ANNUAL REPORT OF THE MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE RAILWAY CO.

INCLUDING CHICAGO DIVISION (WISCONSIN CENTRAL)
FOR THE FISCAL YEAR ENDED JUNE 30, 1914

Submitted herewith is a report for the fiscal year ended June 30, 1914. The Gross Earnings, Operating Expenses, Fixed Charges, Surplus, etc., are as shown in the following condensed statement.

	Soo Line	Chicago Division	Soo Line System
Gross Earnings	$18,717,689.36	$10,588,533.23	$29,306,222.59
Operating Expenses	12,209,227.62	7,145,031.08	19,354,258.70
Net Earnings	$6,508,461.74	$3,443,502.15	$9,951,963.89
Income from other sources	1,083,243.69	46,709.49	1,129,953.18
Total Income	$7,591,705.43	$3,490,211.64	$11,081,917.07
Fixed Charges, Taxes, etc.	4,738,203.13	2,972,515.62	7,710,718.75
Surplus Income	$2,853,502.30	$517,696.02	$3,371,198.32

Dealing with the entire system and comparing the year's results with those of the preceding year, the Gross Earnings decreased $2,998,439.91, the Total Income decreased $2,838,321.28, and the Surplus Income decreased $3,249,567.62.

The percentage of Gross Earnings required for Operating Expenses for the year was 66%. The preceding year it was 59.8%.

Analysis shows the decrease of Gross Earnings to be the result of several factors: first and principally, the loss of grain tonnage caused by the lighter crop of 1913; a considerable loss of manufactured products and merchandise tonnage resulting from the depressed business conditions; a loss of passenger revenue on account of lower passenger rates established by some of the states through which the lines operate, and the refunding of overcharges, both passenger and freight, in consequence of the Court's decision in the Minnesota Rate Case.

A substantial increase in revenue from livestock and other miscellaneous farm products handled, supports the theory that the agricultural development of the Northwest is becoming more diversified in its character and should be an encouragement for the future.

The increased cost of operation is found principally in the increased cost of maintenance of way, structures and equipment, and reflects the higher cost of labor and materials, the necessity of displacing temporary structures, and the increasing cost of depreciation in obsolete equipment. The increases in the other items of expense denote the increasing cost tendencies occasioned by the higher cost of materials and constant pressure for higher wages.

During the year the mileage was increased by completion of the extension from Ambrose, N. D., to Whitetail, Mont., 85.77 miles, by the Iron Mountain Branch and the Ironton Branch in the Cuyuna Iron Range, 11.57 miles. The only new construction in progress at this time is an extension westward from Plaza to the Missouri River, a distance of thirty-three miles.

The Freight Terminals at Chicago were completed and have been in operation since April 1st last. These terminals are the property of the Central Terminal Railway Company, an Illinois corporation owned and controlled by the Soo Line, and report of that Company is therefore embodied herewith.

The Company's funded debt was increased during the year by the sale of $4,638,000 Minneapolis, St. Paul & Sault Ste. Marie Railway Company First Consolidated Mortgage Bonds, $1,280,000 Equipment Trust Notes and $150,000 Wisconsin Central Railway Company First and Refunding Mortgage Bonds; $783,000 of the last named Bonds were authorized and issued.

$1,010,993 Equipment Trust Notes, $56,000 Wisconsin Central Railway Company First General Mortgage Bonds and $7,000 Marshfield and South Eastern Division Bonds were retired during the year.

The early prospects of the season promised a record breaking grain crop in the Northwest this year, but the indications are that only an average crop has been matured. While the business condition in the Northwest seem sound and have the factors for local prosperity, under the present general financial and political complications prevalent throughout the world, superhuman wisdom and courage would be required to predict the business probabilities for the current year.

Respectfully submitted,

E. PENNINGTON,
President.

CAPITAL STOCK.

There has been no change in the Capital Stock.

FUNDED DEBT.

The following changes were effected during the year in the funded debt in hands of the public:

The Missouri Pacific Railway Company—

Funded Debt decreased	$34,000.00	
Equipment Trust Obligations decreased	952,000.00	
Total Decrease		$986,000.00
St. Louis, Iron Mountain & Southern Railway Company—		
Funded Debt increased	$4,144,000.00	
Equipment Trust Obligations decreased	437,000.00	
Total Increase		$3,707,000.00

Statements on Pages 25 and 31 give the detail of these changes.

Under an Extension Agreement dated May 11, 1914, the Three Year Five Per cent Secured Gold Notes, issued by The Missouri Pacific Railway Company under its Trust Indenture dated June 1, 1911, (the total amount of such notes now outstanding being $24,942,000), were extended to June 1, 1915, with interest at the rate of six per cent. Additional collateral was deposited with the Trustee, The Union Trust Company of New York, to the extent of $3,000,000.00 face value of the St. Louis, Iron Mountain & Southern Railway Company First and Refunding Mortgage Six Per cent Forty Year Gold Bonds, Series "A."

The collateral now pledged as security for these notes is as follows:

$25,000,000 face value, St. Louis, Iron Mountain & Southern Railway Company 6 Per cent Forty-Year Gold Bonds, Series "A" (non-convertible), due July 1st, 1952, secured by the first and refunding mortgage and indenture supplemental thereto;

1,070,000 par value (10,700 shares), St. Louis, Iron Mountain & Southern Railway Company Stock;

1,972,000 face value, The Missouri Pacific Railway Company First and Refunding Mortgage Fifty-Year 5 Per cent Gold Bonds, Series "B" (non-convertible), due September 1, 1959;

9,800,000 par value (98,000 shares), The Denver & Rio Grande Railroad Company Preferred Stock;

15,000,000 par value (150,000 shares), The Denver & Rio Grande Railroad Company Common Stock;

828,380 face value, The Texas & Pacific Railway Company 5 Per cent Gold Notes, due June 1, 1915;

490,000 face value, Concordia Coal Company First Mortgage 5 Per cent Bonds, due October 1, 1945;

150,000 par value (1,500 shares), Baring Cross Bridge Company 7 Per cent Stock;

125,000 par value (1,250 shares), Pueblo Stock Yards Company stock;

1,000,000 par value (10,000 shares), Western Coal and Mining Company Stock.

NEW LINES.

No new lines or extensions were constructed during the year. An increase of 0.32 miles is recorded in the main line mileage of the St. Louis, Iron Mountain & Southern Railway Company, due to remeasurements and abandoned track, details of which are shown on Page 55.

EQUIPMENT.

The following new equipment was acquired and taken into the accounts, at a cost of $989,091.23:

7 Mountain Type Locomotives,
5 Pacific Type Locomotives,
30 Mikado Type Locomotives,
1 Business Car,
1 Caboose,
2 Steam Pile Drivers.

Orders were placed for the purchase of the following additional equipment, but delivery had not been made at close of year:

3 Steel Letter Cars,
4 Steel Paper Cars,
18 Steel Baggage Cars,
11 Steel Baggage-Mail Cars,
9 Steel Divided Coaches,
27 Steel Chair Cars,
1 Steel Passenger-Baggage Car,
1 Steam Wrecking Crane,
3 Locomotive Cranes,
1 Locomotive Pile Driver,
1 Bridge Erecting Derrick,
25 Caboose Cars.

Comparisons of inventory and capacity of equipment appear in statements on Pages 50 and 51.

ADDITIONS AND BETTERMENTS.

For the acquisition of right-of-way for extensions to tracks and station grounds, $25,887.74 were expended.

The expenditures for widening cuts and fills were nominal. The charges against this account were almost wholly attributable to bridge filling.

For protection of navigable channels and to prevent further encroachments of the Arkansas River, a large expenditure was recorded and accounts for almost all of the charge against "Protection of Banks and Drainage."

Except to conform to newly established grade line of levee along the Mississippi River at Helena and near Fulton, Arkansas, involving a betterment charge of about $10,000, no grade reductions or changes of line were undertaken.

Because largely in replacement of inadequate structures for waterways, the betterment charges for bridge work were relatively small (approximately $30,000), but the results of total expenditures, including maintenance charges, are reflected in the work performed and listed as follows:

New steel spans placed	311	lineal feet.
Culverts constructed (Concrete)	1,262	" "
(Cast Iron Pipe)	1,909	" "
Wooden bridges eliminated	16.843	" "

The filling in of wooden trestles involved the handling of 409,543 cubic yards of material.

New rail in replacement of lighter sections, was laid in main tracks to the extent of 83.59 miles, more than 92 per cent being standard 90-pound section; 131.13 miles were laid with re-rolled section, and 2.13 miles of released rail were relaid. This work involved a betterment charge of $56,000.

Ballast, involving the handling of 221,859 cubic yards of material, was applied as follows:

Gravel	85.52	miles.
Rock	.99	"
Cinders	2.05	"
Chatts	10.80	"
Total	99.36	miles.

The composition of tracks as to Rail and Ballast, Main Line and Branches, is statematized on page 49.

Additional second track, aggregating 1.29 miles, was added to that installed in previous year at Omaha.

Additional yard facilities were provided at Kansas City, Missouri, Omaha, Nebraska, Horace, Kansas, and Alexandria, Louisiana, which, with newly constructed sidings and spurs at various points, increased the track mileage 11.59 miles.

Right-of-way fencing to the extent of 47.18 miles, were constructed.

By the construction of sub-ways or over-head crossings, in order to comply with State laws and City ordinances, grade crossings were eliminated at six important points, and work is progressing upon viaducts at Nicholas Street, Omaha, and Tower Grove Avenue, St. Louis, which are expensive, and will require several months to complete.

Interlocking plants were installed at three crossings with foreign lines.

Automatic block signals were extended eight-tenths of a mile, and crossing signals, including alarm bells, automatic flag-men and other mechanical contrivances, were installed at a large number of points, involving a betterment expenditure of more than $28,000.

Telephone train dispatching circuits were increased 145.72 miles, and existing telegraph circuits were extended 10.29 miles.

New stations were constructed of Brick, 9; Frame 11; other stations were remodeled, improved or extended at 16 points.

New car repair shed was constructed at Paragould, Arkansas, and existing car repair sheds were extended or enlarged at four terminal points.

Extensions have been made to the water and fuel stations at eleven points, involving an expenditure to betterments of about $28,000.

An ice station for East-bound shipments was established at Osawatomie, and one at Hoisington, Kansas, necessitating the construction of a 500-ton capacity ice house at the former, and a 4000-ton capacity ice house at the latter.

The net expenditures for Additions and Betterments (including Equipment) for the year, of which the foregoing are the most important items, aggregated $1,931,518.56, and are enumerated under "Road and Equipment" on Pages 32 and 33.

OPERATIONS.

The total operating revenues were $59,793,900.17, a decrease of $2,361,605.97 or 3.8 per cent under last year; applied to the average operated mileage of the System, the revenues amounted to $8,208.34 per mile.

The decrease in revenue from freight traffic was $1,753,242.18 or 3.83 per cent. Herein is recorded the direct effect of the unfortunate, if not misguided, insistence upon reductions in tariffs, the legal right, although not necessarily the propriety, of exacting which, was finally confirmed by the United States Supreme Court, and which reductions were made effective during July 1913; for the number of tons of revenue freight handled this year was but 29,533 (0.13 per cent) less than the previous year, against which the revenues for transporting the tonnage show a shrinkage of 3.83 per cent. A similar, although grosser presentation, is found in the revenue of passengers carried, which declined $467,846.51, or 4.02 per cent., although the number of passengers carried increased 13.36 per cent. Combining the returns from both freight and passenger transportation, and striking an average, arrived at by utilizing all of the active factors involved, it is estimated that the enforced reductions in freight and passenger tariffs, have caused a loss in revenue, based upon the volume of this year's traffic, of not less than $1,800,000. even though the facilities and appointments necessary for such transportation—and involving large capital expenditures—have been substantially increased.

As partial compensation for the enforced hardling of Parcel Post, the Post-Office Department has allotted the System about $55,000 advance, which accounts for the increase in mail revenue.

The important effect of the introduction of the Parcel Post has naturally been to force Express Companies to reduce their rates, which in turn has an adverse effect upon the revenues from that business to the railroads. The volume of the combined Parcel Post Mail and Express traffic was greater than last year, yet the combined revenues therefrom were less by $141,431.

The detail of Operating Expenses with comparisons, are recorded on Pages 46 and 47. The total expenses were $43,122,372.69, a decrease of $1,576,624.36, or 3.53 per cent compared with last year. The operation of the property was not confronted with any extraordinarily adverse conditions. The expenditures for Maintenance of Way and Structures, and Maintenance of Equipment, together, equalled 31.43 per cent of total operating revenue. The condition of road-bed, locomotives and cars, generally, has been substantially improved. The particular increases in charges for road-work were against ties and against bridges, which make for greater stability and permanence.

Applying the Maintenance of Equipment charges to the equipment list as it existed at the beginning of the year, the expenditure equalled, per locomotive, $3,240.57; per passenger-train car, $882.96; per freight-train car, $112.40.

Traffic Expenses declined 6.67 per cent.

A reduction was accomplished in Transportation Expenses, equalling 5.49 per cent; the ratio of the total of such expenses to total Operating Revenue, was this year 35.61 per cent—last year 36.25 per cent. These figures exhibit a further refinement in these branches of the service, which directly and largely concern the shipper and passenger; the results reflect the ardent efforts of all Officers and Employes.

General Expenses increased 5.54 per cent, which includes $57,265 for "Valuation Expenses"—a Federal requirement.

There have been some increases in compensation to employes, affecting Maintenance of Equipment, but more particularly in the Transportation Department, which were not in effect throughout all of the previous year, necessitated by Federal or State action, like the so-called "Full Crew Law," which have burdened Transportation Expenses without resulting in any compensating advantages.

New industries, to the number of 547, were established on or adjacent to the right-of-way; additional sidings or extensions thereof were constructed to meet industrial necessities, to the number of 124.

The transactions of the Land Department may be found recorded on Page 59.

During the year, a total of 129 shares of the capital stock of the St. Louis, Iron Mountain & Southern Railway Company were acquired by The Missouri Pacific Railway Company, and are held in its treasury.

Negotiations looking to the construction of a new bridge across the Mississippi River at Memphis, have finally led to the formation of the Arkansas and Memphis Bridge, and Terminal Company, having an authorized capital stock of $100,000, of which $10,200 is paid in, and a 5 per cent Bond First Mortgage, issuable not in excess of $5,000,000. The stock is equally divided between the St. Louis Southwestern Railway Company, the Chicago, Rock Island & Pacific Railway Company, and the St. Louis, Iron Mountain & Southern Railway Company, each of the companies subscribing to an operating agreement extending a period of 50 years, and guaranteeing the principal and interest of the bonds.

Not only will the new bridge afford adequate facilities for each Company, but will insure their accommodation at a reduced cost. It is estimated that the economy to the Missouri Pacific System will be in excess of $100,000 per annum. The foundations and some of the piers are partially completed, and it is hoped to place the bridge in commission in the course of another year.

The desirability of the System having a direct outlet and access to the gulf port of New Orleans, has led to a 99-year contract with the Texas & Pacific Railway Company for the use of its tracks between Alexandria and New Orleans, Louisiana. Permanent terminal facilities at the latter point are assored by the St. Louis, Iron Mountain & Southern Railway Company acquiring one-half of the stock of the Trans-Mississippi Terminal Company, which will, by deed or lease, have immediate control of all the terminals in and about New Orleans which are especially necessary to the transaction of the business of the St. Louis, Iron Mountain & Southern Railway Company and the Texas & Pacific Railway Company, which companies jointly guarantee the principal and interest upon, not to exceed $7,500,000, of the First Mortgage 5 Percent Bonds of the Trans-Mississippi Terminal Company. This transaction will shortly be submitted to the stockholders of the Texas & Pacific Railway Company and the St. Louis, Iron Mountain & Southern Railway Company for ratification.

The Companies' investment in the capital stock of the Wabash Railroad Company was adjusted to market value of June 30th, 1914, resulting in a charge of $2,468,527.45 to Profit and Loss during the year covered by this report.

There is presented on Pages 18 and 19 a consolidated balance sheet of The Missouri Pacific and the St. Louis, Iron Mountain & Southern Railway Companies. This exhibit is prepared in the same form as the individual balance sheets shown herein, excluding all accounts between the two Companies; the Securities Issued or Assumed, held in the Treasury of either Company, having been deducted from the total securities issued, resulting in a statement of the securities outstanding in the hands of the public.

By order of the Board of Directors.

B. F. BUSH,
President.

THE MISSOURI PACIFIC RAILWAY COMPANY.

PROFIT AND LOSS.

Efficient Shop Production

A most decided improvement has been effected in railroad shop operation and organization during the past decade. Because of the growth in the size of locomotives and the increased amount of motive power, a movement had been started a few years prior to that time for improved shop facilities. When the new and larger shop plants were placed in operation it was found that the cost of making repairs was not decreased as had been expected. This focused attention on the necessity for improving the organization and methods of operation in order to make the best use of the improved facilities. In many instances the men were placed on a piecework basis with the idea of increasing their individual output as well as automatically correcting defective methods and practices which had passed unnoticed when daywork was in vogue. Gradually some of the roads tried to scientifically operate the shops by introducing shop schedules and systematically studying each operation with the idea of eliminating lost motion and inefficiency. These things all resulted in increased production at a reduced cost per unit. Many of the roads, however, have not followed up these matters to the extent which they should, probably because of a lack of appreciation on their part of the returns which might be effected. Some of the things have stood the test of time so well that there is no excuse for their not being adopted generally. Improvements which have been made in the mechanical department of the Frisco and which are described elsewhere in this issue are of special interest, in that they indicate those features which the officers of the mechanical department of that road thought to be of greatest value for the special conditions which they may have had to meet.

Final Argument in the Rate Case

There was a curious lack of snap to the final arguments in the rate advance rehearing which was held Thursday and Friday of last week. Especially was this true of Mr. Brandeis' argument. It might almost have been called perfunctory; it was certainly not characteristic. It may have been that the commission's special counsel did not believe that the railways had made out any case; that was the point of his final argument. It may have been that the case of the railroads was so strong that opposition to it on the part of the commission's counsel was for form's sake only. That there is any possibility of doubt as to which of these two conjectures is true throws an interesting light on the rehearing. If the majority of the commissioners still continue to get a comprehension of the question which they must decide by looking at it through a microscope instead of a telescope, they will probably decide against the railroads. Almost every exhibit submitted by the railroads in the rehearing, can be viewed in such a way as to fail, taken by itself or picked to pieces and the pieces studied separately, to be a convincing proof of the railroads' needs. The railroads' case is so large, so fundamentally right, that the real exhibit is the present condition of the country itself. It is so obvious that the commissioners will have to use some artificial means to avoid seeing it. About the only way they could do this would be to lock the door of their conference room and, as a preparation for the study of the evidence and arguments submitted, divest themselves of all previously acquired knowledge, experience and judgment and approach the question with a mind blank—utterly blank.

Truth-Telling and Railway Credit

The principle and system of regulation that have been adopted in this country have forced on the railway managers the necessity of showing before they can get general advances in their rates that they are needed to enable the roads to earn an adequate net return. To say that a road must have higher rates to earn an adequate return is equivalent to saying that it must have higher rates to enable it to pay its interest and reasonable dividends and thereby maintain the value of its securities and its credit. Yet, every time railway managers appear before the Interstate Commerce Commission and say the reason why they want advances in rates is that they must have higher net earnings in order to pay their interest and dividends and maintain their credit, some lawyer or commissioner asks them if they do not think that by saying these things they injure the credit of the railways! Of course they do. It also hurts a man's reputation for health to tell his physician he is sick.

It hurts his reputation for earning capacity to admit that he is out of a job and ask somebody to give him one. But are these reasons why men should not call physicians, or hunt jobs when they need them? The railways have to appeal to the Interstate Commerce Commission for the opportunity to increase their net earnings just as a man has to appeal to his physician when he is sick. The railway managers do not tell the commission that they need higher earnings to injure the credit of the roads, but ultimately to strengthen their credit. They cannot tell the facts without injuring the road's credit temporarily and the reason why they take their troubles to the commission and thereby make them public is to get relief that will enable them to escape from their troubles—relief, in other words, the granting of which is essential in order that the carriers may not only have good credit, but may deserve it. Which is worse: For the managers to tell the facts, even when temporarily this will injure the railways' credit, or to conceal the facts or tell lies in order temporarily to bolster it up?

THE STATESMANLIKE ARGUMENT OF MR. MINNIS

IN his argument before the Interstate Commerce Commission in the final rehearing of the five per cent rate case, J. L. Minnis said:

"At a time like this, when many of our people have lost their savings invested in railroads and the general investing public is apprehensive and more or less suspicious of railroad investments, a clear and explicit definition of the attitude of the government with respect to railroad credit is not only demanded by the public welfare, but by common honesty and fair dealings as between the government and its citizens. The people are entitled to know the attitude of the government expressed through the commission, and to determine for themselves whether they wish further to promote the railroad industry of the country by their savings, and this applies as well to those who now have investments as to those who may have a surplus to invest.

"That attitude cannot be announced in mere words, but if expressed it must be expressed in the application of a rule or measure to the facts in this case."

Never before, so far as we know, has this fact, which everyone who has studied the railroad question at all knows to be a fact, been so frankly, so clearly and so comprehensively put before the commission. If the railroads of the country are to be developed and kept abreast of the requirements of business through the use of private capital, private capital must be induced to enter this field. It would not make one iota of difference in the present case whether or not the securities issued against railroad property in this country had a face value grossly in excess of the actual money investment in the property. It is the duty of Congress to pass such laws as will prevent the misuse of railroad credit, and it is the duty of the courts to enforce such laws. It is, however, a vitally important duty of the Interstate Commerce Commission to so conduct its regulation of railroads as to insure continued investment of private capital in this field. Expediency is sometimes a word of disparagement. In the Interstate Commerce Commission's regulation of the railroads it is synonymous with statesmanship.

The Supreme Court of the United States has fixed a limit below which profits on an investment of private capital cannot be forced either by the legislature or a legislative body. The upper limit of the profits of investors in the stock of railroad companies is a question of expediency. As Mr. Minnis says, "The moral sense of right and justice of the investors has caused them to revolt, and will continue to cause them to revolt, against the suggestions that when they invest their money for the use of the public they must take all the chances and hazards, with a mere possibility of earning at the most a reasonable return on their investments, while the public who uses the product of the investment assumes no obligation or hazard whatever."

WHAT THE COMMISSION MIGHT DO

IT is important to a fair consideration of the question of rate advances in eastern territory, as it is now pending before the Interstate Commerce Commission, that both the developments which have raised it, and the various ways in which the commission can dispose of it, shall be clearly understood.

The original application of the railroads for increases in rates was not based on the ground that their total earnings were declining. It was based on the ground that while their total traffic and earnings were increasing, their operating expenses, taxes and property investment were increasing so much faster that their net earnings were relatively declining, and that therefore they had become unable to pay a satisfactory return either on the capital they already had invested, or on the new capital which they needed to raise. The statistics for the fiscal year 1913 supported this contention in every respect. Those for the fiscal year 1914, which have been made public since the commission's decision in the original case support it in a far more conclusive and striking manner. It is necessary to go back to the panic years of the 90's to reach a time when railway net earnings were relatively as small as in the fiscal year 1914.

The Interstate Commerce Commission conceded in its decision in the 5 per cent case, before the bad figures for the fiscal year 1914 were available, that the net operating income of the railways in eastern territory was insufficient for either their welfare or that of the public.

In other words, before the European war, with its demoralizing effect on the financial markets of the world, had begun the statistics of these railways demonstrated conclusively their great need for an increase in net earnings. The commission had conceded this as to the eastern lines, and had also, in effect, conceded that if the railways could not obtain the needed net revenues by the small advances in rates which it permitted in Central Freight Association territory, and by the other methods which it suggested, these things should be supplemented by still further increases in rates.

Now, what effect has the war had on the situation? Has it created the pressing needs of the railways? No; it has simply rendered very much more acute the pressing needs which already existed. Developments have shown that it is impracticable for the railways to apply speedily most of the various measures which the commission suggested in its opinion in the 5 per cent case as means of increasing their net earnings. Furthermore, the investigations which have been made by the railways show that the amount of additional net revenues which can be derived from these various sources is far less than the commission and its counsel believed.

In view of the statistics showing the results of the operations of the railways in eastern territory in the fiscal year 1913, and especially in view of the statistics showing the results of their operations in the fiscal year 1914, it is clearly manifest that if net results and return on investment are to be given any considerable weight in determining the reasonableness of entire schedules of rates, then it could not be held by any rational tribunal, entirely in the absence of any such emergency and change in conditions as those precipitated by the European war, that rates averaging only 5 per cent more than those now in effect in eastern territory would be unreasonable. Therefore, entirely in the absence of this special emergency and these special conditions the proposed rates on the whole could not be held to exceed a reasonable maximum. And, in addition, the war actually is going on and the conditions which it has created actually do exist to add their compelling force to the argument.

In view of all the facts, what are some of the plans which it may appear that the commission might adopt?

1. It might hold all of the advances proposed by the railways reasonable and permit the tariffs to go into effect immediately.

2. One of the objections which has been made to the tariffs filed by the railways in the so-called "5 per cent case" is that some of them provide for advances exceeding 5 per cent. The

commission might merely hold a general 5 per cent advance reasonable, thereby requiring the roads to eliminate all advances exceeding this percentage.

3. The commission might recognize the needs of the railways for immediate relief, but have some doubts as to whether rates 5 per cent higher than those in effect would in all cases be reasonable. It might therefore let tariffs carrying 5 per cent increases go into effect without previously passing on their reasonableness. There is no doubt about its authority to do this. The law does not require it to hold up all advances before passing specifically on their reasonableness. If it should take this action the roads would be given the immediate relief which they need and the commission would be left free to investigate later any specific rates or schedules of rates whose reasonableness might be challenged.

4. The commission might recognize the fact that the railroads need immediate relief, but feel that in the long run their needed increases in revenues should be secured by other methods than increases in rates. In that case it might let a 5 per cent increase go into effect for a certain specified period, as a year or two years. This would afford the railways immediate relief; it would give the commission time and opportunity to investigate the questions of spotting charges and so on, and, if at the end of the specified period the commission should decide that the higher rates should not be continued, they would automatically expire.

5. The commission might merely give the trunk lines a 5 per cent increase in certain of their rates, as it did the Central Freight Association lines.

The evidence that the railways need not only a 5 per cent increase, but more, is so conclusive that it is difficult to conceive how the commission can possibly convince itself that it should not hold such an increase reasonable. But if it should have its doubts as to whether it should grant such an advance without retaining the power of withdrawing it in case it should later decide that the need for it had not existed or had passed, that is no reason why it should not permit the advance to be made now. There is good ground for believing that some agreement could be reached by the commission and the managers of the railways to put the advance in effect only until it could be found out what time is going to bring forth. The concluding sentences of the statement made by President Willard of the Baltimore & Ohio to the commission on October 19 seem to be quite significant. Mr. Willard said:

> It is hardly necessary to suggest that if the commission, in view of the present situation should now conclude after consideration of all the facts to approve the tariffs as requested, and should it at any time later on appear that the situation had changed and the emergency had passed, and should it further appear that the carriers involved in this proceeding were then, taken as a whole, in such condition as to earnings, maintenance charges and return on capital obligations as to justify a reconsideration of the action now prayed for, this commission would have ample power to order at any time such reductions as might be fair and reasonable, and I am of the opinion that the carriers would not oppose such action by the commission when conditions such as I have enumerated shall have been established.

The railways' case may be summed up in two sentences: First, under the conditions which existed before the war began, and which would have continued to exist if it never had begun, rates averaging 5 per cent higher than those now in effect would not have been unreasonably high, and probably would have not been high enough. Second, the conditions produced by the war have made the needs of the railway greater and more pressing, and on the "fair return" theory itself, have, by increasing the return which must be paid on capital, made higher the "fair return" to which railways are entitled.

There are numerous ways in which the commission might deal with the situation. There is only one way in which to so deal with it as certainly and effectively to promote the public welfare, and that is by permitting the eastern railways to make the advances for which they are asking at the earliest practicable date.

THE NEWSPAPERS AND THE INTERSTATE COMMERCE COMMISSION

GENERALLY speaking, the newspapers of the country have been hostile to the railways for years past. Even papers that occasionally have recognized in their editorial columns the changed conditions in the railway business and in the relations between the roads and the public have been less disposed to publish matter of this sort than news articles giving the outbursts of the irresponsible, notoriety-seeking critics of the roads. In the past year or two, however, there has been evident a strong tendency on the part of the newspapers to change their tone on railroad matters, and to show that the old abuses have largely been corrected, that the railroads have been both tamed and educated and that they now need co-operation rather than further chastisement.

This change has been the result of several causes, chief of which perhaps are that the ethics of railway management have been improved, that the railroads have been rendered comparatively powerless by legislative restrictions, and the wide publicity that railroad officers have given to their affairs and to their arguments, and the consequent better understanding that the public has gained regarding the railroad situation.

This reversal of form on the part of the newspapers is strikingly reflected in their editorial utterances on the rate advance case before the Interstate Commerce Commission. In the general rate advance cases in 1910 and 1911 the newspapers were almost unanimously against the roads, and their columns were filled with inaccurate statements regarding railroad affairs emanating from sources unfriendly to the roads. When the roads were denied any advances in rates by the commission the decision was approved, and for two or three years almost every action of the commission was given hearty approval by the press.

But when the commission's predictions as to the future prosperity of the railroads failed to be sustained by the outcome, and when the net earnings of the railways grew worse instead of better, the newspapers began to question the wisdom of continued raids on the railroads by shippers seeking rate reductions, by labor unions seeking higher wages, and by legislation requiring increased expenditures. During the progress of the hearings before the commission in the case recently decided a large number of newspapers supported the petition of the roads for higher rates, while others that formerly were eager to embrace any opportunity to ridicule the claims of the roads assumed a waiting attitude. They took the position that if the roads needed the advance they would be able to convince the commission, and that the commission's decision could be depended upon to meet the situation.

This view might have prevailed had not the commission's excursions under the tutelage of Special Counsel Brandeis into the byways of "free service" and spotting charges, in the effort to increase rates indirectly, while denying a general advance, so complicated the situation with which the commission was attempting to deal and so delayed the rendering of the decision, that the country became impatient. The impression had become general that the commission would allow an increase, and this prospect was generally hailed throughout the country as a harbinger of returning prosperity. Naturally, the press began to criticise the delay. Had the decision been rendered promptly and upon the clear-cut issue presented it would undoubtedly have been accepted as final, both by the roads and by the public. If the commission had held that the roads were so prosperous that they did not need an advance in rates the press and the public might have believed it, and the railroads might have been compelled to adapt themselves to that fact.

Instead the commission found that the net operating income of the carriers in official classification territory considered as a whole, was smaller than was demanded in the

public interest, but granted only a very small increase in rates in part of the territory and held forth suggestions as to how the net income might be increased, some of which were vague, illusory and impracticable. Therefore, when to the disappointment of an unfavorable pronouncement of such a character that it has been referred to as "5 per cent decision and 95 per cent indecision," was added the circumstance that it was not rendered until a disastrous war had upset business and created an unprecedented emergency the tone of the press was changed to one of almost unanimous denunciation of the commission.

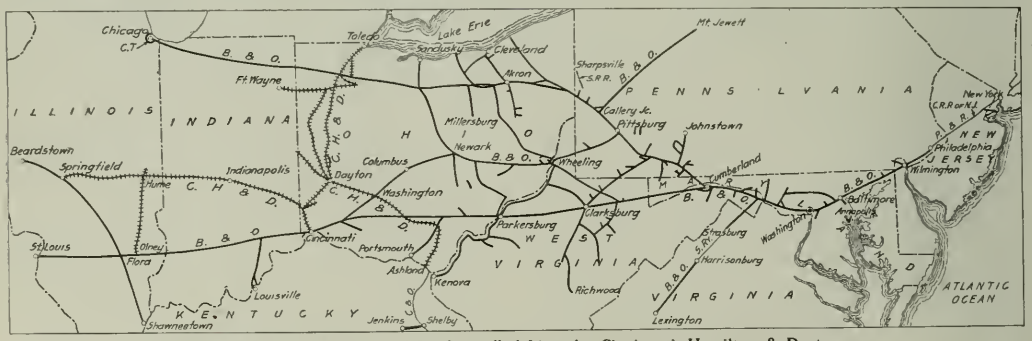
On October 22 we published extracts from about 30 leading newspapers of the country, taken without selection as they came to our exchange desk, demanding an immediate reopening of the case in view of the changed conditions created by the war. Only one of these editorials squarely opposed higher rates and nearly all contained severe criticism of the commission for its previous decision. In this week's issue we present another collection of editorials, most of them called forth by the attitude assumed by the commission in questioning railroad witnesses, and unanimously demanding a prompt advance in rates, not only for the benefit of the roads, but for the welfare of the country as a whole. But two of these oppose the position of the railways.

The *Railway Age Gazette* has frequently criticised the newspapers for their unfairness to the railroads. Some of the present criticism of the commission is perhaps equally unfair. Many papers which have found their advertising falling off have come to the conclusion that the railroad situation is at the bottom of the dull business conditions, and so, right or wrong, they are now for higher rates. But most of the newspaper comment seems to show an increased knowledge of the railway situation. In any event, the change in the tone of the press is highly significant as an indication of the extraordinary change in public sentiment which has taken place.

BALTIMORE & OHIO

As in the course of alternating periods of business prosperity and business depression it is difficult to tell whether a given pause in progress is simply a period of stocktaking before a further advance, or a sign of the turn of the tide to be followed by depression, so it is difficult to say whether the Baltimore & Ohio's showing in the fiscal year ended June 30, 1914, was a pause before a further advance or foreshadows a more or less lengthy period of depression for the road. Earnings fell off and expenses increased; maintenance of way was ample, but no new improvements were undertaken; additions were made to the equipment but repairs to a quite considerable number of freight cars were deferred; the average trainload remained stationary in the face of a large increase in empty car mileage, but transportation expenses per train-mile continued to mount still higher. All of the figures, moreover, in the 1914 annual report are affected by the flood damage caused in the previous year, and furthermore, the Baltimore & Ohio's own financial position is somewhat entangled with that of the Cincinnati, Hamilton & Dayton. The table at the end of these remarks shows the principal figures in the income accounts of 1914 and 1913.

The Baltimore & Ohio operates 4,478 miles of road. Like the Pennsylvania Railroad, it is both a coal road and a through trunk line; but unlike the Pennsylvania Railroad it combines both a line in Central Freight Association territory and one in Trunk Line territory; and furthermore, it is nearly all main line. Congestion of the main line is the problem which is constantly pressing upon the operating department for solution. When Mr. Willard took hold of the management of the property he at once began to add to both the equipment and track capacity and to increase the trainload. With the increased average trainload, however, there were quite considerable increases in transportation expenses per train-mile. The gradual building up of a better operating organization was to be combined with the added track facilities to eventually lower the train-mile cost. It is safe to assume that by no means all of the improvements, additions and betterments which were originally planned have been carried out because of the business depression, the flood and the impossibility of selling long-term railroad bonds. The operating organization is immensely better than it was a few years ago, and yet the net income per mile of road in 1914 is the smallest in more than ten years. The operating ratio has steadily risen in the last ten years from 66.78 to 75.29. The cost per hundred locomotive-miles run of wages, repairs, engine house expenses, fuel and other supplies has risen in these ten years from $25.50 to $38.37; in 1913 it was $36.66. Economies in transportation costs will probably be more clearly reflected in the 1915 figures than in the 1914 figures, because various special circumstances, such as the large increase in empty car movement, the falling off in tonnage of products of agriculture and of bar and sheet metal, and the after effects of the flood, temporarily offset these economies. On the other hand it is only a question of time, and that of a not very long time, until further quite considerable expenditures for additions and betterments will have to be made to increase the capacity of the transportation plant. The ability of the company to raise new capital on reasonable terms will then become a vitally im-



The Baltimore & Ohio and Its Controlled Line the Cincinnati, Hamilton & Dayton

portant question, not only to the railroad company, but to the shippers whom it serves.

Insofar as the present relation of working capital to current liabilities and the volume of business is concerned, the Baltimore & Ohio is in a thoroughly sound condition. In addition to the $20,000,000 which it had in cash to pay off $20,000,000 notes matured July 1, the company had $14,486,000 cash and, excluding the notes, $11,157,000 total working liabilities June

30, 1914. It is interesting to note that the effect of paying all wages semi-monthly has been to almost cut in half the amount of audited vouchers and wages unpaid. In 1914 this working liability amounted to $4,996,000, a decrease from 1913 of $4,278,000. On the other hand, the company refunded its $20,000,000 notes by the sale of $35,000,000 4½ per cent one-year notes. These new notes were sold before the beginning of the European war and the company's credit was high enough to permit of their sale to the public at par. With New York city paying 6 per cent for short-term money since the outbreak of the war, the prospects for refunding Baltimore & Ohio $35,000,000 notes in June of next year at any reasonable rate are bad unless conditions materially change and the public gains a confidence in railroad securities as investments which it does not now have. The Interstate Commerce Commission's attitude is, of course, of the utmost moment in this respect.

In 1914 the Baltimore & Ohio carried a total revenue tonnage of 69,382,000. Of the total revenue 77.80 per cent came from freight. Of the total tonnage carried in 1914, 66.60 per cent was furnished by products of mines, bituminous coal alone furnishing 46.51 per cent of all the tonnage carried. Manufactures furnished 15.88 per cent, products of agriculture 5.08 per cent, and merchandise 2.86 per cent. As was already mentioned, there was a very considerable falling off in the tonnage of products of agriculture, the total tonnage carried in 1914 being 3,522,000 tons, or 499,000 tons less than in 1913. There was also a very large falling off in the tonnage of coke, which tonnage in 1914 amounted to 3,891,000 tons, or less than 1913 by 912,000 tons. On the other hand, the tonnage of l. c. l. freight amounted to 1,987,000, an increase of 106,000 tons.

The Baltimore & Ohio's trainload of revenue freight in 1914 averaged 619 tons as against 620 tons in 1913; but the average number of loaded cars in trains was 23.99 in 1914 and 24.39 in 1913, while the average number of empty cars per train in 1914 was 12.96 as against 11.70 in the previous year. The average length of haul was 194 miles as against 198 miles in 1913; the average ton-mile rate was 5.64 mills in 1914 and 5.60 mills in 1913.

The following table shows the repairs, renewals and depreciation charges per unit of equipment in 1914 and 1913:

	1914	1913
Repairs per locomotive	$3,157	$3,589
Repairs per passenger-train car	564	797
Repairs per freight-train car	81	85

Total transportation expenses amounted to $38,699,000, an increase over 1913 of 3.82 per cent, and they amounted to 39.73 per cent of total operating revenues as compared with the transportation ratio of 36.70 per cent in 1913. As Mr. Willard points out in his annual report, the congestion following the flood necessitated detouring traffic in the earlier months of the year when business was heavy. In addition there was a full year of the higher wage scale for trainmen, which alone accounted for an increase in transportation expenses of $805,000. There was also a large increase in the payments for loss and damage to freight and injuries to persons, the total amount on these accounts in 1914 being $1,593,000 and $719,000 respectively, the total increase in the two accounts over the previous year being a little over $500,000.

The following table shows the principal figures for operation in 1914 as compared with 1913:

	1914	1913
Mileage operated	4,478	4,456
Freight revenue	$75,784,287	$80,194,490
Passenger revenue	15,893,721	15,537,078
Total operating revenue	97,411,441	101,556,132
Maint. of way and structures	12,207,191	14,019,620
Maint. of equipment	16,681,986	18,323,210
Traffic expenses	2,151,887	2,026,274
Transportation expenses	38,699,493	37,274,397
General expenses	2,314,336	2,136,137
Total operating expenses	72,054,892	73,779,638
Taxes	3,226,466	2,960,905
Operating income	21,244,837	23,941,278
Gross income	27,262,556	29,153,484
Net income	9,250,024	13,382,111
Sinking fund	49,457	47,861
Dividends	11,473,395	11,473,653
Surplus	2,223,371*	1,908,458

*Deficit.

Letters to the Editor

THE REDUCTION IN LOCOMOTIVE ORDERS

Chicago, Ill., September 28, 1914.

To the Editor of the Railway Age Gazette:

There are several barometers of general business, such as grain and steel production and prices, but for the railway supply man a more direct indication may be taken.

The buying situation for the past year or more, on railroads, has been affected in various ways by general business conditions; by the wait for the rate decision; by the shadow of the wage strike on the western lines and then by financial and general business reasons as imposed by the European war. All these are on top of a sort of a climax of financial stringency, brought about by increased taxation, expenses on account of state and governmental legislative regulations, wise or otherwise, all serving to reduce the purchasing power of one of the greatest buyers in our markets and have very materially contributed to the lessened market for the staples as well as the specialties used in railway maintenance.

How bad, at least, one phase of the situation has been is shown by a comparison of locomotives purchased this year as compared with past years. Taking the reports of the *Railway Age Gazette*, and for the sake of comparison with former years, including only orders placed by railroad or industrial companies in the United States, Canada or Mexico, we find that the orders in 1914 have been reported month by month as follows:

January 43	April 127	July 99
February 139	May 131	August 45
March 167	June 50	September 17

Total for nine months (locomotives).....818

The figure for any month is not necessarily that of the orders placed in that month, but is the total of the orders reported. The result, however, is the same. The average for the year, at this rate would be about 1,091, but the last three months give no promise of maintaining the average, and the total may not be above 900 or 1,000.

From the table showing cars and locomotives ordered, during the past 13 years, in the issue of January 2, 1914, we find that the average number of locomotives purchased per year, during the period 1901-1913 inclusive, was 3,798 per year. The greatest number ordered in any one of these years was in 1905, the number being 6,265; the lowest being 2,538 in 1904. The next lowest was 2,850 in 1911. The orders for 1912 were 4,515, or above the average, while 1913 indicated the tendency towards present low level by going below the average, the orders being 3,467.

The figures show that the railroads are purchasing, in an important line of their requirements, but about one-quarter of the average for 13 years past, a reduction of between $50,000,000 and $60,000,000 for the year, and this covers many lines of materials and will account for some features of general depression.

A further deduction would be that these conditions may prevail for some time and that the problem of railroad executives and motive power officers is to maintain their present equipment at the highest standard of efficiency and availability until the time does come when renewed purchasing of new equipment is made possible by increased revenues.

C. A. Seley,
President American Flexible Bolt Company.

Argentine Railway Construction.—The public works committee of the Argentine Chamber of Deputies has reported favorably upon the petition of the Buenos Aires Central for the right to construct the following lines of railway: One which, starting from the city of Cordoba, shall connect with the line authorized to the company by a previous law in the neighborhood of Villa Maria, and a branch connecting the company's main line with the city of Luian.

What the Press Thinks About the Rate Case

Sharp Criticism of Attitude of Interstate Commerce Commission. Papers Almost Unanimous for Rate Advance

In the issue of October 22, page 607, were published extracts from editorials from newspapers in all parts of the country on the reopening of the rate advance case, nearly all of which supported the contention of the railways that the emergency created by the European war is such as to warrant a modification of the commission's decision of August 1. Since the hearing in the reopened case the newspapers of the country have been almost unanimous in criticising the attitude assumed by the commissioners, and especially by the attorneys, Brandeis and Thorne, in the questioning of the railroads' witnesses. We present herewith extracts from the editorial utterances on the case which have come to our exchange desk in the last few days. As before, no selection has been made of those favorable to the railways and it is again noteworthy that out of 35 but two of those we have received come out squarely opposed to the plea of the railways.

PUBLIC POLICY AND THE RATE RAISE

[From the Chicago Tribune]

It is difficult to believe that a member of the Interstate Commerce Commission would put the question attributed in the reports to Commissioner Clements, when he asked President Willard if he thought the railroads should be granted relief denied other industries affected by war conditions. The question implies either ignorance or bias, and it is not pleasant to ascribe either to a man in Judge Clements' responsible position.

It is obvious that the railroads would not be before Judge Clements and his colleagues except for the fact that they are in an entirely different situation from "other industries." What they may charge for their commodity, transportation, is fixed by the will of Judge Clements and his colleagues. Any commissioner who should be capable of losing sight of this basic factor, or, worse still, of ignoring it, would be unfit for a place on the commission. Mr. Clifford Thorne, whose anti-railroad sentiment somewhat weakens the credit we are disposed to give argument, is confident that the railroads are fortified against present conditions by accumulated surplus or by the reduction of dividends. He concedes foundation for the railroad claim that a crisis exists. He therefore concedes a flat question of broad policy, and we believe it is one of the most critical ever presented to the commission.

If this question of policy is determined against the railroads and the railroad managers are correct, the results will be serious not merely to the security holders of the railroads, but to all business and all industry, including most emphatically the industry of agriculture.

If the railroads are granted the rate increase, on the other hand, and Mr. Thorne is right, it may result in a temporary injustice to some classes of shippers, or even a slight increase of burden to consumers. But it will be a temporary injustice, for it can be corrected when it is shown to be so, and when the present acute conditions have passed. And at worst the increase of rates cannot bear as heavily upon the public as would the consequences predicted by financiers and railroad experts.

WHY RAIL RATES SHOULD BE RAISED

[From the Milwaukee Evening Wisconsin]

The New York Journal of Commerce a few days ago voiced the sentiments of liberal-minded and practical citizens when it expressed the hope that the commission will regard the embarrassed condition of the railroads, which affects detrimentally their employees, their shareholders, their stockholders and the general credit situation, whose foreign ramifications are of extraordinary importance in this critical time. American railroad securities to the amount of many millions, reasons the Journal of Commerce, are still held abroad. "If the credit of the American railroads is made sound again, foreign holders will be well content to keep their holdings unless need of cash compels them to sell. But if the commission should again refuse to comply with the reasonable request of the railroads, or should again indefinitely delay its decision, then a flood of foreign selling would be inevitable at the first opportunity."

The question should not be decided under class pressure of any sort. The commission should keep its eye fixed on the larger interests of the whole people.

LET US HAVE ACTION

[From the Brooklyn Eagle]

The Times calls attention to some interesting phases, one of which is the fact that it cost the companies $5,000,000 to prepare the schedules first presented to the commission—it is expensive to make a request. Another is that presentation must be repeated, which is to say, facts already recorded must be duplicated. A third is that after protracted hearings, involving large outlays, it takes the commission about three months to reach a conclusion.

Unfortunately, this sort of thing cannot be dismissed as farcical. It is serious. Apparently, the commissioners think that the more drastically they deal with the railroads, the greater the protection they afford to the public. It is useless to remind them that adversity for the carrying corporations spreads, so to speak, all over the face of the earth. It is, or appears to be, a waste of breath to tell them that an ugly problem is clamoring for solution, that the case is desperate and that the patience of the public has reached a limit. It is exhausted. Let us have action.

NEEDS OF THE ROADS

[From the Albuquerque Journal]

Should permission be withheld, the decision apparently would be based upon the sins of a few of the companies, for which all of the other railroads and the public must suffer.

The argument of Mr. Thorne, of Iowa, in opposition to the increase was puerile. His declaration, that if the railroads were permitted to increase their freight rates he would back a movement to pay every Iowa farmer for losses if each of his hens failed to lay an egg a day, might have sounded catchy in a stump speech, but it had no place in an important semi-judicial hearing on a matter of the gravest public importance.

The opposition to the application for advancing rates is based chiefly on the reckless speculation in the New Haven and Rock Island, and to a less degree in the Baltimore & Ohio. In the face of present conditions, which call aloud for strengthening the credit and the service of the railroads by a rate increase, there can be no other basis for opposition.

PUTTING MONEY AT WORK

[From the Toledo Blade]

Money for the railroads can be obtained only if the railroads can show earnings assuring the interest upon the money borrowed. For some time, the railroads have been unable to give any such assurance. Earning power has slid down. Operating expenses have gone up.

So it has been impossible for the transportation companies to replace rails, lower grades, reconstruct bridges, put in branch lines, extend the block system, buy locomotives and order cars, as these things ought to be done in order to meet the demands

of traffic and answer the cry for betterments. Buying has been from hand to mouth. Little construction has been undertaken which could be postponed. And because of this condition, mills have not run to capacity, locomotive and car works have been running on part time, ore carriers have been tied up in the lake harbors, equipment houses have been wrapped in gloom, and labor, instead of being in demand, has had to plead for work.

It would be foolish to be sentimental over the woes of the railroads. But if, by increasing their earnings, the railroads can set millions of dollars of idle money into circulation, they should have that opportunity. Anything promising to set the hoarded money of the country at work ought to be given a trial.

RAILROAD TAX INCREMENT

[From the New York Commercial]

From one point of view, at least, the railroads which are seeking permission to increase their freight rates can present a strong case.

The two principal factors in the increased costs of operation are undeniably the higher rate of wages paid for railroad employees and the advance in prices exacted for railroad supplies and equipment. But besides these two factors of increased operating costs there enters into the situation a third and that is the rapidly advancing taxes paid by railroad companies. This increase is well illustrated by comparative statistics of the fiscal years 1911 and 1914 as compiled by competent authorities. Net earnings of 15 of the largest railroad systems of the country for the fiscal year 1914 are shown to have been $372,730,802, compared with $362,258,931 for 1911, the percentage of increase for the three years being 3 per cent. The taxes paid by the same companies for the fiscal year 1914 were in the aggregate $58,-973,229, compared with $45,621,165 in 1911. In the case of the taxes it then appears that the rate of increase has been 29 per cent during the three years under consideration.

It is not the contention that the value of railroad property has stood still during the three years mentioned; on the other hand it unquestionably has increased in value and therefore some increase in taxes was to have been expected, but the disparity between the rate of improvement of net earnings on the one hand and the increase of taxes on the other obviously is too great not to call for some remedy.

It is one of the phases of the rate question which might well be investigated by the Interstate Commerce Commission with a view to remedial measures.

RAILWAY FINANCES

[From the New York Evening Post]

That inducing foreign investors to renew their loans to American corporations or to refrain from selling back the stocks and bonds they hold, would be greatly simplified if the question of earning power were cleared from obscurity, through some further advance in rates, it is hardly necessary to argue. We are perfectly well aware that the argument is dangerous, for the reason that it might be applied with even greater force to a sweeping increase of rates. But no one expects such action as that, and no one has asked for it. The question really hangs on the commission's withholding, in its July order, of the full five per cent increase applied for by the railways.

IT MUST BE OPEN-MINDED

[From the St. Paul Pioneer Press]

The mental attitude of the members of the Interstate Commerce Commission in so far as it is exhibited by the character of questions they put to witnesses in the eastern rate hearing does not seem to us to be strictly right. It does not indicate that the commission is possessed of the open mind which is the first essential of a body at least semi-judicial in its nature. Questions which have for their purpose the eliciting of all of the facts are not only right, but necessary; but questions which seem studiously framed to embarrass witnesses and which indicate an antagonistic attitude by the commission will not leave a satisfactory impression upon the public mind. It is a business proposition and the commission sits as judge, not as proponent or antagonist. It is a proposition fraught with great importance when it was submitted, but doubly important now that the depressing hand of foreign war has been laid upon the world and we must accept our share. The public would have greater confidence in the wisdom and justice of the final decision if the commission presented a more judicial mind to the proceedings as they develop.

BUSINESS AND RAILROAD CREDIT

[From the Providence Journal]

One of the questions asked at the hearing on the rate schedules—should railroad stockholders not be willing to lose dividends when business is poor?—does not apply to the present situation, notwithstanding its plausibility. There is a difference between railroads and industrial enterprises in the United States.

The storekeeper and the manufacturer are at liberty to charge higher prices when the cost of materials and labor advances. The consumer is liable to be called upon at any time to pay 10, 20 or 50 per cent more for supplies. But the railroads for years have been deprived of the right to increase their incomes to meet higher taxes, the demands of labor, extra expenses forced upon them by new laws and rising prices of commodities. Four years ago the Interstate Commerce Commission rejected an application for rates corresponding to new conditions; last summer the commission acknowledged that the revenue was inadequate, and offered advice as to augmenting earnings without disturbing the present rate schedules to any appreciable extent, and now the petition is up again because the previous decisions did not give the relief needed. If the railroads had been allowed to follow the ordinary rules of business it is not likely that they now would be carrying on an argument in Washington.

PECULIAR STATUS OF RAILWAYS

[From the St. Louis Globe-Democrat]

The principal argument used against the granting of the application of the eastern railways for an increase of rates was an attempted parallel between the railway and ordinary private business. The comparison of railway with ordinary business is not altogether fair. Furthermore, the government has done everything in its power to aid ordinary business. It has extended the Aldrich-Vreeland currency act and enlarged it to care for the emergency in credit conditions. But ordinary business is not run by the government as the railways are. They must in all practical matters submit to the judgment of the Interstate Commerce Commission and the various state commissions and to the acts of Congress and the various legislatures. They must submit every schedule to the scrutiny of commissions, who hold hearings on complaints of shippers. Since the government has seen fit to exercise these large powers, which experience showed to be necessary, it has morally bound itself to do justice to the railways as well as to the public.

THE INTERSTATE COMMISSION AND THE EMERGENCY

[From the Baltimore Sun]

That the situation following the war, taken in connection with the conditions shown to exist prior thereto, has created a crisis in railroad affairs few will deny. The railroads' executives and others have testified to it, and even Mr. Clifford Thorne, who has appeared so persistently in opposition to the general advance in rates, admits that "today the railroads have some foundation for their claim." How will the commission meet this emergency? By permitting a uniform advance of 5 per cent of all the rates in the territory the immediate necessities would be met. The slower processes, proposed in the commission's previous order, of correcting objectionable or inequitable practices and the adjustment of abnormally low rates, could be proceeded with. If then, upon the basis of rates so established, the railroads should earn more than a fair and reasonable return upon the property devoted to the public use, the commission should order such reductions as would be fair and equitable. It would seem as if the

commission, with the co-operation of the railroads, might devise some method which would permit of the carrying out of such a policy.

THE HEART OF THE RATE QUESTION

[From the New York Times]

When the railways again are in the market there will be no question about the dividend upon Steel shares. The reduction of its dividend heretofore has been an early sign of the turning of the tide. Those who have based their judgment of business affairs upon the steel trade always have done well by expanding when the iron trade is low. It is lower now than it has been over any extended period of time since the formation of the Steel Corporation. It is not a prophecy of worse to come, but is a sign that the worst has been passed. In that restricted sense the Interstate Commerce Commission is a more depressing factor than the war. It also is a factor more easily controlled. The light of reason will dawn upon the commission a little before it is dazzling the eyes of everybody—if the commission is prudent.

A QUESTION OF RAILWAY POLICY

[From the New York Times]

The counsel for the Interstate Commerce Commission has made a plea before it, and in its behalf before the country, unlike anything which previously has come from the commission. Hitherto the commission has always asked, and has always received, more power to deal with the crises which its policy has raised. Now for the first time the commission admits its inability to deal with the situation, and refers the subject back to the source of the commission's power. The decline of credit which disables the railways from meeting the necessities of the country for facilities of traffic adequate to the country's growth is no concern of the commission. That is something apart from the reasonableness of rates, and is a question, in the words of the commission's counsel, of "financial policy of the government, with which another government agency is called upon to deal." Others have suggested that the commission was in water too deep for its comfort, and that it might be well for Congress to give it assistance, if the credit and usefulness of the commission, and the theory of regulation, were to survive the storm which the commission has raised, and which it now admits it cannot compose. No doubt the situation is made worse by the conditions growing out of the war, but the war is not the cause of the railways' troubles.

PLIGHT OF THE RAILWAYS

[From the San Jose Mercury Herald]

The attitude of the present national administration towards the railways of the United States has not been characterized by a sufficiently broad spirit of fairness in many important particulars and the result has been an impairment in efficiency which has reacted upon the people at large in the shape of reduced convenience in transportation facilities. While everybody recognizes in most of the railroad companies a willingness to charge all the traffic will bear, there is no general desire to deprive these corporations of a just return upon their capital invested and proper pay for the service they render. The cultivation of antagonism against the railways merely because they are powerful corporations will never adjust differences which may arise between them and the people. If there could be more harmony and a more cordial spirit of co-operation between government and railroads, mutual results would be better and the people would be benefited more acceptably than under the prevailing conditions.

RAILROADS IN A DIFFERENT SITUATION

[From the Jacksonville (Fla.) Times-Union]

From the grilling administered to the railroad men who appeared at the hearing, it looks as if the Interstate Commerce Commission, as at present constituted, is composed of men more prejudiced than the average of the American people against the railroads. Each witness was rigidly cross-examined, and the railroad men were reminded that the people of the United States as well as the railroads needed relief.

This important fact was lost sight of: The people of the United States fix their own prices for what they offer for sale or for their services. There is no commission that holds to the lowest level short of confiscation the value of their products or of their services. If the railroads enjoyed this privilege that is accorded to all other classes they would not be now complaining.

PREJUDICE HAS NO PLACE IN THE RATE CASE

[From the Philadelphia Ledger]

One-eighth of all the wealth of the United States is in railroads. Congress has seen fit to place this one-eighth of our national possessions in the hands of seven men. No other similar body is endowed with such power over the destinies of twenty billions of capital, two million employees and more than that number of investors.

The attitude of the Interstate Commerce Commission which most amazes the public is its apparent hostility to the railroads. It was created to weigh facts and hear testimony, but not to perform the duties of a prosecuting attorney.

What the public, which must pay all the bills of both railroads and shippers, would wish is the commission sitting as a judicial tribunal to hear cases. It ought to be equally friendly to both sides and antagonistic to neither.

In resenting what bankers and others interested in this vast railroad property are doing to protect it, the commission displays an attitude wholly unjustified. It is still the privilege of every American to guard what he owns.

THEY WANT THEIRS, ANYHOW

[From the Detroit News]

The railroad officials in the hearing at Washington stated their whole case when they said that dividend payments must be maintained regardless of conditions which affect income, because the fealty of the investor must be sustained if railroad finance is to go on as it has been going, carrying its load of "water."

It is the perfect privilege of the railroads to so argue. It is also the perfect privilege of the Interstate Commerce Commission to hold in mind the plight of other kinds of business in which dividend payments fall off if earnings decrease. It will strike the average man of affairs that the commission's attitude is the right one. In plain phrase, it is a case of shortened incomes generally and the necessity of getting down to economies. General business is accommodating itself to the condition. Why should not the railroads fall into line?

FAIR TREATMENT FOR THE RAILWAYS AN URGENT NATIONAL DUTY

[From the New York Tribune]

Questions asked at the railroad rate rehearing in Washington indicate that some of the members of the Interstate Commerce Commission do not grasp the problem with which they are dealing. Their point of view seems still to be that of the railroad baiter in the good old times when railroad baiting was supposed to be a patriotic pastime.

Why was the case of the eastern railroads, which had unsuccessfully appealed for a 5 per cent increase in freight rates, ordered to be reopened? Manifestly it was because the war in Europe had made the commission's decision of August 1 look preposterous.

A decision like that, which talked peace when there was no peace, could not be expected to give satisfaction. Public opinion was almost unanimous in regarding it as one of the most inopportune official judgments ever delivered.

Yet although the commission's belated discovery that a great European war had broken out was the only intelligible ground for granting a reargument we find the commissioners asking questions indicating that the extraordinary depression caused by the war is in their opinion no ground for granting the railroads further relief. According to one account of the hearing on Mon-

day, Commissioner Clements asked Mr. Willard, the president of the Baltimore & Ohio Railroad, "if he thought that the railroads should be dealt with in any other manner than other industries affected by war conditions."

Such a question is little short of amazing. Other industries are left free by the government to regulate their own affairs. They may raise their prices as they please without interference from Washington. But the railroads have no free hand. Their earning power is limited for them by the Interstate Commerce Commission's decrees, and they may be made to starve, even in the midst of general plenty, if the commission thinks it advisable to starve them.

The Interstate Commerce Commission needs to enlarge its vision and deal in the broadest national spirit with the rate question. Starving the railroads is a dead policy.

ARE THE RAILROADS STILL CRIMINALS?

[From the Chicago Herald]

Two incidents of the opening session at the rehearing granted by the Interstate Commerce Commission to the railroads on the rate increase question strike unpleasantly the reader who has no personal interest in railroad property, but who realizes that industry cannot prosper if transportation service be crippled. One is the immediate appearance and active participation of Clifford Thorne, who was, and may be yet, Iowa's railroad commissioner. Mr. Thorne first attracted national attention with a scheme for government ownership whose financial mathematics were simply ridiculous and whose estimates of "profits for the public" qualified him for the illustrious company of Colonel Mulberry Sellers and J. Rufus Wallingford.

The other was the attitude of Louis D. Brandeis, counsel for the commission. Mr. Brandeis at once took the tone of a prosecutor and appeared to assume that the railroad officials who were trying to show the need of higher rates were somehow criminals or witnesses for criminals.

The opening of the hearing does not augur well for a practical solution of the problem, nor for speedy action. Meanwhile the railroad situation is growing worse daily, and with it the situation of industry and commerce, which want low rates, of course, but want still more adequate and improved service, and are saying so in no uncertain tones.

Therefore it is respectfully suggested to the commission that it repress the volubility of Mr. Thorne, moderate the prosecuting zeal of Mr. Brandeis, and detach the inquiry from any sort of assumption that the railroads are still criminals who should be punished. That aspect of the situation may well be left to the courts. What the railroads need is help, that they may render the service without which trade and industry cannot prosper. And the evidence accumulates that the railroads, as an industry, are gasping for breath.

RAILROADS NO LONGER UNDER A CLOUD

[From the Indianapolis News]

Various railroad commissions throughout the Middle West, prominent among them being the one in Iowa, are resolved to combat the case. The shippers are ably represented. Among the counsel engaged is the commission's special attorney, Louis Brandeis. The question is even more complicated than it was during the previous hearing. The railroads undoubtedly have in the meantime been further embarrassed. The general trade disturbance was quickly felt by the carriers, and their hesitation about buying is quickly felt by the steel and iron business.

It is said that railroad stocks and bonds are no longer held by small groups, but that such systems as the Pennsylvania are owned by thousands of small shareholders, each of whom is vitally interested in the rate question. But acknowledging this, the maximum number of stock and bondholders is small compared to the body of the public. It is the shipper first, but the public ultimately, that must bear the burden of any general rate increase. It can be truthfully said that the railroads are no longer under a cloud. Even the New Haven investigation, and the more recent revelations in the Rock Island financing, should not—and do not—prejudice public opinion against the transportation business as a whole.

LIFT THEM OUT OF THEIR DIFFICULTIES

[From the Boston Transcript]

The President has recently consented not to push certain legislation that he had had in mind, affecting the roads. Certainly, in thus receding from his purpose his conviction of their embarrassment must be very strong. We can recall no other protest of business that has had any affect upon him. He is anxious that relief in some form shall be extended to them and we know of no other form than that in which it is asked that will lift them out of their difficulties.

PUBLIC POLICY AND RAILROADS

[From the Portland Oregonian]

Shippers have been accustomed to consider their interests best served by low rates and they have generally been ready to join in a demand for reduction. But the loss, delays and damage they suffer through inefficient railroad service under too low rates may far exceed any saving they make through a reduction, or the denial of an advance, in rates. If by paying a rate 5 per cent higher shippers could be assured that goods would arrive in Portland from New York in 14 days and in good condition, they might gain far more than if at the lower rate goods were kept three or four weeks on the road and arrived with packages broken in wrecks or otherwise damaged and some of them missing. The shipper is less interested in the amount of the rate, so long as it is reasonable, than in the assurance that it is as low as and that the service given him is as good as that of his competitor. From the standpoint of public policy, the wise course for the Interstate Commerce Commission seems to be the prompt grant of a fair general increase in rates, to be followed by a readjustment in detail.

RAILROAD RATES

[From the Duluth Herald]

"Why," it is asked on every hand, "should the railroads be any more entitled to relief from war-created difficulties than any other line of business?"

There's an answer to that. Obviously, it is that the railroad business is the only business whose charges are subject to the will of public authority.

MEET THE EMERGENCY

[From the Galveston Tribune]

The railroads were urging increased rates before the European war, and that conflagration has hit them as hard as all other lines of American industry. Now they come into court with added arguments for a raise in rates. And until the United States government gets ready to go into the railroad business it would be as well to allow sufficient rates to take care of reasonable dividends, interests and improvements.

PLEA OF THE DEMAGOGUE

[From the Kansas City Journal]

The railroads are not asking for a "war tax" nor are they trying to secure any special favors. All that the railroads are demanding at the hands of the government is common justice. The great fact seems to have been lost sight of that the government has undertaken to run the railway business of the country by means of the Interstate Commerce Commission. That body has established rates and prescribed methods which have hampered and harassed the railroads for years. If the government had not handcuffed the transportation interests they would not be asking anything. But since the government has assumed the responsibility of dictating to the railroads how they shall run their business, where else can they turn in time of trouble but to the cause of it all? Commissioner Thorne fairly represents the remnant of that feeling of antagonism toward railroads and other

business interests which prevailed so generally a few years ago. But a spirit of fairness and of reason has largely supplanted the unreasoning hostility of the political demagogues in the popular mind.

LIFE OR DEATH FOR RAILROADS?

[From the New York World]

War in Europe merely accentuates the plight of the railroads, which are suffering from too much taxation, too much political agitation, too much harmful legislation, such as the full-crew laws, and from the higher cost of supplies and constantly increasing payrolls. With income outstripped by outgo, the greatest of American industries is in no position to borrow money for betterments or to renew old loans, and the whole world finds in the prices of American railroad securities proof of the distrust with which investors regard the situation. In a country so extensive as this, the transportation interest cannot be starved without weakening every other industry. Its property must be kept up. Its credit must be sustained. If prices and wages rise, its rates must rise. Public regulation that is never constructive is certain soon or late to be destructive.

CARDS ON THE TABLE

[From Manufacturers' News, Chicago.]

We are interested in knowing just now who the shippers are who are opposing the application at present pending before the Interstate Commerce Commission. We read a piece in the newspaper a day or two ago a couple of columns long stating that the shippers were attacking the railroads' plea for freight rates, and we have seen more or less about a politician named Clifford Thorne of Iowa, who always bobs up when any controversy having to do with the railroads is on hand, representing shippers. Mr. Thorne comes from a state that has been going backwards for a number of years. We have no criticism to make of him. He is a lawyer, an office holder and not a shipper, and wants to make himself politically strong with the people of his state. He knows the sentiment in his state as to the carriers, and consequently figures out that it is good politics for him to oppose the advance. We think perhaps he is right from his viewpoint. But we would like to know the viewpoint of the shippers who are opposing the advance in rates. We cannot quite figure them out. We do not see why they do not take the witness stand and produce the figures. If the railroads should not have an advance, let us know why.

RAILROADS AND INDUSTRIES AFFECTED ALIKE

[From the San Antonio Express]

Argued from any angle, it seems pretty hard to get away from the justness of the principal position maintained by organized shipping interests and their counsel before the Interstate Commerce Commission that is now holding court on the petition of eastern railroads for "relief" through a general increase of at least five per cent in freight rates. This position is that our railroads are confronted with no condition as a result of the European war—or any other cause—that does not equally affect every other industry. The people may have become never so well disposed to cooperate in relieving the railroads, but it is obvious they will not worry much, at this time, over the interests of investors if the merit of the rate increase proposition is to be urged solely upon such a basis.

THE ROADS AND THE PUBLIC

[From the Sioux City Journal]

The point is that railroads as common carriers are public utilities, and anything that tends seriously to impair their efficiency must injure the public. This being true, and it being likewise true that the public has undertaken to supervise the railroads, it is not unreasonable to expect the public to take an interest in protecting them from deterioration. If a private business suffers by reason of war emergency its owner can take such measures as he may deem expedient to deal with the situation. If he finds trouble in getting money with which to operate, or if the business becomes unprofitable, he can shut up shop until the clouds roll by. Not so with the railroad. There is no danger that the American railroads will stop operating. There appears to be danger that their efficiency will be seriously impaired if they are not permitted to earn more revenue.

DO JUSTICE TO THE RAILROADS

[From the Virginian Pilot and Norfolk Landmark]

The opponents of rate increase insist that in the present crisis the railways of the country are suffering no more loss than other interests and had no ground for asking special relief. This was the contention of Mr. Brandeis who stands in the peculiar relation of amicus curiae to the commission. We are not able to see the situation that way. The railroads are public institutions first; enterprises for the benefit of their stockholders secondly. The crippling of their resources and curtailment of the service they render to every branch of production and trade in the land tends to spell general calamity. The issue is not alone that of enabling them to return dividends to investors, though that is an equitable consideration not to be lawfully disregarded, but is besides one of momentous concern to the people at large. A crippled transportation system emasculated of means vital to its vigorous operation would necessarily react with injurious effect on every business and industrial activity in America, while to force the railroads into costly sacrifices, in disordered times for protecting their credits and caring for their outstanding obligations, must necessarily have an evil influence on the financial situation, already complicated by the disturbed situation ahead.

THE ROADS AND THE PUBLIC

[From the Lincoln (Neb.) Journal]

Eastern railroads renew their plea for a five per cent rate increase on the ground that the war has increased their needs. But the war has hampered and embarrassed nearly all forms of business. Why should the railroads be allowed to shift their share of the embarrassment to the rest? The cotton growers have just tried this in Congress and were properly refused. It is a time for everybody to do the best he can at standing on his own legs. Few businesses have strength just now to bear the burdens of other business.

THE TRUE REMEDY

[From the Dallas News]

There is no fallacy more popular in this country than the idea that the case of the railroads is precisely the case of any individual, firm or corporation engaged in business. This fact is again illustrated by questions put to President Willard of the Baltimore & Ohio during the consideration of the application of the eastern railroads for an advance in freight rates. Mr. Willard had stated that the revenues of the railroads had decreased to a degree that threatened their solvency, whereupon he was asked if the revenues of all other enterprises in this country had not likewise suffered. Undoubtedly they have; but the case of such industries is not analogous to that of the railroads. When a private industry, a manufacturing industry, for example, finds that its cost of production is increasing, it has recourse to the simple expedient of increasing the price of what it has to sell. Or when it finds that the demand for its commodities is decreasing, it can readjust its expenses to its income either by reducing wages or by diminishing its output. The railroads enjoy no such freedom of action. As we have often said in the past, the true remedy would be to permit the railroads to accumulate and maintain a surplus fund sufficient to bridge over such embarrassments as the one now confronting them; but our policy seems to be opposed to that idea, and so long as it is, we shall be confronted by the alternative of increasing rates or of suffering the roads to become bankrupt.

Mechanical Department Progress on the Frisco

Work Checking System, Shop Schedules, Machinery and Tools, Centralized Manufacture, Locomotive Supplies

In connection with the other developments* toward increased efficiency and economy which have taken place on the Frisco within the past year or two, a number of important and far-reaching improvements are being made in the mechanical department. While several of these are only fairly under way, the results obtained thus far justify describing and commenting on them at this time. The most important of these steps of progress will be considered briefly in the following article:

Shop Schedule or Date Sheet for a Ten-Wheel Locomotive

WORK CHECKING

The locomotive and coach repair shops at Springfield—both the so-called new shops and the North shops—are administered on a day-work basis, and until recently no attempt has been made to check accurately the output of the individual workman. Piece-work has automatically performed this function on roads on which it has been introduced, and at the same time has developed more adequate and efficient supervision. It was not deemed advisable, however, to introduce this system on the Frisco, although it was felt to be vitally necessary to develop some method whereby a careful check might be made of the itemized output, and in a constructive manner, so that the features which restricted the output, such as lack of proper knowledge and training on the part of the individual, unsuitable tools and machinery, defective material, poor design of parts, inadequate supervision, and other features of this sort, might be located and remedied in order to bring the efficiency to a maximum.

Under the old methods a record was kept by a time clerk of the time when the men started and left off work in the morn-

*See Studies in Operation, March 13, 1914, page 501; The Agency Plan, March 20, 1914, page 671; Economical Locomotive Performance, May 8, 1914, page 1018; Development Work, May 22, 1914, page 1125; Oxy-Acetylene Welding and Cutting, September 11, 1914, page 467; and Reclaiming Material, October 2, 1914, page 595.

ing, at noon and at night. The actual account against which the time was charged was based largely on the workman's statement or upon an approximation by the timekeeper. As a result the times charged against different jobs were not of sufficient accuracy to make it possible to intelligently check against abuses or defects such as those above mentioned.

To overcome this the Frisco has adopted a rather unique and unusual scheme. Work checkers have been provided, each one of these looking after from 50 to 100 workmen, depending on the class of work and the department in which they are employed. There are two of these checkers in the erecting shop at the Springfield new shops, three in the machine shop, one in the blacksmith shop, two in the boiler shop and one in the tank and cab shop. These men constantly observe the progress of the work in the department which they serve, but have nothing to

do with the distribution of the work. The checker has a card for each workman, similar to the one which is reproduced in the illustration, on which he enters in detail the operations which are performed, noting the times at which the work was commenced and completed and the engine or shop order to which each job is charged. These cards are 5½ in. by 8 in. in size. In the illustration spaces have been left between the different items in order to preserve a neat appearance in reducing the size of the form; this is not done in actual practice.

The checkers were selected from among the best of the mechanics in each department, and the training which they receive in following up the work will fit them admirably for positions as foremen, if such openings occur. It should be understood

Among the most important advantages of the time checking system as it has been developed thus far, are the following: (a) The recording of the detailed progress of the work, thus making the work of supervision less burdensome for the shop superintendent and general foreman. (b) The detection of waste of time and effort at its occurrence, thus enabling the foreman to promptly take the matter in hand, eliminate delays and reduce

that these men check the quality of the work and accuracy of workmanship, as well as the time of performing it. They are paid practically the same as lead men, which is at a somewhat higher rate than the standard for first-class mechanics. In all cases, in making suggestions or changes, they work through the foremen.

improving the facilities or methods or by rearranging the force.

Much has been published in the past concerning the best methods of comparing the efficiency of one shop with another, the great difficult being to define and decide on a standard unit of measurement. The value of the comparisons of a shop or a department as a whole on the basis of such units as have been

suggested is questionable as far as it concerns the accurate detection of weaknesses or the relative value of different practices or methods. The most logical way of detecting lost motion or effort, and of eliminating it, is to study each operation in detail and make sure that it is the best and cannot be improved upon. The provision of work checkers on the Frisco and the way in which their efforts are being utilized is successfully accomplishing this and is very greatly increasing the efficiency of the departments and the shop as a whole in a way which must appeal to shop officers and foremen as being a most logical one.

WORK DESPATCHING

It seems strange that the railroads generally have been so slow in systematically planning the progress of the work through the shops in order to balance the strength of each of the various departments and to schedule the work of repairing the cars and locomotives in such a way that the entire staff may co-operate closely and effectively. The Chicago & North Western was one of the first roads to inaugurate such a system. This was many

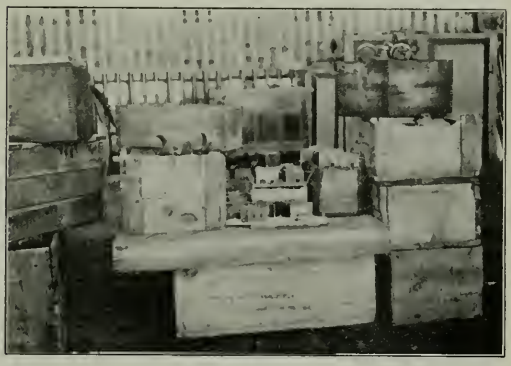
Check or Delay Sheet Used With the Shop Schedule System

years ago, and in spite of the fact that it was given wide publicity and that the whole scheme was most logical, other roads took it up very slowly and even today shop scheduling in its best form is used in a comparatively few shops. The methods which are being used on the Frisco are not essentially different in a general way from those introduced on other roads but are arranged to meet the special needs of the shops on that system.

Not only are the dates set for the completion of repairs to each locomotive, but the intermediate times in which each of the numerous operations must be finished are also designated. The general plan of this scheme is indicated on the accompanying form, which is known as a date sheet, and outlines the work which should be done on the various parts of the locomotive in each of the different departments for a ten-wheel engine which is to be overhauled in 15 days, or rather 150 hours, for arrangements have been made to adjust the schedule for any lengthening or shortening of the working hours per day. This particular sheet covers an ordinary overhauling where no special work, such as firebox sheets, new cylinders or new frames, is required. Repairs of this sort necessitate lengthening the schedule by a certain number of days, depending on the nature of the special work.

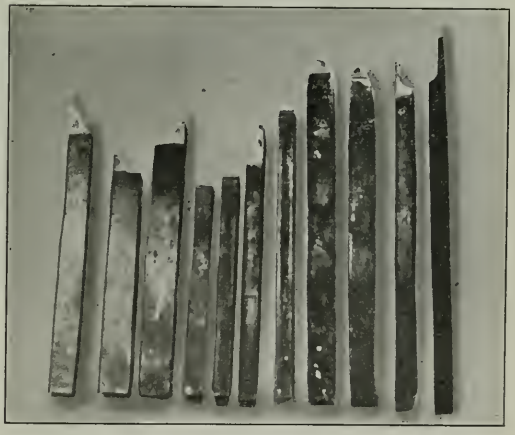
Similar date sheets have been prepared for every class of power and for every combination of repairs. As soon as a locomotive arrives at the shop a thorough inspection is made and a report is drawn up of the necessary repairs, from which it is pos-



Boxes of Surplus Tools Which Were Gathered Up and Returned to Stock

sible to determine exactly what schedule should govern. This makes it possible to set the dates for the completion of each item and routing cards are filled in and issued to each gang or department foreman as a guide for handling the work. Sample cards, such as used by the reverse lever gang, link gang and steam pipe gang, are reproduced in the illustrations.

For the use of the shop foreman who supervises the work of these gangs a special form is made out which applies particularly to the work of his department rather than to the handling



Eleven High Speed Tools Which Were Formerly Used With the Driving Wheel Lathe

of the locomotive as a whole, as on the large date sheets. A sample sheet of this sort for boiler work and the erecting department is reproduced in one of the illustrations.

The despatching system is handled by a foreman who practically becomes an assistant to the general foreman, relieving that

officer to a great extent of the detailed supervision of the progress of repairs. He makes out the despatching sheets, timing the various operations to correspond with the date sheet for the type of engine and class of repairs. It is, of course, necessary for him to maintain a master sheet covering all of the engines in the shop and arranged in such a way that he can see that the work in the various departments is properly balanced, and from such reports of the progress of the work as he receives and enters on the master sheets he can determine practically at a glance whether the schedules are being lived up to. A daily delay report is prepared each evening showing just what operations are behind schedule; provided with this the general foreman can go directly to the gang or department which is responsible for the delay and see that provision is made to overcome the deficiency.

This system, in addition to maintaining a balance between the different departments, thus eliminating annoying and costly delays and securing a maximum output consistent with the force and facilities, has the additional not inconsiderable value of insuring prompt delivery of completed locomotives at a date determined well in advance, and thus enables the mechanical department officers to more intelligently handle the problem of the distribution of power. The shop schedule system to be a complete success must have the hearty support of all of the mechanical depart-

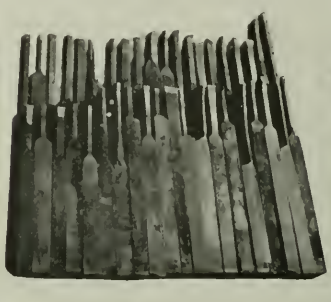
Tool Holder and Tools Now Used With Driving Wheel Lathe

ment officers and particularly of those higher officers having general supervision. If this condition does not obtain and the schedule is interfered with in order to give certain locomotives preferment, it would greatly hamper its usefulness and disorganize the entire shop.

SHOP MACHINERY AND TOOLS

No one who has ever tried to use a dull axe, saw or chisel, and who has then taken time to put them in proper condition and has marveled at their greater effectiveness, will belittle the effort to see that all of the tools and machinery in a large locomotive or car repair shop are kept in first class condition. Possibly a given amount of energy and expense invested in work of this kind has resulted in more striking improvements in efficiency and output than any other one thing that has been advocated in the general campaign for improved shop production within the past few years. Many of the more progressive roads have been prompt to take advantage of this, although some of them have not as yet fully awakened to its possibilities. It was one of the first things which were done by the Frisco in its campaign for improved shop efficiency, and the results thus far have been startling, in that the maintenance expenses for shop machinery and tools have been surprisingly decreased, although this equipment is much improved and maintained in better condition.

The problem was approached from several angles. It has involved the appointment of a supervisor of tools, who has had general charge of the work, which in general includes the standardization and centralized manufacture of small tools and a systematic method of checking them and seeing that a complete and adequate supply, but not an over supply, is maintained at all points on the system. It includes also the strengthening and speeding up of machine tools and the providing of jigs and other apparatus for the accurate and rapid handling of the work. It should be noted, however, that in this latter respect the Frisco, particularly at the Springfield new shops, has not been in the rear ranks in the past. This is indicated by the shop kinks from that system which

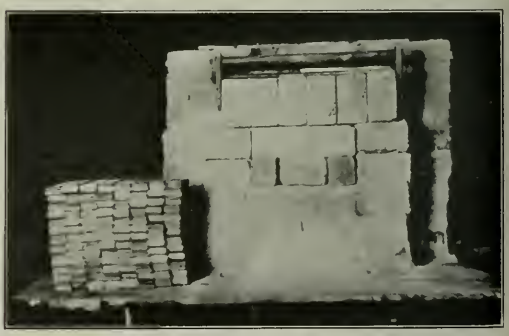


Forty-One Tools Formerly Used on Slotter

Tool Holder Now Used on Slotter

have been published in the *Railway Age Gazette, Mechanical Edition*, from time to time, and particularly in the collection which appeared in July, 1913, submitted by J. C. Breckenfeld, at that time assistant machine shop foreman, who was awarded the first prize in the shop kink competition in which it was submitted. Mr. Breckenfeld is now supervisor of tools.

One of the first steps in the campaign was to make an absolutely correct inventory of all the machinery and tools on hand at the different shops and engine houses. This resulted in the collection of a large amount of obsolete tools, which have either been worked over or sold as scrap, and also in the gathering up



Special Furnace for Making All Lathe, Planer and Similar Tools for the System

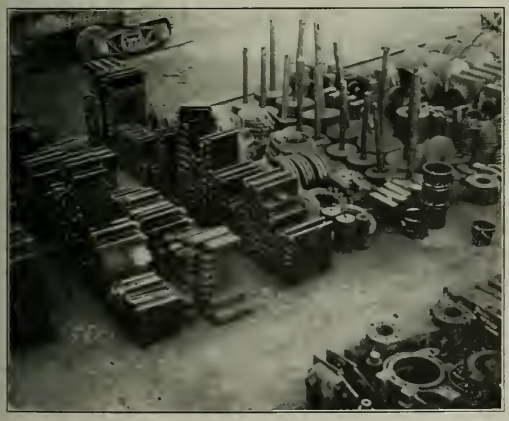
of surplus tools, which have been turned back into the stock and have been reissued as required. For instance, one of the illustrations shows a number of boxes filled with perfectly good tools, but which were in the nature of surplus stock and were turned over to the general store, the shops from which they were collected being given a credit of $2,005.41. This is only one of a number of similar lots of surplus tools which were gathered up. In another case a large number of antiquated air motors were collected and disposed of which were using 300 per cent more air

than the standard tools. Other tools were gathered which were damaged and laid aside, but which at a reasonable expenditure were put in first class condition and reissued as new tools. Meanwhile a stock book has been prepared which shows all small tools on hand each month at each point and those which have been ordered. A continuous inventory is thus provided which makes it possible for the supervisor of tools quickly and accurately to check the requisitions and thus avoid overstocking.

Not the least important of the improvements has been the selec-

Finished Tools Ready for Issuance to Shops

tion of standard designs for the different tools and the centralization of their manufacture at the main shops. As a typical example, the heavy bulky tools formerly used on the driving wheel lathes have been replaced with tool holders and high speed steel cutters, as shown in the illustrations. This has not only decreased the cost of these tools, for only the cutters are now of high speed steel where formerly the entire tool was of this material, but it has greatly increased their efficiency, because of the better design, and has made it possible to more easily maintain

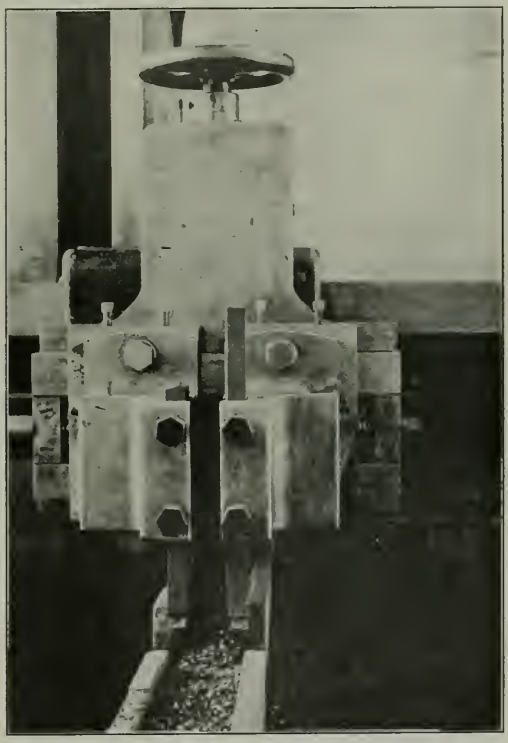


Locomotive Parts Manufactured at Central Shop

the tools in proper condition. As another illustration, one of the slotters was found to have 41 tools weighing more than 900 lb., 70 per cent of the tools being of high speed steel and representing in all an investment of over $500. These were replaced with two tool holders similar to those shown in one of the photos, and a full set of small tools of high speed steel. The total cost of these new tool holders and tools was less than 20 per cent of the cost of the old tools and they are more effective than the large clumsy ones.

In keeping a check on the small tools a record is maintained at each of the shop tool rooms showing just what tools each man has and requiring him to turn in any tools, which he may have taken from the tool room, every Saturday night for inspection and repairs. If any of the tools are found missing the man is notified on Monday morning that if he does not immediately turn them in he must get a release from the general foreman. If a tool is broken the workman must turn in a report which must be passed upon by his foreman. In this way weak or poorly designed tools are located and improved and careless handling is reduced to a minimum.

It was found that there were a great variety of makes of tools of all kinds scattered over the system. As rapidly as possible it is proposed to reduce the number of different types; in the case of jacks, for instance, from 12 to four, and to standardize four sizes of air hammers and five sizes of air motors. Manufacturing



Double Planer Head for Machining Shoes and Wedges

the small tools on a large scale at a central shop reduces their cost very greatly since it is possible to furnish special facilities and specially trained mechanics. The tools shown ready for issuance in one of the illustrations, for instance, are now made at a cost of less than one-half that under the old methods.

In brief, then, the principles which have been applied and which have resulted thus far in an increased efficiency of machine equipment with a decreased cost of maintenance are an intimate constant supervision of tool purchase, manufacture and distribution; the establishment of standards of design for all small tools; the central manufacture of these tools in quantities to insure minimum cost and adherence to standards; the designing and in-

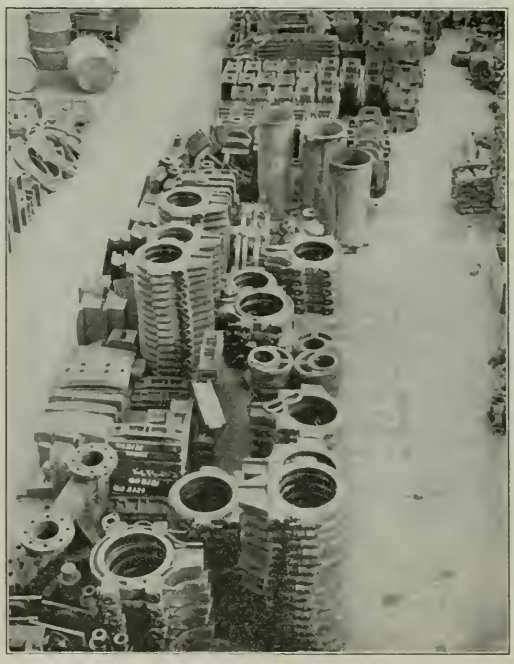
stallation of time and labor saving jigs to facilitate shop output, and the strengthening and rebuilding of machine tools to increase their capacity and their facility for turning out accurate work.

CENTRALIZED MANUFACTURE OF MATERIAL

Considerable progress has been made in the standardization of certain locomotive parts and the manufacturing of this material on a large scale at the central shops. The practice

Special Device for Holding Shoes and Wedges on Planer

of furnishing material in the rough to the small shops and engine houses is usually an expensive one because of inadequate tool equipment at such places. While the reduction in the cost of the finished material when manufactured in quantity at a central shop is an important advantage, it is not the greatest one. Where a supply of finished material is on hand



Finished Locomotive Parts on Storehouse Platform Ready for Shipment

ready for immediate application to the locomotives, the time for making repairs is very greatly decreased, whether these repairs are made at the larger shops or in the smaller shops and engine houses. Moreover, parts which are continually being worn out and broken in service may be replaced with little or no loss of time and the condition of the power is thus always maintained at a high point of efficiency. This means fewer engine failures, a reduction in running repair costs and an increase of mileage between shoppings. This is particularly important where the practice is to haul heavy tonnage trains, utilizing the full capacity of the locomotives, as has been done on the Frisco during the past year.

At present a considerable number of parts are either wholly or partially machined in large lots at Springfield and are shipped to the smaller points where the machine operations are reduced to a minimum. Many locomotive parts may be finished in quantity with special jigs and machinery at a small part of the cost which would be required at one of the smaller shops where the investment in special tools and machinery is not warranted. As an illustration, the centralized manufacture of shoes and wedges may be mentioned. When these are machined at a small shop or engine house in small quantities the labor cost runs from 40 to 75 cents apiece. With the special jig and double planer head arrangement at Springfield, shown in one of the illustrations, it is possible to machine these in lots of 40 at a cost of 10 cents each. The plan is to carry this development to a point that finished parts such a fireboxes, back ends and frames will be kept in stock, thus making it possible to return an engine requiring such repairs to service in a very much shorter time than would otherwise be necessary.

RAILWAY AFFAIRS IN OTHER COUNTRIES

The Swiss correspondent of the Railway Gazette of London has written a letter from Berne under date of September 21 which indicates that the Swiss railways are hard pressed because of the war. The following is an extract from the letter:

"The Swiss Federal Railways are economizing in every possible way. International traffic is almost at a standstill, and ordinary traffic, not to speak of the tourist traffic, is about one-fourth of what it should be normally, while freight traffic is suffering, if possible, even more heavily still. As a matter of economy, work upon the second Simplon tunnel has been stopped. Excavations on the north side ceased on August 4 and masoning over on August 22, while on the south side the work was very considerably reduced on August 3 and most of the workmen dismissed. At present only a few men are employed to insure the safety of the completed and uncompleted tunnels. As for the private railways in Switzerland, they are quite as seriously affected as the Federal lines, especially the tourist railways. There are no less than five mountain railways in the neighborhood of Lucerne. In August the Vitznau-Rigi Railway carried altogether 3,694 passengers, as compared with 39,589 in the previous year—a difference of 35,895. The Rigi-Kulm line, in the same month carried only 2,147 people, as compared with 29,271 in August, 1913—a falling off of 27,124. The Pilatus Railway, in the week from August 30 to September 5, carried only 65 persons, while the total number of travelers since it was opened this season only amounted to 21,452, as compared with 39,312 in the corresponding period of last year. In August, the principal tourist month, it can hardly have carried more than a thousand passengers, while the receipts up to the end of July had decreased by more than $6,000. The Stanserhorn and Rigi-Scheidegg Railways ceased running in August. Yet Lucerne, even in this month, was by no means without visitors, but few of them seem to have had the slightest desire to make excursions."

ENGLISH RAILWAY WILL TRANSPORT BELGIAN REFUGEES FREE.—The directors of the London & North-Western Railway have informed the Lord Mayor of Dublin that they are willing to give free transport to Belgian refugees and their escorts between London and Dublin and London and Greenore.

The Final Arguments in the Rate Advance Case

Basis for the Petition for the Modification of the Former Order; Arguments of Mr. Thorne and Mr. Brandeis

The final arguments in the rehearing of the rate advance case were presented to the Interstate Commerce Commission on October 29 and 30. George Stuart Patterson, chief counsel for the railroads, opened the argument as follows:

MR. PATTERSON'S ARGUMENT

The carriers do not urge that the commission should grant the relief which is asked for as a matter of grace. They do not claim that it is the duty of the commission to increase rates on the general principle of promoting the prosperity of those industries whose prosperity is dependent upon the welfare of the railroads, regardless of whether or not the proposed rates are reasonable. The carriers recognize that it is the function of the commission to determine what are reasonable rates, in view of all the circumstances of the case.

They do claim, however, that in this case they have shown the proposed rates to be just and reasonable in that these rates are required to supply a part of that inadequacy of the carriers' present revenue which has been found to exist and the existence of which is admittedly contrary to a sound public policy. They further urge that the plight of the railroads is one of the gravest dangers in the present situation, not only by reason of the vital importance to the community that its transportation machinery shall at all times be in a state of health and efficiency, but also because railroad credit is the very backbone of the investment structure, now so gravely threatened by the present emergency.

For this reason they consider that nothing can be done more effectively to promote the welfare of the country as a whole at this time than to relieve upon the broadest possible lines open to the commission trouble that is at the heart of the railroad industry.

The carriers, parties to this proceeding, have filed a petition asking the commission for a modification of the order made in the so-called five per cent case, so as to permit the carriers to make effective the rates specified in the tariffs, which were by said order directed to be cancelled, except so far as said rates may have been or may be superseded by advances filed in accordance with the report of the commission.

The authority of the commission to grant this relief is contained in Sections 16 and 16-a of the interstate commerce act. Section 16 provides: "The commission shall be authorized to suspend or modify its orders upon such notice and in such manner as it shall deem proper."

Section 16-a provides: "In case a rehearing is granted the proceedings thereupon shall conform as nearly as may be to the proceedings in an original hearing, except as the commission may otherwise direct; and if, in its judgment, after such rehearing and the consideration of all facts, including those arising since the former hearing, it shall appear that the original decision, order, or requirement is in any respect unjust or unwarranted, the commission may reverse, change, or modify the same accordingly."

The duty, therefore, is imposed upon the commission of considering not merely the facts arising since the former hearing, but, in the language of the Statute, "all facts, including those arising since the former hearing."

At the time (July 29, 1914) the commission rendered its opinion in this case, the commission had before it the financial statements of the carriers from the fiscal year 1898 up to and including May 30, 1914.

Since that date two fundamental considerations have developed:

1. The figures for the entire fiscal year 1914, now available, showing as they do an extraordinary reduction in the return earned on the investment, disclose the existence of a condition much worse than had been expected; and 2. The war in Europe has confronted the carriers with a problem wholly without precedent.

These facts when taken into consideration with the other facts appearing upon this record, justify the belief of the carriers that the order should be modified so as to permit the tariffs in question to become effective as requested.

It will be remembered that the statements filed by the carriers for the 35 systems showed that between 1903 and 1913 the property investment account had increased $1,980,000,000, and during that same period net operating income had increased $85,316,000, or an amount equal to 4.31 per cent on the increased property investment, while between 1910 and 1913, the property investment had increased $659,862,000, and the net operating income had showed an actual decrease of $16,311,000. During this same period, the per cent of surplus (after payment of interest and dividends) to total capital obligations, decreased from 1.83 per cent in 1903 to 1.54 per cent in 1910, and to 1.19 per cent in 1913.

So, also, taking into consideration the combined figures of the three principal systems, the Baltimore & Ohio, the New York Central and the Pennsylvania, which the commission had treated (page 420 of the opinion) as properly typical of the situation, it appeared that between 1903 and 1913 the property investment has increased $1,100,000,000, and net operating income had increased $39,745,000, an amount equal to 3.59 per cent on the increased property investment, while between 1910 and 1913 their property investment had increased 423,000,000, with a decrease in net operating income of $8,380,000, and the surplus, or margin of safety, which in 1903 had been 2.18 per cent, and 2.03 per cent in 1910, had fallen to 1.51 per cent in 1913. It was these facts, together with the result of the eleven months of 1914, which led the commission to state on page 384 of their report:

"In view of a tendency towards a diminishing net operating income as shown by the facts described we are of opinion that the net operating income of the railroads in official classification territory, taken as a whole, is smaller than is demanded in the interest of both the general public and the railroads; and it is our duty and our purpose to aid, so far as we legally may, in the solution of the problem as to the course that the carriers may pursue to meet the situation."

The commission said in its report (page 423) after considering the returns for the first eleven months of the fiscal year ending June 30, 1914: "When the returns for the full year are at hand it is not improbable that the ratio of net operating income to property investment will be found to have been as low as 4.35 per cent, or 1.01 per cent less than for the preceding year." The commission did not, of course, at that time have before it the figures showing the increase in property investment which had been made during that year, and now that those figures are available, it appears that the return on property investment for that period has fallen to 3.99 per cent, the lowest figure in the last 15 years.

The complete returns for 1914 show for the 35 systems—in round figures—

An increase in total capital obligations of $159,000,000.
An increase in Property Investment of $249,000,000.
A *decrease* in operating revenues of $48,000,000.
An increase in operating expenses of $22,000,000.
A *decrease* in net operating revenue of $70,500,000.
An increase in taxes of $3,000,000.
A *decrease* in net operating income of $76,000,000.
A *decrease* in net corporate income of $96,000,000.
A *decrease* in dividends paid of $12,000,000, and
A *decrease* in *surplus over dividends* of $84,000,000, the sur-

plus of nearly $76,000,000 in 1913 having disappeared and a deficit of $8,000,000 being shown in 1914.

A comparison of the details of the 1914 figures, not only with the corresponding figures for 1913, but also with the figures for the preceding fourteen years, seems to indicate something fundamentally wrong with the railroad industry.

The figures for the fiscal year 1914 disclose their true significance better when compared on a proper basis with similar years in the past than they do when compared solely with 1913. Looking over the fifteen years 1900 to 1914 inclusive, it is easy to discern several years of comparative prosperity—and by prosperity is meant large operating revenues—and several years of comparative depression when operating revenues actually declined or remained stationary. For example, the years 1903, 1907, 1910 and 1913, were years of comparative prosperity, and the years 1904, 1908, 1911 and 1914 were years of comparative depression. For convenience, we may term the years of prosperity "peak years" and the years of depression "valley years." In order to avoid multiplying comparisions, the years 1903 and 1904 will be taken as a starting point.

The first series of comparisons that naturally suggest themselves is comparison of "peak" years with "peak" years, and we start the series with 1903. We then have figures for the four years, 1903, 1907, 1910 and 1913. It is not necessary to consider anything more than the items of operating revenue, operating expenses, net operating revenue and net operating income, for these items will give us sufficient information as to the conditions in the transportation industry as a whole, or at least of the conditions of the industry as disclosed in the operations of the thirty-five systems.

If we take the first comparison, 1903 with 1907, we find an increase in operating revenue from $871,000,000 to $1,141,000,000 in round figures, or 31 per cent; an increase in operating expenses from $585,000,000 to $781,000,000 or 33 per cent; an increase in net operating revenue from $286,000,000 to $360,000,000, or 26 per cent; and an increase in net operating income from $251,000,000 to $318,000,000 or about 26 per cent. There is nothing in this comparison to indicate anything unfavorable in the industry from the carriers' point of view.

Taking the second comparison, namely, 1907 with 1910—I will not repeat the figures in dollars, but merely the percentages—an increase in operating revenues is shown of 8.5 per cent; an increase in operating expenses of 6.6 per cent; an increase in net operating revenue of 12.5 per cent, and an increase in net operating income of 11 per cent. Here again the conditions so far as disclosed by these figures are not unsatisfactory.

When we come, however, to the third "peak" comparison namely, 1910 with 1913, a marked change in conditions is apparent. Operating revenue increased 15 per cent; operating expenses 22 per cent; net operating revenue decreased seven-tenths of one per cent, and net operating income decreased 4.6 per cent. These results are unsatisfactory in a high degree. Nothing but the fact that 1913 was a year in which the carriers' business and operating revenues were the highest in their history could for a moment disguise the great change for the worse that had taken place in the industry, which change chiefly showed itself in the increased cost of operation.

To recapitulate: Up to 1910 so far as "peak" comparisons show, the industry was in at least a not unsatisfactory condition from the carriers' point of view. Since that time it has become decidedly unsatisfactory.

Now taking what we may call the "valley" comparisons we find a substantially similar showing. Between 1904 and 1908 operating revenue increased 22 per cent; operating expenses increased 25 per cent; net operating revenue increased 13.3 per cent, and net operating income 13 per cent, a showing on the whole not extremely unsatisfactory.

The second "valley" comparison, 1908 with 1911, shows operating revenue increased 14.6 per cent; operating expenses increased 14.2 per cent; net operating revenue increased 15.6 per cent; and net operating income increased 12.4 per cent—nothing very unsatisfactory here. When we come, however, to the comparison 1911 with 1914, we find a great change, precisely similar to that which we found in the "peak" comparison, 1910 with 1913. Operating revenue increased 9.6 per cent; operating expenses increased 17.6 per cent; net operating revenues decreased almost 10 per cent and net operating income decreased over 16 per cent. This is a very plain story, indicating something decidedly wrong with conditions.

One other series of comparisons is necessary in order to bring out the full significance of the 1914 returns, and that is a comparison of what I may call the "slump" periods, and by that I mean the period covered between a peak year and the bottom of the depression immediately following. It so happens that in the period which we are considering, the valley year was in all cases the year following the peak year—that is to say, the valley year 1908 immediately succeeded the peak year 1907; the valley year 1911 immediately succeeded the peak year 1910, and the valley year 1914 immediately succeeded the peak year 1913. The year 1911 was in one sense of the word not a true valley year, in that there was a very slight increase in operating revenues as compared with 1910, but it was a true valley year in the matter of net results, and for the purpose of this comparison may fairly be considered as constituting a "slump" period.

In 1908 operating revenues decreased 4 per cent, operating expenses decreased one-half of 1 per cent, and net operating revenue decreased 11.7 per cent, and net operating income decreased 13 per cent. Thus, with a decrease of 4 per cent in operating revenue, net operating income decreased 13 per cent.

In 1911 as compared with 1910, operating revenues increased 1.4 per cent; operating expenses increased 6.6 per cent; net operating revenues decreased 9.2 per cent, and net operating income decreased 12 per cent. It will be noted that in this slump period results were materially worse from the carriers' point of view because without any decrease at all in operating revenues the loss in net operating income was almost as great as it was in 1908 when operating revenues decreased 4 per cent.

Now when we come to consider 1914 as a slump perior following the peak of 1913, we find a decrease in operating revenues of only 3.4 per cent; an increase in operating expenses of 2.2 per cent; a decrease in net operating revenues of 17.5 per cent and a decrease in net operating income of over 22.5 per cent. Comparing this period with the 1908 period, we find that with a smaller ratio of falling off in operating revenues, the falling off in net operating income was proportionately very much larger. In other words, 1914 was much the worst of the three.

We thus have cumulative evidence from all these comparisons pointing to the most recent period in the history of these carriers as the worst of any. The nearer we come to the present day the more unfavorable do we find the conditions. Furthermore, if we consider these results with reference to the mileage of track operated, the unfavorable character of the exhibit becomes even more marked. The year 1914 showed the largest operating revenues per mile of first main track operated of any year in the fifteen that the commission took for its review, with the sole exception of 1913. The operating revenue per mile of main track in 1914 was $23,466, whereas in 1903, the starting point for my present comparisons, it was but $16,243. Yet, when we consider net operating income per mile of first main track we find that in 1914 this was $4,441, as against $4,690 in 1903.

In other words the entire growth of these systems in business and operating revenues between 1903 and 1914 amounting as it did to $7,223 per mile of first main track has vanished in increased operating expenses and increased taxes, and $249 per mile additional has gone in the same way.

It must be remembered in considering these figures that all through the entire period under consideration there has been a continuous investment of money in these properties. The property investment in 1903 was in round figures $4,300,000,000. In 1914 this property investment was $6,500,000,000. The result to the carriers is that in a year when their business was within 3.4 per cent of the highest ever recorded, the return shown on their property investment has fallen not only below the ratio of any one of the past fifteen years chosen by the commission for

its review, but as Mr. Rea pointed out, lower even than in the two years, 1898 and 1899, which were expressly excluded by the commission from its comparisons because they were not representative years, being years of great depression.

In order to save time, I shall not treat the figures of the three so-called typical systems, the Baltimore & Ohio, New York Central and the Pennsylvania, in detail similar to that of the 35 systems. The results of such comparison would be substantially the same and lead to the same conclusions. These three strong systems disclose a condition of inherent weakness, just as does the general group of railroads in official classification territory. Comparing, the complete returns for 1914 with those for 1913, the 3 systems show an increase in capital obligations of $112,800,000, an increase in property investment of $135,200,000, a decrease in operating revenue of $31,200,000, an increase in operating expense of $4,800,000 (notwithstanding the smaller amount of business handled), and a decrease in net operating income of $41,476,000. This was the smallest net operating income shown in ten years. The net corporate income decreased $46,690,000, and was the smallest since 1900. These three companies had a surplus in 1914 (after payment of dividends) of only $461,000, or .014 of 1 per cent on total capital obligations of $3,200,000,000, and that after an average rate of dividend paid of 5.53 per cent, the lowest average rate since 1906.

With regard to the returns for July and August, I can only say that they show an aggravation of the carriers' difficulties in that the tendency towards progressive diminution of operating revenues is evident. The decrease in operating revenues in July was 6.7 per cent, and that in August 5.9 per cent. The carriers have been compelled to institute economies in operations of a kind that are known as forced economies. As Mr. Willard and Mr. Rea pointed out, savings of this kind are not true savings nor can they be continued for very long. The railroads have been driven to them by stress of necessity, but in so doing they are in effect borrowing from the future and sooner or later debts now contracted in this way must be paid.

It is most unfortunate that the carriers should, while in such a condition of inherent weakness, be compelled to encounter a storm so serious as that which the war has brought upon the world. Even had their condition been fully recognizable when the commission made its report last July; even had the commission recognized that condition and granted them all the relief they prayed for, they would still have had before them a hard struggle in the future.

After finding in its opinion the inadequacy of the net operating revenues of the carriers, and specifically authorizing certain increases in central freight association territory, the commission made certain suggestions which it expressly designated as tentative and subject to further consideration by the commission as to the means which the carriers might pursue to secure additional net revenue.

As appears from the record, the carriers have been diligently at work investigating these suggested sources of revenue, the extent to which they are available, and the time in which they may be secured. Such investigation has embraced subjects such as the storage of freight; charges for the reconsignment and division of carload freight; expense of bracing shipments of lumber or other articles; the privilege of completion of loading of livestock; trap or ferry-car service; allowance for weight of dunnage; charges for refrigeration; charges for the return of containers, and for furnishing dunnage; milling in transit, elevation allowances, and many other subjects.

It should be pointed out that many of these practices, such as storage, reconsignment, trap or ferry-car service have been in existence for many years, and their curtailment, or the imposition of additional charges will meet the bitter opposition of shippers generally, and will doubtless as heretofore indicated by the commission be made the subject of separate inquiry by the commission.

In this connection, it will be remembered that following the decision of the commission in the industrial railways case, the carriers published tariffs cancelling the allowances to industrial or short lines of railroad. The most important of these cancellations have been set aside by the public service commissions of New York, Pennsylvania, Ohio and other states, and the revenue which was expected to accrue to the carriers from the decision in question has not materialized.

Following the lines as laid down by the Interstate Commerce Commission in that same case, the carriers have imposed charges for spotting cars at plants having what is known as a plant system of railways. These tariffs have been suspended by the public service commissions of New York, and certain other states, as well as by the Interstate Commerce Commission. So, also, the western trunk lines have filed tariffs imposing additional charges for the trap or ferry-car service at Chicago, which charges have been suspended by the Interstate Commerce Commission, as well as by the Public Utility Commission of Illinois.

A bare recital of these facts is sufficient to indicate that no substantial relief to the carriers can be expected in the near future from changes in practices on the lines above indicated.

The question of an increase in passenger fares has also received the earnest attention of the carriers, and an increase has been made from 2 to 2¼ cents per mile in the charge for mileage books in trunk line territory, and the Interstate Commerce Commission as well as the New Jersey commission, though complaint has been made, have declined to suspend these tariffs. Other passenger readjustments are under consideration, but it should be pointed out that there are two-cent fare laws in effect in New York on a portion of the New York Central system, and in the states of Ohio, Indiana, Illinois, West Virginia and Michigan. It may also be noted in this connection that nothing has been done by congress to remedy the conceded inadequacy of railway mail pay revenues, and there does not seem any possibility of securing any increased compensation to the railroad companies for the transportation of express matter.

The carriers propose to increase the rates on certain commodities which were particularly referred to by the commission. The proposed increases, as it appears from the testimony, are in many of these cases more than 5 per cent, and they doubtless will also be made the subject of separate investigation and determination by the commission.

It therefore appears that there is no possibility of securing from these sources, in the near future, the relief which is so urgently demanded by the carriers.

It is therefore submitted that a consideration of all facts including those arising since the former hearing show conclusively that the needs of the carriers can only be met practically by the remedy of a general advance in freight rates, such as that suggested by the carriers.

That under these circumstances the commission has the power to grant that general advance cannot be questioned, but that matter will be more specifically dealt with by counsel who will follow. It may be said, however, that the mere physical inability of the commission to consider each particular rate involved in a general advance in freight rates does not constitute a reason for not permitting that advance.

This proposition is conclusively established by the decisions of the commission in the Express Cases 24 I. C. C. 381, the Arlington Heights Case, 19 I. C. C., 148 and the Inter-Mountain Case—the decisions of the commission in the last two cases having been affirmed by the Supreme Court of the United States.

It is also quite clear that the needs of the carriers for additional revenue sustain the burden of proof in the case of a general advance in freight rates. That appears to be conceded in the opinions of Commissioners Prouty and Lane in the 1910 cases, and by the express decision of the commission in Railroad Commission of Texas vs. Atchison, Topeka & Santa Fe, 20 I. C. C., 464, where the commission sustained an advance in class rates from St. Louis to Texas common points, as well as an advance in many of the commodity rates, upon the ground of the general financial condition of the carriers and expressly declined (page 468) to investigate the reasonableness of individual rates.

Neither can it be successfully asserted that in order to justify

a general advance in all rates, it is essential to establish that the cost of transporting each perticular class of traffic has increased proportionately. This must be so for two obvious reasons.

In the first place, it is practically impossible to segregate each class of traffic and determine its cost of transportation. The inability to do this necessarily prevents any determination of the fact as to whether the cost of each class of traffic has increased proportionately. Secondly, the commission has repeatedly held (West Va. Coal Case, 22 I. C. C., page 623; Connellsville Coke Case, 27 I. C. C., page 132; Youngstown Coal Case, 29 I. C. C., page 436) that the cost of service though a possible factor in the determination of a reasonable rate, is not a conclusive factor, and, therefore, even if it were possible to determine whether the cost of transportation of each class of traffic had increased in the same proportion, the mere fact that it had not so increased would not be conclusive as against the reasonableness of a general advance in all freight rates.

These matters however will be dealt with in greater detail by other counsel.

Mr. Commissioner Lane said in the Western Advance Rate Case, 20 I. C. C., 307:

"We do not say that the carriers may not increase their income. We trust they may and confidently believe they will. If the time does come when through changed conditions it may be shown that their fears are realized, or approaching realization, and from a survey of the whole field of operations there is evidence of a movement which makes against the security and lasting value of legitimate investment and an adequate return upon the value of these properties, this commission will not hesitate to give its sanction to increases which will be reasonable."

The following is the full text of the argument by Mr. Minnis:

MR. MINNISS'S ARGUMENT.

This proceeding has been altered in substantial respects since the previous argument. At that time the commission had before it, for approval, tariffs which, exclusive of the minimum provision, carried substantially a five per cent increase in freight rates in official classification territory, except rates on anthracite coal moving to the Atlantic ports, which are before the commission in another proceeding, and the major body of the rates between points in New England, which had recently received separate consideration.

The subsequent progress of the case has drawn into it tariffs carrying an advance in passenger rates to substantially a uniform basis of 2½ cents per mile, and other tariffs carrying very substantial increases in rates on a number of commodities which were previously carried at what the commission has denominated "unremunerative rates"; and still other tariffs carrying charges for services which the commission has denominated "free services."

The carriers in central freight association territory have, in addition, filed tariffs, which have become effective, carrying substantially five per cent increases in their freight rates in that territory, exclusive of the rates on nine so-called heavy commodities, which comprise a substantial portion of the tonnage of that territory.

The case, as thus developed, embraces substantially all rates of the carriers in official classification territory.

The carriers claim that all the tariffs which have not become effective should be approved and put in force, on the ground that they are in need of all the revenue the tariffs will produce.

Now, what is the proper rule or measure for determining that claim?

Obviously the claim ought not to be determined in a haphazard way. The determination of the appropriate rule or measure which should be applied is of the gravest importance, viewed from any standpoint. It is not only important to the shippers, the consuming public, and those interested in the carriers, for the time being, but it will bcome a precedent and will be regarded as a declaration of the attitude of the government with respect to the financing of the railroads.

On the previous argument, attention was called to the doctrine often announced by our Supreme Court, that the duty to afford railroad transportation is a function of the government and one it owes to its citizens.

Attention was also called to the traditional policy of the government, and the only one compatible with our free institutions, which has been, from the early railroad era, to rely and depend upon private investors, who owe no duty in the premises and invest voluntarily, if at all, to furnish the money necessary to construct and develop our railroad transportation facilities. And it was observed that the continuation of the policy depends upon railroad investments being safe and attractive to private investors, because if they be not so investors will not furnish the money and the policy will fail and the government itself will fail in its duty to its citizens.

And attention was also called to the statutes enacted by Congress in execution of that policy, culminating in the statute under which the commission is now proceeding, from which it appears that the policy of the government, in so far as it affects the credit of the carriers, no longer reposes in statutes of fixed and definite terms which may be understood and relied upon, but manifests itself only in the rulings and decisions of this body.

At a time like this, when many of our people have lost their savings invested in railroads and the general investing public is apprehensive and more or less suspicious of railroad investments, a clear and explicit definition of the attitude of the government with respect to railroad credit is not only demanded by the public welfare, but by common honesty and fair dealings as between the government and its citizens. The people are entitled to know the attitude of the government expressed through the commission, and to determine for themselves whether they wish further to promote the railroad industry of the country by their savings, and this applies as well to those who now have investments as to those who may have a surplus to invest.

That attitude cannot be announced in mere words, but if expressed it must be expressed in the application of a rule or measure to the facts in this case.

The uniform courtesy shown by the members of the commission to every person who has appeared before them in this proceeding, and the indulgent and considerate manner in which they have received suggestions from all sources, howsoever humble, and the spirit of earnest and impartial inquiry which has characterized their deliberations throughout the trial, assures me that I shall not be regarded as altogether presumptuous if I venture to express my opinion with respect to what that rule or measure should be.

The rule so often referred to by the commission in previous cases, that a reasonable rate is one which will produce the legitimate outlays of the carrier and a reasonable return on the value of its property, is not appropriate or adequate in a case like the one we are considering, because it is inapplicable and contrary to the policy of the government to finance the railroad enterprise by private capital.

In the first place, the rule does not measure the rights of the carrier. The rule had its origin in a case brought by a carrier to enjoin the enforcement of rates on the ground that they would confiscate its property in violation of the constitutional guarantees which vouchsafe to every man that his property shall not be taken without due process of law or for public use without compensation. The evidence showed that the body of the rates of the carrier did not afford sufficient revenue to defray its legitimate outlays and a reasonable return on the value of its property, and the court held that the rates were confiscatory.

Thus the rule was promulgated as a measure, not of the rights of the carrier, but as a measure of the rights guaranteed by the constitution.

Constitutional guarantees do not limit or define the rights of persons; they were designed to limit the extreme aggressions one may be forced to suffer.

Thus the constitution, as construed by the rule, guarantees that a carrier shall enjoy the right to produce its legitimate outlays and a reasonable return on the value of its property. But it may lawfully make more, and, according to the general understanding of equity and justice, it ought to be permitted to make more.

The rule, then, is a proper measure of the rights guaranteed to the carrier, but not of the rights it may lawfully enjoy.

In the second place, the constitution does not guarantee that the carrier will make enough money to defray its outlays and pay a reasonable return on its property; so, under the rule, investors in railroads may, at the utmost, make a reasonable return on their investments. They may not make any return on their investments, or if they fail to make a return for a period they have no right during a subsequent period to recoup their losses, even if they may be able to do so.

I do not believe any one circumstance has been more harmful to railroad credit than the necessity which called for the application of that rule to protect the constitutional guarantees to the carrier, and the significance of the rule itself.

Investors say, why invest our money in an enterprise which is forbidden the right to earn more than a return on our investments, without any assurance that it will earn any return whatever, and if it fails to earn a return during one period it has not the right to recoup our losses in the event it is able to do so, when we can invest our money in enterprises whose right to earn money is unlimited?

The moral sense of right and justice of the investors has caused them to revolt, and will continue to cause them to revolt, against the suggestions that when they invest their money for the use of the public they must take all the chances and hazards, with a mere possibility of earning at the most a reasonable return on their investments, while the public who uses the product of the investment assumes no obligation or hazard whatever.

Obviously, no man of sense will invest his money on the theory that he may, in case of necessity, take refuge under the constitutional guarantees to prevent the public from destroying his investment.

In the third place, the rule is an inflexible rule of law which measures an existing situation, and takes no account whatever of the future. It, therefore, does not admit of "taking time by the forelock" or the exercise of foresight in dealing with the needs of the carriers.

Under it you cannot adjust rates to meet a foreseen change in transportation conditions which greatly enhances the cost of doing business, but you must wait not only until the foreseen event happens, but, as the rule has been applied, until your losses therefrom have continued a sufficient length of time to justify the certain belief that the changed conditions are permanent—and then the carrier may be allowed a reasonable return on its property, but nothing to recoup its losses.

No business can prosper or thrive under such circumstances, but in time must inevitably perish.

That this is true accords with the universal experience of mankind. The word "foresight" and the phrases "take time by the forelock" and "an ounce of preventative is worth a pound of cure," are by-words of the people, and were coined to express an indispensable element to the success of any enterprise or achievement in life, whether great or small.

Men who make money and have a surplus to invest have no time to theorize—they are men of practical judgment and their common sense teaches them that they cannot safely invest their money in an enterprise which cannot avail itself of foresight in the conduct of its business.

In the fourth place, the commission is an administrative body, created to administer the great railroad properties of the country. It differs from a court in this respect—that, whereas a court administers fixed and rigid rules of law without flexibility, the exercise of the powers of the commission involves a flexibility limited only by the almost numberless exigencies which arise from time to time in the conduct of the railroad business.

A judge applies his knowledge of the law, whereas the commission must apply sound business judgment in the administration of great properties.

The rule, therefore, if otherwise sound, would not be useful to the commission; in fact, no tight and fast rule of law can be of value in performing administrative functions, except in an argumentative sense.

In the fifth place, from the standpoint of the commission, there is no means at this time of ascertaining the value of the property of the carriers—an ultimate fact indispensable to the application of the rule.

The rule, therefore, in a case of this kind, not only fails to measure the rights of the carriers, but its application would be contrary to the policy of the government, in that it would destroy the credit of the carriers and, in time, the railroad industry. And, as the facts which call for its application cannot be found in the record, to attempt to apply the rule would result only in confusion, especially at a time like this, when the public interests and the property rights in a great industry involving the business structure of the country demand a declaration of a definite policy or rule which will leave no doubt with respect to the attitude of the government toward railroad credit.

My study of the question has convinced me that, as the government itself is under a duty to its citizens to afford railroad transportation, and as it has adopted the policy of discharging that duty by depending and relying on private investors to furnish the money for that purpose, it must have engaged to make railroad investments reasonably attractive as the foundation of its policy, because of a breach of that engagement would destroy the policy, either by depriving the people of transportation or necessitating its conduct by the government directly.

And that in a case of this kind, where the carriers complain of already depleted revenues and greatly impaired credit, and that the financing of the European war, which experts say will throw upon the market for some years to come, in competition with railroad securities, large government loans, naturally preferential in the eyes of investors, the safeguarding of the present and future credit of the carriers is the overshadowing question.

When we consider that the credit of the carriers is now dependent on their revenues, the true rule would seem to be that the commission ought to allow such advances in rates as, in the exercise of sound business judgment and foresight, the evidence shows reasonably necessary to make railroad investments sufficiently attractive to enable the carriers to obtain from private investors the money which they must have in order to afford facilities reasonably adequate for the transportation demanded of them by the public.

I do not mean to suggest that the rates should be advanced regardless of whether the advanced rates would be reasonable. In this proceeding the commission has before it substantially the entire body of rates of the carriers, which, presumably, sustain a proper relationship to each other in respect to service and the burden of transportation. This relationship, as to given rates, cannot be inquired into unless the examination covers each and every rate of the entire rate structure, because it cannot be said that any one rate bears, in relation to service, a greater burden of transportation than it should bear, unless a similar ascertainment be made with respect to each individual rate of the many millions of rates involved—confessedly a task impossible of accomplishment in this proceeding.

The inquiry, under the rule I have suggested, is, whether the body of rates of the carriers should be advanced in order to continue the policy of the government to conduct and develop railroad transportation by private capital. And if it be found that an advance ought to be made for that purpose,

the advanced rates would be reasonable, because reasonable rates, in view of the policy of the government could not, in the nature of things, be lower than a level of rates required to execute that policy.

If the rates are put in force, the commission has ample power, from time to time, to ascertain whether individual rates bear, in relation to service, more than their proper share of the total burden of transportation.

The rule, after all, is founded on necessity, because it is obvious that unless the rates of the carriers are high enough to make their securities attractive, under all the circumstances, the carriers will not be able to obtain the money they must have in order to discharge their public duties.

It will be noted that the rule imposes on the commission the duty of not only exercising sound business judgment, but likewise reasonable foresight in the interest of the carriers.

During the progress of the hearing, observations were made with respect to the power of the commission to deal thus with a situation like the one now before it.

If, under the legislation of Congress, the commission has not the power to exercise the judgment and foresight which may be essential to enable the carriers to obtain the capital necessary to discharge their public duties, the government has disabled itself from executing its policy and discharging its duty to our citizens, because, manifestly, the carriers have no power to exercise as a finality either judgment or foresight.

Obviously that construction involves a misapprehension, because prior to the congressional act of 1910 the carriers had the power to exercise judgment and foresight and do all things needful in the way of increasing rates to protect their credit. That act did not expressly deny any power to the carriers, but it conferred power on the commission to determine the circumstances under which rates may be advanced, and thereby inferentially denied to the carriers the power to make advanced rates effective. The act, therfore, could not have conferred on the commission less power than it took from the carriers, and as it conceded that it took from the carriers the power to determine when their rates ought to be advanced in order to sustain their credit, it follows that the power previously enjoyed by the carriers must have been vested in the commission.

The commission, therefore, has as complete power to deal with the subject as the carriers had prior to the act of 1910.

If the rule I have suggested be sound, the question then is, whether it is reasonably necessary and proper to make effective the proposed advanced tariffs in order to enable the carriers to finance their present needs and their needs in the future, which can now be foreseen, and that question must be determined on the evidence in the record.

