The attractions of his personality are such that he has been as popular with those whom he has had to oppose as with those with whom he has fought side by side. A graduate of Harvard University, he has always been a student in the broadest and truest sense. Beginning his railway work as a machinist's apprentice, becoming a mechanical expert, serving for some time as a superintendent of motive power, and being before this a superintendent of terminals and afterward a general manager, he never allowed his interest in the technique of transportation to absorb all his energies, but so applied himself to the study of the economic side of the transportation business as to become recognized as one of the leading railway economists of the country. A successful executive, he has been also a railway statesman, who has thoroughly understood and fully appreciated the delicate and important relationship which the railway business bears to the public, and the consequent necessity of managing the railways with due regard for the public's rights and susceptibilities, and of educating the public regarding the rights and needs of the railways. Courageous in criticising bad and advocating good regulation he has been equally courageous in defending good and criticising bad railway management.

Mr. Delano's keen interest and absorbing work in the railway business have never prevented him from taking a keen interest in economies and public affairs in the broader sense. The appreciation in which he has been held by at least two presidents of the United States is illustrated by the fact that President Taft offered him the ministry to China and membership on the Interstate Commerce Commission; that President Taft also nominated him for membership on the industrial commission; that his nomination to this commission not having been confirmed, President Wilson renominated him to it; and that now President Wilson has appointed him a member and vice-governor of the federal reserve board.

There is no higher minded or abler class of business or professional men in America than the officers of our railways. There are numerous men among them who could take into the service of the different departments of the government experience and talents which would be infinitely valuable to the government and the public. It is unfortunate for the government that so few of them have ever been taken into its service. Possibly, however, this has not been entirely the fault of the government, but has been partly due to the fact that few railway men have shown the interest and taken the active part in civic affairs that Mr. Delano has.

In accepting a government appointment, obviously Mr. Delano makes a heavy sacrifice, financially and otherwise. The government of this country would be a great deal better in the long run if there were taken into its business more men who, like Mr. Delano, are willing to make financial sacrifices in order to perform a public service and a public duty. How strangely reluctant the country usually has been to accept the self-sacrificing services of such men; and how strangely willing to accept the services of men who offer themselves merely to get more of the loaves and fishes than any private employer considers them worth!

PULL TOGETHER

In its decision in the Eastern rate advance case the Interstate Commerce Commission, while authorizing only a small part of the increases in rates sought by the railways, suggested a number of plans by which it believes the railways could increase their revenues. Railway men do not take much stock in the commission's suggestions. They regard them as makeshifts intended to justify the commission in refusing substantial advances, or academic theorizing, which could not have proceeded from a body of men whose members had had practical experience in railway operation, or practical experience in any walk of life in which they were obliged to handle men and regularly meet pay rolls. Whether the railway officers are right or not in their attitude, it must be clear to them as practical men that it is their duty to their companies to get together and pull together in an honest and determined effort to carry out all the suggestions made by the commission which are at all practical.

The commission has broadly intimated that it believes that the passenger rates in eastern territory are too low. The railways reply that they cannot raise them because of state legislation. But the state laws do not prevent them from raising the interstate passenger fares. If they should raise the interstate passenger fares the result would be a discrimination against interstate commerce similar to that which the Interstate Commerce Commission, and later the Supreme Court, condemned in the Shreveport case. The discrimination would consist not in the interstate rates being too high, but in the state rates being too low. Would not the creation of such a situation empower and practically compel the Interstate Commerce Commission to nullify the state passenger fare laws? Should not the eastern lines get together at once and take whatever steps they can in the direction of enabling the Interstate Commerce Commission to co-operate with them in making advances of both state and interstate passenger fares?

The commission shows that it believes that many freight rates throughout eastern territory are relatively too low, and are in fact unremunerative. It gives in its opinion a list of the average earnings per car mile from 30 commodities moving in large quantities, and adds the significant comment "that they disclosed many rates yielding barely enough revenue to pay for the use of the equipment." No regulating body in its right mind would hold that rates were reasonable which barely covered the cost of using the equipment, and therefore the commission's comments on this subject seem to be a direct invitation to the roads to make advances in certain rates.

The commission criticizes the roads for rendering some terminal services for actually less than cost and for paying allowances to shippers for rendering services which the shippers should render for themselves. When the carriers have filed tariffs covering matters of this sort they usually have been suspended, but it is evident that if they are persevering they will ultimately be able to act upon the commission's suggestions in some way that will increase their revenues.

There are two unanswerable arguments in favor of the railways trying to carry out the commission's views. The first is that by doing so they will secure some additional revenue, and although this may not be as large as the commission thinks, whatever it is, it will be worth having. The second unanswerable argument in favor of trying to carry out the commission's suggestions is that unless the roads do so, they will never again be able to present a petition for more or less general advances in rates with any hope whatever of success. The commission seems to believe that by adopting certain methods which it indicates the roads can secure all necessary increases in their revenues. If the roads can get the necessary increases in their revenues by the means which the commission suggests, then there will be no need for resorting to other means; and they will never be in any position to show the commission that they cannot get them by the methods the commission suggests until they have made a vigorous effort, in good faith, to do so.

One of the main reasons why the railways in all parts of the country have made rather poor progress in the past in solving the problems with which they have been confronted, and especially the rate problems, is that they often have failed to pull together. One road has had one kind of traffic that it has wished to "protect," another has had a large shipper or class of shippers that it has wished to "protect," another has had one or more communities that it has wished to "protect." Instead, therefore, of pulling together they have pulled apart and mutually cut each other's throats. In the endeavor of each of them to get some advantage, fair or unfair, the interests of all have been sacrificed. If there ever was a time for that sort of thing it is now past. The developments in the immediate future will show whether the policies of some railways are dominated by petty men who cannot see beyond the ends of their noses, or whether the roads as a whole are dominated by men whom the mistakes of past experience have taught how to deal with present conditions.

SHOP PAINT FOR STEEL BRIDGES

Specifications for steel railway bridges usually require the application of a coat of oil or paint to the steel in the erecting shop. The following typical clause is from the American Railway Engineering Association's 1910 Specifications: "Steel work, before leaving the shop, shall be thoroughly cleaned and given one good coating of pure linseed oil, or such paint as may be called for, well worked into all joints and open spaces." The use of oil is not favored by many engineers, although it is still used to a limited extent. It is generally considered necessary to adhere to the practice of shop painting in order to preserve the steel from corrosion during the period before it is erected and painted in the field. But this opinion is not universal, as proved notably by the Pittsburgh & Lake Erie practice in handling the large structures on its new terminal line, the Lake Erie & Eastern, at Youngstown, Ohio, referred to elsewhere in this issue. A considerable amount of structural steel has been erected without being given any shop coat of paint.

A limited amount of highway and minor railway bridge work has also been handled in this way; but the size and importance of the Lake Erie & Eastern structures, and the length of time elapsing between rolling and painting, amounting to a maximum of about two years, make this a significant instance in railway practice.

The two principal reasons advanced in favor of dispensing with shop painting, are the difficulty of securing a satisfactory application in the shop and the tendency for the rolling scale to become loose after the steel has received the usual shop and field coats of paint, in which case the paint is removed when the scale comes off. Several factors affect adversely the quality of shop painting. The surface of the steel is usually in poor condition to receive paint. Oil and grease are accumulated during fabrication, and when the material is handled in an open yard, dirt and moisture are especially likely to be present. In addition, little attention is paid to weather conditions, which are often unfavorable for satisfactory painting. The work is usually

done by unskilled laborers, often with little supervision and scant inspection. The quality of the paint is also likely to be poor, either because an inferior grade of paint is furnished or the workmen add elements to make it cover more or spread easily.

The scale that covers the surface of steel when it comes from the rolling mill is known to be the cause of many of the defects that appear, even when the steel has been painted according to the best practice. Moisture may get through pin holes or other defects in the coats of paint and set up corrosion between the scale and the metal. This process loosens large pieces of scale which fall off and, of course, take the paint off with them. This condition can frequently be seen on structural steel. If the steel has been stored for a time before fabrication, a part of the rolling scale will be displaced in handling the pieces, and this is especially the case with structures requiring a large amount of shop work, particularly punching and riveting. Even after fabrication, a great deal of the mill scale still adheres to the steel, and it is this part that it is sought to remove by exposure to the weather without paint.

Engineers who have followed the practice of dispensing with shop painting for structural steel building material have been well satisfied with the results, although in such work the steel is usually erected within six months of the time of rolling and sometimes much sooner. It is subsequently enclosed so that the preservation of the steel is a much less difficult matter than on bridges and other exposed structures. A highway bridge, erected at Dubuque, Ia., in 1900, was not painted until after erection, some four to five months after the steel was rolled. The steel had acquired a thin coat of red rust which was removed by wire brushes, leaving a much better surface for the application of the paint than would have been possible in the shop, and at the same time eliminating the rolling scale. The engineer in charge of that work regards the quality of the painting on that bridge as the best ever secured in his experience. A much better coating of the steel can undoubtedly be obtained in field painting than in the shop on account of the superior skill of the men employed in this work, the ability to clean the surface well, to wait for favorable weather conditions, and to inspect the work competently.

Some men may agree that small structures, such as plate girders, signal bridges or highway structures, whose erection would usually follow closely after the ordering of the material, may be given the first coat of paint in the field with good results, but will hesitate to let steel in large structures, which may be held from one to two years, or even longer, before erection, go from the shop unpainted. It would be impossible to fix any limit to the age of steel beyond which it would be of doubtful expediency to let it go unpainted. The condition of the metal at a given age depends on a large number of factors, including the condition under which it has been stored, the climate, etc., so that one lot of material might lose materially in weight and show objectionable rust scales, when another lot of the same age that had been exposed less, would have the rolling scale removed, but would show only a red rust that could easily be removed and would leave little doubt as to the ability of a good coat of paint to stop corrosion.

In addition to the question of the degree of protection afforded by shop painting or field painting, the ultimate cost must be taken into consideration. There is no doubt that the cleaning required on the Lake Erie & Eastern structures is expensive, and, in view of the thorough manner in which this work is being undertaken, it is conceded that the cost of the three coats and the one cleaning will exceed that of one shop coat, a superficial field cleaning and two additional coats of paint. Time alone will determine the life of the paint, but there seems little question that it will be increased. The Pittsburgh & Lake Erie engineers are to be commended for taking a step so much in advance of current practice, and the outcome will be watched with interest.

NEW BOOKS

The Railway Library for 1913. Compiled and edited by Slason Thompson, director of the Bureau of Railway News and Statistics, Chicago. 469 pages, 5 in. by 7 in., bound in cloth. Published by the author, Chicago. Price 50 cents.

This is the fifth annual issue of "The Railway Library," the first of which was issued in 1909, and, like the previous edition, it brings together selections from the noteworthy addresses and papers of the year relating to railway subjects. As in former issues, the concluding chapter consists of the annual statistical report of the Bureau of Railway News and Statistics for 1913, in which is presented the latest information in regard to American and foreign railways, the space devoted to the latter being greatly increased. The general rule has been to restrict the selection of articles to matter first given to the public in the year 1913, but the date of publication enables the inclusion of several articles of the current year. As in previous editions, the plan governing the selection of material has been to place in permanent form an outline of the principal railway problems of the day, as expressed in public reports and in the utterances of railway authorities, including practical railway men, members of railway regulating bodies, and economists, which have appeared in the form of addresses or in periodicals, and which might not otherwise be readily available to those who may be interested.

The volume opens with a brief summary of "Fifty Years of British Railways," abstracted from the Jubilee Number of the London *Railway News* for the purpose of presenting a comparison of the problems that have confronted railway builders in the United States and Great Britain. Railway conditions as they exist at the present time are outlined in the testimony of President Samuel Rea of the Pennsylvania Railroad before the Interstate Commerce Commission in the advanced rate case. Immediately following is a group of papers presenting the same situation from several different angles, including papers by B. H. Meyer of the Interstate Commerce Commission on "Certain Considerations in Rate-Making," and "Prices and the Raising of Rates," by Clement Colson of the French Institute.

Then follows a series of articles relating to the nationalization of railways, treated from the historical, political and economic points of view. This group includes the concluding chapter of Samuel O. Dunn's recent work on "Government Ownership of Railways," and an exhaustive synopsis of Prof. W. J. Cunningham's "Analysis of the State Railways of Prussia-Hesse," and an article on the Belgian railways by M. A. Pierrard, director of the Belgian Marine Administration. Papers devoted to the labor situation include an address on "Mediation and Arbitration" by Seth Low, president of the National Civic Federation; an article on "Labor Unions and the Railroads" by J. O. Fagan; an address on "Workmen's Compensation" by Frank V. Whiting, general claims attorney, New York Central Lines, and an article on the Sunset Lines Strike from the *Railway Age Gazette*. The trespassing problem is dealt with in an article on "A Nation's Neglect" by Marcus A. Dow, general safety agent, New York Central Lines, and the various questions involved in the valuation of railroads are discussed in an address by C. A. Prouty, director of valuation for the Interstate Commerce Commission.

Other articles include an article on the apportionment of expenses to suburban traffic on the Southern Pacific electric suburban service in Alameda county, reprinted from the *Railway Age Gazette;* "Are Increased Trainloads Practicable," by Charles F. Speare, from the *Railway Age Gazette;* "Fair Pay for Carrying the Mails," by Ralph Peters, chairman of the Committee on Railway Mail Pay of the American Railway Association; "The Ohio Floods in 1913," by Lewis S. Bigelow; "The New Haven Situation," by Howard Elliott; "Canals and Railways," by W. M. Acworth, and "War Time Railroading in Mexico," by Major Charles Hine.

Letters to the Editor

BUSINESS PROBLEMS AND THE ECONOMISTS

Philadelphia, Pa., July 12, 1914.

To the Editor of the Railway Age Gazette:

The article, "Methods of Railway Taxation in Michigan," by Prof. Friday, in your issue of June 12, 1914, was read by me with a great deal of interest.

It was my good fortune to graduate from the University of Michigan, and to know personally both Prof. Friday and Prof. Adams, and know both of them very well, both in and out of the class-room.

All that Prof. Friday has said is perfectly true, and the railroad situation in the state of Michigan is a serious one at the present time. I do not mean to say that it has all been brought about by legislation and taxation. That would be going too far. But certainly the taxation method at present employed in that state does not seem fair, to put it mildly.

Men in our state universities can do a great deal, if they choose, to help mold public opinion. I think that holds truer in the West than here in the East. I only regret that there are not more men in our universities like Prof. Friday and Prof. Adams —I mean men who engage in outside work, who come in contact with the actual problems of the present day; not men who shut themselves up and proceed to work out the problems by theory. Modern business problems cannot be solved that way. I have realized this, because since my graduation I have become engaged in railway work and I have found very little of the theoretical in it.

Charles E. Fisher.

THE ROCK ISLAND'S MOTION PICTURES

Chicago, July 3, 1914.

To the Editor of the Railway Age Gazette:

I have read with interest your notes, printed June 26, concerning motion pictures, and their use on the Pacific Electric Railway for the instruction of employees. L. F. Shedd, general safety supervisor of the Rock Island, has used motion pictures for some time. The Rock Island Lines Safety Bureau was organized August 1, 1912, and a reel of motion pictures for instruction in "safety first" and "prevent injury" was made use of very early in the campaign. This reel has been shown before upwards of 25,000 persons, including railroad employees and their families, city officers and the general public.

The pictures were taken at Rock Island yards and stations, and therefore have a very direct home interest for Rock Island employees; but they have also been used some by other roads. Dangers are illustrated in a real way, yet nothing gruesome is shown; no loss of life or limb and no shedding of blood. Many of the subjects are those with which your readers are already familiar, from photographs which have been published broadcast. For example, getting on to the front of a moving switch engine; this is shown in actual movement instead of a dead picture such as must be used in giving instructions by circular. The companion picture to this is one showing a man boarding the foot board while the engine is at a standstill. Companion pictures are in like manner shown to represent the dangers of hanging on the side of a freight car, where the man strikes a low switch stand; passing between freight cars while they are in motion to loosen a coupling pin; kicking a drawbar into position while cars are moving towards the train man; grabbing the handhold on the front end of an approaching car and riding there, with feet on the brake beam; car inspectors nearly injured by reason of having failed to use the blue flag; jacking up a car and taking out the trucks, leaving the body resting on the jacks as its only support; moving a string of freight cars over a street crossing with no one on the leading car; passenger attempting to board a moving train; scenes in the car shops, etc.

Mr. Shedd has been very successful in getting the families of employees interested; and not only these families, but their neighbors, the general public. In many towns, the mayor has acted as presiding officer, opening the public meeting.

There is no question of the value of this kind of instruction. As you have suggested, in your editorial, it is very desirable, if not necessary to have other and entertaining features in connection with lectures on motion pictures. One good plan is to get a committee of employees actively interested in the entertainment features. At one of the Rock Island shops there is an excellent glee club, which has done good service in the way of entertainment. Even in small places, where the formation of a glee club is not, perhaps, practicable, individuals who can sing, or speak, or play musical instruments, can increase the interest. Local talent is always well appreciated.

G. E. M.

AMERICAN SOCIETY FOR TESTING MATERIALS

Philadelphia, Pa., July 20, 1914.

To the Editor of the Railway Age Gazette:

The reference to the recent annual meeting of the American Society for Testing Materials, held at Atlantic City, N. J., June 30-July 3, as well as the editorial relative to the Society in your issue of July 10, are both calculated, in my judgment, to convey impressions that are not only erroneous but unfair to the Society.

Your brief review of the annual meeting contains the following statement with reference to the discussion following my paper on "A Critical Review of the Procedure Governing the Adoption of Standards":

> Attention was called in the first place to the low estimate in which many of the specifications of the Society were held by the users of materials on the ground that they were voted upon by men who had no knowledge or experience to guide them in their decision.

I wish to challenge the correctness of the sweeping statement that many of the specifications of the Society are held in low estimate by the users of materials. Permit me to say that in my long and active connection with the Society extending over a period of 16 years, I hear for the first time objections to its standard specifications based on the ground here alleged, namely, that the value of specifications should be judged, not on their intrinsic merits, but on the fact that as a final act in their adoption, the proposed standards are referred to letter ballot of the Society at large, and therefore to the vote of a group of individuals of whom many are not qualified to pass expert judgment on a given specification.

The wisdom of adhering to the present policy, by which specifications are finally subjected to letter ballot of the Society, is concededly debatable, and this question was, as a matter of fact, submitted for discussion in open meeting at the recent convention. This was done, however, with no thought that the continuance or discontinuance of this feature of the procedure might serve to raise or lower the high estimate which now attaches to the standards promulgated by the Society, under a system so elaborate that its description in detail would prove wearisome to your readers. Suffice it to say, briefly, that this system provides that proposed specifications are first voted on by the sub-committee with which they originate; second, by the parent committee by which they are reviewed; third, by letter ballot of the entire parent committee; fourth, at the annual meeting of the Society; and, fifth, by letter ballot of the Society at large. To refer a proposed specification to letter ballot requires a two-thirds vote of those voting at the annual meeting.

In that connection permit me to quote the following statement from your editorial:

> Piazza talk sometimes is a far better indication of what men are really thinking than the discussion on the floor, and at Atlantic City last week there was more than one hint thrown out that the committee reports are getting to be dominated by the manufacturing interests. This may or may not be true, and one can only be convinced one way or the other by a careful consideration of the reports in the fullest detail. But the point is that there should be no suspicion of such a thing.

It is indeed surprising that a journal of your standing should give space in an editorial, and on so shadowy a basis as

"piazza talk," to a statement which strikes at the very root of the principles on which the Society must stand or fall. That the charge is fundamentally unfair can be best shown by the following presentation of facts and figures, which, except as to the analysis of the vote between producers and consumers in the accompanying table, were all available in printed form at the recent annual meeting of the Society.

In my own paper I called attention to the fact that on 27 of the 28 technical committees dealing with matters having a commercial bearing, "the non-producers outnumbered the producers, and, on the average, in the proportion of seven to four." Committee A-1 on Standard Specifications for Steel, whose work you criticised, consists of 71 non-producers and 37 producers. In my paper, previously referred to, it is stated that according to the records of this committee "the total attendance at the seven meetings held since January, 1913, was 251, divided in the proportion of 158 to 93 as to consumers and producers, respectively." On this committee many of the leading railroads are represented by able and aggressive men who would promptly withdraw from the committee if any ground whatever existed for the charge advanced in your editorial. In further answer to that charge I adduce below, in tabular form, a detailed analysis of the vote of this committee on each subject recommended for action by the Society at the recent annual meeting, from which you will note that with the single exception of the proposed revision of the standard specifications for steel rails, than which there is perhaps no subject on which it would be more difficult to harmonize conflicting opinion, the vote of the committee on every item is one of substantial unanimity.

Analysis of Vote of Committee A-1 on Standard Specifications for Steel

Membership: Consumers, 71; Producers, 37; Total, 108

Proposed Standard Specifications; New and Revised.	For adoption			Against adoption			Not voting		
Revisions in present standard specifications:	C.	P.	T.	C.	P.	T.	C.	P.	T.
Low carbon steel splice bars	37	20	57	4	0	4	12	9	21
Medium carbon steel splice bars	36	20	56	6	0	6	11	9	20
High carbon steel splice bars	36	20	56	6	0	6	11	9	20
Extra high carbon steel splice bars	36	20	56	6	0	6	11	9	20
Structural steel for bridges	42	23	65	1	0	1	10	6	16
Structural nickel steel	42	18	60	1	0	1	10	11	21
Structural steel for buildings	42	23	65	0	0	0	11	6	17
Shapes, mill plates and bars	37	23	60	1	0	1	13	6	21
Billet steel reinforcement bars	39	21	60	0	0	0	14	8	22
Carbon steel car and tender axles	35	22	57	2	1	3	16	6	22
Cold rolled steel axles	33	19	52	0	0	0	20	10	30
Proposed revised standard specifications to supersede present standard specifications:									
Carbon steel rails	29	18	47	12	2	14	12	9	21
Carbon steel and alloy steel forgings	42	24	66	1	0	1	10	5	15
Quenched and tempered forgings	37	21	58	1	1	2	15	7	22
Carbon steel forgings for locomotives	37	25	62	0	0	0	16	4	20
Proposed new standard specifications and methods:									
Structural steel for cars	39	23	62	2	1	3	12	5	17
Carbon steel bars for springs	36	21	57	3	2	5	14	6	20
Chemical analysis for plain carbon steel	41	26	67	0	0	0	12	3	15
Miscelloneous:									
Recommendations relative to fracture	47	27	74	1	0	1	5	2	7

Votes cast, 82; not voting, 26; total, 108.

Note.—C. = consumer; P. = producer; T. = total.

While the above table is limited to the records of a single committee, I wish to point out that the analysis of the vote of every committee on such matters as were recommended for action by the Society, and on the report as a whole, is recorded in its printed report, and that all matters on which favorable action was taken at the recent annual meeting of the Society were recommended with substantial unanimity on the part of the committees concerned. This circumstance, in connection with the consideration of the published personnel of the committees, should serve as a definite and conclusive answer to any unwarranted inference from your allusion to "piazza talk."

Your editorial further stated that "there are some of the specifications that have been referred to letter ballot at this meeting that appear to be useless," and, as an example, you single out the specifications for cast iron for use in locomotive cylinders. In commenting on this you say:

It is doubtful if the few large locomotive builders of the country would allow their methods of foundry practice to be modified by the specifications of the Society, nor is it conceivable that any railroad making its own cylinders would consider itself bound to use these specifications for its own work simply because it has been adopted as a standard by this Society.

In reply it may be said that the proposed revision of these specifications, recommended at the recent annual meeting, was made at the joint desire and with the direct co-operation of representatives of leading locomotive builders and railroad interests because it was felt by both parties concerned that a proper specification for this class of material did not exist. Since these specifications have been revised in accordance with the joint wishes of makers and purchasers of locomotives, it is to be anticipated that they will be widely used.

In your editorial reference to the Electric Railway Association in the matter of heat-treated axles as applied to motor axles of electrically driven cars, you state in substance that the negative action in this matter was inconsistent with the action in the case of steel springs for automobiles, and with the recognition accorded to the Master Car Builders' Association in connection with the discussion of another matter on the floor. Permit me to point out that the two cases—the one relating to springs and the other to axles—are wholly different in that the requirements for springs for automobiles differ essentially from those for springs for railway cars, whereas in the case of axles the requirements of the leading railways in connection with their electrically driven cars are practically identical with those of the constituent companies of the Electric Railway Association. In the case of the railways the same engineers are in responsible charge of the purchase of axles for both steam and electric motor cars. The numerous representatives of the railway interests on Committee A-1 were unanimously of the opinion that the specifications recommended for adoption on the part of the American Society for Testing Materials would insure a better product than those proposed by the Electric Railway Association. In the letter ballot of Committee A-1 on these proposed standard specifications only two negative ballots were cast, as noted in the above table.

The unfair attitude of the editorial is further evidenced in the regret "that there are not more papers giving the results of the personal research work of the members. Many of them are engaged in work of this character all of the time and it is regrettable that more of it does not come to the light of day at these meetings." In reply it is only necessary to call attention to the fact that no fewer than 32 papers of this character, aggregating 409 printed pages, were presented at the recent meeting. In explanation of the supposed paucity of material of this kind you suggested in your editorial, that "men do not like to present the results of their work in which they are vitally interested to a meeting in which their own presentation must be limited to a few minutes and the discussion thereon to seconds." Without dwelling on the manifest exaggeration of this statement, I shall content myself by reaffirming that the complaint is directed against something which has no existence, and that the value of verbal, as distinguished from written discussion, has its distinct limitations irrespective of the time element. The writer of the editorial appears further to have lost sight of the vast amount of research work conducted by the technical committees as an essential basis of their recommendations, and other research work done under their auspices solely with a view of promoting knowledge within their respective fields.

The general unfairness of the editorial lies, however, not merely in that which was said, but, in no less an important degree, in that which was left unsaid. As a single example attention may well be called to the valuable report of 125 pages on the part of Committee D-1 on Preservative Coatings for Structural Materials, which both your review and your editorial criticise in the allusion to the Havre de Grace and Atlantic City paint tests.

Edgar Marburg,
Secretary-Treasurer.

Railroad Development in the Philippine Islands

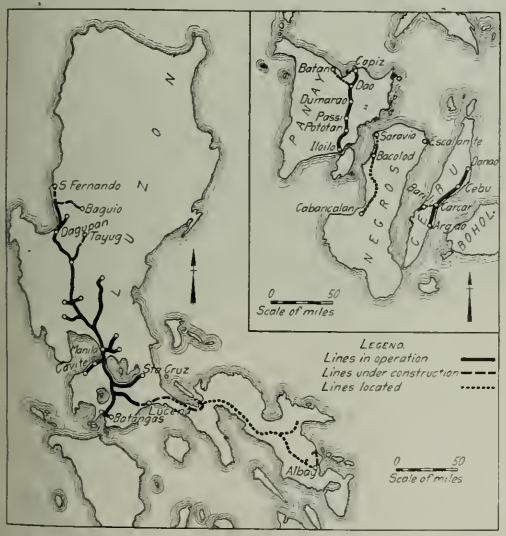
A Discussion of the History, Engineering Features, Organization and Traffic Problems of These Roads

By C. H. Farnham

Formerly Chief Engineer, Cebu Division, Philippine Railway Company

The question of transportation was one of the most difficult problems with which the American military forces had to cope in their early campaigns in the Philippine Islands. There was hardly a road that was better than a rough trail. There was one line of railroad running from Manila north to Dagupan, on the Island of Luzon, and this road was partially destroyed by the Filipinos in their retreat before the American advance. It was rebuilt as fast as the American forces took possession, and was operated by soldiers as a military railroad for the use of the army in its campaign. Thus almost from the first, American influence began to be felt in the railroad development of the Islands.

This first railroad in the Philippine Islands was called the Manila & Dagupan, and was built and owned by an English company under a concession from the Spanish government. It was first operated in 1892. It is the oriental gage, (3 ft. 6 in.), and 122 miles in length. The country through which it runs is



Map of Railroad Lines in the Philippine Islands

a great alluvial plain, with numerous rivers and swamps and is densely populated, and one of the richest rice growing sections in the islands. The construction is light for the greater part of the line, although there are several fairly expensive bridges, the one crossing the Rio Grande de Pampanga at Calumpit having cost $500,000. A section, several miles in length, in the Province of Tarlac, is subject to bad washouts during the rainy season, and must have cost a considerable amount in repairs since the line was first built. This condition is caused by the overflow of the Tarlac river.

Before American occupation the equipment was all English, consisting of the old style compartment coaches for passengers, small goods vans, and light engines. The operating force consisted of a few Englishmen in charge of departments, and in the head office at Manila. All train crews, section gangs, shop crews, station agents, telegraph operators, and the greater part of the clerical force, were Filipinos. All of these natives had been trained by an English manager and his assistants, who had been sent out from England to build and operate the road. Business was none too brisk, and the road just about managed to keep its head above water. It never paid a dividend. When the Spanish war broke out in 1898, followed by the Filipino insurrection in 1899, the road was put entirely out of business. Much of its property was destroyed, and from 1899 to 1901 it was operated as a military railroad by the United States army.

Under the army, the line was repaired and put in shape so that trains could be run; rolling stock was repaired, and new engines and cars were brought from the United States, this being the first American equipment introduced into the islands. The operating forces were American soldiers, and some civilians picked up in Manila. As soon as a measure of law and order was restored along the line, and while yet under the military control, a considerable amount of commercial business was done. Finally in 1901, the line was turned over to the English company and was again operated by it in much the same manner as before.

This was the railroad situation in the islands in 1901, when the civil government was established, and it remained practically unchanged until 1905. There were several small branch lines built by the Manila & Dagupan under concessions granted by the Philippine government. This company also improved its main lines, bought new rolling stock, rebuilt some of its stations and gradually increased its business from year to year.

Among the first things to which the new civil government devoted its attention was the improvement of the means of transportation. To this end it started a road building program. The question of railroads was also taken up very early, but it was a much less pressing and a far greater financial question than the building of ordinary highways.

Under an act of the United States Congress, approved July 1, 1902, the Philippine government was authorized to grant concessions for railways and under an act dated February 6, 1905, it was allowed to guarantee the interest on bonds issued for the construction of railroads. Acting under the authority of these laws, the Bureau of Insular Affairs at Washington, on June 12, 1905, advertised for bids to build certain railroad lines in the Philippine Islands. The lines advertised were located as follows:

Island of	Luzon	833 miles
"	Panay	100 "
"	Negros	100 "
"	Cebu	95 "
"	Layte	55 "
"	Samar	50 "

Several bids were received by the bureau, but as they all departed materially from the terms of the proposal, they were rejected.

New proposals were advertised by the bureau on December 20, 1905. These modified the conditions in many ways, and allowed more latitude to prospective bidders. To this second proposal two bids were submitted, one by Speyer & Co. for certain lines on the Island of Luzon, and the other by a group of New York financiers headed by William Salomon & Co., and including among others, J. G. White & Co., Cornelius Vanderbilt and Charles M. Swift, who proposed to build the lines on Panay, Negros and Cebu. The proposals were accepted by the bureau, and resulted in the formation of two railroad companies. The Manila Railroad Co. took over the concessions granted for the

lines on the Island of Luzon. The Philippine Railway Company received the concessions for the building of lines on the Islands of Panay, Negros and Cebu.

THE MANILA RAILROAD COMPANY

The Manila Railroad Company was organized under the laws of New Jersey in 1906, and took over the concessions granted to Speyer & Co. This company also acquired control of the old Manila & Dagupan line, thus placing all the lines on the Island of Luzon under one management. As a matter of fact, the English owners of the old line are largely interested in the new company, and the same management that operated the old Manila & Dagupan line now operates the new lines, so that it is really but an expansion of the old company.

The lines that this company operates and is building are divided into two main divisions, based upon the fact that some of them have the interest on their bonds guaranteed by the Philippine government in the same manner as the Philippine Railway Company lines, and that others have not this guarantee. It was at first intended to build all the lines without the guarantee, but a modification was made in 1910, and part of them were placed on the guarantee basis.

The Northern, or unguaranteed lines, consist of the old Manila & Dagupan of 122 miles; several small branches built under concessions from the Philippine government prior to 1905, totaling 95 miles; and new extensions from Dagupan to San Fernando de Union and Camp One, also three branches in Pampanga and Tarlac provinces, with a total of 137 miles. This makes a total of 354 miles in this division. All of these lines are either in complete operation or are under construction, with the exception of one small branch of 20 miles in Pampanga province. About 27 miles are under construction, mostly on branch lines. There is also a line under construction from the Dagupan-San Fernando de Union line to Baguio, the summer capital. While this line is physically a part of the Northern Division, it is a guaranteed line, and is included in that division. At present the route used to reach Baguio is by railroad as far as Camp One, and then by stage over the famous Benguet road. All of these lines are through one of the best sections of the islands, and have a large and comparatively prosperous population to serve. They are doing an increasing business from year to year, and really form the backbone of the whole Luzon system.

The Southern, or guaranteed lines, consist of all lines south of Manila and the Baguio Line. The main line south runs from Manila to Albay at the southern point of the Island of Luzon, a distance of 355 miles. At present this line is complete and in operation as far as Lucena, a distance of 88 miles from Manila. The Batangas, Cavite and Santa Cruz branches are all completed and in operation, with a total of 88 miles. The Baguio line of 25 miles and 95 miles of the main line south, are under construction at the present time. This makes a total of 468 miles in the southern lines, of which 176 miles are completed and in operation, 120 miles are under construction, and 172 miles have not yet been put under construction.

The following is a statement of the proposed construction and completed mileage:

	Northern Lines	Southern Lines	All Lines
Completed	306.6 miles	176.1 miles	482.7 miles
Under construction	26.8 "	120.5 "	147.3 "
Const. not commenced	20.9 "	171.9 "	192.8 "
Totals	354.3 "	468.5 "	822.8 "

The lines already built and in operation have done a very good business and their future ought to show a substantial increase. They are in a populous and rich country, and are all within a short distance of Manila, a city of 235,000 inhabitants and the commercial metropolis of the Archipelago. During 1912, about 40 miles of line was completed and placed in operation. In 1913 less than 20 miles was opened. The company expects to complete all lines by 1918. This gives four years in which to complete 340.5 miles, or 85 miles per year, and while this is greater progress than has been made during the past two years, it is not impossible.

The lines are all the standard (Oriental) gage—3 ft. 6 in. with 2 per cent. grades and 8 deg. curves on most of the lines. None of the lines built so far comprises heavy work. Sixty pound rail and native hard wood and Australian ties are used. Native contractors were employed quite extensively on this construction. They proved fairly successful on grading, but did not do very well on other parts of the work, and most of the other construction was done by day labor.

The Baguio line, now under construction, has three rack sections. It runs through a very mountainous country, and reaches an elevation of about 5,000 ft. When completed, it will furnish rail communication between Manila and Baguio. Baguio is in the high tablelands of Benguet, and is a cool, healthful resort, much frequented in the hot season from May to July. Benguet is also quite a mining country, with rail communication to the coast and this industry ought to make rapid advances.

The remainder of the main line south will, when completed, furnish an all-rail route from Manila to the great hemp producing regions of Albay, but it will have to compete with the present water route. The intervening country between Albay and Lucena is not developed, and will furnish little business. It

Constructing a 13,000 yd. Fill on the Island of Cebu

looks as though the road will have to develop it and build up a local traffic. It may take years to do this, but eventually this whole section ought to pay as well as any of the lines.

The lines in operation have 20 locomotives, 47 passenger cars, 324 freight cars and 49 work cars per 100 miles.

THE PHILIPPINE RAILWAY COMPANY

The Philippine Railway Company was incorporated in 1906, under the laws of the state of Connecticut. It owns and operates 73 miles on the Island of Panay and 60 miles on the Island of Cebu. These lines have been built in accordance with the terms of the concession granted the original syndicate and later transferred to the company. In addition to the above, there was included in the original concession 22 miles of branch line on the Island of Panay, and 100 miles on the Island of Negros, also an optional branch line of 35 miles on the Island of Cebu. The construction of these various lines has been either abandoned, or indefinitely postponed with the consent of the government.

Under the terms of the concession granted this railway by the Philippine government, the interest on the 4 per cent. gold bonds is guaranteed for a period of 30 years. It fixes the tax rate at ½ per cent. of the gross receipts for a period of 30 years, and 1½ per cent. for 50 years thereafter. The company is allowed to issue bonds for 95 per cent. of the cost of construction.

On April 29, 1906, the first party of engineers, consisting of

50 men, sailed from Seattle to begin the surveys for this line. They arrived at Manila on June 10, and all were in the field by June 20. Surveys were begun on the Islands of Panay, Negros and Cebu at the same time. Practically all that was determined by the concession was the terminals of the different lines. There were very few maps available, and even these were very inaccurate. The locating engineers had to get for themselves a great deal of information that is generally derived from government maps, reports, etc., in a more civilized country.

As fast as possible the preliminary lines were run, and the final location determined, and run in on the ground, and submitted to the government for approval. By November, 1906, enough of the line had been located on the Islands of Panay and Cebu, to begin construction, and the first sod was turned by Governor-General Smith at Cebu in November, 1906.

A Bridge with Enlarged Foundations on Soft Mud Foundation

As finally located, the lines presented no remarkable engineering features, and involved fairly heavy construction for a new line in a new country. The standards of construction were fairly high, but met with the approval of the government. The lines were located and constructed with a view to getting as low a cost of maintenance and operation as possible. This increased the first cost considerably, and therefore the fixed charges. One of the determining factors was that there was no provision for a future increase of bonded indebtedness, and consequently it was necessary to get everything in under the original bonds or probably not at all. In consequence it was a very complete piece of construction, in fact much more complete than is the case with most roads in similar country.

The islands upon which these lines are located are a part of the Visayan group, and lie 300 to 500 miles south of Manila. The Island of Panay has an area of 4,611 square miles, and a population of 743,646. Tributary to the railroad is a population of 135,000, or 3,500 per mile, with a density of 198 per square mile. Iloilo is the southern terminus of the line of this large island. It is the great sugar port of the Philippines, and is a large commercial center. It has a population of 45,000. There is a protected roadstead, and the Iloilo river has been dredged to 24 ft. as far as the railway terminal.

The line runs from Iloilo in a northerly direction, through the central portion of the island, to the town of Capiz on the north shore. From Iloilo to Passi, the line traverses a wide alluvial plain. This is a rich country, and formerly all of the low lands were cultivated, but owing to the loss of work animals by an epidemic, only about 15 per cent. of the best land is being tilled at the present time. From Passi to Dumarao, the line passes over a range of hills which form the divide between the plain of South Panay and the North plain or valley of the Panay river. Very little of the country has been cultivated, but all admits of cultivation, and will be eventually.

In the valley of the Panay river are located the great rice fields. From Dumarao to Capiz, the line passes through this valley which is subject to heavy floods, and in order to keep the tracks above water, very heavy and expensive embankments were made. The whole construction from Passi to Capiz is heavy work both in bridging and grading. It was originally intended to build a line from Dao to Batan on the north coast of Panay, but it was indefinitely postponed, and will probably be abandoned.

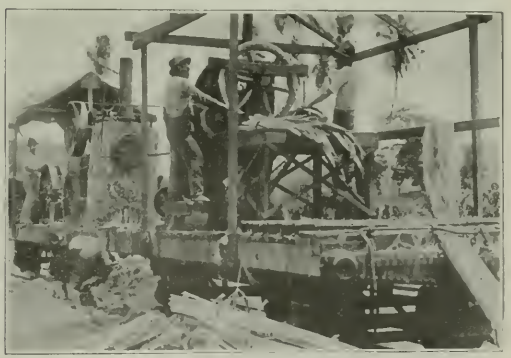
The Island of Negros has an area of 4,481 square miles, and a population of 460,775, of which 249,000 are tributary to the projected railroad between Savaia and Cabancalan, or an average of 3,720 per mile of road with a density of 180 per square mile.

The general topography of the country consists of a heavy mountain range along the east coast and in the southern portion. This slopes down into a flat coastal plain on the west, which is the great sugar producing region of the Philippines. The proposed line runs through this section from north to south, and from one to twelve miles from the coast.

In all this part of Negros, there is no seaport, and the plans as finally worked out, provided a pier and breakwater protection at Bacolod with a water transportation line between this point and Iloilo, which lies 20 miles across the Guimaras straits.

A line was projected around the north coast of the island from Saravia to Escalente, but detailed surveys proved it to be too expensive, and the country so poor, that it was abandoned with the consent of the government. The line south has been indefinitely postponed, and while it may be built in the future, it will probably not be before the lines already built show better returns than at present.

This whole section of Negros is naturally very rich, and with modern methods of cultivation and manufacture, can produce as large a yield of sugar as anywhere in the world, but the sugar industry is fully 50 years behind the times. It is only very recently that a modern central was built at San Carlos on the east coast, while there is room for at least two on the west coast, but there must be a change in the methods of cultivation and that may mean years of education. There is no reason why this island should not be as rich in sugar as Hawaii or Cuba, and when this time comes, the proposed line, and many additional miles will be built.



A Maguay Stripping Machine Provided by the Railway to Clean Fibre for the Natives Without Charge

Cebu is a long, narrow island, about 1,762 square miles in area, the center of which consists of a series of mountainous ridges skirted by a more or less flat coastal plain upon which the greater part of its people live. This coastal plain is highly cultivated as are many of the hills. The population is 592,000, or

about one-eleventh of the Philippine Archipelago. The population tributary to the railway is 309,500, or about 5,158 per mile of road. The density of population along the line of railway is about 515 per square mile. Cebu, the capital and principal city, is the oldest city in the islands, and is the great hemp shipping port of the southern group. Most of this hemp, however, does not originate on the Island of Cebu, but is brought from the neighboring islands for grading, baling and shipment to Europe and the United States. Cebu has a modern port recently built by the government. Steamers drawing 25 ft. of water can lie at this dock and discharge. The railway line connects with this dock.

The line on Cebu is located between Danao, 20 miles north of Cebu, and Argao, 40 miles south. It runs through the populous towns of the coast and along the rich coastal plain, which is from three to six miles wide. This plain is cut by numerous streams and ridges, and parts of the line required fairly heavy grading and bridging.

A line was located from Carcar, 23 miles south of Cebu, across the island to Barili on the west coast. This was an optional line under the concession, but was not built, and it will have to wait until the development of the country will show that such a line will pay.

CONSTRUCTION PROBLEMS

The labor question was the greatest problem that had to be solved in the construction of these lines. The problem of location and design of the various structures, while possessing many new and novel features, was one that admitted of fairly easy solution by the same methods that are used in this country. When a line of railroad is to be built in the United States, it is the general rule to prepare plans, estimates and specifications and then advertise for bids, and to finally contract for the work to be done by one or more contractors. These contractors have the necessary plant, superintendents, and experience gained by many years of similar work. Such a procedure was out of the question in the Philippines. There were no contractors, except a few small firms in Manila and some of the larger towns, and none of these firms possessed the plant, capital or men to undertake a contract of such magnitude. There was not a body of experienced construction men in the Islands from which to draw superintendents, foremen and mechanics. The company decided, that under these circumstances, the best results would be obtained by employing a responsible contracting company to take entire charge of all the engineering and construction work, thus placing all work under one head, and giving this company the greatest latitude in which to meet new conditions as they might arise. J. G. White & Co. of New York was therefore given the contract. This company had handled work all over the world, and had built the Manila Railroad & Light Company. In the construction of this electric line, they had done some very excellent work with native labor, and thus had some experience to help them in this new undertaking.

The organization was finally worked out with a vice-president and chief engineer of the railway company with headquarters at Manila; a chief engineer of J. G. White & Co., with headquarters at Iloilo, and division engineers at Cebu and Iloilo. The Philippine government was represented by the supervising railway expert, who had under him inspecting engineers at Iloilo and Cebu.

All plans had to be approved by the government and all work was subject to inspection. All accounts were audited and approved by the government. Preliminary bond issues were made for each 20 mile section of line opened for traffic, and final issue was made upon its completion and approval of the government.

The division engineers at Cebu and Iloilo had entire charge of all engineering, construction and operation, and reported to the chief engineer at Iloilo. The native workmen were paid daily by a pay check that was redeemable in cash by the company once a week. These checks soon passed as currency among the trades people along the line. The white foremen, mechanics and clerks were paid monthly.

At first a contract was made to feed all native laborers and also to run boarding houses for foremen, mechanics, etc., but this was found to be unsatisfactory in many ways, and was revoked. Native workmen were then fed only in out-of-the-way places, where it was impossible for them to secure food from a nearby settlement. The company furnished good, substantial board to its foremen for $25 per month. This board cost the company $30, but even at this loss, it paid to feed the men well, and keep them contented.

At Cebu and Iloilo, there was maintained a complete hospital, with doctors, nurses and all modern appliances, and at various times small temporary hospitals were maintained on the work as needed. The surgeons not only took care of the sick and injured, but made frequent inspections of all camps and quarters, and drew up rules and regulations for camp hygiene, which were strictly enforced.

When construction work was first started, there were very few natives on either island, who had ever seen a railroad, much less knew anything about the construction of one. There had been some little road building by the government, and J. G. White & Co. had a contract for certain port improvements at Iloilo and Cebu. This, however, was about all the construction

Typical Second Class Station at Sebonga Showing Passing Siding and Block Signal

work done, and from there a certain number of experienced native foremen could be obtained. For the greater part of the labor, it was necessary to depend upon the natives of the Southern Islands, while white superintendents and foremen were mostly picked up in Manila, and quite a number were sent out from New York. Most of the men picked up in the islands were a rough lot, including many ex-soldiers, but they generally spoke the native language, and understood how to handle the Filipino laborer and were acclimated.

The native laborers had to be taught everything, including how to handle a pick and shovel and to wheel a wheelbarrow, but they were willing as a rule and showed steady development. In this same way, gangs had to be taught track work, concrete work, steel erection, in fact, everything that had to be done in order to build a modern railroad. At first it was very discouraging, and unit costs were very high, even with 25 cents per day for labor. It required so much supervision which was expensive, and not very efficient. At the end of a year there was marked improvement, and as the force became more experienced and better organized, unit costs went lower and lower, until they compared favorably with similar work in the United States. Gradually the natives learned the work, and in time a number of native foremen were developed who replaced some of the lower grade of white foremen. Some few really first-class native foremen were developed by the close of the

construction period. At one time there were employed on the Cebu line about 5,000 natives and 250 white men. Fully as large a force was employed on the Panay line when the force was at its maximum.

MATERIALS

All materials, tools and supplies had to be shipped in, as the islands on which the lines were built furnished nothing but the gravel and sand used for ballast and concrete. Native hardwood ties were shipped from neighboring islands, mostly from Mindanao. These ties cost $1 each by the time they were in the track. Ties cut from first group timber are very durable and have a life of 25 or 30 years, but it is very difficult to distinguish the woods grown in the islands, and consequently, many inferior ties would get in, in spite of careful inspection. Many of

A Regular Passenger Train at Cebu Station

these ties would not last over a year or two. All ties had to be bored, as the wood was too hard to take a spike. Lumber was shipped from mills on the islands of Negros and Mindanao, and it was not very satisfactory for temporary construction purposes, such as trestles, forms, etc. All such lumber was manufactured from a native soft wood. It could not compare with Oregon fir for the same class of work, and a great deal of Oregon fir was shipped from the United States. The native hard woods were satisfactory but expensive for finish and car construction.

Gravel for ballast and concrete was obtained by dredging from stream beds. It was a good gravel, and made good ballast and concrete. Cement was obtained from the Green Island Cement Company, Hong Kong, China. Steel and concrete were used for all bridges and culverts. Reinforced concrete was used for all station buildings, roundhouses, train sheds, machine shops, storehouses, and, in fact, all building construction. An up-to-date, well equipped machine shop, with foundry, was built at Iloilo, and a smaller but complete shop was built at Cebu.

Seventy pound rail was laid at first, but most of the lines were laid with 60 lb. steel. Ample yard tracks and sidings were provided and turntables, water stations, roundhouses and trainsheds, were erected at all terminal points. At all order points standard train order two position signals operated by pipe connections from the station were provided. In fact, all the construction was planned to obtain as low a cost of operation and maintenance as possible. All structures were plain but permanent. The maximum grade was 1 per cent., except a short section of 1½ per cent. on the Panay line. The maximum curve of all lines was 6 deg.

All the material, tools and equipment from the United States had to be ordered a year in advance of the needs. In consequence of this, a very large supply of everything needed had to be carried in the storehouses at Iloilo and Cebu. Even with the best of care and forethought, things were constantly needed that were not on hand and not to be had in the local markets. Such needs were largely supplied from the company's shops at Iloilo and Cebu. These shops were quite extensive during the construction period. And here everything from a locomotive to office furniture was built, including all the derricks, pile-drivers, gravel diggers, and many other necessary items of construction plant. All kinds of rolling stock was built with the exception of the running gear, which was sent from the United States. While supplying many pressing needs, the shops were at the same time training a force of Filipinos to do this necessary work when the lines went into commercial operation.

As fast as a 20-mile section was completed, it was put in operation, and so very early (September, 1907, on Cebu) it became necessary to organize an operating force. At first white engineers were brought from the United States, with whom were placed native firemen. At first all conductors and many brakemen were Americans, but soon all brakemen were replaced by natives. A trainmaster was in charge of all train movements, reporting to the division engineer. He had a white despatcher with a native assistant. From the first the telephone was used for the transmission of all orders. As fast as stations were opened for commercial traffic, station agents were installed, and trained by a traveling agent, who reported to the chief clerk Thus, during the progress of the construction work, there was being trained a force of natives that would be able to take over the work of operating the lines when the construction forces should leave.

OPERATING ORGANIZATION

As the track was laid, section gangs were put on under the charge of an experienced native foreman. These men worked under the direction of the general foreman of track, and had the advantage of a constant training for several years under good American track men. As the construction work drew to a close, many of the white engineers, foremen and mechanics had been replaced by natives, and the whole operating force was gradually brought down to as economical a basis as possible with safe and efficient operation.

The organization of the permanent operating force included the vice-president and chief engineer, who is the chief rep-

Passenger Station and Office Building at Cebu

resentative of the company in the islands, with an office in Manila, and the general superintendent in general charge of all operation, with office at Iloilo. Maintenance of way is in charge of an American roadmaster on each island, with Filipino section gangs of a foreman and two men to each five miles of track. Maintenance of equipment is under a master mechanic, with headquarters at Iloilo. A division foreman of machinery is in local charge at Cebu.

In the shops a few American foremen still remain, but most of the mechanics are Japanese, Chinese and Filipinos. The Filipinos are fast replacing the Japanese and Chinese. The enginemen are all Filipinos with an American traveling engineer in charge. Transportation is in charge of a superintendent on each island who is an American. Trainmen, agents, operators

and despatchers are all natives, and they are proving very efficient. Traffic is in charge of a traffic agent to whom the station agents report, as also do the Filipino traveling, freight and industrial agents. Clerical and accounting matters are under the auditor at Iloilo.

Great efforts are being made to build up agricultural production and to introduce new industries. The native traveling freight and industrial agents, under the direction of the traffic agent are all the time working with this object in view. The railway company has distributed some 4,500,000 Maguay plants in Cebu, which were furnished by the government. To encourage Maguay production, a fiber cleaning machine has been mounted on a flat car and is run to various points along the line where the fiber is cleaned for the natives without charge. Seed corn of a superior grade was purchased by the railway company in the United States, and distribution for the purpose of increasing the production per acre. High grade rice is imported and distributed to increase the production of this staple. Encouragement is being given to people to open up sugar plantations along the line in Panay. Through the native agents the people along the line are kept informed of the prices of their products, and markets are found for them if need be.

During the past few years the railway company has worked in conjunction with the government in helping the farmers grow their crops more scientifically. The railway maintains several experimental plants along its lines, and in this way instructs the farmer how to increase his production. The company also provides for a market bulletin which is placed at each station along its lines. In this way the farmer is in constant touch with the outside market. This innovation has brought good results.

Along these lines there are over 600,000 people, and thousands of acres of the richest agricultural land that is producing but a small part of its possible output. The people are very poor, have been very much oppressed, and afflicted in the past, and are but a few generations removed from savagery. At present they merely scratch a meager existence from the soil, but with the security and justice of a strong American administration, with the education that an excellent public school system is giving them, and with the civilizing factor of the modern railroad, they are improving from year to year. The time will come when they will be a much richer and more intelligent people than at present. One of the greatest factors that are helping toward that desired end, is the American railroad, and when that time comes it will reap its reward.

SOME VIEWS ON THE RATE CASE DECISION

President Ripley, of the Santa Fe, has written to the Traffic World a letter on the decision of the Interstate Commerce Commission in the Eastern rate advance case, in the course of which he says:

"It does not require 40 or 50 pages of printed matter to justify the trivial advance that is granted. Everybody who knows anything about it knows that the merchandise rates in central traffic territory are ridiculous, and that the requested 5 per cent is only a fraction of what the advance ought to be. It would not be difficult in that territory to pick out thousands of shipments the freight charges on which are not equal to the actual warehouse cost of loading and unloading, making no allowance either for hauling or interest on plant. The reasons for this are partly chargeable to the railroads, but largely also to the various 'regulatory' bodies.

"Nor did it require so much space to tell us that the passenger business is not profitable—we knew that already—but in fairness should it not also be stated that there has been a theory advanced by our rulers, and to some extent accepted, to the effect that the transportation of individuals freely and at minimum cost is a public necessity and a service which ought not to be expected to pay its full share of operating expenses? Our respected postmaster-general says that the United States mail is such an integral portion of the state, and of such necessity that it ought not to pay on the basis of other business, but so far as transportation is concerned, should be done at less profit than other business. The commission neglects to point out any way by which passenger rates may be advanced in view of the prevalence of statute rates in the states.

"The talk about various methods of saving in expenses is platitudinous but unconvincing to those of us who are 'in it.' If there is dishonesty in purchases or improper connection between business enterprises and railroad directorates it is just like any other kind of dishonesty, and should be punished accordingly, but it is not claimed that such charges are of general application—as a matter of fact, they can safely be denied as applying to any considerable number of carriers.

"As to free transportation, I have long been known as a radical, and, personally, I don't care how soon it is abolished, root and branch, but the figures given in the report as to the magnitude of the losses it causes are 'just piffle'; most of the deadhead mileage is that of employees on company business—much of the remainder is that of persons who in the absence of the free pass would not travel at all—and the amount of free transportation given to those who would otherwise pay fare is negligible.

"The whole document brings forcibly to my mind the saying of our old friend, Sancho Panza:

> Whether the rock hit the pitcher or the pitcher hit the rock is all one to the pitcher.

"Here are a lot of railroads unable to live on present rates, to whom the relief is admittedly inadequate, and the commission, after 14 months and an expenditure of money totally out of proportion to the importance of the case, gives them a fraction of the fraction they asked for, accompanied by a sermon upon other and unrelated matters, which are either impossible of remedy or unimportant. Verily, 'the mountain has labored and brought forth a mouse.'"

The Chicago Herald of August 10 publishes a forcible interview with a Chicago business man whose name is withheld, but who is evidently somebody with a very full understanding of railway matters. As the interview evidently expresses the views of many business men it is well worth republishing despite the fact that the name of its author is withheld. The interview is as follows:

"Commissioner Daniels' views, coming as they do from the commissioner thought to represent most clearly the attitude of the administration, present one of the two rays of light from a thoroughly unsatisfactory decision. The other is the unqualified admission even by the majority that 'upon the facts set forth we are of the opinion that the net operating income and the net corporate income of the railroads in official classification territory, taken as a whole, are smaller than is demanded in the interests of both the general public and the railroads.'

"Greatest encouragement in Mr. Daniels' stand, which was supported by Commisioner McChord, lies in the fact that it may portend a change in the attitude of future commissioners, and that where need of greater revenue is shown the lawful regulators of railways will have the courage to mete out justice in higher rates instead of catering to supposed popular opinion by flat denial as in the past or by petty quibbling as in the present decision.

"If the public comprehended the evasive pettifogging by which the commerce commission avoided granting sorely needed relief to all the petitioning railways, forcing continuance of earnings which the commission itself pronounces against the best interest of public and railways alike, it would rise and demand a speedy change of attitude.

"One of the pieces of advice given the roads as to how they may increase the revenue denied them is to advance passenger rates, since passenger service has been proved to be highly unprofitable. 'Existing statutes in Ohio, Indiana, Illinois and Michigan,' says the commission, 'may be obstacles to the raising of passenger fares in those states. But we are confident that if these statutory fares are shown to be unduly burdensome to the

carriers the people of those great states will cheerfully acquiesce in reasonable increases.'

"Despite the visions of the water pitcher and flag-draped platform raised by 'the people of those great states,' we all know how cheerfully and promptly this relief will come. The roads have spent millions in all the two-cent states in vain proof that the rate is unprofitable. Commissioner Daniels hits the nail on the head by declaring 'the suggestion that they should add to their revenues by advancing their passenger rates is of little force in view of the fact that they are powerless to adopt it.'

"Other recommendations by the commission are as visionary. Time after time it commends the roads for steadily advancing efficiency, for the 'advance in the art of railroading,' for the 'ability of operating officials' in keeping down operating ratios in the face of great odds and concludes by saying, 'We may justly feel proud of the development of our transportation system.' Yet it tells the roads to go out and get their needed revenue by 'the introduction of additional economies in operation and further advances in efficiency.'

"It reproves the roads for spending $4,000,000 in the solicitation of freight and passenger traffic in one year, telling them to cut expenses there. In other words, the commission's preposterous remedy is 'If your business is not paying call in your salesmen and stop seeking it!' Why didn't the commission go to the heart of the problem and recommend the advisability of allowing pooling, such as has been adopted in England?

"In demanding that revenues be increased by abolition of various free services which have grown up with commerce, the commission is trying to lift itself by its own bootstraps, thinking to secure revenue but save the public from contributing it. With industry paying for these services, provided the proposed charges for them withstand the onslaught of state commissions, costs of production must be raised and the consumer must pay in the end as surely as if the added cost were in higher freight rates, while established industry must be seriously disturbed in the bargain.

"The roads are told to expedite freight and relieve terminals by establishing schedules for freight trains, yet I believe any railroad man will tell you that any attempt at schedules for freight trains destroys possibilities for the great economies won by heavy train loads. In other words, to get maximum use of motive power the train must move when tonnage is there. Average movement and loading of cars should be increased, says the decision, but we all know the shipper himself in holding the car at each end of the journey and in his partial loading of the car is one of the greatest factors in cutting car efficiency. The roads have tried often in vain to secure higher minimum car loads, shorter free time or more stringent demurrage charges.

"As to mail pay, in which the official figures show a deficiency, the commission makes no recommendation, as 'it may be assumed that if the compensation for the service is found to be unjust to the carriers relief will promptly be afforded.' Apropos of this the Bourne Senate committee has recommended an increase in mail pay for the railroads, and the railroads are working might and main to starve off an actual cut in pay provided by the Moon bill.

"There are many other suggestions as to how to run the railroads on less money. But the Interstate Commerce Commission, created to secure equality and justice between carriers and the public in rates and practices, steps beyond its proper field when it aspires to tell the operating officials of railroads how to run their own business. Swamped with other duties, this ambitious board would teach the managers of 250,000 miles of railway how to operate their trains. Yet not one has ever sat in an official chair, not one has been asked to accept the presidency of a railroad, and only one, I believe, as brakeman and conductor, has ever worked for a railroad.

"Commissioner Daniels presents hope for relief for this condition when he says: 'This commission is not constituted by law a board of general managers of the railroads of the country, and the assumption of tendering suggestions as to management ought never to delay or postpone the settlement of a plain matter of law and fact involved in an application for advanced rates.'"

George A. Post, president of the Railway Business Association, has issued a statement discussing the decision, in which he says:

"Disappointment over the denial by the Interstate Commerce Commission of rate advances to the Eastern Trunk Lines in the face of the finding that they need more income, is softened somewhat by the temperate tone of the decision and by several important steps forward which are taken by the commission in attitude towards the carriers."

Continuing, Mr. Post makes eight points regarding the opinion, of which the following is a summary:

1. Railway managers are frankly acknowledged to have shown sound judgment when they gave warning in 1908-1910 of an impending decline in net income.

2. Railway income in official classification territory is definitely pronounced too low.

3. Jurisdiction and obligation to consider railway earnings, income and credit in regulating rates are explicitly assumed by the commission.

4. To permit suitable rewards for foresight in promotion and efficiency in management is unreservedly declared wise public policy.

5. Roads of a region are granted advances notwithstanding that some of them have been criticized for their conduct.

6. Increase of passenger rates, very difficult to effect in the past, obtains the prestige of federal approval.

7. Necessity for proceeding to the immediate solution of income problems without waiting for collateral inquiries is recognized.

8. Clear and definite standards are set up by which carriers may hereafter gage their financial condition and determine whether the showing will be regarded by the commission as requiring remedies from that body.

The banking house of Thompson, Towle & Company has made the following estimates as to the amount of direct benefit which will be derived by various roads from the decision:

	Estimated benefits from rate increase based on 1913 fiscal year freight revenue (000 omitted)	Per cent increase	Earnings on common or capital stk., year ended June 30, 1913	Increase earnings per share stock

"SEE AMERICA FIRST"—A LESSON OF THE WAR*

By James Keeley,
Editor of the Chicago Herald.

For days every paper has been filled with stories of American citizens stranded in Europe. The Herald has printed literally yards of such narratives, so there is no need for me to go into detail. What I want to do is to point the moral and the way to keep in America at least some part of the $200,000,000 that is spent yearly by those who go to foreign shores.

In the last few years the slogan "See America First" has been used by foresighted advertising men and railroads, and I think the results have been excellent. Gentlemen, this European cataclysm gives America a chance to cash in on the pioneer work of those who first proclaimed the sanity and sense of investigating the beauties and wonders of our own country. It is a fair estimate that of the 100,000 touring Americans now marooned in Europe, not a tenth have seen all the worth-while sights of their own country.

A trip to Europe in time of peace is undoubtedly enjoyable, but there are just as enjoyable trips in America. There are things in Europe well worth seeing, but there are as many things worth seeing in America. A vacation spent in America means that the tourist is close to home, that he may reach his fireside in a short time in case of necessity. Wars, it is true, do not happen every day, but they may happen, and they have always been more probable in Europe. There are other things besides wars which may make a quick return home desirable. A quick return from Europe, even in time of peace, is not always possible. Transatlantic steamer accommodations are limited—our railroad accommodations are practically unlimited.

Americans of means are not to be discouraged from seeing the world. It is a liberal education. But the foundation of such an education should be a personal acquaintance with their own country which too often is lacking.

In seeing America there is hardly any conceivable catastrophe that could produce a despatch similar to the one in the papers of yesterday, which told of two cattle trains filled with American tourists fleeing from the French capital to a seaport, with the forlorn hope that they might somehow or other get a chance to look the Goddess of Liberty in the eye.

Many a man counted himself fortunate if he had a little bit of straw to rest on, while, so the narrative runs, millionaires and their families seemed supremely happy if they could preempt a few square inches of a hard wooden bench on which to sit. Imagine, if you can, these foreign travel fiends carrying their belongings wrapped in sheets and pillow cases, and also picture to yourselves the globe trotter wearing two suits of clothes at one and the same time, not to keep him warm, but in order to have a change and incidentally, in order to save what personal property he could. You've never heard of cattle trains in the Grand Canyon country, in Yellowstone Park, in the Glacier National Park, in California, in the Rockies, in Florida, and you never will.

Haven't you advertising gentlemen a mission to drive home the fact, and isn't this the psychological time to drive the fact home that America is well worth seeing—that its beauties equal those of any spot on the face of the earth; that its natural wonders are not surpassed by those of any land on any continent? Millions and millions of dollars have been spent every year by those who felt that they were not fashionable unless they took a trip to Europe. The Europeans get us coming, going, and there. They get the greater per cent of the money for going and coming, and you know that they don't overlook an opportunity to get whatever they can while you're there.

Once upon a time there was a First ward gentleman—in politics—and he was connected with the coroner's office. He was known among his intimates as "First Search"—that is, he had the right and prerogative of making the initial examination of the clothes of unfortunates who were murdered, who committed suicide, or who met sudden death in any form. It seems to me that the average European who caters to tourists not only should be called "First Search," but "Last Search." It is of record, or, at least, there is a tradition that once in a while "First Search" overlooked something, but I know of no authenticated instance where a foreign hotelkeeper or shopkeeper committed such a faux pas.

*Extract from an address to the Chicago Advertising Association, Chicago, August 7.

AMERICAN ROADS EARN LESS ON NEW CAPITAL THAN FOREIGN ROADS

The Bureau of Railway News and Statistics has issued the following:

"Although railroads of the United States added a far smaller amount to capital per mile between 1910 and 1912 than any of the three principal railroad countries of Europe, so great was the burden of increased expenses on revenues that they totally failed to keep abreast of the foreign systems in return on the investment. This is in spite of the fact that our own railways made by far the largest increase, both actual and relative, in operated mileage.

"In the two years ended with 1912, for which comparisons for all four countries are now possible, United States railways added 3.7 per cent. to mileage on an addition of 5.2 per cent. to capital. In contrast with this showing, Germany's government roads added 6.4 per cent. to capital to make an addition of only 2.5 per cent. to mileage, while France, to expand by but 0.9 per cent. in mileage, added 4.5 per cent. to capital, and England, adding only 0.4 per cent. to mileage, expanded capital 1.5 per cent.

"The effect of this economical outlay of new capital on American roads is shown partly in the per mile comparisons. United States railways in 1912 were capitalized only 1.4 per cent. higher per mile than in 1910, while German roads were 3.9 per cent. higher and French railways were 3.4 per cent. higher. Though English roads show a smaller relative increase per mile than our own, this is because their capital per mile already is so excessively high, their 1.1 per cent. representing more than three times our own 1.4 per cent. in actual figures.

"It is in the absolute increase of capital per mile, however, that the moderation of American capitalization becomes most apparent, for while the United States in the two years was adding a paltry $878 per mile, England was adding $2,784, Germany $4,245 and France almost $4,500 per mile.

"Yet with all the advantage of moderate capitalization United States railways were so pressed between the millstones of sluggish revenue and rising expenses (spending 8.2 per cent. more to do 3.3 per cent. more business) that the ratio of net to investment was 10.8 per cent. smaller in 1912 than in 1910 (while with taxes included the loss is 12.5 per cent.). Germany, despite its excessive capital expenditure aided by gigantic increases in traffic, and rates rigidly maintained in the face of public demands for reductions, displayed a ratio of income to capital 10.3 per cent. larger in 1912 than in 1910. England's ratio fell 1.1 per cent., while that for France declined 3.7 per cent."

Abyssinian Railway.—It is expected that the Abyssinian Railway will reach the capital of Addis Abeba in February of next year. It is reported that the railway has already been completed to kilometer 312 (reckoned from Diredana) and kilometer 621 from Djibuti. But, as there is a scarcity of camels for the transport of materials from the terminus to the site of construction, the work is frequently interrupted, particularly in the mountainous district, where many bridges have to be erected and cuts made. Nevertheless, the section to the Modjo river, which is 73 kilometers from Addis Abeba, will presumably be finished next November, and as the roadbed from Modjo to Addis Abeba is now nearing completion, the first train is expected in the latter place at the beginning of February.

Building a Modern Terminal Road at Youngstown, Ohio

The Lake Erie & Eastern Is Completing a New Line 8 3-4 Miles Long Involving Very Heavy Work

The Lake Erie & Eastern, which is owned jointly by the Pittsburgh & Lake Erie and the Lake Shore & Michigan Southern is building a new line nearly 8¾ miles long from Struthers, Ohio, about 4½ miles south of Youngstown, on the main line of the P. & L. E., northwesterly through the city of Youngstown, following the Mahoning river, to a connection with the Pennsylvania lines at Girard. In order to secure the desired location for this line it was necessary to purchase considerable right of way in well developed residential and industrial sections of the city, to separate grades at all crossings of streets and satisfy all public and private claims resulting from the work, to handle a large amount of excavation and embankment under difficult circumstances, and to build three long structures crossing the Mahoning river and three railways.

Map of the Lake Erie & Eastern from Struthers, Ohio, to Girard

GENERAL

The immediate advantage which will result upon the completion of the section now under construction will be to reach a number of important industries now operating along the river and the sites of prospective industries which may be developed in this district. The largest industries on the new line are the Republic Iron & Steel Company, the Carnegie Steel Company and the Brier Hill Steel Company.

The second and more remote advantage of the line is that it can be made to form a part of a proposed direct freight connection to be controlled by the New York Central Lines between Youngstown and Cleveland. The northern section of this line, known as the Lake Erie & Pittsburgh, extending from the outskirts of Cleveland to Brady's Lake Junction, about 28 miles, has been in operation since the latter part of 1911. It was built as a joint enterprise of the Lake Shore and the Pennsylvania, although the latter has not availed itself of its privilege of operating over it. Through freight between western points and Youngstown is now handled by the New York Central system over the L. E. & P. between Cleveland and Brady's Lake Junction, thence on the Pennsylvania to Ravenna and on the B. & O. from Ravenna to Youngstown. It is the intention ultimately to connect the southern end of the L. E. & P. with the present northern terminal of the L. E. & E., which will require the construction of nearly 40 miles of road. This line may handle freight traffic only in view of the present satisfactory operating agreement with the Erie, which covers the New York Central Lines' passenger service between Youngstown and Cleveland. The new L. E. & E., as constructed at present, will serve as the terminal and transfer line of the New York Central Lines in the Youngstown district.

The new road has a maximum grade of 0.3 per cent. in both directions, which will also be the standard on the proposed line to the west. The line will ultimately have four tracks, and all masonry structures are being built to carry a four-track roadway. Provision is being made in many cases in the foundations of the steel structures, which are being built for only two tracks, to widen them to carry four tracks, as soon as this is desirable.

Exclusive of the crossing of the Mahoning river at Struthers,

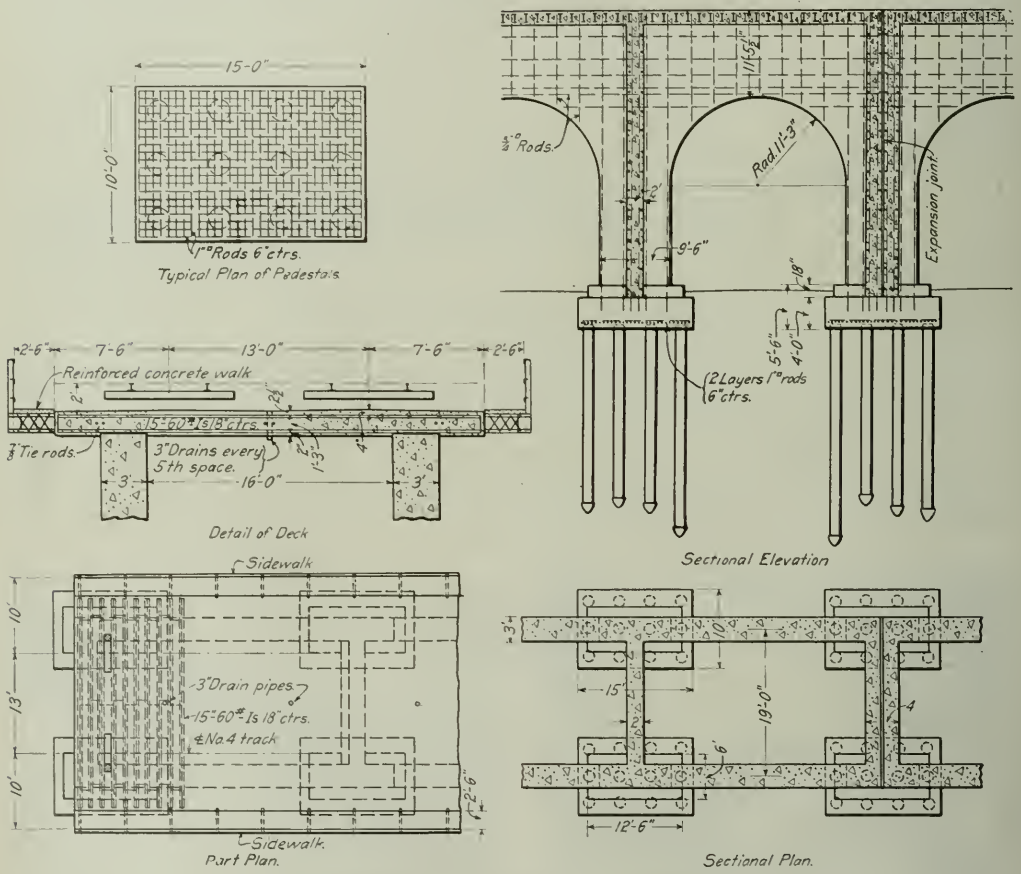
One of the Typical Concrete Arch Bridges Over Streets

The River and Heavy Truss Spans of Crossing No. 1

immediately adjacent to the main line connection, all of the important bridges on the new line are located on the north half of the work, beginning with the Cedar street concrete arch subway. Six other subways of this type and one steel girder under-crossing were required at various points along the line, and two streets and one footway are carried over the new tracks. Three large bridges, known as Crossings Nos. 1, 2 and 3, are required to span the Mahoning river and the tracks of the B. & O., the Erie and the Pennsylvania which parallel the river around two long bends. The last structure, known as Crossing No. 4, spans four tracks of the Pennsylvania and one track connecting the L. E. & E. with the Brier Hill Steel Company's yard. All bridges were designed for Coopers E-60 loadments along lines parallel to the track, preventing undue overloading on any sections of the barrel. The contractor used steel centers in placing all of these arches.

In the section between Cedar street and Crossing No. 1, two old street bridges carrying South avenue and Market street, respectively, over the river are to be remodeled slightly in order to provide clearances for the new line under the approaches on the west bank. In the case of the Market street bridge, new girders will be clamped alongside the old approach trusses and supported on new piers adjacent to the new tracks in order to allow enough of the lower members of the old trusses to be cut out to provide the necessary clearance.

Crossing No. 1, built for double track, the longest bridge on



Details of the Reinforced Concrete Trestle Used in Crossings No. 1 and No. 3

ing and the New York Central Lines' 1910 specifications for steel railroad bridges were used. The work involved the placing of about 80,000 cu. yd. of concrete masonry and between 8,000 and 9,000 tons of steel.

STREET BRIDGES AND CROSSING NO. 1

Taking up the structures in the order named above, the first is the group of seven four-track concrete arch subways, all located south of Crossing No. 1. The spans vary from 18 ft. to 85 ft. 6 in. All of the arches are heavily reinforced, and as most of the streets are crossed at a skew, the rings were placed in sections to insure the loads being transmitted to the abutthe line, has a total length of 1,926 ft., comprising 106 ft. of reinforced concrete viaduct, three through-girder spans over the main line of the Baltimore & Ohio, 317 ft. of concrete viaduct, a three-span, deck girder crossing of a highway, eight deck girder spans crossing the river, and two through-truss spans, each 192 ft. long, over the tracks of the B. & O., the Erie and the Pennsylvania. The material near the surface north of the river consisted of cinder fill, mud, sand and gravel, requiring the use of piles under practically all foundations south of the river piers and on one pier north of the river. The river piers are founded on shale rock.

Simplex concrete piles, from 19 ft. to 25 ft. in length, were

used in these footings, this type of pile being chosen on account of the larger bearing surface provided by the enlarged point as compared with designs in which the entire shaft is tapered. Since the conditions were such that the piles had to be driven through soft material to gravel, the whole area of the Simplex pile is made available for carrying load, while a tapering pile would have little frictional resistance in the soft overlying strata and would have to depend for its bearing power largely on the area of its point, which is much less than the Simplex

A Portion of the Concrete Trestle in Crossing No. 1. Concrete Deck Slab Has Not Yet Been Placed

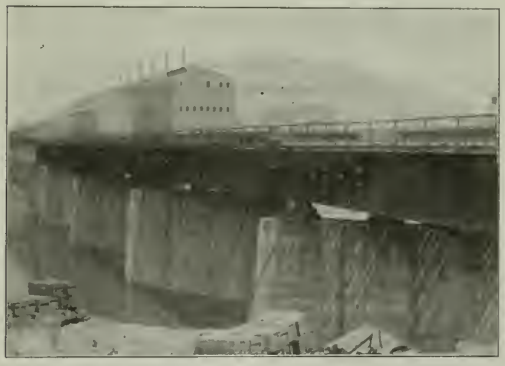
point. The footing designs contemplated the use of 16-in. Simplex piles, capable of sustaining safely a load of 40 tons each. It was specified for this work that all casings must be driven before any piles were cast. The difficulty of handling the work by this method led the contractor to offer to substitute an inserted octagonal pre-molded pile in the 16-in. casings to prevent damage from driving of other casings, the surrounding space between the inserted pile and the cases being filled with grout. This proposition was accepted, as it resulted in piles

Crossing No. 2

capable of carrying 50 tons safely at no greater cost per ton carried. A test pile showed its ability to carry considerably more than the assumed load without damage.

All of the steel superstructure is of heavy rigid construction. The floor beams in the through-girder spans are 30-in., 200-lb. Bethlehem I-beams, spaced 4 ft. center to center, with a longitudinal center distributing girder, 12-in., 55-lb., I-beam stringers under the rails and six 12-in., 21½-lb. I-beam stiffeners in addition to the stringers between each pair of floor beams. Lateral bracing is provided by double diagonals under the floor beams, which are riveted to gusset plates under the main girders and the center distributing girder, and are attached by clips to the under side of one of the floor beams near the center of the length of each lateral. The floor on the deck girder spans consists of transverse I-beams encased in concrete, the same as on the concrete viaduct, which will be explained in more detail in that connection.

The concrete viaduct is carried on bents spaced 32 ft. center to center. A typical bent consists of two reinforced concrete columns 9 ft. 6 in. by 3 ft., connected by a 2-ft. concrete web wall, resting on two pedestals 10 ft. by 15 ft. in area, covering the heads of 12 concrete piles and reinforced over the heads of the piles by two layers of one-inch rods spaced 6 in. center to center. The distance between the inner faces of the columns is 16 ft. Longitudinal girders of reinforced concrete, 3 ft. thick and varying in depth to form a semi-circular arch of 11 ft. 3 in. radius, connect these columns. All reinforcement above the foundation consists of ¾-in. square rods. Across these walls are laid 15-in. 60-lb. I-beams, spaced 18 in. center to center, connected by ⅞-in. tie rods to distribute the load and increase the stiffness. These beams are encased in concrete with a minimum depth of 1 ft. 7½ in. The thickness of concrete over the I-beams is increased 1½ in. along the center line of each track for drainage, a 3-in. drain pipe being provided midway between tracks in every fifth space between I-beams. The design of the deck provides for about 6½ in. of ballast under the tie.



A Portion of Crossing No. 3

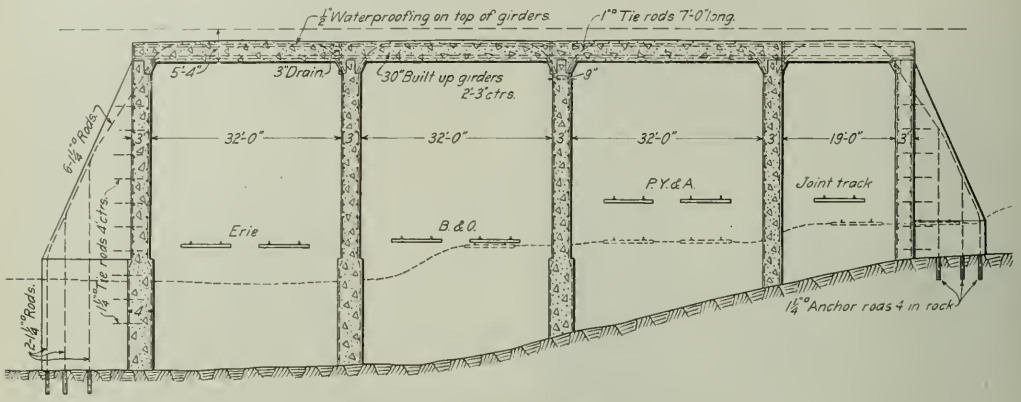
A light latticed girder is attached to the end of every fifth I-beam to support a reinforced concrete walk along each side of the structure. This walk is protected by a hand-rail built up of vertical angle posts with three angle rails. Expansion joints filled with heavy roofing felt are provided in the viaduct over every third bent. In order to protect the expansion joint from the ballast, steel cover plates are used, resting on the upper surface of the concrete. As it is impossible to connect the two I-beams on opposite sides of an expansion joint with the usual tie rods, two channels placed back to back are substituted for the I-beams at these points in order to strengthen and stiffen the floor. Asphalt waterproofing is used on the deck.

OTHER BRIDGES

The under-crossing at Manning avenue, just north of Crossing No. 1, is a single span through-plate girder structure, with a solid deck of transverse I-beams encased in concrete. The overhead foot bridge and the two overhead street bridges between Crossing No. 1 and No. 2 are of steel girder construction, designed to span four tracks. The street bridges have solid concrete decks carrying the paving, and the street approaches are on a grade of 6 to 7 per cent.

Crossing No. 2 is built for double track and consists of three

spans, one a 165-ft. double-track, through-riveted truss, over the B. & O., the Erie and the Pennsylvania, and two 175-ft. trusses over the river. The south abutment has its foundation in gravel, the two piers are carried to shale rock, and the north abutment footing is in slag. A maximum bearing pressure of four tons per sq. ft. was used in the design of these footings. The heavy loading used in the design of the trusses requires heavy sections for all members, a rigid structure being secured



Cross-section of the Skew Structure at the North End of Crossing No. 3

by inserting sub-diagonals and verticals to reduce the panel length. Two heavy fender girders are provided along both trusses to take the shock of a derailed car or locomotive and to reduce the damage to the truss members. Blast plates are attached under the lower chords over the center line of each of the tracks on the lower level and under all transverse members and portal bracing over the tracks across the bridge. The bearings are raised higher than usual and ample room is provided on all sides of the grillages and roller nests for inspection.

Crossing No. 3 has a total length of about 1,635 ft., consisting of six 90-ft. deck girder spans over the river, 195 ft. of concrete viaduct, one 80-ft. deck girder span over a skewed

Crossing No. 4 With a Portion of the Deck Laid

street, 67 ft. of concrete viaduct and 758 ft. of a special type of reinforced concrete structure, designed to carry four tracks over the seven tracks of the Erie, the B. & O. and the Pennsylvania. This portion of the structure is one of the most interesting features of the entire work.

All foundations under this bridge are carried to rock, which is from 15 ft. to 20 ft. below the surface. The sections of concrete viaduct are of practically the same design as those described above. The special design at the north end was necessitated by the fact that the new line crosses the old tracks at an angle little more than 14 deg. The structure consists of thin reinforced concrete walls between each pair of tracks on the lower level supporting a solid deck of transverse I-beams encased in concrete. On account of the flat angle of the crossing and the provision for a four-track roadway over the structure, the walls are very long, the combined lengths totaling 2,270 ft. The entire wall, which is 3 ft. thick, is carried down to rock where it is near the surface, and in places where this would have required an excessive amount of masonry, pedestals 4 ft. by 12 ft. were used to support the wall at intervals varying from 21 ft. 9 in. to 27 ft. center to center. Expansion joints are spaced from 50 to 65 ft. apart. The exterior walls on both sides are buttressed in order to give lateral stability to the deck, these buttresses being placed about 65 ft. center to center. These buttresses are 3 ft. 6 in. thick and extend back a distance of 18 ft. from the inner face of the wall. The deck consists of 30-in. built-up girders, laid at right angles to the walls and spaced 2 ft. 3 in. center to center. These beams are con-

A Retaining Wall Built of Large Pieces of Open Hearth Slag Called "Ciscos"

tinuous, requiring reinforcement at the points of contra-flexure. A ½-in. layer of waterproofing was placed over the tops of the beams and a minimum thickness of 4 in. of concrete over the waterproofing. The surface of the concrete was crowned to 6 in. over the center line of each bay for drainage. The concrete encasing the girders was tied in to the concrete walls by thick key walls at the top of each supporting wall and by 7-ft. tie rods

extending up from the walls into the deck slabs. Provision is made for 10 in. of ballast under the ties.

Crossing No. 4 carries the four new tracks over four tracks of the Pennsylvania, and one L. E. & E. connecting track with the Brier Hill Steel Company, the structure being of the same type as the north end of Crossing No. 3, just described.

An interesting experiment is being tried in the painting of the steel superstructures of these bridges, which, it is hoped, will give better satisfaction than the usual practice. In order to eliminate the rolling scale, which is so frequently the cause of defects which develop after the bridge is painted, starting serious corrosion, no shop coat of paint was applied, and the fabricated material was allowed to stand without paint until after its erection, the total time since rolling amounting to nearly two years in some cases. The surface rusting which resulted has loosened the rolling scale so that it can now be scratched off very readily. The bridges after being completely erected are now being cleaned with chisels and wire brushes and dusted with large paint brushes before applying two coats of paint. It is the expectation to allow them to stand two years or more after this painting and then spot paint any defects that have developed before applying the third coat. In order to secure the best co-operation of paint manufacturers, the large structures have been divided into ten sections, each of which is assigned to a company which has previously demonstrated that its product and the method of application which it recommends

General View of the Side Hill Excavation Above the B. & O. Tracks

can be relied upon to give reasonably good satisfaction. The wishes of each manufacturer in the method of applying his paint are followed as closely as possible in order to give a good comparison of the merits of the various paints, in addition to testing the advantage of painting on the metal instead of on the scale.

GRADING

The excavation quantities on the new line total about 900,000 cu. yd., all of which is used in embankment, and, in addition to this, about 250,000 cu. yd. of slag and refuse is being disposed of in the fills. In common with other roads serving the steel mills, the P. & L. E. has large amounts of mill refuse to handle and the excess of embankment over excavation was in reality an advantage. In some places the excavation was used to make a narrow fill in order to lay a construction track from which slag could be dumped. The width of fill varies considerably, although it is never less than the standard two-track width. In many places it is wide enough for four tracks, and in some cases has been extended over all available land in order to dispose of refuse material. The side hill cut, north of the South avenue bridge, required very careful handling in order to prevent the blocking of traffic on the B. & O., which occupies a lower bench between the new line and the river. A short section of reinforced concrete retaining wall was built at the end of this cut to retain the new fill above the B. & O.

Opposite the works of the Carnegie Steel Company, between Crossings No. 2 and No. 3, a heavy fill was made along the river with a width sufficient to carry six tracks. A retaining wall was built along the river bank of large regular pieces of refuse from the mills known as "ciscos." These pieces are formed of refuse from open hearth furnaces, which is allowed to cool in molds to make it easy to handle. The wall was built up with a 1:4 batter by a locomotive crane, and hot slag was then dumped behind the wall, filling the crevices between the ciscos and solidifying it into a hard mass. The hot slag fill was carried up to 4 ft. below subgrade, the surface layer being made with granulated slag to serve as a cushion under the track.

The general contract for all work south of Cedar street was let to H. T. & R. L. Culbertson, Cleveland, Ohio. McKelvey-Hine, Pittsburgh, Pa., was the contractor on the section extending from Cedar street to the south end of Crossing No. 1, and also for Crossing No. 4. The Duquesne Contracting Company, Pittsburgh, had the contract for the section between the south end of Crossing No. 1 and the north end of Crossing No. 3. The McClintic-Marshall Construction Company, Pittsburgh, fabricated and erected the superstructures of all steel bridges. Albert Lucius, New York, is the designing and consulting bridge engineer. This work is being carried out under the direction of J. A. Atwood, chief engineer of the Pittsburgh & Lake Erie; A. R. Raymer, assistant chief engineer, and F. J. Nannah, assistant engineer in direct charge of the work. The work was started in May, 1912, and at times the progress has necessarily been slow on account of the delays incident to building through a well-developed section of the city. It is expected, however, that the line will be ready for service this fall.

ADJUSTING PERSONAL INJURY CLAIMS*

By H. B. Hull
Chief Claim Agent, Illinois Central.

I know but one rule that may be safely followed in the adjustment of personal injury claims, that negotiations should be conducted upon the high plane of openness and fairness. In adjusting a claim, it is of paramount importance that every word and act of the claim agent's should be such as to withstand at any time the closest scrutiny under the light of day. A railroad company, with its property constantly exposed and subject to attack, must for its protection and defense rely upon its own reputation for fair dealing with its employees, patrons and the public. The deportment of its claim agents, who are constantly in touch with the public, has much to do with placing the reputation of a railway company. If they go about their work inspired by high and honorable resolutions, their efforts will not only be rewarded as they go along, but will assist most materially in establishing for their company a good name, which is the most valuable asset a railway company can have and which, when once enthroned, is as immutable as virtue and truth.

Assume, for instance, that you have a seriously injured person at some hamlet upon your line, far removed from the influences which are always antagonistic to the company in the handling of its claims, and that he is unadvised of his rights and imbued with an abiding faith in the fairness of the company and willing to trust his case in the hands of the claim agent, and that you have it in your power to go to that man and conclude him in an inadequate settlement, and thus save your company a substantial sum of money in that particular case. I affirm that it would not only be unconscionable to overreach that claimant, but that it would also be unprofitable to your company. The dust of the community would scarcely be off your feet till the doctor, the banker and the prominent citizen would get together on the street corner and discuss the result of your visit and the entire community would soon be condemning your railroad, and properly so. Almost in the twinkling of an eye you had encompassed enough to cause your company to be hated and despised in the community where the settlement was made, and to render it certain no more settlements could be made there. A corporation

*Address at the twenty-fifth annual convention of the National Association of Railway Claim Agents, St. Paul, Minn., May 21, 1914.

can only act through its agents, and unless their acts are scrupulously correct it deserves to be condemned.

Contrast the situation which I have attempted to describe with what might have happened had you gone to the injured man in a kindly way and explained that you were representing the railroad and that if he were uncertain as to his rights, that he had best call in two or three of his friends upon whom he would ordinarily rely for advice in a business transaction, and ask them to assist him in arriving at a conclusion as to what would be a proper sum for him to accept in compromise of his claim. In my humble opinion, the railroad gains much in closing a compromise in this manner. It not only satisfies the injured man, but it satisfies his friends and acquaintances, the doctor, the banker and the prominent citizen, who immediately become a potent influence in a community against personal injury litigation.

The claim agent who makes a settlement for the smallest sum is not always the best claim agent. He invariably has many "knockers" on his territory and lots of litigation against his company, whereas the claim agent who exercises good judgment in determining the proper amount to pay has everybody helping him with his cases, and besides, he smooths the way for a pleasant relationship between his company and its neighbors in other and perhaps more important matters. I believe there is as much danger of paying too little as there is in paying too much in cases where the injured person is friendly and inclined to permit the claim agent to name the amount. The art of the business is in being able to survey a situation and decide upon a fair and proper sum to pay. Settlement should be upon a basis so fair as to stand four square to all the winds that blow. But the friendly cases are in the minority, and growing fewer all the time.

In handling the other class of cases, where the claimant is unreasonable and has been listening to the siren song of the damage suit lawyer and his agent, who, before they are employed, are always against a compromise at any figure, I believe the best method is to locate the influences that would naturally control the injured person and work through that source. There is a key to every situation. The difficulty is in finding it.

It is almost unbelievable to what extent the damage suit lawyer and his agents are able to poison the mind of the injured person against the claim agent and the company. No matter how good intentioned you may be toward the injured person, no matter if you be willing to pay more than could be recovered net at the end of a lawsuit after months, if not years, of waiting, it is an uphill job at best to dislodge in his mind the glittering hope of drawing the prize held out to him as an inducement to sue, but it is well to keep on trying and not give up. The claim agent who is easily discouraged and quails in the presence of difficulty is not made of the right kind of stuff to do successful claim work in this day and age. If he perseveres he will succeed oftener than he fails. The claim agent must be able to tell the injured person of settlements he has made that were fair and just and satisfactory to all parties concerned. He must also be able to tell something about cases the damage lawyers will not talk about, the litigated cases that terminated disastrously to injured persons.

A railroad corporation should pay an injured person, in a liability case, about what he could recover net to himself at the end of a lawsuit, figured on the best information obtainable, and only attempt to save attorney's fees and court costs in adjusting claims of serious injury. Twenty-five per cent. of the total paid out by the average railroad in a year and charged to the personal injury account is waste; that is, it goes to the payment of court costs, witness fees and into the pockets of the damage suit lawyer and his organization. If we could save that for the railroads, it would be considerable and would fully satisfy them, and besides, what a blessing it would be to the injured people and their families, if we could only make them see it. Our mission, as I view it, is to starve out the damage suit lawyer and put him out of business. His sinister shadow falls across the pathway of nearly every unfortunate with a claim against a corporation, and he is doing as much in this country today to array employee against employer and stimulate unrest and discontent as any other factor, and why? Simply that he may use the cripple as a vehicle to enrich himself, and with what result? In the cases he is fortunate enough to win, he takes out of the sums recovered his dividends and the expenses ranging from 33⅓ to 50 per cent. He then has no further interest in the cripples and they are cast out into the world with perhaps a few thousand dollars at best and no capacity for taking care of it, and, as a rule, they invest it in some little business and the inevitable happens. They are the familiar fellows you see on the street corners in all of the large cities of the land.

The policy of railroads is to take care of maimed employees in positions which they can fill, wherever it is possible to do so, and this is done entirely separate and apart from any settlement that is made. I would estimate that 75 per cent. of maimed employees who do not sue are provided with positions which, in most instances, they hold as long as they live, clinging to their employers, like the ivy to the oak, for succor and support, and these men usually get about as much net out of their claims as if they had sued, and oftentimes more, but the damage suit lawyer does not get his, and there is the rub.

I am an optimist and can see signs of the dawn of a brighter day for the railroads and their injured employees. There never was a time in our history when railroad managements were so thoroughly alive to the situation as they are today. They are accustoming themselves to think of the distress of human life and how to relieve it. Evidence of this is seen in the pensioning of old employees, in the building and equipping of hospitals, in the liberal sums they are willing to pay in compromise of bona fide personal injury cases, in the sincere efforts that are made to provide the maimed with employment where left free to work the matter out, and in many other ways. They are approaching this matter upon a basis of humanity and sympathy, seeking the good and comfort of the unfortunates for whom they feel a sense of responsibility, a deep-rooted interest born of sympathy. Under these conditions we should not have much difficulty in adjusting our personal injury claims, especially with employees. In our fight to protect injured employees and prevent them from being literally torn away from their employers, their real friends, by self-serving damage suit lawyers and their agents, already drunk with success, and greedy for more coin of the realm, we should stand upon the broad foundation of justice and righteousness between man and man and let it be known far and wide and back it up by sincerity of purpose in our every act. I sympathize, of course, with the poor fellows who are lured away through the subtle methods of the trickster, but after all, good comes out of it in that others are able to profit by the sad experience of unfortunates who are willing to turn against a friend and faithful employer anxious to do a good part by them.

We have still another class of personal injury claims to deal with, the most difficult of all to handle. I refer to the fraudulent claims. In nearly all of these cases the claimants have some bodily infirmity which they try to capitalize by palming it off on the railroad as having resulted from an accident. They invariably select a time and place to pull off the "accident" under circumstances which would render the railroad liable in damages if an injury occurred. They have little difficulty in finding doctors who are willing to be fooled for a stipulated contingent fee. Frequently the desirability of adjusting claims of this character is suggested in order to reduce an uncertainty to a certainty and save the costs of litigation, but the difficulty is, where one of these fraudulent claims is adjusted, the effect is to stimulate more claims, and instead of making progress through such a policy, we actually slip the other way. We make two blades of grass grow where but one grew before, but it is the wrong kind of grass. If we do not settle the game is played to the limit, there is a trial, and sometimes the railroad is mulcted in damages, but oftener the fraud is exposed before the goal is reached. Whatever the result, I am convinced it is wise to

exploit this class of cases before the public as much as possible. If we compromise them as a mere matter of temporary expediency, the railroad becomes a party to the fraud. If a robbery is to be perpetrated, let someone else be responsible for it.

The fact that railroads will at times capitulate and buy their peace by adjusting fraudulent claims, I verily believe, is responsible for as many "railway spines" and "nervous wrecks" as are collisions and derailments. A street railway company in a certain southern city adopted a policy of settling all claims and keeping out of court. Fraudulent claims increased at an alarming rate. The policy was changed and all frivolous and fraudulent claims were fought out to the end. There were so many suits that nearly all the qualified jurors sat upon some of these cases and became educated to look for the fraud and injustice of the litigation and the result was that the juries put an end to the system. They almost carried it to the other extreme and it became difficult for a man with a bona fide case to get justice. All cases were looked upon with suspicion and the honest claimant suffered from the odium cast upon him by the crook.

If the railroads of this country, acting in concert, should adopt a policy of fighting all fraudulent, suspicious and frivolous cases, they could in time educate the people just as did the street railway company in the city referred to. It would be the same proposition except on a larger scale. Our difficulty now is that we too often submit to wrong and injustice in order to gain a temporary advantage. We lose the benefit and effect that would flow from exploiting all the cases that lack merit. We should take up the time of the court and its machinery, and of juries, in trying this class of cases. Too often the suggestion is made to the claim department: "We can settle that case for less than it will cost to try it. Why not?" The fact that a plaintiff is willing to do that is a confession of lack of merit in the claim. If the claim department submits and the claim is paid, the curtain is drawn and the public never knows anything about the transaction. We should make a painstaking effort to separate the wheat from the chaff. If railroads did not pay out so much money to those not entitled to it, they would have more to pay to those that are entitled to it, and if the courts and juries had an opportunity to know the situation as it is, they would help us make the division, but so long as railroads do not take advantage of the opportunity which is theirs, they will never know. I feel that meritorious claims should be adjusted at reasonable, even liberal figures, but that all frivolous, fraudulent and suspicious cases should be resisted and advertised to the fullest extent. By persistently carrying out such a policy, the public would eventually understand it was unnecessary to sue a railroad in order to get justice.

In many instances there has been a disposition on the part of interested persons to give out unreliable information relative to the amounts recovered in personal injury lawsuits and injured persons frequently confront claim agents with this false information. In one case which Mr. Failing handled, a death case of non-liability, in which he offered to pay a substantial sum, suit was filed and there was a verdict for $20,000. This was written up in the newspapers and advertised quite extensively. Later on the case was settled with the attorneys representing the plaintiff for one-half the amount he had originally offered direct to the beneficiary. Of course, there was no publication of the closing transaction, and claimants confronted him so often with the newspaper story of the verdict rendered by the jury that he found it necessary to photograph the newspaper clipping and the release for the amount that was actually paid, which was effective in convincing claimants of what really did happen to the case. We have had a few cases on our line where injured persons recovered damages at the end of the law and later accepted employment as runners for damage suit lawyers. One of the arguments they used in soliciting cases was what they had been able to accomplish through litigation of their own claims. We discovered that they were distorting the facts. One man in particular, who had recovered $5,200 in St. Paul for the loss of a leg, was reporting it around to injured employees that he secured $8,000. We found it necessary to obtain certified copies of the judgment of $5,200 which was affirmed by the Supreme Court and distribute them in the community where this man had given out the false information. We have pursued the same course in a number of other cases.

It is true that the publication of large verdicts at initial trials creates a wrong impression in the public mind, and especially upon the minds of prospective claimants. Also, men who get upon juries read these reports and are doubtless influenced by them to some extent in arriving at their verdicts, but I do not know of any way this situation can be remedied, except where these reports are mentioned by claimants in the course of negotiations for settlement, and in those instances Mr. Failing's scheme of photographing the release and the newspaper report, I think, is good, as well as the other plan of securing certified copies of judgments for distribution.

"Keeping injured persons in line for settlement" is not an easy task. Here is where close co-operation between the claims agent and other departments of the service fits in best. On the railroad which I have the honor to represent (and I think the same is true of all other lines) the practice is to take just as good care of an injured person as it is possible to do—furnish the best of surgical treatment, nursing and hospital service, and when he is sufficiently recovered to be able to talk business, and inclined to do so, to go to him and have a heart to heart talk about his case and request him to hold himself free to deal direct with the company when he is ready to consider the matter of adjusting his claim, explaining, also, that in case of his failure to reach an agreement he would be left upon just as high ground to pursue another course, should he desire to do so, as he was upon in the beginning. It does not require much intelligence for one to understand that a compromise is preferable to a lawsuit and our reasonable request, freighted with so much importance for the weal or woe of the injured person, is usually granted cheerfully by claimants of ordinary intelligence, and always by those of higher mentality. The weak-minded, those who are not able to think for themselves, are the ones most likely to fall a willing prey into the outstretched arms of the damage suit shark, for they can be handled by him like clay in the potter's hands. In many of these cases suit is filed without affording the company an opportunity for a hearing. Nobody ever heard of a business man, or a man of affairs, suing an individual, or a corporation, without first rendering a bill and making at least a reasonable effort to collect it; nobody ever heard of a lawyer sending an agent to a man of brains for the purpose of trying to induce him to file a suit in advance of exhausting every effort to effect a friendly settlement. The business of the damage suit scavenger thrives among the weak and drooping, and how to hold that unfortunate class in line for settlement is, indeed, a problem.

A STATE RAILWAY OFFICER ON GOVERNMENT OWNERSHIP

President Ripley of the Santa Fe recently contributed to the Saturday Evening Post an article on government ownership of railways, in reply to one by former Governor Stubbs of Kansas, which appeared in an earlier issue of the same paper. As a result, Mr. Ripley has received numerous letters discussing government ownership from people all over the world. One of the most interesting of these is from an Englishman who has had actual experience as an officer of a state railway. The following is his letter, excepting for some slight modifications which have been made to conceal the writer's identity and thereby save him from any embarrassment that might possibly result from his frank comments:

"For the past seven years I have held the post of assistant to the general manager of a small colonial railway, owned and operated by the government, and have also been employed in the

United States for three years; in addition to this American methods were the model far more than European ones in the operation of the line. Having always followed railway affairs in the principal countries with great interest it appears that the bait which attracts the public in all lands to advocate government ownership is the hope that the railway service will be run at a loss to the government, or, in other words, so that those using the railway may do so at the expense of those who do not.

"The public were continually making the following demands:

"(1) That *all* rates, both freight and passenger, should be reduced to the figure considered reasonable by themselves.

"(2) That all services should be much improved in every way, not only as to class of accommodation required, but also to the extent of removing necessary regulations, such as demurrage, storage charges on unconsigned or uncollected goods, insurance charges for valuable goods and most other necessary regulations for the protection of the interests of the concern.

"(3) That all rates should be on the ton-mile basis for all articles when this would be favorable to a particular district when compared with the existing rates to some other district, but vice versa when more advantageous; this quite irrespective of the physical characteristics of two sections of the line, etc.

"(4) Perpetual agitation for branch lines into unremunerative districts, very largely for the reason that some other parish had a branch line—the line of argument advanced as regards navy dockyards in the United States.

"These same arguments are further used by the politicians for their own purposes to which they add the cry that all railway employees are underpaid.

"Add to this the opinion held by most government employees that the government's dollar bill is only worth about 80 cents in equivalent work, and that they are of inalienable right entitled to many concessions which they would not expect with a first class company, and it is evident that that much abused ideal 'efficiency' becomes unattainable under such conditions.

"I quite admit that the concern of which I have had experience is microscopic in magnitude compared with any large company, but the point of view of mankind as to desiring something at the other fellow's expense is universal.

"Aside from the impossibility of comparing railway operations in one country with those in another except on very general lines it has always seemed to me that no comparisons of rates could be made unless the differences in the value of money in the corresponding countries was also taken into account. Taking passenger fares, for example, the following rough tabulation will illustrate the point:

Country.	Av. rate per mile. Cents	Av. laborer's wage per day	Miles possible to travel for one day's wage. Miles
United States	2	$1.50	75
England	2 (3rd cl.)	.75	37.5
Germany	1 (4th cl.)	.50	50
British India	0.5 (3rd cl.)	.08	16

"The usual statement by 'popular' writers and many others is that the rate in England and the United States is the same, whereas traveling for a laborer is twice as cheap in the United States as in England. I do not advance these figures as exact, but only to illustrate the necessity of a common unit of comparison."

New Docks for Melbourne.—The Melbourne Harbor Trust has approved a scheme for the construction of four docks on the Yarra costing nearly $30,000,000.

The Hohenzollern Canal of Germany.—On June 17, the German Emperor opened for service the Hohenzollern Canal, joining the rivers Oder and Spree and bringing Berlin into water communication with Stettin on the Baltic sea 150 miles away. The completion of this canal, the history of which dates back to 1669, marks an epoch in the development of German inland waterways that radiate in every direction and solve the problem of chief transportation in Germany.

AMERICAN SIGNAL PRACTICE COMPARED WITH BRITISH*

While the Pennsylvania Railroad generally uses white for clear, green for caution, and red for stop, it has on some small parts of its line followed the practice in vogue on a majority of the mileage in the states and Canada, viz., green for clear, yellow for caution, red for stop. Our use of white for clear is illogical and almost indefensible; your use of red for caution in your distant signals is equally pernicious; and yet we both are in a quandary for a remedy. Our own management feels that the yellow is not sufficiently distinctive, especially in the pall of smoke hanging over our Pittsburgh and other steel centers; while your fog conditions are certainly as bad and probably worse. Our glass makers are working to develop a better yellow, and some of us have worked unsuccessfully on a combination of lights. Your use of red in the fish-tail signal has one advantage—with home and distant signals on one mast you have two reds for stop; we have red over green, or red over yellow, as the case may be, and you will readily see the complications involved, but which are eliminated by the use of the three position signal.

The promoters of the flashlight are making great claims for it, but it has not met with much favor. It has been suggested that we might use red for stop, green for caution, and a flashing white for proceed. This is a possible solution.

It may be possible to develop a position signal for the high running signals, formed of white lights only and available for day and night use. This is another possible solution worth looking into. But, meanwhile, pending the development of these two propositions, it seems to me that, with all its defects, yellow offers the only remedy; and the fact that so many roads are using it with good results goes far to confirm this view.

We are about to electrify our four-track line for local travel in the vicinity of Philadelphia. We are to use an overhead trolley and are now developing a light signal for day as well as night use; it takes about 15 watts per lamp, and is so powerful that it must be reduced at night. If we use it, it will probably be arranged so the lights can be turned down, in sections, from each interlocking cabin. In case of fog at night, they can be turned up to the same intensity as in daylight. A recent demonstration in the fog, in daylight, showed lights visible 2,500 ft. away, while the signal blade could be only dimly discerned at 1,500 ft. This, therefore, has possibilities; but it does not solve the color problem.

We are hearing much about audible signals and the wonderful developments of them in England. We may come to them in time, but, as in our automatic system, a distance signal becomes a home as soon as a train passes it, and continues as such until the train passes out of the block, the problem is complicated. Further, as our tracks are not policed as yours are, it is necessary for our drivers to watch the track constantly, and I doubt the advisability of substituting an audible for a visible signal with our conditions.

In busy places we use the track circuit; approach locking, electric switch locking and route locking, and go much further than you in safeguarding the signalman from making mistakes. A logical sequel is the automatic stop or train control system. As one of our prominent signal engineers remarked, "We try to make our signaling fool-proof; the English eliminate the fool." From recent occurrences it would appear that our attempts are, in some cases, futile, and that your elimination is, perhaps, incomplete.

Many of our signal engineers came from England. Much of our original apparatus was furnished from the same source. The result is a signal system combining English conservatism with American radicalism, which is standing well the test of time. The combination is a strong one.

*From a paper by A. H. Rudd, read in May, 1914, before the Institute of Railway Signal Engineers (England).

Pennsylvania Railroad X-25 Steel Box Car

Wood Is Used Only for the Floor and Lining; the 3-32 in. Roof Sheets Are Spot Welded to the Carlines

Following the lines of eventually having all of its freight cars of the all-steel type, a car, the framing of which can be used practically without change for either box, stock or refrigerator cars, was designed in the mechanical engineer's office of the Pennsylvania Railroad in 1912 and a large number have since been built. The most recent design of box car, which is designated as class X-25, is constructed entirely of steel with the exception of a wooden floor and ⅞ in. wooden lining. This car, when mounted on arch bar trucks with 5½ in. by 10 in. journals, weighs 49,100 lb.

The underframe is of the type in which the weight of the superstructure and lading is transferred to the center sills by means of two crossbearers or cantilevers and the end sills. The center girder has a minimum section area between the rear fol-

End View of the Pennsylvania Steel Box Car

lower stops of 34 sq. in. and is built up of two ⅜ in. fish belly type pressed U or channel shaped sections, 20 in. deep between the crossbearers and with 4 in. flanges top and bottom, the channels being spaced 12⅞ in. back to back and tapering to 11 in. at a point 22 11/16 in. back of the center plate. There is a ⅜ in. by 26 in. top cover plate riveted the full length of the center sills, and a 4 in. by 4 in. by 9/16 in. angle riveted to the bottom of each sill on the inside and extending between the back draft lugs, which are incorporated in the center plate reinforcing casting.

The center construction is also reinforced at each end by a cast steel striking plate and front draft lugs combined, and there are also a steel casting above the center plate, a cast steel spreader at each point of connection between the crossbearers and the center sills, and pressed spreaders between all intermediate diaphragms. The crossbearers are composed of two dished diaphragms, ⅜ in. thick and having 3½ in. flanges. These are set 5 in. apart and have 12 in. by ⅜ in. top and bottom cover plates extending across the center sills and riveted to the crossbearer flanges. The crossbearers are riveted to the center sill and the bottom member of the side truss.

The body bolster is composed of a diaphragm ⅜ in. thick, 7

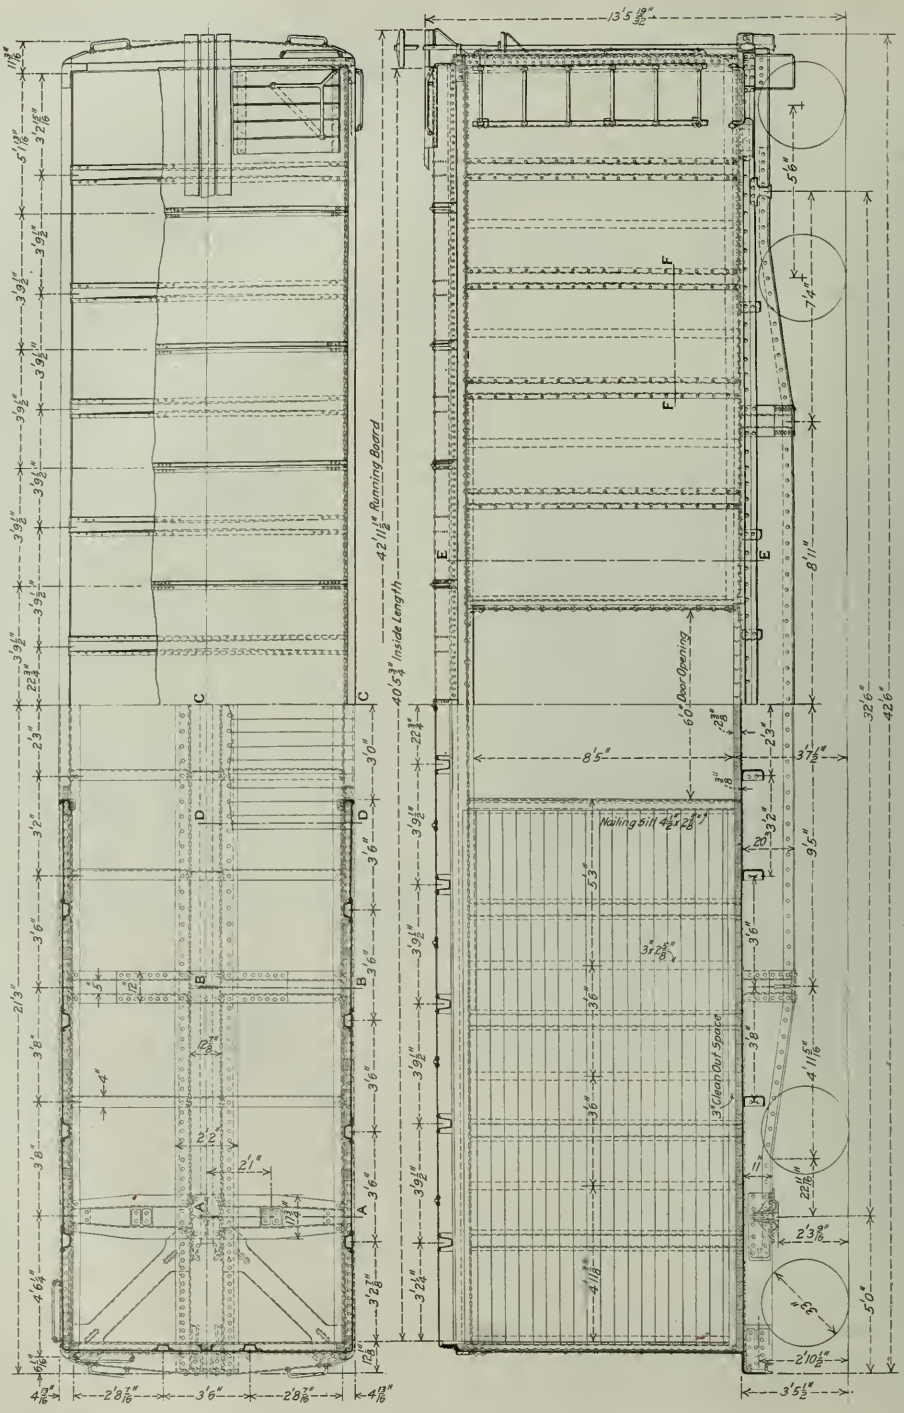
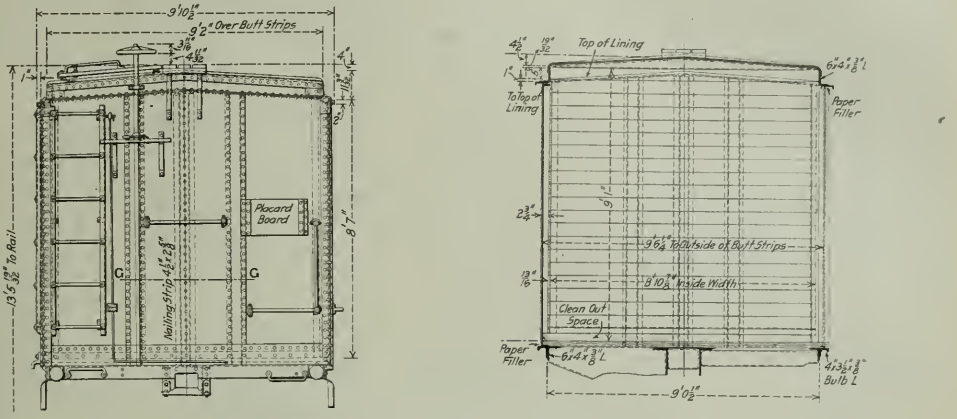
jacking casting. The drop forged center plate is secured to the flanges of the center sills, as well as the center plate reinforcing casting, which extends back towards the center of the car 9 in.



General Arrangement of the Pennsylvania Steel Box Car

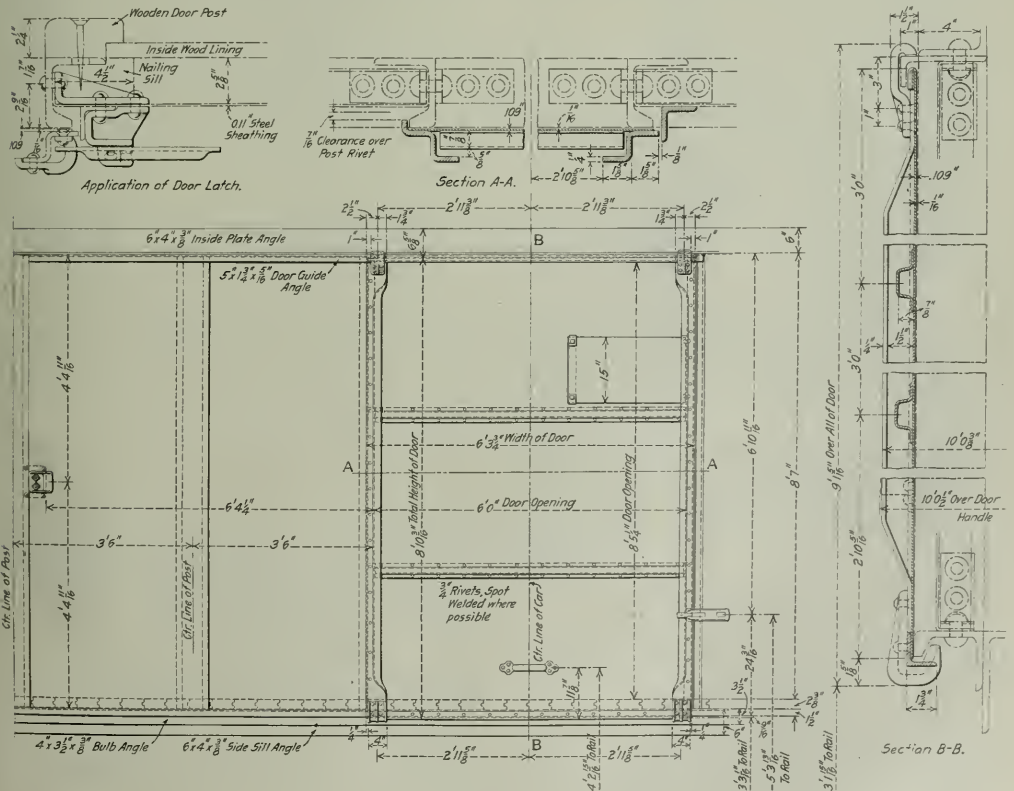
from the center line of the center plate, and reinforces the center sills.

There are six intermediate diaphragms on either side of the car, four of which are located between the crossbearers and one midway between the crossbearer and body bolster at either end of the car. They are 6¾ in. deep and ⅜ in. thick and do not carry any of the load, as their top flanges are ¾ in. below the bottom of the floor, but simply act as stiffeners for the bottom member of the side truss, and as supports for the brake rigging.



End Elevation and Cross Sections of Pennsylvania Box Car

The end sill consists of a Z-shaped plate ⅜ in. in thickness, which extends the entire width of the car, binding the side and end construction together. It is 5 in. below the top of the center

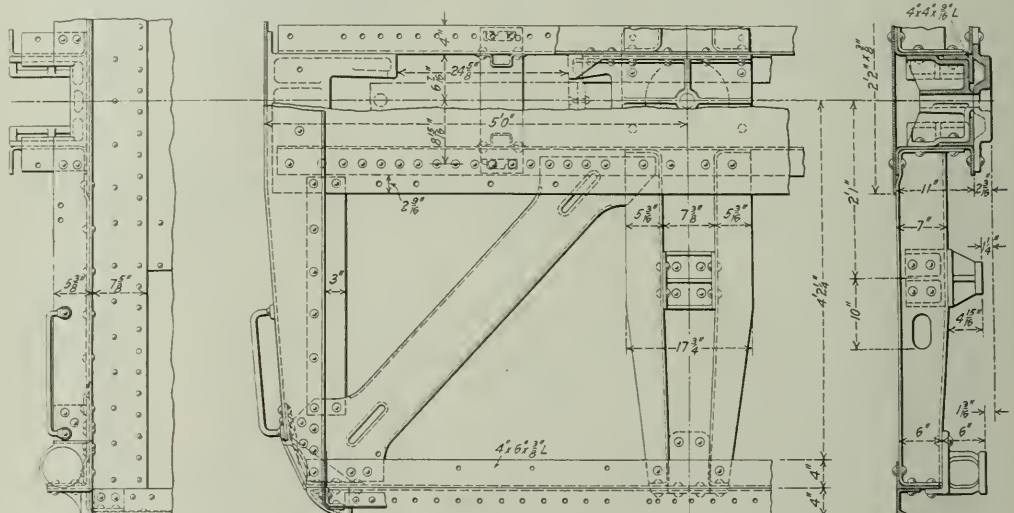


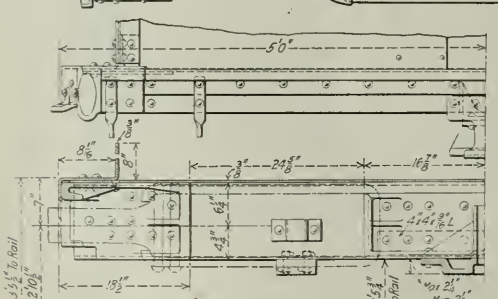
Side Door of the Pennsylvania Steel Box Car

sills and is flanged inward for a distance of 8 7/16 in. at the center, narrowing somewhat toward either side. The back vertical leg, which is 8 in. high, forms a connection for the end construction. The end sill is secured to the striking plate and at either end to a cast steel push-pole pocket and corner casting, which are in turn riveted together and secured to the bottom member of the side truss and to the diagonal brace, while the top vertical leg of the end sill is riveted to the end sheets the entire width of the car.

The diagonal braces are of U-shape section, 8 in. wide and ⅜ in. thick, with 2½ in. flanges pointing downward. They are flattened at both ends, being fastened to the top flange of the center sills at one end and to the push-pole pocket and the bottom member of the side truss at the other end.

The side sill, or bottom member of the side truss, runs continuously between the end sills and is composed of a 4 in. by 6 in. by ⅜ in. angle and a 4 in. by 3½ in. by ⅜ in. bulb angle, which are riveted together back to back. The short leg of the angle points towards the center of the car and the long leg of the bulb points outward, both legs being in the same horizontal plane as the center sill cover plate.





Arrangement of the End Sill and Corner Construction

SUPERSTRUCTURE

In designing the car efforts were made to provide as great a protection as possible for the lading in case of accident or rough usage, and to reduce, as far as possible, the number of parts. The superstructure was designed with an outside shell composed of a series of ⅛ in. sheets for the side, and ¼ in. sheets for the ends, in which the posts are pressed integral. A U-shape post is pressed into one end of each sheet and is overlapped by the adjacent sheet, which acts as a cover plate for the post and gives a smooth surface on the outside of the car. The post portion of the sheet is 2¾ in. deep and 4 in. wide at the back. The sides of the car are composed of ten sheets each, which have a 2 in. flange, top and bottom, by means of which they are secured to the bulb angle of the side sill and to the 6 in. by 4 in. by ⅜ in. eave angle or side plate at the top.

The end construction is similar to that of the sides, each end being composed of three sheets, the two nearest the sides of the car containing the depression which forms the post. Where the central sheet overlaps these, they are depressed ¼ in., making the outside face perfectly smooth so that it may fit down snugly behind the end sill. The middle sheet has an additional U-shape stiffener at the center, 2⅝ in. deep, 9½ in. wide and ¼ in. thick, extending vertically from the end sill to the eave angle. The side door posts are made up of 4 in. by 3½ in. by ⅜ in. bulb angles.

The side and end sheets are tied together by a cover plate, L-shape in section and ¼ in. thick. This is capped top and bottom by suitable castings, which finish off the corners, and at the same time act as a connection between the side and eave angles and the side and end sills. To the side and end sheets, midway between the posts, vertical nailing strips are secured, to which the lining is nailed in a horizontal position.

The carlines are of the bathtub or U-type, being spaced 3 ft. 9½ in. apart, resting on the 6 in. vertical leg of a side eave angle and extending downward from the side a sufficient distance to be securely riveted. The 3/32 in. steel roof sheets are continuous across the car, being spot welded to the carlines, which are located in their center. This allows the butt joint to come midway between the carlines, with the exception of the end roof sheets, which, because of the position of the last carline, must cover one and one-half spaces.

The roof sheets are flanged down on the vertical leg of the side and end eave angles 2½ in. and are secured to them by ⅜ in. rivets spaced 4¾ in apart. Between the roof sheets and the eave angles are 3/16 in. washers, through which the rivets are driven. This construction allows for a slight ventilation and yet is small enough to keep out anything which might cause damage to the lading. The roof sheets are fastened together by an outside and inside strip, the outside strip being 2½ in. wide and 3/32 in. thick and pressed up in the center ⅞ in., which adds to the stiffness of the structure. The inside strip is 2½ in. wide and

3/16 in. thick. These strips are continuous across the car and are riveted to the roof sheets with ¼ in. rivets spaced 1½ in. apart. To insure a perfectly water-tight joint, tar paper is placed between the outside butt strip and the roof sheets. The end and side eave construction is the same, except that there is no ventilation at the end.

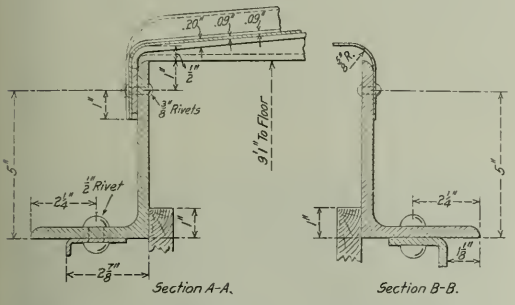
The 13/16 in. pine inside lining is nailed to vertical nailing strips, conveniently spaced around the sides and ends. The lining extends to within 3 in. of the floor. There is an air space back of the lining which allows for ventilation, and also facilitates cleaning. The application of a triangular grain strip around the edge of the floor, next to the side sheets, allows all foreign matter to work its way out from behind the lining.

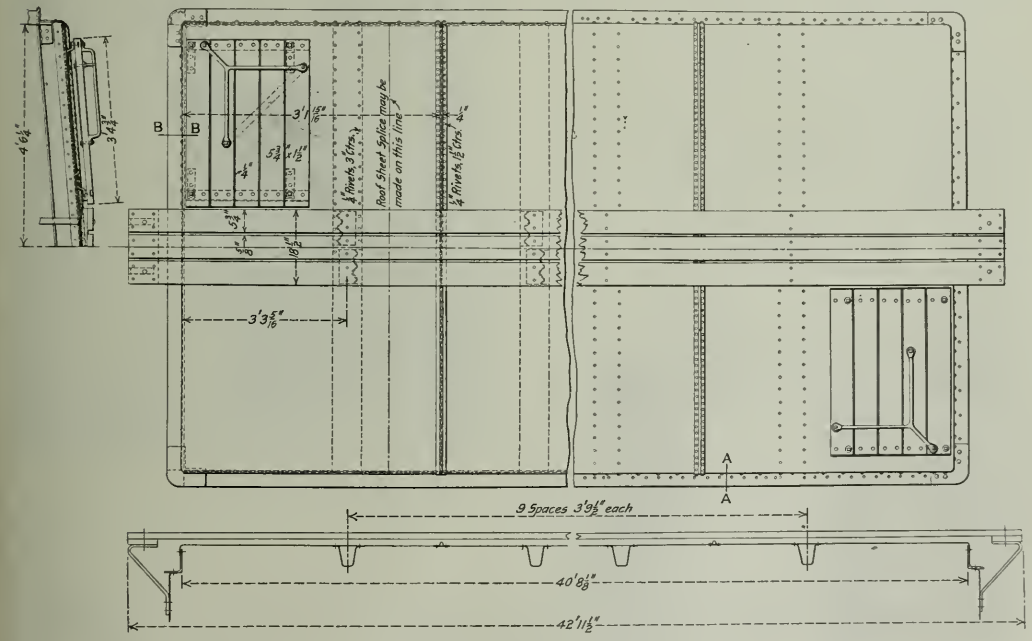
A new feature in this car is the manner in which the safety appliances are secured. All grab irons are fastened to castings by means of a slotted hole in the face, which permits the removal of the grab iron bolt, and thus the renewal of the grab irons without disturbing the inside lining. A like provision is made for the side door stop.

The car is equipped with outside hung doors, supported at the top by hangers at both corners. A 5 in. by 1¾ in. by 5/16 in. angle acts as a top guide rail and weather strip, the short leg being turned down over the face of the door. The door is made of .109 open hearth steel, with two vertical Z-shape edge stiffeners, which are flattened out, top and bottom, supporting the door hanger and door guide castings. The rear stiffener laps over the door post, and the front one butts against a 2 in. by 2 in. by ¼ in. angle riveted to the side sheets and projecting slightly beyond the door, thus forming a weather strip, front and back. There are two horizontal U-shape sections pressed in the end of the top and intermediate door sheets, which overlap the adjacent sheets, forming a stiffener across the door. At the bottom of the door is a 1¾ in. by 1¾ in. by ¼ in. stiffening angle, which runs continuously between the vertical stiffeners. The inside of the door is perfectly smooth, all rivets being countersunk. A clearance of 1/16 in. is allowed for the door to clear the door post. The floor is extended through the door opening, flush with the door post, and is supported by the bulb angle of the side sill.

The following are the leading dimensions and data:

Length over end sills	42 ft. 6 in.
Inside length	40 ft. 5 in.
Inside width	8 ft. 10 in.
Inside height	9 ft. 1 in.
Height top of rail to top of floor	3 ft. 7½ in.
Height at eaves	12 ft. 10 in.
Width at eaves	9 ft. 2 in.
Capacity	100,000 lb.
Cubical capacity	2,343 cu. ft.
Weight	49,100 lb.





Arrangement and Details of the Roof

BUSINESS OF THE SUEZ CANAL.—Suez Canal receipts during 1914 showed an increase up to the end of May of $436,000 compared with the like period in 1913.

GRAIN ELEVATORS IN THE BALKAN STATES.—A new grain elevator which is soon to be opened for public use in Constanza, Roumania, will be the third elevator in that port to be owned and operated by the government. The capacity of the other two is 1,252,352 bu. each, but the only other elevators in the country are at Bralia and Galatz, on the Danube. These two elevators have respective capacity of 1,071,418 bu., and 982,086 bu.

LOYALTY, AS VIEWED BY AN EMPLOYEE

[From Sunset-Central Bulletin.*]

Harmonious relations existing among foremen create a harmonious relation among the men; the spirit of good will and brotherly feeling is contagious. . . . Is there any other business on earth that needs something to encourage the men it employs more than a railroad company? No, not one; for the simple reason railroad companies are criticized, blackguarded, persecuted and unfavorably censored without just cause more than any other enterprise on earth. They are a target shot at from every conceivable angle and with every kind of ammunition. It is a natural consequence that men who hear this unmerited criticism on every hand should enter the company's service with their minds embittered by such unwholesome suggestions; and in spite of the pay they receive and the treatment they are accorded, it takes many a year to purge this venom and antagonism from their minds.

The railroad companies of these United States lose hundreds of thousands of dollars every year through "soldiering," negligence and carelessness, emanating from a spirit of unloyalty which is an inheritance born of malice and handed down from one generation to another. The only antidote the stockholders can employ to overcome these adverse influences is by reaching their subordinate employees through the avenues of their presidents, managers, superintendents and the foremen they employ; and if there is any missing link of co-operation and harmony, from the president to the firing line, the chain is broken and the good influences which are so essential are lost.

COMBINED COAT, HAT AND UMBRELLA HOOK

A novel combined coat, hat and umbrella hook, or holder, unique in that the things it holds may be held securely under lock and key is shown in the illustrations. The device is the design of C. L. Bundy of Kingsland, N. J., and is primarily intended for use in shops or offices, although it can also be used in restaurants, barber shops and similar places. Fig. 1 illustrates the holder closed and empty in its natural position. The key has to be turned before the hook can be opened to the position shown in Fig. 2. The person who wishes to hang up his hat and coat, and his umbrella also, first places the coat on the hook portion projecting from the bottom of the holder. The absence of the hanger or strap on the neck of the garment is no detriment, as the knob which fits into the hole at the end of the hook is small enough not to pinch the coat and cut the cloth. The next step is to place the umbrella in that one of the holes in the horizontal bar which is best fitted to its size and then to place the hat on the smaller bar which extends to the front. The holder may then be shut and the key withdrawn; the three articles will be securely fastened as shown in Fig. 3.

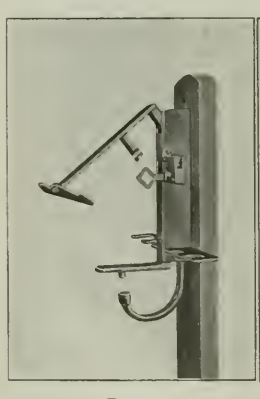


Fig. 1

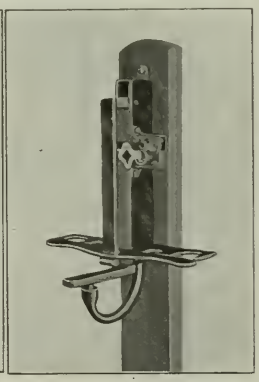

Fig. 2

Combined Coat, Hat and Umbrella Hook Shown Open and Closed

The holder is made of malleable iron and with the exclusion of the lock, is made of three essential pieces of metal, the main body and the two horizontal bars making up one piece, the hook a second, and the clamp which is hinged to the latter in the body of the holder the third. The lock may be as simple or complex as is necessary; it is so devised, however, that the key can be withdrawn only when the hook is shut. The holder has certain advantages as compared to a locker, in that it is cleaner and cheaper and occupies less space. Lockers have a tendency to accumulate waste, old papers and similar things, and it is, necessary, therefore, to exercise careful supervision over the care that is exercised in this respect, or else periodically clean them out.

Fig. 3—The Hook Holding Coat, Hat and Umbrella

The hooks may also be used advantageously in offices, barber shops, railroad dining and lunch rooms. In such cases it may be desirable to have them made of brass, or nickel-plated or lacquered to suit the scheme of design of the room in which they are placed. The polished malleable iron hook costs about $1.25.

*From an article on "Co-operation and Harmony," by Bennette Wilson, Engine Despatcher, Southern Pacific Company.

Chinese Railway Extension.—It is stated with regard to the Ningpo-Hangchow section of the Shanghai-Hangchow-Ningpo Railway that the laying of the rails was completed and opened for traffic in December, 1913, as far as Pakwan, a distance of 53 miles from Ningpo. The rails (85 lb. to the yard) were procured from the Hangyang iron works and America. The daily revenue from both passenger and freight traffic between Ningpo and Pakwan, is estimated to vary between $700 and $1,000. The extent of construction is not of great moment, and its growth has barely influenced the trade in any way. It is rumored that the nationalization of this section through purchase by the Chinese government from the shareholders is contemplated, the question for decision being one of terms alone.

General News Department

The Conference Committee of Managers of the Western roads has selected W. L. Park, vice-president of the Illinois Central, and H. E. Byram, vice-president of the Chicago, Burlington & Quincy, as arbitrators in the enginemen's and firemen's wage controversy.

The United States Steel Corporation reports that the unfilled orders on its books July 31 amounted to 4,158,589 tons, an increase of 125,732 tons over the amount recorded on June 30. As compared with July 31 last year, there is a decrease of 1,240,767 tons.

The new cut-off line of the Southern Pacific from Eureka on the Houston & Texas Central to Stella on the Galveston, Harrisburg & San Antonio, nine miles long, has been put in operation. By the cut-off through freight between North Texas points and the port of Galveston can be expedited materially, as it need not pass through Houston.

The lower house of Congress, on Tuesday of this week passed the Moon Bill, providing for a readjustment of the rates for payment for transportation of the mails by railroad. This bill also contains a number of provisions relating to postmasters, their pay and their rules, and probably will be the subject of disagreement between the Senate and the House.

A standard dining car of the Chicago, Burlington & Quincy has been selected by the state pure food commissioner of Nebraska to demonstrate the proper method of serving food on dining cars, at the state fair to be held in Lincoln, September 7 to 11. All meals will be served to the fair visitors, who will be allowed to inspect the kitchen and see how the work is conducted.

The St. Joseph & Grand Island, which has taken off the one passenger train daily which it ran between Kansas City and St. Joseph, will, on September 1, abandon the freight service also on that section of its line. This will make St. Joseph, 61 miles north of Kansas City, the eastern terminus of the road. Between St. Joseph and Grand Island, 252 miles, the company runs two passenger trains each way, one in the night and one in the day time.

That part of the National Railways of Mexico which has been operated as a military railroad is to be surrendered to the old operating company, E. N. Brown, president. The revival of business of all kinds in Monterey, Saltillo, Torreon and other places in Constitutionalist territory has resulted in an urgent demand that the Laredo gateway be reopened. The war in Europe makes Mexico dependent upon the United States for important supplies, including many food products and machinery; and a heavy traffic between Mexico and the United States is expected quickly to develop by reason of the closing of many European ports, as soon as railroad facilities can be obtained.

The Public Utilities Commission of Illinois has announced that it will carry on an active campaign to reduce the danger to the public at highway grade crossings throughout the state. The most important factor in this campaign is the attempt to secure the arrest of all trespassers and to this end instructions will be issued by the commission, with the consent of the governor, to all municipal and railroad authorities to arrest all trespassers. A systematic effort will be made to educate the public as to the danger of grade crossings and to teach wayfarers to heed the warning signs. An inspection of all grade crossings throughout the state is being made, with the object of ordering better protection for dangerous crossings.

In a paper on the Compound Articulated Locomotive, presented by Anatole Mallet, originator of the Mallet type of locomotive, before the Institution of Mechanical Engineers at the Paris meeting, held in July, an original method of comparing the weight of locomotives with the weight of rail was mentioned. Mr. Mallet showed that in 1829, engines weighing five tons ran on rails of 34.2 lb. per yard, which was equal to 327 times the weight of rail per yard. In 1846, engines weighing 22 tons ran on rails of 70.52 lb. per yard, which is 700 times the weight of rail per yard. In 1880, 56-ton engines ran on rails of 84.6 lb. per yard, which is 1,480 times the weight of rail per yard. In 1911, engines weighing 96 tons ran on 96.77 lb. rails, which is 2,220 times the weight of rail per yard, and in the United States a Mallet engine with 10 coupled axles weighing 245 tons, adhesive weight, ran on 111 lb. rails, which is 4,950 times the weight of rail per yard.

Alaskan Railway Surveys

The Alaskan Engineering Commission now has a number of locating parties in the field running preliminary surveys from Portage Bay, Alaska, to Fairbanks, and also along the line of the Alaska Northern from Seward to the end of the constructed line at mile 72. A party is also running a line from Chitina on the Copper River Railroad, to the Matinuska coal fields. Considerable information is also in hand regarding other possible routes from the seacoast to the interior, but much of the data collected have been secured on reconnaissance surveys only. Some of these other routes will undoubtedly be investigated next year. The present surveys are being made to secure estimates of the probable cost of building the various lines. It is expected that about 600 miles of these surveys will be completed this summer.

Good Results of Safety Campaign on the Santa Fe

The following table, which has been prepared by Isaiah Hale, commissioner of safety of the Atchison, Topeka & Santa Fe, shows the number of personal injuries among employees of this road during the fiscal years ending June 30, 1913, and June 30, 1914. The employees are divided according to the classification in the personal injury record which is as follows: "A," train, engine and switching service; "B," warehouse and storehouse departments; "C," track and bridge and building departments; "D," shops and roundhouses; "E," other employees; "F," total employees. In connection with this report it is fair to note that during the last year a number of minor injuries were reported and recorded of a class of which no record was made in former years, so that as a matter of fact the result of the campaign for safety has been greater than indicated below.

	"A"		"B"		"C"		"D"		"E"		"F"

*Increase.

Protest Against Enginemen's Wage Increase

A petition signed by about 250 men, employees of the various railroads entering Wichita, Kan., in the capacities of clerks, ticket sellers, employees of the freight department, baggage handlers, ushers, and others, has been sent to President Wilson at Washington, protesting against any further increase in the wages of locomotive engineers in the western territory, until such time as the other 90 per cent of railroad employees are better paid. It is declared that the petition is not in any way directed against, or intended to oppose organized labor. Continuing the petitioners say:

"Knowing as we do that railway managers of the country are continually confronted by an increase in operating expense on one side, and on the other hand by lack of power to increase their earnings, we realize that any further increase granted the engineers, who, we believe, are already well paid, would not only lessen our chances for better wages, but would necessitate a reduction of railway employees, or a reduction of some sort in order to meet the enforced deficit which will be caused by the increase asked by the engineers."

The petition then goes on to show that locomotive runners in Kansas earn anywhere from $200 to $300 per month, while their working hours, including all their overtime, would not total as much as those of the nine and ten-hour employees who earn from one-sixth to one-fourth of this amount.

The petition closes by saying "the engineers are already getting

more than their share of the railroads' earnings, as compared to other employees, and we heartily commend the action of the general managers of the roads involved in opposing any further increase for engineers under the present conditions."

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

American Association of Demurrage Officers.—A. G. Thomason, Demurrage Commissioner, Boston, Mass. Annual convention in April.

American Association of Dining Car Superintendents.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next convention, October 22-24, Washington, D. C.

American Association of Freight Agents.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 21-24, 1915, Richmond, Va.

American Association of General Passenger and Ticket Agents.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Annual meeting, September 15-16, Boston, Mass.

American Association of Railroad Superintendents.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next convention, August 20-21, New York.

American Electric Railway Association.—E. B. Burritt, 29 W. 39th St., New York. Annual convention, October 12-16, Atlantic City, N. J.

American Electric Railway Manufacturers' Association.—H. G. McConnaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

American Railway Association.—W. F. Allen, 75 Church St., New York. Semi-annual meeting, November 18, Chicago.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 20-22, 1914, Los Angeles, Cal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1915.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga. Annual meeting, July, 1915.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except, June, July and August, 220 W. 57th St., New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 1-4, 1914, New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 19-21, 1915 Chicago.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Atlanta, Ga.

Association of Manufacturers of Chilled Car Wheels.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Annual meeting, second Tuesday in October, New York.

Association of Railway Claim Agents.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, 3rd week in May, 1915, Galveston, Tex.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual convention, October 26-30, 1914, Chicago.

Association of Railway Telegraph Superintendents.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 22-25, Rochester, N. Y.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York. Next meeting, December 8-9, 1914, Richmond, Va.

Bridge and Building Supply Men's Association.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Civil Engineers' Society of St. Paul.—Edw. J. Dugan, P. O. Box 654, St. Paul, Minn.; Regular meetings, 2d Monday, except June, July, August and September, Old State Capitol Bldg., St. Paul.

Engineers' Society of Pennsylvania.—Edw. R. Dasher, Box 75, Harrisburg, Pa. Regular meetings, 1st Friday after 10th of each month, except July and August, 31 So. Front St., Harrisburg, Pa.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

Freight Claim Association.—Warren P. Taylor, R. F. & P., Richmond, Va. Annual meeting, June 16, 1915, Chicago.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

International Railway Congress.—Executive Committee, 11, Rue de Louvain, Brussels, Belgium. Next convention, June 23 to July 6, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 W. Broadway, Winona, Minn. Next convention, July 14-17, 1915, Sherman House, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, Lima, Ohio. Next convention, August 18-20, Hotel Wisconsin, Milwaukee, Wis.

Maintenance of Way & Master Painters' Association of the United States and Canada.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next convention, November 17-19, 1914, Detroit, Mich.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May, 1915.

Master Car & Locomotive Painters' Association of the United States and Canada.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 8-11, Nashville, Tenn.

Master Car Builders' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1915.

National Railway Appliances Association.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railroad Master Tinners, Coppersmiths and Pipefitters' Association.—U. G. Thompson, C. & E. I., Danville, Ill. Annual meeting, May, 1915.

Railway Business Association.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December 10, 1914, Waldorf-Astoria Hotel, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Railway Electrical Supply Manufacturers' Association.—J. Scribner. 1021 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

Railway Fire Protection Association.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Annual meeting, October 6, 1914, Washington, D. C.

Railway Signal Association.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa. Annual meeting, September 22-24, 1914, Bluff Point, N. Y.

Railway Storekeepers' Association.—J. P. Murphy, L. S. & M. S., Box C, Collinwood, Ohio. Annual meeting, May, 1915.

Railway Supply Manufacturers' Association.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with M. C. B. and M. M. Associations.

Railway Telegraph & Telephone Appliance Association.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill. Next convention, September 8-10, 1914, Chicago.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake City Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Signal Appliance Association.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

Society of Railway Financial Officers.—Carl Nyquist, C. R. I. & P., La Salle St. Sta., Chicago. Annual meeting, September 15-17, Hotel Aspinwall, Lenox, Mass.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. Ry., Atlanta, Ga.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—J. S. Marks, Agent, Interstate Despatch, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillsburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7122 Stewart Ave., Chicago. Annual meeting, June 15, 1915, Minneapolis, Minn.

Transportation Club of Detroit.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Next meeting, September 15-18, Hotel Sherman, Chicago.

Utah Society of Engineers.—Frank W. Moore, Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Consolidated Music Hall, Salt Lake City.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

It has been announced informally in Washington that the Panama Canal will be open tomorrow, August 15, for the passage of vessels not needing more than 30 ft. of water.

The railroads belonging to the Western Passenger Association have decided to make no more special excursion rates locally in states where two-cent fares are fixed by statute. This decision was reached after the receipt of an application for special rates to the Wisconsin State Fair.

The Pennsylvania Railroad announced last week that its agent at Liverpool had been instructed to provide Americans in England, marooned on account of the war, with money for their immediate needs. The railroad will cash letters of credit, or if passengers are without funds will accept their own obligations. Prospective passengers are to be informed also that the Pennsylvania will carry them to their destinations on their arrival at New York or Philadelphia. The other principal trunk line railroads, after a conference in New York City, telegraphed to the London Relief Committee, that all the lines would afford similar accommodations to passengers arriving at New York.

Car Surpluses and Shortages

Arthur Hale, chairman of the committee on relations between railroads of the American Railway Association, in presenting statistical bulletin No. 173, giving a summary of car surpluses and shortages by groups from April 1, 1913, to August 1, 1914, says: The total surplus on August 1, 1914, was 198,998 cars; on July 15, 1914, 228,384 cars, and on August 1, 1913, 69,716 cars.

The total surplus has decreased approximately 29,000 cars in the past two weeks, and stands at 198,998, the highest figure for this season of the year since 1909.

The box car surplus decreased approximately 13,600 cars, the largest part of which decrease is in the grain states and on the Pacific coast. There is a heavy increase in surplus box cars on the Canadian roads. The difficulty in securing vessels for export shipment has doubtless contributed in tying up a large number of cars at the ports.

The total shortage on August 1, 1914, was 2,333 cars; on July 15, 1914, 1,843 cars, and on August 1, 1913, 11,261 cars.

The shortage of 2,333 cars is about 500 greater than on July 15, but this shortage is trifling in any one group.

The accompanying table gives car surplus and shortage figures by groups for the last period covered in the report and the diagram shows total bi-weekly surpluses and shortages from 1907 to 1914.

CAR SURPLUSES AND SHORTAGES

Date	No. of roads.	Surpluses Box.	Flat.	Coal, gondola and hopper.	Other kinds.	Total.	Shortages Box.	Flat.	Coal, gondola and hopper.	Other kinds.	Total.

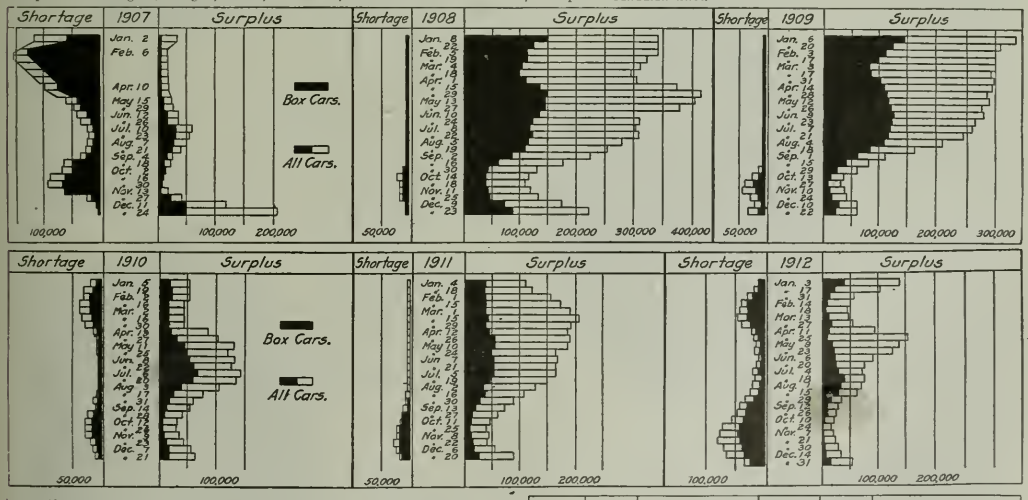
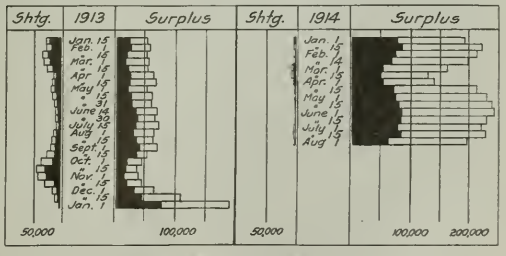
*Group 1 is composed of New England lines; Group 2—New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania lines; Group 3—Ohio, Indiana, Michigan and Western Pennsylvania lines; Group 4—West Virginia, Virginia, North and South Carolina lines; Group 5—Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida lines; Group 6—Iowa, Illinois, Wisconsin and Minnesota lines; Group 7—Montana, Wyoming, Nebraska, North Dakota and South Dakota lines; Group 8—Kansas, Colorado, Missouri, Arkansas and Oklahoma lines; Group 9—Texas, Louisiana and New Mexico lines; Group 10—Washington, Oregon, Idaho, California, Nevada and Arizona lines; Group 11—Canadian lines.





Car Surpluses and Shortages, 1907 to 1914

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Rates on Paper to Muskogee, Okla.

Phoenix Printing Company et al. v. Missouri, Kansas & Texas et al. Opinion by Commissioner McChord:

The commission finds that the rates on news print paper from Minnesota mills and Wisconsin mills to Muskogee, Okla., are unreasonable as compared with the rates to Kansas City, Mo., and various other points in Missouri and Kansas and in western trunk line territory. Giving Muskogee the same rate per ton-mile as Joplin, Mo., the total rate to Muskogee would be about 35 cents per 100 lb., instead of 46 cents, the present rate. It is, therefore, held that the rate to Muskogee should not exceed 35 cents from the Minnesota mills or 34 cents from the Wisconsin mills, and reparation is awarded for the difference in the case of certain shipments. (31 I. C. C., 289.)

Rail and Water Rates to Bowling Green, Ky.

Bowling Green Business Men's Protective Association of Bowling Green, Ky., v. Evansville & Bowling Green Packet Company et al. Opinion by Commissioner McChord:

The commission finds that the rail line carriers should establish through routes and joint rates from St. Louis, Chicago, Detroit, Indianapolis, Pittsburgh, Cleveland, Syracuse and New York via Evansville, Ind., to Bowling Green in connection with the Evansville & Bowling Green Packet Company, observing as nearly as possible the custom that rail and water rates should be lower than all rail rates. The defendants are to submit to the commission within sixty days a tentative scale of joint through rates showing the manner and form in which the same are to be established. (31 I. C. C., 301.)

Rates on Blackstrap Molasses

Louisiana Sugar Planters' Association v. Illinois Central et al. Opinion by Commissioner Clements:

It is alleged that a rate on molasses of 21 cents per 100 lb. from New Orleans and other Louisiana points to St. Louis and East St. Louis is discriminatory as compared with a special import rate of 15 cents on blackstrap molasses from New Orleans and certain other Louisiana points in the immediate vicinity of that point to the same points of destination, the latter rate being restricted in its application as follows: "Molasses, blackstrap, low grade, in tank cars (when imported from foreign countries, including insular possessions of the United States, unloaded into storage tanks and reshipped from storage tanks or transferred direct from vessel to tank cars), estimated weight 11.7 lb. per gallon, agreed to be of value of 8 cents or less per gallon, c. l. minimum weight capacity of tank."

The commission finds that there may properly be some difference between the import rate and the domestic rate on blackstrap molasses, but it believes that in this case the difference between the rates on the two kinds of shipments is too great and that any greater difference than three cents per 100 lb. between the import rate and the domestic rate from New Orleans to St. Louis and East St. Louis is discriminatory against the domestic product; it also holds that the usual relation should be maintained between the rates to St. Louis and East St. Louis and the rates to the other destinations involved. The commission also concludes, in view of the very small risk of loss or damage in the transportation of blackstrap molasses in tank cars, etc., that the difference of six cents between the unconditional rate on imported blackstrap and the special rate based on agreed value is unreasonable and that the difference ought not to be more than two cents per 100 lb. If imported blackstrap is to take a special rate based on agreed value, domestic blackstrap is equally entitled to such a special rate. A special rate on domestic blackstrap should bear the same relation to the unconditional rate on domestic blackstrap that the special rate on the imported product bears to the unconditional rate. (31 I. C. C., 311.)

STATE COMMISSIONS

Discrimination by Use of Private Cars

In an opinion by Commissioner Johnson, handed down August 6, the Pennsylvania Public Service Commission holds it to be unlawful and inequitable for the rate to be lower on coal shipped in producers' cars than when shipped in cars belonging to the carrier.

The opinion is on a complaint filed by the Pennsylvania Rubber Company and others against the Pennsylvania Railroad and concerning the rates on coal from Penn, Biddle, Irwin and Hahntown to Jeannette and Grapeville.

Most of the rates which were put into effect by the carrier on June 1, 1914, and which were very much higher than former rates (in shippers' cars) are declared reasonable and the service performed for the rates charged is characterized as a line haul instead of a switching movement.

The opinion says that the granting of a special rate on coal when moved in shippers' cars enables certain buyers of coal mined at the collieries of the Westmoreland Coal Company to obtain an advantage in rates that other buyers at the same collieries could not secure. The owners of the collieries, who have the power to determine whether private cars or railroad cars shall be used, can decide who shall enjoy the lower rate, and who shall not. The opinion also declares that in determining whether particular rates are reasonable, and especially in deciding whether particular rates are unjustly discriminatory or unduly preferential, it is discretionary with the commission whether a valuation of any or all of the property of a public service company shall be made; and, if the commission decides that a valuation is necessary, the statute prescribes what the commission *may*, not what it *must* consider, in arriving at a fair valuation.

A railroad company is entitled to receive from its entire business a fair return upon a reasonable value of the property which at the time is being used for the public, but this broad question does not necessarily arise in deciding whether the particular rate applying to but one commodity or to but few articles is unjustly discriminatory or preferential. The commission adds that if a valuation were required to decide upon every complaint regarding local rates or fares, the state would be powerless to afford effective relief to complainants.

The commission thinks that the rate to Grapeville and Biddle should not be higher than the rate to Jeannette, and orders a reduction from 25 cents to 20 cents a ton; and the rate of 30 cents a ton from Hahntown to Jeannette is reduced to 25 cents a ton. The rates of 15 cents a ton from Penn to Jeannette and Grapeville and 20 cents a ton from Biddle to Jeannette are held to be reasonable.

All of the rates in question are for very short distances; so short that it was claimed that switching rates ought to apply. The low rate of $2.50 per car was made years ago, when cars were much smaller than now. The distance being very short, the car-service at the loading point (on shipper's premises) and at the delivering point (on consignees' premises) was, of course, worth much more than the car-service during the time the car was in motion, a fact which apparently may be taken as a partial explanation of the very low transportation rate.

COURT NEWS

Railroad Not Responsible for Avalanche

The Supreme Court of the State of Washington holds that the snowslide at Wellington, in that state, on March 1, 1910, when two Great Northern trains were carried down the mountainside and wrecked and 92 persons were killed, was caused by an act of Providence. This is the ruling of the court in the case of William Topping, of Ashland, Ohio, by his guardian, against the Great Northern Railway. The jury in the lower court allowed the boy $20,000 damages for the death of his father, who was killed in the wreck, but the Supreme Court says that the railroad cannot be held responsible, and the lower court is reversed.

Grain Elevators in Russia.—The Russian Imperial Senate has approved the construction of 58 grain elevators in the Cossack provinces of the North Caucasus.

Railway Officers

Executive, Financial, Legal and Accounting

Howard Elliott, chairman of the board of directors of the New York, New Haven & Hartford, with headquarters at Boston, Mass., has been elected also president, succeeding James H. Hustis, resigned to become president of the Boston & Maine.

Frank Scott, whose appointment as vice-president and treasurer in charge of all financial matters of the Grand Trunk and the Grand Trunk Pacific, with headquarters at Montreal, Que., has already been announced in these columns, was born on December 24, 1862, at Montreal, Que. He began railway work in 1879, as a clerk in the audit department of the Grand Trunk, and from 1881 to 1890 was successively clerk and chief clerk in the treasurer's office of that road. In 1891 he was appointed secretary of the audit board and purchasing committee, and from 1893, to 1900, was assistant treasurer of the same road. He was appointed treasurer of the Grand Trunk in 1901, and in 1906, became treasurer also of Grand Trunk Pacific, which position he held at the time of his recent appointment as vice-president and treasurer of the same roads as above noted. Mr. Scott is also a member of the board of directors of the Grand Trunk Pacific, and is a past president of the Society of Railway Financial Officers of America.

F. Scott

Walter Hardman Ardley, who has been appointed controller in charge of all accounting of the Grand Trunk and the Grand Trunk Pacific, with headquarters at Montreal, Que., has already been announced in these columns, was born on April 24, 1858, in London, Eng., and was educated in the City of London College. He began railway work on November 5, 1884, as a clerk in the general auditor's office of the Grand Trunk and has been in the continuous service of that road ever since. In November, 1893, he was appointed chief clerk and general bookkeeper, and from December, 1907, to the following August was auditor of disbursements. He then served for four months as acting general auditor, and on December 31, 1908, was appointed general auditor of the Grand Trunk and the Grand Trunk Pacific, which position he held at the time of his recent appointment as controller of the same roads, as above noted. Mr. Ardley was recently chosen a member of the board of directors of the Grand Trunk Pacific.

W. H. Ardley

The following are appointed officers of the receivers of the Chicago, Peoria, & St. Louis, effective August 1: W. C. Hurts, general manager; H. W. Berger, auditor; F. J. Wilson, treasurer, and P. B. Warren, general counsel; all with headquarters at Springfield, Ill.

Frederic A. Delano, president of the Chicago, Indianapolis & Louisville, has resigned to accept an appointment on the Federal Reserve Board. He will be vice-governor of the board and will have headquarters at Washington, D. C. A portrait and sketch of Mr. Delano were published in the *Railway Age Gazette* of January 2, 1914, page 29.

William C. Tomkins, formerly secretary to vice-president of the Grand Trunk and the Grand Trunk Pacific at Montreal, Que., has been appointed assistant to vice-president of both roads; James A. Yates, chief clerk to the treasurer, has been appointed assistant treasurer, and G. R. Martin has been appointed assistant auditor of disbursements, all with headquarters at Montreal.

Operating

W. S. Hall, trainmaster of the Canadian Pacific, at Cranbrook, B. C., has been appointed trainmaster, with office at Red Deer, Alta., and C. W. Fisher, trainmaster at Strathcona, has been appointed chief train despatcher, with headquarters at Edmonton.

Traffic

W. McN. Knapp has been appointed traveling freight agent of the Central of Georgia, with headquarters at Savannah, Ga.

Guy H. May has been appointed traveling passenger agent of the Tennessee Central, with headquarters at Knoxville, Tenn.

S. G. Lutz, traffic manager of the Minneapolis & St. Louis at Minneapolis, Minn., has been appointed general traffic manager of the Chicago & Alton, with headquarters at Chicago. Mr. Lutz was born December 8, 1868, in Illinois and was graduated from Western College, Toledo, Ohio, in 1887. He began railway work in November, 1890, as a stenographer in the traffic department of the Iowa Central, and subsequently filled various clerical positions until September, 1894, when he became chief clerk in the freight traffic department. From January, 1898, to April, 1904, he was assistant general freight agent of that road, and was then until December, 1908, assistant general freight agent of the Minneapolis & St. Louis. He was freight traffic manager of both roads from December, 1908, to December, 1909, when he was appointed general freight agent of those roads and the Chicago & Alton and the Toledo, St. Louis & Western at Chicago. In November, 1910, Mr. Lutz was made traffic manager of the Minneapolis & St. Louis, which absorbed the Iowa Central, which position he resigned on August 1 to become general traffic manager of the Chicago & Alton, as above noted.

S. G. Lutz

George M. Henry has been appointed general passenger agent of the Detroit, Toledo & Ironton, with office at Detroit, Mich.

F. W. Lyons has been appointed commercial agent of the Lehigh Valley, with headquarters at Hazleton, Pa., succeeding H. E. Dengler, transferred.

H. A. Fidler, traffic manager of the Big Sandy & Kentucky River at Ashland, Ky., has been appointed assistant general freight agent of the Detroit, Toledo & Ironton, with headquarters at Ironton, Ohio.

F. B. Townsend, assistant general freight agent of the Minneapolis & St. Louis, has been appointed traffic manager, with headquarters at Minneapolis, Minn., succeeding S. G. Lutz, resigned. A. B. Cutts, assistant traffic manager, has been appointed general passenger agent, and D. M. Denison, assistant general freight agent, has been appointed general freight agent, both with headquarters at Minneapolis.

Purchasing

W. G. Phelps, the new purchasing agent of the Pennsylvania Lines West of Pittsburgh, with headquarters at Pittsburgh, Pa., was born at La Porte, Ind., and was educated in the public and private schools of his native town and of Valparaiso. From 1877, to 1884, Mr. Phelps was telegraph operator and agent on the Vandalia Railroad, and then left the service of that company. On November 5, 1888, he returned to the service of the Vandalia as a clerk in the general freight office at St. Louis, Mo. He was appointed chief clerk to the fourth vice-president of the Pennsylvania Lines West of Pittsburgh on June 9, 1901, and was promoted to assistant purchasing agent on January 1, 1913, with headquarters at Pittsburgh, which position he held at the time of his appointment on June 1 as purchasing agent of the same road, as above noted.

W. G. Phelps

Engineering and Rolling Stock

T. E. White has been appointed supervisor of track, District No. 1, of the Louisiana & Arkansas, with headquarters at Minden, La., succeeding J. T. Cherry, resigned.

Alonzo G. Kinyon, whose appointment as superintendent of locomotive operation of the Seaboard Air Line has been announced in these columns, was born at Amboy, Ill., on July 12, 1867. He entered railway service in 1888 as a fireman on the Chicago, Milwaukee & St. Paul, later becoming an engineman. A few months before he left the service in 1901 he entered the railway department of the International Correspondence Schools and was respectively compound locomotive instructor, air brake instructor, and combustion and fuel economy instructor. He resigned in 1905 to engage in other business, but in 1906 returned to railway work as road foreman of engines on the Southern Railway, where he remained until June 1, 1907. In November, 1910, he was appointed special instructor of fuel economy of the Buffalo, Rochester & Pittsburgh, but left about one year later to become superintendent of combustion and fuel economy instruction with the International Correspondence Schools. On March 1, 1911, Mr. Kinyon entered the railway supply field as chief traveling engineer of the Hanna Locomotive Stoker Company, Cincinnati, Ohio. On April 1, 1912, however, he left to accept a similar position with the Westinghouse Air Brake Company, in connection with the Street stoker. This position was abolished about one year later, whereupon he became locomotive fuel engineer of the Clinchfield Fuel Company, Spartanburg, S. C., with which company he remained until July 1, when he took up his present work.

A. G. Kinyon

J. E. Epler, assistant to the general manager of the Chicago & Eatsern Illinois, has been appointed superintendent of motive power, with headquarters at Danville, Ill., to succeed J. H. Tinker, resigned, and the former office is abolished.

A. J. Ironsides, district master mechanic on the Manitoba division of the Canadian Pacific, at Saskatoon, Sask., has been appointed district master mechanic of the Alberta division. C. Flint has been appointed resident engineer, and H. Marshall, bridge and building master at Saskatoon, Sask., has been appointed bridge and building master, all with headquarters at Edmonton, Alta.

OBITUARY

Edward P. Amory, secretary of the Western Railroad Association, at Chicago, was found murdered in his office in Chicago on August 12.

Jacob C. Miller, formerly master mechanic of the Eastern district of the Chicago, Milwaukee & St. Paul, died suddenly on July 25, at his summer camp on Tomahawk Lake, Minocqua, Wis., from apoplexy, aged 61 years. He retired from active railway service February 1, 1910, since which time he had been living at Maywood, Ill.

William Henry Chambers, controller of the Florida East Coast, with office at St. Augustine, Fla., died recently in London, Eng. Mr. Chambers was born on September 25, 1852, at Dublin, Ireland, and began railway work in 1871, as a clerk in the freight department of the London & North-Western, and afterwards was assistant ticket agent at Dublin of the same road. Previous to 1887, he was claim clerk of the Savannah, Florida & Western, now a part of the Atlantic Coast Line, at Jacksonville, Fla. He was subsequently, for about a year, auditor of the St. Augustine & Palatka, now a part of the Florida East Coast, and from 1888, to 1892, was chief clerk and cashier of the Jacksonville, St. Augustine & Halifax River. He was then to January, 1901, auditor, and since that time was controller of the same road and its successor, the Florida East Coast.

D. M. Philbin, formerly general superintendent of the Lake district of the Great Northern and president of the Lake Superior Terminal & Transfer Railway, died in Duluth, Minn., August 6, aged 57 years. Mr. Philbin had been in railway service since 1874. From 1890 to 1893 he was superintendent of the Duluth, South Shore & Atlantic and the following three years was general manager of the Duluth, Missabe & Northern. He was then general superintendent of the Duluth & Winnipeg until June, 1898, when he became second vice-president of the Eastern Railway of Minnesota, of which road he also was superintendent from June, 1898, to April, 1903. On the latter date he was appointed assistant general superintendent of the Great Northern, and in 1906 he became general superintendent of the Lake district, which position he resigned December 31, 1913, on account of ill health.

James Thomas Byrne, until recently vice-president and superintendent of the Texas & Gulf, with office at Longview, Tex., died on August 7, at Temple, Tex. He was born on February 26, 1865, and received a common school education. He began railway work on August 1, 1880, as an axman on an engineering corps of the Chicago & North Western. He was then consecutively laborer, section foreman, and steel gang foreman on the same road, and brakeman, fireman, conductor and telegraph operator on the Missouri Pacific and the St. Louis, Iron Mountain & Southern. He then served as telegraph operator on various roads until his appointment in November, 1887, as trainmaster's clerk on the Gulf, Colorado & Santa Fe. He was then consecutively train despatcher, chief train despatcher, trainmaster and assistant trainmaster on the same road, until August, 1908, when he was elected vice-president and superintendent of the Texas & Gulf.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Cleveland, Cincinnati, Chicago & St. Louis is reported in the market for a number of switching locomotives in addition to the five Pacific type locomotives noted in the *Railway Age Gazette* of August 7.

The South Dakota Central has ordered two Consolidation locomotives from the American Locomotive Company. These locomotives will have 20 by 24 in. cylinders, 51 in. driving wheels, a total weight in working order of 138,000 lb., and a steam pressure of 180 lb.

The Chicago, Milwaukee & St. Paul has ordered 20 superheater Mikado type freight locomotives from the American Locomotive Company. These locomotives will have 26 by 30 in. cylinders, 63 in. driving wheels, a total weight in working order of 275,000 lb., and a steam pressure of 185 lb.

The Chicago Junction has ordered two superheater six-wheel switching locomotives from the American Locomotive Company. These locomotives will have 20 by 26 in. cylinders, 51 in. driving wheels, a total weight in working order of 149,000 lb., and a steam pressure of 180 lb. The company also has an option on three additional locomotives.

CAR BUILDING

The Southern Pacific has suspended indefinitely its inquiry for cars noted in a recent issue of the *Railway Age Gazette*

The Northwestern Pacific is in the market for 11 coaches and 3 mail and express, 4 baggage, 3 smoking and 4 chair cars.

The Pennsylvania Railroad is reported to have ordered 60 gondola cars from its Altoona shops for the Cumberland Valley. This item has not been confirmed.

IRON AND STEEL

The San Diego & Arizona has ordered 1,200 tons of material for a viaduct from the Llewellyn Iron Works, San Francisco.

The Paducah & Illinois has ordered 18,000 tons of steel from the American Bridge Company, for its new bridge at Metropolis, Ill.

Railway Extension in Asiatic Turkey.—The Bagdad Railway Company is a German syndicate which holds the concession for the construction of a railway from Konieh across Turkey in Asia to the Persian Gulf, a distance of 1,250 miles. The Bagdad Railway, which it is constructing, is now nearly completed except for a gap in the section crossing the Taurus mountains. It will undoubtedly be in full operation within two years. The concession is very liberal. It provides for a 99-year lease; a division of the line into 12 sections; the payment to the company of an annuity of 11,000 francs per kilometer to provide for interest on and redemption of the bonds issued for construction and 4,500 francs for operation when the line is completed. The capitalized value for each of the 12 sections as originally defined was to 54,000,000 francs, and Turkish 4 per cent. bonds were to be issued to the company before it had started work on any given section. These bonds, although not worth their nominal value, have nevertheless yielded enough to enable the company not only to meet its expenses, but also to make a fair profit. The company has also received very extensive rights in addition to those named above. It has, for instance, the power to construct a whole network of railways, including branches to Aleppo and Urfah, from Bagdad to Khanakin on the Persian frontier, to Marash, to Aintab, to Biredjik, to Mardin, to Arbil, from El Badieh to Hit and finally all the lines connecting the principal railway with the Mediterranean, limited only in space on the north by Mersina and on the south by Tripoli-in-Syria.

Supply Trade News

J. M. Hopkins, president of the Camel Company, Chicago, has accepted appointment as an executive member of the Railway Business Association.

Virgil G. Bogue, civil and consulting engineer, 15 William street, New York, has completed his engineering undertakings in the west, and announces that his office remains as heretofore at the above address.

W. H. Cadwallader, whose appointment to the position of general manager of the Union Switch & Signal Company has been announced in these columns, was born at Pittsburgh, Pa., in 1876. When he was three years old, however, his parents moved to the suburb of Wilkinsburg, which has been his home ever since. Mr. Cadwallader entered the service of the Union Switch & Signal Company as a blue-printer in 1891. In February, 1892, he was made a messenger in the office of the superintendent of works and later became a clerk in that office and in the general manager's office. In 1901, when the specification department was created, he was placed in charge of it. Later he was placed in charge of the estimating department, and in 1912 was made assistant general manager, which is the position he leaves to assume his new duties as general manager as above noted.

W. H. Cadwallader

J. S. Hobson, whose appointment as acting general sales manager of the Union Switch & Signal Company has been announced in these columns, entered railway service in 1884 as a railway apprentice in the shops of the Great Southern & Western Railway of Ireland. He came to this country in 1889 and served as locomotive machinist, draftsman and signal inspector, respectively, on the Chicago, Burlington & Quincy. In January, 1892, he became construction foreman for the Union Switch & Signal Company in the Chicago district, and in 1895 was appointed supervisor of electric signals for the Michigan Central at Detroit. In October, 1897, he was appointed to the new position of signal engineer of the Atchison, Topeka & Santa Fe, and remained in that position until he re-entered the service of the Union Switch & Signal Company in January, 1901, as assistant engineer. He later became assistant general manager and Western manager, and leaves the latter position to take up his new duties as acting general sales manager.

J. S. Hobson

Charles Eugene Denney, whose appointment to the position of assistant general sales manager of the Union Switch & Signal Company, has been announced in these columns, returns to the company after an absence of nine years, during which time he has been engaged in railway service. Mr. Denney was born October 18, 1879, at Washington, D. C. He attended Pennsylvania State College from 1896 to 1899, and in October of the latter year entered the service of the Union Switch and Signal Company. He remained with the company until May 15, 1905, when he left to become assistant signal engineer on the Lake Shore & Michigan Southern. On June 1, 1902, he became signal engineer of the same road, and retained that position until in October, 1913, he was appointed special engineer on the staff of the vice-president of the New York Central Lines West, with headquarters at Chicago. For a time beginning June 1, 1912, Mr. Denney was also signal engineer of the Lake Erie & Western.

C. E. Denney

The Railway Utility Company, Chicago, Ill., has recently received orders for utility ventilators to be used on cars for the following companies: Union Pacific, 107 cars; Missouri Pacific, 85 cars; New Orleans Railways Company, 50 cars, and the Chicago Surface Lines, 228 cars.

On the 21 Mikado type locomotives recently ordered from the Lima Locomotive Corporation by the Southern Pacific, vanadium steel has been specified for the frames, driving axles, main and side rods, piston rods, and main crank pins. All the forgings will be heat treated to give physical properties in conformity with the specifications recommended at the recent convention of the Master Mechanics' Association, by the committee on the Use of Special Alloy and Heat-Treated Steels in Locomotive Construction. The driving axles will be hollow bored.

TRADE PUBLICATIONS

Oil Engines.—The Chicago Pneumatic Tool Company, Chicago, has issued Bulletin No. 34 W., dated July, 1914, descriptive of Class A-O Giant fuel oil engines.

Portable Cranes.—The Canton Foundry & Machine Company, Canton, Ohio, has issued a catalogue descriptive of its portable floor cranes and hoists. The catalogue contains a number of views of the various hoists and shows wherein they are specifically adapted for the work for which they are intended.

Ball Bearings.—The Hess-Bright Manufacturing Company, Philadelphia, Pa., has issued a 28-page booklet aiming to show the advantages that its ball bearings have over the product of other manufacturers. The booklet contains a number of views of the ball bearings themselves and of machines in which they are used.

Steel Pipe.—Bulletin No. 10-C, recently issued by the National Tube Company, Pittsburgh, Pa., contains a paper entitled "The Relative Corrosion of Iron and Steel Pipe as Found in Service," written by William H. Walker, professor at the Massachusetts Institute of Technology, after an exhaustive investigation into the relative life of service pipes which had been in continuous service for a considerable number of years. Mr. Walker arrived at the conclusion, that "These results again demonstrate that, taken on the average, there is no difference in the corrosion of iron and steel pipe." The booklet also contains three other articles on the subject of corrosion, by F. N. Speller, metallurgical engineer of the National Tube Company.

Railway Construction

Alabama Great Southern.—An officer writes that contracts for the construction of 21.8 miles of double track have just been let to M. M. Elkan, Macon, Ga., as follows: Meridian, Miss., to Russell, 6.3 miles; York to Toomsuba, 15.5; the work to be carried out will consist of the construction of parallel track on present grade. The line to be double tracked is used by trains of both the Alabama Great Southern and the Southern Railway.

Alabama, Tennessee & Northern.—According to press reports this company is planning to build a 25-mile extension north from Reform, Ala., to connect with the St. Louis & San Francisco and the Illinois Central.

Canadian Northern.—A contract is reported let to A. L. McKay, Estevan, Sask., for grading work on a branch from Bienfait west to Estevan.

The Sturgeon River sub-division of the Western division has been extended from Edam, Sask., west to Turtleford, 17.4 miles.

The general location plans of the Canadian Northern branch from mileage 222 on the main line from Victoria to Duncan Bay, Sayword district on Vancouver Island, 8.2 miles, have been approved by the minister of railways for British Columbia.

Fairmount & Veblen.—An officer writes that work is now under way grading a section of 10 miles on the extension from Veblen, S. Dak., southwest to Webster 40 miles. The contract for this work was let last May to H. A. Whittier, Northfield, Minn. (May 8, p. 1055.)

Fort Worth-Denton Interurban.—An officer writes that the Stone & Webster Management Association, Boston, Mass., is working out the engineering details and preparing plans for the proposed interurban line which it will build and operate from Fort Worth, Tex., north to Denton, about 35 miles. A committee of citizens in accordance with an arrangement with the company is proceeding to obtain the necessary rights of way and franchises. (July 17, p. 148.)

Janesville & Madison Traction.—An officer writes that a grading contract has been given to M. M. Doran, Madison, Wis., for work on a section of the line, and contracts for track laying and bridge work including a 550-ft. steel bridge, also some trestles, will be let early in 1915. The plans call for building from Janesville, Wis., north via Indian Ford, Edgerton, Albion, Stoughton, along the shore of Lake Kegonsa, MacFarland, Edwards Park on Lake Waubesa, and along Lake Monona drive to Fair Oaks, thence to Madison. Most of the right of way is along public highways, and the company proposes to use gas-electric cars to operate this line. (July 31, p. 227.)

Louisville & Nashville.—The Lewisburg and Northern division has been opened for business from Brentwood, Tenn., south to North Athens, Ala., 93 miles.

New York Subways.—The New York Public Service Commission, First district, will ask for bids on September 11 for the construction of Routes Nos. 43 and 26, the diagonal station at Forty-second street connecting the Lexington avenue subway with the existing subway at the Grand Central station. This contract extends from points in Park avenue near Thirty-eighth and Forty-first streets northerly to the north line of Forty-second street. Also, on a lower level easterly under Forty-second street to about 100 ft. east of Lexington avenue to a connection with the Steinway tunnel. The construction of the line from Forty-second street under the property of the New York Central will be carried on under an agreement with that company.

Paducah & Illinois.—This company has awarded a contract for the grading on its line from a point opposite Metropolis, Ill., to Paducah, a distance of 13 miles, to Morris, Shepard & Dougherty, St. Paul, Minn. The total yardage is estimated as 1,500,000 cu. yd.

St. Andrews Bay Railway & Terminal Company.—A contract has been given to J. M. Willis, St. Andrews, Fla., for

building four miles of railroad for this company. The contractor wants to sublet several thousand cubic yards of grading. E. L. Woods, St. Andrews, is chief engineer of the railroad.

Sutherlin, Coos Bay & Eastern.—This company, which was organized early this year, has been incorporated in Oregon with a $500,000 capital, and headquarters at Sutherlin, Ore. The plans call for building a line from Sutherlin east about 27 miles to a tract of timber at the head of Calapooya creek and eventually an extension further east, also to build west from Sutherlin to Coos Bay. George H. Glynn, A. Stark and Charles E. Lemon, all of Sutherlin, are incorporators. (June 19, p. 1565.)

Suwanee River & White Springs.—An officer writes regarding the report that financial arrangements have been made to build a line from Live Oak, Fla., east to White Springs, that a company is now at work on the line, which is to have a total length of 20 miles. Track has already been laid on five miles, and bids are wanted for building a steel bridge. J. B. Barton, president, Live Oak, Fla.

RAILWAY STRUCTURES

Albuquerque, N. M.—The Atchison, Topeka & Santa Fe has awarded a contract for the building of a new reinforced concrete engine house at Albuquerque, to Henry Bennett & Sons, Topeka, Kan. The estimated cost is $100,000. Plans are also being made for additional improvements at this point.

East Chattanooga, Tenn.—A contract has been given by the Southern Railway to D. F. Brandon, Chattanooga, Tenn., for building a combined freight and passenger station at East Chattanooga, to replace the building destroyed by fire on July 15. The new building will be of frame construction with tin shingle roof. It will have separate white and colored waiting rooms and office and freight room.

Hartford, Conn.—The New York, New Haven & Hartford will ask for bids in about two weeks for rebuilding the passenger station at Hartford, to repair the damage caused by fire.

Jamaica, N. Y.—The New York Public Service Commission First district has ordered the Long Island Railroad to build a new passenger station on the southerly side of South street at Jamaica, on the Old Southern division of the road. The new station is to be ready for use by November 1 next.

La Grange, Ga.—The Macon & Birmingham will at once let a contract, it is said, for building a new passenger station at La Grange, to replace the old structure which was recently destroyed by fire.

North Philadelphia, Pa.—An officer of the Pennsylvania Railroad writes that the contract for the improvements at the North Philadelphia station was let on August 6, to the Keystone State Construction Company, Philadelphia. The work includes remodeling the basement and train floors of the present station so that the basement floor, which is on a level with the new passenger tunnel built under the tracks and leading to the island platforms, will become the main floor of the station where the new ticket office, baggage room, newsstand, telegraph and telephone facilities and the lobby will be located. The upper floor, which is the present train floor, will consist of a waiting room, toilet rooms and lunch room. The street approaches to the station will be regraded to the lower level instead of to the present train floor. Work on a new boiler house is about finished, so that the boilers and the machinery can be removed from the present station. The company expects that work on the improvements will be completed this year. (August 7, p. 269.)

Pocatello, Idaho.—The Oregon Short Line has awarded a contract for the building of a new passenger station at Pocatello, Idaho, to Lynch-Cannon Engineering Company of Salt Lake. The cost is estimated at $150,000.

Richmond, Va.—The Southern Railway has given contracts to the John T. Wilson Company, Richmond, Va., for building the new freight house at Richmond, also for building the combined freight and passenger station at South Richmond. (June 26, p. 1607.)

Spartanburg, S. C.—An officer of the Piedmont & Northern writes that a contract has been given to J. A. Jones, Charlotte, N. C., to build a brick warehouse 100 ft. by 140 ft., and this work is now under way. The cost of the new structure, which is to have three stories, will be $40,000. (July 31, p. 228.)

Railway Financial News

Colusa & Lake.—This company has discontinued passenger service and will run freight trains only. At a recent meeting of the directors the reports showed the passenger and mail service was being operated at a loss, while the freight business was profitable. The state railroad commission was notified and granted permission to discontinue the service. The road connects with the Southern Pacific at Colusa Junction about 50 miles north of Sacramento, Cal. It will maintain an irregular freight service between Colusa and Sites to take care of grain shipments from the foothill section and merchandise shipments for Colusa and Sites.

Denver & Rio Grande.—See Western Pacific.

International & Great Northern.—On the application of the Central Trust Company of New York, the United States District Court at Houston, Texas, has appointed James A. Baker, of Houston, Texas, and Cecil Lyon, of Sherman, Texas, receivers. This action was taken by a committee of noteholders in order to forestall any possibility of similar action in the state courts inasmuch as it was desired to keep the property under supervision of the Federal Court. The notes on which the action was taken amount to $11,000,000, secured by an issue of $13,000,000 first refunding mortgage bonds held by the Central Trust Company.

A statement by Thomas J. Freeman, president of the road, said it was impossible to meet either interest or principal of the notes due August 1, and as there was no market for the bonds a default resulted. The road operates about 1,100 miles of line, all in Texas.

Alexander J. Hemphill, president of the Guaranty Trust Company, New York, and chairman of a committee of bankers which was working for an extension of the notes, to be made conditional on an option for taking control of the property away from the Goulds, is quoted as saying that the plan to extend the notes will not be abandoned. A new agreement will be prepared calling for deposits. Following a meeting of the Hemphill committee a statement was issued to the effect that, in view of the receivership, the committee ought to be clothed with such additional powers as will enable it to act for the noteholders in any situation that may arise. The committee, representing a majority in amount of the notes, has constituted itself a protective committee, with the broader powers which the changed conditions have made necessary. Holders of the notes are requested to deposit their notes at once with the Guaranty Trust Company.

The $11,000,000 notes now defaulted were sold to bankers in 1911 as part of a reorganization plan for raising working capital to take the road out of receivership. The property was sold under foreclosure June 13, 1911, the newly formed company taking possession three months later.

Lake Shore & Michigan Southern.—See New York Central.

Missouri Pacific.—The attempt of the management to get funds in Europe having failed the road will begin a policy of retrenchment. President Bush has just returned from a trip to Europe. Even though war had not been declared, he said there would have been slight hope of floating American railway securities in Europe. Accordingly, arrangements for the expenditure next year of $4,000,000 on improvements have been dropped.

See Western Pacific and also International & Great Northern.

New York Central.—The minority stockholders of the Lake Shore & Michigan Southern who, unsuccessfully, brought suit in the Federal court in Michigan to prevent a consolidation of the Lake Shore & Michigan Southern with the New York Central & Hudson River last week entered suit in the Federal District Court in New York. An equity suit was filed through the law firm of Cadwalader, Wickersham & Taft, to enjoin the merger. It is alleged that since the Central secured control of the Lake Shore in 1898, the management has juggled its books so as to keep the minority stockholders in ignorance of the actual earnings. Since 1897, it is alleged, $187,000,000 of the earn-

ings of the road which should have gone to the payment of dividends has instead been devoted to expenditures which ought to have been charged to capital account. The plaintiffs in the suit are Annie L. DeKoven and Cecil Barnes, of Chicago, as trustees under the will of John DeKoven, who owned 500 shares of Lake Shore stock. Other minority stockholders join in the suit with them. They say that the property of their road is more valuable than that of the Central and that the consolidation was undertaken to aid the Central in its costly undertakings in connection with the construction of the new terminal in New York.

New York, New Haven & Hartford.—The directors of this company have come to an agreement with the United States Department of Justice by which the government will withdraw its suit for the dissolution of the company; the principal feature of which appears to be a clause intended to shorten the time to be allowed for the company to make some disposition of its Boston & Maine shares. Next January, when the Massachusetts legislature meets, the directors will have an opportunity to try to secure a modification of the law of that state which restricts the market for these shares.

The directors ratified the new agreement August 11. Under its terms the road passes its title to the Boston & Maine to trustees, who will endeavor to sell the same within one year, and the department agrees to drop its suit. A statement issued by President Hustis says:

"In pursuance of the hope expressed in the statement of July 22 that a way might still be found to accomplish the peaceful dissolution of the properties, an agreement has been reached, which is substantially a renewal of the original agreement between the attorney general and the company in all respects except as to the Boston & Maine stock, and is in accordance with the vote of the stockholders at New Haven, April 21, authorizing a settlement with the government.

"The members of the board highly appreciated the courtesy of the attorney general and his co-operation in their endeavor to solve the problem without inflicting unnecessary loss upon the shareholders and to effect a rehabilitation of the property in the interest of the public."

By the terms of the agreement a stipulation will be filed in the United States Court in New York City, in which the New Haven will agree to transfer its title to its Boston & Maine stock to a board of trustees, headed by former Chief Justice Marcus P. Knowlton, of the Supreme Judicial Court of Massachusetts, these trustees to have all the power of owners of the stock in disposing of the same within one year, it being understood that on the presentation of reasonable ground for delay in selling, further time may be granted by the court.

It is agreed that any questions of law involved in the sale of the Boston & Maine stock shall be submitted to the courts. This leaves the way open for the New Haven to attack the constitutionality of the law, by which the state of Massachusetts retains a perpetual option on the Boston & Maine, in the event that the legislature at its next session, in January, does not satisfactorily amend the law.

The stocks of the Connecticut trolley companies are to be transferred to a board of trustees, headed by Judge Walter C. Noyes, of New London, which is to dispose of the roads before July 1, 1919.

The Rhode Island trolley roads are to be transferred to a board headed by Rathbon Gardner, of Providence, with instructions to sell the same by July 1, 1919.

The minority stock of the Eastern Steamship Company is to be disposed of before July 1, 1917.

The Berkshire trolley lines are to be sold within five years from July 1, 1914.

The question of retaining the Sound Steamship lines is to be decided by the Interstate Commerce Commission, in accordance with the provisions of the Panama Canal act.

It is further understood, but not made a part of the stipulation, that the Department of Justice will view with approval any act of the legislature of Massachusetts that will tend to make easier the sale of the Boston & Maine, which, by the terms of the law enacted at the last session of that legislature, is made subject to a perpetual option to the state of Massachusetts.

Howard Elliott, who is now president, as well as chairman of the board, is expected to be at the New York office of the company on August 17. It is said that Mr. Elliott has greatly profited by his rest in the woods. He had worked ten months without as much as a Sunday off.

Credit for reaching an amicable settlement appears to be given to President Wilson, who, though he authorized the filing of the dissolution suit, seems to have taken effective action to check the litigation.

Particular prominence is given in the press despatches, especially in the yellow journals, to the fact that the present agreement will not prevent the attorney-general from prosecuting individual directors for any criminal acts that they may have committed; and one paper says proceedings of this kind will be begun in the courts in two weeks; but there is no reliable evidence that anything is being done. No call has yet been issued for a special grand jury to consider the case, and the law requires ten days' notice to jurymen.

President Hustis, in a second statement, said:

"An erroneous impression seems to have gone forth that the company has yielded in its settlement concerning the time limit.

"The agreement between the attorney-general and the representatives of this company of March 21, which was ratified by the stockholders, provided that the company should have two and one-half years from July 1, 1914, to complete the sale, but, for good cause shown, the time may be extended by the United States District Court.

"The arrangement just agreed to provides that the company shall have until January 1, 1917, to dispose of the stock, unless, for good cause, the court grants additional time.

"But if by July 1, 1915, the New Haven company and the Massachusetts legislature agree on terms on which this control shall be parted with, satisfactory to the United States and approved by the court, such plan shall be adopted by order of the court."

Oklahoma Central Railroad Company.—This is the name of the new corporation which has been chartered in Oklahoma to take over the Oklahoma Central Railway, sold, on July 31, by order of the court. The new company has an office at Muskogee, and the incorporators are H. A. Gibson, R. D. Long, William M. Cutlip and J. A. Lathum. Muskogee is 100 miles from the nearest point on the Oklahoma Central, and is 50 miles from Tulsa, the nearest point on the Atchison, Topeka & Santa Fe.

