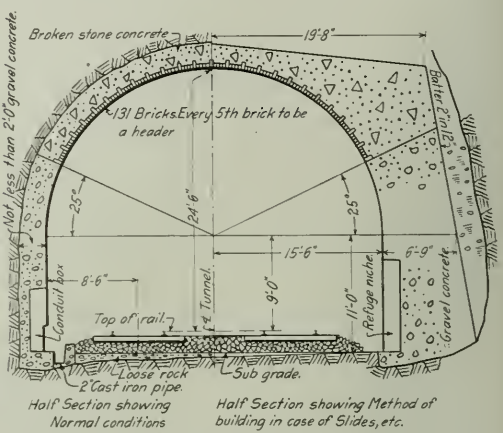
Because of the depth of the cut and the character of the material the slope on the west side has been benched at intervals of 50 ft. vertically, while the opposite slope will be treated in the same manner after the tunnel has been removed. These benches are designed to afford drainage and to prevent slides, and have been built on grades of 3, 2 and 1½ per cent. on the upper, middle and lower levels respectively. The material from these benches was wasted at the elevation of the benches at the ends of the cut.

Immediately west of Doe Gully cut the new line goes through a point by means of a tunnel 1,025 ft. long, known

Looking East Along Bench Towards Randolph Tunnel. Old Tracks in the Foreground

as Randolph tunnel, the four tunnels on this line being named after chief engineers of the road. This tunnel is located on a 4 deg. curve. Here a top heading 9 ft. by 16 ft. was first driven. Following this a Model 20 Marion air-operated shovel widened the heading to the full arch section. The bench was then removed by a large shovel.

The arch was lined with timber as the excavation progressed, and this was replaced with the permanent concrete lining as soon as the steam shovels had completed their work. It was first planned to deposit the concrete by means of compressed air with a mixer at one end and this method was tried, but after encountering considerable difficulty because of the pipe line clogging with the coarse crushed stone aggregate used, and the length of the conveying line, this method was abandoned. The standard lining consists of concrete up to the 25 deg. line, faced with one course of brick above this point. To secure a bond with the concrete every fifth brick



Section of Standard Double Track Tunnel with Concrete Lining

was made a header. Blaw steel forms were used. Refuge niches were inserted on each side at intervals of 100 ft. and cable and switch boxes were placed 300 ft. apart.

BENCH WORK NEAR HANSROTE

One of the most interesting portions of the work is that from Randolph tunnel southerly 1½ miles to Hansrote. Be-

Looking East Over Magnolia Bridge

tween these points the new line is closely adjacent to the existing line and on a bench above it. Because of this close proximity it was decided to handle this section by force account, and over 400,000 cu. yd. of rock is being removed in this manner. Most of this material is being removed by steam shovels, excavating benches not to exceed 8 ft. in

depth and it is wasted in ravines at the level of the different lifts. A considerable amount is also being placed on the river side of the present tracks by station men to permit these tracks to be thrown out at certain locations, in this way reducing the maximum degree of curvature from 5 deg. to 3 deg.

To guard against the danger of accidents to trains on the operated line, an operator is stationed on this work who is in constant communication with the despatcher, and no shots are fired without first learning the location of trains. Flagmen are also sent out in each direction in advance of each shot. To guard against any danger of blocking the main tracks by excessive or poorly placed shots, four powder inspectors are stationed on this portion of the work, one of whom personally supervises the loading and firing of each charge.

Traveller Used for Constructing Retaining Wall East of Paw Paw

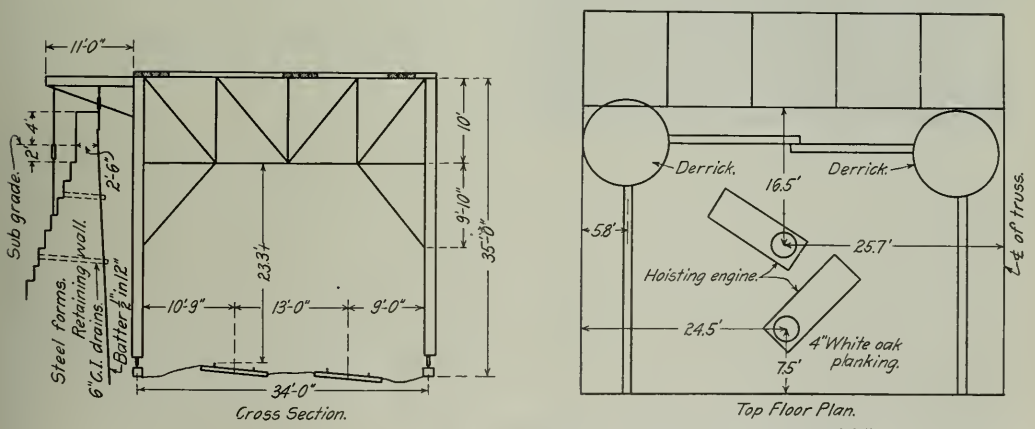
STUART TUNNEL

At Hansrote the new line leaves the old and turns abruptly into the hill, crossing the divide through Stuart tunnel 3,600 ft. long. The east approach to this tunnel required the removal of 205,000 cu. yd. of rock. About 90,000 cu. yd. of similar material was removed from the west approach. At the latter point considerable difficulty has also been encountered in establishing the portal because of the sharply inclined and badly broken strata. This tunnel is on tangent except for 371 ft. of spiral within the east portal.

This tunnel was driven from two shafts 117 and 40 ft. deep, and also from the west portal, the east approach cut not being completed in time to enable a heading to be driven from the east portal. As in the Randolph tunnel 9 ft. by 16 ft. center headings were first driven, working in this instance from five points. These headings were widened to full section by hand except for the first 1,000 ft. in from the west heading, where a small Model 20 Marion shovel was used. With this shovel it was possible to widen and timber 60 to 70 lineal feet of the arch section per week as compared with 45 ft. by hand. The shovel also removed 6 ft. of the bench at the same time to secure the necessary working clearance. The bench was then taken out with large shovels.

Because of the difficulty encountered in establishing the portal at the west end and the uncertain character of the material at the east portal, the center heading was driven from the shaft to within 72 ft. of the east portal, at which point it opened into two wall plate drifts. The entire arch section was then removed for 30 ft., after which the wall plate drifts alone were driven leaving the center support for the roof for 42 ft. in from the portal until the portal was turned.

The West Portal of Paw Paw Tunnel



Plan and Cross Section of Traveller Used in the Construction of the Concrete Retaining Wall

Both steel and timber centers were used in this tunnel. The steel centers were used in those sections of the tunnel where especially bad material was encountered while the wooden centers were used elsewhere.

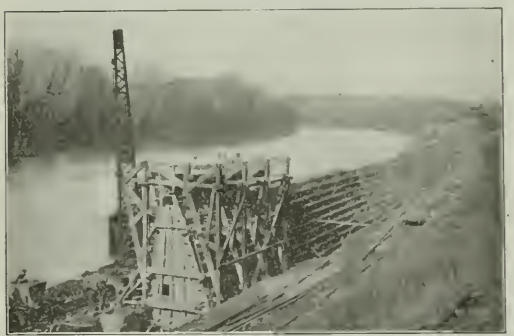
THE RIVER CROSSINGS

A short distance west of Stuart tunnel the new line crosses the old at Magnolia station, continues across the Potomac river, passes through a point in a tunnel 1,600 ft. long, and

again crosses the river and the operated line, all in a distance slightly over one-half mile. The crossing at Magnolia consists of six 100 ft., three 80 ft. and two 75 ft. deck plate girder spans on concrete piers, with the new grade 50 ft. above the old line and 60 ft. above the water. The crossing at Kessler's curve consists of four 100 ft. and six 75 ft. deck plate girder spans with three skew girder spans over the old line, with a combined length of 202 ft. 6 in. Both structures are designed for Cooper's E 60 loading.

The piers for both structures are founded on rock about 5 ft. below the river bed. One of the accompanying views shows clearly the different steps in their construction. About 23,000 cu. yd. of concrete was required at these two crossings. As far as possible the concrete at each structure was deposited by means of a tower located either on the bank or at the first river pier where material could be delivered to it by a derrick. The tower at the west crossing was 185 ft. high. Concrete was deposited by air in the upper portion of a few of the piers at each crossing above the reach of the tower, and one or two piers were completed by depositing concrete directly with a derrick.

Graham tunnel, located between the two bridges, differed from those previously described primarily in that it passed through a stable rock instead of the broken, rapidly weathering material found at the Stuart and Randolph tunnels. It was driven by the same methods employed at the other



Constructing the Retaining Wall West of Paw Paw

points, and it is planned to place the concrete lining with an air mixer.

THE CONCRETE RETAINING WALLS

From Kessler's curve west for a mile the new line is again closely parallel to the old, and on a bench about 40 ft. above it. Over 80,000 yd. of rock is being removed along this bench at elevations varying from 40 to 100 ft. above the present track. This material is being handled by force account under methods similar to those employed east of Hansrote. To prevent slides and other difficulties all of the high side-hill cuts are being benched.

At the west end of this section it was necessary to construct 1,900 lineal feet of concrete retaining wall between the two lines. This wall is of gravity section non-reinforced, and with a maximum height above the footing of 31 ft. The elevation of the top of footing is established at 3 ft. below the top of rail of the lower line. The construction of this footing has involved considerable difficult work, as in some cases it has been necessary to go as much as 14 ft. below the elevation of the top of footing to secure a proper foundation, while in other cases it has been necessary to remove a 40 ft. rock face to secure sufficient room. The top of the wall is 4 ft. above the elevation of sub-grade of the new line.

This wall requires the placing of 22,000 cu. yd. of concrete which is being deposited by means of a movable traveler spanning the two operated main tracks. This traveller is of steel construction, with a horizontal clearance of 32 ft. 9 in. and a minimum vertical clearance of 23 ft. 3 in. above the high rail on curves.

Two derricks with 50 ft. booms, and two boilers and hoisting engines are placed on the upper platform. In this way all excavation for the wall footings and the depositing of the concrete are handled by the derrick without interfering with the main track, and without any material crossing the tracks at grade. The forward derrick handles the excavation ahead of the wall, while the other one deposits the concrete. Because of the lack of sufficient room at the site of the wall, the concrete mixing plant is located nearly one-half mile west, and the material is brought to the traveller in small cars, which are picked up by the derrick and dumped in the forms.

The wall forms are of steel, and are supported by a cantilever projection from the traveller. Their position relative to the traveller is regulated by turnbuckle adjustments in the vertical and horizontal supporting rods. When moving from one section of wall to the next the forms are lifted free of the completed work. The traveller moves on two rails, supported on timber blocking.

The wall is built in 50 ft. sections, and a section can be completed in two days. With the other necessary work it has been found that two sections can be completed per week, although the average to date, including all delays, has been one and one-half sections. At the joint between the first and second day's pouring a bond is secured to the adjacent rock face to which additional form supports can be fastened as required. After the wall is completed the new roadbed is back filled behind it. This traveller has proved very satisfactory for this work, and has enabled about 4,000 cu. yd. of concrete to be deposited monthly during the past spring without any interference with traffic, although the train movement is almost continuous.

THE PAW PAW WORK

A short distance west of this wall the new line leaves the old and passes through the southerly limits of the town of Paw Paw. Shortly after leaving the main line the new location passes through Carothers tunnel, 1,000 ft. long. The material encountered here and the methods of driving are similar to those described at the other tunnels.

One of the largest cuts on the line is at Paw Paw, where over 500,000 cu. yd. of material, largely earth, was removed. The maximum depth of the cut at this point was 96 ft. This material was hauled west to a point where the old line is to be thrown towards the river and raised 7 ft. to give room for a four-track line without disturbing the rock bluff and at the same time to raise the grade of the old line above high water.

A portion of this new fill extends into the river, and to protect it without at the same time encroaching on the stream, another retaining wall similar to that east of Paw Paw is being constructed for a distance of 3,300 ft. This wall has an average height of 24 ft. and is being built in the same general manner as the wall previously described, but here, as it was not necessary to span any tracks, a wooden traveller was provided to carry the forms only, and the concrete was deposited with a locomotive crane. Two sets of steel forms were provided for 30 ft. sections, and these are being used alternately. About 25,000 cu. yd. of concrete is required for this wall.

With the exception of the two crossings on the Potomac river, the only steel bridge on the line is an overhead highway structure crossing Paw Paw cut. There are also two 12 ft. and two 8 ft. concrete arches and several smaller openings. There are no grade crossings with highways.

One interesting feature of the work is the measures taken to prevent the workmen engaged in the construction of those portions of the line adjacent to the operated tracks, from be-

ing struck by trains. Because of the almost continuous movement of trains, and the necessity of men passing back and forth over the work, footpaths were constructed outside the tracks, either on the shoulder of the fill or where the bank was narrow, of trestle construction, and all employees are required to use these paths instead of walking on the track. Special instructions were printed by the road and given to the different contractors and company foremen for individual distribution among the men, who are required to read and sign them. The company has also stationed a number of private policemen along the line, whose duty it is to see that these instructions are obeyed.

This work was started in May, 1913, and it is expected that the new line will be placed in operation during the coming winter. The grading was 85 per cent. completed on July 1; the driving of all four tunnels has been completed; the lining of Randolph tunnel has been finished, and this work is actively under way on the other three tunnels. It is expected the track laying will be started before September 1. The substructures of both river bridges are completed and the erection of the steel work has begun. Automatic signals will be installed on this line, and interlocking plants will be built at each end.

This work is being handled under the direction of Francis Lee Stuart, chief engineer, and J. T. Wilson, district engineer, with E. M. Graham, T. C. Marshall and T. Ellett, Jr., resident engineers. Starting at the east end, the contractors on this work are: Section No. 1 and part of No. 3, Kefauver and McLaran, Baltimore, Md.; sections No. 2 and No. 4, and part of No. 3, H. S. Kerbaugh, Inc., New York; sections No. 5 and 7, Bennett and Talbott, Greensburg, Pa.; part of section No. 6, Sheesley & Janney, Johnstown, Pa.; part of sections No. 6 and No. 8, Smith-McCormick Co., Easton, Pa.; part of section No. 8, The James F. McCabe Co., Baltimore, Md. The American Bridge Company is fabricating and erecting the two bridges across the Potomac river.

ORGANIZATION OF THE MAINTENANCE OF WAY DEPARTMENT OF THE PENNSYLVANIA RAILROAD

At the present time there is a great deal of complaint about the inability of the roads to retain college-trained engineers in their employ, and also about the difficulty of securing a sufficient number of men capable of taking charge of maintenance of way work and of rising through this department into the operating department. On at least one road, however, these complaints are not found. This road is the Pennsylvania. Here, at the present time, a large majority of the operating officers, including division superintendents, rose from the maintenance of way department, from which it is evident that this road is retaining a large number of its technically-trained men who entered the service in that department. It is also evident that this must be the result of a definite system, and it is the purpose of this article to outline briefly the manner in which this system has been developed.

The Pennsylvania organization is strictly divisional, each division superintendent having on his staff a division engineer and reporting to a general superintendent, who, in turn, has an engineer on his staff with the title of principal assistant engineer. The general superintendents report to the general manager, who has on his staff an engineer maintenance of way. The engineer maintenance of way has three immediate assistants, the assistant engineer in charge of roadway and track, the assistant engineer in charge of structures, and the signal engineer.

Since the division is the unit in the operating organization, it is in the division engineers' offices that the maintenance corps of engineers is recruited. The different division engineers hire all men for the classified service, as this branch of special training is termed, as well as for the unclassified service, and applications received by the engineer maintenance of way and by the principal assistant engineers are referred to these officers. In this way there are always more applications for positions than there are vacancies.

Only graduates of engineering colleges of recognized standing are employed and they are started as classified rodmen on the division engineer's corps, either on field work or as draftsmen. Previous to employment they must pass the physical examination required of all employees of the road. They start at a definite fixed salary for the first year, and, if their services are satisfactory, they advance automatically at the end of the year to the second class at a higher salary, and, likewise, at the end of that year to the third class, and are known as third-year rodmen. The principal assistant engineers also maintain more or less of an engineering force in their respective offices, the men on which are drawn from the third-year rodmen in the division offices as vacancies occur. Some six or seven transit men are also attached to the office of the engineer maintenance of way and are drawn from the offices of the principal assistant engineers. Between 60 and 70 men are retained in the classified service in the division and district offices.

After spending from three to five years in the offices of the division and principal assistant engineers, the men in the classified service are brought into the office of the engineer maintenance of way at Philadelphia, where they are given a course in the elements of accounting, signals, maintenance of way records, bridge and building maintenance and valuation. From six to seven men take this course at a time, spending from one to two months in each department. From this office the men are sent out as assistant supervisors on branch line divisions.

An assistant supervisor in the district assigned him has the same authority and performs the same duties as the supervisor. In most cases he relieves the latter of the routine detail matter connected with the office work and the organization of the forces, so that the supervisor is enabled to spend most of his time out on the track. From branch line subdivisions the assistant supervisor is transferred to a main line sub-division, the main line being that portion of the road between Pittsburgh and New York and between Philadelphia and Washington. As vacancies occur the men are promoted from assistant supervisors on main line to supervisors on branch lines. The next move for the man is then to supervisor of main line sub-division. On the four-track main line a supervisor has charge of from 20 to 33 miles of road, while on branch lines of lighter traffic the sub-divisions are longer and may include as much as 150 miles of line. The supervisor reports to the division engineer. An average of from six to eight years is required from the time the man enters the service until he becomes a supervisor on branch lines.

The next promotion is to division engineer, first on branch lines and then on the main line. In this position he has charge of all maintenance work on the division, including the care of the track, bridges, buildings, water service and signals, and has reporting directly to him the supervisors of track, the master carpenter and the supervisor of signals, the master carpenter and the supervisor of signals having, in general, the same territory as the division engineer. From the time they enter the classified service and as they advance through the various grades, and are promoted to positions of greater responsibility, these men are under close personal observation of their superior officers as to their ability, capacity and application, all of which, as well as seniority, are taken into consideration in selecting men to fill vacancies as they occur. From division engineer the men may be promoted either directly to division superintendent or to principal assistant engineer and then to division superintendent.

Aside from the men in the classified service, the remainder

of the men required in the offices of the division engineers and the principal assistant engineers are in what is termed the "unclassified" service where the rate of pay of permanent force is slightly higher than in the classified service, but where there is no similar opportunity for promotion. While all of the men in the classified service are technical graduates, the same requirement is not exacted in the unclassified service and only a portion of the men here have a college education. Also in some few instances assistant supervisors are selected from promising young foremen, although the general practice is to secure men for these positions from the classified service. As indicated above, seniority alone is not considered in making appointments of supervisors, division engineers, division superintendents, etc., but the relative ability of the individual men is also considered. In this way some men rise to positions as supervisors or division engineers and are not promoted beyond this point.

By this system the Pennsylvania has in training at all times a sufficient number of men trained in its methods of operating and familiar with its standards to fill any vacancies which may reasonably be expected, and no men are appointed to positions of responsibility in the maintenance of way or operating departments from other roads. In this way the men also know that vacancies will be filled by promotion from the ranks.

MEANS OF INCREASING THE EFFICIENCY OF TRACK FOREMEN IN HANDLING LABOR

By W. E. Schott
Section Foreman, Southern Pacific, Gila Bend, Ariz.

With the increasing operating expenses of the last few years it has been necessary to reduce maintenance expenditures to the minimum, requiring roadmasters and section foremen to study means of securing the most labor from each man. To the greatest extent this task falls upon the section foremen, and since the material from which foremen are created is varied, more attention should be paid by railroad officers to their education and to instructing them either verbally or by monthly meetings regarding methods of working labor to the greatest advantage.

In most cases the roadmaster now judges his foremen by their ability to turn out the work, by the quality of the work and by their ability to secure, organize and retain laborers. If a foreman does not possess these qualities he is considered unfit and is replaced with a more capable man as soon as possible.

While this view is entirely correct under present conditions, and there is no remedy advocated or applied, it seems that by paying more attention to this subject this could be materially improved. The great disadvantage of present practice is the fact that a foreman discharged from one road will secure employment on another railroad, so that the procedure now consists mainly in exchanging inefficient foremen from one road for those of another road without really accomplishing anything.

There are innumerable suggestions which, if impressed upon the average foreman, will increase his value to his employers immensely. Large department stores endeavor to make their employees more valuable by giving them lessons in salesmanship. It is hard to understand why railroads have so far overlooked an item involving such great expenses as that connected with track labor. To gather such information and to convey it to the foremen in plain, easily understood language can and should be done by all railroads.

One of the foremost requirements which a foreman must possess to secure the best results from any gang is the good will of all his men. It is impossible for any foreman to work men to advantage if he is disliked by them. Brute force on the part of the foreman is a thing of the past and laborers will either quit or, as frequently happens, refuse to obey orders.

I would not suggest that laborers be allowed to take things easy or advocate a foreman becoming too familiar with his men in order to gain their favor. I think the latter attitude will tend more to undermine the respect for the foreman than anything else. He should be firm and should treat his laborers absolutely justly and without any partiality. By studying his men he will realize that in some cases a remark made in a joking manner will do more good than a severe reprimand, and vice versa. Many a good man has left the service because his foreman did not understand him.

Another important factor to be considered in handling labor is the locality. It stands to reason that a foreman employing a gang of Mexicans in Kansas, especially if there is a surplus of labor, can be more exacting and can work the men a little harder than a foreman employing Mexicans close to the border. In fact, the men work harder themselves if they are in a strange community where they cannot expect support from outside sources.

Another handicap of the average foreman is his lack of patience with the faults of his men. To be a good foreman he must realize the relatively small amount of intelligence possessed by the average foreign laborer. His patience will be taxed many times to the limit, but it is always better to tell a man repeatedly how to perform a task than to get mad and discharge him, for the chances are that the laborer whom the foreman will secure in his place will be even worse. By exercising patience many foremen will discover that cases of supposed stubbornness are not nearly as frequent as they had thought. Endeavor to keep the same gang if possible. It is no advantage to the employer or the employee to work continually with a gang of new men. An experienced man, even if of inferior intelligence, is always preferable to a green hand in track work, for, if for no other reason, it is safer to work with him. No foreman can make any progress without a well-trained gang any more than he can without good tools, and he should realize that it is to his own advantage to take good care of his men instead of abusing them and then ordering others from a labor agent.

All of these points can and should be impressed upon the section foremen at monthly meetings held at some convenient place and in charge of an officer who is able to make the meetings interesting and to secure the co-operation of the foremen. The section foreman out on his blind siding has to rely upon his own judgment more than any other railway employee and the roads would gain much if they would make efforts to improve this judgment. A good foreman is an asset for any railroad, while an inefficient one is a liability. To change many of these liabilities into assets should be as important to our railroad managements as any other movement for the betterment of the service; at least, it is worthy of a careful trial.

Up to the present time our track foremen have received their entire education during their apprenticeship under some experienced foreman and there is no doubt that many of these men have absorbed incorrect ideas with reference to handling labor. The average section foreman, like many other railway employees, has not received a high school education, and since a man equipped with a technical education is undoubtedly able to secure better results in these matters by applying up to date methods, the railroads should make it a practice to appoint such men to these positions for the purpose of having them transmit as much of their knowledge as possible to other employees who have so far been practical without any guidance in that line.

Railway Electrification in India.—At the present time there are under consideration three important projects for electrification of railways in India as follows: the suburban railways of Bombay, the Ghats section of the Great Indian Peninsula and the suburban section of the Eastern Bengal State Railway at Calcutta.

Practical Considerations in Installing Turnouts*†

A Discussion of Important Elementary Principles of Assistance to the Foreman Putting in Switches

By W. F. Rench
Supervisor, Pennsylvania Railroad, Tacony, Pa.

The correct and expeditious placing of switch connections requires special qualifications both on the part of the foreman and his men and any important operation of that character should be placed in the hands of a gang expert in such work. Especially should the foreman be one whose ability and taste in the refinements of switch installation have been demonstrated beyond question, although it is almost equally important that his men be expert workmen, as generally what is to be done must be done quickly and completely.

Each supervisor's division should have several such gangs available and other gangs should be constantly in training so as to be able to take up such work when occasion requires. For this purpose the less important switch work, such as new sidings in private industry tracks, additional spurs in isolated locations, etc., should be delegated to the less experienced gangs and their efforts should receive greater assistance from the supervisor. Combining in the larger work a less experienced gang with an expert one is of excellent advantage to the former and no detriment to the general result.

The number of men required to constitute a first class gang for expeditious application of switch facilities in busy main line tracks over which passenger traffic is carried at speed and in considerable volume should be no less than 24, exclusive of the foreman and his assistant. Two of the laborers should be men qualified to act as flagmen; a third, whose dependability is unquestioned, should watch for the approach of trains and convey proper warning; a fourth is needed to carry water and look after the tools; ten should be capable spikers and all should be useful in general lines of work. Each individual of the gang should have a specific duty to perform when the rush is on after the use of the track has been given. The entire gang should fall into their allotted duties naturally and without the necessity of a preliminary line up.

The men who flag should be alert to display the warning signal the moment its necessity is communicated and should be educated to hold the banner against trains until unmistakably recalled. The display of the danger signal at the immediate location of the work should be the signal to proceed and should be the cue for the distant flagmen to act.

Only when the movements of all are automatic and instantaneous can the gang be regarded as well organized. Any members who are slow or awkward or inclined to run into the way of danger should be eliminated. The efficient foreman is able to indicate his instructions with a word, even a gesture, and should exact instant obedience. With the knowledge that his ideas have been trained by thorough familiarity with correct rules, he proceeds unerringly and his confidence inspires efficient co-operation in his men.

SPECIAL TOOL EQUIPMENT FOR THE SWITCH GANG

Besides the ordinary stock tools of any gang the switch gang should have a rail dolly to move rails quickly from place to place; a rail saw to cut the rails of proper length (a very frequent necessity in extensive interlocked switch work carrying specific locations of insulated joints); pneumatic rail drills for use whenever access to a compressed air line is possible; a hydraulic rail bender to break rails for temporary connections, to bend stock rails for accurate adjustment with the switch rail, and in certain cases to bend the rails to conform with the curve of the sharper turnouts, and, not least in importance, a tool which may be called the pick adze, because generally made in the blacksmith shop from an ordinary tamping pick, which is exceedingly useful in switch work for adzing beneath the rails, cutting off tie plugs used in respiking or cutting about spikes to facilitate their withdrawal.

The track gages employed should be only those whose accuracy has been tested and a steel tape divided into twelfths is practically a necessity for nice work. A metallic tape is good enough for measuring the lengths of the switch ties or to lay off their places in the connection, which should always be done by continuous measurements, particularly in slip switch work. A ball of twine for lining should never be lacking. As the switch gang is a floating one a substantial tool box is required and the design of one that has been found very acceptable is appended.

PRACTICE IN INSTALLATION

One of the essential details in switch work is a nice arrangement of the joints. Whether "housing" of the switch points is approved or not, the joints in advance of the point rails should follow a uniform standard. The joints in the two stock rails admit of little staggering, but this should be such that each joint has independent tie support. With the longer switch points no intermediate ties between the joints are possible unless long stock rails are used, the utility of which is doubtful.

Assuming 33 ft. stock rails and a 30 ft. point switch the joint on the main stock rail should be the one nearer the point of switch, because this will enhance the efficiency of the joint at the other end of this rail, which is a part of the main track structure. The distance in advance of the point of switch should be 4 ft. 7 in., which allows sufficient space ahead of the switch for the splice bar and spaces the joint at the reverse end of the rail one tie interval from the heel of the switch. The joint of the turnout stock rail should be 8 ft. 3 in. in advance of the point, which spaces the other end of this stock rail three tie intervals from the heel of the switch. The preservation of this uniform arrangement is desirable even though it may always require the cutting of shorter rails into the main track, and even though if space be limited it may necessitate a resort to the shortening of the lead somewhat, which may be done within the limits of 2 ft. for a No. 6 connection with an 18 ft. switch or of 8 ft. for a No. 20 connection with a 30 ft. switch and of lengths in due proportion for intermediate numbers. This uniformity is of course a necessity when stock rails "housed" at the mills are employed. As switches which occur together are usually part of a route across multiple track systems, the suggested arrangement would be duplicated for the adjoining switch with the result that the two switches would be separated 12 ft. 10 in., which, it will have to be granted, is a very favorable distance.

The elimination of joints from guard rails, desirable at all times, but essential with the employment of guard rail clamps and their fillers, is a well known requirement of nice work. The further arrangement of joints should be such as to use the shorter odd lengths of rail that are supplied with all rail orders to the usual amount of 10 per cent. and whose presence at other points is undesirable. For the best line no rail length less than 15 ft. should be employed. All rails should

†An article on the important elements in the design of turnouts by Mr. Rench was published in the *Railway Age Gazette* of June 19, 1914, page 1542.

be drilled and the joints full bolted and tightened as much as possible before final line is established.

The point at which to introduce the angle in the turnout stock rail is one concerning which practice varies. A computation of the distance from the actual to the theoretical point of switch, assuming the former to be generally ⅛ in. thick, shows it to vary between 3 in. for a 10 ft. switch and 8 in. for a 30 ft. switch. But it is not possible to bend a rail to an exact angle at any point and the distance for each length of switch is soon found by practice for the bending apparatus available. The set should be made in the stock rail leading to the less important track, even though this would normally be the tangent from which the turnout seemingly springs. The important feature is to provide a smooth route for the faster or higher class traffic.

The spacing of the switch ties is a detail which should have careful attention. In main running tracks carrying fast passenger or heavy freight traffic with ties of about 9 in. face a spacing center to center of 22½ in. should be employed, which is equivalent to 18 ties to a 33 ft. rail and is equal in bearing area to 20 ties of a width averaging 8 in. This spacing is a convenient one because in the application of the rule for computing the bill of switch timber (described in the *Railway Age Gazette*, June 19, 1914) the increments become even fractions of an inch for the three most used of the higher numbers of frog, viz., ⅜ in., ¾ in. and 1⅛ in. for No. 20; ½ in., 1 in. and 1½ in. for No. 15, and ¾ in., 1½ in. and 2¼ in. for No. 10.

While this spacing would appear somewhat difficult of application by continuous measurement for the average foreman, facility may readily be acquired in adding 2 ft. and dropping back 1½ in. each tie space.

In private sidings and yards a spacing center to center of 27 in. is sufficient, which is equivalent to 15 ties to a 33 ft. rail or equal in bearing area to 17 ties of a width averaging 8 in. While this may seem excessive for such points from the standpoint of support for the rail, it is none too much to fully conserve the requirements of alinement. This spacing renders the increments in computing the bill 1⅛ in., 2¼ in. and 3⅜ in. for No. 8, and 1½ in., 3 in. and 4½ in. for No. 6. It is, of course, quite a simple procedure in laying out the spaces to go forward 2 ft. and 3 in. each time. The spacing in both cases would have to be modified in the event that hewn switch ties were employed.

It is desirable that non-interlocked switches in main running tracks should have the ground lever so placed that when set for the main track the rod connecting the switch with the switch stand is in tension. For switches that connect ordinary sidings whenever possible the switch stand should be on the right hand side of the switch as one faces the connection. Wherever a siding connects with a main track a derail should be installed in the siding at the clearance point to prevent cars being moved beyond that point by the wind, by error of train crews or by malicious persons, when no lamp or other indication would warn a train approaching on the main track of the danger. When no substantial bumper is provided the blind ends of sidings should be curved away from the main track. This should not be done in the case excepted, because if the momentum is great buckling toward the main track is certain, while if the siding continues parallel the chance of buckling away from the main track is an even one.

PRACTICE IN MAINTENANCE

Whether preliminary to the installation of a new connection or to the renewal of the timbers in the old it is of decided advantage to remove the ballast entirely to the bottom of the ties throughout the length of the connection. In no other way can economy of time be effected in the general respacing of ties that occurs both in their original application and renewal. An exception might be made when spotting of switch timbers only is being done, but this excellent and generally prescribed rule for renewal is seldom practicable, as the timbers are almost certain to be in a fairly uniform state of wear and decay. The entire removal of the old ballast assures a cleanly ballasted track, which is of great benefit both to the riding of the connection and to the life of the ties.

The tamping should receive especial attention, as the comfortable riding of switch connections is the exception rather than the rule. The practice of elevating the switch rail for safety introduces a very neat problem for the expert maintainer. A plotted profile of a succession of closely bunched switches in a main track is calculated to instill despair of fine results in riding, but it is well known that such results can be attained. In general, the joints at the heel of switches and block joints require the hardest tamping and the most frequent surfacing.

Proper line seldom obtains through main track switch connections because enough pains were not taken in the original installation to attain the maximum advantage in this respect. Correction can sometimes be made by separating the main track and the turnout between the switch and frog into independent units by unspiking the respective tracks upon alternate ties and throwing with the bars, completing the adjustment by careful spike lining. The latter should always be done by widening the gage rather than narrowing it. Care must be taken at the frog to preserve the correct guard rail gage at all times that service is permitted.

The cleaning and lubrication of the plates and other bearing surfaces of switches and of movable point and spring rail frogs is a very important item of maintenance. The prevention of sanding over switch connections relieves the maintainer of much useless labor and the road of much unnecessary expense for oil consumed. At the approach of freezing weather it is generally customary to remove the ballast from the tie spaces at frogs, switches and guard rails to facilitate the removal of snow and ice.

Frequent inspection of switches, both by the track foreman and signal maintainer, is necessary to guard against lack of adjustment, which may result in accident. These inspections should be made monthly for general condition, weekly for detail defects and daily whenever possible to detect small irregularities which might assume dangerous degrees in brief time. The limit of safe wear is a variable one, but as regards the frog it is about reached when the half inch point is worn one-half inch below the original top surface of the frog. As regards the switch, this can only be determined by the judgment of the inspector. Stock rails represent only nominal maintenance expense and should be kept in first class condition at all times.

Accurate line through the connection having been secured by careful attention to the rules given, the preservation of this can be assured only by a faithful use of tie plates and the rule should be made inviolable that every switch tie should be protected by these accessories. It is doubtful if treated switch ties, which are frequently of inferior soft woods are safe in connections of heavy service without the addition of tie plates. The use of white oak for all switch ties would be a desirable but probably unattainable ideal. The troublesome maintenance question caused by the running of switches can be largely met by a generous use of anti-creeping devices, both throughout the connections and for some distance along the main track in the opposite direction to that of the traffic.

PRACTICE IN OPERATION

In long ladders a great advantage in operation is secured by a plain designation of the switch leading to each individual track. Time is frequently lost in seeking the right switch and not infrequently greater time is wasted by correcting a false drill movement occurring through error in choosing the switch. This may be avoided by the addition of a target to the switch stand carrying the designating number or letter, so placed that the light from the switch lamp will fall upon

it and slightly inclined so the brakeman riding the car will receive information as to the track he is about to go upon. This banner should not be a fixed board that one might stumble over, but should be integral with the switch stand.

The important question from an operating point of view is what power should be allowed to work through certain numbers of switch connections and what speed limits such operation should carry. On account of the great variation in switch connections through local features of layout this question is better determined by the degree of curve that obtains for the particular turnout. When the use of no less radius than 175 ft. shall be general it may be considered that all classes of switch engines may safely use such a minimum curve.

It is a fair assumption that all ordinary types of road power may operate on a 23 deg. curve, or that of a No. 6 connection from tangent track. The speed should, however, not exceed 5 m. p. h. through No. 8 and No. 10 connections from tangent track, or from light curves at 15 m. p. h., and No. 15 and No. 20 connections similarly at 30 m. p. h. The degree that should be fixed as the limit for operation at 30 m. p. h. with no superelevation of track is 3 deg. 30 min., which represents an unbalanced elevation of 1½ in. for a speed 10 per cent. greater than that specified by the rule.

GIRDER ERECTION WITHOUT FALSE WORK

By William S. Wollner

An interesting example of the manner in which girder bridges may be erected without the use of false work is illustrated by the method used by one of the Pacific Coast railroads now constructing a line through the Coast Range mountains. The building of this road involves many stream crossings and the largest part of the cost of bridge erection is represented in the expense of hauling the material for false work to the bridge sites (when false work is used) and its erection for use. In some places it was found practically impossible to haul false work material to the bridge sites

Lowering a 60 ft. Span Into Place

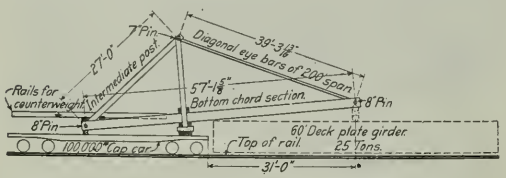
until track was laid to them and it was then necessary to stop laying track until the false work was erected and the bridges placed.

In order to reduce the cost of erecting bridges a method was sought which would obviate the use of false work and would at the same time create the minimum delay to the track laying. It should be remembered that this work was on a railroad under construction and that the methods used at times for placing girders on roads under operation could not be applied. The heaviest crane available for this work was of only 12 ton capacity and it was not considered advisable, in view of the small amount of work to be done, to endeavor to obtain a larger machine, which, if available, would have to be transported a long distance to the work. It was decided, therefore, to construct a derrick from parts of a 200 ft. deck truss span which was on hand awaiting erection when the track reached its location.

The equipment used for erecting these girders consisted of:

One 100,000 lb. capacity flat car,
Parts of a 200 ft. deck truss span,
Rails for counterweight,
12 ton capacity locomotive crane,
Blocks and tackle.

Two bridges were erected by this method; one consisting of three 60 ft. deck plate girder spans and the other of two



Derrick Car Made of Bridge Timbers and Used for Erecting Plate Girder Spans

60 ft. and two 50 ft. deck plate girder spans. The principal dimensions of these girders and the characteristics of the bridge sites were:

Bridge No. 1

Three 60 ft. deck plate girder spans, weighing 52,067 lb. each.
Center to center of girders, 7 ft.
Bottom to bottom of angles, 6 ft. 5¾ in.
Number of panels per girder, 10.
Height of South Abutment, 26 ft.
Height of Pier No. 1, 44 ft.
Height of Pier No. 2, 44 ft.
Height of North Abutment, 14 ft.
Alinement, 10 deg. curve.
Grade, —0.133 per cent.

Bridge No. 2

Two 60 ft. deck plate girder spans, as described above, and
Two 50 ft. deck plate girder spans, weighing 35,000 lb. each.
Center to center of girders, 7 ft.
Bottom to bottom of angles, 5 ft. 11¾ in.
Number of panels per girder, 8.
Height of South Abutment, 2 ft.
Height of Pier No. 1, 58 ft.
Height of Pier No. 2, 60 ft.
Height of Pier No. 3, 54 ft.
Height of North Abutment, 13 ft.
Alinement, 10 deg. curve.
Grade, —0.1053 per cent.

The accompanying sketch gives a general outline of the derrick. The boom consisted of a bottom chord section of the 200 ft. span made up as a latticed box girder 57 ft. 1⅝ in. long (between pin holes), 1 ft. 8½ in. bottom to bottom of angles, 2 ft. 9 in. deep. The back boom stay consisted of an intermediate post from the same structure, 27 ft. long (between pin holes), made up of channels, angles and plates and measuring in cross section 1 ft. 5⅛ in. square. The forward boom stay consisted of a diagonal eye bar from the 200 ft. span 39 ft. 3 13/16 in. between pin holes and 8 in. by 1¼ in. in cross section.

The girders were all riveted up in the general material yard and were hauled on flat cars to the site of the structure. As close to the nearest abutment as it was possible to place them they were unloaded onto rails placed upon the ground along the track and from these they were skidded on to the track. The derrick described above was mounted upon a 100,000 lb. capacity flat car with the pin hole 31 ft. ahead of the front of the car and this allowed the 60 ft. girder spans

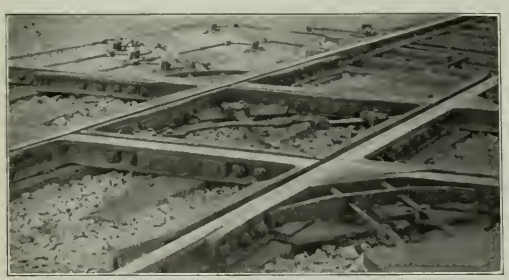
to be handled with one foot clearance between them and the end of the car.

The derrick car was then propelled by the 12 ton locomotive crane to a position immediately behind the span, and tackle consisting of steel wire cable and bridge blocks was run from the center of the girders to the hoisting drum of the crane. The girders were then raised to clear the track and the whole outfit was then moved forward by the propelling mechanism of the crane until the span was immediately above its final position on the abutment and pier. It was then lowered into place and the tackle removed. The next span was then placed upon the track and the operation repeated, with the exception that this time the movement was made over the girders already placed to reach the piers upon which the suspended girders were to be placed.

Placing 60 ft. Girder Span With Derrick Working on Adjacent Span

THE EYMON CONTINUOUS CROSSING

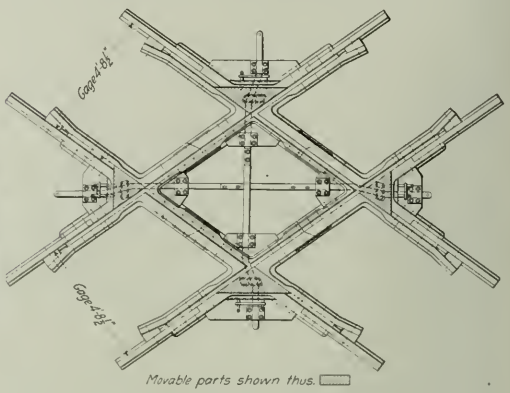
One of the principal disadvantages incident to steam road crossings is the break in the continuity of the running rails which is necessary with any rigid form of construction. These breaks not only transmit a jar to a train as the wheels pass over the interval, but the wheels themselves transmit severe blows to the projecting surfaces of the crossing, wearing these parts rapidly, and making it difficult to maintain any proper line and surface. For this reason there has existed a demand for a movable point crossing which will give a continuous running rail on either track as desired.



The Eymon Continuous Crossing

One of the simplest designs which have yet been brought out for this purpose is that of the Eymon Continuous Crossing Company, Marion, Ohio. This design consists essentially of four triangular movable frog points at the intersections of the gage lines whose movements are controlled by rods passing under the base, with horizontal offsets moving through lugs in the movable castings. These bars are directly connected with an interlocking tower, and move the points from one position to the other by the direct forward or backward movement of the bar without any intermediate points. To prevent the points from moving under a train, each corner is bolt-locked in its proper position by two bolt lugs, also operated from the tower independently of the movement controlling the point.

One of these crossings was installed in the main track intersection of the Pittsburgh-Toledo and the Columbus-Sandusky branches of the Pennsylvania lines at Carrothers, Ohio, on May 25, 1914, and have been in continuous service since that date.



Plan of Eymon Continuous Crossing

Both lines at this point are single track, and carry a relatively heavy traffic. Twelve passenger trains, and over 1,500 freight cars, many of which are heavily loaded with coal, pass over this crossing daily. While it is too early to secure any definite or conclusive data regarding the cost of maintenance, it is reported that no expense has been required to date.

The Eymon Continuous Crossing Installed at Carrothers, Ohio, Showing Interlocking Connections

This crossing is at an angle of about 70 deg., and is built of 85 lb. rail. It is of manganese construction, and weighs 6,900 lb. Before installation it was connected up at one side, and was then slid into place. A gang of 16 men removed the old crossing, placed the new one, and connected it to the interlocking plant, with the exception of the bolt locking, ready for a train to pass in 32 minutes.

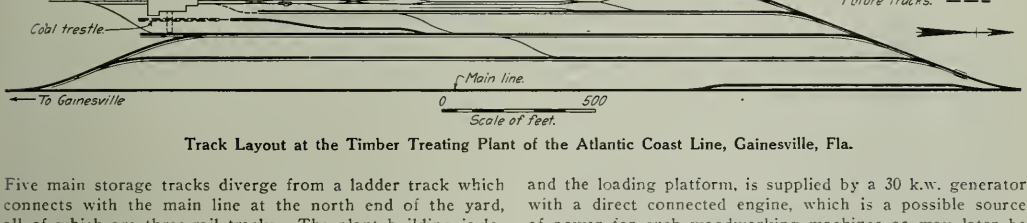
The Creosoting Plant of the Atlantic Coast Line

A Description of the Layout, Equipment and Method of Loading Ties at This Modern Southern Installation

The creosoting plant of the Atlantic Coast Line is located on a tract of level ground adjoining the main line tracks, just north of the city limits of Gainesville, Fla. The plant and storage yard cover about 30 acres, while there is sufficient additional space to provide for any probable expansion in the future.

As is common in Florida, the soil is light and sandy, and quickly absorbs the heavy rainfalls of the wet season. Permanent moisture lies at depths varying from 18 in. to 7 or 8 ft., and caused considerable difficulty in building the foundations for the main building and other structures. This was overcome by the use of Lackawanna steel sheet piling. The heavy loads are all supported on piling. The piling was driven and the concrete foundations were placed entirely by company forces.

The general arrangement is shown on the attached print.



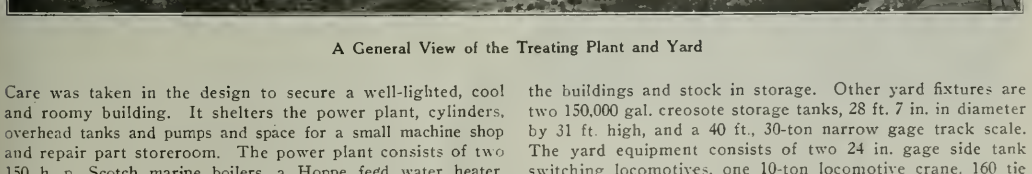
Track Layout at the Timber Treating Plant of the Atlantic Coast Line, Gainesville, Fla.

Five main storage tracks diverge from a ladder track which connects with the main line at the north end of the yard, all of which are three-rail tracks. The plant building is located at the south end of the yard, and is connected with the main storage tracks and the loading platform by a system of 24 in. narrow gage tracks. A spur track connecting with track No. 2 reaches a proposed coal trestle on the east side of the main building, which is not yet built. The main building, machinery, power plant, storage tanks, water tower and water system, and tie trucks were furnished and erected by the Allis-Chalmers Manufacturing Company, of Milwaukee.

The main building is of steel frame construction covered with corrugated iron, and is provided with the usual steel shutter doors, wire glass windows and ventilating monitors, provided with doors at both ends, and designed for 200 lb. working pressure; two 24,000 gal. working and measuring tanks 10 ft. 9 in. by 37 ft. 5.5 in., of 5/8 in. plate and built for 100 lb. working pressure; one 35,000 gal. underground tank, 10 ft. by 60 ft., of 5/16 in. plate; one 1,500 gal. drain tank; two sap drums; one air receiver; one 12 in. by 19 in. by 14 in. air compressor; one 10 in. by 16 in. by 10 in. vacuum pump; two 7.5 in. by 5 in. by 6 in. pot valve pressure pumps, and one 12 in. by 8.5 in. by 12 in. general oil service pump. The arrangement is such that the Rueping process can be used to the greatest advantage, but the Bethell process can also be employed. Prominent features are the large vertical overhead working tanks, and the mercury gages from which their contents is read.

Light for the main building, the office, the pump house and the storehouses, as well as for the narrow gage yard and the loading platform, is supplied by a 30 k.w. generator with a direct connected engine, which is a possible source of power for such woodworking machines as may later be found necessary. A small complete experimental plant of standard design is included. The equipment of gages, both plain and recording, is complete.

Excellent boiler feed water is provided by an open surface well situated at the foot of the water tower and adjacent to the pump house. The latter contains one 10 in. by 6 in. by 12 in. water pump and one 14 in. by 7.5 in. by 12 in. standard underwriters' fire pump, both connected with the well and with the water tower. The tower is of standard steel construction and has a capacity of 45,000 gal. A 6 in. fire main with eight hydrants provides fire protection for



A General View of the Treating Plant and Yard

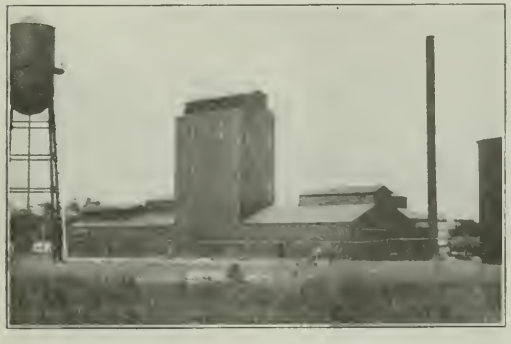
Care was taken in the design to secure a well-lighted, cool and roomy building. It shelters the power plant, cylinders, overhead tanks and pumps and space for a small machine shop and repair part storeroom. The power plant consists of two 150 h. p. Scotch marine boilers, a Hoppe feed water heater, the necessary water feeding installation, and a 48 in. by 90 ft. self-supporting American ingot iron stack. It is separated from the cylinder room by a brick fire wall.

The main operating machinery consists of two cylinders, 6 ft. 2 in. in diameter and 138 ft. 7.5 in. long, of 3/4 in. plate, the buildings and stock in storage. Other yard fixtures are two 150,000 gal. creosote storage tanks, 28 ft. 7 in. in diameter by 31 ft. high, and a 40 ft., 30-ton narrow gage track scale. The yard equipment consists of two 24 in. gage side tank switching locomotives, one 10-ton locomotive crane, 160 tie trucks and 24 piling trucks.

A storage capacity of 1,250,000 gallons of creosote is provided on deep water at Export Terminals, Jacksonville, Fla., by four tanks. The plant at this point is equipped with a boiler and pump for heating and transferring the oil in stor-

age. Six 10,000 gal. tank cars are employed in transferring creosote from Jacksonville to Gainesville.

On the Coast Line practically all crossties are bought delivered in stacks along the right-of-way. In order to load these economically for shipment to the plant, specially equipped flat cars have been assigned to this service, and a modified log-loader purchased to load them. The log-loader



View of the Main Building

places the ties on the flat cars in tiers parallel to the length of the car and the tiers are then securely strapped down to the car by chains fitted with log-binders. The outbound loading of treated ties at the plant is done either with the crane or by hand. Cars thus loaded may be handled to and from the plant either in regular freight service or in special trains. This method of loading and shipping ties in large

Looking Into the Retort Room

quantities was worked out on this railroad, and so far as is known, is new. It is proving satisfactory and economical.

Up to November, 1913, only longleaf heart pine ties bearing a small percentage of sap were treated by the Bethell process. Since then the Rueping process has been adopted for ties, and the specifications modified so as to include the coarser-grained, or "sap" ties. Pine piling and heavy timber and lumber are preserved by the Bethell process of treating.

The "eight-by-one" stacking method is followed, and the necessary seasoning period averages four months for crossties. Experience has shown the climate at Gainesville to be favorable for seasoning the classes of material handled.

The piece-work system of payment has been adopted throughout for handling crossties, except where mechanical handling is practiced. This works especially well with the negro labor with which the yard is manned, and results in making the negro a fairly satisfactory hand. Not enough material other than crossties has yet been treated to make possible the establishment of piece rates in such cases, but here "tasking" has been substituted for the piece rating wherever possible, and provides almost as great stimulation to the negro as the latter.

The plant is operated by Wm. A. Fisher, superintendent of timber preservation, under the direction of E. B. Pleasants, chief engineer.

PAINT PROTECTION FOR PORTLAND-CEMENT SURFACES*

By H. A. Gardner

In many instances it has been found desirable to decorate certain kinds of Portland-cement structures with moisture-proof coatings.† The appearance is thereby made more pleasing and the cement is protected from the destructive action of the elements. The author has occasionally come across statements which would tend to create an impression to the effect that Portland-cement surfaces are highly alkaline and cannot be satisfactorily decorated with oil paints. That such an impression is incorrect, seems to be the opinion of all investigators who have made painting tests of an extended nature. In fact, there is much evidence to show that Portland-cement surfaces are quite as well suited to receive paint coatings as iron, wood and other kinds of structural materials. Moreover, the results of well-conducted tests have shown that pure oil paints, such as are used upon wooden structures, may be used with equal satisfaction upon cement.

That the painting of cement is not a new art, is evident from the many references in the literature which describes methods of decorating and rendering damp-proof all classes of cement. Soon after Portland cement came into general use, it was customary to decorate certain kinds of constructions made from this material, the prevailing method being to apply varnishes containing copal, shellac, rosin or other resins, admixed with oil, turpentine and benzine. Subsequent to the application of such primers, a finishing coat of enamel made by grinding color pigments with the primer, was then applied. The principles underlying these old methods have since been followed with varying success, and up until a few years ago it was a common procedure for painters to apply a coat of varnish suction primer to cement and plaster walls, previous to painting them. Surfaces thus treated were filled, and made less absorptive, and from this standpoint they were in a somewhat better condition than bare walls to receive the final coat of paint or enamel.

The suction varnishes or fillers made for this purpose were of two classes. One widely used was made of rosin dissolved in benzine and admixed with linseed oil. The rosin was sometimes made more suitable by dissolving therein certain drying agents, such as red lead or lime. Lead or calcium resinate would thus be contained in these fillers. Varnishes made of the more expensive resins, such as Manila and copal, have also been used for the same purpose.

Whether these suction varnishes actually enter into chemical combination with the lime or other materials in cement or

* Abstract of a paper presented before the American Society for Testing Materials, in convention at Atlantic City, June 30 to July 3.

† This paper does not refer to treating cement masonry which is subjected to hydrostatic pressure and which may be in a very wet condition. Such masonry requires waterproofing rather than moisture-proofing treatment.

plaster, or whether they simply act as insulation coats, is a matter which has received considerable attention. If chemical reaction really occurs when a varnish coating is applied to cement, varnishes of the highest acidity, such as those made of colophony resin (common rosin), would be most efficient as lime neutralizers and better suited as primers, provided the durability of the coating is dependent upon the amount of calcium resinate which might be formed. Varnishes which have been prepared from the expensive resins generally show an acid number of from 5 to 10, while varnishes made from colophony resin (rosin) generally have an acidity of from 40 to 80. The author is inclined to doubt the possibility of lime neutralization by the use of suction varnishes. It is not a simple matter to produce calcium resinate under the most favorable conditions. Even molten rosin of 150 acidity requires prolonged heating at a high temperature, in order to take up as little as 2 to 3 per cent. of lime. When a varnish of low or high acid value is applied in the cold to a cement surface, drying occurs in an exceptionally short time, and there is no opportunity for the small proportion of resin present in such an extremely thin coating to effect a reaction which even under high temperatures takes place with the greatest difficulty. The effect which is really produced when a varnish is applied to a cement surface is not chemical, but of a physical nature, the varnish having a binding and filling effect upon the cement similar to the binding and filling effect which is produced by the application of certain types of oils to cement surfaces.

Probably too much importance has been attached to the alleged destructive action of lime upon cement surfaces. It is well known that setting Portland cement develops free lime, but the amount to be found upon a Portland-cement structure should be considered as negligible in most instances, as far as it might affect a well-designed paint. If indeed it is advisable to neutralize this small amount of lime, previous to painting the cement surface, such a result is not to be properly accomplished with an organic substance, but rather with an inorganic material which readily reacts therewith. A solution of zinc sulphate has proved most efficient for this purpose and has been used for many years with practical results, especially upon freshly laid cement. It might be well to point out at this place that the priming or ground-coating of cement is often improperly carried out when clear primers of any kind are used. If, for instance, a clear varnish is applied to a cement surface, the primed surface is difficult to differentiate from the untreated area. Consequently, the workmen using clear primers often leave untreated laps or "holidays," as they are technically known. For this reason, the use of color primers should be adopted wherever possible.

The dusting of cement floors, which is brought about by abrasion, may be effectively stopped through the use of oil-pigment paints. If the floor has been freshly laid and is damp, the possibility of lime reaction may be removed by treating the surface with a solution of tinted zinc sulphate. The oil paint may then be applied. Boiled linseed oil, sometimes mixed with Chinese wood oil, may be used as the liquid portion of the paint. These oils have a remarkable binding action when applied to a cement surface. When mixed with pigment, they form paints which are eminently suited as first coaters for cement floors. The first coat will dry rapidly and form a dense surface. Over this may be applied a second coat and, if a high gloss surface is desired, a portion of varnish may be added to this final coat. The various floors of the author's laboratory were treated in this fashion, with prepared floor paints made from such materials, one week after placing of the cement. The zinc-sulphate primer was used only upon the damp areas. The floors have since been subjected to much abrasion from constant walking and the moving of heavy apparatus. Oils and chemicals of various kinds have come in contact with the floors, and soap and water have been used upon them very often for cleaning purposes. After three years' continued service, the floors have not dusted and have never required repainting. The paint films are still in good condition. This service record would tend to show that placed Portland cement may be made dust- and wear-proof and highly desirable as a flooring material, through the application of oil paints.

In April, 1912, the writer instituted a series of tests to determine the durability of various types of paint upon Portland-cement surfaces exposed to the weather. The panels for the tests were prepared by constructing a long board wall to which was fastened expanded metal A mixture of 1 part of Portland cement and 2 parts of clean Potomac River sand was made and applied to the expanded metal, forming a cement wall 3 in. in depth. The wall was divided into 35 sections or panels, each 30 in. wide and 40 in. high. Three coats of paint were applied to each panel by a practical journeyman painter. In order to make the test more severe, nearly all of the paints were applied in white. (Tinted paints are known to be much more durable than white paints.) A stripe of chrome green, 6 in. wide, was placed over the top of the third coat of paint, in order to determine whether the lime which might be present on the surface of the cement would have any effect upon the paint coating. Fading of the green to a yellow would indicate such action.

The general results of the tests at the end of a 2-year period, together with an outline of the composition of the paints tested, is given as follows:

Class No. 1.—Single-pigment paints made with white lead or zinc oxide ground in pure linseed oil. These paints are in very good condition throughout.

Class No. 2.—Combination-pigment paints made of mixtures of white lead, zinc oxide or similar pigments ground in pure linseed oil. These paints are in generally excellent condition.

Class No. 3.—Combination-pigment paints ground with mixtures of raw and heavy-bodied linseed oil or with treated Chinese wood oil. The viscosity of these oils requires the use of considerable turpentine or other thinner in the manufacture of such paints, in order to make them of the right viscosity for application. Semi-flat surfaces are therefore produced during the drying. Most of these paints are in excellent condition.

Class No. 4.—Single and combination pigments ground in oil varnishes containing acid resins. These paints are checking and scaling in many spots. Such varnish paints are apparently not suited to exterior exposure.

Class No. 5.—Paints containing resins dissolved in volatile spirits (spirit varnishes) with or without pigments. These paints are not giving very satisfactory service, the clear varnishes having entirely decayed in some cases. Those to which pigment has been added are in somewhat better condition.

Class No. 6.—Paints made with single and combination pigments ground in a water medium containing glue or casein as a binder. These paints are chalking rapidly and are not moisture-proofing the cement. The pigment binder has been destroyed by the weather.

Opaque white pigments, such as basic-sulphate white lead, basic-carbonate white lead, zinc oxide, and lithopone, were present in the paints which gave the best results. In some of these paints there was also present a percentage of inert pigments, such as barytes, asbestine, whiting, China clay, gypsum and silica.

The results of these tests are quite in line with the results obtained by Ware and Schott in a series of paint exposure tests made upon exterior concrete surfaces. They also agree with previous long-time exposure tests made by the author.

As a result, therefore, it can be stated that concrete surfaces may be decorated with excellent results through the use of high-grade oil paints. When the cement surface is freshly laid and damp, such paints may be safely applied after treating the cement with a zinc-sulphate primer.

THE BAGDAD RAILWAY OF ASIA MINOR.—The section of the Bagdad railway from Bagdad to Sumike, a distance of about 39 miles, was opened for traffic on June 3.

Discipline in the Maintenance of Way Department

Three Further Discussions of This Important Subject Which Is Now Receiving More Careful Attention

A discussion of methods of enforcing discipline in the maintenance of way department, by J. T. Bowser, was published in the *Railway Age Gazette* of June 19, page 1547. This subject has aroused considerable interest and we publish herewith three further discussions.

DISCIPLINE IN THE MAINTENANCE DEPARTMENT

By E. R. Lewis

Assistant to General Manager, Duluth, South Shore & Atlantic, Duluth, Minn.

Discipline in its broadest sense depends directly on the dispensation of exact justice. On the successful application of this principle depends the existence of all governmental bodies. The selection of officers in any organization, from the highest to the lowest, should be made with the administration of justice clearly in view.

To dispense justice, a man must necessarily have been well schooled in self government. Discipline, like charity, should begin, but not end at home. Unless he is able to govern himself, one cannot expect to successfully govern others. It is possible for a man of judicial temperment to learn the details of a business to be carried on under his direction after his appointment. It is hardly possible for a man who has not his own personality well in hand, to succeed as an employer or officer in charge over other men, be he ever so well versed in business details.

The ideal railway officer is one who is able and determined, by virtue of early training in self government, and by knowledge of the details of that which is to be done under his direction, to dispense exact justice in every case presented to him for decision, be it great or small. Such a man will select subordinates similarly equipped. His success will depend very largely on his ability to recognize and to keep men of this stamp. Much of discipline depends on the ability and persistence of officers to teach their subordinates these precepts, as well as their routine duties. Therefore, personality must ever be a prime factor of discipline.

Given an organization composed of officers and foremen so educated, the lines of authority must be most clearly defined and adhered to in order to obtain the best results. Confusion of authority is always to be deplored. Discipline is impossible under such circumstances. The wise officer will devote much thought to so arranging the spheres of action of his subordinates that there will be no possibility of overlapping authority. He will place as much responsibility on each man's shoulders as he shows himself capable of carrying. He will give to the business in hand the closest possible personal supervision, at the same time insisting on his subordinates doing likewise. The results, through the survival of the fittest, cannot but be of the best.

Justice, co-operation and close supervision are necessary to the success of large undertakings. There are many wrong ways and but one right way to maintain discipline. It applies to the maintenance department of a railway as well as to other departments or to other organizations. Discipline, in the sense of punishment, should be rarely necessary in a maintenance department which is well organized. That it is necessary at times, is universally recognized.

The provision of incentive to co-operation of all members of the department for the ultimate welfare of the company as a going concern is of the utmost importance. For with such co-operation, with each employee alive to the fact that his interests are identical with and bound up in those of the employing company, the necessity for punishment is reduced to a minimum.

The writer believes that the infliction of punishment by suspension and the presenting of cash prizes for excellence are alike opposed to the best interests of a railway company. The cash prize has a discouraging effect on the unsuccessful, while it tends to over confidence and carelessness in the successful. Many foremen are hired by the maintenance department to perform certain almost identical duties. They are all paid about the same wage. That wage is accepted as sufficient for the service rendered. There would seem to be no more reason for giving prizes for the best performance at the year end, than for offering bribes for services expected. Suspension is a direct loss to the department. From a feeling of disgrace on the first suspension, the victim passes to a resentful and irresponsible state of mind, making of his punishment an enforced holiday.

What, then, must be the incentive to co-operation? It must be something considered desirable by all concerned. Promotion and increase in wages are probably most appreciated. Choice of location and honorable mention are also desirable.

Where wages are fixed and promotions slow, as is the case in most maintenance departments, the merit system has been suggested and is undoubtedly of much value. Records of service should include in as much detail as possible, the personality and history of the subject. They should be checked with the periodical physical examinations; and they should be comparatively graded with a view to possible promotions. The value of merits, demerits and special honorable mention depends very largely on the publicity given them among members of the staff. Distribution of circulars to the staff announcing acts of special merit or demerit gives the necessary publicity so desirable in this connection. It is a small expense, its results are beneficial to the whole staff and the effects are far reaching. There should be a "best man" in every gang, capable of taking the foreman's place during leave or enforced absence from duty, during which periods the "best man" receives foreman's pay.

Most potent among the factors of excellence in the maintenance department is the permanent employment of the men. An efficient section-man or bridge carpenter, or pumper must have had experience. Steady employment and steady pay are the returns necessary to retention of desirable men, who are thus assured of that stability of income which will permit them to invest in homes in the vicinity of their headquarters. It is the inborn desire of every normal human being to possess a home.

The unfortunate, the abnormal, the mentally and morally deficient, the irresponsible rover and the untutored beginner only, are attracted by temporary employment. To such men discipline is synonymous with punishment only. The indifferent results obtained from the employment of such transient labor demonstrates the false economy bred of alternately sudden curtailment and augumenting of maintenance forces. The matter of discipline is as old as civilization and depends on the same broad, fundamental principles.

RECORDS VERSUS SUSPENSIONS AS DISCIPLINARY MEASURES

By Frank M. Patterson

District Engineer, Chicago, Burlington & Quincy, St. Louis, Mo.

Among the many suggestions offered for encouraging and retaining efficient help in the maintenance of way department the article of J. T. Bowser is worthy of serious consideration. It is trite to say that conditions in railway service are not what they used to be and it is the very truth of this oft repeated assertion that makes it trite. In a former period when our

stallation is illustrated in the accompanying photograph and drawing. The operation of this double reversing valve is so timed that the air pressure in one well chamber is at a maximum at the moment when the pressure in the other chamber is at a minimum. These pressures are predetermined and are adjusted by the weights on the valves. The compressed air is brought into the top of the reversing valve shown as *J* in the drawing. From this chamber it is directed by means of the slide valve to one of the air lines *N* or *O*, leading to the upper and lower stages of the pump respectively. The main valve is of the three-ported slide valve type, similar to those used in steam engines and direct acting steam pumps. The slide (15) is moved automatically by the spool shaped plunger (101) to open and close the ports *A* and *C* alternately to admit and exhaust the air to and from the pump chambers.

In the accompanying illustration the slide valve is about to move to the left to shift the pressure from the upper to the lower stage. As shown by the gages *K* and *K1*, the pressure in the upper pump chamber has reached the maximum, forcing the water up through the discharge pipe and the pressure in the lower chamber is at the minimum, practically all of the air having been forced up the pipe and out through the exhaust inlet to the compressor by the incoming water. The movement of the slide valve to the left which is about to occur is effected by transmitting the working pressure through the port *L* to a piston acting upward against the weighted lever (548). When the pressure in the air line *N* reaches the maximum, it is just sufficient to force up this weighted lever which has just occurred in the position shown in the sketch. The raising of this lever opens the release plunger (735), permitting the escape of air from the auxiliary ports *D E* which are connected to the chamber *J* through the small port *F*. The release of the pressure in *E* unbalances the main plunger (101) since momentarily the pressure is greater in the port *E1* at the right hand end. In the drawing this unbalanced pressure is about to cause the movement of the slide valve to the left. This movement will deflect the compressed air through the pipe line *O* to the lower stage of the pump closing the valve *A A* and opening the valve *B B* to refill the intake chamber of the upper stage. At the same time the upper stage air line will be connected to the exhaust inlet through the port *B*, allowing the air to escape from the upper chamber as the water enters.

As mentioned above, this exhaust air enters the compressor cylinder and is used over and over. The air supply valve for making up losses due to absorption or leakage is shown at *H H*. Two retarding or buffer valves *M* and *M1* are provided, connecting with the exhaust *B* to prevent premature and irregular reversals of the valve. As the upper surface of these pistons is subject to the pressure in the exhausting pipe, these valves serve to keep the weighted lever in place until the air is fully exhausted from one chamber and has reached the full working pressure in the other chamber. These pistons can also be adjusted for vacuum control when desired.

The top of the lower chamber is placed about 10 ft. below the pumping water level to insure a sufficient head to completely fill the intake chamber of the lower stage by gravity. The valve *X X* in the water discharge pipe is provided for flowing wells, so that when the pump is not running the water can be kept out of the reversing valve. The discharge pipes are usually designed to retain a water seal over the discharge opening. To do this, the maximum working pressure should always be less than the pressure required to force all of the water out of the intake chamber down to the level of the discharge pipe valve. This difference in pressure is usually fixed at 2 or 3 lb. The reversing valve is adjusted to allow the water chamber to fill completely with water. The number of reversals depends upon pumping conditions. In general two reversals per minute are to be preferred to four. The discharge from a two-stage pump is intermittent, but the load on the compressor varies uniformly and the receiver pressure is nearly constant.

Each of the pumps at Proviso is operated by a 10 in. by 10 in. air compressor driven by a 35 h. p., 440 volt, three-phase, 60 cycle, 1,200 r. p. m. motor, the air being stored in a 36 in. by 80 in. air receiver. The power exerted by the motor during each cycle varies between that required to overcome friction of the parts and about 33 h. p., making the average about 20 h. p. Although the maximum load is only instantaneous during each cycle, the motor is designed for this load to prevent heating. The compressors, air receivers and motors are located at the well in order to get the greatest efficiency out of the return air arrangement as explained above. The pumps at wells 1, 3, 5 and 9 were tested soon after the installation was made with the following results for 1, 5 and 9. The test on well 3 was not satisfactory owing to the fact that the area between the pump chamber and the well casing was too small to permit a sufficient velocity of inflow. The small casing has since been replaced by a larger one and larger well fittings have also been substituted, bringing the performance of this pump up to that of the others.

Well No.	1	5	9
Pump run (gal. per minute)	95	105	128.81
Current used, k.w. per hour	18.87	...	21.2
Current used, k.w. per thousand gallons	3.3	3.43	2.74
Current cost at 2c. per k.w.	6.6	6.86	5.48

The receiver pressure during these tests was about 100 lb. and the pressure in the pump chambers about 98 lb. per sq. in. These tests showed a pump run varying from 95 to 128.81 gal. per minute. These pumps are designed for a capacity of 150 gal. per minute, pumping from an elevation 250 ft. below the surface to 60 ft. above ground, but this capacity could not be obtained in these wells because all the water that the wells yielded is represented by the figures shown in the test. This fact was proven by a very elaborate experiment undertaken with one of the Weber company's internal exhaust type of air pumps. This pump was placed about 400 ft. below the ground surface and was supplied with air through a 4 in. main from a large 1,600 cu. ft. compressor. No attempt was made to meter the air, as the desire was simply to determine the maximum yield of the well to a given pumping water level. After a series of tests of this kind the yield was practically the same as that shown by the two-stage displacement pump.

In reference to the cost of pumping shown above the manufacturer regularly guarantees for these pumps in this service a cost of one cent per 1,000 gal. for every 100 ft. of lift, this price assuming the use of a steam-driven compressor with coal costing $3 per ton. For the Proviso installation, requiring a lift of 300 ft. this would mean a cost of about three cents per 1,000 gal. This checks quite closely with the cost determined by the tests since the cost of electric current is approximately twice that of a steam-driven compressor on account of the double conversion of power. The cost of six cents per 1,000 gal. under these severe pumping conditions is considered very favorable. The advantage of reliability was even more important in the selection of these pumps than that of efficiency and low cost. It is stated that up to date the repair account on these pumps has been negligible, although they have been in continuous operation more than a year working 24 hours a day most of the time. The maintenance cost for these pumps is kept low by the slight valve wear characteristic of the ball valve. Except when seated, this valve is balanced by the water pressure on all sides and it is free to seat in a new place each time. A 4½ in. ball which has been in service three years is said to be only 0.006 in. out of true.

ARGENTINE RAILWAY EXTENSION.—A government decree has recently approved the plan presented by the Central Argentine Railway for the construction of a branch between Las Rosas and Villa del Rosario. The government has also ordered that the following sums be paid to the administration of the state railways: For completing the line from Dean Funes to Laguna Paiva, $212,300; for equipment on the state railways and maintenance of way, $2,654,000; for the construction of a railway from Nare to San Javier, $255,000, and $212,300 for the construction of the railway line from Talapampa to Rodeo de las Latas.

The Extra Gang Versus the Regular Section Gang

A Discussion of the Relative Merits of These Two Forces in Handling the Routine Maintenance Work

By W. J. Potter

The present demands of railroad maintenance call for extensive renewals of track and roadbed and give rise to a condition which requires the organization of an extra and efficient labor force, or a decided increase in the present established gangs. There are roads whose traffic conditions and engineering features are such as to cause more rapid depreciation of roadbed in some places than in others. Upon these roads the extra gang is at once a problem and the solution of a problem. The extra gang is an efficient institution only so long as it appears to aid in the proper and economic maintenance of track. It is the result of the operation of conditions which tend to prevent the proper type of labor from remaining on the track. The meagre pay, the onerous work and the lack of consideration shown the track laborer have all combined to drive the best types of labor from the field.

EXTRA GANG A NECESSITY

To make extraordinary replacements and extensive renewals, while at the same time maintaining the track up to standard, requires an increase in the regular forces. This seasonal increase is a recognized maintenance cost. It is in the distribution and administration of this labor that the most trouble arises. The extra track gang must perform any task in connection with the track or roadbed. The neglect of trackmen which all railroads have been guilty of has so reduced the efficiency of the supervisory force that four foremen in every five are unable to install a slip-switch or derail. The extra gang must install turnouts and crossovers, as well as renew rail and ballast when any considerable stretch is to be replaced. It must assist in routine work when the regular gang falls behind. In short, any and all work over and above the ability of the regular forces falls to the extra gang for completion.

The field of the extra gang and the reason which should justify its existence is the most neglected. I speak of the extra gang as a training school for prospective section foremen. The adoption of this idea would eliminate haphazard selection of supervisory material, would enable the prospective foreman to learn every type of maintenance, and give him a thorough understanding of the higher ideals of track work—the maximum results at the minimum outlay. By coordinating theory and practice these student foremen would become proficient in a year's time. They should be paid $1.75 per day and be given sections as soon as vacant. They should be recruited from the road sections in the first place and appointment to the extra gang should be considered as a promotion.

DOES THE EXTRA GANG PAY?

The work of the extra gang is not as a rule entirely satisfactory. The nature of track work requires that maximum results be achieved during the eight mild months of the year. Regardless of cost the work must be done, but one cannot increase by any considerable margin the maintenance cost of this predecessor, or his fellows on other divisions. The extra gang performs the overflow work. Upon the formation and direction of this gang depends whether or not it becomes an excessive maintenance cost. The extra foreman, overseeing a force too large for proper supervision, and charged with the rapid completion of the work and also knowing that there is little or no possibility of small discrepancies in the work being laid at his door, rushes the job, often at the cost of permanence and strength. The old dilemma of quality versus quantity is here exemplified. Like a profit and loss statement the gross returns show large, but it is the net returns that should determine a man's standing. So with the work of the extra gang—the report of work done shows large, but the discounting of mistakes and duplications, and the necessity of work done being ripped out and done over considerably reduces the ultimate gain.

The men in the extra gang pattern themselves after their foreman in subserving permanence to outward show. I have seen track which had been raised by an extra gang where the tamping was so poorly done that there was very little ballast under the ties. In rapidly inspecting work the average foreman will not take a pick and test for firmness if he sees the rock well scratched. It takes a blow of at least 30 lb. to properly test a tamped joint. The average foreman is not going to put in a couple of hours each day doing this, and at the same time attempt to properly supervise a gang.

LOSSES IN THE EXTRA GANG

While visiting an extra gang this summer my attention was attracted to three men who were a little apart from the rest of the gang, yet within easy reach of the foreman's voice. I took a record of the actions of these men for an hour and at the end of this time I found that, deducting the time these men wasted, the time actually worked averaged 40 minutes to the hour. One Italian visited the water pail four times during the hour and the other two each twice. Each rinsed the dipper thoroughly, drank deeply and when satisfied threw away at least half a dipper full each time. The time consumed at the water pail by the men was eight, four, and three minutes, respectively, or an average of five minutes each for water alone. Of course this would have been noticed in the gang proper, if every man did likewise, but a record of the average time lost per man in the gang proper was ten minutes per hour. The men had no rest periods, so whenever a man felt tired he straightened up for a minute. The gang was working in cinders and it was a revelation to see how the laborers fooled the foreman. When he would get a little distance away one would stop working and stand with knees bent inward over his shovel and back bent. When several men were directly in line, as they were in tamping, the foreman could not tell if one man was "soldiering" or not.

In this gang of 30 men 300 minutes mere lost every hour, equivalent to $0.80 lost every hour, or $8 every day. Figuring that one-half of the time lost was really necessary for recuperation this still amounted in the season of 200 days to $832. Some will say the foreman has enough to do without bothering with such trifles, and so he has, but an assistant foreman at $2 a day could pay for himself and at the same time save the company money by watching such trifles. In this gang when every man went to the water pail when he felt thirsty it took two men to furnish sufficient water. Upon drawing the attention of the foreman to the waste, a new system was inaguraed whereby twice an hour the water pail went down the line and every man drank as much as he wished. The water boy was instructed to see that the men drank all they took, and that they did not take any more than they could use. The result was that one man was taken off the water bucket and put on the regular work. This was direct gain of the man's wages, representing $1.60 per day, or $332.80 in the season.

The extra gang performs the overflow work, yet the manner of so doing results directly in two sources of loss to

the railroad. First, the morale of the department suffers. Where prizes are offered for the best conducted sections, the mere presence of the extra gang on a foreman's section detracts from his percentage. Knowing this and also the fact that all mistakes will be chargeable to him, and that he will be still further hampered by going over the same work for a couple of days after the extra gang has departed, makes the foreman apathetic and less scrupulous.

After the extra gang has departed the results of the work begin to show. A rail kinked in unloading and spiked in begins to buckle. Poor tamping causes the rail to sag and the ties to churn under traffic. Rails spiked off gage must be gaged and respiked.. Then the treated tie has a hole that should be plugged, and even when plugged the tie has received a wound that results in its destruction before the normal time. When stone is being placed the grade is often neglected, and as a result the regular gang puts in a couple more days rectifying this. All this duplication is a direct loss and works additional hardship on the regular foreman, as his own work is being neglected while correcting errors that a little more care would have prevented in the first place. The following typical time sheets illustrate the extent of this duplication:

EXTRA GANG LABOR SHEET

Date	Foreman	Assistant foreman	Men	Time starting	Time completing	Hours worked	Job
May 31, 1912	1	1	30	7:30 a.m.	5:30 p.m.	9	Relaying rail.
June 1, 1912	1	1	29	7:30 a.m.	5:30 p.m.	9	Relaying rail.
June 2, 1912	1	1	29	7:30 a.m.	5:30 p.m.	9	Installing derail.
June 3, 1912	1	1	29	7:30 a.m.	5:30 p.m.	9	Installing Xover.
June 4, 1912	1	1	30	7:30 a.m.	5:30 p.m.	9	Installing Xover.
June 5, 1912	1	1	32	7:30 a.m.	5:30 p.m.	9	Installing Xover.
June 6, 1912	1	1	24	7:30 a.m.	5:30 p.m.	9	Relaying rail.
June 7, 1912	1	1	29	7:30 a.m.	5:30 p.m.	9	Relaying rail.
June 8, 1912	1	1	30	7:30 a.m.	5:30 p.m.	9	Ballasting and scrap collection.
June 9, 1912	1	1	30	7:30 a.m.	5:30 p.m.	9	Ballasting and scrap collection.

SECTION NO. 40—TIME SHEET

Date	Foreman	Men	Time starting	Time completing	Hours worked	Job
June 10, 1912	1	10	7 a.m.	6 p.m.	10	Grading, lining, removing kinks.
June 11, 1912	1	11	7 a.m.	6 p.m.	10	Grading, lining, removing kinks and surfacing.
June 25, 1913	1	14	7 a.m.	6 p.m.	10	Leveling anchor beams at derail.

The above record shows a complete loss of 350 hours' time at $0.16 per hour, or $56 in addition to the depreciation of the anchor beams, plus the added transportation of extra material, and the loss occasioned by the absence of the regular gang from its own work.

THE PROPER ORGANIZATION OF THE EXTRA GANG

In assembling an extra gang many little but nevertheless important details are passed over as too trivial for consideration. I find that in track work it is the small things that reduce or increase expenses, for the reason that they are not as carefully watched as the larger counts. The first consideration to be decided on is whether the gang shall work from a fixed base or be moved from siding to siding as needed. On the Scranton division of the Lackawanna extending from Washington, N. J., to Scranton, Pa., two extra gangs are located at Stroudsburg, and at Tobyhanna, each with a working radius of about 40 miles, the maximum efficient working radius. I think the fixed base is the best and the cheapest.

The next consideration is whether one gang shall handle only one type of work or shall be called upon for every class of work in track maintenance. Except on track requiring highly specialized work, such as installing interlocking systems, I think the gangs should perform all types of work.

The question of nationality in the making up of gangs is an important one. The Hun is a steady worker, but he is ignorant and hard to teach; the Italian learns quicker, but he is temperamentally lazy. Bickering among men of different nations is continuous, so, to prevent dissension, it is well to man a gang entirely from one group or divide the men into groups of like nations. I have heard the plan advocated of collecting men of different nationalities into one gang, but this creates bad blood in the gang and disrupts it.

The extra gang must be of a size easily handled. No man can properly supervise more than 25 men. I suggest the following organization for a ballast gang:

Foreman

Assistant foreman	Assistant foreman
2 jackmen	2 jackmen
1 jack tamper	1 jack tamper
1 sledgeman	1 sledgeman
2 men filling in	2 men filling in
15 tampers	15 tampers
1 flagman	1 flagman
1 water boy	1 water boy

This gang ought to reballast and surface three miles of track after an 18 in. raise in a month at a cost of $220 per 1,000 ft. of track.

The following is the most efficient sized gang for laying steel:

1 foreman	10 tongmen
2 assistant foremen	8 spike pullers
1 flagman	8 spikers
1 water boy	10 miscellaneous
8 adzemen	

This gang will lay track, taking out the old steel and replacing with new, at the rate of about 6,000 ft. per day. In doing this with 101 lb. new rail they will place 42.86 tons of rails, 134 pairs of splice bars, 804 track bolts, 804 nut locks, 5,700 screw spikes, 2,400 tie plates and 1,000 yd. rock ballast, at a cost, counting material and labor, of $2,580.94.

HANDLING WORK WITH A REGULAR SECTION GANG

While it would be profitable from an economic standpoint to maintain section gangs of a size sufficient to handle all renewals, it would materially increase the maintenance cost of track. For a three-mile section of heavy traffic under a capable foreman all renewals and replacements can be handled by a force of twelve men in summer and eight men in winter. This would necessitate paying a higher salary to the foremen. The present cost of maintaining a section with eight men in summer and four in winter is:

Foreman, 12 months at $70	$840.00
8 men, 208 days at $1.60	2,662.40
4 men, 104 days at $1.60	665.60
Annual expense per section	$4,168.00

With the plan of permanent section gangs the cost would be:

Foreman, 12 months at $80	$960.00
12 men, 208 days at $1.60	3,785.60
8 men, 104 days at $1.60	1,331.20
	$6,076.80

Comparing a 35 section division:

Total cost of sections ($4,168 × 35)	$145,880.00
Cost of two extra gangs	17,500.00
Total labor cost of one division	$163,380.00

On a 35 section division without the extra gangs and with the large permanent gangs the cost would be ($6,076.80 x 35) $212,688.

These figures are based on every man working every day. The $49,308 difference between the two methods could be cut down at least 50 per cent, leaving the margin as the price of safety.

The expense of the extra gang is alone 10 per cent of the total labor maintenance cost. The annual expenditure for labor at present is $163,380, of which the cost of the extra gangs is $17,500, or over ten per cent.

Regular gangs of ten men in summer and eight in winter can relay one mile of track in five days, taking out the old steel and can put under and surface one mile of rock ballast in one month, tamping 14 rail lengths in ten hours, or about ten days to a mile. With a proper foreman (the kind $80 a month would supply) one can do without extra gangs en-

tirely. These regular groups would install switches and crossovers, lay steel and stone and maintain a high standard of track excellence.

THE MIDDLE WAY

Some roads make a practice of combining adjacent section crews for particular kinds of work. This is a good idea, which, if overworked, is spoiled. Where all section foremen are competing for the annual prizes, this system takes a man from his own track to help his neighbor. He fears that he is giving another and perhaps a poorer workman the benefit, and the results, of his own ideas and discipline. His neighbor does not want him, as the presence of additional labor on the section detracts from his percentage and record. The men of the visiting gang do not like it, as quitting time finds them too far from home. They regard it as an added hardship without any additional reward, so they make up for it in soldiering.

This method as practiced places a premium on inefficiency and chokes honest effort on the part of the man who really wants to get ahead. It sometimes places a good foreman under the direction of a poorer man and this is galling to an efficient worker. Tools get mixed with resultant bad feeling.

Renewals should be gradual and universal rather than extensive and local. The establishment of permanent regular sections and the abolishment of the extra gangs is but a matter of time. When the railroads cease pursuing the penny-wise, pound-foolish policy of retrenchment in the maintenance department we will have maximum efficiency. The extra gang has its place in the railroad organization, but the end of its day is at hand. It can train the men who are to supervise the permanent sections and then gracefully follow the untreated tie, and the wooden bridge.

UNECONOMICAL TRACK ECONOMY

By G. S. Crites
Southern Pacific, Tucson, Ariz.

It is regrettable that so many American railroads find it necessary to curtail their expenditures for track maintenance in order that they may make some showing in net revenue.

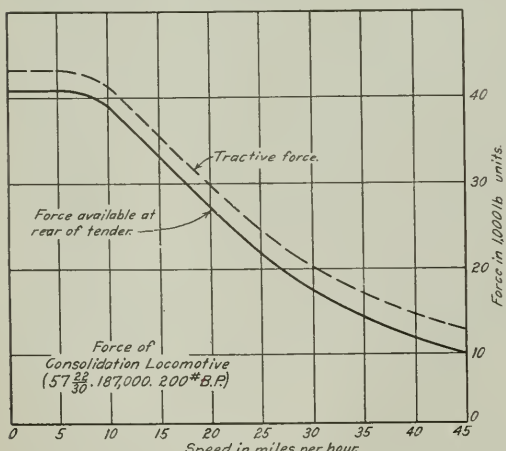


Fig. 1

At best, such an expedient is very temporary, and indications are that savings thus obtained are soon absorbed by increased transportation costs brought about by poor track conditions. On poor track much energy is taken up by concussions, damped oscillations, increased flange friction and other causes, and as all energies of a train in motion, except on a down grade, come from the motive power, the loss due to neglected track is a direct pull against net earnings.

Some of the larger systems are securing dynamometer cars, and it is hoped that, thus aided, they will determine the effect of track conditions upon energy expended by the motive power and thereby show the effect of track conditions upon net earnings. Until the results of such tests are known, it would seem desirable to analyze the effect of rough track with the best approximations possible.

The following diagrams show (Fig. 1) the tractive force

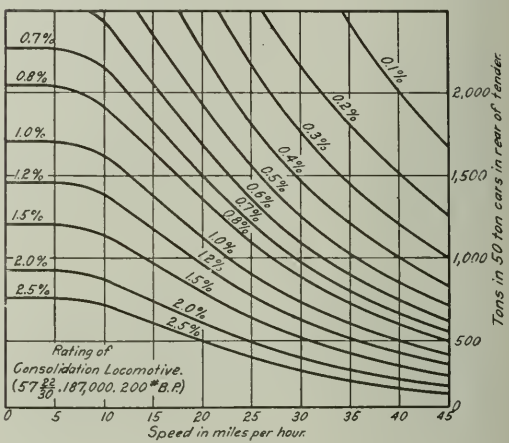

Fig. 2

and available drawbar pull of a consolidation locomotive (Fig. 2), the rating of this locomotive is 50 ton cars (Fig. 3), the velocity head plus head due to rotating parts at various speeds and grades of uniform retardation from such heads and (Fig. 4) the force per 1,000 lb. necessary to acceleration.

Suppose this locomotive, with maximum effort, is hauling 1,200 tons at a speed of 25 miles per hour and encounters a mile of track of such condition that the best that can be

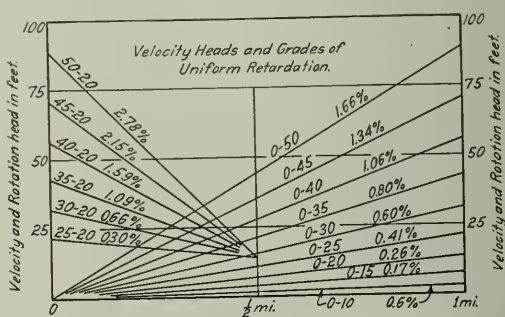

Fig. 3

done is 20 miles an hour. From Fig. 1 it is noted that the engine is exerting 5,600 lb. extra on this mile, consuming 15 h. p. hours. If the speed of 25 miles is regained 11 h. p. hours will be taken up in acceleration. The total loss will approximate 100 lb. of coal and 100 gal. of water.

Again suppose this train finds a slow order out on this piece of track, and reduces speed to 10 miles an hour. From Fig. 3 it is seen that a head of almost 18½ ft. is lost, making

a loss of over 50,000,000 ft. lb. If it picks up its former speed of 25 miles per hour the acceleration will absorb nearly 26 h. p. hours, amounting to about 100 lb. of coal and 100 gal. of water.

It can be seen that many trains on long stretches of weak track will burn much fuel to overcome track resistance. The

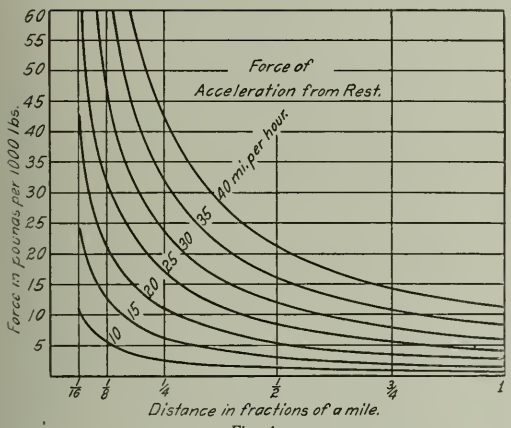

Fig. 4

exact point where the cost of this fuel will equal the money not spent for track maintenance is not known, but judging from the financial showings that have been made by some roads that have skimped on their track repairs, it would seem that good track maintenance pays at all times.

ABSTRACT OF ENGINEERING ARTICLES

The following articles of special interest to engineers and maintenance of way men, and to which readers of this section may wish to refer, have appeared in the *Railway Age Gazette* since June 19, 1914:

Jersey Central Engine Terminal at Communipaw.—The Central Railroad of New Jersey has recently completed a large and unusually complete engine terminal at Communipaw, N. J., to handle the engines entering Jersey City. These facilities were described in an illustrated article in the issue of June 26, page 1585.

The Valuation of Railways.—This subject was discussed in some detail in an article by Logan G. McPherson, lecturer on transportation at Johns Hopkins University, in the issue of June 26, page 1588.

Observations on Finishing Temperatures and Properties of Rails.—A summary of a paper to be published shortly by the Bureau of Standards, prepared by G. R. Burgess, J. J. Crowe, H. S. Rawdon and R. G. Waltenberg, of this bureau, was published in the issue of June 26, page 1592. The investigations reported in this paper are intended to show that the shrinkage clauses commonly found in American rail specifications do not serve their purpose of limiting the finishing temperatures to a value slightly above the critical range.

The Valuation of Railway Property and the Distribution of Earnings and Expenses According to Use.—The railways operating in the state of Oklahoma have recently prepared a formula by which the properties and expenses are divided between states and between "line" and "terminal," while both "line" and "terminal" property and accounts are further subdivided between freight and passenger, and between main and branch line. The apportionment of main and branch line freight and passenger accounts, both "line" and "terminal," are further subdivided between intrastate and interstate. The method by which this was worked out was described in the issue of July 3, page 17.

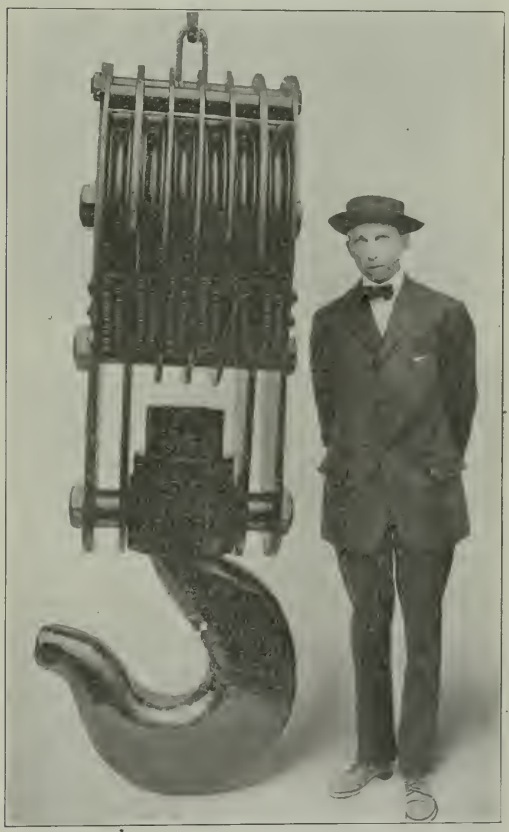
New Pennsylvania Elevator at Philadelphia.—On July 1 the Pennsylvania placed in operation a new reinforced concrete elevator with a storage capacity of 1,000,000 bushels, and a loading capacity of 60,000 bushels per hour. This elevator was described in an illustrated article in the issue of July 3, page 19.

New York Central's Improvements at Utica, N. Y.—The New York Central has been engaged for some time in the construction of a new passenger station and freight houses, and a large classification yard and engine terminal at Utica. The interesting details of the construction of these facilities were described in the issue of July 10, page 47.

A LARGE HOOK BLOCK

A hook block, which is, so far as known, the largest ever built, has recently been constructed for the Illinois Central by the W. W. Patterson Company, Pittsburgh. This block is designed for a working load of 50 tons, with a factor of safety of 3½ and weighs 2,500 lb. This block is provided with a ball-bearing hook which was forged from an 8 in. by 8 in. special billet, which was flattened until it measured 10⅝ in. by 6½ in. This hook and the beam which supports it in the block weigh 1,040 lb. alone.

The block itself is built with strap 8 in. by ⅝ in. by ½ in. plates and ¾ in. plates between the first and second sheaves on each side, which plates support the hook beam. The



A 50-Ton Hook Block Weighing 2,500 Lbs. Complete

inside plates are ½ in. thick. The tail bolt is 2 in. in diameter, the sheave pin 3 in. in diameter, with a ½ in. dog to prevent it from turning, the head bolt is 3 in. in diameter and the lugs of the beam which support the hook are 3½ in. in diameter. Instead of the usual gas pipe separators, this block is provided with four heavy cast iron separators between each pair of plates, making it unusually rigid.

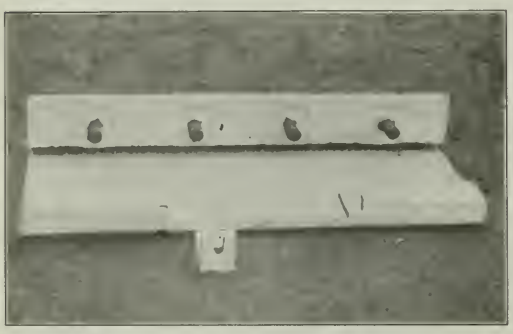
The sheaves are 20 in. in diameter and are ground smooth in the groove for a ⅞ in. wire cable and are bushed with Metaline bushings. The edges of all plates are ground and filed smooth to prevent the cutting of the cable.

This block will be used on a 50-ton Mitchell derrick car

on bridge erection. Although of special design and construction throughout, it was shipped 23 days after the order was placed.

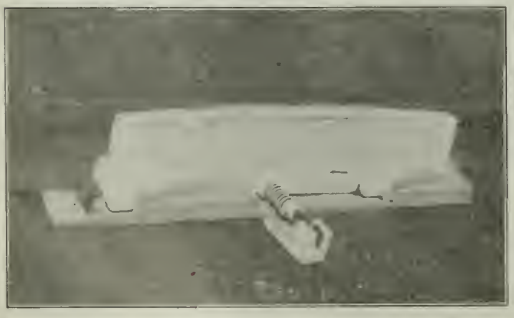
THE AUTOMATIC CONTINUOUS RAIL JOINT

The Automatic Continuous Rail Joint has been under test in a side track of the Chicago & Eastern Illinois at Coaler, Ill., two miles south of Watseka, since last fall, and this road is now making preparations to place others in its No. 4 freight main track near Momence in the very near future. This joint consists essentially of a base plate with an inside angle bar



Base Plate and Inside Angle Bar Section

and lugs to engage the bolt holes in the rail, an outside angle bar and riser, and a pawl and spring to hold the joint in place. In applying the joint the combined base plate and angle bar is inserted under the rail. The other angle bar is then placed in position and driven endwise until the wedging action brings it in contact with the rail. The pawl and the spring hold the joint in place, as shown in the photograph. It is claimed that in this manner the joint is always tight, eliminating the expense and attention required to keep the bolts tight, that the riser prevents the battering of the rail, and that the joint is prevented from opening by the lugs on the inner angle bar. As installed in the Chicago & Eastern



View of Complete Joint in Place

Illinois tracks, the joint is 26 in. long and weighs 100 lb. While in the side track these joints have been carrying the heavy Mikado engines of the Chicago & Eastern Illinois and the Elgin, Joliet & Eastern, drawing tonnage coal trains at speeds up to 10 to 15 miles per hour, and are reported to have required no maintenance in this interval. This joint has been patented and is made by Charles Troup, Watseka, Ill.

TWO METHODS OF TRAINING SECTION FOREMEN

The problem of securing a sufficient number of capable section foremen is common to nearly all roads, and is the subject of much study and thought. As a result several plans have been tried out experimentally on different roads. On the eastern roads this problem is especially urgent because of the almost complete absence of native laborers in the gangs.

To alleviate this condition one eastern road has inaugurated a plan whereby assistant foremen are selected from outside industries. The standard rate of pay for section laborers is $0.175 per hour. A rate of $0.215 has been established for assistant foremen, and one such man is allotted to each section gang. In putting the plan into effect, each section foreman was instructed to secure a promising native man in his vicinity and was authorized to pay him the higher rate at once. All men were selected under the supervision of the supervisor. This man started work with the other laborers, doing the same tasks required of them, but was given more opportunity to develop into a foreman. After he has shown sufficient progress, he is made an assistant foreman of an extra gang at $65 a month, where he has an opportunity to learn the details of switch work, ballasting, rail laying, etc. The assistant foremen of the extra gangs are called on to take the places of section foremen temporarily when they are absent from work because of sickness or other reasons and are eligible for promotion to the position of regular section foreman as vacancies occur.

While it has been the practice on this road to draw the section foremen from assistant extra gang foremen for five or six years, the part of the plan relating to assistant section foremen has been in effect for only 1½ years. It is too early to observe the full results of this plan at the present time, but one noticeable condition is that 12 sons of section foremen have already secured positions as assistant foremen, whereas, previously, it was the almost universal practice for foremen to encourage their sons to go into other lines of industry. Also, while it was supposed that the bonus of $0.04 per hour paid the inexperienced assistant foremen would be lost at first, the officers in charge of this experiment believe that the pace set by these men has stimulated the gangs sufficiently to make the higher rate worth while from the start. The main advantage, of course, is that this road now has a sufficient supply of men capable of promotion to the positions of foremen. In one instance 10 extra gangs were put on because of a large amount of work at one important terminal and all of the foremen for these gangs were secured from the ranks of these apprentice foremen.

However, believing that the day is not far distant when the railways will be unable to secure sufficient native foremen with these inducements, and that the roads must rely upon foreign foremen, this road has recently organized two night schools, one for Italians and one for Slavs, with an attendance of about 30 men each. These students are recruited from the track gangs, and they meet two nights each week in an old passenger car which is provided by the railway company. A course covering two years has been arranged, at the end of which it is expected that the men will have acquired a sufficient knowledge of English to handle the routine work required of them as section foremen. The first course consists of 15 lessons in English, which is followed by an elementary commercial course and then by 17 lessons in track work. This work is being handled in connection with the assistance of the Y. M. C. A., which is providing the teachers. The only cost to the men is $0.02 per lesson to pay for the stationery. The two classes already organized are now starting the track course. It is planned to extend this work to other points as fast as sufficient interest is aroused among the men.

Progress of the Bagdad Railway in Asia Minor.—Another section of the Bagdad Railway from Jerablus, on the Euphrates, to Tel Abiad, about 60 miles to the east, was opened on July 1.

General News Department

The strike at the Westinghouse Works at East Pittsburgh was called off July 9 and it was voted to return to work July 13. Large numbers of the men returned on the 10th and 11th.

Nicholas Roginsky and W. Landburg, officers of the Moscow-Kazan Railway, are inspecting the automatic block signals on the Lehigh Valley. Mr. Landburg is assistant to the chief traffic manager and Mr. Roginsky is assistant to the chief of the telegraph department.

The moving picture promoters have revived an American industry which had long been languishing—show collisions for the amusement of crowds. Such a collision of locomotives was produced at Wharton, N. J., last Sunday and 2,000 persons are said to have witnessed it. The engines collided on a trestle about 50 ft. above the ground. One of the engines was knocked off, and when it struck the ground there was an explosion which wrecked it. The engines were old ones, owned by the Wharton Iron & Steel Company.

A train on the Missouri, Kansas & Texas was stopped by robbers near Matson, Mo., on the night of July 9 and the express car and mail car, after having been detached and run forward some distance, were robbed of their valuables. The safe in the express car was blown open. Three masked men stopped a train of the Oregon-Washington Railroad & Navigation Company near Pendleton, Ore., July 2, subdued the trainmen and proceeded to rob the passengers; but Deputy Sheriff McDuffey, who was in one of the coaches, fired at the robbers and killed one of them. McDuffey, himself, was wounded and one of the robbers was wounded, but he and his uninjured companion got away.

Officers of the engineers' and firemen's brotherhoods representing the men employed on the roads west of and including the Illinois Central renewed their conferences concerning their demands for increased wages and changes in working conditions with a committee of general managers, headed by A. W. Trenholm (Chicago, St. Paul, Minneapolis & Omaha), at Chicago on July 14. Since negotiations were broken off early in June the men have taken a strike vote. On presenting the result of the strike vote to the committee of managers, the brotherhood committee gave the newspapers a long statement in which they said that they would reject any proposition to arbitrate. The managers' committee asked for a detailed statement of the strike vote.

Application has been made to the Federal District Court at Dallas, Tex., by J. W. Robbins, receiver and president of the Trinity & Brazos Valley, for permission to cancel certain trackage agreements with five other railroads because they are unprofitable. These are as follows: Missouri, Kansas & Texas, between Dallas and Waxahachie. For the use of this track the Trinity & Brazos Valley pays an annual rental of $24,000. Chicago, Rock Island & Gulf, Fort Worth to Dallas. Annual rental paid by the T. & B. V. is $60,000. Gulf, Colorado & Santa Fe, Fort Worth to Cleburne and Houston and Galveston. The T. & B. V. pays $48,000 annually. Galveston Terminal, Houston to Galveston. The T. & B. V. pays $72,000 annually. Dallas Terminal and Dallas Union Depot, trackage rights in the city of Dallas. Rental $6,825 annually.

Railway Mail Pay

In reference to the publication yesterday of a report from Washington that the House Committee on Post Offices had taken action designed to increase the allowance made railways for the transportation of the mails, Ralph Peters, chairman of the Committee on Railway Mail Pay, authorized the following statement:

"The bill introduced by Congressman Moon had proposed to reduce the railway mail pay at least $3,000,000 below what had already been appropriated for this fiscal year. The amendment apparently made to the Moon bill merely provides for the restoration of substantially the $3,000,000 by which it had been proposed to cut the pay.

"The railroads have contended and they still insist that they are already underpaid at least $15,000,000 a year. Congress now has at work a bi-partisan commission investigating the question of fact as to whether the railroads are or are not underpaid for this service. It is obviously impossible to properly consider a readjustment until the question of fact has been established.

"The railroad committee believes, therefore, that in justice to the railroads and in justice to the public the report of the joint Congressional commission should be awaited. The railroads are confident that that report will submit a finding on the main question of fact, which will be fair to all concerned.

"When that report is submitted and the question of fact is determined, the railroads' committee will be prepared to co-operate with the government in developing a method of re-adjusting the underpayments or overpayments in such a manner that the interests of all may be properly protected."

Preliminary Valuation Work

The following is the text of the Interstate Commerce Commission valuation circular No. 1:

At the meeting between the engineers of the commission and the committee of railway engineers on February 26, 1914, there seemed to be some uncertainty in the minds of the railway people as to exactly what should be done first in preparing upon their part for the work of valuation. This circular is issued for the purpose of explaining that matter, and has been delayed owing to conferences with the committee of railway presidents touching methods of co-operation.

All carriers having reason to believe that their maps and profiles already in existence will be received under the order effective February 1, 1914, pertaining to specifications for maps and profiles, should at once assemble such maps for inspection. It is not necessary in case of systems of considerable extent that all maps and profiles should be brought together at one point, when this would involve undue labor upon the part of the carrier, but it is indispensable that they should be put into such orderly shape that they can be seen and readily examined.

As soon as the maps and profiles are ready for inspection, the commission should be notified of the place or places where they are and should be requested to make the examination. This will be done as promptly as the work of the commission permits, and when several carriers are awaiting examination at the same time the commission will first act in case of those carriers whose property is to be first valued.

Ordinarily the commission will give at least three months' notice of its intention to begin work upon the property of a given carrier, and it will, so far as may properly be done, consult the reasonable convenience of the carrier in the prosecution of the work. Carriers desiring to obtain copies of cross section and chaining notes, with which to complete their maps and profiles, thereby avoiding a duplication of work, may do so by expressing their willingness to sign the agreement, copy of which is printed at the foot of this circular, at the time they give written notice that their maps are ready for examination.

As soon as the commission has passed upon the maps and profiles, the carrier should proceed to make the changes or additions required in present maps and profiles or to prepare new ones, as the case may be. Carriers having no maps and profiles, or whose maps and profiles are clearly of such a character as to be insufficient for this work, should at once proceed to prepare those called for by the order of the commission. In doing this the requirements of that order must be strictly followed with respect to right of way and station maps. Carriers may, if they elect, prepare a tentative profile, omitting the vertical projection of the original ground surface, but showing the subgrade and giving information as to structures called for in subdivision (b), paragraph 17, of the order of the com-

REVENUES AND EXPENSES OF RAILWAYS

Month of May, 1914.

Name of road.	Average mileage operated during period.	Operating revenues: Freight.	Passenger.	Total. inc. misc.	Operating expenses: Maintenance: Way and structures.	Of equipment.	Traffic.	Transportation.	General.	Total.	Net operating revenue (or deficit).	Outside operations, net.	Taxes.	Operating income (or loss).	Increase (or decr.) comp. with last year.

*Depreciation for back years included.

mission, except that the location of these structures need not be stated with absolute accuracy. Blue prints of this tentative profile shall be furnished the commission and the information obtained by the surveys of the commission may be subsequently utilized by the carrier in completing the profiles as called for by said order.