In my view, the determination of the question involves sound business judgment, based upon the results of the operations of the carriers up to the present time, the effect of the European war, in so far as it may be relevant, and the fact that the carriers must, within the next year, raise as much as $750,000,000 in order to meet maturing obligations and keep up their properties, and all other circumstances which may have a bearing on the case.

In appears in the record that scandal and dishonesty have attended the management of a few carriers, and it has been asserted that that circumstance resulted in making private investors suspicious of railroad investments. If that be true, in determining the case we must take account of that circumstance, as well as any other circumstance which may have impaired the credit of the carriers.

Manifestly, the nature of the causes which have impaired the credit of the carriers is immaterial. If investors have become suspicious, their suspicions must be overcome if we obtain their money which we must have.

The management of the railroads is precisely where the law has placed it, and if any fault may be found on that head, it must be with the law, which cannot be corrected by the commission.

I shall not examine the evidence in the general case, as that has been or will be fully presented by my associates; but I wish now to briefly refer to some relevant facts relating to the condition of the railroads in central freight association territory:

Maxwell's exhibit 9 shows a decline in net operating income of group 1, in 1914 as against 1913, of $41,305,494, or 39 per cent; and that the ratio of net operating income to property investment in 1914 was 2.79 per cent as compared with 4.65 per cent in 1913.

That the operating ratio was, in 1913, 74.61 per cent; in 1914, 80.23 per cent.

That the net operating income of that group was equivalent to 6 per cent on $70,483 per mile of first main track owned in 1913, and $42,900 per mile in 1914, as compared with property investment of $90,940 per mile in 1913 and $92,727 per mile in 1914.

Or that the net operating income was equivalent to 6 per cent in 1913 on $32,050 per mile of all track operated, and $19,333 in 1914.

That the net operating income of group 3, which the commission held to be typical of railroad conditions in the territory in 1913, was $38,700,000, and in 1914, $19,400,000—a decline of 50 per cent.

That the ratio of property investment to net operating income was, in 1913, 2.61 per cent; in 1914, 1.29 per cent. That the operating ratio was in 1913, 79.03 per cent; in 1914, 84.48 per cent.

And that the net operating income was equivalent to 6 per cent on $32,800 per mile of first main track owned in 1913, and $16,300 in 1914, as compared with property investment of $75,500 per mile in 1913 and $75,700 per mile in 1914.

Or that the net operating income was equivalent to 6 per cent on $20,600 per mile of all track owned in 1913, and $10,183 in 1914, as compared with property investment of $47,400 per mile in 1913 and $47,200 per mile in 1914.

Or that the net operating income was equivalent to 6 per cent on $18,100 per mile of all track operated in 1913 and $8,900 in 1914.

As I have said, group 3 was adjudged by the commission typical of the railroad situation in the territory. The Illinois Central is included in that group, but its business consists largely of tonnage controlled by the southern and western classifications and intrastate rates, and is not, to a great extent, affected by the low rates in central freight association territory, and for that reason the commission did not require it to make answers to the 78 questions.

If we exclude from group 3 the Illinois Central, the group will then contain a mileage of 17,969 miles and, exclusive of the Illinois Central the group earned net operating income in 1913 of $27,200,000, equivalent to 2.24 per cent on property investment, and in 1914, $6,600,000 or 0.55 per cent on property investment. The net operating income was equivalent to 6 per cent on $30,100 per mile of first main track owned in 1913 and $7,200 in 1914, as compared with a property investment of $80,700 per mile in 1913 and $80,200 per mile in 1914.

Or the net operating income was equivalent to 6 per cent on $19,100 per mile of all track owned in 1913 and $4,600 in 1914 as compared with a property investment of $51,200 per mile in 1913 and $50,400 in 1914.

Or the net operating income was equivalent to 6 per cent on $16,300 per mile of all track operated in 1913 and $3,900 in 1914.

The Wabash, which is in the hands of a receiver, and has been heretofore regarded as among the more unfortunate roads, is as prosperous as the average of the roads included in group 3, including the Illinois Central, and very far above the average of the group if the Illinois Central be excluded.

The net operating income of the Wabash in 1913 was $3,700,000 in 1914, $2,100,000, which amounted in 1913 to 2.09 per cent on the property investment, and in 1914 1.12 per cent—as compared with 0.55 per cent, the average of group 3 exclusive of the Illinois Central.

The net operating income of the Wabash was equivalent to 6 per cent on $30,300 per mile of first main track owned in 1913,

and $17,300 in 1914, as compared with $7,200, the average of group 3, exclusive of the Illinois Central.

The net operating income of the Wabash was equivalent to 6 per cent on $19,750 per mile of all track owned in 1913, and $11,000 in 1914—as compared with $4,600 in 1914, the average of group 3 exclusive of the Illinois Central.

The net operating income of the Wabash was equivalent to 6 per cent on $15,100 per mile of all track operated in 1913 and $8,400 in 1914—as compared with the average of group 3, exclusive of the Illinois Central, of $3,900 in 1914.

The ratio of expenses and taxes to gross revenue on the Wabash was 80.58 per cent in 1913 and 84.77 per cent in 1914 or 4.08 per cent less than the average of group 3.

The great decline in net operating income, in 1914 as against 1913, of the Central Freight Association lines, was due almost wholly to the increased cost of doing business and taxes.

The figures show that the gross revenues of group 1, 1913 over 1914, declined 4.4 per cent, and of group 3, 1.9 per cent.

The evidence shows that group 3 has no unappropriated surplus, but a deficit amounting to more than $72,000,000.

These figures show that the tendencies of which the carriers complained in 1910 and again throughout the trial of this case, have culminated in central freight association territory in disaster. The same tendencies in the lines in trunk line territory are obvious and have been for some time to Mr. Willard, to Mr. Rea, and other trained railroad men who are responsible to the public and their stockholders and creditors for their proper management.

The cause of that tendency became manifest to them in 1910 when expenses increased enormously without any increase in rates. That is the disease which has almost destroyed the railroads in central freight association territory, and it is obvious to those skilled in railroad management that the same germ is at work in the lines in trunk line territory, experienced railroad men recognized the effect of that tendency, just as a physician recognizes from early symptoms a deadly disease.

Is it in the public interest that an advance in rates in trunk line territory be postponed until great lines like the Pennsylvania, the Baltimore & Ohio, and the New York Central shall have reached the present condition of the central freight lines?

While the rates have been and are now lower in central freight association territory than in trunk line territory, the evidence, I think, shows that the increase in the cost of doing business has grown out of proper relationship to the rates in trunk line territory. The lower rates in central freight association territory co-operated with the high costs to bring the disaster on them first, but it is not unreasonable to conclude that the same cause will, if not timely arrested, produce in time the same condition in trunk line territory.

The commission held, on the evidence exclusive of the 1914 figures, that the carriers had not discharged the burden of proof with respect to the reasonableness of the rates on brick, tile, clay, coal, coke, starch, cement, iron ore, and plaster.

I submit the 1914 figures for the 17,900 miles in group 3, exclusive of the Illinois Central, which produced net operating income equivalent to 6 per cent on only $7,200 per mile of first main track owned, or $4,600 per mile of all track owned, or $3,900 per mile of all track operated, discharges the burden of proof as to those commodities.

The ratio of operating expenses and taxes to gross revenues of those lines in 1914 was 90.96 per cent. The high cost of doing business demonstrates, in connection with the other testimony, that the carriers are, under present rates, transporting the above commodities—a substantial part of their tonnage—without adequate profit, and that the proposed advance on those commodities would not be unreasonable.

The evidence shows that the increase in the revenues of the Wabash from the tariffs carrying the advance of 5 per cent, which have just become effective, will, based on the figures of 1914, produce about $230,000 additional revenue per year, or $139 per mile on the lines of the Wabash in central freight association territory.

The evidence further shows that from the other tariffs carrying increases which have recently been filed, some of which have not become effective, the Wabash it is estimated will receive $320,000 per year, making in all about $550,000 per annum which the Wabash will likely receive. This estimate includes the revenue which may be derived from the proposed increase in passenger fares, and amounts to $332 per mile of road in central freight association territory.

Tariffs under consideration which the carriers will file, and which it is hoped will become effective, will, in the event they become effective, add about $110,000 to the revenues of the Wabash, making the total additional revenues now in prospect $660,000 per annum, or about $400 per mile of its lines in central freight association territory.

We are not justified in believing that the other lines, or any great number of them, will derive as much revenue from the above sources per mile of road as the Wabash, because the commodities excluded from the advance comprises only about 33 per cent of the tonnage of the Wabash, whereas those commodities comprise as much as 85 or 90 per cent of some lines of heavy tonnage, and it is estimated that they comprise more than 50 per cent of the tonnage of the territory—in fact, those commodities likely comprise as much as 50 per cent of the tonnage of group 3.

These added earnings, or the bulk of them, will be absorbed in expenses which must continue to increase.

As a rule the companies have no credit, and are, therefore, bound to pursue a "hand-to-mouth" policy, which, after all, amounts merely to wearing out their properties.

Obviously their operating expenses will continue to increase until their earnings entitle them to credit which will enable them to finance the acquisition of new equipment and other facilities necessary to operate the properties in a normal way and at a reasonable expense.

As I have said, the lines are, as a rule, without credit, and they cannot obtain credit until their earnings show they are entitled to it, and their present earnings will be largely absorbed in expenses. So an increase in rates is absolutely necessary to enable them to make a showing which will justify the financing of much-needed facilities.

As pointed out by the commission in its report, adequate relief to the lines in that territory can only come by a readjustment of the body of rates to a level with the rates in other territories, traffic density and other relevant matters being taken into account. The evidence shows that such a readjustment is well in hand, but that obstacles will likely delay its accomplishment for, say, a year. Those lines will, in due time, take up with the commisison the subject of the readjustment and earnestly invite its co-operation, which I think is necessary to its success.

But in the meantime the lines in that territory ought, if possible, to have relief and at the earliest moment.

In my judgment the restoration of railroad credit is essential to even effective temporary relief, and railroad credit cannot be established if it be true, as claimed, that the lines in trunk line territory are tending towards the present condition of the lines in central freight association territory. The unquestioned credit of the lines like the Pennsylvania Railroad is essential to establish the credit of the railroads of the country. If the credit of the Pennsylvania Railroad and lines of that kind suffers, the credit of the weaker lines will collapse.

The remedy, therefore, in my judgment, is to advance all the rates which have not already been advanced. That will not entirely relieve the situation. If the commission does not see fit to make effective all the tariffs, then I submit that the least that can be done, in view of the condition of the central freight association lines, is to authorize advances in the rates on the 9 excepted commodities and in the rates between points in trunk line and central freight association territory.

THE ARGUMENT OF MR. BRANDEIS AND MR. BROWNELL

The oral argument of Mr. Brandeis, as special counsel for the commission, is not as yet available, and since Mr. Brownell's argument was quite directly the answer to Mr. Brandeis, the two

arguments will be published in these columns next week. Below is given a brief summary of the main points of Mr. Brandeis' argument and of Mr. Brownell's answer.

Mr. Brandeis stated that the commission itself had confined the decision in the rehearing to matters which had come up since the original hearing and since the decision of the commission in the earlier case had been arrived at. He claimed that only evidence bearing on matters which had transpired during this time should be considered by the commission, that it was entirely wrong to go back and rehash the case as it was presented to the commission originally and on the facts of which the commission had already decided.

With this as his premises Mr. Brandeis claimed that the 1914 figures, which have become available since the closing of the original hearing, threw no new light on the case since they simply bore out the estimates which had been made in the original case. Furthermore, he argued that the two months since the close of the fiscal year—July and August—had shown much better returns to the railroads than the corresponding two months of the fiscal year ended June 30, 1914. He then pointed out that the one single and only factor which was new in the case was the war. The war affected everybody, he said. This being so, the stockholders of the railroads should suffer their ills in the same way in which every other investor in the country had to suffer, and he argued that it would be wholly wrong for the commission to permit the shifting of this burden of the war, which was common to everyone, completely off railroad stockholders' shoulders onto the rest of the general public.

Furthermore, he argued that the commission would be going beyond its legal powers in taking into consideration some of the matters brought up by the investment bankers. His point was that the commission's responsibility under the law was to decide in regard to the reasonableness of rates and that many of the broader general questions which had been injected into the case were not matters which were within the jurisdiction of the commission to consider. He pointed out that in his opinion no specific showing had been made as to the injustice of the existing rates and that if the commission saw fit to grant the advance, thereby modifying its previous ruling, it would exceed its legal powers and invade the province of Congress, that such invasion would amount to a declaration by the commission of governmental policies, and that it was plainly outside of the province of the commission to inaugurate governmental policies, Congress alone having that power.

Mr. Brownell pointed out that the roads were not asking that the commission undertake to exercise any powers not conferred on them by law, but that all the considerations which were presented to the commission were proper for them to take into consideration in determining the question at issue. He pointed out that until the passage of the Hepburn act in 1906 there was no express provision in the interstate commerce act for rehearings. At that time Congress, anticipating, perhaps, that emergencies might arise when the commisison clearly should have the power to grant a rehearing on all the facts, including those arising since the original hearing, added a new section to the act, 16A, providing specifically for a rehearing of the same or any matter determined in the original case, and providing further that if the commission, in its judgment after such rehearing and a consideration of all facts, including those arising since the former hearing, should find the original decision unjust or unwarranted, it might reverse, change or modify the same.

Mr. Brownell pointed out that for reasons which had been testified to by Mr. Conant, Mr. Strauss and others, there was grave danger that the financial disturbances which will occur during the process of distribution of government loans necessitated by the war to investors will cause a serious further depression in American railroad securities, and that in the judgment of competent witnesses, this apprehended liquidation of United States foreign held securities will be substantially retarded or accelerated, according as to whether the railroads are now permitted to charge such just and reasonable rates as will secure them adequate net revenues.

Furthermore, Mr. Brownell pointed out that until 1887 Congress had not assumed control and regulation of the railroads generally, except to constitute them post roads. By the interstate commerce act as amended, Congress has declared a new public policy toward the railroads and has adopted and made them instrumentalities of the federal government with new duties and obligations to which they were not subject, Mr. Brownell thought, under the common law or under the laws of the states that created them, but which have been newly imposed by Congress. By this law the railroads were required to provide and furnish on reasonable request all transportation. Mr. Brownell pointed out that this provision placed a duty on the railroads and that when the Interstate Commerce Commission was given its broad powers of regulation, one of the duties which it was clothed with was that of seeing that this section of the law was complied with. It was, therefore, Mr. Brownell pointed out, perfectly obvious that the commission must take a sufficiently broad view of any situation involving rates to include a consideration of whether or not its action would enable the roads to provide transportation or would prevent them from providing transportation, and that so far, from being illegal or extra-legal for the commission to take this broad view, it was very plainly illegal for them to take any narrower view than this.

The following is the full text of Mr. Thorne's argument opposing the rate advance:

ARGUMENT BY MR. THORNE.

Public regulation has been a great benefit to the shippers of this country, through the partial removal of discriminations in some cases. Indirectly it has been of benefit to the consumers, by making competition possible. But regulation has been of very little direct benefit to the consumer, so far as freight traffic is concerned. The introduction of the tonnage system in making up freight trains has retarded the speed of trains. The larger cars and larger trains have reduced the costs to the railroads, but not to the public.

This commission has not enabled the consuming public, the 90 per cent who foot the bills, to share the financial benefits of reduced costs on freight traffic, growing out of the marvelous inventions and improved methods that have revolutionized the railroad industry during the past fifteen years.

So long as competition lasted there was a constant decline in freight charges, as a whole. When competition ceased, that decline stopped. The average freight revenue per ton mile today is where it was 16 years ago. Now, when regulation has finally become a reality; now, just as we have given you the power and the funds to find the value of these properties, which both the courts and this commission have said shall be the basis for determining the reasonableness of an entire schedule of rates; now, these gentlemen propose to increase the freight tax on the American public. Not only are we denied the opportunity of sharing in these great benefits brought about by human ingenuity, but the tax burden is to be increased. Your net revenues have increased as much during these past 16 years, as in all the prior years since the steam engine was invented.

Stock that originally was given away as a bonus, has gradually acquired some substantial value under the kindly care and protection of a beneficient Uncle Sam. Your rate of dividends on all outstanding stock in this district averages almost double what it did 16 years ago, and almost treble what it did 25 years ago.

During the past 10 years the average rate of dividends in this district has been more than one-half greater than it has been during the same period in Great Britain, according to the official reports to Parliament.

These dividends vary slightly from year to year. Not one year during the entire 10-year period did the average rate of dividends in Great Britain reach as high as 4 per cent; not one year during the entire 10 years did the average rate in this district fall as low as 4 per cent.

During the decade immediately prior to 1898, your net revenues increased about $100,000,000, while freight charges declined 25

per cent. Today your net revenues in the United States, as a whole, are $400,000,000 greater, annually, than they were 16 years ago; while freight charges, as a whole, have not declined one iota. This is the old, old game of "heads I win, and tails you lose."

But you railroad men are not even satisfied with this. You now propose to raise American freight rates to a higher level. Not content to leave it on the same level, you propose to increase the freight tax. These freight rates have all the essentials of a tax, for they are levied on practically everything we eat or wear, buy or sell.

You propose to increase this tax burden on the American public when a world-crisis is pending which it is admitted may affect the railroads; but it will likewise affect other lines of industry and some are prostrated as a result thereof; you propose this at a time when a lull, a depression, in business generally prevails. High rates during a depression and low rates during prosperity as has been suggested by one or two of your chief witnesses would be directly contrary to the needs and welfare of the public. Your stockholders should share the results of the general financial situation. Others are doing so.

You propose to increase this tax burden when the credit of American railroads, as a class, is proved by your own witnesses to be better than that of companies engaged in any other line of business in the United States, either telegraph, telephone, electric light, street railway, industrial, public utility, manufacturing, or any other class of companies, engaged in any line of business in this whole nation.

You propose to increase this tax burden at a time when the railroads have been able to maintain their properties better than ever before in their history. Your maintenance allowances last year, right here in this district, according to your own exhibit in this case, were $9,000,000 greater than ever before. In 1913 they were not as high as in 1914, but they were $60,000,000 greater than any other year in your history.

You propose to increase this tax burden on the basis of a property investment which this commission itself has previously declared that no accountant or financial writer of any consequence would accept as any evidence of either original cost or present value.

You railroad men propose to increase this tax burden on the basis of a comparison which no recognized accountant in the United States would claim is sound, because your own records prove, and one of your chief witnesses conceded, that the method of compiling that property investment has changed during the years that are compared. Further, this record proves, and your own witnesses concede, that the method of accounting for depreciation and maintenance has changed during the years compared.

You propose to increase this tax burden on the basis of a so-called property investment which, for about two-thirds of the companies, is greater than all their bonds and all their stocks put together.

You propose to increase this tax burden on the basis of a property investment which includes all the water of that notorious example of high finance—the Erie; on the basis of a property investment which exceeds all the capitalization of twenty other great railroads in this territory.

You propose to increase this tax burden at the end of a decade of unparalleled prosperity, at a time when under ordinary circumstances you have been able to earn a return above all operating expenses and interest and taxes, ranging from 7 per cent to 9 per cent on all your capital stock, water and all, that is held by the public in any of these railroads, the strong and the weak, the Erie, Wabash, the Cincinnati, Hamilton & Dayton, the New Haven, and all the rest put together in one lump.

If you railroad gentlemen are able to put that over on the American people, I shall congratulate you, for your consummate ability. You will have earned your handsome salaries for all the rest of your days on this earth.

If you gentlemen are able to put that over, that thing which will make this epoch famous for all time, the great miracle of the twentieth century will be the transformation of water into gold. This will be done by the magic wand of the Interstate Commerce Commission. No other event in all recorded history is comparable to this, since that wedding feast two thousand years ago. The alchemists of the middle ages tried to turn metal into gold, but they failed. They should have tried water.

If the fair value of these railroad properties justified an advance in freight rates, we could not object; and, as we previously stated, even in the absence of a valuation, if they had not been able to maintain their properties as in former years, or if their credit was ruined, due to inadequate freight rates, so that in ordinary times they could not get new money for additions and betterments, we could not have a valid objection. But in the absence of a valuation, and at a time when they have been able to maintain their properties, as a whole, better than ever before, at a time when the credit of American railroads, as a class, and of these companies in particular, is admitted by all parties to be better than that of all other lines of business in the country, I believe a 5 per cent advance in freight rates to be unjustified.

NEW SOUTH WALES GOVERNMENT RAILWAYS ADVANCE RATES

The Bureau of Railway News and Statistics has issued the following:

"Increases in freight rates of 10 per cent and in passenger fares ranging from 5 to 50 per cent are the means by which the government railways of New South Wales, Australia, have undertaken to combat the world-wide advance in costs of railway operation. The annual report of these railways presents detailed outlines of the advances, and attributes them almost wholly to the expansion in wages and costs of materials. This is looked upon as the most striking recent instance of the facility with which state-owned railway systems have been adopting advances in rates to cope with the rapid rise of late years in operating expenses, and is in sharp contrast to the experience of the private transportation systems of the United States, where in spite of recognition by the Interstate Commerce Commission of pressing need, eastern railways have been refused a 5 per cent advance covering only freight rates, and under emergencies caused by the European war the roads have had to petition for a reopening of their case owing to actual threatening of their credit structures.

"Increased charges for freight transportation placed in effect by the New South Wales government roads are uniformly 10 per cent, and the estimated annual increases in freight revenue are as follows:

First and second class freight rates	$350,000
Class A, B and C mileage rates	230,000
Livestock rates	300,000
Total added freight revenue	$880,000

"Advances have been made in passenger fares despite the fact that 'cheap excursion fares' already were on a basis of 4 cents a mile first class and 2 cents a mile second class, while 'special cheap excursion week-end fares' were 3½ cents a mile first class and 1¾ cents a mile second class, compared with an average of only 2 cents a mile received for all passenger traffic by United States railways in 1913.

"The increases range from 5 per cent in the case of through fares to 50 per cent in second class excursion fares. With the percentages of increase, and the estimated annual additions to revenues the advances are as follows:

Season tickets, 20 per cent	$285,000
Through fares, 5 per cent	460,000
Cheap excursion fares from 4 cents to 5 cents per mile first class (25 per cent) and from 2 cents to 3 cents per mile second class (50 per cent); special cheap excursion week-end fares from 3½ cents to 4 cents per mile first class (14 per cent) and from 1¾ cents to 2 cents per mile second class (14 per cent)	50,000
Workmen's fares increased to basis in effect in 1907	75,000
Total added passenger revenue	$870,000

"Total new yearly revenue from both services is estimated at $1,750,000, or more than 5.3 per cent of gross operating revenues in 1913. A similar increase in the United States would amount to almost $169,000,000."

The Jersey City Passenger Station Improvements

Central R. R. of New Jersey Has Built New Ferry House and Train Shed and Remodeled Station Building

A much needed increase in capacity of the Central Railroad of New Jersey passenger station at Jersey City, N. J., has been secured by the construction of a new double deck ferry house and slips, a new 20-track Bush type train shed and a new train concourse more than double the size of the old one, and a general rearrangement of facilities in the station building. The Jersey City station is unusual in being both a through and a terminal station, since all trains terminate there, but practically all passenger, mail, baggage and express business must be transferred with the least possible delay to and from the ferry boats operating across the river to New York City.

The New Jersey Central Ferry House and Slips

TRAFFIC HANDLED THROUGH THE STATION

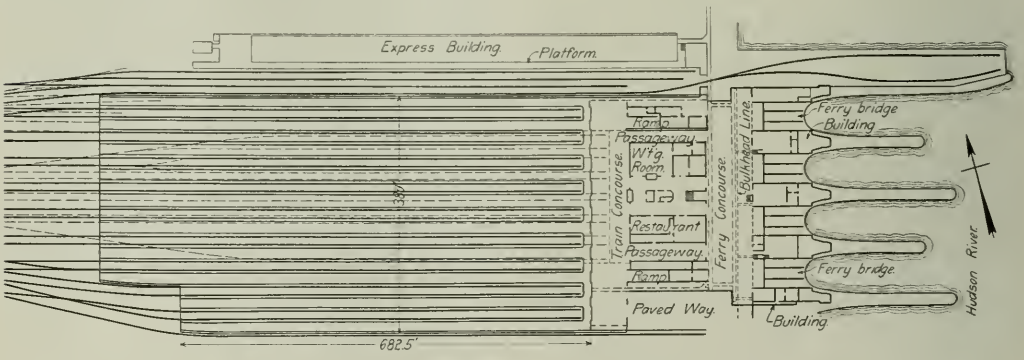
The total number of passengers using this station daily was shown by a one day's count to be between 27,000 and 28,000 in each direction, including the passengers for the Philadelphia & Reading, the Baltimore & Ohio and the Lehigh Valley, which, in addition to the Central Railroad of New Jersey, use this station as an entrance to New York City. The Lehigh Valley traffic was transferred to this station during the course of the reconstruction, adding somewhat to the difficulty of handling the work without interruption to traffic.

About 200 trains in each direction use the station daily. The Jersey Central operates the Philadelphia & Reading and the Baltimore & Ohio trains in the same manner as its own service. The Lehigh Valley operates its own trains into the station over the Jersey Central tracks for a distance of about 10 miles. This service includes about 12 trains each way. On account of the large commuting business the density of traffic is much greater during the morning and evening rush hours, the total number of passengers shown by a recent count during a one hour period in the evening rush being 8,600 outbound and 2,200 inbound. This traffic was handled by 27 outbound and 11 inbound trains between 5 and 6 p. m.

The ferry boat service consists of 129 movements per day each way between Jersey City and the foot of Liberty street, and 57 movements per day each way to Twenty-third street. The Liberty street boats run on an interval of 7.5 minutes during the rush hours and the Twenty-third street boats at 20 minutes intervals during those periods. While the baggage movement through the station is heavy, it is practically all transfer business, coming from or destined to New York. The amount of mail handled has not been very large, but this traffic is being increased by changes in the method of handling mails, especially that coming in on ocean steamers.

NATURE OF THE IMPROVEMENTS

The principal requirement for the efficient handling of passenger traffic in this station, particularly during the rushes, is the provision of an ample number of direct passageways between the ferry boats and the train platforms. In the old station all of the facilities were on a single level. A boat had to be loaded and unloaded over two gangways and a large part of the people were forced to use the main waiting room, located in the center of the station building, as a passage way between the ferry concourse and the train concourse, which seriously interfered with the comfort of passengers sitting in the waiting room and with the proper conduct of business at the ticket offices. Two passageways, one at each end of the building connected the ferry and train concourses, but in many cases these formed a less direct route for passengers than through the waiting room, and even when they were direct, they were inadequate for the maximum crowd. In the present improvement the four wooden slip houses and the wooden shed over the ferry concourse have been replaced by two-story slip houses of permanent construction and a two-level concourse structure.



Layout of Jersey City Passenger Terminal Showing Ferry House, Station Building, Train Shed and Express Building

As both of the ferry houses on the New York side were equipped for two-level operation when they were rebuilt a few years ago, and as the boats in this service were already of the two-level type, the completion of the new Jersey City ferry house made possible the immediate use of four gangways for loading and unloading boats, and by alterations in the station building

the capacity of the connecting passageways between the ferry house and the train concourse has been at least doubled. On the lower level, the two-end passageways remain unchanged, but by a rearrangement of the space in the station building, the waiting room has been removed from the central portion, which will considerably facilitate the movement of passengers who will use that space as a passageway. In addition to these improvements on the lower level, two new passageways have been provided, one at either extreme end of the building, intended primarily for trucking baggage, papers, etc., between the ferry house and the train platform. By the removal of this trucking business from the other passageways an equivalent increase in capacity of those facilities is secured.

On the upper level three new passageways are provided. Near each end of the building a ramp on a grade of 9.5 per cent leads down from the upper ferry concourse to the train concourse and a broad stairway connects the middle of the upper ferry concourse with the corridors leading through the central portion of the station building. As passengers using this stairway mingle with the passengers coming through the central corridors on the lower level, this route can scarcely be considered as adding to the capacity of the passageways. It does serve a very useful purpose, however, in allowing passengers coming in on the upper level to reach the waiting room, restaurants, or other facilities in the station building by the most direct route.

The old train shed covered 12 station tracks, 8 under the main shed and 2 under extensions, on each side. In addition to these 12 covered tracks, there were two short tracks on the south side which were not covered. The old shed was 512 ft. long, of which one 32 ft. section adjacent to the station building was used for a concourse. All of the platforms extended beyond the shed, however, the longest being about 925 ft. At the time the old shed was built the roof trusses, which were 142 ft. 7 in. long, were the longest simple truss spans in service. The new train shed will have a maximum length of 817 ft. 6 in. and a width of

Lower Level Ferry Concourse Showing Ferry House and Bridge

390 ft., covering 18 tracks. Eight of the platforms are 800 ft. long and the other two 675 ft. The approach to the station will also be improved by increasing the number of tracks in the throat from five to nine. This work is a part of the extensive yard changes, which are also now under way.

A three-story express building, extending along the north side of the new train shed, was built about three years ago. Although not a part of the station development, this building was designed to house some of the offices that had been located in the old station, which made possible the rearrangement of facilities in the station building. The following figures indicate the size of the general development:

Area of station and ferry house	102,000 sq. ft.
Area of train concourse	22,650 sq. ft.
Area of completed train shed	313,000 sq. ft.
Length of tracks in completed shed	2.96 miles.

NEW FERRY HOUSE

The new ferry house comprises four slips with pile fenders, five two-story slip houses and a two-story ferry concourse. The entire structure is founded on wooden piles with reinforced concrete pedestals, beams and girders supporting a continuous reinforced concrete floor slab and the framework of the slip houses and concourse superstructure. The building has a steel frame with concrete floors and roof and hollow tile and concrete walls. The lower concourse level is paved with creosoted wood blocks for the accommodation of a heavy teaming traffic, using the ferry boats in addition to the passengers. The teams enter the concourse at both ends as a large amount of traffic from the hill

Upper Level Ferry Concourse

section of Jersey City and Newark comes in at the north end and all teams to and from the company's team tracks use the south end.

In order to handle this business properly, the new concourse was made wider than the old by moving out the ends of the slip houses. On the two floors of the slip houses are located the railway mail service, emigrant waiting rooms, the baggage room, stationer's room, storage space for the news company, a drug store and barber shop. The lower ferry concourse is 75 ft. wide and 348 ft. long, and the upper is 50 ft. wide and 302 ft. 6 in. long. The upper level is lighted by skylights in the roof, and the lower level by two large skylights located between the station building and the upper concourse level. The accompanying illustration of the upper level shows the skylight, roof trusses and the tile wainscoting. The illustration of the lower level shows the steel framework, the girder and slab floor for the upper level, and a portion of one of the slip houses.

The bridge at the end of each slip is suspended from the ferry house structure and is raised and lowered by 20 h. p. a. c. motors at a speed of about 7 ft. per minute. A specially designed buffer is used to absor bthe shock of landing boats. The pivoted end of the bridge has its bearing near the outer end of a spring platform, 18 ft. 10 in. long, which transmits the shock through heavy coil springs to a buffer platform 23 ft. long, which is separated from the heavy concrete bulkhead by similar springs. The spring platform consists of timber piles supporting a timber deck, and the buffer platform of timber piles supporting a timber framework, which is entirely independent of the deck carrying the floor over the platform.

In order to handle the ferry boats without delay during the construction of the new ferry house, a temporary slip was built on each side of the old layout with temporary wooden concourses connecting with the trainshed concourse. The temporary slip on the south side will be maintained indefinitely for emergency use. When the two temporary slips were ready for operation the two northerly permanent slips were thrown out of service and work was started on the foundation for the north half of the ferry house and on the construction of the new bridges and racks.

The concrete in the foundation was placed from the river side, the mixer being located on a fixed platform and the material brought to it by scows. As soon as the two northerly permanent slips could be put in service again, the erection of steel for the ferry house, including the slip houses and the bridge-operating machinery, was begun. The same general course was followed for the two southerly slips. The floor of the lower ferry concourse was built in four parts in order to delay the traffic as little as possible. While each pair of permanent slips was out of service, the portion of the concourse directly opposite these slips and covering one-half its width was rebuilt. The construction of the remaining width followed as soon as the first section was ready for traffic.

A Portion of the New Train Shed

NEW TRAIN SHED AND CONCOURSE

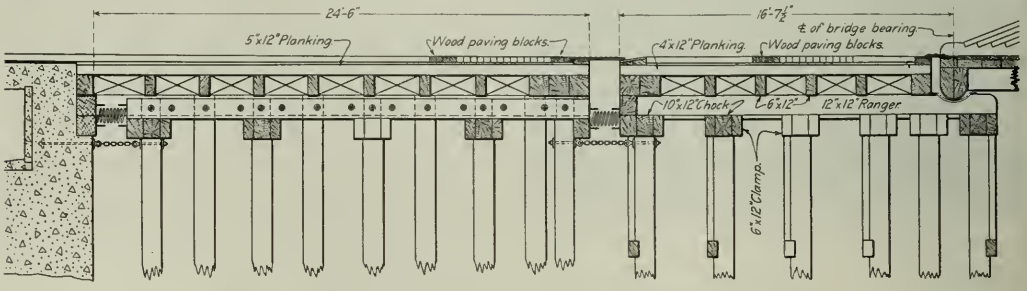
While the train shed is similar to others of the Bush type which have been built recently, a number of details have been improved. The smoke duct is tapered at the top in order to give better protection from the weather and at the same time to present a bottom opening wide enough to catch most of the locomotive gases. The width at the bottom is 3 ft., and the minimum width at the top is 1 ft. 9 in. The skylights have been made smaller than those used in earlier designs in order to reduce the amount of breakage, which in some cases has proven an expensive item of maintenance. The two side lights in each span are 4 ft. 7 in. wide, and the ridge light is 5 ft. wide. All of these are 24 ft. long. Rolled steel bars, sealed with lead, support the ¼-in. rough wire-glass. All exposed metal parts, including bolts, nuts, rivets, flashing and ventilating ridge, are of Monel metal. All skylights are raised on concrete curbs to keep out water and snow. A 3-in. water shed is provided in all gutters from the center of each panel toward both ends. The drainage is carried down the inside of the columns to drains which lead to a 24-in. outfall main. The upper ends of the downspouts are closed by cast-iron strainers.

The foundation under the train shed rests on piles, this type of construction being made necessary by the character of the surface material. The entire site of the station and approaches was originally a mud flat, partially exposed at low water. The road was first built on a timber trestle, which was later filled. Solid rock underlies the fill, and in most cases the piles were driven to this rock stratum. This made necessary the use of piles ranging in length from 50 ft. at the east end of the shed to about 90 ft. near the west end. Spliced piles were used for these long lengths, the splices being made by dowel pins, sometimes adding a wrought-iron collar over the head. Untreated piles were used which were cut off below low water level. The 6-in. reinforced concrete platforms are carried on concrete beams and girders over the pile-supported footings. Heavier footings, which support the shed columns, are located along the center line of each platform at intervals of 27 ft. The floor in each of these 27-ft. panels is supported by three longitudinal beams, a transverse beam at each column support, and one halfway between columns. An expansion joint is provided at every eighth bent. The floor slab is reinforced with No. 38 triangular mesh. The tracks are laid directly on the fill.

The roof is supported by cast-iron columns, the transverse spans varying from 39 ft. to 43 ft., depending on the width of platforms, which vary from 16 ft. along the edges of the shed to 20 ft. in the middle. The wider platforms could not be used in all cases, as the layout was limited in width by the team tracks which adjoin the station on the south. It was thought advisable, therefore, to place the wider platforms in the middle of the shed, where baggage, express and mail must be trucked to the through trains, which use those tracks. The bumping posts are of structural steel, on heavy mass concrete, supported on piles. The shed is lighted by Tungtsen lamps, with special reflectors designed to concentrate all light on the platforms and reduce the difficulty which engineers find in running into a brightly lighted shed. All wires are carried in conduits, and all pipes for water, air and steam are located in a pipe tunnel under the concourse platform, with leads out to the track platforms.

The old high train shed was removed without interruption to traffic by the use of a special traveler built up from three signal bridges. The details of the method used in dismantling the old structure were described in the *Railway Age Gazette* of July 18, 1913. Temporary butterfly sheds were erected on the old platform, as a protection for the passengers during the dismantling of the old shed and the early stages of the construction work on the new shed. Before taking any of the old station tracks out of service two new platforms, serving four additional tracks, were built on the permanent location south of the old shed and one platform and a half, serving three additional tracks, on the north side were completed. A separate interlocking machine, located in the old tower, was used to operate these outside tracks.

The construction of the new shed was carried on consecutively from the south toward the north. The general practice was to take two or three tracks out of service at a time, drive the



Details of Spring and Buffer Platforms to Absorb the Shock of Landing Boats

piles for the foundation, place the platform, erect the steel for the shed structure, place the roof concrete and connect up the tracks in the throat before taking any more tracks out of service. There were never less than 15 station tracks in service during the course of the work, and usually 16 were available. To handle the special holiday crowds the schedule of work was usually arranged to give the operating department 18 tracks on these days.

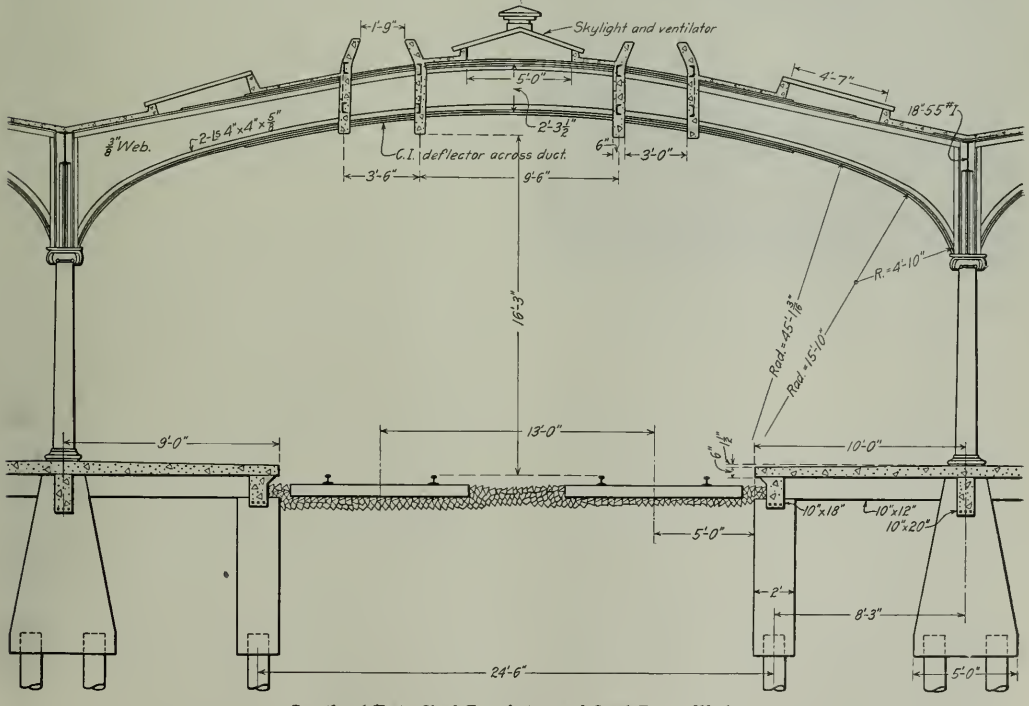
The construction plant used on the shed and concourse consisted of two pile drivers, one drop and one steam, two Ransome mixers, one of ¾-yd. capacity and one 1 yd., both mounted on flat cars, and a 10-ton locomotive crane. The foundations and the platforms were placed by chuting the concrete direct from the mixer. A high tower was impractical for placing the roof, and it was finally found best to mount a system of Insley chutes and gates on a flat car so that four or five bays of the roof could be placed from one location of the mixer. Two tracks were required for the concrete plant, one for the mixing car and placing car and one for the material. In very few cases were more than three tracks required for construction purposes. The steel work was all erected by the locomotive crane.

The old high train shed extended to the wall of the station building, one 32-ft. bay adjoining the building being used as a concourse. This concourse was 215 ft. 6 in. long, giving it an area of about 6,900 sq. ft. The new concourse is structurally independent of the shed and station building, occupying the space 63 ft. 6 in. wide and 383 ft. long between the train shed and the station. Its area is 22,600 sq. ft., an increase as compared with the old concourse of more than 350 per cent.

The floor is a reinforced concrete slab, supported by concrete girders and beams on pile bents. Structural steel columns support transverse roof girders connected by two stiffening trusses. A central monitor, with skylights of the same type as those installed on the train shed, extends for the full length of the concourse roof. A total of 116,000 sq. ft. of the multiple unit skylights, installed by the National Ventilating Co., New York, was required for the entire building. The roof on either side of the monitor is of concrete slabs.

The train platforms are separated from the concourse by sliding gates equipped with Hutchinson indicators and a system of light signals for starting trains. This system, which was worked out by the company's engineering department, differs in some respects from that used in a number of large stations, in that the tower operator receives the signals from the ferrymaster, gateman and conductor, but does not answer except by lining up the route and displaying the clear signal at the end of the shed.

The Train Concourse with Entrances to Train Platforms on Left



Details of Train Shed Foundation and Steel Frame Work

During the construction of the new concourse a temporary shed was built on the old platform as a protection for the passengers, and numerous temporary runways were built to connect the passageways with the train platforms that were in service in various stages of the construction work. The west half of the concourse floor was built first, as this did not interfere with the old platform. During the construction of the east half of the new floor, traffic was handled around the ends of the building onto the completed section. The erection of the steel work was carried on during the progress of the work on the floor, all steel being placed over the heads of the passengers without interruption to traffic. A 15-ton crane with a 70-ft. boom was used for this work, the heaviest piece handled weighing about 13 tons.

ALTERATIONS IN THE STATION BUILDING

The station building is a steel frame structure, with brick walls resting on pile foundations. In order to leave the central portion of the building free for passageways between the ferry and train concourses, new quarters were found outside of the station building for the railway offices which formerly occupied the north end of the building, and the main waiting room, ladies' rooms and smoking room were located in this space. The waiting rooms are finished with terrazo floors, tile wainscoting, plastered walls and ceiling, decorative glass skylights and oak benches and woodwork. The public space or lobby in the central part of the building is divided into two passageways by

A Portion of the Central Lobby in the Station Showing the Ticket Office in the Foreground Which Divides the Area Into Two Passageways

the new ticket office, information booth, telephone and telegraph booth and parcel checking room, which occupy the center of the space. A new tile floor was laid in this room, and it was redecorated and equipped with steam heat. The space occupied by the restaurant in the south end of the building was practically doubled, and the appearance of the room was much improved. It has a tile floor and wainscoting and plastered walls and ceiling.

A new service building, located north of the station, was also a part of this improvement. Electric power, generated at the new engine terminal at Communipaw, is transmitted to this service building, where it is transformed to a voltage that can be used in the terminal. An installation of 1,500 boiler h. p. furnishes heat for the station, and the other equipment includes an air compressor, a fire pump and a 100,000-gal. service tank. All piping and power, signal, telegraph and telephone wires in the terminal district are carried underground.

This improvement work has been carried on under the direction of the engineering department of the C. R. R. of N. J., J. O. Osgood, chief engineer. The foundation and racks for the ferry house were built by G. B. Spearin, New York; the superstructure of the ferry house and the remodeling of the old station were contracted to C. T. Wills, New York, and the train shed was built by R. P. & J. H. Staats, New York. The American Bridge Co. fabricated the steel for the ferry house and train concourse, and the Pennsylvania Steel Co. that for the train shed. The old train shed was dismantled by Terry & Tench, New York. All work was handled on a force account basis. The work was started May, 1912, and is practically completed.

THE CLAYTON BILL

The Clayton bill, to supplement the anti-trust laws, which has been under discussion in Congress for many months, became a law October 15. As adopted it consists of 26 sections; and it deals chiefly with "commerce" which word, in the Act, is used to mean interstate and foreign commerce, substantially as defined in the interstate commerce law. This law deals with carriers specifically only in sections 7, 9 and 10.

Section 7 forbids one corporation to acquire stock of another, if such acquisition will restrain commerce or lessen competition; but with certain provisos; and one of these provisos is that Section 7 shall not prohibit common carriers from aiding or buying branch lines or feeders where competition is not lessened by such action.

Section 9 makes it a felony for an officer of a common carrier to wilfully misapply funds; maximum penalty, ten years' imprisonment and a fine limited only by the discretion of the court.

Section 10 is designed to forbid collusive contracts for supplies. This section goes into effect October 16, 1916, and reads as follows:

SECTION 10. That after two years from the approval of this Act no common carrier engaged in commerce shall have any dealings in securities, supplies or other articles of commerce, or shall make or have any contracts for construction or maintenance of any kind, to the amount of more than $50,000, in the aggregate, in any one year, with another corporation, firm, partnership or association when the said common carrier shall have upon its board of directors or as its president, manager or as its purchasing or selling officer, or agent in the particular transaction, any person who is at the same time a director, manager, or purchasing or selling officer of, or who has any substantial interest in, such other corporation, firm, partnership or association, unless and except such purchases shall be made from, or such dealings shall be with, the bidder whose bid is the most favorable to such common carrier, to be ascertained by competitive bidding under regulations to be prescribed by rule or otherwise by the Interstate Commerce Commission. No bid shall be received unless the name and address of the bidder or the names and addresses of the officers, directors and general managers thereof, if the bidder be a corporation, or of the members, if it be a partnership or firm, be given with the bid.

Any person who shall, directly or indirectly, do or attempt to do anything to prevent anyone from bidding or shall do any act to prevent free and fair competition among the bidders or those desiring to bid shall be punished as prescribed in this section in the case of an officer or director.

Every such common carrier having any such transactions or making any such purchases shall within thirty days after making the same file with the Interstate Commerce Commission a full and detailed statement of the transaction showing the manner of the competitive bidding, who were the bidders, and the names and addresses of the directors and officers of the corporations and the members of the firm or partnership bidding; and whenever the said commission shall, after investigation or hearing, have reason to believe that the law has been violated in and about the said purchases or transactions it shall transmit all papers and documents and its own views or findings regarding the transaction to the attorney general.

If any common carrier shall violate this section it shall be fined not exceeding $25,000; and every such director, agent, manager or officer thereof who shall have knowingly voted for or directed the act constituting such violation or who shall have aided or abetted in such violation shall be deemed guilty of a misdemeanor and shall be fined not exceeding $5,000, or confined in jail not exceeding one year, or both, in the discretion of the court.

Charles Francis Adams' Letter to the President

The Lesson of New England's Financially Crippled Roads as Applied to the Crisis in Railroad Affairs

A letter on the railroad situation in the United States generally, but practically in New England, has been sent to the President by Charles Francis Adams of Massachusetts. Mr. Adams for ten years was a member of the Board of Railroad Commissioners of Massachusetts, and for seven years was its chairman.

The following is his letter:

South Lincoln, Mass., October 24, 1914.

My Dear Mr. President: You will excuse my troubling you with a somewhat lengthy screed; but the topic I have in mind to deal with is important, and, for reasons which will at once suggest themselves, I feel something in the nature of a "call" to express myself thereon. You need give to what I write such amount of consideration only as it may seem to you to deserve, either consigning it to the files or referring it to the Interstate Commerce Commission. For personal reasons, unnecessary to dwell on, I do not care to appear in person before that body; and so doing would necessarily involve on my part a responsibility for statements made, imply perhaps on my part an amount of investigation for which I have not time. I see also no compensating advantages, public or private, likely to ensue there. I cannot afford to get myself involved in either an inquiry or a controversy.

As I believe you are aware, in earlier life I devoted myself for twenty years to matters connected with railroad development and management. I did service, both as public official and as the head of a great railroad company. Although this experience terminated in 1890, and I have given little or no study to what has since taken place in railroad development, yet, as a member of the community, I now feel so impressed with the extremely critical condition of affairs and the significance, so far as public interests are concerned, of what is now going on in my immediate field of observation, that, as I have said, I feel moved to submit certain conclusions.

In doing so, I wish to premise I do not propose to go into details, to use exact figures, or to fortify what I have to submit by statistics or an attempt at argument. I shall deal only with generalities and conclusions, perhaps merely impressions, and that tersely.

Forty years ago I had much to do with the origin and early development of the Railroad Commission. A pioneer, I am free now to say I had little realizing sense of what was finally to result from the movement then initiated; nor has the course of development altogether commended itself to my judgment. In connection with our form of government I still question in many respects its wisdom or its practical results.

However, what now leads to the writing of this letter is the conviction I am under that the present situation is not fully appreciated, and the elements of danger involved in it are far more considerable than is commonly supposed. As that problem presents itself to my mind, I see, moreover, no effort, at once intelligent and comprehensive, made to deal with it.

Confining myself to the situation as it comes under my daily personal observation in eastern Massachusetts—though I am satisfied the conditions prevailing here are general—I am unable to escape the conclusion that so far as our transportation machinery is concerned we are rapidly falling behindhand, and getting also into a well-nigh inextricable snarl. The situation, too, while most portentous—for it is basic so far as prosperity is concerned—does not admit of solution except through treatment both drastic and comprehensive.

Let me come at once to the point: I am satisfied that here within, we will say, fifty miles of Boston, there is an immediate call for a capitalized railroad expenditure, fresh money outlay, of at least $100,000,000. Nor, comparatively speaking, is this outlay excessive; for in New York City alone within the last ten years two railroad companies have spent, or are now spending, in the neighborhood of $300,000,000. This outlay was, moreover, required; nor is there any allegation that it has been wastefully made. Had it not been made, it would not now, under existing conditions, be possible; fortunately, it has been made, and is secure. *That* we have.

In eastern New England it is not, therefore, a question of dividends or interest on existing investment, or of a restoration of credit in this respect. It far exceeds those limitations, for to bring our railroad system up to the proper standard, including a renewal and replacement of rolling stock, the reconstruction of permanent ways and bridges, the separation of grades, and the development of proper terminal facilities and connections necessary to modern competitive conditions would, on a rough estimate, unquestionably call for the amount of fresh money above named—$100,000,000. Moreover, unless that investment is made eastern New England cannot maintain itself industrially. Is the fact generally appreciated that the case thus involves not merely rehabilitation but a costly development essential to continued prosperity?

Meanwhile, from causes unnecessary to enter upon, the corporations owning and managing the railroads in eastern Massachusetts cannot remunerate the capital already invested, much less secure fresh money. They are financially crippled. This is a matter of common knowledge.

Such a state of affairs calls indisputably for prompt remedial action. The existing position is also from a common sense, business point of view impossible of long continuance. I have not time to argue the matter or to enter into details. I will merely state the fact. Here is the largest investment and active business management of the country, and those managing it control neither outgo nor income. They are told what they must do and pay, and have no voice in what they are to charge. Such a situation is economically unheard of, absurd. It needs only to be stated. It is financially impossible of long continuance.

I next find myself further forced to the conclusion that the railroad system generally has outgrown local lines, and that it is futile to expect any adequate remedial action through state legislation or control, partial or complete. The state machinery is, as respects large-scale transportation, antiquated. To indulge then even in an expectation that the problem can or will be dealt with in any comprehensive and constructive spirit through local legislation is, I submit, futile—so futile, indeed, as to be little better than puerile. This we may regret and deplore. I certainly both regret and deplore it; but the fact remains.

Moreover, as recent scandalous disclosures show, the effort to flounder along and accomplish results under existing conditions leads inevitably to indirect action and consequent legislative and other corruption—what are known as 'deals." Glaring instances of this are fresh in public memory. Yet they are mere incidents of an outgrown system, inevitable as they are morally and politically destructive. They simply cannot continue.

The remedy is obvious, even if accepted reluctantly and with apprehension. It must be sought in a system of na-

tional incorporation; and, in so far as it is required, in national supervision. Every day thoughtful consideration of this grave fact is deferred is just so much time lost, and time lost in a condition of affairs rapidly growing worse. The difficulty and consequent cost of ultimate rehabilitation is enhanced.

I do not propose here to enter into the question of public ownership and management, whether state or national. Under our system of government, personally, in whatever form attempted, I do not believe it can result satisfactorily. I am certain that under state control and authority it is simply out of the question. Its consideration is a delusion, and a mischievous one, indicating incapacity and failure to size a situation.

This, however, though it cannot be lost sight of, is remote. It involves considerations, financial, political and social, only to be dealt with as a result of long debate. What is needed immediately is manifest—a restoration of financial standing. Unless the existing situation is rapidly to grow worse, and that to an extent involving safety as well as prosperity, fresh capital on a large scale must be forthcoming.

If I am correct in all this—and daily observation confirms it—the conclusion would seem to be irresistible. The delusive idea prevails that the existing railroad managements being inefficient and extravagant as well as corrupt, only economy and good business judgment are required to produce all desirable results. Personally I have no financial interest in railroad securities. Watching the course of events and legislation, I long since ceased to feel confidence in them. While the demands for increased compensation of labor and improved facilities have been incessant, and almost uniformly complied with, the call for fresh money absolutely necessary to the conduct of the business or to meet requirements imposed by government authority has been quite as insistent and even more pressing. Meanwhile engineering and other constructive changes necessary for the convenience and safety of the public have been to a large extent at a standstill, and, under existing conditions, cannot receive attention. The necessary capital is not forthcoming. How could it be expected to come forward? The situation is unbusinesslike, illogical and absurd, as well as impossible.

Under these circumstances, personal experience advises me that the railroads are called upon to do business at less than remunerative rates; and to such a degree is this the case that I have had frequent occasion to remonstrate with traffic managers, both travel and freight, at receiving from them service at a price less than cost. That, taken as a whole, the railroad business pays, and shows a profit, goes without saying. Were it otherwise, it would stop. On the other hand, I am clear in my conviction that an inquiry by any reasonable, intelligent and judicially minded tribunal would develop the fact that the return on traffic received today is, as a whole, not sufficient fairly to remunerate the capital already invested—far less, in the case of the eastern New England system, to pay interest on the hundred million additional capital indisputably required for immediate development.

From this situation, I further admit, there is one possible escape only. The community in its own interest, and in order that it may not find itself put out of business and in physical jeopardy, must submit to pay for the service it requires what the service required is reasonably worth. This, today, it is not doing.

It is equally delusive to say that in the past, and the recent past, there have been scandals and glaring abuses connected with our railroad management. I would like to know of any business management on earth, public or private, large or small, where instances of abuse and misdoing do not occur and could not be unearthed. We all know such is the case: nor will it ever cease to be the case. When, however, such a condition of affairs as now exists forces itself on the attention there is, I submit, but one way to deal with it. Irrespective of the past or of stories of mismanagement and misdoing, whether well or ill-founded, it must be dealt with in accordance with actualities. A fresh start must be made, and in the present case that start can only be made from the basis of proper and adequate remuneration for services rendered and construction called for. Otherwise, the result is inevitable, and that result spells widespread disaster.

This letter has already run to a length I had not anticipated. The conclusion, however, as it rests in my mind, hardly needs to be set forth. The existing situation, impossible of continuance, involves danger—danger as respects both the safety and prosperity of the community. To remedy it locally calls for the command and output of a large amount of fresh capital—a hundred millions. On the present basis of remuneration for services rendered that capital cannot be obtained. It will not be forthcoming. Rates meanwhile, are unreasonably low. We all know it. We all equally know that an increase of charges for public service is never popular, much less favored politically. Nevertheless, there is, I further and finally submit, no escape from it in the present case, and to palter with the situation simply implies delay, continued stagnation and ultimate irremediable disaster.

Whether, therefore, obtained through government action or through corporate management, directly or indirectly, the service required must be secured, and to be secured must be adequately remunerated. It may be, in this matter, the community will like to be cheated, or insist on somehow deceiving itself, meeting indirectly an outlay much larger than that from which it recoils when directly imposed. This, however, I submit, will be mere self-delusion; and the one party always most dangerous to deceive is one's self. Yet the inclination thereto is politically well-nigh universal and irresistible.

The conclusion to which I have now found myself forced is, therefore, manifest and inescapable. The railroad candle has, so to speak, for some time past now been "burned at both ends." Expenses, especially for labor, equipment and construction, have increased and are still increasing; rates meanwhile have tended steadily to reduction. The calls for new development and improvements of a permanent character and most costly nature have been and now are imperative, incessant. From such a situation there is but one escape—if the community wishes safety and convenience, with a system of transportation equal to the demands and standard of the times, it must make up its mind to pay therefor; nor is the increased remuneration requisite in any respect inordinate. For Eastern New England the improved service would more than justify the increase of cost. Moreover, we must have it.

Excuse the length of this communication, but to deal with our entire railroad situation even in a most condensed fashion does require space. Believe me, Mr. President, most respectfully yours,

CHARLES FRANCIS ADAMS,

To the President, Woodrow Wilson.

CHILEAN TRANSANDINE RAILWAY.—After a long cessation of operation, resulting from the severe winter for which there was insufficient preparation, the Transandine Railway was again opened on August 20, with the passage of the first mail train in some time. The most difficult part of the journey, however, still had to be done on muleback for several weeks following and for a while the postal authorities would accept letters only, newspapers and packets being barred. Under ordinary circumstances, the Andes route should be in full running order early in October, but it is doubtful this year if it be in full running order even now. The Chilian Transandine Railway, if such things as this continue in the future as in the past, will rank as one of the most unfortunate railway enterprises ever undertaken in South America. It was also one of the most costly and difficult to build.

General News Department

The new car shops of the Chicago & Alton at Bloomington, Ill., were formally dedicated on October 29.

In a great fire at North Tonawanda, N. Y., on October 29 the New York Central and the Erie roads lost many thousands of dollars' worth of freight cars.

At the annual meeting of the Association of Manufacturers of Chilled Car Wheels on October 27, George W. Lyndon, secretary of the association, was elected president, succeeding T. A. Griffin.

The court at Buffalo has changed from November 1 to December 1 the date on which the receiver of the Buffalo & Susquehanna Railway is to discontinue the operation of passenger and freight trains.

The Atchison, Topeka & Santa Fe's California Limited train was boarded by train robbers in the yards in Chicago on the night of October 31, and several passengers who were sitting on the observation platform were robbed of their valuables.

Postal service has been established on the Grand Trunk Pacific through to the Pacific Coast, and Prince Rupert now receives mail from the east in two days' less time than before. Hitherto the mails have been carried by steamer from Vancouver. The distance from Liverpool to Yokohama by way of the Grand Trunk and Prince Rupert is 10,085 miles, said to be 773 miles less than the distance by way of New York and San Francisco.

At the third annual convention of the Investment Bankers' Association, to be held at the Bellevue-Stratford Hotel, Philadelphia, on November 12 and 13, the programme will include a committee report on "Railroad Bonds and Equipment Notes," by Samuel L. Fuller of New York, an address on the "Five Per Cent Railroad Rate Case," by Howard S. Graham, president of Graham & Company, Philadelphia, and an address on "Railroad Maintenance and Depreciation," by William H. Coverdale, president William H. Coverdale & Company, Inc., New York.

The Brown News Company, which operates on the Pacific and Atlantic systems of the Southern Pacific, and the Van Noy Hotel & News Company, operating between Chicago, Kansas City and New Orleans, have been consolidated under the name of the Van Noy Brown News Company. The headquarters will be in Kansas City, but the headquarters for the western district, including all of the Southern Pacific trains and stands, will be in San Francisco, under the management of J. J. Mobley. The policy of the new company in purchasing its supplies will be, as far as practicable, to patronize local producers and to advertise in its wares the communities through which it operates.

A report from Trenton, N. J., says that after long continued litigation the railroads of New Jersey, with the exception of the Delaware, Lackawanna & Western, apparently have withdrawn their contention that they are not obliged to honor passes or transportation certificates issued by the Secretary of State to state officers entitled under the provisions of the New Jersey laws to ride free on the railroads. A circular letter has been sent to all pass holders, signed by the Pennsylvania, the Lehigh Valley, the Erie, the Central of New Jersey, the Philadelphia & Reading, the Atlantic City and the New York Central, calling attention to the fact that these passes are not good in connection with any other form of transportation for interstate trips. There is still pending in the First District Court of Jersey City a test suit brought by the Pennsylvania against Secretary Colby, of the State Civil Service Commission, to collect from him a bill of about $70 for railroad transportation between Trenton and Camden.

Banker for Higher Rates

John J. Mitchell, president of the Illinois Trust and Savings Bank, is quoted in the Chicago Herald, as follows:

"There is every logical reason why the commission should allow the railroads the right to advance their freight rates, and there are no reasons other than political why the carriers should not be allowed the relief in the present emergency. The banks of the country came to the relief of a distressed financial situation, and it is beyond their power to help the railroads if the government of this country will not make it possible for them to do so.

"It should not be a question of whether or not higher rates are fair, but the commission should, in point of absolute necessity to keep many transportation companies out of the hands of receivers, grant temporary relief and adjust the inequitable features afterward.

"The largest shipping interests in the country are not opposed to paying more for transportation of their products. They know that the railroads must have more revenue to offset the enormous increase in their operating expense, and they know that if the carriers do not get this it will be only a question of a short time when shippers must suffer the consequence in the form of curtailed transportation facilities.

"The Interstate Commerce Commission's advisers are beating tom-toms to attract attention of the public. There is too much politics and too little application of scientific principles in handling these matters, which are widespread and vital in effect."

Missouri Full-Crew Law Defeated

By the referendum in Missouri at the election last Tuesday the "full-crew" law of that state was rejected by an overwhelming majority.

Western Economic Society

The Western Economic Society will hold a conference on American railway problems at the Hotel Sherman, Chicago, on November 13 and 14.

The program includes the following papers, with a general discussion: Friday morning: "Valuation of Railway Property for Purposes of Rate Regulation," by Pierce Butler, valuation counsel western railways; "The Investor's Interests in Valuation," by Prof. W. Z. Ripley, Harvard University; "Valuation of Railway Property for Purposes of Taxation," by Prof. T. S. Adams, Wisconsin state tax commission. Friday afternoon: "Shall Improvements Made from Earnings Be Capitalized or Included in Valuation," by A. W. Bullard, E. H. Rollins & Sons; "Cost of Service and Rate Making," by Halford Erickson, Wisconsin Railroad Commission. Saturday morning: "The Economic Significance of Interlocking Directors in Railway Finance," by Prof. F. H. Dixon of Dartmouth College; "Railway Accidents and the Safety First Program," by R. C. Richards, chairman central safety committee, Chicago & North Western; "Freight Car Surpluses and Shortages," by Arthur Hale, general agent, American Railway Association.

At the banquet on Friday evening at the Hotel Sherman, E. P. Ripley, president of the Atchison, Topeka & Santa Fe, will speak on "The Railways' Need for an Increase in Freight Rates"; Prof. John H. Gray, of the University of Minnesota, on "The Public's View of the Railways' Need for an Increase in Rates," and Samuel O. Dunn, editor of the *Railway Age Gazette*, on "Efficiency of Railway Operation in Relation to an Increase in Freight Rates."

Tickets for the banquets may be obtained by application to the secretary, H. G. Moulton, Fifty-eighth street and Ellis avenue, Chicago.

L. G. McPherson Retires from Bureau of Railway Economics

On November 1 Logan G. McPherson retired as director of the Bureau of Railway Economics, at Washington, D. C. His retirement followed the adoption of resolutions by the general executive committee of the bureau to the effect, "That the purposes and aims which the subscribers had in view in establishing

and maintaining the bureau have been largely accomplished, as is evidenced by the well deserved reputation which it enjoys as a repository of information and statistical data available for the study of general railroad questions," and that, "It is deemed inexpedient, under prevailing conditions and in view of the state of development which the bureau has attained, to further continue its present extensive organization." The committee, in deciding on this action, adopted a resolution directing, "that in notifying the director of this action the chairman be requested to express to him the appreciation of the committee of the services he has performed in inaugurating the bureau and developing it to its present recognized standard."

On October 31 the employees of the bureau at Washington joined in sending to Mr. McPherson a handsomely bound set of all the publications which had been issued by the organization under his directorship. This present was accompanied by a letter signed by all the donors in which they said: "We cannot permit the delightful relations of these last few years to cease without an expression of the genuine pleasure we have had from our association with you and the deep regret we feel at the severance of these ties. You have insisted upon and exemplified the highest standards of loyal service. You have administered wisely and justly. You have been ever courteous, unselfish and thoughtful for us all. We deeply appreciate it and we thank you sincerely."

Mr. McPherson was the originator of the plan for the establishment of the bureau, and to him is due the chief credit for the high plane on which its work has been done. He will move to New York and devote some time to work in the field of general economics which he began long ago and which his labors in recent years have interfered with his completing.

Circulars on Land Valuation and Abandoned Property

Two circulars have just been issued by the Presidents' Conference Committee, one referring to the land features of the federal valuation work now under way and the other to a valuation order of the Interstate Commerce Commission covering the scheduling of abandoned property. The committee recognizes the magnitude of the task of valuing the land owned by the railways and also the difficulty of determining various items entering into this value. In the absence of well recognized methods of determining land value the committee suggests a plan by which it is believed the experiences of the roads can be made of value to the commission in dealing with this subject. The plan suggested is based on the interpretation of the third section of the act authorizing the valuation, that a division of present value into two items is required, one of which will be the land and the other the damages and expense of acquisition.

A blank form has been prepared by the committee for scheduling the data to be used in making this separation. This form shows the record of the deed and the grantor for each piece of property, the purchase price, the naked land value ascertained by two methods and the difference between the purchase price and each of these methods. Attention is called to the fact that the purchase price should include not only money paid by the carrier, but the money value of all work done or expense incurred as a part of the consideration. Four methods are suggested to be used in determining the naked value of the land, namely: the assessment method, the opinion method, the sales method, and the enhancement method. A separate form is provided for recording the data necessary to secure the value by the assessment method and another form for scheduling vouchers covering expense of acquiring property. It is not expected that the data so collected will produce a single or uniform rate of excess of actual value over naked value, but rather a large number of such excesses from which the commission can select that which it deems best adapted to each particular case.

The other circular contains ten suggestions to the carriers intended to assist them in complying with the requirements of the commission's valuation order No. 2, which requires each carrier to file with the commission before February 1, 1915, complete schedules of all property abandoned with the original cost of such property to the date of abandonment. This order was issued after it had been found by the government parties that in many cases little or no evidence remained upon the ground of the former existence of abandoned lines and structures and was intended to secure aid from the carriers for the government parties in ascertaining the facts; also to furnish the carriers opportunity to present all the claims they desire to make on account of abandoned property. The suggestions contained in the circular include the following: Property gradually consumed in the business of the carrier and replaced in ordinary maintenance should not be included as abandoned property. Property not now in use but intended to be used in the future should not be included. The carriers may and in most cases probably should claim that the actual cost of abandoned property to date of abandonment should be included in the original cost to date which the commission is to ascertain in the report, and if abandoned property would be recreated in a reproduction of the property, the estimated present cost of the same should be included in the cost of reproduction new. Abandoned property includes all fixed physical property, whether or not physical evidence of the existence of such property now remains. The estimated present cost of temporary tracks used until the completion of a tunnel, and other structures built in aid of construction of a line or to hasten its completion, even though permanently abandoned, should be included in the cost of reproduction new and the actual cost thereof should be included in the original cost. Loss resulting from the abandonment of property should be included in the schedule, this loss being the difference between the original cost and the salvage, if any.

Opening of the Kansas City Union Station

The new Union station of the Kansas City Terminal Railway, Kansas City, Mo., which was fully described in last week's issue of the *Railway Age Gazette*, was formally dedicated last week with a two days' celebration, held under the auspices of the Kansas City Commercial Club. The mayor declared a half-holiday on Friday. The formal dedication of the station was held on Friday afternoon and the station was actually opened to traffic at 12:01 a. m., Sunday, November 1. The program on Friday began with a manufacturers' parade in the morning, consisting of 140 floats, 16 bands and motor cars carrying officers of the Commercial Club. The parade was nearly two miles long. In the afternoon was held a civic parade, including members of the principal commercial organizations of the city and representatives of the railways. Following this parade the opening was held at the station, when President H. H. Adams of the Kansas City Terminal Railway Company, formally presented the station to Kansas City. Mayor Jost responded with a speech of acceptance. In the evening a dinner was given by the Commercial Club to the officers of the railways at the Hotel Baltimore, and later in the evening a display of fireworks and a final illumination of the old station was given from the hill opposite the new Union Station. The Saturday program included a golf tournament for the visiting railway men, followed by a luncheon and a motor ride about the city.

It was estimated by the newspapers that the largest crowd ever assembled at Kansas City attended the opening of the new station. The dinner of the Commercial Club was attended by the presidents and other executive officers of the 12 roads which are partners in the new station, and by nearly 100 other prominent railway officers, and the principal city officers and business men of the city, including two former mayors of the city. Among the speakers were Hale Holden, president of the Chicago, Burlington & Quincy; B. F. Bush, president of the Missouri Pacific; B. L. Winchell, director of traffic of the Union Pacific; E. B. Pryor, receiver of the Wabash, and Gardiner Lathrop, general solicitor of the Atchison, Topeka & Santa Fe. Most of the speakers lauded the railroads for their enterprise in building such a magnificent station, adequate to the demands of a city several times the size of Kansas City; and many speakers spoke of the justice of co-operating with the railroads in the future.

Central Railway Club

At the regular meeting of the Central Railway Club on November 13, a paper will be presented by Milton L. Sims, manufacturing expert of the Sherwin-Williams Company, Cleveland, Ohio, entitled "Painting of Steel Car and Locomotive Equipment." It has also been arranged that on the afternoon of the same day the members of the club will visit the plant of the Hewitt Rubber Manufacturing Company, Buffalo, N. Y.

American Railway Association

The fall meeting of the American Railway Association will be held at The Blackstone, Chicago, on Wednesday, November 18. Reports will be presented by the committees on Transportation; on Maintenance; on Automatic Train Stops; on Relations between Railroads; on the Safe Transportation of Explosives, and on Electrical Working.

Railway Business Association

The Railway Business Association will hold its sixth annual meeting and dinner at the Waldorf-Astoria, New York, on December 10. The program of speakers, it is announced, will be given out later.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

AIR BRAKE ASSOCIATION.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—A. G. Thomason, Demurrage Commissioner, Boston, Mass. Annual convention, April, 1915, Richmond, Va.

AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next meeting, October, 1915.

AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 21-24, 1915, Richmond, Va.

AMERICAN ASSOCIATION OF GENERAL PASSENGER AND TICKET AGENTS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next meeting, May 20-21, 1915, San Francisco, Cal.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Buritt, 29 W. 39th St., New York. Annual convention, October, 1915, Atlantic City, N. J.

AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—H. C. McConaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Semi-annual meeting, November 18, The Blackstone, Chicago.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October, 1915.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.— J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June 9-11, 1915, Atlantic City, N. J.

AMERICAN RAILWAY SAFETY ASSOCIATION.—L. F. Shedd, C. R. I. & P., Chicago. Next meeting, November 10, Chicago.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—A. R. Davis, Central of Georgia, Macon, Ga. Annual meeting, July, 1915.

AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

AMERICAN SOCIETY OF ENGINEERING CONTRACTORS.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 1-4, 1914, New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Atlanta, Ga.

ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, third week in May, 1915, Galveston, Tex.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual meeting, October, 1915.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 22-25, 1915, Rochester, N. Y.

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York. Next meeting, December 8-9, Richmond, Va.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August. Windsor Hotel, Montreal, Que.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meetings, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

FREIGHT CLAIM ASSOCIATION.—Warren P. Taylor, R. F. & P., Richmond, Va. Annual meeting, June 16, 1915, Chicago.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

INTERNATIONAL RAILWAY CONGRESS.—Executive Committee, 11, Rue de Louvain, Brussels, Belgium. Next convention, June 23 to July 6, 1915, Berlin.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 829 W. Broadway, Winona, Minn. Next convention, July 14 17, 1915, Sherman House, Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D., Lima, Ohio. Annual meeting, August 17, 1915, Philadelphia, Pa.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next convention, November 17-19, 1914, Detroit, Mich.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May 26 to 28, 1915, Chicago, Ill.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 14-17, 1915, Detroit, Mich.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June 14-16, 1915, Atlantic City, N. J.

NATIONAL RAILWAY APPLIANCES ASSOCIATION.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

RAILROAD MASTER TINNERS, COPPERSMITHS AND PIPEFITTERS' ASSOCIATION.—U. G. Thompson, C. & E. I., Danville, Ill. Annual meeting, May, 1915.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December 10, 1914, Waldorf-Astoria Hotel, New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Next meeting, October, 1915.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa. Annual meeting, September 21-24, 1915, Salt Lake City, Utah.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, L. S. & M. S., Box C, Collinwood, Ohio. Annual meeting, May 17-19, 1915, Hotel Sherman, Chicago.

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders and Master Mechanics' Associations.

RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Annual meeting, Septetmber, 1915.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, C. R. I. & P., La Salle St. Sta., Chicago. Annual meeting, September, 1915.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. Ry., Atlanta, Ga. Next regular meeting, January 21, 1915, Atlanta, Ga.

SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmaster's and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7122 Stewart Ave., Chicago. Annual meeting June 15, 1915, Minneapolis, Minn.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, September, 1915, Chicago.

WESTERN CANADA RAILWAY CLUB.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF AUGUST, 1914

Name of road.	Average mileage operated during period.	Operating revenues			Operating expenses						Net operating revenue (or deficit).	Railway tax accruals.	Operating income (or loss).	Increase (or decr.) comp. with last year.
		Freight.	Passenger.	Total. inc. misc.	Maintenance Way and structures.	Maintenance Of equipment.	Traffic.	Transportation.	Miscellaneous.	General.	Total.

Traffic News

The New York, Philadelphia & Norfolk has applied to the State Corporation Commission of Virginia for authority to increase passenger fares on its line in that state.

The Official Classification in its latest supplement has followed the example set recently by the western roads in eliminating the allowance of 500 lb. for dunnage on shipments in closed cars.

Agricultural exhibit cars of the New York Central Lines began a six weeks' trip through Ohio, Indiana and Illinois on November 2, for the purpose of advertising opportunities along the New York Central Lines in New York. After the trip the entire exhibit will be taken to the Panama exposition.

The New York, New Haven & Hartford has filed new freight tariffs to go into effect December 1, making general increases, though there are some reductions. A sample change is that in the rates from Providence to Boston, 44 miles, which at present are for the six classes, 17, 14, 11, 8, 7, 6; while in the new tariffs they are 19, 16, 13, 10, 9, 8.

The Minnesota Railroad & Warehouse Commission has compiled figures to show that some railroads of that state have refunded $2,305,081 to shippers and passengers since August 1, 1913, for overcharges collected while the state rate case was pending in the courts. Of this amount $258,742 was for passenger rates and $2,046,338 for freight rates.

The Atchison, Topeka & Santa Fe last week issued a notice of an embargo on grain shipments to Galveston on account of a lack of ships at that port to take away the grain. Although shipments aggregating approximately 3,000,000 bu. were sent out from the port during the month of October, the number of loaded cars has increased from day to day, while the number of ships available has decreased. Last week it was reported that there was an accumulation of about 2,000 cars at Galveston.

The railroads entering Chicago have announced that, effective on December 1, a charge will be made for less than carload trap car service of 4 cents per 100 lb., with a minimum of 10,000 lb., or $4 a car; this in addition to the rates to or from main line freight stations. The charge must be paid by the consignor on outbound business, and by the consignee on inbound business. For quantities less than 10,000 lb. an additional charge will be made ranging from $1 for amounts between 9,000 and 10,000, to $6 for amounts less than 5,000 lb. per car.

It is reported from Galveston that approximately $80,000 in demurrage charges has accrued against export grain at Galveston for the past two months. When the European war began cars were arriving at the port at the rate of 400 to 500 a day, and when there was a delay in securing vessels for the transportation of the grain several thousand cars were tied up on the railroad tracks in the vicinity of the port, and it was necessary to impose an embargo for nearly three weeks. Ship agents are opposing the payment of the bills for demurrage because the delay was caused by unexpected conditions. Demurrage has accrued at the rate of $4 per car per day after five days' detention.

The blackstrap traffic is now the largest single contributor to the freight receipts of the Mobile & Ohio. The Cuban Molasses Company has a 2,000,000-gal. tank at Mobile which is kept filled with blackstrap molasses. Blackstrap is the waste product from the sugar refineries of Cuba. It is carried from Matanzas, Cuba, to Mobile in tank steamers which hold from 500,000 to 1,500,000 gal. Since September 15 the quantity received at Mobile has been nearly 3,000,000 gal. The Cuban Molasses Company operates 200 tank cars, with a carrying capacity of 8,000 gal. each. These carry blackstrap to St. Louis and Chicago, where, mixed with alfalfa, corn, oats and other feeds, it is made into food for animals.

The Greenbrier, Cheat & Elk River Railroad has made application to the West Virginia Public Service Commission for permission to proceed with plans for doing passenger business and with making up a tariff and time table. The line connects with

the Greenbrier division of the Chesapeake & Ohio at Cass and is now being completed to Webster Springs, 35 miles west of Cass, where connection is made with the Baltimore & Ohio. In June the company was required by the state to establish itself as a common carrier of freight and it is probable that the request of the railroad now will be granted at once. The road was built several years ago as a private line for the hauling of the company's own timber only. The passenger and freight service will benefit the residents of eighteen stations on the line, six of them being Cass, Spruce, Laurel Bank, Bergoo, Fish Hatchery and Hopkinsville. The total population now to be served by the railroad is between ten and fifteen thousand.

National Industrial Traffic League

The annual meeting of the National Industrial Traffic League is to be held at the Congress Hotel, Chicago, on November 12 and 13. The annual dinner is to be on Thursday, November 12, at the Congress Hotel, at which the speakers will be Edgar E. Clark of the Interstate Commerce Commission and Walter L. Fisher, ex-Secretary of the Interior. Among the committee reports will be those of the Executive Committee on dunnage allowances and proposed charges for trap car service, of the committee on Car Demurrage and Storage on code of storage rules, notification of consignor of refused and unclaimed freight, postal card notices of arrival of freight, and demurrage charges on refrigerator cars loaded with perishable freight; of the Special Committee on Legislation on limitation of liability of common carriers, of the Classification Committee on rate construction, and reports of the committees on Weighing and Freight Claims, the Advisory Committee on proposed charges for spotting of cars, the Special Committee on Uniform Classification and the Special Committee on Relation with the National Association of Railway Commissioners. Other subjects to be discussed include the National Traffic Conference and the establishment of an Information and Tracing Bureau. On Friday, November 13, there will be a luncheon followed by a trip through the Chicago terminals, taking in the Union Stock Yards, the Central Manufacturing District, the Union freight station of the Chicago Junction, the union boat house of the Chicago River & Indiana, Chicago river facilities and other points of interest.

Embargo on Live Stock Traffic

A widespread hoof-and-mouth epidemic is affecting cattle in the middle west. At Chicago on Tuesday Dr. S. E. Bennett of the bureau of animal industry, declared that extensive slaugther of suspected animals might be necessary. Among the packers it was said that the immediate situation should make for lower prices, as it was thought that cattle growers, rather than risk disease among their herds, would rush their live stock to market, where it must be killed immediately. A thousand men were engaged at the yards disinfecting the pens and runways. One case of the malady appeared and was isolated for complete observation by the scientists. On Wednesday the Union Stockyards, the largest cattle market in the world was ordered closed for several days because of the prevalence of the disease. New York and Maryland were added to the states in which quarantine were ordered by the government, cases being discovered at Buffalo and Hagerstown. Quarantines were already in force in Illinois, Indiana, Michigan and Pennsylvania. The first appearance of the disease, it is said, was at Niles, Mich.

Increasing Revenues by Increasing the Commercial Load

The Lumbermen's Association of Chicago, representing some of the largest lumber shipping interests of the country, is actively promoting a co-operative campaign towards increasing railway revenues on lumber traffic by securing heavier loading per car. The association is educating lumber shippers and users in the importance of heavier loading, recognizing that as the commercial load of each car is increased it decreases the dead-weight percentage of the total load—thus increasing the operating efficiency of the carriers as to net returns on the traffic as well as conserving car supply in times of shortage. These efforts are bearing fruit. The Chicago & Eastern Illinois reports an increase in average loading on lumber traffic from 22.9 tons per car in 1910 to 24.5 tons per car in 1914—an average increase of 1,600 lb. per car or 4 per cent, or 1 per cent per year. As the minimums in the tariffs naming rates on lumber have not been increased much of the improvement in the average loading must be credited to energetic missionary work.

Advances in Freight Rates on Central and Western Roads

The Western Trunk Line and Trans-Missouri roads have filed tariffs with the Interstate Commerce Commission, effective on December 1, which represent the first step in the programme for increasing a number of commodity rates which are deemed too low, and for following out the suggestions made by the Interstate Commerce Commission in the eastern 5 per cent general advance case for the elimination of free services performed for shippers. Grain, grain products, hay, packing house products and dressed meat, coke, apples and dairy products are affected by the tariffs. The tariffs provide for a general advance of one cent a hundred pounds in the rates on grain and grain products from the western grain producing territory to points east of the Missouri river, a general advance of two cents a hundred pounds in the rate on hay from the same territory, a general advance of 3½ cents in the rates on packing house products and fresh meats from western trunk line territory to Chicago, Peoria and St. Louis, and points east thereof, an advance in the minimum carload weight on flour and other grain products from 30,000 lb. to 40,000 lb., and a similar advance in the minimum weights on coke. A charge of four cents a hundred pounds, with a minimum of $4 per car, is proposed for less than carload trap car service. Another rule eliminates all arrangements for stopping cars in transit to finish loading or to partly unload carload shipments. A charge of 1½ cents a hundred pounds, with a minimum of $5 per car, is made for storing apples in transit. The storage privilege is eliminated on dairy products, such as butter, eggs and dressed poultry. The local rates on hay and grain are not advanced west of the Missouri river. The tariffs pertaining to stopping in transit, trap car service and storage apply both in Trans-Missouri and Western Trunk Line territory. Similar tariffs have been filed with the various state commissions.

The Central Freight Association roads have filed tariffs similar to the above. These make general advances in rates on grain and grain products from central freight association points to trunk line territory of one cent per 100 lb. A thorough check has been made of unremunerative rates and a large number are being transferred from exceptions back to a higher classification basis. The roads also have filed a number of changes in rules, imposing a charge of 4 cents per 100 lb for trap-car service and eliminating stop off privileges except for live stock. Charges are to be made for storage, and the charges for reconsigning and diversion are advanced from $2 a car to $5. The rate on dressed beef from Chicago to New York will soon be advanced from 45 cents per 100 lb. to 50 cents, and the minimum weight per carload advanced from 20,000 lb. to 21,000 lb. Proportionate advances will be made in live stock rates. More tariffs are to be filed November 15.

Advances in Passenger Fares in Central Territory

The railroads in the Central Passenger Association have filed tariffs with the Interstate Commerce Commission advancing interstate passenger fares in the territory west of Buffalo and Pittsburgh, east of the Mississippi river, and north of the Ohio and Potomac, to an approximate basis of 2½ cents a mile. The present rates vary from 2 to 2½ cents per mile. The tariffs are to become effective on December 1, unless suspended by the Interstate Commerce Commission. The following figures show some of the changes in through fares between Chicago and other important cities in the territory.

	Present.	New.
Cincinnati	$ 6.00	$ 7.00
Cleveland (standard)	7.75	8.55
(differential)	6.75	7.55
St. Louis	5.80	7.50
Buffalo (standard)	12.00	13.10
(differential)	10.50	11.60

The new rates do not change in any way the rates now effective between points within each state. No changes have yet been filed for increases in fares between the Central Passenger Association territory and the Trunk Line territory, although increases in these rates are contemplated, and tariffs are to be filed as soon as they can be prepared. It is understood that the standard fare between New York and Chicago will be increased from $20 to $21.10.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Examiner Gutheim of the Interstate Commerce Commission heard evidence at Shreveport, La., on October 27, on the application of the Shreveport Chamber of Commerce to have the orders of the commission in the Shreveport rate case apply to all of the Texas railroads, instead of only those that were defendants in the original case.

The Interstate Commerce Commission has announced a hearing to be held at Chicago on November 15, on the question of the absorption of tunnel and lighterage charges at Chicago by the railroads. The railroads recently filed tariffs cancelling the absorptions which were suspended by the commission on complaint of the Chicago Association of Commerce.

Examiner Dow of the Interstate Commerce Commission held a hearing at Sioux City, Ia., on October 27, on a complaint of Sioux City shippers that the low intrastate express rates in South Dakota, which are lower to South Dakota points than the interstate rates applicable from Sioux City, Ia., are discriminatory against their business and have brought about a considerable decrease in traffic

Examiner Bradley held a hearing at St. Louis on October 26, on the complaint of the Merchants' Exchange of St. Louis and the Southwestern Missouri Millers' Association on complications arising from the variation of grain rates from points in Missouri, as applied to state and interstate shipments. The St. Louis grain shippers complain that they are discriminated against by a requirement of the eastbound carriers that inbound freight bills showing an interstate rate has been paid shall be surrendered in order to secure reshipping rates on grain to eastern cities from St. Louis. Where no such inbound freight bill can be shown the roads charge a rate of 4 cents per 100 lb. higher for shipping grain and flour from St. Louis and East St. Louis to the east. The complaint of the Southwestern Millers' Association is that the railroads will not apply the low intrastate rate prescribed by the Missouri statute on shipments from points in Missouri to points outside the state, unless the shipment is delivered at a point within the state, such as St. Louis.

A hearing was held at Chicago on October 27, before Examiner Gartner on the classification rules regarding articles too long or too bulky to be loaded in box cars through the side door. The hearing was held on complaints from a large number of iron and steel manufacturers who ask the commission to reopen the case on account of the ambiguity of the present rules adopted by order of the commission. The present rules provide that when l. c. l. shipments of articles are loaded on a flat or gondola car on account of their being too bulky to be loaded in a box car through the side door thereof, they shall be charged at actual weight and l. c. l. class rates for each article, provided that in no case shall the charge for each article be less than for 5,000 lb. at the first class rate. For articles too long to be loaded through the side door of a box car the charge is not less than for 5,000 lb. at first class rate for each shipment for one consignee. Objection was made by the representatives of the shippers against the minimum on bulky articles as penalizing each article, instead of applying to entire shipments, and because the rules are open to question and to various interpretations as to when an article is too long or too bulky.

The commission in connection with its investigation in the matter of embargoes, docket 7,000, calling for a general inquiry into "the subject of the rules, regulations and practices of carriers in establishing embargoes," announces in reply to a number of communications that it is not able to outline in advance the exact scope or extent of the inquiry. In May, 1914, the Board of Railway Commissioners for Canada ordered all carriers subject to its jurisdiction to show cause why an order should not be issued prohibiting the issuing of an embargo for a period longer than four days without at least 10 days' previous notice. In November, 1912, the board issued an order requiring that any railway issuing an embargo shall, within 48 hours thereafter, file a copy of such embargo, together with a statement of the conditions rendering such embargo necessary, the action required to remove such conditions, and the probable time such embargo will be continued. The commission states that "it can not be said, of course, that the investigation to be conducted by this commission will result in any similar order. It is the desire of the commission to receive from both carriers and shippers information as to the necessity for embargoes, their frequency, their misuse (if any), their advantages, the practicability or impracticability of requiring carriers to notify the public generally as well as the commission of each embargo, either before or after it takes effect. And to receive any information which will assist the commission in determining whether or not it is advisable for the commission to take any action in the premises." The hearing in this matter will be held in Chicago on January 20.

Rates on Coal from Points on the Wabash-Pittsburgh Terminal Railway

Pittsburgh & Southwestern Coal Company et al. v. Wabash-Pittsburgh Terminal et al. Opinion by Commissioner Daniels:

The commission finds that the combination carload rates on bituminous coal from points on the Wabash-Pittsburgh Terminal in Pennsylvania to destinations in other states on and reached via the Pittsburgh & Lake Erie and the Baltimore & Ohio are unreasonable and prejudicial to complainants to the extent that they exceed by more than 10 cents per ton joint carload rates on bituminous coal for hauls to the same destinations from mines on the West Side Belt. The defendants are therefore ordered to establish joints rates from these points on the Wabash-Pittsburgh Terminal, which shall not exceed by more than 10 cents per ton the rates to the same destinations from points on the West Side Belt. (31 I. C. C., 660.)

Rates on Deciduous Fruit from California

Railroad Commission of the State of California v. Alabama Great Southern et al. Opinion by Commissioner Meyer:

Complaint is made against the reasonableness of the minimum carload weight of 26,000 lb., applying on deciduous fruit shipped under refrigeration from points in California and the reasonableness of the existing refrigeration rate on carload shipments of deciduous fruit from points in California to Denver, Kansas City, St. Louis, Chicago, New Orleans, Philadelphia, New York and points common to each of these destinations. Practically all of the deciduous fruit traffic moves under refrigeration. A very large portion of the service is furnished by the Pacific Fruit Express and the Santa Fe Refrigerator Dispatch company. The commission, following the lines laid down in the Arlington Heights case (20 I. C. C., 107), relating to refrigeration charges on California citrus fruits, finds that the present refrigeration rates on deciduous fruits are not unreasonable. In its investigation the commission made a study of costs of this service. Since over half of the traffic moves to Chicago and points east, 24 cars of the total list, destined to Chicago, were taken as typical of the entire movement.

It was found that the average ice consumption per car of the cars destined to Chicago was 13.69 tons. The total tonnage of the cars in question was 310.03. The total cost of this tonnage was found to be $785.73, giving an average minimum cost per ton of ice of $2.53. Accordingly the average minimum ice cost per car to Chicago, using this cost per ton and the proper average tonnage of 13.69 was found to be $34.64. The other charges included in the refrigeration cost were as follows: hauling cost of ice, $22.50; additional cost of supervision, $3.00; additional damage to car, $5.00; extra switching, $1.75; a total of $66.89. The present refrigeration rate to Chicago is $75 per car.

The commission also finds that the present minimum weight which was changed some time ago from 24,000 lb. to 26,000 lb., is not excessive. The commission states that while it is very probably the fact that the increase in the minimum weight with some resulting increase in the average height of the load of fruit in the car has resulted in increased deterioration, it is not warranted in prescribing a reduction on the basis of the evidence submitted by complainant, this evidence consisting mainly of statements and figures showing the difference between the selling prices of the fruit in the lower tiers and that in the top tier and the percentage of loss in the value of the latter. The commission also holds that the bare comparison of the minimum ap-

plicable to shipments of deciduous fruit from other States is not sufficient to alter the conclusion induced by a consideration of the California minimum considered by itself that it is not unreasonably high. (32 I. C. C., 17.)

California Fruit Growers' Association et al. v. Alabama Great Southern et al. Opinion by Commissioner Meyer:

Upon a complaint attacking the refrigeration rates on deciduous fruit shipped from California to destinations in other states, the freight rates on deciduous fruit from California points to points in certain southeastern states, and the present minimum weight of 26,000 lb. applicable to the deciduous fruit traffic from California, the commission finds that as to the refrigeration rates and the minimum weight there is no evidence in this case warranting a different conclusion from that reached in Railroad Commission of the State of California v. Alabama Great Southern (32 I. C. C., 17); and that as to the freight rates to southeastern destinations the meager evidence introduced is not sufficient to warrant the extensive reductions sought. Complainants are referred to the decision in Pacific Fruit Exchange v. Southern Pacific 31, 1. C. C., 159, which dealt with the rates to Tampa, Fla., and Montgomery, Ala. (32 I. C. C., 51).

Pacific Fruit Exchange v Southern Pacific et al. Opinion by Commissioner Meyer:

On a complaint against the reasonableness of the refrigeration rates paid on shipments of deciduous fruits from California points to destinations in other states during the season of 1911, and a petition for the establishment of lower rates than the existing ones adopted in 1912, the commission in accordance with the conclusions in Railroad Commission of the State of California v. Alabama Great Southern (32 I. C. C., 17) holds that the existing refrigeration rates are not excessive and that no reparation should be awarded for the difference between 1911 and 1912 rates. (32 I. C. C., 48).

Fourth Section Violations in the Southeast

Opinion by the commission:

The carriers affected by the order in "Fourth Section Violations in the Southeast" (30 I. C. C., 153) reported in the *Railway Age Gazette* of May 15, 1914, page 1067, have found that in endeavoring to check rates in response to that and various other orders, some of the restrictions have the effect of preventing them from establishing a properly related rate adjustment. They therefore ask for such modification of the order as will permit the establishment of rates that will preserve certain long-standing group relations. The commission has therefore modified the order along the following lines:

The original report contained a scale of average rates which was adopted as a basis. The supplemental report corrects this table in the case of certain rates for a two-line haul which were less than for a one-line haul of equal length.

The rates named in the corrected scale will be observed as maxima in establishing rates on both numbered and lettered classes from Baltimore to intermediate points on routes to more distant lower rated points, but the rates named in the scale when applied from New York or Philadelphia over the constructive mileage as computed in the report will be increased by the amount of the differentials on these classes by which the rates from New York or Philadelphia now usually exceed the rates from Baltimore.

In the original report it was stated that carriers operating circuitous routes at least 15 per cent greater in length than the lines described in the report, could meet the competition of the direct lines at the more distant points. It is now ordered that the distances on which the 15 per cent is to be figured will be computed from the gateways on the various routes and not from the original points of origin.

The carriers will be authorized to include Helena in the group containing such points as Valdosta, Quitman, etc., provided the rates established from Cincinnati and the other Ohio river crossings and from New Orleans are not exceeded at intermediate points on any reasonably direct line.

The carriers may continue rates from Louisville and lower Ohio river crossings to Opelika, Ala., and points in Montgomery subterritory lower than those to intermediate points south of Atlanta in Atlanta subterritory, and also rates from Cincinnati to points in Atlanta territory between Eufaula and Macon, and between the Chattahoochee river and Cordele, lower than those to intermediate points in Montgomery subterritory between Montgomery and the Chattahoochee river.

The order in Board of Trade of Carrollton, Ga., v. Central of Georgia (28 I. C. C., 154), is modified to the extent that the carriers will be allowed to establish class rates from Baltimore to Carrollton equal to those to Cedartown, Ga., and from Louisville to Carrollton the same as to Newnan, Ga.

The carriers operating certain short roads in this territory, such as the Alabama, Tennessee & Northern, the Atlanta & St. Andrews Bay, the Georgia Coast & Piedmont, the Georgia & Florida, etc., may meet the rates at their junction points established by their trunk line connections and continue higher rates to intermediate local points for two years from the date of this report.

The Southern Railway will be authorized to make changes in rates from eastern cities to points on its Memphis division necessary to correct fourth section violations.

The Yazoo & Mississippi Valley may continue for two years after the effective date of the order in this case the same rates from Memphis, Cairo and other points north thereof to Jackson that are maintained by the direct line of the Illinois Central, and higher rates to intermediate points between Memphis and Jackson, provided the rates to these points are so corrected as not to exceed the rates for like distances shown in the corrected prescribed scale.

The carriers will be authorized to establish a new scale of rates from Louisville and other Ohio river crossings to local points between the Chattahoochee river and Bainbridge, Ga.

The original order is modified so as to permit a realinement of the rates from Cairo, St. Louis and Chicago to Jackson and Meridian and points north and south thereof, so that they will accord with the fourth section. The proviso is made, however, that the rates to points south of Jackson and Meridian shall not exceed the rates for like distances shown in the corrected scale.

The order is also so modified as to permit a realinement of rates from Cairo, Cincinnati, Louisville, St. Louis and Chicago to points intermediate to Memphis.

Carriers operating routes from Chicago, St. Louis and the Ohio river crossings may continue the same rates to Jackson and Meridian that are maintained to these points by the direct lines, and also continue rates to points between Jackson and Meridian on a prescribed scale of differentials ranging from three cents on first class to two cents on class H higher than the rates concurrently applicable to Jackson and Meridian. (32 I. C. C., 61.)

STATE COMMISSIONS

The Massachusetts Public Service Commission on October 30 approved tariffs which have been filed by the railroads increasing the price of mileage tickets from 2 cents a mile to 2¼ cents. The new tariffs took effect November 1.

The Railroad Commission of Louisiana, acting on the application of commercial organizations in the city of New Orleans, has authorized all railroads entering that city to close their freight houses at 1 p. m., on Saturdays throughout the year.

A delegation of prominent negroes has appealed to the North Carolina Corporation Commission concerning the "Jim Crow" service on the railroads of that state. Their principal complaint is that the railroad companies are using old wooden cars for the "Jim Crow" service and sandwiching them between the big steel coaches for the white people and the steel express and mail cars and powerful locomotives where, in case of wrecks, they are smashed and the lives and limbs of the negroes far more greatly imperiled than those of any others on the train. They want an order requiring all steel or all wood trains.

PERSONNEL OF COMMISSIONS

If the nominations made by Governor Haines of Maine are confirmed by the executive council the new public utilities commission of that state will be composed of three lawyers. The governor has nominated for chairman (salary of $5,000) Hon. Benjamin F. Cleaves, judge of the municipal court in Biddeford, and for the two other commissionerships William B. Skelton and Samuel W. Gould, as heretofore noticed (October 30, p. 794). Judge Cleaves is one of the best-known lawyers in the state and has been prominent in Republican politics. In view of the fact that sentiment is strongly against a board of three lawyers it is thought that there may be opposition in the council.

Railway Officers

Executive, Financial, Legal and Accounting

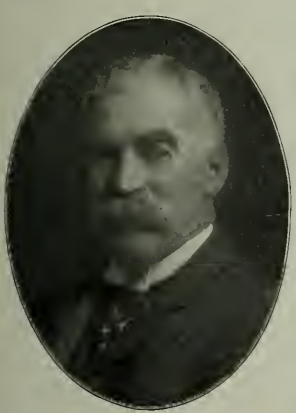
H. D. Chamberlain has been appointed acting freight claim agent of the Delaware & Hudson, with headquarters at Albany, N. Y., succeeding C. W. Nash, freight claim agent, resigned.

H. C. Pribble, freight claim auditor of the Atchison, Topeka & Santa Fe, has been appointed general freight claim agent, with headquarters at Topeka, Kan. The position of claims attorney, formerly held by the late J. D. M. Hamilton, has been abolished.

G. B. Herbert has been appointed freight claim agent of the Galveston, Harrisburg & San Antonio, the Texas & New Orleans, the Houston & Texas Central, the Houston East & West Texas and the Houston & Shreveport, with headquarters at Houtson, Tex., to succeed R. A. Taylor, resigned.

F. A. Lehman, assistant to the vice-president in charge of operation of the Atchison, Topeka & Santa Fe, has been transferred to Newton, Kan., as acting general superintendent of the eastern lines, Western district, succeeding Edward Raymond, who temporarily takes the place of Mr. Lehman, with office at Chicago.

William Hodgins Biggar, whose election as vice-president and general counsel of the Grand Trunk Pacific, with headquarters at Montreal, has already been announced in these columns, was born on September 19, 1852, at Carrying Place, Ont., and was educated at Upper Canada College, Toronto, Ont. Mr. Biggar entered the service of the Grand Trunk on February 1, 1881, and on December 31, 1902, was appointed assistant general counsel. About two years later he was appointed general solicitor of the same road. On January 10, 1910, he was appointed general counsel of the Grand Trunk and the Grand Trunk Pacific, and on September 15 he was elected vice-president and general counsel of the Grand Trunk Pacific, with headquarters at Montreal, Que. Mr. Biggar also retains the position of general counsel of the Grand Trunk.



W. H. Biggar

Operating

C. W. Fisher has been appointed chief train despatcher of the Canadian Pacific at Lethbridge, Alta., succeeding W. J. Manley.

H. W. Buskirk has been appointed assistant manager of the Continental Line and the Central States Dispatch, with headquarters at Cincinnati, Ohio.

S. T. Cantrell, supervisor of transportation of the Baltimore & Ohio, has been appointed assistant superintendent of the Monongah division, with headquarters at Grafton, W. Va.

C. M. Mitchell, trainmaster of the third district of the Cincinnati, New Orleans & Texas Pacific, at Oakdale, Tenn., has been transferred as trainmaster to the second district, and T. C. Blackwell, chief despatcher at Danville, Ky., succeeds Mr. Mitchell.

A. B. Woodward, trainmaster on the Montana division of the Great Northern at Havre, Mont., has been appointed chief train despatcher at that place; Nile Shaw, trainmaster on the Kalispel division at Whitefish, Mont., has been appointed chief despatcher at that point; F. T. Milligan, trainmaster on the Cascade division at Everett, Wash., has been appointed train despatcher at Spokane, Wash., and C. D. Meily, trainmaster on the Butte division at Great Falls, Mont., has been appointed yardmaster at Cut Bank, Mont. All these trainmasters formerly held the positions to which they are again appointed, owing to a retrenchment policy.

Traffic

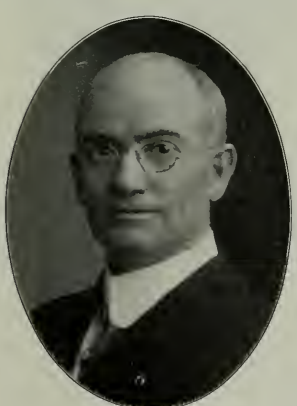
Joel L. Priest, industrial agent of the Oregon Short Line at Boise, Idaho, has been appointed general agent at that point.

John A. Miller, general agent of the freight department of the Great Northern at Seattle, Wash., has been promoted to district freight and passenger agent, with headquarters at Bellingham, a new position.

B. J. Tobron, division freight agent of the Lake Shore & Michigan Southern at Youngstown, Ohio, has been transferred to Toledo in a similar capacity, succeeding A. E. Billings, retired under the pension rules of the company. F. D. Hurst, general agent at Pittsburgh, Pa., succeeds Mr. Tobron, and J. J. Monks, commercial agent at Omaha, Neb., takes the place of Mr. Hurst.

H. C. Hamilton, who has been appointed general freight agent of the Lehigh Valley, with headquarters at New York, as has already been announced in these columns, began railway work as a clerk on the Philadelphia & Reading at Philadelphia, Pa., and subsequently was local freight agent and soliciting freight agent on that road. He then was appointed agent of the Reading Despatch Fast Freight Line, with headquarters at Philadelphia, leaving that position to become division freight agent of the Lehigh Valley, at Newark, N. J. He was then consecutively New England freight agent; division freight agent at Buffalo, and at the time of his recent appointment was assistant general freight agent of the same road.

Edward P. Cockrell, whose appointment as general passenger agent of the Chicago, Indianapolis & Louisville, with headquarters at Chicago, has already been announced in these columns, was born October 1, 1870, at Kinmundy, Ill. He was educated in the public and high schools, and began railway work April 1, 1889, with the Chicago & Atlantic. In September of the following year Mr. Cockrell went to the Chicago, Indianapolis & Louisville, with which road he has remained ever since. He was rate clerk until April, 1891, when he was advanced to chief clerk, which position he held until August, 1909. He was then promoted to assistant general passenger agent, which office he will retain until January 1, when his appointment as general passenger agent, with headquarters at Chicago, of the same road becomes effective.



E. P. Cockrell

M. V. Richards, land and industrial agent of the Southern Railway at Washington, D. C., has been appointed commissioner in charge of the industrial and agricultural department, recently formed by the consolidation of the land and industrial department, the department of farm improvement work and the live stock department. This department takes in the following roads: Southern Railway, Georgia Southern & Florida, Mobile & Ohio, Southern Railway in Mississippi, Northern Alabama and Virginia & Southwestern. H. E. Waernicke has been appointed assistant commissioner, and Z. P. Smith has been appointed immigration agent at Washington, D. C., and the following industrial and immigration agents have been appointed: O. J. Stephens, Atlanta, Ga.; T. G. Wood, Charlotte, N. C.; J. W. Paige, Chattanooga, Tenn.; H. R. Buckey, Jacksonville, Fla., and W. L. Henderson,

Mobile, Ala. C. S. Chase has been appointed western industrial and immigration agent, and F. B. Ayres, G. W. Lee and R. G. Hanson, Jr., have been appointed traveling industrial and immigration agents, with headquarters at St. Louis, Mo.

H. G. Elliott, general passenger agent of the Grand Trunk at Montreal, Que., owing to a rearrangement of the duties of the general officers of the passenger department was retired on October 31, under the rules of the superannuation and provident fund association, and his former duties have been assumed by the assistant passenger traffic manager. Mr. Elliott was born on August 22, 1860, and began railway work in 1882, as city ticket agent on the Central Vermont, at Montreal, Que. In May, 1897, he entered the service of the Grand Trunk and has been in the continuous service of that road ever since, holding various positions in the traffic department until his appointment in May, 1900, as assistant general passenger and ticket agent. He subsequently served as first assistant general passenger agent at Montreal, and later at Chicago, until March, 1911, when he was appointed general passenger agent at Montreal.

William Pittman Hinton, whose appointment as assistant passenger traffic manager of the Grand Trunk and the Grand Trunk Pacific, with headquarters at Montreal, Que., has already been announced in these columns, was born on August 30, 1871, at Ottawa, Ont., and was educated at Ottawa Collegiate Institute. He began railway work on May 3, 1887, in the auditor's department of the Canada Atlantic, and in September 1891, became rate clerk in the traffic department. From March, 1898, to July, 1901, he was assistant general freight agent, and then was general freight agent, until his appointment in February, 1903, as general freight and passenger agent of the same road. In October, 1905, when the Grand Trunk absorbed the Canada Atlantic he became general agent in the passenger department of the Grand Trunk at Ottawa, Ont., in charge of immigration and transatlantic passenger traffic, remaining in that position until January 1, 1907, when he was appointed assistant general passenger agent of the same road at Montreal. On May 1, 1909, he was appointed general passenger agent of the Grand Trunk Pacific at Winnipeg, Man., and on January 1, 1914, was promoted to assistant passenger traffic manager of the same road at Winnipeg, and now became also assistant passenger traffic manager of the Grand Trunk, with headquarters at Montreal, Que., as above noted.

W. P. Hinton

Engineering and Rolling Stock

Cyrus Miller has been appointed roadmaster of the Atchison, Topeka & Santa Fe at Moline, Kan., in place of Lee Claiborne. C. Doherty has been appointed roadmaster at Plainview, Tex., to succeed H. S. Bruce. R. B. Ball, division engineer, Coast lines, at Los Angeles, Cal., has been appointed engineer Grand division at Los Angeles. W. D. Cloud has been appointed assistant signal supervisor, Coast lines, at Los Angeles, Cal., in place of W. F. Price.

OBITUARY

Walter Lee McGill, secretary of the Southeastern Freight Association at Atlanta, Ga., died on October 28, at his home in that city, at the age of 50.

George Morrison Roberts, formerly for many years New England passenger agent of the Pennsylvania Railroad at Boston, Mass., died on October 27, at his home in Malden, Mass., at the age of 76.

Equipment and Supplies

LOCOMOTIVE BUILDING

Carr Brothers, New York, have ordered one 0-6-4 type narrow gage locomotive from the Davenport Locomotive Works for export to Cuba.

CAR BUILDING

The Rutland Railroad is planning to reinforce 4,500 wooden stock, box and flat cars.

The United States Government is in the market for 2 passenger cars to be used at the Sandy Hook Proving Grounds.

The Illinois Central recently classed a large number of its freight cars as unfit for the heavy and continuous service required of them under normal conditions, and is scrapping them at the rate of 300 a month. However, these cars are also for sale and a purchaser has the privilege of selecting any kind of car or cars in the series. A price has been affixed each car, which is approximately the scrap value of the car. The company will deliver these cars free of charge to any point on its line, desired by the purchaser. There was a total of approximately 10,000 cars, of which 5,451 are left, divided as follows: 3,567 box, 78 furniture, 605 stock, 68 fruit, 104 flat, 542 coal and 487 refrigerator cars.

SIGNALING

The Southern Railway is installing an inter-locking plant at Helena, Ga., the crossing of the Atlanta division with the Seaboard Air Line.

Railway Construction in Venezuela in 1913.—The only construction work carried on or under consideration in Venezuela during 1913 was the following: the extension of the Central Railway to its present terminus at Santa Teresa; the extension of the Tachira Railway at its southern end, and building operations on a branch of the Bolivar Railway which will extend from Palma Sola to San Felipe.

Railway Facilities in Paraguay.—Transportation between points in the Republic of Paraguay is by rail or river steamer. There is one railway—the Central Paraguay Railway. Its line is from Asuncion to Encarnacion, a distance of 230 miles. This gives rail connection with Villa Rica, the second city of the republic. Freight trains are run as needed. Almost all the important towns are on the rivers and freight can be sent by river steamers. The wagon roads are poor and travel over them said to be almost impossible.

Destruction of Railways by Warfare.—The destruction of railway permanent way, stations, plant, rolling stock and general equipment will by the end of the war have been stupendous, and manufacturers will for a long time be busy replacing the awful wastage. The Boulogne correspondent of the London Daily Telegraph writes, September 26, that "a German patrol has blown up the railway bridge across the river Ancre, at Mivaumont, Somme. This bridge is on the line to Paris, via Lille and Amiens. The railway lines have suffered greatly in the north. Sometimes it was the French who blew the bridges up to prevent the enemy's advance, and sometimes it was the enemy, as they did at Corbehem. It was, however, more often Germans than French. Up to now the Compagnie du Chemin de Fer du Nord has lost about 179 bridges." From Antwerp, it is reported that recently Belgian military engineers succeeded in passing through the German lines and blowing up a railway viaduct at Bierghes, between Mons and Brussels, and about fifteen miles from the capital. A telegram from Weihsein says that Chinese troops have blown up and destroyed a railway bridge over the Tayu-ho. These are, of course, only a few instances of the work of destruction which is going on in all parts of the vast field of hostilities.—*The Engineer.*

Supply Trade News

The American Car & Foundry Company has announced that its plants at St. Louis, Mo., and Madison, Ill., will be closed on December 1.

R. Harvey White, southern representative of the Chicago Railway Signal & Supply Company, Chicago, was promoted to the position of signal engineer of that company, October 1, 1914.

H. C. Hequembourg, who has been the general purchasing agent of the American Locomotive Company since its organization, has resigned to accept the vice-presidency of the Standard Chemical Company, Pittsburgh, Pa. This company is said to be the largest producer of radium in the world.

M. Wuerpel, assistant general manager of the General Railway Signal Company, Rochester, N. Y., has been appointed assistant to the president of that company, effective November 1. Effective on the same date S. G. Johnson, who was recently elected vice-president, will be in full charge of the sales department (including all branch and foreign offices, commercial engineering, commercial inspection and contract installation) reporting to the president and general manager. Mr. Johnson will have headquarters at Rochester. All those in the sales department formerly reporting to the president and general manager or to the assistant general manager or the sales manager will now report to and receive instructions from Mr. Johnson. A department of publicity and education has been created and H. M. Sperry has been appointed the manager of it, reporting to the president and general manager and co-operating closely with all departments. This department will take over the advertising and catalog work, and in addition will undertake an educational campaign along the lines that have proved successful in other corporations.

TRADE PUBLICATIONS

Compression Tools.—The Lutz-Webster Engineering Company, Inc., Philadelphia, Pa., has recently issued a leaflet entitled "Bulletin No. 4," illustrating and treating briefly of a number of Lutz tools, and also a leaflet describing briefly the proposed prize contest covering the use of Lutz compression tools.

Ball Bearings.—The S. K. F. Ball Bearing Company, New York, has recently issued bulletin No. 16, entitled "S. K. F. Ball Bearings Applied to Electric Motors." The catalog aims to show wherein S. K. F. ball bearings excel and to indicate their advantages for application on motors, the latter subject being treated under such heads as lubrication, maintenance charges, compactness, durability, etc. Several views are given of various installations.

Sprocket and Traction Wheels.—The Lehigh Car, Wheel & Axle Works, Catasauqua, Pa., has issued catalog No. 50, entitled "Fuller Quality Products." The booklet is primarily a price list covering the company's line of face hardened sprocket and traction wheels, but it also gives general descriptions of the company's special castings for all uses requiring resistance to abrasive wear.

Argentine Railway Construction.—On September 29 the Argentine Chamber of Deputies passed an act authorizing the Santa Fe Railway to construct and operate the following lines in connection with its system: (1) A line starting at the present station of Charadai to run westward 59 miles, this to include the branch line of 47 miles already authorized; (2) a branch line to start either at kilometer 35 or at the terminal of the small branch already built toward the north and to run 62 miles in a northwesterly direction. These lines wil be of meter gage, as are the other lines of the Santa Fe Railway. The act provides that the contract for construction must be signed within six months after promulgation of the law. Plans are to be submitted to the government within one year after the signing of the contract, and work is to commence six months after the approval of plans, and to be terminated within two years from date of commencement.

Railway Construction

Baltimore & Ohio.—The report of this company for the year ended June 30, 1914, shows that with the exception of the Magnolia cut-off the more important improvement work authorized by the company has been completed. A third track has been completed and put in operation between Green Spring, W. Va., and Little Cacapon, 7.6 miles. At Winchester, Va., a 2,100-ft. line was built to a connection with the Cumberland Valley Railroad. Progress has also been made during the year on the double tracking of the Chicago division. The second track between Defiance, Ohio, and The Bend, 8.96 miles, was completed and put in service. The Chicago division is now all double track, with the exception of 1.10 miles through the city of Defiance, Ohio, and 23.27 miles between Milford Junction, Ind., and LaPaz Junction. Work has also steadily progressed on the new double track line, and relocation of parts of the old line known as the Magnolia cut-off improvement, between Orleans Road, W. Va., and Little Cascapon, which will effect a saving of 5.8 miles in distance and 877 deg. of curvature. It is expected that this work will be completed and placed in operation during the coming fiscal year.

Cherry River Southern.—An officer writes that contracts will probably be let in February, 1915, to build a 35-mile line from Curtin, W. Va., which is on the Baltimore & Ohio. The projected route from Curtin is along the south side of Gauley river to the mouth of Hominy creek, 20 miles, thence up Hominy creek eight miles, thence along Angling creek five miles to Meadow river and along that stream two miles to Bays Ferry near the point at which the counties of Nicholas, Greenbrier and Fayette meet. About 25 miles has been permanently located, and this work is expected to be finished on the other 10 miles by December 1. About 25 miles of the work will be difficult and heavy, and the other ten miles will be comparatively light construction. The estimated cost of building the line will be $15,000 a mile. The maximum grade will be 1 per cent, and the maximum curvature 16 deg. There will be eight trestles ranging in length from 100 to 450 ft. each. The principal commodities to be carried will be lumber and timber. H. L. Kirtley, president; E. H. Venable, chief engineer, Charleston, W. Va. (October 30, p. 818.)

Chicago Great Western.—This company has awarded a contract for the construction of 1,700 lineal feet of dyke along the east bank of the Missouri river at a point just opposite Leavenworth, Kan., to Dewitt & Shobe, Glasgow, Mo. U. S. standard piles will be used. The cost will be approximately $30,000.

Illinois Central.—This company has awarded a contract for the grading work involved in the building of a 2.5 mile spur line running from Oakridge, Ill., to the Peabody Coal Company's mines No. 3, located in Williamson county, Ill., to M. H. Windham, Centralia, Ill. The yardage is estimated at 33,000 cu. yd.

Norfolk & Western.—An officer writes that a contract has been given to J. J. Boxley & Son, Roanoke. Va., to build five miles of branch lines with a short tunnel from the Dry Fork branch at Rift, near Berwind, W. Va. The new branches are to be known as the Jacobs Fork and Cucumber branches.

Piedmont & Northern (Electric).—This company plans to build an extension, it is said, from Spartanburg, N. C., north to Gastonia, about 32 miles, to complete the gap between the northern and the southern lines. The company also plans to build from the present terminus of the northern line at Charlotte north via Concord, Salisbury and Greensboro to Durham. (April 17, p. 927.)

Princeton Power Company's Line.—An officer writes confirming the report that a contract has been given to Walton & Co., Falls Mills, Va., and grading work is now under way on a line between Princeton, W. Va., and Bluefield, 12 miles. There will be five steel bridges on the line. The maximum grade will be 7 per cent in city limits and 3.5 per cent outside the cities. S. J. Evans, president, Princeton; G. H. Hill, chief engineer, Bluefield. (October 22, page 779.)

St. Paul Southern Electric.—This company has completed work on 18 miles of electric line between St. Paul, Minn., and Hastings and this section is now open for business. The plans call for building an extension south of Hastings to connect Cannon Falls, Zumbrota, Pine Island, Oronoco, Douglas, Rochester, Red Wing and Lake City. It is said that construction work is now under way on the section from Cannon Falls to Zumbrota, 36 miles. P. G. Heintz, president, Rochester, I. Todd, Jr., vice-president, Hastings, and Z. T. Hutchinson, secretary and treasurer, St. Paul.

RAILWAY STRUCTURES

Ada, Minn.—The Great Northern will build a new passenger depot at Ada, Minn., in accordance with an order of the Railroad and Warehouse Commission of Minnesota, which provides that the station shall be constructed by December 1, 1915.

Baltimore, Md.—The report of the Baltimore & Ohio for the year ended June 30, 1914, shows that at Elkridge, Md., the work of eliminating grade crossings at Washington road is well under way and at Frederick Junction, Md., an overhead bridge has been reconstructed The work of eliminating grade crossings in Baltimore, Md., Cincinnati, Ohio, and Chicago has been continued in accordance with the arrangements with those cities, and this work will extend over a period of years. Arrangements have also been made for the elimination of an important grade crossing at Lorain, Ohio. The new passenger subway under Baltimore street, Cumberland, Md., has been finished and is now in use, and at South Cumberland new engine facilities, consisting of engine house, boiler house, machine shop, coaling station, ash pit and sand house were completed and put in service. Combined passenger and freight stations were built at Lore City, Ohio, and Lexington, and the passenger station at Lexington, Va., was remodeled. Additional freight facilities, including freight houses, station tracks, etc., were built at New York City, Baltimore, Md., Clarksburg, W. Va., Cumberland, Md., Akron, Ohio, and Canal Dover. At New York City the improvements included an eight-story steel and concrete warehouse, and at Locust Point, Baltimore, Md., open pier 5 was reconstructed and extended, and is now in operation for the handling of ore and similar commodities. The new yard at Somerset, Pa., for assembling coal has also been completed and is now in operation.

Brighton Park, Ill.—The Chicago & Alton is building an eight-stall roundhouse and a small machine shop and power house at Brighton Park, Ill. The buildings are of concrete and brick construction. The work is being done by the company's own forces, and work is expected to be completed about December 1, 1914. The estimated cost is $45,000.

Brooklyn, N. Y.—The New York Public Service Commission, First district, has approved the plans submitted by the New York Municipal Railway Corporation and the form of contract for the construction of elevated stations on the Liberty avenue line at Hudson street, Boyd avenue, Rockaway boulevard, Oxford avenue, Greenwood avenue and Lefferts avenue, also for a frame building for trainmen at the Lefferts avenue station.

Portland, Oregon.—The Oregon-Washington Railroad & Navigation Company has under construction a new dock on the Willamette river. This structure is 160 ft. by 580 ft. in area and is covered with corrugated galvanized iron. The interior frame work is of timber and the roof is of asbestos. The building is served by a double track trestle. The estimated cost, including the cost of dredging, is $85,000.

Prince George, B. C.—The Grand Trunk Pacific has given a contract to Carter, Halls,& Alinger, Winnipeg, Man., at $300,000, it is said, for constructing terminals at Prince George, at Endako, at Smithers and at Pacific. The construction work has already been started and will include round houses, machine shops and other railway buildings. The company will probably let a contract soon for similar work at Prince Rupert, the coast terminus.

Toledo, Ohio.—The Cincinnati, Hamilton & Dayton is asking bids for the construction of a coal dumper at Toledo, Ohio. The machine will be of the most modern type and will cost, including the expense of incidental track changes, approximately $300,000. The new facilities will be ready for service early next spring.

Railway Financial News

Chicago Great Western.—President S. M. Felton has issued to stockholders a circular in which he says: "On September 1 the property passed from the voting trust into the hands of stockholders. The gross earnings for the year ended June 30, 1914, were the largest in the history of the road. There was a decrease in net as against the previous year, because of the general upward trend of operating expenses from which we could find no escape. . . . While the officers are doing everything in their power to secure better results, they stand in need of the active assistance of every stockholder. Agents along the line, and in the principal cities in the United States where located, will eagerly work with you toward securing any traffic you may be able to influence. Communicate with them freely or write the undersigned at any time you have suggestions to offer. There is now a general feeling that railroads have been overregulated, their rates unnecessarily reduced and that they are entitled to more consideration. The need of the country is rather for better facilities than for reduced rates. It is time that the owners of railroad property should assert themselves, and your frank discussion with senators and congressmen, and with the members of the State legislatures of matters affecting railroad operation cannot but prove beneficial. . . ."

National Railways of Mexico.—The Treasury Department at Mexico City announces that the New York banks holding the papers have granted an extension of time on the $1,000,000 interest due on the bonded indebtedness of the railway corporation. The Government has under consideration a plan to raise the necessary funds by asking the foreign mining companies to deliver $1,000,000 bullion in exchange for Mexican paper money at the rate of $4.70 paper to $1 gold. It is believed that the railway will be delivered to the stockholders by the Mexican Government within a very short time.

New Mexico Central.—The sale under foreclosure of this road, which has been set for October 14, has been indefinitely postponed. The road runs from Santa Fe, N. Mex., to Torrance, 116 miles.

New York, New Haven & Hartford.—The grand jury, in the United States district court at New York city, which has been investigating the affairs of this road for many months, finally returned criminal indictments, on Monday of this week, against 21 members of present and past boards of directors for conspiracy to monopolize interstate commerce by acquiring control of competing lines, both railroad and steamship. The directors named were William Rockefeller, George Macculloch Miller, Charles F. Brooker, William Skinner, D. Newton Barney, Robert W. Taft, James S. Elton, James S. Hemingway, Lewis Cass Ledyard, Charles M. Pratt, A. Heaton Robertson, Frederick F. Brewster, Henry K. McHarg, Edward D. Robbins, Alexander Cochrane, John L. Billard, George F. Baker, Thomas De Witt Cuyler, Theodore N. Vail, Edward Milligan, and Francis T. Maxwell.

Of the foregoing those now on the board are Messrs. Brewster, McHarg, Cuyler, Milligan and Maxwell. Former President Charles S. Mellen testified at length before the grand jury and is not indicted.

The indictment mentions about fifty other persons, some of whom are now dead, as having conspired with the directors, but who are not indicted. Among these are Chauncey M. Depew, Lucius Tuttle, John M. Hall, Richard A. McCurdy, Alexander Cassatt, J. P. Morgan, and a number of former officers of the road. The four last named are now dead.

Those of the indicted directors who have appeared in court have been released on bail bonds of $5,000 each.

The charges deal with corporate acts as far back as 1891, and 160 corporations are named in the list of lines on which the attempt to monopolize commerce has been exercised.

It is not expected that the accused directors will be brought to trial before next Spring. The maximum penalty for the offense alleged is one year in prison and $5,000 fine.

ANNUAL REPORT

BALTIMORE AND OHIO RAILROAD COMPANY—EIGHTY-EIGHTH ANNUAL REPORT

OFFICE OF THE BALTIMORE AND OHIO RAILROAD COMPANY,
BALTIMORE, MD., October 15, 1914.