Pennsylvania.—The lease of the Northern Central went into effect August 1, and the Pennsylvania Railroad Company now operates all lines formerly operated by the Northern Central Railway Company. The Erie division of the Pennsylvania Railroad and the Northern Central Railway have been consolidated under the name of Central division—Pennsylvania Railroad Company. Until further notice the subdivisions and branch roads included under the Erie division of the Pennsylvania Railroad and the Northern Central Railway will continue to be operated as subdivisions and branch roads of the new Central division. The name of the former Central division of the Philadelphia, Baltimore & Washington has been changed to Media division. All of the lines embraced in the new Central division were already operated under a single general superintendent.

Western Pacific.—The directors of the Denver & Rio Grande have voted to pay the semi-annual interest of 2½ per cent. on the first mortgage bonds of the Western Pacific, notwithstanding that the earnings of the road have not been sufficient to meet the entire amount. The deficit will be made up by the Denver & Rio Grande. The interest will fall due September 1. The directors add: "If the Denver & Rio Grande is to continue its support of the Western Pacific some plan of readjustment of Western Pacific finances and the relation of Denver & Rio Grande thereto must be devised which will be acceptable to the holders of the Western Pacific first mortgage bonds, and a call for the deposit of these bonds will be put forth at an early date by a committee of responsible bankers looking to the adoption of a plan which will at once lighten the burden which the Denver & Rio Grande is now carrying, to place the financial structure of the system upon a basis of recognized solvency and credit, and, as far as may be practicable, provide means for the development of the Western Pacific.

"The payment of interest, which will fall due on September 1, 1914, has been decided upon in order to give time to prepare, submit and consider the proposed plan. Money is already assured for the payment of the interest."

Instructive Strike on a State Railway

Some months ago a bad strike took place on the government railways of South Africa. The government suppressed it by armed force. In doing so it was supported by public opinion. Only now has the *Railway Age Gazette* been able to get an article presenting somewhat fully the facts about this strike. It is considered worth while to publish it even at this late day, because it may have a lesson for the people of this country, and especially for railway officers and employees. The advocates of government ownership of railways persistently represent this policy as a remedy for strikes. The strike in South Africa was but one of numerous examples which state railways have afforded that public ownership is not a preventive of strikes. It also furnishes an example of the way in which labor unions and strikes are likely to be dealt with on government railways. The railway employees who read the story are hardly likely to find in it an argument from their standpoint in favor of state ownership. It illustrates the facts, as other incidents of a similar character have illustrated them, first, that public ownership is not a preventive of strikes, and, second, that when strikes do come on state railways they are much more likely to be short-lived than on private railways because public sentiment and the government are almost certain to take a determined stand against the strikers.

Abuse of the Parcel Post

As an incident of the European war, and the upheaval in the American money market, fifty-seven tons of gold was sent by parcel post from the Mint in Philadelphia to the Sub-treasury in New York. This trick of the government to get railroad transportation for nothing is not new, for ten carloads of gold were sent by registered mail, several years ago, from San Francisco to New York. A railroad president who was accused of padding the mails, during the weighing period, on his small road in Iowa, a few years ago, was indicted in court as a criminal and, we believe was punished; but it is difficult to see any great difference between his act and this one of the government. Sending big bags of gold by parcel post is legal, apparently; and so was the sending of tons of grain last year in Colorado, and of fruit in New Mexico; but everybody must admit that it is glaringly illegitimate. A postmaster in West Virginia has gone these fellows one better; it is related that he sent four barrels of flour by parcel post and thereby raised his office from fourth class to third, and secured an increase in his annual salary! These incidents, small in themselves, all combine to reinforce the demand that Congress take hold of the mail-pay question and settle it on a rational basis. The petty policies of the postoffice department are highly discreditable.

Varied Parcel-Post Philanthropies

Though Uncle Sam is by no means generous in his payments to the railways for handling the mails and the parcels, he is far from stingy with some of the contractors who operate star routes. This is strikingly illustrated by an incident of which the *Railway Age Gazette* has just learned the details. A certain contractor has the mail star route between Holbrook and Snowflake, Ariz. Recently this representative of the government bought 10,000 lb. of barley at Mesa, Ariz., on the Arizona Eastern, and shipped it by parcel post via Holbrook to Snowflake. The barley cost him 95 cents per 100 lb. at Mesa. The postage on it from Mesa to Snowflake was $1.08 per 100 lb. Therefore, laid down at Snowflake the barley cost him $2.03 per 100 lb. For transporting the barley via parcel post from Holbrook to Snokflake the contractor received from Uncle Sam $2.25 per 100 lb., or 22 cents per 100 lb. more than the cost of the barley plus the postage on it to Snowflake. In other words, in effect Uncle Sam

made this enterprising mail contractor a present of the barley and also of the transportation of it and, in addition, gave him 22 cents for accepting his Uncle's beneficence. His 10,000 lb. of barley laid down at Snowflake cost him just $22 less than nothing. The person who furnished the foregoing information added, "This fellow seems to have a good business head on him and no doubt will go into the business of retailing barley at Snowflake quite heavily. He is said to be figuring also on shipping baled hay in 50-lb. packages by parcel post." The distance by rail, Mesa to Holbrook is 340 miles; Holbrook to Snowflake, 30 miles. Which means that the contractor gets 22 cents per 100 lb. more than the cost of the barley, plus the postage on it, for hauling it 30 miles out of a total haul of 370 miles, the railway furnishing the other 340 miles of the transportation! We concur in the opinion that "this fellow seems to have a good business head on him." But how about the heads of the statesmen and postoffice department officers who have made this extraordinary transaction possible? Meantime, government officers will continue to send out from Washington long lectures on the inefficient and wasteful way in which the railways of the United States are managed!

German Criticism of State Railroads

Nowhere else has nationalization of railways been so extensively adopted as in Germany. Nowhere else, as is conceded by both the advocates and opponents of government ownership, has the management of state railways been so efficient. But even in Germany satisfaction with the results of government ownership is far from unanimous. A recent letter from a Berlin correspondent to the Springfield (Mass.) *Republican*, which we publish elsewhere, reviews numerous serious complaints which are being made in Germany against the state railways, and especially against the best of them, those of Prussia-Hesse. It is being charged that the Prussian railways have too many officers and employees, that their freight rates are kept too high in order to yield large sums to the public treasury; that rates are so adjusted as unfairly to discriminate between different classes of business concerns; and that government ownership has not remedied or prevented but aggravated the evils of monopoly, because the state railroads constitute a monopoly more powerful and arbitrary than any practicable combination of private corporations. A great evil on the German state railways, to which this correspondent does not refer, is the chronic and severe shortage of cars in seasons of heavy traffic movement. The criticisms of their railways being made by German economists and business men may not all be justified, but they refute the statement so often made by advocates of government ownership in this country that the results of nationalization in Germany give the "greatest satisfaction."

THE PRACTICAL MINIMUM GRADE

THEORETICALLY, the point at which an increase in expenditure to secure a lower grade, and thereby a reduced cost of transportation, ceases to be justified because of a disproportionate increase in fixed charges, is capable of accurate determination. Practically, the assumptions which must be made regarding the amount of traffic and other primary considerations are so largely a matter of judgment that the opinions of different railroad men vary widely. At no period in our railway development has this subject received so much attention, or have such large expenditures been made to secure low grades, as during the past few years. It is therefore highly important that the elements of uncertainty be reduced to the minimum. Many men seriously question whether some of the heavy expenditures now being made are justified, in view of the traffic to be handled now or to be reasonably expected in the future, and whether the fixed charges are not being increased unwisely to secure a low transportation cost.

This question was brought up in the recent investigation of and report on the construction of the National Transcontinental Railway by the government in Canada. On this line ruling grades of 0.4 per cent. eastbound and 0.6 per cent. westbound were adopted, resulting in heavy expenditures for construction, although it will undoubtedly be many years before the freight traffic will amount to over two or three trainloads each way daily. The increased expenditures necessary to secure these low grades through a country now largely a wilderness have been severely criticized. Other conspicuous examples of low grade lines constructed at heavy cost in recent years are the Spokane, Portland & Seattle, from Spokane to Portland; the Virginian and the Carolina, Clinchfield & Ohio, from the coal fields in West Virginia to the Atlantic seaboard; and the new line of the Erie between Meadville, Pa., and Corry, where the adoption of a 0.2 per cent. grade made necessary very heavy work. An instructive contrast in the ideas of different railroad men on this subject is afforded by the construction of the Spokane, Portland & Seattle and the new line of the Oregon-Washington Railroad & Navigation Company, between Spokane and the Columbia river, which is now being completed. The latter line is built generally parallel to the Spokane, Portland & Seattle, with a ruling grade of 0.6 per cent., as compared with a 0.4 per cent. grade on the North Bank road.

The advocates of these low-grade lines point to the low resulting transportation cost as a justification of their policy. On the Carolina, Clinchfield & Ohio, for instance, the transportation ratio for the fiscal year ending June 30, 1913, was only 17 per cent. It is not necessary to emphasize the importance of a low transportation ratio to the successful operation of a railway, or the fact that this becomes increasingly important as the amount of traffic increases. It is, therefore, generally recognized that it is entirely proper and advisable to anticipate the probable increases in traffic which may reasonably be expected within the next few years when planning on any improvements. It is also recognized that it is more expensive to reduce grades under traffic than when originally constructing a line.

On the other hand, it requires a heavy traffic to enable the reduced transportation cost to offset the heavy fixed charges on many of these low-grade lines, and it is difficult to determine how some of them, with two or three trains daily, vindicate the expenditures made. For example, the North Bank road, which was one of the early low-grade lines constructed through a heavy country, has failed to earn its fixed charges for the last three years, although it has now been in operation over six years. A careful estimate made previous to the authorization of a very expensive piece of grade reduction recently on a line handling a dense traffic, showed that even with this heavy traffic the improvement could be justified only in the light of the increased traffic expected a considerable time in the future.

The mere fact that a low-grade line earns a fair return on a large investment is not necessarily a vindication of the expenditure, for it is conceivable that the operation of more trains on a line constructed with heavier grades and at a reduced cost, would result in even greater profits in excess of interest charges. Another influence which must be considered at the present time is that of electrification. The electric operation of freight lines, especially on heavy grades, has not been developed far enough in this country to enable one to determine definitely what this method of operation will accomplish. But electrification must be considered as a possible alternative to low-grades in the near future. While transportation costs can be reduced by the reduction of grades at any time, the fixed charges are permanent.

It is not the intention here to criticize low-grade lines in themselves, but to raise for serious consideration the question whether grades are not sometimes being reduced below the economical limit for handling either the present traffic or that which may be expected in the near future. No one will deny the economy of a low-grade line, or will question the advisability of securing low grades, where this can be done at a reasonable expenditure. But it would seem that the advisability of the heavy expenditures which are being made on some lines are open to question.

AN EMERGENCY ADVANCE IN FREIGHT RATES?

A MOVEMENT has been started by J. S. Bache & Co., members of the New York Stock Exchange, for an immediate and substantial advance in freight rates as a means of dealing with the emergency confronting the American railway industry as a result of the war in Europe. We publish elsewhere a letter which this firm has sent to 32,000 bankers throughout the United States, urging them to petition Congress to pass a resolution requesting the Interstate Commerce Commission to revise its recent decision in the eastern rate advance case and to promptly grant further and adequate advances in rates to all the railroads.

It is impossible accurately to appraise the position in which the war has put the railways and other business concerns of this country, or to foresee what future developments in respect to them will be. There are, however, certain salient facts regarding the railway industry which should be given careful consideration by the public, by Congress and by the commission.

The people of Europe have invested large sums in the securities of American business concerns. A very large majority of these investments have been made in the securities of American railways, and only a relatively small part of them in the securities of American industrials. From the time when war began to be seriously threatened until the stock exchanges were closed European investors dumped American securities, and especially railway securities, on the markets as fast as they could, the purpose being to take as much gold from this country to Europe as possible. The effect was rapidly to drive down the prices of American securities, and especially of American railway securities. How low our railway securities would have gone under this hammering if the stock exchanges had not been closed when they were nobody can tell.

The closing of the stock exchanges arrested the flood of railway securities coming home. But the war abroad destroyed the foreign market for American railway securities; and the closing of the stock exchanges has temporarily destroyed their home market. It may be that in a relatively short time the home market for them will be reopened; but the foreign market will not exist again until the war is over.

This means that the demand for American railway securities has been heavily reduced. If the supply of a thing offered in the market continues undiminished while the demand for it is thus curtailed, there can be but one result. That is, a great decline in its price. If, therefore, the prices at which American railway securities can be sold are not to be heavily reduced—and they were already very low when the war began—either the supply of them offered for sale must be curtailed, or by some means the demand for them must be stimulated.

It is easy to foresee the consequence of a reduction of the supply of securities issued. New securities must be sold to raise capital for new construction and permanent improvements, and a reduction in the supply of them put on the market must result in a proportionate reduction in the amount of expenditures for permanent improvements and new construction.

Assuming that it is not desirable that the amount of capital raised by railways for permanent improvements and new construction shall be reduced, how can the demand for their securities be maintained where a sufficient supply of them can be sold to raise the needed capital? There is but one way in which that can be done, and that is by so increasing the rates and net earnings of the railways as to enable them to pay rates of interest on their bonds and rates of dividend on their stocks which will make them attractive to a larger class of American investors.

Before the European war began it was conceded by all persons familiar with business conditions that the main thing needed to revive our industry and commerce was a renewal of railway development. The situation of the railways certainly has not been improved by the destruction of the foreign market for their securities and by the enormous reduction in their export traffic. Is it not desirable, for the general commercial and industrial welfare, that some energetic and far-reaching action be taken to strengthen the position of American railways, and thereby the position of American business generally? If the general of an army knew there were various weak places in his lines, but that there was one very important place which was the weakest and most vulnerable of all, would he not regard it as the part of wisdom to devote himself first of all to strengthening that place? And if the weakest place of all in the lines of American business is the condition of the railways, is it not the part of wisdom to devote ourselves at once to strengthening their position?

NEW BOOKS

Influence Diagrams for the Determination of Maximum Moments in Trusses and Beams. By Malverd A. Howe, Professor of Civil Engineering, Rose Polytechnic Institute. Size 6 in. by 9 in., 65 pages, 42 illustrations, bound in cloth. Published by John Wiley & Sons, Inc., New York. Price, $1.25.

The method of applying influence lines in analyzing trusses, arches and beams, is made clear in this little book, recently issued. The author begins by stating the single simple rule for drawing the influence diagram for all ordinary trusses, and follows this with numerous examples covering all cases for simple trusses. He then shows that the influence diagram for continuous trusses, cantilever trusses, arches and beams are based upon the same general diagram as is drawn for simple trusses. These diagrams are applicable without any computation. The diagrams shown in the book are constructed for moments, but the same rules can be used in drawing diagrams to indicate stresses or areas of truss members.

Terminal Facilities of North Pacific Ports. Compiled and edited by Welford Beaton. Size 5 x 7 in., 336 pages, cloth binding. Published by Terminal Publishing Company, 309 Burke Building, Seattle, Wash. Price $2.

Although this book is primarily intended for the steamship owner or shipper of goods by sea it is of great value to the railroad man who finds it necessary to have a good idea of the peculiarities and advantages of the Pacific coast ports from San Diego, Cal., to Nome, Alaska. The book contains most detailed information concerning the essential features of each of the ports considered, including the regulations governing the entrance of ships, the depth of water in the harbor and approaches, the wharfage, pilotage, storage and other charges assessed against either the ship or the cargo, the piers, the boat lines operating from the port, etc. In addition there are also lists of the American consuls stationed in foreign countries, list of consuls of other countries stationed at the Pacific ports, customs regulations, comparative tables of foreign monetary and other standards and much other useful and necessary information of that character. It is the intention of the editors to publish the book annually.

Air Brake Association. Proceedings of the 1914 convention. Illustrated, 242 pages. 6 in. by 9 in. Published by the association. F. M. Nellis, 53 State street, Boston, Mass., secretary. Price $2.

The Air Brake Association has made a record this year in placing the bound volume of the twenty-first annual convention in the hands of the members about two months after the convention met. This year's report includes addresses by H. H. Vaughan, assistant to vice-president, Canadian Pacific, and W. A. Garrett, formerly chief executive officer of the Pere Marquette, together with papers on Air Hose, Caboose Air Gage and Conductor's Valve, Electro-Pneumatic Signal System for Passenger Trains, Modern Train Building, and the report of the committee on Recommended Practice. Other subjects discussed were the Clasp Type of Foundation Brake Gear for Heavy Passenger Equipment Cars, and One Hundred Per Cent. Efficiency of Air Brakes. A tribute to George Westinghouse is also included in the proceedings. By prompt action of the executive committee immediately following the convention in Detroit, the secretary has been able to include in these proceedings the list of subjects selected and the committees appointed to report at the twenty-second annual convention, which will be held in Chicago, May 4-7, 1915.

Letters to the Editor

A PENNY SAVED IS AS GOOD AS A PENNY EARNED

New York, August 4, 1914.

To the Editor of the Railway Age Gazette:

The recent decision of the Interstate Commerce Commission advising economies in the railway field will warrant me in suggesting a means of saving which I adopted in Mexico in 1902. In that year, while superintendent of construction for the National Railways, the change of gage of that line was under way, and we were short of freight cars. Standard gage box cars had been received with a marked capacity of 80,000 lb., the cars weighing 36,000 lb. Flat cars received at the same time were marked, capacity 80,000 lb., and tare 32,000 lb.; or 4,000 lb. difference between the two. Trucks, journals, axles, wheels, trussing and all parts below the decks of the cars were identical. I took advantage of the difference and loaded the flat cars to 84,000 lb. regularly.

Since then I have had charge of two roads in operation and found the same error carried out in their equipment. I changed this, and on one of those lines increased the average load handled nearly one ton per car.

What is true of flat cars is true of gondolas, coal and ore cars; and, while it is true that there are few items other than rails, heavy machinery and sometimes timber that will load a flat car to capacity, this is not true of coal, ore and other such commodities.

I examined the cars of one of the big lines entering New York a few days since and noted that the same error still persists. It is obvious that there is no stress on tracks, bridges or any other railway structure which differs on account of whether the weight above center bearings is part of the paying or of the non-paying load.

H. M. Taylor.

A CRITICISM OF RAILWAY COST ACCOUNTING

Baltimore, Md., August 2, 1914.

To the Editor of the Railway Age Gazette:

Referring to editorials and articles in your issues for July 24 and 31 on the division of expenses between passenger and freight service, I desire to call attention to a fundamental defect in the process.

What would be thought of a farmer who had five bins, into the first of which he miscellaneously dumped his wheat, oats, barley and corn; into the second, potatoes, carrots, onions and beets; into the third, apples, peaches, pears and plums; into the fourth, cherries, currants, blackberries and gooseberries; into the fifth, beans, peas, squashes and cucumbers? How difficult it would be to determine the quantity of each, and what amount of labor would be necessary to sort them out for market or for use!

Yet this is practically what is now done in railroad accounting, even to the mixing of passenger, freight, material and labor.

No cost accounting can be had until recourse is had to its fundamental basis, namely, a separation of its different particulars.

Material and labor are two entirely distinct and separate elements, in cost, of which a knowledge is necessary. Separation at the outset of any expense is simple and easy; separation after heterogeneous items have been combined is difficult and costly.

Properly designed and used requisitions for material, permit of such sortings and resortings as will give knowledge to any desired refinement. Work tickets, or service cards, will do the same for all labor.

Itemized items of this kind analyze themselves; being separately tabulated, the aggregates furnish the knowledge upon which correct judgments may be based.

No analysis of the present jumbled up reports can ever yield a basis for accurate thinking or furnish unit costs that will not be open to successful attack.

F. Lincoln Hutchins.

AN APPEAL FOR RELIEF FOR THE RAILWAYS

J. S. Bache & Co., members of the New York Stock Exchange, have sent a letter to 32,000 bankers in the United States urging them to take steps in the direction of securing an immediate and substantial advance in railway rates as a means of strengthening the business position of the nation. Their letter is as follows:

"Owing to the great European war, our financial situation is under an emergency pressure, because threatened by the unloading of railroad securities held by Europe.

"Our securities are in disfavor because of low railroad earnings.

"They should at once be made attractive to capital all over the world.

"This cannot be done unless our railroad securities are given a safe margin of earnings. The value of all other securities depends upon the success of the railroads.

"The railroads have proved and the Interstate Commerce Commission has admitted the necessity of enlarged revenues, but the rate decision grants only a meager and insufficient pittance—not more than enough to increase earnings one-eighth of 1 per cent on the total capital of the eastern railroads which made the application.

"This small advance will have no effect in restoring and establishing the confidence of the large investors here and the holders of our securities abroad.

"These securities will be sent over as soon as possible to do so, to draw our gold or its equivalent, and they will not be taken up freely by our own large investors because they have not sufficient confidence in the success of the railroads under the present scale of low freights.

"Rates need to be advanced materially in order to give such a margin of earnings that railroad securities will be sought.

"Further than that; the credit system of the world has been upset. We have lost Europe as our bankers. We not only cannot hope to place new securities in Europe: We are compelled to take back vast quantities of existing securities which for many years Europe has been absorbing. Every year our railroad systems have to spend enormous sums to increase and extend their transportation facilities to meet the growing demands of American commerce. Where are the railroads to obtain the money with which to make the needed additions and improvements? They cannot turn to Europe: American investors are not attracted under present conditions; they will have to look to their earnings until the confidence of investors is restored.

"Needed raises will start all the business of the country towards a prosperous level, because of the confident buying of railroad securities which will then take place, and because of the heavy purchases which the railroads will then be able to make, but cannot make now because of lack of funds and credit.

"This is now a national question and relief should be given to the railroads immediately, in view of the emergency necessity.

"We, therefore, earnestly suggest that you bring this matter at once to the attention of your representatives in Congress, and if you agree with us, urge them to favor the passing of a joint and concurrent resolution of the House and Senate directed to the Interstate Commerce Commission, requesting it, because of the emergency situation with reference to railroad securities, to review and revise the decision in the recent application of the eastern railroads, and in their discretion and in view of the great and extraordinary necessity for this action, to promptly grant further and adequate advances to all the railroads.

"No financial move could be more beneficial now than to make our securities so attractive that the funds of the investing world would be irresistibly drawn to this country.

"This would be accomplished if the railroads were given full and ample earning power. It would stimulate the whole industrial structure and enhance the values of all other securities.

"Will you give this matter your earnest attention and will you kindly let us know if you agree and will act?

"If you approve, please ask some of your larger shippers also to write or telegraph to Washington."

The Operation of Large Classification Yards

Third Series* of Abstracts of Papers Received in the Recently Decided Contest on This Important Subject

EFFECT OF OUTSIDE INFLUENCES ON YARD OPERATION

By F. Lincoln Hutchins
Baltimore, Md.

Efficient operation of yards depends mainly upon right conditions. Little improvement can be expected until many things, extraneous to the jurisdiction of the yardmaster, have been changed. Small kinks and minor improvements will scarcely affect the tremendous terminal expense, which Hadley says has grown during the last 20 years so that, while the cost of line-of-road movement has been enormously decreased, the cost of yards and terminals has been tremendously increased.

The problem deserves wider treatment, for this gradually increasing cost is mainly due to faulty management. Moreover it is difficult to see how special methods can be made of general application. No two yards are alike in arrangement or in the class of business that they handle, and the methods which would be of great efficiency in one situation might prove to be very inefficient in another. Hence an article devoted to the consideration of more efficient and more economical yard management must take up matters outside of the regular yard operations.

At the outset it may be questioned if the establishment of large yards leads to economical operation. It is the universal testimony that no yard was ever made large enough to hold all the cars that tend to come to it. The temptation is to overcrowd any yard that has a reputation for bigness. Every one at a distance thinks that its capacity is unlimited, with the result that more switching is created, more storage demanded, and there results a general movement of cars towards it from all the contiguous territory. The inevitable consequence of all this is that the large yard is often worse off for room to properly carry on its functions than before its enlargement.

The location of classification yards in many cases is open to criticism. Economical working conditions are sacrificed to accidental ownership of land, geographical situation, divisional boundaries and other considerations. How seldom is the man nearest the work called in to consult with the engineering department in deciding what arrangement will best conserve economical working? Who is so well qualified as the yardmaster to know the movement of traffic and the particular arrangement of tracks that will permit of the greatest facility in handling it?

Yards at connecting points, either with other roads or with different divisions of the same system, lead to large losses through dumping into them heterogeneously marshaled cars, followed by the turning over to the connections of cars in like disorderly array. It is the rule, rather than the exception, to depend upon large classification yards to correct the lack of orderly arrangement in collecting and despatching cars along the line. "Let George do it" is a costly method of procedure when the total travel of the car is taken into consideration and when it is taken into every classification yard for re-classification during its journey.

The highest economy in yard operation is to be obtained by keeping cars out of yards to the greatest extent possible, although the contrary practice is now the rule. The reputation for large yard capacity encourages the idea that accommodation exists for the storage of large numbers of cars from which selections may be made to suit the convenience of wholesale shippers. Cars thus held for disposition cause large expense, which is not properly appreciated. This expense is also further needlessly increased by permitting shippers to order forward certain products by car number. Orders to forward certain kinds, or grades, would greatly reduce such expense, for instance, in the matter of coal.

The first need is to adopt all possible means to keep cars out of classification yards. In the fast freight service it has been found that this requirement is imperative to secure quick despatch and that it is necessary to so make up the trains as to secure the longest rolling distance without yard service. Similar attention to ordinary freight would tremendously decrease the cost of yard service, increase per diem mileage of cars, and effect other economies. The Pittsburgh & Lake Erie is a notable example of the application of this principle. Large yards were vetoed and small accumulating points were established from which solid trains for terminal points of the road were run without breaking up at the different yards.

Parsimony in matter of inspection is very expensive. General officers examining payrolls are likely to cut out inspectors and in so doing increase other yard expenses far beyond the picayunish amounts that they think they have saved; enough attention is not paid to the costly result of delays to the switching locomotives and crews, to say nothing of the preventable breakdowns on the road. Economical inspection is only obtained when it is absolutely thorough, and sufficiently rapid to interfere least with the regular routine of yard work.

Yard records have further largely increased yard costs, and needlessly so, for the reason that improvements in accounting have not kept pace with the growth of business. The present reports are inefficient and require unnecessary duplication. The ideal car record is obtained by having an individual slip for each car, either brought in with the car or made upon its arrival. Such a slip formed to carry all the information that may ever be needed as to car or contents permits of instantaneous reply to all possible inquiries and prevents all duplications. Such records when aggregated will furnish results of all yard operations to as fine a degree of refinement as may be desired with a minimum of cost and avoid the necessity of taking lists of yard, either daily or periodically.

Lack of regularly scheduled work for switching crews is partly due to the irregular nature of the business, but where such schedules have been installed there have resulted a betterment in operation and great reductions in cost. Yard operations may be scheduled, as are trains on the road; it would be as unfair to say that this is impracticable in yard work, because of irregularities, as to say that scheduling of trains is impracticable because wrecks and other delays occur on the line.

Many yardmasters endeavor to carry all the confused and complicated operations of their yards in their own minds, making conductors of switching crews work under their specific instructions. This is a most inefficient method, leading to costly use of power and labor. The most economically worked yard is where the yardmaster has the least to do; that is, where the regular operations of the yard are properly scheduled and the individual conductors are held responsible for the fulfillment of the schedules given them. Having definite tasks a conductor is better able to utilize his time and to avoid extra moves, while without such schedules one cannot plan ahead or take advantage of accidental happenings, while losing much time in obtaining special orders for each piece of work.

Orders from traffic and other high officials for special movement of cars is a grave hindrance to orderly prosecution of yard work. This practice has cost very large sums, unknown to the managers, because the accounting methods are not fitted to divulge the expense consequent upon this practice. Until it is realized that patrons of the road, however important, are not entitled to special, out of order service, not much can be done to obviate the expense due to this uneconomic operation.

Marvelous differences are found in the capability of men in the effective handling of a yard locomotive. I had working for

*The prize article and several others were published in the issue of July 3, and several other contributions were also published in the issue of July 24.

me at one time a genius in this line. A person watching would be puzzled to know what he was trying to do, for apparently he was mixing up rather than sorting out; but by cutting his train in a certain place and keeping one class of cars with his locomotive, thus giving him an extra track, he was able to marshal the cars on a limited number of tracks in the required order with a minimum number of moves. Such a man as an instructor can do much to educate other men in the proper handling, thus reducing the cost of the operations. What railroad has secured expert yard operators and sent them out to its different yards to instruct the local men as to the best switching practice?

Many conductors haul their trains just over the switch point and push the car or cars they wish to detach onto the proper track; then again, moving out just over the switch, they repeat the operation for the next cut and so on until they have disposed of all the cars. If, instead of so doing, they had hauled the cars further away from the switch in the first place, they might have made all the cuts without calling for one movemer of the reverse lever, saving in engine expense and in the time of the crew.

In these days of "safety first" it may seem unwise to suggest that brakemen be required to catch slowly moving cars for the purpose of riding and braking them, but properly done this is not a dangerous proceeding, as is well proved by many years of this practice upon many roads without unfortunate results; only in this way may a train be broken up with the least loss of time and with a proper degree of safety. With sufficient leeway several cuts of cars may be moving to their several different destinations at the same time with the greatest effectiveness and economy of operation.

ADVANTAGES OF ADVANCE INFORMATION ON TRAIN CONSISTS

By Jas. D. Schaefer
City Passenger Agent, Chicago, Milwaukee & St. Paul, Pittsburgh, Pa., and Nelson J. Flocker
Bessemer & Lake Erie, Pittsburgh, Pa.

A yard is not intended primarily to hold cars, but as a place from which they are to be despatched. Of primary importance in the efficient operation of a large classification yard is its location. Much depends on this with regard to grades and dimensions, with the view of projections in the future. Many yards are hampered for room to take care of the increased traffic over that handled when they were originally laid out. In this connection it is well to call attention to the fact that many present-day yards are the outgrowth of a layout of tracks designed to take care of the traffic of 20 or more years ago, when business was light and cars were of small capacity and dimensions.

The despatch with which cars are prepared for movement over a hump depends on the system of marking. The present system in many yards is by crayon for loaded cars prepared from the manifest and for empty cars taken from the train, with a triplicate "cut sheet" prepared by the car marker. This sheet shows the number of cars in each draft and the track in the classification yards on which such cars are to be placed. The original copy (provided the switches are thrown from a tower) is furnished to the leverman, another copy to the car-cutter, and the third copy is kept and checked by the conductor and reported to the yardmaster to keep intact the data regarding the hump's operations. A suggestion for improvement of this method would be to have this information furnished the car marker by wire in advance of the arrival of a train, in order that switching lists could be provided, so that the cars will be marked for classification upon the receipt of the train. In this way the cars would be ready for hump classification without any material delay, and the hump would only have to perform the function for which it is primarily intended, namely, the classification of the equipment. Another advantage of this suggestion is that it does not require the same power to move a train of cars onto the hump when it is received under power as when the movement is a "dead" one. This feature would be aggravated in cold weather.

Perhaps the objection would be made to the suggested system that no opportunity would be allowed for inspection for bad order cars in the receiving yard. However, this could be obviated by a road inspection for such defects, before receipt at the classification yard, preferably at the water tank stop immediately preceding entrance into the receiving yard; bad order cars could be carded at that point. The defective cars could then be classified for repairs on the hump. In case a car becomes defective between the inspection preceding the entrance into the receiving yard and receipt at the yard it could be set out on the bad order track at the despatching end of the yard, as such inspection for light defects and air hose connection is always made at that point under present practice. Notation of many of the defects could also be made by switchmen or yard brakemen when going over the train to cut the air hose preparatory to moving the train over the hump. This method of handling cars preparatory to the hump classification does not in any way contemplate the discontinuance of the present manner of reporting, nor the abolition of the "cut-lists."

When one of the writers was assistant general yardmaster of one of the larger southern lines in Tennessee, there was a complete shutdown on empty cars on the division east of the point at which the classification yard over which he had jurisdiction was located. At that time he was making up through solid trains for five southern terminals. As they were being made up these trains had a fair proportion of company box and coke cars in their consist, the balance being perishable freight. The situation seemed to grow worse and it was necessary to reclassify to rush forward the perishable freight. A blockade was imminent, and while we got through all right a lesson had been learned. After clearing up the yard, a new system was inaugurated which was then an innovation in yard car handling in that region. Thereafter when word reached the office that there would be a shutdown on eastbound cars, we would classify all company cars and hold same on outside tracks. However, as fast as power could be obtained, foreign cars were moved out of the way, carded for movement toward home, with the result there was no reclassifying, and all cars were ready for movement in solid trains for the south. We were handling about 2,800 cars on an average daily, probably 33 per cent. foreign equipment.

SOME IMPROVEMENTS IN THE OPERATION OF A FLAT YARD

By Fred P. Grossman
General Yardmaster, Chicago, St. Paul, Minneapolis & Omaha, Minneapolis, Minn.

The use of hump yards for the classification and breaking up of trains works well in the fall when the business is heaviest. One engine on a hump can break up more trains effectively and classify more cars than an engine can in a flat yard, but it requires an army of switchmen and switch tenders to throw switches and keep the cars going onto the track assigned for each individual cut of cars. The damage to cars is also far greater on a hump than in a flat yard, and the claims following, coupled with the enormous amount of help required, must be kept in view.

I am in favor of a flat yard, with a graduating decline from the switch lead onto the various switching tracks. An engine on a lead of this kind can pull more cars up the lead, and it does not require as many switchmen and switch tenders to guard the movement of cars. Cars are not so easily broken, and the consumption of coal and water is about the same. The cars are allowed to move more freely, and a man in charge of the engine can control his helpers better and give better results for the expense incurred. A yard of this kind with an entrance to the tracks on both ends allows the cars to be pulled away from the lead engine without interrupting the work, and there is no lost motion to the lead engine. A foreman of an engine in a yard of this kind, trained to make the proper cuts in break-

ing up trains, can pull back on the lead, and by the time the engine comes back to where he is will have disposed of all the cars, and be ready for another cut. This makes a yard very effective and economical, and a switch engine will handle very nearly, if not as many cars as an engine on a hump, with about one-half the help.

The bad order proposition is handled in our yard by training the car repairers to mark bad order cars, loads and empties, and heavy and light repairs. The light repairs predominate in every yard, consequently we assign two tracks for this work, the light repair loads being set ahead of the empties. This also holds good with heavy repair loads and empties. Our light repair tracks are pulled twice in each 24 hours and the heavy repair tracks but once.

In addition to these repairs, I would call attention to another system we have inaugurated. Our merchandise box cars for outbound freight are largely made up of cars with minor defects; while spotted at the out-bound freight house for loading, two men make the necessary repairs, with occasionally an additional car repairer pressed into service. This plan has proved economical, as well as successful, and keeps the yard free of light repair merchandise box cars.

Our trains have all been assigned to handle certain classes of commodities and for certain destinations. This keeps the high class freight moving promptly, the first train out being made up with through cars, the second taking the overflow, the next the short hauls, and so on down to the dead freight. In the fall these trains are run in sections, but we never deviate in the class of freight handled in each train, except where dead freight is used to fill out tonnage. Trains on other divisions are lined up so that local cars are either on the head end or the rear; the local cars are taken off, through cars are added and the engine and crews changed with no delays.

A yardmaster must know every inch of room in his territory, and must know perfectly at all times the exact situation of every track in his yard. This enables him to handle almost double the amount of cars actually held in his territory.

One of the most complex problems confronting a yardmaster is to eliminate terminal overtime. An engine working directly in a given territory can be manipulated in such a manner as to stop work promptly at the expiration of ten hours, but when an engine goes into a connecting line yard, one loses control of it. In our yard switch engines have been given special hours to commence work, and must retire when they have worked ten hours. In order to divide the work evenly, we start engines at 6:30, 7, 7:30 and 8 A. M. This gives us an engine at all times, and the night force commences work the same way. In this way overtime has been cut down from 250 hours to 25 and 30 hours per month. The most surprising part of it was the efficient service created by this change. Formerly our engines handled on an average of 75 cars a day, while at the present time they are handling an average of 120 cars a day; in the fall this has run up to 162 cars per engine. The physical condition of our yard is against us, and in addition we receive only credit for cars coming into and going out of the yard, no credit being received for work done within the yard. The saving in fuel was enormous, switch engines now averaging about three tons per ten hours against four tons before the change was made. A reduction was also noticed in the water supply, engines now going to the tank twice a day against three and four times previous to the change. After the crews became accustomed to the change of working ten hours straight, they seemed to feel that we were imposing on them when we asked them to work overtime. The service was also better, as the men were in better physical condition, and never loafed as they did when they were working 12 and 13 hours a day.

Before the change in hours was made, the average cost per car for the year was 38 cents; after the change was made, the average cost for the year was 35¼ cents per car, or a saving of 2¾ cents per car. During this latter period we were also hampered by construction work and gravel trains, about 12,000 cars of gravel and about 900 cars of company material being unloaded. This, of course, delayed us considerably, as our yard has peculiar physical characteristics and is at times hard to work.

SYSTEMATIC OPERATION OF LARGE YARDS

By F. E. Ramsdell

Freight Trainmaster, Pittsburgh & Lake Erie, McKees Rocks, Pa.

In order to successfully operate a terminal, classification or break-up yard, it is of vital importance that the yardmaster surround himself with good, careful and reliable men in order that the system of the yard may be carried out in every detail. A competent and intelligent yardmaster will inaugurate a system of reports whereby any failure of the system inaugurated by him will be promptly detected, the error corrected, and any delay to any detail work of the yard avoided. Should a yardmaster discover any careless act on the part of any of his force, he should immediately conduct a careful investigation, applying discipline if necessary. Should he discover further acts of carelessness on the part of the same employee, he will make no mistake in taking him out of the service, as one careless employee will often be the means of causing careless acts on the part of other employees, especially new and inexperienced men.

In order to obviate delays to cars in large yards, it is necessary for the yardmaster to establish a system of yard checking, taking an accurate check of each track in his yard at least once every 24 hours. This report should be personally handled by a thoroughly competent yard clerk, whose business it should be to check all cars with the bills. If this is done any delayed car will be immediately discovered, and a necessary report made to the yardmaster, whose business it is to see that the car is switched out and moved promptly. Delay to cars can only be overcome by constant watchfulness on the part of the yardmaster and his holding certain members of his force personally responsible for any unnecessary delays that may occur.

In order that terminal overtime may be reduced to a minimum, it is necessary for the yardmaster to anticipate movements, watching closely all reports of train arrivals, considering the number of cars for which track room will be required, and arranging his work in such manner that upon the arrival of these trains he will have sufficient room in his receiving yard to take the trains in promptly and avoid such overtime. To successfully minimize terminal overtime, the yardmaster must be a man of excellent judgment and farseeing qualities. Such a yardmaster can save his salary several times each day, and therefore greatly increase his prospects for further advancement. A yardmaster should see that his subordinates arrange the work for his switch engines to obtain the highest possible yard revenue for each movement, thus avoiding unnecessary engine mileage. He should also arrange his work in such a way as to avoid any unnecessary delay caused by any congested condition that may arise in the yard.

After many years of practical experience, I believe that the only method to pursue that will insure the prompt handling of special traffic such as fast freight, etc., is by inaugurating a system as follows:

(1) Keep special traffic separated from slow traffic.

(2) Establish a system of reports showing the arrival and departure of such trains in the yard; also noting any delays occurring either because of the motive power, car, or yard departments, showing the amount of time consumed by the inspection and testing of air, the time consumed in classifying and building up the train, and also any unusual delay it may receive.

(3) The classifying of such cars should be as far-reaching as possible to reduce the handling to the lowest possible minimum, thereby avoiding serious delays to such freight by reducing the liability of damage to both freight and equipment through too frequent handling.

(4) A certain time should be allotted in the yard for the yardmaster to get such trains through his yard, and it should be his duty to see that this time is not exceeded under ordinary con-

ditions. By a system of reports as above outlined, unnecessary delays can be readily detected and corrected.

Blockades in yards are caused by the inability of connecting lines to accept freight promptly; by accidents; by weather conditions, and occasionally by a lack of power. These conditions can hardly be overcome. However, under the ordinary conditions and if proper judgment is used by the yardmaster, an auxiliary storage yard of sufficient capacity beyond such classification or break-up yard will permit him to store his slow freight there, giving his fast or preferred freight a chance to move from the classification or break-up yard on its regular schedule.

In conclusion, to successfully operate a busy classification or break-up yard, it is of vital importance that all freight be moved currently, the yardmaster bearing in mind the importance of keeping sufficient track room in order to take in incoming trains promptly, and also provide sufficient room for classification purposes. A yardmaster should be in close touch with the chief despatcher, working in harmony with his force, and he should be willing at all times to co-operate with him in any way desired. He should also bear in mind the importance of properly making up trains, so as to minimize the delay to such cars at the next break-up yard, as a move in his yard will prevent a delay in the next yard.

SOME CAUSES OF DELAYS TO YARD FORCES

By J. L. Coss

Assistant Chief Despatcher, Chicago, Rock Island & Pacific, Haileyville, Okla.

A yardmaster must possess more than the average ability and qualifications and must be supported by clerks and others who are inclined to display an interest in the work, and especially more so if the yard facilities are cramped. A thorough and complete check of the yard should be made twice a day, the time to be governed by the conditions, by a competent person who understands the handling of traffic and that the delay of cars is the most important question.

Material for repairs to cars is often short and cars must be moved to certain points for certain repairs. Frequently requisitions for material are reduced to such an extent that shops are always out of this or that, while the cars needing the material are standing in the yards in the way of other traffic. When material is ordered from the car owners for repairs to foreign cars, sometimes it is received in 10 days and sometimes in that many months, still the car is standing still. It has been noticed frequently that brasses were not to be secured at the storehouse and a meat train on the road was compelled to roll another car and set it out to brass the perishable freight.

Home route cards are responsible for certain delays to cars for the reason that in many cases the general office must be wired for disposition, and as there is no one on duty in these offices at night and on Saturday afternoons, Sundays and holidays the cars remain until the reply to the inquiry is received. If the record in the car service office is faulty, the car may be a matter of dispute for days and weeks.

In my opinion diversion orders should not exist. The cars are billed out from commercial centers to some terminal and diversion orders are to follow; these may be two to three days behind and during this time the cars are in the yards. It seems that the shippers should have a sale for their materials before they start them out and not have the railroads acting as storehouses.

Cars are held in yards for tonnage all the way from 6 to 24 hours. We do not believe this is justified in spite of the figures showing that the tonnage train is the money maker, for the tonnage figures are made simply from the number of tons handled in the particular train regardless of any other account which may be affected.

A shortage of track forces should be avoided to insure the maintenance of yard tracks and switches to assist in the speedy movement of engines and cars. Yards should be kept clear of all obstructions and so arranged as to permit of the men moving with perfect freedom. The location of the yards should also be such as to avoid street and railway crossings as far as possible.

No doubt poor train despatching may seem to some a little beside the subject, but one may see switch engines standing still waiting for a first class train which is 30 minutes or an hour late, the delay not having been reported to the yard by the despatcher. These minutes could be used to advantage by the yard crews and might possibly save an hour or more overtime to the engine in the end. It may be that the despatcher has not given a close figure on an incoming fast stock or merchandise train, or if it fell down, he did not revise his figures for the yard.

Every employee on the railroad in a measure contributes to the delay of cars in yards. By being a little dilatory in making delivery of telegrams the messenger boy may be the cause of serious delay; by being a little late in calling a crew the caller contributes his share, the engineer being slow in moving out, his, and so on down the ranks.

KEEPING ALL CARS MOVING

By D. F. Stevens

Trainmaster, New York, New Haven & Hartford, New York City

The successful operation of a classification yard depends on the building up of a plan adapted to the volume of business offered and the physical condition of the yard, with ample supervision of the right kind to ensure the carrying out of the most minute detail of this scheme. To accelerate the movement of cars through a classification yard the trains or yard "drags" must be classified in the order of arrival, giving preference to the perishable and high class freight. It then becomes necessary to put road power into the yard as rapidly as the classifications are made and to keep the freight moving out from under the feet of the yardmaster in charge.

At a certain large water-front terminal in mind 30 eastbound classifications are made, caring for some 1,200 cars per day under normal conditions. Of this number probably 1,150 will ordinarily move out of the terminal in good time. The remaining 50 are the "trouble makers," and the efficient yardmaster knows that his supervision is required to speed up these sluggards to at least approximately normal speed. He must see that the shop and defect tracks are switched at the hour set and not permit this to become a convenient task to be performed after everything else has been attended to, and the repaired cars coming from these tracks should be drilled out at the head end of the yard, thereby saving the time ordinarily required to move the length of the classification tracks.

In the yard under consideration there are, in addition to six eight-hour trick yardmasters, two higher priced men who are not burdened with detail work, thus enabling them to exercise general supervision and check to avoid delay to cars, these cars being handled on chalk marks. These men walk over the tracks, looking for such cars as may seem to be delayed, and, if any are found, they cause them to be put in train line for the next train of proper classification. A note is made of the occurrence and it is followed up to ascertain the cause of the delay. This is followed by the application of the necessary remedy to prevent a recurrence. These men also check up the bill rack each morning and evening to see if any old dates show on the card manifests. If any are found they locate the cars and start them moving.

A feeling of personal pride is instilled in the mind of each employee in the yard to the end that every old car becomes a personal reflection upon him, thereby adding much individual supervision. A record is kept of the number of cars switched in each yardmaster's shift and this is given daily to the yardmasters, so that each man knows exactly what the other is doing. This has resulted in increasing the number of cars switched about 150 per day.

When a car is delayed, resulting in a complaint from either the public or the higher officers, the man responsible is inter-

viewed by the trainmaster in person, all the papers in the case being given in, and he is required to explain the error and his understanding of the proper method of handling. In most cases his interest is stimulated. Cases of accident or personal injury, no matter how small, are always followed to a conclusion. The man responsible is located and he is required to explain just what he did, how he could have avoided it, and the way in which it should have been done.

A yard standing, taken every day at 7.00 a. m., and showing the date of arrival of all cars in the yard and their track location, aids materially in reducing the number of old cars. Every two weeks a check is made by the trainmaster, taking an entire day, and the effect seemingly justifies the action.

Yard figures and costs are available to everybody at the terminal and it is surprising and pleasing to find the mechanical and roadway men taking an interest in breaking records. When going at full speed, under high pressure, the master mechanic and road foreman of engines spend their time with the enginemen, explaining to them what is to be done. The response is always apparent. The track supervisors take almost as much pride in the number of eastbound cars put out in a 24-hour period as do the operating men.

If a man shows by his actions a desire to "hit the ball" and to keep the terminal at the "top of the railroad league," every effort is made to help him in every possible way. Unless he becomes chronically bad every effort is made to retain him. Dismissal follows intoxication, insubordination, and dishonesty, and everybody knows it. There is little of either.

While many little tricks of the trade are worked out in actual practice, as the occasion may demand, it is believed that in operating a big classification yard the main thing is the class of men working in it. To secure the desired result it is probably better to employ green men of good habits and break them in, letting your neighbor hire the "boomers." After a man is on the payroll he should be given to understand what is to be accomplished and educated as he goes along. Employees should be imbued with the idea of not being satisfied in remaining brakemen, but to become trainmasters or superintendents. A certain amount of dignity should be maintained, and this is not incompatible with a friendly feeling. Ambition should be encouraged and individual responsibility developed. With these traits the question of the "old car" need not be a disturbing factor in any terminal.

PERSONALITY IN YARD OPERATION

By O. C. Hill

Assistant Superintendent, Chicago, Burlington & Quincy, Kansas City, Mo.

The organization of forces should provide for a general yardmaster, both days and nights, assistant yardmasters day and night on the hump and in city yards, an inside or desk yardmaster days and an outside yardmaster nights, a chief clerk day and night, bill, manifest and diverting clerks, and car checkers. The assistant yardmaster on the humps should be in charge of the hump and trimmer engines and the engines in the departure yard. The desk yardmaster should be in telephone communication with all parts of the yards and departments, keeping in direct touch with them, and should adjust the slack and congestion in the different yards, directing the power from one district to another. He also should get a check of the tonnage switched and waiting to be switched for all directions and the consist of trains on the road, enabling him to determine some time in advance the amount of tonnage that he will have to move in the different directions. These measures will enable him to avoid congestion, terminal overtime and terminal delay of all kinds. He must be vigilant continually to insure the economical operation of the yard.

The general yardmaster should have direct charge of all organizing and planning of the yard work. He should be a hard-fisted man, who is familiar with the work and who is capable of leading his forces, while, at the same time, speeding up the weaker ones and crowding them to the front. He must impress his personality upon all of his employees, with the "ego" left out. He must be an impersonal judge and see that the employee as well as the employer receives his just dues.

In furnishing car checkers and markers the fact should never be lost sight of that they are cheaper than switch engines. Competent car checkers and markers should be located at the entrances of the yard and should be paid a living wage to eliminate constant changing of clerks. Cars should be carded and waybills forwarded to the office promptly, and the carbon of the conductor's list should be furnished the assistant yardmaster. The switch list is a photograph of each train. The diverting clerk should check his diversion orders with the respective car markers. All work of the yard department should be carefully checked and a careful "turn over" made each day to the night forces and each night to the day forces, so that each shift can take up the work where the other dropped it. Care should be exercised in the selection of assistant yardmasters and foremen, and those men should be chosen who have the ability and also the courage of their convictions and who can perform their duties regardless of the criticisms of the employees. In employing switch tenders, care should be exercised to secure bright, capable young men who can be advanced later to switchmen and yardmasters.

The assistant yardmaster should be in direct charge of all employees at the terminal at night, for occasions may arise that require immediate attention and decision, encroaching upon the so-called prerogatives of other departments. For this reason it is necessary that the night yardmaster should represent the heads of all other departments at night and that he have their support while they are asleep and he is working.

PRACTICAL SUGGESTIONS FOR YARD OPERATION

By J. P. Kavanagh

Assistant Superintendent, Baltimore & Ohio, Baltimore, Md.

A classification yard should be of good proportion, located so as to be within easy reach of the bulk of the traffic in both directions to permit of making classifications for as great a distance as possible in each direction. Classifications should be made with a view to enabling trains to travel over as many divisions as possible by changing engines and avoiding the necessity of taking all trains into the yard at the end of each division. This yard should be limited to the handling of slow and expedite freight; should handle traffic in both directions and should be so constructed that the humps will be in close proximity to each other. There is no question but that such a yard should be a hump yard, divided between the direction of traffic, and so planned that each yard can be operated without cross haul.

Independent humps should be maintained in each direction for the handling of fast freight trains. It is essential to have the fast freight handled in the same vicinity as other freight, as pick-ups and short runs coming into the terminal will always have cars intended for such trains; furthermore, it is a good practice to incorporate a transfer station, as generally local freights from two or more divisions will start and finish there, and this transfer station will make cars for all of the fast freight trains.

The operation of a classification yard, as defined, comes under the direct charge of a terminal trainmaster, reporting to the superintendent. His authority over the yard should be without question, and his jurisdiction extended to cover all employees connected with the yard. A yardmaster should be in charge of each slow freight yard with sufficient clerks to handle the business in an up-to-date and intelligent manner. Both fast freight hump yards should be in charge of one yardmaster, with a yard clerk in each of the hump yards; the number of engine crews and the hours of service to be regulated as conditions demand.

Much can be accomplished in the proper handling of the receiving yard, by giving attention to its construction. The aim should be to locate it as nearly as possible on a tangent with an easy grade up to the apex of the hump, making it possible for the class of engine that brings the trains in to shove them over

the hump. Nothing retards the work of a hump more than incoming trains doubling over this yard.

The classification yard should be built on more or less of a curve, on account of the difference in weight of cars and the possibility of handling both loaded and empty cars over the hump. The hump should be so constructed as to insure all cars getting a good start. Heavy cars should be worked to the curved tracks and the light ones to the straight tracks. This, in many instances, will save the necessity of shoving the light cars into the clear.

When the departure of trains out of yard is limited to any extent and it is possible to despatch trains only during certain periods of the day, which condition occurs more frequently on a single track line, the efficiency of the hump engine is increased by advance yards, and trains despatched from such yards invariably show less transportation delay than those despatched from the classification yard. It is, of course, more expensive to operate a yard requiring engines to move trains from the classification yard to the advance yard and we believe that when there is no restriction on the movement, it is better from every standpoint to despatch trains direct from the classication yard.

Car inspectors should keep a record of all cars discovered damaged and report to the yardmaster, so that it can be taken up with the rider, as cars going over the hump should be in proper condition, and if found damaged the rider should be required to explain the cause. By this method, a tendency towards carefulness is created on the part of the inspectors in the receiving yard and the riders.

One of the principal factors in lessening the delays in yards is the repair yard and, in my judgment, this yard should be so constructed that cars can be dropped from the trains as they are switched over the hump onto the repair track, spotted by the rider and repaired without the necessity of a second movement; to do this, requires about five per cent. more room on the repair track than is usually needed and it is my belief that each repair yard should have a capacity of eight per cent. of the total number of cars handled into the yard. Tracks should be built with 18 ft. centers to allow repairmen to work on cars on a filled track without interference by reason of cars being dropped into tracks not filled.

UNIFORM INSPECTION FOR SPECIAL LOADING

The Rock Island Lines has recently issued a pamphlet of instructions covering the uniform inspection and carding of empty box cars, the coopering of cars for grain loading, and the stripping of doors of cars loaded with flour, with a view to having the men well informed and ready to meet the heavy harvest traffic which, from the reports, will be one that will

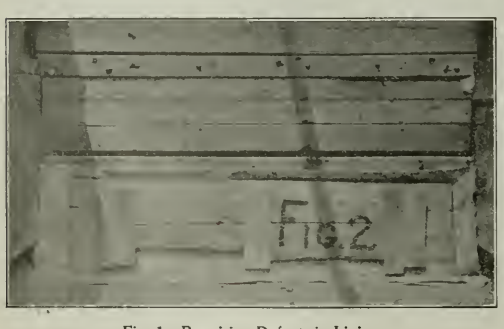

Fig. 1—Repairing Defects in Lining

greatly tax the resources of the road. The pamphlet represents the work of a committee composed of the assistant to the second vice-president as chairman, and other officers who are directly interested in the inspection and handling of cars for special commodities. The following extracts are taken from the pamphlet:

When empty box cars have been repaired, they should be inspected and carded in accordance with the following classification before leaving the repair track:

The maximum use cannot be obtained from box cars if first-class cars are loaded with commodities which damage the floor or lining, stain or saturate the floor with oil or grease, leave a stench, make unfit for carrying flour, merchandise, etc.; or which could, with safety, be loaded in a car in poorer condition or in a car of a different class.

To reduce to a minimum the difference of opinion between car inspectors, the following rules have been provided, specifically indicating the "parts to be examined" and "conditions required" to properly card cars for various classes of lading:

INSTRUCTIONS TO CAR INSPECTORS COVERING EXAMINATION OF EMPTY BOX CARS AND CONDITION REQUIRED TO PROPERLY CARD THEM FOR LOADING FLOUR, CEMENT, GRAIN AND ROUGH FREIGHT.

Parts to be EXAMINED	For FLOUR	For CEMENT	For GRAIN	For ROUGH FREIGHT
Safety appliances	Must be O. K.	Must be O. K.	Must be O. K.	Must be O. K.
Draft rigging	Must be O. K.	Must be O. K.	Must be O. K.	Must be O. K.
Posts and braces	Must be in place and in good condition.	Must be in place and in good condition.	Must be in place and in good condition.	Requires safe running condition.
Siding	Must not be loose, broken or decayed.	Must not be loose, broken or decayed.	Must not be loose, broken or decayed unless can be coopered.	Requires safe running condition.
Roof.	Must be in first-class condition.	Must be in first-class condition.	Must be good, but not necessarily first-class condition.	Not necessary to be in good condition. Safe to run.
Doors	Must be in first-class condition.	Must be in first-class condition.	Operative and safe condition.	Safe condition.
Floor and lining	Must be in good condition, free from protruding nails and from stench, newness, previously having been loaded with Fertilizer, Hides, Bone, Creosote, Oils, etc. Free from oil stains or saturations.	Must be in good condition.	First-class condition not necessary if coopering will make grain tight. Do not O. K. for grain if floor is loose at side sills or is oil soaked. Must be free from stench, account having been loaded with fertilizer, hides, bones, creosote, etc.	Serviceable condition.
Grain strips.	Good condition not necessary.	Good condition not necessary.	Should be in place or in condition to permit of coopering so as to make grain tight and prevent grain from pressing against end.	Not necessary.

GRAIN AND FLOUR CARS

The following instructions apply to the coopering of box cars after such inspection shows they are O. K. for bulk grain loading, or a higher class lading.

Cleaning.—Sweep the car clean, removing any foreign matter that may be lodged behind the lining.

Floors.—Carefully examine the floor for openings through which grain might leak, particularly over the body bolster,

Fig. 2—Further Repairs for Defective Lining

around draft bolts and at the intersection of the floor and the end sills, and at the end, side and door posts. (Most leaks occur over drawbars, at posts over bolsters and at door posts.)

Where openings occur in floor, cover with cooperage paper; if at the junction of floor with posts and braces, use a pad of paper, securing same in either case by nailing a lath or board over the paper.

Where floor shows signs of weakness over the body bolster, cover it for the entire width of car with a piece of 48-in. cooperage paper folded to 24 in. width, securing it with lath and nails

at each edge of paper. If a similar weakness is found over the center sills between the body bolster and the end of the car, cover with paper same as over bolster.

Where bolt heads protrude through the floor and it is covered with paper, an additional precaution must be taken to nail a board over same.

Grain Strips.—Where grain strips are defective or not securely fastened to the floor, apply a paper pad extending 5 in. above the

Fig. 3—Method of Applying Grain Doors

floor of the car, inserting it behind the lining and securing it by nailing a lath or strip of wood over it.

Lining.—Cover any broken or faulty places with cooperage paper over which a piece of board should be nailed. If the size of the defects warrant, cover with paper, over which nail a grain door. (See Fig. 1.)

When the lining is in generally poor condition, in addition to the above mentioned coopering, the defective portion should be protected by lining with cooperage paper 48 in. wide, allowing a 6 in. lap on the floor. When applying to the end of the car, begin at the side of the car about 2 ft. from the corner, fit into the corner and extend half way across the end of the car. Apply to other half of the end of the car in the same manner,

Fig. 4—Method of Applying Grain Doors

letting the ends overlap about a foot where they meet. Secure the paper with lath and nails about 3 in. from the top edge only, using but two 3d shingle nails to a lath. In order that paper behind laths may tear at nails and adjust itself when grain pressure is applied, do not drive nails up to head. (See Fig. 2.)

Cover end doors with cooperage paper and nail boards over the entire opening.

Grain Doors.—Apply three standard grain doors to each side of the door opening. Fold cooperage paper to four thicknesses, making a pad 4 in. wide on the end of a piece of paper 7 ft. long. Apply this to the inside face of the door post, allowing a few inches lap on the floor; then place one end of the grain door against this pad. Fold a similar piece of paper for the other door post and apply in like manner. An additional paper pad should be applied to the face of the door posts extending from the top of the pad above mentioned to the top of the grain doors; then nail the grain doors to the door posts, after which fold the loose ends of the paper extending from the door posts, so as to overlap on the inside of the grain doors, and fasten lightly at the top of the paper with lath and nail. (See Figs. 3 and 4.)

When applying hardwood grain doors, reinforce only cars of 80,000 lb. capacity or over, by nailing an additional grain door

Fig. 5—Cars Stripped for Flour Shipments

lengthwise over the two lower grain doors on inside, with its lower edge about 8 in. above floor. Apply same over cooperage paper.

When applying softwood grain doors, reinforce with two additional grain doors, apply over cooperage paper, placing the lower door about 4 in. from the floor.

Outside Inspection—Siding.—Inspect sides and ends, securely fastening any loose siding with 8d wire nails. Where sills are decayed, prevent leaks at siding by using a pad of paper fastened underneath with a strip of board nailed to bottom of sill.

Stripping Cars Loaded with Flour.—To prevent water damage to floor, the side and end doors of cars loaded with flour should be tightly closed by driving a wedge between door and door-guides, after which apply a strip of 11 in. wide odorless tar water-proof paper over the sides and top of the doors, securing it with lath and nails. (See Fig. 5.)

The Railways of Argentina.—The total mileage of the railways of the Argentine Republic at the end of the year 1913 was 21,908, an increase over 1912 of 569 miles. According to the 1913 statistics, the capital invested in the railroads of the country was $1,168,108,695. The number of passengers carried was 80,279,940, an increase of 7,067,856 over 1912, and the amount of freight transported was 43,038,082 tons, an increase of 4,168,278 tons over 1912. The receipts and expenses in 1913 were $137,255,165 and $86,289,835 respectively.

WILLIAM BARSTOW STRONG

William Barstow Strong, for several years president of the Atchison, Topeka & Santa Fe, whose death on August 3, at Los Angeles, Cal., was noted in the *Railway Age Gazette* of August 7, and whose portrait is given herewith, was one of the prominent pioneer railroad builders of the west. Beginning his railway work as a station agent and telegraph operator, he had worked his way up through the operating departments of the early western railways, the Chicago, Milwaukee & St. Paul, the Chicago & North Western and the Chicago, Burlington & Quincy, when in 1877 he was selected by the Boston interests which had begun the building of the Atchison, Topeka & Santa Fe to take the active direction of the extension of the road, which at that time had built up a system of lines in the state of Kansas, but which had hardly extended beyond the state.

Work had been begun on the line nearly 10 years after the charter was secured in 1869 under a congressional land grant which provided for giving the road 3,000,000 acres of land in Kansas on condition that the road was completed to the Kansas-Colorado line in 10 years from 1863. By the end of 1872 the line had been extended to Colorado and a campaign to populate the country with immigrants was under way. Several brief administrations had had charge of the property between 1872 and 1877, when Thomas Nickerson, who was president, and his Boston associates, put the property into the hands of Mr. Strong as vice-president and general manager.

William Barstow Strong

When Mr. Strong took charge of the property it consisted of 787 miles of line, nearly all in the state of Kansas. He became president in 1881, which office he held until 1889, and thus had executive charge of its affairs during the important period of its extension as a transcontinental system. When he resigned the presidency in 1889, the extreme termini of the company's lines were Chicago, Ill.; St. Louis, Mo.; Galveston and El Paso, Tex.; Deming, N. M.; Superior, Neb.; Denver, Colo.; San Diego, Cal., and Guaymas, Mex., and the mileage including one-half of all the lines owned jointly with other companies, was 7,118 miles.

This was also the period of competitive railway building and rate making on the western railways, and the affairs of the company passed through several exciting crises. When it was proposed to extend towards the Pacific coast by way of Raton Pass, N. M., and also into Colorado, a protracted contest ensued with the Denver & Rio Grande for possession of the mountain passes. This involved much litigation and some fighting by construction gangs. Mr. Strong's connection with the road as vice-president and general manager, with headquarters at Topeka from 1877 until 1881, was therefore during the most active period of the construction and development of this great property. As president of the road he had his office in Boston.

In 1889, on his retirement from railway service, he took up his residence on a farm near Beloit, Wis., near where he had first gone to work for the Chicago, Milwaukee & St. Paul. He served for a time as president of a local bank and was also identified with various other business enterprises. During the last seven years of his life he resided at Los Angeles, Cal. A brief sketch of Mr. Strong's railroad career was published in the *Railway Age Gazette* of August 7, page 266.

REMEMBER IT TO THE ROADS' CREDIT

[From the Chicago Evening Post]

After the railroad rate increase was denied in 1910 the roads comforted themselves with the thought that the fact would keep their employees from wage demands.

No so. Engineers, firemen, conductors, brakemen, yardmen and oilers struck successively for wage increases. And got all or a part of them.

Now, the 1914 rate decision denies the roads everything but a small section of their sorely needed increase in rates.

And despite this limiting of income the cycle of union demands for higher pay is beginning all over again. And the government which limits income is still doing nothing to limit the expense of labor.

On this briefly sketched background yesterday's action by the western roads stands out in something like its true proportions.

They assent to an arbitration that puts their own demands out of court, because the government of the United States asks them to. They could do no less, in view of the world situation.

But when war ends and the country can proceed calmly about its affairs, it should not forget that the railroads, unprotected by the government in wage matters, deliberately threw down their own protective wall for the sake of the general welfare.

The magnanimity of the act should make us the more eager to make regulation regulate *fairly;* to have it regulate the expense to which a road can be put when it presumes to regulate the income of that road.

Financial Returns of the Hungarian Railways.—The returns for the Hungarian railways the first 10 months of 1913, show that during that period the gross receipts were $94,841,600, against $92,321,852 for the corresponding period of the preceding year. Passengers carried in 1913 numbered 147,020,000, as compared with 141,162,361 in 1912. During the 10-month period of 1913, 59,790,000 tons of freight were carried. The total gross receipts of the railways for 1913 are estimated at $112,665,000. This is an increase of about 1½ per cent, but the increase in normal years is usually from 3 to 4 per cent. During the year the railways expended $29,435,000 for the construction of new trackage and switches, stations, rolling stock, etc. There were 222 miles of new line built, making a total of 13,080 miles.

Fuel Economy on the Chicago, Burlington & Quincy

Outline of a Broad and Effective Campaign Conducted by a Committee Representing the Various Departments

By A. N. Willsie
Chairman of the Committee on Fuel Economy

The Burlington has a permanent fuel economy committee consisting of eight members who are officers that are educated in different classes of the service. The committee consists of two superintendents, one of whom has served in the train service, the other in the despatcher's service; two master mechanics, one of whom was formerly the air brake instructor; the chief architect, who is an authority on coal chute matters; the general storekeeper, who is an authority on the quality and cost of coal; the water engineer, who was formerly a special apprentice and is especially proficient in the drafting of engines and who also handles the analysis of water; and the chairman of the committee, who has held an official position both in the mechanical and operating departments. The chairman devotes his entire time to matters of fuel economy. The committee holds meetings at one division point at least every month, and matters pertaining to coal economy are talked over from every viewpoint. At these meetings the local officers are present, including the superintendents, master mechanics, trainmasters, road foremen of engines, roadmasters, master carpenters, chief despatchers, and also as many despatchers, engineers, firemen, conductors, brakemen, yardmasters and switchmen as are available, as it has been found that nearly every department can help to save fuel. The engineers and firemen, and the conductors and despatchers are requested to work closely together. Through the co-operation of the different departments a great deal may be accomplished in saving fuel.

The enginemen are instructed as to how they can save coal by co-operating with the firemen. This co-operation will permit of firing light and often, and will eliminate a great deal of unnecessary popping and smoke. The conductors and trainmen can make material savings by working quickly at stations, by not making any more switches than are necessary, by seeking to prevent hot boxes and, when they do get hot, by having the train stopped at a point where it may be started easily. The roadmasters and master carpenters can help a great deal by repairing defects which cause slow orders just as soon as possible and by seeing that the slow orders are removed as soon as the work has been done. Roundhouse men can help by doing the work reported by the enginemen and keeping the engines in good shape, especially by looking after the grates, keeping the flues cleaned, etc.

The operators and agents can assist by watching the block boards so that it will not be necessary to slow down or stop the trains, as each one of these moves consumes considerable coal. The agents can help by having their switch lists ready so the train crews may readily locate the cars that have to be handled. The conductor before leaving on the trip, is supposed to inform the engineer what work is to be done and at what points. This gives the engineer an opportunity to decide what coaling and water stations he will stop at throughout the trip. By both the engineer and conductor keeping in touch with the despatchers while on the road much more satisfactory plans can be made for making the trip. The despatchers can handle the trains better if they are advised by the individual crews as to what their intentions are.

Yardmasters can save coal by insisting on the switchmen having the hand brakes on the cars released when switching, by properly making up the trains in such respects as having the short loads ahead and putting as many short loads as possible in one train so as to avoid many trains stopping at the same station. The despatchers can help a great deal, not only by keeping in touch with the crews on the road, but by making meeting points at stations where it will not be difficult to start trains, by putting light tonnage trains on the passing track regardless of ruling direction, so as to keep the heavy tonnage trains moving, and also by having the operators open and close switches when it is convenient to do so.

In talking with engineers and firemen a great deal is said about light and frequent firing, the swinging of the doors in order to get good combustion, and especially regarding the unnecessary popping of engines, it being called to their attention that every minute of popping means a loss of 20 lb. of coal and that the biggest part of this can be avoided by careful work on the part of the engineer and fireman, and by their working in conjunction with each other.

Another saving in coal which is of considerable moment is made by the proper firing up of locomotives. It has been found that an engine properly fired up will have steam enough to move it on half the amount of coal that will be used by firing up improperly. Engines that are filled with warm water after having been washed out are fired up with from 300 to 825 lb. of coal, according to the class of the engine, and when cold water is used it requires about 1,200 to 1,400 lb. of coal for the larger types of engines. The despatchers' offices are instructed to give the mechanical department not less than two or three hours' notice when they want an engine. This gives the mechanical department a chance to do the necessary work on the engine and eliminates the necessity of having any engines held, fired up, subject to call.

Considerable attention has been given to the overloading of tanks. It is satisfactory to have the tank filled if necessary, but where it is not necessary, only enough coal should be carried to get the train over the trip safely. Particular attention is called to the tanks that are overloaded. This not only wastes coal at the chutes, but also along the road and that which falls off after leaving coaling stations is an absolute loss. There is also an element of danger from this latter feature, as falling coal is likely to strike some one near the track. It is estimated that the coal which drops around the chute and is allowed to lie there for some time before being picked up involves a loss of $1 per ton. This does not include the loss of the coal that falls off after the engine leaves the chute. A report was started showing the amount of coal picked up at the different coaling stations, and for the last six months of 1913 as compared with 1912 there was a saving of $2,286, and for the last six months of 1913 as compared with 1910, when the committee first began checking this matter up, the saving was $16,141. This is a remarkable saving, but, as stated above, it does not cover the saving that was made by stopping the coal from falling off the tanks after leaving the terminal.

On through passenger trains consisting of 9 to 12 cars the average pounds of coal used per car mile ranges from a little less than 9 lb. to 12 or 13 lb., according to the weather. With our heavy freight engines the pounds of coal used per 100 ton miles ranges from 8 or 9 lb. to 15 or 18 lb., according to the class of the engine and to the weather. Since the fuel economy committee was started a good showing has been made each year. The year 1913, as compared with 1912, shows that on the entire system the gross ton miles increased 6.57 per cent, the passenger car miles increased 2.64 per cent, while the tons of coal used increased only .13 of one per cent. On the lines west, where the daily fuel reports were recently put into effect, the gross

ton miles increased 2.65 per cent, the passenger car miles increased 3.87 per cent, and the coal used decreased 65,863 tons, or 4.5 per cent.

COAL RECORDS

The method of keeping coal records has been made as simple as possible, and at the same time as complete as is necessary. The engineer and fireman are required to sign a coal ticket when they receive coal from the chutes. This ticket gives the division, engine number, weight of coal, service of the train, train number, coaling station and date, and is signed by the engineer and fireman. The coal chute foreman forwards this ticket to the master mechanic. The only other reports the enginemen are required to make out are the regular time report and an engine mileage trip record, these two reports being on the same form, the engine mileage trip record being arranged so it may be easily torn from the time report and sent to the car accountant.

Fig. 1—Form Showing the Engine Mileage Trip Record

The information required on the mileage trip record is shown in Fig. 1.

An engineer's coal performance sheet is made out by the master mechanic daily and posted for the benefit of the men. In switching service the form includes the division, the number of the engine, switching hours, tons of coal and pounds of coal per switching hour, with the name of the engineer and fireman. For passenger and freight service the form includes the division, number of engine, number of train, miles run, number of cars or the total weight of the train, car miles or ton miles, pounds of coal per car mile or ton mile, hours on road, and the names of the engineer and fireman. The superintendent's office supplies the information regarding the number of engine, number of train, number of miles, number of cars or tons per train, hours on the road and the engineer's name, and the master mechanic supplies the rest.

A monthly individual record for each engineer is made out from the daily performance sheets just mentioned. This record contains the date of the month, the engine, train number, train miles, ton miles or car miles or switch hours, tons of coal, hours on the road, and fireman. At the bottom of this form the averages are given with the engineer's name.

A monthly report is also made out for switch service, which includes the division, the engineer's and fireman's name, the total hours switching, the total tons of coal, the pounds per switching hour and the cost per hundred switching hours. This form is sent to the superintendent of motive power, the information being taken from the form previously described. A similar form is made for freight and passenger service, the items here recorded being as follows: Division, engineer, fireman, total ton or car miles, average cars in train, tons of coal, pounds per car or ton mile, cost per car or ton mile, and average speed per hour. This is also sent to the superintendent of motive power for record.

In addition to these detailed forms a summary of the coal performance of all enginemen by divisions is sent to the superintendent of motive power on the form shown in Fig. 2. At the general superintendent of motive power's office these monthly reports are consolidated by divisions. The various items under the headings "Passenger," "Freight" and "Switch" clearly indicate what is required. Under the heading "Coal Used for Miscellaneous Service This Month" the items are credited as follows: For heating, a credit of 20 lb. of coal per car per hour is given; for lighting, 15 lb. of coal per car per hour. This part of the form is filled out by the road foreman of engines, so that during the winter all trains that are heated and lighted are given the proper credit. During part of the year some trains are not heated but are lighted, consequently the road foreman determines how many hours the engines furnish steam for recharging the batteries. The engineers are also given credit for the coal used in intermediate switching. This information is taken from the bottom of the engineer's trip report, and no allowance is made for any switching of less than one hour. Under the heading "Light Engine" is recorded the amount of coal used on engines running light to and from the shops, or when the engines are running light to get a train, or returning after being used on a train, the record being placed under the heading of freight, passenger, or switch, as the case may be. Under the heading "Helper" is recorded the amount of coal used by such engines used for double headers. Under the head "Pusher" is recorded the coal used on regular pusher engines over doubling districts. Under the heading "Work Trains" is recorded all the coal used in this service. Under the heading "Transfer" is recorded the amount of coal used on engines used in regular transfer service for which road rates are paid. Under the heading "Combination Passenger, Freight and Switch on Branch" is recorded the coal used on engines in short stub trains that handle both freight and passenger traffic at different local points.

The last form that has to do with the enginemen's coal performance relates to the monthly performance of each engineer and is placed on a form suitable for a loose-leaf note book for the road foreman of engines. This form gives the month and year, the performance, the average for the particular class of service the engineer is in, the run, and the date attention is called to poor performance. This record is supposed to be carried by the road foreman at all times so that he will be in a position to know what each man's average is whenever he meets him on the road. As stated above, daily reports are posted for the benefit of the enginemen. These reports are usually only one day old, and very seldom over two days old. This also gives the road foreman a good opportunity to keep in touch with the men, and to check up those making a poor performance.

There are four forms made out for keeping track of the coal used and received. The first form is a statement of the tons of coal issued by classes of service, made out from the engineer's coal ticket, as mentioned above. This form includes the engine's number and the amount of coal given the engine for freight, passenger, switch or work service. It also includes an inventory of the coal on hand at each coaling station, being made out the last day of each month, together with a summary which includes the following items: Coal on hand at end of last month; coal unloaded this month; total; coal issued this month; balance on basis of report; on hand as per inventory; and inventory over or short. This form is sent to the auditor of expenditures at Chicago, and is made out by the coaling station foreman with the

name of the station and the period which this report covers.

A daily report of coal unloaded is also made out by the coal chute foreman and sent to the general storekeeper. This form gives the date and number of way-bill, the billing station, the name of shipper, the initial and car number, kind of car, kind of coal, and whether the coal was handled on a tonnage basis or on a wage basis.

A third statement made by the coal chute foreman gives the daily coal statement for the master mechanic. This gives the division, coaling station and date, together with the coal unloaded, car number and tons, together with those engines loaded, giving the number of engine, the tons loaded, the train and the engineer. The summary printed on the same form gives the coal in the chute at 7 a. m. of the previous day and the coal unloaded during the past 24 hours, together with the coal de-

livered to engines as shown on tickets, during the past 24 hours, and the coal in the chute at 7 a. m. of the same day. From these figures the shortage or surplus is made up.

A monthly summary of the daily reports of coal unloaded for locomotive use is made up from the daily reports of coal unloaded, as above mentioned, for the superintendent of motive power. This report covers each division separately, giving the coaling station, the billing station, the number of tons under the various headings, egg, nut, etc.

These forms are the only ones used for covering the fuel situation, and have been found to work out very satisfactorily. The daily reports have been found to be conducive to good results, and are believed to create a certain amount of rivalry among the engine crews which materially aids in the economical use of fuel.

Railways in Tientsin.—Since the rebellion in the summer of 1913, the service on the Tientsin-Pukow Railway has been improved, making it possible to reach Shanghai in 36 hours by the weekly express, and in 46 hours by the daily mail train.

GERMAN CRITICISM OF STATE RAILWAY MANAGEMENT*

Germany's state railroad system is an oppressive monopoly and a political mistake. Recently this view was expressed at three different industrial congresses, and in one case the indictment was backed by a two-thirds majority. This revolt against railroad nationalization comes just at the time when some Americans and Englishmen have begun to see in nationalization an easy, infallible way out of all railroad troubles. What aggravates the indictment is that it is mainly directed against the Prussian state system, which, of all railroad systems in Germany, is the most flourishing and efficient.

Every charge that is customarily leveled against corporation railroad ownership is now being leveled against the Prussian state system. The main charge is that the Prussian system makes for monopoly and restraint of trade. In committing—say critics—all the offenses which private corporations commit, the state knows no fear, for against it the public is doubly helpless, and there are no competing roads which can be used to bring the extortionate state to reason. Prof. Walther Lotz, one of the best authorities on railroad management, has just published a book on "German Communications Since 1800," in which he attacks the popular notion that state ownership prevents monopoly. German experience shows the contrary.

NOT A SOLUTION OF MONOPOLY PROBLEM

"Nationalization," writes Lotz, "is not by any means a solution of the monopoly trouble. Monopoly remains monopoly even if it is managed by officials. True, the state is claimed by nationalization enthusiasts to be a higher and unerring entity. But in reality the state is only the national organ of erring men, who are influenced by their virtues, their faults, their interests and their passions. And these influences are all brought to bear on railroad management quite as much when the state does the managing as when private persons do it. Indeed, in countries governed on party principles, privately owned railroads are often more bearable than state-owned railroads, as state-owned railroads are exploited as much as possible for their own advantage by changing parties." And referring to plans of railroad nationalization in foreign countries, Prof. Lotz adds: "This is a reason against nationalizing the railroads in the United States."

What is just now being said against German railroads mostly applies to Prussia. "German" railroads, owned by the Federal government, on the lines discussed in the United States, do not exist, except in Alsace-Lorraine. The system is railroads owned by individual states. The Prussian state, or strictly, the organization known as the "Prussian-Hessian railroad community" is the biggest owner, for it possesses 38,000 kilometers out of the 62,000 in the whole empire. Bismarck aimed at nationalizing railroads on federal lines, but his bill enacting this was defeated owing to opposition by the middle-German and south-German states. At present the only bond between the different state-owned systems is article 42 of the constitution which obliges the states to manage their roads in the general interest of the empire.

Many think that this splitting up is the cause of the defects of German railroad nationalization. Instead of being controlled by the democratic imperial legislature in the general interest, the roads are controlled by the state governments and state legislatures which nearly everywhere are on a reactionary and class basis. This is particularly the case with the "Prussian-Hessian railroad community." The Prussian government is narrowly conservative and agrarian. The Prussian Diet, elected on a narrow, property franchise, is the same. Prussian government and Diet policy is agrarian. It aims at sparing the landowners in matters of taxation, at encouraging the export of grain which is practically bounty fed; and also at encouraging export by the "schwerindustrie," an ally of the agrarians, which controls, on trust principles, the production of coal and iron. The interests

*Berlin correspondence in Springfield (Mass.) "Republican," July 19, 1914.

of the small trader and consumer are neglected. Prussia's railroads are governed in accord with this policy. She has low rates to favor the grain producer and the iron exporter; and high rates which hit the consumer on imported products.

RAILWAYS USED AS GOVERNMENT MILCH COW

A greater objection to Prussia's railroad system is that it uses its monopoly to accumulate vast funds for the state finances. This is considered a breach of sound railroad management and is a violation of a promise. Thirty years ago, during the era of railroad nationalizing, Prussia's minister of public works promised the Diet that the railroads would be run entirely in the interests of those using them, and not in order to make profits. "State railroads," he said, "are not a milch cow; they are not intended to be a source of state revenue."

He later promised that the railroad rates imposed would be only high enough to cover transport and maintenance and to pay a moderate percentage on the purchase debt incurred by the state. A similar promise was made in England in regard to the postal services, which were also not intended to help the state finances. Experience shows that governments are never able to keep such promises. The moment state finances run dry the state trading departments are resorted to as milch cows. Just as the English postal services are bringing in $25,000,000 a year to help the state finances, so the Prussian railroads are bringing in over $200,000,000 clear profit. This vast profit is 36 per cent. of the gross earnings, a proportion probably reached by no other railroad system in the world.

LARGE EARNINGS FROM EXCESSIVE RATES

Germans, who resent this system of exploiting railroads for gain, are not consoled by the fact that the $200,000,000 goes into the state, not into private, pockets. They object that the $200,000,000 is not equably imposed as a tax on all classes according to wealth. It is taken mainly from the nonprivileged classes, on whose traffic the railroad administration imposes heavy transport rates, while the roads carry the landowners' corn and the iron magnates' metal at very low rates, or even, as is suspected, at a loss.

The account books of the "Prussian-Hessian railroad community" for the past 30 years reveal how the state railroads have acted as milch cow for the state treasury. Between 1882 and 1912 over $1,250,000,000 has been taken out of the railroad profits and handed over to balance the state budget. This transaction is made possible by the fact that the $200,000,000 annual profit is far more than is needed to pay interest on and amortize the railroad debt. The profits amount to about 7⅜ per cent. on the railroad debt. But the railroad debt was borrowed at about 3½ per cent. Of the original railroad debt of $2,875,000,000, $1,085,000,000 is in consols, of which nearly all bear 3½ per cent., but a small portion, 4. The state with its 7⅜ per cent. from the railroads makes on this money a clear profit of nearly 4 per cent. The rest of the capital comes out of the "railroad extraordinary fund" and the "disposition fund," against which no interest-bearing consols are issued; and on this portion the state puts in its pocket the whole of the 7⅜ per cent. earned.

In the matter of profits the state's appetite grows. Twenty years ago it was content with 5½ per cent., which put a clear 2 per cent. in its pockets. When this caused objections, the government pleaded that, owing to the bad condition of the state finances, it could not do without the 2 per cent.; but it promised faithfully that the milch cow process should go no further. If profits, it said, showed signs of rising still further, they would be cut down by means of a general rate reduction. Despite this promise, profits were allowed to rise by yet another 2 per cent. on the capital invested; and the rates remained practically as before. This enormous profit did not result from management efficiency. Judged by American standards the management is not efficient. The ratio of expenses to receipts has steadily risen. The profit is due entirely to the vastly increased traffic, the carried freight being about 2½ times greater than it was 20 years ago.

In addition to subsidizing out of railroads the ill-balanced state finances, Prussia has created from the same source a vast state property. This is shown by the railroad capital account. The railroad administration has written off an excessive amount of the original small capital outlay of $2,875,000,000. Altogether $750,000,000 has been amortized. So that of the original railroad debt only $2,125,000,000 remains outstanding. This judged by European values, is a ridiculously small capitalization for 38,000 kilometers, nearly all double, treble, or even quadruple tracked, and splendidly equipped. As a fact, the present sale value of the state railroad system is appraised at $5,200,000,000. The increase in value is due to the putting back into the roads of part of the profits; to extensions built out of profits; and to the natural rise in land and other values. The difference between the outstanding capital debt of two billion dollars odd and the present value of five billion dollars is the profit and property of the state.

HIGH RATES A TAX ON BUSINESS

If the state were a private corporation it might point with pride to this result of 30 years' ownership, but the public would complain and threaten, and ask why a railroad earning 7½ per cent. and in addition creating out of profits capital values of three billion dollars did not reduce its rates? That is the complaint in Prussia. The state, say the complainants, should cut rates heavily; it should be content with the 3½ per cent. which it itself must pay to borrow capital for railroad construction; and if its finances suffer, then let it mend them by imposing property taxes. The high railroad rates tax, not property, but business; and they tax heaviest the businesses which can stand it least.

The complaint is reinforced by the charge that the roads are not efficiently managed. Reichstag Member Gohre said that the state might cut rates heavily and still pocket its 7⅜ per cent. if only it economized in management. Herr Gohre further showed that the roads are badly overofficialized. In the Cologne chamber of commerce it was stated last year that, counting passengers and train tons carried, the Prussian roads have 2½ times as many officials as the American roads; and that they have five times as many clerical and other officials who do no physical work. "The bureaucratic management and the excessive staff would not," the speaker said, "be tolerated by a private corporation."

RATES NOT ADAPTED TO COMMERCE

Most persistent of complaints is that the rates are fixed by bureaucrats who do not understand business; and are taught by their superiors that the rates should favor grain and iron exporters at the expense of other interests. Bismarck had a plan for letting the Diet fix the rates. This plan was not carried out. The rates are fixed by a nominated railroad council of state officials.

This railroad council invites the co-operation of representatives of the business interests; but the representatives are only advisers and have no decisive vote. The interests, however, bring sufficient pressure to push their points against nonrepresented interests. The chief of the railroads, Minister of Public Works, Breitenbach, ascribes to this the high rates. He says that the interests themselves, in their zeal against competition, have prevented a reduction. Minister Thielen, a predecessor, said the same thing. He described the roads as "a morsel between contending dogs for which there is no parallel even in America, where the trusts exploit the roads in their own interests."

Critics emphasize this weak side of railroad nationalization. They say that where roads are privately owned the rates are invariably controlled by some public authority, and this public authority is in turn controlled by the legislature, whereas in Germany the vital matter of rates is withdrawn from the legislature and handled by a handful of uncontrolled bureaucrats.

Story of the South African Railway Strike*

The Causes, Extent and Lesson of the Walkout on the Government Lines Which Was Terminated by Martial Law

By a South African Correspondent

The people of the United States frequently are threatened with serious railway strikes. Some people in America advocate government ownership as a means of eliminating the danger of such strikes. Some railway employees favor government ownership as a means of preventing the development of the conditions whose existence under private ownership they regard as justifying them in striking.

The railways of South Africa are owned and operated by the government. There was a serious strike on them in the early part of the present year, which was speedily crushed. While this occurred some months ago, a fuller narrative of what occurred than has been published in your country may yet be interesting to, and certain food for thought for, the railway officers and employees of the United States and all other Americans who are interested in the labor problems presented on railways, and especially in the form they may take, and the way in which they may be dealt with, under government ownership.

The South African railway strike was not extensive, involving only about a tenth of the railway staff. It was not prolonged, lasting just over a week. It was not destructive of either life or property, being on the whole free from riot. But it was certainly instructive. It taught many a valuable lesson, pointed many a far-reaching moral. It demonstrated, what in South Africa had previously been uncertain, that as a weapon for securing industrial redress the ordinary or passive strike has greater limitations than the ballot box, and the Syndicalist or violent strike, as great limitations as the ordinary strike.

To arrive at the whole truth is probably now impossible, and to arrive at even an approximation of the truth necessitates going back to six months before the railway strike, and considering the general industrial unrest with which the railway troubles were inextricably mixed, and from which the railway strike arose.

ORIGIN OF THE CONTROVERSY

Rand, means ridge, and is the term applied to the gold-bearing ridge or reef extending for 40 miles along a line of which Johannesburg is the center. Along this ridge scores of gold mines are situated, the annual gold output of which is valued at about thirty-eight million pounds sterling. On one of these mines, in May, five underground mechanics had their Saturday shift increased by three hours, refused to work the extra hours, and were dismissed. Their society took the matter up, prohibited other mechanics from replacing the dismissed, and began negotiations with the management.

After a while it was pointed out, wrongly as it now transpires, that the company had really broken the law, that a month's formal notice of the intended change in the five men's hours should have been given. Thereupon the management undertook to go back to the old hours, and to reinstate its men, but did so with the usual stiff-necked ungraciousness which more than anything else perhaps irritates and makes employees unreasonable. Had the employees been sensible they would not have stood upon the manner of their going back to work, so long as the going was advantageous. Instead, however, of setting employers an example of how not to act reprehensibly, the strikers now acted as waywardly as the worst employer could. They now asked, not only that the five men should as hitherto cease work at 12:30 p. m. on Saturdays, but that all workers who previously had worked to 3:30 p. m. should in future cease at 12:30; that instead of the eight-hour day being calculated from the time a man started work till he left it, even when he had to waste perhaps an hour waiting to be lowered or raised from the pit, the time should be calculated from the time he entered the company's gates till he left them; and that disputes should be discussed not by spokesmen elected from the men, but by better practiced, more competent, less fettered spokesmen chosen from the trades union.

If the men had before been inconsistent and unreasonable, the management now was no less so. The issues were no longer confined to one mine and its employees, but affected all the mines and all their employees. When in disputes with their employees, as in this dispute the mine owners avail themselves of the best collective consultation and co-operation, the men, it seems only logical, should not be denied the opportunity of availing themselves of the best consultation within their reach. But this the mine owners insisted the men should not have. They elected to regard the trouble as purely a domestic quarrel between themselves and their employees. They could not, they suddenly conceived, allow third parties, such as trades union officials, to meddle in the matter. The men's trained negotiators being, so to speak, put out of court, a deadlock was arrived at. It was no longer possible to negotiate. It was like leaving a prisoner in the dock and expecting him to take up his case where his ejected barrister had left it. Industrial arbitration courts, though they have in instances notably failed, have in other instances been useful. They might have patched up peace in this case. But there are no such tribunals in South Africa, so the contest of alleged reason degenerated into what avowedly was purely a trial of strength. The workers called a general strike. The mine owners retaliated by employing strike breakers.

Only one outcome was to be expected. Collisions had previously occurred with some frequency. Now the strike assumed forms of unprecedented violence. Private dwellings were burnt. Women and little children suspected of dependence on strike breakers went in danger of their lives till given police protection. Where argument failed, the pick-handle and the dynamite stick were employed. Anarchy was sweeping over the Rand, and ended, as we have said, in turning Johannesburg into a shambles. Syndicalism was abroad.

The position of the government was awkward. A military change had been designed, whereby the defenses would pass from the Imperial troops to the citizen forces of the country. The authorities were, however, in the middle of their arrangements when the industrial trouble broke out. The police forces, excellent in ordinary times, were inadequate in such an emergency, entailing as it did the defense of millions of pounds' worth of machinery. So for a day or two the Rand fell to the mob, and the Imperial troops in the outer districts had to be called in. The government had, of course, long before this intervened between the strikers and the employers. Cabinet ministers, in the thick of the fight, hurried as fast as their motor cars could ply between the headquarters of the hostile camps. At last, on July 7, both sides realized that continuation of the struggle would mean ruin to all involved in it and gain to no one. A truce was patched up, the terms of which were exactly those which, with patience and clear judgment, could have been contrived when negotiations betwen the disputants first ceased. Certain minor concessions were granted right away; the rest were to be referred to an impartial commission. The strikers were to resume work without victimization, and as they would not tolerate the strike breakers, and as the mine owners would

*The writer of this article is a resident of South Africa who was so situated as to be closely in touch with all the developments narrated.

not break faith with these, they were compensated to the tune of £50,000; and of course the men's union had won the recognition they contended should never have been denied them.

AGITATION BEGUN BY RAILWAY EMPLOYEES

The truce with the miners brought no lasting peace; the railway men immediately entered upon the scene. The secretary of their amalgamated society said they had been groaning under grievances for years, and now was the time to strike for redress. What had been done by the mine workers on the Rand could be done by workers generally all over South Africa. They must organize for a great general strike. In future the railway society would act with the Federation of Trades.

Prior to 1910 the separate colonies of the Cape, Transvaal and Natal had each its own legislature, its own state railway staff, its own fluctuations of prosperity, and consequently different standards of pay. However much the emoluments, for instance, of the average station master in the Cape differed from those of his equivalent in the Transvaal, they were on the whole fairly consistent with what other average station masters in the Cape drew. And so through all the grades. Were a man not receiving what, perhaps with an exaggerated sense of his own worth, he believed his due, he had the comfort of knowing that neither were his colleagues. It was not till the colonies united, and the three railway services became one; not till men from different provinces found themselves working *together*, on the same work, but on very different rates of pay, that anomalies became apparent. Hence a certain unrest throughout the service. The railway society, however, represented more the artisan than the clerical grades. It was, therefore, more to questions of hours, piece work, overtime and minimum wages, than to questions of what should determine seniority and promotion, with which it concerned itself; and in the end the issue on which the strike was fought was the clear one of whether or not the administration should retrench when it thought fit.

The railway society, as stated, was not affiliated with, though it co-operated with, the general trades societies; in the July truce no provision was therefore made for railway men. And as they were state servants the government was not able, as in the case of the miners, to act as mediator between employers and employees. The railway men were, however, instructed to formulate their grievances, and informed that, like the general workers, they should have an impartial commission of inquiry. They asked that the unanimous recommendations of a previously appointed Grievance Commission should be adopted; that the railway society should be recognized; that an eight-hour day should be general throughout the service; that the minimum wage for white employees should be eight shillings a day; that piece work should be abolished; that the salaried staff should be better paid; that a permanent inquiry board be appointed; that punishment for striking and making mistakes in train running be less severe; that equal representation on the present appeal board be given the men; and *that the new Union staff regulations be suspended*.

Before the two commissions could sit, many preliminaries were necessary. Almost daily negotiations between the government and the general workers' and railway men's representatives took place. Unfortunately, a hitch occurred. The representatives of the general workers pointed out that their men were dissatisfied with the truce, were not disposed to be bound by the undertaking given to government. The breach widened. There was a feeling that the July events had given labor the ascendency, and that whereas previously they had to beg now they could compel the terms they wanted. There was probably a mutual distrust of the honesty of purpose of either side. However, this may be, a deadlock soon arose. A general strike, it was declared, would be called—when it suited the workers.

Negotiations between the government and general workers thereupon ceased, but the government was prepared to continue with the appointment of the promised commission, and asked labor to assist in the inquiry. Labor, however, professed itself unable either to have anything to do with the election of commissioners or to recommend witnesses to give evidence.

The railway society, however, could not prevail on the railway men to throw constitutional methods to the winds. So the promised strike was postponed. But it hung like a threat over the community. The election of the railway commission, to consist of a judge of the Supreme Court, a government nominee, and a member elected by the men, was proceeded with. Meanwhile the government had been considering why, as it had negotiated with the railway men's accredited representatives, it could not recognize their society. It was decided the society would be recognized on condition that its constitution was redrafted to provide that it should not be a political organization, that it should be composed only of railway and harbor servants, and that it should in no way be associated with outside organizations.

RAILWAY EMPLOYEES AROUSED BY FALSE RUMORS

This was under discussion, and matters were progressing not perhaps without obstacles, but on the other hand not without hope of peaceful settlement, when suddenly on October 8 the press alleged that a number of railway men were to be dismissed. Estimated railway revenue, it was announced, had not been realized; expenditure had far exceeded expectations, largely through increased increments to staff; recent industrial disturbances had so unbalanced trade that the future looked dark; and some retrenchment was necessary.

Loud and vehement came the retort that this was victimization; the railway men had dared to assert their claims, now they were to suffer for their temerity. Revenue, it was urged, might have fallen; it was bound to fall when by recent rate reductions the earning power of the railways had been reduced by nearly a million pounds a year. But trade, the critics contended, remained good; the tonnage had not appreciably decreased; the railways were as busy as ever; overtime was plentiful: then why dismiss men? The minister of railways explained that the rumor had been premature and exaggerated. Expenditure and revenue were, indeed, being watched. Officers had been asked for recommendations as to possible economies. It was always, and at present more than ever, necessary to consider economies. But there were other ways of effecting economies besides dismissing men. The railway board was considering what should be done. A decision could not be arrived at for some time. But if men had to be dismissed, nothing like the number rumored would go.

The railway society was, however, suspicious. It appointed a deputation to ascertain from the minister exactly what was intended. The minister replied that he was prepared to receive a deputation of railway men, but as the conditions on which the government was prepared to recognize the railway society had not yet been complied with he could not receive the officials of the society. The latter were indignant, and feeling deepened as a rumor got abroad that not only was retrenchment contemplated, but that it had already started. Men in Johannesburg, it was affirmed, who had been prominent in the July events, had already been dismissed, and labor leaders, it was further stated, were itching for an immediate general strike, if the railway men would come out.

The minister repeated and amplified his statement, this time direct to the staff, pointing out that the men were casual employees, engaged on short contract and subject to 24 hours' notice; and were among those employees who in a huge concern like the South African Railways are continuously being dismissed or engaged as the exigencies of a fluctuating traffic necessitate. He could guarantee there would be no victimization, and indeed there was nobody to victimize, as the staff as a whole had been loyal during July, however wild the utterances of the officials of their society; but he could not guarantee that retrenchment might not become necessary, because he could not anticipate the future.

This relieved the position. In a public pronouncement the railway society informed the press there would be no strike.

The crisis was over. The unrest had died down. The position was normal. So matters continued till Christmas. Then just towards the close of the year rumor dropped another bombshell among the smouldering embers. Large numbers of railway men, it was alleged, were being dismissed; five hundred had been scheduled for that purpose; no reason was assigned for the sudden and drastic action; this was the administration's Christmas box to those who had been foolish enough to trust.

The answer was that only 70 men had been dismissed, and that these were temporary employees. Even this, it was retaliated, was unendurable. There was no need for dismissing men. The railway society demanded that retrenchment be stopped, that those discharged should be reinstated, and that a definite guarantee be given that no further retrenchment take place: these demands to be granted by January 7, otherwise a strike would be called.

It was impractical the answer came, to reinstate the 70 men, even if sufficient reason were adduced, as the dismissals had been decided upon by the Railway Board after the most careful consideration. It was impossible to give a guarantee that future retrenchment would not become necessary. And it was preposterous to demand that the Railway Board should abdicate its functions at the dictation of an irresponsible and officially unrecognized society. But if, in anticipation of further retrenchment, the staff had any specific practical suggestions for distributing the burden more equally, by temporarily reducing wages or hours generally, the government was prepared to consider such suggestion. None was made.

It is perhaps inevitable in a huge concern like the South African Railway, even had Union not brought a crop of still flourishing anomalies, that anomalies should frequently arise. Perfect equity is hard to attain even in small affairs. Officials controlling men are not all ideally fitted for the task, are not always in that balanced, temperate frame of mind which men controlling the destiny of another man, however humble the latter, should preferably be. Injustices, therefore, no doubt occur. This is true not only of a railway but of all businesses. But on the South African Railway there is machinery to check this as far as may be. There are impartial appeal boards on which representatives of the workers sit. It is no doubt laborious, it is often discouraging, for an individual, especially a workman with little education, to fight a lonely battle through to the board. A society of his fellows to help him along is then useful, to men and to the government, if it helps to secure equity and content. But the object of the society should be to enable men specifically to present their grievances. The society should not truculently insist on the random granting of what a man asks for merely because he asks. Much less should it do so in the case of an indefinite number of unspecified men. Yet this is what was done, and this is what was wrong. Every charge leveled by the railway society against the administration was vague and unsupported by evidence.

On the South African Railways every man is employed on specific conditions. He knows, or should know, what those conditions are. He may be subject to 24 hours' notice, or to a month. He may, if his services be dispensed with, be entitled to a pension, to a gratuity, or to nothing more than the wage for the time he has worked, according to the terms of his contract. These are his rights. These rights he is entitled to insist upon. And as long as they are respected he has received justice and is entitled to nothing more. For the South African railway man to expect more, is to assume that a government railway is a benevolent institution, not a business concern, which is untenable.

It is perhaps true that whereas a private employer, in theory at least, considers only his own pocket and the exigency of the moment, a government employer should take a wider view; should consider whether in retrenching a man, especially in a country like South Africa, where there are few commercial openings for railway men, the saving to the railway is not less than the burden of unemployment thrown on the country. But if this is a consideration it can weigh only when by parliament it has been laid down as a definite principle to be practiced; and then if the railways are to continue to be run on purely business principles, there must be some arrangement for repaying them from general revenue for the losses which such unbusinesslike principle would entail. Until such arrangements exist, it may be politic, in times of acute industrial unrest, to waste wages on men not required rather than precipitate a strike and bear the consequent expense; or it may not be politic. That is for the government administration to judge, and if in the opinion of labor it judges wrongly, it is for labor, by constitutional means, to get redress through parliament, not to try to overawe the administration. For while strikes and their cost are to be avoided if possible, there is an even worse evil to avoid, and that is the evil that would result from the belief that not the exigencies of the service, but the dictates, the often preposterous dictates of the railway society, is what shall determine the policy of the administration. Strikes are bad. But for a moment to admit that the railway employees, not the Railway Board, should decide when and what men shall be dismissed, is obviously preposterous. It strikes at the root of all discipline. It may be a modern, but it is a silly notion. If in times of depression the Railway Board elects to consult its men for suggestions as to economies that may avert the necessity for dismissals, well and good. That is an act of grace conceivably beneficial to both parties. But to contend that the Railway Board should be responsible for the capital and interest on the £80,000,000 invested in our railways, whilst its economic policy should be dictated by an irresponsible and largely uninformed trades union, is to advance a theory the acceptance of which would be more ruinous than the worst strike ever engineered.

Yet this is precisely what the railway society demanded. Unless the temporary employees dismissed were reinstated by January 7, and unless a guarantee were given that no more employees were dismissed, a general railway strike for January 8 was threatened; with the further proviso that if at any time the railway society could lay its hands on 25 orders of dismissals, it would call a strike. The society claimed that it had the support of 90 per cent. of the railway men; it professed to be able to bring the whole railway service to a standstill in a day, in both of which estimates subsequent events proved that the society was ridiculously mistaken.

Thus the issue in the South African industrial unrest became a railway one. The Federation of Trades decided to support the railway men, and if necessary to call a general strike of all trades, but this latter necessity, it was at first believed, would not arise, as if the railway men struck successfully the mines would soon have to stop for lack of coal.

RAILWAY STRIKE CALLED

It was then seen that the organization of the railway society was bad, that its optimism was ill-founded. The strike was called. In the most turbulent centers, Johannesburg and Pretoria, the response was fair; but not as satisfactory as was expected; many men continued to work, and the administration succeeded in running a number of its trains. At important centers like East London the men demanded a ballot before they would strike. Uitenhage was unwilling to come out. Kimberley voted against a strike. Capetown refused to strike. Bloemfontein was shocked at the executive's precipitate and unsanctioned action.

On the other hand, the government was prepared. It had profited by the experiences of July. The new citizen force was now in existence, and so excellent were the arrangements that within a few hours armed men and munitions were pouring into the disaffected areas. The stations, the railway line, and those who elected to continue working were from the first obviously assured of adequate protection. There was no opportunity for "pulling out," no opportunity for rioting; order was firmly maintained.

On the 9th, however, the Cape mail was dynamited, luckily

with little damage, and of course heated speeches poured in torrents. On that date several of the strike leaders, including the secretary of the railway society, were arrested under the Peace Preservation Act. This action gave an impetus to the strike. The running staff came out in increasing numbers, loyal drivers refused to carry armed men to the Rand, there was a feeling that the government had been needlessly autocratic, and to show their resentment increasing numbers of men in outside centers, especially Durban and Salt River, went on strike.

The Federation of Trades, indignant at the arrest of the strike leaders, and piqued perhaps at the fact that foodstuffs and coal for the mines continued, by extraordinary exertion on the part of the authorities, to be brought to Johannesburg in quantities at least sufficient to prevent acute distress, decided to take over the control of the strike, and to call a general strike of all trades. Meanwhile several unsuccessful attempts had been made to blow up the line. The train services in the Free State, Natal and the Cape were practically unaltered, but in the Transvaal only a limited service could be maintained.

GENERAL STRIKE ORDERED

On January 13 the general strike was called, and the government retaliated by declaring martial law in the centers most threatening. The strikers formed bands to prevent their sympathizers being carried away by excitement, the towns and suburbs were parceled out for military control, committees to supervise the distribution of food and fuel were formed to prevent extortion, and from every part of the country men of all kinds volunteered for whatever duties the government elected to give them.

Thereupon the train service in the Transvaal improved, only a tenth of the railway men were out, the others, certain of protection, followed their inclinations unmolested, and the strike began to crumble. Regrettable events, blunders on the part of the martial law authorities, and blunders on the part of the strike leaders occurred, several arrests were made, much ill-feeling was caused; but there was practically no bloodshed, no destruction of property, and very little brutality of any sort. The iron hand of martial law was too strong for that, and the great tragedy passed off without any of the atrocities which characterized the events of July.

By January 15 the outcome of the strike was certain. Comparative quiet reigned in the worst centers. Fortune, it was clear, was against the strikers. By the sixteenth there was a rush for reinstatement. The surrender was unconditional.

But, however satisfactorily to the public the strike had terminated, the country had suffered heavy monetary loss. It was, in the opinion of the government, impossible to face a recurrence every six months, to have the business of the country upset and its credit prejudiced whenever a few irresponsibles, who as events proved had not the support they imagined, elected to inflame passions and call a strike. So nine of the ringleaders were deported. They were, the government claimed, the enemies of South Africa, "declared by themselves, and declared by their acts." And Parliament, taking that view, has just passed an indemnity bill confirming the action of the government.

But the money and trouble entailed by the strike has not been entirely wasted. Whatever grievances there were have not been removed, but it is the intention to continue with the commission the inquiries which automatically stopped when the railway society's secretary, who was one of the commissioners, was deported. And as now the railway men appear to realize, that however excellent their case, the ballot box, constitution and constructive measures generally are the most likely to prove useful where strikes have proved useless, there is reasonable hope that we are nearer than ever to a solution of our industrial difficulties.

Only about 3,500 railway men went on strike. As previously stated they acted illegally in leaving their work without due notice, and, speaking strictly, those who had pension or other accruing rights had forfeited them. The majority were, however, allowed to resume work.

Finally it should be mentioned that since Union in 1910 the increments to the South African railway men have been increased by over £681,000 per annum, and in many ways the administration has done much to improve the conditions of the workers. But conditions of working have become much more complex and staff complexities have naturally increased proportionately.

LOCOMOTIVE STAYBOLTS*

By C. A. Seley†

The cost of repairing a broken staybolt, even if the work can be combined with other necessary work, is not simply that of the labor and material employed, but also some portion of the value of the service of the engine which is lost thereby, and if the actual costs of staybolt maintenance and other matters incident thereto were closely computed, very good reasons for means of improvement would be manifest. Not that improvements have not been made. The iron makers have been diligent in producing special staybolt irons that have more lasting qualities to stand the peculiar requirements of that service. By the use of special mixtures and methods of piling and working, special brands of iron are produced which give very excellent results, but the breakage of solid staybolts has not been entirely stopped by such means.

With a well-designed and well-built boiler equipped with solid staybolts, there should not be serious staybolt trouble until about the third year of its use. In other words, the solid staybolt in modern, well-designed boilers, is from 50 per cent. to 75 per cent. perfect, based on 100 per cent. being the life of the average firebox, which is now about 5 years.

Experiments have been made showing the relative expansions of the firebox and the outer boiler sheets when under pressure, proving they are not alike, and therefore the staybolts, in addition to the tensile load imposed by the pressure, have also an angular strain due to these irregularities. It is these angular movements many times repeated, that account for broken staybolts, for the direct pull is taken care of by a relatively high factor of safety. In proof of the latter statement assume staybolts with $\frac{7}{8}$ in. diameter at smallest portion, spaced 4 in. by 4 in. in a boiler carrying 200 lbs. steam pressure. Each bolt support 16 sq. in. and a consequent load of 3,200 lb. The bolt area is .60132 sq. in. and the above load is therefore 5,320 lb. per sq. in. As staybolt iron has generally not less than 48,000 lb. ultimate tensile strength the factor of safety exceeds nine. This proves the undesirability of large staybolts, as with large sizes there is an increase of rigidity, whereas the desirable feature is flexibility.

It seems clear that they do not break on account of lack of strength of the cross section, but on account of the overstressing of the outer fiber due to angular vibration, and it might be well to theorize as to when the initial check or break in the outer fiber occurs. Reference has been made to tests showing angular movements of sheets and staybolts under pressure, but it is likely that these do not produce the extreme movement which may account for the initial check or failure of the outer fiber, which progresses gradually inward and results finally in complete fracture. Reference has been made to the irregular temperatures of the sheets, produced by rapid and uneven heating of the firebox in firing up, also in cooling down and washing. It is believed that at these times the angularity is greatest and is accountable for the initial checks, although at these times there is no pull on the bolts. After water circulation is well started, undoubtedly the amount of angular movement is greatly reduced, although remaining in some degree, but the damage has been done, the check started and in course of time evidenced by the complete fracture.

Now, what is the remedy? More flexibility of the body of the bolt between the sheets to reduce the stress on the outer fiber

*Extracts from a paper on "The Art of Locomotive Staybolts," presented at the April meeting of the New York Railroad Club.

†President, American Flexible Bolt Company.

so that the initial check will not occur, and also reduce their strength as levers to punish the firebox material, reduce the buckling and save the fireboxes. It is manifestly impossible to correct the handling of engines at terminals so that these irregular temperatures and stresses will be done away with. Availability of power is the first consideration and terminal forces are under extreme pressure to get engines turned in the shortest possible time, and engines which they are not in a hurry for get the same treatment generally in respect to the matters which contribute to staybolt breakage and firebox cracking.

Recognizing the necessity of meeting the situation and demands for availability of power, many railroads have installed improvements in washing out which contribute materially to that phase of the question. Bright minds have also been at work on the staybolt structure and some very meritorious designs have been produced, but generally at considerable increase over the solid bolt, both as to first cost and application cost. The importance of the necessity for extension of staybolt life and increase of locomotive availability, will, however, justify increased cost, the degree of which being dependent upon conditions. Owing to staybolt breakage occurring generally close to the outside sheet, the earlier attempts to secure flexibility of the staybolt structure in this country were to change the outer end to a ball and socket form, which gave complete and absolute flexibility at that end. This idea originated on the Pennsylvania Railroad, and is in extensive use there and elsewhere at the present time and has served as the basis of subsequent modifications and improvements of the various staybolts of that type and which are generally and commercially known as flexible staybolts.

One of the more recent developments in the art aims directly to increase the flexibility of the body of the staybolt to eliminate breakage and also save the firebox sheets by the simple expedient of making staybolts with a body of two pieces of half-round iron, thus having two neutral axes, each much closer to the outer fiber than in the solid section, and then by twisting the body present the plane of greatest flexibility in every direction in which a lateral stress may come to it. The ends of these bolts are larger than the body and take the usual staybolt thread, and are applied to the boiler in the same manner, and at same cost as that of solid bolts. As they have a relative flexibility of body several times that of solid bolts of equivalent cross section, it is reasonable to believe that the outer fiber stresses have now been reduced so as to give such bolts a life of three, four, or half a dozen times that of solid bolts, and it can be reasonably expected that these bolts will last the life or more of the average firebox, and more than that is unnecessary, an economic feature of importance.

As a general proposition, it pays to use the best, and this applies particularly in locomotive maintenance and availability Analysis shows that it costs about two dollars to apply each dollar's worth of material purchased for a railroad shop, but this is probably too low in considering the relative cost of material for staybolts and their application, particularly in breakage renewals. The costs for cooling down, emptying, stripping, removal and replacement of the broken bolts, and the other parts involved, together with the loss of time of the engine, makes the material costs insignificant by comparison. If the causes which contribute to staybolt breakage, are also responsible for the early failure of fireboxes a railroad could almost afford to use gold staybolts, taking all the factors into consideration.

Brazilian Railway Development.—A recent statement by Senhor Hermès da Fonseca, the president of Brazil, says that the railway system of Brazil was increased in 1913 by 1,431 miles, bringing the total up to 15,280 miles. Of this total 2,188 miles are operated by the federal government, 5,728 miles are leased by it to individuals, 3,454 miles have been "conceded" by the federal government to private enterprise and there are 3,903 miles which have been conceded by the different states.

BUSINESS PRINCIPLES AND RAILWAY MAIL PAY

The Railway Business Association has issued the following statement on the railway mail pay question:

Proposals for readjustment of railway mail pay now pending before Congress involve such serious divergence of view as to facts and as to principles of fairness that the attention of business men is invited to the situation. As business men we submit:

1. The government dealing with a company which cannot refuse to deal should not permit the price to be fixed by an official who has a balance sheet stake in making the price low.

2. The government should not force upon a railroad a contract which no business house would accept, under which the quantity of service to be rendered is estimated in advance by the purchaser, the pay to be determined by that estimate and service in excess of the estimate to be performed but not paid for.

3. Congress should not confuse the consideration of mail pay, a purely economic and business proposition, with political and irrelevant questions such as are involved in the Moon bill and which would draw in a large number of persons interested in its passage wholly apart from the question of pay.

4. Congress should not act on mail pay until it has the report of the Joint Committee of Congress which has been investigating this subject for two years, or at all while engrossed in an unusually large legislative program.

The Moon bill in constituting the postmaster-general the arbiter as to price ignores a fundamental principle of business fairness.

The buyer, in business, fixes the price, but the seller can refuse to deal. The railways cannot refuse to deal. Mail carriage is made compulsory by the Moon bill under heavy penalties. To attain perfect impartiality the umpire should be connected neither with the railways nor with the public. This being impracticable, the power should be exercised by an authority farthest removed from temptation to be overzealous for low pay. The postoffice department is more interested than any other government body. One test applied to postoffice administration is the size of the deficit. There is in mail administration so much that is personal or political that postoffice officials are under undue temptation to bias.

How this works is plain from the record. Postmaster-General Hitchcock stated in House Document No. 105, dated August 17, 1911: "The committee (of postoffice department officers) estimates that through a readjustment of railway mail pay on the basis of cost with 6 per cent profit a saving to the government could be made of about $9,000,000." This estimate, assuming the fairness of cost plus 6 per cent, gave the public the impression that the postmaster-general had declared the roads to be overpaid by $9,000,000.

Congress in 1912 provided for a joint committee before which the railroads emphasized that the method of finding cost omitted allowance for interest on investment.

The postoffice department on January 16, 1914, proposed "to allow such additional amounts as may be necessary as shall render the whole a proper proportion of a fair and reasonable return on the value of the property necessarily employed." Thus the department investigation had been conducted without co-operation of the railroads, although they had offered co-operation, and an estimate of $9,000,000 over-pay had gone to the country before the railways had had an opportunity to point out this vital omission which was subsequently acknowledged by the department.

The department contends that the roads ought to perform government service at a lower rate than private service. Postmaster-General Burleson says: "The carriage of the mails by the railroad companies for the government cannot be considered as of the same character of service as that performed by them as common carriers for the general public. . . . Rates for carrying mails on railroads should be less than those which might be fixed for commercial business." If the argument is that the mails are

a means of communication for the government and for citizens, and hence should be carried at a low rate, it is only necessary to point out that the weight of letters and government matter combined according to the report of the department for 1912 made only 17 per cent of the mail, as against 83 per cent newspapers, magazines, books and merchandise, which are essentially freight. Since that report the parcel post has been established and has swollen to a degree unknown the ratio of "freight" mail to letters and government matter. The department does not attempt to present in 1913 a corresponding analysis. If the argument is that mail-carriage develops the territory served by a road and produces remunerative tonnage, it is sufficient to reply that on that very theory passenger rates have already been depressed below the freight basis by the states and railway mail earnings are even lower than passenger. If passenger rates are to be raised, as Mr. Brandeis suggests, why reduce mail pay?

The most disinterested witness is M. O. Lorenz, associate statistician of the Interstate Commerce Commission. Dr. Lorenz attended hearings of the joint committee and participated in colloquies between representatives of the department and of the railway committee, of which the chairman is Ralph Peters, president of the Long Island Railroad. Dr. Lorenz reached his conclusions as to rates by two methods—first, cost plus taxes and interest on bonds without contribution to dividends or surplus; second, passenger train earnings minus an arbitrary 10 per cent representing those passenger train services in which mail does not participate. Dr. Lorenz says:

"On the basis of the commercial principle, the conclusion is reached that 22½ cents per 60-ft. mail car hauled one mile, with a separate payment for side and terminal services, would constitute a fair adjustment for the first year, being an increase over the present rate of pay, but still probably an underpayment." The 22½-cent rate, Dr. Lorenz states, "would be an increase of certainly more than 10 per cent."

This was on September 27, 1913. On February 12, 1914, Assistant Postmaster-General Stewart submitted his draft upon which the mail pay provisions of the Moon bill are based, and instead of 22½ cents, which Dr. Lorenz concludes would be an underpayment, recommended "not exceeding 20 cents." This aroused so much protest that the postoffice department proposed, and the House Committee on the Post Office and Post Roads adopted, an amendment making the base rate "not exceeding 21 cents," still 1½ cents below the rate on which Dr. Lorenz says mail service would make no contribution to dividends or surplus.

Proposing, in other words, a nominal rate schedule which the expert of the Interstate Commerce Commission says would perpetuate underpayment, the department would reserve to itself the power to reduce even that rate.

The Moon bill in providing that the postmaster-general, without appeal, shall by estimate in advance determine how much service shall be paid for at the rates determined by him, also without appeal, ignores another fundamental business principle.

Congress in adopting such a method would be compelling a railroad to accept a contract which no business house free to decline would accept—a contract agreeing to furnish material for a lump sum, the quantity having been estimated by the buyer and any excess over that amount to be furnished and not paid for. The present statute prescribes quadrennial weighings, about 90 per cent of the service being thus computed and the remainder by space and otherwise. The Moon bill makes weighings annual, but reduces to about 10 per cent the traffic which is to be weighed; about 90 per cent is to be computed by space, and this not space used and measured, but space estimated and authorized in advance by the department. For actual weighings it would substitute the individual personal opinion of officers of the department as to the service which will be performed. While changing the weighings from quadrennial to annual, the bill would shift measurement on the bulk of the business from actual weighings to estimates and from statutory mandate as to method to the discretion of the department, without appeal either as to method or as to the result of applying the method.

Power to determine method and frequency of measurement of mail service performed ought to be statutory, or at least subject to appeal.

The parcel post illustrates the practical importance of this principle. The growth of that service should be considered with special accuracy, because of its immense volume, because it deprives the railways of express and freight revenue, and because its development cannot be computed in advance.

In our judgment measurement should be annual or oftener and the frequency and method of ascertainment determined or umpired otherwise than by the postoffice department.

The Moon bill comes before Congress with powerful momentum. It is based upon a draft made by the second assistant postmaster-general, reported by the House Committee on the Post Office and Post Roads without minority protest, made the subject of a special rule of the House, and contains provisions which attract to its support without reference to railway pay the following:

1. Applicants for assistant postmasters in first and second class postoffices, with whom incumbents must under the bill compete in examinations. 2. First, second and third class postmasters, whose salaries are dealt with. 3. Persons performing service for contractors in carrying the mail, whose claims are made liens. 4. Federal and Confederate veterans, who are exempted from age limitation in selection of fourth class postmasters.

These extraneous provisions, whatever their merits, give an interested motive in the passage of the whole bill to large numbers of persons and tend to deprive of the consideration which it deserves the main question of fairness to railroads.

The largest advantage hoped for from increases in freight rates is the strengthening of the market for railway securities through reassurance to investors concerning the treatment which our railways may expect from the government. What will be the value of this reassurance if the government with one hand grants an advance in freight rates and with the other reduces mail pay? What confidence will investors have in the fair intent of the government if revenue for any railway service is to be determined by specifically interested persons and if provisions dealing with railway compensation are to be passed substantially as a rider upon other provisions with which they have nothing to do and for whose adoption there is great political pressure, and this at a time when an investigation covering many months by a joint committee of Congress is about to result in a report?

We believe that if Congress and the public understood the merits of this question the legislation adopted would differ fundamentally from what is proposed in the Moon bill. Congress and the country should study the question deliberately and in the light of full information.

Whatever legislation is enacted should indicate both by its terms and by the circumstances of its adoption an unmistakable purpose on the part of Congress to deal fairly and justly with the railroads.

Corporation Eugenics.—The institution by the General Electric Company of a compulsory physical examination for employees seeking to return to work after illness or a period of unemployment will naturally provoke opposition on the part of the workmen affected. But the regulation should operate to improve the efficiency of the employees by serving as an inducement to them to keep in good physical condition. There is nothing the average American is so prodigal of as his health. If he knows that his job depends on his keeping fit, there will be the strongest possible incentive for him to safeguard himself against disease. The company is obviously inspired by a desire to reduce its liability under the Compensation law; but the rule may prove a benefit to the men, as have the rules against drinking, enforced by the railroads. Perhaps in the end the corporations will do more for practical eugenics than the legislatures.—*New York World.*

Maintenance of Way Section

The abuse of cost data by using such information without making due allowance for local conditions has created a common prejudice against the collection and use of cost data of any kind. As outlined by Mr. Bowser in another column, there are many conditions which must be taken into consideration in making an accurate analysis of cost figures, especially if made upon such a general basis as the cost of maintenance per mile of line. However, such objections are frequently magnified. The importance of the general collection and comparison of cost data should be strongly emphasized, for they lie at the basis of all economical practices. Evident deficiencies in such data should cause more care in their collection rather than a general condemnation of this material. If used intelligently, with proper consideration of the purpose for which they are prepared, they will reveal the weak as well as the strong points in any organization or system of work. On the other hand, nothing will tend to discourage the use of cost data as quickly as unwise and unintelligent cost comparisons, as such comparisons defeat the very purpose for which cost data are collected.

The Use and Abuse of Cost Data

The extent to which maintenance practices are continually changing can be realized best by comparing present methods with those of a decade or two ago and by noting the numerous instances in which practices which were then considered unnecessary refinements have since been made standard. Not many years ago curves were not spiraled and little attention was given to their correct superelevation The compensation of grades for curvature is another generally accepted principle which was once considered a refinement; and only a few years ago tie plates and rail anchors were commonly considered of doubtful value. The advocates of rail canting believe that this practice should not be considered an unnecessary refinement, but that it is warranted by the increasing service required of the track. They point to its general adoption on the European roads with their permanent track construction as supporting their contention. The fact that this practice is not widely adopted in this country, as shown in another column, indicates that it is not generally approved. But it is standard on several roads and is regarded with favor on others. As with any practice not in general use, it must be used with care, for under certain conditions it can become positively injurious. In general, our tracks are suffering from too little rather than too much attention to the refinements of maintenance. Lack of attention to the accurate maintenance of gage, to line and surface, to drainage, etc., all result in increased wear and destruction of materials and in increased labor charges.

Refinements in Track Maintenance

One early effect on American railways of the European war will be the curtailment of the supply of creosote available for the treatment of ties, bridge material, etc. Over 39,500,000 ties were treated in 1913, approximately two-thirds of which were treated with creosote. Over 108,000,000 gal. of creosote were required in this country last year, of which 62 per cent was imported. This oil comes principally from Germany and England. While the production of American creosote is increasing, it has never exceeded 38 per cent of the requirements of this country, and even with free access to European oils there was a shortage last year which required the closing down of several plants. Since creosote is a by-product, the war will seriously interfere with its production abroad as well as its transportation to this country, and it is to be expected that the amount imported will be seriously curtailed. Many of the plants operating in this country, and especially in the southeastern states, depend almost entirely on foreign oils and carry only a limited supply. When this is exhausted there will be presented the alternative of closing down the plants or operating them with some other preservative material, such as zinc chloride or crude oil, both of which can be secured in large quantities in this country. One favorable factor in the situation is that the war began late in the season when the treatment of material required for this year's work is approaching completion. The general policy of retrenchment enforced this year also undoubtedly has reduced the demand for treated material. While many of the plants operate throughout the year, the effects of their closing down at this season will not be as serious as they would after the first of the year, when the requirements of next year will be more pressing; and conditions in Europe may be entirely changed by that time.

A Threatened Shortage of Creosote

Twenty-two papers were received in the contest on "The Distribution of New Material and the Collection of Scrap." These papers were turned over to W. J. Towne, assistant general manager, Chicago & North Western; D. J. Brumley, engineer of valuation, Illinois Central, and R. D. Long, assistant general storekeeper, Chicago, Burlington & Quincy, who awarded the first prize to Ernest Cordeal, St. Louis & San Francisco, Springfield, Mo., and the second prize to E. J. McVeigh, general storekeeper, Grand Trunk, Montreal, Que. Other papers accepted for publication were contributed by J. P. Costello, roadmaster, Atchison, Topeka & Santa Fe, Pueblo, Colo.; E. B. Fithian, general roadmaster, St. Louis, Iron Mountain & Southern, Little Rock, Ark.; D. F. Stevens, Baltimore & Ohio, Baltimore, Md.; J. T. Bowser, Cincinnati, New Orleans & Texas Pacific, Danville, Ky.; S. C. Tanner, master carpenter, Baltimore & Ohio, Baltimore, Md.; J. W. Powers, New York Central & Hudson River, Oswego, N. Y.; W. O. Houston, division engineer, Michigan Central, Jackson, Mich.; E. M. Keays, material supervisor, Chicago & North Western, Evanston, Ill.; R. B. Abbott, division engineer, Philadelphia & Reading, Harrisburg, Pa.; F. L. Burrell, general foreman bridges and buildings, Chicago & North Western, Fremont, Neb.; J. J. Hess, assistant engineer maintenance of way, Great Northern, St. Paul, Minn.; R. Huber, roadmaster, Chicago, Burlington & Quincy, Brookfield, Mo.; J. W. Carey, clerk to supervisor, Pennsylvania Lines West, Bellaire, O.; A. M. Clough, supervisor, New York Central & Hudson River, Batavia, N. Y.; W. S. Taylor, superintendent of terminals, Chesapeake & Ohio, Covington, Ky.; John Carmichael, Hagerstown, Md.; E. K. Coggins, chief clerk to roadmaster, Southern Railway, Knoxville, Tenn.; P. Quinlivan, roadmaster, Delaware, Lackawanna & Western, Buffalo, N. Y.; George E. Lowe, supervisor, Delaware, Lackawanna & Western, Elmira, N. Y., and W. F. Rench, supervisor, Pennsylvania, Perryville, Md. These papers were prepared by men in all branches of maintenance of way work and cover the entire field. They discuss the problems and the common deficiencies of our present system, and should impress upon all maintenance men the importance of cooperation. The two prize winning and several other papers appear elsewhere in this issue, and others will appear in later maintenance sections.

Awards in Material Contest

FUNDAMENTAL PRINCIPLE UNDERLYING THE SUCCESSFUL DISTRIBUTION OF MATERIAL

THE prompt delivery of material by the store department is essential to the economical prosecution of any kind of railway work. In order that this department may be able to perform its function it is necessary that it be given a detailed and complete list of the material desired, a sufficient time in advance to enable purchases to be made and deliveries secured. In the case of any single order the problem is simple, but when orders are multiplied by the thousand the complications increase. The expenditures for maintenance of way alone of the railways of the United States amount to about $350,000,000 annually, of which approximately $150,000,000 goes for materials used by the 500,000 employees of this department. The distribution of this amount of material over 245,000 miles of line requires close co-operation between the purchasing, store and maintenance of way departments. If the men in each department would try to put themselves in the places of men in the other departments they would better realize some of the problems confronting others, and the first step towards effective co-operation would be taken.

The maintenance of way department initiates the orders for large amounts of materials, and uses them ultimately, and it is with this department that we are more directly concerned here. The first step in the ordering of material is the preparation of a definite schedule of operations for the entire season. With this in mind the dates at which various materials will be required at different points can be determined approximately. If this information is then given to the store department it in turn can plan its work to protect these different jobs. The receipt of material on the site of work either too early or too late, results in unnecessary expense and loss. While under any system which can be devised delays will occur at times, owing to errors in one or more of the three departments concerned, an occasional difficulty should not be permitted to destroy the system and break down this co-operation.

Another phase of this problem that deserves special emphasis is that of the large amount of money tied up in material held in stock. Not being confronted with the actual figures, many maintenance of way officers fail to realize the sums which are tied up continually in unnecessary stocks of new and scrap materials and that the amount of materials so held is multiplied many times over on the entire system. The attention given to this subject during the past few years is tending to better conditions along this line, but to attain the greatest success it is necessary that each officer give the effort to improve conditions his support. As long as the men in charge of work out on the line will run carloads of excess material upon a cut-off while the inspection train passes over the main line, as was done on one eastern road, little progress will be made. The details of the proper methods of handling materials are well covered in the papers received in the contest on this subject, several of which are published in this issue.

NEW BOOKS

Symmetrical Masonry Arches. By Malverd A. Howe, Professor of Civil Engineering, Rose Polytechnic Institute. Size 6 in. by 9 in., 245 pages, illustrated, bound in cloth. Published by John Wiley & Sons, Inc., New York. Price $2.50.

The second edition of Howe's "Symmetrical Masonry Arches," which has just appeared, corrects all errors that were found in the first edition, simplifies the demonstration of the formulae and contains a considerable amount of new material. The book was written to present in simple form the elastic theory of designing masonry arches. The formulae presented in the book are not intended to be rigid or exact, in view of the fact that the materials used in the construction of arches are more or less uncertain in character and it is felt that all formulae given, although somewhat approximate, are within the limit of accuracy to which such construction can be carried out. The book includes a number of examples worked out in detail to show the various processes and methods of checking. It describes a number of typical arches and includes an appendix giving general data for over 500 arch bridges.

Letters to the Editor

RELINING A CURVE WITH A STRING

PHILADELPHIA, August 7, 1914.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Referring to the article entitled "A Practical Method for the Adjustment of Curves," in the issue of May 15, describing a method for the lining of curves by means of offsets from a string 100 ft. long without the use of instruments, I have recently been given charge of a line on which I was confronted with a most interesting problem of this kind, which a corps of engineers had failed to solve satisfactorily after extensive effort. An 18 min. curve 2½ miles long had long been the cause of many complaints. In applying the method described in the article mentioned a foreman spent six hours taking the ordinates with the 100 ft. cord, the ordinates ranging from 1¾ in. down to ⅜ in. with an average of ⅞ in. The office work in computing the corrections required six hours additional, after which the lining of the track was done, the throw amounting to as much as 10 in. in some places. A further increase in the superelevation from 1 in. to 1½ in. was made, since which time all complaints have ceased. The accompanying reading, taken with a track inspection instrument before and after the curve was lined, showed the improvement made in the riding qualities as indicated by the instrument.

	Inspection, June 16, 1914		Inspection, August 4, 1914	
	South track	North track	South track	North track
Water spills	6	17	1	3
Hor. cyclometer readings	1,321	1,914	460	1,191
Vertical cyclometer readings	473	723	211	487
Pedometer readings	184	250	108	113
Time	39	40	42	43

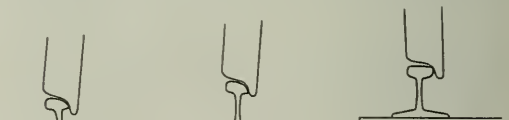
SUPERVISOR.

EFFECT OF CURVE-WORN RAILS ON DERAILMENTS

GILA BEND, Ariz., June 23, 1914.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

One of the most important items of every section foreman's duties is to keep his track in good gage. Straight track, once properly gaged and spiked, will cause little trouble, but on curves a different proposition is presented. The rails on any curve of over 5 or 6 deg., even if double-spiked, will spread from ¼ in. to 1 in. after three or four months' service.



Contact of Wheel Flanges on Curve Worn Rails

The reasons for this are obvious. When rounding a curve wheel flanges hug the gage side of the outside rail, exerting a downward and outward pressure, the outward pressure varying with the speed of the train. The wheel flange will wear the gage side of the rail to the shape of the wheel profile and at the same time the continuous outward pressure will cause the outside of the bottom flange of the rail to sink down into the ties deeper than the inside, causing the rail to "roll out," as shown in Fig. 1.

The usual remedy for this wearing and "rolling out" of

the rail is "setting up the rail." By this method the trackmen pull all the spikes, raise the rail 6 or 8 in. and square the surface of the ties with adzes or sharp mattocks, let the rail down and respike it. This corrects the gage, but the danger of derailments is increased. Before, the ball of the rail, worn to the shape of the wheel, fitted snuggly against the flange; now, having changed its position relative to the wheel, the wheel tread comes in contact with the ball of the rail on top and the flange touches it on the side, which is worn round. Owing to the fact that on a curve the wheel never runs exactly parallel, but at a slight angle with the rail, the round worn surface of the head presents an incline (Fig. 2.) in place of a perpendicular side (Fig. 3.) to the wheel flange, the slightest defects in the road bed or rolling stock are liable to cause the flange to climb the rail. For many derailments which have come under the writer's observation, the causes given were: Rough track, stiff truck bearings, uneven loads, etc. No doubt those defects contributed heavily to such derailments, but the primary and real cause was undoubtedly the changed position of the worn rail surface. Roadmasters and other maintenance of way officers should inspect carefully any curve worn rails before allowing foremen to square them up. If the rail ball is worn to the extent described, the only safe remedy is to relay that particular curve as quickly as possible.

W. E. Schott,
Section Foreman, Southern Pacific.

HANDLING BRIDGE MATERIAL

Sylvania, Ohio, July 11, 1914.

To the Editor of the Railway Age Gazette:

In your issue of June 19 there is a letter from Storekeeper regarding a reduction of the stock of surplus bridge material. While the party writing this letter signs himself a storekeeper, it is quite evident that he has been something else besides a storekeeper, for he knows the requirements of a bridge and building man, as stated in the last two paragraphs of his letter, that such a man must be capable of doing almost everything as well as being a storekeeper.

The question of properly handling stock in the bridge and building department of any road of any consequence is one that probably has caused a great many gray hairs to appear on the head of more than one head of such a department. Usually a man in this department is a good builder, but a poor bookkeeper or storekeeper, unless he is properly supplied with a first class clerk. In my opinion a master carpenter on a division should be given a clerk who thoroughly understands the art of keeping stock and of keeping books so that the master carpenter need not be required to do it. His services are much more valuable along the road to see that the gangs are kept in work and are doing the work properly.

It is very true that a bridge and building man knows what work will be done each year, or at least it should be so, and in my opinion it is so on all well regulated roads of any consequence, for such roads usually prepare a program a year ahead of time. However, authority for such expenditures is seldom given before the snow has left in the spring, for the general officers will say, "There is plenty of time before you will do this work, so why order the material?" The facts in the case, however, are that such material can seldom be supplied short of 60 to 120 days. Therefore, if authority is not granted until, say, March 1 and the material does not arrive until July 1, there is not very much of the working season left, if the program is at all extensive. I very well remember one season while I was division engineer that we ordered our materials in plenty of time to have our work started nicely about July 1. The requisition, however, was not authorized by the general officers until such time as to bring the material on to the division along in November. Anyone familiar with bridge and building work knows full well that this puts an engineer up against a condition which is rather hard to combat.

However, we were fortunate in having a storekeeper at headquarters in the mechanical department who had a great deal of material on which we could draw and make the most important repairs to our bridges and buildings. The result was that we engineers were caught along in December with a great stock of bridge and building material on hand which brought upon our heads a most severe censure. This then brought about a revision by the storekeeping department as to bridge and building material. It was decided, and I think wisely, that a certain stock of material would be kept on hand by the mechanical storekeeper for the use of the maintenance department on proper shop order or requisition. This stock was determined by the division and general officers and included a certain amount of bridge material which, as I remember, was enough to build a bridge 100 ft. long, together with enough other materials to put up a small freight house. We also were permitted to carry at a few places, probably 100 miles apart, a few bridge stringers, caps and ties for use in extreme emergency. This stock, if well watched, should usually be sufficient to take care of any emergency on the division.

The next year we then started a system of ordering our materials delivered at one end of the road in carload lots, say enough to take care of one month's work in the bridge department. This was required to be delivered at a certain time. Another quantity would be delivered a month later and so on through the season. This gives the purchasing agent a chance to buy this stock at fairly good prices and at the same time not carry in the maintenance department a very large stock balance of such materials. This material was usually unloaded by local way freights on the site of the work, which of course saved work train service. Materials for repairs to the buildings were also ordered by the carload under the same system.

Co-operation between the general heads of departments and the purchasing department when requisitions are forwarded by division officers should, in my opinion, make such a system quite practical. I do not know how this system worked out, as I left shortly after it was inaugurated, but believe it to be a system which will keep down the stock balance to the lowest possible point.

A. Swartz,
Vice-president, Toledo & Western.

COMPARISON OF MAINTENANCE OF WAY COSTS ON A MILEAGE BASIS

By J. T. Bowser
Queen & Crescent Route, Danville, Ky.

The comparison of mileage costs of maintaining track and structures appears to be the general method used by railroad executives in judging the relative efficiencies of organizations or of standard practices. These comparisons are, as a rule, made between the costs of two or more divisions, or between two or more affiliated roads, and quite often between competing lines.

It is generally conceded that these comparisons can only be considered very broadly at best, on account of widely varying conditions existing on different roads. It is, however, in comparing divisions or lines operating under apparently the same conditions and through country of apparently the same general character, that such figures are often misleading. If we look beyond the general conditions in making comparisons of costs, wide discrepancies may often be reconciled.

The number and length of the grades should be considered, not the ruling grades. A grade, as a rule, means fast track, and fast track means increased maintenance costs. A difference in the maximum curvature may make quite a difference in the cost of upkeep of track, the increased wear of the rail alone being considerable. The number, length and character of the tunnels are not often considered at first glance. Tracks may traverse a district for miles where the material available for roadbed is of very poor quality, and

yet such a condition may be only local and may not affect a parallel line or a division operating through country of apparently the same general character. Also in comparisons of the cost per mile to maintain bridges, trestles, etc., the number, length and character of construction are not always given due consideration.

It is often the subject of remark, among patrons of railroads and among railroad officials as well, that the general appearance of buildings and grounds on one road is very much better than on another railroad, the railroad official probably adding, mentally, "and on less money too." In such cases, do they always consider the number and kind of buildings to be maintained? Is it kept in mind that the road which does not make such a good showing, probably has to provide and maintain cottages for its section men, operators, agents, etc., at a number of its stations? Is the character of the communities which it serves taken into consideration when judging the appearance of its station grounds? Grounds at stations where a heavy freight business is done, or where timber, ties, etc., are stored prior to shipment, cannot be kept as neatly as grounds at stations where this is not the case.

A very important item in expenses which may not always be taken into consideration in making comparisons is created by the ruling of the Interstate Commerce Commission, which provides that in all betterments which at first glance do not appear to bear any relation to maintenance costs, the cost to replace in kind the structure on which the betterment is made, must go as a charge to expenses. Thus maintenance costs on a road which is following out a policy of heavy betterment, such as replacing light bridges with heavier construction, may show greatly increased maintenance costs, which are not to be explained until the above mentioned ruling is recalled. A fair comparison is a gage of efficiency, a healthy rivalry is good for us; but do we always give each other the credit for what "we are up against"?

DISCIPLINE RECORDS IN THE MAINTENANCE OF WAY DEPARTMENT

By A. Swartz
Vice-President, Toledo & Western, Sylvania, Ohio

Discipline among maintenance of way employees sometimes is a difficult question to handle, depending somewhat upon the character of the employees. Foremen in the track department as a class are of a sensitive nature, so that whatever discipline is necessary it should usually be applied with a great deal of consideration. These men are somewhat different from men in train service, as the results of their work are so much more apparent to everyone. They usually take a great pride in their work and look for commendation, which is very natural among men with a limited education.

My personal opinion regarding the suspension of track foremen for some breach of rules is that very little result is gained by applying such a method. These men usually can be reached more quickly by giving them a good lecture and stating to them the possibility of danger which might have resulted or which did result from the breach of rules. There are no doubt some cases where track foremen positively must be taken out of service, but which all will agree has been done in the past sometimes without proper regard for the results to the road, as well as to the laborers, who are left on the section to be handled by an entirely new man.

I believe in having a man on the section as leading laborer who can at times take charge of the section as might be necessary by the sickness of the foreman or by the foreman being called away on extra gang work for a month or so. However, I never was thoroughly satisfied that when a change of foreman was needed it was best to put this leading laborer in the vacant position as foreman. I think better results are obtained by bringing a foreman from another section or a bright leading laborer and shifting the leading laborer on the section where the position is vacant over to the other section. This way of dealing will bring about better discipline among the men, will result in better work being done and less chance thereby being given for disciplining the foreman because of the fact that the men know how to do the work under the instructions of the foreman.

It has been my observation that any discipline to the foreman is usually brought about by the slackness of some of his men, which, of course, can be laid to the door of the foreman by calling it improper supervision. However, at times men do things which the foreman does not supervise at the very time it is done.

Track supervisors should always have a personal record of all foremen in their employ, together with that of the leading laborers. It possibly would be well if the supervisor kept a record of the minor happenings on a foreman's section so that when it was necessary to apply discipline he would have the past record of his man before him. There are of course some supervisors who can very readily carry a record of these men in their minds at all times because of their close dealings with them day after day. However, such a record is not in the hands of the general roadmaster or engineer in charge of the division unless a written record is kept. There are times when the engineer wishes to know these points about track foremen when filling a vacancy which would result in a promotion for a foreman.

At the same time when keeping a demerit record, as it may be called, I think that a merit record should also be kept. This has been my policy in handling men in the operating department. A record such as this shown to the men themselves in case it is necessary to apply discipline very forcibly impresses on their mind that their actions are being watched. Provided they are men at all they should have some natural pride in keeping down such records. I think it will be found that it is very seldom necessary to dismiss or suspend a foreman and for but very few reasons, excepting the use of liquor.

Perhaps one of the most serious offenses which a track foreman might commit would be to permit his hand car or motor car to be struck by a train. In such a case conditions surrounding the accident must necessarily determine the discipline to be applied. As a rule, however, such acts are very gross negligence and the foreman permitting such accidents is generally ready to be dismissed.

One of the best ways to maintain discipline among track foremen is for the roadmaster or the engineer to keep a record of the work which a foreman has been told to do, stating the time at which it should be done; then if the work is not done within the allotted time the foreman should be reminded of the fact and required to give a first class excuse. If this occurs frequently a severe reprimand with a threat of dismissal will surely bring about the required results. If such action is followed this class of men will be very careful to perform their duties according to the rules of the railroad.

It is my opinion that a foreman who has been reduced to a track laborer will very seldom make good again unless, of course, he had been made a foreman on probation, as you might say. The old track foreman, having been such for a number of years, does not take very kindly to working as a laborer, so that usually it is best to let him go entirely or ship him to the other end of the road to act as leading laborer if it is thought that another chance will wake him up.

It is my opinion that all division engineers should keep a whiphand on their roadmasters, requiring that except in extreme emergency the dismissal of a foreman must first be sanctioned by the engineer, for without a doubt some roadmasters being so closely in touch with men will at times develop personal feelings so that they sometimes dismiss men for these reasons. However, we will admit that with the class of roadmasters now being obtained this is not so customary as in years past. The same sort of discipline can readily be applied to foremen in the other sections of the maintenance work, such as bridge and building, waterworks or interlocking departments.

The Handling of New and Scrap Maintenance Materials

The Prize Winning and Other Papers Received in This Contest. Practical Discussions of the Problem

FIRST PRIZE—THE HANDLING OF MAINTENANCE OF WAY MATERIALS

By Ernest Cordeal

St. Louis & San Francisco, Springfield, Mo.

Any effective plan for the handling of maintenance of way material must be one which insures co-operation between the purchasing, stores and maintenance of way departments. Each of these departments had to do, at some time or other, with the materials which are eventually used in the maintenance of roadway and structures, and each should assume its proper share of responsibility for the insurance of the utmost economy.

Aside from emergency requirements, the maintenance of way department should be able to anticipate its needs within close limits, for a year or more in advance. The purchasing department, provided with accurate information as to requirements several months in advance, should be able to buy at such times and in such quantities as to obtain the best prices, at the same time insuring delivery in advance of the time when this material will be required for use. The stores department, standing between the purchasing and the consuming departments, is in the most favorable position to hold the balance, curbing the tendency of the maintenance of way men to accumulate and hold an over-supply in fear of unexpected shortages, and regulating the rendition of purchase orders so as to prevent either over-stocking or shortage.

The accounting for material from the time of the origin of the order for its purchase to its final disposition as useless scrap, should undoubtedly be in the hands of one and only one department, preferably the stores department. Often interruptions occur in the performance of maintenance of way work and stocks of material remain on hand for periods of months, or even years. In case such material has been turned over by the stores to the maintenance of way department, it is more than likely that its existence will be overlooked; material of the same kind and grade will be ordered unnecessarily to provide for the current needs of some other part of the system and the unused stock will deteriorate and depreciate in value, or be lost by theft or by lack of systematic care.

Foreseeing future requirements in times of fairly stable business conditions is not accompanied by any great difficulties. Records are, or should be, available on every railroad from which a very close estimate may be made as to the requirements each year to provide for the ordinary work of maintenance. It is true, that such estimates may be rendered inconsistent with demands by unforeseen depressions calling for retrenchment, by unexpected prosperity leading to increased activity, or by disasters of considerable consequence, requiring immediate and extensive replacements. Such phenomena are, however, of so infrequent occurrence as to be negligible in the consideration of the material problem.

The material which will be required during any year for the construction or renewal of tracks, bridges or buildings is accurately known months in advance. The maintenance of way department should be able to formulate a definite plan of operation, setting forth the approximate time at which each piece of work will be commenced. This will enable the store department to file its orders with the purchasing department at such time, and in such form as to permit of contracts for material being so placed as to provide for delivery at a time but little in advance of actual requirements, without interfering in any way with the exercise of economical methods of purchase.

All requisitions for material, whether for ordinary maintenance, or for construction and replacement work, should originate with the using department and should pass through the store department. The accumulation of surplus or obsolete stock is frequently the result of efforts on the part of the store department to keep up its supply of material to meet prospective needs, with insufficient knowledge as to changes in standards or variations in requirements.

Requisitions for material rendered by responsible officers of the maintenance of way department at a fixed time in advance of the date needed, would provide the store department with the necessary information to request purchases with accurate knowledge as to requirements, and would thereby prevent over-stocking, or the ordering of material which had been rendered obsolete by changes in design. In passing through the store department, requisitions for material should be carefully checked against the stock on hand, to prevent the placing of purchase orders for articles already on hand. The purchase orders passing from the stores to the purchasing department should be forwarded well in advance of the desired date of delivery, enabling the purchasing official to profit by market conditions.

In the absence of complete and reliable data as to future requirements, the purchasing department is often led by reason of temptingly low prices to stock up heavily on certain classes of material. Such a procedure may be responsible for a large ultimate loss. Interest on the capital invested, depreciation in value due to the necessity of holding the stock for a long period, or total loss of value through a revision of standards may more than offset the initial advantage gained in unit price.

The suggested plan of ordering wherein the maintenance of way and stores departments co-operate in furnishing reliable forecasts as to requirements, if competently and consistently followed, will materially assist in maintaining at a minimum the amount of capital investment in materials.

The material once delivered to the railroad by the producer or manufacturer should be entrusted to the store department, and should remain in its possession until the time of its actual use in repairs or construction. The evils resulting from the practice of turning material over to the maintenance department, to be distributed or stored and accounted for, are manifold. Each division superintendent, roadmaster, section foreman or bridge and building foreman, in a more or less mistaken endeavor to protect himself and his division, increases his orders above his actual needs and accumulates a surplus stock of materials, which are often held pending use for long periods, are frequently lost or destroyed, and represent at all times an unnecessary investment of capital. Large quantities of material scattered over a wide territory are very difficult to keep in strict account, even when their care is in the hands of a department thoroughly conversant with material accounting, and when such a task is required of men burdened with the numerous other duties in connection with maintenance of way, the bookkeeping feature is almost sure to be neglected.

The handling of materials in stock between the time of purchase and use is strictly a store department problem. The ideal condition from the storekeeping standpoint alone would be that in which it were possible to make delivery of all material on cars loaded at the point of purchase, directly to the point of use at the time required. A considerable part of the maintenance of way material may, in fact, be handled in this way, particularly if due consideration is given to placing loading orders, so as to make possible distribution without preliminary sorting or handling.

A great amount of material cannot, of course, be handled in this manner, but must be unloaded and stored, reloaded in such quantities and at such times as required and delivered to the point of use. The handling of such material is the principal function of the store department, and is the item wherein is

found the greatest opportunity for effecting economy by the introduction of adequate methods of storing, and of keeping an accurate check of stock.

Centralization of stores at one or more principal points, from which points issues are made at frequent and regular intervals to smaller points, or direct to the work, simplifies the handling of the material at the same time that it permits protecting all requirements with a minimum stock of each class of material. The central store, located preferably at a point nearest to the base of supplies to minimize useless back-haul, should receive, store and carry in account all material, and should by means of regular and comprehensive reports maintain records of the stock carried by each of the sub-stores.

The systematic arrangement of store shelving and bins, as well as of the platform and yard, to provide for the segregation of the various classes of material to simplify the filling of requisitions, to enable inventories to be taken with great accuracy and little difficulty, and to render the detection of shortage or overage of stock a matter of certainty, should be given special attention. Bin sizes, shelf and platform space and dimensions of skidways should be carefully planned, so as to accommodate the maximum stock required at any time. Minimum limits may also be set to indicate the point to which the stock may be allowed to decrease before orders are placed for its replenishment.

The handling of second-hand and scrap material in such a manner as to secure therefrom the maximum value in reclaimed parts, and the highest market price for that portion which cannot be put to further use by the railroad, is an important factor in reducing the net cost of operation. For all the material used in repairs and replacements, an approximately equivalent weight of scrap is released. Nearly all of this old material possesses a certain value if presented at the proper market. Aside from this value as scrap, it has been demonstrated by a number of railroads, which have gone into the matter of reclamation, that about 20 per cent of the material which is ordinarily sold as scrap may be worked over at small expense and returned to stock to be used in place of new material.

The mere sorting of scrap by competent material men will net large returns on the labor expended. Not only is it possible to secure higher prices for scrap material carefully sorted into the different grades, but during the process a large amount of usable material will be found, which without repairs of any kind can be returned to the store department.

The reclamation of large quantities of material may be effected without any great capital expenditure for the erection of an extensive plant, or for the installation of expensive machinery. A few inexpensive machines, such as pneumatic hammers for straightening bolts and rods, bolt cutters, forges and shears, may be used to great advantage.

Undoubtedly the greatest agent of reclamation is the recently invented process of oxy-acetylene welding and cutting. With a small oxy-acetylene installation at command, a reclamation plant will be able to repair great numbers of castings and forgings, which must otherwise be sold as scrap. The cutting burners are most effectually used in reducing large scrap units, practically worthless in their entirety, but increased to a substantial value when cut into sizes convenient for handling. The cutting may be done very rapidly, and at an insignificant cost by use of the oxy-acetylene burner.

SECOND PRIZE—THE PROPER DISTRIBUTION OF NEW AND THE COLLECTION OF SCRAP MATERIAL

By E. J. McVeigh

General Storekeeper, Grand Trunk, Montreal, Que.

Since the railways were first divided into departments, one of the evils they have suffered from has been the lack of co-operation in the handling of supplies. It was discovered that the best possible excuse for work not done, or delayed, was "waiting on the stores for material." So there has been a lack of co-operation, and the supply department has been made the scapegoat. This has reference to the securing of material as required, and not to surplus material and inflated stocks.

In considering how material should be handled through the stores department, co-operation must be our cornerstone. We will assume that we are dealing with the ordinary railway with its full complement of departments, including that of the stores. Each department should make an effort to anticipate its wants in general maintenance material for 60 days in advance, and send to the storekeeper a requisition properly signed on a specified day in each month, for this material. In making this up the quantity used in the past should be considered, and extra work to be undertaken, taken into account. A full and careful description of the article wanted should be given when it is a thing not in common use, and it should be clearly stated how, where, and why wanted.

In compiling a purchase requisition from department requisitions the storekeeper should give all information possible, adding to that furnished by departments when necessary. He should place all regular maintenance supplies and material on one requisition, and material for betterments or unusual supplies on another, designating these as "A" and "B," or other distinguishing marks, and using different colored paper to further distinguish them, the idea being that the executive officer may tell at a glance what requisitions he should consider carefully, and may safely hold up for consideration, without causing delay and confusion, by holding lists containing material and supplies actually required for the economical operation of the road. The requisition covering the regular stock supplies should be passed on to the purchasing agent at once, and the supplies ordered for prompt delivery. The executive should hold the storekeeper strictly to account for these supplies, the criterion to be the monthly balance figures and the periodical stocktaking. If these requisitions are not carefully made up, and more material is asked for than is actually required for use in the period, the result will show up at once in increased stock on hand. The inventory must be taken by someone other than the storekeeper, and preferably by the auditor of disbursements.

It should be understood that the storekeeper has the right to question any items on department requisitions in his territory, and advise against the purchase of such items as he may consider unnecessary. No item of material on any requisition should be canceled, or reduced in quantity, without the maker of the requisition being advised. No one questions the right of the executive officer to cut off items, or reduce quantities, but it is poor business to leave men in the dark as to what they may expect. The treasury of their company suffers by uncertainty. The stores people should be promptly advised of all contemplated changes in standards, so that, as far as possible, they may avoid being caught with a heavy stock of discarded material on hand.

Finally, the three important factors in maintaining low stocks are, co-operation between the departments and the storekeeper in all things pertaining to material and supplies; careful supervision of requisitions by storekeepers, and prompt purchase and delivery. I have put this last, but it is possibly the most important of all, because prompt purchase and delivery is one end of co-operation, and a very important end. Failure at this end leads to nearly all the evils we suffer from in the handling of supplies. It destroys the other fellow's co-operation. We impress on the storekeeper, the locomotive man, the car man, and all the others, that they *must* ask for a 30 days' supply only, and they *must* make an honest effort to play the game. They get a 60 to 150-day delivery, or worse, and they get into trouble. By the time they get out of it, they make a vow that never again will they be caught in that way—in the future they will look after themselves. One-ended co-operation is no good.

This really throws each man back on his own resources, he proceeds to lay up supplies to protect himself, and stock figures go up in leaps and bounds. In cases where men holding the material make their own inventory, it is frequently the practice to "cook" the figures

The last condition is worse than the first. The money has been paid out, and the material is in stock, but no one knows it. With material on hand for which no account must be made, carelessness in handling it results. Co-operation is the only remedy, and it can be secured by education, and a restoring of confidence. Men order material lightly because they may get it, and they may not. If they are taught that they will get what they ask for, but *will be held strictly to account for it,* not only on paper, but in fact, *and they are so held,* matters will be greatly improved. It has become a habit on many roads for the departments to resent the storekeeper's supervision of requisitions, but if any intelligent man will carefully inspect the requisitions that come to the storekeeper during six months, he will understand why such supervision is necessary and important. The thing that will appeal to him strongest is how supposedly practical men can make such ridiculous mistakes in ordering the material they use in their business. It is not that the storekeeper knows more about each man's business than the man himself does, but he is a check, and who of us would want his important work to go out without being checked? The man ordering lumber is thinking of his building, not how the lumber can be got to best advantage.

After the securing of the material comes the distributing of it, a matter of even greater importance, and one that means much more labor and expense. The fundamental principle here is that all material and supplies shall remain the property of the supply department until actually used. On large railway systems it is neither profitable nor advisable that there be a sufficient number of storekeepers employed to deliver all the material in detail to men who will actually use it. But the supplies in the hands of the departments must not be considered as removed from the jurisdiction of the storekeeper of the division, and whether the parties making the final distribution report it to the storekeeper or auditor, the material should be under the general supervision of the storekeeper of the division, as representing the supply department.

On each division the departments should put in requisitions once each month, these to be an estimate of their requirements and to be approved by the general heads of departments. The material may be issued in detail on requisitions signed by the head of the department on the division, always with the understanding that the division storekeeper shall check them closely, and refer back, or reduce quantities that he finds excessive. Having records of quantities supplied, he can do this as no one else can.

In the handling of scrap, and reclaiming usable material, the first principle to be laid down is, that the department making the scrap must not be allowed to make the final sorting, and reclaiming before it is sold. This may sound somewhat radical, but I make the statement advisedly, knowing whereof I speak. The working departments are just as incapable of handling their scrap properly as they are of handling their new material to good advantage. The scrap pile is the grave for too many mistakes, of both sins of omission and commission.

Man is an animal that does one thing at a time, if he is to do anything well. While he is maintaining track he cannot handle scrap to advantage. While building or repairing locomotives his heart is in his shop, not in the scrap yard, and it is right that it should be so. This is the age of the specialist. Many men have specialized in scrap, and made fortunes thereby. The railroads are the greatest scrap makers in the world. In some years they make $200 worth per mile of road operated. In other words, it is one of the biggest things in the railway world. Why should not they have a specialist to handle it, especially in view of the fact that in nearly every carload of railway scrap sold, there is enough good usable material to pay for the handling of the load, leaving the amount realized from sale a net profit?

Beyond all question, scrap should be sent to central scrap yards and sorted under the supervision of a man who makes a specialty of that work. This man is not made in a day, or a year, nor in five years. He must be familiar with all railway material, and its value. He must know the material so that he may rescue anything that can be used again. He must know the value so that he will not spend more to reclaim an article than the article is worth new. And he also must work in close co-operation with all departments, so that he will not spend money to rescue material that, while fit for use, is nevertheless scrap, on account of changes in design that have made it obsolete.

Most of the railways have a number of flat cars that are out of commission as traffic handlers. These cars should be used in the scrap business. At each shop, money is being spent in an attempt to sort scrap. Stop this, and load the material direct from the shop on to these cars, a number of which may be assigned to each shop. When the car is loaded, bill to a central scrap yard, where it will be promptly unloaded, and returned with a load, or part load, of reclaimed material.

The scrap yard should be laid out on a liberal plan, and should include space for rails of all kinds, frogs, boilers, bridges, and steel cars. The miscellaneous scrap should be unloaded in one pile and sorted from there into separate piles, according to classification. A locomotive crane with a magnet should be used both to shunt cars and to handle the material. Reclaimed material should be piled close to a track for reloading on cars.

Material to be worked over may be returned to the shops, and the work done there, or the necessary machinery may be installed at the scrap yard. Personally, I am of the opinion that work should be done at the scrap yard. The shops want their material ready for use, they will not do reclaiming work willingly, and what we do against our will, we do not do well, or cheaply.

Much time is wasted on many of our railways by the office staff in looking after credits for salvage. There may be something in this for the department, but there is nothing in it for the company. Receipts from scrap yard can go in as extra revenue, and be credited to departments on percentage basis. Good material may be charged back at the price of new when ready for use, or if it is worked over, at a price agreed upon.

APPLYING "SAFETY FIRST" METHODS TO MATERIAL HANDLING

By E. M. Keays

Material Supervisor, Chicago & North Western, Evanston, Ill.

The long and heavy trains of scrap that used to be cleaned up from certain divisions on this road were the subject of many a tale years ago. This is not true at present. Last fall such a train was planned by the operating department on one of the heaviest divisions. The road scrap picked up didn't justify the wages of the train crew. Many of the section foremen said at the time, "If you clean out our scrap bin now, we won't have anything for the regular scrap car next week," or, "If you take away our scrap tools now, we won't have any to exchange with the supply car next trip, and what we can't exchange will be cut off." Nothing could better illustrate the attitude that scrap education has at last produced.

One day last summer, after going over several very clean sections carefully, I came to the end of my work at the last section tool house, just at 6 o'clock, and waited for the section gang to come in on their car. The inside of the section house was another mark of the foreman's workmanship—no "junk" in corners or under the bench, and everything in its place. Before the car was run in for the night, the day's accumulation of small scrap, together with several pieces of car scrap which had been picked up, was unloaded into the scrap bin, and the tools on the car were placed in their racks—everything made shipshape for the next day's work. That's the condition that ought to exist all the time on all sections.

There are, of course, foremen whose very mode of life can be told from their tool houses. There are foremen who "haven't got the time to be bothered with a few old bolts and stuff"—"give me another man and I can do all the fancy work you

want." The scrap propaganda has been one of education for years. Most of the foremen have now been brought up to see that it's easier to bring in the daily scrap than to take the best part of a day cleaning up just before the scrap car is due. A clean tool house, with well-maintained tools, and an ample scrap bin, mean so much towards the efficiency of the section gang that we can't stop to argue about it nowadays. The class of laborers that are employed now only learn by example, and the tool house is both the beginning and the end of every day's work.

Well-maintained tools need not be expensive tools. Storehouses catch a lot of criticism about furnishing the cheapest thing on earth. In three cases out of four it will be found that the loudest denunciation of this kind comes from the foreman who has half the tools on the section in a perpetual state of disrepair. There is a class of foreman who will let his men go thumping over a section week after week on a handcar with loose gears and bearings till the poor old car falls to pieces before he will do ten minutes' work on it. It is his class that keeps better tools off the road.

Some foremen who have learned to be excellent workmen are tough customers when it comes to their "treasures." One foreman had five red lantern globes in his house. Nobody knows how long he had been waiting and carefully ordering these at times when he thought they would slip by to him on requisitions. His excuse was that three years ago the neighboring foreman had borrowed one—"you can't tell when we might need all of these—the station agent might want one, too, some day." But globes cost 50 cents each. Engine tools that are gathered from the right of way are often carefully accumulated and hidden. The problem is to get them turned over to the supply car monthly. If you can't get the foreman to do this voluntarily, you might as well make up your mind to spend the time to make a thorough check of tool houses several times a year.

One foreman had the usual supply of stock rails at his tool house, but also had a multitude of short pieces of all lengths. These pieces were neatly assembled behind the tool house on some old ties, all in the neatest order. Asked about these, he began to be a bit touchy that he was being found fault with, until it was shown to him that in the usual course of events it would be 19 years before his supply of pieces would be used up, and that long before that time he would be on the pension roll, and his side tracks would all be laid with 90-lb. instead of 72-lb. rail. When the money value of those pieces was figured up, and he came to realize that the only dividend being earned was rust, his spirits revived, even when he was told to load up more than three-quarters of it. Tons and tons of steel may sometimes be brought in off the road in this way. Even though a new rail has to be cut occasionally here and there, this will be the cheaper method.

One foreman was very proud of the switch lamps in his yard. He had 31 main line lamps on side tracks in his yard, and one had to admit that they were maintained in a condition to be proud of. He spent so much time on those lamps that this in itself would have been a reason for taking them away. Every engineer coming over those Nebraska plains at night must have been able to see that galaxy of red and green lights for miles. How anybody could figure out which was the main line at night till he got right on top of the switches was a puzzle. Even when presented with this view of the matter the foreman resented being put off with something cheaper—a common side track lamp. When the yard was built a few years before, the construction forces had left these main line lamps, and they were an heirloom. His contention, as far as safety was concerned, was that main line switches were always locked. We showed him one that wasn't. After that those lamps came in very peaceably.

It is easy enough to storm at a foreman, but that method never made good workmen, and they are quite as willing to be good workmen as any other class of men. It is one thing to antagonize men, and to get things done because they know they have to do it; it's another thing to show them that a little daily care towards keeping things in order makes the work easier all around, and is the "right" way to have it done. To do this, not only must one have the co-operation of the roadmaster, but he must make him a thorough convert to the business side of the matter, so that his attitude while among the men is infectious. Some of the best results have been obtained after a quiet walk up the track with a roadmaster and foreman, pointing out each bit of scrap, even as small as a nut or washer, and calling off money values of each as it is passed—"That rod over in the ditch will be worth 90 cents as soon as you send it in to be straightened; that bolt is worth 3 cents now before the thread gets all rusted up," and so on.

Many foremen who do not readily respond to the teaching that scrap is valuable, and for this reason must be cared for, will soon see the point if they are called to account for it as a disfigurement to the section. The men who will leave a drawbar lying out in the ditch day after day are becoming fewer and fewer the more they know that they are certain to be criticized for "that litter out there." Many a man has come away with a different idea of material after he has seen the piles of scrap fed through the reclaiming plant and come through on the other side all sorted and ready for its many uses again.

Because car material coming in off the road is such a large part of all scrap, the car foremen are encouraged to watch for all scrap cars going through to the shops, and to take such material as can be used, or can be repaired locally. All foremen make reports as to what is thus put in service again. This saves much work in the main reclaiming yard, with its attendant congestion of cars there at times, and the double haul on the material. Certain material always finds its way to Chicago as the better facilities at the larger point enable cheaper work. The figures on the outside reclaim work are published monthly, and are instructive, both to the department officers and to the men who have been doing the work at the different points.

It has always been our policy to welcome suggestions and criticism of material and supplies. This is not meant to be an encouragement to the great army of kickers, but if a man has anything worth saying we want to hear it as soon as we can. The safety first idea again emphasizes the wisdom of an open policy of this kind. Nine reports about defective or unsatisfactory material may not amount to much, but the tenth may be valuable, and very often the situation can be remedied without expense—very often with a distinct saving.

Repeated instances like this ought to show that the only way that permanent results can be secured, and the only way that a system can be started that will become self-running, is by keeping at it. At times the men on the road are inclined to laugh at what they call the Chicago idea of co-operation: the best way to get a job done is to get the other fellow hypnotized into doing all the work while you do the bossing—victory for co-operation. There was a division storekeeper who was reproved for the untidy state of his territory. His reply was: "Oh, well, you simply can't do anything with these fellows. They don't know what you want, and they wouldn't do it if they did." Evidently this man had failed to hypnotize. Most of the sections on the division were worked by laborers who seem to understand 25 words of English, and who never get beyond. Had the same method been applied to him in his early days as he applied, he would never have graduated out of first grade in school. As a matter of fact, he had been carefully nurtured through 13 years of school, and had then been on the railway for 14 years. Then "it's no use" if some Italians can't pick up a new method in 15 minutes. This doesn't mean that he is to treat men to a pink tea before starting work with them, either.

Getting material on the ground is simple beside the problem of watching its use. The foremen keep their own material books and forward them monthly, with their coming month's orders, to the roadmaster. These books are checked; if they are not, material will disappear without a proper accounting, and from these books the division accountant makes up his material accounts, rail and tie statements, etc. The supply car takes care of standard material after requisitions have made the due rounds for approval. Rail and large orders for fastenings are ordered

through the assistant general manager. The supply cars, each of which can cover three divisions a month, are handled on the way freights according to regular schedule, and the rule of exchange of tools and other material is insisted upon. Where way freight work is heavy, the scrap cars can be handled as trailers to the supply car. If on a light division such work will delay the train, a separate scrap car is started out of designated points on a merchandise schedule. The division storekeepers reclaim what they can from these cars; the rest is sent to the general scrap yard. A distinct saving can be made in careful loading of scrap. Not only is a carelessly loaded car an annoyance which takes twice as long to unload as it should, but at times of unavoidable congestion in the scrap yard, or at times when there is a car shortage, a purely avoidable loss will accrue. This may not be appreciated by smaller points that handle a few cars of scrap a week, but at a large point as much as 50 per cent greater speed can be made in releasing equipment.

Obsolete material on the road is not as pressing a matter as in the locomotive and car departments, where a type may vanish in a few years. As the lighter rail gradually sifts down to the country divisions, where it still has a long life ahead of it, other material can follow. But don't be so thrifty that everything has to be used up. It's cheaper to buy new angle bars, even for second-hand rail, than it is to have several miles of battered joints. Get all your signal department material under a storekeeper and save money.

The safety first movement wasn't built up in a day. That idea is being emphasized all the time—when it ceases to be, results will stop. Take care of the small accidents and get the habit, and then the large ones won't happen. How many of the men who formerly were too busy to be bothered with the preventing of small accidents are yet too busy to be bothered with saving pennies so that the dollars will take care of themselves? How many of these men are still in the class that will innately fight the very idea expressed by the words material economy?

HANDLING BRIDGE DEPARTMENT MATERIAL

By S. C. Tanner

Master Carpenter, Baltimore & Ohio, Baltimore, Md.

While in general, the policy of keeping stock material at one place for distribution is a good one and prevents a lot of surplus and obsolete material accumulating along the line, I find that much economy can be gained in the bridge and building department by giving the foremen on outlying districts a lumber or material car with their camp equipment. This should be a box car of the non-revenue type, but suitable to keep the stock dry and in good condition and capable of being moved over the road in a train. The foreman should see that this car is well stocked at all times with material of various kinds suitable for taking care of emergency repairs to platforms, walks, floors in buildings and on public road crossings and bridges, so that he can make repairs on short notice without waiting to order materials from the storekeeper or from division headquarters.

Such a car is also valuable in storing the surplus material which usually accumulates when finishing a job and oftentimes is a source of supply to finish a job when the original bill runs short, thus preventing the making of a special shipment of a small amount from the storekeeper with the necessary delay. It can also be used to good advantage in taking care of perishable material, while on small jobs, such as cement, lime, paint and glass. The material supply train which passes over each division each month restocks these cars and takes back into the storekeeper's stock any surplus material accumulated, thus avoiding overstocking the cars on the road.

The material supply train is in charge of a representative from the stores department. All material to fill orders accumulating during the month which have been officially approved, is delivered at the place where it is to be used, and at the same time all the scrap along the line is gathered up and taken to division headquarters. Here it is carefully sorted. That which is suitable for future use is placed in stock; that which can be reclaimed by repairing is sent to the shops and repaired and then placed in stock for future distribution; and the real scrap which is not fit for future use is classified for sale.

When any large quantities of material or any special materials are needed, a requisition is made, and when approved, the order is placed with the purchasing agent, who makes the purchase and the material is delivered where it is to be used, thus saving extra handling and delay. All returnable worn-out material or supplies, tools and agents' supplies must be returned to the supply train before new supplies are issued. Old and second-hand bridge material is carefully guarded by the master carpenter and returned to his headquarters where it is stored for future use in building bulkheads, for blocking or temporary use as it is needed, thus saving the new material and getting full value for the old.

Much economy is derived by the proper ordering of material, and especially in the bridge and building departments. I find that it is a very common practice with foremen to order lumber in even lengths, and usually 14 ft. or 16 ft. long. This method of ordering is expensive and many times is the cause of much delay in furnishing the material. Every order should specify the exact size of lumber required, giving the length, width and thickness, so that the storekeeper can substitute other sizes which will cut to advantage. As an example, many times a lot of lumber is needed for repairs to a platform 5 ft. wide, but the foreman orders 2 in. x 12 in. plank 16 ft. long, figuring on cutting it in three pieces. This would leave 2 ft. B. M. waste, but if ordered in exact sizes, the storekeeper could furnish it in 5 ft., 10 ft., or 20 ft. lengths and would not have any waste. He could also furnish it in any width to suit the needs. It is best to let the storekeeper stand the waste.

In maintenance of way, we find as much if not more true economy in the conservative use of material as in its distribution. The right kind of material should always be used in the right place, as high-priced material is often used, when a cheaper grade would suit the purpose just as well. For example, cheap material should be used in false work or work of a temporary nature, or in permanent work that is submerged in water where it is not subject to depreciation other than decay, while, on the other hand, in permanent work where timber or other material is exposed to the weather, or other destructive elements, the very best should be used.

In wooden water tank construction, the hoops are the vital part, and all depends on them for safe maintenance. Steel hoops are much used in late years, but we find that they are far from being reliable, as their life is usually from four to eight years, and in some localities where there is salt air, their life is very short. They are used as a rule on account of their cheapness, but it is false economy to use them at any price. The very best wrought-iron hoops should be used on all water tanks, as from our experience a service of over 20 years leaves the wrought hoops in good enough condition to place on a new tank.

The best paint should be used on permanent work, but there are many times that a cheap paint would last as long as needed and reduce the cost. When asked to furnish paint for tie spotting last spring, I requested permission to prepare a cheap paint for this temporary work, which request was quickly granted. I then had the paint prepared by the following formula: Mix thoroughly together 30 lb. of white lead, 3 gal. of raw oil, and 1 qt. of dryer, then stir in 120 lb. of silica and ½ gal. of benzine. This will make 10 gal. of thick white paint, semi-paste, which will take up in use 6 gal. of benzine or any light evaporating oil; this paint will weigh about 17 lb. to the gal. We use the benzine or gasolene to make the paint short and sticky. When prepared in this way it will cost about 30 ct. per gal, compared with white lead and oil at a cost of $1.25 per gal. It will last one year in good condition, and as six months is all that is usually required, the saving on a large railway system is important. The tie spotter should be instructed to keep this kind of paint in the paste form, and when using it, should keep with him a small bottle of benzine or gasolene to thin it as needed, thus saving loss by evaporation.

In the framing of all timber, care should be taken to construct the joints so that they will drain themselves and dry out. To

paint the joints of new timber which contains sap, is poor economy, as it will not dry out and soon produces decay. All timber should be provided with a free circulation of air. In a six-year test, we find that crude oil mixed with a little lamp black to make it a thin paint, applied once a year, has proved the best resistant to rust of steel where exposed to salt air and coal and coke. It is cheap and quickly applied, and while these beams six years ago were a solid mass of scale, they are now entirely free from scale. Paint would not stick to these beams, due to the friction of the coal and coke, but the crude oil will not rub off and it therefore preserves the steel.

EDUCATING FOREMEN TO THE VALUE OF MATERIAL

By E. B. Fithian

General Roadmaster, St. Louis, Iron Mountain & Southern, Little Rock, Ark.

For the past several years the tendency has been to concentrate maintenance of way material at some central point convenient for handling and forwarding to location where needed, within the field of operation. These concentrating points are naturally under the supervision of the supply or stores department, which handles not only the requirements of the maintenance of way department, but of the other departments as well. The plan does away with the necessity of carrying material in stock on the line for new work and ordinary repairs, excepting at important junction points and in heavy terminals, where considerable inconvenience in operation might be experienced if prompt repairs are not made.

The success of this plan depends on the following eight fundamental principles: First, close watching and keeping up stock requirements of standard material. The supply department should encourage frequent conference and inspection of stock by division officials to assist in keeping in touch with division requirements. Second, furnishing correct detailed information by division officers in ordering material. Third, furnishing promptly proper material when ordered. Fourth, proper facilities for storage and prompt handling of material. Fifth, co-operation of the operating department in furnishing equipment for loading material, and moving it after loading. Sixth, education of foremen and district officers to foresee their needs, and order material sufficiently in advance of requirements, thus permitting the supply department to handle economically in connection with other work. Seventh, never order material by wire, except where prompt movement is required, and such orders should always be given preference. Confirm all such orders by regular requisitions. Eighth, never make more than one requisition for the material required for each piece of work; and, if necessary to hurry, trace same by referring to previous requisition.

The principal duty of a division maintenance of way officer is the distribution of forces and the provision of proper material for carrying out work. Requisitions for material should receive his close scrutiny for checking and following up to destination. A big mistake often made is the leaving of such work to subordinate officers or clerks, which results in improper information being furnished on requisitions, and the shipment of wrong material. This of course means delay to the work, extra cost, and often in foremen improperly carrying out the work, by taking for granted that material furnished is the material he is expected to use and making the best of it.

Over-stocking in material often occurs when information is demanded of division and other officers before they are in a position to furnish such information intelligently; for instance, requirements for bridge material, prior to inspection and approval of program. In other cases it is due to the lack of careful study and thought of conditions and requirements. Again, information is too often obtained from parties not in a position to supply such information correctly.

The caring for and collecting of maintenance of way scrap has been principally a question of education, on the road with which the writer has been connected for the past six years. Both colored and white foremen did not seem to realize that the railroad was interested in the saving and collection of all material that had a value as scrap, if not again usable. The men, of course, were less interested in this matter than the foremen, and it took time to instill in their minds that the proper place for non-usable material was in the scrap pile, at the tool house, and not over the banks, or in the nearest stream.

The running of scrap cars over the entire division each month, collecting the scrap at tool houses, has its effect in keeping before all foremen and men that the collection of scrap is a matter of interest to the entire division. We also find it necessary to point out scrap where noted and insist on its being kept cleaned.

All scrap material collected on this road is turned into the supply department, which, in turn, sorts and classifies it, saving for further use material that can be used again. Proper credit is allowed the division from which the material is received.

The finding and reclaiming of usable material, shipped with the scrap, requires an experienced and competent man. He should be conversant with all classes of material and tools, and know what is obsolete.

I find it a good practice never to permit a supervisor, roadmaster or foreman to consider a piece of work complete until all material left over in doing that piece of work is picked up and cared for, whether it is new or regular maintenance work.

TRUE ECONOMY IN HANDLING MAINTENANCE MATERIAL

By J. J Hess

Assistant Engineer Maintenance of Way, Great Northern, St. Paul, Minn.

A very great saving can be accomplished by proper distribution of materials, saving expense of rehandling and delays which occur thereby. It has been found good practice when relaying rail to have the old rail marked in accordance with classifications so that the various kinds required on other portions of the line can be loaded at the points released, thus saving rehandling. All rail fastenings and fixtures recovered are sorted, that being fit for further use separated and shipped to stores as second-hand material, and remainder as scrap, receiving proper credit from the stores department in return.

No material is kept on hand other than what is considered absolutely necessary for emergency purposes at division headquarters or some central point, and this is in charge of the stores department. Supply cars are run over the line once a month for the purpose of delivering material on requisitions which are always closely scrutinized to prevent any unnecessary accumulation. It is the duty of the roadway department to keep close check of what is on hand, in addition to showing this information in the requisition book. All surplus and worn-out materials are also loaded and taken to the storehouse at this time, so that there is never any opportunity to make a special cleanup.

The proper distance between post rails would seem to be governed by the density of traffic and the condition of the rail. Two miles would be a long ways to go for a rail in winter time during such storms as are experienced in the northwest. It is conceded to be false economy not to have good and sufficient tools and supplies, and where a surplus is found to exist it would seem chargeable to lack of proper supervision.

There is a danger of going to extremes in economizing on material. The progress of work is likely to be hindered if materials and supplies are not furnished when requested. It is quite often the case that a lack of a switch point necessitates the removal of stock rails. Frogs, crossings, etc., when permitted to remain in use after becoming too much worn are apt to cause derailments and sometimes cause flanges of wheels to break due to contact with fillers, castings, etc.

By permitting a rail to remain in track when battered at the end, the adjoining rail naturally becomes battered. If only three bolts are used where four are required, the extra strain is apt to cause breakage. The same thing applies to ties, piles and, in fact, almost everything used in roadway.

Making a Double Track Fill Nearly 185 Ft. High

The Bessemer & Lake Erie Is Using Large Quantities of Steel Mill Refuse in a 1 1-2-Mile Improvement

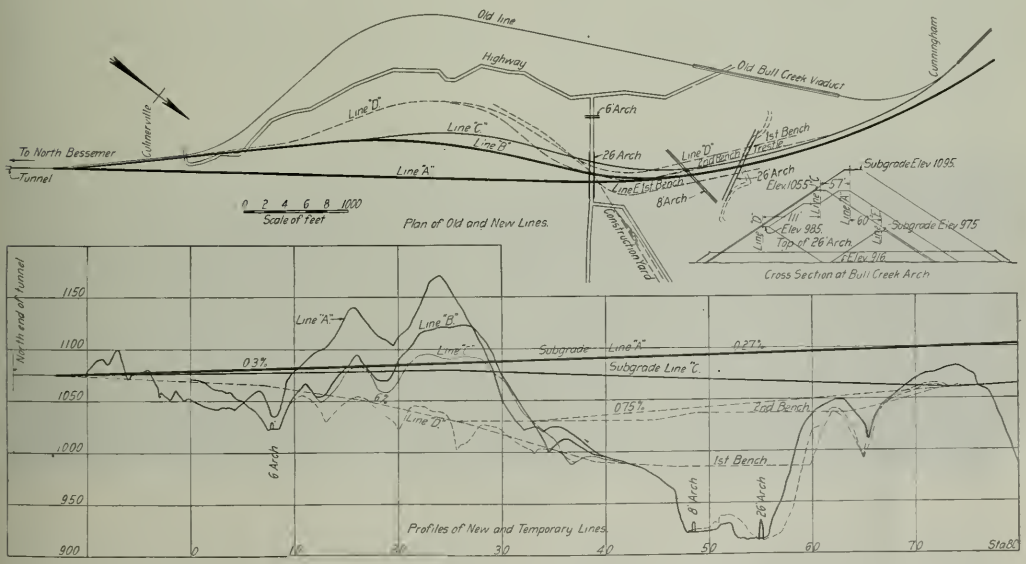
The double-track improvement which the Bessemer & Lake Erie is carrying on between Culmerville, Pa., and Cunningham, a distance of 1½ miles, includes a fill across the valley of Bull Creek having an ultimate maximum height of nearly 185 ft., which is thought to exceed that of any railway em-

Filling the Trestle on the Second Bench

bankment previously constructed in this country. This improvement, as it is being carried out at present, provides a new direct double-track line replacing one of the two remaining single track sections on the company's main line between North Bessemer and Conneaut Harbor; it is designed to form a part of a future reduction in northbound grade which will effect important economies in operation, and it serves as a means for the disposal of a large amount of steel mill refuse.

The disposing of some 100 to 150 carloads of slag and other refuse material daily from the steel mills in the Pittsburgh district which are served by this road must be considered as one of the economical reasons for building the Culmerville fill. As the road is thus enabled to obtain the material already loaded on cars by the steel works with a road haul of about 15 miles, and as substantially all this material has been through the furnace and makes an embankment more solid than could be obtained with excavated material, although the fill is somewhat longer on this line than on a line with the cuts and fills balanced, the results are in favor of this line. The first trestle was 65 ft. high. This was filled and then the track was raised about 10 ft. when another trestle 45 ft. high was driven on top of this new fill. The upper trestle did not go out of line or surface while being filled. Fills 80 to 100 ft. high made from excavated material in this vicinity have all given trouble for some years, either on account of sliding or the upper part of the fill settling down into the bottom part. This waste material has no tendency to slide, however great the weight put upon it, which is a great advantage when the fill is to be about 180 ft. high.

In common with other ore-handling roads in this territory, the Bessemer is continually seeking places along its line where this material can be used economically without wasting and with resulting advantage to the road. The refuse must be removed from the mills daily to prevent serious interference with their operation, and, as it is handled in the same cars that bring in ore, it is essential that it be unloaded promptly in order to release the cars. For this reason several available places are usually kept ready at all times so that when one filling place is completed or cannot be used without wasting the material, as, for instance, when additional trestles are needed or a change in construction



General Details of the Improvement on the Bessemer & Lake Erie Between Culmerville, Pa., and Cunningham

track layout must be made, the force can be moved quickly to another point and the disposal continued without interruption.

In considering plans for double-tracking the section between Culmerville and Cunningham a new alinement was sought, first, because the curvature and grade on the old line are not up to the standard which is desirable for the company's new work, and, second, because the 135 ft. steel trestle which spans the Bull Creek valley has its footings on clay, making it practically impossible to fill the structure without rendering it unstable during the operation. A number of new lines were run and estimates prepared, resulting in the final adoption of the lines shown in the accompanying plan and profile. The line A, with its long tangent, 48 min. curve and uniform grade of 0.27 per cent, is the ideal line, but it does not connect with the old line at Cunningham and is only considered as a part of the further improvement extending to the north. The same is true of line B, except that it provides an alternate location at the south end with smaller quantities of excavation. The line C, with easy grades and curves, connects with the old line at Cunningham, and since the fill required for this line forms a part of the big fill necessary on line A, as shown in the cross-section, line C can be considered as one of the stages in the construction of the ultimate line. The double track fill on line C between Culmerville and Cunningham contains about 1,600,000 cu. yd.

The reduction in northbound grade which will be secured in the construction of line A and its proposed extension to the north, together with similar reductions that can be made at several other points, will make possible the operation of northbound freight trains under the pusher system, instead of double-heading as at present, thereby materially reducing the engine mileage. This possible advantage is increasingly important as the development in the coal mining industry between North Bessemer and Culmerville proceeds, considerably increasing the amount of northbound freight traffic.

The first work on the Culmerville improvement was begun in September, 1912. The temporary construction line, marked D on the accompanying plan and profile, was first built on a 3 per cent. grade from the old line to the south end of the low level trestle. This trestle, which had a maximum height of 70 ft., consisted of four-pile bents braced in towers and built of long-leaf yellow pine for the longer pieces and of maple or native wood for lengths under 40 ft. This first trestle was connected up September 25, 1912. Meantime, work had been under way on the construction of the 26 ft. arch 716 ft. long which carries Bull Creek under the new fill, and an 8 ft. arch 678 ft. long which carries a small tributary creek just south of the larger one.

The first trestle was filled by April, 1913, and a second trestle on the same level was started in June and connected up in August. This trestle was filled by November and during the winter the work of spreading between these trestles and jacking up the tracks about 10 ft. was continued. In the spring a high level trestle 45 ft. high was driven in the dump on the line C, being connected up in April, 1914. This trestle was filled by June and since that time work has continued in spreading on both the upper and lower levels within the limits of the big fill. The work on the upper level is calculated to provide a temporary uniform grade of 0.75 per cent, the same as the northbound grade on the old line, so that an alternate line will be ready for operation for through trains at any time that it may be needed. The next step will be to raise this level to the grade of line C, and when the complete development to the north is authorized the fill can then be raised to the grade of line A.

A Side View of the Second Trestle on the First Bench Showing 26-ft. Arch Carrying Bull Creek and the Old Viaduct in the Background

All of the work in connection with this improvement is being handled by company forces under the engineering department, of which H. T. Porter is chief engineer. This policy of handling improvement work by company forces is well established on the Bessemer, as the road has been practically double-tracked in the last eight years by that method with complete satisfaction to the company's officers. The Culmerville work required an average force of between 125 and 150 men and a maximum of about 200. The filling gangs consisted of from 30 to 50 men, the foreman of each gang reporting to a general foreman in charge of the work train and the unloading of material, who reports to the engineer of track. Similarly, the foremen of trestle and concrete gangs report to a general foreman, who in turn reports to the engineer of bridges.

Panorama of Big Fill Near Culmerville During the Filling of the Temporary Trestle on the Second Bent

The filling material is brought in full trainloads by road crews who set it out in sidings along the old main line and pick up a load of empty cars that have been placed in these sidings to go north to Conneaut Harbor for ore in the summer or back to the mills for refuse, or to the mines for coal in the winter. About 125 cars of material are received daily on this work. The loaded cars are handled from the sidings along the main line down to the dumping trestles and the

Looking Along the Fill Over the First Temporary Trestle. Second Trestle on First Bench at Right and Old Viaduct at Left

empty cars are handled back to the sidings by one work engine. Additional storage tracks, with a capacity of about 85 cars, are provided along the construction line D for storing loads and empties.

During the filling of the two low level trestles and the spreading between these trestles, all loads were handled over the construction line D, approaching the dumping trestles from the south, and the empty cars were removed by the same route. On the completion of the upper level trestle a construction track was laid to connect the north end of this trestle with the old line near Cunningham and the loads were then handled to this upper level from the north end and the empties removed at the south end. More than 50 per cent of the material must be shoveled from the cars as the engineering department has no control over the class of cars in which the refuse is loaded. In order to keep down the dust during this unloading, water tanks, which are filled by pumping from the creek below, were located along the approaches to the trestles and all material is wet down as the cars are pushed slowly past the tanks. In addition to the two concrete arches carrying the creeks under the big fill, a 26 ft. arch 311 ft. long is required to carry a highway near the south end of the fill, a 6 ft. arch 220 ft. long carries a small stream under this highway, a 6 ft. arch 174 ft. long was required just north of Culmerville, and a highway crossing was also built near Culmerville. The total yardage of concrete required for these structures was 18,970. All of these structures are of mass design.

The two creek arches under the big fill, which contained over 12,000 cu. yd. of concrete, were placed from a mixing plant located near the viaduct on the old line. The concrete materials were dropped through the viaduct into storage bins feeding to a one-yard Smith mixer. The mixed concrete was elevated to a bin holding two batches, from which it was dumped into a one-yard car running on a small trestle built over the arch forms the full length of the culvert. This car was operated by a cable and hoisting engine and could be dumped at any desired point along the work.

FELT TIE PADS

Tie pads of felt, which are used to some extent on European roads, are being tested by the New York Central, the Pennsylvania, and the New York subway. These pads are manufactured by the Q & C Company, New York, of imported cow hair, which is saturated with a special tar. They are made in three thicknesses, one, two and three-ply, the latter being about ½ in. thick. They are placed between all tie plates and the ties to absorb the shock, preserve the tie and particularly in terminals, to eliminate the noise. The thinnest pad is generally used in Europe, where one company that has used several million per year, reports that its ties when so protected last one-third longer. The pads are made about ⅛ in. smaller all around than the plates to improve the appearance, as the edges would become ragged if they projected beyond the metal plates.