All carriers should at once prepare a list of their lands, showing grantor, grantee, instrument, etc., as called for in the order. If the carrier prefers, it may in the first instance prepare typewritten schedules which may be so arranged upon separate sheets as to be mechanically transferred to the maps finally. In the end the schedule of lands must appear upon the map as set forth in the order pertaining to maps and profiles.

Roads which have a gross income not exceeding $100,000 annually are excused for the time being from preparing this information. It is possible that the present order may be modified in some respects as to such railroads, and if so, due notice will be given. If no such change has been noted by October 1, 1914, such railroads should prepare to comply with the order of the commission as it now stands.

It should be noted that this circular does not of itself modify the order of January 12, 1914, but simply indicates those modifications which may be made by the commission in due time upon application.

Topics for Next International Railway Congress*

Section I.—Way and Works

I.—Construction of the Roadbed and of the Track.—Arrangements to be adopted in constructing the roadbed and the track, in view of the increase in the weight of locomotives and the speed of trains. *America.*—H. U. Mudge, president, Chicago, Rock Island & Pacific.

II.—Maintenance and Supervision of Track.—Measures to be taken to provide an economic organization for the maintenance and the supervision of the track, taking into consideration the increase of traffic and speed as well as the rise in wages and in the cost of materials. Use of mechanical appliances. Results obtained. *America.*—Epes Randolph, president, Southern Pacific of Mexico.

III.—Special Steels.—Use of special steels, both for the track generally and in particular for the track appliances (points, crossings, etc.). *America.*—W. C. Cushing, chief engineer M. W., Pennsylvania Lines.

IV.—Reinforced Concrete.—Use of ordinary concrete and of reinforced concrete on railways. *America.*—C. H. Cartlidge, bridge engineer, Chicago, Burlington & Quincy.

Section II.—Locomotives and Rolling Stock

V.—(I. of Section 2)—Economic Production of Steam on Locomotives.—Economic production of steam; different systems; results obtained: *(A)* Superheating the steam; *(B)* heating the feed-water; *(C)* special devices; water-tube boilers, etc. *Countries Using the English Language.*—G. J. Churchward, chief mechanical engineer, Great Western Railway of England.

VI. (II. of Section 2)—Trucks, Axles and Springs of Locomotives.—Best arrangement of the bogies, axles and springs of locomotives, especially of locomotives for high speeds, with long wheel bases, so as to facilitate running around curves and to ensure the proper stability of the engines. No American reporter.

VII. (III. of Section 2)—Passenger Carriages.—Improvements to be made in the design of carriages and rules to be observed in the makeup of trains, so as to increase the safety and comfort of passengers. *America.*—B. F. Bush, president, Missouri Pacific.

VIII. (IV. of Section 2)—Electric Traction.—Electric traction on lines with much traffic; production and transmission of energy; type of current; locomotives, motor cars. Technical and financial results obtained. Comparison with the results of steam traction. *America.*—George Gibbs, chief engineer of electric traction, Long Island Railroad.

Section III.—Working

IX. (I. of Section 3)—Terminal Stations for Passengers.—Arrangements for reducing the number of movements of locomotives and empty rolling stock at passenger terminal stations. *America.*—(Vacancy).

X. (II. of Section 3)—Goods (Freight) Stations.—Organization of the receiving and the delivering stations so as to accelerate their business. Arrangement of the buildings and tracks so as to simplify shunting (switching) operations and handling, particularly as regards goods in bulk. Mechanical appliances. *America.*—Howard G. Kelley, vice-president, Grand Trunk.

XI. (III. of Section 3)—Slow Freight Traffic.—Organization of slow freight traffic, in order to increase the effective operation of the rolling stock and the lines. Advisability of using, according to circumstances, heavy or light trains, fast or slow trains. Through trains. Pick-up trains (distributing trains). Shuttle services. *Countries Using the English Language.*—H. A. Walker, general manager, London & South Western.

XII. (IV. of Section 3)—Locomotive Cab Signals.—Repeating and recording the track signals on the locomotive. Different systems already used or tried. Results obtained. Recording the running speed of locomotives. No American reporter.

Section IV.—General

XIII. (I. of Section 4)—Net Cost Rates.—Determination of the net cost of carriage (passengers and goods), taking capital charges into consideration. Its relation to rates charged. *America.*—Fairfax Harrison, president, Southern Railway.

XIV. (II. of Section 4)—Customs Examination.—Organization to be adopted for the customs examination of luggage so as to reduce to a minimum the inconvenience to passengers, while safeguarding the interests of the custom house and of the railway. Establishment of international custom house stations. No American reporter.

XV. (III. of Section 4)—Interchange of Rolling Stock.—Interchange of goods rolling stock (freight cars), and penalty charges in case of delay in the return of that stock: *(A)* Rules to be adopted in the relations between the railways themselves; *(B)* rules to be adopted in the relations between the railways and the consignors and consignees. *America.*—Arthur Hale, general agent, American Railway Association.

XVI. (IV. of Section 4)—Workmen's Dwellings.—How is the problem of dwellings for their workmen and lower-grade employees solved by the railways? How do the administrations assist the individual efforts made by the staff, in particular as regards the building of dwellings for the use of laborers and employees? *America.*—A. F. Banks, president, Elgin, Joliet & Eastern.

Section V.—Light Railways

XVII. (I. of Section 5)—Carriages and Wagons for Light Railways.—Types of carriages and of wagons for narrow-gage railways. Special wagons for facilitating unloading, transshipment and change of gage. No American reporter.

XVIII. (II. of Section 5)—Simplifications in the Operation of Light Railways.—General simplifications to be considered in the operation of light railways. Special methods for collecting fares; issue of tickets at booking offices, before starting; issue on the trains; different types of tickets; auditing systems. No American reporter.

XIX. (III. of Section 5)—Special Methods of Traction on Light Railways.—Special methods of traction applied on light railways. Results obtained. *America.*—H. B. Spencer, vice-president, Southern Railway.

XX. (IV. of Section 5)—Safety Appliances on Light Railways.—Cheap appliances for ensuring safety on light railways. No American reporter.

*The International Railway Congress Association will meet next at Berlin, Germany, in 1915. The questions to be discussed are given in the list here printed, together with the names of American authors of papers.

International Railway General Foremen's Association

The following is a list of the exhibitors at the convention of the International Railway General Foremen's Association held at the Hotel Sherman, Chicago, on July 14 to 17:

Allen & Co., Edgar, Ltd., Chicago—High speed steel.

American Car & Foundry Company, Chicago. Represented by O. F. Schubert and Mr. Spears.

American Steel Foundries Company, Chicago.—American adjustable pilot coupler pocket with Alliance coupler, Vulcan cast steel truck, Vulcan and Hercules brake beams, Economy draft arms. Represented by H. J. Melchert and W. G. Wallace.

Ashton Valve Company, Boston, Mass.—Locomotive safety valves; steam, air and test gages; wheel pressed recording gage, gage testers and appliances. Represented by Jos. F. Gettrust.

Barco Brass & Joint Company, Chicago.—Flexible joints, roundhouse blower sets and washout connections. Represented by F. N. Bard and C. L. Mellor.

Carborundum Company, Niagara Falls, N. Y.—Carborundum and aloxite wheels and aloxite and carborundum cloths and valve grinding compounds. Represented by C. C. Schumaker, H. P. Frost and E. P. Ritzina.

Celfor Tool Company, Buchanan, Mich.—Drills, reamers, flue cutters, boring tools, etc. Represented by C. O. Montague.

Chicago Pneumatic Tool Company, Chicago.—Air and electric drills, pneumatic hammers, speed recorders. Represented by C. E. Walker, P. F. Flaven, J. C. Campbell, J. L. Camby, C. B. Coates and Chas. H. Schumasken.

Colonial Steel Company, Pittsburgh, Pa.—High speed saws, drill rods, 11/16 in. punch shown through 1 ⅛ in. steel, examples of steel fractures, photographs. Represented by T. W. McManus and M. P. Spencer.

Crerar, Adams & Co., Chicago.—Jacks, die starters, pipe benders, wrenches. Represented by Russel Wallace and W. I. Clock.

Crucible Steel Company of America, Pittsburgh, Pa. Represented by Mr. Baskerfield.

Detroit Lubricator Company, Detroit, Mich.—Lubricators. Represented by A. D. Homard and A. G. Machaney.

Duff Manufacturing Company, Pittsburgh, Pa. Represented by Geo. A. Edgin and Chas. N. Thulin.

Edna Brass Manufacturing Compaoy, Cincinnati, Ohio.—Lubricators, injectors. Represented by H. A. Glenn and E. O. Corey.

Ewald Iron Company, St. Louis, Mo.

Flannery Bolt Company, Pittsburgh, Pa.—Tate flexible stayholt. Represented by R. R. Davis.

Galena Signal Oil Company, Franklin, Pa. Represented by W. J. Walsh and Bloss P. Corey.

Garlock Packing Company, Palmyra, N. Y.—Throttle, car cock and air pump packing. Represented by J. P. Landreth.

Goldschmidt Thermit Company, New York.—Thermit welding compounds and sample welds. Represented by H. S. Mann and A. Beaulien.

Greene, Tweed & Co., New York.—"Palmetto" packiogs, "Manhattan" packings. Represented by A. T. Richardson.

Grip Nut Company, Chicago.—Testing machines, deflecting machines, samples grip nuts. Represented by B. C. Hooper.

Hunt-Spiller Manufacturing Corporation, Boston, Mass.—Gray irons for cylinder bushings, packing valve gages, boxes, etc. Represented by J. M. Morse and E. J. Fuller.

Independent Pneumatic Tool Company, Chicago.—New electric tools, new air turbines, small S. S. compound drills. Represented by Robert T Scott, George Wilson, Harold Hendricks and Wm. Gummere.

Jenkins Bros., New York.—Globe, angle Y and check valves, standard medium pressure and extra heavy gates. Represented by B. J. Neely.

Jones & Co., B. M., Boston, Mass. Represented by J. M. Moore.

Keystone Lubricator Company, Philadelphia, Pa.—Model driving box. Represented by J. W. Mowery.

Locomotive Superheater Company, New York.—Boiler tools and unit distributing Presser gages. Represented by G. E. Ryder and Geo. Fogg.

Lutz-Webster Engineering Company, Philadelphia, Pa.—Lutz no-set screw lathe dog, Lutz no-handle ratchet, Lutz one-piece drill ratchet, Lutz adjustable self-feed drilling post—solid and swivel arm, Lutz compression wrench for all finished or rough surfaces—stud driving. Represented by William H. Lutz.

McCord & Co., Chicago.—Model McCord force feed lubricator, pressed steel journal box. Represented by O. H. Neal.

Manning, Maxwell & Moore, Inc.; Ashcroft Manufacturing Company; Consolidated Safety Valve Company; The Hancock Inspirator Company, New York.—Hancock inspirators, boiler checks, Consolidated safety valves, Ashcroft pressure gages, prismatic water glasses and other locomotive appliances. Represented by C. L. Brown.

Miner, W. H., Chicago. Represented by John R. Mitchell.

M. C. B. Company, Chicago. Represented by W. E. Marvel.

Nathan Manufacturing Company, New York. Lubricators, water glasses and valves. Represented by George Royal.

National Machinery Company, Tiffin, Ohio.—Single motor driven bolt cutter and die sharpener. Represented by Chas. Harmon, Jr., and K. L. Ernst.

National Boiler Washing Company, Chicago.

Ohio Injector Company, Detroit, Mich.—Injectors, lubricators, flange oilers and boiler fittings. Represented by Wm. S. Furry and A. C. Beckwith.

Okadee Company, Chicago.—Blow-off valves, water gage, tender hose coupler drain valve. Represented by A. G. Hollingshead, M. E. Keig and G. S. Turner.

O'Malley-Beare Valve Company, Chicago.—Multiplate, Globe, angle, check and blowout valves. Represented by E. O'Malley and Thos. O'Malley.

Pilliod Company, The, New York.—Model Baker valve gear, photographs of installations. Represented by F. S. Wilcoxen, F. E. Pilliod and R. G. Graham.

Pyle-National Electric Headlight Company, Chicago.—Electric headlight. Represented by Crawford P. McGinnis.

Racine Tool and Machine Company, Racine, Wis.—High speed metal cutting machines. Represented by J. M. Jones and Wm. Reinhardt.

Rich Tool Company, Chicago.—High speed tool. Represented by O. F. Schubert.

Ryerson, Joseph T., & Son, Chicago.—Model of a punch and boiler tools. Represented by L. H. Bryan, C. R. Gregg, H. C. Williamson and H. G. Merriell.

Strong-Carlisle & Hammond Company, Cleveland, Ohio.—Randall graphite sheet lubricator, Mac-it set screws. Represented by B. E. Carpenter.

United States Metallic Packing Company, Philadelphia, Pa.—Packings, Leach improved hi trap, Gollmar bell ringers, catalogs. Represented by W. M. Wey.

Westinghouse Air Brake Company. Pittsburgh, Pa. Represented by L. M. Carlton, L. Wilcox and A. K. Hohinyer.

Wilhelm Safety Automatic Coupler Company, The, Chicago.—Model air hose coupler. Represented by S. Wilhelm and B. Loewenthal.

Williamson, H. C., Chicago.—Metal band saw. Represented by H. C. Williamson.

MEETINGS AND CONVENTIONS

The following list gives names of secretories, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 5-8, 1915, Hotel Sherman, Chicago.

American Association of Demurrage Officers.—A. G. Thomason, Boston, Mass.

American Association of Dining Car Superintendents.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next convention, October, Washington.

American Association of General Passenger and Ticket Agents.—W. C. Hope, 143 Liberty St., New York.

American Association of Freight Agents.—R. O. Wells, I. C. R. R., East St. Louis, Ill.

American Association of Railroad Superintendents.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next convention, August 20 and 21, New York.

American Electric Railway Association.—E. B. Burritt, 29 W. 39th St., New York. Annual convention, October 12-16, Atlantic City, N. J.

American Electric Railway Manufacturers' Association.—H. G. McConnaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

American Railway Association.—W. F. Allen, 75 Church St., New York.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 20-22, 1914, Los Angeles, Cal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915.

American Railway Master Mechanics' Association.—J. W. Taylor, Karpen Bldg., Chicago.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga. Next convention, July 20-22, Hotel Sherman, Chicago.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.

American Society of Civil Engineers.—Chas. W. Hunt, 220 West 57th St., New York: 1st and 3d Wednesday, except June, July and August, New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York; 2d Thursday of each month, at 2 P. M., 11 Broadway, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., Washington, D. C. Annual convention, April 28, 1915, Atlanta, Ga.

Association of Railway Claim Agents.—C. W. Egan, B. & O., Baltimore, Md.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Annual convention, October 19-23, Chicago.

Association of Railway Telegraph Superintendents.—P. W. Drew, 112 West Adams St., Chicago.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York.

Association of Water Line Accounting Officers.—W. R. Evans, Chamber of Commerce, Buffalo, N. Y.

Bridge and Building Supply Men's Association.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meeting with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk Ry., Montreal, Que.; 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que.; 1st Thursday, October, November, December, February, March and April, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago; 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York; 2d Friday in January, May, September and November and 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Civil Engineers' Society of St. Paul.—Edw. J. Dugan, P. O. Box 654, St. Paul, Minn.; 2d Monday, except June, July, August and September, Old State Capitol Bldg., St. Paul.

Engineers' Society of Pennsylvania.—Edw. R. Dasher, Box 75, Harrisburg, Pa.; 1st Friday after 10th of each month, except July and August, 31 So. Front St., Harrisburg, Pa.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, Oliver Bldg., Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

Freight Claim Association.—Warren P. Taylor, Richmond, Va.

General Superintendents' Association of Chicago.—A. M. Hunter, 605 Grand Central Station, Chicago; Wednesday preceding 3d Thursday, Transportation Bldg., Chicago.

International Railway Congress.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, 922 McCormick Bldg., Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 West Broadway, Winona, Minn.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, Lima, Ohio. Next convention, August 18-20, Hotel Wisconsin, Milwaukee, Wis.

MAINTENANCE OF WAY & MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next convention, November 17-19, 1914, Detroit, Mich.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, Karpen Bldg., Chicago.

MASTER CAR & LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 8-11, Nashville, Tenn.

NATIONAL RAILWAY APPLIANCES ASSOCIATION.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15 to 19, 1915, Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass.; 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. Frakenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, Union Station, Peoria, Ill.; 2d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

RAILROAD MASTER TINNERS, COPPERSMITHS & PIPEFITTERS' ASSOCIATION.—U. G. Thompson, C. & E. I. Danville, Ill.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

RAILWAY DEVELOPMENT ASSOCIATION.—W. Nicholson, Kansas City Southern, Kansas City, Mo.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Mobile & Ohio, Mobile, Ala. Annual meeting, October 6, Washington, D. C.

RAILWAY GARDENING ASSOCIATION.—J. S. Butterfield, Lee's Summit, Mo.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Bethlehem, Pa. Annual meeting, Bluff Point, N. Y., September 22-24.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, Box C, Collinwood, Ohio.

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with M. C. B. and M. M. Associations.

RAILWAY TELEGRAPH & TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va.; 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Next convention, September 8-10, 1914, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and August, St. Louis.

SALT LAKE CITY TRANSPORTATION CLUB.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah; 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, La Salle St. Station, Chicago. Annual meeting, September 15-17, Hotel Aspinwall, Lenox, Mass.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. Ry., Atlanta, Ga. Next meeting, July 16, Chattanooga, Tenn.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga.; 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

TOLEDO TRANSPORTATION CLUB.—J. S. Marks, Agent, Interstate Despatch, Toledo, Ohio; 1st Saturday in month, Boody House, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillsburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York; last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Erie R. R., Pittsburgh, Pa.; meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7122 Stewart Ave., Chicago.

TRANSPORTATION CLUB OF BUFFALO.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich.; meetings monthly, Normandie Hotel, Detroit.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Next meeting, September 15-18, Hotel Sherman, Chicago.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, Newhouse Bldg., Salt Lake City, Utah; 3d Friday of each month, except July and August, Consolidated Music Hall, Salt Lake City.

WESTERN CANADA RAILWAY CLUB.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago; 3d Tuesday of each month, except June, July and August, Karpen Bldg., Chicago.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago; regular meeting 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

The Salt Lake City Commercial Club Traffic Bureau has announced that it will change its name to the Traffic Bureau of Utah. This is to avoid misunderstanding because the bureau is not identified with the Commercial Club and members of the latter have objected to the action of the bureau in attacking the Union Pacific extra dividend.

F. R. Hanlon, district freight agent of the Oregon-Washington at Seattle, Wash., has been appointed director of traffic of the Port Commission of Seattle, a public body created by popular vote three years ago to take supervision over the waterfront rights, conduct inland water transportation lines and operate locomotive switching terminal service to and from the city's public wharves. The Port Commission property at present consists of two deep-sea docks and a steam ferry line operating within the corporate limits of Seattle between the mainland and the West Seattle peninsula, three miles. Terminal switching rates are now under discussion by the commission.

The Missouri Public Service Commission has issued an order prescribing rates for the transportation of merchandise by express, based on the plan put into effect by the Interstate Commerce Commission last February, and adopted since then by a number of state commissions. The companies are authorized to make the new rates effective on three days' notice, but not later than August 1. It is said that the new rates average 21 per cent. less than those hitherto in effect. The Missouri commission has been investigating express rates since January 1, but action in ordering the reduction was delayed by an injunction that still existed against the old railroad and warehouse commission. The injunction has been dissolved in the federal court.

Disagreement of the jury is the result of the trial of the suit of the government against the Pennsylvania Railroad, the Keystone Elevator and others, at Philadelphia, for alleged illegal rebates on shipments of grain to the Keystone Elevator. The suit has been on trial in the federal court at Philadelphia for four weeks. The jury was out 23 hours. A new trial will probably take place in September. The government charged that the railroad company favored the elevator by leasing buildings to it at an unreasonably low rate and by paying bills for alleged losses which were based on dishonest weights. A former employee of the elevator had been ordered to destroy certain records of weights, of which he saved some, and these fell into the hands of government inspectors.

A Brave Board of Trade

After three or four meetings between a special committee of the Brunswick board of trade and officers of the Atlanta, Birmingham & Atlantic, the commercial body has finally agreed to allow the road to discontinue two passenger trains between Brunswick and Thalman. Officers of the road showed with figures that these trains were being operated at a loss to the company. Although there was a general kick against permitting the road to discontinue them, the board finally arrived at such a decision.—*Macon Telegraph.*

American Shipbuilding in 1914

During the fiscal year ended June 30, 1914, there were built in the United States and officially numbered 1,291 vessels, of 311,578 gross tons, compared with 1,648 vessels, of 382,304 gross tons, for 1913, according to a report by the Bureau of Navigation. The principal vessels are four American-Hawaiian Company steamships, each of 6,600 gross tons, and three Grace Company steamships, each of 6,300 gross tons, all for the Panama canal trade and averaging 4,000 net tons. The steamship *Matsonia,* for Hawaiian trade, 9,728 gross tons, is the largest vessel built in the United States since 1905, and the *John D. Archbold,* 8,374 gross tons, is the largest oil tanker yet built in the United States. On the Great Lakes 10 steamers of over 1,000 tons each were built, the *Alton C. Dustin,* 7,978 gross tons, being the largest. Only three large schooners were built. In all, 38 vessels of over 1,000 tons each were built, aggregating 169,000 tons.

Car Surpluses and Shortages

Arthur Hale, chairman of the committee on relations between railroads of the American Railway Association, in presenting statistical bulletin No. 171, giving a summary of car surpluses and shortages by groups from March 1, 1913, to July 1, 1914, says: The total surplus on July 1, 1914, was 220,875 cars; on June 15, 1914, 232,994 cars, and on June 30, 1913, 70,740 cars. is a small increase of surplus box cars. In the spring wheat section (groups 6 and 7) there is practically no change in the figures. There is also a reduction in surplus box cars on the Pacific coast and in Canada.

The total shortage on July 1, 1914, was 1,333 cars; on June 15, 1914, 660 cars, and on June 30, 1913, 7,036 cars.

No real shortage has yet developed.

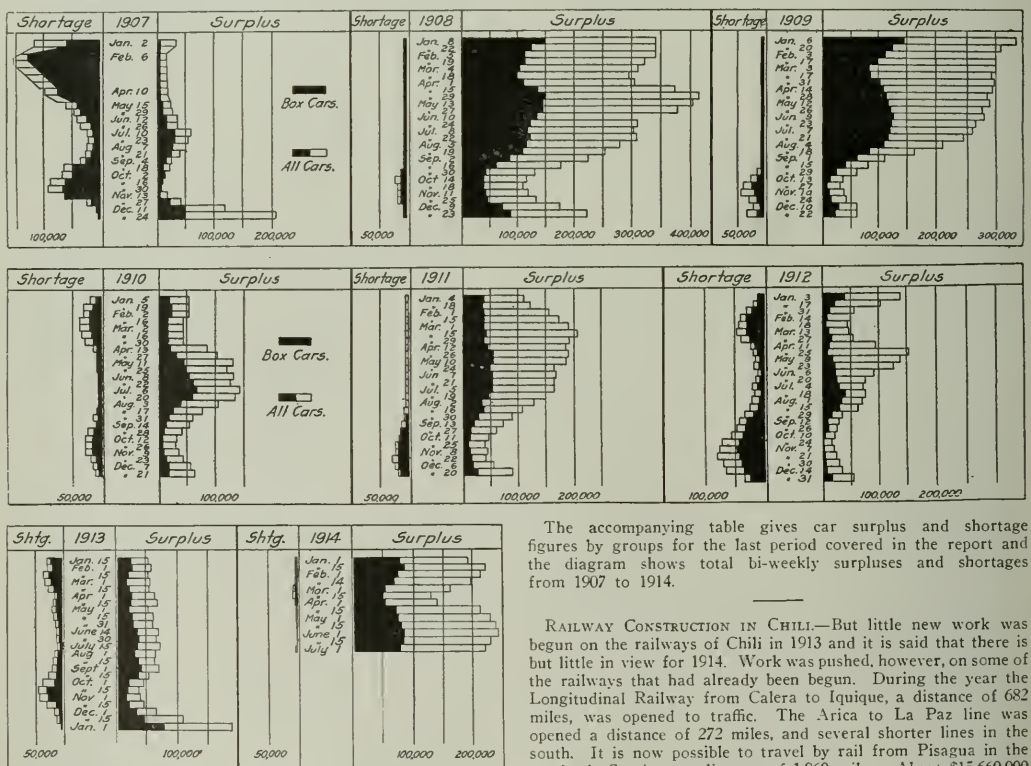
*Group 1 is composed of New England lines; Group 2—New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania lines; Group 3—Ohio, Indiana, Michigan and Western Pennsylvania lines; Group 4—West Virginia, Virginia, North and South Carolina lines; Group 5—Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida lines; Group 6—Iowa, Illinois, Wisconsin and Minnesota lines; Group 7—Montana, Wyoming, Nebraska, North Dakota and South Dakota lines; Group 8—Kansas, Colorado, Missouri, Arkansas and Oklahoma lines; Group 9—Texas, Louisiana and New Mexico lines; Group 10—Washington, Oregon, Idaho, California, Nevada and Arizona lines; Group 11—Canadian lines.



Car Surpluses and Shortages, 1907 to 1914

The surplus of 220,875 cars is the largest for the same period in any year since 1909.

There is generally a small reduction of coal car surplus in all groups except in central freight association territory where there is a small increase.

There is a reduction in box car surplus in New England, official classification territory, and in the western half of the southeast. In the winter wheat section (groups 8 and 9) there

The accompanying table gives car surplus and shortage figures by groups for the last period covered in the report and the diagram shows total bi-weekly surpluses and shortages from 1907 to 1914.

Railway Construction in Chili.—But little new work was begun on the railways of Chili in 1913 and it is said that there is but little in view for 1914. Work was pushed, however, on some of the railways that had already been begun. During the year the Longitudinal Railway from Calera to Iquique, a distance of 682 miles, was opened to traffic. The Arica to La Paz line was opened a distance of 272 miles, and several shorter lines in the south. It is now possible to travel by rail from Pisagua in the north via Santiago, a distance of 1,960 miles. About $15,660,000 was expended on railway construction in Chili during the year, more than one-half being private capital guaranteed by the government. English capital controls 867 miles of Chilian railroads at a total investment of $120,096,468. A government commission has been appointed to thoroughly reorganize the operation of the state railways with the view of putting them on a paying basis. In connection with this it is proposed to place a loan for $24,332,500 to purchase rolling stock, to reorganize the repair shops and to complete double-tracking the line from Valparaiso to Santiago.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

In Chicago, July 9, Chief Examiner Smith, of the Interstate Commerce Commission, resumed hearings which had been begun in New York in a general investigation, undertaken by the commission on its own motion, into private telegraph wire contracts, and a large number of grain brokers gave testimony; also representatives of the American Telephone & Telegraph Company, and the Western Union Telegraph Company.

Examiner Pugh, of the Interstate Commerce Commission, held a hearing at Portland, Ore., on July 1, on a complaint filed by the city of Astoria, Ore., asking for an adjustment of westbound rates which would put Astoria on the same basis as Puget Sound points. Representatives of the railways opposed this on the ground that it would cause a further reduction of the Portland rates, on the ground that Portland is 100 miles nearer the interior than Astoria, and that the result would be to reduce the Portland rates and the Puget Sound rates without improving the relative position of Astoria.

Pig Iron Rates from Virginia

Low Moor Iron Company of Virginia et al. v. Chesapeake & Ohio, et al. Opinion by Commissioner Daniels:

The commission finds that the rates on pig iron from producing points in Virginia on the Chesapeake & Ohio and the Norfolk Western (Low Moor being taken as typical of points on the former and Roanoke of the latter) to points in New England and the Middle Atlantic states are unreasonable *per se* and discriminatory as compared to the rates on competing grades of pig iron from furnaces in Pennsylvania and New York. It is, therefore, ordered that the rates from these Virginia points to points of destination involved be not in excess of the following per gross ton: Baltimore, $2.25; Philadelphia, $2.75; New York, $3, and Boston $3.25. (30 I. C. C., 615.)

Coal Rates from Virginia Mines

Opinion by Commissioner McChord:

This case deals with the relationship between the rates on coal to points north of the Ohio from the St. Charles, or Black Mountain, and the Appalachia groups in southeastern Virginia, the mines at Benham, Ky., and the Middlesboro-Jellico group in southwestern Kentucky and northern Tennessee, all of which are served by the Louisville & Nashville. At present, all mines in the Middlesboro-Jellico district take the same rates to points north of the Ohio, but to points south the mines nearer the destinations take lower rates than those more distant. Rates from the St. Charles district to points south of the Ohio are 5 cents above the rates from La Follette, Tenn.; 10 cents above the rates from Middlesboro, Ky., and Jellico, Tenn., and 20 cents in excess of the rates from Links, Ky. To points north of the Ohio, the St. Charles district has the same rates as the Middlesboro-Jellico district. The rates from Appalachia and Benham to the destinations north of the Ohio are from 10 to 25 cents over the rates from St. Charles.

It is proposed, however, to establish rates from the St. Charles mines to a large number of destinations north of the Ohio, which will be from one to 30 cents higher than from the Middlesboro-Jellico group. Changes are also proposed in the Appalachia and Benham rates, but in general the rates from the Appalachia district will bear the same relation to the rates from St. Charles as at present. The proposed Benham rates are in nearly all cases below the Appalachia rates and in some cases below the rates from St. Charles, but in all cases they are higher than the Middlesboro-Jellico rates. Practically all of the changes are in the form of reductions.

The commission finds that there is justification for higher rates from St. Charles than from the Middlesboro-Jellico district in that the cost of handling is greater. It holds, however, that the differential should not correspond to the entire additional operating cost for the distance from St. Charles to Middlesboro, but that it should, instead, bear a fair relation to the out-of-pocket cost which the St. Charles traffic occasions to the carriers between Pennington and Middlesboro. This cost, as defined in *Louisville & Nashville Coal and Coke Rates,* includes the additional cost of fuel and train supplies, the extra wages of the crews and the repairs to locomotives and cars, amounting in all to 10 cents a ton.

It is therefore held that the rates from mines in the St. Charles group to points north of the Ohio within 400 miles from St. Charles should not exceed the rates from the Middlesboro-Jellico group to said destinations by more than 10 cents per ton and that beyond that the differential should decrease not less than one cent for each additional 100 miles. The rates from mines in the Appalachia group and the mines at Benham are not to exceed the rates from the Middlesboro-Jellico group to points north of the Ohio by greater amounts than the present differentials, but in no case are the differentials of Appalachia over the Middlesboro-Jellico district to be less than the differentials of St. Charles over the same district. These differentials are to be regarded as maxima and the carriers may establish smaller ones should conditions so require. (30 I. C. C., 636.)

Fourth Section Applications

In re rates on tropical fruits from Gulf ports to various destinations. Opinion by the commission:

This case relates to two applications covering rates on tropical fruits, viz., bananas, oranges, pineapples and cocoanuts from the Gulf ports to practically all points in the United States which do not conform with the long and short haul clause. Application No. 659 covers rates from Galveston, Port Bolivar, Port Arthur, Texas City, Houston and Orange, Tex. Galveston is taken as representative. Application 2,176 relates to rates from New Orleans and Port Chalmette, La.; Mobile, Ala., and Pensacola, Fla., but the case considers only the rates from New Orleans to points west of the Mississippi and in general the relief asked is by roads who wish to meet the competition of more direct competitors. The principal departures in the rates from Galveston are those in the rates to points on the Missouri river, Kansas City, Mo., and north thereof, comprising what are generally known as Missouri river points, stations basing thereon, and points east thereof. The rates to these stations, via all lines, are lower than to intermediate points. There is no movement from Galveston except on bananas and cocoanuts, so the carriers have agreed to revise their rates on other fruits to conform with the fourth section. The rate on bananas via all routes from Galveston to Kansas City, Mo., is 58 cents, and this rate is exceeded at intermediate points on all lines. The lines reaching Kansas City through Oklahoma carry higher rates, with few exceptions, to all points north of the Texas-Oklahoma line, the rates to such points varying from 62 to 70 cents per 100 lb. On the Kansas City Southern, the rates from Galveston are highest to points in northern Oklahoma and southern Kansas (62 to 70 cents) and begin to grade down just before reaching Kansas City, reaching their lowest level at points on and in the vicinity of the Mississippi (St. Louis, 43 cents) in Illinois and in western and southern Indiana and then grading upward again as the distance from Galveston increases. These rates bear a definite relationship to the rates from New Orleans and were so adjusted in order to place Galveston on a parity with New Orleans. Despite this aid, however, Galveston still bears a minor position in this business as compared with New Orleans.

To most of the territory east of the Missouri river to which petitioners carry lower rates than to intermediate points the distance via their routes from Galveston is greater than the distance via the lines from New Orleans, and while to some of the territory immediately east of the east bank of the Missouri river the distance from Galveston is less than from New Orleans, the commission holds that on the whole these carriers should be permitted to continue to carry rates to all points east of the east bank of the Missouri river the same as or made with relation to the rates from New Orleans and to continue higher rates to intermediate points.

It does not appear that the direct lines from Galveston to points on and west of the Missouri are at any disadvantage in meeting the competition of the New Orleans lines on account of having circuitous routes. Accordingly, the part of the application for relief from the fourth section relating to these rates is denied.

It is held that the Galveston lines are entitled to some relief in respect to rates to points east of the Mississippi which have been reduced to meet the competition from New Orleans. The present disparities between rates to intermediate points and those to more distant points are, however, termed too great.

The short line carrier between Galveston and Kansas City and other Missouri river points and points east thereof is refused permission to maintain rates to these points lower than to intermediate points, but carriers whose mileage exceeds that of the short line by not less than 15 per cent. may meet the rates of the short line and carry higher rates to intermediate points not less than 800 miles from Galveston. It is made a condition, however, that rates to intermediate points 800 miles and less from Galveston shall not exceed 62 cents per 100 lb. and to intermediate points of greater distances than 800 miles from Galveston shall not exceed the rate of 62 cents by more than one and one-half cents per 100 lb. for each additional 25 miles or fraction thereof.

With regard to rates via the circuitous lines from New Orleans relief is granted wherever the long line is not less than 15 per cent. longer than the short line.

The same measure of relief is granted in respect to rates on cocoanuts as on bananas, but where 62 cents per 100 lb. is prescribed as the maximum rate that may be charged on bananas from Galveston to points on indirect lines intermediate to Kansas City not more than 800 miles from Galveston, the rate on cocoanuts shall not exceed 45 cents and the amounts added to this rate to points of greater distance shall not be greater than the amounts added for the transportation of bananas as provided herein, namely, one and one-half cents per 100 lb. for each additional 25 miles or fraction thereof. (30 I. C. C., 621.)

STATE COMMISSIONS

Complaints involving joint rates and through routes between Missouri points have been set for hearing before the Missouri Public Service Commission at Jefferson City, Mo., on July 21. Every railroad in the state has been notified to be present.

The Texas Railroad Commission has issued a statement declining to approve or disapprove of the tariff submitted by the Texas railways, increasing the freight rates from Houston and Dallas to points in East Texas, in accordance with the order of the Interstate Commerce Commission recently sustained by the Supreme Court in the Shreveport case. The commission states that there is no valid reason for action on its part, and that there is no purpose of holding the railroads in fear of suits for penalties, as obedience to a judgment of the Supreme Court of the United States cannot be prosecuted as a wilfull violation of the laws of Texas.

COURT NEWS

In the federal court at Danville, Ill., July 6, the Vandalia Railroad was fined $2,000 for the payment of illegal rebates.

The Supreme Court of Missouri on July 2 issued an order directing the Missouri Public Service Commission to undertake an investigation to determine whether the two-cents-a-mile passenger fare required by the Missouri law is confiscatory as to the Missouri Southern Railroad. That road applied to the commission some time ago for an order permitting it to charge three cents a mile, and the commission held that it was limited by the law to two cents. The railroad then applied to the Supreme Court for a mandamus compelling the commission to make the investigation, and the court issued the order requested.

In the United States District Court at Rochester, N. Y., July 13, indictments were filed against the Pennsylvania Railroad, the Northern Central, the Delaware, Lackawanna & Western and the Delaware, Lackawanna & Western Coal Company for alleged illegal acts in connection with the transportation of coal. Charges of violation of the commodities clause of the Interstate Commerce Law constitute the basis for the indictments against the Pennsylvania, the government alleging that the railroad company is the real owner of certain coal mining corporations and, therefore, the real owner of coal shipped. The Lackawanna is charged with discrimination against outside coal dealers by renting terminal properties at Buffalo at nominal rates.

Railway Officers

Executive, Financial, Legal and Accounting

Frank A. Peil has been appointed assistant to the president of the Oregon-Washington Railroad & Navigation Company, with office at Portland, Ore.

C. H. Carpenter has been appointed freight claim agent of the Alabama, Tennessee & Northern, with office at York, Ala., succeeding Clayton Jones, resigned to go into other business.

President E. Dickinson, of the Kansas City, Mexico & Orient, announces that the positions of general manager and buyer are abolished and the duties of those offices will be assumed by the president. Lawrence V. Guild has been appointed assistant to the president, with headquarters at Kansas City, Mo., effective July 7.

J. P. Pelham has been appointed assistant auditor of the Piedmont & Northern. E. B. Hardin has been appointed traveling auditor, and W. T. Gill has been appointed freight claim agent, with headquarters at Charlotte, N. C. Reports and correspondence relative to station accounts, interline freight and ticket accounts and car service and per diem reports are sent to the assistant auditor.

Operating

T. L. Terrant has been appointed terminal trainmaster of the Baltimore & Ohio in charge of the Lorain, Ohio, terminals.

J. W. Carnes, trainmaster of the Trinity & Brazos Valley, has been appointed assistant general superintendent, with headquarters at Teague, Tex.

H. B. Grimshaw, superintendent of the Alabama division of the Seaboard Air Line at Americus, Ga., has been appointed general manager of the Macon, Dublin & Savannah, with office at Macon, Ga.

P. T. Carmody, assistant trainmaster of the Lehigh Valley at Cortland, N. Y., has been appointed trainmaster, with office at Cortland, and G. R. Lewis, assistant trainmaster at Auburn, has been appointed trainmaster, with office at Auburn.

Rutledge Smith, general agent for the receivers of the Tennessee Central at Nashville, Tenn., has been appointed also superintendent, and D. F. Bunch, trainmaster at Nashville, has resigned on account of illness and his former position has been abolished

T. W. McGaw, superintendent of the Savannah Terminal division of the Seaboard Air Line, has been appointed superintendent of the Alabama division, with headquarters at Savannah, Ga., succeeding H. B. Grimshaw, resigned to go to another company, and the Savannah Terminal division has been consolidated with and is now a part of the Alabama division.

I. L. Boomer, superintendent of the Canadian Northern at Edmonton, Alta., has been appointed superintendent of the newly created Fourth district Western division, with headquarters at Calgary. J. C. O'Donnell, trainmaster at Rainy River, Ont., has been appointed superintendent, with office at Edmonton, succeeding Mr. Boomer. M. G. Hurd, chief despatcher at Saskatoon, Sask., has been appointed chief despatcher and trainmaster, with office at Calgary, Alta., and R. Nelson, chief despatcher at Edmonton, has been appointed chief despatcher and trainmaster, with office at Edmonton.

Ross S. Marshall, whose appointment as superintendent of the Virginia division of the Seaboard Air Line, with headquarters at Richmond, Va., has already been announced in these columns, was born on March 15, 1880, at Rock Island, Ill., and was educated in the high school at Anaconda, Mont. He began railway work in 1896 on the Great Northern, and was chief clerk in the superintendent's office when he left that company in October, 1902, to go to the Chicago, Rock Island & Pacific as division accountant and chief clerk to the division engineer. From September, 1905, to September, 1907, he was chief clerk to the general manager and local auditor of the Panama Railroad at Colon, Panama, and then entered the service of the

New York, New Haven & Hartford as statistician in the general superintendent's office. He remained in this position until November, 1910, and then was appointed assistant to vice-president of the Minneapolis & St. Louis. In September, 1912, he was appointed superintendent at Oskaloosa, Iowa, of the same road, which position he held at the time of his recent appointment as superintendent of the Seaboard Air Line, with office at Richmond, Va., as above noted.

Traffic

F. R. Johnson has resigned as general agent of the passenger department of the Canadian Pacific at Portland, Ore.

I. G. Thompson has resigned as commercial agent of the Rock Island Lines at Ft. Worth, Tex., to engage in other business.

R. W. Foster, commercial agent of the Chicago, Burlington & Quincy at Portland, Ore., has been appointed general agent at that place, succeeding A. C. Sheldon, deceased.

J. F. Dalton has been appointed assistant general freight agent of the Norfolk Southern, with office at Norfolk, Va., and Boyd Suthers has been appointed commercial agent, with office at Pittsburgh, Pa.

Dan C. Pettibone, general agent of mail traffic of the Northern Pacific, has been appointed general baggage agent, with headquarters at St. Paul, Minn. The mail and baggage departments have been combined in one department under Mr. Pettibone.

E. S. Center, general agent of the Atlanta & West Point and the Western Railway of Alabama at Atlanta, Ga., has been appointed assistant general freight agent of both roads, with office at Atlanta, and F. G. Browder, Jr., assistant general freight agent at Montgomery, Ala., has been transferred in the same capacity to Atlanta, Ga.

W. T. Stevenson, whose appointment as assistant general freight agent of the Cleveland, Cincinnati, Chicago & St. Louis, with headquarters at Cincinnati, Ohio, has already been announced in these columns, graduated from the Covington (Ky.) high school in 1890, and began railway work the same year as messenger in the office of the Chesapeake & Ohio at Cincinnati. Subsequently he was successively clerk, stenographer, ticket agent, traveling freight agent and chief clerk, until February, 1902, when he was appointed division freight agent of the Cincinnati Northern at Jackson, Mich. In November, 1907, he was promoted to chief of the tariff bureau of the Cleveland, Cincinnati, Chicago & St. Louis, which position he held at the time of his recent appointment as assistant general freight agent, as above noted.

William O. Sydnor, whose appointment as assistant general freight agent of the Chesapeake & Ohio, with headquarters at Charleston, W. Va., has been announced in these columns, was born on December 18, 1858, in Dinwiddie county, Va., and was educated in the common schools. He began railway work on January 1, 1876, as assistant agent at Burkeville, Va., on the Atlantic, Mississippi & Ohio, now a part of the Norfolk & Western. From 1880 to 1888, he was agent of the Chesapeake & Ohio at Millboro, Va.; in 1889 he was appointed agent and yardmaster at Staunton, Va., and from 1896 to 1900 was purchasing agent of the same road. He was promoted in 1901 to division freight agent at Staunton, and in 1908 was transferred in the same capacity to Charleston, W. Va., which position he held at the time of his recent appointment as assistant general freight agent of the same road, as above noted.

Engineering and Rolling Stock

W. C. Barrett has been appointed division engineer of the Lehigh Valley, with office at Sayre, Pa.

A. G. Kinyon has been appointed superintendent of locomotive operation of the Seaboard Air Line, with headquarters at Portsmouth shops, Portsmouth, Va.

J. W. Williams, assistant chief engineer of the Northwestern Pacific, has been appointed chief engineer construction, succeeding William C. Edes, resigned, and F. K. Zook, engineer maintenance of way, has been appointed chief engineer maintenance and structural engineer, both with headquarters at San Francisco, Cal. William S. Wollner, engineer in charge of the chief engineer's office, has had his jurisdiction extended over the maintenance of way department.

Mr. Williams, who will be the senior engineer on all construction work, was born in 1879 at Milan, Ohio. He graduated from high school in 1897 and began railway work in 1900 as chainman on location survey on the Albuquerque Eastern. Later in the year he worked with the city engineer of Albuquerque and afterwards was employed in the mechanical department of the Atchison, Topeka & Santa Fe at that place. During 1901 and 1902 he was with the Santa Fe Central as chainman, levelman and transitman on location and construction; in the spring of 1903 he was employed as transitman on location surveys for the Eastern Railway of New Mexico, and in July of that year he was transferred to the San Francisco & Northwestern in California, where he was employed on location surveys along the Russian river and the South Fork of the Eel river. In 1904 and 1905 he was assistant engineer on construction of the Oakdale Western and the Ft. Bragg & Southeastern, and in 1906 served in the same capacity on the San Francisco & Northwestern making various surveys and investigations. Mr. Williams was made acting chief engineer of the latter road in August, 1906, and when the Northwestern Pacific was formed in 1907 by the consolidation of several northern California lines, he was appointed assistant chief engineer of that road, which position he held at the time of his recent appointment as chief engineer construction, as above noted.

J. W. Williams

E. C. Sasser, whose appointment as superintendent of motive power of the Northern and Eastern districts of the Southern Railway, with headquarters at Washington, D. C., has been announced in these columns, was born on November 16, 1875, in Wake county, N. C., and was educated at Holden Academy, Raleigh. He began railway work at the age of 16 in the shops of the Raleigh & Gaston, now a part of the Seaboard Air Line, as machinist's apprentice at Raleigh, and at the completion of his apprenticeship entered the service of the Southern Railway at Alexandria, Va., and was then consecutively machinist, machine shop foreman and general foreman. In 1898 he returned to Raleigh and entered the service of the Lobdell Car Wheel Manufacturing Company. The following year he went to the Seaboard Air Line at Raleigh, leaving that company in May, 1901, to become superintendent of the Acme Machine Works, Goldsboro, N. C. He went to the Southern Railway in May, 1902, as erecting shop foreman at Columbia, S. C., and was promoted to general foreman in August of the same year. The following October he left that company to enter the service of the American Locomotive Company at the Richmond branch as equipment inspector. The following year he was promoted to general

E. C. Sasser

machine shop foreman and in March, 1905, left that company to return to the service of the Southern Railway as shop superintendent. He was promoted to master mechanic of the Charleston shops in May, 1908, and in October of the following year was transferred in the same capacity to the Alexandria shops. He was again transferred in May, 1910, as master mechanic of the Spencer, N. C., shops, which position he held at the time of his recent appointment as superintendent of motive power of the same road, as above noted.

D. Hickey, master mechanic of the Southern Pacific at Sparks, Nev., has been transferred to Ogden, Utah, in a similar capacity. T. D. LaMasters has been appointed general car foreman at Ogden.

Purchasing

The office of C. D. Baldwin, purchasing agent of the Bangor & Aroostook at Milo Junction, Me., has been removed to Derby.

T. D. Singletary has been appointed storekeeper of the Macon, Dublin & Savannah, with office at Macon, Ga., succeeding G. S. Pratt, resigned.

Special

The authority of H. R. Buckey, agent of the land and industrial department of the Southern Railway at Bristol, Tenn., has been extended over the Georgia Southern & Florida, the Hawkinsville & Florida Southern and the Macon & Birmingham, with headquarters at Macon, Ga., succeeding C. W. Fitch, resigned to accept services with another department, and F. L. Merritt has been appointed agent, with headquarters at Bristol, Tenn., succeeding Mr. Buckey.

OBITUARY

Robert M. Boyd, general agent of the freight department of the Chicago, Milwaukee & St. Paul at Seattle, Wash., died in the latter city on July 6.

Henry R. Emmerson, formerly from 1904 to 1907, minister of railways and canals for Canada, and previous to that premier of New Brunswick, also a member of the Dominion Parliament, died on July 9, at Dorchester, New Brunswick.

Samuel F. Prince, Jr., formerly superintendent of motive power and rolling equipment of the Philadelphia & Reading, died in New York City on July 13, from the effects of a bullet wound. Mr. Prince was born 62 years ago and previous to January, 1892, was mechanical engineer of the Philadelphia & Reading, and then to the following March was assistant consulting engineer of the Long Island. He was appointed superintendent of motive power in March, 1892, and from February, 1893, to August, 1899, was superintendent of motive power and equipment of the same road. On August 1, 1899, he was appointed superintendent of motive power and rolling equipment of the Philadelphia & Reading and left that company in June, 1904, to enter the service of the Niles-Bement-Pond Company, at New York. He retired some years ago from active service on account of ill health.

Electric Locomotives in England.—Announcement has recently been made to the effect that the Northeastern Railway in England will conduct some exhaustive experiments with electric engines on its line between Middlesborough, Yorkshire, and Bishop Auckland, Durham, which is used for "mineral" traffic. The engines are reported to be of German design and are now being put together at Darlington. They will be able to draw 100 coal or coke cars each containing 20 tons.

Automatic Brakes for Russian Railways.—A committee has recently been formed in St. Petersburg to consider the question of fitting all freight cars with automatic brakes. Should the decision be favorable, the work will be spread over a period of six years.

Signal Statistics of the Great Western Railway of England.—On the 3,007 miles of Great Western Railway of England, there are 1,611 signal towers, 43,456 working levers, 6,784 spare spaces, 20,430 signals, 3,191 interlocked switches and 682 crossing gates.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Toledo Terminal Railroad is inquiring for 5 locomotives.

The Canadian Pacific has ordered 10 locomotives from the Montreal Locomotive Works.

W. R. Grace & Company, New York, are in the market for 2 tank engines (2-8-4 type) for use in Peru.

The Pittsburg & Shawmut has ordered 6 Mikado type locomotives from the Baldwin Locomotive Works.

The International Railways of Central America have ordered 5 locomotives from the Baldwin Locomotive Company.

The Fosburgh Lumber Company, Norfolk, Va., has ordered one Prairie type locomotive from the Baldwin Locomotive Works.

The Grand Rapids & Northwestern is in the market for 3 Mikado type, 5 ten-wheel and a number of six-wheel switching locomotives.

The Green Bay & Western has ordered one superheater Mogul type locomotive from the American Locomotive Company. This locomotive will have 19 by 26 in. cylinders, 56 in. driving wheels, a total weight in working order of 141,000 lb. and a steam pressure of 180 lb.

CAR BUILDING

The Buffalo, Rochester & Pittsburgh is in the market for 10 caboose cars.

The Tampa & Gulf Coast is inquiring for a number of passenger train cars.

The Chicago, Indianapolis & Louisville is in the market for 250 to 260 40-ton box cars.

The Canadian Northern has ordered 8 passenger cars from the Pressed Steel Car Company.

The Delaware, Lackawanna & Western has ordered 200 mine cars from the Magor Car Company.

The Pittsburg & Shawmut has ordered 25 refrigerator cars from the American Car & Foundry Company.

The Chicago & Illinois Midland has ordered 250 gondola cars from the American Car & Foundry Company.

The Pennsylvania Railroad has instructed its Altoona shops to proceed with the construction of 1,000 all-steel box cars.

The Philadelphia & Reading is reported to have ordered 6 baggage cars from its shops at Reading. This item has not been confirmed.

The Southern Pacific is in the market for 2,600 50-ton double sheath box, 400 50-ton flat, 850 40-ton single deck stock, 250 50-ton gondola, 300 12,500 gal. cap., 50-ton tank, and 20 caboose cars and 150 50-ton flat car bodies. The same company has also asked prices on 40 60-ft. passenger coaches.

IRON AND STEEL

The Southern Railway has ordered 15,000 tons of rails from the Tennessee Coal & Iron Company.

The Chicago, Rock Island & Pacific has ordered 17,000 tons of rail from the Colorado Fuel & Iron Company.

The Pennsylvania Railroad has placed orders for 100,000 tons of steel rails with the following companies: United States Steel Corporation, 44,000 tons; Pennsylvania Steel Company, 22,000 tons; Cambria Steel Company, 22,000 tons; Bethlehem Steel Company, 6,000 tons, and the Lackawanna Steel Company, 6,000 tons. All of these orders are to be of 100 lb. section, with the exception of 5,000 tons of the Pennsylvania Steel Company order, which will be of 120 lb. section.

Supply Trade News

Stephen C. Mason, secretary of the McConway & Torley Company, Pittsburgh, Pa., has accepted appointment as an executive member of the Railway Business Association. William McConway, president of the same company, recently retired as an executive member of the association.

H. A. Strauss, consulting engineer, Chicago, has been retained by the bondholders' committee of the Alton, Jacksonville & Peoria Railway, to prepare a complete valuation of the company's property to be submitted to the Illinois Public Utilities Commission in connection with the application for authorization of a reorganization of this company and the issuance of stocks and bonds.

The Railroad Valuation Company has recently been organized, with offices at 25 Broad street, New York, with a staff of engineers, analysts and accountants of wide experience in valuation work for the purpose of preparing maps and other data for railroads who have to submit such data in the federal valuation and may not otherwise have the advantage of a special staff for this work.

Ralph W. Perry, chemist and engineer of tests for the Michigan Central during the construction of the Detroit river tunnel and the improved terminal facilities at Detroit, has severed his connection with the company and has leased its laboratory at Fifth street and River Front, Detroit, renaming it the Perry Testing Laboratory, with the idea of conducting a general chemical, inspecting and testing business.

Mudge & Co., Chicago, are now manufacturing and selling their own passenger car ventilator which is known by the trade name "Mudge-Peerless." Attractive folders illustrating and describing this device are now ready for mailing to those interested. This company is now representing in western territory the Chambers Valve Company of New York. The Chambers throttle valve now being exclusively manufactured by the latter company was recently acquired from the Watson Stillman Company.

On application made in the United States District Court at Buffalo, for the appointment of receivers for the United States Light & Heating Company, Buffalo, N. Y., on the charge of fraud, Judge Hogel has named Guy Walker, a member of the stockholders' investigating committee; James O. Moore, a Buffalo attorney, and H. Henry Ackerman, the present vice-president and general manager of the company. The receivers are under a joint bond of $100,000 and have been instructed to continue the business. The charges on which the application for receivers was based resulted from the findings of the investigating committee, composed of Guy M. Walker, F. R. Humpage and John A. Sleicher. It is alleged that illegal stock issues were made, consisting of $100,000 to William Hawley, of New York; $10,000 to Sanford Adler, and $100,000 to J. Allen Smith. The latter is the president of the company and Mr. Hawley is a director. The action was precipitated by the issuing by the company of a circular to stockholders offering them $1,500,000 6 per cent. bonds for subscription by July 15. This bond issue was authorized at a special meeting of the stockholders, on the suggestion of the stockholders' investigating committee. The bond offering was made to stockholders without the signatures of the members of the investigating committee.

TRADE PUBLICATIONS

COAL PICKS.—The National Malleable Castings Company, Cleveland, O., has recently issued circular No. 67, descriptive of the company's malleable iron coal picks for locomotive tenders.

ELECTRIC METERS.—The Esterline Company, Indianapolis, Ind. has issued catalog No. 321, descriptive of Esterline model E-B graphic efficiency meters. The booklet contains a detailed description of the instruments and views are included showing the various types of meters and their parts.

Railway Construction

AKRON, CANTON & YOUNGSTOWN.—An officer writes regarding the report that the company is carrying out the plans made some time ago to build an extension from Mogadore, Ohio, east to Youngstown, about 40 miles; also that an extension is to be built from Akron north to Cleveland; that it has not yet been definitely decided to extend the line. The company now operates a 10-mile freight line between Akron, Ohio, and Mogadore.

BUTLER COUNTY.—This road has been extended from Styra, Ark., to Piggott, eight miles. (August 22, p. 353.)

CHICAGO, BURLINGTON & QUINCY.—The improvements now under way in the yards, outside of St. Paul, Minn., include the filling of 14 acres of marsh land, the extension of the present tracks to a length of 4,500 ft., the construction of 5 new tracks, a coach ward and 2 new switching leads. There will also be erected a 12-stall roundhouse, a large transfer platform and a steel water tank with a capacity of 100,000 gallons. This repair yard will have a capacity of 200 cars daily. The cost of improvements is estimated at $250,000.

FORT WORTH-DENTON INTERURBAN.—A meeting of the stockholders will be held July 24, it is said, to formally transfer the right of way and other holdings to the Stone & Webster Syndicate, of Boston, Mass., which will build and operate the line from Fort Worth, Tex., north to Denton, 32 miles. As soon as the transfer has been made construction work is to be started. (December 26, p. 1249.)

GREAT NORTHERN.—An officer writes that a contract has been given to Guthrie, McDougall & Company for work on a change of line on 1.3 miles at Paola, Mont. The work is now under way and includes one double-track tunnel 900 ft. long. The estimated cost of the work is about $250,000.

MINKLER SOUTHERN.—This new single-track line, extending from Minkler through Cutler to Exeter, Cal., a distance of about 40 miles, has just been completed by the Atchison, Topeka & Santa Fe. Operation will begin August 1.

MOULTRIE SOUTHWESTERN.—Application has been made in Georgia for a charter to build from Moultrie southwest through the counties of Colquitt, Mitchell, Grady and Decatur to the Florida state line. The right of way has been secured and work is now under way; about four miles have been completed. W. E. Aycock, Moultrie, is interested.

NEWAUKIM RAILROAD.—An officer writes that the plans call for building from Napavine, in the state of Washington, east via Onaloska. Work is now under way by the company's forces on the first 11 miles to Onaloska. There will be a 300-ft. trestle on this section. The company expects to develop a traffic in logs, farm products, merchandise and live stock. William Carlisle, president, Atchison, Kan.; O. O. Ort, engineer, Centralia, Wash.

NORTHERN PACIFIC.—The Mandon north line of the Dakota division has been extended from Stanton, N. D., west to Golden Valley, 34 miles. (May 1, p. 1011).

OKLAHOMA, NEW MEXICO & PACIFIC.—This road has been extended from Wilson, Okla., west to Ringling, 10 miles. (April 17, p. 927.)

OLYMPIA TERMINAL.—See Oregon-Washington Railroad & Navigation Company.

OREGON-WASHINGTON RAILROAD & NAVIGATION COMPANY.—An officer writes that a contract has been given to the Twohy Brothers Company, Portland, Ore., to build under the name of the Olympia Terminal a new line near Olympia, Wash. The maximum grade will be 1 per cent. compensated, and maximum curvature 15 degrees. There will be a pile trestle 795 ft. long and another 570 ft. long. The plans include putting up a station and freight house at Olympia.

REGISTER & GLENNVILLE.—This company, which operates a 39-mile line from Glennville, Ga., north to Register, is making surveys, it is said, for an extension northeast to Statesboro about 10 miles.

Sheffield & Tionesta.—This road is now in operation from Sheffield, Pa., southwest to Tionesta, 41 miles.

Sutherlin, Coos Bay & Eastern.—Surveys are now being made, it is said, and contracts for building the line may be let in the near future. The plans call for a line from Sutherlin, Ore., east about 27 miles to the head of Calapooia river. H. D. Haley, Sutherlin, is engineer in charge, and C. M. Crego, Spokane, Wash., is interested. (June 19, p. 1565.)

RAILWAY STRUCTURES

Buffalo, N. Y.—Contracts are to be let at once for building the new passenger terminal for the Lehigh Valley on Main street, in Buffalo. It will be of Colonial design and is to be built of Indiana limestone. Preparatory work for carrying out this improvement was begun some time ago and actual work on the new terminal must be started by August 1. (September 26, p. 586.)

Clinton, Iowa.—The contract for the construction of the Chicago & North Western repair yard at Clinton, Iowa, noted in the *Railway Age Gazette* of last week, has been awarded to the Walsh Construction Company, Davenport, Iowa.

Galveston, Tex.—The new eight-story office and depot building of the Gulf, Colorado & Santa Fe has just been completed and the offices are being moved from the old building into the new. The building has a frontage of 100 ft. and a depth of 125 ft. It is a fireproof structure of vitreous buff brick and concrete.

North Wilkesboro, N. C.—The Southern Railway has given a contract to Porter & Boyd, Charlotte, N. C., for building a new brick, with tin shingle roof, combined freight and passenger station and covered platform at North Wilkesboro, to replace the old combined station recently destroyed by fire. The improvements will include a platform, 36 ft. by 240 ft. The station will have separate waiting rooms for white and colored passengers, also a freight and baggage room, express room and freight and ticket offices.

Philadelphia, Pa.—Mayor Blankenburg has signed an ordinance under which the city and the Philadelphia & Reading Railway Company will co-operate to do away with a number of grade crossings in Port Richmond. The agreement embodied in the ordinance as to apportionment of cost between the city and the railway has been under discussion for more than a year. The tracks will be elevated to permit the opening of Emerald and Tulip streets between Lehigh avenue and Somerset street. The lines and grades of Aramingo avenue will be revised to conform with the plans. Pike street, from Third to Lawrence, will be abandoned. Construction of additional tracks is also authorized by the ordinance.

Reidsville, N. C.—The Southern Railway has given a contract to J. P. Pettyjohn & Company, Lynchburg, Va., for building a new brick, tile roof passenger station at Reidsville. The building will be 22 ft. by 100 ft. and will include separate waiting rooms for white and colored passengers, also a baggage room and ticket office. The building will be equipped with steam heat and electric light. A contract for the construction of the heating system has been let to the General Fire Extinguisher Company, Charlotte, N. C.

St. Paul, Minn.—A roundhouse and locomotive plant, consisting of a 33-stall roundhouse, a machine shop with 7 repair pits, a tank and paint shop with 5 repair pits, a turntable, coal docks and a three-story brick storehouse for the use of the mechanical department, will be erected near the Union depot at St. Paul by the Northern Pacific. This new plant will be used chiefly for the care of passenger and switching power. The estimated cost is about $500,000.

South Boston, Va.—The Southern Railway has given a contract to the Wise Granite & Construction Company, Richmond, Va., for building a new brick passenger station at South Boston with tile roof. The new building will be 25 ft. by 106 ft. and will include separate waiting rooms for white and colored passengers, a baggage and express room and ticket office.

Tacoma, Wash.—Bids for a new $100,000 freight shed for the Oregon-Washington Railroad & Navigation Company in Tacoma were to be received on Wednesday. This shed is to be built on the tideflats at Fifteenth street and the city waterway. G. W. Boschke, Portland, Ore., is chief engineer.

Railway Financial News

Canadian Pacific.—It is reported that this company has bought the Lake Erie & Northern, which runs from Port Dover to Galt, Ont., 27 miles.

Chicago & Eastern Illinois.—The Bankers Trust Company, New York, as trustee for the refunding and improvement mortgage, has filed in the federal court at Chicago a suit for the enforcement of the mortgage and sale of the property. "The filing of the bill is intended not as a hostile move but as one of the usual and necessary formal steps in connection with the ultimate reorganization of the property.

Chicago, Indianapolis & Louisville.—A mortgage for $4,000,000 has been filed by the company in Indiana; and a mortgage for $2,000,000 has been filed by the Wabash Valley, a short new line which was recently bought by the C. I. & L. It is reported that a connection will be built at Hammond, Ind., about ten miles long.

Greenville & Knoxville.—See Greenville & Western.

Greenville & Western.—This is the name of the company which is to operate the property of the Greenville & Knoxville, which was recently sold at auction.

Kansas City, Mexico & Orient.—Creditors said to have claims aggregating about $700,000 have secured a temporary injunction against the transfer of the property of this road from the receivers to the new proprietors; and it is said also that the Public Utilities Commission of Kansas will refuse to authorize the new company to do business until its capitalization has been investigated.

The new company, organized in connection with the purchase of July 6, has the same name as the old one, and the charter provides for $50,000,000 of stock and $31,000,000 of bonds.

Marietta, Columbus & Cleveland.—The property of this company was on July 10 put into the hands of a receiver, suit having been filed by the Columbia-Knickerbocker Trust Company, of New York, trustee of a mortgage for $250,000 on which interest has been in default for several years. The court appointed Daniel B. Torpy, of Marietta, receiver. This line runs from Marietta, Ohio, westward 45 miles to Palos, connecting at the eastern end with the Pennsylvania and the Baltimore & Ohio, and at the western end with the Kanawha & Michigan and the Toledo & Ohio Central.

New York, New Haven & Hartford.—The special report made by the Interstate Commerce Commission to the Senate concerning the affairs of this company, made public this week, is noticed on a preceding page. Simultaneously with this announcement comes the report from Boston that a well-known law firm, representing stockholders not named, will enter suit to recover untold millions on account of alleged mismanagement of the company in former years.

It is reported in Washington that the attorney general is disposed to defer his proposed suit against the New Haven, charging violation of the anti-trust law, until the directors shall have had more time to consider what action they will take under the recently enacted law of Massachusetts.

Coal for Russian Railways.—The finance and trade commission of the Russian Imperial Duma has consented to the prolongation of the free importation of coal intended for use on railways.

Purchases of Rolling Stock for the French Railways.—In the year 1913, the French home and colonial railways placed orders for 1,485 passenger cars, valued at about $10,000,000, and for 13,768 baggage and freight cars having an estimated value of $13,000,000, or in all $23,000,000. Orders were also given for 260 locomotives and 165 tenders at a price of about $8,000,000. In 1912, on the other hand, the orders for locomotives and tenders amounted to $13,000,000.

Western Enginemen's Controversy

On Monday the United States Board of Mediation and Conciliation went to Chicago to offer its services in an effort to bring about a settlement of the controversy between the western railways and their engineers and firemen. The latter are threatening a strike unless they are granted demands for increases in pay and superimposed changes in working conditions which would cost the 98 roads involved some $33,000,000 a year. The issues involved were fully presented in a statement issued on June 1, by A. W. Trenholm, chairman of the Conference Committee of Managers, which was published in the *Railway Age Gazette* of June 5, page 1240, and in an editorial in the same issue, page 1218. Since that time the brotherhoods have taken a strike vote, the details of which they decline to give, and have issued to the newspapers a statement that they will not submit to arbitration. They even declined to join with the railways in a request for the services of the federal mediators, although they accepted mediation after the roads had requested it. It is perhaps natural that Messrs. Stone and Carter should consider it necessary to present a bigger bluff each time they present their audacious demands, and the advance refusal to arbitrate must be so classed, but it is inconceivable that they should be able to maintain such an attitude. A strike such as they propose, to tie up the western railways at the beginning of the crop-moving season at a time when the business of the country has completely transferred its hopes of prosperity from a Democratic administration to the forces of nature, would be lost from the start without the support of public opinion—and the newspapers have clearly indicated what kind of a reception would be accorded a refusal to arbitrate.

President Wilson and the New Haven

After a conference with the attorney general on Monday a committee of the directors of the New Haven announced that they could not carry out the dissolution plan previously agreed on because of the law passed by the Massachusetts legislature giving the commonwealth the right to buy for a reasonable compensation at some time in the future the Boston & Maine stock which was to have been sold by the New Haven under the agreed on dissolution plan. President Wilson thereupon made public a letter calling on the attorney general to bring suit under the federal anti-trust law, together with the attorney general's letter to the President and to Mr. Hustis, of the New Haven. President Wilson in his letter, in speaking of the New Haven directors' decision, says: "Their failure upon so slight a pretext to carry out an agreement deliberately and solemnly entered into and which was manifestly in the common interest, is to me inexplicable and entirely without justification." The attorney general in his letter to Mr. Hustis points out that "it must be remembered that ever since 1909 the commonwealth has had the right to buy the New Haven holding company stock [Boston Railroad Holding Company] at a valuation to be fixed in substantially the same way as is now provided in respect to the Boston & Maine, and that therefore the New Haven's interest in the Boston & Maine is not subjected by the recent statute to any restrictions more burdensome than those imposed upon it when the New Haven was authorized to acquire it." While not in any way passing upon the wisdom or lack of it shown in the New Haven directors' decision, it is fair to point out that whereas the New Haven itself might have been willing to accept certain conditions in regard to what was until the Boston Railroad Holding Company law was passed an unlawful acquisition, it might well be that now no investor or banker could be found who would be willing to buy Boston & Maine stock with a string attached to it. The New Haven directors have no power of coercion over a possible purchaser such as the Massachusetts legislature had over the New Haven management in 1909.

The Failure of the Rock Island Plan

The syndicate which had undertaken to underwrite the sale of $30,000,000 new preferred 7 per cent. stock to Chicago, Rock Island & Pacific Railroad collateral 4 per cent. bondholders and Rock Island Company stockholders has decided to abandon the plan because the present rate of earnings of the company does not make a good showing on the proposed new preferred, and the surplus shown on the last balance sheet of the railway company that was made public is not a real surplus. The collateral bondholders' committee, of which James N. Wallace is chairman and of which the other members are James Brown, of Brown Brothers & Co., New York; Bernard M. Baruch, who is a member of the governing committee of the New York Stock Ex-

change; Henry Evans, president of the Continental Insurance Company, and Frederick Strauss, of the firm of J. & W. Seligman & Co., New York, is asking the further deposit of bonds with the expectation of submitting a reorganization plan "based on the principle of giving the collateral trust bondholders the opportunity, or imposing on them the necessity, of themselves providing the money required." It will be recalled that the plan which has failed, commented on at some length in these columns in the issue of July 3, page 2, called on the collateral bondholders to sacrifice more than a third of their collateral—the Railway company stock—but did not compel them to submit to a cash assessment. The protective committee points out that during the year ending June 30, 1915, over $9,250,000 and during the year ending June 30, 1916, over $11,850,000 of capital obligations of the Railway company and its subsidiaries mature. There is furthermore an ominous suggestion in the last sentence of the committee's announcement:

> Had it not been for the tentative plan arrived at in June this situation [a possible receivership of the Railway company] might have arisen on July 1. That it did not arise was due to the fact that through the effort of the committees, banking interests advanced money to the Railway company in view of the adoption of the tentative plan.

In other words, beside the capital obligations maturing in 1915 and 1916 shown on the last public balance sheet, there is an accumulating floating debt of the Railway company. The fact that James N. Wallace consents to act as chairman of the protective committee is a guarantee that everything possible will be done for the interests of the bondholders. Nevertheless in a situation such as this the revised balance sheet of the Railway company ought to be made immediately available to holders of the collateral trust 4's.

Eliminating Boilermakers as Locomotive Inspectors

The House Committee on Interstate and Foreign Commerce on July 14 ordered reported to the House a bill to eliminate boilermakers as locomotive inspectors for the Interstate Commerce Commission under the boiler inspection act. The bill was introduced in the House on May 12, by Representative Goeke of Ohio, and in the Senate on April 17, by Senator Cummins of Iowa, but its real sponsors are the Brotherhood of Locomotive Engineers and the Brotherhood of Locomotive Firemen and Enginemen. The bill, H. R. 17,894, is an amendment to the present locomotive boiler inspection act, and extends the provisions of that act to apply to and include the entire locomotive and tender and all parts and appurtenances thereof, whereas now it applies only to boilers and their appurtenances. Its real purpose is revealed by its final clause: "That upon the passage of this act all inspectors and applicants for the position of inspector shall be examined touching their qualifications and fitness with respect to the additional duties imposed by this act." There already has been considerable rivalry between the members of the boilermakers' and the other unions for positions in the boiler inspection service, with the result that of 49 inspectors only 14 have had experience in boiler work only, while 16 are former engineers and firemen, without any knowledge of boilermaking. The proposed amendment seems well designed to get rid entirely of those who have no general knowledge of locomotives except such as pertains to boilermaking, and to keep them out of the service. What the boilermakers will have to say to this remains to be seen. Several of the mechanical officers of the railways were given a hearing before the House committee on July 1 and pointed out the lack of need for the bill and the lack of flexibility there would be in its operation. While locomotive boiler inspection undoubtedly has had some good results in requiring the railways to maintain their power in better condition, it is one thing to make rules for boilers and their appurtenances, and quite another thing to deal with all of the hundreds of parts of the complicated locomotive machinery about which there may be as many differences of opinion as there are parts. The bill would require the making by the Interstate Commerce Commission and its inspectors of rigid rules governing the construction and maintenance of all parts of the locomotive, to be enforced by inspectors, most of whom are sure to be incompetent for such important duties.

RAILROAD LABOR LEGISLATION IN MASSACHUSETTS

MASSACHUSETTS legislatures used to be looked upon as possessing a good deal more sanity and conservatism than the average American "deliberative" body, but that favorable view can be no longer entertained. Within the last year or two the labor union demagog has ruled in the Bay State about as recklessly as elsewhere. Two laws have just been passed which may be cited as examples. One is to the effect that Massachusetts station employees (not the agent himself) shall not be employed over 9 hours in any 10 hours; and the other that every person employed in signal towers or at interlocking switching machines or in telegraphing or telephoning train orders shall be allowed two days off each month "with regular compensation." Both of these laws have in them elements of fairness; but both bear the earmarks of the labor union specialist who sees to it that the employees themselves shall not be punished for violations of the laws of health. Men who prefer to work without suitable rest so as to get more money, are never touched by labor union law. In a large majority of station jobs 10 hours, or even 12 hours, is not an unhealthful or unsafe period, for the reason that the men can get rest and time to eat while on duty. It is only a question of the reasonableness of the compensation.

Having failed to get what he wants in money—wages rates—the labor specialist gets the weak-kneed legislators to give him an hour's time. This is the best way to annoy the railroad company for it will cost more to supply a relief man for the hour's "lay off" than it would to pay the regular man a proportionate extra sum. In the monthly two-days' deduction scheme, also, the immediate question is a matter of pay—and not religion or social morality. This bill is so illogical that the governor refused to sign it, and it went into effect because of his five days' silence. The very terms of the statute—"with regular compensation"—reveal its purpose. These tower men all work under the Federal law and have easy hours. It would be difficult to prove that eight hours a day is unhealthful, except possibly in a few hard worked positions. Presumably these men have fair rates of pay. If they work two days less they ought to receive pay for two days less. The terms of the act do not forbid the employer to reduce the rate per day; but the promoters of the law can be trusted to see that this is not done. They know how railroad managers always yield, in small matters, to keep the peace. Laws based on alleged considerations of health afford legislators their easiest opportunities to make fools of themselves. When the United States Steel Corporation relieved a lot of men of Sunday work, thousands of them left and went to work for other mills seven days in the week. Others are said to work six days for the big corporations and also on Sunday for some other employer. Making men either healthy or moral, by statute, is a very difficult matter. It is to be hoped that the process will succeed better with the Massachusetts railroad men than with the Pennsylvania steel workers.

GOVERNMENTAL DISREGARD OF THE EXPERT

THE attitude of Chairman Moon of the House Committee on Postoffice and Post Roads, and also of the Postoffice department, toward the report of the Joint Congressional Committee, which was created to investigate the question of the way in which the railways should be compensated for carrying the mails, well illustrates the attitude usually assumed toward expert bodies by politicians and bureaucrats in this country. In Germany, where the administration of public business is a success, it is usually necessary for a man to be an expert before he can

become a high officer in the bureaucracy, and governmental action is habitually taken either on the advice of experts or by officials who are experts. In this country the fact that a man is a recognized expert on any subject is sufficient to make the typical politician or bureaucrat regard him with suspicion and accept with reluctance, or entirely reject his views.

The attitude assumed by the American politician or bureaucrat toward a body of experts which has been created by Congress is similar to his attitude toward any other expert or expert body, if, perchance, the conclusions reached do not harmonize with his preconceived notions or tend to further his political aspirations. The Joint Congressional Committee, of which former Senator Jonathan Bourne, Jr., the author of the parcels post law, is chairman, spent a long time investigating railway mail pay. It found the existing methods of payment crude, antiquated and unscientific, and the amount paid unjustly low. It decided to recommend to Congress legislation providing for a complete change in the basis of compensation. Before the report could be sent to Congress the chairman of the House Committee on Postoffices and Post Roads and the bureaucrats in the Postoffice department, hurriedly collaborated in preparing and introducing a bill which would reduce the compensation of the railways and which Senator Bourne denounces as unjust to them and designed to give the Postoffice department an autocratic power which would be contrary to the spirit of American institutions.

The developments regarding legislation for the regulation of the issuance of railway securities have been similar. During the Taft administration Congress created a commission to investigate this subject. It did investigate it thoroughly and made a very able report. The report specifically recommended legislation of a certain nature and having certain definite purposes. At this session of Congress a bill for the regulation of securities has been introduced which utterly disregards the report and recommendations of the Hadley Commission.

President Wilson recently nominated Messrs. Jones of Chicago, and Warburg of New York for members of the Federal Reserve Board. He selected them because of his belief in their expert fitness. Their confirmation is being vigorously opposed in the Senate by members of that body who put political buncombe above efficient administration.

The United States is the worst governed civilized country on earth. Its city, state and national legislatures and administrations are wasteful, inefficient and often corrupt. The chief cause of the waste and inefficiency is the habitual ignoring of the expert by the politician and the bureaucrat. One of the fundamental duties of government is to provide and maintain good roads and streets. While good highways are the rule in Europe, they are altogether exceptional in the United States. The main and primary function of government is to prevent and punish crimes of violence. In no other civilized country are crimes of violence so prevalent as here or their punishment so rare.

We are rapidly extending the interference and control of the government in business affairs. Many are advocating not merely government regulation but government ownership. It is manifest to every reading and thinking man that regulation will be a failure and a calamity if it is not done by experts. And government management would be a still worse failure and a still greater calamity if not carried on by experts. But while there is a great public movement to reform, regulate or acquire business concerns that are efficiently managed, there is no movement to reform and improve the worst managed of all our concerns, namely, the governments which are doing the regulating of business, and which many people want to do the managing. Could anything be more abysmally stupid?

AUTOMATIC TRAIN STOPS—III

WE have said that those who advocate the use of automatic train stops and those who do not—who declare the use of such devices unnecessary, or inexpedient, or impossible—ought to get together and thrash out their differences. This presupposes that on both sides there are interests of importance and respectability. A superficial observer might be disposed to deny this. The radical advocate of automatic stops—who, for convenience, we may call a "progressive"—declares that the railways are so slow and unenterprising, not to say neglectful, that they are scarcely to be classed as respectable; the government should brush aside their excuses, stop their dilatory conduct, and by congressional enactment tell them what to do. Big manufacturers, acting truly in the interest of the public, make extensive experiments on their own initiative; the railroads do not do this (at least not in the direction that Congress wants them to) and so they should be coerced.

On the other hand, many railroad men look upon the "progressives" as a lot of unpractical theorists, with whom serious railroad managers, responsible to the public and to stockholders, can ill afford to spend valuable time.

Both of these views should be laid aside, though each may have in it an element of truth. The railroads cannot stand too coldly on their dignity, for now and then they kill passengers, and the public's insistent questions must be answered. The progressive cannot be kicked out of doors, for occasionally he finds a capitalist, supposedly of sober judgment, to espouse his cause; while numerous congressmen take a more or less intelligent interest in his ideas. Many thousands of dollars have been put into automatic stop experiments, and the press can be depended on to help popularize every scheme that has even a small measure of merit. The public in general has ample reason for demanding a full discussion.

It is true that a full and fair discussion probably would not prove an easy thing to bring about. To show the perfection of our present safeguards, even those on the best roads, so that Congress and state railroad commissioners will understand the matter, will be a slow process. Mr. Elliott, of the New York Central, and other signal engineers have appeared before the House Committee at Washington and have laid before the committee numerous important facts; but, as in other similar hearings, there was hardly a beginning toward a thoroughly good understanding. Mr. Elliott for the railroads, and Congressman Esch for the public, would have to spend a good deal of time on the subject to get fully acquainted with each other's respective points of view, to say nothing of enlightening the public. That the general use of automatic stops would introduce new dangers and that at best the protection given would be very costly, can be shown to the lay mind only by a tedious course of instruction.

The railroads, as a body, cannot be said as yet to have formulated the case, even for themselves, in any satisfactory way. This ought to be done even if it be a work requiring some time and money. That A. R. A. report will have to be amplified very greatly before any impression will be made on the public generally. The public says, in effect, that railroad travel can be made safer, and proposes a way to do it. It is the duty of the railroads, if they respect their master, the public, to enlighten that public.

How can the public form a correct idea of the railroads' position? It cannot intelligently differentiate between the Chicago & Eastern Illinois, with ninety engines equipped with the Miller apparatus, and the Pennsylvania, which says, in effect, that an investment like that on the Chicago & Eastern Illinois is wasteful. Electric roads, those out-of-doors as well as those in tunnels, use the stops regularly and are reported as finding their use satisfactory. The reason why the Pennsylvania uses automatic stops in and near New York City and not elsewhere is not well understood; it ought to be made clear.

Experiments with automatic stops, more or less desultory, were begun over twenty years ago—in 1893. For five years, now, experiments more or less sincere have been going on in a number of places. Should the public be expected to reject these schemes as worthless unless and until some recognized authority declares them worthless?

We forget the simple maxim, "in time of peace prepare for war." Unless there shall be an unheard of freedom from disastrous collisions, this question will come up again, in an acute

form. When it does come up the same issues that have been discussed on former occasions will be discussed again. Railroad officers, recalling their experiences before congressional committees, and elsewhere, in the past—as, for instance, in the matter of freight car safety, and boiler inspection—must conclude that the railroads, both in their own interest and in the public interest, should present constructive proposals rather than mere obstructive arguments.

The American Railway Association committee thus far has simply set forth the highest possible ideal, which demands so much that most readers interpret the report as a negative declaration—a statement of what cannot be done. This is looked upon by many as only one move in a policy of delay, which leaves the way open for any and all parties or interests, reliable or not reliable, to exploit whatever schemes they choose—as, for instance, the bill introduced in Congress a year or two ago by Mr. Mann, of Illinois, designed to make the use of a certain type of automatic stop compulsory everywhere!

A committee cannot present constructive proposals in any satisfactory way except on the basis of actual experiments; but if it is wise for the railroads unitedly to go before Congress or the public with definite proposals, this duty of making experiments must be faced. Surely there is not much hope of presenting a united front, with any chance of convincing objectors, so long as it is left to individual roads to follow each its own ideas. The New Haven road's ten-thousand-dollar offer does not seem to have resulted in much progress, as yet. If extended experiments are desirable, the railroad interest as a whole should consider the question of carrying them out. If any road were unwilling to bear a fair share of the cost of such experiments, it would have to consider the possibility that Congress may compel all roads to bear an unfair share—that is, require them to make unwise experiments. To congressmen this matter appeals as a small detail, and they will take no great pains to adjust financial burdens with extreme nicety.

In speaking of experiments we mean, of course, not one of those short-lived installations designed to dazzle investors or congressmen, of which we have had far too many, but a course of experiments which shall bring out the full truth. As is well known to every railroad officer who has studied the subject, the real need is not for a device to stop a train—we have a dozen of those already—but a reliable *system;* which includes not only machines and their operation, but men and administration and innumerable operating details. The New Haven road's $10,000 offer, by its terms, can at best only get to the starting point of the essential study.

And not only are the railroads better fitted than the government to do whatever testing is necessary—they only are competent to do it. An experiment extending over two years' time and perhaps a hundred miles of territory, can be fully successful only under the direction of a manager who is clothed with very full powers and who can have at all times a sympathetic official atmosphere.

It is to be remembered, finally, that the real issue is not the accomplishment of perfection, but the accomplishment of a decided improvement. As we understand it, the conclusion reached by the officers of the Interborough as to the lesson of their ten years' experience is that duty to the public requires the adoption of the best available arrangement; that to defer action in the hope of getting something better would be a mistake. The action of the French government must be taken to indicate the same lesson; that with very dense traffic the best available is well worth having. If automatic stops are not desirable, and if the next best thing is a cab signal or an audible roadside signal, Congress will quickly turn its attention in that other direction. The railroads should forestall Congress.

Always it must be remembered that there are two problems: One is that of safety and the other that of economy. By the use of "speed control" to do away with some of the objections to automatic stops, or by the adoption of cab signals or audible roadside signals, the question of safety may be put on the road to settlement; but having settled that, the question of cost will still remain. We do not minimize this feature. But suppose this item—safety from collision—should prove as costly as that of the steel passenger car: Can it be evaded? And, as in the case of the steel car, it may be that it is not desirable to evade it. However this may be, the first question should be settled first.

There is an element of sober truth in the well-known observation of a certain railroad president that it would be possible to preserve passengers' lives at too great a cost per passenger. But the question of the ultimate cost is a vital one. The public, if we may judge by its attitude in the matter of freight rates and other things, will not accept an unfavorable answer concerning the question of cost until the whole subject has been clarified by further demonstrations in the mechanical field.

NEW BOOKS

Proceedings of the American Railway Engineering Association. Size, 6 in. by 9 in., 1,563 pages, illustrated, bound in half morocco, cloth or paper. Published by the American Railway Engineering Association, Karpen Building, Chicago. Price, half morocco, $7; cloth, $6.50; paper, $6.

Following the practice established two years ago, this volume is printed on India paper, enabling the 1,563 pages to be printed in one volume. It contains the complete proceedings of the fifteenth annual convention held in Chicago, March 17-19, 1914, with 21 committee reports and discussions, and eleven monographs which have been published previously in the bulletins of the association during the past year. Following the practice of last year, all the reports have been presented together, followed by the discussions on the various reports grouped together, with the monographs last. The work of this association is so commonly recognized as representing the best accepted practice in the country that detailed comment is unnecessary. This volume is printed in the same high class manner characterizing the Proceedings of earlier years. The Proceedings of this association are coming more and more to be recognized as necessary for frequent reference by all railway officers concerned directly with the maintenance of track and structures.

Engineering Geology. By Heinrich Ries, professor of economic geology, Cornell University, and Thomas L. Watson, professor of economic geology, University of Virginia. Size 6 in. by 9 in., 672 pages, 400 illustrations, cloth binding. Published by John Wiley & Sons, Inc., New York City. Price $4.

The authors of "Engineering Geology" have given students in civil engineering in their respective universities, special courses in geology as applied to engineering for some years, and in the belief that there is a need for a similar course in other technical schools they have undertaken to prepare a suitable text book.

The authors believe that many civil engineering courses are deficient in the attention given to geology and their belief will no doubt be shared by many engineers who in their early practice encountered problems in tunneling, dam or reservoir construction, the handling of land slides, the securing of a proper water supply, the disposal of sewage or the purification of water, etc. The authors have attempted to illustrate all geological principles by actual cases in engineering work, as it is felt that this method appeals more strongly to practical engineers as well as students and is more successful from the pedagogic standpoint.

The following chapter headings indicate the scope of the work: the rock forming minerals; rocks, their general character, mode of appearance and origin; structural features and metamorphism of rock; rock weathering and soil; surface water; underground water; land slides and their effect; wave action and shore currents, their relation to coasts and harbors; lakes, their origin and relation to engineering work; glacial deposits, their origin, structure and economic bearing; building stone; limes, cement and plaster; clay and clay products; coal series; petroleum, natural gas and other hydrocarbons; road foundations and road materials; and ore deposits. Two appendices are included, the first giving a geologic column, and the second treating of geological surveys.

The Division of Freight and Passenger Expenses

New and Old Formulas Contrasted and the Newest Formula Applied to the 1914 Classification of Expenses

The Interstate Commerce Commission in its tentative form of annual report for the fiscal year beginning July 1, 1914, has included blank columns which at the option of the railroad company may be used to show a division between expenses incurred in passenger service and expenses incurred in freight service. The Pennsylvania Railroad was the first important American railroad company to divide its expenses as between freight and passenger service, and its formula for this division has been revised from time to time. The latest and most comprehensive attempt to divide freight and passenger expenses has been made by the roads running through Oklahoma. The accounting officers of these roads have worked in conjunction with the Oklahoma Commission to draw up an experimental set of formula for dividing all expenses as between states, as between state and interstate, as between line and terminal, and as between freight and passenger service. The divisions as between states and as between line and terminal were described in these columns in the issue of July 3.

The Oklahoma scheme is far more comprehensive and less arbitrary than the Pennsylvania's, but, on the other hand, of course, is purely an experiment, while the Pennsylvania's has been used in practice for a great number of years and has been found to be valuable for comparative purposes.

Maintenance of way presents the most difficulties of any of the general classes of expenses, since so many of the primary accounts under this heading must necessarily be divided on some more or less arbitrary basis. Both the Pennsylvania scheme and the Oklahoma scheme are based on the old system of Interstate Commerce Commission accounts, which was discontinued July 1, 1914, but it is possible to apply the same principles to the new system of accounts which went into effect at the beginning of this fiscal year.

The Pennsylvania divides all of the maintenance of way and structure primary accounts as between freight and passenger service on a revenue train mileage basis with the exception of electric power transmission and docks and wharves. There would, therefore, be no change, presumably, in the Pennsylvania's system with the new classification. The Oklahoma scheme does not attempt to divide freight and passenger expenses until expenses have been divided as between line and terminal (see July 3 issue of the *Railway Age Gazette*).

The theory which underlies the Oklahoma division of maintenance of way and structure expenses is that a considerable proportion of these expenses may be divided directly, and fairly accurately, through careful observation of the facts. Thus the expenses of superintendence for both line and terminal maintenance of way accounts are to be divided directly wherever possible, and this presumably means that an actual study of the time spent by officers whose salaries are charged to superintendence shall be made with the expectation of being able to assign at least a part of their salaries, office expenses, etc., directly to one service or the other. The remainder of the superintendence expenses, that is, the expenses common to both services, are, under the Oklahoma scheme, to be divided in the same proportion as are the expenses for line and for terminal, respectively of ballast, ties, rails, other track material, roadway and track, removal of snow, sand and ice, tunnels, bridges, trestles and culverts, over and under grade crossings, grade crossings, fences, cattle guards and signs, snow and sand fences and snow sheds, signals and interlocking plants, telegraph and telephone lines, electric power transmission, buildings, fixtures and grounds, and docks and wharves.

In the first draft of the Oklahoma scheme the line expenses of the first nine of these accounts were to be divided experimentally on four different bases. (1) On a revenue train mileage basis; (2) on a train speed ton mile basis; this is the gross ton miles of revenue freight and passenger trains, including the weight of the locomotive and cars as well as loading, multiplied by the average speed between stations for such trains. (3) On an engine ton mileage basis the weight of the engine including the tender with coal and water; and (4) on the basis of the assigned line expenses—that is, the directly assignable expenses of the cost of the repairs of steam locomotives; cost of repairs of passenger train cars; cost of repairs of freight train cars; road enginemen's wages; road engine house expenses; fuel for road locomotives; water for road locomotives; lubricants for road locomotives, and other supplis for road locomotives; road trainmen and train supplies and expenses, and clearing wrecks.

The line expenses under these twelve accounts are divided as follows: The repairs of steam locomotives on a mileage run basis with the switching mileage subdivided according to time spent in each class of service. Passenger and freight train car repairs are, of course, assigned to passenger and freight service respectively, as are also the wages of road enginemen, engine house expenses and fuel, water, lubricants and other supplies for road locomotives, the engine house expenses being apportioned on the basis of locomotives handled, and locomotives in mixed service being apportioned on the basis of freight and passenger car ton miles in mixed trains, the fuel, etc., involving common expenses being apportioned on the basis of fuel issued to the locomotives involved, with the mixed engine mileage divided on the basis of respective freight and passenger car ton miles; road trainmen and train supplies being apportioned the same as road enginemen, and clearing wrecks being apportioned to the service in which the wreck takes place; common expenses, such as a wreck involving both freight and passenger trains being apportioned on the basis of the charges for clearing wrecks, assignable exclusively to each one of the two services.

The Oklahoma scheme calls this fourth method of dividing the roadway and track (labor and materials) expenses, the Cost Accounting Method. From one point of view this is true since upkeep of roadway is not an object in itself, but simply a means to the desired end of producing transportation and is, therefore, incidental to the cost of producing transportation and as an incidental expense it may properly be divided upon the proportion of determinable expenses. Moreover, the inclusion of maintenance of equipment expenses which vary in part with the weight of equipment and certain expenses which are divided on a car ton mileage basis, as well as the expenses of clearing wrecks, is a highly ingenious attempt to weight the average used in the arbitrary division of maintenance of way expenses.

The second method goes into less theoretical refinement, and for this reason may not be so strictly in accordance with cost accounting principles, but it appears to be more practically useful. In this method speed and weight of trains are given a relationship, arbitrary, of course, but one in which practice alone can show glaring defects. Rails, ballast and other track material do wear out directly both with the tonnage passing over them and the speed of the trains. Ties, of course, rot on most roads from weather conditions rather than because of pounding either from weight or speed of trains, but the standard of ties and the frequency with which they are renewed does depend quite directly both on weight of trains and on the speed of trains. No instructions are given for estimating the weight of passengers, but this is not a difficult thing to do with a fair degree of accuracy, and

when passenger equipment, is once weighed, it is not difficult to keep a record of the weight of trains.

The objection to the second method comes when we consider removal of snow, maintenance of tunnels, and over and under grade crossings. It is fanciful to say that these expenses vary with speed and weight of trains. It would seem that these accounts ought to be divided according to the fourth method.

The final revised Oklahoma scheme uses no one of these four methods and divides the above accounts for common tracks as between freight and passenger on the basis of engine ton miles based on weight of engines in working order. Presumably it was felt that keeping a record of total weights of passenger trains was hardly worth the expense involved and presumably the same consideration led to the elimination of speed as one of the factors. Since, however, this factor of speed varies so widely and, moreover, is of so much importance in determining the standard of maintenance, it seems a pity that for experimental purposes at least the engine ton mile was not multiplied by average speed between terminals.

Terminal expenses of the nine primary accounts are, of course, in many cases on a directly assignable basis. Common tracks, such as shop, store house and repair tracks, are apportioned on the basis of the assigned charges of terminal expenses, of repairs of steam locomotives, repairs of passenger train cars and repairs of freight train cars. Common expenses, such as engine house, turntable, wye, fuel and water tracks, are apportioned on the basis of the assigned charges for engine house expenses.

The maintenance of grade crossings, fences, cattle guards and signs, and snow and sand fences, and snow sheds for line facilities, are apportioned on the basis of revenue train miles as between freight and passenger service, the terminal facilities upkeep charges of grade crossings, etc., being charged to freight, and the snow and sand fences not being charged to terminal at all.

The maintenance of signals and interlocking plants being entirely a line charge, are apportioned between passenger and freight service—for the interlockers on the basis of respective number of freight and passenger trains passing over them, and for signals on the basis of respective train miles.

The maintenance cost of telegraph and telephone lines used in line service are allocated direct to passenger or freight where possible and the common expenses on the basis of revenue train miles, while the maintenance charges of these facilities used in terminal service are apportioned on the basis of the charges for station employees, which charges are assigned on the basis of a time study of each employee.

The maintenance of electric power transmission can, of course, be allocated direct to one class of service or the other for both line expense and terminal expense on the basis of power used.

The maintenance of buildings, fixtures and grounds used in both line and terminal service are allocated direct to freight or passenger, according to use and facilities that are used in common by both services, such as common depot and station buildings on the basis of the estimated portion of repairs incurred by each class of service, considering each building on its merits. Engine house repairs are divided in proportion to the charges made to each service for engine house expenses, both yard and road. Shops on the basis of assigned locomotive and car repairs, fuel and water stations, proportionate to the charges for fuel and water transportation expenses—yard and road; and section and tool houses on the basis of the division of roadway and track expenses.

Maintenance of docks and wharves both line and terminal are allocated direct where possible and common expenses on a basis of use. Roadway tools and supplies (line) are allocated on a basis of revenue train mileage and terminal are all charged to freight.

Injuries to persons, stationery and printing and other expenses both line and terminal are allocated direct to freight or passenger where possible, and common expenses on the basis of previously mentioned maintenance of way and structure accounts, excepting superintendence and roadway tools and supplies. Maintenance of joint tracks, yards and other facilities (line) are apportioned direct where possible, and common expenses on a basis of revenue train miles of each district, and common terminal expenses on a basis of the cars of each class of service handled at the terminals.

MAINTENANCE OF EQUIPMENT

Maintenance of equipment with certain exceptions lends itself comparatively easily to accurate division as between freight and passenger service. The Pennsylvania divides its expenses as follows: Superintendence on the basis of the other maintenance of equipment items, steam locomotive repairs, renewals and depreciation on a revenue train mileage basis; and repairs, renewals and depreciation of electric locomotives, passenger train cars, freight train cars, electric equipment of cars and floating equipment according to the facts; power plant equipment also according to the facts. The repairs, renewals and depreciation of work, equipment and insurance are divided on the basis of revenue train mileage, while shop machinery and tools, injuries to persons, stationery and printing, and maintaining joint equipment at terminals, are divided on the basis of other maintenance of equipment accounts.

The Oklahoma scheme is almost as simple, but expenses that are not directly assignable are divided on what appears to be a more scientific basis. Superintendence, both line and terminal, is apportioned on the basis of assigned charges for respective locomotive, passenger car, freight car, and work equipment repairs. Both line and terminal expenses of repairs of steam locomotives are divided as between freight and passenger, switch and work on a basis of miles run by individual locomotives in each service, and the switch mileage is further subdivided on the basis of the time spent in freight and passenger switching, and the work on the proportion of the basis of assigned charges of maintenance of way and structure expenses, excepting superintendence and roadway tools and supplies, injuries to persons, stationery and printing, and maintaining joint tracks. Renewals and depreciation are divided on the same basis as repairs, as are also the repairs, renewals and depreciation of electric locomotives. The repairs, renewals and depreciation of passenger train cars are, of course, assigned to passenger service, and freight cars to freight service, and all electric equipment of cars on the basis of freight and passenger cars, all floating equipment according to the service in which used, and all work equipment on the basis of the maintenance of way charges mentioned above. Shop machinery and tools are apportioned on the basis of assigned charges for the respective locomotive, passenger car, freight car and work equipment repairs, as are also injuries to persons, stationery and printing and other expenses, power plant equipment being apportioned on a basis of power used.

Maintaining joint equipment at terminals being entirely a terminal charge is divided as between passenger and freight direct where possible and common expenses on the basis of respective cars handled at terminals.

TRAFFIC EXPENSES

There is an interesting difference in the Pennsylvania and Oklahoma methods of dividing traffic expenses. The Pennsylvania assumes that all of these expenses can be accurately divided according to the facts, even to superintendence, which, under each of the other general classes of expenses, is divided in the Pennsylvania scheme on an arbitrary basis.

The Oklahoma scheme considers all traffic expenses as terminal, but does not assume that all of them can be divided accurately as between freight and passenger and of the common expenses apportions 50 per cent. each to freight and passenger. The reason that the Pennsylvania's traffic expenses can all be divided is because the Pennsylvania has a distinct organization of freight and passenger traffic men, all the way up to the vice-president, who, however, is in charge of the entire traffic department.

TRANSPORTATION EXPENSES

The primary transportation accounts which the Pennsylvania apportions between freight and passenger on a basis of "facts" are station employees, weighing and car service associations, coal and ore docks, motormen, enginemen (when in mixed passenger and freight service, their wages are divided between these accounts on the basis of mileage of cars in mixed trains); fuel for road locomotives (for mixed trains divided on car mileage basis); operating power, purchased power, road trainmen, train supplies and expenses (pay of employees and material used in connection with mixed passenger and freight trains apportioned between these accounts on relative work performed or use made of material); operating floating equipment, express, loss and damage to freight and baggage. The primary accounts that are apportioned on revenue train mileage are superintendence, despatching trains, station supplies and expenses, yardmasters, yard conductors, yard switch and signal tenders, yard supplies, crossing flagman, drawbridge operation, clearing wrecks, telegraph and telephone operation, stationery and printing, insurance, damage to property, damage to stock, injuries to persons, operating joint yards and terminals.

Yard enginemen, engine house expenses (yard), fuel for yard locomotives, water and lubricants for yard locomotives and other supplies, are divided on a yard locomotive mileage basis and operation of fuel stations, water for road locomotives, lubricants and other supplies, are divided on a road locomotive mileage basis.

The Oklahoma scheme divides superintendence, both line and terminal, by directly assigning expenses where possible and apportioning common expenses on the basis of assigned charges of all other transportation expenses, except telegraph and telephone operation and express service, stationery and printing, other expenses, loss and damage to property and stock, injuries to persons, and joint tracks and facilities. Despatching trains is apportioned for line service—there being no terminal service—on the sum of total train mileage of freight and passenger trains in the same territorial units as are used for dividing these expenses between the different states.

Station employees are the subject of time studies and their wages are divided in proportion to the duties performed by them in each class of service.

Weighing and car service associations, and coal and ore docks expenses are assigned to freight exclusively. Station supplies and expenses are allocated direct where possible and common expenses are apportioned on the basis of the assigned charges for station employees.

All yard expenses are to be divided on a time basis, the expenses of each yard to be treated separately and all passenger switching to be considered line service.

Motormen, road enginemen, fuel and water for road locomotives, and lubricants and other supplies for road locomotives, road trainmen, train supplies and expenses are all allocated direct with mixed service apportioned on the basis of freight and passenger car ton miles in mixed trains. Engine house expenses are apportioned on the basis of the number of locomotives handled, locomotives in mixed service being apportioned on the basis of freight and passenger car ton miles in mixed trains.

Operating power plants and purchased power are apportioned as between freight and passenger on a basis of mileage of equipment used employing such power, while interlockers and block signal operation, crossing flagmen and gatemen, and drawbridge operation which are line services are apportioned on the basis of freight and passenger trains passing such facilities. Crossing flagmen and gatemen and drawbridge operation, which are terminal service, however, are apportioned on a basis of assigned charges of yard operation.

Clearing wrecks is charged to the service in which the wreck occurs and common expenses apportioned on the basis of located charges. Telegraph and telephone operation is apportioned on the basis of all maintenance of way, maintenance of equipment, traffic and transportation expenses. The cost of operation of floating equipment is, of course, assigned according to the service performed. Stationery and printing and other expenses are assigned directly where possible and apportioned where common on the same basis as superintendence. Loss and damage to freight is, of course, assigned to freight service and baggage to passenger service, and damage to property, to stock on right of way, and injuries to persons directly where possible, and common expenses are apportioned on the basis of directly assignable charges of this account. Operating joint tracks and facilities are assigned directly where possible and common expenses are apportioned on the revenue train mileage by divisions in each service.

GENERAL EXPENSES

The Pennsylvania divides all general expenses on a revenue train mileage basis.

The Oklahoma scheme assigns salaries of general officers, their clerks, expenses and general office supplies, directly where possible, apportions the remainder on the basis of the assigned charges on all expenses other than general expenses. Law expenses are allocated in the same way, while insurance, directly where possible, is apportioned when common on the basis of "appropriate units of property or persons insured." Relief department expenses, pensions, stationery and printing, and other expenses are apportioned on the basis of assigned charges to all expenses except general expenses.

General administration of joint tracks, yards and terminals, where common, is apportioned on the basis of assigned charges on all other joint facility accounts. Valuation expenses are apportioned on the basis of all assigned charges except general expenses.

THE NEW CLASSIFICATION

Both the Pennsylvania and Oklahoma methods of dividing expenses use the old form of primary accounts, but it is possible to apply the theory apparently underlying the Oklahoma scheme to the classification which went into effect July 1, 1914. The following table is an attempt to carry out the Oklahoma theories for the new classification. It is understood that the division of expenses as shown in this table is in all cases direct where possible, and the column headed direct, contains the accounts which may be charged in whole to one service or the other. The other columns give instructions for dividing common expenses of such accounts as are not assignable in their entirety direct to one or the other service. Thus the expense of superintendence under maintenance of way and structures is to be allocated directly where possible to freight and passenger service, and it is only the balance which is not directly allocatable that is to be divided on the same basis as the assigned charges in accounts 202 to 220, excluding 204 and 205, and adding 272. In the same way a part of the charge for roadway maintenance may represent the cost of roadway maintenance of tracks used exclusively in freight service, and another part the cost of roadway maintenance of tracks used exclusively in passenger service. These directly assignable charges are to be made to the proper service and it is only the remainder which is to be allocated on a basis of engine ton miles.

The table will be clearer by following through a hypothetical example. The accompanying table shows an expense account for a road of 800 miles. Superintendence under maintenance of way on this road cost $70,000, and no part of this sum could be assigned directly to either freight or passenger service. According, therefore, to the Oklahoma scheme this $70,000 is to be divided between freight and passenger service on the same basis as the charges to accounts 202 to 220, excluding 204 and 205, and adding 272. It will be seen that these accounts are to be divided direct where possible, and where this is not possible, on an engine ton mile basis. According to our table, the total of these accounts that are common to both passenger and freight amounts to $1,186,500, and there is $24,600 directly assignable to freight and $3,400 directly assignable to passengers. The $1,186,500 is now to be divided on a basis of engine ton miles. Let us suppose

that our road uses Mikados in through freight service and Pacific type locomotives in through passenger service, and that the total engine ton mileage in passenger service was 126,240,000, and in freight service 873,640,000. If X, therefore, represents the proportion of the total $1,186,500 assignable to passenger service, we have 126,240,000 : 873,640,000 :: X : $1,186,500. Thus X =

Maintenance of Way and Structures

On the basis of assigned charges in accounts 202, 220, omitting 204-5 and including 272	Engine ton miles	Revenue train miles	Direct	Repairs incurred by each class of service	Assigned charges accounts 388 and 400	Assigned charges locomotive and car repairs	Assigned charges account 202-203 and 220	Basis of use by trains in each class of service	On a basis of power used in each class of service	Basis of accounts 382 and 394
Superintendence; injuries to persons; assessments for public improvements; insurance; stationery and printing; other expenses.	Roadway maintenance; ties; rails; other track material; ballast; track laying and surfacing; paving; removing snow, ice and sand; tunnels and subways; bridges, trestles and culverts; elevated structures.	Right of way fences; snow and sand fences, and snow sheds; crossings and signs; telegraph and telephone lines; signals; roadway machines, small tools and supplies; maintaining joint tracks.	Grain elevators; storage warehouses; wharves and docks; coal and ore wharves; gas producing plants; miscellaneous structures.	Station and office buildings.	Engine houses.	Shops	Roadway buildings.	Interlockers.	Power distribution systems; underground power tubes; power line poles and fixtures; underground conduits; power plant dams; power plant buildings; power substation buildings; power transmission systems.	Fuel stations. Basis accounts 385 and 397 Water stations.

Note.—The above table shows only the division of line expenses. In general the terminal expenses are to be divided in the same way as the line expenses, or rather in an analogous way. Thus the maintenance charge for wharves and docks, where a line charge, is assigned on the use for either freight or passenger service, where a terminal charge is likewise assigned on the basis of use for either freight or passenger service. There are certain exceptions, however, noted below. Accounts 202 to 220, omitting 204 and 205, but adding 272, where a terminal facility, are divided not on the engine ton mile basis but in accordance with the following instructions: (a) "Common tracks, such as shop, storehouse and repair tracks, to be apportioned on the basis of assigned charges in accounts 308, 314 and 317; engine house, turntable, wye, fuel and water tracks to be apportioned on the basis of assigned charges in accounts 388 and 400." (b) Telegraph and telephone lines, where a terminal charge, are apportioned on the basis of assigned charges in account 373. (c) Maintaining joint tracks, yards and other facilities, where a terminal charge, is apportioned on the basis of respective cars handled at such terminals. "In each case depreciation is on the basis of repairs.