To the Stockholders of The Baltimore and Ohio Railroad Company.

The President and Directors herewith submit report of the affairs of the Company for the fiscal year ended June 30, 1914.

Except where otherwise indicated, the comparisons herein shown are with the figures of the preceding fiscal year.

MILEAGE AND EQUIPMENT.

The statements in this report show the results of the operations of the lines directly operated by The Baltimore and Ohio Railroad Company, embracing:

	FIRST MAIN TRACK.	TOTAL ALL MAIN TRACKS, SIDINGS, ETC.
Miles	4,403.54	8,719.48
Trackage Rights	74.68	188.87
Total Operated Mileage	4,478.22	8,908.35

as shown in detail in Table 28.

There has been an increase of 21.89 miles in first main track, due mainly to reclassification of tracks and to remeasurement.

Your Company's equipment at June 30, 1914, consisted of 2,365 Locomotives, 1,292 Passenger Cars, 88,055 Freight Cars, 3,407 Work Cars, and 146 pieces of Floating Equipment, as shown in detail in Table 27.

INCOME FOR THE YEAR.

The General Income Account of the Company will be found in Table 1.

The total Operating Revenue (including Outside Operations), was $99,032,150.11, a decrease of $4,297,842.21, or 4.16 per cent.

The total Operating Expense (including Outside Operations), was $74,560,847.28, a decrease of $1,866,962.31, or 2.44 per cent.

The Net Railway Operating Revenue (including Outside Operations), was $24,471,302.83, a decrease of $2,430,879.90, or 9.04 per cent.

The Total Operating Revenue from Rail Operations only, was $97,411,441.48, a decrease of $4,144,690.14, or 4.08 per cent.

The revenue from Freight Traffic was $75,784,287.09, a decrease of $4,410,202.86, or 5.50 per cent.

The tons of revenue freight carried were 69,382,145, a decrease of 3,078,919 tons, or 4.25 per cent., and the tons of revenue freight carried one mile were 13,425,552,328, a decrease of 887,575,905, or 6.20 per cent. The ton miles per mile of road were 2,997,966, a decrease of 213,899, or 6.66 per cent. The average distance each ton was carried was 193.50 miles as compared with 197.53 miles the previous year. The revenue from freight per mile of road was $16,922.86, a decrease of $1,072.78, or 5.96 per cent., and the revenue per freight train mile was 3.49^{58}/_{100}$, an increase of $.02$^{46}/_{100}$, or 0.69 per cent. The average earnings per ton per mile were $^{344}/_{1000}$ cents, an increase of $^{004}/_{1000}$ cents. This increase is due primarily to the shorter average distance each ton was handled, as shown above, but applies principally to the Products of Agriculture, on which the average haul decreased 52 miles or 14.25 per cent. under last year. Freight Traffic Statistics are given in Tables 12 and 13.

From the Statement of Commodities Carried, Table 14, it will be seen that as compared with the previous year marked decreases are shown in the commodities grouped as Products of Agriculture, Products of Mines, Products of Forest, and Manufactures, with increase in Products of Animals. There was an increase in less carload shipments, which are classified in the grouping of Merchandise.

The revenue from Passenger Traffic was $15,893,721.39, an increase of $356,643.56, or 2.30 per cent.

The number of passengers carried was 22,718,932, a decrease of 160,307, or 0.70 per cent., but the number of passengers carried one mile was 826,672,210, an increase of 21,465,683, or 2.67 per cent. The average number of miles each passenger was carried was 36.39, an increase of 1.20 miles, or 3.41 per cent. The number of passengers carried one mile per mile of road was 184,598, an increase of 3,910, or 2.16 per cent. The average earnings from each passenger were $.69$^{96}/_{100}$, an increase of $.02$^{06}/_{100}$, and the average earnings per passenger per mile were $.01$^{923}/_{1000}$, a decrease of $^{1}/_{1000}$ cents. The increase in the passengers carried one mile and the decrease in the rate per passenger per mile are due chiefly to the increase in long haul passengers, principally immigrant traffic, and a decrease in short haul traffic, mainly commuter travel. Passenger Traffic Statistics will be found in Tables 10 and 11.

The revenue from the Transportation of Mails was $1,212,071.96, an increase of $6,913.01, or 0.57 per cent., and from Express Traffic $1,848,704.33, a decrease of $60,847.63, or 3.19 per cent.

The Operating Expenses—Rail Operations for the year were $72,054,892.40, a decrease of $1,724,745.58, or 2.34 per cent.

The ratio of Expenses to Earnings increased 1.32 per cent., being 73.97 per cent. for the present fiscal year compared with 72.65 per cent. for the preceding fiscal year.

The expenditures for Maintenance of Way and Structures were $12,207,191.25, a decrease of $1,812,428.32, or 12.93 per cent. These expenditures include $2,112,084.98, on account of directly locatable expenses incident to the flood damage and $493,354.49 covering replacement and revision of existing facilities. The roadway and structures have been well maintained, and the property generally is in good condition.

The expenditures for Maintenance of Equipment were $16,681,986.08, a decrease of $1,641,224.31, or 8.96 per cent. These expenditures include $2,607,881.38 covering depreciation of equipment. The equipment has been satisfactorily maintained, and is in a condition generally to better meet present operating requirements.

The total maintenance expenses for the year were $28,889,177.33, as against $32,342,829.96, for the preceding year, a decrease of $3,453,652.63, or 10.68 per cent. The total amount expended for maintenance was 29.66 per cent. of the Gross Earnings and 40.09 per cent. of the total Operating Expenses.

The total Transportation Expenses were $38,699,492.90, an increase of $1,425,093.84, or 3.82 per cent. over the preceding year. The ratio to Total Operating Revenue was 39.73 per cent. as compared with 36.70 per cent. for the preceding year. This increased ratio was due in part to the unusual distribution of the tonnage handled over the lines of your System, and to the exceptional conditions that prevailed during the year. The congestion following the flood which necessitated much detouring over longer routes, extended through the earlier months of the year, and at a time when the business was heaviest; later, when there was a heavy shrinkage in traffic, the percentage of empty car movement was disproportionately large. These conditions, together with the effects of severe weather prevailing during the winter months, are directly reflected in the increased expense. Increased rates of pay and changed working conditions of employes in train service alone, as a result of arbitration awards, caused an expenditure of $805,000 more than would have been required for the same service had the rates of pay and conditions of employment prevailing in the preceding year continued.

The increase in Traffic Expenses of $125,612.66 is due almost entirely to the expense incident to compiling and printing new tariffs which were considered in the recent application for advances in freight rates.

The increase in General Expenses of $178,198.55 is principally due to larger charges to this account for Pensions, referred to hereafter more in detail on Page 12.

The comparisons shown in Table 7 indicate the general increases and decreases in Operating Expense accounts.

The Net Revenue—Rail Operations was $25,356,549.08, a decrease of $2,419,944.56, and Outside Operations show a deficit of $885,246.25, making the Net Railway Operating Revenue $24,471,302.83; from this amount has been deducted Railway Tax Accruals for the year, $3,226,465.69, an increase of $265,560.60, or 8.97 per cent., leaving as Railway Operating Income $21,244,837.14, a decrease from preceding year of $2,696,440.50, or 11.26 per cent.

Other Income amounted to $6,017,719.18, an increase of $805,513.15, making the Gross Income for the year $27,262,556.32, a decrease of $1,890,927.35, as compared with last year.

There was deducted from Gross Income for payment of interest on funded debt, rents, etc., $18,012,531.94, as set forth in the Income Account, leaving as Net Income $9,250,024.38, being a decrease of $4,132,087.00 under that of the previous year, from which dividends were paid at rate of 4 per cent. on Preferred Stock, $2,354,633.64, and some minor appropriations made to sinking and reserve funds, leaving a balance to be transferred to Profit and Loss of $6,845,933.46. With this transfer and after deductions for interest accrued during the year on advances to the Cincinnati, Hamilton & Dayton R'y Co. and uncollected, amounting to $909,271.71, miscellaneous adjustments, and charges for discount on securities sold during the year, the net balance to the credit of Profit and Loss was $41,922,950.21, against which dividends were charged at rate of 6 per cent. on your Common Stock, aggregating $9,118,762.47, leaving a balance to the credit of Profit and Loss at June 30, 1914, of $32,804,187.74.

Largely because of the extraordinary flood expenditures of over $2,000,000, already referred to, and which were charged to operating expenses during the year, together with the recession in business, the net operating income fell short of the full amount required for the six per cent. dividend which has been paid upon your common stock for the last seven years. By reference to Table 8 in this and previous reports, it will be seen that the Company has earned and carried to surplus during the past ten years over $38,000,000, and the Profit and Loss Account this year, after necessary adjustments, showed a balance of $41,922,950. In view of these circumstances, your Board felt justified in continuing the established dividend on the basis of six per cent. In reaching this conclusion consideration was given to the application for an increase in freight rates then pending before the Interstate Commerce Commission, as a result of which it is hoped your Company may be permitted to so adjust its charges as to offset, in part at least, the increased expenses of a permanent nature, such as higher rates of pay, increased taxes, etc., and thereby he enabled to earn a fair return upon your property investment. In this connection it was shown in the rate hearing in the so-called Five Per Cent. Case, that the expenses and charges of your Company for the year 1913 were $4,712,000 greater than they would have been had the rates of wages and taxes alone remained the same as in the year 1910, an amount equal to more than three per cent. upon your entire common stock.

ASSETS.

The General Balance Sheet will be found in Table 2.

Property Investment—Road and Equipment—shows an increase for the year of $12,796,952.18

made up of the following items:

Net increase for Road (see Table 6).....	$7,021,132.62	
Net increase for Equipment (details on page 10)	5,837,208.70	
	$12,858,341.32	
Less: Sundry adjustments	61,389.14	
	$12,796,952.18	

In the grouping of Property Investment—Securities—the changes in those Pledged and Unpledged are occasioned by the transfer of securities from the latter grouping to the former. The net increase in this grouping of..... $2,279,914.00

is due to:

Purchase of additional securities of the following companies:	
Baltimore and Ohio Chicago Terminal R. R. Co., Bonds	$1,800,000.00
Hampshire Southern R. R. Co., Bonds.	388,960.00
Various subsidiary companies	90,954.00
	$2,279,914.00

Other Investments increased $11,510,425.26

accounted for in the following manner:

Acquisition at maturity, July 1, 1913, of Cincinnati, Hamilton and Dayton R'y Co., Purchase Money Collateral Notes and Coupons		$11,788,140.00
Capital Advances to Sundry Companies...		28,611.34
		$11,816,751.34
Less: Net decrease in Physical Property due to disposition of certain real estate.....	$286,137.26	
Miscellaneous	20,188.82	306,326.08
		$11,510,425.26

Working Assets show a net increase of..... $21,357,615.01.

Included in this grouping is the item of Cash, in which there is shown an increase of $22,821,608.48 over last year, which is due to the provision made for the retirement of $20,000,000.00 One Year Gold Notes, payable on July 1, 1914. The decrease in Securities Issued—Held in Treasury—of $2,017,700.00, was caused by the sale, during the year, of $2,000,000.00 par value of First Mortgage Bonds, and some minor transactions. Loans and Bills Receivable increased $1,901,084.76, included in which is $2,899,827.52 advanced Cincinnati, Hamilton and Dayton R'y Co., and secured by collateral, which amount, less payment of sundry other loans, makes the increase in question. Materials and Supplies decreased $1,420,760.35, due to heavy purchases of material late in the previous fiscal year and to retrenchment made necessary this year by general business conditions.

Deferred Debit Items show an increase of $1,117,804.40, due mainly to the increase in Special Deposits, which grouping includes an item of $1,847,648.80, representing balance of proceeds from the sale of Equipment Certificates of the Trust of 1913, to be applied to the purchase of additional equipment for that Trust. Other Deferred Debit Items show a decrease of $961,770.39, due to the adjustment of departmental accounts, including the clearance of items awaiting final distribution.

Liabilities.

It will be noted, from the Balance Sheet, that there has been no change in the Capital Stock of the Company during the year.

Mortgage, Bonded, and Secured Debt—increased..... $36,659,450.76

explained in the following manner:

Increases:		
First Mortgage Bonds.....		$1,000,000.00
Issued under provisions of the mortgage in recoupment of construction expenditures.		
One Year Collateral Gold Notes, dated June 1, 1914, and due June 1, 1915....		35,000,000.00
Issued to retire $20,000,000.00 One Year Notes due July 1, 1914, and for other corporate purposes.		
Certificates of Interest, B. & O. Equipment Trust of 1913.....		9,000,000.00
Issued for purchase of equipment:		
Real Estate Mortgages and Ground Rent Liens on property acquired and capitalized		40,800.00
		$45,040,800.00
Decreases:		
Collateral Notes dated June 30, 1913, and due September 30, 1913	$6,250,000.00	
B. & O. Equipment Trust of 1912	1,000,000.00	
Series "B" paid at maturity.		
B. & O. Equipment Trust of 1913	1,000,000.00	
Series "A" paid at maturity.		
Real Estate Mortgages and Ground Rent Liens, Liquidated	131,349.24	8,381,349.24
		$36,659,450.76

Working Liabilities show an increase of.....$16,279,108.91.

Going to make up this amount is an increase of $19,900,000.00 in Matured Mortgage, Bonded, and Secured Debt Unpaid, which is occasioned by the inclusion in this account of $20,000,000.00 of One Year Gold Notes maturing July 1, 1914, the day following that on which the books were closed (See Contra—Cash in Working Assets available for payment at maturity and as presented). There is shown a decrease in Audited Vouchers and Wages Unpaid of $4,277,631.31, which decrease partly reflects the change in pay roll settlements. With the passage of laws in several States in which the Company operates, requiring semi-monthly payment of wages, your Company adopted this practice generally with the result that the payment of one-half of the pay roll is made during the month in which the labor is performed, resulting in a lesser amount accrued and unpaid. The other increases and decreases in this grouping are of a normal character incident to the business.

On June 1, 1914, the Company issued $35,000,000.00 One Year Four and One-half Per Cent. Secured Notes, maturing June 1, 1915. These obligations were issued in part for the purpose of retiring the $20,000,000.00 Notes maturing July 1, 1914. In providing funds in advance of these maturing obligations advantage was taken of the favorable money conditions then existing, and it may be of interest that the entire issue of $35,000,000.00 was taken by the public at its par value.

Equipment Trusts.

During the year $9,000,000.00 of Certificates of Interest in the Baltimore & Ohio Equipment Trust of 1913 were disposed of.

The status of the Equipment Trusts at June 30, 1914, follows:

Baltimore & Ohio Equipment Trust of February, 1912:		
Total Issue		$10,000,000.00
Matured and paid—		
Series "A"—Paid February 1, 1913.?.....	$1,000,000.00	
Series "B"—Paid February 1, 1914.....	1,000,000.00	2,000,000.00
Outstanding June 30, 1914.....		$8,000,000.00
Baltimore & Ohio Equipment Trust of 1913:		
Total Issue $10,000,000.00		
Matured and paid—		
Series "A"—Paid April 1, 1914.....	1,000,000.00	
Outstanding June 30, 1914.....		$9,000,000.00

Making total Equipment Trusts outstanding.....$17,000,000.00

Each of these Trusts was issued in ten series of $1,000,000.00, one series of each Trust maturing annually.

Additions to Road and Equipment.

The total capital expenditures for equipment during the year aggregated $9,137,448.09, due mainly to the acquisition of equipment under the Baltimore and Ohio Equipment Trust of 1913. Table 27 shows the equipment in service and the various changes during the year.

The capital expenditures for improvements during the year amounted to $7,113,696.09, as will be seen from Table 6, where these expenditures are shown under the more important groupings of the Road and Equipment Classification.

Road.

With the exception of the Magnolia Cut-off, the more important improvement work authorized by your Board has been completed, and no extnsive new work has been inaugurated during the year.

At Elkridge, Md., the work of eliminating grade crossings with the Washington Road is well under way.

At Frederick Junction, Md., Overhead Bridge No. 35-A has been reconstructed to increased height and width to afford standard clearance.

A third track has been completed and put in operation between Green Spring and Little Cacapon, W. Va., a distance of 7.6 miles; making a continuous three-track line from Little Cacapon to Patterson Creek, W. Va., a distance of 14.4 miles.

The new passenger subway under Baltimore Street, Cumberland, Md., has been finished and is now in use. At South Cumberland, new engine facilities, consisting of engine house, boiler house, machine shop, coaling station, ash pit and sand house were completed and put into service.

At Winchester, Va., a connection 2,100 feet in length for the interchange of traffic with the Cumberland Valley Railroad was completed and put in operation during the year.

Combined passenger and freight stations have been erected at Lore City and Lexington, Ohio, and the passenger station at Lexington, Va., has been remodeled. Additional freight facilities, embracing houses, station tracks, etc., were constructed at New York City, N. Y., Baltimore, Md., Clarksburg, W. Va., Cumberland, Md., Akron and Canal Dover, Ohio.

The double tracking of the Chicago Division has progressed during the year. The second track between Defiance and The Bend was completed and put into service, adding 8.96 miles of additional second track. The Chicago Division is now all double track with the exception of 1.10 miles through the city of Defiance, Ohio, and 23.27 miles between Milford Junction and La Paz Junction, Ind.

During the year 9 new interlocking plants were built, one reconstructed and six rearranged. Automatic signals were installed on 24.7 miles of double track and 151.1 miles of single track. In addition, line control blocking system was provided for 3.8 miles of track; lock and block system for 28.5 miles of track; and a large number of safety devices were installed for protecting switches, grade crossings, etc.

Additions to Track and Betterment of Road.

Work has steadily progressed on the new double track line and relocation of parts of the old line, known as Magnolia Cut-off improvement, mentioned in the last report. It is expected this work will be completed and the line placed in operation during the coming fiscal year. As stated in the report of last year, this improvement will effect a saving of 5.8 miles in distance and 877 degrees of curvature, and in connection with the extensive improvements heretofore made, will give a continuous three-track road all of the way (and four tracks part of the way) between Patterson Creek and Cherry Run, W. Va., a distance of 57 miles. This district has the highest traffic density of the system.

Additions to Terminal Facilities.

The new eight story steel and concrete warehouse, at 26th Street and North River, New York City, N. Y., mentioned in the last report, was completed and put into operation during the year. This warehouse with 155,000 square feet of available storage space, is fireproof throughout, supplemented with a complete sprinkler system, affording storage with minimum insurance rates, and places your Company in a strong position to conveniently serve a large commercial section of the City.

Open Pier 5, Locust Point, Baltimore, Md., was reconstructed and extended and put into operation during the year, for the handling of ore and similar commodities.

The new yard at Somerset, Pa., for assembling coal in the extensive Somerset coal fields, was completed and is now in operation.

Elimination of Grade Crossings.

The work of eliminating grade crossings in Baltimore, Md., Cincinnati, Ohio, and Chicago, Ill., has been continued in accordance with the arrangements with those cities, and will, as previously stated in other reports, extend over a period of years. Arrangements have been made with the city authorities for the elimination of an important grade crossing at Lorain, Ohio.

Equipment.

Total Book Value of Equipment, June 30, 1913, was.....		$99,995,581.56
During the year there were added to the equipment the following:		
150 Locomotives, 111 all steel Passenger Cars, 2,144 Freight Cars, 23 Work Cars, and 1 Car Float, on which payments were made amounting to.....	$8,161,390.89	
And 2 Passenger Cars, 4,358 Freight Cars and 1 Work Car were reconstructed at a net cost of.....	976,057.20	9,137,448.09
		$109,133,029.65
During the year the following equipment was put out of service and credited to Property Investment-Equipment: 2 Locomotives, 9 Passenger Cars, 3,429 Freight Cars, 451 Work Cars, 1 Tug Boat, and 6 Lighters, having a book value of.....		1,376,982.93
Making the Gross Book Value of Equipment.....		$107,756,046.72
From this should be deducted:		
Accrued Depreciation on Equipment in Service, as follows:		
Amount of credit, June 30, 1913.....$13,101,814.89		
Amount charged to Expenses for depreciation, year ended June 30, 1914..... 2,652,739.43		
	$15,754,554.32	
Less: Charges to this account for depreciation accrued on equipment put out of service during the year 729,482.97		
Balance to Credit of Accrued Depreciation on Equipment in Service, June 30, 1914.....		15,025,071.35
Leaving Net Value of Equipment, June 30, 1914.....		$92,730,975.37

Continuing the policy inaugurated several years ago of strengthening certain classes of equipment, during the year 4,358 freight cars were rebuilt with steel underframes and bolsters and equipped with heavy draft gear to better meet the present operating requirements.

The percentage of steel freight cars, including cars with steel underframes and steel center-sills, to the total revenue freight equipment at June 30, 1914, was 72.77%, as compared with 38.83% at June 30, 1909.

Of the new equipment acquired during the year, 150 locomotives, 111 steel passenger cars, and 2,030 steel freight cars, were purchased under the provisions of the Baltimore & Ohio Equipment Trust of 1913. There are now under construction for this Trust thirty-one heavy freight locomotives, which will be delivered and placed in service during the coming year.

WELLS FARGO AND COMPANY EXPRESS.

The United States Express Company, which had operated over the lines of the System since 1887, having determined to retire from business, gave notice of its desire to discontinue operations after June 30, 1914. Coincident with the termination of the contract with that Company, negotiations were concluded with Wells Fargo and Company for the conduct of express service over Baltimore and Ohio Lines commencing July 1, 1914. It is anticipated that the alliance thus effected will be of mutual advantage and result in increased traffic.

The Wells Fargo Express, for a number of years, has been operating over many of the larger railroad systems of the West, and with the addition of your Company's lines is afforded new routes to New York and other eastern termini and its first direct entrance into the cities of Philadelphia, Pa., Wilmington, Del., Baltimore, Md., Washington, D. C., etc. The Wells Fargo Company now has under operation 75,028 miles of railroad lines, 4,186 miles of electric lines and 32,889 miles of steamer and stage lines, a total of 112,103 miles, with over 9,000 agencies throughout the United States, Mexico and Europe.

RELIEF DEPARTMENT.

As the stockholders may not be generally advised of the activities of this Department, it is thought well at this time to give some general review of its operations.

The Railroad Company assumes general charge of this Department; furnishes office room and furniture; gives the services of its officers and employes and the use of its facilities; becomes the custodian of its funds with full responsibility therefor, and guarantees the true and faithful performance of the obligations of the Department.

RELIEF FEATURE.

A statement of the operations of this Feature, which provides accident, sick, and death benefits for employes, are shown on the first page of Table 26. The total number of members of this Feature is 52,971. The total payments for all benefits since the inauguration of this Feature May 1, 1880, to June 30, 1914, amount to $18,680,935.81.

SAVINGS FEATURE.

A statement of the operations of this Feature will be found in Table 26, page 40. This Feature combines all the advantages of a savings and loan association, through which employes and their immediate dependents may accumulate their savings, and from which they may obtain funds to purchase homes to be repaid through reasonable monthly instalments. As an incentive to employes to save, the Railroad Company guarantees four per cent. interest on all deposits. During the past fiscal year this Feature earned sufficient from its operations to pay four per cent. on all deposits and in addition declared a dividend of one per cent., making a total of five per cent. paid on deposits, amounting in all to $407,217.60, after which there was a balance of $60,393.91 carried to the Surplus Account of the Savings Feature. This Feature loans money to employes on first mortgages on real estate only, at reasonable rates and liberal terms for repayment. As an indication of the activities of this Feature, on June 30, 1914, there were 8,949 depnsitors, with total deposits of $8,804,530.39, an average of $983.86; there were 5,020 loans, amnunting to $4,756,852.67, in effect July 1, 1913; during the year 1,321 new loans were made and 1,080 loans were paid off, leaving in force and effect at June 30, 1914, 5,261 loans, amounting to $5,110,299.68. Since the inauguration of this Feature, August 1, 1882, loans to the aggregate amount of $14,911,752.06 have been made, assisting employes in acquiring this amount of real estate.

A committee, composed of representatives of the Executive, Accounting, Real Estate, and Legal Departments, appointed to investigate the operations of this Feature with respect to loans made to employes, made a thorough and exhaustive examination and reported that all loans were supported by deeds, abstracts and other title papers, properly executed, assigned and recorded; that fire insurance policies of sufficient amount to cover unpaid loans were on file, together with papers relating to property appraisals. As the amount of a loan is based upon the appraised value of property, the committee had test appraisals made of over 400 properties, and found the loans amply secured. Such suggestions as the committee offered have been made effective.

PENSION FEATURE.

As stated in the report of last year, pensions, which are paid to superannuated and infirm employes, now constitute a special payroll and are charged to Operating Expenses, the total amount so charged during the year being $231,819.92. Heretofore these pensions have been paid in part from amounts charged to General Expenses and in part from a surplus accumulated in the past when the contributions for pensions were in excess of payments.

During the year 145 names were added to the pension roll and 84 were removed by reason of death, leaving 923 as the total number of pensioners on June 30, 1914. The total payments to pensinners from October 1, 1884, the beginning of this Feature, to June 30, 1914, aggregate $2,220,671.86. The average age of pensioners at June 30, 1914, was over seventy years.

A report of the operations of the several features will be distributed to members.

INDUSTRIAL DEPARTMENT.

One hundred and sixty-seven new industries, manufacturing and commercial, were located on or immediately adjacent to your line during the year, from which the Company should derive substantial freight revenues. One hundred and ninety-four side tracks were constructed: one hundred and four to newly located industries, and twenty-seven to industries previously located but without side track facilities; the remainder being additions to or extensions of facilities at existing plants.

INSURANCE FUND.

A summary of the operations for the year ended June 30, 1914, and a statement of the assets and liabilities are shown in Table 25. The surplus in this Reserve Fund at June 30, 1914, was $1,479,073.63.

SUBSIDIARY LINES.

The Income Accounts of the following lines, owned but operated separately and not included in the Income Account of The Baltimore and Ohio Railroad Company, are shown in the following Exhibits, viz.:—

"A"	The Staten Island Railway Company	12.65 miles.
"B"	The Staten Island Rapid Transit Railway Company	10.89 "
"C"	The Sandy Valley and Elkhorn Railway Company	30.50 "
"D"	The Baltimore and Ohio Chicago Terminal Railroad Company	77.13 "
		131.17 miles.

THE CINCINNATI, HAMILTON AND DAYTON RAILWAY CO.

Owing to a series of unusual and unforeseen circumstances, the Cincinnati, Hamilton & Dayton Railway Company (hereinafter referred to as the "Cincinnati Company") became unable to meet its various obligations and failing, on July 1st, 1914, to pay the interest on certain of its First and Refunding Mortgage Bonds and on certain bonds of which it was the guarantor, upon application of the Trustee of its First and Refunding Mortgage Bonds to the United States District Court for the Southern District of Ohio, Western Division, was, on July 2, placed in the hands of Judson Harmon and Rufus B. Smith, Receivers.

In the Annual Report of your Company for the year ended June 30, 1909, statement was made of the proposed acquisition in 1916 of the Cincinnati Company which, for convenuence in reference, is herein repeated:

"Negotiations pending during the year have been concluded recently and made effective July 1, 1909, whereby your Company will acquire, at the expiration of seven years, at a price then to be agreed upon or determined by arbitration, the controlling stock of the Cincinnati, Hamilton & Dayton Railway Company.

"In this connection a plan was effected for adjustmeat of future interest charges and the payment or adjustment of the floating debt of the Cincinnati, Hamilton & Dayton Railway Company, and providing approximately $7,000,000 for improvements and working capital. Under this plan your Company will guarantee $12,500,000 of the Cincinnati, Hamilton & Dayton Railway Company's First and Refunding Mortgage 4% 50-year bonds, dated July 1, 1909, and $11,557,000 of that Company's 4% notes, due July 1, 1913, secured by a deposit of $13,000,000 of the First and Refunding Bonds. Also, upon the acquisition under the agreement of the stock of the Cincinnati, Hamilton & Dayton Railway Company your Company is obligated either to purchase at eighty-five or guarantee $20,000,000 of that Company's General Mortgage Bonds, due July 1, 1939.

"It is expected the closer relations of the Companies will be productive of results mutually beneficial."

These negotiations were concluded in 1909 after a thorough investigation by a committee and full consideraion by your Board.

The gross earnings of the Cincinnati Company in 1909 were $7,897,000, and the committee estimated that following, and largely because of, the closer association of the two properties, the gross earnings would rapidly increase, their estimate for the year 1913 being $10,700,000. The actual earnings in 1913 exceeded $10,000,000, and but for the interruption of traffic for several months incident to the floods, no doubt would have closely approached the estimate of the committee for that year. The year 1914 was relatively much more unsatisfactory, for the Company was able only to maintain its earnings to the basis of 1913, and failed to realize the anticipated increase in gross, because of the continued interruption to traffic from the effects of the flood in the early part of the year, and in the later portion to the marked decline in general business.

The committee estimated also that there would be an additional source of profit to your Company resulting from the increased interchaage of business between your Company and the Cincinnati Company. The Committee placed the increased business to your Company from this source at an average of $1,000,000 per year, and their estimate in this respect has been exceeded by the actual figures, the revenue to your Company on interchange business with the Cincinnati Company for the calendar year 1913 being $1,753,000 in excess of that of 1909.

Because of events which were not foreseen, and some of which clearly could not have been foreseen, the costs of operation and charges exceeded the committee's estimate, so that there was not realized the net income that was anticipated. The chief causes were the increases in rates of pay, 1913 over 1909, of $507,000, increase in taxes of $130,000, and the devastating effects of the flood in March, 1913, which, in addition to severely wrecking the line, practically caused a suspension of traffic for several months and seriously affected the operations in both the fiscal years 1913 and 1914, and entailed direct property losses in excess of $1,500,000.

Of the $12,500,000 First and Refunding Mortgage Bonds of the Cincinnati Company guaranteed by your Company only $7,500,000 are now outstanding, the remaining $5,000,000 not having been sold, but instead your Company has advanced from time to time for additions and betterments $3,989,000. In addition your Compaay has advanced $1,915,227 for equipment obligations, $3,296,866 for general treasury purposes, and $1,200,000 for the reconstruction of property destroyed by the flood. For these advances your Company holds as collateral security $6,994,000 First and Refunding Mortgage Bonds, and other collateral security of an estimated value of not less thtan $3,000,000. These advances, aggregating $10,401,093 are carried in Balance Sheet grouping "Loans and Bills Receivable."

When, on July 1, 1913, following the disastrous flood, the Cincinnati Company's $11,557,000 Purchase Money Notes matured, that company found it impracticable to refinance this obligation, and your Company, in fulfilment of its guarantee, took up these Notes, which were secured by $13,000,000 First and Refunding Mortgage Bonds, and now holds the Notes and collateral, the same being carried in Balance Sheet grouping "Miscellaneous Investments—Securities Unpledged."

Among the assets in the Treasury of the Cincinnati Company on the conclusion of the negotiations in 1909 was approximately forty per cent. of the capital stock of the Pere Marquette Railroad Company, which had cost the Cincinnati Company over $13,000,000. The Marquette Company's revenues had also been seriously depleted through the increases in rates of pay, etc., and when it became evident that it would need large additional sums of money, which the Cincinnati Company could not advance, it was deemed advisable to dispose of these shares. Accordingly this stock was sold for $2,530,000, payable December 1st, 1916, at the same time The Baltimore and Ohio Railroad Company agreeing that the price of the Cincinnati Company's stock, which it had agreed to acquire in 1916, should not be less than this sum. Subsequently the Pere Marquette Railroad Company was placed in the hands of receivers. To avoid possible misunderstanding it should be stated that The Baltimore and Ohio Railroad Company is in no way obligated with respect to any of the Pere Marquette Railroad Company's securities.

In 1909, the year before your Company became interested in the operations of the Cincinnati Company, the deficit in income was $1,691,000. Following proportionate reductions in 1910 and 1911, the deficit in 1912 had been reduced to $617,000, notwithstanding the large increase in expenses due to increased rates of pay since 1910 and increased taxes. Against

these deficits your Company had the profit derived from the interchange traffic, which was constantly growing. Consequently up to the time of the flood in March, 1913, there had been justifiable expectation that the forecast of the committee would be realized, and that the road would shortly be self-sustaining. The management had been so confident as to this that in October, 1912, your Company entered into a supplemental agreement with Messrs. J. P. Morgan & Co. conditionally fixing $740,970 in addition to the $2,530,000, as the *maximum* price of the stock when acquired. This arrangement was considered reasonable and advantageous, as any improvements made to the property of the Cincinnati Company before the consummation of this agreement would enhance the value of the stock and necessarily influence the arbitrators in arriving at the price to be paid by your Company.

While your Company had advanced the funds necessary for the restoration of the property after the flood, and while this work had been done in a most substantial manner, the direct cost of the work and the increased expense due to the congestion of traffic, which it took months to overcome, resulted in the operations for the years 1913 and 1914 being so unprofitable that it became clear that the Cincinnati Company could not continue its operations and meet the increasing fixed interest charges. Consequently, under these existing conditions, and especially in view of the anticipated demand, which was subsequently made, growing out of the Pere Marquette Company's default on certain of its bonds, bearing the guaranty of the Cincinnati Company, and following consideration and recommendation of a committee, your Board decided it would be inadvisable for your Company to make further advances or payments, other than those for which it was under legal obligation. It is probable the receivership will lead to a readjustment of the Cincinnati Company's obligations and the placing of its finances on a sound basis. The ultimate effect on your Company of such reorganization cannot now be determined, but, having in mind the value of the various current assets of your Company, your Board does not feel justified at this time in making charges in anticipation of losses, other than the interest on advances made, accrued and not collected for the year ended June 30, 1914.

* * * * * * * * * * *

The President and Directors acknowledge with pleasure the loyal and efficient services of the officers and employes during the past year.

By order of the Board,

DANIEL WILLARD,
President.

THE BALTIMORE AND OHIO RAILROAD COMPANY.

CONDENSED INCOME ACCOUNT AND BALANCE SHEET, YEAR ENDED JUNE 30, 1914.

CONDENSED INCOME ACCOUNT FOR YEAR.

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico	$5.00
Canada	6.00
Foreign Countries (excepting daily editions)	8.00
Single Copies	15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention daily issues, North America, $1; foreign, $2.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue 8,800 copies were printed; that of these 8,800 copies 7,409 were mailed to regular paid subscribers to the weekly edition, 250 were provided for counter and newe companies' sales, 1,078 were mailed to advertisers, exchanges and correspondents, and 63 were provided for samples and office use; that the total copies printed this year to date were 429,850, an average of 9,345 copies a week.

Volume 57 November 13, 1914 Number 20

Contents

*Illustrated.

The politicians in various state legislatures have passed and the politician governors of various states have signed so-called "full crew" bills on the assumption that such legislation would be popular. The first complete and satisfactory test of its popularity was made in Missouri at the election last week. The state legislature had passed a typical train crew law. The railways appealed to the people on the referendum ballot. The representatives of the Brotherhood of Railroad Trainmen left no stone unturned to prevent the law from being repealed, and plastered half the billboards in the state with misleading statistics intended to make the voters believe that train crew laws were needed to reduce railway accidents. The railways likewise conducted a state-wide campaign, taking the form chiefly of newspaper articles and advertisements. Their two great arguments were first, that the legislation would not reduce accidents because accidents were not due to the alleged fact that train crews were not large enough, and, second, that the legislation would add $500,000 a year to the expenses of the railways and the passenger and freight rates that their patrons must pay. The railways won. The people knocked out the law by a decisive majority. The result illustrates the fact that politicians often misrepresent what the people want and that when the railways can get before the public the facts regarding regulative measures the public can usually be depended on to decide intelligently and fairly. One great trouble has been that the railways have not tried often enough and hard enough to get their case before the public. The result in Missouri should encourage them to appeal more frequently from legislatures, commissions and courts to the people. It should also help to defeat the senseless train crew bills in states where they are pending and to secure the repeal of the laws on the subject that already are in effect in several states.

Full Crew Relerendum in Missouri

Trip passes issued by 78 railroads in 1913 represented travel, which, if paid for, would have brought in $18,520,000. This statement was one of the shining passages in the Interstate Commerce Commission's decision in the 5 per cent freight rate case, issued last July, and one which naturally elicited the loudest applause from the galleries. Less prominent was the qualifying clause that "some of these passes were no doubt issued to employees traveling on business for the carriers." Excepting specific citations of cases of undue liberality in furnishing private cars for directors' families, this looseness of statement characterized the whole of the commission's chapter on passes. The president of one of the Trunk Lines, quoted in the New York Evening Post, now says that on his road the passes issued in June (the month specially cited by the commission) numbered 8,717; of which 4,486 were for officers and employees of his own company and 3,408 were for their families. This leaves 823 for all others, including officers and employees of other roads. In other words, the abuse, insofar as it is an abuse, is of less than one-tenth the magnitude which the commission's figures, as commonly interpreted, would make out. This president further says:

Alleged Abuse of Passes

> To cut off passes for employees would not materially increase passenger traffic or revenue. Most of this travel is of a character which would not be done at all if passes were not issued, and practically all the remainder is travel the expense of which would be reimbursed by the company. Free transportation to employees induces a better feeling among them; far better results are obtained from them in a business way, and a loyalty to the company developed which brings actual results to the stockholders. They patronize the dining cars and other facilities of the road, bringing in increased revenue. . . . None of the figures here given apply to the issuance of annual passes. It is the custom of general officers to send annuals to general officers of other companies; but business of their own company, with a constant demand for travel upon their own lines, makes their journeys for pleasure on other roads very infrequent.

That the views here expressed are eminently sound, has been evidenced by long experience. Free rides for employees and their families, a large proportion of which are for pleasure trips, constitute, when properly regulated, one of the most rational expenditures of a railroad. Even the brotherhood leaders, whose wishes usually prevail at Washington, agree to this. The actual cost of this passenger service is, undoubtedly, far less than the money value of the good will which results. Free rides for employees of other roads are almost equally justifiable. Moreover, most of the interstate passes allowed by law, outside of those for railroad men, are for charitable or philanthropic purposes. Is there any public sentiment opposed to this use of railroad facilities?

Car Surpluses and Car Shortages

Arthur Hale has prepared for the Western Economic Society a very interesting paper on Freight Car Surpluses and Shortages, which we publish elsewhere in this issue. That Mr. Hale or any one else is able to discuss this subject intelligently is due to the fact that following the great car shortage of 1906, the American Railway Association began the compilation of the statistics to which Mr. Hale refers. Nobody was able before the compilation of these statistics was begun to say with any certainty whether the railways of the United States had provided enough equipment to move their normal traffic, and in consequence when a severe car shortage did come the railways were subjected to widespread and severe criticism and to drastic laws specifying the conditions under which they must furnish cars to shippers and penalties that would be imposed if they failed to do so. The compilation of the statistics since that time renders it possible for us to know just what the car situation has been fortnightly for more than seven years. We know that there have been during these years some brief and comparatively small car shortages and taht there have been numerous prolonged and very large car surpluses. In other words, the figures afford a complete answer to any criticism which may now or in future be made of the railways regarding the facilities provided by them during this period at least. Aside from their value in showing what the car situation has been and thereby serving as a protection against unjust criticism and legislation, the statistics undoubtedly have been of some value as means of increasing efficiency in the operation of the railways. For example, the comparative statistics regarding car miles per day on the different roads undoubtedly have had a stimulating effect on their managements. The statistics have been of such great and unmistakable value in numerous ways that it is to be hoped their compilation will be continued indefinitely.

CHICAGO, BURLINGTON & QUINCY

THE Burlington was fortunate in the fiscal year ended June 30, 1914, in that the crops in its territory were good and there was actually a larger movement of grain than in the previous year. The result was that although the Burlington felt the general depression to some extent in its freight business—the total tonnage carried in 1914 being 32,389,000 tons as against 33,458,000 tons in 1913—the total loss was in tonnage delivered to it by other roads, the tonnage originating on the Burlington being 22,547,000 tons in 1914 and 22,531,000 tons in 1913. Passenger business was considerably better in 1914 than in 1913, so that despite the considerably lower passenger-mile rate, due to the Supreme Court's decision in the two-cent fare law cases, passenger earnings held up. Total operating revenue in 1914 amounted to $92,751,000, compared with $94,374,000 operating revenue in 1913. Expenses decreased to a small extent, other income slightly decreased and rents increased. The result was that net corporate income in 1914 amounted to $17,114,000 as against $19,431,000 in the previous year, and after the payment of the regular 8 per cent dividends there was appropriated for additions and betterments $5,716,000, and there remained in addition $2,531,000 which was credited to surplus. This compares with an appropriation of $7,648,000 for additions and betterments in 1913 and a surplus of $2,916,000 after this appropriation.

The Chicago, Burlington & Quincy seems such a remarkably wealthy property because of three factors. It serves a rich originating territory. Its outstanding securities are at an unusually low ratio to the total property investment, this investment having been consistently added to from earnings belonging to the owners. The road is particularly well managed. Comparatively few railroads in any country combine these three factors to the extent that the Burlington does.

The company operates 9,264 miles of road, of which 836 miles has second track and 42 miles third track, with a total of 2,920 miles of yard tracks and sidings. About 140 miles of new line was opened during the year, this new line being the extension south from Laurel, Mont., to Orin Junction, to connect with the Colorado & Southern, the principal subsidiary of the Burlington. There was 72 miles of second track added during the year, and 19 miles of third track and about 66 miles of yard tracks and sidings. Since a very large proportion of the Burlington's mileage is branch line mileage, or what might more properly be called feeder mileage, it will be seen that for a road west of Chicago it has a large proportion of second track and especially of sidings.

Of the total revenue about 68 per cent comes from freight and 23 per cent from passengers. On the other hand, in 1914 the total mileage of freight trains was 17,066,000, and passenger-train mileage 17,721,000. The freight and passenger density appears smaller because of the large proportion of feeder mileage; but the density on main line is actually remarkably heavy. The average for the whole road was 126,000 passengers one mile per mile of road in 1914 and 125,000 in 1913, and 942,000 ton-miles per mile of road in 1914 and 965,000 ton-miles per mile of road in 1913.

The average passenger journey is short, 49 miles in 1914, with no change from 1913. The receipts per passenger per mile are low for a western road, 1.888 cents in 1914 and 1.921 cents in 1913, the reduction being due, at least in part, to the Supreme Court's decision upholding the two-cent fare laws.

The average length of haul of freight is long for a road with so much branch line mileage, 266 miles in 1914 and 263 miles in 1913. The receipts per ton per mile are not high for an originating road, 7.29 mills in both 1914 and 1913.

As was previously mentioned, all of the loss in freight business came from a reduction in the tonnage received from connections, the total tonnage of all commodities carried in 1914 being 32,389,000, of which 22,547,000 originated on the road and 9,842,000 was received from connections. In 1913 the total tonnage was 33,458,000 tons, of which 22,531,000 tons originated on the road and 10,927,000 was received from connections. The principal decrease in 1914 as compared with 1913 was in the tonnage of bituminous coal received from connections. The total tonnage of bituminous coal carried in 1914 amounted to 10,069,000 tons, or 31.09 per cent of the total revenue tonnage, and of this total 8,339,000 originated on the road and 1,730,000 tons was received from connections. In 1913 the bituminous coal tonnage totaled 10,349,000 tons, or 30.93 per cent of the total revenue tonnage in that year, and of this total coal tonnage 7,764,000 tons originated on the road and 2,584,000 tons was received from connections. The total tonnage of grain in 1914 amounted to 4,309,000, or 13.30 per cent of the total revenue tonnage, comparing with a grain tonnage of 3,919,000 in 1913, or 11.71 per cent of the total revenue tonnage carried in that year.

Total operating expenses in 1914 amounted to $62,148,000 as against $62,843,000. It will be seen that expenses were not reduced in proportion to the loss in revenue; the operating ratio was 67.01 in 1914 as against 66.59 in 1913. The following table shows the percentage of each class of operating expense to total operating revenues:

	1914	1913
Maintenance of way and structures	12.94	13.28
Maintenance of equipment	17.13	17.10
Traffic expenses	1.76	1.68
Transportation expenses	32.59	31.79
General expenses	2.59	2.74
Total	67.01	66.59

The reduction of, roughly, $500,000 in maintenance of way is accounted for by a reduction in the amount spent for rails, other track materials and roadway labor, and by a considerable reduction in the amount spent for buildings, fixtures and grounds, the amount on this latter account being $1,262,000 in 1914 and $1,693,000 in 1913. In part these reductions are offset

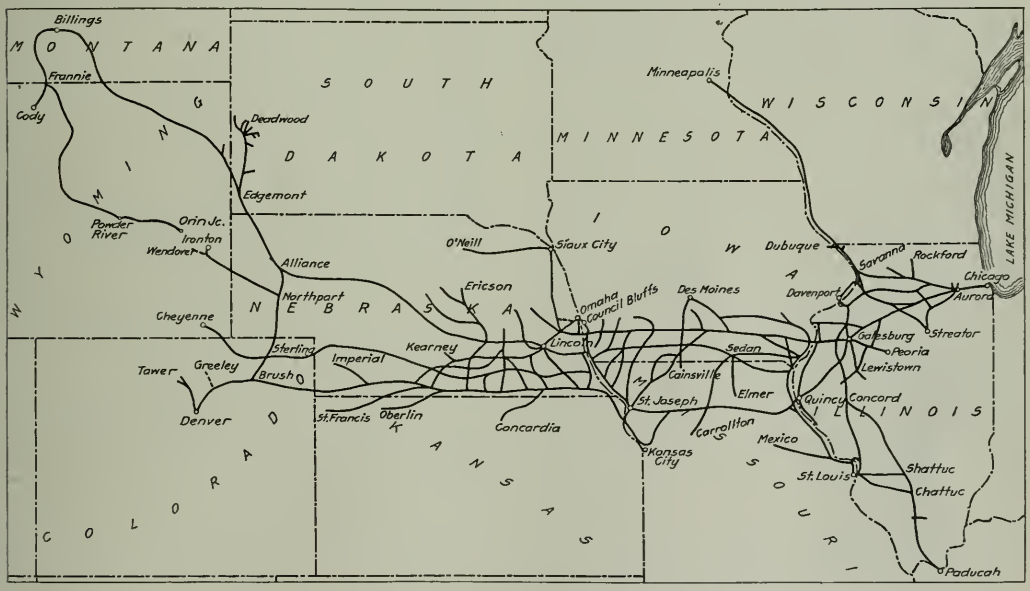
by an expenditure of $2,112,000 on ties, as compared with $1,711,000 in 1913.

In maintenance of equipment the reduction of $245,000 is entirely due to smaller amounts charged to renewals of freight-train cars, $855,000 being charged on this account in 1914 as against $1,698,000 in 1913. In part this reduction was offset by larger charges for repairs and for depreciation. Since the renewals charge represents the original cost, less salvage and depeciation on equipment retired, it is a bookkeeping matter and not a matter of actual money expenditure. In 1914 3,179 freight cars were retired as against 3,995 in 1913. On the other hand, 12,601 cars were added in 1914 as against 4,004 cars in 1913.

Transportation expenses amounted to $30,225,000 in 1914 as against $29,998,000 in 1913. This is an increase of less than 1 per cent, with a decrease of about 2 per cent in ton mileage and an increase of about 1 per cent in passenger mileage. The increase in transportation expenses is due almost entirely to increases in the amounts paid for loss and damage to freight, damage to property and injuries to persons. This may, of course, be due to more prompt settlement of claims or to the payment of claims arising out of the previous year's business. There was some saving in the expense for fuel for road locomotives, $5,771,000 being spent on this account in 1914 as against $5,935,000 in the previous year. Some of the increase in transportation expenses can be explained by a much larger empty car movement, as can also the decrease in average revenue trainload. The trainload in 1914 was 479 tons, and in 1913 484 tons. The mileage of loaded cars was 452,000,000 in 1914, a decrease of nearly 9,000,000 miles, while the mileage of empty cars was 212,000,000, an increase of about 18,600,000. The average loading per loaded car remained about the same in the two years, 19 tons.

The Burlington spent in all $19,073,000 for extensions, new equipment and additions and betterments in 1914. Of this amount $2,216,000 net was for new lines, $6,085,000 for additions and betterments to road, and $10,772,000 for equipment. Of the expenditures for road $3,719,000 was charged to property account and $2,367,000 to income, and of the expenditure for equipment $7,414,000 was charged to property and $3,358,000 to income. Since 1907 the company has charged $27,146,000 spent for additions and betterments to income, and in addition has a surplus of $93,000,000, which, however, by no means measures the surplus which would be shown if the present Interstate Commerce Commission rules had been in effect for some years previous to 1907, since before that the Burlington had been charging additions and betterments to income account without carrying these accounts as appropriated surplus on the balance sheet. Since both surplus and appropriated surplus represent excess of assets over liabilities, what this means, stripped of accounting technicalities, is that there has been something more than $120,000,000 invested in the Burlington property against which no securities have been issued, and, of course, the greater part of this excess in assets is in the form of fixed capital—property, not money.

The net increase in securities outstanding in the hands of the public was $5,825,000 during the year, there having been sold $5,000,000 general mortgage 4 per cent bonds and some additional bonds of this issue to cancel bonds paid at maturity. The unextinguished discount on funded debt amounted to $2,329,000 on June 30, 1914, as compared with $657,000 on June 30, 1913, and in addition $45,000 was charged to income of the year for discount on securities, on the other hand other deferred debit items decreased being $975,000 in 1914 and $2,593,000 in 1914. There was $4,815,000 cash on hand at the beginning of the year, with total working liabilities of $11,469,000, with no loans and bills payable, and at the end of the year $6,516,000 cash on hand and $15,180,000 working liabilities, which included $1,900,000 loans and bills payable. In other words, despite Clifford Thorne's opinion to the contrary, one of the very strongest railroad companies in the entire country could not sell 4½ per cent bonds, even to a comparatively small amount, except at a very considerable discount; and despite the fact that a very large amount of money representing surplus belonging to the stockholders is invested each year in property, nevertheless, the Burlington will have to come into the market for new capital



The Chicago, Burlington & Quincy

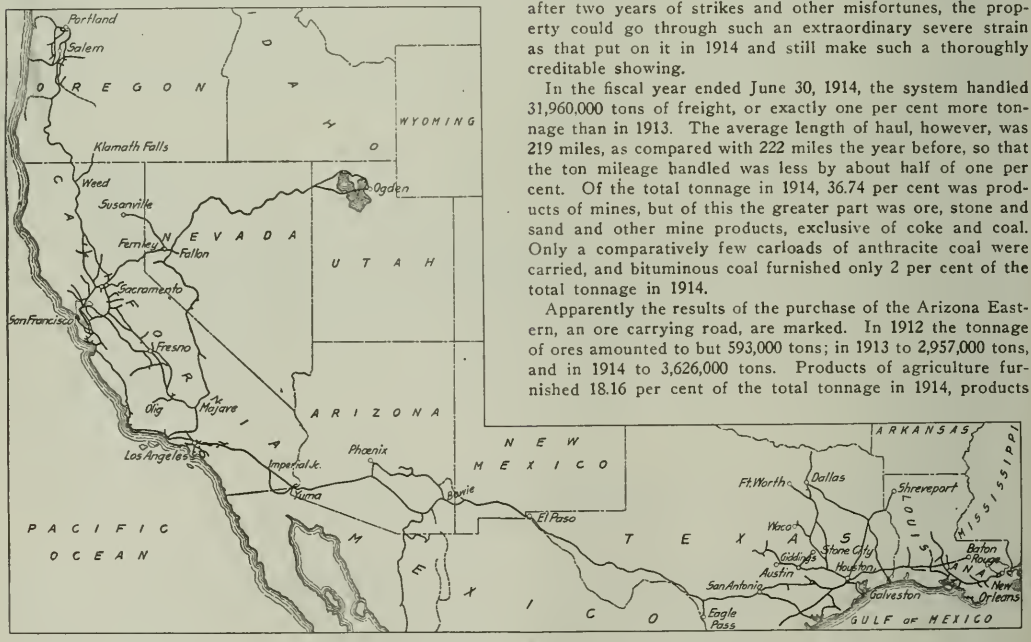
in the not distant future if it is to continue the policy of extensive expenditures on additions and improvements each year.

The following table shows the principal figures for operation in 1914 as compared with 1913:

	1914	1913
Mileage operated	9,264	9,129
Freight revenue	$62,799,188	$64,046,856
Passenger revenue	21,743,507	21,895,691
Total operating revenue	92,750,934	94,374,486
Maint. of way and structures	12,002,628	12,535,863
Maint. of equipment	15,888,686	16,133,215
Traffic expenses	1,634,672	1,586,803
Transportation expenses	30,224,524	29,997,717
General expenses	2,397,888	2,589,293
Total operating expenses	62,148,398	62,842,891
Taxes	4,028,900	3,563,359
Operating income	26,433,388	27,840,545
Gross income	27,934,465	29,800,475
Net income	17,114,407	19,430,746
Dividends	8,867,128	8,867,128
Appropriated for additions and betterments	5,715,875	7,647,743
Surplus	2,531,404	2,915,875

SOUTHERN PACIFIC

NO better measure of the equity back of Southern Pacific common stock could be given than the way in which the plant and the organization have withstood the extraordinary strain put on them in the fiscal year ended June 30, 1914. Floods, fire and unprecedented rains caused interruptions to traffic to an extent never before recorded for a railroad covering such a vast territory as does the Southern Pacific. On the 10,477 miles of road operated in this system there were 227 interruptions to traffic, with an average delay of three days each, in the fiscal year ended June 30, 1914. In every month except November, as Mr. Kruttschnitt, chairman of the executive committee, points out, damages from washouts and landslides were frequent and embarrassing. Added to the loss in both freight and passenger traffic caused by the peculiarly perverse weather conditions, there was a distinct loss in passenger traffic because of the number of passengers who might have gone to California, but who preferred to put off their trip until the Panama exhibition.



The Southern Pacific System

Notwithstanding all this, total operating revenues decreased but 2.87 per cent and expenses increased by less than one per cent. After the payment of expenses, taxes and interest charges the Southern Pacific had in 1914, $20,452,000 available for dividends, compared with $26,868,000 available for dividends in the previous year. Six per cent on the common stock outstanding calls for $16,361,000, so that there was a margin of safety back of the dividend, even last year, of $4,091,000.

The Southern Pacific system consists of the Southern Pacific Company and proprietary companies. It is divided for convenience of the operating management as between lines east of El Paso and lines west of El Paso. The lines west include, of course, the Central Pacific, running from Ogden to San Francisco.

The annual report for 1914 is the thirtieth of the company. The Southern Pacific and the Great Northern are the only two of the great transcontinental systems which have never been through a receivership. Under Collis P. Huntington, the Southern Pacific had plowed into it a huge surplus, and in the early days of the Southern Pacific especially, the Golden State was indeed a golden state for the railroad, which had so large a share of its transportation business. The Huntington regime was a generous one, both to officers and employees and in maintenance of the property. The Harriman regime which followed continued a liberal policy of maintenance and was fortunate in inheriting the Southern Pacific organization. This, then, is the reason why, even after two years of strikes and other misfortunes, the property could go through such an extraordinary severe strain as that put on it in 1914 and still make such a thoroughly creditable showing.

In the fiscal year ended June 30, 1914, the system handled 31,960,000 tons of freight, or exactly one per cent more tonnage than in 1913. The average length of haul, however, was 219 miles, as compared with 222 miles the year before, so that the ton mileage handled was less by about half of one per cent. Of the total tonnage in 1914, 36.74 per cent was products of mines, but of this the greater part was ore, stone and sand and other mine products, exclusive of coke and coal. Only a comparatively few carloads of anthracite coal were carried, and bituminous coal furnished only 2 per cent of the total tonnage in 1914.

Apparently the results of the purchase of the Arizona Eastern, an ore carrying road, are marked. In 1912 the tonnage of ores amounted to but 593,000 tons; in 1913 to 2,957,000 tons, and in 1914 to 3,626,000 tons. Products of agriculture furnished 18.16 per cent of the total tonnage in 1914, products of lumber 17.89 per cent, and manufactures 14.88 per cent. There was a large falling off in the tonnage of manufactures, 4,755,000 tons being carried in 1914 as against 5,115,000 tons in the previous year, and a considerable falling off in products of forests, 5,717,000 tons being carried in 1914 as against 5,910,000 tons in the previous year. The average ton-mile rate in 1914 was 1.110 cents; in 1913, 1.123 cents. Total freight revenue was $78,369,000 in 1914, as against $80,141,000 in the previous year.

As in the case of the number of tons of freight, the number of passengers carried decreased, being 42,745,000 in 1914, as

against 42,006,000 in 1913; but the average length of journey decreased, being 40.92 miles last year as against 43.67 miles in the previous year, a decrease of 6.30 per cent. The passenger mileage, therefore, decreased by 4.66 per cent. The average revenue per passenger per mile was 2.247 cents in 1914 and 2.248 cents in 1913. Total passenger revenue amounted to $40,486,000 in 1914 as against $42,490,000 in the year 1913.

With a decrease in the ton-miles handled of 0.66 per cent and in the passenger-miles handled of 4.66 per cent, there was an increase in total operating expenses of 0.81 per cent, a decrease of 3.02 per cent in freight-train mileage, an increase of 2.15 per cent in passenger-train mileage, and an increase in the average trainload of all freight of 2.25 per cent, the average in 1914 being 471 tons and in 1913 461 tons.

In expenses for the year an increase of $475,000 in maintenance of way was in part offset by a decrease of $361,000 in maintenance of equipment, and a decrease of $226,000 in traffic expenses was more than offset by an increase of $249,000 in general expenses. Maintenance of way and structures amounted to $16,064,000 in 1914. It is estimated that repairs of flood damages amounted to an extraordinary expense of $880,000, and in California alone $1,284,000 additional will be required to complete these extraordinary repairs. Of this amount $475,000, it is estimated, will be chargeable to operating expenses next year and $809,000 to additions and betterments.

Maintenance of equipment cost $18,934,000 in 1914. This included charges of $609,000 for depreciation of locomotives, $279,000 for depreciation of passenger cars and $1,060,000 for depreciation of freight-train cars. The Southern Pacific has never before included a charge for depreciation, but has at last acquiesced in the Interstate Commerce Commission's requirements in this respect. Besides the charge in 1914 a charge of $22,458,000 was made to profit and loss and credited to accrued depreciation on the asset side of the balance sheet for estimated depreciation between July 1, 1907, when the Interstate Commerce Commission's ruling went into effect, to July 1, 1913. The following table shows the expenditures for repairs per unit of equipment, exclusive of depreciation and renewals, in 1914 and 1913:

	1914	1913
Repairs per locomotive	$3,920	$4,721
Repairs per passenger car	838	865
Repairs per freight car	93	94

The state of repairs of locomotives was not quite so good at the end of the year as at the beginning. Thirty-eight per cent of the total number of locomotives in service were in thorough order at the end of the year, as against 40 per cent at the beginning of the year, and 29 per cent were in good order as against 28 per cent at the beginning of the year, and 32 per cent required repairs or were in shop under repair as against 28 per cent at the beginning of the year.

Transportation expenses amounted to $40,937,000 in 1914 and the principal increases are in cost of fuel for road locomotives, operating joint yards and terminals, train supplies and expenses, and injuries to persons. The increase in cost of fuel was largely due to the higher price paid for fuel oil, the cost per ton of coal being $2.87 in 1914 and $2.90 in 1913, while the cost of four barrels of oil, which is figured as the equivalent of a ton of coal, was $2.59 in 1914 as against $2.37 in 1913. Thus the average cost of fuel per ton was $2.60 in 1914 as against $2.40 in 1913. The number of miles run per ton of fuel was 14.83 in 1914 and 14.23 in 1913.

During the year the Southern Pacific sold to its own stockholders at par $54,534,000 20-year 5 per cent convertible bonds. The conversion privilege permits of exchange of bonds for stock at par at any time up to June 1, 1924. The proceeds of the sale of these bonds were used in part to pay off $26,000,000 one-year 5 per cent notes, which fell due June 15, 1914. In addition there was $7,130,000 equipment trust certificates sold and $6,000,000 one-year 5 per cent notes. The net expenditure during the fiscal year ended June 30, 1914, for equipment and additions and betterments was $19,756,000. As of June 30 the company had on hand $19,170,000 cash and deposits, about $148,000 less than at the beginning of the year, and in addition to the expenditures on its own property mentioned above, had advanced to affiliated companies during the year $14,578,000, making the total now $105,525,000. There are no loans and bills payable, and audited accounts and wages payable at the end of the year amounted to $8,259,000, a decrease of $4,588,000 in this account during the year.

The Southern Pacific has an enormous asset which is not carried at any money value on its balance sheet. This is the title to oil lands belonging to the Southern Pacific Railroad Company and the Kern Trading & Oil Company. The Supreme Court held in June, 1914, that except where title to these lands had been obtained by fraud, the title could not be attacked because they were now found to contain oil. In Mr. Kruttschnitt's opinion the Southern Pacific's title to the valuable lands may now be regarded as unassailable.

There is, of course, the Central Pacific merger suit, which is now slowly being fought through the courts.

Mr. Kruttschnitt, like the late E. H. Harriman, is by nature an optimist. His remarks, therefore, in regard to the present state of the railroad business are particularly impressive:

"Your Board repeats the suggestion made last year that you take an active part in repelling the attacks of demagogues on your property. Unfair treatment of railroads is due in great part to the belief of politicians that only financial magnates suffer therefrom. The surest remedy for the evil is for railroad investors to give unmistakable evidence of their numbers and of their resentment of unfair legislation or regulation. You now number over 30,000, and with the stockholders of other railroads and with investors in their securities you form a body of a million or more voters, whose protests, backed up by ballots, can lawfully exert sufficient force to compel fair treatment by your servants in Congress, in legislatures, and on commissions. The common interests of railroad shareholders and of investors in every community, no matter how small, should cause them to actively participate in every election and to perform faithfully all other duties of citizenship, in order to secure proper representatives and protection for their interests. While your company has cheerfully made such expenditures as were required by Federal or State commissions or by legislation, many unreasonable laws have been enacted, which serve no public good, and which add unnecessarily to the cost of operation. . . .

"The reduction of our surplus over fixed and other charges, due to causes largely beyond control, has imposed on your company the necessity of reducing the expenditures for new construction, additions to and betterments of the property, to the lowest possible limits. The uncompleted work, listed above, is being slowly carried on to protect the investment already made, but no extensions or improvements of any description, not imperatively needed for protection of the property, are being authorized or even considered."

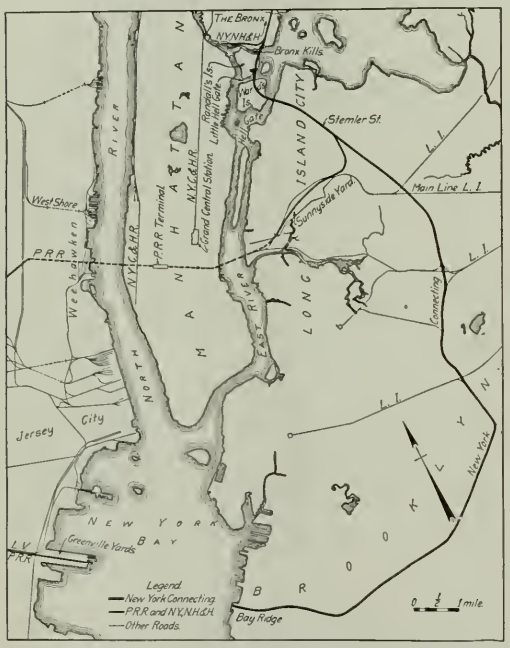
The following table shows the principal figures for operation in 1914 as compared with 1913:

	1914	1913
Average mileage operated	10,422	10,311
Freight revenue	$78,369,414	$80,141,499
Passenger revenue	40,485,949	42,389,837
Total operating revenue	126,614,537	130,353,693
Maint. of way and structures	16,064,457	15,589,027
Maint. of equipment	18,934,335	19,295,725
Traffic expenses	2,889,419	3,115,079
Transportation expenses	40,936,821	40,408,954
General expenses	3,975,035	3,726,326
Total operating expenses	82,800,068	82,135,109
Taxes	7,162,625	5,697,286
Operating income	37,695,367	44,208,009
Gross income	51,799,058	56,558,542
Net income	20,452,216	26,867,807
Dividends	16,361,088	16,360,932
Surplus	4,091,127	10,506,875

Construction of the New York Connecting Railroad

Ten Mile Line Involving Large Bridges and Viaducts Will Connect the Pennsylvania and New Haven

Construction work has now been in progress for more than two years on the New York Connecting Railroad, which will provide a direct connection between the New Haven and the Pennsylvania Railroad Systems, and the first section of the new line, which will be used for passenger traffic only, is nearing completion. On account of the location of this line in well-improved sections of the boroughs of Queens and the Bronx, and the heavy structures required to span the East river, Little Hell Gate, and the Bronx Kill, the cost of this 10-mile road will probably approximate $30,000,000, or $3,000,000 per mile. It will form an important link between two great systems, however, making possible direct connections for both freight and passenger traffic between New England and the central west and the south. The northern end of the new line, which is



Map of New York and Vicinity Showing Location of the New York Connecting Railroad

being built at present, will have four tracks—two for passenger and two for freight traffic. On the completion of this section it is expected to operate through trains between Boston and Chicago, Cincinnati, New Orleans, Washington, and southern Atlantic coast points, over this connecting line. Former President Mellen of the New Haven estimated that the new line would handle at least 40 passenger trains a day.

The road will leave the New Haven's Harlem River branch, at 142nd street in the Bronx, cross the Bronx Kill to Randall's island, then across Little Hell Gate to Ward's island, then turning sharply to the left will cross Hell Gate to Long Island City on an arch bridge having the longest span in the world. A connection is made in Long Island City with the Pennsylvania System through the Sunnyside yard, which is the end of the present work. Passenger trains will use this connection, passing under the East river, Manhattan Island, and the Hudson river in the Pennsylvania's tunnels, and connecting directly with the main line for the west. The freight line, which is also a part of this project, but is not yet under construction, will continue east and south to a connection with the old Manhattan Beach road of the Long Island system, over which freight trains will be operated to Bay Ridge, directly opposite the Greenville, N. J., freight yards of the Pennsylvania. A ferry service connects these points.

The construction of this connecting road is a joint enterprise of the New Haven and the Pennsylvania. The portion known as the East river bridge division, extending from the New Haven connection in the Bronx to Stemler street in Long Island City, is being built by the New York Connecting Railroad, of which Gustav Lindenthal is chief engineer, and the portion from Stemler street to the end of the passenger connection at Sunnyside yard, known as the Southern Division, is being handled by the engineering department of the Pennsylvania Railroad, A. C. Shand, chief engineer, and H. C. Booz, assistant chief engineer.

The new line is elevated for practically its entire length in order to reach the necessary height at the crossing of the East river, and also to eliminate grade crossings with the streets in

Erecting the Superstructure of the Bronx Viaduct

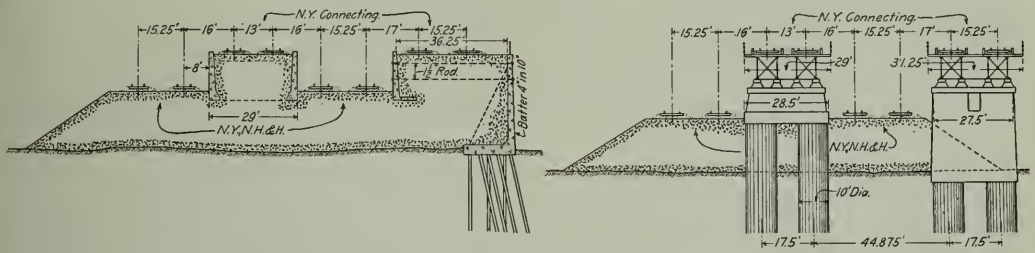
the Bronx and in Long Island City. The grade is continually rising from the New Haven connection to the Hell Gate bridge, the maximum being 1.2 per cent. The grade is level over the arch bridge, and then descends on a maximum grade of 0.72 per cent to Stemler street. The maximum elevation attained is over the East river, where the base of rail is about 145 ft. above mean high water.

Beginning at the New Haven connection at 142nd street, the first section of the line, known as the Bronx viaduct, extends to the Bronx Kill bridge about seven-eighths of a mile. The section over Randall's island, known as the Randall's island viaduct, is about three-eighths of a mile long, and from 75 to 100 ft. high. After crossing the Little Hell Gate bridge another viaduct is used to cross Ward's island, a length of about one-half mile. This viaduct reaches a maximum height of about 135 ft. The line makes a 3 deg. 10 min. curve to the left over Ward's island, approaching the Hell Gate arch bridge, the central angle being nearly 90 deg. The section south of this bridge includes the Long Island viaduct and the Eastern viaduct, having a combined length of a little over one mile. With the exception of short sections at the two ends where retaining walls and earth fill are used, the entire line is carried on steel and concrete viaducts and bridges. About 150 viaduct piers were required, the masonry work containing 450,000 cu. yd. of concrete,

with about 5,000 tons of steel reinforcement. The steel superstructure will total about 90,000 tons.

BRONX VIADUCT TO HELL GATE

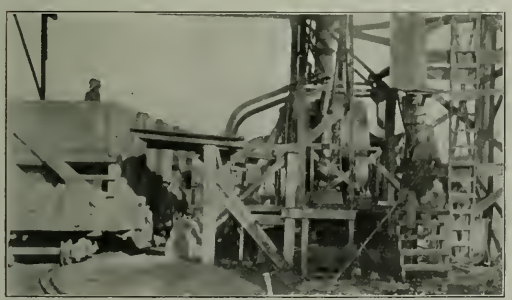
The four New York Connecting tracks join the four New Haven tracks at 142nd street in the Bronx, the New Haven tracks being spread to allow two of the new tracks to be located in the middle of the old layout. The other two new tracks are constructed on the east side of the old line, all four tracks being laid on earth fill between retaining walls as far south as 138th street. The retaining walls and the additions to the bridge



Cross Sections of Roadway Near Connection of New Haven and New York Connecting Railroad in the Bronx

abutments at street crossings, which are necessary to carry the additional tracks, are founded on spread footings supported by piles. About 900 ft. of retaining wall was required for this work, the fill between the walls being furnished by the New Haven.

From 138th street to 132nd street, where the difference in elevation between the new tracks and the old is too great to allow the use of the retaining walls and earth embankment, rectangular concrete piers are used under each of the two double-track portions of the line. Each pier is supported on two cylindrical columns, 10 ft. to 13 ft. in diameter, extending up to the ground level. These piers are placed about 64 ft. apart, the superstructure consisting of two lines of deck plate

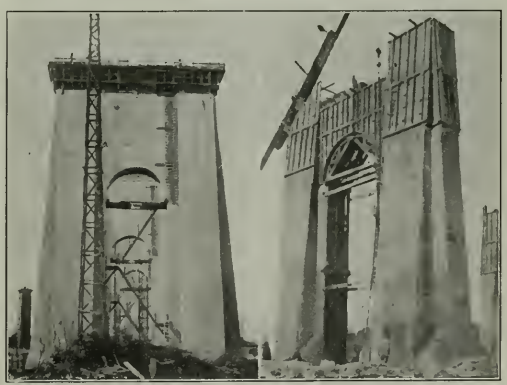


The Mixer Plant for Placing the Viaduct Piers

girders under each track. Between 133rd and 132nd streets the two new tracks, which are carried in the middle of the layout to that point, swing over the two easterly New Haven tracks, and join the other two Connecting tracks to form a four-track line, which is carried from that point to the Bronx Kill bridge on a viaduct consisting of deck girders on concrete piers. These piers, which have an arch opening at the base, rest on cylindrical concrete caissons at each end carried down to hardpan. Since the average pier height was less than 50 ft. it was found more economical for placing the concrete in these piers to use guyed derricks in preference to distributing towers, as the derricks could also be used for handling the sections of the steel forms and other material required around the work.

The Bronx Kill bridge consists of two 175-ft. through truss spans designed for a double-leaf bascule bridge, but built temporarily as fixed spans. While this channel is not navigable at present an improvement is contemplated which will deepen it in order to relieve the severe tidal current in Hell Gate. The center pier and the tower spans at each end for the operating machinery of the proposed bascule bridge are of concrete with granite facing at the water level. The center pier and the southerly abutment are founded on rock, which dips rapidly to the north, necessitating spread footings under the northerly abutment.

The Randall's island viaduct consists of 24 deck plate girder spans, varying in length from 80 ft. to 87 ft., supported on concrete piers. These piers are founded on rock which was comparatively close to the surface on this island, and are designed with buttresses or pilasters at each end with an arch between. For the lower piers derricks supported on raised platforms were used for handling concrete into the forms on account of the economy effected in the handling of other material, as mentioned above. The contractor located a con-



One of the High Piers on Ward's Island

Arrangement of Forms for Building High Viaduct Piers

struction dock on Randall's island for handling the material used in the work.

The new line crosses Little Hell Gate at a sharp skew on a four-span steel structure consisting of inverted bowstring trusses. Two spans are 292 ft. 6 in. long each, and two spans 280 ft. 3 in. The water is very shallow in this channel, rock outcropping at frequent intervals. The three piers are skewed parallel to the channel and consist of two circular piers connected by a reinforced concrete arch. A granite facing is

provided at the water level. The foundations were built in open cofferdams, the excavated material and concrete being handled on a construction trestle across the stream.

The viaduct over Ward's island consists of 30 spans, varying in length from 86 ft. to 93 ft., the design being the same as that on Randall's island, except that the continually rising grade makes the piers from about 80 ft. to 120 ft. high. Practically all of these piers are founded on hardpan, although in a few cases the footings were located on rock. The contractor built a dock on the island with a storage capacity of 1,200 cu. yd. of stone and 600 cu. yd. of sand. Derricks were used to unload the materials from barges lying at the dock onto a belt conveyor, which transported them to covered storage bins. Cement was also handled in the same manner and chuted down to the cement house, adjacent to the storage bins. The bins were constructed at a height sufficient to permit of charging, cars being pushed under the bins and there filled with sand, stone and cement. Each of these charging cars carried sufficient material for about 12 cu. yd. of concrete. Two cars were used, one being loaded at the bins, while the other was discharging at the mixer plant. The concrete was mixed in one-yard Lakewood mixers, located at the base of high distributing towers, serving three piers on each side. The sand and stone were kept separate in the charging car, allowing the proper amounts to be drawn off with the least delay into the charging hopper of the mixer. The towers supporting the hoist and steel chutes were built of timber in interchangeable sections, which could be arranged to give any desired height. The maximum height required was about 224 ft. The form sections were handled by tackle attached to the guy lines supporting the concrete chutes.

HELL GATE ARCH BRIDGE

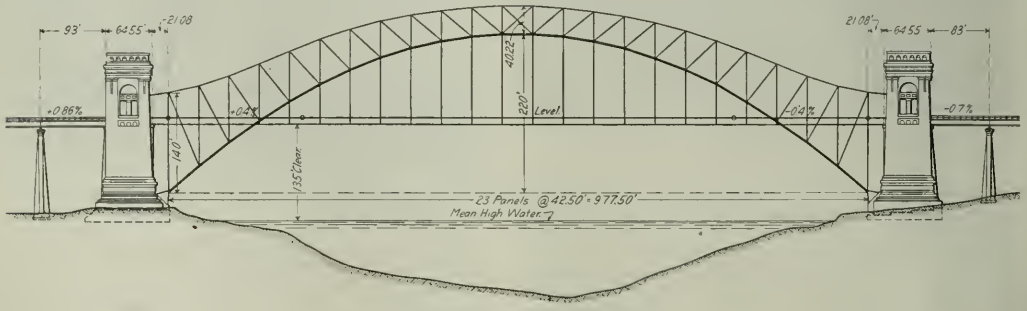
The crossing of the East river, even at its narrowest point in Hell Gate, was the most difficult problem in the construction of the entire line, its solution calling forth the design of a steel arch bridge with the longest span in the world. A single span structure over the river at this point was necessary on account of the depth of the water and the strength of the current, and for the same reason the structure had to be designed for erection without false work. A cantilever bridge, involving anchor spans at the ends, was not feasible on account of the 3 deg. 10 min curve over Ward's island, which commences approximately at the end of the bridge.

The structure is unusual in a number of respects, in addition to the length of span. The adoption of an arch bridge usually presupposes excellent foundations, but at the Ward's island end of the Hell Gate bridge the surface material and underlying strata were of such a poor quality that pneumatic caissons were used to support the tower. This is also the first long span bridge to be designed for four railway tracks. A loading practically equivalent to Cooper's E-60 was used in the design, the dead load amounting to 53,000 lb. per lineal foot of the bridge. Other noteworthy points in design are the use of special rocker joints at splices between chord members, the specification of high carbon steel and large rivets, and the use of girders in the floor at the intersection of the roadway with the arches, to transmit the load from the stringers to the arches, due to braking trains.

The towers are 125 ft. by 140 ft. in area, and are of a hol-

The Construction Plant Used in Building the East Abutment of the Hell Gate Arch

low concrete construction, faced with Maine granite, above the ground, and extending to a height of about 220 ft. The roadway is carried through the arches of these abutment towers. In addition to their architectural value the weight of these towers serves to decrease the size of foundation necessary and increase the stability of the arch structure. The two arches are spaced 60 ft., center to center, and each consists of two chords 140 ft. apart at the ends, and about 40 ft. at the crown. The rise in the lower chord is 220 ft. The roadway level is



Elevation of the Hell Gate Arch Bridge

between the two chords at the end post, crossing the lower chord three panels out from the end, and being suspended more than 150 ft. below the crown of the arch in the middle of the span. The arches are two-hinged, although they will be erected as three-hinged, and maintained in that way until all dead load has been placed. The clearance above mean high water is 135 ft. On account of the enormous dead load the chord members are never in tension, and the sections required are unusually heavy. The lower chord is a box section with a middle diaphragm having a width of 6 ft. 6 in., and a maximum depth at the lower end of 10 ft. 6 in. The upper chord is an inverted U section, and is of course considerably lighter. Continuous ballasted tracks are carried across the structure on concrete slabs, this construction being standard over the entire elevated portion of the line.

The Caissons in the West Abutment of the Hell Gate Arch

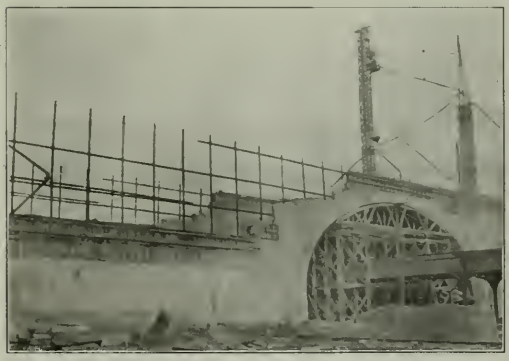
The tower on the Long Island side is founded on rock at a depth of about 20 ft., the foundation being placed in open cut. The westerly tower, however, is founded on rock at depths varying from 58 ft to 120 ft. below the ground surface. Twenty-one pneumatic concrete caissons were used in the construction of the foundation. These caissons were arranged in five groups, extending across the tower area parallel to the line of the arches. Three of these groups consisted of five 18-ft. cylinders each, and the other two, located in the vertical planes passing through the arch ribs, consisted of three rectangular caissons, 30 ft. by 40 ft. in plan under each arch. The three caissons under each truss are interlocked by keys, extending from the top to within 10 ft. of the cutting edges. The material through which these caissons were driven consisted of sand, coarse gravel and boulders, some of the latter being very large in size. On account of the difficulty which was expected in handling this material, and the uncertainty of the exact depth to which the caissons would have to be sunk, it was decided to build this particular part of the tower with company forces under the direction of the engineering department. The plant consisted of five compressors, boilers, electric light, etc. Each circular caisson was provided with two shafts, and each rectangular caisson with three shafts, with separate material and men locks. The material was handled by four derricks and one hoist tower for concrete. The excavation was wasted behind the sea wall, built along the edge of the island. The sinking of the caissons was accomplished in seven months.

A Portion of the Long Island Viaduct Showing Concrete Towers Used in its Construction, Eastern Viaduct in the Background

In the construction of the approaches to the arch bridge six piers are being omitted on each side to provide space for the back stays and counterweight, which will be necessary in the erection of the arches by the cantilever method. An important economy will be effected in this erection by utilizing for the back stays and counterweights a large portion of the steel designed for the superstructure of the arch and of the approach viaducts. It is expected that erection of the arch span will be commenced early in 1915.

HELL GATE TO SUNNYSIDE YARD

The Long Island viaduct is of the same type as that on Randall's and Ward's islands, the only difference in construction being that the piers are founded on gravel or sand, the footings being carried to a depth of from 10 to 30 ft. The rock was at too great a depth along this section to be reached by these footings, and this fact was an important consideration in the adoption of the concrete pier and plate girder type of structure for all viaducts. As the bearing pressure could not exceed three tons per square foot on the gravel and sand under the Long Island approach, it was impossible to secure at a reasonable cost suitable foundations for concrete arches or other heavier types of construction. The footings of the concrete piers were necessarily made wide to secure the required bearing, and this is even more important, as the strata in which the footings are located are water bearing and are above tide level, although with the future development of this district they may be completely drained.



One of the Street Arches in the Eastern Viaduct Showing Also Thin Retaining Wall Construction

The Eastern viaduct, which extends from Lawrence street to Stemler street, adjoining the Long Island viaduct on the east, consists of thin, high concrete retaining walls heavily reinforced, with an earth fill placed in thin, convex, well-compacted layers. Some streets are crossed by reinforced concrete arches, others by deck truss bridges of from 120 ft. to 166 ft. span. The retaining walls reach a maximum height of 72 ft. and are spaced 57 ft. 6 in., back to back. The outer face of the walls is battered 1 to 40, and the back is plumb. The thickness of the wall under the coping is 3 ft. They are reinforced with 8 in. 16-lb. channels, spaced 10 ft. apart, vertically and hori-

zontally, and bolted together at the intersections. Tie rods are provided to connect the two side walls at each point of intersection of the reinforcing channels. Short pieces of these rods were attached to the reinforcement before the concrete was poured, and turnbuckles are used to connect these short ends with the 2¼-in. rods, extending through the fill, which are being placed as the filling progresses. Solid concrete cross walls, which also contain tie rods, are provided at intervals of about 70 ft. Provision is made to carry the drainage down the backs of the walls and through holes near the surface. The filling material for this section of the work is being secured from the Sunnyside yard, the estimated quantity being 180,000 cu. yd. The fill is made with narrow gage equipment from a track laid on timber trestles supported on the tops of the walls, and is being carefully tamped in place in order to secure a fill that will exert practically no lateral pressure on the retaining walls. The design of these walls presupposes a fill of this character, the walls serving rather as facing for the fill than as actual retaining walls.

The reinforced concrete arches over the streets are all built on a skew, the maximum being 57 deg. In one case an elevated railway structure is carried under the arch, the span in this case being 102 ft. In two cases three-centered arches were used where a flatter ring was desired. The arch rings are heavily reinforced with 1-in. rods and wire mesh, the lower face of the arch is bush-hammered, and the upper surface is waterproofed by the membrane method, with a protective layer of brick laid over the waterproofing. High distributing towers were used in placing the concrete on this section, the concrete material being hauled in motor trucks from a dock on the river, about two miles away.

The section between Stemler street and the Sunnyside yard involves no work of unusual nature or of great size. The streets are crossed by concrete arches, or plate girder spans, and the tracks are carried on earth embankments without retaining walls between the streets. The material used for these embankments was secured from the Sunnyside yard, the total fill amounting to about 500,000 yd.

The masonry and foundation work was contracted to three firms as follows, beginning at the south end: Arthur McMullen, New York City; the Patrick Ryan Construction Company, New York City, and the T. A. Gillespie Company, New York City. The Snare & Triest Company, New York City, is building the towers of the Hell Gate bridge above the bases. The American Bridge Company has the contract for fabricating and erecting the superstructure of the arch bridge, the Long Island viaduct and the Ward's island viaduct, and the McClintic-Marshall Construction Company is fabricating and erecting the remainder of the steel superstructure.

In addition to Mr. Lindenthal, we are indebted to O. H. Ammann, assistant chief engineer, and H. W. Hudson, construction engineer, of the New York Connecting, for the foregoing information.

Car Lighting in India.—It is reported that the Railway Board of India has decided to install electric lights on all the passenger cars of the lines operated by the state. This official announcement will also mean that other lines eventually will have to do the same.

New Railway in Corea Opened.—A British consular report states that the entire Keigen (Seoul-Gensan) line was thrown open to traffic on August 16 last, on the completion of the Seoul-Kozan section, 17 miles in length. The railway has a total length of about 138 miles, and it traverses the provinces of Kyeng-Ki, Kang-Won, and South Hamgyeng. There are 22 intermediate stations, and through trains from Seoul accomplish the journey in about eight hours. Gensan occupies the third place in the foreign trade among the open seaports of Corea, and is the chief port on the east coast.

INDUSTRIAL RAILWAYS CASE*

The following is an abstract of the commission's supplemental report given by Commissioner Clark in the Industrial Railways Case, dealing with allowances to short lines of railroad serving industries, the language of the commission being preserved in so far as possible:

This proceeding is an investigation instituted by the commission on its own motion. The original report, held that all allowances to, or divisions of rates with, any of the so-called industrial roads were unlawful. No distinction was made between the industrial roads, although their physical characteristics and the conditions surrounding them varied widely.

As a result of that report, although no order was entered, the line-haul carriers promptly withdrew all allowances, divisions and demurrage and per diem arrangements with the industrial roads in the proceeding, and also with other similar roads. Protests against such cancellations led the commission to suspend them in a number of instances. In so far as the industrial roads that were before the commission are concerned no such allowances, divisions or demurrage or per diem arrangements are in effect.

After our original report was issued, the Supreme Court handed down its decision in the Tap Line cases, 234 U. S., 1.

In its opinion the Supreme Court referred to decisions of the commission, such as the *General Electric Company* and *Solvay Process Company cases,* 41 I. C. C., 237 and 246, and said:

> It thus becomes apparent that the real question in these cases is the true character of the roads here involved. Are they plant facilities merely or common carriers with rights and obligations as such?
>
> It is insisted that these roads are not carriers because the most of their traffic is in their own logs and lumber and that only a small part of the traffic carried is the property of others. But this conclusion loses sight of the principle that the extent to which a railroad is in fact used does not determine the fact whether it is or is not a common carrier. It is the right of the public to use the road's facilities and to demand service of it rather than the extent of its business which is the real criterion determinative of its character.

The court said that it was doubtless true that abuses existed in the conduct and practices of these lines and in their dealings with other carriers, which resulted in unfair advantages to some tap lines and discrimination against others. It pointed out that because the conclusion was reached that the tap lines were common carriers of both proprietary and nonproprietary traffic, and therefore entitled to participate in joint rates with other common carriers, it did not follow that divisions of joint rates might be made with them at the will of the carriers and without power of the commission to control the same.

In fundamental principles the instant case does not differ from the Tap Line cases. There may be a distinction as to the application of the commodities clause, but that can not properly affect the conclusions or action of the commission. If the commodities clause is violated, that infraction of law is not to be corrected or punished by rate adjustment.

Our findings in the original report in the instant case have been given general and substantial effect by the trunk line roads. The withdrawal of allowances to many of these industrial roads seems to have been accepted as proper without much question, but as to a few of them there is insistence that our findings invade the legal rights of the so-called industrial roads, and we are urged to issue an order so that those questions may be tested in the courts. We have concluded, however, that it is our duty to refrain from issuing an order and to avoid the delay which would be attendant upon such litigation. We think that in the light of the decision of the Supreme Court in the *Tap Line cases* it is our duty to so modify our findings in the original report herein as to permit the trunk line roads, if they so elect, to arrange by agreement with any of the industrial roads mentioned in our former report which are common carriers under the test

*The original decision (29 I. C. C. 212) was abstracted in the *Railway Age Gazette* of January 30, 1914, page 233.

applied by the Supreme Court in the *Tap Line cases,* and which perform a service of transportation, for a reasonable compensation for such service in the form of switching charges or divisions of joint through rates. Each road that becomes party to such an agreement must file with us immediately upon the consummation thereof a full statement of the arrangement entered into showing specifically the allowances or divisions granted thereby. We shall, in the exercise of the duty pointed out by the Supreme Court, undertake at the earliest available opportunity to inquire carefully into any of these allowances or divisions which may seem to be unwarranted or unreasonable or to effect unjust discrimination. What we have here said relative to establishment of allowances or divisions with the industrial roads referred to is not to be understood as a finding by us that those industrial roads can resume these relations with the trunk line carriers without transgressing the provisions of the commodities clause. If infractions of that law come to our notice, we shall in the proper way bring them to the attention of the Department of Justice.

We shall expect the trunk line roads, under the modification here made of our original findings, to re-establish allowances, divisions, or demurrage or per diem arrangements with industrial roads only in instances in which the transaction is *bona fide,* and in which it is clearly lawful and proper. Each case must be judged by its own facts and merits. Each of the industrial railways is or is not a common carrier. If it is a common carrier, it is entitled to all the rights and subject to all of the limitations provided in the act.

Commission Harlan in a dissenting opinion says:

In the original report we condemned the allowances and the advantages enjoyed by the industries in question in the elimination of demurrage and in the benefit of reclaims; we also condemned the furnace allowances and the free services, and held upon the fact before us that in each of the cases dealt with in the report the industrial railway was a part of the plant facilities of the industry and performed no service of transportation. Subsequently petitions for rehearing were filed by several of the parties in interest, which after due consideration were overruled. Although no order was entered the carriers later filed tariffs to give effect to our findings and conclusions. The results have been accepted and recognized as proper by nearly all of the industries operating plant railroads under conditions that made the general principles of the original report applicable also to them. More recently, however, several of the larger industrial lines, as well as some shippers served by them, have expressed a desire that an order might be entered so as to give them an opportunity, by application to the courts, to test the legality of our findings.

In my judgment an order should be entered on the basis of the original report so that the matter can be taken into court, and some definite principle established by which we may be guided in the disposition of the many similar cases now pending before us and that may hereafter arise. The propriety of so burdening the revenues of the trunk lines is not only a matter of importance to the trunk lines themselves, but to the general shipping public by which all such burdens must ultimately be borne. It is important also that other industries not receiving these benefits and privileges at the hands of the trunk lines should know what their rights are; and it is most important that this commission, in its administration of the law, should know the views of the court of last resort on these great questions. The majority report, however, while modifying the original report, establishes no rule for the future guidance either of the carriers, or of the industries, or of ourselves with respect to any of the questions involved. The facts are all before us. Before the hearings were undertaken the examiners of the commission spent some months in the field making investigations, and many days were subsequently given to the hearing of testimony at different points. The record so made consists of some thousands of pages of testimony and hundreds of exhibits. With the entire situation before us the original report undertook to determine whether any of these industrial lines were performing a service of transportation as a common carrier. The supplemental report closes with the statement that each of these industrial railways "is or is not a common carrier. If it is a common carrier it is entitled to all the rights and subject to all the limitations provided in the act."

This statement is coupled with an expression of the expectation of the commission that the carriers will re-establish allowances "only in instances in which the transaction is *bona fide* and in which it is clearly lawful and proper." The line carriers are not required, but are permitted, if they so elect, to re-establish allowances with any of the industrial roads mentioned in the original report "which are common carriers . . . and which perform a service of transportation." A statement of any arrangement so entered into by a line carrier with any such industrial road must be filed with the commission which undertakes *at the earliest opportunity* to inquire whether the allowance is "unwarranted or unreasonable or effects unjust discrimination." This was precisely the object of the whole investigation, and so far as I can see we are thus brought back by the supplemental report practically to the point where we started nearly four years ago. (32 I. C. C., 129.)

RAILWAY AFFAIRS IN OTHER COUNTRIES

The Railway News of London has compiled figures showing the number of railway employees of great Britain that have enlisted for the war, a total of over 35,000 for eleven companies. Allowing for the figures of other companies not yet published, the total must be at least 40,000 for the United Kingdom. The North Eastern men were formed into a special battalion. This company's contribution of 5,000 represents about one-tenth of the company's force. The figures for the principal companies are as follows:

Great Central	1,300	London Brighton	1,300
Great Eastern	1,500	Midland	3,000
Great Northern	2,500	North-Eastern	5,000
Great Western	7,600	S.-Eastern & Chatham	1,500
London & N.-Western	9,400	Tube Lines	150
London & S.-Western	2,000		
		Total	35,250

Since the declaration of war on Germany by Great Britain early in August, completely equipped ambulance trains have been prepared by a number of the railroads of Great Britain and turned over to the war office for use in transporting wounded soldiers from the cost to hospitals at various inland points. These trains were made up of existing rolling stock, the interior of which was altered and refitted in accordance with plans approved by the war office; the work of conversion was conducted with such despatch that some of the trains were ready for service by August 14. Each train is made up of from nine to ten vestibule coaches and in effect constitutes a completely equipped hospital capable of caring for about 100 wounded men, together with accommodations for the necessary staff of doctors, nurses and orderlies. Each ward car will accommodate from 16 to 20 men on spring cots, which are arranged in two tiers on either side of the car. A treatment car is provided, one end of which contains a well equipped pharmacy. Next to the pharmacy is an operating room opening from a side corridor, in the fitting of which special care has been taken to provide for proper sanitation. A third compartment is fitted up as an office, and the remainder of the car is arranged for the storage of clean and dirty linen. The trains all include dining or kitchen cars, and ample mess room and sleeping accommodations for the entire staff. Everything possible has been done to promote comfort and convenience, some of the trains having telephone installations for communication between the various cars.

Somaliland Railway Shelled.—A German cruiser is reported to have bombarded and destroyed part of the railroad, which is being built by a French company, between Jibuti and Addis Abeba, Somaliland.

THE PROGRESS OF PUBLIC ENLIGHTENMENT

By Frank W. Noxon
Secretary, Railway Business Association

Some manufacturers and wholesalers have been surprised to find commercial travelers' organizations to which their salesmen belong circulating protests against the advance in price of mileage books, when the concerns themselves had gone on record as favoring larger income for the roads. They find that a representative may not know the policy of the company unless he is directly informed of it. The executive of a very large enterprise sometimes sniffs at the heads of smaller institutions for obstinately clinging to the anti-railroad habit in conversation and thus tending to restrain the restoration of general prosperity by continually stirring up political antagonism; yet this same manufacturer may have in his employ numerous men with whose line of conversation he does not make himself familiar, and men, too, of stature equal to that of the small shipper criticized and of equal or greater influence in their neighborhoods and among other business men. Some concerns in the United States employ as many as 500 or more salesmen each. Not only is there danger of serious damage, but a great opportunity is lost, when an institution sends men over the country without placing in their hands facts about questions upon which public opinion must be set right if anybody is to sell goods at all.

An Interstate Commerce Commissioner, since retired, confided to a visitor soon after the denial of rate advances in 1911 that the railroads would never obtain an increase in freights until public opinion should be in favor of it. "I don't mean shippers," he added. "I mean the general public." Some of those directly responsible for railway prosperity or deeply interested in it exerted themselves accordingly in the months following. An interesting account could be made of the gradual enlargement of horizon as the gospel was carried to wider and wider circles.

Heads of large shipping enterprises in the principal cities were the first inner circle. Generally they had not stood up to be counted for the advance in 1910. They desired it granted, but felt that much harm had been done by controversial attacks upon the railroads in connection with rates and that organized advocacy of advances might evoke a renewal of such assaults. They believed, too, that the advance would almost certainly be sanctioned. They therefore refrained from public approval. Traffic commissioners of bureaus and of individual concerns were permitted to participate in the hearings, to present statistics and arguments in rebuttal and to cross-examine the railway witnesses. Their surprise at the failure of the advance was unmistakably genuine.

By these executives of large institutions, therefore, after 1911 a more public acquiescence in rate advances was made. The result was that practically all the larger shippers went on record and before the end of 1912 many thousands of others had followed their example. Where industrial traffic commissioners gathered in their organizations there was a sudden and marked absence of anti-rate advance conversation. It was the abstention of these men from entering appearances before the commission in 1913 in connection with the 5 per cent advance case that is understood to have led to the retention of Mr. Brandeis by the commission to present "the other side."

The next wider circle was the shippers in the smaller cities and towns. Railway officials visited towns throughout the territory for exchange of views face to face with shippers. Business men particularly earnest in advocacy of higher rates laid the reasons systematically before fellow members of local and trade organizations. One analysis of the result was given by a magazine, the Railway World, which asked secretaries of business organizations throughout the eastern territory what their communities thought about the advance. Out of 261 commercial organizations heard from, only 11 were unfavorable. Of the others, 127 were undecided and 123 actually favorable. The most significant feature was the much more numerous bodies not sufficiently wrought up against advances to reply at all. The compiler, however, states that "those taking a negative position belong more largely to smaller communities."

Here then in the smaller communities was a circle not yet fully reached; and the business men who had communicated their policy to the traffic commissioners find in 1914 that their salesmen, talking weekly with scores of tradesmen and others, have been so little solidified as a craft that the officials of salesmen's mutual benefit associations see no reason for not starting a propaganda against the very increase in income which manufacturers and merchants have advocated and the Interstate Commerce Commission sanctioned.

Transportation questions are more promptly discussed and understood in large cities. By sheer force of numbers organizations can be supported there without a heavy tax upon any individual, and bureaus maintained to study and report upon such problems. The business man in the large city, too, comes into direct relation with the railway officials at headquarters, who speak with authority upon matters of policy and show forth at first hand whatever spirit of conciliation and accommodation may animate the management. Business men located in the smaller cities and meeting railway representatives a good way down the line do not absorb a situation as quickly or as clearly.

Every manufacturer, merchant or railway manager has his own organization—the men whose livelihood depends upon the same economic and governmental factors as his own. Every man lives somewhere, and in that place, wherever it is, there is a business organization and a press. Nearly every business man is a member of a trade which is organized on national or regional lines and has its journals. Every man may have in addition acquaintances influential for this, that or the other reason. It is the conscientious and systematic effort to share with all these people whatever knowledge may be had about any important public question affecting business that is enlisting the energy of more and more men of affairs.

One merchant, employing several hundred salesmen, sends them periodically information upon issues related to prosperity and instructs them to report daily what they hear on these subjects. One large organization encourages its leading officials in the acceptance of invitations to write articles or deliver addresses. The themes are the subject of company conference, while the resources of the concern are put in behind to push dissemination.

Men who up to a short time ago paid their dues in the board of trade and let others "not so busy" frame the policy and do the work now take the time for personal participation. The same is true in trade and other national bodies.

Presidents of companies often have nowadays a special list of concerns with which they do business or with whose officers they are personally acquainted and from time to time send such concerns literature, originating on the premises or elsewhere, and accompanied by a letter requesting perusal. This work is made a part of the business, and some one is made responsible for carrying it out.

Each man may cover his circle as far toward the circumference as he can. A great deal of the time it is not a simple operation of A driving something into B's head. The matter with B may turn out to be gray matter. He may have a different point of view which A needs to understand. Too much talking has been done in America standing up facing a crowd; not enough sitting around a committee table and giving dignity to what shall be said by conferring about it. Hiring a ready writer with instructions to prepare anonymous material and "put it across" is a fossil of the next age back but one. If the business man expects to exchange views with other business men and with the general public he must do it himself.

The Chilean Longitudinal Railway.—The Minister of Public Works, of Chile, is reported to have formulated a contract subject to further approval, with the Howard Syndicate, whereby the latter will undertake the exploitation of the Longitudinal Railway for a period of 30 years.

The Arguments of Mr. Brandeis and Mr. Brownell

Special Counsel for the Commission Seeks to Narrow the Issue; the Vice-President of the Erie's Answer

The following is the final argument of the special counsel representing the Interstate Commerce Commission in the rehearing in the rate advance case:

ARGUMENT OF LOUIS D. BRANDEIS

The course which the evidence and the arguments took in this case indicates that, in the opinion of other counsel, the issues and the powers of the commission are much broader than I conceive them to be. I had supposed, from the form in which the order was entered, that the question before the commission was whether, in view of the new evidence to be introduced, which was strictly limited to "presentation of facts disclosed and occurrences originating subsequently to the date upon which the record previously made in these cases were closed," such new evidence constituted a reason why the conclusions reached by the commission should be modified.

But counsel have argued not alone or mainly that certain alleged new evidence afforded a reason for changing the opinion, but that, upon the evidence which the commission had before it originally the conclusion then reached was incorrect. That was particularly the burden of Mr. Butterfield's objections to the finding in respect to the coal rates. Although in my opinion such considerations are not properly before your Honors, I think I ought to say a few words on that subject because, inadvertently, no doubt, Mr. Butterfield has misstated what I conceive to be the situation.

He said, many times, that the commission gave no reason for its finding in regard to coal rates except that larger cars were used, involving, presumably, less expense. That is not correct. Your Honors will find, on page 392 of the opinion, that attention is called specifically also to this fact:

"While the heavier train loading of the slow trains in which the heavy or bulk freight usually moves has tended to decrease cost."

Your Honors will also remember that in the evidence the cost of fast freight, as distinguished from slow freight, was very particularly referred to, and among other things there was introduced the schedule, being the estimate prepared by the Baltimore & Ohio Railroad, showing that "if 25 per cent of the present fast freight trains were continued for the purpose of handling stock and perishable fruit on present schedule, and the schedules of the remaining 75 per cent of the fast freight trains were lengthened only 24 hours, the saving to that system, conservatively estimated, would be over $400,000."

Now, it was the fact not so much of large cars, but the fact of the heavy trains and that they were slow trains, which was particularly dwelt on as the reason why coal stood in a different position from much other freight.

And that evidence was supplemented by much general evidence, which your Honors referred to on pages 392-3 of the opinion, of a more comprehensive nature. There was shown, the financial condition of those railroads known as coal roads; and the railroads selected for this purpose were not the anthracite coal roads, with which we are not concerned in this proceeding, but the coal roads in Official Classification and, in part, in Central Freight Association territories. Those coal roads were selected, and the particularly prosperous condition of those roads as compared with other roads was pointed out; and a comparison was made by your Honors between the coal subsidiaries of the New York Central and the Pennsylvania. In addition to this your Honors had before you specific testimony as to the cost of moving coal which also showed that the coal traffic was particularly profitable.

That discussion, it seems to me, was one marked example of a tendency to disregard the terms of the order under which this case has been reopened, and to have involved practically a reargument of the original case on the original evidence, instead of confining the hearing to a discussion of the effect of the new evidence.

Now, what are the conclusions which this commission reached and which it is now sought to modify? In the first place, take the Central Freight Association territory. The first proposition was a denial of an increase of the rates on coal and other heavy or bulky articles. There has not been introduced, as I see it, a particle of evidence bearing specifically upon the correctness of that finding. There is no contention that any of the elements entering into cost of operation are higher in price today than it was prior to the date of the decision. Mr. Rea testified he knew of no increase in the rate of wages, or any increase in the price of materials or supplies, or any new governmental regulations imposing additional burdens. There is, of course, evidence bearing upon the general question as to the railroad needs, to which I will call attention later.

Then the next ruling in respect to Central Freight Association territory was that all tariffs bearing a minimum of five cents a ton on commodities moving under rates stated in cents per ton less than one dollar should be cancelled, because, as the commission found, "this would work hardship and discrimination."

Of course there has been no evidence bearing specifically upon that issue or showing that hardship or discrimination therein referred to would not result.

The third finding was that tariffs involving "increases exceeding five per cent by varying amounts" be cancelled because the carriers "failed to justify such variations from the five per cent rate." I have found no evidence bearing specifically on that issue.

The fourth finding was that certain rates controlled by force of unexpired orders of the commission, entered after specific investigation in former cases, be cancelled because carriers failed to introduce any evidence why they should be raised. There has not, so far as I know, been any evidence introduced specifically upon that issue.

There remains, then, only the question, so far as the Central Freight Association territory is concerned, as to whether the great need of the carriers, as to which much evidence has been presented, presents a new fact which should lead to a modification of the findings above referred to in regard to Central Freight Association territory; your Honors found not only what you had found generally in respect to the Official Classification territory, taken as a whole, that the income was less than was demanded in the interest of the public as well as of the railroads, but you found, by very specific statements and a very specific exhibit of facts, that the Central Freight Association lines were greatly in need of additional revenue, and of revenue more, as I read the opinion, than could be hoped to be gained by an increase of five per cent in all freight rates.

The facts which have been exhibited in the complete reports for the year 1914 add practically nothing to the evidence before the commission. Taking the territory as a whole, I mean the whole Official Classification territory, the figures show just about the same reduction in net revenues as had been estimated on the eleven-months basis as to which the commission had the figures

before it. You had, for the whole territory, as I recall it, $68,000,000 fall in net revenue, in eleven months. The exhibit now filed shows the drop to be $76,000,000 in twelve months, which amounts to about the same. Indeed the last month as to which the commission had the figures (May) showed over $8,000,000 fall in net revenue. If that same rate had been assumed by the commission for the month of June, it would have given for the year just the amount which is found now upon the final figures, to have been the reduction in the net revenue. So that the commission has before it in that respect now, substantially what it assumed were the facts at the time of the writing of the opinion. There remains, of course, the question of the effect of the war upon credit and upon interest rates, to which I will refer later.

So much for the Central Freight Association territory.

Now as to the Trunk Line and New England territories, the commission found that the carriers had failed to show either that the existing rates in Trunk Line or New England territories "are too low, or that the increased rates proposed for those territories were just and reasonable."

Again, no specific testimony or evidence of any kind has been introduced as bearing upon this issue. There has been nothing introduced except the general testimony as to the needs of the railroads.

Then the commission found the tariffs which increased inter-territorial rates between the different sections of Official Classification territory should be cancelled "because the carriers failed to prove that the existing inter-territorial rates in Official Classification territory are too low, or that the proposed increases in those rates would be just and reasonable."

Here, again, we are without any specific testimony bearing upon the finding.

As to the lake and rail rates, your Honors found that the tariffs should be cancelled "because carriers have not met the burden of justifying the proposed increase of the lake and rail rates"; also, "because those increases must necessarily fall with the fall of the all-rail rates."

No evidence has been introduced bearing specifically on that subject except one exhibit, to which, undoubtedly, Mr. Butler will specifically refer.

We come, then, to a consideration of the general evidence as to the needs of the railroads and railroad credit. The evidence as to results of operations in the year 1914, I have already referred to. The showing for that year certainly confirms the conclusions that your Honors reached, that the incomes of the railroads, taken as a whole, are not such as are required in the interests of the public and the railroads. The specific evidence as to the period since June, 1914, does not indicate any greater expense of doing business, except in this respect: If the amount of the traffic grows less, and there is a smaller use of the plant, the capital cost per unit of transportation necessarily increases with the reduction of business. As to that, I will speak later. But the operating ratio does not necessarily increase; and in the current year, that is, since June 30, 1914, in spite of losing business, there has been a smaller operating ratio.

I call attention to the figures for July and August for the Eastern District. Taking the month of July, 1914, the figures for 58,585 miles of road show that the operating ratio was 70.05 per cent, as against 71.28 per cent in 1913 for 58,671 miles. In August, 1914, the operating ratio on 58,673 miles was 66.58 per cent, as against 69.72 per cent in 1913 on substantially the same mileage.

Now, Mr. Willard and Mr. Rea have both said that their decreased operating ratios did not properly represent decreased cost of operation, because a less charge had been made for maintenance of way and equipment; and that the expenditures of less for maintenance was practically deferring during those months a part of the cost of operation.

The figures submitted, and to which I referred in the cross-examination of Mr. Shriver, as contained in the Burnside Exhibit, do show a lesser expenditure for maintenance of way and for maintenance of equipment in 1914 as against the corresponding month of 1913; but it also is clear that the other expenses of operation have become less, that is, the railroad managers have been able to reduce—doubtless through greater efficiency—those elements in cost which were not maintenance, and this is particularly large in the month of August, the latest for which we have the figures.

In these Eastern District roads, in the month of August, the operating revenues fell from $124,000,000 to $116,000,000; that is, there was a loss of over $8,000,000 in operating revenues. The reduction in the amounts expended for maintenance was less by nearly $3,000,000. But the figures show an actual increase in net revenue of $614,000. It thus appears that with $8,000,000 less gross revenue and under $3,000,000 less expenditure for maintenance, the railroads have been able to earn more net revenue in that month, than they did in the preceding year; and this greater earning represents an improvement in operating efficiency in part of about somewhere in the neighborhood of $5,000,000.

The showing for July is not as favorable, but it indicates the same tendency. This shows clearly that with a lessened business the managers, or those who are operating these railroads, have been able to reduce expenses other than maintenance. The reduction of those other expenses was a pure gain to the road and not a deferring of expenses.

It is true, however, that while with the diminishing business, the operating costs have been reduced, the fact that the business has diminished in volume has increased the capital cost per unit, and certainly is considerable evidence that at least up to the present time that reduction is in large part the result of the war. That raises the question whether a reduction of traffic which adds to the unit capital cost which by failure to utilize the plant to its full capacity (though it be temporary and may pass almost at any moment, or may continue for a long time), whether such lessening of traffic is an element to be considered in determining the reasonableness of rates. Of course, that is not a question as to which there is any evidence before the commission one way or the other, unless your Honors consider as evidence the opinions expressed by the various witnesses.

There is also evidence that the capital cost per unit has increased through an increase in the prevailing rate of interest due to the war; and there is evidence that this increase in the rate of interest may be expected to continue for some years at least. The question therefore arises: To what extent will that increase in the rate of interest increase the cost of doing the transportation business?

There was evidence tending to show that there would be in this present year—within 12 months or 15 months, certainly—$500,000,000 of obligations which would have to be issued, for renewals and new money and that on those obligations there would, presumably, be some increase in the rate of interest. Some of those obligations are bearing rates of interest which are very high now, and the rate would probably be a good deal less if long-time obligations were substituted for short-term notes; but there is evidence that the rate of interest will, owing to the war, be higher than it has been recently. If, in all, the amount of money required for funding and other purposes amounted to as much as $500,000,000 in a year, and the rate of interest becomes one per cent higher than it otherwise would have been, that would mean $5,000,000 added to the year's burden, and that $5,000,000 would reasonably be spread over the whole revenues of the railroads, and the revenues of the railroads in Official Classification Territory, are, roughly, $1,500,000,000. Of course, if that higher value continued for a series of years, each year's new issues would add to the railroads' burdens. That is, the burden would accumulate from year to year.

Aside from the element of increased capital cost due to an assumed continuation of these two causes, diminished traffic and increased rates of interest, it was urged most strongly

upon the commission that rates should be increased in order to maintain the credit of the railroads; and the new fact that was introduced in this respect, was the war. The facts in regard to the war, except so far as they might result in reduced traffic and an added burden, do not affect the question of credit in itself; but there was much evidence, particularly from the bankers, that the alleged impaired credit of the railroads would become a very serious factor, by reason of the war; that is, that those abroad who hold securities would, if rates were not raised, have an added incentive to sell them. It was further argued that if they did sell, did dump their securities on this market, it would have a very disastrous effect not only on the railroads, but on our financial institutions and on business generally.

Now, it has seemed to me that those considerations led us quite far beyond the powers of this commission, that they had in no proper sense a bearing on what are just and reasonable rates, but very properly a bearing upon what might be the national financial and economic policy, which another branch of the government is called upon to deal with.

There was introduced considerable evidence concerning the additional revenue which might be expected to accrue within a reasonably short time from following the suggestions made by the commission as to other sources of revenue.

I am not clear as to the purpose of the carrier in introducing that testimony. This proceeding began as an inquiry whether the railroads had adequate revenues, and if not, what course they might pursue to meet the situation. It was only four months later that the railroads filed their tariffs, after which the two proceedings were consolidated. Now, as to the first proceeding, the inquiry as to the adequacy of the revenues and as to the possible means "of meeting the situation," if revenues were found to be inadequate: In that proceeding the commission made no formal order. It merely made certain suggestions. There is no application to modify those suggestions; and it is difficult to see how such a request could have been made. That proceeding has not been closed. I am inclined to think, therefore, that the purpose of introducing the estimates of additional revenues to be expected was introduced as tending to show that, in spite of the following suggestions, the railroads could not expect to get, in the immediate future, relief sufficient to satisfy their great needs. If those words "immediate future" are strictly defined, there is perhaps no need of challenging the accuracy of the estimates. But it is clear that, if any other meaning is to be given to them, the probabilities of greater value have not been fully stated.

Take, for instance, the situation in regard to passenger rates. Mr. Butterfield gave as his estimate of passenger increases $3,000,000. The passenger train revenues last year were $302,000,000 in Official Classification territory, of which $200,000,000 were in Trunk Line territory and in New England territory, wherein there is practically no legislative limit to passenger rates. If, as the commission found and set forth in considerable detail in its opinion, these passenger rates are unremunerative—not only unremunerative in that they fail to pay a reasonable return upon the capital, but in some instances, to cause an actual loss in operating costs—there would appear to be no good reason why those rates should not be largely increased, as, in fact, they have been in some communities. They have as to the mileage rates quite generally. That rate has been increased 12½ per cent already, and in some territories—certainly in the New England territory—there have been a great many individual passenger rate increases.

In Central Freight Association territory, there is in most of the states the obstacle of two-cent fare laws; and that brings up also properly the question which Mr. Patterson raised in regard to the mail pay. What is to be the position of this commission if it is to determine the reasonableness of rates according to the financial needs of the carriers, and those needs result from what would appear to be erroneous or unjust action on the part of some other bodies which regulate rates of pay for railroad services? If it be true, as the evidence indicates, that those two-cent fare laws in Central Freight Association territory take out of the railroads a very large amount of money, and if it be true, as is contended, that the Ohio law affecting freight is depriving the carriers of a great deal of money, and if it be true that the State commissions by their rulings are depriving the carriers of a great deal of money, and if it be true that the federal government is withholding from them a great deal of money by reason of inadequate mail pay; if it be true that by reason of these various amounts withheld, or which the railroads are denied the opportunity of earning, the railroads are in need of additional revenues, can this commission say that the existence of such need makes increases of interstate rates reasonable because it is necessary to bring up the net revenue to the point of an adequate return on the investment. And in another way—of course, in an entirely different way—the same question is presented in the consideration of other causes of inadequacy of revenue. If, for instance, inadequacy of revenue was due to past mismanagement, to grave defects in capitalization or similar causes, can it be true, as Mr. Minnis contended, that your Honors must allow increases because of existing need, regardless of how that need arose; and that it is immaterial whether that need arose from mismanagement, or bad judgment, or a war, or through the erroneous decision of some other co-ordinate tribunal? Does mere need force the decision of your Honors so as to compel a finding that rates are just and reasonable, because only with such increases can the necessary amount of money be raised? It seems to me that that question is directly raised by the evidence which Mr. Maxwell and Mr. Shriver introduced in connection with what the Illinois and Indiana commissions have done in the way of holding up the increases which were proposed.

Of course, if your Honors have occasion to consider at all the estimates of increased revenue to be derived from following the different lines of suggestion made by the commission, your Honors will bear in mind that, in very large part, those suggestions have not been acted upon, and have not been taken into consideration in making the estimates.

For instance, there was considerable testimony in the case and a good deal of discussion as to the heavy drain upon the revenues of the carriers by reason of the terminal services, or what are called free services or special services at terminals, and particularly in New York Harbor. That was discussed at very considerable length. In these estimates which are presented, that matter is not at all taken into consideration.

Then there were very many other different lines suggested by which there might be other savings of expenses. For instance, one was the private cars. Again, there was a possible increase of passenger revenue through the abolition of passes, and a good many other suggestions in the way of savings in operation.

Mr. Shriver stated, undoubtedly most correctly, that it would be extremely difficult to estimate, and that he had found it impossible, in the absence of one of his associates, to make any estimate of those savings. All that I want to do is to ask your Honors to bear that fact in mind, if your Honors should deem the amount of these estimates to be important.

Of course, it is also true that in regard to the proposed increases on certain commodities and in certain rates, that it by no means follows that the increases proposed are the only increases that should be made. It may be that the rates should be raised more; and that rates should be raised on many more articles of commerce on which rates are now unremunerative. Your Honors will bear in mind the testimony that a very short time has elapsed since the decision,

that it is a very big task to make the revision of these rates, that it will involve a great many conferences, and the carriers have not proceeded, certainly in many respects, very far.

There is one other matter bearing upon credit, or as to the causes of the lack of credit, which, perhaps, ought to be called to your Honor's attention. Credit may be impaired in many ways, and among the things that may happen is an exhaustion of credit. Your Honors found one element of exhaustion, one means by which credit might have been exhausted; that is by the use of the credit of the carrier for the acquisition of properties not used as a part of its system. There was the finding that in Official Classification territory there were $684,000,000 of such properties held by these carriers. One of the suggestions made by your Honors was that these carriers consider the disposition of these properties. Of course, they could not be sold out under present conditions; but still the fact that they were bought was one of the factors in exhausting credit. It accounts in part for the fact to which attention was called by several of the witnesses, that the railroads in raising money must often raise it on junior securities or on bonds with stock as collateral, rather than by mortgage on the roads.

The following is the argument of George F. Brownell, vice-president of the Erie, in answer to Mr. Brandeis.

ARGUMENT OF GEORGE F. BROWNELL

I share the view expressed by Mr. Thorne that the railroads are now at a parting of the ways. Like him, I see them, in this case, where two ways diverge, with the commission at the switch. To my vision, one of those ways marks the continuance and extension of the public policy under which the railroads heretofore have had their remarkable development and progress—a public policy which has permitted and invited their construction, maintenance, and operation under private ownership and management with governmental regulation, and through capital secured from private investment. But the other way to which he asks you to divert the railroads would subject them and the public alike to serious dangers and difficulties, with the ultimate goal, which I believe is his desire, of government ownership.

I judged that from the substance of the views he has expressed here and what I have understood to be views publicly advocated by him; and that, at least, is what seems to me where the way he advocates would lead as its ultimate goal. In reply to those views I quote these words of Commissioner Daniels in this case:

"Eventually it may come about that railroads will be owned and operated by the government. That is a matter of public policy which it is not the province of the commission to consider. But that such a departure from the present policy of private ownership and corporate operation should be materially hastened by the reluctance of new capital to invest in these properties would seem to be a grave indictment of our present system of regulation and control."

In various other respects I cannot share the vision of my friend from Iowa. I cannot see the prosperity which he seems to think these railroads now revel in. I do not think that prosperity of that character has been seen before since Alice roamed with wondering eyes in Wonderland. . . . There seems to be a misconception on the part of some of the counsel for the opposition as to the scope of this rehearing. Mr. Brandeis, as I recall it, stated his understanding that the rehearing is strictly limited to the question whether the new evidence, limited strictly to the new facts, constitutes a reason why the former conclusions of the commission should be modified. . . . . I think that his view would unduly restrict the scope and character of this rehearing.

Counsel for the opposition have also fallen into error with respect to the contentions of the carriers as to the power of the commission to do what is asked of them. We are not asking that the commission undertake to exercise any powers not conferred upon them by law, but we assert that all the considerations which we have presented to the commission are proper for them to take into consideration in determining the question at issue. We think our views in that regard are amply supported by both reason and authority, and that it is unnecessary to look beyond the provisions of the interstate commerce act itself and the rulings of this commission under it to support them.

Since the former hearing, and indeed even since the decision of July 29 was made, facts and circumstances have arisen which have materially changed the situation of the carriers and the conditions affecting them from those existing at the time of the former hearing, and which, taken in connection with the facts produced at the former hearing, we believe will fully justify the granting of the relief asked for. We believe that had the conditions at the time of the former hearing been what they now are, the decision of the commission would have been very different. We applied to the commission to grant a rehearing in view of such new facts and changed conditions, and the commission granted the rehearing. We are therefore now here, not asking that the commission assume to exercise any power beyond its lawful authority, but that, pursuant to the express provision for such case made and provided by Congress, it fully consider on this rehearing not only the facts and circumstances arising since the former hearing, but all the facts, *including* those arising before as well as since the former hearing.

Until the passage of the Hepburn act in 1906 there was no express provision in the interstate commerce act for rehearings. At that time Congress, anticipating, perhaps, that emergencies might arise when the commission clearly should have the power to grant a rehearing on all the facts, including those arising since the original hearing, added a new section to the Act—Section 16*a*, providing that after any decision has been made by the commission, any party may make application for a rehearing of the same or any matter determined therein, and it shall be lawful for the commission to grant such rehearing if sufficient reason therefor be made to appear. It further enacted that if in its judgment, after such rehearing and *a consideration of all facts, including those arising since the former hearing,* it shall appear that the original decision or order is in any respect unjust or unwarranted, the commission may reverse, change, or modify the same accordingly.

For a rehearing and consideration such as that contemplated and provided for by Congress, it is essential that all the existing facts and conditions be considered with open mind and unprejudiced by the former decision made under other conditions.

On such a rehearing the question should be considered and determined upon all the facts as they now exist and brought down to date.

Among the new developments bearing upon the case is the great war, which was unforeseen when the former decision was made. To use the apt words of the President, the mighty forces of war and of change have disturbed the world. It has already involved most of Europe and a large part of Asia, Africa, and British North America. It has brought about an unparalleled destruction of wealth and dislocation of credit throughout the civilized world. It is probably the most momentous event in modern history, and no one can yet clearly foresee its boundaries, its limits or its consequences. The sun never sets on the countries now involved, or, in fact, even on the present warfare. It is too early to estimate its effects, but it cannot be doubted that they will be world-wide, great and long-continuing. Probably what has already transpired is but the first shadow of what is yet to come. The old order of things has been shattered, and all the king's horses and all the king's men cannot restore the conditions existing a few months ago when the former hearing occurred. The effects of the war are not limited to the countries directly engaged, but they extend to neutral countries. They have already, in many ways, changed conditions in this country and have affected and will continue

to affect the situation of these railroad companies in important ways pertinent to this inquiry.

The credit facilities of the civilized world have broken down. Moratoria have been declared in many countries, stock exchanges have been closed, foreign exchange has been seriously disarranged, and the world's machinery of credit, international, national and corporate, is endangered.

Wealth and property are being destroyed upon an enormous scale. The price of capital has already materially increased, and will continue to increase. Securities have already declined to a disturbing extent, and there is grave danger of a further serious decline.

As shown by Mr. Conant, an international authority of high repute, the direct cost of the war, if it lasts approximately a year and does not extend to other countries, will not be materially less than fifteen billion dollars. This estimate of the appalling destruction of capital for war purposes is based upon the experiences in other recent wars, and includes only a conservative allowance for the cost per man per day of the millions of men engaged. It is supported by known facts as to actual disbursements already made and the estimates of some of the most eminent European economists. Even this vast sum does not take into consideration the loss of other vast sums resulting from destruction of property, the impairment of the industrial production, and the derangement of the machinery of distribution. Even if the duration of the war should happily prove to be less than a year, a large portion of the direct expense would continue during the process of reducing military forces to a peace basis, and a considerable time would be required for restoring to former conditions the industrial and economic fabric. So that, even if an early cessation of the war should permit some reduction in the cost based upon the estimates for a year, it would still leave great sums—probably not less than ten billion dollars—to be raised by loans and taxation in the countries involved.