Panorama of Big Fill Near Culmerville During the Filling of the Temporary Trestle on the Second Bent

The New York Central installed a number of these pads in April, 1911, on tracks in the Grand Central Terminal, in which the rail is carried on wooden blocks imbedded in concrete. Smooth bottom tie plates are used and the rail is held in place with screw spikes. The first pads used were two-ply, but later installations have been made with three-ply pads in order better to absorb the shock. The first pads installed are reported to retain their ability to perform this function and these pads have not shown much evidence of wear.

Raising and Shifting a Six-Track Main Line

A Description of the Manner in Which the Track Work Was Handled Under Traffic on a Very Busy Road

By W. F. Rench
Supervisor, Pennsylvania Railroad, Tacony, Pa.

In addition to the interesting structural and architectural features of the improvements now being made by the Pennsylvania at its North Philadelphia station, which were described in the *Railway Age Gazette* of April 3, there were many and varied problems presented to the maintenance department for solution during the progress of the work. Thus, although the improvement extended over but one mile of line, it included typical problems of alinement, grade, switch connection and bridge adjustment, and involved the raising of a six-track main line system and numerous connecting yard tracks under a heavy traffic.

The object of the improvement was three fold: First, an increase in facilities by providing an additional track for passenger traffic in each direction with high island platforms and an additional drill track on each side of the main track layout, the one on the westward side being used also as a freight running track; second, the reduction of the grade at the station from 0.7 per cent to 0.3 per cent to eliminate delays caused by the difficulty of starting the heavier trains on the former grade; and third, the necessity of renewing three bridges in this section which were inadequate to carry the increasing train loads.

The ideal maximum grade on the division is 0.6 per cent. By the use of this grade west of the station between Seventeenth street and the crossing of the Philadelphia & Reading, with a vertical curve directly over the P. & R. bridge, the increased depth of floor system required for the new bridge at the latter point was secured. The 0.3 per cent grade adopted for the greater portion of the station platform length provided the greater depth of floor necessary for the new bridge over Broad street and supplied some additional headroom for the street. The continuance of the 0.6 per cent grade east of Broad street connected at Allegheny avenue with the opposing grade of 0.1 per cent by a long vertical curve caused the greatest problem in the whole elevation. The maximum change in grade was 3 ft. 10 in., and the average 3 ft. The existing bridge at Germantown avenue was raised to the new grade and later renewed and the Twelfth street bridge was encased in concrete to carry the deeper roadway.

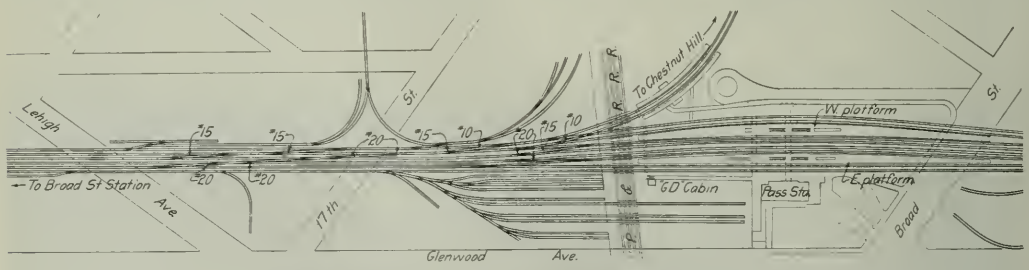
The raising of the main and yard tracks was an interesting problem for the maintenance department on account of the density of traffic. The week day passenger schedule included 200 trains every 24 hours, one-half of which moved between 7 a. m. and 5:30 p. m., during the working day. The freight traffic which was handled almost entirely upon the inner tracks amounted to 15 trains in each direction during the same period. Some of the more important freight trains were run upon the outer tracks, but generally at times when the greatest intervals occurred between passenger trains.

The extent of this traffic practically precluded any raising of those tracks on week days except that on No. 4 track between the hours of 6:30 a. m. and 8:30, two one-hour open periods occurred which were duly utilized. The Sunday schedules not only carried one-third fewer trains, but also had longer open periods. These were necessary to provide the opportunity not only to make a substantial lift, but also to unload on the main tracks the material necessary for the raising.

The yards shown on the accompanying drawing are in constant use on week days for a very heavy local business and for the considerable traffic at the grain elevators, but are idle on Sundays. For this reason Sunday was also the only day when certain of these tracks could be raised.

Gangs furnishing a total of 100 men for the main tracks and 60 for the yards were used for this Sunday work, a different lot of men being used on alternate Sundays. An itinerary was planned for the work train which provided for periods varying from 30 to 45 minutes successively upon No. 4 and No. 1 tracks as opportunity offered and at other times in the yards on either side, care, however, being always taken to utilize intervals in the late afternoon for dumping material necessary to back fill the main tracks which had been raised during the course of the day. These movements were facilitated by the presence of crossover switches at each end of the work.

During the time that actual raising was in progress all trains were slowed by flags, to which attention had been drawn by a general notice. Upon completion of the day's work the tracks were left in fit condition for regular service and at no time was any speed restriction laid by order, nor was any necessary.



The New Track Layout of the Pennsylvania at North Philadelphia

The aim of each Sunday's work was to attain an average raise of one foot through a half mile of both passenger tracks, which with the settlement from traffic of the following week netted about 9 in. of permanent lift. The operation on week days consisted mainly of moderate raising of the freight tracks also under protection of a flag and of the yard tracks whose use could be spared and of such surfacing of the tracks already raised as might be necessary.

The usual consumption of material was about 7 cars each week day and 18 cars on Sunday. In all, 610 cars of cinders and 155 cars of stone were required for the work. The material was all supplied in hopper bottom cars, which greatly facilitated the unloading.

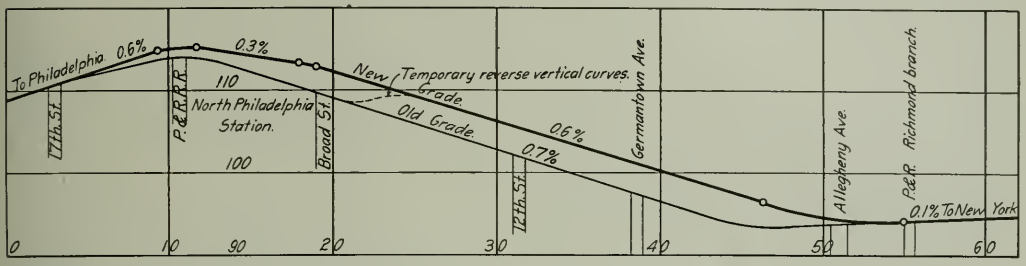
The grade of the main track system had to be adjusted to the

grade of the yard and elevator tracks connecting with it. A crossover was projected between tracks 4 and 5 just west of Twelfth street. This crossover, however, would have prevented the separation of grades between tracks No. 4 and No. 5, which was the only means possible of connecting No. 5 track with the yard tracks without increasing the grade of the latter beyond the allowable maximum which already existed. A solution to this problem was found by moving the crossover to an almost equally satisfactory location near Broad street. An 0.8 per cent grade was then established for No. 5 track, between Broad street and the junction with the yard track near Twelfth street. This distance is just half the maximum train length and by using a 0.6 per cent grade eastward from that point the resultant grade for the maximum train length was kept at 0.7 per cent, which was considered the maximum permissible for this track, which is used rather frequently as a freight running track.

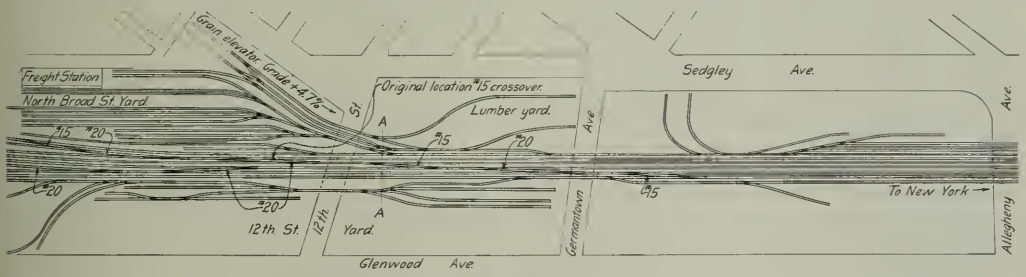
This separation of grades between tracks No. 4 and No. 5 required that the latter should be as much as 20 in. lower than No. 4, but as this is little more than the depth of standard shoulder it has worked no disadvantage from the standpoint either of operation or maintenance. The No. 0 track was also placed 20 in. below the main track grade, and this arrangement was of very great advantage in establishing proper connection with the various yards and industrial sidings, many of which were on trestle work. No greater grade than 2 per cent was required, and all intersections were provided with suitable vertical curves.

A special problem was presented in the raising of the four-track bridge carrying yard tracks across Twelfth street. The elevation of the southerly track on this bridge was fixed by the connection which this track makes with the main line immediately east of the bridge. A similar elevation on the northerly track would have required a grade of 4.7 per cent on the lumber yard lead. As the business of this industry amounts to about 600 car loads per year this siding connection could not be lost, and it was finally decided that a moderate downward inclination of the bridge toward the north could not introduce any great disadvantage either in operation or maintenance, and would allow the northerly track to be lowered enough to secure a 2 per cent grade instead of the 4.7 per cent.

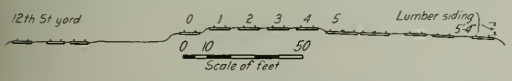
The realinement of tracks to establish the reverse curves, made necessary by the widening of the main track system at the station platforms, involved the substitution of a No. 7 frog for the original No. 8 in track No. 3 and of a No. 10 in track No. 2 to keep the resulting curvature at both ends of the new crossover essentially that of a No. 8. Realining of track No. 1 through the No. 15 crossover required one end of the crossover to be changed to a No. 24 to render the resultant curvature the same as that of the original No. 15, and thus permit the continuation of the 30 mile per hour speed limit through the crossover. These two cases illustrate the advantage of combining odd numbers in the same crossover when occasion demands.



Profile of Grade Revision Through North Philadelphia Station



The New Track Layout of the Pennsylvania at North Philadelphia



Cross Section on Line A-A in the Accompanying Plan

The operation of shifting the two Chestnut Hill branch tracks to their new positions on the new bridges 32 ft. north of the old location and of shifting one of the passenger platforms which forms a part of the improvement, was carried on by a special organization. The westward traffic on this branch, excepting one train which was run against traffic, ceases at 11.20 p. m. Two gangs of men were employed for this work, one working from 10 p. m. until noon and the other from 6 a. m. to 8 p. m. The westbound track was laid during the night, while there was no traffic, and in the morning both eastbound and westbound movements were made over the one completed track, while the relocation of the eastbound track and platform was carried on.

Although it would have been possible to establish a circular curve between the Philadelphia & Reading and the Sixteenth street bridges, it was decided to increase the curvature at the platform in order to continue a curve of larger radius at Sixteenth street, the curvature gradually increasing from this point

to the platform. This arrangement is of benefit to operation as the trains naturally go into the station under some headway which must gradually be reduced to a stop. The curvature varies inversely as the speed, giving the curve somewhat the form of a parabola.

On account of the complicated layout between Seventeenth street and the P. & R. bridge, special care was necessary in shaking out the switch connections and the new curves on the Chestnut Hill branch and the interchange sidings. A drawing was prepared with extreme accuracy to a scale of 32 ft. to the inch, using very thin lines for the tracks. From this drawing dimensions were scaled as required, the result being very satisfactory. The detailed lining of the various curves as well as of the connections was obtained by the use of a string.

Although the force of signal men and track men frequently reached as high as 250, and these men were required to work on tracks which were handling 40 branch line passenger trains in addition to the 100 main line trains, 35 freight trains and almost continuous drill movements on No. 0 and No. 5 tracks, the work was accomplished between March 5, 1913, and September 1, without a casualty of any kind. This was attained not by slowing down the traffic, but by unceasing vigilance and fidelity to established rules of safety. The work was carried out by close co-operation between the chief engineer's organization and that of the division superintendent.

COMPARATIVE TESTS OF BUMPING POSTS

A series of comparative tests of car stopping devices was recently conducted in Chicago by two important trunk line railroads. The report covering the first cost, cost of installation and relative efficiency of these devices, as indicated in the tests, has just been completed, and is abstracted below.

Eight devices were selected for test, representing, as far as practicable, the three general groups in use. Three different principles are used in the design of these three types, as follows: First, blocking the wheels of a car, the arrestive force being transferred through the center pin and center fastenings to the car body; second, direct contact of the car coupler with a solid object, the blow being transferred directly to the frame of the equipment and the stopping device; third, the same as the preceding, except that some portion of the momentum is absorbed by the device. In these tests the first and third groups were represented by one device each, the remaining six being classed in the second group.

The method of testing, as decided upon by representatives of the companies furnishing the devices, was to allow 10 loaded cars rolling free to strike them at a speed of 10 miles an hour. In the first test the number of cars was reduced to 7 and the velocity developed amounted to 7.2 miles an hour. The result of this test was so disastrous that all later tests were made with one loaded car rolling free striking the device at a velocity of from 6 to 8 miles an hour.

The results cannot be considered conclusive, as in all cases the tests were too severe, either destroying the devices or damaging them so badly as to make them of no further service without heavy repairs, except in two cases in the second group, in which there is little doubt that if a second trial had been made they also would have been seriously damaged.

The showing made by the device in Class A indicates that the principle upon which it is designed, namely, stopping the wheels, is wrong. While the wheels may be successfully stopped, the strain on the castings and center pin from the momentum that may be developed is too great to stop the car without some destructive action. In the design of devices in Group B, no provision is made for the motion of the device after it is struck by the car, and the devices have not sufficient strength to resist the great shock which at times they may be required to take up. Even if this strength were provided the shock would manifestly be too severe upon the equipment. The tests indicate that better and safer results will be obtained in switching yards by placing something in front of the device, such as an earth mound, for example, to partially absorb the blow caused by the contact of the car and the stopping device. While the device in Group C is more nearly correct in principle, the tests showed it to be structurally weak, and, although reliable figures are not obtainable as to the cost of its construction and installation, it is evident that, at best, the results obtained are out of proportion to its first cost and maintenance.

The report calls attention to the need for a device that will combine in its design and construction the ability to absorb the blow delivered in general switching service without endangering the equipment. It is recognized that this result cannot be attained at the prices now paid for stopping devices, but it is evident that the decreased cost of maintenance would warrant a much larger expenditure in first cost for such a device than the prices now currently paid.

In order to get comparative costs, all of the stopping devices were installed by the same men and as nearly as possible under the same conditions. The original cost varied from $45 to $60, and the cost of installation from $6.25 to $11.55. Eliminating the first test the impact in foot tons per second developed varied between 552 and 880.

THE ROADMASTERS' CONVENTION

The thirty-second annual convention of the Roadmasters and Maintenance of Way Association of America will be held at the Auditorium Hotel, Chicago, on September 8-11, inclusive. The widespread interest in the work of this association indicates that this will be one of the most successful conventions in its history and a large attendance of roadmasters and supervisors is expected. The following is the program:

TUESDAY MORNING, 10 A. M.

Convention called to order by President T. F. Donahoe.

Addresses of welcome, on behalf of the city of Chicago, by Mayor Carter H. Harrison; on behalf of the railroads by W. G. Bierd, president, C. & A., and R. H. Aishton, vice-president, C. & N. W.; on behalf of the Track Supply Association by President Walter H. Allen.

Three-minute addresses by past presidents.

AFTERNOON

Reading of committee reports and general discussion.

WEDNESDAY MORNING, 10 A. M.

Reading of committee reports and general discussion.

AFTERNOON

Reading of committee reports and general discussion.

THURSDAY MORNING, 10 A. M.

Reading of committee reports and general discussion.

AFTERNOON

Reading of committee reports and general discussion.

FRIDAY MORNING, 10 A. M.

Election of officers.

Reading of committee reports and general discussion.

Among the subjects on which committee reports will be presented are: New and improved manual and power driven track tools; the proper organization and economical use of labor and material for safe maintenance of track; the proper method of rail renewals; the proper type of track accessories, and cleaning and policing the right of way from the standpoint of safety and economy.

The third annual banquet given by the Track Supply Association will be held in the Auditorium Hotel on Thursday evening. Among the speakers will be A. W. Thompson, vice-president of the B. & O.; A. T. Hardin, vice-president, N. Y. C. & H. R.; E. F. Wendt, member, Board of Valuation Engineers, Interstate Commerce Commission, and T. F. Donahoe, president of the Roadmasters' Association.

The Track Supply Association will hold its annual exhibit at the same time and present indications are that the number of exhibitors will exceed even that of last year.

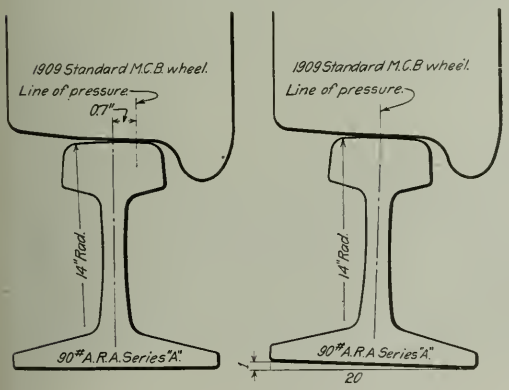
Recent Tendencies Regarding the Canting of Rails

A Discussion of This Subject with a Resume of the Practice of Twenty-four Representative Roads

The rail problem has become one of primary importance within the past few years and all classes and causes of failures have been carefully studied. Prominent among the types of failures is that termed "head" failure, which includes nearly 50 per cent of all failures. Among the contributing causes of head failures is the unsymmetrical loading of the rail. The A. R. A. sections now widely used have a radius of the top of the head of 14 in. The present standard coning of car wheels is 1 in 20. As a result, the line of contact of a *new* wheel on a *new* rail is about ¼ in. from the center of the rail on the gage side. The application of the wheel load to the rail at this point, therefore, introduces shearing and bending stresses in the rail in addition to the direct load.

To overcome this unsymmetrical loading it has been suggested that the coning of the wheels be reduced or eliminated altogether. The New York Central & Hudson River has recently reduced the coning from 1 in 20 to 1 in 38, while several prominent railway men have advocated eliminating this coning entirely. (See article entitled "Rail Failures Due to Eccentric Loading," by C. A. Morse in the *Railway Age Gazette*, April 19, 1912.) However, this latter suggestion meets with the active opposition of the mechanical department, which has found that the wear of wheel flanges and the accidents resulting from worn flanges have increased rapidly in the few instances where coning has been eliminated.

Another suggested remedy is to cant or incline the entire rail to the standard angle of wheel coning, in this way securing a contact with the wheel over the center of the rail. This practice is common in Europe, but has not been widely adopted in this country. The canting of rails is not, however, a new idea in this country, as it has been practiced to a considerable extent by track men for many years. There is a natural tendency for a rail to cant or "roll outward" under traffic, and experienced

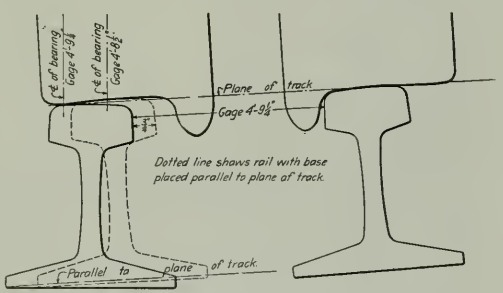


Contact of New Wheels on New Rails When Rails are Vertical and Canted

track men have inclined the rail inward slightly when laying for many years to offset this tendency and also in the belief that the rail remains closer to correct gage.

Theoretically, this practice has considerable to commend it, especially on tangents and on the high side of curves. Practically, however, there are several more or less serious objections to it. It will be admitted without question that the inclining of the rail to permit the application of the load over the center of the rail is to be desired, especially when the rails are stressed to their present high limit. The heavy wheel loads and dense traffic of the modern railroad are justifying numerous refinements in track construction and maintenance which earlier railroading practice would not warrant, and the advocates of rail canting believe that this practice comes within this category. Those men who do not believe in the canting of rails are opposed to it because of the practical difficulties encountered in working this out rather than in the merits of the plan itself, believing that, at present, at least, these difficulties out-weigh any advantages which would be obtained.

The full benefits from canting rails are secured only with new wheels on new rails, while in service both wheels and rails are soon worn from their true contour. Also no matter how well a road may maintain the wheels under its own equipment, the large number of foreign cars which must be handled and which will not be in as good condition, tends to remove the advantage. Without tie plates the inclination must be given to the rail by adzing the ties. At the present time nearly all the ties are adzed by hand. It is difficult to secure even adzing when providing a level rail seat, and the difficulties are materially increased when the ties are adzed at a slope and to one uniform slope. Therefore, it is difficult, if not impractical, to cant rails without using tie plates. Where plates are used the desired slant can be given



Effect of Canting of the Low Rail on a Curve and Wide Gage in Throwing the Wheel Contact to the Outer Edge of the Head

in the plate while the bearing of the plate on the tie is horizontal. However, with inclined tie plates it becomes necessary to tieplate all ties continuously instead of spotting them in on new or treated ties as is customary on many roads, and it introduces torsion stresses in the rails at the joints where Continuous, Weber, or other base supported joints are used. The canting of rails also introduces torsion in the rails at switches, crossings and other special work where the rails must be vertical.

On the low side of curves the canting of the rail introduces a special problem essentially different from that existing on tangents or on the high side of curves. To secure the proper superelevation, both rails are normally inclined towards the center of the curve. In canting the low rail, part or all of this inclination is removed and the line of contact of the wheel with the rail is thereby thrown towards the outer edge of the head. This condition is further aggravated by the wide gage commonly found on curves, permitting the more or less prominent false flanges of the worn wheels to run on the rail. One of the accompanying drawings made from actual contours secured on the track shows this condition. The concentration of the load on the outer edge of the low rail increases the tendency of the rail to roll out, one of the things that the canting is intended to correct. Furthermore, with the load applied at this point, especially under slow trains with frequent slipping of the locomotive drivers, the head of the rail is soon ground parallel to the plane of the track while

the flowing of the metal is materially increased. For these reasons the canting of the low rail on curves can hardly be considered advisable, even though it may be the practice to cant both rails on tangent and the high rail on curves.

Because of the differences in practice and in opinion regarding the advisability of canting rails, we give below the practice and the opinions of 24 representative large roads on this subject:

On the New York Central & Hudson river it is the practice to cant the rails when laying by adzing the ties and by the use of inclined tie plates. The rail is inclined about 1⅛ in. in 5½ in., or about 1 in 40. In this way the rails receive the maximum bearing from the wheels, while very little additional labor is required since it is necessary to adze the ties whenever rail is relaid. It is believed on this road that the results secured from this practice more than warrant this extra work and expense.

The Canadian Pacific strongly favors the canting of rails and for the past four or five years has been purchasing shoulder tie plates ½ in. thick at the shoulder and ⅜ in. thick at the opposite side of the rail base, giving an inclination of 1 in 40. It is believed that this practice tends towards smooth running, and also to prevent the nosing of locomotives and the oscillating of cars from one side to the other. It is found that the head of the rail takes its wear nearer the center than formerly, but it is believed that even better results will be obtained by increasing the inclination to 1 in 20, as is standard on European roads.

On the New York, New Haven & Hartford rails are "rolled in" slightly when laid and when regaging track, although it is not the standard practice to cant rail to any considerable extent. A new design of tie plate has been made providing for canting the rail about 1/16 in. in 5½ in. This plate has been adopted only tentatively and it may be found after experimental use that it will be advisable to increase this to ⅛ in., equivalent to a slope of 1 in 40.

The Southern Pacific uses a flat bottom tie plate 8½ in. square on both tangents and curves. This tie plate is ½ in. wider on the outside of the rail than on the inside to offset the tendency of the rail to roll outward. While it is not the standard practice on this road to cant the rail, it is frequently necessary to regage the track on sharp curves, and in such instances it is the practice of the track men to cant the rail inward slightly. For this reason this road is inclined to favor a beveled tie plate for use on medium and heavy curves, thereby slightly canting the rail at those points.

While the Philadelphia & Reading does not now cant its rails, it is expected that ultimately this will be the practice and that tie plates will be rolled accordingly. It is believed that the ratio of the slope of the rail should be at least as great as the coning of the wheel, although this ratio is now somewhat indefinite due to the present transition in the rate of coning of wheels.

About six years ago the Baltimore & Ohio purchased a considerable number of tie plates tapered ⅛ in. in 5½ in. for use exclusively on curves. While good results were secured from these plates, their use was not extended. It is believed that some beneficial results will be obtained in canting the rail in by bringing the wheel bearing nearer the center of the head of the rail, by overcoming the tendency of the rail to turn outward, and also by giving the tie plate a greater thickness at the outer edge of the rail base where the greatest strength is required. Practically, however, it is believed that the benefits derived from the use of inclined tie plates is very much reduced with the hand adzing of ties.

The Delaware, Lackawanna & Western has never canted its rail, and it is at the present time adzing all ties so that the flat tie plates will have a uniform horizontal bearing. However, the advisability of canting rails when laying has been more or less seriously considered and this road has arranged for the purchase of a small number of Lundie tie plates for use on the new cut-off north of Scranton. It is believed that this practice will materially assist in preventing rails from rolling out, although this road has had no experience to back up this opinion.

For several years it has been the practice of the Chicago, Burlington & Quincy to purchase an inclined tie plate, but for the past year this road has been buying flat tie plates for the lines west of the Missouri river, while still using inclined tie plates on the lines east of the river. One of the serious objections to the use of inclined tie plates on this road is the difficulty encountered at switches and crossings where the rails must be vertical. The use of the canted tie plate is being continued on the lines east, primarily, in order to have all the tie plates uniform.

The Missouri Pacific uses tie plates canted to a slope of 1 in 80 on curves. The canting of the rail to a slope of 1 in 20 is not regarded with favor and since the majority of the wheels in actual service are worn to a coning other than standard, it is believed that the canting of rails to this angle would result in heavy wear on the outside of the head.

The practice of the Union Pacific has never been to cant rails when laying, although this subject has been discussed to some extent. Considering the mechanical difficulties in laying track with present methods, it is doubted if any decided benefits will be secured by canting the rail.

It is not the standard practice on the Minneapolis, St. Paul & Sault Ste. Marie to cant rails when laying. However, recently in laying some new 85-lb. rail, mainly on old ties where the inside rails on curves had been turned over somewhat by a heavy, slow traffic and where there were no tie plates, the outside edge of the base had cut into the ties badly. When laying the new steel the roadmaster adzed the ties to give the low rail on curves a cant to overcome this tendency to over turning. As tie plates were then applied the rail has remained in this same position. Later investigation has shown that this canting has been one of the contributory causes for the flowing of the metal on the outside edge of the low rail, although the wide gage on the curves is the most potent reason for this condition. This flowing is also a result of the fact that fully 75 per cent of all wheels passing over the rail have tires which are more or less grooved and the rim of this depression has a more serious action on the edge of the head of the rail when it is canted than when it is vertical. Because of the many difficulties preventing securing a perfect contact between the rail and the wheel, the road is of the opinion that no benefit is secured from canting the rail.

It was formerly the practice of the Chicago, Milwaukee & St. Paul to use beveled tie plates on curves to cant the rail toward the center of the track, but this practice was abandoned when it was found impractical to apply them so that the rail would not be canted through a portion of its length and level, or canted in the opposite direction, at other points, thereby creating undue stress in the rail. It is not now the practice to cant the rails when laying them, although when relaying rail the ties are adzed slightly deeper on the inside of the rails than on the outside for the purpose of lengthening the time before the rails turn out because of traffic rather than for the express purpose of canting the rails in. Tie plates are now used on all soft ties and on all oak ties on curves on line carrying a considerable traffic. Where the tie plates are used very little trouble is experienced in rails canting out or the gage widening.

It is not the practice of the Chicago & North Western to cant the rails when laying them, although a recent investigation showed that most steel gang foremen and roadmasters were giving the rail a slight inclination. Recent instructions provide that the rails shall be laid on a level bearing.

It is not the standard practice of the Pennsylvania Lines West of Pittsburgh to cant rails when laying them. While the inclination can be given the rail by adzing the ties to the desired angle, this is considered simply a makeshift. Until tie plates are applied continuously on tangents as well as curves the benefits derived from canting rails will be largely theoretical.

The Lehigh Valley lays its rail vertical on tie plates with the outside end extending further beyond the base of the rail than the inside for the purpose of overcoming the tendency of the rail to "roll out."

The Lake Shore & Michigan Southern uses sawed red oak ties almost exclusively, thereby making the canting of rail impractical without further adzing of the ties. It is believed that

the canting of rail has little to recommend it in practice on any individual road, since fully 90 per cent of the wheels are worn by service on rails laid vertically.

Among other roads which do not cant rail when laying are the Chicago, Rock Island & Pacific, the Seaboard Air Line, the Grand Trunk Pacific, the Southern Railway, the Pennsylvania Railroad, and the Louisville & Nashville.

REPLACING A SWING BRIDGE WITH A VERTICAL LIFT STRUCTURE

The new double track vertical lift bridge of the Pittsburgh, Ft. Wayne & Chicago and the Chicago & Alton over the south branch of the Chicago river a little less than two miles south of the Chicago union station was placed in service on July 29. As the old swing bridge, which was formerly in use at this point, extended under the new structure, one-half of the old bridge had to be removed before the new bridge could be lowered into position.

The old structure was a double track through pin connected revolving draw span on a stone center pier and wooden abutments. Its length out to out was 223 ft. 6 in. This bridge was put in service in 1883 and was reinforced in 1893. It was obsolete and did not accord with the latest government requirements as to channel width, making it essential to replace it.

The new bridge is of the vertical lift type, designed by Waddell & Harrington, Kansas City, Mo., with a movable span 272 ft. 10 in. center to center of end pins, which is the second longest span of this kind ever built. The ends of the span are skewed about 45 deg. The supporting towers at each end are 53 ft. 6 in. long, 29 ft. 6 in. wide and 195 ft. high from top of masonry to center of sheave wheels. The bridge has a clearance of 9 ft. above the water when closed and a maximum clearance when raised of 120 ft., requiring a lift of 111 ft. The clear river channel is 200 ft. The weight of the moving span, including tracks, machinery and machinery house, is about 1,600 tons. This weight is counterbalanced by blocks of reinforced concrete suspended from sheaves at the rear of the end towers. The moving span is carried by 64 2¼-in. steel cables, 16 at each corner, passing over the 15-ft. sheaves at the top of the towers.

New Vertical Lift Bridge Over Chicago River Replacing Old Swing Span Shown Below

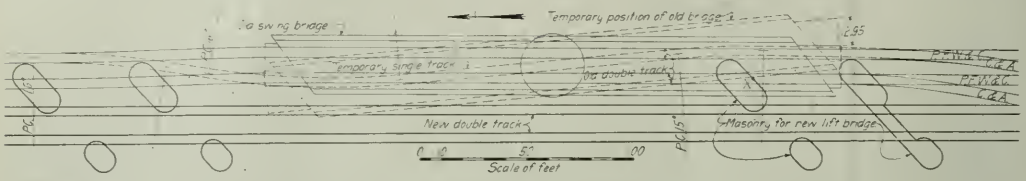
In erecting the bridge, the towers were built first and the movable span was erected by the cantilever method in the open position. Fan falsework was used to support the end panels of the lift span from the towers until the lower chord had been closed. The overturning tendency in the towers due to this method of erection was balanced by the counterweights. On account of the position of the old span it was impossible to lower the new lift span to the closed position until everything was in readiness for the operation of the new bridge and traffic could be diverted long enough to remove one-half of the old span and adjust the new bridge for operation. When the bridge

was finally lowered in position after cutting out the old span the error in grade and line was very small.

The accompanying sketch shows the original location of the swing span, the temporary position that was made necessary in order to clear the post of the new end tower at the point marked "X" and the location of the new bridge. The north end of the swing span in the temporary position extended too far west to allow the two tracks to be carried around the masonry for the new bridge and to clear the fan falsework supported from

The end of the remaining portion of the old draw span was jacked over about four ft. on the center pier in order to clear the new bridge. This allowed the new lift span to be lowered into position, adjusted, and traffic put back on the new structure. The south half of the old bridge was dismantled in place, being supported on falsework.

The design and the erection of the new bridge were handled under the supervision of R. Trimble, chief engineer maintenance of way, and J. C. Bland, engineer of bridges, of the Pennsyl-



Location Plan of Old Swing Span, Temporary Position and Masonry for New Vertical Lift Bridge

the north tower. On this account the bridge was operated with a single track during the construction period, the alinement including a 16 deg. curve, a part of which was on the swing span.

The new bridge being ready for service, all arrangements were made with the shipping interests to close the stream for navigation between 5 and 9 a. m. on July 29. The railroad traffic was detoured during the operation, the tracks being taken at 4 a. m.

The first operation in removing the old bridge was to cut off the skew panel at the north end of the span in order to make this arm of the bridge short enough to handle down the river

vania Lines. The Great Lakes Dredge & Dock Company had the contract for placing the masonry for the new bridge and the Pennsylvania Steel Company fabricated and erected the new span and dismantled the old draw.

Rolling Stock on the Italian State Railways.—On June 30, 1913, the Italian State Railways had in service a total of 10,261 passenger cars, 98,095 freight cars, 2,312 work and repair cars, 3,408 baggage and mail cars, 5,102 steam locomotives, 56 electric locomotives, 95 steam trucks and 51 electric trucks. There were

North Half of Old Span Supported on Scows and Completely Severed from the Rest of the Bridge

on scows. Two steel scows lashed together were placed under the north arm and blocking was placed under the floor beams. The water ballast in the scows was then pumped out by tugs and steam siphons until the weight of that end of the bridge was transmitted to the scows. Oxy-acetylene torches were used to burn off the truss members adjacent to the panel over the center pier and the north half of the bridge was then floated away. This portion of the old span was landed some distance down the river where it could be dismantled at leisure.

also 383 narrow gage cars, of which 224 were in Sicily and the remainder in Tripoli. During the fiscal year 1912-1913 there were constructed for the Italian State Railway 4,750 freight cars, 500 baggage and mail cars, 327 passenger cars, 160 steam locomotives, 51 electric locomotives, 17 narrow gage locomotives, of which 12 were for Sicily and five for Tripoli, and 197 narrow gage cars, of which 59 were for Sicily and 128 for Tripoli. All the new rolling stock was built in Italy, preference being given to Italian firms as an aid to national industry.

A Unique Method of Strengthening a Truss Bridge

Two Spans Carrying Tracks Over Faults in Rock Are Reinforced by Sinking Cylinders Under Panel Points

By Wm. H. Warnecke
Assistant Engineer, New York Central & Hudson River, New York.

In order to permit the operation of heavier motive power on the main line of the River division of the N. Y. C. & H. R. it was necessary to strengthen several bridges in 1912 and 1913. The original bridges on this division, the main line of which is the West Shore Railroad from Weehawken to Ravena, were nearly all reconstructed or strengthened between 1902 and 1904, to permit the operation of heavier motive power and equipment at that time. Several bridges which were stronger than the average of the original structures were allowed to remain at that time and were not strengthened. When the operation of still heavier locomotives became imperative, it became necessary to strengthen these few bridges which remained.

Fig. 1—Bridge No. 54

Two of these bridges, Nos. 54 and 56, located immediately south of Highland Falls station, are peculiar in that they were constructed to carry the tracks over transverse clefts in the rock bottom of the Hudson river, which it was found impossible to fill with safety, on account of the steep slope of the rock toward the center of the river. These bridges, which are placed close to the precipitous faces of the rock cliffs forming the shore, are double track, through truss spans, with two trusses each, of the pin-connected Pratt type, the length of spans being 135 ft. and 199 ft., respectively. The rock bottom on the in-shore side lies above the water level directly under the in-shore truss in each case for nearly the whole length of the bridge, and under the outside truss the water line extends only a portion of the length of the span, the end panels being located over dry bottom, which consists of boulders and gravel overlying the shelving bed rock. The bottom, which is under water at low tide, is overlaid with a considerable depth of soft mud.

In order to relieve the trusses from the full effect of the live loads, wooden blocking was placed under the ends of the floor beams wherever this could be done without going into the water at low tide, or on the soft bottom. In this way the in-shore ends of all floor beams were supported, and also the out-shore ends of all except four interior beams of bridge 54 and six of bridge 56. This blocking under the out-shore ends of the beams was put in somewhat as an experiment to see if the material overlying the rock would hold such load as came upon it, and it was found that it would.

When, in 1912, it became necessary to provide for still heavier locomotives than had up to this time been permitted, it was necessary to further strengthen these bridges, and it was at first decided to replace the superstructures. As this involved a very large expenditure, and as a future change in the line is contemplated which will eliminate these bridges altogether, it was decided to furnish the necessary strength by providing additional bearing to complete the system of temporary floor beam supports and by strengthening the steel floor system. The method of construction for these additional supports for the floor beams is quite unusual and will be described in the following:

DRILLING OPERATIONS

Two core drills were used in drilling the holes for the reception of wrought iron pipe columns. One, a steam-driven drill, was used on bridge 56 only; the other, driven by a three-cylinder gasolene engine, was used on both bridges. Fig. 2 shows the latter drill at work. The drilling operations were carried on from below the bridge in order not to interfere with the operation of trains. At bridge 54, where the water was not so deep as at bridge 56, a crib of ordinary construction was built and sunk to support the platform for the drilling outfit, whereas, at bridge 56, it was cheaper to build a pile platform.

As soon as the temporary drill platform was completed, the drilling operations started. It was necessary to drill through from 15 to 30 ft. of sand, gravel, broken stone and boulders (shown in Fig. 3, which is a section through the center line of the out-shore truss of bridge 56) before solid rock could be reached. The supports shown in this figure are only for the out-shore ends of floor beams, the in-shore ends being supported as hereinbefore mentioned, and as shown under the four exterior beams. This necessitated driving a casing which would subsequently form part of a steel and concrete column. This casing, of extra heavy 12 in. wrought iron pipe in lengths of 5 to 10 ft., was driven by a solid weight of 1,500 lb., operated by the hoist on the drill. Large boulders encountered in driving the casing were shattered by placing a small charge of dynamite in the hole left after the removal of the core made by drilling several feet into the boulder. Before any blasts were set off, however,

Fig. 2—A Core Drill Driving a Casing

the drill was removed entirely and the casing raised about 4 ft.

To provide an even bearing for the casing in the sloping rock, a shelf was made by blasting. The blasting in this case was identically the same as that adopted in shattering the boulders. After the casing was firmly set, the drilling of solid rock was commenced. The depth of holes in the rock varied from 8 to 12 ft., according to the slope. Had the rock been comparatively level, a depth of hole of from 3 to 4 ft. would have been sufficient for the foundation of the 8 in. pipe columns. When the drilling of each hole had been completed, the stone core was broken off at the bottom and removed; this left a hole 10¾ in. in diameter. A core taken from one of the holes is shown in the lower left hand corner of Fig. 2.

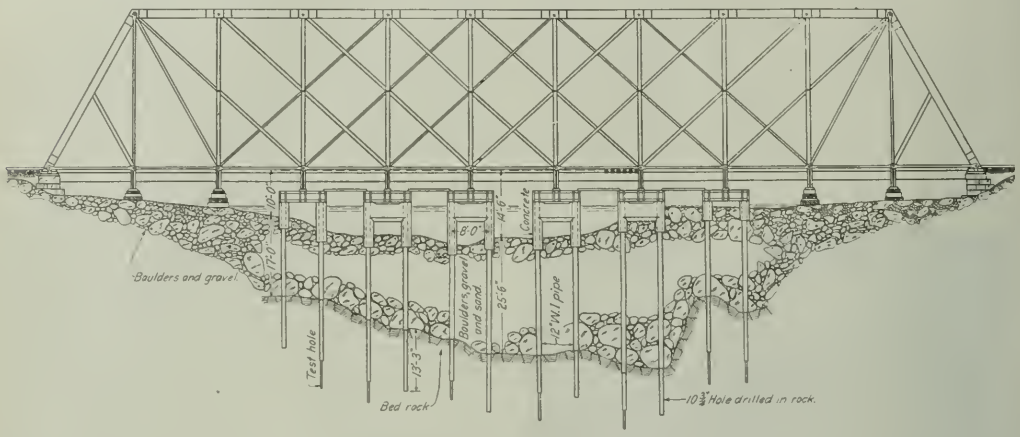


Fig. 3—Strengthening a Bridge by Means of Supporting Cylinders

PLACING PIPES AND COLUMNS

The filling of the pipe casings was deferred until the drilling of all the holes had been completed. During this period of time considerable sand had entered the holes through fissures in the rock, and had become tightly packed. This was removed by loosening it with a steam jet and then cleaning it out with a flopper-valve sand pump. The placing of the inside pipes followed the cleaning of the hole. The inside pipes were centered in the casings by means of two sets of bolts in each length of pipe. Each set contained three bolts, extending from the inside surface of the pipe to the desired distance outside, the bolts being equally spaced around the circumference of the pipe, each set 1 ft. from the end of each length of pipe. Being provided with nuts the bolts could therefore be made adjustable. The inside pipes extended from the bottom of the holes up through the casings to the underside of the girders shown in Figs. 3 and 4; they were made up of 10 ft. lengths of 8 in. wrought iron pipe, ½ in. thick, coupled together with bearing joints, and with the top lengths and casings sawed off at the required elevations. These inside pipes have four rows of 2 in. x 4 in. slot holes, one row in each quadrant, space alternately 1 ft. apart lengthwise of the pipe. These holes permitted the grout of 1:2 proportions, with which the pipes were filled after being placed to run through and fill up the space between the pipe and casing, and the pipe and rock below the casing.

When the work as described above had been completed, the columns were encased in concrete above the river bottom as a matter of preservation. Further, where there was considerable depth of water, and, therefore, a considerable length of unsupported column which might be a source of weakness due to the action of ice in winter, longitudinal expansion and contraction of the bridge span, etc., concrete struts were placed between the columns and were made an integral part of the concrete encasing said columns. These struts are shown in Fig. 3. Where there was little or no water the columns were encased in concrete of octagonal form, as shown in Fig. 4, with the concrete struts omitted. A built-up galvanized sheet metal form, of the shape shown by the finished concrete in Fig. 3, with one side open to permit of its removal after the concrete had hardened, was set up where a strut was required, and the reinforcement then placed. "U" shaped 1¼ in. rods, extending around the 12 in. casings and coupled together at the center of the strut with turnbuckles, were placed near the top and bottom of the concrete. Stirrups, "U" shaped, of ⅞ in. diameter rods, were hung from the upper set of bars. To the stirrups were wired 1 in. diameter longitudinal reinforcing rods equally spaced between the upper and lower set of "U" bars. A mixture of 1:2:4 concrete was then placed. After the concrete had sufficiently hardened, the metal form was removed and used for another strut. To expedite the work, however, several of these forms were made and used at both bridges. The forms for the octagonal concrete column casings were made of wood.

Fig. 4—Octagonal Concrete Casings Supporting Girders and Floor Beam

PLACING THE GIRDERS

Cast steel caps 19 in. x 19 in. x 1½ in., with ¾ in. circular rims of 12¾ in. inside diameter, and 3 in. in depth, were

placed over the pipes after the completion of the concrete work. The underside of the cap and the inside of the rim were faced to provide a snug fit over the outside pipes and a good bearing on the tops of both inside and outside pipes, respectively. The built-up girders shown in Figs. 3 and 4 were then placed and bolted to the caps, which were provided with four 1 5/16 in. holes. A space of 1 3/8 in. remained between the underside of the lower flange of the floor beam and the top of the bearing plate on the upper flange of the girders after the girders were placed. This space was filled with a pair of wedges which were driven to secure a light bearing under the floor beams. Holes were then drilled in the wedges and girder and slot holes were made in the lower flange of the floor beams, and the three bolted together. The slot holes were designed to permit the free longitudinal expansion and contraction of the bridge span. The girders were tied together with 4 ft. x 4 in. x ⅜ in. angle struts placed on the upper flange, as shown in Fig. 3. Stiffeners were placed in the web of the floor beams directly over the center of the girders.

The method of strengthening was developed by A. W. Carpenter, formerly engineer of structures, and now valuation engineer. The field work was under the supervision of R. E. Dougherty, district engineer; J. W. Pfau, engineer of construction, and G. W. Kittredge, chief engineer.

ABSTRACT OF ENGINEERING ARTICLES

The following articles of special interest to engineers and maintenance of way men, and to which readers of this section may wish to refer, have appeared in the *Railway Age Gazette* since July 17, 1914:

New Low Grade Line from Tacoma, Wash., to Tenino.—The Northern Pacific is completing a double track line with low grades, 44 miles long, to replace a single track line between the same points and provide a continuous double track between Seattle and Portland. The construction included some heavy grading work along the east shore of Puget Sound, a large part of the embankment being protected by a sea wall of an unusual type. One tunnel, 4,391 ft. long, was driven near Tacoma. Details of the interesting features of this new line were published in the issue of July 24, page 159.

Passenger Terminal Improvements at Buffalo.—As a result of extended negotiations with the city's Terminal Station Commission, the Delaware, Lackawanna & Western has agreed on plans for a new passenger terminal to be located on the Buffalo river and work has been begun on the structure. The conditions making this improvement necessary and details of the proposed station are included in an illustrated description in the issue of July 24, page 166.

The Federal Valuation of the San Pedro, Los Angeles & Salt Lake.—On account of the general interest in the important task which the government has undertaken of making a physical valuation of the railways of the country, the detailed description of the organization which has been formed on the San Pedro line and the methods which are being followed in collecting the field data for this valuation, written by E. G. Tilton, formerly chief engineer of this line, is very timely. This was published in the issue of July 31, page 195.

New Great Northern Line from Oroville to Wenatchee.—The 134 miles of new line built by the Great Northern between Wenatchee, Wash., and Oroville, serving a large undeveloped area and providing a low grade outlet to Spokane for a considerable amount of traffic, involved the relocation of 13 miles of highway most of which was the Washington state road No. 10, the driving of three tunnels and the bridging of five rivers. This interesting construction work was illustrated and described in the issue of July 31, page 202.

New Passenger Terminal at Dallas, Tex.—Contracts have recently been let for a union station in Dallas, Tex., which will replace the five stations previously occupied by the nine roads entering the city. The details of this improvement were contained in an illustrated article in the issue of August 7, page 252.

Railroad Development in the Philippine Islands.—The problem of transportation was a difficult one in the occupation of the Philippine Islands by the United States military forces following the Spanish war, and the development of adequate railway facilities in the islands was one of the first things to which the new civil government, established after the war, turned its attention. A discussion of this development touching on the engineering features, details of construction, organization and traffic problems, contributed by C. H. Farnham, formerly chief engineer, Cebu division of the Philippine Railway Company, was published in the issue of August 14, page 279.

Building a Modern Terminal Road at Youngstown, Ohio.—The Lake Erie & Eastern, a subsidiary company of the Pittsburgh & Lake Erie and the Lake Shore & Michigan Southern, is building a line 8¾ miles long through the city of Youngstown, O., to reach a number of important industries and possibly to form, ultimately, a link in a direct freight connection controlled by the New York Central Lines between Youngstown and Cleveland. The construction of this road involved exceptionally heavy bridge work in which advanced practice in a number of details has been adopted. An illustrated description of this construction work was published in the issue of August 14, page 286.

An editorial commenting on the elimination of shop painting on the structural steel for the heavy bridges on the Lake Erie & Eastern was published in the issue of August 14, page 275.

NEW FRISCO BOOK OF RULES FOR THE MAINTENANCE OF WAY DEPARTMENT

The St. Louis & San Francisco has just gotten out a book of rules and instructions for employees engaged in the maintenance of way department, which differs from those commonly used in its greater completeness and detail. In addition to the general rules for all employees and those for the foremen, etc., detailed instructions are given regarding the size of gangs and the methods to be adopted when laying rail, placing ballast, etc., the purpose of the book being not only to promulgate rules for the proper prosecution of the work, but to standardize this work as far as possible over the system. Detailed instructions are given regarding the places where tie plates, anti-creepers, etc., are to be used and the methods of installation. Seven pages are devoted to the laying of rails. Equally detailed and complete instructions are given for the guidance of foremen of water service, bridge foremen, signal maintainers, etc. These instructions cover 106 pages. In the rear of the book there are drawings of standard ballast, sections, mile posts and other markers with tabular data showing the amount of material required for repair and renewal work, etc.

A NEW ASPHALT ROOFING

The patterns and colorings of slate and tile roofing are approached in effect by a new prepared asphalt roofing manufactured by the Patent Vulcanite Roofing Company, Chicago. The new material, which is known as "Vulcan-Tile," is new only in the decorative features, the same fire-resisting and weather-proof qualities possessed by the granite coated asphalt roofing, which has been sold by this company for several years, being secured by the use of the same base, the same substance and the same coating. The patterns which give the roofing the appearance of slate or tile when laid are a part of the rock surface which insures that they will last as long as the roof. Vulcan-Tile is coated with crushed granite in two colors, red and green. The Vulcanite asphalt, which is used as the saturating and coating compound, is claimed to make the roofing material withstand softening and evaporation in hot weather, freezing and cracking in winter, crumbling in dry weather, and to insure its being fire-resisting, waterproof and wind-tight. The material is put up in rolls weighing 80 lb., and containing 108 sq. ft. Rust-proof nails and binding cement are packed in each roll. The roofing, the colors and the patterns are guaranteed for ten years.

Electrification of Railways in Italy.—Electric operation has recently been begun by the Turin & Savona Railway of Italy for passenger traffic only, on the section of the line across the Apennines, between the latter town and Ceva, a distance of 29 miles. This section, which is the heaviest part of the line, includes the Belbo tunnel, about three miles in length with maximum grades of 2.5 per cent. The maximum speed is 31 miles per hour. Savona ranks after Genoa and Venice, as one of the important coal ports of Italy; it is also an important manufacturing town, with large steel works.

THE NEELY SPRING LOCK

A new spring nut and bolt lock is being tested by the Pennsylvania Railroad, the Pennsylvania Lines, and the Pittsburgh & Lake Erie, all of which report satisfactory service. The Neely spring lock is applied without special tools and can be used with either square or hexagonal nuts on standard track bolts. The locking feature is secured by the ribs which are shown engaging the edges of the nut in the accompanying illustration. The locks are made from a rolled bar of high grade spring steel which, it is claimed, will insure a permanent spring and take care of the natural elongation of the bolt in service. Each lock is heat treated and tempered in oil.

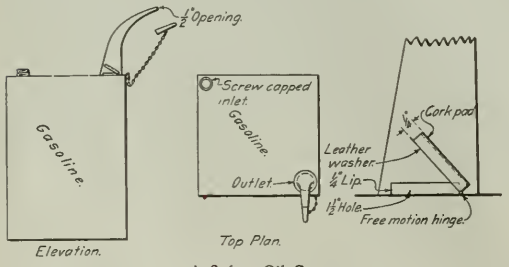
The Pennsylvania Railroad has had a number of these locks in service on the lower rail of a curve at West Philadelphia since March, 1913. The traffic over this track is very heavy and consid-

Neely Spring Lock

erable amounts of water, gas and grease are present. On an inspection made in December, 1913, all of the locks were in good condition, with one exception, the looseness of that particular lock being attributed by the officers making the inspection to peculiar conditions surrounding that point. The test on the Pennsylvania Lines has been made at Upper Sandusky, Ohio, where the locks have been in service on about one mile of track for over a year. A report of this test states that the lock is giving very satisfactory service. The Pittsburgh & Lake Erie is testing 500 of the locks at McKeesport, Pa., the latest report on this test stating that their service up to date has been satisfactory but that they have not been in use for a long enough time to draw final conclusions. This lock is made by the Neely Nut and Bolt Co., Pittsburgh, Pa.

A SAFETY OIL CAN

The oil can shown in the accompanying drawing has been devised by S. Joseph DeGraeff, division storekeeper of the Coast division of the Southern Pacific, in response to a demand for a can which would increase safety in handling gasolene and other highly inflammable oils. This can is made



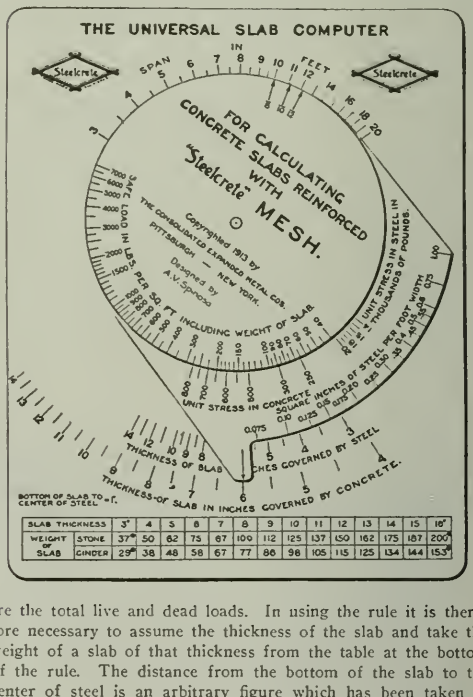
A Safety Oil Can

from an old 5 gal. oil can, and is painted target red for gasolene, and corresponding colors for other materials. The word "gasolene" is stenciled on all sides and on the top. The contents of the original packages are transferred to these safety oil cans immediately upon receipt, thereby doing away with the necessity of keeping an open can around section and tool houses.

THE UNIVERSAL SLAB COMPUTER

A new circular slide rule has recently been perfected by the Consolidated Expanded Metal Company, New York, for the design of reinforced concrete slabs using any unit stresses in the concrete and steel, and any common bending moment, span, load and slab thickness. The rule was designed by the use of the "straight line" formula, which was slightly simplified to reduce the number of operations on the rule. Any difference in results attained by the rule and with the exact formula is said to be negligible and is on the side of safety. The unit stresses in the steel shown on the face of the rule range from 14,000 lb. to 20,000 lb. per sq. in. The unit stresses in the concrete shown on the face of the rule range from 250 to 800 lb. per sq. in. The arrows marked 1/8, 1/10, and 1/12 represent the bending moment factor which is usually covered by the specifications. In general, the value of 1/8 should be used for a simple slab, 1/12 for a continuous slab, and 1/10 for a slab simple at one end and continuous at the other.

The safe loads in lb. per sq. ft. given on the face of the rule



SLAB THICKNESS		3"	4	5	6	7	8	9	10	11	12	13	14	15	16"
WEIGHT OF SLAB	STONE	37#	50	62	75	87	100	112	125	137	150	162	175	187	200
	CINDER	29#	38	48	58	67	77	86	98	105	115	125	134	144	153#

are the total live and dead loads. In using the rule it is therefore necessary to assume the thickness of the slab and take the weight of a slab of that thickness from the table at the bottom of the rule. The distance from the bottom of the slab to the center of steel is an arbitrary figure which has been taken as one inch in designing the rule. If it is desired to provide for a distance other than one inch, the result can be corrected by deducting one inch from the thickness of the slab secured on the rule and adding the value desired. In all slab problems the double solution is necessary, the first to secure the minimum thickness of slab required by the limiting unit stress in the concrete, and the second to secure the area of steel required with the given thickness of slab, load, span and bending moment.

The slide rule is made of celluloid, and is approximately 4¾ in. by 6¼ in. The lettering is covered with a finishing coat to prevent its rubbing off. Full directions for using the rule are given on the back.

English Cloth for Belgian Railway Employees.—The Belgian State Railways recently ordered 180,000 yards of English textiles for employees' uniforms.

General News Department

In Montreal and many other places the Canadian Pacific is putting on duty numerous armed guards to watch buildings, yards, cars, bridges and and other property.

The grain elevator of the Intercolonial Railway at St. John, N. B., was destroyed by fire, August 12, together with 350,000 bushels of wheat. Estimated loss $1,000,000.

On Sunday, August 16, according to a press despatch, the sum of $25,000 was taken in by the government in the shape of tolls for the passage of vessels through the Panama Canal.

The Railroad Smoke Inspectors' Association of Chicago held its annual excursion and outing on August 18, at South Haven, Mich. A number of informal addresses dealing with the smoke situation in Chicago were made.

Plans for the rehabilitation of the Mexico Northwestern have had to be suspended on account of the European war. The road is owned by a syndicate of Englishmen, who also have other large property holdings in Mexico. During the long period of revolution long stretches of track and many of the bridges were destroyed. Parts of the line are now in operation.

On a tour of 3,500 miles traveled by Mayor James H. Preston and party, of Baltimore, recently made in the interest of the coming National Star Spangled Banner Centennial, the efficiency of American railroad service was shown by the fact that the entire journey was made on schedule time. The party traveled in a special car on regular trains; visited 22 cities in 16 states of the central west and south, and used 12 different railroads.

Telegraph operators employed by the Southern Pacific system are taking a vote on authorizing a strike to enforce their demands for increases in pay and changes in working conditions on the lines east of El Paso, to correspond with those provided in a contract for the lines west of El Paso which went into effect on September 1 last year. The men ask an increase of 12½ per cent in rates, increased pay for overtime, and $5 a month extra for operators who are station agents and also perform certain other duties.

The safety bureau of the El Paso & Southwestern has issued a circular showing the behavior of 3,607 automobiles and their drivers observed during the period of one week while crossing the tracks of the road in El Paso. It was found that 2,907, or 80 per cent of the drivers of these automobiles, did not look in either direction; 620, or 17 per cent looked only in one direction, and only 80, or 2 per cent, took the precaution to look both ways before crossing the tracks; while 296 of the number who looked in neither direction crossed at a speed greater than 20 miles an hour. And six of this number saw the flagman and crossed the tracks disregarding his signal.

The monorail street car line which was built in the northern part of New York City a few years ago, appears, after many vicissitudes, at last to be dead. A new line of ordinary street cars, with storage battery motive power, was put in service August 18. The line is from the City Island station of the New York, New Haven & Hartford Railroad to Belden's Point, about 3 miles. The opening of the line followed the condemnation of the monorail as unsafe a few months ago. The Union Railroad bought the monorail franchise from the Interborough Rapid Transit Company. On the first car run over the road this week were Edward E. McCall, chairman of the Public Service Commission; District Attorney Francis Martin; the Acting Borough President of the Bronx, and other public officers.

The Southern Pacific Company has recently completed a new commissary building at Los Angeles, Cal., at a cost of $100,000. In its construction and arrangement every possible means has been taken to provide a sanitary and up to date commissary plant. It is dust proof and fly proof. The provisions are weighed, iced, sorted and issued without once having been touched by human hands. All liquids are delivered in sealed glass containers and cream is moved in gallon tins that are thrown away after once being used. In order to eliminate contamination from refuse there has been provided a special concrete-lined room where the garbage, pending incineration, is immediately placed under refrigeration. The building is surrounded by covered platforms on all sides which are provided with water, compressed air and steam used to keep the buildings in a sanitary condition. The building is also provided with a humidor, measuring 10 ft. by 4 ft., having a capacity of 40,000 cigars. The supplies issued from this commissary aggregate between $40,000 and $50,000 in value per month, and this only for the southern territory, which extends from Los Angeles north to Fresno and Santa Barbara and east as far as New Orleans. In combination with the big kitchen is a cooking school, where the dining car cooks are instructed in the preparation and serving of stock material. The exterior of the building is thoroughly in keeping with the interior in sanitation and cleanliness, the moral effect of cleanliness on the crews not having been overlooked.

Westinghouse Air Brake Contest

The competition in which the sum of $2,000 in prizes was offered by the Westinghouse Air Brake Company for the six best stories submitted, under certain conditions, dealing with the experience and practical knowledge of railroad employees regarding any striking performance of the air brake manufactured by that company closed August 1, 1914. The following committee of judges is now engaged in examining the stories: W. E. Symons, consulting mechanical engineer, Chicago; Willard Smith, editor, Railway Review, Chicago, and R. V. Wright, managing editor, *Railway Age Gazette*, New York. Very considerable interest was displayed in the contest and a large number of stories were submitted, so that several weeks will elapse before the judges will be able to announce the winners of the prizes.

"Safety First" Rules for Passengers*

Don't stand in the doorway. Some fool may rush through the waiting room and hurl you on the tracks. Besides, you are in the way of other passengers.

Don't rush through the doorway. You may collide with someone coming in and hurl him out on the tracks.

Don't stand too near the tracks. There is always a possibility of your being jumped on by some irresponsible leaping from a moving train, or being caught by something projecting from a car.

Don't attempt to cross tracks to eastbound platform until you are sure that there is nothing coming this way on the west-bound tracks. Hesitate a moment and look.

Don't step on any metal if you can avoid it. There is a live rail under the wooden guard on both sides of the center platform, contact with which means death. Use extreme care not to stub your toe under the guard rail.

Don't attempt to board a moving train. There is no business or engagement so important as to risk the chance of going through the rest of your life on crutches.

Don't stand near the door of a baggage car. There may be baggage to unload and a trunk coming down on your toes is not a pleasant sensation.

Don't cross in front of a standing train unless you are sure that you can get clear in case it should start.

Don't fail to reach the station in sufficient time to catch your train. More men have dropped dead from overexertion trying to catch trains than have died under the wheels.

The Western Wages Arbitration

The locomotive engineers of the Western roads have chosen as their member on the board which is to arbitrate the wages controversy with their employers, F. A. Burgess, assistant grand

*From a typewritten bulletin posted by Station Agent S. J. Murray, at Hewlett, Long Island.

chief engineer of the brotherhood; and the firemen have chosen Timothy Shea, assistant president of their brotherhood. The railroads, as announced last week, have chosen Vice-president Park of the Illinois Central, and Vice-president Byram of the Chicago, Burlington & Quincy. The names of the other two members will not be announced for some time. The Act of Congress of July 15, 1913, the Newlands law, providing for the settlement of controversies concerning wages and conditions of service between railroads and their employees, provides that after the selection of the arbitrators by the parties the four thus selected are to be convened upon order of the United States Board of Mediation and Conciliation, and that when thus assembled they shall be allowed fifteen days within which to select the two impartial arbitrators; and the Board of Mediation has adopted the policy of requiring them to exhaust the fifteen days in that effort. But if the four fail to agree upon the impartial arbitrators, the law provides that they are to be named by the government board; but there is no limitation of time as to their selection and appointment. In the present case both parties to the controversy have asked that they be given until the first week in October to prepare their cases, and inasmuch as the hearings must begin within ten days of the appointment of the two impartial arbitrators, the government board will not announce the two names until about September 20, even if the men should be selected before that date.

The Canadian Pacific Telegraph Department

The Canadian Pacific Railway now operates 13,800 miles of telegraph line, 102,600 miles of wire, and 1,400 telegraph offices; and over three-fourths of its wires are used in commercial service. The length of the wires now in use is three times that recorded in the year 1900, and the number of offices is 40 per cent greater than in that year. The number of messages sent in 1913 was about 5,000,000, or three and a half times as many as in 1900. The company operates more than twenty long duplex circuits, including one from New York to Winnipeg. Between Montreal and Bamfield, B. C., which is the terminal of the cable to Australia, the Wheatstone apparatus is used. The Morkrum printing telegraph has been used on this company's lines for two years and four duplex circuits are in operation now.

Apparatus has been ordered for a duplex Morkrum circuit between Montreal and Winnipeg and for another between Winnipeg and Moose Jaw. These two new long circuits will be worked by tape transmission, the speed of which is about 60 per cent greater than can be attained by hand transmission. Telephones are now used by train despatchers on over 6,000 miles of Canadian Pacific lines. Telephone equipments are carried on trains.

Illinois Candidates for Legislature Asked Not to Pledge Support for Anti-Railroad Bills

W. T. Tyler, vice-chairman of a committee of the Illinois railroads, has addressed a circular letter to all candidates for the state legislature, asking them not to pledge their support for anti-railroad bills before their introduction in the assembly. The letter follows:

"As a candidate for the general assembly, you no doubt will be importuned to pledge yourself, if elected, to support certain measures proposed to be introduced at the next session, including bills directed against or ostensibly for the regulation of the railroads. This letter is addressed to you by the railroads of the state of Illinois to ask that you do not bind yourself to support or vote for any bill of this nature until it is regularly introduced in the assembly and you have had an opportunity to inform yourself fully as to its full purport and effect and its need.

"The last session of the general assembly created a Public Utilities Commission with full power to regulate the railroads of Illinois in every particular as to operation, rates of charge, service to the public, etc. It also provided this commission with ample machinery and experts to enable it to correctly determine the necessity for and the best manner of applying regulative measures. Hence, there does not now exist in Illinois a need for direct action by the legislature upon such matters.

"The effect of most legislation affecting railroads, and especially that introduced by the labor organizations, is greatly to increase the cost of operation of the railroads. You will, of course, recognize that this increase in cost of operation must be paid by the consumer; that is, by the citizens of the state, so it is only proper that the Public Utilities Commission charged with the responsibility of securing for the people of Illinois the best service at the minimum of cost, should, after a proper investigation, determine as to the necessity for these items of increase; and, as stated above, this commission is prepared to inform itself fully upon the various matters from every angle and will give full consideration to the interests of the public, the railroads and the employees in its deliberations.

"We believe that it will be repugnant to you to bind yourself to vote for or support a bill upon the full effect of which you have not had an opportunity to inform yourself and which when finally introduced may contain features not fully and fairly represented to you and of immense importance to the public as well as the railroads, and that this in itself will deter you from giving any such pledge; but in the past some candidates have, through misunderstanding or otherwise, inadvertently allowed themselves to be so pledged, to their later embarrassment. Hence the railroads, asking merely for the same consideration accorded to any other citizen of the state of Illinois, ask that you preserve an open mind upon all proposed legislation affecting or regulating them until, if you are elected, the proposed law is placed before you in the regular and proper manner and you are enabled to hear both sides of the issue involved. You will then be free to act as seems to you to be fair and just.

"Won't you do us the courtesy to acknowledge receipt, and if consistent advise if you will grant our request?"

R. S. A. Convention Subjects

Secretary C. C. Rosenberg of the Railway Signal Association has issued the following abstract of the program for the annual meeting of the association, which is to be held at Bluff Point, N. Y., September 22.

Committee I. Signaling Practice.—Reports on aspect for instructions to trains to take siding at a non-interlocked switch; requisites for switch indicators and automatic train control. Also additional data on track circuits and treated ties.

Committee II. Mechanicol Interlocking.—Mechanical derail layouts and switches (8 drawings).

Committee III. Power Interlocking.—Specifications for the installation of a vitrified clay conduit system, including drawings; specifications for incandescent electric lamps; the use of thirty volts or less for the control of interlocking apparatus, conclusions 1 to 8, inclusive. Revised drawing No. 1,309.

Committee IV. Automatic Block.—Specifications for R. S. A. cell caustic soda primary battery and specifications for direct current vibrating highway crossing alarm. Three drawings showing circuits for automatic block systems.

Committee V. Manual Block.—Rules governing signal supervisors and rules governing maintenance of block signals.

Committee VI. Standard Designs, Etc.—Presenting twenty (20) drawings of various apparatus shown in detail and assembly. Also six (6) exhibits as information. Report on signal symbols and nomenclature.

Committee VII. Subjects and Definitions.—Definitions for twelve words.

Committee VIII. Electric Railways and A. C. Signaling.—Specifications for transformer oil; specifications for petrolatum for use in impedance bonds; specifications for a. c. electric generators, and specifications for overhead crossings of electric light and power lines. Also data of systems using a. c. railway signaling submitted as information.

Committee IX. Wires and Cables.—Changes in existing specifications for galvanized steel signal wire. Specifications for galvanized messenger wire, also recommended sags for messenger wire of various sizes and strength; specifications for rubber insulated tape and specifications for friction tape.

Committee X. Storage Battery and Charging Equipment.—Specifications for electrolyte for lead type storage battery; specifications for nickel, iron alkaline storage battery and specifications for concrete storage battery box. Also eight drawings.

Special Committee. Method of Recording Signal Performance.—Five forms for recording interruptions to traffic by signals.

Special Committee. Signaling Requirements of Electric Railways.—Report showing signal aspects and rules for same as

adopted by the American Electric Railway Association; submitted as information.

Special Committee. Lightning Protection.—Specifications and requisites for air gap lightning arresters; specifications and requisites for vacuum gap lightning arresters and specifications and requisites for choke coils for use with lightning arresters.

American Foundrymen's Association and American Institute of Metals

The American Foundrymen's Association and the American Institute of Metals will hold their annual conventions at the LaSalle hotel, Chicago, September 7-11. In connection with these conventions the Foundry & Machine Exhibition Company will conduct its annual exhibit from September 5 to 11, inclusive, at the International Amphitheater located at the Stock Yards in Chicago. This exhibit will include many articles of interest to railroad men. A review of the list of the 164 exhibitors discloses the fact that 50 per cent of them handle railway supplies. About forty of these are prominent builders of modern machine tools that are in every-day use in railway shops. Others represent shop accessories, such as pneumatic tools, grinding machines and abrasives, cranes, hoists and other shop fixtures that are no less important. The oxy-acetylene and electric welding companies will be represented with working demonstrations of their systems as will also the Goldschmidt Thermit Company. Railway men who can take the time to attend this exhibit will find it very well spent.

Master Blacksmiths' Convention

The twenty-second annual convention of the International Railroad Master Blacksmiths' Association was held at the Hotel Wisconsin, Milwaukee, Wis., August 18-20. The meeting was presided over by H. E. Gamble, of the Pennsylvania Railroad, and the convention was welcomed to the city by A. E. Manchester, superintendent of motive power; J. F. De Voy, assistant superintendent of motive power, and J. J. Hennessey, master car builder, of the Chicago, Milwaukee & St. Paul, and by W. W. McLellan. Following is a list of the exhibitors:

Acme Machinery Company, Cleveland, Ohio.—Samples of forgings and model of forging machine. Represented by C. E. Smith, C. W. Durschlag and F. R. Andrews.

Ajax Manufacturing Company, Cleveland, Ohio.—Samples of forgings. Represented by A. L. Guilford, J. A. Murray and Henry Gaul.

Chambersburg Engineering Company, Chambersburg, Pa.—Photographs of power hammers, presses, etc. Represented by H. S. Nixon.

Goldschmidt Thermit Company, New York.—Sample welds. Represented by H. S. Mann and W. A. Aldrich.

Houghon & Co., E. F., Philadelphia, Pa.—Carbonizing compounds, quenching and tempering oils. Represented by F. B. Niesser.

National Machinery Company, Tiffin, Ohio.—Forging, grinding and bolt threading machines.

Convention of United Yardmasters' Association

The first annual convention of the United Yardmasters' Association was held at the New St. Louis Hotel, Duluth, Minn., August 3, 4 and 5. Among the subjects presented for discussion were: Closer Relationship Between Yard Men and Their Superior Officers; Promotion of a Higher Standard of Efficiency in all Departments of Yards and Terminals; Courtesy to Patrons and Fellow Employees; Elimination of the Practice, so Prevalent Among Shippers, of Tipping Switchmen for Services; Concentrated Efforts Against Intemperance, and Promotion of Greater Care in the Handling of Equipment and Shipments, and a More Rigid Inspection of Conditions in Which Loads Arrive and Depart. Through the courtesy of the railroads, special trains carried the members over the terminals of the Northern Pacific and over the Duluth, Missabe & Northern to Virginia, Minn.

This association is composed of yardmasters and assistant yardmasters throughout the country and aims to promote general efficiency in the operation of terminals. The officers for the past year, all of whom were re-elected, were: John Murphy, president; J. J. Meehan, vice-president; D. J. Flynn, treasurer, and W. H. Streeter, secretary. The next convention will be held at Seattle, Wash.

Old Time Telegraphers and Historical Association

Secretary F. J. Scherrer of this association announces that in view of the distressing conditions growing out of the European war, the meeting scheduled to be held in Kansas City, September 15, will not be held. The officers of the Society of the United States Military Telegraph Corps fully concur in the postponement of the reunion. Notice of the time and place for the 1915 reunion will be sent to the members in due course.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

American Association of Demurrage Officers.—A. G. Thomason, Demurrage Commissioner, Boston, Mass. Annual convention in April.

American Association of Dining Car Superintendents.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next convention, October 22-24, Washington, D. C.

American Association of Freight Agents.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 21-24, 1915, Richmond, Va.

American Association of General Passenger and Ticket Agents.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Annual meeting, September 15-16, Boston, Mass.

American Association of Railroad Superintendents.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next convention, August 20-21, New York.

American Electric Railway Association.—E. B. Burritt, 29 W. 39th St., New York. Annual convention, October 12-16, Atlantic City, N. J.

American Electric Railway Manufacturers' Association.—H. G. McConnaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

American Railway Association.—W. F. Allen, 75 Church St., New York. Semi-annual meeting, November 18, Chicago.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 20-22, 1914, Los Angeles, Cal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1915.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga. Annual meeting, July, 1915.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except, June, July and August, 220 W. 57th St., New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

American Society of Mechanical Engineers.—Calvin W Rice, 29 W. 39th St., New York. Annual meeting, Decemher 1-4, 1914, New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Atlanta, Ga.

Association of Manufacturers of Chilled Car Wheels.—George W Lyndon, 1214 McCormick Bldg., Chicago. Annual meeting, second Tuesday in October, New York.

Association of Railway Claim Agents.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, 3rd week in May, 1915, Galveston, Tex.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual convention, October 26-30, 1914, Chicago.

Association of Railway Telegraph Superintendents.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 22-25, Rochester, N. Y.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York. Next meeting, December 8-9, 1914, Richmond, Va.

Bridge and Building Supply Men's Association.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Civil Engineers' Society of St. Paul.—Edw. J. Dugan, P. O. Box 654, St. Paul, Minn.; Regular meetings, 2d Monday, except June, July, August and September, Old State Capitol Bldg., St. Paul.

Engineers' Society of Pennsylvania.—Edw. R. Dasher, Box 75, Harrisburg, Pa. Regular meetings, 1st Friday after 10th of each month, except July and August, 31 So. Front St., Harrisburg, Pa.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

Freight Claim Association.—Warren P. Taylor, R. F. & P., Richmond, Va. Annual meeting, June 16, 1915, Chicago.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

International Railway Congress.—Executive Committee, 11, Rue de Louvain, Brussels, Belgium. Next convention, June 23 to July 6, 1915, Berlin.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 829 W. Broadway, Winona, Minn. Next convention, July 14-17, 1915, Sherman House, Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, Lima, Ohio. Next convention, August 18-20, Hotel Wisconsin, Milwaukee, Wis.

MAINTENANCE OF WAY & MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next convention, November 17-19, 1914, Detroit, Mich.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May, 1915.

MASTER CAR & LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 8-11, Nashville, Tenn.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1915.

NATIONAL RAILWAY APPLIANCES ASSOCIATION.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

RAILROAD MASTER TINNERS, COPPERSMITHS AND PIPEFITTERS' ASSOCIATION.—U. G. Thompson, C. & E. I., Danville, Ill. Annual meeting, May, 1915.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December 10, 1914, Waldorf-Astoria Hotel, New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Annual meeting, October 6, 1914, Washington, D. C.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa. Annual meeting, September 22-24, 1914, Bluff Point, N. Y.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, L. S. & M. S., Box C, Collinwood, Ohio. Annual meeting, May, 1915.

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with M. C. B. and M. M. Associations.

RAILWAY TELEGRAPH & TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Next convention, September 8-10, 1914, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SALT LAKE CITY TRANSPORTATION CLUB.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, C. R. I. & P., La Salle St. Sta., Chicago. Annual meeting, September 15-17, Hotel Aspinwall, Lenox, Mass.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. Ry., Atlanta, Ga.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

TOLEDO TRANSPORTATION CLUB.—J. S. Marks, Agent, Interstate Despatch, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillsburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7122 Stewart Ave., Chicago. Annual meeting, June 15, 1915, Minneapolis, Minn.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Next meeting, September 15-18, Hotel Sherman, Chicago.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Consolidated Music Hall, Salt Lake City.

WESTERN CANADA RAILWAY CLUB.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF JUNE, 1914

Name of road.	Average mileage operated during period.	Operating revenues: Freight.	Operating revenues: Passenger.	Operating revenues: Total, inc. misc. Traffic News

The Oklahoma two-cent fare case will be tried before Federal Judge Youmans, in Oklahoma City, October 21.

The Missouri, Kansas & Texas is running a "good roads special" train over its lines in Texas to arouse interest in the construction of better highways.

The State Railroad Commission of Alabama has ordered sweeping reductions of freight rates on the Central of Georgia, the Western of Alabama, and the Louisville & Nashville.

The Western Classification Committee has announced that hearings will be held at its office in Chicago to consider applications for changes in ratings, rules, etc., on August 24, on nuts and cheese, and on August 25, on junk and fire-fighting apparatus.

The Central Freight Association roads began a meeting in Chicago on Tuesday of this week to prepare tariffs of advanced freight rates as allowed under the commission's recent decision. It is hoped to have the tariffs ready so that they can be made effective October 1.

Export freight is moving from Atlantic ports in small volume, and some increase is expected during the next week. Inquiries for coal are being received from Mediterranean ports. Press despatches from Galveston report that in the four days, August 15-18, large quantities of wheat were shipped from that port—about 1,000,000 bushels.

W. R. Grace & Co. have announced rates on lumber from the Atlantic to the Pacific coast through the Panama canal by the Atlantic & Pacific Steamship Line. The rates are $13 per 1,000 board feet for 30-foot lengths and less, $14 for lengths from 30 to 40 feet, and $17 for lengths from 40 to 50 feet. The $13 rate represents a reduction of $4 from the rate via the Straits of Magellan.

The Senate at Washington on Monday of this week agreed to the House Bill to admit foreign ships to American registry; and this law, facilitating commerce between this country and Europe, was expected to be signed by the President on Wednesday. American vessels will still have the monopoly of coastwise traffic, the new registry privileges applying only for the benefit of overseas trade.

The Southern Railway is to make a month's tour with its "dairy instruction car" over its lines in Virginia, beginning at Charlottesville, August 24. The car will visit 53 towns. The car is fitted out like a complete farm dairy and carries charts and exhibits giving complete information about dairying and its problems. Milk samples will be tested and advice given on all questions of interest to dairymen.

It is reported in Buffalo that while the railroads delivering freight at ports on the Atlantic seaboard in the United States are unable to accept shipments of freight for Europe on account of the unsettled condition of ocean transportation because of the war in Europe, the Canadian Pacific has announced, at its western and southern agencies, that it is prepared to accept all freight for all ports in Great Britain and Ireland.

Representatives of the Texas Railways held a meeting recently in Galveston to discuss plans for obtaining general advances in Texas rates, either by application to the railroad commission or by proceedings in the courts to restrain the operation of rate schedules already fixed by the commission. Commissioner Mayfield, of the commission, has announced that he favors a public hearing to consider a petition from the roads, but he says that the organization of the commission is inadequate for an investigation of such magnitude.

For the benefit of the fruit growers in West Virginia, Virginia and Maryland, the Baltimore & Ohio has issued a booklet containing a list of the orchardmen and commission merchants in the localities mentioned. The lists embody valuable information to both the producers and receivers of fruit. They include a list of brokers and wholesale dealers in the markets of New York, Philadelphia, Baltimore, Washington, Boston, Providence, Springfield, Shelburne Falls and Worcester. In 1912 apples shipped over the Baltimore & Ohio amounted to 1,861 carloads, and there were 221 carloads of peaches.

Charles L. Chandler, South American agent for the Southern Railway, at Chattanooga, tells southern manufacturers and merchants that they should lose no time in taking advantage of the opportunity which the war in Europe has given them for extending their trade with South American countries, particularly with Argentina and Uruguay, on account of the direct steamship service to these countries through the port of Mobile. These countries have been buying largely from Great Britain, Germany and France, but must now find a new source of supply. The recent establishment of an American bank at Buenos Ayres and Rio Janeiro will prove of great advantage. Mr. Chandler is prepared to furnish information of every character in regard to South American markets.

The roads of the Transcontinental Passenger Association have announced the authorization of low fare colonist excursions to the West and Northwest Pacific Coast this fall. Tickets from Chicago one way second class will be sold at $38, and from Missouri river points at $30, with corresponding reductions from St. Louis and other points. These tickets will be on sale daily from September 24 to October 8. This move is contrary to the expressed intention of the roads which voted a year ago not to make the colonist reductions this year. The initiative was taken by one of the larger lines, which insisted that its territory needed the assistance of low rates in securing settlers. A majority of the roads immediately agreed to the plan, but it was decided to limit the sale to two weeks.

A "Corn Show" is the latest novelty adopted by a railroad company to promote business. The Oregon-Washington Railroad & Navigation Company has issued in pamphlet form a premium list for such a show, to be held at Walla Walla, November 25, 26, 27 and 28. Competition is open to everybody in the territory tributary to the company's lines in Oregon, Washington and Idaho. Not much corn (maize) has been raised in those states in the past, and the traffic department of the road is taking measures to encourage its growing. The acreage planted in Oregon and Washington this year is more than double that of last year, and the quality is much better. There will be a large number of prizes, ranging from $50 for the best general display down to $2.50, which is the amount of the smaller prizes for a single acre, and for the best twelve ears of corn. A number of manufacturers have offered prizes of agricultural implements.

The railway members of the Western Trunk Line Committee, the Southwestern Tariff Committee ,and the Trans-Missouri Freight Bureau have prepared tariffs, to become effective on September 15, canceling the allowance for actual weight of dunnage not in excess of 500 lb., used by shippers and furnished at their expense to protect freight in carloads shipped in box, stock or refrigerator cars. This action is in accordance with a recent decision of the Interstate Commerce Commission allowing the cancellation of the dunnage allowance in Southwestern territory. The dunnage allowance was instituted by the Minneapolis, St. Paul & Sault Ste. Marie about two years ago and was adopted by the roads in Western classification territory, but not in the transcontinental tariffs. The commission held that in view of the fact that the substitution of dunnage for the more expensive boxes and crates and other packing material is of advantage to the shipper and reduces the gross weight upon which freight charges must be paid, it is not inconsistent that the carriers should receive revenue for the total weight hauled.

In the Supreme Court of the District of Columbia, on Monday of this week, the American Steel & Wire Company was denied its application for an order directing the Interstate Commerce Commission to make an affirmative order in the industrial railway case. The commission having held that the Newburgh & South Shore Railway, the traffic of which is the subject of this suit, is only a plant facility, the trunk line or long distance railroads on April 1, discontinued dividing through freight rates with it. The Newburgh & South Shore operates 59 miles of freight lines in and around Cleveland, Ohio. During the arguments R. F. Dennison, attorney for the Cleveland City Street Railroad, which also is interested in the suit, said that this is one of the cases in which the commission, by threats of indictments uttered against the trunk lines, is able to accomplish by indirection what the courts will not allow it to accomplish by

direct methods—classification of railroads by ownership. "The fundamental question here involved," declared C. W. Needham, attorney for the commission, "is as to whether the Steel Trust and other big corporations are to be allowed to collect from $25,000,000 to $40,000,000 a year in rebates, under pretense that the tracks which they have built to their plants are common carrier railroads, performing a service of transportation for the public."

The art of packing fruit is the latest subject to be taken up by a traveling instruction car. The "Agricultural Department" of the New York Central road in conjunction with the College of Agriculture of Cornell University is going to start a car on this mission August 21, manned by professors from the college, representatives from the New York State Department of Agriculture, and from the fruit growers' associations, and by Mr. Welsh, agriculturist of the New York Central. The car will be fitted up with exhibits of all kinds relating to the packing and marketing of fruits, and of uniform grading of apples as required under the provisions of the new apple packing law of New York. Demonstrations will be made, at each stop, of the packing of "orchard run" fruit, which will be furnished by local growers. The new law is the outgrowth of efforts of the fruit growing societies of the state, to secure legislation which will result in more uniform packing and a better reputation for quality of New York apples. Lantern slides will be used by the lecturers to show the increasing receipts of different varieties of apples in the New York City market, the preferences of different markets for different varieties, prices of fruit and the effect of cancellations of car orders on the available car supply. The car is going to stop at Marlborough, Ulster Park, Saugerties, Coxsackie, Ravena, Schodack Landing, Stuyvesant, Hudson, Germantown, Poughkeepsie, Spencerport, Brockport, Albion, Medina, Lockport, Fulton, Oswego, Hannibal, Red Creek, Sodus, Williamson, Webster, Hilton, Morton, Lyndonville, Barker, Burt and Ransomville. A period of three hours is allowed at each town.

The Pacific Mail Steamship Company

R. P. Schwerin, vice-president and general manager of the Pacific Mail Steamship Company, in giving testimony this week before the Interstate Commerce Commission, said that the existence of the company depends on the willingness of the commission to grant its application for permission to continue in the eastwise trade to Mexican ports. The Pacific Mail is controlled by the Southern Pacific, which reaches by rail some of the Mexican cities with which the steamship company trades.

The specific point involved in the hearing was Mazatlan. Mr. Schwerin said that he had no fear that the Panama Canal act could be construed to include his company's business with Mexican and Central American points other than those reached by the Southern Pacific's rail lines. But, without the Mazatlan business his company could not engage profitably in the South Coast trade; and the company's Oriental business would become unprofitable if the coasting steamships were discontinued.

The steamship company has paid no dividends since 1898, and he said that its continuance "has been largely sentimental."

The company has seven steamships running to China, Japan and the Philippines and nine between San Francisco and Panama.

Control of Plague at New Orleans

The plague situation in New Orleans is entirely under the control of the Public Health Service of the United States. There are 10 commissioned officers now in the city with 300 employees under their command. All freight passing through and out of New Orleans receives thorough inspection from the officers of the Public Health Service. Every vessel entering and clearing from the port is fumigated with carbon monoxide gas, which effectually destroys all vermin or other animal life without in the slightest degree injuring the most delicate cargo. . . .

Railroad freight leaving the city receives a thorough inspection. As rat fleas are the only carriers of plague, all freight cars are inspected when empty by officers of the Public Health Service, who see that they are clean, free of rats, and rat-proof.

Cars which are not proof against rats are required to be repaired before being loaded. During one week 800 cars were ratproofed and 10 condemned. Approximately, 2,000 cars a week are being inspected. Not only are the cars inspected, but the freight intended for them is also examined, and packages likely to harbor rats are required to be repacked. All cars are loaded under the direct supervision of inspectors of the Public Health Service. Each car so loaded is closed by the inspector, and sealed with a lead seal bearing the Service device. Cars loaded under this inspection are labeled with the inspection number, car number, destination, and the legend, "Inspected and passed as rat free, conditional upon unbroken seal."

Freight passing through the city is handled with the utmost despatch, and there is no need for the diversion of freight intended for any destination other than Costa Rica (which maintains a quarantine).

Several of the railways entering New Orleans have already taken up the question of rat-proofing their storage and freight terminals, in accordance with the plans which are being drawn up by the Public Health Service.—*From a Government Report.*

General Reduction of Freight Rates in North Carolina

The special commission appointed in North Carolina last October to consider a proposed reduction of freight rates in that state has made a report recommending a reduction which on the average amounts to about 18 per cent. The conclusion of the commission is in effect a compromise between the view that present rates are reasonable, and a reduction of about 33 per cent which was made by a law, the "Justice Act," passed by the legislature last year, and subsequently suspended because of the complaints made by the carriers. It is expected that the governor will prescribe the new rates to go into effect October 12; although the railroad companies still have the privilege of protesting. There are few or no reductions on rates for ten miles and less. The provision, heretofore in effect, that the Southern Railway might charge 25 per cent above normal rates on shipments originating in the mountain division, is done away with. Railroads operating less than seventy-five miles of lines in North Carolina are not affected by the present report. The special commission recommends that rates for these shorter roads be fixed by the North Carolina Corporation Commission.

National Industrial Traffic League

The summer meeting of the National Industrial Traffic League was held at the Copley-Plaza hotel, Boston, Mass., on August 12-15. The committee on storage rules reported the success of the negotiations conducted with the American Railway Association and the Interstate Commerce Commission regarding a uniform code of storage rules, which has now been tentatively endorsed by the commission. The committee on weighing also reported the results of similar negotiations which have led to the adoption of a code of weighing rules, with an exception on the part of the league as to the provision for tolerance. The committee also called attention to a new code of rules proposed by the Chicago Coal Dealers' Association which have been submitted to the American Railway Association. The subject of federal supervision over track scales was discussed and the league expressed its tentative disapproval of such supervision.

The proposed elimination of dunnage allowances by the western roads was discussed, but no action was taken, although many of the shippers are opposed to the cancellation on the ground that it will in effect increase freight charges. A report was presented by a special committee on graduated storage charges and demurrage charges and the subject was referred to a joint committee on legislation and storage charges. The committee was opposed to the theory of storage charges graduated to penalize the practice of storing beyond a reasonable time, on the ground that it is the duty of the carriers to store freight. Consideration was also given to a proposition of the American Railway Association for an increased demurrage charge for refrigerator cars when used for perishable freight shipments, the proposed charge being $2 per car per day for the first 48 hours and $3 a day thereafter. The committee on demurrage and storage charges will confer on this with the commission merchants, many of whom are in favor of the plan.

A proposed amendment to the Carmack amendment of the commerce act, which is a part of the administration securities bill, was discussed and opposed on the ground that its prohibition of the limitation of liability by the carriers would nullify present classification provisions relating to the uniform bill of lading, without which rates would be advanced 10 per cent. The legislative committee and the bill of lading committee were instructed to endeavor to postpone any action by Congress on the Carmack amendment at this time.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission on August 19 decided against the railroad commissions of Arkansas, Missouri and Oklahoma in their petition asking for a reduction from the rate of 3 cents a mile on interstate passenger fares through those states. The complainants sought to have the two cent intrastate rate made the basis of interstate charges. The commission held that the defendant railroads did not voluntarily establish and do not voluntarily maintain the intrastate passenger fare of two cents a mile, and that interstate fares at the three-cent rate were not unreasonable. In appealing to the Interstate Commerce Commission the state commissions sought to show that a reduction of the interstate rate would stimulate travel, filing exhibits tending to support the contention that the two-cent intrastate rates had produced increased net revenues for the carriers. The commission thought other conclusions might be drawn from other tables and sustained the three-cent rate. The commission says, however, that the ruling does not mean that "there may not be force in the theory that a reduction of rate tends to increase travel."

Rates on Wheat to Sioux City, Iowa

Sioux City Terminal Elevator Company et al v. Chicago, Milwaukee & St. Paul et al. Opinion by Commissioner Clements:

The commission in this case prescribes local rates on grain from producing stations in South Dakota, Nebraska, Iowa and Minnesota to Sioux City, Iowa. (31 I. C. C., 482.)

Rates on Wrapping Paper to Muskogee

E. C. Adleta, doing business as Adleta Paper Company v. Chicago & North Western et al. Opinion by Commissioner McChord:

The commission finds that rates of 51 and 52 cents per 100 lb., respectively, on wrapping paper to Muskogee from Nekoosa, a representative Wisconsin point and Munising, a representative Michigan point, are unreasonable; and it is ordered that these rates should not exceed 34 cents and 35 cents per 100 lb., respectively. Reparation awarded. (31 I. C. C., 347.)

Rates on Canned Goods to Oklahoma City

Carroll, Brough & Robinson et al v. Atchison, Topeka & Santa Fe et al. Opinion by Commissioner Daniels:

The commission finds that the present rate of 45 cents per 100 lb. in carload lots on canned goods and other similar articles listed under this heading in the western classification No. 51 from Galveston, Houston and other points in south Texas to Oklahoma City and other intermediate points in Oklahoma are unreasonable and discriminatory against Oklahoma City as compared with the rate on the same commodity from Galveston to points in Texas, Arkansas, Kansas and also as compared with rates from other gulf ports and other sources of supply of canned goods to points competing with Oklahoma City. (31 I. C. C., 466.)

Uniform Demurrage Code

Michigan Manufacturers' Association et al v. Pere Marquette et al. Opinion by the commission:

Complainant alleges as unreasonable various provisions of the uniform or national code of demurrage rules, particularly in relation to their application to certain kinds of traffic in Michigan. A request is made that the free time allowed be changed from two days to three days for unloading cars containing coal, coke, charcoal and lumber (except cargo and lightered lumber); to three days for loading or unloading cars of sash, doors, blinds, inside finishing materials, box materials,, and mixed cars of dressed lumber; to three days for loading cars with furniture and to five days for loading, weighing and billing coal at mines in the state. The commission does not feel that these Michigan industries differ so materially from similar industries in other sections as to entitle them to special demurrage rules. In those exceptional cases wherein the exigencies and peculiar nature of the shipper's business are such as to make it more economical to hold cars beyond the free time allowed it is only proper that demurrage for the additional delay should be charged. It would seem that these instances are, with most of the Michigan shippers, sufficiently rare as to permit of such additional charge being offset by credits if the shipper is operating under the average agreement, or to be otherwise taken care of, if not operating under that agreement, by resort to the bunching or weather-interference rules. It adheres to previously expressed views that the existence of merely unique or exceptional transportation conditions in certain localities furnishes no ground for exceptions unless it be made to appear clearly that discrimination would otherwise result against such localities. In this case there would be no such discrimination. (31 I. C. C., 329.)

Rates from Bowling Green, Kentucky

Bowling Green Business Men's Protective Association of Bowling Green, Ky., v. Louisville & Nashville et al. Opinion by Commissioner Meyer:

The commission finds that the construction of through rates from Chicago and Milwaukee territories to Nashville, Tenn., by the addition of proportional rates from points of origin to the Ohio river to the local rates from the river to Nashville contrasted with the construction of rates to Bowling Green by the addition of the local rates to and from the river crossings does not result in discrimination against Bowling Green. A similar manner of constructing through rates from Indianapolis territory to Nashville and Bowling Green is found to discriminate against the latter point and it is ordered that the through charges from Indianapolis territory via Louisville to Bowling Green should not exceed the rates concurrently effective on like traffic to Nashville. (31 I. C. C., 1.)

Through Rates Between Rail and Water Lines

Pacific Navigation Company v. Southern Pacific et al. Opinion by Commissioner Meyer:

Complainant, a common carrier operating the steamers Harvard and Yale (formerly in service between New York and Boston) between San Francisco, San Pedro and San Diego, Cal., asks that the defendant rail carriers be required to establish through routes and joint passenger fares with its steamers to the same extent as at present maintained with the Pacific Coast Steamship Company and the San Francisco and Portland Steamship Company. The commission finds that complainant's request should be granted. In so far as the Western Pacific and the San Pedro, Los Angeles & Salt Lake and their connections are concerned the commission holds that it unquestionably has jurisdiction to require the establishment of through routes with complainant's steamers because the rail carriers have no rail lines between San Francisco and Los Angeles, and the question of short hauling themselves can not be raised. In view of the fact that the Southern Pacific and the Atchison, Topeka & Santa Fe which have rails of their own between San Francisco and Los Angeles have granted through routes in connection with the Pacific Coast Steamship Company and the San Francisco & Portland Steamship Company, it is held that they also may be required to join with complainant in establishing through routes and joint fares. The commission also finds that by maintaining through routes and joint fares with the two steamship companies and refusing to establish them with complainant, defendants are violating section three of the act to regulate commerce. It is also declared that if rail carriers are permitted to choose the particular boat lines with which they will establish through routes and joint rates, they will be able to dictate who shall operate on the water and who shall not, for a boat line which is accorded a monopoly of the through rail-and-water traffic will soon be able to drive its competitor out of business. The spirit of the act to regulate commerce is to maintain the freedom of our ports and to allow boat lines to engage in traffic upon equal terms. To permit the rail carriers serving a port to favor one boat line or another would destroy the freedom of competition between boat lines, which the act is intended to preserve and would practically close ports to all but the favored vessels. (31 I. C. C., 472.)

STATE COMMISSIONS

The Minnesota Railroad & Warehouse Commission has issued an order directing that hereafter the Chicago, St. Paul, Minneapolis & Omaha and the Chicago & North Western, for the purpose of applying rate schedules, shall be considered as separate and independent roads.

The Kansas Public Utilities Commission has issued an order refusing permission to the railroads to apply western freight classification No. 52 on Kansas traffic without approval of the commission. The commission, however, has given its approval, with the exception of 12 classes of items, on which it proposes to have an investigation.

The Texas Railroad Commission has issued an order abolishing the Galveston-Houston differential rates on cotton and cotton linters and establishing in their place commodity rates based on a distance tariff, to become effective on September 10. The commission states that every effort was made to avoid changes in the amounts of the rates.

The Iowa Railroad Commission has filed a petition with the Interstate Commerce Commission asking for a rehearing of the interior Iowa rate case, which was decided recently by the Interstate Commerce Commission. The petition claims that the rates fixed in this case unjustly discriminate against the interior Iowa cities in favor of places along the Mississippi river.

The Public Utilities Commission of Ohio has issued a circular addressed to the railroads and shippers of Ohio entitled, "Keep the Cars Moving," appealing both to the railroads and shippers to make every effort to obtain the maximum efficiency in the use of freight cars to avoid a possible car shortage. The bulletin contains a list of suggestions to the railroads and also suggestions to the shippers of methods for securing maximum efficiency.

The Nebraska State Railway Commission has issued an order, to take effect September 6, providing for a reduction of about 19 per cent in all class freight rates in Nebraska, covering about one-third of the total freight traffic of the state. The reduction is based on a distance tariff with certain modifications. The commission says in its decision that a compilation prepared by its rate expert shows that the reduction on the intrastate traffic will aggregate $611,000 annually. There will also be a substantial reduction on interstate rates, the amount of which is impossible to estimate, but which the commission says will probably amount to $750,000 annually. The commission says that the jobbing points of the state have been placed on an equalized basis, the purpose being to preserve present commercial conditions so far as it is possible to do so without continuing present inequalities or abuses. The commission found the Nebraska merchants opposed to a distance traffic, and is unanimous in its opinion that to establish a rigid maximum and minimum distance tariff would be disastrous to the jobbing and manufacturing interests of the state and that it would reduce competition without benefit to the ultimate consumer.

Colorado Public Utilities Commission

The Colorado State Railroad Commission went out of existence on August 12, and was merged with the new Colorado Public Utilities Commission, which was created by an act of the legislature last year. The new commission has jurisdiction over railroads, express companies, telephone, telegraph, water, lighting, power and street railway companies, and has power to suspend rates in advance of their taking effect, its decisions to be subject to review by the state supreme court. The bill creating the commission was rendered operative recently by District Judge Allen, of the city and county of Denver, through the issuance of an injunction restraining the secretary of state from referring the act to a referendum at the fall election. Two referendums attacking sections of the act will be submitted to the voters under the referendum act, but will not affect it as a whole. The court's decision in effect authorizes the merging of the old commission with the Public Utilities Commission. A. B. Anderson, S. S. Kendall and George T. Bradley, the three railroad commissioners, are to serve in a similar capacity on the new commission. Under the old laws the commission could only act on complaint and could not initiate proceedings on its own motion. The new commission is given power for the immediate enforcement of its decisions until reversed by the supreme court.

PERSONNEL OF COMMISSIONS

Henry L. Oestreich, senior assistant division engineer of the New York Public Service Commission, First district, died August 13, at Atlantic City, N. J., where he had been for eight weeks suffering from septic poisoning. Mr. Oestreich was born in 1869, and was graduated from New York University in 1888. During the construction of the New York subway, 1900-1904, he was in charge as assistant engineer of the section of construction on Lafayette street and Fourth avenue, between Great Jones street and Nineteenth street. Later he had charge of important construction for the Centre street loop.

COURT NEWS

At Fairmount, W. Va., the Baltimore & Ohio has been served with an injunction, under the new prohibition law of West Virginia, restraining the carrier from delivering certain whiskey consigned to A. Bellomo, for 57 other persons; and the company is further restrained from accepting intoxicating liquors for transportation to persons in that state without first ascertaining that the liquors are for the personal use of the consignees.

The New York State Public Service Commission, Second district, has been enjoined temporarily by Judge Ray of the United States District Court, from enforcing its order requiring the Delaware, Lackawanna & Western to restore two trains between Syracuse and Oswego. Judge Ray does not question the jurisdiction of the Public Service Commission to regulate intrastate service on an interstate carrier, but holds that an interstate carrier so regulated may appeal to the federal courts rather than to the courts of the state. But he holds that the present service is sufficient, and the case will have to be tried on its merits in his court. The time for final disposition of the case has not been set.

Decisions of Courts Affecting Labor

The federal bureau of labor statistics has issued its annual bulletin No. 152, containing a selected list of decisions by the federal courts and the higher courts of the various states on labor laws and kindred subjects.

About 170 court decisions are considered. Most notable are the decisions which relate to the new remedy of workmen's compensation for industrial accidents. The constitutionality of the laws of New Jersey and Washington on the subject was sustained by the supreme courts of those states. A provision of the law of Wisconsin which makes it the duty of the employer to provide medical treatment for the injured workmen is the subject of a decision which points out some ways in which abuses may be avoided. This bulletin probably presents the largest number of strictly American cases on this subject that can be found as yet in a single volume.

Many decisions are reported construing the federal statute relating to the liability of interstate railroads for injuries to their employees, the chief point involved being the scope of this law. Among the employees held to be within its provisions are a brakeman getting ice to cool hot boxes on his train, a truckman loading a detached car with interstate freight, a pumpman at a water station, a repair man working on an engine tender on a siding, a member of a switching crew placing an oil car to furnish oil for fuel for an interstate locomotive, a yard clerk taking the numbers of the cars in an interstate train, and a track repairer injured by an intrastate train while at work on a bridge.

There is a report of the contempt case against the leaders of the American Federation of Labor, growing out of the injunction in the Buck Stove and Range Company case. The Supreme Court of the United States in May, 1914, reversed this judgment because of the lapse of time since the acts complained of were committed, but without expressing any opinion as to the merits of the case. A law of Illinois forbidding the use of emery wheels, etc., for polishing processes in basements, without reference to the actual conditions as to ventilation, and one of Louisiana limiting the hours of labor of certain classes of stationary engineers were held to attempt unjustifiable discriminations.

Railway Officers

Executive, Financial, Legal and Accounting

Duval West, of San Antonio, Tex., has been appointed receiver of the San Antonio, Uvalde & Gulf.

E. T. Lamb, receiver and general manager of the Atlanta, Birmingham & Atlantic Railroad, with headquarters at Atlanta, Ga., has been elected president of its successor the Atlanta, Birmingham & Atlantic Railway. Brooks Morgan, of Atlanta, has been elected vice-president, and F. K. Mays, treasurer and purchasing agent, has been appointed secretary and treasurer.

Operating

P. H. Mattimoe has been appointed superintendent of weighing, inspection and handling freight of the Wabash, with headquarters at St. Louis, Mo.

J. L. Terry, general superintendent and auditor of the Denver, Laramie & Northwestern, has been appointed general manager, with headquarters at Denver, Colo.

James B. King has been appointed trainmaster of the Taylor subdivision of the International & Great Northern and J. A Caldwell has been appointed trainmaster of the Gulf division.

David Crombie, who has been appointed superintendent of transportation of the Canadian Northern, Eastern lines, with headquarters at Toronto, Ont., as has been announced in these columns, was born in 1864, at Hamilton, Ont., and was educated in the public schools. He began railway work in, 1882 with the Grand Trunk, and previous to 1890 was operator, agent, and train despatcher on that road. He then served as train despatcher and car service agent on the Flint & Pere Marquette at Saginaw, Mich., until 1900, when he became superintendent of transportation at Detroit of its successor the Pere Marquette. From 1903, to 1907, he was out of railway service, and in the latter year went to the Grand Trunk as master of transportation. Three years later he was appointed assistant to general transportation manager, and in 1912, was made assistant to vice-president, remaining in that position until January, 1913, when he was made general superintendent of transportation of the same road. In August of the same year he returned to the service of the Pere Marquette as inspector of transportation at Detroit, and in May, 1914, was appointed inspector of transportation of the Canadian Northern, which position he held at the time of his recent appointment as superintendent of transportation of the same road as above noted.

D. Crombie

The jurisdiction of C. W. Coe, superintendent of the Toledo division of the Wheeling & Lake Erie, at Brewster, Ohio, has been extended over the Cleveland division. F. B. Barber, who has been superintendent of the Cleveland division, has been appointed assistant superintendent of the Cleveland and Toledo divisions with headquarters at Brewster. D. J. Morris, assistant superintendent, has been appointed assistant superintendent of transportation at Brewster.

H. H. Maher has been appointed trainmaster of the Lake Superior division, including the Duluth-Superior terminals, of the Northern Pacific, with headquarters at Duluth, Minn. R. T. Taylor has been appointed trainmaster of the First, Second, Fifth, Tenth and Eleventh subdivisions, Lake Superior division, with office at Duluth, in place of L. F. Newton, transferred to Mandan, N. D., as trainmaster. A. M. Deverell has been appointed chief despatcher and division operator of the Minnesota division in place of W. G. Howland, transferred.

Arthur John Hills, whose appointment as general superintendent of the Ontario Grand division of the Canadian Northern, Eastern lines, with headquarters at Toronto, Ont., has already been announced in these columns, was born on February 15, 1879, at Toronto. He was graduated from Ridley College at St. Catherines in 1893; from Upper Canada College, at Toronto in 1896, and from the University of Toronto in 1899. In April of the latter year, he entered the service of the Canadian Northern, as stores and material agent of the construction department in Manitoba. From June, 1901, to December, 1903, he was a clerk in the general superintendent's office at Winnipeg, Man., and then went to the third vice-president's office of the same road at Toronto. He was appointed superintendent of the Canadian Northern Ontario in January, 1908, with headquarters at Toronto, which position he held at the time of his recent appointment as general superintendent of the Canadian Northern as above noted.

Traffic

B. D. Shropshire has been appointed commercial agent of the Rock Island Lines at Ft. Worth, Tex., to succeed I. G. Thompson, resigned.

The headquarters of D. L. Rupert, division freight agent of the Detroit, Toledo & Ironton, have been removed from Ironton, Ohio, to Lima.

W. A. Dolan having resigned as general New England agent of the Chicago Great Western at Boston, Mass., that office is abolished, and C. L. Smith is appointed general agent freight department at that place.

Engineering and Rolling Stock

Paul A. G. Tilmot has been appointed assistant roadmaster of the Northern Pacific at Tacoma, Wash.

F. D. Nauman has been appointed division engineer on the Chicago division of the Baltimore & Ohio, with headquarters at Garrett, Ind., succeeding John Tordella, promoted.

H. F. Staley, master mechanic of the Carolina, Clinchfield & Ohio at Erwin, Tenn., having resigned, G. F. Shull has been appointed acting master mechanic, and W. S. Moseley has been appointed mechanical engineer, both will have their headquarters at Erwin.

Purchasing

The office of purchasing agent of the Southern Pacific at Portland, Ore., held by A. E. Hutchinson, has been abolished.

OBITUARY

Major Joseph G. Pangborn, formerly assistant general passenger agent of the Baltimore & Ohio, at Baltimore, Md., died in that city on August 15, of heart disease. He was born at Albany, N. Y., on April 9, 1845, and began railway work in December, 1876. He was general advertising agent of the Atchison, Topeka & Santa Fe previous to 1878, and then for two years was confidential clerk to the general manager of the same road. From May, 1880, for one year he was chief clerk in the advertising department of the Baltimore & Ohio, and has been in the continuous service of that road ever since. In May, 1881, he was appointed assistant to the general passenger agent; one year later he was promoted to assistant general passenger agent. At the time of his death he was a member of the Safety Committee. At the time of the Chicago fair in 1893, he was chairman of the World's Transportation Commission, endowed by the late Marshall Field to study transportation history. In connection with this work he went to Europe, Asia and Africa to gather data for a history of transportation from the earliest times, and some of the results of his researches were embodied in a book entitled "The World's Railway."

Equipment and Supplies

LOCOMOTIVE BUILDING

The Atlanta & West Point is in the market for one locomotive.

The Stewart Sugar Company, Stewart, Cuba, has ordered one Mogul type locomotive from the Baldwin Locomotive Works.

The Cincinnati, Hamilton & Dayton has ordered 30 Mikado and 5 Pacific type locomotives from the Lima Locomotive Corporation.

The Cleveland, Cincinnati, Chicago & St. Louis reported in the *Railway Age Gazette* of August 14 as being in the market for a number of switching locomotives, is in the market for 11 locomotives of that type.

The San Diego & Arizona has ordered one Consolidation freight locomotive from the American Locomotive Company. This locomotive will have 22 by 30 in. cylinders, 57 in. driving wheels, a total weight in working order of 212,000 lb., and a steam pressure of 200 lb. This is in addition to a similar order reported in the *Railway Age Gazette* of August 7.

CAR BUILDING

The Chesapeake & Ohio is in the market for 350 freight cars.

The Lehigh & Hudson is in the market for twenty 50-ton ore cars.

The Southern Pacific has again opened negotiations and is now inquiring for 2,600 box cars.

IRON AND STEEL

The Chicago & Illinois Western has ordered 238 tons of steel consisting of girders, I-beams and columns from the Chicago Bridge & Iron Company, Chicago.

The Chicago, Milwaukee & St. Paul has ordered 128 tons of material for a subway at Winnebago avenue, Chicago, from the Wisconsin Bridge & Iron Company, Chicago.

Roumanian Railway Extensions.—The Roumanian Legislative Assembly recently unanimously voted a credit of about $100,000,000 intended for the development of the railways of the country. Among the most interesting of the new lines proposed is the construction of a line to connect Bucharest directly with Belgrade.

Falling off in Argentine Railway Receipts.—The most important Argentine railways render accounts for the fiscal year from July 1 to June 30. With the exception of three companies gross receipts for 1913-14 show an important falling off as compared with those of the preceding year. This is attributed in the first place to disastrous droughts, which resulted in greatly diminished wheat and linseed crops, and in the second place to the general business depression. The Buenos Aires Great Southern shows a falling off in gross receipts from $31,334,970 in 1912-13 to $26,084,440 in 1913-14. Decrease in gross receipts in 1913-14, as compared with 1912-13, was as follows on the different lines: Buenos Aires Great Southern, $5,250,530; Buenos Aires & Pacific, $3,372,484; Buenos Aires Western, $2,082,862; Central Argentine, $2,068,112; Midland, $104,138; Northeastern Argentine, $95,432; Rosario to Puerto Belgrano, $142,029; Provincial of Santa Fe, $550,706; Compañia General de Buenos Aires, $1,034,451. Gross receipts of three railways showed the following gains in 1913-14 as compared with 1912-13: Entre Rios Railway, $65,698; Central Cordoba, $344,553; Buenos Aires Central, $106,537. The government railways, which render accounts for the calendar year, show the following falling off in gross receipts for the first six months of 1914 as compared with corresponding period of 1913: Central Northern & Chaco branches, $536,009; Northern Argentine, $138,834; Northern Argentine (Cordoba division) and Northwestern, $7,953.

Supply Trade News

The patent granted William R. McKeen covering all-steel box cars, as mentioned in the July 10 issue, on page 80, should have been numbered 1,107,086, instead of the number mentioned, which was the serial number.

George Blackmore, eastern sales manager of the Union Switch & Signal Company, has been elected vice-president and director of the Bryant Zinc Company, Chicago, with headquarters at New York, effective September 1.

Edmund Quincy, Lehigh 1913, for the past year with the Pennsylvania Steel Company, Steelton, Pa., will become connected with the engineering department of the Q & C Company, New York, effective September 1.

Willard Doud, formerly shop engineer of the Illinois Central and Chicago, Burlington & Quincy, having completed the special engineering work involved in the construction of the new shops for the Belt Railway of Chicago, at Chicago, announces the opening of offices in the Morton building, 538 South Dearborn street, Chicago, for the handling of all matters pertaining to the design, construction, equipment and operation of railroad and industrial shops and power plants.

There have recently been put in service three Waddell & Harrington type vertical lift bridges, with unusually long spans. Of these, the one over the Missouri river at Mondak, Mont., for the Great Northern is 296 ft. long, the longest of this type ever built. The second longest is the one over the south branch of the Chicago river in Chicago, for the Pennsylvania, which is 272 ft. 10 in. long. The third bridge, which measures 271 ft. from center to center of pins, is over the Yellowstone river on the Great Northern.

Thomas A. Griffin, chairman of the board of directors of the Griffin Wheel Company, Chicago, died on the steamship Korea on the way from Yokohama to Honolulu on August 12. Mr. Griffin was born August 28, 1852, at Rochester, N. Y. His first business experience was as an apprentice at Rochester, and since 1868 he had been continuously in the car wheel manufacturing business. In 1875 he went to Detroit and operated for the Michigan Car Company its plant known as the Detroit Car Wheel Company. In 1879 the Griffin Car Wheel Company of Detroit was organized, and the following year Mr. Griffin went to Chicago, where he organized the Griffin & Wells Foundry Company, which was merged into the Griffin Wheel & Foundry Company in 1886. Mr. Griffin at this time acquired all of the interest in the Griffin Car Wheel Company at Detroit, and subsequently the name of this company was changed to the Griffin Wheel Company. Besides having five foundries in Chicago the company operates foundries in Boston, St. Paul, Detroit, Kansas City, Denver, Tacoma and Los Angeles.

T. A. Griffin

TRADE PUBLICATIONS

Bridge and Pier Lamps.—Bulletin No. 16 of the Armspear Manufacturing Company, New York, contains eight pages devoted to illustrations of its spheroidal lens bridge and pier lamps. These lamps are built to conform to the latest specifications of the Bureau of Lighthouses.

Railway Construction

Atlantic, Waycross & Northern.—Grading work is now under way, it is said, on an extension from Kingsland, Ga., west to Folkston, 22 miles. The company now operates 11 miles of railroad from St. Mary's west to Kingsland. (February 20, p. 407.)

Birmingham, Selma & Mobile.—An officer writes that as soon as bonds are sold contracts will be let to build a line connecting Blockton, Ala., Marion and Selma, to have a total length of 67 miles. Track has been laid on 12 miles. The maximum grades will be 1.5 per cent, and maximum curvature 4 deg. There will be one 200-ft. steel bridge and 38 trestles. The company expects to develop a traffic in lumber, logs, cotton, grain, fertilizer, cattle and coal. J. F. Johnston, president, Brent, Ala.

Carthage & Copenhagen.—Plans are being made, it is said, to build the extension projected in 1912 from Copenhagen, N. Y., south to a connection with the Lehigh Valley at Camden, about 35 miles. The company now operates 9 miles of railroad from Carthage southwest to Copenhagen.

Chattahooche Valley.—This company, which now operates a 34-mile line from Standing Rock, Ala., south via West Point, Ga., to Jester, Ala., is making surveys, it is said, to build a 15-mile extension. The projected route is from McCulloh to a connection with an existing line to Columbus.

Cincinnati, New Orleans & Texas Pacific.—An officer writes that a contract has been given to Dunn & McCarthy, Chicago, for building 8.9 miles of second track between tunnel 15, just south of New River, Tenn., and tunnel 16, just north of Sunbright. The work will consist of the construction of parallel track on present grade.

Dominion Atlantic.—Work is now under way on the North Mountain branch from Centerville, N. S., on the Cornwallis Valley branch, to Weston 14.79 miles. It is expected that the branch will be opened for operation in 1915. A contract to build the line was given last year to Kirk & Cooke, North Sidney. (December 12, p. 1147.)

Hamlin & Guyandotte.—This company has been incorporated in West Virginia with $50,000 capital and office at Hamlin. The plans call for building from a point at or near Hamlin to a point on the Guyandotte river near West Hamlin, in Lincoln county. The incorporators include L. R. Sweetland, J. S. Pridemore, L. M. Thacker and A. F. Morris of Hamlin. J. W. Dingess, of Huntington, and George E. McComas of Milton.

Illinois Central.—This company has awarded a contract for the extension of its freight yards at Fulton, Ky., to H. W. Nelson, Fulton, Ky. The improvement consists of the extension of the old tracks a distance sufficient to accommodate 80 additional cars and the building of a few new tracks. This will require grading to an extent of 80,000 to 90,000 cu. yd. The estimated cost is $75,000.

Kansas City, Kaw Valley & Western (Electric).—This company will start work soon, it is said, on the extension from Bonner Springs, Kan., west to Lawrence. The company started work in 1913, on a line from Kansas City west via Bonner Springs to Lawrence, about 40 miles, and in June of this year opened for operation the first section from Kansas City to Bonner Springs, 17 miles.

Missouri, Arkansas & Southwestern.—Under this name, a line is to be built, it is said, from Mena, Ark., east to Hot Springs, about 80 miles. The Century Construction Company is the contractor and promoter. G. D. Thayer is president of the construction company and general manager of the railway company. B. W. Bartholomew is chief engineer, Mena.

Monongahela Southern Traction.—Incorporated in Pennsylvania with a $108,000 capital to build from California, Pa., south to Brownsville, about five miles. C. L. Snowden, president, Brownsville; J. P. McKelvey, Pittsburgh; C. H. Story and F. B. Snowden, Brownsville, and L. V. Phillips, Uniontown, are directors.

New York Subways.—The New York Public Service Commission, First district, has executed a contract with the Rapid Transit Subway Construction Company for the construction of section 1-A, of Routes Nos. 4 and 38, the Seventh avenue subway in the borough of Manhattan. This section covers the connection between the new Seventh avenue subway and the existing subway at the Battery. The contract price is $474,244. The commission also, executed a contract with the Station Construction Company, Inc., for station finish on certain stations on the extension of the Fourth avenue subway from Forty-third to Eighty-sixth streets, borough of Brooklyn. The contract price is $251,134.

Northern Pacific.—This company has awarded to the Cook Construction Company a contract for grading a branch line from Beach, N. D., southerly a distance of 26 miles.

Reading, Birdsboro & Pottstown (Electric).—An officer writes that this company expects to let contracts in about 60 days to build from Reading, Pa., southeast via Birdsboro, Berks county, to Pottstown, about 25 miles. W. Abbott Whitman, Sr., president. A. H. Leader, engineer, Reading. (May 22, p. 1171.)

Seattle, Port Angeles & Lake Crescent.—We are told that the Erickson Construction Company, Seattle, Wash., is now at work building about 27 miles west of Port Angeles and 37 miles east, connecting at Fairmount, Wash., with the Port Townsend & Puget Sound. The company will not build a street car line at Port Townsend, nor any extension along Hood canal to Olympia. It is expected that the line will be completed this year between Port Townsend and Port Angeles, 50 miles. It will probably be eventually extended further west into the heavy timber section of Clallam and Jefferson counties. C. J. Erickson, president, Seattle. (July 24, p. 190.)

Shelby Northern.—This company expects to begin work in October, it is said, on a line from Shelby, N. C., north to Casar, about 20 miles. C. R. Poole, Rockingham, N. C., may be addressed.

South Carolina Roads.—We are told that a preliminary survey has been made and most of the right of way has been secured for an 18-mile line to be built from a connection with the Carolina, Atlantic & Western at Hartsville, S. C., northeast to a connection with the Atlantic Coast Line at Society Hill. The promoters are not ready to let contracts for the construction work, as a charter has not yet been secured. Steam is to be used as the motive power for freight service and the question of using both gasolene and electric storage battery cars for passenger traffic, is under consideration. The principal commodities to be carried include fertilizer, cotton, cotton seed, tobacco, grain, fruit, agricultural products and coal. C. D. O'Neal, Wilmington, N. C., may be addressed.

Southern Railway.—An officer writes that a contract has been given to W. W. Boxley & Co., Roanoke, Va., for building seven miles of second track on the Washington division between Charlottesville, Va., and Arrow Head. The work involves a slight revision of grade.

Texas Roads.—M. J. Healey, Big Springs, Tex., and associates, who are promoting the construction of a railroad from Big Springs, Tex., northwest to Texico, N. Mex., about 175 miles, expect to place surveyors in the field to locate the route about September 1. Land and money bonuses in aid of the project have been raised in the different towns along the route. Residents of Big Springs have agreed to contribute $30,000 and 25 acres of land in return for which the general offices and shops are to be located at that place. The line will connect with the Texas & Pacific at Big Springs, and with the Santa Fe at Lamesa and at Texico.

Toledo, Ottawa Beach & Northern (Electric).—An officer writes that this company now operates a line from Toledo, Ohio, north to Toledo Beach, Mich., which is six miles south of Monroe. The company has been considering for some time the question of building an extension of about three miles from Toledo Beach north along the shore of Lake Erie, but will not extend the line to Monroe, as has been reported.

Wilmington & Carolina Beach (Electric).—Under this name a line is to be built, it is said, from Wilmington, N. C., via Sunset Park to Wilmington Beach, about 13 miles. In addition the company plans to build about 11 miles of city lines, and a power house. C. C. Chadbourn is president.

RAILWAY STRUCTURES

Birmingham, Ala.—A contract has been given to the Jefferson Construction Company, New Orleans, La., it is said, to build the viaduct over the tracks of the Louisville & Nashville and the Southern Railway on First avenue, in Birmingham. (May 8, p. 1055.)

Colmar, Pa.—The Philadelphia & Reading has applied to the Pennsylvania State Water Supply Commission for permission to build a bridge at Colmar.

Covallen, Pa.—The Pennsylvania Railroad has applied to the Pennsylvania State Water Supply Commission for permission to build a bridge at Covallen.

Elizabethtown, Pa.—An officer of the Pennsylvania Railroad writes that a contract was given recently to the Pitzel Construction Company, Lancaster, Pa., for improvements at Elizabethtown to cost about $54,000. The work includes the changing and building of the freight station and making other improvements. A new passenger station 27 ft. by 75 ft. of stone construction will be built on the north side of the track, about one-quarter mile east of where the present station is located. The main waiting room will be down on the street level and there will be baggageways leading up to the passenger tunnel underneath the tracks. All platforms will be of cement and there will be two enclosed shelter sheds of stone construction 64 ft. long.

Halifax, N. S.—On the Dominion Atlantic, which is controlled by the Canadian Pacific, improvements are being carried out in connection with the laying of larger rails, which include the substitution of concrete steel structures for all bridges and culverts. The new Bear river bridge over 1,425 ft. long is about completed. Work has recently been started on the Avon bridge at Windsor, to be 1,110 ft. long, and the Weymouth bridge over the Sissiboo river to be 1,100 ft. long. New bridges have been built also on the Midland division across the Shubenacadie river at Cambridge, at Moose river and at Allen's creek, and one is under construction at Gaspereau. Trestles have been filled in and sidings lengthened at various points, and new stations were built at Wolfville, at Patterson and at Mosherville.

Milwaukee Wis.—The Chicago & North Western has awarded a contract for a bridge on its main line over the Milwaukee river near Milwaukee, to the Cleary-White Construction Company, Chicago. This company has let a sub-contract for driving piles to Pellett & McMullen, Manitowoc, Wis.

Pennsylvania.—The Pennsylvania State Water Supply Commission has approved the applications of the following railroad companies to build bridges; Chartiers Southern, six bridges, over Little Chartiers creek and Daniel's run in Washington county; Pittsburgh, Chartiers & Youghiogheny, five bridges, in Washington county, and Pennsylvania Railroad, two bridges, in Crawford county.

Scranton, Pa.—An ordinance has been passed by the city of Scranton, it is said, granting permission to the Delaware, Lackawanna & Western to carry out improvements, including the elimination of grade crossings at McHale's court, West Scranton and at Court street, North Scranton. It is understood that the company will at once carry out this work, also the elimination of the grade crossing at Myrtle street. In addition plans have been made to eliminate the grade crossing at Theodore street, North Scranton.

The Street Car Lines of the Argentine Republic.—There were 666 miles of electric tramways in Argentina in 1913, 476 of which were located in the city of Buenos Aires, and the remainder in various provincial cities. Passengers carried by the Buenos Aires lines in 1913 numbered 423,661,587, an increase in round numbers of 31,000,000 over 1912.

Railway Financial News

Atlanta, Birmingham & Atlantic Railway Company.—This is the name of the new company organized as successor to the Atlanta, Birmingham & Atlantic Railroad Company; and at a meeting of the directors in Atlanta, August 15, E. T. Lamb, receiver in charge of the property and general manager for the past year, was chosen president of the new corporation. Brooks Morgan, of Atlanta, was chosen vice-president. All of the officers of the operating, traffic and accounting departments were continued in their present places. F. K. Mays is both secretary and treasurer. The court is expected to terminate the receivership within a few days. Application for the approval of bonds to be issued by the new company is now pending before the Georgia State Railroad Commission.

Canadian Pacific.—A special meeting of the stockholders is called for October 7, the day of the regular annual meeting, to vote on a proposal to increase the capital stock of the company by the sum of $75,000,000. This will increase the outstanding amount from $260,000,000 to $335,000,000, or the full amount authorized. In a statement dealing with the company's financial position President Shaughnessy says that no new works of any magnitude are contemplated at present, and therefore no necessity exists for a further issue of capital stock, but that this proposal is to provide for the company's future capital requirements as they arise. The last financing of the company was in December, when $52,000,000 of 6 per cent notes were issued.

New York, New Haven & Hartford.—The suit of certain stockholders entered in the Massachusetts Supreme Court July 17, demanding that the company, and the men who were its directors from 1904 to 1911, refund sums alleged to have been wasted by mismanagement, came up before Justice Braley at Boston, August 18, and an injunction was issued restraining the directors named in the suit from transferring stock of the company held by them pending a decision by the full bench of the court, which has under consideration the application for the appointment of a receiver in this suit.

Pere Marquette.—The committee formed last April to protect holders of equipment obligations has agreed with the receivers, to deposit $57,833 on the first of each month during the current fiscal year for payment of principal and interest on equipment obligations. In addition to these contributions by the committee the receivers purpose to apply $65,000 a month to the repair of cars. J. P. Morgan & Co. and the Guaranty Trust Company have acquired approximately $1,700,000 of the equipment obligations, and, under arrangements with the receivers, have taken a like amount of receivers' certificates in exchange.

San Antonio, Uvalde & Gulf.—On application of a majority of the stockholders of this company the United States District Court for the district of Texas, on August 12, appointed Duval West, of San Antonio, receiver for the property of the company and also for the Medina Irrigation Company. This railroad extends from San Antonio, Tex., southeastward to Corpus Christi, and westward to Uvalde and Crystal City. The total length of lines operated is 314 miles. The amount of stock outstanding is $230,000; and the bonds amount to $3,663,000. The Bankers' Trust Company of St. Louis is the trustee. The president and general manager of the road is A. R. Ponder, San Antonio.

Railway Extension in India.—The government of India has given its consent to the construction, by the Mysore Durbar, of a line of meter gage railway from Mysore to Arsikere via Hassan, a distance of 107 miles.

New Chinese Railways Contract.—At Peking, on July 26, a representative of an English firm signed the final contract to finance and construct a railway from a point opposite Shasi in the Yangtze Valley to Shiung-yi-fu in Kwei-Chou, with a branch line from Cheng-te-fu to Changsha, the capital of Hunan.

The Contest on the Operation of Terminal Yards

The superintendent, trainmaster, or yardmaster in charge of the operation of a terminal yard performs a double duty. His first responsibility is to secure the efficient and economical operation of his yard. Hardly secondary in importance is the providing of proper service for the various industries and team tracks. He must not only operate the yard economically for the company, but he must also give the patrons the proper service, for the influence of the yard crew in securing and holding traffic is not always realized by railway men. These are but two of the numerous phases of terminal operation whose consideration is included in the contest on "The Operation of Terminal Yards," which we are now conducting. In order that this discussion may be of the greatest practical value to those engaged in this phase of railway operation, we urge all who are now, or who have been, in charge of the operation of terminal yards, to prepare discussions on this subject. Several excellent papers already have been received. We will pay $50 and $35 for the two best papers received, and our regular space rates for all other papers accepted and published. The awards will be based on the practicability of the methods suggested and the completeness with which the subject is covered. All contributions should be sent to the editor of the *Railway Age Gazette*, 608 South Dearborn street, Chicago, and must be received not later than September 15, to be considered by the judges.

Superintendents Getting Together

The American Association of Railroad Superintendents, whose meeting is reported in this issue, shows an encouraging increase in members and has received a lot of expressions of friendly interest from general managers; but still the association as a whole has not yet found its gait. A gathering like that of last week is profitable to every member who participates in it with serious purpose, and even the informal conferences, outside the meeting room, afford, for many members, a sufficient recompense for the time spent; but to give the association the dignity it deserves, and to avoid letting it fall into the class of mere social gatherings, like the Old Time Telegraphers', a lot of members have got to do some vigorous work in committees. The committee men now in office have done much good work, but evidently they have not felt warranted in giving to their tasks the time necessary to formulate conclusions of the kind which will make an impression on the American Railway Association. The need of an association of superintendents is very definite. The only body which deals with their problems is the American Railway Association, which does very little discussing in open meeting—and even that discussing is not made public until several months afterward. The really important discussions all take place in committee rooms; and that, for many subjects, is not the most profitable way. It is to be hoped that those 41 general managers who have given the superintendents a few pleasant words, will follow up their letters with a substantial "boost." Messrs. Taylor and Underwood have made a good beginning.

The Death of Darius Miller

People sometimes say that no man is indispensable. And it is true enough that after the deaths even of men who have played the largest parts in political and business affairs the world seems to go on much as before. But every once in a while some strong man who is in his very prime and appears to have years of usefulness before him is suddenly stricken down, and then there is a feeling that while he was not exactly indispensable, nevertheless the world has suffered a heavy loss because he was not allowed to live out what, it seems, should have been his allotted years of achievement. The death of Darius Miller is one which causes feelings and reflections of this kind. Urbane, tactful, optimistic, sagacious, an indefatigable worker, an able administrator, at the head of one of the greatest railroad systems in the world where he had an almost unsurpassed opportunity to do creative work for the owners of the property and for the public, it seems sad beyond expression that he should have been cut off at only 55 years old when he was in the very middle period of his prime. Doubtless in the world's hard economy no one is exactly indispensable. But when such men as Darius Miller

go they are long and greatly missed in important places. A certain man, on being introduced to James J. Hill, remarked that he knew Mr. Miller. "Then you know a very great railroad man," Mr. Hill immediately responded. Mr. Hill properly appraised Mr. Miller's remarkable qualities somewhat earlier than others, but every man competent to have an opinion would now accept Mr. Hill's judgment. Mr. Miller was more than a great railroad man. He was a great citizen. He was a great citizen both because of his civic activities and because every man who does creative work in industry or commerce such as he did is a great citizen of his own country and of the world. How unfortunate it is that so many able men devote their lives to promoting the welfare of their country by building up its commerce and industries as Darius Miller did, and receive very little credit or thanks for it from the public, while this same foolish public is bestowing lavish credit and thanks on men whose only public service consists in frequently standing up in their places and talking for two hours without stopping to think. While Mr. Miller will be long remembered as a great railroad man, he will be even longer remembered by those who frequently came in contact with him as one of the truest, finest and most lovable gentlemen that ever lived. Without ostentation or condescension he was the soul of kindness, consideration and politeness to every one, high or low, and whether in business or in social life. The railroad world and the business world of America have suffered a heavy loss.

A FRANK EXPRESSION OF PUBLIC SENTIMENT

THE indifference of the public to the perplexities which policemen, constables and magistrates encounter in dealing with the tramp problem is well known. The average citizen takes so little thought about the possibility of inconvenience or danger to himself by reason of the railroad tramp, and what it might mean, that his representative in the legislature usually takes no thought at all. Public sentiment is so little likely to produce any form of action that the narrow or indolent legislator can safely devote his time and energies to some pleasanter form of activity. But indifference does now and then give way to something positive. There is a reason why there is such general acquiescence in the policy of silence and neglect. The "pocket nerve" is affected. This nerve is always affected when it comes to breaking up a widespread abuse.

Every thoughtful and public spirited citizen should be interested in the following very frank reportorial expression in the Utica (N. Y.) Press:

> Rome, August 16.—Railroad detectives on Saturday arrested 17 tramps, whom they took off trains in Verona and took them to Higginsville before Justice of the Peace Smith E. Schwody, who sentenced them all to 15 days each in the county jail in this city. It will cost the county about $300. The people of Verona should remember this justice when he comes up for office again.
>
> There are now 58 prisoners in the Rome jail. Railroad detectives must stand in with the Prison Commission, who demanded a larger jail for the county. What good does this do? As soon as these tramps are released they will jump the first train out of the city and no one will be benefited. Had they been left alone they would have gone out of the county and no expense would have been imposed on the county of Oneida.

Here is very definite evidence of public sentiment in favor of lawlessness because it costs too much money to enforce the laws. Such sentiment is very common, though it is not often so plainly expressed. Railroad officers have made some little effort to stiffen magistrates' backbones, here and there, but it is evident that such missionary work must continue to encounter the deadening influence of this local short-sightedness.

It is plainly evident that the way to deal with the tramp problem on railroads, whether in the state of New York or in any state, is to consider it as one state-wide problem. The towns and cities are always jealous of each other and usually are actuated by the narrowest views.

The right of local self government is a vital feature of our republican constitution; but it is subject to regulation and limitation by the sovereign state; and there does not seem to be any way in which this regulation can be applied to the tramp problem except through the means of a radical legislative act. Local police departments and local magistrates need to be freed from every influence tending to weaken their respect for a rigid law. The law for repression of tramps should bear with strong and equal force in every part of the state, every day in the year. There seems to be no hope of this except through direct state administration.

SAVINGS UNDER GOVERNMENT OWNERSHIP

WE publish on another page a letter written recently by Sir George Paish, editor of the London Statist, to E. P. Ripley, containing an estimate of the saving in the annual cost of railway capital which could be made in this country under government ownership. In view of several estimates relating to the same subject matter which recently have been made in this country, that of Sir George is highly interesting, for he is one of the leading authorities on financial subjects in the world. For years his paper has specialized on American railway affairs, and its American railroad sections, which have been regularly republished in book form, have been mines of authoritative information regarding the operating and financial results of our roads. Being an Englishman, Sir George can participate in discussions of our railway questions without heat, prejudice or partisanship.

One of the most notorious estimates of the saving which under government ownership could be made in the cost of railway capital was that presented by Clifford Thorne to different organizations and persons, and which varied from $411,000,000 to $464,000,000, according to the size of the mistakes which Thorne made in his figures. In an address last February C. A. Prouty, director of valuation of the Interstate Commerce Commission, roughly estimated that the railways would cost the government $20,000,000,000; that the interest rate that would have to be paid on this debt would be 3 per cent; that, therefore, the total interest of the government would be $600,000,000 per annum, which would be some $72,000,000 less than the interest and dividends paid by the railways. In his recent book on Government Ownership of Railways, Samuel O. Dunn, after making estimates of the total amount that the government would have to pay for the railways, and the rate of interest it would have to pay on the railway debt, concluded that the government's maximum possible saving in cost of capital would be $120,000,000 a year. He believed, however, that the saving was likely to be substantially less than this, if, indeed, there were any at all.

Arriving at his conclusion by a different method, Sir George Paish places the maximum possible saving at $130,000,000 a year. Of this, $70,000,000 would be saved by refunding the funded debt of the railways in 3½ per cent government bonds, provided this refunding were possible. Sir George doubts, however, whether it would be possible for years, simply because he doubts if those who hold the bonds would be willing to exchange them for government 3½ per cent bonds.

"Thus," he concludes, "one cannot safely calculate a greater immediate profit from government ownership than about $60,000,000 per annum," and, of course, if there were any considerable increase in operating expenses under government ownership this saving would speedily be more than wiped out. As a matter of fact, the greatest possible savings that could be made under government ownership in the cost of railway capital are so much smaller than the smallest increases that it can be naturally assumed would occur in the cost of operation, that it may be regarded as certain that the adoption of government ownership, instead of yielding profits to the government, would speedily involve it in heavy losses.

THE INTERSTATE COMMERCE COMMISSION AND PASSENGER FARES

THAT the Interstate Commerce Commission meant business, and was not merely holding forth an empty hope when it suggested, in the eastern rate advance decision, the possibility of increasing passenger fares, is demonstrated by its decision of last week denying the petition of the state commissions of Arkansas, Missouri and Oklahoma for a reduction of the interstate fares in those states from three cents to two cents a mile, the rate forced by those states for intrastate travel.

That there is no immediate danger that the function of the Interstate Commerce Commission is to be limited to computing the sums of intrastate rates made by state legislatures or commissions, and prescribing the result as a measure of the interstate rates, has been thoroughly demonstrated by several recent decisions of the Supreme Court, notably that in the Shreveport case. As to what the commission would consider a reasonable passenger fare, however, it has never given any very definite clew until this opinion. The commission not only holds that state-made fares are not to be taken as criteria of the reasonableness of interstate fares, but expresses the conclusion that "from all the evidence, to base interstate passenger fares from and to and through Arkansas, Missouri and Oklahoma on three cents a mile does not result in rates that we are convinced are unreasonable."

It is interesting to note, moreover, that the commission was not influenced by the claim commonly made by the state commissioners that the growth of traffic proves that it has been stimulated by the two-cent fare. The commission says: "There are so many conditions determining the extent of passenger travel that accurate conclusions cannot be reached from the consideration of any one condition alone. . . . Population is increasing in the states here represented, and greater density of population means more travel. . . . The comparisons of revenues intrastate between the two-cent and three-cent periods prove nothing in favor of the lower fare. . . . This does not mean that there may not be force in the theory that a reduction of a rate tends to increase the traffic or travel."

The lawfulness of the two-cent fares not being in issue, the commission expressed no conclusion as to their reasonableness for intrastate travel, but it does make this highly significant suggestion: "It may be that a mileage scale of passenger rates applicable to both state and interstate business somewhat less than three cents per mile would be reasonable in this territory and would, if adopted, remove the alleged discrimination now complained of. Without expressing an opinion as to this we deem it not improper to suggest its consideration by complainants and defendants as a possible basis of a fair adjustment of the controversy."

The suggested compromise could be brought about by the simple and time-honored expedient of splitting the difference, as the interstate rates are now based on three cents and the state rates on two cents in the territory under consideration. In other parts of the country an adjustment on this basis would require the states to give up something they have gained in state rates in return for concessions which the carriers have already made as to interstate rates and in some of these other sections the roads are already working out plans for advancing all interstate rates to a minimum of 2½ cents a mile. It is understood that it is also proposed to follow the suggestion made by the Interstate Commerce Commission and ask the various states that have enforced reductions to two cents to allow an advance.

There is no reason for making state rates lower than interstate rates; on the contrary, every principle of rate-making demands that rates for short distances be on a higher basis than rates for long distances. The railways now have an excellent opportunity to advance interstate fares to a reasonable basis. If they then fail to convince the states that the two-cent fares are too low, the Shreveport decision points the remedy. It is no longer the case that discrimination in rates can be corrected only by reducing the higher rate. If the commission holds that $3 is a reasonable fare for an interstate journey of 100 miles, there should, it would seem, be little difficulty in proving that the passenger who pays that rate is discriminated against in favor of the man who rides 150 miles for the same fare within the limits of a single state.

Interstate fares in Western Passenger Association territory were generally reduced to about two cents a mile on May 1 under the aggregate fare clause of the fourth section of the commerce act. At the same time the Central Passenger Association roads refrained from reducing their rates by refusing to recognize state rates in filing their interstate basing fares with the Interstate Commerce Commission. As the aggregate fare clause requires only that the fare for a through route shall not exceed the aggregate of the intermediate interstate rates it was only necessary for the eastern roads to maintain their interstate basing fares at 2½ cents a mile to avoid reducing through fares. It is understood they are now planning to advance all interstate fares to that basis.

CANADIAN PACIFIC

IN the last few days of trading before the New York Stock Exchange closed Canadian Pacific stock was conspicuous for its rapid declines in price, even in a market that was almost unprecedented in the rapidity with which prices in general fell. The desire of foreign holders of Canadian Pacific securities to convert their holdings into cash was ample explanation for the drop in the quoted prices of the stock; but the question that arose in a good many people's mind was as to whether the reaction from the boom of recent years in Canada had not adversely affected the Canadian Pacific to such an extent as to account in some part for the greater pressure on this stock than on that of most United States roads. The annual report of the Canadian Pacific for 1914 does not justify any such conclusion, although it indicates that the Canadian Pacific, like other Canadian industries, has felt the reaction which has taken place in Canada.

In the fiscal year ended June 30, 1914, the company earned $81,135,000 from freight, as compared with $89,655,000 in the previous year, and $32,478,000 from passengers, as compared with $35,545,000 in the previous year. On the other hand, revenue from sleeping cars, express, telegraph and miscellaneous increased from $13,274,000 in 1913 to $15,069,000 in 1914, so that the total decrease in earnings was $9,580,000, or between 7 and 8 per cent. This is by no means a startling falling off in gross earnings, especially when it is remembered that the earnings in 1913 were the largest in the history of the company.

Even more important, however, is the fact that the company was able to reduce its transportation expenses in proportion to its loss in gross revenue. Total operating expenses in 1914 amounted to $87,389,000, and in 1913 to $93,150,000. Included in these totals are $42,250,000 in 1914 for transportation expenses and $46,074,000 in 1913. This is a reduction of nearly $4,000,000, or more than 9 per cent. Without detailed expense accounts it is impossible to tell how much of this reduction is in labor. Undoubtedly Canada was paying too highly for its labor in the few years preceding 1913 and it may well be that a considerable portion of the saving in transportation expenses in 1914 was made in the wages paid to employees in this department. Probably the greater part, however, was because of increased trainload.

Appropriations for both maintenance of way and of equipment were reduced with the falling off in business; but were not heavily cut. In 1914 $16,427,000 was spent for maintenance of way, as against $18,499,000 in 1913, and $16,617,000 for maintenance of equipment, as against $17,199,000 in 1913. The reduction in maintenance of way looks heavier than it really is, due to the fact that in 1913, 1912 and for some years previous the Canadian Pacific had been paying too high for its section labor because of the competition for this class of labor, due to the construction work

on the Pacific coast extension of the St. Paul and the extensive building by both the Grand Trunk Pacific and the Canadian Northern. Apparently, therefore, the earning power of the Canadian Pacific, so far from being impaired by the depression in Canada, has suffered less than a great many of United States roads, especially the transcontinentals, in recent years.

In 1914 the Canadian Pacific hauled 27,801,000 tons of freight, as compared with 29,472,000 in 1913, and 25,940,000 in 1912. The average earnings per ton per mile was 7.5 mills in 1914, as against 7.7 mills in each of the other two years, the average length of haul remaining about the same in the two years, so that the ton mileage of revenue freight was less by 5.70 per cent in 1914 than in 1913. The Canadian Pacific in 1913 carried a larger proportion of non-revenue freight than most roads in this country the total ton mileage of non-revenue freight in 1913 being 1,744,000,000. In 1914 the ton mileage of this non-revenue freight was but 1,497,000,000, a decrease of 14 per cent, reflecting, probably, the slackening in branch line building by the company.

Despite the falling off in ton mileage there was a quite notable increase in the average revenue trainload, which in 1914 was 407 tons, as compared with 381 tons in 1913. The total trainload, including non-revenue freight, was 464 tons in 1914 and 440 tons in 1913. This is an increase of 5.48 per cent, and is in part the result of an increase in carloading per loaded car of 2.91 per cent.

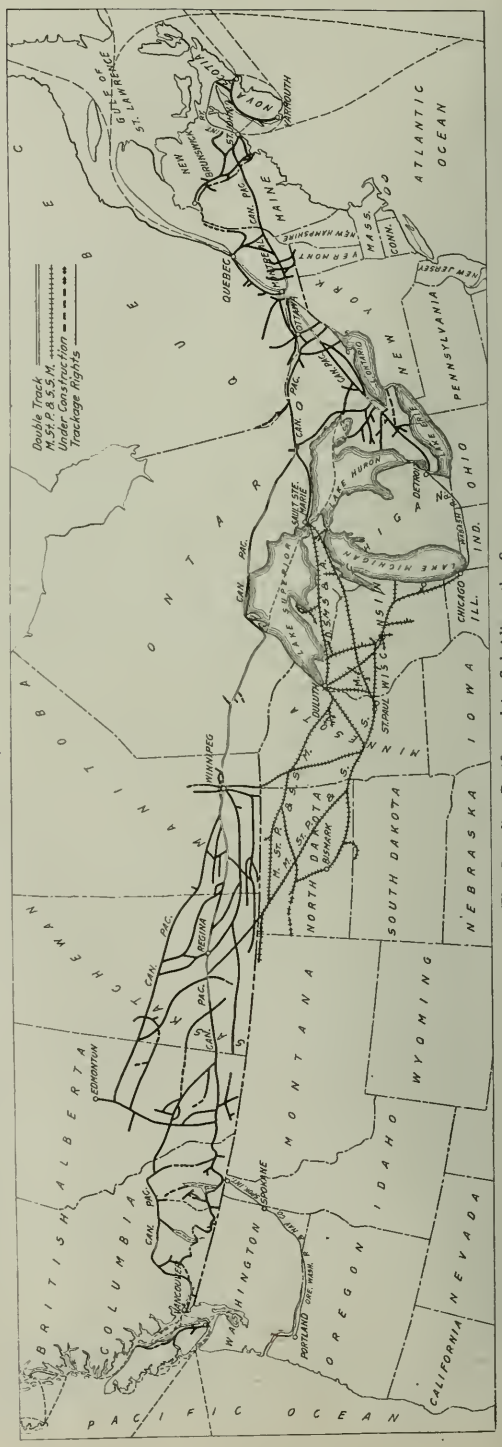
The Canadian Pacific shows only the total tonnage of commodities carried, and in showing the principal commodities separately the annual report shows flour by barrels, grain by bushels, livestock by head, etc. Making a rough approximation, however, the following table shows the tonnage in 1914, compared with 1913, of the principal commodities.

	Tons carried	
	1914	1913
Flour	862,000	793,000
Grain	5,548,000	5,159,000
Livestock	1,000,000	800,000
Lumber	4,532,000	4,000,000
Manufactured articles	8,148,000	9,519,000
All other articles	9,159,000	9,625,000

Earning power is only one of the factors in the price at which Canadian Pacific stock has sold in recent years. The assets of the company, in addition to its railroad property, are enormous. Among these assets, of course, is the company's credit and ability to raise new money cheaply. Undoubtedly the European war as well as the Canadian depression has affected this credit; but on the other hand the Canadian Pacific is in no immediate need, apparently, of new capital and a period of cessation from new construction would give the company, probably, a more efficient and well-knit together plant than would a continuation of an extensive program of branch line building.

In the last annual report for the first time the company separates its property investment as between railway and rolling stock. The total for these two items in 1913 was placed at $452,321,000. In 1914 the railway was carried on the books at $338,084,000, and rolling stock at $153,256,000. In addition, the company owns ocean, lake and river steamships costing $24,171,000, and also owns securities, the cost of which was $107,868,000 and the par value of which is $162,606,000. Previous to 1914 the company did not show on its balance sheet, except in a foot note, the land in Manitoba, Saskatchewan, Alberta and British Columbia. These lands are now taken on to the balance sheet as inactive assets, which, together with certain power and mining company stocks (carried at $4,797,900) are carried at a total value of $133,022,000. Apparently the book value of these lands is a very conservative estimate of their sales value. For instance, Alberta agricultural lands are carried at $13 an acre on the books, whereas an average of $17.80 per acre was received for agricultural lands sold in 1914 and, exclusive of irrigated lands, $16.57. The irrigated land sold during the year brought $66.93, while the irrigated land in the eastern section of Alberta is carried on the books at but $40 an acre.

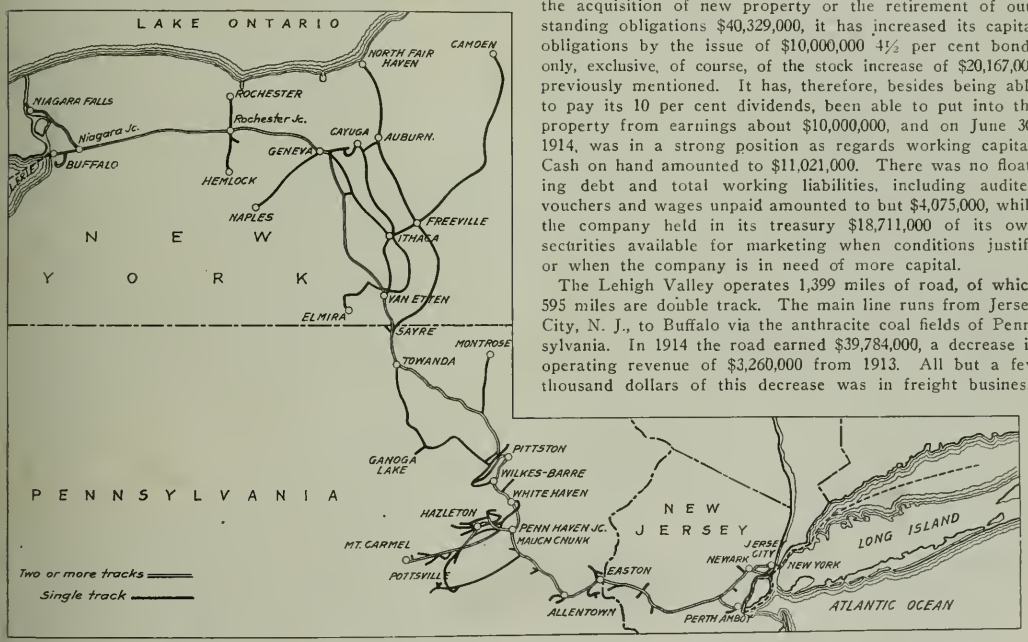
The outstanding securities of the company were increased during the year by the sale of approximately $4,000,000 4 per cent preference stock and $10,000,000 4 per cent consolidated debenture



The Canadian Pacific and its Subsidiary, the Soo

stock, and by the sale of $52,000,000 6 per cent notes, which are secured by the deferred payments on land and town sites totaling $42,667,000; government securities amounting to $10,089,000, and a deposit with the trustee totaling $3,790,000. The note sale was made to stockholders at 80 and amounted, of course, to a considerable extra dividend. President Shaughnessy says that the money provided from this sale of notes is all that will be required for the purposes of the company. Cash on hand at the end of the year totaled $36,778,000. Stockholders, however, are to be asked to authorize an increase of $75,000,000 in the ordinary stock, although there is no intention of issuing any of this stock until conditions materially improve in Canada and increased business warrants extensions or additions and betterments.

During the years 1910 to 1913 the company spent $60,000,000 for cars and locomotives, and during 1914 the deliveries amounted to about $14,000,000. The payment for these deliveries is to be made in 15 annual installments through a separate corporation—the Victoria Rolling Stock & Realty Company; but the entire cost has been advanced by the Canadian Pacific pending the sale of rolling stock equipment bonds.



The Lehigh Valley

The following table shows the principal figures for operation in 1914 compared with 1913:

	1914	1913
Mileage operated	12,044	11,602
Freight revenue	$81,135,295	$89,655,223
Passenger revenue	32,478,147	35,545,062
Sleeping car, express, telegraph and miscellaneous	15,068,667	13,273,732
Total	129,814,824	139,395,700
Maint. of way and structures	16,426,582	18,498,741
Maint. of equipment	16,617,247	17,198,573
Traffic expenses	3,626,612	3,376,981
Transportation expenses	42,250,286	46,074,299
General expenses	4,322,104	3,953,770
Parlor and sleeping car expenses	1,348,979	1,241,700
Commercial telegraph	1,613,688	1,691,953
Expenses of lake and river steamers	4,183,397	1,113,808
Total	87,388,896	93,149,826
Gross corporate income	42,425,928	47,491,437
Net corporate income	32,198,617	36,615,085
Appropriations	*125,000	1,125,000
Dividends	27,709,520	24,379,827
Surplus	4,364,097	11,110,258

The total ton mileage in 1914 of all revenue freight was 5,219,000,000, a decrease from 1913 of 10.21 per cent. The average length of haul was 174 miles in 1914, or about 3 per cent less than in 1913. Of the total 29,924,000 tons carried in 1914, 13,565,000 tons were furnished by anthracite coal. This was a decrease of 1,168,000 tons in the anthracite coal tonnage as compared with 1913. The other commodities in which there was a considerable decrease in tonnage were bituminous coal, cement, brick and lime, iron and steel rails and grain.

With the falling off in coal and other heavily loading commodities it was to be expected that there would be a smaller average train load. The revenue train load in 1914 was 595 tons, and in 1913 599 tons, a decrease of less than 1 per cent, and due in part to a larger proportion of empty car mileage and in part to a smaller loading per loaded car. The Lehigh Valley figures two empty cars equal to one loaded car in estimating the average cars per "draft," and

LEHIGH VALLEY

IN 1911 and the early part of 1912, after the Lehigh Valley had in 1910 increased its outstanding capital stock by the sale of $20,000,000 par value of stock to its own shareholders and raised its dividend to 10 per cent, there were expressions of opinion made quite freely, especially in New York, that the company had overestimated its earning capacity and would fail to justify the optimism of its directors. The year 1912 was not a prosperous one for the company, but even then it succeeded in earning its dividend; 1913 was a very prosperous year, and in 1914, although the company felt the general business depression and especially the falling off in anthracite coal traffic, it earned its 10 per cent dividend, even without the extraordinary $685,000 received as other income from dividends on the stock of the Temple Iron Company.

Furthermore, while the company has spent during the four years since July 1, 1910, for the betterment of the property, the acquisition of new property or the retirement of outstanding obligations $40,329,000, it has increased its capital obligations by the issue of $10,000,000 4½ per cent bonds only, exclusive, of course, of the stock increase of $20,167,000 previously mentioned. It has, therefore, besides being able to pay its 10 per cent dividends, been able to put into the property from earnings about $10,000,000, and on June 30, 1914, was in a strong position as regards working capital. Cash on hand amounted to $11,021,000. There was no floating debt and total working liabilities, including audited vouchers and wages unpaid amounted to but $4,075,000, while the company held in its treasury $18,711,000 of its own securities available for marketing when conditions justify or when the company is in need of more capital.

The Lehigh Valley operates 1,399 miles of road, of which 595 miles are double track. The main line runs from Jersey City, N. J., to Buffalo via the anthracite coal fields of Pennsylvania. In 1914 the road earned $39,784,000, a decrease in operating revenue of $3,260,000 from 1913. All but a few thousand dollars of this decrease was in freight business.

on this basis there were 30.9 loaded cars per draft on the average in 1914 and 30.5 in 1913. This presumably accounts for a very slightly higher percentage of freight helping locomotive mileage in 1914 than in 1913, the figures being 9.52 in 1914 and 8.65 in 1913. On the other hand, the percentage of passenger helping locomotive mileage was but 2.59 as against 2.88 the year before, and the mileage of light locomotives was reduced from 1,820,000 in 1913 to 1,585,000 in 1914, and the switching mileage from 5,517,000 in 1913 to 5,364,000 in 1914.

Total operating expenses of the Lehigh Valley amounted to $27,609,000 in 1914, a decrease of $1,499,000. All of this decrease was in maintenance, maintenance of way and structures costing $5,694,000 in 1913 and $4,575,000 in 1914, a reduction of $1,119,000; and maintenance of equipment, $7,561,000 in 1913 and $7,012,000 in 1914, a reduction of $549,000. The heaviest cut in maintenance was made in the appropriation for rails, $729,000 being spent on this account in 1913 and $310,000 in 1914. With the smaller rail renewal it was, of course, possible to make a saving in roadway and track labor, which includes the labor of placing rails in track. There was also a considerable reduction in the amounts spent for bridges, trestles and culverts. Most of the saving made in maintenance of equipment expenses was through smaller amounts charged for renewals of locomotives and renewals of passenger train cars—which means the charges against operating expenses for equipment sold or scrapped—and a somewhat smaller expenditure for repairs of freight train cars. Larger amounts were charged for depreciation of both locomotives and freight cars.

The full-crew law was probably in part responsible for the company's inability to reduce transportation expenses with a reduction of traffic handled.

It is interesting to note that in 1914 the company had on an average 22,017 employees in its service as against 22,800 in 1913, and the total payments to labor in 1914 amounted to $17,120,152 and in 1913 to $17,639,628.

The following table shows the principal figures for operation in 1914 as compared with 1913:

	1914	1913
Mileage operated	1,444	1,439
Coal freight revenue	$18,492,683	$20,385,389
Merchandise freight revenue	15,026,684	16,339,749
Passenger revenue	4,795,147	4,867,554
Total operating revenue	39,783,564	43,043,372
Maint. of way and structures	4,575,062	5,694,422
Maint. of equipment	7,011,946	7,561,271
Traffic expenses	1,002,872	982,858
Transportation expenses	14,071,183	13,993,617
General expenses	948,099	875,651
Total operating expenses	27,609,162	29,107,820
Taxes	1,549,895	1,447,205
Operating income	10,344,263	12,208,137
Gross corporate income	13,208,535	14,511,892
Net corporate income	7,056,660	8,761,828
Dividends	6,060,800	6,060,800
Surplus	995,860	2,701,028

NEW BOOKS

Theory of Arches and Suspension Bridges. By J. Melan, professor of bridge design, at the German Technical School at Prague. Translation from the German made by D. B. Steinman, professor of civil engineering, University of Idaho. Size 6 in. by 9 in., 303 pages, 119 illustrations, 3 plates, 9 tables, cloth binding. Published by Myron C. Clark Company, Chicago. Price $3.

Professor Melan's treatise on the "Theory of Arches and Suspension Bridges" has gone through three editions in Europe and has already found some application among bridge engineers in this country. Believing that no work of the same scope could be found in any language, the translator undertook to prepare the present English version in order to widen its sphere of usefulness and render it accessible to the profession in this country. The translation is made from the third edition and reproduces that book without omission. In some cases the examples and tables have been converted from metric to English units and characters and abbreviations have been changed to conform to our standard symbols. An appendix covering masonry and concrete arches and a bibliography of literature on arches and suspension bridges are included.

Letters to the Editor

ROADMASTERS' AND MAINTENANCE OF WAY ASS'N

Hillburn, N. Y., August 24, 1914.

To the Editor of the Railway Age Gazette:

May I call the attention of the readers of the *Railway Age Gazette* to the following letter which was recently sent by H. R. Safford, chief engineer of the Grand Trunk, to T. F. Donahue, general supervisor of road of the Baltimore & Ohio and president of the Roadmasters' and Maintenance of Way Association:

"I notice by the press that the annual meeting of the Roadmasters' and Maintenance of Way Association will be held at Chicago on September 8. I have notified all of our officers who are members of your association, not only giving them permission but encouraging them to attend the meeting, and have also arranged to have a number of our supervisors attend the meeting in the hope that they will become connected with your body, as I feel that the work which your association is doing is not only beneficial to the men individually who belong to it but the company whom they serve."

W. C. Kidd,
Secretary Track Supply Association.

WHERE THE COMMERCE COMMISSION MIGHT HELP

New York, August 19, 1914.

To the Editor of the Railway Age Gazette:

Referring to the letter in your issue of July 31 regarding a possible retrenchment in the legal expenses of the railway companies, I write to say that the letter rather understates the case—not that this is a bad fault, but that it may fail to attract the attention it deserves. The Commerce Commission might well address itself to several aspects of the case, because certain phases would be difficult for railroads to handle.

For instance, your correspondent mentions the fact that an insolvent railroad is saddled with receivers and lawyers for receivers, lawyers for the creditors and lawyers for the stockholders. As often as not the receiver is a lawyer, not a trained railroad operator, which is illogical and expensive, even when nothing worse can be said. As a matter of fact the courts have in many instances appointed as receivers lawyers who were either favorites of the court or nominees of the incompetent management which brought about the receivership—in so many instances that it would seem to be a rule rather than an exception. It is hard to understand why the management of an insolvent corporation should have the appointment of its own nominee as receiver. Our general bankruptcy law has advanced beyond this stage. Is it not time for our railroad and general corporation law to advance?

And why should the court appoint lawyers as receivers? The first thing the lawyer-receiver does is to retain another lawyer as counsel. Then he has to overwork the general manager in order to supply the practical information that the receiver himself lacks. Should the corpus of the estate be burdened for such inefficient service? This is perhaps a difficult point to drive home without mentioning specific instances, and these can only be mentioned at the risk of contempt of court. Perhaps the attention of some member of congress could be drawn to the fact and he could be furnished with enough definite instances to prove the case.

A possible retrenchment which your correspondent does not mention is in the department of rolling stock. Most railroad companies in ordering new equipment specify a number of details in their locomotives and cars which differ from the specifications of other lines. Each of these details adds to the cost of equipment out of all proportion to the value of the item, and in addition the railroad pays the salary of one or more experts who have invented the necessity for the detail. If the railroads would buy standard equipment they would save both the extra outlay for fancy specifications and the salaries of the men who devise them.

Rooter.

The Present Status of Clearance Legislation

A Discussion of the Necessity for Such Action, with a Review of the Laws Passed and Orders Already Issued

The subject of side and vertical clearances has received much attention from railway operating and engineering officers during the past decade. Increased attention has been given to it recently because of legislation enacted or threatened in several states and in Congress during the past three or four years. Thirteen bills were introduced in nine different state legislatures last year relating to this subject, three of which became laws, while a bill of this same nature has also been introduced before the legislature of Georgia. In addition, the Railroad Commissioners of Ohio and California issued definite orders last year, and several other commissions have the question under consideration. This is therefore a question of much importance to railway men.

OBJECT OF CLEARANCE LEGISLATION

As the purpose of any legislation establishing minimum side and vertical clearances is ostensibly to remove dangerous conditions, and thereby decrease the risk of accident, the necessity for such action can best be determined by an examination of the accident reports of the Interstate Commerce Commission. These reports show that during the fiscal year ending June 30, 1913, a total of 10,550 persons were killed and 86,688 injured in accidents on steam roads. Of these, 5,558 killed, and 6,310 injured, were trespassers and 2,939 killed and 56,619 injured were employees on duty. Of the accidents to employees on duty, 94 deaths and 1,835 injuries were the result of coming in contact with bridges, tunnels, buildings, or other obstructions while riding on cars or engines. The total number of deaths from this class of causes, including those of passengers and trespassers, was 146, and of injuries, 1,979. Thus, the deaths resulting from persons coming in contact with lateral or overhead obstructions were 1.4 per cent of the total fatalities and the injuries thus caused were 2.3 per cent of the total injuries. As to employees, 3.2 per cent of the fatalities to them and 3.2 per cent of the injuries to them resulted from the same classes of causes.

TABLE SHOWING SUMMARY OF ACCIDENTS FOR YEAR ENDING JUNE 30, 1913

Causes	Total employees on duty		Total persons	
	Killed	Inj'd	Killed	Inj'd
Train accidents—				
Collisions	280	3,367	457	8,031
Derailments	227	2,243	334	6,534
Accidents to trains, cars or engines, except collisions, derailments and boiler explosions	9	293	15	415
Bursting of or defects in locomotive boilers or boiler attachments	41	1,002	43	1,017
Total train accidents	557	6,905	849	15,997
Other than train accidents—				
Accidents to roadway or bridges not causing derailment, such as fires, floods, landslides, explosions, etc.	7	17	8	18
Coupling or uncoupling cars (exclusive of accidents with air or steam hose)	195	3,360	195	3,361
While doing other work about trains (not in shops or engine houses) or while attending switches	143	24,114	143	24,114
Coming in contact, while riding on cars, with overhead bridges, tunnels, or any signal apparatus, or any fixed structure above or at side of track	*94*	*1,835*	*146*	*1,979*
Falling from cars or engines	406	6,647	904	7,659
Getting on or off cars or engines	154	9,358	843	14,486
Other accidents on or around trains not here named	66	1,959	146	7,322
Being struck or run over by engines or cars at stations or yards	752	1,664	2,226	3,474
Being struck or run over by engines or cars at highway grade crossings	...	...	1,125	3,080
Being struck or run over by engines or cars at other places	544	490	3,744	2,133
Other causes	21	270	221	3,065
Total	2,382	49,714	9,701	70,691
Grand total	2,939	56,619	10,550	86,688

If conservation of human life is the object sought by such legislation, there are several other directions toward which it would seem that legislative action could be directed with greater prospect of getting substantial results. For instance, the enactment of stringent legislation regarding trespassing and its enforcement would do a great deal to stop the fatal accidents to trespassers, of which 5,558 were reported last year, or 38 times as many as were caused by narrow clearances. In fact, the deaths resulting from clearance conditions ranked eleventh in number in the 15 classifications of accidents given in the general summary prepared by the Interstate Commerce Commission.

The protection of its employees should be a primary object of all railroads. If this is the purpose sought by such legislation, attention may also be called profitably to the accidents occurring in coupling and uncoupling cars in which 195 employees were killed and 3,360 injured last year, largely as the result of carelessness of employees or their assumption of unnecessary risks. Also, 406 were killed by falling from cars or engines, and 154 in getting off cars or engines, while 1,296 were killed as the result of being struck by trains. The tabulation in the lower part of the preceding column taken from the accident report of the Interstate Commerce Commission for the fiscal year ending June 30, 1913, shows the number of accidents resulting from clearance conditions as compared with those due to other causes, the statistics regarding the former being given in italics.

An investigation made on one of the large systems with several thousand miles of line, and covering the five years from 1907 to 1911, inclusive, showed that only 5 persons were killed and 56 injured by accidents due to overhead obstructions and that 2 persons were killed and 80 injured because of lateral obstructions, while the total claims for the accidents caused by these lateral and overhead obstructions amounted to only $27,000.

The nature of the obstructions causing the clearance accidents reported by the Interstate Commerce Commission is shown in the following table:

Causes of clearance accidents	Total	
	Killed.	Injured.
Switch stands	6	396
Water cranes	6	154
Mail cranes	4	60
Buildings (at side of or enclosing track)	26	244
Bridges, side	29	124
Bridges, overhead	51	315
Tunnels	6	9
Overhead wires	5	143
Poles (including signal, telephone, telegraph, electric light, warning poles, etc.)	4	237
Miscellaneous	9	297
Total	146	1,979

It will be seen that 106 deaths and 683 injuries, or 73 per cent and 35 per cent, respectively, of the totals were the result of striking buildings and bridges. Eighty fatalities, or over one-half of all, resulted from striking bridges alone, while only six were caused by low or narrow tunnels, commonly considered dangerous obstructions. Thirty-four deaths resulted from miscellaneous causes, such as striking switch stands, mail cranes, water cranes, telegraph poles, overhead wires, etc.

In a study of this nature it is important to ascertain to what extent accidents of the class under investigation are increasing or decreasing. Taking the past ten years, covering the period of agitation of this subject, it is instructive to note that the number of employees killed on duty because of clearance conditions decreased from 584 during the five year period from 1904 to 1908, inclusive, to 427 for the five year period from 1909 to 1913, inclusive, a decline of 157, or 27 per cent. During the same time the number of employees in train service, who are exposed to accidents of this kind, increased from 279,831 to 305,195, or 9 per cent. The number killed per 10,000 employees,

therefore, decreased from 4.2 to 2.8, or 33 per cent in 10 years.

This decrease would naturally be expected from a survey of conditions, and is due to a number of important influences. In the first place, the railroads have been the first to observe dangerous conditions on their lines, and have spent large sums of their own accord in remedying them. While it is not possible to secure data showing the number of accidents resulting from coming in contact with switch stands, mail cranes, etc., for any number of years, it is safe to assert that this class of accidents has been greatly decreased as the result of a very general campaign to move obstructions of this nature further back from the tracks. A great deal of attention has also been given to the "safety first" campaigns inaugurated on many of the roads, and they have been the means of directing attention to many other conditions which have been remedied. Also, the working conditions of trainmen have been greatly improved. The universal adoption of the air brake has made it unnecessary for them to expose themselves as formerly, while the increasing proportion of trains which move from one terminal to the next without breaking up, tends towards the same results.

PRESENT CLEARANCE CONDITIONS

With a desire to ascertain the present clearance conditions on the various roads throughout the country, we have collected data regarding the standards, and the extent to which they are conformed to, on 33 representative roads in all parts of the country, and having over 100,000 miles of line. The information naturally divides itself into two parts—one relating to the standards adopted and enforced on new work and reconstruction along old lines, the other relating to clearances actually existing on old operated lines.

A survey of the existing standards shows that a minimum lateral clearance of 7 ft. measured from the center line of the nearest track is commonly adopted, with only three roads reporting less and several more. Likewise, 22 ft. may be regarded as the standard vertical clearance from the top of the rail to the low point of overhead structures, with 8 roads using a less distance and several working to 23 ft. and 24 ft. These standards of 7 ft. and 22 ft. conform to the standard bridge clearance diagram of the American Railway Engineering Association. Several roads which report these clearances as standard on bridges, also state that greater clearances are found elsewhere.

It must not be assumed that no structures will be found which do not conform to the standard clearance limits on the different roads. These limits are merely adopted as standards to which all structures are being brought as rapidly as practical. From the data available it is estimated that about 25 per cent of the structures on old lines do not conform at present to the adopted standards of the various roads, although every road reporting states that its standards are enforced on all new construction and reconstruction where conditions permit. Obviously, there are certain places, especially in cities, where overhead viaducts or other limiting conditions make it impossible to comply with the standards. Also, all but four of the roads that reported state that their standard clearances have been increased since 1900, and most of them within the past four or five years. Obviously it is not possible or financially practicable to bring all the structures on a railway into harmony with these new standards at once. Large sums, however, are being expended in moving switch stands and buildings, widening cuts, securing standard clearances in the rebuilding of structures, etc., one road of 3,500 miles reporting having spent over $1,400,000 on such work within the past few years.

Intimately connected with the subject of lateral clearances is that of the minimum distance between track centers. The standard recommendation of the American Railway Engineering Association is that tracks be spaced 13 ft. between centers. Twenty-three roads report this as their standard for main lines, while one reports 12 ft. and six 14 ft. or more. It is estimated that 75 per cent of the tracks conform to the standards adopted by the different roads for themselves and many individual roads report that 100 per cent conform. The prominent exceptions to 13 ft. track centers are almost all in the east, where physical conditions and long established location make any increase in the distance between track centers difficult to secure and exceedingly expensive. In many of the eastern cities where the right of way is fully utilized, increasing the distance between the track centers means the elimination of one or more of the tracks entirely.

The same distance of 13 ft. is generally standard between the centers of main and adjacent side or passing tracks, although in several cases a wider spacing is used, three roads adopting 15 ft., one 16 ft. and one 19 ft. The purpose of this wide spacing is to protect employees when inspecting trains standing on the passing tracks or engaged in similar work from trains moving at high speed on the adjacent main track. About 60 per cent of the tracks adjacent to main tracks are reported to conform to the adopted standards of the various roads.

In yards the operating conditions are different, and it is entirely practical to place the tracks closer together. The speed of trains here is relatively slow, while the additional land which would be required if a wide spacing was adopted in a yard of 30 or 40 tracks, for instance, would frequently render such spacing in a yard impractical. As a result, several roads are using 12 ft. between centers in yards, although the majority use 13 ft. here also, and this latter spacing must be recommended as better practice. The replies indicate that over 90 per cent of the yard tracks conform to the existing standards of the individual roads. As yards are being rebuilt and new tracks added, the distance between centers is being increased so that the percentage complying with the standards is steadily increasing.

CLEARANCE LEGISLATION

As an indication of what may be expected in legislation on this subject, a digest of the existing laws and important orders of the various commissions is given herewith. The individual states have been most active in passing this kind of legislation, and clearance laws have been enacted in Indiana, Kentucky, Massachusetts, Michigan, Minnesota, North Dakota, New Hampshire, Ohio, Oregon and Vermont. The railroad commissions of some states acting under broad powers have issued orders having the same force as statutes. Such orders have been issued in California and Ohio, for example. Clearance bills have also been introduced in the national Congress at various times, but have never been passed. The latest was the Martin bill introduced in 1910, but which never came to a vote.

In Michigan the minimum allowable height of bridges above the track is 18 ft. except in cities. In Vermont it is required that as bridges are rebuilt they must have a minimum clearance between trusses of 15 ft. for single track and 27 ft. for double track, with a minimum vertical clearance of 22 ft. New Hampshire requires that no bridge shall be rebuilt with a vertical clearance of less than 21 ft. and further stipulates that no car over 14 ft. high be operated within the state. In Kentucky the law requires that no bridge shall be constructed with less than 22 ft. vertical clearance.

The state law of Indiana provides that it shall be unlawful to maintain a structure less than 21 ft. above the top of rail or within 7 ft. of the center of the track without the consent of the commission or to construct any structure within those limits unless it be within a city. It also requires that the nearest point of contact of a locomotive or car shall not be less than 18 in. from any structure without the consent of the commission. The state law of Ohio provides that structures shall not be less than 21 ft. above the track except where the commission finds such a requirement impractical, this exception applying only to side tracks. An administrative order of the commission dated December 30, 1913, specifies a minimum lateral clearance line 7 ft. from the center line of track down to 4 ft. above the top of rail, and extending down from this point to a point 5 ft. from the center of the track at the elevation of the top of rail. Further exceptions are also made for

freight and passenger platforms, while additional clearance is required on curves.

Minnesota and North Dakota are the states which have most recently passed clearance legislation, both having done so in 1913. The Minnesota statute forbids the construction or rebuilding of any structure within 8 ft. of the center line of the track or less than 21 ft. above the top of rail, although the railroad commission is given authority to suspend these restrictions at any particular place. The minimum distance between tracks is also fixed at 14 ft. for main tracks and 13 ft. for yard tracks. The North Dakota law forbids the operation of any locomotives or cars after January 1, 1915, which exceed 10 ft. 6 in. in maximum width and 14 ft. 2 in. in height. It also requires that no structure be maintained or erected along main or side tracks within 8 ft. of the center of the track or less than 21 ft. above the top of the rail. These clearance regulations, however, do not apply to any structures on the railroad right of way which are owned, leased, or used by any outside person or corporation. The railroad commission is also given authority to exempt any structure built prior to the passage of the act. This law also specifies that no tracks shall be constructed with less than 13 ft. between centers.

In Rhode Island it is required by law that no bridge shall be built over any railroad track with less than 18 ft. clear distance above the top of rail, excepting structures rebuilt to replace existing structures. In Oregon, while the railroad commission has not issued any definite orders prescribing clearances, it has recommended a side clearance of 8 ft. and a vertical clearance of 22 ft. above the top of rail for main tracks. Massachusetts requires that no bridge shall be constructed over a railroad at a height less than 18 ft. above the track, except by the written consent of the Board of Railway Commissioners. In Illinois, the railroad and warehouse commission insisted on 22 ft. overhead clearance wherever practical for a number of years, and about three years ago a rule was also adopted requiring yard tracks to be not less than 13 ft. between centers.

The Railroad Commission of California issued an order, effective January 1, 1913, providing for a minimum overhead clearance of 22 ft., and a minimum lateral clearance of 7½ ft. for tunnels and bridges, and of 8 ft. for water stations, fuel stations and other side structures. The minimum distance between the center line of yard and industrial tracks and structures, including platforms higher than 4 ft., is established at 8½ ft., while platforms under 4 ft. in height and over 1 ft. must be 6½ ft. from the center of the track. The minimum distance between the center lines of tracks is established at 13 ft., except that house and team tracks may be built on 11½ ft. centers. While the Corporation Commission of Oklahoma has not issued any definite orders regarding clearances, it has recommended a 22 ft. vertical clearance and 7 ft. minimum lateral clearance in some instances.

A bill now before the legislature of Georgia requires that all structures extending over 40 in. above the top of the rail of the adjacent main track shall be at least 8 ft. from the center of the track. However, all structures which it will cost more than $100 to remove or renew individually, are exempted from the provisions of this act.

The Martin bill, which was introduced in the national House of Representatives in 1910, but which was never brought to a vote, provided that the maximum width of locomotives and cars should not exceed 10 ft. 6 in. and the height 14 ft. 2 in. It also stipulated that no structure of any kind should be closer than 6 ft. 11 in. to the center of the track excepting platforms not over 3 ft. 11 in. from the top of rail and the minimum vertical clearance was established at 20 ft. By the provisions of this act, the Interstate Commerce Commission was to be given authority to exempt individual obstructions from the provision of this act if conditions rendered this necessary. This bill also fixed the minimum distance between tracks as 12 ft. 6 in. and provided that all equipment, track and structures should be brought into conformity with it by January 1, 1912

A bill introduced in the House of Representatives by Representative Stevens on December 15, 1913, intended to promote the safety of railway employees and passengers, provides among other things that the Interstate Commerce Commission shall have power to order any changes in track, structures, or equipment, which in its opinion will increase safety. No action has been taken on this bill, but if passed, it is probable that this broad provision would be interpreted to include authority over clearance conditions.

The railway act of the Dominion of Canada requires a vertical clearance of 22 ft. 6 in. and a clear headway of 7 ft. above the top of the highest car. The Board of Railway Commissioners is given authority to exempt any tunnel or bridge from the provisions of the act where only trains equipped with air brakes are operated. An order of the Board of Railway Commissioners, dated November 9, 1910, has fixed the lateral clearance at 6 ft. from the gage side of the adjacent rail, or 8.35 ft. from the center of the track.

Fundamental difficulties confronting clearance legislation

In view of the legislation passed and proposed, it is pertinent at this time to call attention to a few of the practical fundamental principles governing and some of the difficulties confronting such legislation, which it is evident have not been sufficiently considered in all cases in the past. In the first place, to be consistent, any legislation which specifies the limits within which structures may not be built, should also specify the maximum dimensions of the equipment operating within those limits. This has been done in the North Dakota law, and was included in the Martin bill referred to above. However, as a matter of public policy, it is difficult to see how it can be advisable to set by law any limit beyond which cars and locomotives cannot be built. The continuous record of railway development and increased efficiency of operation in this country has been made possible only by increasing the car and train load. Because of the increasing cost of operation the necessity for economy in operation was never greater than at the present time. A man is rash, indeed, who will venture to seriously predict where this development will terminate. As prominent a railroad man as the late E. H. Harriman predicted a few years ago that the railways of this country would eventually adopt a 6 ft. gage.

If it be necessary to enact any legislation it should refer primarily only to new construction and to reconstruction undertaken by the railways on their own initiative, and should not be retroactive. If reasonable, such legislation undoubtedly would not meet with serious opposition from the railways and would serve to secure uniformity of standards on all new work at once and gradually on old work. It is unfair and frequently not practical to require that all structures on old lines shall be made to conform to new limits within the short period of time given in most of the laws proposed, while it requires an expenditure of large sums of money which could be devoted to much better uses. It is the experience of all roads that practically all facilities, with the possible exception of large terminals in congested cities, are rebuilt every 15 or 20 years. As these structures are rebuilt from year to year they can be brought into conformity with any reasonable requirements without any great additional expenditures. By thus making haste slowly the desired conditions would in a relatively few years be brought about which radical clearance legislation could bring about in a shorter time only at an enormously greater cost.

Any clearance diagrams adopted must be practical and be framed with a full knowledge of railway operation. The clearance diagrams of Minnesota and North Dakota are glaring violations of this principle, being plain rectangles 16 ft. wide and 21 ft. high. Strict compliance with these requirements would necessitate the removal of all cattle guards, through girders, bridge portal bracing, station platforms, intertrack fences, dwarf signals and other similar facilities commonly regarded as not presenting any dangerous conditions.

The adoption of clearance regulations should be made only

after a careful study of local conditions in the territory under consideration. For instance, while horizontal and vertical limits of 8 ft. and 21 ft. may be entirely practical in Minnesota and North Dakota, where the railways have been built comparatively recently and where there are no congested terminals, these limits would be utterly unpractical in Pennsylvania, New Jersey and New York, where track centers and building lines were established many years ago and can be changed only at enormous cost. With the present free interchange of traffic the same cars may be moved over any line in the country, and the danger of accident arises largely from a lack of uniformity in the location of structures rather than from the size of the equipment, and a man on an eastern road accustomed to its narrow clearances will not expose himself in the same manner as will a man on a western road. It is therefore difficult to see how one definite standard can be applied equally on roads in different parts of the country. It would appear to be more equitable to fix these limits for perhaps three or four large areas, taking these different fundamental conditions into consideration in the establishments of the limits.

If legislation of this kind must come it should be national rather than state. The confusion which would result on a road operating in 10 or 12 states, each with different requirements, is evident. Furthermore, such conditions would be an actual menace to the employees. Many crews pass through portions of two or three states on their regular runs, and the existence of different clearance standards is certain to increase the number of accidents. Besides, with the present attitude of several of the state legislatures, it is difficult to predict the limits to which these measures might go.

Within recent years especially the clearances of many structures embraced in grade separation work in cities have been established by ordinances or contract. In some instances, as in New York, these measurements have been established by orders of the state railroad commissions. There is thus opportunity for a conflict of authority which has been recognized in the laws of two or three states. Also, for state or national legislation to nullify the work already done on public order would not appear fair or equitable. In this connection it must be remembered that the establishing of limits, especially of vertical clearances, to apply within cities where grade separation is in prospect may render such work impossible. The adjustment of grades where several roads and numerous intersecting streets are involved is now frequently an exceedingly difficult problem to solve. If still further complicated by additional restrictions, some of these projects will undoubtedly have to be abandoned.

The suggestion has been made that limits could be set in the large cities and terminals less than those governing out on the line. It is the general practice for the road freight crews to leave their trains in the large yards in the outskirts of the important cities. Other crews then bring these cars in for distribution throughout the city. These transfer trains are generally short and of relatively slow movement, and wide clearances are not as necessary for them as for main line trains.

THE FINANCIAL ASPECT OF CLEARANCE LEGISLATION

In view of the present condition of railway finances and the immediate outlook for the future, any discussion of clearance legislation must center very largely about its cost. Very little exact data regarding the cost of such work has been collected. Two years ago when the Martin bill was before Congress, estimates made by 115 roads with 152,600 miles of main line showed an approximate cost of $139,000,000 to comply with the lateral clearance requirement of 6 ft. 11 in.; $135,000,000 to secure an overhead clearance of 20 ft.; $167,000,000 to secure a minimum distance of 12 ft. 6 in. between tracks, and $5,600,000 to bring the equipment within the specified limit, or a total of approximately $450,000,000. Assuming a proportionate outlay for the entire mileage of the country, compliance with the Martin bill would cost the railways $716,000,000, or over $2,900 per mile of main line.

Estimates prepared more recently by 13 roads with 34,895 miles of line show a total cost of $74,857,250 to secure a minimum vertical clearance of 20 ft., or $2,145 per mile for these roads. Likewise, 14 roads with 28,736 miles of line estimate that it would cost them $100,170,000, or $3,486 per mile to secure a minimum clearance of 22 ft., while several roads considered this latter limit unpractical and made no estimate. Similar figures of the cost of meeting a lateral clearance requirement of 7 ft. made by 14 roads with 30,077 miles of line totaled $59,136,349, or $1,966 per mile. On the basis of a minimum lateral clearance of 8 ft., 12 roads with 26,305 miles of line estimated the cost of complying at $104,573,000, or $3,975 per mile. While all the above figures are estimates, they show plainly that compliance with clearance legislation of this sort will be exceedingly expensive on any basis which may be adopted, and on the basis of the legislation so far enacted, it will not fall short of $2,500 per mile of line for the entire country.

Such legislation will affect not only the railways but private industries as well. The above figures refer only to the expense that would have to be borne directly by the roads and do not include the cost of changes that would be made necessary about industrial plants, which would also reach a very high figure. One large corporation which made a careful estimate of the cost of compliance with the proposed Martin bill found that it would cost it alone over $1,600,000. It is entirely probable that the total cost to railways and industries would exceed $1,000,000,000. In North Dakota changes in industrial plants were obviated by exempting from the provisions of the law all structures upon the railroad right of way owned, leased, or used by private parties. It is difficult to see what difference it would make to a railway employee whether he was knocked from a car by an obstruction owned by the railway or one owned by a farmers' elevator company.

It is pertinent to inquire at this time just how the money necessary to comply with such requirements could be secured. As the expenditure could be justified only as an operating measure, and as it would not increase the value of the property or earn any return, it would seem that it should be charged to operation and not to capital account. But with the present decreasing tendency of operating revenues, it is difficult to see how work of such magnitude could be paid for out of operating income.

IS CLEARANCE LEGISLATION ADVISABLE?

In view of all of the above, the question arises whether clearance legislation is advisable. The analysis of railway accidents shows that only 1.4 per cent of all deaths and only 3.2 per cent of the fatalities to employees result from coming in contact with lateral or overhead structures. Likewise, accidents of this sort have decreased 33 per cent in the past five years. The roads have nearly all adopted increased clearance standards, and are bringing their structures into conformity with these standards as fast as is practical and at a relatively large expenditure of capital. It is therefore pertinent to inquire if the agitation for legislation on this subject at this time is not ill advised, and if as a matter of public policy it might not be more expedient to expend the large sums which clearance legislation would cost in other directions where the expenditure would secure greater returns from the standpoint of safety to the railway employees and general public alike, as, for instance, for the elimination of highway grade crossings.

It must be remembered that no matter what form legislation takes it will not eliminate all accidents of this nature. The accident reports of the Interstate Commerce Commission do not show the location of the obstructions causing accidents with reference to the tracks, so it is impossible to determine how many would have been avoided by the enforcement of any specific limits; but it is certain that some of these accidents would not have been prevented by the enactment of any reasonable legislation which could be enforced.

Rock Island Interlocking Plant at Joliet

New Design of Tower and Derails; Storage Battery Reduced from 400 to 160 Ampere-hours Capacity

A 224-lever all-electric interlocking plant was recently installed at the crossing of the Chicago, Rock Island & Pacific with the Atchison, Topeka & Santa Fe, and the Chicago & Alton, at Joliet, Ill. Aside from the fact that this is one of the largest interlocking machines west of Chicago, if not the largest, the original features in the design make the installation of considerable interest.

Fig. 1—Signal Bridge with Dwarf Signal Mounted Above Lower Chord

High signals are three-position, upper quadrant, operating from zero to 45 to 90 deg., and dwarf signals are two-position, upper quadrant, operating from zero to 45 deg. High signals are in general mounted on signal bridges, as are also the dwarf signals which protect the pocket derails. The difference in the visibility of the suspended dwarf and the dwarf mounted above the chord of the signal bridge is well shown in the illustrations of the two signal bridges, Figs. 1 and 3.

POCKET DERAILS

Because of the location of the crossing directly in front of the passenger station, it was necessary to provide additional derails nearer the crossing than the standard 500 ft. required by the Illinois law. These pocket derails are located only 50 ft. from the crossing, and in order to give rapid and positive action, a derail was devised which is quite similar to a movable-point frog. The frog-point is 7 ft. 2 13/16 in. long and the stock-rail from the point to the end is 13 ft. 4 in., the angle of departure being 9 deg. 1 min. The frog point has a 5-in. throw and when open the gage side is supported and reinforced by rail braces placed at the proper angle so that when the point is open each brace gives support and strength to the point. This bracing is necessary, of course, as the point is subjected to considerable

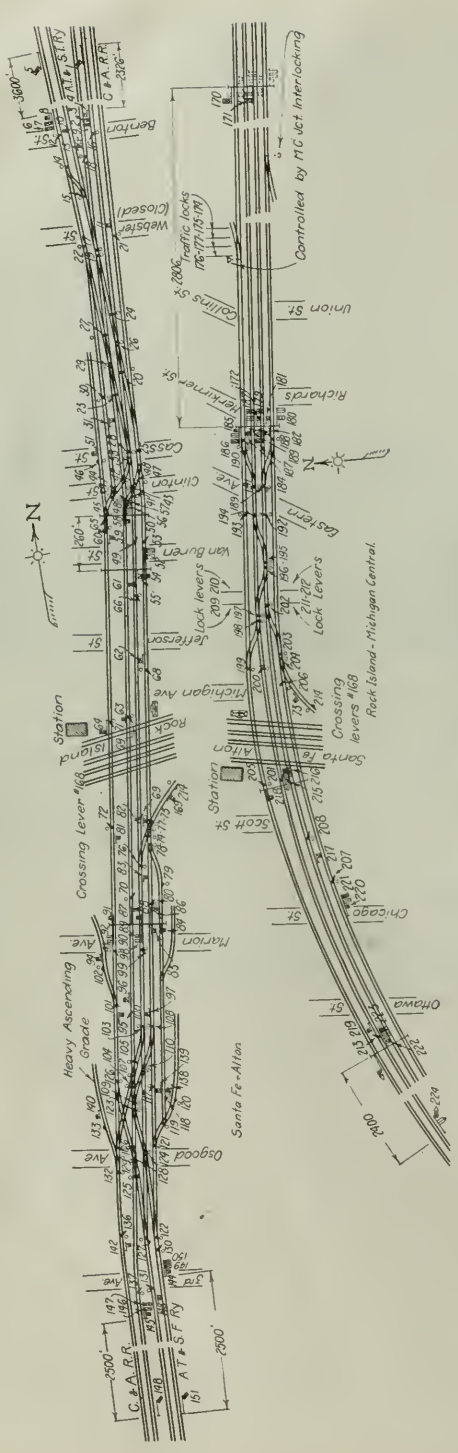

Fig. 4—General Layout of Tracks, Joliet Interlocking, Chicago, Rock Island & Pacific Railway

side thrust in deflecting the wheel to the ground. The rail braces are all upset in the field in order to allow for a certain amount of adjustment after wear takes place.