Maintenance of Equipment

Basis of assigned charges for repairs	Basis of miles run by individual locomotives in each class of service	Basis assigned charges 202-220, omitting 204-5 and including 272	Direct	Basis of power used	Basis of cars handled at terminals
Superintendence; shop machinery; injuries to persons; insurance; stationery and printing; other expenses.	Repairs of steam locomotives; repairs of other locomotives.*	Working equipment repairs.	Freight train cars; passenger train cars; motor equipment of cars; floating equipment repairs; miscellaneous equipment repairs.	Power plant machinery; power sub-station apparatus.	Maintaining joint equipment at terminals.

*Where the locomotives are used in switching, locomotives' repairs are on the basis of time in freight and passenger switching.

Note.—The formulas for dividing maintenance of equipment expenses (terminal) are analogous to those for dividing maintenance of equipment expenses (line). In each case, of course, depreciation and retirements are divided on the same basis as repairs.

Traffic

Direct	50 per cent. of freight and passenger respectively
Outside agencies; advertising; traffic associations; fast freight lines; industry and immigration bureaus.	Superintendents; insurance; stationery and printing; other expenses.

Note.—Terminal expenses are divided in the same way as line expenses.

Transportation—Water Line

Operation of vessels.—The salaries of officers and the cost of fuel for vessels transporting both passengers and freight should be apportioned on a basis of the relative space assigned to passengers and to freight on such vessels.

Operation of terminals—As above.

Incidentals.—As above.

Transportation Expenses

Assigned charges 372-406, 408, 415	Basis of total train mileage of freight and passenger trains in territorial units	Direct	Time basis	Basis of freight and passenger gross ton miles in mixed trains	Basis of mileage of equipment used employing power
Superintendence. Stationery and printing. Other expenses.	Despatching trains.	Station employees. Station supplies and expenses. Weighing, inspection and demurrage bureaus. Coal and ore wharves. Operating sleeping cars. Loss and damage to freight. Loss and damage to baggage.	Yardmasters and yard clerks. Yard conductors and brakemen. Yard switch and signal tenders. Yard enginemen. Yard motormen. Fuel for yard locomotives. Yard switching power produced. Yard switching power purchased. Water for yard locomotives. Lubricants for yard locomotives. Other supplies for yard locomotives. Engine house expenses—yard. Yard supplies and expenses. Operating joint yards and terminals—Dr. and Cr.	Train enginemen.* Train motormen. Trainmen. Train supplies and expenses.	Train power produced. Train power purchased.

Basis of freight and passenger trains passing facilities	Basis of located charges of the same account	Basis of assigned charges of all accounts for maintenance traffic and transportation—rail	Basis of service performed	Basis of locomotives handled	Revenue train mileage	Basis of appropriated units of property or persons insured
Signals and interlocker operation. Crossing protection. Drawbridge operation.	Fuel for train locomotives.* Water for train locomotives. Lubricants for train locomotives. Other supplies for train locomotives. Clearing wrecks. Damage to property. Damage to livestock on right-of-way. Injuries to persons.	Telegraph and telephone operation.	Operating floating equipment.	Engine house expenses—road.	Operating joint tracks and facilities — Dr. and Cr.	Insurance.

Note.—Transportation expenses, where terminal, are divided in the same way as transportation expenses—line, with the following exceptions: Crossing protection and drawbridge operation, where the expense is terminal, is divided on the basis of accounts 377 to 391 inclusive; operation of joint tracks and facilities, where terminal, is apportioned on the basis of cars handled.

*This is, of course, only for mixed train service. In freight or passenger service these expenses are charged direct.

GENERAL EXPENSES

On the basis of all accounts other than general	On the basis of all other joint facility accounts.	On the basis of appropriate units of property or persons insured
Salaries and expenses of general officers	General joint facilities.	Insurance
Salaries and expenses of clerks and attendants.		
General office supplies and expenses.		
Law expenses		
Relief department expenses.		
Pensions		
Stationery and printing.		
Valuation expenses.		
Other expenses.		

MISCELLANEOUS OPERATIONS

Direct	No charge
Dining and buffet service.	Produced power sold
Hotels and restaurants.	
Grain elevators.	
Stock yards.	
Other miscellaneous operations.	

about $171,000. This leaves $1,015,000 of the total of these charges to be assigned to freight service.

Adding the directly assignable amounts to each of the derived figures we have $174,400 total charges against passenger service, and $1,040,100 against freight service. We are now in the position to divide our $70,000 superintendence charges and have $174,400 : $1,214,500 :: X : $70,000, where X represents the amount of superintendence chargeable to passenger service. X equals, therefore, $9,970 and the total superintendence charges is divided $9,970 to passenger and $60,030 to freight service.

This, of course, is only for line expenses. Superintendence charges for terminal maintenance of way are to be divided as the *terminal* proportion of the same 202 to 220, etc., accounts are to be divided. The instructions for dividing these terminal accounts are to locate direct where the facilities are used exclusively in either service and to divide the expenses of common tracks, such as shop, storehouse and repair tracks, on the assigned charges for the repairs of steam locomotives, the repairs of passenger cars and the repairs of freight cars, and such other common tracks as engine house, turntable, wye, fuel and water tracks on the assigned charges for engine house expenses, both yard and road—are apportioned on the basis of locomotives handled.

In our example above we have assumed that there were no superintendence maintenance of way charges for terminal expenses.

The complications that arise under the Oklahoma scheme are at once apparent from our example. It consists of wheels within wheels and complications within complications, but so does the operation of a railroad. If a cost accounting system is to be devised for a very complicated set of transactions a minute analysis is necessary and it would be quite surprising if the accounting could be accurately done by means of some simple formula.

New Classification of Expenses

FOLK'S NEW HAVEN REPORT

[From an article by The Onlooker in *The Annalist*.]

During Charles S. Mellen's exciting career as a witness immune before the Interstate Commerce Commission in the recent New York, New Haven & Hartford investigation at Washington the commission's counsel, Joseph W. Folk, was a frequent caller at Mr. Mellen's rooms in the Shoreham Hotel. He was, in fact, the only caller outside of a few personal friends, and his repeated visits aroused curiosity. At last one of Mr. Mellen's acquaintances asked him what it was all about—what Folk came to talk over with him. He smiled cynically. It was almost incredible. The counsel of the Interstate Commerce Commission, whose knowledge of New Haven affairs was less than that of the Park Row journalist who openly coached him, came evenings to his chief witness, not to learn anything about the case, not to get light on obscure episodes, such as the Billard transaction, and not even to fish for clues, but to solicit the former president of the New York, New Haven & Hartford to employ vivid and picturesque language in his testimony on the morrow, for purposes of newspaper headlines.

On leaving the stand the last day Mr. Mellen could not restrain the remark to an acquaintance that he was going back home with about two-thirds of his information intact. The commission's counsel had not known how to get it.

Mr. Folk had no understanding of accounting himself, and had neither the industry to master its perplexities nor the wit to provide himself with experts big enough for the job. For instance, there was the notorious Billard transaction. Several days after Billard himself had been on the stand, and had succeeded in leaving the subject as bedimmed as it was before, a New York journalist arrived to hear the Mellen testimony first hand. He spent his leisure time going over the Billard testimony. In the official stenographer's record he found references to certain financial exhibits marked, "Billard A, B, C, D, E, and F," which had not been copied into the record. He first applied for them to Billard's personal counsel, who was staying over, but his only copy of the exhibits was in New England. Next the journalist applied to Mr. Folk, who stared at him blankly; he did not know anything about them. His attention was called to the reference in the record at the place where the exhibits were offered in evidence and marked, "Billard Exhibits A, B, C, D, E, and F." He shook his head. Possibly the accountants knew. Ask them. The accountants, too, had forgotten them. By the record it was clear that such exhibits did exist, but nobody knew where to look for them. A search was insisted upon, and after half an hour the exhibits were found in the bottom of a clothes basket full of other papers and documents. The journalist copied them off and then tried to analyze them. They did not analyze, that is, the figures did not balance, as any capable accountant must have been able to see upon five minutes' study, but Billard had been allowed to stand on them, as they were, and to leave a hopeless record of the transactions carried on in his name by the New Haven Railroad. A competent accountant ought to have been able to take those figures, start at the beginning and force either Mr. Billard or Mr. Mellen step by step into a corner out of which either the truth or the bald refusal of it had been bound to come.

"What would you have done," the journalist asked Mr. Mellen, "if a man who knew accounting had forced you through those figures to the point of the ultimate question?"

"I would have been obliged to tell things I did not tell," he said. "I was not there to volunteer information they did not know how to get."

And so it stands in the record and in the conclusions of the Interstate Commerce Commission that John L. Billard retained more than $2,700,000 in a transaction in which he represented the New Haven Railroad, and in which he invested not a dollar of his own. That is not true. That was the apparent difference in the par value of securities, but the actual value of what Mr. Billard came off with, clear and free, was probably under $1,500,000. It was after Mr. Mellen retired, and through a trade with the new management, that he got a final profit at all. The investigators did not go into that; they probably did not know how. It may be said that $1,500,000 was as preposterous as $2,700,000; but the point is that the Interstate Commerce Commission failed to get the truth, and, failing, let it go at that.

THE RAILWAYS OF NIGERIA.—It is said that Nigeria is so swampy that horses and mules do not thrive in it and that, therefore, transportation is dependent entirely upon roads for foot traffic, railways and the waterways. Besides a seacoast of about 500 miles, the country has more than 1,000 miles of navigable inland waterways and over 900 miles of railway, a little over 700 of which is of 3 ft. 6 in. gage and 200 miles of 2 ft. 6 in. gage. There are also about 500 miles of new railway line under construction.

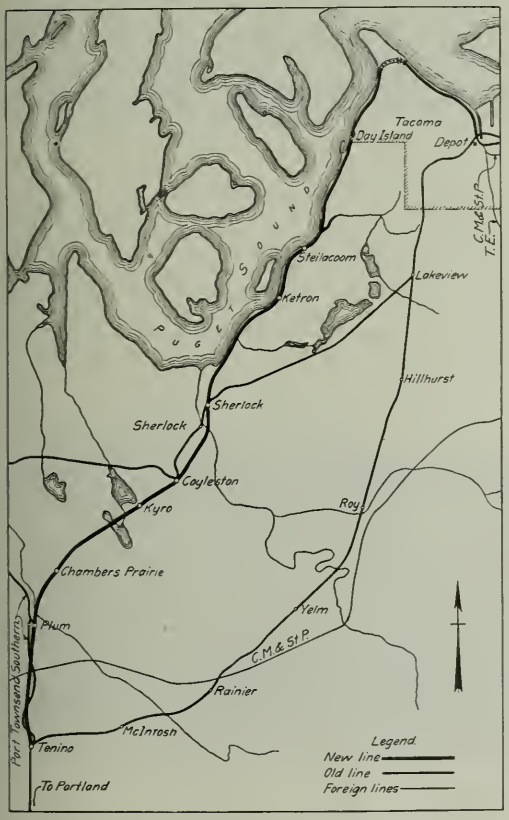
New Low Grade Line from Tacoma, Wash., to Tenino

This 44-Mile Section Completes Northern Pacific Double Track Road Between Seattle and Portland

The Northern Pacific is now completing a double track low grade line from Tacoma, Wash., south 43.7 miles to Tenino, to replace the existing single track line between those points. The new line is on an entirely new location removed several miles from the present one and involves some very heavy construction work under unusual conditions. The building of this line completes the reconstruction and double tracking of the entire line from Tacoma, south to Portland, thus providing double track from Portland to Seattle.

TRAFFIC

In addition to the traffic of the Northern Pacific, the Great Northern also operates over the tracks of the Northern Pacific from Seattle to Portland, and the Oregon-Washington Railroad & Navigation Co. from Tacoma to Portland. Thus, although this line is the only one from Portland north to Puget Sound points, it is used by all three of these trunk lines on an equal basis; it carries 22 regular scheduled passenger trains daily in addition to an average of about 18 freight trains.



Map Showing Location of New and Old Lines Between Tacoma and Tenino

The O. W. R. & N. started operation over this line on January 1, 1910, and the Great Northern on June 19, following, at which time work had already been begun on the reconstruction of the line and building a second track from Tenino south to Portland. With the inauguration of this additional train movement the demand for increased facilities became more urgent and the work was prosecuted vigorously until the second track south of Tenino was placed in operation late in 1911. In rebuilding this portion of the line, numerous changes in grade and alinement were made so that the ruling grade south of Tenino is now 0.3 per cent. in each direction with the exception of five miles of one per cent. grade ascending both ways to Napavine, 25 miles south of Tenino.

CHARACTERISTICS OF OLD AND NEW LINES

North of Tenino the grade on the old line is very broken and consists largely of one per cent. grades in both directions, with 2.2 miles of 2.2 per cent. grade ascending directly from the station at Tacoma. The maximum curve on the old line is 10 deg. The tonnage rating southbound is now 2,000 tons with helper service up the hill from Tacoma; switch engines from the yard are used for helper service, three such locomotives being required as helpers on a tonnage train.

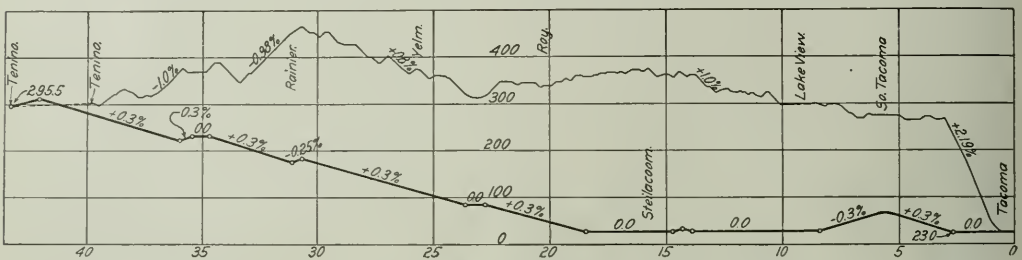
The heavy through traffic of all three roads between Portland and Tacoma is materially increased by local traffic of the Northern Pacific coming onto this line from the Moclips branch at Centralia, from the South Bend branch at Chehalis, and from the Olympia branch at Lake View. This traffic, combined with the physical characteristics of the old line, made necessary the inauguration of radical improvements north of Tenino. The topography along the old line made the construction of a low grade line on this location impractical and an entirely independent line was located.

Starting from Tenino the new line follows in a general way the location of the Port Townsend Southern, a subsidiary of the Northern Pacific, for six miles to Plum, and then continues northeast 16 miles across Patterson Lake to the east shore of Puget Sound. The line then follows the east shore of Puget Sound for 16 miles to Point Defiance, Tacoma, passing through the point in a tunnel 4,391 ft. long to the south shore of Commencement Bay, which it follows for five miles to a connection with the old line at the entrance to Tacoma station.

The distance by way of the new line, as compared with the old, is increased from 39.18 miles to 43.71 miles and the curvature from 824 deg. to 1,347 deg. However, the ruling grade southbound is reduced from the 2.2 per cent. out of Tacoma and one per cent. elsewhere to a maximum of 0.3 per cent., compensated in both directions. With the exception of the 0.3 per cent. grade in the Point Defiance tunnel, provided for drainage, there is practically no adverse grade against northbound trains. The total rise and fall on the new line is 421 ft. as compared with 1,244 ft. on the existing line. The maximum curve is also reduced from 10 deg. on the old line to three deg. on the new. With the locomotives now in use on this division, the new grade will permit an increase in the tonnage to 3,000 tons southbound, limited by the Napavine hill, and will increase this rating still more as far south as Centralia and Chehalis by filling out with cars for these branches, in this way decreasing the mileage of these branch line trains between Tacoma and Chehalis. Because of the rapidly increasing traffic on this, the only north and south line along this portion of the coast, the new line was located as a four track line, of which the two westerly tracks are now being built.

The situation at Tacoma station will also be materially

improved. At present a reverse movement at the foot of the 2.2 per cent. grade is necessary for all trains either in entering or leaving the passenger station, while the freight tracks cross the passenger line at grade at the throat of the station. The present station was built two years ago with the present work in view so that upon the completion of the new line, passenger trains will be pulled directly into and out of the station without any reverse movement and freight and passenger traffic will be entirely separated at the station. From the station north almost to the Point Defiance tunnel, the new line lies on the present location of several important industrial tracks, necessitating a considerable rearrangement of large steam shovels on this line in addition to two Model 40 shovels for miscellaneous light work.



Profile of Old and New Lines

yards and industrial connections to afford main tracks independent of the switching leads.

GRADING

The construction of this line was authorized early in 1912 and work was immediately started on the grading. The yardage is estimated at 7,500,000 yd. consisting almost entirely of earth. The contract provided for only two classifications, earth and solid rock. The largest fill on the line, which was at the crossing of the Nisqually river, was 72 ft. high and about a half mile long, requiring 1,500,000 yd. of material.

The grading south of Puget Sound involved no particular difficulties. The only slide of any importance was about two miles north of Tenino where the line crosses a low divide in a cut originally estimated to contain 195,000 yd., in addition to 200,000 yd. of borrow material which was to be taken out beyond the regular slopes. As the work progressed the material on one side for a horizontal distance of 700 ft. back and to a height of 300 ft. above grade started to move into the cut. A photograph shows the condition of this cut after the shovel had been hurriedly pulled back following a rise in the bottom of the cut and a further side movement during one night. At the time of this slide a total of 600,000 yd. of material had been removed. The contractor placed seven large steam shovels on this line in addition to two Model 40 shovels for miscellaneous light work.

THE SECTION ALONG PUGET SOUND

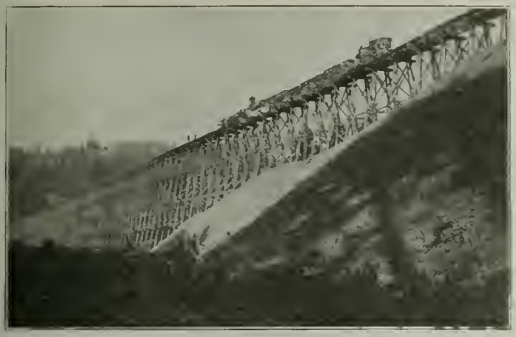
The most interesting problem is in the construction of that portion of the line lying along Puget Sound. For 16 miles this location lies almost entirely in the Sound, supported only on occasional points of land which it crosses. Coming south out of the tunnel at Point Defiance the grade descends until the elevation of subgrade is five feet above high tide and then continues level for 10 miles, after which it rises to turn inland. The average variation in tide in this vicinity is 17 ft. and a maximum variation of 21 ft. has been observed. To protect the embankment on such a location from storms and heavy wave wash it was necessary to construct 12 miles of seawall. To provide this seawall and also a means for the construction of the embankment, a trestle was built consisting of three-pile bents spaced 15 ft. apart for heights exceeding 9 ft. above the bottom of the Sound and two-pile bents below that height with an intermediate braced pile between each two bents. These piles varied in length from 16 to 44 ft., depending on the depth of the water and were driven to a minimum penetration of 12 ft.

The bottom consisted mainly of sand and gravel with some clay and some cemented gravel. In the latter material, holes were sprung with light charges of powder and the piles driven in the holes thus started. The piles were capped by 12 in. by 12 in. timbers and properly cross-braced. The grade of the top of the caps was established at three feet above high tide. The outside piles were driven on a batter of three inches to one foot, this inclination making necessary the use of a pendulum driver pivoted at the upper end. The contractor built three such drivers for this work. The intermediate braces consisted of one pile driven on this same batter with two 4 in. by 8 in. timbers braced to a 16 ft. anchor pile, as shown in the drawing. The inside faces of these main piles

A Heavy Slide North of Tenino

were planked solidly with six inch planks to the elevation of mean high tide.

As this timber seawall was completed, the contractor placed a deck on it and used it as the construction trestle on which he brought out his material to construct the embankment. This material was for the most part loaded by steam shovels working in cuts where the line crossed points extending into the Sound or in borrow pits, although in some instances material was sluiced directly from high banks into the fills. As



Constructing Heavy Fill at Approach to Patterson Lake

the fill was widened out sufficiently behind the wall, the contractor threw his track onto it and raised it to subgrade two feet above the top of the caps. The center of the nearest track was 15 ft. 6 in. inside of the center line of the seawall trestle.

The waters in Puget Sound are seriously infested with teredo which attack the piling up to about 10 ft. above low tide. Although timber given a heavy penetration of creosote is practically immune to the attacks of the teredo for some time, untreated piles were used for this wall as it was not considered necessary to go to the increased expense of using

Making Fill Across a Sink Hole at Patterson Lake from a Trestle Carried on a Raft

treated piles when in any event it would be necessary to protect the bank ultimately with riprap. Accordingly, as fast as a portion of the embankment was completed it was protected with a heavy facing of stone, although in several instances piles were entirely cut off by the teredo and rose to the surface before this riprap could be applied; the life of this timber, in some instances, not exceeding three months.

About 250,000 yd. of rock were required for the protection of this embankment and the specifications required that 90 per cent. of it must be one cubic foot in volume or larger, allowing up to 10 per cent. of spalls. This material was brought in by scows from Waterman and was placed by contract by means of one floating derrick, one derrick working from the seawall and one outfit of scows dumping directly at high tide. The lower portion of the wall was made by these scows and it was completed by the derricks. The finished wall stands on a 1:1 slope up to the top of the timber sheeting and is then inclined on a flatter slope to the shoulder of the embankment as shown in the sketch. Approximately 522,000 lineal feet of fir piling were required for this seawall, all of which was specified to have a minimum of nine inches of heart wood. In addition, 7,220,000 ft. B.M. of timber other than piles was required and over 1,368,000 lb. of iron.

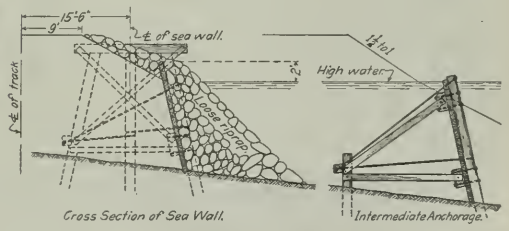
POINT DEFIANCE TUNNEL

Next to the seawall the most interesting problem was the construction of the Point Defiance tunnel through the projection between Commencement Bay and Puget Sound proper, just outside the city limits of Tacoma. This tunnel is 4,391 ft. long and is built for two tracks on a 0.3 per cent. grade each way from the center to provide drainage. It is on tangent with curves at each end. The material through which it

Completed Portion of Sea Wall and Embankment

was driven is very fine sand. Work on this tunnel was pushed from both ends with shields. Wall plate drifts were first driven, followed closely by the shields supported on these wall plates. These shields were driven forward with twelve 80-ton hydraulic jacks with a limit of movement of one foot. The timbering followed immediately behind these shields.

Motor driven belt conveyors carried the material excavated from the wall plate drifts out onto the bench. Similar conveyors carried the muck out from the center drift. At the east end a bottom center drift was then driven at grade sufficiently large to permit a dump car to enter and the remainder of the material was trapped into cars. At the opposite end the bench was taken out with a Marion 40 air



Sea Wall Along Puget Sound

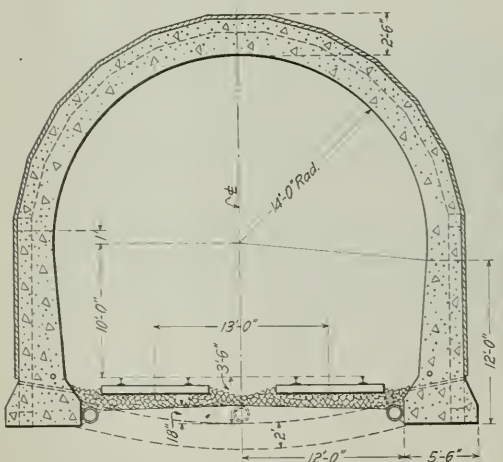
operated shovel loading into small cars which were handled by an electric locomotive. Work on this tunnel was started late in April, 1912. It was holed through on June 11, 1913, and the last of the bench material was removed on June 21. The maximum distance driven in one month was 731 ft. in May, 1913.

In lining the tunnel with concrete, alternate ribs only were

removed and the remaining timbers were concreted in place. The concrete mixing plant at the east portal is shown in one of the photographs. Stone and sand were elevated into storage hoppers above the mixer with a belt conveyor and cement was stored in the adjoining shed. The concrete was dumped into cars which were hauled into the tunnel with a small

Interior of Point Defiance Tunnel Showing Timbering

electric locomotive. The cars were then hoisted and dumped onto an elevated platform which was mounted on four trucks running on two tracks and moved forward as the work progressed. The concrete was shoveled into the sidewalls or arch ring by hand. About 120 yd. of concrete was deposited by each plant at each shift. The cross section of the



Cross-Section of Double Track Tunnel at Point Defiance

wall required 7½ cu. yd. of concrete per lineal foot, enabling a 16 ft. section of the arch to be keyed up daily. This lining required 39,000 cu. yd. of concrete in addition to 3,710,000 ft. B.M. of timber. Power for operating the locomotives, for lighting the tunnel while this work was in progress and for running the mixers was generated by a plant at the west portal.

Another tunnel 300 ft. long was built through heavy blue clay a short distance east of the long one. Side drifts were first driven on the elevation of the wall plates and were then widened until the entire arch section was excavated. Wall benches were then driven, the sidewalls were built and the arch rings put in, after which the center bench was removed. This tunnel was also driven from both ends. Construction

Concrete Mixing Plant at Entrance to Point Defiance Tunnel

was complicated somewhat by an agreement with the town of Rustin in which it was located, providing that a roadway tunnel which the city desired to construct alongside the railroad, be driven first and the intermediate wall be used in common. Delay in completing the city's portion of the work held up the railway for some time but not sufficiently long to delay the opening of the line.

OTHER CONSTRUCTION FEATURES

Three steel bridges are required. The Des Chutes river is crossed seven miles north of Tenino on one 150 ft. deck truss and two 50 ft. deck girder approaches. The Nisqually river is crossed 11 miles farther north on three 150 ft. deck trusses and two 100 ft. approach spans. At Steilacoom an 80 ft.

The Substructure of the Nisqually River Bridge

Strauss direct lift bridge was built with a creosoted timber approach. Creosoted pile structures were also built at Wilton Waterway, Bay Island and two other points along the Sound, care being taken to secure a heavy penetration of creosote to render this timber immune from the attacks of the teredo.

Smaller openings were provided for with concrete pipe made by the railway company at a plant built especially for

this work at Auburn, Wash., 18 miles north of Tacoma, and described in the *Railway Age Gazette* of February 20, 1914. This pipe was made in 24 in. and 36 in. sizes, over 10,000 lineal feet of each size of pipe being required. About 200 concrete piles were also cast in this yard for use under the ends of the girder approaches to the longer spans.

This new line is laid with 90-lb. open hearth rail on untreated ties. After the completion of the line, all through traffic will be routed over it, but the old line will continue to be operated for local traffic.

This road is being built under the direction of W. L. Darling, chief engineer, Northern Pacific; J. C. Breedlove, assistant engineer, is in direct charge of the work to the city limits of Tacoma, while that work within the city is being handled under the direction of A. R. Cook, principal assistant engineer. All bridge work was designed under the direction of H. E. Stevens, engineer of bridges. Porter Brothers, Grant, Smith & Co., Portland, had the contract to build the foundations for all bridges and to do all grading, track laying and ballasting on this line south of the tunnel and the Keasal Construction Co. had the contract north of the tunnel for the grading and masonry work. Nelson Bennett, of Tacoma, had the contract for the tunnels.

GENERAL FOREMEN'S CONVENTION*

At the Thursday morning session A. P. Prendergast, superintendent of machinery of the Texas & Pacific, addressed the association. Mr. Prendergast emphasized the need of good treatment of employees and urged that provision be made for their comfort, and also that good tools be provided for them or they cannot do good work. A large percentage of employees will follow the example of their leaders, and it is therefore necessary that supervising officers use care in conducting themselves. He urged foremen to study the personality of the individual workmen so that they may be assigned to work for which they are best fitted. He also placed considerable stress on the help which can be obtained by carefully reading railway technical papers. The address was replied to by Dr. Angus Sinclair.

VALVES, CYLINDERS AND PISTONS

J. T. Mullin presented a paper from which the following is taken:

Piston valves on superheater locomotives should be examined once every 30 days, as a great deal of carbonization accumulates on them. Piston valves with the Stephenson valve gear should be set with negative lead to obtain the greatest efficiency from superheater locomotives. Piston valves and valve chambers when worn 1/32 in. should be rebored, and new valve rings should be a perfect fit in the valve chamber and should be 3/32 in. larger than the chamber. Old rings reapplied in the shop or engine house should be at least 1/16 in. larger than the valve chamber.

It has been found on locomotives converted from saturated to superheated steam that the cylinders have a tendency to crack leading from the valve chamber to the receiving ports of the cylinder. In order to overcome this we are applying a cross-brace from front to back between the valve chamber and the cylinder, shrinking it and drawing the metal together in order to hold it when under the high temperature. This has overcome the cracking of this part of the cylinder.

Pistons should be examined every shopping as in some cases they are apparently in good condition until examined, when they are found to be worn flat.

Discussion.—With the Stephenson valve gear a number of roads follow the practice of keying the eccentrics to the main axle before the wheels are under the engine. A record is kept of the position of the eccentrics so that the practice may be uniform on different engines of the same class. The Lackawanna has found trouble on superheater locomotives with the graphite lubricator because of carbonization, causing the piston rings to tilt, and blows resulting. It was stated that much trouble with valves may be eliminated by removing the relief valves and instructing the men to work steam to a stop. The practice of examining valves and piston rings periodically, generally every thirty days, seems to be quite general, but one member did not think it was necessary. He claimed that this method was too expensive and that satisfactory results could be obtained by the enginemen reporting trouble after it starts. Several members expressed the opinion that lack of lubrication was the cause of much cylinder and valve trouble where a little more oil would save much repair expense on rings and bushings. Two roads have done away with piston rod oil cups on superheater locomotives and use swabs with valve oil. This has been found to reduce carbonization, as the enginemen, it was claimed, will use low grade oil in the oil cups and this carbonizes very easily.

AUTOGENOUS WELDING

C. L. Dickert (Central of Georgia) presented a committee report of which the following is an abstract:

Literally speaking, the methods mentioned in these papers would not come under the head of autogenous welding, but as we know and speak of them as such we have included them.

Each method has its advantages; the electric, for welding flues to the back flue sheet, I believe, has the field to itself. However, the oxy-acetylene advocates claim great progress along this line. For cutting, the oxy-acetylene process is in a class by itself; there is a difference of opinion as to which is best on a general run of boiler work. Economy and efficiency are the two main points to consider.

We have the electric and oxy-acetylene plants installed at Macon shops, and have done quite a lot of welding with both, but I am not in a position to give a comparative cost or the efficiency of the two methods. We at first installed the oxy-acetylene plant and used this method altogether, and about two years later we installed the electric. Shortly after the electric outfit was going, we had an accident occur to the acetylene plant. We then had to resort to the electric for all classes of welding. We have just about completed our new acetylene plant and have made a few tests on side sheets with the electric and oxy-acetylene. One of our greatest troubles is breaking in operators and holding them after they have learned to handle the torch successfully. Each craft does the welding of metals that originates in its respective department; blacksmiths handle all wrought iron, steel and cast steel; boilermakers all boiler plates and flues; machinists, cast iron; and coppersmiths do all the brass and pipe work.

One great defect is that its use appears too easy, and it is applied in all sorts of ways. The operators, as a rule, give it but little study, which is responsible for practically all failures, as the average mechanic, these days, devotes but little time to study on the things pertaining to his trade. A blacksmith of the right caliber would, in my opinion, be the right man to handle the welding, as he has more knowledge of heating metals, taking care of expansion and contraction, etc., than mechanics from other departments. At any rate, whoever is put on the job should have a competent instructor, and should be furnished with all the reading matter that is published from time to time on the subject, so as to familiarize himself with the work.

Autogenous welding has enabled the railroads to reduce the cost of repairs, increase mileage of flues, prolong the life of fireboxes, reclaim worn parts of locomotives, repair broken parts of machinery, and numbers of other savings. All large shops, to have a complete arrangement, should have all the systems.

Electric Welding.—A field in which electric welding has proved very successful and profitable, is that of welding flues to back flue sheets. We have in service today over 90 locomotives with flues welded to the back flue sheet, making a total of about 27,000 flues. Out of this number of locomotives in service with

*See *Railway Age Gazette*, July 17, 1914, page 105, for report of the first two days' proceedings.

flues welded, we have our first engine to fail on the road from flues. We have, however, had some few flues leak after being in service a short while, which was due to bad beads when they were welded in. If part of the bead is off, exposing the copper, it is very difficult to get a good weld.

When new flues are to be welded, we apply them in the usual manner, with copper ferrules, rolling the bead and prossering. A heavy bead is built up in welding to the flue sheet. This leaves a rough finish. Some roads shape up the beads with a cutter, while others go over them with a beading tool to smooth them over. We find this is not necessary.

Where flues that have been welded in are to be removed, it only requires a few hours longer to cut off the beads, and we find that the flue sheet is in better condition than before welding in flues, as welding builds up the sheet around the flue holes to about the original thickness. We have a tool for facing off the rough surface after the flues are removed, making a good clean sheet for applying new flues.

Welding in half side sheets and patches, repairing mud rings, etc., has proved very successful with the electric process.

Electric welding has proved valuable in filling up worn links, link blocks, blade jaws, saddle pockets and cellar bolt holes in driving boxes; welding new notches in quadrants, worn places in frames caused by spring rigging wearing; building up piston fits to crossheads, rod ends and straps; in fact everything that is worn or broken that it is possible to reclaim at a profit. There is no limit to its usefulness, as we always find something new to be done.

Oxy-Acetylene Welding.—The oxy-acetylene process of welding and cutting has passed the experimental stage, and has made a more rapid growth in the past few years in railroad work than in all the preceding years combined. For cutting it has the field to itself.

Oil Welding.—Oil welding of locomotive frames has been the practice at Macon shops for the past two years. Quite a number of welds have been made during this time which have proved very successful. The success of oil welding, like all other methods of frame welding, depends largely on allowances made for expansion and contraction.

There is but little expense attached to this method of welding. The outfit consists of a small oil burner, an oil tank and two small battering rams. The entire outfit is mounted on a four-wheel truck which is easily handled around the shop. The material used is crude oil, fire brick and fire clay, which amounts to about $2; the balance of expense is for labor, which amounts to about $6; making a total cost for preparing and welding frames on an average of $8.

The Chicago & North Western is using three methods of welding with very good results in each case: oil welding, thermit and oxy-acetylene welding. If there are any light frames broken, say through the pedestal jaw or lower rail, or back braces, they resort to oil welding as it is considered much cheaper and quicker than any other process. For broken frames on heavy power thermit is used almost entirely, and with very great success. They have had one or two cases where the frames have broken again at the weld, but it is not believed that the thermit was to blame so much as the men doing the job, in not allowing enough for contraction in the cooling process, and thereby putting an undue strain upon that part of the frame.

The Delaware & Hudson uses both the electric and oxy-acetylene welding processes. On boiler work they weld in flues, small cracks, seams, mud rings, etc. With boiler work this has not proved entirely successful, due to leaks that develop later and have to be corrected. However, they are making progress along this line, and are continuing its use.

The oxy-acetylene system they have had going about one year, starting with portable oxygen and acetylene tanks. The class of work done includes the welding of various castings when defective, building up of the worn surfaces on the heavier castings, as this is a surer process than the electrical welding of engine frames, which is not always successful, welding engine truck frames and cradles, all frame braces and brackets, plugging holes in heavy motion work parts, reclaiming nearly all tender bolsters, guides and pedestals, cracked locomotive bells, etc. On boiler work they weld in all firebox door sheets when they join in the fire door hole, and apply patches to boilers, which is not always successful, due to the tendency to crack on cooling. They also apply sections to flue sheets and weld broken bridges. These also have to be frequently gone over the second or third time on account of cracks due to contraction.

In repairs to fire door cracks, experience strongly indicates, for back shop practice at least, that better results are obtained by cutting out the cracks, replacing by patches the sizes of which are governed by the nature and size of the crack. Merely welding up old fire door cracks usually leads to future trouble, since the crack starts from the inside and can be only partially seen from the outside with the result that all of the crack is not completely welded up, and possibly cracks existing on the water side and not visible from outside may be increased by the strain of contraction from the heat of welding a closely adjoining crack. By cutting out cracks which are visible from outside and welding in patches of new material this trouble is eliminated The Atlantic Coast Line has experienced excellent success with boiler repairs made by the oxy-acetylene process at the Waycross, Ga., shops, including some radical departures over the old method of repairs.

The report is signed by C. L. Dickert, chairman; R. B. Van Wormer, A. C. L.; C. M. Newman, A. C. L.; A. A. Masters, D. & H.; F. P. Miller, C. M. & St. P., and Wm. Hall, C. & N. W.

Discussion.—The discussion of this paper was entered into with a great deal of interest, and on the subject of oxy-acetylene welding, Mr. Byers, of the St. Louis & San Francisco, presented considerable information on the work done at the new Springfield shops of that road. The shops are piped for acetylene gas and 20 welders are kept busy performing various classes of work. From July 1, 1913, to June 30, 1914, that shop consumed 856,700 cu. ft. of oxygen and 108,800 lb. of carbide, and it was estimated that a saving of $83,191.60 was obtained by the use of this process, the following table giving a list of the amount and kind of work during this time:

Parts	Pieces	Parts	Pieces
Ashpans	637	Shop machines	692
Brackets	391	Main rod brasses	8
Braces	661	Miscellaneous repairs	473
Bolsters	13	Main rods	146
Crossheads and pistons	254	Miscellaneous parts	4,914
Center castings	26	Oil boxes	531
Center plates	2	Pedestals	626
Cylinders	23	Reverse lever strips	368
Driving boxes	240	Rocker arms	100
Drawbars	12	Running boards	374
Driving wheels	3	Steam chests	5
Door collars and sheets	400	Steam pumps	10
Deck castings	1	Side sheets	495
Equalizers	236	Steam pipes	62
Engine frames	567	Truck boxes	113
Front end ring	45	Truck frames	14
Firebox work, misc.	3,017	Triple valves	2
Lubricators	3	Water columns	4
Flue sheets	261		

Mr. Byers stated that all firebox side sheets are welded in and that good success has been obtained with welding frames, there being only two failures out of 77 frame welds made. It has, however, been found difficult to get a satisfactory weld with cast iron, only one man having been found who could do this so that it could be machined. It is necessary to have expert men to perform oxy-acetylene welding, and it has been found that blacksmiths make the most apt students. In welding tubes in the tube sheets, Mr. Byers stated that it is not necessary to use the copper ferrules.

Other members could not report as all-round good success as did Mr. Byers, and attributed their trouble to inexperienced help.

Those roads using electrical welding have found it very successful, being able to weld more difficult jobs than they could with the oxy-acetylene process. C. L. Dickert, of the Central Railway of Georgia, claimed that an electrical welding outfit would pay for itself by its success in welding tubes, and the results have shown that 22 tubes could be welded per hour by one man. With this process he has been able to fill up wrist-

pin and knuckle-pin holes and flat spots on tires very satisfactorily. Thermit welding has proved generally successful. On the Chicago & North Western at Clinton, Iowa, out of 154 thermit welds, there were only five failures, three of these being man failures. Other roads reported equally good results.

AIR BRAKE REPAIRS

The following is an abstract of a paper by Chas. M. Newman (Atlantic Coast Line):

The maintenance of the air brake depends largely on five principles: Accessible location of parts which require frequent attention; proper installation; methods of inspection; to what extent terminal repairs are made; methods of making repairs to the principal parts.

Accessible Location.—As an assistance to maintenance, this is very important. When time is short and many repairs are to be made, the parts most accessible will receive the attention and those inaccessible will be neglected. This results in lowering the efficiency of the brakes, in neglect of equipment and in increase in the cost of maintenance. I have seen air pumps located so close to the running board that it was next to impossible to remove the bottom head or a valve cap without removing the pump or the board.

Proper Installation.—A good air brake equipment improperly installed is an expensive device from which efficient service cannot be obtained. The heart of the equipment, the air pump, should be made perfectly secure in its location, and so located that the intake will not be in a position to get the dirt and grit from the running boards or ashes from the pans when fires are being cleaned or dumped. Reservoirs and other parts which have several pipes connected should be fastened to some place as free from vibration as possible and the fastening made securely, as improper installation and location of such parts are responsible for a great many leaks and broken pipes. When a distributing valve is used, it should be applied to substantial brackets and these to a place free from vibration. As little drop as possible for the brackets will prevent some vibration. Brake valves and signal valves should not be located too close to the boiler, as excessive heat interferes with their efficient operation.

Gages should never be fastened directly to iron brackets, but small blocks of soft wood, of a uniform thickness, should be used between the gage and the bracket. Too much cannot be said on the proper installation of piping. Many failures to engines and cars on account of defects in the air brake equipment can be traced to badly clamped and crooked pipes, or pipes with an insufficient number of clamps, or clamped or bent in such a manner as to form pockets. All piping should be put up with as few elbows as possible, using easy bends instead.

Methods of Inspection.—Before any engine leaves the engine house its entire air apparatus should be given a thorough inspection and test by competent men, and all perceptible defects corrected. The air pump should be given an efficiency test to make sure that it is capable of supplying the necessary quantity of air under ordinary conditions.

Something which is very frequently overlooked by inspectors, especially on locomotives, is the matter of the brake levers, beams and hangers being the correct ones for the type of engine. Frequently, a repair man, at an outside point, will replace one of these with one the nearest to the correct one that he has. This lever may increase the braking power and under unfavorable conditions would cause wheels to slide; or he may have decreased the braking power by applying a light beam or the wrong hanger, which reduces the efficiency of the brakes.

The proper time to inspect a train is on its arrival. To do this, the incoming engineer should add to the reduction required to stop, enough to fully set the brakes on the train. The inspectors should be present and make an immediate examination and bad order all defective brakes. In seeking accessible places to make brake tests and inspection without loss of time, extra switching or danger to workmen, the freight house and transfer tracks should be considered. Here, the number of cars handled per day is considerable, and these tracks should be supplied with compressed air and full advantage taken of this excellent opportunity of locating and remedying defects.

Terminal Repairs.—Good brakes depend on the attention they receive at the terminal. You cannot depend on the repair tracks in shops keeping up the air brake equipment. All defects noted by the inspectors should be corrected. At the very best, the regular terminal test of brakes on engines or cars misses many of the defects, and for that reason it is important that as few defects as possible be allowed to escape repair. However, it does not follow that the repairing of defective brakes cannot be done without delay to cars which should go forward promptly.

Such repairs as ordinary brake pipe leaks, defective hose gaskets, wrong piston travel, etc., which require little time should be made on the service tracks; but cars requiring heavy brake repairs should be marked for the repair tracks. Here is where good judgment must be exercised, as perishable or other very important loads or empties needed for such lading must not be delayed. By assigning a certain track in important terminal yards for air brake repairs, which require more time than the ordinary repairs made on the service tracks, and a few men with the necessary repair materials, such cars are often repaired and go forward in the first train out, and very few are allowed to go forward without repairs being made. All cars in shops or on repair tracks with cleaning dates over nine months old, should have their brakes cleaned and lubricated. Not only will the condition of brake cylinders and triples fully warrant this, but it is improbable that these cars will be so favorably located again for months, without causing delay and switching.

When triples need cleaning, it is not a good policy to do it on the repair or service tracks, but they should be removed and sent to the shops, or some place fitted with a test plant, so that, after the operation of cleaning and lubricating, they can be placed on the test rack and given the required test; then they are ready to be replaced on the car or engine, and efficient operation is assured.

Another apparently small defect will be found on almost every train which is carefully inspected is air leaks. A large railroad, which operates long trains successfully, has an allowable maximum train line leakage as follows: For trains of from 25 to 50 cars, 7 lb. per min.; for trains of from 50 to 75 cars, 6 lb. per min.; for trains of 75 cars or over, 5 lb. per min.

Methods of Making Repairs.—Practically all of our air brake parts are removed and applied to the locomotive by handy men and helpers. When carried to the air brake department for overhauling, the work is done by specialists; that is, handy men or mechanics who have been trained in each line. By using men in this manner, we get the highest efficiency from the man on each part.

Discussion.—The chief point brought out was that the different parts of the air brake apparatus should be placed in more accessible places, giving an opportunity to repair and inspect them readily. A change in the design of the air pump piston rods from the shoulder to the tapered fit of the piston was believed to be needed; where it has been done a reduction in broken piston rods has been experienced.

THE TAYLOR SYSTEM

A subsidiary paper on this subject was presented by W. W. Scott (D., L. & W.) in which he said, in part:

After a careful analysis of the scientific principles of either the Taylor or Emerson school, we may find in many of the details, nothing entirely new in doing work. The shop manager may have a much better way in handling some detail; but the new principles should not be confused with methods. If you have the principles of scientific management and a purpose to carry them out, any man may get results, though his methods of applying the principles may vary.

The history of the development of scientific management calls for a word of warning. The mechanism of management must not be mistaken for its essence or underlying philosophy. Pre-

cisely the same mechanism will in one case produce disastrous results and in another the most beneficial. The same mechanism which will produce the finest results when made to serve the underlying principles of scientific management will lead to failure if accompanied by the wrong spirit in those who are using it.

ELECTION OF OFFICERS

The following officers were elected for the ensuing year: President, W. W. Scott, general foreman, D., L. & W., Buffalo, N. Y.; first vice-president, L. A. North, superintendent of shops, Illinois Central, Chicago; second vice-president, Walter Smith, Chicago & North Western, Chicago; third vice-president, W. T. Gale, machine foreman, Chicago & North Western, Chicago; fourth vice-president, W. G. Reyer, general foreman, Nashville, Chattanooga & St. Louis, Nashville, Tenn.; secretary-treasurer, Wm. Hall, Chicago & North Western, Winona, Minn.

CLOSING EXERCISES

J. Hannahan, formerly chief of the Firemen's Brotherhood and now a representative of the Locomotive Stoker Company, addressed the association, pointing out to the members the necessity of all railroad men working together to prevent so much adverse legislation that has proved to be merely political ammunition. Every railroad man should exert what influence he can to impress his representatives in either the state or federal legislatures, that they should treat the railroads fairly. He also spoke of the vast opportunities ahead of general foremen, mentioning a number of prominent men who have worked up through this position.

PASSENGER TERMINAL IMPROVEMENTS AT BUFFALO

The Delaware, Lackawanna & Western began construction work about the first of the year on its new passenger station and the rearrangement of its terminals in Buffalo, N. Y., in accordance with its agreement with the city's Terminal Station Commission. This commission was created by special act of the state legislature about four years ago, with power to negotiate with the railways entering the city to secure freight and passenger terminal improvements that have been desired both by the railways and the city. The membership of the commission, as fixed by the act of the legislature, consists of ten prominent citizens of Buffalo serving without pay, the commission having authority to act in this matter for the New York Public Service Commission. The constitutionality of the act was contested in the courts and was upheld by a decision rendered in March, 1913. The commission has done little toward the consideration of the problem of improving the city freight terminals, as some immediate relief for the passenger terminal situation was urgently needed.

There are at present four principal passenger stations at Buffalo; first: the so-called union station owned by the New York Central & Hudson River and used also by the Buffalo, Rochester & Pittsburgh; the Lake Shore & Michigan Southern; the Michigan Central; the Pennsylvania, and the West Shore; second: the Lehigh Valley station, used also by the Grand Trunk; third: the Erie station, used also by the New York, Chicago & St. Louis, and the Wabash; and fourth: the Delaware, Lackawanna & Western station. All of these stations are old and inadequate properly to handle the traffic. Also, in a number of instances the approaches cross streets at grade, endangering street traffic and causing delays in entering the station. Following extended negotiations with the Terminal Commission, the Lackawanna reached an agreement last year for the improvement of its entrance and the construction of a new station. The New York Central and the Lehigh Valley are still conducting negotiations for similar improvements and it is possible that in the rearrangement the roads now using the Erie station may become tenants of the New York Central. It has been tentatively decided to locate the New York Central station on the Terrace just west of the present union station near the location of a small station on the Niagara Falls branch of that road. It is expected that the Lehigh Valley will use its present entrance with some improvements in street crossings, but the location of its new station east and west has not yet been fixed.

The Lackawanna enters the downtown district of Buffalo from the southeast, approaching the Buffalo river near Michigan street and paralleling the river from that point to the passenger station and beyond to the coal docks. The double track line crosses Michigan street overhead and then drops down to the street level, the tracks being laid in Ohio street for the remaining distance to the station. The old passenger station is located on the west side of Main street with the lake freight house just across the tracks on the river front. The coal docks are located about one-half mile west of the station and the local freight house north of the main tracks near Columbia street. The advantages of this river front location for the freight traffic are evident, and as the passenger station is only a few blocks from the hotel and office district of the city and the other railway stations, its location was also satisfactory. The old building was entirely inadequate, however, having been remodeled from the structure used by the street railway company as a car barn in the days of horse car operation. It was also very desirable from the standpoint both of the railway and the city to remove the tracks from the public streets along the river front.

Perspective Sketch of Proposed D. L. & W. Passenger Station at Buffalo, N. Y., from the River Side

The traffic to be considered in designing the new passenger

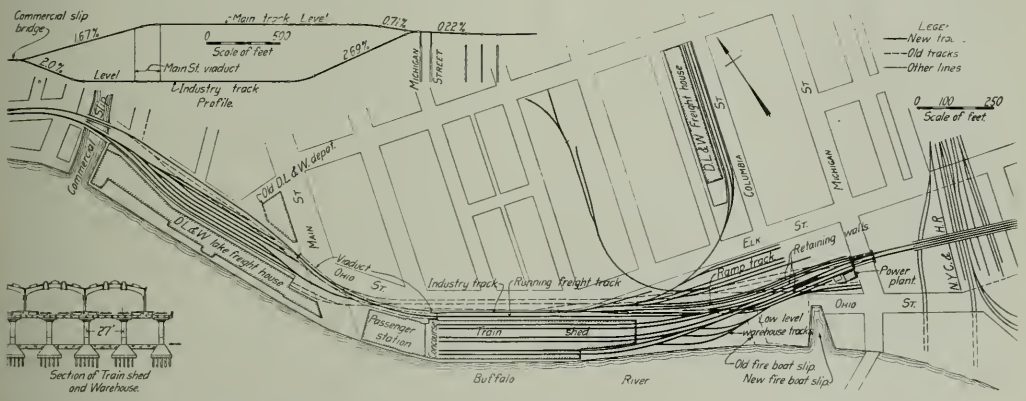
station and terminal approaches consists of eight passenger trains each way per day, five of which in each direction are through trains to and from New York; a heavy movement of Pennsylvania coal, particularly in the summer, which is hauled to the coal dock for loading lake boats; and a considerable package freight traffic for transfer to and from lake steamers at the lake freight house, in addition to the local freight business handled at the separate house mentioned above. The passenger terminal is of the stub-end type, all through cars for western connections being handled at East Buffalo or other junction points east of the station. All locomotives and cars are handled at the East Buffalo terminal, about five miles from the station.

The new passenger station will be located just east of Main street adjacent to the river. By moving Ohio street about 40 ft. to the north and acquiring all property between Ohio street and the river this allows all tracks to be placed south of the street, leaving it unobstructed. The track level is raised about 22 ft. above the street and the single track lead to the coal dock is carried on this elevation across Main street on a steel viaduct encased in concrete. The only grade crossing involved in the new layout is the single track lead to the lake freight house just west of Main street. This lead is carried alongside the train shed and station building and under the Main street viaduct, shed, will be available for future warehouse development. It will be necessary to construct a new fire boat slip in order to remove the old one which interfered with the location of the station leads.

The new station will be a steel frame structure, 110 ft. by 250 ft. in size, with a granite base course, brick facing above the waiting room floor level, and a tile roof. It will be four stories high with a mezzanine floor between the dock level and the train shed floor. The upper portion of the building will be devoted to offices. The new dock will have a concrete dock wall supported on timber piles, all of the timber construction being kept below the water line. About 10,700 piles are being driven under the station and train shed. About 30 ft. of quicksand has been encountered; under part of the work and under this condition the piles are jetted. Elsewhere they are driven. The piles are being driven to rock which is about 40 ft. below street grade.

An electro-pneumatic interlocking tower, controlling the entrance to the station, will be located on top of the power plant which will furnish heat to the new station. This is located just west of Michigan street, this somewhat remote location being chosen in order to leave the more valuable space along the river front free for development.

This improvement work is being carried out under the direc-



Track Plan Showing the Lackawanna Improvements along the River Front in Buffalo, N. Y.

connecting with the small yard adjacent to the freight house. The lead to the local freight house just west of Columbia street is unchanged, connecting with the low level tracks just north of the train shed. The two main tracks will remain unchanged across Michigan street, but just west of that point they will swing to the south diverging to six station tracks, two of which are about 475 ft. long and four 675 ft. long.

Advantage has been taken of the location of the station on the river front in a number of ways. Arrangements have been made to dock the passenger boats of the Detroit & Cleveland and the Cleveland & Buffalo boat lines alongside the station building and passengers of these steamers will use all of the station facilities in common with the railway company's patrons. A Bush type train shed will be used and the station tracks and platforms, as well as the shed, will be supported on a continuous deck structure of reinforced concrete, over the tops of the supporting columns, which will be spaced 27 ft. center to center in both directions. This type of construction will make available all of the space under the train shed for warehouse purposes. This storage space will be accessible to boats docking alongside and it can also be served by three spur tracks connecting by a switchback, shown in the accompanying plan, under the station approach tracks to the low level track along the north side of the station. The new development will involve the construction of about 1,800 ft. of dock, a portion of which, just east of the train

tion of G. J. Ray, chief engineer, Delaware, Lackawanna & Western; A. E. Deal, bridge engineer; G. E. Boyd, division engineer, and O. H. Kellogg, assistant engineer. Kenneth M. Murchison, New York, is the architect for the station building. The contract for all foundation and dock work was let to the Buffalo Dredging Company, Buffalo, N. Y., and that for the station to the Hedden Construction Company, New York City.

SUMMARY OF RAILWAY PROGRESS IN CHILI.—The government of Chili now has under construction 208 miles of railroad estimated to cost about $8,634,000, of which it is expected to complete 63 miles by the close of 1914 at a cost of $1,848,000. On completion of these lines, the Chilian government will own and control 2,270 miles, of which 150 miles is double track. The private railroads of the country cover 1,860 miles with 878 miles under consideration. The 1,860 miles are valued at $93,066,583, and the receipts for 1913 were $14,460,425, with expenses at $11,521,156, showing a net gain of $6,051,378; while the state railways showed a loss of $2,732,596. As has been noted before, the Chilian government is at present outlining a scheme of equipping the government railways with rolling stock sufficient in quantity to handle the growing business of the country, three-fourths of the total number of cars and locomotives required will have to be purchased abroad, and it is said that American material will have the preference at the same price.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION

The sixth annual convention of the American Railway Tool Foremen's Association was held at the Hotel Sherman, Chicago, July 20-22, inclusive. The meeting was called to order by A. M. Roberts of the Bessemer & Lake Erie, president of the association. After a prayer by the Rev. Howard A. Lepper, rector of Christ Church, Englewood, the association was welcomed by J. F. De Voy, assistant superintendent motive power and machinery, Chicago, Milwaukee & St. Paul. Mr. De Voy spoke very highly of the work done by mechanical department associations, stating that the members in attendance at the Atlantic City conventions this year seemed to pay more official attention to what the junior organizations were doing. Many of the superintendents of motive power in attendance when questioned stated that the time had come when the older associations were becoming more dependent on the junior associations for help in developing the mechanical departments of railways. Money spent by the railroads in sending men to conventions of this kind is not wasted in the least, and if the members will give up their ideas to their fellow workers the railroads will be greatly benefited.

Mr. De Voy paid special tribute to the integrity and sincerity of purpose of the men in the motive power department. Conventions of this sort will do a great deal to promote the general efficiency of that department. He referred to the tool foremen as efficiency engineers of the highest type and pointed out that their special field lay in establishing standards that would facilitate the work and reduce the cost of production, referring to the work that had been done in the automobile industry as an illuminating example.

A special field for the tool foremen is the devising of safety appliances to be placed on machines. By their ingenuity they can devise efficient and inexpensive safeguards that will be of vast benefit to the railroads they serve. He called on the tool foremen to shoulder part of the responsibility the state and federal laws have placed on the railroads and do all they can to perfect the safety appliances. Mr. De Voy closed his remarks with some very encouraging words as to the business conditions. Within the past month the Milwaukee has increased its force ten per cent. He laid particular stress on the benefits the railroads would derive from the abundance of grain that is being shipped.

PRESIDENT'S ADDRESS

President Roberts spoke of the opportunities the tool foremen have in increasing the efficiency of the mechanical department. The higher officers are looking to the tool foremen more and more each year, calling on their ingenuity and skill to increase the output of the shops and at the same time improve the quality of the work. A special field for the tool foremen is to standardize the tools so that a much less number will be required to perform the necessary work. Mr. Roberts also spoke of the benefit he has personally received by attending the conventions. Many new ideas obtained from other members through the discussions on the floor have been successfully applied by him.

STANDARDIZING REAMERS

Several members presented papers on standardizing reamers for locomotive repairs. C. A. Schaffer, general tool inspector, Illinois Central, spoke in part as follows: To any one who has had practical experience in a locomotive repair shop the economy resulting from standardized reamers is obvious, and to those who have gone into the matter systematically no argument is necessary to show wherein a saving may be effected. If conditions will not permit of going into the matter in a general way, possibly on account of not wishing to replace all of the large stock of tools of various descriptions at one time, it may be possible to select one or more sets from the following list of reamers to start with, any one of which when completed and put into practical use should show a good saving, as compared with the old method: Crossheads and piston reamers; knuckle pin reamers; ball joint reamers; and rod and frame bolt reamers. A saving in time from one to eight or ten hours may be effected on jobs when compared with the old practice of putting the work into a machine and boring it for a fit. Then, too, the life of the job will be much greater if it is done with the proper tools.

The commercially manufactured locomotive tapered reamers, which are cataloged by all the leading small tool manufacturers, for use on rods and frame work, come far from being suitable for use on the heavy power of today. A revision in standards along this line would, no doubt, result in increased business for the manufacturer and economy for the roads who buy the greater proportion of such tools instead of making them themselves.

E. J. McKernan, Atchison, Topeka & Santa Fe, stated that on the Santa Fe lines all the frame reamers for locomotives have 1/16 in. taper in 12 in. All sizes of reamers 1 in. in diameter and under are purchased from manufacturers and all those over that are made in the tool room at Topeka. Nine reamers have been adopted as standard for crosshead and piston work. These reamers are tapered ½ in. in 12 in., and are made with a left hand spiral. Four reamers are used for the knuckle pin work on side rods. They have a 9-in. flute and a 1½-in. taper in 12 in., with a left hand spiral of 68.57 pitch. A standard tapered reamer of a straight flute 12 in. long is used for the link blade pin. This one reamer takes care of all the jaws on Stephenson link motion as well. The standard reamers for cylinder saddle flange work are used in all holes on cylinder splices as well as on the flanges for truing up the holes after the cylinder has been bolted together. These reamers are tapered to 1/16 in. in 12 in. For general motion work two reamers are used, one 17½ in., and the other 19½ in. over-all. They have a taper of ½ in. in 10 in., measure 1¼ in. on the point and have a left hand spiral. The dimensions of reamers in use on the Philadelphia & Reading, Southern and the Chicago, Rock Island & Pacific were submitted by J. P. Manger, J. E. Dosser and W. J. Eddy, respectively.

Discussion.—From the discussion it was clearly brought out that the square shank was more desirable than the tapered shank for all reamers. These square shanks should be made in four different sizes so that it will not be necessary to have too many wrenches with which to drive them. The high point of the discussion was, however, the success with which the spiral reamer had met wherever it had been used and carefully made. Some reported that it was impossible to use carbon steel reamers and that high speed steel was necessary. Other roads, however, reported that with the fluted reamers carbon steel could be used exactly as well and that there was very little difference in the life. The process of the manufacture of the spiral reamer is a little more difficult than the straight reamer, although devices have been used whereby the machine work is pretty nearly the same. It is more difficult, however, in tempering and grinding as the reamers are more liable to become warped.

The Atlantic Coast Line makes reamers so that they may be ground four times, each time taking off 1/32 in. in diameter. When they have been used up to this limit they are reclaimed by being made into smaller reamers, or small tools. The discussion was closed with a recommendation that the secretary be instructed to gather information from the members of the association concerning the sizes and the degree of taper, together with other information, with a view of establishing standards for reamers at the next convention.

The remaining sessions of the convention will be reported in next week's issue.

Rolling Stock on a Chinese Railway.—At the end of 1913 the rolling stock of Tientsin-Pukow Railway of China consisted of 32 locomotives; 66 passenger and inspection cars and 490 freight cars. The freight and passenger receipts for the year were $900,600.

THE RAILROADS' MOST GIGANTIC TASK

By JOHN FINDLEY WALLACE

[From Leslie's Illustrated Weekly Newspaper, July 16, 1914]

Chicago, which conquers in the sign "we will," now contemplates picking up a river which is in her way and carrying it out west where she wants it; not very far west—only a few city blocks—but the job will cost about $6,000,000, and that is only one item in the complicated and costly undertaking by which 1-764 of the city's area, where more than twenty railroads handle every day 112,000 tons of freight and 200,000 passengers, must be unmanacled from congestion.

At New York the national government, the city and state of New Jersey are endeavoring to work out colossal projects for handling the natural growth of freight at a port doing an annual business of more than $2,000,000,000, plus that which is expected from the three great new ditches, the New York state barge canal, the Cape Cod and Panama canals. For the railroads this situation presents expensive problems. On the west side of Manhattan there is great congestion of incoming food, raw materials and manufactures and outgoing factory products and distributers' merchandise. Yards are to be constructed between Sixtieth and Seventy-second streets taking some of the costliest land in the world; it is desired to have surface operation below Sixtieth street eliminated by boring a subway to the Battery which will serve business on the land side, connect with the New Jersey ferries and link up the steamship piers with the island and with one another. Freight tunnels under the Hudson are contemplated to the New Jersey terminals. Dock development in Brooklyn with a marginal railway adjacent thereto will call for further expenditures by the rail lines for effective and convenient connections.

Boston lies between roads south and roads north, subjecting business to a high cartage cost and demanding some form of belt line, probably involving a tunnel from South Boston to East Boston under the harbor, to say nothing of electrification for both passenger and freight service.

Philadelphia must rearrange and electrify her passenger terminals so as to care for an immense number of commuters directly on the line of a very extensive through service to the south and west; while our old friend, the cartage charge, demands that freight consumed and disgorged by 8,000 or 9,000 manufacturing establishments be laid down and taken up more nearly at every man's door—and every man's door is located where it is going to cost money to plow a railroad track through to it.

Baltimore is opening an entire new section to the southeast by means of the so-called "Key Highway" with a network of tracks connecting manufacturing and jobbing sites with the railroads and piers; and the Calvert freight houses and yard spaces are to be doubled in capacity.

At Buffalo a state commission has been working out for two years the disentanglement of the Buffalo situation, which has been tying itself up tighter and tighter. Fast through passenger trains roll as serenely past this lakeport of nearly half a million people as if it were a country village; there is no quick way of getting a train in and out again. A score of railways are scattered here, there and everywhere over the city with their unrelated passenger and freight facilities which must be systematized. The New York Central alone must spend $9,000,000 for a passenger and freight terminal recently sanctioned by the commission.

St. Louis is served by ten eastern lines whose rails terminate at East St. Louis on the Illinois side of the river and by seven lines running into the city. The intermediate service is performed by practically one switching line over the two bridges except a small portion which is ferried. This arrangement requires extensive terminal accommodations. On the St. Louis side the situation is serious. Additional team track service and freight house facilities can be provided upon land already acquired for that purpose, if an ordinance can be agreed upon with the city authorities. Cleveland, Columbus and Cincinnati have all outgrown their facilities. The list might be prolonged.

Terminal betterments are made in order to reduce the time that freight cars and packages are in the hands of the railroads and not traveling. L. F. Loree some months ago told the story of a freight car trip. The car was in the hands of the railroads 63.7 per cent. of the time and in the hands of the shippers 36.3 per cent. of the time. On the average, shifting and interchange movements consume 10.1 hours out of 24, or two-thirds of the time that the car is in the possession of the railroads. "Here," says Mr. Loree, "center the largest opportunities of reducing the delays that are wasteful of time and money alike."

Each of the great cities is beset by the gravest anxiety, because its people know history. They have read the legend, which scientific excavators credit, that a cat could walk from wall to wall and house-top to house-top through the Syr-Darian river valley from Kashgar in Eastern Turkestan to the Sea of Aral; that the remains of ancient Bactra (Balkh) cover a circuit of twenty miles after 600 years of abandonment, and that Jenghiz Khan is said to have slain 800,000 people in Bagdad alone. Life was fine and fair in Bagdad and in many a metropolis of old created at the convergence of camel routes between Europe and China and India. When shipbuilders began to use iron nails instead of wooden pegs and to navigate the Red sea with loss from shipwreck so diminished that freight rates were lower by ship than by caravan, the inland center with a population running into the millions could shrivel and evaporate, and become the tomb of busy commerce, muck for the antiquarian's rake.

Through routes today in the United States are assailed by competition on every hand. Freight shipped at New York, jobbed at Chicago and rejobbed at Spokane can go, if induced, by way of Tehuantepec or Panama; San Francisco or Seattle will do the jobbing. If transshipment at Chicago came to involve sufficient delay, freight from New York might even travel coastwise to Newport News or Baltimore and beat the Chicago route into Spokane in point of time as well as of cost. This is especially true when industry is booming, terminal facilities strained and everyone eager to cash in while the going is good. One such period might almost create a new major center of transshipment for the country. Men in middle life can remember when St. Louis ridiculed the prediction that Chicago would outstrip her in business and in population. There is another kind of competition. If merchandise manufactured on the Atlantic seaboard is delayed long enough in going through inland terminal cities on its way across the Mississippi, manufacturing plants will be established at points from which product can be laid down in the trans-Mississippi territory without going through those centers of transshipment.

It is not only the residents of terminal cities who suffer if transportation through those cities is defective. The point at which the shipper comes in contact with a terminal defect may be a thousand miles away from the defective terminal. He wants a car which he cannot get or he is waiting for a load that does not come. He thinks and says that he is suffering from a car shortage. The fact may be that too many cars have clogged a terminal somewhere. The real shortage is a terminal shortage.

To some extent his sufferings may be ameliorated by the addition of more rolling stock and to a large extent in the recent past the railways, turning in the direction of least resistance, have increased their rolling stock as a stop gap while postponing the city terminal improvements which involve such enormous land costs.

More cars under some circumstances will enable the shipper to start his shipment sooner, but delivery will be no more prompt if a clogged terminal stands in the way. Ultimately what interests the shipper is the time consumed from the moment when his shipment is ready to load to the moment of delivery to the consignee.

A group of railroads in reply to an inquiry have furnished a detailed computation showing that they would spend in terminal development in the next five years if they could obtain the necessary capital an average of $3,312 per mile of track. At this rate the total for all roads would be $1,316,924,064. To borrow

this sum at 5 per cent. would impose an annual interest charge of $65,846,203. In 1911, the latest year for which statistics are complete, the roads had available for resuming or increasing dividends but used instead for improvements or surplus $161,825,740. Taking from this amount the interest on the investment estimated as desirable for terminals, $65,846,203, and another interest charge of $19,635,000, estimated for substituting steel cars for wooden, and the roads would have had available in 1911 for improvements and surplus $76,344,537—an amount which would be completely wiped out merely by an average advance of 7 per cent. in the compensation of railway employees. There is also to be provided a huge additional sum annually, of which well-based estimates are practically impossible, for safety appliances on cars and locomotives, for block signals, for automatic trainstops, and for the elimination of grade crossings, none of which enlarge earning power.

The United States must choose. Either we must give up in some degree our pre-eminence as having by far the lowest railway capitalization in the world, and permit our lines to earn such revenues as will attract enormous investment for terminal and other improvements; or we must on the other hand renounce the American rapidity of national development and content ourselves with the slow growth which is typical of older countries.

ACCIDENT BULLETIN No. 50

The Interstate Commerce Commission has issued quarterly Accident Bulletin No. 50 containing the record of railway accidents in the United States during October, November and December, 1913. The number of persons killed in train accidents was 191 and of injured 3,726.

The total number of casualties of all classes reported, including industrial accidents, was 2,792 killed and 50,776 injured. The accidents are summarized as follows:

TABLE No. 1.—*Casualties to persons—Steam railways*

Causes	Passengers		Employees (including employees not on duty)		Other persons (trespassers and non-trespassers)		Total persons	
	Killed	Inj'd	Killed	Inj'd	Killed	Inj'd	Killed	Inj'd
Train accidents.								
Collisions	3	1,004	77	734	9	42	89	1,780
Derailments	31	1,198	55	520	9	34	95	1,752
Miscellaneous, including boiler explosions	..	7	6	183	1	4	7	194
Total	34	2,209	138	1,437	19	80	191	3,726
Other than train accidents.								
Accidents (113) to roadway or bridges not causing derailment	..	...	...	...	3	...	3	...
Other accidents (classes C3 to C12, inclusive)	51	1,927	688	13,139	1,742	2,977	2,481	18,043
Total	85	4,136	826	14,576	1,764	3,057	2,675	21,769
Industrial accidents to employees.								
While working on tracks or bridges	..	...	40	6,470	...	...	40	6,470
At stations, freight houses, enginehouses, etc.	..	...	24	6,678	...	...	24	6,678
In and around shops	..	...	31	13,989	...	...	31	13,989
On boats and wharves	..	...	7	508	...	...	7	508
At other places	..	...	15	1,362	...	...	15	1,362
Total	..	...	117	29,007	...	...	117	29,007
Grand total	85	4,136	943	43,583	1,764	3,057	2,792	50,776

Table No. 1A, following, presents comparisons with the record in the bulletin next preceding and the bulletin covering the corresponding quarter of the previous year.*

TABLE No. 1A.—*Condensed summary of fatalities.*

No.	Item	Bulletin No. 50	Bulletin No. 49	Bulletin No. 46
1	Passengers killed in train accidents	34	33	57
2	Passengers killed, all causes	85	96	114
3	Employees (on duty) killed in train accidents	137	141	170
4	Employees (on duty) killed in coupling	49	42	54
5	Employees (on duty) killed, total	730	759	861
6	Total passengers and employees (items 2 and 5, above)	815	855	975
7	Other persons killed (including trespassers, nontrespassers and employees not on duty), all causes	1,860	2,186	1,886
8	Employees killed in industrial accidents	117	132	106
	Grand total (items 6, 7 and 8)	2,792	3,173	2,967

The total number of collisions and derailments reported was 3,757 (1,450 collisions and 2,307 derailments), of which 182 collisions and 217 derailments affected passenger trains. These are classified as follows:

TABLE No. 2.—*Collisions and derailments*

No.	Classes	Number	Killed	Inj'd	Damage to road and equipment
	Collisions—				
1	Rear	250	22	477	$311,063
2	Butting	141	37	644	*307,444
3	Train separating	98	2	26	35,401
4	Miscellaneous	961	28	633	556,482
	Total	1,450	89	1,780	$1,210,390
	Derailments due to—				
5	Defects of roadway	576	25	855	$433,395
6	Defects of equipment	1,091	4	236	840,948
7	Negligence	126	3	83	97,774
8	Unforeseen obstruction	76	14	108	73,670
9	Malicious obstruction	16	5	54	31,661
10	Miscellaneous	422	44	416	402,522
	Total	2,307	95	1,752	$1,879,970
	Total collisions and derailments	3,757	184	3,532	$3,090,360
	Total for same quarter of—				
	1912	3,994	227	4,010	$3,408,953
	1911	3,346	230	4,132	2,893,948
	1910	3,366	219	3,175	2,831,469

The usual tables are given classifying certain kinds of accidents in detail.

Thirteen accidents occurring during this quarter were investigated by the inspectors of the commission and the reports of these investigations fill 27 pages of the bulletin. The accidents occurred as follows:

Southern	Oyama, N. C.	Mar. 31, Derailment
St. Louis Southwestern	Stephens, Ark.	Oct. 2, Butting collision
N. Y., Chic. & St. Louis	Fairview, Pa.	Oct. 3, Butting collision
Mobile & Ohio	Buckatunna, Miss.	Oct. 19, Derailment
Pennsylvania	Portville, N. Y.	Oct. 20, Side collision
Southern	Easley, S. C.	Oct. 27, Derailment
St. Louis & S. F.	Chelsea, Okla.	Oct. 29, Derailment
Phil., Balt. & Washington	Washington, D. C.	Oct. 31, Derailment
Great Northern	Rexford, Mont.	Oct. 31, Butting collision
Lake Shore & Mich. So.	Mount Union, Ohio.	Nov. 6, Butting collision
Central of Georgia	Clayton, Ala.	Nov. 13, Derailment
Central Vermont	Georgia, Vt.	Nov. 16, Butting collision
Virginian	Keever, Va.	Nov. 29, Butting collision

Electric Railways reporting to the commission (not included in the foregoing statistics) had 124 persons killed during the quarter and 1,445 injured; and there were 57 collisions and 15 derailments. Train accidents are charged with seven fatalities. The total number of passengers killed from all causes was 9 and of employees 25 (13 in industrial accidents). The number of trespassers struck or run over by cars was 65; 37 killed and 28 injured.

COMPARATIVE SUMMARY OF FREIGHT CARS IN SERVICE

The tables on the two pages immediately following show the number of freight cars in service on all of the important railroads of the country in 1912 and 1913, and in 1900 and 1913. It will be noted that narrow-gage cars are excluded, as well as non-revenue cars, but that cars used to carry company freight are included. The railways are grouped under the heads of New England roads, trunk line roads, Southern classification roads, Central classification roads and Western classification roads.

The tables show the number of cars in service, the number of cars per mile of road, average length of haul, freight cars per thousand freight car miles and per thousand ton miles, the average rate per ton per mile, and the freight cars in service per thousand dollars of freight earnings.

The table does not show the capacity of cars and, of course, roads which show a decrease in the number of cars may have cars with a larger total capacity despite the smaller number.

*Preceding bulletins have been noticed in the *Railway Age Gazette* as follows: No. 49, May 15, 1914, page 1072; No. 48, March 6, 1914, page 468; No. 47, October 24, 1913, page 759; No. 46, August 29, 1913, page 383.

COMPARATIVE SUMMARY OF FREIGHT CARS IN SERVICE ON RAILROADS OF THE UNITED STATES—1912 AND 1913

Note.—Narrow gage cars excluded. Non-revenue cars excluded. Company freight included.

	Miles.		Frt. equipment.				Frt. cars per mile of road.		Average length of haul.		Freight Cars—Per 1,000 frt. car miles,		Freight Cars—Per 1,000 rev. ton miles.		Rate per ton mile. (Dollars)		Freight cars per $1,000 frt. earnings.

The Operation of Large Classification Yards*

The Second Series of Papers Received in Contest, Bringing Out Practical Ideas Gained by Experience

ESSENTIALS IN SUCCESSFUL YARD OPERATION

By E. C. Tucker

General Yardmaster, Norfolk & Western, Portsmouth, O.

The most economical method of breaking-up and classifying trains is secured in the hump yard, which not only reduces the yard-switching movement and the operation cost to the minimum, but materially decreases the switching causes of damage to equipment. Gravity yards should be located at such points on the system as the character and the volume of traffic may require, and especially at those divisional points where terminal or junctional classification of the outgoing movement is demanded. This junctional classification is highly important, permitting the traffic to be delivered promptly and with the minimum switching expense at the junction point.

One Mallet locomotive with 30 car-riders will weigh and classify more cars in an 11-hour working day in a gravity yard than 10 switch engines and crews working in flat yards, and with fully one-half less damage to the equipment. A gravity yard is very necessary for the classification of empty cars, as such cars may be handled and classified in this manner with the least amount of delay and expense. This is an important consideration, as it is necessary to get the cars in revenue haul with the smallest loss of time, in order that the railway may secure the full value of its equipment. Every day a car is held unnecessarily when equipment is in demand means a loss of freight revenue.

Time freight trains should be classified as far as possible at the originating point. The cars traveling under refrigeration should be placed next to the engine and kept in that position to destination so that there will be no delays to time freight trains in transit due to re-icing the cars at icing stations. The despatcher should keep the yardmaster fully advised as to the expected time of arrival of these trains, and crews at terminal yards should be called in advance to avoid any loss of time on the schedule. The handling of time freight trains by the despatcher, the yardmaster and his assistant should be given the same consideration as a passenger train—careful handling, proper classification and "on time"! If this measure of service is not secured in the divisional yards the railway stands to lose rather than to increase its freight business of this character.

A very considerable and often a very unnecessary expense is attached to overcrowding and blocking of yards. This can only be controlled by the yardmaster keeping in close touch with the power and crews available, by regulating the movement according to the clear trackage, and, if necessary, by deadheading additional crews from other terminals and moving light power to the crowded yard.

The regulating or proper balancing of power and crews by the chief despatcher should prevent yard congestion, provided the yardmaster has kept up with his classification and yard work as the traffic has reached him. A blocked yard with classified cars therein is really a question only of power and crews, and additional trains should not be forced into the yard which will block the leads and take up what little reserve classification space may have been held open by the yardmaster.

As a means of preventing delays to cars in yards, the yardmaster should define the duties of each employee and educate him to the extent that his work may assist in every proper measure toward the regular movement of the traffic through the yard. Care should be taken to avoid as far as possible any causes for special movements by making the regular movements with such promptness and so systematically that special movements will not be necessary.

Frequently cars of coal, coke or similar bulk commodities may be found to be too heavily loaded when they arrive at the scales in the gravity yard, requiring that a portion of the lading must be removed from the car before forwarding. The most economical manner of removing this excess is to set aside two short tracks in the vicinity of the scales, and place an air whistle at the scales so that a signal may be given by the weighmaster to the switch-tenders when cars are found to contain an excess of lading. The cars may then be run direct from the hump tracks into the over-load track, where a crane should be located, provided with a dipper holding about 2,000 lb. The excess can then be readily removed and placed in an empty car in front of the crane, the original car being then reweighed and allowed to go forward to destination without any unnecessary delay. Short tracks are more desirable for this purpose, as they will require the cars to be removed promptly and thus avoid congestion in the classification yard, as well as preventing delay to the shipments.

All time freight bills should be kept separate from the slow freight bills in the yard office. The system outlined below, which requires two separate racks or bill cases, has proved to be highly satisfactory. One case consists of 10 apartments for the card bills, the filing of bills in the rack being governed by the last figure in the car number. Each apartment is numbered, the numbers running from 0 to 9. Thus the bill for car number 23,646 would be filed in apartment numbered 6. This case is used for time freight only. The second case contains 100 apartments; it is square, with 10 apartments across and 10 high. The filing of the bills in this rack is governed by the last two figures in the car number. Beginning at the upper left-hand corner of the case and running horizontally across it, the apartments are numbered 00, 01, 02, 03, 04, 05, 06, 07, 08, and 09; and starting at the same corner and running vertically from the top to the bottom of the case the apartments are numbered 00, 10, 20, 30, 40, 50, 60, 70, 80, and 90. Thus, if a car number is 44,599 the bill would be filed in the extreme lower right-hand corner of the case. This case is used exclusively for bills covering everything other than the time, or preference freight. In using this described system, the bills should be filed as soon as they arrive at the yard office, so that when the train-checker brings in a list of the track from which a train is to be run the bills are readily accessible and the time consumed in picking them out is reduced to a minimum. When a car is cut out of a time freight train for any reason, the bill should immediately be stamped "Delayed car—Rush," to insure its being handled to destination in preference movement, and the car should be forwarded from the yard in the next section of the time freight schedule.

A careful check should be made daily of all bills in the yardmaster's office. The yardmaster or his assistant should personally go through the bill cases and note the date on each card bill, and if any bill has remained in the box for 24 hours or more, and the car is yet in the yard, it should be located and movement secured without further delay.

Another feature in the handling of the bills at a large terminal is that all bills remaining in the case for a period of six days should be removed therefrom until the car is located, to avoid any cars moving out on the wrong bill or an erroneous or duplicate bill. A great many claims have been presented against railroads on account of improper movements of carload shipments from this cause. Unless the greatest care is used in securing duplicate bills and in checking the bill case, the delayed car may move from the yard on either the misplaced original or a duplicate bill, and in a second movement through the yard be improperly forwarded on one or the other of these

*The first series of papers received in this contest was published in the *Railway Age Gazette* of July 3, page 5.

bills which had been allowed to remain in the case an undue length of time.

The handling of shop cars in a large break-up yard where every car length of room is always in demand, is of large importance. Every car in bad order is not only a car out of service, but is occupying track space which could be used for cars moving under revenue load. Cars in bad order will continue to take up track room until they are repaired, and therefore the yard is serving itself best when it seeks to aid the repair department in reducing the amount of time consumed in the handling and repairing of bad order cars to the minimum.

Car repair forces can best handle shopped cars if they are given to them on the repair tracks in a classified order; that is, with reference to the heavy repair or light repair cars. Since the repairmen must handle the repair material from the supply wharves to the cars being repaired, the heavy repair cars should be placed as near as possible to the wharf carrying heavy repair material, and the light repair cars should be placed as near as possible to the wharf carrying light repair material. This will not only decrease the amount of time consumed in carrying material from wharves to cars, but will make it possible for the forces to repair the maximum number of cars daily and thereby decrease the total number of bad order cars being held each day on the yard tracks. It is also the better practice to have separate shop yards for loaded and empty shopped cars, to prevent delay to loaded cars.

Another saving in time, secured by classification of the shopped cars when placed on the repair tracks according to the amount of repairs necessary, is through the fact that each track will contain cars the repairs for which can be made in practically the same amount of time for each car, this track being ready to pull when any one of the cars is ready; no one of the cars will be delayed waiting for the other cars.

Since the repair work is usually performed out of doors, the weather plays an important part in the amount of time consumed, and if a large terminal yard should have a heavy movement of traffic with a number of days of rough weather, the accumulation of shop cars would consume badly needed track room in the yard. In districts where the weather may be inclement for long periods at a time, good results are to be secured by having 40 to 50 car-lengths of track space, in both the loaded shop yard and the empty shop yard, covered with protecting sheds so that a sufficient number of repairmen may work each day regardless of the weather.

The shop track foreman should keep the yardmaster advised as to probable time certain repair tracks will be ready to pull. Such an arrangement permits the yardmaster to include the repair track switching in laying out his work through the day, and to do this switching to the best advantage. The repair forces should endeavor to complete the repairing "by tracks," as in this way the switching work in the repair yard is kept to a minimum, the repair work is interrupted less frequently, and the entire service is carried forward in a more regular and systematic manner.

The transfer tracks should be switched at stated times each day, and by one certain yard crew if possible, in order to secure the best and quickest service. If a certain yard crew performs this service every day, it will be thoroughly familiar with the work and will know just what should be done; what kind and class of cars to spot to each shipment in bad order, and just where to place the cars to best advantage for work to be done. The periods at which the transfer tracks should be switched should be governed by the number of cars awaiting transfer of ladings, the number of cars completed, etc., but the best time for such switching and spotting is at night, inasmuch as the transfer men work during the day, and at night there will be nothing to hinder the switching crew in their work and no possibility of injuring the men of the transfer force while switch work is being done.

The yardmaster's assistants should advise the foreman of the transfer force regarding such cars as are to be given preference movement. The assistants should also make note of any loss or damage to shipments, either before or after transfer, and also note whether the work is being carried on in the quickest and most economical way possible. Instructions require that the empty car which is to receive the lading from the crippled car shall be light-weighed before transferring is commenced. The carrying out of these instructions may require both time and expense if cars are to be specially light-weighed for this purpose, but much of this loss of time may be successfully avoided by utilizing cars which have been light-weighed after receiving heavy repairs.

The comparative expense of terminal yard operation is daily indicated in the statements of total switch engine mileage and terminal overtime. Engines employed in yard switching service are given an arbitrary mileage allowance per hour of service. This total mileage in its relation to the volume of cars handled into and out of the yard reflects the cost of yard operation, and the comparative showing from day to day, or month to month, serves as a barometer to indicate proper and economical yard management. It is therefore necessary for the yardmaster to give close attention to the number of engines employed in switching service from day to day to see that engines are not used except when absolutely required, and that the work is so systematized and given such close and constant supervision that the full maximum service be secured from each engine or switching crew.

It is primarily important, of course, that the traffic should receive good and prompt movement through the yard, but it is also of the greatest importance that the expense of yard operation shall be maintained at the lowest limit with reference to the service to be performed. In a well-regulated and economically-operated yard the methods of work will be such as to decrease the switching movement per car through the yard to the exact needs. This can largely be secured by proper grouping of cars in breaking-up incoming trains with reference to the outbound movement of such cars, so as not to handle a car repeatedly in the switching work when a fewer number of switch handlings can be made to answer the purpose.

Any condition of the yard making it impossible to take in trains promptly from the road results in the crews of such trains making terminal overtime. The expense of this road crew overtime is charged against the yard showing, and very properly so, although more frequently than otherwise the yard condition resulting in this overtime being made has been due primarily to road conditions such as derailments, power failures, etc., causing bunching of trains into the terminal and a congested condition of the yard. Not only is the expense of this overtime an absolute loss, but the effect of trains held out of the yard is far-reaching and operates to further cripple both the road and the yard movement.

HUMP OR FLAT YARDS

By W. B. Hendricks

Superintendent of Terminals, Chicago, Milwaukee & St. Paul, Milwaukee, Wis.

The relative merits of hump and flat yards for the make-up and break-up of trains in transit have been a disputed question for a number of years. Considering this question, and eliminating entirely industrial and local switching, let me present some data compiled from actual performance on the Chicago, Milwaukee & St. Paul, in Milwaukee, Wis., where the break-up and make-up of east-bound trains is done by hump switching and all west-bound trains are made up in a flat switching yard.

The hump is located in the middle of three yards. Two receiving yards are west of the hump and contain 17 long tracks with a capacity of 957 cars, and 5 short tracks with a capacity of 150 cars. The long tracks will receive trains containing from 50 to 75 cars, while the short tracks are used by way freights and patrols. Five divisions entering Milwaukee from the west discharge their trains into these receiving yards, and during the busy season bring in from 2,000 to 2,500 cars a day.

The classification yard is located east of the hump. This yard

has 25 tracks for classification purposes and 8 tracks for receiving trains from the west, the latter to assist the two receiving yards, so there will be no delay in the prompt receiving of trains. It will be readily understood that when a train arrives on one of these tracks, it must necessarily pass the hump on its way in, and when switched the train must be pulled westward past the hump, but not over it, and then shoved eastward over the hump. The 25 classifying and the 8 receiving tracks east of the hump have a capacity of 2,700 cars, the longer tracks holding 70 cars.

A trimmer engine was employed both night and day, when the hump was first put in service in the fall of 1912, but this was dispensed with later on, when it was found that the work could be performed with very little delay by the engine working on the hump, after it had completed shoving the string of cars over the hump into the different classifying tracks.

The riders walk back to the hump. While this, at times, causes a slight delay, the number of riders is increased or decreased according to the volume of business. The first three cars placed on any track in the classifying yard are anchored by setting the hand brakes. During the night a green lantern is placed on the ground on each of the 25 classification tracks, to indicate the position of the last car, the rider moving the lantern to the proper position after each cut is made. Green lanterns are preferred for this purpose, as they are not as readily carried away as the red and white lanterns would be.

The pin puller on the hump announces by signal (a hand signal during the day and a lamp signal at night) to the switchtender at the junction switch, which is located about 300 ft. east of the summit of the hump, the number of the track the car is to go on, and he in turn conveys the information to the switchtender having charge of the track, who repeats the signal back to the junction switchtender. The track reference of the second cut to come over the hump is marked in chalk on the rear end of the last car on the first cut, etc.

Track No. 25 in the classification yard is an outside track used exclusively for bad order cars. It leads directly to the repair yard and is switched several times every day.

It has been demonstrated by experience that one hump rider is capable of taking care of three cars, either loads or empties, with the exception, of course, that when the loads are extremely heavy it is advisable to have two riders. Two riders can handle from three to six cars and three riders from six to nine cars, and so on. The pin lifter at the summit has charge of the riders and regulates the number required to handle the different cuts. The three yard men working on the hump engine take their turn as riders in disposing of their drag when shoving cars over.

The men are not permitted to work during the noon hour, nor is overtime allowed to be made except when absolutely necessary to handle stock and time freight. This is controlled entirely by the yardmaster.

It has been demonstrated that the maximum capacity for a 24-hour period is about 1,800 cars, our high mark being 1,836. It is only possible to reach this figure under the most favorable conditions, where most of the cuts are large, consisting of from 5 to 10 cars and upwards. The average number of cars actually moved over the hump will amount to about 1,200 for a 24-hour period. To do this work at present we are using one engine during day time and two during night time. At this writing eight hump riders are employed days and the same number nights. With the assistance of three yard men on the hump engine this increases the day riders to eleven men, and the six yard men on the two engines nights make the total number of night riders fourteen.

At each of the 25 switches located in the classification yard two skates are placed to be used in case the riders find that they cannot control the cars by the hand brakes. When this occurs the rider signals the switchtender of the track upon which the car is to go, and he places a skate upon the rails. This is done to reduce the speed of the car and prevent the destruction of equipment, particularly where the run may be short and the rider has not the time to get the cars under control after leaving the hump. This is mostly occasioned by the hand brake failing to hold as it should or by some other defect in the braking apparatus.

The brakes on all cars are tested by the riders before the cars are cut off at the hump, and if a brake is found to be defective an additional car or cars is sent down with the cut to furnish sufficient hand braking power. It frequently happens, after brakes have been found to be apparent'y satisfactory at the hump, that they become inoperative when the cars are under way, and it is upon these occasions that a skate is called for by the rider.

The type of engine used at the hump is what is known as the C-2, handling trains of from 2,000 to 2,200 tons with ease. These locomotives have a weight on drivers of 189,200 lb., a tractive power of 42,800 lb., a boiler pressure of 200 lb., 63 in. driving wheels, and 23 in. x 30 in. cylinders. During the winter months a Mallet locomotive is used on the hump in place of one of the C-2's for the entire 24-hour period, being double crewed. The weight on the drivers of this engine is 323,500 lb., the tractive power 76,200 lb., boiler pressure 200 lb., and the diameter of driving wheels 57 in. These engines average from 36 to 40 miles per 10-hour period.

In making up trains in the flat switching yards we use two engines days and two nights. One of these engines—day and night—is of the same type as those used on the hump, viz., C-2. The second engine is a regular switch engine of the I-5 type, with a weight on drivers of 125,550 lb., a tractive effort of 28,158 lb., a boiler pressure of 180 lb., and driving wheels 51 in. in diameter. The average mileage made by these switch engines is about 25 or 30 miles per ten-hour day.

During the month of October, 1913, the total number of cars handled on trains in and out of Milwaukee, amounted to 133,000, or an average of nearly 4,500 a day, including Sundays. This large number of cars was about evenly divided east and westbound. Of the 67,000 eastbound cars, 55,000 were switched in the hump yard, and the balance were taken care of in what is known as the stock yards, a flat switching yard, where beer, merchandise and stock trains are made up every night, owing to the fact that the hump cannot take care of all of the business between the hours of 7 p. m., and 12 midnight. The 67,000 cars westbound are made up in trains in two different yards, on a flat switching proposition entirely.

The following statements will show a comparison of the actual expense of handling cars in hump and flat switching for October 23, 24 and 25, 1913.

Total number of cars handled by hump engines	5,223
Cars actually passed over the hump	3,437

The balance of the cars which were received at the hump yard were taken care of by the hump engines without any additional expense, but were not switched over the hump, owing to the fact that they were either stock trains or trains arriving in such condition that "humping" was not required, the engines simply making an exchange of caboose, or adding or deducting tonnage to fill the requirements of the connecting division.

Following is a table showing the expense incurred in the operation of the hump yard for the three days mentioned:

3	engineers	90 hr. at	4.25	$38.25
3	firemen	90 hr. at	2.55	22.95
14	riders, night	420 hr. at	3.70	155.40
12	riders, day	360 hr. at	3.50	126.00
2	foremen, night	60 hr. at	4.00	24.00
2	foremen, day	60 hr. at	3.80	22.80
10	switch tenders	300 hr. at	1.92	57.60
3	car clerks	90 hr. at	60.00	18.00
2	car clerks	60 hr. at	65.00	13.00
2	car clerks	60 hr. at	55.00	11.00
2	yardmasters	60 hr. at	4.50	27.00
				$516.00
	10 per cent. added for accounting and supervision			51.60
				$567.60
3	engines, use of	90 hr. at	8.00	72.00
3	engines, roundhouse expense	90 hr. at	2.50	22.50
24	tons coal	at	3.00	72.00
12	tanks water	at	.50	6.00
	Oil and waste			2.25
	Total			$742.35

This would make the cost of cars actually switched over the

hump 21.6 cents each, but as the total number of cars handled by the same employees and with the same equipment, without any additional expense whatever, amounted to 5,223, it will reduce the average cost of switching in the hump yard to 14.2 cents per car.

The total number of cars handled in the flat yards, for the same period, was 4,444. Following is a statement showing the cost of operating these yards for October 23, 24 and 25, 1913:

4 engineers	120 hr. at	4.25	$51.00
4 firemen	120 hr. at	2.55	30.60
4 helpers, nights	120 hr. at	3.70	44.40
4 helpers, days	120 hr. at	3.50	42.00
2 foremen, nights	60 hr. at	4.00	24.00
2 foremen, days	60 hr. at	3.80	22.80
1 switch tender	30 hr. at	1.92	5.76
2 yardmasters	60 hr. at	4.50	27.00
1 yard clerk	30 hr. at	65.00	6.50
1 yard clerk	30 hr. at	60.00	6.00
Proportion of expense of other yard clerks carding cars			10.00
			$270.06
10 per cent. added for supervision, etc.			27.00
			$297.06
4 engines, use of	120 hr. at	8.00	96.00
4 engines, roundhouse expense	120 hr. at	2.50	30.00
36 tons coal	at	3.00	108.00
12 tanks water	at	.50	6.00
Oil and waste			3.00
Total			$540.06

This will make the average cost of flat switching during this period 12.1 cents per car.

While these statements show that hump switching costs 2.1 cents per car more than the flat switching, it does not tell the entire story. When the hump yard was first inaugurated at Milwaukee, I was decidedly prejudiced against its use, because of the fact that a large number of cars were damaged by striking or colliding with cars standing on tracks. However, it was proved that this was mostly caused by the inexperience of the riders. At the opening of the hump yard the average number of cars damaged in a 24-hour period amounted to 35 or 40. After the riders became more experienced and knew how to handle the cars, the damage to equipment greatly decreased, and it is now a very frequent occurrence that we do not have a single car damaged in a 24-hour period. I feel safe to say that as many as ten days in every month go by without any equipment being damaged in this yard. Of course, it occurs occasionally that three or four cars will be damaged at one time, which is invariably due to the inefficiency of the brakes after the cars have left the hump. All cases of damage to equipment are thoroughly investigated for the purpose of ascertaining how the damage was brought about.

On the other hand, flat switching cars thrown down on the different tracks, and the abrupt stops required when cutting off cars, results in much damage to equipment as well as to commodities loaded in the cars. It is safe to estimate that the damage done in flat switching to equipment and freight is at least five times as great as that done in hump switching. I am therefore convinced that switching cars over the hump is more economical than flat switching, when the matter of damage to equipment and freight is considered.

THE PROPER SELECTION OF MEN

By I. T. Tyson

Assistant Trainmaster, Philadelphia & Reading, Philadelphia, Pa.

In handling any terminal, large or small, eternal vigilance and loyal employees, all working in perfect harmony, are required to bring most efficient service and economic results. The man in charge can never feel for a moment that there is nothing to do but to take life easy, look wise, and draw his salary, for that feeling spreads surprisingly fast and within a very short time everything begins to drag and irregularities and congestions appear.

I have always felt that the most important duty is the selection of men for employment. After the most careful examination has been made and the man has been accepted and put to work, his development must be watched and if it is found that a mistake has been made, and that he is not going to make good, the only thing to do after a fair trial is to drop him from the service. On the other hand if he develops any special points keep him headed that way so that he will take more interest in his work and the results obtained will far exceed what they would had the man been kept at something for which he was not fitted.

I find it necessary to watch closely for the fellow who becomes careless, lazy or indifferent. This class of men should be eliminated immediately, before they contaminate the entire force. I have known by actual experiment where one lazy, drunken man who was permitted to remain too long in the service destroyed the efficiency of the entire force with which he came in contact because he neglected every duty possible, which naturally threw everything out of bearing and caused friction. We know how easy it is for friction to crop out among men who are being forced under high pressure all the time in a busy terminal. This friction must be stamped out immediately. I have always made it a point where there are two or more yardmasters and each begins to feel that the other fellow is rubbing it in and begins to balk, to get on the ground just as quickly as possible to show all concerned the conditions in their true light. Then all can get back into the one long steady pull.

The man who is able to keep his entire force working in absolute harmony, from the general yardmaster to the newly appointed messenger boy, has the opportunity to put his mind to new problems which may arise or which may be of benefit to some part of the service, if properly worked out and put into effect. We have always found that from the moment a man is employed he should be made to feel he is an important cog in the wheel of a great organization. The assistant yardmaster, whose duties are about the same as those of his immediate superior, must depend upon his efficiency and loyal service for advancement. The switchman who squanders a lot of money in an hour in wrong moves will correct his method if he is shown what one minute lost on each move amounts to in a day. If the car checker who marks the cars on arrival is slow he should be made to see what slowness means in dollars and cents, and if the proper material is in him there will be no more trouble.

The engine despatcher is the next to the most important man in the whole organization. He must insist upon the engine being ready for service on the minute. The men must understand that there are 600 minutes in a day of 10 hours, which the company pays them for and which it does not get if they come out late.

Even in the selection of the messenger boy the greatest care should be used. In this young man we plant the seed for the future practical railroad man. From the very start he must understand the importance of his position and be made to feel that it is his duty not only to take care of this position, but also to fit himself for the next in line as soon as the opportunity may offer for advancement. The boy that fails in this is dead timber.

After such a careful selection and training of men there should be no reason why the handling of any terminal should not be successful. The secret is eternal vigilance, with every man constantly pushing the work. We have always trained our men to understand that just so soon as the work begins to push us, it requires double the effort to get even small results.

SOME DEFECTS IN YARD OPERATION

By A. B. C.

The subject of the operation of classification yards is one of minute detail requiring continuous ability; live, personal interest and smooth-running team work on the part of all concerned. No one, I think, has yet come forward with the knowledge, the courage and the backing to increase the cost of yard operation to the point where delays to freight will be avoided. Yards generally are run too cheaply. Too often a dollar is made saving yard engine service, and lost in per diem. There is

too much judging efficiency by comparing present with past figures.

In the same yard there is little sameness in the work for the same seasons of different years. The car movement and not the expense should be, and is not, the standard. Larger yards are not needed as badly as better road movement with present facilities. Except to handle certain equipment at certain periods storage yards are a mistake. Better car movement will obviate for some time the necessity of either. Larger yards will permit ready trains to wait on power, while storage yards will tend to lose cars and lessen the per-car per-day necessary mileage. Better car distribution will avoid storing many cars.

Yard operation does not appear to have been given close enough supervision by the higher officers. Too many decisions are based on information and detail from sources lacking experience or knowledge. We have many expert traffic minds promoted from clerkships, many good managers from mechanics or operators, but few promoted yardmasters. There are not many officers with a detailed knowledge of yard work. At many points on all roads conductors are running yards who don't want the job, but who have to be used for their switching knowledge, and who, in trouble, go back to their turns.

The interchange yard, where per diem is the much discussed item; the delivery yards at termini, where cars go to floats or piers or to industries, where the biggest kicker gets the best attention; the producing yard, where freight is collected from big industries, quarries and mines, and built into trains; and the classification yard at a divisional point, where sufficient room and facilities are supposed to be furnished for the properly classified handling of goods to or towards destination; all are different, but they are all alike in that they mean car movement.

Excessive continued yard crew overtime shows an unhealthy condition. There are too few yard engines, the schedule of work is wrong, there is no system in handling the work, or team work and personal interest are lacking. If the proper number of engines is worked, and they are rightly handled, the excessive overtime will disappear, though there will always be some overtime, as no two days are alike in the detail of the work they present, and it is impossible all the time to produce results in a given ten hours. Reasonable overtime should not be objected to as we get value received for the money spent.

Our modern hump and gravity classification yards seem to have proved that despatch in handling cars in yards is preferred above the risk of damage to freight by rough handling. In many places the number of brakemen riders is too small to properly protect and handle the business; and the damage done by bad brakes, etc., is too great, particularly in handling explosives, which under our present I. C. C. regulations make many an extra car.

The general yardmaster has not a free enough hand. By reason of his duties, probably pursued, he should be in line for the position of trainmaster. Perhaps, if his jurisdiction extended over the car and roundhouse foremen, and the transfer agent, much better team work might result, provided the train despatcher took the proper interest in team work. Under present actual conditions of work surrounding a general yardmaster's duties there is too much friction. The work of a general yardmaster should be purely of a supervisory nature, and his executive ability and power to handle men should be the criterion, rather than his ability to "rawhide" night and day.

On coming into a yard the first element to be considered is the classification required, for, regardless of the physical aspect of the yard, the men, or the power supplied, particular assigned work must be done at different points.

The second item for consideration is the organization—the human element and the system of work. The kind of men and the working plan mean much, as different men produce vastly different results with a given problem of yard operation.

Next to the general yardmaster his chief clerk should be experienced and capable of handling the correspondence, as well as smaller matters of the yard extra list, and the placing of clerks. He should see that every man is at his post at the beginning of his trick. He should have the assistance of an index or inventory clerk to handle car records and the many yard reports required. Car records by booking inbound and outbound trains, or filing by conductors trace reports, should be kept in the yard office. Such additional clerks as the work requires should be supplied.

The assistant yardmaster should be educated, trained and young. He is frequently not any of these. His education should be provided before he comes to the road, quite possibly in these days, and, if properly handled, his experience can be had from the bottom up in yard service in a very few years. He should appreciate the relative importance of all freight by a glance at the card manifest accompanying the cars; he should have a working knowledge of the freight agent's work, particularly billing; and he should be able to direct and work in harmony with his yard and road crews and subordinates. The clerk, weigher, checker, switch-tender and caller should be his men, trained and handled by him. His particular duties vary, but the proper conduct of the yard is his responsibility during his hours of service. The minute duties of his force should be considered separately with reference to requirements and circumstance in each instance.

To my mind the most important feature of yard operation is the handling of bad-order and stray or "no bill" cars. The "no-bills" should have a particular place in the yard, and the effort to locate bills should be constant and unremitting. The shop cars should have a sufficient space of their own. They should be placed and repaired promptly, and regularly taken off the repair tracks—once or twice in 24 hours, as may be demanded. There should be a positive unvaried schedule in handling this work. "Working Book" rules were made to be observed, and a yardmaster should understand the importance of strict compliance with instructions, and have cars forwarded on the time required. But if failure to carry out instructions were investigated with a view to understanding why certain things could not be or were not done, and if more consideration were extended, better results would obtain. If properly trained no yardmaster will ever disobey instructions. He will carry them out if his yard ties up provided he knows he will get the credit due obedience and good faith.

ORGANIZATION OF THE HUMP RIDERS

By E. W. Brown
Assistant Superintendent, Lake Shore & Michigan Southern, Chicago, Ill.

Riders should be required to get on cars and have their brakes tested before the cars are cut from the train. When defective brakes are found, which cannot be adjusted with little delay, another car should be added to the "cut" and the cars allowed to drop in on some track which is not in use, where they will not be overlooked, but will be picked up later by the "roustabout" engine, or by the "hump" engine after the train is switched.

During the daylight hours riders should be instructed to get off their cuts when the speed has been reduced to a slow rate and not to kill time riding until the cars stop. Whenever a rider is given more than one car the conductor should call to him the number he has in the "cut," and if the rider feels he cannot hold these cars he should call for another rider. When taking down long cuts, or when conditions are out of the ordinary, and more than one rider is used these men should be required to get off the "cut" when the speed has been checked so that one man can handle the cars. With an arrangement of this kind in effect very few cars will be damaged in switching. When cars are damaged a brake inspection should be made by the car inspectors and a report rendered to the general yardmaster who will investigate all cases and discipline careless riders.

Good switchtenders are of the greatest importance in avoiding sending cuts onto wrong tracks. They should also keep the "hump" conductor posted when the tracks are filling up and when cuts do go wrong they will advise the conductor so that the cars may be taken out before the train is ready to leave the yard. It has been my pleasure to have switchtenders who

took as much interest in a successful day's work as I, and to whom I owe much. Switchtenders should be promoted as soon as they are qualified, thereby encouraging new switchtenders.

Where classification tracks are long, or when they are clear, the conductor should instruct the riders as to just what distance he desires the cars to go and not allow the riders to ride the cars the entire length of the track, which consumes a great amount of time for these and the following riders. To enable the general yardmaster to have proper knowledge of the amount of work done in his yard, each rider should be required to turn in to his conductor or yardmaster, at the end of each day's work, a report showing the number of "cuts" he has taken down the hill and the hours and minutes used in other work. The reports, properly checked, will show just what is being done by each set of men and one can readily locate any slow work.

The noon hour should be watched very closely and riders should not be allowed to work unless absolutely necessary. The yardmaster should have cars on the hill if possible so as to start work promptly at the expiration of the noon hour. This can be done by working two or three men during noon hour, requiring all others to take the full hour for lunch.

A SUFFICIENT NUMBER OF CLASSIFICATION TRACKS

By G. O. Sarvis
Assistant Trainmaster, Philadelphia & Reading, Harrisburg, Pa.

One of the debatable questions in the design of yards is the number and length of classification tracks. It is the writer's opinion that the best interest will be served with a larger number of classifying tracks of sufficient length to accommodate the maximum train handled on the road, rather than fewer tracks of greater length. With sufficient tracks only to provide one for each classification, even if of considerable length, circumstances will arise preventing the prompt movement of one or more classifications. These tracks will fill up and it is then possible to keep working only by combining two or more classifications on one track, which is very undesirable and ultimately results in loss of time. With tracks for each classification, and a number of auxiliary tracks, each of sufficient length to hold a maximum train, it is possible under all ordinary circumstances, to avoid delay, and to keep the traffic properly classified.

Also with a classification yard consisting of one track only for each classification, the handling of preferred freight is a difficult proposition and cannot be accomplished expeditiously, without serious and costly delay to slow freight movement. With a yard having a number of auxiliary classification tracks, it is fair to assume that there will be a few tracks unoccupied and on which the preferred freight may be classified, and while this will greatly reduce the delay, it cannot be entirely eliminated. The ideal condition is a separate yard for the classification of all preferred freight, accessible without interfering with the slow freight movement.