The amount of annual savings of capital throughout the world for investment, that is to say the amount of capital annually available for investment, is shown to be not much in excess of four billion dollars, so that, as shown by Mr. Conant, the demand for capital for purely war purposes and for the settlements which will succeed the war, will be so great as to absorb an amount equal to the entire savings for investment made in all civilized countries for a period of at least several years. Apparently some of the powers at war are already exhausting the moneys which were available to them for war purposes at the beginning of the war, and have already commenced to offer war loans. Germany has already offered loans amounting to more than one billion dollars for war purposes, and is contemplating the raising of two and one-half billion dollars to furnish employment for her people at home on internal improvements. England, France and other European countries, including some that have mobilized, but are not at war, have commenced to offer war loans.

Under these circumstances it would seem practically certain that the greatly diminished supply of capital in Europe available for investment will, because of patriotic and business and other considerations, be invested at home, and there is no reason to hope that for a long time to come any considerable amount of European capital can be diverted, as it has been heretofore, to the purchase of new securities which the railroad companies must issue in order to refund maturing obligations and to make necessary betterments and improvements. The demand for new capital will surely be much greater than the available supply. It inevitably follows that this great demand for capital resulting from the war and war loans will largely raise the rental price for the use of capital or interest rates, for many years to come, *and even then many who seek new capital will have to go empty-handed.* Already rates have largely risen, both at home and abroad. The new German loan bears 5 per cent interest. and it is understood is being put out at less than par. In this country, rates for call money and commercial paper have risen to from 6 to 8 per cent, and borrowers of such undoubted credit as the city of New York, and one of the United States, have been obliged to pay as high as 6 per cent or more for short time accommodation. Railroads, such as the New York Central and the Erie, have been unable to refund maturing short time notes, except by the issue of other short time notes, and even then only with great difficulty and upon an interest basis of about 7 per cent in the one case and about 8 per cent in the other.

It is clear that one of the effects of the war will be to raise the interest rates on investment securities much higher than it has been for many years, and that these railroads will have to pay for any new capital they may be able to obtain, interest at a rate considerably higher than that paid by governments.

In the judgment of competent witnesses, this apprehended liquidation of our foreign-held securities will be substantially retarded or accelerated according as to whether the railroads are now permitted to charge such just and reasonable rates as will secure them adequate net revenues.

The suggestion has been made by counsel that the railroads can remedy their situation by curtailing or suspending dividends. It would hardly seem that such a suggestion will receive serious consideration. Unless the railroads as a whole are able to receive rates for their transportation services that will produce net revenues sufficient to meet reasonable dividend requirements and leave a reasonable surplus as a margin of safety to help defray "the cost of progress" and secure the future stability of rates, establish confidence in the continuation of dividends, and otherwise maintain credit, there is but little ground to believe that private investors will afford the necessary new capital.

Curtailment of dividends would aggravate the situation, while suspension of dividends would make it increasingly difficult to obtain any capital, even by the sale of bonds. Total suspension of dividends by the railroads, though it would produce a panic, would not produce the amount of new capital required.

Moreover, such a suggestion is impossible of application by a large number of railroads in Official Classification territory which are most in need of relief and which are now unable to pay any dividends. Out of 73 roads, a list of which is filed with the commission, having stock outstanding in the aggregate of $2,500,000,000, 40 roads pay no dividend upon capital stock amounting to over $687,000,000, or 26.8 per cent of the whole. Also, five roads pay dividends of less than 4 per cent upon a capital stock of over $220,000,000, or 8.6 per cent of the whole, and that 16 of these roads pay dividends of less than 6 per cent upon capital stock aggregating about $482,000,000, or 18.8 per cent of the whole.

In this connection it is worthy of note that a number of the roads that appear in the table as paying some dividend last year and as being in the dividend-paying class, like the New Haven, have now passed into the non-dividend paying class and have no dividends which they can reduce for any purpose.

It is not contended by these carriers that the commission have the power to, or should undertake to, approve rates that will be unjust or unreasonable, or that the commission have the power to or should undertake to, approve rates irrespective of their being just or reasonable, merely on the ground that such action would "stimulate business" or "restore confidence in the financial and business world" or accomplish any other such result, although such accomplishment might be very desirable in itself. I do, however, contend that in determining whether the carrier's charges for its transportation services are just and reasonable, the commission have the right, and it is their duty, to take into consideration, among other things, the adequacy of the net operating income derived therefrom, its sufficiency to enable the carrier properly to perform its important quasi-public functions, and to secure the new capital necessary therefor, and for the other related matters of public interest and welfare to which reference

has been made in this case, and that this view is amply supported by both reason and authority.

In addition to all these considerations, which properly should be taken into account in determining the maximum rates which would be just and reasonable, there are other considerations of public and private interest which properly should be taken into consideration in determining the method and time of relief, if not the amount. *If there are several methods by which the commission lawfully can enable the carriers to find relief from the existing inadequacy of their revenues, and one of these methods will also promote the welfare of, or safeguard public or private interests, while the adoption of the other method will either not accomplish that result or be doubtful in its effect, then I say the commission should take these matters into consideration and should adopt the method of relief which will inure to the benefit of all.*

Until the passage of that act of 1887, Congress had not assumed the control and regulation of the railroads, generally, except to constitute them post-roads. *By the interstate commerce act, as amended, Congress has declared a new public policy toward the railroads and has adopted and made them instrumentalities of the federal government, with new duties and obligations to which they were not subject under the common law, or under the laws of the states that created them, but which have been newly imposed by Congress.*

The basic, and I think by far the most important provision of that act, is that contained in section 1, by which it is made the duty of every carrier subject to the provisions of the act *to provide and furnish, upon reasonable request, all transportation,* as broadly defined by the act, over all the railroads, owned or operated, as broadly defined; and to establish through routes and just and reasonable rates applicable thereto; and to provide reasonable facilities for operating such through routes.

This is one of the provisions which, by section 12, the commission is broadly authorized and required to execute and enforce.

Another such provision is that contained in section 5, which requires that "in time of war or threatened war, preference and precedence shall, upon demand of the president of the United States, be given, over all other traffic, to the transportation of troops and material of war, and carriers shall adopt every means within their control to facilitate and expedite the military traffic."

Thus Congress has declared its policy that the railroads remain under private ownership and continue to be maintained by private capital, and—except as otherwise provided in the Act—operated under private management. It has, moreover, made them public instrumentalities, charged with the duty of performing, and being ready and prepared to perform, upon any reasonable request therefor, all transportation services which the public or government may call upon them to perform on any reasonable notice, either in time of peace or war. Congress has recognized that the carriers cannot perform the duties so imposed unless permitted to charge rates just and reasonable to enable them to accomplish what is involved in such performance; and the commission should take the requirements of these provisions into consideration in passing upon the question of the propriety of the proposed rates. The railroads must be given strength to accomplish—and to be prepared to accomplish—the task so imposed upon them—and remunerative rates, and adequate revenues, are the very sinews of that strength.

I think this principle has been recognized in previous decisions of the commission.

In the Western Advanced Rate case, decided February 22, 1911, the commission, speaking by Commissioner Lane, said:

"We do not say that the carriers may not increase their income. We trust they may and confidently believe they will. If the time does come when through changed conditions it may be shown that their fears are realized or approaching realization, or from a survey of the whole field of operations there is evidence of a movement *which makes against the security and lasting value of legitimate investments and an adequate return upon the value of these properties,* this commission will not hesitate to give its sanction to increases which will be reasonable."

In the majority report on the former hearing in this case, Commissioner Harlan said that railroads, although constructed with private capital, are public highways subject to public control, and that in constructing and maintaining such a highway under public sanction, the railroad company really performs a function of the state; that, "unlike most other countries, we have committed the performance of this public function to companies of private ownership"; that "the policy of inviting and authorizing the performance of this public function by privately owned companies involves obligations on the part of the public to the owners of these properties." In the same connection it is further said that "the *public interest* demands not only the adequate maintenance of existing railroads, but a constant increase of our transportation facilities to keep pace with the growth and requirements of our commerce. If, however, that development is to be accomplished with private capital in conformity with our traditions, nothing can be more certain than that the facilities will not be provided except under such a system of regulation as will reasonably permit a fair return on the money invested."

In the light of these considerations of public interest and welfare, as well as that of the railroads, the commission found that "the net operating income of the railroads in official classification territory, taken as a whole, is smaller than *is demanded in the interest of both the general public and the railroads;* and it is our duty and our purpose to aid, so far as we legally may, in the solution of the problem as to the course that the carriers may pursue to meet the situation."

When the decision was handed down in July the commission, although finding that the revenues of the carriers, taken as a whole, are inadequate from the standpoint of the interest of both the public and the railroads, concluded that the carriers were not facing a crisis and had no cause for alarm, and that their need of relief was not so urgent as not to permit of the investigation of the possible sources of additional revenue other than by the proposed rate increase.

It was said in that connection that the railroad executives insisted that grave and serious responsibilities would be incurred if the commission failed to relieve the situation by at once approving the five per cent increase; that the principal danger suggested was that the carriers would incur great difficulty in refunding their maturing short-term notes and other obligations, unless the investors were assured that the carriers' revenues would be increased immediately, but that "subsequent developments have shown that there was little foundation for any such view."

The majority report further expressed the opinion that "the earning capacity of our railroads is so great that their credit will soon be restored if their revenues are conserved. The crop estimates give promise of greatly increased gross revenues for the current fiscal year."

That a crisis now exists in the affairs of these railroads, and that their credit, seriously impaired as we believe before the war started, principally because of inadequate operating income, is now confronted by a grave emergency, would seem to be but plain truths. If this be so, we submit that the commission should aid, so far as they legally may, in the solution of the problem by permitting the carriers to secure a more nearly adequate net income through the proposed increased rates.

The crisis which confronts the railroads has been emphasized, has been aggravated and has been made more clear and certain by the war, but the war does not constitute and did not alone create the existing crisis in our affairs. That crisis existed before the war and is reflected in the records of their operations and the long-continued increase in expenses and accompanying reduction in net revenues and income, whereby the railroad industry has been forced to become an industry of constantly decreasing returns.

The nature and extent of the public interest involved and the occasion for co-operation of those in private or in official position in aiding to meet the situation in every proper and legitimate way are clearly indicated in the letter recently sent by the President to Mr. Frank Trumbull as chairman of the Committee of Railroad Executives, who had presented to him some aspects of the situation.

The various departments of the Government are now engaged in doing whatever they properly and legitimately may to aid in the restoration of normal financial and credit conditions and to protect investors and business interests generally and the public interests involved against the disasters that are threatening them. The comptroller of the currency has just instructed national bank examiners to pass unquestioned all collateral loans based on the closing prices for securities on the New York Stock Exchange July 30, and to recognize those prices as determining the value of securities held as collateral for loans by national banks, notwithstanding that since that time the securities may have sold at considerably lower prices and the prices of July 30 could not now be obtained. This action is in line with the policy which has been pursued by the New York state banking department. The treasury department is co-operating to the best of its ability and the extent of its authority to the same general end, and the Federal Reserve Board has entered earnestly upon the task of aiding the effort to relieve the cotton situation through the proposed "cotton loan fund."

It is obvious that the railroad and transportation interests of the country lie at the basis of our industrial and financial fabric, and that unless those interests can be made reasonably prosperous through adequate revenues, their financial necessities relieved, and confidence in the stability of their securities restored and maintained, no permanent relief from existing conditions can be expected. It is also obvious that the confidence of the investing public, both in this country and abroad, in the value and stability of our railroad securities has been impaired. That this is the situation has been established by the testimony, among others, of financial authorities, bankers, and economists of national and even of international standing and repute, and in their judgment, as well as in the judgment of those in responsible charge of these railroad properties, unless these conditions are promptly remedied, the effect must be disastrous to all interests, public as well as private.

In the majority report delivered by Commissioner Harlan on the former hearing, it was stated that the credit of our railroads has undoubtedly suffered in recent years, but that this was largely from causes that were independent of their rates. The majority were inclined to attribute this loss of credit and impairment of the confidence of the public in the stability of railroad securities largely to the mismanagement of some great railroad systems of international repute, to the circumstances leading up to the appointment of receivers for certain other companies, to the interlocking of railroad systems with weak lines, and other causes not related to the adequacy of rates or revenues.

However, *upon the rehearing it now appears by the uncontradicted testimony of Mr. Strauss and others, that in their opinion and in the opinion of others who are best qualified to judge,* while the considerations referred to in the majority report have operated to a relatively slight extent, yet *the principal cause for the impairment of railroad credit and the impaired confidence in the value and stability of railroad securities has been the inability of the railroad companies to increase their rates to the extent necessary to secure to them reasonably adequate net revenues.* As stated by Mr. Strauss, this is the view entertained by Sir George Paish, an eminent British authority upon the subject, and similar views have been publicly expressed both here and abroad by Herr von Gwinner, the managing director of the Deutsche Bank of Berlin, and himself one of the most eminent continental authorities upon the subject.

In the early stages of this case there was presented to the carriers the prospect of large additional revenues other than from increased rates, such as extra charges for so-called free services to industrial roads, charges for the spotting of cars on industrial sidings, charges for lighterage and switching services in New York Harbor and elsewhere, and it was urged that the carriers could and should increase their revenues from such sources so as to render them adequate without resorting to increased freight rates.

At the first sight the glitter of the profit it was thought might result to the carriers blinded the eyes of many. In the light of recent events we have a clearer vision, and now we realize again the force of the familiar truth that "all that glitters is not gold."

The majority report of the commission also made certain tentative suggestions as to measures which might be taken by the carriers to secure additional revenues and thereby "to meet the situation" otherwise than by resorting to a general advance in their freight rates.

As shown in the carriers' petition and by the evidence of Mr. Willard and other witnesses, the carriers have given and are giving earnest attention to the recommendations and suggestions of the commission in those regards, but *one of the new factors in the case which we think the commission should take into consideration is that the hopes of increased revenue from most of these sources instead of having an early realization will not end in fruition in time to afford a relief for the present situation and crisis,* even though they happily may at some more remote period result in partial realization.

It is believed by those responsible for the management of the carriers that they cannot safely rely upon any expectation that the additional revenues which may ultimately be secured by the adoption of means other than a general advance in freight rates can be obtained in the near future; or that when secured any such additional revenues will be adequate to meet the reasonable needs of the carriers for increased revenues in the present situation.

It was asserted by Mr. Brandeis as special counsel for the commission in his brief on the former hearing that the commission's only function is to refuse to permit increased rates except upon proof that they are just and reasonable, *"and in the absence of such proof, to prescribe a rate that will be just and reasonable."*

In the Eastern Advanced Rate case of 1910, the commission, speaking through Commissioner Prouty, held that the commission's authority is limited to inquiring into the reasonableness of a challenged rate *"and establishing the rate or practice which is found lawful in place of one condemned as unlawful,"* and again "the question before the commission is still the same and is upon the reasonableness of the rate in effect if the advance has taken place, or upon the proposed advanced rate if the tariff has been suspended. . . . *If, in our opinion, the rate is unreasonable, we must find what would be a reasonable rate and order the observance of that rate."*

It is worthy of note in this connection that the commission, at the conclusion of its report in that case, required the defendants to cancel their advanced tariffs *and to restore their former rates,* which are the rates then and (substantially) for a long time prior thereto and now in effect. It is submitted that this necessarily involved a finding by the commission that the rates so restored were not more than just and reasonable rates. Apart from other considerations the changed conditions since 1910 would seem to be more than sufficient in themselves to justify the comparatively small increase now asked for.

The views so expressed by the commission in the 1910 case, and by Commissioner Daniels and by counsel for the commission in the present case, with respect to the power and the duty of the commission to themselves determine and prescribe the maximum reasonable rates to be charged by the carriers in case the commission determines that challenged rates are unjust and unreasonable, would seem to be fully borne out by the provisions of the Interstate Commerce Act with respect thereto.

Section 15 of the Interstate Commerce Act provides that when-

ever after full hearing the commission shall be of opinion that any rates or charges charged by any carriers subject to the act for the transportation of persons or property are unjust or unreasonable, "*the commission is hereby authorized and empowered to determine and prescribe what will be the just and reasonable individual or joint rate or rates, charge or charges, to be thereafter observed in such case as the maximum to be charged, . . . and to make an order that the carrier or carriers . . . shall not thereafter publish, demand or collect any rate or charge for such transportation in excess of the maximum rate or charge so prescribed.*"

It is further provided that all orders of the commission shall continue in force for such period of time, *not exceeding* two years, as shall be prescribed in the order of the commission.

By a further provision the commission may, as they have in this case, enter upon a hearing concerning the propriety of rates before they go into effect, and may, as therein provided, suspend the operation of such new rates, but the order which, after full hearing, whether completed before or after the new rates go into effect, the commission are authorized to make in reference to such new rates is only such as would be proper in a proceeding initiated after the rates had become effective.

The officers of the carriers who are responsible for the management of these railroads, conscious of the responsibilities devolving upon them and of their duties to shippers, to the public at large and to the holders of their bonds, capital stock and other securities, filed with the commission, in the manner prescribed by Congress, the advanced rates in question. They believed then, and they now believe, that such advanced rates were and are well within the limits of what would be just and reasonable. They have endeavored to present to the commission as fully and as fairly as possible the facts bearing upon the propriety of these advanced rates in the effort to satisfy the commission that they are just and reasonable, and in order to aid the commission to determine what will be the maximum just and reasonable rates in case the commission finally shall be of the opinion that such advanced rates are unjust and unreasonable.

Under the law and the facts in this case, in the event that the commission are finally of opinion that the rates are unjust and unreasonable, or in the event that they do not feel justified in allowing the rates to go into effect without exercising their power of suspension, should not they themselves presently determine and prescribe the maximum reasonable rates which the carriers will be permitted to charge and which will produce the adequate net income which the existing rates do not produce?

We hope and believe that, upon all the facts which the whole record now contains, the commission will find that the proposed rates are no more than just and reasonable and allow them to become effective, before it is too late; but in case the commission determine to the contrary, should they not, in that event, as a matter of sound discretion (even if they are of opinion that the provision of the statute in that regard which I have quoted is not mandatory) adopt the course indicated by the statute, instead of requiring the carriers to await the outcome of the attempted application of the tentative suggestions as to substituted measures which might be taken by them to secure additional revenue? Would not that be the better, proper and safer course to pursue in such contingency—*particularly* in view of the fact that the carriers believe that what can be accomplished through such suggested substitute measures will be too inadequate in amount, and too remote in point of time, to provide necessary relief, and that the record justified that belief, *and in view of the further fact that the carriers, and the great public and private interests dependent upon their future welfare, otherwise would be subjected to the great risk of such alternative measures proving to be inadequate or ineffective?*

It may be said that even conceding the correctness of the rule that the carrier is entitled to charge just and reasonable rates that will produce adequate revenues, it is difficult to apply the rule in practice, or to ascertain or in terms define it. It is true that the results cannot be determined with the ease and certainty of the application of a mathematical rule or the weighing of a commodity; but that affords no reason for abandoning a proper and logical rule, which is as definite as the constitutional guarantee that property shall not be taken without just compensation or without due process of law, or as the rules with respect to the taking of property by eminent domain. Though it were as difficult to express and define all the elements which constitute this standard, as the star by which the mariner steers his ship is unattainable, it none the less affords as safe and sure a guide.

FREIGHT CAR SURPLUSES AND SHORTAGES*

By Arthur Hale
General Agent, American Railway Association

Eight years ago, in the fall of 1906, the country suddenly awoke to the fact that there was a great shortage of freight cars. No one knew just how great the shortage was; no one knew just where the shortage was, although it was widely stated that it was the greatest car shortage in history and was felt everywhere. The car shortage was coincident with serious congestions of loaded cars in many parts of the country. No one knew whose fault it was, although it was widely stated that it was the fault of the railways.

There was an investigation of the subject by the Interstate Commerce Commission, but the report contained no positive recommendations.

The railroads of the country, however, took up the question very seriously and arranged to secure current information as to car shortages and their causes and effects. They also, with the help of the interstate and state commissions, revised their demurrage rules, making them stronger, fairer and more uniform. We are still far from perfection, but possibly as a result of this action by the railways, we have since 1907 had no shortages or congestions comparable with those of 1906. The statistics which the railways have gathered have enabled them to foresee coming shortages, and to take such steps that when a period of car shortage does come it is met, so far as may be, by an improvement in car efficiency. There have been some congestions of loaded cars but wherever any marked congestion has occurred it has usually been composed of cars loaded to a point where there has been some defect in the demurrage rules or in their administration.

The statistics are collected by the American Railway Association. They include not only the car shortage and car surplus figures, but also figures showing the location of cars on the various roads, the average number of miles the cars make in a day, and comparisons of this daily car mileage with the earnings and the ton mileage. Most previous car statistics had been based upon the performance per mile. These new statistics introduced a time factor, and showed the car performance by the day. And much light has been thrown on the subject by these statistics, chief of which are the mileage per car per day, the percentage of loaded mileage, the tons per car and the ton-miles per car per day. Some of these terms and the situation which they deal with may seem abstruse. The car shortage is plain enough. It is reported whenever a shipment is offered for transportation and there is no car for it. It may be that the car shortage is only for a day or so and the shipment is merely detained at loading point until the cars arrive. On the other hand, when car shortages are serious and long continued, a shipper may send his shipment in via some other route so that it is lost to the railroad. Worse than this it may be that the order for the goods is cancelled in which case the shipment is not made at all.

A car surplus is reported whenever an empty car stands more than one day without a load. A reasonable car surplus is an advantage both to the shipper and the railroad, because

*A paper presented at the Conference of the Western Economic Society on American Railway Problems, Chicago, November 13 and 14.

it enables the railway to fill unexpected orders. Railways try to get shippers to order their cars a day ahead, but even the shipper himself cannot tell just what cars he will need until the very day of shipment and if there is not a certain amount of surplus unexpected shipments may be delayed.

The location of freight cars on the various railways is necessary if we are to know whether a railway or group of railways is supplying its proper quota of freight cars. The location is simply a report of the number of cars in use on a railroad and when this number of cars is compared with the number of cars which the railway itself owns we know at once whether the railway is using cars in excess of what it owns, or on the other hand, is forced to get along with a deficit in cars.

If for any period a railway reports a car shortage and for the same period is using cars in excess of what it owns, it is quite evident that that railway does not own enough available cars. It would seem to be the duty of such a railway either to purchase more cars or to improve its other facilities so that the cars which it owns can do more work.

It is to give the railways a standard for the work done by their cars that the other figures alluded to are compiled. Every railway ought to know every month the average number of miles per day its freight cars travel. To know whether or not this is a good showing, it must be in position to compare its own records with the records of other railroads. Again it helps a railway very little to know how many miles a day its cars are moved if it is not assured that a proper proportion of these miles is made under load. A high percentage of loaded mileage is an indication of good performance.

But this is not enough. Unless the cars are loaded as nearly as possible to their full capacity, a high percentage of loaded mileage may be altogether deceptive, and to ascertain whether proper loads are being secured, the ton miles are counted up and are compared with the car miles, so that each road may know for itself and its neighbors the average load per car, and what is better yet, the number of ton miles per car per day.

Perhaps this may be clearer if we investigate in the same way the economies of a man's automobile. Its first duty is to take the man to work and back. It is five miles from the man's house to his office. The man is taken alone into town. The car returns empty and in the afternoon the operation is reversed, making 20 miles a day. During the interval the automobile travels 30 more miles with members of the man's family; 10 of these miles are empty and the other 20 it carries, on an average, two people. We will then have for the car 50 miles a day of which 60 per cent is loaded; one passenger per car mile and 1⅔ passengers per loaded car mile and 50 passenger miles per car per day. We can hardly say that there is even a car surplus except at night. We may conceive that there is an automobile shortage for certain periods of the day. For instance, soon after the man has gone into town in his automobile, his wife may want it. Then there is a shortage of one car until it returns from town. In the same way the husband may need the car during the day or he may want it earlier than usual in the afternoon. He is short a car for these hours, because the automobile is not available. When the man cannot get the automobile for his return home, he may go back on the trolley. The automobile may be sent for him in error and may then make a round trip of 10 unnecessary empty miles, which would bring down the percentage of loaded mileage for that date from 60 per cent to 50 per cent, a bad showing. This would be a case when a car shortage actually resulted in the loss of a shipment. Ordinarily the automobile shortage would result merely in the delay to the man's movements. This, as above, is exactly what generally happens in a freight car shortage.

We can conceive that the delay to this automobile might lead to an approach to a demurrage system. If the wife holds the car an hour too long, the man might perhaps withhold $1 of her allowance. This would be the equivalent of demurrage. If, on the other hand, the man kept the automobile in town too long in the morning, his wife might be in a position to inflict some penalty upon him, possibly in the quality of his dinner.

When the automobile breaks down and has to be sent to the garage for repairs, we have 100 per cent cars in shops and a constant car shortage.

Suppose that the inconvenience of the arrangement is such as to induce the man to buy another automobile, and suppose the two cars now divide the work formerly done by one. We will then have a surplus of one car at one or another point most of the day, but normally there will never be any shortage, except when one of the cars is in the garage for repairs. It may happen that the work will be done with less total mileage, as the husband will be able to keep one car in town all day until he uses it back home in the evening. The total mileage for the two cars will then be only 40 miles, only 20 miles per automobile per day, apparently a bad showing; but the percentage of loaded mileage will be increased from 60 per cent to 75 per cent with the same 1⅔ passengers per loaded mile. The passenger miles per automobile will, however, drop to 25.

We have not the data to show whether or not this new arrangement is economical as compared to the old. One can conceive a man's friends accusing him to extravagance in keeping two automobiles to do the work of one, and of his explaining that he saves the gasoline necessary for ten miles of unnecessary empty movement. While his two machines will undoubtedly depreciate more through obsolescence than did the one, they will depreciate much less by use. The man may indeed conclude that the extreme convenience of the new arrangement is worth all that it costs.

In the same way the public is pleased with the railways when they can supply them promptly with cars, though it is unfortunately a fact that when there are no car shortages the mileage per car is low and frequently the percentage of loaded mileage as well.

Perhaps the most economical arrangement for our friend of the automobile would be to confine himself to one machine to take his family down town with him and make them stay in town until he was ready to go home. Here we would get more favorable looking automobile statistics from an economical point of view, but this would be at a sacrifice of a great deal of convenience. There would be frequent losses of tonnage when one party was not ready for another. Here again when our car statistics are most favorable economically it is always during a period of car shortage when shippers are sometimes obliged to wait a day or so for cars before they are able to make their shipments.

Taking another case, a little more technical. Let us suppose that some small railway has 100 stock cars which are regularly occupied in hauling stock a distance of 100 miles to make a Saturday market. We will suppose that these cars leave the point of origin on Friday, that they make the market on Saturday and that the stock cars are utilized with a return load which with its necessary delay for loading and unloading and slow freight movement occupies the rest of the week. Here we have a record of nearly 29 miles per car per day. There is a 100 per cent loaded mileage, the cars average 10 tons of stock and 30 tons with return load, so that the average tonnage per loaded car is 20 and the tons per mile per day are 429, all very good figures. Suppose that through some technicality or other mischance it is discovered that there are no demurrage rules in effect on the return load. The consignee finds that he need not unload the cars at destination on arrival but can await until his men are

through with certain other work. He then takes four days on an average to unload the cars instead of the two that it took before.

Now, you will remember the cars are in the stock trade two days in the week. The day after they are released is Sunday, and they have been occupied for the other four days of the week with the return load. Just as soon as the consignee begins to use four days in unloading, the cars will not be ready on Friday for the regular stock movement, and there is a serious shortage of stock cars unless they are supplied from some other source. There may also be a congestion at the unloading point. The facilities have probably been arranged for unloading the cars in days. If four days are occupied on each car there will be twice as many cars as there were. Suppose that this extra delay makes the round trip average a week and a half instead of a week. Then 150 cars will be needed to do the work of 100. They will average only 19 miles per day instead of 29. The mileage will still be 100 per cent. loaded, but the ton miles per car day will drop from 429 to 286, a low figure.

As is shown in the diagram the various figures have a distinct relation to each other. When there is a car surplus the percentage of loaded mileage falls, so does the mileage per car per day. The percentage of loaded mileage remains low until a car shortage comes, when at once the cars move faster and are loaded heavier. The car mileage applying as it does to all the cars is, of course, directly affected by the car surplus inasmuch as a surplus car does not move, but it is quite evident that the cars in motion do not move as fast as they did under the pressure of a car shortage. This is shown in the diagram by the two curves representing the ton miles per car per day, one of which excludes surplus cars and the other includes them.

It cannot be said that the introduction of these statistics has made any marked change in the practice of American railways. Their use has only confirmed transportation men in their old conviction that freight cars should be moved as fast as practicable, that they should be loaded as heavily as practicable and that empty mileage should be avoided. These are the principles on which the good car distributor has always worked on the division and the good superintendent of transportation at headquarters. The statistics are chiefly useful to them as a record which enables them to foresee coming shortages and to tell them whether or not they have handled their equipment well as compared with previous years or with other railroads.

Whatever conclusions are derived from the statistics must always be modified by traffic considerations. An attempt to handle cars too economically will discourage traffic and it is for this reason that the car surplus figures are of such great importance. If one railroad has a car surplus while its neighbors have occasionally car shortages, it is well to examine the situation and make sure that it is not attempting undue economies in the handling of its freight cars.

REPORT ON TIPTON FORD COLLISION

The Interstate Commerce Commission has issued a report by H. W. Belnap, Chief, Division of Safety, dated September 19, on the butting collision of passenger trains on the Kansas City Southern near Tipton Ford, Mo., on August 5, in which 38 passengers and 5 employees were killed and 34 passengers and 4 employees were injured. The collision was reported in the *Railway Age Gazette*, August 7, and in an editorial in the issue of August 14, the problem of the prevention of collisions and the relation thereto of the gasolene fire hazard were briefly discussed.

The collision occurred on a straight line where there is a view, from curve to curve, of about 900 ft. The tangent is 550 ft. long, and the collision occurred about 100 ft. south of the middle of it. Each train was running about 35 miles an hour. The operator at Joplin who handled the train order which figured in this collision, an employee of the Joplin Terminal Company, had been in the service of that company only about two weeks.

The conductor of the train which ran past the appointed meeting station was killed. There was a suggestion that the conductor's signature, on the copy of the order produced by the operator, was not genuine, but Mr. Belnap throws little or no light on this point, nor does he say who made the charge of forgery.

After stating these and the other facts, already known to the reader, he concludes his report as follows:

"This accident was caused by southbound train No. 209 failing to wait at Tipton Ford for northbound train first No. 56, as directed by order No. 84.

"While at the hearing before the Public Service Commission of Missouri the question was raised as to whether or not the name 'Nicholas' on the carbon copy of train order No. 84, furnished by Operator Hadley, was the signature of Conductor Nicholas, there was no positive or direct evidence that the signature was not genuine. While a number of persons saw Conductor Nicholas with papers in his hand at the train register book and when leaving it, no person saw him sign or receive train order No. 84 except Operator Hadley, who is positive in his statements that Nicholas signed and received this order at Joplin. On account of the entire crew of train No. 209 being killed in the collision and their bodies cremated, no evidence is procurable as to the reason why the direction contained in order No. 84 was not obeyed by them.

"Conductor Nicholas entered the service of the Missouri & North Arkansas as a brakeman on January 17, 1901, and was promoted to conductor on April 1, 1901. In June, 1901, he left the service, but was reinstated as conductor in April, 1902. On November 15, 1906, he was promoted to superintendent, but resigned that position September 12, 1908, and resumed work as a passenger conductor. His record was good.

"Operator Hadley is 29 years of age and secured his first position as an operator in 1903, since which time he had been in the employ of eight different railroad companies. It further appeared that when he first became a telegrapher he was discharged by the Atchison, Topeka & Santa Fe at Holly, Colo., for failure to deliver a train order. He entered the employ of the Joplin Terminal Co. about July 22, 1914, and had been rendering satisfactory service.

"This is the first accident investigated by the commission wherein a gasolene motor car was involved. On account of the fire caused by ignition of this highly inflammable substance, the casualty list in this accident was much larger than it otherwise would have been. The rapidly increasing use of these motor cars, carrying large quantities of gasolene, introduces such an additional element of danger as to demand extraordinary precautions against the possibility of collisions wherever such cars are used.

"As previously noted, no block-signal system is in use on the Kansas City Southern. It appears also from the facts developed in this investigation that even the inherently weak train-order system is not used at its highest degree of efficiency on this railroad. Rule No. 208 provides for the placing of a meet order at the designated meeting point 'when practicable.' It was obviously not practicable to use the middle order in this case, for the reason that no operator was stationed at Tipton Ford.

"The 20 miles of track between Joplin and Neosho is used jointly by trains of the Kansas City Southern and the Missouri & North Arkansas. Four first-class and two third-class trains of the latter road are scheduled to pass over this section of track daily, subject to the operating rules of the Kansas City Southern. There are two passing tracks between Joplin and Neosho and it must frequently become necessary to require trains to meet at those points; yet no operator is employed at either place, and it is thus rendered impossible to use the middle order at meeting points on this section of track."

Convention of Railway Electrical Engineers' Association

Electric Headlights, Wireless Telephones, Industrial Trucks and Head End Equipment Were Discussed

The seventh annual convention of the Association of Railway Electrical Engineers was held at the Hotel LaSalle, Chicago, October 27 to 30, C. R. Gilman, chief electrician, Chicago, Milwaukee & St. Paul, presiding. The secretary-treasurer reported a cash balance of $1,125 and 541 members.

DATA AND INFORMATION

This committee sent a list of questions to 67 of the most prominent roads, 50 of which replied in considerable detail. In regard to the car lighting systems, it was found that in the United States and Canada there are 18,936 electric lighted cars, of which 12,458 are lighted by axle generator sets and 2,707 by straight storage. There are also 259,842 lead battery cells, 31,883 nickel iron cells and 273 head end generator sets in service. Within the past two years there has been a falling off in the use of the head end equipment. In regard to electric headlights, the returns from the circulars show that 12,432 arc lights and 1,287 incandescent lights are now in use. This is a material increase in the use of incandescent lights over the roads reporting last year. Under the subject of Shop and Station Equipment it was found that about 25 per cent of all the lighting units reported were 250 watt Tungsten lamps, and about 21 per cent alternating current arc lamps. The use of the Tungsten filament lamps greatly predominates in the shops of the railroads reporting. The total capacity of the generators in use by those roads replying to the circular is 123,401 kw. alternating current and 65,077 kw. direct current. Of 415 shops reported, 42 per cent, representing 30 per cent of the total power, purchased power from local central stations, while 58 per cent of the shops, representing 70 per cent of the total power, generated their own power. The horsepower of the motors reported in use in the shops amounted to 176,954, or 5.37 hp. per locomotive handled in those shops. The following table shows the number and total power of the various types of motors reported:

Type of motor.	Number	Total horsepower	Average horsepower	Horsepower of the greatest number
Direct current	4537	70,234	15.5	5
A. C. single phase.....	177	527	3.0	¼
A. C. two-phase.....	1118	17,150	15.3	10
A. C. three-phase.....	5601	96,595	17.3	10

The direct current motors are very much more numerous in the smaller sizes than the a. c. motors, and constitute 40 per cent of the total number and 38 per cent of the total horsepower of motors in use on the railroads reporting.

The information gathered on shop traveling cranes showed that there is a wide difference in the motor horsepower used for the same capacity cranes. For instance, the main hoist motors of 108 cranes of 10-ton capacity, as reported, varied from 7 h.p. to 50 h.p., with an average of 26.5 h.p. The committee recommended that a committee be appointed to establish standard sizes of motors and motor mountings for the cranes, as it was believed that much cheaper equipment could be obtained and the cost of maintenance would be much less.

The report is signed by: E. Wray (Elec. Eng.) chairman; T. V. Buckwalter (Penn.); C. J. Causland (Penn.); B. F. Bilsland (Gen. Elec. Co.); A. J. Farrelly (C. & N. W.); J. E. Gardner (C. B. & Q.), and W. M. Wiggins (Pullman Co.).

STANDARDS

The committee on Standards restricted its work this year to the following three subjects: Axle pulleys, generator pulleys and generator pulley fits on armature shafts. It emphasized particularly the necessity of establishing standards for generator pulleys. At the present time there are more than 20 different types of generator pulleys and more than 10 different pulley fits. Two sizes of axle pulleys were recommended, one having a maximum diameter of 21 in. on the crown of the face and the other 16 in. Two sizes of generator pulleys were also recommended, the large pulley to be 10½ in. in diameter and the smaller pulley 8 in. in diameter, both being measured on the crown of the face. While the committee recommended a generator pulley fit with a ¾ in. in 12 in. taper, a 1½ in. shaft, and a 2⅝ in. hub, it was finally decided to make the generator pulley fit with a 1½ in. in 12 in. taper, a 1⅝ in. shaft and a 4 in. hub. It was believed that by doing this the larger pulley bearing obtained on the shaft would be of value and the longer hub would permit of having the web of the pulley nearer the center. It was also suggested that the 1½ in. taper would correspond with the taper recommended for roller bearings, and thus keep the recommendations of the association standard.

The report is signed by: D. J. Cartwright (L. V.) chairman; J. H. Davis (B. & O.); E. W. Jansen (I. C.); Ward Barnum (L. & N.), and C. H. Quinn (N. & W.).

ELECTRIC HEADLIGHTS

It was believed that wiring from the generator to the headlight through the hand rail was more costly in the long run than where a separate conduit was provided. The use of a one inch conduit with condulets at the outlet with a special connection box at the cab so that the cab or conduit can be removed without interfering with the wires offers the best solution of the wiring problem. It is expected that within a short time the lamp manufacturers will be able to produce a lamp with a concentrated filament of high candle power that will prove very serviceable for the incandescent headlights of high power. Attention was also called to the battery headlights which are used with good results on the Southern Pacific. The lamps have a candle power of 140, and are of the nitrogen-filled Tungsten type, requiring 13 amperes at 6 volts. The headlight lamps are mounted in standard oil lamp reflectors and in addition to these three cab lamps and two blizzard lamps are used. The batteries have a capacity to run the entire lighting equipment for 13 hours. They are mounted on top of the boiler and are removed each trip with a jib crane for charging.

The report is signed by: C. R. Sugg (A. C. L.) G. E. Murray (C. & N. W.); J. J. Hack (So. Pa[illegible]man; Gardner (C. B. & Q.), and L. C. Hensel (St. L. & S. F.).

Discussion—J. L. Minick, Pennsylvania Railroad, w[illegible]ticipated in the tests of locomotive headlights conducted Pennsylvania Railroad for the Master Mechanics' Assoc spoke of these tests and suggested that this committee co-op with the committee of the Master Mechanics' Association the Lamp Committee of the Association of Railway Electri Engineers for the purpose of establishing standard methods rating the different lamps, and of obtaining standard voltages.

WIRELESS TELEGRAPH AND TELEPHONE

Dr. Frederick H. Millener of the Union Pacific, presented an illustrated talk on the wireless telegraph and the wireless telephone as an adjunct in the operation of a railroad. Doctor Millener spoke of the experiments he had made on the Union Pacific towards finding a method of signaling the cab of a locomotive or communicating with a train. While experimenting he used a storage battery electric truck weighing 5,500 lb. He was able to control the movements of this truck throughout the narrow gage railway on which it was installed by means of the wireless, but he found that this method was not reliable as atmospheric conditions will sometimes interfere with the correct operation. It was therefore decided to discontinue the work on the mechanical wireless cab signal, as it would not be reliable. The next work taken up was the wireless telegraph between stations. These experiments were made for 600 miles west of Omaha, where it was found that in the summer the static electricity causes disturbances. On account of this the best results

could only be secured by using a higher frequency than 60 cycles, for when there is static electricity prevalent the musical note in the receiver is so low that it is confused with the atmospheric or static electricity. For this reason a frequency of about 550 cycles, transformed up to 12,000 volts in an open core transformer, was used.

It was found absolutely necessary to have the aerials close and compact, and they should be of simple construction and easy to repair. It has been found that the use of the flat top aerial is much more practical than the umbrella type. It should be elevated by two self-sustaining towers, the height of which should be at least 210 ft., and it should be constructed so as to stand a wind stress of 90 miles an hour. The aerial should be placed close to the tracks, as the wireless wave will be rendered directional by the track and will travel farther with the rail than in other directions. For more than three years the Union Pacific has been ready to install a wireless telegraph, but for various reasons not connected with the wireless, it has been postponed.

In the meantime, experiments have been made with the wireless telephone. The apparatus that has now been designed at the Union Pacific shops is a composite telephone. By that is meant, it is possible to talk by wireless and also to use part of the same apparatus to talk by wire between the cars, or, when at stations, to talk over the local or long distance wires by making connections between the cars and the local exchange. When used as a wireless telephone it will be possible to talk with the train ahead, the train behind, or the station. The device is so arranged that while talking from car to car it is selective talking and selective signaling. While talking on the long distance wire only one person at a time can talk from the train. The wireless system is placed in operation by first calling the attendant in the baggage car and requesting him to start the wireless generator. The aerial on the train sends the messages to the telegraph lines along the side of the track; part of these wires have been balanced up and equipped with condensers around the telegraph instruments and are used as an aerial for the station.

INDUSTRIAL TRUCKS

The committee on this subject recommended a standard capacity of 4,000 lb. for industrial trucks. A lower rating was not considered advisable for the reason that the industrial trucks are years loaded to about 4,000 lb., or slightly in excess of that ... and this condition would result in overloading. It was recommended that a speed of 5 m. p. h. be made standard, ... an exception of 7 m. p. h. for operation under special conditions where the runs are comparatively long and the runways free from workmen.

A standard voltage of 24 volts was recommended for general industrial truck service, and a battery consisting of either 12 cells of lead battery, with jar sizes 5 13/16 in. by 6 3/16 in., with a high bridge and a 5/32 in. wall; where Edison batteries are used, it was recommended that 21 A-6 cells assembled in three trays of seven cells each be used. It was also recommended that the motor voltage be rated at 24 volts.

The report is signed by: T. V. Buckwalter (Penn.) chairman; C. E. F. Ahlm (Elwell-Parker Elec. Co.); F. H. Fildes, (Penn.); A. H. G. Grorer (C. W. Hunt Co.); J. E. Hale (Goodyear Tire & Rubber Co.); H. G. Thompson (Edison Storage Battery Co.), and Dr. W. E. Winship.

ELECTRIC TRACTION

The committee on Electric Traction reviewed the present status of electric traction as applied to steam roads, the ordinary urban and interurban line not being considered. A short description of the various railroad electrifications, both in this country and many European countries, was included in the report.

Direct Current Installation.—In regard to the use of direct current on railroad lines the committee stated that the low voltage system is extremely flexible and is particularly desirable for its range of operating speed, but it cannot be considered economical for long lines carrying heavy traffic, as expensive substation installations are required in such cases, and the distribution system will be unduly expensive. The potential used for these installations varies from 500 to 750 volts, and for traction work a third-rail system of distribution is almost universal, as it is not practicable to collect the heavy currents taken by the locomotive from a trolley wire. It has been a natural step in the progress of electric traction to increase the voltage and thus reduce the amount of current to be transmitted for a given load requirement. The voltage of 2,400 and 3,000 volts is now considered standard for high voltage, direct current, heavy traction installations. It is doubtful if a third-rail system of distribution will be desirable for this high voltage direct current due to the necessity for considerable insulation coupled with the requirement of obtaining sufficient clearances for the installations.

Alternating Current System.—The attractive feature of the single-phase commutating motor type system has been its facility to supply electricity direct to the locomotive at high voltages, the only limit being the practical insulation of the locomotive equipment. It has not been found necessary to go beyond 12,000 volts up to the present time, and this potential provides for heavy power supply with 20 to 30 miles between generating stations, or transformer sub-stations if the power is taken from a transmission system. It has been the standard practice in America to use 25 cycles for this system as a higher frequency is not practicable. The advantages of this system consist in the elimination of sub-stations with rotating apparatus, an extensive electrification only requiring outdoor sub-stations containing transformers and switching equipment, and the smaller amount of copper for feeder requirements.

The three-phase system of distribution, operating induction motor equipment on locomotives, has been used considerably in Europe. A double trolley and track circuit is used for the three legs of the system. The only installation of this kind in this country is through the Cascade tunnel of the Great Northern and has been in successful operation for about five years.

Electric Braking.—In the case of the electrification of roads having heavy grades, such as occur on mountain divisions, the use of dynamic braking is an important consideration, as it saves the wear and tear on the mechanical braking equipment and adds to the safety of operation.

The report is signed by: H. M. Van Gelder (Westinghouse, Church, Kerr & Co.), chairman; J. H. Davis (B. & O.); D. C. Woodbury (N. Y. C. & H. R.); Paul Real (N. Y. N. H. & H.); C. P. Kahler (O. S. L.), and C. B. Keiser (Penn.).

AXLE EQUIPMENT

The committee on this subject found that almost without exception roads operating in the northwest quarter of the United States favor the head-end system on long runs for through trains. On the other hand, owners of practically all cars in the eastern half of the country and in the southwestern quarter, as well as the owners of all cars in Canada and England, favor the axle system exclusively for train lighting. From statistics obtained from various roads in the United States, Canada and England, it was found that on July 1, 1914, 23,472 cars were equipped with the axle lighting plant, while 4,627 were equipped with the head-end equipment. During the years 1913 and 1914, 3,642 cars were equipped with the axle lighting plant, whereas only 169 cars were equipped with the head-end system. The average cost for maintaining the axle-light equipment on one road operating 166 cars for the year ending December 31, 1913, is included in the following table:

Item	Road maintenance	Shop maintenance	Total maintenance	Cost per 1,000 car-miles
Generators	$3,171.49	$651.62	$3,823.11	$0.3192
Batteries	875.19	1,332.07	2,207.26	.1843
Labor	8,365.08	2,522.56	10,887.64	.9092
Total direct charge	$12,411.76	$4,506.25	$16,918.01	$1.4127
Lamp renewals	1,995.83	162.92	2,158.75	....
Miscellaneous	309.18	488.05	797.23	....
Credit	55.00	369.11	424.11	....
Grand total	$14,661.77	$4,788.11	$19,449.88	$1.6241

The total mileage made by these 166 cars was 11,975,599 miles.

From the information obtained from other roads, the average cost per 1,000 car-miles for this road is somewhat below the average of all the roads from which the information was obtained. The average maintenance cost per 1,000 car-miles of those roads reporting in the United States was $1.78, which corresponds to a cost per car per month of $14.51. Attention is called to the high cost of maintaining dynamos as compared with all other parts of the equipment. The battery maintenance seems to be a little more than one-half that of a dynamo.

The report is signed by: H. R. Bucks (O. S. L.), chairman; R. L. Smith (Gt. West., Eng.), and E. M. Cutting (Edison Storage Battery Co.).

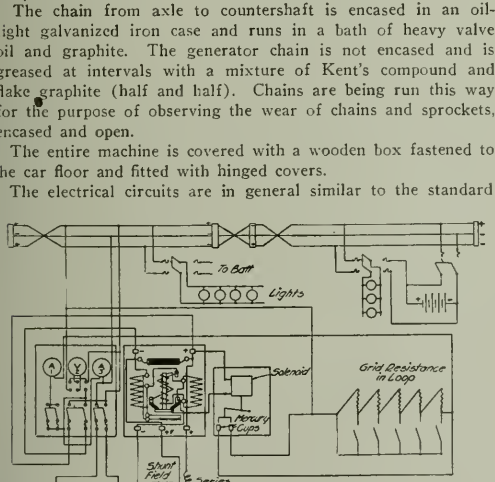
HEAD-END EQUIPMENT

The report of this committee was restricted almost entirely to the history and description of the axle-driven head-end generator as used by the Northern Pacific. In 1909 this railway experimented with an axle machine designed to light an entire train and the machine now in service is known as the Gould axle train lighter. It is a 20-kw., 6-pole commutating pole, compound-wound, 80-volt, 300 to 2,100 r. p. m. generator mounted on a cast-steel base, arching the center sills and extending into the car through two rectangular holes in the car floor. The machine is driven by a Morse silent chain from a countershaft, which in turn is chain-driven from the forward axle of the forward truck. The wheels on this axle do not have a brakebeam. The machine itself is ring oiled but the counter shaft is equipped with ball bearings.

The chain from axle to countershaft is encased in an oil-tight galvanized iron case and runs in a bath of heavy valve oil and graphite. The generator chain is not encased and is greased at intervals with a mixture of Kent's compound and flake graphite (half and half). Chains are being run this way for the purpose of observing the wear of chains and sprockets, encased and open.

The entire machine is covered with a wooden box fastened to the car floor and fitted with hinged covers.

The electrical circuits are in general similar to the standard



Wiring Diagram of Generator, Regulator Batteries and Train Line for Unit Axle System

head-end system of the Chicago, Milwaukee & St. Paul. The lamp current at present passes through a temporary variable resistance, causing a drop from charging voltage to 64 volts. A large lamp regulator of 125 amperes capacity is being constructed to take the place of the hand operated variable resistance and other test equipment now in the car.

The generator controlling apparatus consists of a regular Gould generator panel constructed on a large scale. The current coil limits the current to 125 amperes, while the voltage coil limits the generator voltage to 80 volts. The current coil is equipped with a shunt resistance that causes it to limit the current to 250 amperes if this is desired. The main switch closes at 66 volts, or when the train speed reaches 18 m. p. h.

Temporarily there is installed a solenoid which short circuits the variable loop or lamp resistance when the main switch drops out. The new lamp regulator, which will be large enough to take care of the entire train, will take care of this feature.

The Gould axle lighter has made the following mileage to date without a light failure:

	No. of trips	Miles
From St. Paul to Glendive, Mont., and return	2	2,668
From St. Paul to Seattle, Wash., and return	1	3,808
From St. Paul to Winnipeg, and return	32	30,796
Total miles		37,272

The equipment is practically hand operated at present.

The distribution of the batteries on the train equipped with the unit axle system is a point to be considered. It is the practice on the Northern Pacific to place 9 plate, 200 ampere hour batteries under the postal car, if any, the dynamo car, the standard sleepers and the observation car.

One fundamental difference between a steam head-end system and a unit axle system is that with the latter system the lamp load is carried by the batteries at every stop the train makes. For this reason steam head-end experience cannot be used as a basis for determining the exact relation that should exist between the connected lamp load in the train, the current output of the generator and the total battery discharge current at the eight-hour rate.

Following is a statement showing comparative costs of operating the steam head-end system and the unit axle system on the Northern Pacific:

	Steam Head End	Head End Axle
Current consumed per day (all cars), per actual check of electric lighted trains	1,300 kw. hr.	1,300 kw. hr.
Pounds of steam consumed by General Electric Company's turbine per kw. hr. delivered, for average load, per actual test N. P. and C., B. & Q.	160 lb.	.....
Pounds of steam consumed by axle generator per kw. hr. delivered (average load), based on 40 lb. of steam per drawbar h. p. (N. P. test), and 95 per cent efficiency in chain drive	.....	59.5 lb.
Total pounds of steam consumed per day for lighting of cars	208,000 lb.	77,300 lb.
Pounds of coal required per day for lighting of cars, based on 7 lb. of water evaporated per pound of coal (N. P. test)	29,700 lb.	11,042 lb.
Cost of coal per day @ $3 per ton	$44.56	$16.56
Cost of coal per year @ $3 per ton	$16,300	$6,045.50
Wages per year:		
24 baggagemen @ $5 per month, 36 train electricians @ $85 per month	$38,160	.....
Total cost per year, fuel and wages	$54,460	$6,045.50
Cost of current production per kw. hr. (fuel and wages above mentioned)	11.5c	1.27c
Actual saving per year in favor of head end axle light system	.....	$48,414.50

The saving on other roads of course depends on the wages paid to train electricians and other details of operation, but in any case it would no doubt be considerable. This is because the efficiency of the locomotive is approximately four times that of the turbine at one-third load and also because with the unit axle system all manual attention on the road is unnecessary. It has also proved unnecessary on the Northern Pacific to add local or terminal inspectors due to the use of this system. The men who have taken care of the steam head-end sets have no trouble taking care of the unit axle machines. In fact, due to the fact that no terminal charging is necessary with the unit axle system, they have more time to spend on inspection of machines.

The absence of excessive heat in baggage and express cars practically eliminates the claims for damages to baggage and express due to this cause.

The report is signed by: K. R. Hare (N. P.), chairman; Jos. A. Andreucetti (C. & N. W.); C. R. Gilman (C. M. & St. P.), and J. J. Hack (So. Pac.).

ILLUMINATION

From the results of the day coach tests reported at the last convention this committee recommended the following positions for the 2¼ in. shade holder; 1⅛ in., ½ in. and 0 in. above the top edge of the reflector, and one position for the 4½ in. shade holder which is 1 in. above the top edge of the reflector. With some of the postal car lighting units, however, other positions

are required to give the proper distribution of light. The committee also recommended 65 deg. as the limiting screen angle of reflectors in car-lighting service—that is, no portion of the bare lamp filament or bare mantle should be visible to the eye when the unit is observed at an angle of 65 deg., or greater, from the nadir.

The committee also presented a progress report of the work they are doing on the illumination of classification yards, especially pertaining to track scales.

The committee believes that the incandescent lighting will eventually supersede arc lighting in the railway field, with possibly a few exceptions, although improvements have been made in the arc lamp that should not be overlooked.

In the incandescent lamp field the most important improvements have been made in the development of the high candle power, high efficiency Mazda lamp. With the larger sizes of multiple gas-filled Mazda lamps, the reduction feature is approximately 90 per cent as contrasted with about 78 per cent for the other Mazda lamps—that is, in comparing the lamps on a horizontal candle power basis for the same candle power in each case, the total light flux of the improved lamp is 90 per cent compared with 78 per cent for the other class. The reports of the earlier installations of multiple lamps have shown widely varying results. With the improvements that have been made in the past few months in obtaining more uniform life performance of gas-filled lamps, as well as that which can be expected in the coming months, the committee feels that there should be no hesitancy in adopting this type of lamp as far as life performance is concerned.

The report is signed by: L. S. Billan (B. & O.), chairman; J. L. Minick (Penn.); H. C. Meloy (L. S. & M. S.); L. Schepmoes (Safety Car Heating & Lighting Co.); D. P. Morrison (P. & L. E.); W. H. Robinson (West. Lamp Co.); P. S. Millar (Elec. Test. Lab.), and C. W. Bender (Nat'l Lamp W'ks.).

SHOP PRACTICE

This year the committee on Shop Practice considered the subject of the electrical equipment of cranes, hoists, transfers and turntables. There is a very strong sentiment in favor of direct current motors for crane and hoist service. This is due not only to the lower maintenance costs of direct current motors, but also to the increasing use of dynamic braking. The most interesting development in connection with transfers and turntables is the operation of tractors instead of mounting the motors on the platform direct. Here, also, preference is given to the direct current motors.

The series wound direct current motor possesses the characteristics which make it ideal for the requirements of overhead crane service. The service requirements are such that crane motors must have a high starting torque, but it also permits the use of motors rated on an intermittent load basis, so it has become customary for most manufacturers to use motors which are really too small for the work.

Of the controllers for crane motors the drum type is preferred by most engineers because of its simplicity, ease of repair, interchangeability of parts, magnetic blow-out, and being enclosed.

Transfers and Turntables.—Where direct current is available it is considered preferable by a large number of shop men for this class of service, and series wound, railway type motors are generally used. If alternating current only is available motors with wound rotors and drum type controllers are generally used, although high torque induction motors have also been tried with some success.

The report is signed by: C. W. Cravens (C. & C. Elec. & Mfg. Co.), chairman.

YARD FACILITIES FOR CHARGING STORAGE BATTERIES

In order to determine the size of generating units for charging storage batteries the number of cars to be charged at one time must be known, the length of time they can be placed for charging and the approximate amount of charging required. It will be found that abnormal conditions caused by extremely cold weather interruptions to the service, etc., will at times cause a much greater demand and the committee recommended, therefore, an allowance of at least 50 per cent above the normal load. It was also suggested that the dependence for service should not be placed on a single unit, as in case of a breakdown the source of power will be entirely disrupted.

Platforms erected throughout a passenger yard are an economical investment in taking care of the storage batteries so that quick repairs and changes to the batteries and axle generators may be made in the shortest possible time. Electrically-operated trucks of sufficient capacity to carry a 30-volt set of standard car-lighting batteries and of a height to reduce the lift both at the cars and the battery racks to a minimum, was strongly recommended.

The report is signed by: D. B. Pastorius (Penn.), chairman; J. A. Andreucetti (C. & N. W.); E. S. M. MacNab (C. P. R.). and N. H. Keirn.

OTHER BUSINESS

Other reports were presented on Wire Specifications, Standard Rules for Car Wiring, Outside Construction and Yard Lighting, giving detailed information and specifications which are of direct interest to electrical engineers.

The following officers were elected for the ensuing year: President, H. C. Meloy, Lake Shore & Michigan Southern; senior vice-president, E. W. Jansen, Illinois Central; junior vice-president, J. L. Minick, Pennsylvania; secretary-treasurer, Joseph A. Andreucetti, Chicago & North Western.

Germany's Interrupted Railway Traffic.—The Swiss correspondent of an English contemporary, writing from Berne under date of September 1, says of conditions in Germany that "Germany's loss in railway traffic can hardly be estimated. Her railways are now carrying certain goods at reduced rates because if they did not do so German merchants, owing to heavy war risk insurance, would not be able to bring any goods at all on to any neutral market at a price which anyone could afford to pay. The other day the Hamburg Merchants' Association appealed to the government to allow them to carry goods on German railway lines at 50 per cent reduction, because such goods had now to be taken a long and expensive railway journey to a neutral port in order to be shipped."

Financial Returns of the Malay States Railways.—The Federated Malay States Railways' Administration has the control of the railways in the Malay Peninsula (including the Johore State Railways leased since January, 1912), and in the adjacent islands of Penang and Singapore. During 1913 the Singapore Railway (20 miles), which had been leased to the administration from the colonial government as from January, 1912, at a rent of $150,000, was purchased for $4,136,000. The total length in operation by the administration is now 771 miles, including 37 miles opened in 1913. In the recently published report it is stated that there was a steady development of railway business during 1913, but comparison with previous periods is difficult, as the expenditure covers a period of 12½ months and the revenue a period of 12 months only. Expenditure was previously dated from December 16 of one year to December 15 of the next, but commencing with the 1913 report it has been decided to include expenditure from January 1 to December 31 of each year to correspond with the period for revenue. This has reduced net profits for 1913 from $3,050,184.41 to $2,722,946.41 and the consequent interest on capital from 4.41 per cent. to 3.93 per cent. Gross earnings, including those from motor services, amounted to $9,548,374, an increase of $1,127,357, of which $640,746 came from passengers and $526,630 from freight and live stock. Apart from the additional $327,238 due to the change in accounting the expenditure increased by $758,768. Locomotive fuel was mainly responsible for this increase.

Convention of the Railway Development Association

Ways and Means of Creating Traffic by Improving Farm Production and Promoting Industries are Discussed

The semi-annual convention of the Railway Development Association was held at the Hotel La Salle, Chicago, on November 10 and 11. F. H. LeBaume, agricultural and industrial agent of the Norfolk & Western, presided, and an address of welcome on behalf of the Chicago Association of Commerce was presented by J. D. Shoop. H. H. Gross, president of the National Soil Fertility League, also addressed the convention.

Abstracts of some of the principal papers presented at the meeting are as follows:

PERSONAL WORK WITH FARMERS ON THE SOUTHERN

M. V. Richards, of Washington, D. C., industrial and agricultural commissioner of the Southern and associated lines, discussed the subject of personal work with farmers in part as follows:

The efforts of the railway development man should be for a well-rounded development in the territory his lines cover. While the manufacturing city or district may be developed to the fullest extent with accompanying agricultural development in the nearby regions, it is poor policy to attempt such urban development without the corresponding attempt to advance the interests of the farm. A well sustained and prosperous agricultural community feeds the nearby manufacturing town at the lowest cost and, more than this, it does its part in furnishing efficient labor for industrial establishments.

Nearly all railroads which have maintained industrial departments, have at the same time maintained immigration departments; very often the industrial and immigration work being carried on by the same people. In this way they have sought to build up both the urban and the farm population. Within the last few years, railroad development work has been extended, through direct effort, to reach the farmer already settled in the company's territory and so increase the quantity and quality of farm products and in other ways help the farmer to a better conservation of his land and better returns from his efforts. This, of course, is carrying to the furthest the policy of enlightened selfishness which has been behind so much of the railroad work. During the last few years, the Southern and associated lines have undertaken to carry on to the greatest possible extent a personal work among their farmers, with the idea that the products of our southern lands can be very greatly diversified and that, acre for acre, these lands can be made much more profitable than they ever have been. When the boll weevil first threatened the territory of our company, agents were put into the field under what then was called the "cotton culture department," whose duties were primarily to work with the growers of cotton in an attempt to combat the ravages of the weevil and to overcome, through the diversification of crops, the losses resulting from it. This work has since then been greatly extended.

During the past three years, the Southern and associated lines have carried on, with a force of from fifty to sixty men, direct work with the farmers in their territory, which covered a very large portion of the activities of farm life. This work was carried on through separate departments—the land and industrial department, which had a force of dairy and poultry agents, and also one or two horticultural agents; the department of farm improvement work, with a large force of field agents, who spent their time directly with the farmer; and live stock agents, whose attention was given entirely to the building up of the general live stock industry. This work has now all been consolidated under the industrial and agricultural department of the railroad. The agents working with the farmers, must, of course, first of all, get close to them and obtain their confidence. Our field agents constantly move among the farmers, consulting and advising with them about their crops, helping them in selecting seeds, advising in regard to the preparation of the soil and its conservation, and in every way doing what they can to secure a better agricultural development. The same method of work has been followed by the livestock and the dairy agents. All of these agents have been preachers of advanced agriculture, and have endeavored to convince the farmer that better methods must be adopted and that these better methods will pay. The work so far has, we believe, been profitable.

In the year 1913, the agents of the department of farm improvement work made demonstrations with 2,409 farmers. By demonstrations, I mean that that number of farmers raised their crops under the direction of these agents, using the methods they advocated. These were generally the same methods advised by the fields agents of the United States Department of Agriculture and of other advanced agriculturists. In these demonstrations, 38,256 acres were planted to cotton, 15,755 acres to corn and 4,584 to miscellaneous crops, the entire work covering 58,595 acres. Returns from these acres showed at the end of the season that the average cotton production per acre was 1,130⅞ lb. of seed cotton, which was about twice the average production of the entire territory. The average yield of corn per acre on these fields was 40 13/16 bu., while the average corn yield for all the states covered was only 19 3/10 bu. Individual farmers made as high as 110 bu. of corn to the acre and 2,600 lb. of cotton to the acre, not on single acres only, but on good sized fields. During the winter months these agents turn their attention to personal work among the farmers in consultation regarding coming crops and in holding meetings, in which various farm and crop problems are discussed. Last year 804 of these meetings were held, at which there was a total attendance of 95,721.

Some years ago we began making educational exhibits at local fairs along our lines. These exhibits included demonstrations in dairying, horticulture and domestic science. Through them we were enabled to reach many farmers and their families. We have found that, as a rule, the farmers have welcomed the assistance thus given them and that, outside of those who made demonstrations under our agents, large numbers have used the same crop methods. The work which our field agents are doing is also carried on in the southern states by the county field agents of the Department of Agriculture. Between these agents and our own there has been co-operation, the railroad company endeavoring to cover, so far as possible, fields which the government agents did not reach. It is largely to this personal demonstration work among farmers that acre-corn-crop yields in the southern states are growing larger, and also that there is a steady advancement in the diversification of crops and, therefore, progress in general agriculture.

In the dairy and poultry work, we have maintained a dairy instruction car, which has been constantly at work along our various lines, usually making a stop of a day at a station. At these stops our own agents and state dairy agents have made demonstrations of dairy equipment, delivered lectures on dairy cattle and on the dairy problems which the farmer has had to meet. The agents in their travels have preached the necessity for more attention to dairy cows, to the introduction of first-class stock, the building of silos, good dairy barns and milk houses and proper cleanliness in handling milk. During the past year our agents report the purchase, through their instrumentality, of 1,000 pure-bred bulls, cows and heifers, and 926 grade animals. For the same time, they report the building of 713 silos, 131 modern dairy barns and 48 milk houses, and the establishment of 78 dairies and four creameries.

To some of you this may not appear as a great work. Remember, please, that the South has not heretofore been a dairy

section, except perhaps in two or three isolated paces. The silo has almost been an unknown thing, and under our system of devoting the farm to mostly cotton or tobacco, dairy farming has been neglected, notwithstanding the conditions for its success which so largely prevail. The same methods of work have produced like results in the introduction of better grades of beef cattle and increased attention among farmers to general live stock raising. It is evident to anyone who has made a study of the farmers' problems that a great deal of loss has come to farmers in all sections of the country through the inability to properly market farm produce. This has caused many farms to be unprofitable. Our company now maintains a market bureau, with market agents, who work with the grower and the buyer seeking to solve the problem of better markets for our farmers. This bureau has so far been successful.

Personal work among the farmers, whether carried on by the railroad company, the government, local or other associations, is a success, and its results prove that it is a necessity.

IMMIGRATION.

L. J. Bricker, general immigration agent of the Northern Pacific, read a paper on "Securing Desirable Immigration." Some extracts from his paper follow:

If only one person located at some point on our road, though he may have no means, he has to be fed and clothed, and the money expended for this purpose inures to the benefit of the local merchant or tradesman, and some per cent of it reaches the railway company, directly or indirectly. When one of our representatives has induced a farmer to locate in our territory, he has done what will prove to be a lasting benefit to the company. When an immigrant learns that he can get better results in a new field, he informs his friends, and others will follow him later on. A small farm in the eastern or middle states will sell for enough cash to enable the owner to double or treble the acreage in a new country, and still have sufficient cash left for all modern conveniences and utilities.

The desirable foreign settler is the industrious, God-fearing, liberty-loving man, who will readily assimilate and quickly become a loyal American citizen. I believe we still have plenty of room for this type of immigrants. In this connection it seems to me that the work of eliminating the *undesirables* should be done as much as possible on the other side, rather than waiting until they reach our shores.

With reference to our domestic settler—the man who, by his unfailing industry, indomitable courage and will power, has wrested a livelihood for his family from poor and often rocky land—is the man who will make a phenomenal success when located on fertile soil in a congenial climate. That man will not expect a fortune to spring up over night, like Jonah's gourd; but he will patiently and cheerfully await the natural returns from his labors.

The immigration agent, above all else, should possess patience. The agent who, in his eagerness to show results, quickly, tries to hustle settlers along his line without taking into consideration whether the settlers in question are at all adapted to that particular territory, is liable to bring his company more grief than prosperity; for one discontented man can do a locality more harm than a ton of advertising matter can do it good, whereas a little time and patience expended in finding out the man's special fitness for certain lines of work, and directing him to the locality best adapted to his needs, would make of him a "booster" instead of a "knocker." In other words, it pays, and pays big, in immigration work, to "make haste slowly" and do your work thoroughly.

DIVERSIFIED FARMING.

Diversified farming and its relation at this time to the cotton grower was discussed by J. C. Clair, industrial and immigrationer of the Illinois Central, and J. F. Jackson, agricultural agent of the Central of Georgia. Mr. Clair said in part:

Today the southern cotton crop will reach upward of 15,000,000 bales and millions of acres of land could be cleared that would produce many more millions of bales. Heretofore cotton has been as good security as a bank-note. Today, however, with the largest crop ever produced on the southern farmers' land, and produced at the greatest expense, he finds this cotton is without a demand, and while the war continues the crop must be reduced. There has been a campaign of education for the past 10 years for the diversification of crops. Agronomists, business men and industrial men have foreseen the awful plight which the one-crop system would some day bring the south. Only an occasional planter has had the temerity to leave off some cotton and grow fruit on his own farm. Whenever we find a farmer who has been practicing long enough that system of making his farm self-supporting we find a prosperous farmer, but the one crop farmers today are helpless as a result of their folly. Notwithstanding the fact that he has on his hands the largest crop of cotton ever grown, the very prospect of a war or of hard times puts him on the verge of bankruptcy. This shows the false economies of the southern farmer, yet the farmer has not been altogether to blame, for the business man, the banker, the merchant and manufacturer have required the southern farmer to grow crops in order to receive the backing necessary to make the crop, in spite of the adaptability of the country for other crops.

It has been found by actual test on the demonstration farms established by the Illinois Central, which have been under the supervision of three expert agriculturists, that within three years' time we can increase the production of cotton, by diversified farming, 300 per cent from the average production. Take the other great portion of Mississippi and Louisiana, and of the entire cotton growing states, by diversifying their crops—I mean by growing all of the hogs on the farms that are required to feed the men who work that farm; all the cows required to give an abundant supply of milk and butter for the tenants and proprietor to use; all the beef cattle that can be raised upon his worn-out and wasted lands and all the horses or mules that can be used in the farming operations, the planter can still produce as much cotton on one-third of the land formerly cultivated. A highly intelligent and educated class of people will not long grow one crop for all the money they receive in a country that is so well adapted for so many profitable crops. The farmer who grows foodstuffs that are rich in feeding value and who grows his land richer instead of poorer, who makes the greatest and most profitable crop on the most economical basis and leaves the land in better condition to grow a crop next year, is the kind of a farmer that we must look to to develop the South and to put into practice the system of diversified farming, which is going to make the Southland the beacon light of all agricultural sections.

It is my judgment the result of the war now going on across the seas is going to make every southern planter realize to the fullest extent the value of diversified farming, which will place the so-called cotton growing territory of the southern states 10 years ahead in agricultural progress.

Mr. Jackson said in part: The agricultural colleges, the farm demonstration agents, the railroad agricultural departments, and all forces working for better agriculture, now have a greater opportunity than they have ever dared to hope for, to preach the gospel of diversified farming to willing listeners. Many cotton planters who have for years sneered at "book farming methods" are now eager to accept any instructions or assistance offered them. This is particularly noticeable in the increased interest shown by those who visit the Central of Georgia exhibit tent at the state and county fairs this fall. Over our literature table is a sign which reads, "Mr. Cotton Planter, now is the time to consider the importance of legumes, lime, and live stock. Pamphlets free, help yourself." This creates a great deal of comment and demand for the pamphlets on the subjects of better beef cattle, vegetable matter, lime, the boll weevil, reports of test farm work for last year, etc. Expressions such as "We sure need something besides cotton," and "We must grow something we can eat," are frequent. In one of the cases containing products grown on the test farms, with some oats and cow-pea hay is a placard which strikes a popular chord. It reads: "Oats and hay make greater

profits than cotton under normal conditions. On the Central of Georgia test farms in 1913, the double crop made a net profit of $25.92 an acre, or $2.51 more than cotton, and cost $4.06 an acre less to produce." It's a common thing to have a man who reads this, add, "And they're better for the land." Literature and pamphlets will be more effective now than ever before, but real demonstrations of proper farming methods, something the farmer can see with his own eyes, are, as always, the most effective methods of encouraging better farming. While we are very well pleased with the results of our test farm work heretofore, we are confident its effectiveness will be more than doubled next year, and we are having a great many more applications for the establishment of test farms than we can grant.

The present experience of having to trade low-priced cotton for high-priced food will advance several years the date when the farmers of our section will be the most prosperous in the United States, for they will grow at home all of the more important food products for which they have been sending away money to other sections.

RAILWAY TERMINALS

"The Railway Terminal and Its Relation to Industrial Development" was discussed by F. A. Spink, traffic manager of the Chicago & Western Indiana and the Belt Railway of Chicago, who said in part: The railroad terminal was originally looked upon as solely an instrumentality for handling trains and cars in the ordinary dispatch of business. With a change in commercial conditions and the demand for track connection by industries many roads were found hampering their operation by the encroachment of industry tracks in the territory which should have been reserved for transportation uses only. This is a short-sighted policy that results in restricting the operation of the industry and curtailing its scope and possibilities, and in the end defeats the object sought to be gained. Recently a broader vision on the part of railroad managers, coupled with decisions of the Interstate Commerce Commission on the use of terminals by competing lines, has resulted in throwing open for more general use the terminals of the country on the basis of a reasonable charge for use. The day of exclusive terminals is at an end, and in the future we may see the individual road terminals giving place to general locality terminals.

In the Chicago terminal district to-day there are 38 railroads terminating, 24 of them trunk lines, 4 belt lines, and 10 so-called industrial roads. The total single-line mileage of the rails within the Chicago District is said to be 4,000 miles; approximately 1,300 passenger trains enter and depart from this terminal daily carrying something like 200,000 passengers; into and through these terminals are daily hauled 12,000 loaded freight cars and some 10,000 cars are dispatched from it; 15,000 tons of less-than-carload merchandise are brought into Chicago and 10,000 tons sent out each 24 hours. A graphic statement of the movement of cars interchanged between the various roads shows a most bewildering mass of criss-cross lines and the amount of empty engine mileage due to present operating conditons means a waste of hundreds of thousands of dollars per annum. Would not the co-ordination of these terminal facilities and their operation on a more co-operative basis, if not as a separate unity, mean a great saving to the owners in actual cash outlay and to the industries and business of Chicago in improved service and elimination of delays.

In the past little thought was given to the location of industry tracks in such a manner as to offer the least obstruction to operation. As the volume of tonnage has increased this encroachment of industry tracks on main line and yard facilities has become more and more undesirable and troublesome, so that in the evolution of the problem the industry center has come into being bringing about a segregation of industry business, giving better service at less cost and affording both industry and railroads scope to further develop without hampering or being hampered by the transportation uses of the terminal.

Roads with extensive and expensive terminals feel they are inadequately compensated for their use by competitors; on the other hand roads without terminal facilities feel they are having an undue burden placed upon them in many instances by the payment of existing terminal charges; and the industries are declaring they are not getting adequate service for the money they are paying.

If the writer may set forth his own personal thought on the subject the solution of the problem would be this, unify all terminals and operate them as a separate facility under separate management. Let the road haul carriers' duty cease at the junction with the terminal. Then, to met the suggestions of the Interstate Commerce Commission, make the rates apply to and from the terminal, assessing a separate charge for terminal service; or, operate the terminal on a cost basis, preserving the present basis of rate construction. For the present, and for the purposes of this paper, the method of handling the terminal charges is unimportant. The point which it is sought to bring out clearly is the separate and unified operation of the terminals themselves.

THE BANQUET

The semi-annual banquet of the association was held on Tuesday evening at the Hotel La Salle. The speakers were W. L. Park, vice-president of the Illinois Central, and Samuel O. Dunn, editor of the *Railway Age Gazette*. Edith Loring Fullerton, vice-president of the Women's Horticultural and Agricultural Association, also spoke on country home development.

MR. PARK'S ADDRESS

An abstract of Mr. Park's address follows:

The progressive achievement of the American railroads is the greatest industrial achievement in the world's history. There has been, concurrently, with it, a similar achievement in all branches of industry and general development wherever the railroads have reached. Notwithstanding the fact that for more than four hundred years we had reveled in a wealth of natural resources, our agricultural lands, mineral beds and forests were practically untouched before the advent of the railroad.

The Illinois Central followed the Chicago & Northwestern into this city, its charter permitting it to enter along the river, where there was some little prospect of business development. The mayor owned a home on the corner of Madison and Michigan avenue; the waves of Lake Michigan cut up his front yard, and for other reasons the Illinois Central was driven to the marsh on the east side and compelled to protect the city from the lake until the present time at enormous expenditures and great loss of business opportunities. Mark the irony—it is now frequently accused of having stolen the lake front! It is a fact that there was at this time no little speculation as to the benefits of a railroad to the city; there were many prominent people who contended that it would interfere with and retard its prosperity.

Surmounting many obstacles, the railroads gradually increased the mileage. From 1850 to 1870 the Civil War and the period of reconstruction held them back; the next half century witnessed the tremendous achievement of more than 225,000 miles of construction. In the light of subsequent events they were, perhaps, built too fast. The successes were few compared with the opportunities opened up and embraced in all other lines of business. The financial methods necessary at the time to carry on these stupendous undertakings are the subject today of unfair criticism. The people were most willing to vote bonds and offer other strong inducements to secure transportation, knowing they would get it back many times over in the enhancement of their property and increased business. The roads in Great Britain and Continental Europe found a country already made. Those of America were built in advance of its development as they stretched across the plains, over the mountains and through the valleys; they were compelled to create their business by developing the resources of the country.

The first officials who performed the duties you gentlemen are now delegated with were the general superintendent and the

general freight agent. In connection with their other duties they sought out industrial locations, opened up mines, located saw mills, established cattle ranches and packing houses. Immigration was encouraged by low rates, both passenger and freight. By their indomitable energy and perseverance, the tide of empire turned toward the west, to the north, to the south. As the growth of the railroads increased it was necessary to specialize the work of industrial development. Departments were created to expedite this line of railroad activity. But the work of development was never for a moment lost sight of. If, as General Sherman said, an army traveled on its belly the railroad certainly did. It was fed, however, by what it created. Its development agents were alive to every commercial activity that meant present or prospective revenue. The wise builders never lost sight of this essential to their prosperity.

While the opportunity for industrial development is greater than ever before, the most important of all at the present time is unquestionably the scientific use of the soil. Perhaps the most prominent one feature of agricultural development is the reclamation of waste lands. A large percentage of this land cannot be reclaimed by state, corporate or individual effort; the work should be done by the federal government. The United States government promises to take over from the railroads a part at least of the agricultural development work they have so extensively been engaged in. The lever bill, with which you gentlemen are familiar, is one of the most valuable legislative enactments passed by the congress. It is the means by which a scientific agricultural demonstrator can ultimately be placed in every township in this country.

We, as railroad men, are apt to think that our development work is not fully appreciated by the public. I do not take this view. The best asset we have in these troublesome times is our investment in development work. We are hampered, it is true, with unnecesary and unwise laws, rules, regulations and orders from congress and the legislatures, commissions and municipalities. I have the most sanguine expectation that the well-known official efficiency of the railroads will ultimately throw them off where they encumber and profit by that which is needed in such regulation. There can be brought about another era of prosperity similar to that of the decade previous to the present era of "progressiveness" by the thinking public deprecating any attempt to make political capital out of investigations of business methods.

The work you gentlemen are engaged in has been more pleasant than that of some of the other officials who have been compelled to take the brunt of adverse sentiment. You have been continually welcomed in good society; your part of the railroad work is unquestionably universally appreciated; your services are sought after. If there is any turning down of your schemes by the executive officers, you are as much aggrieved as your client. Nevertheless, you must all feel keenly the effect of the present hampering regulations. If you are not moving ahead, you are not moving at all. You must not be discouraged by present conditions. Your work is constructive and the benefits growing out of development work must receive the thanks of posterity. There is a reward in seeing things grow, in the advancement of our commercial interests; the location of industries and the development of new resources are monuments to your energy and efficiency; the obstacles encountered make them the more conspicuous.

OLD AND NEW WAYS OF DEVELOPING TRAFFIC

Mr. Dunn spoke in part as follows: Formerly, the means almost universally employed to get business were solicitation, superior service, rate-cutting or rebating, and new construction. Most of these means of getting business are still in use. But co-operation between the railways themselves, and more especially public opinion and public regulation, have largely destroyed competitive rate-making. Likewise, new railway construction has practically ceased.

While competitive rate-making and railway construction have been declining as means of developing traffic, new and important means have been developing. Your work is not entirely new in all its phases. But in most of its phases it is new. You are first getting people and industries located on your lines; and then you are doing all you can to make them prosper so that your railways may prosper with them.

That is creative work of the highest order. The railways and the country should rejoice that the old competitive methods are to such a large extent giving way to creative methods. A system under which there would prevail open co-operation between the railways themselves in respect to service and rates; under which creative methods of getting business would be developed in the most varied forms and to the highest degree, and under which government regulation would protect the public in its right to good service at reasonable rates and the railways in their right to fair profits, would be infinitely superior from the standpoint of both the public and the railways, to the old cut-throat system.

We need a revival of new railway construction; I mean of construction in territory not now provided with railways. The construction of this new mileage would attract a larger population into the territories in which it was built; it would increase production in those territories; it would afford traffic not only directly to the new lines, but indirectly to the railways for which they would serve as feeders and to connecting lines throughout the country. The most effective means which could be adopted to cause a revival of new construction would be to make our regulation of railways fairer.

In order that industrial concerns may produce at the least cost and at the highest profit, they must be located as advantageously as practicable with reference to natural resources, supplies of labor, transportation facilities and markets. Who could be better, or even as well, situated to study thoroughly the natural resources and market conditions of a territory and to advertise them, and to advise business men regarding them, than a competent railway industrial agent whose company gave him all the opportunity and facilities needed to carry on such work?

Two of the most important problems confronting the people of this country are that of maintaining a healthy ratio between our urban and rural populations, and that of increasing the output of our farms.

Not only has our farming population not been increasing fast enough, but the efficiency with which those on the farms have worked the acreage under cultivation has left much to be desired. The failure of the growth of the supply of agricultural products to keep pace with the demands for them is the main cause of the general and heavy increase in the cost of living. Continued increases in the value of farm lands and in the wealth of the farmers can be made consistent with the welfare and prosperity of the nation as a whole only if these increases ceased to be caused chiefly by increases in the price of agricultural products, and begin to be caused chiefly by increases in the amounts of corn, wheat, hogs, cattle and so on produced *per acre*.

I do not say that too much of the resources and energies of the traffic departments are used up in the solicitation of business and in the struggle with shippers, with competing lines and with public authorities over the rates charged on existing traffic. But it is certainly as important to develop the largest practicable traffic as to get reasonable rates for transporting it; and after one has surveyed the entire situation in a broad way it would seem that he is apt to conclude that if as much money, energy and thought were devoted to the creation of entirely new traffic as are expended in soliciting and dealing with the rates on existing traffic the results gained would be quite remarkable.

I have no doubt that our railways will adapt their methods of developing traffic as skillfully and effectively to the new conditions as they did to the old, and that if not too much hampered and burdened by government regulation they will be in the future as in the past, the most potent agency in the country for promoting production along all lines and increasing the national prosperity.

OTHER BUSINESS

H. B. Fullerton, director of agricultural development of the Long Island Railroad, presented a paper illustrated with lantern slides on "Ways and Means of Increasing a Railroad's Agricultural Tonnage." An abstract of this paper will be published in a later issue.

F. H. Labaume, agricultural and industrial agent of the Norfolk & Western, read a paper on "Getting City People Back to the Country," which will also be published in abstract form in a later issue.

William Gourlay, of the American Express Company, described some of the plans the express companies are now trying to work out to bring the producer and consumer more closely together and facilitate the marketing of farm products.

R. W. Cooke, industrial agent of the Pennsylvania Lines, presented a paper on "The Effect of War on American Business," which was followed by a general discussion.

Anderson Pace, industrial commissioner of the Chicago Association of Commerce, made an address on the commercial association in its relation to industrial development.

H. M. Bainer, agricultural demonstrator of the Atchison, Topeka & Santa Fe, read a paper on "Personal Work with Farmers on the Santa Fe."

D. G. Mellor, manager of the order, commission and food products department of Wells, Fargo & Company, described methods recently adopted by his company for increasing the returns from farm produce. An abstract of this paper will be published in a later issue.

An exhibit was held in connection with the convention showing photographs and advertising literature which have been used in development work. The members of the association also made an inspection trip through the Chicago terminals on Thursday.

ACCIDENT STATISTICS ON THE PENNSYLVANIA*

By R. H. Newbern

Superintendent of the Insurance Department of the Pennsylvania Railroad System

On the Pennsylvania System, employing normally over 225,000 men and carrying over 185 million passengers and with a freight movement exceeding 385 million tons annually, there are 60,000 reports of accidents to employees and 10,000 reports of injuries to passengers and others forwarded to the company's insurance department. In order to simplify the handling of this large number of reports, the Hollerith tabulating machines are used, and items are classified by causes, nature of injuries, occupations, locations, days of disability and other features. As the reports are received they are codified, each item of information being marked with its designated code number and a permanent record of the accident is transferred to a card by means of a punching machine, and when statements or data are needed for the information of the executive or operating department or for the guidance of the safety organization, the cards are sorted by means of machines and the desired information obtained quickly, accurately and economically.

For statistical purposes employees are separated into two classes: one, employees in the maintenance of equipment, commonly known as shopmen, and the other, all other employees, such as trainmen, maintenance of way men, station men, etc., designated as road and yard men.

The statistics show the number killed and injured by—

Detailed causes.	Time of day or night.
Nature of injury by cause and occupation.	Weather conditions.
Length of disability.	Division.
Occupations.	Grand Division.
Length of service.	Shops.
	Large stations and yards.

The statistics are compiled on the same basis for shop and road and yard accidents, excepting as to detailed causes, there being 360 shop causes and 340 road and yard causes, making 700 separate causes of accidents. The causes in turn are classified under 36 general readings which indicate the nature of the work at the time of the accident.

By comparing the number of accidents under each general heading, we ascertain what kind of work is the most hazardous and the specific cause under which the accidents are reported. The primary cause of every accident is indicated. The records are kept by divisions, shops, stations and yards, and it is, therefore, easily seen at what points any particular kind of accident is most frequent.

There are included in the statistics additional information bearing an important relationship to accident frequency, such as the average age of employees, length of service, etc. Regarding the length of service, it was found that during the year 1913 there were 90,000 new men employed, although the total increase in the number of employees for the year was less than 9,000, the greater number of transient employees being in the maintenance of way department. The statistics developed the fact that during the year 25 per cent of the men killed and injured had less than six months' experience and that 28 men were killed and 2,391 injured who had been in the service less than 30 days. Assuming a similar experience on all the other railroads of the United States, at least 360 men were killed and 15,000 injured last year having less than one month's experience, and many met death during their first week's work—not because they were careless or foolhardy, but because they were ignorant of the hazards of the work.

A business employing men in more than 100 occupations will be unable effectively to teach the doctrine of safety unless some means are provided to discover the number of injuries sustained by men in each specific occupation. The statistics, therefore, are so arranged that the number of injuries and fatalities can be shown in each department and to each occupation of the various departments, also the reports are tabulated to show the specific cause for each occupation.

The number of accidents occurring during each hour of the day or night is shown as the time of the accidents suggests various preventives, such as improved lighting facilities and rearrangement of working hours.

A statement of a certain number of men injured during a certain period does not convey a proper meaning; it is the loss of time that shows what the employee really suffers. Therefore, the statistics provide for the number killed, the number injured, the number of indefinite injuries and the actual number of days lost. Our statistics include all accidents resulting in a disability of one day and over. It was found that 18 per cent of all the injuries involved less than four days' disability, and the number of "15 days or over" accidents (the minimum period covered by liability laws) amounted to 50 per cent of the total days' disability.

Our statistics also show the nature of the injury; this information embodies 141 different kinds of injuries, included under the following general headings:

Amputation	Fractures
Eye Injury	Electrical Shocks
Sprains and Strains	Burns
Bruises	Dislocations
Incised Wound or Laceration	Injuries not included above

This information enables the management to study methods of treatment to reduce the length of disability. Take the subject of fractures for example: There were 758 cases last year resulting in 19,190 days of disablement, 87 indefinite disability cases and 53 fatalities. The medical profession recognizes the necessity for the best treatment of these injuries, as fractures may result in extended disablement on account of improper treatment.

Our experience clearly indicates that comprehensive accident statistics furnish a most effective means of suggesting remedial measures in accident prevention work.

*From an address before the National Council for Industrial Safety at Chicago, October 15.

General News Department

Track foremen of the Philadelphia & Reading have been appointed fire wardens by the Pennsylvania State Department of Forestry.

The general offices of the Wabash at St. Louis will be moved from Seventh and Chestnut streets to the Railway Exchange building about December 15.

On the middle division of the Pennsylvania cup vending machines are being installed, to supply passengers with drinking cups at one cent apiece. Hitherto flat, folded cups have been furnished, free; but with the new machines paper cups shaped like common glass tumblers will be furnished.

The Wabash is printing on all of its working timetables a large "Safety Always" emblem and the following in large type: "Safety should be the first consideration of every employee. Every employee should report promptly to his foreman, some member of the safety committee or other proper person, every unsafe condition."

There are 77 men who have worked for the Pennsylvania Railroad 50 years or more and are young enough to be still busily working. Two of them have records of more than 56 years; two others have served 55 years; two, 54 years; seven, 53 years; six, 52 years, and twenty, 51 years. Of the 77 men five are conductors and eight are enginemen.

Four locomotives on the Louisville-St. Louis division of the Southern Railway are to bear the names of the enginemen who run them. The names will be painted in gilt letters, along with the number of the engine. The men who have been thus recognized are Frank Busching, William Hanafee, Robert Greenlaw and Daniel Shine. The requirement for the distinction is 25 years of efficient service.

The Railroad Commission of Georgia, realizing the present serious financial predicament of the railroads, has written a letter to the Southern Railway to the effect that in view of the material decrease in the revenues of carriers the commission, until the present financial situation is relieved, will not impose on any of the roads any expenditures for new stations, warehouses, terminal facilities, etc., except such as are absolutely necessary.

To reduce unnecessary use of the telegraph wires, the Lehigh Valley has extended its censorship of railroad telegrams temporarily to all messages. A carbon copy of every telegram sent by an employee is to be sent immediately to the superintendent of telegraph, in whose office the "censor" will scrutinize every message from every office, from the highest to the lowest. Men who waste words will be advised concerning their uneconomical habit.

Following the election at which the voters of Missouri decisively defeated the full crew bill by referendum vote, the St. Louis & San Francisco announced that its shops at Springfield, Mo., would immediately be placed on a working basis of six days a week and eight hours a day. The main shops have been on a five-day schedule for several months and other shops have been operated only intermittently. Additional men also were given employment.

The golden spike marking the closing of the last gap in the line of the Northwestern Pacific from San Francisco to Eureka, Cal., 283 miles, was driven at Cain Rock Crossing, Cal., 80 miles southeast of Eureka, on October 21, with appropriate ceremonies, and the first through passenger train was run over the line on the same day. Regular service will be started on November 15. The road is owned jointly by the Southern Pacific and the Atchison, Topeka & Santa Fe.

The Baltimore & Ohio, by a circular which has been issued to station employees and others who come in contact with the public, calls attention to the inelegance of using tobacco during working hours. It is believed by the management that a man using tobacco while at work renders inferior service. In larger stations and behind ticket counters the employees are required to refrain from using tobacco, and the same is also true of passenger trainmen; but the circular is an appeal to personal pride rather than mandatory.

At the safety congress of the National Council for Industrial Safety, held in Chicago on October 14 and 15, there were present from the Chicago & North Western one delegate from each division, terminal shop and local safety committee, all making the trip as the guests of the company, 52 men in all. The delegates have adopted resolutions stating that they obtained much valuable knowledge and information at the meeting, which will be a great help in promoting the safety first work on the North Western; and thanking President Gardner and Vice-President Aishton for arranging the trip.

The United States Civil Service Commission announces an examination, for which applications will be received up to December 1, for the position of examiner of accounts, positions being vacant both in the division of valuation and the division of carriers' accounts, of the Interstate Commerce Commission; salaries from $1,860 to $2,100. The commission desires applications from men of large experience in this kind of work. Also, examinations will be held throughout the country, on December 2, for the position of freight rate clerk for the quartermaster of the army, at Chicago; salary $1,200.

The Buffalo & Susquehanna Railway, extending from Buffalo, N. Y., southeastward to Wellsville, 90 miles, which has announced that business will be suspended on December 1 because of insufficient income to keep the road in operation, may possibly be bought by the Lackawanna Steel Company, which owns the South Buffalo Railway. It is reported that a fair offer has already been made. A recent decision of the Interstate Commerce Commission has removed doubts as to whether the South Buffalo Railway could be classed as a common carrier or was only a plant facility. The commission holds that it is a common carrier.

The National Transcontinental Railway, over which trains are running from Moncton, N. B., northwest to Escourt, 56 miles beyond Edmundston, is shortly to be put in operation between Moncton and Levis, opposite Quebec. Trains between Moncton and Escourt are operated by the Intercolonial, and the Intercolonial will manage the extended service. The whole of the National Transcontinental is now finished, so as to be ready for use, but the arrangement by which the Grand Trunk Pacific was to operate the road appears to have encountered some obstacle. According to the Toronto World, the line west of Levis is likely not to be put in use until next spring.

H. K. Gilbert, well known in the railway and supply business in Chicago, has just returned from a year's traveling in Europe and England. While in England this summer, he had an unusual experience for a railway supply man. On account of his familiarity with organization problems his services were availed of by the Medical Service Corps of the British Army in the recruiting department, and afterward in connection with the visiting of wounded, etc., at base hospitals. Mr. Gilbert was for several years vice-president of the Sargent Company, which later was merged in the American Brake Shoe & Foundry Company, and also for a number of years, vice-president of the Buda Company.

President Wilson has awarded a medal of honor to W. A. Holley, of Greenville, Tex., for saving the life of Mrs. Sallie Griffin, on the Missouri, Kansas & Texas Railway of Texas at Greenville. The lady became confused or did not realize the danger, and started across a main track at Greenville station directly in front of an approaching train. Switchman Holley was standing near the building, and, realizing that Mrs. Griffin had not time to cross the track, ran forward, lifted her bodily, and carried her out of danger. He was struck by the hand railing on the front end of the engine, but neither he nor Mrs. Griffin

was injured. This is the fifteenth medal of honor which has been bestowed under the Act of February 23, 1905.

In Louisiana, the special trains bearing traveling teachers who give instruction in agriculture and in "safety-first" are not allowed a complete monopoly of the railway-social-service news columns; there is a third propaganda, Instruction in Hygiene. Dr. Oscar Dowling, president of the Louisiana state board of health and his "Health on Wheels" train has been noticed heretofore in these columns; and now it appears that the doctor is extending his activities into other states. The Birmingham (Ala.) Herald says that he is to appear in that city with his exhibit, remaining throughout one day. He has displays in his car classified under four heads; namely, Prevention of Disease; Food Products; Community Hygiene, and Care of the Baby and School Hygiene.

Those independent conductors of the St. Louis Southwestern were successful in their application to the court, at St. Louis, for an injunction forbidding the brotherhood to call a strike on that road; and the injunction is directed against three brotherhoods; those of the conductors, the brakemen and the firemen. The judge said that the injunction did not prevent the unions from taking a strike vote. The threat of a strike was made because the railroad company refused to reinstate a conductor, dismissed because of intoxication, when the brotherhood claimed that the charge against the conductor was unfounded. Press despatches of November 9, telling of the granting of the injunction, say that the brotherhood had accepted mediation, as asked for by the railroad company, but that the mediators have not yet finished their work.

Credit for Saving Scrap

Bulletins telling of specially meritorious acts on the part of employees have an added interest where the persons named in them are known; and the smaller the territory covered by a bulletin, the more likely are the employees generally to recognize the names published. W. T. Lechlider, superintendent of the Cleveland division of the Baltimore & Ohio, issues bulletins, once a month, or as often as may be found desirable, which are confined to happenings on his own division. One of the things noted in a recent bulletin was the commendation of a baggage master for making neat and comprehensive reports. The station forces at three places, and a dozen individual trainmen and section foremen were commended for saving scrap, the value of which, in two weeks, amounted to $218.

Northern Pacific Efficiency Bureau

On the Northern Pacific the promotion of what is commonly called the "safety-first" habit is in the hands of the "Bureau of Efficiency," of which a special representative of the first vice-president is the chief officer. The organization of this bureau was noted in the *Railway Age Gazette* of January 24, 1913; and in the issue of December 19, 1913, page 1196, some of the doings of the bureau during the year then ending were briefly noted.

In a sketch of the activities of the bureau for the year 1913, which was prepared by Mr. Banks, the officer in charge of the bureau, but which has only recently been made public, 38 subjects are deemed of sufficient importance to be specially mentioned; and up to December 4, 1913, about 80 circular letters had been sent out to the division superintendents calling attention to dangerous conditions or practices.

In the removal of dangerous or objectionable structures at the side of the tracks, marked improvement was made. A standard card was adopted for use in giving authority to yard engines to enter on a repair track, the card to be issued by the repair man. A new blue flag device was adopted. A standard squirt hose and connections, adopted early in the year, will prevent many scalding accidents. An improved bar for shaking locomotive grates has been adopted. The railings of cabooses have been made safer and each caboose will have a permanent air-brake valve and whistle at each end, making a back-up hose unnecessary. New tank spout ropes were provided throughout the company's lines, where needed. A superior grade of tool handles has been made standard. Turntables have been floored at the ends with plank the height of the rail, thus removing the danger of shearing off a man's foot between the rails on the table and the rails on the circle. The standard clearance of switch stands has been changed from 6 ft. to 7 ft. from the rail.

The standard clearance for company's buildings has been made 12 ft. from the track; where this distance cannot be obtained doors of such buildings must be in the end or the back side and not open toward the track. Gravel has been filled in around trunking used in connection with signals, so that workmen will be less liable to stumble over the trunking. A standard brake club has been designed. Torpedoes are now made with red tops so that they will be more surely seen, especially by employees using hand cars. The walls of turntable pits are being whitewashed so that the men will be less likely to walk into them.

The doors of shelters for crossing flagmen are being changed so as to open toward the street and not toward the track. An order has been issued forbidding the use or occupancy of kitchen cars when such cars are being moved; cooks and helpers must ride in cabooses or on passenger trains. Superintendents are required to pay personal attention to the location of poles belonging to telephone and other outside companies, so as to prevent the setting of these poles where they will obscure fixed signals.

Fewer Mules in Mines

The anthracite coal operators of Pennsylvania report that in the last decade, from 1902 to 1912, the horse power developed at the mines increased from 354,237 to 680,700, or 326,463 horse power; but electric power is used and the number of mules in the mines has fallen off. A good mule is now worth $240. If this 326,463 additional horse power had been added in mules, supposing such a number obtainable, the investment since 1902 in power alone would have been nearly $80,000,000, without replacing any mules that died during that period. As a matter of fact, the number of mules decreased from 16,139 in 1902 to 15,187 in 1912. On the other hand the number of electric locomotives increased from 53 to 951, and the number of steam locomotives (on the surface) from 373 to 575. Steam and electricity are saving millions of dollars annually.

But the increase in other necessary forms of energy makes the problem of operating the mines at a profit one of careful selection of the most economical means. In 1912 the consumption of powder was 41,401,015 lb., and of dynamite 13,685,062. There has been since 1903 an increase of over 9,000,000 lb. of explosives used, an increase wholly disproportionate to the amount of coal produced, due mainly to the great amount of rock work which now has to be done.

A Dishonest Claim Agent Punished

In the United States District Court at Baltimore last week, George Elmer Long was convicted on five counts of defrauding the Baltimore & Ohio Railroad by bogus claims paid by Long while in the employ of the road. Long will serve three years in the federal penitentiary at Atlanta. He entered the employ of the Baltimore & Ohio about three years ago as a claim adjuster in the freight department, having had previous experience with southern roads. For some time after securing the position he was establishing himself in the confidence of superiors, after which, through the medium of confederates, a scheme of filing fraudulent claims was undertaken. The accomplices represented themselves as shipping concerns and made claims for losses or damage to shipments never shipped, and others which were shipped and contained only junk. In his confession Long admitted shipping four boxes as the property of different concerns. In most instances, however, no shipment was even made, the plan having been that where legitimate claims were adjusted the waybills were stolen and changed to cover shipments to firms existing only in the minds of the gang and on the stationery which they used. The claims varied usually in amounts ranging from $200 to $500. Long was tracked by Edmund Leigh, chief of the railroad detective force, the chase having been conducted in Pittsburgh, Niagara Falls, Hamilton, Chicago and Detroit. Long was arrested in Detroit while calling for mail at the post office.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

AIR BRAKE ASSOCIATION.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—A. G. Thomason, Demurrage Commissioner, Boston, Mass. Annual convention, April, 1915, Richmond, Va.

AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next meeting, October, 1915.

AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 21-24, 1915, Richmond, Va.

AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICIALS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—F. H. Harman, Room 101, Union Station, St. Louis, Mo. Next meeting, May 20-21, 1915, San Francisco, Cal.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 29 W. 39th St., New York. Annual convention, October, 1915, San Francisco, Cal.

AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—H. C. McConnaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

AMERICAN RAILROAD MASTER TINNERS, COPPERSMITHS AND PIPEFITTERS' ASSOCIATION.—W. E. Jones, C. & N. W., 3814 Fulton St., Chicago. Annual meeting, Chicago.

AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Semi-annual meeting, November 18, The Blackstone, Chicago.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 19-21, 1915, Detroit, Mich.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.— J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June 9-11, 1915, Atlantic City, N. J.

AMERICAN RAILWAY SAFETY ASSOCIATION.—L. F. Shedd, C. R. I. & P., Chicago. Next meeting, November 10, Chicago.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—A. R. Davis, Central of Georgia, Macon, Ga. Annual meeting, July, 1915.

AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

AMERICAN SOCIETY OF ENGINEERING CONTRACTORS.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 1-4, 1914, New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Atlanta, Ga.

ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, third week in May, 1915, Galveston, Tex.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sts., Chicago. Annual meeting, October, 1915.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—P. W. Drew, Sou Line, 112 West Adams St., Chicago. Annual meeting, June 22-25, 1915, Rochester, N. Y.

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York. Next meeting, December 8-9, Richmond, Va.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meetings, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

FREIGHT CLAIM ASSOCIATION.—Warren P. Taylor, R. F. & P., Richmond, Va. Annual meeting, June 16, 1915, Chicago.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

INTERNATIONAL RAILWAY CONGRESS.—Executive Committee, 11, Rue de Louvain, Brussels, Belgium. Next convention, June 23 to July 6, 1915, Berlin.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 829 W. Broadway, Winona, Minn. Next convention, July 14-17, 1915, Sherman House, Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D., Lima, Ohio. Annual meeting, August 17, 1915, Philadelphia, Pa.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next convention, November 17-19, 1914, Detroit, Mich.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May 26 to 28, 1915, Chicago, Ill.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 14-17, 1915, Detroit, Mich.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June 14-16, 1915, Atlantic City, N. J.

NATIONAL RAILWAY APPLIANCES ASSOCIATION.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

RAILROAD MASTER TINNERS, COPPERSMITHS AND PIPEFITTERS' ASSOCIATION.—U. G. Thompson, C. & E. I., Danville, Ill. Annual meeting, May, 1915.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December 10, 1914, Waldorf-Astoria Hotel, New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Next meeting, October, 1915.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa. Next meeting, March 15, 1915, Chicago. Annual meeting, September 21-24, 1915, Salt Lake City, Utah.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, L. S. & M. S., Box C, Collinwood, Ohio. Annual meeting, May 17-19, 1915, Hotel Sherman, Chicago.

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders and Master Mechanics' Associations.

RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Annual meeting, September 14-16, 1915, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, C. R. I. & P., La Salle St. Sta., Chicago. Annual meeting, September, 1915.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. R. R., Atlanta, Ga. Next regular meeting, January 21, 1915, Atlanta, Ga.

SOUTHERN AND SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Bondy House, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmaster's and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7122 Stewart Ave., Chicago. Annual meeting June 15, 1915, Minneapolis, Minn.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, September, 1915, Chicago.

WESTERN CANADA RAILWAY CLUB.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF SEPTEMBER, 1914

Name of road.	Average mileage operated during period.	Operating revenues			Operating expenses							Net operating revenue (or deficit).	Railway tax accruals.	Operating income (or loss).	Increase (or decr.) comp. with last year.
					Maintenance										
		Freight.	Passenger.	Total. inc. misc.	Way and structures.	Of equipment.	Traffic.	Transportation.	Miscellaneous.	General.	Total.

Traffic News

A single shipment of 3,000,000 eggs from western states was exported to England from Boston last week. The reduction in England's egg supply from Russia on account of the war is said to have brought about the shipment.

The committee on relations between railroads of the American Railway Association reports that on November 1, 1914, the total freight car surplus was 172,325, as compared with 154,342 on October 15. The total shortage was 2,229 cars.

Of 2,457 passenger trains run on the New York, New Haven & Hartford in the last two weeks of July, 1914, five had earnings of only one cent a mile; 88 earned ten cents a mile or less; 619 earned fifty cents a mile or less, and more than half of the whole (52.1 per cent) earned one dollar a mile or less. Only 22.7 per cent of the trains showed earnings of more than two dollars a mile. The time tables now in force show 256 fewer trains on week days, and 83 fewer on Sundays, than the tables in effect a year ago. These figures represent unprofitable trains taken off. The total reduction, in train miles, is 5,817 on week days and 1,478 on Sundays.

F. R. Stevens, agriculturist of the Lehigh Valley, has issued warnings to farmers regarding the outbreak of foot-and-mouth disease among cattle in the west. The symptoms are mainly inflammation about the hoofs and in the tissues of the mouth, causing a froth to appear in the mouth. These symptoms may come from other causes, but any suspicious case should be reported immediately to the nearest veterinarian. Stock owners in sections without a veterinary close at hand are told that if they have the slightest doubt as to the presence of the disease to notify the nearest station agent of the Lehigh Valley, and he will get word to its agriculturist at once.

The steamship Pleiades, of the Luckenbach line, arrived at Galveston November 5 from San Francisco by way of the Panama Canal, with a cargo of 66,000 cases of fruit and wine. The Oregonian arrived recently at Poughkeepsie, N. Y., 75 miles above New York City, on the Hudson river, direct from South Bend, Wash., through the Panama Canal, with a cargo of 4,500,000 ft. of lumber. Shipments of grain from the Pacific coast, formerly carried around Cape Horn, are now moving freely through the Panama Canal. The value of shipments from San Francisco by way of the canal in the month of August was $1,376,000, and in September, $4,248,000. In October the total was about 25 per cent higher than September. The freight going to New York embraced not only wheat, but also barley, onions and prunes.

W. L. Ross, president of the Toledo, St. Louis & Western, and formerly vice-president of the Chicago & Alton, was indicted by a grand jury at Chicago on November 6, on a charge of violating the interstate commerce law relating to passenger rates, on the ground that he allowed the late Edward Morris, the meat packer, and members of his family, to ride in a private car as his guests on a trip to Hot Springs in January, 1912, while Mr. Ross was vice-president of the Alton. The railroad also was indicted. It is charged that the Chicago & Alton and Mr. Ross violated the law by permitting Mr. Morris and family to travel without purchasing the full number of fares (18) required by tariff for the use of a car. The Alton officers explained that Mr. Morris had bought tickets for his family and as Mr. Ross' car was attached to the train Mr. Ross invited Mr. Morris and his family to ride in his car as his guests.

New tariffs which have been filed by the Trunk Lines reduce from ten days to five days the length of time which flour will be stored without charge at New York City terminals. The flour dealers say that, because of the irregularity in the arrival of shipments, it will be impossible for them to do business under the new arrangement. Flour is sold on such a small margin of profit that the seller "cannot afford to take any risk of having his profits eaten up by storage charges." Moreover, the amount to be charged after the expiration of the free time is increased from one cent a barrel to 1 cent per 100 lb. A new baggage tariff which has been issued by the Pennsylvania Railroad, prescribing the usual charge for storage of baggage at passenger stations after 24 hours, makes this rule universal, with no exceptions for Sundays or holidays.

Car Location

The accompanying table, which was taken from bulletin No. 23 of the American Railway Association, gives a summary of freight car location by groups on October 1, 1914.

Car Location on October 1, 1914

How to Get Freight

On the St. Louis & San Francisco the plan of making each local freight agent responsible for securing traffic within his territory has now been in operation about 18 months, and the officers of the road are agreed that it is a decided success. With a view to making still further progress toward the high standard which has been set, Chief Traffic Officer W. B. Biddle has issued a circular, the gist of which is as follows:

"Every agent should know every shipper or receiver of freight in his community.

"He should get his full share of the business of each and every one or know the reason for his failure.

"He should know what business is not controlled by his people and advise the proper representative.

"Time is the essence of success and advance information will often get the business.

"His slogan should be—*routing on the order for the goods.* Other forms of advices are important when this cannot be obtained, but at best they are supplementary. The *routing on the order* will usually bring home the bacon.

"Cultivate the traveling salesman. He is an important factor and can frequently give valuable information; and if he is a friend of the road, will go out of his way to help, so long as it does not conflict with his duty to his house or his customer. Where a purchaser does not express preference the traveling salesman frequently inserts the name of the road."

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The Kansas Public Utilities Commission has filed a complaint with the Interstate Commerce Commission against new tariffs filed by the western railways, eliminating the storage privileges on poultry, butter and eggs.

Reconsignment Privileges on Less-Than-Carload Freight

Opinion by Commissioner McChord:

The commission finds that the Atchison, Topeka & Santa Fe and other respondent carriers have justified a proposed withdrawal of the privilege of reconsignment of less than carload freight west of Albuquerque and Belen, N. Mex. (32 I. C. C., 85.)

Westbound Lake-and-Rail Knit Goods Commodity Rates

Opinion by Commissioner Meyer:

The commission finds that the carriers have justified a proposed restoration to the class rate basis of the present commodity rail-and-lake rates on knit goods from Albany, N. Y., and Albany rate points to Chicago, Ill., St. Louis, Minneapolis and other points, the change being intended to eliminate a departure from the general rate structure. (32 I. C. C., 54.)

Reparation Awarded

Schrager Coal Company v. Delaware, Lackawanna & Western, et al. Opinion by Commissioner McChord:

The commission finds that the rates on anthracite coal from complainant's washery on the tracks of the Delaware, Lackawanna & Western to tidewater points on the Central of New Jersey are unreasonable to the extent that they exceed the joint rates to the same destinations from Taylor, Pa.

Rates on Produce from Pittsburgh

Cranford & Bunce et al. v. Pittsburgh, Cincinnati, Chicago & St. Louis et al. Opinion by Commissioner Clark:

The commission finds that the carriers have justified a proposed cancellation of commodity rates and a resulting restoration of class rates on general produce from Pittsburgh to points within about 150 miles east of that city. A similar change in the rates to points west and north of Pittsburgh was made some time ago and approved in *Kochler Produce Company v. Pennsylvania Railroad* (27 I. C. C., 635), decided June 9, 1913. (32 I. C. C., 12.)

Rates on Granite from Points in Vermont to Nebraska

Nebraska State Railway Commission v. Central Vermont et al. Opinion by Commissioner Meyer:

The commission finds that the carriers have not justified the present differences in classification and the considerable difference in rates applicable respectively to dressed and polished granite used for building purposes and granite used for monumental purposes shipped from points in Vermont to points in Nebraska. It is therefore held that the carriers should establish on the monumental granite a classification rating and a rate not in excess of those applicable to dressed and polished granite. (32 I. C. C., 41.)

Charge for Cleaning Cars Made Necessary by Government Quarantine

New Orleans Live Stock Exchange, Limited et al. v. Louisville & Nashville et al. Opinion by Commissioner Clark:

The commission finds a charge of $2.50 per car for cleaning and disinfecting cars imposed by carriers upon the owners of cattle moved in such cars from territory quarantined because of cattle tick to New Orleans, La., is not unreasonable in itself or discriminatory to New Orleans as compared with points at which no charge is made for a like service required by the same regulations. The commission states: "The carrier's tariff rates are presumed to provide reasonable charges for the service ordinarily or normally required and performed. If the shipper or receiver demands an additional service, the carrier has a right to assess a reasonable charge therefor. If, because of the nature or condition of the shipper's freight, the federal government or the state finds it necessary or appropriate to require extra precautions in connection with such shipments, which precautions impose upon the carrier an additional service, it is entitled to a reasonable compensation for that extra service." (31 I. C. C., 609.)

Rates on Knitting-Factory Products to Texarkana, Tex.

Opinion by Commissioner Meyer:

The commission finds that the carriers are not justified in canceling certain commodity rates on knitting-factory products from points in North Carolina to Texarkana, Ark., and nearby points, thereby leaving in effect much higher class or commodity rates. The decision in the case of Texarkana Freight Bureau v. St. Louis, Iron Mountain & Southern. (28 I. C. C., 569) makes necessary further revision of these rates to Texarkana. The commission, therefore, does not make an order that the present rates be maintained for the future. (31 I. C. C., 669.)

Transit Privileges on Lumber a North Carolina Points

National Casket Company et al. v. Southern Railway. Opinion by Commissioner Clark:

This case relates primarily to the transit privileges on lumber at Asheville and other points in western North Carolina applying on traffic originating in that territory on the Southern Railway west of Asheville from which lumber shipped to the east may be given transit privileges at the points involved herein and all territory on the Southern east of Nashville, Tenn., from which lumber may be drawn to the points in question, there given transit privileges and reshipped west, or to the north of the Ohio river. These privileges with respect to destination are limited to traffic to Ohio and Mississippi river crossings, for beyond; to Virginia cities, for beyond; and to the south Atlantic ports. The commission finds that the present charge of two cents per 100 lb. is neither unreasonable nor discriminatory, it being held that the decisions in the *Spiegle & Company* cases (19 I. C. C., 523; 25 I. C. C., 71) and Bristol Door & Lumber Co. v. Norfolk & Western (25 I. C. C., 87) in which a charge in excess of 1.5 cents for similar privileges at Bristol, Johnson City and Newport, Tenn., was held unreasonable, do not mitigate the controlling effects of the evidence in this case.

In like manner the commission finds defendant's rules and regulations governing the transit arrangements not restrictive or burdensome. The commission upholds the regulations of the carrier which do not permit substitution of one kind of lumber for another, except in certain cases. It is also held, however, that certain unreasonable practices in connection with the transit privileges are to be corrected. (31 I. C. C., 678).

Rates on Wheat from Montana

Board of Railroad Commissioners of the state of Montana v. Butte, Anaconda & Pacific et al. Opinion by Commissioner Daniels:

The commission finds that the rates on grain, especially wheat, and flaxseed from stations in Montana to St. Paul and Minneapolis, Minn., and other eastern primary markets, and also to Seattle and Tacoma, Wash., and Portland, Ore., are not unreasonable. In the case nearly all the railroads in Montana except the Oregon Short Line are made defendants, and it is argued mainly that, although Montana is fast becoming one of the leading wheat producing states, it is unable to realize the full advantages of that fact, because of the high freight rates to the wheat consuming centers. In its decision the commission observes that the price of wheat in Montana is now lower than it has been for a number of years, and states that the reasonableness or unreasonableness of freight rates can not be gaged solely by the ability or inability of shippers under depressed prices to market their products at the existing rates with a reasonable margin of profit.

With reference to a statement that the Chicago, Milwaukee & St. Paul, which is a comparatively new carrier in this territory,

should have established lower rates than those of the older and less direct lines, it is noted that the present ton-mile rate via the St. Paul is not unreasonable and that the line operates in a region comparatively undeveloped.

The commission also holds that the rate on flaxseed, two cents higher than on wheat, is not unreasonable, and that there is justification for differences in rates on the two commodities. The commission also states:

"It was strongly urged by the complainant that a public interest was involved in this case. It was averred that the extension of the Montana wheat-growing area and the increased immigration and settlement thereof would both be promoted by the establishment of rates that would afford the grower a chance of reasonable profit. It was also forcibly urged that the growing necessity of raising breadstuffs for the supply of our own people instead of importing them from abroad warranted this reduction in the national interest. However this may be, it is clearly a question of national policy and one which this commission can hardly consider in gaging the single question of the reasonableness and the justice of existing railroad rates." (31 I. C. C., 641.)

The Manufacturers Railway Case

Manufacturers Railway et al. v St. Louis, Iron Mountain & Southern, et al. Opinion by Commissioner Clements:

The complainant railway, operating 2 miles of main line and 23 miles of branches and sidings in St. Louis connects the Anheuser-Busch Brewing Association, owned by the same interests, with the trunk line carriers and also serves other industries and shippers. The original report in this case (21 I. C. C., 304), later modified in a supplemental report (28 I. C. C., 93), held that trunk line carriers did not discriminate against the complainant in withdrawing allowances, averaging $4.50 per car, to the Manufacturers Railway, while continuing to absorb charges, averaging $3 per car, made by the Terminal Railroad Association of St. Louis, owned by the carriers themselves. It was held that the allowances made to the complainant were voluntary charges and could not be considered as divisions of joint rates. It was further held, however, that the carriers might voluntarily participate in joint rates, provided that in the final division of the through charge received from the shipper they did not pay to the complainant for its service more than was reasonable and did not thereby in the amount of the excess indirectly refund to the brewing association a part of the through transportation charges paid to them by the brewing company. The allowances of $4.50 per car were found excessive. In the supplemental report in addition it was stated that the reasonable division to the complainant out of any joint rate which might be established should not exceed $2 a car. Upon further consideration it is now held that the division should not exceed $2.50 a car.

The present case was brought up partly because it was alleged that the former decision was not in strict accord with the Supreme Court's findings in the Manufacturers Railway case. The commission, however, does not agree with that contention.

In the supplemental report it was stated that an order would be entered on October 1, 1913, if the findings had not been complied with by that date. This has since been extended. An order will now be entered requiring the establishment of maximum joint rates to and from points on the complainant railway which shall not be more than $2.50 in excess of the trunk lines' rates to and from St. Louis. If the carriers are unable to agree on divisions the commission may be called upon to decide in the matter; it is its present opinion that the proper division would be $2.50 per car. The commission also reserves the right if necessary to institute an inquiry upon its own motion under those provisions of the act which forbid the giving or receiving of rebates or undue concessions directly or indirectly by any device whatsoever, having in mind particularly in connection therewith the fact of the common ownership of railway and brewery association stock. "There must, in any view taken of this case, be some point at which the fact of this common ownership of stock becomes importantly significant; and immediately beyond the limit of reasonableness in allowances, divisions, or concessions of any kind whatsoever granted by the trunk lines to the complainant railway, comes, in the commission's view, that point. If this be not so, then gross discriminations must thrive, notwithstanding the inhibitions of the act against undue preferences and discriminations." The report also states: "We are confident in the belief that we have decided the issues raised by it in accordance with both the letter and the spirit of the law. If our conclusions are not sound, we desire that the courts settle definitely the question of what the proper interpretation of the law applicable in this and similar cases is. Cases of this nature involving payments by trunk lines to short terminal lines of railroad which were once only appurtenances to private industrial plants served by them have been the causes of much investigation by and concern to us in our efforts to effectively administer the law under which we act, and the sooner any doubtful constructions of that law with respect to such matters are clearly settled by judicial decisions the better."

Commissioner Harlan in a dissenting opinion states that he is unable to see wherein the complainant railway should receive different treatment from other industrial railways. "Notwithstanding our ruling in the cases last cited that the movement of traffic between a plant and the plant interchange tracks in such cases is a shipper's service and not a carrier's service, a principle that seems, when applied to like conditions, to have been accepted as sound with practical unanimity by railroads, industries, and the courts, the commission here permits the trunk lines out of their rates to pay the shipper for performing an entirely similar service."

He also says: "It is certain that the great privileges enjoyed by large shippers in the form here recognized as proper by the majority will not be tolerated by the general shipping public, which must bear the burden, when they are more fully understood; and the present law, which in my judgment is entirely adequate to enable us to cope with the evil, must either be more strongly construed in the public interest or must promptly be amended by the Congress."

STATE COMMISSIONS

By an order of the Railroad Commissioners of North Dakota rates for excess baggage carried on the railroads of that state have been reduced about one-third; and, according to a St. Paul paper, wholesale merchants of that city expect by this reduction to save $30,000 a year on the expense bills of their traveling salesmen in North Dakota.

The Public Service Commission of Massachusetts has authorized the establishment of a six-cent fare unit throughout the Middlesex & Boston Street Railway system. In a long opinion the board emphasizes the right of capital to earn a living income; urges investment value as the proper basis of rates rather than the cost of reproduction; affirms the broad powers of the commission with respect to rate making, irrespective of previous franchise agreements between constituent companies and municipalities; condemns the holding company plan; contends that money prudently invested and lost in the earlier stages of a public utility's life should not be irretrievably lost to the stockholder, and sets forth the importance of adequate depreciation allowances. The commission says that the policy of the state is to afford a fair return to capital by the imposition of rates for transportation capable of providing first-class service and a margin of profit sufficient to attract investors into the field. Without such a return, says the opinion, the whole experiment of private ownership and public regulation will fail.

COURT NEWS

The Court of Appeals of Kentucky has declared unconstitutional the law of that state passed by the legislature at its last session limiting passenger fares throughout the state to the basis of 2½ cents a mile. The statute has no enacting clause.

Judge Davis of the Circuit Court at Marshall, Mo., has issued a decision sustaining the demurrer filed by the Chicago & Alton against a suit filed by the attorney-general of Missouri to recover $2,000,000 in overcharge claims, covering the time when the state freight and passenger rates were in litigation. Of nine demurrers filed in different counties by the different railroad companies against similar suits filed by the attorney general, this is the first that has been sustained. The railroads contended that the suits should have been brought in the federal court.

Railway Officers

Executive, Financial, Legal and Accounting

The office of F. E. Connors, assistant to vice-president of the Atchison, Topeka & Santa Fe, has been removed from Topeka, Kan., to Chicago, Ill.

A. W. Lefeber, general manager of the Midland Valley at Muskogee, Okla., has been appointed vice-president and general manager, with headquarters at Muskogee.

C. G. Austin, general attorney of the Chicago & Western Indiana Railroad and the Belt Railway of Chicago, has been appointed general solicitor, with headquarters at Chicago.

Operating

W. L. Schneider has been appointed inspector of transportation of the Delaware & Hudson, with office at Albany, N. Y.

W. E. Cline has been appointed chief train despatcher of the Canadian Pacific, with headquarters at Edmonton, Alta., succeeding C. W. Fisher, transferred.

Walter T. Spencer, trainmaster of the New York, New Haven & Hartford at Providence, R. I., has been appointed superintendent of the Old Colony division, with headquarters at Taunton, Mass., succeeding H. C. Oviatt, promoted.

A. N. Stroud, examiner of rules for trainmen, enginemen and yardmen, on the Oregon Short Line at Pocatello, Idaho, has been appointed trainmaster of the Utah district of the Utah-Montana division, with headquarters at Salt Lake City, Utah, succeeding M. A. Pond, assigned to other duties.

C. A. Grimsley, acting superintendent of the Florida East Coast at Miami, Fla., has been appointed superintendent of the Northern division, with headquarters at New Smyrna, succeeding C. G. Wakeley, who has been appointed a special agent, with headquarters at St. Augustine, and E. L. Cline has been appointed acting superintendent of the Southern division, with headquarters at Miami, succeeding Mr. Grimsley.

Traffic

C. B. Michelson, immigration agent of the St. Louis & San Francisco, has been appointed marketing agent, with office at St. Louis, Mo.

L. R. Everett has been appointed general agent of the Atchison, Topeka & Santa Fe at Santa Barbara, Cal., succeeding W. B. Frisbie, transferred.

S. A. Story, who has been appointed assistant general freight agent of the Lehigh Valley, with headquarters at Buffalo, N. Y., as has already been announced in these columns, began railway work as a clerk in the general freight office of the Pennsylvania Railroad at Philadelphia, Pa., later becoming stenographer to the freight traffic manager. He was then successively chief clerk to the president of the Central New England; New England agent of the Poughkeepsie Bridge Route; eastbound freight agent of the Lehigh Valley at Boston, Mass., and New England freight agent of the Lehigh Valley. He subsequently served as manager of the Lake Shore-Lehigh Valley Fast Freight Line, and the Michigan Central-Lehigh Valley Fast Freight Line, later becoming through freight agent of the Lehigh Valley at Buffalo, N. Y., which position he held at the time of his recent appointment as assistant general freight agent of the same road as above noted.