INTERLOCKING TOWER

The interlocking tower is of plaster on hollow tile, supported on a concrete wall foundation. The outside dimensions are 17 ft. 2 in. x 57 ft. 2 in. the tower having two stories and a basement.

Beneath the interlocking machine and extending its whole length is a pit, deep enough so that a man can stand in it upright when wiring, repairing or inspecting. This greatly facilitates the maintainer's work and assures better and quicker service.

Another feature which is worth noting is the tunnels, which are used for cable ducts. These are immediately beneath the ground floor; that is, in the upper part of the basement. There are two of these tunnels, built at right angles to each other. The one running lengthwise of the tower is 7 ft. wide and 10 in. deep and is used for Rock Island cables; the other is 6 ft. wide and 10 in. deep and runs out into a manhole between tracks extending some distance away from the tower. The latter tunnel is for the Santa Fe and the Alton wires.

The interlocking tower presents a neat and attractive appearance, the wide eaves contributing to a graceful design. The building is fire-proof, with the exception of the finish above the second floor. The hollow tile used was a recently perfected "National" type, having rough, wedge-shaped ribs on the outside. As the outer edge of the ribs is the thicker part the shape constitutes a good mechanical bond. The plastering was "Stonecote," made by the Garden City Sand Company, Chicago. Two coats of the plaster were used, a scratch coat applied directly to the tile and a finishing coat applied to the scratch coat. The face of the coating was marked, before it had set, to resemble the Bedford stone in the station across the tracks.

Fig. 5 Tile and Cement Tower

PROVISIONS FOR REVERSING TRAFFIC

Traffic levers are provided for each of the tracks on the Rock Island road. These are operated in connection with a like number of levers in the adjacent Michigan Central Junction interlocking tower to the north. The home signals of one plant are the distant signals of the other.

If it becomes necessary to reverse traffic, the towerman who wishes to do so communicates with the other towerman, asking him to reverse the traffic-lever for the desired track. If the latter can allow this movement, he reverses the lever, which operation mechanically locks all levers controlling signals for movements opposed to the direction of traffic desired by the first towerman. The first towerman will then be able to reverse his lever. The

reversing of this lever mechanically unlocks the levers controlling signals for traffic in the direction desired.

POWER

Normally, and according to R. S. A. specifications, a storage battery of 400 ampere-hours would be required for this plant. To reduce the storage battery required, an auxiliary gasolene engine was installed in the tower. This will not furnish enough power to run the entire plant, but in connection with a small storage battery it furnishes a sufficient supply.

This arrangement requires an emergency signal lighting apparatus consisting of a motor-generator set, 110-volt d. c. motor, driven by power received from the 110-volt storage battery. This motor drives a one-half k. v. a. single-phase, 110-volt, 60-cycle a. c. generator, which furnishes current for lighting the signal lamps. It is equipped with a centrifugal governor which controls the alternating current within 5 per cent of the desired frequency, this being necessary on account of the voltage variations which take place in the storage battery.

Normally, power is furnished by the Public Service Company at 220 volts, 60 cycles, three-phase. This current drives a three-unit motor-generator set. A duplicate set is provided. Each set has a motor and two generators mounted on the same shaft. One generator has a capacity of 40 amperes, at 15 volts, d. c., and is used with five cells of storage battery for the track circuits. The other generator has a capacity of 15 amperes at 10 volts and is used with three cells of storage battery for line circuit current.

The power for the 110-volt storage battery used for operating the interlocking section is supplied from a 110-volt d. c. generator driven by a three-phase, 220-volt, 60-cycle, a. c. motor. The 7½ h. p. gasolene engine and generator is used with the 110-volt storage battery to generate current for operating the interlocking section in case of failure of the commercial power.

The interlocking was designed by the Chicago, Rock Island & Pacific signal department, H. K. Lowry, signal engineer. The construction was done under the supervision of C. Hartvig, foreman, and L. Wyant, superintendent of construction. All the interlocking apparatus was supplied by the General Railway Signal Company, Rochester, N. Y.

SIR GEORGE PAISH ON SAVINGS UNDER GOVERNMENT OWNERSHIP IN THE UNITED STATES

The following letters which were published in the last issue of The Saturday Evening Post are self-explanatory.

Chicago, July 6, 1914.

Editor The Saturday Evening Post:

Dear Sir: One of the principal arguments of ex-Governor Stubbs and others who have advocated in this country the government ownership of railroads has been that vast savings could be effected by the use of government credit. Mr. Clifford Thorne goes so far as to estimate the saving at $400,000,000, on the assumption that government could finance the properties on a 3 per cent basis; but ex-Governor Stubbs figures it at four.

Being very much in doubt as to these estimates and wishing for expert opinion I wrote to Sir George Paish, editor of the London Statist, and well known all over the world as an authority on financial matters. I inclose his reply, from which it appears that there might be a possible economy of sixty millions, and a later and ultimate saving of seventy millions, or one hundred and thirty millions in all, arising from the ability of government to raise money on better terms than can the railroads under present conditions.

But when this possible saving is put over against the inevitable extravagance and waste and loss of every government enterprise, it would melt so rapidly as to leave hardly a trace.

Yours truly. E. P. Ripley,
President The Atchison, Topeka & Santa Fe Railway System.

The letter to which Mr. Ripley refers in the above follows:

June 23, 1914.

Dear Mr. Ripley: I have been very much interested in your letter of the sixth of June. According to the return of the Interstate Commerce Commission for the year ended June 30, 1911, the funded debt of the railways of the United States was $9,816,079,405 and the interest accrued on the funded debt for the year was $410,326,852. Thus the average rate of interest paid by American railways on their funded debt was only 4.18 per cent. Were the railways to be purchased by the government the money could not be raised on better terms than this. Indeed, if the government were to purchase the railways they would, in my judgment, leave these underlying bonds untouched. To issue nearly $10,000,000,000 of government bonds to investors would be an impractical operation unless the bonds were taken in exchange for existing bonds. To induce the existing holders to exchange their present bonds for government bonds the latter would have to be offered at an attractive price. In purchasing the railways there would, of course, be no necessity for the government to take over the existing bonds, and I imagine that no attempt would be made to do so. Hence, there would be no saving of interest from government purchase as regards the funded debt, although later on it might or it might not be feasible to refund the existing debt into 3½ per cents as the bonds fell due for payment.

If refunding were possible the saving would ultimately be about $70,000,000 per annum.

The amount of the capital stock of the railways at the end of June, 1911, was $8,364,419,520, and the dividend distributed upon this stock from current income was $302,037,778, or an average return of 3.61 per cent. From surplus, dividends amounting to $158,157,598 were distributed. The total sum distributed from income and from surplus was $460,195,376, or an average return upon the share capital of 5.5 per cent. Here again it would be quite impossible for the American or any other government to sell bonds to investors sufficient to provide cash to buy this vast quantity of railway stock from the existing holders. Ability to carry the transaction through would be governed by the price at which the government would offer bonds in exchange for stock. If the price were attractive, stockholders would take payment in bonds; but if it were not tempting, the government bonds would not be taken in payment, and the transaction could not be carried through. Possibly by offering to sell a 4 per cent United States government bond at par, and to take in exchange railway stocks on a 5 per cent basis (par for a 5 per cent stock), would be sufficient inducement. One must not forget, however, that many stocks are receiving no dividends whatever, and that substantial prices would have to be paid for these nondividend-paying stocks. When allowance is made for these various factors it would probably be found that the advantage in the matter of interest from government ownership would be much less than 1 per cent upon the total amount of common stock outstanding.

In brief, there would be no immediate profit from government ownership as regards the bonded debt of the railways, and as to the stock of the railways the advantage would be probably not more than about $60,000,000 a year.

As to the undivided profits, the public gets the advantage of these anyway. When the surplus profits are put into the roads (as they are at present) the capital account is kept down, and it is not necessary to charge as high freight rates and passenger fares as otherwise would be necessary to pay interest and dividends. I imagine that under government ownership the policy of applying surplus profits to betterments would be much the same as the policy pursued by the companies hitherto.

Thus one cannot safely calculate a greater immediate profit from government ownership than about $60,000,000 per annum—excluding, of course, subsequent economies, or subsequent greater cost of operation under government than under company ownership, and excluding a possible ultimate economy of $70,000,000 per annum from the conversion of the funded debt upon the maturity of the existing bonds.

Yours very truly,

George Paish.

E. P. Ripley, Esq.,
President, Atchison, Topeka & Santa Fe Railway.

DARIUS MILLER

Darius Miller, president of the Chicago, Burlington & Quincy and of the Colorado & Southern, died at Glacier Park, Mont., on August 23, after an operation for appendicitis. Mr. Miller had been on a trip to Denver and Glacier Park, on which he had been accompanied by Mrs. Miller and Vice-President Hale Holden. The party had been joined at Glacier Park by President Louis W. Hill of the Great Northern; and in response to the summons of President Hill, special trains carried medical help for Mr. Miller from Spokane, Wash., and Havre, Mont., and later James J. Hill personally took surgeons on a special train from St. Paul, Minn. But before the party from St. Paul arrived it was necessary to operate; and even then the operation proved to be too late.

Mr. Miller's death removes from the railway field of America one of its ablest and most remarkable men. He was an extraordinary example of perfect tact, great geniality, fine social qualities and consummate diplomatic skill united with tireless bodily and mental energy, great business sagacity, ambition, a resolute will, rare courage, and administrative capacity of the first order.

Darius Miller

He impressed everybody who came in contact with him with his accessibility, his suavity, his kindliness, his pleasantness and the perfect poise of his manner. Even after he became president of the great Burlington system, with its almost 10,500 miles of line, he received in his office almost all who called on him and listened smilingly and patiently to all they had to say. He never seemed ruffled, never seemed in a hurry, never seemed to have a single worry. If his visitor had a favor to ask, Mr. Miller was pretty sure to grant it, if he could, for he had a sincere liking for taking the time and trouble in his busy life to do nice things for others.

But this was only one side of his character. Those who saw much of him soon found that back of his easy-going manner he was a ceaseless, indefatigable laborer. The lowliest employee of the road did not put in any longer hours. During all of the year, except the summer months, his working day at his office was from about 9:30 a. m. to 7 p. m. Even after he went home it was a very common thing for him to sit up till midnight or later reading hour after hour reports, newspaper articles, magazine articles and books on subjects pertaining to transportation, and business and political matters in general. The same energy he put into the work he did himself he put into that of directing the labors of his subordinates. It was so when he was a traffic man, and even more so after he became president of the Burlington.

Mr. Miller was essentially and eminently pacific in his attitude toward competing lines, toward regulating authorities and toward the labor organizations. He was always anxious not to do or say anything which it was not fair to do or say or that might provoke reprisals from concerns or persons that were attacked. But when there was occasion for it, he displayed an amount of courage that was hardly likely to be expected from one with his pleasant, urbane exterior. He met the attacks of aggressive competitors half-way, and no railway man in the country was more vigorously outspoken than he was during the last years of his life in replying in letters or through the press to persons or publications that indulged in unjust criticism of the Burlington in particular, or the railways in general.

One of the most interesting features of his career was his relationship with that great master of railroad transportation, James J. Hill. Mr. Hill's powerful, dominating personality has made it hard for some men to work with him; but Mr. Miller, from the time he went to the Great Northern as vice-president in charge of traffic in 1898, seemed to get along perfectly with Mr. Hill, and to none of his lieutenants, except his son, Louis W. Hill, did James J. Hill apparently give quite such unreserved confidence and support as to Mr. Miller. Probably this was due to Mr. Miller's remarkable combination of tact with courage, and urbanity with strength. With characteristic modesty, he always gave Mr. Hill the lion's share of the credit for the policies so successfully carried out on the Burlington; but doubtless Mr. Hill would be the first to give Mr. Miller full credit both for the part he took in shaping the Burlington's policies, and the equally important work he did in carrying them out.

Mr. Miller's experience until he became the road's president was that of a traffic man. He was so pre-eminently a good traffic man that it was expected when he left the Great Northern to become first vice-president of the Burlington he would have charge of the traffic of the entire Hill system. This plan, it is understood, was defeated by the proceedings of the federal government for the dissolution of the Northern Securities Company. The methods which traffic men had to use to get business were quite different in the earlier part of Mr. Miller's career from those which legislation and concerted action by the railways themselves have finally established. In those days railways competed in the same way and by the same means that other industrial and commercial concerns did. But while Mr. Miller was as skillful as anybody in using the older methods, his success as a traffic man always was due mainly to his clear-headed recognition of the fact that a railway's profits are derived chiefly, not from the business which it wrests from its competitors, but from the business which it develops on its own lines; and it was as a creator of traffic that he first established himself with that greatest of all traffic creators, Mr. Hill.

His reputation as a traffic officer was such that some curiosity was felt as to how successful a president he would make. That curiosity was soon satisfied. The Burlington property

under the presidency of George B. Harris, with Daniel Willard as vice-president in charge of operation, and Mr. Miller as vice-president in charge of traffic, had been put in fine shape. Coming to Mr. Miller, as president, in this condition, it presented him with a rare opportunity; and he and his able lieutenants took advantage of that opportunity to the fullest extent. Mr. Hill was the father of the tonnage system on American railways. He must, therefore, have regarded with satisfaction the advance in the Burlington's revenue freight trainload from 381 tons in 1910, the first year of Mr. Miller's administration, to 484 tons in 1913, an increase in three years of 103 tons, or 26 per cent.

Mr. Miller had a marked capacity for impressing on those who reported to him exactly what he wanted done and for then leaving them a free hand to do it. While he seldom interfered with them, he watched the results of their work closely and keenly, and his influence was felt in every department. Certainly, if his 3½ years' administration as president is a criterion he was one of the ablest railroad administrators that this country has had. Few other railroads have come through the last four years of business stress and strain as well off physically and financially as the Burlington, and the remarkable increase in its average freight trainload, with the economies in operation which it represented, is one of the chief explanations of its present relatively strong position.

A man with Mr. Miller's personality was bound to be popular with his business associates. But his circle of warm friends and admirers extended far outside to other railways, to other businesses, and embraced men in every walk of life.

When he was vice-president of the Burlington he served for years on the Traffic Committee of the Chicago Association of Commerce. When the Chicago Association of Commerce Committee of Investigation on Smoke Abatement and Electrification of Railway Terminals was appointed he was designated as one of its railway members. His railroad activities extended beyond his own lines. He was chairman of the executive committee of the Kansas City Terminal Railway Company, a director of the Union Station Company of Chicago, a director in the Union Station Company of Denver and a member of the committee of presidents having charge of the work of the Bureau of Railway Economics at Washington. His tact and influence were largely instrumental in securing finally the passage of the Union Station ordinance in Chicago last spring. He was a director in the Continental Commercial National Bank and the Union Trust Company of Chicago.

He was a self-made man in the best sense. Born at Princeton, Ill., on April 3, 1859, he was but 55 years old when he died. He entered railway service at 18 as a stenographer in the general freight office of the Michigan Central. From June, 1880, to February, 1881, he was a clerk in the general freight office of the St. Louis, Iron Mountain & Southern; from February, 1881, to October, 1883, chief clerk to the general manager of the Memphis & Little Rock, and from October, 1883, to June, 1887, general freight agent and ticket agent of the same road. From June, 1887, to July, 1889, he was general freight and passenger agent of the St. Louis, Arkansas & Texas, and from July, 1889, to December, 1890, traffic manager of the same road, being, it will be noted, only 30 years old when he was appointed traffic manager. From December, 1890, to May, 1893, he was traffic manager of the Queen & Crescent; from May, 1893, to September, 1896, he was traffic manager of the Missouri, Kansas & Texas system; and from September, 1896, to November, 1898, vice-president. He then became second vice-president of the Great Northern. James J. Hill himself was then, and for some years later, president of the Great Northern, and it was thus that Mr. Miller's business association with him began. He came to the Burlington as first vice-president on January 1, 1902, and succeeded George B. Harris as president on January 31, 1910. He at the same time became president of the Colorado & Southern.

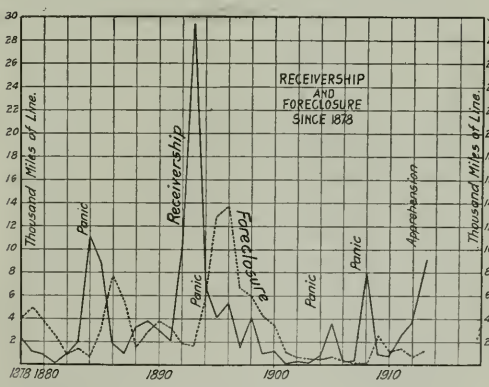
Mr. Miller's funeral was held at Trinity Episcopal Church in Chicago on Thursday afternoon at two o'clock. The active pallbearers were all officers of the Burlington and were as follows: W. W. Baldwin, C. G. Burnham, C. M. Dawes, E. A. Howard, H. E. Byram, G. W. Holdredge, E. P. Bracken, Hale Holden, T. S. Howland and C. I. Sturgis.

RAILROAD RECEIVERSHIP AND REORGANIZATION

By William Z. Ripley
Ropes Professor of Economics, Harvard University

The *Railway Age Gazette* has for a number of years annually reviewed the statistics concerning receivership and foreclosure, regarding them as one of the best available criteria of the general condition of the transportation business. This subject is one of peculiar interest at the present time in view of the fact, as will appear, that almost 25,000 miles of line are now undergoing reorganization as a result of financial breakdown. The facts, year by year, are graphically presented upon the accompanying diagram.

The intimate relationship between railroad failure and industrial depression is matter of common knowledge. An outcrop of receivership for the weaker members of the railroad fraternity is one of the first signs of trouble. Such an announcement for the Erie Railroad, as Sprague puts it in his admirable study of



Miles of Line in Receivership and Foreclosure 1878-1913

panics for the United States Monetary Commission, "has been a customary feature of our commercial crises for half a century." In 1857, in 1873, with the Grant and Ward failure in 1884, in 1893, and again within a hair's breadth of it in 1907, has this historic property served notice upon the community of widespread financial distress. The Northern Pacific went down with Jay Cooke in 1873, and again twenty years later. The Philadelphia & Reading was in receivership in 1884, and nine years thereafter a second time. All along the line, to be sure, are scattered sporadic failures of important companies during time of fair weather, such as the Rock Island, the Reading again and the Union Pacific in 1880; the row-of-bricks downfall of the Gould roads in 1888-91; and the Chicago Great Western affair in 1909. These independent collapses, however, may be regarded as local phenomena due to individual mismanagement or inherent weakness. In the main, railroad failure, as of course one might expect, characterizes and concentrates about panic years. What is the situation at the present time?

The diagram of railroad receivership and foreclosure for a period of almost forty years, is based upon the miles of line

affected. The outstanding feature has already been mentioned, namely, the close connection between transportation and commercial or industrial distress. This is first noticeable on a generous scale in 1884, when 11,000 miles of line were precipitated into receivership; and again in the fall of 1907 (1908), when 18,000 miles of road succumbed. The short, sharp panic of 1903 alone stands forth upon this record by way of contrast, as practically unproductive of railroad disorder. It well deserves the name of a "rich man's panic." Interest at this particular time focuses naturally upon 1913-14. It appears as a time of "apprehension"; but that it is a period of "realization" of trouble as well, is indicated by the rising mileage of railroads in distress. Judged by this standard, the present day bears definite earmarks of severe depression. Yet the fact deserves mention, of course, that the railroads seem peculiarly marked out for suffering, for the well understood reason of steadily rising costs of operation along with fixity under governmental regulation of the rates chargeable for service rendered.

A notable feature of the diagram is the extraordinary prominence of railroad distress in 1893-94. All records in this regard —it is to be hoped forever—were broken when the control of an unprecedented mileage was handed over to officers of the state and federal courts. On June 30, 1894, 192 companies were in the hands of receivers, of which 126 had been consigned thereto during the preceding year. The total mileage operated by these defaulting roads was 40,818. The stocks and bonds affected by receivership aggregated two and one-half billion dollars—that is to say, one-fourth of the total railroad capitalization of the United States at that time. Thus was a dire penalty exacted for the violation of inexorable economic laws throughout a large part of the preceding decade of development.

Yet another point, while we are about it, is emphasized by this chart. This is the sequence in point of time of the allied phenomena of receivership and foreclosure. The latter follows the former in frequency like a shadow after an interval of about two years. This will be observed in 1884, 1893 and 1907. Events are now shaping themselves to bring about a similar sequence in 1914. Almost 23,000 miles of line, principally in the Gould and (old) Rock Island systems, are just now either in process or in need of reorganization. Most of the other properties in distress consist of a half dozen independent enterprises, such as the Kansas City, Mexico & Orient; the Atlanta, Birmingham & Atlantic; and the Moffatt road in Colorado. The troubles of these last named railroads are somewhat peculiar, and are, in the main, due to local circumstances; for most of them represent invasion of territories in which great banking and railroad interests were already firmly intrenched. Undoubtedly the hostility of the great powers to these independent companies has been an appreciable factor contributing to their downfall.

One feature of the present situation contrasts rather strikingly with past experience. A larger proportion than usual of these properties in distress seems likely to pass directly into reorganization without the intervention of receivership at all. On the whole, despite the recent distress there has been a relative decline in judicial interference with embarrassed roads. Decade by decade, a decided subsidence in the railroad mileage thrown into the hands of receivers has taken place. According to recent evidence in the *Railway Age Gazette*, as set forth in the following table, judged by any of the three standards, number of companies, mileage or aggregate stocks and stocks and bonds, the last decade compares most favorably with either of the other two. The contrast with the 80's is even more striking, when one considers these figures in the light of the relative size of the railway net at that time. With all our phenomenal development, receivership still is absolutely less, and very substantially so, than ever before in a similar period of time.

	Receivership		
	First Decade, 1882-91	Second Decade, 1892-01	Third Decade, 1902-11
Companies	279	222	86
Mileage	37,816	62,266	17,574
Capitalization	$1,884,000,000	$3,543,000,000	$1,245,000,000

Nor is this condition of diminishing receivership due to a mere change of fashion in procedure. Substantial economic forces are at work. In the first place, a rigorous process of natural selection has weeded out many of the feeble and unfit roads. A railroad seldom perishes from the face of the earth. It finds refuge instead in alliance with stronger companies. A more powerful and definitely organized banking support is also probably in some measure accountable for the greatly improved record. The prejudicial effect upon the prestige of official bankers is sufficient to make it worth their while to ward off receivership even at heavy cost. It is the railroads without banking friends, such as the Gould roads, which are taken most readily out of the hands of their stockholders and given over to the mercy of an officer of the court. But undoubtedly the most important influence of all in lessening the frequency of receivership, decade by decade, has been the growth and filling up of the country—traffic having developed, that is to say, more in proportion to the facilities for transportation provided. For it is one of the fundamental axioms in the economics of transportation that a growing density of traffic is the most certain panacea for the financial ills to which railroad flesh has fallen heir. All of which lends added interest to the record now in the making. Have we seen the end of present troubles? Or are there more receiverships yet to come? It is our prediction that already the worst is known and that better things will soon be in sight.

A QUESTIONNAIRE FOR STATION AGENTS

Did you—

See that brakes were set on those cars when you went home?
Lock those stock chute gates when last used?
Clean those batteries when they needed it?
Let that guy get off with your hatchet?
Turn in that extra impression book?
Lock those trucks after being used?
Put locks on those toilets?
Fill that red light?
Turn in that extra stationery?
Make that broom last another month?
Break that black lamp chimney, or clean it?
Scrub the waiting room and office this week?
Mark that shipment or guess it off with the shipper?
Put that freight inside to keep from being pilfered?
Look at switch stand after train passed to see if locked?
Sign that bill of lading before you looked at the freight?
Act courteously to that passenger, or snap his head off?
Use a new lamp burner when that old one could have served?
Remove that chunk from platform so no one would be injured?
Put those stove legs and shovels where you could find them next year?
Answer that telephone or make a customer wait for his information?
Accept that shipment of household goods with pasteboard tags, or make them use linen tags?
Leave the cork out of your ink bottle so it would evaporate, causing you to order again next month?
Did You?

—*M. K. & T. Employes' Magazine.*

British Railways in Venezuela.—It is reported that the new branch line of the so-called Bolivar Railway from Palma Sola to San Felipe is approaching completion, and that this railway paid in 1913 for the first time a small dividend on its common stock. The main line runs from Tucacas to Barquisimeto, with a branch to Aroa, where the South American Copper Syndicate, a British company, is working the copper mines very successfully. The Central Railway is extending its line which runs from Caracas inland, from Santa Teresa to Ocumare and Cuan and the work is progressing satisfactorily. The Caracas & La Guaira Railway had a successful year, though traffic on that and on all other lines was affected in the latter half of 1913 by political unrest.

Chicago, Burlington & Quincy 2-10-2 Freight Locomotive

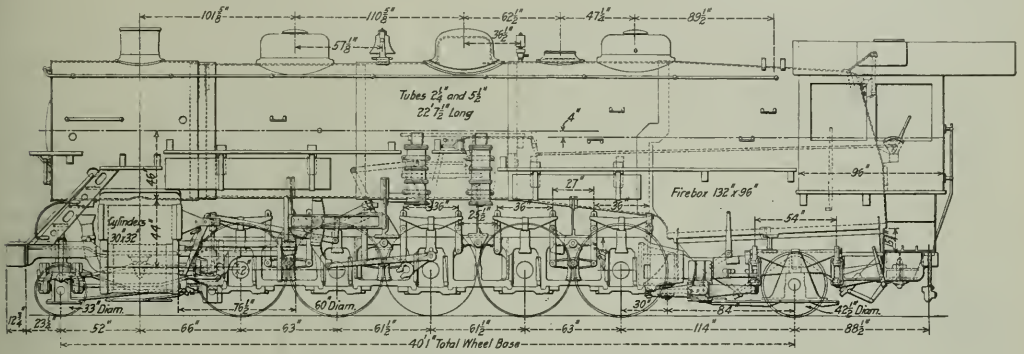
Second Order Includes Refinements in Design Effecting a Reduction of 16 Per Cent in Reciprocating Weights

Ten locomotives of the 2-10-2 type have recently been built by the Baldwin Locomotive Works for the Chicago, Burlington & Quincy. In the spring of 1912 the Burlington received five engines of the same type which were described and illustrated on page 1006 of the *Railway Age Gazette* for May 3, 1912. They have proved efficient and economical in handling heavy coal traffic, and the general design of the new locomotives closely follows that of the original order. The rated tractive effort of all these locomotives is 71,500 lb., and with a large number of interchangeable parts, they constitute a notable group of unusually large units.

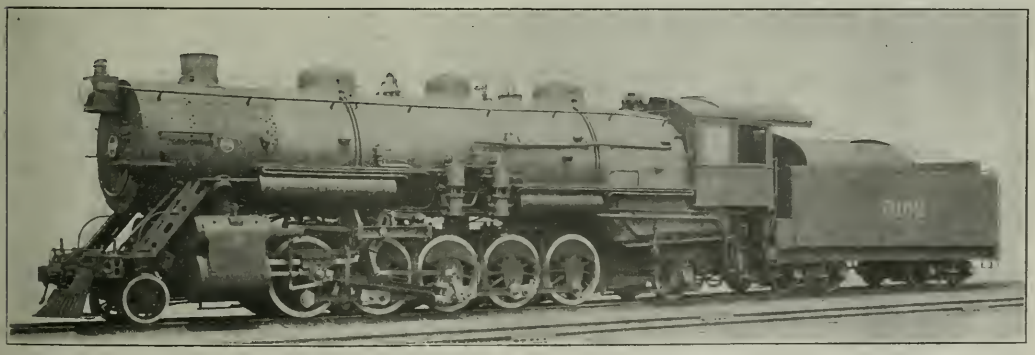
One of the most difficult problems, in designing large locomotives with comparatively small driving wheels, is to properly counterbalance the reciprocating and revolving weights. A number of eight and ten-coupled locomotives built by the Baldwin Locomotive Works have been fitted with counterweights keyed to the main axle; and these, in conjunction with the usual weights in the wheel centers, have balanced a sufficiently large proportion of the reciprocating and revolving parts to avoid destructive effects at the speeds at which these engines are run. This arrangement is used in eight of the ten new Burlington locomotives. In the two remaining locomotives, the weights of the reciprocating parts have been sufficiently reduced, by the use of special steels, to avoid the necessity of applying additional counterweights. The illustration shows one of the two locomotives equipped with the lighter parts.

The pistons of this locomotive have dished bodies of .40 per cent carbon steel, annealed. These are riveted to cast iron bull rings, which are 6 in. in width, widened to 8 in. at the bottom to give ample bearing area. The packing rings are also of cast iron. The piston rods are of nickel-chrome steel, annealed. They have a diameter of 4¾ in., with a 2½ in. diameter hole in the center. The crosshead is of the Laird type, with an unusually light section. The body is of .40 per cent carbon steel annealed, and the bearing shoe is of bronze. The piston rod has a taper fit in the crosshead, and is secured by an oil-tempered steel key; while the crosshead pin is of nickel steel. The main and side rods, stub straps, and main crank pins are of nickel chrome steel, annealed. The main pin has a fit in the wheel center 9 in. in diameter, and is drilled with a 4 in. hole. The main driving axle is of vanadium steel. All the rods are channeled to an I-section. The eccentric crank has been lightened, to reduce the weight on the main pin. It weighs 125 lb., as against 160 lb. for the cranks used on the previous engines.

The use of special materials, as described above, has effected a saving in weight of reciprocating parts on each side, amount-



Elevation of Burlington 2-10-2 Type Freight Locomotive

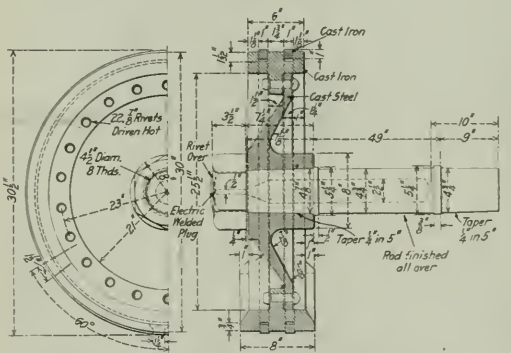


Heavy 2-10-2 Type Freight Locomotive for the Chicago, Burlington & Quincy

ing to 379 lb., or 16 per cent, as compared with the other locomotives using heavier parts. The balancing of the main wheels is greatly improved, and there is a material reduction in the amount of excess weight to be applied to the other wheels. The result is less wear and tear on the locomotive and track, while the lighter parts are more easily handled in the shop when making repairs.

The frames are 6 in. wide, each main frame being cast in one piece with a single rail front section; while the rear sections are separate, and of slab form. The frames on the original order of five engines had double rail front sections, both rails being separate from the main frames; and the rear sections were of bar construction with pedestals through which the trailer axles passed. The rear truck is of the Hodges type, and is equalized with the fourth and fifth pairs of driving wheels. The back truck spring hangers are pinned to brackets, which are bolted to the engine frames. These brackets, together with the foot plate, serve as supports for a wide expansion plate which carries the back end of the firebox. The front end of the firebox is also supported on an expansion plate. This is bolted to a steel casting, which supports the radius bar pin for the trailer truck, and also braces the frame at the splice between the main and rear sections.

The boilers of the ten new locomotives are all alike and are



Dished Piston with Hollow Rod of Nickle-Chrome Steel

of the same general dimensions as those of the 1912 order. The firebox is equipped with a Security sectional arch supported on four 3½ in. tubes, and a Street mechanical stoker is applied. The longitudinal seams on the barrel rings are all placed on the top center line. The main dome is placed on the second ring and the auxiliary dome on the third, and the seams on these rings are welded throughout their entire length. The opening under the auxiliary dome is 16 in. in diameter, so that a man can enter the boiler to make an inspection, without dismantling the fittings in the main dome. The superheater is of the Schmidt top-header type, with 45 elements, and a superheating surface of 1,232 sq. ft. With ample grate area and heating surface, mechanical stoking, and high superheat, this boiler is considered fully capable of supplying all the steam needed for the most severe class of service.

The continued use of this design of locomotive on the Burlington, after thorough service tests of the locomotives built two years ago, indicates the adaptability of the 2-10-2 type for heavy freight service. With 25 per cent greater hauling capacity than a Mikado type locomotive carrying the same weight per pair of driving wheels, this type will, under favorable conditions, effect a material reduction in the cost per ton mile of moving freight.

The principal dimensions and ratios are given in the following table:

General Data

Gage	4 ft. 8½ in.
Service	Freight
Fuel	Bit. coal
Tractive power	71,500 lb.
Weight in working order	370,000 lb.
Weight on drivers	293,000 lb.
Weight on leading truck	27,900 lb.
Weight on trailing truck	49,100 lb.
Weight of engine and tender in working order	about 555,000 lb.
Wheel base, driving	20 ft. 9 in.
Wheel base, total	40 ft. 1 in.
Wheel base, engine and tender	74 ft. 9¼ in.

Ratios

Weight on drivers ÷ tractive effort	4.1
Total weight ÷ tractive effort	5.2
Tractive effort × diam. drivers ÷ total equivalent* heating surface	596.1
Total equivalent* heating surface ÷ grate area	81.8
Firebox heating surface ÷ total equivalent* heating surface, per cent.	18.8
Weight on drivers ÷ total equivalent* heating surface	40.7
Total weight ÷ total equivalent* heating surface	51.4
Volume both cylinders	26.2 cu. ft.
Total equivalent* heating surface ÷ vol. cylinders	549.8
Grate area ÷ vol. cylinders	6.7

Cylinders

Kind	Simple
Diameter and stroke	30 in. by 32 in.

Valves

Kind	Piston
Diameter	15 in.

Tubes, number and outside diameter	264—2¼ in.
Flues, number and outside diameter	45—5½ in.
Tubes, length	22 ft. 7½ in.
Heating surface, tubes and flues	4,966 sq. ft.
Heating surface, firehox†	383 sq. ft.
Heating surface, total	5,349 sq. ft.
Superheater heating surface	1,332 sq. ft.
Heating surface, total equivalent*	7,197 sq. ft.
Grate area	88 sq. ft.

Tender

Tank	Water bottom
Wheels, diameter	33 in.
Journals, diameter and length	6 in. by 11 in.
Water capacity	10,000 gal.
Coal capacity	15 tons

*Total equivalent heating surface = evaporating heating surface + 1½ times the superheating surface.
†Includes brick arch tube heating surface.

INDIAN AMBULANCE TRAIN.—Certain portions of the North Western State Railway of India were constructed almost entirely for strategic purposes, which would be much assisted by a traveling hospital. The company has therefore built an ambulance train at its Lahore shops with this end in view. The train includes a hospital car, a kitchen car, a dispensary and staff car, and a medical officers' car. Each of these cars has a 61 ft. 9 in. body, and is carried on two four-wheeled trucks. The hospital staff car, which is 64 ft. 2 in. in length over the buffers, is divided into two sections. In one section are three compartments, of which one contains berths for two hospital assistants, another contains berths for four ward servants, while a third and larger compartment has berths for two Indian N. C. O.'s and four Sepoy ward orderlies. The other section contains four compartments, having four berths each, respectively, to accommodate four dhabies, eight cooks, and four sweepers. The hospital car is also divided into two sections, each of which contains a bath and lavatory and berths for 12 sick persons. The kitchen-car is divided into British kitchen and pantry, store, Hindu and Mahommedan kitchens. In the dispensary and staff car there are berths for two British N. C. O.'s and eight men, while the other half of the car contains dispensary and office, and beds for two assistant surgeons. Accommodation is provided in the medical officers' car for two lady nurses and two medical officers, and there is also the officers' mess and accommodation for four native servants.

Annual Meeting of Superintendents' Association

Discussions on Freight Transportation, Train Rules, Personnel; and Addresses by Two Veteran Officers

The twenty-seventh annual meeting of the American Association of Railroad Superintendents was held at the Hotel Cumberland, New York City, on Thursday and Friday, August 20 and 21, with President Charles Burlingame (Wiggins Ferry Co.) in the chair. The members of the association, nearly all of whom were from places west of Buffalo, were welcomed to New York by J. C. Lincoln, traffic manager of the Merchants' Association of New York. Mr. Lincoln was formerly a railroad traffic officer, and assured the superintendents that their society would have the cordial co-operation of the New York merchants.

President Burlingame, in his opening address, exhorted the members to put their best efforts into the committee work, with a view to sending sound and well-considered conclusions to the American Railway Association. The superintendents should never fear to recommend a new thing if it has merit. This association should back up its sister associations in every reasonable way. For example, the recommendation that rubber stamps be used to stamp the name of the shipping point on every package of freight should receive the attention of all superintendents; and if it is an economical and useful idea, it should be endorsed. The local freight agents' association has recommended that a standard board be put on steel cars for carrying cards; the superintendents should be able to say whether or not this proposal merits approval. The American Railway Association, with its co-ordinate associations of subordinate officers, ought to be developed into a strong law-making body. The railroad world is so extensive and important that it should be a law unto itself; and there is much work to do.

Mr. Burlingame, in working up interest for this meeting, had written to the general managers of railroads with which association members are connected, and of 50 such letters 41 had elicited favorable replies. Superintendents who may be in doubt as to whether they are justified, in their own interest, and that of their employers, in devoting time and energy to this co-operative work may be assured by this fact that the work of the association is appreciated among the higher officers.

Mr. Burlingame had received invitations from the Central of New Jersey, the New York Central & Hudson River and the Long Island roads requesting the members to avail themselves of all facilities and to inspect features of interest. On Saturday, following the close of the convention, many members accepted these invitations.

The report of the Secretary showed a membership of 266, an increase of 121 over the number reported one year ago. The members come from 135 different roads.

At this point the association listened to an address by R. V. Taylor, vice-president and general manager of the Mobile & Ohio, on "Organization." Mr. Taylor said in part:

"If I should be called upon for my opinion as to the official most important to the success of any railroad organization, I am certain that I could with perfect truthfulness say the superintendent. His duties are of a manifold character. They have to do not only with the maintenance of the property and the movement of the traffic, by which he is brought in touch with its actual working forces, but they bring him into close relationship with the patrons of the company from which it draws its life blood. Upon his good judgment and tact depends the relationship of the corporation to the municipalities, and every part of the management must rely upon his intelligence, integrity and industry.

"The subject of organization is a great one, and I can hardly hope to express in a condensed form some of the general views founded on 37 years of active railroad experience. . . . The grand divisions pertaining to the maintenance and operation of a railroad's property, the roadway, the equipment, the transportation, the traffic, the legal, the accounting and the treasury departments are merely convenient groupings of individual factors which still retain their relationship to the whole, and are so divided only that the managing head may be enabled to quickly and fully understand the part which each unit is performing, and that he may be able to direct in the most effective way the forces at his command.

"I have been much impressed by the accounts of the hurried preparation for the great war which is now being waged beyond the sea; how as the successive grades of the reserves have been called for, each man responded by number, to find his uniform already provided and stored at a convenient central point and with the exact part he was expected to play, as well as the terrible purpose of the aggregate, grimly but clearly before him.

"In the creation of a railroad organization, the ruling purpose should always be to provide by a methodical and orderly arrangement of forces, the means by which the guiding hand may, in the most direct and effective way, reach down through each successive form of supervision to the man who actually does the work. . . . The managing man should never permit any delegation of authority on his part to destroy a direct and positive relationship between himself and each one of the individual units under his control. Napoleon Bonaparte, who was probably the greatest organizer of men the world has ever seen, prized his title of "Little Corporal," which he won upon the bridge at Lodi by leaving his position of command to fight in the ranks, more than all of the honors with which his imperial brow was crowned: and the connection he maintained with the individuals constituting his army is impressively illustrated in the picture which shows a sleeping sentry awakening to find the emperor keeping watch while he slept.

"Napoleon's best lesson, however, to any organizer of men, lies in the fact that he taught each of his soldiers to feel that he carried a marshal's baton in his knapsack. Any railroad manager who does not impress upon his men the fact that all promotions will be made from their own ranks, fails to employ the greatest power at his command to create enthusiasm and solidarity among his forces.

"In administering discipline, courage and consideration, firmness and fairness, should go hand in hand. As long as we deal with human agencies we must consider human imperfections. Weakness in the application of discipline brings the management into contempt, while extreme harshness creates a feeling of resentment scarcely less destructive to best organization.

"Esprit de corps is of the highest value. 'It implies sympathy, enthusiasm, devotion and jealous regard for the honor of the body as a whole.' It cannot, however, exist when discipline is absent. It is to the organization what the spirit is to the body; it is all-pervading and ever-present; it acts alike upon the highest and lowest; it makes the president of an organization speak with swelling pride of *his* officers and *his* men; it makes the call boy at the roundhouse couple himself and the president under the common word 'us.' . . ."

Speaking of the value of co-operation and hearty loyalty, Mr. Taylor gave examples from his own experience. Being away from home on the occasion of a great flood, he was gratified to find on returning that his subordinates had worked with great efficiency and had saved many thousands

of dollars for the company, by each doing his part in a well ordered plan. Every manager should have an organization which will work well in his absence. When the late Samuel Spencer expressed regret at the resignations of certain officers, Mr. Taylor assured him that his (Taylor's) single section of the Southern Railway system was prepared to supply the required number of officers to fill all vacancies, and, moreover, that there were understudies in the service ready to take the place of the men who might be thus promoted.

Continuing, Mr. Taylor said:

"It is popular in these days to criticize railroad management and railroad managers, and while I hold no brief for the misdoings, either large or small, which have crept into the management of some of the railroads of this country, I am certain that there never was a more courageous, honest, intelligent and industrious set of men, as a whole, engaged in any business, than those who are devoting their lives to the transportation service of this country; and whether for the purposes of peace or war, I do not believe there ever has been a more effective organization of men than that under which these great affairs are managed and controlled."

NEXT YEAR

The executive committee reported in favor of holding the meeting of the association next year at San Francisco, on Thursday and Friday of the third week in May; and this recommendation was adopted unanimously.

The nominating committee, W. L. Booth, W. J. Blizzard and J. H. Abrams, reported in favor of the re-election of all of the present officers and members of committees, and this conclusion was adopted by the association. It was based on the general feeling that the policies of the present administration ought not to be interrupted. The office of second vice-president, being vacant, was filled by the election of W. S. Williams (Illinois Central). The other officers are as follows: President, Charles Burlingame (Wiggins Ferry Company), St. Louis, Mo.; vice-president, H. R. Saunders (C. R. I. & P.), Kansas City; secretary, E. H. Harmon, St. Louis. Chairmen of committees: Transportation, E. H. Shaughnessey (C. & N. W.); Interchange Car Inspection, M. Marea (St. Louis T. & E.); Arbitration, A. E. Boughner (M. K. & T.); Train Rules, J. E. Scott (G. C. & S. F.); Executive, A. G. Smart (C. B. & Q.); Arrangements, G. J. Shreeve (Belt Ry. of Chicago).

THURSDAY AFTERNOON

The election finished the forenoon session. In the afternoon the first discussion was on the report of the committee on transportation, E. H. Shaughnessey, chairman. The report first took up the subject of marking, packing and stowing freight, and summarized what had been done by other associations. The committee recommended that the rules on this subject be rigidly enforced. The closest supervision is necessary everywhere, and yet no two roads appear to have the same instructions. A considerable number of roads have traveling inspectors to educate agents, but very few have printed instructions. A committee of the American Railway Association has formulated a code of rules, 89 in number, and the best thing that this association could do would be to devise ways of properly enforcing these rules, when promulgated. Continuing, the committee said:

"A division office should be created for the purpose of supervising the marking, packing and handling of freight and enforcing the rules in relation thereto. This officer should have authority equal to that of a trainmaster. If the business on the division does not warrant an additional officer, the duties assigned to the trainmaster or his assistants should be adjusted so that he can make this feature a part of his work without loss of efficiency along other lines. On one of the large western roads out of Chicago, just recently the trainmasters have been relieved of all routine office work so that their entire time could be given to supervision on the road, specializing in loss and damage matters; and good results have been secured, principally along educational lines. Education is the prime necessity. The loyal conductor or brakeman who would not think of violating an operating rule will through ignorance cause continual damage to freight through improper loading. This also applies to the freight house forces. The only satisfactory way to correct them is to do so on the ground by a responsible representative. Admonition suited to the disposition of the person at fault, delivered verbally, is worth countless circulars.

"Reports on over, short and damaged freight should be handled by a higher priced clerk than is generally the practice at present. It is customary on some roads to delegate this work to a clerk once removed from an office boy, whereas it should be handled by a person of good judgment who can draw logical conclusions and compile satisfactory statistics for the superintendent and for the man on the road.

"This organization should be permanent and not dependent on crop reports. . . . Good results can only be obtained by constant energetic efforts throughout the year."

This part of the report was discussed at length by Messrs. Williams (I. C.), Smart (C. B. & Q.), Cox (Atlanta & West Point) and others. The Illinois Central made a great reduction in reports of irregularities by beginning, about five months ago, to rigidly enforce the rule that consignees shall receipt for all freight immediately on delivery. Mr. Farley (A. T. & S. F.) told of the work of the inspectors on the different divisions of that road, as described in the *Railway Age Gazette*, August 7, last. On the Burlington, the investigation of losses has been so improved that now, in 70 per cent of the cases, the claim agent has his data well in hand before the claim reaches him. On the Atlanta & West Point, by the employment of a special man, at $110 a month, acting as the special traveling representative of the superintendent, information concerning losses is now promptly gathered and the work of the claim department has been almost revolutionized.

Vigorous expression was given to the idea that the superintendents' association, as soon as it becomes strong enough, should fight out with the traffic department the question of requiring more substantial packages. To accept goods in paper boxes of insufficient strength and at the same time try to move freight in trains of 100 cars each is an impossible task. The paper boxes now furnished by many shippers cannot be put in the bottom of a car, to be subsequently covered by other freight, and therefore it is impossible to load freight in station order. The weighing and inspection bureaus should be made use of in the enforcement of rules about packages and about marking, as the bureaus usually have a higher class of employees than do the roads. It pays to have enough men of the right quality to handle freight properly.

Mr. Farley thought that paper boxes of approved design caused little trouble. They are better than 75 per cent of the wooden boxes.

IDENTITY OF MEN EMPLOYED IN TRAIN AND YARD SERVICE

On this subject the committee reported additional information in connection with a paper read at the last annual meeting. In Chicago the street railways, employing large numbers of men, have photographs taken of all applicants. The same method is employed in St. Louis, Kansas City, Milwaukee and Los Angeles. A photographer contracts to make pictures of men at 7 for 15 cents or 11 for 25 cents. Photographs are attached to letters of inquiry sent out to learn about an applicant's record. In Chicago, a hundred undesirable characters were detected in two years by means of photographs. The committee believes the plan of requiring photographs of all applicants for employment would be entirely feasible and not expensive, and it would have a good moral effect from the beginning.

On this part of the report there was a long discussion in which were brought out many facts concerning difficulties dealing with "boomers" and others who apply for work in

freight yards and on freight trains when there is a rush of business, and who do not intend to remain permanently in the service. There are men who will send substitutes to the medical examiner, if this trick is not carefully guarded against, and, no doubt, the photograph safeguard would be circumvented if there were any possible way to do it. Sale of counterfeit letters of recommendation is said to be flourishing in more than one city. It was stated that in Oklahoma there is a law requiring that "service letters" given to employees shall be written on plain white paper, to be furnished by the employee himself. For reasons that can be readily understood, a rule calling for photographs would at once be objected to on the ground that the roads were preparing a "rogues' gallery."

Some members have had trouble with dishonest men applying for the position of telegrapher, and there was a demand that the photograph rule, if adopted, should be made to apply to that department as well as to the train-service department.

This part of the report contained no recommendation for any specific action and as the committee intends to continue its studies the report was referred back.

EFFICIENCY OF DIVISION ORGANIZATIONS

The secretary next read that part of the report dealing with the question of efficiency of division organizations. This consisted of mainly a strong plea for a regular assembling of the different subordinates of the division superintendent for consultation and for inspection trips. The committee described at length what was done on the Illinois Central last winter as reported in the *Railway Age Gazette*, April 17, 1914. Mr. Williams, superintendent of the Illinois Central division referred to, said that his road had adopted the plan of a special train, to run over the division, periodically, to be put in effect throughout the company's lines.

Mr. Boughner (M. K. & T.) told of the practice on his road. An inspection train is run over the road each month, carrying two cars to collect scrap; one oil car; one stationery car, and one with track supplies. Where there is not much scrap to be collected the cars are run on the local freight, but then no picking up is done. So far as the collection of scrap is concerned, the speaker thought that the use of such a train, in a business-like manner, ought soon to remove the necessity for it, but it is a great educational opportunity for each department to have a chance to check, at every station, the work in which he is interested.

On the Belt Railway of Chicago a special train is run every Monday to pick up scrap. Mr. Burlingame (St. Louis) has scrap thrown into large boxes, and a derrick car is sent out periodically to pick up these boxes and put them on platform cars. He thought that the piece-work method might be applied to this work.

This part of the report also was referred back to the committee, the chairman having been obliged to present it to the meeting without full consultation with all of the members.

In connection with the suggestion for further investigation by this committee the point was brought up by Mr Cuineen (C. N. E.) that every railroad superintendent could do a good turn, when traveling on other roads, by reporting to the superintendent of such other roads any observations which he might make, looking to the good of the service. That many irregularities flourish because the superintendent cannot have his eye on all parts of the road at all times is too well known to need mention; but in addition to this, the mere fact that the superintendent-passenger is unacquainted with the road will often make his observations instructive to the man on the ground.

INCREASED EFFICIENCY OF FREIGHT CARS

Reporting on this subject the committee presented the usual arguments in favor of pooling freight cars. Mention was made of an arrangement, said to be in effect in Peoria, under which two roads having a heavy interchange business have put on a joint crew to do all of the transferring, the expense being equally divided. Reporting on the handling of explosives, the committee recommended that the Bureau of Explosives have more lecturers and that all employees whose duties make it necessary or desirable should be required to attend the lectures. Most violations of the rules are discovered by the inspectors of the bureau, indicating that there is not sufficiently minute supervision by the officers directly in charge. Failure to remove placards from a car which has been used to carry explosives is one of the prominent causes of carelessness. The men come to have insufficient respect for the cards.

MR. UNDERWOOD ON THE QUALIFICATIONS OF THE SUPERINTENDENT

At the close of the foregoing discussion the meeting listened to a paper by F. D. Underwood, president of the Erie Railroad. Mr. Underwood began by recounting his own recollections of the time when he was an assistant superintendent and later a superintendent. Looking back he felt sure that in those days he fell far short of the essential qualifications which he was now describing and, said he, "I should like a chance on a busy superintendent's division, to prove that I could now be a better superintendent than I was then." The paper then went on to summarize the main qualifications that a good superintendent should possess, in substance as follows:

"A superintendent should not do physical acts that can be done by someone else. The bawling and hauling that we old-timers did is unwise from several points of view. A real superintendent is around, about, over and under the job; but never conspicuous. By this I do not mean 'gum shoe' methods.

"Reticence is a great quality. Hear everybody on *any subject they have a mind to exhibit* Sort out what is useful; but say nothing. A silent man commands both respect and admiration. When one has to speak, speak low. A man who is never angry is not an efficient boss; but the spur of anger (and it is a good one) should be concealed. It should be used but to stimulate the stroke, never paraded.

"There are on all sides those who bluster, plead, lie and bring pressure to move a superintendent to undo really essential things. . . . Quietly sidetrack them when you are *sure* you are right; never willingly recede from a position that is fair. Be slow to take a position that contains a probability of retreat.

In the doing of all official things be open and frank. Many of your staff and all of the rank and file think that there are tricks in the trade. Show them that there are none. There is no more transparent business than operating a railway.

"Breaking a rule, or doing something outside of the rules is many times an offense to be condoned—provided the offender has brains. His action showed him fearless and perhaps resourceful. There are the seeds of a good man in every rebel. Mentally pussy-footed men are not desirable from a 100 per cent efficiency standpoint. Even the 'argufyer' has his uses.

"In the disciplining of employees some things had better remain unseen. Seek to instil into every employee the truth that each year of his service improves and cements his relationship with the company; that the aim is to have men permanent; to have them grow old in the service. Bear in mind that permanency makes for efficiency. . . .

"A superintendent is necessarily a go-between; between the public, the company and the employees. From distant headquarters he may be directed many times to do things that when done are misfits. He should be on such terms of confidence with headquarters that his opinion would be sought in advance, and should carry weight. Or, when action is taken without his knowledge or recommendation, his suggestion should have weight as a stay.

"You cannot do better than to stick close to the proverb: 'Wisdom is the principal thing; therefore get wisdom.' I sometimes think all cautionary signs should come down

and have painted in their place 'Wisdom.' Figuratively, it should be the last and the first word in every rule. . . ."

FRIDAY

The first business on Friday was a discussion of the report on train rules. Numerous proposed changes in the standard code have been under discussion for more than a year past by a committee of members of this association and of the Train Despatchers' Association. A report was made at the annual meeting one year ago; and the same subject was discussed by the train despatchers at their last annual meeting at Jacksonville, Fla. Considerable work has been done by the committee since then, and the present discussion was to explain the details of this work for the members of the superintendents' association. The report was in the nature of a progress report, as the proposed changes were not of such a nature as to be susceptible of discussion by the association in a general meeting, and no formal recommendation was presented by the committee.

The subject was presented by J. E. Scott (G. C. & S. F.), chairman of the train despatchers' committee. Mr. Scott presented cogent arguments in favor of certain changes designed to facilitate the movement of trains under circumstances where the conductor and engineman have to act without consultation with the despatcher, and pointed out certain features of the rules applicable to double-track operation which could be made applicable also to single-track. He also spoke in favor of the proposal to use green signals on the last train of a number of trains running on the same schedule, instead of using that signal on all the trains except the last. The discussion of the report of the committee also brought out an interesting discussion on the proposal to modify rule 93 so as to allow passenger extra trains to run through yards without reducing speed. The present rule is not interpreted alike by all railroad officers.

The discussion on train rules was followed by a short paper by E. H. De Groot (C. & E. I.) on "The superintendent, past, present and future." Mr. De Groot gave an interesting description of the old-time superintendent, the benevolent autocrat who accomplished great things with small resources. For the superintendent of today he recommended assiduous study, and he named a number of useful books which the railroad officer ought to read. His ideal for the future, while lofty in conception, called only for those qualifications which the ambitious and high principled superintendent can acquire by taking advantage of facilities for learning which are everywhere available.

The committee on interchange car inspection, M. Marea, chairman, presented a report recommending that the doors of freight cars be lettered, C on one side and D on the other, so as to facilitate the securing of accurate seal records. The proper identification of doors also would facilitate checking of bills for doors which are lost. Sometimes a number of bills are made for a single loss.

The committee favors a change in A. R. A. rule 15. Delivering lines should not be charged for transferring a carload of freight unless the car from which the goods are taken is delivered with a combination of defects as set forth in the M. C. B. rules. The committee declares that A. R. A. rule 15 should be printed in the code of the Master Car Builders' Association.

The committee discusses the standardization of side doors on box and refrigerator cars in the interest of greater safety and better economy. It also recommends that all end doors be made near the top of the car and be made to close and fasten on the inside. With doors thus arranged the danger and inconvenience incident to securing seal records of end doors would eventually be done away with.

This report was not discussed at great length, and it was finally referred back to the committee for further consideration. One of the members made a dissenting report, objecting to the recommendation concerning the lettering of side doors and also concerning a change in rule 15. On motion of J. M. Walsh (I. C.) it was voted that the recommendation concerning side doors be referred to the American Railway Association for its information.

Mr. Walsh next moved that all end doors be declared unnecessary, with a view to having them done away with. This led to considerable discussion. A strong argument in favor of abolishing end doors is found in the fact that many unlocated losses are due to thefts at end doors. It was said, however, that if there are no cars with end doors shippers will cut openings for themselves. Mr. Walsh declared that this would be better than having the large number of cars with end doors which we now have; it would be cheaper to repair the damage done by the shippers. A claim was made that long pieces of freight are delayed at large freight houses waiting for cars with end doors; but on the other hand, certain members testified that in their experience this inconvenience had not been of serious moment. It was observed that locking the doors on the inside would not clear up all of the difficulties, for consignees frequently would force open a door with an iron bar. Again, the absence of a lock on the outside would not make the seal taker's record unnecessary, for he should look to see if the door had been tampered with.

MASTER BLACKSMITHS' CONVENTION

The twenty-second annual convention of the International Railroad Master Blacksmiths' Association was held in the Hotel Wisconsin at Milwaukee, Wis., August 18-20, as mentioned in the *Railway Age Gazette* of August 21, on page 361.

President H. E. Gamble, in his address, laid particular stress on the vastly important part the master blacksmiths play in the "safety first" propaganda. The master smith must not only make the conditions in his shop safe, but he should also see that all work passing through his shop is capable of passing the most severe inspection. The work of the blacksmith makes possible the building and operating of railroads, and every means should be taken to perform the work in a safe and efficient manner. No work that is at all questionable should be allowed to pass out of the blacksmith shop or its jurisdiction. A special smith is employed on the Pennsylvania Railroad to take care of tools and keep them in a good, safe condition, thereby protecting the workmen. By doing this the responsibility is placed on one man and better all-around results are obtained. The members were exhorted to enter freely into the discussion and give their ideas on the various subjects presented for the good of the association and the railroads represented by the members in attendance.

ADDRESS BY A. E. MANCHESTER

A. E. Manchester, superintendent of motive power, Chicago, Milwaukee & St. Paul, addressed the convention in part as follows:

Your association is one of those that has helped, by better methods and management, to make up for some of the losses in the earnings due to increased taxes and higher rates for material and wages, railroading standing almost alone among the industries as the one that has steadily and constantly reduced the rates on the thing it had for sale, namely transportation, and at the same time has to a large extent improved its quality. But the unfortunate feature of this all is that the public, the purchasers and users of this commodity, fail to appreciate the fact that they are receiving the best and cheapest transportation in the world, and it ought to be one of the aims and efforts of every association to work for the bettering of the methods of railroad building, maintenance, and operation, and to let their lights so shine that wherever an opportunity affords they will bring forth these thoughts in a form that will help to bring a better understanding of true conditions to the minds of the general public.

To illustrate, the railroad with which I am associated has, since the year 1875, reduced its average rate of transportation from 2.5 cents per ton per mile to a rate of 0.79 cents per ton per mile for the year which closed June 30, 1913. You will see from this that the road now receives an amount equal to one-third for the unit of service as compared with 1875.

Can you think of any other commodity that is today sold at any such a depreciated rate? When these matters are referred to, the answer will probably be that your railroad is vastly over-capitalized, and that you are looking for a return on a fictitious capital, but these statements are made without a true knowledge of the facts. As to the rate received for transportation, a year ago the average rate for all the railroads in the United States was 0.75 cents per ton per mile for moving freight. In England they received 2.5 cents, in Germany 1.44 cents, and in France 1.39 cents. If the rates received in the United States were equal to those paid in the European countries, the railroads here could readily meet almost any demand that might be made upon them so far as taxation, rates of pay, etc., went and still pay a reasonable dividend on the investment in the property.

I recall a few years ago attending a political meeting, in which the speaker was trying to show what great things his party had done for the good of the people of Wisconsin. He said, "We are building in Madison a new capitol building; it will be one of the finest in the United States, and will cost about $6,000,000 to build. You will not have to pay one penny of the cost of erecting that building; it will all be taken out of the railroads." And the people cheered; that was a great hit. The party was getting something for nothing and they were to get the benefits. It is such a feeling and spirit as this that has got to be corrected and better understood before railroads will have a fair chance to maintain or improve their conditions.

FROGS AND CROSSINGS

W. F. Stanton, of the J. A. Fay & Egan Company, stated that railroads using manganese for the points in frogs and crossings realize that the work will not give the maximum service unless the bolts will prevent the moving or racking of the parts. In order to overcome the stretching and breaking of ordinary bolts, one road has resorted to heat-treating them, requiring the following physical characteristics of the metal: Tensile strength, 100,000 lb. per sq. in.; elastic limit, 75,000 lb. per sq. in.; elongation in 2 in., 15 per cent; reduction in area, 40 per cent. These bolts are hardened and tempered and have given very good results. In the discussion it was mentioned that the Oregon Short Line sends out a crew with a couple of cars fitted up to repair frogs and crossings on the line, such as putting in new rivets, bolts, etc. This has been found to be very satisfactory.

CARBON AND HIGH-SPEED STEEL

George F. Hinkens (Westinghouse Air Brake Company) spoke of the necessity for the tool smith to know definitely just the process to use in tempering each different kind of steel. All the different alloy steels, tungsten, chromium, vanadium, etc., will require different treatment, which can be best obtained by experimenting, as they will all require special processes. The furnace used for hardening high-speed steel should be so constructed that the oxygen of the air from the blast and fuel openings will not attack the metal. A furnace within heated from a furnace without would be ideal. Special care must be taken in not working high-speed steel at too low a heat.

H. A. Hatfield (Canadian Car & Foundry Company) believed that when ordering steel much better results will be obtained by giving full information as to what it is to be used for rather than by ordering by specification. In this way there can be no misunderstanding of what grade of steel is required, and the manufacturer will be in a better position to furnish it. After the steel has been received each tool made from each specific kind should be marked and the hardness noted so as to guide the tool smith in performing his work. The hardness testing machine is of particular value in establishing standard tools and its constant use is advisable for this end. The location of the hardening plant should be given careful consideration and should be far enough away from heavy machinery to prevent vibration of the temperature recording instruments. A direct vision spectroscope has been found advantageous in this work.

TOOLS AND FORMERS

H. G. Sharpley (Lima Locomotive Corporation) spoke of the importance of equipping smith shops with modern smith shop machines where the amount of work warrants their installation. Where these machines are installed it is the duty of the smith shop foreman to devise suitable tools and formers to be used in them so that they may be used to their greatest efficiency. There is no question that in many shops the cost of production could be materially decreased by the use of satisfactory machines and special formers.

Other papers were presented illustrating various types of formers that have been used on forging machines, that materially reduced the cost of production.

DROP FORGING

F. F. Hoeffle (Louisville & Nashville) spoke of the good work that may be accomplished by the use of drop forging machines. However, he mentioned that in many cases where the quantity of work did not permit of buying one of these machines, very good results could be obtained with drop forging dies under the steam hammer. For small jobs and those not requiring very accurate finish he has had very good success with cast iron dies. It was pointed out in the discussion, however, that these dies would not give entire satisfaction and steel dies would give much better service. Some members stated that they were forced to use cast iron dies in order to get any dies at all as they experienced considerable difficulty in getting the machine shop to provide the dies required. Scrap axles were recommended for making dies, but .50 to .60 per cent carbon steel was believed to give the best result. The main point in making dies for drop forging machines is to so design them that the metal will flow freely. In this respect, it was stated that where forgings of irregular shape are made the heavy offset should be made in the upper die, as the metal would flow much easier into that die than the bottom die.

SPRING-MAKING AND REPAIRING

F. F. Hoeffle (Louisville & Nashville) laid particular stress on the importance of obtaining the proper grade and kind of steel for springs, and in tempering, the amount of carbon contained in the steel must be considered. Springs should be set so that when they bear the greatest load they will carry it in an almost straight position. The life of springs depends a great deal upon the roadbed, flat wheels, low rail joints, design of spring rigging, etc. The spring leaves should be of equal thickness so that the load will be distributed proportionately on all plates. Other members pointed out that it is an excellent plan to punch the date when a spring is placed in service on the band so that an accurate record may be kept of their mileage. Vanadium steel has been used by a few of the members with great success, but it was pointed out that when tempering, a pyrometer should be used so that the temperature may be accurately regulated.

John Carruthers (Duluth, Missabe & Northern) gave the following process for tempering vanadium steel springs: The springs are first heated to a temperature of 1,700 deg. F. and set to shape, then cooled in oil. They are again heated to 1,650 deg. F., cooled in oil and then drawn in a tin bath to 1,000 deg. F. The tin bath is used instead of lead as it has been found vanadium steel will float in a lead bath. Pyrometers are used for all operations. The carbon steel springs are heated to 1,600 deg. F., and tempered in a 750-deg. F. bath. He has also found that by heat-treating old springs that have lost their elasticity they can be reclaimed and used very satisfactorily.

Other members stated that they eliminated the first quenching of the vanadium steel springs, as mentioned by Mr. Carruthers.

T. E. Williams (Chicago & North Western) stated that all the springs are made for the system at the Chicago shops, where they are tested for deflection and permanent set. The aim on that road is to keep all springs standard and standard spring hangers are used on all of the power. The North Western uses carbon steel for springs.

FRAME-MAKING

George Hutton (New York Central & Hudson River) stated that by means of the electric welding and oxy-acetylene processes it was now possible to make almost any frame weld without taking the frame from the engine. During the past eight months on the New York Central no frames have been removed from engines on account of breakage and only three have been removed in two years, all the frame welding being done by electricity. He also stated that he believed much less frame breakage would occur if all frames were properly heat-treated as well as annealed.

Many of the members contended that the best way, where possible, to weld a frame is at the forge, but granted that oftentimes it is not expedient to remove the frame from the engine, and in this case careful judgment must be used in making the weld. Considerable success has been obtained with both oil welds and thermit welds, and mention was made that there are many frame breaks that can be better welded with thermit than with oil. All frames should be annealed after welding, leaving the furnaces on until the frame has become cool.

J. M. Poland (Richmond, Fredericksburg & Potomac) said that out of 65 frames welded by electricity only one has broken, and that was on account of being made too close to a thermit weld. He has not found it possible to make a satisfactory electric weld next to thermit metal. On that road two men weld the frame at the same time, one on each side. The frame is heated before starting and the welding is done as quickly as possible to avoid too much expansion. Among the causes mentioned for frame breakages are ill-fitting pedestal caps and the improper alinement of turntables. Oftentimes it has been found that an engine will drop three inches in running on to a turntable. It was also believed that the practice of applying braces to frames rather than welding them at once is a bad practice, as it will cause the frame to break in other places.

HEAT TREATMENT OF STEEL

John F. Keiler (Purdue University), chairman of the committee, submitted the practice recommended by the American Society for Testing Materials for annealing miscellaneous rolled and forged steel objects.

H. E. Gamble (Pennsylvania Railroad) described the plant for heat-treating the reciprocating parts of locomotives at the Juniata shops of that road. This company heat-treats the main rods, side rods, axles, crank pins, piston rods and valve motion parts, as well as a varied line of miscellaneous work. Their method of treating carbon steel axles is as follows: The axles are heated in vertical furnaces eight hours after the furnace assumes a constant temperature of 1,550 deg. F. and are quenched in water of 70 deg. F. for eight minutes. They are again reheated in a horizontal furnace for eight hours, after it has assumed a constant temperature of from 1,100 to 1,200 deg. F., and cooled in air, being placed on rails in a pyramid so that they will cool slowly. A physical test is made on all heat-treated parts. The sample is taken with a hollow drill which cuts the core 7/8 in. in diameter and 6 in. long. The axles, if they pass the physical test, are put through a drop test. The following are the physical characteristics required: 50,000 lb. per sq. in. elastic limit; 80,000 lb. per sq. in. ultimate strength; 20 per cent elongation; 40 per cent reduction in area. The chrome-vanadium axles are heated to 1,650 deg. F., then quenched in water at 70 deg. F., reheated to about 1,200 deg. F., and cooled in air. The physical tests require an elastic limit of 85,000 lb. per sq. in., and an ultimate tensile strength of 120,000 lb. per sq. in., with 20 per cent elongation and 50 per cent reduction in area. Mayari axles are heated to 1,500 deg. F., quenched in water at 70 deg., and reheated to 1,055 deg. F., and allowed to cool in air. The physical tests require a 70,000 lb. per sq. in. elastic limit, a 100,000 lb. per sq. in. ultimate tensile strength, with 20 per cent elongation and 50 per cent reduction in area. In connection with their heat-treating work, the steels are chemically analyzed in a laboratory and the physical tests are made on a 100,000-lb. tensile machine. He strongly recommended pyrometers in handling the work.

OTHER BUSINESS

Among other papers presented at the convention were a number of shop kinks with drawings describing them. Thomas F. Keane (Ramapo Iron Works) read a paper on electric welding, in which he described different systems. T. E. Williams (Chicago & North Western) presented a similar paper on oxy-acetylene welding and cutting processes.

The following officers were elected: President, T. F. Buckley, Delaware, Lackawanna & Western; first vice-president, T. E. Williams, Chicago & North Western; second vice-president, W. B. Scofield, Illinois Central; secretary-treasurer, A. L. Woodworth, Cincinnati, Hamilton & Dayton, and assistant secretary-treasurer, George P. White, Missouri, Kansas & Texas.

Philadelphia, Pa., received the highest number of votes for the next place of meeting. The members of the association were invited to visit the shops of the Chicago, Milwaukee & St. Paul and the Allis-Chalmers Manufacturing Company while they were in Milwaukee.

NEW SHOP BUILDING CONSTRUCTION ON SUNSET LINES

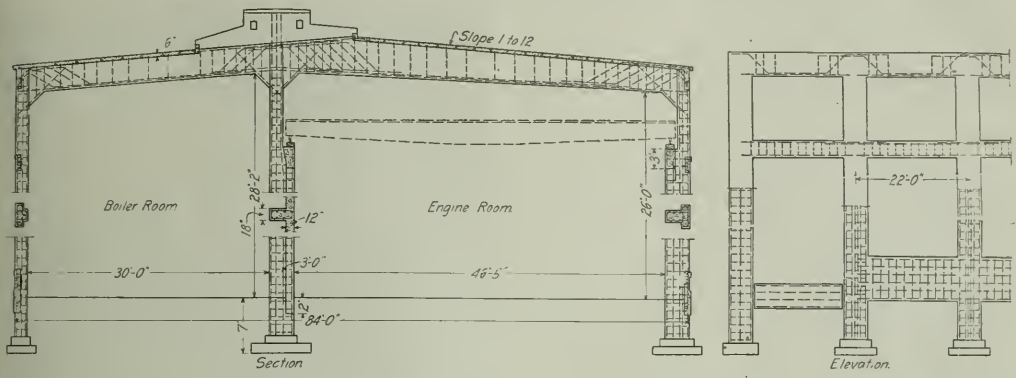
The Sunset-Central Lines have recently completed several shop buildings at Houston which are of somewhat unusual construction. When building shop structures or other buildings, where it is necessary to avoid columns and where panel openings

Powerhouse After Completion Showing Temporary End Construction Arranged for Ready Removal When Necessary to Extend the Building

over 25 ft. are required, the general practice has been to use I-beams, girders or trusses. However, the Houston buildings are entirely of reinforced concrete, including the long roof girders and the runway girders supporting the heavy 150-ton bridge cranes.

It was at first feared that the use of concrete would create the effect of clumsy members in the column and girder construction, but it was found that these worked out with very satisfactory proportions.

The principal buildings erected are the boiler shop, the power house and the combination machine and locomotive erecting shop. So far as is known, the roof spans are the longest that

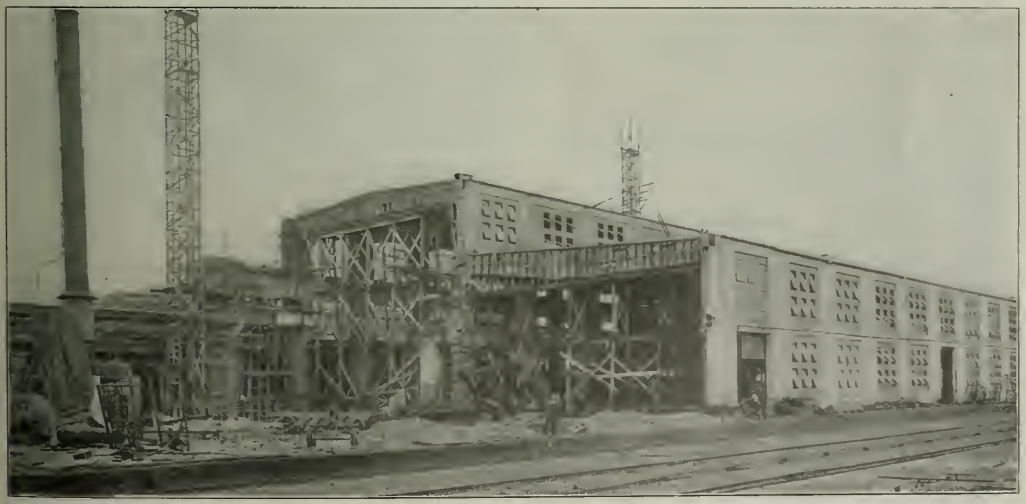


Section and Elevation of Power House Showing Concrete Construction

have been attempted in shop building work. All of the buildings shown were built without expansion joints, and as they have gone through both extremes of temperature without developing cracks anywhere, it is evident that the expansion has been well taken care of by the reinforcing steel in the concrete.

The entire building load is carried by the column foundations which are of the slab type. It was feared unequal settlement might occur if the cranes were permitted to lie at isolated points over night or when not in motion. To overcome this, the area of the footings was increased to reduce the soil value under the footings with the heaviest crane load added to what was thought would not cause indenture of the soil. The dead load unit pressure was then determined and all footings designed for the reduced dead load only, the live loads being disregarded. Investigation was also made to determine the bending stresses in the columns due to eccentric loads resulting from the crane supports, but it was found that this effect was not serious from any possible condition of loading.

One of the most difficult things to contend with was the fact that the buildings had to be erected over the site of existing buildings, that shop operations could not be interrupted and that interference must be as little as possible. A number of machines occupied spaces of the new columns and one of the old walls had to be replaced by the new. Shafting had to be temporarily supported and as the footings covered large areas, they were mostly put in at night and on Sundays. Vertical supports for slab and girder centering were made into towers, and trussed upper supporting members had to be provided. The roof is much higher than in the old buildings and holes were cut through the old to pass the vertical supports and column centering through, the old roof being left practically intact for the protection of the men and machines against rain and falling building material. Notwithstanding hundreds of mechanics were working underneath the building operations all during their construction, not a single personal injury resulted from falling material.



Machine and Erecting Shop Showing Nine Bays Completed and the Old Shop Cleared Away to Make Room for the New Construction

Owing to the crowded condition of the building site, due to the

immense amount of timber required for centering and the necessity of leaving space for shop materials adjacent to the work, the concrete materials had to be prepared under great difficulty and handled by towers and chutes quite a distance, much of it being handled through two tower lifts. Yet with all these disadvantages, very low unit cost figures were secured. The shops were built in sections of three and four panels at a time, and as fast as the centering could safely be removed the completed sections were put into service.

To economize in the false work and centering, panel lengths of all buildings were made uniform, and as far as possible the members in various buildings were made of the same or similar dimensions to permit using the centering oftener. In this way some of the centering was used as often as six times, and while not as smooth appearing concrete was possible with the last work done, it was successful as to appearance throughout and the cost of centering was reduced to a minimum. Crude oil was applied to the centering, and no trouble was experienced in the removal of forms.

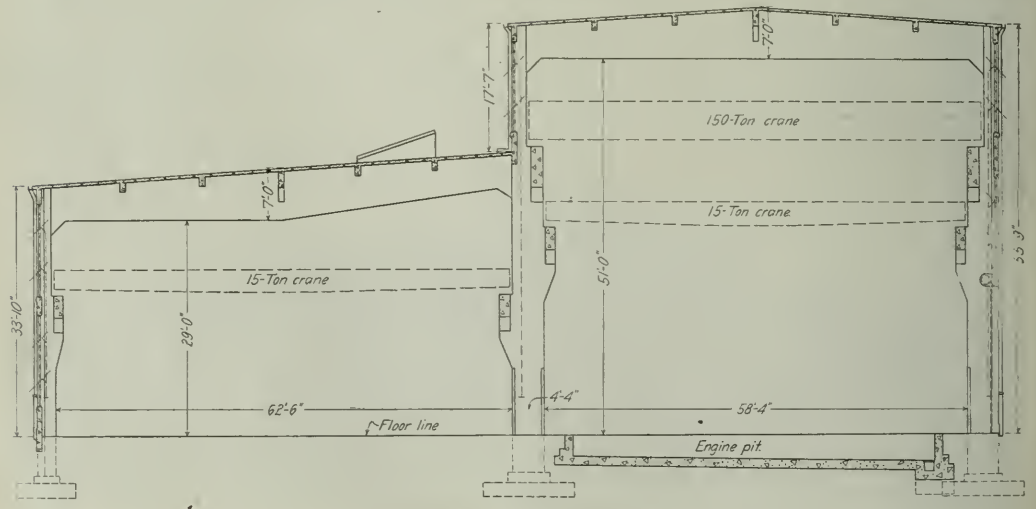
All lighting wires were run in metal conduits embedded in the concrete work and to prevent mutilation of concrete members for the purpose of bolting pipe and other fixtures after the completion of the buildings which could not be anticipated by the motive power department, plate shapes were provided at intervals on the walls, columns and girders during the process of pouring the concrete. These were anchored into the concrete flush with the finish, and of such thickness as to permit tap bolting.

Only preliminary and general plans had been completed when information was received that the funds had been appropriated for the work and the officers were asked how quickly actual construction could be gotten under way. As all computations had been completed and foundation investigations had been made, it was only a question of how quickly concrete material and reinforcing steel could be assembled. It was found that the reinforcing rods for foundation work could be secured from stock and that cement, sand and gravel were immediately available. Hence actual construction work was under way within two weeks after instructions were received to proceed. As the foundation and preliminary work necessarily consumed considerable time, ample opportunity for detailing of the superstructure was allowed.

Had the buildings been made of structural steel, it was estimated that six months' time would have been consumed in designing and getting sufficient material on the ground to begin work. It is believed that concrete is a more suitable material for buildings exposed to the fumes of locomotive smoke than structural steel and because of the difficulty of protecting steel and the cost of this maintenance charge. Also in addition to being the more permanent, concrete is more fireproof, and for these reasons much of the recent construction work on this road has been of concrete, including a roundhouse, small machine shop and an oil house at Beaumont.

Interior View of Boiler Shop Showing the Completed Building and Machinery and Fixtures Being Moved In

What is considered a very cheap warehouse building was built about four years ago at Galveston, on the property of the Southern Pacific Terminal Company. This structure is 1,000 ft. long, and is entirely of reinforced concrete. It is divided into four compartments, and otherwise satisfies conditions imposed by the underwriters, and was built at a cost slightly less than $1 per sq. ft. of floor area. Although occupying a site which was dredge filled with quicksand from Galveston bay, this building is supported entirely on floating foundations.



Section of Machine and Erecting Shop

The machine and erecting shop consists of 14 panels each 22 ft. long, with a total length of 312 ft. over all. In cross section

and arrangement, the building is of the type generally followed for this kind of shop. The erecting wing is 51 ft. high from the engine pit rail to the underside of the main roof girder and permits of the movement of the heaviest locomotive from the entrance track to position in any stall in the building by means of a 150-ton capacity Niles bridge crane. The roof girder span is 67 ft. long over all, or 65 ft. between centers of supports. A 15-ton Niles crane is also provided which travels below the 150-ton crane for use in handling parts of locomotives. This also clears the tops of locomotives standing under repair. In the machine room section, there is another 15-ton crane. The machine room is the same width as the erecting room, but is only 29 ft. high to the underside of the roof girders.

The runway rails for cranes are all carried on reinforced concrete girders; the one for the 150-ton crane which has a dead weight of 205,000 lb. has a direct support on the columns, while the smaller cranes have supports for runway girders bracketed beyond face of the columns which construction was followed to hold down the size of the columns.

The boiler shop is 120 ft. wide by 314 ft. long outside and is divided into two longitudinal bays 56 ft. 2 in., and 53 ft.

Interior View of Machine and Erecting Shop Showing the Building Practically Completed

in the clear between columns. One bay is served with a 15-ton, and the other with a 50-ton crane. There are 14 transverse bays, 22 ft. center to center, opposite the corresponding bays of the machine and erecting shop with tracks running through between the two buildings.

The oil house is 35 ft. wide by 72 ft. 6 in. long, with a basement the full size of the building for receiving the oil storage tanks. There are five 8,000-gal., two 1,000-gal., and two 480-gal. tanks in the basement, and one 8,000-gal. and two 2,000-gal. tanks buried outside of the building for storing gasolene and distillate. All of the tanks are connected to self-registering pumps, located in a convenient position in the oil house.

The power house is 84 ft. wide by 90 ft. long outside, having a boiler room 32 ft. 6 in. wide inside. It is of sectional construction, provided with a temporary end construction so that additional sections may be annexed when required. The boiler room is proportioned to suit the type of boilers installed, but is unlike other modern boiler rooms, in that it is not arranged with coal bins and ash pits; as crude oil fuel is used exclusively by both for road and stationary service and its supply seems so extensive that the use of coal is not contemplated. The stack, which is also of reinforced concrete construction, is 6 ft. 6 in. in diameter and 125 ft. high. Under average conditions in coal plants this would mean a stack capacity of about 800 h. p., but serving as it does, the crude oil furnaces of the boilers, the capacity is easily 1,400 h. p.

One interesting feature in the erection of the boilers and power house machinery was the pipe work. Detail drawings of all steam, water and air piping were prepared and the pipes and fittings were ordered from a Chicago manufacturer completely bent and fitted for erection. The placing of boilers and machinery and the cutting and bending of pipes by the manufacturer were accomplished so accurately, in accordance with the design, that it was necessary to cut only one length of straight pipe in the assembly of the complete equipment.

TRAIN ACCIDENTS IN JULY[1]

Following is a list of the most notable train accidents that occurred on railways of the United States in the month of July, 1914:

Collisions.

Date.	Road.	Place.	Kind of Accident.	Kind of train.	Kil'd.	Inj'd.
3.	Southern	Roysters, S. C.	rc.	P. & F.	1	6
3.	G. S. & Florida	Tamworth.	bc.	P. & P.	0	35

Derailments.

Date.	Road.	Place.	Cause of Derailm't.	Kind of train.	Kil'd.	Inj'd.
7.	Central Vermont	Sheldon Spgs.	washout	P.	0	9
11.	Chicago, M. & St. P.	Tacoma.	fire	F.	3	13
22.	Mobile & Ohio	Artesia	unk.	F.	3	0
26.	Galv. H. & S. A.	Spofford.	fire	P.	0	1
27.	Cin. N. O. & T. P.	Rockwood.	acc. obst.	P.	1	4
29.	Central N. E.	Holmes, N. Y.	d. eq.	F.	1	2

The collision at Roysters, S. C., on the 3rd of July resulted in the death of the engineman of the passenger train. Passenger No. 114 ran into engine No. 701. Three passengers and five trainmen were slightly injured. The collision was due to the negligence of the man in charge of the light engine, which was on the main track without right.

The trains in collision at Tamworth, near Macon, Ga., on the third were northbound passenger No. 2, second section, and southbound passenger No. 7 of the Macon & Birmingham. The trains met on a trestle 30 ft. high, but neither train was running very fast and the engines, though badly damaged, were not thrown off the track, except the front wheels. A carload of beer on the southbound train next to the engine was wrecked. About 30 passengers were injured, but all of the injuries except six were slight. Five trainmen were injured. The collision was due to the negligence of the men in charge of the southbound train, who miscalculated time and encroached on the time of the northbound.

The train derailed near Sheldon Springs, Vt., on the evening of the 7th, was a southbound passenger. The fireman was badly scalded and seven passengers, one mail clerk and two trainmen were injured. The derailment was due to a heavy rain storm which washed out the roadbed.

The train derailed at Tacoma, Wash., on the night of the 11th, was a switching freight, and the cause of the derailment was the distortion of the rails of the track by the heat of a fire in a lumber mill. The switching crew risked their engine and their lives in running a gauntlet of flame to save some loaded lumber cars in the mill yards from a fire that was rapidly burning up two large mills; but the engine ran off the track in the midst of the flames; and of the 17 men on it 3 were killed and 13 injured.

The train derailed near Artesia, Miss., on the night of July 22, was a northbound freight, and twelve freight cars broke through

[1]Abbreviations and marks used in Accident List:
rc, Rear collision——bc, Butting collision——xc, Other collisions——b, Broken——d, Defective——unf, Unforeseen obstruction——unx, Unexplained——derail, Open derailing switch——ms, Misplaced switch——acc. obst., Accidental obstruction——malice, Malicious obstruction of track, etc.——boiler, Explosion of locomotive on road——fire, Cars burned while running——P. or Pass., Passenger train——F. or Ft., Freight train (including empty engines, work trains, etc.)——Asterisk, Wreck wholly or partly destroyed by fire——Dagger, One or more passengers killed.

a trestle bridge and were wrecked. Three trespassers riding in a box car were killed. The cause of the derailment was not discovered.

The train derailed near Spofford, Tex., on the 26th, was a westbound through passenger. The engine and first car fell through a bridge which had been weakened by a fire. The engineman was seriously injured.

The train derailed at Rockwood, Tenn., on the 27th, was southbound passenger No. 1. The engine struck a hay-baling machine on a highway crossing and was ditched; and the engine and first three cars were overturned. The baggageman was killed and two passengers and the two men on the engine were injured.

The train derailed at Holmes, N. Y., on the 29th, consisted only of a locomotive, which was running backward. It was overturned. The fireman was fatally scalded and the engineman and flagman were badly injured. The cause of the derailment was the breaking of a pin, disarranging a brake beam of the tender.

Electric Car Accidents.—Of the half dozen serious accidents to electric cars reported as occurring in the United States in July, three were attended with fatal results. Elyria, Ohio, 7th, collision with work train; nine persons injured, one of them fatally. Norfolk, Va., 17th, electric cars ran into side of freight train; four killed, many injured. Westport, Conn., 23rd, collision, four killed, many injured. Collisions at Lynn, Mass., and Faribault, Minn., injured a score each.

A LOOK AHEAD

The New York Evening Post, over a hundred years old, gives variety to its miscellany by reprinting from day to day items which appeared in its columns in the year 1814. In like manner we give below some extracts from the columns of the *Railway Age Gazette* of 1919. They are in the shape of letters stolen from the files of a railway general manager:

State of Busybodies.
Railway Regulation Commission,
Mephistophelia, Bb., January 21, 1919.

General Managers,
All Railroads under Jurisdiction of State of Busybodies.

Gentlemen: I would respectfully call your attention to the following legislation which has been enacted by the Commission, which is retro-active, being made effective January 1, 1918. I also desire to inform you that it will be the duty of the Commission to exact the fullest penalty of the law for the violations of this Statute which have already been committed by your Company.

"Be it enacted, This the 1st day of January, A. D. 1919, by the Railway Regulation Commission of the State of Busybodies, in conference assembled,

"Whereas, Certain devout and well meaning busybodies have in good faith represented that certain railways are wantonly abusing and otherwise tampering with God's pure air by compressing, storing and otherwise manipulating such air in the compressors, reservoirs, cylinders and pipes of air brake systems—

"Wherefore be it enacted, That on and after the 1st day of January, 1918, all railways subject to the jurisdiction of this State shall discontinue the use of all and every brake systems involving the use of air in a compressed, confined, rarefied or otherwise unnatural form, and shall equip all engines, cars and trains with the 'No-Slip Patent Automatic Shoestring Brake' recently patented by the Chairman of this Commission.

"Wherefore he it further enacted, That the penalty for the violation of this Statute shall be $1,000 for each and every day on which each and every car not conforming to this statute shall be operated. Such penalty to be collected for and in the name of the Retrogressive Campaign Fund of the State of Busybodies."

I am, gentlemen, your very obedient servant,

X. Brown,
Chairman.

State of Busybodies.
Department of Public Health,
Mephistophelia, Bb., January 20, 1919.

General Manager,
O. & D. T. RR.; Darktown, Bb.

Dear Sir: It having been represented to this Department that the explosion of certain of the torpedoes in use upon your railroad produces certain vapors said to be deleterious to the cultivation of Jamaican Radishes, I would therefore request that within ten days you will furnish me with complete information upon the following subjects:

(1.) What type of torpedoes do you use? (Give detailed chemical analysis and photograph of each.)
(2.) How many torpedoes do you furnish to each flagman? (Differentiate between passenger, freight and work.)
(3.) How many flagmen do you employ? (Differentiate between passenger, freight and work.)
(4.) How many flagmen do you estimate you will employ ten years hence?
(5.) Have you any age limit for flagmen? (State if minors are employed.)
(6.) Are flagmen instructed in train rules before being appointed? (Make special reference to any rules regarding the use of torpedoes.)
(7.) Have any tests been made of exploding torpedoes close to the nose, in order to detect any gases which may emanate from them?
(8.) Have you any laboratory for the chemical determination of gases? (If so, give photograph of same and also of chemist and his assistants.)
(9.) Have you studied the culture of Jamaican Radishes and the probable effects upon same which might result from the continued operation of your railroad?

Your replies should be as complete and as concise as possible as it will probably be necessary to introduce several measures before the forthcoming session of the legislature upon this subject.

Yours respectfully,

Y. Jones,
Chief Surgeon.

State of Busybodies.
Railway Regulation Commission,
Mephistophelia, Bb., January 21, 1919.

General Manager,
O. & D. T. RR.; Darktown, Bb.

Dear Sir: I shall esteem it a favor if you will kindly forward me transportation for myself, wife and seven friends who will travel as servants, from this city to Utopia and return, good for ninety days.

You are of course aware that the laws of this State prohibit the issuance of any free transportation whatsoever, and it will therefore be necessary for you to send me regular tickets, crediting the tariff charges for same to passenger revenue in order that operating revenues may duly reflect the value of such tickets. The expense should be disposed of through your operating expense accounts under General Expenses Account "Relief Department Expenses."

It might be well to have this transportation forwarded before the vote is taken in the recently introduced measure to limit the salaries of railway officials, but this, of course, is purely a matter of suggestion.

I am, dear sir, yours very truly,

A. Grafter.

State of Busybodies.
Office of the Attorney General,
Mephistophelia, Bb., January 19, 1919.

General Manager,
O. & D. T. RR.; Darktown, Bb.

Dear Sir: Complaint has been filed in my office by Mr. D. Foole of this city, in which the following serious allegations are made against your Company, to wit:

> That on the nineteenth day of December, A. D. nineteen eighteen the Oppressed & Downtrodden Railroad did sell to the said Mr. D. Foole for the sum of two and one-quarter cents United States currency, at its duly and legally appointed ticket office in the township of Desert, a certain and sundry passenger ticket to be used for travel by the said Mr. D. Foole or his assigns from Desert to Drearyville. And that upon the back of said passenger ticket, embodied in the regulations for the use thereof, the word "the" appeared misprinted "The," thereby causing complainant much mental annoyance and perturbation.

Section 641 of the Act to Regulate Railroad Corporations, 1917, provides as follows: "Railways shall be held responsible for the safety and comfort of passengers whilst on their trains, stations or other property, and any railroad company causing unnecessary annoyance to any passenger or passengers shall be guilty of misdemeanor."

It would therefore seem clear that your Company acted illegally in this matter, and before taking such steps as may seem proper to enforce the above-quoted statute I am writing you as a mere matter of form to enquire whether you wish to enter any defense, although you will of course be aware that such could only result in increasing the costs to be assessed against your Company.

I am, dear sir, your obedient servant,

Z. Smith.

The South Manchuria Railway's New Hotel.—The South Manchuria has recently opened to the public its new Tamato Hotel at Dalny. The hotel, which is said to be one of the finest in the Far East, was built by the railway at a cost of $480,000. It is four stories high and has 88 rooms, 53 of which are with bath. It is doubtful, however, if the hotel will pay for some years.

General News Department

The Canadian Northern has opened its passenger line between Toronto and Ottawa and has made a contract for the use of tracks in the Grand Trunk station in Ottawa.

The Western Maryland, in connection with the Pittsburgh & Lake Erie and the Lake Shore & Michigan Southern, has put on a through mail car to run between Baltimore and Chicago. The passenger traffic over this line is increasing.

The Delaware & Hudson has increased the pay of the 1,500 employees in the company's shop at Watervliet, N. Y., by from 1 cent to 4 cents an hour. All men who have received less than 32 cents an hour will receive an increase of 1½ cents.

The Nashville, Chattanooga & St. Louis has given annual passes, good throughout the lines of the company, to all train despatchers, agents, operators, enginemen, firemen, conductors, yardmasters, shop and roadway foremen, brakemen and clerks, who have been continuously in the service for fifteen years. Fully 1,000 men will receive this favor.

The House committee on interstate and foreign commerce reported to the House on Tuesday of this week the Stevens bill, conferring on the Interstate Commerce Commission extensive powers of regulation and investigation concerning block signals, steel cars, high power headlights, and, in general, all matters affecting safety. Mr. Stevens' bill, as introduced, May 27, was summarized in the *Railway Age Gazette*, June 12, page 1342.

The Railway Business Association calls attention to the fact that a million-dollar error was made in transmitting the Moon bill, regulating postal expenditures, from the House to the Senate. In the Senate print the maximum rate for a 60-foot car has been altered to "not exceeding 20 cents a mile," while the bill as it passed the House reads 21 cents. If the bill passes the Senate at the 20-cent rate it will mean for the railroads a loss of $1,000,000 a year, as compared with the income at 21 cents.

The headings of the Snoqualmie tunnel, which the Chicago, Milwaukee & St. Paul is driving through the Cascade mountains, about 60 miles east of Seattle, met on August 4. The lines checked within 0.15 ft., the elevations checked within 0.13 ft., and the actual distance through the tunnel checked that measured over the summit within 6 ft. While this latter error might be considered large, it is not excessive in view of the fact that no special effort was made to secure refinements in measuring the surface line and there was from 12 to 14 ft. of snow over the summit at each time the line was measured. The construction of this tunnel was described in detail in the *Railway Age Gazette* of May 29.

A Big Opportunity to Correct a Big Mistake

John M. Glenn, secretary of the Illinois Manufacturers' Association, is sending out the following circular letter:

"Many members of the Illinois Manufacturers' Association are writing letters to their senators and to representatives in the lower house urging the adoption of a joint resolution directing the Interstate Commerce Commission to review and revise its decision in the recent application of the eastern railroads for a 5 per cent advance in freight rates.

"It is contended that our financial situation is under a severe pressure because it is threatened by the unloading of railroad securities held by Europe and that the break is only temporarily halted by the close of the public markets. It is claimed that the small advance which the Interstate Commerce Commission has given the carriers will have no effect in restoring and establishing the confidence of the large investor and the holders of American securities abroad, which it is maintained will be sent over as soon as it is possible to do so to draw our gold or its equivalent.

"The Interstate Commerce Commission will have a big opportunity to take a big view of a big question if Congress will take the action requested; and it will take it if enough people appeal to it to act."

New York to Boston by "Continuous Trolley"

This is the announcement which has been made in connection with the running of a street car through from Boston to New York and back last week; though on the return trip the experimental excursionists went by a high-speed railway as far as New Rochelle, 17 miles east of New York. This trip was made to further a project of the Bay State Railway Company, to promote through travel between these cities, especially by pleasure-seekers. This proposal follows the recent completion of a line 30 miles long through a thinly settled country between Danielson, Conn., and Providence, R. I. Hitherto, the traveler wishing to go from New York to Boston by electric cars has had to go by way of Springfield and Worcester. The present line is through New London and Providence.

The party who made the initial trip went from New York to New Rochelle by the New York, Westchester & Boston. Thence to New Haven the trolley lines parallel the New York, New Haven & Hartford. From New Haven to New London the course is even nearer to the ocean, running between that railroad and the Sound. From New London the route is up the beautiful Thames River to Norwich; thence northeast up the Quinebaug river to Danielson, whence the line turns east and makes a bee line through the wilderness to Providence. From that city to Boston, the fifty-mile run is within smelling distance of salt water for the most part, through Taunton, Brockton and the famous Blue Hill district. The total distance traveled was about 280 miles each way, and two days was the schedule time for the trip. Leaving New York at 8:15 a. m. the car arrived at 7 o'clock in the evening at New London, where the passengers remained for the night.

Resuming the journey at 9 o'clock next morning, the car reached the post office in Boston before 6 o'clock that evening. The passengers were surprised at the beauty and fertility of the farms and great estates never seen or heard of by ordinary railroad travelers.

Interchange Inspectors and Car Foremen's Association

The fourteenth annual convention of the Chief Interchange Car Inspectors and Car Foremen's Association was held in the Hotel Sinton, Cincinnati, Ohio, August 25-27. The meeting was presided over by F. C. Schultz, chief interchange inspector at Chicago and president of the association. The invocation was offered by Rev. Henry C. Martin of the St. Luke's Methodist Church, and the association was welcomed to the city by Mayor Spiegel. After the address of the president the secretary reported a cash balance of $31.19 and a total membership of 422. The discussion of the M. C. B. rules of interchange constituted the work of the convention. The following is the list of exhibitors:

American Steel Foundries (Simplex Railway Appliance Company), Chicago.—Models of the Economy draft arm and Simplex coupler. Represented by W. C. Walsh and W. G. Wallace.

Acme Supply Company, Chicago.—Diaphragms, safety tread and Chanarch flooring. Represented by R. C. Munro.

Grip Nut Company, Chicago. Represented by B. C. Hooper and J. Roberts.

Hale & Kilburn, Philadelphia, Pa.—All-steel car seats. Represented by J. K. Hoffman.

McCord & Co., Chicago.—McCord journal box. Represented by H. E. Creer.

Newkirk, W. P., Portsmouth, Ohio.—Newkirk's blue flag rail.

International Association for the Prevention of Smoke

This association, consisting of smoke inspectors for the various cities and railroads, will hold its ninth annual convention at Grand Rapids, Mich., on September 9, 10 and 11. The program includes an illustrated lecture on "Cinder Production and Cinder Catchers," by C. H. Bromley of New York; an address and discussion on "Railroad Smoke Elimination," by Charles W. Corning, secretary of the Chicago Railroad Smoke Inspectors' Association; an illustrated lecture on "The Effect of the Smoke Nuisance on Health, Building Materials, Vegetation, Weather, Etc.," by John O'Connor, Jr., of the University of Pittsburgh;

an address on "Smoke and Its Commercial Relations to Boilers and Stokers," by Lloyd R. Strong of St. Louis, and an address on "Gas Analysis as an Aid to Smoke Elimination," by Joseph W. Hays of Chicago, Ill.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

American Association of Demurrage Officers.—A. G. Thomason, Demurrage Commissioner, Boston, Mass. Annual convention in April.

American Association of Dining Car Superintendents.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next convention, October 22-24, Washington, D. C.

American Association of Freight Agents.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 21-24, 1915, Richmond, Va.

American Association of General Passenger and Ticket Agents.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Annual meeting, September 15-16, Boston, Mass.

American Association of Railroad Superintendents.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next convention, August 20-21, New York.

American Electric Railway Association.—E. B. Burritt, 29 W. 39th St., New York. Annual convention, October 12-16, Atlantic City, N. J.

American Electric Railway Manufacturers' Association.—H. G. McConnaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

American Railway Association.—W. F. Allen, 75 Church St., New York. Semi-annual meeting, November 18, Chicago.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 20-22, 1914, Los Angeles, Cal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1915.

American Railway Safety Association.—L. F. Shedd, C. R. I. & P., Chicago. Next meeting, November, Chicago.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga. Annual meeting, July, 1915.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except, June, July and August, 220 W. 57th St., New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 1-4, 1914, New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Atlanta, Ga.

Association of Manufacturers of Chilled Car Wheels.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Annual meeting, second Tuesday in October, New York.

Association of Railway Claim Agents.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, 3rd week in May, 1915, Galveston, Tex.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual convention, October 26-30, 1914, Chicago.

Association of Railway Telegraph Superintendents.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 22-25, Rochester, N. Y.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York. Next meeting, December 8-9, 1914, Richmond, Va.

Bridge and Building Supply Men's Association.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Civil Engineers' Society of St. Paul.—Edw. J. Dugan, P. O. Box 654, August and September, Old State Capitol Bldg., St. Paul.

Engineers' Society of Pennsylvania.—Edw. R. Dasher, Box 75, Harrisburg, Pa. Regular meetings, 1st Friday after 10th of each month, except July and August, 31 So. Front St., Harrisburg, Pa.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

Freight Claim Association.—Warren P. Taylor, R. F. & P., Richmond, Va. Annual meeting, June 16, 1915, Chicago.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

International Railway Congress.—Executive Committee, 11, Rue de Louvain, Brussels, Belgium. Next convention, June 23 to July 6, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 W. Broadway, Winona, Minn. Next convention, July 14-17, 1915, Sherman House, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, C. H. & D., Lima, Ohio.

Maintenance of Way and Master Painters' Association of the United States and Canada.—T. L. Goodwin, C. R. I. & P., Eldon, Mo. Next convention, November 17-19, 1914, Detroit, Mich.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May, 1915.

Master Car and Locomotive Painters' Association of the United States and Canada.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 8-11, Nashville, Tenn.

Master Car Builders' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1915.

National Railway Appliances Association.—Bruce V. Crandall, 537 So. Dearborn St. Chicago. Next convention, March 15-19, 1915, Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railroad Master Tinners, Coppersmiths and Pipefitters' Association.—U. G. Thompson, C. & E. I., Danville, Ill. Annual meeting, May, 1915.

Railway Business Association.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December 10, 1914, Waldorf-Astoria Hotel, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Railway Electrical Supply Manufacturers' Association.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

Railway Fire Protection Association.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Annual meeting, October 6, 1914, Washington, D. C.

Railway Signal Association.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa. Annual meeting, September 22-24, 1914, Bluff Point, N. Y.

Railway Storekeepers' Association.—J. P. Murphy, L. S. & M. S., Box C, Collinwood, Ohio. Annual meeting, May, 1915.

Railway Supply Manufacturers' Association.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with M. C. B. and M. M. Associations.

Railway Telegraph and Telephone Appliance Association.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill. Next convention, September 8-10, 1914, Chicago.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake City Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Signal Appliance Association.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

Society of Railway Financial Officers.—Carl Nyquist, C. R. I. & P., La Salle St. Sta., Chicago. Annual meeting, September 15-17, Hotel Aspinwall, Lenox, Mass.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. Ry., Atlanta, Ga.

Southern and Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—J. S. Marks, Agent, Interstate Despatch, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillsburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7122 Stewart Ave., Chicago. Annual meeting June 15, 1915, Minneapolis, Minn.

Transportation Club of Detroit.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Next meeting, September 15-18, Hotel Sherman, Chicago.

Utah Society of Engineers.—Frank W. Moore, Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Consolidated Music Hall, Salt Lake City.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

The House committee on interstate and foreign commerce has introduced in Congress a bill to provide for uniform freight classification throughout the United States.

The Canadian Pacific has announced that it will make a special rate of one cent a mile for farm laborers destined for the Saskatchewan farms to take care of this year's large harvest. It is also announced that those unable to pay will be transported by the railway company free.

In reply to various rumors that the Panama-Pacific Exposition to be held next year at San Francisco might be postponed on account of the European war, Charles B. Moore, president of the organization, has announced that the exposition will positively open on the scheduled date, February 20, 1915, and that the work is more than 90 per cent completed.

The railways in Western Trunk Line, trans-Missouri and Southwestern territories have announced that at the end of September all arrangements for concentration of butter and eggs and other dairy products, also live and dressed poultry, will be discontinued, except at the assessment of the full classification rate into the concentration point and the full tariff rate therefrom.

Senator Thomas introduced in Congress on Monday last a resolution calling on the Interstate Commerce Commission to inquire into an order which has been issued by the Union Pacific, to the effect that after the end of September it will not accept through tickets held by passengers from the east arriving at Salt Lake and Ogden, destined to points in the Pacific northwest.

The Southern Railway is to make displays this year at three big expositions and thirty-six district and county fairs throughout the north and west. Southern farm products will be shown in great profusion. There will be four circuits of exhibits taking in county and district fairs in Iowa, Minnesota, Wisconsin, Illinois, Indiana, Michigan, New York, Pennsylvania and Connecticut, while special displays on a more elaborate scale will be made at the great Canadian National Exposition at Toronto, Canada, and at other expositions.

Following the recent action of the Chicago & North Western, the Chicago railways have given notice that at the end of September they will discontinue absorbing tunnel and lighterage charges in Chicago. This means the cancellation of tariffs with the Merchants' Lighterage Company, the Chicago Lighterage Company, and the Chicago Warehouse & Terminal Company. The Chicago Association of Commerce last week filed a petition with the Interstate Commerce Commission and the Illinois Public Utilities Commission asking the suspension of the North Western's cancellation.

The Texas Tariff Bureau has prepared and expects to issue within a few days a circular including tables showing the short line mileage by various routes between all Texas junction points. This will be a great convenience, both to the railways and to the shippers, as under many of the railroad-commission tariffs rates are made by using the shortest mileage by any practicable route.

Governor Colquitt of Texas has authorized the state railroad commission to employ N. A. Stedman of Ogden, and S. H. Cowan of Ft. Worth, as attorneys to represent the commission in the interrogation of witnesses and development of facts in the hearing to be held by the railroad commission in response to the petition of the railroads for a general advance in freight rates. The governor is said to have told the railroad commissioners that he believed the railroads were entitled to have some of their rates advanced, as he considered a few of them too low. The governor said that the roads had been heavily hit by the flood, decreases in traffic and earnings, and that they are entitled to a readjustment, although he did not believe the rates on cotton or on some other staple articles should be changed.

The Missouri railways are preparing statistical evidence to be presented before the Missouri Public Service Commission on September 15 in support of an application for advances in both freight and passenger rates. This action is being taken in accordance with the decision recently rendered by the Missouri Supreme Court in the Missouri Southern case, holding that the power of the commission to prescribe just and reasonable rates is not limited by the maximum freight and passenger rate laws, which preceded the law creating the commission, and that therefore the commission may consider evidence bearing on the reasonableness of rates exceeding the statutory rates. The roads are compiling passenger fares on a basis of about three cents a mile.

Car Location

The accompanying table which was taken from bulletin No. 20 of the American Railway Association, gives a summary of freight car location by groups on July 1, 1914:

Car Location on July 1, 1914

Advances in Passenger Fares Proposed

Railways in Central Passenger Association and Trunk Line territories are working on plans for advancing interstate passenger fares, in accordance with the suggestions made by the Interstate Commerce Commission in the eastern rate advance case. While the interstate rates in these territories have not been reduced to the two-cents-a-mile basis which prevails for intrastate traffic in Illinois, Indiana, Ohio and the southern peninsula of Michigan, the interstate fares have been influenced by the low state rates, although on May 1 many of the interstate basing fares were placed on a 2½-cent basis. It is now proposed to advance interstate fares to approximately 2½ cents wherever possible, which would involve increases in many of the long-distance through fares such as that between Chicago and New York. It is also proposed to equalize rates between points which now take different rates in opposite directions. Rate

clerks have been meeting in Chicago to figure the possibilities of a readjustment, and a joint meeting of the rate clerks of the Trunk Line and Central Passenger Associations was called for Wednesday of this week at Niagara Falls. The Western Passenger Association roads have also discussed plans for advancing interstate fares. Passenger officers of the Southwestern lines called a meeting, to be held on Tuesday at St. Louis, to discuss the situation created by the Interstate Commerce Commission's decision in the Oklahoma, Arkansas and Missouri case, upholding the three-cent interstate fare. The St. Louis Southwestern had reduced the interstate rate to two cents. The roads are confronted with the problem of dealing with passengers who buy tickets at the state lines in order to get the advantage of the lower rate, a practice that has attained large proportions because the Oklahoma commission has ordered the roads to hold trains at stations near the state line and has prohibited a higher charge for fares paid on trains.

Car Surpluses and Shortages

Arthur Hale, chairman of the committee on relations between railroads of the American Railway Association, in presenting statistical bulletin No. 173-A, giving a summary of car surpluses and shortages by groups from April 15, 1913, to August 15, 1914, says: The total surplus on August 15, 1914, was 174,260 cars; on August 1, 1914, 198,998 cars, and on August 15, 1913, 69,253 cars.

There is a further decrease of 24,738 cars in surplus, bringing the total down to 174,260.

The principal reduction in surplus is in coal and gondola cars in central freight association territory, where the surplus of August 1 is reduced almost one-half, although the decrease in this class of equipment is general throughout all states east of the Mississippi river.

Box cars show a net increase of 2,881, the greater part of which is in the middle Atlantic and southern states (groups 4 and 5), with lesser increases in the winter wheat states and on the Pacific coast. There is a slight decrease in surplus box cars in the northwestern grain states (groups 6 and 7) and on the Canadian roads.

The total shortage on August 15, 1914, was 2,115 cars; on August 1, 1914, 2,333 cars, and on August 15, 1913, 14,828 cars.

There is very little change in the total shortage, which stands at 2,115—a decrease of 218 under the figures in our last bulletin.

The accompanying table gives car surplus and shortage figures by groups for the last period covered in the report and the diagram shows total bi-weekly surpluses and shortages 1907 to 1914.

CAR SURPLUSES AND SHORTAGES

Date	No. of roads.	Surpluses Box.	Surpluses Flat.	Surpluses Coal, gondola and hopper.	Surpluses Other kinds.	Surpluses Total.	Shortages Box.	Shortages Flat.	Shortages Coal, gondola and hopper.	Shortages Other kinds.	Shortages Total.

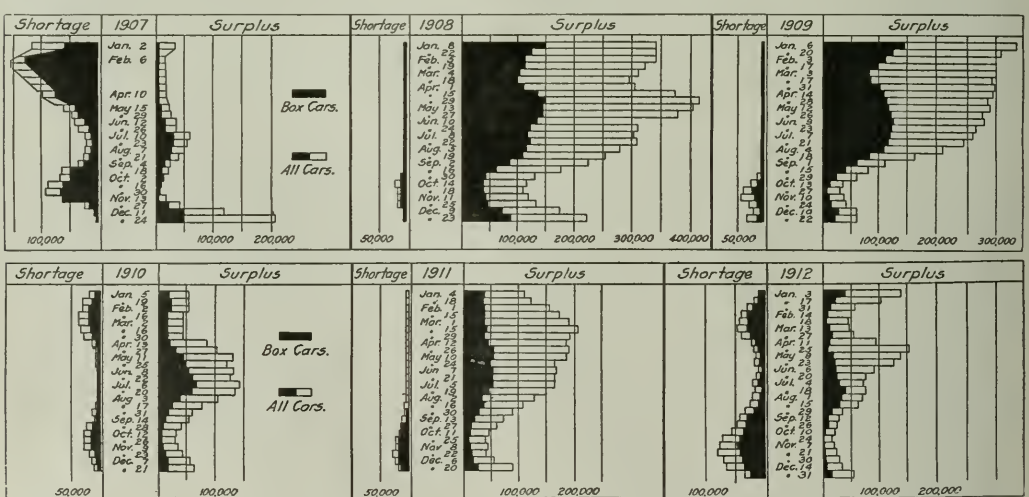
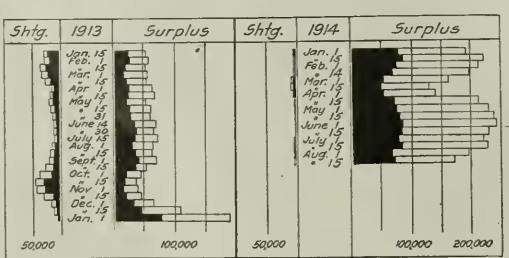
*Group 1 is composed of New England lines; Group 2—New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania lines; Group 3—Ohio, Indiana, Michigan and Western Pennsylvania lines; Group 4—West Virginia, Virginia, North and South Carolina lines; Group 5—Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida lines; Group 6—Iowa, Illinois, Wisconsin and Minnesota lines; Group 7—Montana, Wyoming, Nebraska, North Dakota and South Dakota lines; Group 8—Kansas, Colorado, Missouri, Arkansas and Oklahoma lines; Group 9—Texas, Louisiana and New Mexico lines; Group 10—Washington, Oregon, Idaho, California, Nevada and Arizona lines; Group 11—Canadian lines.





Car Surpluses and Shortages, 1907 to 1914

Commission and Court News

INTERSTATE COMMERCE COMMISSION

California-Nevada Lumber Rates

Opinion by Commissioner Hall:

The commission, upon a re-argument of this case, the original report of which was given in 28 I. C. C., 313, re-affirms its former decision that the Southern Pacific should be required to cancel certain proposed advance rates on carload lumber from Newcastle, New England Mills, Colfax, and Gold Run, Cal., to Verdi and Reno, Nev., thus leaving in effect the present rates. (31 I. C. C., 464.)

Bills of Lading on Reconsigned Shipments

Jung & Sons Company v. Louisville & Nashville Opinion by the commission:

The commission finds that defendants' practice of refusing to issue new bills of lading, concealing the names of the original shippers, in exchange for old bills of lading, in cases where cars are reconsigned at the terminals of their lines, is not unreasonable. (31 I. C. C., 455.)

Rates on Fertilizer from Norfolk, Va.

F. S. Royster Guano Company v. Atlantic Coast Line et al. Opinion by the Commission:

The commission finds that the rates charged by the Atlantic Coast Line and the Seaboard Air Line on fertilizers from Norfolk to certain points in North Carolina are unreasonable and discriminatory as compared with rates to the same points and to points equally distant from Wilmington, N. C. A new schedule of rates on commercial fertilizers in carloads from Norfolk to points in North Carolina is therefore prescribed, these rates being based on a distance scale varying from $1.50 for 30 to 50 miles to $3.25 for 325 to 350 miles, carload minimum 20,000 lb. (31 I. C. C., 458.)

The Tap Line Case

Second supplemental report of the commission. Opinion by Commissioner Harlan.

In accordance with the decision of the United States Supreme Court in the Tap Line Cases (234 U. S. 1), which held that the five tap lines appealing from the commission's findings in 23 I. C. C., 277, 549, were common carriers with respect both to proprietary and nonproprietary traffic and that the commission had exceeded its powers in preventing the divisions previously allowed them, the commission now restores all the through routes and joint rates which were in effect prior to May 1, 1912, between the trunk lines and the 57 tap lines involved in the instant case.

It is held, however, that the divisons out of the through rate on interstate shipments of lumber and forest products, from points on such of these tap lines as file tariffs and have otherwise complied with the commission's accounting rules, etc., should not exceed the following maximum amounts: For switching a distance of 1 mile or less from the junction, $2 per car; over 1 mile and up to 3 miles from the junction, $3 per car; on shipments from points over 3 miles and not more than 6 miles from the junction, 1½ cents per 100 lb.; over 6 miles and not more than 10 miles from the junction, 2 cents per 100 lb.; over 10 miles and not more than 20 miles from the junction, 2½ cents per 100 lb.; over 20 miles and not more than 30 miles from the junction, 3 cents per 100 lb.; over 30 miles and not more than 40 miles from the junction, 3½ cents per 100 lb.; over 40 miles from the junction, 4 cents per 100 lb. These divisions are the net amounts that may be paid out of the trunk line rates from the junctions, and when the rates from points on the tap line are made by the addition of an arbitrary, such arbitrary shall accrue to the tap line.

These divisions are to be applied to all interstate shipments of lumber and forest products that moved from points on the tap lines since May 1, 1912, and the tap line carriers are allowed reparation accordingly.

In case the delivery of lumber and forest products to a trunk line involves a haul over two or more tap lines, the divisions herein fixed should be applied to the aggregate haul, and not to the separate service of each of the tap lines.

With respect to the milling-in-transit rate on logs as formerly practised on the tap lines, the commission adheres to its original conclusion that the rate on lumber at the junction or mill point may not lawfully be extended back to the point on the tap line where the logs originate, and that any division out of the through lumber rate on account of the log haul can not be sanctioned.

The commission reaffirms its conference ruling to the effect that it is its view "that the law does not prohibit the use of interstate free passes by such officials and employees who devote substantially all their time to the service of the tap line and where by the use of such free passes no unlawful discriminations are effected." (31 I. C. C. 490.)

Rates on Sugar from New Orleans

In re sugar rates from New Orleans, La., and points taking same rates to Ohio river crossings, Memphis, Tenn., St. Louis, Mo., and intermediate points. Opinion by the commission:

The carriers transporting sugar in carloads from New Orleans, La., and points taking the same rates to Ohio river crossings, Memphis, Tenn., St. Louis, Mo., and other Mississippi river points, and points intermediate thereto, have in effect many rates which violate the fourth section, and have filed applications asking to be allowed to continue these lower rates to the river points and certain various intermediate low rate points on the routes operating to the river crossings than are concurrently in effect on like traffic to intermediate stations. The commission follows its ruling in previous cases that "insofar as the Ohio river itself, by affording a means of transportation, gives to these cities upon its banks lower rates than would otherwise be obtainable, they should be accorded the benefit of their location." It does not agree, however, that the relief should be granted to the extent prayed by all the applicants. The Queen & Crescent constitutes the direct short line from New Orleans to Cincinnati, which is the most distant of the river crossings involved. The distance via this route is 836 miles. There are in effect blanket rates of 23 cents in carloads to all points on this line between Chattanooga and Cincinnati except to Lexington, which is accorded the Cincinnati rate; and these blanket rates are applied to a certain territory approximately 300 miles in length for distances ranging from 498 to 833 miles. These voluntary blanket rates to the non-competitive points bear a reasonable relation to the competitive rates which would warrant relief to the Queen & Crescent from the rule of the fourth section to the extent prayed to Cincinnati. The commission finds, therefore, that the Queen & Crescent route should be permitted to continue to charge lower rates on sugar from New Orleans to Cincinnati than are concurrently in effect to intermediate points between Chattanooga and Cincinnati, provided the present intermediate rates of 23 cents per 100 lb. in carloads and 28 cents for less than carloads are not exceeded.

It is also held that no justification has been shown by the other applicant carriers for the maintenance of higher rates to points south of the river crossings than the rates to the local points between Chattanooga and Cincinnati on the Queen & Crescent and similar findings are made to apply. Relief is granted to Lexington to the same extent as to Cincinnati.

The commission also finds that the Illinois Central should be allowed to charge lower rates to Memphis than to intermediate points, provided the rates to the latter do not exceed 20 cents per 100 lb. on carloads and 25 cents on less than carloads. The Yazoo & Mississippi Valley is allowed relief with reference to rates on sugar to river points on its line, provided the rates to intermediate points not on the river do not exceed 17 and 20 cents per 100 lb. on carload and less than carload lots respectively.

The commission holds that the Louisville & Nashville should be allowed to continue to charge lower rates on sugar from New Orleans to Nashville and Bowling Green than are concurrently in effect on like traffic to intermediate points, provided the rates to the said intermediate points do not exceed 23 cents per 100 lb. in carloads, and 28 cents in less than carloads.

That portion of the Louisville & Nashville's application to be allowed to increase its rate to Montgomery from 17 to 20 cents per 100 lb. is denied. With reference to the rates of the same carrier to Mobile relief is granted provided the rates to intermediate points do not exceed 15 cents per 100 lb. on carload and 20 cents on less than carload shipments.

The Queen & Crescent has proposed to increase its rates on

sugar from New Orleans to Chattanooga from 20 and 23 cents to 23 and 28 cents on carloads and less than carloads respectively in conformance with a decision in a previous case. It can be allowed, therefore, to charge higher rates to intermediate points.

Relief is denied with reference to the rates on sugar to such points as Tuscaloosa, Attalla, Holt, Akron and Birmingham.

The commission also holds that whatever local rate on sugar is made by the direct line from New Orleans to any interior point south of the rivers, must not be exceeded by any rate to any point intermediate thereto upon the direct line. Carriers having indirect routes to all points to which lower rates may be charged than to intermediate points will be authorized to meet the rates on sugar established over the direct route from New Orleans in those instances where the indirect route is not less than 15 per cent longer than the direct line between the same points, and to maintain higher rates on like traffic to points intermediate thereto, provided the rates to said intermediate points on the indirect routes do not exceed 15 and 20 cents for carloads and less than carloads respectively for distances not in excess of 200 miles, 17 and 22 cents for distances not exceeding 300 miles, 20 and 25 cents for distances not exceeding 400 miles, 23 and 28 cents for distances not exceeding 700 miles, and 25 and 30 cents for distances greater than 700 miles. (31 I. C. C., 495.)

STATE COMMISSIONS

George A. Henshaw, of the Oklahoma Corporation Commission, has announced that application will probably be made by the commissions of Missouri, Arkansas and Oklahoma for a rehearing of the case before the Interstate Commerce Commission in which the commission decided last week that three cents a mile is not an unreasonable rate for interstate passenger travel in those states, in spite of the fact that the state rate is two cents a mile. Commissioner Henshaw says that such an application will be made by the Oklahoma commission even if the other states do not join.

Representatives of the state commissions of Idaho, Montana, Nevada, Utah, Arizona and Colorado, have called a meeting to be held in Denver on August 28, to prepare their cases for hearings which are to be held in Chicago on October 6, at which the Interstate Commerce Commission will consider a petition filed by the transcontinental railways asking for modifications of the federal commission's order in the intermountain rate case as to 107 commodities which meet heavy water competition on the Pacific coast, and on which the roads desire to charge rates at variance with a strict interpretation of the long and short haul clause without making similar reductions to interior points. It is said that the state commissions are planning to oppose this application of the roads.

The Railroad Commission of Texas has announced that it has decided to accord the railroads of the State a hearing on their application, presented on January 26, asking for a horizontal advance of 15 per cent in freight rates in the state. At the time the application was presented the commission declined to give a hearing on the petition, saying that it had no merit. As reported in last week's issue, the railroads recently held a meeting at which it was decided to make further efforts to obtain an advance in rates. This was followed by the commission's announcement that it would give a hearing. The plan recently considered by the railroads has not, however, contemplated a horizontal general advance in rates, such as was proposed in January, but a general readjustment of rates, which would advance a large number. No date has yet been set for the hearing, but Commissioner Williams has suggested that before this is decided upon an agreement should be had if possible with the principal carriers for the preparation of statistical evidence from their records for investigations along certain lines preceding the hearing.

PERSONNEL OF COMMISSIONS

John W. Flintham has been appointed secretary of the new Colorado Public Utilities Commission, with office at Denver, Colo.

W. A. Mitchell of Sedalia, Mo., has been appointed an inspector of car equipment, Division of Valuation, Interstate Commerce Commission.

Railway Officers

Executive, Financial, Legal and Accounting

W. O. Wall has been appointed general claim agent of the Georgia & Florida, with office at Augusta, Ga., and the office of freight claim agent has been discontinued.

T. V. Pomar, auditor of the Florida East Coast, at St. Augustine, Fla., has been appointed general auditor and assistant treasurer, with headquarters at St. Augustine.

E. B. Pierce, having resigned as auditor of the Missouri, Kansas & Texas on account of ill health, all communications heretofore forwarded to him should be addressed to the controller until further notice.

W. F. Ingram, assistant auditor of the Southern Pacific, at San Francisco, Cal., has been appointed assistant treasurer, with headquarters at San Francisco, succeeding H. A. Jones, resigned on account of failing health, and the position of assistant auditor is abolished.

William C. Tomkins, whose appointment as assistant to vice-president of the Grand Trunk, and the Grand Trunk Pacific, with headquarters at Montreal, Que., has already been announced in these columns, entered the service of the Grand Trunk on September 1, 1885, in the office of the auditor of pay rolls. Two years later he was transferred to the office of the general manager, and subsequently served in the president's office of the same road. In May, 1908, he became secretary to the late Martin M. Reynolds, vice-president in charge of finance and accounting of the Grand Trunk and the Grand Trunk Pacific, with headquarters at Montreal. Mr. Tomkins remained in that position until the death of Mr. Reynolds, which occurred on June 17, of this year. On August 1 Mr. Tomkins was appointed assistant to vice-president of the same roads as above noted.

W. C. Tomkins

Thornwell Fay has been appointed assistant to the receivers of the International & Great Northern, with jurisdiction over all departments of the receivership, with headquarters at Houston, Tex. A. G. Whittington has been appointed general manager for the receivers, with jurisdiction over the operating, mechanical and maintenance departments, with headquarters at Houston. He has been second vice-president and general manager.

Operating

D. E. Nichols has been appointed trainmaster of the Minnesota division of the Northern Pacific at Staples, Minn.

H. E. Allen, until recently superintendent of the Trinity & Brazos Valley at Teague, Tex., has been appointed superintendent of the Louisiana division of the Chicago, Rock Island & Pacific, with headquarters at Eldorado, Ark., succeeding A. E. Walker, who has been appointed superintendent of the Arkansas division, with office at Little Rock, Ark., vice A. B. Copley, promoted.

George Collins, whose appointment as superintendent of the Ottawa division of the Canadian Northern with headquarters at Trenton, Ont., has been announced in these columns, was born on July 20, 1860, at Carrying Place, near Trenton, and was edu-

cated in the public schools of Trenton. He began railway work in June, 1882, on the Central Ontario, and has been in the continuous service of that road ever since. From 1884, to 1890, he was agent at Trenton, and during the next two years served as a train despatcher. He was then to 1894, secretary, treasurer and assistant superintendent, and from 1894, to 1902, was general superintendent and secretary. From 1902, to 1906, he was receiver and manager, and since that time was general manager and secretary of the same road until his recent appointment as superintendent of the Ottawa division of the Canadian Northern. Mr. Collins was also a director of the Central Ontario from 1903, to 1914, when the road was taken over by the Canadian Northern.

Traffic

V. D. Fort, assistant freight traffic manager of the Illinois Central at Chicago, has been transferred to Memphis, Tenn.

J. T. Graffis, traveling freight agent of the Minneapolis & St. Louis, with headquarters at Indianapolis, Ind., has been appointed general agent traffic department at that place succeeding A. E. Lee, resigned.

Frank B. Townsend, whose appointment as traffic manager of the Minneapolis & St. Louis, with headquarters at Minneapolis, Minn., has already been announced, was born October 22, 1875, at Kirbyville, Mo. He was educated in the public schools of Marshalltown, Iowa, and began railway work in February, 1892. He was for ten years in the accounting and traffic departments of the Iowa Central, and in 1904 he became traveling freight agent of that road and the Minneapolis & St. Louis, with headquarters at Indianapolis, Ind. From December, 1906, to January, 1909, he was commercial agent, and the following year was general agent at Chicago. From January, 1910, to January, 1911, he was coal freight agent of the same roads and the Chicago & Alton and the Toledo, St. Louis & Western. On the latter date he was appointed assistant general freight agent of the Minneapolis & St. Louis, from which position he was recently promoted to that of traffic manager, as above mentioned.

F. B. Townsend

Purchasing

C. B. Williams, general storekeeper of the Central of New Jersey, at Elizabethport, N. J., has been appointed purchasing agent, with office at New York City, and LeRoy Cooley, chief clerk in the office of the superintendent of motive power, has been appointed general storekeeper, with headquarters at Elizabethport, succeeding Mr. Williams. Mr. Cooley was born on July 19, 1877, at Flemington, N. J., and began railway work in 1899, as a clerk in the office of the superintendent of motive power of the Central of New Jersey, and has been in the continuous service of that road ever since. He held various positions until September, 1908, when he was appointed chief clerk of the same office.

Engineering and Rolling Stock

John A. Marshall has been appointed road foreman of engines of the Northern Pacific at Duluth, Minn.

Joseph Billingham has been appointed superintendent of motive power of the Grand Trunk Pacific, with headquarters at Transcona, Man., succeeding G. W. Robb, resigned.

T. S. Lowe, road foreman of engines of the Canadian Northern at Limoilou, Que., has been appointed master mechanic of the Lake St. John division, with office at Limoilou.

T. C. Hudson, master mechanic of the Canadian Northern at Joliette, Que., has been appointed division master mechanic of the Quebec Grand division, with office at Joliette.

D. W. Gross, chairman of the valuation committee of the Atlantic Coast Line, at Wilmington, N. C., has been appointed valuation engineer, and has been relieved of all duties as engineer of construction.

William O'Brien has been appointed master mechanic of the Springfield division of the Illinois Central, with headquarters at Clinton, Ill., succeeding Fred M. Baumgardner, resigned to accept a position with the Interstate Commerce Commission, Division of Valuation.

Morgan King Barnum, general mechanical inspector of the Baltimore & Ohio, at Baltimore, Md., has been appointed superintendent of motive power of the Baltimore & Ohio proper, with headquarters at Baltimore, effective September 1. This position, which was abolished about a year ago, when A. P. Prendergast left the B. & O., has now been restored. Mr. Barnum was born on April 6, 1861, and was graduated from Syracuse University in 1884, with the degree of A. B., and later received the degree of A. M. He began railway work in 1884, as a special apprentice in the shops of the New York, Lake Erie & Western, now the Erie, at Susquehanna, Pa. He was then consecutively machinist and mechanical inspector, and later general foreman of the same road in Salamanca, N. Y., general foreman of the Louisville & Nashville shops at New Decatur, Ala.; assistant master mechanic of the Atchison, Topeka & Santa Fe at Argentine, Kan.; superintendent of shops at Cheyenne, Wyo.; district foreman at North Platte, Neb., and then division master mechanic at Omaha, Neb., on the Union Pacific; assistant mechanical superintendent of the Southern Railway. In February, 1903, he was made superintendent of motive power of the Chicago, Rock Island & Pacific, and in April of the following year was appointed mechanical expert of the Chicago, Burlington & Quincy; in 1907 he was appointed general inspector of machinery and equipment, of the same road. He left that road in April, 1910, to become general superintendent of motive power of the Illinois Central and the Yazoo & Mississippi Valley, remaining in that position until July 1, 1913, when he became general mechanical inspector of the Baltimore & Ohio, and now becomes superintendent of motive power of the same road as above noted.

M. K. Barnum

OBITUARY

William Tinkham, formerly president of the Providence & Springfield, now a part of the New York, New Haven & Hartford, died on August 20, at Providence, R. I., at the age of 92.

William E. Harwig, formerly, from 1902 to 1912, supervisor of bridges and buildings on the Lehigh Valley, died on August 24, at his home in Phillipsburg, N. J. Mr. Harwig entered the service of the Lehigh Valley in 1878, and about two years ago left that company to become supervisor of bridges and buildings on the Lehigh & New England.

John Player, formerly superintendent of machinery of the Atchison, Topeka & Santa Fe, died at Chicago on August 14, aged 67 years. Mr. Player began railway work in June, 1873, and until September, 1887, was with the Central Iowa consecutively as machinist, general foreman of shops, master mechanic and also in charge of the car department. He then became superintendent of motive power of the Wisconsin Central, leav-

ing that road in June, 1890, to go to the Atchison, Topeka & Santa Fe as superintendent of machinery, which position he held until January, 1902, when he was appointed consulting superintendent of motive power. In June of that year he retired from active railway service on account of ill health.

Isaac Duell Barton, formerly from 1881 to 1892 general superintendent of the Long Island, died on August 21, at his home in Flushing, N. Y., at the age of 80. He began railway work in 1852, as a station agent on the New York & Harlem, now a part of the New York Central & Hudson River, and was then consecutively freight conductor, passenger conductor, general freight agent and assistant superintendent of the same road. He was then superintendent of the Long Island, and subsequently became superintendent of the United States Rolling Stock Company. He then served consecutively as general superintendent of the Atlantic & Great Western, superintendent of the North Shore & Central of Long Island, superintendent of construction of the Manhattan Beach Railroad, general superintendent of the Indiana, Bloomington & Western, and general superintendent of the Manhattan Beach Railroad. On January 1, 1881, he was appointed general superintendent of the Long Island, remaining in that position until January, 1892, and then was general superintendent of the New York & New England. Mr. Barton was general superintendent of the Brooklyn Elevated Railroad from February, 1894 to 1900, and then retired from active service.

Edgar Thaddeus Welles, vice-president of the Wabash Railroad, with headquarters at New York, died on August 22, at his home in that city. He was born on August 29, 1843, at Hartford, Conn., and was a son of Gideon Welles, who was secretary of the navy in President Lincoln's cabinet. Mr. Welles was graduated from the high school of his native town, and then from Yale College, in the class of 1864. Shortly after leaving college Mr. Welles was admitted to the bar, but never practiced. He was vice-president of the Wabash Railroad since its reorganization and was, previous to that time, vice-president of the Wabash Western Railway. He was formerly president of the Peninsular Railway of Lower California, and in addition was a director of the Ohio & Mississippi, now a part of the Baltimore & Ohio Southwestern, the Wabash and the Peoria & Pekin Union.

E. T. Welles

Rolling Stock for Argentine Railway—The Central Argentine Railway has recently ordered the following rolling stock in England: 40 freight engines, 20 passenger engines, 25 switch engines, 14 sleeping cars, 4 first-class passenger cars, 50 first-class motor cars for the electric line from Buenos Aires to the Tigre, 20 second-class motor cars, 50 trailers, 1 dining car, 15 baggage cars for passenger trains, 15 baggage cars for freight trains, 100 ballast cars, 745 closed freight cars, and 300 freight cars for live stock. With these orders, the total rolling stock of the Central Argentine Railway will be as follows: 265 freight engines, 353 passenger engines, 125 switch engines, 102 sleeping cars, 226 first-class passenger cars, 158 second-class passenger cars, 109 passenger cars for both first and second class, 100 first-class motor cars, 70 second-class motor cars, 100 trailers, 30 dining cars, 11 restaurant cars, 168 baggage cars for passenger trains, 353 baggage cars for freight trains, 334 ballast cars, 11,310 closed freight cars, 1,250 freight cars for live stock, 1,465 flat cars, 2,675 open cars with high sides, 1,841 open cars with low sides, 552 cars with grating, and 38 refrigerator cars.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Detroit, Toledo & Ironton is in the market for 10 locomotives.

The Atlanta, Birmingham & Atlantic has ordered five Mikado type locomotives from the Baldwin Locomotive Works.

The Central of Georgia has indefinitely postponed its inquiry for four locomotives reported in the *Railway Age Gazette* of July 24.

The Illinois Central has withdrawn for an indefinite time its inquiry for three hump switching locomotives reported in the *Railway Age Gazette* of July 24.

The Cincinnati, Hamilton & Dayton, as reported in the *Railway Age Gazette* of last week, has ordered 30 Mikado and 5 Pacific type locomotives from Lima Locomotive Corporation. The Mikado type locomotives will have 64 in. driving wheels, 26 by 32 in. cylinders, a weight on the drivers of 223,600 lb., a total weight in working order of 282,200 lb., a boiler pressure of 190 lb., and a tractive effort of 54,587 lb. The Pacific type locomotives will have 76 in. driving wheels, 24 by 28 in. cylinders, a weight on the drivers of 159,200 lb., a total weight in working order of 248,600 lb., a boiler pressure of 190 lb., and a tractive effort of 34,272 lb.

CAR BUILDING

The Carolina & North Western is in the market for 100 30-ton box cars.

The Winston-Salem Southbound is in the market for about 35 freight cars.

The Chesapeake & Ohio is in the market for 30 eight-wheel steel underframe caboose cars.

The Havana Central has ordered 6 steam and 6 electric passenger cars from the Wason Manufacturing Company. The same company has also placed orders for 315 freight cars.

The Baltimore & Ohio, reported in the *Railway Age Gazette* of August 7 as being in the market for 29 passenger cars for the Cincinnati, Hamilton & Dayton, is in the market for 12 70-ft. coaches and one 73-ft. steel dining, 8 70-ft. passenger and baggage, 5 70-ft. baggage and mail and 4 70-ft. baggage cars.

IRON AND STEEL

The Chicago Surface Lines have ordered 574 tons of steel for underframes for its cars from the J. G. Brill Company.

SIGNALING

The Illinois Central has recently appropriated $14,000 for the equipment of a telephone system of train despatching between Clinton and Centralia, Ill., a distance of 115 miles. Work will be begun immediately, and the date of completion is set as October 1, 1914. This company has just put in operation the Coalfield train despatching telephone system on the St. Louis division. This system extends between Carbondale, Eldorado, Johnston City and Marion, Ill., a total distance of 95 miles.

The Union Switch & Signal Company has taken an order from the Baltimore & Ohio for furnishing the material and installing a type "F" electric interlocking plant at Calumet River Draw; one from the Missouri, Kansas & Texas, for installing a mechanical interlocking plant at Whiteright, Tex., and one from the Nashville, Chattanooga & St. Louis for installing an electro-mechanical interlocking plant at Cravens Yard. This machine will consist of 16 mechanical levers and 16 style "S" electric levers.

Supply Trade News

The C & C Electric & Manufacturing Company, Garwood, N. J., has opened a branch sales office, in charge of R. L. Wells, in the Security building, Minneapolis, Minn.

Graham Dedge, assistant sales manager of the Edgar Steel Seal & Manufacturing Company, Chicago, has been appointed assistant general manager, in addition to his present duties.

R. L. Brown has resigned as sales agent of The Barney & Smith Car Company, Dayton, Ohio, to become associated with Hotchkiss-Blue & Co., Ltd., Railway Exchange building, Chicago.

The Chicago Car Heating Company, Chicago, on August 22, removed its southern office from 521 Realty Trust building, Atlanta, Ga., to 829 Munsey building, Washington, D. C. This office will still be known as the company's southern office and will remain in charge of Harry F. Lowman as southern manager.

C. W. Rhoades has been appointed manager of sales of the Daniels Safety Device Company, manufacturer of the "Bulldog" nut, with office in the Webster building, 327 South La Salle street, Chicago. Mr. Rhoades was formerly assistant sales manager of Valentine & Co., Chicago, and previously was with the St. Louis Surfacer Company.

Wm. Wharton, Jr., & Co., Inc., Philadelphia, Pa., have appointed R. T. Hoffman & Co., Inc., their representatives for the southern Atlantic coast states, effective August 1. The latter company has main offices in the Continental Bank building, Baltimore, Md., and an Atlanta, Ga., office in charge of H. F. McDermott in the Candler building.

H. D. Shute has been elected treasurer of the Westinghouse Electric & Manufacturing Company, to succeed T. W. Siemon, who recently resigned to become secretary and treasurer of the Union Switch & Signal Company. J. J. Hanauer has been elected a director to succeed Paul M. Warburg, resigned, and T. P. Gaylord has been elected vice-president, succeeding Mr. Shute.

W. L. Rickard, of Rickard & Sloan, Inc., New York, will leave that city in the latter part of September to make an extended trip, lasting possibly between four and five months, through South America. He will visit the principal cities on both coasts and will make a thorough investigation of the markets and the best methods of selling machinery and mechanical materials and devices in the Latin-American countries.

Judge Killitts of the United States District Court of the Northern District of Ohio, Western division, on August 15 handed down a decision finding that the Baker valve gear patents Nos. 721, 994 and 1,008,405 of the Pilliod Company are valid and that the Pilliod Brothers Company and Charles J. Pilliod in the manufacture and sale of their so-called B valve gear infringe claim 8 of patent No. 721,994 and claims 1 and 2 of patent 1,008,405. Both defendants are estopped from denying the validity of the latter patent, it being stated in the decision that: "It is quite plain that, while Charles J. Pilliod was still a member of the complainant company, Baker was under obligation to give to that company and did give thereto the benefit of his inventions which crystallized in Baker patent No. 1,008,405, and that the complainant company's interest in this invention was one of the property incidents with which Charles J. Pilliod parted for a valuable consideration when he sold his interest in complainant company."

TRADE PUBLICATIONS

Washers.—The National Malleable Castings Company, Cleveland, Ohio, has recently issued circular No. 52, descriptive of its line of malleable iron washers and bridge pin nuts.

Air Compressors.—Ingersoll-Rand Company, New York, has recently issued Form No. 3030 descriptive of Ingersoll-Rogler class ER-1, power driven single stage straight line air compressors and Form No. 3024 descriptive of Ingersoll-Rogler valves for air compressing cylinders.

Union Pacific.—The passenger department has issued a very attractive folder entitled "The Scenic Columbia River Route to the Great Pacific Northwest," for the purpose of influencing travel to Alaska and the northwest, and also treating of the circle tours of the West.

Tours to the East.—The Great Northern Steamship Company has recently published an interesting folder containing a description and illustrations of numerous points of interest in Japan, China and the Philippines. The booklet also gives detailed information regarding the schedules of the steamer Minnesota, and the accommodations for passengers.

Metal Sheets.—"Evidence" is the title of an interesting booklet recently issued by the Stark Rolling Mill Company, Canton, O., containing testimonial letters from various firms and also views of a large number of buildings upon which Toncan metal corrosion resisting sheets and products were used. The buildings shown are of many varieties, several railway stations and shops being included in the number.

Magneto Telephones.—The Western Electric Company has recently issued a detailed catalogue descriptive of its line of magneto telephones and supplies. The same company has also issued a similar booklet illustrating and describing the various telephone cords which it manufactures. In this it is stated that the Western Electric Company during 1913 shipped 1,218,718 desk stand cords, 1,380,609 switchboard cords, 2,077,513 receiver cords and 1,108,700 transmitter cords.

Rail Reports.—The Titanium Alloy Manufacturing Company has issued bulletin No. 7 of its series of rail reports, giving the results of tests of three additional Titanium treated open hearth and three plain open hearth rails in addition to the 14 similar comparisons published in previous reports. The report is accompanied by sulphur prints, etched sections and photographs of magnified sections. These reports are of more than ordinary interest to students of the rail problem.

Ball Bearings.—The S. K. F. Ball Bearing Company of New York has recently issued bulletin No. 16 dealing with the use of ball bearings as applied to electric motors. The booklet, which contains 36 pages, gives views of ball bearings and of different machines on which they have been installed. The reading matter deals largely with the advantages to be obtained from the use of S. K. F. bearings and names such items as improvements in motor efficiency, lubrication, maintenance charges, compactness, etc.

Pumping Machinery.—The National Transit Company, Oil City, Pa., has recently issued bulletins Nos. 10 and 11 descriptive of the company's line of pumping machinery. The bulletins contain a number of views of the company's shop. There are also illustrations of a number of the pumps which the company makes, a table of sizes and capacities being given in connection with each. Bulletin No. 10, in addition, indicates the information that is necesary in ordering and contains a number of directions for setting up and operating the pumps.

The Young Man and the Electrical Industry.—This is the title of a story written by James H. Collins which has recently been issued in pamphlet form by the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa. The little book contains an article reprinted from the Scientific American of May 16, 1914, which deals with the opportunities afforded a young man in this industry and the different lines in which he may direct his activities, particular reference being given to the way in which the problem is solved in the work of the Westinghouse company.

Modern Methods in Train Despatching.—The Western Electric Company has issued an attractive 16-page booklet by this name containing a brief history of train despatching and showing wherein telephones are superior to the telegraph. The booklet contains a list of the railroads on which telephones are used. It also contains views of a typical train despatcher's office, a tower, etc., as well as illustrations of the various kinds of equipment used. There is also a very interesting inset in the form of a photographic copy of the Pittsburgh & Lake Erie train despatching sheet for April 19, 1913, on which day the road was able to handle a record-breaking movement by means of its telephone despatching, even though the line was only partly re-established after the floods.

Railway Construction

Beaver, Meade & Englewood.—We are told that grading work has been finished on the section from Beaver, Okla., north to Forgan, 6.5 miles, and contracts have been let to John L. Love, Oskaloosa, Iowa, for the track laying, and to R. F. Baker, Oskaloosa, for building a pile bridge over the Beaver river. The plans call for building from Beaver north to Meade, Kan., 40 miles. Frank McKillips, president, Beaver. (April 17, p. 927.)

Boston Elevated.—The Boston Transit Commission has given a contract to the Hugh Nawn Contracting Company at $673,780 for building section D of the Dorchester tunnel, at Boston, Mass. This contract covers about 800 lineal feet, one-half of which will be tunnel excavation and the other half open cut work.

Canadian Northern.—An officer writes that grading work is about finished on the line from Bienfait, Sask., west to Estevan, about 8.5 miles. The work was carried out by the Western Canada Construction Company, Winnipeg, Man. The only grading yet to be done is a small section at Bienfait, which is now being carried out by H. Nicholson, Estevan, Sask. (August 14, p. 310.)

Canadian Pacific.—The report of this company for the year ended June 30, 1914, shows that the company has 941.5 miles of new line under construction, on which work is now under way, as follows:

Name	Miles
Ontario Division	
Campbellford, Lake Ontario & Western; Glen Tay, Ont., to Agincourt	182.3
Lake Superior Division	
Interprovincial & James Bay; Kipawa, Que., north	10.0
Manitoba Division	
Selkirk branch; Gimli, Man., north	26.0
Snowflake branch; Snowflake, Man., west	10.0
Saskatchewan Division	
Weyburn branch; Shaunavon, Sask., to mile 317	87.7
Moose Jaw Southwest branch; Mileage 35 to 50	15.0
Alberta Division	
Swift Current North branch; Swift Current, Sask., north	23.4
Swift Current North branch; Coronation, Alta., northwest	25.0
Stirling East branch; Stirling, Alta., east	75.0
Bassano East branch; Bassano, Alta., to Empress	118.3
Suffield branch; Suffield, Alta., southwest	27.0
Gleichen branch; Gleichen-Shepard	40.0
Alberta Central; Red Deer, Alta., west	64.5
Kootenay Central; Fort Steele North branch	81.3
Calgary & Edmonton; Lacombe, Alta., east	72.1
British Columbia Division	
Kootenay Central; Golden, B. C., south	18.0
Kaslo & Slocan; Whitewater to Kaslo	17.5
Esquimalt & Nanaimo; Osborne Bay Junction to Crofton	3.4
Esquimalt & Nanaimo; McBride Junction to Courtenay	45.0
Total	941.5

Chehalis & Cowlitz.—See Washington Electric.

Erie & Ontario.—See Toronto, Hamilton & Buffalo.

Glengarry & Stormont.—Work is now under way building from a point about a mile west of Polycarpe station, Quebec, on the Canadian Pacific to Cornwall, Ont., 28 miles. The Glengarry Construction Company, Montreal, Que., has the general contract and sub-contracts have been let for most of the work. A. A. Mellor, chief engineer. (May 1, p. 1011.)

Lehigh Valley.—The report of this company for the year ended June 30, 1914, shows that the extension of the Seneca Falls branch for 5.7 miles to a connection with the New York Central & Hudson River, also the rebuilding of the Cayuga branch and the installation of a "wye" connection with the Auburn & Ithaca branch at Cayuga Junction, N. Y., were completed. Work on a third track from Pittsburgh & Lehigh Junction, N. Y., to North LeRoy 4.98 miles was also finished. During the year the company laid 40.39 miles of company's sidings and 3.81 miles of industrial sidings. Work was finished on the excavation of the rock cut and building the necessary concrete walls to provide room for the construction of a switching lead from Florence yard, and construction of the track will be started soon. An additional switching lead and tracks were constructed at Richards, and a trestle for the necessary tracks for transferring bulk freight was built at Suspension Bridge. Tracks with a capacity of forty cars to provide for the transferring of freight from crippled cars were constructed at Tifft Farm, Buffalo. The yards at Plainsville, Delano and South Plainfield were enlarged; the yard at Sterling was rearranged and the capacity slightly increased, and the yard tracks at Ithaca were moved to a new location.

Missouri, Arkansas & Southwestern.—An officer writes that this company has been incorporated in Arkansas with $2,500,000 capital, to build from Mena, Ark., east to Hot Springs, about 80 miles. The general contract has been given to the Century Construction Company, Mena. A. H. Scoggin, president; J. H. Hamilton, vice-president; Minor Pippin, secretary; J. W. Bradley, treasurer, and George D. Thayer, chief engineer, Mena. (August 21, p. 369.)

Nashville, Shiloh & Corinth.—An officer writes that this company has been given a charter to build from Corinth, Miss., in a general northeasterly direction, via Savannah, Tenn., Waynesboro, Linden and Centerville to Nashville, about 160 miles. Bonds for a total of $750,000 in aid of the project have been voted by several counties along the proposed route. About October 1, the city of Nashville and the county of Davidson will vote on the question of issuing $1,250,000 additional bonds, and if carried the construction of the line will be started at once. The plans include building a drawbridge over the Tennessee river, and also two other bridges over the Buffalo river. The company expects to develop a traffic in iron ore, phosphate and timber, also agricultural products. Allen W. Jones, president, Midville, Ga., and Clopton Thomas, secretary, Corinth, Miss. (August 7, p. 268.)

New York Subways.—The New York Public Service Commission, First district, has given a contract to the Flinn-O'Rourke Company, Inc., for building Section 3 of Route No. 33, the Montague street section of the Whitehall-Montague street tunnel in the borough of Brooklyn. This firm was the lowest bidder at $3,395,152. The commission is asking for bids until September 15, for building Section 2 of Route No. 48, the William street section of the Park place, William and Clark street subway.

Norfolk & Western.—An officer writes that a contract has been given to W. W. Boxley & Co., Roanoke, Va., to build the Tug River & Kentucky up Blackberry creek to the mouth of Peters creek, in Pike county, Ky., about 1.4 miles, also for building the masonry of a bridge over Tug river.

Pennsylvania Railroad.—We are told that a contract has been given to A. L. Anderson & Brothers, Inc., Altoona, Pa., to build a 3.5-mile single track extension of the Homer & Cherrytree branch of the Conemaugh division to coal lands in Indiana county, Pennsylvania.

Salt River Valley (Electric).—An officer writes that a contract will be let within thirty days to build from Phoenix, Ariz., south thence east via Tempe to Mesa thence south to Chandler. The company plans to build one steel bridge, a car-barn, power house and also a number of sub-stations, and expects to develop a traffic in local freight, alfalfa, dairy products, fruit, vegetables and live stock. The headquarters of the company are at Phoenix.

San Diego & Arizona.—Bids were recently received by this company, it is said, to build about 46 miles of line through San Diego county, Cal. The lowest bidder was the Utah Construction Company, Ogden, Utah. This company is building from Seeley, Cal., west through California and Mexico to San Diego, Cal., 139 miles, of which about 65 miles has been completed. (April 24, p. 967.)

Savannah Western.—Incorporated in South Carolina with headquarters at Columbia to build from Estill, northeast through Hampton, Colleton, Bamburg, Orangeburg and Clarendon counties to St. Paul, about 90 miles. The incorporators include G. H. Milligan, Charleston, S. C., Virgil Walker and Adrian M. Rea of Newbern, N. C.

Southern Railway.—An officer writes that contracts have just been let for the construction of 36 miles of double track on the Danville division between Greensboro, N. C., and Pelham. The contract from mile post 248 to 263 was let to the Parker Brooks Construction Company, Greenville, S. C., and from mile post 263 to 284 to the Morrow Contracting Company, Atlanta, Ga. This makes a total of 75 miles of double track work on the Washington-Atlanta line which the Southern has placed under contract recently.

Texas Roads.—I. H. Fetty of Kansas City, Mo., and associates will build a 15-mile railroad from Conroe, Tex., to timber lands, which they control. It is said that the line will be operated chiefly in the interest of the Delta Land & Lumber Company and will be extended later to a point in eastern Texas.

Toronto, Hamilton & Buffalo.—An officer of the Erie & Ontario writes that this company has been incorporated in Canada and the general location from Smithville, Ont., via Dunnville to Port Maitland about 20 miles has been approved. Contracts were let recently to Fitch & Douglas, Oshawa, and to Robert Bennett, Dunnville, and construction work is well under way between Smithville and Dunnville which is on the Grand river, 4.5 miles from Port Maitland. The grading work involves handling about 8,000 cu. yd. to the mile. The maximum grades will be 0.4 per cent and maximum curvature 3 deg. on the main line and 8 deg. on branch lines to the terminals. The plans call for building an 87-ft. steel bridge over Twenty Mile creek; two 160-ft. trestles over Welland river and Oswego creek, and a passenger station with a freight shed at Dunnville. The principal commodities the line will carry are manufactured articles, farm produce and merchandise. The prospects of making Dunnville an industrial center is largely the reason for building the line. J. N. Beckley, president, Rochester, N. Y., and R. L. Latham, chief engineer, Hamilton, Ont. (August 7, p. 269.)

Washington Electric.—Work is now under way on the 10-mile extension of the Chehalis & Cowlitz, it is said, along the south fork of the Newaukum river to a point beyond Onalaska. (May 22, p. 1171.)

RAILWAY STRUCTURES

Chicago, Ill.—Plans are being made for beginning work on the new union station soon after September 20. The roads have until that date to accept the ordinances providing for the erection of the station. The Union Station Company has decreased its capital stock from $50,000,000 to $3,500,000.

Gunpowder, Md.—The Pennsylvania Railroad has given a contract to the J. T. Gorsuch Construction Company, Baltimore, Md., for renewal work on the concrete bridge at Gunpowder falls.

Mortonville, Pa.—The Philadelphia & Reading has given a contract to Enos L. Seeds, Philadelphia, Pa., it is said, to build a re-inforced concrete bridge at Mortonville.

San Diego, Cal.—The new passenger station of the Atchison, Topeka & Santa Fe at San Diego, Cal., which is being erected at the foot of Broadway, on the site of the old station, is about one-third completed. The new building is 55 ft. by 292 ft. in area and one story high. It is of steel frame construction with a brick veneer and finished in stucco. There will be four additional tracks leading to the station. Work was begun in March, and it is planned to complete it by January 1, 1915. The estimated cost, including the laying of the new tracks, is $325,000. The William Simpson Construction Company, San Diego, has the general contract for the erection of this station.

Railway Extension in the Shantung Province of China.—At the present time there are 946 miles of railway in the Chinese Shantung Province, 256 miles of which are included in the Shantung railway and 690 miles in the Tientsin-Pukow line. It has also been proposed to construct three new lines as follows: From Tehchow on the Tientsin-Pukow line to Shuntefu on the Peking Hankow Railway, about 150 miles distant; from Kaomi on the Shantung Railway southwest to Hsuchowfu also on the Tientsin-Pukow line, about 300 miles distant, and from Chefoo to Weihsien on the Shantung Railway, 200 miles. It was reported a short while ago that arrangements were being perfected in Peking between the German commissioners and the Chinese Government for the construction of the first two lines. It was presumed that they would be constructed by German capital and under German superintendence, eventually to be turned over to the Chinese Government for operation by the Chinese in a similar fashion to the Tientsin-Pukow line. The matter of constructing the projected Chefoo-Weihsien line was likewise receiving the consideration of the Chinese Government, and it was reported that the road would probably be constructed with German capital and German materials also.

Railway Financial News

Michigan Central.—The company announced last week that one year 6 per cent notes, maturing this week, to the amount of $2,000,000 would be paid off.

Mobile & Ohio.—A special meeting of stockholders has been called, to be held at Mobile, September 25, to vote on a proposal to authorize the issuance of bonds to the amount of $50,000,000. The company has abandoned the proposed note issue of $3,000,000, which was part of the financial plan announced recently to provide for real estate, improvements and equipment. The present proposal is to issue bonds as the market may be found to be favorable. Among the items for which money is needed in the immediate future are $1,200,000 to reimburse the company's treasury for expenditures for additional real estate in Birmingham and Mobile, new yard facilities at Meridian, Miss., and other improvements; $1,200,000 for additional passing and other tracks, double-tracking 57 miles of main line, additional water and coal stations, and additional shop facilities.

New Jersey & Pennsylvania.—See Northern Central of New Jersey.

New York, New Haven & Hartford.—This company has issued a brief statement of the financial results for the 12 months ended June 30, which shows balances over fixed charges, for the several companies in which the New Haven is interested, as follows:

New York, New Haven & Hartford, surplus	$268,662
Central New England, surplus	230,020
New York, Ontario & Western, surplus	663,692
New England Steamship Company, *deficit*	77,802
Hartford & New York Transp'n Co., surplus	85,965
New Bedford, M. V. & N. Steamboat Co., surplus	62,708
The Connecticut Company, surplus	1,501,072
The Rhode Island Company, surplus	347,642
Berkshire Street Railway Company, *deficit*	72,507
New York & Stamford Railroad Company, *deficit*	5,824
Westchester Street Railway Company, surplus	4,883
New York, Westchester & Boston, *deficit*	246,923
Housatonic Power Company, surplus	78,506
Westport Water Company, surplus	1,664

The New Haven's interest in the Ontario & Western is only 50.1 per cent. The statement says:

"Every property in which the New Haven is interested earned all fixed obligations except The New England Steamship Company and that company showed improved results, in that the shortage of $355,070 for the fiscal year ending June 30, 1913, was reduced to $77,802. The Berkshire Street Railroad shows an improvement of $19,354. The New York & Stamford reduced a deficit last year of $36,556 to $5,824 this year. The New York, Westchester & Boston (apart from the interest on its bonds and notes) reduced its deficit from $334,554 to $246,923, an improvement of $87,630. The Rhode Island trolleys had a new wage scale on a much higher basis than a year ago, in addition to heavy maintenance expenses. The steamer lines all did a little better in net than last year."

For the New Haven proper the statement is as follows (cents omitted):

	Month of June		Twelve months to June 30	
	1914	1913	1914	1913
Operating Revenue, including net results of Outside Operations	$5,775,784	$5,386,488	$66,703,172	$69,258,950
Operating Expenses and Taxes	4,447,427	3,592,801	52,083,568	50,942,094
Operating Income	$1,328,356	$1,793,687	$14,619,604	$18,316,855
Other Income	2,086,708	5,472,262	7,247,989	10,063,784
Gross Income	$3,415,065	$7,265,950	$21,867,593	$28,380,640
Deductions—interest, rentals, etc.	1,848,499	1,636,310	21,598,931	19,458,402
Net Corporate Income	$1,566,566	$5,629,639	$268,662	$8,922,237

Northern Central Railroad of New Jersey.—This is the name of a company which is being organized to take over the New Jersey & Pennsylvania Railroad, which is being rehabilitated by the Central New Jersey Construction Company. The president of the new company is Frank W. Patterson of Bound Brook, N. J. The line of the road is from White House, on the Central of New Jersey, northward, 27 miles, to Morristown.

ANNUAL REPORTS

SIXTIETH ANNUAL REPORT OF THE LEHIGH VALLEY RAILROAD COMPANY

PHILADELPHIA, August 12, 1914.

To the Stockholders of the
LEHIGH VALLEY RAILROAD COMPANY.

The Board of Directors herewith submit the annual report of the business and condition of your Company for the fiscal year ended June 30, 1914.

MILEAGE

The first track mileage owned or controlled and operated by the Lehigh Valley Railroad Company, the main line of which is double track, extending from Jersey City, N. J., to Buffalo and Suspension Bridge, N. Y., is as follows:—

	Miles
Lehigh Valley Railroad Company	316.90
Controlled by ownership of entire capital stock	938.90
Controlled by ownership of majority of capital stock and lease	115.37
Operated under lease	27.73
Total mileage operated (owned or controlled)	1,398.90
Trackage rights over railroads owned by other companies	44.84
Total first track mileage	1,443.74

In addition to the above there are 595.36 miles, or 41.24 per cent., of second track, 99.51 miles of third track, 44.84 miles of fourth track and 1,207.56 miles of yard tracks and sidings, a total of 3,391.01 miles of track in operation at the close of the year. A detailed statement of track mileage is shown on pages 49 to 51. The average number of miles of railway operated for the year was 1,439.99, upon which the mileage statistics in certain tables submitted in this report are based.

The total increase of 36.18 track miles over the preceding year is due, in the main, to the construction of the Seneca Falls Branch, extension of third track and additional sidings at terminals and important yards.

OPERATING REVENUES AND EXPENSES

The following statements sets forth the total revenues and expenses and net revenue from operation for the fiscal year, not including outside operations and other income, compared with similar figures for the fiscal year 1913. The complete income account appears on page 26.

OPERATING REVENUES

FROM	1914	1913	INCREASE	DECREASE
Coal freight	$18,492,683.35	$20,385,389.09	.....	$1,892,705.74
Merchandise freight	15,026,684.11	16,339,748.97	.....	1,313,064.86
Passenger	4,795,147.44	4,867,554.03	.....	72,406.59
Mail	195,052.87	191,821.11	$3,231.76	.....
Express	443,971.75	506,191.11	.....	62,219.36
Other transportation	478,453.44	415,731.71	62,721.73	.....
Miscellaneous	351,570.99	336,935.87	14,635.12	.....
Total operating revenues	$39,783,563.95	$43,043,371.89	.....	$3,259,807.94

OPERATING EXPENSES.

	1914	1913	INCREASE	DECREASE
Maintenance of way and structures	$4,575,061.96	$5,694,422.24	.....	$1,119,360.28
Maintenance of equipment	7,011,946.34	7,561,270.87	.....	549,324.53
Traffic expenses	1,002,872.11	982,857.66	$20,014.45	.....
Transportation expenses	14,071,182.70	13,993,617.35	77,565.35	.....
General expenses	948,098.72	875,651.45	72,447.27	.....
Total operating expenses	$27,609,161.83	$29,107,819.57	.....	$1,498,657.74
NET OPERATING REVENUE	$12,174,402.12	$13,935,552.32	.....	$1,761,150.20
Ratio of operating expenses to operating revenues	69.40%	67.62%	1.78%	.....

OPERATING REVENUES.

COAL FREIGHT.

The transportation of coal and coke produced a revenue of $18,492,683.35, a decrease of $1,892,705.74, or 9.28 per cent., as compared with the preceding twelve months.

The percentage of coal freight revenue to total operating revenues was 46.48 per cent., a decrease of .88 per cent.

The coal and coke transported, excluding the Company's supply coal, was 16,464,948 tons, a decrease of 1,430,459 tons, or 7.99 per cent.

This class of tonnage was 55.02 per cent. of the total tonnage hauled during the year, a decrease of .27 per cent.

MERCHANDISE FREIGHT.

The revenue received from the transportation of merchandise freight was $15,026,684.11, a decrease of $1,313,064.86, or 8.04 per cent., as compared with the preceding year.

The revenue derived from the transportation of merchandise freight was 37.77 per cent. of the total operating revenues, a decrease of .19 per cent.

The tonnage moved, excluding Company's material, was 13,459,171 tons, a decrease of 7.00 per cent.

GENERAL FREIGHT.

The total revenue from both coal and merchandise freight was $33,519,367.46, a decrease of $3,205,770.60, or 8.73 per cent., as compared with the preceding twelve months.

The entire freight traffic amounted to 29,924,119 tons, a decrease of 2,443,677 tons, or 7.55 per cent.

The number of tons carried one mile was 5,218,751,555, a decrease of 593,633,362 ton miles, or 10.21 per cent.

The average haul was 174.40 miles, a decrease of 5.17 miles, or 2.88 per cent.

The average revenue per ton was 112.01 cents, as compared with 113.46 cents last year, a decrease of 1.45 cents, or 1.28 per cent.

Company's freight, not included in the above, amounted to 3,135,755 tons, a decrease of 186,286 tons, or 5.61 per cent.

The total freight train mileage was 8,768,300 miles, a decrease of 935,011 miles, or 9.64 per cent.

The revenue received per freight train mile was $3.82, an increase of $0.04, or 1.06 per cent.

The average trainload of revenue freight was 595.18 tons, a decrease of 3.83 tons, or .64 per cent. Including Company's freight, the average trainload was 617.13 tons, a decrease of 3.58 tons, or .58 per cent.

PASSENGER.

The earnings from passenger traffic amounted to $4,795,147.44, a decrease of $72,406.59, or 1.49 per cent., compared with the preceding year.

The total number of passengers carried was 5,729,042, an increase of 210,518, or 3.81 per cent.

The number of passengers carried one mile decreased 6,353,172, or 2.34 per cent.

The average revenue per passenger was 83.70 cents, a decrease of 4.50 cents, or 5.10 per cent.

The average revenue per passenger per mile was 1.807 cents, an increase of .015 cent, or .84 per cent.

The average distance traveled by each passenger was 46.31 miles, a decrease of 2.92 miles, or 5.93 per cent.

Passenger train mileage was 4,340,095, a decrease of 150,918 miles, or 3.36 per cent., as compared with a decrease in this revenue of 1.49 per cent.

The average revenue from passengers per passenger train mile was 110.48 cents, an increase of 2.10 cents, or 1.94 per cent.

MAIL.

The sum of $195,052.87 was received from the Federal Government for the transportation of United States mails, an increase of $3,231.76.

EXPRESS.

The revenue from this class of business amounted to $443,971.75, a decrease of $62,219.36.

OTHER TRANSPORTATION.

The earnings derived from transportation other than shown under the preceding headings were $478,453.44, an increase of $62,721.73.

MISCELLANEOUS.

Miscellaneous revenue amounted to $351,570.99, an increase of $14,635.12.

OPERATING EXPENSES.

MAINTENANCE OF WAY.

The expenditures for maintenance of way and structures amounted to $4,575,061.96, a decrease of $1,119,360.28, or 19.66 per cent., as compared with the preceding year.

Seven steel bridges, one concrete-steel bridge and seven steel reinforced concrete culverts were built in connection with additional track construction. Eighteen steel bridges and six concrete-steel bridges were placed in the track, replacing light iron or wooden bridges and seven iron bridges were strengthened. Seven bridges were replaced by pipe culverts and three iron bridges were abandoned and the openings filled. One steel highway bridge with concrete floor was built to eliminate a grade crossing, one wooden highway bridge was replaced by a steel structure and one iron highway bridge was replaced by a new steel bridge with concrete floor. One arch culvert was extended for two additional tracks and another was filled up and abandoned.

4,203 tons of 110-pound rail, 21,440 tons of 100-pound rail and 31 tons of 90 pound rail, together with necessary frogs, switches, etc., were placed in the track.

1,146,583 tie plates and 238,649 anti-rail creepers were used.

809,663 cross ties, 2,323,285 feet B. M. switch ties, 615,754 feet B. M. bridge ties and lumber amounting to 4,139,088 feet B. M. were used.

537,952 of the cross ties, 1,882,832 feet B. M. of switch ties and 560,112 feet B. M. of bridge ties were treated with creosote.

40,761 cubic yards of crushed stone were used in ballasting track. 40,512 feet of drain tile were placed in the roadbed.

1,630.47 miles of copper and 148.76 miles of iron wire were used in extending and renewing the telephone, telegraph and signal wires on the system.

MAINTENANCE OF EQUIPMENT.

The sum of $7,011,946.34 was expended for the maintenance of equipment, a decrease of $549,324.53, or 7.26 per cent., as compared with the preceding twelve months. Included therein is a charge of $1,234,729.16 for the depreciation of equipment, as called for by the accounting requirements of the Interstate Commerce Commission.

Sixteen worn-out locomotives, one combined passenger and baggage car, one express car, 730 freight equipment cars and forty-two road service cars were condemned and either sold or destroyed during the year and their value written off the books by appropriate charges through operating expenses.

Three library buffet cars were converted into combined passenger and baggage cars, one baggage and express car into a combined baggage and mail car, three passenger coaches and one combined passenger and baggage car into workmen's cars and 169 produce cars into ice cars. Three combined passenger and baggage cars were transferred to caboose service and 140 freight equipment cars to road service.

One light passenger engine has been converted into an inspection engine. Seventy-six locomotives have been equipped with additional air pumps and fifty-two with bull's-eye lubricators, replacing old tubular lubricators, to meet the requirements of the Interstate Commerce Commission. 1,044 locomotives received heavy and general repairs.

411 passenger equipment cars received heavy repairs, 252 were painted and varnished and thirty-six equipped with electric lighting apparatus. Two dining cars, twelve wooden coaches and one milk car were equipped with steel underframes.

Steel underframes were applied to 1,779 wooden freight and coal cars, making a total of 12,372 cars so equipped during the last six years. 9,643 freight equipment cars, 154 passenger equipment cars and thirty-nine road service cars were equipped with safety appliances to conform to the requirements of the Interstate Commerce Commission. 261 steel coal cars and high side gondolas, of 100,000 pounds capacity each, were equipped with solid steel wheels. 27,480 freight equipment cars received heavy and general repairs.

The total number of locomotives on hand at the close of the year was 947, with a tractive power of 30,231,790 pounds. The total number of freight equipment cars was 46,080, with a capacity of 1,710,000 tons.

TRAFFIC EXPENSES.

The expenditures under this heading amounted to $1,002,872.11, an increase of $20,014.45, as compared with the preceding twelve months.

TRANSPORTATION EXPENSES.

The cost of conducting transportation was $14,071,182.70, an increase of $77,565.35, or .55 per cent., over the preceding year.

The ratio of transportation expenses to total operating revenues was 35.37 per cent., as compared with 32.51 per cent. last year, an increase of 2.86 per cent.

GENERAL EXPENSES

This class of expenses amounted to $948,098.72, or 2.38 per cent. of the total operating revenues. The increase of $72,447.27, compared with the preceding year, is due almost entirely to the expenses incurred in valuing the Company's property.

TAXES.

The taxes accrued on your property, capital and business during the year amounted to $1,691,241.47, an increase of $82,090.08 over the preceding year.

ADDITIONS AND BETTERMENTS.

There was expended during the year, for the acquisition of new property and for the improvement and development of existing property, the sum of $7,647,524.25, which was charged to Additions and Betterments. A statement of these expenditures, classified as required by the Interstate Commerce Commission, appears on page 46. The more important expenditures are here specifically referred to:—

The new equipment purchased and added to the property during the year is as follows: Thirty-eight freight locomotives, seven passenger locomotives, fifteen switching locomotives, seven locomotive tenders, thirty-five steel passenger coaches, one thousand 80,000-pound steel underframe box cars, two thousand 100,000-pound steel coal cars, twenty-six 100,000-pound flat cars, three steel well cars of 220,000 pounds capacity each, one hundred eight-wheel cabooses, two locomotive cranes and one 120-ton steam derrick. A portion of this equipment is covered by the Equipment Trusts mentioned in detail under the heading "Financial."

In addition to the foregoing, orders have been placed for three passenger locomotives, ten switching locomotives, thirty steel passenger coaches, ten steel smoking cars, twenty-five steel baggage cars, twenty-five 80,000-pound flat cars and twenty-four 100,000-pound flat cars.

Construction work in connection with the passenger and freight terminals at Buffalo is being advanced as rapidly as possible. The raising and lengthening of the viaducts carrying the several streets over the right of way was practically completed June 30th. Detail plans for the station structures are in course of preparation and work will be started thereon at an early date, as provided in the contract with the City of Buffalo.

The extension of the Seneca Falls Branch for a distance of 5.7 miles to a connection with the New York Central and Hudson River Railroad, the rebuilding of the Cayuga Branch and the installation of the necessary "Y" connection with the Auburn and Ithaca Branch at Cayuga Junction were completed and the line placed in operation on July 1, 1914. These improvements, together with trackage rights over the New York Central and Hudson River Railroad for a distance of 2.2 miles, mentioned in the preceding annual report, will shorten the haul from Auburn and points north to Geneva and points west by 55.2 miles.

The third track from Pittsburg and Lehigh Junction to North LeRoy, a distance of 4.98 miles, referred to in the last annual report, was completed, making a continuous third-track system of 12.07 miles on an ascending grade between the former point and Stafford. This improvement will greatly facilitate the movement of freight trains.

213,259 feet, or 40.39 miles, of Company's sidings and 20,117 feet, or 3.81 miles, of industrial sidings were constructed during the year.

The excavation of the rock cut and the building of the necessary concrete retaining walls to provide room for the construction of a switching lead from Florence Yard, mentioned in the preceding annual report, have been completed and the construction of the track will be undertaken shortly. An additional switching lead and tracks for crippled cars were constructed at Richards. A trestle with the necessary tracks for transferring light freight was built at Suspension Bridge and tracks with a capacity of forty cars to provide for the transferring of freight from crippled cars were constructed at Tifft Farm, Buffalo. The yards at Plainsville, Delano and South Plainfield were shipped, resulting in increased capacities of 205, 93 and 80 cars, respectively, and the yard for the interchange of business with the New York Central and Hudson River Railroad at Sterling was re-arranged and the capacity slightly increased. The yard tracks at Ithaca were moved to a new location, the land on which they formerly laid having been transferred to the State of New York for barge canal purposes.

Additional freight delivery tracks, with paved driveways, were constructed at East 22nd Street, Bayonne, and the driveways leading to the freight house at Elmira, the passenger and freight stations at Cortland and the passenger station at Hazleton were paved.

The concrete and steel platforms, with necessary office and other buildings at Manchester, mentioned in the last annual report, have been completed and placed in operation. To facilitate the transferring of freight, electrically operated trucks are used.

Seventeen stalls of reinforced concrete construction, each 102 feet in length, were added to the Coxton roundhouse, making a total of thirty-two stalls, and in connection therewith a steel and brick machine shop was constructed.

To improve the method of cleaning the interior of freight cars used in the transportation of grain and grain products, a track with platform and hot water connections was installed at Tifft Farm, Buffalo. The rebuilding of the ore dock at that point, mentioned in the preceding annual report, was completed and an electric car haulage system was installed on the coal shipping trestle.

Hollow tile and concrete structures were erected as follows: A passenger and freight station at Gorham; a passenger station at Lehighton; a freight house at East 22nd Street, Bayonne; and a tool and bunk house at Vosburg.

An ice house of 1,000 tons capacity was erected at Mauch Chunk. The ice house at Jutland was enlarged and the freight station and platform at Rochester were extended. At Warren Street, Jersey City, the milk platform was extended and the driveway paved. Improvements were made to the milk shipping stations at Jutland, Wysox, Springville, Freeville, Truxton and Fair Haven.

At Wilkes-Barre, Cortland, Auburn and Canastota 46-ft. track scales were installed, replacing 38-ft. scales, and the track scales at National Stores were strengthened and moved to a new location.

An air-testing plant was installed in the Claremont Yard, Jersey City, and air compressors were placed in the enginehouse at Lehighton and the machine shop at Hazleton. A new air compressor, with necessary extensions of the pipe lines, and an electric generator for lighting the buildings and yard, were installed at Delano. A thirty-ton electric derrick was erected at Easton.

At Coxton and Lehighton 100-ft. electrically operated turntables were installed and the 75-ft. turntable replaced at Coxton was moved to Towanda. The 60-ft. turntable at Auburn was replaced with a 70-ft. table and an electric tractor was installed on the one at Cortland.

Eighteen gasoline motor cars were purchased for use of section, bridge, signal and telegraph gangs, making a total of ninety-nine now in service.

Two 40,000-gallon standard steel water tanks were erected at the Lehighton enginehouse, replacing one wooden tank, and a new 50,000-gallon wooden tank on concrete foundation was erected at Richford. A brick addition is being made to the pumphouse at Manchester and new large capacity steam pumps with boilers are being installed. Owing to the recurring shortage of water on the Mountain Cut-Off during the summer season, an emergency pumping system was installed in connection with the Gardner's Run water station, drawing water from another source. Extensive improvements are being made in connection with the water supply at Lehighton and Packerton, comprising the construction of a reservoir of 5,000,000 gallons capacity on Beaver Run and a dam across Mahoning Creek, together with electric pumping machinery and necessary pipe lines, which will afford an independent and ample supply of water for the locomotives and shops at those points.

Mechanical interlocking plants were installed at the coal docks at Perth Amboy and at the ends of the third and fourth tracks west of Flagtown. A complete revision of the interlocking at Pittsburg and Lehigh Junction was made in connection with the third track work in that vicinity. Improvements were made to the interlocking plants at East Penn Junction, Packerton, Black Creek Junction, Hazle Creek Junction, Pittston Junction and Tifft Farm Junction.

The Lehigh and Lake Erie and Ithaca Branches have been completely equipped with three-position upper-quadrant automatic acetylene gas lighted signals and the new third track from Pittsburg and Lehigh Junction to North LeRoy with two-position lower-quadrant automatic signals. The automatic disc signals between Slatington and Phillipsburg have been replaced by three-position upper-quadrant signals, acetylene gas lighted, and the automatic disc signals between Athens and Laceyville have been replaced by two-position lower-quadrant signals. Mechanical signals were installed at Gerhard's, Stewarts and Quakake to protect crossovers at those points. Controlled absolute electric block signals were placed at New Boston Junction and manual absolute block signals were installed at Mt. Carmel.

Visible and audible crossing signals were installed at nine highway crossings at grade and at three crossings visible features were added to the audible signals already in service.

New telegraph and telephone pole lines were erected for a distance of 1.50 miles on the New Jersey and Lehigh Division, .33 mile on the Mahanoy and Hazleton Division, 5.70 miles on the Auburn Division and .35 mile on the Buffalo Division. Telegraph and telephone lines were rebuilt for a distance of 1.58 miles on the New York Division, 14.65 miles on the New Jersey and Lehigh Division, 10.65 miles on the Wyoming Division, one mile on the Auburn Division and 22.35 miles on the Buffalo Division. Poles were reset for a distance of 38.55 miles on the New Jersey and Lehigh Division and 18.30 miles on the Wyoming Division.

FINANCIAL

To provide cash funds for the retirement of $2,000,000 Elmira, Cortland and Northern Railroad Company Five and Six Per Cent. Bonds, which matured April 1, 1914, the purchase of additional equipment and the prosecution of needed improvements to the property, your Company issued, under its General Consolidated Mortgage dated September 30, 1903, $10,000,000 Four and One-half Per Cent. Gold Bonds, maturing May 1, 2003, which were sold and the proceeds used or will be used for the purposes stated. The mortgage in question provides for the issuance of bonds bearing interest at such rate as the Company may, from time to time, determine, up to but not exceeding five per cent. per annum. Although previous issues of bonds under that mortgage have been at the interest rate of four per cent., after careful reflection by the Board of Directors, it was deemed advisable to have the above issue bear interest at the rate of four and one-half per cent. per annum, in view of the existing condition of the market for railroad securities.

These $10,000,000 bonds represent the only new capital obligations issued and sold by your Company to provide it with funds for capital expenditures since the sale to stockholders, in 1910, of 403,338 shares of capital stock at par, which produced funds of $20,166,900. Since then, viz., July 1, 1910, the Company has made capital expenditures (referred to in the yearly reports) for the retirement of obligations in the hands of the public, acquisition of new property and improvements to existing property, as follows:—

SECURITIES IN HANDS OF PUBLIC RETIRED:—

Bonds:—		
Lehigh Valley Railroad Company Second Mortgage 7%	$6,000,000.00	
Lehigh Valley Railroad Company Collateral Trust 4% (matured)	4,000,000.00	
Lehigh Valley Railroad Company Collateral Trust 4% (purchased)	1,255,592.89	
Elmira, Cortland and Northern Railroad Company First Mortgage Preferred 6%	750,000.00	
Elmira, Cortland and Northern Railroad Company First Mortgage 5%	1,250,000.00	
Equipment Trust, Series J, Certificates 4½%	2,000,000.00	
		$15,255,592.89
Capital Stock Guaranteed by Lehigh Valley Railroad Company:—		
Morris Canal and Banking Company Preferred 10%	$1,476,917.65	
Morris Canal and Banking Company Consolidated 4%	472,027.12	
		1,948,944.77
Real Estate Mortgage		115,000.00
EXPENDITURES FOR PROPERTY:—		
Construction Hays Creek and Buck Mountain Branches		1,069,889.74
New property and additions and betterments chargeable to Capital Accounts of Lehigh Valley Railroad and subsidiary companies		9,911,766.73
Rolling stock and floating equipment		12,028,267.86
Total July 1, 1910, to June 30, 1914, inclusive		$40,329,461.99
Proceeds of increase in capital stock in 1910		20,166,900.00
Balance		$20,162,561.99

From the foregoing it will be observed that up to the close of the present fiscal year the Company has expended $20,162,561.99 in excess of the funds raised by the increase in the capital stock. That portion of the funds representing this balance, not derived from the sale of the $10,000,000 of bonds referred to, has been provided out of the cash resources of the Company.

The following capital obligations of your Company matured and were retired during the year:—

DESCRIPTION	INTEREST RATE	MATURITY	AMOUNT
Collateral Trust Bonds	4%	Feb. and Aug.	$1,000,000
Equipment Trust, Series I, Certificates	4%	September	400,000
Equipment Trust, Series J, Certificates	4½%	Mar. and Sept.	500,000
Equipment Trust, Series K, Certificates	4%	Mar. and Sept.	300,000
Elmira, Cortland and Northern Railroad Company Bonds:—			
First Mortgage Preferred	6%	April	750,000
First Mortgage	5%	April	1,250,000
Total			$4,200,000

An Equipment Trust, designated Series L, was created during the year, under which were issued $2,400,000 Four and One-half Per Cent. Certificates, maturing in semi-annual installments April 1st and October 1st, each year, the final maturity being October 1, 1919. $200,000 matured April 1st and the remainder, $2,200,000, have been placed in the treasury and are available for sale or other disposition as occasion may require. This trust is a

lien upon one thousand self-clearing double hopper steel coal cars of 100,000 pounds capacity each, one thousand steel underframe box cars of 80,000 pounds capacity each and twenty-five freight locomotives.

An additional Equipment Trust, known as Series M, covering the issue of $1,800,000 Four and One-half Per Cent. Certificates, was also authorized and will be a lien upon one thousand self-clearing double hopper steel coal cars of 100,000 pounds capacity each, sixty-five steel passenger coaches, twenty-five steel baggage and express and ten steel smoking cars. This equipment is now under construction and delivery will be completed in the near future, at which time the certificates will be executed and placed in the treasury. These certificates will mature in annual installments of $200,000 on March 1st each year, commencing March 1, 1915, the last installment falling due March 1, 1923.

The advances made by the Lehigh Valley Railroad Company to subsidiary companies, of which it owns the entire capital stock, were reimbursed by the issuance of Fifty-Year Five Per Cent. Gold Debentures, as follows:

The Lehigh Valley Rail Way Company	$3,000,000
Lehigh Valley Railroad Company of New Jersey	275,000
Lehigh Valley Transportation Company	175,000
Pennsylvania and New York Canal and Railroad Company	135,000
National Storage Company	35,000
Easton and Northern Railroad Company	18,000
Montrose Railroad Company	3,000

These securities, with the exception of those issued by the Montrose Railroad Company which are in your treasury, have been deposited with the Trustee as required by the terms of the General Consolidated Mortgage. Included in the advances to The Lehigh Valley Rail Way Company, for which $3,000,000 of debentures as above were received, is the sum of $2,000,000 which was used to retire a like amount of bonds of the Elmira, Cortland and Northern Railroad Company which matured April 1, 1914, that company having been merged with The Lehigh Valley Rail Way Company in February, 1905.

There have also been received and placed in the treasury of your Company $30,000 Wyoming Valley Water Supply Company First Mortgage Five Per Cent. Bonds, in reimbursement of advances made to that company for capital expenditures.

The account "Advances to Subsidiary Real Estate Companies" shows an increase of $117,020.74 over the preceding year, due to additional real estate acquired for terminal and other improvements.

The charter of the Penn Haven Junction and Glen Onoko Railroad Company, organized in 1902 to project a branch line from Penn Haven Junction to Glen Onoko, was allowed to lapse, as there was no further necessity for maintaining that corporation. The nominal amount of capital stock issued has been written off the books.

In accordance with the practice in preceding years the book value of the capital stock of Coxe Brothers & Company, Incorporated, has been reduced by the sum of $1,000,000, Profit and Loss having been charged with that amount.

Materials and Supplies on hand at the close of the year amounted to $3,373,260.78, a decrease of $492,084.99.

Working Assets are $3,077,353.61 in excess of Working Liabilities.

Semi-annual dividends of five per cent. each on the preferred and common capital stocks of the Company were declared in December, 1913, payable in January, 1914, and quarterly dividends of two and one-half per cent. each were declared in March and June, 1914, payable in April and July, 1914, respectively.

Certified public accountants have verified the cash and security balances of the Company for the year and furnished a certificate as to the correctness of the same, which is given on page 21.

GENERAL REMARKS

The Company has experienced a sharp decline in its earnings for the year under review from practically all sources of revenue as a result of the general business depression throughout the country. In addition, the earnings from the transportation of anthracite coal have been adversely affected by dull trade conditions in that commodity incident to the exceptionally mild winter, particularly in the Northwest. Some reduction was effected in the operating expenses, but with the high rates of wages paid and high prices of all commodities required in railroad operation it was impossible to reduce expenses proportionately to the falling off in earnings. The increase due to compliance with the so-called "Full Crew Laws" of the States through which your Company's lines pass and the increase granted labor amounted to approximately $375,000 for the year. All work not immediately necessary for safety and economy of operation or to maintain the property in its usual high state of efficiency, together with such improvements and extensions as could be deferred, has, of course, been suspended until general business improves.

In order to establish a closer relationship in the operation of the Lehigh Valley Railroad Company of New Jersey, which is owned by your Company, it was deemed advisable to effect a lease of the property and appurtenances of the New Jersey Company. Accordingly, by proper action of both Companies and with the approval of the Board of Public Utility Commissioners of New Jersey, a lease has been consummated for a term of ninety-nine years from July 1, 1914, the consideration being the cost of maintenance, taxes, the payment of interest on all bonded and other indebtedness and providing also for reimbursement, by the issue of securities to your company, for amounts expended for additions and betterments to the property.

The Lehigh Valley Transportation Company, the entire capital stock of which is owned by your Company, has fully maintained its floating equipment and has, in fact, added to the same during the year by the purchase of one steel tug, one steam lighter, one steel car float, two steam hoisting barges, five covered refrigerator barges, five covered house barges and five open lighters equipped with gasoline hoists. In addition to the above, five covered house barges were ordered but have not as yet been delivered. One covered barge was converted into a cattle boat, one fuel lighter was sold, and nine barges, unfit for further service, were condemned and sold. The inventory of equipment on page 48 shows in detail the floating equipment used by your Company and its affiliated companies.

Thus far the Legislature of the State of New Jersey has failed to pass any bill which would relieve the Company from the necessity of operating the Morris Canal and settle the various matters in dispute with the State, although every effort has been made in that direction by your Company. Further efforts to bring about a satisfactory adjustment of the points at issue are being made.

Your Company entered into a contract with the American Express Company covering the handling of express business over your lines beginning July 1, 1914, the United States Express Company, which formerly handled this business, having served notice terminating its contract with your Company, effective June 30, 1914.

A loss of $199,598.04 for the year was experienced in the operation of the Lehigh and New York Railroad under the lease made in 1895.

Fifty-nine new industries were located on the system during the year, of which forty-nine have direct track connections with your Company's lines.

There were no fatalities to the 5,729,042 passengers carried during the year, resulting from a train accident. There has further been a very gratifying decrease in the injuries to employes as a result of the Safety Committee work conducted by the Company and its men.

The total payments direct to labor for the year amounted to $17,120,151.82, or 56.30 per cent. of the total operating expenses, including outside operations, the same having been distributed among an average of 22,017 employes.

Your Company contributed $59,677.13 to its Employes' Relief Fund.

Mr. Morris L. Clothier, of Philadelphia, and Mr. William P. Clyde, of New York, were elected Directors to fill the vacancies caused by the resignations of Mr. George F. Baer and Mr. Charles Steele.

The Directors thank the officers and employes for their faithful and efficient services rendered during the year.

E. B. THOMAS,
President.

COMPARATIVE INCOME ACCOUNT FOR THE YEARS ENDED JUNE 30, 1914 AND 1913

	1914	1913	Increase or Decrease
Operating Revenues:—			
Coal freight revenue	$18,492,683.35	$20,385,389.09	—$1,892,705.74
Merchandise freight revenue	15,026,684.11	16,339,748.97	—1,313,064.86
Passenger revenue	4,795,147.44	4,867,554.03	—72,406.59
Mail revenue	195,052.87	191,821.11	3,231.76
Express revenue	443,971.75	506,191.11	—62,219.36
Other transportation revenue	478,453.44	415,731.71	62,721.73
Miscellaneous revenue	351,570.99	336,935.87	14,635.12
Total operating revenues	$39,783,563.95	$43,043,371.89	—$3,259,807.94
Operating Expenses:—			
Maintenance of way and structures	$4,575,061.96	$5,694,422.24	—$1,119,360.28

THE LEHIGH VALLEY COAL COMPANY

REPORT OF OPERATIONS

PHILADELPHIA, August 12, 1914.

The annual report of the operations conducted by The Lehigh Valley Coal Company for the fiscal year ended June 30, 1914, and statements indicating its financial condition at the close of the year, are herewith submitted.

The total net income of the Company from all sources, after deducting charges for royalties, sinking funds, depreciation of the property and interest on the funded debt, amounted to $564,859.44, a decrease of $906,415.43 as compared with the preceding year. The shrinkage in the net earnings of the Company is due almost entirely to the restricted demand for anthracite coal as a result of the mild winter. This not only reduced the profits by reason of the smaller volume of business done, but also added materially to the cost per ton of mining such coal as was shipped.

The production of anthracite coal from the lands owned and leased by The Lehigh Valley Coal Company, including that mined by tenants, was 7,877,390 gross tons, a decrease of 982,642 tons.

The percentage of sizes above pea produced by the mining operations of the Company was 66.46 per cent., a decrease of 2.22 per cent.

The number of breaker hours worked was 41,218, a decrease of 5,796 hours.

Mining operations conducted on the Snow Shoe lands, located in Centre County, Pennsylvania, produced 252,731 gross tons of bituminous coal, a decrease of 97,373 tons.

Ample expenditures have been made to fully maintain the property of your Company. Additions and betterments amounting to the sum of $344,785 were made during the year.

The new breaker at Franklin Colliery, referred to in the last annual report, has been completed and is now in successful operation. In connection therewith certain improvements have been made in outside operating conditions to minimize the danger of fire.