THE NEW HAVEN'S ANSWER TO PRESIDENT WILSON

The following is the statement given out by President Hustis of the New Haven:

"The directors of the New York, New Haven & Hartford Railroad Company desire to make their position entirely clear. They have never refused, but on the contrary have always been willing and anxious to carry out the agreement with the Attorney-General made on March 21, 1914, approved by the stockholders on April 21, and sanctioned by the Governor of Massachusetts.

"That agreement was framed to accomplish two objects, first, the sale of certain properties owned by the company which the Attorney-General demanded, and second, the sale to take place at such times and on such terms as would insure a return at a fair price. This last object, in the judgment of the directors, will be defeated if the sale of the Boston & Maine stock is made subject to the condition imposed by the legislature of Massachusetts, and therefore they have declined to accept it and have stated fully the reasons for their decision.

"They have not refused to carry out any agreement which they have made, but they have refused to change that agreement, as the change would entail on the company a very large pecuniary loss and at the same time increase enormously the difficulty of reorganizing the Boston & Maine Railroad.

"As evidence of the good faith of the directors a representative committee consisting of President Hustis, Mr. Cuyler and Dr. Hadley, accompanied by Mr. Moorfield Storey, counsel in these proceedings, waited on the Attorney-General on July 20 and offered to carry through the settlement in all respects according to the agreement, and further in order to meet the difficulty which had been created by the Massachusetts legislature the committee offered to place the control of the Boston Holding Company in the hands of the trustees who had been selected by the Attorney-General and the Governor of Massachusetts, with full power to absolutely control the Boston & Maine Railroad until either the Massachusetts legislature passed the necessary legislation or the rights of the parties interested were decided by the Federal court in proceedings which the company offered to expedite in every way possible.

"In making this offer the committee did everything possible to avoid hostile proceedings without at the same time sacrificing the interests of their shareholders, and the directors only regret that an offer which seems to them eminently fair should not have been accepted.

"The following authorized statement will be issued to the stockholders:

"'You authorized your directors to compromise the questions pending between the United States and the company upon the basis set forth in the statement by the Attoreny-General on March 21 and submitted to you and approved by you at a special meeting of the stockholders held on April 21 last.

"'You have been advised through the statement adopted by the directors on July 8 that the legislature of Massachusetts has attached a condition to the sale of the Boston & Maine stock held for this company by the Boston Holding Company to which the directors cannot assent, and in that statement the directors have given the reasons for their decision.

"'Since that time a committee of the directors has conferred with the Attorney-General and has explained to him that the company cannot modify the agreement made with him by making the sale of the Boston & Maine shares subject to the terms imposed by the legislature of Massachusetts. The committee pointed out that the amount involved is very large, that in the judgment of the directors the condition would seriously depreciate the value of the stock and that it practically prevents the sale of these shares except at a great sacrifice and hampers very seriously all efforts to reorganize the Boston & Maine Railroad.

"'The committee called attention also to the fact that the right which the legislature seeks to acquire by the recent act is very different from the power reserved in the acts incorporating the Boston Holding Company, since these gave Massachusetts the power not to buy the Boston & Maine shares but only the shares, "bonds, notes and other evidences of indebtedness" issued by the Boston Holding Company, and this upon condition that it took them all and at the same time relieved the New Haven company from all its obligations as guarantor of those securities.

"'The New Haven company has guaranteed the principal and dividends on 272,939 shares of preferred stock issued by the holding company, of which 28,000, worth at par $2,800,000, are outstanding in the hands of the public. These shares are all secured by a lien on the Boston & Maine shares and the proposed act gives the right to take this security without assuming the New Haven company's liabilities as guarantor.

"'The Attorney-General has decided that it is his duty to bring his suit for a dissolution of the system and there is now no existing agreement between him and the representatives of the company, but the directors hope that a way will be found after the suit is brought through negotiation and action of the court to carry out the compromise agreement and thus achieve a result which all parties earnestly desire.'"

General News Department

The Chicago, Milwaukee & St. Paul has increased the working time of 2,000 men employed in its Milwaukee shops, from 8 to 8½ hours.

The new car shops of the Philadelphia & Reading at the coal shipping yard at Pottsville, Pa., have been turned over by the contractors to the railroad company.

The Public Service Commission of Pennsylvania and the Department of Labor and Industry of that state are holding conferences with railroad officers and with managers of industrial plants looking toward the formulation of a simpler report for state purposes, and especially for the reporting of accidents by corporations.

A joint committee of the New York City Club, the Citizens Union, the Independent Club of the West Side, the West End Association, the Twenty-third Street Improvement Association, the Washington Heights Tax Payers Association, the West Side Tax Payers Association, the Greenwich Village Improvement Association, the Woman's Municipal League, the League to End Death Avenue and the Merchants' Association has made an appeal to the Board of Estimate of the city of New York to cut short the negotiations with the New York Central looking toward some compromise on the question of the elimination of surface operation on Eleventh avenue and on the west side of New York, and to proceed immediately either through the courts or the legislature to forbid operation on Eleventh avenue unless the New York Central shall at once come to the terms asked by the city for the elimination of these tracks.

The Senate Committee on Interstate Commerce which had come to a tentative agreement on the draft of the Railroad Securities Bill, and was understood to be ready to report it to the Senate has, after a conference with Louis Brandeis and George Rubelee, decided to reconsider the bill. The objection found to the bill by Mr. Brendeis and by Senator Lippitt and Senator Brandegee was that in the form in which it was to be reported the Interstate Commerce Commission's approval of a security issue would amount to an implied guarantee by the government of the propriety of such an issue. As first agreed on the bill would have given the Interstate Commerce Commission power to investigate proposed improvements for which funds were sought, to approve issues if deemed necessary or advantageous, or to reject them if regarded as extravagant or unnecessary. The commission also would have been given power to go into court to enjoin a bond issue if made in violation of its order. Electric railways were to be exempt.

Controversy with Western Engineers and Firemen

The United States Board of Mediation and Conciliation arrived in Chicago on Monday, July 20, and offered its friendly offices in bringing about a settlement of the controversy between the Western railways and the engineers and firemen who have taken a strike vote. The request for mediation was made by the conference committee of managers, of which A. W. Trenholm, general manager of the Chicago, St. Paul, Minneapolis & Omaha, is chairman, after the representatives of the engineers and firemen had declined to join in the request on the ground that to do so would place a moral obligation on them to accept arbitration as provided for in the Newlands act. They had previously announced that they would not accept arbitration because of their claim that in past arbitrations the railroads had refused to place the awards in effect.

As briefly noted in last week's issue, the representatives of the engineers and firemen who had broken off negotiations on June 1, met with the committee of managers in Chicago on July 14, headed by W. S. Stone, president of the Brotherhood of Locomotive Engineers and W. S. Carter, president of the Brotherhood of Locomotive Firemen and Enginemen, and presented the results of a strike vote, claiming that 99.2 per cent. of the engineers' brotherhood had voted for a strike unless their demands were granted and 97.2 per cent. of the Brotherhood of Locomotive Firemen and Enginemen. The managers then requested that they submit in writing the results of the strike vote in detail by roads, which request was declined, in a letter stating that if the managers' committee had nothing further to offer, negotiations would be immediately discontinued and they would be notified of the time when the men would leave their service. The managers then asked for a statement of the final demands on which the men proposed to strike and were told that the men intended to stand by the final demands presented at the previous conference which were fully described in the statement issued by Mr. Trenholm on June 1, which was published in the *Railway Age Gazette* of June 5, page 1240. On July 16, Mr. Trenholm addressed a letter to Messrs. Stone and Carter, stating that as it was apparent that further negotiations between the committees would in all probability result only in reaffirmation of their relative positions without progress toward a settlement, the managers' committee requested the engineers and firemen's committee to join them in a request for the services of the federal board of mediation and conciliation. To this Messrs. Carter and Stone replied as follows:

"Your request has been referred to the joint committee representing the engineers, firemen and hostlers in the Western territory, and has been declined for the reason that should they join with you in the request to the United States Board of Mediation and Conciliation, it would place a moral obligation upon them to accept arbitration as provided for in the Newlands act. As we have stated to you on several occasions they will not accept arbitration because in our past arbitrations, the railroads have refused to place the awards in effect."

The managers then requested the services of the board and William L. Chambers, chairman, offered its services to the engineers and firemen, who accepted, but stated in the telegram "that it is unfair to ask us to wait four days before mediation begins in view of the present strained relations."

The managers' committee also issued a statement on July 17, in the form of a letter to the engineers and firemen, denying that the Western railroads had ever refused to abide by arbitration awards, and requesting that specific instances be cited in support of the charge.

The board of mediation and conciliation on its arrival in Chicago on Monday immediately went into conference with the managers' committee and the brotherhood's committee, separately, and announced its intention of holding a meeting with each committee daily.

American Railway Safety Association

A meeting of the American Railway Safety Association, which was organized in Chicago on June 9, 1913, was held on July 16, at the Hotel Bismarck, Chicago. This was the fifth meeting since the organization. At the previous meeting the election of permanent officers was postponed, pending possible action by the American Railway Association toward organizing a bureau of safety or a committee on safety within its organization. As the American Railway Association had taken no action on these plans it was decided to proceed with the permanent organization, and the following officers were elected: President, A. W. Smallen, chairman general safety committee, Chicago, Milwaukee & St. Paul, Chicago; vice-president, Isaiah Hale, safety agent, Atchison, Topeka & Santa Fe, Topeka; secretary-treasurer, L. F. Shedd, safety supervisor, Rock Island Lines, Chicago. It was decided to hold the next regular meeting of the association at Chicago in November.

On recommendation of a committee appointed at the previous meeting it was decided that the association should become an associate member of the National Council for Industrial Safety. A committee was appointed with N. D. Ballantine, assistant to second vice-president, Rock Island Lines, as chairman, to investigate and report at the next meeting on a uniform plan of

reporting accident statistics. It appeared that the safety departments of various roads were using different methods in compiling their reports of injuries, some following the rules of the Interstate Commerce Commission regarding the reporting of injuries to that body, which requires the report of an injury only where the injury causes the employee to lose three days' time, while some roads include in their reports all injuries, regardless of whether time is lost, and others only report injuries that cause the loss of time, thus making it difficult to make comparisons between the safety records presented by different roads. A committee was also appointed to compile statistics of automobile accidents at crossings, with a view to conducting a campaign of education among automobile owners and manufacturers.

Following the completion of the routine business of the meeting, the meeting was thrown open to general discussion of safety methods. E. R. Scoville, of the general safety committee of the Baltimore & Ohio, gave an outline of the work on that road, which was reorganized on January 1, with a general safety committee of seven members to give all their time to the work. J. G. Pangborn, formerly special representative of the president, is chairman, and the other members of the committee include a superintendent of motive power, a division engineer, a division superintendent, a medical examiner, a supervisor of safety service, and a former inspector of the Interstate Commerce Commission. The General Safety Committee usually attends meetings of all of the division safety committees, 20 in all, each month, and have a car assigned to their use. The committee reports to the third vice-president, and obtains special authority for expenditures recommended by the division committees, which are of such a nature that they cannot be taken care of out of the funds allotted to the divisions. The general committee recently spent one month in visiting large terminals on the road other than the division headquarters where the regular division meetings are held. A large number of separate meetings were also held with various classes of employees, the men being paid for the time spent at such meetings. For the month of July one member of the committee is attending the division meetings and the others are traveling over other parts of the system, inspecting conditions. A. A. Krause, commissioner of safety, Missouri, Kansas & Texas, also spoke briefly regarding the safety work on his road. M. A. Dow, general safety agent, New York Central Lines, described some of the features of the safety work on the New York Central Lines, and distributed samples of some of the literature used. He said the most important feature of the work was the education of employees along safety lines. During the past year 100,000 men have attended the meetings held in the safety exhibit car. Special shop meetings were held which were attended by every man working in the shop. His department has issued a leaflet of 40 special safety rules, which are supplemental to the regular operating rules, which the men are required to keep in the rule books, and on which they are required to pass an examination. He also described the use of a safety work card, which is filled out when special work is recommended for certain divisions, one copy being left with the division superintendent and the other mailed to his office. When the work is completed the superintendent fills out the card mailed to him stating that the work has been completed. If the work is not done within 30 days, it is taken up by his office from the card records. He also outlined plans which are now being worked out for the use of moving pictures in the campaign during the next winter. J. D. M. Hamilton, claims attorney of the Atchison, Topeka & Santa Fe, spoke of the importance to the railroads of exercising more care in the inspection of men before they are hired, to see that they are qualified for their work, and the education of these men after they are in service. He said that railroads must seek to obtain a higher degree of perfection in the employees, and to eradicate habits of carelessness which have been acquired through long practice, and because the men have never been taught any better. He also dwelled on the necessity of teaching the men habits of concentration on their work. Several other members spoke along the same lines. L. F. Shedd, of the Rock Island Lines, said that under the present workmen compensation laws the railroads are running insurance companies without knowing what risks they are taking, unless the men are examined thoroughly before they are hired. J. M. Guild, of the Union Pacific, told of the plan recently adopted by the Union Pacific for keeping in touch with good men that apply for jobs, but who cannot be put to work at once. Waiting lists have been established, so that when men are needed the road has an opportunity to make better selection. Mr. Hamilton was appointed chairman of the executive committee; Mr. Guild of the committee on publicity and entertainment; and C. T. Banks, of the Northern Pacific, of the committee on membership.

Crossing Accident on the Virginian

An electric train of two cars on the Virginia Passenger & Power Company's line from Ocean View, Va., to Norfolk ran into a train of 71 empty cars on the Virginian on the night of July 16, killing four people and injuring a considerable number of others. From unofficial accounts it would appear that the train of empty coal cars was in considerable part past the crossing when the electric cars, fairly well crowded with people returning from Ocean View, either disregarding the regulations to stop before the crossing or for some season unable to do so, crashed into the train almost at right angles, breaking it in two, overturning the electric cars and derailing two or more of the gondola cars.

American Railway Tool Foremen's Association

The following is a list of the exhibitors at the convention of the American Railway Tool Foremen's Association, held at the Hotel Sherman, Chicago, on July 20 to 22:

American Specialty Company, Chicago.—Drill sockets. Represented by H. S. Mills and C. N. Weakes.

Brown & Sharpe Company, Providence, R. I.—Machinists' tools. Represented by R. C. Brown and R. E. Doras.

Carborundum Company, Niagara Falls, N. Y.—Carborundum and aloxite wheels, and aloxite and carborundum cloths, and valve grinding compounds. Represented by C. C. Schumaker, H. P. Frost and E. P. Ritzina.

Chicago Pneumatic Tool Company, Chicago.—Air and electric drills, pneumatic hammers, speed recorders. Represented by C. E. Walker, P. F. Flaven, J. C. Campbell, J. L. Camby, C. B. Coates and Chas. H. Schumasken.

Cleveland Twist Drill Company, Cleveland Ohio.—Twist drill reamers. Represented by Herbert S. White and A. L. Beardsley.

Colonial Steel Company, Pittsburgh, Pa.—High speed saws, drill rods, 11/16 in. punch shown through 1⅛ in. steel, examples of steel fractures, photographs. Represented by T. W. McManus and M. P. Spencer.

Crerar-Adams & Co., Chicago.—Jacks, die starters, pipe benders, wrenches. Represented by Russel Wallace and W. I. Clock.

Crucible Steel Company of America, Pittsburgh, Pa. Represented by Mr. Baskerfield.

Detroit Twist Drill Company, Detroit, Mich.—Drills, reamers, milling cutters, sleeves, sockets, chucks. Represented by M. P. Crawmer.

Faessler Manufacturing Company, The, Moberly, Mo.—Catalogs, Represented by G. R. Maupin.

Grip Nut Company, Chicago.—Testing machines, deflecting machines, samples grip nuts. Represented by B. C. Hooper.

Halcomb Steel Company, Syracuse, N. Y. Represented by Garson Myers.

Independent Pneumatic Tool Co., Chicago.—New electric tools, new air turbines, small S. S. compound drills. Represented by Robert T. Scott, Geo. Wilson, Harold Henricks and Wm. Gummere.

Ingersoll Rand Company, New York, N. Y.—Pneumatic tools. Represented by N. O'Connor.

Lutz-Webster Engineering Company, Philadelphia, Pa.—Lutz no-set screw lathe dog, Lutz no-handle ratchet, Lutz one-piece drill ratchet, Lutz adjustable self-feed drilling post, solid and swivel arm; Lutz compression wrench for all finished or rough surface stud driving. Represented by Wm. H. Lutz.

Manning, Maxwell & Moore, Inc.; Ashcroft Manufacturing Company; Consolidated Safety Valve Company; The Hancock Inspirator Company, New York.—Hancock inspirators, boiler checks, Consolidated safety valves, Ashcroft pressure gages, prismatic water glasses and other locomotive appliances. Represented by C. L. Brown.

Midvale Steel Company, Philadelphia, Pa.—Catalogs. Represented by F. W. Sager.

National Machinery Company, Tiffin, Ohio.—Single motor driven bolt cutter and die sharpener. Represented by Chas. Harmon, Jr., and K. L. Ernst.

Norton Company, The, Worcester, Mass.—Two 2¼ in. Model C grinders, equipped with Model P protection hoods; one stand showing wheel broken in its hood; one stand showing exhaust system-line of tool-room wheels; booklets on Safety First grinding. Represented by J. W. Horne.

Racine Tool & Machine Company, Racine, Wis.—High speed metal cutting machines. Represented by J. M. Jones and Wm. Richards.

Rich Tool Company, Chicago.—High speed tool. Represented by O. F. Schubert.

Ryerson, Joseph T., & Son, Chicago.—Model of a punch and boiler tools. Represented by L. H. Bryan, C. R. Gregg, H. C. Williamson and H. G. Merriell.

Strong-Carlisle & Hammond Company, Cleveland, Ohio.—Randall graphite sheet lubricator, Mac-it set screws. Represented by B. E. Carpenter.

Weaver Manufacturing Company, Springfield, Ohio.—Weaver roller jaw chucks. Represented by C. F. Hodgson.

Western Tool & Manufacturing Company, Springfield, Ohio.—Tool holders, expanding mandrels, lathe dogs. Represented by J. Z. Wells.

Whitman Barnes Company, Akron, Ohio.—Drills, reamers, wrenches. Represented by A. O. Wange and M. E. Towner.

Williamson, H. C., Chicago.—Metal band saw. Represented by H. C. Williamson.

American Boiler Manufacturers' Association

The American Boiler Manufacturers' Association will hold its twenty-sixth annual convention at the Waldorf-Astoria, in New York, from September 1 to 4. An invitation to attend has been extended to all boiler, tank and stack manufacturers, fabricators of steel plate and representatives of supply companies.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

AIR BRAKE ASSOCIATION.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—A. G. Thomason, Boston, Mass.

AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next convention, October, Washington.

AMERICAN ASSOCIATION OF GENERAL PASSENGER AND TICKET AGENTS.—W. C. Hope, 143 Liberty St., New York.

AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, I. C. R. R., East St. Louis, Ill.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next convention, August 20 and 21, New York.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 29 W. 39th St., New York. Annual convention, October 12-16, Atlantic City, N. J.

AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—H. G. McConnaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 20-22, 1914, Los Angeles, Cal.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, Karpen Bldg., Chicago.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—A. R. Davis, Central of Georgia, Macon, Ga.

AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. W. Hunt, 220 West 57th St., New York; 1st and 3d Wednesday, except June, July and August, New York.

AMERICAN SOCIETY OF ENGINEERING CONTRACTORS.—J. R. Wemlinger, 11 Broadway, New York; 2d Thursday of each month, at 2 P. M., 11 Broadway, New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, 1300 Pennsylvania Ave., Washington, D. C. Annual convention, April 28, 1915, Atlanta, Ga.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—C. W. Egan, B. & O., Baltimore, Md.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Annual convention, October 19-23, Chicago.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—P. W. Drew, 112 West Adams St., Chicago.

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York.

ASSOCIATION OF WATER LINE ACCOUNTING OFFICERS.—W. R. Evans, Chamber of Commerce, Buffalo, N. Y.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meeting with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk Ry., Montreal, Que.; 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que.; 1st Thursday, October, November, December, February, March and April, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawler Ave., Chicago; 2d Monday in month, except July and August, Lytton Bldg., Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York; 2d Friday in January, May, September and November and 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

CIVIL ENGINEERS' SOCIETY OF ST. PAUL.—Edw. J. Dugan, P. O. Box 654, St. Paul, Minn.; 2d Monday, except June, July, August and September, Old State Capitol Bldg., St. Paul.

ENGINEERS' SOCIETY OF PENNSYLVANIA.—Edw. R. Dasher, Box 75, Harrisburg, Pa.; 1st Friday after 10th of each month, except July and August, 31 So. Front St., Harrisburg, Pa.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, Oliver Bldg., Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

FREIGHT CLAIM ASSOCIATION.—Warren P. Taylor, Richmond, Va.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 605 Grand Central Station, Chicago; Wednesday preceding 3d Thursday, Transportation Bldg., Chicago.

INTERNATIONAL RAILWAY CONGRESS.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—C. G. Hall, 922 McCormick Bldg., Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 829 West Broadway, Winona, Minn.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, Lima, Ohio. Next convention, August 18-20, Hotel Wisconsin, Milwaukee, Wis.

MAINTENANCE OF WAY & MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next convention, November 17-19, 1914, Detroit, Mich.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, Karpen Bldg., Chicago.

MASTER CAR & LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 8-11, Nashville, Tenn.

NATIONAL RAILWAY APPLIANCES ASSOCIATION.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15 to 19, 1915, Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass.; 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. Frakenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, Union Station, Peoria, Ill.; 2d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

RAILROAD MASTER TINNERS, COPPERSMITHS & PIPEFITTERS' ASSOCIATION.—U. G. Thompson, C. & E. I. Danville, Ill.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

RAILWAY DEVELOPMENT ASSOCIATION.—W. Nicholson, Kansas City Southern, Kansas City, Mo.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Mobile & Ohio, Mobile, Ala. Annual meeting, October 6, Washington, D. C.

RAILWAY GARDENING ASSOCIATION.—J. S. Butterfield, Lee's Summit, Mo.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Bethlehem, Pa. Annual meeting, Bluff Point, N. Y., September 22-24.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, Box C, Collinwood, Ohio.

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with M. C. B. and M. M. Associations.

RAILWAY TELEGRAPH & TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va.; 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Next convention, September 8-10, 1914, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and August, St. Louis.

SALT LAKE CITY TRANSPORTATION CLUB.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah; 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, La Salle St. Station, Chicago. Annual meeting, September 15-17, Hotel Aspinwall, Lenox, Mass.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. Ry., Atlanta, Ga.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga.; 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

TOLEDO TRANSPORTATION CLUB.—J. S. Marks, Agent, Interstate Despatch, Toledo, Ohio; 1st Saturday in month, Boody House, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillsburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York; last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Erie R. R., Pittsburgh, Pa.; meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7122 Stewart Ave., Chicago.

TRANSPORTATION CLUB OF BUFFALO.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich.; meetings monthly, Normandie Hotel, Detroit.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Next meeting, September 15-18, Hotel Sherman, Chicago.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, Newhouse Bldg., Salt Lake City, Utah; 3d Friday of each month, except July and August, Consolidated Music Hall, Salt Lake City.

WESTERN CANADA RAILWAY CLUB.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago; 3d Tuesday of each month, except June, July and August, Karpen Bldg., Chicago.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago; regular meeting 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

During the month of May, the Atchison, Topeka & Santa Fe "California Limited" train arrived on time in Los Angeles and Chicago terminals 59 out of a possible 62 times.

Returns made to the committee on relations between railroads of the American Railway Association show that on July 15 the total freight car surplus was 228,384 cars, an increase of 7,509 as compared to July 1. The total shortage on the same date was 1,843 cars, an increase of 508.

The Lumbermen's Association of Chicago has addressed a letter to all its members, urging them to co-operate with the railways by loading cars to full capacity, thereby reducing the number of cars required to handle its products and releasing them for use in the grain traffic, and to appeal to the consumer to co-operate by unloading cars as promptly as possible. With the letter is sent a letter to be sent out by individual firms to be sent to other mills.

The City Club of Chicago has published a book of 89 pages, by George E. Hooker, civic secretary of the club, on Through Routes for Chicago's Steam Railroads, which discusses the Chicago terminal and local transportation system in detail, with many maps and charts, and advocates the plan of through-routing the suburban trains of the steam railroads by means of subways through the central portion of the city, to give passengers on one road direct access to other portions of the city now served by the other roads.

Agreement Reached on Intermountain Rate Case

Following a recent conference between traffic officers of the western transcontinental railways and the Interstate Commerce Commission at Washington, an agreement has been reached providing for the final disposition of the entire intermountain rate cases by January 1, 1915, and for putting into effect most of the rates involved by October 1 of this year. As the order of the commission, which was recently sustained by the Supreme Court, dates from June 22, 1911, a new effective date had to be set on which the order should become effective. On July 9, the carriers submitted to the Interstate Commerce Commission a petition which has now been granted by the commission to extend the effective date of the order from June 22, 1911, to October 1, this year, in order to enable the carriers to compile and publish rates to conform to the order, with the exception of 107 commodities on which they ask further consideration. The roads submitted to the commission with the petition three schedules of rates.

Schedule A is a list of commodities on which the rates to Pacific coast terminals will apply as maxima to intermediate points, and on which no relief is requested. These include rates on such commodities as fruit, grain, flour, vegetables, products of the soil, agricultural implements, building material, etc., particularly those rates in which the individual is much interested as a consumer, upon some of which the carriers consider the rates low, but on which they will continue to apply the coast rates as maxima.

Schedule B consists of commodities subject to water competition at the Pacific coast terminals, but on which the rates from the Missouri river to the Pacific coast by rail are generally not less than $2 for less than carload lots, and $1 for carload lots, and as to which the carriers will observe the fourth section rule of the commission, applying only such percentages over the through rates at the intermediate points as were designated for the respective zones in the original order of the commission.

Schedule C is a list of 107 commodities covering generally manufactured articles subject to the most severe water competition, and on which the rates to the coast are less than $1 in carloads, and $2 in less than carloads, which rates the carriers consider subnormal to a marked degree, measured by any recognized standard that has been fixed by the commission as reasonable, but which are necessary to move a share of this water-competitive traffic by rail; also to enable manufacturers and shippers at points of production not located directly on the Atlantic seaboard to share in the trade of the Pacific coast. These rates are so low that the carriers consider they should not be used as a basis for rates to interior points. Schedule C embraces such articles as sulphate of ammonia, chloride of calcium, carbide of calcium, canned fruit, fish, corn, meat, mincemeat, tomatoes, etc., green coffee, cotton piece goods, hardware and tools, pig iron, structural iron, iron fence, iron posts, iron pipes, wire fencing, paint, paper, rice, radiators, sectional boilers, etc., pig and slab tin, and insulated copper wire.

The rates on commodities named in schedules A and B will become effective on October 1, therefore, when the carriers will have in effect new schedules conforming either literally to the fourth section of the Interstate Commerce act or taking only such percentages over the through rates as were designated for the respective zones. As to the rates in schedule C, the carriers asked sufficient time to present to the commission such evidence as, in their opinion, will completely justify a greater degree of relief from the provisions of the fourth section than was granted in the order. The carriers now feel that they can present convincing facts and arguments in support of such modifications of the order as to these rates. As to these rates the commission agreed to grant a hearing beginning in Chicago on October 6, to afford the carriers opportunity to present their evidence. Of the 107 items, 67 are carload and 40 less than carload rates. By stipulation of the carriers they agree that after this hearing, or after the commission has given consideration to the data there presented, they will, on January 1, without delay, comply with the order of the commission in toto.

The commission also determined slightly to modify zone boundary lines fixed in the original order so as to make the zones upon diagonal traffic from Lake Superior regions to the south Pacific coast, and from Galveston to the north Pacific coast to conform to the zones already fixed in the tariffs applicable to class rates.

It will thus come about that by October 1, on 372 commodities in carloads, and 41 commodities in less than carloads, the fourth section order will be fully operative. Since the issuance of the original order, by agreement with the intermountain shippers, commodity rates from all eastern points to intermountain points have been established on all commodities involved that move in sufficient volume to justify commodity rates. This made a very considerable reduction in previous rates. The commission had previously reduced all class rates from eastern points to all intermountain territory and the roads have established class rates to the coast based on a scale of $3.70 New York to the coast.

Shippers Asked to Co-operate for Car Efficiency

W. S. Tinsman, chairman of the Association of Western Railways, has issued the following circular letter addressed to shippers and receivers of freight, industrial traffic managers and commercial organizations, asking their co-operation in promoting the most efficient use of freight car movement during the crop-moving season to avoid the possibility of car shortage:

"Two years ago in anticipation of the large tonnage which the railroads would be required to move as a result of the heavy crops of that year, this association appealed to the shippers and receivers of freight for co-operation in obtaining the maximum use of freight equipment. The results of that appeal, and the interest manifested by the shippers throughout the country, were very gratifying.

"The present prospect of exceptionally heavy crops, as evidenced by the tables attached hereto, warrants an appeal of the same nature at this time.

"In spite of the fact that a great surplus of cars has existed for some time, the surplus of box cars is not so great as to warrant any feeling of security, and unless the co-operation suggested below can be had, the prospects are for a difficulty in moving these crops which may affect disadvantageously the interests of the shippers and receivers alike.

"The railroads are making every effort which their resources will permit to put cars in condition for service and in other directions to prepare themselves to handle the traffic with promptness.

"Shippers and receivers, commercial organizations and others

having to do with the commerce of the country, are earnestly urged to lend their efforts and influence in every way possible to bring about the most economical use of equipment, and the following suggestions are made for which the widest publicity is solicited:

"First.—Move all the coal, lumber, cement and other supplies that you can before the heavy crop movement starts.

"Second.—Load and unload all cars as quickly as possible. (If, without additional cost, the use of greater force will get the load ready for movement or the car released more quickly, do it.)

"Third.—Load all cars to the full capacity. (A leeway of 10 per cent. above the marked capacity is permitted before reduction of load is required. All cars should so far as possible be loaded to a weight between the marked capacity and 10 per cent. above.)

"Fourth.—Anticipate the disposition of freight before its arrival.

"Fifth.—Only order such cars as can be loaded promptly. (Orders for cars should state the number required for that day's loading, the kind of cars, the final destination of the shipment, and the routing via which it will move.)

"Sixth.—Reduce to the minimum the practice of billing cars to intermediate points to be held for reconsignment."

The circular also includes tables of the crop reports for previous years, with the estimates for this year, as an indication of the probable demand upon the carriers for equipment during the coming season, and says: "The greatly increased crops here indicated cannot but be reflected in the movement of other freight, or fail to impress upon the minds of every one interested in the subject, the necessity for the most hearty co-operation on the part of all if a serious car shortage and its accompanying damage to all lines of trade is to be avoided."

Another table gives information as to the general situation with respect to cars available, with comparisons for previous years. These figures indicate an increase in the number of available cars in the western territory, as well as in the whole country, and taking into consideration the increase in the average capacity of all freight cars the improvement is substantial. For 1913, for the western states, the number of freight cars owned was 6.41 per mile of road, as compared with an average from 1907 to 1913 of 6.04. The percentage of cars in shop was 6.7. For the entire United States the number of freight cars owned was 2,127,314, as compared with an average of 2,019,681, or 10.03 per mile, as compared with an average of 9.79, and the percentage in shop was 7.30, as compared with an average of 6.85. Exclusive of cars in shop the number of cars per mile of road was 9.30, as compared with an average of 9.12. About 40,000 copies of the circular have been sent out, including a large number to newspapers.

James E. Quan, chairman of the Illinois Public Utilities Commission, has issued a statement saying the Illinois roads have informed the commission that 20,650 new cars will be available on seven lines, in addition to the old equipment, for handling the grain movement this season, and that the roads are exerting every effort to have their equipment in proper condition. The cars are to be delivered by August 1, and 120 new locomotives are to be delivered to the roads in the state by that time. "We expect few or no complaints of car shortage this year," says the commission, "notwithstanding the fact that the crops are the largest ever known. All that is necessary is that shippers and receivers of grain co-operate with the railroads by prompt action in loading and unloading cars in order that they may be promptly available for other service."

The office of markets of the United States Department of Agriculture has made inquiries in Texas, Oklahoma, Kansas, Missouri, Nebraska, Iowa and Illinois as to the possibilities of a car shortage for movement of grain this fall. The report of this investigation says in part:

"The sentiment is by no means universal among the country elevators that there will be a car shortage. The belief that there will be a shortage is most prevalent among the country elevators of Kansas. Expressions from terminal elevator points indicate that there will be a shortage in all states.

"On the part of the roads statements from officials through the press are given to the public and growers, and elevator men are personally advised by local agents, traveling freight agents and other representatives, of all steps taken to minimize shortages."

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Molasses Rates to Knoxville, Tenn.

Opinion by Commissioner Hall:

The commission finds that the carriers are justified in canceling a special rate of 25 cents on "blackstrap" molasses in carloads from New Orleans to Knoxville and restoring in its place the domestic rate of 33 cents on all other molasses, except in so far as the 33 cent rate may violate the long and short haul clause in comparison with a rate of 32 cents to Bristol, Tenn. (30 I. C. C., 613.)

Cotton Rates to Augusta, Ga.

Augusta Cotton Exchange & Board of Trade v. Southern Railway. Opinion by the commission:

The commission finds that the rates on cotton to Augusta, Ga., from stations in South Carolina on the Southern Railway are unreasonable to the extent that they exceed rates from the same point which were in effect prior to September 23, 1909, the rates then in effect being on the basis of the South Carolina scale as are the present class rates. (30 I. C. C., 704.)

Lumber Rates from Batesville, Miss.

Southern Hardwood Traffic Bureau, for the benefit of R. J. Darnell, Inc, v. Illinois Central et al. Opinion by the commission:

The commission finds that the rates on lumber, other than cottonwood and gum from Batesville, Miss., to points in central freight association, western trunk line and trunk line territories are not unreasonable, but they are discriminatory to the extent that they exceed the rates to the same destinations from Sardis, Miss., a point nine miles north of Batesville. (31 I. C. C., 6.)

Increases in Rates on Fencing Allowed

In re rates on fencing and fencing material from Anderson and other points in Indiana to Texarkana, and other points Opinion by Commissioner Harlan:

The commission finds that the carriers are justified in increasing from 37 cents to 40 cents per 100 lb. the present rate on fencing and fencing materials from Anderson, Crawfordsville, Kokomo, Muncie and Richmond, all in Indiana, to Texarkana. No substantial reason is given for the charging of a lower rate for shipments of fencing materials from the five Indiana points named, than is charged on similar shipments from other points in Chicago-Cincinnati territory. (30 I. C. C., 650.)

Switching Charges on Ice in the Chicago District

Peoples Fuel & Supply Company v. Grand Trunk Western et al. Opinion by the commission:

The Minneapolis, St. Paul & Sault Ste. Marie, and the Grand Trunk Western, in compliance with an order of the commission, established a joint rate on ice from Silver Lake, Wis., to a point of delivery on the tracks of the Grand Trunk Western in Chicago. There having been a dispute as to divisions, the commission finds that the Soo line should allow the Grand Trunk Western the regular reciprocal switching charges applicable under the provisions of the Lowrey tariff to reciprocal switching in the Chicago district. (30 I. C. C., 657.)

Lumber Rates from Thebes, Ill.

Opinion by Commissioner Meyer:

The commission finds a proposed cancellation of proportional rates on lumber and forest products from Thebes, Ill., to points in southwestern Illinois on the Chicago, Burlington & Quincy via the St. Louis, Iron Mountain & Southern to Herrin and the Chicago, Burlington & Quincy beyond to be justified because of the discontinuance of the physical connection at the interchange point. It is ordered, however, that the rates via the route over

the Chicago & Eastern Illinois, or over the latter to Goreville and the Chicago, Burlington & Quincy beyond should be maintained upon the same relative basis as the rates charged to competitors located on the St. Louis & San Francisco. (31 I. C. C., 15.)

Grain Transit Privileges at St. Louis

Merchants Exchange of St. Louis, Mo., v. Baltimore & Ohio et al. Opinion by Commissioner Meyer:

The commission deems that the record in the case is not sufficient to enable it to determine the reasonableness of the regulations requiring shippers to surrender their expense bills covering inbound shipments in order to obtain the benefit of reshipping rates from St. Louis, Mo., and East St. Louis, Ill., to central freight association and trunk line territories, which rates apply regardless of the point of origin of the original shipment. The case is therefore reopened and set to be heard with *Southwestern Missouri Millers' Club v. Chicago & Alton* at an early date to be announced later. (30 I. C. C., 700.)

Increased Rates from Maine Refused

In re class and commodity rates from stations in the state of Maine. Opinion by Commissioner Meyer:

The commission finds that the Maine Central has not justified charges in its tariffs whereby it will eliminate stations east of Lewiston and Brunswick in the Ellsworth group from the list of stations taking the Boston rates and apply to the eliminated territory differentials over the Boston rates on traffic destined to central freight association territory. The carrier has not sufficiently shown the necessity of such an increase in rates by the presentation of statements of earnings per ton mile and proof of increased general operating expenses, nor has it shown that the rates heretofore maintained yield less than a fair return. That the average length of the haul is slightly in excess of the haul from points from which it is proposed to continue the Boston rates does not prove that the rates under suspension are just and reasonable, no evidence having been offered as to the reasonableness of the Boston rates. (31 I. C. C., 18.)

Kelly's Creek Colliery Case

Hughes Creek Coal Company et al. v. Kanawha & Michigan et al. Opinion by Commissioner Meyer:

In the original case of *Kelly's Creek Colliery Company v. Kanawha & Michigan*, reported in the *Railway Age Gazette* of April 10, page 850, the commission held that the defendants should establish through routes and joint rates on coal between stations on the Kanawha & Michigan and its branches and various eastern and southeastern territory on the lines of the Chesapeake & Ohio and its connections and that as reasonable rates for these routes defendants should apply rates not in excess of those applying to those destinations for shipments from the mines on the Chesapeake & Ohio. Upon reconsideration of the case the commission now holds that there may properly be a slight difference between the rates applicable to the through routes ordered and those applicable to the single movement over the Chesapeake & Ohio. The difference, however, must not exceed five cents per ton.

Intermediate and Joint Rates

Humphreys-Godwin Company v. Yazoo & Mississippi Valley et al. Opinion by the commission:

The complainant made carload shipments of cottonseed meal from Helena, Ark., to certain New England points. The shipments were consigned in the first instance to itself at Louisville, Ky., but while en route, defendants at Louisville were furnished with instructions to forward the shipments to the respective New England destinations. The joint through rate was 33 cents; the sum of the intermediate rates via Louisville was 30½ cents. Upon complaint alleging that the shipments to and from Louisville were separate and distinct transactions and that the shipments should have been charged at the intermediate rates, the commission finds that the shipments were not handled under such circumstances as to have constituted separate and distinct shipments to and from Louisville, and that although the fact that a joint rate exceeds the sum of the intermediate rates over the same through route raises a strong presumption that the joint through rate is unreasonable to the extent that it exceeds the sum of such intermediate rates, the presumption is not conclusive and may be rebutted by evidence to the contrary. Under the circumstances of the instant case the presumption of unreasonableness inhering in the 33-cent rate is held to be satisfactorily rebutted by the evidence. Complaint dismissed. (31 I. C. C., 25.)

Rates from the Twin Cities to Dakota Points

Minneapolis Civic and Commerce Association v. Chicago, Milwaukee & St. Paul. Opinion by Commissioner Meyer:

Complaint is made that the class rates from Minneapolis and St. Paul to South Dakota and North Dakota points on the Hastings & Dakota division, the James River Division (now consolidated with the Hastings & Dakota division) and the trans-Missouri division of the Chicago, Milwaukee & St. Paul, are unreasonable per se, and discriminatory. The three operating divisions referred to constitute that part of the transcontinental line of the Chicago, Milwaukee & St. Paul which crosses the northern part of South Dakota, and the southwestern corner of North Dakota, and the branch lines running northward and southward from the main line. Comparisons are made between the rates from the Twin Cities to the points of destination involved and the distance tariffs of Minnesota and Iowa for intrastate traffic; the rates from Minneapolis to Iowa points on defendant's line; the rates to South Dakota points on defendant's line to Rapid City, S. D.; the rates for equal distances from Chicago and Milwaukee to points in Minnesota, Iowa and South Dakota and the rates from the twin cities and from Duluth to points in North Dakota on the lines of the Great Northern and Northern Pacific, which, it is argued, bear out complainants' contentions. The commission finds, however, that the existence of undue discrimination is not proven in the rates from the twin cities to South Dakota points, as compared with those to the same points from competing markets, and that to a certain extent carriers are justified in placing competitive markets on an equal basis. It is also held, however, that in many instances the rates involved are unreasonable in that they increase in the movement westward greatly out of proportion with the increase in distance. A new table of rates is prescribed, therefore, for distances varying from 200 to 600 miles, which, it is believed, will remove this discrepancy. (30 I. C. C., 663.)

Switching Charges at Seattle

Transportation Bureau of the New Seattle Chamber of Commerce et al. v. Great Northern. Opinion by Commissioner Meyer:

The commission finds that defendant's class E rate of 3 cents per 100 lb. applicable to shingles and lumber moving in carloads from Ballard to Seattle for interchange at the latter place with other roads is not unreasonable in so far as it results in charges not greater than $10.50 per car. At one time defendant moved cars from industries on its Sobey Spur at Ballard to the Chicago, Milwaukee & St. Paul's car barge slip at Ballard from which the cars were carried on floats to Seattle and charged for the service at a switching rate of $3 per car. The construction of the Lake Washington Canal necessitated the abandoning of the barge slip and for a time cars were taken by the defendant to Seattle at a charge of $4.50 per car, which it is proposed to supersede by the new rate. Complaint is made that the three cent rate is excessive, particularly since it prohibits the former absorption of switching charges that were in force for traffic destined to competitive points. As has been noted above, the commission finds that the increased charge is not unreasonable. The Chicago, Milwaukee & St. Paul no longer maintains terminals at Ballard. The Great Northern, on the other hand, contends that it is entitled to the long haul and that it is not proper that the St. Paul should be allowed to compete for this traffic originating on the Great Northern's terminals at a charge which does not compensate the latter for so affording the use of its terminals to its competitor. The commission believes that the arrangement suggested by the Great Northern for joint rates between it and the St. Paul on the flat Seattle basis, applicable to traffic from complainants' mills to non-competitive local points on the latter road is a proper one and should be adopted even though the St. Paul may lose all of the traffic to competitive points. Apart from the possible consequences flowing from the nature of the service or the form of the charge, defendant's contention that the com-

mission should prohibit the absorption by competitive roads of its established charges applicable to the movement over its terminal between Ballard and Seattle, is held not to be sustained. The commission's duty is to pass upon the reasonableness of the established charges, and the act does not require that in so doing it shall take into its calculations the consideration of the possibility of the absorption of the charge by competitive roads. (30 I. C. C., 683.)

Rates on Fresh Fruits from Grand Rapids and Other Points to Milwaukee

Milwaukee Produce & Fruit Exchange v. Crosby Transportation Company et al. Opinion by Commissioner Hall:

The Crosby line is a water carrier operating its own steamers for a year round service across Lake Michigan between Milwaukee and Grand Haven. During that time of year when Muskegon is open a side trip service is also maintained between that port and Grand Haven. Boats are also operated in the fruit picking season on the Grand River to Grand Rapids and Grand Haven. By virtue of a contract by which the Crosby Line began in 1906 to perform the Grand Trunk's break-bulk service across Lake Michigan, certain joint rates and through routes were canceled which had been in effect between the steamship line, the Grand Rapids, Grand Haven and Muskegon and electric line, which operates a service from Grand Rapids to Grand Haven, with a branch from Grand Haven Junction north to Muskegon, nearly the whole service in direct competition with that of the Grand Trunk. The commission finds that the former through route and joint rates between the electric company and the steamship company, from points on the former line to Milwaukee except Grand Rapids, Grand Haven and Muskegon, where the service of the Grand Trunk, alone, is sufficient, should be re-established insofar as is necessary to provide for the transportation of fresh fruits, it having been found that a very large portion of the fresh fruit business from the region on the electric line west of Grand Rapids had been diverted from Milwaukee. (30 I. C. C., 653.)

Railroads and Private Business

The commission has submitted a report to Congress in response to a resolution passed about six years ago concerning the relations of railroads to coal and oil properties. The report deals chiefly with certain large purchases of coal lands in Illinois by the Cleveland, Cincinnati, Chicago & St. Louis for the purpose of protecting the future coal supply of the New York Central Lines. In it the commission criticizes the management of the latter and makes the following recommendation:

"From the facts related herein, particularly those discovering the industrial railways around St. Louis and those describing the relations of the New York Central Lines to coal properties in Illinois, the commission believes it important that the public business of transportation should be clearly separated from private business; that railroads should be prohibited from furnishing directly or indirectly capital or loans to private enterprises; that railroads should be prohibited from extending the use of their credit for the benefit of private individuals or companies, and that the commodities clause should be enforced and extended to all traffic."

The commission finds that the New York Central Lines through the Big Four in 1905 began to acquire coal lands in Saline and Williamson counties, Illinois, and purchased altogether 23,000 acres. The plan, the report says, originated with W. C. Brown and was carried out by him through S. W. McCune and Charles P. Hewitt, Mr. Brown's brother-in-law.

"Many irregularities took place in connection with the purchase of these properties and both McCune and Hewitt profited substantially. The irregularities were accomplished by the use, apparently, of one or more of the following devices: (1) by preparing vouchers for amounts in excess of those actually received by the grantors of the properties sold to the Big Four; (2) by taking lands in Hewitt's name and turning them over to the Big Four at advanced prices; and (3) by secreting the legitimate commissions in the purchase prices and then passing additional vouchers in favor of Hewitt as his alleged commission on the same land. Hewitt definitely asserted that he was not aware of these acts.

"Funds so pilfered from the Big Four were handled in the same manner as were legitimate commissions, i. e., deposited in McCune's bank account and then divided with Hewitt, the latter's share passing through Mr. Brown's hands to the bank at Clarinda. Mr. Brown asserts that he had no way of verifying the amounts sent to him by McCune and they were merely passed through his hands for Hewitt's convenience. Traveling auditors of the Big Four in 1909 checked over the vouchers and other papers in connection with these coal land purchases, but failed to report the irregularities mentioned.

"The record does not show that Mr. Brown had any knowledge of irregularity in the purchase of the properties. The only charges that can be made against him in connection with the pilfering of the funds of the company of which he was an executive are these (1) he placed McCune, without bond, in a responsible position, involving the expenditure of over $1,000,000, to which trust, the record shows, that person was unfaithful, and (2) he assigned to a lucrative position netting nearly $25,000 in a little over a year, a relative, who was not competent even to handle his own money affairs, was inexperienced in the work itself and was lacking in the most ordinary business ability."

W. C. Brown and other officers of the New York Central took an active part in the promotion of the Saline County Coal Company and the O'Gara Coal Company. The report charges that the latter company has been granted a great many unusual concessions, and from the time it began shipping coal to within the last year it has been a preferred institution of the New York Central Lines, and that the carriers have practically supported the company for years. In September, 1913, the O'Gara Coal Company went into the hands of friendly receivers, the investigations of the commission having caused the New York Central to restrict its support.

"Many of the concessions described were skillfully concealed and some were discovered almost by accident. The attempts of Mr. Brown and others to explain the concessions leave much to be desired. In short, they amount to ignorance of the rebates mentioned, while as to loans, advances and extensions of credit, Mr. Brown and his associates admit knowledge of the practices, but claim to have been actuated by a desire to protect the fuel supply and the traffic of their lines by protecting a patron from the financial disaster that would otherwise occur. It is significant, in this connection, that among the hundreds of industries along the 13,000 miles of the New York Central Lines, the carriers should have overlooked all moribund concerns except one of those in which the carriers' officers were interested."

Speaking of a tentative plan of consolidation which contemplated that the Chicago & Harrisburg Coal Company, owned by the Big Four, would issue bonds guaranteed by the latter, and purchase its coal lands and the mines and lands of the companies mentioned above, whereupon there was to be formed an operating company to which the mines and part of the land would be leased for operation, the report says:

"W. C. Brown and other officers testified that the plan never received serious consideration and in all probability would never be effected. It is worthy of mention, on the other hand, that in the latter part of 1913 the capital stock of the Chicago & Harrisburg Coal Company was increased from $55,000 to $150,000 and that the company began taking over the coal and coal lands owned by its parent company, the Big Four. Whether this is the beginning of a gigantic coal proposition involving the purchase of the Saline and O'Gara properties and based on the credit of the New York Central Lines, the record does not disclose. Such a use of railroad credit for the private ends of favored individuals should obviously receive, if carried out, the severest condemnation of law."

STATE COMMISSIONS

Illinois Public Utilities Commission has issued an order on complaint of the Springfield Commercial Association, ordering the steam roads to switch cars for the Illinois Traction System at Springfield and to allow the traction system the use of their tracks for switching at that point.

The Illinois railroads, through the Illinois Freight Committee, asked the Illinois Public Utilities Commission last week for permission to increase certain rates within the state, within the maxima fixed by the commission. The commission announced that the petition would be considered within 30 days.

The Railroad and Public Service Commission of Montana announces that a general reduction in freight rates, averaging 20 per cent., is to go into effect in Montana, on July 29, as the result of a conference between the commission and representatives of the principal railroads. It appears that the railroads voluntarily proposed tariffs prepared on the same basis as those in effect in the state of Washington. The new tariffs do not affect so-called distributing rates from the jobbing centers.

According to press reports, the members of the Texas Railroad Commission have given informal consideration to a plan to appeal to Congress for legislation clearly defining the powers and duties of the Interstate Commerce Commission, so that it cannot interfere in any way with state commissions in the fixing of rates between points within the states, in order to obtain for the Texas Commission relief from the decision of the United States Supreme Court and the Interstate Commerce Commission in the Shreveport rate case.

The Michigan Railroad Commission has issued an order against the Pere Marquette, Lake Shore & Michigan Southern, Michigan Central and Detroit, Grand Haven & Milwaukee railways, requiring them to issue, and make effective by September 1, a tariff which shall provide that on the tender by shippers at any one time during cold weather, of 10,000 lb. of any perishable commodity for shipment to stations on the main line of the road serving the shipping point, or on the payment of the charges on 10,000 lb., a refrigerator car must be furnished.

The California Railroad Commission has recently been holding a hearing on complaint by residents of the San Francisco peninsula, against the passenger fares in effect on ferry and electric lines of the Southern Pacific between San Francisco and Oakland. Some of the trans-bay fares were lowered in October, 1913, after a hearing by the commission, from 15 cents to 10 cents one way. In answer to the present complaint the company has requested the commission to advance these fares from 10 cents to 12½ cents. After a hearing in June the case was adjourned for 60 days, to allow attorneys for the complainants to consider the data submitted by the company. This included a valuation of the property involved, and figures to show that the revenue from the ferries and the electric service is not sufficient to meet the cost of operation, plus interest and taxes.

PERSONNEL OF COMMISSIONS

S. N. Mills has been appointed an inspector for the Interstate Commerce Commission and has been assigned to the work of investigating and testing signal and train control systems and other safety devices. Mr. Mills received his early education in the public schools of Minnesota and later completed a course in electrical engineering. He entered the service of the Interstate Commerce Commission in September, 1906, and was chief clerk of the Block Signal and Train Control Board throughout the five-year period of its existence. When that board was abolished in June, 1912, Mr. Mills was assigned to the commission's accident-investigation work. In December, 1913, the work of investigating and testing devices was again taken up by the commission under the act of October 22, 1913, and Mr. Mills was one of the first men assigned to this service. On May 1, 1914, he was appointed an inspector and assigned to field work.

COURT NEWS

The Mississippi supreme court has dismissed a suit brought by the state railroad commission against the Louisville & Nashville to compel the company to stop certain through passenger trains at Bay St. Louis, Miss. A fine of $402,000 had previously been imposed on the company by the lower court because of its refusal to obey the order of the commission.

Judge Landis, of the United States district court at Chicago on July 17 issued a decision ordering F. W. Ellis, vice-president of the Armour Car Lines, to answer questions asked of him by the Interstate Commerce Commission in connection with its investigation of private car lines. At the time of the commission's hearings in Chicago in January, Mr. Ellis declined, on advice of counsel, to answer questions regarding the private business of the company.

Railway Officers

Executive, Financial, Legal and Accounting

George H. Winsor has been appointed auditor and traffic manager of the San Benito & Rio Grande, with headquarters at San Benito, Tex., to succeed C. T. Davis, resigned.

W. R. Campbell, at present assistant to president of the Susquehanna & New York, the Tionesta Valley and the Leetonia Railway, has been appointed vice-president of the Susquehanna & New York, with office at New York, effective August 1, succeeding E. C. Hoyt, resigned, and the title of assistant to president has been abolished.

Operating

E. E. Cain, superintendent of the Toledo-Ludington division of the Pere Marquette, has been appointed superintendent of the Chicago-Petoskey division, with headquarters at Grand Rapids, Mich., succeeding J. W. Mulhern, resigned.

James Patrick Houston, whose appointment as superintendent of the Eastern division of the Minneapolis & St. Louis, with headquarters at Oskaloosa, Iowa, has already been announced in these columns, was born April 5, 1865, at Durand, Ill. He received a common school education and began railway work in 1875 with the Chicago, Burlington & Quincy, with which road he remained until 1886, being employed consecutively as water boy, flagman, brakeman and operator and agent. The following two years he was with the Western Union Telegraph Company as operator, and from 1888 to 1899 he was despatcher and chief despatcher for the Chicago Great Western. He was then with the Great Northern for three years as chief despatcher and trainmaster, going to the Chicago Great Western in 1902 as chief despatcher. Subsequently until 1909 he was trainmaster, and in the latter year he became trainmaster of the Minneapolis & St. Louis. Later he was made assistant superintendent, which position he held at the time of his recent appointment as division superintendent, as above noted.

Traffic

A. J. Blaisdell has been appointed general agent of the passenger department of the Canadian Pacific at St. Louis, Mo.

J. S. Henney, traveling freight agent of the Toledo, St. Louis & Western at Cleveland, Ohio, has been appointed commercial agent at Kansas City, Mo.

F. R. Hanlon has resigned as district freight agent of the Oregon-Washington Railroad & Navigation Company at Seattle, Wash., to become traffic manager of the port of Seattle.

W. R. Busenback has been appointed general agent, freight department, of the Erie at Akron, Ohio. The headquarters of J. H. Hackett have been removed from Akron to Marion.

J. S. Brown, general freight agent of the Illinois Central, has been appointed manager of the transportation department of the Board of Trade of Chicago, succeeding E. B. Boyd, resigned.

The territory of H. C. Dinkins, general agent of the Gould Lines for Mexico, has been extended over West Indies, Central America and South America, with offices at New Orleans, La., and Galveston, Tex.

C. A. Torrence, foreign freight agent of the Missouri Pacific, the St. Louis, Iron Mountain & Southern, and Denver & Rio Grande, with headquarters at Chicago, will also have jurisdiction over the Western Pacific, effective July 15.

M. T. Dean, at present assistant to general manager of the Tionesta Valley and the Leetonia Railway, has been appointed general freight and passenger agent of the Susquehanna & New York, the Tionesta Valley and the Leetonia Railway, with office at New York, effective August 1, and the position of assistant to general manager has been abolished.

Engineering and Rolling Stock

F. L. Beal has been appointed valuation engineer of the Louisiana & Arkansas, with headquarters at Stamps, Ark., reporting to F. W. Green, general manager.

E. A. Sweeley, who recently resigned as supervisor of car repairs of the Atlantic Coast Line, has been appointed master car builder of the Seaboard Air Line, with headquarters at Portsmouth, Va. He will have jurisdiction over the entire car department.

John L. Mohun, formerly in the motive power department of the Pennsylvania Railroad, has been appointed assistant to consulting engineer of the Union Pacific, the Oregon Short Line and the Oregon-Washington Railroad & Navigation Company, with headquarters at New York. Mr. Mohun began railway work as an apprentice at the Altoona shops of the Pennsylvania Railroad, and was successively assistant master mechanic of the Juniata shops, master mechanic and assistant engineer of motive power of the New Jersey division, with office at Jersey City, N. J.

OBITUARY

P. J. Halloran, chairman of the executive board of the Brotherhood of Railroad Conductors, died suddenly of heart disease in Boston on July 16.

Eugene E. Osborn, formerly vice-president of the Chicago & North Western, died at Frederick, Md., July 20, aged 60 years. Mr. Osborn was born at Norwalk, Conn., May 1, 1854, and was a graduate of the Sheffield Scientific School of Yale University. He entered railway service in 1894 as general attorney for the Chicago & North Western. In June, 1901, Mr. Osborn was elected vice-president and secretary of the North Western and assistant secretary of the Chicago, St. Paul, Minneapolis & Omaha, which positions he held until his retirement from active service in 1911.

RAILWAY CONSTRUCTION IN KYUSHU, JAPAN.—The length and estimated cost of the lines projected at present by the government railways on the Japanese island of Kyushu are as follows: Yatsushiro-Sendai line, 67 miles, $6,500,000; Kumamoto-Oita line, 83 miles, $8,250,000; and Saheki-Miyazaki line, 88 miles, $8,500,000.

THE HEDJAZ RAILWAY TO ARABIA.—It is enjoined upon Moslem pilgrims without fail to visit Medina and Mecca at least once in their lives. At one time, the trip from Damascus to Medina was a journey by caravan of 35 to 40 days' duration. With the construction of the railway, the journey has been reduced to but 58 hours. Most of the pilgrims use the railroad in order to get to Medina and then return the same way and embark at Haifa or Beirut for Jedda, the nearest port to Mecca on the Red Sea. Arrangements have been made whereby there are steamers in waiting at Beirut and Haifa for the trains from Mecca so that immediate embarkation is possible. The Turkish government has for some time worked to extend the railway to Mecca and thus entirely eliminate the route by sea. At present, the distance from Medina to Mecca takes 12 days by camel through an arid desert so pilgrims prefer to return north and reach Mecca by the sea route. Until last year, only first and third class cars were in use, but lately second class cars have been introduced and commodious sleeping cars have been added for the benefit of first class passengers. For this accommodation an additional charge of about $4.40 is added to the price of a first class ticket. The trains make five stops daily for a sufficient length of time to enable the Moslems to make their required devotions. There are comfortable dining rooms at Derra and Maan and native buffets at some of the smaller stations, such as Tebouk, Aman and Medam-Salih. The fares are as follows: From Haifa to Medina and return—first class, $52.10; second class, $39.07; third class, $26.05; from Damascus to Medina and return, first class $50.95; second-class, $38.24 and third-class, $25.08. The rates from Damascus are slightly less. From the first of Chaaban (June 24) to the end of Zelcaade (October 18) a special reduction of 50 per cent. is allowed on the above prices. Non-Moslems are allowed to travel only a part of the way because their entrance into Medina and Mecca is rigidly prohibited.

Equipment and Supplies

LOCOMOTIVE BUILDING

THE CENTRAL OF GEORGIA is in the market for 4 Pacific type locomotives.

THE EL PASO BELT has ordered 2 locomotives from the Baldwin Locomotive Works.

THE COLORADO, WYOMING & EASTERN is in the market for 2 Mikado type locomotives.

THE SKANEATELES RAILWAY is in the market for one six-wheel switching locomotive.

THE RUSSIAN GOVERNMENT is asking prices on a large number of locomotives of various types.

THE ATLANTIC COAST LINE is in the market for a number of Mountain and Pacific type locomotives.

WINSTON BROTHERS COMPANY, Minneapolis, Minn., are in the market for 8 or 10 six-wheel switching locomotives.

THE INTERCOLONIAL RAILWAY OF CANADA has ordered 3 switching locomotives from the Montreal Locomotive Works.

THE CHICAGO, BURLINGTON & QUINCY has ordered 15 Santa Fe type locomotives from the Baldwin Locomotive Works.

THE STANDARD OIL COMPANY OF NEW JERSEY has ordered one switching locomotive from the Baldwin Locomotive Works.

THE NORTHWESTERN PACIFIC is in the market for 4 ten-wheel passenger, 2 ten-wheel freight and 3 six-wheel switching locomotives.

THE CHILEAN STATE RAILWAYS are proposing the purchase of 125 locomotives as part of a plan for the rehabilitation of the railways of Chile.

THE CAROLINA SPRUCE COMPANY, Philadelphia, Pa., has ordered one 70-ton Shay geared locomotive from the Lima Locomotive Corporation.

THE ILLINOIS CENTRAL is in the market for 50 Mikado type and a number of Pacific type locomotives, and for a number of locomotives for hump-yard service.

THE INTERNATIONAL RAILWAYS OF CENTRAL AMERICA, reported in the *Railway Age Gazette* of last week as having ordered 5 locomotives from the Baldwin Locomotive Works, have ordered 5 Consolidation locomotives of that company.

THE BANGOR & AROOSTOOK has ordered 5 superheater Consolidation locomotives from the American Locomotive Company. These locomotives will have 23 by 30 in. cylinders, 56 in. driving wheels, a total weight in working order of 213,000 lb., and a steam pressure of 175 lb.

THE DULUTH & NORTHEASTERN has ordered 2 consolidation and 2 70-ton Shay geared locomotives from Lima Locomotive Corporation. The former will have 20 by 24 in. cylinders, 50 in. diameter driving wheels, a weight on the driving wheels of 128,000 lb. and a total weight in working order of 144,000 lb.

THE SOUTHERN PACIFIC has ordered 20 superheater Mikado type passenger and 10 superheater switching locomotives from Lima Locomotive Corporation. The Mikado locomotives will have 26 by 28 in. cylinders, 63 in. diameter driving wheels, a weight on the driving wheels of 218,000 lb. and a total weight in working order of 305,000 lb. The switching locomotives will have 19 by 26 in. cylinders, 51 in. diameter driving wheels and a total weight in working order of 155,000 lb. Both the Mikado and switching locomotives will be equipped for oil burning.

CAR BUILDING

THE CHILEAN STATE RAILWAYS are preparing plans for the purchase of about 400 freight cars.

THE CHICAGO GREAT WESTERN has ordered 500 40-ton box cars from the American Car & Foundry Company.

The Baltimore & Ohio has awarded a contract to the Ryan Car Company, Chicago, for the repairing of 2,000 box cars.

The Intercolonial Railway of Canada is in the market for 8 all-steel sleeping cars and one all-steel compartment observation car.

The Delaware, Lackawanna & Western, reported in the *Railway Age Gazette* of June 26 as being in the market for 55 all-steel suburban coaches has increased its inquiry to 110.

The New York Central Lines have ordered, 1,250 gondola cars each from the Ralston Steel Car Company and the Haskell & Barker Car Company. These cars will be put in service on the Toledo & Ohio Central.

The Union Pacific order for 107 passenger cars from the Pullman company, as reported in the *Railway Age Gazette* of May 29, is divided as follows: 15 69-ft. baggage, 2 75-ft. baggage and buffet, 10 60-ft. postal, 5 60-ft. baggage, 4 69-ft. baggage and postal, 21 72-ft. 6-in. dining, 8 72-ft. 6-in. observation, 2 70-ft. parlor cars, 5 60-ft. coaches, 5 70-ft. coaches, 10 60-ft. chair, and 20 70-ft. chair cars.

IRON AND STEEL

The Chicago & Western Indiana has ordered 1,200 tons of rails from the Illinois Steel Company.

The Intermountain has ordered 1,200 tons of rails for immediate shipment from the Illinois Steel Company.

The Atchison, Topeka & Santa Fe has ordered 115 tons of steel for a 100-ft. through plate-girder turntable, from the American Bridge Company.

The Chicago, Indianapolis & Louisville has ordered 276 tons of material for deck girder spans at Bedford, Ind., from the Wisconsin Bridge Company.

The Arthur Iron Mining Company has ordered 131 tons of steel from the American Bridge Company, Chicago, for a locomotive repair shop for the Dunwoody mine, Chisholm, Minn.

The Boston & Maine, which recently ordered 5,000 tons of rails from the Pennsylvania Steel Company, has placed an additional order of 5,000 tons, divided equally between the Bethlehem Steel Company and the Lackawanna Steel Company.

Chicago, Rock Island & Pacific.—The item in the *Railway Age Gazette* of last week to the effect that this company had ordered 17,000 tons of rails from the Colorado Fuel & Iron Company was incorrect. The company has, however, ordered 10,500 tons from the Illinois Steel Company.

SIGNALING

The Southern Railway is preparing to install a telephone block system to take the place of the telegraph system now in use on the Atlanta division between Macon, Ga., and Ooltewah, Tenn., a distance of 225 miles and part of the route for the Southern Railway's through trains between the west and Florida.

The telephone is now being used for despatching trains and handling messages over the entire line of the Alabama Great Southern between Chattanooga and Meridian, the circuits between Chattanooga and Birmingham having just been completed and put in service. The line from Birmingham to Meridian has been in service since June 1. With the completion of the circuits on the Alabama Great Southern the telephone is now being used for despatching over the entire line of the Queen & Crescent route between Cincinnati and Meridian, a distance of 630 miles.

Transportation Facilities in South Manchuria.—South Manchuria railway runs daily and thrice weekly express trains from Dairen connecting with the Trans-Siberian Railway, the Peking-Mukden and the Kirin-Changchung lines of the Chinese government railway, the Korean government railway and the Dairen-Shanghai direct mail steamers. Steamships leave weekly (in some cases twice a week) for ports in Korea, Japan and China. It is said that the Korean government railways are attempting to secure the bulk of the freight transportation between Japan and Manchuria.

Supply Trade News

Announcement is made that J. M. Oden has severed his connection with B. E. Tilden & Company of New York and Chicago.

The Pennsylvania Equipment Company, Philadelphia, Pa., has moved its office from the West End Trust building to 503 Coleman building, 15th and South Penn square.

John W. Dix has been appointed assistant general sales manager and structural engineer of the Carnegie Steel Company, Pittsburgh, Pa., effective July 15, succeeding John C. Neale, who has resigned to become president and general manager of the Central Steel Company, Massillon, Ohio.

Edward N. Lake, Chicago representative of the Stone & Webster Engineering Corporation, sailed on the *Lusitania* on July 14 with the party accompanying the Chicago Railway Terminal Commission, which is making a six weeks' study of European railway practices with special reference to terminals.

W. D. Jenkins, who has for several years been private secretary to Judge Freeman, general counsel of the Texas & Pacific, and who is well known in southern railroad circles, has been appointed southern representative of the Union Railway Equipment Company, Chicago, with office in the Whitney Central building, New Orleans, La.

John H. Wynne, who since May 1, 1914, has been manager of sales of the Montreal Locomotive Works, Montreal, Que., graduated from the regular course at Cornell University in 1898, and from the special post graduate course in 1899. He immediately entered railway service as a special apprentice on the Illinois Central. Three years later he went to the Procter & Gamble Company, Ivorydale, O., in the capacity of shop engineer, but in the following year returned to the Illinois Central as a gang foreman. After working in that position for a short while he became a general foreman on the Pennsylvania Lines at West Richmond, Md. In 1904 he again returned to the Illinois Central, however, and served as mechanical engineer at Chicago. In April, 1906, he entered the supply field, taking the position of manager of the Chicago office of the Atlantic Equipment Company, and in September, 1910, went to New York as general sales manager. On February 1, 1912, he entered the service of the American Locomotive Company as manager of its Rogers & Cooke plants, and retained that position until, on May 1, he reached his present position as manager of sales at Montreal. Mr. Wynne in addition is also in charge of the design of small locomotives for industrial service.

J. H. Wynne

Joseph T. Ryerson & Son, Chicago, have taken over the plant, merchandise, equipment and good will of the W. G. Hagar Iron Company, St. Louis, Mo. It is the intention of the company to supplement the plant of the latter with complete modern warehouses and equipment for the handling and cutting of shapes, reinforcing bars and similar heavy material. Ryerson & Son will thus be able to render immediate service in their lines of finished steel to customers in the territory tributary to St. Louis.

C. W. Cross has been appointed Chicago representative of the Equipment Improvement Company, with headquarters at 30 Church street, New York. Mr. Cross began his railroad experi-

ence with the Pennsylvania Lines West and left that system when assistant master mechanic at Fort Wayne to become master mechanic of the Lake Shore & Michigan Southern, with headquarters at Elkhart, Ind. He was made superintendent of apprentices of the New York Central Lines in 1906 when that system revised and centralized its apprenticeship department to meet modern conditions. Mr. Cross' work in the development of this department requires no comment, as it is widely known and understood.

Colonel H. G. Prout has resigned as president of the Union Switch & Signal Company. W. D. Uptegraff, formerly vice-president, has been appointed president pro tempore. Sydney G. Johnson, vice-president in charge of sales, has also resigned, no successor being appointed. T. W. Siemon, treasurer and assistant secretary of the Westinghouse Electric & Manufacturing Company, has been made secretary-treasurer of the Union Switch & Signal Company, succeeding James H. Johnson, resigned.

TRADE PUBLICATIONS

ELECTRIC INDUSTRIAL LOCOMOTIVES.—The Westinghouse Electric & Manufacturing Company has recently issued a four-page folder illustrating a number of Baldwin-Westinghouse electric industrial locomotives.

CONCRETE REINFORCING.—Joseph T. Ryerson & Son have issued a second edition of Technical Library No. 8, entitled "Concrete Reinforcing." The same company has also issued bulletins Nos. 9,071 and 13,071, descriptive respectively of the Ryerson high-speed friction saw and the Lennox serpentine shear.

AIR BRAKES.—The Simplex Air Brake & Manufacturing Company, Pittsburgh, Pa., has issued a 14-page booklet descriptive of the construction and operation of its locomotive air brake equipment. This circular contains a colored diagram showing the arrangement of parts and the action of the valves and controlling device.

LIGHTING OF MACHINE SHOPS.—The General Electric Company of Schenectady, N. Y., has just published a very well illustrated bulletin describing the lighting systems which can be applied to machine shops and metal working plants. As a supplement to this bulletin there is published a table showing the characteristics of Edison Mazda lamps used for standard lighting service.

TELEPHONE CABLE.—The Western Electric Company has recently issued a 15-page booklet entitled "The Making of the Voice Highways," descriptive of the manufacture of lead covered telephone cable. The booklet goes into a brief consideration of the several steps involved in the making of the product and contains a large number of views taken in the shops where it is made.

HYDRAULIC PRESSES.—The Hydraulic Press Manufacturing Company, Mount Gilead, Ohio, has recently issued catalog No. 40 containing 128 pages, 8 by 11 in. in size, showing representative views of the company's line of hydraulic presses. Specifications and descriptions are given of each press illustrated, and a brief statement of the work of which it is capable. The book also contains a number of interesting views of the company's plant.

CEMENT GUN.—The Cement Gun Company, New York, has issued an elaborate 107-page catalog devoted to the description of the cement gun apparatus, its principle and mechanical construction; the cement gun product, "Gunite," and its applications and adaptability. This book contains many illustrations showing the method of application and also the finished work. Many letters of engineers and construction men commenting on the use of "Gunite" are also reproduced in this catalog.

LIFTING THE QUEBEC BRIDGE.—The Electric Controller & Manufacturing Company, Cleveland, Ohio, has issued an interesting 16-page pamphlet, devoted to the general description, and the method of erection of the new Quebec bridge over the St. Lawrence river. The general description of the bridge and conditions to be contended against are taken from a paper by H. F. Stratton, which appeared in the December, 1913, issue of the *Engineering Magazine*. The Electric Controller & Manufacturing Company, which is furnishing all the electrical equipment, gives an interesting account of the electrical control of the apparatus used in the erection work.

Railway Construction

CALGARY & FERNIE.—The Railway Commissioner of Canada has approved the application of this company to build a 174-mile line from Fernie, B. C., through Kananaskis pass and Elbow pass, thence along the south branch of the Sheep river, through the oil fields and through the Sarcee reserve into Calgary, Alta. J. R. Lawreyn, S. S. Manahan, Victoria, B. C., and A. Mutz, Fernie, are interested. (January 2, p. 50.)

DENVER & RIO GRANDE.—An officer writes that a contract has been awarded to C. Wells, Denver, Colo., for the grading for a 16-mile narrow gage line from Caliente, Taos county, N. Mex., to La Madera, to connect with the lumber line of the Hallack & Howard Lumber Company of Denver, Colo. The line will have a maximum grade of 2½ per cent., and a 16 deg. maximum curve. Other work than the grading will be done by the company forces. J. G. Gwyn, Denver, Colo., is chief engineer.

DENVER & RIO GRANDE.—According to press reports, work has been started on a 16-mile branch from Caliente, N. M., southwest. This line is to connect with a line to be built by the Hallack & Howard Lumber Company, of Denver, Colo., which is also to be 16 miles long.

EXPORT PHOSPHATE RAILWAY & TERMINAL COMPANY.—Under this name a line is being built, it is said, for the Export Phosphate Company, of Mulberry, Fla., to a phosphate drying plant near Tampa, also a number of branch lines, in all about 50 miles. E. L. Blood, president; H. E. C. Capewell, vice-president, and E. A. Pierce, secretary and treasurer.

FAIRMOUNT & VEBLEN.—The Greenville & Southeastern has asked for incorporation in South Dakota with a capital of $50,000 to build a 10-mile line from Roslyn, S. Dak. This is a section of the Fairmount & Veblen extension building from Veblen, southwest to Webster, 40 miles.

GREAT NORTHERN.—An officer writes that the Montana Eastern, which started work some time ago on a line from New Rockford, N. Dak., west to Lewistown, Mont., has track laid from Fairview, Mont., east to Arnegard, 30.4 mile. A north and south line has also been completed from Sidney, Mont., north via Fairview to a connection with the main line at Snowden, 25 miles. A. Guthrie & Co., St. Paul, Minn., had the contract for this work. It has not yet been definitely decided when other sections of the line will be built.

GREENVILLE & SOUTHEASTERN.—See Fairmount & Veblen.

MISSOURI ROADS.—According to press reports, capital has been secured and surveys are being made for a line to be built from Springfield, Mo., southeast to a connection with the St. Louis, Iron Mountain & Southern at a point south of Mountain Home, Ark., about 100 miles. E. C. MacAfee, Springfield, Mo.; K. V. Loba and H. S. Wickersham, North Yakima, Wash., are interested.

MOBILE & OHIO.—It is reported that this company is preparing to double-track its line between Corinth, Miss., and Jackson, Tenn. B. A. Wood, chief engineer, Mobile, Ala.

MONTANA EASTERN.—See Great Northern.

NEW YORK SUBWAYS.—The New York Public Service Commission, First district, has awarded six contracts for as many sections of the subway system, aggregating $21,035,185. The most important is that for the construction of the East River tunnels from downtown Manhattan to Brooklyn awarded to the Flinn-O'Rourke Company, newly formed by the O'Rourke Engineering Company and Booth & Flinn, Ltd., who submitted a joint bid of $12,444,726; $6,469,916 being for the Interborough tunnel from Old Slip, Manhattan, to Clark street, Brooklyn, and $5,974,810 for the New York Municipal Railway tunnel from Whitehall street, Manhattan, to Montague street, Brooklyn. Contracts were also awarded for the construction of section No. 1 of route No. 12, a part of Eastern Parkway subway in Brooklyn, to the Cranford Company, for $2,195,296; section No. 2 of route No. 20, the Canal street railway in Manhattan, to the Underpinning & Foundation

Company, for $1,822,994; section No. 7 of route No. 5, the portion of the Lexington avenue subway from Forty-third to Fifty-third streets, to Rapid Transit Subway Construction Company for $1,915,165, and section No. 2 of routes Nos. 4 and 36, the portion of the Broadway subway from Twenty-sixth to Thirty-eighth streets, to the United States Realty & Improvement Company for $2,657,005.

Northern Pacific.—This company, it is said, is planning to construct a branch line from Beach, N. D., southeast 25 miles in Golden Valley. W. L. Darling, chief engineer, St. Paul, Minn.

Seattle, Port Angeles & Lake Crescent.—A perpetual franchise for the use of the streets for railroad purposes in Port Townsend, Wash., has been granted to C. J. Erickson, president of this company, which is building from a point near Oak Bay, Wash., west via Irondale, Chimacum valley, Sequim Dungeness valley and Port Angeles to the Lyre river, thence west past Lake Crescent into the Olympic timber district. Work has been finished on 25 miles. The franchise gives the company control of much of the water frontage and provides a route for an extension to a tidewater terminal in Port Townsend. (July 3, p. 40.)

Southern Railway.—A contract has been given to Robert Russell, Danville, Va., for building a new double track cut-off between Danville and Dry Fork, 12.95 miles, to eliminate a heavy grade, and reduce the curvature between these two places which are on the existing line. The work will include a double track bridge over the Dan river.

Tampa & Gulf Coast.—A contract is reported let to Morrisey, Bouly & Company, for work on the extension building from Belleair, Fla., south, thence east to St. Petersburg. (May 15, p. 1119.)

RAILWAY STRUCTURES

Butte, Mont.—The Chicago, Milwaukee & St. Paul has awarded a contract for the grading work for its new passenger station at Butte, Mont., to Guthrie, McDougall & Company, Spokane, Wash.

Mount Airy, N. C.—The Southern Railway has given a contract to Porter & Boyd, Charlotte, N. C., for building a new granite passenger station at Mount Airy.

New York.—The New York Central & Hudson River has given a contract to R. P. Johnson, New York, for erecting the superstructures, including timber work, concrete work, paving and all incidental work, for 12 overhead bridges and one railroad bridge on the Hudson River division.

New York.—The Lehigh Valley has awarded contracts for dredging and other preliminary work for a large ore pier in the Constable Hook section of Bayonne, N. J., fronting on New York Bay, which will be the northern terminus of a line of ore-carrying steamers to be used by the Bethlehem Steel Company to bring iron ore from its deposits in Chile via the Panama Canal. It is said that the steel company plans to import at least 750,000 tons of ore annually. The pier will be 1,150 ft. long and 67 ft. wide. There will be a basin 200 ft. wide, and a channel will be dredged that will have a depth of 35 ft. at low tide. The pier will be equipped with modern unloading machines, two of which will be able to work in one vessel at the same time with a maximum capacity each of 500 tons an hour. The site is known as the old French oil yard and adjoins the plant of the Standard Oil Company. It is directly on the line of the Lehigh Valley, which is intending to establish yards at this point with a capacity at first of 350 cars.

Texas City, Tex.—Work has been started on improvements at the Texas City ocean terminal of the Texas City Transportation Company. The work includes building a steel and sheet metal warehouse along the north side of pier A to cover an area of 880 ft. by 163 ft. Dredging work is also to be carried out in the slip alongside the new structure. The work will cost about $110,000.

Siberian Railway Concession.—St. Petersburg advices state that a Frenchman has secured a concession for a South Siberian trunk line of about 1,300 miles, which will require an outlay of about $80,000,000.

Railway Financial News

Atchison, Topeka & Santa Fe.—This company has leased the Oklahoma Central, which for a number of years has been in the hands of a receiver.

Lancaster, Oxford & Southern.—This company ceased operation of train service on July 1. The reasons given for this are that the operation of the road did not pay, although it might at some time be taken over by some other railroad.

Las Vegas & Tonopah.—This road, it is understood, is to take over the Bullfrog & Goldfield, which runs from Rhyolite and Betatey to Goldfield and parallels in part the Las Vegas & Tonopah. The plan is said to have been approved by the Nevada State Railroad Commission, and provides for the abandonment of parts of the parallel lines and the reconstruction of the remainder so as to make available for one line the best parts of the two existing lines.

Lewisburg & Northern.—See Louisville & Nashville.

Louisville & Nashville.—The Lewisburg & Northern, a subsidiary of the Louisville & Nashville, began operation on Wednesday, July 15. This road runs from Brentwood, Tenn., to Athens, Ala.

Missouri Pacific.—A committee has been formed for the protection of holders of 5 per cent. notes of the Missouri Pacific which were extended to June 1, 1915. This committee consists of Edwin G. Merrill, president of the Union Trust Company, New York; Stephen Barker, president of the Bank of the Manhattan Company; Howard Bayne, vice-president of the Columbia-Knickerbocker Trust Company, New York; Louis V. Bright, president of the Lawyers' Title Insurance and Trust Company; A. B. Hepburn, chairman of the Board of the Chase National Bank, and Henry Ruhlender, of Speyer & Company, New York.

New York Central & Hudson River.—Stockholders by an almost unanimous vote on July 20 approved the consolidation of the New York Central & Hudson River and the Lake Shore & Michigan Southern, and it now remains for the court to pass upon protest of certain minority stockholders of the Lake Shore & Michigan Southern and for some of the state commissions that have jurisdiction to give their approval. The majority of the state commissions have already approved the plan.

New York, New Haven & Hartford.—In addition to the suit which the Attorney General is to bring under the Sherman Anti-Trust Law, a suit by Sherman Whipple on behalf of the estate of Ole Bull and all stockholders of the corporations who may desire to join therein has been brought. The appointment of a receiver to prosecute claims for $306,000,000 alleged to be due under the Sherman law is sought. See also editorial and abstract of New Haven's reply to President Wilson.

Oklahoma Central.—See Atchison, Topeka & Santa Fe.

Toledo, St. Louis & Western.—It is reported that on August 1 the interest on the $11,527,000 collateral, 4 per cent. bonds which are secured by the deposit of Chicago & Alton stock will be defaulted.

Union Pacific.—The extra dividend, consisting of $12 par value Baltimore & Ohio common, $22.50 par value Baltimore & Ohio preferred, and $3 in cash, the total of which had a market value of $30.50, was distributed to stockholders on July 20.

Progress of Railway Construction in Argentina.—According to data published by the Argentine ministry of public works relative to progress of different government railway lines under construction, the number of miles of track laid up to the latter part of April, 1914, was as follows: On the line from San Antonio to Nahuel Huapi, 251 miles; Comodoro Rivadavia to Colonia Sarmiento, 122 miles; Puerto Deseado to Lago, Buenos Aires, 170 miles; Formosa to Embarcacion, 153 miles; Barranqueras al Oeste, 127 miles; Barranqueras to Quimili, 55 miles; Diamante to Crespo, 22 miles; Hasenkamp al Norte, 61 miles; Nare to San Javier, 43 miles.

Barring Ability from Public Service

The withdrawal of the nomination of Mr. Jones for the Federal Reserve Board after the failure of his confirmation by the Senate became certain, has profound significance, not merely for those interested in banking and currency, but for all who are interested in the relations between government and business. The government has been within late years rapidly extending its regulating authority over various classes of business concerns. It is essential, if regulation is to be fair, intelligent and beneficial, that the regulatory laws shall be administered by men having expert fitness for their duties. Numerous proposals are being made for government ownership of various facilities, such as the telephone, the telegraph, railways, coal mines, and so on. The need for expert administrators would be still greater under government ownership than under government regulation. Large enterprises cannot be managed by any other kind of men. The advocates of public regulation and public ownership say that the government could and would secure such men. Yet every time that Congress has a chance to, it furnishes evidence tending to refute this contention. The test of business ability is achievement in the field of business, and men who achieve in that field necessarily become identified with large concerns; but almost every time a man who has been identified with a large concern is suggested for a public office requiring business ability, the leather-lunged and wooden-headed demagogues begin to split the ears of the groundlings with their bellowings against him. Neither government regulation nor government management can ever be a success in this country so long as it is as easy as it is now for yelping demagogues to get into Congress, and as hard as it is now for men of ability and experience to get into any branch of the public service.

Division of Freight and Passenger Accounts

The Interstate Commerce Commission has apparently definitely decided to require a form of accounts which will show freight and passenger expenses separately. It is now at work with a committee of the Association of Railway Accounting Officers looking to the formulation of a set of rules for dividing expenses that are not directly assignable between these two classes of service. The commission announces that if sufficient progress can be made, carriers will be asked to file a special report for the year ending June 30, 1915, in which no operating expenses are to be left unapportioned. With the question of whether or not such a separation is wise and feasible decided probably beyond appeal by the commission, it is of the utmost importance that the very best system for making an arbitrary division of expenses should be adopted. Such a system ought to combine two seemingly irreconcilable characteristics. It ought to be flexible enough to be adaptable to widely different conditions, and it ought to be stricty enough defined so as to provide uniformity. Since it is to be an important step in the development of cost accounting for railroads, it should be based on a careful, painstaking analysis of the facts and not on a theoretical or arbitrary basis of reasoning.

A Formula Now Being Tested

The attempt to make a comprehensive formula for the apportionment of expenses between freight and passenger service, a description of which was published in our last issue, is, so far as we know, the most comprehensive and scientific attempt that has ever been made to lay down the principles of cost accounting for railroads. This scheme was worked out by a committee of which James Peabody, statistician of the Atchison, Topeka & Santa Fe, was chairman. Most fair-minded, unprejudiced railroad officers will probably acknowledge that if this scheme could be applied to the operations of a railroad by a corps of unusually intelligent accountants it would show with at least a working degree of accuracy a division of expenses as between freight and passenger service. The difficulty lies in the fact that in practice if such a scheme as this were to be prescribed by the Interstate Commerce Commission it would not be and could not be applied by an unusually intelligent and competent corps of accountants to the operations of every railroad company in the country. The scheme depends for the accuracy of its results both on a keen analysis of conditions and on a sympathetic and painstaking application. Its application to different railroads would undoubtedly be most uneven. No one who has had anything to do with the returns which are now made to the Interstate Commerce Commission can doubt that on some roads the commission's instructions would be most unsatisfactorily carried out. There are infinite oppor-

tunities for bias or bad judgment to warp the results that would be obtained by the application of such a scheme as this by the Interstate Commerce Commission. This is not, however, saying that it would be without value to the roads themselves, or would not in time be found to yield information of real importance and usefulness.

Government Statistical Report for 1912

The total length of railroad in the United States on June 30, 1912, was 246,816 miles, or 2,837 miles more than the total one year prior to that date. Railroads in Hawaii and Alaska (655 miles) are not included. This total appears in the final statistical report of the Interstate Commerce Commission for 1912, the first 65 pages of which were issued this month and were noticed in these columns two weeks ago, page 87. As was suggested in that notice the value of most of the two-years-old facts here given out by the commission is impaired by the great delay, and by readers' confusion due to preliminary partial publications; but this item of total mileage, which will be wanted in all future comparisons, should be classed as real news. The figure for 1911, used in the statement of increase, is 200 miles less than that which was given in the commission's report for that year; and it appears that this discrepancy is the result, not of a single error in adding, but of corrections in a considerable number of items. The table now printed gives the total for each state, with the increase or decrease from the preceding year. *Nine* states show decreases. While this statement of mileage is the only one in the report which is of major importance and which has not been in part anticipated by earlier publications, there are many pages of matter which now appear for the first time and which are useful to the student and investigator—such as details of cars and engines and of data concerning employees and wages, capitalization, interest and dividends. Indeed, for the investigator who keeps his eye on the country as a whole this partial report for 1912 is almost as satisfactory as the full volume; and he gets it a good deal earlier. It contains a three-page analysis of railroad taxes by states, with the three classes of roads—big, medium and small—shown separately; and the full statement of roads in the hands of receivers; and these and all the other statistics are given separately for each of the three grand divisions into which the country is divided—eastern, southern and western.

THE OPERATION OF LARGE TERMINAL YARDS

TWO series of the papers received in the contest on "The Operation of Large Classification Yards" already have been published in these columns (July 3 and July 24), and the third and last will appear at an early date. The interest which this contest has excited has shown that railway men are fully awake to the importance of the problem of yard operation. An equally important problem is presented by the operation of large terminal yards where freight is received and delivered. To secure a full discussion of this subject we announce a contest on "The Operation of Terminal Yards," including the switching of cars to and from freight houses, team tracks, docks, industry tracks, etc., the delivery of cars to, and their receipt from connecting lines—in fact, all the problems presented to the terminal superintendent or yardmaster in the handling of freight cars between the classification yards and the various points of receipt or delivery.

The terminal superintendent, or yardmaster, is in direct contact with the shipper, and the problem of giving him satisfactory service, while at the same time operating the entire terminal economically and efficiently is a complicated one. There is a great chance for cars to be delayed or lost, while it is most difficult to exercise close supervision over a large number of switching crews widely scattered and frequently working for a large portion of the day on the track of other roads. These and numerous other problems call for the exercise of a high degree of executive ability.

Every practical operating officer has considerable knowledge of this subject. But it can best be discussed in its many ramifications by those who are now, or who have been, in actual charge of this work; they are in the best position to offer valuable suggestions for improvements in this branch of the service. We especially desire to secure a thorough discussion of this subject, and will pay $50 and $35 for the two best papers received, and our space rates for all others accepted and published. The award will be based upon the practicability and value of the ideas presented, and on the completeness with which the subject is covered.

All contributions should be sent to the Editor of the *Railway Age Gazette*, 608 South Dearborn street, Chicago, and must be received not later than September 15 to be considered by the judges.

DANGER IN THE CAR SITUATION

THE statistics of the American Railway Association show that, in the aggregate, there is a large surplus of freight cars in the country. But the situation which already has developed at Galveston illustrates strikingly the danger of traffic congestion and car shortage with which the railways, the shippers and the consignees are confronted. As usual, the country elevators and farmers have been rushing the wheat crop to Galveston almost as fast as it has been threshed. The railways were at first able to move it as rapidly as it was offered to them. But there have not been enough boats at Galveston to take away the grain delivered there. The facilities of the consignees for unloading the cars, and the storage capacity of their elevators, mills and warehouses, have proved inadequate. Consequently, after getting their terminals crowded with cars, the principal carriers to Galveston, have had to put an embargo on the movement of grain to that port. The Santa Fe alone, at latest reports, had 1,800 cars on the island, and 1,900 waiting outside that could not be moved to it.

There is danger that a like situation will develop at other large grain markets, unless the railways, the shippers and the consignees heartily co-operate to prevent it. There will be a great effort on the part of the farmers and country elevators generally to ship the grain as fast as cars can be obtained. Statistics of car supply published from time to time by the American Railway Association show that the number of cars owned by the railways operating in the territory west of Lake Michigan and the Mississippi river was 658,151 on January 1, 1910, and 766,275 on January 1, 1914, an increase in four years of 108,124, or 16.4 per cent. Owing to the large capacity of the cars constructed during this period, the actual increase in the aggregate car capacity has been not less than 20 per cent. Besides there has been recently a substantial increase in the number of surplus box cars available in this territory, they having been moved there to be ready for handling the crop. There has been a corresponding increase in the number and power of locomotives; and additional track, signals and yard facilities have been provided. As a result, the numerous lines leading from the grain fields to the great markets, which are largely double track, can move grain in practically unlimited quantities. But can it be promptly handled at the elevators, mills and warehouses, to which it is ordered on arrival?

The increase in the capacity of these facilities of the consignees has not, it is feared, kept pace, except in rare cases, with railroad development. In few cases have the increases in the capacity for the storage of grain been accompanied by increases in facilities for unloading it. This is believed to be the condition at Chicago, Milwaukee, Minneapolis, Duluth and the Atlantic and gulf ports. The most serious troubles in transportation arise from difficulties encountered in disposing of the loads. So long as the facilities of the consignees permit cars to be unloaded promptly and started back to the grain-producing districts for

more loads, it is probable there will be no serious congestion at the terminals and no car shortages in the grain-producing districts. But when the consignees begin to fail to unload promptly, cars will begin to accumulate at other terminals as they have at Galveston. The terminals will become congested, as at Galveston, hindering prompt movement and causing shortages of equipment in the grain-producing districts. The only recourse of the carriers must then be to decline to furnish cars for loading to markets where they cannot be promptly unloaded.

Needless to say, it is to the interest of all concerned that this situation shall be avoided, and that the grain shall be moved with the greatest possible facility and the least possible friction.

REGULATION OF RAILROAD SECURITIES

THE *Railway Age Gazette* long has advocated some form of federal regulation of the issuance of railway securities. It has regarded some such regulation as inevitable, and has felt that if it were reasonable, and recognized business conditions and sound economic principles, it would do good. The bill pending in the Senate ignores business conditions and is not based on sound economic principles.

Doubtless legislation should specify, as the bill in the Senate does, the purposes for which securities may be issued. It should contain provisions, as this bill does, which would give publicity to the purposes for which securities are to be issued, the amounts received for them, how they are marketed, the disposition made of the funds raised, and so on. Ample authority should be vested in the Interstate Commerce Commission or some other agency for ascertaining whether the reports made by railway directors and officers concerning these matters are correct, and for securing swift and exemplary punishment of those guilty of wrongdoing either in connection with the issuance of securities or with the disposition of the receipts.

The bill before the Senate goes much farther than this. It prohibits the issuance of any securities without the approval of the Interstate Commerce Commission, and authorizes the commission "to fix a minimum price below which said securities shall not be sold or disposed of or said obligations entered into and to make such other rules and regulations relating to the sale or distribution of said securities" as in its judgment may be for the best interest of the carrier and the public.

The objections to such legislation were clearly and conclusively stated in the report of the United States Railroad Securities Commission three years ago. One of the present members of the Interstate Commerce Commission, B. H. Meyer, was a member of the Railroad Securities Commission. If Congress will not heed spokesmen for the railroads, will it not give ear to a public official so well fitted to advise it as is Mr. Meyer?

Among the principal objections to the proposed legislation are the following:

First, there are numerous railway companies, and it is essential to the proper management of their business that, in the aggregate, they make many issues of securities each year. In order that they may place their stocks and bonds to the best advantage it is often necessary for their directors to decide and act quickly. The Interstate Commerce Commission is very busy, and, because of the increased duties Congress constantly is giving it, will grow busier. It would be impossible for a single body of men, even though it had no other duties to perform, to pass on all the securities issued by all the railways with anything like the facility that commercial conditions demand. As the Railroad Securities Commission said, "A growing railroad has constant need of money, and its officers and directors are the best judges of the amount of its annual requirements. It is manifestly to the interest of the company and of the public that a road should get its money as cheaply as it can. The policy of allowing a floating debt to accumulate with a view to its extinction by the sale of permanent securities upon the completion of its improvements is not a good one and should be avoided wherever possible. An administrative body, whose approval was required in advance for the sale of securities, would have great difficulty in always acting promptly enough to enable the roads to avail themselves of favorable money markets and avoid the creation of floating debts."

Second, for the commission to attempt to fix the minimum price at which securities should be sold would result disastrously directly to the railways, and indirectly to the public. No board of directors can foresee with an approach to certainty at what price an issue of securities will sell. Banking houses which make a business of underwriting securities often err, and in consequence have to pocket losses. If directors and bankers with a good working knowledge of individual properties, and familiar with the attitude of investors toward them, often cannot estimate accurately what their securities can be placed for, how can it be thought that the Interstate Commerce Commission would be able to determine what prices the securities of all of the railways of the country would bring? In many cases the commission would fix minimum prices that were too high, thereby disabling the roads from selling them and rendering impossible the making of contemplated improvements.

The experiment of having regulating bodies fix the prices at which railway securities shall be sold has been tried and has failed. As the Railroad Securities Commission said in its report, "The experience of Massachusetts has shown that the attempt to prohibit the issue of stock below ts market value has hampered the investment of capital and has distinctly interferred with the development of facilities. If this has been the experience of Massachusetts, where capital was abundant, we can hardly expect better results in states where capital is more scarce." That the attempts of the Massachusett's Railroad Commission to regulate the prices at which securities should be sold were failures was confessed in 1908 in the most conclusive manner—namely, by the repeal of the law under which the commission had acted for 15 years.

Third, such legislation as is proposed is objectionable because it would tend to deceive investors, and thereby to injure instead of benefit them. If the Interstate Commerce Commission should fix a minimum price for an issue of stocks or bonds it would thereby say that it believed that the stocks or bonds were worth that much. No doubt, at first, many investors would buy securities because of faith in the commission's judgment. But it would soon develop that the commission made mistakes. There would be many cases where securities would not yield the returns the commission expected or long command the price in the market that it had caused to be paid for them. In numerous cases investors in the securities of Massachusetts railways paid for them prices fixed by the Massachusetts commission, only to suffer losses because of subsequent heavy declines in their values. If the government through the Interstate Commerce Commission is going to say to innocent investors that a railway share or bond is worth a given amount, and encourage them to buy it at that price, than it ought to be prepared to make its guarantee good by a suitable system of taxation or of rate regulation. Either of these alternatives is objectionable. Louis D. Brandeis is a Massachusetts man who knows how the law in that state worked, as well as a public-spirited citizen, and, therefore, his drastic criticisms of the proposed federal legislation should carry great weight.

Legislation for the regulation of the issuance of railway securities should, first, prescribe the purposes for which securities may be issued; second, cause such publicity to be given to the facts regarding the business of the railway issuing them that the investor will be able to determine for himself what they are worth, and third, prevent the money derived from securities from being recklessly or dishonestly misapplied. Any legislation which tries to do more than this will cause more harm than good.

Letters to the Editor

PLACING HUMP RIDERS ON A PIECE WORK BASIS

Chicago, Ill., July 7, 1914.

To the Editor of the Railway Age Gazette:

Noting the discussions regarding the operation of large classification yards in your issue of July 3, I offer a suggestion that where the volume of business will warrant, the car riders in gravity yards be placed on a piece work basis, paying these men for the number of cuts they ride, instead of by the day or hour. It is an established fact that we are not securing over 75 per cent. efficiency with our present system of riding these cuts. The only objection to this would seem to be that the men will take chances, and thereby create additional damage. I feel, however, that this can be readily overcome by proper supervision.

E. W. Brown,
Assistant Superintendent, Lake Shore & Michigan Southern.

A RETRENCHMENT THAT MIGHT STRIKE NEAR HOME

New York, June 1, 1914.

To the Editor of the Railway Age Gazette:

I have been for many years a reader of your paper and have read discussions of many items of expenses connected with the operation of railways, some of them forming but a fraction of 1 per cent. of the gross earnings. There is one item, however, which amounts to a great deal more in many cases, to which I have seen no reference. I refer to legal expenses. Some of the large roads may be able to carry this burden with ease, but to some of the smaller ones it seems almost crushing.

I have a case in mind of a small railroad which has been earning about $100,000 a year gross, which has been paying to its very efficient and active counsel $900 a year. The company has recently extended its line and its gross earnings are now about double, but the company has had the misfortune to lose the services of the above mentioned general counsel by death and no other law firm of standing in the particular town adjacent to the road seems to be willing to accept its business for less than $2,400 a year, and this does not cover all the legal expenses by any means. I have talked with the officers of other lines who all join in complaining about the exorbitant demand made for legal services.

There is another subject bearing on this point. The item of expenditures on part of the railroads is supervised by the Interstate Commerce Commission, but when the company gets into trouble there are lawyers for the receivers, lawyers for the company, lawyers for the bondholders and lawyers for the stockholders, as well as for secured creditors and unsecured creditors, and they all expect to be, and generally are paid out of the corpus of the property. Frequently the legal expenses run up to large figures and the result obtained for this large sum is generally quite disproportionate.

Possibly legislative bodies being largely composed of lawyers do not care to legislate against these exorbitant legal charges, but with hard times pressing the railroads, this matter should certainly be fully discussed.

Kicker.

EARLY RAILROAD BUILDING

Albany, N. Y., June 10, 1914.

To the Editor of the Railway Age Gazette:

Among the many broad generalizations made by Professor Ripley in his instructive articles on "Railroad Construction Finance," there is the statement:

> The first railroads laid down in America were built as in England, to last forever. On the Boston & Lowell and Baltimore & Ohio, iron rails were laid upon granite cross ties in order to give permanence.

Although we can have no definite proof as to what was in the minds of the early railroad builders, there is, however, considerable doubt whether the Baltimore & Ohio was originally laid upon granite "cross ties" so as to be built to last forever. In a report signed by three eminent engineers, dated March 14, 1835, to the Canal Commissioners of the State of New York,* it is stated regarding the Baltimore & Ohio (then 67½ miles):

> Over ⅗ of the superstructure is timber sills and rails capped with an iron plate; ¼ or (26/100) is stone rails capped with iron plates; and 1/17 is timber rails on light stone blocks.

Thus, nothing is said regarding granite cross ties. If they existed, they were laid at the ends of stringers for the purpose of preventing tracks from spreading, and not for durability.

Professor Ripley also gives as evidence of the "permanent character" of the early construction of American railroads the fact that the original New York & Erie elevated 200 miles of track on piles for the purpose of eliminating grades. It seems, however, that building on piles in the early days was less expensive than excavations and embankments. Thus the South Carolina Railroad is described in the report of the New York Canal Commissioners as "having been placed on piles, excavation having been avoided as much as possible, and embankments omitted altogether, by which the expense of grading has been very little."

A. M. Sakolski,
Lecturer on Railroad Economics, New York University.

NEW BOOKS

Foundations of Bridges and Buildings. By Henry S. Jacoby, professor of bridge engineering, Cornell University, and Roland T. Davis, professor of structural and hydraulic engineering, West Virginia University. Size 6 in. by 9 in., 603 pages, illustrated, cloth binding. Published by McGraw-Hill Book Company, New York. Price $5.

This book can readily be divided into four parts, the first consisting of five chapters with a total of 197 pages devoted to timber, concrete and sheet piles; second, seven chapters with a total of 210 pages covering cofferdams and caissons; third, three chapters with 76 pages, devoted to piers and abutments, and fourth, four chapters treating of spread foundations, underpinning buildings, explorations and unit loads, and a chapter giving very complete references to engineering literature, classified as to the subjects treated in the previous chapters.

The large amount of space devoted to piles is justified by the authors on the ground that the primary field for the book is for class room instruction and young engineers are more likely to come in contact with pile foundation work than any other class of foundation construction early in their experience. It is also felt that the recent introduction of concrete piles will do much to keep that type of construction in the lead of other classes of foundations. The treatment covers equipment, methods of driving, bearing power, the various types of concrete piles and metal and sheet piles. The discussion of cofferdams and caissons includes one chapter on cofferdams, one on box and open caissons, two on pneumatic caissons for bridges, one on pneumatic caissons for buildings, one on pier foundations in open wells, and one on pneumatic caisson practice, which was written by T. Kennard Thomson, a consulting engineer who has specialized in foundation construction. The three chapters on piers and abutments are included to meet the demand for a concise treatment of this subject in engineering schools which combine the study of masonry construction with that of foundations.

The authors have recognized the impossibility of covering so large and varied a subject exhaustively within the limits of such a book, and have met this difficulty by the very liberal use of references to engineering literature, both in the bibliography in the last chapter and in notes scattered through the discussion.

Telegraphic Communication in Nigeria.—In 1911 Nigeria owned and operated 1,704 miles of telegraph line and 3,286 miles of wire. There have been several important extensions since that time, so that now the lines connect all of the principal office headquarters and trade centers.

*This is reprinted in the "Annual Report of the State Engineer on the Canals of New York," 1862, pp. 145-178.

The Federal Valuation of the S. P., L. A. & S. L.

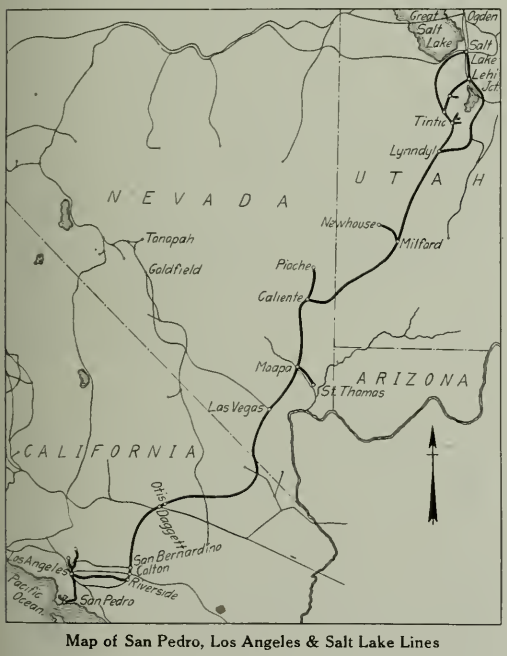
A Description of the Organization Employed and the Methods Followed in Collecting the Required Data

By E. G. Tilton

Formerly, Chief Engineer, San Pedro, Los Angeles & Salt Lake.

As its name indicates, the San Pedro, Los Angeles & Salt Lake extends from San Pedro, on the southern coast of California, to Salt Lake City, a distance of 810.7 miles, passing through Los Angeles 27 miles inland from San Pedro. This line is known locally as the Salt Lake route and the owning company is referred to as the Salt Lake Company.

Of the 1,129.24 miles composing Salt Lake system, of which 783.58 miles are main line and 345.66 miles are branch lines and industrial spurs, the Salt Lake Company owns 681.14 miles of main line and 329.13 miles of branches and spurs. Only that portion of the road between Los Angeles and Salt Lake is designated as main line; the portion from Los Angeles to San Pedro being included with the branches. The main line is not owned continuously by the Salt Lake Company. Between Riverside, Cal., and Daggett, 100 miles, and for the last two miles entering Salt Lake City, trains are operated over the lines of foreign companies under trackage agreements, while the terminals in Salt Lake City are also used under such an agreement. Also on the Provo subdivision, formerly the main line, trains operate from Sandy to Salt Lake City, 13 miles, over the rails of another company.



Map of San Pedro, Los Angeles & Salt Lake Lines

With the exception of the branch to Pioche, a ten-mile line change on the Provo sub-division and branch line extensions amounting to about ten miles more, all the lines of the Salt Lake system lying east of Caliente, Nev., and west of Los Angeles, were built by different companies during the 25 years preceding 1900 and were purchased by the Salt Lake Company in 1901. The line between Los Angeles and Caliente has been constructed since 1900, since which date all the main lines purchased have been rebuilt to the adopted standards and the branches have been very much improved.

Some of the purchased lines had passed through several ownerships with the result that many of the original records of construction were mislaid, lost or destroyed. For this reason it will be impractical in all cases for the federal valuation engineers to determine the first cost of component parts of this system. Quite complete data covering the construction of the line from Lynndyl via Tintic and Garfield to Salt Lake City is in existence as this section had just been completed when it was taken over by the present company and its construction records are well preserved. Complete data are likewise available covering that portion of the lines west of Caliente, and but little difficulty will arise in determining the original cost of those lines. An exhaustive valuation of the company's lines in California has recently been compiled by the engineers on the road for the California State Railroad Commission. Therefore, it may be stated that the engineering and accounting records of about 40 per cent. of the mileage of the system are very complete, while they are only partially so for the remainder.