Engineering and Rolling Stock

J. J. Sullivan has been appointed superintendent of machinery of the Nashville, Chattanooga & St. Louis, with headquarters at Nashville, Tenn., to succeed A. G. Kautman, who recently resigned to devote his time to private affairs.

Purchasing

A. E. Yuill has been appointed tie and timber agent of the Canadian Northern, with jurisdiction over eastern lines, with headquarters at Toronto, Ont.

OBITUARY

Charles L. Atterbury, formerly assistant and attorney to the president of the New York, Lake Erie & Western, now the Erie, died on November 10, at his home in New York. He was born on December 3, 1842, at Detroit, Mich. After graduating from Yale in 1864, he studied law in Detroit. He was in the legal department of the Erie for many years down to about 1885.

Thomas Eedson, formerly auditor of freight accounts and freight claim agent of the Michigan Central, died at his home in Detroit, Mich., on November 1. Mr. Eedson was born January 4, 1842, at Niagara, Ont., and began railway work in 1872 in the treasurer's office of the Canada Southern, then under construction. He continued with that company as cashier from the commencement of its operation up to the time of its operating agreement with the Michigan Central on January 1, 1883, when he became a clerk at St. Thomas, Ont. In September of that year he was transferred to Detroit, Mich., as clerk in the auditor's office, and subsequently was chief traveling auditor, freight accountant and freight claim agent, until July, 1905, when he was appointed auditor of freight accounts and freight claim agent. He held the latter positions until February, 1912, when he was retired under the pension rules of the company.

Will George Van Vleck, vice-president and general manager of the Sunset-Central lines in Texas and Louisiana, with office at Houston, Tex., died on November 10, at his home in Houston.

W. G. Van Vleck

He was born on March 5, 1857, at Elbridge, Onondaga county, N. Y. He received a common school education, and began railway work in August, 1873, as a telegraph operator with the Grand Rapids & Indiana, remaining with that company for two years. He went with the Galveston, Harrisburg & San Antonio in October, 1875, where he until 1885 was consecutively, for one year telegraph operator, four years despatcher, one year chief despatcher, one year trainmaster of the Mexican & Pacific extension, and two years division superintendent. For over two years from March, 1885, he was superintendent of the San Antonio division; he was then transferred to the Louisiana division of the Southern Pacific Company, and six months later was made general superintendent of the lines in Texas. From October, 1895, he was manager of the Galveston, Harrisburg & San Antonio, and the Texas & New Orleans, and for a number of years was also second vice-president of those lines, until his election in December, 1911, as vice-president and general manager of the Sunset Central lines.

Indian Railway Accident.—Press despatches report that on October 15 eight persons were killed and eight injured as the result of a collision between two freight trains on the Ghats Mountains, 70 miles from Bombay.

Wire Ropeway Construction in India.—It has been proposed to construct a wire ropeway from Rajpore, in the territory below Mussoorie, in the northwest Provinces of India, into that city. Mussoorie is a large hill station to which people of the plains and other hot districts go in the heated term. The railway stops at Dehra, just south of Mussoorie, and merchandise is carried up part of the way in carts and partly by coolies. Under the present system above five hours is required to bring goods from Rajpore to Mussoorie. It is believed that the rates will be about the same by wire ropeway as at present, but the saving in time and proper handling of goods will be great.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Maine Central is inquiring for prices on 7 Mikado type locomotives.

The Central Vermont has ordered 3 ten-wheel type locomotives from the American Locomotive Company.

The Chicago, Milwaukee & St. Paul has ordered one 50-ton electric locomotive from the General Eectric Company.

The Russian Government Railways are reported to have ordered 30 locomotives from the Baldwin Locomotive Works

The A. Guthrie Construction Company, St. Paul, is said to be in the market for one or two locomotives. This item has not been confirmed.

CAR BUILDING

The Illinois Southern is in the market for 300 freight cars.

The Northern Pacific has ordered 21 sleeping cars from the Pullman Company.

The Union Pacific is said to be preparing specifications for 2,000 fruit cars. This item has not been confirmed.

IRON AND STEEL

The Paducah & Illinois has ordered one 70-ft. through plate girder span, weighing 103 tons, from the American Bridge Company.

The Armored Train "Simba" in Uganda.—The armored train "Simba," which forms part of the rolling stock of the Uganda Railway stock in war time, was constructed in the Nairobi locomotive shed within a week, work being carried on night and day. The sides of the cars employed are about 5 ft. high and of one-quarter inch steel. To the outside of these are riveted one-half inch steel plates, which bring the total height of the sides of the wagon up to something over six feet, thus affording ample protection to the 40 men accommodated in each car. The steel plates are further covered with a thickness of wood which is painted a slate color. The engine is armored in the same way as the cars.

The Sara Bridge Over the Lower Ganges.—There is now in process of construction in India a bridge over the lower Ganges which ranks as one of the most costly engineering schemes now in hand in India and the Far East. The bridge is being built at Sara Ghat, about 118 miles northeast of Calcutta. When completed it will carry the main line of the Eastern Bengal State Railway across the river at that point, thereby connecting the broad gage system of that road south of the river with the roads north of it. As part of the scheme, also, a line will be built from Sara to Sirajgunj on the Brahmaputra river. Many of the present lines to the north of the Ganges are now of meter gage. For the present, therefore, traffic through to and from Calcutta will have to be transshipped at Santahar, where large yards will be established for that purpose. In the course of time, however, these meter gage lines may be broadened first from Santahar to Parbatipur and then beyond to Siliguri, the southern terminus of the Darjeeling-Himalaya Railway. The bridge has been under discussion for over 20 years and was sanctioned in 1908, as now being constructed it will have 15 main spans of 345 ft. center to center of bearings on piers spaced 359 ft. apart, and at each end there are three land spans of 75 ft. The total length of the bridge will be about 5,900 ft. from abutment to abutment. The main girders have an over all depth at the center of 52 ft.; the width from center to center will be 32 ft., and the total width of the bridge, including the footway will be 48 ft. 6 in. There will also be extensive training works to confine the river to its proper channels. The estimated cost of the work is about $15,500,000.

Supply Trade News

The Power Specialty Company, New York, has moved its Chicago office from the Peoples Gas building to the Harris Trust building.

Ralph H. Wilson, southeastern representative of the Walter A. Zelnicker Company, St. Louis, has been appointed advertising manager of that company, and has been succeeded by E. F. Prichard, formerly auditor of the St. Louis Car Company, St. Louis, Mo.

The American Locomotive Company announces that it is not its intention at this time to appoint a successor to H. C. Hequembourg, who has resigned, effective November 15, to become vice-president of the Standard Chemical Company, Pittsburgh, Pa. Until further notice the purchasing and stores department will be under the jurisdiction of Leigh Best, vice-president.

George W. Lyndon, whose election as president of the Association of Manufacturers of Chilled Car Wheels, with headquarters at Chicago, was announced in the *Railway Age Gazette* of last week, was born at Rochester, N. Y., February 16, 1859. Mr. Lyndon attended the Kewanee, Ill., high school, graduating in 1877. He was then a law student with Charles K. Ladd, Kewanee, and Turner A. Gill, Kansas City, Mo., until 1880, when he entered railway service with the Kansas Pacific at Kansas City, Mo. Shortly thereafter he was transferred to Omaha on account of the consolidation of the Kansas Pacific with the Union Pacific. He remained with the Union Pacific as chief clerk of freight accounts until 1885, then accepted a position as traveling auditor of the Kansas City, Fort Smith & Memphis, with headquarters at Kansas City. In 1887 he was appointed freight auditor, resigning in 1889 to accept a position as freight auditor of the Chicago, Kansas City & St. Paul, now the Chicago Great Western. In 1890 he resigned to take a position as general auditor of the Griffin Wheel Company and Ajax Forge Company. Later he was made manager of the improvement and review departments, which position he held until 1907. In 1908 he was made western secretary of the Railway Business Association, and in the same year he accepted a position as secretary and treasurer of the Association of Manufacturers of Chilled Car Wheels, which position he held until his election as president on October 27.

George W. Lyndon

Dr. J. A. L. Waddell and John Lyle Harrington announce the dissolution of the firm of Waddell & Harrington, consulting engineers, Kansas City, Mo. The firm's business will be conducted as usual till the conclusion of its affairs in July, 1915, except that it is accepting no new commissions. Dr. Waddell will give his attention to special engineering and financial matters, and to important advisory work. Mr. Harrington will become a member of the new firm of Harrington, Howard and Ash, as noted elsewhere.

Charles Dyer, vice-president of the National Dump Car Company, died November 8, 1914, at his home in Denver, Colo. Mr. Dyer was born April 30, 1845, at Springfield, Vt. He entered railway service in 1863 with the Rutland & Bennington. From 1868 to 1870, he was with the Boston & Albany, and from November 1, 1870, to February 1, 1900, with the Atchison,

Topeka & Santa Fe, successively as clerk and operator, agent, chief despatcher, trainmaster and division superintendent; from February 1, 1900, to January 30, 1903, he was general superintendent of the Colorado & Southern, and in May, 1903, he accepted the position of second vice-president of the National Dump Car Company, Chicago.

Colonel H. G. Prout has been elected president of the Hall Switch & Signal Company, and William P. Hall is now vice-president and chairman of the executive committee. W. J. Gillingham, hitherto western representative of the company, with office at Chicago, has been appointed general sales manager, with headquarters at the main office in New York City. W. A. Peddle has been appointed acting chief engineer, in charge of engineering and production, and W. H. Lane, chief engineer, has been granted leave of absence until January 1, on account of ill health. Colonel Prout in July last resigned as president of the Union Switch & Signal Company. A sketch of his life was published in the *Railway Age Gazette*, March 27, 1914.

John Lyle Harrington, E. E. Howard and Louis R. Ash have established the firm of Harrington, Howard & Ash, with office in the Orear-Leslie building, Kansas City, Mo., and will conduct a general consulting practice relating to hydro-electric developments, advisory municipal engineering appraisals, examinations, and reports upon engineering projects, giving special attention to foundations, bridges—particularly movable spans—and other structures in steel and reinforced concrete. Mr. Harrington spent many years in bridge and structural shops, two of which he designed and operated, in the service of railroad companies, and in mechanical and electrical work. For three years he was the executive engineer of the C. W. Hunt Co., New York, and for two years chief engineer and manager of the Locomotive & Machine Company of Montreal. For the past eight years he has been a member of the recently dissolved firm of Waddell & Harrington, consulting engineers, Kansas City, and has directed the design and construction of many bridges. Mr. Howard has been associated with Dr. J. A. L. Waddell for fourteen years, for many years as principal assistant engineer, and later as associate engineer of Waddell & Harrington. His experience covers every phase of the firm's work. Mr. Ash has had many years' experience in engineering work, and from July, 1910, to April, 1913, was city engineer of Kansas City, in which capacity he was responsible for the design and construction of sewers, paving, grading, flood protection work, etc. He also made an appraisal of the property of the Metropolitan Street Railway Company, and was engineering adviser for the city in the street railway franchise negotiations. Mr. Ash resigned from the position of city engineer to become associate engineer and office manager of Waddell & Harrington.

TRADE PUBLICATIONS

Light and Ventilation.—The David Lupton's Sons Company, Philadelphia, Pa., has just issued specialty catalog No. 8. This book contains 84 pages and gives in considerable detail the design of the various types of steel sash, steel partitions, steel tube doors and jambs, Pond and sawtooth trusses and various kinds of operating devices manufactured by this company. It also contains a description of rolled steel skylights, sheet metal fireproof windows and Waldmire louvers. Numerous illustrations clearly show the details of construction and the method of installation of these products. Many prominent structures equipped with Lupton products are also shown, together with a list of recent installations.

Gas-Electric Motor Cars and Locomotives.—The General Electric Company recently issued bulletin No. 44,300, which illustrates and describes some gas-electric motor cars and locomotives adapted to branch line service on steam roads and also for interurban service. The power equipment is described in considerable detail, and the average cost of operation of the standard car is given, in addition to other data relative to weights, dimensions, etc. It has also issued bulletins Nos. 44,403 and 44,405, describing its ventilated commutating-pole railway motors for 600 and 600/1,200 volt service. Bulletin 44,403 is devoted to the GE-222-G railway motor, which has a rated output of 140 h. p. at 600 volts, and, having modified windings, can be supplied for operation with two in series on 1,200 volts, at which voltage the rating is 150 h. p. Bulletin 44,405 describes the GE-233-A motor for operating two in series on 1,200 volts.

Railway Construction

Central Canada.—This company, which filed route maps with the Alberta Government early this year for a line to be built from a point on the Edmonton, Dunvegan & British Columbia, at or near Round lake, Alta., through the North Hart river valley to Peace River Crossing, is asking permission to build a line also from Sucker creek, on the E. D. & B. C., to Grouard, Alta. J. D. McArthur, Winnipeg, Man., is interested, and Short, Woods, Biggar & Collison, Edmonton, Alta., are solicitors for applicants. (May 1, page 1,011.)

Chicago, Burlington & Quincy.—The report of this company for the year ended June 30, 1914, shows that during the year the line extending southerly from Laurel, Mont., was almost completed to Orin Junction, Wyo., at which place, since the close of the year, it has been connected with the Colorado & Southern. Construction has been carried on for a connection of the Northport-Guernsey line with the Colorado & Southern at Wendover, Wyo., and work was started on the construction of the Chalco-Yutan line, which is to be a cut-off connecting the Omaha line with the line to Sioux City. There was placed in operation during the year 135.15 miles of new road, 73.81 miles of second track and 87.69 miles of other tracks. Additional land for needed facilities has been bought at Chicago, at Aurora, Ill., and at other points, and a number of freight houses and passenger stations were built.

Florida Roads.—According to press reports plans are being made to build a municipal railway in Jacksonville. The proposed belt line is to connect the municipal docks with the railroads entering the city.

Gadsden, Bellevue & Lookout Mountain (Electric).—An officer of this company, which operates an electric line connecting Gadsden, Ala., with Noccalula Falls, 3.1 miles, writes regarding a report that an extension is to be built between Gadsden and Center, that the company expects to start surveys for the extension in about 60 days.

Glenn Rose & Walnut Springs.—According to press reports grading work has been finished on two miles and track laying will be started soon on the line building from Glenn Rose, Tex., south to Walnut Springs, 14 miles. S. Lewis, secretary, Waco; F. B. King, general manager, Glenn Rose, and L. J. Wright, construction foreman. (See Texas Roads, September 4, p. 452.)

Kentucky Southwestern Electric Railway, Light & Power Company.—An officer of this company, which was incorporated in 1911, writes that contracts will be let and construction work started soon, on the line projected from Paducah, Ky., south through Lone Oak, Melber and Fancy Farm to Mayfield, thence east via Sedalia and Lynn Grove to Murray, 57.75 miles. The work will be easy and calls for cuts and fills involving the handling of about 1,000,000 cu. yd. The maximum grade will be 2 per cent, and the maximum curvature 8 deg. There will be one 1,800-ft. trestle and a number of smaller ones. The plans include: a power house, three sub-stations, stations, carbarns and repair shop. H. C. Rhodes, president; Paducah.

Lula-Homer.—Application has been made in Georgia for a charter by this company, with a capital of $200,000, to build a line from Lula, Ga., on the Southern Railway southeast to Homer, 14 miles. S. S. Carter, E. Chapman and J. Coffee, Lula, are interested. (See Georgia Roads, October 2, p. 624.)

Mercer Electric.—Plans are being made, it is said, to build an electric line from Athens, W. Va., southwest to Princeton, about seven miles. R. G. Meador, president, Athens.

Monongahela Railroad.—The River division has been extended from Martin, Pa., south to Vanzandt, 9.1 miles.

Niagara River & Eastern.—An officer writes that the plans call for building from Lockport, N. Y., west to the Niagara river. At Lockport connections will be made with the Buffalo, Lockport & Rochester and the International Railway. The company plans to carry out the work with its own forces and to use both steam and electricity as the motive power. Charles Hickey, president, Lockport, N. Y. (October 30, p. 818.)

Ontario Municipal Electric.—We are told that contracts will probably be let next summer to build from Toronto, Ont., northeast to Port Perry; also from St. Catharines northwest through Hamilton and Guelph to Owen Sound. The grading work will involve handling an average of 15,000 cu. yd. to the mile. The maximum grades will be 2.5 per cent, and the maximum curvature 6 deg. The plans also call for building an interurban terminal at Toronto. F. A. Gaby, chief engineer, Continental Life building, Toronto, Ont. (See Canadian Roads, October 30, p. 818.)

Orleans-Kenner Electric.—An officer writes that work is now under way by Johnson & Co., Inc., New Orleans, La., building a line in Louisiana from St. Charles parish line east, to connect Hanson City, Kenner, Harahan, Shrewsbury, West Carrolton, Southport and New Orleans, about 14 miles, and that track laying is about 90 per cent finished. A contract has also been let for building a sub-station. E. A. Stanford, president; H. K. Johnson, chief engineer. New Orleans. (October 23, p. 779.)

RAILWAY STRUCTURES

Albany, Pa.—The Philadelphia & Reading has given a contract to M. & J. B. McHugh, Philadelphia, Pa., for building a concrete bridge over Maiden creek at a point south of Albany. The bridge wil have six spans each about 23 ft. long.

Bridge End, Ont.—The Railway Commission of Canada has approved the locations of the Glengarry & Stormont Company's proposed stations and grounds in Glengarry county, Ont., at Bridge End, mileage 5.28, and at Glen Gordon, mileage 12.78. This company is building a line from St. Polycarpe Junction, Que., southwest to Cornwall, Ont., 30 miles.

Chattanooga, Tenn.—We are told that construction work is expected to be finished this month on a reinforced concrete viaduct which is being built over the tracks of the Cincinnati, New Orleans & Texas Pacific, and the Western & Atlantic at East End avenue, Chattanooga. The length of the concrete structure between abutments is 371.7 ft. The length of the north approach fill is 160 ft., and the south approach fill is 470 ft. The viaduct is 60 ft. wide.

City of Panama.—The Panama Railroad has begun work on a new freight house. The building will be 75 ft. by 600 ft., and one story high, and will replace the old freight house which was recently condemned by the health authorities on account of its lack of protection against an invasion by rats.

East St. Louis, Ill.—The Southern Railway will start work at once on new engine terminal facilities at Denverside, near East St. Louis, at a cost of about $275,000, and is asking for bids for the construction of an 18-stall roundhouse, shops and other buildings. The improvements also include a 90-ft. turntable, modern coal and cinder handling plant, oil house, office building, etc., and the construction of repair yard tracks and other track work. The grading work for the tracks is now under way.

Lexington, Ky.—The Louisville & Nashville has given a contract to Rommel Brothers, Louisville, Ky., it is said, for building the roundhouse and repair shops in the yard at Lexington. (October 2, p. 624.)

Norfolk, Va.—A contract was let recently, it is said, to the Richardson Construction Company, Norfolk, for building a two-story addition to the general office building of the Seaboard Air Line at Norfolk. (August 7, p. 268.)

St. Catharines, Ont.—According to press reports the Grand Trunk is planning to put up a new station at St. Catharines.

St. Petersburg, Fla.—According to press reports the Tampa & Gulf Coast which recently completed an extension to St. Petersburg is making plans to build a passenger station at St. Petersburg. The cost of the improvements will be about $20,000.

Spartanburg, S. C.—Plans have been made, it is said, for the enlargement of the present passenger station at Spartanburg, and when the improvements are completed it will be used jointly by the Southern Railway, the Carolina, Clinchfield & Ohio and the Charleston & Western as a union station.

Railway Financial News

Missouri, Kansas & Texas.—The Supreme Court of the United States on November 9 dismissed the suit of the Missouri, Kansas & Texas Railway Company against the United States for $61,000,000 damages for failure to convey to it alternate sections of land through what was the Indian Territory.

Congress in 1866 offered alternate sections of public land in Indian Territory to the first railroad constructed from the Kansas state line to the Red river in Texas. The predecessor of the Missouri, Kansas & Texas won a construction contest, but the government declined to convey the land on the ground that the land was "Indian land" and not "public land" within the meaning of the act. The Court of Claims decided in favor of the government and the railway appealed to the Supreme Court, which now has affirmed the decision of the lower court.

The railway company brought the suit on the ground that the company as a land grant road was entitled to take alternate sections on each side of its right of way whenever the Indian title became extinct. The issue was whether the Indian title was extinguished when the Indians gave up their tribal relation and took lands in severalty as allottees of the government.

The railroad company contended that when the government divested the Indians of their tribal title the claim of the railway under its grant of alternate sections attached. The Court of Claims took a different view.

St. Louis & San Francisco.—Suits to recover $14,000,000 from directors and former directors of the St. Louis & San Francisco were dismissed in the federal court at St. Louis on November 10. The dismissal of the suit, which was filed by the receivers is part of the plan of the receivers to disclaim liability of the Frisco on a $26,000,000 bond issue of the New Orleans, Texas & Mexico. The attorneys for the receivers issued the following statement:

Inasmuch as the dismissal of this action will deprive the defendants of the opportunity to meet the charges of fraud made in the petition, we deem it but just to them to say that we have made an exhaustive examination.

We found that in that so-called Brownsville and Iberia deals for the latter of which settlement has been made, there was, in our opinion, an excessive exercise of authority by the directors, for the results of which, in the case of the Brownsville, the directors probably could be held accountable, and that certain of them also might be held accountable for profits made out of the deal, if the courts should decide that the St. Louis & San Francisco Railroad Company is liable at all on account of the New Orleans, Texas & Mexico division bonds.

We have failed, however, to find, and judging from the information that we have, we do not believe that any of the directors of the St. Louis & San Francisco have been guilty of any actual, wilful or intentional fraud in the administration of the affairs of the company.

On January 22, 1914, the receivers of the Frisco filed suit in the federal court for more than $14,000,000 against ten men who are directors of the Frisco from December 1, 1909, to June 1, 1910. During that time the Brownsville road was purchased. The ten men sued were B. F. Yoakum, former president of the Frisco board of directors; James Campbell of St. Louis, vice-president of the Frisco and head of the North American Company, which instituted the receivership proceedings, and seven other former directors of the Frisco—W. K. Bixby of St. Louis, A. S. Greig of St. Louis, B. L. Winchell of Chicago, E. V. R. Thayer of Boston, and C. W. Hilliard, Frank Trumbull and Hans Winterfeldt of New York.

San Antonio, Fredericksburg & Northern Railway.—This property was on October 29 put in the hands of a receiver on application of R. A. Love of Kansas City, Mo., president of the company. The line extends from Fredericksburg southward 24 miles to a connection with the San Antonio & Aransas Pass. It has been in operation only about a year. M. L. Trice was appointed receiver by Judge Maxey in the Federal Court. The road's indebtedness is $173,000; assets said to be $500,000.

ANNUAL REPORTS

CHICAGO, BURLINGTON & QUINCY RAILROAD COMPANY—SIXTIETH ANNUAL REPORT

Chicago, July 1, 1914.

To the Stockholders of the Chicago, Burlington & Quincy Railroad Company:

The following is the report of your Board of Directors for the year ended June 30, 1914:

CHICAGO, BURLINGTON & QUINCY RAILROAD COMPANY.
YEARS ENDED JUNE 30,

Per Cent.	1914.	OPERATING REVENUES.	1913.	Per Cent.
67.71	$62,799,188.01	..... Freight Revenue	$64,063,856.49	67.88
23.44	21,743,507.05	..... Passenger Revenue	21,895,690.73	23.20
2.62	2,428,503.50	..... Mail Revenue	2,329,351.41	2.47
2.80	2,595,965.75	..... Express Revenue	2,894,812.78	3.07

NEW WORK.

During the year the line extending southerly from Laurel, Montana, was almost completed to Orin Junction, Wyoming, where, since the close of the year, it has been connected with the Colorado & Southern Railway.

Construction has been carried on for a connection of the Northport-Guernsey line with the Colorado & Southern Railway at Wendover, Wyoming.

Work has been begun on the construction of the Chalco-Yutan line, which is a cut-off connecting Omaha and Sioux City.

$1,243,481.60 has been expended for second track, and there have been placed in operation during the year 135.15 miles of main track, 73.81 miles of second track and 87.69 miles of other tracks.

Additional land for needed facilities has been purchased at Chicago, and Aurora, Illinois, and at other points.

A number of freight houses and passenger stations have been built.

Following is the report of the General Auditor, with statements prepared by him.

By order of the Board of Directors.

HALE HOLDEN,
President.

SOUTHERN PACIFIC COMPANY—THIRTIETH ANNUAL REPORT

REPORT OF THE BOARD OF DIRECTORS.

NEW YORK, October 29, 1914.

To the Stockholders of the Southern Pacific Company:

The Board of Directors submit herewith their report of the operations of the Southern Pacific Company and of the Proprietary Companies for the fiscal year ended June 30, 1914.

PROPERTIES AND MILEAGE.

The transportation lines constituting the Southern Pacific System, June 30, 1914, were as follows:

Divisions.	First Main Track.	Additional Main Track.	Sidings.	Ferries.	Water Lines.
A.—*Mileage of lines belonging to or leased by Companies, the capital stocks of which are principally owned by the Southern Pacific Company.*					
(1)—Operated by the Southern Pacific Company under leases:					
Central Pacific Ry.	2,205.46	251.70	852.24	9.90	125
Oregon & California R. R.	697.45	2.85	165.91		
Southern Pacific R. R.	3,497.37	190.02	1,486.59	3.00	
South Pacific Coast Ry.	106.69	20.46	49.59	3.00	
(2)—Operated by the owning Companies:					
Morgan's Louisiana & Texas Railroad and Steamship Co.	404.53	40.22	228.50	3.00	
Louisiana Western R. R.	207.74	—	70.15		
Texas & New Orleans R. R.	438.03	3.46	177.06		
Galveston, Harrisburg & San Antonio Ry.	1,342.68	6.59	325.85		
Houston East & West Texas Ry.	190.94	—	56.03		
Houston & Shreveport R. R.	39.78	—	7.35		
Houston & Texas Central R. R.	829.66	1.27	245.27		
Southern Pacific Terminal Company	—	—	22.31		
Arizona Eastern R. R.	366.74	—	79.77		
Corvallis & Eastern R. R.	140.58	—	15.80		
Southern Pacific Company	—	—	—	—	4,683
B.—*Mileage of lines belonging to Companies, the capital stocks of which are principally owned by the Morgan's Louisiana & Texas R. R. & S. S. Co., but which are operated by the owning Companies.*					
Iberia & Vermilion R. R.	21.44	—	7.00		
Direct Navigation Co.	—	—	—	—	65
Total	10,508.49	516.57	3,789.42	18.90	4,873
Less operated jointly by Proprietary Co's.	31.49	9.97	.49		
Total mileage operated June 30, 1914	10,477.00	506.60	3,788.93	18.90	4,873
Total mileage operated June 30, 1913	10,330.06	425.10	3,674.92	18.90	4,997
Increase	146.94	81.50	114.01	—	—
Decrease	—	—	—	—	124

The total operated mileage of the lines constituting the Southern Pacific transportation system, and of the lines of other companies controlled by the Southern Pacific Company, including 400.99 miles of the Northwestern Pacific Railroad Company and 49.47 miles of the Sunset Railway Company, one-half of the capital stocks of which is owned by the Southern Pacific Company, amounted, on June 30, 1914, to 13,278.93 miles.

INCOME FOR THE YEAR.

The income for the year ended June 30, 1914, of the Southern Pacific Company and of the Proprietary Companies, combined, excluding offsetting accounts, compared with last year, is as follows:

	This Year.	Last Year.	+ Increase. — Decrease.	Per Cent.
Average miles of railway operated:				
Lines East of El Paso	3,459.16	3,435.01	+ 24.15	.70
Lines West of El Paso	6,962.49	6,875.98	+ 86.51	1.26
Total	10,421.65	10,310.99	+ 110.66	1.07
OPERATING INCOME.

Land department expenses	115,635.12	116,639.65	— 1,004.53	.86
Taxes on granted and other lands	292,583.15	256,934.39	+ 35,648.76	13.87
Miscellaneous expenses of Proprietary Companies	57,418.65	82,841.13	— 25,422.48	30.69
Taxes and other expenses of Southern Pacific Company	464,300.44	291,243.30	+ 173,057.14	59.42
Additions and betterments payable from income of Southern Pacific Company	21,094.49	71,219.37	— 50,124.88	70.38
Amortization of discount on funded debt	505,476.92	7,766.41	+ 497,710.51	...
Reserve for depreciation of rolling stock owned by Southern Pacific Company and leased to other companies	1,024,221.46	978,239.14	+ 45,982.32	4.70
Total	$31,346,841.98	$29,690,735.27	+$1,656,106.71	5.58
Surplus over fixed and other charges	$20,452,215.75	$26,867,807.15	—$6,415,591.40	23.88

Surplus over fixed and other charges brought over (equivalent to 7.50 per cent. on the outstanding capital stock of the Southern Pacific Company) $20,452,215.75

Applied as follows:

Dividends on common stock, viz.:		
1½ per cent. paid January 2, 1914	$4,090,086.08	
1½ per cent. paid April 1, 1914	4,090,086.08	
1½ per cent. payable July 1, 1914	4,090,086.08	
1½ per cent. payable October 1, 1914	4,090,086.08	
Dividends on stocks of Proprietary Companies held by the public	744.00	
		16,361,088.32
Surplus after payment of dividends		$4,091,127.43

The details of Operating Income and Operating Expenses are fully dealt with under "Transportation Operations."

The increase in the income for the year from interest on loans and open accounts, results, principally, from the increase in investment advances to Affiliated Companies.

The increase in the interest on the outstanding funded debt is the result, principally, of a full year's interest charge this year on the One-Year Five Per Cent. Notes, and on the Equipment Trust Certificates of the Southern Pacific Company, issued in the latter part of last year.

The year's income is charged with $805,702.07 for sinking fund contributions and income from sinking fund investments pledged for the redemption of bonds. The proceeds during the year from the sale of lands, also pledged for the redemption of bonds, amounted to $3,040,909.54. These sums, aggregating $3,846,611.61, are dealt with as Profit and Loss items, for the reason that they are applied in reducing the bonded indebtedness of the companies.

The increase in taxes and other expenses of the Southern Pacific Company, is the result, principally, of the increase in the amount of income tax paid to the United States Government, and of the increase in taxes paid to the State of Kentucky.

Under the provisions of the lease to the Southern Pacific Company, the expenditures for additions and betterments to the property of the South Pacific Coast Railway Company are payable by the lessee, and are, therefore, a charge to its income. Such expenditures for the year amounted to $21,094.49.

The increase in the charge for amortization of discount on funded debt is the result, principally, of charging against this year's income both the remainder of the discount on the One-Year Five Per Cent. Notes issued in June of last year and retired in June of this year, and a full year's proportion of the discount on Equipment Trust Certificates issued in the latter part of last year.

On June 30, 1914, the principal of advances to the Southern Pacific Railroad Company of Mexico amounted to $38,423,719.71. Interest accruing on these advances has not been taken into the income of the Southern Pacific Company.

CAPITAL STOCK.

There was no change during the year in the capital stocks of the Southern Pacific Company and of the Proprietary Companies. The amount outstanding June 30, 1914, was as follows:

Southern Pacific Company:		
Common stock		$272,672,405.64
Proprietary Companies:		
Common stock	$315,800,572.00	
Preferred stock	29,400,000.00	
		$345,200,572.00

Stocks of Proprietary Companies outstanding June 30, 1914, were held as follows:

Owned by Southern Pacific Company	$344,767,400.00	
Owned by Morgan's Louisiana & Texas R. R. & S. S. Co.	349,500.00	
In the hands of the public	83,672.00	
Total		$345,200,572.00

FUNDED DEBT.

To provide for the payment of $26,000,000, par value, One-Year Five Per Cent. Secured Gold Notes, due June 15, 1914, for advances to be made to its various controlled companies for construction, additions and betterments, and for other corporate purposes, the Southern Pacific Company authorized an issue of Five Per Cent. Twenty-Year Convertible Gold Bonds to an amount not exceeding $55,000,000, par value, to be dated June 1, 1914, and to mature June 1, 1934. The privilege was given to the holders of the capital stock of the company to subscribe to these bonds at par, on or before April 22, 1914, to the extent of twenty per cent. of their respective holdings, payment therefor to be made in three instalments, viz.: $333.32, at the time of making subscription, on or before April 22, 1914; $333.32, on or before June 1, 1914, and $333.36, on or before July 10, 1914. The subscriptions amounted to $54,534,000.00, of which the sum of $51,526,426.58 was received to June 30, 1914.

The bonds are convertible into paid up shares of capital stock of the company at $100 per share of $100 par value on or at any time before June 1, 1924, or, if before that date called for redemption, then up to thirty days prior to the redemption date mentioned in the call for redemption. All such bonds at any time outstanding (but not part thereof) are redeemable at the option of the Company at 105 per cent. of the par value thereof and accrued interest on June 1, 1919, or on any semi-annual interest date thereafter upon not less than ninety days previous notice.

In September, 1913, to provide for the purchase of new equipment, an equipment trust known as "Southern Pacific Company Equipment Trust, Series B," was created and an issue of $2,010,000, par value, Four and One-Half Per Cent. Equipment Trust Certificates authorized, all of which the trust provides shall be guaranteed by the Southern Pacific Company. The entire $2,010,000, par value, of certificates authorized were issued during the year.

The remaining $5,120,000, par value, of Southern Pacific Company Equipment Trust Certificates, Series A authorized in March, 1913, as mentioned in last year's report, were also issued during the year.

The funded and other fixed interest-bearing debt of the Southern Pacific Company and Proprietary Companies outstanding at the beginning of the year, was as follows:

Southern Pacific Company	$165,581,910.00	
Proprietary Companies	456,034,091.68	
		$621,616,001.68
Issued during the year:		
Southern Pacific Company.		
Equipment Trust Certificates Series "A"	$5,120,000.00	
Equipment Trust Certificates Series "B"	2,010,000.00	
Five Per Cent. Twenty Year Convertible Gold Bonds, Subscription Receipts	51,526,426.58	
One-Year Five Per Cent. Secured Gold Notes	6,000,000.00	
	$64,656,426.58	
Arizona Eastern Railroad Company.		
First and Refunding Mortgage Five Per Cent. Bonds	2,155,000.00	
		66,811,426.58
Retired during the year:		
Southern Pacific Company.		
One-year Five Per Cent. Secured Gold Notes due June 15, 1914, paid off	$26,000,000.00	
Equipment Trust Certificates Series "A" due March 1, 1914, paid off	1,012,000.00	
		$27,012,000.00
Arizona Eastern Railroad Company.		
Gila Valley, Globe & Northern Railway Company Five Per Cent. First Mortgage Bonds: Purchased from payments to sinking fund		2,000.00
Central Pacific Railway Company.		
Three and One-Half Per Cent. Mortgage Gold Bonds:		
Purchased from sale of lands	$428,000.00	
Purchased from sale of securities	391,000.00	
Purchased from payments to sinking fund	8,000.00	
	$827,000.00	
Less: Bonds included in above which were purchased prior to June 30, 1913, but which were cancelled during the present fiscal year	98,000.00	
		729,000.00
First Refunding Mortgage Four Per Cent. Bonds: Purchased from payments to sinking fund		27,000.00
Houston & Texas Central Railroad Company.		
First Mortgage Five Per Cent. Bonds: Purchased from proceeds of lands sold		71,000.00
Morgan's Louisiana & Texas Railroad and Steamship Company.		
General Mortgage Five Per Cent. Bonds due July 1, 1913, paid off		1,000,000.00
South Pacific Coast Railway Company.		
First Mortgage Four Per Cent. Bonds: Purchased from payments to sinking fund		235,000.00
Southern Pacific Railroad Company.		
First Refunding Mortgage Four Per Cent. Gold Bonds: Purchased from payments to sinking fund		13,000.00
Texas & New Orleans Railroad Company.		
Payments to State of Texas for account of School Fund Debt		5,459.44
		29,094,459.44
Amount of funded and other fixed interest-bearing debt of the Southern Pacific Company and Proprietary Companies outstanding June 30, 1914		$659,332,968.82
Net increase during the year		$37,716,967.14
The outstanding bonds are held as follows:		
In the hands of the public		$584,410,619.29
Owned by the Southern Pacific Company	$62,165,349.53	
Owned by Proprietary Companies	3,554,000.00	
Held in Sinking Funds of Proprietary Companies	9,203,000.00	
		74,922,349.53
		$659,332,968.82

ASSETS AND LIABILITIES.

The combined assets and liabilities of the Southern Pacific Company and of the Proprietary Companies, on June 30, 1914, and the increases and decreases during the year, excluding the offsetting accounts between the Companies, summarized, were as follows:

INVESTMENTS.	Total June 30, 1914.	Increase.	Decrease.
Investment in road and equipment	$902,631,959.28	$19,755,936.39	
Sinking funds	*12,226,059.84	578,100.81	
Deposits in lieu of mortgaged property sold	15,694.24	1,799.63	
Improvements on leased railway property	356,844.08	53,644.91	
Miscellaneous physical property	†16,792,531.80	—	$124,543.83
Stocks and bonds owned of Proprietary and Affiliated Companies	*415,830,946.61	3,089,882.16	
Advances to Affiliated Companies	105,524,690.33	14,577,743.54	
Other investments	15,033,270.06	—	470,622.67
	$1,468,411,996.24	$37,461,940.94	

Current and Deferred Assets.	Total June 30, 1914.	Increase.	Decrease.
Cash and demand loans and deposits	$19,170,584.79	—	$148,447.46
Special deposits	87,286.40	—	2,521,930.73
Other cash accounts	15,092,096.03	$2,761,560.60	
Material and supplies	18,682,686.49	1,544,613.15	
Deferred assets	6,021,735.14	19,070.09	
	$59,054,388.85	$1,654,865.65	
Unadjusted Debits.			
Discount on funded debt	$8,346,750.78	$1,464,558.48	
Other unadjusted debits	3,896,498.98	—	$1,409,000.56
	$12,243,249.76	$55,557.92	
Total assets	$1,539,709,634.85	$39,172,364.51	
Stock.			
Capital stock of Southern Pacific Company	$272,672,405.64		
Capital stock of Proprietary Companies	*345,200,572.00		
	$617,872,977.64		
Long Term Debt.			
Funded debt of Southern Pacific Company	$203,226,336.58	$37,644,426.58	
Funded debt of Proprietary Companies	*456,106,632.24	72,540.56	
	$659,332,968.82	$37,716,967.14	
Nonnegotiable debt to Affiliated Companies	$1,467,388.61	—	$3,086,271.76
	$660,800,357.43	$34,630,695.38	
Current and Deferred Liabilities.			
Audited accounts and wages payable	$8,259,352.31	—	$4,587,854.81
Interest and dividends matured unpaid	8,074,420.80	—	2,064,265.01
Unmatured dividends declared	4,090,086.08		
Unmatured interest accrued	5,541,822.41	$261,478.17	
Other cash accounts	4,338,022.28	—	102,139.93
Deferred liabilities	874,027.42	23,615.45	
	$31,177,731.30	—	$6,469,166.13
Unadjusted Credits.			
Accrued depreciation	$34,168,162.57	$23,846,976.16	
Other unadjusted credits	26,800,825.99	—	$8,684,353.14
	$60,968,988.56	$15,162,623.02	
Total liabilities	$1,370,820,054.93	$43,324,152.27	
Balance to credit of Profit and Loss	$168,889,579.92	—	$4,151,787.76
Total	$1,539,709,634.85	$39,172,364.51	

*The outstanding capital stock and funded debt include Proprietary Companies' capital stocks and funded debt of the part value of $345,116,900 and $74,922,349.53, respectively, a total of $420,039,249.53, which securities are owned by the Southern Pacific Company or by Proprietary Companies, or are held in sinking funds of Proprietary Companies. The cost of these securities is included in the investments shown above. Of the said amount, stocks of the par value of $249,653,161, which stand charged on the books at $232,932,667.41, are pledged against the issue of Southern Pacific Company stock and bonds.

†The value of the granted lands belonging to the Central Pacific Railway Company and to the Oregon and California Railroad Company, which remained unsold at the close of the year, is not included in the statement of the assets of the said companies.

TRANSPORTATION OPERATIONS.

The results of the year's transportation operations compared with those of last year are as follows:

	This Year.	Last Year.	Increase or Decrease.	Per Cent.
Average miles of railway operated	10,421.65	10,310.99	110.66	1.07
Operating Income.				
Freight	$78,369,414.08	$80,141,498.84	—$1,772,084.76	2.21
Passenger	40,485,949.07	42,389,837.48	—1,903,888.41	4.49
Mail	2,562,342.64	2,460,309.29	102,033.35	4.15
Express	2,622,158.72	2,757,259.88	—135,101.16	4.90
Other transportation revenues	1,213,384.83	1,332,463.69	—119,078.86	8.94
Revenues from operations other than transportation	1,361,287.50	1,272,323.48	88,964.02	6.99
Total—rail lines	$126,614,536.84	$130,353,692.66	—$3,739,155.82	2.87
Revenues from outside operations	11,905,721.72	12,421,012.41	—515,290.69	4.15
Total	$138,520,258.56	$142,774,705.07	—$4,254,446.51	2.98
Operating Expenses.				
Maintenance of way and structures	$16,064,457.14	$15,589,026.66	$475,430.48	3.05
Maintenance of equipment	18,934,335.01	19,295,724.63	—361,389.62	1.87
Traffic expenses	2,889,418.58	3,115,078.74	—225,660.16	7.24
Transportation expenses	40,936,821.47	40,408,953.93	527,867.54	1.31
General expenses	3,975,034.57	3,726,325.53	248,709.04	6.67
Total—rail lines	$82,800,066.77	$82,135,109.49	$664,957.28	.81
Expenses outside operations	10,862,200.16	10,734,300.58	127,899.58	1.19
Taxes	7,162,624.57	5,697,285.83	1,465,338.74	25.72
Total	$100,824,891.50	$98,566,695.90	$2,258,195.60	2.29
Net operating income over expenses and taxes	$37,695,367.06	$44,208,009.17	—$6,512,642.11	14.73
Freight Traffic.				
Tons of commercial freight carried	31,959,625	31,642,587	317,038	1.00
Tons of commercial freight carried one mile	6,987,916,295	7,034,174,870	—46,258,575	.66

Average distance carried—including ferry suburban	40.92 miles.	43.67 miles.	—2.75 miles.	6.30

During the past ten years, with an increase of 24.46 per cent. in mileage Company's lines were abnormal during the year, and obstructions to traffic caused serious losses in earnings and heavy increases in expenses.

In every month of the fiscol year, except November, damages from washouts and landslides were frequent and embarrassing. The total number of interruptions was 227, with an average delay of three days each. The most serious interruptions were:

Eight days on Louisiana line, in September, from floods in the Calcasieu River.

Five days in October, on Victoria Division, and from two to sixteen days in December, at various points on the Houston and Victoria Divisions of Galveston, Harrisburg & San Antonio Railway and on Houston & Texas Central Railroad from phenomenal rains in Texas.

Seven oays between Colton and Los Angeles, eleven days between Los Angeles and Ventura, sixteen days between Ventura and Santa Barbara, and seventeen days on the coast line north of Santa Barbara, from the heaviest rains, in Southern California during January and February, of which there is any record.

The Nordhoff branch was cut to pieces and closed to traffic for forty-four days.

The continued sinking of the tracks in the Suisun marshes between Benicia and Sacramento, was the cause of very heavy expense, although the constant presence of large forces kept the tracks open for the safe but slow passage of trains.

On September 17th the lining of a tunnel, 1,371 feet long, in the Santa Lucia Mountains, near San Luis Obispo, was destroyed by fire, the tunnel caved in, and interrupted traffic for sixty days.

These unusual conditions caused serious losses in earnings, while the expenses for repairs amounted to $1,278,527, an increase over expenses of a similar character in the preceding year of $880,398. On our California lines alone, a further expenditure of $1,284,000 will be required to restore previous conditions and to provide reasonable protection against future damage. Of this amount $475,000 will be chargeable to Operating Expenses, and $809,000 to Additions and Betterments.

The large decrease In passenger and express earnings is attributable to deferred travel in anticipation of the California Expositions and numerous conventions to be held on the Pacific Coast in 1915; the diminished transportation of labor incident to the postponement of new enterprises; the curtailment of excursion, tourist and commercial travel by enforced economy; increased competition of interurban electric lines and motor vehicles; and reduction in express rates by the Interstate Commerce Commission and the Railroad Commission of California, which became effective in February and March of this year.

Notwithstanding the yield of normal crops in sections served by these lines, there has been a decrease in gross freight revenue of $1,772,084.76, due to a substantial curtailment of shipments of forest products in Louisiana and Texas resulting from the inability of railroads to make the usual purchases of cross-ties and from the postponement of other new construction requiring the use of lumber; the previous completion of electric power, water supply, irrigation and oil pipe line construction in California; and the extremely conservative purchases of merchandise.

Reduced rates compelled by influence of Federal and State Commissions which were in effect during last fiscal year and were not in effect throughout the previous year resulted in a shrinkage of at least $500,000 in the gross revenue of these lines, and it is conservatively estimated that cumulative reductions of this character during a period of four years ending June 30, 1914, decreased the gross revenue of these lines at least $4,000,000.

The decrease in net operating income over expenses and taxes, of $6,512,642.11, or 14.73 per cent., was caused by a decrease of $4,254,446.51, or 2.98 per cent., in total operating income, and an increase of $2,258,195.60, or 2.29 per cent., in total operating expenses, due principally to an increase of $1,465,338.74, or 25.72 per cent., in taxes. Operating expenses of rail lines include charges amounting to $2,617,760 for extraordinary expenses as follows: Repairing flood damages, as hereinbefore mentioned, $880,398; increased cost of locomotive fuel, $843,886; higher wage schedules, $221,404; increase in charges for renewal and depreciation of rolling stock as hereinafter explained, $672,072. But for these extraordinary charges, operating expenses of rail lines would have shown a decrease of $1,952,803, or 2.38 per cent., instead of an increase of $664,957. As an offset to these large increases in extraordinary items, substantial economies were effected by raising the average freight train load from 460.84 tons to 471.21 tons, and by promoting greater efficiency in the use of locomotive fuel, the latter being effected by the moving of 7.95 per cent. more gross ton miles per pound of fuel in freight service, and of 8.70 per cent. more gross tons miles per pound of fuel in passenger service. The saving in the fuel bill by this economy amounted to $707,627.

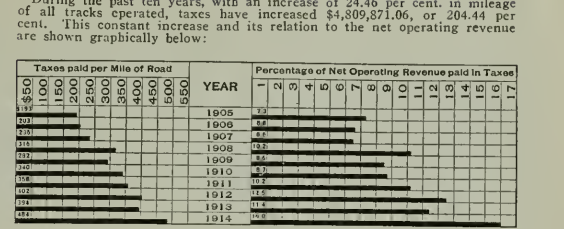
The accounting rules of the Interstate Commerce Commission, effective July 1, 1907, prescribe that estimated monthly charges shall be made to operating expense for depreciation of equipment, and that as equipment is retired from service, the amount of depreciation accrued prior to July 1, 1907, shall be charged to profit and loss. For many years prior to July 1, 1907, the transportation lines constituting the Southern Pacific System provided for the renewal or replacement of equipment condemned, sold, or otherwise disposed of, by charging operating expenses with the original cost thereof, less salvage, at the time the units of equipment were retired from service. In 1907, the Executive Committee of your Board, after giving the matter consideration, continued your Company's practice in lieu of that prescribed by the Interstate Commerce Commission, believing that as it recorded facts it was preferable to a method dealing with arbitrary estimates.

During the year 1912, a number of roads complied witb the instructions of the Interstate Commerce Commission and adopted its rules, in consequence of whicb, on reconsideration, your Executive Committee directed that, commencing July 1, 1913, your Company should set up depreciation currently in accordance with the Interstate Commerce Commission rule, and should write off the depreciation that accrued prior to July 1, 1913, to profit and loss, at the time the units of equipment were retired from service. As the Commission objected, however, to this method of handling the accrued depreciation, the matter was again considered by your Executive Committee, which approved the Controller's action in yielding strict obedience to the instructions of the Interstate Commerce Commission in charging the depreciation that accrued prior to July 1, 1913, based on the estimated life of the equipment in service on tbat date, and amounting to $22,458,476.54, to the profit and loss accounts of the system companies for the year just closed and crediting the same amount of reserve for "Accrued Depreciation —Equipment."

During the fiscal year ended June 30, 1913, charges to operating expenses on account of retirement of rolling stock, equipment under the old plan, as explained above, amounted to $1,518,986.18. Charges made during the fiscal year ending June 30, 1914, in accordance with rules prescribed by the Interstate Commerce Commission, amounted to $2,191,058.48, or an increase of $672,072.30.

TAXES.

During the past ten years, with an increase of 24.46 per cent. in mileage of all tracks operated, taxes have increased $4,809,871.06, or 204.44 per cent. This constant increase and its relation to the net operating revenue are shown graphically below:



SAFETY OF OPERATION.

In the derailment of a mixed train in the month of June, 1914, a passenger lost his life. This was the first fatality to a passenger in a train accident for FIVE YEARS AND TEN MONTHS, during which period 316,531,599 locomotive miles were run and 237,317,775 passengers were carried, involving 10,234,656,080 passengers carried one mile. In the year just closed, 7 employes out of 9,418 lost their lives through train accidents in running 57,054,594 locomotive miles. Out of 42,571 employes engaged in pursuits not involving train movements, 16 lost their lives, or one fatality to every 832,800 days, or 2,300 years worked.

GOVERNMENT ATTACK ON RIGHT TO CONTROL CENTRAL PACIFIC RAILWAY.

On February 11, 1914, the United States, acting through the Attorney-General, brought suit in the United States District Court for tbe District of Utah, against the Southern Pacific Company and the Central Pacific Railway Company, to separate the two companies, on the ground that their union in one system was in violation of the Federal Anti-Trust Act of 1890, known as the Sherman law, and also in violation of the Pacific Railroad Acts, meaning the acts of Congress providing for the construction of the Union Pacific and Central Pacific Railroads. The nature of this suit was fully explained in a circular issued to the stockholders of this company on February 5, 1914, after the Attorney-General had publicly announced his intention to endeavor to divorce the Southern Pacific Company from the Central Pacific Railway Company. The case is now at issue, and the Government, which has the opening, began taking its testimony on September 21, 1914. So much depends upon the time consumed by the Government and the nature of its testimony, that it cannot now be said with any certainty when the case will be ready for argument in the lower court. It may be assumed that an appeal to the Supreme Court of the United States will be taken by the losing party. While suits under the federal Anti-Trust Act have heretofore afforded striking examples of the uncertainty of the law, this much is certain, that a decision declaring the union and one management of the Southern Pacific Company and the Central Pacific Railway Company to be in violation of the Sherman law, would go far beyond any previous decision of the Courts. It would involve a construction of the law, which, if impartially applied, would result in the wholesale disintegration of the railroad systems of this country. We have, moreovcr, in this case the unusual advantage of having as our allies the very communities in whose supposed interest the suit was instituted. The charge that the common control of the Central Pacific lines and the Southern Pacific lines is inconsistent with the provisions of the Pacific Railroad Acts, is based on a construction of those acts which was discovered for the first time when needed as a weapon of attack in the present suit. The relations between the Central Pacific and the Union Pacific have always been harmonious. That they were in accord with the requirements of the acts of Congress has never been questioned during the forty years of their existence, until the Government last February asserted the contrary. We believe that the rights and interests of both companies, as well as the interests of the communities they serve, justify and require the vigorous defense which the management is prepared to make against the demand of the Government for a disruption of our system of roads.

GOVERNMENT ATTACK ON TITLE TO OIL LANDS.

On June 22, 1914, the Supreme Court of the United States decided in favor of the defendants the suit of Edmund Burke and others against the Southern Pacific Railroad Company and the Kern Trading and Oil Company. The object of this suit was to recover some 3,200 acres of the oil lands of defendants in California, on the ground that, by reason of the provision in the act of Congress containing the land grant excepting mineral lands, and especially by reason of a so-called mineral reservation clause in the Railroad Company's patents, the subsequent discovery of oil under the lands made the patents inoperative and defeated the Railroad Company's title to the lands. In deciding against claimant, the Supreme Court declared that the subsequent discovery of oil did not cause the lands to revert to the Government, and that the mineral reservation in the patents was unauthorized and inoperative. The Court, in effect, held that

the patents could be avoided only by proving that they had been fraudulently obtained, and that suits to set aside such patents must be brought within six years from the date of issuance of the patents. These principles are as applicable to a suit by the United States as to a suit by an individual.

It follows, as a result of the decision in the Burke case, that proven fraud alone can avail to defeat our title to our oil lands. We know there was no fraud in obtaining the patents, and we may consider that the danger of losing the lands is now removed. Moreover, except as to a comparatively small quantity of land, in respect to which suits have already been instituted, the six years period of limitation is believed to be a bar even to a suit alleging fraud.

There are four suits pending based on alleged fraud, three against the Southern Pacific Railroad Company and one against the Central Pacific Railway Company. The aggregate number of acres involved is 7,493. There are only two other suits pending relating to oil lands. The acreage involved is 89,450 acres. These suits were originally based solely on the supposed efficacy of the mineral reservation clause. Since the Burke case was decided, the Government has attempted to amend its pleadings by alleging fraud. Our counsel advises that these suits need cause us no apprehension, because the charge of fraud comes too late and because it cannot be proven.

It is a subject for much satisfaction that our title to the valuable lands in question may now be regarded as unassailable.

GENERAL.

Your Board repeats the suggestion made last year that you take an active part in repelling the attacks of demagogues on your property. Unfair treatment of railroads is due in great part to the belief of politicians that only financial magnates suffer therefrom. The surest remedy for the evil is for railroad investors to give unmistakable evidence of their numbers and of their resentment of unfair legislation or regulation. You now number over 30,000, and with the stockholders of other railroads and with investors in their securities you form a body of a million or more voters, whose protests, backed up by ballots, can lawfully exert sufficient force to compel fair treatment by your servants in Congress, in legislatures, and on commissions. The common interests of railroad shareholders and of investors in every community, no matter how small, should cause them to actively participate in every election and to perform faithfully all other duties of citizenship, in order to secure proper representatives and protection for their interests. While your Company has cheerfully made such expenditures as were required by Federal or State Commissions or by legislation, many unreasonable laws have been enacted, which serve no public good, and which add unnecessarily to the cost of operation. There is, moreover, a continuous agitation for the passage of more laws to further burden the railways regardless of necessity or reason. During the fiscal year ended June 30, 1914, the cost of complying with such legislation and with the unreasonable requirements of Federal and State Commissions, has added $1,099,405.00 to the operating expenses of your Company, viz.:

Cost of inspectors required by the Safety Appliance Act, and the Boiler Inspection Act	$326,589.00
Increased cost incident to Full Train Crew laws, Hours of Service laws, and the law requiring self-cleaning ash-pans for locomotives	286,580.00
Cost of complying with laws requiring substitution of electric for acetylene headlights	4,121.00
Cost of unnecessary train service required by railroad commissions	18,872.00
Cost of physical valuation of property required by state commissions	37,609.00
Cost of compiling statistics, printing tariffs, and other similar requirements of Federal and State Commissions	425,634.00
Total	$1,099,405.00

In addition to the above, your Company lost approximately $275,000 during the year through failure to obtain approval of the Arizona Railroad Commission to an issue of $30,000,000, par value, two-year 5 per cent. secured gold notes, as hereinafter explained.

To provide funds for corporate purposes, arrangements were made with Bankers, in May, 1913, for sale of two-year notes at a very satisfactory price. Authority of the California Railroad Commission to issue the notes was obtained without delay; approval by the Arizona Corporation Commission, however, was withheld, pending certain assurances and guaranties on the part of the Company with reference to the conduct of its business in Arizona which it was not warranted in giving, and during the time the matter was pending before the Commission the condition of the money market had so changed that a sale of the notes could not be made. Further consideration of a two-year note issue was abandoned, and one-year notes, dated June 15, 1913, and maturing June 15, 1914, were issued instead, and sold at a price yielding approximately $275,000 less than would have been received, had the two-year notes been issued without delay. Under the laws of California and Arizona the issue of one-year notes did not require Commission approval.

The construction of the line of the Northwestern Pacific Railroad Company from Willets toward Eureka, Cal., a distance of 105.64 miles, referred to in the last annual report, has been completed, physical connection of the lines running north from Willets and south from Shively having been made on October 23, 1914. For the present, through freight business between San Francisco and Eureka is being handled at the convenience of the Company, and through daylight passenger service between those points will be commenced about November 15, 1914.

It is expected that with the opening of this line for business, and with the development of the country served, the earnings of the Company will be materially increased. One-half of the capital stock of this Company is owned by the Southern Pacific Company and one-half by the Atchison, Topeka & Santa Fe Railway Company.

On the lines of the Southern Pacific Railroad Company of Mexico, the revolutionary disturbances referred to in the last annual report have continued. Structures, track, and equipment have been destroyed and business conditions demoralized the result of which has been to decrease the revenues and to retard prospective traffic. The loss on account of the interruption to traffic from revolutionary causes, from the beginning of the Madero Revolution in 1910, to June 30, 1914, is estimated to be approximately 8,000,000 pesos. During the fiscal year ended June 30, 1914, the revenues of the line, including those derived from the transportation of troops and munitions of war, were considerably in excess of the expenditures made in connection with the maintenance and operation of the property. Only such maintenance work has been done, however, as was absolutely necessary to render it possible to operate the road. The Company has claims for loss and damage caused by revolutionary disturbances amounting to 287,000 pesos which have been approved by the Mexican Government, and claims amounting to approximately 1,846,000 pesos for troop train service and rental for road operated by the Mexican Government, none of which has been paid. Claims amounting to approximately 2,174,000 pesos, covering additional losses on account of revolutionary disturbances will be presented to the Mexican Government in due course.

There still remains to be completed 99.47 miles of line from Tepic to La Quenada. The revolutionary disturbances preclude any thought of completing this mileage at the present time.

In addition to the completed lines of railway reported under "Properties and Mileage," and the railways of the Northwestern Pacific Railroad Company and the Southern Pacific Railroad Company of Mexico referred to above, construction either was completed or is progressing on the lines of the following companies, viz.:

	Length of Projected Line. Miles.	Track Completed. Miles.	Grading Completed. Miles.	Grading Progressing. Miles.
Central Pacific Railway:				
Colfax to Blue Canon, Cal.—second track:				
Length of projected line	25.42			
Less placed in operation	13.22			
	12.20	9.39	2.08	.73
Fernley, Nev., to Westwood Junction, Cal.:				
Length of projected line	125.41			
Less placed in operation	106.21			
	19.20	*19.20		
Westwood Junction to Westwood, Cal.	11.96	*11.96		
Colusa & Hamilton Railroad:				
Hamilton to Harrington, Cal.	61.15	40.95	13.63	6.57
Galvestan, Harrisburg & San Antanio Railway:				
Bay Shore Junction to Seabrook, Tex.	11.24	2.63	4.13	4.48
Houston & Texas Central Railroad:				
Eureka to Stella, Tex.	9.50	†9.50		
Willamette Pacific Railroad:				
Eugene to Marshfield, Ore.	121.50	39.31	42.94	39.25

*Opened for traffic September 1, 1914. †Opened for traffic July 27, 1914.

The reduction in our surplus over fixed and other charges, due to causes largely beyond control, has imposed on your Company the necessity of reducing the expenditures for new construction, additions to and betterments of the property, to the lowest possible limit. The uncompleted work, listed above, is being slowly carried on to protect the investment already made, but no extensions or improvements of any description, not imperatively needed for protection of the property, are being authorized or even considered.

Under the pension system put into effect on January 1, 1903, six hundred and eighty-eight employes are carried on the pension rolls of the rail and water lines. The payments to them for the year amounted to $300,630.98.

By order of the Board of Directors,

JULIUS KRUTTSCHNITT,
Chairman of the Executive Committee.

United States and Mexico	$5.00
Canada	6.00
Foreign Countries (excepting daily editions)	8.00
Single Copies	15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention daily issues, North America, $1; foreign, $2.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue (the monthly Engineering & Maintenance Edition) 10,750 copies were printed; that of those 10,750 copies 7,421 were mailed to regular paid subscribers to the weekly edition, 1,901 to subscribers who get the Engineering & Maintenance Edition only, 250 were provided for counter and news companies' sales, 1,073 were mailed to advertisers, exchanges and correspondents, and 105 were provided for samples and office use; that the total copies printed this year were 440,600, an average of 9,375 copies a week.

VOLUME 57 NOVEMBER 20, 1914 NUMBER 21

Contents

*Illustrated.

George E. McCaughan, claims attorney of the Rock Island, who has lectured in the Chicago common schools on "Safety-First," and who in other ways has participated in the movements in that city for the promotion of safety, recommends that this subject be made a part of the regular curriculum of all schools. Occasional lectures or meetings are not enough. There should be regular instructions. He suggests also that those railroad companies which, like the New York Central and the Rock Island, have motion-picture outfits, could do a good thing by lending these to schools in those cities where the city officers encourage such instruction. No argument is needed, of course, to convince anyone of the desirability of educating children in guarding against the dangers of the road, the railroad and the playground. Habits are formed in childhood. Many a child's playground can best be described as "everywhere," including railroad yards and tracks. The railroad officer who already has to spend half his time in doing things—believed to be in large measure unnecessary—which are required by the Interstate Commerce Commission, may not relish the suggestion that he go still further out of his immediate field; and emulate Mr. McCaughan in spending his mornings or evenings in school houses. Railway men are, indeed, branching out in directions which a few years ago were unheard of, but the superintendent who, like an ornamental mayor or governor should spend his whole time in making speeches would misuse his position. Nevertheless, there is, here, no doubt a field. Cultivation of the school children has been tried in other places. It is not wholly a new thing.

Safety-First for School Children

Our attention has been called to a series of developments in the Second Congressional district of Oregon which indicate that even in that state of radical ideas and radical legislation the people are not disposed to look with favor on politicians who advocate government ownership of railways. The present representative of the Second Oregon district is A. W. Lafferty. Last spring the Hon. Lafferty arose in his place in Congress and made, or at least secured leave to print, a speech advocating government ownership of railways. In support of his thesis he presented the hackneyed arguments and a large number of statistics and alleged facts which, apparently, were derived chiefly from a book written some years ago by one Anthony Van Wagenen of Sioux City, Iowa. In this book Mr. Van Wagenen advocated government ownership of railroads in a way which showed that he probably knew as little about the subject as any man living. It would appear that after making his speech Mr. Lafferty was defeated for renomination by the Republicans, who had originally elected him. At any rate, on October 2 he again arose in his place and referred in very uncomplimentary terms to a speech against government ownership which, he said, had been delivered by C. N. McArthur, the Republican candidate for Congress from the Second Oregon district, before the Portland Transportation Club. Thereupon Mr. Lafferty had both his original speech and Mr. McArthur's speech in reply embalmed in the Congressional Record. Now, in view of the fact that Oregon is the real birthplace of the initiative, the referendum and the recall in this country, one would naturally think that it would be as safe a place for a candidate for Congress to advocate government ownership and as unsafe a place to oppose it as anywhere in the United States. Nevertheless, we note by the election returns that C. N. McArthur, Republican, has defeated A. W. Lafferty, Independent, for re-election to Congress from the Second Oregon district. Evidently the people of that state are not as yet more prepared to accept the gospel of government ownership of railways than the people of the United States showed themselves to be when William Jennings Bryan made his famous speech on this subject at Madison Square Garden some years

Government Ownership in Oregon

ago. If the people of radical Oregon reject this gospel, how must we think that the people of the rest of the country would deal with it?

SUPERHEATERS ON SMALL LOCOMOTIVES

IN order to realize the greatest benefit from the economies which obtain in the use of superheaters, applications to existing locomotives have for the most part been confined to the larger classes of power which are, of course, the greatest money earners. The value of the superheater is now so well recognized that large numbers of the heavier types of locomotives which were originally built as saturated steam engines have had superheaters applied while passing through the shops, and others are undergoing the same change as rapidly as arrangements can be made to accomplish it. However, as yet little has been done toward the application of superheaters to what were the large locomotives of a few years ago, and which are now, for the most part, relegated to branch line and local main line service.

This is a problem which should, of course, be considered strictly from a business standpoint and it is not intended to suggest that the railways should apply superheaters to all existing locomotives, no matter how small or in what condition they may be, although in at least one case locomotives that would otherwise have to be discarded are being reclaimed by the expenditure of a comparatively small sum in the application of superheaters and allied changes, in such a manner as to make them serviceable for many years on branch lines. But the locomotives which would seem to hold out the greatest immediate possibility of economy by conversion from saturated to superheated steam are those of the Atlantic, Ten-wheel and Eight-wheel types in passenger service, and the Consolidation, Ten-wheel and Mogul types in freight service, built within the last 15 or 20 years. Many of these engines are already equipped with piston valves, a factor of considerable saving in making the change, as the slide valve cannot as yet be said to work satisfactorily with superheated steam. There are passenger trains now being hauled by Pacific type locomotives on schedules which could be successfully maintained by Ten-wheel or Atlantic type locomotives if given the increased boiler capacity which the superheater provides, and trains now operating on schedules which tax the capacity of engines of the two latter types to the utmost could then without difficulty undergo an increase in the number of cars or in the weight of the equipment. In this connection the increased weight of cars is a consideration which should not be overlooked. The general introduction on the main lines of most of the railways of steel equipment for passenger service has resulted in a great many cases in heavy wooden coaches being displaced for use on local and branch line passenger trains; indeed in some instances, steel underframe and all-steel passenger cars are in every-day use on such trains as well as on the heavier through trains. The use of this heavy equipment frequently presses the smaller saturated steam locomotives to the limit, and it becomes difficult or impossible for them to make up lost time or to get over the road on the schedule when it becomes necessary to add a car or two. The addition of superheaters to locomotives of the types mentioned increases their capacity so that they can successfully haul trains which otherwise they would be unable to handle and which, on the other hand, would not justify, from the standpoint of needed capacity, the employment of locomotives of the larger types.

Another opportunity for utilizing the economy of superheated steam is to be found on roads or divisions where the purchase of heavier motive power in order to increase trainloads will necessitate heavy expenditures for increasing the track and bridge capacity. In such cases the application of superheaters to existing engines will increase their hauling capacity and thus postpone the time when an increase in the weight of rails and the strength of bridges becomes necessary. Altogether it would seem that there must be large numbers of locomotives of these smaller types, on which the expenditure required to change them for the use of superheated steam would be amply justified by the economy afterward obtainable.

SPECIAL CHARGES FOR SPECIAL SERVICES AT CHICAGO

THE traffic and terminal situation at Chicago is, for various reasons, the most complex in the world. In the hearing of the 5 per cent rate case the Interstate Commerce Commission animadverted on the practice which has grown up at many places of the railways rendering certain services for nothing, or paying others for rendering certain services, the effect of which is to give many shippers store door delivery. The Commission intimated that the roads should impose special charges for the so-called "spotting" of cars and should discontinue arrangements under which some shippers are given what amounts to store door delivery while most shippers are not given such delivery.

The views expressed by the Commission applied with special force to the situation at Chicago. The railways centering there have now filed tariffs intended to carry out the policy which they understand to have been recommended by the Commission. The Chicago Association of Commerce and the National Industrial Traffic League are opposing this action. The situation at Chicago is so important, and at the same time raises so many questions which also come up at other large terminal points, that it merits special discussion.

The *Railway Age Gazette* from the first opposed the plan for making special a charge for merely placing freight cars on private sidings. We did so because this service is merely a substitute for another railway service, that of placing cars on team tracks, and is preferable from the standpoints both of the carrier and the shipper, in many cases, to placing cars on team tracks. At the same time this paper took the view that when the railway renders some service in addition to that of merely placing cars at a convenient point on the shipper's siding, such as that of moving them about within the shipper's plant, and spotting them for him, an additional charge should be made. The reason why this should be done is that the additional service is not a substitute for some ordinary railway service, such as that of placing cars on a team track, but is a substitute for a service which should be performed by the shipper himself, namely, that of teaming the freight.

Now, the railways at Chicago have been rendering the so-called trap car service for nothing. This is the service of placing a car at an industry to be loaded with less-than-carload freight and moving it to a freight station for the subsequent handling of the contents in the same way in which less than carload freight is handled after it has been delivered at the station by a team and truck. There is under the business district of Chicago a tunnel in which an electric freight railway is operated by a company known as the Chicago Warehouse & Terminal Company, and there is also a lighterage company operating on the river called the Merchants' Lighterage Company. These concerns haul freight between industries and their own stations and the railway stations. Some years ago some of the railways began applying the regular Chicago rates not only to and from their own stations and terminals, but also to and from points of origin and destination reached by the Chicago Warehouse & Terminal Company and the Merchants' Lighterage Company and to pay these companies allowances for the services which the latter render. It is now proposed by the railways to impose an extra charge for the trap car service, and to cease paying allowances to the Merchants' Lighterage Company and the Chicago Warehouse & Terminal Company, thereby making the Chicago rates apply only to the railways' own terminals and stations.

Now, what are the trap car service, the tunnel service and the lighterage service, fundamentally? Are they, like the service of placing a car at a convenient point on a shipper's siding, merely substitutes for some ordinary railway service? Clearly not. Obviously, they are services substituted for the service of handling freight between the stations of the railways and other points in the city by teams and trucks. How true this is, is indicated by the fact that the lighterage service was established on the Chicago river originally to move freight to and from the railway stations when, owing to a teamsters' strike, sufficient teams and trucks for this purpose were not available. In effect, then, by rendering the trap car service free, and by paying for the tunnel and light-

erage services, the railways of Chicago are doing the *equivalent* of teaming freight for nothing to and from their freight stations for those shippers of Chicago to whom the trap car, tunnel and lighterage services are rendered.

Now, the railways do not render the tunnel and lighterage services to shippers in other cities than Chicago, because in other cities such tunnel and lighterage facilities do not exist. In consequence, the payment by the railways for these special services in Chicago operates as a discrimination in favor of the benefited shippers in Chicago and against the shippers of other and competing cities. Furthermore, in other cities most of the shippers are not so situated that they can take advantage of the trap car service. Therefore, when it is rendered free it operates as a discrimination in favor of those shippers who receive it and against those who are obliged to deliver their freight to the railways by trucks and bear the expense of doing so. Finally, in Chicago there are many shippers who are unable to take advantage of the trap car, the tunnel or the lighterage service, but who must truck their freight to the railways; and therefore the rendering by the railways of these services free to the shippers who receive them operates as a discrimination in favor of them and against the rest of the shippers. In other words, not only do the railways by rendering the trap car service free, and by bearing the expense of the tunnel and lighterage services, render services additional to the ordinary railway service for which they receive no compensation, but they also discriminate in favor of some shippers and against other shippers.

Is there any justification for the railways continuing these practices? There does not appear to be any more justification for them rendering at their own expense services which are clearly substitutes for the teaming of freight than there would be for them bearing the expense of providing teams and trucks to haul freight to and from their stations. It is said that the trap car service saves the railways money, and is therefore of benefit to them as well as the shippers. But if we may assume that the shippers know what is best for them, why may we not also assume that the railway managers know what is best for the railways? Why all this solicitude on the part of the shippers for the welfare of the railways?

Again, it is said that if a special charge is made for the trap car service and the allowances for the tunnel and lighterage services are discontinued, the freight now moved in trap cars and by the tunnel and lighters will be transferred to trucks, and in consequence the present congestion of the streets of Chicago will be greatly aggravated. It is to be presumed that any charge which may be permitted by the Interstate Commerce Commission to be made for the trap car service will be reasonable; in other words, will only cover the cost of the service and perhaps a reasonable profit. A reasonable charge may be less than the cost of teaming the freight. If it is, how can it be assumed that the shippers would choose to incur the greater expense of teaming their freight in preference to the smaller expense of using the trap car service? On the other hand, if a reasonable charge for the trap car service would be greater than the expense of teaming the freight, why should the railways be expected to incur the greater expense of handling the freight by trap car rather than the smaller expense of handling it by team? On the assumption that a reasonable charge for the trap car service would exceed the cost of handling the freight through the streets in trucks, it would be better for the railways themselves to pay the cost of teaming rather than to render the trap car service for nothing.

Likewise, if the railways discontinue paying allowances to the tunnel and lighterage companies shippers subsequently will either find it less or more expensive to have their freight handled by the lighters and the tunnel than by team. If they find it cheaper to handle it by team it is hardly to be expected that they will quit sending it by tunnel and lighter. On the other hand, if it would be cheaper for the shippers to handle the freight by team than by tunnel and lighter, then obviously it would also be cheaper for the railways to bear the cost of having the freight teamed than to bear the cost of having it handled by tunnel and lighter, and on that assumption the railways are now losing money by paying for having the freight handled by tunnel and lighter rather than by teams.

The argument of the shippers that if the railways make a reasonable charge for trap cars and discontinue paying allowances to the tunnel and lighterage companies the freight now handled by them will be transferred to the streets is simply an argument that it is cheaper for whoever foots the bill to have the freight handled by team, and if that argument is valid, then the way in which the freight is now being handled in Chicago involves heavy economic waste and the trap car, lighterage and tunnel services ought to be totally abolished in order to stop this waste. Certainly, that line of reasoning is not persuasive when used to show that the present arrangements should be continued.

It may be contended, however, that while they do result in economic waste they should be continued because it is better that there should be such economic waste than that the streets of Chicago should be further congested. But if it is so desirable that the streets of Chicago should not be congested, why should the railways be required or expected to bear the cost of preventing them from being congested? If economic waste is to be incurred in order to keep the streets of Chicago from being congested, why should not the people of Chicago, or the shippers of Chicago, foot the bill rather than the railways? When did it become a function of railways to render services at a loss in order to relieve congestion of the streets of a city? Evidently, if they do incur loss in this way somebody must foot the bill. Who is that somebody to be? Evidently either the stockholders of the railways or the passengers and shippers of other communities. But to say that the stockholders of the twenty-seven railways entering Chicago or the passengers and shippers of other communities should bear the expense of preventing congestion in the streets of Chicago, rather than the people and shippers of Chicago themselves, is absurd.

We reach, then, the conclusions (1) that the trap car, lighterage and tunnel services in Chicago are services additional to the ordinary transportation services; (2) that when the railways render or pay for these services without charging those to whom they are rendered anything for them, they discriminate against all communities in which and against all shippers to which similar services are not rendered on the same basis; and (3) that the argument that the present arrangement should be continued in order to prevent congestion of the streets of Chicago is the height of absurdity. It is quite possible that in the tariffs which the railways have been preparing and filing for the changing or abolishing of these arrangements there are injustices. But these can be remedied. As to the proposition that the railways should not continue to render the trap car services free or to pay allowances to the tunnel and lighterage companies, that proposition cannot be controverted on any other or better ground than can the proposition that rebating ought not to have been abolished and ought now to be revived; for the fact is that the present trap car, tunnel and lighterage arrangements in Chicago are merely devices to give rebates.

ILLINOIS CENTRAL AND LOUISVILLE & NASHVILLE

THE Illinois Central was a Harriman road as long as that term was applicable. There is, of course, now no such thing as a Harriman road; but the traditions, organization, viewpoint and ideals of the Illinois Central may still be called, without violating the Sherman anti-trust law, characteristic of the Harriman system. The Louisville & Nashville is a Walters road.

The Illinois Central and the Louisville & Nashville are very nearly the same length—the Illinois Central, 4,769 miles; the Louisville & Nashville, 4,938 miles. To some extent the two roads are competitive; to some extent they are comparable in physical condition, nature of traffic, etc.; in other respects they are quite unlike. It is interesting, even if no definite conclusions can be reached, to compare and contrast operating and traffic conditions and to attempt to analyze, even if in a very general

way, differences in the operation of the properties that may fairly and properly be attributed to differences in policy of the owners.

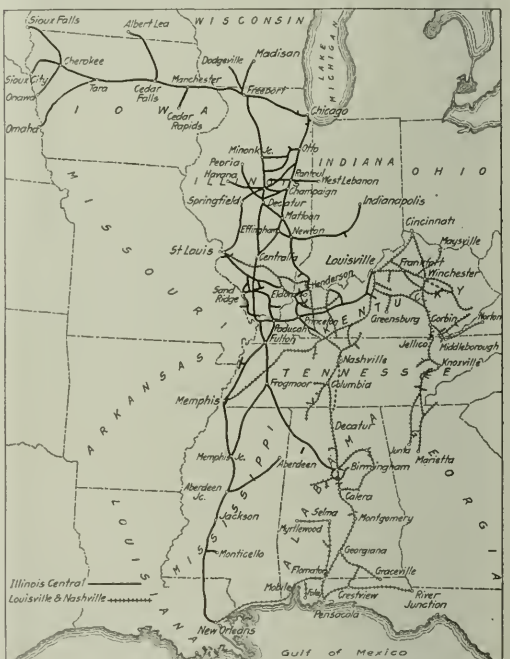
The roads are so nearly alike in length of mileage that it is not necessary to reduce earnings and expenses to a per-mile basis. The Illinois Central in the fiscal year ended June 30, 1914, operated an average of 4,769 miles, almost the same as in the previous year. The Louisville & Nashville operated 4,937 miles of road, an increase of a little over 100 miles as compared with the previous year. The principal cities which are served by both the Illinois Central and the Louisville & Nashville are St. Louis, Memphis, New Orleans, Birmingham and Louisville. The map shows the quite striking difference in topography of the two roads. The Illinois Central consists of a main line from Chicago to New Orleans, with an important branch to Birmingham and branches tapping Indianapolis and Louisville. The line running west from Chicago to Omaha and Sioux Falls is of secondary importance; in other words, the Illinois Central is largely main line. The Louisville & Nashville, lying east of the Mississippi valley, connects the important industrial centers of the middle west and southeast. It has, furthermore, a large percentage of branch line mileage.

The character of traffic and characteristics of traffic statistics reflect this difference in location and topography. The average length of haul of freight on the Illinois Central was 241 miles in 1914 and 171 miles on the Louisville & Nashville. The average length of passenger journey on the Illinois Central was 26 miles; on the Louisville & Nashville, 43 miles. The Illinois Central's very large commutation business into Chicago is an important factor in explaining the difference in the average passenger journey. The difference in the location of the roads explains the difference in length of haul. The earnings per ton per mile on the Illinois Central were 5.63 mills in 1914; on the Louisville & Nashville, 7.78 mills. The earnings per passenger per mile on the Illinois Central were 1.908 cents, in the Louisville & Nashville, 2.266 cents.

The Louisville & Nashville does not include in its report to stockholders a table showing classification of tonnage; but from its report to the Interstate Commerce Commission it is possible to make a comparison with the Illinois Central which, like most other roads, includes such a statement in its report to stockholders. Of the total 32,215,000 tons of freight carried in 1914 by the Louisville & Nashville, 36.97 per cent was furnished by bituminous coal, the total coal tonnage in 1914 being 11,910,000, comparing with 11,369,000 tons in 1913. Of the total tonnage of 32,343,000 tons carried by the Illinois Central in 1914, 37.55 per cent was bituminous coal, the total coal tonnage being 12,146,000 tons, comparing with 10,489,000 tons in 1913. Besides its coal tonnage the Louisville & Nashville has a very large tonnage of ores, 4,185,000 in 1914, or 13.18 per cent of its total tonnage. The tonnage of ores on the Illinois Central is negligible. On the other hand, products of agriculture furnished but 7.55 per cent of the total tonnage on the Louisville & Nashville, and forest products 9.12 per cent, while on the Illinois Central products of agriculture furnished 17.14 per cent and lumber 14.85 per cent. Manufactures furnished 11.83 per cent of the Louisville & Nashville's total tonnage, and but 8.16 per cent of the Illinois Central's.

Before making a comparison of the showing in 1914, and especially of the changes, as compared with 1913, shown by the annual reports of these two roads, emphasis must be laid on their recent history. The Illinois Central was very seriously affected by a strike in the fall of 1911, the effects of which extended through most of the fiscal year ended June 30, 1913. Furthermore, the Illinois Central suffered seriously from the floods in 1913. The Louisville & Nashville suffered much less from the floods in 1913 and had no strike on its hands. The comparison therefore, between 1914 and 1913 on the Louisville & Nashville is a comparison between two comparatively normal years, while this comparison for the Illinois Central is between an abnormal year and a comparatively normal one. By normal is meant a year which for the particular road in question is not unlike the same year for other roads.

In 1914 the Illinois Central had net income available for dividends of $8,139,000, or $1,564,000 more than the net in 1913. The Louisville & Nashville had $7,084,000 in 1914, or $1,547,000 less than in 1913. The Illinois Central has outstanding $109,296,000 common stock on which it now pays 5 per cent dividends, and the Louisville & Nashville has outstanding $72,000,000 stock on which it pays 7 per cent. The total funded debt of the Illinois Central is $197,261,000, and of the Louisville & Nashville $184,463,000. It will be seen, therefore, that the Illinois Central has outstanding considerably larger amounts of capital securities; but, on the other hand, the Illinois Central has an investment of $48,853,000 in securities of proprietary and affiliated companies, $42,196,000 advances to these companies, and $53,215,000 miscellaneous investments, while the Louisville & Nashville has a total of but $10,483,000 of securities of proprietary and controlled companies, $18,913,000 advances to these companies, and $22,188,000 other investments; so that whereas the Illinois Central's



The Illinois Central and the Louisville & Nashville

outstanding securities exceed the Louisville & Nashville's by $60,072,000, the Illinois Central's investment other than in its road and equipment exceeds the Louisville & Nashville's by $82,680,000. The Illinois Central's total income other than from the operation of its railroad was $7,321,000 in 1914, an increase over the previous year of $1,321,000. The Louisville & Nashville's other income was $2,813,000, a decrease of $224,000; and whereas the Illinois Central's total other investment is nearly three times that of the Louisville & Nashville's, its other income is quite a little less than three times that of the Louisville & Nashville. The Louisville & Nashville's surplus, after the payment of 7 per cent on its stock, of $1,639,000 as compared with the Illinois Central's $2,632,000, after paying only 5 per cent on its stock, is in small part explained by the more profitable other investment of the Louisville & Nashville, due largely to its investment in Nashville, Chattanooga & St. Louis, in part by the smaller proportion of its stock to total outstanding securities, and in part to the somewhat larger net earning power of the railroad. The smaller proportion of face value of stock

to total securities, while it concentrates the profit, is a factor of weakness rather than strength, although, of course, it is rather beside the question to talk about weakness in connection with the Louisville & Nashville.

The Illinois Central's railway operating income was $11,739,000, in 1914, an increase over 1913 of $489,000, and the Louisville & Nashville's was $12,325,000, or $588,000 less than in 1913. Although the Illinois Central's operating income is smaller—about in proportion to its lesser mileage—than the Louisville & Nashville, we would expect to find it considerably larger, so great a proportion of the mileage being main line mileage, with a long freight haul. The table at the end of these remarks shows how nearly alike the two roads are in proportion of revenue from passengers and from freight to total revenue; but it will be remembered that both the ton-mile rate and the passenger-mile rate are very much lower on the Illinois Central than on the Louisville & Nashville. The business handled, therefore, is, of course, much larger on the Central than on the Louisville. The total number of tons of freight carried in 1914 by the Central was 32,343,000, comparing with 30,447,000 in 1913. On the Louisville the total tonnage in 1914 was 32,215,000, and in 1913 32,242,000. With its longer average haul, however, the Central had 7,789,000,000 ton-miles in 1914 as against the Louisville's 5,512,000,000 ton-miles.

The total number of passengers carried by the Central was 27,523,000 in 1914 as against 27,538,000 in 1913. On the Louisville & Nashville it was 13,360,000 in 1914 and 12,928,000 in 1913. The passenger mileage in 1914 on the Central was 719,000,000, and on the Louisville & Nashville 577,000,000.

As would be expected, therefore, transportation expenses on the Illinois Central are higher than on the Louisville & Nashville, $24,150,000 on the former and $20,638,000 on the latter in 1914. With 41 per cent more ton mileage and 25 per cent more passenger mileage handled, the Illinois Central's transportation expenses were but 17 per cent more than the Louisville & Nashville's. One reason, presumably for this is the very much larger freight trainload, which on the Illinois Central was 417 tons in 1914, an increase of 10 tons over the previous year, and on the Louisville & Nashville 297 tons in 1914, an increase over the previous year of 2 tons. Of course it is quite impossible to say as to how much of this difference in trainload is due to a difference in traffic conditions and how much to a difference in the stress which is laid by the operating management on the importance of heavy trainloading.

The two roads pursue much the same policy in regard to maintenance, although the Illinois Central in the last two years has held down rather hard on its maintenance of way expenditures. In 1914 the Central spent $9,206,000 on maintenance of way, and the Louisville $9,323,000; in 1913 the amounts spent were $8,519,000 and $11,033,000 respectively. With such a comparatively small amount of branch line mileage, the Central's policy is not quite as generous compared with the Louisville's as would appear at first glance.

Maintenance of equipment expenditures on the Illinois Central were affected seriously by the strike which was previously mentioned. In 1914, however, all bad effects of the strike had disappeared. In that year the company spent $14,510,000 for maintenance of equipment as against the Louisville's $12,240,000. These figures compare with $13,952,000 for the Central and $11,217,000 for the Louisville in 1913. The mileage of equipment on the two roads compares as follows:

	I. C.	L. & N.
Revenue freight-train miles	18,395,000	18,004,000
Revenue passenger-train miles	13,180,000	10,649,000
Percentage of empty freight-car mileage	33	31

As to financial condition, the Louisville & Nashville is in funds; the Illinois Central at the end of the year was not. The Louisville & Nashville had on hand on June 30 $13,816,000 cash, with no loans and bills payable, and total working assets of but $8,048,000. The Illinois Central had on hand $10,859,000 cash, but of this $10,780,000 was due on the following day, July 1, on 4½ per cent notes. There were $725,000 loans and bills payable, which, however, was less by $5,755,000 than loans and bills payable at the beginning of the year, and total working liabilities, exclusive of the 4½ per cent notes just mentioned, but including the bills payable of $10,200,000. The Illinois Central has in its treasury $21,666,000 securities of its own, and in addition $15,718,000 marketable securities. Its very low working capital, therefore, is due not to any lack of liquid assets, but to the bad state of the bond market. The Louisville & Nashville's strong cash position is due to the sale in 1913 of $12,000,000 stock. During 1914 the Louisville & Nashville sold $19,592,000 bonds and retired $1,541,000, leaving a net increase in the debt outstanding in the hands of the public of $18,051,000. The Illinois Central sold in all $4,000,000 refunding mortgage bonds and $3,500,000 equipment trust certificates, $2,975,000 equipment trust certificates, however, being retired. In 1914 the Illinois Central spent a total of $11,814,000 on additions and betterments The Louisville & Nashville spent $12,036,000 for additions and betterments, including equipment.

The following table shows the principal figures for operation, comparing the two roads in 1914 and in 1913:

	1914		1913	
	I. C.	L. & N.	I. C.	L. & N.
Average mileage operated	4,769	4,938	4,763	4,820
Freight revenue	$43,871,272	$42,868,078	$42,589,299	$42,924,952
Passenger revenue	13,715,979	13,082,509	13,455,884	12,835,658
Total operating revenue	65,873,700	59,682,778	64,280,903	59,465,699
Maint. of way and structures	9,205,946	9,323,206	8,519,025	11,033,134
Maint. of equipment	14,510,079	12,239,795	13,952,654	11,216,889
Traffic expenses	1,290,778	1,334,264	1,320,583	1,239,702
Transportation expenses	24,150,040	20,638,427	24,743,324	19,884,015
General expenses	1,618,484	1,247,015	1,513,325	1,417,141
Total operating expenses	50,775,327	44,782,708	50,048,912	44,810,880
Taxes	3,341,247	2,600,288	2,903,551	1,761,626
Operating income	11,739,475	12,324,900	11,250,848	12,913,621
Gross income	19,060,075	15,137,877	17,250,200	15,950,725
Net income	8,138,824	7,084,162	6,575,113	8,630,944
Appropriations	*41,643	†405,275	.....	250,646
Dividends	5,464,800	5,040,000	6,557,760	4,618,733
Surplus	2,632,381	1,638,887	17,353	3,761,565

*For additions and betterments.
†Sinking fund and doubtful accounts.

NEW BOOKS

Federal Trade Commission Law. Pamphlet, 42 pages, 6 in. by 9 in. Published by W. H. Lowdermilk & Co., 1424 F street, Washington, D. C. Price 50 cents.

This pamphlet contains a digest of the U. S. Federal Trade Commission Act, which was approved September 26, and the text of the anti-trust law and of other acts or parts of acts supplementary to it. There is also given the full text of the latest supplementary act, known as the Clayton bill, which has become a law since this pamphlet was written. The only discussion in the book is that contained in an introduction of ten pages by John B. Daish, a well-known lawyer of Washington.

American Society for Testing Materials 1914 *Year Book.* Size 6 in. by 9 in., 500 pages, illustrated, bound in cloth. Published by the society, office of secretary-treasurer, University of Pennsylvania, Philadelphia, Pa. Price $5.

The "Year Book," which is one of the regular publications of the American Society for Testing Materials, contains all of the standard specifications of the society in their latest revised form. Among those of special interest to railway men are the revised specification for rails; splice bars; structural steel for bridges; structural steel for locomotives; concrete reinforcing bars; axles, shafts and forgings for locomotives and cars; tires and locomotive cylinders, and the new specifications adopted at the last convention for cars, carbon bars for springs, methods of analyses of plain carbon steel and drain tile. In addition to the standard specifications adopted by the society, the book also contains selected specifications from other sources for reference purposes. These include the A. R. E. A. 1914 rail specifications and specifications for Bessemer and open hearth rails by the United States Steel Products Company, dated September 1, 1914. The book also includes the personnel of the technical committees and the regulations governing the work of these committees.

Letters to the Editor

CONNECTICUT CITIZENS MADE POSTHUMOUS CRIMINALS

New York City.

To the Editor of the Railway Age Gazette:

The action of the government in its proceedings relative to the New York, New Haven & Hartford, whether one considers the utterances of the Interstate Commerce Commissioners or the varied moves of the Attorney General, has been characterized by numerous mistakes, which are obvious to all broad-minded railway men who have followed the facts; but the latest proceeding, the prosecution in New York, under which the grand jury was induced to return indictments against 21 men for alleged violations of the anti-trust law, going back to the year 1891, was peculiarly crude and blundering. This long-range firing from Washington, reported in the *Railway Age Gazette* of November 6, page 878, can be seen in its worst aspect only by one who is acquainted with Connecticut affairs and who is able to take a calm perspective over the last 30 years. Let me call your attention to a letter by the Rev. Dr. E. P. Parker, of Hartford, printed in the Hartford Courant. He says, in part:

"I have read with gratification the editorial comments of the Springfield Republican on the indictment of directors and former directors of the New York, New Haven & Hartford for criminal conspiracy, with little or no discrimination. Perhaps the just severity of its comments is the more effective for being couched in a guarded form of expression. Some of us, who know several of these indicted gentlemen, find it difficult to refrain from language more charged with indignation.

"With what justice, with what propriety, yea, with what decency, was the list of indicted persons officially published to the world with another sort of black list of the names of [fifty] persons not under indictment, many of whom have been for years sleeping in honored graves? Some of these men thus unnecessarily and, as I think, most indecently blacklisted, I had known for long years. Had Connecticut a man of his day more respected for his flawless integrity than Luzon Morris, of New Haven? Permit me to name three others, personally and intimately known to me, Leverett Brainard, Henry C. Robinson and Col. Frank W. Cheney.

"Whatever mistakes of judgment these men may have made in the course of their lives of public service, no one who knew them, no man of their day in Connecticut, ever doubted their absolute fidelity and integrity. Without the slightest prejudice to others, one may safely say that no man in Connecticut was more in the respect, confidence and honor of his fellow-citizens, no man more completely combined the virtues and the graces of an irreproachable gentleman, than Col. Frank Cheney. Rather than do a known wrong thing, in private or in public business, he would have cut off that arm shattered at the battle of Antietam. And it pleases somebodies, in the misuse of office and power, for motives which may be conjectured, to blacklist such names before the public; to attempt to discredit and dishonor the dead whom they cannot indict, and who can make no protest nor defense! . . . I, for one, wish to speak plainly for my dear dead friends, and to protest against what seems to me a heedless, if not wanton sacrilege. One would rather go to hell with some men than to heaven with others."

One of the fifty names in the list of those not indicted according to law, but, by this publication, indicted before the public by the press agent of the Washington officials, was that of the late J. Pierpont Morgan. Who that has read the facts believes that Mr. Morgan desired or intended either to defy the Attorney General or to rob the New Haven road? With our hindsight, we can say that in buying the New York, Westchester & Boston and putting that great burden on the New Haven's treasury he made a colossal blunder; but will the courts call that blunder a crime? These prosecutions began with an extremely silly mistake—the indictment of Mellen and Smithers for an alleged agreement not to waste millions of money in building useless railroads to Boston and Providence—and the gentlemen of the Department of Justice have been trying, ever since, to make amends by doing something that would prove to be really in the public interest. Thus far they have had no success. There is no sign of success in the future; and so, presumably, those of the New Haven men who are still living must face a two years' campaign in the courts, like that of the suit against the United States Steel Corporation—two years, or four years, or whatever number of years may be necessary for the government to find some way to let itself down softly.

Chief Justice White, in laying down a "rule of reason," has restored the courts to a position where, it is to be hoped, they can get along with the anti-trust law without killing the business of the country; but who can infuse reason into the Attorney General's department? R. Blanchard.

CHEMICAL SPECIFICATIONS FOR BRAKEBEAMS

Franklin, Pa.

To the Editor of the Railway Age Gazette:

In looking over the report of the American Railway Master Mechanics' Association for 1914, I note that progress has been made in the adoption of chemical specifications for various parts of the locomotives, but fail to find any for brakebeams. If there is any one part of a locomotive or car that demands the highest grade material it is the brakebeam. It is subject to many shocks and strains other than direct pulls, such as the emergency application and the vibrations due to chattering. A broken brakebeam means the loss of braking power on the car or locomotive tender to which it is attached, and this is an important factor in the case of high speed passenger trains; and a broken beam often causes derailments, wrecks and delays.

The chemical analysis of axles, wheels and other parts of railroad equipment has been given great thought and study, but today brakebeams are used which are made from scrap, without regard to its physical or chemical value. I know of one mill that is rolling sections for the solid type of beam from scrap steel axles. Inasmuch as the price of steel axles is not uniform, it is safe to assume that quality is not. This mill also rolls a section for the compression member of a trussed beam from scrap high carbon steel rails. From my knowledge of the material, I believe it is liable to fracture from shocks, such as an emergency application of the brakes and those incident to a chattering beam.

The chemical analysis of steel rails is not uniform, hence the strength and quality must vary. Steel of this character has gone through various heat treatments to bring it up to a standard required for the purpose for which it is first used, but the heat treatment it receives in the scrap reducing mill is crude and the cooling is governed by the temperature of the atmosphere; hence it is a material of unknown value, and a treacherous material in extremely cold and frosty weather. Would an engineer consider the use of shapes rolled from scrap axles and rails in the construction of railway equipment, bridges and skyscrapers? I think not. Then why use it for such an important and vital part as a brakebeam? I believe the American Railway Master Mechanics' Association and the Master Car Builders' Association committees on standards should determine by tests and investigation the analysis best adapted to withstand the shocks incident to the service of this device and recommend specifications, or at least, have specifications call for the best structural steel.

It is claimed by manufacturers that they test all beams, but I understand this test is only by a direct pull. I know of no beams being subject to a drop test, which would be similar to an emergency application of the brakes. B. Haskell, M. E.

After Effects of the War on Business and Railroads*

Railroads Basis of Country's Credit. Their Stability and Prosperity Must Be Protected In New Conditions

By James J. Hill

The business men of the country are occupying themselves, most properly, with efforts to adapt our interests to the great change of conditions resulting from the European war. Although outside the zone of conflict, we have to pay our tribute and bear our share of the burden. The government is promoting measures looking to the strengthening of our finances, the provision of a merchant marine and the raising of supplementary revenue. Everywhere there is thoughtful study of conditions. Only in mutual co-operation can the sacrifices which a great war imposes on all the nations be lightened. On the whole, the immediate crisis created by the war has been met with wisdom, and its necessary evils combatted with no small measure of success.

The country would, however, be foolish if it did not go further; if it did not examine some of the other needs which have thus far been put off until a more convenient season; if it did not, above all, consider the greater changes in industrial and financial conditions that must be the aftermath of a struggle on such a scale between the commercial countries, which, with us, have been the mainspring of the material progress of the world.

What is to happen when the war closes, leaving half a continent in ruins, killed or maimed industries, and dead and wounded men, the whole structure of the world's activity and intercourse to be rebuilt? What are to be the new conditions under which we as well as others will have to labor, and how may we by wise forethought at this time save ourselves from consequences which affect our own country as well as others, from mistakes that may well if not avoided write the name of the United States among those of the great sufferers by this war?

One common factor will enter into any adjustment after hostilities have ceased, no matter who may be victors. This is the relation of the supply of capital to the demand for it, and the effect of a changed situation in this respect upon the larger interests of the country, in common with the rest of the world. It would be criminal neglect not to consider this future, and make against it what provision we may be able to. For out of accumulated capital have arisen all the successes of industry and applied science, all the comforts and ameliorations of the common lot. Upon it the world must depend for the process of reconstruction in which all have to share. And the need of available capital in the period following the close of this war will constitute one of the greatest problems that the world has had to face.

NATIONS STRAINED THEIR CREDIT

Before the outbreak these warring countries had already strained their credit to the breaking point to provide for internal development and at the same time maintain their enormous military and naval establishments.

The combined debts of the five principal nations now fighting amounted in 1912 to more than $23,000,000,000. They borrowed several billions more in the following two years. Their expenditures during the continuance of hostilities run from $25,000,000 a day to twice that sum, according to the activity of movement. In the first 30 days their borrowings or anticipations of credit through note issues ran again into the billions. As soon as peace approaches, not only will all these expenditures and forced loans have to be consolidated and secured on some basis to avoid national bankruptcy, but the financial strain will really only have begun.

The billions upon billions' worth of property destroyed will have to be replaced. Granting that a sadder and a wiser world shall determine never again to permit the creation of mighty military establishments which can have no other use than the provoking of war, the amount of money and credit required merely to make good the ravages of the conflict is beyond estimate. Whole cities must be rebuilt. Whole agencies of commercial progress, like the German merchant marine, must be renewed. The annual production of wealth will be lessened by the total labor product of the million or more workers who have given their lives during the conflict. One conclusion stands out more prominently than any other when we come to consider the certain conditions following the conclusion of peace, no matter who triumphs and no matter what its terms. This is that there will be such a relative scarcity of available capital as the world has not seen for a century or more, while the demand for it will be greater than the world has ever known.

Cash and credit will, therefore, in the United States as elsewhere, command higher rates and be more difficult to obtain, probably, than within at least any recent experience. There can be no relief from outside, for the condition must be world-wide. Capital is the most cosmopolitan as well as the most fluid of all the world's resources. In ordinary times it flows instantly from point of supply to that of demand. The nation with a money surplus relieves that with a deficit. But this deficit will be as international as industry itself. The inequality of capital to the work to be performed will be a world condition. It may affect us almost as seriously as those whose homes and industries lie in ruins about them. And it is just this possibility that we should now acknowledge, study and endeavor to prevent.

The largest single industry in the United States is the tilling of the soil, and this will suffer least of all. Our farmers are gathering crops of unprecedented abundance, and marketing some of them at the highest prices received for many years. Whatever else the survivors of the war abroad may lack, they must have food. The farmer needs no considerable supply of extra capital. He has been, on the whole, helped or not hurt by this war, and it will continue to be so. And he is sure, through the working of the new banking law, of money enough to move his crops and finance his legitimate agricultural operations. So he may be dismissed with no more than such temporary and incidental relief as the passing circumstances of the present season may call for.

EFFECT ON RAILROADS

The next greatest industry is the operation of the railroads of the United States, and here we find a situation greatly different. The whole country has taken measures to assist interests immensely inferior. Our commerce is, most wisely, helped in every way possible to tide over the monetary interruptions of war. Our manufacturers are to be helped to reach their markets wherever possible, while movements are under way that will go far towards turning over to them a share of the business formerly done by some of the combatants who will not be in a position for years to come, if ever, to regain the trade that they have lost. But, while the President, in response to an appeal by a committee of business men, has expressed in general terms his opinion that the railroads should receive some consideration, nothing has been done nor is there immediate prospect of definite and effective action. Yet, without the railroad, without its unimpaired service and its constant extension and improvement, neither the farmer, nor the merchant, nor the manufacturer, nor the consumer, can prosper.

It should be obvious to every one that the railroads must be

*Paper in Forward St. Louis, published by the Business Men's League of St. Louis.

so treated that they can at least earn in part and borrow in part the vast sums which they are going to require. Unless they can earn, and earn more liberally than in the past, they could scarcely borrow even in such a market as that of the first six months of this year. In the financial market created as a consequence of this war, they will not be able to borrow at all, or only on unfavorable terms and to a limited extent. With pressure upon them from all sides for more wages, more taxes, more facilities, more kinds of costly service and more money to pay the salaries of state and national agencies charged with the never-ending task of investigation and inquisition, they cannot even maintain the unsatisfactory rate of earnings of their recent past. This is not the argument of an advocate for a cause; it is the conclusion drawn from official facts.

According to the latest figures given out by the Interstate Commerce Commission, which are those for the year 1913, the total par value of outstanding railway capital in the United States is only a little short of $20,000,000,000. Of the total capital stock, almost exactly one-third paid no dividend whatever. On over 10 per cent of the total funded debt no interest was paid. It will take some unusual inducement to tempt capital, even if over-abundant and seeking for investment, to loan in large volume an employment showing such a rate of return.

The work done by the railroads increased in 1913 in every direction. More passengers, more ton miles, more tons of freight per train mile, work and efficiency were growing. Yet the increase in total operating revenue was but $90,000,000 more than the increase in operating expense, leaving out of account the great increase in other items of expenditure. The present situation is disclosed by some quite reliable figures from other sources, which carry the facts down to a date later than that covered by the last complete official report.

The railroads east of the Mississippi and north of the Potomac and Ohio rivers, in their statement filed with the Interstate Commerce Commission this spring, show that in the last ten years population in their territory had increased 17 per cent, freight traffic 53 per cent, passenger traffic 42 per cent, and mileage only 6½ per cent.

The 35 principal railroads in this territory proved that since 1910 they had added $659,000,000 to their property investments, and that their net earnings were $16,311,000 less last year than they were then, although their gross earnings were $186,775,000 more. All had been eaten up by additional compulsory expenses and taxes. And this affects not merely the holders of stock, more widely diffused among persons of moderate means than ever before, but the more than 1,800,000 employees whose wages cannot be maintained if railroad earnings are reduced arbitrarily below a given point.

The Bureau of Railway News and Statistics has carried the figures right down to the present day. While they are not complete or official, yet, so far as they go, they are computed from reports received by the Interstate Commerce Commission. These show that for the fiscal year ended June 30, 1914, the gross operating revenues of the railroads of the United States were nearly $80,000,000 less than those of the year before. The ratio of operating expenses, which for 1913 reached the high figure of 69.40 per cent, went to 72.33 for 1914, and in the last six months of the year averaged 75.70. The total taxes paid by the railroads of the country were a little over $80,000,000 in 1907, and in 1914 they were nearly $142,000,000. Yet between 1907 and 1913 the average freight receipts of the railways of the country had been reduced from 7.59 to 7.29 miles per ton per mile, a reduction that meant to the railroads $90,000,000 lost revenue. During all this time, wages, supplies and pretty nearly every item on the expense list have shown a steady increase.

BILLIONS REQUIRED FOR PROGRESS

Now, these are the facts with which the railroads of the country are soon to confront the abnormal conditions that will follow the close of the great European war. Seven years ago a conservative calculation showed that they needed a new investment of five billion dollars, not to provide for future growth, but merely to do the business that was then offered to them. The need of such investment and the amount of it required to raise the facilities of the railroads to the level of the demands made upon them by the public have grown each year since then.

With the new stimulus which our people reasonably expect after peace is established, the new markets to be satisfied, the new demands filled, all involving additional demands upon the carrier, his machine will break down hopelessly unless it can be made more adequate. That can be done only by securing the investment of enough capital. It could not be done today if the supply of capital and the demand for it stood relatively as they did six months ago. To imagine that it can be done when there is such a poverty of available capital as there will be for ten, twenty, possibly more years to come, is absurd.

WHAT WILL FOREIGN INVESTORS DO?

What are likely to be the effects at home of conditions which surely approach, if no preventive is provided? There are probably $15,000,000,000 to $16,000,000,000 of American railroad securities held at home, and from $3,000,000,000 to $5,000,000,000 held abroad. What must happen to these securities if nothing is done?

To look only at the probable action of the foreign holder, so soon as the exchanges are opened once more, what is he likely to do with property averaging him a return of 4 or 5 per cent, in another country, when the reconstruction of industry at home is calling for all available capital at a much higher interest rate? What is likely to be the effect upon the railroads, upon the credit of the country, upon the gold supply and the whole financial system, if the holders of these securities are virtually compelled, as sound business men looking for the highest average rate of profit, to dump any such quantity of their holdings upon the markets of the United States? What must be the effect upon business, credit and banking of so profound a disturbance in the basis of such an enormous financial and industrial interest?

I have stated in outline the main facts of the after-the-war situation as it relates to the railroads. Through them it relates to every business and to every family and every man in the country.

The railroads require a loosening of the bonds which even in ordinary times clasp them so tightly that they cannot give to the public the best service of which they are capable. It needs no reversal of general policies, no unsettling of the relation between the railroads and the government, but an agreement upon just two things: First, a general permission to all the railroads to advance rates, if they find it necessary, to not to exceed a certain per cent of the rates at present in force; second, the assurance by common consent of the leaders of public opinion and political action that there will be no more legislation restricting railroad activities, lessening receipts or increasing their expenditures.

The magnitude and the urgency of this matter have not yet impressed themselves duly upon the people of this country. They have been too stunned by the awful and unexpected spectacle abroad, too absorbed in the progress of the most terrible event in history, too involved in study of the immediate consequences which had to be faced almost in the day that they were born, to realize the railroad situation in the new light thrown upon it by the lurid flames of conflict. But it cannot be relegated to a later time or an inferior place.

The railroad is the sap of the industrial tree. It is the speed regulator of industry. It is the thermometer of credit. Its stability, its prosperity, its ability to confront with confidence a totally new era in the capitalistic and credit conditions of the world, must be protected and assured. No duty devolving upon those who sit in the watch-tower of the world while nations sway and fall below them, studying how to guard ourselves against the calamities that their ambition and hate and faith in force threaten to send on us as well as on them, can take precedence of this.

Annual Meeting of Railway Fire Protection Association

Report of the Second Annual Meeting of This Association with Abstracts of Papers on Fire Prevention

The second annual convention of the Railway Fire Protection Association was held at the Hotel Raleigh, Washington, D. C., on October 6 and 7. The meeting was called to order by President F. H. Elmore, superintendent of insurance of the Southern Railway. In his address, the president called attention to the preliminary work to which the association's first year had been devoted and noted that the real work of the society, to prescribe the methods of fire protection, had hardly been begun. He emphasized the necessity of co-operation, first, on the part of members in their relations with the various committees, and, second, on the part of the society towards the operating department, expressing the opinion that once the interest and support of the operating officer were secured, accomplishment would be assured. The real work of the society, therefore, he said, lies in devising practical, economic and effective ways and means for the protection of and the prevention of loss to property. Its province is to develop standard practices and to play the part in the railway field that the National Fire Protection Association plays in industry in general; it must prove to the operating officer and to the latter association that it is the authority in its branch of the subject.

The report of the executive committee showed that the society had increased its membership approximately 57 per cent, and recommended the establishment of a number of new committees.

The Committee on Fire Hazards, Charles N. Rambo (Norfolk & Western) chairman, presented a report, from which the following is abstracted:

The Committee on Fire Hazards has not attempted to ascertain the causes of fire, but rather to consider some of the common hazards that exist and to prepare standards for correction or elimination. It has put its recommendations in the form of bulletins of the Committee on Fire Hazards and proposes that they be improved upon, if necessary, and adopted as standards, possibly in the form of a "Manual" or "General Code" on fire prevention. During the year the committee has prepared six bulletins.

Bulletin No. 1 giving general recommendations for the prevention of fire losses, deals primarily with buildings and is subdivided into four sections: Construction, Care of Property, Lighting, Heating and Power.

Bulletin No. 2 relates to the hazard of locomotive sparks. The members of the committee, without exception, believe one of the greatest hazards to contend with in connection with railroad risk is that of the spark hazard, and it has, therefore, through a sub-committee, gone into the subject very minutely. The bulletin aims primarily toward the elimination of the hazard and invites uniformity of action in connection with the proposed maintenance safeguards. The bulletin is given herewith almost in full:

The hazard of locomotive sparks and the consequent fire damage to railroad and other property has received special study by the railroads and insurance companies.

It seems to us that this subject having been given such careful thought and attention by the departments of railroads vitally interested, is one in relation to which your committee should consider positive means of eradication of the hazard, rather than some of the auxiliary methods that have been pursued to lessen the result of the hazard. By the former is meant that the principal place to offset this hazard is in the roundhouse and shops in keeping the screens, fittings, front end appliances, ash pans and dampers up to the standard as set forth in the blue prints of most railroads. By the latter we mean corrections in construction of buildings, such as has been undertaken in the past through the substitution of a better class of roof coverings, the avoidance of unnecessary pockets in roofs for the accumulation of sparks, etc., the cutting of weeds in the vicinity of railroad property, digging of ditches, cutting of avenues in timber tracts and the application of fire resistive coatings to woodwork exposed or subject to lodgment of sparks or hot coals; and by keeping the ties and stringers on bridges and trestles in good order.

While sparks from smoke stacks or cinders from ash pans may be classed as the primary cause of fires started in this way, the secondary cause is running with damper doors not entirely closed. What may also be termed secondary is the bad condition of shingle roofs, platforms, trestles, roofs of wooden cars, exposed inflammable merchandise in cars, or rubbish about buildings. If the secondary causes were taken care of the result through the primary cause would be reduced to a minimum.

The various motive power departments of the railroads, as well as the Master Mechanics' Association, have given this matter a great deal of consideration and standards have been adopted which, it has been believed, would give generally satisfactory results, by meeting both the conditions of service and minimizing the hazard. On some of the large railroads severe service tests have been made; spark arresters have been given careful constructive consideration, and in many instances the losses from sparks have been greatly decreased. It is a question for the committee to emphasize whether it may not be possible in the future to eliminate fires from this cause entirely. It seems to be a question for the master mechanics, shop and roundhouse foremen to solve by periodical inspection and careful maintenance, as we who are studying the prevention of loss by fire, must necessarily defer to a large extent any investigation of or judgment as to the correction or elimination of the spark hazard to those dealing more directly with the mechanical contrivance concerned.

The main point that this committee can emphasize, therefore, is the importance of the inspection of spark arresters and ash pans; not a haphazard inspection, but an examination of the screen to see if it is stripped or worn out; if the wires are spread, if the fittings around the sides of manhole cover, the nozzle and steam pipes are tight; to see if the ash pan dampers, damper controlling devices and the extension of pan outside of mud ring are in good order. There should be a weekly inspection of all engines and a duly authorized form of report provided, on which the signature of the inspector making the examination should be recorded. There should also be an inspection when any repairs are completed and the locomotive again turned over for road service with the corresponding signature of the inspector making the final inspection. In addition to this, we would recommend that efficiency committees be authorized to check up the inspectors. We also recommend that whenever fires occur on or near the right of way, alleged to be caused by sparks, a report be immediately made of the condition of the spark arresters and ash pans of the locomotives passing the location several hours prior to the fire and that such report be checked against the last weekly inspection of these engines. We also recommend the following as a systematic method of dealing with the subject:

"Master mechanics and engine house foremen should see that all locomotives are properly inspected after each trip, and that any defects in ash pans or ash pan gear are properly reported on special form for that purpose and repairs made.

"Weekly, or at staybolt or boiler wash period, the front end of locomotive must be opened and examined and a special examination of ash pans made. The condition of front ends and ash pans must not only be reported on special form for that purpose, if repairs are necessary, but the condition as found must be carefully noted in book or blank form and signed for by the inspector or inspectors actually making the inspection.

"If repairs are necessary, the front end and ash pans must be

re-inspected upon completion of repairs and proper notations as to condition made in the book or blank provided for that purpose and signed by the inspector actually making inspection.

"Books or blanks when filled should be forwarded to the master mechanic upon whose division the locomotive has been in service, and he will send them to the superintendent of motive power."

Accompanying these suggestions is the blank form of report recommended for use.

We believe with a uniformity in respect to careful maintenance of the corrective influences that have been devised that much can be done in preventing the large fire waste caused by flying sparks. This, however, must receive careful individual co-operation on the part of all railroads and then the motive power departments, and our hope is that we may be able in the future to acknowledge the result of the work of some inventive mind that will bring about the entire elimination of fires caused by sparks thrown from the smoke stacks of locomotives.

Bulletin No. 3 gives general recommendations in connection with chimney flues, stoves and furnaces. Bulletin No. 4 relates to boiler houses, boiler settings and boiler stacks.

Bulletin No. 5 deals with the storage of railway fusees and torpedoes. The handling of these supplies possibly has not resulted in any serious fire loss, but there have been sufficient damage resulting from lack of care and difference of opinion as to proper methods to lead the committee to take up the subject with a view to possible improvements. An abstract of the bulletin follows:

Railway fusees and track torpedoes are classed in the group of "Less Dangerous Explosives" as fireworks; more specifically fusees as "Common Fireworks" and torpedoes as "Special Fireworks" with placards "Inflammable," "Handle Carefully" and "Keep Fire Away."

The hazard of railway fusees and torpedoes is recognized by the "Bureau of Explosives," to whom due acknowledgment is given for suggestions as to handling or storage.

Fusees when handled in original unbroken shipping packages in quantities at distribution centers should be stored in a small magazine, preferably 40 feet from other buildings or lumber. The magazine should be lightly constructed and covered inside and out with incombustible material. It should keep out rain, snow and sparks, and should be provided with a ventilator. No artificial means of heating or lighting should be employed. The magazine should be sufficiently dry if supported on posts or pilings a foot or more from the ground, and so arranged that there is free circulation of air beneath.

Not more than four gross of fusees should be kept in the general storehouse at one time. Any broken packages should be kept in a tight metal lined or asbestos board lined wood box with a spring hinge or self-closing cover. This box should be used for no other purpose and kept in a dry place, not in proximity to any artificial source of light or heat.

Torpedoes when handled in original unbroken shipping packages in quantities at distribution centers should be stored in a separate magazine similar to that used for fusees.

Not more than ten gross of torpedoes should be kept in the general storehouse at any time. Broken packages or loose torpedoes should be kept in a tight asbestos board lined wood box, with sliding cover, used for no other purpose. A sliding cover is recommended in preference to a drop hinged cover to prevent premature explosions in case a torpedo should rest over the edge of the box. The box should be kept in a dry place not in proximity to any artificial source of light or heat, and care should be taken to prevent the accidental dropping of torpedoes on floors where they might be stepped on or run over by trucks.

Placard all magazines and storage boxes: "Explosives—Handle Carefully—Keep Fire Away." Do not store fusees and torpedoes in same magazine or box. Do not store fusees and torpedoes with other explosives or inflammables. Exercise care in keeping fusees dry—improperly made fusees if damp are liable to spontaneous ignition. Broken, wet or oily fusees should be destroyed by burning. Broken or defective torpedoes should be destroyed by immersion in water.

We suggest as a suitable receptacle for such loose supplies as have been obtained by trainmen from storehouses a small metal or rectangular shaped wood box with spring hinged cover. The box should be only large enough to hold the requisite number of fusees and one end partitioned off for torpedoes. In cabooses racks may be used to advantage for fusees.

The above suggestions are not meant to interfere with any special and safe practice now followed, such as that relating to trainmen's metal receptacles as are now used for carrying flags, fusees and torpedoes.

Bulletin No. 6 deals with storage and handling of small oil supplies at miscellaneous properties. An abstract follows:

One of the greatest hazards is the storage of oil without proper safeguards, and this undoubtedly is one of the most difficult hazards to guard against.

On railroads having little fire prevention supervision, small supplies of oil will be found scattered around throughout the various station buildings, the quantity and location depending on the convenience of the user. At many places the oil supplies will be surrounded by an oil soaked floor and small quantities of oily waste or rags will be in evidence, no thought whatsoever being given to the hazard involved. The danger of such storage without proper precautions is evident, particularly where floors become thoroughly saturated from constant lamp filling drippings.

The fire loss records show that too little attention is being paid to safeguarding the country stations against loss; and a study of this subject will show that a large percentage of fires in them are of unknown origin. Many agents use oil for illuminating purposes; many also take care of signal lights, and in some cases they keep a supply of gasoline for cooking and motor car purposes. Sometimes this oil is kept outside of buildings, but more often it is found stored in the coal bin, or in one corner of the freight room, and quite frequently with records or in concealed places like closets underneath stairways.

The hazard of spontaneous ignition is often present with improper oil storage and handling, for although pure mineral oils in combination with cotton or oily waste or rags will not oxidize and the hazard of spontaneous ignition is not present when they are used, they are often adulterated with vegetable or animal oils and therefore the presence of oily waste in railroad properties is always a menace.

We therefore make the following suggestions and recommendations: Oil storage of every nature at properties other than standard oil houses, wherever possible, should be entirely removed from station buildings and other properties and housed in a separate and inexpensive structure built expressly for that purpose, in a portion of which provision can also be made for the coal supply. This combination coal and oil house should be located a sufficient distance from all other properties to permit possible destruction by fire without endangering any other structure, but not far enough away to be inconvenient. All lamps and lanterns should be filled and trimmed in this structure.

The use of ordinary metal trays or sand boxes is better than allowing cans of oil to set on wooden floors of freight house, but your committee recommends that a separate, isolated coal and oil house be given preference and that if for any reason this cannot be arranged or wherever it becomes impracticable to construct a separate building, a metal lined oil cabinet be installed in the freight room.

Regardless of where or how oil is stored a supply of fine dry sand for extinguishing fires should always be on hand.

At large terminal warehouses, where electricity is used oil is frequently kept in buildings (generally in the basement) often in large quantities, for use in car heaters during the winter months or for oiling warehouse trucks, etc. No matter what precautions are taken to guard against fire the danger is too great for the values at risk. It is recommended in such instances that a separate building be constructed similar to that suggested for station

buildings and miscellaneous properties. Where it is felt that a large expense is warranted, or the city ordinances or fire authorities prohibit the construction of a wooden building, a brick oil house should be built.

In the report of the Committee on Statistics and Forms, presented by B. F. James (Colorado & Southern), chairman, there were submitted several forms as follows: Causes of fires; classification of property losses; telegraphic advice of fire; detailed report of fire (by mail); card notice of fire to be thrown off by trainmen notifying section men of fire; local fire prevention report; fire department drill report; fire inspector's report.

Two of these had been used by the committee in connection with its work in the past year, and it was ascertained that the fires in the past five years on the roads investigated (ranging from 19 roads operating 27,396 miles in 1909 to 28 operating 39,576 miles in 1913) were traceable to the following causes:

Unknown	44.29 per cent
Sparks from engines	20.47 per cent
Heating appliances and flues	6.17 per cent
Caught from adjacent property	4.55 per cent
Tramps and trespassers	3.87 per cent
Incendiary	2.79 per cent
Coals dropped by engines	2.45 per cent
All other causes	15.41 per cent

The total fires in these five years numbered 10,160, the total loss was, including railroad property and lading liability, $5,840,644, an average of $574.86 per fire.

The report on Fire Fighting Organization presented by E. B. Berry (Southern Railway) chairman, emphasized the necessity of forming fire fighting brigades and of regular drills at frequent intervals.

The report on Fire Fighting Apparatus presented by B. S. Mace (B. & O.) chairman, treated primarily of the apparatus used or needed at local freight and passenger stations, at coaling stations and on engines and cars. A brief description was given of the practices that are generally followed on most roads and various recommendations were made for the further extension of good practices or for the remedying of bad ones.

The officers of the association were re-elected to serve for the following year. They are: President, F. H. Elmore, Southern Railway; vice-president, P. Hevener, Chicago, Rock Island & Pacific; secretary and treasurer, C. B. Edwards, Mobile & Ohio.

New executive committee members were chosen as follows: One year, C. S. Sherwin, Missouri, Kansas & Texas; three years, B. F. James, Colorado & Southern; C. N. Rambo, Norfolk & Western.

FORTY-TON ELECTRIC FREIGHT-YARD CRANE

The illustrations show a modern transfer crane installed at the "West Yard" of the New York, New Haven & Hartford in Providence, R. I., a four-motor electric traveling gantry crane with a main lift of 40 tons, and a higher speed auxiliary hoist of 5 tons capacity. The span from center to center of runway rails is 55 ft. 6 in. This covers a wide driveway and two tracks, while the range of crane travel is approximately 300 ft. About 12 or 15 cars can be set for unloading at one time. In Fig. 1 the crane is shown with a fairly heavy load on the main hook and of a character necessitating careful handling to avoid damage.

The other illustration (Fig. 2) shows how a wide-awake shipper has taken advantage of the new facilities. A certain scrap dealer in Providence ships quantities of metal turnings and filings, collected from numerous machine shops. Before this crane was available, these turnings were all shoveled by hand from wagon to car, holding the team and two men for from one to one and one-half hours for each load, as it was, indeed, hard digging. Now, however, by the use of the removable wagon

Fig. 1—Electric Traveling Crane in the Yard of the New York, New Haven & Hartford at Providence, Rhode Island

body, as shown, the load is transferred to the car in five minutes; and with no other labor than the driver can himself perform.

The wagon body has a hinged tail-board, the latch of which is released by pulling on the rope which is held by the teamster.

The saving in time and labor in a single operation is a comparatively small item, considered by itself, but multiplied many times a day there is a substantial gain for both the railroad and the shipper. Not the least of the benefits to the railroad, when freight traffic is brisk, is the earlier release of inbound cars.

The number of teams using the crane averages perhaps twenty

Fig. 2—Loaded Wagon-body, to be Emptied into Gondola

a day, using it to unload or load structural steel and other building materials, heavy machinery, etc.

The cost of this crane, installed, including foundations, was about $14,000; and the expense of operation is about $100 monthly.

This crane was built and erected by the Shaw Electric Crane Company, a subsidiary of Manning, Maxwell & Moore, Inc., New York. Alternating current motors are used, protected by weather-tight housings; and electric power is supplied from the central station service.

Irregular Express Service on the Trans-Siberian.—As evidence of and owing to irregularity of the express service on the Trans-Siberian route, caused by the present situation in Europe, the Korea-Manchuria express between Fusan and Changchun, on the Korean Railways, which has hitherto been operated three times a week, will be run once a week for the time being.

ANNUAL REPORT OF SPECIAL COMMITTEE

The special committee of the American Railway Association on relations of railway operation to legislation, W. J. Jackson, chairman, under date of November 3, has issued Report No. 13, which includes the following:

Two hundred and forty-two roads (227,141 miles) are supporting the work of the committee. The sub-committees have been continued, viz.: (1) officers of the mechanical departments; (2) enginering officers; (3) signal officers.