Additions have been made to the pumping plants at Prospect and Dorrance Collieries and certain changes and improvements effected in the methods to enable the flowing of silt into the mines. These expenditures were necessary to comply with legislative enactments regarding the pollution of streams in that vicinity.

In order to provide for additional pumping at Exeter Colliery, a substantial addition has been made to the steam plant by the installation of high pressure boilers to replace old-fashioned return tubular boilers installed many years ago. The boiler plant at Heidelberg Colliery has also been renewed and improved.

The developments at Park Colliery have been continued throughout the year in order to place the colliery on a better operating basis and conditions are now becoming more satisfactory. The unwatering of the old workings at the western end of the property, so that mining can be undertaken in that territory, is under way.

Extensive renewals and improvements to Centralia Breaker have been made during the year in order to maintain its efficiency and modernize its methods.

The erection of the washery at Springdale for the purpose of re-working the culm banks on the Delano lands has been completed and it is now in operation.

The shaft at Blackwood Colliery has been sunk so that mining can be conducted on a lower level and, upon the completion of the necessary tunnels and gangways, operating conditions at that colliery will be improved.

At all collieries very considerable sums have been expended to reduce the fire risks and safeguard the lives of employes.

The prospecting done on the Snow Shoe property has demonstrated that there is sufficient coal in the lower or "A" vein to warrant the construction of a plant to mine the same. Accordingly an expenditure was authorized to carry on the necessary construction work and the same is now under way.

The leases with the Girard Estate, under which your Company has for many years been conducting operations at the Packer and Continental Collieries, expired by limitation December 31, 1913. After protracted negotiations a renewal was effected for a further period of fifteen years—the maximum term that could be obtained—but at higher rates of royalty than those paid heretofore. Owing to the uncertainty with respect to the renewal of these leases various contemplated improvements and development work on the property had been held in abeyance until the question of renewal was definitely settled. As soon as the new leases were executed, expenditures were authorized and work is now under way for the construction of a new steel fireproof breaker at Packer No. 5 Colliery and extensive alterations and betterments at Packer No. 4. Many important underground developments and mining improvements are also being prosecuted. These expenditures will place the operations at the Packer Collieries on the most scientific and economical basis possible and are the more necessary because of the high rates of royalty which the Company is required to pay under the new leases.

The general offices of the Company have for a long time been located in rented quarters in the City of Wilkes-Barre, an arrangement which of late years has been very unsatisfactory because of the growth of the Company. The space occupied was utterly inadequate, and failed to provide proper facilities for the storage of the very valuable maps and records and prevent their destruction in case of fire. The Company has, therefore, erected a modern office building, of fireproof construction, on North River Street, Wilkes-Barre, with sufficient space, not only for its present needs but also for future requirements. The building was completed and occupied before the close of the fiscal year.

The tax assessments upon the property and business of your Company increased very heavily in recent years. The taxes for the fiscal year under review are approximately twenty-five per cent. greater than the preceding year. This does not include the special tax levied by the State of Pennsylvania of two and one-half per cent. of the value of the coal mined. The question of the constitutionality of the law imposing this tax is now before the courts for determination.

The Company has issued no new capital obligations during the year. In fact, the obligations appearing on the balance sheet as "Deferred Real Estate Payments," representing short term notes given for the purchase of property in prior years, have been reduced by the sum of $100,000.

Payments, amounting to $111,136, were made to the sinking funds of the various mortgages on the Company's property.

Current Assets are $2,543,103 in excess of Current Liabilities.

The books and accounts of the Company have been verified by certified public accountants and a copy of the certificate as to the correctness thereof is appended.

F. M. CHASE,
Vice President and General Manager.

CANADIAN PACIFIC RAILWAY COMPANY

THIRTY-THIRD ANNUAL REPORT
OF THE
DIRECTORS OF THE CANADIAN PACIFIC RAILWAY COMPANY.
YEAR ENDED JUNE 30TH, 1914.

To the Shareholders.

The accounts of the Company for the year ended June 30th, 1914, show the following results:—

Gross Earnings		$129,814,823.83
Working Expenses		87,388,896.15
Net Earnings		$ 42,425,927.68
Deduct Fixed Charges		10,227,311.17
Surplus		$ 32,198,616.51
Contribution to Pension Fund		125,000.00
		$ 32,073,616.51
Deduct Net Earnings of Pacific Coast Steamships, Commercial Telegraph, and News Department, transferred to Special Income Account		2,115,842.15
		$ 29,957,774.36
From this there has been charged a half yearly dividend on Preference Stock of 2 per cent., paid April 1st, 1914	$1,545,026.80	
And three quarterly dividends on Ordinary Stock of 1¾ per cent. each, paid January 2nd, 1914, April 1st, 1914, and June 30th, 1914	12,600,000.00	
		14,145,026.80
		$ 15,812,747.56
From this there has been declared a second half yearly dividend on Preference Stock, payable October 1st, 1914	$1,564,493.46	
And a fourth quarterly dividend on Ordinary Stock of 1¾ per cent., payable October 1st, 1914	4,550,000.00	
		6,114,493.46
Leaving net surplus for the year		$ 9,698,254.10

In addition to the above dividends on Ordinary Stock, three per cent. was paid from Special Income.

THE FOLLOWING ARE THE DETAILS OF SPECIAL INCOME FOR YEAR ENDED JUNE 30th, 1914.

Balance at June 30th, 1913	$3,358,941.93	
Less Dividend paid October 1st, 1913	1,500,000.00	
		$1,858,941.93
Interest on Proceeds Land Sales to October 31st, 1913		492,136.05
Interest on Deposits and Loans		1,139,461.48
Interest from Minneapolis, St. Paul & Sault Ste. Marie Ry. Bonds		159,720.00
Interest from Mineral Range Ry. Bonds		50,160.00
Interest from Toronto, Hamilton & Buffalo Ry. Bonds		10,840.00
Interest from Dominion Government Bonds for half year		91,250.00
Interest from Ontario Government Bonds for half year		24,000.00
Interest from British Consols for half year		57,284.72
Interest from Montreal & Atlantic Ry. Bonds, and on other Securities		348,472.18
Interest from Berlin, Waterloo, Wellesley & Lake Huron Ry. Bonds		17,040.00
Interest from St. John Bridge & Ry. Extension Co. Bonds.		5,437.50
Interest from Esquimalt & Nanaimo Ry. Bonds		193,280.00
Interest from Dominion Atlantic Ry. Extension Debenture Stock		50,068.27
Interest from Dominion Atlantic Ry. 2nd Debenture Stock.		36,986.67
Dividend on Esquimalt & Nanaimo Ry. Stock		125,000.00
Dividend on St. John Bridge & Ry. Extension Co. Stock		70,000.00
Dividends on Dominion Express Co. Stock		200,000.00
Dividends on Minneapolis, St. Paul & S.S.M. Ry. Common Stock		890,645.00
Dividends on Minneapolis, St. Paul & S.S.M. Ry. Preferred Stock		445,326.00
Dividends on West Kootenay Power & Light Co. Common Stock		52,250.00
Dividends on West Kootenay Power & Light Co. Preferred Stock		3,850.00
Dividends on Toronto, Hamilton & Buffalo Ry. Stock		57,012.00
Dividends on Consolidated Mining & Smelting Co. Stock		140,912.00
Dividend on Berlin, Waterloo, Wellesley & Lake Huron Ry. Stock		12,500.00
Earnings from Ocean Steamships		783,677.93
Revenue from Company's interest in Coal Mine Properties.		294,857.17
Cash Proceeds from Townsites Sales		550,303.49
Net Earnings of Pacific Coast Steamships, Commercial Telegraph, News Department and Hotels		2,134,255.21
Received for space rented in Office Buildings		151,144.86
		$10,446,812.46
Less:—Payments to Shareholders in dividends; January 2nd, 1914, April 1st, 1914, and June 30th, 1914		5,400,000.00
		$ 5,046,812.46
From this a dividend has been declared, payable October 1st, 1914		1,950,000.00

2. The working expenses for the year amounted to 67.32 per cent. of the gross earnings, and the net earnings to 32.68 per cent., as compared with 66.82 and 33.18 per cent. respectively in 1913.

3. Four per cent. Consolidated Debenture Stock to the amount of £2,065,119 was created and sold, and of the proceeds the sum of £239,000 was applied to the construction of authorized branch lines, and £1,826,119 was devoted to the acquisition of the securities of other railway companies whose lines constitute a portion of your system, the interest on which had, with your sanction, been guaranteed by your Company.

4. Four per cent. Preference Stock to the amount of £800.000 was created and sold for the purpose of meeting capital expenditures that had previously been sanctioned by you.

5. Your guarantee of interest was endorsed on the Four per cent. Consolidated Bonds of the Minneapolis, St. Paul and Sault Ste. Marie Railway Company, to the amount of $1,947,000 issued and sold to cover the cost of 97.35 miles of railway added to that company's system.

6. During the year 259,371 acres of agricultural land were sold for $4,618,420, being an average of $17.80 per acre. Included in this area there were 6,318 acres of irrigated land which brought $66.93 per acre, so that the average price of the balance was $16.57 per acre.

7. To give effect to an agreement with the City of Toronto, and to an order of the Board of Railway Commissioners requiring the railway companies to provide a Union Passenger Station and Joint Terminals commensurate with the passenger traffic of the City, and to eliminate grade crossings by the elevation of their tracks in the Joint Terminals on the water front, the Toronto Terminals Railway Company has been organized with the sanction of Parliament, and a contract has been made between your Company, the Grand Trunk Railway Company of Canada, and the Toronto Terminals Railway Company, for the construction and operation of the Union Passenger Station and Terminals, which fixes the rental to be paid by each company for the use of the facilities at five per cent. per annum on one half the amount of the Terminals Railway Company securities outstanding at any time, provides for the joint and several guarantee by your Company and the Grand Trunk Railway Company of Canada of the payment both as to principal and interest of the said securities, and establishes the basis on which the expense of operating the station and terminals shall be divided between the companies. The Dominion Government and the City of Toronto will participate in the expense of carrying out these works on a basis to be determined by agreement between the parties, or to be settled by the Railway Commissioners of Canada, but it is estimated that the portion of the cost to be borne by the Terminals Company will be approximately $12,000,000. The contract will be submitted for your consideration and approval.

8. An agreement has been reached between the Kettle Valley Railway Company and the Vancouver, Victoria & Eastern Railway Company, covering the use, by the latter company for its trains, of the Kettle Valley line between Otter Summit and Hope, a distance of about 54 miles, and for the like use by the Kettle Valley Company of the Vancouver, Victoria & Eastern Company's line between Princeton and Otter Summit, a distance of about 38 miles, all in British Columbia. In each case the lessee undertakes to pay a rental equal to two and one-half per cent. per annum on the cost of the other company's line used in common, and its proportion of the cost of maintenance. By this means the unnecessary duplication of 92 miles of railway through a difficult country is avoided. Inasmuch as the Kettle Valley Railway Company has been leased to your company, your consent is required to make the arrangement effective, and therefore, the agreement will be submitted for your sanction.

9. A lease for 999 years of the Lake Erie & Northern Railway, extending from Port Dover on Lake Erie through Simcoe, Waterford, Brantford, and Paris in Ontario, to a connection with your railway at Galt, a distance of approximately 51 miles, at an annual rental equivalent to the interest on bonds issued or to be issued by the Lake Erie and Northern Railway Company with the consent of your company, will be submitted for your approval. This line will provide access to territory that is not now served by your railway, and will at a later stage be equipped for operation by electricity, in connection with your Galt, Berlin and Waterloo branch.

10. There will be submitted for your consideration and approval a lease of the Southampton Railway from a point on the Gibson Branch of this Company's railway between Millville Station and the Railway Bridge crossing the Northeast Nackawick Stream to a point in the vicinity of the Pokiok Bridge in the County of York, all in the Province of New Brunswick, a distance of approximately 13 miles, for a term of ninety-nine years, on the basis of a rental of forty per cent. of the gross earnings as defined in the said proposed lease; a lease for that portion of the Fredericton and Grand Lake Coal and Railway from a point on the Intercolonial Railway at or near Gibson, in the County of York, to a point at or near Minto, in the County of Sunbury, to connect with the present line of the New Brunswick Coal and Railway, a distance of approximately 31 miles, for a term of nine hundred and ninety-nine years, on the basis of a rental of forty per cent. of the gross earnings as defined in the said proposed lease; and a lease from the Glengarry and Stormont Railway Company of the whole of the Railway which that company has been by law authorized to construct, whether constructed or to be constructed, from a point on this Company's railway at or near the station known as St. Polycarpe Junction, in the County of Soulanges in the Province of Quebec, to the Town of Cornwall, in the County of Stormont, in the Province of Ontario, a distance of approximately 27 miles, together with the appurtenances of the said railway, for a term of ninety-nine years from the date of completion of the said railway, on the basis of a rental of forty per cent. of the gross earnings and other terms more fully set out in the said proposed lease.

11. The capital expenditure of over $60,000,000 for cars and locomotives in the years 1910-1913 was so very large that your Directors decided that it would be proper to spread the payments for this year's deliveries, about $14,000,000, over a period of fifteen years, under the terms of an ordinary Equipment Trust Agreement, and, therefore, a contract was made with the Victoria Rolling Stock and Realty Company to provide the equipment and receive payment in 15 annual instalments, with interest at four and one-half per cent. per annum. All of the equipment has been delivered, and the cost has been advanced by your Company pending the sale of the Rolling Stock Company's bonds, when your Treasury will be reconped.

12. The accounts for the year show that $35,571,959.97 had been advanced from your current funds to meet the cost of additional railway mileage and ocean steamers against which no securities have been issued or sold. In ordinary course, Four per cent. Consolidated Debenture Stock would have been utilized to meet this expenditure, but market conditions were not favourable to the sale of this security in large amounts without unduly depressing the market price.

In these circumstances your Directors decided to create a Special Investment Fund composed of the deferred payments on land sold, and securities in which land funds had been invested, to the amount of $55,000,000, and to issue against this fund and the Company's credit ten-year Note Certificates to the amount of $52,000,000, carrying interest at the rate of 6% per annum, to be offered to the shareholders at 80% of their face value, thus providing all the money required for the present purposes of the Company, and at the same time giving the Shareholders participation in the proceeds of land sales to the amount of about $10,000,000.

The issue was entirely successful. The Note Certificates, with interest, will be paid off in instalments without any encroachment on your revenue from traffic, and of the Four per cent. Consolidated Debenture Stock can be marketed in such amounts and at such times as may be most advantageous.

13. Since the close of the last fiscal year First Mortgage 5% Bonds to the amount of only £64,700 or $314,873.33 have been taken up and cancelled, because the holders were unwilling to surrender their bonds at a premium satisfactory to your Directors. The outstanding Bonds, amounting to £2,638,900 or $12,842,646.67, will mature July 1st, 1915, and on or before that date they will be paid off and cancelled with funds set aside for the purpose.

14. As mentioned in the notice to Shareholders, the Annual General meeting will be made Special for the purpose of authorizing, if approved, an increase of the Company's Ordinary Capital Stock by the amount of $75,000,000, namely, from $260,000,000 to $335,000,000, in order to make it accord with the amount for which the Company has the sanction of Government. Although with the curtailment of capital expenditure no necessity exists for issuing any additional Ordinary Stock at this time, and there will be no resumption of works requiring any large amount of money until a decided improvement in business conditions furnishes ample warrant, your Directors are convinced of the prudence of making provision at this time for your capital requirements covering a considerable period in the future. No portion of this increased amount will, of course, be issued by the Directors until the sanction of the Shareholders has been obtained at a Special General Meeting called for the purpose.

15. The death in January last of the Right Hon. Lord Strathcona and Mount Royal, G.C.M.G., was a source of sincere sorrow to your Directors. Lord Strathcona was one of the prominent founders of the Company, and he remained a member of the Board of Directors until the time of his death.

Your Directors also report with regret the death, in April of this year, of Sir William Whyte who had occupied a position of importance in the Company's affairs for many years. As Vice-President in charge of the Company's interests West of Lake Superior he proved himself a most capable and useful officer, and on his retirement from active service in 1911 he became a member of the Board of Directors.

Mr. A. M. Nanton of Winnipeg has been elected a Director in place of the late Sir William Whyte. The vacancy caused by the death of Lord Strathcona has not as yet been filled.

16. As foreshadowed at the last Annual Meeting, the General Balance Sheet has been recast so as to show in more specific form the active and inactive assets of the Company. In the schedule of these assets which appears in the Annual Report the estimated value per acre of the unsold agricultural lands has been placed at lower figures than had been mentioned, in order that it might be quite on the safe side, but your Directors and the officers of the Land Department are satisfied that your unsold lands will eventually command much higher average prices per acre than those given in the schedule.

The values fixed for the townsites and other lands and properties available for sale are on a conservative basis, and the active assets taken into the schedule at cost could be readily disposed of at figures very much higher than those given.

17. Some years ago, for the purpose of securing access to the State of Washington and other important territory in the North Western United States, the Company entered into a working arrangement with the Spokane International Railway Company, extending from Kingsgate, on the line of your railway in British Columbia, to Spokane, Washington, a distance of 141 miles, with branch lines 22 miles in length. The volume of traffic secured to your lines by this connection has become so important that a more permanent arrangement is very desirable. Your Directors have not as yet decided whether this could be best accomplished by the acquisition of the Capital Stock of the Spokane International Railway Company, by a guarantee of interest on its bonds or by some other means, and therefore they will ask your authority to exercise their discretion in carrying out such a transaction for closer and more permanent relations with the Spokane International Railway Company as may appear to be most desirable in your interest.

18. The net revenue of the Commercial Telegraph System, Pacific Coast Steamers, and News Department, that in previous years had been incorporated in the revenue of the railway, is deducted from the surplus shown in the Revenue Statement this year and transferred to Special Income Account.

19. The undermentioned Directors will retire from office at the approaching Annual Meeting. They are eligible for re-election:—

Sir Thomas G. Shaughnessy, K.C.V.O.
Sir Thomas Skinner, Bart.

For the Directors,
T. G. SHAUGHNESSY,
President.

Montreal, August 10th, 1914.

GENERAL BALANCE SHEET, JUNE 30TH, 1914.

ASSETS.

Property Investment:

Auditors' Certificate.

We have examined the Books and Records of the Canadian Pacific Railway Co., for the fiscal year ending June 30, 1914, and having compared the annexed Balance Sheet and Income Account therewith, we certify that, in our opinion, the Balance Sheet is properly drawn up so as to show the true financial position of the Company at that date, and that the relative Income Account for the year is correct.

PRICE, WATERHOUSE & CO.,

Eliminating Free Services

The western railways before applying for advances in rates apparently have adopted the policy of following some of the suggestions made by the Interstate Commerce Commission in the eastern rate decision in reference to eliminating certain free services. As mentioned last week, the lines in Western Trunk Line, trans-Missouri and Southwestern territories have filed tariffs cancelling the dunnage allowance, effective September 15; and it is now announced that, effective October 1, all arrangements for concentration of poultry, butter and eggs and other dairy products will be discontinued, except on the basis of full rates in and out of the concentrating points. The Chicago roads also have given notice that they will discontinue the practice of absorbing tunnel and lighterage charges at Chicago. The fight against the dunnage allowance was made some time ago, and its elimination in Southwestern territory has already been approved by the Interstate Commerce Commission. This will add to the revenues of the carriers, and some shippers protest against it as an advance in rates. But it means simply the withdrawal of a concession that has been made to the shippers during the past two years amounting to the freight rate on the weight of packing that would otherwise be required. The commission said: "If shippers elect to dispense with the use of boxes, crates and other packing which might be available for further use and upon the full weight of which the carriers would receive freight charges, we think the carrier offering equipment which would otherwise adequately take care of the shipment is entitled to revenue for the gross weight transported." The practice of allowing the shipper for the actual weight of dunnage used, not to exceed 500 lb., was introduced about two years ago by one road and spread rapidly through the West. The carriers are to be congratulated on having been able to get rid of it so promptly, before it attained the prestige of a time-honored custom. The lighterage question is likely to develop a heated controversy, but if the railways file tariffs at the suggestion of the commission, which the commission afterward suspends, the commission can hardly criticize them for failure to make the effort to eliminate the lighterage allowance.

The Katy Freight House Experiment

The substitution of trucks and elevators for the telphers in the Missouri, Kansas & Texas freight station at St. Louis marks the close of one of the most interesting and instructive experiments ever made in freight house operation, and the failure is in this case fully as instructive as any success could have been. There has been a great deal of criticism of the hesitation shown by the railways in applying mechanical equipment to freight house operation. Some of this may have been justified. But in many cases the criticisms have been made without an accurate knowledge of the actual problems involved. In this connection it will be recalled that in the rate advance hearing three years ago wide publicity was given to statements regarding this lack of mechanical facilities in freight houses, and suggestions were made which the installations at St. Louis have shown were impractical. Mechanical apparatus of some type will undoubtedly be developed which, when conditions warrant its installation, will reduce the amount of labor required and also the cost of handling freight, and at the same time will be sufficiently flexible to enable it to deal with the wide variety of packages encountered, and the experience gained at St. Louis will go far towards avoiding many of the difficulties now evident, but not realized three years ago. It is certain that had not this important experiment been made here it would have been made at some other point, and the railways of the entire country have benefited by it.

The Supply Man and the Purchasing Agent

A prominent railway supply man has written a letter which is published elsewhere in this issue, suggesting that the purchasing agents of the railways adopt a plan of arranging for interviews with representatives of the supply concerns which will save time and annoyance to both of them. The exact plan suggested by the writer of this letter may not be the very best one that could be adopted, but there unquestionably is merit in his contention that railway officers should co-operate with the supply men in some way that would save the time of both. The fact cannot be too strongly emphasized that the railway supply fraternity of this country plays a most important part in connection with the railway business, and that its members are entitled to be treated by their patrons with every consideration that the de-

mands on the time of railway officers will permit. As a purely practical business matter railway officers should always bear in mind that in the long run the railways have to pay in the form of the cost of railway supplies for every expense which the supply concerns incur and that therefore to put the railway supply concerns to needless expense is to put the railways themselves to needless expense. There is no question that the supply concerns are put to needless expense in the way that our correspondent points out. While, however, the supply men complain that they are often compelled to waste time cooling their heels outside the doors of railway officers, the purchasing agents and other railway officers complain that a great deal of their time is taken by the calls of the railway supply men. There is room for improvement on both sides. The best way to make the improvement would be for representatives of both sides to get together and adopt some common sense plan. If our correspondent's letter should start a discussion which should lead to this result he would be a benefactor of both the railways and the supply concerns.

CHANGING SENTIMENT TOWARD THE COMMISSION

It is very plain to all close students of public affairs that an extraordinary change in public sentiment regarding the regulation of business is taking place in the United States. The public believes the kind of regulation which we have been having has been doing more harm than good, and that that is one of the main things that is the matter with business. Therefore, the spirit of radicalism is rapidly being supplanted by a spirit of conservatism; and those public men and public bodies that until recently were popular because of the part played by them in regulation are fast becoming unpopular for precisely the same reason.

No phase of the change that is taking place is more interesting and significant than the part of it which affects the Interstate Commerce Commission. Until recently the commission could do nothing that the majority of the public, and the part of the press which reflected its views, did not defend and commend. Now it can do hardly anything that the same parts of the public and press do not criticize and condemn. One of the most significant utterances we have seen lately is an editorial in Collier's Weekly for September 5. Collier's has long been recognized as a radical magazine. "Big business," including railways, has fared ill at its hands. It has been a thick-and-thin advocate of railway regulation and usually a strong supporter of the Interstate Commerce Commission. Listen, now, to an editorial on the recent rate advance decision, which it publishes under the caption, "A Poor Halfway Measure."

There has now been time for the thoughtful to look into the long-expected freight rate decision by the Interstate Commerce Commission. It proves to be a half-baked, shuffling piece of business which settles nothing very much and distinctly unsettles confidence in the commission. The decision is based upon what we believe to be an unsound conception of the commission's powers and of the nature of the railroad business. A regulative body of this sort is useful in proportion as it keeps in touch with facts and acts with quick decision on matters brought before it. (The recent decision was six months overdue.) Regulative bodies are obstructive and inefficient in proportion as they assume to themselves the tardy dignity and stuffy bureaucratic fussiness of the wrong sort of courts. When, in addition, they wait on events and balance up what they want the railroads to do against what they are willing to concede to the railroads, the whole thing tends to become a messy sort of farce. The railroads of this country constitute a great national service and must be treated as such. Rates must be based on what is best for the country's development, not on arbitrary and meaningless apportionments of expenses between freight and passenger traffic. Service is the goal of regulation; cost is a delusion. The Interstate Commerce Commission, in this decision, has shown itself to be, as compared with the Supreme Court, very distinctly on the wrong track and very distinctly employing the wrong methods. The final misfortune would be to have this sort of bureaucracy in full charge of our railroad operations as it would be under government ownership. We want more and better regulation of the railroad problem.

In view of such utterances as this Congress, the administration and the Interstate Commerce Commission had better begin to wake up and look around. Such utterances are not very important in themselves, perhaps. And a barometer is not as important as a storm. But as an indicator of the approach of a storm, a barometer is mighty important.

RAILWAY MAIL PAY

SUCH satisfaction as railway men may derive from the report of the Congressional Committee on Railway Mail Pay, an abstract of which is published elsewhere in this issue, will be due entirely to an appreciation of the fact that half a loaf is better than no bread. The committee recommends the adoption of car space used in the carriage of mails as the sole basis of compensation. If the postoffice department should make heavy economies in the space now used the mail pay might be reduced even though the rates fixed for the various amounts of space used were just. Furthermore, the rates suggested, which include both charges for terminal service and charges for line service, are experimental and might yield less revenue in proportion than the committee estimates.

If the rates did yield what the committee estimates, it would not follow that they were remunerative, because the committee concedes that if they were applied the space in passenger trains used for the transportation of mails would yield less revenue in proportion than the space occupied by passengers; and it was clearly demonstrated in the recent rate advance case, and conceded by the Interstate Commerce Commission, that passenger train earnings, even in eastern territory, are far lower relatively to passenger train expenses than are freight earnings relatively to freight train expenses, which means that passenger train earnings as a whole are unremunerative. This being true, it must follow that mail pay rates relatively lower than passenger rates would be decidedly unremunerative. Finally, it is not certain that Congress will adopt rates as favorable even as those recommended, and which the joint committee estimates would increase the total mail compensation of the railways by about $3,000,000 a year.

But the report has its good as well as its bad features. For years the postoffice department officials have been giving the nation the impression that the railways have been overpaid for carrying the mails. The joint committee severely criticizes them for this. It shows that the statistics prepared and estimates made by the postoffice department have been worse than valueless; that they have not only been inaccurate but have been cooked up for the express purpose of misrepresenting the situation; that the postoffice officials have been living in blissful ignorance of the facts regarding the operations of their own department; that the truth is, that the railways have for years been underpaid for their services; that the system of computing mail compensation which has been followed has been wholly unscientific and unjust; and that the plans for readjusting mail pay which officials of the postoffice department have proposed have been crude and unfair and apparently have been intended to cause the railways to haul the mails at a heavy loss in order that the postoffice department might make a fallacious and dishonest showing of profit from its own operations. It is something to have finally got a committee appointed by Congress to tell Congress and the country the truth about the statistics which the department has prepared; about the incompetency which prevails in the department; and about the reckless way in which it has sought to deal with the subject of railway mail pay. It is also something to have the truth regarding the unremunerativeness of the mail compensation which the railways have been receiving laid before Congress and the public by a congressional committee.

While the recommendation that all mail pay be put on a space basis will not be satisfactory to the railways, those who have studied the subject most believe that the space basis is the most scientific, and that if properly used it will work out the fairest results. As to the rates which the committee suggests, while they may not be high enough, the committee recognizes the fact that they are experimental and provides for a reference of the question of their reasonableness to the Interstate Commerce Commission after they have been tried for two years.

Finally, a great point would be gained if, instead of granting the postoffice department the additional arbitrary authority over rates which it has sought, Congress should, as the committee recommends, take from it even such arbitrary authority as it now has and delegate the entire fixing of mail pay rates to the Interstate Commerce Commission. The commission fixes freight, passenger and express rates, and there is neither reason nor justice in an arrangement under which the regulation of mail pay rates is withheld from it and largely delegated to the postoffice department. That department is, in effect, the purchaser of mail transportation; and it would be just as reasonable and fair to let shippers determine what rates they should pay to the railways as to let the postoffice department determine what rates it shall pay to them.

The report of the joint committee may prove a long step toward the solution of the difficult and vexatious problem with which it deals. Will the present Congress, with the information which is now available, proceed to deal with the problem fairly, or will demagogism prevail and an attempt be made to continue, and even increase, the spoliation which the government has been practicing on the railways? Public opinion recently has undergone a great change. The public has come to a realization of the fact that the railways are being dealt with unjustly and in a way that is seriously hurting business in general. Therefore, it is but a matter of time until the long-eared gentlemen who now arise in Congress to bray every time a railway question comes up will be replaced by others of some intelligence, fairness and brains. Of all those in Congress who in recent years have tried to further their political ambitions by attacking the railways none has been more persistently and irritatingly pestiferous than Senator Bristow, of Kansas. Mr. Bristow recently was defeated at the primaries in Kansas, which assures his retirement from the Senate; and the country is in a mood to send a lot of other statesmen of like caliber and views to join him. If, therefore, the present Congress does not do justice to the railways it will simply increase the prospects of the election this fall of candidates for Congress who have some business sense and some notion of what it is decent, just and expedient for the government to do in dealing with railways and other business concerns.

ELECTRIC FEEDERS FOR STEAM ROADS

THE steam railways of this country have been slow to realize the importance of electric interurban lines either as competitors for passenger and freight business or as feeders for their trunk lines. As a result fairly extensive systems of electric roads have been developed in various parts of the country without attracting the serious attention of steam railroad men before they had begun to make serious inroads on their traffic. Naturally their competition was first felt in the local passenger business, but as the electric lines have increased their mileage they have had an effect on the long haul passenger business, and on both l. c. l. and c. l. freight traffic.

In several localities on the Pacific coast the steam railways, instead of allowing interurban lines to become active competitors, have built such lines themselves as feeders for the parent systems. In this way they have become able to give communities local passenger service, which it would not be practical to render with steam road methods of operation, and at the same time have controlled the through routing of passenger and freight traffic competitive with other lines. If interurban roads throughout the country which have had no arrangements for the through billing of freight have been able to operate successfully, it would seem that similar lines operating in conjunction with large roads, and receiving divisions of their through rates should be even more successful financially.

The Spokane & Inland Empire, and the Oregon Electric lines, which are described elsewhere in this issue, are good examples of electric line feeders. They are owned by the Hill roads, and are operated in close harmony with the controlling properties. Since the Oregon Electric is the newer line, and was built by these interests, it more nearly represents their standards of construction for such lines. It is built to steam road standards, modified only where necessary to permit electric operation. It extends for 125 miles down the center of the Willamette Valley, which had previously been served exclusively by the Southern Pacific. One immediate effect of its invasion of this valley was the announcement by the Southern Pacific that it would electrify and extend its branch lines in the same territory, which work has been under way for the past two years.

The development of a system of electric line feeders has brought forward a number of new problems of more or less seriousness. One of these is due to the attitude of organized labor. While the electric lines conform closely to steam road in their methods of operation, the qualifications that they require of men in the train service are, as is the case on similar roads throughout the country, considerably below those required of men on steam roads, and a correspondingly smaller wage is paid. But because of the ownership of the electric lines by the steam roads the employees of the electric lines have sought to secure the standard steam road rates. Doubtless their thought is that once these rates have been put in effect on the electric lines owned by steam roads, they can be more easily established on all electric lines. If the employees succeed in getting steam road wages adopted on electric lines one of the important economies of electric operation will be lost, and the further development of such lines will be hindered.

"PERMANENCY MAKES FOR EFFICIENCY"

MR. UNDERWOOD, president of the Erie Railroad, in that highly condensed lecture which he gave the superintendents at their New York meeting, and which was reported in our issue of August 28, touched, in a dozen words, on one of the most important yet most difficult features of discipline: "Seek to instil into every employee the truth that each year of his service improves and cements his relationship with the company . . .; permanency makes for efficiency." We have called this important because every superintendent desires to have employees with whom his friendship, as he represents the company, is "cemented"; and that this is difficult goes without saying, for railroad officers everywhere deplore the fact that their practice in this respect is much below their ideals.

This state of things is not strange. In all walks of life, words of censure for misconduct are necessary and are familiar in everybody's experience; while words of commendation for good conduct freeze on our lips—if they get so far as the lips. Cementing things together is a process not always easy to explain. Chemists tell us that in old brick walls the mortar and the bricks are found to have united in a way which cannot be explained, so that the union between the mortar and the bricks is stronger than the cohesion in the brick itself, or in the mortar, by itself. So in the relations between employer and employee; there is not a new cementing each year, but the strength of the original union should increase. In notable instances, which every reader can recall, this strengthening does occur; and usually its causes are as hard to define as is the mysterious condition of the brick wall.

A superintendent has, let us say, 100 men of a certain class. Ten of them have been reprimanded or otherwise talked with during the past year concerning derelictions (and, incidentally, their good qualities or good acts have perhaps been mentioned); five have been commended for some specific act; and 85 do not appear on the record; there has been no formal communication concerning the quality of their work or conduct. It must be presumed that their services were satisfactory. What can be done to better encourage this larger number. They may feel as though they had been ignored. To strengthen their loyalty something more definite is needed.

Everybody admits that something ought to be done; but what, when and how?

One superintendent says that the pay envelope answers the question. Agreeing, for the moment, with this view, it is safe to say that the great majority of officers would like to add something more, even if there be nothing owing to the employee. Should a letter or message go with every pay envelope? That would make the thing too common. The three-line paragraph from the directors, at the end of their annual report to the stockholders, stands at the opposite extreme. This expression of appreciation is so very general that it has no effect at all. A circular from the general manager, sent separately in envelopes, one to each employee, is an improvement on the directors' method; but still it is pretty vague. Speeches at meetings for "safety-first," or other purposes, are also unsatisfactory.

The need is for an individual communication; a letter or message known by the recipient to be based on thoughts concerning him, and referring to no other employee. On one road, the name of which we do not recall, a brief commendatory letter was sent, one December, to each employee whose record for 12 months was clear, and the result was very gratifying. Credits for specially meritorious acts, to be entered in a printed monthly bulletin, are now common on many roads. These seem to be quite generally liked; but one hears frequently the objection that it is not good practice to commend a man for doing his simple duty. To make a distinction between what is in the line of duty and what is not, is often difficult. And there is the more serious objection that the rewards are very unequal. The most vigilant telegraph operator may wait five years, or even ten, before he sees a fallen brakebeam in a passing freight train; while some comparatively lazy young novice may in the meantime get his name in the record by good luck. The publication of these commendatory bulletins, however, is a move in the right direction. If any ill effects shall result from their use, the need will be not for abolition but for correction. Can this feature be improved?

The reader will recall the paragraph, printed in our account of discipline without suspension on the Baltimore & Ohio, on January 16 last, which tells of a conductor who had a clear record—a blank page—and who procured a copy of that page and framed it, to hang up in his home, where the eloquent emptiness of the sheet would be a constant incentive to him to keep it empty. That is a very good idea. Would it not be a good stimulus for any conductor to make use of?

What can a superintendent do to improve on a blank sheet as a record of satisfaction with a conductor's or an engineman's service. This is not being written with the expectation of answering this question, but rather to give prominence to the subject with the hope that it may cause railway men to give the matter increased attention. But it is easy to imagine a superintendent, one who has the constant aid of two or three trainmasters and a dozen active inspectors, who at least once a year would have the material for a brief letter to each employee—at least to each of, say, the 20, 30 or 40 best men in the supposed hundred—in which should be made definite mention of the work that that employee has done.

Is this a fantastic ideal, outside the range of practical railroading? Would the expenditure of time and money be any more of an extravagance than the inspection (and the accompanying reporting) that is expended on rails, locomotives, air brakes, lawsuits and other things?

The following paragraph is an extract from the plea made by a veteran conductor who recently went before his superintendent as spokesman of a committee to ask for the adoption of some plan by which adverse entries might be offset by—something; presumably by a series of months showing nothing unfavorable. It voices a feeling that is very common:

> When a man is young he is careless, and he treats suspensions and reprimands, fines and cautions lightly. Why? Because he has not reached that age yet where he sits down to think. But when he reaches my age, and possibly a little younger, that foolishness has all left him, and I tell you it is not a question of a day, nor is it a question of a week, or of the loss of the time; it is the humiliating feeling that comes to a man, who is striving to do his best. . . . There is only one side of the ledger when you go to look at your record—and I am ashamed of mine. I have seen it; three pages, representing 30 years. A man sees nothing there but his shortcomings; no matter what he has done that may be commendable, it does not appear. It has appeared in some way in times gone by, but either it has been lost, or has been carried out by the scrubwoman; it is not there now. In such a situation a man feels sore. Can there not be some rule adopted whereby discipline could be imposed and yet the men given a chance to wipe some of it out? We have thought from time to time it would be an excellent thing if we were permitted in some way to clear up the record. I feel satisfied that if Mr. X., the superintendent, got my record and looked it over he would he fair enough to ascertain whether I was improving, or whether I was going back; and I think he would give me an opportunity if I showed a disposition to brighten that record; but Mr. X. may leave here and some other gentleman may come to take charge, and not seeing anything good on that record, nor knowing anything more about it, he might not be as liberal as Mr. X. He would see that record, three pages in thirty years, and say at once, why, that man is not fit for the service at all. And I might have got all the unfavorable entries in the first ten years.

Cannot some definite response be made to such a plea? It is the general understanding that those roads where Brown's discipline is in effect and where demerits are regularly wiped out by the lapse of time—a certain number of clear months for a certain number of "days"—have not been so thoroughly satisfied with the plan as to lead other roads to adopt it. What is the reason for this?

BUFFALO, ROCHESTER & PITTSBURGH

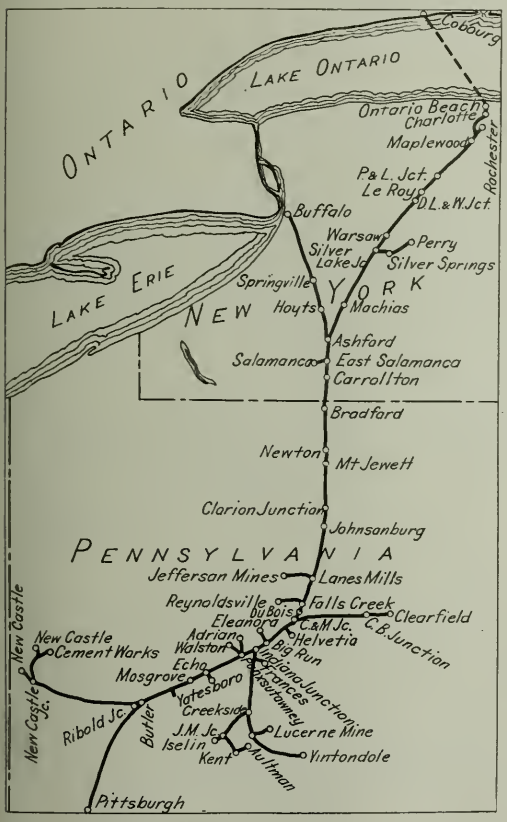
INSOFAR as gross and net earnings were concerned, the fiscal year ended June 30, 1914, interrupted the quite remarkably steady growth in prosperity that has been shown by the Buffalo, Rochester & Pittsburgh since 1909. Insofar as the development of the property, improvement in organization and the fundamentals of progress were concerned, there was no interruption. In brief, the Buffalo, Rochester & Pittsburgh in 1914 earned gross a quarter of a million less than in 1913, due to loss in coke and general merchandise traffic; spent in operating expenses a quarter of a million more than in 1913, due to increased transportation expenses; and had about $200,000 less other income, finishing the year, therefore, with net corporate income of $1,355,000, as compared with $2,127,000 in 1913. Dividend requirements, with both common and preferred on a 6 per cent annual basis call for $990,000. Six per cent was paid on both the common and preferred in the 1914 fiscal year, but since the close of the year the rate on the common has been reduced from 3 per cent semi-annually to 2 per cent. This reduction in the dividend rate reflected, however, the conservatism of Buffalo, Rochester & Pittsburgh policy rather than necessity.

The company operates a total of 586 miles of line, of which 207 miles are double track. The road is an independent north and south line, running between the Pittsburgh district and Lake Erie via the bituminous coal and coke fields of Pennsylvania, and in active competition with the Pennsylvania Railroad and, to a less extent, with the New York Central Lines. It is, as would be expected in this territory, a line with rather heavy grades, a large percentage of coal and coke traffic, and a quite heavy density of passenger business. The mileage of line operated has increased since 1909 by only 13 miles, while the earnings have been as follows: $7,608,000 in 1909, $9,486,000 in 1910, $9,973,000 in 1911, $10,322,000 in 1912, $11,959,000 in 1913 and $11,528,000 in 1914.

The Buffalo, Rochester & Pittsburgh has, moreover, succeeded in doing what comparatively few roads in eastern United States have done, namely, conserved to the owners of the property a portion of the increase in gross. Thus net earnings in 1909 were $2,810,000; in 1910, $3,394,000; in 1911, $3,615,000; in 1912, $3,654,000; in 1913, $4,077,000, and in 1914, $3,356,000.

One of the most important elements in this growth of net earnings, despite the annually increased cost of doing business, has been the equal development of each part of the property to fit into a general scheme of betterment. The development, of course,

has been intensive. The extensions which have been made since 1909 were extensions of branches into the coal fields necessitated by the exhaustion or partial exhaustion of the more readily accessible mines. It is impossible to go into a detailed description of this carefully carried out general scheme of development, and yet the scheme itself consists of a great mass of detail. In 1909 and 1910 the management began replacing Consolidation locomotives with Mikados, but before this purchase had been made, heavier rail and ballast had been installed, so that by the time the Mikados were delivered the districts for which they were destined were in shape to utilize them to the fullest extent. Since then, while no spectacular expenditures were made for additions and betterments, a comprehensive plan of relaying with heavier rails, bringing bridges up to Cooper E 60,



The Buffalo, Rochester & Pittsburgh

strengthening embankments and increasing engine house facilities has been going on.

In 1914 the Buffalo, Rochester & Pittsburgh for the first time ordered Mallet locomotives. This illustrates quite well, although it does not begin to describe, the policy which the management of the property has pursued. With the grades which the road has there was no doubt probably in the minds of the management, even earlier than 1909, that Mikados could be used economically on nearly the entire line and that on considerable portions of the line for certain classes of traffic Mallets could be made to effect a saving; but the company had its Consolidation locomotives. It was able, through improvement in organization to earn an increased profit with the increase in business, and instead of selling a large issue of securities to buy heavier locomotives and then to strengthen the road so that these locomotives could be used, the change was made gradually, so that the value of the older and lighter locomotives in service was gotten out of them before they were retired, and the increase in traffic was made to more than pay for the increased interest charges resulting from improvement to roadway and track.

The reduction of dividends is another aspect of this same progressive conservatism. It was thought better for stockholders to sacrifice a part of their present income rather than to narrow the margin of safety between dividend requirements and amounts available for dividends which for a number of years on the Buffalo, Rochester & Pittsburgh have been kept ample.

Of the $10,710,000 operating revenues in 1914, 85 per cent was from freight and 11 per cent from passengers. Freight revenue was less in 1914 by $258,000 than in 1913 and passenger revenue more by $57,000, the net loss in total operating revenues amounting to but slightly over 2 per cent. This loss was almost entirely due to a decreased tonnage of coke carried and to decreases in the tonnage of iron ore and manufactures. Bituminous coal furnishes the largest proportion of the traffic, and in 1914 8,176,000 tons of coal were carried out of a total tonnage handled by the road of 12,295,000 tons. In 1913 the coal tonnage was 7,980,000 tons and the total tonnage handled 12,490,000 tons. The increase in coal tonnage was despite the fact that most of the collieries on the road were idle for all of April and nearly two weeks of May, due to a cessation of work during an adjustment of the miners' wage scale. The loss in coke traffic was, of course, because of the depression in the iron and steel trade. It is indicative of the soundness on which the growth of Buffalo, Rochester & Pittsburgh business rests that in a year of very marked depression freight traffic earnings should have fallen off only about 2 per cent and passenger earnings actually increased.

The increase in expenses amounted to 3.55 per cent. The following table shows the percentage of each class of expenses to total operating revenues:

	1914	1913
Maintenance of way and structures	13.52	14.23
Maintenance of equipment	20.69	19.74
Traffic expenses	1.41	1.30
Transportation expenses	36.23	32.71
General expenses	2.27	2.05
Total	74.12	70.03

It will be noticed that the larger part of the increase in expenses came in transportation expenses. Detailed expense accounts throw some light on this increase in transportation expenses in the face of a decrease of 2.96 per cent in the ton mileage hauled. Fuel for road locomotives cost $773,000 in 1914 as against $795,000 in 1913, a decrease of between 2 and 3 per cent. Wages of road trainmen amounted to $563,000 in 1914 and $494,000 in 1913; in other words, where economy could effect a saving, a saving was made, and where the full-crew bill compelled a useless expenditure it was necessary to show a loss.

Despite the slight increase in passenger business there was a decrease in the mileage of revenue passenger trains from 1,378,000 in 1913 to 1,367,000 in 1914; but in freight service, with a decrease of over 2 per cent in ton mileage there was a very slight decrease —from 2,837,000 to 2,816,000—in the mileage of revenue freight trains. Stated in another way, the average revenue trainload in 1913 was 710 tons, and in 1914, 694 tons. This decrease in trainload was due entirely to changes in the direction and character of the traffic. The number of tons of freight per loaded car was 35.74 in 1914 as against 34.61 in 1913. Car loading, which has been improved steadily on the Buffalo, Rochester & Pittsburgh since 1909 and which is high, was still further improved in 1914. On the other hand, loaded cars were but 58 per cent of the cars in freight train in 1914 as against 60 per cent in 1913. Mention has already been made of the loss in the tonnage of iron ore. Iron ore moves south in coal cars and the utilization of these cars, which would otherwise have to run empty south-

bound, has been one of the very important factors in the larger revenue trainload in recent years. A falling off in iron ore traffic, therefore, with an increase in coal traffic, automatically increases the empty car mileage and decreases the average revenue trainload.

There is another factor which has probably increased transportation expenses, and that is the fact that a larger proportion of the coal each year comes from mines further away from the main line. This is not reflected in a longer average haul of all freight, probably because of other changes in traffic conditions which offset it, but it is nevertheless a cause of increases in the transportation expenses.

In 1914 the Buffalo, Rochester & Pittsburgh spent $1,629,030 for new equipment and $1,893,000 for additions and betterments to roadway and structures. The company appropriated out of income $348,000 for equipment agreement sinking funds, and sold $2,000,000 equipment trust certificates dated July 1, 1913; $887,000 equipment trust bonds authorized in 1910, and $1,400,000 consolidated mortgage 4½ per cent bonds, retiring various amounts of equipment trust bonds maturing under the trust agreements, with the net result of an increase of $3,068,000 on the outstanding funded debt of the company, with no increase in the amount of outstanding stock. At the beginning of the year there were no loans and bills payable, and at the end of the year there were $47,000 loans and bills payable. Cash on hand at the beginning of the year amounted to $1,620,000, and at the end of the year to $1,228,000.

The following table shows the principal figures for operation in 1914 as compared with 1913:

	1914	1913
Mileage operated	586	576
Freight revenue	$9,153,942	$9,411,879
Passenger revenue	1,184,417	1,127,612
Total operating revenue	10,709,535	10,947,246
Maint. of way and structures	1,447,953	1,557,963
Maint. of equipment	2,216,194	2,161,210
Traffic expenses	150,553	141,659
Transportation expenses	3,880,160	3,580,617
General expenses	243,202	224,441
Total operating expenses	7,938,063	7,665,891
Taxes	234,000	216,000
Operating income	2,534,575	3,057,960
Gross corporate income	3,355,798	4,076,708
Net corporate income	1,354,784	2,126,994
Appropriated for pension and insurance funds	16,432	1,498
Appropriated for new equipment	74,104	125,796
Appropriated for retirement of equipment bonds	274,247	323,000
Dividends	990,000	990,000
Surplus	.....	686,701

NEW BOOKS

Poor's Manual of Industrials for 1914. 2,500 pages. Published by Poor's Railroad Manual Company, 535 Pearl street, New York.

The publication of this fifth edition of Poor's Manual of Industrials completes the Poor's Manual for 1914, which is in three volumes, the Manual of Railroads, the Manual of Public Utilities and the Manual of Industrials. Long before the Interstate Commerce Commission or any other government body had begun to collect scientific and intelligible figures in regard to railroads, Poor's published an authoritative and comprehensive manual of statistics of railroads in the United States that was indispensable to bankers and investors. With the great growth in industrial corporations within the past ten years there has grown up a need for an accurate and comprehensive manual of industrials comparable to the need for statistics in regard to railroads in the eighties. While, of course, it is far more difficult to get uniform and comprehensive figures for industrial corporations than for public utility and railroad corporations, the Poor's Industrial Manual contains a really remarkably accurate set of income accounts and balance sheets, many of them in comparative form.

Letters to the Editor

CO-OPERATION BETWEEN SUPPLY MEN AND PURCHASING AGENTS

Chicago, Ill., August 7, 1914.

To the Editor of the Railway Age Gazette:

At the present time when economy is being preached and practiced by the railroads, and of necessity also by the concerns engaged in the railroad supply business, a practice exists on the part of the railroads which puts the supply companies to a heavy, needless expense.

I refer to the fact that a majority of the railway purchasing agents, especially those with offices in Chicago, are not willing or able to make definite appointments for interviews. It is therefore necessary for a supply company representative, desirous of an interview, to call at the purchasing agent's office and wait an indefinite length of time. A wait of an hour is, I am sure, considerably less than the average. When it is considered that frequently the callers are executive officers of their companies, and that almost all of them are high salaried men, it will be seen that an hour wasted out of a day is a large waste, and that when this is multiplied by the number of officers and the number of men waiting, the total waste is enormous.

This is not intended to apply to the chief clerks of purchasing agents, who see many representatives on questions of detail.

As a remedy for the condition cited, I would suggest that the purchasing agent set aside an hour and a half in the morning, say from 10:30 to 12:00, and the same length of time in the afternoon, say from 2 to 3:30, for interviews. This time could be divided up into ten minute intervals on a sheet and put into the hands of a secretary; these appointments to be adhered to strictly, not only by the caller but by the purchasing agent; the interview to be terminated at the expiration of the time allotted.

I appreciate the fact that the purchasing agent at present is frequently interrupted by other officials of his own road and by the telephone, but I do not believe it would be difficult to get the co-operation of other railroad officers, and undoubtedly the telephone messages could be handled for the purchasing agent during the time set apart for interviews.

The advantage to the purchasing agent would be that he would always know in advance who was calling and could prepare himself by reference to his files, etc., when necessary.

I understand that some time ago one of the large railroads contemplated moving its purchasing agent's office to a location considerably removed from the business section of Chicago. A protest was made to the officials by the purchasing agent on the ground that the heads of the various supply companies would not call on him at that distant location, and that he considered frequent interviews with them very essential. On this account the change of location was not made.

I am confident that there are at present many executive officers of supply companies who would like to call on the railroads, but are deterred by the long waits necessary and the uncertainty of being able to get any interviews.

I believe some plan of the kind suggested would be to the advantage of both the railroads and the supply companies, and I am sure it would result in a great saving of time and money to the supply companies.

Railway Supply Man.

Railway Extension in Argentina.—The Argentine chamber of deputies has sanctioned a bill granting a concession for a railway from Rosario to Rufino.

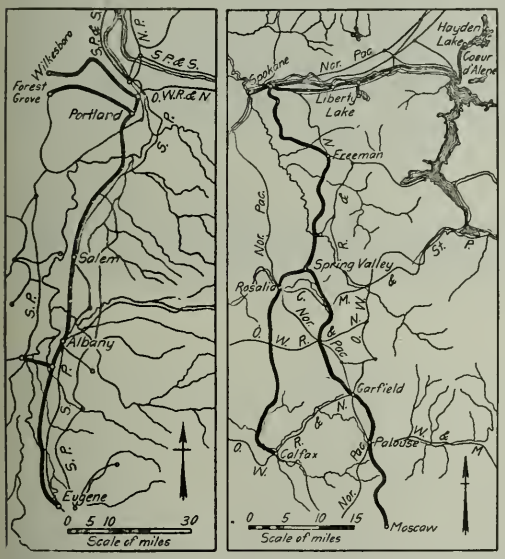
Rolling Stock for Italian State Railways.—Contracts aggregating $10,446,974 have just been awarded to 17 Italian firms for building 885 baggage and passenger cars and 4,481 freight cars for the Italian State Railways.

Hill System Electric Lines in the Northwest

The Development of High Grade Interurbans as Freight and Passenger Feeders for Trunk Roads

In spite of the rapid development of electric interurban lines throughout the country, the railroads, especially in the eastern and central states, have given relatively little attention to the possibilities of such lines as feeders for their main trunk lines. The roads on the Pacific coast have been the first to realize the opportunity for development in this direction on a large scale, and it is here that the greatest progress has been made. Over 1,500 miles of such lines are now in active operation under the control of the Southern Pacific and the Hill Lines, the former in the vicinity of Los Angeles, San Francisco and Portland, and the latter near Portland and Spokane. These lines are more than the ordinary interurbans in that they compete actively for all classes of freight as well as passenger traffic, and have the same standards of equipment and construction as steam roads.

The lines of this nature most nearly approaching steam road standards of construction, operation and traffic, are the Spokane & Inland Empire system, extending south and east from Spokane, and the Oregon Electric-United Railways line, in the Willamette Valley south and west of Portland of which are Hill properties. These systems compete actively with the steam roads for all classes of traffic in highly competitive territory and participate in through rates with the owning and other companies.



Maps Showing Lines of Oregon Electric and United Railways on Left and Spokane and Inland Empire on Right

PHYSICAL CHARACTERISTICS OF THE INLAND EMPIRE

The Inland Empire is the older of the two lines, and extends from Spokane south to Colfax, Wash., and to Moscow, Ida., and also east to Coeur d'Alene, Ida., and Hayden Lake, with a total of 177 miles of main line. In addition, this company also operates 36 miles of street railway lines in Spokane, which, however, will be excluded from this study. The lines south, commonly termed the Inland division, are single track throughout, while 18 out of 41 miles of the Coeur d'Alene division is double track. These two lines were built separately in 1906, and were consolidated under one management in 1908. They were acquired by the Great Northern and Northern Pacific in 1911. They are operated entirely separately from the parent companies, but are under the executive control of the Spokane, Portland & Seattle.

The Inland division crosses a rolling country with a maximum grade of 2 per cent and a maximum curvature of 12 deg., although only a few curves of this high degree are found. The longest grade is nine miles against southbound traffic a short distance out of Spokane. The maximum grade on the Coeur d'Alene division is one per cent. No reduction of grades has been undertaken since the present owners assumed control of the property, although numerous high timber trestles have been filled. Passing tracks are placed at intervals of about three miles with numerous intermediate spurs. The track is laid with 70 lb. rail on gravel ballast.

For the first 20 miles the Inland division traverses a rapidly developing fruit country, which merges south of Freeman into the wheat area known as the Palouse country. The Coeur d'Alene division traverses a country devoted largely to fruit raising, with many summer resorts in the vicinity of Coeur d'Alene and Hayden Lake. The territory south of Spokane is competitive with the Oregon-Washington Railroad & Navigation Company and the Northern Pacific, while the line east is paralleled by the Chicago, Milwaukee & St. Paul and the Northern Pacific.

At Spokane the passenger trains proceed over city streets for about a mile to a terminal in the center of the city, shown in one of the accompanying photographs. Freight trains are assembled in a separate freight yard located between the yards of the St. Paul and the Great Northern, with transfer connections with all roads. Physical connection is also made with the Northern Pacific and the Oregon-Washington Railroad & Navigation Company at Moscow. The terminals at Spokane are adapted for the handling of all classes of traffic ordinarily found on steam roads, while the station facilities at the smaller towns, including combination freight and passenger stations, house tracks and side tracks, are also similar.

All trains are operated electrically. The company has its own hydro-electric power plant on the Spokane river, nine miles below Spokane, where it now generates about 11,000 h. p., about 4,500 h. p. of which is sold to outside parties. The Inland division is operated on 6,600 volts, alternating current, while the Coeur d'Alene division uses 650 volts, d. c. A 46,000-volt line supplies current to substations spaced at intervals of 12 miles along the Inland division. The overhead line is of catenary construction.

The motive power consists of six 47-ton and five 72-ton single phase, a. c., and two 37-ton d. c.—600 volt locomotives. On the Inland division, two locomotives are commonly operated in multiple on freight trains, two of the lighter ones hauling 450 tons and two of the larger ones 630 tons on the maximum grade. On the Coeur d'Alene division they are operated singly, a 37-ton locomotive hauling as high as 725 tons. Two of the a. c. locomotives make the trip from Spokane to Moscow and return, 180 miles, with a local freight carrying full tonnage daily, in 12 hours and 45 min. regularly.

INLAND EMPIRE TRAFFIC

An average of over 3,000 passengers are handled daily on the Spokane & Inland Empire, and the number exceeds 4,000 on Sundays during the summer. The passenger receipts last year were over $565,000, forming practically half the total revenue. Three trains are operated each way daily from Spokane to Colfax and to Moscow and nine to Coeur d'Alene. The passenger business is especially heavy on this latter line with a considerable com-

muter traffic and two daily boat trains each way during the season of navigation which connect with steamers for Harrison and St. Maries. These latter trains run through without stops, making the 32 miles in 55 min., including crossing nine streets at grade entering Spokane. As indicating the heavy passenger traffic handled at certain times, 1,085 special trains were run on this line during the 55 day racing season at Coeur d'Alene in 1912. Parlor cars are operated on the four limited trains on this division. Great Northern express and United States mail are carried on several trains on each line.

However, it is the freight traffic which presents the greatest opportunity for development. About 75 carloads of freight are handled daily, two-thirds of which originates on the Inland division. This traffic consists principally of grain, lumber, fruit, stock and merchandise. One regular freight train leaves Spokane about midnight daily for each branch of the Inland division, making the round trip in about 12 hours, while two freights are operated each way daily to Coeur d'Alene. Extra freights are run as required, an average of three being operated daily on the Inland division during the fall wheat rush. Previous to their acquisition by the Hill lines, through carload freight originating on these lines was turned over to different roads at Spokane indiscriminately. Now, however, as much of it as possible is routed over the Great Northern or the Northern Pacific, from 15 to 20 cars being given these two roads daily, aside from the heavy wheat business, most of which is also long haul traffic.

The heaviest carload traffic consists of wheat from the Palouse country, about 3,000 cars being brought into Spokane last year, most of which were billed to Tacoma, Seattle and Portland. Forty-two warehouses have been erected at various points along the line with a capacity of over 4,000,000 bu. Considerable lumber is also hauled out for eastern points, an average of about 10 cars being turned over to the Inland Empire by the Washington, Idaho & Montana at Palouse daily, in addition to some at other points.

The carload fruit business is growing rapidly, in addition to which much is handled by express and l. c. l. As indicating the possibilities along this line, 13 cars of berries and several cars of cherries were shipped in one week from one station, while a special train consisting of 12 cars of fruit was brought from Moscow to Spokane. To accommodate the heavy l. c. l. fruit business, a tri-weekly refrigerator service is operated on all lines, generally requiring two or more cars on each train.

About 18 cars of l. c. l. freight are loaded at Spokane daily. Freight received up to 5 p. m. is despatched on night trains for delivery at all stations along the line at 6 o'clock the following morning. In addition, local freight received up to 11 a. m. daily at Spokane is delivered at Coeur d'Alene at 1 o'clock the same afternoon. Solid cars are loaded for Colfax, Moscow, Palouse and Coeur d'Alene, while two solid cars are loaded for points on the Washington, Idaho & Montana points via Palouse,

Passenger Terminal at Spokane One Block North of the Post Office

Main Freight Terminal in Spokane

Typical Combination Passenger and Freight Station on the Inland Empire at Palouse, Wash.

and peddler cars serve other points. During the season of navigation at least three cars of l. c. l. traffic are also delivered daily to the boats at Coeur d'Alene for St. Joe, St. Maries and intermediate points. As indicating the extent to which this road is

Typical View on Inland Division Showing Track and Single Catenary Construction for a. c. Operation

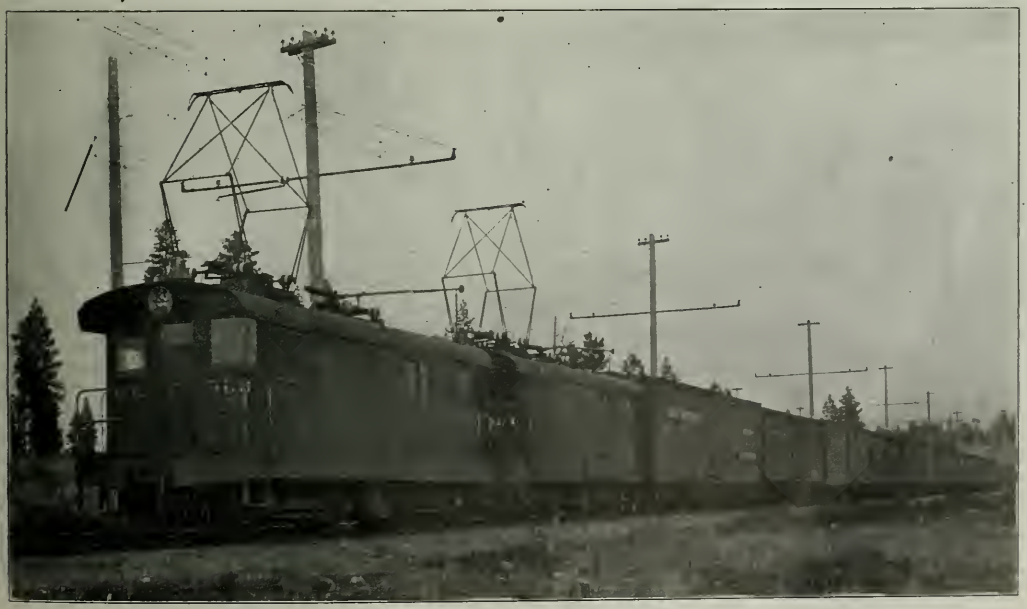
enabled to meet competition, it secures over 90 per cent of the l. c. l. business from Coeur d'Alene in competition with two other lines.

PHYSICAL CHARACTERISTICS OF THE OREGON ELECTRIC

The Oregon Electric is a more recent development of the Hill lines, and is another example of the competition existing between the Hill and Harriman interests in the northwest, as it extends up the productive Willamette valley, long a stronghold of the Southern Pacific. The Oregon Electric operates from Portland south through Salem and Albany to Eugene, Ore., a distance of 122 miles, with a branch from Garden Home to Forest Grove 19 miles long. It was originally built to Salem and to Forest Grove as an interurban road and was purchased by the Hill lines in 1910. Work was immediately begun on an extension to Eugene, which was completed in October, 1912. At the same time the Oregon Electric was purchased, the Hill lines also secured control of the United Railways operating from Portland west into the Tulatin valley, and have since extended it west 12 miles to Wilkesboro. The United Railways also possess valuable franchises for operation over city streets in Portland. While both lines are now owned by the same interests, they are still operated independently in all except executive matters.

Since taking control, the new owners have built these extensions and have revised the old line so that they now conform to steam road standards of construction. The line to Eugene is located with long tangents and light curves, having one 24-mile tangent south of Albany and another 17 miles long north of Salem. South of Salem the maximum curve is 3 deg. and the maximum grade 0.4 per cent., while it is planned to revise the grade north of Salem to a maximum of 0.5 per cent. As indicating the character of construction, the Willamette river is crossed south of Harrisburg with three 200 ft. through truss spans and a 100 ft. through girder span at each end, and a trestle approach across the low lands, while the Santiam river is crossed with seven 175-ft. truss spans and 3,000 ft. of trestle at each end. The track is laid with 75-lb. rails with heavy angle bars, with welded bonds. Eighteen ties, full tie plated, are used per rail with 8 in. of gravel ballast under the ties. South of Salem 2,000 ft. sidings are provided at intervals of four miles. Except in cities, the line is built throughout on private right of way of 100 ft. width.

Power is purchased by contract from hydro-electric plants with auxiliary steam units and 33-cycle current is transmitted at 60,000 volts for a maximum distance of 120 miles. It is de-



A Freight Train on the Inland Division

livered to the cars and locomotives from a trolley, carrying 1,200 volts d. c. by means of a trolley pole rather than a pantograph. This line was changed over from 600 volts d. c. in 1912, at which time the spacing of sub-stations was increased from 12 to 18 miles. The United Railways was changed over to the same system in July, 1913. The sub-stations are of concrete construction and contain one 500 k. w. generator with room for another whenever it may be needed. A triple cottage is provided at each station for the three attendants and their families. One 500 k. w. portable sub-station has been built on a steel car

Delivering Wheat to an Inland Empire Warehouse in the Palouse Country

for use at burn-outs and in handling peak loads. It was also used when changing over from 600 to 1,200 volts.

Eight locomotives weighing 60 tons each with 19,000 lb. tractive effort when running, and 32,000 lb. when starting, are required on the Oregon Electric and one on the United Railways. These locomotives haul 500 tons on the ruling grades.

The overhead construction consists of a single 45 ft. pole with a bracket supporting a catenary, which in turn carries the aluminum strand transmission wire. Guy poles are placed on curves. A telephone line was built independently at one side of the right of way. As a means of increasing the life of the poles the Orr system of reinforcement is used, consisting of a

One of the Larger Bridges on the Oregon Electric

concrete collar reinforced at the ground line and costing about $9 per pole. All pole butts are treated with creosote or carbolineum before setting and each pole is inspected annually.

Among the numerous improvements which have been made on this line during the past few years is a five mile cut-off between Orenco on the Oregon Electric and Helvetia on the United Railways, which will eliminate the necessity of hauling freight through the streets of Portland, and gives direct access to the common yard of the Hill lines at that point. At Salem a detour line two miles long for freight traffic passes through the wholesale district and removes this traffic from the main residence streets, while a similar line has also been built at Albany. A second track was also built south to Garden Home last year. In connection with the construction of this second track, alternating current, automatic signals were installed.

TRAFFIC ON THE OREGON ELECTRIC

Both passenger and freight traffic is actively solicited in competition with the Southern Pacific and its subsidiary, the Portland, Eugene & Eastern. Five passenger trains are operated each way daily between Portland and Eugene, two of which are limited trains making the run of 122 miles in four hours. Two additional trains are run from Portland as far as Albany, and three more to Salem. All these trains carry at least two cars and most of them three cars. Buffet parlor cars are carried on the limited trains, and one sleeping car is operated each

Automatic Signals at Entrance to Passing Track on the Oregon Electric

way between Portland and Eugene nightly. All through trains carry express, the Great Northern having replaced Wells Fargo & Company on August 1, 1913. The express business has developed very rapidly, especially in milk and berry traffic, and six express cars have recently been purchased for this special use. Although most of this line has been in operation less than

Oregon Electric 60 Ton Freight Locomotive

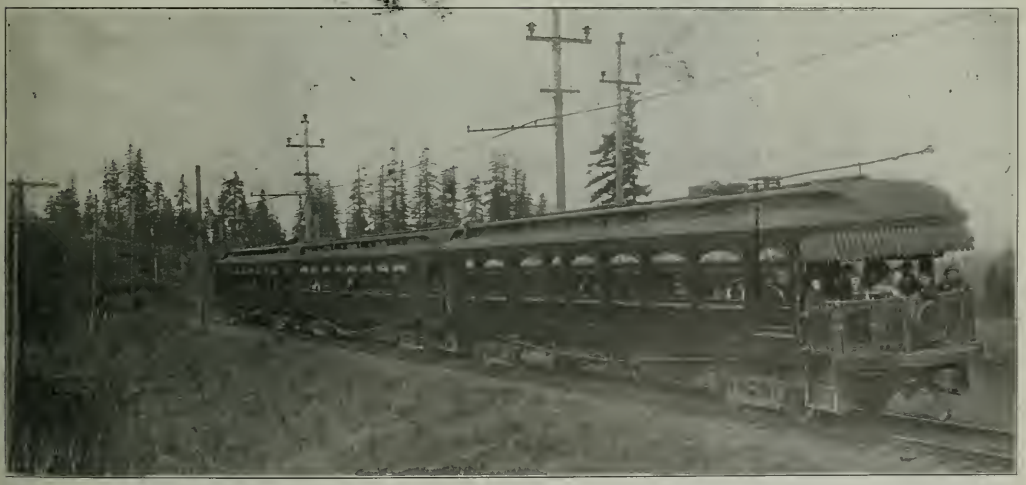
two years, a very satisfactory passenger business has already been developed.

Equally promising with the rapid development of the passenger traffic is the growth in both l. c. l. and carload freight traffic. One through freight train is operated each way nightly between Portland and Eugene, and another between Portland and Forest Grove, while a local freight is operated between Portland and Salem three times weekly. Merchandise is accepted at Portland up to 5:30 p. m. for these trains leaving at 8 o'clock and is unloaded at all stations for delivery at 7 o'clock the following morning. Full cars of l. c. l. freight are loaded for Salem, Albany and Eugene with peddler cars for other points. In addition to Portland, freight houses have been built at Salem and Eugene with team tracks, eight such tracks with a capacity of 25 cars being provided at Eugene. The regular night freights place the cars on these tracks, and on the industry spurs, so as to require no further switching.

The principal commodities shipped in carload lots are: cord wood, hops, fruit and lumber. The hop movement is especially heavy, and is rapidly growing, over 200 cars being shipped during the fall of 1912, shortly after the line was opened and before complete facilities could be provided. Hop warehouses have since been built at several points along the line. Much cord wood is also shipped locally to Portland for fuel, while considerable quantities of fruit are handled for Portland and for eastern points. Practically all of the hops go to New York and other eastern points, the Hill lines securing the through routing to Chicago. This illustrates an important advantage resulting from the control of these lines as feeders, over 25 per cent. of the carload freight handled on the Oregon Electric being billed through over the other Hill lines. In this connection it is instructive to note that, whereas, the Hill lines secured only 40 per cent. of the freight moving through Portland a few years ago, they now secure over 60 per cent. of all this traffic. On the Oregon Electric proper about 50 cars of freight are being handled daily.

In addition to this road business, the United Railways does a switching business among industries along its tracks in Portland for all roads. Several tracks are laid in the city streets, through the wholesale district, and two electric locomotives are employed in switching here during the night. Cars are placed opposite the different warehouses during the evening, and are removed early in the morning. In this way these industries are given railway facilities without noticeable inconvenience to street traffic, and cars can be loaded or unloaded without the necessity of trucking through the street. From 15 to 20 cars are handled nightly in this way, this switching service being performed for all roads.

All trains on the Oregon Electric, the United Railways and the Spokane & Inland Empire are operated under standard steam road rules, modified where necessary to adapt them to electric operation. Many of the employees were transferred directly from steam road service, while others were recruited directly for this work. The trains are dispatched by telephone with auxiliary telegraph.



Limited Passenger Train With Parlor Car on the Oregon Electric

---

Sicilian Transport Conditions.—The state-owned Sicilian railway system has a total length of 839 miles. This is all of standard gage except for 46 miles of 3 ft. 1 in. gage. A train ferry service is also maintained across the Straits of Messina, a distance of 14 miles.

HALE HOLDEN

Hale Holden, vice-president of the Chicago, Burlington & Quincy, was elected president of the company to succeed the late Darius Miller, at a meeting of the directors held in Chicago on August 27, immediately following Mr. Miller's funeral.

Mr. Holden has been directly connected with the Burlington only since July, 1907. But for several years before he had practiced law in Kansas City as a member of the firm of Warner, Dean, McLeod & Holden, who were local attorneys for the Burlington. It was during this time that he attracted the attention of the management of the road, and in July, 1907, went to Chicago to take the office of general attorney in charge of its interstate commerce litigation.

His later promotions have come rapidly, but naturally. In January, 1910, Daniel Willard, vice-president in charge of operation, left the Burlington to become president of the Baltimore & Ohio. The jurisdiction of Darius Miller, who was vice-president in charge of traffic, was then extended over all departments, the operating department being placed in direct charge of H. E. Byram, who had been Mr. Willard's assistant, and the traffic department in charge of C. G. Burnham, who had been Mr. Miller's assistant. A few weeks later George B. Harris retired, and Mr. Miller was made president; Mr. Holden, assistant to the president; Mr. Byram, vice-president in charge of operation, and Mr. Burnham vice-president in charge of traffic. On November 8, Mr. Holden was promoted to vice-president and also made a director of the company.

Hale Holden

Both as assistant to the president and as vice-president Mr. Holden performed duties assigned to him by Mr. Miller, and was very closely associated with him in devising and carrying out the broad but general policies of the company. He was Mr. Miller's right-hand man, relieving his chief of the details of administration of various departments, and steadily demonstrating his increasing usefulness and executive ability. He owes his very rapid promotion and his election to the presidency of this great system to the fact that he has shown the possession of remarkable natural executive ability and driving power; to the broad knowledge he has gained and the broad training he has received; to the fact that as Mr. Miller's "understudy," if such a term may be used in such a connection, he had become very fully conversant with his chief's methods, plans and policies, and to the fact that his election would least disturb the organization built up by Mr. Miller and his predecessor, George B. Harris. The wonderful record made by the Burlington in recent years has been achieved by an organization in which very few changes have been made and which undoubtedly owes much of its success to that fact, and Mr. Holden's election made necessary fewer other changes in the official personnel than would have been necessitated by the election of any of the other higher officers of the company.

Mr. Holden was picked for president of the Burlington in a deathbed suggestion of Mr. Miller himself. In his last hours Mr. Miller asked Louis W. Hill to say to his father, James J. Hill, that he need not worry about the future of the Burlington, that he had left him three men, any one of whom was big enough for the presidency; but that Mr. Holden should be given the place, so that the work of the Burlington organization might continue without interruption. Mr. Miller's choice was approved as logical by the directors, and is popular with the other officers of the road.

In character, ability and personality, Mr. Holden long has been recognized as a big and coming man. His railway work has commanded the attention both of his superiors and other railway men for its thorough, painstaking and brilliant qualities. As general attorney of the Burlington he represented it in some of the most important cases ever before the Interstate Commerce Commission and in the subsequent litigation before the courts. Among these were the Missouri river rate case and the Pacific coast lumber rate case. He also represented the stockholders of the Great Northern and was in charge of the litigation extending over 3½ years of the Minnesota rate case, involving the reduction of state freight and passenger rates in Minnesota, in which the roads, while technically losing the case, really established the principle subsequently explicitly upheld in the Shreveport case, that the paramount power of congress over interstate commerce may not be nullified by state action.

Mr. Holden's work in this case is said to have commended him especially to James J. Hill. His experience in commerce cases gave him a broad schooling in the workings of the various departments of railroading, of which he took advantage to acquire a sound and enlightened perception of the relations of the railroad to the public and to the regulating authority of the government.

The Minnesota rate case, as well as others in whose handling he participated, involved a physical valuation of the railways, and he became such a recognized expert on this subject that he was made chairman of the western presidents' committee on relations to the Interstate Commerce Commission's valuation, a position which he held until recently. He also represented the Burlington in the recent arbitration of the wage demands of the trainmen and conductors of the road.

A strong and vigorous man in appearance, direct in his methods, plain and unassuming in manner, accessible to everybody who has any business with him, keenly appreciating the importance of maintaining good relations between the railways and the right way in which to do it, Mr. Holden will prove a popular as well as an able railway president.

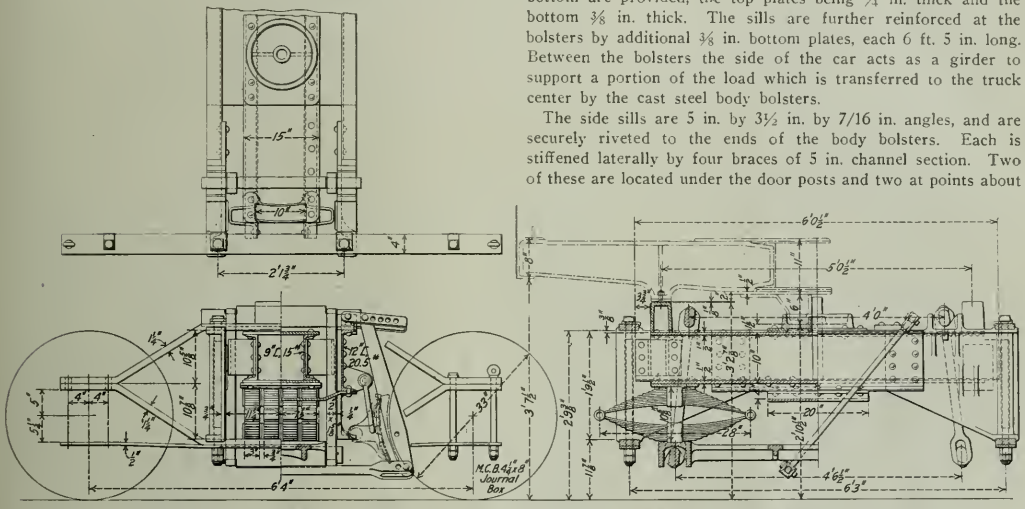
The new head of the Burlington was born at Kansas City, Mo., on August 11, 1869, and was educated at Williams College and the Harvard Law School.

Short Steel Baggage Car for the Long Island

An Exceptionally Light 40 Ft. Car Having Arch Bar Trucks with Swing Bolsters and Self-Centering Couplers

The Long Island has recently placed in service 20 steel baggage cars of a design possessing a number of notable features well suited to the service conditions under which the cars operate. They are 40 ft. in length over the end sheathing and have an average weight of 50,600 lb.

Over a number of its lines the Long Island handles a heavy



Arch Bar Truck with Swing Bolster Used Under Long Island Baggage Car

baggage and express business, in many cases the consignments to two or three stations completely filling a long baggage car. The consignments for such a station may be loaded into one of the short cars, which is set out at its destination. The delays to passenger train service incidental to unloading express are thus materially reduced. A large part of this traffic moves during the summer only and advantage has been taken of this fact to build a car of exceptionally light weight and low first cost. During the winter, when many of these cars are out of service, a minimum investment is thus tied up in idle equipment.

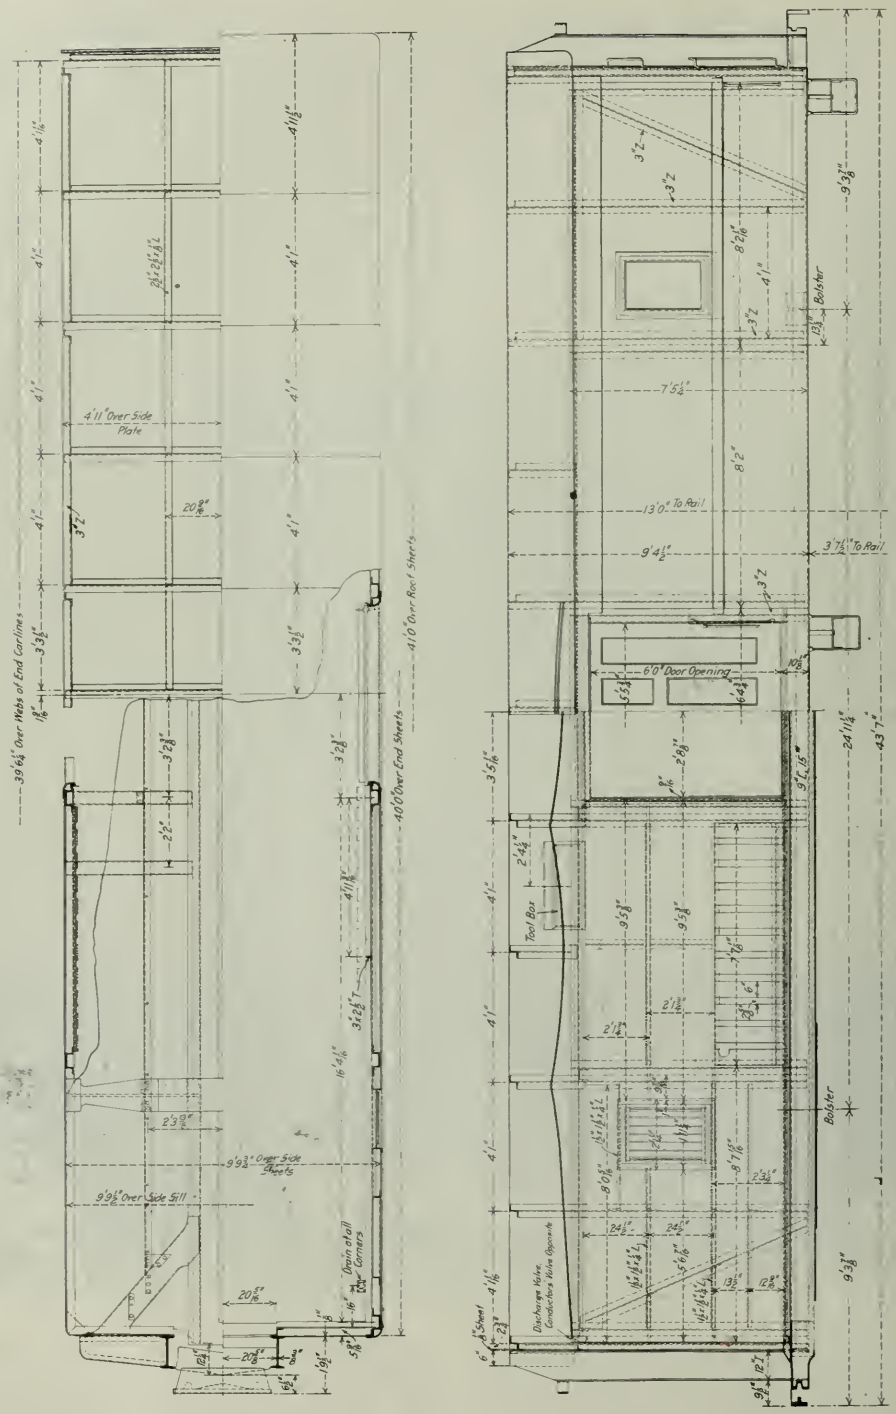
UNDERFRAMES

The center sills are 9 in. channels extending continuously between the end sills. Continuous cover plates both top and bottom are provided, the top plates being ¼ in. thick and the bottom ⅜ in. thick. The sills are further reinforced at the bolsters by additional ⅜ in. bottom plates, each 6 ft. 5 in. long. Between the bolsters the side of the car acts as a girder to support a portion of the load which is transferred to the truck center by the cast steel body bolsters.

The side sills are 5 in. by 3½ in. by 7/16 in. angles, and are securely riveted to the ends of the body bolsters. Each is stiffened laterally by four braces of 5 in. channel section. Two of these are located under the door posts and two at points about 26 in. from the door posts. They extend from the top flange of the center sill to the lower flange of the side sill and are placed with the flanges downward. The side sills are stiffened under the side doorway by 7 in. channels riveted to the inside flanges of the Z-bar posts.

Light Baggage Car of Steel Construction for the Long Island

The frame is designed to be equivalent in strength to the requirements of the railway mail service. In order to meet these requirements two 12 in. I-beam end posts have been included in

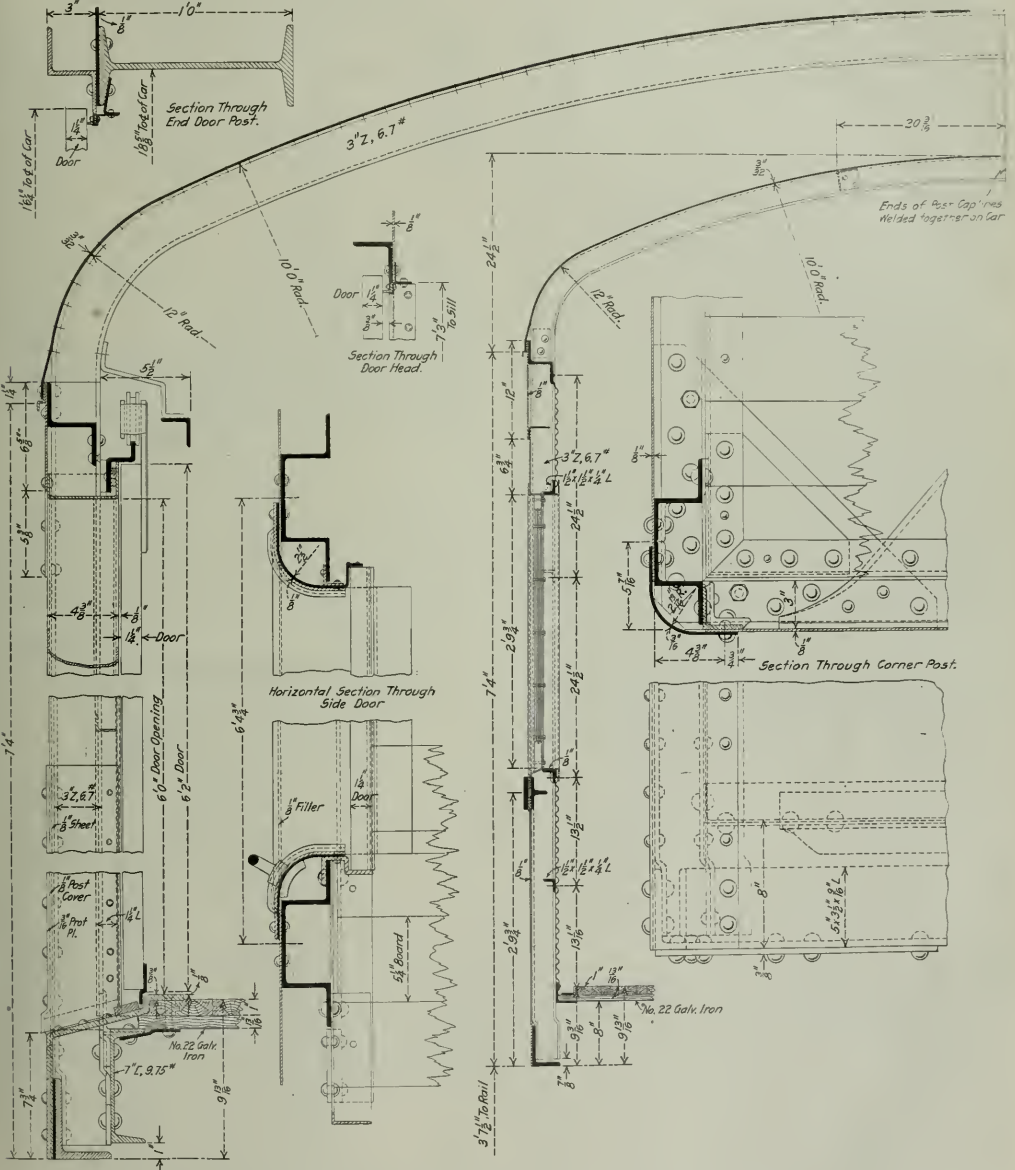


Plan and Elevation of Long Island 40-ft. Baggage Car

the construction of the end frame. These are framed into a steel bumper casting at their lower ends and are secured to the carlines at their upper ends. They are located at points 20⅝ in. on either side of the center line. The center sills are also attached to the steel bumper castings, thus securely tying the end

SUPERSTRUCTURE

The body frame members are 3 in. Z-bars. The roof is U-shaped without clerestory. The carlines are extensions of the corner and side posts, being formed in two parts and welded at the center of the roof when placed on the car. A Z-bar plate



Sections Showing the Door and Window Framing, and Section Through the Corner Post

frame to the underframe and making a very rigid construction.

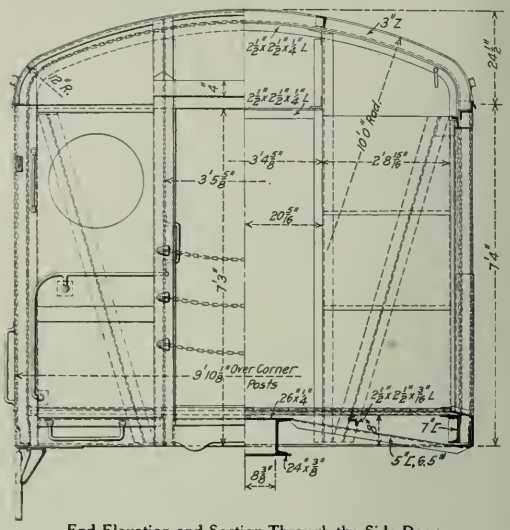
Extending from the corner of the car to the end post on either side are 5 in. by 3½ in. by 7/16 in. angle sills, to which the end sheathing is secured.

extends continuously from corner post to corner post except where the web and one flange are cut away to allow the continuous side posts to pass through. The corner, transom and door posts are made up of two Z-bars, one of which extends

from the side sill to the plate only. The outside sheathing is ⅛ in. steel plate, four pieces being required for each side of the car. These pieces extend continuously from the end to the side door casing and are joined horizontally by a cover plate at the belt rail, which is located just under the windows. Longitudinal stiffness is secured by means of a T-bar riveted behind the belt rail. The inside of the car is lined with corrugated sheet steel, the corrugations running lengthwise. Considerable longitudinal stiffness is secured in this manner and no vertical stiffeners are required between the posts. The outside and inside window casings are each flanged in one piece from ⅛ in. plate to form a Z-section. The outer flange of the outside section is riveted to the side sheet and the inner flanges of the two sections are placed back to back. The window is held in place in the outside casing by means of bolts passing through both inner flanges. The inner casing is secured to a 1½ in. by 1½ in. by ¼ in. angle both at the top and bottom; these angles extend between the two adjacent side posts, with the backs of the vertical flanges flush with the inside flanges of the side posts. Similar stiffeners are placed longitudinally at points 24½ in. and 49 in. below the side plate, at which points the corrugated lining sheets are joined.

The side door casing is made up of post covers formed from ⅛ in. plate, which overlap the side sheets and are riveted to the outside flanges of the posts. They extend to the inside of the car and are secured to the inner flanges of the side posts by means of angle connectors. On one side of the doorway a connector of special form is used which serves as a door stop. On the other side the post cover is bent around parallel to the side wall of the car, where its edge forms a seat for the weather strip on the back side of the door. The door is supported by rollers, the track for which is a special Z-section flanged from ¼ in. plate. This is secured to the flanges of the side posts. In order that the top casing may extend inside the car flush with the side post cover, ⅜ in. filler blocks are included on either side of the door track.

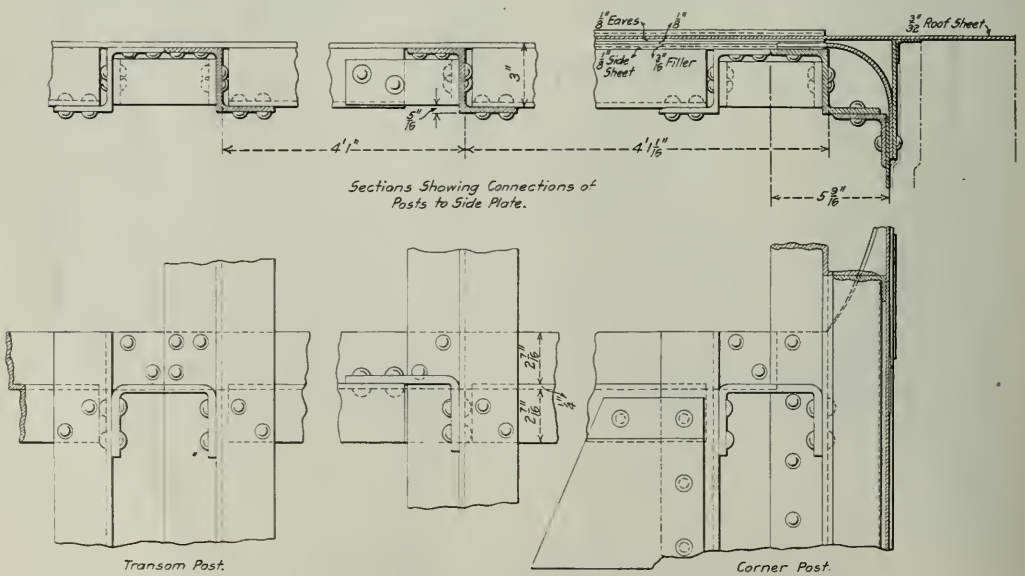
The floor is made up of two thicknesses of wood flooring, the under side of which is protected by one thickness of No. 22 galvanized iron. The ends of the first course of flooring are supported by angles which are riveted to the inner flanges of the side posts. A wood nailing strip secured to the top cover plate of the center sills on the center line of the car supports the floor at this point. Intermediate nailing strips located about 28 in. on either side of the center line are supported by 2½ in. by



End Elevation and Section Through the Side Door

2½ in. by 3/16 in. angles secured to the diagonal end braces and to the top flanges of the cast steel bolsters.

The roof is covered with 3/32 in. steel plate. Longitudinal roof supports of 2½ in. by 2½ in. by ⅛ in. angle section are



Sections Through the Side Posts, Showing the Connections to the Side Plate

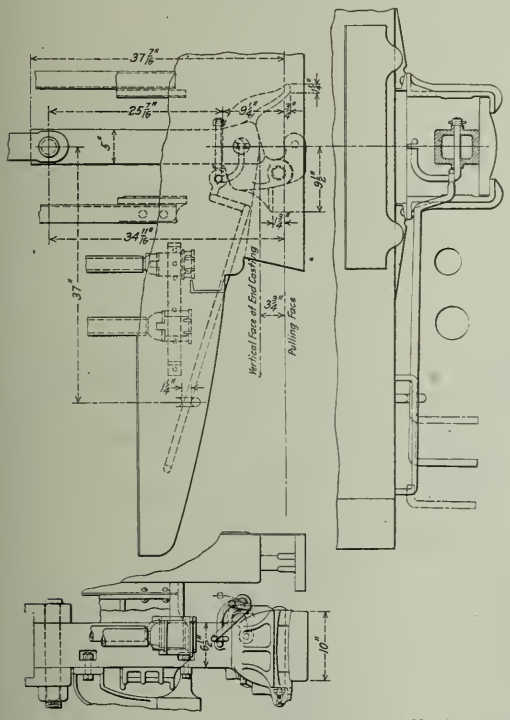
placed between the carlines at points about 20 in. on either side of the center line; these serve to stiffen the roof sheets, but the sheets are riveted only to the carlines.

TRUCK

The truck applied to these cars is of a design unusual for passenger equipment. It is of the unequalized arch bar type having a wheel base of 6 ft. 4 in., but has been modified to include a swing bolster. The cross frame is made up of two 12 in., 20½ lb. channels securely riveted to the truck columns. A cast steel spring plank is suspended from the frame by means of swinging hangers, from which the truck bolster is supported on elliptical springs. The wheels are cast iron, 33 in. in diameter and are mounted on standard M. C. B. 4¼ in. by 8 in. axles. Standard 4¼ in. by 8 in. freight car journal boxes are used.

OTHER DETAILS

The cars are equipped with special Sharon couplers designed to be self-centering. The drawbar is of the usual long shank



Coupler with Centering Lug on the Side of the Head

type used in passenger service. A special lug is cast on the coupler body which acts as a stop to the guard arm of the engaging coupler and thus limits the angle between the center lines of the two drawbars.

In designing these cars full advantage has been taken of the requirements of the service to build a car having a capacity of 50,000 lb. and weighing but little more than 50,000 lb., and one which meets the service conditions much better than would a heavier car of more expensive construction.

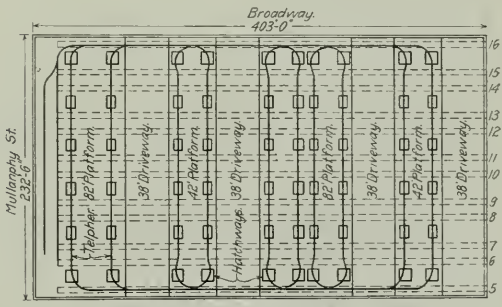
MOTOR OMNIBUS SERVICE IN SOUTH AMERICA.—The Argentine Minister of the Interior has under consideration a project to establish a motor omnibus service in the national territories of Argentina. It is proposed to initiate a service in the tobacco-growing districts of San Javier and Tacaruare in the territory of Misiones, where tobacco cultivators frequently suffer losses because of lack of transportation facilities.

THE REARRANGEMENT OF THE M. K. & T. FREIGHT HOUSE, ST. LOUIS

The construction of the Missouri, Kansas & Texas freight house at St. Louis, a description of which was published in the *Railway Age Gazette* of June 23, 1911, excited a great deal of interest among railway men because of the novel features in its construction and the mechanical equipment installed for handling freight. After the house was put in service it was visited by many engineers and other railway men interested in the handling of l. c. l. freight who desired to see whether the telpher system installed was a success when handling the wide variety of freight commonly received at the ordinary freight house of this character.

This installation of the telpher system was an exceedingly courageous experiment involving, as it did, the expenditure of a large amount of money for equipment. While the outcome was unfortunate, and the telphers were abandoned late last year, the experiment should prove of great benefit to the railways of the country at large because the results secured definitely disproved the claims made for this class of equipment in this particular kind of service.

It will be recalled that the Missouri, Kansas & Texas freight house at St. Louis is a two-level house with the upper or street level floor devoted to the delivery and receipt of freight by wagons, while the tracks are on the lower level. All freight was handled by telphers running on tracks supported



Arrangement of Telphers in Original Layout

above the upper floor and was dropped through hatchways to platforms opposite the desired cars.

After over two years' trial, several fundamental objections to the system became evident. One of the most serious was the unreliability of the telphers in operation, the average daily delay because of breakdowns ranging from three to four hours and resulting not only in a corresponding direct loss, but also in the demoralization of the working force. At times of breakdowns or current trouble, the system afforded no alternative method of handling the business, while it was also found to lack elasticity, as the telpher tracks more properly covered a line than an area. The system offered no possibility of speeding up under the pressure which comes in nearly all freight houses during certain parts of the day.

The buggies were heavy and clumsy, blocking the platforms. As they were 4 ft. by 6 ft. in size and weighed empty about 1,000 lb., they were too large and heavy to be run directly into the cars, making necessary a rehandling of the freight at each end. It was also impossible to counterweight in any way to balance the dead load and the average live load, in consequence of which an excessive use of electric current was required. This system of overhead transmission was found to be comparatively unsafe, causing numerous personal injuries and relatively heavy damage to freight, the latter item being estimated to average $1,000 per month. In addition, the repairs to equipment, platforms and scales were

relatively heavy, while the telphers were noisy and interfered materially with calling and checking freight, leading to frequent errors. There was also some damage caused by grease and oil dropping from the carriers.

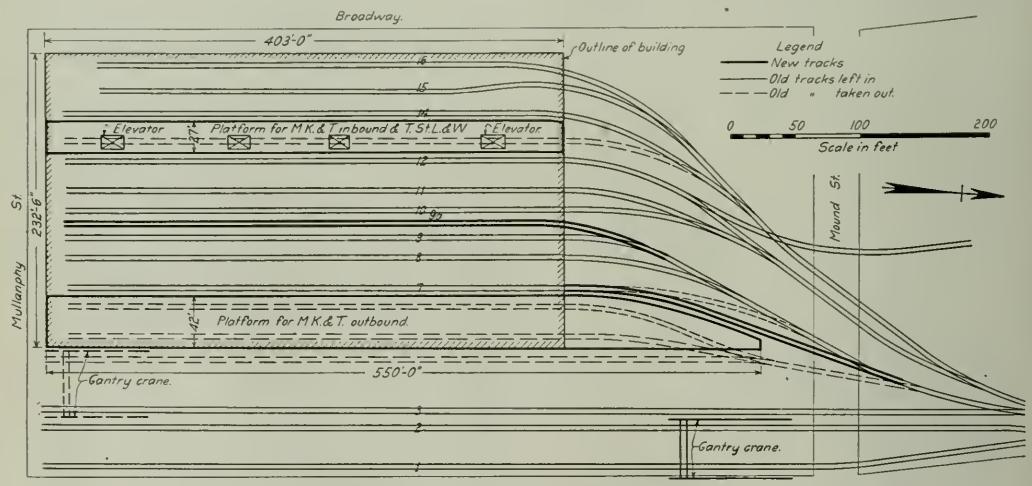
Because of these various conditions, the cost of handling freight was not reduced to the figure expected when the house was built, but on the contrary, it rose materially until in October and November of last year it averaged $0.595 per ton, exclusive of damage to freight, repairs to telphers, loss on account of improper weighing, etc., all of which were estimated to amount to a total cost approaching $1 per ton of freight handled. Also, although there was a track standing capacity of 117 cars and an average of only 70 cars were actually handled per day, the house had practically reached the limit of its capacity under the existing system of operation and a change became imperative. Accordingly, careful studies of the situation were made, as a result of which it was found that the two-level house was well adapted for this particular location and that the construction of the building proper could not readily be improved upon. No change in the building proper was therefore suggested.

The rearrangement effected is shown in the accompanying drawing and consists essentially of the following features. On the lower, or track floor, the space between the outside edge of the east row of columns and the inside edge of the row next west was housed in and extended north almost to Mound street, making a freight house 42 ft. wide by 550 ft. long, side, the truckers leaving or picking up their trucks at the elevator and not moving from floor to floor.

In this way while the track standing capacity of the entire house has been reduced from 117 to 102 cars, the real capacity of the house has been increased to this latter figure from 75. At the same time the cost of handling this freight has already been reduced from approximately $1 per ton to $0.39, with a possibility of further reduction. This plan has the further advantage that when additional capacity is needed it will be possible to return to the two-level house for the M. K. & T. outbound business, giving a total estimated capacity of 174 cars. While it is true that the investment in the telpher system has been wiped out by these changes, the advantages of the two-level house as installed here over the one-level house commonly built in St. Louis and elsewhere throughout the country, have been sufficient to more than offset the loss in this regard, and it is now being operated at a cost low enough to yield a good return upon the entire investment.

DESIGN OF JOLIET INTERLOCKING

The Joliet interlocking, described in the *Railway Age Gazette* of August 28, page 381, protects the crossing of the Atchison, Topeka & Santa Fe and the Chicago & Alton with the Chicago, Rock Island & Pacific and the Michigan Central. T. S. Stevens, signal engineer of the Santa Fe, G. W. Hulsizer, signal engineer of the Alton, and A. G. Shaver, then signal engineer of the



Re-Arrangement of Lower Floor of M. K. & T. Freight House Showing New Platforms and Track Changes

The two tracks Nos. 5 and 6 were removed, and the island platforms extended to provide a floor for this house, which was assigned to M. K. & T. outbound business in connection with the five tracks Nos. 7 to 11, inclusive. The intermediate island platforms were retained with the exception of the one between tracks 9 and 10, which was replaced with another track. The rails were removed from the No. 4 team track immediately east of the house, and this area was saved to serve as a driveway for the use of trucks delivering freight to this outbound house.

Track No. 13 was also taken up and a platform built in its place with four elevators. In connection with the upper or street level floor this is used as an inbound house for both M. K. & T. and T. St. L. & W. freight, as well as an outbound house for the T. St. L. & W. Electric elevators were installed and the drop truck system of operation was adopted on this

Rock Island, co-operated in making the design. The cost of construction, operation and maintenance is apportioned as follows:

Atchison, Topeka & Santa Fe	38 per cent
Chicago & Alton	32 per cent
Chicago, Rock Island & Pacific, and the Michigan Central	30 per cent

The construction work was done by the Rock Island, but entire credit for the design should not have been given in our article to that company.

New Use for English Dining Cars.—In addition to its work of carrying the troops, the Great Eastern Railway of England is converting its restaurant and kitchen cars into ambulances. The interior fittings are removed, and the interior arranged with ambulance materials, everything being done on the most approved principles.

Report of the Joint Committee on Mail Pay

Bourne Committee Recommends Payment by Space; 21 Cents a Mile. Post-Office Department Criticized

The Joint Congressional Committee which has been studying the railway mail pay question since January, 1913, issued its report on Monday last, and a bill embodying the committee's recommendation was introduced in Congress by Senator Bankhead. The report is a pamphlet of 124 pages, and presents a well digested summary of all that the government has done in this matter since 1878. It recommends that the calculations for paying the railway for their services by weight be done away with; that the railways be relieved of carrying mails between stations and post offices and that rates be fixed by law, and not in any degree left within the discretion of the postmaster general, except in connection with certain details named in the proposed bill. The basis of the rates per car per mile is a proportion of the calculated receipts of the railways per passenger train mile, the committee assuming that existing passenger rates are fair and reasonable. Unlimited free transportation of railway postal clerks to and from their homes is continued.

The committee consists of Jonathan Bourne, jr., chairman, Harry A. Richardson, John H. Bankhead, James B. Lloyd, Wm. E. Tuttle, jr., and John W. Weeks. Senators Bourne and Richardson are no longer members of Congress, their terms having expired in March, 1913; but they have continued to act on the joint committee, serving without pay and paying their own expenses.

The report, by order of the committee, was prepared by the chairman; and the assents of the other members are in the form of letters printed in the preface to the report. Mr. Richardson gives hearty approval; but the other members decline to join Mr. Bourne in his severe criticisms of the post office department, and also object to his unfavorable declaration on the general subject of government ownership of public utilities. The principal features of the committee's conclusions are embodied in a proposed bill which is printed below, nearly in full; and the thirteen chapters of the report contain the facts and arguments supporting the views embodied in the bill.

Chapter 1 explains the reasons for different features of the bill; chapter 2 is a historical review, including a resumé of the testimony taken by the committee and of the statistical studies made by Mr. Lorenz, statistician of the Interstate Commerce Commission, temporarily employed by the joint committee; chapter 3 discusses the weight basis of compensation, disclosing its defects; chapter 4 deals with the post office department's claim that the railroads are over paid; chapter 5 is a study of the question of reasonable rates; chapter 6 compares mail with express and other chapters make comparisons with passenger traffic and Pullman service. Chapter 10 declares against government ownership of railway post office cars and chapters 11 and 12 criticize severely the conduct of the post office department in many matters.

At the beginning of their studies the committee soon decided in favor of paying by space instead of by weight, and also to establish a terminal charge separate from the charge for transportation over the line. The adoption of a standard length of car, 60 ft., and standard apartments 30 ft. and 15 ft. long is an important simplification. The adoption of units of seven linear feet and three linear feet for pouches (in baggage cars) settles many difficult questions. The assumption that the present average passenger car mile revenue is ample and reasonable is based on the fact that present rates of fare have been so generally approved by railroad commissions, legislatures and courts. The average passenger revenue for the past five years, as shown by reports of the Interstate Commerce Commission, has been 25.3 cents per car mile. The car mile revenue for passenger service, excluding mail, express and milk, is probably over 26 cents. Other calculations confirm the view that 25 cents a mile is fair to the government for hauling a 60-ft. mail car; but it is recognized that more satisfactory data concerning the cost of transportation might warrant giving the railroads a more liberal sum.

This 25-cent rate includes terminal service. To make a separate charge for this the committee examined the cost of switching; and finally concluded that $1.25 would be fair for each of the six movements usually made with a mail car on a round trip; and to this was added $1 for two cleanings of the car. This makes up the rate of $8.50, named in the bill. Calculating on the average length of the runs of mail cars—which average is admitted to be inexact—the committee adopts a line rate of 21 cents a mile, and the calculations for the different kinds of services are as shown in the following table:

JOINT COMMITTEE RATES ON 60-FT. CAR BASIS

	Rate per unit		Average rate on 60-ft. car basis				
					Term'l and line combined		
Unit	Terminal (round trip)	Line *Cents*	Average distance *Miles*	Terminal (single trip)	Line *Cents*	For average dist. *Cents*	For 100 miles *Cents*	For 1,000 miles *Cents*
60-ft. R. P. O.	$8.50	21.00	301.0	$4.25	21.0	22.41	25.25	21.42
60-ft. storage.	8.50	21.00	556.0	4.25	21.0	21.76	25.25	21.42
30-ft. apartm't.	5.50	11.00	185.0	5.50	22.0	24.97	27.50	22.55
15-ft. apartm't.	4.00	6.00	80.5	8.00	24.0	33.94	32.00	24.80
7-ft. pouch...	1.00	3.00	34.5	4.29	25.7	38.13	29.99	26.13
2-ft. pouch...	.50	1.50		5.00	30.0	44.49	35.00	30.50
All units...	....	.....	.....	....	21.82	24.69	.....	.....

The report says that some members of the committee believe 21 cents to be too low a rate. It will be seen by the table that this makes an estimated total compensation of 22.41 cents per mile per car, for the average distance, as compared with 25.3, the average for five years reported by the Interstate Commerce Commission for all cars in passenger trains.

Because of the belief on the part of some of the committee that 21 cents is too low, and because of the meagerness of the information at the committee's command, a clause in the bill provides for revision of the figures after the new rates shall have been in force two years.

Under the rates recommended the committee estimates that the cost to the government will be about $65,000,000, as compared with an appropriation of about $62,000,000 for the current fiscal year. The proposed rates are fixed, not maximum, and the transportation of the mails by the railroads is made compulsory. The fiction that railroads when dissatisfied may refuse to perform the service should no longer be recognized. If they have such a right public opinion forces them to forego insistence on it.

In chapter 5 the committee gives the data justifying its conclusions as to what is a reasonable rate. There is no reason why the government should not pay the same rate for the use of a car as is paid by passengers. It is claimed that the mail service is a wholesale traffic; but the government does not pay in advance, as do passengers, and, moreover, it imposes penalties for delays. It also requires the mail to be carried on fast trains without extra pay. The committee makes rates universal throughout the country because there is no practicable basis on which a difference can be made in favor of lines where the traffic is light.

A chapter is given to comparisons of mail and express earnings, but the evidence is unsatisfactory and largely inconclusive. The post office department's attempt to show higher

relative railroad earnings from mail is rejected as reckless and misleading.

Comparing with earnings from passengers and from mail traffic the committee finds that practically every expense which improves the passenger traffic in speed, regularity, frequency or safety, is also beneficial in a corresponding degree to the mail service; and the mail service, therefore, should yield to the railroads a revenue per car mile equal to that found to be reasonable for passenger service.

Chapter 9 contains an analysis of the bill presented by the committee. The provision that payment for a car must always be made for a round trip will put an end to unfair requirements of the post office department which have made is necessary to haul cars empty considerable distances without compensation, though it is provided that the Postmaster General may, if he can, contract with a railroad (as, for example, for storage cars) to pay for single trips only. In some cases the railroads may be able to use a storage car for other service in the return direction.

The committee considers at length the question of government ownership of railway post office cars, taking up particularly the statement of Postmaster General Vilas in 1887 that the government would profit greatly by having cars of its own. A comparison is made with rate charged by railroads for hauling special cars, owned by outside parties, and the conclusion is reached that government ownership would be much more expensive than the present system of compensation. Calculating on all the available data, the Interstate Commerce Commission would be forced to allow higher rates per car than the committee now recommends. The committee points out that the government probably would not be able to maintain and repair cars as cheaply as his work is done by the government, and government service is usually extravagant. In the parcel post service the government employs men at an average of $93 a month, whereas the express companies pay an average of less than $50 a month.

In chapters 11 and 12 the committee sets forth in strong language the unbusinesslike way in which data desired by the committee in its investigations was made up and presented by the post office department, and also by the representatives of the railroads. The post office department presented estimates of alleged overpayment by the government to the railroads, but under criticism changed these three times, in each case having to admit that it had been unfair to the railroads. The railroad companies in like manner varied their estimates of under payments from $15,000,000 to $38,000,000, and they were "either reckless or else had no definite data." The inadequacy of the statistics furnished by the post office department "is no more subject to criticism than the seeming lack of frankness with which the department prepared statistics for submission to Congress."

Reference is made to the order issued in 1907 by which the method of averaging the daily weight of mail was changed so as to reduce the pay to the railways $5,000,000 yearly. This, with the recommendation of Postmaster General Hitchcock that the railroads be paid actual cost of operation and taxes with 6 per cent profit, no adequate allowance being made for return on capital employed, is used as an argument against clothing the postmaster general with discretion in making rates.

These and other acts, such as sending magazines by freight trains, are declared by Chairman Bourne to be evidences of "bureaucracy gone mad."

In conclusion the report says:

"We are convinced that space should be substituted for weight as the basis for compensation; that the rates should be such as will yield a car-mile revenue approximating the car-mile revenue derived from passenger service; that legislation on this subject should be drawn as specifically and comprehensively as possible, and that as little as need be shall be left to the discretion of the post office department.

"The record herewith presented fully demonstrates the wisdom of Congress in refusing to enact the legislation proposed by the post office department in its four suggested plans. . . . We believe it better for Congress to bear the unjust criticisms of those who are misled by hasty advisers than to place upon the statute books laws which will be demonstrated by experience to be unworthy the approval of men charged with the sacred trust of legislating intelligently for all the people of the United States.

"It has been our view that it is not our duty to endeavor to make out a case that is favorable or unfavorable to either the government or the railroads, but to ascertain with as great accuracy as possible what is a reasonable compensation to be paid. We believe that the government should deal justly with its citizens, for if it expects them to deal justly with one another and with the government, the government must set the example by dealing justly with them. To what extent the rates we suggest will increase the total amount of compensation is largely problematical for the reason that it cannot be known in advance exactly what space the post office department will authorize for the transportation of mail. We firmly believe, however, on the showing made in the Lorenz table that the enactment and operation of our suggested bill will not result in increased postal expenditures of more than $3,000,000 over the actual appropriations carried in the last post office appropriation bill for railway-mail pay, including inland transportation by railroads, postal pay for freight or expressage, and railway post office car service.

"That there should be an increase in railway-mail pay need not be surprising; in fact, it must be expected. The volume of postal revenue increased at the average rate of about 7 per cent per annum, or an average of about $13,000,000 a year during the 10-year period from 1903 to 1913. This necessarily means a corresponding increase in the volume of mail. No reasonable man can expect that the government can increase its postal revenues at an average rate of $13,000,000 per year without increasing its expenses in practically all departments of the service, though perhaps at a smaller ratio. In this connection it is pertinent to remark that although the postal revenues doubled in that 10-year period railway-mail compensation increased only 20 per cent. . . ."

COMMITTEE BILL

Section 1. From January 1, 1915, or from an earlier date if practicable, the postmaster general is authorized and directed to readjust the compensation to be paid steam railraod companies for the transportation of mail on passenger trains, mixed trains, mail trains, or cabooses of freight trains, and for services connected therewith at the rates hereinafter named: *Provided*, That where two or more railroads have varying distances between the same points, the compensation for the longer distances may be reduced to that of the shortest distance by mutual agreement between the Postmaster General and the railroad companies.

Sec. 2. The Postmaster General may authorize mail service of the following five classes, namely: Full railway postoffice car service, apartment railway postoffice car service, storage-car service, closed-pouch service, and side and transfer service.

Full railway postoffice cars and storage cars shall be of a standard length of 60 ft., inside measurement: *Provided*, That 30 or 15 ft. of space may be authorized for the round trip in baggage cars, at the respective rates hereinafter named for 30 or 15 ft. apartment cars. Apartment cars shall be of two standard lengths, namely 30 ft. and 15 ft. inside measurements. Closed-pouch mail service shall be the transportation of mail in pouches, bags, or hampers in custody of railroad employees on trains on which no full railway postoffice cars or apartment cars are authorized. Closed-pouch service may be authorized in units of three linear feet or seven linear feet, inside measurement: *Provided*, That not more than seven linear feet of space shall be authorized on any one train at the rates here-

inafter specified for closed-pouch service. Side and transfer service shall be the transportation of mail between railroad stations and postoffices supplied therefrom and between railroad stations.

Authorizations of railway postoffice cars, apartment cars, and storage cars herein provided for shall be for the round trip of the car and the maximum space authorized in one direction shall be determinative of the space to be paid for in the opposite direction, unless otherwise agreed upon between the Postmaster General and the railroad company in any particular case: *Provided*, That authorizations may be changed only at points where the switching of cars into or out of trains would not delay the running of such trains: *And provided further*, That not more than one apartment car shall be authorized on any one train. Authorizations for mail service under this act may be made upon any passenger or mixed train scheduled for public use, or upon the caboose of any freight train, and fast-mail trains may be contracted for at rates not exceeding those hereinafter named.

Sec. 3. Service by railway postoffice, apartment, and storage cars shall include the carriage therein of all mail matter equipment, and supplies for the mail service: *Provided*, That the Postmaster General is authorized to return to the mail, when practicable for the utilization of car space paid for and not needed for the mails, postal cards, stamped envelopes, newspaper wrappers, empty mail bags, equipment, and other supplies of the postal service. The rates fixed by this act shall also cover the transportation of persons who are discharging official duties in connection with the railway mail service. Such persons shall include clerks handling mail in cars, clerks traveling from their homes to the beginning of a mail run to which they have been assigned or to their homes from such mail run, and all other persons while discharging official duties as inspectors or supervisors of the railway mail service or in any other manner assigned to duty in the administration of such service.

The rates provided for herein shall further cover expenses of delivering within and receiving mails at car doors and the switching, lighting, heating, furnishing of suitable drinking water, and cleaning of mail cars. Railroad companies carrying the mails shall furnish reasonable facilities for caring for and handling them while in their custody. They shall furnish all cars or parts of cars used in the transportation and distribution of the mails, except as herein otherwise provided, and place them in stations before the departure of trains at and for such reasonable time as the department may require. They shall also provide reasonable station space and rooms for handling the transfer of mails in transit, and for offices and rooms for the employees of the postal service engaged in such transportation, when required by the Postmaster General.

Sec. 4. Standard specifications shall be prepared by the Postmaster General for the construction and fittings of full railway postoffice cars, 30-ft. apartment cars, 15-ft. apartment cars, and storage cars, and the rates herein named shall apply only to cars constructed and fitted in accordance with such standard: *Provided*, That whenever a railroad company is unable to furnish standard cars or apartments of the length requested, the Postmaster General may accept cars of lesser length if sufficient for the needs of the service, and pay only for the actual space furnished, the compensation to be a pro rata of that provided for by this act for the standard lengths requested: *And provided further*, That the Postmaster General may accept cars and apartments of greater length than those of the standard requested, but no compensation shall be allowed for such excess lengths.

Sec. 5. The rates of payment for the services authorized in accordance with this act shall be as follows, namely:

For full railway postoffice car service, a terminal charge of $8.50 for each round trip, or $4.25 for each single trip, of a 60-ft. car, irrespective of the distance run, and in addition thereto a line charge at the rate of 21 cents per mile run.

For 30-ft. railway postoffice apartment-car service, a terminal charge of $5.50 for each round trip, or $2.75 for each single trip, of a 30-ft. apartment car, irrespective of the distance run, and in addition thereto a line charge at the rate of 11 cents per mile run.

For 15-ft. railway postoffice apartment-car service, a terminal charge of $4 for each round trip, or $2 for each single trip, of a 15-ft. apartment car, irrespective of distance run, and in addition thereto a line charge at the rate of 6 cents per mile run.

For closed-pouch service, when a 3-ft. unit is authorized, a terminal charge of 50 cents for a round trip, or 25 cents for a single trip, irrespective of the distance run, and in addition thereto a line charge at the rate of 1½ cents per mile for the authorized number of miles. When a 7-ft. unit is authorized, a terminal charge of $1 for a round trip, or 50 cents for a single trip, irrespective of the distance run, and in addition thereto a line charge at the rate of 3 cents per mile for the authorized number of miles.

For storage car service a terminal charge of $8.50 for each round trip, or $4.25 for each single trip, of a 60-ft. car, irrespective of the distance run, and in addition thereto a line charge at the rate of 21 cents per mile run.

Payment for side and transfer service shall not be covered by the rates named herein. The Postmaster General is authorized to provide, in his discretion, by regulation screen or other wagon, automobile, or mail messenger service under existing law, or to contract with the railroad company or with other persons for the performance of such service at the lowest rates obtainable.

Sec. 6. Railroad companies whose railroads were constructed in whole or in part by a land grant made by Congress on condition that the mail should be transported over their roads at such price as Congress should by law direct shall receive only eighty per centum of the compensation which would otherwise be authorized by this act.

Sec. 7. After the rates specified in this act shall have been in effect for a period of two years, the Interstate Commerce Commission shall, whenever requested by the Postmaster General or by the representatives of railroads with an aggregate mileage of at least twenty-five per centum of the mileage of railroads carrying mail, make an investigation of the justice and reasonableness of rates then in effect, . . . and report to Congress at the earliest practicable date. . . .

Sec. 8. All laws or parts of laws prescribing fines on railroad companies for failing or refusing to perform mail service and furnishing facilities therefor when required by the Postmaster General are continued in force and made applicable to this act.

Railroad companies carrying the mails shall submit under oath, when and in such forms as may be required by the Postmaster General, evidence as to the performance of service.

Sec. 9. It shall be unlawful for any railroad company to refuse to perform mail service at the rates of compensation specified in this act when required by the Postmaster General so to do, and for every such offense it shall be fined not exceeding $5,000. Each day of refusal shall constitute a separate offense.

Sec 10. All laws or parts of laws in conflict with the provisions of this act are hereby repealed. . . .

Experiments with All-Steel Cars in India.—At the present time several Indian railway lines are carrying on experiments with all-steel cars, and it is said that others will also probably undertake experiments. Metal freight cars have already been used in India for some time, but passenger cars are usually built of teakwood resting on steel underframes. Owing to the intense heat and in some cases the great changes in temperature through which the cars run, the wood warps, swells or shrinks, thus affecting the joints. The wood of which the cars are made has been cheap, but lately the price of teak has been rising and that of steel has fallen.

Pennsylvania Improvements in Cleveland

Separating Grades at Eleven Street Crossings, Building New Freight Station and Altering Passenger Station

In the general plan to separate grades at all street crossings on its line entering the city of Cleveland, the Cleveland & Pittsburgh, one of the subsidiary companies of the Pennsylvania Lines West, divided the work into five groups numbered consecutively from the Union station on the lake front to the southeastern limit of the city, a distance of about 7½ miles. Groups IV and V, embracing the section between the city limits and Holton avenue, have been finished, and the work on group II, extending from Central avenue to East Twenty-sixth street, has recently been completed.

EXTENT OF THE WORK

The work on group II involved the elevation of tracks for nearly 2¼ miles through a densely settled industrial and residential section, and the building of permanent subways over 11 streets, and temporary subways over two streets, among which are the most important thoroughfares serving the east side of the city. In connection with this work two main tracks have

A Portion of the City of Cleveland Showing the Pennsylvania's Entrance

been added on this section, making it a four-track line, which will help materially in handling the heavy ore traffic from the unloading dock on the lake front west of the Union station. Also a new freight house and team yard have been built, and some additions and alterations made to the Euclid avenue passenger station which handles fully half of the road's passenger business at Cleveland. New automatic signals were installed, and electro-pneumatic interlocking plants were located at the ends of the four-track section. The additional width required for the third and fourth tracks made necessary some changes between Hamilton avenue and Thirty-third street, where a small brick round house had to be cut through and the leads to this house and the local freight house a short distance east, had to be rearranged. The east end of the local freight yard between Thirty-third and Twenty-sixth streets had to be raised to conform to the new main line grade as the two passenger tracks are carried through the center of this yard.

The freight tracks from Twenty-sixth street to the ore dock are on a continuous 0.8 per cent grade, which is the ruling grade on the division, so that it is improbable that any further elevation of these tracks can be undertaken. If the new Union station is located on higher ground on the steep hill facing the lake, as is now planned, the two Pennsylvania passenger tracks entering this station will probably be elevated so as to eliminate the remaining grade crossings between Twenty-sixth street and the station.

According to the terms of the ordinance under which this work was performed, the Pennsylvania handled all the work incident to elevating the tracks, building retaining walls and bridges over the streets, depressing streets, etc., and the city repaved the streets and made the necessary changes in sewers and water mains. The cost of right of way other than that used for additional railway facilities, of retaining walls, embankment under existing tracks, changes in existing side, switch and industrial tracks, bridges to carry existing tracks over Euclid avenue and streets south of that point, and to carry all tracks over Windsor avenue and streets north, street paving, changes to sewers and water mains, changes in street grades, damages to abutting property and all other incidental expenses were divided between the city and the railway in the proportion of 35 per cent and 65 per cent, respectively. In addition to its share of 65 per cent of the above expense, the railway paid the total cost of bridges, filling and all other work made necessary by the additional facilities which are being provided. The total cost of the work was about $2,800,000, of which the city's share was estimated at $912,000. This amount was authorized to be paid from the grade crossing fund created by the sale of grade crossing bonds. All public service corporations owning tracks, pipes, conduits, poles, etc., located in the streets affected by the work were required to pay the cost of making changes to these lines, with the exception that the relaying of the street railway tracks in the permanent pavement was considered a part of the cost of track elevation work, and divided between the city and the railroad.

METHODS USED IN SEPARATING GRADES

All tracks were elevated on embankments between retaining walls, requiring about 240,000 cu. yd. of slag and refuse in addition to 84,000 cu. yd. of excavation removed from streets and foundations, most of which was used for fill, although this was optional with the contractor. The former material was collected along the division, hauled in in dump cars and placed in the embankment by company forces. The remainder of the work was handled under contract. The work of building retaining walls and street bridges, and of placing the fill was complicated by the necessity of keeping two traffic tracks open at all times, and handling trains without interruption at intervals as short as eight or nine minutes during the ore season. The right of way on which to handle this traffic, and to carry on the construction work, has a maximum width of 60 ft., and in some places is considerably narrower. As all streets had to be kept open it was necessary to drive continuous temporary trestles before the traffic tracks could be elevated.

Although local conditions caused some modification of the general plan, the method adopted was about as follows: West of Windsor avenue two trestles were driven along the south side of the right of way and traffic turned over these temporary tracks. The north retaining wall, the north half of the abutments and the north half of the fill were then built from a construction trestle driven close to the north right of way line. After the fill had been widened sufficiently to carry a second track, traffic was shifted to this track from the outside temporary trestle on the south, and this trestle was used for construction

purposes in building the south retaining wall, the remaining half of the abutments and for placing the remainder of the fill.

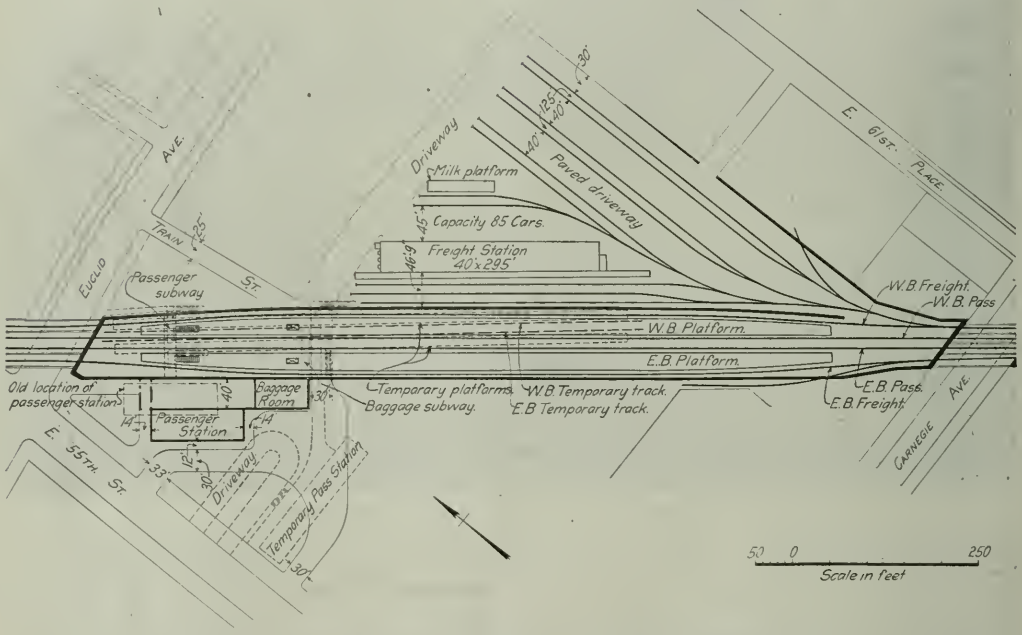
On the other side of Windsor avenue this system could not be used on account of the interference that would have resulted to passenger traffic at the Euclid avenue sation. The old station with two tracks at grade along the south side of the right of way was kept in service while work was under way on the north retaining wall and the north half of the fill. Then traffic was put up on the new grade on a temporary location between two temporary platforms reached by stairways from the street, and from the old freight station which was remodeled to serve as a temporary passenger station. The old passenger station which had been built only eight years before, and was still in excellent condition, was moved back about 40 ft. to allow a covered concourse to be built between the station and the south retaining wall. This concourse has a reinforced concrete roof

Roof of New Concourse at Euclid Avenue Station Under Construction

Euclid Avenue Freight House and Yard

built up of beams and slabs, and is lighted by prismatic skylights. A 20-ft. passenger subway will lead from the concourse under the tracks to two island platforms. A baggage and express building has been added adjoining the station on the south, and a baggage subway extends from this building under the tracks with elevators reaching the two island platforms. The handling of the work at Euclid avenue was also influenced by the desire to complete the new freight station just opposite the passenger station at as early a date as possible. As many as four mixers were used in pushing the concrete work in this locality.

The accompanying profile shows the change in grade that is made by the new improvement with the temporary grade that



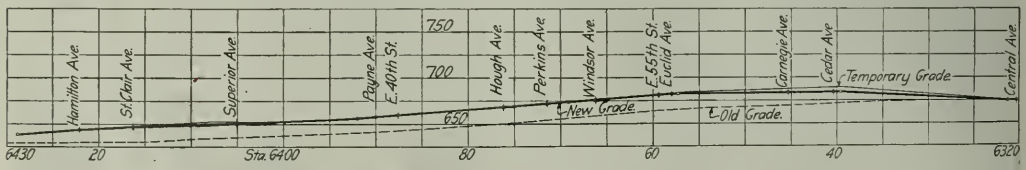
Passenger and Freight Station Layout at Euclid Avenue Showing Temporary Arrangements

was necessary during the course of the work. The maximum temporary approach grade was 0.8 per cent in order to keep within the limits of the ruling grade on the division. As the operated tracks had to be elevated over Cedar avenue before the work of lowering that street could be completed, the temporary trestle was driven at an elevation high enough to clear the street car traffic on the old street level, which raised it considerably above the permanent grade. In lowering this street one street car track was kept in service continuously, a practice which was followed in all cases.

The reconstruction of industrial sidings to connect with the new grade was left to the companies owning the industries, and in some cases these companies had to build two trestles, one at the elevation of the temporary track, and another after the permanent work was completed. No facing point switches were used for these industrial tracks, a double rail track with trailing switch being resorted to wherever this expedient was necessary to eliminate the facing point. The track standards are up to the best Pennsylvania practice, 100-lb. rail being laid on oak ties with rock ballast. The track work was handled by the division forces.

SUBWAY AND RETAINING WALL CONSTRUCTION

The work involved the construction of 11 permanent bridges and two temporary structures, one providing a 10-ft., and the other a 20-ft., driveway. The permanent bridges were all designed to carry four tracks with the exception of Carnegie avenue, just south of the entrance to the new freight yard, which will carry five tracks. The agreement with the city required the construction of bridges which would give the full width of the street under the subway, these street widths varying from 60 ft. to 132 ft. Curb supports were allowed in all cases, and at Superior avenue, where the street is 132 ft. wide, two intermediate supports were allowed between the curbs. The maximum street depression was 8.7 ft. and the maximum approach grade was 4 per cent, although this maximum was only used in three cases, and at important streets the grade was two per cent or less. The clearance was 15 ft., except at three



Profiles of Old, New and Temporary Grades on Group II of the Cleveland Track Elevation

streets where a lower limit was allowed. At seven of the streets provision for street car lines had to be made.

The subways are in general trough floor bridges on concrete abutments and steel columns. The abutments are of mass design with spread footings, no piles being used in the foundations. The columns are carried on concrete piers with grillage tops. The columns support transverse girders, and in general the troughs are run at right angles to the column lines. The longest rim girder span is 67½ ft. at east Fortieth street, and

Temporary Trestle Over St. Clair Avenue, Showing Type of Construction Used and Provision for Street Traffic

the longest trough span is 45 ft. at Payne avenue. The Superior avenue bridge, on account of its extreme length, is provided with a high concrete parapet wall to improve its appearance. The St. Clair avenue bridge is not of the trough floor type, the tracks being supported on transverse girders with buckle plate covers. The transverse girders are supported by web connections and the lower flanges of the rim girders.

In order to save concrete and decrease the dead load on the trough floor bridges, the troughs were not completely filled with concrete. A four-inch layer was placed in the bottom and along each side, the latter supporting a steel arch form at an elevation making its highest point level with the top of the trough. A continuous layer of concrete with a minimum thickness of about seven inches was then laid over the troughs and these arch forms. The water-proofing, consisting of five-ply felt and asphalt compound, was covered by a protecting coat of two inches of cement.

Finished Subway Over Perkins Avenue—One of the Typical Bridges

In placing the retaining walls, a stratum of quicksand was encountered in almost all cases. On account of the lack of right of way, the footings of the walls could not project beyond the wall face, and the walls were designed with a toe support of 13-in. square concrete piles 16 ft. long driven on six-ft.

Typical Floor Construction on Trough Floor Subway, Using Blaw Steel Arch Forms

centers. The quicksand was confined and was so near the surface that it had been drained by the sewers, making the driving of these piles very difficult. A two-inch jet was therefore used with very good results. After turning on the jet a pile would frequently drop of its own weight for half its length. A No. 2 Vulcan steam hammer was used very success-

A Row of Concrete Piles in Place for Toe Supports, Under Retaining Wall

fully for driving the concrete piles, a good day's run being from 25 to 30 piles.

The retaining wall is reinforced with one inch rods spaced 12 in. center to center, and is built in sections of 30 ft. with expansion joints at 60 ft. intervals. A three-inch coping is placed on the walls, and the batter below the coping varies with the height in order to place the toe of the wall on the right of way line. The inside face of the wall is stepped down. Two four-way conduits are carried on each wall with manholes at convenient points. These conduits are designed to carry low tension wires on one side of the right of way, and high tension on the other. One section of retaining wall 1,500 ft. long has been under load for more than a year, and as yet no settlement whatever is noticeable. The wall is in excellent line, showing that the use of the concrete piles has proved very satisfactory in securing a good piece of work. The cost for a design such as the one used is very little higher than would have been necessary to build a wall with a wide toe. Some of the retaining walls were built with horizontal scoring for the ornamental effect, but as this was not very well favored by the city it was stopped.

The piles in the temporary trestles were from 28 to 32 ft. long, and were driven with the jet. The stringers on these trestles were lapped over the entire width of the caps to save framing of stringers and corbels, and this plan was quite satisfactory. The total length of the temporary trestle was 28,000 ft., 90,000 cu. yd. of concrete was required, 2,400 concrete piles were driven. 6,000 tons of bridge steel were used, and 100,000 sq. ft. of waterproofing, 24,000 sq. yd. of street paving and 10,000 sq. yd. of sidewalk were laid.

The contract for pile driving, excavation and concrete work was let to the Brownell Improvement Company, Chicago; the steel was fabricated by the Fort Pitt Bridge Company, Pittsburgh, and was erected by the Strobel Steel Construction Company, Chicago. The work was handled under the direction of R. Trimble, chief engineer maintenance of way North West System, and H. W. Petersen, engineer in charge.

EUROPEAN RAILWAYS IN WAR TIME

American railway officers who have been inclined toward discouragement on account of the poor business conditions and the resulting effect on traffic and earnings which have prevailed in this country for several months, and which still exist, with considerable uncertainty as to the future, should be able to extract a grain of comfort from observation of the far worse plight of the roads in Europe. On the continent of Europe railways in the territory affected by war operations have been required practically to suspend business except for the transportation of troops, and a great deal of their property has been destroyed or damaged, while the lines that are not directly affected by military operations are suffering from the loss of traffic because business is at a standstill. In Great Britain, where the railways are all owned by private companies, the government immediately on the declaration of war with Germany on August 4, issued an order assuming control of the railways. For the time being the railways practically cease to exist as individual commercial undertakings and are merely parts of a great national system.

The announcement of this step made by the British War Office was as follows:

An order in council has been made under section 16 of the Regulation of the Forces act of 1871, declaring that it is expedient that the government should have control over the railways in Great Britain. This control will be exercised through an executive committee composed of general managers of railways, which has been formed for some time, and has prepared plans with a view to facilitating the working of these provisions of the act.

Although the railway facilities, for other than naval and military purposes, may for a time be somewhat restricted, the effect of the use of the powers under this act will be to co-ordinate the demands on the railways of the civil community with those necessary to meet the special requirements of the naval and military authorities.

More normal conditions will in due course be restored, and it is hoped that the public will recognize the necessity for the special conditions, and will, in the general interest, accommodate themselves to the inconvenience involved.

The railway executive committee is composed of the general managers of 10 of the leading railways in Great Britain, with the president of the Board of Trade as official chairman and H. A. Walker, general manager of the London & South Western, as acting chairman. An American, H. W. Thornton, general manager of the Great Eastern and formerly general superintendent of the Long Island, was not numbered among those chosen at first, but the committee had been in charge of affairs only two days when he was asked to become a temporary member, which he did.

This committee, through Mr. Walker, immediately issued a notice to the public explaining the situation, and stating that the control of the railways had been taken over by the government for the purpose of insuring that the locomotives, rolling stock and staff could be used as one complete unit in the best interests of the state for the movement of troops, stores, and food supplies. "The necessity for this action must at once become apparent," the announcement said, "when it is realized that certain ports through which the bulk of our food supplies enters this country may be closed for the purpose of such food supplies and in that event the rolling stock, locomotives, etc., may have to be diverted to other lines for the purpose of serving other ports. The staff on each railway will remain under the same control as heertofore, and will receive their instructions through the same channels as in the past."

The announcement also stated that in order to give due effect to the instructions received from the War Office and the Admiralty for the movement of troops, etc., it might be necessary to discontinue, at short notice, a portion of the advertised service or to close certain of the lines against ordinary traffic, and that, under such circumstances, no responsibility could be accepted for any delay or loss that might arise.

The act under which control of the railways was taken by the government provides that when the Crown by an order in council declares that an emergency has arisen in which it is expedient for the public service that the government shall have control over the railroads or any of them, the secretary of state, by warrants, may empower any person or persons named to take possession of any railroad in the United Kingdom and of its plant or of any part thereof, or may take possession of the plant without taking possession of the railroad itself and use it for government service in such manner as the secretary of state may direct. Any such warrant is to remain in force for one week only, but may be renewed from week to week as long as, in the opinion of the secretary of state, the emergency continues. The act also provides for such full compensation for any loss or injury sustained by the railway companies by the exercise of this power as may be agreed upon between the secretary of state and the railways and provides for arbitration in the case of difference; and that while the railways are in the hands of the government, all contracts for the operation and maintenance of the road shall be enforceable by or against the government.

The arrangements necessary for moving troops, horses and materials by rail for mobilization have been constantly under consideration by the military authorities, and the railways have naturally been regarded as an important factor in any mobilization scheme. There is a war railway council and a railway staff corps attached to the Royal Engineers and there have been various meetings at the Board of Trade to discuss methods for obtaining the maximum efficiency of the railways. Immediately following the taking possession of the railways by the government, the London & South Western gave notice that in consequence of the requirements in connection with the movement of the forces it was not practicable to continue the whole of the passenger train service as advertised, and that it would be necessary to reduce and alter this service from August 5

until further notice. The notice stated that full particulars of the suspension and alteration would be issued, and the company also announced that it would be unable to guarantee the running or punctuality of trains and could not be responsible for any delay, loss or damage which might occur in passenger train service. Similar notices of modified passenger train service were issued by other leading English and Irish railway companies, several of which announced that their ordinary passenger and goods train service would be subject to material alteration and discontinuance without further notice.

The publication of weekly traffic returns of the railways was also discontinued, as during the continuance of the war the railways will be operated almost as a single system, the government compensating the companies for any loss or injury in paying for the movement of troops and stores after the railways are restored to normal conditions. As the sums to be received from the government cannot be dealt with in weekly installments, the publication of these reports would, under the circumstances, be futile. With the business of the country disorganized on account of the obstacles to export and import traffic, the business of the railways would, of course, have been vitally affected even without the necessity for the use of their lines for military purposes.

With the practical cessation of European imports and exports and the general interruption of all kinds of business, the merchandise and general traffic has been heavily reduced and the pleasure and ordinary passenger travel reduced to a minimum. Operating expenses will also naturally be affected by the rise in the prices of materials and in other ways. The declaration of dividends was postponed by several railways, pending the outcome of events.

The Railway News, of London, in its issue of August 8, published an estimate that over 20,000 railway employees had left their employment in obedience to mobilization orders, their places being filled by promoting men of lower grades or by taking on new men for the less skilled occupations. The companies announced that so far as possible they would keep places open for the men who return to civil life when the war ends. At the time of the South African war, the railways not only made arrangements for keeping places open, but also for providing for those dependent upon the men killed or incapacitated during their military service. Similar arrangements are being made now.

The British railways have never yet been put to a complete test as to their ability in the matter of handling such a volume of traffic as would be necessitated in the transportation of an army to resist invasion, but they have often been called upon to handle large numbers of troops, horses and military equipment for maneuvers and royal reviews, frequently at times when their capacity was being subjected to a far greater strain by the handling of holiday passenger traffic.

The British railways are admirably adapted to the handling of troops in large numbers. Among the factors which are considered advantageous are the duplication of lines and the proximity of stations to each other. As the stations are rarely more than three or four miles apart, not all of the trains need go to the same station. Thus if 12 trains are required for the district served by stations A, B and C, the first, fourth, seventh and tenth trains could go to A, the second, fifth, eighth and eleventh to B, and the remainder to C. Should the trains run at 10 minute intervals, there would be half an hour to load or unload the first at A before the next train was due. Moreover, nearly all of the lines are double track and two trains may therefore, in emergency, be run in the same direction at the same time. Other advantages are found in the complete installation of block signals, telephones, speaking instruments and other signals.

As to the continental railways they are largely owned by the governments and a great many lines have been built with reference to their possible use in war time; and naturally the transportation of military forces has been their first consideration. Germany's arrangements for mobilization by railway have been unusually complete. A war time-table, revised as occasion demanded, has always been in the possession of railway officers throughout the country, capable of being put into force at the shortest notice. All railways are administered by the military authorities in time of war, irrespective of whether the railways are state or company owned.

The Russian railways have a different gage from the other European lines and this difference has been maintained for strategic reasons. Short strategic lines built by Germany on the French and Belgian frontiers naturally have been of the greatest importance, and in addition most of the main lines are so located as to have the greatest efficiency for military purposes.

THE TRAIN MASTER'S CHARACTER AND DUTIES*

By W. E. Williams
General Superintendent, Missouri, Kansas & Texas

The question of where a trainmaster should come from is a matter involving considerable difference of opinion. Whether his previous training should have been that of a despatcher, trainman, engineman, station agent or office man is an unsettled question. The fact is, it does not make much difference from what line he comes, as it is the man, after all, that counts. He should be constructive, analytical and judicial. He should be both suspicious and trustful, sufficiently suspicious to hold every man under observation until his worth is determined, and then sufficiently trustful to give to loyalty and worth the confidence that these qualities deserve.

He should by no means have a fixed plan or schedule for covering his division, but on the contrary should be prepared to change from one train to another on a moment's notice so that in no case will his men have a fixed schedule on which to look for him. But little time should be devoted to riding passenger trains, as ordinarily passenger trains take care of themselves; but where it becomes necessary to ride a passenger train that is not doing well and it is necessary to improve the movement, the trainmaster should in all cases ride in the first car of the train so that he will be convenient to the place where the work is being done at stations and will be in position to see and observe the movements of the train and station men, and know to what extent each is putting forth a proper effort to avoid unnecessary station delay. You will frequently see trainmasters on the rear of passenger trains, but, except at night, and for the purpose of observing switch lights, they have no business on the rear of passenger trains. They should, of course, go through every passenger train on which they ride, to observe the condition of the coaches and the general appearances and conduct of the crew.

Check of the more important yards should be made at least once each month and an eternal and never-ending check of foreign cars should be made at all times, particularly cars set out at blind sidings, as by the prompt release and handling of foreign cars alone the trainmaster can easily earn his salary in the saving of per diem, to say nothing of adding to his available car supply.

He should, of course, be at all times familiar with instructions issued by the superintendent of transportation as to the disposition and routing of various line cars in order that he may be in position to see that such cars are properly handled. He should have each day a statement of the overtime made by individual crews the day previous, and a memorandum from the chief despatcher showing tonnage handled on each train run; and where overtime appears to be unnecessary and excessive, the matter should be handled immediately with the crew interested. He should make it his business to spend sufficient time with work trains to see that work is properly organized and that there is no delay or lost motion so far as train service is concerned.

He should never camp at any place, only remaining sufficiently

*Extracts from a paper read at a staff meeting at Galveston, Tex., June 22, 1914.

long in any yard or on any train to see that the work is being properly handled, and then move to some other place. The trainmaster, to be of service, must be in action, up and going at all times. He should be observant of track conditions and methods of track repairs, should work closely with the roadmaster, with the road foreman of engines and the division engineer, and thus relieve the superintendent of detail investigation and supervision.

The right sort of man as trainmaster can be of wonderful assistance to his superintendent in making investigations, and he should so arrange that his report will conclude the matter, so that it will not be necessary for the superintendent to follow after him and conduct an additional investigation.

The trainmaster, in dealing with his men, particularly in matters involving failure to properly perform duty can do best by personal conference with the employee concerned; and this can usually be accomplished by simply waiting your opportunity of riding with the employee where you can have a quiet heart to heart talk with him, point out his error and what will be expected of him in future. In no case, where possible to avoid it, should men be publicly reprimanded or unnecessarily humiliated. A man who is of any account at all, will, regardless of the justice of your action, resent a public reprimand; and where discipline is such as to deprive a man of his self respect it is of a character that, so far as the employee is concerned, absolutely destroys his usefulness.

STREET AND ELECTRIC RAILWAYS IN 1912

The bureau of the census has issued bulletin No. 124, including statistics for street and electric railways for the year 1912, covering all railways other than steam roads in operation during any portion of the year. Comparative statistics are also shown for the censuses of 1907, 1902 and 1890. The statistics for electrically-operated divisions of steam roads are included only in cases where full reports could be made therefor separate from those for steam road operation. In the case of electric railway companies selling electricity for lighting and industrial purposes, when it was impossible to obtain complete, separate reports for the railways and for the electric light and power operations, data for both branches are included in the report for the railway. Comparisons for different censuses are to some extent affected by the inclusion of incomplete or estimated reports. The principal statistics are shown in the following comparative summary:

Comparative Summary, Including Traffic, Income and Capitalization: 1912, 1907 and 1902

	1912	1907	1902	Per cent of increase, 1902-1912
Number of companies	1,260	1,236	987	27.7
Miles of line	30,437.86	25,547.19	16,645.34	82.9
Miles of single track	41,064.82	34,381.51	22,572.52	81.9
Rolling stock:				
Cars, number	94,016	83,641	66,784	40.8
Passenger	76,162	70,016	60,290	26.3
All other	17,854	13,625	6,494	174.9

Deductions from income	16,090,372	19,465,984	8,779,294	83.3
Interest on funded and other debt	15,234,132	18,030,522	8,376,559	81.9
Miscellaneous deductions	856,240	1,435,462	402,735	112.6
Net income	19,514,995	28,447,265	17,359,605	12.4
Dividends	19,342,101	28,030,542	17,157,961	12.7
Surplus	172,894	416,723	202,544	—14.6
Capitalization:				
Total	4,708,568,141	3,774,772,096	2,308,282,099	104.0
Operating companies	3,956,718,023	2,811,876,374	1,775,468,781	122.9
Lessor companies	751,850,118	962,895,722	532,813,318	41.1
Capital stock	2,384,344,513	2,097,708,856	1,315,572,960	81.2
Funded debt	2,324,223,628	1,677,063,240	992,709,139	134.1
Cost of construction and equipment	4,596,563,292	3,637,668,708	2,167,634,077	112.1

The total capitalization in 1912 is reported as $4,708,568,141, an increase over 1902 of 104 per cent. Of this $2,384,344,513 was capital stock, and $2,324,223,628 was funded debt.

Of the total amount disbursed for salaries and wages in 1912, 13 per cent was for salaries, 47½ per cent for wages of conductors and motormen, and 39½ per cent for all other wage earners. In 1907 wages of conductors and motormen constituted 50.1 per cent of all salaries and wages, and in 1902, 55.1 per cent.

Of the total operating revenues, 91.7 per cent was derived from transportation in 1912, as against 93.3 per cent in 1907, and 95.3 per cent in 1902. The percentage derived from passengers was 88.6 per cent in 1912, as against 91.4 per cent in 1907, and 94.5 per cent in 1902, while the percentage from freight was 1.8 per cent in 1912, as against 1.3 per cent in 1907 and 0.4 per cent in 1902.

A special table is presented showing a comparison of income and expense on a passenger basis, showing that while the gross income per passenger increased from 5.25 cents in 1902, to 6.14 cents in 1912, the passenger revenue per passenger increased from 4.9 cents to 5.27 cents, and the operating expenses from 2.98 cents to 3.49 cents, making an increase in gross income less operating expenses from 2.27 cents to 2.65 cents, and an increase in net income from 0.64 to 0.65 cents.

A Belt Railway for Peking.—The Chinese ministry of communication has arrived at an arrangement with the Peking city authorities whereby they will be able to connect the terminals of the Peking-Kalgan, the Peking-Mukden, the Peking-Tungchow and the Peking-Hankow railways. Later a Peking central railway station will be built. The line will be about seven miles in length and will hug the wall the whole way. To facilitate the handling of traffic in and out of the city two tunnels will be bored through the wall on either side of the existing arch forming the Chien-men.

General News Department

The men in the shops of the Philadelphia & Reading are now working fifty-five hours a week, an increase of fifteen hours over the schedule in force for several weeks past.

No passenger has been killed in any train accident on the New York Central & Hudson River since February 1, 1911; and during that time the number of passengers carried was 136,154,983.

Following a derailment, and while the wreck was being picked up by a derrick, four employees, one of whom was Homer S. Badgett, assistant superintendent, of the New Orleans, Texas & Mexico were killed and three others were probably fatally injured near Savoy, La., August 28, by an explosion of gasoline. The gasoline car was in the freight train which had been derailed. The fire which caused the explosion is supposed to have been started by a spark caused by a chain slipping.

The Baltimore & Ohio has issued general instructions to employees constituting them an organization of fire-fighters, always ready for emergency service. When fires are discovered by enginemen, conductors or other employees in train service, they must lend assistance in extinguishing them, and any delay occasioned by assisting in putting out a fire must be reported at the first telegraph station. At division points the road has provided fire-fighting apparatus and the men are drilled.

The safety department of the Delaware, Lackawanna & Western, in Safety First Bulletin No. 8, gives the number of deaths and injuries to employees during the first half of each year since 1910—1911, 1912, 1913 and 1914—showing a decrease each year. The number of killed was reduced from 34 in 1911 to 7 in 1914, and the number of injuries from 137 to 99. The bulletin gives the causes of the deaths of the seven men in 1914, and contains a large number of suggestions for improving the safety record; also a long list of commendable actions of employees shown on discipline bulletins for four months of this year.

Central Railway Club

The next regular meeting, the annual outing of the Central Railway Club, will be held at Buffalo on September 11. The program for the day is as follows: Members will assemble at the Statler Hotel, the club headquarters, and leave there at 8:45 a. m. to go by the Niagara street cars to the foot of Austin street, from whence a boat leaving promptly at 9:30 will convey them down the west channel of the Niagara river around Grand Island and up the east channel to either the Buffalo Lunch Club or the Motor Club grounds on Grand Island; dinner will be served on arrival and will be followed immediately by the regular club meeting, at which a paper on Locomotive Arch Brick will be read by George Wagstaff of the American Arch Company, New York. For the accommodation of members in New York and vicinity arrangements are being made for a special Pullman sleeping car to be attached to the train leaving the Lackawanna station at Hoboken at 6:55 on September 10.

American Society of Mechanical Engineers

A hearing will be held by the committee on standard boiler specifications in the rooms of the society, 29 West 39th street, on September 15 at 10 a. m. The basic idea of this committee's work is the formulation of a standard of the highest requirements in order to reduce the loss of life and property from boiler explosions. It is the intention also to create a standard which it is hoped will ultimately be adopted by the federal government, and state governments not now having boiler regulations. A considerable number of associations and engineering organizations have been invited to have representatives present and it is also desired insofar as is possible that all who have not already done so, prepare and send a statement in writing previous to the hearing to assist in the deliberations.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

American Association of Demurrage Officers.—A. G. Thomason, Demurrage Commissioner, Boston, Mass. Annual convention in April.

American Association of Dining Car Superintendents.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next convention, October 22-24, Washington, D. C.

American Association of Freight Agents.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 21-24, 1915, Richmond, Va.

American Association of General Passenger and Ticket Agents.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Annual meeting, September 15-16, Boston, Mass.

American Association of Railroad Superintendents.—E. H. Harman, Room 101, Union Station, St. Louis, Mo.

American Electric Railway Association.—E. B. Burritt, 29 W. 39th St., New York. Annual convention, October 12-16, Atlantic City, N. J.

American Electric Railway Manufactureas' Association.—H. G. McConnaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

American Railway Association.—W. F. Allen, 75 Church St., New York. Semi-annual meeting, November 18, Chicago.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 20-22, 1914, Los Angeles, Cal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1915.

American Railway Safety Association.—L. F. Shedd, C. R. I. & P., Chicago. Next meeting, November, Chicago.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga. Annual meeting, July, 1915.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except, June, July and August, 220 W. 57th St., New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 1-4, 1914, New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Atlanta, Ga.

Association of Manufacturers of Chilled Car Wheels.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Annual meeting, second Tuesday in October, New York.

Association of Railway Claim Agents.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, 3rd week in May, 1915, Galveston, Tex.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual convention, October 26-30, 1914, Chicago.

Association of Railway Telegraph Superintendents.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 22-25, Rochester, N. Y.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York. Next meeting, December 8-9, 1914, Richmond, Va.

Bridge and Building Supply Men's Association.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod,176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Civil Engineers' Society of St. Paul.—Edw. J. Dugan, P. O. Box 654, August and September, Old State Capitol Bldg., St. Paul.

Engineers' Society of Pennsylvania.—Edw. R. Dasher, Box 75, Harrisburg, Pa. Regular meetings, 1st Friday after 10th of each month, except July and August, 31 So. Front St., Harrisburg, Pa.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

Freight Claim Association.—Warren P. Taylor, R. F. & P., Richmond, Va. Annual meeting, June 16, 1915, Chicago.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

International Railway Congress.—Executive Committee, 11, Rue de Louvain, Brussels, Belgium. Next convention, June 23 to July 6, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 W. Broadway, Winona, Minn. Next convention, July 14-17, 1915, Sherman House, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, C. H. & D., Lima, Ohio.

Maintenance of Way and Master Painters' Association of the United States and Canada.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next convention, November 17-19, 1914, Detroit, Mich.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May, 1915.

Master Car and Locomotive Painters' Association of the United States and Canada.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 8-11, Nashville, Tenn.

Master Car Builders' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1915.

National Railway Appliances Association.—Bruce V. Crandall, 537 So. Dearborn St. Chicago. Next convention, March 15-19, 1915, Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railroad Master Tinners, Coppersmiths and Pipefitters' Association.—U. G. Thompson, C. & E. I., Danville, Ill. Annual meeting, May, 1915.

Railway Business Association.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December 10, 1914, Waldorf-Astoria Hotel, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Railway Electrical Supply Manufacturers' Association.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

Railway Fire Protection Association.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Annual meeting, October 6, 1914, Washington, D. C.

Railway Signal Association.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa. Annual meeting, September 22-24, 1914, Bluff Point, N. Y.

Railway Storekeepers' Association.—J. P. Murphy, L. S. & M. S., Box C, Collinwood, Ohio. Annual meeting, May, 1915.

Railway Supply Manufacturers' Association.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with M. C. B. and M. M. Associations.

Railway Telegraph and Telephone Appliance Association.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill. Next convention, September 8-10, 1914, Chicago.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake City Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Signal Appliance Association.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

Society of Railway Financial Officers.—Carl Nyquist, C. R. I. & P., La Salle St., Chicago. Annual meeting, September 15-17, Hotel Aspinwall, Lenox, Mass.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. Ry., Atlanta, Ga.

Southern and Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—J. S. Marks, Agent, Interstate Despatch, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillsburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7122 Stewart Ave., Chicago. Annual meeting June 15, 1915, Minneapolis, Minn.

Transportation Club of Detroit.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Next meeting, September 15-18, Hotel Sherman, Chicago.

Utah Society of Engineers.—Frank W. Moore, Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Consolidated Music Hall, Salt Lake City.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

The receivers of the Pere Marquette have asked Judge Tuttle, in charge of the receivership, for permission to advance freight and passenger rates.

On August 9 the running time of the Chicago & North Western's Duluth-Superior Limited train, from Chicago to Duluth, was shortened by 30 minutes.

The Panama Railroad last week notified connecting carriers that at the end of ninety days the road will withdraw from all agreements relating to through freight traffic. In other words the Panama Canal has superseded the railroad.

The Department of Agriculture has issued an order that spoiled food transported in interstate commerce must be denatured, so that it cannot be eaten. For example, spoiled eggs, to be used in tanning, must be treated with salt, petroleum or coloring matter, so that no one will attempt to use them as food.

Officers of a number of Texas railways recently appeared before a committee of the state legislature to protest against the clause in the cotton warehouse bill now before the special session of the legislature, requiring the roads to build sheds at all points where cotton is received and to protect it from the weather while in transit.

The railways entering Chicago have announced their intention of assessing a charge for trap-car service in the Chicago district after October 1 of 4½ cents per 100 lb., with a minimum of 8,000 lb. The charge will apply from all industries and universal freight stations. The cost of trap-car service is now absorbed, the eastern lines requiring a minimum of 10,000 lb., and the western lines, 6,000 lb.

The United States District Attorney at New York City has begun a suit in the Federal Court against the Lehigh Valley for an injunction forbidding payments as commission or salary to George W. Sheldon & Company, forwarding agents. Sheldon & Company have been indicted for accepting rebates, the charge being that they represent the shippers and are not properly to be regarded as forwarding agents.

The Louisville & Nashville and other roads in Southern territory have filed tariffs to be effective October 1, making advances in certain rates on lumber from points in Mississippi and Louisiana to Ohio River points, as well as numerous advances from Memphis to points in Iowa, North and South Dakota, Minnesota and Western trunk line territory. The increase varies from 1 cent to 4 cents per 100 lb. on oak, gum and cottonwood.

The Chicago, St. Louis & Gulf Transportation Company, which began service between Chicago and LaSalle, Ill., on August 10, via the Illinois & Michigan canal and the Chicago river, making tri-weekly trips with 150-ton capacity barges, is basing its rates on a 20 per cent differential under the rail rates. The company announces that the tonnage is increasing with every trip and that it is planned to make the service daily within the next month. The company is agitating for a deepening of the canal, with the idea of running boats from Chicago to New Orleans via the Mississippi river.

The freight traffic department of the Chicago & Eastern Illinois has issued "Lumber Specialization Circular No. 1," signed by E. S. Stephens, assistant general freight agent, describing the service that the road gives on lumber shipments, which are handled as "Green Ball" freight at an average movement of 100 miles a day, and giving a brief outline of the various rate bases applying on lumber. The circular states the belief that there will soon be great activity in the lumber trade and that officers of the road have been giving closest attention to all details of the lumber traffic. Other circulars are to follow.

The embargoes on shipments of grain to Galveston for export, which had been in effect for about three weeks, were raised on August 27, and all lines entering Galveston have notified their connections that they are ready to accept shipments. The

embargoes were imposed on August 4, on account of the delay to export shipping caused by the outbreak of the European war, and approximately 3,000 cars of wheat had been tied up at Galveston during their continuance. The Illinois Central announced the lifting of its embargo at New Orleans on September 1. The Texas & Pacific last week modified its embargo to clear the congestion of wheat at Westwego, near New Orleans.

The embargo on freight for export to Europe, which was placed by the trunk lines soon after the opening of the war, was lifted August 29 to the extent of announcing that freight would be accepted if prepaid to the Atlantic seaboard, and if, before shipping it, arrangements had been made with the steamship agents. No through export bills of lading can be issued until contract for ocean transportation has been made through foreign freight agents, and all through export bills of lading must have attached the ocean condition war clause, as required by transatlantic lines. The export movement of flour during the past two weeks has been unusually heavy. There is no scarcity of vessels for grain.

Representatives of the Pennsylvania, the Pittsburgh & Lake Erie, the Baltimore & Ohio, and the Bessemer & Lake Erie appeared before the Pennsylvania Public Service Commission September 1 concerning the general 5 per cent increase in freight rates which has been decided on, following the recent order of the Interstate Commerce Commission. They requested the commission to grant blanket permission to all roads publishing Pennsylvania intrastate rates to cancel the tariffs now under voluntary suspension, effective on or before September 12, and also asked authority to re-publish the 5 per cent rates, as modified on the basis laid down by the Interstate Commerce Commission, on less than statutory notice of 3, 5 or 10 days. The Commission agreed as to the withdrawal of the present rates, but reserved its decision regarding the proposition to make effective the 5 per cent increase on less than the statutory time. The Commission also made it plain that no matter what its attitude on the latter question may be, it would not affect the question as to the reasonableness of the increased rates. The matter only involves those lines in the western part of Pennsylvania which come within Central Traffic Association territory.

Rate clerks of the Trunk Line Association and the Central Passenger Association comprising the railways east of the Mississippi river, are working day and night on the compilation of tariffs advancing interstate passenger fares, as mentioned in last week's issue. A meeting of the rate clerks of the Trunk Line and Central Passenger associations was held on August 26 at Niagara Falls, which was attended also by a large number of passenger officers of the roads, at which some little progress was made. The task of revising the tariffs is so large and so complicated that it may be several months before it is completed. Roads in trunk line territory have announced some of their advanced rates to go into effect by October 1, as above noted, but on ordinary ticket fares the advances in that territory will be of less importance than those in Central Passenger Association territory and on the western lines, because a large number of their rates are now on the basis of 2½ to 3 cents, whereas in the Central Passenger Association territory the intrastate rates are on the two-cent basis and have pulled down the interstate fares to some extent. It will therefore be some time before the rates can be advanced in Central Passenger Association territory, or for through fares. The general basis proposed is 2½ cents a mile.

Increases in Passenger Fares

The Pennsylvania Railroad on September 1 filed with the Interstate Commerce Commission tariffs, to take effect October 1, increasing the price of interchangeable mileage tickets from two cents a mile to 2¼ cents. The company announces that other changes are in contemplation. This action is taken in pursuance of the suggestion made by the Interstate Commerce Commission, in its recent decision on freight rates, to the effect that passenger rates are too low, as compared with freight rates.

On Wednesday it was announced that the Boston & Albany, the Boston & Maine and the New York, New Haven & Hartford had issued similar notices; and at Harrisburg, Pa., similar notices were filed with the state commission by the Philadelphia & Reading, the Pittsburgh & Lake Erie, the Lake Shore & Michigan Southern, the Lehigh Valley, the Delaware, Lackawanna & Western and the Delaware & Hudson. The Reading proposes to revise all of its fares, except for season tickets, on the basis of 2¼ cents a mile. Round trip fares will be no lower than single trip.

Resumption of Traffic to Mexico

Announcement has been made by officers of the Texas & Pacific and International & Great Northern that affairs in Mexico have reached a state where traffic with the United States is being resumed. The International & Great Northern, in connection with the Texas & Pacific and St. Louis, Iron Mountain & Southern, previous to the trouble in Mexico ran through trains via Laredo, Tex., to the City of Mexico in connection with the National Railways of Mexico. The war caused the suspension of this traffic. Recently arrangements have been made with the Constitutionalists for an interchange of traffic between the Gould lines and the Mexican railways at Laredo. All freight in both directions is transferred in the International & Great Northern yards at Laredo. No through rates are in effect and through bills of lading cannot be issued.

Through train service over the railroad between Laredo and the City of Mexico was resumed on August 26, the track which was destroyed in connection with the operations of the war having been made passable. Numerous branch roads are being repaired rapidly.

Controversy Over Western Passenger Traffic

The Union Pacific has received many protests from connecting lines on account of a notice issued by the traffic department on August 13, closing the Ogden gateway both eastbound and westbound, to passengers desiring to travel on through tickets via the Denver & Rio Grande and connecting lines east of Colorado common points, the notice to be effective on October 1. The notice says that on passenger traffic originating at Colorado common points, Denver, Colorado Springs, Pueblo and Trinidad, or points east, south or north thereof, destined to points on the Oregon Short Line, or from points on that line, interchange at Ogden or Salt Lake City will be discontinued and that such business must be routed via the Union Pacific between Denver, Colo., or authorized points of interchange east thereof on the one hand, and Granger, Wyo., or Ogden, Utah, on the other. Interchange on traffic to or from points beyond Huntington is to continue as at present, and interchange on traffic originating on points west of, but not including Colorado common points, destined to points on the Oregon Short Line or the reverse, is to continue as at present. Connecting lines are requested to arrange to eliminate from tariffs all routing in conflict with this notice and for the withdrawal of tickets accordingly.

The Denver & Rio Grande issued a notice to the public stating that should the Ogden gateway be closed the Burlington, the Rock Island, the Santa Fe, the Missouri Pacific, the Colorado & Southern and Colorado Midland and their connections would be unable to ticket passengers to Oregon Short Line points through Colorado and Utah, and the result would be to divert from Denver, Colorado Springs, Manitou, Pueblo, Canyon, Canyon City, Leadville, Glenwood Springs, Grand Junction, Green River, Price, Provo, Salt Lake City and Ogden, all travel originating in the east and the south destined to Oregon Short Line points; also the very large Yellowstone Park and other round trip tours in commercial travel that has been moving through Colorado and Utah. The notice says that the major portion of the diverted travel which has heretofore passed through Colorado and Utah would be ticketed through St. Paul, Billings and other northwestern routes, to the disadvantage of Colorado and Utah cities and towns if the Ogden gateway were closed to the Denver & Rio Grande and its connections.

On Tuesday of this week it was reported that the Union Pacific would defer action, because of the vigorous protests from interested lines. The object of closing the gateway was control of tourist business; but in recalling its notice the Union Pacific says that it will take measures to accomplish its purpose in another way.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

New England Lumber Rates

Opinion by Commissioner Clements:

The commission finds that the carriers have justified proposed increased rates on lumber and other forest products from points on the Maine Central to points on the Boston & Maine. In justification of the proposed increases reference was made to the general financial condition of the two roads. It was stated that in order to maintain their present standard of service and to insure a reasonable return to investors it was necessary that means be taken to increase revenues. In this connection it was shown that, although the total revenue of the Maine Central for the eight months ended February 28, 1914, increased $192,554 over the total revenue for corresponding months in the previous year, operating expenses increased $436,944, and that there was a decrease in net operating revenue of $227,018, with an increase in taxes of $38,703. It was further shown that the percentage of operating expenses to operating revenues during the eight-months period referred to increased from 70.43 to 74.16 per cent over the corresponding period in the previous year. It was also asserted that the proposed rates are lower than rates generally for equal distances in the same general territory and that they are lower than lumber rates applicable on connecting lines in Maine, such as the Bangor & Aroostook and the Canadian Pacific. (31 I. C. C., 553.)

Fourth Section Violations in Rates on Sugar

Opinion by the commission:

The carriers have asked permission to continue rates on sugar lower than to intermediate points (a) via certain routes from San Francisco and from beet-sugar producing points in California, Utah and Arizona to destinations on and east of the Missouri river; (b) from Colorado beet-sugar producing points to El Paso, Tex.; (c) from New Orleans, La., and points taking the same rates to El Paso, Tex.; (d) from New Orleans to various points in Arkansas, Illinois, Iowa, Kansas and other states and (e) to establish a rate of 46 cents on sugar in carloads, minimum weight 60,000 lb., from San Francisco and other sugar-producing points in California, Nevada, Arizona and Utah to Chicago and rates from the same points of origin to all points between the Missouri river and Chicago, 23 cents higher than the present rates to the same points from New Orleans, while continuing higher rates to intermediate points.

Rates from California points to Chicago: The traffic is carried via four routes and as a rule the rates increase to 55 and 60 cents for carload minima of 60,000 and 36,000 lb., respectively, to points in eastern Nevada, which rates are blanketed to points west of the Missouri, the rates to points between the Missouri and Chicago being 5 cents higher. The rates applying for the route over the Southern Pacific and Union Pacific through Ogden, Cheyenne and Omaha already accord with the fourth section. The commission does not find any necessity for violations of that rule in the rates via the route over the Western Pacific, Denver & Rio Grande and the Missouri Pacific or that afforded by the Santa Fe via Bakersfield, Cal., Albuquerque, N. Mex., and Trinidad, Cal. The route via the Southern Pacific to El Paso, the El Paso & Southwestern to Tucumari, N. Mex., and the Rock Island beyond is circuitous as compared with the other routes. It is held that the rates to the Missouri river should not be exceeded at intermediate points via this line west of and including Tucumari and that east of Tucumari they should not exceed the rates to the Missouri by more than 10 cents per 100 lb.

Rates to El Paso: No justification is found for the maintenance of lower rates via the direct lines from Colorado beet-sugar producing points or from New Orleans and points taking the same rates to El Paso than to intermediate points. The line of the Santa Fe from New Orleans is 23 per cent longer than the short line, so that line will be allowed to carry rates to stations west of Vaughan, N. Mex., not more than 10 cents higher than the rates to El Paso.

Rates from New Orleans to points in Arkansas, Oklahoma, etc.: The commission finds no necessity for violations of the fourth section in the rates to these points via the direct lines. The rates from producing points on Morgan's Louisiana & Texas Railroad, the New Orleans, Texas & Mexico, the New Iberia & Northern and the Texas & Pacific intermediate to New Orleans on routes from New Orleans to stations west of the west bank of the Mississippi have or will have the same rates as from New Orleans. To St. Louis, Cairo, Chicago and certain points east of the Mississippi the rates are from 2 to 5 cents higher than from New Orleans. This violation of the fourth section will be allowed. The rate on sugar from New Orleans to Cairo is 17 cents, to St. Louis 17 cents and to Chicago 23 cents and the short lines are east of the Mississippi river. The rates via these lines were considered in 31 I. C. C. 495 and it was held that carriers east of the river could maintain lower rates to Cairo and St. Louis than to intermediate points. The rates to the Mississippi river crossings have been influenced by water competition. Rates grade westerly from the river towards the western boundary of these states and traffic moving in a northwesterly direction usually moves under rates conforming with the fourth section. The opposite holds true of traffic moving in a northeasterly direction.

The commission grants relief from the fourth section in several cases. The Kansas City Southern is allowed to continue a rate to Fort Smith, Ark., lower than to points north of Texarkana. Lower rates are also allowed to the Mississippi river points, Helena, Memphis, Cairo, St. Louis and points north thereof than to points in Louisiana, Arkansas, Missouri, Iowa and Minnesota. Lower rates are also permitted to Chicago, Milwaukee and other points in eastern Illinois and Wisconsin than to intermediate points.

The commission does not allow lower rates to Oklahoma than to intermediate points in Texas on the direct lines.

The rate to Omaha is 32 cents. The Rock Island is allowed to meet this rate and to continue higher rates to intermediate points provided the latter do not exceed 40 cents at the highest rated points. The same carrier is also allowed relief as to the rates via Keokuk and Burlington to Davenport and Clinton.

The Missouri Pacific may meet rates of 12 cents to Arkansas City, Helena, Memphis and 17 cents to Cairo and St. Louis, provided the rates to intermediate points south of Arkansas City do not exceed 22 cents, south of Memphis 24 cents and south of St. Louis 28 cents. No relief is granted with reference to the rate of 28 cents to Fort Smith.

The Santa Fe because of its circuitous route is allowed to continue lower rates to Kansas City, Mo., etc., and to Illinois than to intermediate points in Missouri, Kansas and Oklahoma.

The Chicago Great Western may continue lower rates to the twin cities than to intermediate points and lower rates to Chicago and Illinois points than to intermediate Iowa and Missouri points.

The rate of 46 cents from San Francisco to Chicago: A rate of 46 cents from San Francisco and beet-sugar producing points to Chicago will compare with a rate of 55 cents to the Missouri river and points west thereof. The commission finds that the carriers may establish rates from San Francisco to Chicago and points taking Chicago rates from New Orleans 25 cents higher than the rates to the corresponding points from New Orleans, and to other stations between Chicago rate territory and Missouri river points 23 cents higher than the rates to the same points from New Orleans, provided the rates to other intermediate points west of the Missouri river are corrected as outlined in the preceding portions of this report.

It was shown in the record that the total consumption of sugar in the United States in 1913, including sugar for manufacturing purposes, was 3,600,000 tons, an average per capita of 82 lb. During that year the seven western states, California, Nevada, Utah, Idaho Montana, Colorado and Arizona, produced 573,000 tons of beet-sugar and during the same year approximately 280,000 tons of cane sugar, mostly from the Hawaiian Islands, was brought to San Francisco, refined at and distributed from that point. This total of 853,000 tons is enough to supply a population of 20,000,000 people, while the total population in the 11 western states—including the

above seven and Washington, Oregon, Wyoming and New Mexico—was but 6,825,821 persons, according to the census reports of 1910. It is obvious that a large part of the sugar produced or refined in these 11 states must find a market in the territory east thereof.

The rates made to the Missouri have enabled the cane-sugar refiners at San Francisco and the beet-sugar producers in the western states to market some of this sugar in the territory bordering on the Missouri. It was represented, however, that the rate of 23 cents made to Chicago from New Orleans and by the lake-and-rail lines from the Atlantic seaboard was so low as practically to prohibit the movement of western sugar to Chicago on the rates now in effect.

It was also shown that about 270,000 tons of sugar move from the Hawaiian Islands via the Isthmus of Tehuantepec to New York, where it is refined and then distributed. The refiners at San Francisco and the carriers serving that point desired to secure a larger proportion of this Hawaiian sugar than they are now doing and in order to do so had to have rates to consuming territory that would enable them to compete with the sugar refined at New York or New Orleans, or the Louisiana sugar, coming mainly from New Orleans. (31 I. C. C., 511.)

STATE COMMISSIONS

The Minnesota Railroad and Warehouse Commission has allowed an extension of time from August 10 to September 10 for putting into effect its recent order reducing freight rates in the State.

The Illinois Public Utilities Commission on August 26, ordered the suspension of freight tariffs by the Chicago & North Western canceling the absorption of tunnel and lighterage charges in Chicago.

The Texas Railroad Commission has announced that a hearing will be held on September 8 to consider a proposition of canceling the special rates on all kinds of fruits, melons, vegetables in carloads and less than carload lots.

Indiana railroads have announced that they will file new freight tariffs of class rates with the Indiana Public Service Commission on September 12, embodying advances made on the same basis as that allowed by the Interstate Commerce Commission for interstate traffic in the 5 per cent case.

The Missouri Pacific has filed notice with the Nebraska Railroad Commission that it intends to appeal from the commission's order of August 5, making a reduction of about 19 per cent in the class freight rates in Nebraska. The appeal will be taken to the state supreme court. The rates will go into effect, however, pending the appeal.

The Oklahoma Corporation Commission has announced that a hearing will be held on September 22, in connection with the application filed by the attorney-general of the state for refunds amounting to approximately $6,000,000 on passenger fares collected by the railways of the state while the two-cent fare law was under injunction. Claims for refunds of approximately $700,000 in express charges are also involved.

The Texas Railroad Commission has set November 23 as the date for the public hearing of the application of the Texas railroads for authority to increase freight rates throughout the state. The commission announces that the investigation will embrace the following questions: "First, do the present rates of transportation yield to common carriers by railroad operating in the state of Texas adequate revenue? Second, if not, what general course will be pursued to meet the situation?"

The Iowa Railroad Commission will hold a hearing on October 9, on a controversy between the Wabash and the Iowa State Board of Control regarding demurrage charges on coal shipped to the state school for the deaf at Council Bluffs. At that point the Wabash turns cars over to the Street Railway Company, which in turn places them on a side track at the state institution. Occasionally it takes three or four days to switch the cars to the school. The state board claims that delivery is not effected until the cars are received at its side track. The Wabash claims that the street railway is an agent for the school and that demurrage begins 48 hours after that road receives the cars. Both the board of control and the street railway have refused to pay the demurrage charges, which, since August, 1912, have aggregated nearly $1,000.

Railway Officers

Executive, Financial, Legal and Accounting

Hale Holden, vice-president of the Chicago, Burlington & Quincy, has been elected president, with headquarters at Chicago, to succeed Darius Miller, deceased. A portrait and sketch of Mr. Holden appear elsewhere in this issue.

The office of car accountant of the Rock Island Lines, held by W. H. Wallace, has been placed under the jurisdiction of the accounting department. He will report to the controller instead of to the superintendent of car service as heretofore, and the headquarters will remain at Hamilton Park, Chicago.

C. V. Lewis, freight claim agent of the Baltimore & Ohio, at Baltimore, Md., at his own request has been relieved of the duties of that position, and has been appointed special representative of the freight claim department. B. M. Waldron, freight claim agent of the Cincinnati, Hamilton & Dayton, at Cincinnati, Ohio, since February, 1909, succeeds Mr. Lewis.

William J. Cunningham, assistant to the president of the New York, New Haven & Hartford, has been appointed president's assistant of the Boston & Maine, with headquarters at Boston, Mass. Mr. Cunningham will continue as assistant professor of transportation in the Harvard School of Business Administration. A photograph and sketch of Professor Cunningham were published in the *Railway Age Gazette* of October 17, 1913, page 722.

Operating

Fred N. Beal, general freight and passenger agent of the Sandy River & Rangeley Lakes at Phillips, Me., has been appointed general manager, with office at Phillips, and the offices of general freight and passenger agent, and superintendent, are abolished.

Traffic

R. W. Rigdon has resigned as commercial agent of the Kansas City, Mexico & Orient at Ft. Worth, Tex.

P. J. Leimbach, local freight agent of the Missouri Pacific at Hutchinson, Kan., has been appointed commercial freight agent at that place.

H. S. Baggs has been appointed traveling passenger agent of the Atlanta, Birmingham & Atlantic, with office at Atlanta, Ga., succeeding R. E. Camp, resigned.

J. R. Long has been appointed traveling freight and passenger agent of the Wabash, with headquarters at Philadelphia, Pa., succeeding C. H. Latta, resigned.

H. G. Locke, traveling passenger and freight agent of the Chicago Great Western at Boston, Mass., has been appointed district passenger agent with headquarters at Boston.

E. K. Garrison, district freight and passenger agent of the Chicago, Milwaukee & St. Paul at Portland, Ore., has been appointed general agent of the freight department at Seattle, Wash., succeeding Robert M. Boyd, deceased.

H. C. Davis has been appointed traveling passenger agent of the Nashville, Chattanooga & St. Louis, with office at Chattanooga, Tenn., succeeding J. H. Latimer, who was retired at his own request on September 1, after a service of 57 years with that road and its predecessors.

J. H. Fitch, general agent of the traffic department of the Louisville & Nashville at Detroit, Mich., has been appointed division freight agent of that road and the Lexington & Eastern, with headquarters at Lexington, Ky. L. G. Parsons, commercial agent of the Louisville & Nashville at Indianapolis, Ind., succeeds Mr. Fitch and C. H. Ryan, Jr., traveling freight agent at Chicago, succeeds Mr. Parsons. W. C. Dillard, traveling freight agent at Houston, Tex., has been appointed division freight agent, with headquarters at Pensacola, Fla., succeeding J. W. Lurton, deceased. W. L. Dulaney, soliciting agent at New Orleans, La., succeeds Mr. Dillard and J. J. Coburn succeeds Mr. Dulaney. Fred Mulberry, soliciting agent at Cincinnati, Ohio, has been appointed travel-

ing freight agent at Chicago, succeeding Mr. Ryan, and W. D. Clary succeeds Mr. Mulberry. F. L. Salisbury, contracting agent at Knoxville, Tenn., has been appointed traveling freight agent of the Louisville & Nashville and the Lexington & Eastern, with headquarters at Lexington, Ky. D. M. Goodwyn has been appointed general freight agent of the Lexington & Eastern and R. D. Pusey has been appointed general passenger agent of the Lexington & Eastern, both with headquarters at Louisville, succeeding C. Scott, deceased.

Engineering and Rolling Stock

C. M. Buck has been appointed division engineer of the Atchison, Topeka & Santa Fe, with office at Emporia, Kan., vice F. L. Guy, resigned.

R. A. Billingham has been appointed master mechanic of the Tennessee Central, with office at Nashville, Tenn., succeeding J. J. Clark, resigned.

E. E. Chrysler, master mechanic of the Chicago & Alton at Slater, Mo., has been appointed superintendent of shops of the Oregon Short Line, with headquarters at Pocatello, Idaho, succeeding D. J. Malone, deceased.

W. J. Miller, master mechanic of the St. Louis Southwestern of Texas at Tyler, Texas, has been appointed superintendent of motive power of the St. Louis Southwestern, with office at Pine Bluff, Ark., vice T. E. Adams, deceased, and J. M. Kilfoyle succeeds Mr. Miller.

W. D. Warren, division engineer of the Midland division of the New York, New Haven & Hartford, at Hartford, Conn., has been appointed division engineer of the Providence division, with office at Providence, R. I., succeeding W. T. Spencer, promoted. H. E. Astley, division engineer of the Central New England at Hartford, succeeds Mr. Warren. C. F. Yardley, track supervisor on the Providence division of the New York, New Haven & Hartford at Providence, R. I., succeeds Mr. Astley, and R. L. Pearson succeeds Mr. Yardley.

Purchasing

C. B. Williams, whose appointment as purchasing agent of the Central of New Jersey, with headquarters at New York City, has been announced in these columns, was born on March 22, 1873, at Beech Creek, Pa., and after leaving the common schools was a student at the Pennsylvania State College for a short time. In 1890, he was graduated from Eastman Business College and in July of the following year began railway work with the Beech Creek Railroad, now a part of the Pennsylvania division of the New York Central & Hudson River. He entered the service of the Central of New Jersey on November 27, 1893, as stenographer and chief clerk to the general superintendent. From February, 1900, until September, 1908, he was chief clerk to the superintendent of motive power and then was appointed general storekeeper, which position he held at the time of his recent appointment as purchasing agent of the same road, as above noted.

C. B. Williams

OBITUARY

Francis B. Sears, formerly vice-president and director of the Chattahoochee Valley, died on August 26, at his summer home in Weston, Mass., at the age of 65.

Daniel E. Sullivan, formerly master mechanic of the Union Pacific at Cheyenne, Wyo., died at Ogden, Utah, on August 20, aged 60 years. He was employed by the Union Pacific for 34 years, retiring July 1 last on account of illness.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Georgia Railroad is in the market for 4 Mikado type locomotives.

The Erie has ordered one Santa Fe type locomotive from the Baldwin Locomotive Works.

The Southern Railway has ordered one ten-wheel type locomotive from the Baldwin Locomotive Works.

The Charleston & Western Carolina has ordered one six-wheel switching locomotive from the Baldwin Locomotive Works.

The Northwestern Pacific has ordered four ten-wheel passenger locomotives, two ten-wheel freight locomotives and three six-wheel switching locomotives from the American Locomotive Company. The four ten-wheel passenger locomotives will have 20 by 28 in. cylinders, 63 in. driving wheels, and a total weight in working order of 180,000 lb. The two ten-wheel freight locomotives will have 21 by 28 in. cylinders, 57 in. driving wheels, and a total weight in working order of 198,000 lb. The three six-wheel switching locomotives will have 19 by 24 in. cylinders, 50 in. driving wheels, and a total weight in working order of 124,000 lb.

CAR BUILDING

The Rutland is in the market for 75 50-ton steel hopper cars.

The Cincinnati, Hamilton & Dayton has ordered 1,000 box cars from the Standard Steel Car Company and 1,000 gondola cars from the Cambria Steel Company.

IRON AND STEEL

The International & Great Northern has ordered 116 tons of material for a Strauss bascule bridge across Buffalo Bayou, Houston, Tex., from the Wisconsin Bridge & Iron Company, Chicago.

SIGNALING

The Nashville, Chattanooga & St. Louis on September 8 will change the colors of its signal lights on the Paducah & Memphis Division, adopting green for the proceed indication and yellow for caution. At the same time long-time burners will be put into the lamps. Hand signals used to indicate caution will be made yellow—lanterns, flags and fusees.

The Stentor Electric Manufacturing Company, New York, has recently completed an installation of "Stentor" loud speaking telephone despatching apparatus on the Dillsburg division of the Cumberland Valley, extending from Harrisburg, Pa., to Dillsburg, 16 miles. Loud speaking receivers have been installed in all operating stations, thus making the use of selectors unnecessary. The Stentor loud speaking telephone was described in the *Railway Age Gazette* of July 31.

Chilean Railway Contract.—It is reported that probably one of the largest contracts ever secured by Chilean manufacturers was recorded on July 6, when the government placed a home order for railway equipment to the value of $8,240,000.

Railway Construction in India.—At the present time there are in India 2,331 miles of railway in course of construction or planned for construction during the year 1914-15. Of this total 1,575 miles are already under way and 856 miles are merely proposed. Of the former 220 miles are being constructed by the state and 1,355 miles by private companies. Of the latter, 173 miles will be constructed by the state and 583 miles by private companies. The total cost of the 2,331 miles of line is estimated at $80,000,000.

Supply Trade News

Charles B. Yardley, Jr., formerly of Jenkins Bros., has been appointed manager of the railway department of the United States Metal Products Company, New York, effective September 1.

Henry D. Shute, whose election to the position of treasurer of the Westinghouse Electric & Manufacturing Company, has been announced in these columns, was born at Somerville, Mass., and attended high school in Boston. He graduated from the Massachusetts Institute of Technology in 1892, and following his graduation spent a year in Germany at the School of Mines, Clausthal, and in Dresden. In 1893 he entered the works of the Westinghouse Electric Company at Pittsburgh as an apprentice, and spent his first two years in the testing department, following which he was engaged for a considerable time in erection and laboratory work, part of the time as assistant foreman. In 1897 he entered the engineering department. One year later he was transferred to the commercial department, and in 1901 was appointed head of the latter's alternating current division. Two years later he was made assistant to vice-president L. A. Osborne, and in that position was particularly active in the development of heavy electric traction and single-phase railway work. In 1910 Mr. Shute succeeded Walter McFarland as acting vice-president, which position he held until his election as treasurer. Mr. Shute is a member of the American Institute of Electrical Engineers, the National Electric Light Association, and the Engineers' Club of New York. He is also a director of the Pittsburgh Chamber of Commerce, and is closely identified with a number of other technical and social organizations.

H. D. Shute

The C & C Electric & Manufacturing Company, Garwood, N. J., has removed its Detroit office in charge of R. K. Slaymaker, from 144 Seyburn avenue to 1111 Chamber of Commerce building.

W. J. McKone, sales manager of the Edgar Steel Seal & Manufacturing Company, Chicago, has resigned to engage in other business, and Graham Dodge, assistant general manager, has arranged to perform his duties temporarily.

A. T. Gardiner, for many years connected with the Landis Tool Company, Waynesboro, Pa., has accepted a position with the Modern Tool Company, Erie, Pa. He will cover the same territory as when with the Landis Tool Company.

James H. Van Dorn, president of the Van Dorn Iron Works Company, Cleveland, Ohio, and the Van Dorn & Dutton Company, died at his home in Cleveland on Saturday, August 29, 1914. Funeral services were held at the family residence on Tuesday, September 1. Mr. Van Dorn was 73 years old.

W. J. Johnson, formerly of the Western Electric Company, has recently been appointed a member of the engineering department of the Stentor Electric Manufacturing Company, Inc., New York. Mr. Johnson, who has had an extended experience with the Bell Telephone Company of Pennsylvania, and the Chesapeake & Potomac Telephone Company of Baltimore will look after the installation work which the company has on hand at the present time.

The Ogle Construction Company, Chicago, Ill., has been awarded contracts for the erection of a 150-ton balanced bucket type coaling station for the Chicago & Alton at Venice, Ill., and a 200-ton station of the same type for the Chicago, Indianapolis & Louisville at New Albany, Ind. This company has also received orders from the Louisville & Nashville for machinery and equipment for a large concrete station at Paris, Ky., and for one at Lebanon Junction, Ky.