Characteristics of the Road

West of Riverside the lines of this system traverse thickly populated valleys, while of the 300 miles of practically unsettled desert country between Daggett and Caliente about two-thirds are sandy plains and the remainder mountainous. In this last section the atmosphere is very dry and the summer temperature is high. For some 90 miles in this section the main line traverses a series of attenuated valleys, connected with each other by ravines and canyons, down which Meadow and Clover creeks, the main drainage streams, flow merging together at Caliente. These streams are usually dry or nearly so, but when in freshet from melting snows or heavy protracted rains they become violent torrents and run at high velocity down sandy beds having gradients averaging one per cent. Floods in these creeks so frequently and seriously damaged the road and interrupted its operation, that after the destruction of most of it in the winter of 1909-10, a new line was built in a safer location and of a more substantial design.* Between Caliente and Salt Lake City, with the exception of about 60 miles of mountainous and broken country, the main line traverses a high plateau which was once the bed of a prehistoric lake of which body of water the existing Great Salt Lake is but a shrunken remnant. Most of the mileage of branch lines in this division lies in the valleys.

The main freight and passenger terminal is located at Los Angeles, where an extensive yard and other facilities, including division shops for light repairs, are provided. Repair shops and freight yards are also located at four other terminals on the line. The main shops are at Las Vegas, Nev.

The material encountered when grading the valley and plateau sections of the road was principally earth with which loose rock and cement were occasionally combined. In a few instances rock and conglomerate were encountered. Classification of material on these portions of the line during construction was not difficult, and it is quite possible to determine it even now with a fair degree of accuracy by examination and measurement. In the mountainous sections, however, the formation included several kinds of rock, massive conglomerate, loose rock, cemented material and earth, the latter generally lying as an overburden

*In an address recently delivered, a prominent person stated that the line in this place had been twice rebuilt on new locations after being destroyed by flood. This is incorrect. After washouts, previous to the one referred to, the line was always restored on its original location.

upon the other materials. In many of the cuts these materials were so mixed that classification for the contractor's estimates was a perplexing task. To determine accurately the component classification and yardages of such cuts now, 10 or 12 years after they have been excavated, is quite impracticable. At best an engineer can only make an approximate estimate based chiefly upon his visual examination and his judgment derived from experience gained on work where analogous geological conditions prevailed, unless he uses the railroad company's records as a guide in his determination. It is also impracticable now to ascertain accurately by measurement the vast yardage of riprap protection which has been placed along the slopes of embankments exposed to the wash of streams.

THE VALUATION WORK

The work of making a valuation of the Salt Lake Company's property in accordance with the congressional enactment of March 1, 1913, is now being done. The Pacific valuation district embraces the states lying west of the Rocky mountains, and the Salt Lake line was the first on which work was undertaken in this district. The factors which contributed to the choice of this line were: That it contains a smaller mileage than any of the other large railroad systems; that a large proportion of its mileage has been built within the past decade and its records for that part are complete and in available form; that its property includes ocean as well as inland terminals; that the climatic conditions prevailing throughout the year over the entire line are such that work could be started at any time and carried on without interruption, and because on this road a long section of main line had been destroyed by floods and a new section had been built on another location in its stead, which factor brings up for decision by the commission the question of what proportion of the sums expended in the construction of the destroyed line can be included in the company's capital account and what proportion in its operating account. The ruling of the commission on this subject will be of much interest to other roads, especially in the west, where nearly all have been obliged to rebuild portions of their lines on new locations and on more stable ground.

To begin the work, two parties were placed in the field about February 1, which number has since been increased to five. Four parties are termed roadway and track parties and each consists of one instrument man, one recorder, one computer, four rodmen and tapemen, one laborer and one cook, all in charge of an assistant field engineer. The fifth party is a structural party composed of one assistant structural engineer in charge and three assistants. An assistant engineer employed by the railway company is also assigned to each of the five parties.

The roadway and track parties are housed in cars provided for this purpose. Two box cars fitted up by the company were assigned to each of the first two parties, one car being a combined kitchen and dining room and the other a combined office and dormitory. The three parties sent out later were each given an old Pullman tourist car containing all the provisions described above. Double deck metal cot beds were provided in the box cars, although the men will probably find it necessary for comfort at night to remove their beds to the ground outside when on the desert during the summer. The government pays for the rental of the cars, the hire of cooks and transportation and furnishes the cots and bedding. The men pay for the commissary and supplies, each being allowed one dollar a day subsistence money. The freight rate for commissary supplies has not yet been fixed. The men's laundry is carried to and from town by local passenger trains, which also receive and deliver mail for the camps. Ice is delivered by train and water is also likewise provided at dry sidings. Camp is shifted at intervals of about 15 miles by local freight trains.

The interval between the parties is not uniform, each being assigned sufficient territory to keep it employed for a considerable length of time. A hand car and a track velocipede are furnished by the railroad company to each camp for the use of the men going to and returning from work. While motor cars were considered for this purpose, it was decided to use hand cars as safer and in general as expeditious. The men in the parties sign agreements releasing the railway company from liability for injuries sustained while using the hand cars. The length of the working day for these field forces exceeds eight hours, the limit set by the government for most of its civilian employees.

The roadway and track parties carry on the field work as outlined below. A recorder and two chainmen measure the center line, noting the station and plus at each point of switch, structure, etc., measuring the length of all side tracks and spurs and locating and taking measurements of all buildings and structures sufficiently for noting on the maps, with their size and location. Notes regarding the details of the tracks and of small bridges and culverts are also made by the recorder, while the larger bridges are left for the structural party. A party of three men in charge of an instrumentman, follows the chainmen, taking cross-section notes of all grading, ballast and bank protection with a level, rod and tape. This party completes from 2½ to 3 miles of surveys on desert and valley lines and about one mile on mountain lines per day. The assistant field engineer carefully examines cuts containing various formations with the object of determining their proper classification. He also examines the structures, the composition of the track and fittings, the ties and the roadbed and notes their condition. Depreciation rates will probably be determined largely from tables prepared from data gathered by the Commission, due consideration being given in the case of rails and fastenings to the tonnage which has passed over them, and in the case of ties, to their size, the kind of wood, etc. The field engineers' condition notes will be of service, however, and probably will be used. Notes of the cross-section party are turned over to the computer in the field office who plats and computes as many of them as his other duties permit. After examination the platted sheets are forwarded to the district office in San Francisco where the computations of quantities and overhaul are made and compiled.

The assistant field engineer confers with the company's assistant engineer and settles with him, when possible, questions which may arise respecting the classification of grading or similar matters. If the two cannot agree the question is referred by each to officers of higher rank in order that it may be decided promptly, as it is desired by all interested that as few matters as practicable be left for adjustment after the field work is completed.

INFORMATION FURNISHED BY THE COMPANY

To assist the engineers in their investigation, the railroad company furnishes them a typewritten copy of all final construction estimates for grading, bridging and any other work done by contract and paid for upon a quantity basis. It also provides them with statements of force account work, such as for clearing, grubbing or excavation for foundations, and any available data concerning grade changes, ballasting, riprap, ditching, well drilling, pile penetration, etc., which may aid in arriving at a closer determination of the quantities and the facts than could otherwise be attained. In addition to the above the railway furnishes prints of alinement and station maps, profiles and standard and special plans; and also prints of maps and profiles of abandoned portions of the lines and of new lines substituted therefor, with a statement of grading and of other quantities in the abandoned lines and statements of quantities, with maps and sketches when necessary of any other work which has been abandoned or obliterated, as well as abstracts of agreements concerning the ownership of joint property such as crossings, interlockers, tracks and other property in which it possesses an interest, and bills of material for miscellaneous standard structures such as depot shelters, section houses, cattle corals, pump houses, etc.

The assistant engineer representing the railroad company who is attached to each roadway and track party is a man of considerable construction experience and possessing a knowledge of the work executed on this line. He looks after the company's interest generally in the field in connection with the valuation and watches to see that no property is overlooked which should

be included in the inventory. He confers with the assistant field engineer and whenever possible settles with him on the ground classification and other questions which may arise. He furnishes information relative to all disbursements for work, such as for paving of street crossings, construction of drains and the payment conditions under which industry tracks were put in, etc., when such information is not noted on the prints of maps furnished. He takes with him into the field the original notes of cross sections, pile driving records, etc., and is the responsible custodian of such documents.

The structural field party notes the condition and takes measurements of all buildings, docks, wharves, fuel and water-plants and bridges—but not culverts—in sufficient detail to supplement standard and special drawings that bills of material may be prepared referring to them; and it also inventories all fixtures and supplies in depots, noting their condition. It is furnished by the company with prints, statements and other information required to facilitate its investigation. The data secured by this party will be worked up in the district office. The party progresses an average of about five miles a day.

The duties of the company assistant engineer attached to the structural field party are in general much the same as those of his colleagues attached to the roadway and track parties; that is, he is watchful to see that no property properly included is overlooked in making the lists for the inventory and also that the assistant structural engineer is supplied with all data available to help him secure the facts he is seeking.

Under the district member of the accounting board are prepared the organization and financial histories of the common carriers; the analyses of original cost of road and equipment—that is, all expenditures chargeable to capital account; reports of earning and operating expenses and the compilation of cost data required by the engineers in fixing the unit prices for their reproduction estimates. The federal accounting force engaged in the valuation of the Salt Lake Company's property consists of a senior accountant, reporting to the member of the accounting board, and six or seven assistant accountants who carry on their work in the offices of the company's chief engineer. This force examines all books and all supporting papers relative to disbursements for construction insofar as may be necessary to verify charges to capital account and to make proper segregation as to location on the line of road and as between the various accounts, from which data will be produced a statement of original cost of the property. Unit cost data for the use of the engineers will also be deduced by the accountants from their examinations. From their investigations a statement will be produced respecting the sale of capital stock and bonds by the company, which will set forth the sums received therefor, the commissions paid and the discounts allowed; also a statement setting forth the amounts of money and securities paid for those portions of the lines which were purchased.

The valuation force of the company is under the jurisdiction of the chief engineer, whose offices are at the general headquarters of the company at Los Angeles. The chief engineer is aided by an assistant engineer in charge of valuation, who in turn has under him the company field assistant engineers, whose duties have been described, an assistant engineer and three clerks in his office. He is also aided by a chief accountant who at present has an assistant accountant. The assistant engineer in charge of valuation sees to it that all requisitions from the field for prints, statements and other data and construction records are prepared and forwarded promptly. He has frequent conferences with the senior and structural engineers respecting matters that arise, and from time to time visits the field parties and confers there with the federal and company assistant engineers attached to them. He sees that new drawings which have to be made from which to produce prints to be furnished the federal engineers conform with the specifications of the commission. When the valuation has been finished and tabulated and a copy furnished the company, it will be his duty to investigate it closely and in detail respecting matters of construction.

The chief accountant collects from the auditor's office and other sources and supplies to the federal accountants' books, vouchers and any other documents which are required by them. He discusses with the senior accountant any questions of accounting which may arise relative to the documents and together they settle them if possible, otherwise they refer them to their superiors. He and the valuation assistant engineer have frequent conferences concerning matters that are correlative to the branch of each in the valuation.

The inventory of rolling stock, equipment, shop machinery and telegraph, and right of way and real property both operative and non-operative, has not yet been undertaken, but will be later by assistants who will be entrusted with this phase of the work by the member of the engineer board in charge of the district.

From details obtained in the field and from the company's records, quantities will be computed and an estimate made therefrom in the district engineer's office in San Francisco, and the railroad company will probably detail engineers and accountants to that city to look after its interests while that portion of the work is being done.

The valuation sections into which the road has been divided have, as yet, only been tentatively fixed upon, but it is probable the present division will be adhered to. Each branch, the terminal at San Pedro and the terminal at Los Angeles, will probably be treated as a valuation unit or section, and the main line will be broken into sections of from 50 to 150 miles in length corresponding generally with the operating sub-divisions or engine districts.

It is not practicable yet to estimate the length of the time which will be required to perform the task of evaluating the property of this company nor what its cost will be. The federal forces engaged upon it will probably conclude the physical examination and the investigation of accounts by the end of this summer.

TRAIN ACCIDENTS IN JUNE[1]

Following is a list of the most notable train accidents that occurred on railways of the United States in the month of June, 1914:

Collisions.

Date.	Road.	Place.	Kind of Accident.	Kind of train.	Kil'd.	Inj'd.
†12.	Atchison, T. & S. F.	Bagdad, Cal.	bc.	P. & F.	2	9
*12.	Georgia	Robinson.	bc.	F. & F.	1	8
13.	Hocking Valley	Starr, Ohio.	bc.	P. & P.	5	43

Derailments.

Date.	Road.	Place.	Cause of Derailm't.	Kind of train.	Kil'd.	Inj'd.

28.	Louisville & N.	Moore's, Ky.	d. track	P.	2	22

The trains in collision at Bagdad, Cal., on the night of the 12th were an eastbound passenger train, No. 4, and a westbound freight. The passenger train ran over a misplaced switch and into the head of the freight. Two passengers were killed and 8 injured, one of them fatally, and the conductor was fatally injured.

The trains in collision near Robinson, Ga., on the 12th were

[1]Abbreviations and marks used in Accident List:
rc, Rear collision——bc, Butting collision——xc, Other collisions——b, Broken——d, Defective——unf, Unforeseen obstruction——unx, Unexplained——derail, Open derailing switch——ms, Misplaced switch——acc. obst., Accidental obstruction——malice, Malicious obstruction of track, etc. ——boiler, Explosion of locomotive on road——fire, Cars burned while running——P. or Pass., Passenger train——F. or Ft., Freight train (including empty engines, work trains, etc.)——Asterisk, Wreck wholly or partly destroyed by fire——Dagger, One or more passengers killed.

westbound freight No. 19, and eastbound freight No. 210. Both engines and many cars were wrecked. One fireman was killed and eight other trainmen were injured. A car of oil took fire, and some of the injured were rescued from the flames with great difficulty. Most of the wreck was burnt up, and a dwelling house nearby was damaged. No. 19 had run past the appointed meeting station.

The trains in collision at Starr, Ohio, on the night of the 13th were northbound and southbound passenger trains. The collision was due to failure of an operator to stop a train for an order. Five trainmen were killed and 39 passengers and 4 trainmen were injured.

The train derailed near Madison, Ga., on the morning of the 6th was westbound passenger No. 1. It was running at low speed. The cause of the derailment was not determined. Eight passengers and two trainmen were injured.

The train derailed at Braintree, Vt., on the 7th was the northbound Montreal express. The first two cars fell down a bank. Six passengers and four trainmen were injured. The cause of the derailment was a broken rail.

The train derailed near Clarksburg, W. Va., on the 11th was an eastbound express passenger. The engine was derailed at a misplaced switch, and fell against some freight cars standing on a side track. Twenty passengers were injured, four of them seriously.

The train derailed near Moccasin Springs, Mo., on the 13th was northbound passenger No. 802, and 31 passengers were injured, none seriously. A dining car and one coach broke through a trestle. The train was crowded, but the passengers in the other cars were not seriously injured. The derailment was due to a loose wheel.

The train derailed at Sadler, N. C., on the 14th of June was southbound passenger No. 29, and three coaches left the track. The engineman and fireman were killed, and one passenger and three trainmen were injured. The cause of the derailment was a loose switch rail, which had been forced out of place by a piece of iron which had fallen from a car in a freight train.

The train derailed near Covington, Ky., on the 14th was a westbound passenger. Its engine struck a westbound freight. One passenger car was overturned. The engineman was killed. The cause of the derailment was not discovered.

The train derailed near Whittle's, Va., on the 19th was northbound passenger No. 36. Two cars ran off the track to the left, and fell against some of the cars in a southbound passenger train, which was passing at the moment. The cars in the southbound train were steel, and it is said that the serious scraping of the sides is about all the damage that they suffered. The northbound cars, however, were considerably broken up. Fourteen passengers and two trainmen were injured, all of the injuries being slight, except that of a ticket collector. The cause of the derailment was buckling of the track.

The train derailed on the afternoon of the 20th of June, near Wapakoneta, Ohio, was a southbound wrecking train, and a derrick car was overturned. Six employees were injured. The cause of the derailment was failure to secure the boom of the derrick in a safe position.

The train derailed near Shelbyville, Ky., on the 24th was westbound freight No. 72. The engine and eight cars fell through a bridge to a ravine 84 feet below the track. One brakeman was killed, and two other trainmen were injured. The wreck, including most of the bridge, was destroyed by fire. The cause of the derailment was the weakening of the trestle by fire which had been started presumably by sparks from a locomotive.

The train derailed near Richwood, Ky., on the 28th was southbound passenger No. 11. The engine and two cars fell down a bank. The engineman was injured. The derailment was due to failure of the roadbed on a bank. This track had been in use seven months, and there had been no rain for two months.

The train derailed at Moore's, Ky., on the 28th was a northbound excursion train. Two trainmen were killed, and one trainman and 21 passengers injured, none of the passengers seriously. The cause was reported as a loose rail.

Canada.—In a butting collision between an eastbound passenger and a westbound freight train on the Canadian Northern, near Kamsack, Sask., on the night of the 5th of June, an express messenger and two mail clerks were killed and four other persons were injured. In a butting collision of freights on the Grand Trunk, near Kinburn, Ont., on the 21st, two firemen were killed.

RAILWAY TAXATION FOR 1913

The Bureau of Railway Economics has compiled the following table showing the taxes accrued on railways of the United States in the aggregate and per mile of line, during the fiscal year ended June 30, 1913.

Railway Taxation, Year Ended June 30, 1913

Railways of Classes I and II (Including leased and proprietary roads)

State	Taxes	Mileage	Taxes per mile of line	Taxes of switching and terminal companies	Total taxes
Alabama	$1,546,694	4,521.83	$342.05	$49,196	$1,595,890
Arizona	884,089	2,360.16	374.59	.....	884,089
Arkansas	1,765,785	4,098.54	430.83	.....	1,765,785
California	4,230,953	7,434.59	569.09	.....	4,230,953
Colorado	1,847,783	5,488.06	336.69	20,432	1,868,215
Connecticut	1,115,007	1,000.87	1,114.04	721	1,115,728
Delaware	148,945	334.97	444.65	.....	148,945
Dist. of Columbia	56,742	34.21	1,658.64	81,411	138,153
Florida	1,053,486	4,032.40	261.26	38,792	1,092,278
Georgia	1,724,971	5,953.63	289.73	40,763	1,765,734
Idaho	1,434,986	2,455.34	584.43	.....	1,434,986
Illinois	6,866,093	12,197.54	562.91	851,967	7,718,060
Indiana	4,535,497	7,429.20	610.50	183,722	4,719,219
Iowa	2,830,762	9,644.61	293.51	101,798	2,932,560
Kansas	3,401,989	8,913.20	381.68	40,465	3,442,454
Kentucky	1,636,135	3,421.94	478.13	230,267	1,866,402
Louisiana	1,486,001	4,448.11	334.07	71,698	1,557,699
Maine	1,112,211	2,249.31	494.47	42,699	1,154,910
Maryland	935,393	1,294.33	722.69	55,878	991,271
Massachusetts	3,542,864	2,085.53	1,698.78	6,396	3,549,260
Michigan	4,002,885	8,589.55	466.02	108,885	4,106,770
Minnesota	4,840,651	8,982.30	538.91	23,447	4,864,098
Mississippi	1,364,658	3,837.82	355.58	5,874	1,370,532
Missouri	2,204,457	8,010.84	275.18	178,958	2,383,415
Montana	1,874,406	4,303.57	435.55	.....	1,874,406
Nebraska	2,324,354	6,142.17	378.43	11,612	2,335,966
Nevada	931,431	2,097.29	444.11	.....	931,431
New Hampshire	862,289	1,206.95	714.44	10	862,299
New Jersey	6,824,108	2,129.49	3,204.57	35,365	6,859,473
New Mexico	970,914	3,072.00	316.05	.....	970,914
New York	10,560,490	7,921.45	1,333.15	106,483	10,666,973
North Carolina	1,327,478	4,520.76	293.64	10	1,327,488
North Dakota	1,728,169	4,954.04	348.84	.....	1,728,169
Ohio	7,800,208	9,015.37	865.21	175,979	7,976,187
Oklahoma	3,117,360	6,346.09	491.23	85	3,117,445
Oregon	1,495,146	2,335.09	640.29	88,659	1,583,805
Pennsylvania	8,497,141	10,540.97	806.11	132,114	8,629,255
Rhode Island	350,960	197.94	1,773.06	.....	350,960
South Carolina	860,854	3,157.51	272.64	23,502	884,356
South Dakota	956,242	4,160.18	229.86	.....	956,242
Tennessee	1,345,195	3,412.09	394.24	47,195	1,392,390
Texas	3,216,714	14,316.05	224.69	213,997	3,430,711
Utah	932,594	1,996.75	467.06	27,820	960,414
Vermont	386,965	924.29	418.66	.....	386,965
Virginia	2,244,539	4,115.65	545.37	13,224	2,257,763
Washington	3,751,589	4,636.20	809.19	.....	3,751,589
West Virginia	1,492,546	3,166.86	471.30	9,443	1,501,989
Wisconsin	3,855,846	7,083.91	544.31	12,074	3,867,920
Wyoming	655,992	1,624.21	403.88	.....	655,992
Total state and local taxes	$122,932,567	232,195.76	$529.44	$3,025,941	$125,958,508
Internal U. S. Revenue Tax	4,902,055	.....	.....	183,474	5,085,529
Miscellaneous	214,303	.....	.....	.....	214,303
Canada	1,529,052	14,594.58	104.77	12,479	1,541,531
Mexico	158	51.67	3.06	.....	158
Total all taxes	$129,578,135	246,842.01	$524.94	$3,221,894	$132,800,029

Taxes paid by switching and terminal companies are not shown per mile because of their great proportion of terminal real estate and also because report of miles of first main track of these roads is not required by the commission.

Railways of Classes I and II include respectively roads having annual operating revenues above $1,000,000 and those having annual operating revenues from $100,000 to $1,000,000. The mileage given for these two classes of roads is miles of line, that is, miles of first main track owned, including branches and spurs. Taxes have not been apportioned per mile of track because the Interstate Commerce Commission does not require reports of miles of track by states.

Class III roads are omitted, because their taxes are only about two-thirds of 1 per cent. of the aggregate.

Total state and local taxes per mile of line amounting to $529.44 in 1913 show an increase over 1912 of $26.49, or 5.27 per cent., and over 1911 of $70.50, or 15.36 per cent.

Making Provision for Emergency Grain Cars

The Rock Island is Fitting Up Stock and Automobile Cars to Meet the Pressing Needs in Its Territory

By W. J. Tollerton
General Mechanical Superintendent, Rock Island Lines, Chicago, Ill.

The heavy grain crop in the West this year has caused not a little anxiety among the railroads extending through the farming sections in connection with proper and prompt handling of the grain to the markets. The majority of our railroads, of course, own and operate rolling equipment for the transportation of all classes of freight; therefore, when it becomes necessary to make extremely heavy shipments of one particular commodity requiring a special class of car, it is often necessary to go to extremes in fitting up cars for the transportation of this freight.

Fig. 1—Stock Car Coopered for Handling Grain

The bulk of the grain is shipped when harvested; therefore, the railroads are called on to furnish an enormous number of cars in a comparatively short period of time. To better meet the demand, all repair shops and yards are required to give box cars preference in order to reduce the bad order cars of this class to a minimum, and all box cars turned out must be in condition for hauling grain. Not only must attention be given to the bad order cars, but all box cars, regardless of their condition, are carefully inspected, repaired and coopered for carrying bulk grain. The car must not only be rendered grain tight, but the construction must be such as to eliminate any possibility of damage to the lading from the elements.

The proper fitting up of a box car for grain shipments is merely the placing of the car in a reasonably perfect condition, which is the regular procedure; but making cars which were not originally designed for hauling grain suitable for this purpose is entirely another proposition. The Chicago, Rock Island & Pacific, in order to take care of extreme necessities of grain shipments, is now fitting up stock and automobile cars for this purpose.

The stock cars are first thoroughly cleaned, removing all odors, and are given any required repairs. They are then ready for proper coopering. Strips of wood of proper width are fitted between the slats of the frame of the car; and the inside, with the exception of the ceiling, is completely covered with an odorless tar felt waterproof paper, this paper being secured by means of laths tacked over it. A heavy lath is used on the floor to protect

Fig. 2—Roof of Stock Car Equipped for Handling Grain

Fig. 3—Interior of Stock Car Equipped for Handling Grain

the paper when a scoop is used in unloading. The side doors are fitted with temporary grain doors and properly coopered. All grain doors except the top one on each side are applied on the repair tracks, and it is only necessary to apply one temporary grain door on each side after the car is loaded. Coopering paper and are covered with roofing paper, as shown in Fig. 2. The strips of paper are applied crosswise of the car and secured by means of laths, the application requiring the removal and replacement of the running board. The small end doors in the stock cars are covered both on the inside and outside with old metal roof sheets.

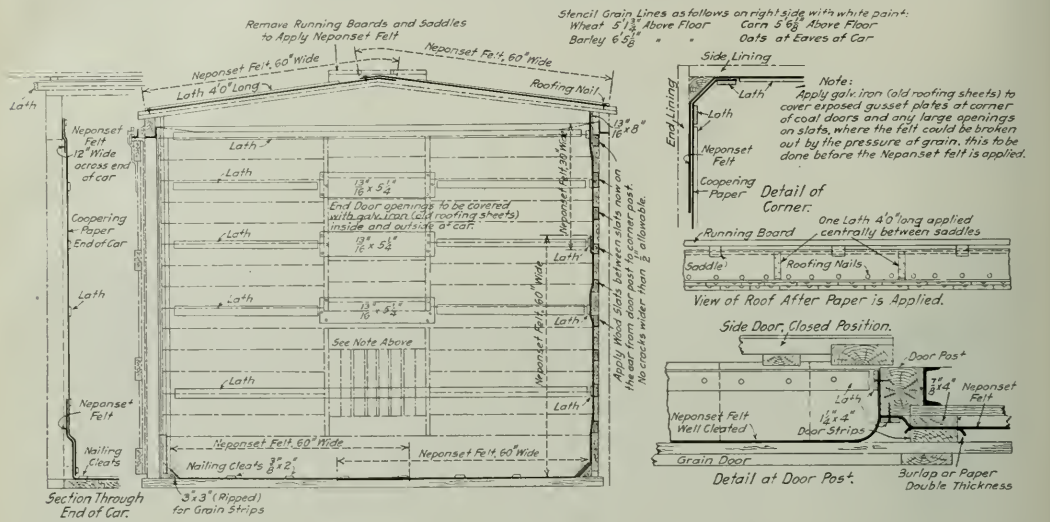

Fig. 4—Coopering of Stock Cars for Emergency Grain Service

is then secured to the top of the side door opening and bent inward and secured to the grain door near the upper edge.

The general appearance of the car after the openings between the slats have been closed and the temporary grain doors have been put in place is shown in Fig. 1. The cars have board roofs It is estimated that from three to five loads can be shipped in these cars before the renewal of the paper lining is required. Fig. 4 shows the general construction with cross sections and Fig. 3 is an interior of the car.

The automobile cars selected for grain shipments are 50-ft.,

Fig. 5—Automobile Car Fitted for Handling Grain

40-ton capacity cars, having large double doors at one end and 12-ft. side doors. One of these cars is shown in Fig. 5. It was necessary to apply a wooden bulkhead up to the end plate at the end door and properly cooper with paper. The bulkhead consists of 1¾ in. decking extending crosswise of the car from the floor to a height of about 5 ft. and then ordinary 13/16 in. lining to the end plate, these boards being secured to the inside of the sheathing, to a center post nailed to the floor and to the end plate. This center post is set against the end door, which greatly assists in taking up the load due to the pressure of the bulk grain. Fig. 6 shows in detail the construction of the bulkhead.

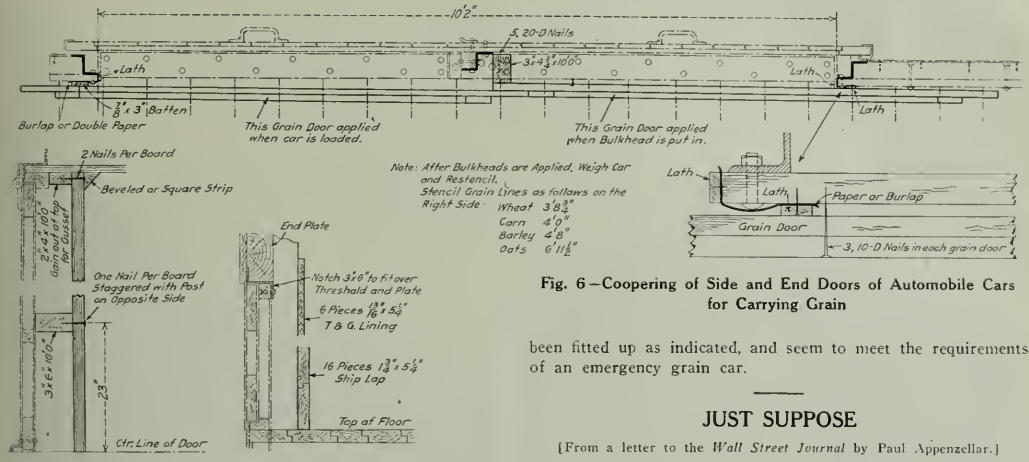

Fig. 6—Coopering of Side and End Doors of Automobile Cars for Carrying Grain

In order to apply the grain door to the side door openings of these cars, it is necessary to apply a temporary post at the center, the doors on one side consisting of two six-foot doors opening in opposite directions; therefore, one door on each side is closed and secured, having the temporary center post at its inner edge.

Fig. 7—Method of Closing Part of Side Door in Automobile Cars

To this center post and door post one set of temporary grain doors is secured. On the other door post is secured a wooden strip the full length of the post and of a thickness equal to the temporary grain doors so that the second set of grain doors, applied when the car is loaded, will be parallel to the side of the car. Fig. 7 shows the temporary grain doors as applied to one-half of the side door.

Both the stock and the automobile cars, after being equipped for grain loading, are properly stenciled, the stock car as an emergency grain car and the automobile car as being equipped for grain loading. It is, of course, necessary to paint grain lines on the inside and to reweigh the cars before placing them in service. A total of 500 automobile and 300 stock cars has been fitted up as indicated, and seem to meet the requirements of an emergency grain car.

JUST SUPPOSE

[From a letter to the *Wall Street Journal* by Paul Appenzellar.]

Suppose that along with other investigations a committee of business men would investigate Congress, bringing out a record of all errors of judgment and instances of inefficiency. Supplied with as large a stock of adjectives and adverbs as the Interstate Commerce Commission what kind of a report could be written?

Suppose that someone asked the President to reconcile the law against unfair business competition (say the New Jersey statute) which he has had enacted, with the government's action in placing the post office in competition with the express companies by naming rates lower than the actual cost of doing the business.

Suppose that when passenger rates on railroads were ordered reduced some one had suggested that a reduction be made in the 20-cent per mile allowance to Congressmen.

Suppose that some one investigated William G. McAdoo's business record—investigator to be an original holder of Hudson & Manhattan securities.

Suppose that the Interstate Commerce Commission were considering a petition from the American Federation of Labor asking for an increase in wages throughout the United States. How long would they take to hand down a decision and what would be the chance of its being unfavorable to the American Federation of Labor?

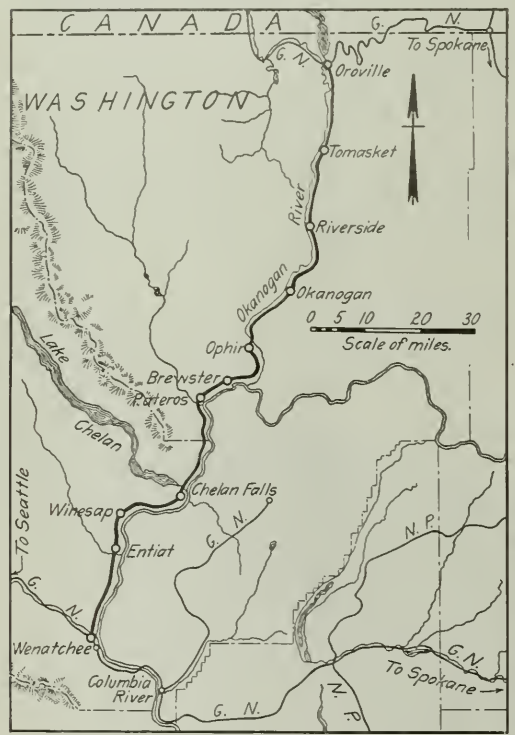
Suppose that instead of Mr. Gompers, a captain of industry had sat in the gallery of the house and checked off the members as they voted on a bill to exempt from the operation of the law a special group of citizens?

LONG DISTANCE TRAVELING ON ENGLISH RAILWAYS.—The story is told of an English gentleman who recently contrived to cover 1,008 miles in 22½ hours of traveling. Leaving the London St. Pancras station by the midnight Scotch express, he reached Leeds (196 miles) at 4:03 a. m., from which he commenced his return to London seven minutes later. He arrived in the metropolis at 8:15 a. m., and at 9:30 was on his way to Carlisle (308½ miles) which was reached at 3:50 p. m. In eight minutes he took the 3:58 train and arrived at London at 10:25 p. m. It might be possible to improve upon this record in America, and perhaps in England. It is to be doubted, however, whether American railroads could produce as remarkable a record of punctuality.

New G. N. Line from Oroville to Wenatchee

Road Serves an Area Previously Without Facilities, Providing Low Grade Line from British Columbia East

The Great Northern has been working for three years on the construction of a line north from Wenatchee, Wash., to Oroville. The main line of the Great Northern crosses the state of Washington from Spokane to Seattle north of the Northern Pacific and St. Paul roads, and about 100 miles south of the Canadian border. A branch line of the Great Northern runs north from Spokane to the international border and then west, generally parallel to this border to the Cascade mountains. A third line runs north from Seattle along Puget Sound to Vancouver, while another line is now building east from Vancouver to a connection with one extending west along the international boundary. With the exception of a few branch lines of the Northern Pacific along the western coast and one adjacent to



Map of Wenatchee-Oroville Line of the Great Northern

the main line of the Great Northern from Spokane west to Adrian and a short branch of the Great Northern east of the Columbia river, this area 200 miles long by 100 miles wide has been without railway facilities. While this area includes the Cascade mountain region, much of it is productive land suitable for wheat and fruit raising.

Early in 1910 the Great Northern undertook the construction of a new line extending through the center of this area north and south. Due to various complications, actual construction work on the southern half of this line was delayed until the spring of 1912, and the grading for the entire line has only recently been completed. This road will provide transportation facilities for a large area, much of which is already set out in orchards, although the only transportation heretofore has been daily packet service on the Columbia river as far north as Brewster, and stage transportation beyond. This new line starts from a connection with the main line at Wenatchee and extends north along the west bank of the Columbia river to Brewster, from which point it follows the Okanogan river to a

One of the Tunnels With Highway Overhead

connection with the east and west line along the border, at Oroville, a total distance of 134 miles.

With the completion of the new line, the Great Northern has two lines from Oroville to Spokane. The older line running east along the boundary has heavy grades and curvature, and is therefore expensive to operate. The new line from Oroville to Wenatchee is built with a maximum grade northbound of 0.4 per cent., and southbound of 0.3 per cent., and with 4 deg. curves the sharpest, except at M. P. 40, where three 5 deg. curves are inserted. As southern British Columbia, through

Typical Point Projecting into River

which the old line passes west of Oroville, originates much fruit and other traffic, it is expected that a large proportion of this will eventually be sent over the new line via Wenatchee to Spokane. Thus, in addition to providing railway facilities for a large area previously undeveloped, this line also gives a low grade outlet for a considerable amount of traffic.

Owing to difficulties in completing negotiations with the state

for certain necessary changes in the state highway near Wenatchee, work was started first at the north end of the line. The grading of that portion of the road between Oroville and Pateros was started in 1910, but due to the delays in completing negotiations further south the work at the north end was not pushed and the bridges and track laying on this section were not completed until early in the spring of 1913. Grading on the portion of the line south of Pateros was started early in 1912, and was completed late in the fall of 1913. All track has now been laid.

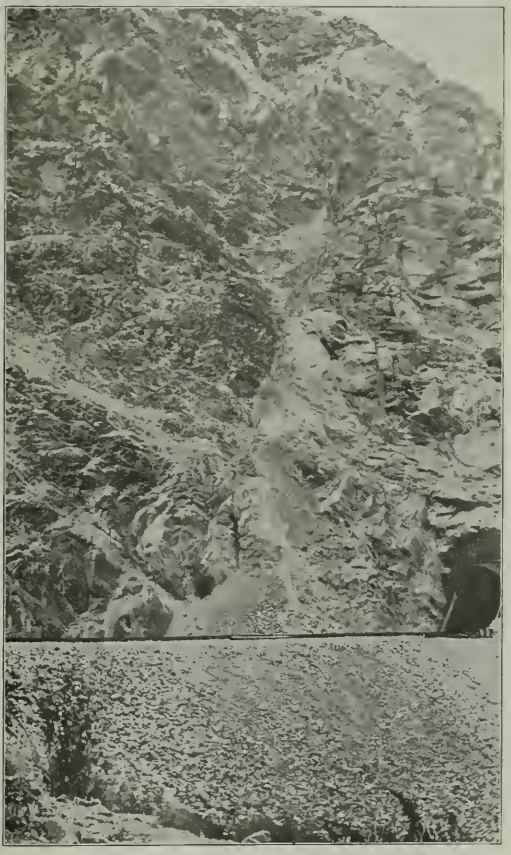
The relocation of Washington State Road No. 10 was the

Bluff Debris Encountered on Mile 23

most complicated problem in the construction of this line of railroad. At frequent intervals throughout the lower 27 miles of the line the railroad location occupied the highway, and necessitated the relocation of the highway. The points where relocation was necessary were usually around steep rock bluffs, and building of the railroad at such points was rendered about doubly expensive and very complicated by providing a roadbed for the highway, as well as for the railroad. In all 13 miles of wagon road was rebuilt in three stretches, at a total cost of over $100,000. The accompanying photographs show the railroad with reference to the reconstructed highway at some of the steepest bluffs. It was necessary to maintain continuous traffic over these highways, so the new roads had to be built before the old ones could be abandoned, which, of course, had to be done before the railroad grade could be built. The specifications under which the new highway was built were furnished by the state engineer, and required a roadbed 10 ft. wide, with frequent turnouts, 100 ft. long where the roadbed is 16 ft. wide, and protected with a substantial fence on the embankment side. The maximum gradient allowed on the wagon road was 7 per cent.

At Destruction Point, a few miles north of Wenatchee, it was necessary to move over 200,000 cu. yd. of rock and one steam shovel worked at this point for nine months. It was necessary to relocate the highway up on the face of the bluff and the location was so confined at this point that after the highway was completed and placed in service it was necessary to lay a narrow gage track in it and plank it over for the use of the contractor in excavating the first cut for the railroad alongside, by loading into cars standing on the highway. In this way, however, the highway was kept in service with the exception of one day when the shovel was moving down the highway to cut in. In that portion of the line north of Knapps Hill the new highway extended across a bay in the river where one fill of 200,000 cu. yd. was made in deep water.

Grading on this line of railroad is light on the northerly 76 miles, which is through the Okanogan valley. The 58 miles south of Pateros is heavier—the grading on this stretch amounting to 3,194,000 cu. yd. of material, 50 per cent. of which was rock. With the exception of relatively heavy work at one point, near Wenatchee, and for a short distance north of Knapps Hill, Mile 27, these quantities were quite evenly distributed over



Typical Rock Formation Encountered at Tunnel Portal

the distance. About 90 per cent. of the material was moved by steam shovels and the remainder by station men. Ten steam shovels in all were employed.

Three tunnels of 442 ft., 755 ft. and 383 ft., respectively, were required. All three were driven from top headings, working from one end only. The southerly tunnel was driven entirely by hand. As the material encountered was solid rock it was only necessary to line the portals with timber. The hard character

of this material is shown in one of the accompanying photographs.

Five rivers are crossed which require truss bridges. The Wenatchee river is crossed about 2½ miles north of Wenatchee, on three 150-ft. Howe truss spans. At Entiat the line crosses the Entiat river on one 150-ft Howe truss, while the crossing of the Chelan river at Chelan Falls is made on three 150-ft. and one 100-ft. Howe truss spans. The Okanogan river is crossed near Wakefield on two 60-ft. and one 190-ft. Howe trusses, the latter being a draw span. The Methow river is crossed at Pateros on one 150-ft. through Howe truss and one 100-ft. through Howe truss. These bridges were all built of

Howe Truss Bridge Across Wenatchee River

dressed timber, creosoted. The timbers were framed in the material yard at Olds, and after framing all exposed surfaces were given a further brush treatment with creosote. Timber trusses are unusual in most parts of the country, but the arid climate here gives these structures a relatively long life, while fir timber is comparatively cheap, and steel high in price on account of the long haul. Several large timber bridges have recently been built in this vicinity, notably that of the O.-W. R. & N. across the Columbia river, near Kennewick. The photograph of the Wenatchee river bridge shows a typical structure on this line, supported on pile foundations and surrounded by cribs filled with rock, which are in turn protected by heavy riprap.

Corrugated iron culvert pipe was used for small openings under all fills up to 15 ft. in height. Above that height, cast iron

Typical Heavy Highway Reconstruction Work

pipe was used for openings up to 36 in. in diameter. A few small concrete culverts were built at points requiring larger openings than these pipes.

The stations were located at intervals of about five miles, at which points the grading was completed for a 2,000 ft. passing track and a house track, although with the exception of Entiat, only the passing tracks were laid. No intermediate yards or fuel stations were built between Oroville and Wenatchee, but water stations were built at intervals of 20 miles. With the exception of one gravity supply, the water was secured from wells as the river was either too far distant or the lift was too great. The track was laid with 68-lb. rail on fir ties and gravel ballast by the contractor, using a Roberts track laying machine.

The line was built under the direction of A. H. Hogeland, chief engineer, of the Great Northern, and Ralph Budd, formerly chief engineer, and now assistant to the president; A. F. Whitcomb was district engineer in immediate charge; Guthrie, McDougall & Company, of Portland, Ore., were contractors for the grading, bridge work and track laying.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION

A report of the opening sessions of the Tool Foremen's Association convention was published in the *Railway Age Gazette* of July 24, page 168. Following is a report of the concluding sessions:

TOOL ROOM GRINDING

W. C. Diebert (Chesapeake & Ohio): Considerable difficulty is experienced in grinding tools without automatic machines. At Clifton Forge, Va., we have made a surface grinder, an automatic reamer grinder, a small die grinder and a grinder for the Ingersoll milling machine cutters. This latter machine will cut up to 14 in. in diameter and grind the radius on the cutters used in channeling out driving rods. Wheel lathe tools are given an angle clearance of 7 deg.

J. C. Bevelle (El Paso & Southwestern): The tools issued from the tool room on check are all ground in the tool room. To insure a reasonable life for a drill it should be properly ground at the point. The two cutting edges must be exactly of the same length and should be at an angle of 59 deg. for ordinary purposes. The angle of lip clearance should be about 12 deg. This angle, however, should gradually increase as the center of the drill is approached until the line across the center of the web stands at an angle of 135 deg. with the cutting edges. For heavy cuts in soft material the angle of lip clearance may be increased to 15 deg. The failure to give sufficient angle of lip clearance at the center of the drill is the principal cause of splitting drills up the web. Standard reamers should be kept sharp and properly ground, otherwise a great deal of time will be wasted by the men using them. In the shop at El Paso, Tex., the reamers are not placed in the rack until they have been inspected and put in first-class condition.

Owen D. Kinsey (Illinois Central): Our grinding machinery is placed as far from the precision machinery as possible to avoid trouble from dust and it is in a position to command good light and ventilation. The spindles of all the grinding machines have been made standard so that the grinding wheels may be interchanged. They are also provided with substantial safety hoods and fixtures for every operation. Instructions have been posted on each machine showing the belt position for grinding wheels of different diameters. Success or failure in grinding operations depends directly on the proper selection of wheels for the particular work in hand. We have found that a cool free cutting wheel is the most economical in the long run, even though the wheel life is shorter. The heaviest cutters we handle are 10 in. by 20 in. peg cutters. These are ground on a Bath universal grinder using a radius arm projecting from an arbor upon which the cover is mounted.

Thomas F. Eaton (Baltimore & Ohio): There are 70 grinding wheels in service at the Baltimore shops and it has been found expedient to have one man inspect all the wheels throughout the plant rather than to have each department look after its own. By this means we are kept posted as to the condition of the bearings, the safeguards and the balance of the wheel and are enabled to keep the wheels in safe and efficient running condition. A large number of high speed steel frame reamers and drills have been reclaimed by welding new shanks on by the oxy-acetylene welding process.

Discussion.—Many of the members have experienced considerable difficulty in grinding high speed steel wet, it being found that the tools will split and chip off. For that reason

it was believed to be better practice to do this work dry, being careful not to over-heat the metal. Care should also be taken to see that the right kind of grinding wheel is used. Many of the members favored a soft wheel. Some believed that much better results could be obtained by honing the edges of tools with a soft stone to take off the wire edge. This has been especially successful on slab millers, they having been found to give much better service both in the work done and the maintenance of the cutting edge.

SAFETY FIRST IN GRINDING

R. G. Williams, safety engineer of the Norton Company, Worcester, Mass., gave an illustrated address on safety as applied to grinding wheels. He stated that the manufacturers, immediately before packing grinding wheels, submit them to a speed test in which the wheel is revolved at a speed which subjects it to between three and four times the centrifugal stress it will be subjected to under actual working conditions. Defective wheels break under this test. After completing a test a record is made of the order number and other data connected with the wheel, and each testing sheet is taken before a Justice of the Peace and the man doing the testing work is required to swear that he has made a true record of his work. The manufacturer thus has on record a sworn statement of every test made.

In considering grinding wheel breakages, 15 causes were discussed and a number of illustrations were shown. Among the causes for wheel breakages may be mentioned the wheel receiving a blow on the side, improper adjustment of the work rest, heating of the wheel from forcing the work, the wheel running out of true, and the mounting of the wheel so that the nut works loose. The matter of protection devices was taken up, tests having been conducted to prove the relative value of hoods and flanges as protectors in case of breakage. These tests indicated that protection hoods provide greater safety than do safety flanges.

MACHINE TOOL REPAIRS

J. B. Hasty (Atchison, Topeka & Santa Fe): All machines are taken to the tool room for general repairs, dismantled, and all the serviceable parts used. Small cast iron gears that require renewal are replaced with steel. Light repairs are made throughout the shop by repairmen from the tool room. All repairs and renewals to shop machinery and tools are charged to a separate account, the different departments being designated by letters. The machines have serial numbers and a record is kept as to their location and the work done on them by the repair department. The classes of repairs are designated by numbers 1, 2, 3, 4 and 5, according to the amount of work done.

John Tothill (Buffalo, Rochester & Pittsburgh): Plenty of shop space should be allotted to this work and it should be thoroughly equipped with the necessary tools, appliances, etc. Every machine should be given a shop number when purchased and an accurate record kept by the man in charge of machine repairs as to the amount expended on each machine. A full set of catalogs of all tools in service covering repair parts should be readily accessible to the repairman so that he can order new parts promptly. He should be ready with new parts of tools that are wearing fast, thereby causing a minimum delay to the work.

G. W. Smith (Chesapeake & Ohio): Machine tools require much more repairing at the present than in former years owing, principally, to the introduction of high speed steel and greatly increased speed. In the majority of the cases it does not seem to be the upkeep incident to long service so much as the breakage resulting from overstrain. In order to overcome this we strengthen, wherever it is possible, broken gear wheels, worm wheels, worms and racks by making them of Bessemer steel. It is a serious mistake to operate a machine that is in a very bad condition, but it is often difficult to work on these machines, as they can seldom be spared.

Discussion.—While many of the members replace broken parts by duplicate parts made of stronger material it was pointed out that it was not always advisable to do this. Sometimes a part is purposely made weaker than another so that when any undue strain is placed on the machine it will be the part to fail. If this part was strengthened the next time the machine was subjected to such strain some more intricate part might be damaged which would cost a great deal more to replace. On new machines that were especially designed for the work they are doing it was deemed best to replace any broken parts with exactly the same kind of material as was used in the first place. On the Rock Island at Silvis one man is detailed to constantly inspect all the machinery, pumps, engines, etc., making note of the parts that are becoming worn and that will have to be replaced. By doing this it is possible for the repair gang to anticipate many failures and place a machine in good condition a short time after it fails.

DISTRIBUTION OF SHOP TOOLS

Henry Otto (Atchison, Topeka & Santa Fe): The tool room of a locomotive repair shop is one of the most important, but oftentimes one of the poorest equipped and most neglected departments in the whole shop. In many instances it is located in an out-of-the-way corner, causing the workmen who are in need of tools to waste time going back and forth. In properly planning a tool room it is necessary to consider the distribution and care of the small tools, the special tools, jigs, air motors, hammers, etc. A practical checking system should be installed to keep a record of all tools issued.

W. E. Ross (Baltimore & Ohio): The messenger system for distributing tools, if perfected, will give much better results than having the men call for their tools. The messenger boys are stationed in the tool room and are called to various parts of the shop by means of an annunciator.

John W. Nutt (Chicago Great Western): The tool room counter over which the tools are handed out should run the full length or width of the tool room and should be so arranged as to permit the placing thereon of the tools most frequently called for, such as hand taps, dies, studs, gages, etc., so that they shall at all times be accessible to the tool passer. Various other tools may be placed on revolving racks located immediately behind and parallel to the tool room counter, readily accessible to the tool distributor. Each gang foreman in the erecting shop should have a tool cupboard where tools, such as wrenches, hand punches, a set of die nuts, set nuts, etc., may be kept. No method of handling tools, however good, will operate successfully without the hearty co-operation of department foremen who should be watchful of the care the tools are given while in the hands of the men under their jurisdiction.

Discussion.—All the members were practically agreed that in order to get the best results in the distribution of tools the tool distributor must have the co-operation of all the foremen in the shop in order that the tools may be properly used and returned to the tool room. Various methods of accounting for the tools were mentioned. The tool distributor himself should be very tactful with the workmen coming to the tool room for tools, and should treat them so they will be interested in returning the tool in good condition. The tools should be handy to the distributor, so that he may fill the requests as quickly as possible. Also the tool room should be so located that the men will not waste much time in getting the tools they desire.

COLD PUNCHING DIES

B. Henrikson (Chicago & North Western): The cold punching dies in use at the Chicago shop of the Chicago & North Western might be divided into three different classes as follows: Boiler sheet punching, sheet iron copper and brass, leather and rubber punching. In boiler sheet punching the first important item is to choose the proper kind of material. The best steel to use in boiler punches is one of low carbon content, about 85 points, for both the punch and the die, which should be hardened. The temperature at which the hardening is done should be determined by

the carbon content. The approximate temperature should be between 1,700 and 1,800 deg. Fahr.

The punches used for sheet iron, tin, copper and brass, are commonly called "blanking" dies. This type of die should preferably be made of a special steel of high carbon content, about 110 points. The method of manufacture varies according to the type of the die. The die is sometimes forged to shape and other times made directly from stock. The tempering of these dies should be carefully done in order to avoid warping. The electric furnace is generally used to heat the dies to the required tempering temperature which should be between 1,400 and 1,500 deg. No clearance is allowed between the punch and the die in this case. For dies on sheet iron a slip fit should be allowed. Both the die and the punch should be hardened. For dies used in punching tin the fit between the punch and the die should be tight. The plunger is left soft, only the die being tempered. By doing this it is possible to upset the punch by hammering when either the punch or die becomes worn. The method of making dies for leather and rubber is practically the same as that used in making blanking dies.

Discussion.—As a general rule, a clearance of one-tenth of the diameter of the punch was recommended.

CLOSING EXERCISES

An interesting paper was presented on "Special Tools for Drilling, Reaming and Milling," consisting almost entirely of descriptions of tools that have given particularly good service. The discussion on this subject brought out the great opportunities of milling machine work, one member stating that he had doubled his output by designing cutters for milling machine work, having found it necessary to increase all the arbors used for these cutters to 1½ in., so that a heavier cut could be taken.

The following officers were elected for the ensuing year: President, Henry Otto, Atchison, Topeka & Santa Fe, Topeka, Kan.; first vice-president, J. J. Sheehan, Norfolk & Western, Roanoke, Va.; second vice-president, C. H. Shaffer, general tool inspector, Illinois Central, Chicago; third vice-president, J. C. Bevelle, El Paso & Southwestern, El Paso, Tex.; secretary-treasurer, Owen D. Kinsey, Illinois Central, Chicago. The next meeting will be held in Chicago some time during July, 1915.

PRESIDENT RIPLEY ON WAGE DEMANDS

The following statement by E. P. Ripley, president of the Atchison, Topeka & Santa Fe, was published in the Chicago *Herald* on July 26:

"What position the transportation industry is in today is told in a nutshell by the simple figure of operating ratio. Total operating revenues of the railways in the fiscal year just closed, as compiled within the last few days by the bureau of railway news and statistics from the official reports to the Interstate Commerce Commission, at $3,000,000,000, stood almost $80,000,000 below that for the preceding fiscal year.

"To do the smaller business, operating expenses were entailed which were more than $35,000,000 higher than the year before. Taxes continued their advance and after their deduction the remaining net income fell $130,000,000 below 1913. Here is a ratio between expenses and revenues of 72.33 per cent., against 69.40 per cent. the year before, and if taxes are added the ratio jumps to 76.91 per cent.

"Yet in the face of such a showing we have the engineers and firemen threatening to tie up the railways of the West if their demands are withheld.

"The demand in the present instance is from the men who already have the highest pay of any organized labor on the railroads, and who already have the highest pay for the quality of work demanded that can be found in any industry.

"It has been estimated—I am not vouching for the correctness of the estimate, for I did not make it—that the western roads would have to pay out about $33,000,000 a year more in compensation than they pay out now, were these demands to be met, and the total $33,000,000, of course, would necessarily be a clean loss in net.

"But this is not the worst of the difficulty. It is a question whether this class of labor, that is, the engineers and firemen, are not already overpaid as compared with the great mass of other labor on the railways. We have advices to the effect that if this advance is granted to the engineers and firemen there will next be camping on our doorsteps several times as many conductors and trainmen, to say nothing of station agents, clerks and machinists of all kinds. So the estimate of $33,000,000, if granted to the engineers and firemen, will be likely to be found on final analysis more nearly $100,000,000.

"It doesn't require any special knowledge of arithmetic or extraordinary power of prevision to see where this will land us. The result would be that the strongest roads would be crippled and the weakest, to use an unvarnished phrase, would turn up their toes.

"The poor results for the last fiscal year simply show what might be expected. There has been a depression in general business, such as has recurred at intervals ever since I've known. The railroads have been entirely unable to resist, because they have been hammered continually by lawmaking bodies of one kind or another. In our experience with the Interstate Commerce Commission and with the various state commissions there has been a constant, increasing whittling away of our rates.

"On the other hand, taxes are enormously high and show no check in the tendency to increase. Our own records show that the percentage of increase in taxation during the five years ended June 30, 1912, was slightly over 68 per cent. There has been no diminution of this burden since; on the contrary, the advance has continued. Taxes in the year to June 30, 1913, reached $4,662,152, a sum equivalent to 11.8 per cent. of the operating income for the year and exceeded taxes of 1912 to the extent of 10.8 per cent.

"The crux of the trouble is not far to seek. It is stated in the fact that the Interstate Commerce Commission has enormous powers, with no responsibility. With all its dominion it does not hold itself in any way responsible for the success or failure of the enterprise it controls.

"Yet our expenses to assist it in its work of regulation have mounted until now we alone are paying $250,000 a year for the privilege of being regulated."

TEXT OF COMMISSION'S ACCOUNTING ORDER

In re the Separation of Operating Expenses. Opinion by the commission:

Statistical circular No. 3, issued by the commission through the division of statistics, contained a proposed order requiring railway companies having annual operating revenues of $100,000 and over, covering roads of classes I. and II., to report to the commission separately the greater portion of their freight and passenger expenses, certain common expenses being left unapportioned. A copy of this circular was sent to all railroad companies of these classes under date of March 19, 1914. In order that the subject might be thoroughly discussed a public hearing was held before the commission in Washington on May 2, 1914. Briefs were filed both before and after the hearing.

The question before us is not new. Prior to 1894 a separation of freight and passenger expenses was made in the reports of the carriers. From 1888 to 1893, inclusive, the results of this separation were published by the commission in its annual statistical report. The rule which was followed in the separation as made at that time is quoted below:

> All expenses which are naturally chargeable to either freight or passenger traffic should be entered in their respective columns; expenses which are not naturally chargeable to either traffic should be apportioned on a mileage basis, making the division between freight and passenger traffic in the proportion which the freight and passenger train mileage bears to the total mileage of trains earning revenue.

Soon after this separation of expenses was inaugurated railroad accountants began to suggest that it be discontinued. As early as 1890 a committee was appointed by the National Association of Railroad Commissioners to report upon the question. At the fourth annual convention of this association in 1892 the subject was actively discussed. It was not until 1893, however, that it was finally disposed of by the adoption of the report of the committee that the practice be discontinued. Under date of February 12, 1894, the statistician of the commission advised the carriers that thereafter a separation of operating expenses between freight and passenger service need not be made.

From an examination of the early reports of the carriers, it is clear that the belief of those making the returns was that only a very few expenses were "naturally chargeable" to one service or the other. An arbitrary division of all, or nearly all, expenses on a train-mileage basis is useless, and the discontinuance of the separation at that time was undoubtedly justified. During the last 20 years, however, railway accounting and accounting generally have greatly developed, and for this reason a reconsideration of the matter at the present time seems warranted.

The arguments advanced in support of a separation of the expenses at the present time were that it would be a material aid in the determination of the cost of railway services, not only as between the two services—freight and passenger—as a whole, but also in determining the cost of particular classes of traffic, for the reason that the separation of freight and passenger expenses is fundamental in all cost of service inquiries. That the authoritative formula would simplify their work to a certain extent in rate cases is the argument urged by some of the carriers for a general separation between freight and passenger services of all operating expenses, leaving none unapportioned. It was also claimed that the proposed reports would be of assistance in the study of comparative costs among railways.

The argument was advanced by one carrier that it is desirable to compare only total expenses with total revenues. The proper revenue of a carrier having then been determined, rates should be made in the various branches of the traffic solely on the basis of public utility. We do not believe, however, that sufficient reason has been given for abandoning the policy consistently pursued by the commission of giving consideration to cost in establishing rates. What weight to give to the cost factor depends upon the particular case. The question now before us is the practicability of providing for the ascertainment of cost figures in the general manner indicated in circular No. 3.

In the case of manufacturing concerns it has been shown to be practicable to make some estimate regarding the cost of the individual articles manufactured. This is done not only as a basis for comparison of the efficiency of various departments, but also as a basis for ascertaining at what price the manufactured product should be sold. This naturally suggests the question whether it is not possible to pursue the same or similar methods in the accounting of railway companies. There is probably a difference in the extent to which the ascertained cost could be utilized as between manufacturing and railway companies, for the reason that a manufacturer may discontinue to manufacture a product which he finds to be unprofitable, whereas a railway may be compelled to continue an unprofitable service.

The actual practice of railway companies is helpful in the consideration of the question now before the commission. For approximately one-half the mileage of the large carriers in the United States, operating expenses are now being divided between freight and passenger service. Among the railroads which make this separation are the Pennsylvania lines east and west, the Erie, the Baltimore & Ohio, the Louisville & Nashville, the Chicago, Burlington & Quincy, the Great Northern, and Northern Pacific. On the other hand, the New Haven, the Boston & Maine, the New York Central lines, the Southern, the Union Pacific, and Southern Pacific systems do not make a complete separation of all of their operating expenses between passenger and freight, although some of the important transportation accounts may be kept separately for the two services.

The officials of the roads which make this voluntary separation state that it is done in order to secure efficiency and not for rate-making purposes. If the comparison is made on the same basis year after year, these officials state that it is not important whether the arbitraries which are used are exactly correct or not. To their minds what is exact enough for efficiency purposes could not be considered sufficient as a basis for rate making. It was also argued that the method of keeping these statistics is different when made for efficiency comparisons from what it would be when made suitable for cost of service accounting. Nevertheless the impression seemed to prevail that circular No. 3, as submitted to the carriers, does not conflict with efficiency accounting.

It is erroneous to suppose that the commission is interested in statistics of this character merely for the purposes of rate making. The statistics would be valuable in making comparisons from year to year for the same railroad and for different roads in the same year. It is the duty of the commission to keep itself informed regarding the manner in which the railway business is conducted, and a knowledge of the variations in unit costs is valuable to us even if no rates are based thereon.

The assumption that railway cost accounting cannot be made sufficiently accurate for useful consideration in dealing with rates does not seem warranted. Although not possible 20 years ago, it would appear that at the present time approximately two-thirds of the operating expenses of a railroad can be separated in a reasonably satisfactory manner. The separation of the remaining one-third is useful if a basis is selected which equitably measures the use which either service makes of common facilities. This indicates the extent to which freight expenses can be subdivided among the various branches of freight traffic. Just as fuel, wages, and other direct expenses can be ascertained as between freight and passenger trains, so can they be distinguished as between individual freight trains.

It was urged that should the commission really need information concerning costs, a special study could be undertaken at any time and be pursued until the requirements of the individual case had been met. Special studies will always be necessary, but they cannot take the place of general statistics systematically compiled year after year. The latter, so far as they are applicable, are looked upon as more reliable than those which are collected for any particular case. Whether rightly or wrongly, "special purpose" statistics rarely command that confidence which inheres in figures that are kept continuously on accepted bases without reference to a particular controversy.

It was suggested at the hearing that the commission should wait until the courts had rendered decisions in certain pending rate cases before making a requirement of this character. What the courts have said must carefully be considered and conformed to. As to the cases before the courts at the present time, we believe that the courts have a right to look to this commission and to the various state commissions for a careful study of railway statistics and accounts. What the Supreme Court said in the *Minnesota Rate case, Simpson* v. *Shephard*, in regard to the distribution of capital charges is an incentive to proceed with the work. The court said in that case that after distributing to each class of traffic the property exclusively used by it, comparable use units might be found for distributing the property used in common.

The possible misuse of information collected was also urged as a reason for not developing the subject of railway cost accounting. It was urged that to give cost accounting information to the public would be the same as giving dangerous instruments to children. The systematic development of this subject and its free discussion in the light of all information available is the best safeguard against the misuse of cost figures. There is reason to believe that the failure of carriers to develop cost figures along permanent lines has been responsible for some of the events regarding which many of them have complained in the present

hearing. The action of certain state legislatures and commissions was alleged to have been unjust and unreasonable. Commissions and legislatures are not intentionally unfair, and if any of them have enforced unjust rates would not the kind of statistics here contemplated have convinced them that some other schedule would have been fairer? Would not this class of statistics command confidence which specially prepared figures can not always do? Comparisons of expense and performance have long been made by carriers in contested cases before the commission. These have nearly always rested upon transient data. Those of the future should be based upon permanent analyses and compilations.

The fact that circular No. 3 provides for a separation for only a part of the accounts was referred to. A distinction is to be noted between those expenses which can be distributed between freight and passenger service only from an analysis of pay roll and vouchers, and those which must be distributed on various statistical bases. For the greater part circular No. 3 deals with the former class of expenses. If these expenses were analyzed, it would be possible to complete the distribution for other accounts with the statistical bases which are in our possession. However, the information which is called for by circular No. 3 would be useful in ascertaining particular cost units among railways for different years and for the same railway from year to year. Nevertheless we believe that we should proceed to work out a complete formula for all expenses and require a separation of all expenses on prescribed bases.

The expense of making cost analyses was one of the chief arguments against the adoption of such a requirement. If followed out continuously in the closest detail, it may be that the expense would be prohibitive. That is not suggested here, and a division between freight and passenger service alone will not involve additional expense which can not be justified. The carriers were asked to submit estimates as to the expense of complying with circular No. 3. A request was made for a second estimate, based upon a modification of the circular along the lines suggested by the carriers. Copies of these replies were sent to the chairman of the Association of Railway Accounting Officers. In his opinion, compliance with the circular would mean an expense of $8.78 per mile of road, or a total of $2,057,478 for carriers having operating revenues in excess of $100,000 per annum. This estimate is probably substantially correct if it is intended, as it appears to be, to cover a literal compliance with the circular as interpreted by him; but that is not what is here proposed.

The wide variation in the estimates is noteworthy. No satisfactory explanation has been advanced as to why it should cost the Lackawanna $78.29 per mile, the Lehigh Valley $18, the Southern $14.25, and the Southern Pacific only $3.17. If expense alone were to be the determining factor it would be necessary to have a new estimate after circular No. 3 has been revised in the light of the suggestions received.

Another argument in opposition was that after a simple and relatively inexpensive division between freight and passenger service had been instituted, more comprehensive and expensive requirements would be made in the future. Future requirements must rest upon their own merits and the future alone can decide whether additional requirements will justify the added expense. The carriers also contend that a division would have to be made between state and interstate traffic, because the commission has no jurisdiction over interstate traffic. This argument overlooks the fact that it is not claimed that circular No. 3 would be sufficient in all cases. If it should become neessary for the commission or a court to know the total expenses for interstate passenger traffic the work involved would be simplified very much if the division between freight and passenger service as a whole could be accepted at the start. Moreover, the commission has considered cost in many freight cases and has never found it necessary to separate the state from the interstate cost. Cost does not change because a state line is crossed. The length of the haul and the volume of the traffic are among the determining factors in arriving at cost.

In our opinion ample reason exists for requiring railway companies to extend their analysis of operating expenses with respect to freight and passenger traffic beyond that which has hitherto been required in the annual reports. Circular No. 3 will be revised in the light of suggestions received, and a workable plan developed which will not be unduly burdensome to the carriers and which will yield statistical results of a fundamental character of value alike to carriers and the commission. Additional conferences will be held with the view of eliminating and minimizing as far as possible all objectionable features. It does not seem practicable to do this, effective July 1, 1914. If sufficient progress can be made in the perfection of the circular, carriers will be asked to file a special report for the year ending June 30, 1915, showing the separation between freight and passenger expenses. As early as practicable all carriers in class I will be required to separate operating expenses for each account as follows:

1. Expenses directly assigned to freight service.
2. Expenses directly assigned to passenger and allied services.
3. Expenses apportioned to freight service on prescribed bases.
4. Expenses apportioned to passenger and allied services on prescribed bases.

No operating expenses are to be left unapportioned. (30 I. C. C., 676.)

NEW HIGH RECORD TRAIN LOAD

By R. S. Mounce

The Erie's monster Triplex type locomotive, recently put in service for use as a pusher on Susquehanna Hill was given a hauling capacity test on the Susquehanna division July 23, in which all previous records for train loads, hauled by one locomotive, were broken and a new record established which bids fair to stand uncqualled for some time to come.

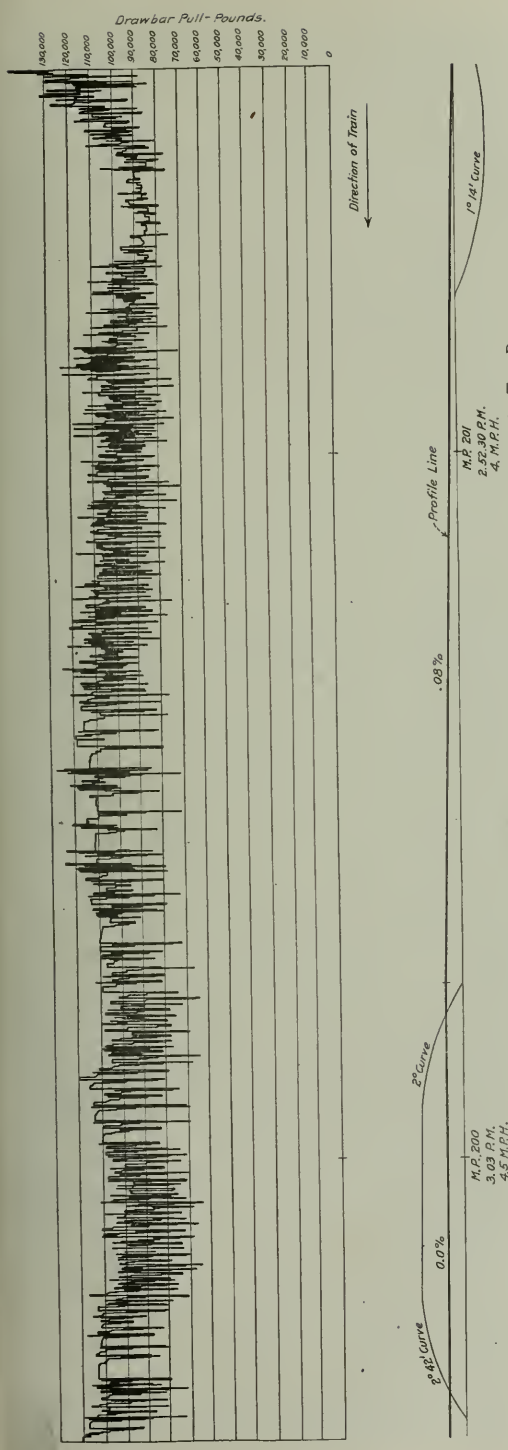
The test was made from Binghamton, N. Y., to Susquehanna, Pa., a distance of about 23 miles. The train consisted of 250 fifty-ton steel gondolas, each loaded to capacity, and a dynamometer car, and weighed 17,912 tons, exclusive of the locomotive. Its total length was 8,547 ft., or 1.6 miles. The grade between the two stations is gradually ascending, the worst condition being a combination of .09 per cent. grade and 5 deg. curvature.

Pushers were used to assist in getting the train under way. They pushed the slack forward until the Triplex lead locomotive had all the cars moving, after which they were uncoupled and followed the train in case they should be needed again. This operation eliminated the danger of pulling out drawheads in starting, which otherwise would undoubtedly have occurred with a train of such length. Portable telephones were used to communicate from the head end to the rear of the train, and this made it possible for the pushers to do their work in unison with the lead engine in starting the train.

A portion of the dynamometer record, which shows the drawbar pull at its maximum, is reproduced on the opposite page. A summary of this record breaking haul is given below:

Number of cars in train	251
Total weight of train (excluding locomotive)	17,912 tons
Total length of train	1.6 miles
Maximum speed attained	14 miles per hr.
Maximum drawbar pull	130,000 lb.
Minimum drawbar pull	67,000 lb.

Railway Construction in Southwest Africa.—It is reported that following long preliminary negotiations with the government, a syndicate has been formed to undertake the construction of railways in German Southwest Africa. The syndicate is said to include among others the Hamburg-American Line, the North German Lloyd Steamship Company, the Woermann Line and a number of banks. The construction company which the syndicate will form will have at the outset about $12,000,000 capital, which will be used at once for construction purposes. The first line, it is planned, will extend from the coast through the territory of the Mossamedes Company to the province of Angola.



A Representative Section of the Dynamometer Record of the Erie Triplex Locomotive on its Test Run

WILL GOVERNMENT REGULATION SUCCEED?*

By Samuel O. Dunn

Whether government regulation of railways and other public service corporations will succeed is a question of foremost importance to the American people. If regulation is a failure the public will be presented with two alternatives. It may let these concerns be managed without regulation and control; or it may acquire and operate them itself.

Many have no doubt as to which of these alternatives would be preferable. They would unhesitatingly choose public ownership. Many would even prefer public ownership rather than private ownership subject to public regulation. I have given some years of study to government ownership; and I have become with respect to the politico-economic opinion now apparently dominant, a heretic. I do not accept the view that if we had to choose between unregulated private management and government ownership we ought to choose public ownership. Under the political conditions that exist in this country, if I had to choose between unregulated private management and government management I would choose unregulated private management. Five years ago I would have said the opposite. That was before I had really studied the subject. Unregulated private management has serious faults. It has developed numerous abuses in this and other countries. But government management is also unregulated management, for the government cannot regulate itself. And unregulated government management has greater faults than unregulated private management. Under unregulated, or practically unregulated, private management of railways we had rebating, stock watering and numerous other abuses. But along with those abuses we had the most enterprising and progressive railway management that ever existed. The unregulated private management developed railways faster, built them cheaper, paid higher wages, charged lower rates, and did more to promote commercial and industrial development than has been done by any other railway management, regulated or unregulated, private or public. It was the first railway management in the world to adopt the air brake. It was the first to adopt the automatic block signal. It was the first to adopt steel freight and passenger cars. It was the first to develop those systematic methods for increasing the average load hauled per car and per train which have done more to reduce the cost of railway transportation, and thereby to keep down the rates that must be charged for it, than all the other methods that have been developed since the railway was invented. As President Hadley of Yale has said, "With all the talent that has been put into the public administration of industry, it is a salient fact that the important inventions have been made in countries enjoying private enterprise. . . . In most cases it took government experts from twenty to twenty-five years to discover them after they had been in use on private (railway) lines." It is this initiative and enterprise which constitute the great merit of private management; and it is the lack of them which constitutes the great defect of public management. And this one demerit of public management is more than an offset to all the shortcomings and offenses of unregulated private management.

Private management means progress, although incidental to that progress there may be abuses. Nowhere has public management meant progress in the true sense. Public management is like the Japanese nation. It is often skillful at imitating improved methods or machinery that others have introduced, but it never creates them. And this is a shortcoming of public management which is ineradicable.

I know that the advocates of public ownership make remarkable claims regarding the results it has secured in other countries, and that it would secure here. But you will search the world in vain for evidence in support of these claims. They tell us that government management would be more economical

*An address before the Indianapolis Transportation Club, May 11, 1914.

than private management; but the evidence shows that under comparable conditions private management is almost invariably more economical than public management. They tell us that public management would provide more adequate facilities than private management; but the evidence shows that under comparable conditions private management usually has provided more adequate facilities than public management. They tell us that our railways would be safer under public management; but when you study the evidence you find that in almost every country where there are both state and private railways the private railways are as safe as, or safer than, the state railways. They tell us that under government ownership railway rates in this country would be lower, in spite of the fact that the evidence shows that, all conditions considered, the rates here are the lowest in the world. They tell us that under government ownership the public would derive a profit from the railways, in spite of the fact that a great majority of state railways do not earn their operating expenses and interest, and, therefore, have a deficit which must be paid from public taxation.

But while to some of us it may seem clear that private ownership, even without regulation, would be preferable to government ownership, the fact must be recognized that it is very doubtful if the public could be convinced of this. The public believes that the only alternatives are either successful public regulation or public ownership. And if regulation fails public ownership very probably will soon follow. Therefore, all who believe in the advantages of private ownership and management should be anxious to see a policy of regulation worked out and adopted which will succeed.

The first essentials of such a policy are that its purpose and scope be clearly defined, and that it be kept to that purpose and within that scope.

The proper purpose of government regulation is the promotion and protection of those interests of the public that are affected by the concerns regulated. And how may this be best accomplished? The fact that a policy of regulation is adopted implies a conviction that the government cannot best promote and protect the interests of the public by undertaking the management of railways and other similar concerns itself. It may be assumed that if the public believed that government management would be preferable it would adopt that policy. By adopting public regulation the public shows that it wants the duties and responsibilities of management left with the owners and officers of these concerns, and intends that the regulating authorities shall interfere with and control their acts and policies only when they require control for the protection of the public. The function of those who regulate is not an executive function. It is a corrective one. It is not ordinarily their place to tell the managements what they must do any more than it is ordinarily the place of a police department to tell citizens what they must do. It is ordinarily their function to tell the managements what things they must not do, and keep them from doing those things, as it is the duty of a police department to tell citizens what they must not do and keep them from doing those things. Because policemen are required to prevent burglaries and apprehend those who commit them is no reason why the police departments should be authorized to control and direct every action of every citizen in every detail of his life. Likewise, because it is necessary to have laws and commissions to control those public service concerns and their officers who may be disposed to act dishonestly or unfairly, it does not follow that all public service concerns and all their officers should be presumed to be malefactors and extortionists and should have their every business act subjected to scrutiny and direction by public authorities.

The purpose of public regulation is, or ought to be, to conserve all the benefits of private enterprise and management while curbing the excesses and abuses to which they give rise when unregulated. To attempt to control and direct in detail the acts and policies of public service concerns while leaving them in private hands would be to sacrifice all of the advantages of private ownership and management, and secure none of the advantages of public ownership and management.

The purpose of public regulation should be, then, not managerial or executive, but corrective. Over what parts of the business of a public service concern should this corrective authority extend? It should extend, it would seem, wherever experience shows that abuses will develop which work a detriment to the public. Experience has shown that railways may discriminate unfairly in their rates. Therefore, the regulating body should have authority to correct unfair railway discriminations. Experience has shown that railways and public utilities may charge exorbitant rates. Therefore, the regulating body should have authority to reduce rates that are unreasonable. Experience has shown that private managements, in the absence of competition, or where there is combination, may give poor service. Therefore, the regulating body should have power to correct defects of service. Experience has shown that such concerns may so keep their accounts as to deceive investors. Therefore, the regulating body should have authority to make them keep proper accounts and make proper reports. There is no necessary conflict between the principle that regulation should be given a wide scope, and the principle that it should not seek to arrogate to itself the functions of management. The regulating body which has a proper conception of its functions, and a reasonable capacity for self-restraint, will have no difficulty in correcting unfair discriminations in rates and shortcomings in service without trying to supersede the traffic manager in initiating rates and the general manager in directing operations.

Experience has shown that if regulation is to be at once tolerably intelligent and tolerably effective it must be taken out of the hands of both legislatures and courts and intrusted to administrative commissions. We have developed regulation by commission to a greater extent than the people of any other country, and some foreign observers whose opinions merit respect have expressed optimism regarding our experiment in this direction. "There can be little doubt," says Sidney Brooks, one of the leading publicists of England, "that it is in the utilization of such commissions to stand between the local authorities on the one hand and the corporations on the other that the United States is destined to lead the world and make the most valuable of all contributions to the problem of combining private initiative and enterprise with protection of public rights." Another Englishman who is a very keen student of public affairs and economic matters in this country is W. M. Acworth; and recently when Mr. Acworth appeared before the British Royal Commission on Railways he described the authority and work of the Interstate Commerce Commission, and advocated the creation of a body with somewhat similar powers in England.

As we have adopted a policy of regulation which in outward seeming approximates the policy which it would appear is adapted to our needs, it might be thought that there could be no reason for serious doubt as to its success. And yet there is much ground for very serious doubt as to whether it will succeed. Why is this? Whose fault is it? What needs to be done to insure the success of regulation?

That the permanent success of regulation is so doubtful is due to the attitude and conduct of the corporations and their representatives, on the one hand, and the attitude and conduct of the public and its representatives, on the other hand.

When the policy of public regulation first began to be adopted most officers of public service corporations resented and resisted it as a meddlesome interference with their work and an encroachment on the property rights of investors. As time passed this general opposition to regulation merely as such declined, and it has finally disappeared. But there are managements of public service corporations here and there which, although some of them are honest and efficient, still regard public regulation in the same old way, and seize every opportunity to flout and defy the regulating authorities and the public

which they represent. A short time ago a newspaper despatch described how a vice-president of a large railway system—which, by the way, is notably well managed—had literally booted out of his office a representative of the Interstate Commerce Commission. Now, nothing could be sillier from the standpoint of the railways themselves than such conduct on the part of a railway officer. Its necessary tendency is to incense the regulating authorities and the public against the railways, and, thereby, to promote drastic and harmful regulation. Again, some railway managements continue to do things which are unwise and dishonorable, if not downright dishonest, and the disclosure of which tends to blacken the reputations of all railway managers and managements. For example, right in the midst of the splendid fight which railway officers have been making for less drastic regulation of their rates and earnings were disclosed the facts regarding the financial legerdemain which contributed so largely to throw the St. Louis & San Francisco into bankruptcy and to compel the New York, New Haven & Hartford to suspend its dividend. These disclosures have done more harm to the cause of fair and salutary regulation for railways than the malevolent and exaggerated attacks of many muckrakers and many demagogues. It is regrettable, but it is true, that one imbecile or dishonest railway manager can do more to turn government regulation in the wrong direction than ten capable and honest railway managers can do to turn it in the right direction.

While the success of regulation is menaced by the tactless, unwise, or unscrupulous conduct of a minority of corporation managers, it is menaced even more by the spirit which animates a large part of the public and which to an even greater degree animates most of the public authorities that are directly concerned with regulation. The public began to adopt laws and create tribunals for regulation in a prejudiced, revengeful spirit. This is not surprising, in view of some of the abuses which had prevailed and which it was the purpose of regulation to correct. It is not very surprising that this prejudiced, revengeful spirit has continued to be shown in view of some of the disclosures regarding corporation management which have continued to be made up to the present time. Nevertheless, that spirit has come to be, as respects the managements of most railways at least, entirely unjustified, and it is now, because of the effects which it is producing, very much the greatest obstacle to the success of public regulation.

One of its effects is the continuance of the adoption of legislation to regulate features of corporation management which either ought not to be regulated at all or ought to be left to be dealt with by the public service commissions. For example, there are the full crew laws which the labor lobby has succeeded in getting ignorant or vote-seeking lawmakers to burden the railways with. You have one of them in Indiana. As means of promoting safety they are worse than worthless. They increase expenses, and they tend rather to increase than reduce the danger of accidents. Why are such laws passed? Sometimes it seems that the public must think that any legislation which will injure the railways is bound to benefit the public. You may say that the public is not responsible for such legislation and does not want it. But in every democratic community or country the people get the kind of legislation and government they really want and deserve. It is mere cant to say they do not. If a democratic government is corrupt, it reflects a corrupt people; if it is vicious, it reflects a vicious people; if it is foolish it reflects a foolish people.

Another menace to the success of regulation is the subjection of railways and other large concerns, such as telephone and telegraph companies, to the requirements of all of the states and of the federal government, besides. This might be tolerable if the various regulating authorities would show a disposition to unify and harmonize their regulations and to be reasonable and just. But, unfortunately, the requirements made by them are extremely diverse and often conflicting. And as to most of the states, it is impossible to say whether their laws, or the men they put on commissions to enforce them, are the more ignorant and unjust.

A spectacle which has been presented at the recent hearings before the Interstate Commerce Commission in the matter of advances in freight rates in eastern territory illustrates the kind of regulation and the kind of regulating officials we have in many states. The state commissions, like the Interstate Commission, are charged with enforcing the regulatory statutes. They are, besides, charged with the regulation of rates. It is tacitly assumed that in passing on the reasonableness of rates they will act as impartial arbiters between the concerns that charge them and those who pay them. Nevertheless, some time ago representatives of the commissions of eight states, all of them west of the Mississippi river, met at Kansas City, adopted resolutions declaring that no advances in rates were justified and designated the chairman of one of these commissions to appear for them before the Interstate Commerce Commission and oppose any advances. These wise and impartial commissioners, without having heard a single word of testimony or argument on either side, settled the entire question to their own satisfaction, and then proceeded to constitute themselves parties to the case. Their representative went to Washington and appeared there, as the record shows, not only for the state commissions which paid his expenses with the money of the taxpayers of their states, but also for two large shippers' organizations, the American National Live Stock Association and the Grain Dealers' Association.

Now, what must we think of the spirit that animates the railroad commissions of those eight states? What must railway men think of their chances of getting a square deal from them? What must investors think of the chance of fair treatment that capital invested in railways has in those states? Manifestly, those state commissions are packed against the railways. Their members have no sense of fairness and only a rudimentary sense of decency. A railway stands as much show of getting a square deal from them as a heretic stood of getting a square deal from the Spanish inquisition under Torquemada, or as a negro accused of rape does from a southern mob. Railway regulation is in the same condition in those states as the administration of the criminal law was in Kansas and Colorado in past years when every distinguished citizen of Dodge City or Cripple Creek had his own private burying ground; and it is not without its significance that in the one western state where railway regulation has been the most drastic the chairman of the commission is an ex-cowpuncher who was once tried for murder, and one of the leading candidates for governor is a former member of the Dalton gang of bandits. This state, I might add, is one of the eight whose commissions sent Mr. Thorne to Washington. Do you say that the action of these eight commissions did not reflect the public opinion of their states? It can hardly be without significance that in every one of them the members of the commissions are elected by the vote of the people.

Perhaps the most serious menace of all to the success of government regulation is the acceptance by many regulating authorities and a large part of the public of the principle that public service corporations should be limited to what is called a "fair return" upon the fair value of their properties. To this principle it is now being attempted to add the principle that there should not be included in valuation any allowances for increment in value or for value created by the investment of earnings. It is commonly assumed that the Supreme Court of the United States has held that all that a public service corporation is entitled to is a "fair return." The court never has laid down any such principle. What it has held is that a concern rendering a public service may not be restricted to less than a "fair return." Furthermore, it has held that such concerns are entitled to benefit by the increase in the value of their properties. But the public assumes, and perhaps correctly, that the court meant that the public may restrict a public service corporation to barely what might be construed to be a fair re-

turn, and a large part of the public has assumed, further, that this minimum which the courts have fixed may properly be taken by the regulating authorities as a maximum.

Now, there are two questions to be considered here. One is, how small a return a public service corporation may be restricted to without confiscation of its property? That is a legal question. The other is, what return ought a public service corporation to be allowed to earn in justice to investors and for the best interests of the public? That is a question of equity and public expediency. Now, it is the question of expediency, not the question of law, with which the public is most vitally concerned, and it is very unfortunate that it has got the two questions confused in its mind. It seems not improbable that it would be better both for the owners of railways and public utilities and for the public if the constitutional rule that public service corporations cannot be denied a fair return had never been established. Then the question of public policy could be presented to the public without being mixed up and confused with a question of constitutional law. This is the situation in our neighbor Canada, as it is in France; and in both of these countries the profits well managed railways are allowed to earn, and which they are actually guaranteed by the public, are substantially larger in proportion than the public and regulating authorities in this country are disposed to allow to be earned. In our attempts to apply the legal formula of a fair return to the solution of a problem that is purely one of public policy and public expediency we are hindering, and threatening to arrest, the improvement and the increase of our transportation facilities.

Now, these are some of the obstacles to the success of government regulation. Will they be overcome? Will the attitude and conduct of public service corporations and their representatives, on the one side, and of the public and its representatives, on the other side, change enough to enable us to improve our system of regulation until it shall accomplish what such a system ought to accomplish, without hindering and hampering the managements of the concerns regulated in doing the things which it is their proper function and their right to do? There is no great reason for pessimism on that score. The attitude and conduct of the owners and managers of public service corporations have improved remarkably within recent years. The number of them who now oppose fair and reasonable regulation is relatively small. On the other hand, there has been, especially within the past year, a remarkable change in public opinion with reference to public service corporations, and especially railways. The talk of business men in their offices and at their clubs, and of people generally on street cars and in trains, as well as the comment of the press, shows that the public is convinced that the policy of railway regulation has been growing too drastic, restrictive and burdensome to be either fair to the concerns regulated or beneficial to the interests of the public.

But while there is ground for optimism it would be easy to be too optimistic. Regulation in most of the states is still an utter failure, because it is ignorant, unpractical, demagogic, and even grossly and viciously unjust. It is much better in the nation, but far from entirely satisfactory. We are not out of the woods. It will take years of educational work and effort to remove the numerous formidable obstacles to the success of regulation. The railway financier who holds up his fellow stockholders and the public, the big shipper who practices piracy on both the railway and the little shipper, the railway official who does not know how to get on with the public, the railway official who grafts, the demagogue who furthers his political ambitions by hurling unjust incentives and cooked-up statistics at the railways, the railway commissioner who discloses his own character and prostitutes his office by constantly appearing as the *persecuting* attorney instead of acting as a just judge, and the numerous people of socialistic temperament and ideas who cannot conceive of any good coming out of a large corporation—these we shall always have with us to oppose all efforts and to defeat many efforts to put and keep regulation on a fair and sound basis. Perhaps we shall overcome them. Perhaps we shall not. If I were a candidate for office or ever intended to become one, I should tell you that all that is necessary to get this great question settled right, is to refer it to the good sense and discriminating judgment of the American people. As I am not a candidate for office and never expect to be, I feel very strongly that it will be necessary to strive strenuously for many years in order to educate the public mind and the public conscience up to the place where they will be disposed and able to solve the problem fairly and intelligently.

THE RAILWAYS OF RUSSIA

M. Edmond Théry, director of the *European Economist*, recently published an elaborate analysis of the Russian Railway system. According to M. Théry, Russia is the most poorly equipped with railway facilities of any of the leading nations of Europe. In fact it has only about one mile of line for each 100 square miles of territory, a condition that acts as a severe handicap on Russian development, and it is vital to such development that the railway mileage should be increased. Such an increase is needed for its agricultural and mineral development, as well as for a rapid military mobilization. The following is a condensed abstract of M. Théry's article:

The first railway to be built in Russia was that running from St. Petersburg to Tzarskoie Selo, a distance of about 16.5 miles, and was intended exclusively for passenger traffic. In 1842, when there were more than 3,600 miles of railway in Europe the Emperor Nicholas ordered the construction of the St. Petersburg-Moscow line, about 400 miles long. This was at the expense of the crown. Work was begun in 1843, but the road was not opened for traffic until November 1, 1851. In 1868 the line was conceded to the Grand Railway Company of Russia, but was reacquired by the state in 1868 with the balance of the company's system. There has followed a series of changing policies in the matter of railway construction. Up to the time of the Crimean war, all lines were built and operated by the state; but from 1857 to 1881, very few lines were built by it, recourse being had to private companies, the interest on whose securities was guaranteed. Then from 1881 to 1891 no more concessions were granted to private companies, but nearly all the new lines were not only built by the state, but it bought about 4,275 miles of road belonging to the companies. Since 1891, though the state built some lines, its energies were almost entirely absorbed in its Asiatic work, so that it reverted to an encouragement of the activities of the companies. The result has been a multiplication of companies and comparatively little railroad building by the state.

After the two great arteries of communication from St. Petersburg to Moscow, and from Varsovia to Vienna had been opened, the first to be built was that from St. Petersburg to Varsovia in 1851. It was started by the state, but the work was interrupted by the Crimean war, and was finished by a French company, the Grand Russian Railway Company, which also built the Nijni-Novgorod line, about 1,050 miles, in 1857. This was the first large concession granted to a private company. Then, for a number of years, the government granted numerous concessions, besides giving financial assistance so that between 1867 and 1879 about 10,800 miles were opened, or an average of 900 miles a year, as compared with an average of 192 miles for the corresponding period from 1855 to 1867. In 1881 the construction of the Krivoi—Roy (Catherine Railway) 310 miles, was undertaken by the state and this inaugurated a period of railway construction and operation by the state. Between 1881 and 1891, the state authorized the construction of a few lines by companies already in existence, but no new companies were incorporated. On the other hand, the state bought 15 lines from the companies, with a mileage of about 4,275. It was during this period that a unification of the tariffs was undertaken. From 1891 to 1901 the state continued its policy of purchase. It took

over about 10,100 miles of road from the private companies, including the Grand Company in 1894 and the Southwestern Railway in 1895. The total of the lines acquired by the state between 1881 and 1901 included 35 companies and 14,400 miles of road. During this same period the state built a number of new lines, both in Europe and Asia, and the ukase of the Czar Alexander III authorizing the construction of the Trans-Siberian Railway bears the date of March 17, 1891. The dates of the opening of the great Asiatic lines are as follows: Oussouri Railway, 1897; Siberian Railway to Irkoutsk, 1899; Irkoutsk to the Manchurian frontier, 1901; Trans-Caspian of the Central of Asia, 1899; Tachkent Railway from Orenborng to Tachkent, 1906. The total length of these Asiatic lines with their branches was about 6,775 miles.

While the government was engaged in this new construction, it granted a number of concessions to private enterprises and even gave up a number of its own lines to the same, so as to form homogeneous systems from an operating standpoint. In this way the following companies were organized between 1891 and 1895, and they still exist.

1. Moscow-Kazan Railway, incorporated in 1863 with 168 miles, and owning 1,610 miles in 1891.

2. Moscow-Kiew-Veronege Railway, incorporated in 1866; owning 294 miles in 1891 and 1,625 miles at the present time.

3. Vladicaucasus Railway, incorporated in 1872 with 600 miles, and has, today, about 1,560 miles and more than 400 miles of recent concessions.

4. Riazan-Ouralsk Railway, incorporated in 1865 with 460 miles, now operating a system of 2,700 miles.

5. The Southeastern Railway, incorporated in 1893, and now operating 2,140 miles.

6. Moscow-Windau-Rybinsk Railway, which from 1869 to 1895 operated but 185 miles, now controls over 1,600 miles of line.

Up to very recent years these six companies, together with the Varsovia & Vienna Railway, which was bought by the state on January 1, 1912 (the only purchase since 1902), operated about 97 per cent. of all the Russian railways that were controlled by private companies. The state controlled 69.6 per cent. of all the railways of the country in 1900, a proportion that has been maintained up to the present. On January 1, 1913, the situation was as follows:

State railways in Europe	22,250	53.8
State railways of Asia	6,775	16.3
Total	29,025	70.1
Private lines	12,409	29.9
Total	41,434	100.00

In addition to this construction was begun in 1912 on 3,850 miles, of which 2,640 miles were for the state and 1,210 miles for private lines. Beyond this, 37 new projects, representing about 2,980 miles, were submitted in 1912, all of which were favorably reported by the commission of new railways. Finally the commission has laid out a program of construction, extending through five years, of at least 18,000 miles.

Besides these main lines, there are a number of purely local lines, the mileage of which has grown from 1,175 miles in 1902 to 1,400 miles in 1912.

The following figures give the cost per mile of line for both the state and the private lines:

	State		Private	
Year	Mileage	Cost per mile	Mileage	Cost per mile
1898	18,040	$54,075	9,237	$53,560
1899	20,117	50,830	10,455	50,367
1900	22,317	51,500	†	†
1901	23,601	52,170	10,800	48,000
1907	27,634	57,330	11,735	50,212
1908*	28,032	57,268	11,804	51,088

* Last official report available. † Report incomplete.

From these figures it appears that the cost of the state roads was more than of the private, but it must be taken into consideration that the proportion of double track was more on the state roads, being 28 per cent. of the whole, whereas on the private lines it was but 13 per cent.

The number of passengers carried rose from 15,500,000 in 1897 to 54,400,000 in 1911. The average number of passenger miles per year from 1897 to 1901 was 1,661,880,000, while from 1907 to 1911 it was 3,178,560,000. If these figures are taken on the basis of mileage operated, they would show an increase of 44 per cent. in density. In freight traffic the annual ton mileage rose from 5,402,964,600 in the period from 1897 to 1901, to 9,651,751,560 in the period from 1907 to 1911. Taken on the basis of mile of line operated the density of traffic rose from 415,800 to 558,360 ton-miles, an increase of 34 per cent.

The cost of operation was only 58 per cent. of the gross receipts in 1897, but it rose steadily up to 66 per cent. in 1901. During the Russo-Japanese war and the internal political trouble that followed, the falling off of traffic produced a marked increase in the ratio, which rose to 73 per cent. in 1907, and since that time, because of the rapid increase of traffic, has fallen to 56 per cent.

On the European lines operated by the state the passenger traffic increased 53 per cent. and the freight 25 per cent. from 1897 to 1911.

The disappointing part of the state operation is that while the gross receipts of the private companies increased 41 per cent., and their operating expenses only 40 per cent., the gross receipts of the state lines increased 22 per cent., and their operating expenses 35 per cent.

Railway operation, in Russia by the state, then, was much more expensive during the 1907-1911 period than it was by the private companies. In fact the ratio of expense to gross receipts on the European system of the state ran from 62 to 69 per cent., while with the private companies it remained stationary at 62 per cent. During the past four years the state management has succeeded in gradually lowering this percentage to 57.6, while the private companies have reduced theirs to 55 per cent.

The principal Asiatic lines were opened and put into operation in 1902. The period of partial operation from 1897 to 1901 was one of loss, so that it is only from 1907 to 1911 that the system can be considered as complete and homogeneous. But, the earlier years of this period were seriously affected by the liquidations of the Russo-Japanese war, so that it was not until 1910 and 1911 that there was any appreciable profit. In 1908 the operating ratio was 108 per cent., and this was reduced to 83 per cent. in 1911, due to an increase of receipts and decrease of expenses. Russia has great faith in the future of the Asiatic system, which is expected to develop the immense territory in which it is located and whose fertility is very great. In 1913 the Trans-Siberian lines had a mileage of 4,165 miles and the Trans-Caspian lines of 6,800 miles.

From the lines comprised in the above mileage, numerous branches have been planned and authorized, which will run into the southern part of Siberia and to the center of Turkestan. It is thought in St. Petersburg that, within the next seven or eight years, the Asiatic system will consist of from 10,000 to 10,500 miles, and that the receipts will quite suffice to pay all fixed charges on the capital invested.

Because of the interest guaranteed on private lines under different forms and at different times, as well as the payment of interest and amortization of capital on the state railways, the Russian treasury has been called upon to make contributions of very considerable amounts, so that starting in 1898 it was not until 1910 that the receipts exceeded the expenditures.

The report of the minister of finance to the Douma in 1913 shows for the years 1908, 1909, 1910 and 1911 the net annual receipts of the state railroads rose from $67,936,000 to $155,751,000. But the question at once arises as to whether these net receipts, large as they are, are sufficient to meet fixed charges. In this case the capital has been obtained from two sources:

1. The sale of bonds in the home or foreign markets.
2. The issuance of government bonds.

For the past 20 years these bonds have been cared for by the

annual budget, but they must be regarded in the same way as though the funds had been borrowed from the public. The interest and amortization of the capital so obtained form a state obligation and are part of the public debt. In the case of the government bonds, the comptroller of the Empire debits the state system each year with a theoretical 4½ per cent. on the total capital employed.

Thus at the end of 1911, the capital represented by the Russian State Railway System amounted to $2,612,595,000 divided into *A*, $1,379,178,000 and *B*, $1,233,417,000 of treasury obligations. To meet the interest and amortization of capittal *A*, an annuity of $56,444,000 was put upon the budget of 1908, or 4.09 per cent. of the capital in circulation. The theoretical annuity upon capital *B* calculated at 4½ per cent., requires, in round numbers $55,500,000

The difference between the net receipts of operation, $155,787,500, and the annuity, $56,444,000, or $99,343,500, represents the real net receipts of the state. But if the state had also been obliged to pay, as a private company would have been obliged, the 4½ per cent. for interest and amortization on the capital which the treasury had furnished gratuitously, amounting to $55,500,000, its profits would have been reduced to $43,843,500.

In 1913 passenger rates were raised, and these rates are the same on the state and the private railways. They are based on a differential sliding scale, and the present rates for first-class passengers are as follows: 2.9 cents per mile for the first zone of 100 versts (66 miles); 2.7 cents per mile for a zone of 200 versts (132 miles); and 2.5 cents per mile for a zone of 300 versts (198 miles).

On express trains an extra charge of about 10 per cent. is made, and if the passenger wishes to reserve a chair in a first or second-class compartment, a reservation ticket is obtained at a cost of from 40 to 75 cents. To occupy exclusively a two passenger compartment for the night, the first class passenger will be required to pay about $3 instead of 76 cents, to which must also be added one rouble (51.5 cents) for bed clothes and a pillow. Passengers have the right of free transportation for 36 lb. of baggage.

On both the state and the private railways, the monthly wages of locomotive engineers range from $67 to $82.50; those of firemen from $56.50 to $67, plus certain premiums paid for economy of fuel and oil and for good service. The pay of trainmen runs from 76 cents to $1.30 a day; that of track laborers is quite variable, running from 57 to 62 cents a day in the provinces to about 76 cents a day in the large cities. The railway employees are granted a pension on retirement proportioned to the number of years of service and the salary received during the last year. They also have the right to a day of rest each week.

In Russia there are no associations of engineers or other railway employees, as such associations are expressly prohibited by law. Hence, with the exception of the strike of 1905, which was really a political demonstration, there has never been a strike or an attempt at a strike on the Russian railways.

Russian locomotives burn wood, coal or oil, according to the region in which they operate. On the Baltic and Northern lines they burn wood. This is also the case on the great Nicholas line running from St. Petersburg to Moscow. Along the Douetz and upon the roads running from Moscow to Varsovia and the German frontier by way of Smolensk and Brest, and on the lines into Little Russia, Kiew and Odessa, they burn coal from the Douetz or Dornbrova. But on lines within easy transportation distance of the Volga, oil is used.

The economic development of Russia has been more rapid than the increase in its production of fuels, so that, for the past ten years, the prices of wood, coal and oil have steadily increased, thus handicapping industries and putting a burden on the inhabitants of cities, where the cost of heating has almost doubled. In consideration of the effect of this condition on manufacturing and the railways, the minister of commerce and industries has just submitted to the vote of the Douma a proposition to cancel the duty for one year on the importation of foreign coal, intended for public service of the railways. Now the duty, which is only 47 cents per gross ton at St. Petersburg and the Baltic ports, rises to $2.03 per ton in the Black Sea ports and the Sea of Azov, where foreign coals could readily compete with those of the Douetz.

During the past few years, railway operation in Russia has made great progress both on the state and private lines. It is still a subject of discussion as to whether it is better for the state to reserve to itself the sole right of railway construction and operation, or grant the rights to private capital under certain reserves of guaranteed interest and state control. Under certain circumstances the state monopoly idea has prevailed, under the pretext that it tends to a more impartial service of the national interests. Those who favor private companies contend that their management is less arbitrary and less expensive to the public in the end than that of the state. Finally they have come back to the state system since the question of national defense has become so important, because it is thought that the problems of strategic railway construction best adapted to the rapid mobilization of troops can most properly be solved by the state.

Count Witte, the former prime minister, with whom railway matters were of the first importance, said, in an address in 1910, that after many years of deficit, the Russian railways had at last returned an income to the treasury in the period from 1895 to 1900, but that this had been again followed by a period of deficits because of the considerable mileage of strategic railways that had been constructed. "In countries," he said, "where political or military purposes control the location of railways, and Russia stands in the front rank of such countries, it is quite the custom to build strategic lines, knowing full well that such roads will not be on a paying basis for a number of years. Between 1889 and 1904, 17,435 miles of railway were authorized and construction thereon begun. Out of this I put 4,030 miles as being incontestably strategic, or 23.1 per cent. and 14.5 per cent. as being purely political, such as the Astrakan Railway. It is quite evident that if these roads had not been built, and if they had not been operated, the general deficit of our railways would have been considerably diminished."

Count Witte's ideas were evidently shared by his successor, M. Stolypine, and they certainly are by M. Kokovtzoff, the actual head of the government, and by the Czar himself. In fact, since 1910, and especially since the accession of M. Kokovtzoff to power in 1911, a fresh impulse has been given to railway construction, for more than 4,600 miles have actually been started or authorized.

LOUD SPEAKING TELEPHONES ON THE LACKAWANNA

The Delaware, Lackawanna & Western, which has attracted no small amount of attention in the past few months because of its successful experiments with the wireless telegraph for communicating with moving trains, has also been carrying on some equally successful work with "loud speaking" telephones for train despatching. No one disputes that the telephone is far superior to the telegraph for transmitting and repeating train orders; but the telephone has its disadvantages. Wearing a telephone constantly on the head is not the pleasantest thing in the world, especially when there is an electrical storm at some point on the line. L. B. Foley, superintendent of telegraph of the Lackawanna, has experimented with several loud speaking devices, but the one now in use, made by the Stentor Electric Manufacturing Company, of New York City, formerly the Electrical Experiment Company, is the first that has proved a success. Loud speaking instruments have been installed on two train despatchers' lines, including all the Lackawanna lines in New Jersey. The two despatchers are stationed at Hoboken.

The device is quite simple. The transmitter is much like the

ordinary transmitter, but is much more efficient. The receiver in like manner is very sensitive and in addition is furnished with a horn similar to that used on a phonograph. It is placed on the despatcher's desk in the position shown in the illustration, or may be on the wall. There is nothing in the nature of an amplifying device. The telephones are simply intended to reproduce at the receiving end the normal conversational tone of voice at the same volume used by the speaker at the transmitting end. The transmitter requires from six to eight volts in the primary circuit and operates on a current of from 0.2 to 0.3 amperes. It is necessary that the loud speaking transmitters be used in all stations on the circuit on which a loud speaking receiver is installed, but no other change in the standard equipment is necessary. The cost of the instruments is small, there being no amplifying devices. A station, provided with both the loud speaking transmitter and the loud receiver, can be equipped at a cost of $50 exclusive of the batteries. In stations where the use of the loud speaking receiver is not necessary, the loud speaking transmitter alone can be put in for $25. The battery cost per station per year is about $1.80. The Lackawanna uses dry cells which have to be renewed twice a year.

With complete installations at all stations a circuit can be

Despatcher's Desk Showing Loud Speaking Telephone Receiver

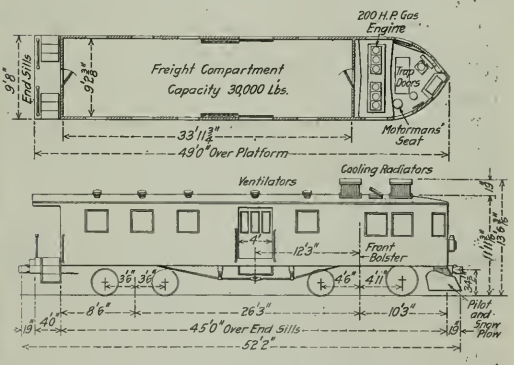
worked without the use of selectors for calling. Without the calling bell the despatcher, to call a station, merely speaks the station's name into his transmitter in an ordinary tone of voice. The name is heard in all the loud speaking receivers on the line and for a distance of at least 15 feet from any one of them. The operator who is called can respond at once. An operator can call the despatcher in like manner.

The operator at a station equipped with the loud receiver can keep track of all that is going on, the same as with the Morse telegraph. As is well known, one of the chief objections to the use of telephones on the train wire has been the isolation of each office from all others except when the operator could take time to put the receiver to his ear. With the Stentor apparatus the operators have less occasion to call on the despatcher for information as to the position of trains. The added opportunity for supervision on the part of the despatcher himself is also worth mentioning. The Lackawanna despatchers are glad to get rid of the head telephones. Disturbances on the line sometimes cause a continual buzzing which is most annoying to the person using the head receiver. In regions where electric storms are common there is the additional chance of receiving violent sounds in the receiver, and the shock sometimes is dangerous as well as inconvenient.