Practically all the individual bills relating to railway operation have been combined in a single bill giving the Interstate Commerce Commission authority to require the installation, under certain conditions, of block signal systems, automatic train stops, and steel passenger equipment, and authorizing the commission to designate the type of headlights to be used; to investigate roadbed, track, equipment and facilities, and to direct changes, improvements and repairs. This bill has not yet been reported out of committee, but it is probable that this is the form which any legislation on this subject will take. Your committee has obtained the views of a very large number of operating officers on this bill, and is prepared to present the conclusions of the railways on the subject when opportunity offers.

To ascertain the extent of the financial burden placed upon the railways by legislation affecting operation, your committee recommends separation of accounts to enable each road to know definitely the precise amount which it is obliged to pay out by reason of such legislation.

Since the last report no bill has passed both houses of Congress.

A bill changing the penalty clause in the hours of service act has passed the House of Representatives, and is pending in the Senate. If this becomes law, the penalty for violation of that act will be not less than $100 nor more than $500, instead of not more than $500, as at present.

An agreement has been reached with the chief inspector of locomotive boilers as to setting a factor of safety for boilers in service prior to January 1, 1912, and the necessary changes in the rules were promulgated by the commission on June 9, 1914. A bill is pending in Congress extending the jurisdiction of the bureau of locomotive boiler inspection over all parts of the locomotive. The railways have appeared in opposition to this bill.

In April, 1914, a committee of the American Society of Mechanical Engineers proposed a code for the construction, maintenance and inspection of stationary boilers, and offered a draft of a typical law enforcing such code. In view of the inclusion of a number of requirements which were not in harmony with the experience of the railways, the matter was discussed with the responsible officers of the American Society of Mechanical Engineers, and it is thought that the code in question will be materially modified. Your committee, however, has not felt that it should give even tentative approval to any proposed legislation on this subject. . . .

The number of steel and steel underframe passenger equipment cars constructed in the United States in the calendar year 1914, was 3,129, bringing the total number of these cars in existence to approximately 14,100. This latter figure compares with 1,302 such cars in service January 1, 1909.

Your committee on July 11, 1914, bulletin No. 63, containing a revised arrangement for the telegraphic notification of accidents to the safety division of the Interstate Commerce Commission and the bureau of locomotive boiler inspection, together with a cipher code adapted for this purpose. There has been an extremely heavy demand for this bulletin, which was issued with the consent or approval of the heads of both of the departments named above.

Presentation of the railways' case before the Interstate Commerce Commission in the private car investigation, was concluded in June, 1914. The total expense was $6,129. . . .

During 1915, the legislatures of 43 states will be in session. Your committee has decided to maintain the arrangement of

keeping itself informed of all bills affecting railway operation introduced and passed in all states, and will arrange to notify its supporters of them. Your committee feels that in the states where state committees have been organized, the work done by such committees has been extremely beneficial to the general movement. Their continuance during the session of the legislatures which meet next year is strongly recommended.

An appendix to the report, filling ten pages, gives an abstract of all legislation pending before Congress.

STEAM LOCOMOTIVES OF TODAY

The sub-committee of the railroad committee of the American Society of Mechanical Engineers has prepared a report in the form of a paper for presentation at the annual meeting. The report is signed by G. M. Basford, F. H. Clark and W. F. Kiesel, Jr., and will be presented in the afternoon of Wednesday, December 2, 1914, at the rooms of the society, 29 West 39th street, New York, when a full discussion is invited. The report in full is given below:

Recent progress and improvement in the efficiency and capacity of steam locomotives has been of such remarkable character and extent that a record in the proceedings of this society is justified.

Steam and electric locomotives as rivals in the same field has been a favorite subject for discussion before engineering societies, and it is easy to start arguments in favor of each of these rivals among the partisans interested. Whether or not the steam locomotive is to be displaced by the electric is, of course, an important question which will in time be settled by the court that settles all such questions, that of the treasurer's figures. For the present and for the immediate future the burden of transportation falls and will continue to fall upon the steam locomotive. If the steam locomotive is to be perpetuated it is fitting that it should be improved to the utmost limit. If it is to be finally displaced it is fitting that it shall be so improved in order that progress to something better shall be intelligently developed upon a solid foundation. This discussion will be confined to the steam locomotive, its progress in the recent past, and its possibilities for the near future.

PROGRESS IN CAPACITY

While efforts individual in character and extent were made in this country before that time, the first consistent and systematic plan to secure the utmost power of locomotives within given restrictions of weight and cross-section clearance was inaugurated 20 years ago. This plan began with an eight-wheel or American type passenger locomotive, built for an eastern railroad in January, 1895. This locomotive weighed 116,000 lb., with 74,500 lb. on driving wheels. It provided a tractive effort of 21,290 lb. While this locomotive was not the most powerful in passenger service at that time, it was the first of a chain of passenger locomotives leading in a connected series by the same builders, up to and including recent designs of the Mountain type, representing the largest passenger type of present practice. This type has four-wheel leading trucks, eight driving wheels and two trailing wheels. The largest of the Mountain type weighs 331,500 lb. with 240,000 lb. on driving wheels and produces a tractive effort of 58,000 lb., or about three times the tractive effort of the first design of the series built during a period of 20 years.

In the year 1898 the engineering and railroad world was interested by the appearance of the largest and most powerful locomotive built up to that time. This was of the Consolidation type with a two-wheel leading truck and eight driving wheels. This locomotive was built in Pittsburgh, and for a number of years was the largest and most powerful of its type, and the largest and most powerful locomotive in the world. Its total weight is 330,000 lb., weight on drivers 208,000 lb. and tractive effort 53,300 lb.

Today the most powerful freight locomotive has two leading and two trailing wheels and 24 driving wheels. It gives a tractive effort of 160,000 lb. and weighs 410 tons. This locomotive has hauled a train of 251 freight cars weighing 17,912 tons, exclusive of the locomotive. The total length of the train was 1.6 miles, the maximum speed attained was 14 miles per hour. This required a maximum drawbar pull of 130,000 lb. This locomotive has six cylinders and three groups of driving wheels.

A freight locomotive has recently been built having two cylinders and a single group of driving wheels which develops a tractive effort of 84,500 lb. Such has been the progress in capacity.

This progress has been rapid, perhaps somewhat too rapid with respect to improvements in operating facilities and progress in other features of railroad equipment. It has been rendered possible by corresponding developments of factors making for greater efficiency in boilers and in engines. During the past 20 years in this country locomotive development in capacity and in efficiency, particularly during the past five years with respect to efficiency, has been remarkable, and is worthy of record with progress in marine and stationary engineering.

In Europe the relatively high cost of fuel led to efforts to improve efficiency before this problem aroused serious attention in this country, but physical limitations more rigidly restricted the size and weight of locomotives in Europe. Our problem is to secure maximum efficiency combined with great size, great weight and great power which is more difficult. Since the development in the size and weight has been tremendous, even though these limits may not yet have been reached, it is now appropriate to concentrate on efficiency.

For a number of years the physical capacity of the fireman to shovel horsepower through the fire door determined the capacity of the locomotive at speeds. Mechanical stokers have removed that limitation. It is now possible to fire six tons, and more, of coal per hour into a locomotive firebox. This has changed the problem into one of getting the maximum amount of heat out of the coal and using it economically in the cylinders. With the large figures now prevailing for drawbar pull and weight it is fitting that closest attention should be given to the best possible use of every pound of metal and every pound of coal. Due to recent application of several economy producing and capacity increasing factors great improvements have already been made with promise of more to come.

Among these economy producing and capacity increasing factors are the following improvements:

- Boiler design in the relationships of the factors making up heating surface;
- Firebox design;
- Front end design, draft appliances, exhaust nozzles;
- Ashpan design as to air openings;
- Superheating;
- Compounding;
- Feedwater heating;
- Firebrick arches and circulating supporting tubes;
- Valve gear;
- Detail design to secure reduced weight of reciprocating parts and other parts;
- Use of high-grade alloy steels to reduce weights;
- Mechanical stokers;
- Labor-saving devices for the engineman and fireman;
- Improved counterbalancing to permit of greater weight on driving wheels by reducing dynamic stresses.

And yet to come is powdered fuel with possibilities unknown in scope and in importance. Powdered fuel is in reserve, promising the ideal method of complete combustion under control more perfect than is possible with present methods other than oil burning and perhaps with economies impossible to obtain with oil.

PROGRESS IN EFFICIENCY

Valuable comparisons may be drawn from the best results of ten years ago and of today. At the Louisiana Purchase Exposition in 1904 the tests made by the Pennsylvania Railroad revealed important figures concerning locomotive performance at

that time. It was shown to be possible to obtain equivalent evaporation from and at 212 deg. of 16.4 lb. of water per sq. ft. of heating surface, indicating the power of locomotive boilers when forced. It was shown that when the power was low, the evaporation per pound of coal was between 10 and 12 lb., whereas the evaporation declined to approximately two-thirds of these values when the boiler was forced. These results compared favorably with those obtained in good stationary practice, whereas the rate of evaporation in stationary practice lies usually from 4 to 7 lb. of water per sq. ft. of heating surface per hour. In steam consumption the St. Louis tests showed a minimum of 16.6 lb. of steam per i. hp. per hour. In coal economy the lowest figure was 2.01 lb. of coal per i. hp., the minimum figure for coal per dynamometer horsepower was 2.14 lb. These records were made after the superheater had become a factor in locomotive practice and they represent economies attained by aid of the superheater in one of its early applications. This is important in the light of the recent development of the superheater. These remarkable figures have never received the attention which they deserve from engineers. They serve, however, to show that 10 years ago a steam locomotive had attained results which were worthy of the best attention of the engineers of the time. Since then greater progress has been made and today locomotives of larger capacity than those concerned in the St. Louis tests have given better results.

Voluminous records of recent investigations of locomotive performance taken from the Pennsylvania Railroad test plant at Altoona show that the best record of dry fuel per i. hp. hour down to the present date is 1.8 lb., with a large number of less than 2 lb., while the best performance in dry steam per i. hp. hour is 14.6 lb. with a large number less than 16 lb. A reduction of 10 per cent in fuel and 12 per cent in water is remarkable as the result of a development of 10 years. This coal performance was recorded by a class E6S Pennsylvania Railroad locomotive while running at 320 r. p. m. and developing 1,245.1 i. hp. The same locomotive gave a fuel rate of 1.9 lb. while running at the same speed and developing 1,750.9 i. hp. The best water rate was given by a class K2SA Pennsylvania Railroad locomotive while running at 320 r. p. m. and developing 2,033.1 i. hp. These high powers indicate that the locomotives were not coddled as to output of power in order to show high efficiencies, but that high efficiencies accompany actual conditions of operation in severe service. As to power capacity expressed in terms of evaporation, it is interesting to note that the maximum equivalent evaporation from and at 212 deg. per sq. ft. of heating surface per hour on the Altoona test plant is 23.3 lb. These figures of high efficiency were obtained from locomotives which represented not only very careful, general and detail design, but their design included several of the improvements making for greater capacity and higher efficiency.

Having in mind the facts that steam locomotives are power plants on wheels, built to meet rigid limitations of weight, both static and dynamic, and that the use of condensers is impossible, engineers in general must admit the high character of the work of locomotive designers which has attained these results.

Greater efficiency, which is revealed on the test plant and through reports of engineers, would be important because it proves that progress is being made in the possibilities of locomotive performance. Improvement which is revealed by operating statistics and which, therefore, appears in the records of the treasurer's office is the real test in this case. It is important to know that increased power of locomotives, attained largely through the development of economy-producing and capacity-increasing factors, has produced results which the financial reports of railroads prove beyond question. A recently published list of train tonnage on 45 prominent railroads indicates that 16 of these roads have increased their average freight trainloads by over 30 per cent during the last five years. Credit must be given to the improvement in the locomotive for most of this development. These figures reveal the value of increased power and efficiency of steam locomotives and the end is not yet in sight.

WHAT REMAINS TO BE DONE

American locomotive development to its present state would have been impossible without the use of the improvements already mentioned. It is believed that all these are capable of still further development, making for still greater economy in the use of fuel and, therefore, promising greater power capacity. It is the object of the committee to present these possibilities for discussion by those who are engaged in perfecting and improving steam locomotive practice in this country. It is the hope of the committee that engineers who are devoting their attention to the design of locomotives as a whole and those who are engaged in the development of the various details which have contributed to the high efficiency of the steam locomotive of today will discuss the progress of the recent past and reveal possibilities for future development and improvement in capacity and efficiency.

RAILWAY AFFAIRS IN OTHER COUNTRIES

A despatch from London under date of October 31 states that the directors of the Central Argentine Railway (owned by English interests) have decided to raise immediately $5,000,000 of new capital by the issue of 6 per cent three-year notes at par. These notes will be offered to existing stockholders, and are already quoted at 1 per cent premium. Most of the railroads in Argentina, however, are at the present time meeting with financial difficulty, partly because of the war and partly because of a poor agricultural year. The Buenos Ayres Pacific which paid 3 per cent dividends last year, has passed its dividends. The Central Argentine, the Buenos Ayres Great Southern and the Buenos Ayres Western have likewise reduced their dividends. The Argentine Railway, one of the Farquhar companies has fared even worse. This company, which was formed in 1912 by Percival Farquhar, has control of the Cordoba Central and large interests in the Entre Rios, the Argentine North Eastern and the Province of Santa Fe Railway. It is now understood that the first two lines will break away from the control of the Argentine Railway, and it is also stated that the latter will have difficulty in meeting $7,500,000 of 6 per cent notes falling due in February, 1915.

The mileage of the South Australian state railways on June 30, 1914, was 1,845, of which 1,052 miles was of 3 ft. 6 in. gage, 85 miles more than on June 30, 1913, and 793 miles was of 5 ft. 3 in. gage, 70 miles having been added during the year. The railway administration also operates under agreement with the Australian government an additional 478 miles of 3 ft. 6 in. gage railway from Port Augusta north to Oodnadatta almost on the Northern Territory line. There are also 463 miles of line authorized or in course of construction. In the fiscal year ended June 30, 1914, the South Australian Railways, exclusive of the Port Augusta-Oodnadatta line earned a total of $11,349,040, of which $3,657,067 was passenger train revenue, $7,456,149 freight train revenue, including $3,125,649 received for the carrying of minerals, and $245,775 miscellaneous revenue, such as wharfage, rents, etc. There were increases in all items of traffic except wheat and livestock and the total earnings, $558,001 greater than in the fiscal year ended June 30, 1913, constituted a new record. The total expenditure, on the other hand, was $7,318,028, $544,271 greater than in 1913. The net revenue of $4,042,772 was equal to 5.33 per cent on a capital expenditure of $75,812,740 on average mileage open. From this net revenue there were deducted interest charges of $2,753,175, chargeable to the railways by the government at the rate of 3⅞ per cent. The surplus for the year was $1,287,874, or $1,319,738, including the balance to credit of profit and loss on the Port Augusta-Oodnadatta line; and the administration's total surplus on June 30, 1914 was $2,593,544. The South Australian Railways in 1914 carried 19,809,533 passengers an average distance of 11.95 miles. The total revenue freight tonnage was 15,082,769, of which 1,617,804 tons were minerals, 300,579 wheat, 26,089 wool, 110,762 livestock and 1,048,237 other commodities. The total earnings per mile open were $6,250.

Eighth Conference of the Western Economic Society

Report of Meeting Devoted to Subject of "American Railway Problems" With Brief Abstracts of Papers

The eighth conference of the Western Economic Society was held at the Hotel Sherman, Chicago, on November 13 and 14, and was devoted to the subject "American Railway Problems." Various topics pertaining to some of the principal problems involving railway regulation, were assigned to prominent authorities on the various subjects for prepared papers, and each was followed by a general discussion. Following is a brief summary of some of the papers of interest to railway men:

VALUATION FOR RATE REGULATION

Pierce Butler, valuation counsel of the western group of railways, presented a paper on "The Valuation of Railway Property for Purposes of Rate Regulation." Mr. Butler said that the ascertainment of the value of a thing, whether it be a vacant lot or railroad property, is the determination of a fact, and that the same property cannot be of two or more different values at one time. Reliable knowledge concerning the value of railroad property may be useful for various purposes, for example, as a basis for taxation, as a guide to investors in railroad securities, as an aid to the public control of the issuance of stock and bonds, as an aid to test the reasonableness of the general level of rates, and as a guide for further legislation. It is, however, a mistake to suppose that railroad rates are, or as a practical matter can be, *made* or *based upon* the value of the property used to render the service. In rate cases involving the question of confiscation, the value of the property is an essential fact, but a rate only high enough to be nonconfiscatory may be much below what is reasonable.

The federal valuation act requires the commission to ascertain and report value, and also to report in detail many facts and much information, so that data may be at hand for the application of whatever principles of valuation may finally be adopted. The value required to be ascertained is not for any particular purpose, so it may become involved in rate-making, in rate-judging, in taxation, in accounting, in capitalization, in public purchase, in sales of securities and it may be used as a guide to future legislation, but it is value in its broadest sense that must be found and reported.

The substitution of cost for value and the making of rates on that basis would unjustly deny reward and profit to the owners of the best railroads of the country, and amount to seizure of the use of private property without just compensation. There is no foundation for the suggestion that there exists between the public and each railroad carrier the relation of principal and agent or beneficiary and trustee. The title to railroad property is not held either in whole or in part, for the use or benefit of the public. The company has the full title and ownership.

VALUATION FOR TAXATION

T. S. Adams, member of the Wisconsin Tax Commission and secretary of the National Tax Association, presented a paper on "Valuation of Railway Property for Purposes of Taxation." Mr. Adams said that the aim or goal of valuation for purposes of taxation is in most states to find the price at which property would sell under normal conditions. What the property cost has, in this connection, no necessary significance. This fact, he said, distinguishes tax valuation from valuation for purposes of rate regulation. Valuation for taxation depends primarily upon earnings, and earnings in turn depend upon rates. It is obvious that no such valuation can be employed for the purpose of regulating or changing rates. For the same reason that local valuation of railway property is bad, state valuation of railway property could advantageously be replaced by federal valuation, or better still, by co-operative valuation on the part of the state governments acting jointly, or through some central bureau maintained by them. Such control, he urged, should certainly go to the promulgation of binding and uniform rules regarding the allocation or apportionment of revenues and expenditures to the various states. At present there is no uniformity of practice. This is preeminently a task for the Interstate Commerce Commission. In his opinion, however, such control by the superior jurisdiction should not go to the length of replacing state by federal taxes.

IMPROVEMENTS MADE FROM EARNINGS

Albert W. Bullard, of E. H. Rollins & Sons, presented a paper on the subject "Shall Improvements Made From Earnings be Capitalized or Included in Valuation?" His conclusions were summarized as follows: That net earnings are the property of the stockholders, and, therefore, property acquired with net earnings is likewise the property of the stockholders. That it is better to invest a portion of the earnings in improvements, and subsequently capitalize them after a liberal surplus has been created than to pay out all net earnings in cash dividends and sell securities to provide funds for all improvements. That valuation has to do with the property owned and not the source from which funds to acquire it were obtained, and therefore, property obtained from net earnings should be included in a valuation for any purpose.

RAILWAY ACCIDENTS AND SAFETY FIRST

Ralph C. Richards, general claim agent and chairman of the Central Safety Committee of the Chicago & North Western, presented a paper on "Railway Accidents and Safety First." which was illustrated with lantern slides and charts illustrating the safety first work on the North Western and accident statistics of the railways of the United States. He said that for all practical purposes the only accidents that can now be materially reduced on the railways without the assistance of the public are those resulting in death and injury to employees. During the 52 months in which the safety first movement has been in effect on the North Western, the company has had 360 fewer reports of people killed and 10,951 fewer reports of people injured than it would have had during that period on the basis of the experience during the year ending June 30, 1910. "This being an economic society," he said, "perhaps some one may want to know what the economic value of the safety first movement is in dollars and cents. The average cost of railroad accidents in this part of the country is $113.93 per case. So every time you save an accident you save $113.93. In the 52 months on the North Western, with an increase of 450 miles and about 10 or 12 per cent increase in earnings we have had 11,311 fewer accidents. Any one can figure what the saving in dollars and cents is, although the movement was started to save lives and increase safety and regularity of operation, improve working conditions and create a better feeling between the officers and the men, and only incidentally, to save dollars."

COST OF SERVICE

Halford Erickson of the Railroad Commission of Wisconsin, presented a paper on "Cost of Service as a Basis of Rate Making." Mr. Erickson said that to apply the value of the service principle as the fundamental one to railroads and public service companies generally would be in opposition to the law and to the economics of public policy. The value of the service principle is held mostly by those who argue for the greatest freedom in rate making or who are against any restrictions therein. It is noted for its lack of more exact measure upon which to adjust rates, and for the freedom it gives to the play of judgment and motives. The cost of service basis, on the other hand, is advocated by those whose aim it is to develop more scientific systems of rate making than those now in effect, and who are considering the interests of the public as well as those of the carrier. This basis recognizes the importance of distance in rate making. The

all-inclusive nature of the phrase "value of the service" and its companion phrase "What the traffic can bear," makes it next to impossible to define their real meaning. That the carriers can always be depended upon to treat all shippers, including the public, equitably and fairly, would seem to be refuted by experience. There are such variations in views honestly held as well as in the conditions that are encountered, that even with the best of intentions serious inequalities are likely to find their way into the management of such enterprises as public utilities. It is possible, however, that such phrases may in a sense be applied to the principles involved in the classification of freight.

Many manufacturing plants, where the common expenses are relatively about as great as in railway service, through their systems of cost accounting are in a position to determine the cost per unit so closely that these costs are made the basis for both present and future prices. The methods which are thus successfully employed in the manufacturing world would, it seemed to him, lead to equally satisfactory results if applied to the railway service.

INTERLOCKING DIRECTORATES

"The Economic Significance of Interlocking Directorates in Railway Finance" was discussed by Frank Haigh Dixon, professor of economics, Dartmouth College.

If our judgment as to the desirability of the relationship of railways and credit institutions is to be determined solely by results, he said, we must conclude that the balance swings heavily in favor of the continuance of the present policy. Opposition to the close association of financial houses and railways grows rather out of the concentration and monopolization of credit. The real evil resulting from the interlocking of railways and credit houses, he said, if any evil exists, arises primarily out of the relation of credit institutions to each other, rather than out of their relation to the railways through representation on railway boards. The menace is in the concentration of credit.

As to the interlocking relationship arising from the demands of construction or operation, he said, many of them are absolutely essential, and most of them are harmless. With the power in the hands of the Interstate Commerce Commission and many of the state commissions to control the accounting and examine the books of railway corporations, we may safely assume that public interests will in nowise be prejudiced by the close relationship of parent railways and their subsidiary operating companies. Regarding such affiliations as have the restraint of competition in mind, their economic significance depends upon the purpose in view and the methods by which such purpose is effected.

"When that day comes," he said, "and it is not far in the future, that the commission assumes as complete control of service as it has already done of rates, it will then in my judgment be of little or no public concern whether parallel and competing railways are or are not interlocked. That every evil of a monopoly character will then be done away with for good and all I do not assert. That would be placing too low an estimate on the ingenuity of the financial juggler. But the public advantages of co-operation on the part of large railway systems under the conditions here described so decidedly outweigh any remote disadvantages that there seems to me to be no justification for a prevention of interlocking relationships. Such close co-operation will work not to the restraining of trade unreasonably, but rather to its liberation, for it will permit the execution of co-operative plans for relief in many situations that are now wastefully handled. It will permit the application of the principles of scientific economic railway operation to the railway system as a whole. It is a curious myopia that persists among the American people and demands competition between these great industries to the certain burdening of them ultimately with its inevitable costs. Yet with this prejudice against combination lodged in the breasts of the people, the movement of events as expressed in legislation has been steadily away from reliance upon the efficacy of competition and in the direction of more and more rigid regulation. That it will stop short of government ownership does not seem at all clear."

THE BANQUET

At the banquet on Friday evening, "The Public View of the Railways' Need for an Increase of Freight Rates" was discussed by John H. Gray, professor of economics, University of Minnesota; "The Railways' View of the Freight Rate Question," by E. P. Ripley, president of the Atchison, Topeka & Santa Fe, and "The Efficiency of Railway Operation in Relation to an Advance in Rates," by Samuel O. Dunn, editor of the *Railway Age Gazette*.

PRESIDENT RIPLEY'S ADDRESS

President Ripley spoke in part as follows:

Railroads in this country were built upon the theory that competition would prevent extortion, and the business was considered in the light of other ordinary ventures, but it gradually became apparent that each railroad was a practical monopoly at least so far as certain territory was concerned, and that there should exist some impartial tribunal which should limit the amount of charge which a railroad company might make. The fundamental and underlying trouble with our legislation, as has long been recognized by students of economics, is that our present laws strive to retain the former theory of competition and consequently forbid combination, while at the same time prescribing uniformity in charges, and thus practically rendering combination necessary. This contradiction in our laws is pretty clearly recognized, but no lawmaking body seems to have had the courage to attempt to change the conditions.

Owing mainly, though not entirely, to unintelligent legislation the railroads as a whole find themselves unable to meet the demands made on them; and it is not possible for the best of them to raise money at rates which they can afford to pay. This is not a development of the European war conditions, but something that took place before any war was declared. The attack of the muck-raker and the agitator had done its work and the government, heeding these attacks and ignoring the actual conditions, had in effect declared railroad investments unsafe. It will be said that mismanagement of certain properties has helped to bring about this result, and this is very likely; I am not apologizing for these cases, but they nearly all occurred under your laws and were by advice of counsel.

The simple truth is that rates are unremunerative; that the end of the rope has been reached for some of the roads and is not far off for others. All the talk that has been given us about extravagance in operation, about facilities granted free of charge to favored individuals, about free passes, about mistakes of railroad management, may be allowed for all it is worth and more than it is worth, and the stubborn fact still remains that the public does not pay enough to warrant first-class service, and that it will have nothing else; also that much of our trouble comes from laws that are fundamentally wrong—and that altogether our various governments—state and national—are responsible for these conditions.

I could go on at great length on the inconsistencies and crudities of our present laws; of the impracticable character of regulation by 49 local commissions plus one general commission; of that impossible condition created by the duties of the interstate commission—detective bureau and prosecuting agency in the initial stages—later attempting to act as a judicial body on cases worked up by its own endeavors; and not so much interested in bettering conditions as in getting convictions: rules and regulations prescribed without regard to the cost or inconvenience to the carrier and adding greatly to his burdens.

Even admitting for argument's sake the fairness and ability of each individual member of the commission, there does not exist a body of seven men who could by any human possibility transact the business of 250,000 miles of road; nor who could act as unbiased judges on cases which they had themselves developed and which they or their subordinates had already passed on.

Therefore I say that our present laws regulatory of railroads are a "hodge podge" incapable of intelligent administration. Do not understand me as desiring to be free of restraint—quite the contrary. I simply say that present conditions cannot continue

and the public will rightfully refuse to make investments which the acts of government have made uncertain.

I refrain at this time from forecasting the future; a change is coming because present conditions cannot last. The danger is that they will last long enough to wreck the best railway system the world has ever known and its epitaph will be "Killed by Government Interference."

Arthur Hale, general agent of the American Railway Association, presented a paper on "Freight Car Surpluses and Shortages," which was published in last week's issue.

W. Z. Ripley, professor of political economy, Harvard University, presented a paper on "The Investor's Interest in Railroad Valuation."

EFFICIENCY OF RAILWAY OPERATION

Mr. Dunn pointed out that no evidence had been produced in support of the sweeping charges of inefficiency. The greatest economy in transportation is secured by moving traffic in large units. The density of passenger traffic of our railways is small compared with that of European railways and they haul fewer passengers per train, but between 1900 and 1910 they increased the number of passengers per train 36½ per cent. Between the same years the average tons per train in France increased from 144 to 181; in Prussia Hesse, from 163 to 236; in the United States from 271 to 380. Up to 1913, the freight trainload in this country had increased to 469 tons. The passenger journeys and freight hauls are longer here, but the wages paid are higher. The average annual railway wage in Germany increased from $338 to $392 between 1906 and 1911, or 16 per cent, and in the United States from $588 to $724, or 23 per cent, and to 1913 to $758, or 29 per cent. In spite of the relatively high wages paid here, the units of traffic moved per dollar of capitalization and of operating expenses in 1911 were as follows:

	Germany	France	United States
Ton miles per dollar of capital cost	8.6	3.8	18.4
Passenger miles per dollar of capital cost	5.6	2.9	2.1
Ton miles per dollar of operating expenses	67.5	62.9	138.9
Passenger miles per dollar of operating expenses	44.3	47.5	15.9
Total traffic units per dollar of capital cost	14.2	6.7	20.5
Total traffic units per dollar of operating expenses	118.8	110.4	154.8

If the evidence shows that under efficient management net earnings are insufficient to attract sufficient investment a case has been made out from the standpoint of public expediency for higher rates.

ELECTRIC ARC WELDING*

By J. H. Bryant†

Electric arc welding as a commercial process may be divided into two general classes:

First—Benardos or carbon electrode process in which the arc is drawn between the metal to be welded and a carbon electrode.

Second—Slavianoff or metal electrode process in which the arc is drawn between the metal to be welded and a metal electrode.

These two processes are generally spoken of as carbon electrode and metal electrode welding respectively.

In addition to these there is the Zerener process, in which the arc is drawn between two carbon electrodes, as in the arc lamp, and the metal to be welded is placed in contact with the arc. This is, however, not considered a commercial proposition in this country, as its field of application is limited, and the apparatus itself is unwieldy.

Quoting from C. B. Auel in the *American Machinist* (1911): "In carbon electrode welding the metal to be welded is made one terminal of a direct current circuit, the other terminal being a carbon electrode. Upon closing the circuit by bringing the carbon electrode into contact with the metal and then withdrawing it to a distance, an arc is drawn between the two terminals. Through the medium of the arc, which is the hottest flame known (having a temperature between 3,500 deg. and 4,000 deg. Centigrade—6,300 deg. to 7,200 deg. Fahrenheit), the metal may be either entirely melted away, molded into a different shape or fused to another piece of metal as desired."

The metal electrode process of welding is a somewhat later development than the carbon electrode method, and differs from the latter in that a metallic electrode is substituted for the carbon.

If direct current is available from a shop or commercial circuit, welding can be done directly from this source of supply, but this method has been found to be very wasteful of power and should not be resorted to except where welding is only to be done at very infrequent intervals. An additional disadvantage of the use of the shop circuit as a source lies in the fact that, unless arrangements are made for insulating the work from ground, the shop circuit is grounded, with attendant danger to other employees in the shop, as well as to the welding operators. A much more economical method is that of using a motor generator set, the motor being constructed with characteristics suitable for operation on the shop or other circuit, and used to drive a low voltage generator. The generator may be either shunt or compound wound, the shunt wound machine being satisfactory where only one arc is to be operated, while the compound wound machine is preferable if several arcs are to be supplied from the same unit. Experience has shown that generators giving a potential of 75 volts or thereabouts will enable satisfactory results to be produced. As different welds require different strengths of current, it is at once evident that there must be some means of regulating the current supply. This is usually effected by inserting resistance in the welding circuit connecting it in series with the arc.

A suitable electrode holder must be provided for both carbon electrode and metal electrode welding. Protective equipment is necessary for the operator on account of the fact that the exposure to the rays of the arc causes an irritation and subsequent peeling of the skin if the exposure has been sufficiently long, say several minutes. The irritation is very similar to sunburn and is uncomfortable, but no serious consequences ensue, and at the end of a few days all traces of the burn disappear.

When the carbon electrode is used, the filling material is usually of the same metal as that being worked upon and may be used in any convenient form. When metal electrodes are used for welding iron and steel they should be of best quality of soft iron or steel wire and may range in diameter from ⅛ in. to ¼ in. The length most generally used is about 12 in. Copper, bronzes and brasses with a low percentage of zinc may also be welded by this process, in which case the electrodes should be of the same material as that being welded. Where the zinc content of brasses is high, it volatilizes to such an extent as to make the work porous and brittle.

The current required for carbon electrode welding varies from a minimum of about 200 amperes to a maximum of around 700 amperes, or even more in very heavy work. In general, however, 300 or 400 amperes have been found to be sufficient for ordinary carbon electrode work.

The metal electrode process, though a considerably later development than the carbon electrode method, has a field of application very distinct in many cases from the older process. Its principal advantage is on work where it is desirable to localize the heat to the greatest extent possible, thus minimizing strains due to expansion and subsequent contraction. An example of this is in the welding of sheet metal or of a broken bridge in a flue sheet. Another advantage of this process is that it enables welding to be done in a vertical plane or even from the underside of the piece to be repaired. With the metal electrodes much lower currents are used than in the carbon electrode process. The maximum value hardly ever exceeds 150 to 175 amperes. For a greater portion of the work a current of about 100 to 130 amperes is found satisfactory, although the amount of current required will vary with the size of the electrode and the class of work being done.

The carbon electrode process is also well adapted for cutting

*Abstract of a paper presented before the Western Railway Club, November 17, 1914.

†Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa.

of metals. In cutting the arc is drawn just as in welding and is played along the line to be cut, provision being made for the melted metal to run off. Very rapid work of this sort can be done, especially if heavy currents are used. The heat generated varies approximately as the square of the current so that a comparatively small increase in current will give a considerable increase in the rapidity with which work may be done.

Among the principal uses of arc welding equipment in steam railroad shops are the following: Flue welding; firebox repairs; frame repairs, and building up of worn parts. Besides these there are innumerable minor uses for the equipment.

General practice varies as regards the best method of welding flues. The time of welding will probably average 15 per hour, although as high as 25 per hour have been reported. This time is for 2-in. flues. Five inch superheater flues are being welded at about one-fourth this rate. It is interesting to note that the flue sheet is found to be in better condition upon removal of flues than is the case where flues have not been previously welded in. This is due to the fact that the welding builds up the sheet around the flue holes to about the original thickness.

Closely related to flue welding is the subject of firebox repairs. The defects to be repaired include cracks in the side, flue, door and crown sheets, leaky staybolts, leaky seams, etc. Also sheets will often be found to be in such condition that repairs are impossible, and it is necessary to put in patches. All of this class of work can be done very satisfactorily by the use of the arc welding equipment. Broken locomotive frames also are very satisfactorily repaired by the use of the electric arc. One railroad (R. F. & P.) reports that it has in service at the present time 65 welded locomotive frames and has had only one failure; this failure was attributed to the fact that the arc weld was in close proximity to one made by another process.

The following figures are taken from records of actual repairs made in a large railroad shop in the middle west at various times, the figures given being a comparison between the actual cost of welding and that of putting the apparatus back into service by methods previously used, either by replacement or by repair of the old parts. The arc welding costs were based on a power cost of 51 cents per hour for the carbon electrode and 17 cents an hour for the metal electrode, together with cost of labor and an overhead charge of 40 per cent. The power costs used are slightly higher than those usually obtaining in shops of this nature:

	Cost of welding	Cost by other methods
Plugging 51 holes in expansion plate, holes 1 in. diam. by ½ in. deep	$2.75	$10.15
Repairing mud ring	6.50	34.57
Cutting four 6-in. holes in tender deck sheet ½ in. thick	1.08	8.35
Welding eccentric strap, broken through neck	1.08	41.28
Repairing mud rings	6.50	24.57
Welding two spokes in driving wheel center	7.98	99.98
Welding cracks in bulkhead in tender tank	2.33	8.00
Welding cracks in side sheets	26.15	31.79
Repairing firebox	134.89	869.58
Building up flat spots on locomotive driver	.40	225.00

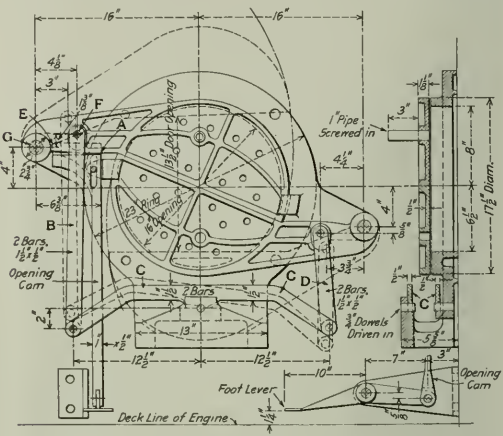
No hard and fast rules can be laid down as to the size of outfit required, as no two installations will be alike in their requirements, and the matter of selection of apparatus of proper capacity is largely one of judgment and experience. In steam railroad shops installations are usually made of sufficient capacity to take care of not less than four to six operators, and the larger shops can occasionally use even greater capacities to advantage. Where a greater number of operators are to be supplied, however, it is generally found to be more economical to install additional outfits in other sections of the shop where welding is to be done, rather than to put in one large central plant. This is on account of the fact that as this work is usually more or less scattered the cost of line copper becomes an item for consideration.

Arc welding is not to be considered as a panacea for all the ills that the metal worker is heir to. There are many classes of work for which it is entirely unsuitable, but its range of usefulness is so wide that it has long since fully justified its existence.

GRAVITY FIRE DOOR

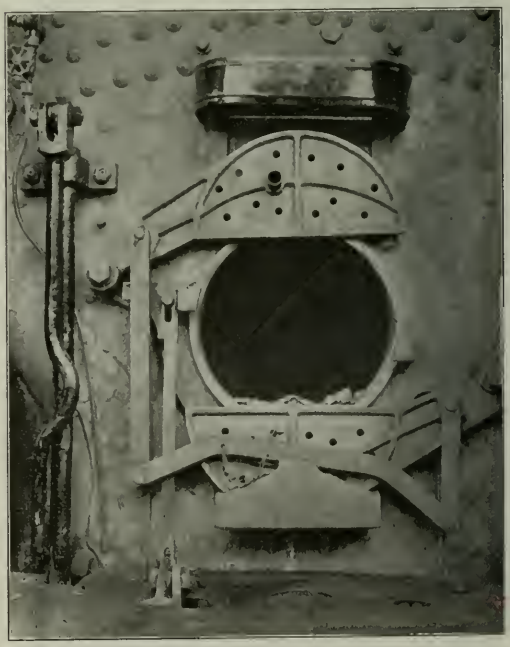
A foot-operated locomotive fire door, the two halves of which are so arranged as to counterbalance each other, thus making unnecessary the employment of a power cylinder, has been developed and patented by P. C. Withrow, mechanical engineer of the Denver & Rio Grande.

As shown in the engraving the door is in two sections, the



Simple Gravity Fire Door

upper part being pivoted at the left and the lower part at the right. It is opened by means of a foot lever located at the left and 20 in. out from the back head. This lever operates the door opening cam, which has a specially formed shoe at its upper end bearing against the under side of the upper door at *A*.



Gravity Fire Door Locked in Open Position

As pressure on the foot lever opens the door the point of contact between the cam and the door shifts from *A* to *E*. This gives a comparatively large leverage by means of which to start the door without unnecessary effort, and the decreasing leverage as the movement progresses keeps the travel of the foot pedal within reasonable limits.

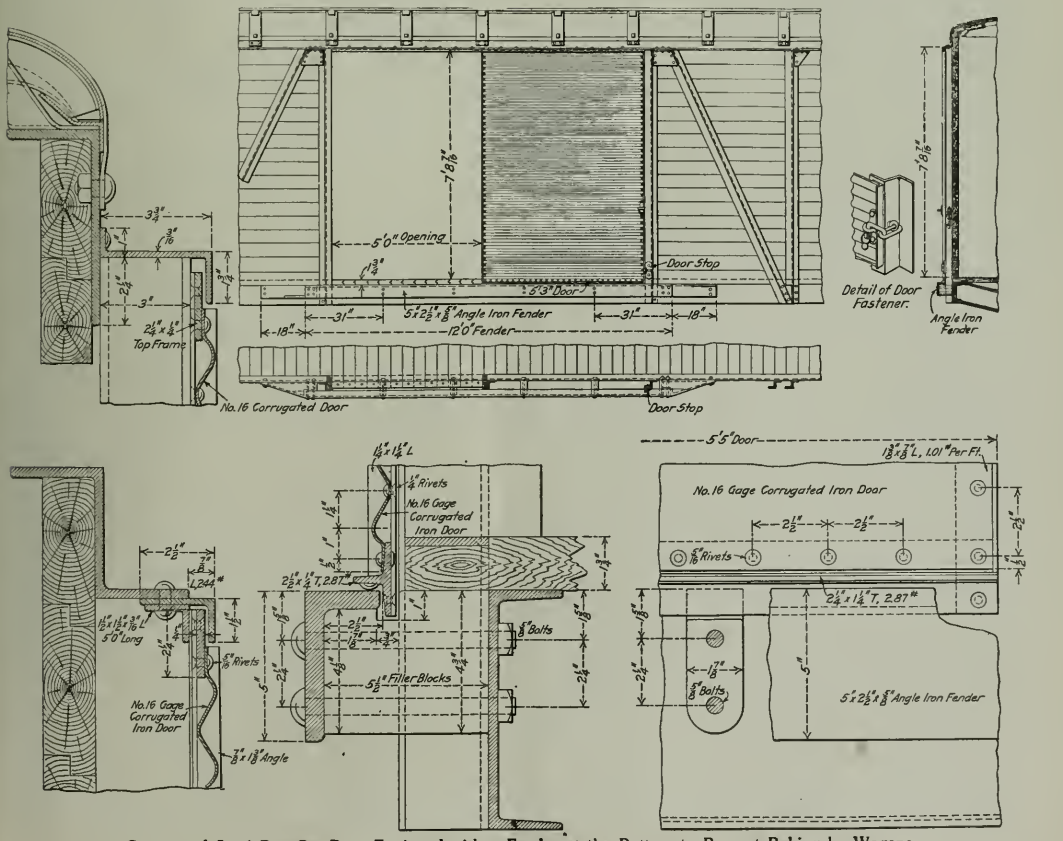
The upper and lower sections of the door are connected by means of rods *B* and *D* and equalizer *C*. The pin *F* which connects rod *B* to the upper door is located above the hinge pin *G*, thus causing it to swing in closer to the vertical line through the hinge pin as the door is opened. The leverage of the upper door, the weight of which causes the closing movement, is thus increased. It will be noted that the pin which secures rod *D* to the lower section of the door is located at a point much nearer the horizontal center line through the hinge pin than is pin *F* in the upper door. The increase in leverage of the lower door in the open position is therefore less than that of the upper door. A further increase in leverage of the upper section is effected by the rolling contact between equalizer *C* and the door frame at the right of the equalizer fulcrum pin. This causes the fulcrum to gradually travel to the right as the door is opened. The upper door thus has sufficient overbalance to insure prompt closing on releasing the pressure from the foot lever. As the closing movement proceeds the various points return to a normal position, thus destroying the overbalance, and the closing is completed without slamming. The foot lever bracket may be fastened either to the back head or the deck as is most convenient.

This device has been in use experimentally on the Denver & Rio Grande for about two years, where it has been meeting with considerable favor. It is claimed that prompt opening of the door is effected without extraordinary effort; sufficient force is brought to bear upon the pedal by the natural swinging of the weight to the left foot as the fireman swings the shovel toward the fire door.

CORRUGATED STEEL DOOR WITH FENDER ATTACHMENT

A corrugated steel box car door which is being manufactured by the American Car Roof Company, Chicago, is fitted with a fender attachment to prevent the doors being raked by wagons, etc., when the car is being loaded or unloaded.

The fender consists of a 5 in. by 2½ in. angle held out from the side of the car by means of cast filler blocks; at the ends snub-nosed castings are used. When shut the front end of the door fits into an angle, the idea being to prevent it from bulging out in case freight should accidentally fall against it on the inside. It is securely fastened by a one link chain and hook in the rear which it is believed is sufficient to keep the rear edge of the door from bulging out. This door does not run on pulleys, but is supported at the bottom near each end by hard bearing points. It is claimed that in many instances after several months' service the pulleys which are commonly used for supporting car doors rust and stick. Further advantage in suspending the door on bearing points at the bottom is claimed, as when it is suspended from the top by means of pulleys, very few bolts or rivets can be employed to carry the weight of the door itself.



Corrugated Steel Box Car Door Equipped with a Fender at the Bottom to Prevent Raking by Wagons

AMERICAN RAILWAY ASSOCIATION MEETING

The fall session of the American Railway Association was held at the Blackstone hotel, Chicago, on November 18. There were present 210 members, represented by 180 delegates. The executive committee reported that the membership now comprises 402 members, operating 274,790 miles, a decrease of one member and an increase of 900 miles. The associate membership now comprises 201 members, operating 12,138 miles, an increase of 38 members and 1,610 miles.

The executive committee also reported that its attention had been called to the use of illuminated electric signs on the rear of passenger trains. The committee adopted the following resolution in connection therewith: "Resolved, that the American Railway Association disapproves of the use of electric illuminated signs on the rear of passenger trains, by reason of the effect they have of concealing essential indications of standard marker signals, and also because they absorb the light of other signals and have a tendency to divert the attention of the employes, whose duty it is to observe signals which are essential in railway operation."

The committee also stated that the president, as authorized at a meeting of the Association on May 20, appointed a committee of nine to investigate such changes as have been, or may be, suggested in the system of uniform standard time, as adopted in United States and Canada in 1883, to report to the Association at the present session. The committee consists of E. B. Thomas (chairman), president of the Lehigh Valley; B. McKeen (vice-chairman), general manager, Pennsylvania Lines West of Pittsburgh; C. W. Galloway, general manager, Baltimore & Ohio; H. A. Worcester, general manager, Cleveland, Cincinnati, Chicago & St. Louis; D. C. Moon, general manager, Lake Shore & Michigan Southern; A. W. Johnston, general manager, New York, Chicago & St. Louis; A. J. Stone, vice-president and general manager, Erie; M. S. Connors, general manager, Hocking Valley, and H. W. McMaster, general manager, Wheeling & Lake Erie.

The committee presented a report, and resolutions recommended by it were adopted asking that when any proposition shall be made for change in standard time of the whole or any part of the membership of the Association the subject shall be referred to the executive committee. The executive committee shall thereupon appoint a committee of nine members on standard time, which shall promptly examine and report on the effect of such proposed change of time—as to its advantages or disadvantages to the road or roads directly affected—to any other member of the Association, or upon the uniform standard time system generally; and it is further recommended that no change be made in the standard used by any member until such committee shall have presented its report and it has been acted upon. The Association urges the roads which made changes in their standard in April and May by adoption of Eastern time in place of Central, and so departed from heretofore uniform standard time, to return to the use of uniform standard upon their lines at the earliest practicable date.

It was decided to discontinue the compilation of statistics of car surpluses and shortages, and of car balance and performance for reasons of economy.

The committee on transportation reported that it has now practically completed the revision of the standard code of train rules for single and double track, rules governing movement of trains with current of traffic on two or more tracks by means of block signals, rules governing movement of trains against current of traffic on two or more tracks by means of block signals, and additional rules for three or more tracks. Before presenting this to the association for adoption it desires to give each member an opportunity to examine the rules and formally submit its criticism. Circular No. 1,472 has, therefore, been issued, embodying the revision of train rules, and replies thereto are requested on or before December 14, 1914. As a result of suggestions which it hopes to receive in reply to this circular, the committee expects to be able to present a complete report to the association at its May, 1915, session.

COMMITTEE ON MAINTENANCE

The committee on maintenance reported that E. C. Carter had resigned as chairman on account of his retirement from railroad service and A. T. Dice had been elected chairman. The vacancy on the committee has been filled by the election of F. T. Hatch, chief engineer, Vandalia Railroad. The committee announced the result of the letter ballot, ordered at the previous meeting of the association, relative to standard inside dimensions of box cars. Although a majority of the members voted in favor of the three resolutions, the number of freight cars represented by such memberships was less than two-thirds of the freight cars owned and controlled by the members of the Association. The resolutions were therefore not adopted.

The committee also included in its report a summary of the replies to the circular respecting the number of freight cars, passenger cars and locomotives equipped with safety appliances as required by the United States safety appliance standards, as of July 1, as follows:

Number of members reporting, 384.

(a) Freight cars in service 2,510,214.

(b) Passenger cars in service, 56,980.

(c) Locomotives in service 66,853.

Fully equipped with safety appliances required by the United States safety appliance standards, promulgated by the Interstate Commerce Commission in its order, dated March 13, 1911:

(a) Freight cars 652,999.

(aa) Freight cars put in service since July 1, 1911, 551,455.

(b) Passenger cars 52,470.

(c) Locomotives 63,687.

Fully equipped with secure grab-irons or handholds on the ends and sides of each car, as required under section 4 of the act of 1893, as amended April 14, 1896, and March 2, 1903:

(a) Freight cars 2,510,214.

(b) Passenger cars 56,980.

The joint committee on automatic train stops reported that F. C. Rice, general inspector of transportation of the Chicago, Burlington & Quincy, had been elected chairman, vice E. C. Carter, resigned. The committee also reported that it had continued its research of the subject and had received the reports of tests of automatic train control devices which have been recently made. Since the adoption of requisites of installation for automatic train control, as approved by the association on May 20, 1914, no stop device, which has been thoroughly and practically tested and has been demonstrated to comply therewith, has come to the notice of the joint committee. The committee has planned to pursue further its investigations, and has issued a circular (number 1470) to the members of the association for that purpose.

The committee on electrical working reported that the subjects which have been under consideration since its report of April 20, 1914, are those connected with electrical working conductor clearances as affected by permanent way and rolling equipment structures, also specifications for electric power and telegraph or telephone wire line crossings over railways. The existing standards were recommended. The practice of the associations in regard to these facilities has been under investigation by the committee with the view of securing uniformity in standards adopted by various engineering associations. The committee stated that the diagram of the third rail working conductor clearances adopted by the association in May, 1912, has been under consideration by the sub-committee in joint session with subcommittees of the American Railway Engineering Association and the American Electric Railway Engineering Association, with the view of establishing limited rolling equipment clearances in space close to track rail, for permanent way structures or for other devices, such as automatic train stops. These sub-committees have concluded that the "third rail clearance" diagram can be extended towards track rail without materially affecting interchange equipment, and have accordingly adopted the following resolution:

"That the limiting clearance line for rolling equipment as adopted by the American Railway Association should be changed so that the points FE 2½/15 and GE out 15 become FE 2½/6 and GE out 6."

This recommendation was adopted by the association: This provision will allow devices attached to the permanent way to project 2½ in. above top of track rail in space from point ¾ in. to point 6 in. distant from gage line.

The sub-committee of Railway Engineers' Association recommended the adoption of the five overhead clearances diagrams approved by the association at its meeting in Chicago, March, 1914, as recommended practice. The association accepted this recommendation.

The specification of the American Electrical Railway Engineering Association for overhead crossings of electric light and power lines was adopted as recommended practice.

The committee advised that consideration of overhead crossings for telegraph and telephone lines had been referred to a sub-committee which has been in conference with similar committees of the American Railway Engineering Association and the American Electrical Railway Association. The sub-committee recommended the adoption of the telephone, telegraph and signal wire crossing specification prepared by the Association of Railway Telegraph Superintendents, with the exception of one paragraph relating to minimum clearances of poles from railway tracks. The side clearance specified by the telegraph superintendents was not considered sufficient, and it was recommended that the minimum clearance of poles be made to conform to that established for the transmission line crossing structures.

The specification which the committee offered has not been definitely acted upon by the engineering associations, but the committee thought it desirable to place on record at this time the essentials of a matter which is of immediate and increasing importance to railroads, and the committee, therefore, offered the specifications for adoption as recommended practice of the association. The association took action accordingly.

The sub-committees appointed by the committee for further investigation of continued subjects are as follows:

On third rail working conductors and on overhead working conductor clearances, A. S. Baldwin, Illinois Central; J. H. Davis, Baltimore & Ohio; E. B. Katte, New York Central.

As representatives of committee on national joint committee on specifications for wire and cable crossings, E. B. Katte, New York Central; J. H. Davis, Baltimore & Ohio.

The committee on relations between railroads reported that it has approved the application of 66 roads to sign the per diem rules agreement, and has rejected the applications of four. It has reported to the executive committee on the eligibility of 47 roads to become associate members of the association.

On the recommendation of the committee a national form of weight agreement was approved.

The committee submitted a code of L. C. L. rules governing receiving, stowing, handling and delivery of less than carload freight, and also recommendations covering methods for handling carload shipments of flour, which were approved.

The committee reported that it was advised that in official classification territory a uniform charge had been adopted of $2 for cars reconsigned en route and $5 for cars reconsigned at destination, and that it understands that similar action is contemplated in other parts of the country. The committee also reported that it had authorized an increase in the number of members of the committee on weighing and the committee on packing, marking and handling of freight by the addition of the president of the Freight Claim Association, and the president of the American Association of Freight Agents, ex-officio.

The following were elected members of the committee on the safe transportation of explosives and other dangerous articles: Central of New Jersey, Missouri Pacific and St. Louis & San Francisco.

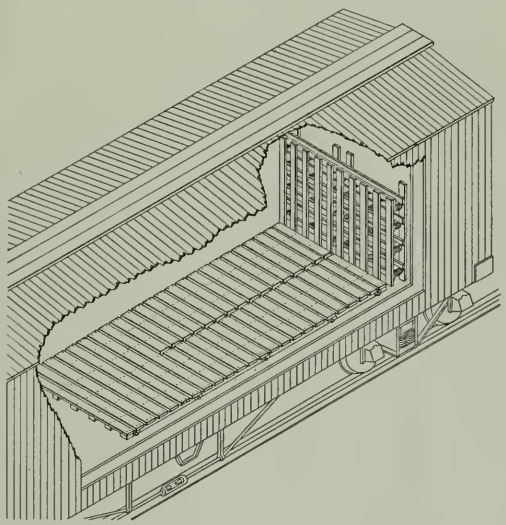
The following were elected members of the committee on electrical working; Illinois Central and Long Island.

The following were elected members of the committee on nominations: C. W. Galloway, Baltimore & Ohio, and W. B. Storey, Atchison, Topeka & Santa Fe. The association decided to hold its next session in Atlantic City on May 19, 1915.

SHOCK ABSORBER FOR FREIGHT CAR LADING

A means of protecting freight of a fragile nature against breakage due to shocks while in transit has been developed by B. Monesmith, of Cresco, Ia., and George E. Cutler, a commission merchant of New York City, and application has been made for patents. It has been applied to two shipments of eggs from Cresco, Ia., to New York City, both of which arrived at destination in perfect condition. Each shipment consisted of something over 400 cases and formed a refrigerator carload.

The patents which have been applied for are designed to cover the application of two principles, one the placing of the load upon a disengaged floor or platform free to move longitudinally upon the floor of the car, and the other a means of absorbing the momentum due to this movement without shock to the lading. The application of these principles to the two refrigerator cars,



Shock Absorber as Applied to Refrigerator Cars for Egg Shipments

while crude in some respects, was very simple and effective in its action. Longitudinals of 2 in. by 4 in. section were secured to the under side of the floor racks and the whole was then placed upon a number of rollers of small iron pipe. These rollers, which are placed crosswise of the car, were held in line by shallow notches in the bottom of the longitudinals, the length of the notches being sufficient to allow a motion on the rollers of about 5 in. With the sections all in place the result is a single structure free to move lengthwise of the car through a distance of about 4½ in. or 5 in. In each end of the car was placed a shock absorber in two sections, temporarily secured to the car with lag screws. Each section of the shock absorber consists of 12 coils of light wire placed between two light timber frames, one of which was secured to the end of the car and the other free to move as the springs were compressed.

In loading a space of about 6 inches remained unfilled at the middle of the car. This was loosely filled with straw and excelsior which on being unpacked at destination showed practically no evidence of having been compressed by the shifting of the load in the two ends of the car, and an egg placed in this space came through unbroken. The cost of the equipment as applied to these cars is stated to be about $30 per car.

Maintenance of Way Section

Concrete Railway Signs

The report on concrete posts, presented at the recent annual convention of the American Railway Bridge & Building Association, brought out an extended discussion of concrete signs, indicating the very general interest in this subject at the present time. While one man reported that concrete signs had been standard on his road for six years, a number of others reported that they were using them only experimentally and other members had not used them at all. The sign along the railroad right of way has not only to withstand the ordinary ravages of the elements, but also the more serious attacks of maliciously inclined persons. It is the latter abuse which concrete signs withstand with difficulty. The Santa Fe found that the long thin panels forming the arms of the standard crossing sign were defective in this regard, and have tentatively adopted metal crossarms bolted on concrete posts. For mile posts and similar signs where a heavier post can be used, concrete has been found well adapted. Several methods have been used to bring out the letters or figures in the posts. Probably the most common is the casting of the posts with blocks in place of the letters, which blocks are later replaced with a mixture of lamp-black and cement. The determination of the proper quantity of lamp-black to give a sharp distinctive color, and at the same time to prevent smearing to adjacent surfaces, requires care. Several men also reported a tendency for the inserts to break and fall out. One member stated that he had overcome this difficulty by partially imbedding a number of small staples in the green concrete in the bottom of the opening left for the colored concrete to serve as a bond with the latter. While requiring greater care in handling, the concrete sign is more durable than the wooden and with proper care should prove more economical.

Sanitation of Camp Cars

In view of the very general activity of state and local boards of health throughout the country, the importance of the maintenance of clean and sanitary quarters for laborers employed in maintenance work, especially in floating gangs, is being brought more directly to the attention of railroad men. For section gangs the box car removed from its trucks is rapidly being replaced with permanent frame or concrete buildings. However, this is not universally the case, as many old box cars are still doing service as living quarters for the men and, differing from the cars on wheels, after once being set out, they continue to be used long after their proper life has been reached. The real problem, however, is to provide quarters for the floating or extra gangs. Box cars condemned for revenue service make the practical camp for such a gang moving from place to place and can be fitted into very suitable quarters. The men employed in such gangs a few years ago readily maintained their cars in a satisfactory condition, but the general introduction of laborers from southern Europe and Mexico with their lower standards of living, has made it very difficult to maintain sanitary conditions. As a result, railway officers have been inclined to pay less attention to the character of the cars furnished to these men. While in nearly all cases in which complaints have arisen, equally objectionable conditions can be found elsewhere in the community, this is no defense of these conditions on the railroads, and with the present attitude of the public, the railroads are apt to be the first to be criticized. In several states drastic action has already been taken, even to the extent of limiting to four men the number who may sleep in one car. If the roads are to avoid similar requirements in other states, they will have to overhaul their camps in the near future, and then keep them in proper condition.

Treated Ties on the L. & N.

The timber treating plant at Gautier, Miss., operated by the Louisville & Nashville, was one of the first plants of this kind built in the country. It has long supplied the road with treated bridge timber, but until the completion of the new plant at Guthrie, Ky., described in this issue, no ties had been treated by this road. It is a striking evidence of the satisfactory service of treated timber that a road should extend its use so widely after long experience in one field. This decision to treat ties is also significant because the road is located in a timbered country where ties can be secured on practically the entire system. A comprehensive study of present and probable future costs of untreated and treated ties on the various lines was made in considering the project to build the new plant at Guthrie as the first step in a program of tie preservation. This study showed that economy could be effected by treatment in addition to the well recognized advantage of conserving the available timber supply. In order to secure the maximum economy it was found that the curve ties which must be plated should be creosoted and the others not requiring plates, treated with zinc chloride. In accordance with this conclusion, the plant was designed for both processes, and a great deal of care was used in planning the arrangement and details of equipment to reduce the cost and increase the efficiency of operation. As evidence of the result of this preliminary study, the cost per tie for heating as shown in the early months of the plant's operation, is more than 400 per cent lower than the similar figure in many large plants, on account of the compact arrangement and the improved details of the heating system in the tanks and cylinders.

Why Not 40-Ft. Rails?

A few years ago the standard length of rails was 30 ft. Within the past decade this has been increased 33 ft. and many men are now asking why this cannot now be increased to 40 ft. The immediate purpose, of course, is to reduce the number of joints and as the joint is the weakest part of the track and expensive in first cost and maintenance, this is an important advantage. One factor limiting the length of rails is the length of the cars available for their transportation. A few years ago 34-ft. and 36-ft. cars were most common, but within recent years cars 40 ft. long or longer have come into very general use. Another objection raised is the necessity of providing increased expansion for the longer rails. However, with the adoption of the heavier sections within the past few years, it has been found possible to reduce the relative allowance of expansion when laying rails so that this is not serious. A third objection is that the longer rails would be more difficult to handle because of their increased weight. This is a serious objection where the rails are handled by hand, but with the adoption of the heavier sections mechanical appliances have come into more general use for unloading and loading rails, as well as for placing them in the track, and the adoption of longer rails would undoubtedly increase their use. From the standpoint of the manufacturers there are more serious objections. Some of the mills will have to be reconstructed in large part to make rails of this length, although other mills are now prepared to roll them in limited quantities. It is also stated that with the increased length it will be more difficult to keep the rails straight. Both of these are serious objections which, however, the manufacturers will undoubtedly be able to obviate when the demand arises.

EXCESSIVE LIVE STOCK LOSSES

THE killing and injuring of live stock on the right of way is a source of loss to the railways which amounts to more than is usually realized. One western system, on which conditions are probably no worse than on many other roads in central, southern and western territory, has analyzed these losses very carefully, and found that for the last fiscal year the claims paid for live stock killed and injured by trains averaged $27.85 per mile of line. For individual divisions this figure varied widely, being as low as $6 on some and as high as $112.49 on one. On another central western road the number of head of stock killed annually on the tracks averages 1.32 for every mile of line.

It is scarcely necessary to point out that claims paid for stock killed represent an absolute loss both to the owner and the railway. The former is seldom satisfied with the settlement, and the roads must pay in addition to the amount of the claim the cost of burying or removing the carcasses. Also, the settlement of claims is a fruitful cause of dispute between the company's representatives and actual or prospective patrons, often resulting in permanent antagonism to the road. When such a loss becomes as great as that mentioned above, special efforts to reduce it are warranted.

The possible success of such efforts depends to a large extent on local conditions. In some of the eastern states, where there is a comparatively small amount of stock, the problem of keeping it off the track is not so serious. On the other hand, in some southern or western states, where stock is raised in large numbers, and particularly where the free range laws are in effect, removing all responsibility from the owner to fence up his stock, a railroad has a very difficult task to prevent trains from striking animals on the track. The first road mentioned above finds that 55 per cent of its stock claims are the result of accidents occurring on 14 per cent of its mileage located in states where these laws govern and the second road killed more than 6,000 head of stock in one state, or 74 per cent of the total for the system, while only 28 per cent of the system mileage is operated in that state. In some parts of the country the owners of stock consider it their inalienable right to let their stock graze on the railway right of way, and attempts to fence this property are not popular and in some cases have even been met with active resistance.

The part of the right of way around stations cannot be fenced off and on every road some live stock is struck within the limits of station grounds. This class of accidents forms 25 per cent of the total on the road referred to. Little can be done to prevent them beyond trying to educate the enginemen to be careful and to enlist the co-operation of local employees in correcting conditions that would tend to attract loose stock to the station grounds and in driving such stock out of the way of harm whenever possible.

In the endeavor to prevent the rest of the accidents, which are a large majority, two means are available—to keep the animals off of the right of way and to keep the trains from hitting those that do succeed in getting on. The former involves the construction of fences and cattle guards and their proper maintenance. The typical right of way fence is almost invariably better than adjacent line fences, costing perhaps $500 to $700 per mile of line. Such a fence is required by law in many states and in view of the nature of the service that is required of it, is probably the most economical that could be provided. Many cattle guards in service do not turn stock successfully. On the other hand, some states have required pit guards, a type much more expensive than is justified and one the use of which involves actual danger to the stock. It has been estimated by one of the roads furnishing the above figures that 90 per cent of the accidents to live stock on the divisions with the worst records could be eliminated by a complete installation of fence and steel or other equally efficient cattle guards.

After the installation of proper structures to turn stock, the section foremen have an important duty to perform in maintaining them. It is very difficult to get foremen to take time from track work to fix a fence before an accident happens, but if they could be made to realize the average loss to the company for stock killed on every mile of line, they would see that they cannot afford to delay the fence repairs too long. In some cases minor points in maintenance are overlooked which destroy the effectiveness of the most expensive fence and cattle guards. Insufficient barriers at small streams crossing the tracks, too much space under wing fences and the leaving out of cattle guards for several days after heavy ballasting work, are illustrations of such points.

The high cost of fences and cattle guards makes it necessary to consider carefully the possible saving to be effected by their installation and in some cases it may be difficult to justify this expense. In general, however, the amount spent to maintain fences is much below the economical figure. The first road mentioned above, for example, spent about half as much for repairing fence during the last fiscal year as for claims paid to owners of stock killed or injured. In so far as greater expenditure for fence repairs would have decreased these stock claims, that use of the money would have been much more beneficial both to the road and its patrons.

COMPARISONS OF RAIL FAILURES BY MILLS

IN compiling the annual statistics of rail failures for the year ending October 31, 1913, an abstract of which is published on another page in this issue, the Rail Committee of the American Railway Engineering Association has made two important departures from the methods followed in compiling previous reports. Up to this time only the failures occurring during the preceding year have been tabulated in the annual reports, but this year all failures occurring since the rail covered by the records of the Association was laid in the track have been included. As the total number of failures in any one year depends largely on the average age of the rail, the total number of failures to date in the rails covered by the records is a better indication of the character of all the rails thus covered than the records of failures for any individual year. While it is unfortunate that a number of the roads are not co-operating with the committee by reporting to it their failures, so that only about 30 per cent of the rails rolled during the period under consideration are included in these statistics, this total tonnage of over 5,500,000 tons is sufficiently large to make any conclusions drawn reasonably representative of the situation throughout the country.

The second innovation in this year's report is the comparison of failures by mills, which is the most important step yet taken by the committee in the analysis of rail failure statistics. It has been common knowledge that there are wide differences in the quality of the rails rolled at different mills and that while some manufacturers have been making every endeavor to improve the quality of their product, the efforts of others have been less marked. The publication of statistics of rail failures, grouping these failures by mills, will serve as an incentive to still further effort on the part of those manufacturers desirous of maintaining a high standard which will force the other manufacturers to meet the standards set by their competitors. The *Railway Age Gazette* has, therefore, repeatedly advocated during the past few years, the compilation and publication of such statistics and in its issue of January 12, 1912, such a tabulation was made and published, compiled from the best data then available. The committee is to be commended for compiling this data in this form for public information, and it is to be hoped that they will be revised from year to year to show the progress made by the different mills. It would appear advisable to separate the mills in some way to equate for the more important differences in the climatic conditions under which the rails are in service. However, despite such differences in conditions which must be allowed for, we believe that the publication of statistics such as these will do much to improve the standards of rail manufacture.

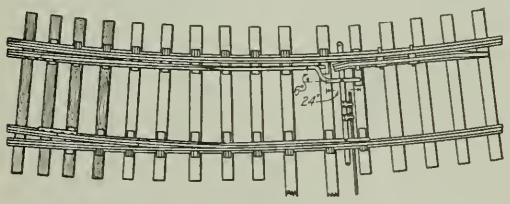
Letters to the Editor

STAGGERED SWITCH POINTS

Tullahoma, Tenn.

To the Editor of the Railway Age Gazette:

An arrangement of switch points very similar to the one described in your issue of September 18, by W. F. Rench, supervisor, Pennsylvania Railroad, has been in use on the Centreville branch of the Nashville, Chattanooga & St. Louis since February, 1908. The only difference apparent from the diagram accompanying the description mentioned is that two tie rods are used in that design and a connecting rod at right angles, while the switch worked out by me has only one rod. The point to be protected is shortened 24 in. and a flanged reinforcing angle extended the same distance with an offset of 6 in. in order to provide room for the guard rail. The head rod is connected to the reinforcing bar the same as to the switch point in standard switches. This switch was patented in December, 1908, having been worked out in order to avoid derailment where a side track leading to the depot at Centreville, Tenn., turns out of the inside of a 20-deg. curve. Before this



An Arrangement of Staggered Switch Points in Use on the N. C. & St. L.

switch was put in the side line point could only be used four months with safety. After that time the wheel would mount the point and leave the track. With the arrangement shown in the sketch the switch point will last as long as the rails. This has the added advantage that when switch points have to be changed before the rails wear out, the new points do not match the old rails and make rough joints. Three other switches on the branch referred to have a similar arrangement of the points designed to protect the main line points on outside turnouts to avoid danger of derailment and to keep the outside points from wearing. One of these switches is on a 20-deg. curve, one on a 10-deg. curve, and the other on an 8-deg. curve. Arrangements to market this switch are now being made by J. Z. Easley, Nashville, Tenn.

R. A. Easley,
Road Supervisor, N. C. & St. L.

AN AGENT'S IDEAS OF EXTRA GANGS

Three Lakes, Wis.

To the Editor of the Railway Age Gazette:

This summer a gang of about 30 Greeks spent a month or so putting in ties in this vicinity. They were in charge of an Irish foreman, who admitted that he had no control of them. There were probably half a dozen good workers in the gang, and the rest were drones, but if one of the laziest had been discharged the whole gang would have quit. They received about 15 cents a day more than the section men, and averaged about four ties per day per man. After they were gone the regular gangs had to retamp, line up, and make a track out of the mess they left. If in putting in ties the section men in that district did not average a dozen ties per man per day under similar conditions they would not think they had done a good day's work, but they had to watch those Greeks loaf and draw more money than they, which probably did not have a tendency to increase their ambition to do good work.

My suggestion for doing such work is as follows: Most section foremen know one or two available men who can be picked up at any time that an increase in the section force is authorized. Why not take half a dozen sections, three each way from the work to be done, pick out two of the best men on each gang for a temporary extra gang, replacing them with the extra men the foremen can pick up, pay them at least two dollars a day, give them a good clean car with clean blankets and bunks to sleep in, and treat them right? The best trackman among the section foremen in the district should be put in charge of this gang at a salary of at least $100 a month, and he and the gang should be made to understand that they must produce results to hold their jobs. I believe that such a system would cut the cost per tie in half. The men would also feel that the company wanted to do the fair thing with them, and to give them the benefit of any extra money to be spent.

D. E. Lamon,
Agent, C. & N. W.

A LARGE HOOK BLOCK

Toledo, Ohio.

To the Editor of the Railway Age Gazette:

My attention has been called to the description of a 50-ton hook block published in the *Railway Age Gazette* of July 17, in which it is stated that this block is "so far as known, the largest ever built." It may interest your readers to know that a four-sheave block of my design is now in use for oil well drilling that has a working load of 80 tons and weighs 2,015 lb. without the hook. The side bars of the block are 1⅛ in. thick, and 8 in. wide; the plates are ⅜ in. thick, the separators are of cast iron, the sheave pin is of forged steel 4½ in. in diameter, the shackle bolt is 2 15/16 in. in diameter, and the becket bolt is 2 7/16 in. in diameter. The sheaves are of cast iron 26 in. in diameter, bronze bushed, and designed for a 1-in. wire rope.

The hook that is used with this block weighs 800 lb., and has a working load of 75 tons. The Union Tool Company, Los Angeles, Cal., which manufactures this block, also manufactures a five-sheave block which weighs approximately 2,600 lb., and has a working load of 100 tons.

William H. Wolfgang.

NEW BOOKS

Plane Surveying. By William G. Raymond, dean of the College of Applied Science, State University of Iowa. Size 4½ in. by 7 in., 590 pages, 239 illustrations, 19 tables and 7 plates. Flexible leather binding. Published by the American Book Company, New York. Price $3.

The second edition of Raymond's "Plane Surveying" has just been issued in pocket book form. Portions of the book as written 18 years ago have been rearranged and all of it rewritten, although little change has been made in the subject matter. This book is intended for classroom use and deals largely with land surveying. The author does not attempt to go into the details of the operations of various surveying methods, but explains principles fully, and includes problems intended to show the possibilities and limitations of the various instruments and methods.

Surveying Manual. By Howard Chapin Ives, professor of railroad engineering, Worcester Polytechnic Institute. Size 4½ in. by 7 in., 296 pages, illustrated, bound in flexible leather. Published by John Wiley & Sons, New York City. Price $2.25.

Ives' "Surveying Manual" has been prepared for the use of students in engineering courses other than civil, and is therefore more elementary than most of these manuals. The use of all the common instruments is covered, and there are chapters on railroad curves, the laying out of public lands, computation, plotting, latitude, longitude and azimuth and large surveys. The common tables which are required in using the ordinary instruments are included for easy reference.

New Tie Treating Plant With Unique Features

L. & N. Builds Two-Cylinder Plant at Guthrie, Ky., After Careful Study of Timber Conditions on Its Lines

The Louisville & Nashville has operated a new wood preserving plant at Guthrie, Ky., for the past season, which is designed to treat ties either with creosote or zinc chloride. The Bethell process with 8 lb. of creosote per cu. ft., and the Burnett process with ½ lb. of dry zinc chloride per cu. ft. injected in a 4 per cent solution are used. The ties treated at the new plant are red oak and black oak. The capacity of the plant is about 800,000 per year.

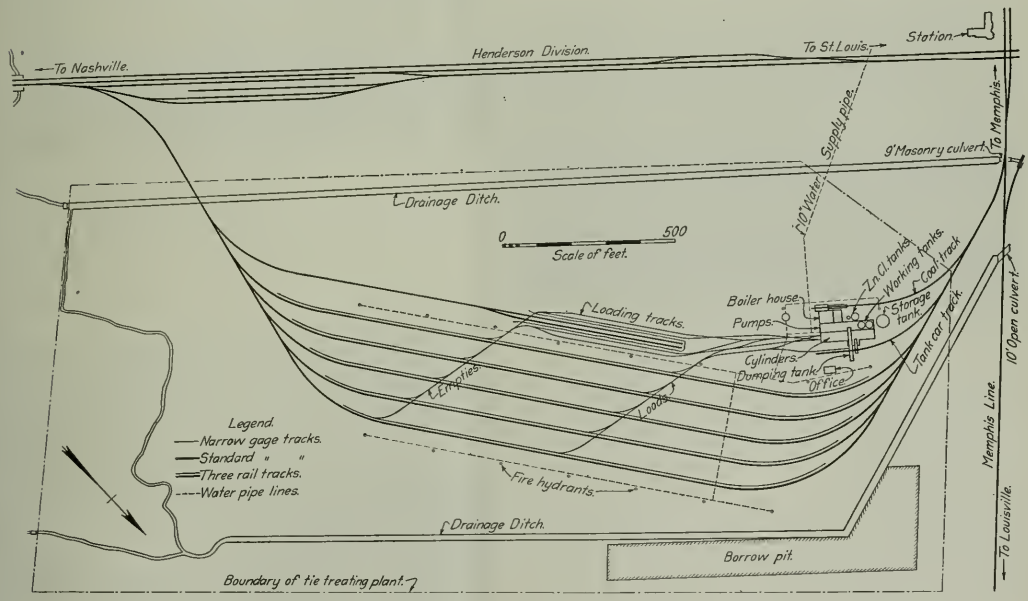
GENERAL

White oak ties were formerly standard in the territory to be served by the new plant, these ties being plated on curves, primarily to resist rail spreading rather than wear of the ties. In determining whether to replace these ties with treated ones, and if so, the type of treatment to be used, comparative capitalized costs of untreated, creosoted and zinc chloride treated ties, both with and without tie plates, were prepared. Including all items, such as the cost of ties and treatment, transportation, interest and Decatur. As timber can be secured over practically the entire L. & N. system, it is expected that additional plants will be located at the most economical points for distribution and in choosing future locations it is planned to limit the haul of treated ties to about 150 miles, which is equivalent to a transportation cost of $0.06 per tie.

The tie supply for the Guthrie plant is secured within a radius of about 100 miles. The ties are delivered along the track by the contractors and are inspected by a representative of the timber department of the railway before being loaded by the section gangs. The standard tie is 7 in. by 9 in. by 8 ft. 6 in., and the standard method of stacking in the tie plant storage yard is 1 by 9. Practically all ties for treatment are loaded in box and cattle cars.

STORAGE YARD

The new plant is located on a tract of about 70 acres in the southeast intersection angle of the Henderson division and



Layout of New L. & N. Tie Treating Plant and Storage Yard at Guthrie, Ky.

on treating plant, etc., and with an assumed life of 8 years for an untreated tie, 11 years for one treated with zinc chloride and 14 years for one treated with creosote, the zinc chloride treatment was shown to be the most economical without tie plates and the creosote with them. The present standard has therefore been changed to provide for creosoted ties on curves which are tieplated anyway, and zinc chloride ties without plates on tangents. As the cost of timber increases, the advantage of zinc chloride over creosote is reduced and it is expected that eventually creosote will be substituted for zinc chloride.

The new plant was located at the intersection of the Cincinnati-Memphis and the St. Louis-Nashville lines in order to facilitate the distribution of the treated ties over a large area. The ties will be shipped as far as St. Louis, Memphis, Louisville Memphis line tracks and directly opposite the Guthrie station. The track connections to both lines, the layout in the storage yard and the position of the buildings are shown in the accompanying plan. The grading of the yard required the moving of about 50,000 cu. yd. of material, most of which was taken from drainage ditches with a bottom width of 20 ft., which were dug along each side of the property, and the remainder from a borrow pit conveniently located. Open drains were provided across the yard at intervals of about 120 ft., and the surface was sloped 0.5 per cent towards the east side. Drains are to be put in transversely under each track in line with the open drains.

In order to secure nine months' storage before treatment, space sufficient for stacking about 450,000 ties has been provided along the yard tracks. Five three-rail tracks, averaging

about 1,650 ft. long, are spaced 73 ft. center to center, the standard gage tracks connecting by 14-deg. curves to a ladder track at each end leading to the main lines. Two narrow gage ladder tracks cross the yard at an angle of 46 deg. There are also a standard gage lead from the south ladder to the two depressed load tracks, a coal track leading to the coal trestle alongside the boiler house, and a tank car track reaching the receiving tank.

A double crossover is located between the narrow gage tracks immediately in front of the cylinders and the number and arrangement of tracks leading to the cylinders is calculated to facilitate the movements of trains of tie cars. Ordinarily the north narrow gage ladder track is used for loaded trains going to the cylinders and the south ladder track for empties going from the loading platform back into the yard for ties. The yard is laid with cinder ballast and white oak ties, 70-lb. rail being used on standard gage tracks and 58¼-lb. rail on the narrow gage tracks.

The ties are stored in piles 11 high. As many as 65 tie handlers are used to unload and stack the ties, the rate for this work being one cent per tie. The loading of treated ties is handled by the same men using skids from the trams into the standard gage cars on the depressed tracks. A tie checker and the superintendent are in charge of the operation of these tie handling gangs.

A 32½-ton narrow gage steam locomotive is used for all

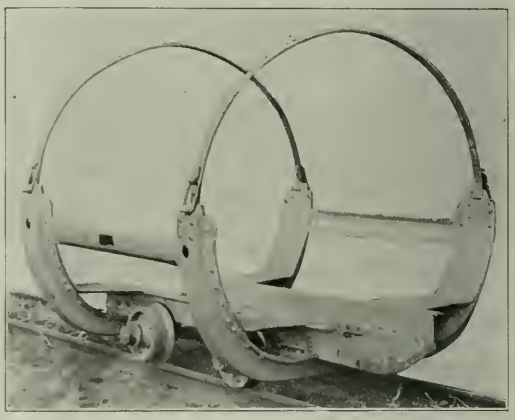
General View of the Tie Storage Yard With the Treating Plant in the Background

switching of standard and narrow gage cars in the yard. It is a four-driver Baldwin locomotive, weighing 65,000 lb. and equipped with Walschaert valve gear. It is capable of handling 12 to 14 loaded box cars. An engine pit and penstock are provided for this yard engine near the cylinder building.

The tie trams, of which there are 120, are of a new design by the Allis-Chalmers Company, providing unusual strength. The frame consists of heavy Z-bars with cast steel bumpers at the ends and mounted upon square steel axles securely bolted to the Z-bars. The arms are of cast steel consisting of a flat upper plate and a lower plate pressed into a tapering box section securely riveted together and to the frame. Additional stiffness is provided by connecting the arms to the top of the Z-bars by corrugated gusset plates. The design has been carefully worked out to provide the strongest section at the point where the greatest stress is applied. The arms are further stiffened by connecting them near the top on either side with a pressed steel brace. A flat bail and a link connecting by a locking device of malleable iron riveted inside the arm are provided, these features being patented. The wheels are provided with roller bearings and are held in place by cast iron collars secured to the ends of the axles. As the axles are secured to the frame by a single bearing there is no obstruction outside of the wheels, making it possible in case of breakage to remove any wheel without disturbing the remainder of the car.

BUILDINGS AND TANKS

The main building is 156 ft. by 58 ft., with a boiler house, 66 ft. 7 in. by 36 ft. 1 in., on one side and a test cylinder room, 12 ft. 1 in. by 32 ft., on the other. A dumping and drain tank cellar extends transversely under the middle of the building and the main floor is divided into three parts, the cylinder room, the pump room and the working cylinder room. The foundation is of concrete with reinforced footings under concentrated loads. The basement walls are also reinforced. The floor over the cellar is a 4-in. reinforced concrete slab supported by 16-in. concrete beams The floors in the other portions of the building are also of concrete 4½ in. thick laid directly on the fill. The walls of the building are of brick with Fenestra steel sash in the windows, some of which are movable for ventilation. The



Heavy Tie Tram of New Model Designed for This Plant

roof is a 3½-in. reinforced concrete slab supported by 15-in., 42-lb., I-beams and covered by a composition tar and gravel surface. A monitor of reinforced concrete construction provides additional light from the roof.

An office building of brick construction, which also includes a laboratory, is located near the main building.

The storage tanks for creosote oil and 50 per cent zinc chloride solution and the mixing tank for the 4 per cent solution are located outside the building, but immediately adjacent to it. All other tanks and equipment are contained in the building, the arrangement being unusually compact. The creosote oil storage

Side View of the Treating Plant Showing Tanks, Boiler Room and Coal Dumping Trestles

tank is 40 ft. in diameter and 30 ft. high, of standard steel construction, the roof being supported by two angle iron trusses placed at right angles to each other. Its storage capacity is 273,405 gal. The zinc chloride storage tank is 15 ft. by 15 ft., with a capacity of 18,827 gal., and the 4 per cent mixing tank adjacent to it is 20 ft. by 20 ft., holding 44,983 gal. The working tanks, which extend up through the roof of the building, are 20 ft. in diameter and 24 ft. high, each having a capacity of 53,944 gal. They are set up 7 ft. 2 in. above the floor level on a re-

inforced concrete slab supported by four 12-in. concrete walls on a reinforced concrete foundation mat.

A 4-in. air space is left between the tanks and the protective cover above the roof of the building. The heating system in these tanks, which is one of the unique features of design, consists of straight lengths of pipe extending from a manifold. Each length of pipe consists of a 1-in. live steam pipe inside a 2½-in. exhaust pipe. The end of the larger pipe is closed by a plug, the inner surface of which is rounded so that the live steam coming out in the inner pipe is directed back through the annular

End View of Treating Plant Showing Boiler Room, Cylinder Room and One of the Heavy Narrow Gage Locomotives

space around the smaller pipe. Important advantages of this system are that each line of pipe is free to expand or contract and that the pipes can be easily removed for cleaning. By carefully locating the points at which these heating pipes enter the tanks, it was made possible to draw them straight out through windows in the side of the building.

With the exception of a measuring tank 4 ft. 8 in. in diameter by 8 ft. 9 in. high for the test cylinder, which is located in the test cylinder room, all of the other tanks are arranged in the basement under the building. One of these, 7 ft. in diameter and 38 ft. 4 in. long, is used to receive either creosote or zinc chloride from tank cars standing on the track outside. Another 7 ft. by 100 ft. receives the contents of the cylinders at the com-

One Corner in the Operating End of the Pump Room Showing Arrangement of Valves and Cylinder Room Through the Opening at the Left

pletion of a change. A 3-ft. by 10-ft. drum is used for measuring the 50 per cent zinc chloride solution when transferring it to the mixing tank and a 3-ft. by 15-ft. sap drum is provided to receive the sap coming from the cylinders during the application of the preliminary vacuum.

PUMP EQUIPMENT AND PIPING

Four solution pumps are provided; one 7½-in. by 8½-in. by 10-in. duplex piston tank pump for handling either creosote or zinc chloride from the tank car receiving tank to the proper storage tank, being provided also with a 2-in. suction line to connect to the dome of a tank car if it cannot be discharged by gravity; one 12-in. by 12-in. by 12-in. Worthington tank duplex piston pump for transferring the solution from the 7-ft. by 100-ft. dumping tank to the working tank, suction and discharge lines also being arranged to connect to any of the outside tanks; and two 7½-in. by 4½-in. by 12-in. Deane oil-pressure pumps equipped with automatic pump governors for applying the pressure on the solution in the treating cylinders. There is also one Deane 10-in. by 16-in. by 12-in. duplex crank and fly wheel vacuum pump with jet condenser for exhausting the air in the cylinders before the application of the solution and one 4½-in. by 2¾-in. by 4-in. Deane duplex oil pressure pump for use with the test cylinder. No air compressor is included in the present equipment, although provision has been made in the piping system to connect up a compressor in case it should be decided in the future to use air in the treatment or for transferring the solution.

The boiler equipment consists of two 200-hp. Vogt boilers of the water tube type equipped with "Vigilant" feed water regulators. A 500-hp. Cookson open type feed water heater and two 6-in. by 4-in. by 6-in. Blake duplex center packed plunger type feed water pumps are also installed. The boilers are equipped with automatic stops and check valves. The

One End of the Pump Room Showing Type of Equipment and Piping Arrangement

boiler draft is furnished by a 100-ft. steel stack, 4 ft. in diameter. An 8-in. steam header supplies all pumps and heating coils in the cylinders and storage tanks. The coal for the boilers is dumped in a reinforced concrete hoppered chute alongside the boiler room, which is approached by five spans of reinforced concrete trestle.

The water supply for the plant is secured from the railway's pipe line at a pressure of 35 to 40 lb. The zinc chloride mixing tank and the boilers are supplied directly from the feed line and a 50,000-gal. steel tank is kept full for use in emergencies. A 16-in. by 9-in. by 12-in. Blake & Knowles duplex Underwriters' fire pump, with a capacity of 750 gal. per min., is provided, and an ample number of fire hydrants are located throughout the storage yard and around the buildings. The plant is lighted by electricity furnished by a 7½ kw. d. c. generator located in the pump room.

The piping received a great deal of study in the design of the plant, both as to the details of pipe material, valves, fittings, etc., and the arrangement of the runs to simplify as much as possible the operation of the plant. The same relative position is maintained between all pipe lines, valves, gages, etc., which are in duplicate for the two cylinders, thereby eliminating as far as possible the chance for mistakes in using the equipment. The steam and exhaust lines are of standard steel pipe with 250-lb. flanged and screwed fittings for the former and 125-lb. fittings for the latter. The steam lines include five steam traps. The

air lines are of 175-lb. flanged cast iron pipe with 250-lb. fittings and 125-lb. steel pipe with 125-lb. fittings. All solution lines 4 in. in diameter or over, and the 3-in. pressure lines, are of flanged 175-lb. cast iron pipe, all other solution lines being of standard steel. The high pressure solution lines have 250-lb. valves and fittings and low pressure 125 lb. The fire lines in the yard are of hub and spigot cast iron pipe.

Gate valves are used in all water and solution lines, and in some steam lines where it is essential that the valves be either full open or shut. Throttle valves of the globe type are used in other lines. Provision for expansion in the 10-in. pipe line leading to the 40 ft. by 30 ft. creosote storage tank is secured by inserting an 8-in. steel U-bend, and 6-in. copper expansion joints are used in the connections to the two exterior zinc chloride tanks. The problem of providing for expansion is greatly simplified by the location of the tanks close to the building.

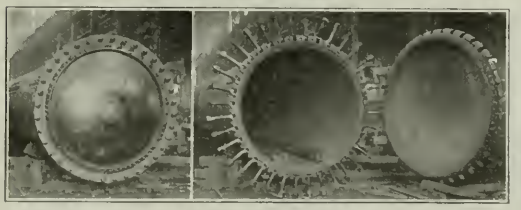
All valves in solution lines that need to be operated in treating a charge have long stems which are carried up through the floor slab over the cellar to stands which are carefully grouped to simplify the operation of the valves. All valves and indicators used in treating a charge are located within a space 60 ft. by 24 ft.

CYLINDERS

The two cylinders are each 133 ft. long and 7 ft. in inside diameter. They are designed for a working pressure of 250 lb. per sq. in., the shells being of ¾-in. flange steel. Each shell is made in 17 courses, each course being a single plate 99 in. wide. The circular seams are lapped and double riveted and the longitudinal seams are double butt strapped and triple riveted. The cylinders are supported on cast iron saddles, the one located near the center being bolted securely to the foundation while the others rest on rollers allowing free expansion.

The doors are of the built-up type, consisting of a cast steel shell frame, a cast steel door frame and a flange steel dished head riveted to the door frame. The door is secured by 36 T-head bolts resting in semi-circular grooves in the shell frame. Each bolt is secured in place by a bolt retainer fastened to the shell frame. The door hinges are designed to carry the entire weight of the door when opening and closing, and are provided with ball thrust collar bearings making the door easily operated.

The track construction used in the cylinder was adopted on account of its strength and the fact that it absolutely prevents



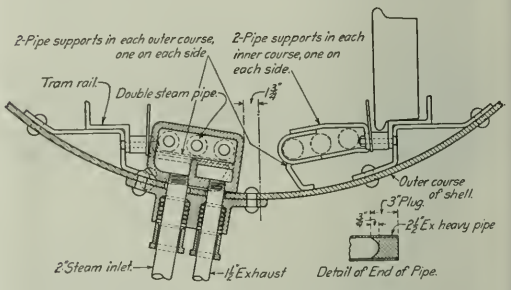
The Built-up Doors for the Treating Cylinders, Closed and Open

the derailment of cars in the cylinders. The track consists of heavy Z-bar rails mounted on pressed steel brackets riveted to the shell. The wheel is guided by a heavy steel plate bolted to the inner flange of the Z-bar and separated from it by cast iron spreaders, the height of this guide plate being such that the wheels cannot pass over it when a car is in its highest possible position.

Each cylinder is provided with a 36-in. by 36-in. dome located near the center, within which an automatic float valve is operated by a pressed steel float secured to the lower end of the valve stem. An electric indicating device is arranged on the upper end of this valve stem and properly connected to a bell or light in the pump room to notify the operator when the cylinder is full and the valve closed. This arrangement has been found to be a decided improvement over gages, indicators, or similar devices.

The system of heating the solution in the cylinder is the same as that described above for the working tanks, except that ¾-in. and 2-in. pipes are used. The manifolds are located at the center of the cylinder from which the heating pipes extend in both directions. The steam inlet and exhaust pipes are screwed directly to the bottom of the manifold, preventing leakage of steam or water in the cylinder and also preventing leakage of oil from the cylinder around the pipe connections. Two sets of pipes are provided in each cylinder, a clear space being left between them in order to make it possible to flush the cylinder to wash out any accumulation of chips, dirt, etc.

The compact arrangement of the plant makes it possible to maintain the desired temperature in the working tanks and cylin-



Detail of Pipe Arrangement for Heating Treating Cylinders, Showing Also Track Construction in the Cylinders

ders without undue loss of heat in transmission, as no long exposed pipe lines are required. In view of the consideration which was given this feature in the design, it was gratifying to find that the actual cost of heat per tie for the first three months of operation was less than 0.2 cents.

A test cylinder 3 ft. 6 in. in diameter by 11 ft. 6 in. long with all necessary piping connections is installed for experimental work which is being carried on continuously.

OPERATION

The standard method of treating is, first, to apply a vacuum of 20 to 24 in. for one hour, then without relieving the vacuum, to allow the creosote or zinc chloride to flow into the cylinder at a temperature of 170 deg. F. The pressure is then raised to 160 lb. per sq. in and maintained for six hours.

The plant is operated by an engineer, an assistant engineer, a fireman and a helper, with an assistant engineer and a fireman at nights. The charges are changed at 6 a. m. and 6 p. m. Each charge consists of 15 trams, making it possible to treat 60 trams in 24 hours, with an average of about 2,800 ties.

The design of this plant was carried out under the direction of W. H. Courtenay, chief engineer, and the buildings were designed in his office under the direction of J. A. Galvin, architect. The general arrangement of the plant and many of the details, including the piping, were worked out by John B. Lindsay, superintendent of timber treating plants, who also has charge of the operation of the plant through his assistant, H. G. Laird. The grading and concrete work were contracted to the Meacham Contracting Company, Hopkinsville, Ky., and the track work and building construction were handled by company forces. The Allis-Chalmers Company, Milwaukee, Wis., furnished and installed the cylinders; the Henry Vogt Machine Company, Louisville, Ky., furnished the tanks, and all piping and valves were supplied by the Crane Company, Chicago. Engineer, J. M. Foley, of Birmingham, Ala., installed the pumps, piping, valves, etc. Work was begun on this plant in June, 1913, and it was open for operation on March 7, 1914.

A Simplified Method for the Location of Sidings

Several Typical Problems Together With Some Important Practical Considerations Regarding the Layout

By W. F. Rench
Supervisor, Pennsylvania Railroad, Perryville, Md.

A supervisor frequently has need of a simplified method by which the curves of a siding may be laid out on the ground, either at the time the preliminary survey is made, with the object in view of showing the applicant for the siding the salient features of the location or of making notes necessary to an estimate of the grading, when a tape line layout may be the only one possible, or at a later time when the siding is about to be constructed and a transit may be unobtainable or its use inconvenient. Doubtless many cases require some instrumental work and it is then useful to know how the processes can be simplified, as the corps will generally consist of the supervisor or his assistant and a trackman or two.

It is thought that probably the greater number of cases of siding layout can be met by the use of the tape line alone. Most supervisors carry with them at all times a 5-ft. extension rule and a 50-ft. steel tape and not a few a 100-ft. length of string to correct the general line of curves. By the aid of the simple rules of geometry and with the use of the accessories mentioned, it is possible to dispose immediately of very many cases and often avoid the necessity of a subsequent visit to the location.

The matter is greatly simplified by the fact that the right of way line is nearly always parallel with the tracks and the building which fixes the location of the siding is also parallel. The siding therefore is either parallel or at right angles with the track. But even for those cases where the siding is not parallel or at right angles with a tangent main track a special solution is possible which is not unduly complicated and which can be comprehended by most maintainers of track.

It is not claimed that any new theories have been developed, but it is claimed that certain of the solutions offered are not to be found in any of the field books. Of the many which are to be found there only those have been selected which tend to simplify the supervisor's work and even to open the way for the safe handling of such problems by the brighter track foremen, not a few of whom are now entering the ranks of supervisor.

It will perhaps be thought by some that in neglecting the tangents introduced into the siding curve by the straight

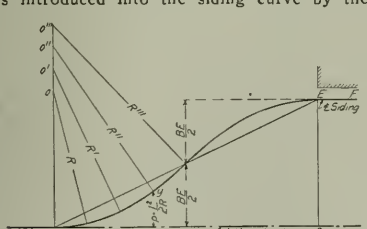


Fig. 1—A Siding Parallel to the Tangent Main Track

switch and frog accuracy is being sacrificed, but it will be found that for turnouts above No. 5 (and those below have been practically eliminated by the operation of the Safety Appliance law) no sensible error will result from this source. Stakes need not be set at either the point of switch or the point of frog, but their location should be indicated by marks on the rail and care should be taken that the half inch point of frog is always understood.

The simplest case is that of a siding parallel with a tangent main track and flanking a building, the location of which fixes the maximum offset distance. There is no practical need nor is there usually the space for introducing any tangent between the curves, but in order to render the physical conditions at the point of reverse as favorable as at the beginning and ending of the curve, it is quite advantageous to make the curves flatter at the reversing point. This may be done by using the formulae for the parabola. While this increases the length of the curve somewhat, the extension is not more than a few feet even for an extreme case.

The formulae symbolized are $p = \frac{l^2}{2R}$ and $l = \sqrt{2pR}$, or expressed in words signify that for a chosen distance from the point of the curve along the tangent, *the offset is equal to the square to the distance divided by twice the radius,* or conversely, for a chosen offset from the tangent, *the linear distance is equal to the square root of the product of the offset multiplied by twice the radius.* The field books employ these formulae for staking out a circular curve by offsets from the tangent and chords produced, the value of the offset from the chord produced being twice that from the tangent, when the distance used is a chord of the curve instead of a length on the tangent. The method is undesirable because the operation of successively producing the chords renders the process subject to cumulative error.

By the use of the formulae in the manner suggested, the distance from the end of the curve to the reversing point and from the reversing point to the point of switch may be obtained at once. These distances will be equal if the two

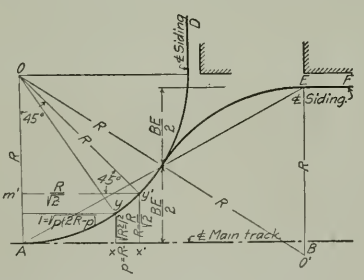

Fig. 2—A Siding Parallel to or at Right Angles to the Tangent Main Track

curves are of equal radii and the reversing point will be midway between the line of the main track and of the siding. Whether the curves be of equal radii or otherwise, this point will lie in the line joining the two tangent points. Any number of intermediate points on both curves may be set after computation of the offsets. Those for the second curve may be made supplements of the whole distance between the siding and the main track and thus all the measurements be made from an actual base line and every source of error in the field work be eliminated. It should be noted that the offsets vary as the square of the linear distance and if the distances selected are in a simple ratio, the square of this ratio multiplied by the first offset will supply the other offsets with a considerable saving in computation.

When the length of radius is not absolutely determined by

limiting conditions, as indeed seldom is the case, one should be chosen which will make the offset at the point of frog equal to the gage. This radius will be about 5 per cent larger than the actual radius obtaining through the lead, but this advantage is quite desirable both from the maintenance and operating standpoints. This solution may be used for the case of a crossover between two tracks which are parallel, but which are so far separated that a tangent between the frogs is impracticable.

If it is preferred to make the reversed curves circular rather than parabolic the formulae outlined for a continuous circular curve should be employed.

The problem of locating a siding at right angles with the main track may likewise be met by the use of offsets and with as great accuracy as the average transit instrument will supply. It is necessary in any event to adjust the detail line of the curve when finally laid, and this can best be done with a string. The formulae for offsets employed in the preceding case will not answer for the circular curve required and the proper formulae for such cases are the following: $p = R - \sqrt{R^2 - l^2}$ and $l = \sqrt{p(2R - p)}$. These symbols signify that for a chosen distance from the point of curve along the tangent, *the offset is equal to the radius minus the square root of the difference between the radius squared and the linear distance squared;* or, conversely, for a chosen offset from the tangent, *the linear distance is equal to the square root of the product of the offset multiplied by the difference between twice the radius and the offset.*

This may be used for the offsets from either end to the middle of the curve, for which point it should be noted that the linear distance is equal to the radius divided by the square root of 2, which is 1.414, and the offset is equal to the difference between the radius and this linear distance.

A test of the correctness of the layout will lie in the fact of the total measured length of the curve agreeing with the length as computed by the simple properties of the circle.

The problem when the line of the siding either converges

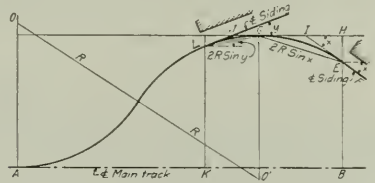

Fig. 3—A Siding at an Angle with the Tangent Main Track

toward or diverges from the line of the main track may appear to be quite complicated, but when understood becomes really quite simple. The field work necessary to a solution of such a case consists only in measuring the angle of divergence and the offset distance at the point of tangency. The problem then is to determine the position of a tangent parallel with the main track which, for the chosen radius, will make the curve pass through the point desired and be tangent to the line of the siding at that point.

The field books develop with great interest to the mathematically inclined the problem of finding the equal radii for a known position of the line joining the two ends of the reversed curve. But as the effect of such a proposition is to establish a curvature that will generally necessitate the use of special frogs it is clearly not of much use in the solution of the practical track problem.

The angle may be obtained with the tape line by laying down equal distances along the two sides of the angle and measuring the spread at the ends of such distance and by dividing the constant 57.3 by the ratio of these measurements, which it will be noted is the same problem as used in measuring the angle of a frog.

The length of chord subtending a central angle of this computed value may be found with sufficient accuracy by dividing the angle by the degree of curve. The tangent offset for this chord will be obtained from the formula in Example 1, and the linear distance by a solution of the right angled triangle in which the chord is the known hypothenuse and the tangent offset the other known side. The position of the parallel tangent and the linear distance to the point of curve are now

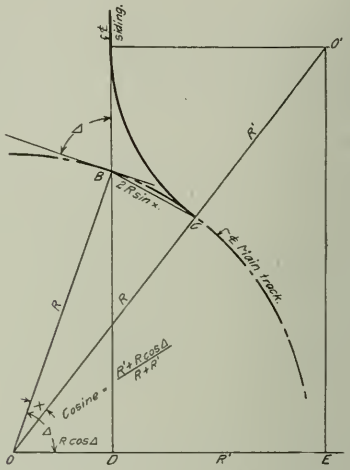

Fig. 4—A Siding from the Outside of a Curved Main Track

known and the solution of the problem becomes simply that of Example 1, except that for the diverging line a portion of the computed curve is imaginary and for the converging line a portion of the computed curve will be duplicated beyond the point of tangency with the imaginary parallel line.

The problem of establishing a connection from a curved main track requires instrumental work in measuring the angle between the siding tangent and the tangent to the main track curve at the point of intersection and of de-

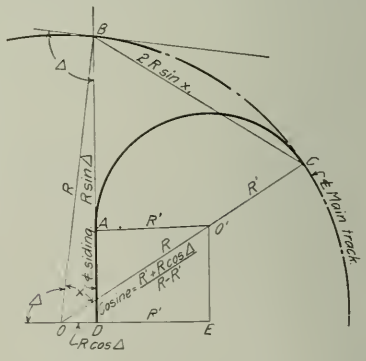

Fig. 5—A Siding from the Inside of a Curved Main Track

flecting for the several stations after computing the length of curve between the point of intersection and the p. c. of the siding curve and of the distance on the siding tangent between the main track curve and the p. t. of the siding curve. This distance from the main track curve to a possible point of tangent for the siding curve should be measured as a check on the selection of radius for the sliding curve. The choice of curves is limited to those which will permit the use of a

regular number of frog and will thus be the curvature of some regular connection plus or minus the degree of the main track curve, depending upon whether the siding is from the inside or outside of the curve.

There are six cases of this one general problem, of which the two that most commonly occur are given. The other cases include two more from the inside, in both of which the angle ⌐| is greater than 90 deg. and R^1 either greater or less than R cos ⌐|, and two more from the outside in both of which ⌐| is less than 90 deg. and R^1 either greater or less than R cos ⌐|. Each case supplies variations which the mathematical skill of the engineer will readily differentiate.

The solution of all is rendered more facile by extending the siding tangent to a normal line which passes through the center of the main track curve and intersects a line parallel with the siding tangent through the center of the siding curve. This brings the measured angle ⌐|, which it will be noticed is included between the radius of the main track curve and the normal to the siding tangent, into direct geometric relation with the two known radii. The solution indicated for the two cases may be applied with apparent modification to all the cases when the angle between the siding tangent and the radii passing through the p. c. of the siding curve may be obtained, as well as the central angle of the siding curve and the distance to the actual p. t. of the siding curve when a test of the correctness of the assumed radius will be had upon comparison with the tentative measured distance.

When it is not necessary to establish the siding curve immediately, the work may be greatly simplified by taking scale measurements from an accurately plotted plan. These will answer every purpose if the original survey was correct and

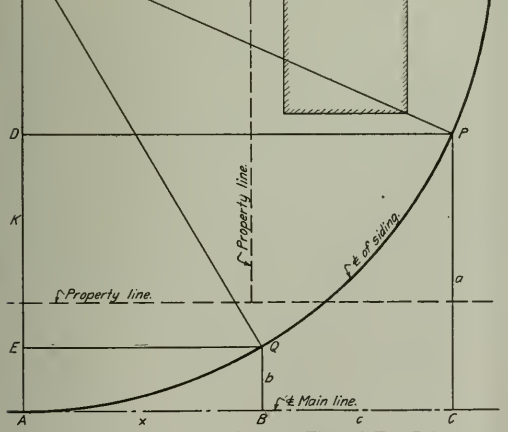

Fig. 6—A Siding Required to Pass Through Two Points

the drawing made to a scale as large as 1 in. to 40 ft., or preferably 1 in. to 32 ft.

The problem of locating a siding on a continuous simple curve which shall pass through two definite points is of very frequent occurence, as when a property corner must be avoided and farther on a corner of a building cleared. The finite problem is capable only of theoretical solution when the result will be a curve which may or may not approximate that of some regular connection. But it will generally be possible to change one or both points so that the curve of the nearest regular number of frog may be employed.

The theoretical solution is readily made by means of the geometrical relations indicated in the diagram and furnishes the two following formulae by which the radius may first be computed and if this answers the practical requirement, the distance from the point of curve to the foot of the perpendicular through the nearer point.

It will be noted that the formula for obtaining the radius has been reduced with a view of establishing the function R in its simplest form, which will be found to facilitate greatly the detailed solution. Indeed without this simplification the solution is immeasurably tedious.

$$R - \frac{a+b}{2} - \frac{c^2}{2(a-b)} = \frac{c}{a-b}\sqrt{2bR - b^2}$$

$$x = \sqrt{b(2R - b)}$$

The factor preceding the square root sign need only be carried to two decimal places and to the same degree of accuracy when squared. The remaining members may be used throughout of the nearest even whole number.

When the radius found is not of practical application, as when a radius of 375 ft. results, which lies midway between the curve of a No. 6 and a No. 8, No. 7 not being used, the problem becomes one of adjustment within the limits that are possible for changes in the two assumed points. The quarters will seldom be so close that a change of a few feet will not be practicable and in such event the choice will lie between a compounded curve and a special frog.

A solution of the extreme case mentioned will afford some hints that will tend to simplify the solutions of other problems. It should be noted that a radius within 50 ft. will furnish practical results in the use of any particular frog. Thus a radius of 300 ft. will answer for a No. 6 or 450 ft. for a No. 8. But upon the determination of the radius a computation should be made of the distance to the point where the offset distance is equal to the gage plus ½ in., and this point be used for the point of frog and a proper lead laid off to determine the point of switch, which need not be exactly at the point of curve.

Let a = 137, b = 51, c = 100; then, $R - 152 = 1.16\sqrt{102R - 2601}$

Squaring, $R^2 - 304R + 23104 = 138R - 3511$

(138) (25737)

$R^2 - 442R + 48841 = 22226$

(diff. 25737)

$R - 221 = 149$, or $R = 370$.

Changing to a = 132, b = 56, c = 100, $R - 160 = 1.32\sqrt{112R - 3136}$

$R^2 - 320R + 25600 = 196R - 5456$

(196) (40964)

$R^2 - 516R + 66564 = 35508$

(diff. 40964)

$R - 258 = 189$, or, $R = 447$ ft., which permits the use of No. 8.

Changing to a = 144, b = 44, c = 100, $R - 144 = \sqrt{88R - 1936}$

$R^2 - 288R + 20736 = 88R - 1936$

(88) (14608)

$R^2 - 376R + 35344 = 12672$

(diff. 14608)

$R - 188 = 113$, or $R = 301$ ft., which permits the use of No. 6.

PRACTICAL CONSIDERATIONS IN SIDING LAYOUTS.

The feature of clearance in siding layout is a basic one because it concerns not only the switching movements but affects also the question of safety to persons. Some roads prescribe the minimum distance from the track for structures and a few require that this limit shall be followed in the case of movable obstructions. But the addition to this minimum made necessary by the "nosing," overhang or tilt of the cars, which is a variable one, is not generally stated. Assuming that the widest car which moves in regular traffic is 10 ft. 9 in., a limit of 4 ft. 7 in. from the gage line of tangents for all obstructions would allow a margin of 1 ft. 7 in. without any correction for accidental unevenness of elevation or for swaying of the car while in motion and with a fair degree of maintenance this would render operation entirely safe.

Car design is such that in a general way the nosing nearly

equals the overhang on curves that are without super-elevation. The corrections may be readily computed for cars with 30 ft. truck centers by taking one-fourth the degree of the curve as inches of overhang and assuming that the nosing is no more than that figure and adding or subtracting whatever may be proper for the super-elevation employed. If this is 1½ in. as suggested, the tilt at the eaves of the car would add or subtract 4½ in. from the correction depending on whether the low or high side were in question. The fact should not be overlooked that at the end of the curve a correction should also be made which is one-half that for the body of the curve. The distance beyond the point of tangency to the point where correction no longer applies is about 18 ft.

The overhead clearance limit is conveniently fixed at 16 ft. above the top of rail which meets the requirements of all present equipment and probably is ample for all future design. As this clearance will not pass a man riding a car, tell tales should be placed. The least overhand clearance that will safely pass trainmen standing upon the highest cars is 20 ft. 9 in. above the top of rail.

The considerations of alinement, grade and super-elevation are other important elements in a siding layout. As a general proposition, if space is available, no shorter radius should be employed than can be operated practically by any class of engine. For most roads this is the curve of a No. 6 turnout from tangent which is 23 deg. or 250 ft. radius. This requirement is not practical in congested districts and it will often be necessary to modify the curvature to the minimum that a due consideration for safety in coupling cars will permit. This radius has been variously determined, but probably is close to that of a No. 5 turnout from tangent or a 162-ft. radius. Where sharp curvature and maximum gradient are both involved insistence should be had upon the best possible feature for each.

The allowable maximum gradient for siding connections for the best service is 2 ft. in 100 ft. and the maximum for a track upon which cars stand for unloading 1 ft. in 100 ft. It is possible to operate sidings with a gradient as great as 4.7 ft. in 100 ft., but the best drill engines cannot handle more than three loaded cars on such a gradient and the operation is therefore unprofitable. The danger of wrecks from cars running away with the possibility of fouling the main line even when derails are provided renders such a gradient highly objectionable. It is very important that all radical changes of grade in siding connections shall be eased by vertical curves, as the absence of such advantage is a frequent source of accident.

The general feature of gradient concerns the approaches to coal trestles more particularly, and is one where the road must often take a firm stand against the insistence of the applicant for more headroom. The adoption of a limiting gradient by the road many times would supply the means of combatting such demands. If greater headroom is desired it can nearly always be had by excavating the site. Any less clear height than 6 ft. 6 in. below the stringers will not permit a horse being driven through and any greater headroom than 14 ft. will break the coal or grind a measurable amount of it into dust with a considerable loss to the dealer.

The question of super-elevation is one concerning which authorities differ. It will be argued that no super-elevation is possible through the connection and therefore none is necessary beyond the connection. But the difference is that the track through the extent of the switch timbers is more rigidly secured in line, surface and gage, if tie plates be used on the timbers as should be the case, and there is less chance for distortion. It will be found that a super-elevation of 1½ in. for all siding curves is a decided maintenance advantage.

The importance of good line and surface is not fully appreciated. Very many obscure cases of siding derailment wherein the cause is given as "truck failing to curve" is really irregular line or uneven elevation. To spend money in siding maintenance is much better than spending it for small wrecks with its annoying interruption to drill work or the possibility of injury to men.

The best maintenance of sidings can only be attained by constant inspection and supervision. The track walker should go over every siding once every day. The foreman should inspect each siding in his territory twice a week. The supervisor should make a careful examination of his sidings and switches once every month and make permanent notes of what he finds. He should also require a report every two weeks from his foremen stating that he has made his inspection and calling attention to any specified repairs that may be necessary requiring material that he lacks. For the best results the foreman should not be overburdened with siding responsibility. Probably 30 switches is the most that one foreman can look after if he has main track duties also.

MOTOR CARS ON THE KATY*

By J. L. Walsh

Superintendent, Parsons District, Missouri, Kansas & Texas, Parsons, Kan.

In March, 1913, we were furnished 10 Fairbanks-Morse No. 32 motor cars at a total cost of $2,444. In the 13 months these cars have been in service they have made 80,465 miles, consuming 2,701 gallons of gasolene at a cost of $256.63, with oil and other supplies costing $75.61—making 29.9 miles per gallon of gasolene.

When these cars were put in service on the Kansas City division the number of sections was reduced from 16 sections of six miles each, to 12 sections of eight miles each. During the 13 months ending June 1, 1914, our total cost of track labor on sections, including wages of foremen and laborers, was $36,497.15, while for the 13 months previous to the use of these cars the expense was $39,823.95, showing a saving with the cars of $3,326.80. Deducting from this amount the cost of the cars leaves a net saving of $882.30. It is, therefore, conservative to figure that our saving on the 10 cars now in operation will amount to $3,000 per year.

This saving of $3,326.80 has enabled us to maintain a tiling gang in maintenance work. Outside of the tiling gang the use of the motor car has enabled us to maintain the Kansas City division without the use of an extra gang, and we believe the track conditions on that division are considerably better than they were last year, even though our heaviest power has been in service on the division since May, 1913.

In addition to the real money saved in the operation of these cars, probably the largest saving is effected in going to and from work as under ordinary conditions the cars will make a speed of 20 miles per hour, enabling the men to start to work fresh from 30 to 45 minutes earlier than they would on the hand car, and permitting them to work the same length of time longer in the evening. The total saving thus effected is represented by 13,134 labor hours, amounting to $1,970.10, which amount alone would pay for the cars in 15 months.

There are many instances where we have been able to double up section men for work that would ordinarily require an extra gang, and which would be very expensive if we attempted to double up gangs with the hand cars. As an instance of the value of motor cars, I will cite the case of a serious derailment which damaged the track and a high trestle. We were able to get four section and one bridge gangs to the scene four hours before the wrecker arrived, during which time the track and bridge were made safe for the passage of trains, so that we were able to open up the main line in one hour after the wrecker arrived, we thus saving a detour to one of our fast passenger trains which we would have had to make, had it not been for the motor cars.

Another great advantage of the motor car is the fact that we are able to keep a full quota of section laborers on each section, as the motor car relieves them of the hardest work trackmen are called upon to do. In the event of storms, the motor car acts as an incentive for section men to patrol their track, which

*An abstract of a paper presented at an operating department staff meeting held at Galveston on June 22 and 23, 1914.

otherwise might not be done. Another advantage is that the foreman can leave three of his men on a piece of work and go over his section with one man. The same is true in going after water, or material needed, all of which amounts to considerable saving when it is not necessary to use the entire gang.

These cars will accommodate 10 men, together with the track tools, and they have handled a push car with from 25 to 40 ties with comparative ease. With the aid of a push car we are able to handle 20 men in extra gang work, enabling the gang to get to work sooner, and work longer per day, thus saving many labor hours.

While the motor car promotes economy and efficiency in track work, probably a greater efficiency and economy obtains from their use by bridge gangs. We had in use by a bridge gang a Buda motor car No. 19 equipped with a free-running engine which gave perfect satisfaction. We found that it was possible to eliminate four moves of the bridge outfit per month, the average move being about 25 miles. As the outfit consisted of six cars, or about 150 tons, and as the transportation expense of handling freight on this district is 0.027 cents per ton mile, we were able to save on this item alone $486 per year. A further saving of 20 hours each month to trains handling bridge material will amount to $65 per month, or $780 per year. With the aid of a motor car in a bridge gang, we can operate with one man less, making a saving in wages of $648 per year, or a grand total of $1,914 per year, while the cost of the car is a trifle above $300. With the aid of a push car we can handle four 30-ft. stringers, together with the men and tools. A great deal of money was also saved by distributing gang over 20 or 25 miles doing small jobs that would be very expensive if handled in the old way.

RAIL FAILURES STATISTICS FOR 1913*

By M. H. Wickhorst
Engineer of Tests, Rail Committee, American Railway Engineering Association

This report deals with the statistics of rail failures for the year ending October 31, 1913, furnished by various railroads of the United States and Canada in response to a circular sent out by the American Railway Association. The information furnished by each railroad showed the number of tons laid of each year's rolling from each mill and the total number of failures that had occurred in each year's rolling from the date laid until October 31, 1913. Heretofore only the failures occurring in the year covered by the report were shown, but in this report the total failures occurring since the rail was laid are made the basis of comparison.

The tonnages of rail represented by these statistics are shown below:

Year rolled	Bessemer	Open-Hearth	Total
1908	282,945	156,120	439,065
1909	432,155	461,261	893,416
1910	564,713	828,111	1,392,824
1911	276,933	646,809	923,742
1912	80,146	939,025	1,019,171
1913	63,472	793,557	857,209

FAILURES CLASSIFIED BY MILLS

For the purpose of determining the failure performance of the rails furnished by the different mills, the statements were first grouped between Bessemer and open-hearth steel. They were then grouped by steel mills, and each mill's tonnages grouped by the year the rail was rolled. Totals and averages were obtained for each of these groups.

Failures of Bessemer and Open-Hearth Compared

Year rolled	Failures per 10,000 tons		Comparative failures	
	Open-Hearth	Bessemer	Open-Hearth	Bessemer
1908	268.9	302.1	100	112
1909	109.0	212.4	100	195
1910	57.6	132.1	100	229
1911	37.4	94.2	100	252

*Abstracted from Bulletin 170 of the American Railway Engineering Association, just issued.

The rails for 1912 and 1913 are not included in this comparison, as they are probably too young for the comparison to be as reliable as for the older rails. Comparing the different years, the failures per 10,000 tons of open-hearth rails are proportionately much larger for the year 1908 (approaching the number of Bessemer failures), and this suggests the thought that there were faulty practices in the early rollings of open-hearth rails that were improved upon in later years.

In order to show the relative number of failures from each of the mills and to show the ranking of the mills as regards the failure performance of the rails rolled by them, the following table has been prepared. Taking the average number of failures per 10,000 tons of all the mills in any year's rolling as 100, the relative number of failures of each of the mills is shown for the years 1908, 1909, 1910 and 1911. The later rollings are not included because of being too young.

Bessemer			Open-Hearth		
Mill	Rank	Relative failures	Mill	Rank	Relative failures
Maryland	1	56	Colorado	1	20
Cambria	2	71	Tennessee	2	26
Lackawanna	3	89	Lackawanna	3	52
Illinois	4	89	Pennsylvania	4	58
Carnegie	5	161	Maryland	5	76
Algoma	6	191	Carnegie	6	96
			Illinois	7	107
Average		100	Cambria	8	136
			Bethlehem	9	210
			Algoma	10	312
			Dominion	11	539
			Average		100

The "100" given as "Average," it should be understood, is not obtained as the average of the column below which it appears, but is taken to represent the failure performance of the tonnage covered by these statistics of all the mills during the four years represented and for Bessemer and open-hearth rail separately. The "Relative Failures" give the number of failures that occurred in the same tonnage that had 100 failures as an average of the rails of all the mills.

A striking feature noticeable in this comparison is the very large differences between the different mills, especially in the open-hearth steel, some of which can be attributed, probably, to differences in the service to which the rails are subjected, but this can be only a partial explanation.

COMPARISON OF SECTIONS, WEIGHTS AND POSITIONS IN THE INGOT

A retabulation was made of all the failure reports with special reference to the matter of performance of different sections and was divided into three groups as follows: Thick base, high rails, or the A. R. A. type A group; thick base, low rails, or the A. R. A. type B group, and thin base, or A. S. C. E. group. The results indicate that the various types of section have about the same failure tendency, although on account of the differences in service no definite conclusions can be drawn as to the different types of section. The thin-base rails showed a somewhat larger percentage of failures as base breaks and broken rails, although the failures per 10,000 tons were about the same.

Comparisons were made of failures by weights of rail, but definite conclusions as to the failure performance of different weights of rail probably cannot be made from these statistics because of the difference of service to which the light and heavy rails are subjected. The comparisons indicate that the weight of rail per yard does not greatly influence the failures per 10,000 tons.

A comparison of the rails from the different ingot positions indicated that, as a general average, the failures classified as head failures of the "A," or top rail, were 2.7 times the failures of the other rails of the ingot in Bessemer steel and 1.8 times in open-hearth steel. In the failures classified as base breaks and broken rails the different rails of the ingot showed about the same failure tendency, or a little less in the "A," or top rail.

A comparison of rails made of steel treated with titanium with those of plain steel showed that in some cases the treated rails gave fewer failures per 10,000 tons than the plain rails,

and in other cases the plain rails gave the smaller number of failures. As a general average the titanium-treated rails gave somewhat less failures per 10,000 tons.

The tables showed that, after a period of service of five years, as a general average, about 1¼ per cent of the rails were reported as failed.

ROADMASTERS' ASSOCIATION COMMITTEE ASSIGNMENTS

The following subjects for investigation on which reports will be made at the 1915 convention of the Roadmasters' & Maintenance of Way Association were selected at a recent meeting of the executive committee. The personnel of the committees assigned to this work are also given.

New and Experimental Track Accessories and Tools: William Shea (C. M. & St. P.), chairman, J. W. Dahl (N. Y. C. & H. R.), J. O'Connor (M. St. P. & S. S. M.), D. O'Hern (E. J. & E.), Emmet Keough (C. B. & Q.) and George Beckingham (G. T.).

Proper Organization of Section Forces and Methods for Maintaining and Policing Track. Sub-committee No. 1, For High Speed, Heavy Traffic Railroads: M. E. Eagan (N. Y. C. & H. R.), chairman, H. Ferguson (G. T.), A. L. Kleine (A. T. & S. F.), W. P. Murn (N. P.), J. E. McNeil (A. T. & S. F.), David Mau (C. M. & St. P.) and L. C. Ryan (C. & N. W.). Sub-committee No. 2, For Light Constructed Railroads Carrying Heavy Traffic: J. Buel (A. C.), chairman, J. W. Fletcher, Jr. (Car. & N. W.), William Wharry (G. T.), H. A. Buel (C. M. & St. P.), George Corcoran (C. & N. W.), E. W. Gulley (C. R. I. & P.), and B. F. Harrison (C. R. I. & P.). Sub-committee No. 3, For Large Terminals: G. H. Brooks (St. L. T.), chairman, David McCooe (G. T.), F. E. Crabbs (C. & N. W.), William Lawrenz (C. & E. I.), A. M. Anderson (C. M. & St. P.), J. P. Corcoran (C. & A.), M. Griffin (C. R. R. of N. J.), and T. F. Donahoe (B. & O.).

ABSTRACT OF ENGINEERING ARTICLES

The following articles of special interest to engineers and maintenance of way men, and to which readers of this section may wish to refer, have appeared in the *Railway Age Gazette* since October 23, 1914:

Licenses for Engineers.—The arguments formulated by D. F. Crawford of the Pennsylvania Lines West against the bill for licensing engineers which is now being prepared by a commission of the Pennsylvania state legislature were commented on in an editorial in the issue of October 30, page 782.

The New Kansas City, Mo., Union Passenger Station.—The new passenger station used by all roads entering Kansas City, Mo., which has just been completed at a cost of about $11,000,000, was opened for traffic on November 1. An illustrated description of this building and the accompanying facilities was published in the issue of October 30, page 799.