H. O. Fettinger has been appointed eastern railroad representative of the Ashton Valve Company, Boston, Mass., with headquarters at 128 Liberty street, New York, to succeed W. H. Foster, resigned to become associated with another company. Mr. Fettinger formerly served for a number of years in the motive power department of the Pennsylvania Railroad, and resigned from the position of chief air brake and steam heat inspector to engage in the supply business.

Fred. B. Corey, for eleven years in the engineering department of the General Electric Company, and for the past three years engineer of inspection and tests of the Union Switch & Signal Company, reporting to the general manager, has resigned that position and opened an office at 404 Arrott Building, Pittsburgh, Pa. He will conduct a consulting engineering business, making a specialty of inspection methods and organizations for manufacturing companies. He will also give attention to electric railway signaling and allied subjects.

William M. Kinch, of the Gordon Primary Battery Company, New York, died at his home in that city on August 29, and was buried at Altoona, Pa., on Monday, August 30. Mr. Kinch had been connected with the Gordon Primary Battery interests for over 12 years, and prior thereto was signal engineer of the New York Central & Hudson River, and before that was in the signal department of the Pennsylvania Railroad. He was one of the early members of the Railway Signal Association, and was a familiar figure at all the conventions and meetings.

T. P. Gaylord, who has recently been elected acting vice-president of the Westinghouse Electric & Manufacturing Company, succeeding Mr. Shute, as announced in the *Railway Age Gazette*, of last week, was born at Shelby, Mich., and attended preparatory school at Allen Academy, Chicago. He subsequently attended the University of Michigan, and in 1895 received the degree of electrical engineer from the Armour Institute of Technology. Mr. Gaylord was engineer of underground construction during the World's Fair at Chicago, 1892-3. At the close of the fair he became assistant professor of electrical engineering in the Armour Institute, and retained that position until 1898, when he became associated with the Commonwealth Edison Company of Chicago as electrical engineer. In July, 1899, he entered the employ of the Westinghouse Electric & Manufacturing Company as a salesman, and followed this line of work until 1903, when he was appointed district manager at Chicago, which position he has held up to the present. Mr. Gaylord is a member of the American Institute of Electrical Engineers, the National Electric Light Association, and is closely identified with a number of other engineering societies.

T. P. Gaylord

In New York on August 26 C. Philip Coleman and Grayson M., P. Murphy were appointed receivers of the International Steam Pump Company, New York, in an equity suit brought by bond and stockholders and a creditor, the corporation itself joining in the application. The receivers have been authorized to continue the business. It is stated that the receivership was necessary because, although the company has been doing a fairly

prosperous business, and has been earning considerably more than its interest charges, it will not be able to make the interest payment of about $235,000 and the sinking fund payment of $250,000 due September 1 on its first lien twenty-year 5 per cent bonds. It also lacks adequate working capital. The receivership is not expected to involve the associated companies, among which are the Henry R. Worthington Company, the Blake & Knowles Steam Pump Works and the Power & Mining Machinery Company.

George A. Blackmore, whose election as vice-president and a director of the Bryant Zinc Company, New York, has been announced in these columns, was born at Wilkinsburg, a suburb of Pittsburgh, Pa., on January 7, 1884. When he was but 12 years old he entered the service of the Union Switch & Signal Company as an office boy, later becoming a clerk and stenographer in the office of the general manager. In 1901 he was appointed chief clerk in the engineering and estimating departments at Swissvale. In July, 1904, however, he was transferred to New York and was associated with Sidney Johnson in the work on the Interborough subway and other signaling construction work in the east. In March, 1909, he was appointed assistant eastern manager of the company, with office at New York, and in April, 1911, was promoted to the position of eastern manager in direct charge of the company's New York, Montreal and Atlanta offices and of sales and construction. Mr. Blackmore at the time he resigned to enter the service of the Bryant Zinc Company had completed 18 continuous years of service with the Union Switch & Signal Company.

G. A. Blackmore

E. S. Jackman & Co., agents of the Firth-Sterling Steel Company, of McKeesport, Pa., have issued a circular calling attention to the fact that the European war may seriously interrupt the foreign supply of those American buyers who have been satisfactorily served by the tool steel makers of other countries, and announcing that "if, during this period when business connections of long standing have been forced apart, we can help such shops to continue their work and usefulness, we shall be glad to respond with our best efforts and in the true American spirit that the misfortunes of others will be of short duration."

TRADE PUBLICATIONS

Sprayers and Whitewashers.—The Dayton Manufacturing Company, Dayton, Ohio, has recently issued hand implement catalogue No. 176, descriptive of Dayton sprayers and whitewashers.

Conduit Boxes and Fittings.—The Sprague Electric Works of the General Electric Company, New York, has recently issued pamphlet No. 442 descriptive of the company's line of conduit boxes and fittings.

Roofing Material.—The Barrett Manufacturing Company, New York, has recently issued a folder showing "Another Mile of Barrett Specification Roofs" on the buildings of the Standard Steel Car Company at Butler, Pa.

Valves.—The National Tube Company has recently issued bulletin No. 7D describing in detail the advantages of N. T. C. regrinding valves. Three illustrations in the bulletin show a valve which was opened and closed 327,094 times when the photographs were taken, and which after being reground several times has since been opened and closed over 3,046,280 times, and is still in use.

Railway Construction

Canadian Northern.—A new branch called the Brazeau subdivision has been opened for business on the Western division from Warden, Alta., west to Nordegg 174 miles.

Canadian Pacific.—The new Alberta Central subdivision has been opened for business from Forth, Alta., west to Rocky Mountain House 63.2 miles.

The new Gleichen subdivision has been opened for business from Gleichen, Alta., west to Shepard 41 miles.

The Esquimalt & Nanaimo has been extended from Parksville Junction, B. C., formerly McBride Junction, north to Courteney 44.5 miles. (December 19, p. 1207.)

Carolina, Clinchfield & Ohio.—Announcement is made that the first train was run over the extension from Dante, Va., north to Elkhorn City, Ky., 35 miles, on September 1.

Cincinnati, Indiana & Louisville.—According to press reports surveys are now being made for this line from Cochrane, which is a suburb of Aurora, Ind., via French, Rising Sun, North, Patriot, Florence, Markland and Vevay to Lamb, in Switzerland county. The company was organized recently in Indiana to build from Madison, Ind., east, then north via Aurora to Lawrenceburg, and eventually east to Cincinnati, Ohio. L. S. Cook, president, Cincinnati. (April 10, p. 855.)

Detroit, Bay City & Western.—This road has been extended from Snover, Mich., to Sandusky eight miles. (November 20, p. 1004.)

Esquimalt & Nanaimo.—See Canadian Pacific.

Illinois Roads (Electric).—Financial arrangements have been made and the right of way has been secured, it is said, for an interurban line to be built from Mattoon, Ill., southwest to St. Louis, Mo. H. R. Budd, Bunker Hill, Ill., may be addressed.

Indiana Roads (Electric).—Residents of Liberty, Ind., are back of a project to build an electric line from Hamilton, Ohio, northwest via Liberty, Ind., to Richmond, about 40 miles. The plans also include a 10-mile branch from Liberty west to a connection with the Indianapolis & Cincinnati Traction Company's line at Connersville. The Liberty Commercial Club may be addressed.

Kansas Roads (Electric).—According to press reports R. A. Long of Kansas City, Mo., and associates have under consideration the question of building an interurban line from Kansas City southeast via Lees Summit to Pleasant Hill, thence southwest to Harrisonville, about 45 miles.

Louisiana Railway, Light & Power Company.—Financial arrangements are being made, it is said, to build an electric railway from Lockport, La., northwest via Thibodaux, to Donaldsonville, about 55 miles. W. Ohlmeyer, Plattenville; L. P. Caillouet, A. Picot and H. S. Smith, Thibodaux, are said to be interested.

Mascot & Western.—An officer writes that contracts are to be let at once to build a railway from the Mascot Copper Companies' mines near Dos Cabezos, Ariz., west to Wilcox 17 miles. The grading work will call for handling an average of 15,000 cu. yd. to the mile. About 25 per cent of the work will be rock work. The maximum grades will be 3.5 per cent, and the maximum curvature 10 deg. The line is to be built to carry copper ore. J. N. McCauley, president. C. R. Weston, general manager and engineer.

Oregon Short Line.—The Oregon Eastern branch of the Idaho division has been extended from Juntura, Ore., to Riverside 19 miles.

Southern Minnesota Traction.—Incorporated in Minnesota with $250,000 capital to buy and operate steam and electric railways. The incorporators include W. D. Mitchell, W. Rumble and G. Hoke, St. Paul, Minn.

Texas Roads.—A line will probably be built from Glen Rose, Tex., south to Walnut Springs, about 14 miles. S. Lewis, Waco;

J. H. Farr, Walnut Springs, and J. P. Lightfoot, Austin, are said to be back of the project.

Surveys are being made, and construction work is to be started soon, it is said, on a line from Luling, Tex., northwest to San Marcos, about 20 miles. The proposed route is through San Marcos river valley via Prairie Lee, Fentress and Martindale. A syndicate of eastern capitalists are back of the project.

RAILWAY STRUCTURES

Hartford, Conn.—An officer of the New York, New Haven & Hartford writes that a contract has been given to the P. J. Carlin Contracting Company, New York, at about $220,000 for rebuilding the station at Hartford. (August 14, p. 311.)

Matewan, W. Va.—An officer of the Norfolk & Western writes that a contract has been given to the Virginia Bridge & Iron Company, Roanoke, Va., for the steel work of a bridge over Tug river. W. W. Boxley & Co., Roanoke, has the contract for the masonry work.

Mobile, Ala.—An officer of the Southern Railway writes that a contract has been given to Hancock, Harbin & Hancock, Mobile, to build a new freight house and office building at Mobile. (June 26, p. 1607.)

New York.—Plans have been filed by the New York Central & Hudson River for the erection of a four-story office building as an addition to the New York terminal. The building is to be built on the block bounded by Forty-fifth and Forty-sixth streets and fronting on Lexington avenue. The new building is to be used by the express companies and for railway mail service, and in the upper stories will have offices.

Pittsburgh, Pa.—We are told that a contract has been given to the Raymond Concrete Pile Company, New York, for concrete piles and concrete foundations for steel towers on the Ohio Connecting Railway bridge, Brunots Island, Pittsburgh. The Seaboard Construction Company, Philadelphia, Pa., has the general contract.

Savannah, Ga.—A contract has been given to the Phoenix Construction Company, New York, for driving about 8,500 timber piles and building the reinforced concrete substructure for the Ocean Steamship Company's terminal improvements at Savannah.

Woodlawn, N. Y.—The bridge of the New York, New Haven & Hartford, at Woodlawn, is to be replaced by two arches with steel girders covered with concrete.

Freight Rate Increase Denied in Ireland.—On July 24 the British Railway and Canal Commission rejected the application of the Great Southern & Western for a general 4 per cent increase in merchandise and package rates. This decision affects directly one-third of the railway mileage of Ireland and may also affect most of the remainder. In the spring of 1913 the Irish railways simultaneously announced a 4 per cent increase in rates. Under the traffic act of 1894 the roads were subject to be called upon to justify the increase if challenged by the trading public, but as it happened no protest was forthcoming. The Great Southern & Western, which, with controlled lines, operates 1,122 miles of line, or more than any other two railways in Ireland, was in an exceptional position, however, owing to provisions of an act of 1900 whereby it had been permitted to absorb certain rival lines. By this act the burden of proof for justifying proposed increases was cast upon the company. As the railway has now failed to justify the increases it seems probable that the other railways which have been enforcing the 4 per cent increase will promptly be challenged on behalf of the commercial public. The decision was based largely upon a study of the facts as to both costs and efficiency of operation. The commissioners found that the system had been so wisely conducted that the rising expenses in connection with labor and upkeep have been neutralized. "Notwithstanding that wages have undoubtedly increased and hours have been reduced and local government rates (of taxation) have grown larger, this company has been so prudently and skillfully managed by its board of officers by the introduction of improved methods of working and by effecting the economies which the amalgamation was designed to effect, that the extra outlay has been recouped and the net result has been advantageous to the company."

Railway Financial News

Chicago, Rock Island & Pacific.—The suit by preferred stockholders of the Keokuk & Des Moines against the Chicago, Rock Island & Pacific has been transferred from the Iowa supreme court to the United States district court.

New England Investment & Security Company.—This company is understood to own the street railways of Worcester and Springfield and its preferred stock is guaranteed 4 per cent dividends by the New York, New Haven & Hartford. A protective committee, consisting of Henry B. Cabot, Moses Williams, Jr., and E. V. R. Thayer, has been formed to buy in the interests of the preferred stockholders the common stock. The committee has sent out a circular which says in part:

The organization of this company is peculiar. The owners of 1,000 common shares select four of its seven trustees, and the owners of the 40,000 preferred shares select only three. For several years all these properties, operating about 420 miles of street railway, have been controlled, now by one set of owners of common stock and now by another set—the whole common stock representing a par value of only $100,000. The preferred stock, largely held by investors in Springfield, Worcester and Boston and of a par value of $4,000,000, has been legally in the position of a minority.

The preferred stockholders, nearly all of whom reside in Massachusetts, have become uneasy and restless at this anomalous situation. The frequent criticisms in the press and by public officials, voicing the dissatisfaction of the patrons of the street railways over such an unusual method of control and complaining of unsatisfactory service and difficulty of obtaining relief, have now led influential preferred shareholders to form a protective committee. The committee announces, as its purpose, the purchase of all the common stock in the permanent interest of such preferred shareholders as wish to co-operate. If the plan is successful it will result in vesting the control of the important Worcester and Springfield street railways in the preferred shareholders, who have a substantial financial interest in seeing that those properties are maintained and operated in such a way as to give a service satisfactory to the public and under a management easily accessible and responsive to that public.

Pennsylvania Railroad.—The Wall Street Journal has been making an investigation of the extent to which stock of the various American railroad companies is held in Europe. In regard to the Pennsylvania The Wall Street Journal finds that of a total of 90,114 stockholders registered on books of the Pennsylvania Railroad as of June 30, 1914, 11,822 were European, holdings amounting to $74,490,442 (par value) of a total outstanding stock of $499,265,700. On June 30, 1913, there were 84,244 stockholders, of which 11,215 were European, holdings totaling $73,003,614 par value. The number of women stockholders on June 30, 1914, was 43,454 as compared with 40,325 on June 30, 1913. The total number of stockholders in 1906 was 40,153, and in 1901, 27,540.

St. Louis, Iron Mountain & Southern.—This company has asked the Missouri Public Service Commission for permission to issue $893,000 5 per cent equipment trust bonds.

Exportation of Manchurian Lumber.—At the present time, one of the most important factors in the business of exporting lumber from Manchuria is the possibility of changing the place of shipment from Vladivostok to Nikolaiefsk. If such a change is made it will be because of the heavy charges on the Chinese Eastern whereby the cost of transporting the timber to Vladivostok is 7.7 cents, whereas the cost of river transportation to Nikolaiefsk is only 4.6 cents. A Russian concessionaire owning 1,318 square miles of timber land and three sawmills located near the Sungari river has planned to build his own narrow gage railway to the river and then to ship via his own line and the latter to Nikolaiefsk, at which port the timber will be shipped to the southern ports of China and to Europe.

ANNUAL REPORT

TWENTY-NINTH ANNUAL REPORT OF THE BUFFALO, ROCHESTER & PITTSBURGH RAILWAY COMPANY,

FOR YEAR ENDING, JUNE 30th, 1914.

REPORT.

The Directors of the Buffalo, Rochester and Pittsburgh Railway Company submit to the Stockholders the following report for the year ending June 30, 1914:

ROAD OPERATED.

	1914. Miles.	1913. Miles.	Increase. Miles.
Owned	367.06	360.30	6.76
Leased	89.90	87.29	2.61
Trackage rights	129.52	128.87	.65
Total length of road operated	586.48	576.46	10.02
Second track	207.32	194.89	12.43
Sidings	360.48	333.59	26.89
Total miles of all tracks, all steel rail	1,154.28	1,104.94	49.34

The increase of road operated is due to the construction of 6.76 miles of mine lines, 2.61 miles of additional line leased from the Allegheny & Western Railway Company, and an adjustment of .65 mile in trackage rights, from remeasurement.

The second track was increased by the construction of 12.09 miles between Rochester, N. Y., and Scottsville, N. Y., .09 mile at Riverside, N. Y., and an adjustment of .25 mile of trackage rights, from remeasurement.

Sidings were increased 26.89 miles.

INCOME.

Rail Operations:	1914.	1913.	Increase.	Decrease.
Operating revenues	$10,709,534.81	$10,947,246.06		$237,711.25
Operating expenses	7,938,062.89	7,665,891.28	$272,171.61	
Net operating revenue	$2,771,471.92	$3,281,354.78		$509,882.86
Outside Operations:				
Revenues	$25,213.99	$25,581.60		$367.61
Expenses	28,111.02	32,946.34		4,835.32
Deficit	$2,897.03	$7,364.74		$4,467.71
Total net revenue	$2,768,574.89	$3,273,990.04		$505,415.15
Taxes Accrued	234,000.00	216,000.00	$18,000.00	
Operating Income	$2,534,574.89	$3,057,990.04		$523,415.15
Other Income	821,223.05	1,018,717.73		197,494.68
Gross corporate income	$3,355,797.94	$4,076,707.77		$720,909.83
Deductions for Interest and Rentals	2,001,013.78	1,949,713.70	$51,300.08	
Net corporate income	$1,354,784.16	$2,126,994.07		$772,209.91
Appropriations:				
Pension and Fire Insurance Funds	$16,432.49	$1,497.51	$14,934.98	
Equipment Agreement Sinking Funds	348,351.67	448,795.68		$100,444.01
Total Appropriations	$364,784.16	$450,293.19		$85,509.03
Surplus available for dividends	$990,000.00	$1,676,700.88		$686,700.88

Taxes amounted to $234,000, an increase of 8.33%, due to additional property purchased, higher assessments on Capital Stock, and the new Federal Income Tax Law.

A special appropriation of $348,351.67 was made from the Net Corporate Income. Of this amount $125,000 was paid into the Sinking Funds under Equipment Agreements Series A, B and C, out of which $2,000 Series B and $50,000 Series C bonds were retired, leaving $73,000 to be applied to the purchase of new rolling stock; $207,000 represents one-half of the principal of Equipment bonds Series D, E and F paid off during the year, the other half being refunded by 4½% Consolidated Mortgage bonds held in the Treasury of the Company; the remainder, $16,351.67 is a part of the appropriation to the Sinking Fund under Equipment Series G, together with the interest accrued on the various Sinking Fund balances in the hands of the Trustee.

Profit and Loss Account was charged with $138,433.05, the balance required for the Sinking Fund under Equipment Agreement Series G.

DIVIDENDS.

Dividends in cash were paid on:		1914.	1913.
Preferred stock	$6,000,000	6% $360,000	6% $360,000
Common stock	10,500,000	6% 630,000	6% 630,000
Total	$16,500,000	$990,000	$990,000

Since the close of the fiscal year, your Board of Directors has declared semi-annual dividends of three per cent. on the preferred stock and two per cent. on the common stock, payable August 15, 1914.

CAPITAL STOCK.

There has been no change during the year in this account. The total outstanding Capital Stock of the Company amounts to $16,500,000, and consists of $6,000,000 preferred stock and of $10,500,000 common stock.

FUNDED DEBT.

In accordance with the provisions of the Consolidated Mortgage of 1907, $1,051,000 4½% bonds were issued and sold, and the proceeds applied to payment of Additions and Betterments. The Trustee also delivered to the Company $206,000 Consolidated Mortgage 4½% bonds, representing 50% of Equipment Bonds Series D, E and F retired during the year. These bonds, added to those in the Treasury of the Company, made a total of $1,524,000, of which $349,000 were sold during the year for corporate purposes, leaving a balance of $1,175,000 held in reserve.

Under the terms of the Sinking Fund for the redemption of Equipment Bonds, $619,000 bonds were retired, as follows: $2,000 Series B; $50,000 Series C; $117,000 Series D; $117,000 Series E; $179,000 Series F; and $154,000 Series G. The balance of Equipment Bonds Series G authorized in 1910, was issued to the amount of $887,000.

To provide for additional rolling stock, an issue of $2,000,000 five per cent. Gold Bonds was authorized, to be secured by new equipment costing $2,200,000. These bonds were issued under an Agreement, known as "Equipment Agreement, Series H" dated July 1, 1913, and were all sold during the year. The agreement provided that both principal and interest are payable without deduction for any tax. The bonds mature in annual installments of $125,000, commencing January 1, 1915, and ending January 1, 1930.

The net result is an increase of $3,668,000 in the bonded debt of the Company, outstanding on June 30, 1914.

CONSTRUCTION.

Capital account has been charged during the year with $1,892,696.28 for additions and betterments, as follows:

Land	$51,323.48
New station, Lackawanna, N. Y.	5,807.53
Station improvements	12,357.47
Genesee dock improvements	16,438.74
Second track, Rochester, N. Y., to Scottsville, N. Y.	190,393.37
" Riverside Junction, N. Y.	5,127.01
Improving bridges and culverts	173,440.63
Increased weight of rail, frogs and fastenings	54,927.22
Stone ballast	29,371.16
Tearing Run mine line	351,785.90
Guthrie mine line	43,898.12
Sidings and yard extensions	138,494.65
Interlocking apparatus, C. & M. Junction, Pa.	11,589.29
Automatic block signals	150,973.78
Telephone train despatching lines	16,528.95
Roadway machinery	4,849.53
New roundhouse, Du Bois, Pa.	139,180.67
Additions to shops, Du Bois, Pa.	84,769.79
Shop machinery	53,451.79
Water and fuel stations	8,829.53
Storage warehouse, Rochester, N. Y.	46,638.30
New terminal, Lincoln Park, N. Y.	256,937.64
Subway, Saxton St., Rochester, N. Y.	15,789.02
Other items	29,792.71
Total	$1,892,696.28

The following work, referred to in last year's report, is completed:

Telephone train despatching line between East Salamanca, N. Y., and Punxsutawney, Pa., a distance of 119 miles.

Automatic block signals for 76 miles, from Gainesville, N. Y., to East Salamanca, N. Y., and Falls Creek, Pa., to Punxsutawney, Pa.

Second track, Rochester, N. Y., to Scottsville, N. Y., a distance of 12.09 miles, turned over to the Operating Department on December 31, 1913.

The Tearing Run and Guthrie mine lines.

New yard near Rochester, N. Y.

New roundhouse and extension of boiler and tank shops at Du Bois, Pa.

A new station was constructed at Lackawanna, N. Y.

Among the important work now in progress, may be mentioned:

Storage warehouse at Rochester, N. Y.

Subway, Saxton St., Rochester, N. Y.

Extension of power house, etc., at Du Bois, Pa.

Automatic block signals for 45 miles, from Buffalo Creek, N. Y., to Ashford, N. Y.

Replacing various timber bridges, trestles and culverts in permanent form.

In keeping with the policy of your Company to promote efficiency and economy in operation, other improvements were made, including the construction of 26.89 miles of additional sidings and yard tracks.

EQUIPMENT.

Expenditures were made for new rolling stock as follows:

Three passenger locomotives	$69,550.12
Twelve freight locomotives	277,799.32
Twenty-seven steel passenger train cars	377,885.41
One thousand steel coal cars	789,609.40
Six caboose cars built at Company's shop	5,843.84
Three locomotive crane hoists	21,930.07
One scale test car	4,163.36
Two derrick cars	3,866.72
Steel underframes applied on four hundred and eleven freight train cars	26,321.36
Steel side stakes applied on two hundred and thirty-six freight train cars	3,954.34
Sundry other betterments, including re-classification or transfer of rireteen freight train cars and twenty-five work equipment cars	47,963.33
	$1,628,887.27

In addition to the above, fifteen freight locomotives, two passenger locomotives, and one thousand steel underframe freight cars for commercial traffic were purchased, but owing to late delivery will be accounted for in next year's report.

There was credited for equipment sold, transferred or destroyed, the following values, charged in part to Operating Expenses, and the balance, representing the depreciation since June 30, 1907, charged to Reserve for Accrued Depreciation.

One locomotive	$3,459.45	
Seven passenger train cars	13,056.08	
Six hundred and sixty-one freight train cars	290,776.20	
Twenty-eight work equipment cars	11,222.27	
		318,514.00
Making a net increase of		$1,310,373.27

The total tractive power of engines aggregates 10,643,255 pounds, an increase of 710,362 pounds over last year. The average tractive power of each engine increased 765 pounds, being 34,782 pounds as against 34,017 pounds last year.

The total carrying capacity of cars in freight service now amounts to 737,498 tons, an increase of 28,685 tons over last year. The average carrying capacity or efficiency of each freight car increased 1.03 tons, being 42.29 tons as against 41.26 tons last year.

The reserve for accrued depreciation of equipment on June 30, 1914, is as follows:

On equipment owned	$1,912,961.95	
On leased equipment	190,949.67	
Total		$2,103,911.62

PASSENGER REVENUES.

The gross passenger revenue, the largest in the history of the Company, amounted to $1,184,416.99, a gain of 5.04 per cent., or $56,804.87.

The average rate received per passenger per mile increased .063 cent, being 27.01 miles, against 26.98 miles last year.

The average distance each passenger was carried increased .03 mile, being 27.01 miles, against 26.98 miles last year.

Passengers carried in 1914	2,059,683	
Passengers carried in 1913	2,023,020	
An increase of 1.81 per cent., or		36,663
Passengers carried one mile in 1914	55,632,097	
Passengers carried one mile in 1913	54,573,203	
An increase of 1.94 per cent., or		1,058,894

FREIGHT REVENUES.

The average rate received per ton per mile increased .01 mill, being 4.62 mills as compared with 4.61 mills last year.

The average distance each ton was hauled decreased 2.31 miles, being 161.04 miles, against 163.35 miles a year ago.

Pending an adjustment of the miners' wage scale most of the collieries shipping over your line were idle for about six weeks from April 1st. In spite of this loss, the revenue coal tonnage moved was the largest in the history of the Company. All of the other general commodities show decreases, due to the depression of business, especially in the iron and steel trade.

The revenue tonnage moved was as follows:

	1914.	1913.	Increase.	Decrease.
Bituminous coal	8,176,430	7,980,204	196,226	
Coke	393,358	593,447		200,089
Iron ore	699,702	781,201		81,499
Pig and bloom iron	265,521	310,374		44,853
Other freight	2,760,038	2,825,382		65,344
Total	12,295,049	12,490,608		

A decrease of 1.57 per cent., or		195,559
Tons moved one mile in 1914	1,980,012,951	
Tons moved one mile in 1913	2,040,358,520	
A decrease of 2.96 per cent., or		60,345,569

The result for the year is a loss of 2.74 per cent., or $257,936.90 in gross freight revenue.

EXPENSES.

Operating Expenses increased $272,171.61 or 3.55 per cent., due principally to advances made in wages, the employment of extra trainmen in New York under the requirements of the so-called "full crew bill" and the extraordinary expenses attending the large program of new work in progress during the year.

The operating ratio increased 4.09 per cent., being 74.12 per cent., against 70.03 per cent. last year.

The percentage of each group of operating expenses to gross earnings for the past five years, is as follows:

	1914.	1913.	1912.	1911.	1910.
Maintenance of way	13.52	14.23	12.52	12.57	13.65
Maintenance of equipment	20.69	19.74	18.94	19.35	20.78
Traffic	1.41	1.30	1.26	1.44	1.35
Transportation	36.23	32.71	32.88	32.11	28.55
General	2.27	2.05	2.14	1.81	1.74
Total	74.12	70.03	67.74	67.28	66.07

The average cost per ton per mile is 3.23 mills, being .23 mill more than last year.

The average number of revenue tons carried one mile per revenue freight train mile, excluding the mileage of helping engines, decreased 16.44 tons, being 693.60 tons, against 710.04 tons a year ago.

The average number of revenue tons carried one mile per revenue freight engine mile, including the mileage of helping engines, decreased 8 tons, being 454, against 462 a year ago.

The averages for the past ten years are as follows:

Year.	Train Load.	Engine Load.
1905	507	374
1906	525	418
1907	543	435
1908	530	371
1909	597	400
1910	638	420
1911	635	430
1912	647	439
1913	710	462
1914	694	454

The average number of revenue passengers carried one mile per revenue passenger train mile is 40, being 1 more than last year.

The non-revenue traffic, not included in any of the other figures of this report, is as follows:

	1914.	1913.
Number of passengers	323,720	331,305
Number of passengers carried one mile	13,098,629	12,820,161
Number of tons	1,106,032	1,117,413
Number of tons carried one mile	108,941,868	99,797,191

LEASED LINES.

Advances were made to leased lines for additions and betterments expenditures, as follows:

ALLEGHENY & WESTERN RAILWAY.

Land	$3,957.49
Track fastenings and other material	6,480.44
Sidings and spur tracks	15,887.13
Branch, Craigsville, Pa.	93,195.74
Block and other signal apparatus	5,018.26
Telephone and telegraph lines	9,339.55
New station, West Mosgrove, Pa	1,696.04
Terminal, New Castle, Pa	2,925.92
Other items	115.97
Total	$138,616.54

CLEARFIELD & MAHONING RAILWAY.

Land	$2,356.48
Track fastenings and other material	2,213.37
Sidings and spur tracks	44,443.50
Other items	1,020.45
Total	$50,033.80

All of the above work is completed, including the branch at Craigsville, Pa., 2.61 miles in length, which was turned over to the Operating Department on November 19, 1913.

FIRE INSURANCE FUND.

The assets of this fund were increased $22,963.32 during the year, and now amount to $282,507.47 in interest-bearing securities and cash.

PENSION FUND.

The assets of this fund, created July 1, 1903, were increased $6,623.14 during the year, and now amount to $197,575.92 in interest-bearing securities and cash.

There were fifty-seven pensioners upon the roll on June 30, 1914, a net decrease of one during the year.

GENERAL REMARKS.

The Ontario Car Ferry Company, Limited, paid a dividend of 5% for the year ending December 31, 1913. The sum of $12,485 received on the $249,700 of this Company's stock was credited to Other Income account.

To accommodate the increasing traffic, the Ferry Company has contracted for another boat, with the Polson Iron Works, Limited, of Toronto, Canada, to be delivered the ensuing year.

The acknowledgments of the Board are renewed to the officers and employes for their faithful and efficient services.

Statements and statistics of the operation of your road for the year are submitted herewith.

By order of the Board,

WILLIAM T. NOONAN,
President.

ROCHESTER, N. Y., July 31st, 1914.

PROFIT AND LOSS ACCOUNT.

June 30th, 1914.

CREDIT.

By Balance Surplus, June 30, 1913		$4,199,713.41
By Miscellaneous Credits—		
Unclaimed wages, etc.	$2,846.11	
Discounts on debt retired	12,659.75	
Sundry items	.83	
		15,506.69
Total		$4,215,220.10

DEBIT.

To appropriation to Sinking Fund of Equipment Agreement Series G for retiring bonds of said Series, the balance being appropriated from Net Income		$138,433.05
Premiums on funded debt retired.	$2,775.00	
Discounts on funded debt issued	100,892.63	
		103,667.63
Loss on abandoned tracks		4,787.59

W. E. HOOPER, B. B. ADAMS, E. T. HOWSON, H. H. SIMMONS, H. F. LANE, R. E. THAYER, A. C. LOUDON, C. B. PECK, C. W. FOSS, F. W. KRAEGER, K. L. VAN AUKEN, E. G. ZACK, GEORGE L. FOWLER

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico	$5.00
Canada	6.00
Foreign Countries (excepting daily editions)	8.00
Single Copies	15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention daily issues, North America, $1; foreign, $2.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue 8,900 copies were printed; that of these 8,900 copies 7,434 were mailed to regular paid subscribers to the weekly edition, 250 were provided for counter and news companies' sales, 1,112 were mailed to advertisers, exchanges and correspondents, and 104 were provided for samples and office use; that the total copies printed this year to date were 346,850, an average of 9,361 copies a week.

VOLUME 57 SEPTEMBER 11, 1914 NUMBER 11

Contents

*Illustrated.

Why should the appeal of the railroads to President Wilson deserve a different consideration than that of the cotton industry or any other great industry desperately hard hit by the war? The magnitude of the property involved, the extreme urgency of the emergency both entitle the railroads' case to the President's consideration, but not necessarily on these accounts alone to a different kind of consideration than that given to other hard hit businesses. The President having shown himself a strong man, undisputed leader of his party and a director of the course of the country, is in the present crisis beset with many and moving appeals for help. But no government can shoulder the burdens and misfortunes of private business. Why then should the railroads ask special consideration? Precisely because the railroads are not a private business. This fact railroad presidents of twenty years ago were loath to unreservedly acknowledge. Since then the fact has been pounded home by legislators, by agitators, by courts and by overwhelming public opinion. There can be no investor so blind to conditions as to have any doubts that when he buys railroad securities the property he invests in is subject to public regulation. This distinction between the railroads' case and that of other businesses that have appealed to the government for some measure of relief is vital and fundamental. The public have heretofore been mainly impressed with only one side of this fact. Now every consideration of justice and integrity require the consideration of the other side of the same fact. The railroads' appeal is a modest one, the facts are momentous. The loss in 1914 in net operating income was $120,000,000. No government guarantee of railroad securities is asked. The President is simply requested to urge on the people that no further immediate burdens be placed on the railroads, and on the "appropriate governmental agencies" that they seek a way by which additional revenue may be promptly raised. The granting of these two requests would mean the recognition of the government's obligations, as well as its prerogatives in the regulation of private capital engaged in public service. Its effect on the credit of the railroads would be incalculably great.

President Wilson and the Railroad Situation

Railroads, speaking generally, have a reputation for punctuality. This reputation dates from the time, 60 to 80 years ago, when railroad trains were compared with stage coaches. A correspondent, in another column, avers that today, in this respect, many prominent roads deserve execration rather than praise. How many there are to which our correspondent's criticisms and admonition may apply we do not know; but every one must agree that his position is sound. A passenger's loss of three minutes may not produce a grievance that ever will be felt by the general manager; but the superintendent who prevents those three-minute delays will have greatly improved the general discipline of his forces; for only good men can perform the satisfactory service which the best punctuality implies. Any engineman (or conductor, or station master) who is not alive to the arts involved in being punctual can learn them any day, by a visit to the New York subway, where time-intervals of 96 seconds are quite regularly adhered to; and the schedules are maintained too. Why not send some of your men on such a visit? Premiums to enginemen for punctuality could be made very useful and profitable, at least temporarily. Again, on many runs, a satisfactory degree of punctuality, once accomplished, would suggest a saving by the use of lighter engines. How many thousands of tons do we haul over the road daily, in the shape of monster locomotives, far too heavy for their loads, simply to be able to make up lost time? Punctuality is a fascinating study in many directions.

Unpunctuality as Affecting Reputation

In connection with the efforts of the railways to carry out the suggestions recently made by the Interstate Commerce Commission in the direction of increasing passenger fares and charging for incidental services now rendered free in freight traffic, a suggestion has been made that the railways impose a charge for handling baggage. European roads generally charge for handling baggage in excess of a very small amount, and while the adoption of such a plan in this country would undoubtedly raise a storm of protest, there are many reasons why a difference should be made in the charges paid by those for whom the railroad checks baggage and those for whom it does not. Certainly the idea is consistent with the gradual tendency of the com-

Charging for Free Service

mission toward the cost of service basis of rate-making. The equipment and labor necessary to handle baggage both at terminals and in transit cost money, and passengers for whom the roads provide transportation and care for 150 pounds of personal property receive an appreciably greater service than those for whom it does not handle baggage. The usual charge for checking a parcel at stations for 24 hours is 10 cents. This service is far less valuable to the patron and costs less to render than the handling and transportation of baggage, yet the man who cares for his own hand baggage en route, but checks it at a parcel room at either end of his journey, pays more than the man who asks the railway to handle his 150-pound trunk. Whether the charge should be a fraction of a cent per mile for each 100 or 150 pounds, or a certain percentage of the ticket rate, is a matter of detail. Excess baggage rates are based on the latter plan, and under the prevailing mileage system of passenger fares both come to about the same. Even a flat charge of 10 cents, regardless of distance, would yield a considerable income in the course of a year. This suggestion should, but probably will not, appeal to the very numerous class of people who are fond of pointing out examples of railroad discrimination in favor of the other fellow.

Opportunity for American Supply Concerns

It looks as if the great European war were going to open up an unusual opportunity for the railway supply manufacturers of the United States. The railways of a country tend to purchase equipment and supplies in the same countries in which they are financed. This is by no means an invariable rule, but is what usually is done. For example, most of the capital invested in the railways of Argentina has come from England, the roads have been built chiefly by Englishmen, and most of their equipment and supplies have been bought in England. The railways of Australia, while most of them are owned by the governments, have been built by men of English birth or descent with capital raised in England, and they likewise have bought in England most of the equipment and supplies which have not been made in Australia itself. Largely because of the fact that relatively few of the railways of foreign countries have been financed by American capital the railway supply concerns of the United States have had great difficulty in winning foreign markets. The war, however, has largely stopped the exportation of railway supplies and equipment from most of the countries on the continent of Europe, and has most seriously interfered with their manufacture and shipment from Great Britain. This should broaden the market of the railway supply concerns of America in all parts of the world outside of Europe. As long as the war continues there will be more destruction of railways in Europe than building or equipping of them, but when the war is over Europe's demands for railway supplies to be used in reconstructing and re-equipping the lines that are now being allowed to deteriorate or which are actually being destroyed will be something enormous. Of course, the one large market to which the railways of Europe can turn will be that of America. While, therefore, the war may have temporarily injured the railway supply business of this country, it would seem that it will not be long until it will begin to help it, and that in the long run it will help it a great deal.

Government Stamp of Approval on Railroad Securities

Professor William Z. Ripley, of Harvard University, has a very interesting article in the current number of The American Economic Review discussing public regulation of railroad securities, in which he comes to the conclusion that the power to compel publicity alone, as recommended by the Hadley Securities Commission, is not enough authority to give the Interstate Commerce Commission over the issuance of railroad securities to prevent interference by state authorities. It must be remembered that the decisions in the Minnesota and Shreveport cases had not been rendered by the Supreme Court when the report of the Hadley commission was made, and it is quite possible that a majority of the Hadley commission would now agree with Professor Ripley. The report of the commission made it plain that the majority did not believe that conflicting state regulation was desirable, and that it did believe that its elimination by the assumption of authority by a federal body was desirable. On the other hand, Professor Ripley apparently believes that a great deal of good has resulted from state regulation, and cites the work of the New York and Texas commissions as examples of the successful prevention of overcapitalization. He fails to mention, however, that one of the earliest decisions rendered by the New York commission was one in which it gave permission to the Delaware & Eastern to issue $2,050,000 stock and $4,570,000 5 per cent bonds at not less than 80. That was early in 1909. In the latter part of February, 1910, the company was put into the hands of a receiver, and on March 2 The Wall Street Journal had the following to say in regard to the affairs of the company:

> Receivers for the Delaware & Eastern are at work on the company's books in an effort to straighten them out sufficiently to enable the bondholders to see just what sort of situation they confront. As matters stand the exact amount of the railway company's liabilities is unknown, and its assets appear to consist of little more than a lease of the Delaware & Eastern Railroad Company, an agreement with a foreign underwriting syndicate, and a heap of overdue and unpaid bills.

This is a rather glaring instance of the failure of public regulation of the issuance of securities to protect the investor, and it is worth while recalling just at present when the federal bill for the regulation of securities is under discussion.

DIVISION OF MAINTENANCE OF WAY EXPENSES BETWEEN PASSENGER AND FREIGHT TRAFFIC

DURING the past two years there has developed a very marked tendency on the part of regulating bodies to demand the division of railway expenses between freight and passenger service. The methods adopted by the Pennsylvania Railroad and by the Oklahoma Commission, and those tentatively outlined by the Interstate Commerce Commission, were reviewed in our issue of July 24, page 153. Among the most difficult classes of expenses to distribute accurately between passenger and freight traffic are those incurred in the maintenance of way and structures. While the division of these charges is an accounting problem, the accountants must depend upon the maintenance of way department for their basic data and, therefore, the problem becomes primarily one for the maintenance of way department.

It is necessary to assume some unit as a basis for the distribution of charges, and it is here that the great difficulty arises. Various units have been proposed which differ according to the degree of refinement desired. The most common one is the revenue train mile, which is the unit adopted by the Pennsylvania and very generally by other roads in the distribution of charges for the maintenance of joint tracks. The advantage of this unit is its simplicity. But, it is inaccurate in that it assumes that all trains cause equal damage to the track and structures and ignores all the effects of tonnage and speed. A light two-coach passenger train is assumed to cause as much damage to track as a 4,000-ton freight train or a high speed passenger train with 10 or 12 heavy cars. To eliminate these causes of error the "train speed ton mile" was proposed in Oklahoma, although it was not adopted finally. This unit equates for the greater wear on the track and structures resulting from the operation and high speed passenger trains and heavy freight trains. But it also is subject to criticism because, while it is known that a locomotive is more destructive to the track than an equivalent weight of cars, the scheme of division in question does not allow for this. The relative allowance which should be made for a locomotive is a point on which there is a wide diversity of opinion. Some authorities have estimated that a locomotive is five times as destructive as cars having the same

weight. The committee on Economics of Railway Location of the American Railway Engineering Association concluded a year ago that a locomotive does twice as much damage per ton of weight as the rest of the train, while a passenger train is twice as destructive as a freight train of the same weight. While this conclusion was not formally adopted by the association, it is supported by results taken recently from the records of some roads. While the use of this unit, called "the equivalent ton mile" requires the collection of considerable data and statistics, it is probably nearer correct than any of the others favored.

Unfortunately, very little accurate information throwing light on this general question has been collected. There is, however, a rapidly increasing need for it. When it has been secured many points that are now doubtful will be cleared up, and the expenses which must be divided arbitrarily between freight and passenger traffic will be reduced to a small proportion of the total. Now that the railroads are beginning to face this problem squarely its solution will be found.

RESULTS OF MUNICIPAL OWNERSHIP

SOME interesting figures bearing on the question of government ownership of public utilities are given in a bulletin on central electric light and power stations for 1912, just issued by the Bureau of the Census. The figures include comparisons of the operations of municipal and commercial plants. The bulletin shows that during the 10-year period, 1902-1912, the total number of stations increased from 3,620 to 5,221, or 44.2 per cent, and that while the number of commercial stations increased from 2,805 to 3,639 or 30.4 per cent, the number of municipal stations increased from 815 to 1,562 or 91.7 per cent.

Municipal ownership of these utilities seems to have become rather popular. If this popularity has been justified by an increase in efficiency or by improved service it would be expected that this would be shown in the figures for income, output and expenses. But during this 10-year period the total income of commercial stations increased 254.2 per cent, and of municipal stations 233.4 per cent; the output of commercial stations in kilowatt-hours increased 375.8 per cent, and of municipal stations 174.4 per cent; and the total expenses of commercial plants increased 246.1 per cent, while the increase in municipal plants was 222.5 per cent. In other words, with three times the percentage of increase in numbers the municipal plants increased both their income and their output in less proportion than the commercial plants and had an increase of 222 per cent in expenses to produce an increase of 174 per cent in output, while the commercial stations, with only a slightly greater increase in expenses, obtained over twice the increase in output.

This is not the kind of efficiency that is promised by advocates of government ownership. Reduced to units of output the expense of producing electricity in municipal plants in 1912 was 3.15 cents per kilowatt-hour, while that in commercial plants was only 1.96 cents. On the other hand, the total income of municipal stations grew faster than either their expenses or their output, while the commercial plants had a gain of 254 per cent in income to pay for a 375 per cent increase in output, which enhanced their expenses by 246 per cent. This would indicate that the commercial stations had their rates reduced, but that the municipal stations not only were more successful in maintaining their rates than the commercial stations, but were more successful in making rates high than in increasing production or controlling expenditures.

The bulletin does not give statistics showing the rates charged for service, but by dividing the total income by the number of kilowatt hours of output we obtain an average rate of 2.5 cents for the commercial stations and 4.3 cents for the municipal stations. The rate of the commercial companies had been reduced from 3.4 cents in 1902, while that of the municipal plants had been increased from 3.5 cents.

Figures are not given separately in the bulletin for the wages and salaries paid, but it is significant that the number of persons employed in municipal plants is shown as 10 per cent of the total for both classes of stations, while the kilowatt capacity of their dynamos was 7.2 per cent, and their actual output was 4.7 per cent of the total. The total number of persons employed in municipal plants increased 132.4 per cent in 10 years, to produce an increase of 174.4 per cent in output. In the commercial plants an increase of 165.3 per cent in the number of persons employed produced an increase of 375 per cent in output. The commercial stations also were more successful in obtaining the greatest efficiency from their plants, the kilowatt capacity of their dynamos increasing 333.7 per cent for an increase of output of 375 per cent, while in the municipal plants the kilowatt capacity of dynamos increased 225.2 per cent for an increase of output of 174.4.

Of course, central electric stations are not railroads and municipalities are not the same as the federal government, but it is noteworthy that the more the results of government activities are studied, whether in relation to their own finances or to the operation by them of the postoffice, railways, telegraph, telephone, or other utilities, the more glaring becomes the showing made of the inefficiency of political management as applied to business.

NEW BOOKS

Proceedings of the Sixth Annual Convention of the International Railway Fuel Association. 342 pages, 41 illustrations, 6 in. by 9 in. Bound in morocco. Published by the Association, 922 McCormick building, Chicago. Price $1; paper binding, 50 cents.

This book contains a complete record of the proceedings of the convention of the International Railway Fuel Association which was held at Chicago, May 18 to 21, 1914. Committee reports and papers were presented and discussed relative to many phases of the railway fuel problem. To those who are interested in the efficient storage and handling of coal and the various conditions affecting combustion, this book will be of value; it contains much that is authoritative on these subjects.

Traffic Glossary. By R. D. Riley, instructor in Interstate Commerce, La Salle Extension University, Chicago. 136 pages, 6 in. by 9 in. Bound in paper. Published by the La Salle Extension University, 2550 Michigan avenue, Chicago. Price $1 postpaid.

This book has been prepared especially for the use of students of the course in Interstate Commerce and Railway Traffic of the La Salle Extension University, and is devoted to definitions of traffic territory and technical traffic terms. It is divided into four sections. Section A comprising the larger part of the book, defines territorial traffic terms. These are subject to changes from time to time to meet the various changes in traffic requirements and section A will gradually become obsolete. For the benefit of the readers who desire to keep in touch with these changes a list of territorial directories and freight association publications is given. Section B defines technical traffic terms, section C contains a list of abbreviations frequently used in traffic publications and section D is devoted to the application of classifications both to intrastate and interterritorial traffic.

Brass Furnace Practice in the United States. By H. W. Gillett. 287 pages, illustrated, 5¾ in. by 9 in. Bound in paper. Published as bulletin No. 73 of the Department of the Interior, Bureau of Mines, Washington, D. C.

This bulletin is issued as a contribution to the increase of safety and efficiency in the preparation and utilization of the mineral resources of the United States. The object of the investigation of brass furnace practice was to find out the melting and fuel losses in brass melting as practiced at present and to indicate as far as possible the methods by which the losses may be reduced. The investigation deals with the general types of furnaces in use and gives the result of the investigation in detail. General factors affecting the operation of brass furnaces are carefully considered and considerable space is devoted to remarks on furnace types and parts. Possible improvements in furnaces and accessories are discussed as well as some furnace problems which are awaiting solution. The latter part of the book is devoted to causes of disease and danger and essentials for health and safety.

Letters to the Editor

THE LATE STARTING OF PASSENGER TRAINS

New York, August 20, 1914.

To the Editor of the Railway Age Gazette:

In casting about for ways and means to please the public some railway officers could well afford to devote more attention to the matter of getting trains away from terminals on time. There are roads on which it is a chronic condition for trains to leave terminal stations from two to five minutes late, almost entirely because of waiting for late passengers and late baggage. Of course there is the argument that no one need worry as long as the train arrives on time, no matter how late it is in leaving; but in a great many cases the few minutes late in leaving are never made up. And then, again, what about the passengers who get off at a local station before there is any opportunity to make up time? They are as much entitled to schedule time service as those who go the full length of a division.

Passengers are largely to blame for this condition; they adopt an "Oh, the trains are always late anyway" attitude, and get into a habit of arriving at the station at the last minute, or later. But, after all, the railways are responsible for this attitude on the part of the traveling public. If they had made a reputation for getting trains away on time instead of late, a much greater percentage of the passengers would be on hand at leaving time. There will, of course, always be some stragglers who will complain about being left, but if the trains leave on time the majority will be on hand to leave with them, and will adopt a different attitude toward the road and its service.

Some years ago a western road achieved such an unenviable reputation for late trains that the vice-president issued a circular to all concerned in train operation, calling upon them to co-operate in every possible way to bring about an improvement. A great deal may be accomplished by the prompt closing of doors and giving of signals by trainmen, and by enginemen being ready to receive a signal and act on it immediately. Particularly in suburban service, where schedules are often so exacting that a two-minute or a three-minute delay in starting is never regained, there should be close co-operation among the members of the crew. On a certain road which does a large suburban business, a considerable proportion of the trains are almost always two or three minutes late in starting, and in most cases this time is never made up, the trains falling back on the time of following trains and causing additional delays. Holding the gates open in terminal stations until the leaving time of a train, of course makes it impossible for the train to get away on time. In some of the large stations with their magnificent distances that must be traveled after the gates are passed, the situation is more complicated, but it should surely be possible to arrive at a solution even here. There is no reason why a road should not have a reputation for starting trains on time. If trains start on time they are more likely to arrive on time, and the officers of a road that has such a reputation will not need to worry much if some of their competitors have a little nicer cars.

L. C. N.

BASIS OF REASONABLENESS OF COMPETITIVE RATES

Ann Arbor, Mich., July 10, 1914.

To the Editor of the Railway Age Gazette:

The discussion of "Economic Theory and Railway Rate Regulation," by Mr. Hand in the *Railway Age Gazette* of February 27 has suggested to me one interesting problem—namely, the basis of the reasonableness of a competitive rate. Mr. Hand has shown that there are today many cases of competition—competition of localities, facilities and markets.

The organization of our commercial and industrial enterprises is influenced to a considerable extent by the construction of our competitive rates. The relative rates on wheat and flour, for instance, from the Kansas wheat fields to California, has a direct influence upon the location of flour mills. Since flour made from California wheat must be mixed with the durum wheat of Kansas, the margin between the rates on wheat and flour from Kansas will determine where the mill had best be located. When the carriers increased the rate on flour from $.65 to $.75, and kept the rate on wheat at $.58, the Kansas millers complained to the Interstate Commerce Commission (29 I. C. C. R., 459). This is one of the many examples of the competitive rate problems. The decision in this case was that no proof had been made that the increase was justifiable. There was no reason why the California miller be put upon a parity with the Kansas miller to the detriment of the latter. The course was open to the railroads to reduce the rate on wheat rather than to increase the rate on flour in order to equalize the difference.

As Mr. Hand suggests, such a readjustment of rates would not mean extra traffic for the railroads involved, and so, from the point of view of profit for the carrier such an increase is not justifiable. Let us consider, on the other hand, a case where a railroad has reduced its rates upon competitive traffic to that point, which, in the estimation of the traffic manager, affords the greatest net return, allowing a free movement of the commodity—but, after a period of years, the competitive situation which necessitated the low rate has become less acute, or perhaps has entirely ceased to exist.

My desire, therefore, is to discuss what factors a commission should consider in determining the reasonableness of a competitive rate which has been increased by a railroad for the purpose of securing a greater return from the traffic involved. This question is complicated with the problem of a railroad absorbing part of the prosperity of an industry; its analysis also will throw light upon such issues as the present advance in rates case, the reasonableness of the schedule as a whole, and "specific cost for the specific service."

The increase in the rate on fir, hemlock and spruce from the Pacific coast to St. Paul and common points directly presents the issue. (14 I. C. C. R., 1.) In order to utilize an empty car movement eastward, the western roads in 1893 established low rates on lumber moving to the central west. By 1907 the empty car movement, due, in part at least, to the lumber industry, which had grown to enormous proportions, became westward. At this time the carriers raised the rate from $.40 to $.50. There were many rates on lumber involved, but for illustrative purposes one will suffice. The problem for the railroads was to justify this increase of a rate which, when first established, was admittedly low.

The question is pertinent: what was the effect of this increase? Did it mean that southern and northern lumber producing areas would encroach upon the market of the Pacific coast? Did it mean that those lumber concerns which operated upon the margin, under the least favorable circumstances, suffered, although, as a whole, the lumber industry continued to be prosperous? An analysis of these questions will throw light upon the theory of competitive rate structure.

On economic grounds, this increase was due to the great prosperity of the business; the carriers realized that they were not receiving all that the traffic could bear. The original low rate was justifiable because some return was made over and above actual haulage cost, thereby reducing the burden of the constant charges upon the non-competitive rates. As long as that competition exists, and the rates are adjusted with reference to that competition, should a railroad be allowed to construct its rate so as to secure the maximum return from the commodity? If the competition of the southern lumber regions in this central territory should suddenly cease, the cause of the original low rate on Pacific coast lumber would no longer exist. If that competition continues, but not to so great an extent, the prob-

lem for the western railroads is to organize their rates with the view of obtaining the largest possible return.

It is a problem of broad public policy to what extent a railroad must equalize economic factors. If an increase in rates, in addition to decreasing profits for some concerns, forces others into insolvency, that rate increase is bound to be opposed. If, however, we argue upon the hypothesis that the sole justification of the rate when first made was to allow an industry to enter a competitive market, that industry cannot with justice demand a maintenance of this low rate whenever that competition ceases. If, on the other hand, there enters a new and more acute competition, the shippers will request their railroad to reduce rates so that they may continue in that market. The traffic manager must then determine at what point in the readjustment of the rate, the railroad will secure the maximum return. The railroad will not be compelled to establish a rate so low that the concern which existed "on the margin" under the former may continue to earn a profit with the lower rate which the exigencies of competition necessitated. In this case, however, the competition did not continue to remain acute, and the railroad felt it could secure a greater return from the traffic by an increase in the rate. Such an increase, therefore, ipso facto, is justifiable, although all the concerns served by that rate may not continue to enjoy prosperity.

The construction of rate schedules upon this basis of the prosperity of the industry concerned is open to the criticism that the gains of good management in that industry, as well as the advantages accruing to an industry because of its excellent location, would thus be shared with the railroad. In answer to that it is well to remember that no rate can be increased above the point at which the principles of classification are operative. We realize that lumber should not be rated as high as sixth class, but the principles underlying the basis of classification applied to lumber would determine the upper level of the lumber rate.

The success of an industry depends in part at least upon its market. If now a market which is not naturally tributary to that producing area is opened to that producing area by reason of a low rate, is it justifiable that such a low rate continue when the competitive forces which caused its inception have ceased? It is fair that a railroad share in the prosperity which it has occasioned, not only through the increased tonnage, but also by an increased rate, and what is more important, it is right that whenever a railroad requests an increase in its non-competitive rates, that railroad can claim, that from its competitive rate structure, it is securing a maximum return.

The advance in rates case involves to some extent such a situation. I do not claim that this theory is particularly applicable when the rate schedules of many carriers in a large district are at issue. To some extent such a readjustment would mean that certain carriers would secure a larger tonnage of competitive traffic. I do offer the suggestion, however, that not only with industrial tracks are the large industries securing revenue due to the railroads, but also that these companies are not paying as high a rate upon the competitive business as the railroads may, with justice, exact.

It is also a question of considerable importance whether such competition would result in severe rate wars. From the point of view of the public, a repetition of the rate wars of the eighties is highly undesirable. If such competition is indirect in its influence, we have little to fear from fluctuating rates, and cut-throat tactics. But such a situation must be recognized in the adjustment of the organization of our commercial and industrial resources.

The theory of the reasonableness of the competitive rates, furthermore, has considerable importance in the question of the reasonableness of the schedule as a whole. There has been, of late, discussion as to the results of a physical valuation upon the structure of our rates; it is claimed that all the railroads are not operating under the same conditions so that what would be a living rate for some carriers would mean insolvency for others. In order to earn a fair return, a road with severe grades must have higher rates than a water-level line, and competition will force the road with severe grades to meet the rates of the more favorably located company. Is there not, however, a tendency to exaggerate this factor? As a matter of fact, railroads do not compete at each and every point along the line. Some rates are necessarily non-competitive so that, on a line of heavy grades the class rate structure, on which the burden of the constant charges naturally falls, will be relatively high.

Similarly, a road which enjoys a regular heavy tonnage, as is the case with the Pittsburgh & Lake Erie, will establish a lower class rate than a road which serves a large passenger traffic must maintain, because the passenger business is not only in competition with interurban electric lines, but also because of the sociological necessity of a wide distribution of workers from a large city.

It is, in addition, important for a traffic manager to know what is the lowest point at which he can place a rate upon a commodity when requested by a shipper, that that article may enter a competitive market. The traffic manager knows that every increase in the volume of the business does not, within reasonable limits, incur a proportionate increase in the cost of haulage. We see, therefore, that some cost figures must be ascertained in order to determine this lowest possible level for a competitive rate.

The Interstate Commerce Commission in 22 I. C. C. R., 623, considered the reasonableness of an advance in rates on coal from the West Virginia fields to the lakes.

> Is a rate unreasonable because it does not pay its full share of taxes, fixed charges and dividends? At the end this is the question to which we come in this case. The carriers themselves having fixed these rates under the mandate of the law that they shall fix just and reasonable rates, have they justified higher rates by showing that the existing rates which they had fixed fall somewhat short of meeting all the related expenses which the carrier must bear, not only for transportation, but to secure an adequate return upon its property? Let us see where this doctrine would lead. If a carrier may raise all rates to a basis where each rate will bear its share of the cost, including all costs, and no lower rate is reasonable, then it must follow that all rates are unreasonable which yield to the carrier a greater return than such cost. Under such theory what would be the rate on tea or silks, or high-priced horses, or delicate machines? . . . In all classifications consideration must be given to what may be termed public policy, the advantage to the community of having some kinds of freight carried at a less rate than other kinds. And this is the true meaning of the phrase "what the traffic will bear." It expresses the consideration that must be shown by the traffic manager to the need of the people for certain commodities. . . . We may not say that a rate shall be fixed so as to meet the requirements or needs of any body of shippers in their efforts to reach a given market, nor may we establish rates upon any articles so low that they will not return out-of-pocket costs. . . . There is, however, a zone within which we may properly exercise "the flexible limit of judgment which belongs to the power to fix rates." . . . A just and reasonable rate must be one which respects alike the carriers' deserts and the character of the traffic. It cannot be a rate which takes from the carrier a profit and thus favors a shipper at the carrier's expense, nor is it one which compels the shipper to yield for the transportation given a sum disproportionate either to the service given by the carrier or the service rendered to the shipper. The words "just and reasonable" imply the application of good judgment and fairness, of common sense and a sense of justice to a given condition of facts.

We realize that the economic basis of the existence of this zone in which to exercise the flexible limit of judgment is the law of increasing returns. We would like to know, on the other hand, what principles should guide judgment in ascertaining whether the rate in a competitive situation is disproportionate either to the service given by the carrier or the service rendered to the shipper. It is our function to measure the value of a transportation service given to one commodity that it may reach a certain market. We must analyze the factors of that service, and it is our firm conviction that the margin of profit for the shipper and the nature and intensity of the competition, so that the railroad may receive the greatest possible return upon the traffic involved, are factors of considerable importance.

Bradshaw Langmaid,
University of Michigan.

CONFERENCE BETWEEN THE PRESIDENT AND RAILROAD EXECUTIVES

On Wednesday of this week a committee of railroad executives held a conference with President Wilson. The committee was made up of Frank Trumbull, chairman, chairman, Chesapeake & Ohio and Missouri, Kansas & Texas; Samuel Rea, president, Pennsylvania Railroad; Daniel Willard, president, Baltimore & Ohio; Fairfax Harrison, president, Southern Railway; E. P. Ripley, president, Atchison, Topeka & Santa Fe; Hale Holden, president, Chicago, Burlington & Quincy.

The following statement was presented by the committee to the President:

The purpose of this conference is to lay before the President in brief terms the present situation of the railroads of the United States—250,000 miles of great national highways. That the case of the railroads deserves sympathetic treatment arises from the fact that, although privately owned, their property is devoted to public service. The industrial health of the country depends upon an adequate railroad service; such service cannot be rendered and proper response to public needs cannot be made, unless the financial soundness of the railroads is maintained.

The credit of the railroads, seriously impaired as we believe, before the war started, is now confronted by an emergency of a magnitude without parallel in history. To understand the full import of the existing crisis, it is necessary to consider briefly the antecedent conditions.

The purpose here is not to complain but to point out the one paramount fact that by reason of legislation and regulation by the federal government and the 48 states, acting independently of each other, as well as through the action of a strong public opinion, railroad expenses in recent years have vastly increased. No criticism is here made of the general theory of governmental regulation, but, on the other hand, no ingenuity can relieve the carriers of the burden of expense created thereby. However desirable may have been the expenditures which have been forced upon the railroads, no adequate provision has been made to pay the bill.

This great increase in expenses now coincides with seriously depleted revenues, with no corresponding ability of the railroads to reduce their costs in proportion. Governments can proceed with expenditures of all kinds by taxation, but railroads cannot. While the effect of the European war upon railroad earnings may vary in different sections, it is painfully evident that there will be serious decreases in the total because of the unprecedented difficulties in the marketing of cotton, the great decrease in imports, and the general dislocation of trade and industry.

Even prior to the existing emergency and to meet the antecedent situation, railroad expenditures generally had been reduced to absolute necessities. The difficulty of further contraction is enhanced by existing wage agreements, and, in so far as the western railroads are concerned, by the possibilities involved in the arbitration proceedings to which they have recently agreed.

The net operating income of the railroads of the United States for the year ending June 30, 1914, was $120,000,000 less than for the previous year, or about 15 per cent. The gross earnings for the year were $44,000,000 less than for 1913—expenses and taxes were $76,000,000 more.

The maintenance of the credit of the railroads (and the credit of the railroads establishes the standard for all industrial enterprises) depends upon their ability to increase their net earnings. The railroads may have the most perfectly appointed plants in the world, but if the net earnings are not adequate, new capital cannot be attracted.

In the important eastern rate case, the Interstate Commerce Commission unanimously found that the railroads in the richest section of the country needed more revenue. That finding was based upon the situation prior to the first of July, this year; indeed upon conditions of a year previous.

No emphasis need at this time be put upon the new railroad capital which has heretofore been required to provide for normal development, but this has been from $400,000,000 to $500,000,000 per annum, and railroads should not only be able to keep abreast of the times, but should even in this emergency be in a position to anticipate the demands of an expanding commerce.

Simultaneously with the great impairment of earnings, general credit conditions have broken down, and the absolute and immediate necessities of both public and private borrowers of money here and abroad have already increased interest rates to a level unthought of a few months ago—rates much higher than present net earnings return upon the railroad property of the United States.

This emergency was not contemplated when the Interstate Commerce Commission rendered its decision in the eastern rate case, yet the problems now confronting the railroads greatly transcend the seriousness of those which existed then. The menace is now not only to railroad credit but to the transportation service itself, and efficient transportation is inseparably connected with the welfare of our people.

Securities of United States railroads held abroad are computed at from three to five billion dollars. It is a certainty that bond and note obligations of the railroads maturing before the end of next year aggregate over $520,000,000. In the highest public interest, it is imperative that these obligations shall be met. Yet it is evident that for a long time Europe will not be a lender of money to America. On the contrary, the war will create such enormous debts and involve such a general dislocation of industry and commerce, that Europe must realize largely on its holdings of American securities regardless of the price obtainable.

The New York Stock Exchange has now been closed for a longer period than at any other time in its history. There is no present market for railroad securities, either old or new. The United States is in a condition of financial isolation. If the Stock Exchange were to open (and it must open some time), the pressure of selling would inevitably be greatest against railroad securities. If they go down, industrial issues will fall still more seriously. The public necessity to stem this tide of selling and to reduce to the utmost its destructive effect, is one that calls for the exercise of every resource of statesmanship.

Our respectful requests are:

1. That the President will call the attention of the country to the pressing necessity for support of railroad credit by the co-operative and sympathetic effort of the public and of all governmental authorities, and that the railroads be relieved as far as possible of further immediate burdens involving additional expense; and.

2. That the President will urge a practical recognition of the fact that an emergency is upon the railroads which requires, in the public interest, that they have additional revenue and that the appropriate governmental agencies seek a way by which such additional revenue may be properly and promptly provided.

Railway Construction in the Chinese Province of Shantung.—At present there are two railways in operation in the Chinese province of Shantung; the Shantung railway from Tsingtau to Tsinanfu, 256 miles, and the Tientsin-Pukow line, 690 miles long, traversing the western portion of the province. Both of these lines are of standard gage. The former is German owned and operated. The latter, likewise a standard gage road, is divided into two sections. The northern runs from Huschowfu on the southern border of Shantung to Tientsin. It is 457 miles long and was built by the Germans. The southern section is 235 miles long and extends from Huschowfu south to Pukow on the Yangtse river. It was built by the British, but in common with the northern section is operated by Chinese. There are, however a few German overseers on the German section and a few British overseers on the other. The Chinese government administers both sections as an undivided government railway under a European engineer in chief who of course has a voice in the ordering of supplies.

The Erection Equipment for the Quebec Bridge

A General Description of the Method Adopted and the Traveler Built for This 1,800-Foot Span

By H. P. Borden
Assistant to Chief Engineer, Board of Engineers, Quebec Bridge.

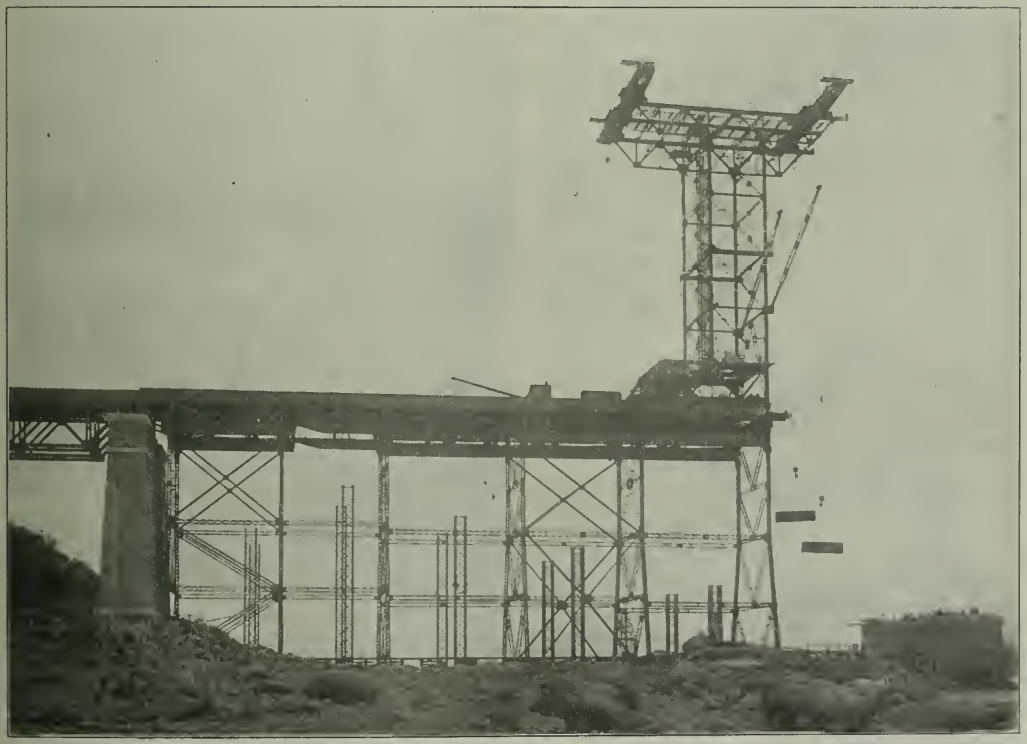
During the present season considerable progress will be made towards the erection of the new Quebec bridge. The unprecedented weight and size of many of the members have created problems unusual in ordinary bridge erection. This phase of the work has been very carefully studied, the result being that every step has been thoroughly worked out and equipment has been designed to meet every emergency.

The center span is of the same length as that of the old bridge, namely, 1,800 ft. center to center of main piers, being divided into two cantilever spans 580 ft. long, and one suspended span 640 ft. long. The two anchor arms are each 515 ft. long center to center of piers. The main posts over the piers are 310 ft. high center to center, the cantilever and anchor arms tapering back to 70 ft. at each end.

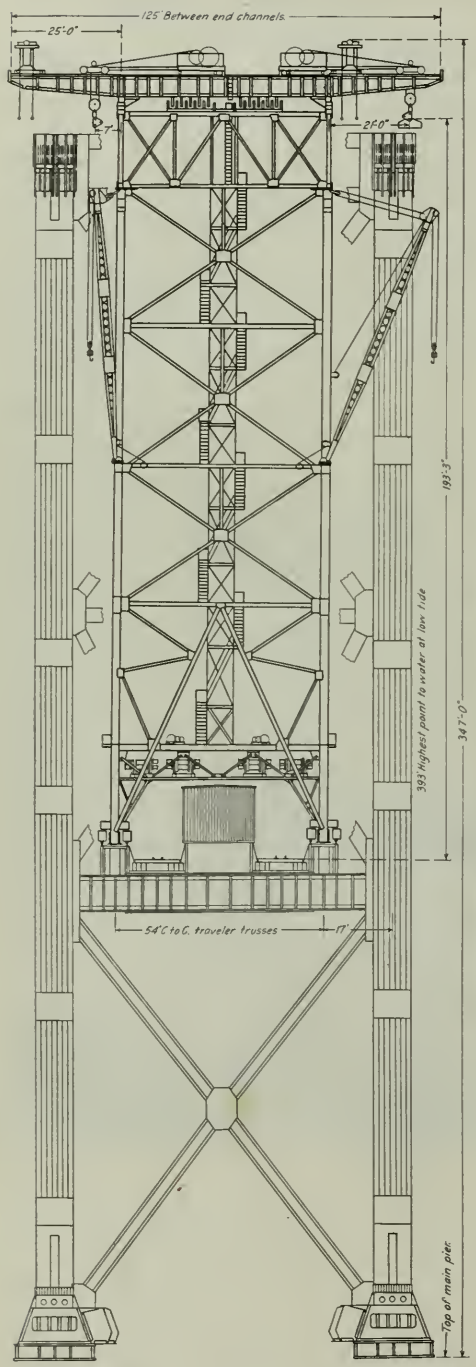
The suspended span, being designed to be floated into position, is of a bow-string Pratt design 110 ft. high at the center. The trusses of the bridge are vertical, and are 88 ft. center to center. There are two approach spans on the north side between the anchor pier and the abutment 110 ft. and 157 ft. long, and one span 140 ft. long on the south side. The over-all length of the bridge is 3,239 ft. face to face of abutments.

Owing to the requirements of navigation, the center of the bridge for a distance of about 700 ft. is 150 ft. above extreme high water. In order to provide sufficient clearance for ships it was necessary to design the bridge with a one per cent grade entering from the abutments to the ends of the cantilever arms, the suspended span, however, being on a level grade. The extreme height of the bridge above the water did not entail any extra expense for approaches, due to the fact that the high banks on each side of the river conformed approximately to the required grade level.

In designing the plant required for the erection, the St. Lawrence Bridge Company, the contractors for the superstructure, spared no expense to develop an equipment that would combine the greatest efficiency with absolute safety. The bridge itself is situated about seven miles from Quebec in a more or less isolated district, and the difficulty of obtaining labor within a close radius was apparent. In order to provide accommodation for a large staff, and to locate them within a reasonable distance from the work, the company went to a large expense in fitting up a model camp at the bridge site. Bunk houses were provided for 250 men with an up-to-date kitchen and dining-



General View of the Traveler, Placing the Grillage for the Last Bent of Falsework



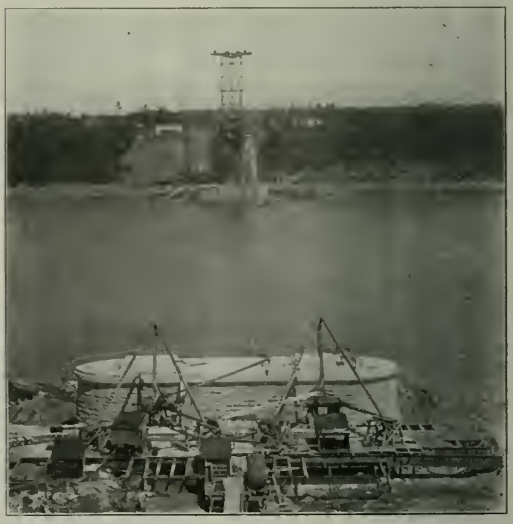
The Quebec Bridge Traveler Between the Main Trusses

room, bakery, wash rooms, recreation rooms, laundry, as well as general offices, hospital and police quarters. An efficient water supply service was inaugurated with fire protection and electric light. For the use of the officers of the company, several bungalows were also constructed in the vicinity.

As all the mechanical equipment is operated by electricity, power was obtained from the City of Quebec and transformed at the site to suit the various requirements of lighting, heating and operating machinery. A compressed air plant, operated by electricity, was also constructed on each side of the river. In the north and south handling yards, crane runways were established and equipped with traveling cranes having a capacity of 90 tons each.

ERECTION OF CANTILEVER SPANS

The main traveler, which will be used for the erection of the cantilever span proper, is of heavy steel construction, weighing when fully equipped approximately 1,000 tons. This traveler is about 200 ft. high from base of rail, and is supported on four buggies of six wheels each, running on four lines of tracks at the floor level. The upper arms of the traveler extend 50 ft. fore and aft of the main tower. On the top of the traveler two electric cranes are located, running on tracks parallel to the center line of the bridge. On each of these cranes are two trolley hoists running at right angles to the center line of the



General View of the Crossing Showing the Traveler on the North Shore

bridge, thus commanding every point within their radius. These cranes have a capacity of 110 tons with a 35-ft. overhang, and have an out-to-out reach of 47 ft. 6 in. on each side of the center line. All the movements of these cranes, as well as the operation of the hoists, are controlled by one man at two switch boards located on the bridge of the traveler at the lower platform. By this means the superintendent can stand by the side of the operator, and in an ordinary conversational tone give instructions as indicated by the foremen at the different points where the work is going on. The operator can also see all operations at close range, and consequently can use better judgment in operating the hoists.

In order to avoid any possibility of accident, automatic electric brakes are attached to every machine, which will prevent the machine running away should anything happen to the electric current. In lowering a heavy member, the machines, operating through electrical resistance, have to work just as hard as in

the operation of lifting. Should a fuse burn out, it is impossible for the load to move until the proper connection is again made. By this means the mechanism is made as nearly foolproof as it is possible to make it.

Four small gantry cranes with two six-ton hoists each are also situated at the extreme ends of the crane girders on the top of the traveler, and are used to handle pins and other small material in line with the trusses. These gantry hoists are also

View Looking Back from the Traveler Showing the Four Lines of Rails Carrying the Traveler

operated from the bridge at the lower level. At each of the four corners of the main tower, steel booms have been installed having a reach of 90 ft. and a capacity of 20 tons each. These booms are operated by four electric hoists on the lower deck, and are used to handle smaller members between the trusses, such as the floor system and lateral and sway bracing.

In order to facilitate reaching all parts of this traveler for inspection or other purposes, an electric elevator travels from the main deck to the floor under the crane girders at the top. There is also a stairway around this elevator for emergency purposes. In order that the progress of the work may not be held back, a second traveler, a duplicate of the one already erected on the north side, is now being constructed for use on the south side and will be in operation next spring. These two travelers, fully equipped, will cost in the neighborhood of $500,000.

ERECTION OF APPROACH AND ANCHOR SPANS

The north approaches, consisting of two Warren-type truss spans 110 and 157 ft. in length, respectively, were erected complete last fall. As the railway tracks are 32 ft. center to center, each span is composed of two distinct bridges, each carrying one track. The railway floor is trough-shaped, being in fact a series of through plate girder spans with sub-floor beams and track stringers. These track stringers are heavily reinforced with gusset plates and inverted channel top flanges in order to provide an extra factor of safety to the bridge as a whole in case of derailment. In the case of the approach spans these track girders

Placing One of the Four 40-Ton Castings That Form the Base of Each of the Main Shoes

are carried directly on the top of the vertical posts of the trusses which posts extend through the top chords.

The approach spans were erected with two traveling derricks before the main traveler was constructed. The shorter span, from the abutment to the intermediate pier, was supported on wooden falsework at the first and third panel points, the two outside panels being cantilevered out to the intermediate pier. The span was lowered to its proper position on the pier members by means of sandjacks on the falsework. The longer of the approach spans was erected in the same manner, with the exception that

View Showing One Half of Diagonal Tension Member 108 ft. Long on Cars for Shipment

steel falsework was used throughout. This falsework was so designed that it could be taken down and reused for the falsework of the anchor arm.

The falsework for the anchor arm consists of two distinct sets, known as the inside and outside falsework. The inside falsework carries the floor and the traveler up to the time the anchor arm is swung. The outside falsework is of varying length from the main pier to the anchor pier and supports first the bottom chords

and finally the entire weight of the anchor arm with the exception of the floor system.

The main traveler is used to erect this anchor arm falsework. Two of the lines of rails upon which this traveler runs are placed on the top flange of each of the outside track girders, the other two lines of rails being placed on special erection girders located about 4 ft. outside of these track girders and connected to the falsework bridge floor by special inclined struts and bracing. As each panel of the inside bracing is erected, the permanent floor of the bridge is placed in position. This does not apply to the main floorbeams which attach to the trusses of the anchor arm. These are put in a temporary position to accommodate present erection purposes and will not be put in their permanent position until the web members of the anchor arm trusses are erected in place.

There are seven bents of falsework for the inside staging and six bents for the outside. This staging and flooring is now practically all in place between the anchor arm and the main north pier, and the work of setting the shoes is going ahead. These shoes are approximately 26 ft. by 21 ft. at the base, are 19 ft. high and are shipped in seven sections, the heaviest of which weighs 70 tons. The shoe as a whole weighs over 400 tons.

If no unexpected delay occurs, it is expected that most of the anchor arm, or in the neighborhood of 10,000 tons, will be erected during the present season. During the coming winter the traveler for the south side will be erected and next season work will be started on the south shore, both sides working simultaneously towards the center. The cantilever arms will, naturally, be erected without staging. In order to save practically a year in erection, the big suspended span will be erected on the shore, in the vicinity of the bridge, and floated into position, being lifted from the pontoons by means of enormous hydraulic jacks.

The work is under the direction of the Board of Engineers, Quebec Bridge, a commission appointed by the Dominion government, and is composed of C. N. Monsarrat, chairman and chief engineer, Ralph Modjeski, and C. C. Schneider.

UNNECESSARY TELEGRAPHING*

By W. H. Hall
Superintendent of Telegraph, Missouri, Kansas & Texas

. . . I find that we still have a few officers and employees who believe that the telegraph rules, the telegraph code, etc., were made for the other fellow, and do not apply them. Recently I was told that the traffic department people were using the code to some extent and using symbol letters and numbers on a large majority of their telegrams; but that the operating department people do not seem to be doing so well. This was to me an astonishing statement, but I found that, generally speaking, it was correct. [Mr. Hall here quoted a telegram *of the traffic department* of 33 words which ought to have been put into 17. Other examples of lack of care were a message from a roadmaster ordering grass to be cut around bridges and directing responses, by wire, from 40 section foremen; and one from the passenger department, and one from the legal department omitting symbols, and thus necessitating unnecessary words in the reply. Six relaying offices found in one day 400 messages lacking symbol letters or numbers.]

In August, 1913, the telegraph department issued a telegraph code of about 75 code words, covering sentences used many times each day by all departments. Some of the departments are using this code, with a marked decrease in the length of telegrams. Others are not making any use of it. I quote a few words that can be used to advantage by all departments.

Anxiety:	All concerned are instructed to rush.
Arrow:	Urgent that we have quick action.
Converse:	Referring to our conversation.
Decision:	What action has been taken.
Exact:	Advise if now O. K.
Hearken:	Have matter up and will advise soon as possible.
Hindrance:	Advise by wire what is delaying.
Home:	Referring to my letter of.....
Stimulate:	Very urgent, immediate attention and reply requested.
Searching:	Will investigate and advise you.

There are others just as good. I heard an employee the other day dictating a telegram, and by the use of four or five code words a message that would have contained probably fifty words was cut down to about twelve. It was a revelation, even to me, of the economy that can be effected by an intelligent use of this code.

As our railway increases in mileage and cities increase in size and industries multiply, there will be a legitimate growth in the number of telegrams, and I have found the management willing to meet this demand for additional facilities; but unwilling to have the telegraph service used for unimportant and unnecessarily long communications.

I believe that fully 25 per cent of the messages now being handled by wire could be handled by letter and serve every purpose. Recently on a certain middle west railroad the management came to the conclusion that there was too much telegraphing being done, and in one relay office, where there had been 24 men employed, they cut the force to 5. Clerks were put on and it was left to the discretion of the manager as to what messages should be sent by wire and what messages should be sent by mail; and, while their service has suffered to some extent, still it has been shown that a large proportion of the messages heretofore handled were unnecessary.

*Abstracted from a paper read at a staff meeting at Galveston, June 22, 1914.

THINK OF THE ENGINEMAN

Many automobile drivers are daily "flirting with death" by failing to observe the highway regulation, "stop, look and listen," when approaching railway crossings; and, commenting on this, the press agent of the Southern Railway, calls attention to the experience of M. C. Glenn, an engineman of that road, on September 3. "Yesterday," said Mr. Glenn, "I was engineer on train No. 108 and at Williams Crossing, about four miles west of Raleigh, I only missed striking an automobile by about two seconds, and in this automobile were grown people and children. If I had struck the automobile some one would have said that the engineer failed to sound the whistle; when in fact, I had just whistled for Thompson, answered a signal from the conductor, and had blown a road-crossing signal. The bell was ringing also, but the driver of the auto evidently did not hear any of the signals; for when I came in sight of him, which was only for a short distance, on account of a curve in the track, he averted a collision by suddenly cutting his car to the right, and I passed within 10 or 12 ft. of him." And the "some one" who in cases like this says that the engineman was at fault, usually proves to be a witness for the plaintiff in a lawsuit against the railroad; and jurymen who do not believe his statement are rare. Mr. Glenn's experience should go on record, for it is an instance where the runner's testimony was not contradicted.

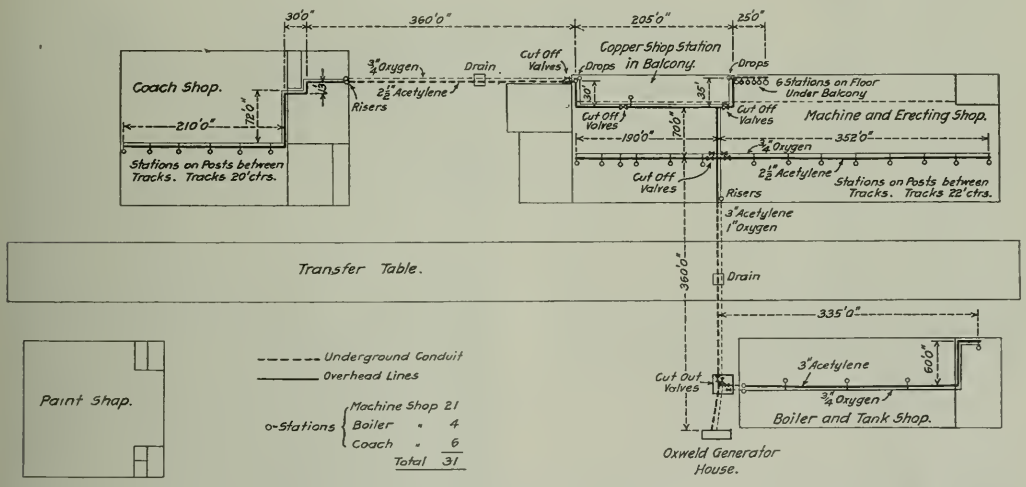
Canals in Norway.—An old scheme for a waterway between Lake Mjösen, Norway, and the sea is again being given attention, and as a first step the part canalization of the Glommen is being advocated. The building of several dams on the section Vamma-Mörkfas will facilitate the solution of this important question by the Glommen being made navigable from Oieren to Sarpsborg and on to Frederiksstad. Lock will have to be built by the side of the dams already built, or about to be built, but this is not expected to present any difficulties. The water level above the Sarpsfos Falls will have to be raised to a mean of 77 ft. above the level of the sea, in order to make the canalization of Glengshölen efficient. The passage round the Sarpsfos Falls, will be solved by means of a combination of locks and tunnel, and the whole scheme is looked upon as feasible also from a financial point of view.

Oxy-Acetylene Welding and Cutting on the Frisco

Large Savings Made by Use of Central Generating Plant and Piping System to Different Shop Departments

After about two years experimental work with apparatus that did not prove satisfactory, the St. Louis & San Francisco decided to install a complete modern plant for oxy-acetylene welding and cutting on a large scale at the Springfield (Mo.) shops. With the object of extending its use to the several departments of the locomotive and car repair shops, it was decided to install a central generating plant and to pipe the gases to the various departments, providing outlets at the several points where this process would be required, either for welding or cutting. This was done in the belief that in the end it would prove more economical to install and maintain such a plant than to follow the practices either of bringing the work to a central point or trucking the oxy-acetylene apparatus to the different places. A study of the extent to which oxy-acetylene welding and cutting is now being used throughout the shops and the resulting savings, seems to amply justify this decision.

So successful has the plan worked out that similar installations have been made at the old north shops at Springfield and at the reclamation plant at Springfield, which is located in the old Kansas City, Fort Scott & Memphis shops, which were practically abandoned when the new Frisco shops were built several years ago. Other small plants have also been installed at Birmingham (Ala.), Chaffee (Mo.), Enid (Okla.), Kansas City (Kan.), Memphis (Tenn.), and Sapulpa (Okla.). The railroad company was not put to any capital expense in building and equipping these plants. They were furnished by a service company which also provided in its contract for supervision and instruction as to methods, free of charge, and conditioned only on the purchase through the service company of oxygen, carbide and other necessary supplies at the usual and current market prices.



Plan of the Oxy-Acetylene Layout at the Springfield New Shops of the St. Louis & San Francisco

THE APPARATUS

The installation at what is known as the new shops at Springfield is by far the largest of the nine plants thus far placed in operation on the Frisco. Twenty operators are regularly employed; of these four are in the machine and erecting shop, eleven in the boiler shop, three in the blacksmith shop, one in the coppersmith department and one in the coach shop. The welding operators have been selected from the various departments of the shop and are assigned as nearly as possible with reference to their trades and qualifications. The scope and variety of the work is continually increasing, as the welders become more and more proficient in handling the apparatus and as the shop management becomes more familiar with its possibilities.

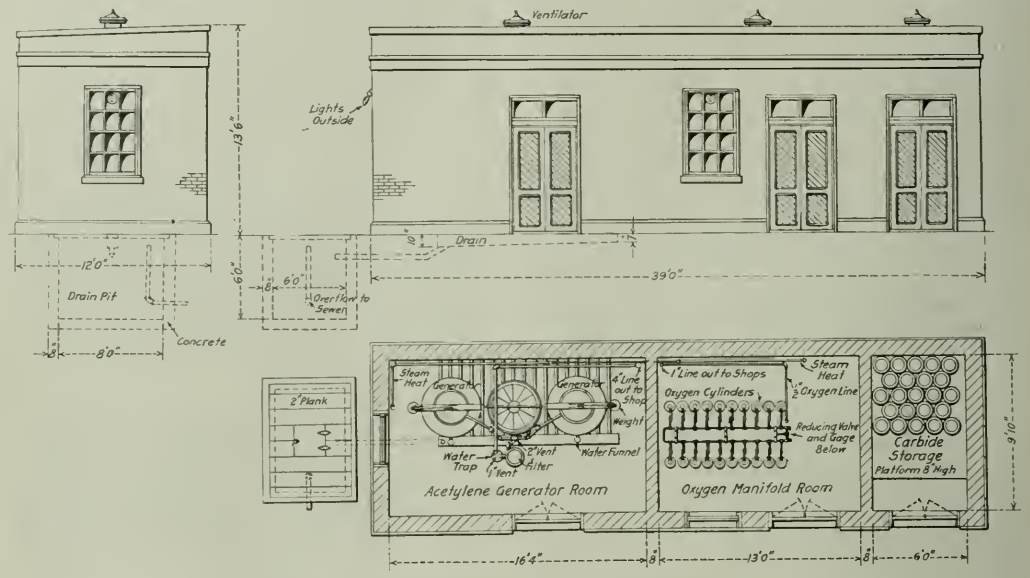
Some idea of the extensive area which is served at the new Springfield shops may be gained from the fact that there are 6,204 ft. of piping, divided as follows: For acetylene, 60 ft. of 4 in. pipe, 745 ft. of 3 in., 1,677 ft. of 2½ in. and 620 ft. of 1 in. For oxygen, 390 ft. of one 1 in. pipe, 2,092 ft. of ¾ in. and 620 ft. of ½ in. There are 21 outlets or stations in the machine and erecting shop, four in the boiler shop, and six in the coach shop. As shown on the diagram, the piping between the buildings is placed underground, while that inside is carried overhead. In the erecting shop and in the coach shop, the outlets are placed on the columns between the pits or tracks.

At the north shops in Springfield there are 4,500 ft. each of acetylene and oxygen piping, with 25 drops or outlets. Three of these outlets are in the erecting shop, three in the machine shop, 10 in the freight car repair yard, two in the motor shop, two in the coach shop, three in the boiler shop and two in the tin shop. At the reclamation plant there are 1,060 ft. of piping and 16 outlets. This article will consider only the work which is being done in the new shops and the north shops, that at the reclamation plant being reserved for a later article descriptive of that plant.

The arrangement of the apparatus in the generator house at the new shops is clearly shown in the illustrations. The greater part of the building is used as an acetylene generator room. Here is placed the Oxweld low-pressure duplex generator which consists of two acetylene generators and one gasometer. The generators may be operated independently of each other, the advantage of the duplex arrangement being that one generator may be in operation, while the other is being recharged. The generators operate automatically and require only a comparatively small amount of attention.

The oxygen containers are grouped in two rows in another

room and are connected to a manifold by flexible copper pipes, as shown in one of the photographs. Only one or two of the cylinders are opened into the manifold at one time. As soon as a tank exhausts its supply, which is indicated by the pressure gage, it is cut off and a fresh tank is cut in; as soon as convenient the empty tank is then removed and replaced by a filled one. The reducing valve regulates the pressure to the piping for making similar repairs. At the new shops, for instance, a report is made on each operation on a special form which is shown in one of the illustrations. This is made up by the shop checker or foreman, and is referred to the chief clerk of the shop superintendent, who personally checks the data to insure its accuracy. The accompanying statement is taken at random from one of a large number of records on file in the shop, super-



Oxweld Generator House at the Springfield New Shops

system. The cans containing the carbide are stored in still another part of the house, as shown on the plan.

The building at the new shops at Springfield is a substantial brick structure, agreeing with the style and architecture of the other buildings in the plant. At other places, and particularly the smaller points, much less pretentious buildings are used, such, for instance, as the one at Birmingham (Ala.), which is shown in one of the photographs.

Statement Showing Work Performed with Oxweld Welding Plant at New Shops, Springfield, and Cost During January,* 1914

Articles Cut or Welded		Date	Time welding or cutting	Rate per hr., cents	Amount of labor	Cost per blow pipe hr.	Total cost	Material	Labor	Total	Saving

*This shows only a few of the items for January 2.

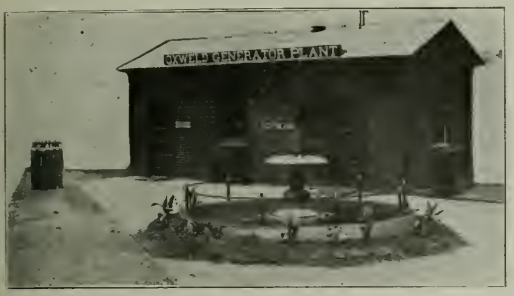
COMPARATIVE COST OF DOING WORK

Accurate and thorough records have been kept of the comparative cost of doing the work with the use of the oxy-acetylene apparatus and by the methods which were formerly employed intendent's office and will give some idea of the care and thoroughness with which the railroad has checked the comparative costs.

As noted, each item is separately considered, the cost by the Oxweld process being determined by totaling the labor cost, the gas cost and the expense of supervision, operation and maintenance of plant.

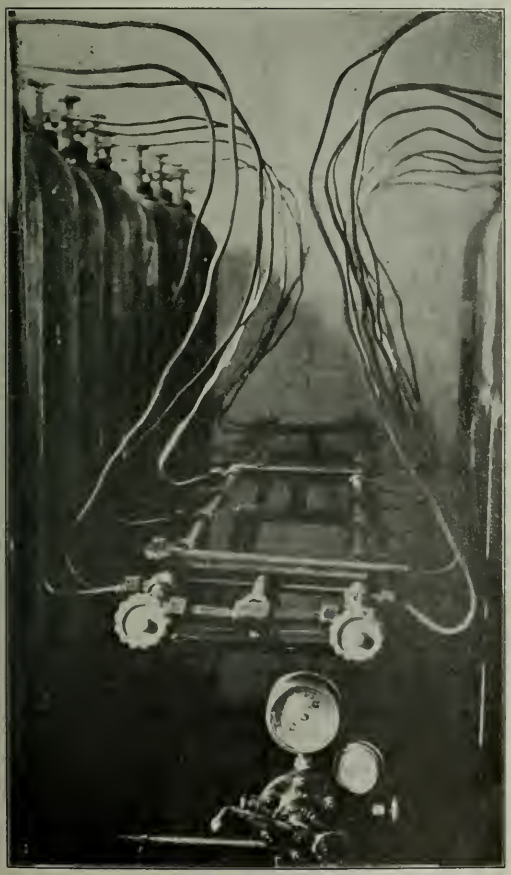
The average cost per burning hour of the gas consumed is determined by dividing the total expenditure for gas and gas making material by the number of hours worked by burner operators. The cost of gas per burner hour is influenced by a number of factors and the lowest cost does not necessarily denote the greatest efficiency of operation. A lower gas cost per

burner hour may be due to the large per cent of time lost by the operator during which the flame is not actually burning. A higher cost, on the other hand, may be due to a wasteful use of gas, accounted for by an improper mixture or by allowing the



Oxweld Generator House for the Frisco at Birmingham, Ala.

flame to burn while not actually welding. Obviously, the cost per burner hour is not an acceptable measure of welding efficiency. The most equitable comparison may be made between the performance at different plants, or different periods at the same plant, by using the economy effected by burner hours, or per dollar expended for gas.



Oxygen Manifold in the Generator House

The cost of making repairs by former methods is arrived at as follows:

In all cases where, in the absence of the Oxweld plant, the parts would have been scrapped, the cost is computed by deducting the scrap value of the old parts from the cost of new material.

In all cases where it would have been necessary to remove the parts to complete repairs by other methods, the cost of removing and replacing has been added to the cost of effecting repairs.

In cases where, by either the Oxweld or other methods, the parts would have been removed, the cost of repairs in the blacksmith, machine or other shops is considered as against the cost by the oxy-acetylene process.

The following table shows in detail the welding operations which were performed at the new Springfield shops for the twelve months ended June 30, 1914, giving also the direct labor and material cost of the repairs made by the oxy-acetylene process, the estimated cost by former methods, and the estimated saving effected by the use of the oxy-acetylene method. No attempt has been made to take into consideration the overhead or indirect expenses as they practically offset each other in both cases. This saving does not include a large number of minor operations of insufficient importance to justify the labor of recording them separately. Nor does it take into consideration the indirect saving due to time saved. For instance, if a locomotive is assumed to be worth $25 a day and a freight car 45

Savings by Individual Items—Springfield New Shops, July 1, 1913, to June 30, 1914

cents a day, the amount saved by returning them to service several days sooner than would otherwise be the case would be very considerable.

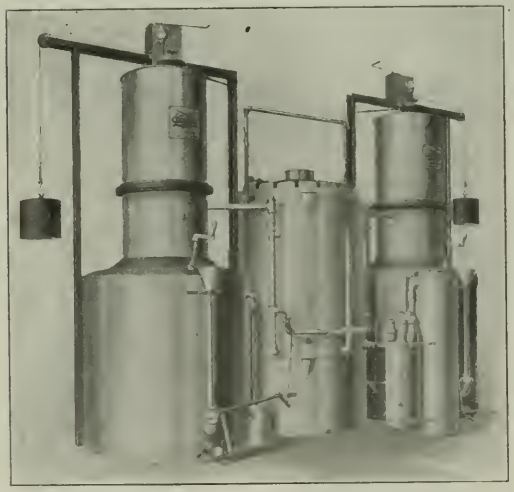
The chart showing the relative savings due to the use of oxy-acetylene for various groups or classes of repairs is of more than ordinary interest and indicates that its greatest use thus far has been in connection with boiler repairs.

The table showing the saving effected by the oxy-acetylene

Oxweld Generator House at the Springfield New Shops

process from April 1, 1913, to June 30, 1914, is also of special interest because of indicating the extent to which this process is used at the various shops. The variety of work performed at the north shops and at the reclamation plant is so great that its listing would occupy more space than is available.

Sometimes figures of economies claimed are questioned as to their accuracy and authenticity. In order that the officers of the company might not congratulate themselves with unwarranted optimism or enthusiasm a thorough check of these accounting figures was recently made by Haskins and Sells, certified public accountants. The result determined the substantial accuracy of the figures quoted.



Oxweld Low-Pressure Duplex Generator

BOILER AND FIREBOX REPAIRS

All firebox sheets and patches are welded in instead of using rivets and patch bolts. The actual saving thus accomplished is very large, but even this is insignificant as compared to the saving made by lessening the running repair work at the engine houses and curtailing terminal delays. The Frisco now has in operation more than four hundred locomotives in which firebox sheets and patches have been welded. Seventeen of these have been reported as leaking. Careful inspection, however, developed the fact that four had pin hole defects in the welds while the remaining 13 had developed defects in other sheets than those welded.

When new staybolts are applied to fireboxes, the usual practice is either to cut off the protruding ends with a staybolt nipper, an air hammer and chisel, or a chisel bar and sledge. When the nippers are used the end of the staybolt is crushed and the threads are held less securely in the sheets than they otherwise would be. When the staybolt ends are cut off, either by the use of an air hammer or the sledge and chisel bar, the hole in the sheet is to a slight extent elongated, resulting oftentimes in a loose staybolt. Where staybolts are carefully driven up after being cut off, such defects may not immediately cause trouble, but often within a short time leaks develop and after the bolt

STATEMENT OF WORK PERFORMED

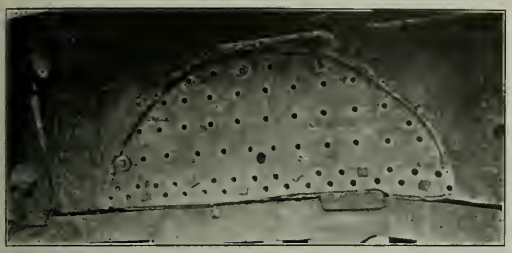
Diagram Showing Relative Saving on Various Classes of Work Repaired With the Oxy-Acetylene Apparatus for 17 Months, Ending August 31, 1914

has been calked a few times, and the metal of the head has worked away, the only way of stopping the leak is to remove the bolt from the sheet and apply a new one.

With the use of oxy-acetylene cutting burner the protruding ends may be cut off in less time and at no greater expense than by the other methods; when done in this way neither the bolt nor the sheet is injured and the end of the bolt is also annealed so that it may easily and properly be driven up.

Two or three typical cases of repairs to fireboxes made by

the oxy-acetylene method are illustrated. One of these shows a welded door hole patch on engine 740. This patch saved the renewal of a door sheet, and except for the discoloration of the metal due to heat from the burner it is practically impossible to detect the weld. It cost $21.10; it is estimated that if done by former methods it would have cost $81.68. One of the other views shows a firebox sheet, which had been badly worn by a driving wheel, with a patch in place ready for welding. The companion view shows the patch welded in by oxy-acetylene process.



Patch in Place, Ready for Welding, on Firebox Sheet Worn by Driving Wheel

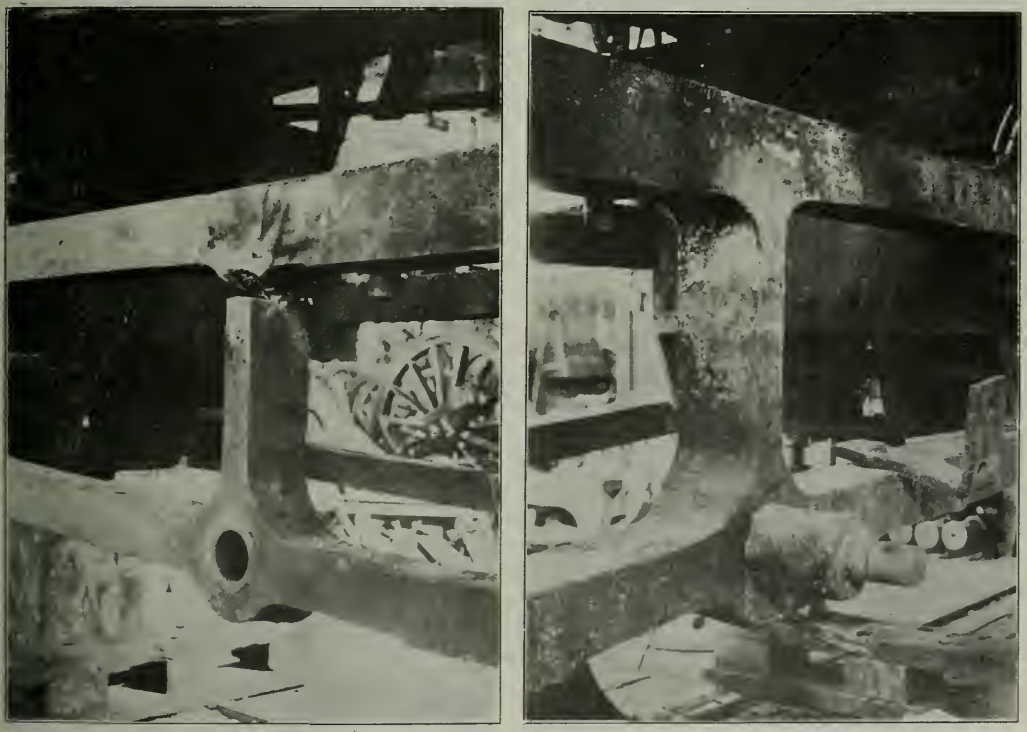
Firebox Patch Welded in Place by Oxy-Acetylene

Following is a brief extract from a report made by one of the master mechanics:

We have engine 975 with a collar patch on the firebox door, and it is surprising to see the job that was done. There is no sign of a leak whatever. I also took guide yoke off of engine 1404, which was badly cracked and patched, and sent it to the north shops at Springfield. It is a hard matter to detect where the weld was made; it is now as strong as ever, and saved applying a new one.

TUBE WELDING

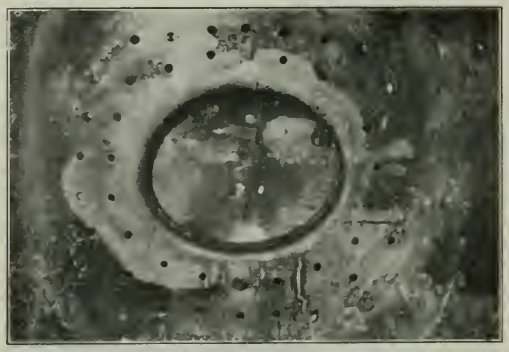
The welding of tubes into the tube sheet has proved most successful. One engine had an entire set of tubes welded in 11 months ago and has been in continuous service since that time; it was recently inspected and the tubes were found to be in splendid condition. During this period no repairs have been necessary to keep the tubes tight in the sheet and to prevent leaking. As a result of this experiment, the welding in of tubes has been adopted as a standard practice and all of the locomotives will be treated in this way as rapidly as the oxy-acetylene plants can handle the work.



A Difficult Frame Weld Accomplished by the Oxy-Acetylene Process

While the original or first cost of welding in the tubes is higher than the ordinary practice of rolling and beading, this

additional expense is much more than compensated for by the advantages of the welded tubes. If the original welds are properly made the maintenance cost is reduced to practically nothing. This is especially appreciated by those in charge of the engine houses. In addition to the reduction in engine house work the life of both the tubes and the tube sheets will be increased, possibly as much as 50 per cent. With the continual rolling and working ordinarily done to stop leaks, the life is gradually worked out of the tube ends and the tube sheets are distorted, necessitating renewals at more frequent intervals than



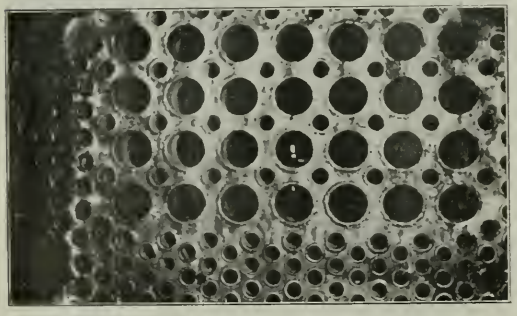
Fire Door Patch Welded in by the Oxy-Acetylene Process

is the case with welded flues where no work is necessary. One of the illustrations shows an installation of superheater tubes which have been welded into the tube sheets.

MISCELLANEOUS REPAIRS

As indicated on the chart which shows graphically the relative savings made by oxy-acetylene welding in the handling of different classes of repairs, the welding of locomotive frames plays a most important part at the new Springfield shops. Several of the photographs show repairs which have been made, either by welding broken frames or filling up worn places. This method has given uniformly good results.

Thus far the work accomplished at the new Springfield shops



Superheater Tubes Welded into Tube Sheets

has been very largely in the line of boiler and frame repairs, although splendid use has been made of the apparatus in repairing broken machine castings and in welding various locomotive and passenger car parts. The volume of boiler work has prevented, or interfered with, this miscellaneous class of work. However, it is steadily increasing in volume. A few of the articles which have been thus repaired are shown lying on the bench and floor in the photograph of the pre-heating forge which is used by the oxy-acetylene welders in the machine and erecting shop.

A considerable amount of work has been done in filling up and re-enforcing worn side rods, some of which were originally of poor design. It is estimated that the saving effected in forming and welding on new ends amounts on the rods of a ten-wheel engine to approximately $65.

The flange joints at the end of the water columns and spouts are subject to frequent breakage. Ordinarily this means the scrapping of the column and its replacement with a new one.

With the oxy-acetylene process broken flanges may be welded at a slight cost. As an instance of this sort, the water column at Monett, a most important point, was damaged in this way.

Preheating Forge and Bench for Making Welding Repairs

It was sent to the north shops on a night train and the iron flange which was broken in several places was repaired and the column was returned to Monett the following night.

NORTH SPRINGFIELD SHOPS

The north Springfield shops are largely used for the finishing or manufacturing of material and for freight car repairs. How-

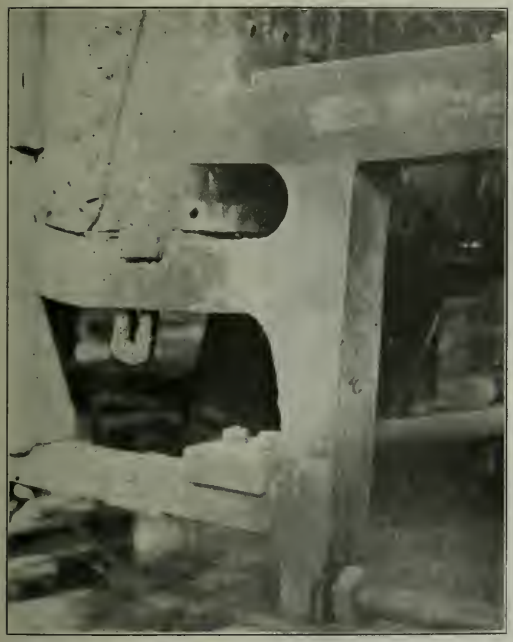
This Frame Worn to a Depth of 5-8 in. by a Spring Hanger Was Built up to Size by the Oxy-Acetylene Process

ever, several engines are repaired in the erecting shop each month and there is also a special department for overhauling work equipment and motor cars. Naturally, under these conditions, many possibilities are offered for the advantageous use of the oxy-acetylene apparatus. The greatest volume of this

work is in connection with the repair of freight car castings. The value in making repairs to broken or worn parts of the work equipment and motor cars can hardly be estimated, but is very great. Many of the parts for this class of equipment are not regularly kept in stock, and if the oxy-acetylene plant were not available extended and expensive delays for securing material would be unavoidable.

Wonderful results have also been obtained at the north shops in making repairs to machine tools and machinery. Following are a few instances of this sort:

Engine 1000 came into the shop for repairs to a cylinder. The planer upon which this work was to be done broke down. Under ordinary conditions it would have required from ten days to two weeks to secure a new part for the planer and the locomotive would have been held out of service for that length of time, although no repairs were necessary other than those to the cylinder casting. With the use of the oxy-acetylene ap-



Pedestal Jaw Broken Between the Top and Bottom Rail Which Was Welded by Oxy-Acetylene Process

paratus the planer was repaired and placed in service within 45 minutes.

The internal gear was broken on a power forcing press, two of the teeth being torn off. It would have required at least ten days to procure a new gear. With the oxy-acetylene apparatus the teeth were built up and the press was again in operation on the following day.

The housing for a large roll was broken. The factory was immediately telegraphed for a new part which reached the north shops six weeks later. Meanwhile the oxy-acetylene operator got busy and welded and replaced the housing within a day and a half. The new housing is still held in reserve.

A long hole of large diameter was being drilled through a locomotive trailer truck casting. There was only one drill of the proper size in the shop and it broke through the middle. In one and one-half hours it had been repaired with the use of the oxy-acetylene apparatus and was back in operation. This was several months ago and the drill is still working.

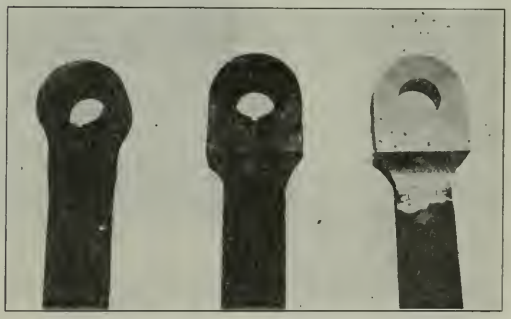
Repairs are made to brass, bronze, special alloy castings, and steel castings, as well as to those of cast iron. Important savings are made in repairing the cases for air motors and other of the smaller parts of these tools. Other interesting jobs which have been performed at the north shops are as follows: In a number of cases deck castings have been welded. A locomotive bell of a special composition which had become cracked was successfully welded without in any way affecting the sound qualities. Splendid results have been obtained in repairing steel

A Water Column and Spout Which Were Repaired by the Oxy-Acetylene Process

passenger coaches by cutting out worn parts of the roof, thus allowing new parts to be riveted in place. A cast steel frame on a six-wheel coach truck was broken on both sides. There were no extra castings of this sort in stock and the pieces were successfully welded together, resulting in a very large saving, as the steel castings would otherwise have had to be scrapped. Instead of drilling the cylinder saddle holes in a new smokebox they are burned through with the cutting burner. Large savings have been made in repairing injector castings which have been cut by the wind sheet.

Particularly important results have been gained at the north shops in welding cast steel bolsters. The average cost of these bolsters when new, allowing for their scrap value, is $19.36; the average cost of making repairs to a large number proved to be $2.46, a net saving per bolster of $16.90.

Examples of savings such as mentioned above, might be multi-



The Ends of Side Rods are Reinforced by the Oxy-Acetylene Process

plied indefinitely, but those cited will give some idea of the adaptability of the oxy-acetylene apparatus for emergency repairs of all kinds, as well as for the routine work in a locomotive and car repair shop.

The installation of the Oxweld plants on the Frisco and the progress of the work in these plants has been carefully supervised by H. W. Jacobs, of the Oxweld Railroad Service Company, who was probably the first engineer to suggest the piping of oxygen and acetylene gases for this purpose in railroad shops in this country.

HARRY R. KURRIE

Harry R. Kurrie, general attorney of the Chicago, Indianapolis & Louisville, at Chicago, on September 4 was elected president of the company at a meeting of the board of directors in New York, to succeed Frederic A. Delano, who recently resigned to become a member of the Federal Reserve Board. Mr. Kurrie is 39 years old and is, therefore, one of the youngest railroad presidents in the country. He was selected by the executive committee which has had the matter under consideration since Mr. Delano's resignation.

Mr. Kurrie is a lawyer, and for the past 13 years has been connected with the legal department of the Monon; for the last four years as general attorney. Having previously been engaged in the private practice of the law he has never been directly connected with any other corporation than the Monon, and in his work in the legal department he has commanded the respect of his superiors for his character and ability and his unremitting industry.

Harry R. Kurrie

In announcing Mr. Kurrie's election E. C. Field, vice-president and general solicitor of the road, gave out a statement in which he spoke of Mr. Kurrie as follows: "He is a man of character and deliberate judgment and his proficiency as a lawyer became well established throughout Indiana. He has always been a hard worker, has unusual capacity for the details of transportation problems and is now the most thoroughly equipped man for chief executive on the Monon road. He will have no outside matters to embarrass him and his sole ambition will be to make successful the property that has acquired the most enviable reputation under the splendid management of Fairfax Harrison, and later of Frederic A. Delano. Mr. Kurrie knows practically every man on the system and there will be no disturbance either in the policy of the road or its organization. The Monon is essentially an Indiana road, most of its mileage being in that state. Mr. Kurrie is the first Indianian to have executive charge of the property, and I predict his appointment will be more gratifying to our patrons than any other that has ever been made. He is a young man yet and he is a very sensible man. He will make as good a president as any railroad man in the world."

Mr. Kurrie was born in Orange county, Indiana, on April 26, 1875, of German stock, and although of recent years he has maintained a residence in Chicago, he has also spent much of his time on his farm at Paoli, Ind., his home town, and has always lived almost within sight of the Monon tracks. The Monon road was built through Paoli soon after he was born, and he has thus been constantly associated with it throughout his life and has felt a real attachment to the company. Since being connected with the road he has had various opportunities to accept other places at greater salaries, but has always felt a strong inclination to remain with the road. His early life was spent on a farm near Paoli; later he became a student in the State University at Bloomington, Ind., and he was graduated from both the literary and law departments. In June, 1895, he began the practice of law at Rensselaer, Ind., and on February 10, 1902, he was appointed assistant general solicitor of the Chicago, Indianapolis & Louisville, in Chicago. In January, 1910, he was promoted to the office of general attorney.

ENDING THE MILEAGE-BOOK DISCRIMINATION

[New York World].

The Pennsylvania and New England railroads which have announced increases in passenger rates are confining the advances to their mileage-books. If any change upward is to be made, and the commission has virtually sanctioned an upward change, this is the best way to go about it. A general advance in passenger rates would undoubtedly reduce passenger traffic. An advance in mileage-book rates alone should have slight effect in reducing traffic. There has never been any sound reason for this discrimination against single-ticket travelers. The wholesale and retail principle does not apply. While mileage is sold wholesale in the book form, its transportation is actually used retail by the buyer as he pleases, in time or place or distance, just as with the single-ticket buyer. He is as incalculable a traveling quantity to the railroad in the one case as in the other. The money of the hand-to-mouth buyer of transportation ought to be as good as that of the man who buys his transportation ahead of its use.

[Philadelphia Public Ledger]

The Interstate Commerce Commission is responsible for the proposed increase in mileage-book passenger rates. The commission is committed to the proposition that every branch of the railroad business should show a profit. . . . A 5 per cent increase in freight rates would have distributed the burden so widely that no one would have felt it. . . . But the extra cost of every mile one travels on mileage books will be considerably greater than the extra freight which the railroad wished to charge on the pair of shoes that he wears. The traveler will feel the increased cost of each mile, but the increased cost of the shoes would not have been discernible. It is a beautiful theory that every branch of the railroad business should show a direct profit; but every practical man knows that the indirect profits of an apparently unprofitable branch of his business are sometimes so great that he would have to go into bankruptcy if it were not for them. It is the men traveling in the passenger trains who make the business that fills the freight cars. Theorists in Washington do not seem to be able to comprehend these simple business principles.

Port Development in Costa Rica.—The president of Costa Rica, subject to the approval of Congress, has signed a contract providing for the development of Port Tortuguero.

Controlled Manual Block for Opposing Movements

A Short Two-Track Freight Railroad in New Jersey Fulfilling the Functions of a Three-Track Line

By C. C. Anthony

The Pennsylvania Railroad has recently installed on two miles of double track a controlled manual block system designed to permit movements to be made by signal indications in either direction on either track and to protect against opposing trains every possible movement from a yard or over a crossover near the middle of the section. The installation is on a part of the freight line connecting the four-track main line with the terminal yard on the Hackensack Meadows, near Jersey City. On account of the large number of both slow and fast freight trains passing over these tracks it was thought desirable to provide block signal protection and, at the same time, to provide for movements against the current of traffic by signal so that one train could be run around another in the section in question, without the use of train orders. It had been found necessary to make such movements frequently (on one occasion sixteen trains were run against the current of traffic in one day) for the purpose of getting trains of perishable freight into Jersey City for the New York market when slow freights ahead of them were blocking the normal track; getting fast freight, from Jersey City around slow trains that had pulled out of the Meadows Yard, and getting trains into the yard within the sixteen-hour limit.

For movements with the current of traffic the two-mile block section is divided into three blocks by automatic signals. The signals governing entrance to the two-mile section in the normal direction are, however, necessarily absolute signals to hold trains when opposing trains are in the section. To enable trains to follow one another the same as they do under automatic block signals, each of these signals is provided with a second—"calling-on"—arm. Both arms must be horizontal when a train moving against the current of traffic is at any point in the two-mile section. When trains are moving in the normal direction, the top arm may be set at caution if the block extending to the first automatic signal is clear and that signal is at stop, or at proceed if the block is clear and the first automatic signal is at caution or proceed. If, however, the block is occupied (by a train that has entered in the normal direction), the top arm is held in horizontal position by track-circuit control and the calling-on arm can be set at caution to allow a second train to enter the occupied block.

For movements against the current of traffic it was not thought necessary to provide intermediate automatic signals and, on each track, the block extends the entire length of the two-mile section. Entrance to this block in the direction against the current is governed by a three-position signal which is, of course, locked in (absolute) stop position when trains are moving in the normal direction, but can be set at proceed for a movement in the reverse direction, if the block is clear; or at caution for a second train to enter the block occupied by a preceding train. That is, trains move normally under the automatic block signal system varied by the use of a calling-on arm for movements past an absolute stop signal at the entrance of the first block; while, in the reverse direction, they move under the permissive manual block system. The layout of tracks and signals is shown by the right-line plan, Fig. 1. West of CG the tracks run through a yard and are not block-signaled; hence the absence of westward signals at that point.

In working out the system it was assumed that the rear protection to be provided should be the same as that afforded by the simple manual block system; that it would not be justifiable to complicate and increase the cost of the system for the purpose of making it necessary to secure a separate unlock for each of several successive trains in the same direction. The circuits and controlling devices are designed primarily to prevent the admission of opposing trains to a section under any circumstances. If, however, power-operated or electrically slotted signals are installed, it is a simple matter to provide a degree of rear protection that is not possible with the simple manual block system; that is, the movement of a signal from the caution to the proceed position may be controlled by all the track circuits in the section, so that a clear signal cannot be given unless the whole section is clear. And, as a matter of course, such a signal would be made semi-automatic so that it would be set at stop by every train passing it, and manipulation of the signal lever for each train would be necessary. The signals of the installation in question are motor signals controlled in this way.

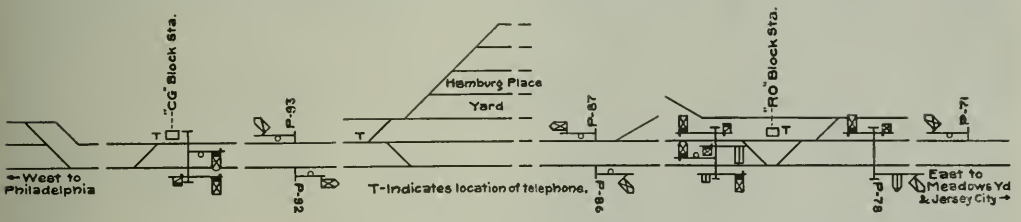


Fig. 1—Tracks and Signals on Freight Line

It is true that, if the system were designed for absolute blocking only, it might not be a difficult matter to arrange it so that a separate unlock would have to be secured for each train. But it is important to note that, to secure the full protection of the system, every train movement into a section should be made by signal indication, or by its equivalent, such as the unlocking of an outlying switch. If absolute blocking is provided for and if then, in practice, it happens rather frequently that freight trains are allowed, by caution card or train order, to pass stop signals for the purpose of following other freights in the sections, the checks applied by the system are ineffective in these cases; a card or order may be issued in error to admit a train against an opposing train. Therefore, if permissive movements are to be made even occasionally, the system should be designed so that proper signal indications can be given for such movements. To accomplish this in a simple way it is practically necessary that the apparatus be so arranged that an unlock, once obtained, can be held until the section is clear. The only occasion for admitting trains under stop signals should be when there is some derangement that prevents the clearing of a signal; or when a train must be admitted in the opposing direction to reach a disabled train; or when a train has to be run over the working

limits of a work train that entered the section in the opposite direction. In all such cases on the Pennsylvania the despatcher takes charge and issues the necessary orders, first assuring himself that any apparent derangement is not due to the presence of an opposing train in the section.

The novel feature of the system is the provision for control of movements into the section at outlying switches. The apparatus and the essential circuits are shown diagrammatically in Fig. 2. Readers who are not interested in these details will find the possible train movements and the protection afforded, illustrated by the diagrams in Fig. 3, which are explained farther on.

Fig. 2 shows a block section with two outlying switches, one controlled from each block station. For the control of an outlying switch the block instrument is made up of two manually operated electric locks, C and D, interlocked by mitered mechanical locking clearly shown in the figure. When the operating handles, c and d, of these electric locks are moved to the right or left, the lock segments, of course, rotate in the opposite direction; in the three conventional symbols for the circuit-controller contacts in each lock (shown below the lock) the lower ends of the contact arms are supposed to move in the same direction as the handle. The signalman at station A, to give an unlock to B, moves the handle c, of his block instrument, to the left. The circuit is then from battery (+) through contact of indicator E, which is controlled by the track circuits extending to a point just beyond outlying switch a; wire 1, contact of electric lock F, which is closed when the signal at A is locked in stop position; wire 2, armature contact of block instrument C, which is closed when the instrument is locked against a movement that would release the signal; wire 3, contact closed when c is moved to the left, wire 4 through contacts of track relays I, J, i, covering the middle portion of the block, between the outlying switches; normally closed contact of the block instrument at B, wire 5, electro-magnet C to common return. The signalman at B then moves his handle c to the right, thereby mechanically releasing the other part of his instrument, D, and closing the circuit from wire 6 to 7. The circuit from 4 to 5 remains closed so that after an unlock is received, the indicator of C will show at any time whether the portion of the block between A and b is occupied.

B is now ready to clear his signal. To do this he must move handle d to the right and this can be done only when indicator E is clear, the circuit being from battery at B through contact of E, wires 1, 2, 6, 7 and 8 to electro-magnet of D. Movement of d to the right breaks connection between wires 7 and 8 so that the armature of D will fall, lock d against return to normal position and close a circuit from battery through wires 9 and 10 to the lever lock F, which then releases the signal.

When the signal has been cleared and thereafter returned to normal position, d may be moved to position MR to break circuit 9, 10, and lock the signal lever; but it cannot be moved farther until the train for which the signal was cleared has passed beyond switch b; then indicator E will clear and close circuit 1, 2, 6, 7, 8, thereby unlocking D. Handle d can then be moved to normal position, when it releases c, which is mechanically locked in position to the right when d is moved either to the right or left.

If B should now move c to the left he would close a circuit to unlock A, exactly the same as the one first described. This circuit, however, would not be complete so long as the train was on any track circuit controlling a relay h, i, J or I; (relay h controls indicator E which prevents the giving of an unlock, by B by opening the connection between battery and wire 1; while relay H, although similarly preventing the giving of an unlock by A, does not prevent the receipt of an unlock at that station because wire 4 goes directly to instrument C). Assuming that

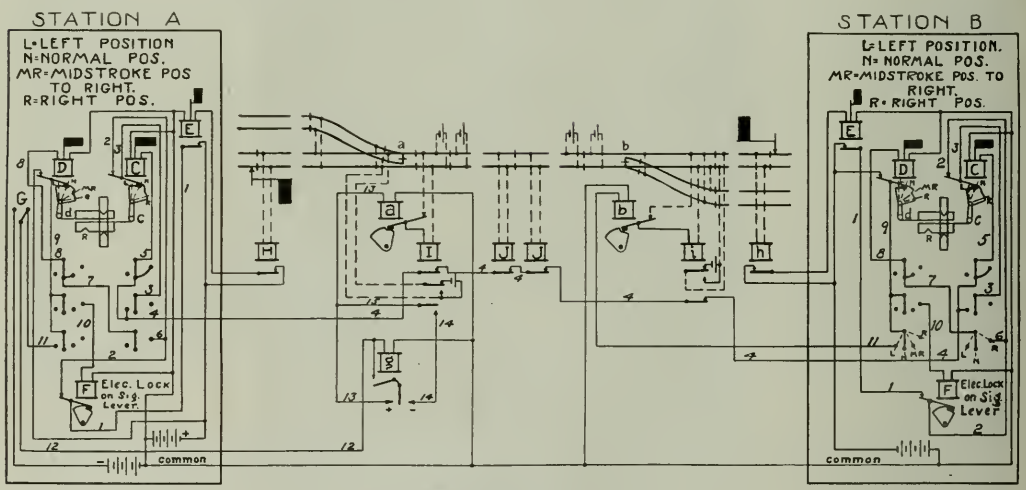

Fig. 2 Typical Diagram of Circuits

there is a train on the siding waiting to pull out at a, the crew will report by telephone when the train moving from B to A passes. B may then give A an unlock. A will move handle c to the right but cannot move d to the right, so as to release his signal, because the circuit for unlocking D (1, 2, 6, 7, 8) is open at indicator E while the approaching train is between a and A. He is, however, free to move d to the left because it is mechanically released by c (moved to the right) and the electric lock of D is not effective against movement of d to the left but locks only against movement to the right or return from position MR to normal. Movement of d to the left breaks connection between wires 7 and 8 so that, when there is no train between A and a and circuit 1, 2, 6, 7, 8 is closed at E, the armature of D will fall. The same movement, the armature contact of D being closed, completes a circuit from battery through wires 9 and 11, circuit controller G and wire 12 to polarized relay g which closes a branch of the same circuit through wire 13 to the electric switch lock, a.

As the armature of lock a controls relay I and relay I controls the circuit of H, indicator E is open while the switch is unlocked and while a train pulling out is on the track circuit of relay I. It is therefore impossible, during that time, to move

handle d to the right to release the signal; and the train would be protected at A if it should make the move illustrated by case 4 or case 6, Fig. 3. Assuming that it moves toward B, an unlock cannot be received at B while it is between a and b; consequently an opposing train cannot be admitted to the block either by signal at B or by unlocking of the switch at b. After it has passed b an unlock may be received and used to let a train out of the siding at b but, as explained in the case of A, cannot be used to release the signal. A, however, still retaining the unlock obtained to let the train out at a, may, after this train has cleared the track circuit of relay I, move handle d to the right and give a caution signal to admit a following train.

If a train moving from B to A has to enter the siding at a,

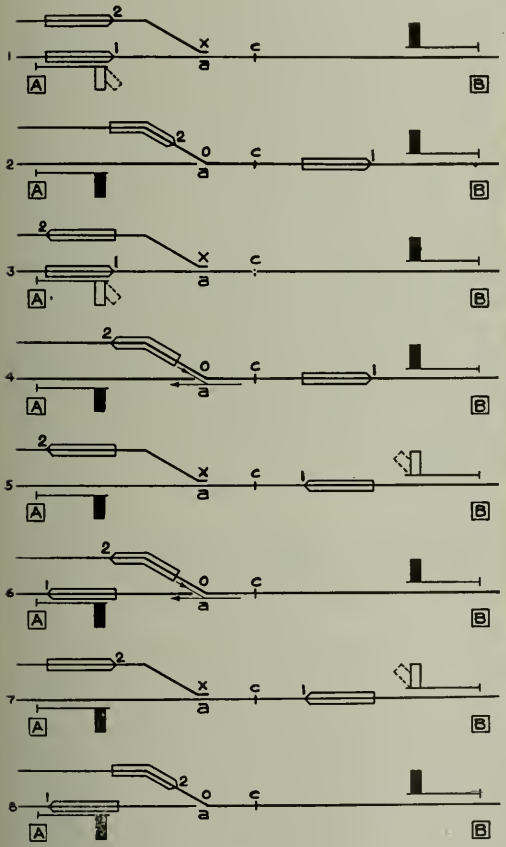

Fig. 3—Diagrams Illustrating Protection and Possible Train Movements

circuit controller G is moved to the left to close a circuit from the negative pole of a separate battery to relay g. This relay then continues the circuit through wire 14, back contact of relay I, wires 15 and 13 to the switch lock which may thus be unlocked when the train is shunting relay 1. Obviously the switch could be unlocked in this way while a train was passing on the main track or while the track relay was open because of some defect. But it is equally obvious that, if electric switch locks are used, some provision must be made for unlocking switches at which trains have to enter sidings; the arrangement illustrated is reasonably simple and has been found satisfactory in practice. If a switch is normally used only for trains leaving the siding, the circuits are arranged as at station B.

There are various additions to these circuits where semi-automatic signals, electric distant signals, approach locking, etc., are installed; but the block circuits remain the same and, as the diagram shows, require but two line wires through each block and one additional wire for each outlying switch, extending from the switch to the block station from which it is controlled. Indicator E, however, requires a line wire if there is a semi-automatic distant signal between the block station and the farther end of the track circuit for relay 1.

Turning now to Fig. 3, the results obtained in the way of protection and facility of movement may be explained with the aid of the diagrams; these show a block between block stations A and B, the signals governing entrance to that block and an outlying switch, a, controlled from block station A, with trains passing and meeting under various conditions. X indicates that the switch is electrically locked; O, that it is unlocked. Semaphore arms in solid black indicate that the signals are, for the time being, locked in stop position; arms in outline are free to

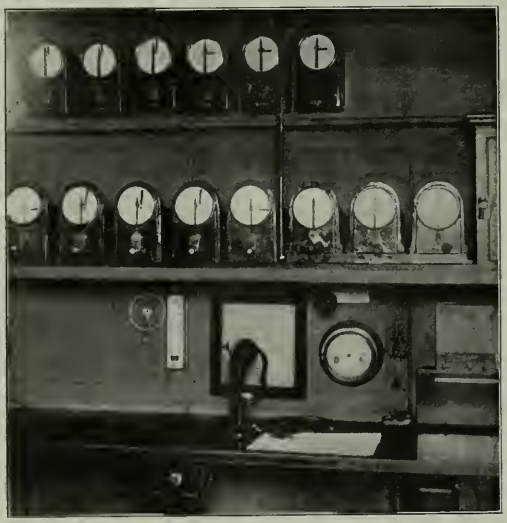

Fig. 4 Interior of R O Cabin

be set in caution position as indicated by dotted lines. The point c is the end of an intermediate track circuit beginning at the switch and extending 500 feet or more.

In case 1, train 1 has entered the block at A and switch a cannot be unlocked. When train 1 has passed c, as in case 2, the switch can be unlocked for train 2 to follow. Whether train 2 shall be allowed to follow permissively or shall be held on the siding till the block is clear, is a matter of manual block operation; but if it is allowed to follow train 1, it will be protected against opposing trains, by the signal at B, until it clears the block. In case 3 and 4 it is assumed that train 2 has taken the siding to meet train 1, but, for some reason, will have to back out at a instead of pulling through the siding and going out at the other end. Again the switch is locked until train 1 has passed c and may then be unlocked for train 2 to back out and proceed toward A. In this case the signal at A remains locked until train 2 clears. In cases 5 and 7 the switch is locked while train 1 is approaching from B, but may be unlocked as soon as train 1 has passed it, so that train 2 may back out and follow train 1, as in case 6, or pull out and proceed to B, as in case 8.

It is hardly necessary to say that, if two or more trains are in the block, the last train in must pass c, in cases 1 and 3, or a, in cases 5 and 7, before the switch can be unlocked. In case 2, as

soon as train 2 has passed c, the switch having been set and locked for the main track, the signal at A is free to be set at caution for a third train to enter the block at that point. Similarly in case 4, if, after train 2 has cleared at A, a third train should arrive at A before train 1 has cleared at B, the signal at A can be set at caution for this third train to follow train 1; and in case 8, after train 1 has cleared and train 2 has passed c, a third train may be admitted at A on a caution signal. In cases 4 and 6, however, the signal at B remains locked until train 2 clears the block; it is hardly practicable, without undue complication, to arrange the circuits so that the signal at B, in these cases, can be unlocked as soon as train 2 has started from a toward A (assuming that, in case 4, train 1 has cleared in the meantime). Nor is such facility of much importance in practical operation.

In actual operation there is, of course, an understanding as to the move to be made in each case; but it is obvious that, *so far as the signal system is concerned*, the unlocking of an outlying switch leaves a train free to enter the block and move in either direction, and must, therefore, be preceded by the locking of signals against other trains from both directions. It is found to be quite practicable, however, to release the signal at the block station from which the switch is controlled, as soon as the rear of a train that moves away from that block station has cleared a track circuit at a point about 500 feet from the switch, as in case 2, Fig. 3. It is assumed that, if the train stops on the main track for the switch to be set normal and then moves in the reverse direction, as in case 4, it will not clear the track circuit in question and will hold the opposing signal locked until it clears the block.

An indicator or electric signal might be used, instead of an electric switch lock, to govern trains leaving a siding, with practically the same circuits and operation. The electric switch lock requires means for unlocking the switch to allow a train to enter the siding, as explained in connection with the circuits.

Although the circuits and operation have been explained for the typical case of one or two outlying switches in the block—one controlled from each block station—the number of switches that can be controlled is not limited. In one block on another part of the Pennsylvania, there are four switches, all of which it was thought desirable to place under complete control because trains might occasionally clear the main track at any one of them. An additional section of the block instrument, with the necessary switch-lock and controlling circuits, is provided for each additional switch controlled from a given block station, and the same protection and facility are secured for movements into the block at any one of the switches as are obtained in the case of one switch controlled from each block station. In practice complete control is provided only at those switches at which trains are expected to clear the main track in normal operation. The switch of a short industry track, for example, is not electrically locked and the instructions prohibit the regular use of that track for passing of trains. If, in some emergency, an engine should get clear on such a track and allow other trains to pass, its return to the main track would be governed by train order.

An example of a switch not controlled is the one at the spur track near signal P87, Fig. 1; as there will practically never be any occasion for even an engine to get clear on this track, the cost of providing an electric lock fully controlled, as a part of the block system, would not have been justified. The crossover between main tracks, near Hamburg Place yard, is treated, with reference to each main track, as a connection between that track and a siding. Thus, if a train is on the westward main track waiting to cross to the eastward track, the crossover must be unlocked by circuits connected with the eastward track—the track that the train is about to enter; and, as already explained in the case of a siding switch on single track, these circuits permit the unlocking of the crossover only when conditions are such that a train may safely enter and move in either direction on the eastward track. The presence of the train on the westward track prevents the unlocking of the crossover by means of circuits connected with that track. Conversely the crossover must be unlocked by circuits connected with the westward track when a train is to cross to that track. The connection between the yard and the westward track falls under the typical case of a siding connecting with a single-track line; the circuits are necessarily arranged, as explained in connection with Fig. 2, to permit the unlocking of the switches for a train to enter the yard.

The benefits derived from the system in this application to double track are the saving of the despatchers' time that would have to be given to this section if movements against the current of traffic were frequently made by train order, and the facility for making such movements safely at a moment's notice whenever conditions permit, without the delays incident to the issue of train orders—a facility that means, assuming a certain use of the tracks against the current of traffic, the maximum capacity possible with such use of the tracks.

The same system is used on several sections of single track, among them two that lie between sections of double track. In one case, the first installation, the single track is about 8½ miles long, divided into two blocks of 3½ and 5 miles. There are passing sidings extending into the blocks from both ends of double track and a passing siding with crossovers at the middle block station. Each block station is an interlocking and a certain amount of benefit results, of course, from the saving of stops of trains that have to enter the sidings. Double track was thought to be urgently needed before the system was installed, seven years ago; from that time to the present there has been no serious difficulty in handling the trains on the single track, and second track, which would be quite costly, seems to be still some distance in the future. The latest installation has been made in connection with a section of new line about five miles long built to secure a better grade on a single-track division. Both the old and new lines are equipped with controlled manual block and the old line has one passing siding and one station spur track in the block. In this case passenger trains and local freights in both directions have to run over the old line on account of intermediate stations. The installation permits the use of both lines to the best advantage for the meeting and passing of trains, and at the same time gives some relief to the despatchers on a very busy single-track line.

The system described is the subject of a patent issued to the writer.

A QUARTER CENTURY OF DEFICITS IN PASSENGER SERVICE

The Bureau of Railway News and Statistics has issued the following:

Twenty-one years ago more than one-third of the railway mileage of the United States was carrying its passenger business at a loss. Taken in conjunction with the recent decisions of the Interstate Commerce Commission in both eastern and southwestern rates cases, finding present state-enforced passenger fares unprofitable and ruling that the railways need not apply to interstate traffic the excessively low rates forced by state legislation, figures taken by the Bureau of Railway News and Statistics from early reports of the commission show that at least for a quarter century the passenger traffic of the United States has either resulted in actual loss to the carriers performing the service or has failed to contribute its proper share to railway revenues.

The commission's recent decision, therefore, is seen as the result not of a recent development in passenger traffic, but of the fact that American passenger fares never have been adequate to the expensive quality of service demanded by Americans.

For six years after its creation the commission compiled figures showing not only the average revenue received by the railways for carrying one passenger one mile, but also the average cost of performing the service. For these six years the revenue, cost and difference in cents per passenger mile are as follows:

Year	Revenue	Cost	Difference
1888	2.349	2.042	.307
1889	2.165	1.993	.172
1890	2.167	1.917	.250
1891	2.142	1.910	.232
1892	2.126	1.939	.187
1893	2.108	1.955	.153

Taking these costs of a quarter century ago it may be seen how slight could be the profit today, when the average revenue has declined to 2.01 cents per passenger mile, forced upon the railways by state legislation, while all elements of cost, particularly labor, fuel, equipment and terminal facilities, have risen enormously.

By 1893, in fact, when the commission abandoned the computations, the railways in 4 of the 10 territorial groups were shown to be carrying passengers at a loss. The deficits for these groups for the several years follow in fractions of cents per passenger mile:

Group	1890	1891	1892	1893
V	*.388	*.217	*.089	.146
VII	*.063	.093	.283	.151
VIII	.026	.176	.212	.250
IX	.153	.057	.133	.050

*Net profit.

Thus in 1893 there was an average loss for every passenger carried by the railways of Georgia, Florida, Alabama, Mississippi, Tennessee, Kentucky, Louisiana, Arkansas, southern Missouri, Oklahoma, Indian Territory, Kansas, Nebraska, western North and South Dakota, Montana, Wyoming, Colorado, eastern New Mexico and Texas. These railways, paying more to furnish the passenger service than they earned from the service, operated 58,843 miles of the 169,780 for the entire country, or almost 35 per cent.

Today American railways furnish the highest class passenger service in the world at a price as low or lower than that charged by any of the railway systems of Europe in their first class tariffs, even disregarding the much greater value of the American cent in these foreign countries. The comparative cheapness of American travel is shown more truly in the length of journeys purchasable by an average day's labor, the wage taken being that of railway employees:

	Av. wage per day	Av. rects. 1st class per passenger mile	First class for day's labor
Switzerland	$0.99	*3.26 cents	30.4 miles
Great Britain	0.93	*3.00 cents	31.0 miles
Italy	1.15	*3.52 cents	32.7 miles
France	0.87	2.12 cents	41.0 miles
Belgium	0.85	2.01 cents	42.1 miles
Germany	1.35	2.93 cents	46.1 miles
United States	2.49	2.01 cents	123.9 miles

*Tariff rate.

One day's labor in the United States purchases thus almost three times as much travel as would the same labor traveling first class in the nearest European competitors above.

TARE WEIGHTS AND REFUSE*

By Arthur Hale

General Agent, American Railway Association

It was abundantly proved by the recent investigation into railroad weighing by the Interstate Commerce Commission that on an average the tare weights marked on cars were higher than the actual weights of the cars. This is because cars on an average decrease in weight by wear, rust and general decay, and gradually fall below the weight with which they were originally marked.

It seemed to surprise the commission and many of the shippers to find that this situation is an advantage to the shipper. But there is no doubt that whenever the tare weight of a car is used in arriving at the net weight, and this tare weight is too large by, say, 1,000 lb., the railway is moving 1,000 lb. of freight free for the shipper.

Of course, there are cases when the tare weight is too low. Sometimes cars are repaired so thoroughly that they weigh more than they did, and sometimes the addition of new wheels or other new parts to cars increases their weight; but the railways are growing more and more careful to reweigh cars after repairs are made and there is not near the difficulty with this that there used to be. There is still difficulty when refuse is left in a car and when the car with refuse in it weighs more than the stenciled tare weight upon it. This is something we will return to.

The important point is that cars grow lighter, and as they are growing lighter the light weighing of cars should be renewed from time to time to prevent losses by the railways in carrying freight.

It was testified in this investigation by the superintendent of the largest weighing association that in light weighing over 30,000 cars under the old rule, it was found that the tare marked on 73 per cent of the total exceeded the actual tare by an average of 1,008 lb. per car. Let us see what this means in freight money. The last statistics of the Interstate Commerce Commission show that lumber pays the railways a little over 7 mills per ton per mile. This means that if one of these cars, whose marked tare weight was 1,000 lb. too much, was loaded with lumber for a thousand mile trip, the railway makes a gift to the shipper of $3.51, which is enough to clean, weigh and mark the car several times.

The average rate on bituminous coal is 4.7 mills per ton per mile. Coal does not move as far as lumber, but many cars of coal move 500 miles, and on every such trip we are presenting the shipper with $1.17 whenever we use one of these cars.

The situation has undoubtedly improved since the investigation. The rule has been improved; the railways are weighing their cars more frequently and it may be fair to presume that the old status has been so far improved that we should use on an average 500 lb. instead of 1,000 to indicate the difference in light weight of cars which should be weighed. Taking the average rate of freight, 7½ mills per ton per mile, and the average trip of a ton of freight, 254 miles, we are on the average presenting each shipper 47 cents for each load if we neglect the light weighing of cars. The average freight car makes so many trips per month that it is an immediate economy to see that it is light weighed in accordance with the new rules. It may be safely stated that millions of dollars are being saved to the railways by this more frequent weighing and marking of their cars. But this is not a question to handle by averages. The average car is probably all right, but here and there a car will be found which has not been weighed for several years and is dried out, so that it is 1,000, or even 2,000 lb. light. Whenever a shipper loads a car like this, the railroad man responsible therefor may be absolutely certain that he is going to charge the shipper less freight than he should, and with a very old car and high class freight this may run up to $10 or $20 for the trip, according to the freight rate per hundred.

This weighing of a car rests primarily with its owner, but cars are away from home so much now that liberal provisions have been made to encourage railways to weigh foreign cars. The rules provide for the light weighing of wooden cars every two years and steel cars every three years, and any railway finding a foreign car on its line which has not been light weighed as per the rule can weigh the car and make a charge against the owner of $1 for the work, which charge is increased to $1.25 in the case of stock cars.

We understand that at points where a large number of empty foreign cars are handled, railways can make very good money by systematically examining and reweighing foreign cars; and this is as it should be, because in practice the railway which bills out the lading of one of these light cars not only loses a portion of its own revenue, but compels the other railways which move the car to lose a portion of their revenue as well.

I know from experience how difficult it is to get cars regularly light weighed and marked. In times of car surplus the demand for economy is such that it is sometimes difficult to get proper force assigned to this work; but when it is fully understood, not only by the traffic department, but also by the transportation and mechanical departments that every time the marked tare weight is reduced to the true figure there is an important increase in the freight earnings, the difficulty of getting the work done is very much lessened; and this paper is written chiefly with the idea of getting this important question

*Published in the Proceedings of the St. Louis Railway Club.

before the transportation people who arrange to have the cars light weighed, and the mechanical people who have to look after the marking of the car after it is light weighed.

The moment that it is generally understood that the reweighing of the old car is likely to bring an immediate and lasting reward in freight revenues, the difficulties in securing this light weighing will be diminished, even in hard times.

There is great difficulty too in getting cars light weighed when they are in demand. It seems hard to make a shipper wait while cars are being light weighed and remarked, but on the other hand it is very unfair to the railway to expect it to continue to use cars which are so marked as not to give full freight revenue.

This is one of the many things where railroad clubs, including as they do members of all departments, can help to improve railway practice. Normally the transportation and mechanical railroad men know little about freight rates, and when the traffic men are brought into contact with them the traffic men can tell them readily what rates are in effect on the principal commodities weighed on track scales; and they can work out together the actual economy in securing true weights on the freight which they are actually handling. If, for instance, there is a 10-cent rate on some iron pipe which is being shipped and the only car available is one whose light weight has not been renewed within two years, the agent can be pretty nearly sure that $2, or even $3 freight money can be saved to the company if that car is light weighed before shipment. This is also a matter of great importance to shippers who sell their goods on railroad track scale weights. If too high a tare is used they are going to be paid for less freight than they ship.

There is another way to look at this question, and here the yardmasters and agents can be especially useful to the railways. The marked tare is an important thing when cars are weighed on track scales, but not when cars are not weighed on track scales. It makes no difference to the railways what the marked tare is on cars loaded with warehouse freight, or on cars loaded by shippers with freight which moves under weight agreements. When it is impossible to get all cars light weighed to date, agents and yardmasters can do a great deal by using the cars with the old light weights in business where the tare weight is not a matter of importance.

There is a matter related to this on which the shippers can help the railways a great deal and where the railways can also help themselves, and that is the question of refuse in cars.

Under the law, consignees should unload *all* their freight, and this means they should not leave refuse in the cars, more especially when that refuse is incidental to that particular load of freight. Our present difficulty, however, in trying to get the consignees to clean out cars is that this rule has never been generally enforced, especially with open cars. Further, the railways, themselves, are not guiltless in this matter, and they do not always clean out the cars which they unload themselves.

It is true, as above, that a consignee ought to clean out his car, but on the other hand the railway ought to furnish a shipper with a clean car. The case is complicated where a consignee reloads a car and fails to clean it out before it is reloaded, and frequently a consignee objects to clearing out the car after he has unloaded it because he believes it contains refuse from a prior carload.

This state of things was fully exploited in the Weighing Investigation, and it was represented chiefly as a hardship on the shipper who might be called upon to pay freight on refuse left in the car by some one else. But the investigation did not fully develop another point, which is that the railways are now hauling about in their cars an amount of refuse so great in the aggregate that it must make some increase in their cost of operation. It is by no means infrequent, when cars of coal are unloaded by hand, to leave in the bottom of a car, and especially in the hoppers, slack coal and slate weighing 1,000 lb. or more. If 40 such cars get into one train of empties, it would cost the railway just as much to haul those 40 cars as it would to haul 41 really clean cars.

I see no way in which we can get definite figures on this subject, but the expense is undoubtedly there, and I believe that this would justify railways in spending more money than they do in cleaning out cars. If the railways will get their cars cleaned, I think it will be practicable to take the next step which will be to insist on consignees cleaning out cars, or charging them with the expense of such cleaning.

Can we not then conclude that there is more than one reason why the railways should see that their freight cars are clean and that the tare weight marked upon them is kept up to date? Not only will it pay the railways to do this, but it is the only honest thing to do.

EXPRESS COMPANY PROFITS NEAR VANISHING POINT

The Bureau of Railway News and Statistics has issued the following:

"With above 4,000 more miles of railway covered by their services 11 express companies operating in the United States during 10 months of the last fiscal year experienced a loss of 85 per cent in operating income. Official figures just published by the Interstate Commerce Commission show that for the 10 months to April, 1914, operating income for these 11 companies was $628,487, only 15 per cent of the operating income for the corresponding period in the year before, or $4,231,465.

"So drastic an exhibit as this raises the question before the American people whether they desire to see the express business wholly taken from private management and given entirely to the government through the parcel post. The showing is the direct result of the immense deflection of tonnage formerly carried by express to the parcel post, which in its competition for the business has enjoyed the overwhelming advantage of being able to increase its tonnage steadily through raising of the weight limit on parcels admitted to the mails while refusing with impunity to bear the increased expenses entailed, as would be necessary for a commercial enterprise, by withholding from the railways increased remuneration to cover the heavier work of carrying the enlarged mail tonnage. At the same time rates on the traffic left to the express companies have been cut 16 per cent.

"In gross receipts from operation for the 10 months, due largely to these influences, there was a loss of more than $8,000,000. Payments to the railways for their service in the express business consequently fell more than $3,000,000, while the tonnage which would have saved this revenue for the carriers as express was carried by the same railways without pay in mail cars. Operating revenues of the express companies thus fell $5,000,000, while a reduction of only $1,500,000 in expenses left a loss in net of $3,500,000, which was aggravated by an increase in taxes.

"For April alone, due to the same conditions, operating income fell from $437,826 in 1913 to $48,747 in 1914.

"The figures for the ten months and for April are as follows:

Ten months—	1914	Loss
Mileage	303,986	*4,213
Gross receipts	$132,646,163	$8,382,778
Express privileges—Dr.	66,413,551	3,266,223
Total revenue	66,232,612	5,116,555
Expenses	64,376,816	1,581,227
Net revenue	1,855,796	3,535,328
Taxes	1,227,309	*67,650
Operating income	628,487	3,602,978
April—		
Gross receipts	$12,839,513	$970,175
Express privileges—Dr.	6,475,442	373,537
Total revenue	6,364,071	596,638
Expenses	6,185,416	226,738
Net revenue	178,655	369,900
Taxes	129,908	*19,180
Operating income	48,747	389,080

*Increase.

"Of the 11 companies covered by the official figures, five reported operating deficits for the 10 months. One of the largest express companies alone during that period took in $466,258 less than it paid out to operate, and after paying taxes reported a deficit of $635,657 for the ten months' operations.

KANSAS CITY RAILROAD COLLECTION BUREAU

The railways entering Kansas City have organized the Railroad Collection Bureau of Kansas City, which began business on September 1, for the purpose of making joint collections of freight bills for all roads. The bureau is operated by the credit officers of the Kansas City lines under the supervision of an executive committee of the Credit Officers' Association. The expenses will be apportioned monthly to the lines according to the number of bills and the amount of money collected.

All freight bills, except the following three classes, are to be sent to the bureau for collection: 1. Bills collected in advance of delivery or forwarding of freight, known as counter-collections. 2. Bills covering freight interchanged with other lines. 3. Bills covering livestock collected by the Kansas City Stockyards Company. Fourteen collectors are employed and the cities of Kansas City, Mo., and Kansas City, Kan., are divided into districts with one collector assigned to each district. Each local freight office lists in numerical order bills for delivery to the bureau on a form made in duplicate, the original to be receipted by the bureau and returned to the local office, and the duplicate to be retained by the bureau. As fast as the bills reach the bureau they are to be charged to the collectors and distributed in cases provided for the collectors in the order of the names of the payees. Each collector gives a receipt for all bills received by him. The bills for collection turned over to the bureau are to consist of the original freight bill, cashier's memorandum, and, when receipt from consignees for freight is desired, a form of receipt, and all parts of each bill are to be attached together. Each collector is to make a list of the bills collected by him and balance them with the checks and cash collected, turning all in together with the cashier's memoranda of bills collected.

The bureau is to make a list daily of all bills collected for each line, separating them into the following classes: Inbound, outbound, switching, demurrage and storage, using a form which each line may use as a loose leaf sub-cash book. In case exception is taken to any bill the collector is required to obtain a written statement of the exception, and such statement and all parts of the bill are to be returned to the local office and a receipt taken for them. When correction has been made it is treated as a new bill and will take the regular course.

The manager of the bureau is required to deposit daily the full amount of cash collected for all lines and to draw a check daily in favor of each line for the full amount of the collections made for it, and will make such disposition of the same as the proper officer may direct. Each line is to designate the name of some officer or a bank to whom checks shall be made payable and the bank acting as depository for the bureau is instructed not to pay any checks drawn in favor of any one else. The manager of the bureau is authorized, and it is his duty to check the local offices to prevent bills being sent direct to patrons for collection. All bills are to be receipted in the name of the bureau manager.

Prepaid bills are considered as due and payable upon presentation after loading or forwarding of freight. A reasonable time, according to conditions surrounding the business, with a maximum of one week, is allowed for checking, auditing and payment of bills.

In case a patron refuses or neglects to pay bills according to these conditions the manager is authorized to call upon him and in a diplomatic way, without embarrassing any line, to endeavor to arrange to have bills paid satisfactorily. If such arrangements cannot be made the manager is to notify each agent that the patron expects the railroad to discriminate in his favor, and payment of bills in advance of the delivery of freight will be required till the manager of the bureau can reach an understanding with him and get him to pay his bills promptly. No credit is to be granted by any line until the manager shall have made a report favorable to the applicant, and new applications for credit are to be referred to the manager, who, after investigating the financial standing of the applicants, their proposed plan of making payment, etc., is to report to each agent.

The force of the bureau includes about 25 people, a manager, cashier, chief accountant, stenographer, 5 adding machine operators, 14 collectors, and a messenger. The plan of the bureau was recommended by a committee of the Kansas City Local Freight Agents' Association, which compiled figures showing that the total number of bills collected for all lines monthly would amount to 357,595, and that the total amount of money collected by all lines monthly amounted to $2,792,000. It was estimated that a considerable saving would be made in the cost of collections, as well as in the efficiency of collection, and that the plan would promote the convenience of both the railways and the shippers, as the latter would have to make out but one check a day for all lines, instead of making separate payments to the different lines. R. P. Isitt has been appointed manager of the bureau.

PROGRESS ON VALUATION WORK

The following statement has been issued by Thomas W. Hulme, general secretary of the Presidents' Conference Committee on Valuation on the Developments in Connection with Federal Valuation during July and August:

"A. W. Newton, general inspector permanent way and structures of the Chicago, Burlington & Quincy, was elected a member of the engineering committee, and J. F. Cleveland, land commissioner of the Chicago & North Western, was elected a member of the land committee, western group, to fill the vacancy caused by the resignation of E. C. Carter; D. W. Gross, valuation engineer of the Atlantic Coast Line, was elected a member of the engineering and land committees, southern group, to fill the vacancy caused by the resignation of Robert Scott.

"The engineering land and accounting committees met during the first week in August. The engineering and land committees will hold their next meeting during the third week in September; the accounting committee will meet in September, at a time not now determined. Special consideration was given at these meetings to the subjects of depreciation, abandoned property, and transportation charges for men and material in estimating the cost of reproduction and for addition and betterment work as provided from July 1, 1914, in the new accounting classification of the Interstate Commerce Commission. These subjects are to be further considered at the meetings in September, at which the equipment officers, selected to aid the engineering committee are expected to be present. The Land Committee is giving consideration to the proper scheduling of land acquisitions (see circular issued by the general secretary on August 10, 1914).

"On June 25 there was issued from the office of the general secretary a circular communication in explanation of the mechanical process for reproducing maps on tracing cloth as contemplated in the government map order.

"Referring to the circular communication of May 9, 1914, with reference to transportation of government employees, the sundry civil appropriation bill, as amended in the Senate, and finally passed, contained the following provision with reference to transportation, which materially differed from the form in which the legislation was introduced in the House:

> It shall be the duty of every common carrier by railroad whose property is being valued under the act of March first, 1913, to transport the engineers, field parties and other employees of the United States who are actually engaged in making surveys and other examination of the physical property of said carrier necessary to execute said act from point to point on said railroad as may be reasonably required by them in the actual discharge of their duties, and also to move from point to point, and store at such points as may be reasonably required the cars of the United States which are being used to house and maintain said employees; and also to carry the supplies necessary to maintain said employees and the other property of the United States actually used on said railroad in said work of valuation. The service above required shall be regarded as a special service, and shall be rendered under such forms and regulations and for such reasonable compensation as may be prescribed by the Interstate Commerce Commission, and as will insure an accurate record and account of

the service rendered by the railroad, and such evidence of transportation, bills of lading, and so forth, shall be furnished to the commission as may from time to time be required by the commission.

"It is my understanding that government employees will purchase tickets and pay tariff charges for transportation of their outfits and supplies in regular trains, but that where a special service is provided by the carrier under survey, said carrier should, pending the determination by the commission of the 'reasonable compensation' for said special service, render the same at the request of the government district engineer.

"The general secretary expects to issue in September a circular communication for the assistance of carriers in determining what shall be classified as abandoned property and advising of the importance to the carriers in preparing the information contemplated by the order. It is believed that an extension of time beyond February 1, 1915, can be secured to prepare the detail information required by the order, but the list and general statement of the carrier's claim should be filed by February 1, 1915.

"The commission adopted on June 25, 1914, effective July 1, 1914, 'Regulations to Govern the Recording and Reporting of all Extensions and Improvements or other Changes in Physical Property of every Common Carrier,' but has not promulgated up to this time the forms upon which to make the reports. It is, however, to be noted that, by the terms of the order, carriers which are not inventoried as of June 30, 1914, are only required to keep and not report the detail of what is commonly designated as addition and betterment records. It is possible that there may be further conferences with reference to the form of these reports between the accounting committee and the division of valuation. As this order is drawn particularly to enable the commission to keep up to date, as required by the valuation act, inventory of the property of each carrier, it is of importance to the carriers that they should see that the record is kept of all quantities and elements of cost of each improvement, so that there may be no failure to include in the additions to the inventory all proper charges.

"The Interstate Commerce Commission on June 25, 1914, adopted an order providing for the inventorying of materials and supplies as of June 30 of each and every year beginning June 30, 1914. It is the understanding of the general secretary that this order is intended to apply to the verification of the balance sheet account 'materials and supplies' and that it is not intended to apply to other items of a movable nature which are not embraced in said account.

"The division of valuation of the Interstate Commerce Commission has created a cost data bureau under the supervision of M. A. Zook, resident engineer. Our engineering committee has expressed its willingness to co-operate with the government in the gathering, preparation, and consideration of such data and has tendered its services through the group engineers.

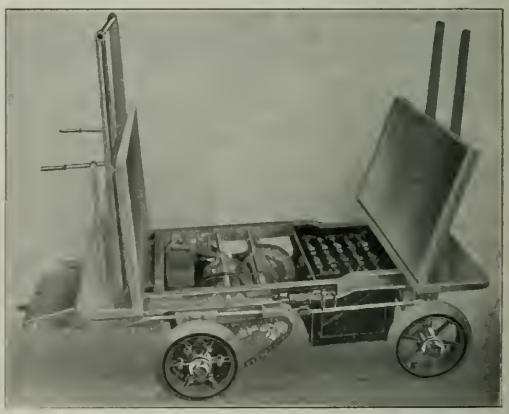
"The general secretary desires to issue as of October 1 a statement showing the progress of valuation work on all railroads, and therefore has made a request that each railroad should send him by September 21 advice as to the progress of the government work on its lines, and, also, information as to the work that has been done by each company in preparation for the government work."

STORAGE BATTERY TRUCK FOR RAILROAD STATIONS

A storage battery electric truck for use in and about railroad stations, industrial plants, etc., has been developed by the Electromobile Company, St. Louis, Mo. Three types are built, each having a carrying capacity of 2,000 lb. and a tractor capacity ranging from 5,000 lb. to 8,000 lb. Type A is capable of speeds up to 10 miles per hour, type C up to seven miles per hour and type E up to five miles per hour.

The truck is operated by a storage battery which is mounted under the platform in a cradle hung between the side frame channels. The motor is hung upon a shaft extending across the frame and drives the countershaft through a differential by means of a Morse silent chain. The countershaft is supported in three hangers swung from a second shaft extending across the frame. These hangers are in two parts to facilitate the removal of the countershaft, and are equipped with S. K. F. self-alining ball bearings. Large sprockets bolted to bosses cast on the spokes of the two rear wheels are driven by chains from smaller sprockets on the ends of the countershaft. Independent adjustment of the side chains is effected by means of radius rods between the axle and countershaft hangers, the bearings maintaining proper alinement without strain on the countershaft.

Malleable iron pedestals of strong construction are riveted to the side frames of the truck over each axle. Spiral steel springs are placed in these pedestals and supported on the axles, the pedestals being closed at the bottom by means of plate binders which hold the body of the truck firmly upon the axles. The front axle is of I-beam section with steering knuckles on each end. A steering rod connected to one of the steering arms extends to the opposite end of the truck where it is operated by means of a lever having a vertical movement, through a bell crank and a vertical rod extending through the floor of the truck. This lever and the controller handle are pivoted on a shaft which is supported by malleable iron uprights riveted to the frame. A foot pedal conveniently



Storage Battery Truck, Showing Motor and Transmission Suspension

located on the operator's platform controls the band brake upon the drum of the differential. Standing on the pedal pushes open a spring which normally sets the brake, and closes the battery switch in the controller. Raising the foot from the pedal cuts off the current and sets the brake. The pedal is locked in this position until the controller handle has been brought back to its neutral position. When the truck is running the speed may also be regulated by raising or depressing the pedal slightly. This effect is produced by means of electrical contacts controlled by the pedal.

Ample battery capacity is provided for a full day's work on one charge without changing the battery. The wiring arrangement is such that a maximum capacity fuse located directly in the battery circuit is removed when recharging, thus making it impossible to start the truck while the batteries are charging. If 24-hour operation is desired the battery may be readily lifted out of its cradle and a fresh one inserted.

The trucks are regularly equipped with wheels 20 in. in diameter over the tires, which are of solid rubber. The platform stands 22½ in. high and has a width of 40 in. The length of loading space varies from 6 ft. to 7 ft., type A having the longest platform and type E the shortest. The trucks are designed to be operated by ordinary laborers and will handle loads on 30 per cent grades.

General News Department

The annual convention of the Veterans' Association of the New York, Chicago & St. Louis was held on September 5 at Cleveland, Ohio.

The four arbitrators who have been selected in the western enginemen's and firemen's wage controversy have not as yet agreed on the fifth and sixth members.

The Pennsylvania, in pursuance of its retrenchment policy, announces that 68 trains are to be discontinued on the lines east of Pittsburgh and Erie, September 15.

The Lake Shore & Michigan Southern has asked the approval of the Ohio Public Utility Commission for a demurrage rule to provide for an increase from $1 to $2 per day on refrigerator cars.

The North Dakota board of equalization has declined to adopt recommendations of the state tax commission to greatly increase the assessed valuation of railroads in the state. The board expressed the opinion that the present assessments are on a basis of equality with assessments of other kinds of property, and only allowed increases on some branch lines on which improvements have been made. The total assessment of railroads for the state is $45,422,000.

A passenger train of the Grand Trunk was boarded by two masked robbers near Detroit, Mich., on the night of September 5, and a number of passengers in the parlor car were made to give up their valuables. A passenger who refused to obey the orders of the robbers was shot, probably fatally, and they also wounded another passenger. After the shooting they escaped from the train, which was running at low speed. The whole affair lasted only two or three minutes.

Most of the divisions of the National Railways of Mexico have now been reopened, but there is such a shortage of cars and engines that shippers are meeting with difficulty in having their transportation orders filled. Through traffic between the United States and Mexico is also inconvenienced because there is no through billing. It seems likely that it will be many months, even with internal affairs in Mexico undisturbed, before the enormous amount of equipment that was destroyed during the war can be replaced and traffic put on a normal basis.

The Mexican Northwestern has let the contract for restoring the Cumbre tunnel, which was destroyed by Mexican bandits some months ago. At present the tunnel forms a complete blockade, and there can be no through travel on that road between Juarez and Madera. All of the timbers in the tunnel were burned, and in many places the sides caved in. It is estimated that it will take five months to clear and re-timber the tunnel. As soon as the line is reopened the large lumber mills at Pearson and Madera, which are owned by the same British interests that own the railroad, will be put in operation.

The governor of Massachusetts, acting under a special act of the legislature, has appointed the "Western Massachusetts Transportation Commission" to study the general subject of transportation throughout the wetsern part of the state. The chairman is Louis C. Hyde of Springfield. The studies of the committee will have to do especially with the question of electric lines to small towns, in the hills, which now have no railroad connection. The New York, New Haven & Hartford, under President Mellen, secured control of most or all of the existing electric lines in western Massachusetts, and had planned a number of new lines. It is the failure of these plans which has led to the present action of the legislature. The special commission has an appropriation of $10,000 for its expenses.

The Salt Lake division on the northern district, the Stockton division on the southern district and the Sacramento general shops have won the 1914 safety banners awarded annually by the Southern Pacific for sending in the largest number of practicable suggestions for safety and the elimination of carelessness and hazardous conditions and practices. Almost without exception there was a fine increase in the total number of suggestions made for the year ended June 30. For the Pacific system over 50 per cent more suggestions were received this year compared with 1913 and over 81 per cent more of them were found practical. There was an improvement of over 108 per cent in the number of practical suggestions per 100 employees in the service. The Shasta division ranked second on the northern district and the San Joaquin second on the Southern district. The cost of improvements made as a result of these suggestions this year amounted to nearly $130,000, with pending expenditures for adopted suggestions approximating $160,000.

Sweetness Long Drawn Out

The Mobile & Ohio lately moved a trainload of 17 tank cars loaded with Cuban black strap molasses destined for East St. Louis. Another tank steamer with a load of this freight was due September 5. This is the traffic over which a strenuous fight was made by New Orleans lines when the Mobile & Ohio made a low rate to Chicago.

Railway Mail Pay

The railroads' Committee on Railway Mail Pay has discussed the report submitted to Congress by the Joint Congressional Committee, and Mr. Peters, chairman of the railroads' committee (representing 218 principal railroads) expresses gratification that the congressional committee so fully and unanimously sustains the main contention that the railroads are now materially underpaid for carrying the mails; and also that it agrees that the railroads ought to be paid for the terminal messenger service they now perform. Continuing, he says: "While the congressional committee does not see eye-to-eye with the railroads as to the total compensation due the companies for their mail service, the railroad committee has expressed its willingness to accept the views of the Bourne committee upon this main question of fact. The specific plan proposed by the Bourne committee for hereafter meeting the underpayment due the companies is open to question. The feeling of the railroad managers is that the present system of payment, based on the weight of the mails and the distances over which it is carried, is scientific, and, that, if fairly administered, it should be satisfactory. It actually measures and provides payment for the actual service performed. The proposed plan does not.

"That, however, is a technical matter. The Bourne committee has established the doctrine that the railroads should be compensated on a commercial basis for the services they render. The railroad committee is now prepared to co-operate with Congress in establishing detailed standards of payment which should place this purely commercial relation of the government and the railways upon a sound business basis."

Western Society of Engineers

The first autumn meeting of the Western Society of Engineers will be held on Monday night, September 14, in the society's rooms in the Monadnock block, Chicago. Two papers will be presented: one on "The Permeability of Gravel Concrete," by M. O. Withey, assistant professor of mechanics at the University of Wisconsin, and the other on "Reactions in a Three-Legged Stiff Frame with Hinged Column Bases," by N. M. Stineman.

American Electric Railway Association

The American Electric Railway Association will hold its annual convention at Young's Million Dollar Pier, Atlantic City, N. J., October 12-16, five days. Special trains will be run from Chicago and St. Louis to Atlantic City. It is expected that the advance copies of the papers to be read will be in the hands of members by the middle of next week.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

American Association of Demurrage Officers.—A. G. Thomason, Demurrage Commissioner, Boston, Mass. Annual convention in April.

American Association of Dining Car Superintendents.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next convention, October 22-24, Washington, D. C.

American Association of Freight Agents.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 21-24, 1915, Richmond, Va.

American Association of General Passenger and Ticket Agents.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Annual meeting, September 15-16, Boston, Mass.

American Association of Railroad Superintendents.—E. H. Harman, Room 101, Union Station, St. Louis, Mo.

American Electric Railway Association.—E. B. Burritt, 29 W. 39th St., New York. Annual convention, October 12-16, Atlantic City, N. J.

American Electric Railway Manufacturers' Association.—H. G. McConnaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

American Railway Association.—W. F. Allen, 75 Church St., New York. Semi-annual meeting, November 18, Chicago.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 20-22, 1914, Los Angeles, Cal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1915.

American Railway Safety Association.—L. F. Shedd, C. R. I. & P., Chicago. Next meeting, November, Chicago.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga. Annual meeting, July, 1915.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

American Society of Engineering Contractors.—I. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 1-4, 1914, New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Atlanta, Ga.

Association of Manufacturers of Chilled Car Wheels.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Annual meeting, second Tuesday in October, New York.

Association of Railway Claim Agents.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, 3d week in May, 1915, Galveston, Tex.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual convention, October 26-30, 1914, Chicago.

Association of Railway Telegraph Superintendents.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 22-25, Rochester, N. Y.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York. Next meeting, December 8-9, 1914, Richmond, Va.

Bridge and Building Supply Men's Association.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Civil Engineers' Society of St. Paul.—Edw. J. Dugan, P. O. Box 654, August and September, Old State Capitol Bldg., St. Paul.

Engineers' Society of Pennsylvania.—Edw. R. Dasher, Box 75, Harrisburg, Pa. Regular meetings, 1st Friday after 10th of each month, except July and August, 31 So. Front St., Harrisburg, Pa.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

Freight Claim Association.—Warren P. Taylor, R. F. & P., Richmond, Va. Annual meeting, June 16, 1915, Chicago.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

International Railway Congress.—Executive Committee, 11, Rue de Louvain, Brussels, Belgium. Next convention, June 23 to July 6, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 W. Broadway, Winona, Minn. Next convention, July 14-17, 1915, Sherman House, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, C. H. & D., Lima, Ohio.

Maintenance of Way and Master Painters' Association of the United States and Canada.—T. J. Goodwin, C. R. I. & P., Eldon, Mo. Next convention, November 17-19, 1914, Detroit, Mich.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May, 1915.

Master Car and Locomotive Painters' Association of the United States and Canada.—A. P. Dane, B. & M., Reading, Mass.

Master Car Builders' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1915.

National Railway Appliances Association.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railroad Master Tinners, Coppersmiths and Pipefitters' Association.—U. G. Thompson, C. & E. I., Danville, Ill. Annual meeting, May, 1915.

Railway Business Association.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December 10, 1914, Waldorf-Astoria Hotel, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Railway Electrical Supply Manufacturers' Association.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

Railway Fire Protection Association. C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Annual meeting, October 6, 1914, Washington, D. C.

Railway Signal Association.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa. Annual meeting, September 22-24, 1914, Bluff Point, N. Y.

Railway Storekeepers' Association.—J. P. Murphy, L. S. & M. S., Box C, Collinwood, Ohio. Annual meeting, May, 1915.

Railway Supply Manufacturers' Association.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with M. C. B. and M. M. Associations.

Railway Telegraph and Telephone Appliance Association.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

Richmond Railroad Club. F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & W. W., Sterling, Ill.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake City Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Signal Appliance Association.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

Society of Railway Financial Officers.—Carl Nyquist, C. R. I. & P., La Salle St. Sta., Chicago. Annual meeting, September 15-17, Hotel Aspinwall, Lenox, Mass.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. Ry., Atlanta, Ga.

Southern and Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—J. S. Marks, Agent, Interstate Despatch, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November, Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7122 Stewart Ave., Chicago. Annual meeting June 15, 1915, Minneapolis, Minn.

Transportation Club of Detroit.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Next meeting, September 15-18, Hotel Sherman, Chicago.

Utah Society of Engineers.—Frank W. Moore, Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Consolidated Music Hall, Salt Lake City.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF JULY, 1914

Name of road.	Average mileage operated during period.	Operating revenues			Operating expenses						Net operating revenue (or deficit).	Railway tax accruals.	Operating income (or loss).	Increase (or decr.) comp. with last year.
					Maintenance									
		Freight.	Passenger.	Total. inc. misc.	Way and structures.	Of equipment.	Traffic.	Trans-portation.	Miscel-laneous.	General.	Total.

Traffic News

The Western Classification Committee has announced hearings at its Chicago office on September 16, September 22, September 29, September 30, October 1, and October 6.

Freight, except perishable, for points in Great Britain, and Ireland and also for Norway, is now accepted by American railroads without requiring the inland American freight charges to be prepaid.

The Southern Pacific announces that during July out of a total of 7,632 local trains arriving at terminals on its Pacific system, 6,821, or nearly 91 per cent, made schedule time or better, and 6,709 arrived on time. Of the others 460 were less than 15 minutes late.

The Nashville, Chattanooga & St. Louis took out of Nashville the other day a solid train of 28 carloads of flour, 8,700 barrels, destined for Europe by way of New Orleans. The train was run through on a passenger schedule by way of the Mobile & Ohio and the New Orleans & North Eastern.

The Chicago, Burlington & Quincy has announced that passenger service will be established over the new Galveston-Puget Sound route about October 15, through the installation of through service from Denver to the north branch. Later through sleeping car service will be inaugurated between Galveston and Seattle.

The Denver Clearing House Association has adopted resolutions urging the Colorado representatives in Congress "at once to advocate and work for the submission of a joint resolution asking for such prompt revision by the Interstate Commerce Commission of its recent decision as shall afford substantial and adequate relief to all railroads in the present emergency."

The Erie, which recently established a lighterage service on the Chicago river for carload freight, has announced that beginning October 1 it will lighter l. c. l. freight to and from industries that have dock facilities on the Chicago river. The notice provides that the Erie shall receive the road haul, and the limit is a minimum of 10,000 lb. outbound in a single shipment, or 10,000 lb. inbound received for one industry in one day. This new service is in addition to the car float service, which was established by the Erie some time ago.

The through night passenger trains of the Seaboard Air Line between Savannah, Ga., and Montgomery, Ala., are not very profitable, and the company recently asked authority from the State Railroad Commission of Georgia to discontinue the trains; and at the same time announcing that day and evening trains would be put on so as to largely take the place of the trains discontinued. But because of a good deal of opposition from a number of towns, the petition before the commission has been withdrawn, and the night trains are to be continued.

On September 2, the Grand Trunk Pacific began the operation of through passenger service on its western division between Edmonton and Prince Rupert. Passenger trains between Winnipeg and Edmonton have been in daily operation for some time. On September 2, a tri-weekly service was established between Edmonton and Prince George, and a bi-weekly service between Prince George and Prince Rupert, the Pacific coast terminal. Through trains for Prince Rupert will leave Winnipeg on Mondays and Saturdays, and will leave Prince Rupert for Winnipeg on Sundays and Tuesdays.

The Northern Pacific has opened a new suburban freight station at Seattle, Wash. The building cost $20,000, and is intended to afford a level haul for shippers and receivers north of Madison street in the wholesale section of the city. The company expended $750,000 in reaching this station, $200,000 of which was paid to the city of Seattle for right of way. The branch to the freight station leaves the main line at Ross station, and follows Lake Union to the new terminal yards. It gives the Northern Pacific valuable water front rights in the vicinity of the new ship-canal which is to connect Lake Washington with salt water shipping at Salmon Bay.

*Denotes deficiency.

The Chicago, Milwaukee & St. Paul announces the opening of its new transcontinental train service through Spokane, Wash., for September 14. On that date the main line passenger trains will discontinue the use of the 87 miles of the main line between Plummer and Marengo, Wash., and will be run through Spokane, the abandoned line being served with local trains. The company plans to put on a local train running between Seattle and Spokane, to be known as the "Cascadian." By the new arrangement the distance between Chicago and Seattle has been increased only fourteen miles. The time at both terminals will be the same as before. The service would have been begun several months ago but for the delay in the construction of the bridge at Spokane, which passes over the city bridge.

Increases in Passenger Fares

A general advance in mileage-ticket rates in the Eastern states was noticed last week, page 447. Some additional details are given by the New York State Public Service Commission, Second district, as follows:

On 500-mile books the rate is advanced from 2 cents to 2¼ cents per mile by Boston & Albany, Boston & Maine, New York, New Haven & Hartford, and Rutland. The sale of 500-mile ticket books is discontinued by the New York Central & Hudson River and its leased line, the West Shore. Thousand mile ticket books are advanced from 2 cents to 2¼ cents per mile by Boston & Albany, Boston & Maine, Buffalo, Rochester & Pittsburgh, Buffalo & Susquehanna, Delaware & Hudson, Lehigh Valley, New York, New Haven & Hartford, Rutland, and Pennsylvania. The sale of 1,000-mile ticket books is discontinued by the Central New England and Erie.

The New York Central & Hudson River continues sale of 1,000-mile ticket books at 2 cents per mile, but use is restricted to travel between points in New York state not interchangeable.

By all railroads the use of mileage tickets is practically confined to travel over their own lines of road.

In many instances limits of tickets are changed from "Good until used" to "One year from date of sale," and, except as to the Delaware & Hudson. On the Delaware & Hudson tickets sold prior to October 1, 1914, will only be honored to and including September 30, 1914, but the company will redeem unusued coupons of such tickets at the rate of two cents per coupon.

All companies selling trunk line interchangeable 1,000-mile refund tickets have changed the regulations governing redemption value of cover of ticket from $5 to $2.50, which change has the effect of increasing the cost of travel from 2 cents to 2¼ cents per mile. This form of ticket has not heretofore been good over the New York Central or the Lake Shore, but such tickets sold on and after October 1, 1914, will be good over those lines.

Car Balance and Performance

Arthur Hale, chairman of the committee on relations between railroads, of the American Railway Association, in presenting statistical bulletin No. 176, covering car balance and performance for May, 1914, says:

The miles per car per day were 22.2, compared with 23.0 for April. This figure for May, 1913, was 25.0.

Ton miles per car per day for May were 320, compared with 334 for April. This is a decrease of 17.3 per cent compared with the figure for May, 1913, which was 387.

The proportion of home cars on line was 68 per cent, compared with 64 per cent in April. This is an increase of 12 points over May, 1913.

The per cent of loaded car mileage increased from 60.2 per cent in April to 68.0 per cent in May. This figure for May, 1913, was 68.7 per cent.

The average earnings per car per day for all cars on line decreased 23 cents to $2.18 in May. This figure for May, 1913, was $2.55.

The accompanying table gives car balance and performance in the month covered by the report, and the diagram on the following page shows car earnings and car mileage and different car performance figures monthly from July, 1907.

Car Location

The table on the following page, which was taken from bulletin No. 21 of the American Railway Association, gives a summary of freight car location by groups on August 1, 1914.

CAR LOCATION ON AUGUST 1, 1914

	New England.	N.Y., N.J., Del., Md., Eastern Pa.	Ohio, Ind., Mich., Western Pa.	Va., W. Va., No. & So. Carolina.	Ky., Tenn., Miss., Ala., Ga., Fla.	Iowa, Ill., Wis., Minn.	Mont., Wyo., Neb., Dakotas. Freight Car Mileage, Earnings and Performance, 1907 to 1914

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission announces that its general investigation into complaints relative to embargoes on freight will be made the subject of a public hearing at Chicago, January 20, next. The investigation is in charge of Commissioner Daniels.

Switching Charges at Harrisburg, Pa.

Hooven, Owens, Rentschler Company v. Cincinnati, Hamilton & Dayton et al. Opinion by the commission:

The commission finds unreasonable a charge of 4 cents per 100 lb. charged by the Pennsylvania Railroad for switching service rendered at Harrisburg, Pa., and reparation is awarded to the extent of the amount collected over a charge of 2 cents per 100 lb. (31 I. C. C., 550.)

Switching Charges at Charlestown, W. Va.

Jefferson Milling Company v. Baltimore & Ohio. Opinion by the commission:

The commission finds that a charge of 4 cents per 100 lb. for switching cars loaded with flour from complainant's spur track on the line of the defendant at Charlestown, W. Va., to points on the Norfolk & Western, reached also by connections of the defendant, is unreasonable and that the switching charge on that competitive traffic should not exceed 2 cents per 100 lb., with a minimum charge of $3 per car. (31 I. C. C., 547.)

Rates on Pulp Wood to Rhinelander, Wis.

Rhinelander Paper Company v. Minneapolis, St. Paul & Sault Ste. Marie. Opinion by the commission:

The commission upon rehearing reaffirms its former decision given in 26 I. C. C., 104, to the effect that the rate of 7.5 cents on pulp wood in carloads from Whitedale, Bovee, Christiansen Spur and Spur No. 447 to Rhinelander, Wis., was unreasonable to the extent that it exceeded 6.5 cents, and that the rate of 6 cents from Trenary, Delta Junction and Manistique to Rhinelander was not unreasonable nor discriminatory. (31 I. C. C., 555.)

Rates on Beer from the Twin Cities to Sioux Falls and Sioux City

In re beer and other malt products between stations in Iowa and South Dakota and points in Minnesota and Wisconsin. Opinion by Commissioner Harlan:

The commission finds that the carriers have justified a proposed increase in the carload rates on beer and other malt products from the special commodity rate of 15 cents per 100 lb. to the fifth-class rate of 20.1 cents from St. Paul, Minneapolis and La Crosse to Sioux Falls, of 20 cents from the same points of origin to Sioux City, of 20 cents from La Crosse to Pipestone, of 26 cents from La Crosse to Granite Falls, Minn., and of 18 cents from La Crosse to Marshall, Minn. (31 I. C. C., 544.)

Transit Privileges on Grain at Atlanta

Atlanta Milling Company v. Louisville & Nashville. Opinion by the commission:

The commission does not find that the failure of defendant to establish prior to May 16, 1909, a transit privilege under which grain could be forwarded from Cincinnati, Ohio, and Lexington, Ky., to Atlanta, Ga., there milled and reshipped to points in Carolina territory, resulted in damage to complainant. Complaint dismissed. (31 I. C. C., 485.)

STATE COMMISSIONS

The Railroad Commission of Mississippi on September 3 entered orders imposing fines on the St. Louis & San Francisco of $500 for each of three failures to comply with orders of the commission requiring the construction of stations, freight houses, etc.; and also one fine of $500 against the Yazoo & Mississippi Valley.

The Railroad Commission of Texas has announced its adoption of the accounting methods and forms of the Interstate Commerce Commission. This will make a considerable saving for the Texas lines by saving them extra bookkeeping which has been required in the past to conform to the systems both of the interstate and state commissions.

Government Freight-Car Standards in Canada

The Board of Railway Commissioners for Canada, modifying its general order of February 17, 1913, respecting safety appliances on trains, has granted an extension of time until July 1, 1916, within which to make the following changes:

To change the location of brakes on all cars; to comply with the standard specifications prescribed in the regulations in respect of all brakes; to change cars having less than 10 in. end ladder clearance within 30 in. of the side of car; to comply with the standard prescribed in the regulations in respect to hand holds, running boards, ladders, sill steps, and brake staffs, except that when a car is shopped for work amounting practicaly to rebuilding body of car, it must then be equipped according to the prescribed standards regulations.

Railway companies are not to be required to make changes to secure additional end ladder clearance on cars that have 10 or more inches end ladder clearance within 30 inches of side of car, or to make the changes in end ladders, side ladders, hand grips and steps which have been made in accordance with the provisions of the general order above referred to, or to comply with the board's regulations aforesaid, until the car is shopped for work amounting to practically rebuilding body of car.

And it is further ordered that railway companies shall not be required to change the location of hand holds (except end hand holds under the end sills), ladders, sill steps, brake wheels, and brake staffs on freight train cars where the appliances are within 3 inches of the required location, except that when cars undergo regular repairs they must then be made to comply with the prescribed standards.

PERSONNEL OF COMMISSIONS

H. E. Kellenberger has been appointed as senior signal engineer of the central district, division of valuation, Interstate Commerce Commission, with headquarters at Chicago. He was formerly superintendent of signals on the Chicago Great Western.

J. A. Lindstrand has been appointed senior architect in the central district, division of valuation, Interstate Commerce Commission, with headquarters at Chicago. Mr. Lindstrand was for 15 years in the architect's office of the Chicago, Burlington & Quincy, and for the past eight years has been architect for the Chicago, Milwaukee & St. Paul.

Fred M. Baumgardner has been appointed as senior inspector of motive power in the central district, division of valuation, Interstate Commerce Commission, with headquarters at Chicago. His experience has been with the mechanical department of the Union Pacific and the Illinois Central, having served as roundhouse foreman, general foreman and master mechanic on the latter road and having recently been made master mechanic at Clinton, Ill.

D. K. van Ingen has been appointed second assistant field engineer in the central district, division of valuation, Interstate Commerce Commission, with headquarters at Chicago. He was educated at Rensselaer Polytechnic Institute, and has been with the Chicago & North Western, Choctaw, Oklahoma & Gulf and New York Central & Hudson River, having been assistant engineer in charge of valuation work on yards and terminals in Iowa on the Chicago & North Western since 1913, and within the last month having been appointed as chief draftsman in the valuation department of the same road. Mr. van Ingen is a member of the Western Society of Engineers.

W. E. Van Hook has been appointed to the position of office engineer for the central district, division of valuation, Interstate Commerce Commission, with headquarters at Chicago. He is a graduate civil engineer of the University of Wisconsin. The first five years after graduation he was on railroad work in lo-

cation, construction, maintenance and valuation work with the Chicago & North Western, the Chicago & Alton, and the Chicago, Milwaukee & Puget Sound. For the past three years he has been with the Illinois Railroad & Warehouse Commission, and later the Public Utilities Commission of the state of Illinois. He is a member of the Railway Signal Association.

W. A. Christian, formerly first assistant chief engineer of the Chicago Great Western, has been appointed by the Interstate Commerce Commission as senior civil engineer in charge of the roadway and track department for the central district, division of valuation, with headquarters at Chicago. Mr. Christian graduated from the University of Cincinnati, and his early work was with the Baltimore & Ohio, Chesapeake & Ohio, and Cleveland, Cincinnati, Chicago & St. Louis. In 1894 he was assistant county engineer of Hamilton county, Ohio, and from 1895 to 1902 was with the United States Army Engineer Corps as assistant engineer in charge of plans and estimates for river and harbor improvements. He was then with the C. C. C. & St. L., for about a year on maintenance work, and from 1903 to 1907 was again with the United States Army Engineer Corps as assistant engineer in charge of plans and estimates for concrete movable dams in the Ohio river. Since 1907 he has been with the Chicago Great Western as assistant chief engineer. He is a member of the American Society of Civil Engineers and of the American Railway Engineering Association, being chairman of the committee of records and accounts.

W. A. Christian

Canadian Pacific Reserve Men.—The Canadian Pacific has received a cable from Sir Thomas Shaughnessy, its president, to the effect that the positions of men who are called to the colors will be reserved for them, and that they will receive full pay for six months or for such shorter period as they may be serving their country.

Proposed Railway Electrification in Santiago, Chile.—The commission appointed to report on the proposed railway from Santiago to Valparaiso via Casa Blanca, has advised the construction of an electric line. The commission further proposes the construction of branch lines to Melipilla and Talagante. It is suggested that the former proposals for the electrification of the present steam railway system should be abandoned for the time, and that the $11,500,000 intended for this undertaking be utilized in the construction of the proposed new line.

Railway Extension in Korea.—During the year 1913 133 miles of railway were opened in Korea. The total length of line now opened to traffic is, therefore, about 970 miles. The Honam Railway was completed in January, 1914, and the Seoul-Gensan line is expected to be finished in October or November next. During 1913 the Korean railways carried 4,143,803 passengers and 1,425,246 tons of freight, an increase, as compared with 1912, of 1,695,075 passengers and 293,474 tons of freight. No light railway was constructed in 1913. Starting from the financial year 1914-15, the third railway program is to be undertaken and will include the reconstruction of the Seoul-Fusan line, which was originally built in a hurry, owing to the exigencies of the time, and which, though since then to some extent improved, requires reduction in grades, etc. A line from Gensan to Yong-heung, 34 miles in length—a continuation of the Seoul-Gensan track—passing through Munchon and Kowon, is also to be laid down later, and the extension is expected to be carried on to Hamheung.