SELF-PROPELLED CONVERTIBLE FREIGHT AND PASSENGER CAR

The Minneapolis & Northern Gasoline Motor Railway has recently purchased a gasoline motor freight car from the McKeen Motor Car Company, which is being used for freight and express service between Minneapolis, Minn., and Anoka. It is a semi-convertible car which, during periods of heavy passenger traffic, can be used for transportation of passengers, removable seats and chairs being installed for that purpose. It is equipped with the McKeen Motor Car Company type "A" motor truck in which have been incorporated many of the important features of the latest model type "C" motor truck. The air brake system has a special Gregory motorman's valve for operation of straight air on the motor car and automatic air on the trailers.

The length of the car over end sills is 45 ft., while the total length is 52 ft. 2 in. The floor plan and side elevation illustrate the general design of the car. It will be noted that the front end is wedge shaped and that the car is entered from a platform at the rear end. The McKeen depressed center side entrance is not a feature of the car, because its use is chiefly for freight and



Convertible McKeen Car for the Minneapolis & Northern Gasolene Motor Railway

express service. The car structure consists of a metal underframe, and continuous 2-in. grooved steel combination side posts and carlines extending from side sill to side sill, with metal diagonal bracing. The outside and inside wall sheathing is of 13/16 in. fir. The floor is of 1⅝ in. fir. The principal dimensions are:

Length over end sills	45 ft. 0 in.
Length over platform	49 ft. 0 in.
Length over-all	52 ft. 8 in.
Width over side sills	9 ft. 8 in.
Width over sheathing	9 ft. 9⅝ in.
Width over-all	10 ft. 4⅜ in.
Width inside	9 ft. 2⅛ in.
Length of freight compartment	33 ft. 11¾ in.
Height, rail to roof	11 ft. 11 3/16 in.
Weight	56,000 lb.

SUBWAY EXTENSIONS IN BUENOS AIRES.—A Buenos Aires municipal decree has been issued authorizing the Anglo-Argentine Tramways Company to construct a tunnel section underneath Plaza Constitucion. The object is to enable the company to test its machinery and ascertain the most suitable procedure to be adopted in the excavation of the subway between Plaza Constitucion and Plazo Retiro. Due to the narrowness of some of the streets under which the route is projected, the subway will be constructed entirely by tunneling.

General News Department

A press despatch from Boston says that the vacation of Chairman Howard Elliott, chairman of the New York, New Haven & Hartford, is to be indefinitely extended, on account of impaired health.

A new ferry boat for the New York Central & Hudson River Railroad has been launched at the Harlan & Hollingsworth shipyard, Wilmington, Del. The boat is named *Weehawken*, and is for service in New York harbor. It is 210 ft. long and 66 ft. wide.

In an attempted train robbery on the Louisville & Nashville, three miles east of New Orleans on the night of July 24, the flagman of the train was shot and killed. The robbers, two of them, boarded the train at New Orleans. They got a small amount of money, and after the shooting, escaped.

Successful experiments with wireless telephone apparatus were made on the Pacific Limited Express of the San Pedro, Los Angeles & Salt Lake road July 17. Conversations were held between a car of the moving train and an office at the station at Los Angeles over distances from five to fifteen miles.

A press despatch from Fairbanks, Alaska, says that the government engineers are making rapid progress on the preliminary surveys for the railway between Fairbanks and the coast. The parties working on both sides of the Tanana river have completed their surveys between Fairbanks and Nonana, a distance of 55 miles.

Representative Park has introduced in Congress a bill to make copies of railroad tariffs admissible as primary evidence in courts. A copy offered as evidence must be accompanied by satisfactory proof that it was procured from the Interstate Commerce Commission, and persons sending to the commission for copies, must pay ten cents to cover postage.

The lines of the Pennsylvania Railroad system—East and West—in the six months ending July 1, 1914, carried 87,000,000 passengers, and not one of them was killed in a train accident. On the lines east of Pittsburgh no passenger has been killed in a train accident since 1912. During this period these lines alone have carried more than 161,000,000 passengers.

Two giant cacti, the largest ever moved from the desert, have been taken from Arizona by the Atchison, Topeka & Santa Fe to San Francisco, and have been placed at the entrance to the Hopi Indian village, which forms a part of the $350,000 reproduction of the Grand canyon of Arizona. One of the cacti stands 25 ft. high and weighs 4,500 lb. The removal cost $1,000 for each cactus.

The United States Board of Mediation and Conciliation, which went to Chicago last week in the effort to bring about a settlement of the controversy between the western roads and their engineers and firemen, has held daily conferences since Monday, July 20, with representatives of the Brotherhood of Locomotive Engineers and the Brotherhood of Locomotive Firemen and Enginemen and the Conference Committee of Managers. Up to the early part of this week no definite results had been accomplished.

Officers of the Catskill Mountain Railway, the Otis Railway and the Catskill & Tannersville Railway, three small companies, have applied to the New York State Workmen's Compensation Commission for release from the obligations of the new compensation law. Under the regulations they are called upon to pay $7,000 a year as premium for state insurance; and this sum, they say, will nearly or quite bankrupt them. The companies are not able to pay the interest on all of their bonded debt. The New York Central & Hudson River proposes to test this new law in the courts, on the ground that it does not apply; this for the reason that the company is subject to the Federal law relating to compensation for accidents.

About 300 members of the Western Society of Engineers were the guests of the Chicago & Western Indiana on July 25, on an excursion by special train to inspect the Chicago Clearing yard, now under construction, which is designed to handle the interchange business between the trunk line railroads entering Chicago. The yard will have facilities to move 8,000 to 10,000 cars a day. It is expected that it will be put in operation late this Autumn. On the way to Clearing stops were made for an inspection of the new lift bridge of the Pennsylvania Lines over the south branch of the Chicago river, which has a movable span of 272 ft. 10 in.; also of the separation of grades of the Chicago, Rock Island & Pacific and the Chicago & Western Indiana at Seventy-ninth street, where the roads cross each other at an angle of about 17 degrees. When the city required the elevation of the tracks above the street it was decided to separate the railroad grades as well, and the plan calls for five Rock Island tracks above and 10 Western Indiana tracks below, with Seventy-ninth street underneath both. The small angle of intersection, together with a street subway, requires a complicated structure.

Automatic Block Signals on the Pennsylvania

The Pennsylvania Railroad announces that on September 1 the main line between Pittsburgh and New York, and between Philadelphia and Washington will be equipped with automatic block signals throughout. With the completion on that day of recent elaborate improvements the Pennsylvania will have more four-track line operated under automatic signals than any railroad in the world. Within the past three years the company has equipped 253 miles of its main lines with automatic signals, at a cost of $6,000,000.

The signal system on the lines east of Pittsburgh and Erie, automatic, non-automatic and interlocking, represents an estimated investment of approximately $18,000,000. The electro-pneumatic interlocking switch and signal system in the New York station and on the electric line between Sunnyside yard, Long Island, and Manhattan Transfer, N. J., cost $1,750,000. Eighteen hundred men are employed to maintain the Pennsylvania's signal system, and it costs $1,500,000 yearly to keep these signals in order.

Opening of Cape Cod Canal

The Cape Cod Canal, connecting Buzzard's Bay with Cape Cod Bay and shortening by 70 miles the water route between New York and Boston, was opened to commerce July 29, but with only 15 ft. of water, about 10 ft. less depth than will be finally provided.

The dedication ceremonies took place at the village of Buzzard's Bay and were witnessed by thousands. Seth Low, president of the Chamber of Commerce of the state of New York, presided. The speakers included August Belmont, president of the canal company; Assistant Secretary of the Navy Roosevelt; Governor Walsh of Massachusetts, and Congressman Thomas C. Thacher, the representative from the Cape district.

Railway Revenues and Expenses for 1914

The Bureau of Railway News and Statistics, Chicago, has issued a bulletin giving the railway revenues and expenses of the railways in the United States for the fiscal year ending June 30, 1914, as computed from the monthly reports of the Interstate Commerce Commission, with the figures for June estimated from incomplete reports. The bulletin shows total operating revenues of $3,091,669,713, a decrease of $79,776,279, as compared with 1913, operating expenses as $2,236,182,518, an increase of $35,191,237, and net operating income as $712,133,126, a decrease of $130,276,210. The ratio of operating expenses to total operating revenues for the year was 72.33 per cent., as compared with 69.4 per cent. in 1913. This operating ratio is the highest in the history of American railways. The bulletin says that not

within a decade has the net income of the railways in the United States been as low per mile of line as for this year, and that when it is considered that a mile of railway in the United States represented a net investment of $64,000 in 1914, against only $52,000 in 1904, the true significance of the shrinkage in net income per mile of line becomes startlingly apparent. The difference of $12,000 per mile represents the additional investment of over $3,000,000,000, with no increase in revenue per mile to take care of it. While the total operating revenues were greater both absolutely and per mile of line, than in any year since 1907, except 1913, operating expenses were greater than for any previous year, although $9 less per mile of line than for 1913. The net operating income per mile of line was $2,812, as compared with $3,384 in 1913, and $3,342 in 1907. The ratio of net operating income to total operating revenues was 23.03 per cent. The operating ratio for the last half of the year is given as 75.7 per cent. Of the $79,000,000 lost in gross revenues, over $75,000,000 was in freight traffic, while the earnings in passenger traffic show an increase of about $59,000.

Bulletin of Revenues and Expenses of Large Steam Roads in May

The advance figures in Section I of this summary have been compiled by the Interstate Commerce Commission from the reports of operating revenues and expenses of roads having annual operating revenues above $1,000,000 for the month of May, 1914, filed in the division of statistics by July 10, 1914. The figures, which are subject to correction, embrace returns for 177 roads.

The figures in Section II are reproduced from the printed Bulletin of Revenues and Expenses of large roads for the same month of 1913.

SECTION I—COMPARATIVE FIGURES BASED ON REPORTS OF 177 LARGE ROADS

FOR THE MONTH OF MAY

The Campaign of 1915

The Kansas railroads and representatives of the Brotherhood of Railroad Trainmen have addressed letters to members of the legislature and candidates for the legislature, regarding proposed labor legislation to be introduced in the next session. The first letter was sent by R. U. Snider, representative of the Brotherhood of Railway Trainmen. He says that the measures introduced "for the benefit of railroad men" at the last session of legislature, which were defeated, will again be presented to the next session of the legislature, though partly modified, and that the one most desired is the full crew bill. He expresses the opinion that the full crew bill as presented at the last legislature was a little too drastic, and asks if the men can have support if the bill is modified to place an additional brakeman on freight trains consisting of more than 30 cars. The letter also contains the following: "The trainmen of the state come directly in contact with many of her citizens and are in a position, therefore, to do much good to the office seeker, and we take the liberty at this time to ascertain if our measures will receive the support due them at your hands at the next session of the legislature." A reply to this letter was sent to the legislators and candidates by C. W. Kouns, general manager of the Atchison, Topeka & Santa Fe, as chairman of the Kansas committee of the Committee on Relation of Railway Legislation to Operation. He says: "The 'full crew' is a term which tends to deceive those who are not familiar with railroad phraseology. It gives the impression that the railroads are operating with short crews, which is not so. The conductor, two brakemen, the engineer and firemen constitute a full crew on trains where five men are sufficient for the duties devolving upon them. On many trains three brakemen already are employed, when three are needed to do the work. These are local freight trains stopping at stations to load and unload shipments, and to place cars for loading and unloading. Most of these local trains, on which three brakemen are employed, haul less than 30 cars, while Mr. Snider's campaign is to induce the legislature to force the railroad to employ three brakemen on the through freight trains which have practically nothing for two brakemen to do from one terminal to another."

Mr. Kouns calls on the legislators to withhold assent to this unfair bill, imposing a useless financial burden on the Kansas railroads, until after a thorough investigation.

Summary of Revenues and Expenses of Steam Roads

The Bureau of Railway Economics' summary of revenues and expenses and comments thereon for May, 1914, are as follows: Railways operating 225,858 miles of line are covered by this summary, or about 90 per cent. of all steam railway mileage in the United States. Their operating revenues for the month of May, 1914, amounted to $232,567,938. This amount includes revenues from freight and passenger traffic, from carrying mail and express, and from miscellaneous sources connected with rail operation. Compared with May, 1913, total operating revenues show a decrease of $25,038,021. Total operating revenues per mile averaged $1,030 in May, 1914, and $1,150 in May, 1913, a decrease of $120, or 10.4 per cent. There was a decrease

of 13.4 per cent. in freight revenue per mile, and a decrease of 2.8 per cent. in passenger revenue per mile.

Operating expenses, which include all the costs of maintaining track and equipment, operating trains, securing traffic, and of administration, amounted to $176,029,940. This was $9,921,181 less than for May, 1913. These operating expenses per mile of line averaged $779 in May, 1914, and $830 in May, 1913, a decrease of $51 per mile, or 6.1 per cent.

Net operating revenue, that is, total operating revenues less operating expenses, amounted to $56,537,998, which was $15,116,840 less than for May, 1913. Net operating revenue per mile of line averaged $250 in May, 1914, and $320 in May, 1913, a decrease of $70 per mile, or 21.7 per cent.

Taxes for the month of May amounted to $11,905,010, or $53 per mile, an increase of 11.2 per cent. over May, 1913.

Operating income, which is net revenue from rail and auxiliary operations, less taxes, averaged $197 per mile of line, and in May, 1913, $273, thus decreasing $76, or 27.9 per cent. Operating income for each mile of line for each day in May averaged $6.35, and for May, 1913, $8.81. Operating income is that proportion of their operating receipts which remains available to the railways for rentals, interest on bonds, appropriations for betterments, improvements, new construction, and for dividends.

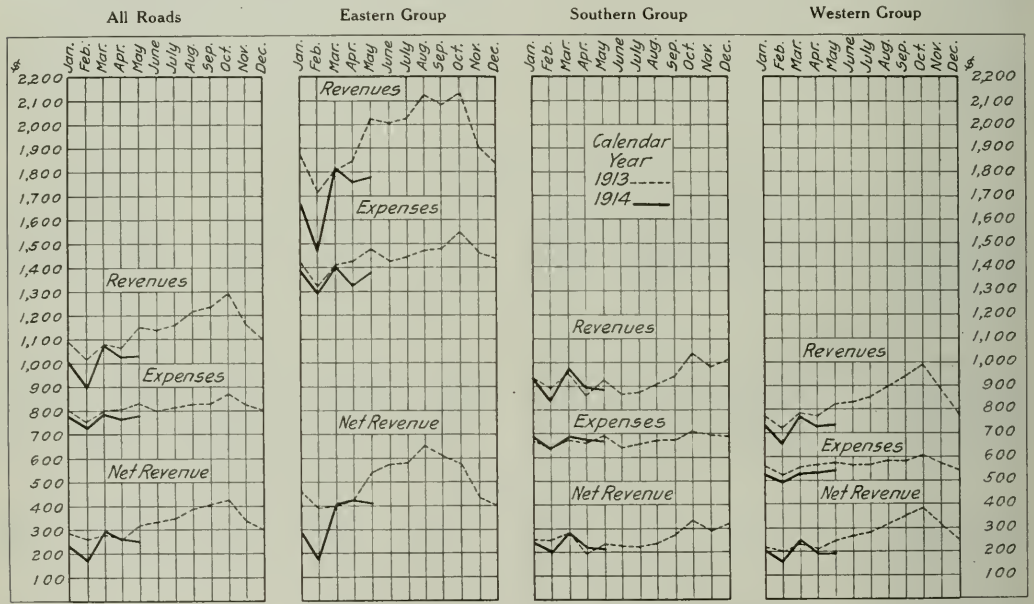
The operating ratio for May, that is, the per cent. of total operating revenues absorbed in operating expenses, was 75.7 per cent., which is comparable with 72.2 per cent. in May, 1913, and 71.4 per cent. in May, 1912.

The railways of the eastern district show a decrease in total operating revenues per mile of line as compared with May, 1913, of 12.3 per cent., the railways of the southern district a decrease of 4.4 per cent., and the railways of the western district a decrease of 10.2 per cent. Operating expenses per mile decreased 7.3 per cent. in the east, decreased 2.7 per cent. in the south, and decreased 5.6 per cent. in the west. Net operating revenue per mile decreased 26.1 per cent. in the east, decreased 9.2 per cent. in the south, and decreased 21.0 per cent. in the west. Taxes per mile show an increase of 6.3 per cent. in the east, an increase of 13.8 per cent. in the south, and an increase of 15.5 per cent. in the west. Operating income per mile decreased 32.1 per cent. in the east, decreased 12.9 per cent. in the south, and decreased 28.1 per cent. in the west.

Comparison of returns for eleven months of the current fiscal year with those of the corresponding months of the previous fiscal year reveals a decrease in total operating revenues per mile of 3.2 per cent., an increase in operating expenses per mile of 0.9 per cent., and a decrease in net operating revenue per mile of 12.4 per cent. This net operating revenue per mile decreased 19.5 per cent. in the east as compared with the corresponding period of the previous year, decreased 0.5 per cent. in the south, and decreased 9.7 per cent. in the west.

When the returns for the five months of the calendar year 1914 are compared with those of the corresponding months of 1913, they show a decrease in total operating revenues per mile of 6.7 per cent., a decrease in operating expenses per mile of 3.9 per cent., and a decrease in net operating revenue per mile of 14.5 per cent. This net operating revenue per mile decreased 23.6 per cent. in the east as compared with the corresponding period of the previous year, decreased 4.1 per cent. in the south, and decreased 9.7 per cent. in the west.

The diagram shows the variations in operating revenues, operating expenses, and net operating revenue per mile for the separate months of the calendar year 1913 and of the calendar year 1914 to date. The following table shows the per cent. of operating revenues consumed by each class of expenses:



Monthly Revenues and Expenses per Mile of Line in 1914

PER CENT. OF TOTAL OPERATING REVENUES.

	May.		Fiscal year ending June 30.		Eleven months ending May 31.	
	1914.	1913.	1913.	1912.	1914.	1913.
Freight revenue	68.4	70.7	69.8	68.7	69.1	70.0
Passenger revenue	23.1	21.3	22.2	23.2	22.8	22.0

Transportation expenses	36.5	35.1	35.2	35.9	36.4	35.2
General expenses	2.9	2.5	2.4	2.5	2.6	2.4
Total operating expenses (excluding outside operations and taxes)	75.7	72.2	69.3	69.1	72.1	69.2
Averages per mile per day:						
Operating revenues per mile per day	$33.22	$37.09	$37.76	$34.78	$36.41	$37.61
Operating expenses per mile per day	25.14	26.77	26.17	24.05	26.26	26.02
Net operating revenue per mile per day	8.08	10.32	11.59	10.73	10.15	11.59
Operating income per mile per day	6.35	8.81	10.08	9.28	8.48	10.11

Association of Railroad Superintendents

The twenty-seventh annual meeting of the American Association of Railroad Superintendents, which is to be held in New York City on August 20 and 21, will be held at the Hotel Woodward. The Long Island Railroad has extended the courtesy of a free trip for members of the association over a portion of its electrified territory, including Flushing, Jamaica, Flatbush Avenue station, Jamaica Bay trestle and Long Beach. Aside from this no definite plan of entertainment has been outlined. It is expected that the program will include addresses by a railroad president, a vice-president, and a superintendent of transportation, in addition to the reports of committees.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

AIR BRAKE ASSOCIATION.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—A. G. Thomason, Boston, Mass.

AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next convention, October, Washington.

AMERICAN ASSOCIATION OF GENERAL PASSENGER AND TICKET AGENTS.—W. C. Hope, 143 Liberty St., New York.

AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, I. C. R. R., East St. Louis, Ill.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next convention, August 20 and 21, New York.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 29 W. 39th St., New York. Annual convention, October 12-16, Atlantic City, N. J.

AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—H. G. McConnaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 20-22, 1914, Los Angeles, Cal.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, Karpen Bldg., Chicago.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—A. R. Davis, Central of Georgia, Macon, Ga.

AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. W. Hunt, 220 West 57th St., New York; 1st and 3d Wednesday, except June, July and August, New York.

AMERICAN SOCIETY OF ENGINEERING CONTRACTORS.—J. R. Wemlinger, 11 Broadway, New York; 2d Thursday of each month, at 2 P. M., 11 Broadway, New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, 1300 Pennsylvania Ave., Washington, D. C. Annual convention, April 28, 1915, Atlanta, Ga.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—C. W. Egan, B. & O., Baltimore, Md.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Annual convention, October 19-23, Chicago.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—P. W. Drew, 112 West Adams St., Chicago.

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York.

ASSOCIATION OF WATER LINE ACCOUNTING OFFICERS.—W. R. Evans, Chamber of Commerce, Buffalo, N. Y.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meeting with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk Ry., Montreal, Que.; 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que.; 1st Thursday, October, November, December, February, March and April, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawler Ave., Chicago; 2d Monday in month, except July and August, Lytton Bldg., Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York; 2d Friday in January, May, September and November and 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

CIVIL ENGINEERS' SOCIETY OF ST. PAUL.—Edw. J. Dugan, P. O. Box 654, St. Paul, Minn.; 2d Monday, except June, July, August and September, Old State Capitol Bldg., St. Paul.

ENGINEERS' SOCIETY OF PENNSYLVANIA.—Edw. R. Dasher, Box 75, Harrisburg, Pa.; 1st Friday after 10th of each month, except July and August, 31 So. Front St., Harrisburg, Pa.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, Oliver Bldg., Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

FREIGHT CLAIM ASSOCIATION.—Warren P. Taylor, Richmond, Va.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 605 Grand Central Station, Chicago; Wednesday preceding 3d Thursday, Transportation Bldg., Chicago.

INTERNATIONAL RAILWAY CONGRESS.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—C. G. Hall, 922 McCormick Bldg., Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 829 West Broadway, Winona, Minn.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, Lima, Ohio. Next convention, August 18-20, Hotel Wisconsin, Milwaukee, Wis.

MAINTENANCE OF WAY & MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. J. Goodwin, C. R. I. & P., Eldon, Mo. Next convention, November 17-19, 1914, Detroit, Mich.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, Karpen Bldg., Chicago.

MASTER CAR & LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 8-11, Nashville, Tenn.

NATIONAL RAILWAY APPLIANCES ASSOCIATION.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15 to 19, 1915, Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass.; 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, Union Station, Peoria, Ill.; 2d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

RAILROAD MASTER TINNERS, COPPERSMITHS & PIPEFITTERS' ASSOCIATION.—L. G. Thompson, C. & E. I., Danville, Ill.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

RAILWAY DEVELOPMENT ASSOCIATION.—W. Nicholson, Kansas City Southern, Kansas City, Mo.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Mobile & Ohio, Mobile, Ala. Annual meeting, October 6, Washington, D. C.

RAILWAY GARDENING ASSOCIATION.—J. S. Butterfield, Lee's Summit, Mo.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Bethlehem, Pa. Annual meeting, Bluff Point, N. Y., September 22-24.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. F. Murphy, Box C, Collinwood, Ohio.

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with M. C. B. and M. M. Associations.

RAILWAY TELEGRAPH & TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va.; 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Next convention, September 8-10, 1914, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and August, St. Louis.

SALT LAKE CITY TRANSPORTATION CLUB.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah; 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, La Salle St. Station, Chicago. Annual meeting, September 15-17, Hotel Aspinwall, Lenox, Mass.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. Ry., Atlanta, Ga.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga.; 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

TOLEDO TRANSPORTATION CLUB.—J. S. Marks, Agent, Interstate Despatch, Toledo, Ohio; 1st Saturday in month, Boody House, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillsburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York; last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Erie R. R., Pittsburgh, Pa.; meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7122 Stewart Ave., Chicago.

TRANSPORTATION CLUB OF BUFFALO.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich.; meetings monthly, Normandie Hotel, Detroit.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Next meeting, September 15-18, Hotel Sherman, Chicago.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, Newhouse Bldg., Salt Lake City, Utah; 3d Friday of each month, except July and August, Consolidated Music Hall, Salt Lake City.

WESTERN CANADA RAILWAY CLUB.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago; 3d Tuesday of each month, except June, July and August, Karpen Bldg., Chicago.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago; regular meeting 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

The definite announcement of a steamship passenger service from the Atlantic to the Pacific coast through the Panama Canal to be inaugurated with the opening of the Panama-Pacific International Exposition has been made by the traffic department of the exposition. The International Mercantile Company will operate the "Panama-Pacific Line." The trips will be made by the *Finland* and the *Kroonland*, two of the finest Atlantic ocean vessels and both in the Red Star fleet.

Clifford Thorne, chairman of the Iowa Railroad Commission, has already begun a campaign against the expected plan for an advance in freight rates on the western roads. He has addressed a letter to the shippers of the state to heed its suggestions. Much can be done to ease the situation when car shortage begins by following the suggestions of the Association of Western Railways."

Car Surpluses and Shortages

Arthur Hale, chairman of the committee on relations between railroads, of the American Railway Association, in presenting statistical bulletin No. 171-A, giving a summary of car surpluses and shortages by groups from July 15, 1913, to July 15, 1914 says: The total surplus on July 15, 1914, was 228,384 cars; on July 1, 1914, 220,875 cars, and on July 15, 1913, 76,280 cars.

The total surplus increased about 7,500 cars in the past two weeks, and stands at 228,384, the largest for the same period in any year since 1909.

Surplus coal cars increased generally, and the total box car surplus shows an increase in all sections, except in the winter

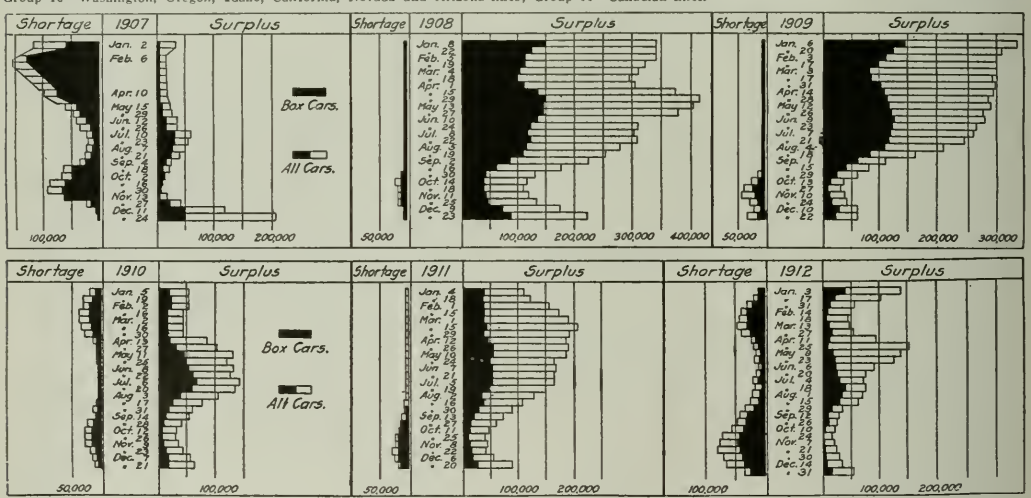
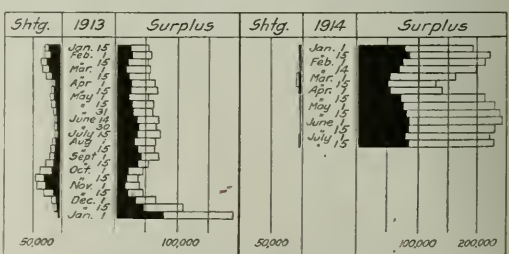
*Group 1 is composed of New England lines; Group 2—New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania lines; Group 3—Ohio, Indiana, Michigan and Western Pennsylvania lines; Group 4—West Virginia, Virginia, North and South Carolina lines; Group 5—Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida lines; Group 6—Iowa, Illinois, Wisconsin and Minnesota lines; Group 7—Montana, Wyoming, Nebraska, North Dakota and South Dakota lines; Group 8—Kansas, Colorado, Missouri, Arkansas and Oklahoma lines; Group 9—Texas, Louisiana and New Mexico lines; Group 10—Washington, Oregon, Idaho, California, Nevada and Arizona lines; Group 11—Canadian lines.



dressed to the western state commissions a long letter enclosing a copy of a "strictly private and confidential" letter sent out by J. M. Johnson as chairman of a meeting of western railroad officers held in Chicago in May to consider the matter of asking for an increase in rates. The letter outlined a tentative plan which had been considered at that meeting. Mr. Thorne calls on the western commissioners to "give the matter some consideration." He estimates from the tentative plan that the western railroads "have agreed to attempt to secure an advance in freight revenues aggregating $100,000,000."

Chairman John H. Roemer, of the Wisconsin Railroad Commission, has issued a public statement to shippers, advising that all coal, lumber and cement shipments be made immediately, before the time to move crops, in order to avoid the possibility of a car shortage. Mr. Roemer cites the circular sent out last



Car Surpluses and Shortages, 1907 to 1914

wheat states and on the Pacific coast, where there is a slight reduction; there is still, however, a considerable surplus there.

The total shortage on July 15, 1914, was 1,843 cars; on July 1, 1914, 1,335 cars, and on July 15, 1913, 6,875 cars.

The shortage of 1,843 cars is spread out over the whole country and is trifling in any group.

The accompanying table gives car surplus and shortage figures by groups for the last period covered in the report and the diagram shows total bi-weekly surpluses and shortages from 1907 to 1914.

Car Balance and Performance

Arthur Hale, chairman of the committee on relations between railroads, of the American Railway Association, in presenting statistical bulletin No. 472, covering car balances and performances for March, 1914, says:

The committee presents herewith statistical bulletin No. 172, covering car balance and performance for March of this year.

The miles per car per day were 23.8 compared with 21.8 for February. This figure for March, 1913, was 23.7.

Ton miles per car per day for March were 369, compared with 333 for February. This is a decrease of 1.34 per cent., compared with the figure for March, 1913, which was 374.

The proportion of home cars on line was 62 per cent., compared with 63 per cent. in February. This is an increase of 9 points over March, 1913.

The per cent. of loaded car mileage increased from 67.5 per cent. in February to 67.6 per cent. in March. This figure for March, 1913, was 70.0 per cent.

The average earnings per car per day increased 22 cents to $2.42 in March. This figure for March, 1913, was $2.47.

The table on the next page gives car balance and performance in the month covered by the report, and the diagram shows car earnings and car mileage and different car performance figures monthly from July, 1907.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission is to make a general country-wide investigation into the practice of railroads in refusing to accept freight at certain points for lack of cars or other reasons.

Examiner Esch held a hearing at Chicago last week in an investigation by the commission in the matter of stopping in transit for partial loading and unloading of livestock. The Western Trunk Line roads in May filed tariffs increasing the charge for stopping a train for partial loading or unloading from $2 to $5, which were suspended by the commission. The roads now want to abandon the stops.

Examiner Brown held a hearing in Chicago on July 21, on the complaint of the E. C. Best Company, of Milwaukee, charging unreasonable and discriminatory rates on potatoes in heated cars for shipment to Minnesota, North and South Dakota, Wisconsin, Illinois and Missouri points. A new tariff was filed in April, making increases of 4 to 7 cents per hundred pounds to these points, which the complainant alleges to be discriminatory to Minnesota potato shippers. The shippers also object to an alternative clause in the new tariff, which provides a rate for a car heated by the carrier and another rate for cars to be heated by the shipper.

A hearing was held at Chicago last week before Examiner Brown, on a petition filed by the Atchison, Topeka & Santa Fe, Chicago, Burlington & Quincy, Missouri, Kansas & Texas, Missouri Pacific, St. Louis & San Francisco, Kansas City Southern, St. Joseph & Grand Island and the Union Pacific, asking for the cancellation of a tariff filed by the Kansas City Stockyards Company, imposing a trackage charge of 75 cents a car on every carload of cattle sent into the yards of the Stockyards company, for unloading, or loading, at a stockyards chute. The Stockyards company does not operate engines, the cars being brought onto its tracks by the locomotives of the trunk line carriers. The railroads allege that these tracks are mere plant facilities.

Complaint has been filed with the Interstate Commerce Commission by Charles R. McCormick & Co., against the San Pedro, Los Angeles & Salt Lake and other roads, in a case similar to the Shreveport rate case recently decided by the Supreme Court. The complaint involves rates made by the Arizona Railroad Commission, which result in rates on lumber and forest products from Flagstaff, Williams and Cliff, Ariz., to other Arizona points, lower than from San Pedro and Los Angeles, Cal. The complainant asks for a reduction enabling it to meet the competition created by the state rates. The complainant cites a paragraph from an order of the Arizona commission as follows: "In establishing rates on lumber and timber which we deem reasonable as compared with the San Pedro rates, we announce that if the carriers further disturb this relationship by a reduction in the San Pedro rates, it is to be reasonably expected that this commission will make a similar readjustment of the rates in northern Arizona."

A hearing on the application of the western railways for a general readjustment of freight rates from the Missouri river to Utah points was begun at Salt Lake City on July 21, before Commissioner H. C. Hall. The rates were filed by the railways some time ago and were suspended by the Interstate Commerce Commission on the protest of the Salt Lake City Commercial Club Traffic Bureau until July 20, and since that time they have been again suspended until January 20, 1915. The first day's session was taken up by the testimony of W. A. Poteet, chairman of the Trans-Missouri Freight Bureau, who presented a large amount of documentary evidence as to the proposed changes in rates and the plan on which they had been compiled. Mr. Poteet said that the equalization of rates west of the Missouri river was destroyed by the decisions of the Interstate Commerce Commission in the Salt Lake, Spokane and Colorado rate cases, and that the proposed advances were intended to bring about a readjustment to restore the equality from eastern

shipping points. The new tariffs, he said, established a more equitable relationship than that now in effect, and include 187 items on which rates are increased, 158 on which the rates are reduced, and 62 on which no changes are made. The advances, he said, were to correct discrimination against Colorado points. The Traffic Bureau of Utah (the new name of the Commercial Club Traffic Bureau) which is the principal complainant in the case, asked for a postponement until October 1, which was agreed to by the railroads, but Commissioner Hall said it was necessary for the case to be heard at the time set if it was to be heard before a commissioner, on account of the itinerary which had been arranged.

Rates on Apples from Virginia to Eastern Cities

John Nix & Company et al. v. Southern Railway et al. Opinion by the commission:

The commission finds that the rates on apples from points in Virginia to New York, Philadelphia, Baltimore and Washington are not unreasonable nor discriminatory. (31 I. C. C., 145.)

Rates on Cast Iron Pipe from Birmingham

Southern States Supply Company v. Southern Railway, et al. Opinion by the commission:

The commission finds that the rate of 22 cents per 100 lb. on cast iron pipe in carloads from Birmingham, Ala., to Columbia, S. C., is neither unreasonable nor prejudicial. (31 I. C. C., 30.)

Complaint Dismissed

Edward Wolverton v. Union Pacific. Opinion by the commission:

Complaint is made that double the first-class rate charged for the transportation of an automobile, crated, from Wamsutter, Wyo., to Boulder, Colo., was unreasonable to the extent that it exceeded the first-class rate. The evidence shows that the automobile was not crated in accordance with the classification requirement, and that double the first-class rate was the published rate for such a shipment. (31 I. C. C., 23.)

Lumber to Nashville, Tenn.

Opinion by Commissioner Hall:

The commission finds that certain proposed increases in the rates on lumber from points in Kentucky and Tennessee on the Memphis division of the Louisville & Nashville to Nashville, Tenn., are not justifiable. The carrier seeks to remove certain inconsistencies and inequalities in the rates, but it is the commission's opinion that the inconsistencies and inequalities which the proposed schedule would create are greater than any it seeks to do away with. (31 I. C. C., 186.)

Kaufman, Tex., Discriminated Against

Kaufman Commercial Club v. Texas & New Orleans et al. Opinion by Commissioner Daniels:

The commission finds that defendants' rates on grain and grain products from points in Kansas and Oklahoma to Kaufman, Tex., are prejudicial as compared with the rates to Terrell, Tex., about 10 miles to the north of Kaufman and in a different rate group. It is, therefore, ordered that the rates on the commodities involved to Kaufman should not be in excess of those to Terrell. (31 I. C. C., 167.)

Refusal to Deliver Cars Except Upon Certain Conditions as to Routing

R. E. Downie Pole Company v. Northern Pacific et al. Opinion by the commission:

The defendant refused to furnish its own cars for a shipment of cedar poles from complainants' spur at Inglewood near Redmond, Wash., unless complainant would agree to route the shipment over the Northern Pacific via its lines to Portland, thereby giving the road a longer haul. Complainant was therefore compelled to ship via Portland, thereby losing the benefits of the lower rate through Seattle. The Northern Pacific did not restrict the application of its local rates on poles from Redmond to Seattle to intrastate traffic. It filed the tariffs naming those rates with this commission, and in the absence of joint through rates between it and the Oregon-Washington Railroad & Navigation Company via Seattle was required to use them in constructing through rates on traffic through that gateway. That requirement carried with it the duty on the part of the Northern Pacific to furnish cars and to make suitable arrangements with the Oregon-Washington for the transportation beyond Seattle. The commission, therefore, awards damages for the excess in the rates via Portland over those via Seattle. (31 I. C. C., 142.)

Tennessee Central Joint Passenger Fares

Blanton W. Burford et al v. Louisville & Nashville et al Opinion by the commission:

The refusal of the Louisville & Nashville and the Nashville, Chattanooga & St. Louis, to enter into arrangements with the Tennessee Central for through routes and joint interstate passenger fares from points on their lines to Bloomington, Horn Springs and Hamilton Springs, Tenn., points on the Tennessee Central at which complainants' resorts are located, while participating in through routes and joint fares to resorts on the lines of the Southern Railway, the Illinois Central and other carriers is held by the commission to be discriminatory. (31 I. C. C., 182.)

Class Rates from Pueblo to Durango, Col.

Pueblo Commerce Club v. Denver & Rio Grande. Opinion by the commission:

Complaint is directed against the second, third, fourth and fifth class rates from Pueblo to Durango, Col., principally on the ground that they are the same as the corresponding class rates from Denver to Durango. The commission, however, finds that the rates are not discriminatory. Although Pueblo does not appear to be given the full benefit of its location with respect to the rates to Durango, it has a compensating advantage in that it is given the same rates as Denver to points in Wyoming and Nebraska to which the distance from Pueblo via the short line is 119 miles greater than from Denver. (31 I. C. C., 133.)

Grain Elevation Allowances at St. Louis

Opinion by Commissioner McChord:

The commission finds justified the withdrawal by the carriers of an elevation allowance of one-fourth cent per bushel at St. Louis and East St. Louis on grain when destined to Evansville, Ind., it appearing that the proportional out of which the allowance is made is a compelled rate. It is also held that a comparison of rates from St. Louis and East St. Louis to Evansville with that from Peoria to the same destination does not necessarily signify undue discrimination if the withdrawal of the respondents' concurrence in the rate from the latter point would not affect the movement, rates, or practices respecting elevation. The test of discrimination is the ability of one of the carriers participating in the two through routes to put an end to the discrimination by its own act. (31 I. C. C., 696.)

Rates on Boots and Shoes from Boston to Atlanta

In re the investigation and suspension of advances in rates by carriers for the transportation of boots and shoes from Boston, Mass., and other points to Atlanta, Ga. Opinion by Commissioner Clements:

The commission finds that the respondents have failed to justify certain proposed increases in the rates on boots and shoes from Boston, New York and other eastern port cities to Atlanta, Ga., via water and rail routes and it is, therefore, ordered that they maintain for the future rates not in excess of those at present in effect, which were prescribed by the commission in the case of *Kiser & Company v. Central of Georgia* (17 I. C. C., 430) decided November 27, 1909, and the two year period having expired. (31 I. C. C., 154.)

Rental Charges for Insulated Cars

Opinion by Commissioner Harlan:

The rule under consideration in this case relates to the movement of potatoes from points of origin in Minnesota and neighboring states and reads as follows: "When shipper orders a refrigerator or other insulated car to be heated by him or to move without heat, a charge of $5 per trip will be made for use of car and will accrue to the owner thereof." The commission finds this rule to be reasonable. It will probably work to increase the available supply of cars, particularly since the private car lines have announced their willingness to supply cars on this

basis. It is also the fact that in the beginning potatoes moved in box cars during the fall months and that rates were fixed on that basis, but that now they were more largely in refrigerator cars during the winter months. (31 I. C. C., 255.)

Milling-in-Transit Charges

F. W. Stock & Sons v. Lake Shore & Michigan Southern. Opinion by the commission:

Complainant having mills at Hillsdale and Litchfield, Mich., on defendant's line draws its grain from points in Michigan, Indiana, Illinois and western trunk line territory, and ships grain products principally to points in the east. The tariffs provide for milling in transit on the basis of the through rate applying on the grain or grain product, whichever is higher, from point of origin to destination, plus a charge of one-half cent per 100 lb. If there is an out-of-route or back haul and provided the grain moves into the milling point and the product out over the same road, the charge is made on the basis of a distance scale varying from 1½ cents for 25 miles or less to 5½ cents for 250 and over 175 miles plus the local, reshipping or proportional rate from the milling point to final destination. The commission finds that this arrangement is neither unreasonable nor discriminatory. (31 I. C. C., 150.)

Apple Rates from Espanola, N. Mex.

M. W. Thompson v. Atchison, Topeka & Santa Fe, et al. Opinion by the commission:

In the original report in this case, the commission held that the rates on carload shipments of apples from Espanola, N. Mex. (a local station on a branch narrow-gage line of the Denver & Rio Grande), to certain points in Arizona were unreasonable to the extent that they exceeded a rate of 80 cents per 100 lb., minimum weight, 30,000 lb. In view of the facts developed on rehearing, however, the commission is of the opinion that the 80-cent joint rate was possibly too low. The present rate from Santa Fe to the points of destination is $1, and that rate, covering a large number of points of origin, is not here in issue. A lower rate from Espanola would not be proper if the $1 rate is to be maintained from Santa Fe and other points. Without deciding whether the present rate of $1 from Colorado common points and Santa Fe is reasonable, it finds that a joint rate should be established from Espanola on the same basis. (31 I. C. C., 138.)

Fruit Rates from California to Florida

Pacific Fruit Exchange v. Southern Pacific et al. Opinion by Commissioner Meyer:

At present deciduous fruits in carloads move from California points to Montgomery, Ala., at a combination rate of $1.60 per 100 lb., made up of the western lines blanket or territorial rate of $1.15 to Memphis and an unpublished proportional of 45 cents from Memphis beyond. The rate to Tampa, Fla., is $1.92 made up of $1.62 to Jacksonville and 30 cents beyond. Request is made that the blanket rate of $1.15 be applied to Montgomery and that of $1.92 be applied to Tampa. The southern lines are opposed to the idea. The western lines have favored it, on the other hand, but have been unwilling to decrease their own revenues in order to permit the necessary reductions. The commission does not believe that the application of blanket rates would be justified, but that remedy should be sought in negotiations which are now going on between the southern and western carriers concerning reductions in the rates involved, and it is prepared to take up the matter again if reductions are not made. It is also found that the southeastern roads' proportionals of the through rates are not unreasonable. A fourth section application requesting permission to continue lower rates to Montgomery than to intermediate points such as Baltimore, to which it is intermediate via certain routes is granted, it appearing that the larger part of the traffic moves over a circuitous route. (31 I. C. C., 159.)

The Minnesota Rate Case as Affecting Passenger Fares

Hans Trier v. Chicago, St. Paul, Minneapolis & Omaha. Opinion by Commissioner Daniels:

This case was originally reported in 30 I. C. C., 352, a brief abstract of the report being given in the *Railway Age Gazette* of May 29, 1914, page 1210. Rehearing is now asked on the ground that the commission did not give due heed to this question: Does the fact that the rate charged for one leg of an interstate journey exceeds the maximum allowed by the statute of the state in which that leg lies cast the burden of proof on defendant to establish the reasonableness of the through rates? The commission decides this question in the negative and dismisses the petition for a rehearing. It holds that for the purpose of determining the reasonableness of an interstate rate, a rate established by the state is no more to be presumed reasonable than one voluntarily by the carrier.

On principle it would seem that the reasonableness *per se* of an interstate rate should be independently determined. It is inclined to doubt the propriety and legality of permitting the assumption that a passenger who buys a through ticket for an interstate journey pays a charge which consists of a combination of a number of state charges, or of an interstate charge plus an intrastate charge. It would seem that an interstate journey should be viewed in its entirety, and that a complainant should not be permitted, except so far as the fourth section is applicable, to divide the interstate rate into as many parts as the number of states through which the interstate journey runs, merely for the purpose of ascertaining whether each separate intrastate leg of an interstate journey carries a rate which conforms to the rate prescribed for intrastate trips by the state in which that leg lies. (31 I. C. C., 707.)

STATE COMMISSIONS

The Missouri Railroad & Warehouse Commission has issued a decision ordering the cancellation of tariffs filed in October, 1913, by the Atchison, Topeka & Santa Fe, Missouri, Kansas & Texas, St. Louis & San Francisco, Kansas City Southern, and Chicago, Burlington & Quincy, naming team track charges for the detention of cars after free time upon the team tracks at Kansas City, Mo. The tariffs were suspended by the commission some time ago pending an investigation.

The Missouri Public Service Commission held a hearing at Jefferson City on July 21, on a proposed order requiring the publication of additional joint rates and through routes. The hearing was postponed until September 24, by which time it is expected the roads will be able to present a satisfactory plan. The commission advised the roads that any rates filed under this plan would not militate against their proposal to ask for a general advance in freight or passenger rates in the state.

The Pennsylvania Public Service Commission, acting on the application of certain railroad companies, has concluded that the law of the state does not prevent a common carrier from according free or reduced rate transportation to a contractor, his men, materials, tools, equipment and supplies, etc., necessary to be transported by such contractor in the performance of work being done for the carrier by the contractor. The contractor, under such circumstances, is, to all practical intents and purposes, an employee of the carrier engaged in work for the carrier, and the transportation is, in substance and effect, transportation rendered by the carrier to itself.

PERSONNEL OF COMMISSIONS

Thomas L. Wolf has resigned as rate clerk for the Illinois Public Utilities Commission to engage in other business.

John F. Meaney has been appointed a member of the Massachusetts Public Service Commission in place of George W. Bishop, whose term has expired. Mr. Bishop has been a railroad commissioner for many years. He has now been appointed chief of one of the bureaus of the commission.

COURT NEWS

All evidence to be presented by both sides in the suit of the state of Illinois against the Illinois Central to collect $2,500,000 in back taxes has been presented before the special master, L. D. Puterbaugh, who has set August 24 for the beginning of arguments.

Railway Officers

Executive, Financial, Legal and Accounting

J. R. Frink has been elected secretary and treasurer of the Macon, Dublin & Savannah, with headquarters at Macon, Ga., vice A. S. Hale, resigned, effective July 16.

H. E. Cartwright has been appointed auditor of disbursements of Wells Fargo & Company, with headquarters at Chicago, succeeding J. G. Innes, resigned to accept service in the operating department.

Operating

John F. Tracy, assistant trainmaster of the St. Paul division of the Northern Pacific, has been appointed trainmaster at Minneapolis, Minn.

E. A. Sollitt, assistant division superintendent of the Wabash at Montpelier, Ohio, has been appointed acting superintendent of the Peru division, with office at Peru, Ind., in place of J. C. Sullivan, granted leave of absence on account of ill health.

Traffic

Jonathan Story has been appointed traveling passenger agent of the Wabash, with headquarters at Boston, Mass., reporting to J. D. McBeath, New England passenger agent.

W. B. Groseclose, formerly assistant freight traffic manager of the Missouri, Kansas & Texas, has been appointed traffic manager of the Detroit, Toledo & Ironton, with headquarters at Detroit, Mich. The office of general freight and passenger agent, heretofore filled by H. C. Bell, is abolished. Mr. Groseclose was born October 27, 1858, at Salisbury, N. C. He entered railway service in 1876 and from that time until 1888 was consecutively clerk, operator and agent of the Indianapolis & St. Louis and the Atchison, Topeka & Santa Fe, and cashier, agent and route agent of the Adams and Wells Fargo expresses. On December 10, 1888, he was appointed agent of the St. Louis, Arkansas & Texas, of Texas, retaining that position until April, 1890, when he became general agent. From July, 1890, until July, 1893, he was general freight agent of the same road which is now the St. Louis Southwestern, of Texas. In July, 1893, he became the general manager of the Tyler Car & Lumber Company, Tyler, Tex., but in June, 1894 was appointed commissioner of the Galveston Freight Bureau. From January 15, 1895, to November 15, 1898, he was assistant general freight agent of the Missouri, Kansas & Texas, of Texas, at Houston, Tex. On November 15, 1898, he was appointed to a similar position on the Missouri, Kansas & Texas, at St. Louis, and on January 15, 1901, succeeded to the position of general freight agent. From June 1, 1910, to January 1, 1914, he held the position of assistant freight traffic manager, with headquarters at Chicago, as above noted.

W. B. Groseclose

R. E. Larmour has been appointed assistant general freight agent of the Canadian Pacific, with office at Vancouver, B. C., and has been succeeded as division freight agent at Vancouver by H. A. Plow. Gerald Hiam has been appointed division freight agent at Fort William, Ont., succeeding C. S. Morse, transferred, and K. Elliott has been appointed city freight agent at Calgary, Alta., all four of the above appointments being effective July 1. Effective July 25, O. H. Becker has been appointed district freight agent at Portland, Ore., succeeding E. L. Cardle, resigned, and has been succeeded as district freight agent at Tacoma, Wash., by Nelson Fleming.

J. W. Gray, assistant general claim agent of the Beaumont, Sour Lake & Western, has been appointed general claim agent of the Houston Belt & Terminal, vice W. J. Laffey, resigned, and has been succeeded by C. E. Belk.

C. C. Cameron, coal traffic manager of the Illinois Central, has been appointed general freight agent of the northern and western lines, and has been succeeded by Burton J. Rowe, assistant general freight agent of the northern and western lines. These officers will have headquarters at Chicago.

J. H. Peebles, superintendent of the Nashville, Chattanooga & St. Louis, has been appointed assistant general passenger agent of this road and the Western & Atlantic with headquarters at Chattanooga, Tenn. W. I. Lightfoot, assistant general passenger agent at Nashville, Tenn., has assumed immediate charge of the solicitation of all passenger traffic.

Engineering and Rolling Stock

Thomas Turnbull has been appointed assistant chief engineer of the Canadian Northern, effective July 21.

Purchasing

George E. Scott, whose appointment as purchasing agent of the Missouri, Kansas & Texas, with headquarters at St. Louis, Mo., has already been announced in these columns, was born May 27, 1885, at Cleveland, Ohio. He received a grammar school education, and began railway work with the Lake Shore & Michigan Southern in July, 1901, as telegraph messenger at Toledo, Ohio. Subsequently he was clerk to the assistant superintendent and superintendent, and from December, 1905, to January, 1907, was secretary to the general superintendent and assistant general manager of that road at Cleveland. He was then until July, 1911, secretary to the vice-president of the New York Central Lines at Chicago, being made assistant chief clerk to the vice-president on the latter date. In May, 1912, Mr. Scott went to the Missouri, Kansas & Texas, as secretary to the president, and one year later was made assistant purchasing agent. On January 1 of this year he became acting purchasing agent, and on July 1 was appointed purchasing agent, as above noted.

Photo by Matzene, Chicago.

OBITUARY

Daniel J. Malone, superintendent of shops, of the Oregon Short Line, at Pocatello, Idaho, was shot and killed, July 24, by Frank Madden, foreman of the tin shop. The murderer, with the same revolver, at once killed himself. The men were both old employees and had long been friends, but Madden, it is believed, had became mentally unbalanced because of criticisms received on account of unsatisfactory work. Mr. Malone was born at Western Point, Md., in 1860, and he was on the Union Pacific for a number of years before going to the Oregon Short Line in 1890. Madden was 60 years old. Malone had four brothers, two of whom met death in murders very much like this one; Edward in West Virginia in 1896, and Michael, division foreman on the Southern Pacific, in Nevada, in 1906.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Western Maryland is said to be in the market for 16 Mallet type locomotives.

The Inter Mountain has ordered four locomotives from the Lima Locomotive Corporation.

The Cincinnati, Hamilton & Dayton is in the market for 30 Mikado and 5 Pacific type locomotives.

The Mobile & Ohio has ordered one superheater Consolidation freight locomotive from the American Locomotive Company. This locomotive will have 24 by 30 in. cylinders, 63 in. driving wheels, a total weight in working order of 220,000 lb., and a steam pressure of 190 lb.

CAR BUILDING

The Southern Pacific has ordered 50 passenger cars from the Pullman Company.

The Wabash has ordered 7 postal cars from the American Car & Foundry Company.

The Baltimore & Ohio is inquiring for 1,000 box cars for the Cincinnati, Hamilton & Dayton.

The Erie has ordered 200 gondola cars from the Standard Steel Car Company and will soon place orders for an additional 600.

The Chicago, Indianapolis & Louisville has ordered 254, 36 ft. 40-ton box cars from the Haskell & Barker Car Company.

The Minneapolis & St Louis has ordered two postal cars from the Pullman Company, and is in the market for 500 gondola and about 750 box cars.

The Delaware, Lackawanna & Western has ordered 96 suburban passenger coaches and 14 suburban combination baggage and smoking cars from the Pullman Company.

The New York Central & Hudson River has placed orders for 1,000 box cars for its own use, the number being divided equally between the Haskell & Barker Car Company and the Barney & Smith Car Company

The Canadian Northern has ordered 5 steel underframe postal cars from the Preston Car & Coach Company, 15 steel underframe baggage and 5 steel underframe first class cars from the National Steel Car Company, 8 all-steel suburban cars from the Pressed Steel Car Company, 7 wood colonist cars from the Crossen Car Company and 11 steel underframe standard sleeping, 2 steel underframe compartment sleeping, 7 steel underframe compartment observation sleeping, 7 steel underframe dining and 7 steel underframe tourist cars from the Canadian Car & Foundry Company.

IRON AND STEEL

The Missouri Pacific has ordered 110 tons of steel for single track deck girder spans from the American Bridge Company.

W. S. Barbee and Railway Traction & Supply Company has ordered 250 complete bumping posts, amounting to 127 tons of steel, from the American Bridge Company.

The Paducah & Illinois has ordered 587 tons of miscellaneous material for its bridge at Metropolis, Ill. The Chicago Bridge & Iron Company received an order for 180 tons of this allotment, the remainder of the order being placed elsewhere.

The Trans-Amazon Railway of Ecuador.—It is reported that the preliminary studies for the Trans-Amazon Railway of Ecuador are advancing rapidly and that about one-half of the work is already completed.

Supply Trade News

The Railway & Traction Supply Company has moved its office from room 1307 to larger quarters in room 504, Rector building, Chicago.

W. H. Cadwallader, assistant to the general manager of the Union Switch & Signal Company, has been appointed general manager.

The American Flexible Bolt Company, Pittsburgh, Pa., has opened offices at 50 Church street, New York, with R. W. Benson in charge as general sales manager.

The Ogle Construction Company, Chicago, has recently received contracts from the Illinois Central for the erection of a 500-ton coaling station at Jackson, Miss.; one of 200 tons at Rolling Fork, Miss., and one of 300 tons at Amboy, Ill.

It is announced that Charles R. Crane will retire shortly as president of the Crane Company, Chicago, to be succeeded by R. T. Crane, Jr., now first vice-president, and that R. T. Crane, 3rd, will be advanced from second vice-president to first vice-president.

The Roberts & Schaefer Company, Chicago, has received a contract from the Canadian Northern for the designing and building of five Holmen type locomotive coaling plants for installation at Trenton, Capreal, Hector, Foley and Fitzbach, Ont. The approximate contract price was $70,000.

The American Car Roof Company, Chicago, manufacturer of the Christy steel freight car roof, has changed its method of business and now gives the right to build the Christy roof on cars to the car builders themselves on a royalty basis. This arrangement makes it possible to equip a car with this particular roof, in the same shop that the car itself is being built.

Sidney G. Johnson, until recently vice-president in charge of sales and engineering of the Union Switch & Signal Company, has been appointed assistant to the president of the General Railway Signal Company, Rochester, N. Y., and will have his headquarters at the New York office of the company at 55 Liberty street. A portrait of Mr. Johnson and a sketch of his career appeared in the *Railway Age Gazette* of March 27, 1914, page 765, at the time of his appointment as vice-president of the Union Switch & Signal Company.

E. A. Fleming, chief clerk to the president, Rock Island Lines, Chicago, and the designer and patentee of the form of trip pass that has been used by that company during the past year, is now placing the pass on the market in order that other carriers may, if desired, secure the privilege of using the form. The pass, which is termed the Fleming "automatic" trip pass, has been given a test of 12 months, during which time 250,000 passes were issued. The Interstate Commerce Commission after a special examination of the pass returns covering a period of six months gave its approval and consent to the further use of the form. A circular has been issued giving a very complete description of the form and its special features. This pass form and the method of using it were described in the *Railway Age Gazette* of August 15, 1913, page 275.

Judge Hazel in the U. S. District Court at Buffalo has upheld the directors and majority stockholders of the United States Light & Heating Company, Niagara Falls, N. Y., in the receivership of that corporation by ordering the answer of Henry A. Ackerman stricken out and vacating the appointment of receivers in the action which was brought by the Picher Lead Company. Simultaneously, he appointed James O. Moore, of Buffalo, and James A. Roberts, of New York, receivers in a new action brought by the Central Trust Company of New York, which holds $200,000 of the company's notes. The Central Trust Company is not antagonistic to the existing control of the United States Light & Heating Company. The plaintiffs in the other receivership proceeding, Henry A. Ackerman and G. M. Walker, who were appointed receivers at the outset of the Picher Lead Company's action, were removed a few days ago.

TRADE PUBLICATIONS

DENVER & RIO GRANDE AND WESTERN PACIFIC.—The passenger department of these companies has issued an attractive folder devoted to panoramic views and descriptions of scenes along the route through the Colorado-Utah Rockies and the Sierra Nevada mountains.

WATERPROOFING.—The Standard Asphalt & Rubber Company, Chicago, has issued a 16-page booklet descriptive of the various "Sarco" methods and materials. It also shows a number of illustrations of important structures in which this material has been used.

STEEL TRACK WORK.—The St. Louis Foundry Company, St. Louis, has issued a 56-page booklet devoted to illustrations and the description of its solid cast manganese steel track work for steam and electric railroads. This booklet also contains tables of dimensions for switches and for point mates.

SOUTHERN PACIFIC.—This company has recently published an elaborate folder, entitled "Seven Months Before," which shows by comprehensive photographs the arrangement of the buildings of the Panama Pacific International Exposition in San Francisco. It also quotes rates from all important cities to the exposition grounds.

STAY BOLTS.—The Flannery Bolt Company, Pittsburgh, Pa., has recently issued its 1914 catalog of Tate flexible stay bolts. The booklet which has 30 pages contains detailed descriptions of the bolts with instructions concerning their ordering, installation, adjustment, etc. There are a large number of views of the bolts and sleeves and a number showing typical installations.

CONCRETE BINS.—The Brown Hoisting Machinery Company, Cleveland, Ohio, has issued catalog S, 1914, descriptive of Brownhoist suspended concrete bins for storing coal, coke, ashes, cement, sand and other materials. These bins are reinforced with Ferro-inclave reinforcement and are equipped with Brownhoist chutes, gates and spouts; and, being made of concrete, they are not subject to deterioration by the action of acids. The catalog is very well illustrated and contains a number of views of typical installations.

GREAT NORTHERN.—The passenger department has issued a 160 page booklet, entitled "Annotated Timetables of the Great Northwest," which gives a brief description of the principal cities and scenic attractions on its line from St. Paul and Minneapolis west to the Pacific coast. The descriptions are given in order, with their mileage from St. Paul or from Seattle, and give the principal facts of interest about each place, together with maps and profuse illustrations.

HEAT-TREATING FURNACES.—Tate, Jones & Company, Inc., Pittsburgh, Pa., have recently issued a catalog devoted to their heat-treating furnaces for annealing, hardening and tempering of steel and all heat-treating operations. The catalog attempts to show wherein Tate-Jones furnaces are superior to others and the various types of furnaces are illustrated and described in detail, care being taken to show for what kind of work each furnace is designed.

BORING MILLS.—The Pratt & Whitney Company, Hartford, Conn., has recently issued an attractive catalog describing its side head boring mill. The booklet contains a detailed description of the machine and a number of engravings showing the machine itself and a number of its parts, special attention being given to the central control feature whereby all the controlling levers, etc., are within easy arm's reach of the operator and may be manipulated by him without the necessity for his moving out of his position or taking his eye off the work that is at hand.

LINK BELT.—The Link Belt Company, Chicago, has recently issued section "A" of catalog No. 110 descriptive of the original Ewart detachable link belt and sprocket wheels. The booklet has 112 pages. It contains actual size views of the various types and sizes of detachable links, the number of the link, the approximate number of links in 10 ft., and the average ultimate strength in pounds being given for each size. There are also sections devoted to methods for obtaining the working strains and horse powers, and to price lists, attachments, chains and sprocket wheels.

Railway Construction

ALTON & JACKSONVILLE (Electric).—Reported incorporated to build a line between Jacksonville and Alton, Ill., about 50 miles. Among the incorporators are F. L. Butler, W. T. Meloan, J. S. McClellan and H. Okin.

THE CHICAGO & ALTON will resume work presently on the enlargement of the freight yards at Venice, Ill. The work consists of the placing of additional tracks sufficient to hold 500 cars.

CHICAGO & NORTH WESTERN.—An officer writes that a contract has been let to Peppard & Burrill, Minneapolis, Minn., for the construction of a branch line from Koepenick, Wis., eastwardly seven miles to the west bank of the Wolf river. The line will tap a lumber district to the north of the Menominee reservation.

ILLINOIS CENTRAL.—It is reported that this company is having surveys made for its proposed extension from Jackson, Miss., to Birmingham, Ala., about 200 miles distant. It is also said that the company is considering a project of building a 15 or 20 mile line from Haleyville, Ala., to Brilliant, the northern terminus of its independent line from Winfield, to connect with a line to be built by the Alabama, Tennessee & Northern from Reform to Winfield, about 40 miles, the connection being made for the purpose of giving the Illinois Central access to Mobile.

JANESVILLE & MADISON TRACTION (Electric).—A contract is reported let to M. M. Doran, Madison, Wis., for grading the section between Edgerton and Stoughton, Wis., of the proposed interurban line from Janesville to Madison. (March 20, p. 703.)

MASCOTT & WESTERN.—Incorporated in Arizona for the purpose of constructing a line from Willcox, Ariz., southeast to the mines of the Mascott Copper Company at Dos Cabezos, about 18 miles distant. The incorporators include F. N. McCauley, D. S. Stevenson, C. V. Weston, J. A. Street, J. C. Knapp, C. M. Stoddard and M. A. Pickett, all identified with the Mascott Copper Company.

NEW YORK, CHICAGO & ST. LOUIS.—An officer writes that work will be started shortly on the elimination of West Side grade crossings of the road at Cleveland, Ohio. The cost of the work will be about $3,000,000. Robert Hoffman, chief engineer, department of public service, city of Cleveland.

NEW YORK SUBWAYS.—The New York Public Service Commission, First district, has opened bids for the construction of section No. 5 of routes 4 and 36, including that part of the Broadway-Fourth avenue subway in Manhattan, extending easterly from Fifty-ninth street and Seventh avenue to Fifth avenue, where it divides into two branches, one continuing through Fifty-ninth street and the other through Sixtieth street to Second avenue. It is said that the Degnon Contracting Company, New York, presented the lowest bid of $2,808,661.

OGDEN-LOGAN & IDAHO (Electric).—An officer writes that a new company by this name is being organized to take over the properties of the Ogden Rapid Transit and the Logan Rapid Transit companies, and that a contract has been let to the Utah Construction Company for the grading for a line which will unite the two present systems and extend from Ogden, Utah, to Logan, and thence to Preston, Idaho. The line will pass through Ogden, Willard, Brigham, Honeyville, Deneyville, Collinston, Mendon, Wellsville, Hyrum, Millville, Providence, Logan, Hyde Park, Smithfield, Richmond, Webster and Lewiston, Utah, and Preston, Idaho, a territory at present served by the Oregon Short Line. One-fourth of the line only will involve difficult construction work. There will be a number of bridges, but no trestles or tunnels. The maximum grade will not exceed 1¾ per cent., and the maximum curve 8 per cent. The line will mainly do a passenger business, but it may also have some traffic in agricultural products and possibly coal. Contracts have already been placed for all track materials, bridges, cars, etc. R. W. Armstrong, Ogden, Utah, is chief engineer.

PENNSYLVANIA RAILROAD.—An officer writes that a contract has been let to the Latta & Terry Construction Company, Phil-

cent. in the opposite direction. Coal will constitute most of the traffic.

The Chicago & Alton will resume work presently on the enlargement of the freight yards at Venice, Ill. The work consists of the placing of additional tracks sufficient to hold 500 cars.

RAILWAY STRUCTURES

Chattanooga, Tenn.—The Cincinnati, New Orleans & Texas Pacific is now preparing plans, it is said, for a new brick, steel and concrete freight station and warehouse to cost about $250,000, and to be erected on a site at the corner of Market and Union streets, now occupied by an old passenger station.

Colburg, Mo.—The Chicago, Milwaukee & St. Paul is now starting work on 12 additional reinforced concrete grain storage tanks at Colburg, Mo. These tanks are set on a pile foundation. The total capacity of these additional 12 tanks is 500,000 bu., 20 tanks with a total capacity of 750,000 bu. have already been completed. James Stuart & Company are the contractors.

Dyersburg, Tenn.—The Illinois Central is said to be planning to lay out a small yard and to construct shops, the total costing about $150,000.

Ludlow, Ky.—The Cincinnati, New Orleans & Texas Pacific, it is said, has purchased 28 acres of land near Ludlow, and intends to build an addition to its shops and to lay new tracks and sidings.

McPherson, Kan.—The Atchison, Topeka & Santa Fe is just completing the plans for a new passenger depot at McPherson, Kan. The estimated cost is $16,000.

Portsmouth, Ohio.—The Chesapeake & Ohio is reported to have decided to build its proposed bridge over the Ohio river, at a point about eight miles east of Portsmouth, Ohio, and a short distance above the mouth of the Little Scioto river. The railroad follows the south bank of the Ohio, which makes a bend to the northward at this point, so that the crossing of the stream will be near the apex of an acute angle and in the general direction of the line which will be built from there to a point near Columbus, Ohio, about 93 miles. The bridge will consist of two cantilever spans, each 750 ft. long, and 24 plate girder spans, each 80 ft. long, making its total length 3,420 ft. It is estimated that the cost will be about $2,000,000.

Spartanburg, S. C.—A contract is reported let by the Piedmont & Northern to J. A. Jones, 404 Realty building, Charlotte, N. C., for a warehouse and station, 108 by 110 ft. in size and costing about $40,000.

Tacoma, Wash.—The Oregon-Washington Railroad & Navigation Company has awarded a contract to O. R. Larson, Tacoma, for the construction of new freight terminals at this point.

Toronto, Ont.—The contract for the construction of the new union station to be constructed by the Toronto Terminals Railway for the Grand Trunk and the Canadian Pacific has been awarded to the P. Lyall Construction Company, of Montreal and Toronto, the amount of the contract being about $3,000,000. The station will be constructed on a site east of the present building and will be bound by Front, Bay and York streets. The architects are Ross, Macdonald & Jones, with whom is associated J. M. Lyle. J. R. W. Ambrose is chief engineer of the terminal company. The erection of the union station is part of a $15,000,000 development project which includes a large amount of grade separation to be effected along the water front.

A Chinese Railroad in the Banking Business.—A $250,000 loan borrowed by the Chinese authorities at Mukden from the South Manchuria Railway last year fell due at the end of May. It was agreed, however, that the loan be extended an additional year.

Railway Extension in Russia.—It is reported that construction work is soon to begin on a 95 mile narrow gage railway from Riga, on the Gulf of Riga, in the eastern part of Russia to Moisekull. It is announced that work is to be begun at three points along the line and that the road is to be in operation by January 15, 1917.

Railway Financial News

Buffalo, Rochester & Pittsburgh.—A semi-annual dividend of 2 per cent. has been declared on the common stock. This compares with 3 per cent. paid six months ago.

Evansville & Indianapolis.—A protective committee for the first mortgage 6 per cent. bonds and for the first consolidated mortgage 6 per cent. bonds has been formed consisting of Frederick H. Shipman, chairman, treasurer of the New York Life Insurance Company; William B. Cardozo, vice-president of the Farmers' Loan & Trust Company; Ellis W. Gladwin, vice-president and secretary of the Home Life Insurance Company; Edward H. Ladd, Jr., of Ladd & Wood; Raymond M. Smith, of Megargel & Company.

International & Great Northern.—Holders of the $11,000,000 3-year 5 per cent. notes have agreed to an extension for two and a half years at 6 per cent., the notes to be repaid at maturity at 101. The notes were originally bought by J. & W. Seligman & Company and associates, and the following statement was given out by Frederick Strauss, of J. & W. Seligman & Company, after a meeting of the holders of these notes:

"An understanding has been arrived at between the trustees of the estate of Jay Gould, the owners of a majority interest in the stock of the International & Great Northern Railway, whereby an option has been given to a committee consisting of Alexander J. Hemphill, president of the Guaranty Trust Company; Alvin W. Krech, president of the Equitable Trust Company; Benjamin Strong, Jr., of the Bankers Trust Company; S. H. Voorhees, of the Royal Bank of Canada; Franklin Q. Brown, of Redmond & Company; R. Lancaster Williams, of Middendorf, Williams & Company, and Frederick Strauss, of J. & W. Seligman & Company, representing a majority of the noteholders, to purchase 51 per cent. of the preferred stock of the International and Great Northern Railway Company, and 51 per cent. of the stock of the International and Great Northern Corporation (the Virginia holding company which owns the entire common stock of the railroad company), which option if exercised will insure control to the purchasers.

"It cannot be too clearly impressed upon noteholders that no arrangements have been made or are contemplated whereby nonassenting noteholders will be paid. The alternative of a failure to extend the notes is a receivership, with all the complications and disadvantages that this implies."

Kansas City, Mexico & Orient.—The Kansas Public Utilities Commission, on application of the new company—the Kansas City, Mexico & Orient Railroad—to issue bonds and stocks to the amount of $76,000,000, finds that the physical property is worth at least $25,000,000, and on this authorizes a stock issue of $20,000,000. The company is permitted to borrow $6,000,000 on 2-year notes to pay its floating debt and for immediate use for improvements and betterments. The company is also permitted to issue $31,000,000 income bonds to be used as collateral for the $6,000,000 notes.

Northern Central.—See Pennsylvania Railroad.

Pennsylvania Railroad.—The Pennsylvania Public Service Commission has approved the lease of the Northern Central. (See July 3, 1914, page 40.)

Southern Railway.—A sub-committee of the Senate Committee on Naval Affairs is engaged in an investigation of charges filed by B. W. Dulaney, a coal operator of Bristol, Tenn., which claim that the Southern Railway has not developed southern coal fields because of a desire on the part of the voting trustees to prevent too keen competition with the Pennsylvania coal fields. President Harrison was a witness and denied absolutely that the Southern Railway had in any way been improperly influenced in its policy or had failed to do its best to develop southern coal fields.

Wabash, Chester & Western.—J. F. Gilster has been appointed receiver of this road, which runs from Menard, Mo., to Mount Vernon, 65 miles. The receivership followed the application of the St. Louis Union Trust Company, trustee for the $500,000 bonds outstanding.

Audible Distant Signals on the Orleans Railway

The use of cab signals in France, noticed last February, page 255, has now made so much progress that the (English) Institution of Mechanical Engineers made it the subject of a general discussion at its last meeting, which was held in France (Paris) July 7. The most interesting feature of the discussion is the statement of Mr. Solacroup, locomotive superintendent of the Orleans Railroad, to the effect that his road has taken no action on the government's request to try cab signals, for the reason that it does not need them; it has something fully as satisfactory, in the shape of an audible distant signal (torpedoes placed on the rail) loud enough to be heard by everybody in the first car of the train; and *"there is no accident on record* on the Orleans Railway due to a driver having passed a stop signal in front of him." This system of audible signals has been in use fifty years! The Orleans operates 4,600 miles of road, and owns 2,000 locomotives. Aside from this, the principal information brought out by the Institute's discussion is that the other prominent French railways are using cab signals to a considerable extent, but that they are making progress slowly and with caution. They all speak of their installations as experimental. This, however, cannot be said to apply to the Northern, which, as our readers know, has used cab signals for a long time—about forty-two years. The pressure exerted by the French government has been long-continued but gentle; and the railroads' attitude appears generally to have been decided by the conservatives. The Eastern has equipped two important sections of road for cab signal operation. The P-L-M has started extensive installations, as heretofore noted; and the Midi (Southern) has 20 engines and 30 signals fitted. The state railroads have 112 locomotives equipped. Mr. Aspinall, general manager of the Lancashire & Yorkshire, was at the meeting and said that his road was trying a cab signal.

THE DECISION IN THE RATE ADVANCE CASE

THE decision of the Interstate Commerce Commission in the eastern rate advance case affords ground for both pessimism and optimism. The railway managers earnestly believed that conditions which had been created by developments over a period of years warranted and demanded an increase in the net revenues of the eastern carriers. From past experience they thought that the only practical way to obtain this was by a general increase of freight rates. They feared that they could not get an increase of as much as 10 per cent., although they believed that this much was needed. They thought that the very least which should be allowed them was 5 per cent. This they hoped that they could get, and therefore, this they asked for.

The commission finds that "the net operating income of the railroads in Official Classification territory, taken as a whole, is smaller than is demanded in the interest of both the general public and the railroads." Then it finds that the situation of the railways in Trunk Line territory and New England is better than that of the railways in Central Freight Association territory, and refuses increases east of Pittsburgh and Buffalo. In Central Freight Association territory, also, it refuses increases on minerals, cement, brick, and other bulky commodities constituting over one-half of the tonnage, but authorizes an increase of 5 per cent. in the rates on the rest of the traffic. As the traffic on which the increases are to apply already carries much higher rates than that on which increases are refused, the additional revenues will certainly be much more than half of what the C. F. A. lines asked. Advances in lake-and-rail rates are refused, but this probably will prevent increases by the railways on only a relatively small amount of traffic. The additional in net revenue that will result directly from the foregoing concessions will be small compared with the increases which the railways need and which the commission admits that they need.

But there is another side to the matter. Three years ago, in the decision in the original rate advance cases, the commission held that the railways did not need larger revenues. In the present case it holds unanimously that, taken as a whole, the roads in Official Classification territory do need larger revenues, both in their own interest and in that of the public. Three years ago the decision of the commission was unanimous. In the present case two of the commissioners, Messrs. McChord and Daniels—the latter an appointee of President Wilson—dissent, and contend that advances should have been allowed in the territory east as well as west of Pittsburgh and Buffalo. The opinion of Commissioner Daniels implies that he believes that all the advances the roads asked for, except those in lake-and-rail rates, should have been allowed. The commission suggests that there are numerous rates in eastern territory which have been reduced below a fair basis by competition, and that

the carriers can add to their revenues by advancing these. There is great merit in this suggestion, and it is to be hoped the roads will act in harmony with it. The commission shows that it believes that passenger rates are too low, and implies a willingness to co-operate with the railways in securing advances in them. The commission probably has enough power, if it has the courage to exercise it, to nullify all the state two-cent fare laws. It remains to be seen what it will actually prove willing to do. The commission suggests that the railways may increase their revenues by making charges for special services now rendered to shippers for nothing, and by discontinuing certain allowances that they make to shippers. There is merit in this suggestion; but already experience has shown the difficulty of so acting on it in practice as to obtain the desired results.

It is asserted that there are various ways in which important economies in operation can be effected, such as by increasing trainloads, and more especially car loads; by adopting means for securing savings in fuel; by unloading unprofitable outside investments; by scrutinizing the relations of directors and officers with concerns from which the railways buy supplies and the contracts with sleeping car companies, private car lines, and so on. To our mind, the most meritorious of these suggestions is that regarding increases in car efficiency. But it is probable larger car loads cannot be obtained without advancing minimum weights; and commercial difficulties and the opposition of shippers will be met which the railways cannot overcome without the assistance of the commission. Will the commission give its assistance? Probably the best answer that could be made to all of the more or less academic suggestions of the majority of the commission regarding the possible operating economies is given by Commissioner Daniels in his dissenting opinion: "The proposals in the majority report whereby carriers may conserve their revenues without advancing their rates are held not to constitute a necessary or proper function of the commission in deciding a plain issue as to the reasonableness of suggested rate advances. Many of the expedients are ingenious, some of them are promising, most of them are remote in possible effect, and all of them pale into insignificance as against the admitted economies in fuel and the heavier car and train loading attained by the carriers within the last few years."

The summation of the matter seems to be that a majority of the commission has awakened to a partial realization of the railway situation in the United States, and especially in eastern territory; that a minority of the commission has awakened to a full realization of it; that the group of railways which probably needs relief the most is to be given some relief immediately; and that if the railways, the shippers, the state regulating authorities and the commission can co-operate in adopting the various suggestions which the commission makes, the tendency will be for the railway situation, as a whole, to improve. A large part of the difficulties of railways in recent years has been due to the business situation in general; and if it improves, the situation of the railways also will tend to improve. In view, however, of the general European war, what are going to be the commercial and industrial developments in the United States?

It will be interesting to see how the decision will be received. A few months ago it would have helped business. Coming, as it does now, in the midst of a great European war, it will be almost impossible to trace its effects because of the other powerful influences that are operating on commerce and industry. The commission will, probably, find that it has rendered a decision which pleases nobody very much. The habitual and professional critics of the railways will denounce the commission for having conceded anything. Railway men and business men generally and the public will criticize it for not having granted enough. Meanwhile, the carriers should waste no time in beginning to try to act on the various suggestions for increasing their net revenues the commission has made, so far as those suggestions are practical. The welfare of the railways and that of the country require that the closest possible co-operation should be developed and maintained between the roads and the commission.

THE CONDUCT OF THE RATE ADVANCE CASE

REPRESENTATIVE government rests upon two theories—that the people are competent to select legislators who shall be capable of deciding public questions, and secondly, that the great mass of people, as a mass, have an intuitive capacity to decide wisely on questions of grave public importance. The highest function, therefore, of a legislator, might well be to combine in his official actions the best of his own judgment with a sympathetic interpretation of the will of his constituents. The Interstate Commerce Commission is a branch of the legislature. A few years ago there might have been some doubt as to how far the commission's duties were quasi judicial. Today there can hardly be a doubt in the mind of an unprejudiced observer of events that the commission, both by the decree of the court of public opinion and by the decisions of the Supreme Court of the United States, is a branch of the legislature, and as such has the duty and the power of representing and interpreting the will of the people. The manner of trying questions of law and questions of governmental policy are quite radically different, although the present tendency in American government is apparently to make legal procedure more sensitive to contemporary public opinion and less dependent on precedent.

The 5 per cent rate advance case was a question of the gravest public policy, and it was a question moreover which was to be passed on by a branch of the legislature. Few criticisms of railroad managers have been better founded than the criticism leveled against the older school which refused to take the public into its confidence. The rate advance case was conducted on the railroads' side by a man whose own sterling honesty and democratic simplicity made the idea of underhand methods or autocratic rough-shod riding abhorrent. On the commission's side the case was conducted by a lawyer whom even the majority of railroad men would acknowledge to be a broad-minded and public-spirited citizen. It was inevitable, therefore, that the question would be thrashed out, not only within the walls of the Interstate Commerce Commission's hearing room, but before the public as a whole.

In the preparation of the railroads' case there was first of all the stupendous problem of eliminating the non-essential. Secondly, there was the problem of presenting the essential points in a non-technical way which could be understood not only by Commissioner Harlan and his colleagues, but by the American public. In this particular case the majority of the Interstate Commerce Commission failed to reflect and interpret fully public opinion, probably because of a certain lingering feeling among some of the commissioners that their actions should partake of the aloofness of the judiciary. It is probably this feeling which called forth the adverse comments in Commissioner Harlan's opinion on the "campaign of publicity."

The case as conducted by Chairman Harlan was above serious criticism. No attempt was made either by the chief counsel for the commission or by the counsel for the railroads to "play politics." Clifford Thorne was a bit out of place, but his presence was not taken seriously either by Mr. Brandeis or the commission. Commissioner Harlan was admirably fair in his questions and in his attitude toward the admission of all relevant matters pertaining to the case. The only criticism that might possibly be leveled against the commission was that it gave somewhat undue weight to organized opposition. It is quite apparent also from the opinion that Commissioner Harlan and Mr. Brandeis worked in close accord in formulating it. The commission by its appointment of Mr. Brandeis acknowledged its need for help, and by its adoption of many of Mr. Brandeis' opinions as a whole confirmed this acknowledgment. The pity of it is that the commission did not rely on and reflect crystallized public opinion.

W. M. Acworth, in his testimony before the English Royal Commission on Railways, expressed a belief that the legal railroad commission court of England should be superseded by full jurisdiction given to the president of the Board of Trade who should be assisted by a non-political board of experts. Applying this theory to the American form of railroad regulation

there would be a cabinet officer with final authority who would, of course, in the great majority of cases rely upon the opinions of the expert body—the Interstate Commerce Commission—but who would be more directly representative of public opinion than are the commissioners, and who could in a case where public opinion strongly demanded a certain policy, guide the commission toward a compliance with the policy; in other words the policy of the government representing the will of the voters would be a consistent policy in all its branches.

It was a recognition of the fact that the rate advance case was one of broad and vital public policy comparable to the tariff question, which led the railroads to conduct their case, as the case of all important matters of policy, in a democratic form of government must be conducted, both before the legislature and the electorate. The success of the railroads before the general public more than compensates for the disappointment or but partial success with the commission.

PREVENTING LOSS AND DAMAGE CLAIMS

THE article in this issue by H. R. Lake, describing the work of the freight loss and damage organization on the Atchison, Topeka & Santa Fe should be of absorbing interest to every operating officer. For five years the Santa Fe has been conducting a most vigorous campaign in the prevention of loss and damage to freight, which has resulted in a reduction in the percentage of loss and damage payments from over 3 per cent. of gross revenue to less than 1 per cent. Various causes have combined to bring about an increase in loss and damage claims on the railroads as a whole in recent years until the total of such payments now amounts to about $30,000,000 annually, a sum which certainly warrants the closest analysis and the most earnest efforts toward its reduction. The size and capacity of cars have been increasing and their strength has been proportionately increased so that the cars themselves can stand the heavier shocks which added weight naturally brings. Moreover, the development of more powerful locomotives, hump-yard switching and the use of automatic couplers have increased rough handling. At the same time shippers have not increased the strength of their packages, or the bracing and packing.

The fact that loss and damage claims have increased has not been entirely lost sight of. Many roads have conducted campaigns to bring about an improvement but have found it no easy task either to ascertain the causes or to apply the most effective remedies. On several roads, in spite of the most vigorous efforts, it was found that little headway was made until it was decided that the prevention of loss and damage is an operating department duty, and not a function of the claim department. This was done on the St. Louis & San Francisco, whose successful campaign for the reduction of loss and damage through a special organization in the operating department was described in the *Railway Age Gazette* of November 12, 1909, page 925, and September 8, 1911, page 186, and for the past three or four years the operating department on the Santa Fe has handled the investigation of loss and damage claims.

There is much to be said in favor of the handling of claims, or at least the investigation of claims, through this department. It is the department whose shortcomings are largely responsible for the claims and it would seem that it is in the best position to effect needed reforms. On the Frisco the entire work of handling, investigating and settling claims has been turned over to the operating department. On the Santa Fe practically the entire operating department has been turned into a committee for the study of loss and damage and for the purpose of correcting the mistakes. This work is now well organized, and the methods used on the Santa Fe have already aroused the interest of other roads. On July 1, a similar plan was adopted by the Chicago, Burlington & Quincy

There are many reasons why the investigation of O. S. and D. reports should be conducted by the operating department. The freight claim agent's business is to determine whether liability exists in respect to claims entered, to determine the measure of the liability and to settle with the claimant with reasonable promptness. If he is then charged with the investigation as to the cause of the loss or damage he is at a marked disadvantage as compared with the department on which the responsibility really rests. The operating department is naturally more familiar with conditions within its jurisdiction, and is, moreover, a far better position to administer discipline or apply any corrective measures as the result of its own investigations than upon the recommendation of a representative of another department.

Because of the close relationships existing between railways in the handling of freight, the best results can only be obtained through co-operation of all the roads. This being so, there has been a strong movement to bring about such co-operation through the medium of a national loss and damage bureau or association, to be organized by the operating departments for the purpose of preventing loss and damage, instead of adjusting it afterward, which is the function of the Freight Claim Association.

In 1910, the General Managers' Association of the Southeast adopted resolutions requesting the general managers' associations of New York, Chicago and St. Louis, and Texas to appoint committees on loss and damage to work along the lines of a similar committee of the southeastern association, looking to the establishment of a bureau for the whole country, either independently or as a part of the organization of the American Railway Association. The suggestion for the organization of committees by the other associations was not adopted, but the plan resulted in the formation by the American Railway Association of a subcommittee on Packing, Marking and Handling of Freight, which has done very good work.

It was then proposed that the Freight Claim Association amend its constitution, and turn its attention actively to the prevention of claims, on the ground that that association had proved itself one of the strongest of railroad organizations, and as it had done most effective work in its own field, there was no need of having two associations, both working on loss and damage. This plan met with approval and at the recent annual convention of the Freight Claim Association held at Galveston in May, it was decided to enlarge the scope of its work to include not only the settlement of freight claims, but the study of causes and the prevention of freight claims. A new committee on Causes and Prevention was formed for this purpose. The past work of the Freight Claim Association furnishes good evidence that it should be able to accomplish important results in this direction, but the active prosecution of the campaign must be done by the individual roads, and as previously stated, the operating department seems in the best position to carry on the needed investigation. The General Superintendents' Association of Chicago has had a strong committee at work on this subject since June, 1913.

The Southeastern Claim Conference and the General Managers' Association of the Southeast have been advocating for some time a plan which it is believed will have an important bearing on loss and damage claims by promoting better methods of loading. Under the existing rules of the Freight Claim Association, unlocated losses in interline traffic are prorated on an agreed average percentage of probability. For instance, the unlocated loss of an entire package is charged 30 per cent. to the loading carrier, 20 per cent. to the unloading carrier, and the remaining 50 per cent. is prorated on mileage. It is argued that if an initial line goes to extra expense and extraordinary diligence to put freight in the right car, and has a system of records by which it can show affirmatively that the package was put in the right car, it should be exempted from the 30 per cent. presumption against the loading line on average probability, and that responsibility would be centered where it belongs if the initial line were held wholly responsible, unless it can show by a positive affirmative record that the package was put in the right car at the start. Various plans for obtaining such affirmative record have been proposed and are being investigated.

A THREATENED STRIKE AND ITS MORAL

THE vital defects of the Newlands-Erdman arbitration law are made manifest by the very narrow escape which the United States has just had from a strike of all the engineers and firemen on the 98 railways west of Lake Michigan and the Illinois Central Railroad. That a strike was averted is not in any part due to the engineers and firemen, or to the board of mediation and conciliation. It is due to the intervention of President Wilson and to the public-spirited and patriotic action of the railway managers. The true issue involved was clouded during the last few days of the negotiations because of a step taken by the mediation board which was grossly unfair, and which resulted in placing the railways in a wholly false position.

The main developments in the controversy were as follows: On October 10, 1913, the engineers and firemen made demands which, if granted, would have increased their wages approximately $27,000,000, or 40 per cent. The railway managers long had been aware that some such demands were to be presented. They were as dissatisfied with the existing schedules as were the employees. Controversies, negotiations and struggles over a long period of years have caused rules and principles to be incorporated in the schedules which the railway managers regard as unfair and uneconomic. Therefore, when the employees presented their proposals the railways gave notice of cancellation of the existing schedules and made counter proposals. The purpose of these counter-proposals was to correct the anomalous, unfair and wasteful rules and principles referred to. It was claimed by the employees that the railways' plan would result in a reduction of their wages. The Conference Committee of Managers replied that, if the employees' committee would join it in a revision of the parts of the schedules to which the railways objected, it would join with the employees' committee in a revision of the wage schedules which would secure to the employees at least as large compensation as they already were receiving. The employees rejected this proposal and made new and additional demands, the granting of which, together with their original demands, would have increased their wages by $33,000,000, or 50 per cent.

No agreement being reached, the employees took a strike vote. The Conference Committee of Managers then proposed arbitration of *all* of the demands of both the employees and the railways. When the employees rejected this the managers suggested that the two parties join in asking the Board of Mediation and Conciliation to tender its good offices. The employees rejecting this suggestion, the managers alone asked for mediation. In the course of the mediation the board made various proposals to each side with the object of securing a basis of agreement or arbitration. Finally, it made this proposal: The schedules in effect prior to October 10, 1913, to be restored; *all* of the demands made by the railways to be withdrawn; the demands made by the employees in May, *which were additional to their original demands, and were made merely in a spirit of bluff and bravado*, to be withdrawn; the original demands of the employees presented in October, 1913, and *they only*, to be arbitrated. The very thing which the managers were fighting for was recognition of the principle that demands made by the railways on their employees as well as demands made by the employees on the railways should be submitted to arbitration, and the very thing the mediation board asked the railways to accept as a basis for arbitration was the principle that the demands of the employees should be arbitrated and *that the demands of the railways should not be arbitrated.*

Of course, the employees immediately accepted this plan. They had everything to gain and nothing to lose by it. And of course the managers rejected it. They had everything to lose and nothing to gain by it. Thus, although the railroads were the first to propose arbitration, and insisted upon arbitration, and were at all times willing to arbitrate *all* the points in issue, the mediation board and the employees deftly put them in the position of refusing to arbitrate.

This was the situation when President Wilson invited the representatives of the employees and of the railways to confer with him at the White House. Meantime, a terrible and totally unexpected condition of affairs had developed. All Europe was going to war. The business situation in the United States had become strained to the breaking point. Every stock exchange in the country was closed. It was apprehended that only some such great catastrophe as this threatened strike in the West was needed to precipitate a violent panic. The President of the United States appealed to the employees and the railways to settle their differences. He appealed in the name of patriotism, of the public welfare, of humanity. The railway managers repeated their proposal to arbitrate all differences. It was suggested by President Miller of the Burlington that in order to avoid a rupture at such a critical moment both parties suspend all further controversy for 90 days. But the leaders of the employees had called a strike for August 7; and they showed their public spirit and patriotism by coolly announcing that unless the railways accepted the absolutely unfair plan of arbitration that had been last proposed by the mediation board and accepted by the employees the strike would occur on schedule time! They had the railways and the country by the throat and they didn't intend to relax their grip, no matter what were the consequences. The railways' managers promptly rose to the occasion, and accepted the one-sided plan of arbitration they had previously rejected. In the interest of the public welfare they agreed to compromise on the basis of "heads I lose, and tails you win."

The moral of all this is clear. No consideration of fairness, public welfare or patriotism exercises any restraining influence on certain leaders of organized labor. In the absence of laws forbidding strikes they will call strikes if they think they have anything to gain by them, even though the ultimate result may be that the heavens will be rolled together as a scroll, and the earth will be consumed with fervent heat. The public may think that because it is so often threatened with general railway strikes which do not come, there is no serious danger that any ever will come. But that is the way that the people of Europe regarded the incessant talk of a great European war, and the great European war has come. And unless legislation is passed forbidding strikes and lockouts, at least until after there has been arbitration, and the findings of the arbitration board have been made public, there will be a railway strike in this country one of these days whose consequences will be more terrible than the public can now even imagine.

BROOKLYN RAPID TRANSIT

SINCE the growth of the population in the city of Brooklyn has assured to the Brooklyn Rapid Transit Company a substantial annual increase in its operating revenues, the problem has been to conserve to the company and especially to its stockholders their share of the increased earnings. To do this it has been necessary to offset increases in wage scales through the training of employees to greater usefulness, to offset very large increases in taxes through economies in some branch of operation, and to overcome what was not many years ago a strong prejudice against the company on the part of its patrons.

Total passenger earnings in the fiscal year ended June 30, 1914, were $24,709,000; in 1913, $23,453,000. Net income, after the payment of operating expenses and charges to income for betterment, amounted to $12,015,000 in 1914, as compared with $11,659,000 in the previous year. The growth of the company's business is shown by the annual increase in passenger earnings over each succeeding year. The increase in 1910 was 7.44 per cent.; in 1911, 4.28 per cent.; in 1912, 5.66 per cent.; in 1913, 3.94 per cent., and in 1914, 5.35 per cent.

Despite the increases in wages the cost of general operating (transportation), exclusive of maintenance, consumes a smaller proportion of operating earnings now than in 1910. The ratio in 1910 was 35.21; in 1911, 34.59; in 1912, 33.89; in 1913, 33.53, and in 1914, 34.67. On the other hand, the ratio of maintenance

charges has been slightly increased. In 1910 it was 16.53; in 1911, 16.21; in 1912, 16.39; in 1913, 16.13, and in 1914, 17.03.

The net surplus in 1914 available for dividends was $5,316,000, an increase over 1913 of $819,000. Dividend requirements in 1914 were $3,660,000, and in 1913 $2,441,000. The increase in dividend requirements was due to conversion of bonds and stocks mentioned later.

The relation of either a street railway company or a steam railroad company to its patrons is in the great majority of cases the relation of the employees to the public. Street railway employees are a difficult class of labor to deal with. Their work is hard and is full of annoyances. It is difficult to establish and to hold a permanent force of men and for this reason it is particularly difficult to train either motormen or conductors thoroughly. Furthermore, a very large item of expense for a street railway company results from damage claims and personal injury suits. This is, of course, a worse than nonproductive expenditure and is dependent both on the care and training of the employees of the company and on the attitude of the public in the city served. The substantial financial success in the last few years of the Brooklyn Rapid Transit is probably in considerable part due to the broadminded, farsighted policy which the company has adopted towards its employees and toward the education of both employees and patrons in regard to safety.

In 1914 the company spent $69,000 for medical services and sick and death benefits not reached by the Employees' Benefit Association. The company has a system of compulsory medical inspection and free medical attendance for employees excused on account of illness. In the first complete year of operation of this system—the calendar year 1913—10,000 men benefited from it. Time lost on account of illness was 24 per cent. less in 1913 than in 1912. The medical inspection bureau now has a chief inspecting physician and five assistants. First aid instruction is also being given employees in all departments.

The safety campaign which the Brooklyn Rapid Transit is carrying on is quite unusually broad in its scope. The company has a bureau of public safety which co-operates with the board of education of New York City and with the parochial schools. This bureau gives instruction in 179 public schools and 26 parochial schools, with a total membership of 262,000 children. Besides this 23 parents' organizations were addressed and moving picture lectures given in the city parks.

Working along analogous lines, the legal department has during the last few years been making special efforts to settle damage and personal injury claims promptly. In 1907 damages were 3.86 per cent. of total operating earnings; in 1908, 4.14; in 1909, 3.66; in 1910, 2.66; in 1911, 3.43; in 1912, 2.95; in 1913, 2.51, and in 1914, 2.14.

Liberal expenditures were made for maintenance of way and maintenance of equipment. In 1914 $2,022,000 was spent for maintenance of way, which is 20.47 per cent. more than was spent in 1913, and $2,316,000 for maintenance of equipment, which is 5.17 per cent. more than was spent in 1913. More liberal expenditures were also made for additions and betterments. Exclusive of the amount spent for the work on the new dual subway and extensions of elevated lines, $1,544,000 was spent for additions and betterments and charged to capital account. Of this amount $958,000 was for cars and electrical equipment, and $306,000 for track and roadway. Work on the dual system has been progressing about as fast as was expected and $11,000,000 was spent during the year on this account.

The financial position of the Brooklyn Rapid Transit Company was very considerably improved during the year by the conversion of refunding mortgage 4 per cent. bonds into stock, the conversion privilege expiring July 1, 1914. On June 30, 1913, there were $120,435,000 bonds outstanding, and at the end of June, 1914, $100,972,000, the amount of stock outstanding having increased from $49,837,000 to $75,592,000. The company earned net in 1914 the equivalent of 7.87 per cent. on the present outstanding stock.

Letters to the Editor

THE RAILROAD TROUBLE

Grayslake, Ill., August 3, 1914.

To the Editor of the Railway Age Gazette:

It happened once upon a time, about four years ago, that after having made a somewhat extended investigation of the subject, a witness who was testifying before the Interstate Commerce Commission in what was then known as the Western Advanced Rate Cases, stated that because the units of cost were steadily increasing and the units of revenue were steadily decreasing, the railroads would make less money the more business they did. The witness was publicly laughed at by the learned counsel for the opponents of the railroads, jumped on for a harmless sort of a fool by the commission, and privately advised by experienced railroad officials that it might be a good theory, but they didn't take much stock in its working out that way.

Now comes the Bureau of Railway Statistics, and shows that while the business for these four years has increased from $2,787,266,000 to $3,091,670,000, the net operating income has decrease from $838,617,000 to $712,133,000. Just what the derided witness stated would happen has happened within four years, and will not only continue, but will increase in ratio, until net earnings will disappear, unless something deflects the present course of either the line of expense or the line of revenue from their direction toward each other.

A glance at the separate accounts shows where the trouble lies with expenses. From 1910 to 1914 maintenance of way increased sixteen hundredths of 1 per cent.; maintenance of equipment, 2.43 per cent., traffic, six hundredths of 1 per cent.; transportation, 3.24 per cent.; general expenses, seventeen hundredths of 1 per cent. Maintenance of way is largely material, and what labor it contains is practically all unorganized; maintenance of equipment is very largely organized labor; traffic is the expenses of getting the business, and represents no organized labor; transportation is the cost of moving the business, and is very largely organized labor; general expenses include salaries of officials and incidental expenditures. We find that the substantial increase in costs falls practically entirely upon organized labor. In the three accounts, maintenance of way, traffic and general expenses, the increase was thirty-nine hundredths of 1 per cent. In the two accounts, maintenance of equipment and transportation, the increase was 5.67 per cent. During this period, revenues increased 7.33 per cent.; expenses increased 21.05 per cent., and net income decreased 15.08 per cent.

The deduction of the witness referred to seems to be borne out by the results. If an increase in business of 204 million dollars cost 388 million dollars to get, how long will it take to wipe out the net earnings simply by increasing the business? And the increase has been unbroken annually; for the four years the ratio of expense to revenue has been, respectively, 66.27 : 69.38; 69.40 : 72.33. And the two years showing the big jumps are the years in which substantial advances in the demands of organized labor were enforced. Demands are now pending which if secured in full would of themselves put the 1914 ratio up to over 74 per cent., and make the increase in transportation account over 5 per cent. The assertion that the more business the railroads get the less money they make, does not look as absurd as it did in 1910.

Four years more at the same ratio would bring the net operating income below the necessary payments for interest and dividends. As many railroads are making no dividend payments, four years at the same raito will see the commencement of the inevitable period of receiverships not based on high finance

or stock juggling. Another four years would wipe out more than half the dividends, and in twelve years the interest on the bonds would begin to go. With the destruction of dividends and the impairment of interest payments reasonably in sight, it is not to be wondered at that railroad stocks are no longer desirable for investment, and that long-term railroad bonds are not sought after.

The trouble is that the governments of this country have put a hopeless block in the way of increased revenues that are at all adequate, and at the same time refuse to put any check whatever upon the increase of expenses.

The time has come when the government must accept the full responsibility attaching to the powers it has assumed, or accept responsibility for the wrecking of the greatest commercial institution of the world.

The real trouble with the American railroad today is unregulated and uncontrolled organized labor. That railroad labor had organize and protect its interests, no one can deny. But when its rapacity reaches the point at which it portends public disaster of inestimable damage, there should be some substantial and effective consideration of the interests of the public.

If the car which carries the freight is so much an instrument of commerce that the public has a right to regulate the charges for its use, why isn't the man who hauls the car equally an instrument of commerce, and equally subject to public regulation? Railroad labor gets almost 50 per cent. of the money the public pays to the railways, and the stockholders get about 5 per cent. Shouldn't the government be as solicitous about the reasonableness of the 50 per cent. as it is about the 5 per cent? When it becomes apparent that the load that is bearing the railways down is the power of organized labor, shouldn't the government determine the reasonableness of its demands? If reasonable the government should then permit the railways to charge enough to meet them. If not the government should condemn the demands.

I do not assert that organized labor imposes an undue demand upon railroad revenues. I do not know whether its toll is reasonable or unreasonable. But it is clear that its ever-increasing toll is the burden that is breaking the backs of the railways in their present inability to make adequate revenue provisions. If the reasonableness of a railroad rate is, as it surely is, a fair subject for administrative determination, why is not also the 50 per cent. of that ratio which is imposed upon the railways by a force beyond their control and in many cases against their fair judgment? William Ellis.

THE IMPORTANCE OF THE CONDUCTOR

Haileyville, Okla., July 10, 1914.

To the Editor of the Railway Age Gazette:

It is accepted as truth by those who know, that not enough attention is given to the employment of men for the train service to ultimately get proper men for the position of conductor. We begin with the brakeman. When a brakeman is required, the average employing officer, or sometimes a clerk of a few months' experience as a stenographer, takes the applicant into a corner and puts such questions to him as he can remember having heard his superior use in examinations. He may omit important matters, many of which should have been determined by the superintendent personally.

Was the applicant's past record fully investigated? What about his education? How about his physique and personal appearance? What was his manner in entering the office? Would not a man, say, six feet in height, broad-shouldered and straight, and with a steady gait, present a far better appearance when going through a train taking up tickets, than a tall, slim, swingy, or a short, chunky, bow-legged individual? If it were necessary for the conductor to give a passenger a written memorandum concerning some connection or other important matter should he not be able to write so that the ordinary person could read it? Would a commercial institution place a man in charge of a $100,000 business without knowing something of his educational qualifications, his past record, and his personal appearance? When you start a man out with a $20,000 locomotive and eight or ten fine passenger cars loaded with men, women and children, what do you expect of him? He should be a man possessing a good stock of broad general knowledge. Has he the proper interest of the company at heart so that he will thoroughly investigate accidents that occur within his notice, making the proper notations, and securing statements from passengers and others to fortify the company against suits at law? It should be borne in mind that whenever a call boy is employed he may some day be a conductor; and if he is not of the right kind of material and not properly coached he will prove an undesirable conductor. Just as soon as a brakeman demonstrates that he is not of the proper material for a conductor he should be dropped from the list, for he will not even make a good brakeman, knowing, as he does, that that is all there is in store for him. When a man in the train service is discharged for cause and his record has shown that he is not fit to be retained in the employ his reinstatement should be fought to the last, however strong a fight may be put up by the organizations to which he belongs.

A man in any capacity who does not work for the interest of the company at all times is not a desirable employee. To get over the road as quickly as possible with the least work is not doing the company justice. A local train is run for the purpose of doing the local work and not to see how quickly it can reach the terminal, leaving the bulk of the work for the fellow on the opposite run. I have in mind a case that occurred not long ago at a small station where two passenger trains were to meet. One reached this point 15 or 20 minutes in advance of the other. A stock shipper was waiting at this station to load a car of stock for an extra westbound which had made the first station east for the passenger trains. The car had not been spotted at the chute, as the chute was located on the passing track. The conductor of the waiting passenger train heard the conversation between the operator and the stock man, and of his own accord took his engine and spotted the car at the chute so that it was loaded by the time the extra arrived. In this way he saved an hour's delay to the extra and did not delay the passenger train a minute. This conductor did not ask for local freight pay for the balance of the trip; neither did he make any talk about it. On another occasion when there was trouble on account of a washout this same conductor found that a car of ice had been loaded and was being badly delayed on account of there being no freight service. He picked up the car and took it to the next station, which was its destination, without stopping to ask for instructions. The conductor just mentioned is still running his passenger train; never has any trouble, and never complains about being delayed by the despatcher or by freight trains. If he should happen to get into trouble he would certainly have a lot of friends who would come to his rescue.

On the other hand a case recently developed where a conductor on a "red ball" train with 20 "red balls" and 30 empties set out 4 red ball loads instead of empties to get over a hill; this because the empties were on the rear end and it was easier for the brakemen to set out four loads at the head end. Is such a fellow as this a good man for the company? His action brought severe criticism; but he is still running his train, and is protected by his organization.

What a farce we see every day in the full crew laws. The brakemen now on the trains have nothing to do but clean the lamps and get out on top when passing through stations; and half of them do not do that. J. L. Coss,

Assistant Chief Despatcher, Chicago, Rock Island & Pacific.

Mileage of Railways in Russia.—The Russian ministry of ways of communication has announced that the mileage of Russian railroads is 43,788, of which 29,594 miles belong to government railroads. In addition, the railroads in Finland cover 2,430 miles and the Eastern Chinese Railroad, 1,073 miles. There are also temporary lines covering 2,031 miles. There are 5,657 miles under construction, and permission has been granted for the building of 3,899 miles.

Decision in the Five Per Cent Rate Advance Case

Abstract of the Majority and Dissenting Opinions with the Exact Language of the Commissioners Preserved

The following is the majority opinion by Chairman Harlan:

The Interstate Commerce Commission on June 21, 1913, ordered a proceeding to inquire into the following matters:

1. Do the present rates of transportation yield the common carriers by railroad operating in official classification territory adequate revenue?

2. If not, what general course may carriers pursue to meet the situation?

In adopting this plan for the investigation the commission was not unanimous. Two of its members dissented on the general grounds that until the proposed increased rates had been filed as required by law there could be no effective basis for the inquiry and no legal warrant for a finding or for an order based thereon. To avoid any such question of law, the carriers on October 15, 1913, filed tariffs providing increased rates on practically all freight traffic moving in official classification territory. These tariffs were suspended by the commission.

The rates now proposed by the carriers are commonly spoken of as providing a five per cent. increase in freight charges. As a matter of fact the increases range from less than three per cent. on some traffic, and as high as fifty per cent. in certain short haul traffic.

The additional revenue expected to accrue under the rate advances discussed in a case of 1910, was estimated at $27,000,000. The increased revenue under the proposed advance here under consideration, as estimated by the carriers' experts, would aggregate about $50,000,000.

On November 24, 1913, the hearings were commenced and were continued at intervals until May 1, 1914. The record was closed so far as the first question in the general investigation is concerned, except as to certain inquiry formally addressed to the carriers by the commission, to which they have not yet fully responded, and except as to the relations of the Baltimore & Ohio with the Cincinnati, Hamilton & Dayton, concerning which a hearing was had on May 29, 1914.