The Jersey City Passenger Station Improvements.—A unique problem in passenger terminal construction has been solved by the Central Railroad of New Jersey in the improvements recently completed at its Jersey City station, where all passengers are transferred between trains and ferry boats. A large increase in capacity has been secured by building a new two-story ferry house, enlarging the concourses and rearranging the station building. This work was described and illustrated in the issue of November 6, page 860.

Construction of the New York Connecting Railroad.—The 10-mile line which is being built at an estimated cost of $30,000,000 to connect the New York, New Haven & Hartford in the Borough of the Bronx with a point in Brooklyn opposite the Greenville yards of the Pennsylvania for freight traffic and with the East river tunnel line of the Pennsylvania for passenger traffic, was described and illustrated in the issue of November 13, page 888. This line includes an arch bridge over the Hell Gate which is the longest arch span ever built, a considerable length of high viaduct, and other important structures.

New Alpine Tunnel Pierced.—The last wall of rock was brought down in the tunnel from Montiers, in France, to Granges, in Switzerland, on the morning of October 28, the engineers from the two sides meeting at half-past four amid cheering.

AN UNUSUAL FAILURE OF A CREOSOTED PILE

In the construction of a turntable in the Brownwood, Tex., division yard of the Gulf, Colorado & Santa Fe recently, it was thought advisable to drive piles under the foundation as there was no rock within reach. This yard is laid on a fill of 5 to 8 ft., the natural surface being bottom land which proved to be very compact and to offer great resistance to the driving of the piles. The piling furnished for this work was removed in 1913 from the Galveston bay bridge, where it had been driven in 1895. The timber was long leaf yellow pine which had been preserved by the marine treatment, consisting of steaming and the injection of 24 lb. of creosote per cu. ft. When this bridge was dismantled the best of the piles were pulled and saved.

These piles failed during driving at Brownwood and were later dug out and replaced by concrete. The condition of one of these piles after its failure is shown in the accompanying photograph. The point bears practically no evidence of battering, although at a distance of about 3 ft. from the point the wood fibers have been distorted, splintered and compressed longitudinally until the diameter was increased to nearly 4 ft. This tearing of the fibers shows that the preservative treatment was of the best, and the condition of the wood as to decay has remained excellent. The only plausible explanation of the failure is that the pile penetrated the natural ground for the length which is undamaged, and that the failure occurred at the level dividing the ground and the filling material.

Creosoted Pile that Failed by Brooming About 3 ft. from the Point

The Trans-Australian Railway.—The latest report concerning the East to West Transcontinental Railway which the Australian government is constructing between Port Augusta in South Australia and Kalgoorlie in Western Australia shows that 231 miles of earthworks have been completed and that the rails have been laid for 225 miles.

Constructing Embankments with Suction Dredges

The Burlington Has Constructed Three of these Large Dredge Outfits to Rebuild Line Along the Mississippi

The Chicago, Burlington and Quincy is now engaged in the reconstruction of its line and the building of a second track between Savanna, Ill., and St. Paul, Minn., a distance of 280 miles. This line follows closely the east bank of the Mississippi river for the entire distance and for the greater part of the way is closely hemmed in by high bluffs on the east and by the river on the west. It was built in 1885 with a maximum grade of 0.3 per cent and maximum curve of 3 deg. In reconstructing this line the grade is being reduced to a maximum of 0.2 per cent and the curvature to 1 deg. While the reduction in grade has not introduced any serious problems, the establishment of this low standard of curvature has made necessary some very heavy grading work.

Since the old 3-deg. line followed the river closely it is evident that a 1-deg. line must either cut heavily into the projecting bluffs or cross the numerous bays of the river. The decision between these alternative locations depended largely on the type of construction equipment to be employed. After making detailed surveys, the river line was adopted. The work has been carried on continuously since 1910 until now the second track is about half completed. It is costing from $25,000 to $75,000 per mile and will require the expenditure of about $13,500,000 for the entire line.

Over 12,000,000 cu. yd. of embankment lies in the river or immediately adjacent to it in addition to the excavation and

The Old Line and a Completed Cut Off Built by a Dredge

other embankment work on the main land. This large amount of river work has prompted the construction of three complete suction dredge outfits by the railroad, which are now being operated by its own forces. The first one with a 15-in. suction pump was completed and placed in service in 1910 and was described in the *Railway Age Gazette* of August 25, 1911. The following year an 18-in. dredge of the same general design was built, while the third, with a 20-in. pump, was placed in service last year. Considerable dredge work is also being done by contract. As these three company dredges have all been in operation for more than one entire season, it is possible to gain a fairly accurate idea of their performance.

The first essential for economical dredge operation is good material to handle. Mud or very fine sand deposits slowly on the bank and a large portion is carried off with the water, while coarse sand or gravel is readily retained on the bank. Accordingly the river channel or slough adjacent to the work is first sounded to determine the character of the material in the bottom. The dredges are then located where they may secure the greatest proportion of heavy materials, readily working down stream as the embankment is completed and the material in the river bottom gives out or is exhausted. Under good working conditions about 20 per cent of the material pumped consists of solids, while about 35 per cent of the working time of the dredges is consumed in necessary delays.

Another factor limiting the output is the length of the discharge line. While this naturally depends on the distance from the beds of good material to the bank, it is kept under 2,000 ft. whenever possible, although the 20-in. dredge has pumped through a line over 3,000 ft. long. When starting work at a new

Completing a 300,000 cu. yd. Embankment at Lynxville, Wis.

location the discharge is directed on the center line of the proposed embankment until the fill appears above the water, when the discharge end of the pipe line is turned lengthwise along the bank and the water is conducted over the end to give the material an opportunity to deposit, the end of the bank being built ordinarily on a 6:1 or 8:1 slope. The sides of the bank are built to the desired slope of 2:1 by the use of sheet iron shields 10 ft. long and 24 in. high. As the bank is brought to the desired grade it is leveled off by the bank gang during the intervals when the dredge is not working. No side or top shrinkage is added since the material is deposited wet. These embankments are being built 34 ft. wide on top for double track. As they are completed, track is laid along the outer edge and the outer face, which is exposed to wave action of the river, is pro-

The 20-in. Suction Dredge

tected with a 3-ft. coating of riprap or bluff debris loaded in the vicinity by steam shovels.

Another source of delay is occasioned by the necessity of moving the dredge as the material is exhausted. The 20-in. dredge can reach 37 ft. below the surface of the water and can pump within a radius of 250 ft. without stopping operations. Beyond this distance pumping must be stopped while the boat is being moved.

These dredges were formerly operated with two 12-hour shifts, although the shifts have since been reduced to 11 hours to enable minor repairs to the dredge to be made without the resulting

delay to the men. The regular force employed on each shift on the 20-in. dredge consists of a foreman, 6 men on the dredge, and 15 men on the bank. The bank, pontoons and dredge are lighted at night by electricity generated by a steam turbine driven dynamo on the boat.

While it is difficult to compare the yardage of material handled by these dredges because of the influence of local conditions of material, length of discharge line, size of embankment, etc., the performance of last year is fairly typical of the results which have been secured. Two sets of yardage figures are kept. The gross yardage is estimated and includes all material pumped, while the net yardage only includes that between the specified slopes. It is found that the gross yardage normally exceeds the net by about 30 per cent, owing mainly to the amount of material deposited outside the slopes and principally below the water line where the sand assumes a slope of 3:1 or even flatter. The 20-in. dredge, working in poor material, pumped 445,000 cu. yd. gross measurement or 316,000 cu. yd. net measurement in 149 working days last year or an average per day of 2,100 cu. yd. net. The corresponding total net yardages for the 15-in. and 18-in. dredges working 174 and 187 days, respectively, were 362,000 and 507,000, making a total net yardage for the three dredges last year of over 1,185,000. The total net yardage of the three dredges this season up to September 1 is 800,000. One of the accompanying photographs shows the 20-in. dredge 2 miles north of Lynxville, Wis., before the discharge line and pontoons were in place, preparatory to starting work on a 400,000-yd. embankment, while another shows the 18-in. dredge completing a 300,000-yd. embankment at Lynxville, Wis.

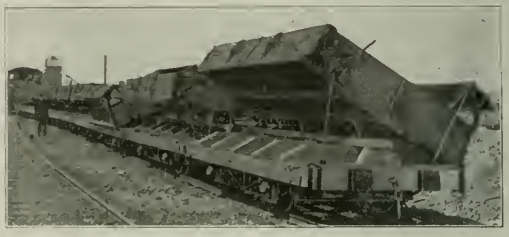
The most important advantage of the dredges for this work is the reduction in cost of the yardage handled. The cost of building a construction trestle and bringing material in by steam shovel and work trains would have made this location prohibitive in cost and would have required that the line be located closer to the bluff with the resulting difficulties with rock slides, bluff debris and storm water. As handled at present the dredges are depositing the material from 25 to 50 per cent cheaper than it could be placed by steam shovels on a line located for steam shovel work. Other advantages are that no work trains hauling material are required on the main line while the ballast is not damaged by the dropping of sand or dirt from passing construction trains. Also, more yardage can be deposited in a given time in this way than by steam shovels, while there is no shrinkage or settlement of the banks.

AN IMPROVED SIDE DUMPING CAR

A wooden side dumping car that has been under development in the shops of the Hecla Mining Company for the last two years, and used on the Calumet & Torch Lake Railway for one year, has been placed on the market by the Calumet Car Company, Houghton, Mich. The car, as it is now built, has a capacity of 9 cu. yd. It is 17 ft. long from coupling to coupling, and weighs 10,500 lb. It is of simple construction, which reduces both the original cost and the maintenance. Several of these cars have been in constant use from 6 to 12 months, and it is said that no repairs have been necessary.

The truck of this car is of the ordinary four-wheel type with a spacing of 7 ft. 6 in. between axles. The frame is of wooden construction and supports a central longitudinal bar 4 in. by 11½ in. in section and 14 ft. 10 in. long, to which the body of the car is fastened and about which it rotates in dumping. The body is 8 ft. 8 in. wide, 14 ft. long and 20 in. deep. The angle of repose of the car when in the unloading position is 30 deg., which was found from experiment to be sufficient for the easy discharge of coarse material. It is planned, however, to adjust the height of the car to the required angle for easy and quick discharge of any class of material.

The side boards are fastened to the ends of the body by sector shaped castings in such a way that they are pushed outward and upward when the car is dumped, affording ample room for discharging the load and eliminating all friction between the load and the side board. The side board is held up in dumping by vertical rods attached to the frame, as shown in the illustration. The end boards of this car are beveled and the side boards fit up snugly when in normal position. One man can operate the car. The lever that holds the car in normal position is equipped with a locking device which prevents it from being jarred out of place and permitting the car to be dumped thereby. There is also an automatic locker on the side to prevent any portion of the load escaping while the



A Train of Calumet Dump Cars

car is in its normal position. Another improvement on this car is the automatic locker for holding the load bed in a tilted position while dumping. This device consists of catch hooks fastened to the under side of the body, opposite hooks being connected by an operating rod and spring which holds them in a position to engage with keepers that are fixed to the frame, when the car is tilted to a dumping position. This is useful when the material is moist and does not run out readily. It is also planned to construct the frame of the car of steel and to use air for unloading.

ANNUAL TRACK INSPECTION ON PENNSYLVANIA LINES

The annual track inspection of the Pennsylvania Lines West of Pittsburgh was made on Tuesday, Wednesday and Thursday, October 6, 7 and 8, inclusive. The inspection party, as customary, consisted of the general manager and his staff, including the chief engineers maintenance of way and their assistants, the general and division superintendents, the division engineers, assistant division engineers and supervisors of the system, traveling on six special inspection cars. Meals were served in special commissary cars at stopping points en route and sleeping car accommodations requiring three trains were carried for the entire party. The inspection covered the main line of the Fort Wayne from Pittsburgh to Chicago and of the Pan Handle from Chicago to Pittsburgh.

The first prize for the best supervisor's subdivision, based on line and surface, was awarded to Charles McCarthy, supervisor of the Logansport division at Union City, Ind., while the prize for the best supervisor's subdivision based on all points was awarded to Simon Clary, supervisor of the Pittsburgh division at Carnegie, Pa. The prize for the best track foreman's section, based on line and surface, was awarded to P. S. Crawford, section foreman on Mr. McCarthy's subdivision of the Logansport division. In addition to these three prizes, others were awarded to the track foreman on each supervisor's subdivision having the best section, based on all points.

The Shantung Railway of China.—It is officially announced in Tokio that the Shantung Railway, which has been in the hands of the Japanese since the beginning of October, is still in their control, despite constant Chinese efforts to effect a dislocation.

A Discussion of the Common Forms of Rail Failures

Describing the Various Types of Failures Generally Encountered With Their Causes and Means of Detection

By F. E. Weymouth
Engineer of Tests, Maryland Steel Co.

The logical classification of rail failures seems to be one that places them under headings descriptive of the manner in which the failures develop or occur in service. A classification of these various types leads naturally into a study of the causes. A description of the *causes* of rail failures, however, involves a detailed study of each failure, and it is usually the case that two or more causes contribute to the ultimate failure of the rail in service.

CRUSHED HEAD FAILURES

Under this heading are placed all rails that indicate a "flattening" of the head or a breaking down of the head structure.

This type is sometimes given the term "split head" as are many of the "crushed head" rails from which a piece has been split off. Rails with this type of failure are also very frequently termed "piped" rails by the trackman. While the term "piped" may serve the trackman very well, it suggests that this type of failure comes from the presence in the rail of unwelded surfaces of an original cavity (called a "pipe") of the ingot. If this were true the term "piped" would be preferable to "crushed head," but very few failures are traceable to this cause.

"Crushed head" rails in track are readily detected in three ways. First, the widening out of the head is very apparent in track. Second, a dark streak appears in the center of the top of the head of the crushed portion, indicating that a portion of the metal is depressed and is not receiving the usual brightening from the wheels. Third, the distortion or breaking down of the head structure can be detected by a fishing template or by the appearance of a rust streak under the head. This type of failure develops very slowly in service and can be readily detected in its earlier development.

The question naturally arises, Does this type of failure occur in unsegregated steel? and our answer must be, "unfortunately yes." To investigate this type of failure a machine was designed at our plant with the purpose of reproducing the condition of the wheel loading that we get in service. Unsegregated rails have been tested in this machine and it has been found possible to develop "crushed heads" in any rail. The rapidity with which the crushing develops under this test is dependent upon the weight applied and the number of passes given.

To further answer this question of the occurrence of "crushed heads" in unsegregated steel, we can refer to the reports covering the rail failures on all the principal railroads of this country. Of 3,864 rails that failed from "crushed heads," 2,398, or 62.06 per cent, were from the top portion of the ingot, where we may expect segregation, and 1,466, or 37.94 per cent, were from the center and lower part of the ingot, where there is no segregation.

Mention was made of the misuse of the term "pipe." A "piped" rail is one in which the sides of the original shrinkage cavity (called a pipe) in the ingots are found pressed closely together in the rail. Cutting open the section we find that the walls of the cavity are not granular, but smooth, thus showing clearly that these two surfaces have always been separate and distinct.

Another means of differentiating between true pipe rails and true split heads is in the location of the opening in the rail. The opening of a split head is almost always confined to the head, while a true pipe is confined to the web, extending very little into the head. In some few cases we find a true split head running into a pipe, but these cases are very rare indeed.

*Abstract of a paper presented before the New England Railroad Club on November 10, 1914.

FLOW OF METAL

This term is used to describe rails that show a "rolling out" or flowage of the top metal of the head toward the sides, without a breaking down of the head structure. Flowage of the top metal occurs in many different forms. The most prevalent failures of this type are those rails that show flowage at the ends of the rail. While it may be true that under severe traffic conditions the design of the joint is of great importance, our observations have been that by far the great majority of failures of rails at the ends are due to loose bolts at the joint.

One of the most annoying types of "flow of metal" to the trackman who desires a smooth riding rail is that which has been given the term "flowed in spots." A sloughing off of the top metal in several spots with the subsequent breaking off of the flowed metal causes what is sometimes called "roaring" rails. These spots appear on the gage corner of the head. A satisfactory explanation of this type has not been evolved, but intense localized wheel pressure which stretches the metal beyond the elastic limit is one of the main causes.

The effect of slipping drivers and of sliding wheels is very marked in the development of rails that fail from "flow of metal." In both cases the top metal of the head is overheated and cooled quickly in the same manner that a piece of steel is hardened by heating and quenching. Failures of rails from "Flow of Metal" cannot be classed as being in any way dangerous failures, but may be a starting point for the development of splits and breakages.

BROKEN RAILS

Under the heading "Broken" rails we include all rails that show cracks or splits of any kind, as well as those rails which have broken across, separating them into two or more parts. "Broken" rails are the most important class in our study of rail failures, since it is the rail that gives way suddenly in track that is the most dangerous.

In looking over the statistics of wheel loads for the last few years, and comparing them with the number of flange breaks, we find that the increase in "flange breaks" goes hand in hand with the increase in wheel loads. By "flange breaks" we mean the breaking out of a piece of the flange, usually over a support. These pieces usually take the shape of a crescent and are often termed "crescent shaped flange breaks."

It has been stated by some investigators that at least 60 per cent of all rails that failed from breakage across the section are the result of flange breaks. Some go even further and give 90 per cent, but while our investigations do not show as high a percentage as 60 per cent, it is important to note that flange failures will undoubtedly greatly weaken the rail section, and we may expect breaks across the section at any point where the rail section is so weakened. Failures of this type are due to one part of the flange carrying more of the load than the other part; in other words, by an uneven bearing of the flange of the rail.

The claim is often made that flange breaks are the result of lack of transverse ductility in the rail accompanied by the presence of seams. We must remember that a rail is one of the rolled shapes which does not receive any rolling in the direction at right angles to its length. The crystals or grains are elongated and knitted together in the direction of rolling, while the cohesion between the crystals or grains transverse to the rolling is necessarily less. This lowering of the ductility when we break a rail in the direction of its length is a natural consequence

of its manufacture, and its tendency to cause flange breaks must be overcome by some other means than changing the method of rolling.

Seams are very prominently mentioned by some investigators as the main cause for "flange breaks." A critical examination of a large number of "flange breaks" shows that many of these pieces do show distinct seams, while in many others the seam would only be visible under a microscope, and in very many cases no seam whatever is present. Seams are elongations of small cracks formed in the early passes in rolling the ingot, and even with the utmost care and best practice known, they are bound to occur in the steel. It is safe to state that no rail has ever been rolled by any manufacturer, at any time, that was absolutely free from seams.

Maintenance conditions play a very important part in the occurrence of breaks across the section. The surface or vertical alinement is of utmost importance. Weights and speeds of locomotives and the method in which these weights are imposed upon the rail are also important factors in the stresses in rails.

Within the last few years a type of failure called the "transverse fissure" has come to our notice. This name is given to a fractured rail section that shows smooth dark or silvery spots in the head, while the rest of the metal is granular. In track this type of failure seldom gives any warning. The "transverse fissure" is found on the fractured surface usually without any connection with the outside skin of the rail, indicating that it is an internal fissure that radiates from a nucleus. No satisfactory explanation of the cause has as yet been evolved. As yet "transverse fissures" have not been found in rails that have not been in service. They occur, for the most part, on the gage side of the head, indicating that they are developed at the places of greatest strain. The large majority of these failures occur in steel that is high in carbon. Failures of this type are not confined to any proces of manufacture, or to any one mill, but some mills are practically free from these "transverse fissure" rails.

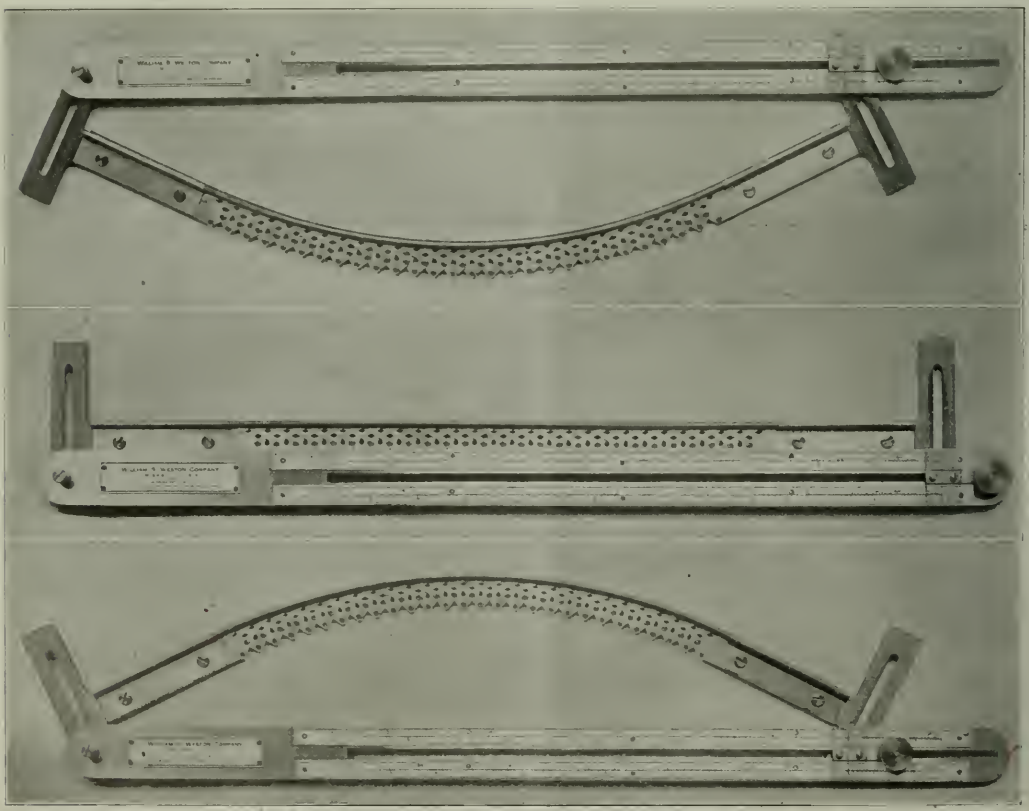
BREAKS IN WEB

Breaks in the webs of rails usually occur at the bolt holes. By far the majority of the breaks occurring at bolt holes are due to loose joints. When a joint is allowed to become loose a leverage is set up, which, combined with the severe blow due to the joint being loose, may easily cause the breaking out of a piece, or a longitudinal split in the web. It is the writer's opinion that low joints due to loose bolts contribute more broken rails at the bolt holes than any other one cause.

Very rarely we find cracks occurring longitudinally in the web at the bolt holes. The cause of this occurrence has not been satisfactorily explained, but blows from a spike maul, and excessive alternate bending, either in cold straightening or in track, may be contributory causes.

AN ADJUSTABLE ARC RULER

A new drafting instrument known as the adjustable arc ruler has been patented and is now on the market which is intended to replace an entire set of curve templets commonly used in railway drafting offices. It is designed for drawing



The Concave, Straight and Convex Positions of the Adjustable Arc Ruler

short arcs of circles of any radius over 3½ in., and can also be used to draw long arcs, replacing a beam compass, by locating auxiliary points on the curve not farther apart than the length of the instrument, through which successive sections of the curve can be drawn. It is claimed that the instrument is accurate for all practical requirements little short of the limit of hair line tests with a rigid compass.

The instrument can be used with either a concave or convex ruling edge, as shown in the illustrations, a change from one form to the other being made by sliding the scale bar and its bearings in the slots in the T-shaped end plates from one limit to the other. This shifting of the scale bar can be easily and quickly accomplished with the thumb and index figure of each hand as a preparatory movement in the act of setting the gage plate of the scale to the radius required. The scale bar carries separate lines of graduation on highly polished celluloid for the convex and concave ruling edges so arranged that the scale to be used is always the one nearer the ruling edge.

The lattice shaped curving member, which in the instrument now on the market is 10 in. long, maintains the regularity of the curve automatically by a mechanical movement. The fundamental principle of this construction is illustrated in the accompanying diagram. The flexible curving member consists primarily of two light steel ribbons about as heavy as watch springs placed edge to edge, a series of inclined arms attached rigidly to one ribbon, a series of oppositely inclined arms attached to the other ribbon and pivotal connections between the free ends of the oppositely inclined arms.

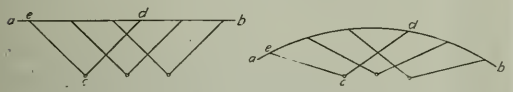


Diagram Illustrating Construction of Arc Ruler

The line a-b in the first figure represents the steel ribbons one above the other, the line c-d inclined to the right, represents arms rigidly attached to the upper ribbon, while the line c-c inclined to the left represents the arms attached to the lower ribbon. The ribbons are free to have a relative longitudinal movement. When the instrument is adjusted for a convex curve as in the second figure, the upper ribbon is moved toward the right so that the bases e-d of the triangles e-c-d are all an equal amount longer than in the first figure, and as the arms are rigidly attached to the ribbons, the latter are necessarily curved. As the arms are all of equal length, the relative movement of the ribbons produces a uniform change in all the triangles and accomplishes the automatic regulation of the curvature. With the exception of the steel ribbons the instrument is almost entirely of German silver. It is being manufactured and is for sale by the William S. Weston Company, 1431 Marquette building, Chicago.

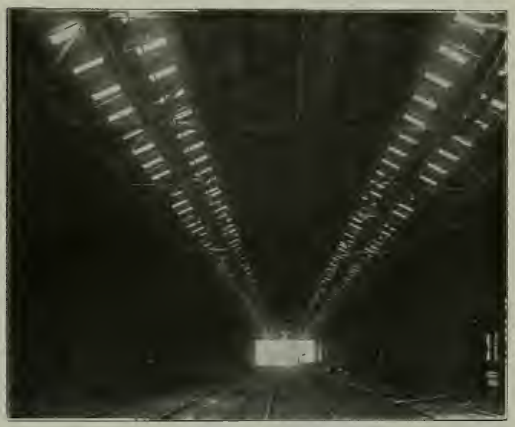
A CORRECTION

In the article entitled "The Present Status of Ferro-Titanium in Rail Manufacture," published on page 750 of our issue of October 23, the statement was made that only one heat out of 31 treated with titanium and tested for segregation exceeded the maximum limit of 12 per cent, fixed by an important eastern road. In the same sentence, however, it was stated that the maximum variation in the 31 analyses was 11.5 per cent, which proves the inaccuracy of the statement which followed. In the earliest reports of these tests, from which the article was first written, this maximum variation slightly exceeded 12 per cent. When the figure was corrected later we omitted to strike out the remainder of the sentence, although this doubtless caused little misunderstanding on the part of careful readers.

The concluding sentence in this article, stating that the results secured were not necessarily conclusive because of the small number of rails available for comparison, was also liable to misinterpretation, as it referred only to the Santa Fe tests, while the other tests referred to were more comprehensive, and therefore more conclusive.

CEMENT TILE ROOFING

A large installation of cement tile, which illustrates well the adaptability of this type of roofing to special forms of construction and to harmonious effects with elaborately planned architectural details, is a feature of the new Union station at Kansas City, Mo. Approximately 1,000,000 sq. ft. of surface has been covered by this tiling in the new building and train shed, a special plant being built at Kansas City to manufacture the tiles.



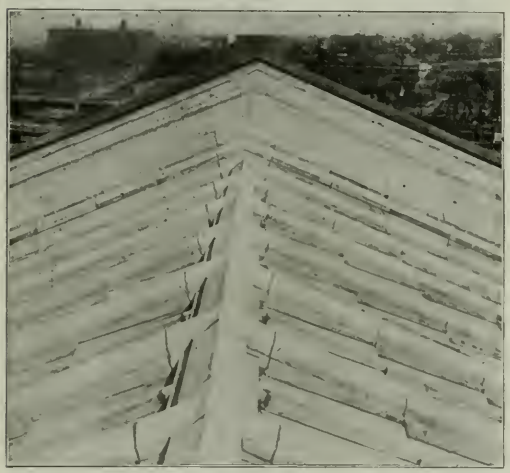
Interior View of a Building Lighted by Wire Glass Insert in Federal Cement Tile

Portion of the Train Shed at Kansas City Station Showing Vertical Tiles Along Right Side of Smoke Duct

The details of the tiles used on the building were designed by Jarvis Hunt, the architect who prepared the plans for the station, the object being to secure the effect of a cut stone roof. This effect was further obtained by making the tiles of a gray color, instead of the red ordinarily used, in order to match closely the sandstone walls of the building. As the station roof is pitched, no waterproofing coat over the tiles was necessary.

In the construction of the train shed, tiles 1½ in. thick, 24 in. wide and about 7 ft. high were placed vertically along the edges of the 15-ft. 6-in. opening over each pair of tracks. These tiles are supported by lugs on the outside resting on the roof. A portion of the roof over these sheds is also covered with cement tiles about 24 in. by 48 in. in size, covered by a composition roofing.

This installation was made by the Federal Cement Tile Company, Chicago, sub-contractors under the George A. Fuller Construction Company, Chicago. The former company has placed cement tile roofs on many important buildings, including a number for railway companies, which are reported to be giving very satisfactory service. The standard red tiles for pitched roofs are made by a special process which combines other ingredients with Portland cement to form a material which it is claimed is waterproof, fireproof, and not subject to corrosion from sul-



Portion of the Roof of the Kansas City Station Building Showing Special Cement Tiles Designed to Imitate a Cut Stone Roof

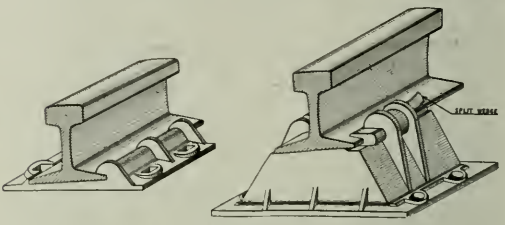
phurous gases. Each tile covers an exposed surface 24 in. by 48 in., and is ⅛ in. thick. The reinforcing metal is carefully imbedded in the cement to prevent corrosion. The tiles interlock by means of lugs on the underside and are joined by an adjustable roll sealed with elastic cement. Federal tiles for pitched surfaces are also made with an insert of wire glass 12 in. by 24 in., which interlocks with the standard red tile for top lighting. An installation of these tiles is illustrated herewith.

In addition to the advantages of permanence and absence of maintenance costs, the use of cement tiles effects a saving in steel construction to support the roof, which in the case of the Kansas City installation is estimated at 25 per cent as compared with a solid concrete slab roof.

One of the important large installations of these tiles on railway buildings is at Gary, Ind., on the general shops of the Elgin, Joliet & Eastern. Eight buildings, including the locomotive and car repair shops, paint shop, oil house, machine shop, power house, etc., were covered with Federal cement tiles six years ago, and the roof is reported to be giving the best of satisfaction now.

A CANTED RAIL BRACE AND TIE PLATE

To eliminate the necessity of elevating the outer end of the tie and the shoulder of the roadbed on curves, the Track Specialties Company, New York City, is now placing on the market a canted brace plate and tie plate. With this device all ties are laid level in the ballast and the outer rail is elevated the desired amount on curves by means of this type of chair, which is securely fastened to the tie by spikes and



Two Types of Canted Rail Braces and Tie Plates for Different Degrees of Super-Elevation

which in turn holds the rail by means of a split wedge. These chairs are made in varying heights to give the desired elevation for any degree of curve and speed of trains. They are also designed for all standard rail sections. The wedge holding the rail is driven against the traffic to retard creeping. These plates are made of malleable iron.

A UNIQUE PUMPING STATION

An automatic pumping plant has recently been completed by the Pittsburgh, Fort Wayne & Chicago at Verner, Pa., to supply water to the railroad shops at Washington avenue, about a mile away, and to the locomotives and the passenger station at Federal street in the old city of Allegheny. The plant is unusual in the construction of the pump house, and in the fact that

Interior of Pennsylvania Pump House Showing Motors and Controllers

the three rotary centrifugal pumps with which it is equipped have a larger capacity than any similar pumps heretofore installed by the Pennsylvania Company.

The station is located on the bank of the Ohio river. The pump house is a brick structure, circular in shape and 32 ft.

in diameter, with foundations of reinforced concrete surrounding a water well. This foundation is 40 ft. in diameter, and was sunk to rock 24 ft. below the water level in the Davis island pool. The foundation, which is in reality a concrete caisson, was sunk in a single piece, being fitted at the bottom with a steel cutting edge and loaded with 1,000 tons of rail. Under the circumstances a cofferdam could not have been constructed in this location. Cast iron gratings are placed in the walls of the concrete substructure to admit water.

An intake crib 96 ft. long and 16 ft. wide, made of 2 in. by 12 in. planks, was sunk in the river and filled with gravel to act as a filter for the water passing into the intake pipes which lead to the pump house. The bottom of the crib is 21 ft. below pool level. Two 24-in. intake pipes are provided, which were assembled on shore and floated into place. In order to accomplish this, the ends were plugged with wood in order to make the pipes watertight, and when they had been floated into position, water was permitted to enter through a hose until the pipes had sunk to the bottom of the river. The wooden plugs were then removed by a driver.

The three electrically operated centrifugal rotary pumps each

Circular Pump House on the Ohio River at Verner, Pa.

have a capacity of 1,000,000 gal. of water a day. Two of them will be used continuously, the third being held in reserve in case one of the others should be out of service. Space is provided in the pump house for two additional pumps if they are required. The electric power used to drive the pumps is transmitted from the Washington avenue shops. The motors are direct connected to the pumps by vertical shafts, being set above high flood water line, 26 ft. above pool level. The pumps are located a few feet above pool level, being submerged during floods and operating equally well whether submerged or not. They are driven at a speed of 1,200 revolutions per minute.

The water is pumped from the station through a 14-in. supply pipe to two 100,000-gal. steel tanks on the bluff about 300 ft. above the pumps. The starting and stopping of the pumps is controlled by an automatic electric device depending on the elevation of the water in the tank. The cast iron supply pipe on the hillside is now being encased in concrete, this work being made difficult by the rocky, precipitous face of the bluff. The distributing pipes from the tanks are 12-in. cast iron.

The entire work of building the pump house, crib, tanks and pipe lines was handled under the supervision of R. Trimble, chief engineer maintenance of way, Northwest System, and the pumping machinery was designed and installed under the supervision of T. W. Demarest, superintendent of motive power.

P. & L. E. CLASSIFICATION YARD LIGHTING

The lighting of a classification yard presents a special problem because of the long, narrow lanes between rows of freight cars, which are darkened by shadows unless the light is properly dispersed. An effective installation of lighting in such a yard was recently made by the Pittsburgh & Lake Erie at McKees Rocks, Pa., just outside the city limits of Pittsburgh. This yard contains about twenty tracks extending for approximately one half mile.

The sources of light are eight Cooper Hewitt quartz lamps, mounted on steel towers, as shown in the accompanying illustration. The lamps are rated at 2,400 candle power, with an energy consumption of 726 watts, resulting in an efficiency of .3 watts per candle. Direct current at 220 volts is supplied to the lamps from the company's power plant located nearby.

The towers are 12 ft. square at the base, 100 ft. high, and are

General View of the P. & L. E. Yard at McKees Rocks Showing 100-ft. Steel Towers Supporting 2400 Candlepower Lamps

spaced about 400 ft. apart in two rows, one on each side of the yard, which is approximately 225 ft. wide. Each lamp is suspended from a short mast arm which extends out over a platform for the attendant, access to which is had by means of a ladder mounted on the side of the tower. A chain and a cut-out, however, permit the lamp to be lowered from the ground, thus obviating the necessity of the lamp attendant climbing the tower.

As the quartz burners have a life of several thousand hours, and the globes are at such a height as to be out of the smoke zone, almost no cleaning or other attention is required. The light given by these lamps enables the men to see with proper clearness, not only every track and car, but also the switches at the head of the yard. The illumination is such that one may readily read a newspaper at night. The absence of shadows and glare greatly facilitates the movement of the cars throughout the yard by permitting the exact location of each to be easily determined, and also tends to prevent accidents.

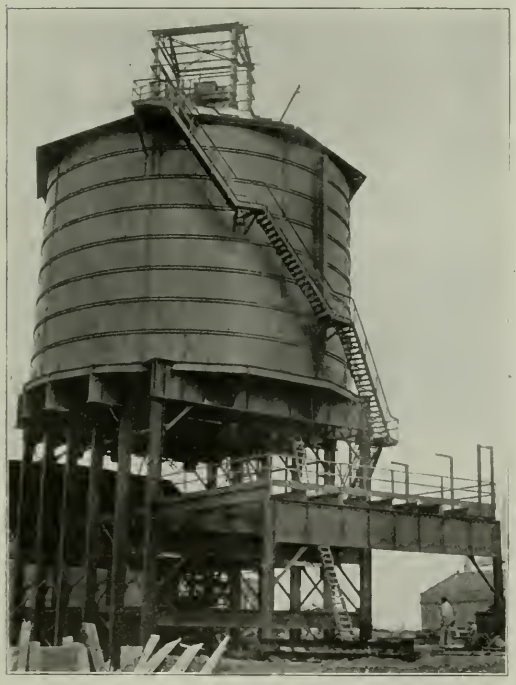
In addition to the increased speed in handling cars gained through the better lighting, conditions are made much easier

for the men returning on foot to the hump as they are enabled to avoid incoming cars, switches, posts and other obstacles. The fact that the lamps are mounted at such a height permits an excellent distribution of the light which possesses an inherent color value that is particularly suitable for outdoor illumination. Another feature that peculiarly adapts the quartz lamp to this field of lighting is the steadiness of the light.

This installation was made under the direction of D. P. Morrison, electrical engineer of the P. & L. E.

CONCRETE LINING FOR STEEL BUNKERS

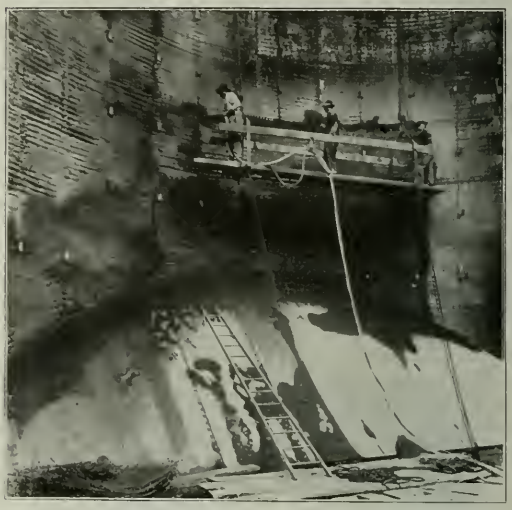
The ability to place a coating of concrete over a steel surface with the cement gun has been utilized by the Minnesota Steel Company, Duluth, Minn., in lining a large circular steel tank used for supplying coal to its coke plant and also for lining a row of parabolic coal bunkers. This lining was adopted in connection with the steel tank as the best and most economical solution of the problem of storing coal containing small percentages of sulphur without damage to the tank from the corrosive action. Such a structure is said to be less expensive and lighter than one of reinforced concrete and the character of the material placed with the cement gun insures a continuous non-porous surface which it



A 2,100-Ton Coal Bunker Lined With Concrete

is difficult, if not impossible, to secure by placing concrete by hand.

The circular tank is approximately 55 ft. in diameter and 40 ft. high, with a capacity of 2,100 tons of coal. The 33 parabolic bunkers are approximately 20 ft. wide, 12 ft. deep and 17 ft. long. A layer of 5 in. of concrete is used in the large tank and 2 in. in the bunkers. A layer of triangular mesh wire cloth was placed in horizontal bands over the inner surface of the tank, being secured to vertical rods attached to iron lugs provided at numerous places in the surface of the tank. The mesh was held away from the steel approximately ¾ in. The first layer of "Gunite," which is the name applied to the material placed with the cement gun, was deposited through this mesh serving to hold the wire cloth in place and to cover and protect the steel plate thoroughly. A second layer of Gunite was then placed to bring the total thickness to 5 in. In the case of the parabolic bins, where the drop of the



Placing a Concrete Lining in a Large Coal Bunker With the Cement Gun

coal against the sides and bottom could never be great, a 2-in. lining was considered sufficient.

The work of lining these tanks was carried out by The Gun-Crete Company, Chicago.

STRENGTHENING THE TRANSCONA ELEVATOR

The work of moving back into position the storage of bins of the Canadian Pacific elevator at Transcona, near Winnipeg, which settled to an angle of 27 deg. from the vertical on October 18, 1913. As described in the *Railway Age Gazette* of April 18, 1913, both the handling house and the storage bins were supported on a reinforced concrete mattress. The usual tests indicated sufficient strength in this type of construction to carry the load without the necessity of sinking piers to bed rock, and confidence in this plan was increased by the fact that other elevators in this vicinity have been erected in the same way without mishap.

When the settlement of the bins occurred, the low corner of the foundation mattress settled to a point very much below the mattress of the handling house, but fortunately the latter structure was not disturbed sufficiently to cause any movement in it. Before the work of underpinning and straightening the bins could be undertaken, however, it was necessary to secure the handling house. This was accomplished by first sinking shoring piers to rock outside the main structure, on which timber shores were placed which were calculated to carry a very large proportion of the total weight of the building. The underpinning of the columns of the handling house was then undertaken by cutting through the mattress in the panels between columns and drifting in to points under the centers of the columns and there sinking piers to rock by the "Chicago" method.

After this underpinning of the handling house structure had been advanced sufficiently to make its stability absolutely certain, work was begun on the straightening of the bins. The bin

structure weighs about 20,000 tons, consisting of five rows of circular bins with 13 in each row. The final underpinning consists of five rows of piers with 14 in each row located under the contacts of the bins. Before any movement was allowed to take place, piers were sunk underneath the low corner of the mattress to avoid any possibility of the structure sinking further into the ground. On the high side a general excavation was made to a point about 15 ft. below the high corner of the mattress for the full length of the building. By the use of a belt conveyor placed along this excavation which delivered into the elevator at the north end, the excavated material was removed at a minimum cost.

After the low corner was made secure, work was undertaken on the other foundation piers, at the same time loosening up the supporting ground under the high side of the structure and allowing it gradually to sink back towards a plumb position. This method was followed until the structure reached an angle of 18 deg. from the vertical, when a series of solid oak rockers was introduced in the mattress on top of the middle line of piers. Jacks or shoring screws were placed underneath the low side, working on top of the piers that were in place, and by jacking up the low side and removing earth from under the high side the structure was gradually brought back until it was 8 deg. from the vertical when another line of oak rockers was introduced on the next line of piers east of the middle. This was done in order to give the structure an additional lift, which when it was brought into the vertical position, would leave the bottom of the tunnels above the natural ground water level.

During the settlement of the elevator the north end dropped about 5 ft. lower than the south end on account of the ground being somewhat softer at the north end and the supporting ground at the south end being prevented from flowing, due to the location of the work house. This inclination has been allowed to remain in straightening the elevator, as there is no loss of efficiency, convenience of operation or safety. The structure has been lifted above 12 ft. during the process of straightening, this movement being accomplished without any damage to the structure. The method adopted for straightening the elevator has proved efficient and very economical as compared with the cost of taking down the old structure and rebuilding it. This work was handled by The Foundation Company, New York, in conjunction with the engineering officers of the Canadian Pacific, lines west.

EDUCATIONAL WORK AMONG EMPLOYEES IN THE MAINTENANCE OF WAY DEPARTMENT

By J. T. Bowser

Maintenance of Way Department, Queen & Crescent Route, Danville, Ky.

The value of educational work among railroad employees has long been recognized. In the mechanical and transportation departments there are apprentice schools, reading room courses of various kinds, and lectures on safety and efficiency. In the maintenance of way department very little has been done along this line, due perhaps to the fact that the employees of this department are so widely scattered. That much good can be done in an educational way among this class of railroad employees can hardly be questioned, but the methods employed in these other departments are not altogether practicable in the maintenance of way department, while their cost would probably be prohibitive.

I will set forth a few ideas which if carried out will be both practicable and inexpensive. Of course, anything of this nature must be entirely elective, and it will be said that the average section, extra gang, or bridge and building foreman has hardly enough time to do what is required of him, much less to give much attention to something that is entirely aside from his work. But the average foreman does read a little, and, by giving him something to read which will be of value to him, an interest may possibly be stimulated which will awaken an intelligence which has become dormant in the rut of the routine of daily work.

The division head of the maintenance of way department on any railroad, with the co-operation of an intelligent and interested chief clerk, can organize an inexpensive system of educational work which will be of value to his subordinates. In the average division office two or three railroad or technical magazines may be found which, when read by the subscriber, are usually discarded or left on file for possible reference. Frequently one section of these magazines is devoted to the maintenance of way department and questions are discussed in such a manner that they may be readily grasped and understood by anyone interested in this class of work. These magazines can be forwarded to the foreman at one end of the road, with instructions attached to forward to the foreman next to him on the line when he has finished reading it, and so on over the entire road. These instructions can be gotten out by mimeograph and so worded as to apply to any literature which may be sent out. Copies of speeches, lectures, and even advertising matter, having more or less to do with railroading, which are constantly being received in the division offices, have their educational value and may be sent out in this manner. Articles of especial interest should be marked so as to be readily located.

Some discretion must, of course, be used in selecting the class of employees to whom a certain magazine or other piece of literature is to be sent. Literature having more strictly to do with bridges, buildings or concrete work should be sent to bridge and building foremen, though, when the interest of a section or extra gang foreman is really aroused, he will be interested in this also. Many will say that not one foreman in twenty will read this material, or if they read it, they will receive no practical benefit from it. What if only one in twenty does read what is sent him? It has made one better employee and has lost nothing.

It may not require much mental ability to tamp a tie or to frame a bridge timber, but if we are to supply the crying need for intelligent and resourceful foremen and supervisors, we must add a little variety to the mental food of those from whom we draw this supply. Give the track foreman something beside track and the bridge and building foreman something beside structures. The employees should be encouraged to ask questions personally or by mail, and if the office or the head of the department cannot answer all of them, a little effort on their part will secure the desired information and both parties will be benefited. Inquiries should be answered promptly so as not to discourage the questioner. All questions should be treated seriously, for an inquiring mind is often very sensitive to the least suggestion of ridicule. If, in the opinion of the head of the department, an inquiry can be better explained or answered by personal interview, the questioner should be summoned to the office and the matter thrashed over thoroughly. This personal attention will encourage him and many questions which might never have come up in correspondence may be discussed in a few minutes. Foremen should be encouraged to make trips over the road and see what others are doing, and especially to look over any interesting or unusual work which may be going on, and, briefly, a policy of interest and encouragement should be adopted to supply the food to keep the interest alive. Like any other innovation, it will have its scoffers, but the spirit is contagious, and results that are well worth the trouble and the slight expense will be obtained. Such a policy will create among the employees an increased respect for themselves and for their position. It will stimulate ambition, increase mental ability and vastly improve the quality of the material from which supervisors or other minor maintenance of way officers must be selected.

Hostile Aircraft and English Railway Trains.—The following notice has been posted in the London & South-Western trains: "In view of possible attacks by hostile aircraft it is necessary that the blinds in the carriages of all railway trains should be kept down after daylight. Passengers are requested to assist in this direction."

Boring 100,000 Ties by Hand With Simple Apparatus

A Description of the Manner in Which This Was Accomplished in a Short Time Without Special Equipment

By C. W. Lane
Supervisor, Timber Treating Plant, Baltimore & Ohio, Green Spring, W. Va.

The Baltimore & Ohio desired quick action in securing 100,000 treated ties, adzed and bored, for use with screw spikes on a special form of tie plate. A costly betterment of road was nearly one-half completed when the decision was made to use ties of this character, consequently no delay in furnishing the material could be permitted.

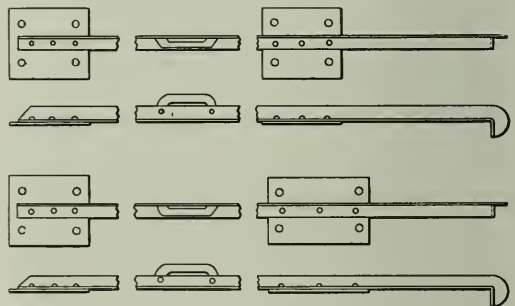
Of course, bored ties must be bored before treatment, and as the road operates a treating plant at Green Spring, W. Va., it was decided to adze and bore the ties at this plant. The road owned no boring and adzing machine, yet the cost of the work had to be kept down. It was plain that adzing the ties would be the most expensive part of the process and it was decided to eliminate this feature entirely by using only sawed ties, of which an adequate supply fortunately was available.

Plenty of air pressure at 100 lb. per sq. in. was to be had at the plant and it was determined to bore the ties by using small portable air motors capable of driving a ⅝-in. bit 6 in. into the wood. In one portion of the tie plant yard a standard gage track was paralleled by a narrow gage track 40 ft. away. It seemed logical, then, to load the sawed ties on

The Three Skidways on Which the Ties to Be Bored Were Handled

flat cars in the yard, deliver them at one end of a rude skidway built between the standard and narrow gage tracks, bore them on a rough platform at the narrow gage end of the skidway, and load them on trams to be run into the cylinders for treatment.

In all such enterprises the adjusting of the little details of arrangement and apparatus means the ultimate success or failure of the project, so as a first step some little thought was given to the form of skidway upon which the ties were to be handled. The first skidway built was in the form of a rude trestle work, sloping from a height of about 2½ ft. above the floor of a standard gage flat car to the level of the boring platform which was at the height of the arms on the narrow gage tram cars. This skidway is shown at the left in one of the accompanying illustrations. After this skidway was completed the cost of labor and material entering into its construction was deemed too high and a cheaper method of building these skidways was sought. There were some piles of ties ready for treatment between the narrow and standard gage tracks at this place and in building the next skidway one of these piles was taken down to a level slightly below that of a flat car floor. Rails were then laid across this level crib-work of ties and a boring platform erected at the narrow gage end at the level of arms on the narrow gage tram cars, as before. This is the middle skidway shown in the illustration. This proved a fairly cheap construction, but for the third and last skidway built three 67-lb. rails were used at the height of a flat car floor and the arms on the trams, the rails being supported by simple crib-work of ties, as shown in the foreground of the illustration. It is well to



The Templet Used in Boring Intermediate and Joint Ties

note here that the first or sloping skidway proved to be the more efficient inasmuch as ties could be fed faster to the men doing the boring, which meant, of course, that the work could be done a little cheaper.

The sawed ties having been picked up in the yard, loaded on flat cars and delivered on the skidway, the next step was the marking of the places where the holes were to be bored.

A Close View of One of the Skidways Showing the Inspection, Marking, Boring and Loading of Ties

This was done by using a template made of iron with holes exactly corresponding to the holes in the tie plate that was to be used. There were two of these templates, one for joint and one for intermediate ties, constructed according to the accompanying sketch. The joint ties had to have four holes bored for each tie plate, while the intermediate ties had to have only two holes for each plate. The little hook

on one end of the template was hooked over one end of the tie and thus determined the distance from the end that the holes were to be bored; this was known as the "line end" of the tie.

Two men performed the operation of marking the ties for boring. The template was first properly placed in position and then the men marked the places by driving a hand punch through the holes in the template with a wooden mallet. One little detail was quickly worked out which added greatly to the success of this part of the work. The punches were first made fast to a stiff spring which was in turn fastened to the template and which kept the punches out of the holes until struck. Instead of having to pick up and insert the marking punch in two or four holes and strike two or four blows with the mallet, according to the template used, one smart blow on the spring marked the whole set of holes. This little change naturally pleased the laborers and meant more output, which is only another way of saying "more money for the men at a cheaper rate for the company."

The ties having been marked were pushed along the skidway to the men who did the boring. The little air motors, driving the boring-bits, were suspended from a sort of walking-beam or old fashioned well-sweep, pivoted overhead so that it could move up or down, or in a horizontal direction, as desired. As the motors were too heavy to handle steadily all day they were counterbalanced by weights placed on these walking-beams. The bits with which the boring was done were fitted with stops to insure the holes being bored to the exact depth desired, which in this case was 6 in.

After the ties were bored they were immediately loaded on trams, stamped, checked, reported and sent to the treating cylinders.

In any statement of costs the particular conditions surrounding each bit of work bear directly on the unit-price, and the following prices are given as fairly well suited to the locality where this work was done, but with a full understanding that cheaper or possibly higher rates might fit the situation in other places. It cost 1½ cents per tie to sort out and load ties in the yard and ½ cent per tie to deliver them properly piled on the skidway.

A gang could bore 600 intermediate ties in 10 hours. The two men marking and pushing ties to the boring-platform and the two men doing the boring received 1½ cents per tie divided equally. These four men earned then about $2.25 per 10-hour day per man. The two men loading trams received ¾ cent per tie or $2.25 each for 600 ties. This made the total cost for an intermediate tie 4½ cents.

A gang could bore 400 joint ties in 10 hours. The rate for marking and boring these ties was 2¼ cents per tie, but the men loading the trams received the same rate of ¾ cent per tie because they could be loading other trams at regular yard rates during the time they had to wait for the slower moving joint ties to be bored. The total cost per joint tie was therefore 5 cents. A portion of these costs should not be included in the bill against adzing and boring by hand, because these same ties would, in the natural course of events, have to be picked up for treatment which would cost something, varying at the different plants, say, approximately 1½ cents per tie. This leaves then as the cost chargeable strictly to this work 2¾ cents for the intermediate ties and 3½ cents for the joint ties, which is entirely prohibitive as compared with work done by a modern adzing and boring machine, but is not necessarily prohibitive when a comparatively small number of ties are needed, as in this instance, to form a component part of a costly project.

The initial cost of an adzing and boring machine properly installed, of a sufficient size to take care of the requirements of a fair sized road, would probably be $15,000 to $18,000, including, of course, the buildings and grading necessary. In this instance, the installation of such a machine could not be considered inasmuch as speed and immediate delivery of the output were vital.

DIFFICULT TRACK MAINTENANCE

The track maintenance in the New York subway is of interest to maintenance men because of the very dense traffic on these tracks which, among other things, gives a very short interval of time between trains in which the men can work. Regardless of these frequent interruptions, the tracks must be in condition for the passage of trains whenever necessary. The question of safe-guarding the men at work in so limited a space, either from coming in contact with each other or from an oncoming train, and yet to work them to the best advantage, is a difficult one in itself. Some very interesting points in this connection were brought out in a paper read by O. O. Dixon, assistant engineer, Interborough Rapid Transit Company, before the New York Railroad Club on October 16, 1914. The following abstracts are taken from the paper:

When relaying rails under traffic, a gang consists of about 18 to 20 men. The work involves the withdrawing of the spikes, taking off the joints, cutting out the bonds, the removal and replacement of rails and rebonding. One rail is removed in from one to two minutes. From 1:00 a. m. until 5:00 a. m. 33 rails can be renewed on curves of local tracks. The intervals between trains on local tracks during these hours is 7½ minutes. On the express tracks, where there is no traffic during the hours mentioned, 65 rails can be renewed on curves, and more on tangents.

The men are protected by two caution lights placed 500 ft. away from the gang, and a man with a red light within communicating distance of the gang. In pulling the spikes between the third rail and the running rail a shackel bar is used. The ballast in front of express stations is taken out and renewed about every two years, and at local stations every five years. Few ties have been renewed, except at switches and on curves where they have split due to frequent rail renewals, also where they were decayed due to dry rot. In making tie renewals, one rail is removed and all new ties installed for a rail length.

In the initial installation 100 lb., 33-ft. rails were used with joints staggered and spliced with 24-in., four-bolt angle bars. On curves the same construction was used, with the addition of an inclined guard rail which was bolted to the lower rail about every three feet, using adjustable cast iron separators to take up the wear. The curves were laid to 4 ft. 8½ in. gage, and the flangeways varied from 1¾ in. to 2¼ in., depending upon the degree of curvature. It was soon found that the guard rail was so flexible that it concentrated the pressure on the bolts, causing frequent breakages, and when the bolts held the wheels were allowed to sideslip between them, causing considerable corrugation. In view of these facts this light guard rail was replaced by one of the same section as the running rail, having one flange sheared off. The adjustable separators were replaced by one-piece separators to give the correct flangeway, also the gage of track was slightly widened on sharp curves, depending on the radius. Later, the rails on the high side of a curve having a radius of 700 ft. or less, were further reinforced with malleable iron tie plate rail braces placed on every other tie, also shoulder tie plates and cast iron rail braces were installed to support the guard rail and relieve the strain on the guard rail bolts. Under existing conditions of traffic it is necessary to use as many as four anti-creepers per rail to prevent the traveling of the rails. Owing to the frequent rail renewals, screw spikes have not been used to any extent because of the time and difficulty involved in pulling them.

Damage to the Ottoman Railway of Asia Minor.—The secretary of the Ottoman Railway from Smyrna to Aidin has announced that a severe earthquake occurred in the Sparta and Bouldour district of Asia Minor on October 4, and damaged the roadbed in several places, although operation was resumed in less than 24 hours. Two stations and other buildings have been seriously damaged, but it is estimated that the total cost of repairs will not exceed $45,000.

General News Department

In a fire at Galveston, Tex., November 17, the Southern Pacific elevator was destroyed, together with 909,000 bushels of wheat; loss $1,500,000.

E. L. Tinker, secretary of the Central Safety Committee of the El Paso & Southwestern, has resigned that position and the duties have been taken up by R. P. Kyle. Headquarters at El Paso, Tex.

It was announced in Canada, November 13, that regular trains would begin running on the National Transcontinental Railway between Moncton and Levis this week. A train will run each way three times a week.

The Atchison, Topeka & Santa Fe, on November 10, had the largest commercial freight loading in its history. A total of 5,229 cars were loaded on the entire system that day, compared with the previous record of 5,204.

The St. Louis & San Francisco has announced that on November 10 train auditors were removed from all passenger trains on the system, and their duties are now performed by the conductors. The order is said to be a part of the company's general retrenchment policy.

The New York State Civil Service Commission announces examinations to be held December 12 for the position of inspector of equipment, for the Public Service Commission, First district (New York City). The salary will be from $900 to $1,200 yearly. The commission desires to get men who have had six years' experience in car house or car shop work.

Fairfax Harrison, president of the Southern Railway, speaking at Atlanta, last week, said that the severe retrenchment made necessary by the falling off in traffic would be continued, even to the extent of depriving passengers of some of the luxuries and conveniences which they have been accustomed to. The gross receipts of the railway company in September were 8.33 per cent less than in the same month of last year, and in October the decrease was 18.75 per cent. Curtailment of expenses has been necessary, in some cases, as a "war measure," even where it was uneconomical to make the reduction. Both the officers and the employees of the company have to stand serious losses. He believes that the present severe stress will be temporary and new construction work, provided for by capital which was raised last spring, has not been suspended.

Complete official figures show that the majority given by the voters of Missouri against the full crew bill was three times as great as was shown in the estimate based on the early returns; 324,085 votes against and 159,593 in favor, a majority of 164,492 in opposition to the bill. This makes the vote more than two to one against the law. Outside of the three principal cities, St. Louis, Kansas City and St. Joseph, the measure received only 86,660 votes in the state, and was beaten by a ratio of about three to one. The farmers in every section of the state voted almost solidly against it. St. Louis, in which the Brotherhood looked for a big majority in favor of the bill, went against it by 18,417. In Kansas City and in St. Joseph it was carried. The majority against the bill is one of the greatest in the history of Missouri and is larger than the state has ever given to any candidate.

Increased Passenger Fares in Eastern Territory

The Pennsylvania and the Philadelphia & Reading have filed with the Interstate Commerce Commission new passenger tariffs, to go into effect December 15, which advance the rates for many long distance interline tickets and abolish round trip tickets for local travel. Despatches from Washington indicate that changes, like these, and others of smaller amount, are to be made by all the principal roads in trunk line territory. Most of the interline rates in the new tariff are made on the basis of 2½ cents a mile. From Philadelphia to Chicago the present rate is $18.22; new rate $19.10; Philadelphia to Indianapolis, present rate $16.72, new rate $18.03. Local round trip tickets will cost double the one way fare. Examples of this change are: from Philadelphia to Paoli and return, present rate 80 cents, new rate $1; Atlantic City, by electric line $1.75, advanced to $2; by steam line $2 to $2.25. The round trip rate between New York and Philadelphia, $4, will be advanced to $4.50; between Baltimore and Washington $4, advanced to $4.80; Philadelphia and Washington $6, advanced to $6.80. On the Reading the round trip rate between the terminus and Wayne junction is advanced from 20 cents to 26 cents. Monthly tickets on both roads will be advanced 25 cents a month. Tickets good for 100 rides (family tickets) will be withdrawn from sale, as will also the fifty-trip tickets. Ten-ride tickets good for bearer will be sold at nine-tenths the local rate for ten single tickets.

Tramps by the Train Load

A press despatch from San Bernardino, Cal., November 16, says that 93 tramps, on their annual winter tour westward, are in jail at that place, charged with having seized a San Pedro, Los Angeles & Salt Lake freight train on the Mojave desert. The tramps, more than a hundred strong, when the train entered Otis overpowered the trainmen, broke seals of freight cars and after making themselves comfortable, ordered the engineman to proceed to Los Angeles. A posse was waiting at San Bernardino for the train, and all but ten of the tramps were captured.

Arbitrators in Western Enginemen's and Firemen's Controversy

The arbitration board, to consider enginemen's and firemen's wages on the western roads, has finally been completed, after months of delay, and hearings are to be begun at Chicago, November 30. The arbitrators are: H. E. Byram, vice-president of the Chicago, Burlington & Quincy; W. L. Park, vice-president of the Illinois Central; F. A. Burgess, assistant grand chief of the Brotherhood of Locomotive Engineers; Timothy Shea, assistant to the president of the Brotherhood of Locomotive Firemen and Enginemen; Charles Nagel, ex-secretary of Commerce and Labor, and Jeter C. Pritchard, presiding judge of the United States Court of Appeals of the Fourth Circuit.

Electrification on the St. Paul

Construction work in connection with the electrification of the Chicago, Milwaukee & St. Paul between Harlowton, Mont., and Avery, Idaho, has been resumed. Thus far the poles have been placed for a distance of 30 miles on the 116-mile division between Three Forks and Deer Lodge, Mont., which is the first to be equipped. The company has ordered nine freight and three passenger electric locomotives from the General Electric Company. These locomotives will be of the same construction except that those to be used for passenger service will be geared for a higher speed. The total weight of these locomotives will be 519,000 lb. each, and the weight on drivers 400,000 lb. They are to be delivered in October, 1915, at which time, it is planned, the construction work over the entire line will have been completed.

Railway Development Association

At the closing session of the Railway Development Association held in Chicago last week, a report of which was given in last week's issue, Mrs. Edith Loring Fullerton, wife of H. B. Fullerton, director of agricultural development of the Long Island Railroad, was elected an active member of the association. Mrs. Fullerton has actively co-operated with her husband in the direction of the Long Island experimental farm at Medford, L. I., since its establishment in 1905, and has recently been appointed assistant director of agricultural development. She was the author of a book, "The Lure of the Land," describing the Long Island development work, which was widely circulated, and is vice-president of the Woman's Agricultural and Horticultural

Association. It was decided to hold the annual meeting of the association on May 10, 11 and 12, 1915, at St. Paul, Minn.

Western Association of Short Line Railroads

Thirty representatives of the short line railroads in California, Arizona, Nevada and Idaho met in San Francisco, November 17, and formed a permanent organization to look after their common interests as to rates for carrying the mails, legislative matters and dealing with the Interstate Commerce Commission. The organization will be known as the Western Association of Short-Line Railroads. D. M. Swobe, vice-president of the McCloud River Railroad, San Francisco, was elected president.

A committee was instructed to oppose the Bourne and Moon bills pending in Congress, in both of which the provisions are such that, it is believed, the payments to the small roads for carrying the mails will be reduced.

Revenue and Expenses of Steam Roads in August

The Bureau of Railway Economics' summary of revenues and expenses and comments thereon for August, 1914, are as follows: Railways operating 227,184 miles of line are covered by this summary, or about 90 per cent of all steam railway mileage in the United States. Their operating revenues for the month of August, 1914, amounted to $266,928,165. This amount includes revenues from freight and passenger traffic, from carrying mail and express, and from miscellaneous sources connected with rail and auxiliary operations. Compared with August, 1913, these operating revenues show a decrease of $12,496,358. Total operating revenues per mile averaged $1,175 in August, 1914, and $1,244 in August, 1913, a decrease of $69, or 5.6 per cent.

Operating expenses, which include the cost of maintaining track and equipment, operating trains, securing traffic, and of administration, amounted to $179,163,880. This was $12,989,650 less than for August, 1913. These operating expenses per mile of line averaged $789 in August, 1914, and $856 in August, 1913, a decrease of $67 per mile, or 7.8 per cent.

Net operating revenue, that is, total operating revenues of rail and auxiliary operations less operating expenses, amounted to $87,764,285, which was $493,292 more than for August, 1913, but that this increase is due to increase in mileage is shown by the fact that net operating revenue per mile decreased. Net operating revenue per mile of line averaged $386 in August, 1914, and $388 in August, 1913, a decrease of $2 per mile, or 0.6 per cent.

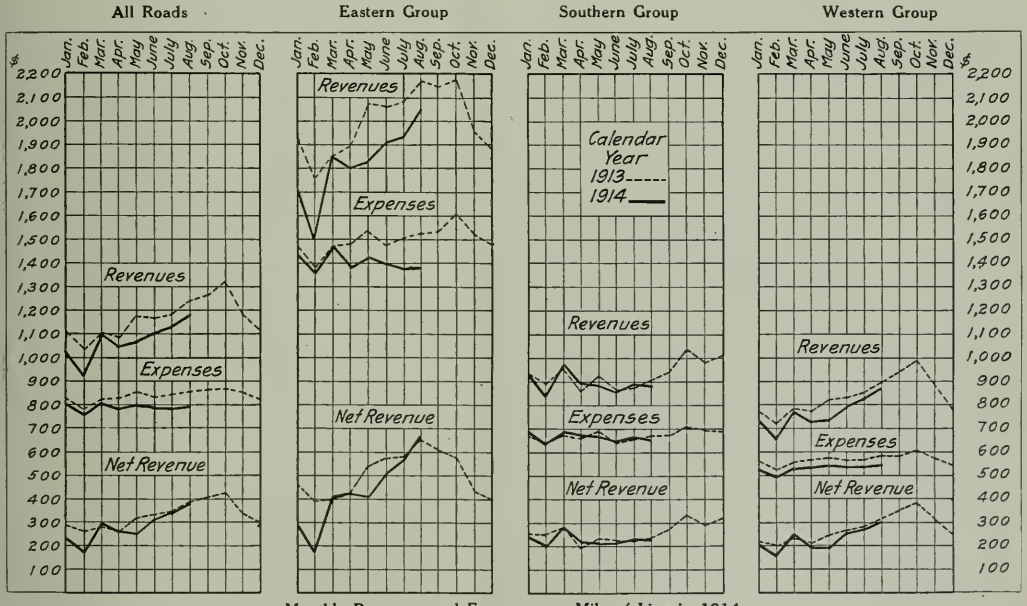
Taxes for the month of August amounted to $11,288,351, or $50 per mile, an increase of 0.7 per cent over August, 1913.

Operating income, which is net revenue from rail and auxiliary operations, less taxes, averaged $336 per mile of line, and in August, 1913, $339, thus decreasing $3 or 0.8 per cent. Operating income for each mile of line for each day in August averaged $10.85, and in August, 1913, $10.95. Operating income is that proportion of their operating receipts which remains available to the railways for rentals, interest on bonds, appropriations for betterments, improvements, new construction, and for dividends.

The railways of the Eastern district show a decrease in total operating revenues per mile of line as compared with August, 1913, of 6.4 per cent, the railways of the Southern district a decrease of 2.3 per cent, and the railways of the Western district a decrease of 5.1 per cent. Operating expenses per mile decreased 10.0 per cent in the East, decreased 2.3 per cent in the South, and decreased 6.7 per cent in the West. Net operating revenue per mile increased 2.0 per cent in the East, decreased 2.3 per cent in the South, and decreased 2.2 per cent in the West. Taxes per mile show an increase of 1.0 per cent in the East, an increase of 2.1 per cent in the South, and an increase of 0.5 per cent in the West. Operating income per mile increased 2.1 per cent in the East, decreased 3.1 per cent in the South, and decreased 2.7 per cent in the West.

The operating ratio for August, that is, the per cent of total operating revenues absorbed in operating expenses, was 67.1 per cent, which is comparable with 68.2 per cent in August, 1913, and 64.0 per cent in August, 1912. The operating ratio in the Eastern district for August was 67.3 per cent, as compared with 70.0 per cent for August, 1913; was 74.2 per cent in the Southern district as compared with 74.2 per cent in 1913; was 64.5 per cent in the Western district, as compared with 65.5 per cent in 1913.

Comparison of returns for two months of the current fiscal year with those of the corresponding months of the previous fiscal year reveals a decrease in total operating revenues per mile of 5.3 per cent, a decrease in operating expenses per mile of 7.0 per cent, and a decrease in net operating revenue per mile



Monthly Revenues and Expenses per Mile of Line in 1914

of 1.3 per cent. This net operating revenue per mile decreased 0.3 per cent in the East as compared with the corresponding period of the previous year, decreased 0.5 per cent in the South, and decreased 1.9 per cent in the West.

When the returns for the eight months of the calendar year 1914 are compared with those of the corresponding months of 1913, they show a decrease in total operating revenue per mile of 6.2 per cent, a decrease in operating expenses per mile of 4.8 per cent, and a decrease in net operating revenue per mile of 9.8 per cent. This net operating revenue per mile decreased 15.0 per cent in the East as compared with the corresponding period of the previous year, decreased 3.6 per cent in the South, and decreased 6.6 per cent, in theWest.

The diagram shows the variations in operating revenues, operating expenses, and net operating revenue per mile for the separate months of the calendar year 1913 and of the calendar year 1914 to date, and the following table shows the per cent of operating revenues consumed by each class of expenses:

PER CENT OF TOTAL OPERATING REVENUES

Account	August, 1914 United States	Eastern District	Southern District	Western District	Two months of the fiscal year 1915
Freight revenue	66.3	65.1	69.5	66.4	66.0
Passenger revenue	25.0	25.4	23.4	25.1	25.1
Mail revenue	1.7	1.4	1.7	2.1	1.8
Express revenue	2.1	2.1	2.3	2.1	2.2
All other revenues	4.9	6.0	3.1	4.3	4.9
Maintenance of way and structures	13.2	12.1	14.7	13.9	13.4
Maintenance of equipment	16.5	16.8	20.3	14.9	16.9
Traffic expenses	1.8	1.5	2.5	2.0	1.9
Transportation expenses	32.8	34.0	34.1	30.9	33.3
General expenses	2.2	2.1	2.5	2.3	2.3
All other expenses	0.6	0.8	0.1	0.5	0.6
Total operating expenses	67.1	67.3	74.2	64.5	68.4

International Engineering Congress

Announcement has been made of the program for the International Engineering Congress to be held in San Francisco, September 20 to 25, 1915, under the auspices of the American Society of Civil Engineers, the American Institute of Mining Engineers, the American Society of Mechanical Engineers, the American Institute of Electrical Engineers, and the Society of Naval Architects and Marine Engineers. Col. G. W. Goethals, governor of the Canal Zone, has consented to act as honorary president of the congress and is expected to preside over its general sessions. In spite of the conditions now prevailing in Europe the committee of management is in receipt of a sufficient number of communications from various foreign countries to indicate that a large majority of the papers originally requested for presentation at the sessions of the congress will be handed in on time and that the congress will be truly international in character. The total number of papers contemplated was about 290. Of this number about 220 are either definitely promised or well assured. The remainder, apportioned chiefly among the nations in the present war zone, are uncertain and it is expected that some of them will not be secured, but it is believed that by substituting for these others that have been offered the general plan for the congress may be carried out with a minimum of change.

The papers to be presented will cover the general field of engineering in a broad and comprehensive manner and with special reference to the important lines of progress during the past decade, and the most improved practices of present and future development. The authors of the papers are distributed over the engineering world and comprise men eminent in the various branches of the profession. A special effort will be made to procure discussions carefully prepared in advance for presentation with the papers, and opportunity will be afforded for oral discussion. The meetings will be held in the new Auditorium building in the civic center of San Francisco. The topics to be discussed are grouped as follows: Panama Canal, 24 topics; waterways, 6 topics; irrigation, 11 topics; railways, 7 topics; municipal engineering, 8 topics; materials of engineering construction, 20 topics; mechanical engineering, 28 topics; electrical engineering, 8 topics; mining engineering, 10 topics; metallurgy, 10 topics; naval architecture and marine engineering, 19 topics, and miscellaneous. The topics to be discussed in relation to railways include: Relation of railways to social development; present status of railways; economic factors governing building of new lines and location; physical characteristics of road, including track and roadbed; bridges, tunnels and terminals; construction methods; signals; equipment, including motive power other than electric; rolling stock in general; loading equipment and electric motive power in general.

B. F. Yoakum Suggests Government Copartnership in Railways

B. F. Yoakum has addressed a letter to Judson C. Clements of the Interstate Commerce Commission, to clear up a misunderstanding which he says has arisen from his testimony before the Interstate Commerce Commission in the Rock Island investigation, and to show that he is in favor of a form of government co-partnership, as distinguished from government ownership. Mr. Yoakum says that he believes a co-partnership arrangement under special federal charters to be granted to railroads desirous of operating under a federal license would be the wisest solution of the presenr unsettled condition. "The federal government," he said, "is now regulating the expenses and revenues of railroads, but should go a step further and safely aid them in future financing, and in consideration therefor enjoy a share of the profits, with representation on the boards of directors." His plan contemplates an exchange of government 3 per cent bonds for the higher interest railroad bonds.

"The change of securities," he says, "should be gradual through the creation of a low interest bearing government-railroad bond to take the place of the underlying higher interest bearing railroad bonds as they may mature; or they could be exchanged under a refunding process. Each transaction should be approved by the Interstate Commerce Commission, always provided that the net earnings of the railroad must be at least 2½ times the interest on the government-railroad bonds exchanged for the present underlying bonds. These new bonds should be a first lien on the property. All junior mortgage bonds and the stock would be subject to these new bonds, on which the government would not be responsible but would, under equitable terms to be agreed upon, share in the profits with the stockholders. At a rough estimate, in the course of a few years, one-half of the present underlying bonds, or about five billion dollars, would be exchanged or refunded into a lower interest bond. A large proportion of these old bonds bear 5 per cent and 6 per cent, and a few 7 per cent interest; therefore under the proposed system there would eventually be a saving to the railroads of approximately 100 million dollars a year in interest alone. This is on the assumption that such a government-railroad bond, being a first lien, would be as attractive to bankers and investors as the present 3 per cent government Panama canal bonds. If in this way the railroads of the country can save 100 million dollars a year in the item of interest, under my estimate it would insure the government receiving as its share under the proposed copartnership arrangement, probably from 15 to 20 million dollars a year."

The Railway Business Association

Fairfax Harrison, president of the Southern Railway, and Warren G. Harding, United States senator-elect from Ohio, are announced as the speakers for the sixth annual dinner of the Railway Business Association, the national organization of manufacturers, merchants and engineers dealing with steam railroads, which will be held at the Waldorf-Astoria hotel, New York, Thursday evening, December 10. The business meeting of the association will be held at 11 a.m. at the hotel, the election of officers at 1.30 p.m. and the dinner at 7, the doors opening exactly on the hour.

The circular announcing the names of the speakers says in part:

"Mr. Harrison unites long experience and responsibility as a railway official with the oratorical art of the attorney. Practiced for many years in the study of public opinion as it affects the prosperity of the railways, he is a leader in the cultivation of friendly sentiment and cordial co-operation between railway managers and the people whom they serve.

"Mr. Harding is a journalist with substantial business interests. During several years of legislation affecting business and transportation he has given constant admonition, caution and counsel lest industry and commerce be shackled and the public welfare impaired. On that platform he has now been chosen by the people of Ohio as their senator in Congress. The obligation of government to promote national prosperity will furnish the keynote of his

address, while his brilliant endowment as a writer and speaker complete the promise of a message appetizing in form as well as invigorating in substance.

"Subscribers to the dinner as this circular goes to press exceed those upon the corresponding date in 1913. Such response to an announcement not naming the speakers and at a time like the present is a display of enthusiasm by our members which proves anew their belief in the cause and their loyalty to the work."

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

AIR BRAKE ASSOCIATION.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—A. G. Thomason, Demurrage Commissioner, Boston, Mass. Annual convention, April, 1915, Richmond, Va.

AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next meeting, October, 1915.

AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 21-24, 1915, Richmond, Va.

AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.

AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next meeting, May 20-21, 1915, San Francisco, Cal.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 20 W. 39th St., New York. Annual convention, October, 1915, San Francisco, Cal.

AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—H. C. McConaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

AMERICAN RAILROAD MASTER TINNERS, COPPERSMITHS AND PIPEFITTERS' ASSOCIATION.—W. E. Jones, C. & N. W., 3814 Fulton St., Chicago. Annual meeting, Chicago.

AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next session, May 19, 1915, Atlantic City, N. J.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 19-21, 1915, Detroit, Mich.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June 9-11, 1915, Atlantic City, N. J.

AMERICAN RAILWAY SAFETY ASSOCIATION.—L. F. Shedd, C. R. I. & P., Chicago.

AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—A. R. Davis, Central of Georgia, Macon, Ga. Annual meeting, July, 1915.

AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

AMERICAN SOCIETY OF ENGINEERING CONTRACTORS.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 1-4, 1914, New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Atlanta, Ga.

ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, third week in May, 1915, Galveston, Tex.

ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual meeting, October, 1915.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 22-25, 1915, Rochester, N. Y.

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York. Next meeting, December 8-9, Richmond, Va.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meetings, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

FREIGHT CLAIM ASSOCIATION.—Warren P. Taylor, R. F. & P., Richmond, Va. Annual meeting, June 16, 1915, Chicago.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

INTERNATIONAL RAILWAY CONGRESS.—Executive Committee, 11, Rue de Louvain, Brussels, Belgium. Next convention, June 23 to July 6, 1915, Berlin.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 829 W. Broadway, Winona, Minn. Next convention, July 14-17, 1915, Sherman House, Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D., Lima, Ohio. Annual meeting, August 17, 1915, Philadelphia, Pa.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. I. Goodwin, C. R. I. & P., Eldon, Mo.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May 26 to 28, 1915, Chicago, Ill.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 14-17, 1915, Detroit, Mich.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June 14-16, 1915, Atlantic City, N. J.

NATIONAL RAILWAY APPLIANCES ASSOCIATION.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. Frankenherger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

RAILROAD MASTER TINNERS, COPPERSMITHS AND PIPEFITTERS' ASSOCIATION.—U. G. Thompson, C. & E. I., Danville, Ill. Annual meeting, May, 1915.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December 10, 1914, Waldorf-Astoria Hotel, New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Next meeting, October, 1915.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa. Next meeting, March 15, 1915, Chicago. Annual meeting, September 21-24, 1915, Salt Lake City, Utah.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, L. S. & M. S., Box C, Collinwood, Ohio. Annual meeting, May 17-19, 1915, Hotel Sherman, Chicago.

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders and Master Mechanics' Associations.

RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Annual meeting, September 14-16, 1915, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, C. R. I. & P., La Salle St. Sta., Chicago. Annual meeting, September, 1915.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. R. R., Atlanta, Ga. Next regular meeting, January 21, 1915, Atlanta, Ga.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Kanawa Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7122 Stewart Ave., Chicago. Annual meeting June 15, 1915, Minneapolis, Minn.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, September, 1915, Chicago.

WESTERN CANADA RAILWAY CLUB.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF SEPTEMBER, 1914—CONTINUED

Name of road.	Average mileage operated during period.	Operating revenues			Operating expenses						Net operating revenue (or deficit).	Railway tax accruals.	Operating income (or loss).	Increase (or decr.) comp. with last year.
		Freight.	Passenger.	Total. inc. misc.	Maintenance Way and structures.	Maintenance Of equipment.	Traffic.	Transportation.	Miscellaneous.	General.	Total.			
Chicago, Peoria & St. Louis	255	$119,338	$31,262	$159,791	$25,128	$24,524	$5,585	$61,226	.....	$5,379	$121,842	$37,948	$5,700	$32,248	$45,551

Traffic News

The Illinois Central fast freight train between Chicago and New Orleans recently completed a record of 310 days' service in which it arrived at destinations on time.

All the St. Louis railroads, except two, have agreed on a plan for having their city ticket offices in one building, at Broadway and Locust street, but to have separate offices for each road, not a joint office. It is expected to save $100,000 a year in rentals.

The Traffic Club of New York

The Traffic Club of New York will hold its annual meeting and election of officers at the Hotel Astor, New York, on November 24.

National Industrial Traffic League

The annual meeting of the National Industrial Traffic League was held at Chicago on November 12 and 13.

In his opening address President H. G. Wilson, traffic commissioner of the Traffic Bureau of the Toledo Commerce Club, severely criticized railway men and others for attempting to undermine the present system of railroad regulation, and for "the present veiled attack on the usefulness of the Interstate Commerce Commission," which, he said, "is the culmination of studied effort and purpose on the part of those who would have that body composed of creatures of their own choosing, instead of the conscientious men they are." Following this the league adopted the following resolutions:

"Whereas, regulation of common carriers through the medium of the commerce act, as administered by the Interstate Commerce Commission has been received by many interests in other than a friendly spirit, and

"Whereas, recently much criticism has been indulged in through the public press, and otherwise, of the act and particularly of its administration, therefore be it

"Resolved, that the National Industrial Traffic League, in annual convention assembled, declares its firm belief in the wisdom of governmental regulation and reaffirms its approval thereof; and, while reserving to itself, as well as granting to others, the privilege of recommending such changes in or additions to the commerce act from time to time as may be deemed wise for the best interests of all concerned; it hereby further resolves that it renews its expression of respect for and belief in the ability and integrity of the Interstate Commerce Commission, and is unalterably opposed to any action that would have the effect of repealing the commerce act or influencing unfairly the administration of this act by the Interstate Commerce Commission."

The business session of the league was devoted to the presentation and discussion of committee reports. On the recommendation of the executive committee it was decided to make a fight on tariffs filed recently with the Interstate Commerce Commission by the railroads in Western Trunk Line and Central Freight Association territories, imposing a charge of four cents per hundred pounds for trap car service, and the attorneys of the league were instructed to file a petition with the commission for suspension of the tariff. It was also decided to oppose the tariffs filed by the railways eliminating stop-over privileges, and to oppose the proposed increased demurrage for regrigerator cars loaded with perishable fruit and vegetables. A committee of seven was appointed to negotiate with the carriers to secure a general adoption of the uniform code of storage rules agreed on by the league and representatives of the carriers through the American Railway Association and approved by the Interstate Commerce Commission, but which has not been made effective by all the carriers. There was considerable discussion on a report that the railways in many cases do not promptly furnish copies of new tariffs to the shippers, and that the shippers have difficulty in ascertaining the exact provisions of such tariffs in advance. The president was instructed to confer with the Interstate Commerce Commission to see what steps could be taken to improve the situation.

The league adopted a report of the legislative committee favoring a resolution of the American Bar Association, recommending a congressional commission to codify the interstate commerce laws, and also favoring a recommendation made by the Interstate Commerce Commission that suits under the interstate commerce act shall be brought in the name of the commission instead of the government. The league also endorsed the recommendation made by the National Association of Railway Commissioners urging a standardization of state laws regulating commerce. A plan for a national traffic conference to be held next year at the San Francisco exposition was referred to the executive committee.

The officers of the league were all re-elected for the ensuing year: President, H. G. Wilson, traffic commissioner Traffic Bureau of the Toledo Commerce Club, Toledo, Ohio; vice-president, J. Keavy, commissioner of freight and traffic division Indianapolis Chamber of Commerce; secretary-treasurer, O. F. Bell, traffic manager, Crane Company, Chicago; chairman executive committee, H. C. Barlow, traffic director Chicago Association of Commerce. A. W. McLaren, traffic manager, Morris & Co., was added to the executive committee.

The annual banquet of the league was held on Thursday evening at the Congress hotel. D. P. Chindblom, assistant secretary of the league, spoke on the organization and purposes of the league, with a plea for more extensive co-operation between the railroads and the shippers. William Heath, vice-president of Larkin & Co., of Buffalo, spoke in place of E. E. Clark, of the Interstate Commerce Commission, who had been expected to be present. Walter L. Fisher, ex-secretary of the Interior and a member of the Chicago Railway Terminal Commission, spoke on "Railway Terminals," criticizing the railways of Chicago for uneconomical use of some of the most valuable property in the city, and urging some form of co-operation between the railways to secure unified use of the terminals, possibly under one operating company to operate all of the Chicago terminal facilities with a separate charge for terminal service.

Trap Car Charge at Chicago Opposed

The National Industrial Traffic League, through its attorneys, Borders, Walter & Burchmore, has filed with the Interstate Commerce Commission a petition asking the commission to investigate and suspend tariffs filed by the eastern and western railways, imposing a charge for trap car service, as recently reported in the *Railway Age Gazette*. The petition applies especially to the tariffs filed for the Chicago district, but it is stated that supplemental petitions will be filed when the numbers of the other tariffs become known. The term "trap car" is defined in the tariff as follows: "The term 'trap car' is applied to a car placed at an industry and loaded with less-than-carload freight (except perishable freight requiring refrigerator car protection), to be forwarded to a freight station of the road on which the industry is located, for handling of contents, or, at issuing carrier's option, sent to one of its freight stations or transfer points for handling of contents, or, at issuing carrier's option, sent to destination; also a car containing less-than-carload freight forwarded, at issuing carrier's option, from point of origin, or contents handled at a transfer point or freight station and forwarded to an industry."

The petition states that under these tariffs each of the originating or delivering carriers at Chicago will move trap or ferry cars without any charge over the Chicago rate when such trap cars move from or to freight stations on their own lines in the Chicago switching district from or to so-called universal freight stations on foreign lines in the Chicago switching district, provided the freight is received at such freight stations by street vehicles, and provided each trap car contains not less than a minimum aggregate weight of less than carload freight. Charges are provided to be assessed on trap cars when moving to or from industries either situated on the road-haul carrier or off the line of the road-haul carrier. The result is that a shipper having an industry on the Michigan Central, for example, must pay 4 cents per 100 lb. for the movement of a trap car from his plant to the freight house or transfer point of the Michigan Central, the movement from such industry to such transfer point or station being at the expense of the Michigan Central, but without allowance or payment by that company to any other company. On the other hand, in the case of a trap car loaded

at one of the universal freight stations of the Chicago & North Western, for example, and containing the specified minimum weight of less-than-carload freight, such freight having reached said station by street vehicle through public driveway entrance, the Michigan Central will pay the terminal lines the switching charges necessary to move the car to the station or transfer point of the Michigan Central, amounting to a minimum of $6 per car, and in addition the Michigan Central will perform practically all of the services that it performs in the corresponding case of an industry on its own line, while the freight in such trap car loaded at the North Western freight station will pay no charge in addition to the flat Chicago rate. These facts and others, the petition states, represent serious questions of transportation theory and practice, and involve discriminations that are prima facie unjust and undue. The petition also states that these tariffs were filed with the commission by order of the executive officers of the railways, without due consideration and recommendation of the traffic officials of the railways by whom changes in transportation rates ordinarily are considered and proposed.

Car Surpluses and Shortages

Arthur Hale, chairman of the committee on relations between railroads of the American Railway Association, in presenting statistical bulletin No. 179, giving a summary of car surpluses and shortages by groups from June 30, 1913, to November 1, 1914, says:

There is a further increase in surplus cars of almost 18,000, bringing the total up to 172,325, the largest surplus for the same period in any year since the committee began the publication of these reports, which was in 1907.

The total surplus on November 1, 1914, was 172,325 cars; on October 15, 1914, 154,342 cars; on November 1, 1913, 38,276 cars, and on October 28, 1908, 110,912 cars.

CAR SURPLUSES AND SHORTAGES

Date	No. of roads.	Surpluses: Box.	Flat.	Coal, gondola and hopper.	Other kinds.	Total.	Shortages: Box.	Flat.	Coal, gondola and hopper.	Other kinds.	Total.

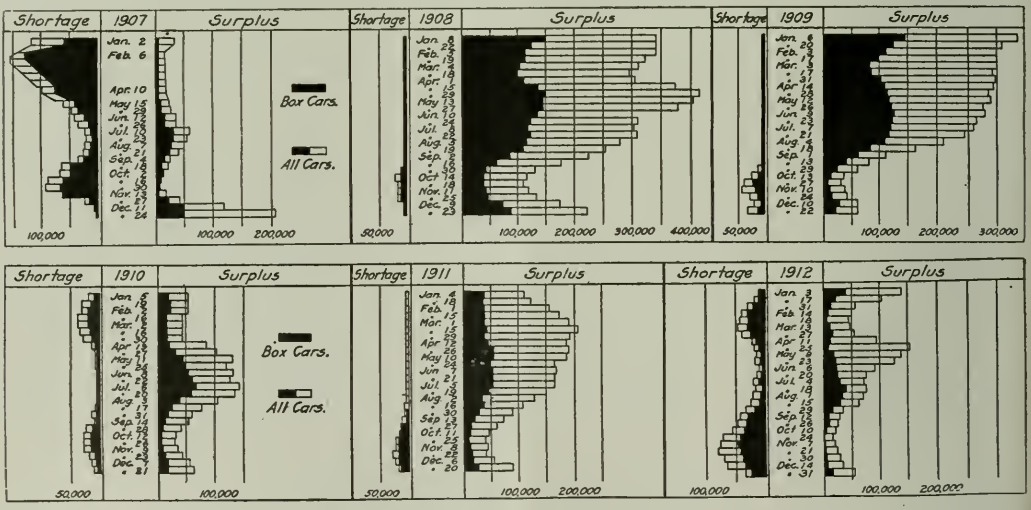
Total	192	59,511	12,383	67,619	32,812	172,325	1,349	20	274	586	2,229

*Group 1 is composed of New England lines; Group 2—New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania lines; Group 3—Ohio, Indiana, Michigan and Western Pennsylvania lines; Group 4—West Virginia, Virginia, North and South Carolina lines; Group 5—Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida lines; Group 6—Iowa, Illinois, Wisconsin and Minnesota lines; Group 7—Montana, Wyoming, Nebraska, North Dakota and South Dakota lines; Group 8—Kansas, Colorado, Missouri, Arkansas and Oklahoma lines; Group 9—Texas, Louisiana and New Mexico lines; Group 10—Washington, Oregon, Idaho, California, Nevada and Arizona lines; Group 11—Canadian lines.



Car Surpluses and Shortages, 1907 to 1914

The greater part of the surplus increase is in coal cars. This class of equipment increased 11,706 cars in group 3 (Middle) and 5,882 cars in group 2 (Eastern).

Box cars show a heavy decrease in group 6 (Northwest), and smaller decreases in group 8 (Middle Western), group 10 (Pacific), and group 11 (Canada), while a considerable increase is noticeable in group 3 (Middle) and group 5 (Southern).

The total shortage on November 1, 1914, was 2,229 cars; on October 15, 1914, 2,360 cars; on November 1, 1913, 40,118 cars, and on October 28, 1908, 10,839 cars.

There is very little change in the shortage.

The accompanying table gives car surplus and shortage figures by groups for the last period covered in the report and the diagram shows total bi-weekly surpluses and shortages from 1907 to 1914.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Examiner Kelly held a hearing at Chicago on November 10 on a proposed increase of 25 cents a ton in the rates on anthracite coal from West Virginia points to Chicago. Members of the Chicago Coal Dealers' Association appeared in opposition to the advance.

Examiner Kelley held a hearing at Chicago on November 13, on complaints filed by the Illinois Manufacturers' Association, the Wholesale Grocers' Exchange and the Chicago Association of Commerce against the proposed addition of switching charges to the rates on coal shipments to Chicago, which have heretofore been absorbed.

The commission has issued the following in reference to applications for relief from the assessment of the demurrage charges upon embargoed shipments of live stock, held on account of the quarantine declared to prevent the spread of the foot-and-mouth disease. The commission will be glad to contribute whatever it can toward affording relief at the present juncture. Should the carriers petition this commission to make effective upon one day's notice tariffs which will suspend the assessment and collection of demurrage occasioned by the order of the Department of Agriculture, this commission will be glad to give prompt and favorable consideration to such applications.

Rates on Flour from Inman, Kan.

Enns Milling Company v. Chicago, Rock Island & Pacific et al. Opinion by Commissioner Harlan:

The commission finds that defendants' rates on flour, bran and shorts from Inman, Kan., to various destinations in southwestern Missouri are unreasonable to the extent that they exceed 14½ cents on flour and 13 cents on bran and shorts. A fourth section application for permission to continue lower rates from Hutchinson and McPherson, Kan., is denied, the carriers since the hearing having withdrawn the lower rates to these points. (32 I. C. C., 38.)

Reparation Awarded

George R. Worn et al. v. Boca & Loyalton et al. Opinion by Commissioner McChord:

The commission finds that the carrier discriminated against Boca, Cal., by maintaining from February 20 to November 7, 1910, a rate of $1 per ton on dry lumber from Star, Cal., to Boca on traffic destined to Truckee, Cal., while maintaining a rate of $1.50 per ton from Star to Boca, applicable on traffic to Verdi, Nev., and other interstate points. The present rate of $1.50 from Star to Boca, however, is not found unreasonable nor discriminatory, as it is applicable on all traffic irrespective of destination. Reparation awarded. (32 I. C. C., 58.)

Rates on Potatoes to Independence and Coffeyville, Kans.

Kansas Wholesale Grocery Company, et al. v. Ahnapee & Western, et al. Opinion by Commissioner Meyer:

The commission finds that a rate of 35 cents per 100 lb. on potatoes from producing territory in Wisconsin, Minnesota and Michigan to Independence and Coffeyville, Kans., is prejudicial to the two latter points as compared with the rate to Chanute, Kans., and Bartlesville, Okla., and other Kansas and Oklahoma points, in so far as it exceeds the rate to Pittsburg, Chanute and Parsons, Kan., by more than 1½ cents. It is also held that the rate to Coffeyville should not in any case exceed the rate to Bartlesville, Okla. (32 I. C. C., 139.)

Cement Rates from Mitchell, Ind.

Opinion by Commissioner Clark:

The commission finds that a rate of 11 cents per 100 lb. on cement from Mitchell, Ind., to Memphis, Tenn., established by a note to a tariff excepting Michell from the application of a group rate of 14 cents as to shipments to Memphis was not cancelled by a supplement to the tariff, which merely transferred Mitchell to a group taking a rate of 9 cents. The commission also finds that the carriers have justified a proposed increase in a rate on cement from Mitchell to New Orleans and New Orleans group points. (32 I. C. C., 93.)

Refrigeration Rates from Kenner, La.

Kenner Truck Farmers' Association v. Illinois Central et al. Opinion by Commissioner McChord:

The commission finds that the Illinois Central's practice of permitting shippers of fruit and vegetables from New Orleans to ice their own cars if they so choose, while denying a like privilege to shippers from Kenner and other Louisiana points on defendant's line north of New Orleans is not discriminatory. It is also found that the carrier has justified certain increased charges for icing shipments from New Orleans and points north thereof to Chicago. In the same case reparation is awarded on a shipment of vegetables from Kenner, La., to Chicago, which moved via New Orleans and was charged the combination of rates on that point. (32 I. C. C., 1.)

Grain Rates from St. Paul, Minn.

Opinion by the commission:

The commission finds that the carriers have justified a proposed cancellation of joint rates on grain from stations on the Great Northern in Minnesota and Iowa to Kansas City, Mo., and points in Missouri, Kansas, Oklahoma and Colorado. The rates in question apply to Kansas City via a three line haul over the Great Northern to Sioux City, Ia.; the Chicago, Burlington & Quincy to St. Joseph; and the Atchison, Topeka & Santa Fe beyond; or to the other points via the Great Northern to Sioux City; the Chicago, Burlington & Quincy to St. Joseph or Kansas City, and the Atchison, Topeka & Santa Fe, the Missouri, Kansas & Texas or the St. Louis & San Francisco beyond. The commission holds that the rates via these routes are relatively lower than the rates from the producing territory in Nebraska to Chicago, whereas there is no necessity for such low rates. There will also still be in effect rates via the Great Northern and the Chicago, Burlington & Quincy which although higher are reasonable. (32 I. C. C., 96.)

Rates on Whiskey from Midway, Ky.

S. J. Greenbaum Company v. Louisville & Nashville et al. Opinion by Commissioner Clark:

It is alleged that the carload and less than carload rates on whiskey and the carload rates on distillers' dried grain, from Midway, Ky., to various destinations and their inbound carload and less than carload rates on bottles, boxes and bottle-carrying boxes from certain points to Midway are unreasonable and discriminatory as compared with the rates to and from Lexington and Louisville, Ky.

Rates on whiskey and distillers' dried grain. The commission finds that the rates on these commodities via the Southern Railway and the Cincinnati, New Orleans & Texas Pacific and their connections from Midway via Cincinnati to points in central freight association territory are not unreasonable or discriminatory.

The following rates, however, are termed discriminatory: Rates on distillers' dried grain and whiskey in carloads from Midway, via the same carriers through Cincinnati to points in trunk line, New England, and Atlantic seaboard territories and rates on whiskey in carloads via Cincinnati to Virginia cities in so far as they exceed the carload rates from Lexington via Cincinnati by more than the following amounts: distillers' dried grain, two cents; whiskey in wood in bulk, three cents; whiskey in glass, packed in barrels or boxes, four cents. The rates over the Louisville & Nashville and its connections on whiskey and distillers' dried grain via Lexington to points in central freight association, New England, trunk line and Atlantic seaboard territories in so far as they exceed the rates from Louisville via Lexington. Rates on whiskey and distillers' dried grain to points in New England, trunk line, and Atlantic seaboard territories when moving through Lexington, in so far as they exceed the rates from Louisville via Lexington. Rates on whiskey to Virginia cities via Lexington in so far as they exceed the rates from Louisville to Virginia cities. Authority to grant lower rates from Louisville and Lexington to points in central freight association, New England, trunk line, or Atlantic seaboard terri-

tories or to Virginia cities on whiskey moving via the Louisville & Nashville from Louisville through Lexington or from Lexington via Louisville than from Midway and other intermediate points is denied.

Rates on bottles, boxes and bottle carrying boxes The following rates are termed discriminatory: Rates to Midway via Louisville in so far as they exceed the rates via Louisville to Lexington; rates to Midway via Lexington to the extent that they exceed the rates to Louisville via Lexington, and rates to Midway via the Southern and the Cincinnati, New Orleans & Texas Pacific through Cincinnati in so far as they exceed the rates via Cincinnati to Lexington by more than two cents on bottles and three cents on boxes and bottle carrying boxes.

The record does not present a clear basis for fixing less-than-carload rates on whiskey from Midway via Cincinnati, or on bottles, boxes, etc., from the points of origin complained of to Midway via Cincinnati. It is ordered that these rates be brought into proper relation with the carload rates, and also with the less-than-carload rates on whiskey from Lexington via Cincinnati to the same destination, and the rates on bottles, boxes, etc., from the points of origin complained of to Lexington, via Cincinnati. (31 I. C. C., 699.)

Joint Rates With the Birmingham Southern

In the matter of the investigation and suspension of new joint class and commodity rates for the transportation of freight originating at and destined to points on the Birmingham Southern. Opinion by Commissioner Meyer:

In August and September, 1911, the Atlanta, Birmingham & Atlantic filed tariffs naming new joint rates between it and the Birmingham Southern. A complaint has been filed against these schedules by the Louisville & Nashville, the Southern and other carriers, it being alleged that the Birmingham Southern has no right to participate in joint rates and receive divisions thereof, because it is a mere plant facility, and that even if it is a common carrier, the amount of the divisions it would receive under the proposed rates is excessive.

The Birmingham Southern is owned directly by the Tennessee Coal, Iron & Railroad Company. It operates a main line about 43 miles in length and has 85 miles of yard tracks and sidings, most of which are within and about the plant of the Tennessee company. The tonnage of the latter is about 40 per cent of all the traffic originating in the Birmingham district and about 93 per cent of that handled by the Birmingham Southern. The road is the only one of several industrial lines in the Birmingham district that has been incorporated as a common carrier; and it alone makes reports and files its tariffs with the commission.

At the present time for long hauls the trunk lines apply the Birmingham district rate to or from competitive points. At Birmingham, Ensley and Bessemer the trunk lines absorb the switching charges of each other to all industries. At the same points they absorb the switching charges of the Birmingham Southern for deliveries to or from all shippers not affiliated with the Tennessee company, in conformance with a decision of the Alabama Railroad Commission in 1908 which ordered the Birmingham Southern to reduce its switching charge from $3 per car to $2, and further ordered the trunk lines to absorb the same. On traffic to and from points on the Birmingham Southern, outside of these switching limits, the charges are the group rates plus the individual rates of the Birmingham Southern. On traffic to or from the plants of the Tennessee company, no absorption of the Birmingham Southern's charges is made at any point.

The commission holds that the Atlanta, Birmingham & Atlantic may properly enter into joint rates with the Birmingham Southern and arrange with it concerning divisions out of the through rate. "If the Birmingham Southern were owned by interests independent of the Tennessee company, the protest of the Louisville & Nashville would probably never have been filed. Generally speaking, the mere fact of ownership should make no difference in the status of a common carrier as such. The record shows that the Birmingham Southern is a common carrier. It is so situated that it can and it does serve the public. The fact that other common carriers can serve the great majority of the industries which the Birmingham Southern seeks to serve can have little or no weight in the consideration of the issues here presented. A railway independently owned and having the present and prospective tonnage of the Birmingham Southern would doubtless be looked upon as desirable railway property. The proposed extensions southward, apparently in anticipation of the opening of the Panama Canal, will greatly enhance the strategic importance of its location."

The commission also concludes that a division of 6.5 cents per ton on carload traffic to be paid by the Atlanta, Birmingham & Atlantic to the Birmingham Southern would be just and reasonable. It is held that the carriers should establish a proper relation between the less-than-carload and carload rates. The suspended tariff did not contemplate the payment of more than $2 per car switching charge on freight originating at Birmingham proper and Bessemer, and it is assumed that no change is contemplated in this respect. The carriers will be expected to reissure their tariffs, effective within 60 days, modified in accordance with the above views.

In a dissenting opinion Commissioner Harlan states that he is unable to see why the Birmingham Southern should be given different treatment from that accorded to the other railways serving industries in the Birmingham district, and that it is his opinion that the Birmingham Southern like these other railways is no more than a plant facility. He also states: "It seems to me logically to follow from the principle announced that facilities, physically and economically a part of an industrial plant and necessary to its successful operation, when turned over to an incorporated railroad company owned by the industry take on a new relation to it, and that the cost of their operation may then lawfully be transferred from the industry to the trunk line carriers with all the additional advantages and privileges that follow, notwithtsanding the resulting discriminations against other industries. In other words, so long as a correct outward form is created the real relation between the industry and its subsidiary railroad company appears not to be open to inquiry. I assume that the manufacturing concerns of the country will not be slow, as the result of the rulings here made, to make the necessary arrangements to relieve themselves of the cost of operating their plant facilities of this character." (32 I. C. C., 110.)

STATE COMMISSIONS

The Illinois Public Utilities Commission has suspended proposed advances in the rates on milk, of approximately five per cent, by the railroads throughout the state.

At the request of the railroads the Texas Railroad Commission has postponed until January 14, 1915, the proposed hearing on the application of the railroad companies for a general advance in freight rates throughout the state. The hearing has been set for December 1.

COURT NEWS

The Court of Appeals of Kentucky has handed down a decision holding that the Louisville & Nashville, in providing only one lavatory in the passenger car assigned to negroes, while it furnishes separate lavatories for males and females in the cars assigned to white passengers, has made no illegal discrimination. In this decision the court reverses a lower court, which had imposed a fine on the railroad company of $500 for violation of the separate coach law. The decision says that equality of accommodation does not mean identity of accommodation. It appeared that the average number of passengers carried in the negro compartment was much less than the number usually traveling in the white compartment of the car.

Judge Landis of the United States district court for the western district of Illinois at a hearing at Freeport on November 9, denied an appeal from his recent decision ordering Frederick W. Ellis, vice-president of the Armour Car Lines, to answer questions put to him by the Interstate Commerce Commission at a hearing in Chicago last January in connection with its investigation of private car lines, regarding the relations between the car lines and the railroads. Frank B. Kellogg, counsel for Ellis, argued his right to present the entire matter to the United States Supreme Court. Judge Landis decided that no final order could be entered in the case until Ellis is recalled as a witness before the commission. If he persists in his refusal the final order will be entered.

Railway Officers

Executive, Financial, Legal and Accounting

O. L. Dickeson has resigned as president of the White Pass & Yukon, the resignation to take effect about February 1.

E. W. McKenna, vice-president of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, has been retired.

Harry L. Miller, general freight agent of the Southern Railway at Knoxville, Tenn., has been elected president of the Interstate Railroad, with headquarters at Big Stone Gap, Va., succeeding Daniel B. Wentz, resigned.

The officers of the Shreveport, Alexandria & Southwestern Railway System are now as follows: R. A. Long, president; F. J. Bannister, vice-president; R. S. Davis, second vice-president and general manager in charge of operation and traffic; J. D. Tennant, third vice-president; R. T. Demsey, secretary; P. C. Rickey, general auditor, and W. R. Thurmond, general counsel. The headquarters of the company are at Kansas City, Mo.

Operating

O. S. Jackson, superintendent of motive power of the Chicago, Terre Haute & Southeastern, has been appointed general superintendent, with headquarters at Terre Haute, Ind., succeeding J. C. Muir, deceased.

Fred B. Oren, roadmaster of the Illinois Central at Carbondale, Ill., has been appointed trainmaster of the Peoria and Mattoon districts, with headquarters at Mattoon, Ill., to succeed Roldin A. Brown, resigned.

Walter Tuttle Spencer, whose appointment as superintendent of the Old Colony division of the New York, New Haven & Hartford, with headquarters at Taunton, Mass., has already been announced in these columns, was born on July 5, 1869, and was graduated from Sheffield Scientific School of Yale University in the class of 1890. He began railway work in September 1890, as a rodman on the New York, New Haven & Hartford. From 1892, to 1893, he was transitman and then was appointed division engineer. On September 1, 1914, he was transferred from the engineering department to the operating department and was made trainmaster, with headquarters at Providence, R. I., which position he held at the time of his recent appointment as superintendent of the Old Colony division of the same road, as above noted.

Traffic

C. J. Birchfield has been appointed assistant general advertising agent of the Atchison, Topeka & Santa Fe, with headquarters at Chicago, succeeding N. H. Reed, resigned to engage in other business.

Engineering and Rolling Stock

A. Sturrock has been appointed district master mechanic of the Canadian Pacific, with office at Nelson, B. C., succeeding A. Mallinson.

W. F. Weigman has been appointed general foreman of the car department on the Charleston & Western Carolina, with headquarters at Augusta, Ga.

H. F. Staley, formerly master mechanic of the Carolina, Clinchfield & Ohio at Erwin, Tenn., has been appointed master mechanic of the Boyne City, Gaylord & Alpena, with office at Boyne City, Mich.

H. B. Hayes, master mechanic of the Cincinnati, New Orleans & Texas Pacific at Somerset, Ky., has been transferred to Birmingham, Ala., as master mechanic of the Alabama Great Southern.

Milo M. Backus has been appointed roadmaster of the Springfield division of the Illinois Central, with headquarters at Clinton, Ill., in place of Lewis H. Bond, who has been transferred to Carbondale, Ill., as roadmaster of the St. Louis division, succeeding Fred B. Oren, transferred.

A. G. Kantman, who has resigned as superintendent of machinery of the Nashville, Chattanooga & St. Louis, had been employed by the Nashville, Chattanooga & St. Louis for some 20 years in various capacities—as mechanical engineer, later as assistant superintendent of machinery, and recently as superintendent of machinery. Mr. Kantman has taken active part in M. C. B. Association affairs, and is for the present at his home at 1916 Adelcia street, Nashville, Tenn., attending to his various private matters.

OBITUARY

George F. Clough, commercial agent of the Lake Shore & Michigan Southern at Cleveland, Ohio, died on November 8, aged 38 years.

James Geddes, assistant to general manager of the Louisville & Nashville since September, 1901, with office at Nashville, Tenn., died in that city on November 13, at the age of 87.

H. A. Jones, who resigned last August as assistant treasurer of the Southern Pacific Company, at San Francisco, Cal., on account of ill health, died recently in San Francisco, at the age of 63.

L. F. Day, formerly vice-president and general manager of the Minneapolis & St. Louis and the Iowa Central, died on November 12 in New York City, aged 56 years. He began railway work in 1885 as clerk in the general freight office of the Texas & St. Louis. From June, 1886, to February, 1887, he was traveling freight and passenger agent for the St. Louis, Arkansas & Texas and its successor, the St. Louis Southwestern, remaining with the latter road until April, 1892, successively as chief clerk general freight office, assistant general freight agent, general freight agent and freight traffic manager. He was chairman of the Southwestern Traffic Association from November, 1893, to June, 1897, and then became general manager of the Minneapolis & St. Louis. In October, 1899, he also was made vice-president of that road, and in June of the following year he was appointed vice-president and general manager also of the Iowa Central. Mr. Day retired from active railway service about five years ago.

Railway Construction in Italian North Africa.—On October 2, 1914, a section of railway was opened to public use between El Maia and Zavia in Tripolitania. This marks the completion of the Tripoli-Zavia division, which, with the exception of the Tripoli-Azizia line, is the longest stretch of track in the colony. The new road is 11 miles long, and the total distance from Tripoli and Zavia is about 31 miles. Construction will now be pushed beyond Zavia to Zuara, a port about 35 miles farther on, and work is so advanced on the section beyond Azizia that it is predicted that by the end of the year the railway will be completed to the foot of the Gharian mountains, about 20 miles beyond Azizia and 70 miles from Tripoli. The greatest engineering difficulties yet met in railway building in this province have been encountered in that region, in consequence of which progress has been much slower than on the line to the west.

The Madeira-Mamoré Railway of Brazil.—The Madeira-Mamoré Railway, the Maine corporation, which with its controlling company, the Brazil Railway, has recently been placed in the hands of receivers, has met with difficulties almost from its beginning. The line was built primarily to avoid the danger, delay and expense of porterage and transshipment caused by the series of cataracts obstructing the waterway between the town of Santo Antonio on the river Madeira, and Guajaramirim, on the river Mamore. Between these two points cargo—principally consisting of rubber from Bolivia and goods of every description from Europe—had always been carried in *batelones* (large boats manned by a crew of about 15 men carrying paddles) at a cost of many lives and the loss of immense quantities of freight annually. Trains have been running on the line with more or less regularity since early in 1911. The cost of operation, however, has been so great that but little net revenue has been realized. The development of the region served, in addition, has been much slower than was anticipated and there has been no improvement in the steamship service from Europe to Porto Velho, which was depended on to feed the railway. The supplementary river service beyond the railhead has also failed to satisfy expectations. It has been evident that Bolivia could be much more likely to benefit from the operation of the line than Brazil; but it has happened that the Farquhar interests which have been responsible for the operation of the line have withdrawn from their holdings in Bolivia.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Quebec Central has ordered 2 American type locomotives to be built in its own shops.

The Central Fe Railway of Cuba has ordered one Mogul type locomotive from the Baldwin Locomotive Works.

The Chicago, Milwaukee & St. Paul has ordered 9 electric freight and 3 electric passenger locomotives from the General Electric Company. (See General News section.)

The Russian Government Railways are said to be considering the purchase of something over 100 locomotives in addition to the 30 reported as ordered last week. This item has not been confirmed.

CAR BUILDING

The Chilean Government is reported to have asked prices on 250 freight cars. This item has not been confirmed.

The Russian Government Railways are said to be in the market for approximately 8,000 freight cars. This item has not been confirmed.

The Southern Pacific has ordered 24 all-steel interurban cars from the Pressed Steel Car Company for service on the Pacific Electric.

The Louisville & Nashville has ordered 8 coaches, 6 baggage cars, 4 combination baggage and mail cars and one dining car body from the American Car and Foundry Company.

The National Transcontinental Railway has ordered 250 50-ton all steel freight cars of the Eastern Car Company, 200 50-ton all-steel flat cars of the Nova Scotia Car Works, and a number of sleeping cars from the Preston Car Company.

Railway Supplies for the Swedish Railways.—The Swedish railway authorities are stated to be preparing a list of the materials which will be required in the course of the next few years, and as soon as it is complete it is intended to place orders with various engineering and other firms to a value of about $2,000,000. This is being done for the purpose of assisting to keep the various factories of the country running, and so diminishing unemployment.—*The Engineer.*

Scottish Railways Defy the Elements.—The railway from Dunblane to Oban is liable suddenly to be impeded by large stones dashing down the mountain side. In order to protect the traffic a number of signals are connected to a wire fence alongside the track. In the event of a stone striking the screen and forcing its way through it, the fact of the wires being broken causes the signals to assume the danger position, and, at the same time, starts electric alarm bells ringing in the signal boxes. The Highland Railway goes in largely for "blowers," to prevent snow or sand drifts. The "blowers," which are constructed of galvanized iron, are erected in the cut itself, and not on its edge. Their roofs dip towards the foot of the slopes, thus contracting the orifice through which the snow or sand reaches the rails. This contraction increases the velocity of the wind, or, rather, that of its lower layers, causing it to blow the snow or sand out of the cut before it can settle. The Levens Viaduct, in Morecambe bay, on the Furness Railway, occupies a very exposed position. A train crossing the viaduct during a gale was blown over on its side. A wind pressure gage was then placed in the middle of the viaduct, and so arranged that when it records a pressure of 32 lb. per square foot, electric bells ring in the nearest signal boxes. All traffic across the viaduct is suspended as long as the bells ring, and for a further period of 15 minutes after they have ceased.

Supply Trade News

C. E. Harrison has resigned as co-receiver of the Barney & Smith Car Company, and H. M. Estabrook will continue as sole receiver.

A. L. Moler has been elected vice-president, manager and a director of the Durbin Train Pipe Connector Company, Ltd., Montreal, Que. Mr. Moler has been connected with several large railways as master mechanic and superintendent of motive power in the course of the past 16 years.

J. A. Smythe has been appointed boiler expert of the Lukens Iron & Steel Company, and the Jacobs-Shupert U. S. Firebox Company, with headquarters at Coatesville, Pa., effective November 1. Mr. Smythe was formerly associated with the Parkesburg Iron Company, Parkesburg, Pa., in a similar capacity.

J. Vipond Davies, vice-president of Jacobs & Davis, Inc., consulting engineers, New York, on November 3 was awarded the Telford Gold Medal of the Institution of Civil Engineers of London for his paper on the "Extensions of the Hudson River Tunnels of the Hudson & Manhattan." This medal is the premier medal of the institution and is awarded annually for a paper presented in the minutes of the proceedings of the institution. It dates back to the year 1835, funds for the purpose having been bequeathed by the celebrated engineer Thomas Telford, the first president of the institution.

The representatives of the Sherwin-Williams Company, Cleveland, Ohio, brimful of optimism, are just now getting down to work after the thirty-fourth annual convention of the company held at the Hotel Statler, Cleveland, on November 9-12. Nearly 400 representatives, both traveling and local, attended and listened to talks by their fellow representatives and the department heads concerning the various branches of the company's activities and the successful methods used to get increased business. Particular emphasis was placed on the results of the company's "Forward Again Campaign" instituted last February which has met with splendid success despite the war. The officers and representatives of the company have announced it to be their intention to go forward unhesitatingly with the plans of expansion laid down before the war, an idea well expressed in the president's message to his staff, reading: "We feel confident in the near future that this country will benefit commercially from the sad misfortunes of the great powers now engaged in a life and death struggle. We on this side of the Atlantic not only enjoy the inestimable blessings of peace, but by reason of our abundant harvest and the great demand for our products, a very large section of our population is enjoying unusual prosperity. The financial difficulties resulting from the war and some interference with the shipment of our products abroad are being straightened out, and we believe all who have the courage, the energy and the faith to keep on perseveringly will meet with proper reward."

TRADE PUBLICATIONS

Gate Valves.—Jenkins Brothers, New York, have issued a folder descriptive of the Jenkins Brothers brass gate valves.

Telephone Switchboards.—The Western Electric Company has issued a bulletin in Spanish on Western Electric switchboards for the Central and South American trade.

Power Hammers.—Beaudry & Company, Inc., Boston, Mass., have issued an eight-page booklet illustrating some of the Beaudry power hammers and giving the sizes and dimensions of each.

Foundry Cranes and Equipment.—Catalog No. 99 recently issued by the Whiting Foundry Equipment Company, Harvey, Ill., contains illustrations of the cranes, overhead-trolley systems, air hoists, cupolas, cupola charging machines, core ovens, ladles, tumblers and other foundry equipment made by the company. The various machines and appliances illustrated are briefly described and information given concerning the various variations of types which may be supplied.

Railway Construction

Algoma Central & Hudson Bay.—The line from Oba, Ont., north to Hearst, 50.3 miles, has been opened for operation.

Arkansas Roads.—The A. L. Clark Lumber Company has awarded a contract for the construction of a six-mile railway at Glenwood, Ark., to J. N. George & Son.

Atchison, Topeka & Santa Fe.—This company has begun the construction of eight coach-washing tracks on the river-front property between Seventh and Ninth streets, at Los Angeles, Cal., with the necessary push tracks and air, steam and water lines. The combined length of the coach tracks will be 11,300 ft. In addition to the construction of these new tracks 810 ft. of old track will be relocated. The embankment for the tracks will require 10,000 cu. yd. of dirt and 9,000 cu. yd. of gravel. This improvement is to be completed by January 1, 1915, and will relieve the congestion caused by the increasing traffic due to the Panama-Pacific Exposition. The work is being done by the company's own forces, and the cost will be approximately $52,000.

Battle Creek, Coldwater & Southern (Electric).—According to press reports work will be started as soon as financial arrangements can be made on a line to connect Battle Creek, Mich., with Girard and Coldwater. T. A. Hilton, president; J. F. Thompkins, vice-president, Girard; E. F. Pangburne, secretary, and A. J. Dorrance, treasurer, Coldwater.

Butler County.—This road has been extended from Linstead, Mo., to Poplar Bluff, one mile.

California Terminal.—Right-of-way is being secured, it is said, for an interurban line to be built from San Rafael, Cal., northeast to Sacramento, about 90 miles, through Marin, Sonoma, Napa, Solano, Yolo and Sacramento counties. C. W. Conlisk, San Francisco, is said to be interested.

Canadian Pacific.—The line of the Alberta division, formerly operated from Java, Sask., to Prussia, has been extended from Prussia, Sask., northwest to Empress, Alta., 23.3 miles, and a new sub-division called the Bassano sub-division has been opened for business on this division from Empress west to Bassano, 118.3 miles. An extension of the Weybourne extension has been opened for operation from Govanlock, Sask., to Altawan, seven miles. The Winnipeg Beach sub-division has been extended from Gimli, Man., north via Flaxa, Arnes and Jellicoe to Riverton, 25.4 miles.

Fort Smith, Subiaco & Eastern.—This company, which operates a 14-mile line from Paris, Ark., east via Subiaco to Scranton, has surveys made for the extension which was projected last year from Scranton east to Dardanelle, 23.4 miles.

Great Southern.—This company, which operates a 42-mile line from The Dalles, Ore., via Dufur to Friend, has surveys made for building an extension from Friend to Juniper Flats, 29 miles.

Gulf, Florida & Alabama.—This company has secured funds, it is said, to complete the work on the extension from Broughton, Ala., to Pine Hill, 50 miles. (March 20, p. 703.)

Lakeville Holding & Development Company.—Preliminary surveys are being made by this company, it is said, to build a double track electric line from the terminus of the Dual Rapid Transit Line at Verona, L. I., and Creedmoor east to Lake Success. The plans provide for building a viaduct over the meadows and Flushing creek; also for constructing a bascule bridge. The line may eventually be extended east to Roslyn, in all about 15 miles. W. K. Vanderbilt, Jr., New York, and J. A. Wigmore are said to be interested.

Lorain, Ashland & Southern.—A new line called the Northern division has been opened for business from Ashland, Ohio, via Ashland Junction north to Lorain, 45.5 miles. (October 2, p. 624.)

Mascot & Western.—An officer of this company, which was incorporated last summer, writes that the final location is now being made for a line about 35 miles long, to be built from Kelton, Cochise county, Ariz., the junction point of the El Paso & Southwestern and the Arizona Eastern, north to Mascot, which is just north of Dos Cabezos. The line will be built this coming year. John A. Street, general counsel, 1611 Harris Trust building, Chicago. (July 21, p. 227.)

Metolius, Prineville & Eastern (Electric).—This company, which was incorporated early this year in the state of Washington with $500,000 capital to build from Prineville, Ore., northwest to Metolius, about 32 miles, has surveys completed, it is said, and the right of way secured. Definite plans have not yet been decided upon in regard to the construction of the line. H. B. Scheel, Prineville, president. (April 24, p. 966.)

Mexico North Western.—This company will build a temporary track, it is said, around the tunnel at Cumbre, Mexico, in the Sierra Madres, to expedite traffic while the tunnel is being repaired. This tunnel was wrecked by revolutionists more than a year ago. The proposed line will be about 25 miles long. As soon as the tunnel is reopened through traffic between Juarez and Chihuahua via Pearson and Madera will be resumed.

Northampton & Hertford.—This company, which operates a 9-mile line from Gumberry, N. C., south to Jackson, is making surveys for an extension to be built from Jackson east to Ahoskie, 30 miles.

Pacific, Peace River & Athabaska.—This company, which was organized in Canada, to build from a point on the Pacific coast east to Prince Albert, Sask., about 1,500 miles, has asked the Canadian parliament for authority to build railway lines from tidewater near the head of the Kitimat arm, British Columbia, along Kitimat river, in a northerly direction and via the valley of the Lakelse lake and river to the Skeena river, which is to be crossed by a high level bridge, thence to the valley of the Nass river, near Aiyansh, about 112 miles; also to build a 57-mile line from a point on the Nass river to the summit between the Blackwater river and the Galankeest river, thence to the Skeena river, and up the Skeena river to the mouth of Bear river. Pringle, Thompson, Burgess & Cote, Ottawa, Ont., are solicitors for applicants. (April 24, p. 967.)

St. Joseph Valley.—A new line has been opened for business from Angola, Ind., to North Metz, 9.8 miles. (December 26, p. 1249.)

Tampa & Gulf Coast.—This company is building with its own forces a branch from Baskin, Fla., west to Indian Rocks, 2.5 miles.

Texas Roads (Electric).—L. M. Hewett and associates of Bryan, Tex., are promoting the construction of an interurban electric loop line from Bryan, south via Independence and William Penn to Navasota, thence north to Bryan, about 45 miles. Connection is to be made at Bryan with the Bryan & Central Texas Interurban.

Texas Southern Electric.—According to reports from Corpus Christi, Tex., this company has been granted a franchise in Nueces county to build an interurban electric line between Corpus Christi and Bishop, 35 miles. It is said that the company plans to construct a network of interurban railways to connect the different towns in this section of Texas.

RAILWAY STRUCTURES

Brooklyn, N. Y.—The New York Public Service Commission, First district, is asking for bids until December 1, for the reconstruction of the DeKalb avenue station on the line of the Fourth avenue subway in the borough of Brooklyn. The new work calls for the construction of additional cross-overs and certain station finish work.