Railway Officers

Executive, Financial, Legal and Accounting

H. R. Kurrie, general attorney of the Chicago, Indianapolis & Louisville, has been elected president, with headquarters at Chicago succeeding F. A. Delano. A portrait and sketch of Mr. Kurrie appear elsewhere in this issue.

Operating

T. D. Stafford has been appointed assistant superintendent of the New Orleans, Texas & Mexico at DeQuincy, La., in place of H. S. Badgett, deceased.

Traffic

M. L. Schultz has been appointed commercial agent of the Detroit, Toledo & Ironton and the Georgia & Florida, with headquarters at Chicago.

C. W. Hay, traveling freight agent of the Louisville & Nashville, at Frankfort, Ky., has resigned, and the office of traveling freight agent at that place has been abolished.

Willis Callaway, Florida agent of the Atlanta, Birmingham & Atlantic, at Jacksonville, Fla., has been appointed commercial agent of the Norfolk & Western, with headquarters at Jacksonville.

Claude P. Wilson, commercial agent of the Missouri, Oklahoma & Gulf at Houston, Tex., has been appointed general agent at Dallas, Tex., succeeding F. S. Sleight, resigned on account of ill health.

Engineering and Rolling Stock

Gustave Gullickson has been appointed roadmaster of the Northern Pacific at Forsyth, Mont.

Charles Manley has been appointed master mechanic of the Missouri & North Arkansas, with office at Harrison, Ark., succeeding J. P. Dolan, resigned.

J. W. Barrie, principal assistant engineer of the Florida East Coast, with office at St. Augustine, Fla., has resigned, and his former position has been abolished.

William Schuman has been appointed general foreman of shops of the Chicago, Indianapolis & Louisville at Lafayette, Ind., in place of George Crumbo, resigned.

E. B. Kelliher, chief engineer of the Grand Trunk Pacific at Winnipeg, Man., has resigned on account of ill health, and H. A. Woods, assistant chief engineer at Montreal, Que., has assumed charge of the engineering department, with headquarters at Winnipeg.

W. S. Moseley, who has been appointed mechanical engineer of the Carolina, Clinchfield & Ohio, with headquarters at Erwin, Tenn., as has been announced in these columns, was born on March 5, 1880, at Bonsack, Va., and was educated in the public schools and at Virginia Polytechnic Institute, Blacksburg, Va. He began railway work as a messenger boy in the auditor's office of the Norfolk & Western, and from June, 1894, to January, 1899, was messenger and clerk in the same office. He was then for three years machinist apprentice in the Norfolk & Western shops and drawing office at Roanoke, Va., and from January, 1902, to January, 1909, was draftsman in the mechanical engineer's office of the same road, with the exception of two years, during which time he was an assistant shop instructor and special student at the Virginia Polytechnic Institute. In January, 1909, he was appointed mechanical draftsman of the Carolina, Clinchfield & Ohio, which position he held at the time of his recent appointment as mechanical engineer of the same road as above noted.

Purchasing

E. O. Griffin, general fuel and supply agent of the International & Great Northern, has been appointed purchasing agent for the receivers, with headquarters at Houston, Tex., and will report to Thornwell Fay, assistant to receivers.

OBITUARY

Paul P. Rainer, superintendent of the joint rate inspection bureau, with headquarters at Chicago, died at Brockville, Ont., on September 8.

Richard F. Stevens, formerly secretary and treasurer of the Camden & Amboy, now a part of the Pennsylvania Railroad, died recently at his home in South Orange, N. J., at the age of 82.

Frank Barr, formerly vice-president and general manager of the Boston & Maine, died recently at Winchester, Mass., at the age of 62. Mr. Barr was born at Nashua, N. H., and began railway work on March 1, 1869, as freight clerk and telegraph operator on the Worcester & Nashua, now a part of the Boston & Maine. From June, 1873, to November, 1892, he was general agent of the same road, and in November, 1892, was appointed superintendent of the Worcester, Nashua & Portland division of the Boston & Maine, at Nashua, N. H. He was promoted to assistant general manager in December, 1896, remaining in that position until July, 1903, when he was elected third vice-president and general manager of the same road, and in July, 1912, Mr. Barr was retired under the pension rules of the company.

Frank Barr

Railway Construction in British Guiana.—In 1913 a project was seriously considered of constructing a hinterland railway into British Guiana which would undoubtedly have been of great advantage to the balata, timber and mining industries. The governor made a two months' tour of the interior of the colony, going to the Brazilian boundary, accompanied by a railway expert. At present there is a very earnest controversy over the advisability of constructing two railways immediately, one to be a considerable extension of the existing lines along the coastal districts and the other to run into the interior with possible connections with Brazilian points. A proposition was made to the secretary of state for the colonies for building these roads, but it was not favorably considered. The scheme has not been abandoned, but it is unlikely that actual construction will be undertaken for several years. At the present time a short extension of the existing railways along the coast is being built.

French Railway Employees.—Statistics recently issued by the French commission which is charged with the duty of supervising the work of railway employees show that in 1912 the total number of these was 171,240. These were divided as follows: Nord, 29,451; Est, 21,775; Orleans, 23,814; Paris, Lyons & Mediterranean, 40,090; Midi, 14,497; State Railways, 40,150; Ceinture, 1,463. Of the total number 11,799 were enginemen and 13,891 were firemen. Conductors and brakemen numbered 14,161, and there were 8,258 stationmasters and assistant stationmasters. Yard brakemen, switch tenders, etc., numbered 41,748 and the cleaners, car inspectors, etc., amounted to 4,139. Maintenance of way men numbered 42,406, crossing gate men 2,270 and signal men, etc., 3,194. There was also a number of miscellaneous employees. The Paris, Lyons & Mediterranean has more locomotives than any other railway in France and, as might have been expected, has therefore employed the largest number of enginemen, 2,302. On the other hand the Nord employed the largest number of firemen, its total being 3,429. The Paris, Lyons & Mediterranean employed the largest number of stationmasters and assistant stationmasters, 2,032, as well as of maintenance of way employees, 13,126.

Equipment and Supplies

CAR BUILDING

The Rutland, reported in the *Railway Age Gazette* of September 4, as being in the market for 75 50-ton steel hopper cars, has ordered that equipment from the Standard Steel Car Company.

The Cincinnati, Hamilton & Dayton, reported in the *Railway Age Gazette* of September 4, as having ordered 1,000 box cars from the Standard Steel Car Company, has ordered that equipment from the Mt. Vernon Car Manufacturing Company, with the provision that the railroad has the right to cancel the order any time before October 1, 1914, provided that the receivers are unable to make satisfactory financial arrangements.

Improving the Uganda Railway of British East Africa.—It has been proposed to relay the Airobi-Kisumu section of the Uganda railway with 80-lb. rails. The cost would be about $13,300 per mile, exclusive of the strengthening of bridges, but it would permit the use of locomotives having three times the tractive effort of those at present in service.

Free Transportation for Soldiers in London.—The London street and underground railways and the London General Omnibus Company have announced that until further notice men in uniform, whether soldiers or sailors, will be permitted to ride free on all their lines whether or not in possession of the necessary government warrants.

German Southwest Africa Railway.—It is reported that in 1913 no new railways were constructed in German Southwest Africa with the exception of a few private lines for mining purposes. The principal railway in the colony is the Otavi Railway, which, during the year ended March 31, 1913, had earnings of $1,209,815. Its total expenditures were $597,165, leaving a surplus to $612,650. The total earnings of all the railways in the colony were $2,107,705, and the total expenditures $1,235,045.

Financial Returns of the Cuba Railroad.—The annual report of the Cuba railroad for the fiscal year ended June 30, 1914, shows that the company had gross earnings of $5,164,671, as compared with but $4,632,040 in 1913. The net earnings after deducting taxes were $2,470,922 and interest charges were paid to the amount of $819,417. There was paid in preferred dividends $600,000, and a like amount in dividends on the common stock, so that the surplus for the year is $316,505, comparing, however, with $414,280 in 1913, when but $1,000,000 in dividends was paid.

The Hauenstein Tunnel of Switzerland.—At 10:40 a. m. on Friday, August 10, the Hauenstein tunnel on the Basle-Olten line in Switzerland, was pierced. The tunnel is 5 miles 94 yards in length, and was commenced on February 1, 1912. When completed it and its approach lines will replace the existing line between Sissach and Olten. On the latter line there is a tunnel 1 mile 968 yards in length, constructed in 1854-8. There is practically no difference between the lengths of the old and the new routes, but the new line will have much easier grades. On the old line there is a grade of 2.63 per cent for about 4 miles, and on this incline the tunnel is situated. The rest of the route has an average grade of about 2 per cent. On the new route the maximum grade will be 1 per cent, and in the tunnel the grade will be .75 per cent for about 4½ miles and .15 for the remaining distance. As a result of the improved grade wear and tear of rolling stock will be saved, economy of coal will be effected, and twenty minutes taken off the time of the journey between Basle and Olten. The contractors for the new tunnel were the Julius Berger Tiefbau Company, of Berlin, and the contract price was $3,963,545. The tunnel has been pierced about eighteen months in advance of contract time.

Supply Trade News

W. H. Pratt, general superintendent of the North Works of the Illinois Steel Company, Chicago, died at his home Saturday afternoon, September 5, 1914. Funeral services were held on Tuesday, September 8.

Jay G. Coutant, formerly engineer of the plant of the Lima Locomotive Corporation, Lima, Ohio, has gone with the Railway Materials Company, Chicago, Ill., to specialize in the design of furnaces for burning powdered fuel and water gas, having done considerable experimenting in this work.

The Transportation Utilities Company, with general offices at 30 Church street, New York City, has opened a branch office at 1201 Virginia Railway & Power building, Richmond, Va. This office is in charge of Frank N. Grigg, and is devoted exclusively to the appliances manufactured by the Transportation Utilities Company.

The New Process Gear Corporation, Syracuse, N. Y., is building an addition to its plant, which was doubled in capacity less than two years ago and was at that time claimed to be the largest in the world devoted exclusively to gear making, and is planning to double the capacity of its casehardening and heat-treating departments.

The Gun-crete Company, Chicago, has acquired the interests of the Cement Gun Construction Company and has absorbed the construction department of the General Cement Gun Company. The combined business will be conducted under the name of the Cement Gun Construction Company, with office at Chicago. Carl Weber is president, John V. Schaefer, secretary and treasurer, and C. L. Dewey, construction manager.

TRADE PUBLICATIONS

SECOND HAND RAILWAY EQUIPMENT.—The Walter A. Zelnicker Supply Company, St. Louis, Mo., has recently issued bulletin No. 159, an 80 page booklet containing an illustrated and alphabetically arranged list of second hand railway equipment which may be bought from the company.

ENAMELED IRON SIGNS.—The Royal Enameling & Manufacturing Company, Chicago, has issued a catalogue of the Royal line of enameled iron signs. The booklet contains illustrations of a large number of typical signs, many of which are intended for use at railway stations, offices, shops, etc.

USEFUL SPANISH WORDS AND PHRASES.—This is the title of a 20 page booklet recently issued by the Joseph Dixon Crucible Company, Jersey City, N. J. The booklet, which is issued at a very opportune time, contains a large number of common English words and phrases with their Spanish equivalents, and has been compiled primarily for the use of tourists in the West Indies or South America.

TELEGRAPH POLES.—The Western Electric Company has recently issued a booklet entitled Western Electric Poles, describing in brief the obtaining of telegraph poles and containing the standard specifications of white cedar products established by the Northern White Cedar Association, several inspection comments, shipping data relating to northern cedar poles and in addition the official specifications of the Western Red Cedar Association.

SHEET METAL.—The American Rolling Mill Company, Middletown, Ohio, has recently issued two booklets descriptive of Armco Iron, entitled, respectively, "Defeating Rust, The Story of Armco Iron," and "Iron Roofs That Resist Rust," The former booklet is divided into chapters having such heads as: Armco Iron Has Historical Antecedents, Where Armco Iron Goes, What Scientists Say, What Engineers Say and What Users Say. Several illustrations are given showing the Armco Iron in various kinds of service. The latter booklet describes and illustrates the various Armco products.

Railway Construction

ALBERTA & GREAT WATERWAYS.—See Edmonton, Dunvegan & British Columbia.

ARKANSAS VALLEY INTERURBAN.—Arrangements have been made, it is said, to build an extension from Halstead, Kan., west via Burrton to Hutchinson, about 30 miles. The Hutchinson & Northern, a separate organization, is also planning to build from Hutchinson east to Burrton, about 15 miles, and may extend the line to Halstead.

ASHLEY, DREW & NORTHERN.—The final survey is now being made, it is said, for building a section of an extension north of Monticello, Ark. The projected route is via Gillett to Helena. (June 27, p. 1631.)

CANADIAN PACIFIC.—The Railway Commission of Canada has authorized this company to open a section of the Weyburn West branch from Shaunavon, Sask., west to Govanlock, 76.5 miles.

CENTRAL OF NEW JERSEY.—We are told that contracts have been let to the estate of Charles McDermott, Philadelphia, Pa., for the grading work and concrete abutments on the Easton & Western, a switching branch to be built from Glendon, a suburb of Easton, Pa., into the manufacturing district of Easton, about four miles. (April 3, p. 811.)

CHARLESTON, PARKERSBURG & NORTHERN.—An officer writes regarding the report that contracts are to be let to build a section of this line, that contracts will probably be let next spring. The plans call for building from Parkersburg, W. Va., south via Guthrie, to Charleston, about 75 miles. The cut and fill work will involve handling about 28,000 cu. yd. to the mile The maximum grades will be 1.75 per cent, and the maximum curvature 9 deg. There will be five tunnels on the line varying in length from 800 ft. to 2,300 ft. The company expects to develop a traffic in coal, farm products and limestone. Henry H. Archer, president. Robert Cutler, chief engineer, Parkersburg. (April 24, p. 966.)

CHICAGO, BURLINGTON & QUINCY.—Track laying was recently finished, it is said, on the extension from Casper, Wyo., to Orin Junction. This completes the extension from Thermopolis, Wyo., via Powder River to Orin Junction. (July 10, p. 80.)

EASTON & WESTERN.—See Central of New Jersey.

EDMONTON, DUNVEGAN & BRITISH COLUMBIA.—Announcement is made that construction work will be continued on this line and the Alberta & Great Waterways railways, now building in northern Alberta. About 1,500 men and 475 teams are now at work. The Edmonton, Dunvegan & British Columbia has completed 70 per cent of the grade between Sawridge and Smoky river, 133 miles, and the line between Edmonton and Sawridge, 160 miles, has been completed. The Alberta & Great Waterways is being built by the provincial government between Edmonton, Alta., and Fort McMurray, 180 miles. Grading work has been finished on 95 miles, and track has been laid on 25 miles. (June 5, p. 1257.)

HUTCHINSON & NORTHERN.—See Arkansas Valley.

INDIANA ROADS (Electric).—Surveys have been made, it is said, for an electric line to be built from Boonville, Ind., north to Lynnville, and it is expected that work on the line will be started soon.

Surveys have been made, it is said, to build an electric line from Evansville, Ind., northwest to New Harmony, about 30 miles. Bonds are now being sold to secure funds for building the line which may eventually be extended north to Mt. Carmel, Ill., 35 miles additional, including a bridge over the Wabash river. Capitalists of Evansville are said to be back of the project.

MIDLAND PENNSYLVANIA.—A syndicate has been formed to take over the rights and property of this company, which was organized in 1910, to build from Millersville, Pa., on the Susquehanna river northeast via Sacramento and Gordon to Ash-

land on the Philadelphia & Reading, 44 miles. About 10 miles of the line have been partly completed. J. H. Williams, Pottstown, Pa., is secretary of the railroad company.

New Orleans, Mobile & Chicago.—An officer writes that owing to financial conditions, it is doubtful whether actual construction work will be started in the near future on the proposed extension from Beaumont, Miss., south to a connection with the Louisville & Nashville at Ansley, about 80 miles. (March 13, p. 556.)

Pennsylvania Lines West.—An officer writes that work is now under way on the Lengeloth branch, building from Burgettstown, Pa., to a coal section southwest of that place. The work includes putting up bridges at Burgettstown.

Rock Falls & Southern Traction.—Plans are being made, it is said, to build an electric line to connect Sterling, Ill., with Rock Falls, Tampico, New Bedford, Princeton and Kewanee, about 70 miles. A. S. Goodell, secretary, Rock Falls.

Rosston, Grand Rapids & Protection.—Organized in Oklahoma with headquarters at Doby Springs, to build from a point on the Wichita Falls & Northwestern at or near Rosston east to Doby Springs, 12 miles. L. A. Walton, president and general manager; J. H. Butler, secretary, and J. D. Scott, treasurer.

Teal Creek.—Incorporated in Oregon with $10,000 capital to build a line from Falls City, Ore., to timberlands in Polk county. W. McCamant is an incorporator, Portland.

Van Horn Valley.—Contracts have been given to E. G Beecher and F. J. Cumming, it is said, to build from Van Horn, Tex., to a point in southeastern New Mexico, about 100 miles. The plans call for eventually extending the line further north, probably to Roswell. The incorporators include J. M. Daugherty, J. Y. Canon and J. Irby, all of Van Horn. (May 15, p. 1119.)

RAILWAY STRUCTURES

Baltimore, Md.—It is understood that the Western Maryland will soon start work on new piers and warehouses to increase its terminal facilities at South Baltimore.

Burgettstown, Pa.—See Pennsylvania Lines West under railway construction.

Butte, Mont.—Work on the proposed new passenger station of the Chicago, Milwaukee & St. Paul, which has thus far consisted only of grading has been discontinued for an indefinite period.

Chicago, Ill.—Following a meeting of the directors of the Union Station Company on September 5, a statement was sent to the mayor asking an extension of time of one year for the acceptance of the ordinances providing for the construction of the new Union station, on account of the impossibility of financing the project at this time. The ordinances were to be accepted by September 23. The mayor has announced that he is in favor of the extension and that he will call a special meeting of the city council to consider it.

Ft. Worth, Tex.—The St. Louis Southwestern is building a new freight depot between Fifth and Sixth streets on Terry street. The structure is 34 ft. by 300 ft., and has a covered platform 140 ft. long. It is constructed of brick and concrete. The west end of the building will be two stories high and devoted to office space. A. W. Black & Sons, architects and contractors, St. Louis, Mo., are doing the work and expect to have it completed in four months.

Noblestown, Pa.—The Pennsylvania Lines West are reconstructing bridge No. 22 at Noblestown, by putting a concrete slab top on the old masonry.

Oil City, La.—The Kansas City Southern will erect a new passenger station. This structure is to be similar to the old station which was destroyed by fire on August 5, 1914. The approximate cost will be $1,500.

Washington, D. C.—Plans are being made for putting up a concrete overhead highway viaduct over the tracks of the Philadelphia, Baltimore & Washington and the Baltimore & Ohio at Benning Road. The cost of the improvements will be about $110,000, of which one-half is to be paid by the government and the other half by the railroads.

Railway Financial News

Belt Railway of Chicago.—This road, which is owned jointly by 11 railways, each of which holds $240,000 of its $2,640,000 capital stock, leases from the Chicago & Western Indiana the latter's Belt division on a 50 year lease from November 1, 1912, and also the equipment which it uses. In 1913 the Belt Railway's operating revenues were $3,088,798, $2,111,250 of which was for transfer and $924,675 for local switching. The total operating expenses, on the other hand, were $1,975,736, so that the net operating revenue was $1,113,062, as compared to $1,090,094 in 1912. Taxes paid amounted to $118,105, operating income to $1,001,363. The gross income was $1,168,999, from which must be deducted rentals of $953,170, leaving a net income of $215,829. As dividends of $86,400 were declared the surplus for the year was $129,429.

The company's property investment is in the form of leasehold estate, rights and franchises, and has a value of $1,200,000. On December 31, 1913, the working assets amounted to $2,444,483, $1,262,871 of which was cash and $879,460 miscellaneous accounts receivable. As noted above the capital stock, which is all common, amounts to $2,880,000. There are no bonds outstanding. The company on December 31 had working liabilities of $545,404, of which $480,848 was audited vouchers and wages unpaid. There was also a liability item of $109,508 of taxes accrued. The surplus on December 31 was $81,940.

Boston & Maine.—The Hampden Railroad has begun suit against the Boston & Maine, in the Superior Court, at Springfield, claiming compensation for failure on the part of the Boston & Maine to carry out its agreement to take a lease of the Hampden road. Damages are claimed to the amount of $4,000,000.

Canadian Northern.—It is announced in Toronto (as coming from Sir William Mackenzie) that the financial blockade in the affairs of the Canadian Northern has been raised by good news from the London underwriters; and Sir William says that the completion of the transcontinental line can now be carried forward at full speed. Nearly ten thousand men are now at work on the undertaking. It was generally understood that the enactment of the British moratorium was sufficient to place the plans of the C. N. R. in anything but a happy condition; and it was expected that the company would have to fall back on the Dominion Government and ask for further special legislation. The London underwriters had completed the purchase of the company's issue of $45,000,000 of Dominion-Government-guaranteed bonds and had sent to Canada the first instalment of cash. Just as the flotation was ready for the British market came the declaration of war. Investors were not in an investing mood and the London house was caught between two fires. Even when Lloyd George blanketed all contracts by his moratorium act, that did not relieve the underwriting concern from the legal loss of its first payment to the Canadian Northern, amounting to several millions. Only by carrying out the agreement could the initial payment be saved. The only explanation that Sir William Mackenzie would make of the ultimate solution achieved at the London end was that the underwriters had resources of their own. These resources, it is said, are probably insurance companies' funds, which would be available independently of the iron-clad policy of the banks.

Chicago, Rock Island & Pacific.—The Central Trust Company, trustee under the 4 per cent collateral trust bonds of the Chicago, Rock Island & Pacific Railroad Company, began foreclosure proceedings in the United States district court at New York on September 3, the company having defaulted on the interest due on May 1 on these bonds amounting to $71,353,500. The collateral on which these bonds are issued is stock, for the same amount, of Chicago, Rock Island & Pacific Railway Company. The amount of interest in default on May 1 was $1,420,060.

New York Central & Hudson River.—The 5 per cent notes of this company maturing on September 15 to the amount of $5,000,000 have been extended for one year at 7 per cent interest.

Taxation Under Government Ownership

E. M. Heigho, in a letter published elsewhere, referring to the estimate made by Sir George Paish that a saving of from 60 to 130 million dollars might be made in the cost of railway capital under government ownership in the United States, raises the question whether this saving would not be reduced by the amount of the 135 millions paid in taxes by the railways in 1913. It is true, as Mr. Heigho suggests, that as federal government property the railways would be relieved of taxation. But the federal government would not actually lose, because as the owner of the railways it would be the beneficiary of the saving made in the taxes that otherwise would be paid to itself. And as between the states and municipalities, on the one hand, and the federal government on the other, what the former would lose in taxes, the latter, as owner of the railways, would gain by not having to pay them. Therefore, on the whole, in the matter simply of taxes, the federal government would be the gainer, while the states and municipalities would be just equally heavy losers, and would be compelled to make up their loss by increasing the taxes on other property.

Traffic Officers as Trade Promoters

The officers of the traffic department of the Lehigh Valley propose to spend a week, and two weeks, or more, if necessary, in explaining South American trade opportunities to the manufacturers in the dozen principal cities along the company's lines between New York and Buffalo. They are going to run a special train, and stop in each place as long as may be necessary to see every interested shipper; and, as far as possible, they are going to give out first-hand information. For example, details of shipping methods will be explained by a man experienced in exporting goods to South America. Another man on the train will be the manager of the foreign department of the National City Bank, of New York, which has recently established branch banks in Buenos Aires, Rio Janeiro and Valparaiso. New York consuls of South American republics will go on the train or send representatives. From teaching farmers how to plant corn and spread fertilizer, and their wives how to make and sell butter and jam, the railway traffic manager has grown in a few years to be the most versatile "promoter" in the country. Banks and boards of trade have copied some of the railways' educational schemes, and at times it has looked as though the traffic man might be called on with discouraging frequency to share his laurels; but the action of the Lehigh Valley people indicates that the watchful railway promoter is liable any day to find some new field of effort. Not the least useful feature of this South American propaganda is a fifty-page pamphlet, issued with the "Compliments of the Lehigh Valley," summarizing in lucid form the varied and voluminous information on this subject which otherwise could be had only by extensive studies.

Prevention of Locomotive Smoke

In a paper entitled "A Practical Method of Handling Locomotive Smoke," presented before the ninth annual convention of the International Association for the Prevention of Smoke recently at Grand Rapids, Mich., the writers, a committee of the Railroad Smoke Inspectors' Association of Chicago, state that the most important features in smokeless firing are eternal vigilance on the part of the smoke inspectors and the authorities controlling the engine crews, the careful instruction of the engine crews as regards the manner of firing and operating locomotives and the special smoke-consuming devices, the co-operation of the engineers and firemen, and, if possible, the use of one grade of coal. These points certainly cover the smoke question very thoroughly, and when they are closely and consistently observed, there is no question that much will be done toward the elimination of locomotive smoke. Perhaps the most

important of these items is the careful instruction of the engine crews. Without this the value of any smoke-consuming device placed on the locomotive will be lost. The instruction of the engine crew should not be restricted to the fireman. Oftentimes the engineer is the one who most needs to be told a good deal about smoke prevention. He may have been brought up in the old days when it was thought that an engine which was not smoking was not steaming properly. This notion should be removed from his mind, and he should be made familiar with the proper methods for smokeless firing in order that he may properly control the work of his fireman. There is also need of close co-operation between the engineer and fireman, and unless the engineer is made to see the reasons why a certain method of firing should be used and thoroughly understands it he is likely not to give his firemen the support that it is necessary he should. That smokeless firing may be properly maintained, eternal vigilance on the part of the smoke inspectors is absolutely necessary. Perhaps the most effective and satisfactory plan of smoke inspection is in use at Chicago. That city covers an area of 191 square miles, which is overspread with tracks and yards on which operate engines of every road entering it. It would be impossible for each road satisfactorily to inspect all of its engines operating over the entire district. In order to secure satisfactory inspection the Railroad Smoke Inspectors' Association of Chicago was formed under the direction of the General Managers' Association, as has been previously described in these columns. It is now the duty of each smoke inspector to report locomotives of all roads impartially. Since this system has prevailed the average density of smoke emitted from locomotives has been reduced from 11.99 in 1912 to 6.034 in 1914. The plan has worked with very little friction and is recommended for other large localities where operating conditions are similar.

KEEP A STIFF UPPER LIP

THE present in the United States is the kind of a time when strong men show their strength and weak men show their weakness. Six weeks ago the outlook for business throughout the United States generally, and in the railway and railway supply businesses particularly, was promising. It looked as if, when the fiscal year was ended and the decision of the Interstate Commerce Commission in the rate advance case was rendered, the corner would be turned and prosperity would be renewed. But the decision in the rate case was unexpectedly delayed and before it was handed down Europe was involved in a terrible war. It was unavoidable that the beginning of this war should affect business in the United States unfavorably and to a great degree. It was inevitable that it should force a painful readjustment in many directions. We are now going through this period of readjustment and almost everyone is keenly feeling the effects of it. The consequence is most business men are assuming a pessimistic tone and are disposed drastically to reduce their organizations and cut expenses in every direction.

Is this wise? Does the situation justify the adoption of such a policy? When a storm comes up it is desirable to take in sail, but it is never considered desirable entirely to destroy the sails because it is assumed that after the storm is over there will be further use for them. Now, under present conditions it is undoubtedly desirable for business concerns generally, and those in the railway and railway supply fields particularly, to proceed cautiously. But is there not great danger of carrying retrenchment so far as not merely to protect the solvency of the concerns affected, but as to lose the opportunities which the war is opening up and make it impossible for the concerns which do the severe retrenching to handle their business successfully and profitably after the war is over?

At home all the underlying conditions are sound. Abroad the war is opening up for American manufacturers and exporters markets in South America, Asia and even in Europe itself, which, to a large extent, have been closed to them. Are we not thinking too much about the dark side of this cloud and not enough about its silver lining? Is there not being manifested too general a disposition to take flight before the danger with which American business apparently is menaced, and not enough disposition to meet the situation squarely, to confront the seeming menace courageously, and to put up a good fight for better business?

It is a familiar fact that in almost every shake-up in any kind of business concern the incapable men suffer while the capable ones gain. The weak go down while in the long run the strong keep on climbing almost regardless of what occurs. The same thing applies to business concerns in the same field or in the same country, and it applies to the business men and business concerns of different countries. Are the business men and business concerns of America really weak or really strong as compared with those of other countries? If they are weak they will be injured both relatively and absolutely by the crises which we are going through. If they are strong they will benefit by it both relatively and absolutely.

There is opportunity as well as danger in the present situation, and probably some concerns will be ruined by it and others will take advantage of the opportunity it offers and profit by it. And those which will be ruined will be those which assume the defensive, pull their organizations to pieces, quit seeking business and think of nothing but saving money, while those which will gain by it will be those which hold their organizations together with a firm hand, assume the aggressive and make a real fight, not merely to keep down expenses, but to hold all the business that they have and to get the business that their weaker competitors are letting slip away from them.

THE PROPOSED FREIGHT TAX AND THE PORK BARREL

DESPATCHES from Washington last week indicated that the people of the country might have an opportunity to experience what would be, in effect, to consumers, a general advance in freight rates, despite the laudable efforts of the Interstate Commerce Commission to hold down the cost of living. The House Ways and Means Committee included in its emergency war tax bill a provision for a three per cent tax on railroad, steamship and express freight shipments, to be added to the freight bill and collected by the carriers, the remainder of the war tax to be levied on beer and wine. Based on the freight earnings for the fiscal year 1913, which the Interstate Commerce Commission reports as $2,198,930,565, this would produce a revenue of about $66,000,000 a year on railroad freight, which, as we have often been reminded, would be a charge on the ultimate consumer.

A five per cent advance in freight rates, for which the eastern roads asked, but which they were denied, would amount to about $110,000,000 if applied over the entire country. This is $44,000,000 more than the proposed tax would amount to; but the tax would be plenty large enough to test the extent to which a general advance in freight rates would operate as a hardship on the public. The railroad contention has been that the general public would hardly notice the effect of a five per cent increase in rates as reflected in the prices of commodities. It is interesting to note, therefore, that the selection of freight for taxation is ascribed to the desire of the Democratic leaders to distribute the burden as widely as possible by an "indirect charge on the consumer imposed in such a way as not to annoy the man who was thinking of voting the Democratic ticket"; and it is easy to believe that, as reported, the President favored a tax on freight rather than on passengers.

Under other circumstances the railways would have little reason for objecting to being made tax collectors for the government. The machinery is provided. They could simply add the United States to their interline accounts, and would receive one per cent of the collections. And, of course, there is no real question that the traffic will bear the tax.

But the rank absurdity of the government's position was quickly disclosed. It was seen that it was proposed to make,

in effect, a general advance in freight rates, which the railways need and have been refused, and to use the proceeds, not to maintain the solvency of the railway companies, to improve the efficiency of transportation, and to distribute throughout the country in wages and in the purchases of equipment money whose disbursement in this way is needed to revive general business, but rather to spare the government the painful necessity of practicing the sort of economy it has so long preached to the railroads, and in order to escape levying a tax on whiskey, tobacco, patent medicines, legal instruments and other proper subjects.

The shippers, generally speaking, had not objected to the five per cent advance proposed by the railways. Many of them openly advocated it. And they probably would not seriously object to paying a three per cent tax on their freight shipments, certainly not if they thought it were needed. But they probably would organize a strong opposition to attempts to both make a general advance in rates and impose a tax on freight.

The railways needed an advance in rates before the development of the emergency created by the war, which has so seriously interfered with the movement of their traffic and with the marketing of their securities. While prices in other businesses have advanced, the average freight rate per ton mile has been reduced from 7.63 mills in 1903 to 7.27 in 1913; and meantime railway expenses have greatly increased. Railway taxation has already been increased from $57,849,569 in 1903 to $129,052,922 in 1913. And yet, in the face of all these facts, it was nonchalantly proposed to raise $66,000,000 out of an estimated war tax of $107,000,000, not from the railroads directly, it is true, but by laying a tax on the public in such a way as greatly to increase the difficulties met by the railways in obtaining the advances in rates which they so sorely need!

The railways have been censured for wasting their revenues, but the railway managers have less need for advice on this subject than for assistance in putting some of it into practice. Moreover, the worst forms of extravagance practiced by the railways have been economy itself compared with the least extravagant practices of the United States government. Our government is so ill-managed that its extravagance and inefficiency have become proverbial. Even while the President was asking Congress for a war tax of $100,000,000 Congress was about to appropriate $93,000,000 for the annual river and harbor "pork barrel." Later reports indicate that the receipt of thousands of telegrams of protest from "back home" has induced the senators in charge of the "pork" bill to cut off appropriations for all new projects, thereby reducing the total by about 50 per cent. This would leave about $46,000,000 to be expended largely for the benefit of politician-contractors. What "drastic economy" this represents will be appreciated when it is noted that the average annual appropriation for river and harbor improvements for the last seven years has been $37,500,000, and that the appropriation of $51,118,889 for 1914 was the largest during that time.

In other words, at a time when the railways are struggling desperately to keep up their earnings and to keep down their expenses, at a time when the business of the country is in bad shape largely owing to the situation in which the railways find themselves, the leaders in Congress felt free to take from the shipping public $66,000,000 a year which ought to go to the railways in order that Congress might make "pork barrel" river and harbor appropriations amounting to $6,500,000 more than the average river and harbor appropriations of the past seven years!

Fortunately the protests against this reckless stupidity came very promptly, and from the press of all political complexions; and after a few days of hedging the freight bill tax was dropped. The caucus decided definitely on the evening of the 15th to draft a bill imposing stamp taxes and other taxes which have been shown by experience to be rational from a business standpoint, and sound politically.

HOW TO GET PROMOTED

NAPOLEON BONAPARTE, the greatest organizer of men the world has ever seen, taught each soldier to feel that he carried in his knapsack a marshal's baton; and Vice-President Taylor, of the Mobile & Ohio, in his recent address before the superintendents' association at New York (*Railway Age Gazette*, August 28, page 389) declared that, for railroad officers, this incident carries the most important lesson that is to be learned from the great general's career. The railroad superintendent who would create enthusiasm and solidarity among his forces must impress on the men the fact that promotions will be made from the ranks. And the speaker implied, of course, that this policy of using "home talent" should be the fact. It is out of the question to impress employees with a "fact" which is impaired by so many exceptions that they cannot believe in its existence.

And to fill responsible positions from the ranks implies that men in the ranks are all the time being educated for higher places. Innumerable appointments have been made from the outside world because the appointing officer could not find among his own men the most suitable candidates. Instead of providing systematic education he trusted his men to educate themselves, and they failed to do so. Mr. Taylor's appeal, if we read between the lines, is, therefore, a call on the superintendent (and his right-hand man, the trainmaster) to educate employees to look upon that imaginary baton with an intelligent appreciation of what a baton is for. Dreaming of future power is a pleasant occupation in which many a young man has spent far too many hours. It might be a good thing, in this present humdrum world, to modify Napoléon's dictum by telling the ambitious railway employee to indulge in that dream for about seven minutes each week, and to spend the rest of his available time in studying the conduct of men who actually wield batons today, to see how they turn the trick. For, in truth, we are here using highly figurative language. The real desideratum is not a symbol of power, but actual ability to exercise power; a mental equipment which enables one, first, to know how to do railroad work in the best possible manner, and, second, to successfully guide other men in doing such work. The brakeman who aspires to be a conductor ought to study conductors' work ten times more assiduously than the average brakeman usually does study. Conductors who make sad blunders in their first six months' service simply because they neglected earnest study beforehand are to be found on every hand. The far-sighted fireman who aspires to be a locomotive runner does not content himself with passing his successive examinations; he studies, night and day, so as to attain to a 100 per cent proficiency. The station agent who expects to rise to a superintendency—or even halfway there—not only studies the rule book and the innumerable circulars which he receives from headquarters; he studies the relations of railways to the public, the knotty problems of the labor question and other things far beyond his present duties. He realizes that if his acts as a superintendent are to measure up to a fair standard of efficiency, his thoughts or studies must go far beyond a fair measure; he must aim to know *everything* bearing on the duties of a semi-public officer managing an important public service.

And, speaking of superintendents, this little lesson which was set forth by Mr. Taylor was admirably supplemented, a week later, by another, equally brief, by General Superintendent W. E. Williams of the Missouri, Kansas & Texas (*Railway Age Gazette*, September 4, page 444). Mr. Williams, writing of the work of the trainmaster, tells that officer that he can do important tasks for the superintendent, and adds this significant injunction: "In making investigations, so arrange your report that it will conclude the matter; so that the superintendent will not have to follow after and conduct an additional investigation." That is setting a pretty high

standard; but what lower one can be called satisfactory? One may adopt a compromise theory; aim to make reports which probably (not surely) will suit the superintendent and trust that he, rather than humiliate you by himself making further investigations, will recommit the matter to you. That is easier. But to make a report which shall be entirely satisfactory not only accomplishes the primary purpose of saving the superintendent's time; it educates the man who makes it; and he gets more profit from it than does the superintendent.

To make a report that will surely be acceptable it is necessary to explore a subject to its utmost limits. If it is necessary to go to the biggest library or to visit a half dozen cities, the situation must be faced in a business-like way. If there is another trainmaster on the road whom the superintendent may think could do the job better, the trainmaster must show him that that supposition is unfounded. Can the superintendent have any wavering of opinion as to what is the right conclusion in the matter? The trainmaster should be prepared to compel him by unanswerable logic to come to a decision. Does this task demand research and night work? The trainmaster should be prepared to get someone on his staff to relieve him of a part of his work, so that he can do the night work without impairing his general personal efficiency. These few suggestions will indicate the comprehensive nature of Mr. Williams' simple demand for "conclusive" reports.

To be able to command, one must first learn to obey. To be capable of being a general manager, one must learn to serve a general manager efficiently. George Findlay, former general manager of the London & North Western, in his book on the Working and Management of an English Railway, gives four rules for the conduct of his office, and the second one is this:

> Before any question is submitted to you for decision, insist upon having all the details filled in, and all the facts before you, so that you may not have to apply your mind to it a second time, but may decide it once and for all with a full knowledge of all its bearings.

If *your* boss is so easy and amiable that he has not adopted this rule—why, that is bad for you!

M. C. B. RULES OF INTERCHANGE

THE time is drawing near for the changes in the M. C. B. Rules of Interchange to go into effect, and it is the duty of every railway mechanical officer to see that the men under his jurisdiction affected by these rules thoroughly understand them. The important changes made this year are in Rule 1, the footnote under Rule 42, and Rule 120. The change in Rule 1 requires each railway company to give foreign cars, while on its line, the same care as to repairs that it gives to its own cars, the previous rule mentioning only "running repairs." This change was made to obviate differences of opinion regarding what constituted running repairs, and also to obtain more complete repairs to the railroad equipment. The chief purpose of this rule is to eliminate bad order cars in so far as possible, and if the roads will repair the foreign cars as conscientiously as they do their own, no matter whether they are repairing defects for which the repairing road or the owner is responsible, much good will come from this rule. The number of bad order cars will be reduced, the cars will be maintained in a more serviceable condition, the car shortage will be reduced, a smaller number of cars will be required, and the car situation will be materially improved. The railroads must pull together, for without the co-operation of all the full benefit of this rule will not be realized.

The foot-note under Rule 42 is intended to eliminate the present practice of holding a car for the owner's authority to repair combinations of defects involving decayed parts, or longitudinal sills requiring renewal or splicing due to elongated holes, or to sills split on this account—a joint inspection statement serving as the necessary authority. Considerable good may be expected from this change, for the roads can get the authority for making the necessary repairs much more quickly, and thus eliminate to some extent the accumulation of defective cars.

The new Rule 120 removes the necessity of home routing cars in a general worn-out condition, and gives the car owner the option of having the reported car rebuilt or destroyed. It is believed that this rule will greatly expedite the handling of cars in this condition, and by doing away with the home route card it is surely relieving the roads of hauling some very undesirable cars. In the past it has been found that some roads are very slow about advising as to what shall be done with such cars, the delay running from a year to 18 months. This crowds the repair tracks of the handling line, and in several instances it has been a cause of great annoyance. All roads should make it their business to reply to the report of the joint inspectors just as soon as possible so that the handling line may make a prompt disposition of the car. If the car is to be rebuilt it is to the financial advantage of the owner to reply promptly for per diem ceases on the date of the request for the disposition of the car by the handling line, and if it is to be destroyed the owner should be only too glad to extend the courtesy of a prompt reply to the handling line.

Those making the joint inspection should be persons in whom the owner can place the greatest confidence, and should be men whose experience justifies their acting in that capacity. In other words, the best men available in the locality in which the inspection is to be made should be chosen as joint inspectors. If this policy is followed the owner will feel perfectly sure that his interests have been carefully considered, and will be more likely to give the necessary authority promptly.

NORFOLK & WESTERN

THE growth of coal traffic on the Norfolk & Western in the last five years has been quite remarkable, not only the actual tonnage carried having increased largely each year, but the proportion of coal to other traffic has also increased. Thus in the fiscal year ended June 30, 1910, the tonnage of bituminous coal carried was 13,990,000 tons, which was 55.04 per cent of the total tonnage carried. In 1914 the tonnage of bituminous coal was 23,220,000 tons, or 64.71 per cent of the total tonnage carried. The gain in coal tonnage in 1914 over 1913 was 2,000,000 tons, or nearly 10 per cent.

It was largely due to this increase in coal tonnage that the Norfolk & Western's earnings in 1914 compared favorably with 1913. Total operating revenues amounted to $44,470,000 in 1914, an increase of $730,000, or 1.67 per cent. The total amount available for dividends, however, was $9,350,000 last year as against $10,190,000 the year previous, a decrease of over 8 per cent. It will be seen, therefore, that there was a disproportionately large increase in expenses or deductions from gross income. As a matter of fact, the increase came both in expenses—4.80 per cent—and in deductions—5.76 per cent.

It is particularly interesting to see why expenses should have increased to a greater extent than the increase in volume of traffic when the greater part of the increase in traffic was in the low grade commodity coal, and the tonnage of many other commodities which are generally more expensive to handle, such as manufactures, merchandise and miscellaneous commodities, decreased. The following table shows the per cent of each class of operating expense to total operating revenues in 1914 and 1913:

	1914	1913
Maintenance of way and structures	11.24	12.67
Maintenance of equipment	20.72	19.06
Traffic expenses	1.66	1.58
Transportation expenses	31.64	30.16
General expenses	2.06	1.84
Total	67.32	65.31

The Norfolk & Western operates 2,036 miles of road. This is an increase in the average operated in 1914 over 1913 of 13 miles. In 1914 there was 491 miles of second-track and 1,230

miles of sidings and yard tracks. There was an increase during the year of 40 miles of second-track and 79 miles of sidings and yard tracks.

Besides this coal traffic, manufactures and products of forests furnished the larger proportion of the traffic. In 1914 manufactures furnished 9.98 per cent as against 11.02 per cent in the previous year, and products of forests, 6.20 per cent as against 7.10 per cent.

Even allowing for the fact that the Norfolk & Western has a large proportion of second-track, the freight density is heavy. The revenue tons carried one mile per mile of road was 4,500,000 in 1914 and 4,380,000 in 1913. The passenger density—passengers carried one mile per mile of road—was 113,000 in 1914 and 109,000 in 1913.

It will be noted that the principal increases in operating expenses were in maintenance of equipment and in transportation. Transportation expenses amounted to $14,070,000 in 1914, an increase over the previous year of 6.64 per cent. In its separation of expenses as between freight and passengers, which is probably made on the same basis as that of the Pennsylvania Railroad, namely, largely on a train-mile basis where it is not easily possible to allocate direct, the Norfolk & Western shows an increase in 1914 over 1913 in transportation expenses for freight from $11,310,000 to $12,080,000, and for passengers from $1,880,000 to $1,990,000. The increase in passenger expenses is easy to understand. The increase in passenger mileage was 4.44 per cent; in passenger train mileage, 2.66 per cent, and in passenger locomotive mileage, 3.12 per cent. In addition there were the increased wage costs and an increase in fuel costs, which will be mentioned later. The increase in freight transportation expenses was in the face of a decrease of 1.59 per cent in revenue freight train mileage and 1.05 per cent in freight locomotive mileage, with an increase in average trainload of 38 tons, or 5 per cent. As has already been mentioned, the proportion of slow drag freight was greater in 1914 than in 1913, and beside the better trainload there was better carloading per loaded car—in 1914, 31.60 tons, and in 1913, 30.57 tons. This would be expected with an increase in the coal traffic, as would also an increase in the empty car mileage.

The total freight car mileage in 1914 was 483,820,000, an increase of 3.88 per cent, while the increase in eastbound empty mileage was 9.33 per cent, and in westbound, 11.32 per cent. It is interesting to note that while the mileage of all Norfolk & Western cars increased 11.39 per cent and was 63 per cent of the total car mileage, the mileage of foreign freight cars decreased 7.18 per cent and was 37 per cent of the total freight car mileage. The Norfolk & Western received a large number of freight cars during the year, and the average number in service on all roads in 1914 was 43,787, and in 1913, 41,174. This, coupled with the fact that the increase in traffic was in coal, explains the much smaller proportion of foreign mileage, but does not explain why the hire of equipment credit balance should have been less in 1914 than in 1913.

Detailed figures for operating expenses show that by far the largest single item in the increase in transportation expenses was in the cost of fuel for road locomotives. This was $2,900,000 in 1914, an increase of 13 per cent over 1913. Fuel per engine mile was more expensive in 1914 than in 1913, both because there was an increase in the cost per ton of coal and because less engine miles were made per ton of coal. The average pounds of coal per engine mile in 1914 was 2.15, and in 1913, 2.02. This is an increase of a little less than 6 per cent. The average cost of fuel per 100 engine miles was $11.19 in 1914 and $9.93 in 1913, an increase of a little less than 13 per cent.

The increase in maintenance of equipment expenses was due to considerably larger expenditures on repairs and also to larger charges for depreciation. The increase in depreciation charges for locomotives was 12.20 per cent; for passenger cars, 30.93 per cent, and for freight train cars, 12.35 per cent. Of course there was more equipment in service on which to charge depreciation, but whether or not this would account for all of the increase in depreciation charges it is hard to say. The following table shows the charges for repairs, renewals and depreciation per unit of equipment:

	1914	1913
Locomotives	$3,120	$2,934
Passenger train cars	870	994
Freight train cars	108	103

During the year the tractive power of total locomotives in service increased 3.19 per cent; the seating capacity of passenger train cars, 20.68 per cent, and the tonnage capacity of freight train cars, 16.16 per cent. This is a very large increase in available equipment and the increase in coal cars probably in part accounted for the large increase in coal tonnage, many times, especially in the early part of the year, in West Virginia desiring to ship more coal than there were always coal cars for.

Few railroads in the United States are in a stronger financial position than is the Norfolk & Western. Through skillful financing—in recent years by the issue of convertible debenture bonds—the company has kept its proportion of funded debt to capital stock comparatively low. At the end of 1914 there was $111,645,000 funded debt outstanding and $130,760,000 stock. The sale of convertible debentures cost the company less for its money than would have the sale of stock. As the earnings grew and the amount available for dividends increased, these debentures were converted, and while this increased the dividend requirements, it widened the margin of safety above interest charges. Thus, while the debentures outstanding increased during 1914 by $10,726,000, this increase wiped off $17,139,000 subscriptions for debentures, the common stock having been increased by $7,627,000, due to the conversion of debentures. Even in 1914 the company earned a net available for dividends of 8.68 per cent on its common stock after having paid the 4 per cent on its $23,000,000 preferred.

There was appropriated from surplus $2,094,000 for additions and betterments, and including this amount, there was $7,264,000 spent for additions and betterments. An issue of $10,000,000 equipment trust certificates was sold during the year, and besides paying off $1,300,000 of matured certificates, a large amount of new equipment was bought, which included 10 passenger locomotives and 16 freight locomotives, 4,327 hopper coal cars of 57½ tons capacity, and 748 flat bottom gondola cars of 90 tons capacity.

In commenting on the financial changes, President Johnson has the following to say:

> The urgency of the requirements for additional facilities to be met by that issue of convertible bonds was set forth in the circular dated January 30, 1913, to the stockholders. Early in the year, however, the unfavorable outlook led to the curtailment of expenditures for additions and betterments by postponing the less urgent and reducing the rate of progress upon the more important. This left temporarily in the treasury a considerable balance of funds raised for such expenditures. In order to secure a greater revenue therefrom than was obtainable from ordinary deposits (suitable authority having been given by your board) these funds have been utilized from time to time to purchase well secured short term obligations, maturing in conformity with the company's cash requirements. A substantial addition to the company's dividend and interest income has thus been made.

These short term investments mentioned by President Johnson all mature in 1914 and 1915, and include short term railroad notes, equipment trust certificates and quite a number of municipal issues. They are carried on the books at $12,353,000. In addition the company has $8,010,000 cash, with total working liabilities of but $3,550,000.

The following table shows the principal figures for operation in 1914 as compared with 1913:

	1914	1913
Average mileage operated	2,036	2,023
Freight revenue	$38,038,622	$37,588,024
Passenger revenue	4,908,679	4,715,294
Total operating revenue	44,470,619	43,739,921
Maint. of way and structures	4,998,612	5,542,960
Maint. of equipment	9,214,007	8,336,631
Traffic expenses	737,690	691,558
Transportation expenses	14,068,577	13,192,922
General expenses	916,954	801,742
Total operating expenses	29,935,842	28,565,813
Taxes	1,620,000	1,552,000
Railway operating income	12,894,903	13,714,499
Gross income	14,892,293	15,478,981
Net income	10,268,140	11,166,641
Dividends	7,180,592	6,706,465
Surplus	3,087,548	4,400,176

Letters to the Editor

RAILWAY TAXATION UNDER GOVERNMENT OWNERSHIP

New Meadows, Idaho, September 3, 1914.

To the Editor of the Railway Age Gazette:

In your issue of August 28, 1914, I note an article headed "Savings Under Government Ownership," in which Sir George Paish is quoted as estimating a saving in the annual cost of railway capital, which could be made in the United States under government ownership of from 60 million dollars to 130 million dollars per annum.

Is it not true that the taxes paid by the railways of the United States for the calendar year of 1913 amounted to $135,321,866, and is it not true that under government ownership the railways, as government property, would be relieved of taxation, and therefore does it not follow that at the highest estimated saving from government ownership there would be a loss of over 5 million dollars, and at the lowest of 75 million dollars since all of the taxes are at the present time applied to purposes of government of one sort or another?

Briefly, would not the government, federal, state and municipal, actually lose the difference between the amount of taxes now paid by the railways and the amount which would be saved in other ways by reason of governmental ownership of railways?

E. M. Heigho,
President and General Manager, Pacific & Idaho Northern Railway.

SENATOR BOURNE ON GOVERNMENT OWNERSHIP

New York, September 15, 1914.

To the Editor of the Railway Age Gazette:

You have reported briefly the strong declaration of the Bourne committee against government ownership of mail cars (September 4, page 436). This part of the committee's report will bear further emphasis. A positive and plausible statement from an apparently reliable source, will always be accepted by most people as true, however, erroneous it may be as a matter of fact. This is particularly the case with a statement from a government official appearing in printed form, like that of Postmaster-General Vilas in 1887, cited by the committee. He declared that the government would save a million and a half dollars yearly by purchase and ownership of the railway postoffice cars. The statement appeared plausible and there was no contradiction. For more than 25 years this declaration has been accepted as true by the great majority of people. No proof on the subject was presented.

But in this report Mr. Bourne shows that if the government owned the cars and paid the railroads the usually prevailing rates for transportation of similar cars, and paid the expense of maintenance, repairs, inspection, icing, cleaning and lighting, the government would pay more than it does today.

After presenting statistics showing that under government ownership of railway postoffice cars the expense to the government would be greater than under ownership by the railroads, Mr. Bourne asserted that purchase of the railway postoffice cars would also be unwise because it would be the beginning of a general government ownership policy, eventuating in bureaucratic paternalism, inertia, and, inside of a century, governmental dissolution. He cited the fact that under general government ownership of public utilities there would be over three million governmental employees; that in the last ten presidential elections the President has been elected by a plurality of from 7,000 to a little over 2,500,000, and that, therefore, government employees could absolutely control the government, the tendency being more pay, less service in governmental employment, resistless efforts on the part of outside labor to secure government employment, because less onerous and more remunerative, and dissatisfaction and irritation in all private enterprise. Mr. Bourne's chief objection to government ownership is apparently because of the bureaucratic system which would be built up; and he concludes his discussion of this subject as follows:

"Governmental efficiency and economy of operation can never equal that of private enterprise, and the whole desiderata of government should be equal legal opportunity for all and limitation on individual liberty only in the prohibition of preying on the personal or property rights of others. Our present drift to departmental rule and regulation, instead of a government by law, which is the greatest menace to the future of our country, would, in our opinion, be greatly accentuated by governmental ownership."

E. R. S.

WAGES NOT SALARIES

July 8, 1914.

To the Editor of the Railway Age Gazette:

The letter from "Operating Officer" in your issue of June 19 calls attention to a point which heretofore has been given very little consideration. That such is the case, operating officer made quite clear, but it would not be well to embrace other lines of railroad activity that have grievances of a more pressing nature. I make no complaint about my own salary, but wish to call attention to the men under my jurisdiction, whose periods of service with the company for which I work range from 5 to 35 years in the capacity of concrete foremen and bridge foremen. Each one of these foremen before being appointed such had seen not less than five years service with this or some other railway company in the capacity of laborer, carpenter helper or carpenter, whose average monthly wages for the laborer and carpenter helper rarely exceeded $65 per month, while the carpenter generally obtained $15 more. Foremen, both concrete and bridge, generally draw $100 per month, or thereabouts, for services that call for a knowledge in the reading of plans and execution of work that requires many years to acquire. The men above referred to are not complaining about the wages paid them, but the purpose of this letter is to contrast such wages, which, by the way, "operating officer" should have done for section forces, with the wages of brakemen and conductors and enginemen. The former (brakemen) draw $100 per month and over, probably for the first month's service they render, while the conductors receive $165, and those on work trains exceed the $200 mark. Brakemen and many conductors, spend their spare time "studying" how to avoid work as per schedule, while any common sense man would decide what they should do inside their hundred mile run or ten hour day.

I have been on washout work where bridgemen were face to face with real danger while brakemen and conductors sat nearby looking on if they were interested, but never volunteering to give a helping hand, the engineer being the only man of the work train crew that was at work. Man for man the bridgeman is the equal if not the superior of the trainman. A man who is now vice-president of one of the big systems told me that the bridge crew is unquestionably the most efficient unit in railroad work today.

In the matter of consideration the conductor and his family can get passed on the best trains. Only a few mornings ago, I saw a conductor, his wife and two children on one of the best trains on the continent. I had asked for a pass on the same train, returning from a wedding trip, some time before and was refused.

Does the bridge foreman draw as much as the conductor? How do their duties compare? A readjustment of the wage question is necessary—not to give the trainmen more wages but to take some away and give it out in dividends to stockholders, if the company does not think the section foreman or the concrete laborer or bridgeman entitled to an increase over what they are now getting. Let us "side track" cataclysm referred to by "Operating Officer" and bring about fair treatment of all

Ass't Engineer Bridge & Buildings.

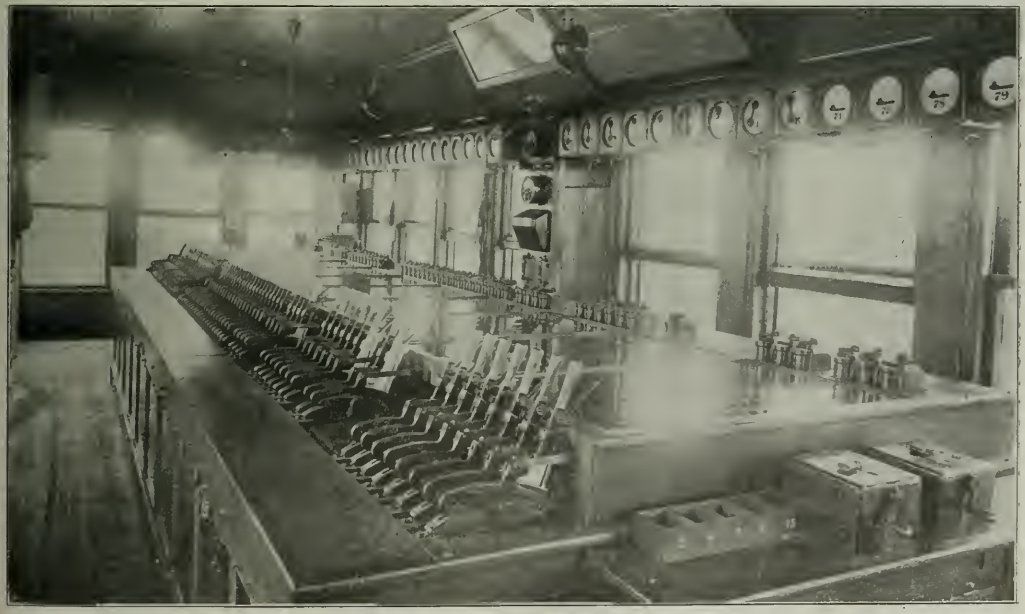
Electric Interlocking at Rome, New York

Speed Conditions Required No. 14 Turnouts. Restricted Track Centers Necessitated Special Signal Supports

At Rome, 109 miles west of Albany, the line of the New York Central & Hudson River expands from four tracks on the east to six tracks on the west. At this point, an 80-lever electric interlocking has been installed to operate the crossovers and turnouts. The improvements are on an entirely new line of road, which was built to eliminate two crossings with the New York State Barge Canal, as located, and which improvements were described last year in the *Railway Age Gazette* of August 15, 1913.

Bracket Post, Looking West; Cantilever Signal Bridge, Looking East

As the layout is to provide for high speed traffic, No. 14 crossovers are used throughout, and turnouts from the ladder leading to the fifth and sixth tracks are also No. 14. The use of these long turnouts makes the interlocking plant a long one. The speed restrictions through this interlocking are: Tracks



Federal All-Electric Interlocking Machine, Rome, N. Y.

1 and 2, maximum speed 40 miles an hour; tracks 3 and 4, maximum speed 20 miles an hour.

SIGNALS AND SIGNAL SUPPORTS

The cantilever signal bridge supporting the eastbound home signals for tracks 1, 4 and 5 is an interesting feature of this plant. The main part of the bridge spans tracks 1, 2, 3, and a siding, with one support outside of track number 1 and one between track No. 4 and the siding. The cantilever section projects over a second siding and also over tracks Nos. 4 and 5. The accompanying illustration shows this bridge and also the bracket post at the east end of the plant adjacent to track No. 3 supporting the westbound home signals for tracks Nos. 2 and 3 (signals 73, 74, 75, 77, 78, 79). These two special types of support were made necessary by the arrangement of track centers, and by the necessity for locating the foundations between tracks in such positions as to allow sufficient clearance.

The signals are three-position, moving in the upper quadrant. The high arms are the Federal Railway Signal Company's top post, 110-volt d. c. motor type and operate as semi-automatic non-stick signals. The dwarf signals are Style 4, Federal Railway Signal Company's design, the mechanism being exactly the same as that used in the top post signals; but when used in

New York Central Signal Station, Rome, N. Y.

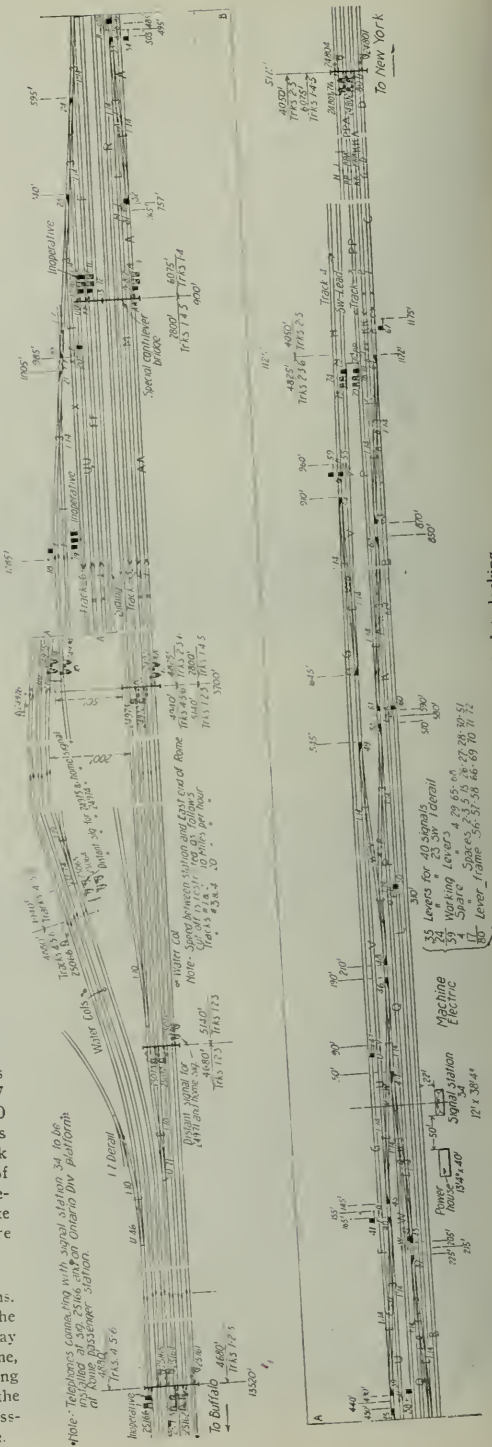
dwarf signals it is mounted on cast iron supports, which are bolted directly to concrete foundations.

All signals are electric lighted, the current used being 100-volt d. c. Each light has two 2-c. p., 100-volt carbon lamps. In case the first lamp fails to light or is burnt out, a cut-in relay completes the circuit to the second lamp. Night indications are green for clear, yellow for caution and red for stop.

The interlocking machine is of the Federal Signal Company's standard type, and has 59 working levers, 4 spare levers and 17 spare spaces, in an 80-lever frame. Thirty-five levers operate 40 signals and 24 levers operate 23 switches and 1 derail. This plant has but one interlocked derail, that on the ladder track leading to track No. 6 at switch 23. The complete outfit of crossovers provides diverging tracks for any and every movement which convenient and safe block signaling may make necessary; and derails, as substitutes for diverging tracks, are not needed.

SIGNAL CABIN

The signal tower, 12 ft. by 38 ft. 4 in. outside dimensions, is a two-story frame structure set on a concrete foundation. The lower floor contains the hot water heating plant and the relay track. The second floor contains the interlocking machine, the operating board, a group of unit type indicators strung across the top of the windows, and the operator's table. In the relay track on the lower floor there are 112 wall type glass-enclosed relays of the Hall Switch & Signal Company's type.



POWER

Power is supplied to the power room at 220- 110-volts, three-phase, 60-cycles, transformed from a 2,200-volt a. c. high tension transmission line of the Rome Gas & Electric Company, which is converted to d. c. by a mercury-arc rectifier and a motor generator set; the former for the indicator, interlocking and local track battery and the latter for track batteries in automatic territory outside the interlocking limits. The switchboard arrangement is such that the local track batteries, one of the duplicate six-cell batteries, and the main battery may be charged either separately or in series in any combination. Overload and reverse current circuit breakers are provided to protect against excessive charging or a reversal of power from the battery.

In addition to the ordinary rectifier equipment, a resistance is provided which may be cut in when operating the interlocking direct, in case of failure of the battery. This resistance has an increased tube capacity to take care of the heavy current rushes incident to the simultaneous movement of several switches or signals. The motor-generator set consists of two separate two-bearing machines mounted on a common base, connected by a flange coupling. The motor is of the three-phase induction type, 15 h. p., 1,800 r. p. m., 220-volts, 60 cycles, and the generator is shunt wound, 10 k. w., 600-volts, d. c.

The storage battery has a capacity of 400 a. h. and is located in a separate room of the powerhouse. The main battery stands on shelves at the sides of the room, while the low voltage and track batteries occupy a space in the center of the room. The low voltage and track batteries have a capacity of 120 a. h. The storage battery consists of 34 cells in duplicate, feeding 17 track circuits. The powerhouse is heated from the hot water plant in the tower.

Wooden trunking above ground and vitrified tile below ground are used for carrying wires. Loricated conduit is used in the powerhouse. Concrete relay box posts were used wherever necessary.

THE DIAGRAM

The automatic signals are indicated in the drawing by numbers which explain distances and track numbers. For example, signal No. 24803, at the east end of the plant, is 248.0 miles from New York, and is for track No. 3. At the other end are signals 251.6 miles from New York for tracks 1, 2, 3, 4, 5 and 6. The interlocked switch farthest from the machines is No. 64, in track No. 1, which is 1,122 ft. east of the tower. The letters on the tracks are used to identify the track circuit sections.

The tracks were laid by the engineers of the New York Central & Hudson River, and the signal equipment was installed by the Federal Signal Company. In November the railroad company called upon the Federal people for a quick job, so as to make it possible to open the new line by January 1; and, responding to this call, the manufacturers installed the whole of the interlocking in 41 working days. Much of the time the temperature was around zero. Many of the men worked extra hours, at times, and a small night force was organized.

Atlanta, Fourth Telegraph Center—A telegraph authority says that Atlanta is the fourth largest telegraph center in the United States. For the past four months the Western Union has handled in Atlanta an average of 1,080,238 messages a month, of which 191,792 originated in Atlanta. The traffic department is composed of thirteen supervisors, 210 operators and forty-four clerks. With the other departments there is a total of 339 employees in the main office proper, eighty messengers and thirteen branch offices. The payroll runs about $30,000 monthly.

Railway Construction in Portuguese East Africa.—The engineer in charge of the proposed Mozambique-Nyasaland has been authorized to spend some $185,000 on commencing work. The line will be about 342 miles long, of which 62 miles will be in British territory and will extend from Mozambique on the east coast of Portuguese East Africa inland to British territory to the west. The cost is estimated at about $17,500 per mile.

CONVENTION OF TRAVELING ENGINEERS' ASSOCIATION

The twenty-second annual convention of the Traveling Engineers' Association was held at Chicago, September 15-18, President F. P. Roesch, presiding. The convention was opened with prayer by Dr. Samuel Fallows. J. F. DeVoy, assistant superintendent of motive power, Chicago, Milwaukee & St. Paul, called attention in an address to railroad conditions in this country, showing how earnings have declined, wages increased and freight rates decreased. He also compared shipments of staple commodities this year with those of last year, showing the decrease in business, and urged associations of this kind to take active interest in these affairs and exert all the influence possible to better conditions. Mr. De Voy also spoke of the development of the traveling engineer and his importance in railroad work; he must be capable of thoroughly instructing men and should ride with all those under his charge at least once every month. He should keep in close touch with conditions on the road, and with the train despatchers.

President Roesch in his address advised everyone to make the best of the conditions imposed on the roads by the commissions and to educate the enginemen along the lines designed to bring the best out of such improved devices as brick arches and superheaters. He stated that the mental qualifications should be raised for new men, and firemen should be under constant training for the position of engineman. He considered that greater intelligence is necessary to operate the large power of today than the small power formerly used. Enginemen should report engine defects thoroughly, as he considered that they would find more than terminal inspectors.

SMOKE PREVENTION

In order to eliminate dense black smoke, three conditions must exist, viz., to supply the fire with sufficient air, to thoroughly mix the combustible gases and air, and to maintain the temperature in the firebox to cause the combustible gases and oxygen of the air to unite. In stationary practice this is much easier to accomplish than in a locomotive. It is found that inadequate draft is usually responsible for smoky chimneys; therefore it is evident that it is necessary to have a properly designed front end, including the exhaust nozzle, ample grate opening and ash-pan opening large enough to insure free access of air. Grate opening is more generally found to be restricted by failure to clean clinkers from between the bars than by faulty design. Trouble is sometimes caused in properly designed from ends, by air leaks in the smokebox. The effort to overcome fires along the right of way has resulted, to some extent, in restricting the air opening in the ashpan. The ash-pan openings are frequently permitted to fill up with ashes, especially in winter on account of freezing.

The brick arch is a great aid in smoke elimination, as it increases the travel of the gases and gives them a chance to combine with the oxygen of the air before coming in contact with the comparatively cool firebox sheets. When fresh coal is applied, the steam jets, beside giving a small mixing effect, are helpful in furnishing the necessary air over the fire. Special effort should be made to furnish a uniform grade of coal because it is hard for the best fireman to obtain the best results with a grade of coal which is continually changing. Better results will be obtained if an inferior grade of coal is furnished at all times, because where it is changed frequently the locomotive is drafted to burn the inferior grade and the better grade is wasted. In regard to the relative cost of fuel in connection with smoke elimination, it has been proved beyond reasonable doubt in stationary practice that where plants have been remodeled to overcome smoke a saving in fuel and increased efficiency have resulted. In locomotive practice the same results have been obtained where the smoke-preventing devices have been judiciously used, but to obtain these results constant watchfulness is necessary.

Locomotives must be maintained in good shape at all times

to enable the crews to eliminate smoke. Of course this costs money, but it pays in the long run on account of the efficiency obtained when this is done.

The question is frequently asked: "Why do railroads in this country fail to control the smoke problem as well as they do in European countries?" A communication from F. R. Wadleigh, of the firm of Wadleigh & Osborn, consulting engineers, Philadelphia, shows that conditions are entirely different in Europe and much more favorable for smoke elimination. The following is taken from his letter:

"In the first place, it must be remembered that the European railways pay much more attention to firing than we do; their men are more carefully instructed, the observance of proper methods is strictly enforced, and every appliance is made use of that will decrease fuel consumption.

"Then, they are much more particular as to size of coal used. For instance, on the French railways, each class of service has its locomotive fuel carefully divided as to lump and slack or briquettes and slack, by weight; passenger service uses 20 per cent slack and 80 per cent lump or briquettes; fast freight, 40 per cent slack; yard engines, 80 per cent slack, etc.

"Large quantities of briquettes are used. The following contracts were placed in 1912 by the Paris, Lyons & Mediterranean Railway, the largest in France: The total amount used is 1,830,000 tons, of which 600,000 tons was imported from England, Germany and Belgium; ninety thousand tons large Welsh Monmouthshire steam. This is all double screened coal running about 25 to 29 per cent volatile. One hundred and forty thousand tons Welsh smalls; this is for making briquettes. Volatile, 13 to 15 per cent. Sixty thousand tons German smalls for making briquettes; will run about 28 to 30 per cent volatile. These two coals mixed in briquettes giving about 20 per cent volatile. Sixty thousand tons German briquettes. One hundred thousand tons Burham coking unscreened; will run about 23 to 27 per cent volatile. This is used as slack without briquettes. The specifications require:

"First: Coal must not produce adherent clinkers.

"Second: Ash—large Welsh, 6 per cent; smalls, Welsh, 9 to 13 per cent; briquettes, 8 to 10 per cent.

"Third: Large steam coal must contain from 25 to 35 per cent volatile substance and the smalls and patent fuel (briquettes) about 20 per cent."

Mr. Wadleigh's letter indicates that the use of briquettes is a large factor in the elimination of smoke from European railroads, but the cost of a good grade of coal is so small in this country as compared to the cost of briquettes that their use here is prohibitive.

The report is signed by Martin Whelan, chairman; A. M. Bickel, P. K. Sullivan, W. A. Heath and B. J. Feeny.

Discussion.—The discussion brought out that without the proper instruction and conscientious co-operation of engine crews, smokeless firing cannot be expected even though locomotives are equipped with efficient smoke consuming devices. Engines must also be correctly designed, with not less than 90 per cent ashpan air openings and 46 per cent openings in the grates. Brick arches were strongly recommended by E. W. Pratt, Chicago & North Western, for use on all engines. One member reported 20 per cent saving in fuel by increasing the ashpan openings.

CARE OF LOCOMOTIVE BRAKE EQUIPMENT

The care of locomotive brake equipment on the line is a question in which the engineman, trainman and car inspector are concerned. The engineman is concerned regarding the complete equipment, the trainman in regard to the proper handling of the angle and cutout cocks, hose and also the use of the retaining valves, all efficient brakes, and to see that the brake pipe leakage is kept as low as possible at all times. The car inspector is concerned as to the brake pipe leakage and the general condition of the train brakes. With the increase in the weight of locomotives and tenders it is necessary that the braking power be maintained at its maximum efficiency in order to reduce draft gear strain, liability of wheels sliding, and to provide smooth handling of trains in so far as possible. The engineman should be responsible for properly inspecting and caring for the air brake apparatus while it is in his charge, or for the proper reporting of all existing defects on the arrival at terminals. The committee is unanimously of the opinion that the brake equipment should be tested and inspected by the repair men at the terminals, and correct the defects without waiting for the report of the engineman. On one of our large roads the official in charge of mechanical matters has recently issued instructions that the compressors and other air brake equipment on freight and passenger locomotives should be tested each trip before the locomotive left the roundhouse for the train and by so doing has reduced the air pump failures from 231 in 1912, to 123 in 1913.

The committee also included in its report complete instructions for testing air brake equipment, together with instructions for repairing the various troubles. The report is signed by George H. Wood, chairman, B. Hyanes, R. E. Anderson, W. V. Turner, E. Bales.

ADDRESS BY H. C. BAYLESS

H. C. Bayless, mechanical engineer, Minneapolis, St. Paul & Sault Ste. Marie, in an address called attention to the increasing importance of the traveling engineer, especially in investigation work connected with new locomotive devices. He also said that there is a large field for them in increasing the efficiency of operation.

The balance of the proceedings of the convention will be published in next week's issue.

THE DUTIES OF A STATION AGENT*

By R. Morgan
General Manager, Savannah & Northwestern

The general term "agent" as applied to men in the service of railroads, covers a multitude of duties. An agent must be a diplomat. He must know when to assume a stern and uncompromising manner, and also when to be gracious and appealing in his attitude towards his patrons. He must have at his command a regular bureau of information for the benefit of the public, and be fully able to forecast future weather conditions, as well as keep well posted concerning the conditions of the market, and when to sell a clergy ticket to a preacher. He should also acquire early in his experience as an agent the art of carrying from the train the pouch of United States mail, the bundle of railroad mail, from three to five suit cases, the package of express bills, pulling at the same time a truck of express, and in passing consult his watch and give the correct time to Old Man Jones, who in all of his life never had occasion to hurry, except to get a drink of ice water before the train pulled out from the station.

In other words, as a rule, an agent is usually the sole representative of the company at his station. It is up to him to see that his company is well represented. If the agent makes for himself a good reputation with his patrons, he likewise strengthens the reputation of his company, as the company is always governed by his representations concerning matters pertaining to its business and patrons at such stations. The agent is on the ground and can form more accurate conclusions regarding all matters concerning the company's affairs there, than can be formed by others at a distance. He is in close touch with conditions as they exist, and therefore must be the source of the company's information, and his influence has everything to do with the current opinion existing in reference to the company.

Along this line it is well to mention the benefits to be derived from the sociability of the agent. By this, it is not meant that he should be sociable with those whose society would be distasteful, but his disposition should be such as to reach as many people

*Address at Station Agents' Meeting, Savannah, Ga., on August 16.

as possible, making them feel that they have a friend and a neighbor, who will go to trouble to accommodate them, giving them the benefit of such privileges as are due them, and one who will ably and gladly represent them in their business relations with the company. Much competitive business is secured by agents of such amiable disposition, which after all redounds to the good and credit of the agent. It increases the amount of business at his station, it increases his worth to his company, and will in time make his services sufficiently valuable to warrant the company in giving him promotion which he has really earned.

Personal neatness on the part of an agent is also to be commended. It has its effect on old neighbors as well as strangers to come into your office and find everything in orderly and systematic array, showing signs of having recently had a touch of a feather duster, floors clean and walls minus spider webs. Neat station grounds will always attract the eye of the passenger passing through on the train, and may possibly have some effect, in some instances at least, in inducing people to locate in your town. It is not always things of much magnitude that influence the casual observer, but sometimes little things have far-reaching effects, and bring about results astonishing in view of the minute circumstances to which their origin is due. Therefore, do not wait until opportunity presents some great thing for you to do, but perform the little duties, the little things that come up day by day. The result will be gratifying, and it is certain you will not have to grow old awaiting your opportunity.

It is well also for agents to benefit from observation. It is not meant by this assertion that the agents are the only class of employees who could be benefited through means of observation. Each class of employees could become more efficient if they would observe closely the methods and plans of others in the same line of work. If you observe a method of billing cotton by another agent, that you are sure is an improvement over the method you have previously used, it is the better part of judgment to adopt the same method. Or if you observe the loading of merchandise by some particular agent is an improvement over your method, you will benefit by adopting the same method. If you find that the local freight train by following certain modes of procedure in doing your yard work could thereby save time, and at the same time reduce the amount of work to be done, make up your switch list so as to accomplish this end. Unless you observe closely the switching as performed in your yard, you can hardly hope to be instrumental in improving the service.

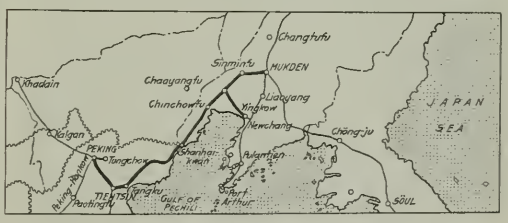
"Safety First" has been extensively preached to trainmen and all employees in yard service, but very little has been said in reference to this matter to agents. "Safety First" cannot mean more to engineers and conductors than it means to an agent. You can be the means of preventing many accidents in the course of a long term of service. Leaving express trucks too close to the tracks oftentimes results in personal injury accidents. This, you can prevent, by keeping a watchful eye on the parties handling the trucks. The agent is probably the only one who can prevent improper loading of inflammables and explosives, which otherwise might result in serious accidents. It is hardly necessary to call attention to what "safety first" means with reference to train orders. When the despatcher calls you to take an order for a superior train giving certain rights to an inferior train, the superior train then being due at your station, "safety first" would mean that you should put out your signals to the superior train, indicating that you have orders for it. This, of course, should be done before you take the orders; otherwise the train might possibly get by you, and the result be a serious accident. These are only a few instances of "safety first" as referring to agents. There are many others.

Next to "safety first" agents would do well to consider "self protection first," which in almost every instance would also mean company protection. The interests of the agent are so closely allied with those of the company, that the protection of one invariably means the protection of the other. For instance, if an agent signs a bill of lading for a car of lumber before ascertaining that it is properly loaded for transportation, he fails to protect himself or the company, and the lumber is adjusted or reloaded at the expense of the company, and the agent is open to criticism and reprimand from his superior officer. Or if an agent signs a bill of lading carrying the endorsement "Shipper's Load & Count" for a shipment less than carload and the shipment checks short of the number or quantity shown, then the agent does not protect himself or the company, for less than carload shipments should not be accepted as "Shipper's Load & Count," but should be checked by the agent before issuing bill of lading. These are only a few of the instances of "self protection" and "company protection" on the part of an agent. There are many other instances, and all agents should always exert their uttermost efforts towards such protection.

The manners and general behavior of visitors at the station should also come under the observation of the agent. It is a matter of history that many people congregate around the depot who would not be welcomed in ordinary good society, and unless it is compulsory, their behavior would not be becoming in the presence of ladies and gentlemen. This is where the agent must be the diplomat, and if necessary put on the stern and uncompromising manner already referred to, in seeing that such visitors conform to the demands of decent society. This will not only meet with the approval of the better element of your patrons, but will greatly add to the respect accorded you by the other element.

Railway Construction in Honduras.—The construction of several new lines in Honduras was started in 1913, and it is expected that the work will be pushed to completion in the near future. The Tela Railroad is building a 90-mile line from Tela to Progreso, through the banana lands along the Ulua river valley; about 10 miles of this line has been completed, and a 2,000-ft. wharf is to be built at Tela. This company is also building a line to be about 15 miles long, to Colorado, where connection is to be made with the line now in operation from a point 20 miles up the Lean valley. The Tropical Timber Company has in operation about five miles of railroad and will build 10 miles additional into a timber section.

The Peking-Mukden Railway of China.—The Peking-Mukden railway, formerly known as the Imperial Railways of North China, earns the greatest revenue of any of the Chinese government railways. The principal part of the railway was completed in the early nineties. The main line extending from



The Peking-Mukden Railway

Peking to Mukden is 522 miles long. The principal branch, to Newchang, is 57 miles in length and there are other small branches which make up the total of 606 miles. Sidings are numerous, totaling 148 miles, and extensions of the line have been proposed, aggregating 180 miles. The line for the most part is built in easy country. The sharpest curve has a radius of 1,000 ft., and the heaviest grade is 0.9 per cent, but occurs in a few short lengths only. The weight of rails from Peking to Tongshan is 85 lb., but from Tongshan to Mukden it is only 60. The ties are of Japanese hard wood. The line has no competing railroad, and it is said that rates on it are high and that facilities are not of the best. By means of the railway it is possible to travel from Peking via the Trans-Siberian to Europe.

TRAIN ACCIDENTS IN AUGUST[1]

Following is a list of the most notable train accidents that occurred on railways of the United States in the month of August, 1914:

Collisions.

Date.	Road.	Place.	Kind of Accident.	Kind of train.	Kil'd.	Inj'd.
*†5.	Kansas City So.	Tipton Ford, Mo.	bc.	P. & P.	39	30
15.	N. Y. N. H. & H.	New London.	xc.	F. & F.	1	1
23.	Mo. Kan. & Tex.	Smithville.	bc.	P. & P.	0	8
30.	Atlantic C. L.	Fayetteville.	xc.	P. & F.	0	5

Derailments.

Date.	Road.	Place.	Cause of Derailm't.	Kind of train.	Kil'd.	Inj'd.
3.	Pitts. & L. E.	Beaver Falls.	b. flange	F.	1	2
12.	Southern	Tuxedo.	d. switch	P.	1	6
13.	Tenn. Central	Mount Juliet	unx.	P.	0	11
25.	St. Louis & S. F.	Kelleyville.	d. track	P.	0	35
28.	Kansas C. So.	Marble City.	b. rail	P.	0	12
29.	Lancaster, O. & S.	Tweedale, Pa.	.....	F.	0	3

The trains in collision on the Kansas City Southern near Tipton Ford, Mo., on the fifth were a northbound passenger of the Kansas City Southern and a southbound passenger of the Missouri & North Arkansas, the latter consisting of a single car, a gasolene motor. Thirty-six passengers and three employees were killed, all of them on the southbound train; and twenty-seven passengers were injured. It is possible that other persons were killed, the bodies of some being so badly burned that identification was impossible. The cause of the collision is given as disregard of a meeting order by the men in charge of the southbound train. They should have waited at Tipton Ford. This accident was reported in the *Railway Age Gazette* of August 7 and August 14.

The train involved in the collision at New London, Conn., on the 15th was a switching freight. The engine was run into at the side by a string of empty passenger cars and four cars were wrecked. The fireman was killed and the engineman injured. The cause of the collision was negligence in switching operations.

The trains in collision on the Missouri, Kansas & Texas, near Smithville, Tex., on the 23rd, at about 3 a. m., were passenger trains Numbers 1 and 2. The southbound train, No. 1, had been brought to a stop. Both engines were badly damaged and five passengers and three employees were injured. The collision was due to an oversight on the part of the despatcher. He had given these trains an order to meet at Kirtley, five miles south of Smithville, and subsequently annulled this order; but the annulling order was not sent to train No. 1.

The trains in collision at Fayetteville, N. C., on the 30th were a passenger and a freight, both of the Atlantic Coast Line; passenger No. 85 ran into the freight at a crossing of two tracks, the main line and the Yadkin branch, and two freight cars were wrecked. Three passengers and two trainmen were injured. The cause of the collision was disregard of signals on the part of the passenger train.

The train derailed near Beaver Falls, Pa., on the morning of the 3rd, was an eastbound freight and six cars were wrecked. The cause was a broken flange. Three trespassers were injured, one of them fatally.

The train derailed at Tuxedo, N. C., on the 12th, was an excursion bound for Asheville, and the locomotive was overturned. The fireman was fatally scalded and six passengers were injured. The accident was caused by a broken switch rod.

The train derailed on the Tennessee Central, near Mount Juliet, Tenn., on the 13th, was an eastbound local passenger; two passenger cars fell down a bank and nine passengers and two trainmen were injured. The cause of the derailment was not discovered.

The train derailed near Kelleyville, Okla., on the 25th, was passenger No. 408. Four cars ran off the track, but remained upright. Thirty or more passengers were injured, but none seriously. The cause of the derailment was a low joint, and this appears to have been due to water which had accumulated in the ballast because of imperfect drainage, aggravated by heavy rains. The train was running about 45 miles an hour on a straight line, and the tender was the first vehicle to jump the rail.

The train derailed near Marble City, Okla., on the 28th, was southbound passenger No. 1, and the mail car and first two passenger cars were overturned. Twelve passengers were slightly injured. The cause of the derailment was a broken rail.

The train that was derailed on the Lancaster, Oxford & Southern, near Tweedale, Pa., on the 29th, was an eastbound mail train, consisting of a single gasolene car. Three men were injured. The derailment was due to a pile of stones on the track, believed to have been placed there maliciously.

[1]Abbreviations and marks used in Accident List:
rc, Rear collision——bc, Butting collision——xc, Other collisions——b, Broken——d, Defective——unf, Unforeseen obstruction——unx, Unexplained——derail, Open derailing switch——ms, Misplaced switch——acc. obst., Accidental obstruction——malice, Malicious obstruction of track, etc. ——boiler, Explosion of locomotive on road——fire, Cars burned while running——P. or Pass., Passenger train——F. or Ft., Freight train (including empty engines, work trains, etc.)——Asterisk, Wreck wholly or partly destroyed by fire——Dagger, One or more passengers killed.

THE PRESIDENT'S RESPONSE TO THE RAILROADS

President Wilson, responding to the appeal presented to him by the committee of railroad presidents last week (*Railway Age Gazette*, page 462) sent to Chairman Trumbull, on Thursday, the following reply:

"Since you read it to me yesterday, I have read again the statement you made me on behalf of the committee of railroad presidents whom I had the pleasure of meeting and conferring with at my office. It is a lucid statement of plain truth.

"You ask me to call the attention of the country to the imperative need that railway credits be sustained and the railroads helped in every possible way, whether by private co-operative effort or by the action, wherever feasible, of governmental agencies, and I am glad to do so, because I think the need very real.

"I cannot say that I entertain any deep anxiety about the matter, except, of course, the general anxiety caused by the unprecedented situation of the money markets of the world; because the interest of the producer, the shipper, the merchant, the investor, the financier and the whole public in the proper maintenance and complete efficiency of the railways is too manifest. They are indispensable to our whole economic life, and railway securities are at the very heart of most investments, large and small, public and private, by individuals and by institutions.

"I am confident that there will be active and earnest co-operation in this matter, perhaps the one common interest of our whole industrial life. Undoubtedly men, both in and out of official position, will appreciate what is involved and lend their aid very heartily wherever it is possible for them to lend it.

"But the emergency is, in fact, extraordinary, and where there is a manifest common interest we ought all of us to speak out in its behalf, and I am glad to join with you in calling attention to it. This is a time for all to stand together in united effort to comprehend every interest and serve and sustain it in every legitimate way.

"The laws must speak plainly and effectively against whatever is wrong or against the public interest, and these laws must be observed; for the rest and within the sphere of legitimate enterprise, we must all stand as one to see justice done and all fair assistance rendered, and rendered ungrudgingly."

New Mileage of Brazilian Railways.—During 1913 the railways of Brazil put in operation 1,438 miles of new lines, making a total of 15,246 miles now in operation, of which 2,185 miles are government lines, 5,716 miles privately leased roads, 3,447 miles granted to various enterprises by government concessions, and 3,897 miles operated by private corporations under state concessions.

Annual Meeting of Master Painters' Association

Discussions on the Finishing of Steel Passenger Cars, Standard Freight Car Lettering, and Apprentices

The forty-fifth annual convention of the Master Car and Locomotive Painters' Association was held in Nashville, Tenn., September 8 to 11, Oscar P. Wilkins, master painter of the Norfolk & Western, presiding. The opening prayer was made by Mr. Spain, secretary of the Nashville Y. M. C. A., after which the association was welcomed to the city by W. S. Mitchel, chief of factory and shop inspection for the state of Tennessee. He was followed by Mattison Wells, secretary to the Mayor of Nashville.

PRESIDENT'S ADDRESS

President Wilkins spoke of the value of these annual conventions, and called upon the members to co-operate in the exchange of ideas, as without this the association could not hope for success. The master painter should be progressive, seeking to increase the efficiency of his department. Attention was also called to the necessity of developing young men in the painting trade who will be called upon later to take charge of departments.

TEST COMMITTEE'S REPORT

In order to successfully cope with the ravages of rust on steel equipment the designer must lend a helping hand providing a construction that it will be possible to protect. The rain guard on cab roofs has been found difficult to protect properly as it catches dust and cinders from the locomotive, which, with moisture, forms an acid that will penetrate the paint. The protection of steel under-frames of tenders and cars is also a greater question than even the steel cab, and a careful study should be made with a view of providing an absolutely protective paint. An elastic paint film is necessary to stand the vibrations the equipment receives in railroad service. When red lead is used a pigment should be used that has a tendency to minimize the oxidizing influence of this material. When mixing paint for the second or protective coat of the primer, the facts that linseed oil will absorb moisture, and that all vegetable oils are readily attacked and disintegrated by sulphurous and other acids, must be taken into consideration.

From tests made by the committee in different parts of the country it was proved conclusively that the baking process retains the lustre of the varnish, and is more free from checks than the air-dried plates. The report was signed by J. W. Gibbons, chairman, H. Hengeveld and A. S. Baldwin.

FINISHING STEEL PASSENGER EQUIPMENT

J. B. Wright (B. & O.): While it has been found that the baking oven has given very good results in painting steel equipment, it is believed that it will not be universally used on account of the expense of painting the equipment in this manner, especially in establishing the plant. This process also eliminates the opportunity for doing other work on the cars while they are being painted. While this is very advantageous from the painters' standpoint, it will require holding a car for a longer time. The surfacers used in painting steel equipment are of great importance. They must be inhibitive and elastic. In order to decrease the number of necessary coats applied a smoother metal surface must be provided by the metal workers. The decks, deck screens and roofs of the steel passenger equipment cars are causing the greatest trouble. These parts should be well painted when the cars are built and carefully watched while in service, repainting as often as necessary for their protection. Our road has adopted the practice of sprinkling sand in the last coat of paint on the roof in order to eliminate the trouble caused by hot cinders which fall thereon, burning and destroying the paint coating. It is believed that the use of plain colors for finishing the interior of steel cars will be found very much more practical and economical, as with the grained finish it is difficult to repaint parts which frequently become scratched or chipped.

Discussion.—A. J. Allen (D. L. & W.): The most essential part of painting begins with the man who inspects the cars while they are being built. The greatest care should be exercised in seeing that every concealed part is well painted with some good, elastic paint and all joints, especially, should be red leaded, for I do not think that anything has as yet been discovered to take the place of red lead. I have also found that the cement or paste used to apply the insulation to the car sheathing will eat the life out of the paint, and allow the sheet to rust. On the same car where the cement had not been applied the paint was in splendid condition.

The roof and deck are also very important. The paint should be carefully applied and the surface thoroughly cleaned before painting as this will save an endless amount of trouble. Where it is possible, every sheet that goes on the roof should be sand-blasted and primed with red lead immediately after it has been cleaned with the sand-blast. Red lead has given us the best results as a primer. It is also a good plan to sand on top of the paint as it prevents the hot cinders from making holes through the paint to a certain extent. We do not sand the entire roof, but simply the parts most exposed to the flying cinders. We have experienced no trouble in painting or taking care of the body of the car if it is painted according to a system and the proper amount of care taken in applying the different coats. I do not think that a steel coach should be painted in less time than 22 days, although with some elastic paint good results may be obtained in a much shorter time, but the number of coats should not be curtailed.

From the discussion the consensus of opinion seems to be that the metal should first be carefully prepared by having all rust and dirt, grease, etc., removed from it, and then apply carefully a coating of proper thickness and maintain it properly, not at the regular shopping, but at certain times throughout the year, keeping the paint well ahead of the rust and not allowing it to get too thin on account of wear.

INTERIOR WOOD FINISH FOR PASSENGER COACHES.

F. E. Breese (L. S. & M. S.): Almost the entire passenger equipment of the Lake Shore & Michigan Southern is finished in mahogany color. On receiving a new car from the shops the surface is carefully sanded and cleaned, and is then stained to our standard shade. It is then covered with a coat of paste filler tinted to the same standard shade. After the paste filler has been applied the surface is alternately sanded and covered with a coat of rubbing varnish three times, and finally a fourth coat of rubbing varnish is applied. After this the surface is rubbed with water and pulverized pumice stone. The average shop time for finishing a coach is about 19 days.

Mr. Breese closed his remarks by outlining in detail the method of handling the headlinings, the saloon, doors, sashes, seat arms, etc.

A. R. Given of the Canadian Pacific presented a paper explaining the methods used in finishing colonist, tourist, suburban, first class, sleeping, dining, observation and parlor cars. In the colonist and tourist cars birch is used for finish. Mahogany is used in the suburban and first class cars, and also in sleeping, dining, observation and parlor cars. Mr. Given went into the details of finishing these cars, laying particular stress on the headlining.

J McCarthy (G. T.): Our natural wood finish consists of

corn starch made with pure linseed oil to a semi-paste form with a quantity of sienna and other staining colors to give the required shade. This filler is thinned with benzine to a working consistency. An interior wood finish that is well filled with the required color and the necessary staining, shading, toning and blending, covered with two coats of good white shellac and three coats of good pale rubbing varnish, will when rubbed down or polished with pure raw linseed oil or renovator produce a rich, silky appearance, and good, permanent results will be obtained.

(Mr. McCarthy also included a more detailed description of the practice followed at the Montreal, Que., shops.)

PAINT SHOP APPRENTICE SYSTEM

B. E. Miller (D., L. & W.): The painters' apprentice system has been in effect on the Lackawanna for 15 years. Schools of instruction have been maintained at Kingsland, N. J.; Scranton, Pa., and Buffalo, N. Y., for the past four years. The apprentices are entered between the ages of sixteen and eighteen, and the average age is 16½ years. A four-year course is prescribed for the painters as in the other trades, a total of 10,000 hours being required before a diploma is issued. The rate of pay is advanced at the expiration of every 2,500 hours as follows: First period—8.5 cents per hour; second period—11.5 cents per hour; third period—15 cents per hour; fourth period—18 cents per hour. Upon the recommendation of the apprentice instructors, the general foreman and other officials, a diploma may be granted after serving three years of 2,500 hours each, if it is believed the apprentice is capable of earning a mechanic's wages.

No hard and fast rule is followed as to the assignments and periods of service in the various classes of work into which the four year term is divided. In general six months is given to the following work: General locomotive work; varnish room work; general work on the floor; body work and surfacing; interior finishing; general work and glass painting; striping and lettering; and the last six months' work is governed by conditions. Piece work is allowed in the fourth year.

It has been found particularly difficult to secure good material for paint shop apprentices, the other trades seeming to draw the more desirable applicants. Of the men that have taken the paint shop course 25.35 per cent. of all apprentices employed during 14 years are still in service. The greatest number leave during the first year of service, the percentage being 45.09. The percentage leaving the second year is 8.45, and for the third and fourth year the percentage is only 2.82 and 2.81, respectively.

Discussion.—It was believed that if more attention was given the paint shop apprentice in the apprentice school and elementary lessons in chemistry pertaining to paints and oils given in the place of other subjects they are now required to study which do not pertain to their trade, much better results would be obtained and a better class of boys could be interested in the work.

THE SAND BLAST AS A PAINT REMOVER

W. O. Quest (P. & L. E.): We are firm in the belief that the sand blasting method of cleaning metal or stone surfaces is the best, the most effective and the most economical to use. This preparatory cleaning must be figured upon regardless of cost in order to avoid making the costly mistake of painting over live corrosion or mill flash scale. If a sand blast system is properly installed and handled its work can be depended on for a maximum of service results. The average cost of removing paint, etc., from an 8,500 gallon tender tank by the sand blast is a fraction less than eight mills per surface foot, and the total piece work price is $3.33. The same tank cleaned with the best known non-dry-hardening caustic mixture, soluble in water, will cost $7.10, and even then the flash scale will not be wholly removed. The cost of chemically removing the flash scale, and of neutralizing the acid used is prohibitive. This leaves the sand blast as the only practical metal cleaning method that will provide a clean, inert surface to receive paint.

At the McKees Rocks shops all large sand blast work is done in an elevated track sand storage house. The sand used for blasting is used again for sanding locomotives. This also eliminates the trouble from dust in other shops. The sand blast can also successfully be used for glass ornamentation work, and is, in fact, superior to the acid method of cutting. There are, nevertheless, cases where the chemical removers can be used to much better advantage than the sand blast, especially on small castings, driving wheels, dome and sandbox base castings.

F. A. Weis (C. R. R. of N. J.): The sand blast not only removes the paint, rust and flash scale, but it leaves a roughened metal surface to which the paint will readily adhere. This not only better protects the metal surface, but gives a longer life to the paint. The cost of the sand blasting has been found to be cheaper than chemical methods.

Discussion.—The members were agreed that the sand blast gives much the best results, and is cheaper than other methods everything considered. The New York Central & Hudson River at the Albany shops have sand blasted a first class vestibule car in five hours with two men, but find that about 7½ hours is the average time. If a good silica sand is used it may be possible to use it over two and three times. Shot has not given satisfactory results on cars. The advisability of using the sand blast on the inside of cars was questioned by some members.

STANDARD FREIGHT CAR LETTERING

The standardizing of freight car lettering was strongly favored by the association, and many instances were mentioned where, on account of the lettering not being standard, considerable trouble had been caused. The following resolution was adopted in this regard:

"Whereas, The Master Car and Locomotive Painters' Association recognize the advertising value of the trade marks of the railroads that have been in use for years, and realize it would be useless for us to ask them to dispense with this invaluable medium of reaching the public, but

"Whereas, A uniform stenciling of freight cars is very desirable from the standpoint of shop efficiency and economy, and efforts have been made in the past, both by this association and by the M. C. B. Association, to accomplish this end, with more or less success; be it therefore

"Resolved, That we renew our efforts to arrive at this desirable end; and that we appoint a committee to design a series of letters and figures for this purpose, said committee to confer with the M. C. B. Association for its general adoption on all railroads."

OTHER BUSINESS

In considering the subject of the classification of repairs it was the consensus of opinion among the members that by classifying interior and exterior repairs separately a much more accurate estimate of the total cost could be made. The Pennsylvania Railroad has been using this system very successfully.

Other papers were presented on Rust Inhibitive Paint and Non-whiting Varnish for Locomotive Tenders.

The secretary reported a membership of 292.

The following officers were elected for the ensuing year: President, T. J. Hutchinson, formerly of the Grand Trunk; first vice-president, H. Hengeveld, Atlantic Coast Line; second vice-president, John F. Gearhart, Pennsylvania Railroad, and secretary-treasurer, Alfred P. Dane, Boston & Maine. Detroit received the greatest number of votes for the next place of meeting.

New Railway Tunnel in India.—Work is now under way on a 1,507-ft. tunnel for the Great Indian Peninsular Railway in the Western Ghats, about 100 miles from Bombay, India. The contractors are Pauling & Company, Bombay. Work on the tunnel was begun in December, 1913, and it is expected that the tunnel will be completed by July, 1915.

THE EUROPEAN WAR, THE SOUTHERN RAILWAY AND ITS EMPLOYEES

In the course of an address on Labor Day at Spencer, N. C., Fairfax Harrison, president of the Southern Railway, discussed as follows the effect of the European war on the Southern Railway, its employees and the people of the south:

We have on the rolls of Southern Railway Company a splendid body of employees. I am proud to say that, individually and collectively, our organization will compare most favorably for efficiency and loyalty with that of any other railroad system in the United States, be it north or south, east or west. In the broad sense of the word we are all employees. As the words are generally used the organization is composed of officers and employees, but the line between these two classes is not a barrier. Under the Southern Railway policy of filling vacancies in the higher grades by the promotion of qualified and loyal subordinates the line between employees and officers is constantly being crossed and in every department of the service there is a wide field for promotion. Like Napoleon's soldiers every one of us carries a field marshal's baton in his knapsack.

More than this: Aside from adhering to the policy which assures promotion so far as opportunity may arise, the management of the company believes that it has shown its appreciation of its employees by just, and even liberal, treatment in the matters of wages and conditions of employment. For all classes of skilled labor Southern Railway Company and the railways of the south are paying as high wages as any railroads in the United States and higher than many, especially those north of the Ohio and Potomac rivers and east of Chicago in territory where the density of traffic which creates railway revenue is much greater than along our lines. We have met most of the expectations of our employees and, were it possible consistent with our whole duty, we would be glad to meet them all. Nothing in my career has given me more profound and sincere satisfaction than to be connected with a company which has been able to advance so notably—as Southern Railway Company has done—the social welfare of the sturdy, hard working and faithful men who are its responsible employees, and I feel this whenever I have the privilege of shaking hands with and looking into the face of one of our older men—as I am always proud to do—a man who has known something of what conditions on the railroad used to be and what they are today. These older men have, themselves, largely made possible what we have been able to do for our employees generally and should have the credit for the advantages the younger men now enjoy almost without knowledge of where they came from. I look forward with confidence to the efficient and sustained loyalty of these men making possible still further improvement in their own condition and that of their juniors. We can not, however, accomplish this without regard to the business conditions which make a railroad a living thing.

While the element of danger can not be entirely eliminated from some kinds of railroad employment, the management of Southern Railway Company is constantly endeavoring to reduce this danger to a minimum and to safeguard its employees and the public. Accidents by which employees or others are injured are systematically studied with a view to installing such appliances or issuing such instructions as will tend to prevent them in the future. The best practice of other companies for the prevention of accidents is being closely studied in connection with our own initiative and every device and practice that is an improvement over what we already have is adopted so far as it is practicable for us to do so.

Our high level of wages and conditions of employment at least as favorable as substantially all of the other railroads in the United States were established at a time when the business of the company was normal and when there was reason to expect increased earnings rather than the reverse. Suddenly we find today that the entire situation as affecting the business of the company has been changed. Under the modern systems of world-wide exchange of commodities and of international credits, though the American people are at peace with all nations, the war in Europe has profoundly disturbed all lines of business in the United States and has brought about a curtailment of production and a consequent falling off in transportation, the full extent and duration of which no man can now predict with certainty. We know, however, that, although the war is being waged three thousand miles from our shores, its effects are being felt to a greater or less degree by practically every family in the United States. We also know that, unfortunately, the effects of the war are being felt in no part of the United States more seriously than in the south.

But a few weeks ago the south was looking forward after a winter of hesitating business to a season of unsurpassed prosperity. Rejoicing in having a substantial monopoly in supplying the world with cotton, the southern people were looking with satisfaction upon the bountiful crop maturing in the fields which they had every reason to believe would be sold at a remunerative price. When Europe plunged into war, because of the fact that a large proportion of the crop must seek foreign markets, the cotton monopoly of the south, instead of being a source of strength, became an economic weakness. The market for cotton was wiped out. Steps are now being taken by the federal government and by patriotic bankers to relieve the situation and prevent widespread bankruptcy and distress throughout the south. However successful these may be, they can afford only partial relief, for, excluded from foreign markets, a large proportion of the crop must be stored in the south and will not be offered for shipment for many months. The situation is made worse by the fact that the activities of American cotton mills are being hampered, not only by financial conditions, but also by inability to secure dyes which in the past have been supplied only by European countries involved in the war. Likewise southern farmers will have to restrict their acreage of leguminous crops this year, because of inability to secure supplies of seed from Germany and Austria. Looking forward to next year, we find that, unless the war shall be of short duration, the manufacture of some kinds of commercial fertilizers, which are an important article of freight for the railroads of the south, will be greatly restricted because Germany is the sole source of supply of potash.

Under present conditions and prospects in the south all lines of business have fallen off and railroad traffic and earnings are showing substantial decreases. We hope for the best and are doing all in our power to bring about improved conditions. We are continuing the extensive construction work for which, fortunately, capital funds were secured before the war began. The disbursement of this money in southern communities will be helpful, not only to the men employed, but to southern business enterprises generally. We realize that, with all the great manufacturing and commercial nations of Europe involved in the war, there is splendid opportunity for the expansion of the export trade of the United States, especially to the markets of Central and South America, and we are actively co-operating with southern manufacturers and merchants who desire to enter this field. But, under most favorable circumstances, it will take time for the business of our section to recover, and while we hope for better conditions for the south and the Southern Railway, we can not be blind to the present situation of declining traffic and decreasing earnings. It is then a time for caution. The Manufacturers' Record has this past week given an admirable statement of the duty which this situation imposes on us all. I venture to quote a paragraph:

"Every responsible citizen of the United States, in whatever calling he may be, should lose no time in adjusting his material affairs to meet the economic emergency created by the temporary paralysis of civilization in Europe. The very conveniences with which civilization has equipped mankind have begotten a world-wide sensitiveness to any action anywhere interrupting the play of the forces of civilization. In war involving directly seven peoples of Europe, and indirectly all peoples of that continent,

the material influences for the advancement of the human race have virtually collapsed. Consequences are already felt in this country. They will become more manifest day by day and will persist for a while even after wholesale murder and rapine have ceased in Europe. The people of the United States are today beginning to pay the bills for the destruction wrought. Such payments mean resources taken from productive enterprises here and unjustified burdening of every capitalist and wage-earner, every farmer, every manufacturer, every banker, every merchant, every broker in the United States."

In this situation the interests of all officers and employees of the company are identical with the interests of its owners. Wages and dividends are drawn from the same fund—the earnings of the company—with this important difference, that wages must be paid first regardless of whether there is anything left for dividends or not. But the owners of the property who have adventured their money in the provision of this great railroad system which gives employment to tens of thousands of southern people have rights which can not be disregarded, and, but for the fact that it was anticipated that the company would earn reasonable profits, it would have been impossible to secure the money with which we are now making it not only a more efficient carrier for the people of the south and a safer plant on which our employees may work, but are putting it in a position to afford employment to increased numbers of men when business shall have once more revived.

The earnings of the railroad, which are at once the source from which its expenses must be paid and the basis of its credit, can not be advanced by the mere volition of its managers. We are powerless to raise a single passenger or freight rate without the approval of a state or federal commission, and we are now faced with the fact that earnings are decreasing, and that since August first each week's revenues have been less than for the previous week, though the falling off has as yet been rather an indication of a tendency than of an actually serious condition.

I do not anticipate any trouble for the company, but my point is that manifestly this is no time for consideration of wage increases or the eight-hour day. I should be lacking in frankness if I did not say that these matters can not now be considered by the management of Southern Railway Company and if I did not at the same time express the hope that our decrease in business may not become such as greatly to curtail opportunity for employment and make necessary a policy of strict retrenchment. Like the general staff of one of the warring nations of Europe we have long had a plan of retrenchment ready for the emergency and I may say that, disagreeable as retrenchment always is, we have the courage to put our plant into operation, if that shall seem to be the best interest in the long run of the company and of the southern people. But, please God, it may not be necessary. What shall be the event lies largely in the demonstration of character, and patience, and cheerfulness of southern men and women, and I venture to believe that we, as southern men and women, will be as ready, as ever our ancestors were, to accept sacrifices when that shall prove necessary. If such shall become the necessity of Southern Railway Company, the sacrifice will be borne by officers as well as men, but I pledge you my word that I will keep the interests of our men and those dependent upon them faithfully in mind and that no sacrifice will be asked until it shall be necessary. As one responsible for the ultimate decision, I pray for strength to decide right and I ask with confidence the understanding and the support of all you men and women here assembled with whom I am linked in a strong bond of common service to the public and the attachment of many years of association.

Harbor Improvements at Antofogasta, Chile.—A bill for harbor improvements at Antofogasta, Chile, to include the construction of a railway connecting Antofogasta with the Longitudinal Railway is now before the Chilean senate. The work will cost about $7,600,000, and will be completed in six years.

STRIKE THREATENED ON THE ST. LOUIS SOUTHWESTERN

Conductors and trainmen on the St. Louis Southwestern have taken a strike vote because of the refusal of the management to reinstate a passenger conductor, J. R. Tillman, who was discharged about 16 months ago on a charge of being intoxicated on May 16, 1913, while on duty on passenger train No. 1 from St. Louis to Jonesboro, Ark. The controversy arises from a dispute as to whether Tillman was intoxicated at the time or sick. When he arrived with the train at Jonesboro on the day in question his actions while at the station were such that over a dozen employees of the road who saw him made statements to the general yardmaster, on request, that he was intoxicated, and he was dismissed from service. Nearly all of the statements were very positive, giving details of his actions while around the station, and several said that they had smelled whiskey on his breath, while a few were unwilling to state positively that the man was intoxicated, but said that he bore every appearance of being so.

Tillman claims that he was not intoxicated but sick, and to offset the written statements obtained by the company produced an affidavit from a physician at Jonesboro that he had treated him for acute indigestion and that he had found no evidence to indicate that he was suffering from the effects of alcohol in any form.

The matter was taken up by the officers of the Order of Railway Conductors, who claim that Tillman had been a marked man ever since he gave some testimony unfavorable to the company's contention in a controversy regarding provisions of the schedule when the men had asked for an additional crew on a certain passenger run. A strike vote was taken, whereupon F. H. Britton, president of the road, agreed to conduct a hearing of the case, and all of the witnesses who had given statements were heard at a hearing in President Britton's office in St. Louis, on August 28, 29 and 31, of this year.

A complete printed transcript of the evidence taken at the hearing before a notary public, amounting to 113 pages, has been distributed by the company to all employees in the train, yard and engine service. The hearing was conducted before President Britton by General Manager J. W. Everman for the road, and by W. C. Turner, vice-president of the Order of Railway Conductors, for Mr. Tillman. By agreement each witness was assured by the general manager that he could tell the whole truth in the Tillman case without fear or favor, that the company would fully protect him, that he would be in no danger of being dismissed from the service or disciplined in any way for anything he might say, and Mr. Turner also gave each witness assurance that nothing he might say would thereafter result in causing him any trouble in the hands of the organization. The physician was examined and cross-examined at great length by Mr. Turner and by Mr. Everman regarding Tillman's appearance and condition when he came to him for treatment late in the afternoon. He had arrived on the train in the morning. The examination went into great detail regarding the symptoms of intoxication and of indigestion. Following the doctor's examination the witnesses who had made written statements were asked if they would change them in any way. Two or three who had made positive statements that Tillman was intoxicated changed their testimony to an expression of opinion, but only one reversed his opinion.

It was testified among other things that when Tillman arrived on his train in the morning he staggered when he walked, could not write intelligently in attempting to make out his delay report, could scarcely talk so as to be understood; that he smelled strongly of whiskey; that he fell asleep and was carried into a baggage room, where he spent the afternoon asleep, having been left there by the employees who thought he was intoxicated. There was no evidence that

Tillman had actually taken a drink during the run in question, and the physician attributed his whiskey breath to a swallow of "Peruna." Several persons who had been on the train asserted that he had shown no signs of intoxication during the trip from St. Louis to Jonesboro, and several witnesses asserted that they had never known him to take a drink, although others had seen him apparently intoxicated. At the conclusion of the hearing officers of the Order of Railway Conductors summed up the evidence, asserting it had not proved that Tillman was intoxicated, but that he had been discharged at the first opportunity because the company had decided to get rid of him. But President Britton announced that he could not change his decision and that the company had evidence that Tillman had been in the habit of getting drunk. He said this evidence was not produced at the hearing because of the agreement not to go outside of the case in question. Later, however, the company gave out an affidavit signed by a traveling salesman who had known Conductor Tillman for seven years, who said that he had seen him intoxicated while on duty several times. On the day in question he had boarded his train and found Tillman intoxicated and asleep in the negro compartment neglecting his work.

NEW PETITION IN 5 PER CENT RATE ADVANCE CASE

The railroad companies in official classification territory have filed the following petition with the Interstate Commerce Commission:

"Your petitioners, 112 railroad companies, comprising the thirty-five railroad systems in official classification territory, parties to the above-entitled proceedings, respectfully petition the commission for such a modification of the order of July 29, 1914, which will permit the carriers to make effective the rates specified in the tariffs which were made by said order directed to be canceled. Since the filing of the report and entry of the order by the commission in these cases facts and circumstances have arisen which, taken in connection with the facts already before your commission, your petitioners believe, will justify the relief herein prayed for. These facts and circumstances are briefly as follows:

"First: During the month of October, 1913, your petitioners published and filed with this commission the tariffs involved in these proceedings. At the time of the filing of the report of the commission, there were available for the information of the commission the annual reports of your petitioners for the year ending June 30, 1913, as well as the monthly reports of your petitioners up to and including May, 1914. Since that time the complete income accounts of your petitioners for the fiscal year ending June 30, 1914, have become available.

"The reports of your petitioners for the year ending June 30, 1914, as compared with the year ending June 30, 1913, show a decrease in total operating revenues of approximately $44,700,000, while during that same period operating expenses have increased about $23,300,000. After deductions of taxes and deficit in outside operations, there was a decrease in operating income of approximately $74,700,000 notwithstanding an increased property investment. Thus the tendency toward a diminishing operating income, found by the commission in its report, is emphasized by the figures covering the complete year to June 30, 1914, while the reports for July and such figures as are available for August, 1914, show a continuance of this declining tendency, notwithstanding the extraordinary efforts that have been made to reduce expenses.

"Second: The unforeseen European war has brought about an unparalleled destruction of wealth and dislocation of credit throughout the civilized world. It is certain that the competition for capital will be keener and interest rates higher for some years to come than in any corresponding period within living memory. The emergency thus resulting is extremely serious. It is conservatively estimated that the railroad companies of the United States have obligations maturing in the next fifteen months amounting to well over five hundred millions of dollars, and it is imperative in the public interest that these obligations shall be duly met. A large part of this sum is owed by your petitioners and they will further need from time to time in the next few years large amounts of money to provide for improvements which will be necessary in the public interest to prevent a serious deterioration in the standard of transportation service. In order to compete effectively for this new capital they must have a material increase in revenues.

"Third: The commission in its report made certain tentative suggestions as to measures which might be taken by the carriers to secure additional revenue. Your petitioners are proceeding as rapidly as possible to put into effect the increase in freight rates in Central Freight Association territory authorized by the report of the commission, and are giving earnest attention to the other recommendations and suggestions of the commission with respect to other rates and practices.

"It is believed, however, that the additional revenue which may be secured by the adoption of means other than a general advance in freight rates cannot be obtained in the near future, and when secured will be inadequate to meet the needs of the carriers for increased revenue in the present situation.

"Wherefore, your petitioners ask that the commission modify the order aforesaid, so as to permit the carriers to make effective the rates specified in the tariffs, which were by said order directed to be canceled, except so far as they have been or may be superseded by advances filed in accordance with the report of the commission and that your petitioners may have such other and such further relief in the premises as the commission may deem proper."

THE PLEA OF THE RAILWAY BUSINESS ASSOCIATION

The general executive committee of the Railway Business Association, which held a meeting in Chicago, on September 16, authorized the following statement:

The Railway Business Association commends the spirit in which the railway presidents recently conferred with the president of the United States upon the grave conditions confronting the railways aggravated by the European war, and is profoundly appreciative of the appeal made by President Wilson on behalf of the railways. We are moved thereby to say that the logical sequence of the president's appeal is for business men to plead that the Interstate Commerce Commission may find a way to grant immediate relief in response to the petition which the eastern railways have now filed. This association has always observed an attitude of respect for the commission and has by its utterances ever voiced our appreciation of the burdens imposed upon it and of the perplexities involved in the issues presented for its adjudication. Our appeal to the commission now is made with a friendly desire that it cope, as the exigency demands, with a portentous situation, the factors of which have never before existed in their deliberation.

The president in his conference with the railway executives manifested earnest sympathy with them and showed great familiarity with the facts as presented. The president in certifying that the statement made to him by the railways was a "statement of plain truth," called the attention of the country "to the imperative need that railway credit be sustained," and in urging co-operative effort to that end included, "the action, wherever feasible, of governmental agencies." It was unnecessary to specify the Interstate Commerce Commission, which is the only tribunal possessing information, facilities and authority to afford the immediate relief required.

The substitute methods of increasing income pointed out in the decision of July 29, were volunteered by the commission to meet what it considered to be then existing conditions. It seems to us that it would be entirely proper, as it

is surely important, for that body now to volunteer a solution to meet the unlooked-for emergency. The previous investigation was so recently concluded that the data already at hand is ample. Legally, the tariffs suspended in that case have now been withdrawn but physically they exist. The commission has already given exhaustive consideration to the details of the decree which would have been issued had it been decided to grant an advance to the trunk lines and to New England. In any event, upon return of normal conditions the commission can at any time readjust rates if revenue is regarded as too large.

Out of the war has risen an emergency affecting the railways which has no parallel and which demands extraordinary measures. Reports of earnings and expenses for the year ending June 30, 1914, which were not yet available when the commission decided the five per cent case, have now been laid before the commission and show a serious decline of operating income in face of increased property investment. The war has influenced and is inflicting still further losses in gross earnings. It was evidently the commission's expectation that current earnings would be sufficient to tide the roads over until the new sources of revenue should materialize into money. The war has put an end to that hope. The roads are now vigorously taking steps to follow the recommendations of the commission as to passenger rates, unremunerative freight rates, free services and other matters. It is, however, a work exceedingly intricate and of large volume and considerable time must necessarily elapse before any of these resources can be made to yield income. Neither the roads nor the country can afford to wait. Immediate relief is required in the interest of all concerned.

It would be difficult to overestimate the value and the importance of the stand taken by President Wilson in counting the problem of railway credit as among the imperative measures for national protection against the evils of the war.

"This is a time," says the president, "for all to stand together in united effort to comprehend every interest and serve and sustain it in every legitimate way."

The price level and strength of railway securities has a potent influence upon the financial transactions of all other corporations. If railways cannot renew their notes or refund maturing bonds this fact severely impairs the confidence which lenders feel in other companies. Current prices for old issues cannot decline far without destroying the market for renewals and refundings, not to mention new securities, of which no one at this moment thinks. The outbreak of hostilities caused the wholesale return to this country of American railway securities held abroad and prices slumped violently. This sacrifice was temporarily suspended by the closing of the European and American stock exchanges. The government cannot by legislation provide volume of tonnage; but impairment of credit may be mitigated to some extent by an advance in freight rates. This would stay the downward tendency of income somewhat and the sanction itself would be invaluable as making good in substantial fashion the declared purpose of the commission "to aid, so far as we legally may, in the solution of the problem as to the course that carriers may pursue to meet the situation."

We would respectfully urge upon Congress that in consideration of railway mail pay the recommendation of the congressional joint committee points a way whereby the railways may be dealt with in a spirit of greater liberality than is provided in the house bill now under consideration in the Senate. This is surely a time when the government should be actuated by a desire to pay adequately for an important public service rather than to drive a hard bargain with the carriers because it has the power to do so.

We earnestly hope that the prayer of the railway executives that the roads be relieved as far as possible of further immediate burdens involving additional expense will be heeded by legislative and regulatory bodies and that railway employees will refrain from pressing at this time demands which, if granted or awarded, would result in higher labor cost.

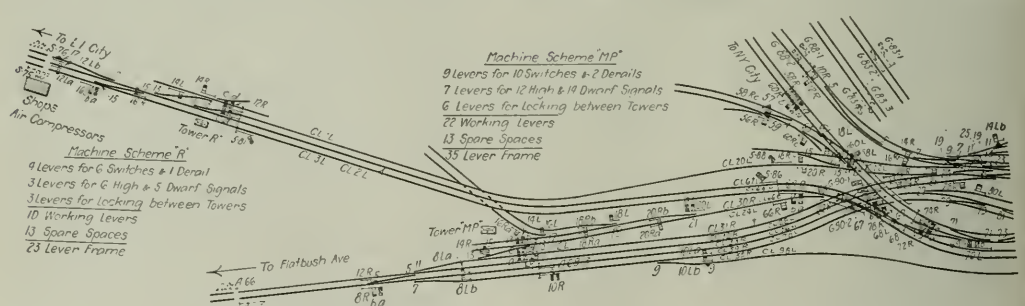
Extensions and Improvements to Railways in Honduras.—A 10-mile railway, to be operated by the Trujillo Railroad, was built in 1913, from the port of Trujillo to Juticalpa, and it is probable that it will be extended this year for a considerable distance. Work has been started by the Cuyamel Fruit Company on an extension of its line from Vera Cruz to Omoa, nine miles, and it is expected that work on a wharf 800 ft. long at Omoa will be finished this year.

EXTENSIVE INTERLOCKING AT JAMAICA, LONG ISLAND

An unusual combination of interlocking plants has been installed at Jamaica, Long Island, on the Long Island Railroad, to protect train movements through that terminal. A complete description of the terminal track and station improvements was published in the *Railway Age Gazette* of August 1, 1913, page 184.

The signaling installation consists of four electro-pneumatic interlocking plants, one east and three west of the station, together with a considerable number of electro-pneumatic automatic block signals, all of which are shown in the track layout, herewith. The interlocking plant east of the station, known as "J E," has a machine of 71 levers, controlling 36 switches, 3 derails, 7 double-slips with movable-point frogs, 29 signals, and 27 dwarf signals, and has 11 spare spaces. This plant governs switches and signals for train movements to or from Rockaway Junction, Springfield Junction, and the station, as well as main-line movements between Jamaica, Montauk Point, and intermediate stations.

The interlocking known as "J" is the largest of the four and



Track Layout, Jamaica Interlocking, Long Island Railroad—Continued on Next Page

is located, with two other plants, west of the station. The machine has 86 working levers and 21 spare spaces, controlling 54 single switches, 4 derails, 9 double-slip switches with movable-point frogs, 1 pair of movable-point frogs, 39 signals, 29 dwarf signals, and has 21 spare spaces. The other two plants are known as "M P," which has 22 working levers and 13 spare spaces, and "R," which contains 10 working levers and 13 spare spaces.

INTERLOCKING TOWERS

The interlocking towers are of brick, each two stories high, and are of artistic design. The upper floors contain the interlocking machines, while the ground floor houses the motor-generators, switchboards and cabinets which hold relays, fuses, etc. A basement is provided for storage batteries, transformers, etc., and also a heating apparatus and workshop for maintainers.

POWER SUPPLY AND DISTRIBUTION

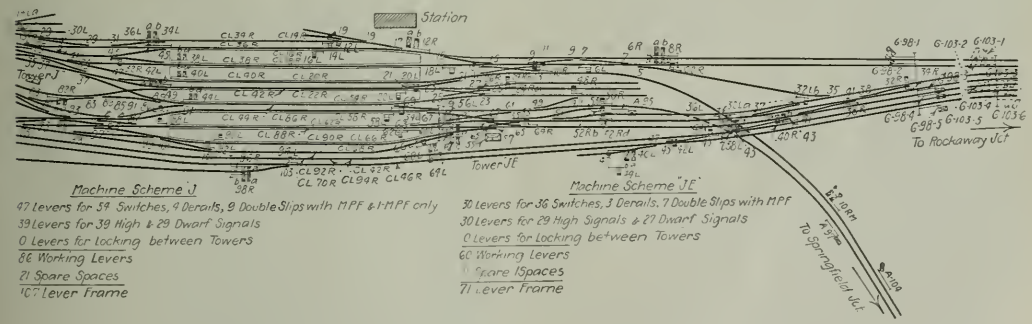
Power is furnished from the Woodhaven substation and is transmitted at 2,200 volts, 25 cycles, a. c. Oil-cooled static transformers cut this down to 220 volts for lights, motor-generator sets, and two small air-cooled transformers which supply the track circuits. Motor-generator sets supply direct current at 12 volts, through the medium of storage batteries for operating switches and signal units. Compressed air is supplied from the Morris Park carshops, for operating the electro-pneumatic signals and switches.

The storage batteries charged at 12 volts d. c. by motor driven generators, consist of duplicate sets of seven cells each, and have sufficient ampere-hour capacity to supply direct current of from 12 to 14 volts for the operation of all switch and signal controlling magnets, etc., as well as to operate the generators as motors when for any reason the primary current is cut out. Each of the duplicate power-generating sets is made up of a 15-volt, d. c. generator and an a. c. synchronous motor. A failure of the primary supply causes the d. c. generator to be driven as a motor by current from the storage batteries, and the synchronous motor becomes a generator giving 220 volts 25 cycles a. c. Provision is made for automatic changes in the field connections, so that the reversing of the motor-generator necessitates no field adjustments whatever. If the primary power fails when the lights are not needed, the apparatus is so arranged that no emergency shifting of connections takes place.

Jamaica Interlocking Looking East, Long Island Railroad

INTERLOCKING MACHINES

The interlocking machines are the Union Switch & Signal Company's standard electro-pneumatic type, with equipment for electric detector circuits, which are used throughout the plant in place of detector-bars. Each machine has a track model, as shown in the illustration. Small lamps, which illuminate small round disks set in the sections of the model representing sections of track indicate whether the different track sections are occupied.



Track Layout, Jamaica Interlocking, Long Island Railroad—Continued from Preceding Page

ELECTRIC LOCKING

Approach electric locking is provided throughout. Indicators are also provided to show the presence of trains in these approaching sections. Route locking is provided throughout, which, through the track circuit, locks all levers governing any route as soon as a train passes the signal governing that route. The

switch-levers are released as soon as the rear end of the train passes the switch point of the trailing switches or the fouling points of the facing switches, which allows for the maximum number of movements consistent with safety.

A system of locking is provided between towers, affording all needed facilities for using tracks in both directions, and this is so arranged that clear signals cannot be given for conflicting movements between towers; but for emergencies there is a clockwork time release. By the use of this release low speed movements can be made into a section which is already occupied.

SIGNALS

The controlling valves for the compressed air are arranged so that any failure of the controlling current will de-energize the magnet controlling the valve and will prevent air entering the cylinder. Thus any failure will result in the signal giving the stop indication.

The top arms of the high speed signals are used for indicating

Machine at "J" Tower, Long Island Railroad

straight route only, and the lower arms indicate for diverging routes. All signals are three-position, operating in the upper quadrant.

CONSTRUCTION

The apparatus in the four plants was installed by the Union Switch & Signal Company, under the supervision of E. M. Weaver, engineer of maintenance of way of the Long Island Railroad, Charles Soper, supervisor of signals, and L. S. Vieillard, inspector.

A CONCLUSIVE ARGUMENT

[From the Portland, Ore., Oregonian.]

There has recently come to light a story which indicates the present predicament of some of the railroads. In a small town the city council determined that the railroad should build a new station. The president of the road pointed out to the council that no funds were at hand and none could be borrowed to build such a station.

"A way will have to be found," said the council.

"Well," said the railroad president, "I'll tell you what I will do. I'll give you the railroad. I don't mean sell it to you, but give it to you. You can have it, equipment, right of way, property, debts and all. I'll turn it over to you right now."

The bonded indebtedness of the road was large, there was an annual deficit and the city refused to take the railroad that was handed to it virtually on a silver platter. But the demand for a new station was withdrawn. The argument of the railroad president had been conclusive.

FLANGE OILERS

F. W. Edwards, mechanical engineer of the Ohio Injector Company, presented a paper on this subject at the September meeting of the Western Railway Club. Mr. Edwards briefly sketched the history of the development of the flange oiler, and in speaking of the advantages of the flange lubricator he said in part:

There are numerous cases where a new locomotive was put into service and after thirty days it was necessary to take it into the shops to change tires because the flanges were worn down to the minimum; many other cases where 60 days' service would wear the flanges to minimum, while on numerous roads 90 days appeared to be the absolute limit of service for a set of new tires. Every 1/32 in. flange wear requires the removal of 1/16 in. of metal from the tread of the wheel, and 1/8 in. flange wear would require the removal of 1/4 in. from the tread. On many roads this represents one year's tread wear. Taking this as our basis, we must figure on the removal of 1/2 in. to 5/8 in. of metal from the wheel tread every time a pair of wheels is taken into the shop for turning, on account of the flanges being worn to the minimum. This represents a loss of two years of actual mileage metal. The amount chargeable to the turning of a pair of locomotive driving wheels when the flanges are worn down to the minimum will vary. It was found that on an average it costs $40 for every pair turned. If this one expense could be eliminated, it does not require very close calculating to prove that a great saving has been made, and the cost of the maintenance per engine mile greatly reduced.

The application of the flange oiler works in with one of the foremost subjects of today—"Safety First." One instance that stands out more clearly than others was a switching engine in a Buffalo yard. This engine was working on a sharp lead going into the freight house tracks. The driving wheel flanges had worn so that they came in direct alinement with the worn sides of the rail, but were not down to the minimum. Just as soon as these two lines come together, the driving wheel flange would grip on the rail, raising the engine over the rail and off the track. This was an almost daily occurrence. The flange oiler was applied in July, 1909, and the engine placed in the same service, leaving the flanges just as they were. A careful record kept on this engine up to December, 1912, shows that the engine was not off the track once during that entire time. Another engine in switching service that could not be run longer than three months without its being necessary to turn the driving wheels on account of sharp flanges was equipped with a flange oiler and oil applied to the forward and back drivers on each side of the engine; this engine ran 20 months instead of three months and made 39,785 miles, and the driving wheels were then turned for tread wear only. On one road, four heavy Pacific type passenger engines without flange oilers could make about 39,770 miles when flanges were reduced to the limit. These same engines in the same service with flange oilers applied made an average of 91,850 miles. On another road one Atlantic type passenger engine without flange oilers would only make 20,000 miles, when the flanges would be worn to the minimum. After flange oilers were applied in the same service this engine made 110,000 miles, a gain of 450 per cent, and the front tire flanges showed 1 5/32 in. full and the back tire flanges 1 3/16 in. full. There are other records of success fully as interesting.

In order to give some idea of the saving in dollars and cents, we have one instance where a road in switching service had one engine working in a yard by itself, and after one year's service with this engine equipped with flange oilers they showed a total saving of $480. On another engine doing similar work in another yard, $160 was saved. The amount of saving in both instances is based upon oil, driving wheel tires, track material and labor. These examples can be

duplicated on any division or any number of divisions where flange wear is a source of annoyance.

It is a known fact that where there is excessive wheel flange wear there is also excessive rail wear, and the remedy for one is the remedy for the other. The flange oiler is the remedy and it has proven so effective that it would be a paying investment for the railroads if they equipped their engines with flange oilers for the saving of the rails only. The flange oiler is also an important factor in fuel economy, as it will reduce the friction between the wheel and the rail.

The initial cost of a flange oiler which will reduce the cost of locomotive repairs and track maintenance, and show economy in fuel is approximately $75 to $85 applied to a locomotive. The oil will cost from 16 cents to 18 cents a gallon, and one gallon is sufficient for from 500 to 800 miles of engine service, which would make the cost about 2 cents or 3 cents per 100 miles for oil. The cost of turning the tires on the average locomotive and the value lost in service, which on an average is about $125 to $200 per day, will more than pay for the initial cost and application of the flange oiler, to say nothing of the increased tonnage, fuel economy, derailments eliminated, saving on switch points and frogs, higher speed on curves with the greatest element of safety and more than doubling the life of rails on curves.

Discussion.—The discussion brought out that care is necessary in the application and maintenance of flange oilers. Flange wear is often due to incorrect alinement of driving wheels and by placing more weight on the leading truck it has been found possible to reduce it 50 per cent. The greatest benefit is found on curved track.

PORTABLE STEAM STERILIZER

The accompanying illustration shows a portable steam boiler for sterilizing drinking water coolers in passenger cars as provided by law. It is sold by the West Disinfecting Company, 12 East Forty-second street, New York City. It consists essentially of a steam boiler of 10 gal. capacity, which is heated by a kerosene vapor flame from three Lovett Giant flash burners in a tank under the boiler. The boiler is well lagged with two thicknesses of asbestos, that next to the boiler being composed of soft fiber and that next to the jacket being asbestos mill board. The jacket extends below the boiler and forms the furnace within which the oil tank is placed.

Steam Sterilizer for Water Coolers

The boiler is constructed of galvanized steel, the joints being welded by the oxy-acetylene process. It is built to stand a test of 200 lb. steam pressure, which gives an ample factor of safety for the working pressure of 40 lb. to 50 lb. The fuel tank is also built of galvanized steel in the same manner, to withstand a test pressure of 75 lb., the actual working pressure being about 7 or 8 lb., which is secured by means of a hand pump incorporated in the construction of the tank.

The device is mounted on wheels so that it may be easily moved from one car to another throughout the yard. The steam is taken from the top of the boiler and is discharged through a ⅛-in. outlet into the cooler, which is turned upside down over the outlet, as shown in the illustration. With this sterilizer one man has sterilized 157 coolers from 34 cars in eight hours, using 4 gal. of low grade kerosene costing approximately 5 cents per gallon, and 16 gal. of water. In this specific case the cost of labor for performing this work was $1.52. To do this work it was found necessary to refill the boiler four times, and to replenish the burner twice. The boiler is easily filled by simply removing the nozzle from the end of the discharge pipe, placing a water hose thereon. The water is then turned on and allowed to pass into the boiler in this manner, the top gage cock being opened to provide the necessary vent. In this way it is not necessary to draw all the steam off the boiler nor to extinguish the light. When being filled in this manner only 15 min. is required to raise the pressure sufficiently high for operation. On starting up in the morning, however, 30 min. is required to bring the boiler up to a working pressure. Tests have shown that it is only necessary to sterilize the coolers by this method for one minute, very satisfactory results being obtained in this time.

While the number of coolers that can be handled by one man has been found to be about 160 per eight hours, it is believed that two men would be able to handle between 250 and 300 coolers in the same time if necessary. The roads using this system have found it more satisfactory than the yard steam line system. Dryer steam is obtained, and where these machines are in service the yard steam line has been discontinued entirely, thus eliminating the losses due to condensation. It is also estimated that this device will save from 25 to 30 per cent in the cost of labor for sterilizing the water coolers. Each sterilizer is provided with a steam gage, water glass, three gage cocks, washout plug and safety valve. The whole device weighs 325 lb. when loaded for operation.

LEGISLATION RELATING TO OPERATION

The Special Committee on Relations of Railway Operation to Legislation has compiled a table similar to that which has been issued in previous years, which is reproduced herewith, showing the classification of bills introduced and laws enacted relating to railway operation in the state legislatures which were in session in 1914. The table shows that in 14 states in which the legislatures were in session, including special sessions, 236 bills relating to railway operation were introduced of which only 27 were enacted. A comparison with the three preceding years is shown in the following table:

	1914	1913	1912	1911
Legislatures in session	*14	42	*19	37
Bills introduced	236	1,393	292	512
Laws enacted	27	230	48	†

*Including special sessions.
†This data not compiled in 1911.

As in previous years laws relating to employees, equipment and stations were the most numerous among those passed. There were 16 laws enacted relating to employees, of which 6 relate to terms of employment, 4 to hours of service, 4 to service letters and time of payment, 1 a full crew law, and 1 relates to

shelter for employees. There were 3 laws relating to equipment, including 1 pertaining to cabooses, 1 a headlight law, and 1 a safety appliance law, and there were 3 station laws. Only one law was enacted relating to crossing protection, in New Jersey, and none were enacted relating to freight trains, cars, block signals, clearances or maintenance of way. There was one law in South Carolina regarding the stopping of passenger trains, one law regarding the time of payment of claims in Virginia, and one law is classified under the head of miscellaneous. One law regarding trespassing was enacted in Louisiana.

Thirty-one bills were introduced in Louisiana and in Mississippi, of which five were enacted in each state. South Carolina and Virginia each passed 6 bills out of 28 introduced in South Carolina and 29 introduced in Virginia.

SAVING CAR DAYS

O. C. Castle, car service agent of the Sunset-Central Lines, has issued a bulletin on the subject of "Saving Car Days," giving figures to show that during the fiscal year 1914 the system made a saving in car hire balance of $430,865, a daily average saving of $1,180, or the equivalent of 2,622 car days. The average mileage per car per day for all cars on the line increased from 20.4 in 1912-13, to 21.9 in 1913-14, while the movement of foreign cars increased from 21.4 to 28.6 miles per car per day. The bulletin states that these results were accomplished by eternal vigilance and persistent "plugging" on the part of hundreds of loyal employees in the campaign to save car days; and it urges all the employees and the officers to continue their efforts in this direction. The bulletin concludes with the following:

"From the present unsettled outlook, due to the European war, the company is going to need every 'car day' we can put away in our savings banks.

"Let's watch the little car days, and make the slogan 'Save the Car Days' next in importance to 'Safety First.'

"I'll be glad to get a note from any one any time, telling how you have saved a 'car day.' Am sure the assistant general manager will take time to look at such notes as I may pass along to him. And the president, too—he is never too busy to hear about a piece of good work in the line of car movement.

"After all, when you come to think of it, that's what we are all here for—to move cars; and if we move the cars the 'days' will take care of themselves."

New Railway Line for Greek Government.—Early in 1914, the government of Greece made arrangements to secure control of the railway known as the La Societe des Chemins de Fer Hellenique, and the government also entered into a contract with La Societe de Constructions Batignolles to connect that railway with the railways from the port of Salonica to Monastir and from Salonica to Scopia. It is expected that the work will be finished and the new line put in operation not later than April, 1915. The contract price for the work is $2,316,000, and plans are now being made for the purchase of the necessary locomotives and other rolling stock.

Maintenance of Way Section

In order to present a complete report of the convention of the American Railway Bridge & Building Association, which will meet in Los Angeles on October 20-22, inclusive, the October maintenance section will be postponed from the regular date of October 16, to October 23.

An interesting contrast of ideas was brought out in the discussion of the curving of rails at the Roadmasters' convention last week. The committee originally recommended that rail for all curves over six degrees should be curved. In the discussion, one member advocated curving all rails for curves of three degrees and over. Several other members opposed curving rails for curves of less than 10 or 12 degrees and some would eliminate it under all conditions. The tendency on the better maintained roads is to curve rails for curves down to three degrees, the object, of course, being to obtain a better riding track and one that can be maintained to line more easily. It is evident that curving the rails before placing them in track should promote these results. On the other hand, the general objection to this practice on the part of the roadmasters shows a serious difficulty. The objection is not to the practice itself, but is based on the difficulty of curving the rails in the field at a reasonable expenditure of time and money. Various devices have been perfected which will curve rails, but few give a sufficient output with the heavy sections of rails and hard metal now employed. It was for this reason that the association finally decided to recommend that rails to be curved should be curved at the mill and eliminated the recommendation regarding the degree of curve at which this work should be started. The curving of rails at the steel mills will probably meet with the opposition of the manufacturers, since it will require additional and slow work on their part. It will also add somewhat to the difficulties of loading and shipping the curved rails. As an alternative, it would seem advisable for the roads to establish a power driven rail curver at some centrally located point on their lines where rails could be curved for particular locations, as desired. With the necessity for continually increasing standards of maintenance, the curving of rails is to be desired, and the problem is how to do this economically and expeditiously.

The Curving of Rails

It would appear unnecessary to suggest that if any device or material is considered of sufficient merit to warrant a test of it being made, such test should be conducted in such a way as to secure the greatest amount of comparative information. Observation shows that this often is not done. A new type of crossing is inserted at a single intersection where there are little or no data regarding the life of former crossings, and where there is no opportunity of comparing the life of the new crossing with that of others carrying the same traffic under the same conditions. Again, a curve is laid entirely with rails of a new composition, and an attempt is made to compare the results secured with those of standard rails laid on another curve several miles away with different conditions of grade, curvature and traffic instead of laying half of the curve with the experimental rail and the remainder with the standard material. In selecting a location for a test it is also advisable to choose a place where conditions are severe to secure an accelerated test in order that the results may be made known at an early date. For this reason it is better, for instance, to place experimental rails on curves of high degree rather than on tangent. If a material or device gives indications of possessing considerable merit it is of as much advantage to the railway as to the manufacturer to determine this fact, and both should co-operate fully in the conduct of the test. When the manufacturer furnishes the material, frequently at or below cost, in order to have the test made, it would seem only fair that the road should co-operate to the extent of placing this material where the most comprehensive results may be secured. Manufacturers frequently complain that this is not always done. Where this condition exists the difficulty commonly arises from the fact that the man who authorizes the test and arranges with the manufacturer to secure the materials turns them over to his subordinates to install with very incomplete instructions and pays little or no further attention to them. Not knowing the purpose of the test, and taking very little interest in it, the subordinates frequently place the materials where they will require the least expenditure of energy on their part, regardless of the purpose of the test.

More Care in Conducting Tests

FIXED DATES FOR SEASONAL MAINTENANCE WORK

THE suggestion is made in one of the papers on handling material, published in this issue, that economy could be promoted by fixing certain dates for some classes of maintenance work that are seasonal in nature and requiring all foremen to attend to such work at the specified time. The author had in mind particularly classes of work requiring large quantities of material, and that the plan he suggests would enable the store department to carry a minimum stock of such material except immediately in advance of the date specified, when a heavy demand could be anticipated. The regular stock of crossing planks, tie plates, bolts, fencing material, etc., could be considerably reduced the rest of the year with a resulting saving in interest on the investment in such stock.

In addition to this advantage the suggested practice has another strong point in its favor which alone has warranted its use to some extent. On one eastern road a general order is issued each year to all section foremen that the right of way must be mowed during a certain week. The considerations which first prompted this order were the desirability of insuring the cutting of all weeds at the time when their propagation would be at least partially arrested and of maintaining a uniform appearance along the line, particularly just before the early fall inspection. Experience has shown, however, that the absolute check provided on the performance of each gang on that particular work is one of the most important advantages of this system. Foremen who are poor organizers and who, as a result, waste considerable time in changing from one job to another and moving around over their sections are forced to apply themselves diligently to the one task until it is completed. By this means a direct comparison between different gangs is afforded, due allowance being made for differences in conditions on the various sections.

The same advantage would be gained in handling other maintenance work seasonally as in mowing the right of way, and in so far as this system is applicable it would tend to attain the same end as the equating of track sections which has been tried to a limited extent on some eastern roads. This consists in the establishment of some unit by which the performance of section gangs can be measured, a thing highly desirable inasmuch as the determination of a unit should be the first step in any attempt to increase the output of laborers.

PERMEABILITY OF CONCRETE

IN the design of many railway structures it is necessary to assume that water will not penetrate a concrete slab or wall. To secure this condition of impermeability reliance is sometimes placed on the impermeability of the concrete, in other cases slacked lime, alum, or some other ingredient is added to the mixture, and in probably the majority of cases a coating of some waterproofing material is spread on the surface. In most solid floor bridges, arch structures and foundation walls below the ground-water level it is considered necessary to adopt the latter method, although for retaining walls, buried abutments, etc., opinion seems to be divided between three general views. The first is that no provision need be made for excluding water, concrete mixed in the usual proportions and in the usual way being impervious enough; the second, that extreme care should be taken in removing the water pressure by laying porous material next to the concrete and by placing blind stone drains or tile lines leading to weep holes at frequent intervals; and the third, that the entire surface exposed to the water should be carefully waterproofed and ample drains also provided.

The application of waterproofing coating to a concrete surface adds materially to the cost, and some are questioning whether an equal degree of imperviousness could not be secured at less expense by paying more attention to the quality of the concrete. It has been demonstrated repeatedly that watertight concrete can be made, a notable example being the concrete water tank on the Baltimore & Ohio, in the construction of which a 1:1⅞:3½ mixture was used, slacked lime was added in mixing, and the entire inner and outer surface was coated twice with a cement coating. Little data is available as to the amount by which the cost of concrete is increased in making it impermeable. While it is evident that the elaborate precautions taken in the Baltimore & Ohio tank work would be prohibitively expensive for structures in which a degree of permeability is less objectionable, the experience of many engineers leads to the belief that at least in many cases, a slight increase in cost to secure more careful proportioning, mixing, placing and curing of concrete would be more than repaid by its impermeability.

In general, it has been recognized that a rich mixture and wet mixing decrease permeability, but there has been a lack of definite data to guide men in the field in attempting to place concrete that would not require waterproofing. Tests along this line have in the past been concerned chiefly with neat cement and mortar. A series of tests now under way at the University of Wisconsin are the basis for a number of interesting conclusions in a paper by Morton O. Withey, read before the Western Society of Engineers on September 14, covering the degree to which ordinary gravel concrete can be made to resist the passage of water and suggestions for increasing its resistance to.

As to the most suitable mixture, a 1:1½:3 by volume was shown to be very impervious, although in nearly all cases the mixtures of 1:7, or richer, showed a rate of flow for a 50-hour period under a head of 40 lb. per sq. in. less than 0.0001 gal. per sq. ft. per hr., which is negligible for ordinary structures. It is, of course, to be remembered that for many cases other objections in addition to the cost could be advanced against the rich mixtures, and the author mentions the fact that a rich mixture is subject to greater changes in volume under alternate wetting and drying, necessitating added provision for reinforcement and expansion joints. The tests also showed that the permeability of such concrete can be decreased by grading the sand and gravel to reduce the voids, by increasing the fineness of the cement for 1:9 mixtures, by mixing the concrete longer than is customary, with a short period of dry mixing of the aggregate before the water is added, and by exercising more care in the curing of the concrete.

When a graded mixture approaches the theoretical curve of minimum voids, the concrete is practically watertight under pressures up to 40 lb. per sq. in. The best results with 1:9 mixtures were secured when the mixer with a rate of 30 r. p. m. was run at least 1½ to 2 min. For richer mixtures 1 min. seemed to be long enough.

THE OPPORTUNITY OF THE ROADMASTERS' ASSOCIATION

THE convention of the Roadmasters' Association, held last week in Chicago, was one of the best in the history of that organization. While it did not equal that of last year in point of attendance, the discussions and reports were equal to those of any previous meeting.

This association has made a very gratifying growth during the past three years. But, while the active membership has now passed 800, it includes only 40 per cent of the roadmasters of the country, exclusive of their assistants. No association has a more important field for study and the exchange of ideas. Over $350,000,000 is spent annually for maintenance of way and structures. Over $225,000,000, or 60 per cent of this amount, is spent under the direction of the roadmasters. In other words, the average roadmaster is responsible for the proper expenditure for labor and material of over $100,000 annually. It is to study of the application of these large sums that this association is devoted.

The comment is sometimes heard that the Roadmasters' Association is no longer necessary since the formation of the American Railway Engineering Association, and that its work is being done by the latter association, resulting in unnecessary duplication. However, a glance at the reports of these two associations will show that there exist the same distinct fields for association work that are to be found in the railway organizations themselves. The activities of the two organizations should be correlated but not conflicting. With the many important problems now confronting the maintenance of way department, there is a demand for all the constructive work each association can do without duplicating the work of the other. In planning committee work for the year, the officers of these and other maintenance associations should bear this point in mind, since all of them are working to the same end, that of promoting the efficiency of maintenance of way work. For this reason it would have seemed advisable for the committee on Track Accessories not to have attempted to recommend definite dimensions for frogs and tie plates, since the American Railway Engineering Association has already adopted complete specifications and designs for these materials, and especially since this report was prepared without considering these other designs and is in conflict with them. On the other hand, reports on such subjects as The Laying of Rail, The Organization of Forces, and The Policing of Right of Way, are distinctly within the province of this association, as they discuss problems with which the roadmaster is continually confronted. There is a wide field for the Roadmasters' Association in the investigation of economical maintenance methods and organization in the track department. More money is spent for track labor than for all track material, and it is in the study of means for economizing in the use of this labor that the greatest opportunity of the Roadmasters' Association should be found.

BRIDGE AND BUILDING CONVENTION

The next convention of the American Railway Bridge & Building Association will be held at the Alexandria hotel, Los Angeles, on October 20-22, inclusive. Committee reports will be presented on Ice Houses and the Preservation of Ice for Railway Service; Warning for Overhead and Side Obstructions; Railroad Crossing Gates, Towers, etc.; Reinforced Concrete Bridge Work; Station Buildings for Passenger Service; Mechanical Coaling Stations; Care of Traffic While Constructing Bridges to Eliminate Grade Crossings; Water Supply; Concrete Culvert Pipe and Piles; Heating, Lighting and Ventilating Roundhouses and Shops, and Concrete Posts, Poles and Signs.

From present indications a large number of members are planning to attend. For the benefit of those going from Chicago and east, arrangements are being made by the secretary, C. A. Lichty, C. & N. W., Chicago, for special cars going via the Santa Fe with a stop at the Grand Canyon en route. Sufficient reservations have already been made for two cars and it is probable that a third will be required.

The Roadmasters' Thirty-Second Annual Convention

An Abstract of the Committee Reports and Discussions at the Meeting Held Last Week in Chicago

The thirty-second annual convention of the Roadmasters' and Maintenance of Way Association of America was held at the Auditorium Hotel, Chicago, on September 8-11, inclusive. While the attendance did not reach the previous high record established last year, the convention was more than usually successful in point of interest and value of the discussion to the members, while the exhibits of the Track Supply Association were more numerous and representative of maintenance of way materials than at any previous convention.

Over 225 members were present, the average length of railway service of these men being 28 years.

The convention was called to order by President T. F. Donahue (B. & O.) at 10:30 Tuesday morning, and was opened with invocation by Past-President A. M. Clough. The association was welcomed to Chicago by Mr. Mathias, corporation counsel, speaking in behalf of the mayor; by R. H. Aishton, vice-president, Chicago & North Western, and by Walter Allen, president of the Track Supply Association. In his remarks Mr. Aishton particularly emphasized the importance and responsibility of the track department in the efficient and economical operation of the railways, stating that over $1,100 was spent for labor and almost $900 for materials every minute by the track departments of railways of the United States. Past-presidents T. Hickey (M. C.); J. A. Kerwin (C. P. & St. L.); James Sweeney (C. & E. I.); T. Thompson (A. T. & S. F.); A. M. Clough (N. Y. C. & H. R.), and W. Shea (C. M. & St. P.), spoke on various activities of the association, emphasizing the value of the association in general, and particularly the discussions to track men.

The officers of the association for the past year were: President, T. F. Donahue (B. & O.); first vice-president, C. H. Gruver (C. R. I. & P.); second vice-president, B. C. Dougherty (C. M. & St. P.); secretary and treasurer, L. C. Ryan (C. & N. W.). The reports of the officers reflected the healthy condition of this association, 170 new members having been received during the past year, the largest number for any similar period in the history of the association, while the total membership now exceeds 800. The financial statement was equally encouraging, the report of the treasurer showing a balance of $1,075 on hand.

The following committee reports and discussions were presented at the four days' sessions:

NEW AND IMPROVED TRACK TOOLS

During the last 20 years, our track has increased in weight 37 per cent. With this increase in weight of track the unit load hauled over it has in some instances increased over 300 per cent, which in turn has increased our work proportionately. When we had light rail and few ties to the rail, four or five men could line track. Today it takes six or eight and sometimes more. In maintaining the track under light power it was only necessary to go over the track twice during the summer and it was in good shape; today under heavy power if track is maintained as good as formerly it has to be re-surfaced almost continuously. Accordingly it is plain that if our work is as nearly complete at all times, as it should be, it would require twice the number of men now apportioned for each mile of track.

In order to diminish the necessity of putting on this many men we urgently recommend the more general adoption and installation of power driven machinery and tools for all kinds of work pertaining to the building and maintaining of tracks.

Section Motor Cars.—The use of section motor cars is considered by the committee an important development toward increase in efficiency. There have been diverging views existing among some railway men concerning the advisability of installing motor cars on sections and while their use may not be equally advantageous on all territories it is evident to the committee, after careful investigation and actual experience by some of its members in the use of these power driven cars, that there is absolutely no doubt of the economy and advantages in their use as the following illustration will show:

Price of one hand car	$36.00
Labor cost to run hand car 12 mi. per hour, 5 men and foreman	$0.0906
Depreciation and wear of car	.0006
Total	$0.0912
Motor car	$200.00
Fuel, including repairs, per mile	$0.0173
Depreciation and wear of car per mile	.0034
Men's time, including foreman, riding on car 20 miles per hour	.0505
Total	$0.0712

This is a saving of $0.02 per mile in favor of the motor car.

In view of the above facts, we recommend the adoption of motor cars instead of hand cars, on the same basis of foremen and men now allowed, as experience shows that greater efficiency and long hours of work are secured and men are more easily obtained on sections where they now have been installed, and, therefore, their adoption will help to a certain degree to increase the amount of work accomplished per day per man.

Ballast Cars, Unloaders and Spreaders.—In the handling of large quantities of ballast or waste material on improvement work, the use of specially designed unloaders and spreaders is recommended.

Rail Handling Machines.—There are a number of these machines now on the market and we do not feel that any certain make ought to be recommended as the local conditions should be the main factor in deciding the design most suitable. In order to prevent tieing up too much capital in machinery, machines suitable for different kinds of work should be adopted. Where heavy ditching has to be done in the spring and autumn, machines that can be utilized for ditching and handling rail should be assigned, while in territories where ditching is very light machines operated by air seem to answer the purposes more suitably, but under all conditions rail should be handled by power driven machinery, as this kind of work can be done at a cost of 50 per cent less by power than by manual labor.

Rail Benders and Curvers.—We recommend that when we find it necessary to curve the rail, it be done at the mill. We also recommended the use of the lightest rail bender that will kink the rail used.

Rail Laying.—The relaying of rail is one of the big jobs we all have to contend with during the summer. It requires a large force of men at the present time and, no doubt, even larger ones in the future as all our work has to be done in such a manner that there shall be no detention to traffic. Accordingly it can easily be seen that more or less time must necessarily be lost while the gang is waiting on trains. If, however, machines were substituted so that rails could be laid with a smaller force, a great saving in the cost per lineal foot of track laid would thereby be obtained. There is now on the market a machine known as the "three men" track layer that has been tested and approved by practical track men. We recommend the general adoption of such labor saving devices.

Snow Handling Machinery.—Keeping the track, particularly the switches and interlocking apparatus, in a serviceable condition during severe snow storms, constitutes a heavy item of expense on the railroads of the northern states. Large size snow plows are indispensable in cold climates, the rotary plow equipped with flangers proving most satisfactory. All snow car equipment should have the flangers operated by air.

In busy and complicated yards and terminals where train movements are frequent, it is a physical impossibility to keep the switches in an operative condition by the hand method of

cleaning. The unskilled laborers hired to assist in such emergencies do not and cannot understandingly perform the duties required of them. Therefore, any labor saving appliance that will minimize the danger to the men and effectually keep switches in operation should receive earnest consideration.

From experience it has been found that the method of cleaning snow from switches by chemicals is more effective than any other. The switches, intricate mechanism of interlocking, etc., in busy yards by this method are kept in working order by the regular, experienced forces during the heaviest snow storm. This method consists in melting the snow by pouring the chemical upon it. It is applied to switches by hand distributing cans which hold about 3 gal. The cans have a long spout of ⅜-in. pipe and a valve. The opening at the end of the spout is 1/32 in. diameter and the spout is wrapped with asbestos for several inches from the end. This method is very efficient in removing snow from the intricate mechanism of interlockings, switches, slip crossings, etc. It is estimated that the efficiency of a man at interlockings is increased 200 to 300 per cent by using the chemical cleaning method.

Ditching Machinery—The thorough draining of road bed is the first and most important thing to be done in order to obtain good track. To obtain this different methods have been used, but practically all of it is done by manual labor. This is a slow and expensive process, especially when trains are frequent and work trains have to spend most of the time in sidings.

Suggestions have been made to do the ditching by the use of wheelbarrows and ditching cars. This can be done to good advantage if ditching is done to a side cut or short through cut where material removed can be wasted at the end of the cut over an adjacent embankment, provided there is no place in the vicinity where the road-bed does not actually need to be strengthened. In most cases the roads that have heavy ditching also have very narrow fills. Therefore, material should be hauled to these places and the ditching should be done by machinery, in order that the biggest quantity that possibly can be moved in a short time will be removed from cuts while the work train has the main track. There are on the market for this purpose several machines, all of which are good.

Miscellaneous.—Under this head almost every tool used in maintenance work could be mentioned. In passing we might speak of lining jacks, ratchet track wrenches, tie adzing and boring machines, appliances for drawing screw spikes, etc. There is also a possibility of installing pneumatic tools in our department. In nearly every yard of any size on all railroads, air power is distributed for the use of the motive power and car departments. When air will drill steel plates on cars and engines, why can we not drill rails? When air will drive rivets, why can it not drive spikes? When air will lift cars and engines, why can it not be utilized in jacks for lining tracks, etc.?

J. W. Dahl (N. Y. C. & H. R.) Chairman.

Discussion.—In opening the discussion, the chairman stated that in throwing track, men will ordinarily be distributed at intervals of 2 ft. along the track. A 2-ft. section of track weighs 182 lb., while the resistance against throwing laterally is 10 times this amount or 1,820 lb. The average man can lift his own weight, or 142 lb. With a lining bar he can lift four times his own weight or 568 lb. He also deprecated the tendency to install motor cars as a substitute for section foremen, stating that the foremen have all they can do and that increasing the length of sections adds to their duties and decreases their supervision and efficiency in direct proportion.

In discussing the benefits derived from the use of motor cars, M. Donahoe (C. & A.) stated that he did not believe motor cars would make as great mileage during their life as hand cars. He also called attention to several types of engines which can be attached to hand cars at an initial expenditure considerably less than the $200 referred to in the committee report. W. F. Muff (A. T. & S. F.), stated that while he has several such cars on his sections, his company does not allow the men to purchase their own cars, but that if they are considered advisable, the company purchases the engines and mounts them on the hand cars. Other members stated that their roads allowed the men to purchase their own engines and mount them on the hand cars if they desired.

P. J. McAndrews (C. & N. W.) believed one of the obscure benefits he has secured from motor cars lies in the fact that while it has not been practicable for him to reduce his forces with the adoption of motor cars, he has been able to avoid the necessity of increasing forces during the past two years in spite of the continually decreasing efficiency of labor. While unable to show exact figures, he believed that on sections employing seven or eight men, motor cars effected a saving of one man in each gang.

J. Buel (Ark. Cent.) stated that he has used motor cars for five years, eliminating alternate sections. The hand cars were kept for use when the motor cars were in the shops for repairs, but it has been found that whenever a gang was required to go back to the hand car, the laborers left. J. P. Corcoran (C. & A.) also stated that his laborers tend to move from sections equipped with hand cars to adjoining sections supplied with motor cars and that he has no trouble keeping these latter gangs to their desired quota. On the other hand, W. F. Muff stated that the Mexican laborers employed on his division complain about the increased hours of labor now spent on the track where motor cars are used.

The consensus of opinion was that motor cars should be strongly recommended, but that no sections should be eliminated. Some opposed their use on lines with many curves or heavy traffic, while others reported using them safely on such lines. L. C. Ryan stated that during June and July, 1914, the North Western paid $35 per minute for track labor. If the motor cars saved only 20 min. per day for these forces the economy is evident.

In the discussion of rail handling machines there was a diversity of opinion regarding the type best suited for different conditions. D. O'Hern (E. J. & E.) stated that he uses a locomotive crane with a magnet in loading scrap, this machine picking up twelve 33-ft., 100-lb. rails at one time. It is also used to pick up angle bars, bolts and spikes. It is used principally in yards where the ordinary air or steam-operated rail loaders are too slow.

There was also a wide diversity of opinion regarding the necessity for curving rails. The committee report originally advocated curving all rails for curves of 6 deg. and over. T. Hickey (M. C.) advocated curving all rails for curves over 3 deg., stating that he has found that rails properly curved will stay in line as well as on tangent. D. O'Hern, H. Van Gorder (C. & N. W.); M. Burke (C. M. & St. P.), and others opposed the curving of rails for all curves less than 10 deg., believing that money so expended is wasted and that the necessity for curving rails for such curves has disappeared with the gradual change in the practice of laying rail with broken rather than square joints. It was finally voted to amend the report to recommend that where necessary to curve rails they should be curved at the mills.

C. King (L. I.) and A. M. Clough (N. Y. C. & H. R.) described the operation of a type of tie tamping machine, 12 of which are now in use on the New York Central. This machine is mounted on a push car, is self-propelled and is driven by a gasolene engine operating an air compressor. It works similarly to a riveting machine with two tampers having a stroke of about 1½ in. This machine requires two men to operate it and will tamp 350 to 450 ft. of track per day, replacing 10 men.

PROPER METHOD OF RAIL RENEWAL

The roadmaster or supervisor of track who is in immediate charge of a division should be the one to recommend when rail should be renewed. He sees it under all conditions; sees it either too light or gradually deteriorating under traffic, and knows from year to year just how much more difficult and expensive it becomes to maintain it. The question of the weight of the new rail to be laid should be determined by the chief en-

gineer or other official conversant with the probable increase in traffic or tonnage or acceleration of speed contemplated over that district which is not always known to the man in charge of the track.

Rail should be laid as early in the spring as possible, weather and other conditions permitting. It should be furnished from the mills on flat cars when practicable and all full length rails should be loaded separate from short lengths.

Rails loaded in gondola cars should be unloaded with a power unloader operated by air or steam as provided. Rail can be unloaded with skids from the side of the car or by pulling them off from the ends of cars with an incline arrangement to permit the rail to reach the ground easily, the main object of all concerned being to use care so that rail will not be injured while being unloaded.

Rail should be laid with broken joints. In laying rail around curves, rails cut from 6 to 12 in. shorter at the mills should be used on the inside of curves so that a joint on the inside rail would never get more than from 3 to 6 in. ahead of the center of the opposite rail until a short rail is put in. Any extra effort to keep joints properly broken is fully repaid in the proper spacing of ties on curves, one of the most vital points.

Rails shorter than the standard lengths should be marked green on the ends, except those cut special for curves, which should be marked red. All second quality rails should be marked white. Full length rails, of course, do not need to be marked.

Where conditions permit rail should be laid in track one rail at a time and great care should be used to see that they are not bumped against the last rail laid in. Proper expansion shims should be used to keep the rails the right distance apart according to the weather conditions. The shims should be made of hard steel. Rails of the same width of base should be laid from the inside which will permit the ties to be adzed and rail set up level without interfering with outside spikes, and all bad spikes should be renewed.

If a rail with a wider base than existing rail is being laid, one rail should be laid from the outside and one from the inside with the same care in adzing ties so that the wheel will tread the full width of the head of the rail as in laying from the inside. The track should be put to true gage when the rail is laid.

When the proper tables for expansion are not given the tables recommended by the American Railway Engineering Association should be used. This table is herewith given with a slight variation:

20 deg..... 5-16 in.	80 deg..... 1-8 in.
40 deg..... 1-4 in.	100 deg..... 0 in.
60 deg..... 3-16 in.	

No rail should be laid in temperature below zero.

A foreman laying rail should be provided with a thermometer to enable him to know what the temperature is and to use expansion shims accordingly and he should also have a steel tape-line to check frequently the positions of his joints and understand the importance of keeping the joints uniformly broken, without which uneven spacing of ties between joints and unsightly and improperly laid track will result.

Three or four bolts in a joint, properly tightened up during the day while laying operations are going on, are sufficient to permit traffic to go over, but all joints should be full bolted and bolts made reasonably tight and all spikes driven down before quitting work at night.

The practice of using switch points to make temporary connections while laying rail is gradually losing favor and the safer way of having compromise joints made to fit both sections of rail that are being handled is recommended, having in mind, of course, to do the least cutting of full length rails possible. The foreman should carry forward with him the portions of the first cut rail and while laying rails longer than the existing rails or where rails run away from the old location of joints, he can always make his closure where a shorter rail will answer until the full rail is used up.

As the proper expansion between the new rail being laid nearly always varies from that being taken out, rails should be laid without regard for holding the joints on the old joint ties and enough rail anchors used to hold it from creeping until the ties are spaced and the joint ties properly spiked. It is also recommended that a sufficient number of rail anchors be used permanently, according to conditions, to keep the rail from creeping, the idea being that in the past too much was expected of the only way we had of holding the rail, viz.: the slots in the flanges of the angle bars.

Ties should be spaced as may be required and all defective ties renewed and track properly surfaced, gaged and lined as soon as possible after the rail is laid. All bolts should be tightened to as near the same tension as possible—a most important feature in getting the best results from new rail, as nothing so effectually destroys or nullifies the good work of a foreman in getting rail laid with the proper expansion than to have some joints tight and some loose, the heat or cold always pulling the rails apart or closing them up where there is the least resistance. No poor spikes should be redriven.

In handling relayer rail the same general methods should be used; in addition care should be taken not to relay any poor rail or worn out joints. The proper place and time to guard against this is when the rail is being removed from track; flaws are easier detected then and the condition of joints is more readily seen.

Rail laid near depots or water stations where trains stop and start will be worn down more than out in the open and this rail should either be kept together or culled out entirely. All good rails from one side should be loaded on the same cars and as near in rotation as possible and unloaded the same way, so as to put the rails back in as near the same relation to each other as possible.

Great care should be exercised to see that rail is properly in place. When a new rail is laid where an old joint was slightly low, it should be tamped or blocked up to prevent it being surface bent by the first train over it.

There are many other details that the foreman who is considered capable of handling a rail gang will see to of his own accord. The organization of his gang, the rules of flagging, the time of day to run rail and the amount that can be well and safely laid, can reasonably be left to him and the prime object should be, not how much can be laid, but how much can be well laid and with the least interruption of traffic or anxiety to the officers who are immediately responsible for its proper laying and maintenance and with the results that the higher officials expect from the money expended.

The following is an outline of an arrangement of a steel gang of 58 men:

Two men, one flagman in each direction at all times when gang is at work; two men, taking up and putting down crossings and handling insulated joints; one man, with hand car, handling tools, switch point, rail bender, etc.; four men pulling spikes; three men throwing in old rail; ten men adzing ties; twelve men lifting in new rail; two men barring in new rail; two men spiking joints and quarters; four men spiking; one man adzing ties for new joints; six men or more putting on new joints and wrenching; one man removing expansions shims; four men throwing out old rail; one man carrying water; one foreman of the gang; two assistant foremen, and one time keeper.

A. M. CLOUGH (N. Y. C. & H. R.), Chairman.

Discussion.—The extent to which rails should be allowed to wear before being renewed aroused discussion. Several members stated that rail worn out is evidenced by the increased cost of maintenance to keep the track in proper condition and also by the increase in the number of breakages. There is no rigid line of demarcation between safe and unsafe rail. J. P. Corcoran (C. & A.) called attention to the economy in transferring rail from main to branch lines before it has been entirely worn out in main line service, the effect of this being to decrease the cost of maintenance on both main and branch lines.

In reply to a question, Chairman Clough stated that one important advantage of laying rail in the spring is that the more

uniform temperature enables the rail to be laid with less difficulty from expansion. It is also possible to get more work from a gang of men at this season.

To expedite the unloading of rail along the track, J. P. Corcoran stated that he has transferred rail from coal cars to flat cars with a rail loader in a yard at a cost of $2.10 per car. W. Shea (C. M. & St. P.) defended the shipment of rails from the mills in stock cars as practiced on many western roads, because of the ultimate economy to the railroads in reducing empty car mileage. He also stated that he would rather load released rail into stock cars than on flat or gondola cars as there was less danger of injury to the men.

G. H. Prentice (L. S. & M. S.) stated that he has found difficulty in preventing the tongmen from bumping the adjacent rails and closing up the expansion so he leaves several shims between the last rails laid. A. M. Clough stated that he avoids this by setting the rail on the ties close to the old rail and moves it laterally into its final position.

In discussing which line of spikes should be removed, W. Shea stated that he has found ordinary spikes on the outside of the rail to be badly corroded and cut whenever the rail required renewal and he did not believe it advisable to allow such spikes to remain in the track. He advocated pulling all spikes, which is, of course, necessary when tie plates are used.

While it was the general opinion that rails should be laid singly as recommended by the committee, M. Griffin (C. R. R. of N. J.) stated that on his subdivision it is impossible to secure the use of the track to exceed 15 to 30 min. at a time. Under these conditions he bolts up 100 rails on the ends of the ties, bonding all but the last joint and throws this stretch in at one time. On curves he places 25 to 30 rails in a string. Expansion is maintained by holding the shims in position until the rail is in place and spiked.

The original recommendation of the committee that ties should be spaced immediately after the rail is laid, aroused a vigorous discussion. L. C. Ryan (C. & N. W.) stated that he had recently examined a New York Central track where care is taken to secure a supported joint. He had also studied the Pennsylvania track where a suspended joint is used and had gone over the Lehigh Valley track where either suspended or supported joints are used without the spacing of ties and found that all this track rode well. He therefore questioned the necessity of spending a large sum of money to secure a standard spacing of joint ties. W. Shea stated that anchoring the rail to the joint ties loosens these ties and mainly for this reason, the St. Paul has abandoned slot spiking the joints and the spacing of joint ties. They have found that rail can be fully anchored on intermediate ties, although this requires a special joint tie plate. With these tie plates he has found that rail can be laid and maintained on single track much cheaper than where the ties are spaced. P. Madden (C. M. & St. P.) stated that he had found the same results on double track. Other members spoke of the practice of the Michigan Central and Lake Shore along the same lines, the former road having abandoned the spacing of ties when laying rail on some divisions for the past three years. While other members strongly opposed this practice, the association decided to amend the report as printed above.

The original recommendation of the association that rail in double track be laid in the direction of the traffic was also attacked. M. Donahoe (C. & A.) stated that he had found that rail could be laid better against the traffic. A. M. Clough stated that on the other hand, when laying rail with the traffic on a road equipped with block signals, there was less danger of a train running into open track. W. F. Muff (A. T. & S. F.) stated that until this year it had been his practice to lay rail with the traffic. During this season he has laid rail against the traffic and finds that it creeps less. He also believed that there was less danger of accidents when using point connections. T. Thompson (A. T. & S. F.) and P. J. McAndrews (C. & N. W.) stated that they are able to maintain the expansion better when laying rail against the traffic. A. E. Muschott (E. J. & E.) stated that he has laid rails both ways and could see no difference in the results. M. Griffin (C. R. R. of N. J.) stated that it is the practice on his road to lay rail with the traffic. No switch points are used at connections but rails are cut as required, and it has been found that when laid with the traffic the new rail is not battered at these connections.

PROPER ORGANIZATION AND ECONOMICAL USE OF LABOR AND MATERIAL

Additional supervision has been provided in all other departments of our railways as the need became apparent, but on many important roads we find today practically the same scheme of track organization as existed as much as 40 years or more ago. It would seem the time has arrived for careful consideration of the needs in the track department for such supervision as will guard against waste.

Under the organization in effect on some lines, where the division superintendent has the division roadmasters or supervisors immediately under him, it is thought that some measure of efficiency is lost because often the superintendent is not familiar with track matters and especially so during the early years of his experience as superintendent before he has had opportunity to study and absorb some of the essential principles of track maintenance.

Each division has a master mechanic under whose direction road foremen of engines, traveling foremen and various inspectors are employed to supervise the men and machinery, a master car builder whose business it is to keep the cars in condition to handle the traffic, trainmasters and their assistants to instruct and direct trainmen, each of those mentioned being a specialist in his line. There should therefore be an experienced trackman at the head of the track department on each division whose knowledge properly applied would enable his company to get maximum results from all money expended for material and labor used in track maintenance.

No plan of organization can be worked out that would exactly fit conditions on all railways nor perhaps on all divisions of any large systems, but the following proposed plan with modifications might be found suitable for many of the principal lines with heavy or medium traffic.

Division Superintendent or Division Engineer.
Division or General Roadmaster.
Roadmaster or Supervisor.
General Foreman.
Extra Gang Foreman.
Section Foreman.
Student Foreman.
Laborers.

A general roadmaster should have jurisdiction in the same district as his division superintendent. On heavy divisions, roadmasters should have districts not exceeding 50 miles of double track or 100 miles of single track while on lighter divisions through prairie country 125 miles should be the maximum length of district.

All records should be kept at the office of the general roadmaster and the district roadmasters should only conduct such correspondence as may be necessary to direct the work of the foremen, a sufficient force to be employed at the office of general roadmaster to keep the necessary accounts showing expenditures for material and labor with correct distribution thereof to the various prescribed divisions of charges. Through the elimination of office work, the district roadmaster would be in a position to spend the greater portion of his time out on the line among his foremen and laborers, giving the personal supervision and instruction which is essential to efficiency.

A general roadmaster should exercise supervision over his assigned territory, carrying out the policy of the management, distributing to his district roadmasters, necessary material and making such allowances for labor on the various districts as conditions warrant, placing the material and labor to the best advantage. Necessary general instructions to roadmasters should be issued from his office, proper data for cost records should be secured and worked out to determine the efficiency of those employed under him and a careful survey should be

made of conditions on the various roadmasters' districts at frequent intervals.

All pay rolls, vouchers, requests, etc., should be carefully scrutinized and a system of checking be adopted to insure the accuracy of all time rolls.

District roadmasters should devote their entire time to the supervising of the work being done by the various extra gangs, section gangs or other crews employed in track work on their districts, looking after all material to avoid any waste. They should carefully watch the work done by all foremen and promote the most efficient men to better positions as opportunity is presented.

General foremen should report to the district roadmasters working under their instructions, spending such amount of time with the various extra gang and section foremen as will secure maximum results in safety and efficiency and should pay special attention to the instruction of foremen with least experience.

Extra gang and section foremen should render all accounts of material and labor to general roadmasters and work under the direction of the district roadmaster and the general foreman.

Student foremen should work on the section or extra gangs under the immediate direction of the foremen and be given instruction and opportunity to become familiar with the work, so as to fit themselves for promotion to the position of foreman.

The maximum length of sections should be 3½ miles of double track or 6 miles of single track, and where a number of sidings or yard tracks are included, the length of sections should be reduced correspondingly.

Forces should be assigned to the various sections based on the number of miles of main track, miles of sidetracks, industry tracks, interlocking plants, extent of station grounds, number of highway or street crossings, etc., on each section. The number of laborers that should be assigned to sections, depends largely on the physical characteristics of the line, the amount of traffic handled and the degree of excellence or refinement desired by the management.

Thus far organization has been discussed only as it pertains to supervision, but unless the standard of track laborers can be raised, all efforts to increase the efficiency of the supervising officials will amount to but little. In order to compete with other industries in securing laborers, a reasonable rate of compensation should always be paid with an "all year round" program of work for extra as well as section gangs, and the majority of laborers should be retained in service continually.

The general practice at present on most systems is to reduce section forces to the minimum and dispense entirely with all extra gangs about the time of the first frost and tie up track maintenance until the following May or June. This practice of all the railways trying to do their year's work in a few months creates an abnormal demand for labor during the short season and makes necessary the payment of much higher wages than would be the case if men were steadily employed and the work spread out over the year. The cost of additional supervision recommended above would be more than saved if the men were kept all the year round as in this way a great many local laborers could be secured for section and extra gangs, dispensing with the inferior class of foreign laborers that must be used during the short season of track work.

Where it is necessary to use foreign laborers, good facilities for the men should be provided, with necessary attention to sanitary conditions and an endeavor should be made to educate the foreign laborers in a manner that will result in their becoming better citizens.

It is suggested that an all year round program of work would result in a reduced cost of material, such as rails, fastenings, tie-plates, rail anchors, frogs, switches, etc., for the same reasons that economies for labor could be shown. A more uniform demand for materials would enable the various mills and foundries to produce a more regular output, thus employing a nearly uniform force of men steadily rather than increasing their output spasmodically during the summer months as at present. If this improved practice would not result in a reduced price for track supplies, it would at least tend to improve the quality. General roadmasters with a program of work covering all or nearly all the year would be in a position to give the stores department advance notice and get materials in such quantities and at suitable times to avoid accumulation of large stocks.

P. J. McAndrews (C. & N. W.), Chairman.

Discussion.—The discussion was devoted mainly to that portion relating to the proper length of roadmaster's and section foremen's territories. It was generally agreed that these present limits are too great for best results and that the recommendations of the committee, if followed, would improve conditions. The committee's suggestion that a general roadmaster be appointed on those divisions with three or four roadmasters, also met with general approval, the advantage being pointed out that this general roadmaster could so correlate and distribute the work of the different roadmasters on the division to secure the most economical operation of work trains and extra gangs and the distribution of material. C. King (L. I.) described the practice of his road of employing track forces on a yearly basis, which was described in the *Railway Age Gazette* of October 24, 1913, and March 13, 1914.

PROPER TYPE OF TRACK ACCESSORIES

Rail-Joints.—A plain four-hole angle bar joint, 24 in. long, with sufficient weight and proper distribution of metal, in accordance with the rail section it is applied to, to best resist deflection, is recommended. The bolts for 90-lb. rail section should be one inch in diameter, U. S. standard thread, with a good make of spring nut lock, square head tap, staggered in joint. Where traffic is very dense and heavy a separate plate is recommended. This base plate should be about ⅜-in. thick, 2 to 3 in. wider than the angle bar, turned up at ends of angle bar, and might also have a longitudinal rib under center of plate to act as a strengthener or truss for additional support under the rail ends. Base plates can be eliminated where the traffic is light.

Switches and Manganese Separable Points.—For split switches in common use the reinforced point is recommended, with length and planing in accordance with the length of lead or angle of frog it is commonly used with.

For plates we recommend a ⅝-in. Gage plates should be about 6 in. long, by 6 in. or 6½ in. wide and not less than 9-16 in. thick, insulated where necessary and turned up at each end to form a shoulder for a rail brace. The slide plates should be at least 9-16 in. thick, 6 in. wide and 12 in. long for plain plates and 20 in. long for brace plates with a riser three to four inches in width, rolled or planed and a shoulder for a brace to be applied against. This brace should be a separate part of the plate punched and fitted to spike through the brace and plate. These plates should be on every other tie from the gage plate at switch point to heel of switch, every other plate to be plain. Special tie plates without braces should be used commencing with the joint tie at heel of switch and extending some four ties from the heel of switch to a point where the regular tie plates can be applied. These long special plates should be properly spike-punched for the road's standard turn-outs, the spike-punching for turnout rail to be made large enough to care for a ⅝-in. variation in line.

For a heel joint, it is recommended that a 20-in. cast heel block filler be used. It should be made to fit snugly between the joint and traffic rail, bolted through the block filler and joint to an angle bar on the gage side of the point independent of the traffic rail. The bolt heads should be countersunk in the cast filler block so the latter will set up snug against the traffic rail, answer for a foot guard and be free from creeping of the traffic rail under one-way traffic.

For yard use, at inside switches, where work is heavy, we recommend the manganese separable switch point. The cutting or sawing off of worn points and applying the manganese point should be done at terminal roundhouses where there is a blacksmith employed and at local shops when they are not too far distant. The stock rail supporting the turnout point in switching

yards and at all inside switches should have the double kink to protect the switch point from excessive wear and to prevent the switch from being split by a wheel flange on account of a loose-fitting switch point. We do not recommend a switch point shorter than 12 ft.

Crossing and Other Frogs.—The committee recommends the solid manganese frog for crossings, other than where the traffic is light and the wear in either direction only moderate. In frogs where the inserted manganese filler is used, the common steel rail should join onto the manganese with a square cut end, and in such a manner that the track-men can renew the section of common rail should it become necessary. We also recommend solid manganese rigid frogs in all terminals, on busy switching leads, and where the Bessemer or open hearth rail would wear out in less than one year. Manganese crossings for steam railroads should be made up in two or four sections, depending upon the angle The outside arms should be made as short as possible for better service as well as saving in material.

For rigid frogs of planed "T" rail, we recommend the cast filler bolted frog with spring nut lock and square head lock nut, bolts to be of Mayaria heat treated steel. Rigid frogs of a flat angle can be used right and left hand, by having the short point on turnout side of frog, turnout rail at toe of frog to be enough longer than the lead rail, or tangent rail of frog, to square the switch points at head block when enclosure rails of same length are used between frog and switch.

Spring rail frogs should have tie plates attached in accordance with proper tie spacing, except under joint ties, at the heel and toe of frog, where special detached plates should be used, slot punched to mate with gain holes in the angle bar joints. An anti-creeping device should be used about midway between throat and joint at toe of frog. The rail for a sufficient distance back of all spring rail frogs, on one-way traffic, should be securely anchored with anti-creepers to prevent rail from crowding the frog, or wing rail of frog.

Switch Stands.—The committee recommends the automatic switch stand for use on main line switches about yards and terminals where the switch is subject to being run through, as well as to operate all busy yard or inside switches. We recommend round holes in the base of switch stands instead of square ones with the stand fastened to head blocks with ¾-in. lag screws instead of spikes. When fastened with screws an adjustable connection rod should be used.

Guard Rails and Fastenings.—The committee recommends an eight-foot guard rail, curved out at the ends to a clearance of five inches from the traffic rail. The ends of the guard rail are to be bolted through a cast filler to the traffic rail with one large size bolt (1 in. for a 90-lb. rail). This cast filler is to serve as a foot guard as well as to help hold the guard rail secure. A good make of guard rail clamp is to be applied at center of guard rail or opposite throat of frog. Tie plates should reach under both guard rail and traffic rail, slotted for spiking on outer side of traffic and guard rail. The guard rail should be planed on inner side sufficiently to permit it setting up to the proper clearance for flangeway In placing this style of guard rail, set the center of the guard rail opposite or at right angles to the throat of the frog, or just ahead of the theoretical point of the frog.

Tie Plates.—This committee recommends a wrought iron plate, 6 in. by 9 in. by ⅜ in for 5-in. 80-lb. rail, with a shoulder for the outside flange of the rail, punched for two spikes on the gage side of the rail and one spike on the outside of the rail. Tie plates should be used on all curves, on all soft wood ties on tangents as well as on curves and on all ties where traffic is heavy.

Anti-Rail Creepers.—The boltless, self-maintaining, wedge, skew, spring or clamps, in our opinion, is the best type of anti-creeper on the market.

Nickel chrome steel frog, crossing and track bolts, screw spikes, and the "frictionless" rail were also discussed at length in the report

M. Donahoe (C. & A.), Chairman.

Discussion.—In discussing rail joints, some objection was raised to the recommendation that base plates be used and there was considerable difference of opinion as to the value of joints of this type. It was finally decided to receive the section on rail joints as information.

Speaking on the second paragraph of the section on switches and manganese separable points, A. E. Muschott (E. J. & E.) objected to gage and slide plates less than ¾ in. thick on account of their liability to buckle under heavy traffic. Several members spoke in favor of plates with double shoulders, one for the rail and one for the brace. A number of other minor suggestions were adopted in this paragraph.

Referring to the recommendation of the committee providing for three hold-down devices on the spring rails of frogs, B. C. Dougherty (C. M. & St. P.) stated that he has found that two such devices are not sufficient. T. F. Donahue (B. & O.) referred to the difficulty in renewing bolts on spring frogs without cutting the frogs apart. To eliminate this difficulty the report was amended to add that "the design of spring frogs should be such that the wing rail may be removed to permit bolts to be renewed."

The recommendations of the committee with regard to the adoption of automatic switches created a spirited discussion. Referring to yard work, J. W. Guffey (S. A. & A. P.) stated that he has found that switching crews would run through automatic switches rather than to stop to throw them for the desired track and has had much difficulty in breaking up this practice. D. O'Hern (E. J. & E.) has installed automatic switches in one yard so that the switch engines can run through them without stopping, facilitating their work. M. Burke (C. M. & St. P.) vigorously opposed this practice, believing that automatic switches were never intended to be run through, but were designed to prevent damage when a switch was run through accidentally. He did not believe a stand would endure such service for any length of time.

There was an even greater division of opinion regarding the advisability of installing automatic switches on main tracks. B. F. Brown (B. & M.) stated that automatic switch stands are used exclusively on main lines on his subdivision. Other men opposed them and some roads were reported to forbid their use in such locations.

W. Shea (C. M. & St. P.) objected to the recommendation of the committee that guard rails should be bolted or clamped to the main track rails. Where such bolts or clamps are used he has found that they will loose the spikes holding the main rail, resulting in derailments. He pointed out the necessity for a better device and advocated as one solution, a guard rail independent of the running rail. T. F. Donahue (B. & O.) avoids difficulty with derailments by placing heavy tie plates under the guard rails and running rails and applying from two to five rail braces to each guard rail. M. Donahoe (C. & A.) advocated short guard rails, believing that a length of over 10 ft. was detrimental and that the shorter length was sufficient to guard the point.

The committee's recommendations for size of tie plates were attacked and after considerable discussion it was decided to amend the report to recommend that tie plates be used with a minimum thickness of ½ in. and of a width equal to that of the standard tie.

CLEANING AND POLICING THE RIGHT OF WAY

On some eastern trunk lines the right of way is given the same care as the tracks. The weeds and grass are kept cut down at stations each week and papers and refuse dropped from trains are picked up each day.

In the Middle West the right of way should be mowed of weeds and grass as soon after July 1 as possible, or sooner where weeds will go to seed before this date, to prevent fires from spreading into wheat, oat and hay fields which annually cause heavy losses to the railroads. Where the ground is level, the

right of way should be cut with a mower and team, paying from $8 to $10 per mile.

As soon as the weeds and grass are dry the section men should go over the ground and burn off the right of way, either by placing a piece of waste at the end of a wire and drawing it over the right of way cut, or by using a 2-in. pipe, 8 or 10 ft. long, filled with waste and soaked in kerosene oil. This pipe has very small holes bored in it to allow fire to work from the oil in the waste. In burning of right of way great care should be exercised by the section foreman to do the work when the wind is blowing from the field, to prevent the fire from getting away from the section gangs. Every vestige of old wood, trees and other rubbish should be burned while cleaning the right of way.

Rail.—New or relay rail, when unloaded, should be properly distributed and not scattered along the right of way on the ends of ties or down in ditches but should be set off the ends of ties onto the ballast. As soon as the new rail is laid the old rail should be unbolted and loaded as soon as possible to be taken to headquarters or to points where it is to be used. Every vestige of scrap, such as old bolts, spikes, short pieces of rail, old frogs and switches, should be picked up by the rail loader and the right of way should be left clean. It is much cheaper to load rail with a rail loader than by hand with section labor and at the same time injury to laborers is avoided.

Ties.—Ties unloaded in the fall and winter for next season's work should be piled in accordance with the standards, the piles set at certain distances, so that the section forces will not have too long a haul in distributing them for spring work. These ties should be set up out of ditches on high ground so that spring freshets will not wash them into openings of bridges and block the water, thus causing it to go over track.

All treated ties should be covered with two inches of dirt to prevent them catching fire and weeds and grass should be cleaned away from each pile of ties to prevent fire and give it a tidy appearance.

When ties are distributed on outlying sections they should not be placed between tracks as this might invite boys or mischievous persons to place them on the main track. Ties used in yards should be distributed as used. Old ties removed from track should be picked up each night and not allowed to remain between tracks to cause some switchman or trainman to be injured.

Where practicable ties removed from tracks in cuts should be hauled out of the cut for burning. If burned in the cut the dirt is likely to wash down and fill the ditch. Foremen should be working close to the spots where ties are burning to prevent fires spreading to adjoining fields and also to see that all ends of ties are properly burned.

Scrap.—All track scrap such as old spikes, bolts, splices, rail and frogs, should be picked up at the close of each day's work and taken to the scrap pile. Crooked or bent spikes should be sorted out and set in tool house and on rainy days the section gang can straighten them and use them in side tracks. Old bolts picked up should be sorted over and bolts found good for use in side tracks should be oiled and nuts placed on them, so that, when wanted, they will be ready for use.

Ditches.—Section forces should watch their ditches and waterways very closely and keep them cleaned out and open. In the fall the section men should go over their sections, clean out all ditches and waterways and, where possible, use the dirt for subgrade.

Ditches to drain the ballast are better than none at all, but they will not aid materially in maintaining good surface. All ditches should be deep enough to properly drain the subgrade. The bottom of the ditch should be from two to three feet below the bottom of the tie, depending on the nature of the soil. Such a ditch, if properly constructed, will keep the roadbed fairly well drained and aid materially in maintaining the surface; and, in addition, will reduce to a considerable extent the liability of track heaving during the winter months.

Particular attention should be paid to drainage at frogs, switches, railroad crossings and street and highway crossings. The remedy depends on the local conditions. This depends, in turn, on the matter of providing sufficient rapid drainage and supplementing it by subdrainage wherever necessary. Blind drains of cobble stone, broken stone, or tile, laid parallel to the track four inches outside of the tie and six inches lower than the bottom of the tie, will carry off the surplus water, avoid the puddling of the joints in crossings and save considerable work and money.

Fences.—Right of way fences should be built substantially with the posts set firmly in the ground and in good line. Corner posts should be well braced and anchored so that fences will not sag. Light convenient gates should be provided at private crossings, and the hearty co-operation of the farmer and land owner should be solicited in keeping those gates closed when not in use. It is economy for each supervisor or roadmaster to have a fence gang of five or six men and foreman, to repair or rebuild fence out of face. In this manner a uniform fence is secured much cheaper than if built by section gangs.