PROTESTS AGAINST PROPOSED ADVANCES

Protests againts general increase in freight rates were presented by the railroad commissions of the Iowa, North Dakota, South Dakota, Nebraska, Kansas, Oklahoma, Arkansas and Missouri, and by the National Council of Grain Dealers' Association, and the Farmers' Association of Iowa. Protests against increase in lake and rail rates were presented by the Chicago Association of Commerce, and the Board of Trade of Duluth. Protests against proposed increases in rates so far as they effected specific articles of which the tonnage in some cases is large were presented by many shippers, particularly by shippers of coal, coke, ore, brick, cement, lumber, ice, sand, gravel, paper, pulp, corn products and petroleum. The hearing of these special protests occupied 36 days.

RELATIONS OF THE CARRIERS AND THE PUBLIC

The general duties that common carriers owe to the public are well understood. They must provide prompt and safe service and they are held to strict responsibility for injuries or damage to property which they undertake to carry and for which they are under obligation not to charge an excessive rate for the services. This was a rule of common law, and it has been emphasized by specific legislation; on the other hand we cannot doubt that there are responsibilities on the part of the public to members of privately owned companies.

Investors in railroad securities share part of the consequences of dishonesty or inefficiency on the part of those selected to manage the properties. No one could reasonably contend that the public should pay higher transportation rates because once prosperous properties like the New Haven, Chicago & Eastern Illinois, the Alton, the Frisco, or the Cincinnati, Hamilton & Dayton, may now be in need of additional funds as a consequence of mismanagement. Investors in railroad securities must also take the risk of those errors of judgment which not infrequently attend the careful management of enterprises conducted for profit, but they likewise should be permitted to enjoy fully the profits which naturally flow under reasonable scale of rates, from the exercise of good judgment, integrity and efficiency in the management of the properties. The public owes to the private owners of these properties, when well located and well managed, full consent to earn a fair return on the investment, and the carriers owe to the public an efficient service at reasonable rates.

The property investment of the 35 railway systems in official classification territory, as shown by their exhibits, aggregated about $3,787,000,000 on June 30, 1898. The return upon this amount in net operating income for that year is stated at 4.39 per cent. During the next few years conditions in the transportation world improved rapidly. In 1900 the property investment as reported stood at about $3,952,000,000. The net operating income for that year is stated at 5.28 per cent. In 1903 their property investment was reported at about $4,300,000,000. The net operating income for that year reached 5.85 per cent. It is obvious that if we select either the low ratio of the net operating income for 1898 or the high ratio of 1903, as a basis for comparison, some very unsound inferences may result. All things considered, it is clear that in place of a comparison of one particular year or period with another, we must take a more comprehensive view of the trend of railway earnings. We shall, therefore, begin our examination with the year 1900, omitting the years 1898 and 1899, which show relatively low earnings and appear not to be fairly representative of railroad conditions.

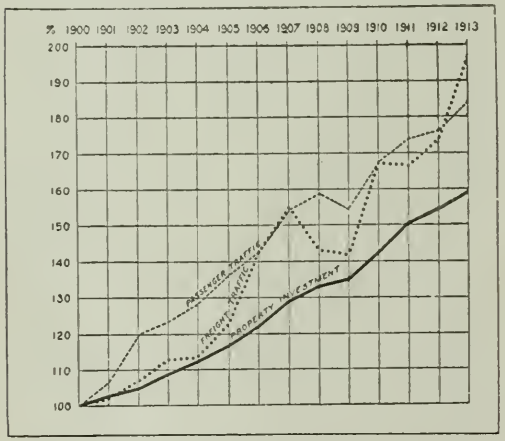
During those 14 years the property investment of these carriers has increased from $3,952,000,000 to $6,281,000,000. This represents an advance in the property investment account of 59 per cent. The operating revenue shows a far greater advance during the same period of years, having increased by 110 per cent. It will be noted, however, that the operating expenses increased even more rapidly, or by 133 per cent. in the 14 years, the result being that the net operating revenue shows a lower ratio of increase than does the gross revenue. Expressing the thought in a more definite form, it may be said that in 1900 it cost the carriers 64.62 cents in operating expenses to secure $1 of revenue, while in 1913 the cost had risen to 71.77 cents. Had the operating cost of securing their revenue remained the same in 1913 as in 1900 the net operating revenue of these carriers in 1913 would have been greater than it was by more than $100,000,000. The taxes increased during that period in about the same proportion as did operating expenses; but the decrease in the capital cost per unit of production was so great that the ratio of net operating income to property investment was larger in 1913 than it was in 1900. The explanation of this reduced capital cost is due mainly to two facts; first, the advance in the art of railroading; and, second, the increase in the density of traffic, both resulting in the greater utilization of the plant.

CAUSES OF INCREASED OPERATING RATIO

We have already mentioned the fact that the returns of these carriers in gross operating revenues have increased much more rapidly since 1900 than the property investment. It will be observed, however, from the accompanying chart, showing the ratio between the two accounts, that while the gross revenues, as compared with property investment, increased quite regularly from 1900 to 1907, they have remained practically stationary, with some fluctuations, since the latter date. This has been due not to a

relative decrease in the volume of the traffic moved but largely to a decreased return per ton mile and per passenger mile since 1904, and especially during the years 1906 to 1913. If the ton-mile and the passenger-mile rates earned in 1906 had been repeated in 1913 the net operating income of the carriers during the latter year would have been at least $30,000,000 greater than it actually was.

There is, however, no basis of record for the assumption that the reduction in these earnings per ton mile has been caused wholly by the adoption of lower rates for the service. There are many factors, other than rate reductions, that affect the earnings of carriers per ton mile. Without any reduction whatever in the charge for the service a reduction in the revenue per ton mile will be brought about by a relative increase in the length of haul or in the volume of traffic taking low rates. A very marked reduction in revenue per unit of service results also from the absorptions occasioned by payments for switching, lighterage, elevation, etc. The record indicates that some of the decrease in the yield per ton mile was due to voluntary rate reductions by the carriers; some rate reductions have also resulted from the orders of this commission and from the orders of state commissions. But it may fairly be assured that the



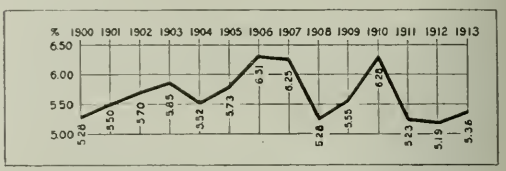
Comparison of Increases in Capital Investment and Traffic, 1900 to 1913 Inclusive

causes that we have just mentioned were more influential than any lowering of the rates on freight.

The reduced earnings on passenger traffic were caused largely by reductions which the carriers were compelled to make in their passenger fares in Ohio, Indiana, Michigan, Illinois, and in other states, under local legislative action. We shall refer later to this very important phase of the case, but it is proper to say at this point that the returns made by ten of the roads, representing only a portion of the mileage in what is known as central freight association territory, show that during the period from 1906 to 1913, inclusive, there was an estimated loss of nearly $18,000,000 in revenues due to state legislation under which those carriers were compelled to make substantial reductions in their local passenger fares with accompanying reductions in their interstate passenger fares.

Another cause which has depressed the ratio of revenue to investment in recent years, is the increasing proportion of investment in property, which, although used in transportation and acquired in response to a public demand for better service, is relatively unproductive under present practices. Among other things, investments in equipment of improved type, displacing other equipment of equal capacity, the elevation of tracks, and the construction of expensive terminal facilities in the large cities, while adding to the value of the service rendered, have not yielded proportionate returns in revenue. The greater part of these expenditures has been for the immediate benefit of the passenger service.

The carriers were also prevented from realizing the full benefit of the increase in gross earnings by the great increases in operating expenses and taxes.

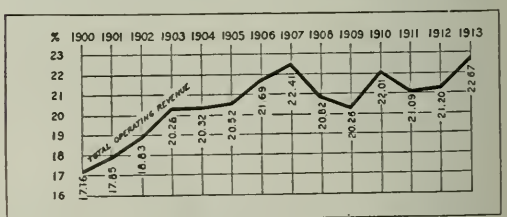


Ratio of Net Operating Income to Property Investment

At two points, 1906 and 1910, the rising line in the operating ratio has been interrupted; but both those years were periods of relatively large railroad earnings. The lower operating ratios of those two years were obviously due to the greater density of traffic; and conversely the higher operating ratios of 1904 and 1908 were due to the lower density of traffic incident to the business depression during those years. There were also large revenues in 1911, 1912, and in 1913, but they were offset by the large increase in wages and other operating costs during that period, in consequence of which the operating ratio was held at a high level.

Each of the different groups of expenses has played a part, but not an equal part, in increasing the operating ratio of railroads. The advance in relation to revenues of the last group of expenses, shown on the table and charts as general and outside operations, has been confined almost entirely to the expense of conducting outside operations, such as boat and ferry lines, harbor terminal transfers, sleeping, dining, and special car services, grain elevators, stock yards, hotels and restaurants. Many of these enterprises result in substantial losses to the carriers; and they often involve services for which no charge is made or for which the charge when made is unremunerative. The expenses incident to these so-called outside operations have grown rapidly in recent years.

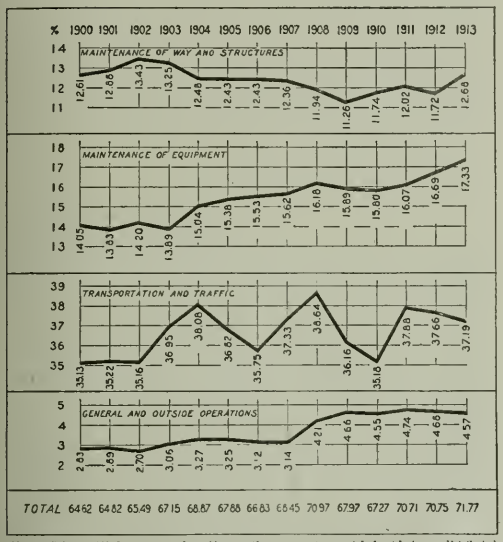
The transportation and traffic expenses, as shown on the above chart, have very substantially advanced in ratio to revenue during the 14 years under review. This group includes expenses incident to the actual moving of traffic and the most important items are the cost of fuel and the wages of employees, both of which in recent years have been increased to such an extent as to account for a great portion of the total increase in



Ratio of Total Operating Revenue to Property Investment

operating expenses. Compilations made by the commission of the answers of the carriers to its questions concerning fuel show that the average price of coal increased 7.7 per cent. from 1910 to 1913. Exhibits filed by 30 of the 35 railway systems involved in this proceeding indicate an increase of 9.02 per cent. in the average daily wage paid in 1913 as compared with 1909, and that if the scale of wages for 1909 had been in effect during 1913 the labor costs of the latter year would have been less by about $51,000,000 than they actually were. What part of this

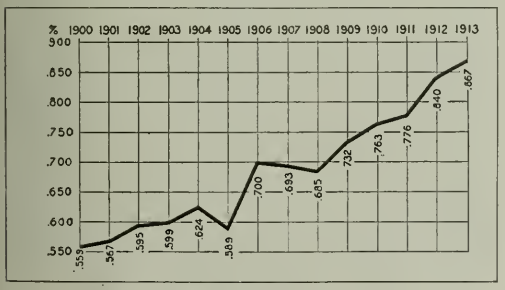
amount properly belongs to operating expenses and what part to the betterment and improvement accounts does not appear. It is interesting to note, however, that notwithstanding wages constitute an exceptionally large part of the transportation expense, this group of expenses has shown a relatively smaller advance than other groups. That the ratio was not still greater in 1913 is a tribute to the ability of operating officials and an evidence of the possibilities in the direction of economy. A relatively



Note.—Prior to 1908 the expenses of outside operations were not separately kept but were distributed among the other groups. This accounts for the sudden rise in the ratio line for general and outside operations.

Ratio of Groups of Operating Expenses to Operating Revenues

small portion of the increase was made necessary by the so-called full crew and hours of service laws and similar federal or state statutes. A substantial part of the increase in this group has been due to the increase in the special services performed for shippers at terminals and elsewhere without the imposition of any charge or for an inadequate charge. Such special services, which are considered later in this report, include



Ratio of Taxes to Property Investment

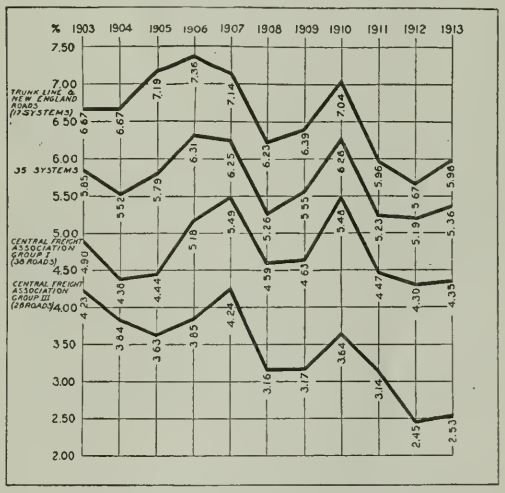
reconsigning, switching, storage, teaming, etc., the cost of performing which falls for the most part within the group of transportation expenses.

The most extraordinary increase in the operating expense accounts from 1900 to 1913 was in the maintenance group, and especially in the maintenance of equipment.

The safety-appliance acts, boiler-inspection laws, state legislation requiring the elimination of grade crossings, and other enactments show the demands of the public for a higher standard of service; and a portion of the increase in maintenance charges is due to such causes. These laws, to no small extent, enforce measures of precaution which the carriers ought to take and which they would voluntarily have taken in many particulars in pursuance of sound railway policy and practice. It is, nevertheless, true that in many cases they have had the effect of hastening improvements in equipment and roadway that would have come later, and of burdening the maintenance expenses of the years in which the improvements were made. Wise policy requires that a railway property should be kept up to the level of its highest reasonable efficiency at all times; and the postponement of needed repairs either in road or equipment because of a temporary falling off in revenues can not be justified or be regarded as true economy.

FINDINGS AS TO THE ADEQUACY OF PRESENT REVENUES

In view of a tendency towards a diminishing net operating income as shown by the facts described we are of opinion that the net operating income of the railroads in official classification territory, taken as a whole, is smaller than is demanded in the interest of both the general public and the railroads; and it is our duty and our purpose to aid, so far as we legally may, in



Comparison of Ratios of Net Operating Income to Property Investment

the solution of the problem as to the course that the carriers may pursue to meet the situation.

The financial condition of the various railroads composing the 35 systems varies greatly, as disclosed by their net corporate income as well as by their net operating income. The condition of some of them is so prosperous that they clearly do not need a higher net income; the condition of others is such as to preclude the expectation of a return upon outstanding capital stock or the possibility of raising much additional capital without a thorough reorganization.

SHALL THE PROPOSED ADVANCE IN FREIGHT RATES BE APPROVED?

Treating as one road the 35 railway systems that have joined in this application for our approval of a so-called 5 per cent. advance in their freight charges, we have reached the conclusion that their net operating income is insufficient and should be increased. We proceed now to consider under our general order of inquiry "what general course may carriers pursue to meet the situation."

They proposed but one remedy—the so-called 5 per cent. increase in freight rates. As that remedy was offered through the

formal filing of tariffs, we are legally bound to adopt it, if the new rates are just and reasonable, even though it may not seem to us the best remedy available. But we are unable upon the record to find that the rates so proposed are just and reasonable, except as hereinafter stated.

NO INCREASE OF PASSENGER FARES PROPOSED

The proposed advance in rates is limited to freight traffic; and it does not extend even to all the traffic of that character. Yet practically every railroad seeking approval of these increases in freight rates maintains a passenger service also; and passenger train revenues amount to more than 24 per cent. of the total transportation revenues of the carriers, as heretofore stated. It is consistent with the evidence of record as to some of these carriers that the increase shown in the ratio of operating expenses to operating revenues is attributable wholly to the increased cost of passenger service; and it is probable, in the case of every railroad showing a largely increased operating ratio, that the increased ratio is due, in large measure, to its passenger service. The unit of cost of moving certain kinds of bulk freight carried in large volume appears to have been reduced by more efficient operating methods despite increases in the rate of wages; on the other hand, the unit cost of moving passengers has been almost uniformly increased independently of the effect of wage advances, through the use of heavier equipment, the adoption of safety devices, and better service.

Passenger fares are paid directly to the carriers by those making use of the service, and they know what it costs them. Payments for freight charges, while less direct, are none the less actual. The general public does not know, and probably does not stop to consider what proportion of the cost of a ton of coal, or of the price of a dwelling, or the rent of an apartment represents freight charges, but the cost of freight transportation enters into the cost or selling price of practically everything used by the public. In many cases, to be sure, freight charges represent but a small proportion of the total cost of things used or consumed, but it is quite probable that the average family pays much more in the course of a year as freight charges than it does for passenger fares. We know of no provision of law under which we should be justified in increasing freight rates to provide a return upon property used exclusively in the passenger service, much less to take care of losses incurred in such service. In our opinion each branch of the service should contribute its proper share of the cost of operation and of return upon the property devoted to the use of the public.

DIFFERENCES IN FREIGHT TRANSPORTATION COSTS

But even if the evidence clearly established an increase in the general freight operating expense ratio, we should not be at liberty on this record to conclude that the cost of transporting each kind of freight had increased, much less that it had increased proportionately. The evidence is clear that as to certain classes of bulk or heavy freight, like coal, coke, ore, cement, brick, tile, clay, and plaster, the use of larger cars must have reduced operating costs, whereas in respect to expedited package freight, shipped in cars moving on a regular schedule regardless of the quantity of their contents, the use of larger cars, involving greater unused car capacity, must have increased the operating costs. Similarly the extension of the expedited service in carload freight must have increased the cost, while the heavier train loading of the slow train, in which the heavy or bulk freight usually moves, has tended to decrease the cost.

DIFFERENCES IN TERRITORIAL CHARACTERISTICS

There is a wide difference in the character and profitableness of the traffic moving under substantially similar conditions in different parts of official classification territory. That territory is divided into three parts: The New England territory, with 8,071 miles of railroad reaching a population of 1,389 persons per mile; the trunk line territory, with 23,777 miles of railway line and a population of 889 per mile; and the central freight association territory, with 35,849 miles of railroad and a population of but 506 per mile. In the New England territory only 17 per cent. of the population is rural, in trunk line territory 30 per cent. is rural, and in central freight association 46 per cent. With 2,000,000 less population than trunk line territory, the area of central freight association territory is 74,000 square miles greater and is traversed by 12,072 more miles of railroad; it embraces nearly three times the area of the New England territory and is traversed by 27,778 more miles of railway. Its navigable lakes and rivers constitute one of the influences affecting the level of the rail rates now prevailing there. In the New England territory there are no coal mines, and a large part of the traffic is of a high-grade character. In trunk line territory the products of mines furnish a large part of the tonnage, while on group III of the central freight association lines the traffic is more diversified. The differences in the freight earnings per ton per mile are illustrated as follows:

Illustration of Differences in Earnings per Ton-Mile in Three Territories

Names	1910 Cents.	1911 Cents.	1912 Cents.	1913 Cents.
Boston & Maine	1.085	1.095	1.089	1.054
New York, New Haven & Hartford	1.417	1.390	1.371	1.345
New York Central lines east of Buffalo	.642	.647	.653	.623
Pennsylvania lines east of Pittsburgh	.618	.619	.617	.617
Central freight association lines	.570	.573	.575	.563

READJUSTMENT OF CENTRAL FREIGHT ASSOCIATION RATES

The testimony tending to show that a readjustment of rates in central freight association territory is what is needed was not disputed. The class-rate structure is honeycombed with inconsistencies.

The attitude of the officials of the roads operating in central freight association territory, as disclosed on the record, indicated that they joined in this proceeding not because they thought the so-called 5 per cent. increase of rates would meet their requirements or that this form of relief is appropriate in central freight association territory, but only because of the desire of other and more powerful lines operating in trunk-line territory to present to us in this proceeding one general plan of relief. These officials, while stating that the so-called 5 per cent. increase would add substantially to their revenues, expressly condemn the present basis of rates as unsuitable and unsatisfactory. The leading railroad witness on the question affirmed, with some earnestness, that "the class rates do not sustain any logical relation to each other," and that under the present basis of rates "certain shippers of certain classes of freight have not for years borne their share of the burden of transportation, and in addition to the rates being extremely low they are unscientific and illogical."

CONCLUSIONS

In what has preceded we have found, treating as one road the 35 railway systems in official classification territory that have asked for this so-called 5 per cent. increase in rates, that their net operating income is insufficient and should be increased. There remains for consideration the question whether the proposed increases in rates should be approved.

We have seen that the class rates in central freight association territory are on a lower scale than can be found elsewhere in the country, and that many of the commodity rates are too low and are probably unremunerative, considering the diversified nature of the traffic. The class rates and many of the commodity rates may therefore with propriety be increased. This approval, however, is subject to the following limitations:

(*a*) With respect to certain heavy commodities, namely, brick, tile, clay, coal, coke, starch, cement, iron ore, and plaster protestants made such a showing as to constrain us to hold that the carriers have failed to sustain their burden under the statute.

(*b*) Reference has heretofore been made to the fact that the proposed tariffs are based on a minimum increase of 5 cents per ton on all commodities moving under rates stated in cents per ton when less than $1 per ton; with respect to certain hauls, this would result in increases much in excess of 5 per cent. and in certain cases the increases would be as high as 50 per cent. The

carriers have failed to establish the propriety of this minimum increase, and the evidence offered by the protestants makes it clear that it would work hardships and discriminations and can not be approved, since under it a disproportionate burden is cast upon the heavy short-haul traffic.

(*c*) The tariffs also name many other rates involving increases exceeding 5 per cent. by varying amounts; these rates also must be condemned as throwing upon the traffic affected by them a disproportionate burden, for which no justification has been shown.

(*d*) There may be also a number of rates throughout central freight association territory that still are controlled by the force of unexpired orders of this commission, entered after specific investigations in formal cases. No showing has been made why those orders should be modified.

Except in respect of the rates above referred to we are of the opinion that the proposed intraterritorial rates in the central freight association territory have been justified by the carriers and may be put into effect.

We find that the financial condition of the trunk-line carriers does not warrant a general increase of freight rates and shall also show that the needs of the New England lines are being cared for locally. The carriers failed to prove either that the existing rates in trunk-line or New England territories are too low or that the increased rates proposed for those territories would be just and reasonable rates. Nor have they proved that the existing interterritorial rates in official classification territory are too low or that the proposed increases in those rates would be just and reasonable. The carriers will be required therefore to cancel all the tariffs in which these rates are proposed.

Upon the whole record we find that the carriers have not met the burden of justifying their proposed increased lake-and-rail rates. On general grounds, also, those increases must necessarily fall with the fall of the increases in the all-rail rates. The carriers that have published such rates will therefore be required to cancel them except in so far as any increase here approved in central freight association rates may require, under established bases, some increase in the rail-and-lake rates or in the factors upon which those rates are based.

THE EFFECT ON THE TRUNK LINES OF RATE INCREASE IN CENTRAL FREIGHT ASSOCIATION TERRITORY

Increased revenues resulting from increases in rates in central freight association territory will afford some relief to practically all the lines in official classification territory which are in need of additional revenues, except the New England lines. The latter roads have only a relatively small interest in this proceeding, and their requirements are being considered locally in conferences with the state authorities and others. It will also aid several large roads not included in the 35 systems and more than 30 small roads in central freight association territory which appear to be in greatest need.

In the conduct of these inquiries the commission has not had the full co-operation of the carriers and the shippers have not had an opportunity of being fully heard. For these reasons our suggestions as to the steps to be taken to secure additional revenues are to be regarded as tentative merely. The information collected and put on record convinces us, however, that great opportunity exists for increasing the net revenues of all carriers in official classification territory, otherwise than by resorting to a general advance in their freight rates.

The practice of granting free transportation of passengers and private cars, although less general than formerly, in part because of prohibitory legislation upon that subject, is still a heavy burden upon the railway passenger service, and it is recommended that the practice be still further restricted by the carriers.

Compilations prepared by the Commission show that the revenue from private cars handled free during the year 1913 on 88 of the roads which have made answer to our question would, at tariff rates, have amounted to $644,250.79.

We suggest a careful review of methods for increasing freight-car efficiency. In certain departments of railroading great advances have been made in efficiency in recent years; for instance, by increasing the train loading. On the other hand, the cost of the freight car as an element in the cost of transporting goods seems to have grown greater instead of less. The capital cost of equipment has increased more rapidly within recent years than the capital cost of the road. The ratio of the maintenance of equipment expense to gross revenue has grown largely, but it is not unreasonable to expect that such added costs can be overcome, as they have been in some other departments of railroading and in many other industries, by advances in management and methods. It is, however, in the use and operation of cars that we must look for the most substantial economies.

IS THERE A CRISIS OR CAUSE FOR ALARM?

It was insisted during the hearings that the carriers are facing a crisis and that the need of relief is so urgent as not to permit of the orderly investigation of the possible sources of additional revenue other than by the proposed freight rate increase. The executives admitted the propriety and need of a general readjustment of many of their present rates and practices, and the possibility of further economies and of increased efficiency; but they insisted that grave and serious responsibilities would be incurred if we failed to relieve the situation by at once approving the proposed 5 per cent. increase in rates. The principal danger suggested was that the carriers would encounter great difficulty in renewing their maturing short-term notes and other obligations unless investors were assured that the carriers' revenues would be increased immediately. Subsequent developments have shown that there was little foundation for any such view. During the world-wide financial stringency prevailing in 1913 the railroads, in common with states, cities, and the industries, found it difficult to secure loans, however good the security, but with the growing ease in the money markets this difficulty has largely disappeared. According to the standard financial journals, nearly $500,000,000 of bonds and notes have been disposed of by the railroads since January 1, 1914. Recently $35,000,000 of Baltimore & Ohio Railroad Company short-term notes were taken at par in an afternoon. The interest rates exacted were undoubtedly high as compared with those prevailing generally during the 14 years preceding, but the burden of high interest rates is not confined to railroad securities.

The credit of our railroads has undoubtedly suffered in recent years, but largely from causes that were independent of their rates. Their borrowing power has suffered relatively, because of the great competition for money by governments, states, municipalities, public-service corporations, and industries. It has suffered actually because of the mismanagement of great railroad systems of international repute. The conspicuous decline in the securities of certain railroads and the circumstances leading up to the appointment of receivers for others have impaired the confidence of the public in the stability of railroad securities. This feeling of insecurity has been increased, first, by the fact that recklessly mismanaged railroads have been largely under the control of powerful banking houses theretofore considered conservative; and, secondly, by the fact that the great railroad systems have become interlocked with weak lines either directly through stock ownership or by common directorships or otherwise.

The credit of some of our leading railroads has also been strained by the too free use of it in unwise and sometimes disastrous extensions of their lines, and even more seriously by the acquisition of properties not forming a part of their railroad system or used at all in transportation service. The campaign of publicity hereinafter referred to has also increased the strain on the credit of the railroads. But the earning capacity of our railroads is so great that their credit will soon be restored if their revenues are conserved. The crop estimates give promise of greatly increased gross revenues for the current fiscal year.

THE CAMPAIGN OF PUBLICITY

The letters and telegrams received disclosed an unmistakable purpose to hurry the commission to a conclusion before the record had been closed and before there could be an opportunity to hear, much less to consider, the testimony that the protestants and others desired to offer in protection of what they conceived to be their interests as shippers. Respectable journals joined in demanding the immediate approval of the proposed rates. Cartoons appeared in the public press depicting the commission as an obstruction to progress and prosperity, as if increasing the burdens of commerce by an increase in the rates for its transportation was the only solid foundation for our permanent prosperity. One traffic association offered to deluge the commission's offices with thousands of telegrams; other organizations started chains of letters, some of which, in identical language, are still reaching the offices of the Commission from widely separated parts of the country; others took the trouble to send to members of the commission clippings from newspapers and magazines containing editorials and news items relating to the case and denouncing our delay in disposing of it. All this was done regardless of the fact that the commission is under the express statutory obligation of affording a full hearing in such matters to all who desire to be heard and have reasonable grounds for a hearing.

Most of these communications were doubtless well intended, but they have not been helpful. Those that have been examined disclose that the writers were without any real understanding either of the many intricate questions involved in the investigation or of the facts disclosed upon the record; and they show little appreciation of the statutory standards by which we must be controlled when considering the rates and practices of carriers. Many asserted that business was dull and that an increase in rates "would give things a start." The general thought running through practically all the communications was that new enterprises were being held up; that men were out of employment; that business was in need of a stimulus; and that the laying of an additional burden upon commerce through increased freight charges would be a sufficient tonic to start a general forward movement, because the railroads themselves would then become large purchasers of supplies. The law fixes the standards by which the rates and practices of carriers must be judged and the commission can act only in accordance with those standards and after a full hearing; we have no authority to approve rate increases with a view to stimulating business. Nevertheless, the writers of many of these letters urged immediate action by the commission on the ground that the prompt approval of the increased rates would "restore confidence" in the financial and business world and that such a result in itself would be a sufficient basis for action by the commission; and in many cases they frankly stated that they would prefer an increase in rates rather than a continuance of the present dullness of trade because the burden of increased rates could "be passed along to the consumer."

Mr. Willard, president of the Baltimore & Ohio Railroad Company, and chairman of the committee of executives in charge of the presentation of the case of the carriers, while frankly admitting that the carriers had established a publicity bureau for the purpose of accurately advising the press and shippers of the facts developed upon the record, disclaimed any personal responsibility for the propaganda, and definitely stated that his personal endeavors were limited to an effort to have the facts correctly laid before the public. Whether other and subordinate officials of the carriers may be responsible we do not know, nor have we sought to ascertain. There can be no doubt, however, that this clamor and outcry have tended to mislead the public and have seriously aggravated the present commercial depression.

This matter is referred to because of its general impropriety and because it shows the existence of a widespread misconception as to our powers and duties.

We may justly feel proud of the development of our transportation system. Despite occasional discreditable chapters, the history of our railroads has been marked by great achievements. There is among the carriers a growing spirit of co-operation with the commission in its efforts to enforce the law. With the application of correct and helpful accounting, the establishment of sound business methods, and a better understanding by both carriers and the public of their mutual obligations, to which we believe this investigation has contributed, the future is full of promise. We see no reason why our American railroads should not enjoy a large measure of prosperity consistently with just and reasonable rates.

In order to give effect to our findings and conclusions herein and to avoid confusion in establishing the rates herein approved, it will be necessary for the various carriers to cancel all the tariffs now under suspension; and an order to that effect will be entered.

DISSENTING OPINIONS

Commissioner McChord: To prevent in central freight association territory the increased rates proposed in the majority report and to deny increases to the trunk lines appears to me to be unwarranted by the facts of record and not in harmony with the general basis of rate adjustment that has so long existed in official classification territory, and I deem it proper to state briefly what seem to me to be certain practical reasons which lead me to this conclusion.

To disallow an increase in the joint through rates and at the same time allow an increase in central freight association territory to and from the Ohio river gateways would have the effect of allowing increased locals to central freight association lines on this through traffic at the expense of their southeastern connections, who would be expected to shrink their earnings to the extent the central freight association lines increased theirs.

The two subdivisions of this territory, to wit, central freight association and trunk line, constitute one great industrial community which supplies the bulk of the manufactured products of the country and through which move the great streams of east and west bound commerce. The two territories are divided only by an imaginary line.

Within each territory are some of the greatest commercial centers of the country, each in active competition with the other in the purchase and sale of raw materials and manufactured products. For many years the rates between these cities have borne a fixed and well understood relation each to the other. Commercial conditions have, to a considerable extent, come to be based upon this relationship and, in so far as is shown by this record, it appears to have given general satisfaction. It must follow that any general increase of rates within central freight association territory alone will change the rate relationship as between cities in that territory and cities in trunk line territory, perhaps to the advantage of the latter

Viewed from a commercial, geographical, or transportation standpoint, and in the light of the facts of record, I am convinced that the reasons which impelled the commission to approve certain changes in central freight association rates apply equally to trunk-line rates, and that the transportation conditions in the two territories are not absolutely so much unlike as to indicate the wisdom of dissimilar treatment of the rates proposed by the carriers in the entire official classification territory.

Commissioner Daniels: In the conclusions reached in the majority report I am unable to concur. Except as hereafter indicated, the 5 per cent. advance should have been granted in trunk-line territory no less than in central freight association territory. To the extent that an increase is permitted upon rates in central freight association territory I concur. The majority opinion, however, falls far short, in my judgment, of giving even to the carriers in that region the relief to which the evidence of record clearly shows they are entitled.

For more than a decade the operating and maintenance expenses of the railroads of the United States have constantly

risen. The rates charged, on the other hand, have been either static or declining. Unable to raise their rates without the sanction of this commission, the railroads have found that the margin between their receipts and their outgo has progressively narrowed; that their net profit from operation has tended to decline; that their operating ratio—the number of cents out of every dollar received which are absorbed by the cost of conducting their business—has steadily increased. Despite recent investments of hundreds of millions embodied in extensions and improvements, the addition to net operating income has been meager in the extreme. In conspicuous instances, despite such additional investments, there has been an absolute decrease in net operating income; this decline in net earnings has occurred during a period when the carriers have handled an increasingly greater tonnage and carried more passengers than ever before. While they have been furnishing greater and better service, both in the transportation of freight and the carriage of passengers, their net operating income has at the same time progressively dwindled.

While the suggestions offered at the close of the majority report as to methods of conserving and increasing railroad revenue are, many of them, interesting and significant, others are more or less conjectural, and most of them remote in possible effect. This commission is not constituted by law a board of general managers of the railroads of the country, and the assumption of tendering suggestions as to management ought never to delay or postpone the settlement of a plain matter of law and fact involved in an application for advanced rates.

The testimony offered by the carriers deals mainly with insufficiency of return. Such testimony is germane and proper. Evidence establishing general inadequacy of return impeaches the general reasonableness of rates which result in such inadequate return. It is not conclusive evidence that rates are unduly low, but it creates a reasonable presumption to that effect, and it suffices to meet the burden of proof cast by the law upon the carriers which propose rate advances.

Failure to advance passenger fares at the same time is no persuasive reason for declining permission to increase freight charges to a level that is just and reasonable. Peculiar difficulties center around the advance of passenger fares, and while they eventually ought to be made to bear their proper share of transportation expenses, their elevation under existing circumstances must in point of time inevitably follow comprehensive adjustment of freight rates.

To deny advances which would establish rates just and reasonable, and in consonance with changed conditions of costs and income, will but postpone a necessary and inevitable readjustment. It is true that the difficulties confronting the carriers may be temporarily lessened or even for a time offset by unusually heavy tonnage arising, for example, from exceptional crops; but in the ebb and flow of material prosperity from year to year these difficulties will reappear and, without adequate offset in the shape of higher rates or otherwise, will eventually become chronic.

The averment was made that the maintenance costs have been excessive, but it is significant that the majority report though canvassing this particular subject fails anywhere to find that the maintenance costs are excessive.

Certain of the carriers seeking to make this advance are charged with waste or other financial irregularities. The New Haven, which has been shown guilty of such practices in the past, is not interested, save to a slight degree, in the present decision; but even if a few vitally interested railroads had been shown culpable it would not change the conclusion, because it has already been demonstrated that where their lines are inextricably interlaced with other lines no practical distinction can be made in according advances. The attempt would defeat its own end. So with this in view the majority report accords, of necessity, the same advances to the Cincinnati, Hamilton & Dayton, the Pere Marquette, and other lines in central freight association territory whose administrative integrity has been impeached, as to the remaining lines in the same region whose management has not been questioned.

THE BURDEN OF PROOF UNDER THE STATUTE*

It is clear that evidence of inadequate returns upon the fair value of property devoted to the public use is *prima facie* a showing that present rates are unduly low, and that rates higher than those current are presumably just and reasonable. To this extent revenue evidence is rate evidence; and revenue evidence applying to rates in their totality is rate evidence which applies to each specific rate.

The contention that the commission may not pass upon rates as a whole, but that it is obliged under the law to consider and to pass separately upon each particular rate between every two points, is expressly and explicitly repudiated.

The obvious conclusion, both from reason and from precedent, is that the commission may legally deal with rate schedules as a whole, and also that insufficiency of revenue is a proper ground upon which, nothing substantial to the contrary appearing, to accord advances which will result in just and reasonable rates.

The further contention is made that the proposal of a 5 per cent. advance upon existing rates presumes a relationship between particular rates which is just and proper; that there is no conclusive evidence of this fact; and that a 5 per cent. advance would simply accentuate the disparities, inequalities, and inconsistencies already interwoven in the rate fabric. It is clear that this contention can not have prevailed in the majority opinion. Had it done so the 5 per cent. advance could not have been accorded in central freight association territory. There exists a presumption in favor of inter-relations in a rate fabric that have long continued undisturbed. Moreover, there are commonsense limits within which any attempts at a rate adjustment are necessarily confined. Every act of rate making necessarily carries vestiges of discrimination; the very classification of freight assimilates into one class many articles not identical in weight, bulk, value, or fragility. The commission is not called upon to do the impossible and to show such meticulous attention to the adjustment of fractions as to preclude the possibility of any readjustment of rates whatever. With a demonstration of inadequate revenues, and with a presumption in favor of the propriety of the interrelation between rates long in effect, an advance moderate in amount, calculated to produce but a reasonable increment in earnings, and affecting all traffic in the same proportionate degree, is the plain dictate of law and of common sense in the premises.

Another contention that sought to impeach the propriety of granting advances was founded on the idea that the failure to increase passenger rates simultaneously with the proposed advance in freight rates would impose on freight traffic an undue burden.

It is becoming increasingly clear that passenger traffic does not bear its proper share of the joint costs incurred by the carriers for the transportation of freight and passengers. But it is even more clear that as a practical matter passenger fares can not be speedily readjusted upon a higher basis. Although the record in this case clearly shows that the carriers generally do not find passenger traffic highly remunerative, the suggestion that they should add to their revenues by advancing their passenger rates is of little force in view of the fact that they are powerless to adopt it. In recent years state commissions and state legislatures have established maximum intrastate passenger rates. So long as the rates thus established are not so low as to be deemed confiscatory in violation of the fourteenth amendment to the federal constitution the carriers are bound to observe them. The activity of the states in this respect has been so general that the carriers no longer can fairly be expected to

*Note.—It ought to be said, however, that what is above stated as to the burden of proof and the authority of the commission to pass upon rates as a whole does not imply that these views are opposed to those of the majority.

look upon their intrastate passenger traffic as a possible field for the substantial augmentation of their revenue.

CONCLUSION

The ratio of return upon the property investment has been indicated. The contention of the carriers is that upon investments in property amounting to approximately $640,000,000 since 1910, no commensurate return has been made, and that the net operating revenue between 1910 and 1913 shows an actual decline. It is no sufficient rebuttal of these contentions, if the supporting figures are true, to point out that the "revenues received by the carriers have been earned by the whole investment, and it is not correct to say that a part of the investment made since a given date has earned no return." The point of the contention is that additional investment can not be expected on the showing made on the last increments of investment. It may be true that physically the $640,000,000 invested since 1910 has been annexed to or blended with the property previously existing. It is admittedly true that the net return has come from working the entire property, old and new. But it is equally certain that if the marginal investment affords no addition to net revenue, the incentive to add further investments is lacking. From this standpoint, the financial standpoint, the case is exactly as though the original property had alone yielded the entire net revenue, and the addition had failed to make any return whatever. Expected earnings constitute in the last analysis the bid which the carriers must make for new capital for needed improvements, extensions, new rolling stock, and similar purposes. It is not necessary to say that on such a showing the investing public will hardly be eager to intrust its funds to transportation enterprises. Where well-secured, long-time bonds bearing 4½ per cent. interest command little over par, and where stock can be sold at par only on the prospect of a much higher rate of return, it is clear that the carriers must make a better showing of net revenue before they can as a whole enlist large additional supplies of capital.

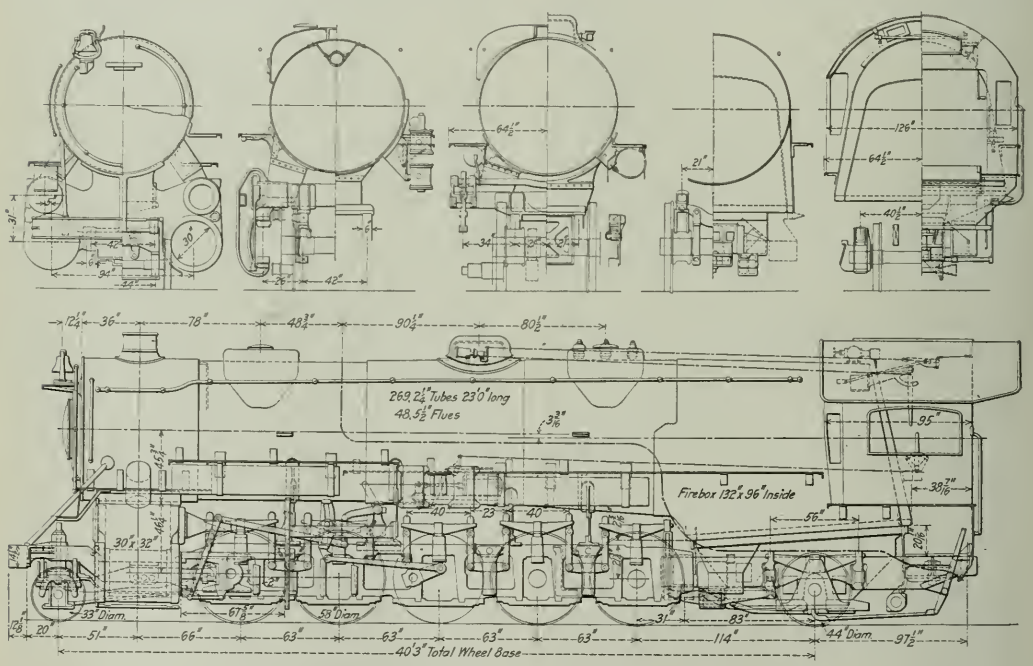
BALTIMORE & OHIO 2-10-2 TYPE LOCOMOTIVE

The Baltimore & Ohio recently placed in service a large locomotive of the 2-10-2 type which was built by the Baldwin Locomotive Works. It will develop a tractive effort of 84,500 lb. and marks an interesting step in the development of the non-articulated locomotive for heavy freight service. The tractive effort exceeds that of many Mallet articulated locomotives of the 2-6-6-2 type; while at the same time, the capacity for speed and the simplicity of construction, especially as concerns the driving mechanism and steam piping, commend it for heavy road service where operating conditions are severe and locomotives must be kept in service a large proportion of the time.

The ratio of adhesion is approximately 4. Many locomotives are operating successfully with a ratio as low as this, and with reasonably careful handling, the full starting tractive effort may be developed under ordinary service conditions.

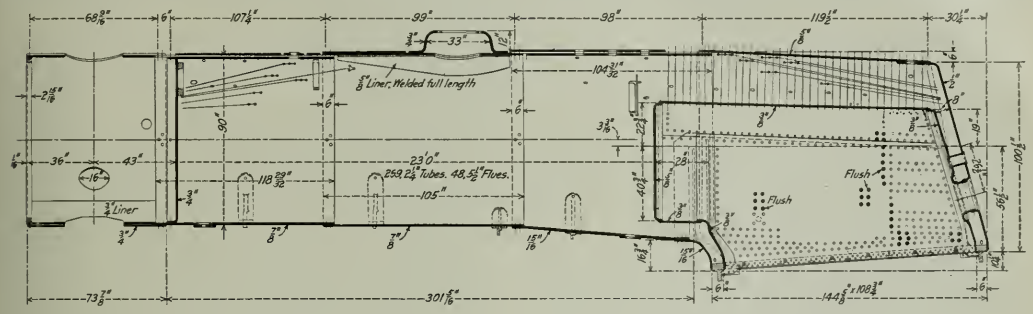
The boiler is of the straight top type with a combustion chamber 28 in. long and tubes 23 ft. long. The third ring in the barrel is tapered, with the slope placed on the bottom in order to give a free entry to the throat. The equipment includes a Security sectional arch and a Street mechanical stoker. The superheater is of the Schmidt type, and is composed of 48 elements. The dome is of pressed steel, 33 in. in diameter and 12 in. in height. Owing to restricted clearance limits, the whistle is tapped into the side of the dome in a horizontal position, and the safety valves are screwed directly into the boiler shell.

The cylinders are each cast in one piece with a half-saddle, and the castings are bolted to the smokebox and to each other by double rows of 1¼ in. bolts. The steam distribution is controlled by 16 in. piston valves, driven by Walschaert motion and set with a lead of ¼ in. The valves have a steam lap of 1¼ in., and are line and line on their exhaust edges; the Ragonnet power reverse mechanism is applied. No vacuum relief valves are used, but the cylinders are equipped with by-pass valves of the Sheedy pattern.

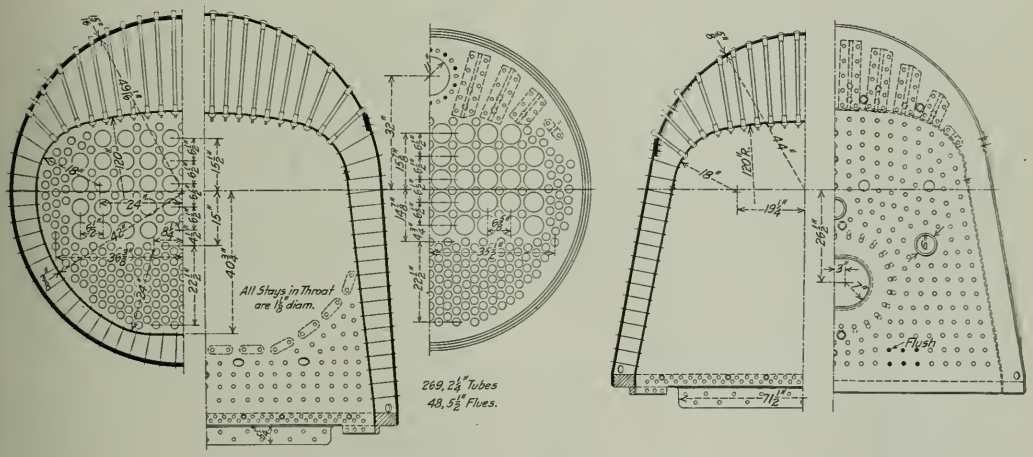


Longitudinal and Sectional Elevations, Baltimore & Ohio 2-10-2 Type Locomotive

The cylinders and steamchests are lined with bushings of Hunt-Spiller metal, and the piston and valve packing rings are of the same material. The pistons are steel forgings, of dished section, and are fitted with bull rings of Hunt-Spiller metal. These rings are secured to the pistons by retaining rings, which are electrically welded in place. The main rods are of I-section, and the main stubs are of the Markel solid end type; the side rods are of rectangular section. The knuckle pins are fitted in case-hardened steel spherical bushings to allow the rods a limited amount of lateral flexibility. A total lateral play between the rails and flanges amounting to one inch is allowed on the front and back driving wheels, while the play on the second and fourth pairs is ¾ in. The wheels of the third or main pair have plain tires, and all the driving wheels have a lateral play of ¼ in. in the boxes. These provisions for flexibility are necessary in order that the locomotive can traverse the sharp curves on the mountain divisions of the Baltimore & Ohio.



Boiler for the Baltimore & Ohio 2-10-2 Type Locomotive



End and Sectional Elevations of the Boiler

The frames have a width of 6 in. and a depth over the driving

Heavy 2-10-2 Type Locomotive for the Baltimore & Ohio

pedestals of 7 in. The pedestal binders are secured by three bolts on each side. The frames are braced transversely by the guide yoke and valve motion bearer; also by crossties placed respectively over the fourth pair of driving pedestals, and between the fourth and fifth pairs of driving wheels. The second and fourth pairs of pedestals are also braced by steel castings which extend the full depth of the frames. The rear frame sections are spliced to the main frames immediately back of the rear driving pedestals, and are braced by a steel casting which serves the triple purpose of a crosstie, a support for the front end of the firebox, and a carrier for the radius bar pin of the trailing truck. The main frames have single front rails, 13 in. deep, cast integral with them, and each cylinder is secured to the corresponding frame by 16 horizontal bolts, 1⅛ in. in diameter, and by a key at the back, providing a connection with a liberal amount of bearing area.

The trailing truck is of the Hodges type, with the spring hangers placed at an angle so that they will swing in planes tangential to the arc in which the truck swings. The first and second pairs of driving wheels are equalized with the leading truck, and the three remaining pairs with the trailing truck.

In designing this locomotive, care was necessary in order to keep the overall dimensions within the specified clearance limits. The bell is mounted on the righthand side of the smokebox front, on a level with the headlight. There are four sandboxes, two for use when going ahead and two for backing up. They are mounted right and left, on the top of the boiler, and the corners are rounded to keep within the tunnel clearances. For the same reason the cabroof is rounded with a comparatively short radius.

The tender is of the Vanderbilt type, with capacity for 10,000 gal. of water and 16 tons of coal. The wheels are of forged and rolled steel, manufactured by the Standard Steel Works Company.

The success which locomotives of the 2-10-2 type have achieved thus far, points to their increasing use for freight service where the hauling capacity of Mikado type locomotives is inadequate, and where conditions are such that Mallet locomotives cannot be used to advantage. Locomotives of the 2-10-2 type can be built to develop high tractive effort, and at the same time carry moderate wheel loads.

The following are the principal dimensions and data:

General Data

Gage	4 ft. 8½ in.
Service	Freight
Fuel	Bit. coal
Tractive effort	84,500 lb.
Weight in working order	406,000 lb.
Weight on drivers	336,800 lb.
Weight on leading truck	22,700 lb.
Weight on trailing truck	46,500 lb.
Weight of engine and tender in working order	584,000 lb.
Wheel base, driving	21 ft. 0 in.
Wheel base, total	40 ft. 3 in.
Wheel base, engine and tender	76 ft. 6 in.

Ratios

Weight on drivers ÷ tractive effort	3.99
Total weight ÷ tractive effort	4.81
Tractive effort × diam. drivers ÷ total equivalent heating surface*	647.80
Total equivalent heating surface* ÷ grate area	86.00
Firebox heating surface† ÷ total equivalent heating surface*, per cent.	4.27
Weight on drivers ÷ total equivalent heating surface*	44.52
Total weight ÷ total equivalent heating surface*	53.66
Volume both cylinders	26.2 cu. ft.
Total equivalent heating surface* ÷ vol. cylinders	288.8
Grate area ÷ vol. cylinders	3.36

Cylinders

Kind	Simple
Diameter and stroke	30 in. by 32 in.

Valves

Kind	Piston
Diameter	16 in.
Outside lap	1¼ in.
Inside clearance	Line and line
Lead in full gear	¼ in.

Wheels

Driving, diameter over tires	58 in.
Driving, thickness of tires	4 in.
Driving journals, main, diameter and length	13 in. by 13 in.
Driving journals, others, diameter and length	11 in. by 13 in.
Engine truck wheels, diameter	33 in.
Engine truck, journals	6 in. x 10 in.
Trailing truck wheels, diameter	44 in.
Trailing truck, journals	8 in. by 14 in.

Boiler

Style	Straight top
Working pressure	200 lb.
Outside diameter of first ring	90 in.
Firebox, length and width	132 in. by 96 in.
Firebox plates, thickness	⅜ in.
Firebox, water space	6 in
Tubes, number and outside diameter	269—2¼ in.
Flues, number and outside diameter	48—5½ in.
Tubes, length	23 ft.
Heating surface, tubes	5,215 sq. ft.
Heating surface, water tubes	35 sq. ft.
Heating surface, firebox	258 sq. ft.
Heating surface, combustion chamber	65 sq. ft.
Heating surface, total	5,573 sq. ft.
Superheater heating surface	1,329 sq. ft.
Total equivalent heating surface*	7,566 sq. ft.
Grate area	88 sq. ft.

Tender

Wheels, diameter	33 in.
Journals, diameter and length	6 in. by 11 in.
Water capacity	10,000 gal.
Coal capacity	16 tons

*Total equivalent heating surface = total evaporative heating surface + 1.5 times the superheating surface.
†Including combustion chamber heating surface.

SOME DON'TS FOR THE CLERKS

By R. L. White

Don't throw the pins away when you clear up your desk. Chances are they still have the sharp point and can be used again.

Don't throw the letterhead and blind copies in the waste basket because you made an error in date or salutation. Tear the good bottom portion off; it makes admirable paper to "figger" on.

Don't sharpen the next pencil as you would whittle a stick. There is a difference between the two. Watch the man who makes the pretty point on the pencil.

Don't use a large envelope for mailing the next man's mail to him when small or medium size would suffice. A suit of clothes costs more than a pair of trousers.

Don't ever use more than one envelope for one time of mailing to one party. It takes you just as long to address the extra envelope or envelopes as it would to get all mail together. Think of the mail clerk, the train baggageman and the man who opens two or more envelopes when one would have sufficed.

Don't throw the rubber bands on the floor. Bands cost one railroad in this country fifty thousand dollars a year. If you doubt the high cost of rubber bands buy one box.

Don't throw the pencil away because it is half used up. A pencil lengthener can be used and permits usage to the last inch.

Don't throw carbon paper away until it has "served full time." Don't leave carbon paper on top of your typewriter to be blown to the floor by the janitor's broom.

Don't use the printed letterheads or printed forms for scratch paper. Scratch paper is far cheaper; it requires a printer to feed to the printing press.

Don't throw away the top sheet of the writing paper pad. Oftentimes it is not the least bit soiled.

Don't fail to count your needs before printing mimeograph circular letters. It is wasted energy and waste of paper to print more copies than you really need.

Don't throw away your old file records without recovering the file; it can oftentimes be used again.

Don't fail to turn off the electric fan when you leave at night. The motor wears out the same as you do.

Don't fail to turn out the lights, where proper to do so, before going home at night.

Japanese Railway Ferry Service.—Connection between the Japanese and the Korean-Manchurian railway services of the imperial government of Japan is made by the Shimonseki-Fusan railway ferry service, which, among other equipment, has two new boats capable of eighteen knots, which were completed and put on the run during 1913.

Santa Fe System Freight Loss and Damage Organization*

Investigation of Claims by the Operating Department; Results of a Vigorous Five-Year Campaign

By H. R. Lake

Chief Clerk to General Superintendent, Atchison, Topeka & Santa Fe

RELATION OF FREIGHT LOSS AND DAMAGE TO FREIGHT OPERATION

The prevention of loss and damage to freight is primarily the work of the operating department. Therefore investigation of all OS&D reports should be conducted to a conclusion by that department. The function of the freight claim department is to deal with the claims, determine as nearly as practicable the carrier's liability and adjust the transaction with the claimant. The aim of the former department is, or should be, to eliminate the cause and, therefore, the claim, and to the extent that success is attained the labor and worry of the claim department are reduced. The aim of every well-regulated claim department is to make prompt and equitable settlement with the patron. Therefore, there should be no conflict of authority or interest in the conduct and disposal of this great problem of the railway service.

The operating department has a peculiar interest in seeking out and eliminating the causes of loss and damage, for the reason that every dollar paid out on that account is chargeable directly to operation. Loss and damage claim payments have increased to an alarming extent; on some roads more than 3 per cent. of the total freight revenue is so paid out. There are no beneficial returns, but instead a feeling of resentment on the part of the shipping public which finds vent in many directions.

After all the best talking cards for a freight solicitor are "regular delivery" and "safe delivery," and the accomplishing of safe delivery is just as much the duty of the operating department as "regular delivery," and it is upon the general superintendent that that duty devolves. The freight claim department, not being in direct touch with freight operation, would not be expected to realize as the operating department does what it means to increase train haul, which so greatly affects operation, nor would it be expected to be familiar with operating costs. The freight claim department is not charged with holding down cost of operation, and since it is not, that department could hardly be expected to have as much interest as the operating department in the prevention of loss and damage claims, the payment of which results in a direct charge to operating expense.

The total amount of money paid out in claims for loss and damage to freight during the fiscal years of 1910, 1911, 1912 and 1913 by various roads of which I have record was:

AMOUNT OF LOSS AND DAMAGE TO FREIGHT, FISCAL YEARS 1910, 1911, 1912 AND 1913

	Loss and damage payments				Per cent. L. & D. to freight revenue			
Eastern Roads:	1913	1912	1911	1910	1913	1912	1911	1910

These figures show that one of the eastern roads' percentage of loss and damage to freight revenue in 1913 was 2.98, in 1912 2.55, in 1911, 2.52 and in 1910 2.63. Another important eastern road jumped from .78 per cent. in 1910, to 1.55 per cent. in 1913, an increase of nearly 100 per cent., representing in dollars and cents $701,724. Their total claim payments for the year were over $1,200,000.

One of the western roads which has a mileage of over 4,000, paid loss and damage claims amounting to 3.18 per cent. of its freight revenue for 1913 having risen from 1.51 per cent. for 1910. Another western road having a mileage of over 7,000 miles jumped from a percentage of loss and damage freight revenue of 1.16 in 1910 to 2.49 in 1912, an increase of 114.6 per cent. This increase represented in dollars and cents $538,312.

RELATION OF ONE OPERATING DIVISION TO ANOTHER

Centralization of forces for the purpose of concentrating effort in the prevention of loss and damage to a degree is necessary to accomplish the best results and I speak advisedly, for we, on the Santa Fe, have tried out division organization and found it to be lacking for the want of proper supervision. The relation of one operating division to another to bring about the results must necessarily be close because loss and damage is confined to no one division, or grand division for that matter, and, as it is a system-wide proposition, it must be met with combined and well-directed forces which is impracticable with each division working independent of the other. Again, minimization of expense is a featured condition of a well-organized movement and it can best be accomplished through centralization, but we may even go too far in that direction. Extending the authority of one man over more than one general superintendent's operating district, unless he bear the title of general manager or assistant general manager, where the territory is under one general manager, is apt to result in a clash of authority and bring about the same objection as that which obtains when the work is handled by the freight claim agents.

With no intention of criticizing any method of handling that may have been adopted by any other railroad, let me urge that you profit by the experience of the Santa Fe and steer clear of divisional organization which contemplates the investigation of OS&D reports in the offices of the division superintendent by an ordinary clerk, because in the end the experiment will be a costly one.

To begin with, our loss and damage work was under the direction of the freight auditor. The general superintendent or his superintendents personally seldom if ever saw an OS&D, and except for a general idea from lump sums appearing on the monthly freight operation sheet chargeable to loss and damage, had no knowledge of what part freight loss and damage represented in the cost of operation, nor what caused the payment of such large amounts. Being accustomed to seeing those charges month after month, they became hardened to the thought that it was a necessary evil of transportation and when the amounts increased as they did, month by month, would console themselves with the thought that the loss and damage was en

*From papers presented before the General Superintendents' Association of Chicago.

titled to show some increase because of an increase in business, never going far enough into the question to determine whether or not there was a disproportionate increase in loss and damage compared with business handled. This went on and on until a time came when there was an actual decrease in business handled, yet there was an even more than usual increase in loss and damage. Then the general superintendent asked himself, Why are things used and so? The management cuts his track force allowance 25 per cent. this month and in doing so says operating expenses must be held down to a certain point and it is then that the general superintendent looks about to see where he can make a saving that his track may be gotten in shape for the winter. In going over his operation sheet again, his eye rests on loss and damage. He notes $30,000, or approximately the same amount as his force allowance was cut. It was after just such an experience as this that it was decided to relieve the freight claim agent of the investigation of loss and damage and turn it over to the division superintendents, the idea being to get at the seat of the trouble and remove it. In the movement to prevent loss and damage, we had to feel our way. We continued to fall behind, simply because of a lack of united effort.

There are 14 operating divisions on the Atchison proper, four on the Coast Lines and four on the Gulf Lines, a total of 22. To each of these divisions there was assigned a $75 OS&D clerk who was supposed to investigate under the direction of the superintendent's chief clerk, all loss and damage reports. Any one who has had experience as a division superintendent, or in a division superintendent's office, knows that the chief clerk is a very busy man, without looking after what he has always regarded as being inconsequential OS&D reports. I dare say there is not a superintendent's office in the country that has more force than needed at any time during the month, and from the first to the fifteenth of the month—pay roll and distribution time—everybody is on the job from early until late and all other work takes a back seat, so to speak. The OS&D clerk is also pressed into service on payrolls, distribution and other monthly reports which you cannot put in the auditor's office too early to suit him. The result is, that OS&Ds which up to this time had been considered of least importance pile up higher and higher until the rush is over, when everybody available turns to and makes the OS&Ds scatter, not so much with the intention of getting at the seat of the trouble, as with the evident purpose of moving the papers; and there is where such plan fails. I would rather investigate one OS&D to a finality, locate the employee responsible for the freight going astray, or for damage, and take corrective action with that one employee than to investigate 25 in a haphazard manner and accomplish no certain purpose. Anything that is worth doing at all is worth doing right and there is no branch of the railroad service where the application of this old adage is more essential than in the investigation of OS&Ds.

Then suppose the Illinois division checks over without marks a box of dry goods which later develops checked short on the Los Angeles division. To match up the over with the shortage it is necessary for the Illinois division to communicate in some way with 21 divisions, while the Los Angeles division is busy at the same time looking for the box to fill a shortage. True, this could be accomplished by a daily exchange report of freight checking over without marks, but note the many divisions with which this report must be exchanged.

In the reorganization of the loss and damage work on the Santa Fe, after proving the failure of the divisional plan of action, we concentrated our forces, but not without first giving due consideration to an even more centralized plan, namely, that of handling the work for the entire system from one central office. On first thought the centralized plan appealed to us as being ideal, upon the theory that if it is better to concentrate in six general superintendents' offices, instead of 22 division superintendents' offices, why should it not be better to handle from one central office, under the direction of one official? However, we finally decided, after much deliberation, that the plan of having each general superintendent handle the work of his respective district has distinct advantages over the more centralized plan and for more than three years we have been so working, and with most gratifying results.

I might say further that this work was not turned over to the general superintendents without some directing influence other than a desire on their part to reduce operating expenses through prevention of loss and damage. The assistant to the vice-president in charge of operations was charged with the duty of reducing loss and damage, and was not only empowered to organize a system loss and damage committee and various sub-committees, but to act when, in the judgment of himself and other members of the committee, it was time to act to remove a cause for loss and damage. And this official was given the undivided support of every other official that he chose to assist him in the work; therefore, the system and organization which the Santa Fe has gradually evolved is the work not alone of one man but of all the officials of the operating, freight traffic and auditing departments, assisted in no small degree by the agents of the more important terminals and points of interchange. Our officials themselves have attended the semi-annual get-together meetings at which every department concerned in freight traffic over the entire system is represented. While the general superintendent should be charged with carrying out the actual operation of loss and damage investigation and the applying of curative measures, he alone cannot succeed; he must have the undivided support of every department concerned in the traffic because there are classifications, tariffs, claims, and many other features that he is not acquainted with that play an important part in the successful handling of this work, and there is not a day in which he does not need to counsel with the other departments.

ORGANIZATION

First of all we have a loss and damage committee covering the entire system, with membership consisting of

Assistant to vice-president—chairman,
Assistant general freight agent—secretary,
Assistant to general manager,
Claims attorney,
Superintendent of transportation,
General storekeeper,
Superintendent car shops,
General superintendents,
Superintendents,
Chief special agents,
Freight agents—Chicago, Kansas City, San Francisco, Los Angeles, Dallas, Galveston, Ft. Worth,
Manager Santa Fe Refrigerator Despatch,
General freight agents,
General live stock agent,
General baggage agent,
Freight auditors,
Freight claim auditors.

This committee meets at some convenient point on the line semi-annually. In addition to the members the following representatives are in attendance and take an active part in the deliberations:

Chief clerks to general superintendents,
General superintendents' chief of OS&D bureaus,
Superintendents,
Transportation inspectors,
Agents—important stations,
Head claim clerks of auditors' staff,
Special agent,
Traffic representatives,
Freight conductors,
Warehouse foremen.

This committee considers every phase of loss and damage from every angle. If a decision cannot be reached on any one recommendation or question that is brought before the committee, a sub-committee is appointed, charged with the special duty of making further study of the subject and reporting to the chairman its findings, and at that time giving its recommendation looking to a solution.

The present active sub-committees are: Cooperage; OS&D; Standing committee on seals; Oil; Blocking and stowing of automobiles; Eggs; Method of loading, stowing and bracing of freight; Refrigerator rules in book form; marking L. C. L. freight at stations; Loading, stowing and bracing furniture; Character of butter and candy pails; Leaky roofs, system and foreign cars; Form of receipt required of consignee for freight delivered.

The sub-committees already discharged after completing the duties assigned are: Inspection cards; Mismarking and butter tub covers; Crockery and glassware; Household goods shipped by forwarding companies; Leaky oil valves; Marking tobacco; Loading tobacco and cigars; Form for reporting delays to live stock; Packing house products; Card waybills, loading and stowing; Paper seals for boot and shoe boxes; Preparing cars for sugar loading; Crating of stoves; Handling potatoes; Connecting line shipments; Closer inspection of foreign cars at junction points; Marking L. C. L. freight at stations; Notifying owners of freight lost in transit.

The system committee has had nine meetings, the last of which was at San Diego, Cal., March 23-26, 1914. All members of the committee and others attending the meeting are supposed to keep on the alert between meetings and bring up any subjects that would be likely to prove of system-wide interest; in fact, any topic the discussion of which would be likely to result in the adoption of some improved rule or practice to prevent loss and damage; some six or eight weeks before the date is set for the next meeting the secretary calls for suggested topics for consideration and these constitute our docket. Every member suggesting a topic is supposed to come prepared to intelligently discuss it and give some solution. At these meetings we also consider every item of increase in our loss and damage statements for a six months' period ending with June and December, and inquire closely into the reasons therefor.

Just prior to the semi-annual meeting, the general superintendent calls local loss and damage meetings at which consideration is given to every item of interest in connection with loss and damage that may be suggested, so fortifying himself with ideas and the opinions of his division men. Such meetings are attended by superintendents, trainmasters, transportation inspectors, agents, conductors, warehouse foremen, and frequently by the freight claim auditor, freight auditor, division freight agent, general live stock agent and others who are interested in the loss and damage movement. These local meetings are conducted along the same lines as the system meetings, being different only in that they are localized to one general superintendent's territory.

In addition to these meetings the division superintendents hold monthly good service meetings at which any and every feature of freight and passenger operation is discussed. These meetings are attended by the superintendent, who acts as chairman, trainmaster, master mechanic, transportation inspector, special agent, local agents and other station men, conductors, brakemen, engineers, firemen; in fact, every employee who has to do with the operation. The minutes of these meetings are written up and exchanged with superintendents and general superintendents so that the entire system is constantly exchanging ideas; and there never was a better school of instruction for matters of this kind.

The working force employed wholly in the prevention of loss and damage in each general superintendent's office consists of chief of bureau, two investigators, one stenographer, one file clerk. This force handles all loss and damage correspondence, and compiles all loss and damage statistics. This bureau is under the direct supervision of the chief clerk to the general superintendent.

In addition to this the general superintendent of one of the districts employs one statistician to compile certain data respecting claim payments for the entire system, a position created at a recent system loss and damage meeting. This man, however, does not prepare all loss and damage statistics for general superintendents. Each bureau prepares its individual monthly analytical statement showing:

Analysis of OS&Ds investigated, showing cause developed by the investigation,
Statement of disciplinary action taken,
Inspection of cars of bulk grain passing given points,
Statement of carload shipments of eggs forwarded and out-turn checks,
Statement of test checks of loading at important stations,
Statement of grain doors recovered,
Report of arrests and convictions by the chief of the special service department,
Statement of OS&Ds issued by stations compared with same month of the previous year, and OS&Ds charged to each individual station, compared with same month of the previous year,
Statement of astray way bills, compared with same month previous year,
Statement of OS&Ds charged to each conductor, separate as between overs, damage, and pilferage,
Statement of errors definitely placed with conductors.

Also each general superintendent has a transportation inspector for each operating division. In view of the general nature of the work performed by these men, they might better be known as service inspectors. The duties are observation and correction of everything wrong pertaining to the obligations of the carrier, the shippers and the consignees of freight from the time it is placed in our possession until delivery is completed.

The transportation inspectors have a wide field for action, which is not restricted. Special attention is given to the following important items, the observance of which is essential to the proper handling of freight without loss or damage:

Education of Agents.—Instruct agents concerning the importance of promptly reporting unmarked overs and of forwarding marked overs to destination or delivering them to consignee or connecting lines without delay. The prompt reporting of unclaimed and refused freight. The prompt rendering of O. K. reports and of other matters making for efficiency in the station service.

Astray Waybills.—One of the most important factors in preventing wrong payments of claims is the matching of astray waybills with revenue waybills. Agents are careless in this respect. In examining stations they take a number of astray waybills for which revenue waybill reference is not shown, and search for revenue waybills to cover, and impress upon the agent the importance of watching this matter closely.

Defective and Dirty Cars.—Much damage to mill products arises from leaky roofs, and heavy losses of grain are chargeable to unsound cars and poor grain doors. These features are given particularly close attention at grain and milling stations. Cars set for grain or other loading are examined and if any are found unfit for the commodity which they are intended to carry, the inspectors ascertain who is responsible therefor and report the matter to the superintendent.

Delayed Correspondence.—They search the stations for delayed correspondence and if any is found, ascertain the cause and assist agents in getting it up. They do not take the agent's word respecting the condition of his correspondence but satisfy themselves by personal examination of the places where correspondence is kept. During this examination they look for unreported waybills and generally assist the agent in getting his work up where it seems necessary.

Delivery of Freight.—Many agents are exceedingly lax in delivering freight. Draymen are permitted to help themselves and delivery receipts are frequently not taken at the time of delivery. Freight should not be delivered until after the freight bills are made out, except where some special arrangement is made, and the agent should check the freight from the freight bills and take receipt at the time of delivery.

Loading, Stowing, Unloading, etc.—The improper performance of these functions is probably the greatest single source of losses and damages. Under this head may be classed: Failure to load in geographical order; unskillful and careless loading; failure to properly rearrange the cargo when freight is taken out

at intermediate stations; stowing heavy freight on top of other freight for intermediate stations, necessitating carrying the other freight several stations beyond where it belongs; the piling of heavy freight on other freight not strong enough to bear it; lack of diligence on part of train crews in searching for freight for intermediate stations.

Loading in Station Order.—They examine cars unloaded at stations where they are working to see whether the load is well stowed, or if the car contains any over freight, whether the freight is arranged in geographical order, etc., and take up direct with superintendent or agent, giving car number, seals, date of arrival, name of conductor and way bill reference.

Proper Stowing of Cars.—They examine loads stowed at stations at which they may be working, compare discrepancies discovered with the station records and see whether proper record was made of the condition of the freight and whether the station is responsible for the discrepancy or not. They give particular attention to freight loaded in wrong cars and follow their investigations to a satisfactory conclusion.

Manner of Transacting Business.—They are importuned to make investigations in a tactful and friendly manner, proceeding in the main along educational lines, trying to make the employee feel that their business is to help rather than to censure and that the report of their findings will be fair.

Marking.—The want of proper marking is one of the greatest sources of loss. They devote especial attention to this feature at jobbing centers. When freight is not properly marked, they discuss the matter with the agent and the shipper with a view to having it corrected, and where competition is an obstacle, investigate the feasibility of overcoming the trouble by joint agreement with other roads.

Station Force and Facilities.—If the force at any one station seems to be insufficient or there is a lack of facilities for handling the freight economically, they go carefully into the matter, giving their estimate of the cost of supplying the station's need and in like manner investigate any excessive force.

Claims that the freight claim auditor cannot satisfactorily adjust by mail are sent to the general superintendent for further investigation and adjustment by the transportation inspectors; because of their knowledge of the operating conditions of the division they are perhaps better able to adjust such claims than a special adjuster sent out from the freight claim department; in fact, they save many times their salaries every month in avoiding improper claim settlements, and expediting proper claim settlements.

These men report direct to the general superintendents but work very closely with superintendent and trainmaster, and unhesitatingly render assistance when called upon by them. Although they make special report of all irregularities of any consequence to the general superintendent, they often show in their report that the same thing has already been brought to the superintendent's or trainmaster's attention and corrected. They are privileged to write the superintendent direct on any question pertinent to their work but in each case send copy of such communication to the general superintendent.

In addition to these special reports of irregularities, the transportation inspectors make a weekly report to the general superintendent showing briefly where they were each day, what trains ridden, stations inspected, claims adjusted; in short, a brief summary of their week's work.

Next in importance to transportation inspectors are our train riders. The latter are assigned to no certain operating district but are placed by the chief special agent, to whom they report. The chief special agents report to the general superintendent and place the train riders where they are most likely to be needed. For instance, our line was infested with thieves between Chicago and Joliet and between Lexington Junction and Kansas City; and even now, notwithstanding our close surveillance, we are bothered occasionally with thieves breaking into cars while in trains but we are glad to be able to say that this policing of trains has had a most wonderful effect. We have four of these men assigned to the Eastern district. The work is important in that they catch the box car thief in the very act of his depredation, and the moral effect it has upon the hobo element is far-reaching.

EDUCATION OF EMPLOYEES

There are few, if any, railroads that have not placed in the hands of their station and trainmen ample instructions, the compliance with which will almost entirely eliminate loss and damage. But of what avail are these instructions if they are not complied with or even studied by the employees who are supposed to be guided by them? What precautions, if any, are taken to see that a complete file of instructions is maintained at every station and is in possession of each freight conductor? When a change is made in agents, what effort is made to see that the new agent has proper instructions?

We are accomplishing this on the Santa Fe through a series of examination letters, which are now being conducted with the agent and station forces over the entire system. Each examination letter consists of from 15 to 20 pertinent questions on freight traffic, and is put out to our agents and their forces once a month. They are required to mail to the general superintendent a written answer to each of those questions within a week or 10 days from the date of its receipt, and are graded on their replies. A grade sheet showing the percentage made by each agent or clerk is sent to every employee who takes these examinations, that he may know just what grade the others received. Should he take more than 10 days in replying to an examination letter, 1 per cent. for each day delayed, after 10 days, is deducted from his percentage. The questions asked in these examinations are carefully selected and to answer them an employee simply must know the rules. We have been carrying on these examinations for over a year, and we can already see the result in an improved efficiency. When we began the examination the average percentage of correct replies was low, but on the last examination there was a far greater percentage that ran from 90 per cent. to perfect than there was that fell below 90. To some extent we have conducted this same sort of an examination with our freight conductors and intend to go into that even further.

CO-OPERATION OF THE SHIPPER

It goes without saying that the support of the shippers in this great undertaking will make it far less difficult. Manufacturers and shippers working on a close margin pack their wares in the cheapest possible containers and already they have got a start on the railroads that is going to be difficult to overcome. We have made mention of the heavier power and stronger equipment that is being used today, which in the ordinary course of things would call for even more secure bracing and packing of freight than was the custom in years gone by, but instead of having better bracing and packing, we are having worse.

We recently made a test check at five of our more important stations covering a period of one week to see what percentage of wooden packages were in bad order, and also the fiber-board packages. We handled *outbound* RG.DGC wooden packages weighing less than 100 lb. Of this number, 508 were in bad order. We handled at the same time 30,749 fiber-board packages of which 449 were in bad order. We handled *inbound and on transfer,* 11,148 wooden packages of which 56 were in bad order and 2,416 fiber-board packages, of which 131 were in bad order. The fiber-board package is of recent origin and it behooves the carriers to see that its use is restricted to the class of freight shipments for which it is suitable. It is for the railroads to so amend their classifications as to properly limit the use of these containers. The shipper is just as anxious to have his goods delivered to his customer in good order as he is to have them delivered promptly, and we believe that if properly approached, he will assist the railroads in accomplishing that end, but we cannot go to a shipper and persuade him to use a better container than our classification provides. Good work can be done with shippers to get them to give correct descriptions of the

weights and kind of freight they ship, to pack their shipments securely, and to legibly mark all consignments—erasing all old marks. We have already had gratifying results from the efforts thus far made.

CLAIM AND OS&D ANALYSIS

You may think in the handling of OS&Ds that because you get a good many covering the loss of candy, you are paying out a large percentage of your money in the settlement of candy claims and would probably pay no special attention to millinery claims because you may find you only had one or two in a three-months period. An analysis of three-months claim payments showed that we had 179 claims on candy, representing 2.28 per cent. of the total number of claims paid, whereas the amount of money was only $643.74 or .83 per cent. of the total amount of money paid out in claims, whereas we had two claims on millinery representing .02 per cent. of the total number of claims, but in amount of money equalling $439.06, representing 57 per cent.

We paid 69 claims in a period of three months on potatoes, representing .84 per cent. of the total claims paid, but the amount of money represented by these 69 claims was $1,992.35 or 2.59 per cent. of the total amount of money paid out. In this three-months analysis, there were 8,193 claims and 397 commodities, represented; 5,640 claims, or 68.8 per cent. of the total paid were on 43 commodities or only 10.8 per cent. of the total commodities, 1,636 claims or 19.9 per cent. of the total number were paid on 79 commodities or 19.9 per cent. of the commodities; in other words, 122 commodities took in 88.7 per cent. of the total claims paid, leaving 275 commodities representing only 11.3 per cent. of the claims.

Without proper analysis, how do you expect to go about the elimination of loss and damage? It is of even greater importance to classify the *causes* for loss and damage than it is to classify the *commodities* with which you are having the most trouble. It is also important that you know with what shippers or consignees you are having the most trouble. This same three-months analysis showed that on a total of 66 claims for beer, 28 were by one shipper, out of a total of 25 claimants and the same brewing company was the claimant in 28 out of 66 claims paid. We have every confidence in our ability to prove this shipper's carelessness. On bathtubs we had a total of 42 claims and 16 of the 42 shipments were made by one firm. Would that not indicate that there was something especially wrong with the manner in which that firm put up the bathtubs for shipment?

This same analysis shows that on boots and shoes we prorated 48 claims with 13 different railroads and 20 of these claims were against one railroad. Would not that record indicate that there was considerable thievery going on on that railroad? Nine were with another railroad, making 29 out of the 48 shipments prorated with two railroads out of a total of 13 railroads. On one of these railroads, by reason of our persistently following up pilferage, they succeeded in sending to the penitentiary a number of their employees.

The same analysis showed that we paid 41 claims on cement; 20 of them were due to damage from wet. Would that not indicate that the cars into which the cement was loaded were either leaky or that the damage was done at the side door? Further investigation developed that damage was done mostly at the side door, and as a result of this record we commenced the stripping of side door cracks of cars loaded with cement, just as we do in the case of flour.

There were 51 claims paid on coke; 27 of these claims were paid to one company representing $521.38 out of a total claim payment of $694.54. The coal company in this case happened to be the shipper, also the claimant. Would not that record indicate to you that there was something wrong with the scales of that coal company? Detail analysis of claims and OS&Ds is one of the most essential features in the handling of loss and damage.

DETAIL OF ROUTINE. FORMS IN USE

Form 1,565, *Over, Short and Damage Report.*—Whenever freight checks over without marks, short or damaged, at any station, an agent makes out this report in duplicate, keeping an impression copy for his record, sending both copies to the general superintendent. One of these copies is placed in his permanent file; the other is used in connection with his investigation; in fact it forms the basis of investigation. We require our agents to answer every interrogatory, returning the report to them whenever any question is unanswered. In the case of freight checking over, a very clear description is given.

Form 1,566 *O. K. Report.*—An agent who has made an OS&D covering a shortage, fills out one of these forms whenever freight checking short is received. This report is also sent to the general superintendent in duplicate, the agent keeping an impression copy for his record. There is space for the agent to show car number from which the freight was received. By tracing this car back, we can find out in nine cases out of ten the cause for the freight checking short in the first place. In most cases, it was loaded in the wrong car, in which event we charge the improper handling to freight checker or stowman who is responsible. The receipt of one of these O. K. reports closes our investigation immediately insofar as tracing for the shortage is concerned, but the investigation is continued further to develop responsibility for the shortage in the first place, and when this responsibility is definitely placed, some disciplinary action is usually taken, as it is invariably shown that it was due to carelessness.

Form 1,568, *Report of Concealed Shortage or Damage.*—The need of this report developed after the general superintendents took over the investigation of OS&Ds. The agents make no OS&D for a concealed shortage or damage which is not developed before delivery of the freight to consignee, and formerly these shortages or damages were reported to the freight claim auditor, in the form of a letter. It developed that we had a good many concealed shortages or damages and that it was just as important, or more so, to investigate such shortages or damages as it was to investigate an over, short or damage that developed before delivery to consignee.

Form 1,413, *Pilferoge Report.*—Whenever freight is received indicating pilferage, agents make out one of these reports, sending it to the general superintendent in duplicate, the same as an OS&D. Agent makes this report in addition to a regular OS&D, because in pilferages there is information furnished that is not needed in an ordinary OS&D. We do not attach to this report the importance that we do to an OS&D, but it is helpful in the checking of our investigations. A copy of pilferage reports is also sent to our chief special agent, who assists in the investigation, even to the extent of assigning a special man to investigate.

Form 1,688 is designed to simplify our investigation: The use of such a form may be objected to by some who may prefer to handle by individual letters, on the theory that an agent or conductor will not pay as much attention to a printed form as a typewritten letter, but when the general superintendent is investigating OS&Ds they soon get that idea out of their heads and pay just as much attention to these forms as they do to a letter. Many OS&Ds are completed without the writing of a single letter, these forms being used exclusively; however, when it comes to closing out an OS&D with discipline we usually write a letter to the superintendent directing him in the matter or explaining to him the circumstances, allowing him to use his own judgment in the matter.

Form 1,414, *Seo Report.*—This is a special report covering cars that are found in trains or at stations with broken seals. A broken seal is usually evidence of pilferage and every case of this kind is given a special investigation in which the chief special agent assists.

Freight Conductor's OS&D Report Form 1,552.—Freight conductors make this report in triplicate for each shipment check-

ing over, short or damaged, and mail original copy to general superintendent. The duplicate copy in case of shortage, is attached to and remains with waybills for the car until it is made empty, unless shipment is found in the meantime, in which event conductor turns this report over to agent to whom freight is delivered. If not found, agent where car runs empty mails the report to the general superintendent. The agent at station where shortage is found shows on duplicate copy reference to astray billing on which freight is sent to destination and mails to general superintendent.

In case of freight checking over, conductor turns over to agent the duplicate copy of report where freight is left and agent shows thereon reference to revenue billing, if freight belongs at his station, or reference to astray billing, if freight belongs elsewhere, and mails to general superintendent.

In case of damaged shipment, conductor turns duplicate copy of report over to agent where freight is left and agent checks same against revenue billing and attaches to station OS&D report which he makes and mails to general superintendent. This report is put up in book form and the triplicate copy remains in the book for the conductor's record. The report provides for showing full reference to the train, the waybill and car number, covering each shipment on which there is reported over, short or damage. It gives apparent cause for damage, if any, and reference to car in which shortages are found, or in which freight checks over, and the disposition made of the freight by the conductor.

OS&D Record.—When an OS&D is received in the general superintendent's office, it is immediately entered in an OS&D record, which is a loose leaf system. These loose leaves are filed in the binders alphabetically, according to station.

The different headings on this form may be explained as follows:

a. OS&D reference, agent's number. Agents carry their OS&Ds consecutively, beginning with 1. If any agent's OS&D goes astray it is known in the general superintendent's office immediately upon receipt of the next numbered OS&D, for instance, should we receive Atchison OS&Ds up to No. 5, and the next one we received would be 7, we would know that No. 6 was missing and would call upon the agent for a duplicate, thus insuring the receipt of every OS&D.

b. All OS&Ds are numbered in the geenral superintendent's office consecutively beginning with 1 and without regard to the station. This is our file reference and OS&Ds are filed according to this number, in numerical order.

c. Date. In this column there is recorded the date of the agent's OS&D.

d. Billing station. The name of the station billing the freight that checked over, short or damaged is entered here.

e. Name of the conductor handling into the receiving station is entered here.

f. Train number. There is entered here, the number of the train handling freight into stations that checked over, short or damaged.

g. Name of commodity checking over. For instance, one case guns, one barrel of salt, or one bundle of sash weights.

h. Disposition of commodity checking over. For instance, the case of guns that checked over at Atchison may be found to be short at Burlingame. It would be sent to Burlingame and under "H" there would be written Burlingame.

i. Date freight checked over, forwarded to proper destination.

j. Commodities checking short.

k. Point at which commodity was found.

l. Description of freight checking damaged.

m. Description of freight checking pilfered.

n. Cause of OS&D.

After our investigation is completed, we can, in most cases, determine the cause of the OS&D, that is, the initial cause, and under this heading we merely show a number indicating reference to the cause—so arranged to avoid unnecessary labor writing out the causes, some of them being lengthy.

Under the heading "Action taken" is shown disciplinary action taken. We use the Brown system of discipline by which system we assess demerit marks and when an employee receives as many as 60 demerit marks, he is taken from service. He is given credit marks, however, to offset demerits for a period of perfect service.

At the beginning of the general superintendent's campaign, OS&Ds when investigations were completed, were passed to the freight claim auditor. At present, however, the general superintendent is holding the OS&D investigation papers in his file until the auditor calls for them which he does when claim is filed. If no claim is filed, the papers are never called for.

Memorandum of Overs.—In addition to recording freight checking over, all overs are reported in this memorandum and filed in a loose leaf binder alphabetically in order to give quick reference. When the OS&D are received in the office each day they are separated into overs, damaged and shorts. The overs are entered first in this memorandum of overs, and as the shortages are entered, reference is made to this memorandum, and by so doing, it is possible to immediately match up overs and shorts; every time OS&D papers are returned to the office, reference is had to this memorandum, so that if an overage is reported after an investigation has been started, we catch it on this memorandum and thus stop further investigation. System general superintendents exchange with each other a daily report of freight checking over, giving full description. These are numbered consecutively so that each general superintendent will know immediately if one of the reports goes astray. The overs so reported from other parts of the system are also entered in this memorandum of overs, so that if there is a piece of freight anywhere on the system that would fill any one of our shortages, we have the information before us without having to conduct a lot of correspondence to develop the fact.

These two forms are the only ones used in recording OS&Ds in the general superintendent's office. We have not used a card index in any place. Our experience with card indexes is that you lose more time with them than they are worth. OS&Ds, as explained, are filed in numerical order and the conductor's report serves the purpose of a file index book, in addition, giving the information needed to prepare the monthly analytical statement.

Check Clerk's Over Report.—This was designed with the intention of having reported to the general superintendent all freight checking over with marks, in fact, all over freight except dead overs, which are reported on regular OS&D forms.

Form 1,579 Standard, Bulk Grain Car Condition and Weight Report.—This was designed to locate grain leakages and secure better coopering of cars. Provision has been made to show teh loading agent's record wherein full way bill reference to given, including the weights and kind of weights, whether they be track scale weights, hopper scale, wagon scale, automatic or estimated, the name of the employee inspecting and approving condition of car for bulk grain loading being also shown. Following this is the in transit agent's and conductor's record in which report of leakages in transit is shown. The name of the conductor, employee or inspector reporting leakage, station, train and place where leakage was seen, and advice as to what repairs were made, or action taken to prevent further loss and an estimate of possible extent of leakage. Following this is the unloading or junction agent's record which gives the out-turn weight and the kind of scales over which the grain was weighed. We have got very gratifying results from the use of this form, enabling us as it has to get a line on inaccurate scales, both at originating point and destination, and as a result of the use of the form, we have made many inspections of shippers' and consignees' scales for our own account and found inaccuracies which have not only saved us the payment of claims but put us on record with the shipper or consignee as knowing that his scales are inaccurate, weights over which cannot be used in adjustment of claims until necessary repairs have been made. Our grain claims for the season of 1912 were reduced over $20,000, and this form played no little part in their reduction.

Daily Report of Stock Movement.—During the year 1911, we reduced our live stock claims $99,304.72, or 49.9 per cent.; during the year 1912, we made further reduction of $3,092.32, or 2.8 per cent. Our reduction in 1912, compared with 1911, was low because we had a most unusual record to go up against, having cut the live stock claims in 1911 in two. Our experience has been that the best way to cut live stock claims is to give regular service. We have been trying to get an early start with our stock, keep it moving at a fair rate of speed and make an early market, and that is what we are doing, and this report I feel has done more to accomplish the results than any other one thing, in that it has placed before the general superintendent personally every morning the actual movement of live stock over his district, each train and its average rate of speed, and if there is any one train that moved at a lower rate of speed than he feels we were justified in maintaining, he immediately gets after the superintendent. A copy of this report is also mailed under personal cover in a traingram envelope each morning to the superintendent so that the general superintendent knows that he has the information in his hands, and in most cases the superintendent is after the slow movement before he hears from the general superintendent.

WHY RAILROADS SHOULD CO-OPERATE

So interlaced are the railroads of this country in serving the shipping public that no one of them can well disregard the influence of conditions upon other roads made possible through uniform tariffs and classifications. The relationship of railroads must needs become closer and closer if they would save themselves needless expense and agitation. Should not the originating line of a car of sugar be just as much interested as the delivering line in knowing that the car used had protruding nails or bolt heads that did damage to the sacks and caused a loss for which both companies share in the claim that is paid, or that a car of flour was damaged because of flour having been loaded into a leaky car or that a car of automobiles had been damaged because of the shipper using too frail a blocking; and should not that line have just as much interest in working with the shipper of the automobiles in persuading them to adopt a safer plan of blocking their cars? Surely they are even more responsible for the damage than is the delivering line. The mere fact that they would adopt safer methods, and many have adopted our standards.

If railroads were properly inspecting cars before loading, properly loading the freight, taking up vigorously with shippers and insisting upon proper loading and compliance with the classification, and properly handling freight, there would not be so much damage done. The Santa Fe has made great strides, but it has considerable house cleaning to do. If it succeeds, even only in a small degree, in influencing other railroads to join in the elimination of causes of loss and damage, it will have done more for the cause than it has yet accomplished in any one direction.

In the past 15 months, from one district alone, there have been addressed to the general superintendents of other railroads 1,206 letters, calling attention to specific instances of loss and damage; 401 cases were due to defective equipment, 215 cases to poor stowing, insufficiently braced, etc., 376 cases to pilfering, 110 cases over without billing (these 110 letters covered some 2,500 shipments), 104 cases miscellaneous causes. We have gotten acknowledgments from about one-tenth of those letters and have in the meantime received only about 25 letters from other lines calling attention to similar conditions on cars of freight interchanged with our line.

We feel justified in our desire to interest all railroads in this movement, because nearly 40 per cent. of the claims we pay are prorated with other lines, under Freight Claim Association rules. If we would free our operating accounts of this burden, we must work together, for even though we individually equip ourselves with necessary machinery and clean our own houses, we will still pay loss and damage claims because of our neighbor's neglect.

ANALYSIS OF CLAIMS

The analysis that follows covers 26,203 claims representing in dollars and cents, $324,302.27, divided as between carload and L.C.L., carload $218,239.41, L.C.L. $106,062.86. Has it ever occurred to you before that loss and damage to freight in carloads is more than twice that of L.C.L., considering the movement as a whole? Most people not posted would have scarcely thought that. Let us see what caused the paying of these claims:

Cause	Number of claims	Per cent.	Carload	Per cent.	Less than carload	Per cent.	Total	Per cent.
Wrecks	94	.359	$12,195.95	5.583	$2,138.80	2.017	$14,344.75	4.420
Delay	309	1.179	13,673.76	6.266	2,074.99	1.956	15,748.75	4.856
Defective equipment—leaky roof	665	2.538	14,412.43	6.604	827.39	.779	15,239.82	4.699
Freezing	370	1.412	6,878.54	3.152	1,852.95	1.747	8,731.49	2.699
Transferring carload freight	24	.091	810.96	.371	9.42	.009	820.38	.253
Unclean cars	363	1.385	2,847.40	1.305	376.45	.354	3,223.85	.994
Fire in excess of insurance collected	6	.023	107.51	.049	62.64	.059	170.15	.052
Improper refrigeration and ventilation	36	.137	2,650.34	1.214	89.23	.084	2,739.57	.845
Concealed damage	2,710	10.342	4,143.40	1.898	13,563.50	12.798	17,706.90	5.459
Damage, other causes except carelessness of employees	12,721	48.548	97,152.31	44.516	39,111.89	36.877	136,264.20	42.017
Loss of entire packages	2,758	10.525	12,176.11	5.579	22,484.78	21.199	34,660.89	10.688
Loss from packages	1,683	6.424	2,280.73	1.045	7,054.93	6.651	9,335.67	2.940
Loss from bulk shipments	2,323	8.865	42,318.41	19.391	285.29	.269	42,603.70	13.137
Concealed loss	1,336	5.098	275.84	.126	8,426.47	7.935	8,702.31	2.683
Theft	288	1.141	1,264.14	.569	2,952.76	2.784	4,216.90	1.302
Loss, other causes except carelessness of employees	177	.675	1,005.16	.461	1,388.40	1.309	2,393.56	.738
Loss and damage due to carelessness of employees	340	1.336	4,046.40	1.854	3,362.98	3.171	7,409.38	2.284
Totals	26,203		$218,239.41		$106,062.86		$324,302.27	

they do not settle with the claimant is no reason why they are not interested under the Freight Claim Association rules, which is now the governing factor in adjustment of claims between carriers. We both pay, and the wide-awake railroad today that inspects its fragile freight at point of interchange pays less than the other. Not only does it save itself money in claims, but the delivering line as well.

The Santa Fe has saved thousands of dollars on automobiles alone, simply through its inspection for defective bracing at junction points, and as a result of the alarming conditions disclosed by those inspections, has conducted a campaign with the various automobile manufacturers for better bracing that is not only saving money for itself today but for every other railroad in the country. While we have met with some opposition in certain quarters we have the assurances of fully 90 per cent. of the shippers whose attention was called to their inferior blocking, that

A total of 347 commodities are represented in that quarter of a million dollars and it is interesting to note that out of that 347, 31 commodities, or 8.8 per cent. of the whole, represent 57.9 per cent. of the total claims paid. Thirty-two other commodities, or 9.2 per cent. of the whole represent 19.3 per cent. of total claims paid so that 63 commodities or 18 per cent. of the whole represent 77.2 per cent. of all our trouble.

It ought to be an easy matter for the railroads to get together and so supervise the handling of those 63 commodities as to prevent the causes for claims and at the same time make substantial headway on the other 284 commodities.

Suppose there were placed before you still another statement classifying those claim payments as between shipper, claimant, point of origin, destination, cause, carload and L.C.L. for each commodity, and you noticed as we did, for instance, on coal and coke that out of a total of 373 claims paid, representing

$4,555.40, that 87 of them, or 23.6 per cent. were on one shipper over one scale. What would be your conclusion? No doubt the same as ours, that there was something radically wrong with their scales, it being unreasonable to suppose that nearly one-fourth of our claims would be on coal lost from one shipper's consignment, and principally from one mine, weighed over one scale when we have scores of shippers and mines in operation on our line of road. Out of 31 claims on collars and cuffs 21, or 67.7 per cent., were on one shipper, and that shipper was also the claimant on 15 of those claims.

It is going to take the closest possible supervision on the part of the railroads to prevent or make any improvement in the bad conditions forced upon them through the growing demand for cheaper and lighter packing cases, and packing material; in fact, it has already got to the point where containers offer no protection whatever from the sneak thief, who can now in a surprisingly short space of time, open a case of valuable goods, extract therefrom a part of the contents and replace the package in as good condition as it was before, leaving no evidence of the theft. Why have not the railroads, not only in justice to themselves, but in justice to society, the right to demand of the shipper a container for his goods that cannot be entered hurriedly without leaving unmistakable evidence of it so that when a pilferage occurs we will know it forthwith and be in a position to trace the theft before he has had an opportunity to make his getaway or cover his tracks? We on the Santa Fe are going to the expense of making a test on a representative number of shipments of commodities susceptible to theft, by first invoicing the shipments as received from connecting line or direct from the shipper that we may have a definite knowledge of what they contain and then securely gluing a strip of tough fibrous poper or cloth around each end of the box, similar to the method of sealing cigar boxes, and across the ends of certain makes of boxes.

If this scheme develops protective features worth while duplicating, will be successful in convincing the shipping public of their duty from an economic standpoint to add such protection to their shipments? Will we have the moral support of the country at large to our plea for a safe container? That remains to be seen. Certainly not if railroads do not co-operate and show by their activity along the same lines of endeavor, their desire for protection against the ever-present thief. It may be asked, why lay so much stress upon concealed loss? Is it of such moment as to cause so much uneasiness? In answer to which, while I might point out several causes for loss and damage, occupying greater prominence in the category of causes, for loss and damage to freight, there are none that has shown such dogged resistance to close supervision than has concealed loss. Instead of a five years' campaign conducted on the Santa Fe having had any effect on the reduction of loss from this source, there has been an increase of 90 per cent., and I attribute this increase very largely to the susceptibility of the container to easy manipulation. The great majority of packages, instead of affording protection, are nothing less than an invitation to commit theft.

NEW PASSENGER TERMINAL AT DALLAS, TEXAS

The Union Terminal Company, Dallas, Tex., is a corporation whose stock is owned equally by the Gulf, Colorado & Santa Fe; the Chicago, Rock Island & Gulf; the Missouri, Kansas & Texas Railway of Texas; the St. Louis, San Francisco & Texas; the Houston & Texas Central; the St. Louis Southwestern; the Trinity & Brazos Valley, and the Texas & Pacific. This company was organized to provide passenger terminal facilities for the above roads, which comprise all those now operating into Dallas with the exception of the Texas & New Orleans, which will be admitted as a tenant of the Houston & Texas Central.

At present there are five passenger stations in Dallas, four of which are relatively close together, while the fifth is removed about a mile. Practically all the stations have become inadequate

Track Layout, Showing Entrance to Proposed Union Station

and beginning about 1907 there has been active agitation for a union terminal for all the roads. After considerable preliminary study, five companies, the Gulf, Colorado & Santa Fe; the St. Louis, San Francisco & Texas; the Chicago, Rock Island & Gulf; the Missouri, Kansas & Texas, and the Trinity & Brazos Valley, agreed to construct joint terminal facilities for their use, while the Texas & Pacific; the Houston & Texas Central, and the Texas & New Orleans decided to construct joint facilities for their lines, leaving the St. Louis Southwestern in its present location. Plans on this basis were well under way, but they were not satisfactory to Dallas interests and further negotiations were undertaken, resulting in an agreement being reached in 1911 for all companies to join in one large terminal, if a satisfactory location could be found. A number of sites were carefully studied, as a result of which the present location was finally chosen in 1912; its principal advantages are its proximity to the business center, its convenience of access by most of the railways and its freedom from street crossing entanglements. Plans for this work have now been practically completed and contracts have just been let.

The main lines of the Missouri, Kansas & Texas; the St. Louis Southwestern, and the Chicago, Rock Island & Gulf, the latter carrying as tenants the Trinity and Brazos Valley, and the St.

Louis, San Francisco & Texas, now traverse the adopted station site from north to south, while the Texas & Pacific crosses it just north of the north throat of the depot yard. The Gulf, Colorado & Santa Fe with its tenant, the St. Louis, San Francisco & Texas, will reach the station from a connection with the terminal tracks at Santa Fe Junction. The Houston & Texas Central will use the Missouri, Kansas & Texas tracks from a point south of the city to Katy Junction, about four miles north of the station. The Texas & New Orleans passenger trains which now enter Dallas over the tracks of the Houston & Texas Central will be diverted to the Gulf, Colorado & Santa Fe at Central Junction and enter the station via Santa Fe Junction. The Trinity & Brazos Valley now enters Dallas from the north over the tracks of the Chicago, Rock Island & Gulf and departs for the South over the Missouri, Kansas & Texas. The St. Louis, San Francisco & Texas enters Dallas from the north over the Rock Island tracks and departs for the east via the Gulf, Colorado & Santa Fe.

The station is to be of the through type with four lead tracks entering from the north, 18 depot tracks arranged in pairs, of which 10 are to be built at once, and four lead tracks at the south end, two of which are for immediate construction. The tracks will be spaced 13 ft. centers between pairs with 28 ft. centers at platforms. The tracks will hold from 14 to 20 coaches with engine and tender. Two exclusive freight tracks will also be built from between North Junction and South Junction, while provision is made for a third track for the exclusive use of the St. Louis Southwestern whenever it may be required. From South Junction to Santa Fe Junction, four tracks are planned, although only two will be built at present.

The passenger station is to be 282 ft. long by 135 ft. wide and will be placed 35 ft. back from the west line of Houston street, one of the principal thoroughfares. The building will be of the Renaissance type of architecture with a base of Texas granite and the upper parts of brick. It will rest on a solid rock foundation 25 ft. below the floor level. The front part of the first floor will contain the lobby and ticket office with a baggage checking room opposite, a parcel checking room, and an emergency hospital and stores, with the rear part devoted to a large baggage storage room. Near the south end of the building a broad staircase will lead to the second floor, where the various waiting rooms, restaurants, etc., are located. This staircase is situated immediately opposite a wide entrance to Houston street and connects with the passenger bridge or thoroughfare over the depot tracks, thus permitting direct travel between the streets and trains without passing through the ticket lobby or waiting room.

The facilities on the second floor include the general white waiting room, 135 ft. long and 70 ft. wide, with a high arched ceiling, extending to the roof of the building. A large loggia extends along the front of this waiting room, and affords an outdoor adjunct to it, while a concourse enclosed by glazed sash stretches along its track side. North of this room will be the white women's waiting and retiring rooms with toilets and baths, and the matron's room and the restaurant facilities. At the south end of the building will be the white men's smoking and toilet rooms, barber shop and baths, and the negro waiting rooms and toilets.

The third floor will consist of two unconnected parts, over those parts of the second floor north and south of the general waiting room. The south wing will be used for the despatcher's office, conductors' room, and offices of the Union Terminal Company and the Pullman Company, and the north wing will in part be assigned to the restaurant service.

To avoid the necessity of crossing tracks at grade, bridges have been selected in place of subways. Had the latter been used, the difficulty of water-proofing them, in view of the fact that the lower parts would be below high water line, and that in part they would be constructed in a high fill, would have made entire success doubtful. A bridge 36 ft. wide in the clear, consisting of girders encased in concrete, will span all tracks from a point opposite the head of the staircase mentioned above. The walls of this thoroughfare will be of glazed sash. From it the track platforms will be reached by stairways located on each side of the thoroughfare.

Track platforms, 18 ft. wide and 6 in. above the top of rail, are provided between each pair of tracks. These platforms are to be covered by reinforced concrete butterfly sheds, between the thoroughfare and the baggage bridges, the extreme ends of the platforms being left uncovered to facilitate the loading of baggage and express. For the accommodation of the different express companies, a building 500 ft. long by 50 ft. wide, and one story high, is located south of the depot building, with a 40-ft. teamway along the east side and tracks for carload express on the west side, the floor of the building and platform being 3 ft. 9 in. above the roadway and tracks. South of this building a commodious garage will be erected for housing electric trucks, which it is planned to use. In order to reach trains with baggage, express and mail, bridges, 15 ft. wide in the clear, of the same type as the thoroughfare, will span the tracks, 300 ft. each side of the thoroughfare, with elevators for trucks at their east ends and also at each track platform.

Facilities for caring for and storing passenger equipment and engines, and making emergency repairs to them are located at South Junction, and the power plant for furnishing heat, light and power for the terminal facilities is also placed here.

The Texas & Pacific crosses the terminal tracks at grade just north of the north throat. This cannot be avoided under present circumstances for high water conditions, as well as the necessity of maintaining the connections shown on the map, prevent the depression of the terminal tracks, and the very great cost of elevating the Texas & Pacific through the city makes that, at the present time, impracticable to consider.

Two new interlocking plants will be constructed, one at North Junction to control the crossings and the connections and switches at the north end of the depot tracks, and one at South Junction to control the crossings and connections there and the south switches of the depot tracks. In addition, the existing plants at Santa Fe Junction and Central Junction will be enlarged to take care of the increase in functions made necessary.

The Union Terminal Company has leased from various railways a part of its holdings, and has also purchased at a cost of $1,750,000 about ten acres of property, for the most part expensive business blocks, improved with high grade warehouses. In addition, in order to obtain the vacation of the various streets intersecting the site, it was necessary to purchase over 80 acres of river bottom land lying west of the site between Commerce street bridge and Oak Cliff viaduct. Of this tract, 32 acres was given to the city of Dallas for wharfage purposes, if the Trinity river should ever become navigable, upon the express condition that there should never be any other streets opened at grade across the Terminal tracks.

In order to admit trains of the Texas & Pacific to the station, it is necessary to construct a new bridge across the Trinity river. This bridge will be located on an 11 deg. 30 min. curve, and will consist of a through span, 150 ft. long, with 26 ft. between centers of trusses. Whenever required by the government, this span will be converted into a lift span, the river being technically navigable.

New French Railway Proposed.—For several years past the business interests of Havre have agitated the question of a second railway line from Havre to Paris, supplementing the double track line of the Western Railway of the state system, which now carries the heavy freight as well as passenger traffic between the port and the capital. The administration of the state railways has made an investigation and report concerning the cost of the project. It is estimated that the proposed line could be built for $16,405,000, and that it could be constructed in about ten years.

STRIKE ON WESTERN RAILWAYS AVERTED

A strike by all of the enginemen and firemen on the railways west of Lake Michigan and Fort William, in the United States and Canada, has been averted by the intervention of President Wilson. The history of the controversy between the western lines and the engineers and firemen has been partly told by the *Railway Age Gazette* in its issues of June 5, page 1240, and July 24, page 179.

On July 31, Warren S. Stone, grand chief of the Brotherhood of Locomotive Engineers, and W. S. Carter, president of the Brotherhood of Locomotive Firemen and Enginemen, announced in a statement to the newspapers that a strike would be called for August 7, unless the railways in the meantime should agree to arbitrate only the original demands made by the men, without considering the counter demands of the roads.

This announcement was made after the efforts of the United States Board of Mediation and Conciliation to bring about a settlement of the differences between the railways and the engineers and firemen by mediation had proved unavailing, the board having been in daily conference at Chicago with the engineers and firemen, and the Managers' Conference Committee from July 20 until July 30. On July 30, W. L. Chambers and Martin A. Knapp returned to Washington, leaving G. W. W. Hanger in Chicago to keep in touch with any further developments; and on July 31, Messrs. Stone and Carter, and members of the Conference Committee of Managers, headed by A. W. Trenholm, general manager of the Chicago, St. Paul, Minneapolis & Omaha, left Chicago for Washington at the request of President Wilson to discuss the case with him.

During the ten days of the conferences with the members of the board of mediation, during which every effort was made to bring about a settlement, the representatives of the enginemen and firemen steadily refused to submit the entire case to arbitration, and repeated their threat to declare a strike. On July 29 the members of the board telegraphed to President Wilson, advising him of the situation, and President Wilson replied, inviting representatives of both sides of the controversy to confer with him at the White House on Saturday morning.

Before leaving for Washington Messrs. Stone and Carter gave out their statement announcing the date of the strike, and declaring that they had accepted a proposition by the mediators that only the original demands of the men be submitted to arbitration, which the managers had refused, because the proposition did not include the submission to arbitration of any of the companies' counter demands.

This was one of several propositions made by the mediators, all others being rejected by the representatives of the employees, who had repeatedly refused arbitration, but thus sought to place the responsibility for refusing arbitration on the roads.

The plan of arbitration proposed by the mediators considered only the demands submitted by the men October 10, 1913, which meant consideration only of the demands for increased wages and other changes in working conditions which would be equivalent to an increase in wages. The counter proposals of the managers that certain provisions of the existing agreements be submitted to arbitration were not contained in the plan.

The Conference Committee of Managers conferred with the President at the White House on July 31, at 2 o'clock and the representatives of the engineers and firemen conferred with the President at four o'clock. The president represented to both sides that it was their patriotic duty to agree to some plan for averting a strike. The outbreak of a great war in Europe had, he said, created a very bad situation which would be greatly aggravated by a strike. He pointed out that the administration was making efforts to build up the American merchant marine in order to transport the crops from the United States to Europe, and that a strike on the western roads would defeat its efforts. The employees refused to change their position. On Sunday evening, August 2, the President sent a letter to the Conference Committee of Managers, in which he said in part:

"In view of the world-wide conditions it is obvious that the suspension of business on roads serving more than half the territory of the United States would be a calamity of incalculable magnitude. The situation has reached a crisis which hardly permits a full consideration of the merits of the controversy, and I feel that in the circumstances I can appeal with confidence to your patriotism and to your regard for the public welfare to make whatever sacrifice is necessary to avert a national disaster."

On Monday morning Mr. Trenholm, chairman of the Conference Committee of Managers, replied in a letter to the President in which he said that in response to the request of the President the managers had decided to recede from their positions and to accept arbitration, as proposed by the mediation board. He added that the Conference Committee of Managers never would have assented to arbitration that did not recognize the right of the railroads to present their claims to the arbitration board, if it had not been for the crisis in European affairs and the consequent effect that would be produced by a strike in this country. "Under ordinary circumstances," said Mr. Trenholm in his letter, "we should feel that our plain duty to the interests committed to our charge would not merely justify, but would require us to insist upon a plan of arbitration that would recognize our right to be heard upon claims regularly presented on our behalf."

On Monday, August 3, Darius Miller, president of the Burlington, speaking for the executives of all the western railroads, issued the following statement:

"The President appealed to the railroads upon the large ground of patriotism and grave public emergency, and the roads have acquiesced.

"In doing so the committee representing the roads did the big thing, although at a sacrifice of the right to be heard—that is exactly what it amounts to. The organizations lost one of their great opportunities to show the country that they are as big as the railroads; that their leaders are as patriotic and as anxious for the public welfare as the officers of the roads.

"My suggestion was, in view of the appeal of the President, who did what every great leader would do under the circumstances, that both parties should suspend all further controversy for ninety days and thereby relieve the country of the added anxiety of a strike.

"In times like these it is unwise and unpatriotic to press selfish demands and doggedly threaten to carry any apparent advantage to a crisis. That is what the men have done, and there is where they have lost their opportunity vastly to gain in public respect and confidence.

"As usual, the railroads have made the sacrifice, and some months from now they will see the price expressed in dollars and cents. But, on the whole, I think the position of the roads is the better one. It always has and probably always will happen that the test of the better citizenship is the willingness to make sacrifices to serve the public interest. That is the big thing that the Western roads have done, and perhaps that is a good definition of patriotism.

"I do not think the public fully understands the difference between the parties. The men initiated the conditions that led to the crisis by demanding more pay and reduced hours at a time when all industrial conditions were halting and depressed. The existing schedules and rules have been the growth of years of individual trading and compromise to avoid trouble, until they differ widely on different roads and contain many rules that are wrong in principle and uneconomic in application. For these reasons the roads asked to have the schedules revised and all questions, on both sides, submitted to arbitration, coupled with a guarantee that rates of pay would not be reduced.

"This the organization refused, and it was only after pressure from the mediators that they finally agreed to arbitrate even their own demands, and they have denied the right of the roads even to be heard; and, following the recommendation of the mediators for peace at any price, the President was apparently compelled to follow the only course open to him—namely, appeal for a settlement upon the broader grounds of the public welfare."

General News Department

A fire on July 30, destroyed some of the docks and passenger wharves at Seattle, Wash., including the Grand Trunk Pacific pier, causing damage estimated at $500,000.

Announcement was made at the locomotive shops of the Pennsylvania, at Altoona, last Saturday, that henceforth the men would work 50 hours a week, instead of 40 hours, as hitherto.

The examiners of accounts of the Interstate Commerce Commission—the men who go about the country visiting railroad accounting offices—are to have their territory divided; and they and their clerks will have district headquarters. These branch offices of the "Division of Carriers' Accounts" will be established at New York, Pittsburgh, St. Louis and San Francisco.

Collision on the Kansas City Southern

Thirty-eight persons were killed and 25 injured, six fatally, on August 5, by a northbound passenger train on the Kansas City Southern crashing head on into an interurban car on the Missouri & North Arkansas near Tipton Ford, 12 miles south of Joplin, Mo., at 5:30 p. m., August 5. The Missouri & North Arkansas Railway uses the Kansas City Southern tracks from Joplin to Neosho. The cars met on a curve. The interurban car, which was going about 35 miles an hour, was telescoped and took fire.

Italian Railway Strike Punishments

As a result of the Italian railwaymen's strike, the following measures have been adopted: Forty-eight employees of various grades have been called upon to resign; two stationmasters, 16 lower employees, and 362 mechanics and firemen have been degraded; increases in salary of other persons taking part voluntarily in the strike will be postponed for periods varying from six months to two years, alternatively they will be suspended from duty for periods of from 6 to 12 days. The council of administration has decided to commend those employees who did not leave work and thus maintained the fidelity and discipline which are the first bases of good railway service.

Safety at Pacific Coast Grade Crossings

Statistics seem to indicate that Pacific coast pedestrians and drivers exercise more care this year at crossings than they did in 1913, though there is still plenty of room for improvement. The Southern Pacific has made every effort to educate careless people and now has the satisfaction of seeing a little improvement. Observations made in widely separated localities in August, September and October, 1913, showed that of 17,021 motor vehicles observed, the drivers of 11,836, or 69½ per cent., looked neither to the right nor to the left before crossing the tracks; 2.7 per cent. looked one way only; and 27.8 per cent. looked in both directions. The astonishing number of 3,301, or 19.3 per cent. of the total ran over the crossings at a reckless rate of speed, and only 35 drivers stopped their machines before crossing.

Of the 4,889 drivers of teams, 39.4 per cent. looked in neither direction; 8.6 per cent. looked one way only; and 52 per cent. looked in both directions.

Similar observations were made in June of this year, and mostly at the same crossings. Twenty-three per cent. more drivers of automobiles are looking in both directions than last year. The number of drivers of teams looking both ways shows no improvement, both years being 52 per cent., but 6 per cent. more are looking one way than did last year. Pedestrians show an increase of 29 per cent. looking in both directions.

Freight House, Tacoma, Wash.

The Oregon-Washington Railroad & Navigation Company is building a new freight house on the tide flats at Fifteenth street and the city waterway, Tacoma, Wash. The building is 50 ft. by 342 ft. in area, and is one story high, except at the head house end for a depth of 81 ft., where it is two stories. It is supplied with a basement under the head house on the track side. Both floors of the head house are devoted to office space. The building is a semi-fireproof structure of brick, resting on a concrete foundation.

The floors throughout are of reinforced concrete slabs. Those in the freight house are covered with a 1 in. layer of asphalt. Those in the public space, vestibule, steps and back hall are finished in terrazzo, while all the other floors in the head house have a surface of cement one-half inch thick. All window sills and copings are also of concrete.

Kinnear steel rolling doors are used throughout the freight house, two of which on the freight house side of the fire wall of the head house are equipped with fusible links.

The roof is of five-ply tar and gravel construction built in accordance with the Barrett specifications. The lumber used is fir. The building is heated by a hot water system.

Three tracks run parallel with the shed on one side and a driveway on the other side. In the rear of the building is a wooden platform 14 ft. by 19 ft., used for unloading automobiles. The freight house is fitted with new style automatic dial scales.

The building is being put up by O. F. Larson of Tacoma, the approximate cost being $50,000.

President Ripley on Proposed Strike

President E. P. Ripley of the Atchison, Topeka & Santa Fe, has addressed the following letter to all employees of his road:

"A statement to the public by the railroad enginemen has been widely circulated in the western territory as a justification for the action of enginemen in demanding more pay and shorter hours, and refusing to arbitrate the questions involved. The statement is long and involved and for the most part is either wholly untrue, or states but a portion of the truth. The statement has been sent broadcast with request to have it printed in the newspapers in whole or in part.

"In order that the full situation may be known to the public and especially to our own employees, I desire to state these facts:

"The railroads propose a full arbitration of all questions involved; the enginemen offer to arbitrate only the question of their own demands.

"In order that it might be apparent to all that no attempt is being made to reduce wages the railroads gave the enginemen assurance that if the arbitration is unsatisfactory the men will have the option of rejecting it and continuing to work on the existing schedule.

"It seems hardly necessary to state that any claims that the Santa Fe has not or will not live up to any agreement it makes are ridiculous. You all know that it does and that it will.

"We have before us the question of being able to live or perish. We cannot operate this railroad except with loyal and faithful employees. We will, of course, stand by the result of any arbitration, but to submit to 'arbitration' which ignores all justice and provides only that the claims of one side be adjudicated is absurd.

"You know the record of the company for square dealing, and you may rest assured that it is not being departed from in this case."

Locomotive Smoke in Chicago

The method of controlling locomotive smoke in Chicago under the direction of the General Managers' Association has been referred to several times in these columns. That this arrangement has proved very successful is shown by the biennial returns made by the department of smoke inspection of the city. This summer's returns, including 9,453 observations, shows the best record for summer reading since the department was established. This

year the average density is 6.304, as compared with 11.99 last summer. While the latest average is larger than that shown in the autumn of 1913 (5.79), it must be remembered that usually a great deal more smoke will be shown in the warm weather than in cold.

Out of seven reports this is the sixth in which the Chicago, Burlington & Quincy has maintained first place. The Burlington certainly is to be congratulated on the success it has attained, especially when it is considered that this road has a very large number of locomotives operating in the city. J. H. Lewis is chief inspector for the Burlington and also chairman of the Railroad Smoke Inspectors' Association, which reports to the General Managers' Association.

The roads in Chicago maintain 50 smoke inspectors, at a cost of about $65,000 per year in salaries, to keep locomotive smoke to a minimum. That this expenditure is warranted is shown by the smoke returns for the summer of 1914, as follows:

New York Central Lines and Officials Indicted

The federal grand jury at Chicago on July 31, returned three indictments before United States Judge Geiger, against the Lake Shore & Michigan Southern; the Cleveland, Cincinnati, Chicago & St. Louis, and the Chicago, Indiana & Southern railways; the O'Gara Coal Company of Chicago; William C. Brown, former president of the New York Central Lines; John Carstensen, vice-president of the New York Central Lines; R. M. Huddleston, general auditor, New York Central Lines; Thomas J. O'Gara, former president of the O'Gara Coal Company, and William A. Brewerton, secretary of the O'Gara Coal Company. The indictments are based on evidence gathered by the Interstate Commerce Commission in connection with its investigation of the relations between railways and coal companies in Illinois, on which the commission recently made a report to Congress, which was abstracted in the *Railway Age Gazette* of July 24, page 185.

The indictments charged conspiracy to violate the Interstate Commerce law and the Elkins act by giving and accepting rebates on coal shipments, and participating in the financing of the coal company. The railroads and the coal company were also indicted over a year ago for rebating. The first indictment charges discriminations in favor of the O'Gara Coal Company, in that extensions of time were granted by the railroads in which to pay freight bills. The second indictment charges violation of the Elkins act in the granting of discriminations by the extension of credit for the payment of freight bills. This indictment includes 50 counts, charging that the railroads accepted a less, or different, compensation for freight charges than the public tariffs on coal shipments. It also includes 49 counts, charging acceptance of coal in payment of freight bills, and 50 counts, charging discrimination in favor of the O'Gara company in connection with the buying of fuel coal and the method of payment. This indictment also charges the railway officials with loaning the O'Gara company $500,000 in cash. The third indictment charges 112 separate violations of the Elkins act, and is directed against the coal company, O'Gara and Brewerton, who are charged with accepting concessions and rebates.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

American Association of Demurrage Officers.—A. G. Thomason, Boston, Mass.

American Association of Dining Car Superintendents.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next convention, October, Washington.

American Association of General Passenger and Ticket Agents.—W. C. Hope, 143 Liberty St., New York.

American Association of Freight Agents.—R. O. Wells, I. C. R. R., East St. Louis, Ill.

American Association of Railroad Superintendents.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next convention, August 20 and 21, New York.

American Electric Railway Association.—E. B. Burritt, 29 W. 39th St., New York. Annual convention, October 12-16, Atlantic City, N. J.

American Electric Railway Manufacturers' Association.—H. G. McConaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

American Railway Association.—W. F. Allen, 75 Church St., New York.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 20-22, 1914, Los Angeles, Cal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915.

American Railway Master Mechanics' Association.—J. W. Taylor, Karpen Bldg., Chicago.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.

American Society of Civil Engineers.—Chas. W. Hunt, 220 West 57th St., New York; 1st and 3d Wednesday, except June, July and August, New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York; 2d Thursday of each month, at 2 P. M., 11 Broadway, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., Washington, D. C. Annual convention, April 28, 1915, Atlanta, Ga.

Association of Railway Claim Agents.—C. W. Egan, B. & O., Baltimore, Md.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W. Ry., Chicago. Annual convention, October 19-23, Chicago.

Association of Railway Telegraph Superintendents.—P. W. Drew, 112 West Adams St., Chicago.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York.

Association of Water Line Accounting Officers.—W. R. Evans, Chamber of Commerce, Buffalo, N. Y.

Bridge and Building Supply Men's Association.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meeting with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk Ry., Montreal, Que.; 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que.; 1st Thursday, October, November, December, February, March and April, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago; 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York; 2d Friday in January, May, September and November and 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Civil Engineers' Society of St. Paul.—Edw. J. Dugan, P. O. Box 654, St. Paul, Minn.; 2d Monday, except June, July, August and September, Old State Capitol Bldg., St. Paul.

Engineers' Society of Pennsylvania.—Edw. R. Dasher, Box 75, Harrisburg, Pa.; 1st Friday after 10th of each month, except July and August, 31 So. Front St., Harrisburg, Pa.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, Oliver Bldg., Pittsburgh; 1st and 3d Tuesday, Pittsburgh, Pa.

Freight Claim Association.—Warren P. Taylor, Richmond, Va.

General Superintendents' Association of Chicago.—A. M. Hunter, 605 Grand Central Station, Chicago; Wednesday preceding 3d Thursday, Transportation Bldg., Chicago.

International Railway Congress.—Executive Committee, 11, rue de Louvain, Brussels, Belgium. Convention, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, 922 McCormick Bldg., Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 West Broadway, Winona, Minn.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, Lima, Ohio. Next convention, August 18-20, Hotel Wisconsin, Milwaukee, Wis.

Maintenance of Way & Master Painters' Association of the United States and Canada.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next convention, November 17-19, 1914, Detroit, Mich.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York.

Master Car Builders' Association.—J. W. Taylor, Karpen Bldg., Chicago.

Master Car & Locomotive Painters' Association of the United States and Canada.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 8-11, Nashville, Tenn.

National Railway Appliances Association.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15 to 19, 1915, Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass.; 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—H. D. Vought, 95 Liberty St., New York; 3d Friday in month, except June, July and August, New York.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill.; 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo.; 3d Friday in month, Kansas City.

Railroad Master Tinners, Coppersmiths & Pipefitters' Association.—C. G. Thompson, C. & E. I., Danville, Ill.

Railway Business Association.—Frank W. Noxon, 30 Church St., New York.

Railway Club of Pittsburgh.—J. B. Anderson, Penna. R. R., Pittsburgh, Pa.; 4th Friday in month, except June, July and August, Pittsburgh.

Railway Development Association.—W. Nicholson, Kansas City Southern, Kansas City, Mo.

Railway Electrical Supply Manufacturers' Association.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

Railway Fire Protection Association.—C. B. Edwards, Mobile & Ohio, Mobile, Ala. Annual meeting, October 6, Washington, D. C.

Railway Gardening Association.—J. S. Butterfield, Lee's Summit, Mo.

Railway Signal Association.—C. C. Rosenberg, Bethlehem, Pa. Annual meeting, Bluff Point, N. Y., September 22-24.

Railway Storekeepers' Association.—J. P. Murphy, Box C, Collinwood, Ohio.

Railway Supply Manufacturers' Association.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with M. C. B. and M. M. Associations.

Railway Telegraph & Telephone Appliance Association.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va.; 2d Monday in month, except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill. Next convention, September 8-10, 1914, Chicago.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo.; 2d Friday in month, except June, July and August, St. Louis.

Salt Lake City Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah; 1st Saturday of each month, Salt Lake City.

Signal Appliance Association.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

Society of Railway Financial Officers.—Carl Nyquist, La Salle St. Station, Chicago. Annual meeting, September 15-17, Hotel Aspinwall, Lenox, Mass.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. Ry., Atlanta, Ga.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga.; 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—J. S. Marks, Agent, Interstate Despatch, Toledo, Ohio; 1st Saturday in month, Boody House, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillsburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York; last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa.; meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7122 Stewart Ave., Chicago.

Transportation Club of Buffalo.—J. M. Sells, Buffalo; first Saturday after first Wednesday.

Transportation Club of Detroit.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich.; meetings monthly, Normandie Hotel, Detroit.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Next meeting, September 15-18, Hotel Sherman, Chicago.

Utah Society of Engineers.—Frank W. Moore, Newhouse Bldg., Salt Lake City, Utah; 3d Friday of each month, except July and August, Consolidated Music Hall, Salt Lake City.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man.; 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago; 3d Tuesday of each month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago; regular meeting 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

Press despatches from Washington say that traffic officers of the road west of Chicago have had informal conferences with the Interstate Commerce Commission looking to the presentation of new freight tariffs providing for extensive increases in rates.

H. G. Wilson, who for the past seven years has been traffic commissioner of the Commercial Club of Kansas City, has resigned, and on September 1 will retire to become traffic commissioner of the traffic bureau of the Commerce Club of Toledo, Ohio, which has recently been organized.

The Missouri railroads have announced that they will make an application to the Missouri Public Service Commission within 90 days for a general increase in freight and passenger rates throughout the state. The roads have been gathering data in support of the application for several months.

The Chicago & North Western has given notice that from September 1 it will no longer absorb tunnel and lighterage charges in Chicago. This means the cancellation of tariffs with the Merchants' Lighterage Company, the Chicago Lighterage Company, and the Chicago Warehouse & Terminal Company.

An embargo on all grain shipments to Galveston, Tex., for export was issued last week by the Atchison, Topeka & Santa Fe and the Chicago, Rock Island & Pacific to their connecting roads on account of a shortage of steamers from the port of Galveston. The embargo was effective throughout the week, expiring Saturday night.

The Luckenbach Steamship Company announces sailings of its express freight steamers from New York to San Francisco through the Panama Canal. The first sailing from New York is on August 7, and the schedule is as follows: *New York*, August 7; *Cristobal*, August 16; *Balboa*, August 17; *East San Pedro*, August 27, and *San Francisco*, August 31.

The summer meeting of the National Industrial Traffic League is to be held at the Copley-Plaza hotel, Boston, Mass., on August 12-15. The program includes reports from the committees on Demurrage and Storage, Freight Claims, Transportation Instrumentalities, Weighing, Graduated Storage Charges, Handling L.C.L. Shipments at Transfer Points, Uniform Classification, Spotting Charges, the Legislative Committee, Classification Committee, Bill of Lading Committee, and Tariff Committee. An interesting entertainment program also has been arranged.

Key West-Havana Car Ferry Near Completion

Mr. Flagler's long-cherished dream of through cars to and from Cuba will soon be an accomplished fact. The oversea railroad of the Florida East Coast to Key West has been in successful operation for several years past, and by next January the final link of the through route to Havana, a gigantic car ferry, with a capacity of 30 freight cars, will be running between Key West and Havana. This car ferry is now under construction at Cramp's yard, Philadelphia, and will cost approximately $500,000. It will be 380 feet long and will have four tracks, the two inner tracks holding 8 cars each and the two outer tracks 7 each. The launching is expected to take place about the middle of September. The speed will be 15 knots an hour and the time between Key West and Havana will probably be about six hours. It is expected that arrangements will be made with the Cuban railways whereby cars can be run through to all points on the Island which are reached by standard gage lines.

Blockade of Export Freight

The Pennsylvania, the Baltimore & Ohio and the Norfolk & Western early this week issued notices that on account of the suspension of ocean traffic, because of the war in Europe freight to be exported from Atlantic ports could no longer be received. Merchandise in warehouses and grain in cars was already considerably congested at New York and the sudden stoppage of

ocean traffic was very quickly felt. As we go to press it is expected that an embargo on export freight will be announced by all of the railroads; but it is expected that on account of the probable great demand for grain in Europe the European governments will very soon take action looking to the restoration of the grain movement across the Atlantic.

Car Balance and Performance

Arthur Hale, chairman of the committee on relations between railroads, of the American Railway Association, in presenting statistical bulletin No. 174, covering car balances and performances for April, 1914, says:

The committee presents herewith statistical bulletin No. 174, covering car balance and performance for April, 1914.

The miles per car per day were 23.0, compared with 23.8 for March. The same figure for the month April, 1913, was 24.0.

Ton miles per car per day for April were 334, compared with 369 for March. This is a decrease of 0.95 per cent. compared with the figure for April, 1913, which was 369.

The proportion of home cars on line was 64 per cent., compared with 62 per cent. in March. This is an increase of 10 points over April, 1913.

The per cent. of loaded car mileage decreased from 67.6 per cent. in March to 60.2 per cent. in April. This figure for April, 1913, was 69.4 per cent.

The average earnings per car per day decreased one cent to $2.41 in April. This figure for the month of April, 1913, was $2.48.

The table on the next page gives car balance and performance in the month covered by the report, and the diagram shows car earnings and car mileage and different car performance figures monthly from July 1907.

*Denotes deficiency.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission has given formal notice that it will make an investigation concerning the character of the service, physical condition of the equipment and property and financial history of the Cincinnati, Hamilton & Dayton.

The Interstate Commerce Commission has opened a branch office in St. Louis for inspectors and accountants working in the territory east of the western boundary of Colorado, north of the Gulf of Mexico and west of the eastern boundary of Tennessee.

The Sioux City Live Stock Exchange has filed a complaint with the Interstate Commerce Commission charging that Sioux City dealers are being discriminated against in favor of South St. Paul on shipments of cattle from North and South Dakota and Montana points.

Examiner Edgar Watkins began a hearing at Sioux Falls, S. D., on July 29, on proposed advances of two cents per hundred pounds on cattle and one cent per hundred pounds on sheep, from producing points to points on the Mississippi and Missouri rivers. A large number of representatives of various live stock exchanges and cattlemen's associations west of the Mississippi river appeared as witnesses to protest against the advance, which has been suspended by the commission.

Rates on Sectional Bookcases

Globe-Wernicke Company v. Baltimore & Ohio et al. Opinion by Commissioner Clements:

The commission finds that the present rating in the official classification of one and one-half times first class on sectional bookcases is not unreasonable nor discriminatory, and dismisses the complaint. (31 I. C. C., 274.)

Rates on Dust Collecting Systems

Dixie Manufacturing Company, Inc., v. Baltimore, Chesapeake & Atlantic et al. Opinion by the commission:

The commission finds that the official classification ratings on dust collector or arrester outfits is not unreasonable. Complaint dismissed. (31 I. C. C., 337.)

Rates on Box Shooks from Leavenworth, Wash.

Lamb-Davis Lumber Company v. Great Northern et al. Opinion by the commission:

The commission finds unreasonable a rate of 60 cents per 100 lb. on pine box shooks in carloads from Leavenworth, Wash., to Paonia, Hotchkiss and Austin, Col. A rate of 46 cents is prescribed for the future and reparation is awarded on that basis. (31 I. C. C., 341.)

Packing House Products from Iowa Points

Opinion by Commissioner Harlan:

The commission finds that the carriers have justified a proposed increase from 15 cents to 18½ cents in the rate on packing house products from Cedar Rapids and other points in Iowa to St. Paul and Minneapolis. The proposed rates are not unreasonable, while on the other hand they eliminate certain inconsistencies in the present rate structure. (31 I. C. C., 309.)

Cement Rates from Evansville, Pa., to Jersey City

Allentown Portland Cement Company v. Philadelphia & Reading et al. Opinion by Commissioner Clements:

The commission reaffirms its finding in the original report (27 I. C. C., 447) to the effect that defendants in maintaining or participating in rates on cement in carloads to eastern destinations, such as Baltimore, Philadelphia, New York and New England points, which are not higher from Evansville than the rates which they contemporaneously maintain to other mills in the Lehigh district, while refusing to participate in the same

relative adjustment from Evansville to Jersey City, thereby subjects Jersey City and its traffic to undue prejudice. (31 I. C. C., 277.)

Lumber Rates from Lake Charles and West Lake, La.

Opinion by Commissioner Daniels:

The commission finds that the carriers have justified a proposed increase in the rates on lumber from Lake Charles and West Lake, La., to Palacios, Port Lavaca, Aransas Pass, Portland, Rock Port and Corpus Christi, Tex. The present rate of 13¾ cents, originally made to meet water competition, is held to be hardly a reasonable charge for the service performed. Compared with the rates established by the carriers or the Texas commission's basis for lumber rates in this territory, it is abnormally low and beyond Houston the service is a branch line service performed in a country where the traffic is thin. (31 I. C. C., 258.)

Rates to Wichita, Kan.

Wichita Business Association v. Clinton & Oklahoma Western et al Opinion by the commission:

The commission finds that the class rates from Wichita, Kan., to a number of points in Oklahoma on the Clinton & Oklahoma Western are unreasonable to the extent that they exceed the so-called Kansas-Oklahoma one-line distance rates by more than certain prescribed differentials ranging from 8 cents per 100 lb. on class 1 to 2 cents on class E. Commodity rates on grain, feed and broom corn between Wichita, Kan., and points on the Clinton & Oklahoma Western are likewise found to be unreasonable and reasonable rates are prescribed. (31 I. C. C., 323.)

Rates on Coal to Beatrice, Neb.

Beatrice Commerce Club v. Chicago, Burlington & Quincy, et al. Opinion by the commission:

The commission finds that the rate on hard coal from Milwaukee, Wis., and Chicago and East St. Louis, Ill., the rates on soft coal from Chicago and Peoria, Ill., and the southern Illinois coal fields and those on coal from fields in Ohio, northern Missouri, southwestern Missouri, southeastern Kansas, northwestern Arkansas to Beatrice, Neb., are not unreasonable or prejudicial as compared with the lower rates to Lincoln, Neb., to which points Beatrice is intermediate via certain routes. The complaint is therefore dismissed and the carriers are relieved from the operation of the long and short haul rule of the fourth section in so far as the rates to Lincoln via routes through Beatrice are concerned. (31 I. C. C., 173.)

Switching at Galesburg, Ill.

Opinion by Commissioner Meyer:

Following the decision in *Buffalo, Rochester & Pittsburgh v. Pennsylvania Company* (29 I. C. C., 114), the commission finds that the Chicago, Burlington & Quincy in refusing to switch cars for the Rock Island Southern at Galesburg, Ill., as it does for the Atchison, Topeka & Santa Fe at that point, discriminates against the former road. It is therefore ordered that the Chicago, Burlington & Quincy remove this discrimination, either by terminating its present switching arrangement with the Santa Fe or by canceling a suspended tariff item proposing the elimination of the Rock Island Southern System from the switching arrangements at Galesburg. The commission does not find, however, that the so-called reciprocal switching charge of $2 is necessarily a just charge for the service demanded of the Burlington by the Rock Island Southern. (31 I. C. C., 294.)

Road Performing Switching Service Need Not Provide Cars

Wabash Sand & Gravel Company v. Vandalia et al. Opinion by the commission:

Complainant owning a sand and gravel pit on the Chicago, Terre Haute & Southeastern at Terre Haute, ships to points on the Vandalia, making use of a reciprocal switching arrangement between the two roads, but has difficulty in getting cars because in times of shortage both roads refuse to furnish them, each claiming that it is the duty of the other to do so. The commission finds that the Vandalia should supply the cars, it having in effect placed complainant's industry in the same position as industries on its own rails in providing for the absorption of the switching charge. The carrier should supply satisfactory cars, but in accordance with *Balfour, Guthrie & Co., v. O. W. R. R. & N.* (21 I. C. C., 539), if complainant is put to expense in cleaning or repairing equipment it cannot secure payment for such services. (31 I. C. C., 344.)

Joint Rates Between Rail and Water Lines

Decatur Navigation Company v. Louisville & Nashville et al. Opinion by Commissioner Daniels:

The complainant in this case requests that the commission direct the defendant to join in the publication of through routes and joint rates between certain Tennessee river landings and points on the line of defendants and its rail connections. Such through routes and joint rates are now published by defendant for shipment via the line of complainant's water competitor, the Tennessee River Navigation Company, but defendant has refused to grant the same privileges to complainant. The commission finds that a navigable river being a public highway, a responsible common carrier operating thereon is prima facie warranted in requesting the commission to require rail carrier, such as the defendant, to join in establishing through routes and joint rates between landings on the river and points on the rail carrier's lines. The refusal of the defendant to join in establishing such through routes from landings on the Tennessee river between Chattanooga and lock No. 6 is found to be unlawful and the defendants are required to join in the establishing of the requested through rates. (31 I. C. C., 281.)

Lumber Rates from Oregon and Washington to Eastern Points

Opinion by Commissioner Harlan:

The commission held in its original findings in this case that the Union Pacific might lawfully close the Wallula gateways for eastbound shipments of wool, but that it must continue the through routes applied to the lumber traffic moving from mills on other lines through the Silver Bow, Spokane and Butte gateways to the east over Union Pacific; and also the through routes by way of the Colorado gateway, through which rates are applied in connection with the other prairie lines on all traffic moving between points in Oregon and Washington on the one hand and the Missouri River and points east thereof on the other. On the ground that this ruling would have the effect of denying to the lines of the Union Pacific System the long haul on the traffic involved and because the connections that would ordinarily be entitled to the long haul as originating lines on westbound traffic had made no objection to this cancellation of gateways, the commission now rules that the through routes by way of the Colorado gateways may be cancelled, provided they are left open for the transportation of fruit and lumber, the shippers of which appear to be the only ones whose interests may be prejudiced. (31 I. C. C., 131.)

Lumber Rates from Southern Railway Points to Eastern Points

Opinion by Commissioner Harlan:

The tariffs involved in this investigation contain both increases and reductions in the rates on lumber from points on the Southern in North Carolina, South Carolina and Tennessee to (a) eastern port cities, (b) interior eastern points in Maryland, Pennsylvania, New York, Delaware, New Jersey and the New England States, (c) the Virginia cities and (d) Norfolk when for export. The territory of origin includes substantially the whole of the lumber producing district of western North Carolina, served by the Southern, and a considerable portion of western South Carolina and eastern Tennessee, a section largely given over to the production of lumber of the same general character and selling in the same market. The reason advanced for revising the lumber rates is to correct what were believed to be indefensible discrepancies in the present rates from the various sections of this producing territory. It was not the intention of the defendant to increase its rates for the purpose of obtaining larger revenues, but it appears that the advances are much more numerous than the reductions, the ratio being approximately 2½ to 1. There also appear to be a number of inaccuracies and other discrepancies. The commission is of the opinion that the Southern Railway has attempted to make a revision of its lumber rates along lines that are desirable and in the general public interest, but that the revision has serious defects. The revision attempted to establish different rates on the different grades of lumber based on value; the commission does not believe that this is justified. It therefore holds that the increased rates proposed have not been justified and it is

ordered that the tariffs under consideration be cancelled but without prejudice to the Southern Railway to present another plan of revision. (31 I. C. C., 244.)

Commodity Rates on Groceries, etc., from Western Points to Nashville

T. Cheek & Sons et al. v. Canadian Pacific et al. Opinion by Commissioner Hall:

The commission finds that the rates on canned salmon, canned goods, citrus and deciduous fruits, dried fruits and other like products from California terminals and from interior points in Arizona, California, Nevada, New Mexico, Oregon and Utah, and also points in British Columbia, Idaho, Montana, Oregon and Washington to Nashville are discriminatory as compared with the rates on the same commodities to Humboldt, Jackson, Milan, Memphis, Martin, Union City and Rives, Tenn.; Birmingham and Tuscaloosa, Ala.; Columbus, Paducah, Hopkinsville, Louisville, Lexington, Owensboro, Henderson, Elizabethtown and Princeton, Ky., and Evansville, Ind.; Cairo, Ill., and Cincinnati, Ohio. The rates to these specified points are those which apply alike to Missouri river and common points to Cincinnati and Detroit and common points and thence east to New York and common points. The rates to Nashville, however, are made by taking the rates to the Ohio or Mississippi crossing point, via which the transcontinental lines choose to make the through rate and adding thereto whatever local or proportional the southeastern lines accept as their division of the through rate. The complainants were compelled to present their complaint principally by the extension of the Cincinnati-Detroit basis to Birmingham and Tuscaloosa, but it happens that the Louisville & Nashville and the Nashville, Chattanooga & St. Louis did not concur in that extension and have since announced their intention of canceling their participation in the Cincinnati-Detroit basis to Paducah, Jackson, Humboldt, Milan, Hopkinsville and Elizabethtown, although in a former case it was held that the application of this basis to these cities did not constitute discrimination against Nashville by these two carriers.

It is also held, however, that the present rates to Nashville are unreasonable. The southeastern carriers have offered to accept as a fair division south or east of the river crossings out of the through rates to Nashville, certain so-called unpublished proportions which were named from Henderson, Ky., and Hickman, Ky., and which may be denominated as unavailable combination rates to Nashville. It is therefore held that the carload rates to Nashville upon the commodities involved should not exceed the lowest rates that can now be constructed, whether as published through rates, published combination rates or unavailable combination rates. It is found that certain published through rates were unreasonable to the extent that they exceeded published combination rates which were also available, and reparation is awarded to the extent of such excess. (31 I. C. C., 265.)

STATE COMMISSIONS

The Minnesota Railroad and Warehouse Commission has issued rules for the construction of joint rates on intrastate freight shipments, in accordance with the Cashman distance tariff law, which goes into effect on August 10.

The Oklahoma Corporation Commission in its annual report, urges legislation to give the commission power to regulate stock and bond issues for all public utilities whose property is wholly within the state. In case Congress fails to pass a law for the regulation of securities of interstate carriers, it recommends that Oklahoma pass a law similar to those of several other states.

The Illinois Railroad and Warehouse Commission has issued an order requiring storage warehouse companies, including cold-storage warehouses, to file schedules of their charges with the commission, holding that they are public utilities.

The Illinois Public Utilities Commission held a hearing in Chicago on July 28 on complaints of Elgin shippers that the express rates between Elgin and Chicago are so high as to be discriminatory in favor of the rates between Aurora and Chicago. Both cities are 37 miles from Chicago, and the difference in their rates arises from the location of the boundaries of the rate zones in eastern territory.

Railway Officers

Executive, Financial, Legal and Accounting

E. C. Deal has been appointed vice-president and chief engineer of the Carolina & Yadkin River, with headquarters at Greensboro, N. C., succeeding J. P. Clark, resigned.

E. A. Bynum, assistant general freight agent of the Mobile & Ohio, with headquarters at New Orleans, La., has been elected vice-president and general manager of the Texas City Terminal Company, of Texas City, Texas.

The following appointments are announced on the Texas & Pacific: A. J. Biard, assistant auditor; G. W. Danner, auditor of disbursements; D. W. Beddo, auditor of freight receipts; F. E. Stanberry, auditor of passenger receipts; A. A. Martin, freight claim agent; all with headquarters at Dallas, Tex.

President E. J. Chamberlin of the Grand Trunk and Grand Trunk Pacific, announces that owing to the death of M. M. Reynolds, vice-president in charge of finance and accounting, that position has been abolished. Frank Scott, treasurer, at Montreal, Que., has been appointed vice-president and treasurer in charge of all financial matters, and W. H. Ardley, general auditor at Montreal, has been appointed controller in charge of all accounting.

William R. Campbell, whose election as vice-president of the Susquehanna & New York, with headquarters at New York, has already been announced in these columns, was born on January 23, 1855, at Louisville, Ky., and was educated in the public schools of his native town. His first railway work was with the Chesapeake & Ohio Southwestern, now a part of the Illinois Central, in 1885. He was appointed assistant to the president of the Susquehanna & New York on January 13, 1908, and at the time of his recent election as vice-president of the same road, was also assistant to president of the Tionesta Valley and the Leetonia Railway. In 1889 Mr. Campbell went to the Louisville Board of Trade as secretary of the Transportation Committee, and since 1893, he has been in the service of the United States Leather Company and affiliated companies, first as freight and claim agent and then as traffic manager.

W. R. Campbell

Operating

The headquarters of John F. Tracy, trainmaster of the Northern Pacific, are at White Bear, Minn., instead of Minneapolis, as stated in our issue of July 31.

The Canadian Pacific announces that the following appointments have been made on the Alberta division, effective August 1: J. M. MacArthur, terminal trainmaster, with headquarters at Calgary, Alta.; R. Sinclair, trainmaster at Field, B. C.; C. E. Mansfield, chief train despatcher at Calgary, and W. E. Cline, chief train despatcher at Cranbrook, B. C.

D. Crombie has been appointed superintendent of transportation of the Canadian Northern, Eastern lines, with jurisdiction over transportation matters, with headquarters at Toronto, Ont. G. A. Hoag has been appointed superintendent of car service, and H. H. Smith, car service agent of the Canadian Northern Quebec, at Montreal, Que., has been appointed car accountant of the Cana-

dian Northern, Eastern lines, with jurisdiction over all lines east of Port Arthur, Ont., with headquarters at Toronto.

The Alberta division of the Canadian Pacific will in the future be operated in five districts, as follows: District 1 includes Medicine Hat, Calgary, Empress, Bassano, Suffield, Langdon, Irricana and Gleichen subdivisions, J. M. Cameron, superintendent, with headquarters at Medicine Hat, Alta. District 2 includes Lethbridge (including Dunmore terminal), Crow's Nest, Aldersyde, Macleod, Coutts, Cardston, Woolford and Foremost subdivisions, F. Walker, superintendent, with headquarters at Lethbridge. District 3 includes Calgary Terminals, Laggan and Red Deer subdivisions, P. F. Weisbrod, superintendent, with headquarters at Calgary. District 4 includes Edmonton (including Red Deer terminal), Hardisty, Lacombe, Coronation and Alberta Central subdivisions, J. A. MacGregor, superintendent, with headquarters at Edmonton. District 5 includes Cranbrook (including Crow's Nest terminal), Sirdar, Kingsgate, Kimberly, Waldo and Fort Steele subdivisions, A. C. Harshaw, superintendent, with headquarters at Cranbrook, B. C.

Rutledge Smith, general agent for the receivers of the Tennessee Central, whose appointment as superintendent, also, has been announced in these columns, was born on August 1, 1870, at Cookeville, Tenn., and was educated in the public schools at that place. He also received a training for civil engineer, and for a time was engaged in field work as a transitman. In 1887 he established the Cookeville *Press*, and has been owner and publisher of it ever since. Since 1901 also he has been manager of the Southern Press Association, and since 1897 chairman of the Tennessee Press Association. Mr. Smith was also assistant of public instruction of Tennessee from 1900 to 1906. In the latter year he became the cashier of the People's Bank at Cookeville, and one year later was appointed its president. He first entered railway service on March 6, 1911, when he was chosen industrial agent of the Tennessee Central. On March 1, 1913, he was appointed general agent for the receivers, and on July 1, 1914, was also appointed superintendent as above noted.

R. Smith

A. J. Hills, superintendent of the Canadian Northern Ontario, at Toronto, Ont., has been appointed general superintendent of the Ontario Grand division of the Canadian Northern, Eastern lines, with jurisdiction over the transportation, the maintenance of way and the mechanical departments, with headquarters at Toronto, Ont. The Ontario Grand division includes the Canadian Northern Ontario, the Central Ontario, the Bay of Quinte, the Irondale, Bancroft & Ottawa and the Brockville, Westport & North Western railways. George Collins, general manager of the Central Ontario and the Irondale, Bancroft & Ottawa, at Trenton, Ont., has been appointed superintendent of the Ottawa division, with headquarters at Trenton, and W. J. Curle, superintendent of the Brockville, Westport & North Western, at Brockville, has been appointed superintendent of the Toronto division of the Canadian Northern, with office at Toronto, both have jurisdiction over the transportation, the mechanical and the maintenance of way departments. R. S. Derbyshire has been appointed assistant superintendent of the Ottawa division, with office at Trenton. H. B. Sherwood, superintendent of the Bay of Quinte, at Napanee, Ont., has been appointed superintendent of the Ottawa division, with headquarters at Napanee. S. J. Kitchen has been appointed trainmaster, with office at Trenton. W. R. Kelly, trainmaster of the Canadian Northern Ontario, at Toronto, has been appointed assistant superintendent of the Toronto division of the Canadian Northern, with headquarters at Toronto, and P. H. Fox has been appointed chief despatcher, with office at Toronto.

Everett E. Cain, whose appointment as superintendent of the Chicago-Petosky division of the Pere Marquette, with headquarters at Grand Rapids, Mich., has been announced in these columns, was born February 14, 1867, at Dublin, Ind. He received a high school education and began railway work with the Wabash in 1887 as a telegraph operator, and from that year until 1903 was at different times operator for the Missouri Pacific, the St. Louis Southwestern and the Denver & Rio Grande. He then went with the St. Louis, Iron Mountain & Southern as a brakeman, and was promoted to train despatcher at Van Buren, Ark., in 1896. He was transferred to Little Rock, Ark., as chief despatcher in 1900, where he remained for a year. He was then out of service for two years, and in March, 1903, became chief clerk to the superintendent of transportation of the Missouri Pacific-Iron Mountain system. In December, 1904 he was appointed trainmaster on the Pere Marquette, with office at Detroit, Mich. In December, 1910, he went to the Cincinnati, Hamilton & Dayton as superintendent at Wellston, Ohio. He remained with that company until June 1, 1912, when he was appointed superintendent of the Toledo-Ludington division of the Pere Marquette, with headquarters at Saginaw. On July 1, 1914, he was transferred to Grand Rapids as superintendent of the Chicago-Petosky division, as above noted.

Traffic

C. R. Moffett has been appointed commercial agent of the Tennessee Central, with office at Knoxville, Tenn., vice A. P. Cooper, resigned to engage in other business.

C. A. Lahey, chief of the tariff bureau of the Chicago, Milwaukee & St. Paul, has been appointed assistant to the freight traffic manager, with headquarters at Chicago, and C. A. Butler succeeds Mr. Lahey.

John S. Brown, general freight agent of the northern and western lines of the Illinois Central, has been appointed manager of the transportation department of the Chicago Board of Trade, succeeding E. B. Boyd, resigned.

C. A. Morse, district freight agent of the Canadian Pacific at Fort William, Ont., has been appointed district freight agent, with office at London, succeeding H. A. Plow, promoted, and the position of H. C. McMullen, general live stock agent, with office at Calgary, Alta., has been abolished.

Engineering and Rolling Stock

Melvin S. Montgomery has been appointed road foreman of engines of the Northern Pacific at Staples, Minn.

P. A. Bliss, signal supervisor of the Tucson division of the Southern Pacific at Tucson, Ariz., has been transferred to the Salt Lake division. C. A. Veale succeeds Mr. Bliss.

The Canadian Pacific announces that the following appointments have been made on the Alberta division, effective August 1: W. J. Rennix, district master mechanic, with headquarters at Calgary, Alta.; G. Glasford, district master mechanic at Cranbrook, B. C.; R. C. Harris, resident engineer at Calgary; D. McTaggart, bridge and building master at Calgary, and T. J. Brown, resident engineer and bridge and building master, at Cranbrook.

T. R. McLeod, master mechanic of the Canadian Northern Ontario and the Bay of Quinte, at Toronto, Ont., has been appointed division master mechanic of the Ontario Grand division of the Canadian Northern, Eastern lines, with headquarters at Toronto; R. A. Miller has been appointed general foreman, and W. C. Moore has been appointed road foreman of engines of the Ottawa division, both with headquarters at Trenton, and J. W. Findlay has been appointed general foreman of the Toronto division, with headquarters at Parry Sound.

R. A. Baldwin has been appointed engineer maintenance of way of the Ontario Grand division of the Canadian Northern, Eastern lines, with headquarters at Toronto, Ont. J. D. Evans, chief engineer of the Central Ontario, at Trenton, has been appointed division engineer of the Ottawa division of the Canadian Northern. E. Myers, roadmaster of the Canadian Northern Ontario at Toronto, has been appointed roadmaster of the

Ottawa division of the Canadian Northern, and the following supervisors of track have been appointed: W. Walsh and D. McDonald, both with headquarters at Trenton, and O. Ogden, with headquarters at Ottawa, on the Ottawa division; E. Haystead, with headquarters at Toronto, and G. M. Elliott, with headquarters at Parry Sound on the Toronto division; W. H. See has been appointed supervisor of bridges and buildings at Toronto. See an item under Operating Officers.

Purchasing

L. C. Thomson, storekeeper of the Canadian Northern Ontario, at Toronto, Ont., has been appointed division storekeeper of the Ontario Grand division of the Canadian Northern, Eastern lines, with headquarters at Toronto.

OBITUARY

J. B. Sheldon, superintendent of telegraph of the Union Pacific, with office at Omaha, Neb., died at his home in that city on July 29, at the age of 53 years. Mr. Sheldon had been in the service of the company for 32 years and had held the position of superintendent of telegraph since 1888.

Robert Moran, master mechanic of the Louisville & Nashville, with office at Nashville, Tenn., was drowned while bathing at Santa Rosa Island, Fla., on July 31. He was born on February 10, 1857, at Wilmington, Del., and began railway work in November, 1870, as an apprentice in the machine shops of the Edgefield & Kentucky, at Edgefield, Tenn., and since that time he has been in the continuous service of its successor, the Louisville & Nashville and lines now forming part of that road. In December, 1890, he was appointed master mechanic at Bowling Green, Ky., and since February, 1900, was master mechanic at Nashville, Tenn.

William Barstow Strong, formerly from 1880 to 1889 president of the Atchison, Topeka & Santa Fe, died at Los Angeles, Cal., on August 3. He was born at Brownington, Orleans county, Vt., on May 16, 1837, and graduated from Bell's Business College, Chicago, in 1855. He began railway work as station agent and telegraph operator in March of the same year at Milton, Wis., and was later station agent at White Water and at Monroe, and then general western agent of the Southwestern division of the Chicago, Milwaukee & St. Paul at Janesville, Wis. From 1865 to 1867, he was assistant superintendent of the McGregor & Western, now a part of the Chicago, Milwaukee & St. Paul. He was then to 1870 general western agent of the Chicago & North Western, and from 1870, to 1872, was assistant general superintendent of the Chicago, Burlington & Quincy at Burlington, Iowa. In 1872 he was appointed assistant general superintendent of the consolidated Burlington & Missouri River and the Chicago, Burlington & Quincy at Chicago, and in 1874 became general superintendent of the Michigan Central at Chicago. The following year he was appointed general superintendent of the C. B. & Q., and from 1877 to 1880 was vice-president and general manager of the Atchison, Topeka & Santa Fe at Topeka, Kan. He was then president of the same road, with headquarters at Boston, Mass., until 1889, at which time he retired from active service.

Passenger Traffic in Greater Berlin.—An official report which has recently been published shows that in the calendar year 1913 there were 732,800,000 passengers carried by the street car lines and the combination subway and elevated system of Greater Berlin, as compared with 707,000,000 in 1912. Of these 732,800,000, 80,800,000 were carried on the elevated and subway lines. Of those transported on the surface lines 566,400,000 were handled by the Greater Berlin Street Railway Company and allied companies. The Berlin municipal street car line handled 26,900,000. The omnibus lines, both horse and motor, carried 170,400,000 as compared with 161,900,000 in 1912, and the elevated steam "city" and "belt" lines operated by the Prussian Railway Administration, 263,800,000, an increase over the 238,400,000 of the preceding year. The suburban trains of the railway administration carried in addition 131,800,000 persons as compared with 149,500,000 persons in 1912. Leaving the last out of consideration, the total movement of passengers in 1913 may be put at 1,167,000,000. The total population of the community served is about 4,000,000 people.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Gould Southwestern has ordered one Mogul type locomotive from the Baldwin Locomotive Works.

The Grand Rapids & Northwestern has ordered a number of locomotives from the Baldwin Locomotive Works.

The Midland Pennsylvania has ordered one eight-wheel locomotive from the Baldwin Locomotive Works.

The Georgia Railroad is reported to be in the market for 8 Mikado type locomotives. This item has not been confirmed.

The Scott Lumber Company, Bennettsville, S. C., has ordered one Columbia type locomotive from the Baldwin Locomotive Works.

The Cleveland, Cincinnati, Chicago & St. Louis is said to be preparing plans for the purchase of 5 Pacific type locomotives. This item has not been confirmed.

The Atlantic Coast Line.—An item in the *Railway Age Gazette* of July 24 to the effect that this company is in the market for a number of Mountain and Pacific type locomotives is denied.

The San Diego & Arizona has ordered one Consolidation freight locomotive from the American Locomotive Company. This locomotive will have 22 by 30 in. cylinders, 57 in. driving wheels, a total weight in working order of 212,000 lb. and a steam pressure of 200 lb.

CAR BUILDING

The Delaware, Lackawanna & Western has ordered 500 40-ton gondola cars from the Pressed Steel Car Company.

The Georgia Southern & Florida is said to be contemplating the purchase of 15 coaches. This item has not been confirmed.

The Erie has ordered 600 gondola cars, divided equally between the American Car & Foundry Company, the Pressed Steel Car Company and the Standard Steel Car Company.

The Baltimore & Ohio is reported to be in the market for 1,000 hopper and 29 passenger cars for the Cincinnati, Hamilton & Dayton, in addition to the 1,000 box cars previously noted.

The Southern Pacific is reported as interested in the purchase of 250 miscellaneous cars for a number of industrial roads operating over its lines. This is in addition to the order for 4,600 cars now pending.

New York Municipal Railways.—The New York Public Service, First District, has authorized this company to order 100 steel cars for operation in the subways that the company will operate in the dual system. Another order of 100 cars placed some time ago will be ready for delivery in December.

IRON AND STEEL

The Duluth, Missabe & Northern has ordered 251 tons of steel from the American Bridge Company for a connecting trestle supporting a trimmer's house between ore docks 4 and 5 at Duluth, Minn.

The Illinois Central has contracted with the Jones & Laughlin Steel Company, Pittsburgh, Pa., for a large tonnage of punched channels for repairing cars. This work will be done from time to time, extending over a number of years.

SIGNALING

The Baltimore & Ohio has contracted with the Union Switch & Signal Company for the installation of a type "F" electric interlocking plant at the Calumet river draw bridge near Chicago. The machine will have a 29-lever frame; 18 working levers, 4 spare levers and 7 spare spaces.

The Indianapolis Railway & Lighting Company, a 600-volt direct current interurban line, has contracted with the Union Switch & Signal Company for the installation of alternating current automatic block signals between Pit and Junction, 7.2 miles in Indiana. There will be eight model "13" electric light signals installed on the TDB system, which will permit two trains to follow each other between turnouts, but will prevent opposing movements. Vane relays will be used on the line circuits and galvanometer relays on track circuits.

The New York State Public Service Commission for the First district announces that it has approved a contract to be made by the New York Municipal Railway Corporation with the Federal Signal Company for the installation of automatic block signals in the Centre street loop subway. The Federal Signal Company was the lowest bidder for this work. The Union Switch & Signal Company protested to the commission, alleging that the Federal Company could not meet the requirements of the specifications without infringing on its patents. Commissioner Robert C. Wood held hearings in regard to this, but in view of possible delay that might ensue the commission determined to approve of the award of the contract to the Federal, subject to its giving assurances of indemnity against patent claims. The Centre street loop is a part of the first section of the tri-borough subway system of New York City. This contract covers 2.1 miles of double track automatic block signaling and three interlockings; and includes automatic stops. As direct current is used for propulsion the signal apparatus must have alternating current track circuits. The Federal Signal Company proposes to use apparatus of its own design and manufacture throughout.

Automatic Signal on the Western Maryland

The Western Maryland has contracted with the Union Switch & Signal Company for the installation of automatic block signals on the line between Cumberland and Big Pool, 60 miles, single track. The system used will be the "TDB," which allows trains to follow each other between stations, but for opposing movements provides a positive block from siding to siding. The signals will be style "S" three-position, upper quadrant. There are already isolated block signal installations for the protection of five tunnels on this 60-mile stretch. With these there will be a total of 108 signals and 34 switch indicators.

Panama Canal Transferred.—A railway paper published in India states that the following recently appeared in an Indian examination paper: "The Panama Canal is being cut from Delhi to Bombay in order to facilitate the speedy passage home of persons going on short leave from the new capital of India."

A Spanish Car Building Plant.—The annual report for 1913 of the Spanish Metallic Construction Company, of Madrid, shows that the company's business for the year totaled $2,888,000, an increase of $449,100 over 1912. The company has five plants and the number of men employed is 1,800 as against 1,650 in 1912. The chief factory of the five is at Beasain, province of Guipuscoa. This plant alone built during the year 1,250 flat cars and five first class passenger cars for the Northern Railway; 1,215 freight cars of various kinds, and 43 first-class passenger cars for the Madrid Saragossa & Alicante Railway; 4 first-class and 3 third-class passenger cars for the Oviedo-Hendaye Railway, besides a number of cars of various kinds for companies and individuals. This plant has a capacity of 3,000 freight and 200 passenger cars per year.

German Railroad Agricultural Rates.—With a view to the encouragement of agriculture, the German state railways carry stable manure and similar soil fertilizing materials at 20 per cent. less than the usual tariff. These rates are based upon a special tariff known as the Notstands-Tarif (expediency tariff) and are 20 per cent. lower than the prices which would be charged for hauling manure and similar products intended for manufacturing purposes. Expressed in terms commonly used in the United States the special rate for transporting the products mentioned averages per mile about $0.64 for each ton hauled. The following are the rates per metric ton (2,204.6 pounds) charged by Prussian railroads for hauling stable manure between Berlin and certain well-known points: Berlin to Breslau, 230 miles, $1.49; Berlin to Konigsberg, 367 miles, $2.25; Berlin to Frankfort-on-Main, 336 miles, $2.11; Berlin to Dresden, 100 miles, $0.89.

Supply Trade News

The Apollo Steel Company, Apollo, Pa., has appointed Theodore Geissmann & Company, Inc., Chicago, Ill., as its district sales agents in the central west.

The Christy steel roofs have been specified for the 500 freight cars recently ordered by the Chicago Great Western from the American Car & Foundry Company.

Sidney G. Johnson has been elected a vice-president and director of the General Railway Signal Company, Rochester, N. Y., with headquarters at 55 Liberty street, New York.

J. S. Hobson has been appointed acting general sales manager of the Union Switch & Signal Company, and C. E. Denny, assistant general sales manager. Both will have office at Swissvale, Pa.

The Protective Signal Manufacturing Company, Denver, Colo., has appointed William R. Garton & Company, 299 Broadway, New York, its general sales agents and advisory engineers for the United States.

M. H. Loughridge, formerly with the New York, Westchester & Boston, and at one time on the engineering staff of the Union Switch & Signal Company, has been appointed office manager in the New York office of the Federal Signal Company, New York.

The Terry Steam Turbine Company, Hartford, Conn., has appointed Fidanque Bros. & Sons of New York and Panama, with main office at 15 Whitehall street, New York, its representatives for Panama and the Canal Zone. It also announces that on August 1 their Cleveland office, in charge of L. G. Finlay, was moved to 503 Union building.

William E. Clark, for many years in charge of outside track inspection of the Rail Joint Company, New York, died at the home of his son in Charlestown, N. H., on July 5, after an illness of only one week. Mr. Clark was born in Manchester, N. H., on November 5, 1847. During the Civil War, he enlisted in the navy at the age of 16, and served for three years, participating in the capture of Fort Fisher in January, 1865. Soon after the war he became engaged in the business of railroad bridge building and later served for nearly 25 years as a roadmaster on the Connecticut division of the Boston & Maine. Mr. Clark became associated with the Rail Joint Company about 1897, and had held the position of representative in charge of outside track inspection for many years.

A. H. Ackermann, vice-president and general manager of the United States Light & Heating Company, Niagara Falls, N. Y., prior to the receivership, has been appointed general manager, and the entire staff of salesmen, engineers, etc., have been retained in their former capacities. Mr. Ackermann has issued the following statement: "The action recently sustained in the appointment of the receivers for the property of the company was a necessary step to conserve the assets to the benefit of all. With assets of $3 for every $1 of debt, the company is amply stable, and the court's direction to continue the business is the last proof necessary to reassure the buying public. There are already under way plans for broad financing, and with the return of general prosperity in the country, the USL, more aggressive than ever before, intends to secure its own full share of the business and to continue the manufacture and sale of its special electrical products."

TRADE PUBLICATIONS

Derails.—The Hays Track Appliance Company, Richmond, Ind., has issued a folder illustrating the Hayes derail.

Gate Valves.—The National Tube Company, Pittsburgh, Pa., has recently issued bulletin No. 13-A, descriptive of N. T. C. iron body brass mounted wedge gate valves.

Steam Hose Couplers.—The Gold Car Heating & Lighting Company, New York, has recently issued a circular descriptive of the company's latest type steam hose coupler No. 804 S.

Air Compressors.—The Chicago Pneumatic Tool Company, Chicago, Ill., has issued bulletin No. 34, descriptive of its class M Chicago pneumatic steam and power driven enclosed compressors.

Conveyor Scales.—The Electric Weighing Company, New York, has recently issued bulletin No. 8, illustrating and describing Messiter conveyor scales and certain other Messiter electric specialties.

Engines and Outfits.—The Novo Engine Company, Lansing, Mich., has issued a folder devoted to illustrations and the description of the "Novo" engine and the various uses for which it is adapted.

Locomotive Valve Gear.—The Pilliod Company, New York, has recently issued a very attractive booklet containing views of a number of locomotives on various roads which have specified Baker valve gear for use on their motive power equipment.

Cranes.—The Whiting Foundry Equipment Company, Harvey, Ill., has issued catalog No. 110, meant to describe and illustrate some of the latest features of Whiting crane construction. The booklet contains a large number of photographs, nearly one-half of these showing typical installations of various sorts.

Brake Rods.—An eight page booklet has been issued by the Schaefer Equipment Company, Pittsburgh, Pa. It describes the solid forged truck-lever connections which are manufactured by this company. These rods are formed from heavy sheet steel without welds, the ends being drop forged to form reinforced jaws and holes.

Winches and Winding Drums.—The Sprague Electric Works of the General Electric Company, New York, has issued bulletin No. 48,901, descriptive of Sprague electric winches and winding drums. The catalog contains a number of views showing how the winches may be used to advantage in freight yards, locomotive repair shops, ferry slips, etc.

Hammers.—The David Maydole Hammer Company, Norwich, N. Y., has recently issued a 1914 catalogue of Maydole hammers. The catalogue contains 64 pages and is printed in four languages, English, French, German and Spanish. It includes illustrations of the several types of hammer and gives specifications concerning each one of them.

Adjustable Hub Plates.—The Smith Locomotive Adjustable Hub Plate Company, Pittsburg, Kan., has issued a 12-page pamphlet, descriptive of its adjustable hub plate. This device is so designed that a heavy grease behind the plate, applied through a grease hole with screw pressure from the outside of the driving wheel, acts as a cushion behind the plate. The plate may be adjusted to any position necessary to take up the lateral play, by increasing the pressure on the grease.

Steel Sash and Partitions.—The David Lupton's Sons Company, Philadelphia, Pa., has recently issued catalogue No. 8 descriptive of the various Lupton products for light and ventilation. The book is 9 in. by 12 in. in size and contains 84 pages. It describes in detail the various products made by the company such as Lupton standard construction and special type steel sash, Lupton steel partitions, Lupton steel tube doors and jambs, Pond continuous sash, Pond truss, the Pond operating device, etc. Views are given showing the construction of the products and of the various buildings on which they have been installed.

The Exposition at San Francisco.—The Panama-Pacific International Exposition Company has recently issued a remarkable booklet describing in full detail the plans for the exposition which is to be held at San Francisco in 1915. The booklet is remarkably well done. It is divided into a number of short chapters headed, respectively: The Event; The Celebration; San Francisco, the Exposition City, and California, the Hostess. Illustrations are given showing the various sections of the Panama Canal, many of the buildings which have thus far been erected on the site of the exposition, the business section of San Francisco and some of the more interesting features in the country around about. Perhaps the most unique thing about the booklet is the section containing a number of color studies of the exposition city showing a panoramic view of the completed layout and some of the better buildings which will be erected.

Railway Construction

Canadian Pacific—The Kaslo sub-division of the British Columbia division has been opened for business from Kaslo, B. C., to Parapet, the junction point with the Nakusp subdivision, 25.6 miles.

Denver & Salt Lake.—See this company under financial news.

Detroit, Pontiac & Owosso (Electric).—Permission has been granted this company to issue $3,300,000 of bonds to secure funds for building the line. The company was incorporated recently with $50,000 capital, and plans to build from Pontiac, Mich., northwest via Clarkston and Fenton to Owosso, about 55 miles. Dr. Oliver H. Lau, Detroit, Mich., is the principal promoter.

Erie & Toronto.—See Toronto, Hamilton & Buffalo.

Great Falls Western.—This company, with a capital of $1,000,000, recently filed articles of incorporation in Montana. The plans call for building from a point on the Chicago, Milwaukee & St. Paul, in section 30, township 21, north range 1, east of the principal meridian of Montana in Cascade county, in a general southwesterly and westerly direction through the counties of Cascade, Lewis, Clark and Powell, to a point on the Big Blackfoot Railway in section 30, township 15 north, range 13 west, of said meridian in Powell county, about 115 miles. A number of branch lines and extensions are also projected. The main line is to be built over the route surveyed more than a year ago, and it is expected that construction work will be started in the near future. The incorporators include C. A. Goodnow, assistant to president of the Chicago, Milwaukee & St. Paul, Chicago, Ill.; J. D. MacVickar, J. O'Grady and P. H. Scanlan, Great Falls, and C. L. Whiting, Lewistown.

Montana Roads. (Electric).—According to press reports, plans are being made for building a 150-mile electric line in Montana. The projected route is west from Bozeman across Gallatin valley and following Madison valley south to the west entrance of Yellowstone National Park. E. W. Dawes, Bozeman, and C. L. Loomis, Kansas City, Mo., are said to be interested.

Moultrie Southwestern.—An officer writes that the plans call for building a 22-mile to connect Moultrie, Ga., with Meigs and Hansell or Ochlochnee, passing through Funston. The company will develop a new town 12 miles southwest of Moultrie and the prospects of carrying out the work are good, but it has not yet been decided when contracts will be let. Track has been laid on five miles. The company expects to develop a traffic in lumber, cotton, naval stores, fruits, etc. W. E. Aycock, Moultrie, Ga., may be addressed. (July 17, p. 148.)

Nashville, Shiloh & Corinth.—Elections have been held and bonds aggregating $740,000 have been voted in aid of this project. The city of Nashville and Davidson county will be asked in the near future to vote on a bond issue and it is said that this additional issue of bonds will insure the building of the line. The company was organized about a year ago by residents of Corinth, Miss., to build from Corinth, northeasterly to the Tennessee river, thence via Savannah, Tenn., to Nashville about 160 miles. The line may eventually be extended from Corinth, Miss., southwest. A. W. Jones, a capitalist of Augusta, Ga., and associates have agreed to build the line as soon as the bonds are voted. Clopton Thomas, secretary of the Business Men's Club, Corinth, Miss., may be addressed. (April 24, p. 966.)

New York Subways.—Bids are wanted on August 21 by the New York Public Service Commission, First district, for the construction of Section No. 3 of Route No. 33. This section is a part of the extension of the East river tunnel from Whitehall street, in the borough of Manhattan to Montague street, borough of Brooklyn. Bids are also wanted on the same date for the supplying of more special work for the Fourth avenue subway, Brooklyn. A contract was let recently for the construction of Section No. 5 of Routes Nos. 4 and 36 of the Broadway subway in Fifty-ninth and Sixtieth streets, includ-

ing the construction of stations at Fifth avenue and at Lexington avenue in the borough of Manhattan, to the Degnon Contracting Company for $2,819,511, and a contract was also let for the construction of station finish at the six stations on the extension of the Fourth avenue subway from Forty-third to Eighty-sixth streets, Brooklyn.

North Carolina Roads (Electric).—A franchise has been granted to T. J. Markham, J. E. Commander and D. E. Williams, of Elizabeth City, N. C., to build an interurban line from Wades Point and Listers pier, in the lower part of Pasquotank county, north via Elizabeth City, N. C., and South Mills to Norfolk, Va., about 75 miles.

Oregon Short Line.—The Idaho Northern branch has been extended from Donnelly, Idaho, west to Lakeport, 13.8 miles.

Toronto, Hamilton & Buffalo.—Under the name of the Erie & Ontario a company has been incorporated in Canada with $500,000 and headquarters at Hamilton, Ont., to build from Port Maitland on Lake Erie, Ont., north about 20 miles, to Smithville on the T. H. & B.; also to build from Port Maitland east to Port Colborne an additional 20 miles. Surveys are now being made. J. N. Beckley, Rochester, N. Y., president of the T. H. & B., is also president of the new company.

RAILWAY STRUCTURES

Charleston, S. C.—The Southern Railway is planning to erect an extensive system of coal handling piers on a site which was purchased for this purpose about a year ago. The necessary funds have been appropriated for the work and the engineers have already submitted their first report.

Dyersburg, Tenn.—An officer of the Illinois Central writes that the company recently started work on the construction of a small mechanical terminal at Dyersburg, Tenn., together with a yard at that place. The total cost of the improvements will be about $100,000. The buildings will consist of a four-stall roundhouse and boiler house, together with an 85-ft. turntable equipped with electric tractor, all buildings to be of frame construction. The railroad company is doing the grading and track laying, and the construction of the buildings will be let by contract. (July 31, page 228.)

Macon, Ga.—The railroads interested in the construction of the Union station at Macon have been granted an extension of time to August 12 to file complete plans of the new structure. (October 24, p. 806.)

Metropolis, Ill.—The Paducah & Illinois has awarded the contract for the superstructure of its bridge over the Ohio river at Metropolis, Ill., amounting to about 18,000 tons of steel, to the American Bridge Company. The contract for the grading work will probably be let some time this week.

Norfolk, Va.—The Seaboard Air Line recently opened bids, it is said, for building a two-story addition to the general office building at Norfolk.

North Philadelphia, Pa.—Bids were received on August 4, by the Pennsylvania Railroad for improvements to be made at the North Philadelphia station.

Pennsylvania.—Permission has been granted by the Pennsylvania State Water Supply Commission to build bridges for the following railroad companies: Pennsylvania Railroad over Sinnemahoning creek, Cameron county; East Broad Top Railroad & Coal Company over Aughwick creek at Aughwick, and over Blacklog creek near Orbisonia; Pittsburg, Cincinnati, Chicago & St. Louis over streams near Burgettstown and Nobles-town, and to the Lancaster & Quarryville over Mill creek, Lancaster county.

Raleigh, N. C.—An officer writes that the Biscoe, N. C., shops of the Norfolk Southern have been discontinued and that all the machinery has been removed to the company's Glenwood yard shops at Raleigh. It is not proposed, however, to erect large shops at this point. The company has constructed a six stall engine house, equipped with drop pits, and connected with a new machine shop, 40 by 90 ft. in size, a woodworking shop 30 by 50 ft., an oil house and small storehouse and a 300-ton coaling station and an ash pit. The total expenditure has not exceeded $30,000.

Railway Financial News

Altus, Roswell, Lubbock & El Paso.—Control of this road has been sold by Edward Kennedy and associates to J. M. West, E. C. Noble and associates of Houston, Tex.

Chicago, Peoria & St. Louis.—This company was put in the hands of receivers under application of the Bankers Trust Company of New York as trustee for $2,000,000 bonds on which interest was in default.

Chicago, Rock Island & Pacific.—N. L. Amster, who claims to be a holder of collateral trust railroad company fours, is asking to communicate with other holders of these bonds looking toward independent action.

Denver & Salt Lake.—After conference between Newman Erb and various officers of the railroad and contractors a statement was given out with regard to the probable action of the company following on the decision of the Colorado Supreme Court which held that the city of Denver could not guarantee the tunnel bonds. This statement said in part, "It was decided to build the tunnel. The only question is whether to force the recall of the Supreme Court decision or to organize a separate company and build the tunnel. The majority of the board of directors are opposed to the recall on account of expense and time involved. If a tunnel company is organized there will be an opportunity for Salt Lake people to join in the organization of it. President Erb and associates will subscribe for one-third of the stock, and Denver people will take at least one-third of it. It is proposed that the tunnel company lease the tunnel to all railroads wishing to use it on a royalty basis of approximately fifteen cents per ton for freight and fifty cents per passenger."

Three surveys have been made. The one receiving the greatest approval is from Craig, Colo., following the White river to Jensen, which is about twelve miles from Vernal, then along the Duchesne river to the head of Daniels canyon through Heber and Probo canyon, and from there to Salt Lake.

New York, New Haven & Hartford.—John L. Billard has resigned as a director. Mr. Billard's counsel says that the resignation could be made now because the Interstate Commerce Commission had finished their investigation and it was proper because a committee of New Haven directors were investigating the relations of the Billard Company with the New Haven.

Texas & Pacific.—Stockholders have approved a contract with the St. Louis, Iron Mountain & Southern under which the Iron Mountain is given trackage rights over the Texas & Pacific into New Orleans. The Iron Mountain also acquires joint proprietary rights with the Texas & Pacific in the Texas & Pacific's terminals and the terminals of the Trans-Mississippi Terminal & Warehouse Company in New Orleans. The Trans-Mississippi Terminal & Warehouse Company has bought seventeen blocks on the water-front and proposes to sell $7,000,000 bonds guaranteed jointly by the Texas & Pacific and the Iron Mountain.

Toledo, St. Louis & Western.—No interest was paid on the series A and series B 4 per cent. collateral trust bonds due on August 1. A protective committee has been formed consisting of Edwin G. Merrill, chairman; R. Walter Leigh, A. B. Morton and Robert Walker. Bondholders are asked to deposit their bonds with the Union Trust Company, New York.

Pensions for Railway Employees in India.—The East Indian Railway is providing a sum of two lakhs of rupees ($64,866) in its budget for next year for pensions to be paid on retirement to the subordinate staff who have rendered efficient and faithful service. It has also sanctioned a grant of training fees to daughters of senior subordinate employees, to enable them to be trained for nurses in recognized hospitals in India.

ANNUAL REPORT

BROOKLYN RAPID TRANSIT CO.

REPORT OF THE BOARD OF DIRECTORS TO THE STOCKHOLDERS.

FOR YEAR ENDING JUNE 30, 1914.

85 Clinton Street,
BROOKLYN, N. Y., July 28, 1914.

A comparison of the financial results of the system for the year ending June 30, 1914, is affected by two special influences: one being the inclusion of the statistics of operation of the Coney Island and Brooklyn Railroad Company for the last six months of the fiscal year, and the other being the conversion into stock of the greater portion of the Brooklyn Rapid Transit Company's First Refunding Gold Mortgage Bonds.

As a result of these influences the passenger earnings show an abnormal increase, and the fixed charges (even after making provision for the interest on the cost of Coney Island and Brooklyn Railroad Company's shares) reflect a substantial decrease.

As shown in the last Annual Report $4,177,000 par value of the Refunding Mortgage Four Per Cent. Bonds had been converted into stock prior to June 30, 1913. The conversion privilege expired on July 1, 1914, and the total number of bonds converted was $29,619,000, leaving outstanding in the hands of the public $3,459,000, and owned by the companies of the system $18,714,000. The increase of stock by reason of the conversion of bonds was $29,619,000, making the total capital stock on July 1, 1914, $74,520,000.

The operating results for the year show a surplus of $5,315,704.86 after paying $553,826.68 of interest on Refunding Bonds, which have now been converted into stock. With this interest saved the surplus earnings would have been equivalent to 7.87 per cent. on the stock if the issued stock on July 1, 1914, after conversion, namely, $74,520,000, had been outstanding during the year.

In common with the experience of other public service corporations higher wages and increased cost of materials are reflected in the operating expenses. Of the total increase for the year, namely, $1,161,096.77 (9.05 per cent.), $580,697.87 is in trainmen's wages and expense directly connected with car operation, and $457,305.64 in maintenance. Damages show a decrease of $61,206.64 (over 10 per cent.), in spite of heavier traffic. Other expenses are relatively less than the increase in business, except appropriations in connection with employees' welfare work, hereinafter referred to, which show a marked increase.

Dividends at the rate of 6 per cent. per annum have been paid on the stock outstanding from time to time during the fiscal year.

A summary of the financial results is given in the following table:

COMPARATIVE STATEMENT OF THE RESULTS OF THE OPERATIONS OF THE BROOKLYN RAPID TRANSIT SYSTEM FOR YEARS ENDING JUNE 30, 1914 AND 1913.

	1914	1913	Increase or Decrease.
Gross earnings from operation	$25,558,249.60	$24,152,288.09	+$1,405,961.51
Operating expenses	13,994,552.66	12,833,455.89	+ 1,161,096.77
Net earnings from operation	11,563,696.94	11,318,832.20	+ 244,864.74
Income from other sources	451,771.65	339,946.88	+ 111,824.77
Total income	12,015,468.59	11,658,779.08	+ 356,689.51
Less taxes and fixed charges	6,699,763.73	7,161,851.41	— 462,087.68
Net income	5,315,704.86	4,496,927.67	+ 818,777.19
Surplus at beginning of year	7,904,606.63	5,863,812.80	+ 2,040,793.83
Coney Island & Brooklyn R. R. Co.'s surplus at time of acquisition	506,625.76	.....	+ 506,625.76
Total	13,726,937.25	10,360,740.47	+ 3,366,196.78
Other credits to surplus during year:			
Miscellaneous items	30,653.36	7,483.39	+ 23,169.47
Settlement of B'klyn City R. R. Co.'s suit (see statement elsewhere)	582,566.72	.....	+ 582,566.72
Sale of easement South B'klyn R'y Co.	738,986.59	.....	+ 738,986.59
Total	15,079,143.92	10,368,224.36	+ 4,710,919.56
Of this amount there has been appropriated:			
Accounts written off	2,315.30	28,513.60	— 26,198.30
Adjustment of taxes prior years	10,801.78	*116,255.73	+ 127,057.51
Adjustment of expenses prior years	*948.67	66.68	— 1,015.35
Supercession and depreciation	174,339.01	60,522.83	+ 113,816.18
Amount set aside as reserve	1,500,000.00	50,000.00	+ 1,450,000.00
Dividend on B. R. T. Co.'s stock outstanding	3,660,048.00	2,440,770.35	+ 1,219,277.65
Total appropriations	5,346,555.42	2,463,617.73	+ 2,882,937.69
Balance sheet surplus	$9,732,588.50	$7,904,606.63	+ 1,827,981.87

*Credits.

No Refunding Mortgage Bonds under the mortgage of July 1, 1902, have been sold during the year, funds for the purchase of the Coney Island and Brooklyn Railroad Company's stock and for other capital charges (other than rapid transit construction) having been obtained from the proceeds of temporary notes. The outstanding bills payable on June 30, 1914, aggregating $3,451,604.73, were, in spite of these requirements, only $701,604.73 in excess of the amount outstanding on June 30, of the preceding year.

INCREASE IN NUMBER OF STOCKHOLDERS.

On June 9, 1913, the date of closing the books for the dividend payable July 1 of that year, the number of stockholders was 3,709. On the same date of 1914 there were 6,319, an increase of 2,610, or over 70 per cent. This increase is accounted for partly on account of the conversion of bonds into stock and partly on account of wider distribution of the company's shares.

ACQUISITION OF THE CONEY ISLAND & BROOKLYN RAILROAD COMPANY.

The Public Service Commission having finally given its approval, the Coney Island & Gravesend Railway Company (all of whose stock is owned by Brooklyn Rapid Transit Company) acquired on January 15, 1914, 26,370 shares of the Coney Island & Brooklyn Railroad Company at a cost to it of $2,637,000, which amount was obtained by the sale at par to the Brooklyn Rapid Transit Company of certificates of indebtedness, payable on demand. In addition the Brooklyn Rapid Transit Company was obliged to pay to the vendors of the stock the sum of $75,030.32 on account of the delay of the Public Service Commission in giving its approval, the terms of the option providing that, if it were exercised, interest should be paid on the purchase price from the date of the option, less any dividend paid in the meanwhile by the Coney Island & Brooklyn Railroad Company. A dividend of 6 per cent. having been paid by the latter company during the interim the interest charge above referred to was consequently reduced to the sum of $75,030.32. It will be necessary to expend considerable money in bringing up the property of the company to the standard of the remainder of the Brooklyn Rapid Transit system, and this work is now proceeding. At the same time unified operation is producing economy in various directions, while improving facilities and service.

SETTLEMENT OF THE BROOKLYN CITY RAILROAD SUIT.

On March 3, 1910, the Brooklyn Heights Railroad Company, lessee of the Brooklyn City Railroad Company, obtained judgment in the Supreme Court of the State of New York against the lessor company for $3,356,938.53 in an action brought to recover monies which the Heights Company claimed should have been expended by the lessor in fulfillment of the terms of the lease of February 14, 1893. The Appellate Division reduced this judgment by excluding interest figured therein, leaving the amount of the modified judgment $1,740,258.38. Both parties to the litigation appealed to the Court of Appeals, and before the appeal was argued a settlement was agreed upon for $1,650,000. Of this amount $900,000 was paid in cash by the Brooklyn City Railroad Company to the Heights Company on November 1, 1913, and the remaining $750,000, with interest thereon at the rate of 5 per cent. per annum from November 1, 1913, is being paid in installments of $50,000 each upon the first days of January, April, July and October of each year. The amount due on June 30, 1914, was $550,000.

Of the total amount of recovery it was agreed that the sum of $858,000 be applied to the principal, and the remainder, $792,000, to interest thereon. The principal amount ($858,000) has, therefore, been credited by the Heights Company to Brooklyn City Railroad Construction Account, and $582,566.72, representing the interest after deducting the expense of litigation, has been credited to the Profit and Loss Account of the Heights Company.

OVER HALF A MILLION PASSENGERS PER DAY REQUIRED TO PAY TAXES.

The burden of taxation continues to increase. It cripples and restricts our ability to furnish the best facilities and service. For the fiscal year the taxes paid by the system were at the rate of over $4,800 per day. Inasmuch as the net return per passenger was less than one cent, it required the transportation of over 540,000 passengers each day to yield profit enough to pay our tax bills. The amount which we paid to the city alone was more than sufficient to defray the entire expense for the year of many of the departments of city government, and upon the basis of the per capita tax for Brooklyn for 1913 was equivalent to the tax bill of nearly 78,000 persons. Capitalized at 5 per cent. our annual tax bills would permit an expenditure of over $35,000,000 for added improvements, facilities and extensions. Yet each time we apply to the city government for permission to furnish tracks which will give transportation where none now exists, or relieve transportation where it is now congested, there are short-sighted public officials who erroneously think their duty to the city and to the people requires the imposition of additional tax burdens, making the same property subject to double and even treble taxation.

ADDITIONS, IMPROVEMENTS AND MAINTENANCE.

The policy of maintaining the property of the system in good condition has continued. Our schedule of track and paving renewals on surface lines for the current year is the largest in the history of rail transportation in Brooklyn. Last years' schedule was the largest on record up to that time, covering thirty-nine miles of track, but this year's schedule covers over forty-four miles. The expenditures for maintenance of equipment are also the largest on record. The expenditures during the fiscal year for maintenance alone of way and structure and of equipment were $4,337,637.35, an increase of $457,305.64 over similar expenditures for the preceding fiscal year. Renewals of track and paving are chargeable to maintenance, except to the extent that additions and improvements to property are involved.

The construction charges (outside of those made for rapid transit additions and extensions under contract with the city) aggregated $1,543,315.66 and are classified in detail elsewhere.

Among the principal maintenance and construction expenditures during the fiscal year (other than on rapid transit lines elsewhere referred to) are the following:

The 20,000 K. W. Turbo Generator Unit alluded to in the last annual report as contracted for has been put in service in the Williamsburg power station, making the total capacity of the station 90,000 K. W.

The Tompkins avenue and Myrtle avenue sub-stations have been enlarged to permit installation of additional equipment. During the year contract was made with the General Electric Company for three 3,000 K. W. Rotaries, two of which have been delivered and installed.

Since January last the Coney Island & Brooklyn Railroad Company having become affiliated with the system, power for the lines of that company has been supplied from other stations of the system, permitting the shutting down of the Ninth street power station and the Sanford street substation of that company.

There were removed during the year 22.14 miles of overhead feeders.

Trolley wire to the extent of 75.75 miles was renewed and 2.47 miles of high tension cable were installed.

Two thousand one hundred and forty-eight trolley poles were repainted, 473 reinforced and 497 reset.

On the elevated lines renewals were made as follows:

52,312 lineal feet of rail,
1,313 lineal feet of steel guard rails,
34 switches,
32 frogs,
2 crossings,
15,086 ties,
37,411 lineal feet of timber guard rail,
20,450 tie plates and
61,118 lineal feet of 2 x 6 foot-walk.

On the surface lines 198 pieces of special work were installed, repaired or renewed; 115,592 feet of single track was relaid with standard 7 in. 105 lb. rail; 130,524 sq. yd. of improved granite block pavement on concrete have been laid, and 2,000 sq. yd. on sand foundation, in addition to which the city laid at the expense of our companies 41,123 sq. yd. of improved paving.

Track drains were installed at thirteen locations.

A double-track extension was constructed of the tracks in Roebling street, from Division avenue to Lee avenue, measuring approximately 400 feet of track.

20,000 lineal feet of elevated structure was repainted.

On the Brighton Beach line approximately 12,000 feet of iron fence was repainted; also the steel work of 31 bridges between Franklin and Neptune avenues.

Column bases on the Broadway elevated line, from Alabama avenue to Cypress Hills, were repainted.

Much work was done on the various buildings of the system, involving not only ordinary repairs and repainting, but improvements intended to reduce fire risk.

Eighty-nine new centre entrance passenger cars were completed and placed in service; eleven additional cars of the same type having been placed in service during the preceding fiscal year.

1,130 complete air-brake equipments were purchased, of which 669 have been installed on semi-convertible and closed surface passenger cars.

482 partial air-brake equipments have been purchased, of which 282 have been installed on surface convertible passenger cars.

1,918 improved geared hand brakes have been purchased to supplement air brakes, of which 1,453 have been installed.

Fifty pairs of new trucks have replaced a like number of old style interior frames.

559 pairs of improved design maximum traction truck frames have been purchased for installation under cars which are being equipped with air brakes.

Two 55-ton electric locomotives were purchased; also one 15-ton electric locomotive crane and 26 air dump cars.

Two cars have been constructed for transporting rails through city streets, and one steam railroad box car was purchased and converted into a flat car.

On the surface division 66 single truck closed passenger cars, 211 double truck closed passenger cars, 390 semi-convertible cars, 190 double truck open cars, 281 convertible cars and 9 mail cars have been repaired and revarnished.

Seventy-five plows and sweepers were repaired.

190 service cars and 1,357 damaged passenger cars were repaired.

331 passenger cars were equipped with W. H. 3-pt. resistance.

1,164 cars were equipped with wheel guard chains.

In 88 convertible cars rattan seating was replaced with wooden seats and in 45 semi-convertible cars longitudinal seats were substituted for Chamberlin chairs.

On the elevated division 38 cars have been repaired and repainted and additional circuit of five lights installed; 549 motor and trailer passenger cars have been repaired and revarnished; 200 motor cars have been equipped with automatic trip cocks; 934 cars have been equipped with fire extinguishers, and 55 damaged passenger cars and 11 service cars have been repaired.

New machinery has been installed in the shops for the better performance of work and devices have been installed for the protection of employees.

INTERFERENCE OF CITY IMPROVEMENTS WITH TRAFFIC.

On at least ten of the surface lines car service has been materially interrupted or diverted by reason of the operations of contractors for the city in constructing sewers. The expense to which the Company will be subjected by reason of these improvements, to say nothing of loss of earnings, is approximately $248,000.

FREIGHT BUSINESS.

The constant demand on the part of manufacturers and shippers for freight service is somewhat embarrassing to the Company. In certain sections of our territory, and especially upon what were formerly steam railroad tracks, freight can be handled without interference of passenger business, and except by our tracks it would be impossible in these sections to furnish freight service by rail.

The business during the past year yielded a gross revenue of $497,569.16, an increase over the preceding year of $126,716.22.

PROGRESS OF WORK ON RAPID TRANSIT LINES UNDER CONTRACTS WITH THE CITY.

The New York Municipal Railway Corporation has prosecuted as vigorously as conditions would permit the work of construction and equipment of rapid transit lines required under its contracts with the city dated March 19, 1913.

At the request of the Public Service Commission and as part of its contribution to cost of city-owned lines that company has undertaken the completion of the four tracks in the Centre Street Loop (two of which were placed in operation on August 4, 1913), the reconstruction of the Fourth avenue subway between Thirty-sixth and Thirty-eighth streets and the construction of the connecting tracks between Fourth and Tenth avenues. By the use of the two tracks in the Centre Street Loop, express trains of the Cypress Hills line, formerly operated via Lexington avenue, have been diverted via Broadway into the loop, thus shortening the running time between Cypress Hills and Chambers street, Manhattan, by approximately ten minutes. The most marked effect of operation through the loop has been the relief thus afforded to traffic over the Brooklyn Bridge, tens of thousands of passengers being daily diverted to the Williamsburg Bridge.

In addition to the construction work undertaken for the city the Company has, in discharge of its own obligations under the city contracts, progressed as follows:

SEA BEACH LINE.—Contract was let on October 6, 1913, for reconstruction as a four-track depressed railroad between Fourth avenue and Eighty-sixth street. The work is now rapidly proceeding and it seems likely that the section between Fourth avenue and New Utrecht avenue will be completed ready for operation by January 1 next, and the remaining section, between New Utrecht avenue and Eighty-sixth street, by May 1 next. Under additional contracts new highway bridges over the right of way between Fourth and Eleventh avenues are being provided.

BROADWAY-MYRTLE AVENUE CONNECTION.—This improvement was contracted for on July 8, 1913, and operation will begin about July 30, 1914. It permits of through trains from the Myrtle avenue elevated and new Lutheran Cemetery lines over the Broadway structure and Williamsburg Bridge into the Centre Street Loop, and obviates change of cars at Broadway and Myrtle avenue to about 30,000 passengers daily.

LUTHERAN CEMETERY LINE.—This involves in effect an extension of the Myrtle avenue elevated line from Ridgewood to Lutheran Cemetery. The work is divided into three contracts, one of which, namely, that of August 25, 1913, for steel structure from Ridgewood to Fresh Pond road, was completed near the end of the fiscal year. Another contract, involving a short continuance of the elevated structure, rearrangement of yard tracks, interlocking plant and the erection of despcher's office and trainmen's building near Fresh Pond road, was entered into on February 27, 1914, and will soon be completed. The remaining contract is for station buildings required on this line.

LIBERTY AVENUE ELEVATED EXTENSION.—Consents of property owners having been completed, contract was let on February 9, 1914, for the steel structure. A considerable amount of work has been performed.

JAMAICA AVENUE ELEVATED EXTENSION.—Practically all the necessary consents of property owners have been acquired and plans are being perfected preparatory to letting contract. The proper construction of this line, however, may require some changes in the street, as to which the city has yet taken no action.

ADDITIONAL TRACKS ON EXISTING ELEVATED LINES.—Consents of property owners have been obtained on Fulton street, Broadway and Myrtle avenue. Contract for the Fulton street third tracking between Nostrand avenue and Sackman street has been entered into. Contract for the steel required for the third tracking of the Broadway line between Havemeyer street and Myrtle avenue is awaiting the approval of the Public Service Commission.

CAR EQUIPMENT.—Contracts were entered into for the construction of one hundred steel subway cars, completely equipped according to best modern designs. The contracts for both car bodies and equipment give an option on additional orders up to six hundred cars, and such an order for one hundred cars is awaiting the approval of the Public Service Commission. The delivery of the first one hundred cars is promised prior to December 1, 1914.

MISCELLANEOUS WORK.—Preparatory to entering into the above contracts much preliminary work was necessary in the making of plans, purchase of real estate, acquisition of easements and the approval of all by the Public Service Commission. The extension of power facilities in connection with the operation of the Centre Street Loop and the proposed operation of the Fourth avenue subway has been partially provided for, contracts having been let for new sub-stations and additional equipment. A contract for complete interlocking and signal equipments for the Centre Street Loop is awaiting approval of the Public Service Commission. Plans are rapidly being perfected for the remaining improvements which the company has undertaken to make.

The city on its part is proceeding with the construction of subway and elevated lines which are to be operated in conjunction with our existing lines as extended and improved.

The New York Municipal Railway Corporation's expenditures for construction and equipment to June 30, 1914, under the city contracts were as follows:

On account of contribution to city-owned lines	$8,230,256.39
On account of equipment of city-owned lines	1,647,982.49
On account of additions, extensions, improvements of existing railroads	4,798,868.27
Undistributed	593,486.70
Total	$15,270,593.85

TEMPORARY OPERATION OF RAPID TRANSIT LINES UNDER CITY CONTRACTS.

Two tracks in the Centre Street Loop were, under order of the Public Service Commission, placed in operation on August 4, 1913, and pursuant to the terms of the contract with the city, dated March 19, 1913, the pooling of earnings from these new tracks and from the existing lines of the New York Consolidated Railroad Company then became effective. Eleven months (lacking three days) of such operation are reflected in the figures given below.

The contract with the city provides as to these jointly operated lines that after deducting operating expenses, taxes and provision for depreciation the net revenue is to be applied as follows:

1. To the lessee, $3,500,000 per year as representing the net earnings of the existing railroads which are to form part of the new rapid transit system. Out of this reservation the lessee is to pay interest charges on capital investments in the existing railroads prior to March 19, 1913.

2. To the lessee an amount equivalent to 6 per cent. per annum on its new investment in construction and equipment prior to the beginning of permanent operation, and thereafter interest and 1 per cent. sinking fund.

3. To the city interest and 1 per cent. sinking fund on its investment in cost of construction.

Any surplus remaining after making provision for a moderate contingent reserve fund is to be divided equally between the lessee and the city.

Of course, the operation of the two tracks in the Centre Street Loop has merely extended further into Manhattan service heretofore rendered as far as the Williamsburg Bridge Terminal, and has not yielded a material amount of additional revenue, although it has increased the expense of operation.

Consequently during this period of nearly eleven months the operation has failed to provide the company's preferentials by $219,687.46, and has also failed to provide the city's charges on the cost of construction of property placed in operation during this period by $310,060.48, leaving a total deficit both in the company's preferentials and the city's charges of $529,747.94.

The deficit in the company's preferentials is cumulative and is to be made good from future net income before payment of the city's interest and sinking fund charges, but under the provisions of the contract the deficits in the city's charges during temporary operation is to be added to the cost of construction of the city-owned lines, thereby swelling the amount upon which interest will hereafter have to be earned. It seems quite likely that the deficits above referred to will continue (in lessening degree, however) until new lines of greater earning capacity than the Centre Street Loop and the Fourth avenue subway are placed in operation. The cost of these two lines was not justified by their probable earning capacity, and it was only by merging their operation into that of a larger system that the city will eventually be able to make them self-supporting. It is, therefore, extremely essential both for the city's interest and our own that all the new lines should be constructed and placed in operation as speedily as possible.

The details of results from this temporary operation are as follows:

RESULT OF OPERATIONS OF NEW YORK CONSOLIDATED RAILROAD COMPANY, LESSEE, UNDER THE PROVISIONS OF CONTRACT NO. 4 DATED MARCH 19, 1913, BETWEEN THE NEW YORK MUNICIPAL RAILWAY CORPORATION AND THE CITY OF NEW YORK.

		For the period Aug. 4, 1913, to June 30, 1914.
Revenue		$7,830,990.51
Passenger revenue	$7,653,755.84	
Chartered cars and misc. transp. revenue.	1,234.92	
Advertising	65,849.17	
Other car and station privileges	50,225.42	
Rent of buildings and other property	26,486.08	
Rent of tracks and terminals	33,150.65	
Miscellaneous	288.43	
	$7,830,990.51	
Deductions		$8,050,677.97
Rentals	$83,428.55	
Taxes	$35,053.41	
Operating expenses exclusive of maintenance	3,060,943.02	
Maintenance fund	940,645.01	
Depreciation fund	235,161.24	
Proportion of company's preferentials	3,195,446.74	
	$8,050,677.97	
Deficit* in Company's Preferentials		$219,687.46
Interest† Paid by City on Its Cost of Construction of Property Placed in Operation Plus Sinking Fund at Rate of 1 Per Cent. per Annum		310,060.48
Total Deficit		529,747.94

*To be made good from future net income before payment of City's interest and Sinking Fund charges.

†Deficits in City's charges during temporary operations to be added to the Cost of Constructions of City-Owned Lines.

EMPLOYEES' WELFARE WORK.

The Company has continued on a more liberal scale its policy of improving the conditions under which its employees work, involving provision for club houses, social diversions, pensions, medical services and sick and death benefits not reached by the work of the Employees' Benefit Association. For these purposes during the past year, in addition to charges for improvement of club rooms, the companies of the system have expended $69,365.

The system of compulsory medical inspection and free medical attendance for employees excused on account of illness, affecting nearly 10,000 men in the operating department, completed its first year December 31, 1913. A comparison of records of time lost on account of illness for the entire year as to the surface lines, and for the year, exclusive of Sundays and holidays, as to the elevated lines, indicated a reduction of time lost on account of illness of approximately 24 per cent. over the year ended December 31, 1912.

This reduction means greater efficiency for the working force and unbroken earning capacity for the men. The operation of the compulsory medical inspection system has been welcomed by operating officials and received with apparent favor by the uniformed employees subject to its provisions. The medical inspection bureau having this service in charge is supported entirely by the company and the service is rendered without cost to the employees.

The existence of the medical inspection bureau has enabled the company to meet in a satisfactory way the medical requirements of the Workmen's Compensation Law which became effective on July 1, 1914. Instead of being obliged to make hasty and untried arrangements with outside physicians to care for employees injured in the course of their employment as required by the law, the company is in a position to have such attendance provided by its own staff and without any new relationships between employees and physicians.

The medical inspection bureau at present is organized with a chief Inspecting Physician and five assistants. The medical work of the employment branch of the operating department and the periodical re-examination of motormen has been brought under the supervision of the bureau; systematic first-aid instruction is being given to employees in all departments of the company and special studies are being undertaken along several new lines which it is believed will be effective in materially raising the already high physical standard of our operating force.

SAFETY CAMPAIGN.

The public safety campaign, experimentally undertaken by the Company for the spring and summer school sessions of the year 1913, produced such a satisfactory response that the campaign was continued on a greatly enlarged scale beginning with the fall term of the schools last year.

It appeared also that the activities of the company in this direction could be greatly assisted by co-operation with representative citizens, so as to carry the safety work outside the limits of the public schools and to lay a foundation for organized safety activity which might ultimately extend to all branches of industry in the territory in which the lines of the company are operated.

Accordingly, an invitation was extended to a number of individuals representing the city administration, the borough administration, the schools, the churches, the bar, the bench, the banking and insurance communities, department stores and industrial enterprises, to organize, with the co-operation of the company, a Brooklyn Committee of Public Safety. The committee completed its organization in November, 1913, and in January the Board of Education of the City of New York issued to this committee the authority to conduct safety education in the Brooklyn public schools. The co-operation of the parochial schools was also obtained in large measure and the work of teaching safety to children was extended to a variety of other institutions.

To conduct this work, the company organized a Bureau of Public Safety with appropriate staff, and in the school year just closed this Bureau has given instruction in 179 public schools and 26 parochial schools, reaching 261,976 children. Ten charitable institutions were visited one or more times for safety instruction, as were three church institutions and several large industrial establishments. Twenty-three parents' organizations have been addressed and a variety of miscellaneous lectures given, including moving picture safety lectures in city parks during the present summer.

The extent of this work is indicated in the distribution of 672,000 safety blotters and in 8,100 safety calendars, which were supplied for every public school classroom in Brooklyn.

Many other cities throughout the country have sought suggestions and advice in organizing public safety work, material from the Brooklyn campaign having gone to over sixty cities in the United States and foreign countries.

In addition to affording patronage and directive advice for the safety work in the public schools, the Brooklyn Committee of Public Safety has accomplished a great deal in awakening the public to the necessity of more careful attention to the problem of public safety. The Brooklyn Rapid Transit Company, which has a larger stake in the public safety of the territory in which it operates than any other single enterprise, has taken a double satisfaction in giving impetus to a fine movement while at the same time reducing its own hazards of operation through the public streets.

INCREASE OF TRANSFER PRIVILEGES.

Under order of the Public Service Commission a new transfer system went into effect on June 1, 1914, whereby the total number of transfer points in the territory in which the surface railroads operate was increased from 721 to 1,008. The full effect of this order it is as yet too soon to estimate. The passenger earnings of the companies affected fell off during the month $67,827. How much of this falling off was due to bad weather, how much to business diverted to the elevated lines, how much to business depression and how much to the great increase in transfer privileges it is impossible to determine. In accepting the order the companies have reserved all their legal rights and will apply for a modification or repeal of the order if the burden imposed thereby should prove unreasonable.

INSURANCE RESERVE FUND.

With a view to finally insuring its own fire risks the companies of the system have gradually been accumulating an Insurance Reserve Fund, which on June 30, 1914, aggregated $599,197.19.

REFUNDING MORTGAGE FOUR PER CENT. BONDS.

Authenticated at July 1, 1913	$51,062,000.00
Issued during year	730,000.00
	$51,792,000.00
Converted into stock to June 30, 1914	29,619,000.00
Net authenticated and outstanding	$22,173,000.00
In hands of the public	$3,459,000.00
In possession of the B. R. T. System	18,714,000.00

As follows:

*Collateral to $40,000,000.00 6 yr. 5 per cent. notes	$10,000,000.00	
Collateral to bills payable	4,568,000.00	
In treasury B. R. T.	2,135,000.00	
In treasury N. E. R. R.	1,046,000.00	
Deposited with City of New York by the N. E. R. R. Co.	15,000.00	
Deposited with trustee of the Nassau Electric Railroad Consolidated mortgage	700,000.00	
Guaranty fund Brooklyn City Railroad lease	250,000.00	
	$18,714,000.00	

Detailed statements of operation, statistics and consolidated balance sheet are appended hereto.

Respectfully submitted by order of the Board of Directors.

T. S. WILLIAMS,
President.

*$301,000 par value of these notes have been converted into New York Municipal Railway Corporation's five per cent. first mortgage bonds, as permitted, prior to January 1, 1916, by the terms of the trust agreement.

Professor Marburg's reply, on another page, to the criticisms of the American Society for Testing Materials, which appeared in our issue of July 10, is deserving of most careful consideration. As one who has been connected with the society from its very inception, and as a most important factor in its development and up-building, the facts which he presents for consideration cannot but carry conviction. A canvas of a considerable number of railway men who are actively identified with the committee work of the society indicates that it is doing a work which is deserving of the support and appreciation of all those who are interested in developing and standardizing the specifications of the various materials which are used by the railways. No opportunity is being overlooked by those in charge of the society to so adjust and revise its methods of procedure as to insure the very best results in the effort to develop and perfect standard specifications. Reference was made in the above mentioned editorial, and also in Professor Marburg's letter, to the Havre de Grace bridge paint tests. There can be no question as to the value of the data thus far obtained from these tests in assisting the paint chemist in his task of selecting the best paint for various purposes. These results would, however, be greatly enhanced by additional information concerning the ingredients used in mixing the paints and information as to the manner of their mixing. The paints which were applied for test were chemically analyzed and these analyses have been published, but those familiar with paint chemistry realize that such analyses cannot show just what ingredients were used in mixing the paints, or indicate how the mixture was made.

American Society for Testing Materials

We publish on another page a letter from a man who specialized in university on economics, and is now engaged in railway work, who expresses regret that there are not more professors in our universities who "come in contact with the actual problems of the present day," instead of showing themselves up and proceeding "to work out the problems by theory." Few persons who have lived in close contact with practical business affairs, and also read the literature dealing with these affairs which emanates from the schools, have failed to feel a similar regret. In the field of railway economics, for example, there are several university professors who really know their subject, but there is a larger number who are far from knowing it. Seldom has there been a more pitiful disclosure of the ignorance of men who think themselves wise than the discussion of the subject, "The Control of Public Service Corporations," at the meeting of the American Economic Association in Minneapolis last December. The trouble with most of the economists who treat matters of this kind is that they have never had any of the hard, practical experience in earning their livings as managers or employees of business concerns which is absolutely essential to give a man the atmosphere of commercial and industrial life; to show him what can and what cannot be done with human nature, and to convey to him in the most impressive manner information regarding the risks of loss that are taken and the losses that are actually incurred in business, as well as the opportunities for gain and the gains that are actually made. There has been a remarkable development of colleges of business administration within recent years. Several of them are doing excellent work in the field of railway economics. But the thing most needed to make valuable the work in this field done by many of them is to teach the professors their business by bringing them into contact with, and giving them a real knowledge of, the railway business.

The Economists and Business Problems

The disastrous butting collision near Tipton Ford, Mo., August 5, reported last week, page 255, is said to have been due to disregard of a despatcher's order by the southbound train, which had run about one mile beyond the appointed meeting station. The trains were both running at good speed and the southbound train, consisting of a single gasolene motor car, was almost instantly enveloped in flames from burning gasolene. Of 77 persons in this car only five escaped injury; and 47 were killed or fatally injured. The three members of the crew of this car were killed. The chief lesson of the collision—that nothing less absolute than the block system affords adequate protection for passengers—can scarcely need repeating for readers of the *Railway Age Gazette*. An officer of the road is quoted as saying that this is the first time since the introduction of gasolene motor cars

The Tipton Ford Collision

on railroads that there has been a collision in which fatalities were due to the type of car; that is to say, in which gasolene has caught fire and passengers have been burned to death; and such cars have been in use 15 years. Quite true, no doubt. But that is a very deceptive statement and it may afford a false comfort. For the first ten years of this period the number of cars in use was very small. The great majority of them are used on lines of light traffic. Increasing use may make the liability to collision in the next five years, twenty or fifty or more times as great as in the last five. For the hundredth time we are warned that the thing to do is to prevent collisions, not merely mitigate their effects. To the extent that a gasolene engine is more terrible than a steam boiler and its firebox, this horror is a more vivid warning than have been former collisions. And the use of the block system on single track, as a safeguard against butting as well as rear collisions, is no longer an experiment—though the reluctance of some roads to adopt it would seem to indicate doubts of its availability. The simple manual system, properly managed, is, no doubt, superior to the "time-table and train-order" system; the simple manual with despatchers' supervision has made a great reputation for safety on the Erie and the Northern Pacific; the controlled manual has proved its reliability on the Pennsylvania; and the virtues of the electric train staff are known everywhere.

WHY APPEAL TO THE RAILWAYS?

WHEN the great war in Europe began this country was threatened with a strike of all the engineers and firemen on the western railways. The President of the United States appealed to the committee representing the employees and to the committee representing the roads to avert the peril. Why the government felt free to appeal to the employees in the name of patriotism and the public welfare is easy to understand. But did it have any right to feel free to appeal on these grounds to the managers of the railways? In railway wage arbitrations conducted under federal law the arbitration boards have without quibbling given the employees every single cent to which they have believed them entitled.

But just before this appeal was made to the railways to prevent a strike the Interstate Commerce Commission had rendered an opinion holding that the railways throughout the east needed larger revenues, but at the same time refusing to allow them to make anywhere near as large advances in their rates as their situation demanded.

The Sherman anti-trust law applies to both combinations of labor and combinations of capital. The government has studiously refrained from enforcing this law against combinations of labor, and it is now engaged in modifying it so that it will not apply to them. Through the Interstate Commerce Commission the government has condemned the railways for not introducing economies in their operations which cannot be introduced except by joint action of the carriers, and then by enforcing the Sherman law has prevented, and still prevents, the roads from taking the joint action which, in effect, the Interstate Commerce Commission commands them to take.

The courts have issued injunctions to prevent violations of law by both combinations of labor and railway corporations. Congress is now engaged in passing legislation which will prevent the courts from effectively using the process of injunction against labor, while leaving that process to be used in its full force against capital, including railway capital.

A short time ago a government commission reported that the compensation paid to the railways for carrying the mails is unremunerative. Promptly there was introduced in Congress a bill not to increase, but to further reduce the mail pay of the railways.

And yet, when a great strike threatened the government appealed to labor and to the railways alike, and labor showed its appreciation of what the government has been, and is, doing for it by refusing to concede anything, while the railways showed their usual disposition to turn the other cheek by withdrawing all of the demands they had made on their employees and accepting a one-sided plan of arbitration.

The railway managers did right. By the same token the leaders of labor did wrong. How is the government going to show in the future its appreciation of the very different attitudes assumed at this time of crisis and peril by organized railway labor and by the managers of the railways?

FREDERIC A. DELANO

THE railway service of America loses and the public service gains, by the retirement of Frederic A. Delano from the presidency of the Chicago, Indianapolis & Louisville Railway to become a member and vice-governor of the federal reserve board. Mr. Delano's railway career has been unique in some ways. He has never been the head of one of the larger railway properties. Neither the Wabash nor the Monon, of both of which he has been president, ranks among the really great systems. Yet for years Mr. Delano has taken rank among the foremost leaders of the railways of this country. That he has never been president of one of the great properties may be because he has not wanted to be. That he has been recognized, both inside and outside the railway business, as a leader in his field has been because he has possessed and exercised qualities of character and intellect which would have gained him eminence in almost any line of professional or business endeavor.