Bridges.—Section foremen passing over bridges and culverts should note their condition and see that they are safe. Weeds should be cut from around all wooden and pile bridges, and taken from under the bridges to avoid catching. All bird's nests in pile trestles or wooden bridges should be removed by the track walker as he passes over the track each day, to prevent the bridges from catching fire from cinders dropping from the engine.

Water barrels at bridges should be filled at intervals; and, in dry weather, where there are long trestle bridges, the local freight trains should be stopped to fill the water barrels.

The Track Walker.—The track walker should be the best and most intelligent man in a section gang. He should be able to read and write and should study the rules of track work and flagging, so that in case he found a broken rail he would know how to flag trains until he could send word to his foreman to come and replace it.

The track walker's duties are numerous. In passing over the section he should examine and open every unlocked switch, switch stand and guard rail each day and know that they are positively safe for the day; he should tighten any loose bolts found; drive down any loose spikes to the rail; change any broken angle bars found; reset, if possible, any planks found heaved up in road crossings which are liable to catch the pilots of engines; watch fences and farm gates as he passes over the track, patch any broken fence wires and close farm gates which are left open. The track walker should keep a very close watch for track spreading and spike it back to gage. If it continues to spread he should call the foreman's attention to it.

Cleaning Around Yards, Freight Houses and Station Grounds.—In cleaning freight yards at terminals the dirt and scrap scattered between the tracks should be gathered up in piles on three or four tracks so there will be no delay to work train waiting for the dirt to be gathered up to load. A work train with 12 or 14 flat cars should then be furnished to load up this dirt the same day it is put in piles to avoid injury to train or switching crews. To handle this material with a wheel-barrow or box is too expensive and dangerous for men working between tracks where cars are being switched.

In cleaning around freight houses a side dump car should be set and litter and dirt cleaned from the cars should be wheeled to and thrown in this car by the freight house employees. A wagon with two wheels that will hold a half yard of dirt should be furnished to freight houses and in that way no rubbish or dirt is allowed to accumulate at freight house tracks. This committee has investigated two railroads where this method is employed and freight house tracks are only cleaned once a year by the section men.

Driveways at freight houses and stations not over 1,000 ft. long should be cleaned by using a wheelbarrow with a car to wheel it on. Where drives are longer a horse with a dump cart should be used to pick up the dirt and take it to a car to load.

All old paper and litter around station grounds should be picked up and burned at least twice a week to give the station grounds a tidy appearance.

Sign Posts.—All sign posts, mile posts, crossing and whistling posts, etc., should be watched closely, kept set up plumb and weeds and grass kept cleaned from around them to give them a tidy appearance.

J. P. Corcoran (C. & A.), Chairman.

Discussion.—In discussing the proper time to cut weeds, several men preferred doing this work before July 1, and again later in the fall. Chairman Corcoran stated that where weeds are cut in July and the ground then burned over, few weeds will grow to any considerable height that season.

In discussing the subject of drainage, W. Shea (C. M. & St. P.) stated that he would be unable to maintain track in cuts on his division with ditches three feet deep with the heavy motive power operating on that line. He is forced to place a large amount of cinders under the track, to install subdrainage and then to construct shallow ditches.

THE ANNUAL BANQUET

The third annual banquet of the Track Supply Association for the Roadmasters' & Maintenance of Way Association was held in the Auditorium hotel on Thursday evening, with about 200 members of the two associations attending. President Walter Allen of the Track Supply Association acted as toastmaster. In introducing the first speaker, Mr. Allen compared the duties of the roadmaster during recent years with those of the officer who "carried the message to Garcia." He referred to the fact that in spite of reductions in appropriations and forces, the roadmasters were expected to keep their lines open for traffic in times of storm and to keep them safe for operation at all times.

J. A. Spielman, district engineer maintenance of way, Baltimore & Ohio, Pittsburgh, Pa., spoke on the conditions under which the track department is operating today. He referred to the advantages of precedents in methods and variety of appliances the roadmaster now has as compared with 25 years ago and stated that he thought the manufacturers of track appliances might be considered one department of the railways, taking the burden of developing new devices off the roads themselves. Efficiency has replaced the dollar as the standard of track maintenance today and with this in view, he strongly urged that the Roadmasters' Association go on record as protesting against the present limits of the fiscal year.

T. F. Donahue, president of the Roadmasters' Association, spoke briefly on the necessity of the roadmasters spending more time among their men on the track, endeavoring to develop them as track men and to increase their efficiency. He also urged the roadmasters to take more interest in public affairs affecting the railways and to use their influence against adverse legislation.

W. C. Kidd, secretary of the Track Supply Association; E. M. Fisher, president-elect of the Track Supply Association; P. J. McAndrews, president-elect of the Roadmasters' Association, and past president A. M. Clough of the Roadmasters' Association also spoke briefly on various phases of their organizations.

CLOSING BUSINESS

The selection of a location for the 1915 convention aroused considerable discussion between the advocates of Chicago and New York. The vote was so close that on the first ballot, when St. Louis was also being considered, New York stood one vote ahead of Chicago, but did not have a majority. A second ballot from which St. Louis was dropped, showed a slight majority for Chicago. It was then proposed that the selection of Chicago be made unanimous and a motion to that effect was carried. It was decided to hold the next convention the second week in September, 1915, convening on Tuesday, September 14.

The election of officers resulted in the choice of the following: President, P. J. McAndrews (C. & N. W.), Belle Plaine, Ia.; first vice-president, Coleman King (Long Island), Jamaica, N. Y.; second vice-president, M. Burke (C. M. & St. P.), Chicago; secretary and treasurer, L. C. Ryan (C. & N. W.), Sterling, Ill.; W. H. Kofmehl (C. M. & St. P.), Elgin, Ill., was elected a member of the executive committee for the full term of three years, and A. Grills (G. T.), St. Thomas, Ont., was elected to fill the vacancy on the executive committee caused by the election of Mr. McAndrews to the presidency.

P. J. McAndrews (C. & N. W.) suggested that it might be wise to publish in the form of a manual of recommended practice, a resume of the important action taken by the association at recent conventions and after a short discussion, a motion was passed to request the executive committee to consider this matter and act if it is deemed advisable.

TRACK SUPPLY ASSOCIATION

The meeting of the Track Supply Association held in connection with the convention showed that organization to be in a flourishing condition. The officers for the past year have been: President, Walter H. Allen, Pennsylvania Steel Company; vice-president, E. M. Fisher, Fairbanks, Morse & Co.; secretary-treasurer, W. C. Kidd, Ramapo Iron Works, and members of the executive committee, Henry Fisher, Verona Tool Works, and L. P. Shanahan, American Steel & Wire Company. The exhibit in the corridors of the hotel was larger than ever and as in the past, was exclusively an exhibit of track appliances.

At the annual meeting held on September 10, the following officers were elected for the ensuing year: President, E. M. Fisher, Fairbanks, Morse & Co.; vice-president, F. A. Preston, P. & M. Company; secretary-treasurer, W. C. Kidd, Ramapo Iron Works; director for one year, L. P. Shanahan, American Steel & Wire Co.; director for two years, R. A. Van Houten, Sellers Manufacturing Company.

EXHIBITS

The following companies had exhibits at the convention.

Ajax Rail Anchor Company, Chicago.—Double grip rail anchor. Represented by H. C. Elfborg.

American Guard Rail Fastener Company, Philadelphia, Pa.—Vaughan guard rail clamp. Represented by David L. Vaughan.

American Hoist & Derrick Company, St. Paul, Minn.—Transparency and photographs illustrating American railroad ditcher. Represented by Edward Coleman and C. C. Austin.

American Steel & Wire Company, Chicago.—Steel fencing, posts and gates. Represented by L. P. Shanahan, C. J. Boon, J. F. Alexander and J. W. Collins.

American Valve & Meter Company, The, Cincinnati, Ohio.—Anderson interlocking switch stand and safety switch lock, quick repair and economy switch stands. Represented by F. C. Anderson and J. T. McGarry.

Buda Company, The, Chicago.—Motor cars, switch stands, grinders, jacks and drills. Represented by G. J. Slibeck and Emil Johnson.

Carnegie Steel Company, Pittsburgh, Pa.—M-28 insulated and non-insulated steel ties, various sections of Duquesne bars and Braddock insulated rail joints. Represented by Robert Coe.

Commercial Acetylene Railway Light & Signal Company, New York City.—Acetylene flash light signal lighting and acetylene signal lightng. Represented by H. G. Doran.

Creepcheck Company, The, New York City.—Dinklage Creepcheck rail anchor. Represented by O. Metcalf, John R. C. Long and M. S. Schmalholz.

Crerar, Adams & Co., Chicago.—Calumet track drill, Eureka bonding drill, carbic light, Mac-it set screws, enameled signs, jacks. Represented by Russell Wallace, W. J. Clock, J. A. Martin and G. D. Bassett.

Daniels Safety Device Company, Chicago.—Bull dog nut. Represented by C. W. Rhoades and B. E. Dettman.

Duff Manufacturing Company, The, Pittsburgh, Pa.—Jacks. Represented by C. W. Thulin and G. A. Edgin.

Fairbanks, Morse & Co., Chicago.—Kerosene and gasoline motor cars. Represented by E. M. Fisher, L. H. Matthews, E. C. Golladay, F. M. Condit and A. A. Taylor.

Fairmont Machine Company, Fairmont, Minn.—Fairmont engines. Represented by F. E. Wade and H. E. Wade.

Frictionless Rail, Boston, Mass.—Frictionless rail. Represented by T. F. Dwyer, Jr., and Geo. H. Bryant.

Gosso Company, The, Chicago.—The Gosso bed. Represented by A. E. Gosso and T. J. Burke.

Hatfield Rail Joint Company, New York City.—Hatfield rail joint. Represented by T. B. Bowman and C. P. Williams.

Hayes Track Appliance Company, Richmond, Ind.—Hayes derails. Represented by S. W. Hayes, E. L. Ruby and E. W. Brown.

Heller Forge Works, East St. Louis, Ill.—Holdfast guard rail connector, R. S. A. switch stand. Represented by C. T. Coates and W. J. Webb.

Hubbard & Co., Pittsburgh, Pa.—Track tools. Represented by Edward Youngquist.

Indianapolis Switch & Frog Company, Springfield, Ohio.—The Eymon continuous crossing. Represented by E. C. Price, James H. Eymon and W. E. Harkness.

Kelly-Derby Company, Chicago.—Combination rail brace and tie plate, rail laying machine. Represented by C. W. Kelly and W. B. Holcomb.

Keystone Grinder Manufacturing Company, Pittsburgh, Pa.—Keystone tool grinders and attachments. Represented by H. C. Holloway.

Lackawanna Steel Company, Buffalo, N. Y.—Lackawanna hook shoulder tie plate, Abbott rail joint plate, spikes and bolts. Represented by C. H. Hobbs, F. E. Abbott and A. H. Weston.

Madden Company, The, Chicago.—Three-man track layer, Brown rail loader. Represented by T. D. Crowley and H. C. Holloway.

Morden Frog & Crossing Works, Chicago.—Guard rail clamps, rail braces, compromise joints. Represented by Arthur C. Smith, W. J. Morton and W. H. Hartz.

Mudge & Co., Chicago.—Motor cars. Represented by B. W. Mudge, R. D. Sinclair and George W. Bender.

National Lock Washer Company, The, Chicago.—Hi-power nut locks. Represented by John B. Seymour, Jesse Hough and John T. Patterson.

National Malleable Castings Company, The, Cleveland, Ohio.—Rail braces, tie plates, wrecking hooks and washers. Represented by J. J. Byers.

Northwestern Motor Company, Eau Claire, Wis.—Casey Jones engines. Represented by R. R. Rosholt and F. W. Anderson.

P. & M. Company, The, Chicago.—P. & M. rail anchors. Represented by P. W. Moore, F. A. Preston, A. R. Sutter, W. W. Glosser, S. M. Clancey, George E. Johnson and R. Harris.

Pennsylvania Steel Company, The, Steelton, Pa.—New Century switch stands, steel and positive switch stands, Never-Turn bolts, Mayari shovels. Represented by W. H. Allen and Stanley H. Smith.

Pittsburgh Steel Company, Pittsburgh, Pa.—Wire fencing, nails, staples and barbed wire. Represented by W. Sidney Lewis and H. C. Woodside.

Pocket List of Railroad Officials.—Copies of publication. Represented by J. Alexander Brown and Charles L. Dinsmore.

Positive Rail Anchor Company, Louisville, Ky.—Positive rail anchors, Betts anti-creeper tie plate, Economy switch points. Represented by W. M. Mitchell, W. E. Marbel, J. A. Shoulty, John C. Haswell and Charles J. Webb.

Prince-Groff Company, The, New York City.—Wedglock track drills, Kwik-grip wrenches, Pressurlokd water gage systems. Represented by Sherman W. Prince and C. B. Groff.

Q & C Company, The, New York City.—Vaughan rail anchor, Bonzano rail joint, O'Brien insulated joint, Q & C special guard rail clamp. Represented by J. V. Westcott, E. M. Smith, A. R. Horn and A. E. Stokes.

Rail Joint Company, The, New York City.—Weber, Continuous, Walhaupter and 100 per cent rail joints, reinforced angle bars. Represented by E. A. Condit, D. C. Isbester, R. W. Smith, W. C. Boyce, Chas. Jenkinson, C. B. Griffin, G. T. Willard and G. H. Larson.

Railroad Supply Company, The, Chicago.—Tie plates and derailers. Represented by A. H. Smith and H. G. Van Nostrand.

Railway Age Gazette.—Copies of publication. Represented by E. T. Howson, H. H. Simmons, K. L. Van Auken and Walter M. Ford.

Railway List Company.—Copies of publication. Represented by William E. Magraw, W. A. D. Short and Dalton Risley.

Ramapo Iron Works, Hillburn, N. Y.—Solid rolled double shouldered switch slide plate, manganese switch points, automatic switch stands. Represented by W. C. Kidd, Thos. E. Akers, A. Germunder, Denby Germunder and E. P. Bigelow.

Reading Specialties Company, Reading, Pa.—Rail straightener, reversible rail bender, guard rail clamps, rail joints, compromise step joint, trolley car rerailer, car replacers. Represented by B. J. Buell, F. G. Dunbar and George W. Sargent.

Sellers Manufacturing Company, Chicago.—Tie plates. Represented by R. A. Van Houten, G. M. Hogan and T. F. Geraghty.

Southern Railway Supply Company, St. Louis, Mo.—Saunders car stopper, Whitman & Barnes tools. Represented by Dick Achuff.

Spencer Otis Company, Chicago.—Tiger steel bunks, absolute lock nuts, Economy tie plates. Represented by T. W. Blatchford, H. H. Hart and W. L. Doremer.

Suggitt, J., Minneapolis, Minn.—Reversible side guard plow. Represented by J. Suggitt.

Templeton, Kerly & Co., Ltd., Chicago.—Simplex jacks. Represented by A. E. Barron, W. B. Templeton and Arthur Lewis.

Union Switch & Signal Company, Swissvale, Pa.—Keystone insulated rail joints. Represented by J. J. Cozzens.

Verona Tool Works, Pittsburgh, Pa.—Track tools, nut locks, levels, gages and jacks. Represented by H. Fisher, E. Wooding and Howard C. Mull.

Wharton, Wm., Jr., & Co., Inc., Philadelphia, Pa.—O'Brien insulated switch rod, guard rail clamps, switch stands, car placers. Represented by Thos. O'Brien and George R. Lyman.

ABSTRACT OF ENGINEERING ARTICLES

The following articles of special interest to engineers and maintenance of way men, and to which readers of this section may wish to refer, have appeared in the *Railway Age Gazette* since August 21, 1914:

The Present Status of Clearance Legislation.—A discussion of existing conditions as to side and vertical clearances, a review of the legislation in force on this subject, and a study of the need for more legislation of this kind, was published in the issue of August 28, page 377. The article showed that only 1.4 per cent of all deaths and only 3.2 per cent of fatalities to employees resulted from limited clearances and that accidents of this kind have decreased 33 per cent in the past five years.

New Shop Building Construction on Sunset Central Lines.—The construction of several shop buildings by the Sunset Central Lines at Houston, Tex., entirely of reinforced concrete and including 65-ft. roof girder spans, which are thought to be the longest ever attempted in shop building work, was described in an illustrated article in the issue of August 28, page 394.

The Re-arrangement of the M. K. & T. Freight House, St. Louis.—A description of the changes which have been made since the use of the telpher system was discontinued in order to fit the house for operation by the drop truck system on two levels, was described and illustrated in the issue of September 4, page 433. An editorial comment calling attention to the value of the experiment on mechanical apparatus for handling freight at this point, was published in the same issue, page 417.

Pennsylvania Improvements in Cleveland.—The structures and methods used in elevating about 2¼ miles of the Pennsylvania's line in a densely settled portion of Cleveland and the construction of a new freight station and improvements to the Euclid avenue passenger station, were described in the issue of September 4, page 438.

Division of Maintenance of Way Expenses Between Passenger and Freight Traffic.—The difficulty of dividing maintenance of way expenses as tentatively outlined by the Interstate Commerce Commission and some of the units that might be taken as a basis for such a division were discussed editorially in the issue of September 11, page 458.

The Erection Equipment for the Quebec Bridge.—A description of the method adopted for the erection of the new Quebec bridge with its 1,800-ft. span and the details of the unusual traveler which was built for this purpose, was published in the issue of September 11, page 463.

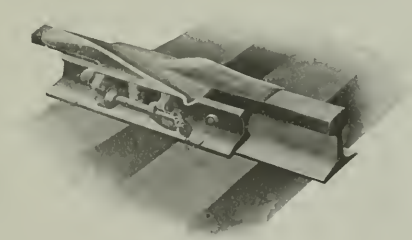
THE SUPERIOR DERAILER

The Superior derailer consists essentially of a main casting and two eyebolts, one of which has an enlarged head to permit a locking pin to pass through it, to which a padlock may be fastened. This derailer is designed for either hand throwing, or for connection with an interlocking tower. To apply this derail, it is only necessary to remove the two center bolts of any rail joint, and to substitute therefor the two eyebolts furnished

Derailer in an Open Position

with the derail. A shaft is inserted through these eyebolts on which the main casting hinges. Thus the device can be applied readily in a very few minutes' time.

In one of the accompanying illustrations the derailer is shown open, in which position it clears standard snow flangers and low hanging equipment, while it does not permit the packing of snow. The other illustration shows the derailer in position for



Derailer in Position for Service

service, from which it can be seen that it permits of cars trailing backwards over it without derailing the car, while it is stated that tests have shown that it would derail empty freight cars moving forward at a speed of 30 miles per hour. This derailer may be attached to any standard interlocking switch stand, ground target, or other device that the signal or maintenance department may require. It is manufactured and sold by the Track Specialties Company, New York.

Rebuilding a Pontoon Bridge on the St. Paul

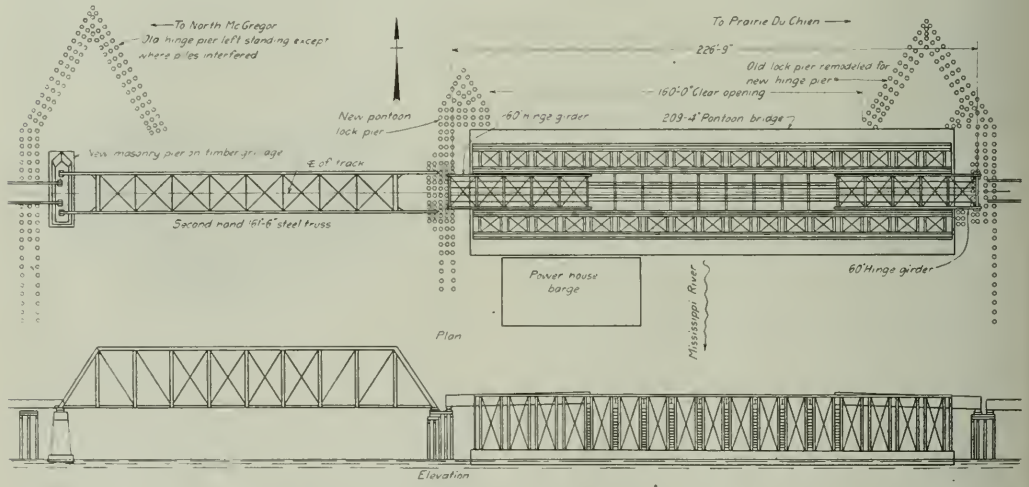
This Road Has Recently Completed a 209-ft. Span of This Unusual Type at Prairie du Chien, Wis.

One of the few roads on which the timber pontoon bridge is still used is the Chicago, Milwaukee & St. Paul, where four are in service—two crossing the east and west channels of the Mississippi river between Prairie du Chien, Wis., and North McGregor, Iowa, one crossing the Mississippi river at Wabasha, Minn., and one on the Missouri river at Chamberlain, N. Dak. The one over the east channel of the Mississippi river at Prairie du Chien, Wis., has been entirely renewed during the past year and was swung into place on August 2, while it is expected that work will be undertaken in the near future on the reconstruction of the pontoon across the west, or North McGregor channel. The deterioration of the old structure and the increasing weight of motive power made this work necessary. The new structure is designed for Cooper's E-50 loading, and in addition to allowing the operation of heavier motive power, it is an interesting example of modern design in this unusual form of construction.

Pontoon bridges have been used at this point ever since the line was first opened for operation over 60 years ago. When it became necessary to renew the structure at this time it was decided to rebuild it in kind, principally because of the heavy expenditure which would be involved in the construction of a steel bridge and in the raise in grade which would be required with the construction of a permanent structure since the extreme high water level is at practically the elevation of the present base of rail.

The present structure consists of a pontoon span across each channel with a pile trestle on an island between them and at each end. To offset the smaller first cost, this type of structure possesses several disadvantages. In the first place the maintenance cost of a timber structure is high, the life of the untreated timber pontoons previously used being only about 15 years. With the treated timber employed in the new structure a considerably longer life is expected. The cost of operation is also high. On the old pontoon two men were required day and night, while in the winter it was necessary to keep the ice cut away from the hull to prevent it being damaged. Also in the spring when the ice is moving and at times of extreme high water, it becomes necessary to swing the pontoon open for periods ranging from a few hours to two or three days at a time, requiring all traffic to be diverted via La Crosse, Wis., 60 miles north, or Savanna, Ill., 100 miles south. With the network of lines in this vicinity, however, much of the traffic normally crossing the river at this point can be diverted with little increase in mileage.

Preliminary to the renewal of this pontoon, permission was secured from the United States government to reduce the length of the span from 396 ft. to 209 ft. since the rafts which formerly comprised the main traffic through the east channel have now disappeared and the movements consist mainly of launches and small steam boats, the larger passenger boats using the west channel. As a part of the reconstruction a 160-ft. through truss was added to span the interval between the west piers of the new and old pontoons, enabling small boats to pass under this span at ordinary stages of the water without swinging the pontoon.



Plan and Elevation of Pontoon Bridge at Prairie du Chien, Wis.

The hull of the new pontoon is 209 ft. 4 in. long, 55 ft. wide and 6 ft. 3 in. deep from the bottom of the sheathing to the top of the deck at the center. It is built of creosoted material and is sheathed with 4-in. planks. As far as possible all material was framed before treatment and wherever cut or bored in the field, the exposed surfaces were painted with Carbolineum. The deck is also of 4-in. planking and is provided with three inspection and eight ventilating hatches, each 20 in. by 30 in. in size. The hull is braced laterally by 2-in. rods extending from the bottom to the deck, while it is divided longitudinally into six compartments by five bulkheads constructed of 8-in. timber.

The track structure is carried on 10 steel floor-beams spaced 12 ft. center to center and a 60-ft. steel approach girder span at each end. These floor beams are supported on blocks and are moved vertically between four guide posts at each end to maintain the tracks at a uniform elevation with varying stages of the river. These guide posts form the vertical posts of two of the four longitudinal trusses extending the full length of the pontoon. These trusses are spaced 9 ft. 2 in. and 19 ft. 2 in., respectively, from the center line of the barge and are designed to give it stability. The vertical members of these trusses con-

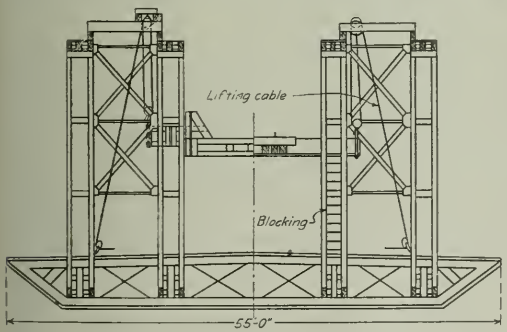
sist of four posts spaced 2 ft. between centers and connected by 2-in. inclined truss rods. The two trusses on each side of the center are also connected by inclined timber cross bracing and 1¾-in. diameter horizontal truss rods.

The floor beams rest directly on the blocking in the center group of posts. The amount of blocking inserted depends upon the stage of water, a maximum variation of 18 ft. being permitted in these guides As the greatest known variation between high and low water elevation is 22.5 ft., extreme high water conditions, which are encountered only at considerable intervals, are met by raising the tracks on the approach trestles at each end.

The floor beams are provided with hooks at each end to which

The Pontoon Nearing Completion Previous to Launching

are attached cables running over sheaves in the tops of the guide posts and then to a drum in the machinery boat. When it is necessary to raise or lower the track the floor beams are raised one at a time and blocking is inserted or removed as desired. The minimum depth of block used is 7 in., minor variations in water level being taken care of by the approach girders. About one hour is required to raise or lower the track. The approach girders are supported on ordinary steel shoes and nests of rollers resting on pile abutments at each end of the bridge and on cross girders carried on blocking on the pontoon.



Cross Section of Prairie du Chien Pontoon

These cross girders are raised and lowered in the same manner as the floor beams The track is given a camber of 8 in. when the pontoon is unloaded. Three stringers are provided under each rail with the ties resting directly on the stringers. Miter joints are inserted in the rails at each end of the pontoon, and they are raised before the bridge is swung.

The new pontoon is hinged at the east end. Its movement is controlled by a chain anchored to a pile buried in the bed of the river 100 ft. north of the fender piling at the free end of the bridge and also to a second pile cluster near the location of the swinging end of the pontoon in its open position. This movement is regulated by passing this chain over a sprocket wheel in the machinery boat, which is attached to the free end of the pontoon and swings with it. Under normal conditions the current is sufficient to swing the span open, while it is pulled back to its closed position by the engine on the machinery boat. Each end of the pontoon is protected by a pile fender, leaving a clear channel of 160 ft. Between 3 and 4 min. are required to open and close the span.

An average of about 10 trains cross this bridge daily. Flags are set in each direction before the bridge is opened, while all trains are required to stop and wait for a hand signal from the attendant before coming onto the pontoon. The maximum speed of trains is set at 10 miles an hour.

The hull was launched on May 22, 1914, after which the superstructure and lifting apparatus were applied. As stated above, it was floated into position on August 2. To reduce the inter-

View From Deck of Pontoon Looking Up Under the Track

ference with the operated lines to a minimum while placing the new pontoon in position, a detour trestle was built 38 ft. downstream from the permanent location and the old pontoon was floated to this offset line in January, 1913. Traffic was then directed to this line while the new pile abutment for the girder span and the concrete abutment at the west end of the steel spars were built. Permission was secured from the government to close this channel for four days while placing the new pontoon. It was started from its location on the bank ¼ mile above the bridge at 5 a. m., and the first train was run over at 4 o'clock in the afternoon of the same day. Shortly after the pontoon was connected up so that it could be opened for river traffic.

This structure was designed and built under the direction of C. F. Loweth, chief engineer, and J. H. Prior, formerly engineer of design. It was built and floated into position by company forces under the direction of Chas. Lapham, district engineer, and A. A. Wolf, district carpenter

---

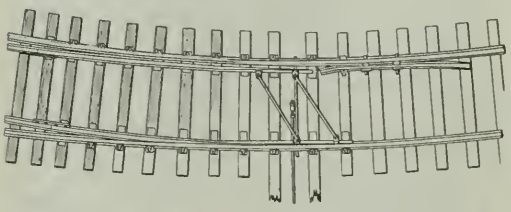
South American Railway Construction Company's Lines in Brazil.—A total of 471 miles of railway controlled by the South American Railway Construction Company is now in operation in Brazil. The company is building 29 miles on the line from Fortaleza to Macapa, three miles on the branch from Ico, 31 miles from Fortaleza to Itapipoca, 21 miles on the line from Camocim to Therezina, and 12 miles from Amaracao to Campo Naior, a total of 96 miles now under construction. In addition the company plans to build 709 miles of approved proposed line.

STAGGERED SWITCH POINTS FOR SPECIAL SERVICE

By W. F. Rench
Supervisor, Pennsylvania Railroad, Perryville, Md.

Considerable economy is effected in the wear of switch points in yards at points where the service is extreme by moving the point of lesser wear back a distance of 26 in., so that the first lug of the one point and the second lug of the other are opposite, and introducing a guard rail 9 or 10 ft. long curved sharply through 12 in. at the end which covers the switch and in the standard manner at the other end. The guard rail is set close to the one point which permits 12 in. of 2 in. flangeway opposite the longer point. This greatly increases the life of the point and is an excellent protection against derailment as well. One set of lugs must be connected with the standard head rod and for entire safety each lug should be connected with the one diagonally opposite. If made on a standard plan these rods may be of regulation design, but if resort must be had to makeshift designs a flat made rod of 2½ in. by ½ in. material is quite satisfactory. Care should be taken that the guard rail, which is subject to a severe strain, is braced by anchor clamps and at least one tie plate guard rail fastener.

This arrangement has been used in a number of places



Sketch Showing Arrangement of Staggered Switch Points On a Curve of Heavy Wear

where the wear is severe, but perhaps in none where the conditions are as extreme as at two switches in the Midvale Branch, a siding leading to the Pennsylvania's Nicetown (Philadelphia) freight station, and to the plant of the Midvale Steel Company. These two switches follow each other closely and spring from the inside of a 17-deg. curve. Approximately 30 movements are made over these switches every day.

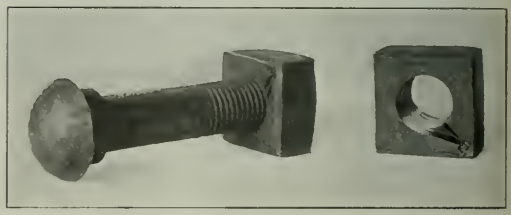
At each one of the switches the high side point, applied new of P. R. R. 100-lb. material, formerly lasted just two months, it being a matter of actual knowledge that 12 switch points were consumed in the two places within a period of one year. Besides, it was the rule for a derailment to herald the time for renewal which by reason of the difficulties of access to this location usually involved an expense for the wrecking and repair of equipment equal to the value of a new point. It is three years since the points now in track, which were then close to the limit of safe wear, were cut back and the guard rails applied and it is quite probable the points will still last two years longer. At this one location 60 switch points will have been saved in a period of five years, which represents at least $1,200 in money. As derailments have ceased there is the further saving along that line. It is doubtful if any single device or method in switch work is capable of effecting one-tenth the saving in expense of maintenance as the one herein described and illustrated in detail in the accompanying cut.

Safety First for Railroad Crossings.—At a certain particularly dangerous crossing on the Central Vermont the following significant sign has been erected: "Danger! This railroad crossing is a well designed death trap and is a disgrace to the state of Connecticut."

A NEW LOCK NUT

The "bulldog" lock nut has recently been placed on the market by the Daniels Safety Device Company, Chicago, and a number of railroads have given the new nut a thorough test. The design of this lock nut eliminates washers and separate nuts, the locking feature being secured by the insertion of a small piece of tempered steel into the face of an ordinary nut, as shown in the accompanying photograph. This pawl is set at such an angle that it will slide freely over the bolt threads when the nut is turned on, but when an attempt is made to reverse the nut the sharp edge of the pawl immediately cuts into the threads and effectually locks the nut against loosening. A variation of 1/32 in. in the diameter of the bolt thread does not interfere with this action of the nut. In case of the wearing away of the surface or of the stretching of the bolt the nut can be turned on further and will lock itself in the new position as effectively as when first applied, and it is claimed that in locations where the bolt is subject to vibration the lock nut will tend to tighten itself. The nut can also be made with the pawl on the outside or on the crown in order to make it possible to unlock it with a nail or wedge.

The principal advantages claimed for the new nut are that it saves in the length of bolt as compared with devices using two



The "Bulldog" Lock Nut

nuts, a cotter pin or washer, in the cost and the labor and inconvenience of applying such extra devices. It is impossible to put the bolt on the wrong way, as the locking pawl prevents its being turned in the wrong direction. When once started onto the bolt the "bulldog" nut cannot be removed after two threads of the bolt have been engaged.

The Chicago, Milwaukee & St. Paul put 26 of these nuts on bolts in frogs and joints in its Western avenue coach yard, Chicago, in December, 1913, which up to the present time have given very satisfactory service. The Chicago & Western Indiana equipped a crossing at Burnside, Ill., with the new nuts in March, 1914. It has been necessary to tighten these nuts once on account of the expansion of the bolts, but since the application of the new nuts no bolts have been broken, which is attributed to the fact that the nuts keep all of the bolts uniformly tight, making each take its share of the strain. Other roads that have test installations of the new bolts include the Elgin, Joliet & Eastern, the Chicago Great Western, the Chicago & Eastern Illinois and the Illinois Central.

An English Railway Storekeepers' Association.—A railway stores superintendents' association has recently been formed representing practically the whole of the railways of Great Britain and Ireland. The objects of the association are defined as follows: The promotion of the interests of railway companies in matters connected with the purchase and storage of material by (a) confidential interchange of information concerning markets, conditions of purchase, etc.; (b) the reading and discussion of papers on matters connected with the purchase, manufacture, sale, storage and distribution of material.

New Railway in Morocco.—The Spanish government has entered into a contract to build a railway from Tangier to Fez, Morocco.

The Handling of New and Scrap Maintenance Materials

The Second Series of Papers Discussing This Important Problem from the Standpoint of the User

THE SYSTEMATIC USE OF MATERIAL

By J. P. Costello

Roadmaster, Atchison, Topeka & Santa Fe, Pueblo, Colo.

I consider the distribution of new material with intelligent discrimination the most important item in a discussion of the handling of track material—not the restriction of distribution. When material is needed it is usually needed at once. Delays are always expensive and to have made plans which cannot be carried out, due to lack of material, is expensive not only to the job in view, but to other work which is being done pending the receipt of the material required.

In nearly all discussions which I have heard or read relative to the unnecessary holding of materials, the division engineer, roadmaster, supervisor or foreman is the one to whom the lectures have been addressed. Are these people always to blame? On nearly every division of every railroad there is to be found some piece of good material not in use which is being held to take care of some emergency which the store department is not able to handle with celerity. I have always found it advantageous to have on hand one left hand and one right hand standard main track frog. This, I know, is contrary to established "best practice." However, by so doing I can usually take care of a broken frog in one-third the time required by the storehouse. I *do not* think that every roadmaster should hold two emergency frogs—I *do* think that the store department should be able to deliver a frog so expeditiously, in case of emergency, that there would be no necessity of the roadmaster having them on hand. Aside from the handicap of a necessarily small stock, I have found greater efficiency in the division storehouse than in the large centralized storehouse.

Another thing which encourages the collection of unused material is the requirement, on many roads, that foremen must make their requisitions a month in advance of the receipt of the material. This causes the foremen to try "to be sure to have enough stuff to work with." Since the conditions of track work are variable and the right kind of foremen are naturally interested in having sufficient material to make the work progress, it seems to be asking too much of the foremen to expect them to foresee needs so far in advance? Why not cut this time down to about a week? If the store department takes three weeks to fill a requisition, then it is guilty of holding material too. Requisitions for certain materials, of which tie plates have been a striking example, have been held up from month to month until an accumulation sufficient for a mill order has been received and then the material comes in a deluge and quite likely at a time of the year when, on account of the other work, it is impracticable to use it.

In maintenance work there are many jobs, the accomplishment of which can be set for a certain date. For instance, bolts should be tightened in the spring and fall. Tie plating of curves can be done in winter. Replanking of road crossings can be done in the spring and fall. A complete job of tightening will require many renewals. Repairs to road crossings will require many new planks. Likewise tie plating requires a lot of necessary material. If jobs of this kind were set for a certain time, then unusually heavy requisitions about this time should be expected and at other times the minimum amount of material for this work should be on hand. I believe if I were engineer of maintenance of way or the corresponding official of a railroad I would set a certain time in the spring and also in the fall when every bolt in the main track should be tightened. I would see that sufficient new bolts were furnished. I would further see that no special job encroached on the allotted time. After that time any foreman, other than a yard foreman, who had more than a hatful of bolts would be subject to discipline. Jobs which can be timed can be handled satisfactorily both from the labor and material standpoint.

A proper balance should be maintained between material ordered and the amount of help allowed to use that material. A man may order a lot of material with the best intentions in the world, but due to a reduction in force it may be impossible to apply that material. Managements of various railroads do not object so much to new material in use as they do to unused new material. If the wastefulness of unused new material is to be measured by the loss of income which the capitalized value of this material would produce, then in the force allowance due regard should be given to the supplying of sufficient help to utilize this material.

Section foremen should gather up daily all scrap that comes to hand easily, but should not go to extraordinary pains to get it all unless the work being done is of such a nature that the scrap might be lost. A systematic "clean up" should be made about four times a year and the resulting scrap should be loaded. Foremen should be furnished full instructions as to the sorting of old material, so that various kinds can be loaded in separate cars eliminating further sorting. If a sorting or reclamation yard is maintained and all "pick up" material is sent there, it will be more economical to simply load all the stuff indiscriminately on cars and depend on the reclamation yards for sorting.

Much second-hand material is as good as new and such reclaimed articles should by all means be used. However, when a piece of material is used, it is certainly the intention to improve conditions, and the use of certain pieces of second-hand material is not consistent with the improvement desired or in keeping with the other material being used on the job. Considering the desired improvement, the cost of application, and the longer life of new material, the scrap value of the second-hand material would offset the saving of using it in preference to the new. I once worked for a railroad that was so parsimonious in furnishing spikes that about 90 per cent of the spikes in the track were "cutthroats." This is not economy.

Repairs to tools and material is an item of great importance. To be able to secure tools, which, though second-hand, are in good shape for use is a satisfaction and a pleasure. A road which takes proper care of its tools, equipment and materials not only saves money directly but also develops a good spirit among the workmen. Tools should be repaired properly and when the repairing is done on a large scale the quality of the work should receive more consideration than the amount of the output. Where a divisional repair shop is maintained each foreman should receive the same tools which he sent in for repairs. Of course where a large centralized plant is maintained this might not be practicable.

Credit should be given a division for tools or material sent to reclamation plants and this should be done with fairness so that there would be no necessity for making extensive checks and accounting of material, except at the plant. When a shipment is made figures should be furnished to the officers instrumental in the reclamation so that they would have the satisfaction of knowing the result of their efforts to save.

Measuring up scrap material merely to satisfy accounting purposes is useless and extravagant. When a rail is taken out of a side track because it is no good, it is scrap, and then the weight and not the lineal measurement is of interest. Definite but simple methods in the handling of scrap material should be adopted. It is unfortunate that railroads either have no definite methods of handling scrap and accounting for it or else the methods are so elaborate that they are not understood by all interested.

True economy in the handling of materials will depend more

upon the education of the foremen who have the direct handling than upon any other feature. This means the retaining of men in service long enough for them to learn the road's methods and to apply them.

The supervision of an engineer of maintenance of way or a general superintendent is necessarily superficial, hence the curtailing of requisitions by him must be to a certain extent arbitrary unless allowances are standardized. The adoption of a standard allowance of tools and materials for ordinary work is practical. The reason why it has failed has been not so much the fault of the foremen as the fault of the officers who should have allowed the tools. It is argued against the adoption of a standard list of tools that the size of the gang varies, hence, in order to have enough tools for a heavy section force we would have, at times, unused tools on hand. These unused tools comprise principally just picks and shovels, and picks and shovels are too cheap to interfere with a good system. I believe there are enough fair-minded roadmasters on any road to choose a standard allowance of tools.

Expeditious handling of requisitions, prompt deliveries of supplies, good repair work handled promptly, consideration as to the timeliness of certain work, education for foremen and others, standardization of tool allowances, figures showing in dollars and cents the extent of any reclamation project—these are things that will aid in the economic and satisfactory handling of materials.

A SYSTEM FOR THE DISTRIBUTION OF MATERIAL

By D. F. Stevens

Baltimore & Ohio, Baltimore, Md.

The reason men carry an oversupply of material is due primarily to the indiscriminate manner in which requisitions are "chopped." On one road this important item is turned over to a $25 clerk, unfamiliar with the road, the men or their various requisites. The usual procedure, when the operating head finds material is going up over last year's figures, is to get out a letter on the subject. This letter is repeated until every one is imbued with the idea of using just as little material as possible. The "ultimate consumer" then puts in a requisition for exactly the amount of material he can get through the month on. Every official from yardmaster or track supervisor up through all the various steps to the head of the department takes a whack at it, and when the material is eventually delivered to the man who ordered it, it reminds him of a 100 lb. piece of ice left out in the sun for hours in July, and next month he orders four times what he needs to allow for the cuts. A freight conductor once ordered two markers for his caboose and was surprised and amused to find that somewhere it had been cut to one. They might just as well have laid the main line with one rail instead of two.

The following system is based on divisional stores. The general storekeeper orders his material through the purchasing agent, who in turn has it shipped direct from the factory to the divisional stores and thus avoids extra handling. The individual requisitions are assembled in the division superintendent's office and, after being approved by him, are forwarded direct to the division storekeeper. On each division is a supply car which moves once a month over the division on the way freights. On the receipt of the requisitions the supply cars are loaded with each order and a triplicate blank filled out for each requisition. Before the trip is started all material in the cars are charged to the supply men, who go with the cars. The necessary empty scrap cars are carried with these loaded cars. An advance notice is sent out on the division outlining the movement of the cars. All scrap is located so it can be loaded where the good material is unloaded.

On arrival at a station, yard, section house, etc., the cars are met by the man receiving the supplies. At this point comes the secret of success of the plan. He is required to turn into the supply cars, scrap, second-hand or first class material for every piece of new material he receives, except in the case of waste, matches and other material of this nature. Only under this condition does he receive any material from the cars. Should a new tool be needed for which there is no old material to be turned in, the division officer directly responsible must personally sign the requisition and explain the necessity. When the cars arrive back at the stores, the man who accompanied the cars and distributed the material is obliged to check back an equal amount of scrap, second-hand or new material for every article he took out of the stores except in the case of matches, etc. The superintendent of the division assigns a trainmaster, chief despatcher, track supervisor or other officer to accompany the cars each month.

The success of this system is apparent. It teaches men to be economical with the material entrusted to their charge; it puts back into service first class material not applicable and second-hand material which is repaired and put back into stores; it collects scrap regularly to a common point which is sold and keeps the railroad from being cluttered up with a lot of material which takes up room, looks bad and goes to help swell the grand total of non-revenue producing investment. No cutting of requisitions is necessary here and an opoprtunity is afforded the division superintendent each month to check the supplies on his division. Old brooms eke out the last of their lives on engine decks or sweeping snow out of switches. Shovels are straightened up, track chisels are sharpened, lantern frames adjusted and all go back into service again, except the scrap. A 40 per cent saving can be effected in six months.

There are cases where the size of the division will not permit the supply of cars to be handled on the way freights and here a supply train is run, but the distribution is accomplished in half the time. When this system is installed for the first time it should be preceded by a general clean up of scrap. One year of this system cleaned up $380,000 worth of scrap material. This figure is net and not original cost.

LOCAL SUPERVISION IN THE DISTRIBUTION OF NEW MATERIAL AND THE COLLECTION OF SCRAP

By R. B. Abbott

Division Engineer, Philadelphia & Reading, Harrisburg, Pa.

For a number of years it has been the practice on our road to keep the emergency and maintenance supplies down to the lowest point consistent with safety and good judgment as to the probable requirements. As an aid to this plan, a monthly statement is prepared showing the material on hand as referred to an established basis of requirements determined jointly by the material and supplies department and the engineer maintenance of way. As this statement is itemized and worked up into money values, a very satisfactory check is afforded on the subsequent requisitions and it is very easy to see at a glance just where oversupply exists and how the excess can be distributed and interchanged.

Supplementary storehouses are located at each supervisor's headquarters and this prevents to a great extent the duplication and multiplication that would exist if the materials were shipped from the general storehouse direct to the foremen out along the line. Some extra handling is of course caused at the supervisor's storehouse, but this is many times offset by the saving in quantities.

The only materials sent direct to the foremen are oil and battery renewals. New rails and fittings are usually unloaded as soon after receipt as possible and distributed direct from the cars to the point where renewals are to be made. This saves double handling of heavy material and permits a prompt release of the cars. A monthly report is submitted showing the mill rail and relaying rail on hand for sale or interchange and orders for shipment are usually given first place on the work train schedule.

Years ago the loading of miscellaneous scrap was dependent on the market price of such material and much delay in cleaning up was occasioned by long waiting for orders to load and ship. Our plan is now, however, to load once a month regardless of

market conditions and send the scrap to the general storehouse where it is picked over and properly arranged for disposition. Much waste is checked in this way as the reclaim is considerable.

The assembling and loading of scrap is too often neglected, as it is work that does not appear important to the section foremen and they are usually so busy at other things that the collection of scrap will be put off as long as possible. Hard and fast rules covering this can hardly be carried out, but the supervisor and division engineer should make it their business to see that a general plan is outlined and followed as rigidly as conditions permit, so that the tracks and right of way can be kept as clean as possible all the time and the money value of the scrap promptly recovered.

Section foremen should assemble the scrap at junction points of branch lines, near the entrance to yards and also at their headquarters. The points should be as few as possible to save delay to the worktrain, and each foreman should send a statement to the supervisor showing where the piles are located. On minor branch lines it is often possible to load the scrap without the assistance of a worktrain. This can be accomplished by starting a car at one end of the line and moving it along by local freight, setting it off at each section foreman's headquarters and forwarding it along in turn as the scrap is loaded.

The method to be followed is variable and must be selected to suit the different conditions, but I think it will be generally conceded that the greatest difficulty lies in the fact that section foremen do not appreciate the importance of gathering their scrap and must be stirred up occasionally. This is where the supervisor enters into the scheme and the results obtained are in direct proportion to the degree of supervision maintained.

DISTRIBUTING, RECLAIMING AND COLLECTING BRIDGE MATERIAL

By F. L. Burrell

General Foreman, Bridges and Buildings, Chicago & North Western, Fremont, Neb.

Our plan is to make a careful inspection of all structures on the division, being accompanied by a representative of the engineer of maintenance, and, if possible, by the general bridge inspector or his representative. We recommend what is to be done and submit the results of our inspection to the proper department, where decision is made as to just what will be done the coming year. Schedules are written up in detail, showing what repairs, renewals or permanent work is to be done.

From these schedules we make up a bill of material required for the work shown. We then take an inventory of all the material on hand and check over the unfinished work for the current year, or period, making allowance, as emergency material, for at least one 15-span bridge. We then deduct the material required for the current and emergency work from our stock on hand and apply any surplus to the requisition for the work of the coming year.

Separate requisitions are made for the different classes of material. We ask that the piles be made in three deliveries, March 15, April 30 and May 15; also three deliveries for timbers, April 10, May 20 and July 15. Bolts and other iron should be on hand not later than May 1. Cast iron or concrete pipe for culverts, cement, crushed rock, sand and stone, for permanent work, depending upon the amount of work to be done, should be delivered not later than June 15.

As the material is received and unloaded in the yards it is checked and a daily report of all material is made at the close of the day to the office. We also receive a daily report of all material sent out. We do not send the material out until the gangs are ready for it. As the material is received, especially the piles, each piece is measured and marked as to length. Any piles that we can not use in bridges, on account of serious defects, are used for "stubbing."

Once a month an inventory is taken and checked against the in and out shipments. This method calls to our attention any surplus stock or scrap that can not be used in the work that we have to do. In spite of this care, we often have a surplus; sometimes from our own carelessness, at other times because the storekeeper will insist on sending us something "just as good," or duplicate orders.

It would, perhaps, be a good idea in making requisitions to bear in mind that a large amount of timber taken from a structure that is rebuilt can be used for other purposes as at stockyards, where no great weight is to be sustained, around scales or in similar places. About 60 per cent of timber from such bridges can be used as bulkheads; or, in very shallow openings for drains, under highway approaches at railroad crossings. About 20 per cent can be used for repairs to other bridges, and 15 per cent perhaps will have an inch or two of rot on the exposed face or under the ties and other bearings which can be trimmed off, allowing the balance of the timber to be cut into planks suitable for stockyard fences or light platforms. Five per cent will go to the wood pile, to be cut up for kindling fires in locomotives.

Short pile heads, say from 2 to 4 ft. long, or old piles removed from a renewed bridge, are used for platform supports. Sometimes they are used for stubbing piles in repairing bridges whose life has about expired; we also split and use them for fence posts. If the piles are good cedar and the fiber has not been too badly damaged in driving, they are used in making shingles. Washers and spools are used in renewing the structure. Old bolts with good threads are used for the same purpose. If the heads are broken off, we use them for drift bolts and dowels. We also cut them to shorter lengths for car repair and other work; old iron of every kind is scrapped for melting for castings, etc.

We gather this scrap from time to time by local trains if possible, and by worktrain, where locals can not be used. Before we pick up, we use all the material needed in making repairs to nearby bridges.

We attempt to eliminate obsolete material by paying close attention to our monthly check and sending such material that we may not be able to use to the shops. The clean up must be made once a month and include an inventory that will force a surplus of any material upon the attention of the official in charge.

COLLECTING MAINTENANCE SCRAP

By R. Huber

Roadmaster, Chicago, Burlington & Quincy, Brookfield, Mo.

Our system of loading and picking up scrap is as follows: All section foremen have instructions to keep scrap cleaned up on their sections at all times. Adjoining the section tool house is a bin for the assembling of all small scrap. All scrap found along the right of way is brought in at the end of each day on the car and put into this bin. Scrap rail is piled next to the bin. At the end of each month the local freight trains carry a stock car for the loading of small scrap and a flat car for the loading of scrap rail, frogs, etc. These cars are placed next to the caboose. On this day all section foremen pile the scrap near the depot, so that a couple of men —who have been left to clean up station grounds and put everything in order around the yards—can readily load this material, while the merchandise is handled at the station. This eliminates delay to the train and inconvenience to the station force. This system has proved successful, not only inasmuch as it adds no expense whatever to train service, but it requires only one day to pick up all scrap on the entire division. While trains are being made up at the division point the yard maintenance force look over the contents of this car to see if there is any material that could be used in repairs around the yards, and thus avoid ordering new material.

We use an air rail-loader for picking up our rail. Our rail is first examined and marked by the inspector in three grades, thus: I, II and III and O for scrap. We generally

have more of grade II, and this being the largest quantity, is picked up first.

It requires seven men to operate the rail-loader and aid in the loading of rail. One man handles the air and three men stay on the ground; one to handle the hook and one at each end of rail to steady it on the car. We have two men on the car, one to unfasten the hook and one to place the rail. The seventh man has general supervision of the work and gives the necessary signals, etc. We also have a car for the loading of scrap bolts and spikes, and usually employ two men in doing this work.

We have picked up as many as 700 rails in a day, but the average day's work is about 500 rails.

All the new material that is left over, such as tie plates, anglebars, bolts, etc., is loaded by one man on the rear end of the rail-loader. This keeps all new material cleaned up, thus avoiding the making of extra trips over the division to pick up such material.

When unloading new material, such as rail and fastenings, it is handled with the same worktrain. Rail is unloaded from flat cars and the car containing angle bars is unloaded by two men, who throw off one pair of anglebars with every rail. We also distribute bolts, spikes and nut locks at the same time, and when we have the rail distributed everything is in readiness for the rail laying gang to commence work.

DISTRIBUTION OF MAINTENANCE MATERIAL AND COLLECTION OF SCRAP

By J. W. Carey

Clerk to Supervisor, Pennsylvania Lines, Bellaire, Ohio.

To provide for the proper ordering and distribution of new material, I would suggest that a storeroom be established at some point on each division and the supervisors be given instructions from the office of the division engineer to furnish the storekeeper at a certain period of every month a complete list of the material that will probably be needed for the next 30 days.

The storekeeper can then compile all these statements to determine the amount of material to be kept in stock. This material can be ordered directly from the manufacturer and when received kept on hand for distribution to the section foremen.

Section foremen will order material as needed from the supervisor, who in turn will request the same from the division engineer, by furnishing the necessary order. The division engineer will then approve such order and forward to the storekeeper as authority to furnish the material to the section foreman. When received, the section foreman will unload where needed. The kinds of material coming under this heading are frogs, switches, guard rails, clamps, switch stands, bolts, nut locks, spikes, etc.

To properly care for such material as ties, rail, anglebars and tie plates, each section foreman should go over his respective section each year, accompanied by the supervisor, to ascertain the amount of material needed for the following year. Orders should then be made to have the material shipped directly to the supervisor. When received the supervisor will arrange to have his worktrain distribute the material where needed.

In the event of cross ties being received in the winter time, they should be unloaded in piles of 50, located as close as possible to the point where needed. If ties are received in the spring, however, they should be unloaded and scattered along the line where they are to be used, in order that the one handling will suffice.

As to the collection of scrap material, all heavy material such as frogs and switches accumulating from the track should be picked up and placed in piles by section foremen daily and all other heavy scrap placed in the same piles as soon as discovered along the track. To take care of light scrap material, each section consisting of three miles or less should be provided with a scrap box, located at the center of the section, while all sections consisting of four or more miles should be provided with two boxes, located about one mile from each end. As such material accumulates the section foreman should pick it up while running over the section on his hand car daily and place in the nearest or most convenient box.

The supervisor should make arrangements for a worktrain to go over his subdivision at least once a month for the purpose of picking up all scrap material, mill rail and old frogs and switches. The worktrain on such occasions should be provided with three cars, one to receive the mill rail, one for scrap frogs, switches, stands, etc., and the other for worthless scrap. When loaded, cars should be shipped to the storeroom and the storekeeper given a correct report of the amount and weight of the rail contained in the mill rail car, which will enable him to dispose of rail, without unloading, providing he has sale for it. All scrap frogs and switches and other scrap can be separated into bins at the storeroom while being unloaded and then disposed of by the storekeeper as rapidly as he can secure sale for it when the best price is prevailing.

The foregoing suggestions include some of the methods actually pursued on this subdivision.

DISTRIBUTION OF NEW MATERIAL AND DISPOSITION OF SCRAP

By A. M. Clough

Supervisor, New York Central & Hudson River, Batavia, N. Y.

My experience leads me to believe that the following methods of distributing maintenance of way department material will prove most satisfactory under present conditions. Rails, ties and switch timbers are furnished in accordance with the annual budget compiled in the office of the engineer of maintenance of way from estimates furnished by the various supervisors of track, after a careful inspection of their territory as to necessary track repairs and renewals for the coming year. The supervisor always advises the most advantageous point for this material to be shipped to prevent back haul or unnecessary handling.

New rail is unloaded as fast as received and set up between tracks at points where it is to be laid, the anglebars being handled in the same manner. The released rail is assigned to other tracks or subdivisions the same as the new rail and is loaded and shipped promptly when taken out of track.

When the ties are received late in the fall or during the winter they are unloaded into standard piles as near as possible to the points where the foremen will use them when they start the spring work. This refers more particularly to untreated ties, as our tie-treating plant does not usually start operations until about April 1, and when these ties are received they are distributed along the track on which the foreman is working, thus obviating the expense of more than one handling.

The annual allotment of switch timber is received during the fall and winter and is unloaded at headquarters, where it is sorted according to lengths and is sawed into sets to fit the various turnouts before being taken out on the road.

Frogs, switches, miscellaneous track material and tools are ordered monthly by the supervisor of track and are stored at headquarters, with the exception of a small amount of material, especially frogs and switches, at various points along the division for emergency use. Everything that can be should be placed under cover to prevent deterioration from weather and no more of any material should be ordered at one time than is needed as a supply for two months or the length of time required to get it from the manufacturer.

The section foreman should send in on the first day of each month a requisition to his supervisor for such track material, tools and supplies as he will need for the month. This is checked by the supervisor and given to the storekeeper to furnish. This is

shipped by local freight except in cases where it can be handled to better advantage and with more economy by a work train.

The foreman should keep an accurate record of all material on his section on blanks furnished him for that purpose which should show the material on hand at the beginning of the month, the amount received during the month, the amount used and the balance on hand at the end of the month, at which time it should be sent to the supervisor for his information and file and to enable his office intelligently to furnish foremen with material required and avoid any surplus material accumulating.

Each supervisor of track should prepare each month a statement showing a list in detail of all surplus and obsolete material he has on his division, these statements to be sent from one supervisor to another, thus enabling the various supervisors to see what is on hand at various points. If they can use any of the material they furnish shipping directions. If this method is followed up vigorously very little surplus material will remain inactive for any great length of time.

Scrap material should be handled in just as systematic a manner. The worktrain should make regular trips over the division to pick up all such material, loading separately each class of scrap, that is, car scrap in one car, miscellaneous track scrap in one, frog and switch material in another and rail in another, as this will save considerable sorting at headquarters.

All miscellaneous car and track scrap should be shipped in carload lots when possible to a scrap platform located at some central point where it is sorted as to iron and steel and wrought, cast, malleable, etc., after which it is advertised for sale by the purchasing agent, who keeps in close touch with the market value of this material and sells it when the price is right.

Regarding scrap steel rail, frogs and switches. This should be divided into three classes: First, straight rail free from frogs, switches and guard rails and over 5 ft. in length and weighing more than 50 lb. to the yard; second, all cropped rail ends under 5 ft. and over 50 lb. section; and, third, all sections of rail not coming under Classes 1 and 2, and including frogs, guard rails and switch points which are free from plates, fillers, etc. Rail is to be reported under these classes each month by the supervisor, who is furnished with a sale order later by the purchasing agent.

SUGGESTIONS FOR THE HANDLING OF MATERIAL

By Geo. E. Lowe

Supervisor, Delaware, Lackawanna & Western, Elmira, N. Y.

Making proper requisition for new material, preserving it in first class condition without loss or deterioration until used and assorting and reclaiming usable material from scrap amounts to a large saving to a railroad company. A large part of the gain in scrap is up to the maintenance of way department, as that department must gather all scattered scrap on the right of way. Therefore every man in the maintenance department should be instructed and drilled in the best method of handling scrap, which of course varies to some extent owing to the different conditions on the different roads, but the general principle of instruction can be the same.

Very good results have been accomplished by calling together as many of the division officers as possible. Going over the whole question of material and scrap, then spending one day on an inspection and observation tour over certain parts of the road and in the maintenance shop and scrap yard with the head officer of the maintenance department as pilot, will do more in the way of educating the men to the proper method of handling material and scrap than any number of circular letters could do, if not followed up with these meetings. These instructions should be passed along down the line to every man in turn and each division officer should call together as many men under his supervision as possible at different times and not only instruct them, but have them discuss between themselves the question of handling material and scrap.

There should be as few special requisitions as possible. All requisitions should cover the amount of material required until the following requisition is filled. This is very important, for to have to do unnecessary work, or have work held up on account of shortage of tools or material is equally as bad and expensive as to order and carry on hand too much.

A supply of material is usually kept on hand at the division headquarters. This should be well taken care of and a careful record and check kept of it. Each division officer whose duty it is to supply foremen under his supervision with tools and material should keep a record of the exact amount and date of tools and material received by each foreman from time to time. This will enable him to handle the foreman's requisition in such a manner as to prevent wastefulness, as by referring to his record at any time he can ascertain just which foreman is ordering more material or tools than is really required.

An inspection of all tool houses, tool cars and scrap yards should be made from time to time, and all excess tools and material should be collected and put into use where needed, or, if obsolete, scrapped. All material that is affected very readily by the weather should be kept under shelter. Metal material, including rails, frogs and switches, should be neatly piled, and either painted or oiled often enough to prevent rusting. This can be handled at a very small cost, if painting is done by the painters as they go over the division painting other right of way fixtures, and each foreman having a supply of material on hand is furnished with a barrel of oil and a sprinkling can or even a broom. The barrel of oil should be planted in the ground near the material yard, and should have a cover and lock. This will eliminate the necessity of keeping it in a car or tool house and lessen the danger of fire.

On the average section outside of yards the amount of material held in stock for repairs and emergency cases may be materially reduced by pairing the sections off in twos, then placing the rail posts or rail racks and supply material at the intersection of the two sections paired together. This will practically cut the amount of material of this kind down to one-half that necessary under the individual section plan.

The gathering and collection of reclaim and scrap material would be necessary from a safety standpoint, if from no other, as it is very dangerous to the traveling public to allow scrap to lie around where someone may fall over it, or some mischievous boy may place it on the rail, where it may cause a wreck. Also it is very dangerous to life and limb of employees, whose duty requires them to move around moving trains and cars, especially at night. A very good system to follow and one which has given excellent results is to have maintenance of way men from laborers up consider it part of their duty to remove every piece of scrap they may see at least 8 ft. from the nearest rail, wherever possible. One day of the week, preferably Saturday, should be set aside for cleaning up, gathering and sorting scrap, classifying it as much as possible, placing all small scrap in old kegs or boxes, so that it may be loaded by the worktrain gang without sorting and with as little delay as possible to the worktrain and traffic.

Each division should be cleaned of all scrap material at least once a month, it being the custom of most roads to hold scrap material until the market is good. This being the case, it should be neatly piled up along some siding where cars can be placed and unloading and loading done without the aid and expense of a worktrain.

On nearly all roads more or less good reclaim material will accumulate, especially metal fastenings, which on account of the increase of weight of load and weight of rolling stock necessitates the use of larger and heavier material. After being removed from track this should be sorted from scrap material, neatly piled up and preserved, and a list of such

material furnished the head of the maintenance of way department, who will order it shipped to minor divisions or points where it can be used, thereby saving the ordering of new material where this reclaim or second-hand material will answer as well.

ECONOMIES THROUGH LIMITING EMERGENCY STOCK AND THROUGH PROMPT DISPOSAL OF SCRAP

By W. F. Rench

Supervisor, Pennsylvania Railroad, Perryville, Md.

The period of semi-depression through which the railroads have operated of late has brought with it new economies that will be of benefit for all time. Chief among these are the great reduction in the amount of surplus and inactive material and the more active assembling and disposal of scrap material. It used to be the opinion of operating officers that every important switch layout should be protected by duplicates of the frogs and by an ample number of surplus switches. A slip crossing was not protected unless there was a complete set of rails, frogs and switches and even plates and chairs. But now a half slip set is recognized as supplying ample material and a length of rail that could be used to continue main line movement, together with a single switch, is sufficient to cover an important interlocking. The ordering of material for new work a long time ahead of its prospective use is an item of extravagance that is now discontinued. A case is known of material for new work to the amount of $20,000 having been ordered and received two years in advance of its application. Fortunately the exigencies of the hard times uncovered the error before much was lost through interest accruing on this large investment in unproductive material. A closer scrutiny of requisitions and comparison with amounts on hand, a more exhaustive check of material one section lacks against the excess on another section and even the interchange of lists of material surplus on the different divisions of the road have resulted in a reduction in the surplus stock accounts—it is no idle guess—of fully one-half.

It is doubtful if the average operating officer appreciates what it means to his company in money to dispose promptly of the scrap that accrues constantly, both from the source of repairs and of damage to equipment in passage. It is no unusual circumstance to find in various secluded places at times when its loading is mandatory as many as 30 carloads of scrap on a single superintendent's division. This amount, if the material were all scrap, represents a value of perhaps $20,000, and if held three months longer than necessary involves a dead loss of $250, which, applied to a grand division, means $1,000, or to an entire system $5,000. But the material is not all scrap. When it reaches the storehouse and is sorted at least half is found to be usable and no small part entirely new material.

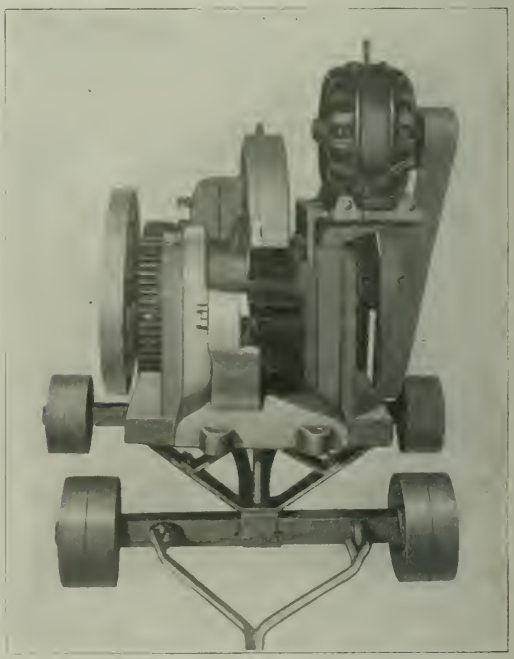
No system of scrap reclamation will furnish the desired results that is not automatic and routine. On many roads the rule is in force that Saturday, whether it be the entire working day or the short day, that is more common, is given over to policing and the general cleaning of the roadbed, which includes the collecting of small scrap. Every tool house is provided with a bin where this small stuff is stored, often until it overflows, but not infrequently the Saturday's collection lies in the center ditch awaiting a convenient time for trucking it to the section headquarters. If the supervisor were equipped to run a train over his division every Saturday afternoon this unsightly material might be disposed of at once, but the considerable time required for hand loading necessarily postpones the collection.

There is in use at some of our shops a type of locomotive crane with magnet, generator and switchboard which handles small scrap quickly and with a minimum of expense. Such a contrivance requires only the attendance of one man and the cost per ton of loading the scrap at the shop has been found to be as low as one cent. The cost would of course be very much greater loading it along the road, but with average opportunity to work would probably be no more than 6 cents per ton. Such a contrivance run special over the road, say every other Saturday, would result in a clean division for the holiday travel and would bring the scrap under the eye of the proper authority.

A PORTABLE MOTOR DRIVEN SHEAR

A motor driven alligator shear has been mounted on a truck by the Canton Foundry & Machine Company, Canton, Ohio, in order to make the shear easily portable and facilitate the cutting of scrap material in various parts of a yard or at different points along the line. The advantage to a railroad of cutting its scrap is evident when it is realized that much of the light scrap is sold to dealers at prices as low as $0.50 a ton, while the same dealers after cutting it, sell it for as high as $6 per ton.

These shears are made in two sizes, the No. 1 having a maximum capacity of 1½ in. square in soft machinery steel or iron



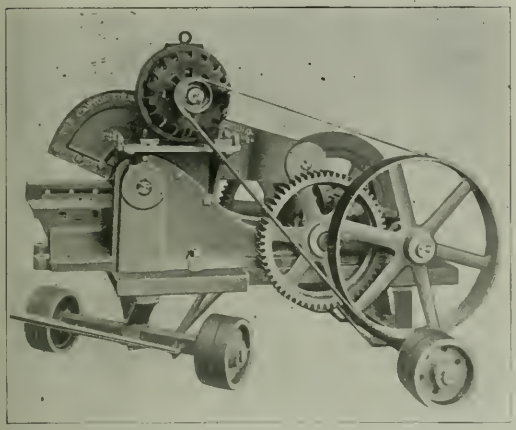
Portable Shear for Cutting Scrap

and making 50 cuts per minute. It has a 13-in. knife with a 6-in. opening at the widest point, weighs 4,200 lb. and requires 3 h. p. to operate it. The No. 2 size has a maximum capacity of 1¾ in. square, making 45 cuts per minute. It has an 18-in. knife, a 7½-in. opening at the widest point, weighs 8,000 lb. and requires 5 h. p. for its operation. Larger sizes could be mounted in the same way if desirable, although the larger shears are not as easily portable.

The trucks are substantially made, having wheels of good diameter and a 3 in. oak plank bed to which the shear is bolted. The front axle turns under to facilitate the turning and backing of the shear, while the tongue or pulling handle can be fastened to either the front or rear axle. This makes it possible to draw the shear up to a pile of scrap and after cutting it,

attach the tongue to the rear of the machine and pull it out backwards without turning or backing. The bed of the truck does not extend out to the front of the machine, so that in cutting scrap none of it can accumulate in and around the machine.

The shears are driven by a motor belt connected to the shear pulley. This method of driving has the advantage over direct gearing that in case of an accident which would overload the



A Motor Driven Alligator Shear Mounted on a Truck

machine either the gears or the motor must break if the connection is secured by direct gearing, while with the belt drive the belt can slip the fly wheel and no damage will be done. The Canton shears are double geared, making them smooth and easy running and prohibiting the breaking and twisting of the crank and countershafts. This is also said to decrease the amount of power required per square inch of cutting capacity.

PRACTICAL CONSIDERATIONS IN CURVE MAINTENANCE

By W. F. Rench

Supervisor, Pennsylvania Railroad, Perryville, Md.

The physical requirements of a curve having been amply met in perfect alinement and correct superelevation and the easement and run-off being in proper proportion and location, the supervisor is confronted with the task of maintaining the excellence of these features. It is well known that each is co-related to the others. Perfect line will not continue if the surface becomes deficient; the surface breaks down more quickly when the line is allowed to deteriorate, and the easement and the run-off suffer if one or the other develops defects.

The maintenance of good surface is more necessary on curves than on tangents. A ¼ in. variation in the level of a tangent, provided it is continuous, cannot be regarded as poor maintenance. Such a condition might exist for some time and its presence be undiscovered until a critical test was made with the level board. In ordinary practice no attempt would be made to level up a tangent track having no greater variation than this until a raise in face was being made, when, of course, the surface would be made true.

But on curves such a defect would be immediately objectionable. While superelevation is generally chosen to the nearest half inch, care is taken that any error is in excess rather than deficiency. Many main line curves are of light degree, 20 min. being most in favor. Experience has shown that at high speed ½ in. variation in superelevation makes the difference between satisfaction and discomfort. The difference is much more marked if the established superelevation of 1½ in. becomes as little as 1 in. in places through breaking down of the surface. Bad maintenance would soon be apparent, both in the line and the surface.

Uniform superelevation is the most important element in curve maintenance. This requirement can only be attained by consistent supervision. The track foreman is ordinarily quite faithful in his use of the track level when surfacing is being done, but he is not so apt to carry his level with him to try his curves for this defect. If the surface of the rail sights properly the track is in his view all right. A test under his eyes with the level is the best lesson that can be given. The line having been made correct, the maintenance of good surface is necessary to its continuance. But even with faithful maintenance there is a certain amount of slight shifting under the traffic which cannot be controlled and which requires periodical correction. If neglected these slight detail defects soon increase to the extent of a general deficiency and eventually the line of the curve is lost and another relining with the string is necessary. In no other feature of track work is the old saw regarding the stitch in time more aptly illustrated.

There is no permanent means of marking the correct line of a curve. Stakes are struck by dragging parts of cars and sometimes only slightly disturbed when they become worse than useless. Steel pins, old rails, even stone monuments are disturbed by frost and in any event their usefulness depends upon measurement with a varying tape line held in every position except the horizontal. Maintenance of the correct line by continued watchfulness is the better practice.

The correction of the short depressions often no more than two or three rail lengths in extent is an important item in curve maintenance. These dips are very unfavorable at any point, as they render fine lining impossible and, no matter how perfect the work with the level, their presence prevents fine results in surface. But they are particularly objectionable on curves. Doubtless in theory they cause no defect if symmetrical with the cross section. But the depressions in the two rails are seldom directly opposite and a rolling of the car is the inevitable result, which under extreme circumstances may become a lurch. They should be regarded as defects and carefully eradicated in the general surfacing program.

A raise in face is periodically necessary for all main tracks, the intervals depending upon the kind of roadbed and the character of the traffic. When such raising is being done on curves, it is customary for the low rail to be selected as the grade rail. But a very distinct advantage may be gained by using the opposite rail. In raising tangents it is very desirable to raise both rails together and usually against the current of traffic. But on curves many foremen prefer to raise the high rail to a proper grade, introducing for the time being added superelevation, and to follow this by bringing the low rail to the grade required for proper superelevation, and this procedure is usually the better one when the raise is moderate.

The basic requirement for curve maintenance is an ample renewal of the cross-ties to provide a firm bearing at all times. Generous tie replacement is desirable in all kinds of road, but it is essential on curves. This is not alone needed for maintaining the gage, although that is the prime consideration, but it is also necessary for conserving the surface, which in turn contributes to permanence of the line. A main line curve can hardly be considered adequate track for heavy service unless well tied and having each tie protected by a tie plate.

The importance of correct gage on curves cannot be overestimated. The superelevation of a curve is of course adjusted to just one speed. If the movement is at a very much slower speed the wheels will impinge upon the inside rail, if faster upon the outside rail. In either case a variation in the gage becomes immediately noticeable. The tendency of every curve to spread can only be met by a full equipment

of tie plates. These should be provided with a single rib across the axis of the tie, both on the top and on the bottom, the one to maintain the plate in its established place on the tie and the other to supply a bearing surface for the rail base. The tie plate should carry a third spike to draw the plate close against the rail base and to help hold it in place. When tie plates are being applied the gage should be made ⅛ in. tight, so that when the rib of the tie plate has settled into the tie the gage may be neat 4 ft. 8½ in. The gage should only be widened when the degree of the curve exceeds 10 deg. and should never be made more than 4 ft. 9 in. The best means of detecting imperfect gage by a casual inspection is to run the eye along both rails of the track. If an irregularity shows upon one rail and not upon the other the trouble is surely in the gage. Even where the track is plentifully equipped with tie plates there is constant need of gage correction and to this end it is the practice on many divisions to keep a gaging gang of three men constantly employed. If the leader of this gang is efficient the gage correction may be made a means of correcting the detail line as well.

The order of correction for the various defects of curves that are generally deficient should be: First, a roughing in of the line to render the test with the string more effectual; second, adjustment of the line after a careful study of the ordinates obtained; third, application of a proper superelevation, including the run-off, or correction of any deficiency that may be found in the existing superelevation; fourth, the regaging, which is readily apparent after the line rail has been made true, and, fifth, a fine detail lining.

The general correction of the line is nearly always the first operation, because if the throws should be several inches the fine surface would be disturbed and in the event that the established superelevation were excessive for the curve when made regular, this amount of elevation might be necessary even for safety at points on the curve where sharp places exist. Further, the proper superelevation and its limits and the approach and run-off can only be determined by the line study of the curve. A careful examination of the present run-off is quite essential, as it is no unusual occurrence to find the run-off improperly located, sometimes as much as several hundred feet from where it should be.

A very common defect which is of the tangents, but pertains to the curve adjustment, is the protruding of the ends of the curve outside the line of the tangents. This defect arises through the tendency of a curve to make its own easement and through the invariable practice of maintainers lining out the ends of curves to obtain the advantage of an easement. It is found when the curve is provided with proper easements in the relining, the natural shifting ceases and there is no longer a tendency of the foreman thus to distort the line in endeavoring to make a seeming correction. The elimination of this defect should be one of the main considerations in the preliminary lining, as its presence precludes a proper adjustment of the line.

When accurately adjusted and faithfully maintained curves are just as comfortable in riding as any other track. Although once the opposite of comfortable, the presence of curves is scarcely noted by the ordinary passenger and this result has been reached through the greater consideration that is now being given to curve maintenance.

Aeroplane Accidents.—The number of aeroplane accidents reported from various principal countries in the first six months of this year in which the pilots were naval or military flyers, and which had fatal results either to pilot or passenger, was as follows: Germany, seventeen; Russia, eight; Great Britain, seven; France, seven; Austria, three; United States, two; Italy, two; Turkey, two. The following was the number of fatal accidents in which the pilots were civilians: France, fifteen; Germany, four; Great Britain, four; United States, four; Russia, two; Italy, one.

AN INTERESTING USE OF PORTABLE TRACKS

An interesting use of portable tracks in construction work is illustrated in the filling of a large hollow at Golden Gate Park, San Francisco. Here one mile of 20 lb., 24 in. gage, portable track is laid, over which 75 steel dump cars of 36

Lifting Section of Portable Track off Street Car Rails

cu. ft. capacity are used to transport sand from a high bank to the hollow, the cars being loaded by specially designed excavators operated by gasoline and capable of loading 10 cars every 10 minutes. These cars are hauled down a city

Loading the Cars

street from the point of excavation to the fill, crossing one street car line, where a man is stationed who removes the section of portable track whenever a street car approaches, as shown in one of the illustrations. Both the cars and the track are of Orenstein-Arthur Koppel Company construction.

AN UNUSUAL ARTESIAN WELL FOR A WATER STATION

By C. R. Knowles

General Foreman Waterworks, Illinois Central, Chicago.

Two things are essential to an artesian water supply. First, that the porous water bearing bed receive its supply at a point, or in a region where it lies comparatively high; and second, that it be enclosed by comparatively impervious beds. If the enclosing beds permit no water to escape and completely surround the reservoir, except in the region of supply, then when the reservoir is penetrated by a well the water will rise to the height of the lowest point of supply.

This condition is never fully realized. The so-called impervious beds are never absolutely water tight and but few water bearing beds are completely enclosed by impervious material. The head of artesian water is therefore somewhat lower than the source of supply and it may be very much lower. It is a common belief that the head of water increases with the depth of the well, or that flowing wells may be secured anywhere if wells are sunk to a sufficient depth, but experience has shown that the sinking of wells far below the principal water bearing strata has commonly resulted in highly mineralized waters rather than an increased head.

Flowing wells are by no means uncommon, particularly in

the southern states, but a well delivering water sufficient for over one hundred locomotives daily at 50 ft. elevation deserves special mention. Such a well supplies the new water station of the Illinois Central at Roseland, La., which eliminates the old steam plant at Tangipahoa. Roseland is located on the McComb district of the Louisiana division, 72 miles north of New Orleans. The location of a water station at this point provides a better spacing, and permits an increased tonnage over this district.

The qualifications for an ideal railway water station are, first, an abundance of good boiler water; second, proper location with reference to grade, curvature and spacing; third, low cost of pumping. The new station at Roseland embodies all of these qualifications, the distinctive feature being the flowing well which delivers water direct to the tank without cost for pumping.

This well is 6 in. in diameter and is drilled to a depth of 924 ft. It flows over 700 gal. per min. at the surface of the ground, and the flow through the overflow pipe after filling the tank 45 ft. above the surface is over 400 gal. per min., sufficient to supply 125 trains daily. The total static head of the well is 90 ft. The quality of the water is excellent both for drinking and for locomotive use. It contains less than ½ lb. of incrusting solids per 1,000 gal. The chemical analysis is as follows:

Iron, aluminum and silica oxides	.93 grains
Calcium carbonate	1.16 grains
Magnesium carbonate	.88 grains
Alkali chloride	.93 grains
Alkali sulphate	.70 grains
Alkali carbonate	.72 grains
Total solids	5.32 grains

The flow was encountered in white sand at a depth of 720 ft. This stratum of sand is 204 ft. thick with an overlying stratum of hard clay 122 ft. thick. There is also a stratum of clay beneath the flowing sand, the thickness of which was not determined. The well was drilled by company forces with a rotary well machine. This method of drilling consists of rotating down the casing under water pressure, the water washing out the sand and clay as the pipe is lowered.

In drilling in sand strata great difficulty is experienced from caving and loss of wash water through the sand unless a mud laden water is used. No suitable mud could be found at Roseland for mixing with the water used for drilling and a sticky clay, or gumbo, was brought from Harahan for this purpose. It required a carload of this gumbo to complete the well. About 15 per cent of clay is mixed with the water. The action of this mud laden fluid on sands, or other porous formations may be likened to the action of muddy water in passing through a filter. Most of the sediment is deposited on the surface of the filter and some of it enters the filter, the portion diminishing as the filtering medium is penetrated. The clay from a mud laden fluid in a well will penetrate a porous formation in the same manner, the penetration depending on the porosity of the formation and pressure of the fluid in the well, but finally no more water will go through and the result is that the well is nicely walled up with mud. When the well is completed to the required depth, a strainer is placed in the bottom of the well and the casing withdrawn until the strainer is exposed. The Roseland well has 125 sq. ft. of strainer exposed to the sand.

The water is delivered to locomotives through two 12-in. penstocks located so as to serve both north and southbound mains. These penstocks are supplied by a 100,000-gal. cypress tank on a 20-ft. creosote frame. The foundations of the tank are of concrete set on 48 creosoted piles 25 ft. long.

Illinois Central Water Station at Roseland, La., Securing Supply from an Artesian Well

CONTENTMENT.—W. Hanley, a signalman on the North Eastern Railway of England near Selby, has been 40 years in one signal box, and it is calculated that he has walked to and from his work 61,000 miles.

COST ACCOUNTING ON THE COLEMAN CUT OFF

By J. B. Skeen

Assistant Engineer, Atchison, Topeka & Santa Fe, Los Angeles, Cal.

A brief description of the construction of the Coleman Cut-Off was published in the *Railway Age Gazette* of February 13, 1914. It has been suggested that an outline of the methods of keeping the records on this piece of construction work would be of more than passing interest at this time, as the physical valuation of common carriers by the federal government now under way, as well as the valuation of railroads by various state commissions, makes the subject of cost keeping an important one. The rigid investigation of the carriers' records by the valuation engineers will, without doubt, bring to light the fact that with most roads this feature has been given little consideration in the construction of new lines in the past, and it will probably also be found that additions and betterments have not been recorded in sufficient detail to enable the roads to compile an appraisal of their property readily without an immense amount of searching of old records and files and extensive field investigations.

When the above work was commenced a system of bookkeeping in line with past practice on construction on this road was inaugurated on a plan that contemplated a completion report at the close of the work that would reflect the exact cost of each individual structure and facility, divided between labor, freight and material, with a further separation of charges in the case of bridges and like structures as between sub-structure, superstructure, etc. The simplest and most direct methods were employed, and if the results attained were more than ordinarily satisfactory, they were due to close application of the principles of accounting as prescribed by the Interstate Commerce Commission for expenditures of road and equipment, and a proper appreciation of the value of individual cost records that could be relied upon.

As charges accrued they were recorded by I. C. C. accounts in a journal provided with suitable headings for that purpose. This journal was balanced monthly with the auditor's books and any discrepancies were adjusted while matters were fresh, without waiting, as is often the case, until the completion of the work, to correct errors that are likely to creep in on work, involving expenditures of $500,000 to $1,000,000 per month.

A set of job ledgers covering the detailed cost of all structures was opened and every charge that it was possible to locate was entered in such a manner as to give a reference to where the minute details making up the charge could be located. Labor charges were posted in monthly order as they were incurred, the amount being entered under individual jobs and the source of the charge being given. Material charges were entered in a like manner, entries only being made of requisition or voucher number, amounts and a brief description of the material covered. All papers supporting expenditures of whatever nature were filed in monthly order, and the details of each transaction were readily located by reference to the ledger for the date charged out. Thus the same result was attained as though the details had been posted directly in the ledger, at a great saving of time and expense.

Many charges accrued every month that could not be located to definite jobs. To care for these, a "Miscellaneous" account was carried in connection with each I. C. C. account and at the completion of the work such unlocated items of expense were absorbed by applying them to the located expenditures on the basis of the relation of the unlocated charges to those that could be located, each account, of course, being treated separately in this respect. For instance, many thousands of dollars chargeable to Account 206, Bridges, Trestles and Culverts, could not be located to individual structures during the progress of the work. These items consist of the cost of pile driving equipment, tools and supplies, expense of train and enginemen distributing material, office expense, etc. This expense was carried in the books as "Miscellaneous Charges, Account 206," and prorated as above over individual structures on a cost basis at the completion of the work.

The total of the located charges and miscellaneous expense for each account was balanced each month with the account distribution, which, as before stated, was balanced monthly with the auditor's books, and errors in accounting, either in the engineering or accounting department, were more readily located, and adjustments made easier than if only costs by accounts were kept.

On a piece of work of this magnitude the economical ordering of material and supplies is a problem within itself. In this case this problem was solved in the following manner: A purchasing agent and storekeeper was installed in a field office at a point convenient to the headquarters of department heads directing the field work. Tentative orders for track, bridge, building, fence material, etc., were placed at the beginning of the work and the materials were stored at yards at either end of the line. Large amounts of other supplies were also ordered in a like manner. In order to avoid the delay that would necessarily ensue were the general practice adhered to, of requiring an approved requisition before issuing material and supplies and to fully protect the storekeeper in his issues, parties authorized to order material were supplied with memorandum requisition forms and orders for material and supplies were made on this form, the original going to the storekeeper and a copy to the chief engineer's office. These memos were given departmental and consecutive numbers and the storekeeper was instructed to fill all such orders, unless requested by chief engineer's office by wire to the contrary, after examination of the copy which reached the chief engineer's office about the time the storekeeper received the original.

At the end of each month regular requisitions were made from the memos furnished during the month and the storekeeper was furnished with approved form. They were then priced by him, covering the entire cost of the items furnished, including the cost of handling by the store department, freight, etc., and the invoice portions were forwarded to the chief engineer's office, where they were used in the scheme of cost keeping as above.

Special attention was given to the preparation of map data. Very complete right-of-way and station maps, profiles, bridge and building plans, yard layouts, ravine sections, etc., delineating the property as it was constructed, were prepared during the course of construction. In addition to the usual map data, there was compiled in considerable detail the following: Bridge list, station list, ballast statement, rail record, railroad crossing record, stock yard record, clearance chart, tie plate record, rail joint record, tie record, fence record, building record, side track record and water service record.

The value of the maps, records and cost data covering the construction of this line was fully appreciated in the preparation of the valuation of the property for the Texas railroad commission and will doubtless be appreciated as fully in the valuation for the federal government.

A New Field for Tourists.—The through passenger and freight train service between Fort William and Prince Rupert, announced recently by the Grand Trunk Pacific, will place Prince Rupert in direct touch with eastern Canada and the United States and provide a new avenue of commerce to Canadian agriculture and industry. The thriving townships in Central British Columbia which have grown up along the main line of the Grand Trunk Pacific, but which have hitherto been reached only by stage or river steamers, will quickly feel beneficial effects. The Grand Trunk Pacific now has 2,195 miles of main line in operation.

General News Department

Congressman Bryan of the state of Washington has introduced in the House a bill for the construction by the government of a railroad from Marysvale, Utah, southward into the National Forest in Arizona. Marysvale is the southern terminus of a branch of the Denver & Rio Grande.

Retrenchment on the Pennsylvania Railroad has extended to the closing of a number of small passenger stations, and it is announced that the following stations on the Pittsburgh division will be discontinued after October 3: Weaver's Old Stand, Brinkerton, Shoup, United, Trauger, Udell, Hecla, Mutual, Calumet, Rumbaugh, Mammoth, Pleasant Unity Crossing, Marguerite, Leith, Pennsville, Chambers and Biddle.

The creosoting plant of the Missouri, Kansas & Texas at West Denison, Tex., has suspended operations because of a shortage of creosote oil. Large quantities of timber and ties are on hand ready to be treated, but the company's sources of supply have been Germany and England, and both of these are now cut off. The Pennsylvania Railroad has on hand a supply of creosote sufficient for the needs of its timber preserving plant for a considerable time to come.

Thomas Cooper, land commissioner and assistant to the president of the Northern Pacific, has issued a statement announcing that during the last fiscal year the road has sold 800,000 acres of land, chiefly in Washington and Montana. A large area of eastern Washington land, suitable now only for grazing, brought 75 cents to $2.50 per acre. The company estimates the total land grant from Lake Superior to Puget Sound at 40,000,000 acres. The total sales to June 30, last, approximated 30,000,000 acres. Of the 10,000,000 acres remaining about half is still unsurveyed and unpatented. These figures were made public to refute many incorrect statements made during political campaigns, in which it has been alleged that the railway delayed federal surveying of its land to escape taxation. Mr. Cooper says that for 10 years the company has urged the government to hasten surveys, thereby enabling the company to sell its land and push development of its tributary country. The company has applied for a survey of practically all of the 5,000,000 acres still unsurveyed.

Passenger Train Disaster at Lebanon, Mo.

Twenty-seven persons were drowned early on the morning of September 15, before daylight, when a St. Louis & San Francisco westbound passenger train was derailed in a flood, caused by a cloud burst, two miles west of Lebanon, Mo., 182 miles southwest of St. Louis. Two passenger cars toppled into a deep gully filled with water. Eighteen persons were injured, but none seriously. Ninety-nine persons, including the train crew, were on the train. The fireman is among the killed, but the engineman escaped. The engineman had been running cautiously, because of the rain, and the train was moving about 15 or 20 miles an hour. A twelve-foot embankment on which the track crossed a ravine had been partly washed away by the rush of water. The locomotive and first two cars passed through on the sagging track, but the chair car and the smoking car rolled over into the torrent. The locomotive and the mail and baggage cars finally left the rails and fell into three feet of water. Four sleeping cars remained on the track. The chair car and the smoking car were submerged, and some of the occupants were drowned while they slept.

Brotherhoods Enjoined

Five conductors of the St. Louis Southwestern went into court at St. Louis on Wednesday and secured a temporary injunction restraining five vice-presidents of railwaymen's unions from bringing about a strike following an ultimatum delivered to the management of the road. The trouble arose when the management refused to reinstate a conductor who had been accused of drunkenness.

The five conductors said a majority of the engineers employed by the road had voted against a strike and that the engineers' brotherhood had withdrawn from the federation when it appeared that the strike order would be issued. The defendants must show cause next Tuesday why the injunction should not be made permanent.

Soon after the injunction was granted the railroad company asked the Federal Board of Mediation to use its offices to avert the strike. President Britton said that this action was taken in order to leave no stone unturned toward preventing the strike.

Traveling Engineers' Exhibitors

The following is a list of the exhibitors at the convention of the Traveling Engineers' Association, held in Chicago, September 15-18:

American Arch Company, New York.—Models of Security arch. Represented by Le Grand Parish, W. L. Allison, H. D. Savage, J. P. Neff, J. T. Anthony, M. K. Tate, R. J. Himmelright, E. H. Cook, T. M. Ferguson, T. F. Kilcoyne, T. Mahar, W. W. Neale, G. Wagstaff, L. S. Allen, G. M. Bean, C. E. Miller, G. E. Crisp, F. G. Boomer, C. T. Pfeiffer, G. C. Denney and C. A. Coons.

American Steel Foundries, Chicago.—Simplex couplers, coupler pockets, Vulcan and Andrews trucks, Simplex bolsters, cast steel bolsters; Ajax, Hercules and Vulcan brake beams, Economy draft arms, Davis cast steel wheels. Represented by F. A. Lorenz, Jr., W. A. Wallace and W. G. Wallace.

Ashton Valve Company, Boston, Mass.—Valves, gages and gage testing appliances. Represented by J. W. Milliwell, J. F. Gettrust and H. O. Fettinger.

Barco Brass & Joint Company, Chicago.—Metallic connections for tenders and cars, flexible joints. Represented by F. N. Bard, C. L. Miller and L. W. Miller.

Bird-Archer Company, New York.—Boiler chemicals. Represented by J. M. Robb and John Barnes.

Buda Company, The, Chicago.—Buda-Ross headlighting sets. Represented by J. W. Cleary, M. A. Ross and H. P. Bayley.

Chambers Valve Company, New York.—Chambers throttle valve. Represented by F. H. Clark and C. E. Coffee.

Chicago Car Heating Company, Chicago.—Car heating apparatus.

Commercial Acetylene Railway Light & Signal Company, New York.—Acetylene railroad signals.

Dearborn Chemical Company, Chicago. Represented by J. D. Purcell, W. S. Reid, J. F. Roddy, C. S. Murray, A. W. Cooley, F. Fosdick and C. B. Hennessy.

Detroit Lubricator Company, Detroit, Mich.—Cylinder and flange lubricators. Represented by A. D. Homard and A. G. Machesney.

Dixon Crucible Company, Joseph, Jersey City, N. J.—Graphite products. Represented by L. W. Brooks and J. E. Simpson.

Economy Devices Corporation, New York.—Ragonnet power reverse gear, Universal steam chest, Economy engine truck, Economy exhaust nozzle, radial buffer. Represented by J. L. Randolph.

Edna Brass Manufacturing Company, Cincinnati, Ohio.—Lubricators, injectors, water glasses, water gages, boiler checks, coal sprinklers and fire extinguishsers. Represented by E. O. Corey and H. A. Glenn.

Equipment Improvement Company, New York.—Solid end main rod, lateral motion plates, flangeless shoe and wedge, removable driving box brass, packing. Represented by F. H. Clark, R. H. Weatherly and C. W. Cross.

Flannery Bolt Company, Pittsburgh, Pa.—Tate flexible staybolts. Represented by W. M. Wilson and B. E. D. Stafford.

Franklin Railway Supply Company, New York.—Franklin locomotive drifting valve, Franklin fire door, Franklin water joint, Franklin strainer valve. Represented by W. L. Allison, W. H. Coyle, R. G. Coburn, J. Sinkler, C. W. F. Coffin, J. S. Coffin, Jr., and S. D. Rosenfelt.

Galena-Signal Oil Company, Franklin, Pa. Represented by W. O. Taylor, E. V. Sedwick, J. E. Linahen, Ed. McVicker, Louis Gleason, J. S. Brown, J. S. Graham, J. A. Roosevelt, P. H. Stack, M. Meehan, Fred Smith, D. L. Eubank, W. E. Brumble, Wm. H. Holmes, W. J. Walsh, W. F. Walsh, F. J. Walsh, J. G. Arn, H. H. Hale and Cbas. Royal.

Garlock Packing Company, Palmyra, N. Y.—Fibrous packing. Represented by M. E. Hamilton and G. H. Green.

Greene, Tweed & Co., New York.—Palmetto steam packing. Represented by Victor B. Nickerson and F. M. Thomson.

Grip Nut Company, Chicago.—New York pump nuts, Westinghouse pump nuts, knuckle pin nuts. Represented by B. C. Hooper.

Hammett, H. G., Troy, N. Y.—Trojan packing, Trojan bell ringer. Represented by E. C. Sawyer.

Henry Manufacturing & Grease Cup Company, Terre Haute, Ind.—Grease cups. Represented by M. Henry.

Hunt-Spiller Manufacturing Corporation, Boston, Mass.—Cylinder packing and bushing, valve packing and bushing, crosshead shoes, bull rings, piston heads, side rod bushings, driving box crown bearings. Represented by W. B. Leach, J. G. Platt, V. W. Ellet, J. M. Monroe and E. J. Fuller.

Jenkins Brothers, New York.—Extra heavy valves. Represented by B. J. Neely.

Keystone Lubricating Company, Philadelphia, Pa.—Model of Keystone driving box. Represented by J. N. Mowery.

King & Company.—Packing. Represented by J. K. King.

Leslie Company, The, Lyndburst, N. J.—Steam heat regulators and electric headlight pressure regulators. Represented by S. I. Leslie and J. J. Cizek.

Locomotive Stoker Company, New York. Represented by L. V. Stevens.

Locomotive Superheater Company, New York.—Superheater parts. Represented by H. B. Oatley, F. A. Schaff, G. E. Ryder, R. M. Ostermann, R. R. Porterfield, G. E. Spengler, W. G. Tawse, W. Boughton, G. Fogg, B. G. Lynch, J. E. Mourne, A. C. MacLacklan, A. S. McDonald, C. D. Hilferty, W. A. Buckbee, J. Bell and C. M. Wickham.

Long, Chas. R., Jr., Company, Chicago and Louisville.—Railway paints. Represented by Chas. R. Long, Jr., G. S. Turner, W. H. Heckman and M. E. Keig.

Manning, Maxwell & Moore, New York.—Hancock inspirators, Consolidated safety valves, Ashcroft gages. Represented by C. L. Brown and F. J. Wilson.

Mudge & Company, Chicago.—Model of spark arrester. Represented by Burton W. Mudge and G. W. Bender.

Murdoch & Co., H., Pittsburgh, Pa.—Babbitt metal. Represented by A. L. Dunlap.

McCord & Company, Chicago.—Force feed lubricator, pressed steel journal box. Represented by O. H. Neal and H. E. Creer.

Nathan Manufacturing Company, New York.—Steam boiler appliances, Nathan Simplex and Monitor lifting injectors, Nathan Simplex non-lifting injectors, Nathan Simplex lifting injectors, Bull's-Eye lubricators. Represented by George Royal, A. S. Work, W. R. Walsh and J. S. Seeley.

National Boiler Washiog Company, Chicago.—Model of Safety First fire door, model of locomotive cleaning device. Represented by H. A. Varney and E. B. White.

National Graphite Lubricator Company, Scranton, Pa. Represented by E. L. Pollock.

National Railway Devices Company, Chicago.—Model of Shoemaker fire door. Represented by J. D. Robinson, E. J. Gunnison and M. M. Auerbach.

National Tube Company, Pittsburgh, Pa.—Kewanee specialties. Represented by F. J. Kelley.

New York Air Brake Company, New York. Represented by R. G. Parker, W. Owens, L. W. Sawyer, G. Kleifges, B. Hyanes and O. Trieglaff.

Ohio Injector Company, Chicago.—Chicago lubricator, Chicago non-lifting injector, Ohio injector, Chicago flange oiler, hose strainer, boiler checks. Represented by F. W. Furry, W. S. Furry, F. W. Edwards, F. Wipperman and A. C. Beckwith.

Okadee Company, Chicago.—Hose coupler, drain valve, water gage, blowoff valve, locomotive sander, packing, sand dryer. Represented by H. Vissering.

O'Malley-Beare Valve Company, Chicago.—Multiplate valves, Duplex blow-outs. Represented by Edward and Thomas O'Malley.

Parkesburg Iron Company, Parkesburg, Pa. Represented by J. H. Smythe, L. P. Mercer, G. Thomas and W. H. S. Bateman.

Paxton-Mitchell Packing Company, Omaha, Neb.—Packing. Represented by C. A. Coons.

Pilliod Company, The, New York.—Model of Baker valve gear. Represented by R. H. Weatherly, F. E. Pilliod, R. Graham and F. Wilcoxen.

Pyle National Electric Headlight Company, Chicago—Electric headlights. Represented by J. Will Johnson, R. C. Vilas, W. A. Vilas, W. T. Bretherton, G. E. Haas, C. E. Kinnan, C. F. McGinnis, W. Miller and L. H. Steger.

Sellers & Co., William, Inc., Philadelphia, Pa.—Lifting and non-lifting injectors, strainers, boiler checks, coal sprinklers. Represented by John D. McClintock and L. H. Burns.

Simmons-Boardman Publishing Company, New York.—*Railway Age Gazette, Mechanical Edition; Railway Age Gazette.* Represented by L. B. Sherman, F. H. Thompson and R. E. Thayer.

Southern Locomotive Valve Gear Company, Knoxville, Tenn.—Model of valve gear. Represented by L. D. Tyson and E. L. Chollman.

Standard Heat & Ventilation Company, New York City.

Storrs Mica Company, Owego, N. Y. Represented by T. Brown.

Stroog, Carlisle & Hammond Company, Cleveland, Ohio.—Sheet lubricator and set screws. Represented by B. E. Carpenter and H. B. Prescott.

United States Graphite Company, Saginaw, Mich.—Lubricating graphite, boiler graphite and graphite paint. Represented by J. G. Draught and J. W. Eviston.

U. S. Metallic Packing Company.—King type piston, valve stem and air pump packing, Leach type pneumatic sanders, Gollmar bell ringers. Represented by B. Brewster, Harry M. Wey and James J. Grogan.

Vissering & Co., Harry, Chicago and Louisville, Ky.—Sanders, bell ringers and metallic packing. Represented by Harry Vissering, G. S. Turner, W. H. Heckman and M. E. Keig.

Westinghouse Air Brake Company, Pittsburgh, Pa. Represented by A. K. Holmyer.

Federation of Trade Press Associations

The ninth annual convention of the Federation of Trade Press Associations will be held at the Congress Hotel, Chicago, Thursday, Friday and Saturday, September 24-26, 1914. The opening addresses and committee reports will be made on Thursday morning, and on Thursday afternoon there will be an editorial symposium followed by a circulation symposium. Friday morning will be devoted to an advertising symposium and Friday afternoon to a subscribers' and advertisers' mass meeting, while the annual banquet will be held in the gold room of the Congress Hotel on Friday evening. A publishers' symposium on Saturday morning completes the program.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

American Association of Demurrage Officers.—A. G. Thomason, Demurrage Commissioner, Boston, Mass. Annual convention in April.

American Association of Dining Car Superintendents.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next convention, October 22-24, Washington, D. C.

American Association of Freight Agents.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 21-24, 1915, Richmond, Va.

American Association of General Passenger and Ticket Agents.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.

American Association of Railroad Superintendents.—E. H. Harman, Room 101, Union Station, St. Louis, Mo.

American Electric Railway Association.—E. B. Burritt, 29 W. 39th St., New York. Annual convention, October 12-16, Atlantic City, N. J.

American Electric Railway Manufacturers' Association.—H. G. McConnaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

American Railway Association.—W. F. Allen, 75 Church St., New York. Semi-annual meeting, November 18, Chicago.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 20-22, 1914, Los Angeles, Cal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1915.

American Railway Safety Association.—L. F. Shedd, C. R. I. & P., Chicago. Next meeting, November, Chicago.

American Railway Tool Foremen's Association.—A. R. Davis, Central of Georgia, Macon, Ga. Annual meeting, July, 1915.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 1-4, 1914, New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Atlanta, Ga.

Association of Manufacturers of Chilled Car Wheels.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Annual meeting, second Tuesday in October, New York.

Association of Railway Claim Agents.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, 3d week in May, 1915, Galveston, Tex.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual convention, October 26-30, 1914, Chicago.

Association of Railway Telegraph Superintendents.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 22-25, Rochester, N. Y.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York. Next meeting, December 8-9, 1914, Richmond, Va.

Bridge and Building Supply Men's Association.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Civil Engineers' Society of St. Paul.—Edw. J. Dugan, P. O. Box 654, August and September, Old State Capitol Bldg., St. Paul.

Engineers' Society of Pennsylvania.—Edw. R. Dasher, Box 75, Harrisburg, Pa. Regular meetings, 1st Friday after 10th of each month, except July and August, 31 So. Front St., Harrisburg, Pa.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

Freight Claim Association.—Warren P. Taylor, R. F. & P., Richmond, Va. Annual meeting, June 16, 1915, Chicago.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

International Railway Congress.—Executive Committee, 11, Rue de Louvain, Brussels, Belgium. Next convention, June 23 to July 6, 1915, Berlin.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 829 W. Broadway, Winona, Minn. Next convention, July 14-17, 1915, Sherman House, Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D., Lima, Ohio.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next convention, November 17-19, 1914, Detroit, Mich.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May, 1915.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June, 1915.

NATIONAL RAILWAY APPLIANCES ASSOCIATION.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—C. Maolove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

RAILROAD MASTER TINNERS, COPPERSMITHS AND PIPEFITTERS' ASSOCIATION.—U. G. Thompson, C. & E. I., Danville, Ill. Annual meeting, May, 1915.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December 10, 1914, Waldorf-Astoria Hotel, New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Annual meeting, October 6, 1914, Washington, D. C.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa. Annual meeting, September 22-24, 1914, Bluff Point, N. Y.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, L. S. & M. S., Box C, Collinwood, Ohio. Annual meeting, May, 1915.

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with M. C. B. and M. M. Associations.

RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SALT LAKE CITY TRANSPORTATION CLUB.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, C. R. I. & P., La Salle St. Sta., Chicago.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. Ry., Atlanta, Ga.

SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

TOLEDO TRANSPORTATION CLUB.—J. S. Marks, Agent, Interstate Despatch, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November, Noonday meetings October to May.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7122 Stewart Ave., Chicago. Annual meeting June 15, 1915, Minneapolis, Minn.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Consolidated Music Hall, Salt Lake City.

WESTERN CANADA RAILWAY CLUB.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

The twenty-eighth annual convention of the Canadian Ticket Agents' Association will be held at the Hotel Sherman, Chicago, on October 6, 7 and 8.

After resisting the state authorities in the courts for several years, the Louisville & Nashville, it is said, has finally accepted a tariff of reduced freight rates prescribed for it in Alabama.

Passenger service between the City of Mexico and El Paso, Tex., was resumed on September 9, when the first through passenger train for public service arrived at the border at Juarez.

The principal railways in Missouri on Wednesday of this week filed with the Missouri Public Service Commission applications for authority to increase passenger rates to three cents a mile on main lines and four cents on branches.

The New York Central, in conjunction with the American Express Company will send two agents to the principal cities of South America with a view to promoting more intimate commercial relations between this country and Brazil, Argentina, Uruguay, Chile and Peru.

R. D. Sangster, who has been manager of the Traffic Bureau of Muskogee, Okla., has been appointed transportation commissioner of the Commercial Club of Kansas City, Mo., to succeed H. G. Wilson, who recently resigned to take a similar position in Toledo.

Representatives of the tap-line railroads of the southwest held a conference last week in Chicago to discuss the denial of milling-in-transit privileges in the tap-line order recently issued by the Interstate Commerce Commission. A conference with the trunk lines will be asked

The Official Classification Committee has announced a preliminary hearing to be held in New York on September 22, on proposed changes for the next issue of the classification. A preliminary hearing will also be held in Chicago, in the offices of the Central Freight Association, on September 17.

Congressman Clark, of Florida, has introduced in the House a bill directing the Interstate Commerce Commission to equalize rates on fruit and vegetables. The purpose of the bill appears to be either to reduce the rates on fruit from Florida or to increase those on similar commodities from California, with a view to removing existing differences.

An agreement has been reached between the Sunset-Central Lines and their telegraph operators in the wage controversy in which the employees some time ago took a strike vote. The agreement provides for an increase in wages of 5 per cent with no change in hours. The men had demanded a 12½ per cent increase in wages and a reduction of hours.

The Erie Railroad has made use of the Cape Cod Canal. One of the railroad company's tugs which is engaged in the coal carrying traffic between New York and Massachusetts ports, returning from Boston, August 11, passed through the canal on the 12th, towing three empty barges. The trip through the canal took two hours, forty minutes. For a part of the time the tide was running against the vessel, the speed of the current being estimated at about two knots an hour.

Gerrit Fort, passenger traffic manager of the Union Pacific, explains as follows the recent action of the Union Pacific in closing the Ogden gateway to through passengers via the Denver & Rio Grande, which has aroused a controversy among the western railways: "What we have actually done is to request our eastern connections not to 'short haul' us on business destined to territory which is strictly local to the Union Pacific system. Only the state of Idaho and a small part of southern Montana are involved, and we have not cut off a single privilege affecting the Colorado cities. The Union Pacific has its own line to Colorado, Utah and Idaho, and owns the short and direct line between Denver and Salt Lake City and all points on the Oregon Short Line. It has eight daily passenger trains operating over its main line and furnishes adequate service

for all passengers desiring to reach Oregon Short Line points. In deciding that it does not wish to longer divide this business with the Denver & Rio Grande railroad it is simply following a well-established precedent, as all the railroads of the United States undertake to secure, wherever possible, their long haul to and from their own local territory. For example, the Missouri Pacific Railway, a part of the Gould system, issued on May 6, 1913, a circular, No. 681, calling in all forms of one-way tickets destined to Colorado points and beyond reading over lines other than the Missouri Pacific west of Kansas City. The Gould system is, therefore, in the inconsistent position of objecting to a policy to which one of the units of that system is already committed."

The Department of Agriculture estimates that the total of all the grain crops of the country this year will be 4,853,000,000 bushels or 302,000,000 bushels more than the quantity actually harvested last year, an increase of 6¼ per cent. Because of the corn crop shortage, the estimated total is less by 680,000,000 bushels than the great harvest of 1912; but the aggregate value of the three principal grain crops—wheat, corn and oats—is $3,400,000,000, whereas their estimated value after harvest last year was $2,741,000,000. The wheat crop amounts to the unprecedented total of 896,000,000 bushels, which, it is estimated by the department, will allow for an export surplus of 300,000,000 bushels, exceeding all previous figures and more than doubling the export from the large crop of 1913.

Car Surpluses and Shortages

Arthur Hale, chairman of the committee on relations between railroads of the American Railway Association, in presenting statistical bulletin No. 175, giving a summary of car surpluses and shortages by groups from May 1, 1913, to September 1, 1914, says: The total surplus on September 1, 1914, was 165,244 cars; on August 15, 1914, 174,260 cars, and on September 1, 1913, 73,576 cars. The report for this period shows a further decrease in the total surplus of 9,016 cars from August 15, all of which decrease is in coal cars.

There is an increase in surplus box cars in the southern and western states of approximately 7,000, about half of which is in Montana, Wyoming and Nebraska (group 7), with reductions in eastern and central states and Canada.

The largest decreases in surplus coal cars are in the eastern states and central freight association territory (groups 2 and 3), with a smaller reduction on the Pacific coast, while a slight increase is noticeable in the northwest.

The total shortage on September 1, 1914, was 1,918 cars; on August 15, 1914, 2,115 cars, and on September 1, 1913, 15,270 cars. The shortage shows a further slight reduction.

The accompanying table gives car surplus and shortage figures by groups for the last period covered in the report and the diagram shows total bi-weekly surpluses and shortages 1907 to 1914.

Car Surpluses and Shortages, 1907 to 1914

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission on September 11 received a protest against the tariffs recently issued by important eastern roads increasing by 12½ per cent the prices to be charged for mileage tickets.

The Interstate Commerce Commission has postponed the effective date of its recent order in the southeastern fourth section case from October 1 to April 1, 1915, in order to give the roads more time to make the necessary readjustments in their rates, and to compile tariffs. The commission has also postponed the effective date of its orders in the intermountain case from October 1 to November 15. The commission has also issued an order allowing the roads in Central Freight Association territory to file tariffs embodying the 5 per cent advance on 10 days' notice.

Rates on Coal to Geneva, N. Y.

Empire Coke Company v. Buffalo & Susquehanna et al. Opinion by Chairman Harlan:

Rates for the transportation of coal from mines in the Clearfield region of Pennsylvania to Geneva, N. Y., not found to be unreasonable or unduly discriminatory. The withdrawal of a rate of $1.25 per ton applicable only on coal to be coked in transit at Geneva, N. Y., is held to have been justified by the carriers, on the ground that it was a preferred rate to a single city and industry, and was not in fact a true milling-in-transit rate. Complaint dismissed. (31 I. C. C., 574.)

Rates on Salt from Michigan Field

Colonial Salt Company et al. v. Chicago, B. & Q., et al; Same v. Illinois Central et al. Opinion by Chairman Harlan:

Present rates for the transportation of salt from the Michigan field to destinations in various western states are unduly prejudicial as compared with salt rates from Chicago and Milwaukee to such destinations. Salt rates from the Michigan field to points in Illinois should not exceed by more than 2½ cents per 100 lb. those from Chicago and Chicago rate points to the same destinations. No change should be made in the present relationship in salt rates as between the Ohio and the Michigan fields. A readjustment should be made which will place the salt rates from Chicago, Detroit and Akron to the Ohio river crossings upon a more equitable basis. Subsequent hearing will be had upon the fourth-section applications. Reparation denied. (31 I. C. C., 559.)

Switching Rate at Arcade, N. Y.

Buffalo, Attica & Arcade Railroad v. Buffalo & Susquehanna et al. Opinion by Chairman Harlan:

The switching rate on interstate traffic moving between the junction of the Buffalo & Susquehanna and industries and team tracks on the Buffalo, Attica & Arcade, at Arcade, N. Y., on commodities other than coal and coke is prescribed at $5 per car, and on coal and coke at 15 cents per ton, with a minimum charge of $5 per car.

This proceeding follows and is closely related to the case entitled *Switching at Arcade, N. Y.*, 30 I. C. C., 501 (*Railway Age Gazette*, p. 1560); the two roads could not agree and so this proceeding was begun. The commission increases the switching rate from $3 a car to $5 a car and expects the B. & S. to absorb all or a part of the increase. If, in 60 days, the roads do not act the commission will order a through rate. (31 I. C. C., 583.)

STATE COMMISSIONS

The Arizona Corporation Commission has issued a general order to the railroads authorizing free carriage of household goods and personal effects of employees who are transferred between points in the state.

F. W. Gomph, agent for the Pacific Freight Traffic Bureau, has asked the California Railroad Commission for authority to increase the charge for sanding stock cars from 50 cents to $1 for single-deck cars, and from $1 to $2 for double-deck cars, on the ground that the average cost of sanding single-deck cars is $1.25 and double-deck cars in proportion.

The Michigan Railroad Commission has rendered a decision that the Delray Connecting Railroad is a plant facility of the Solvay Process Company and the Semet Process Company of Detroit, and that trunk line railroads need not absorb its switching charges on business for these two companies. The commission holds, however, that the road is a common carrier as to other traffic and that the railroads must absorb the charges.

The railways in Central Freight Association territory have filed petitions with the state commissions of Ohio, Indiana and Pennsylvania for permission to publish tariffs embodying the five per cent advance in freight rates allowed by the Interstate Commerce Commission for interstate traffic, on less than statutory notice. The commissions have all reserved decision, and will probably ask for hearings.

The Washington Public Service Commission has recently had the novel experience of an application from a shipper for an advance in rates. The Granger Brick Company, of Yakima county, set forth that it had established its plant at Granger while the rate on brick from Seattle to North Yakima was 12 cents. Subsequently, when North Yakima needed a large quantity of brick for street paving, the rate from Seattle was reduced to 9 cents, greatly to the detriment of the Granger company's business.

James E. Quan, chairman of the Illinois Public Utilities Commission, has announced that the commission is contemplating a strong recommendation to the legislature for more stringent legislation against trespassing. The commission in investigating accidents has come to the conclusion that the state laws on this point are inadequate. "We hope, said Mr. Quan," to make railroad trespassing a serious offense so that the public will stay off the railroad property, such as bridges, yards and right of way. We would also include in the proposed legislation measures providing a penalty for the railroads that fail to do their share toward keeping the public off their property."

COURT NEWS

In the United States District Court at Nashville, Tenn., September 9, a decree was entered denying the government the right to have free access to the correspondence files of the Nashville, Chattanooga & St. Louis. This suit is the one which was brought by the attorney general in seeking to carry out the resolution of the Senate calling for a sweeping investigation of the doings of the Louisville & Nashville and its controlled lines.

In the Federal Court at Philadelphia, September 15, the Pennsylvania Railroad Company and Harvey C. Miller, and John F. McLoughlin of the grain firm of L. F. Miller & Sons, pleaded guilty to four counts of an indictment charging them with unlawful rebating. The court imposed a fine of $1,000 on each of the defendants for each count, aggregating $12,000. One of the charges was that the grain men made false reports of the weight of grain, and that the railroad in accepting these reports was in effect granting rebates. The government agreed to drop the other counts in the indictment and also six other indictments. This is the case in which a jury disagreed last summer after a six weeks' trial.

In the federal court at San Francisco, Cal., September 14, Judge Maurice T. Dooling issued a permanent injunction, restraining Attorney General U. S. Webb and the state railroad commission from enforcing the punitive provisions of the California pipe line act, passed by the last legislature, against the Associated Pipe Line Company, a subsidiary of the Southern Pacific Company. It was held that the fine, $15,000 a day, was excessive, and the effect of the decision is to remove what the court called the "dread of excessive and unreasonable penalties," until the state courts, or if need be, the United States Supreme Court, can pass on the constitutionality of the act. The pipe line act, which became effective August 10, 1913, declared all pipe lines common carriers, and ordered all pipe line companies to file their rates with the commission, or stand liable to a fine of 50 cents a barrel a day. The Associated Pipe Line has a capacity of 30,000 barrels a day.

Railway Officers

Executive, Financial, Legal and Accounting

Frank W. Blair, one of the three receivers of the Pere Marquette at Detroit, Mich., has resigned.

E. J. White, general attorney of the Missouri Pacific-Iron Mountain system at Kansas City, Mo., has been appointed general solicitor, with headquarters at St. Louis, succeeding the late Martin L. Clardy, and E. G. Merriam, assistant to vice-president and general solicitor, has been appointed assistant general solicitor, with headquarters at St. Louis.

Operating

J. B. Mertes, local freight agent of the Wheeling & Lake Erie at Toledo, Ohio, has been appointed inspector of yards and stations, with headquarters at Toledo.

B. C. Cooper, trainmaster of the Peoria division of the Vandalia at Decatur, Ill., has been transferred to Logansport, Ind., as trainmaster of the Michigan division, succeeding O. E. Linn, transferred.

W. E. Price, superintendent and traffic manager of the Carolina & Yadkin River, at High Point, N. C., has been appointed general manager, with headquarters at High Point, and the office of superintendent has been abolished.

J. F. Jones having been relieved of the duties of superintendent of terminals of the Grand Trunk on account of ill health, F. J. McKee, acting superintendent of terminals at Port Huron, Mich., has been appointed superintendent of terminals, with office at Port Huron.

Traffic

J. M. Andrews has been appointed livestock agent of the Texas & Pacific at Ft. Worth, Tex.

J. A. Scheurman has been appointed assistant general passenger agent of the Detroit, Toledo & Ironton, with headquarters at Detroit, Mich.

C. E. Jordan, Jr., has been appointed contracting agent of the Louisville & Nashville, with office at Knoxville, Tenn., succeeding Frank L. Salisbury, transferred.

E. L. Dalton has been appointed general agent freight department of the Chicago & Alton at Chicago, succeeding B. J. Libbe, resigned, to engage in other business.

W. S. Smith, traveling freight agent of the Frisco Lines, with headquarters at Houston, Tex., has been appointed assistant general freight agent of the St. Louis, Brownsville & Mexico, with headquarters at Kingsville, Tex.

F. J. Sizemore, assistant traffic manager of the Carolina & Yadkin River, at High Point, N. C., has been appointed traffic manager, with headquarters at High Point, succeeding W. E. Price, promoted; and the office of assistant traffic manager has been abolished.

G. C. Whitney, traveling freight agent of the Queen & Crescent Route at Dallas, Tex., has been appointed commercial agent with headquarters at Greensboro, N. C. This is a new agency and formerly this territory was under the jurisdiction of C. C. Elder, commercial agent at Charlotte, N. C.; G. F. Kay, soliciting freight agent at Houston, has been appointed traveling freight agent succeeding Mr. Whitney.

George E. Herring, district passenger agent of the Louisville & Nashville, at Nashville, Tenn., has been appointed division passenger agent, with office at St. Louis, Mo., succeeding R. C. Wallis, who has been appointed district passenger agent at Nashville, succeeding Mr. Herring. C. H. Mann, traveling passenger agent at Houston, Tex., has been appointed district passenger agent at Pensacola, Fla. H. H. Milner, city passenger agent at Atlanta, Ga., has been appointed traveling passenger agent at Houston, succeeding Mr. Mann. D. W. McDonald, traveling passenger agent at Pensacola, succeeds Mr. Milner, and the position of traveling passenger agent at Pensacola, Fla., has been abolished.

Engineering and Rolling Stock

Elmer H. Brown has been appointed roadmaster of the Northern Pacific at Dilworth, Minn.

A. E. Reid has been appointed supervisor of signals of the Chicago & North Western, at Boone, Iowa, succeeding K. E. Kellenberger, resigned.

E. H. Peck, assistant engineer of the Chicago, Burlington & Quincy, has been appointed engineer Missouri district, with headquarters at St. Louis, Mo., to succeed F. M. Paterson, resigned.

C. A. Zweibel has been appointed supervisor of car repairs of the Atlantic Coast Line, with office at Wilmington, N. C., succeeding E. A. Sweeley, resigned, to go to another company.

S. S. Senter, engineer of construction of the Wheeling & Lake Erie, at Brewster, Ohio, has been appointed superintendent of bridges and buildings, with headquarters at Brewster, and his former position has been abolished.

OBITUARY

Barney F. Keefe, general agent of the Chesapeake & Ohio, with office at Covington, Ky., died on September 6 at Toledo, Ohio.

N. M. Markley, for many years supervisor of bridges and buildings of the Peoria & Eastern division of the Cleveland, Cincinnati, Chicago & St. Louis, died at his home in Arcanum, Ohio, September 5, aged 67 years.

Amos Howard Calef, secretary and treasurer of the Missouri Pacific, with office at New York, died on September 16, at his summer home at Seabright, N. J., at the age of 71. The cause of his death was acute indigestion and heart disease. Mr. Calef was for many years closely associated with the Gould railroad interests. Mr. Calef was born in Gloucester, Mass., and began railroad work as a clerk. He was with the Kansas Pacific and the Denver Pacific, now a part of the Union Pacific system. In 1880 he went to New York as secretary and treasurer of the Missouri Pacific system.

Thomas E. Adams, superintendent of motive power of the St. Louis Southwestern, with headquarters at Pine Bluff, Ark., died at his home in that city on August 25 at the age of 63 years. Mr. Adams had been in railway service since August, 1865, when he began as a fireman on the Illinois Central. He was consecutively locomotive engineer on that road, the Illinois Midland, the St. Paul, Minneapolis & Manitoba and the Great Northern, from November, 1870, to February, 1893, when he was appointed division master mechanic on the Great Northern. Three years later he became superintendent of the Dakota division of that road, and from February, 1897, to April, 1901, he was successively master mechanic of the Fergus Falls division and at Superior, Wis. He then went to the St. Louis Southwestern as general master mechanic, and in July, 1905, was promoted to superintendent of motive power.

Export Coal Traffic.—With a view to aiding the coal operators of the United States to expand their markets at a time when the exporters of other coal-producing nations are inactive, the Bureau of Mines has issued a bulletin describing American coals, which, printed in Spanish, Portuguese and English, will be distributed among the large coal-users and importers of South and Central America. The bulletin lists as available for this promising export trade seven groups of coal fields. These are the Pocahontas and New River coals of West Virginia, with Norfolk and Newport News as shipping ports; the Maryland and eastern Pennsylvania coals, to go through Baltimore or Philadelphia; the Virginia, Kentucky and Tennessee coals, through Hampton Roads or Charleston; the Alabama coals, through Mobile or New Orleans; the western Pennsylvania coals, through New Orleans; the Illinois and Indiana coals, through New Orleans; and the Washington coals, through Seattle.

Equipment and Supplies

LOCOMOTIVE BUILDING

The San Pedro, Los Angeles & Salt Lake has ordered one Mikado type locomotive from the Baldwin Locomotive Works.

W. R. Grace & Co, New York, are making inquiries for three 2-8-0 type locomotives for a railroad in Chile.

The Louisville & Jeffersonville Bridge Company, Louisville, Ky., has ordered one superheater six-wheel switching locomotive from the American Locomotive Company. This locomotive will have 21 by 28 in. cylinders, 51 in. driving wheels and a total weight in working order of 163,000 lb.

CAR BUILDING

The Lehigh & Hudson River, reported in the *Railway Age Gazette* of August 21, as being in the market for 20 50-ton steel ore cars, has ordered that equipment from the Pressed Steel Car Company.

The Rutland, reported in the *Railway Age Gazette* of last week as having ordered 75 50-ton steel hopper cars from the Standard Steel Car Company, has ordered 100 of these cars from that company.

SIGNALING

Automatic Signals on the Burlington in Colorado

The Chicago, Burlington & Quincy has put in service 24 miles of automatic block signals near Akron, Col., the work being done by the Federal Signal Company. The section now completed is that from Akron, westward to and including the Brush (Col.) yards, at which place the Billings-Denver line forms a junction with the Chicago-Denver line. This installation comprises 19 one-arm home signals, 19 one-arm distant signals, 9 two-arm home and distant signals and one signal equipped with a calling-on arm in addition to home and distant arms.

All signals have the Federal Signal Company's type "4" mechanisms fitted with enameled corrugated steel blades, operating in two positions, 0 deg. to 60 deg., in the lower quadrant.

Separate distant signals are used, and they are set approximately 2,500 feet in the rear of the home signals, excepting the distant signal of the home signal governing movements out of the passing tracks. These distant signals are located on the same mast as the home signal at the entering end of the passing track.

The day indications are distinguished by the different types of blades. Absolute home signals have square end blades enameled red with a white stripe; distant signals fish-tail blades enameled green with white stripe. Two permissive home signals, one between Akron and Xenia, and one between Story and Brush, have yellow blades with square end and black stripe. These have yellow glass and are governed by special instructions.

An "absolute permissive" scheme of wiring, using neutral line circuits, developed by the signal department of the railroad company, is used throughout this section. A selecting interlocking relay, especially designed and manufactured by the Federal Signal Company, is used in this arrangement. One set of contacts is mechanically locked by the electrical releasing of another set. For example, a train moving westward releases one side of the interlocking relay which prevents the opening of the contacts on the opposite side, through which the westbound signals are controlled. Permissive indications are displayed for following movements as soon as all track circuit sections, in a block section, are clear. For the opposite direction the other side of the interlocking relay is similarly released.

All switches leading into the main tracks are fitted with style "D" switch boxes and style "C" switch indicators.

An additional length of 88 miles will be put in service about the middle of October.

Supply Trade News

W. E. Marvel, recently elected vice-president of the Positive Rail Anchor Company, has sold his entire interest in the M-C-B Company, Chicago, to R. L. Brown.

The Raymond Concrete Pile Company, New York, has been awarded a contract for the design and construction of concrete ore, coke and limestone bins, and ore and yard trestles, by the Pennsylvania Steel Company, Steelton, Pa. The work calls for several thousand concrete piles and a large yardage of concrete construction.

At a meeting of the board of directors of the American Locomotive Company, held September 16, S. L. Schoonmaker was elected chairman of the board, succeeding Pliny Fisk, resigned, and Andrew W. Mellon, president of the Mellon National Bank of Pittsburgh, was elected a director succeeding James McNaughton. Mr. McNaughton will continue as vice-president of the company. Mr. Schoonmaker is a director of the General Electric Company and the American Telephone & Telegraph Company.

American Locomotive Company

As predicted by President Marshall in March, the American Locomotive Company earned little more than expenses in the second half of the fiscal year ended June 30, 1914. During the first half of the year, however, the company had earned its fixed charges and 7 per cent dividends for the entire year on its $25,000,000 preferred stock. It, therefore, completed the fiscal year with a surplus of $326,127. This compares with a surplus, after the payment of 7 per cent dividends in 1913, of $4,435,305. The new locomotive orders received during the entire year amounted to but $14,454,831, which, as President Marshall points out in his annual report to stockholders, is only about 25 per cent of the company's capacity. As a matter of fact, during the first half of the year the company's plants averaged 67 per cent of their capacity, and in the last half of the year, 29 per cent; but at the beginning of the year unfilled orders amounted to $17,156,388, and at the end of the year, $4,162,365. Business was taken on a very small margin of profit; consequently it was impossible to cut down expenses in the same proportion as the loss in gross earnings. Thus, the gross earnings in 1914 were but $29,987,438, a decrease of $24,880,737, whereas expenses, including maintenance and depreciation, were $27,425,187, a decrease of but $20,616,505.

The company made the best of the falling off in business by strengthening its financial position. At the beginning of the year there were $13,326,031 accounts collectable, and the company had $1,562,474 cash on hand. At the end of the year there were $5,114,531 accounts collectable, and cash and cash items, including a little over $1,000,000 New York City stock certificates and city of Newark revenue bonds, of $8,411,467. Materials and supplies, which amounted to $5,749,234 at the beginning of the year, had been reduced to $2,707,505, the market value of materials and supplies having fallen very much during the year and the company having written down the book value of materials and supplies by a substantial amount and charged that amount against the year's income. Total current liabilities, including gold coupon notes, amounted to $7,085,917 at the end of the year as compared with $13,726,383 at the beginning of the year.

TRADE PUBLICATIONS

Cables.—The Western Electric Company, New York, has just issued a remarkably attractive booklet called "The Making of the Voice Highways," describing the processes entering into the making of lead covered copper cables for telephones. The booklet describes the production of the copper wire, the production of the paper, the production of the lead and the antimony, the testing of the raw materials, insulating, pairing and twisting, stranding, drying, putting on the sheet and the final testing. The booklet is beautifully illustrated and printed.

Railway Construction

Alabama Great Southern.—In connection with the construction of new double track between Chattanooga, Tenn., terminal station and Wauhatchie, improvements to cost $80,000 are to be carried out on the Belt Railway of Chattanooga, including the construction of second main track between East End avenue and the wye where connection is made with the extension line now being completed through the Lookout Mountain tunnel.

Arkansas Mining & Development Company's Line.—According to press reports, this company plans to build a railway from Hoxie, Ark., west via Smithville, Poughkeepsie, Evening Shade and Melbourne to Calico Rock, about 70 miles. J. A. Gay, Poughkeepsie, may be addressed.

Chicago & North Western.—This company has awarded a contract for the building of a logging road from Kingston, Wis., westerly a distance of five miles, to Cleary, White & Duffy, Chicago.

Evansville & Chisney (Electric).—It is expected that work will be started in October on an electric line from Boonville, Ind., east to Chisney, 15 miles. The line may eventually be extended east via Cannelton and Corydon.

Florence & Huntsville Interurban.—Incorporated in Alabama to build an electric line from Florence, Ala., east to Huntsville, about 65 miles. A branch line is to be built from Killen northeast to Lexington, 15 miles, which is ultimately to be extended to Pulaski, Tenn. T. H. Allen, president; T. W. Pratt, vice-president, and N. F. Thompson, secretary-treasurer, Florence.

Fourche River Valley & Indian Territory.—An officer of this company writes that in addition to the 14-mile line from Bigelow, Ark., to Bellevue, a 5-mile extension was recently put in operation. The company plans to build an extension of 38 miles, but the work will not be carried out in the near future.

Frederick & Brunswick.—See Hagerstown & Frederick.

Frontier Electric.—An officer writes that the company is just completing the purchase of a right of way between Niagara Falls, N. Y., and Buffalo, and may possibly do some grading on the line this fall, so that the line may be completed early next spring. J. S. Simmons, Niagara Falls, may be addressed. (August 15, p. 313.)

Greenville & Northwestern (Electric).—This is the new name of the Greenville, Whitewright & Northern Traction, which was organized in 1912, to build a 25-mile electric line from Greenville, Tex., northwest. The new company will have its headquarters at Greenville, and plans to build from that place northwest via Merit, Blueridge and Westminster to Anna, thence west to Denton and then north to Gainesville, about 110 miles. A branch is also projected from Westminster northeast to Bonham, about 25 miles. A. R. Nicholson, president, Greenville.

Greenville, Whitewright & Northern Traction.—See Greenville & Northwestern.

Hagerstown & Frederick (Electric).—According to press reports work is to be started in November on the Frederick & Brunswick. The plans call for building from Jefferson, Md., to Brunswick, about seven miles. (April 24, p. 966.)

Jefferson & Northwestern.—An officer writes that a grading contract has been given to C. T. Fitts, Greenville, Tex., for work on a change of line. The grade is to be reduced from 2 per cent to 1.5 per cent and the curvature reduced from 5 and 9 degree curves to 1 and 2 degree. The work involves handling 30,000 cu. yd. of earth, and clearing four acres of land.

Jellico Coal & Railroad.—Under this name a company has been organized at Chattanooga, Tenn., it is said, to build a railroad from a point near Pine Knot, Ky., on the Queen & Crescent Route southwest to Jellico, about 18 miles. It is understood that construction work is to be started in October. W. E. Wheelock, superintendent of terminals of the Queen & Crescent at Chattanooga, is president of the new company.

Louisiana Railway, Light & Power Company.—An officer writes that this company has secured a right of way, 75 ft. wide, for the electric line to be built from Lockport, La., northwest, via Thibodaux, to Donaldsonville, about 56 miles. It is expected that arrangements will be made to carry out the work in the near future. W. Ohlmeyer, president, Plattenville. (September 4, p. 452.)

Missouri Roads (Electric).—Plans are being made, it is said, to build an electric line from Keokuk, Iowa, west to Wayland, Mo., thence south via Williamstown, La Belle, Newark, Bethel, Shelbyville, Shelbine, Paris, Mexico and Fulton to Jefferson City, about 140 miles. H. W. Knight of Chicago, represents a number of capitalists who are back of the project.

New York Subways.—The New York Public Service Commission, First district, is asking for bids until October 9, for the construction of section No. 1 of route No. 48, the Park Place, William street and Clark street subway, in the borough of Manhattan.

Norfolk & Western.—The report of this company for the year ended June 30, 1914, shows that the double track work under way at the end of the previous year was completed and double track work is now in progress west of Suffolk, Va., on 1.60 miles and between Zuni and Disputanta on 26.6 miles. This work is expected to be finished by January, 1915. A double track tunnel 1,257 ft. long was built at Glen Alum, W. Va., and a twin tunnel, 1,000 ft. long, for second track, was completed at Hatfield, W. Va. The Tug River & Kentucky was organized in January, 1914, to build a 17-mile line in Pike county, Ky., and Mingo county, W. Va., to reach coal deposits. The line has been located from a point in Pike county, at or near the mouth of Poplar creek, and up the valley of Poplar creek, the valley of Peters creek, and the valley of Blackberry creek also down the valley of Tug river. Work is now under way on 1.5 miles of this line, including a bridge over Tug river, and is expected to be finished by June, 1915. On the North Carolina division grading work was completed during the year on 21 miles and was approaching completion on 28 miles; bridge work was well advanced, and 8.8 miles of track was laid and surfaced. The New River, Holston & Western is building an extension from Rocky Gap to Suiter's in Bland county, Va., about 14 miles, grading has about been finished and 8.1 miles of track has been laid.

North Carolina Roads.—Application has been made by J. T. Deal, of the Kinston Manufacturing Company, for a franchise to build a railroad at Kinston, N. C. The plans call for building from Kinston south to Maple Hill, about 50 miles. The Kinston Manufacturing Company now operates a logging line from Pink Hill to Beulaville, about nine mines, which is to form part of the new line.

Northern Pacific.—This company has completed work on a short connecting line, it is said, from Cedar Lake, Minn., northwest to a connection with the Minneapolis, St. Paul & Sault Ste. Marie at Ironhub.

North Louisiana (Electric).—According to press reports a contract was let recently for building from Shreveport, La., east to Monroe, about 100 miles. A. B. Blevins, president, Jefferson. (April 3, p. 812.)

Salisbury Interurban.—This company was recently incorporated in Maryland, and will soon begin construction work, it is said, on an electric line from Nanticoke Point, Md., north via Bivalve, to Tyaskin, thence east via Salisbury to Willards, about 40 miles. E. R. White, W. H. Bedsworth, H. J. Messick and W. H. Insley are said to be interested. (April 10, p. 856.)

Sutherlin, Coos Bay & Eastern.—A contract has been let to the McAllister & Son Construction Company, Portland, Ore., it is said, to build from Sutherlin, Ore., east about 27 miles to a tract of timber at the heal of Calapooya creek, and the line is eventually to be extended further east. Surveys are said to be made for an extension from Sutherlin west to Coos Bay. G. H. Glynn, A. Stark and C. E. Lemon, all of Sutherlin, are incorporators. (August 14, p. 310.)

West Virginia Electric.—Under this name application will be made in West Virginia for a charter to build from the eastern

terminus of the Little Kanawha, at Owenport, in Wirt county, W. Va., east to Weston, about 50 miles. The plans also call for building a branch from a point near Creston south to Spencer, about 10 miles. Residents of Parkersburg are said to be back of the project.

RAILWAY STRUCTURES

Boyce, Va.—The report of the Norfolk & Western for the year ended June 30, 1914, shows that during the year passenger stations and freight houses were built or enlarged at Boyce, Galax, Wilson and Evergreen, Va., at Willardsville, N. C.; Roderfield, W. Va., and Waverly, Ohio. A number of new turntables were installed at various places on the road. A new 1,200-ft. coal pier on concrete foundations was completed and put in operation at Lamberts Point, Va.; and new shop buildings were built and extension made to the existing structures at Roanoke, Va. The company also carried out a large amount of bridge improvement work during the year.

Buffalo, N. Y.—An officer of the Grand Trunk writes that a contract has been given to Metz Bros., Buffalo, for putting up a combined freight station and office building on Niagara street in Buffalo. The proposed structure is to be of brick construction, two stories high, 50 ft. by 200 ft. on the first floor and 30 ft. by 125 ft. on the second floor. The improvements will cost about $75,000.

Chicago, Ill.—The city council has extended from September 23 until December 23, the time within which the railways may file their acceptance of the ordinances for the new Union station, the Pennsylvania Lines freight terminal and improvements in connection therewith. The Union Station Company had asked for an extension of one year on account of the impossibility of financing the project at this time.

Jackson, Miss.—The Illinois Central has awarded a contract for the construction of a mechanical terminal at Jackson, Miss., to Geo. B. Swift & Company, Chicago. The improvement consists of structures as follows: A roundhouse having five 100-ft. stalls with walls of concrete and brick construction, and roof of wood, covered with composition roofing; an 85-ft. turntable electrically operated; a machine shop and boiler room 40 ft. by 75 ft. by 16 ft. high, with brick walls and a flat concrete roof covered with composition roofing; an oil house and storeroom 30 ft. by 60 ft. one story high, with a low wooden platform 40 ft. by 75 ft. at one end; a shelter and shop building 20 ft. by 140 ft. by 11 ft. high, of wooden construction, and sand bins, 9 ft. by 98 ft. by 9 ft. high, also of wooden construction. A 500-ton wooden coal chute which is being built by the Ogle Construction Company, Chicago.

Jefferson, Tex.—An officer of the Jefferson & Northwestern writes that the company has under consideration the question of building a combined passenger and freight station at Jefferson.

Memphis, Tenn.—An officer of the Southern Railway writes that a contract has been given to the Ragland-Baxter Morford Company, Nashville, Tenn., for the construction of shop buildings at Memphis, and a contract has been given to the R. F. Creson Company, Memphis, for putting up a pump house, also transformer house at Memphis.

New York.—The New York Public Service Commission, First district, will open bids on October 6, for the construction of the diagonal subway station under Forty-second street in front of the Grand Central station, New York. The diagonal station will be built on the line connecting the existing subway just south of Forty-second street with the new Lexington avenue subway just north of that street. It will be more than 100 ft. wide, and will have two platforms serving four tracks. A concourse is to be built above the level of the station to connect with the Grand Central station, the Lexington avenue subway, the existing subway, and the Hudson & Manhattan tubes when extended to this point. Elevators will be used to connect with the Steinway tunnel, which is at a lower level.

Richmond, Va.—An officer of the Southern Railway writes that a contract has been given to P. J. White & Son, Richmond, for the construction of shop buildings at Richmond, and a contract has been given to the J. T. Wilson Company, Richmond, for building a transformer house at South Richmond.

Railway Financial News

Central New England.—This company has declared the full 5 per cent interest on its general mortgage bonds for the year ended July 1, 1914.

Chicago & Western Indiana.—This company is owned jointly by the Chicago & Eastern Illinois, the Wabash, the Grand Trunk Western, the Chicago & Erie and the Chicago, Indianapolis & Louisville, each of which owns $1,000,000 of the capital stock. In the fiscal year ended December 31, 1913, as shown by the annual report the company's total operating revenue was $174,769; the operating expenses $152,123, and the net operating revenue, $22,646. The rentals from lease of road, however, made up the larger portion of the company's income and in 1913 amounted to $2,781,646. The total other income inclusive of this amount, other rental taxes collected from tenants, parcel room receipts, etc., was $3,351,946, and the total income $3,374,592. From this income there was paid in interest on bonds, $2,256,296; taxes, $440,338, etc., leaving a net income of $637,095. Dividends were paid, in addition, to the amount of $300,000, and $210,000 was paid out as the division of surplus under the inter-tenant agreement of November, 1, 1882. The surplus for the year was $83,476, so that the total surplus on December 31 was $533,655.

The company's total property investment on December 31, 1913, was $59,892,582. There was also an item of securities issued pledged of $1,351,000. The company's working assets in turn amounted to $5,907,035, $478,414 of which was cash in treasury, $3,051,988 was cash in hands of trustees, $748,980 was consolidated mortgage bonds in treasury, $783,730 was in miscellaneous accounts receivable, etc. The deferred debit items amounted to $2,153,598. The company's outstanding stock as noted above amounts to $5,000,000. The bonded debt is now $61,180,083. The working liabilities on December 31 were $1,981,622, $1,043,873 of which was included in audited vouchers and unpaid wages, and $835,320 in matured interest due on January 1. In 1913 the Chicago & Western Indiana expended $3,265,144 for additions and betterments, the principal improvements being those on the clearing yard and on track elevation.

Erie.—A special meeting of stockholders has been called for October 13, to vote on the approval of a "refunding and improvement mortgage covering the railroad properties, rights and franchises."

Grand Trunk.—This company has declared the regular 4 per cent dividends on the guaranteed stock.

Minneapolis, St. Paul & Sault Ste. Marie.—The stockholders at the annual meeting approved the plan of the directors to increase the capital stock from $42,000,000 to $62,000,000. No new stock is to be issued at this time.

O. C. Wyman, of Minneapolis, has been elected a director to succeed C. H. Petit, deceased.

Pere Marquette.—Frank W. Blair, one of the three receivers, has resigned.

Southern Railway.—President Harrison, in a letter to stockholders, says in part in regard to the annual meeting on October 13:

"An effort will be made to make this meeting more than the conventional routine, which current criticism finds to be characteristic of the meetings of stockholders of American railway companies, and the co-operation of the stockholder is necessary to that end. The principal officers will be in attendance to answer questions directed to the management or as to any detail of its business, and the report of operations during the last year will be before the stockholders for discussion."

Addition Service for Vancouver.—A large number of new steamships and sailing vessels are to be added by the various shipping companies that now maintain a service out of the port of Vancouver, B. C., to meet the anticipated increase in trade incident to the opening of the Panama Canal.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico.....$5.00
Canada 6.00
Foreign Countries (excepting daily editions)..... 8.00
Single Copies.....15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention daily issues, North America, $1; foreign, $2.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue 8,900 copies were printed; that of these 8,900 copies 7,430 were mailed to regular paid subscribers to the weekly edition, 250 were provided for counter and news companies' sales, 1,098 were mailed to advertisers, exchanges and correspondents, and 122 were provided for samples and office use; that the total copies printed this year to date were 366,050, an average of 9,886 copies a week.

VOLUME 57 SEPTEMBER 25, 1914 NUMBER 13

Contents

*Illustrated.

The Interstate Commerce Commission deals with subjects which are highly controversial by their very nature. The way in which a body dealing with such subjects does its work is certain itself to become a subject of controversy; and in the course of such controversy the body in question is sure, at times, to become a target for criticism. Some of the criticism is bound to be just, because every man and every body of men makes mistakes that justify criticism. Some of the criticism is bound to be unjust, because critics are, perhaps, of all people, the most liable to make mistakes. And so, in the natural course of things, the Interstate Commerce Commission becomes the object of many criticisms, some just and some unjust. When one considers the complexity and magnitude of the work of the commission, especially just after having read a frank, manly and able address like that delivered by Commissioner Clark to the American Association of General Passenger Agents, and published elsewhere in this issue, he is apt to conclude that the commission is nowadays being given somewhat less consideration than it deserves from those who discuss its work, and somewhat too much criticism which is misdirected and unjust. Commissioner Clark evidently had some such thought in mind when he made his address. So far as the *Railway Age Gazette* is concerned, it probably publishes more discussion of the work of the commission than any other publication in the country; and it therefore gives us satisfaction at this particular time to express the most unreserved confidence in the ability, the public spirit and the honesty of purpose of the commission. We do believe that it would be a more useful body if it contained more members with experience in the businesses of the concerns which they regulate; but certainly no man in private or public life has ever worked harder or more faithfully to fit himself to perform his duties according to the highest standards than have the members of the commission, and of no member of it is this more true than of Mr. Clark himself. Criticism of the commission does not necessarily imply lack of confidence in it, as indicated forcibly by the fact that some who criticize it a good deal at the same time advocate giving it universal authority.

Criticism of the Commission

There is on almost any railway more or less friction between the minor operating officers and the engine house forces, but it is difficult to find a good reason for it. There is no question that trainmasters, yard masters and despatchers frequently exercise poor judgment and very little tact in their relations with the engine house staff and it is possible that if they were to spend a little time periodically with the engine house foreman, getting better acquainted with him and his problems, they would more fully realize the task which he always has confronting him; a great many tactless moves on the part of the transportation department officers can be directly traced to a lack of knowledge of the main essentials of engine house practice. On the other hand the engine house foreman is prone to a lack of tact in his dealings with the transportation department. He is likely to overlook the fact that locomotives are intended to haul trains and not to stand in the roundhouse undergoing repairs. There are engine house foremen in considerable numbers who have nothing but contempt for the ideas of a trainmaster or despatcher on the terminal handling of locomotives; such men go around with chips on their shoulders awaiting an opportunity to make sarcastic replies to inquiries from the despatcher's office. And in the engine house foreman's defense it must be said that many of these inquiries are calculated to stir up resentment. But in the great run of cases the transportation officer has this in his favor; he realizes that he is there to move traffic and all his efforts are used in that direction. The engine house foreman is probably a man whose training has been almost entirely in the shop and he is likely to find it difficult, unless he be broad minded, to see beyond the engine house conditions and surroundings. When an engine house foreman is appointed one of the points which should be most forcibly brought home to him is that he is there to help in every way possible in the moving of traffic; that he is expected to keep the locomotives in good condition but above all to furnish them quickly when they are required. On the whole what is needed on both sides is a little broader viewpoint of the other fellow's side of the question and the realization by all that their efforts should be all toward one end, the movement of trains.

The Trainmaster and the Engine House

The New York Railroad Club paper on delays in the handling of packages in Boston freight houses, which is reported in this issue, affords an interesting example of careful and scientific study of a subject which seems almost to defy systematic analysis. These investigators, in spite of the obstacles, have made a good beginning. They make no formal and definite recommendations, as they were commissioned only to get the facts, but, so far as wagon delays are concerned, they have plainly suggested the principal remedy —whether they meant to do so or not—and in a single sentence; that the main thing is the teamster. In other words, when you put teams in charge of the most energetic men that can be found, you have met the chief demand of the situation. The theorist can construct a perfect freight terminal, where boxes and barrels will move as smoothly and rapidly as a fifty cent piece moves in the cash carrier of a dry goods store; but in real life a city freight house is a great bunch of costly problems. Such a large share of the obstacles and hindrances are so difficult to deal with by rule or at arm's length, and so peculiarly amenable only to vigorous executive ability on the spot, that the personality of the man at the helm is by far the biggest factor in the whole business. As to the remedy for slow yard movements of inward cars, the investigators give us very little light; but the statement that large numbers of shipments, every day, are ready for the consignees an hour, or two hours, before the clerk is ready to hand them their freight bills, indicates reprehensible slowness on the part of somebody besides the switching crews. In both these features more detailed information is needed. Such dilatory handling of way-bills would come in for pretty severe criticism if it should come up for investigation before those officers of the government who investigated the express companies a year or two ago. Whether or not our present investigators' imposing array of average delays will afford a suitable lever by which to raise the level of efficiency, and to convey lessons to the managers of other freight houses, it is impossible to say; but there can be little doubt that a lot of the *maximum* delays, if suitably studied and explained, would be very instructive. Most freight agents and yardmasters who read this paper will look upon the investigation as having been only just begun.

Freight House Delays at Boston

SOLID IVORY

THE remedy advocated by most of the professional radicals and muckrakers for commercial and industrial ills is either government ownership of numerous industries, including railways, public utilities, coal mines, water power sites, and so on, or out-and-out socialism.

Pearson's Magazine claims the distinction of publishing articles muckraking business and advocating government ownership which are of such a character that no other magazine would publish them. And its claim is valid. It is the only publication in the country which impartially vilifies all classes of business concerns; and it regards socialism, or the practical equivalent of it, as the only avenue to social and economic salvation.

Imagine our astonishment, then, on finding in the current issue of Pearson's an article muckraking the Congressional "pork barrel." The most notorious railway wreckers in the country, the editor asserts in an introductory note to this article, have done nothing worse than the members of Congress who rob the public by habitually voting for such legislation.

Is it not true, after all, then, that the politicians who run the government are vastly superior in ability, honesty and zeal for the public welfare to the malefactors of great wealth who run the railways and other business concerns? Is it possible that our statesmen take advantage even now of such opportunities as they have to use their official positions to further their own selfish ambitions, and the interests of friendly business concerns and communities? The writer in Pearson's so asserts, and cites evidence. And yet, according to Pearson's, virtue can be enthroned and the social and economic welfare of the public promoted only by adopting government ownership of all kinds of business concerns and turning over their management to the very men or kind of men who are now engaged in frying fat out of the tax-paying public by means of the pork barrel!

Some people think, and some people just think they think. The bones in the heads of those who just think they think have varying degrees of thickness and power of resistance to facts and logic. But for real solid ivory we commend the skulls of those whose investigations and whose thinking that they think lead them at one and the same time to the conclusions (1) that government is dishonest and imbecile, and (2) that it is essential to the public welfare for government to be intrusted with the management of many or all of the business concerns of the country.

THE TRUE FUNCTION OF THE COMMISSION

THE prompt decision of the Interstate Commerce Commission to reopen the eastern rate advance case is gratifying. A majority, not only of students of transportation questions, but of the general public think that its original action in this case was wrong. But regardless of that, everybody recognizes the fact that a great change has taken place in the railway situation since then. The commission said in its opinion that it had found that the earnings of the railways in eastern territory were too small either for their own good or that of the public, and while granting a relatively small increase to the central freight association lines, it recommended the adoption of various means by which it believed that all the lines concerned could increase their net income.

The disturbance to business in the United States, and the consequent reduction in railway traffic, caused by the war in Europe, have led to a heavy reduction in railway earnings, thereby making them still more deficient than they were before. The loss of earnings thus brought about has come suddenly, while the means for increasing net earnings which the commission suggested to the railways could not be applied quickly. The situation is aggravated by the fact that the war has not only reduced railway earnings, but has also increased and will for an indefinite time increase the demands on earnings. Already it has made it practically impossible to market new securities and has caused a sharp advance in the return which must be paid on both new securities and those issued for refunding purposes.

Furthermore, this increase in the rate of return which must be paid on capital is not a temporary one. Every day the war is causing the destruction of millions of capital. It is thereby tending to reduce the ratio of the supply of capital in the world to the demand for it and thereby to push up the rate of interest. When the war is over there will be an enormous demand in Europe for capital with which to restore to their former condition the industries which are now deteriorating or being rapidly destroyed there, either because of their inability to get labor or hold markets for their products, or by the military operations themselves. It seems probable, therefore, that the rate of interest which will have to be paid on capital for a long time will be much higher than it has been within recent years; and, of course, a high rate of interest makes it necessary to pay proportionately high dividends on stock in order to market it at a reasonable price, for nobody will accept a dividend of 6 per cent on stock with the risks attendant on its ownership if he can get almost an equal rate of interest on bonds, the ownership of which does not involve such risks. If the railways are going to have to pay much higher rates of interest and dividends in the future in order to maintain and market their securities at fair prices, they must have larger earnings.

It is to be hoped that in reopening the case the commission will consider the important matters involved in a somewhat different spirit from what it did before. It complained in its opinion that during the original hearings it was the object of many criticisms because it did not hasten its decision, and the recipient of many letters, resolutions, etc., petitioning it to dis-

pose of the application of the railroads quickly and favorably as a means of improving business in general. It resented these efforts to influence it. It said in one place in its opinion, "The law fixes the standards by which the rates and practices of carriers must be judged, and the commission can act only in accordance with those standards and after a full hearing; we have no authority to approve rate increases with a view to stimulating business." Elsewhere it said, "These questions involved the exercise of quasi-judicial functions, and the law requires us to afford to all parties an ample opportunity to introduce evidence and to be heard in support of their objections to the additional burdens upon their traffic proposed by the carriers. . . . The law did not confer upon us the power of aiding general prosperity or of introducing new economic policies through railroad rates." These statements indicate that the commission was acting according to a somewhat different idea of its functions from that which it had expressed on former occasions. It will be recalled that in one decision it held that it was not necessary for it in deciding a case to confine itself to a consideration of the record made in that case, but that it might also consider facts of which it had special knowledge. The supreme court reversed this ruling. Is it surprising that some people have not looked upon the commission as they do on a court, when the commission itself has expressed such views regarding its functions? Again, the commission in one of its annual reports declared, in the course of a denunciation of the way in which the Commerce Court had been reversing some of its decisions, that in the fixing of rates it performed a legislative function delegated to it by Congress, and that therefore the court could review its decisions only to ascertain whether it had violated any statutory or constitutional provision.

Now, the commission doubtless is justified in resenting efforts to make it decide a case before it has ascertained the facts involved or to make it decide contrary to the facts which it believes it has found to exist. But it would seem that in the utterances referred to in its opinion in the rate advance case, it somewhat too completely forgot that, as it has said on other occasions, it performs legislative as well as judicial functions. It is a judicial function to determine what is a reasonable rate, and doubtless the commission should proceed in the performance of that duty much as a court would. But it has always been held to be a legislative function to fix a rate, and it is a recognized duty of law-making bodies in the performance of their functions to consider not merely questions of law or constitutionality, but questions of public expediency; and Congress in delegating to the commission authority to fix rates has clearly authorized it to consider questions of expediency as well as of law. Congress has authorized and required it to fix not the lowest rates which constitutionally can be fixed, but *maximum* reasonable rates. While, therefore, the commission cannot constitutionally fix rates that are confiscatory, it can consider what is expedient for the public and fix or permit the railways to fix the maximum rates which would be reasonable in the circumstances. Consequently, in saying, "The law did not confer upon us the power of aiding general prosperity," the commission expressed an entirely erroneous view. It is quite proper for a court to take this attitude, but entirely wrong for the commission to do so.

The commission cannot constitutionally fix rates that are confiscatory, but over and over again it has said in its opinions that it is its duty to so adjust rates as to cause enough capital to flow into the railway business to enable the carriers to make adequate improvements in and additions to their property. But what is regulating rates so as to cause an adequate amount of capital to flow into the railway business but so regulating them as to promote the general prosperity?

Since the commission should consider the questions of public expediency involved it follows that while it should not be pelted with petitions and resolutions intended to make it render a decision disregarding the facts, it ought to hear and give heed to individuals and organizations that are in a position to inform its mind on the broad question of public policy involved. The commission's continued usefulness depends upon it getting out, and keeping out of its head, the notion that it is a court trying law suits. The Commerce Court was merely a court trying law suits; but the Interstate Commerce Commission is an administrative body having at once legislative, judicial and executive functions, and created for the express purpose of performing a function which the courts cannot perform, viz., that of solving a great problem of public policy. It ought to act regardless of public clamor, but on the other hand, it should act for the express purpose of promoting the public interests. If, because of lack of ability or courage, or of an improper conception of its place in the machinery of government, it seeks to hedge itself about with the formalities, technicalities, traditions and precedents of the courts, its days of usefulness will be few in number. It has a great opportunity in passing once more on the eastern rate advance case, to show whether it has a proper conception of its duty and responsibilities and a disposition to live up to them.

TRAVELING ENGINEERS' CONVENTION

GREAT credit is due the members of the Traveling Engineers' Association for the splendid attendance at their recent convention, for the large number present at every session and for the thoroughness with which the subjects were discussed. Nearly 50 per cent of the membership of the association registered. Two sessions a day were held. The morning sessions started before 9:30 o'clock and the afternoon sessions closed some time after five in the afternoon with only about an hour and a half for lunch. It made a long day for men not accustomed to the confining work of a convention, but the interest was intense from first to last, and the discussions, while not always carefully restricted to the subject of the paper, were full of interesting, serviceable information for the members and the railroads they represent.

The point-of-view and the information obtained by the road foreman of engines in the performance of his duties is of great importance to the mechanical department, to the transportation department and to the railroads as a whole. Being on the road a large part of the time he is in a position to observe how the service may be improved and how the real work of a railroad, that is, the transportation of freight and passengers, may be performed in a better and more economical manner. He, therefore, fills an important position, and his suggestions for improvements should be given careful consideration. Likewise, he must realize the importance of his position and take advantage of his opportunities to better the service. In order to do this he must be constantly increasing his knowledge of locomotive design with a view of understanding why certain things must be done to obtain certain results. By thus enlarging his technical knowledge the road foreman of engines with his highly developed practical knowledge will be in a position to effect and recommend improvements that will greatly benefit locomotive operation.

The papers considered this year that were of special value in this respect referred to mechanical stokers, smoke elimination, locomotive air brake equipment and the practical chemistry of combustion. The papers and discussions by the various mechanical experts have provided the association with information that will make its 1914 proceedings a text book worthy of careful study.

NEW BOOKS

Foundations. By Malvert A. Howe, professor of civil engineering, Rose Polytechnic Institute. Size 6 in. by 9 in. 110 pages, 56 illustrations. Bound in cloth. Published by John Wiley & Sons, New York. Price $1.25.

Howe's "Foundations," is a short text book covering the supporting capacity of soils, wall footings and column footings, piles and pile foundations, chimneys and towers, bridge piers and abutments and methods employed in difficult foundations. The au-

thor has attempted to treat the fundamental principles of design in an elementary fashion and draw the illustrations from actual practice, eliminating most of the descriptive matter and depending on references to previously published descriptions of such work.

Rational Stock Speculation. By Walter Thornton Ray. 86 pages, 15 plates, 10½ in. by 6¾ in. Bound in cloth. Published by the author, Spartanburg, S. C. Price $2.

This book is intended as a help to putting stock speculation on a more secure basis by furnishing the data for estimating the future in the light of the past. It is based on the theory that the long swings of stock fluctuation are in relation to the variations in fundamental conditions, and that therefore the general course of prices may be estimated in advance by a correlation of the various factors which enter into the causes of such variations and by comparison with the existing records for previous years. The author states that the book is intended as an aid in forecasting long swings of stock prices, that such studies can never replace studies of the prospective and comparative futures of individual stocks and that he does not hesitate to place his investigations in the second rank. The book consists mainly of tables and charts giving the history of New York interest rates, foreign open market interest rates, foreign banks' official discount rates, prices of iron and steel, prices of non-ferrous metals, prices of commodities in general, iron production in the United States, bond transactions on stock exchanges and bond and security prices, volume of stock sales on the New York stock exchange, statements of New York City clearing house banks, bank clearings, building permits, and percentages of return on stocks and bonds. With these are given comments on the importance to be given to the various factors and instructions for interpreting them.

Power and Power Transmission. By E. W. Kerr, M. E., professor of mechanical engineering, Louisiana State University. Third Edition, revised. 373 pages, 6 in. by 9 in., illustrated. Bound in cloth. Published by John Wiley & Sons, Inc., New York. Price $2.

The first edition of this book was published in 1901 and the second in 1907. It has now been revised and contains 24 more pages of matter and 61 more illustrations than the previous edition. The book is divided into three parts. Part 1, which deals with machinery and mechanics, contains an introductory chapter dealing with definitions, terms, etc., and the other chapters in this section consider such subjects as shafting, bearings, friction and lubrication, friction wheels, pulleys, belt gears, toothed wheels, the screw, cams, the lever and some of its modifications, link work and pipe fittings. Part 2 is devoted to steam power with chapters dealing with elementary steam power plants, the simple steam engine, automatic cut-off engines and high speed engines, indicators, compound engines, condensers, valves and valve gears, valve diagrams and rotary engines and steam turbines. Part 3 is devoted to pumping machinery, internal combustion engines, water power and compressed air.

Railway Fuel Association Proceedings. 342 pages, illustrated, 6 in. by 9 in. Bound in Morocco. Published by the association, C. G. Hall, Secretary, 922 McCormick building, Chicago. Price $1; paper binding, 50 cents.

This book is the official proceedings of the sixth annual convention of the International Railway Fuel Association held in Chicago, May 18-21, 1914. It contains a very interesting address by Dr. W. F. M. Goss, reports of committees on Fuel Tests, Firing Practice and Fuel Stations. Also papers on Honeycomb and Clinker Formation, The Relation of Front End Design and Air Openings of Grates and Ashpans to Fuel Consumption and Sparks, Uniform Methods of Computing Fuel Consumption, Sizing of Coal for Locomotive Use, Storage of Coal, Morden Locomotive Coaling Station, Reheating Locomotive Boiler Feed Water, Fuel and Failures, and Economies in Roundhouse and Terminal Fuel Consumption. These proceedings contain valuable information on the subjects above mentioned and may be considered authoritative in questions pertaining to fuel economy on railroads.

Letters to the Editor

SIMPLICITY AND DIRECTNESS IN TRAIN DESPATCHING

Nashville, Tenn., August 30, 1914.

To the Editor of the Railway Age Gazette:

It has always been a puzzle to me why the initials of a superintendent or chief train despatcher should have to be added at the bottom of a train order to make it valid. They do not issue the order, are not aware of its contents, and often are made to appear ridiculous because of this old custom; and it also cheapens their positions. The names of the train despatchers should be printed on time-tables; and then if any initials must be used it should be those of the despatcher who actually gives the order.

This would give the despatchers the standing they ought to have and also make them more careful in their work. It would save all bother in having to search the records to see who authorized a certain order, in case of any exception being taken to it, or when necessary to produce an order as evidence. I hope officers will give this matter careful thought when they next revise their rules. The attention of the Train Rule Committee of the American Railway Association is invited.

H. W. Forman.

THE MACHINES IN R O CABIN

Chicago, September 14, 1914.

To the Editor of the Railway Age Gazette:

I have read the article, "Controlled Manual Block for Opposing Movements," in the *Railway Age Gazette* for September 11, page 475, and think I correctly understand the application of the system on the double-track freight line, as described, except as to the use of the eight electric locks shown on the shelf in R O Cabin, Fig. 4. By "putting two and two together" —taking into account the statement on page 478 that an additional section of the block instrument is provided for each additional switch controlled from a given block station—I conclude that one of the electric locks forms the block instrument for the eastward track in which, I assume, R O controls no switch, and that three locks form the block instrument for the westward track in which R O probably controls two switches. Possibly the other four locks serve as levers for operation of the signals.

Is this so? X. Y. Z.

[We are informed by Mr. Anthony that X. Y. Z.'s understanding is correct.—Editor.]

English Railwaymen Enlist.—As might be expected, all of the English railways have lost, for the present at least, large numbers of their employees who have enlisted in the ranks. The Navy and Army Reservists and Territorials who have joined the colors from the Great Western Railway, for instance, number over 4,000. There are 1,775 from the locomotive, 721 from the goods, 617 from the engineering, 566 from the traffic, and 158 from the signal departments. The general manager has announced that the posts hitherto filled by the men will, as far as possible, be kept for them on their return to civil life, and if the identical positions are not available, others will be found. The company will make good at its own expense the men's contributions to the Pension, Society and Widows' and Orphans' Fund, and arrangements will be made to see that the men's respective families do not suffer financially by their absence. The general manager of the Great Central has likewise announced that "Single men who join the colors for the period of the war will be treated as on leave with pay. Their subscriptions to the company's superannuation fund, or the mutual provident association, will be paid by the company in their absence. Scales of pay will continue to advance until their return."

Practical Considerations in Design of Large Stations

Features Which Should Be Studied in Planning a Large Passenger Terminal to Reduce Operating Costs

By A. H. Stone
Assistant Engineer, Kansas City Terminal Railway

In view of the number of large passenger stations in prospect and under construction at the present time, it may be interesting and helpful to those having the responsibility for their arrangement and design to discuss briefly some practical features affecting the general layout of the building and its operation that have come up during the construction of one of the new stations now being completed. Little if any published information is to be found bearing on these points and, while exactly the same situation may not be met in another terminal, yet the discussion may serve to call attention to modern requirements and thus help to prevent awkward and expensive operating conditions in other stations.

Designs for most of the large passenger terminals have been turned over to architects, working more or less independently of the railroad company; but unless full and free discussion is had with the operating and engineering officers as the preliminary plans are under way, the result is likely to be more ornamental than practical, owing to the difference in the viewpoint of the architect and the railroad man. The former is intent on producing a structure which will reflect credit on his ability as an architect, while the latter is more concerned with a proper layout for handling the business at the minimum of expense. A harmonizing of both ideas is the end to be sought.

The inspection of other stations should include not only a study of the general layout and building appointments, but also a careful study of operating conditions and their cost. The size and extent of a modern passenger terminal make it very expensive to operate, and the opportunity of reducing these costs without impairing the service rendered to the public is worthy of the best efforts of the engineer.

SITE AND GENERAL ARRANGEMENT

The selection of a site for a new passenger station is a difficult task and but little of a general nature can be said, as the circumstances affecting it are distinctly local in character, but, from the public standpoint, accessibility to principal streets and the city's transportation system is of prime importance. Where there is more than one terminal in a city, the one most accessible will get the greatest share of the competitive business.

One of the principal factors influencing the layout of a station is the track arrangement, that is, whether it shall be a stub end or a through terminal. Both have their advantages and disadvantages, although the consensus of opinion now seems to favor the arrangement of through tracks as enabling a greater number of trains to be handled with the same layout. In the case of a union station caring for a large number of roads, involving the transfer of a great number of passengers, baggage and mail from train to train, many of the operating problems are simplified with the stub-end arrangement, but these problems are made greater at a through terminal by the necessity for elevating or depressing the railroad tracks to remove grade crossings with streets.

The general outlines of the building should not be fixed until after a comprehensive scheme for operating trains and handling the baggage, mail and express has been tentatively agreed upon. Plenty of time should be allowed at this stage for a full and free discussion of the plans by all members of the operating staff to eliminate all chances for introducing faulty operating conditions, and those leading to unnecessary operating expenses. As soon as a definite arrangement has been agreed upon, the detailed designs of the building can proceed rapidly.

A secondary consideration to be given attention at this time, but one that is essential in securing additional revenue to offset the expense of the new building, is whether the designs shall be modified to include an office building which will necessarily detract somewhat from the appearance of the structure, or whether the owning company prefers as a matter of pride to omit this feature and assume the expense of operation and maintenance with such help as can be secured from the rental of concessions usually found in a railroad station. Whichever policy is decided upon, the location of these concessions should always be kept well in mind in order that the public, which has come to expect such conveniences, may be well served, and also that the revenue accruing to the railroad company may be the maximum. A slight change in the location of these concessions frequently increases their earnings by many thousand dollars a year, so the advice of someone experienced in handling them should be obtained in order that their value to the public and as a revenue producing medium may receive the proper consideration. The modern idea is to make these concessions regular stores, provided with ample facilities to display wares for sale. As an indication of the revenue to be obtained from a well located concession, a certain store selling general travelers' supplies, in one of the new stations, is reputed to do a yearly business in excess of $200,000.

Prior to the construction of the Pennsylvania station in New York, but little attention was given in this country to the separation of incoming and outgoing traffic, yet it is a subject which is growing in importance owing to the rapid increase in travel at the large railroad centers and to the congestion which occurs at certain hours of the day even in some of the smaller stations. This separation can be more easily provided in what might be called true terminals than in those stations which are, in effect, way stations, because the latter stations are usually junction points and provision must be made for the prompt handling of those passengers who must transfer from one train to another with close connections. Such a situation is found at Kansas City, where the larger proportion of those using the station are through passengers, and failure to make the outgoing train may mean a delay of possibly 12 to 24 hours.

No information can be found that will enable one to determine the proper size of public rooms to care for a given number of passengers. The size of the same rooms in other large stations per passengers handled varies between wide limits and leads to the conclusion that the dimensions selected were largely guess work. Where the new building takes the place of an old one, some idea of the amount of space required can be obtained from estimating the increase in size by a comparison with the business at the old station. The accompanying table shows the dimensions of the principal rooms in a number of modern stations, together with an estimated number of passengers handled.

WAITING ROOMS AND LOBBIES

In large terminal stations like those of the New York Central and the Pennsylvania in New York City there is not the necessity for providing a large seating capacity that there is at a large junction point like St. Louis and Kansas City because the frequent train service enables those passing

through to reach their destination with little delay. In the western cities where there are fewer trains serving a given territory, through passengers have longer layovers and consequently a greater area in waiting room must be provided per passenger using the station. The special retiring room for women and the smoking room for men should be located adjacent to this room.

Most modern stations have a space known as the concourse interposed between the waiting room and the train platforms, arranged with entrances and exits so that those who wish can reach trains without passing through the waiting room. There is some advantage in having such a space in that it

*Same as main waiting room.

provides a place for those wishing to meet friends to get close to the exit from any platform and it further acts as an unobstructed passageway for outgoing passengers to find their particular train. On the other hand, it increases the distance from the waiting room to the trains, which is thought by some to be a serious objection. In the new Kansas City station this space is eliminated and the gates to trains are located along the sides of the waiting room, enabling passengers to sit close to the gates from which their train departs.

The room around which are the ticket offices, baggage check stand, etc., has various names; in the Pennsylvania station it is known as the general waiting room, although there are no seats in it; in the Grand Central station it is known as the concourse; in the Northwestern station, Chicago, it is known as the public space; in the Washington station it is the waiting room, where the seats are located; in the Kansas City station it is known as the grand lobby. As far as possible, all facilities required by a passenger in preparing for a trip should be located around this room where they can readily be seen.

If there is any considerable number of emigrants to be taken care of, as is the case in most western cities, comfortable quarters easily accessible to trains should be provided where the emigrants can be protected from confidence men and those ready to take advantage of their ignorance. There should be a lunch room in connection where wholesome food can be obtained at reasonable prices and this food should be such as they are accustomed to in the fatherland and not what an American would expect. In addition it may be advisable to provide a laundry room with a steam dryer, such as is furnished in the Northwestern station at Chicago.

Another room that will be found extremely useful is what might be called an isolation room where passengers whom it is desirable to keep away from the general public, such as prisoners, insane patients, or those who have been taken sick with some contagious disease en route, may stay. This room should be so located that it can be reached from incoming and outgoing trains without having to go through the waiting room and should be provided with toilet facilities.

Another desirable room is one where those bringing lunches may eat them in comfort without having the main waiting room littered up. This room should be immediately adjoining the main waiting room and should be equipped with tables and chairs. There should be little difficulty in inducing the public to make use of it, especially if there is a lunch counter in connection where they can supplement their meals with warm food. The revenue received would no doubt be more than sufficient for keeping the room in order.

More and more consideration is being given in modern stations to providing special facilities for women and children that make for their comfort and convenience in traveling. This is of greatest importance in those stations where the colonist and homeseeker travel is heavy, because those taking advantage of colonist rates comprise whole families. They are more or less inexperienced in traveling, and require considerable assistance from the station attendants. Since most western roads are interested in the colonization of their lines, special facilities for taking care of the women and children are now considered a necessary adjunct of the women's rooms. A room should be set aside for children where they may run around without being in the way. It should be provided with beds where the little ones may sleep, and with rattan couches for the mothers, who may secure rest knowing that their children are safe. There should be a woman attendant in charge to render assistance and give information. Besides this, a more isolated room for elderly or invalid travelers is needed, where they may be alone and practically undisturbed between their trains. Private bath rooms, shoe shining stands and telephones are also considered necessary in this department. In some stations the matron's duties are more like a chief janitress, while in others she takes a more active part in seeing that those in her charge reach their proper train and secure the services of the ushers. Where the latter is the case, she should be provided with means for quickly calling the ushers, with wheel chairs if necessary.

The rooms for the exclusive use of men should be grouped together, such as the barber shop, smoking rooms, bath rooms and toilets. Not nearly so much space is needed in the smoking room as was formerly considered necessary, as custom in this respect has changed until the room has become simply an ante room to the toilets. A desirable location for a cigar stand should be adjacent to the smoking room, if not in it. The barber shop should have private bath rooms and a shoe shining stand as well as a small stock of gentlemen's furnishings, such as collars, shirts, etc., provided these articles cannot be purchased elsewhere in the building.

PARCELS AND BAGGAGE

A well located parcel room with ample facilities for doing business will prove to be one of the best revenue producers in the station and its importance in this respect is frequently overlooked. Investigation shows that the space devoted to this business will net $1 or more per square foot used per day. To secure this revenue it is necessary to provide a convenient location with well designed layout of shelving so as to handle the maximum business with the minimum of attendance. Too frequently it is located in some out of the way corner in which

the shelving is crowded in without allowing adequate aisles, or another floor is used to provide the requisite amount of shelving considered necessary. All this tends to increase the cost of operation and to reduce the profits that would otherwise accrue. Shelving made of iron pipe is found the most satisfactory because it is cleaner and does not allow dust and dirt to collect. Provision should be made for checking overcoats and umbrellas; for the former a rod to which coat hangers are attached will be found the best arrangement, as more coats can be taken care of in a given space than by any other means. After the station has been in operation a short time quite a number of unclaimed umbrellas will be accumulated which can be rented on rainy days. The receiving and delivery windows should be located on one side of the room only, because they can be watched better than if located in any other way, but there should never be less than two such windows so that a separation of the receipt and delivery can be made. As a rule people do not call for their hand baggage until just before train departure and cases are not unknown where trains have been missed owing to delays at the parcel window, due to a rush of inbound business. An analysis of the business done at a number of the large stations has developed the fact that two parcels are handled every 24 hours per lineal foot of shelving.

The location of the baggage check stand should be as close as possible to the direct line of travel from the ticket office to the waiting room. Provision should also be made for handling the occasional pieces that come on a conveyance with the passenger, so that a claim check can be issued for it without delay and with the least inconvenience to him. It is usually necessary to provide for the handling of considerable hand baggage and this should be done at a point where it can be received and delivered promptly from trains and where it is convenient to the public. In most modern stations the checking of baggage is done at a different location from that at which the baggage is handled, necessitating some rapid means of sending checks back and forth, as well as informing the check stand of the receipt of baggage, its claim check number, and condition. This is usually accomplished by installing a pneumatic tube system. In large union stations used by a number of railroads, it is not usually considered advisable to have the checkman collect the excess charges on baggage, on account of the difficulty in keeping them posted on the various changes in tariffs and rules. This work is turned over to a cashier who should be located convenient to the public and the checkmen. He should be provided with cabinets for filing the tariffs and for the safe keeping of the C. O. D. and excess checks which are charged to him the same as money. The office of the official in charge of the baggage department should be accessible to the public so that claims for lost or damaged articles, the release of bonded baggage and all other matters of this character may be handled by the office force without taking up the time of the checkmen.

A great deal of thought should be given to the arrangement of facilities on the floor where the baggage and mail are actually handled, that the work may be prosecuted promptly and with a minimum force. The necessity for this is more apparent in those stations where there is a large amount of transfer business from train to train. Frequently mail connections have to be taken care of in 10 or 15 minutes with connecting trains at opposite ends of the station. Again some trains will arrive with a full car of baggage and express, the greater part of which is destined for the city and would warrant switching the car to tracks adjacent to the baggage room, but, in addition, they have a small number of pieces to go forward on connecting trains. All this means that plenty of platforms with cross connections should be provided, that the greatest flexibility in operation may be obtained without interfering with the passengers. Where the distances are great, motor driven trucks can be used to advantage. A sufficient number of scales should be provided with quick reading attachments that individual pieces of baggage received by each expressman may be weighed promptly. If the station is a junction point for a number of roads, it will be the business of the station company, to take care of the transfer of the mails, and, for mail weighing periods, scales of a size and capacity to take trucks should be so located as to require as little extra hauling as possible.

TICKETS AND INFORMATION

The location of the ticket office should be made prominent, at the same time providing quarters that will allow the maximum number of patrons to be served with economy and despatch. Where the station is in use by only one or two railroads, it is customary for each road to have quarters of its own, and each ticket seller has his own stock of tickets. In a union station used by a number of railroads, individual ticket offices are not practical, so only one stock of tickets is provided, which is used by all the sellers. Different designs of offices are required for these two cases; for the former, a long rectangular office best meets the conditions; while for the latter, one with the windows on a semi-circle will prove more desirable. By this arrangement the cases containing the local card tickets, which are in most demand, can be placed equidistant from all the windows, with the coupon forms behind them. It is possible to arrange the cases so that there is very little interference between the sellers, and so that the distance between the cases and the windows is reduced to the minimum. For the economical operation of the entire department, the ticket stock should be kept in a storeroom close at hand, but it need not be on the same level. With a little study odd space not otherwise available for use can be made to do, provided it can be reached directly from the ticket office. Quarters should also be provided for visiting auditors so that in checking the office there is little interference with the work of the regular office force. Plenty of natural light should be provided if possible, both for the ticket office proper and for the auditing force. It will be found that a baggage rack placed under the ticket windows will reduce the chances of passengers' hand baggage being stolen while they are buying tickets. Attention is also called to the fact that the marble plate at the ticket window is frequently made so thick that passengers have difficulty in gathering change into their hands without some of the pieces dropping to the floor.

The information bureau is one of the most important features in a station from the standpoint of the traveler and its location should only be made after thorough consideration of the service to be given and the necessity for keeping the expense of operation low. In the first place, a separation should be made of the telephone calls and the personal calls. It will be found desirable to place the attendants handling the telephone calls in a remote portion of the building where it is quiet and where the operators cannot be disturbed. The room should be provided with special desks fitted up so that folders and guides may be referred to promptly. Each operator should have a special headpiece with a transmitter and receiver combined, allowing both hands to be free. The wires should end in a jack board to permit calls to be held until answered. With the telephone calls handled at another location, the main information bureau can give better service than if the attendants are continually interrupted by the telephone.

There is another room which is needed especially in union stations where the depot passenger representative of the individual lines can give information to prospective passengers. It frequently happens that on Sundays or holidays when the city passenger offices are closed, people go to the station to get information concerning long trips and other information which would take considerable time to give even if the attendants could keep posted. This interferes with the regular work of the bureau and the idea would be to call the depot

passenger representative of the line over which the person wishes to travel, who would conduct him to this room, where the necessary time could be taken to answer fully all questions. The same room could also be used as an appointment room where an incoming passenger en route through the city with a layover could keep his business engagements without loss of time. Arrangements for the use of this room could be made through the station master.

RESTAURANT AND LUNCH ROOM

The problem to be solved in the restaurant and lunch room is to serve the maximum number of people in the minimum time and the first consideration should be to locate the kitchen as close as possible to the dining rooms, not only to reduce the time required by the waiters to pass back and forth, but to enable the food at the tables to be received in good condition. The arrangement of the kitchen equipment should receive the attention of an expert restaurateur and the selection of the manager of this department should be made as early as possible in order to have the benefit of his advice in the first stages of the design. The lunch room especially should be laid out to give quick service, as a greater net revenue can be made from this room than the restaurant, since more people will patronize it. Proper arrangements should be made so that silverware, glasses and linen can be handled close to the points where they will be used, to reduce the time a waiter must be away from his station. In this connection it will be found advisable to consider some means for communicating orders to the kitchen without the need of the waiter's going himself. By a satisfactory solution of these requirements the only time a waiter need be away from his station is when it is necessary to bring food from the kitchen. An entrance for the employees of this department should be provided so that they will not have to use the public entrances in reaching the kitchen.

As I indicated at the beginning of this article, it is impossible to make general statements concerning the size, layout and design of the different departments in a large passenger station that will be applicable in all places. It is hoped, however, that the above brief review of some of the practical considerations in modern stations may be of interest.

SOCIETY OF RAILWAY FINANCIAL OFFICERS

The annual meeting of the Society of Railway Financial Officers was held at the Hotel Aspinwall, Lenox, Mass., on September 15, 16 and 17. The society had a well-attended and instructive meeting, taking up among other things the matter of a uniform form of vouchers and agents' drafts, general railway clearing-house, loose-leaf system for treasury department records, methods of paying large shop forces, freight collection bureaus in large cities and other items of general interest.

President George A. Walker, assistant treasurer of the Pennsylvania Railroad, presented the president's address, in which he discussed the effect of the European war on the business situation, the rate decision of the Interstate Commerce Commission, the proposed war tax, and railway mail pay. He also described a plan by which the lines of the Pennsylvania Railroad system, both east and west, beginning with July, 1914, established a system of clearing all their accounts with other railroad companies through the treasurer of the Pennsylvania Railroad at Philadelphia, under which settlements are to be made on a net basis. The system embraces 23 separate reporting railroad companies and the plan involves the transfer of all charges and credits through the Pennsylvania Railroad, where they are consolidated in the office of the auditor of miscellaneous accounts. The consolidation will thus permit a foreign line making one draft for the balance in its favor, or one draft for several classes of accounts. It is the intention ultimately to include car repairs and overcharges, and in fact all items. If the balance is in favor of the Pennsylvania system one draft will be made by the treasurer of the Pennsylvania Railroad against a foreign line which will embrace the charges and credits as reported to and consolidated by the auditor of miscellaneous accounts. The plan is now in effect between the Pennsylvania system lines and the Chicago, Burlington & Quincy, Baltimore & Ohio, and Central Railroad of New Jersey. It is expected to prove a great saving in financial transactions if foreign lines will co-operate and adhere to the principle of making one draft or check for the balance due to or by them in connection with the adjustment of Pennsylvania system accounts. Charges and credits reported by the system lines to the Pennsylvania Railroad during a calendar month are settled by one draft for the balance on the fifth of the following month.

Secretary Nyquist read the report of the executive committee, which reported that important progress had been made during the year in the direction of the general railway clearing-house settlement plan. The membership is now 141, a net increase during the year of 21.

A. O. Wellman presented a paper by E. L. Copeland, secretary and treasurer of the Sante Fe, on "Curtailment of Credits by Railroads in Establishing Collection Bureaus."

Odell Smith, secretary and treasurer of the Norfolk & Washington Steamboat Company, presented a paper on "The Relations of Railroads and Financiers to Stock Values."

L. B. Franklin, vice-president of the Guaranty Trust Company of New York, addressed the society on the subject of "The Effect of the War on American Railroad Bonds."

A resolution was adopted expressing the sense of the meeting that the society's committee on Clearing-House Settlements should be continued, and that the meeting favored a sustained continuance of the efforts already made to bring about the establishment of a railroad clearing-house, in which the co-operation of the American Association of Railway Accounting Officers is, of course, essential. It was also resolved that the meeting suggest the redistribution to members in pamphlet form of copies of the last report of the clearing-house committee, with printed copies of the exhibits, together with the latest available estimate of the cost of establishing and operating the proposed clearing-house, to the end that each member may lend his best efforts to bring to the attention of his chief executive officer the scope of the plan, the benefits, advantages and saving in cost which it is believed will flow from it, with a view to ascertaining as soon as possible the attitude of each carrier.

The following officers were elected for the ensuing year: President, A. O. Wellman, assistant treasurer, Atchison, Topeka & Santa Fe, Topeka, Kan.; first vice-president, J. G. Stidger, president, Wheeling & Lake Erie, Cleveland, Ohio; second vice-president, C. W. Rhodes, assistant treasurer, Baltimore & Ohio, Baltimore; secretary and treasurer, Carl Nyquist, assistant secretary, Chicago, Rock Island & Pacific, Chicago.

The time and place of the next annual meeting of the society will not be decided until after the first of the coming year.

LABOR UNIONS IN POLITICS.—Pennsylvania's state police force, which has attracted general attention by its efficiency in dealing with labor disturbances and has afforded protection from tramps by patroling large sections of the rural districts of the state, is being made an issue in the election of members of the state's general assembly which will meet in January. Men connected with the State Federation of Labor are buttonholing legislative candidates on the subject of voting for the abolition of the force. On the other hand many property owners, especially in rural districts, are insisting that the police force be increased, because it furnishes protection to large areas where tramps formerly annoyed farmers and endangered barns. The Pennsylvania Conservation Association's committee on agricultural conservation has endorsed the police for rural patrol work, while the Pennsylvania Manufacturers' Association is combating the movement launched by the labor leaders.

Convention of Traveling Engineers' Association

Address by Frank McManamy; Papers on Mechanical Stokers, Operation of Locomotives and Speed Recorders

The opening sessions of the Traveling Engineers' Association convention were reported in the issue of last week on page 503. The following is a report of the remainder of the convention:

ADDRESS BY FRANK MCMANAMY

Frank McManamy, chief inspector of locomotive boilers, Interstate Commerce Commission, addressed the association Wednesday afternoon, calling attention to the many ways in which the traveling engineers and the government inspectors may be of assistance to each other. Attention was called to the increasing number of locomotives inspected by the 50 government inspectors, and the decreasing number of locomotives found defective, which is a credit to both the inspectors and the railroads. In the year 1912, 74,234 locomotives were inspected, of which 65.7 per cent were found with reportable defects; in 1913, 90,356 locomotives were inspected and 60.3 per cent were defective, and in 1914, 92,716 locomotives were inspected, of which 52.9 per cent were found with reportable defects. All of these, however, were not in direct violation of the law. Those that were in violation represented 4.5 per cent in 1912, 5.2 per cent in 1913, and 3.6 per cent in 1914, of the number of locomotives inspected. The number of accidents has also decreased during this period, as shown by the following reportable accidents due to the failure of locomotive boilers and their appurtenances:

Year	Number of accidents	Number killed	Number injured
1912	856	91	1,005
1913	820	36	911
1914	516	21	574

It is believed that these figures represent the results of the inspectors and the effect of the law. The greatest trouble from accidents has been with the failure of arch tubes and four out of every five of the accidents are caused by their improper application. The careful cleaning of them is also of vital importance.

All roads should insist on a proper inspection of the locomotives before they leave the terminal, and some roads provide blanks to be filled out by the engineer for this purpose. Some difficulty is being found in having the boilers washed out properly. All wash out plugs should be removed at every washing and the work should be done in a thorough manner. The government inspectors want to co-operate as much as possible with the railroads in correcting defects, and so far have found that most of the railroads are anxious to co-operate with them so that it has been unnecessary as yet to file suits in the courts regarding the violation of the boiler inspection law.

ADVANTAGES OF MECHANICAL STOKERS

The advantage to be derived from stoker firing of locomotives is the ability to fire the engine continually up to its capacity, and it is found that the stoker-fired locomotive can either take the same tonnage as the non-stoker over the road in less time, or a larger train can be handled in the same time. As a concrete example of this fact we note that in a recent test for the capacity of locomotives a stoker-fired engine was operated for six hours, firing an average of 7,800 lb. of coal per hour, which means a continual capacity of the locomotive firing in excess of that which could be maintained by hand firing.

It has also been demonstrated that mechanical stokers have permitted the enlarging of the exhaust nozzle area from 5 to 5¼ in., which means an increase of about 3 sq. in., thus giving the locomotive greater efficiency. Other advantages are obtained by not opening the fire doors, viz.: doing away with the glare or dazzling light which is produced after dark and which makes the observation of signals more difficult. It also prevents sudden change in firebox temperature which produces contraction of sheets or tubes.

A properly adjusted mechanical stoker will reduce the use of fire hook or rake on the fire bed, as the distribution of coal can be regulated to prevent banking. This is an advantage, as the frequent use of the rake disturbs particles of fuel which are carried by the draft onto the brick arch or lodged in the flues, reducing the draft.

The application of the stoker has proved to be a benefit from the standpoint of smoke abatement and there are some stoker locomotives at present being used in the heavy transfer service within the limits of large cities, resulting in practically complete elimination of smoke. Although all types of stokers are not showing an improvement in smoke prevention, the good results of some types indicate that future developments may be expected to produce good results along this line.

Those engaged in stoker firing do not have to devote as much time and attention to the use of the methods employed in hand firing, but are required to operate the mechanical stoking machine which furnishes them with a practical experience in the care of steam driven machinery. This mechanical education should greatly aid in the development from fireman to locomotive engineer. This, we believe, is an improved condition and should greatly increase the possibilities of securing a higher type of candidate for the position of locomotive engineer.

We have not received any information which indicates that the development of the mechanical stoker has reached a point where the utilization of cheaper fuel has been accomplished.

In conclusion, we will not attempt to state the cost of installation and maintenance of the mechanical stoker, as the different types will vary in these items, but from the developments up to date it is safe to say that the advantages may be expected to greatly multiply with the service of the machines and by the efforts of the various stoker manufacturers.

The report is signed by J. H. DeSalis, chairman; S. V. Sproul, O. E. Whitcomb, T. B. Bowen, O. B. Capps, T. B. Burgess, H. F. Hensen and A. L. Lopshire.

Discussion.—Those members familiar with mechanical stokers were very enthusiastic regarding their use. The Norfolk & Western is operating the Street, Hannah and Standard stokers and is obtaining good results from them all. It was stated, however, that a stoker failure usually meant an engine failure, as it was very difficult for a fireman to build up a stoker fire with the scoop without permitting the steam pressure to drop, on account of the light fire the stoker carries. Reports regarding the Standard stoker indicated that 7,670 miles have been made by one engine during July and August, with an average boiler pressure of 198 lb., and without once hooking the fire. The grates were shaken on an average of every 98 miles in July and every 71 miles in August. The efficiency of that stoker was 99.7 per cent in July and 100 per cent in August.