Delray, Mich.—The Detroit, Toledo & Ironton will build with its own forces, a frame five-stall roundhouse with concrete engine pits, and a frame freight house 20 ft. by 90 ft. in area, and with a platform surface of 2,500 sq. ft., at Delray, Mich. The approximate cost will be $15,000.

Duluth, Minn.—The Minneapolis, St. Paul & Sault Ste. Marie has awarded a contract for the grading on the site for its proposed freight house on Twenty-ninth and Superior streets,

Duluth, to Fred Baxter. The estimated yardage is 7,000 cu. yd. The freight house, which will be 24 ft. by 64 ft., will be erected by the company's own forces.

Lynchburg, Va.—According to press reports the Chesapeake & Ohio, the Southern Railway, and the Norfolk & Western, have entered into an agreement to build a reinforced concrete viaduct over the James river at Lynchburg. The city of Lynchburg and Amherst county will pay part of the cost of the approaches on both sides of the river and the bridge proper is to be paid for by the railways. The bridge will carry tracks for the operation of street railway cars.

Prince George, B. C.—The Grand Trunk Pacific raised the counterbalance lift section of its bridge across the Frazer river at Prince George for the first time last week to permit steamers to pass up the river. The lift span is 100 ft. long and is raised vertically, a distance of 30 ft. The entire bridge is 2,654 ft. long and has 12 fixed spans and one lift span. A 12-ft. roadway for vehicular traffic is provided on each side.

Rutherford, N. J.—The Erie expects to let contracts early next year for improvemnts to be carried out at Rutherford, including a new station. There will be an island platform and waiting sheds on the opposite side of the tracks which will be connected with the station proper by a subway. The improvements include the elimination of two grade crossings and the construction of a plaza. All the work, including the grading of streets, surrounding the station is to be carried out by the railway company, and the cost of most of the improvements will be paid jointly by the railway and the town of Rutherford.

St. Catharines, Ont.—An officer of the Grand Trunk writes regarding the report that the company will build a new station at St. Catharines, that the question has been under consideration for some time, but has not progressed beyond the preliminary stage. The company has not yet decided when the work will be carried out. (November 13, p. 925.)

St. Petersburg, Fla.—An officer of the Tampa & Gulf Coast writes that work is now under way on the new passenger station in St. Petersburg. The new building is to be of fireproof construction and will cost about $20,000. (November 13, p. 925.)

Wilkinsburg, Pa.—We are told that the Pennsylvania Railroad will ask for bids early in 1915 for building a new station at Wilkinsburg, near Pittsburgh. The station proper is to be of stone and brick construction, 50 ft. by 100 ft., and will cost about $60,000. It is to be built at the street level and the railway tracks will be elevated at that point. The station will have baggage and express facilities in the basement to be reached by wagon from the street level and a waiting room, ticket office and other facilities on the ground floor at the street level. There are to be two tunnels or subways under the tracks with elevators for baggage, and stairs to the platforms. The plans call for the construction of two island platforms of concrete, each 30 ft. wide and 1,000 ft. long built to the level of car floors similar to the arrangement at North Philadelphia, with shelters and shelter waiting rooms. The cost of the platforms and shelters will be $60,000.

Wilkesbarre, Pa.—A contract has been given to the Neeld Construction Company, Pittsburgh, Pa., for constructing a bridge over the tracks of the Delaware & Hudson, the Central of New Jersey and the Lehigh Valley from Butler street on Pennsylvania avenue to Kidder street in Wilkesbarre. The improvements will cost about $87,000. (October 31, page 818.)

German South-West Africa Railways.—The principal line of railway in German South-West Africa is of 3-ft. 6-in. gage and runs from Swakopmund inland via Karibib to a point about 180 miles from the coast. It then turns southward and goes via Windhuk and Keetmanshoop to Seeheim, where it bends coastward, terminating at Luderitzbucht. From Seeheim a branch runs southward to Warmbad. The total length of the line from Swakopmund to Luderitzbucht is 790 miles and of the branch line from Seeheim to Warmbad 139 miles. There is also a narrow gage (2 ft.) line from Swakopmund to Tsumeb, 370 miles, with a branch from Otavi to Grootfontein. The various distances are as follows: Luderitzbucht to Warmbad, 338 miles; Luderitzbucht to Windhuk, 545 miles; Swakopmund to Karibib, 125 miles; Swakopmund to Windhuk, 244 miles, and Warmbad to Windhuk, 484 miles.

Railway Financial News

Baltimore & Ohio.—The stockholders have approved the making of a general refunding and improvement mortgage under which bonds can be issued to the amount of $600,000,000, and have approved of the purchase of the subsidiary lines in Ohio.

John R. Morron has been elected a director, succeeding James Stillman, resigned.

Grand Trunk Pacific.—A press despatch from Ottawa says that the Grand Trunk Pacific has sold $6,000,000 of the $15,000,000 bonds which were guaranteed by the Dominion government last year. This will give sufficient money to carry on its construction work this year.

Liberty White Railroad.—This road, which runs from McComb City, Miss., to Liberty, 40 miles, has been placed in the hands of a receiver.

Missouri Pacific.—This company and the St. Louis, Iron Mountain & Southern have sold to Philadephia bankers $800,000 5 per cent equipment trust notes maturing semi-annually in the next ten years. The proceeds of the sale are to be used to pay in part for 73 all-steel passenger cars now ready for delivery to the railroad.

San Antonio & Aransas Pass.—This company, operating 724 miles of road in Texas, earned in the fiscal year ended June 30, 1914, $4,648,000, a decrease, as compared with 1913, of $461,000. Operating expenses amounted to $3,985,000 in 1914, an increase of $209,000. After the payment of expenses, taxes and interest charges the company had a deficit of $391,000 in 1914 as compared with a surplus in 1913 of $203,000. Operating revenues were seriously affected by the floods and extraordinary rains and washouts that occurred in Texas last year and operating expenses were very much increased from these same causes.

The San Antonio & Aransas Pass, or Sap, as it is spoken of locally, lies wholly within the state of Texas. Its main line runs from San Antonio to Aransas Pass, and it has in addition lines running from Waco to Kennedy on the main line about half way between San Antonio and Aransas Pass, and from Houston to Kennedy. The total quantity of freight carried in 1914 amounted to 1,369,000 tons, which is less by 5 per cent than the tonnage in 1913. Of the total tonnage carried in 1914, stone, sand, etc., furnished 13.76 per cent, lumber and other forest products 13.09 per cent, merchandise 8.44 per cent, cotton and cotton seed 14.00 per cent, and livestock 5.56 per cent. A little less than half of the total traffic carried originates on the line, and the principal decreases were in the tonnage of lumber and other forest products and in the tonnage of fruit and vegetables and of cotton seed. The average length of haul was 135 miles, a decrease of 5.41 per cent from the average in 1913. The average revenue per ton per mile was 1.613 cents, a slight decrease from the previous year. The average trainload in 1914 was 226 tons, an increase over the previous year of 6 tons, or nearly 3 per cent. The total number of passengers carried in 1914 was 1,292,000, a decrease of 1.65 per cent, the average length of journey being 43 miles, almost exactly the same as in the previous year. The average revenue per passenger per mile was 2.420 cents, a decrease of 3.35 per cent.

The Sap had at the end of the year a total of $25,700,000 capital securities outstanding, of which $1,000,000 was stock and the remainder bonds and notes. This is at the rate of $35,497 per mile. There was on hand at the end of the year $159,000 cash, which is less by $416,000 than the cash on hand at the beginning of the year. There were no loans and bills payable, and total working assets amounted to $810,000.

Toronto, Hamilton & Buffalo.—This company has made an application to the Canadian railway commission for permission to merge with it the Erie & Ontario. The main line of the Toronto, Hamilton & Buffalo runs from Waterford, Ont., to Welland Junction, with some branches, making a total of 92 miles.

Economy in Railway Shops

A few weeks ago we mentioned the advantages to be obtained by operating railway shops in such a manner that the progress of the work may be carefully watched with a view of eliminating lost motion and correcting unprofitable practices. There is another point of attack that is open for the road that realizes the opportunity of decreasing its operating expenses by the practice of economy in the maintenance of equipment. We refer to the installation of the improved equipment that is now available for the railway shop. A careful analysis of the shop equipment field will show the intelligent shop engineer machine tools and devices that will materially reduce the cost of production. Of course, money is required to purchase these improved devices, but money is required in almost every case where improvements are to be made. The main question is: Where can the money that is available be spent to the best advantage? Industrial concerns find it profitable to employ the most improved methods in manufacturing their products, the automobile industry being an illuminating example. Much progress can also be made in railway shops if the problems are carefully studied and scientifically analyzed. A dollar saved in maintaining equipment is as valuable as a dollar saved in transportation expenses.

Prosecutor, Judge and Jury

What would be said if the district attorney prosecuting a case were to be suddenly made judge and given also the right to dispense with a jury, and proceeded to hear the remainder of the case which he had begun as public prosecutor? Yet the prosecuting lawyer in the anthracite coal case was, when the case was partly completed, appointed examiner for the Interstate Commerce Commission and sat as examiner through the rest of the case. On the report of this examiner and on the record the Interstate Commerce Commission will decide this tremendously important and highly complicated case. The more conscientious of the commissioners may make some attempt to study the record for themselves, but it would seem to be an impossibility for any one of them to make a thorough study of this very voluminous collection of documents, and the opinion of the majority of them will be based on the report of the examiner; in other words, on the report of the man who began the case as prosecutor. Regardless of how high the ethical standard of this particular lawyer is, his study of the case was originally made with the object of showing that the railroads were wrong. Only by so doing could he add to his reputation as a successful lawyer. It seems hardly possible that any man, no matter how conscientious, would not be to some extent influenced in his way of looking at things by such a preliminary study. This hearing of cases by examiners is another instance of absentee landlordism on the part of the commission, and besides this it is open to objection for other reasons, as in the instance mentioned above. Furthermore, the commission appoints a special counsel to act as a district attorney, as it were; that is, prosecutor. Now the prosecutor may quite possibly be a friend of the examiner who hears the case. This may or may not have ever taken place, but it is a possibility. The only way that the prosecutor can make a reputation for himself is by winning his cases. He is liable, therefore, to become a persecutor rather than a prosecutor, and the influence he can bring to bear on the mind of the examiner may be far stronger than that of the attorneys for the railroad involved in the case. The commission in most cases goes on the report of the examiner in making its decision. This is by no means a wholly fair proceeding to the railroad.

Car Shortage and Surplus Statistics

At the meeting of the American Railway Association in Chicago last week, it was decided to discontinue the compilation of the statistics regarding car surpluses and shortages and car balance and performance. This action was recommended by a special committee composed of some of the leading operating officers of the country. The *Railway Age Gazette* hesitates to disagree with the conclusions of such men, and yet it is most decidedly of opinion that this action was a serious mistake. It may or may not be true that the statistics in question can be so used as to increase the efficiency of operation of individual roads; but railway managements have something else to do besides operate their properties efficiently. They have to defend the properties against unjust regulation. In order that they may do this they must have and use information showing that the attacks made are unjust. Now, some years ago there were serious car shortages. These resulted in the passage of numerous reciprocal

demurrage laws which were intended to compel the roads to furnish cars promptly and were predicated on the assumption that the railways had been negligent in developing their facilities. Periods of traffic congestion and car shortage will come again. The railways will then be criticized again and other proposals will be made for action to compel them to furnish cars promptly. The most effective answer to such proposals would be the presentation of the statistics of car surpluses. The passage of a very little unfair and burdensome legislation would cost the roads more than they would save in many years by discontinuing the compilation of these figures. The railway managers have a great capacity for forgetting and repeating the errors of omission and commission which have got them into their present troubles.

WHAT IS THE MATTER WITH THE RAILWAYS AND REGULATION?

THE attitude which railway men have assumed toward railway regulation, especially within the last few years, has been puzzling to many intelligent persons. These persons know that before the present policy of regulation was adopted the railways made their own rates and managed their own affairs. They know that the rates made then averaged in some years lower and never much higher than now. They know also that there was a progressive increase in the prosperity of the roads before the present system of regulation was adopted. Why, therefore, they naturally ask, do railway men complain so much about regulation? If the roads could prosper before, why can they not now? These questions have to a large extent remained unanswered. Therefore the suspicion has been engendered that railway men have been attacking the policy of regulation followed because they resent any public control and desire entirely to destroy it. The questions referred to deserve to be answered. It is most important that they shall be answered. Briefly stated, then, *the reason why railway men are justified in criticizing the current policy of regulation is that it is steadily undermining the vitality of the railway industry;* and the reason why it is *doing so is that it is based on theories and principles drawn from the experience of the railways before effective regulation was begun and on the assumption that their experience following the adoption of this policy would be and has been the same as it was before, whereas, largely by a coincidence, the course of developments since the present policy of regulation was adopted has been entirely different from what it was before, and for this reason the assumptions and principles on which the present policy of regulation is predicated are wrong.*

Let us briefly survey the course of developments just before the present policy of regulation was adopted and their course since, and we shall see that the foregoing statements are conclusively supported by the facts.

There had been more or less regulation for a good many years. But the present policy dates from August, 1906, when the Hepburn Act went into effect, this being immediately followed by the passage of a mass of state legislation relating to railways. Therefore, between the time when this policy was entered on and the end of the last fiscal year for which we have complete statistics of the Interstate Commerce Commission, June 30, 1913, there was a period of seven years. Let us, therefore, survey the course of developments in the seven years ending on June 30, 1906, and in the seven immediately following.

The former period was one of remarkable expansion in all business, and especially in the railway business. At its beginning railway facilities were built in advance of traffic. There were no considerable advances in the wages of railway employees during this period. There was a rapid growth of traffic and as at its beginning railway facilities exceeded the demands on them, every increase of traffic resulted in each unit of traffic being handled at a lower cost, both in property investment and in operating expenses. Therefore the railway business during this period was economically one of so-called "increasing returns." This would have been so in the absence of an upward tendency of rates; and, as a matter of fact, both the average passenger rate and the average freight rate increased slightly. All the conditions were favorable for a substantial increase in railway earnings and in the percentage of return on investment, and in consequence, the prosperity of the railways did increase to a marked degree.

These developments inspired a spirit of optimism regarding the future of the railways in railway managers, investors and speculators and the public. Investors, speculators and railway managers were so optimistic that the prices of railway securities soared to unheard of figures and the control of some railways by others was purchased at prices which were obviously predicated on the assumption that increases in railway net return would continue indefinitely. But the public was not disposed to let promoters, investors and speculators enjoy all the benefits of the railways' increasing prosperity. It was argued by economists and others that the public should share in it through reductions of rates, and therefore the Hepburn Act empowered the Interstate Commerce Commission not only to correct discriminations, but to reduce rates which it found excessive. Soon afterward there was a flood of state legislation reducing freight and passenger rates; and in 1906 Congress provided in the Mann-Elkins Act that the burden of proof should be upon the railways to establish the reasonableness of any advance in rates made after January 1, 1910. No power was given the commission to raise rates or prevent reductions. The entire system assumed that the tendency of rates should be downward.

Thus the present policy of regulation was begun. By a coincidence the year 1906 not only marked the beginning of the new policy of regulation, but also closed a cycle in railway development. In the fall of that year came the greatest congestion of traffic and car shortage ever known. The traffic had caught up with and now exceeded the facilities. Business conditions and public opinion demanded the investment of enormous sums of new capital in the railways to provide additional facilities, and large new investments were made. In 1907 the railway brotherhoods began extensive and successful movements for large increases in wages. The states and nation quickened the pace at which they were raising railway taxes. And beginning in 1907 there was a marked slowing down in the growth of railway traffic.

The resultant of all these tendencies would have been that the railway business would have ceased to be one of increas-

*Decrease.

ing returns and become, for a time at least, one of decreasing returns, even if the new policy of regulation had not been adopted and rates had remained unchanged. But the new policy of regulation was applied to these new and changed conditions. Instead of rates being increased the average freight rate was reduced. There were thus converged upon the railways, first, influences tending to turn their business from one of increasing returns to one of decreasing returns, and, second, a policy of regulation predicated on the theory that the business was always one of increasing returns and that wherefore the tendency of rates ought always to be downward.

That the course of developments in the periods before and since 1906 has been as we have said is clearly demonstrated by the statistics. The reader's attention is invited to the table on the preceding page.

It will be seen that this table shows that practically every condition favored an increase of income greater in proportion than the increase in outgo in the first period, while practically every condition favored an increase in outgo greater than the increase in income in the second period. The density of passenger traffic increased 47 per cent in the first period and less than 25 per cent in the second. The density of freight traffic increased almost 49 per cent in the first period and less than 27 per cent in the second. The average rate per ton mile increased 3⅓ per cent in the first period and declined 2½ per cent in the second. Gross earnings increased over 49 per cent in the first period and only 23 per cent in the second.

On the other hand, investment in road and equipment increased only 6⅔ per cent in the first period and over 12 per cent in the second. *The average annual wage of labor increased only* 4.4 *per cent in the first period and* 29 *per cent in the second.* Operating expenses increased 51 per cent in the first period and only 29 per cent in the second, but this was because there was a smaller increase in the traffic to be handled in the second period; and it will be noted that the increase in operating expenses in the second period was relatively greater than the increase in either freight or passenger traffic. The increase in taxes per mile was 36 per cent in the first period and 55 per cent in the second. The resultant of the operation of all these forces is summarized in the figures for average net operating income per mile, the increase which in the first period was almost 4/ per cent, and in the second period only 6.25 per cent, as compared with an increase in investment per mile in the first period of only 6.32 per cent and an increase in the second period of 12.23 per cent!

It should be borne in mind, in this connection, that in 1913 the earnings of the railways were the greatest in their history, the total per mile being over 23 per cent larger than in 1906. Enough is known about the results in the fiscal year 1914 to show that when the complete figures for that year are available they will demonstrate even more strikingly than do those for 1913 how true it is that since 1906 the railway business has been one of decreasing instead of increasing returns. For example, we know that in Official Classification Territory the net return on property investment in 1914 was only 3.99 per cent, the lowest figure reached in 15 years. It may be said that the railways earned so much before 1906 that they should have had enough left to carry them through the period of decreasing returns since then. But while the increase in net earnings before 1906 was relatively great, the average earned even in 1906 was not absolutely great, the rise being from 3.9 per cent in 1899 to 5.33 in 1906.

The summation of the whole matter is that beginning in 1906 the country adopted a policy of regulation based on an experience in the preceding decade which led railway financiers, railway officers, shippers and the public to look on the railway business as one of increasing returns, and therefore as one in which the tendency of railway rates should always be downward, and the machinery of the state and national governments have therefore been used since then to hold railway rates down and reduce them. But experience since has been entirely different from experience before 1906. Experience in these two periods has shown that the railway business may be during one period economically a business of increasing returns and in another one of decreasing returns. It has been the latter kind of business since 1906. When economic conditions in general tend to cause diminishing returns, regulation should be such, if the vitality of the railways is not to be undermined and the public prosperity is not to be menaced, as to permit an upward tendency of rates; and the reason why regulation has been and is doing great harm, is that it has run and is running counter to the plain economic tendencies of the time. The trouble is that the railways have been and are still being ground between the lower mill stone of natural and irresistible economic tendencies and the upper millstone of a system of regulation intended to be applied to entirely different and opposing economic tendencies.

What is the remedy? The only remedy is a recognition by the public and the regulating authorities of the plain facts and a change of the policy of regulation accordingly. There is strong reason for believing that developments in the railway business go in cycles; that, in accordance with certain economic laws, there are periods when on any given basis of rates the net return tends to increase and other periods in which on any given basis of rates the net return tends to decrease. If regulation is not to be destructive of the welfare of the railways and the public it must be made flexible enough not only to hold down and reduce rates when these things are justified, but also to maintain and advance rates when these things are needed.

AN UNUSUAL LOW GRADE DEVELOPMENT

JAMES J. HILL is generally recognized as the pioneer exponent of low grade lines as a means of increasing the trainload, and the Great Northern stands today as a practical example of the working out of his ideas. When control of the Burlington was secured by the Great Northern and Northern Pacific, the purpose, of course, was to give the Hill System an entrance to Chicago and access to the large area in the middle west between that point and Denver. The two points of contact between the Burlington and the Great Northern-Northern Pacific lines are St. Paul and Billings. It is not surprising therefore that one of the most comprehensive developments of low grade trunk lines should be carried out on that part of the Burlington leading southeast from Billings, the purpose being to give the Hill system a low grade line from the Pacific coast to Chicago and the Ohio river, and also to Denver and the Gulf of Mexico, as described on another page of this issue.

While we have previously emphasized in these columns the fact that there is a limit to the expenditure which a road is justified in making to secure a low grade line, in this case the cost is moderate when the entire development is considered, while in addition to the local traffic which will follow the opening of the various sections of these lines, there already exists a fairly heavy through traffic which will be turned over to them.

The point of special interest in this entire project is the way in which these various links are being built with reference to the project as a whole, through the rougher and heavier, as well as the more level country, so that when it is all finished it will be possible to run trains from Billings or from the Ohio river to the opposite terminal with almost no breaking up at intermediate terminals to adjust the tonnage for different grades. Practically the only line of similar length on which this condition is found is that of the Santa Fe from Chicago to Belen, N. Mex., a distance of almost 1,400 miles, over which trains are despatched with the same tonnage from one end to the other, the differences in the ruling grades on the several divisions being compensated for by the adjustment of motive power.

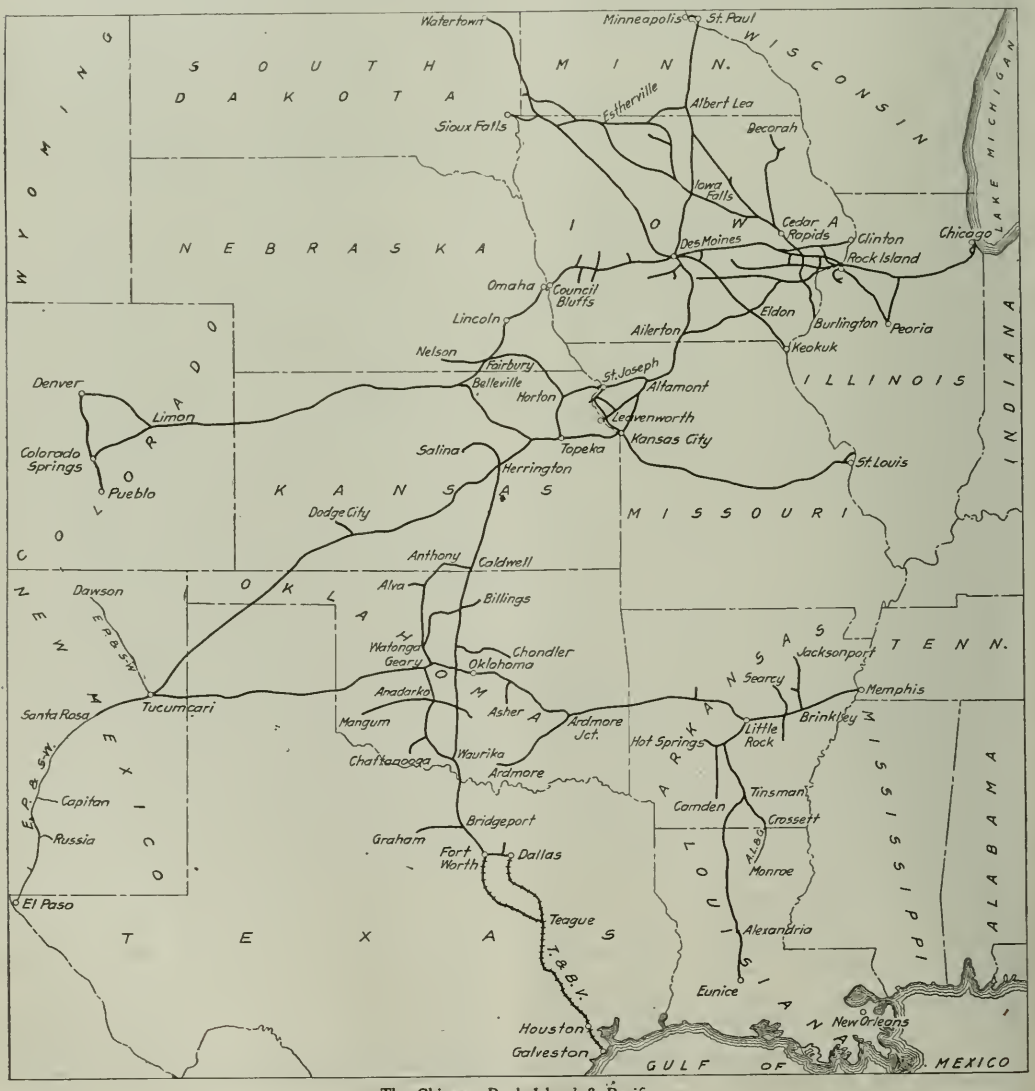
While the economy of reducing grades over a single division is generally recognized, this economy is materially increased when the reductions are extended over connecting divisions so that the cost of breaking up trains because of different tonnage ratings is eliminated. Local conditions seldom permit the development

of a system of low grade lines as extensive, as that here outlined; and the utilization to such an extent of the opportunities that do exist is so rare as to be of unusual interest.

An interesting detail of this project is the evident belief of those in control of the Hill Lines that a considerable increase in the north and south traffic is to be expected, as indicated by the taking over of the Colorado & Southern in 1909, and by the extension of the low grade line of the Burlington to the Ohio river, where the construction of a $4,000,000 bridge was authorized a few weeks ago.

CHICAGO, ROCK ISLAND & PACIFIC

JOSEPH W. FOLK, as prosecuting attorney for the Interstate Commerce Commission, would lay all the present troubles of the Rock Island to evil financial practices of the group of men who have been in control since 1902. President Mudge, in the annual report for the fiscal year ended June 30, 1914, would, by implication, lay the Rock Island's present troubles to reduction in rates, increased rates of wages, increased expenses due to legislative enactments, increased taxes per unit of value and increased cost of capital funds. The truth lies between the two. Mr. Mudge attempts to show that during the years from 1902 to 1914 the property has been improved to an extent that might fairly be said to keep it abreast of its competitors. Capital securities have not been unduly added to, increased operating efficiency has kept pace with the progress of the science of railroading, and the gain in traffic on the Rock Island has been commensurate with the growth of the territory served. Mr. Folk's accusations are so oratorically general, and the strikingness of the picture that he draws is so much a matter of splashes of color indiscriminately applied, that it is impossible to summarize in work-a-day language just what the crime is that has been committed; but in substance it is that in some way the control of the Chicago, Rock Island & Pacific Railway Company by the



The Chicago, Rock Island & Pacific

unfortunate and badly conceived holding company, in turn controlled by a small group of individuals, has resulted in bringing the railway company to the verge of bankruptcy.

In the first place, as of June 30, the railway company was not on the verge of bankruptcy, and although today it is badly in need of some new capital, its earning power is not really impaired and its securities hold out possibilities as a semi-speculative investment that are very far from suggesting a property on the verge of bankruptcy.

Although the Rock Island's history has often been described in the *Railway Age Gazette*, a brief summary of it properly belongs with the comments on this year's annual report. In January, 1902, Chicago, Rock Island & Pacific Railway common stock was selling at 154, and by October 1 was selling at 200. During 1901 the stock had ranged in price from 117 to 136, and during that time D. G. Reid, W. H. Moore and W. B. Leeds had bought sufficient stock to control the board of directors. A plan was put through by which two holding companies were formed—the Chicago, Rock Island & Pacific Railroad and the Rock Island Company. Stockholders of the old company, the Chicago, Rock Island & Pacific Railway were offered $100 in Rock Island common, $70 in Rock Island preferred and $100 in railroad 4 per cent collateral bonds for each $100 of their railway stock; this railway stock to be deposited as the collateral for the 4 per cent railroad bonds. Voting control of the three companies rested in the preferred stock of the Rock Island company. There was in this scheme absolutely no inflation of the railway company's securities; there was simply an exchange of pieces of paper for other pieces of paper with a very much larger nominal value. The income of both holding companies has been nothing more nor less than the dividends which the railway company paid each year on its stock, of which it had at that time about $60,000,000 outstanding, since increased only to $75,000,000.

Operating at a 61.60 per cent ratio in 1902, the company was earning 12 per cent on its $60,000,000 stock, although paying but 4 per cent, while in 1914 the company operated at a 75 per cent ratio and failed by over $3,000,000 to earn a 5 per cent dividend on its $75,000,000 stock, which would have been necessary to pay the interest on the collateral trust railroad 4's.

Briefly summarized, Mr. Mudge's review of the history of the property from 1902 to 1914 is as follows: The mileage increased from 4,094 miles to 8,328 miles; renewal of rails had changed the character of road from one on which a quarter of the mileage was laid with 80-lb. rail and three-quarters with 70-lb. rail, or less, to one on which four-sevenths was 80, 85, 90 and 100-lb., and three-sevenths 70-lb., or less, and tie renewal had resulted in nearly half of the total ties now in track being treated ties. In 1902 about half of the road was ballasted, much of it poorly; in 1914 5,440 miles out of the total 8,328 was ballasted, most of it with rock, burnt clay and gravel; bridges had been strengthened; the mileage of tracks block signaled increased from 20 to over 2,300; terminal facilities and shops had been added to to the extent of $15,000,000; available tractive power of locomotives had been tripled; capacity of freight cars had been more than doubled; passenger equipment had been added to and replaced, making the comparison between 1902 and 1914 as 475 wooden cars to 817 wooden cars and 346 all-steel cars. In the meantime outstanding securities had increased only from $45,713 per mile to $46,730; the capital stock showed a decrease, while the funded debt showed an increase of from $28,088 per mile to $36,604.

All this leads Mr. Mudge to the "indisputable" conclusion that the "primary and fundamental causes for the failure of your company to earn dividends are" those enumerated at the beginning of these remarks. This conclusion hardly seems indisputable.

The Chicago, Burlington & Quincy earned nearly 13 per cent on its capital stock in 1914, compared with less than 10 per cent earned on the same amount of capital stock in 1902. The Burlington's mileage increased only from 8,124 miles in 1902 to 9,264 miles in 1914. The outstanding capital stock remained the same, $110,000,000, and the funded debt outstanding increased only from $18,700 per mile of line operated in 1902 to $19,700 per mile of line operated in 1914. The Burlington's passenger-mile rate in 1902 was 2.12 cents, and its ton-mile rate 7.72 mills; in 1914 the passenger-mile rate was 1.89 cents and the ton-mile rate 7.29 mills. In 1902 the passenger-mile rate on the Rock Island was 2.17 cents and the ton-mile rate 1.06 cents; in 1914 the passenger-mile rate was 1.92 cents and the ton-mile rate 8.6 mills. There is considerably more of a reduction in the ton-mile rate on the Rock Island than on the Burlington; but just as difference in character of traffic largely accounts for difference between the present Rock Island and Burlington rates, so it in part accounts for the difference between 1902 and 1914 rates on the Rock Island. In 1902 the Burlington's average revenue trainload was about 252 tons, and in 1914, 479 tons. The Rock Island's trainload in 1902 was 183 tons, and in 1914, 306 tons.

There is something here besides adverse legislation and general conditions to explain why the Burlington, affected by the same general conditions and by adverse legislative interference, has been able to offset these conditions, while the Rock Island has not. The holding company device *per se* is not an adequate explanation; it was rather the way in which this device was used.

The great and fundamental difference is that the Burlington, besides spending the proceeds of the sale of capital securities on additions and betterments to its property, has made an additional investment in the property through surplus income of $145,683,808. The Burlington's stock outstanding has remained the same, as has the Rock Island's since it was deposited in accordance with the offer of 1902 for exchange of securities.* Whereas the Burlington was able to make its capital expenditures out of surplus without an additional stock issue, the Rock Island was not, and the fact that the agreement under which the stock was deposited prohibits the issue of more stock, either common or preferred, has prevented any financing being done in this way. To this extent the holding company device is directly responsible for the failure of the company to finance its needs through an additional stock issue.

The Rock Island has been well maintained and has been, and is, very well operated. It was in the broader policy of management that the mistakes were made. Neither Judge Moore nor D. G. Reid was a railroad man, nor had they ever taken the time to become railroad men. While the Burlington was spending millions of dollars in grade revision, the Rock Island was operating over the same old 1½ and 2 per cent grades. During all this time from 1902 to 1914 the small group of New York directors held the purse strings. There were able men in the operating management of the Rock Island, but their influence with the New York directors was not sufficient to enable them to awaken the latter to a realization of the opportunity they were missing and to secure a change in policy. All of the things which are recited in the 1914 report as having been done for the betterment of the property added to the value of the service which the road gave; but the essential expenditures for grade revision which were needed to reduce cost of transportation per unit were not made. All of this may be summed up by saying that the management of the road was controlled from New York by a group of shortsighted financiers whose knowledge of railroading was of the slightest. The holding company device permitted control of the road by this small group through a very much smaller actual investment than would have been necessary without the device; and it was the mistaken policy of the men in control, rather than the mere holding company device, that caused the mischief.

The loss of something over $8,000,000 in connection with the merger with and later separation from the St. Louis & San Francisco, is another phase of this same matter, although a more *directly* serious one to the property, since the $8,000,000 loss was a direct drain on the assets of the railway company.

When we have made the allowances indicated above, President Mudge's conclusion is modified as far as it needs to be modified. All of the things which he points out as having tended to re-

*The increase from $60,000,000 to $75,000,000 in stock took place before the stock was deposited as collateral for the railroad 4's.

duce the net of the Rock Island have taken place. If the genius of a Hill or a Harriman, with strong banking support, might during the years between 1902 and 1914 have offset these adverse conditions as it did in the case of the Burlington and of the Union Pacific, this is no reflection whatsoever on the operating management of the Chicago, Rock Island & Pacific, nor need it be a subject of undue alarm, either to investigator Folk or the security holders of the railway company.

The present condition of the Chicago, Rock Island & Pacific Railway is critical, but very, very far from hopeless. Dividends on the railway company's stock having been discontinued, the railroad 4's have necessarily defaulted in their interest payments, and the collateral securing the 4's, which consists of railway stock, has been ordered sold under foreclosure. The railway company operates 8,205 miles of road. In 1914 its total operating revenues amounted to $67,667,000, or 4.50 per cent less than in the previous year. Its total operating expenses amounted to $51,000,000, or 2.86 per cent less than in the previous year. Other income fell off by 84 per cent, and interest and rentals increased by 5.62 per cent, so that there was a net income available for dividends of but $451,000, as compared with $4,058,000 in the previous year. The two quarterly dividends in the first half of the present fiscal year were paid, calling for $1,872,000, so that there was a deficit of $1,421,000. In part, the falling off in other income was due to the failure to receive 4 per cent on the Toledo, St. Louis & Western $5,447,000 4 per cent stock held by the Rock Island. There is no very clear and concise statement in the annual report of the increase in funded debt outstanding in the hands of the public. The statement that $30,519,000 is the net increase in the funded debt is followed by the statement that of such bonds and notes issued during the year and outstanding on June 30, 1914, only $11,986,000 were sold, the balance remaining in the treasury or being pledged as collateral for loans. A total of $20,532,000 was spent on capital account during the year, of which $12,347,000 was for the acquisition of the St. Paul & Kansas City Short Line, the Malvern & Camden and the Rock Island, Stuttgart & Southern. Cash on hand at the end of the year amounted to $5,828,000, comparing with $5,120,000 on hand at the beginning of the year. Up to June 30 the company had borrowed $4,800,000, and the total working liabilities, including these $4,800,000 loans and bills payable, was $12,986,000. Probably the amount of loans and bills payable is considerably larger now than it was on June 30.

The Rock Island is a fine property, with very great possibilities of development. The report which was made by E. W. McKenna, until recently vice-president of the Chicago, Milwaukee & St. Paul, found that between forty and sixty million dollars ought to be spent on the property in the near future. This estimate was high. Any business man can make a study of someone else's business and discover that the other man ought to make innumerable improvements. The McKenna report was that kind of a report. No one can doubt that if $40,000,000 were available it could be spent on the Rock Island to great advantage; but few people who know the property intimately believe that any such large amount is immediately required to restore in a large measure the earning capacity of the road. A strong financial control and the sale of $20,000,000 preferred stock would put the Rock Island in an enviable position.

The following table shows the principal figures for operation in 1914 as compared with 1913:

	1914.	1913.
Average mileage operated	8,205	8,048
Freight revenue	$44,309,636	$46,428,045
Passenger revenue	18,824,651	19,777,431
Total operating revenue	68,208,113	71,364,935
Maint. of way and structures	8,838,586	9,885,324
Maint. of equipment	9,820,703	10,072,854
Traffic expenses	1,924,090	1,999,138
Transportation expenses	28,449,907	27,772,587
General expenses	1,966,660	1,774,199
Total operating expenses	50,999,946	52,504,102
Taxes	3,315,632	2,946,438
Operating income	13,892,534	15,914,395
Gross income	14,060,855	16,944,190
Net income	450,621	4,058,355
Dividends	1,871,763	3,743,525

Letters to the Editor

A PLEA FOR THE YARDMASTER

Minneapolis, Minn.

To the Editor of the Railway Age Gazette:

Railroad terminals are becoming more and more important each year, and require deeper study than any other branch of railroad operation today. Business is continually increasing while terminal yards seem to grow smaller. Heretofore a yardmaster has been given slight consideration and his assistance has been classed as insignificant. Was the yardmaster ever taken into the official family and given an opportunity to discuss his problems and to help his superior officers to make suggestions to bring about changes for the benefit of all concerned? I think not. He was merely the stumbling block. The burden of blame was placed upon his shoulders and he wiggled out of it the best he knew how. But times have changed and the yardmaster has become the skilled chess master of the railroad. Today you find him rubbing elbows with everyone. His views are accepted while the officials offer him suggestions which give him a broader view and renewed courage.

My contention is that the general yardmaster needs a little diversion from his regular routine to stimulate him and show him both sides of a problem. Show me a yardmaster today who is not working hard for promotion. If this is true, why cannot our superior officers train us, as we are willing students and wish to broaden out and learn? Even though we are not promoted, the general knowledge is an education, and I know it is no burden to carry around a little new-found knowledge.

In our yard it is customary to hold yardmasters' meetings, and I can say that every man in our yard knows just as much about the work or changes as the general yardmaster. Let us see what bringing the men together means. The chief clerk in the general yardmaster's office has been taught to handle the detail work and to distribute all instructions and orders. His word is accepted by all concerned, leaving the general yardmaster free of this work.

A line up of each track in every yard and an accurate line up of all transfers from one yard to another, the number of cars and whom they are for, the amount of each kind of empties, the number of cars for all connecting lines, a list of the available engines and crews, with the time they are ready for duty and the number of cars, the tonnage and the class of freight to move, is made out in detail each morning, ready for the general yardmaster at 7 a. m. The general yardmaster puts these lists in his pocket, and no matter where he is, he can talk intelligently on any subject in the yard. Every assistant yardmaster also carries his list and there can be no dispute as to what cars he has and how many. At a glance a general yardmaster can transact such business as may be important and go to any point in the yard where his presence may be needed. Every engine foreman can tell exactly what he has in his territory and what he can do and how he can handle cars of any description. This organization today is handling more cars than ever before and every man is waiting for the end of the month to find out how much we beat the corresponding month of the preceding year.

If the yardmasters' meetings have taught us economy and team work, what would the taking in of the general yardmaster into the official family mean? It would give him ideas he never dreamed of and he in turn could educate his men to higher ideals and make his work a joy instead of drudgery. There are many good points talked over and the spirit of economy would spread not only to the yard but all over the entire system. The terminal problems would be solved and the handling of cars increased far beyond anyone's comprehension.

Fred P. Grossman,
General Yardmaster, C. St. P. M. & O., Minneapolis, Minn.

A Comprehensive Low Grade Trunk Line Development

The Burlington Is Completing One Link of a New Route from Billings to the Ohio River and Denver

The Chicago, Burlington & Quincy has been working for several years on one of the most comprehensive low grade trunk line developments ever projected in this country. Briefly, this includes a low grade route from Billings, Mont., to Paducah, Ky., a distance of 1,500 miles, with a connecting low grade line from Wendover Junction, Wyo., to Denver. This line also connects, at Lincoln, Neb., with the present main line to Chicago.

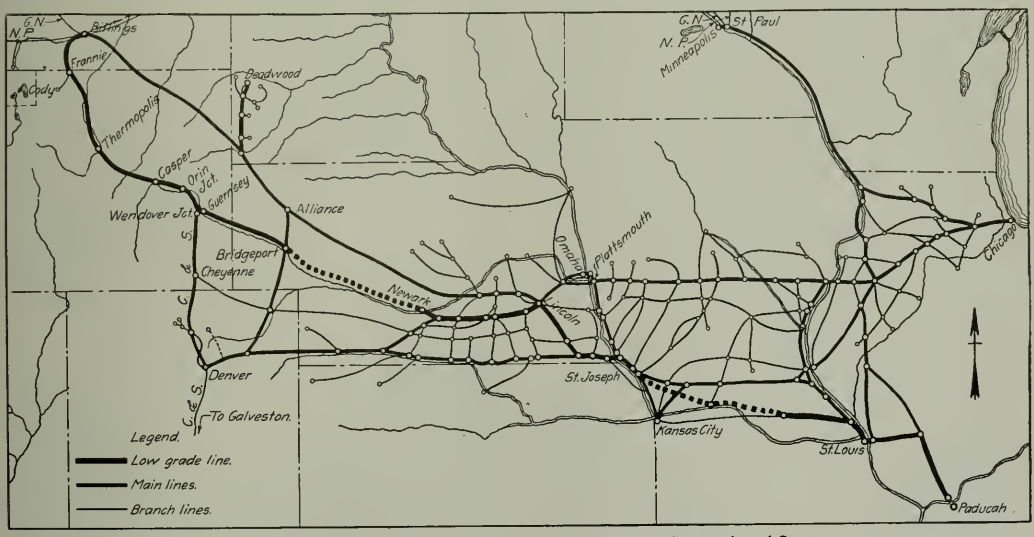
When the work is completed, the maximum grade eastbound will be 0.3 per cent from Billings south 225 miles to Alkali Summit, Wyo., 55 miles west of Casper, and 0.15 per cent from Alkali Summit to the Missouri river at Plattsmouth, Neb., a distance of 674 miles, with practically no adverse grade. From Plattsmouth there will be a maximum grade of 0.3 per cent to Paducah. Westbound this maximum grade has been established at 0.4 per cent from Paducah west to Lincoln, Neb.; 0.3 per cent from Lincoln to Casper, Wyo., and 0.45 per cent from Casper to Alkali Summit. From Alkali Summit to Billings there is practically no adverse grade, with the exception of 35 miles of 0.5 per cent ruling grade from Kane, Wyo., 80 miles southeast of Billings, to Warren, and this will probably be operated as a helper grade. The ultimate plans also provide for a low grade line with a maximum grade of 0.5 per cent from a connection with the Billings-Paducah line, 120 miles north of Cheyenne, Wyo., south via Cheyenne to Denver. As the Burlington is controlled jointly by the Great Northern and the Northern Pacific, and as it in turn controls the Colorado & Southern, this will give the Hill lines direct low grade outlets from Puget Sound points to the Ohio river and to Denver, with the possibility of also securing a low grade outlet to Galveston by reducing the grades on the Colorado & Southern.

The carrying out of the project involves the use of the tracks of the Northern Pacific from Billings south 37 miles to Fromberg, Mont.; the construction of a new line from Fromberg southeast 358 miles to Orin Junction, Wyo.; the use of the Colorado & Southern line from Orin Junction southeast 31 miles to Wendover Junction; the construction of a new line from this point east 8 miles to Guernsey, Wyo.; the use of the present Guernsey branch of the Burlington southeast 98 miles to Bridgeport, Neb.; the construction of a new line from Bridgeport southeast along the North Platte to Newark, Neb., 232 miles; the use of the present line of the Burlington from Newark via Lincoln and Plattsmouth to St. Joseph, Mo.; the construction of a new line from St. Joseph, Mo., to Mexico, Mo., about 200 miles, and the use of existing lines from that point to the Ohio river at Metropolis, Ill., where work has been started on the construction of a new bridge to cross the river and a 12 mile extension to enter Paducah, Ky.

COMPARISON OF NEW AND OLD LINES

Billings has been an important gateway to the northwest for many years. Here the Burlington connects with the Northern Pacific and the Great Northern for Spokane, Seattle and other western points. Since the acquisition of the Burlington by these two roads the amount of traffic exchanged with it at Billings has increased materially. The importance of a low grade line from Billings to points in the central states is, therefore, evident. The present line from the Missouri river, via Lincoln, Neb., and Alliance, is one of relatively high grades, ranging from 1 per cent to 1.6 per cent, with many of 1.25 per cent, especially west of Edgemont, North Dakota.

The new line will avoid these heavy grades and have practically no greater mileage. It will also open up a large territory in northern and central Wyoming, which is now entirely without railroad facilities. While largely a grazing territory, this section is now being rapidly settled up, especially in the Big Horn valley. This line will also provide a new route from Denver to the northwest. At the present time the Burlington handles traffic between Denver and Billings via



Map of Burlington Lines Showing Relation of New Line to Remainder of System

Brush, Colo., and Alliance, Neb. The new line will provide a route of lower grades and is about 75 miles shorter.

At present this new low grade route has been completed and is in operation from Billings south to Orin Junction, where connection is made with the Colorado & Southern. A new line has also been built from Cheyenne to Fort Collins, Colo., completing the new outlet to Denver, although considerable grade reduction work will have to be done on the Colorado & Southern north of Cheyenne. A cut-off is projected from Greeley, Colo., on the Colorado & Southern south to Hudson on the Burlington to complete the low grade line into Denver.

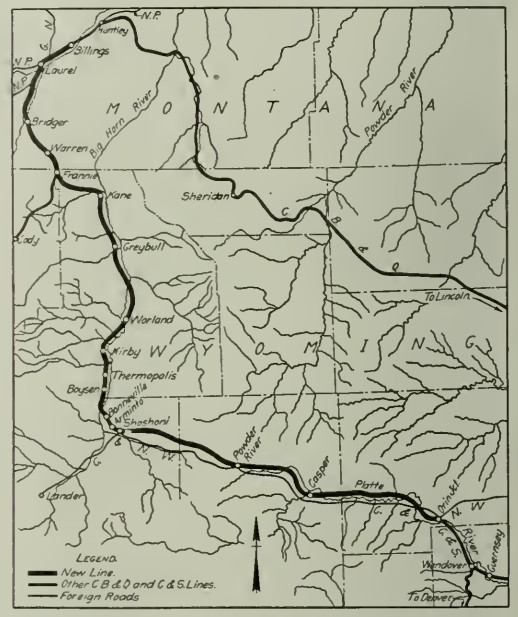
Work was started but is now temporarily discontinued on the construction of an 8 mile connection from Wendover Junction, Wyo., to Guernsey, where a connection is made with the present 0.3 per cent line to Bridgeport. From Bridgeport to Newark no work has been authorized, up to this time, but the construction will be light, as the line will follow the North Platte river for the entire distance. Nothing has been authorized between St. Joseph, Mo., and Mexico, but as stated above, work has recently been authorized between Metropolis, Ill., and Paducah, Ky. It will be seen that work either has been completed or is under way on all but two portions of this 1,500 mile line. West of the Missouri river the only gap is that between Bridgeport and Newark, 232 miles, and an alternate line can be used via Alliance and Lincoln, which is but 45 miles longer, although with heavier grades.

WIND RIVER CANYON

The most interesting portion of this entire project from an engineeering and construction standpoint is that between Billings and Casper and especially that portion south of Thermopolis, Wyo., which was completed late last year. Immediately south of Thermopolis the line passes through Wind river canyon for 12 miles, involving some very heavy construction work costing about $250,000 per mile.

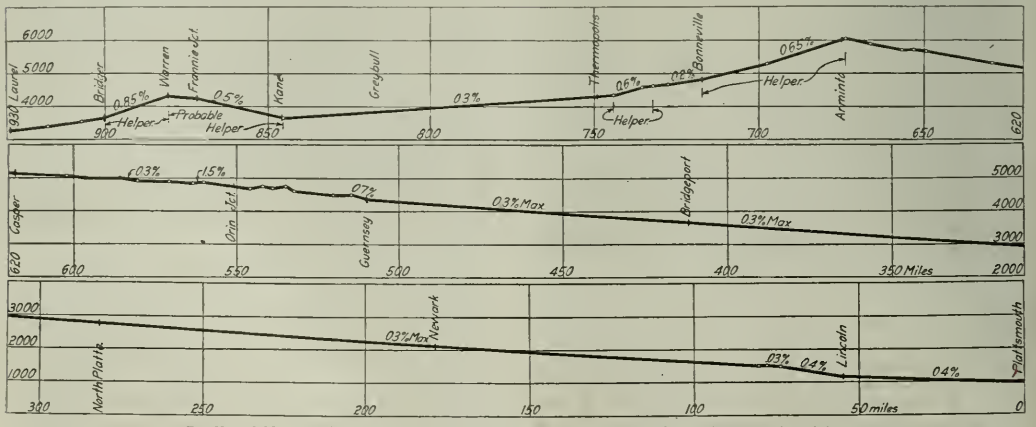
The maximum grades have been given above and are also shown on the profile. The maximum curvature is 1 deg. 30 min. from Orin Junction west to Casper, and 2 deg. west of Casper, with the exception of four 4 deg. and one 3 deg. curves in the canyon.

The heaviest work on the entire line was encountered in Wind river canyon, starting at a point 4 miles south of Thermopolis, and extending south 12 miles to Boysen. At this point the Big Horn or Wind river has cut a narrow channel through a heavy rock formation, forming a gorge 900 ft. deep and in many places less than 200 ft. wide at the bottom. The ruggedness of this canyon and the problems encountered in construction are indicated by the difficulty of locating the line. It was necessary to make the location in the winter in order to get into the canyon on the ice, as there was only one point at which it was possible to descend into it from the top. The presence of several springs along the lower 2 miles made it impossible to work there even on the ice. There was only one point at which the stream could be forded. At times the locating parties were able to spend only one to two hours a day at the work, the remainder of the time being taken in getting in and out. A site for a camp was finally selected in the canyon, and it required a pack train of five burros an entire week to move the camp and provisions a distance of six miles, and cost $165.



New Burlington Line from Billings (Mont.) to Orin Jct. (Wyo.)

The contractors encountered the same difficulty later in



Profile of New Burlington Low-Grade Line from Laurel (Mont.) to Plattsmouth (Neb.)

getting in their equipment and supplies, one man spending a month on the construction of a pack trail in from the north end to his camp. Eventually a trail was completed on the opposite side of the canyon from the line at a cost to the contractors of over $10,000 for the 12 miles. Because of the lack of room beyond the limits of the excavation all camps were established on the opposite side of the canyon from the line. Several cable suspension bridges were erected across the stream by which men and supplies were brought in to the work. The contractors employed a pack train of 40 burros continuously to bring in their supplies. One Japanese sub-

Rock Fill Across Channel of Big Horn River, North of Thermopolis

contractor also lowered considerable material over the cliff with ropes.

The line was located on the west side of the canyon for the entire distance, as it was possible to secure a somewhat better location as regards curvature, as well as to protect it better against the river. The presence of a small dam for power development at the upper or south end of the canyon required the adoption of a 0.6 per cent grade through the canyon, where a 0.5 per cent line could otherwise have been built at a saving of $150,000.

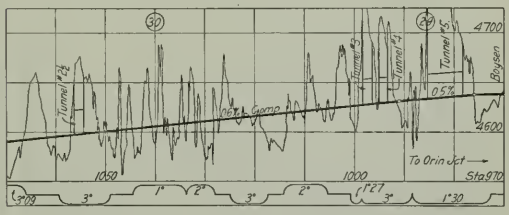
Because of the inability to get heavy equipment in to the scene of the work all material was handled by hand, being hauled out on the fills in many cases in small carts. In constructing the fills a narrow bank was first made with the heavi-

Heavy Work in the Canyon

er rock on the outside to protect it against the stream until it was widened to its full section. At one point a "shoo fly" line was located around a high point, and after the track had been laid through the canyon a steam shovel removed 170,000 cu. yd. of material from this point which was used to widen the embankments to their full section. By this means, the use of rip rap as such was avoided, although the toe of the slope was in the stream for almost the entire distance.

The cuts averaged in general from 100 ft. to a maximum of 238 ft. in height on the high side. In numerous instances they were "daylighted" and the material later placed in the fills. There was some trouble with loose or sliding materials, in which cases it was necessary to remove all this material from the face of the cliff.

In one instance a contractor removed a heavy rock face entirely in a single shot. He drove a tunnel 50 ft. into this face at the center, and then 50 ft. at right angles in each direction, loading it with 60 per cent dynamite and powder. The preparation of this shot, including the explosives, cost



Profile of Heavy Two-Mile Section in the Canyon

$3,500, while the blast threw 8,000 cu. yd. of rock into the adjoining fill, and brought down over 22,000 cu. yd. additional, 15,000 yd. of which was later placed in the embankment.

At another point, the shooting down of a vertical face 125 ft. high completely blocked the river for a time until the water had risen 8 ft., when it cut a channel 65 ft. wide through the debris. The narrowing of the channel at various points through the entire canyon has resulted in a noticeable rise in the surface of the stream.

Six tunnels were constructed in the canyon, the longest of which was 725 ft. The most northerly one was taken out entirely by hand. It was possible to operate air drills at the others, the contractor erecting a compressor plant at the north end of the south or longest tunnel, which was located at the south end of the canyon. Four tunnels were located in the southerly two miles of line in the canyon, three of which were within a distance of 2,000 ft. It was at this point

Trapping Side Hill Debris into Small Cars

that the heaviest work in the entire canyon was encountered, the grading for 3 miles requiring the moving of over 425,000 cu. yd. of rock, in addition to the driving of the tunnels, and costing $450,000, while for one mile the grading alone cost $210,000.

Mud seams in the rock made it necessary to line all the tunnels throughout, except the long tunnel, only the portals of which were timbered. The timber lining for the two norther-

ly tunnels was placed by company forces, while the others were timbered by the contractors as the work progressed. The character of the rock encountered in driving these tunnels and the excavation in the canyon varied widely. At the north end a soft sandstone was found which changed to a hard sandstone, and then to a limestone. At the northerly tunnel a red granite was found, which gave way to a very hard black dyerite near the south end of the canyon.

BOYSEN TO ORIN JUNCTION

Leaving the canyon, the line follows Wind river for 10 miles south of Boysen. It then swings to the east on a 40

After the Heavy Shot was Fired, Bringing Down 30,000 cu. yds. of Rock

min. curve two miles long and follows Badwater creek for 24 miles, after which it ascends Alkali creek to Alkali Summit. In this section there was no work of special interest, the material generally encountered being a clay, with shale in some few instances.

At Alkali Summit a tunnel 830 ft. long was driven through a moderately soft sandstone. Work was carried on from the east end only, and all drilling and handling of material were done by hand. The wall plate drifts were first driven on each side, after which the center section was removed and the full arch centers placed. The bench was then removed in two lifts, the material being loaded in standard gage dump cars. The tunnel has recently been completed and it is now being lined with concrete deposited by air from a mixer located on a car, as described in the *Railway Age Gazette* of November 20.

From the summit to Powder river the work was generally light and presented no special problems. From Powder river to Casper the line follows Casper creek, from which point it parallels the North Platte river to Orin Junction. Ultimately this line will follow the North Platte river from Casper, Wyo., to Newark, Neb., a distance of 437 miles. The grading between Powder river and Orin Junction was mostly earth and amounted to over 5,000,000 cu. yd., the greater part of which was handled by teams.

In a number of instances the force of streams was utilized in an interesting manner in cutting their own channels. Three miles north of Thermopolis it was necessary to change the channel of the Big Horn river, as Wind river is known north of the canyon, to avoid two crossings of the stream. To

North Portal of the Long Tunnel—Boysen Dam at the Left

move the river a small ditch was dug at the proposed location of the stream. A fill of heavy rock was then constructed from the upstream bank on the center line of the road, the forward end of the dumping trestle being carried on a boat. As the fill progressed, the stream was crowded over into its new course and cut its own channel. Under similar conditions one mile south, the old channel was shut off and the stream forced to a new location by sinking a timber crib in the channel, while one mile south of Thermopolis end dumping cars were employed in building an embankment in the channel.

At Bonneville Badwater creek ran close to the line for over one mile, and threatened to cause serious damage at flood stage. A ditch 10 ft. wide was dug some distance from the track with a small dike on the track side. On the first heavy storm the water started down this ditch, widening it to 100 ft., and deepening it so that a permanent channel was established, and danger of further trouble was eliminated. The same plan was adopted at Fetterman, where a drag line excavated a 50 ft. channel for the North Platte river, which the river itself has since widened to accommodate its entire flow.

The bridge work on this line was relatively light. Wind

river is crossed twice at the north end of the canyon and once at the south end on permanent structures. The south Powder river is crossed at Powder river on a high framed timber trestle, and the North Platte is crossed just above Casper on a timber structure. Between Casper and Orin Junction the line crosses the North Platte river four times on permanent bridges. Numerous smaller streams and ravines are crossed by pile bridges. Whenever it was possible to haul material in to the line, cast iron pipe was used for small openings; where pipe was inserted after the track was laid, concrete pipe was used.

Leaving the South End of the Canyon

It was necessary to give close attention to the development of water supplies, both for use during construction and for permanent operation. South of the canyon all water is highly alkali for a considerable distance, rendering it unsuitable for camp use. A large spring of good drinking water was found 1,000 ft. above the grade line, four miles north of the south end of the canyon, and the water from this point was hauled to all the camps along the line. This water was not suitable for boiler use, however, and a pumping station was erected at Boysen during the early stages of the construction. Water secured from Wind river at this point was hauled for the steam shovels working along the line as far south as 62 miles.

In addition to the water station at Boysen permanent supplies have been secured from surface reservoirs at Bonneville, Lysite, Arminto (Alkali Summit) and Powder river, all of which are gravity supplies, except the last. At Powder river the water is impounded by the roadbed embankment, while at the other points reservoirs have been constructed away from the line. At Lysite a six-inch wood stave pipe line was laid from the reservoir to the tank, but all the others were of cast iron. Between Casper and Orin Junction water is secured directly from the North Platte river.

Division terminals have been established at Greybull, 112 miles south of Laurel; at Bonneville, 100 miles further south, and at Casper 100 miles southeast of Bonneville. Passing tracks 4,000 ft. long have been built at intervals of 10 miles, with provision for one every five miles eventually. Slack grades have been introduced at all passing tracks.

The track is laid with second-hand 75 lb. rail west of Casper and new 90 lb. rail east of that point, with square joints on tangents and staggered joints on curves. Treated ties are laid on gravel ballast secured from a pit four miles north of Thermopolis, and another near Casper. Tie plates are used on all ties. The track was laid with a McCabe & Steen track-laying machine, which has laid an average of 7,500 ft. of track daily with a gang of 115 men.

Striking Lighter Work a Short Distance Out of the Canyon

Work on this extension south from Thermopolis to Powder river was started in 1909, and was completed late last year.

The section from Powder river to Orin Junction was started last year. Between Wendover Junction and Guernsey, the contractor has begun driving three tunnels, 3,052, 1,600 and 1,900 ft. in length, respectively.

This entire project has been developed under the direction of T. E. Calvert, chief engineer. A. L. Hoagland is engineer in charge of construction, and C. H. Cartlidge, bridge engineer, has been in charge of the design and construction of all bridges. MacArthur Brothers of New York were the contractors for the construction of the line from Thermopolis

Channel Created by One Storm at Bonneville

to Powder river, and Twohy Brothers of Portland, Ore., did the grading of that part of the line from Powder river to Orin Junction. Kilpatrick Bros. & Collins, of Beatrice, Neb., have the contract for the work between Guernsey and Wendover. Including the station men in the canyon McArthur Brothers had 86 sub-contractors on their part of the work at one time. All track and bridge work was handled by company forces.

REVIEW OF CANAL TRAFFIC

[From the Canal Record]

During the period of two months, from August 15 to October 15, that the Panama canal has been open to traffic, the commercial vessels which have been using it have carried through 583,949 tons of cargo. The traffic has followed fairly well defined trade routes, and the course of the great majority of vessels may be roughly classed in four great groups.

The heaviest traffic has been between the Atlantic and Pacific coasts of the United States. Manufactured goods of great variety and general merchandise are carried from the Atlantic seaboard, principally from New York, and secondarily from Boston, Philadelphia and New Orleans, to the principal California and Puget Sound ports; also, to Honolulu. On the eastbound voyage, these vessels carry chiefly canned fruits, vegetables and salmon, lumber, grain, sugar, pineapples and wine. This trade is restricted to vessels of American registry, and nearly all the American vessels which have used the canal have been engaged in it. During the period of canal operation, 24 vessels have passed through eastbound on this route with 151,290 tons, and 25 westbound with 135,214 tons. These passages, 49 in all, have constituted approximately 44 per cent of all the 113 passages through the canal. The total cargo carried on this route, 286,504 tons, has been almost exactly 50 per cent of all cargo.

A route between the eastern coast of the United States and the west coast of South America has been second in cargo through the canal. Northbound vessels carry principally nitrates from the fields of Chile, with secondary cargo of raw material products of the western countries of South America, and southbound vessels carry manufactured goods from the United States and Europe. The northbound traffic, passing 13 vessels with 93,139 tons through the canal during the two month period, has considerably exceeded the southbound, consisting of three vessels with 18,800 tons, and one in ballast, though the latter seems to be getting under way.

There has been a marked, though probably seasonal, traffic from the Pacific ports of the United States and southwest Canada to Europe with grain. Ten vessels, each heavily laden, have gone through eastbound, with 71,560 tons, and eight vessels, all of foreign registry, have gone from the Atlantic to the Pacific in ballast, to return on this route with grain. In addition, one vessel, which went through the canal with 6,000 tons of manufactured goods, from Antwerp to Tacoma, is to return with grain.

The fourth great route has been from the Atlantic seaboard of the United States to China and Japan, with refined petroleum in bulk and in cases, and other petroleum products. Four vessels have gone through in this trade from the Gulf of Mexico, with 24,931 tons, and four from Philadelphia and New York, with 26,570 tons, an aggregate of 51,501 tons. No vessels have gone in the other direction on this route.

Next to the four principal routes just described, the most notable development has been the coal traffic from the middle Atlantic seaboard of the United States to the Pacific coast of North and South America. Five vessels, four from Norfolk, with 22,535 tons, and one from Baltimore, with 6,000 tons, have carried coal to the upper Pacific, and one vessel from Baltimore has carried 6,010 tons to Valparaiso. The total coal carried has been 34,545 tons. None of these vessels have returned through the canal to this time, but it is understood they will load with Pacific coast products for the eastern United States and for Europe.

The development of a line from Liverpool around South America, with vessels sailing both ways, via the canal, has been arrested by the European war. The only vessel to have used the canal in this route was the steamship Potosi, which passed through the canal on September 25, on its way south, along the west coast of South America. It was held in the bay at Balboa, awaiting orders, but sailed on October 14.

The steamship Desabla, which passed through the canal on October 12, in ballast, was on its way from Rio de Janeiro to San Pedro for a cargo of fuel oil.

The military service of the United States has used the canal for the passage of one army transport and one navy collier, both from Pacific to Atlantic.

In the week from noon, October 20, to noon October 27, following the resumption of traffic through the canal after the opening of the channel opposite the new Culebra slide, 17 vessels were put through the canal from the Pacific to the Atlantic, and 21 from the Atlantic to the Pacific, a total of 38 vessels in seven days. Up to the end of the week, 71 commercial vessels and three launches had passed through the canal in the 27 days of October. The tolls collected on tonnage in this period amounted to $329,704.72, as compared with the total of $369,706.29 collected prior to October 1, in which are included charges for 115 barges towed through the canal before its formal opening to commercial traffic on August 15.

Exports of Cars and Locomotives.—The Wall Street Journal has compiled figures showing that in September, 1914, there were 19 locomotives, having a value of $129.193, exported from this country, as compared with 38 locomotives exported in September, 1913, having a value of $360,788. In the nine months ending on September 30, 1914, the exports of locomotives numbered 222 and their value was $2,240,959, whereas in a like period in 1913, there were 383 locomotives exported, having a value of $3,447,798. The falling off in exports of cars for steam railroads was even larger in proportion than that in locomotives. In September this year the total value of cars exported was $119,531, including those for passenger service. This compares with $929,037 for the same month of last year. The decrease for the nine months period is even greater, the exports in 1914 being valued at $2,303,123 as compared with $9,288,378, four times as great.

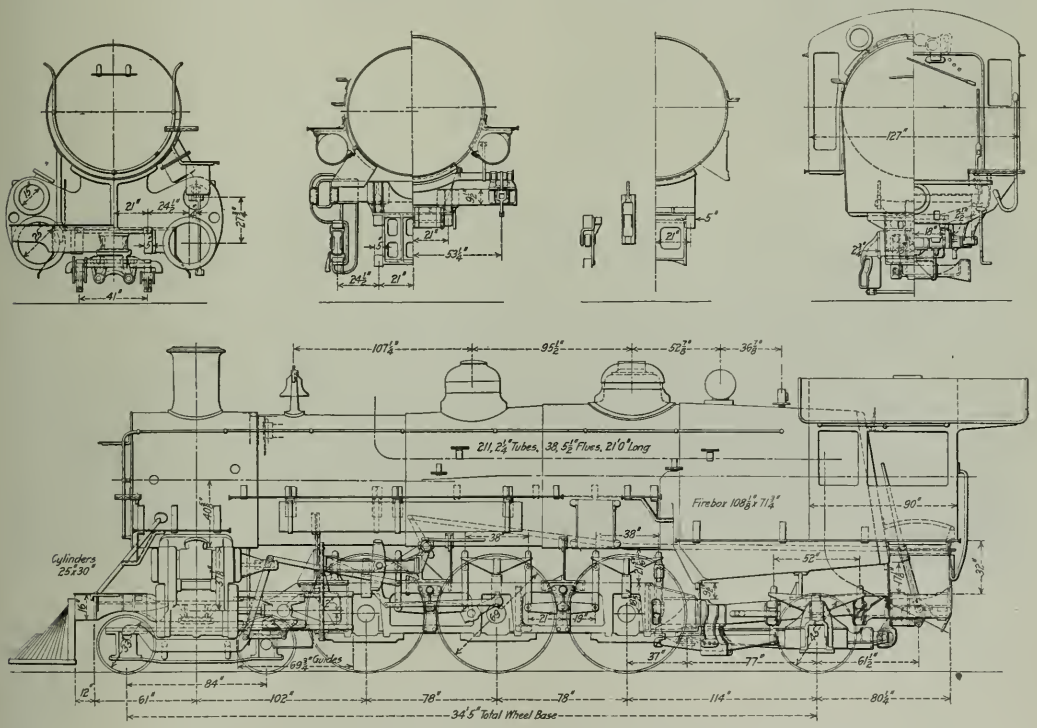
Pacific Type Locomotives for the Clinchfield

Designed for Moderate Speed Service on Heavy Grades; Weight on Drivers, 176,900 lb.; Tractive Effort, 46,000 lb.

The Carolina, Clinchfield & Ohio traverses a mountainous country, and although steep grades were avoided as far as possible during its construction, it is far from level. There are numerous grades from 0.5 to 0.8 per cent, the maximum for a comparatively short distance being 1.7 per cent, while one of the hardest stretches is an unbroken grade of 1.2 per cent approximately 20 miles long. On a line of this character, passenger service is necessarily worked at moderate speeds over the greater part of the distance and the locomotives employed must have capacity to maintain a high drawbar pull for sustained periods, rather than the ability to run at unusually high speeds. This requires sufficient starting tractive effort, backed by ample fully utilized. This is especially true of class P-2, which, as far as tractive effort is concerned, is one of the most powerful six-coupled locomotives thus far built.

The boiler of the class P-2 locomotive is of the extended wagon-top type, 85⅞ in. diameter at the largest course, and is fitted with a 38-element superheater of the Schmidt type; the furnace equipment includes a brick arch. The design has been so worked out that a Hanna stoker can be subsequently applied should such equipment be found necessary. The construction of the boiler is in accordance with the regular practice of the builders, and presents no unusual features of design.

The cylinders have Sheedy by-pass valves and graphite lubri-



Elevation and Sections of Pacific Type Locomotives for the Carolina, Clinchfield & Ohio

boiler power to maintain full steam pressure when working with a relatively long cut-off at moderate speeds.

These qualities are realized in two designs of Pacific type locomotives built for the road by the Baldwin Locomotive Works in 1910 and 1914, and known respectively as classes P-1 and P-2. Three of the former and two of the latter are in service. The leading dimensions of these locomotives are as follows:

Class	Cylinders	Driv-ers, diam.	Steam pres-sure, lb.	Grate area, sq. ft.	Water heat-ing sur-face, sq. ft.	Super-heat-ing, sur-face, sq. ft.	Weight on drivers, lb.	Weight total, lb.	Trac-tive effort, lb.
P-1	23 in. x 30 in.	69 in.	190	54	4,095	...	152,900	233,050	37,200
P-2	25 in. x 30 in.	69 in.	200	53.8	3,982	955	176,900	280,300	46,000

In both these designs, the weight available for adhesion is

cators. The cylinder and steam chest bushings are of Hunt-Spiller metal, as are also the bull-rings and packing rings used in the valves and pistons. The piston heads are of the built up type, with cast steel bodies of dished section to which the bull-rings are riveted. The valves have cast iron bodies, and the bull-rings are carried on cast steel spiders. The valve motion is of the Walschaert type, and the valves are set with a lead of ¼ in. The locomotive is balanced according to the Master Mechanics' Association rule, and careful attention was heen given to the design of the reciprocating parts in order to eliminate unnecessary weight. The driving-tires, driving-axles, and crank pins, are of chrome vanadium steel, and the engine springs and frames are of steel with vanadium content.

The main frames are 5 in. wide, with single rail sections 12 in.

deep under the cylinder castings. The guide yoke is bolted to a steel casting which has long bearings on the upper frame rails, and extends the full depth of the leading driving pedestals. Midway between the first and second pairs of driving wheels is placed another broad casting, supporting a transverse plate to which the link and reverse shaft bearings are bolted. This casting also supports a boiler waist sheet. A similar casting is placed between the main and rear pairs of driving wheels, and a deep brace is placed at the main driving pedestals. The rear driving pedestals are braced by a large casting, which carries the radius bar pin for the trailing truck. This casting also has bolted to it a vertical expansion plate which supports the front end of the mud ring. The rear end of the mud ring is supported in a similar manner by a plate which is bolted to the foot plate.

The tender wheels are steel tired, and the trucks both have side bearings. The tender frame is composed of 12 in. channels, the center sills weighing 40 lb. per foot and the side sills 25 lb.

On the basis of tractive effort, the class P-2 locomotives rank with many large Consolidation and Mikado type engines employed in heavy freight service.

The following table gives the principal dimensions and data:

General Data

Gage	4 ft. 8½ in.
Service	Passenger
Fuel	Soft coal
Tractive effort	46,000 lb.
Weight in working order	280,300 lb.
Weight on drivers	176,900 lb.

THE OPERATION OF A BUSY FLAT YARD*

By R. R. Farmer

Trainmaster, Missouri, Kansas & Texas, Parsons, Kan.

In the operation of a flat yard, the terminal for six divisions, handling an average of 1,800 cars per day, and with a total car capacity of yard tracks of 840 cars, it is absolutely necessary to keep all cars moving. The average number of trains in and out of this terminal each day is 58 freight and 38 passenger trains,

making a train movement in or out every 15 min. and a freight train movement each 28 min. The average amount of terminal overtime is 1 hr. and 30 min. daily.

All trains are broken up, switched and started from this yard. Trains arriving are carded by the carding clerks. After checking the waybills seal clerks and car repairers go over the trains and card all heavy repair cars with full bad order cards and all light repair cars with one-half bad order cards. The trains are then pulled up over the lead, broken up and switched to the various tracks. All heavy repair cars are taken to the car shops and the light repair cars are placed on light repair tracks contiguous to the yards. All cars are classified to the various tracks for the different divisions, which necessitates holding tonnage for some divisions from three to eight hours to get full trains for the slow service freights and to protect tonnage of high class freight such as stock or fruit.

The yard is equipped with an air compressor plant and all train tracks are piped so that the air test may be made by inspectors before the road engine is placed on the train. All crews are required to be in attendance 30 min. before the time

*A paper submitted in the Terminal Yard Contest.

called to leave. We use no engine herder, the head breakman taking the engine to and from the house, leaving it 30 min. before the departure of the train.

The yard force consists of one general yardmaster day and night, one assistant yardmaster day and night, one yardmaster's clerk day and night, who handles all crews and directs the calling of crews, keeps all stock records, terminal delays and rest records; a chief register clerk day and night, with one assistant; two sealers day and night, two carders, one weighmaster and a diverting clerk day and night.

The yardmaster personally checks all details which are furnished from the terminal or point where the train originates, showing loading time on all stock and the release information, etc. This enables him to determine the amount of tonnage and the commodities that are en route to the terminal from four to six hours in advance. Twenty-five per cent of the trains passing the terminal are allowed only 45 min. in the yard and 25 per cent are allowed 1 hr. and 30 min. This includes the time for the trains to be broken up and switched and the re-icing of meats and other perishables, 3 min. per car being allowed for re-icing, which includes all time consumed in spotting the cars to the icing station, re-icing and the air test.

The foreman of the lead engines keeps a check of all tonnage on the various tracks as it is classified, both short and through, which can be furnished to the yardmaster at any time, and is furnished every hour. The yard is equipped with a telephone system with bells at intervals of 150 ft., and telephones are located at convenient points so that the yardmaster is in touch with the engine foremen at all times, and at all points in the yard.

The yardmaster's office is located in the second story of a two-story building at one end of the yard, the first floor being occupied by the operators and yard clerks, and messages being handled from one floor to the other by means of a dumbwaiter. The location of this office gives the yardmaster a full view of the yard and the telephones with the various bells enable him to direct the work of any crew working in the yard at any time.

The yardmaster confers with the chief despatcher frequently by telephone, and at 4 o'clock each evening the chief despatcher furnishes a "starting sheet" to the yardmaster, assistant yardmaster, engine foreman, callers, roundhouse foreman, register clerks and car inspectors, containing general instructions, car orders, special services to be performed, work trains, special cars, and movements of circuses or show troops. This starting sheet usually contains from 30 to 70 special orders. Copies of the starting sheet for the engine foremen are sent to the yardmaster, who checks off the work for the various engines and the foremen are instructed in the work assigned to their engines. As the work is done it is reported hourly to the yardmaster and is checked off on his sheet. This sheet is checked by the yardmaster personally at 7 p.m., 12 midnight, 7 a.m. and 12 noon, and on the last check any work that has not been done is placed on the delay pickup sheet which is used between 12 o'clock noon and 4 p.m. All work that has not been done and cars that have not been gotten out are then given preference over other work.

All foreign cars arriving under load destined to this terminal without home route cards are placed for unloading and immediately on their arrival telegraphic request is made for the home route so that the cars may be moved home promptly when released. All cars passing the terminal destined to stations on the district under the same jurisdiction as the terminal, have a slip attached to the billing instructing the agent at destination to wire for the home route as soon as the car arrives. All bad order cars under load are reported to the chief register clerk by the yard inspector, who "bad orders" the car on a slip showing the number and initial of the car, whether or not a transfer of the load will be necessary and whether the car requires light or heavy repairs. The register clerk then makes copies of this slip in triplicate, sending one copy to the yardmaster, one to the car accountant and one to the foreman of either the light or heavy repair track, as the case may be. When the car is "O. K.'d" on the repair track, the foreman of the repair track fills out the slip showing the time the car was set and the time O. K.'d and sends the slip back to the register clerk, who takes the bill out of the bad order box. The yardmaster is then furnished with this notice after the register clerk has signed it, and checks for the car in the classification tracks after the repair tracks have been pulled. The car accountant holds his slip until the yard is checked at 8 a.m. the following day, and if the car is still on hand advises the yardmaster and trainmaster and the foreman of the car department that the car has been in the yard 12 hours for repairs. All repair tracks are pulled at 12 noon and at 6 p.m. Light repair tracks are also pulled at 12 midnight. With the heavy power and heavy tonnage on this line the average number of bad order cars repaired at the terminal is about 5,000 per month and the average cost of handling cars is about $0.20 per car, which includes wages and fuel.

All engines are assigned to regular work on a ten-hour basis, taking the meal hour in the sixth hour. In order to keep engines in the yard at all times, this necessitates starting them at 6, 7 and 8 o'clock. This system has a tendency to keep down overtime and is more satisfactory to the men, as it enables them to have regular meal hours and the senior men in the service have the engines with the best hours, so they can be at home at the most desirable part of the day.

We make our own switchmen to a great extent by promoting yard clerks and young road brakemen and use great discretion in employing experienced men for the positions of engine foremen. As a rule too little attention is paid to this most important feature. The engine foreman is the one man in the organization that the greatest care should be taken in choosing. He should not be too old or too young and should be cool-headed, steady and sober and should have a fair education. As a rule our yardmasters are chosen from the ranks. They must be instructors as well as governors and must have tact, enthusiasm, friendliness and patience. They must be honest and loyal, and be organizers and disciplinarians.

We keep a permanent record at the yard office of all cars handled, the cost of handling, and the yard damages; comparative statements are made each month with the preceding month and the same month of the previous year, showing all decreases and increases in cost of operation, yard damages, personal injuries and yard and terminal overtime. Any item showing an increase calls for a complete analysis and explanation. All the force takes a lively interest in reducing the cost of operation and yard damages and in decreasing the number of personal injuries. We have a safety committee which makes a periodical trip of inspection over the yards and reports all unsafe conditions and practices which are given immediate attention and either remedied or eliminated.

The yard is patrolled day and night by special watchmen who hold commissions as city or county officers, and all unauthorized persons are kept out of the yards as far as possible. Merchandise trains are guarded by these watchmen all of the time they remain in the yards.

Disinfecting Railway Cars in Russia.—In the year 1910, experiments were made in Russia in the disinfection of railway cars by steam and formalin, the latter being sprayed from a mechanical sprayer worked by naphtha. The results as regards destruction of germs—plague, typhoid, tuberculosis, etc.—and insects have recently been reviewed. They have been fairly satisfactory. At the commencement of the operation the temperature of the inside of the car—which is completely closed—is raised by the admission of steam to 65 deg. C. This occupies from 15 to 20 minutes, according to the design and size of the car. But it has not proved an easy matter to get a uniform temperature. The spray is then applied for 20 minutes. In practice the entire process occupies on an average about 45 minutes. Stress is laid upon the necessity for maintaining the internal temperature at or near 65 deg. C. Lately ammonia has been used with formalin. The vapors affect some of the paints used in the carriages, and that least injured appears to be the white lead paint used in the interior of the fourth-class cars.

RAILWAY AFFAIRS IN OTHER COUNTRIES

H. A. Walker, general manager of the London & Southwestern, in a speech at a dinner in London last week said that when the government took control of the English railways a period of 60 hours was allowed the railways in which to transport troops in 350 special trains to given points. The whole job was accomplished in 48 hours. Mr. Walker said that his own road had handled at the docks at Southampton 75 special troop trains in one day. These trains came from every part of the Kingdom, and were scheduled to arrive at 12-minute intervals. Every train kept to its schedule to the minute, yet in that 12-minute interval each preceding train unloaded troops, horses, etc., and got out of the way of the succeeding train. Mr. Walker paid a warm tribute to Henry W. Thornton, the American general manager of the Great Eastern, saying he had been received by his colleagues in that spirit of friendliness which dominated English and American railway men. Mr. Thornton made a speech, praising the efficient organization and spirit of patriotic co-operation manifested when the railways of England were suddenly called on to handle one of the biggest transportation problems in the world.

Railway Bridge in Poland Destroyed by Austrians to Check the Russian Advance

* * *

The first electrification of a steam railway within the Polar zone has been practically completed by the Swedish government on the Kiruna-Riksgraensen section of the line from Lulea, Sweden, on the Gulf of Bosnia, across the Scandinavian Peninsula to Narvik, Norway, on the Atlantic Ocean, a distance of 293 miles. Electrification was determined upon for the section from Kiruna, which is about 87 miles north of the Arctic Circle to Riksgraensen on the border line between Sweden and Norway, a distance of 80 miles, for the purpose of increasing the capacity of the line in preference to double tracking. Practically the only freight business is the transportation of iron ore, of which 3,000,000 tons were hauled in 1913 by steam. It was desired to increase the capacity to 5,000,000 tons a year, and electricity was adopted to permit heavier trains and an average increase of about 25 per cent in speed. The large amount of available water power and the scarcity of coal were also important factors. The electrified line runs through an uninhabited country where temperatures of from 25 to 35 deg. below zero are common in January and February. Although a period of two years was allowed in the contract for completing the work, the actual time available on account of weather conditions was only about seven months. The power station is located at Porjus Falls, 74 miles south of Kiruna, and power is transmitted at 80,000 volts by a tower transmission line to four substations, where the potential is stepped down to 15,000 volts for the contact trolley line. Electric locomotives hauling passenger trains of 200 metric tons and ore trains at 1,855 tons will be used, and the contract specifies speeds of 31 miles an hour on level track and 18.6 miles an hour on 1 per cent grades. The equipment will include two passenger and 13 freight locomotives.

SAFETY BAGGAGE RACK

The Atchison, Topeka & Santa Fe has placed in service on some of its through passenger train cars a new type of baggage rack designed by the engineer of car construction. These racks were designed to provide ample storage capacity. They are provided with gates which slide on the frame of the rack and serve to keep the bags, parcels, wraps, or whatever may be placed in the rack, in place. The illustration shows the racks installed in one of the day coaches recently built by the Santa Fe, and also shows the way in which the gates are operated by the passengers. There are two gates to each rack, so arranged that each may be operated independently of the other.

Safety Baggage Rack in Santa Fe Coaches

The racks are of special advantage, especially on through trains where a considerable amount of hand baggage is often carried by the passengers, in that they will hold more than the ordinary rack now used, and at the same time prevent the luggage from falling on the heads of the passengers. In this way it eliminates damage claims from these causes and provides sufficient capacity to hold all the baggage of the passengers, thus keeping the aisles free from obstruction. The construction is so substantial that the gates will slide easily when the rack is loaded to its full capacity.

The National Association of Railway Commissioners

Convention at Washington, D. C. Abstract of Committee Reports and Addresses. Valuation Discussed and Criticized

The twenty-sixth annual convention of the National Association of Railway Commissioners was held at Washington, D. C., on November 17 to 20. Delegates were present from 27 states and from Canada. Judson C. Clement, of the Interstate Commerce Commission, presented an address of welcome in which he urged the necessity for co-operation between state and federal authorities for the purpose of bringing about a uniformity of regulation, pointing out that unless there be uniformity in state policy the discrimination against which regulatory legislation is aimed will be perpetuated. He said that a state which declares a policy of low passenger fares places a burden on interstate commerce which must be borne by states which allow higher fares, and that the same is true with regard to low scales of freight rates.

Lawrence B. Finn, of Kentucky, president of the association, in his annual address, also discussed the conflict between state and federal legislation, saying that if the Interstate Commerce Commission ignores state-made rates, as it has announced its intention of doing in a number of cases, discriminations will continue. He referred to the conflict created by the differences between the policies of the federal commission and the state commissions as "competition in regulation," calculated to perpetuate discrimination. "Suppose a state commission has fixed intrastate rates," he said, "and the courts have refused to hold them to be unreasonable; subsequently these rates are investigated by the Interstate Commerce Commission, and are found to discriminate against interstate commerce. On an appeal to the courts the state rates are found not to be confiscatory; on an appeal to the federal Supreme Court, the finding of the Interstate Commerce Commission that they are discriminatory is sustained, which judgment shall prevail? If the former judgment prevails the discrimination continues. If the judgment concerning the act of the Interstate Commerce Commission prevails, then the state is deprived of rates which the courts refused on the first appeal to condemn."

Charles A. Prouty, director of valuation of the Interstate Commerce Commission, presented a discussion of the work of the commission in its valuation of the property of the railroads. Mr. Prouty said that probably the most important practical question before this country today is its treatment of the railroads, and that he has felt that this valuation must have a profound influence upon its discussion. The question as to whether the government is to take over these agencies of transportation or whether they shall be left to the operation of private capital can never be satisfactorily answered in the minds of most people until we know what relation the actual value bears to the present outstanding securities. Assuming that we are to leave the discharge of this function to private enterprise, there arises the even more difficult question as to what the treatment of this private capital shall be, and what rates shall be accorded in order that the present investment may be fairly dealt with. In the past this question has not been acute for rates have been sufficient to maintain railroad credit, but it is evident that the time is at hand, if it is not already here, when there is grave doubt as to whether these rates must not be generally increased. This question cannot be satisfactorily answered until there is a national valuation of these properties. He said the commission has not yet determined the relation between present value and reproductive value, nor has it determined what value is to prevail in the final valuation of the property itself. Great doubt, he said, exists as to what ought to be attempted as to original cost to date. An attempt has been made to go back to the beginning and to rewrite the accounts for the carrier down to the present time, but that the work was so voluminous and expensive, as well as difficult, that a simpler plan had to be evolved. He estimated the cost of making the valuation at from $25,000,000 to $35,000,000 for the railroads, and about $12,500,000 for the government, if no attempt is made to find the original cost to date in too minute detail.

The discussion of the conflict between state and federal authorities also came up in connection with the report of the committee on amendment of the act to regulate commerce.

The Committee on Car Service, Demurrage, Reciprocal Demurrage and Storage Rules advocated reciprocal demurrage, and recommended that there be a meeting between the committee of the association and the National Industrial Traffic League demurrage committee, and the Committee on Relations Between Railroads of the American Railway Association to consider the subject.

The Committee on Express Rates and Express Charges, of which Martin S. Decker, of New York, is chairman, presented a report showing that the gross operating revenues of the express companies had been reduced from $168,800,000 for the fiscal year ending June 30, 1913, to $158,000,000 for the year ending June 30, 1914, while the operating income was reduced from $4,413,459 to $404,529. The report made no attempt to analyze the figures.

The Committtee on Rails and Equipment, of which C. C. McChord of the Interstate Commerce Commission is chairman, presented a report saying that rail statistics should be gathered and made available, which will show the causes of failure.

The Committee on Statistics and Accounts, of which B. H. Meyer of the Interstate Commerce Commission is chairman, recommended that the state commissions adopt completely the various accounting orders of the Interstate Commerce Commission on the ground that such adoption will secure a uniformity in accounting not otherwise practicable, and will permit the accumulation of a body of statistics which will become increasingly valuable as the period of years covered becomes greater. The committee also recommended that the committee for the ensuing year be instructed to revise the state forms for annual reports of steam railway companies to conform as closely as practicable to the revised form of annual reports adopted by the Interstate Commerce Commission.

The Committee on Railroad Taxes and Plans for Ascertaining the Fair Valuation of Railroad Property, of which John M. Eshleman, of California, is chairman, submitted a report outlining in detail the work done thus far by the Interstate Commerce Commission in its valuation of the property of the railroads. The committee made no recommendations, but suggested that those who framed the statute under which the commission acts were not as well informed on the problems to be met as might have been desirable, and suggested the necessity of a study of the statute both by representatives of the states and of the Interstate Commerce Commission, with a view to recommendations to Congress in the way of suggested amendments as the work proceeds. The committee expressed the belief that the work mapped out in the statute is impossible to be accomplished in its entirety, but that the commission will develop the difficulties of the plans. The committee also expressed the belief that the value of the work will not meet with the expectations of those who framed the statutes under which the work was undertaken.

The Committee on Uniform Classification and Simplification of Tariffs, of which E. E. Clark of the Interstate Commerce Commission is chairman, submitted a progress report, and recommended the adoption of a resolution which had been adopted in the previous two years, providing that there should be appropriate legislation by Congress authorizing and directing the Interstate Commerce Commission, assisted by a body of disinterested experts appointed by the commission and paid by the fed-

eral government, to frame and promulgate a classification of rates to apply uniformly over the United States.

The committee on Railway Service and Railway Accommodations, of which O. H. Hughes of Ohio is chairman, urged greater attention on the part of commissions to station accommodations. The committee said that "it is reasonable to say that more deaths are occasioned by improper ventilation of train coaches and waiting rooms than by train accidents." The report also considered a large number of the various details of railway service in which it found material for criticism, and recommended that the Interstate Commerce Commission be given full power and authority to prescribe the character of equipment to be used in interstate commerce, also authority to prescribe the manner of using or hauling the same.

The Committee on Rates and Rate-making submitted a report in which it said that while rates continue to be made by carriers and to be passed upon by regulatory commissions by the exercise of individual judgment, rather than by the application of any accepted formula or standard, there are two very noticeable present tendencies in the theory and practice of making and regulating rates. These are to give greater weight to cost in rate-making and to recognize the close relationship between railroad securities and railroad rates. One member of the committee is of the opinion that cost of service can be and ought to be made the basis of transportation charges.

The executive committee of the General Committee on Physical Valuation, of which Milo R. Maltbie of New York is chairman, submitted a report reviewing at length the work done by the Interstate Commerce Commission in connection with its valuation of the property of the railroads of the United States, and describing what has been done by the committee in an advisory capacity. The report states that generally the committee has taken the position that the department of valuation should report to the Interstate Commerce Commission the vital and fundamental facts necessary to a complete appraisal, but should not attempt to settle the questions of public policy, finance and law that are involved. These must be settled by the Interstate Commerce Commission, and if the department of valuation were to prejudge them, and if the department were not in accord with the commission, much of the work done by the department might be useless or subject to expensive revision. The report reviews a large number of questions in connection with the valuation which the committee has considered and on which it has expressed its views before the department of valuation. At the last conference the committee took the position that the railroad companies should state or the accountants of the department should ascertain to what extent existing property has been paid for, (1) by the issuance of securities or other obligations, (2) out of surplus income or, (3) out of operating expenses. This suggestion brought forth a statement from the railroad companies that if a company owned property used for railroad purposes it was entitled to have that property valued, and that it did not matter whether or not its cost had been included in operating expenses. To this the committee replied that the discussion of this subject involved questions of public policy and of constitutional law, and that the Interstate Commerce Commission should have before it a statement showing the sources of the funds used to pay for the property.

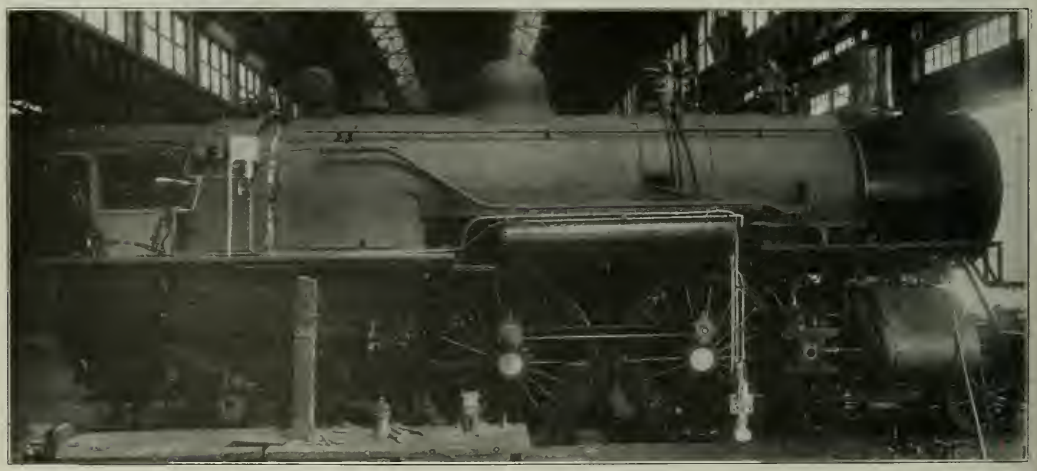
Arthur Hale, general agent of the American Railway Association, presented a paper on "The Danger of Freight Congestion."

Officers were elected for the ensuing year as follows: President, Clifford Thorne, of Iowa; first vice-president, R. B. Prentis, of Virginia; second vice-president, Max Thelen, of California. William H. Connolly, now secretary, was elected secretary for life, and James B. Walker, of New York, was made assistant secretary. It was decided to hold the next convention in San Francisco on October 12, 1915.

AUTOMATIC TRAIN STOPS ON THE CHICAGO & EASTERN ILLINOIS

The Miller automatic train stop apparatus, which has been in use on the Chicago & Eastern Illinois for a year past, constitutes the most extensive installation of the kind in America. The officers of the road have given us some account of their experiences with it; and for the first time we have some notes on the behavior of apparatus of this kind in a situation where both long and short trains are run and where both low and high speeds, with both passenger and freight trains are common in everyday service.

This device has been developed by the Miller Train Control Corporation, of Staunton, Va., a new concern in this field; and the installation on the Chicago & Eastern Illinois tracks has been made by it, at its own expense. A brief description of the system was published in the *Railway Age Gazette*, June 5, 1914, page 1246. Ninety locomotives have been equipped with the apparatus and the length of the road embraced in the in-



Automatic Stop Apparatus on Chicago & Eastern Illinois Locomotive

Cab Removed; Special Apparatus Painted White.

stallation is 107 miles, all double track, on the Chicago division. On 24 miles the stops have been in use for a year. The apparatus is electro-mechanical, so called. A ramp fixed on the ties, 22 in. outside of the track rail, engages a member depending from the engine. The ramps are fixed in the rear of each automatic block signal a sufficient distance to allow room in which to stop fast trains. The ramp, when not electrified, causes an application of the air-brakes; when electrified it energizes an electro-magnet on the engine which prevents the operation of the brake-applying apparatus. There is no visual or audible signal, and no speed recorder; neither is the operation of the apparatus affected in any way by the speed of the train; though these additional features have been worked out, so that they could be readily applied.

Each ramp is 180 ft. long with a short insulated section in the middle, making virtually two contact pieces. The outgoing end of the ramp is kept constantly electrified, so that an engine moving backward, as in switching operations, would never be stopped. The ramps are made of 35 lb. standard T-iron.

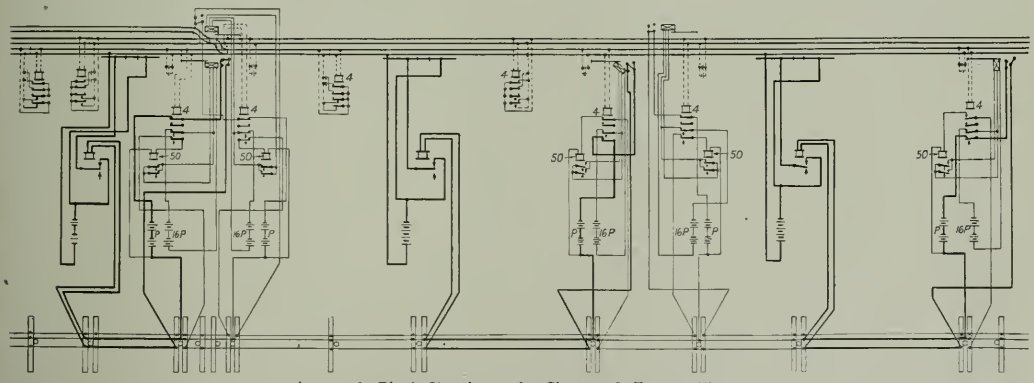
The contact member on the locomotive consists of a shoe fastened to the bottom of a vertically movable piston working against a strong spring, the whole being supported on the back end of the crosshead guides. The piston is raised three inches when it engages the ramp, the ramp being three inches higher in the center than at the point near the end where the shoe strikes it. The movement of the piston opens a valve, allowing air pressure from the air-brake train line to enter a small air cylinder in the cab of the locomotive. This pressure forces a piston upward; and this piston operates a crank controlled by an electric lock. The lock, mounted on an axle, revolves if its magnet is de-energized, but does not revolve if the magnet is energized. Revolving, an arm attached to it operates a three-ported valve, allowing air pressure from the train line to enter the operating cylinder. This opens the engineman's air-brake valve, giving a service application of the brakes; and closes the throttle. The electric lock is operated by a current from the road-side battery conveyed through a wire extending from the shoe upward through a pipe to the box in the locomotive cab which contains the lock.

Thus the absence of the electric current at a ramp, from any cause, will result in the application of the air-brakes. There is train line pressure in all pipes and a failure of pipes or their connections also causes a stop.

In the drawing, ramps are shown on the lower or eastbound track only. The wires which are added to the signal system for the operation of the stop are shown in heavy lines. The three eastbound signals shown in this drawing, it will be seen, are successively in the clear, caution and stop positions. At the signal which is at stop the circuit-breaker is open, de-energizing the relay which opens the circuit connecting with the ramp in the rear of this signal. At the other two signals the circuit-breakers connected with the signals are closed and the corresponding ramp relays hold the local circuits closed.

Immediately after the first installation was put in service, two enginemen were employed by the manufacturers as traveling inspectors, with orders to make surprise tests. In this way, check has been kept on the operating conditions developed; enginemen never knew when or where one of the traveling inspectors would board the train. The inspectors were required to report on daily forms the exact conditions met, on each train, when passing each ramp and each signal. During the entire time nothing has ever been encountered showing a false clear condition. In every case where there was a signal failure or an unnecessary stop, a careful analysis has been made to determine the exact cause. The inspectors report on each trip to the division engineer, and after investigations of any stops requiring explanation, a report is made to the superintendent, and a copy sent to the engineer of the train control company; the development of the system has very closely followed the information given in these reports. Some minor details have been changed to meet operating conditions more efficiently. There have been unnecessary or "safe" stops, but the number of these has been gradually reduced by investigating the causes and removing them.

The signal maintainers are required to report the ramp voltage on each ramp-stop report, and to test and report the ramp voltage weekly to see if there is any depreciation. The train speed has been required on ramp-stop reports, this to furnish data by which to determine whether the ramps are placed the right distances from the signals. These distances were estimated on a basis of a speed of 60 miles an hour. The reports also require information regarding the condition of the rail, whether there is sleet, rain or snow, and whether it is foggy or clear, and the direction and estimated velocity of the wind.



Automatic Block Signals on the Chicago & Eastern Illinois

Wires for train control apparatus are shown by heavy lines

As all of the ramps are fixed at or beyond the estimated necessary braking distance in the rear of the automatic block signals, and as, therefore, the engineman has no warning as to what to expect at any given ramp (except as he can see far ahead, or may be able to guess the conditions of the block which he is about to enter) the apparatus has come into use many times. In other words the system has been used not merely as an adjunct or a warning, or as a provision against emergencies, but has been worked regularly, along with the stop signals. There is no provision for warning the enginemen, to enable them to avoid being stopped by the operation of the shoe at any given ramp. In a given month for example, there were 122 cases of trains being stopped by the ramps. Of these, 107 are to be classed as normal; that is to say, the engineman found the visual signal against him.

Fifteen stops were caused by defects of apparatus, the block in advance being clear. These causes are classified as follows: two because of a broken wire on the engine magnet; one by a broken wire at the shoe; one because of wires crossed; six by the burning out of relays at the ramp; one by failure of battery; four by defective relays at the ramp.

To test the practicability of applying air-brakes safely on long trains by means of an automatic apparatus, the Chicago & Eastern Illinois has made a number of experiments; and as a result of these experiments all of the locomotives used on long and heavy freight trains have been fitted with a control device which applies the air-brakes but does not close the throttle. With the lighter locomotives used on passenger and fast freight trains, the brakes are first applied and then the throttle is shut off after the reduction in pressure has had time to reach the rear end of the train. With the long and heavy freight trains, however, it was found that the automatic apparatus closed the throttle too soon. The throttle is now in complete control of the engineman. On passenger trains and light freights, the stops made by the apparatus are regarded as satisfactory.

In order to get a good idea of the performance of the train stops in bad weather, orders were given to the maintainers not to touch the ramps or to clear snow and ice from them during last winter, nor to adjust them during the summer when track was surfaced. A recent inspection of the ramps showed that none of them had been displaced a half-inch out of line in the entire length. No damage had been done to any of the ramps by parts dragging from cars. The ramp is fixed close to the running rail and the ends of it are bent downward and safely buried under the ties.

None of the ramps shows an appreciable effect of the wear of the shoes during service of more than a year. The wear on the shoes, which are made of hard metal, has resulted in a change in the device so that new wear blocks may be inserted in them by loosening two small bolts and exchanging the old wear block for a new one. There has been no mechanical maintenance charge for ramps to date, although a dragging freight car door came in contact with one of them.

It is estimated that the battery, of 16 cells, R. S. A. Standard, will last two years, the local circuit being closed only when a locomotive is passing over the ramp.

A good example of the successful operation of the apparatus under adverse conditions is given in the report of Inspector Wamba of the trip of passenger train No. 4 on February 23, 1914, when there were snow drifts six and eight feet deep in the cuts and the temperature was about zero. The storm had begun on the morning of the day before and continued all night, snow falling continuously and drifting badly, with a strong northeast wind. The windows of the cab of the locomotive were covered with snow on the outside and with a good deal of ice on the inside, caused by the melting and subsequent freezing of snow which was drawn into the cab by suction. The engineman's clothing was so badly frozen by the snow, which was blown in and covered everything in the cab, that he had to be relieved for a part of his trip by the inspector, who had been an engineer on the road. Most of the signals were not seen at all, and dependence was placed entirely on the automatic apparatus. All of the 16 signals shown on the report indicated "proceed" except one, No. 106, at which the train was stopped by the control apparatus. After the train had been stopped, the signal was seen to be red. The train made practically its running time, the engineman declaring that he felt safe because of his knowledge of the reliability of the train control apparatus. At the end of the trip the apparatus—shoe, wiring, piping and all details—was examined and found to be in perfect condition, although the shoe was a solid mass of ice and frozen snow.

Losses of Towels from English Railway Cars.—It was stated in a police-court prosecution at Newport, lately, that the Great Western had 30,000 towels stolen from its car lavatories last year.

EFFICIENT MARKETING OF FARM PRODUCE*

By D. G. Mellor

Manager, Order, Commission and Food Products Department, Wells, Fargo & Co.

Our food products department was organized in August, last year. We are a part of the traffic department, with a manager in New York City, assisted by seven industrial agents located in Baltimore, Cleveland, Chicago, St. Louis, Kansas City, Houston and San Francisco. The territory in which the company operates is definitely divided between them. Their duties are of a very general character, and cover anything that promises to be useful to producer, dealer or consumer. They familiarize themselves with the products now obtainable in their territory, their general quality and quantity; when they mature, how packed, and where marketed. We learn what produce that might be sold to good advantage is not grown in certain districts, and endeavor to interest someone in it. We secure data regarding the kind and size of packages required by law or practice in convenient markets, and advise where they may be bought. The names of dealers, hotels, restaurants, and other consumers living in towns along our lines are tabulated and given to producers who are interested in better markets, and the names of producers located on our lines are given to dealers and others who are anxious to secure more and better produce. This starts correspondence, and the movement of fruit, vegetables, butter, eggs, etc., from the farm, not only to the large cities, but to many small towns that under ordinary circumstances would not receive any of the melons, peaches, berries, etc., grown practically at their door. This results in a quick, cheap and very general distribution and minimizes the opportunity for glutted markets in which prices are often forced below the cost of transportation.

On July 1, Wells Fargo succeeded the United States Express on the Baltimore & Ohio. When this change had been decided on the Baltimore & Ohio officials called our attention to a large new crop of particularly fine peaches maturing almost immediately at several points on their line in West Virginia, in what may be termed the Cumberland district. I went there immediately and found the crop was all it had been reported to be. We suggested that we would undertake to circularize our agents at all fair-size towns on lines we operated east of Chicago and St. Louis, and tell them about the fine fruit, when it would begin to mature, and instruct them to call upon all dealers in their cities, and leave with each one a list of the growers which we had prepared and which was sent with our circular letter. This idea appealed to the leading orchardists, and the advice was sent out within a day or two. In the circular we also called for information regarding quantity and quality and maturing date of any locally grown fruit. This data opened up additional opportunities for business, and gave advance information that enabled us to avoid over-supplying certain districts and pointed out those offering the best market. We also asked for the names of dealers in each city, and how many baskets they thought they could sell daily. This data was compiled in convenient form and given to the growers. People at each end of the line began to write those at the other end. New opportunities for trade sprang up. Two thousand carloads of fruit moved to a very large number of markets and was sold at good prices, much better than would have been possible had they gone to only a few markets. No glut occurred anywhere.

To facilitate the movement of early fruits and vegetables from southern California, south Texas near the Mexican frontier, and other districts having a favorable climate, a fleet of up-to-date refrigerator cars have been built and are operated anywhere on the company's lines. They will soon begin to move early lettuce, peas, beans, etc., from the territory farthest south to St. Louis, Chicago, New York, Boston, Philadelphia, and other large northern cities where local consumption is considerable and from

*Abstract of paper presented before the Railway Development Association, Chicago, November 11, 1914.

which distribution to less important centers can conveniently be made. As the season advances the cars are loaded at more northerly producing points. By the closest possible supervision they are kept busy practically the whole year and offer sufficient refrigerator service to move all crops that mature and require refrigerator service by passenger train from points on our lines. The work of these cars is supplemented by a considerable number of pony refrigerators that are carried in ordinary express cars in care of our regular train messengers who attend to reicing whenever necessary. For the past month they have been moving regularly from southern California loaded with the first strawberries. Later they will carry the earliest cherries from the neighborhood of Sacramento. These little boxes, about as large as a good-sized trunk, moved from California last winter and spring to practically every northern state and to many important cities in Canada, Quebec and British Columbia. They made it possible for the grower to market his crop efficiently and are coming into more general use each season.

Our food products department is also doing a great deal of work on the direct-from-farm-to-table idea, something that appeals more directly to people generally than does the work I have just spoken of. When we find someone with good things to sell at fair prices, we tell interested consumers about it. Orders and cash are given to our agents who send both to the agent at the producing point. The orders are promptly filled and shipped. All concerned are benefited. So far the number of consumers who use this marketing medium has been steadily gaining.

Each Monday morning we receive quotations at New York and some other important cities, on various kinds of produce. These prices hold good for the whole week. This data is tabulated and a weekly bulletin is sent off each Monday to agents and to people who have asked for them. Against each kind of produce we show where it can be had and how it is packed. With this data it is an easy matter to see if there is an advantage and how much. In New York City and in the Jersey suburbs we have a large number of branch offices. To each of these we send one or more bulletins, for information and distribution. A large number of individuals outside our service are also supplied. Many orders for produce are given to our agents to fill. Eggs are another commodity that moves advantageously in small lots direct from producer to consumer. During the past year we have heard from a great number of shippers and have moved many hundreds of cases. Usually 15 or 30 dozen can be had for about five cents per dozen less than the retail city price. Many families cannot use a large quantity of either butter or eggs. For such people we have shippers who put up 10 lb. of butter and 10 doz. of eggs in one package, or any other quantity that will suit better, but less will not be economical.

Farmers are putting up bushel boxes of either apples or potatoes, also boxes containing a half bushel of each. At 10 cents per quart a bushel would cost $3.20. Good potatoes are delivered in New York for 90 cents per bushel and apples from $1 to $1.50. Honey is another product with which our success has been marked. Thirty tons were shipped last season in small lots from one station in Michigan. We are advised that this successful movement has resulted in the production of 40 tons this year and that orders are coming in fast. Ham and bacon, maple sugar and syrup, country sausage, fancy cheese, buckwheat flour, and dressed poultry, either by itself or in combination boxes with eggs and butter, are popular. Chestnuts and pecans are also seasonable products that take well. Last year between Thanksgiving and New Year's we took many orders for a combination box consisting of a turkey, celery, cranberries, and sweet potatoes. This year there is a great demand for the same package.

For the purpose of developing trade in California specialties we made a rate last year of four cents per pound, with a minimum of 35 cents per package, to apply on all kinds of food products from the Pacific Coast to any point reached by Wells Fargo, the American, Adams, or United States Express. In other words, the rate applied entirely across the continent to the farthermost point in Maine. A little booklet of 20 pages, mentioning many of the products for which California is famous, was printed and distributed from our important offices east of the Missouri River. In this booklet we explained that raisins, prunes, figs, olives, nuts, oranges, and all kinds of dried and preserved fruits and vegetables would be delivered at the door for a certain price. A gallon of ripe olives cost only $1.28. Eight pounds of freshly packed prunes were delivered for $1.13. Orders were received by hundreds. Between November 1 and May 1 80,000 packages of these delicious products moved directly from producer to consumer. Many housewives learned for the first time that these home grown fruits were the best in the world. This year's booklet came out last week; already orders are coming in. Judging from results during the few days since distribution and by the numerous calls we had for the booklet before it was issued, we expect that the volume of business this year will be even greater than last.

In this direct marketing idea one difficulty developed early. That was, the inability of small families to buy much at one time of many things in almost daily use. Our buying clubs are the result of this condition. In offices, stores, factories, police and fire stations, also in post offices, men have seen the advantage to be secured through collective buying. Ten men decide that between them they can use 30 dozen eggs or 20 pounds of butter. One of them acts for the club, collects the cost of the eggs and butter from his fellows, and takes it with the order to our nearest agent. He issues a money order and sends both to the producer. The eggs and butter are promptly shipped. On arrival a division is made and each man carries his share home. All are actually doing something themselves to reduce their cost of living. They can usually save about five cents per dozen on eggs and five cents per pound on butter.

TESTS FOR COLOR BLINDNESS IN NEW SOUTH WALES

Dr. G. H. Taylor, chief medical officer of the government railways of New South Wales, reports that in examinations of men for defective vision, he is making use, with very satisfactory results, of Stilling's plates and Nagel's anomaloscope. The regular examinations on the New South Wales roads are by Holmgren's wools and Williams' lantern, but in any case which is doubtful resort may be had to these other schemes.

Stilling's plates are a series of plates arranged two on a page in book form, each plate about 4 by 3½ in. They were designed by Professor Stilling, of Strassburg. On each plate there are numbers, some 2½ in. in height, made up of a series of reddish dots, of different shades; and, forming a background for these reddish figures, is a groundwork of dots of different sizes and shades, and of such colors as the color blind are likely to confuse with colors in the figures. When a person with normal vision is shown these charts he has no difficulty in reading the numbers, but one with defective color sense, especially for red and green, finds it difficult or impossible to distinguish the color of the figures from that of the background; and so he cannot read the figures.

The anomaloscope is made by Dr. Nagel, of Berlin. One of them was shown by Dr. Williams at the meeting of the Ophthalmological Section of the American Medical Association at Atlantic City last June. It is very useful in testing doubtful cases, but is not available for use in the routine examination of large numbers of men on account of the care necessary in its manipulation and the difficulty of transporting it safely. It uses pure prismatic colors, and is so arranged that as one looks into the eyepiece he sees a circular field, the lower half of which is lighted by a pure sodium yellow, which can be varied in intensity, while the upper half is lighted by a mixture of pure red and green. These colors, in certain proportions, make a yellow which corresponds to the yellow in the lower half of the field, if it is of a certain brightness.

The tests are made (*a*) by seeing what mixture of red and green the person under examination will make to match the

sodium yellow, and then (*b*) by seeing what brightness of the yellow he will make to match the red-green mixture, the mixture being varied to show a marked red, or a marked green. The normal eye cannot make a match under these last two conditions, but the person with defective vision is satisfied with a match made of the two halves of the field by altering the intensity of the yellow.

Dr. Taylor says that in the year 1913 the number of candidates for employment on the New South Wales lines who were rejected because of defective color sense was 800 out of a total of 13,803 applicants, or 5.8 per cent; and for the past six years the average percentage rejected was 5.5. Furthermore, in a study of 200 consecutive examinations this last year he found 15 rejections, or 7.5 per cent. Of these 15, seven, or nearly one-half, passed Holmgren's wool test successfully, but all failed when tested by Williams' lantern.

In the early years of the investigation of color blindness—a physical defect which, broadly speaking, is congenital and incurable—it was everywhere accepted as a fact that among men (not including women) the universal percentage of color-blinds was four; in any large number of men, one in twenty-five would always be found defective. Whether these higher percentages reported from Australia are the result of more searching tests or are due to some difference in Australian subjects, as compared with men examined in Europe and America, does not appear.

In all of the 200 examinations just referred to, Stilling's plates were used; and, in addition, 52 consecutive cases were tested with the anomaloscope. Writing concerning these cases, Dr. Taylor says:

"The method of examination in this railway service is by regulation confined to the modified Williams' lantern and Holmgren's wools. Men in the service and employed on the running lines are periodically examined by the lantern only.

"My method of examining by Stilling's plates is to take candidates in batches of four, after the examination by the wools and lantern. A large majority of partial failures was in mistaking the 3 for an 8, or the 7 for a 2. In a second attempt they named the numbers correctly. A failure was recorded when a man did not correct his mistake, although he may have named one of the two numbers correctly. Red-green-blinds by the lantern are in my experience always convicted of color blindness by Stilling's plates. A candidate who can name all of the plates without hesitation is rare, although I have seen an uneducated laborer do so. I have examined a very large number of candidates by Stilling's plates. In my opinion it is an admirable method of testing color sense, and is of more assistance to the examiner and much more reliable than is Holmgren's wool test. It is indeed the best single test I have seen. But it would be unwise to trust entirely to Stilling's plates, as occasionally a feeble color sense is not detected by that method, and a defect by Stilling's method may not be so clearly defined to an ordinary observer as by the lantern. The education of a defective color sense by Stilling's test depreciates the value of the test, as it does with the wools, the lantern and the anomaloscope, but there is a limit in each person beyond which the education of a defective sense cannot go.

"Complete blindness in the numbers of any of Stilling's first five groups should, in my opinion, be enough to reject a candidate, although he is able to pass the lantern test without mistake.

"Stilling's method is of great assistance in determining the fate of green-white men. A green-white man by the lantern, in my opinion, if he fail completely in any plate of Stilling's first nine groups should be rejected without the right of appeal. If he fail in the lantern test, but does not fail in Stilling, he should be allowed a re-test. If he fail only in Stilling he should be allowed a re-test. Every color tester of wide experience must have seen, as a rare case, a green-white man convict himself in a second examination of red-green-blindness by the lantern.

"When large numbers of men are examined, it would be necessary that each pair of numbers in Stilling's plates should be separated from the book and pasted on a flat surface and used as a card.

"With the anomaloscope, persons with a normal color sense and trained in color will be found to vary on different days. Some persons are more consistent in their appraisement than others.

"Has the tobacco or alcohol habit an equal effect upon the appraisement of color in persons with a keen and in persons with a feeble sense of color? Is a temporary disorder of body or mind, which may slightly disturb the judgment of an ordinary man, more liable to cause error in color discernment in a person with a feeble sense than in a person with a keen color sense? Is it safe to allow a person who has at any time been convicted of having a feeble color sense to act as a driver or fireman on the running lines? These are interesting questions concerning which science has not yet spoken definitely. But the examiner can take no risk."

Dr. Taylor sums up his experience with Stilling's plates by the statement that in his opinion these plates should replace Holmgren wools, as a test for color vision in the railway service, and be used in conjunction with the Williams lantern, as modified by him.

STRIKE ON THE ST. LOUIS SOUTHWESTERN

As noted in a recent issue the circuit court of the city of St. Louis (Mo.) has issued an injunction restraining the firemen, trainmen and conductors' brotherhoods on the St. Louis Southwestern from striking on account of the discharge of a conductor for intoxication. The following extracts from the court's opinion reveal some of the methods adopted by the brotherhood to prevent the exercise of discipline by the management, and their manner of taking a strike vote. The decision relates the history of the case, showing that after Conductor Tillman had been discharged for intoxication he filed a grievance with the committee of the Order of Railway Conductors, which in due course reached the defendants in the case, the chief officials of the federated organizations on the railway. A complete investigation was held in the president's office, and a large amount of testimony was taken on both sides. That testimony was printed and distributed in booklet form by the railway company on September 4, but on September 2 the officers of the organizations ordered a strike ballot of the engineers, conductors, firemen and trainmen, and although they were informed by President Britton that he would have the testimony printed in full and furnished to all the members of the order, they declined to wait for the testimony. The result of the vote by the engineers was against a strike. The other three orders voted for a strike, the conductors by a very small majority.

The court says:

"The method of taking the vote was to send a messenger to call upon the members of the order, and after they had voted to deliver the vote to the messenger, to be returned to the defendants. In most cases they declined to let the members take the vote and brief home with them or to have any chance to examine them, except right there at the time.

"The strike ballot purports to convey to the members of the orders the facts which had come into the possession of these defendants with reference to the intoxication of the conductor at the time he was alleged to have been intoxicated.

"The ballot sent out was a printed document, purporting to present to the members at least a synopsis or resumé of the facts and testimony that the defendants had taken, and to be a fair presentation of the facts to the members, so that they could vote intelligently, and that undoubtedly is a necessary requirement, because the members themselves know nothing about the proceeding except what they may gather in a general way, and from this statement; and they undoubtedly relied very much upon what this strike ballot contained in deciding how they should vote.

"It was a matter of a good deal of importance with them whether a strike should be ordered or not, and the statement should contain a fair synopsis of the testimony and of all the facts.

"After the vote had been taken and reported, and before it was declared, the pamphlet of the 4th of September, which was published by the railway company, was sent out, containing all the testimony. There was an effort then made by the members of the orders, or quite a number of them, to have either a new vote taken, or to have the strike declared off. They held meetings at points on the road, and some of them telegraphed and some sent by letter requests to have their votes changed. The committee refused to accept those orders to change any of the votes. The testimony shows that they claimed that before they were received the votes had already been canvassed, counted and the result declared. I do not think that the testimony establishes that fact. Some of those telegrams at least came before that was done. I think that was not done until about the 15th or 16th of September. In passing it is well enough to say that there is no question but that a member should have a right to have his vote changed at any time before the vote is canvassed and the result finally declared. The method of doing that should only have required such means as would properly and certainly inform the committee that that particular member wanted his vote changed, whether by telegram, a letter or in person; provided the committee was assured of the verity of the demand.

"Finally, a large number of the members of these orders came to St. Louis, and there was a meeting held at which some of the defendants were present a part of the time, and the result was that the members who came here did not succeed in any way and they were informed by the chief officer who had the right to declare a strike that they had received the authority to do so, and he was going to do it whatever might happen. I think his language was that he would declare a strike if only one man went out and the orders went to perdition.

"Having failed to get any relief in that way, certain members filed this suit to enjoin the defendants from declaring a strike on the vote which had been taken. I think there were five members to begin with, all conductors. Afterwards a large number of the members sent their written requests to counsel representing the plaintiffs, to have their names entered as plaintiffs. Afterwards quite a number of those made affidavits stating that they wanted their names withdrawn as plaintiffs.

"A comparison of the matter set out in the strike vote or strike ballot and the printed testimony contained in the pamphlet of September 4 last and a careful consideration of all the testimony leave no doubt whatever in my mind that the matter set forth in the strike ballot does not present to the members such a statement as would enable them to intelligently pass upon the question of the intoxication of Mr. Tillman.

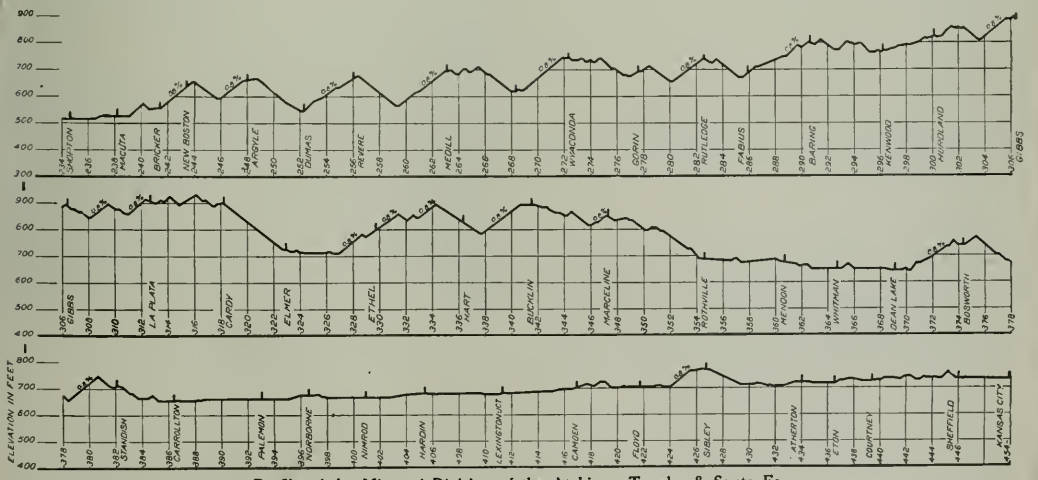
"The members in a case of this kind must necessarily depend to a large degree upon the officials who investigate it and they are entitled to a fair statement of the facts. If they attempt to give the facts which they ought to do, because these members who vote act somewhat in the capacity of a jury, as it were, they ought to give the facts on both sides so the men can vote intelligently and determine for themselves whether a strike should be ordered or not. It must be a two-thirds vote. The engineers, as I have stated, voted not to go out, and the conductors, I find from the testimony, so far as it bears on that, had a very small majority.

"The conclusion, therefore, is that that paper called the strike vote or ballot, does not contain that full and fair statement that it should, which necessarily results in a finding in favor of the plaintiffs. A temporary injunction will be granted on plaintiffs' giving a bond for $3,000.00. The injunction will not interfere with the defendants' taking another vote if they choose to do so."

PERFORMANCE OF SANTA FE BALANCED COMPOUND PACIFIC TYPE LOCOMOTIVE

In the early part of the present year the Atchison, Topeka & Santa Fe received 35 balanced compound Pacific type locomotives, some of which were put in service on the Missouri division. These locomotives, which were illustrated and described on page 1519 of the June 19, 1914, issue of the *Railway Age Gazette*, have a total weight of 277,700 lb., develop a tractive effort of 34,000 lb. and, owing to the continually increasing weight of passenger trains, are being used to replace balanced compound Atlantic type locomotives, on this division. As will be seen from the profile the Missouri division is very hilly with a ruling grade of .8 per cent; and from Shopton, Ia., to Carrollton, Mo., a distance of 152 miles, about two-thirds the length of the division, the curves are numerous with but little straight track. While none of the grades are long, many are too long to be considered as momentum grades.

On September 24 a test run was made with one of the Pacific type locomotives on train No. 7, between Shopton, Ia., and Big Blue Junction, at which point the Santa Fe joins the Kansas City Terminal. No. 7 is a fast express and mail train leaving Chicago at 2:15 a. m.; it is delivered to the Missouri division at Shopton, which point it is scheduled to leave at 8:16 a. m. The test train consisted of one dynamometer car, one test car, two mail cars, 10 baggage and express cars, three coaches, and one business car, making a total of



Profile of the Missouri Division of the Atchison, Topeka & Santa Fe

18 cars, weighing 1,085 tons. On the first district between Shopton and Marceline, a distance of 112.7 miles, the train is scheduled at an average speed of 40 miles an hour, including two regular station stops. Over the second district from Marceline to Big Blue Junction, a distance of 99 miles, the schedule speed is 37 miles an hour including three stops. The test train left Shopton at 8:21 a. m., five minutes late; arrived at Marceline at 11:07 a. m., two minutes late and left that point at 11:14, four minutes late. At Deans Lake, 21 miles west of Marceline the train was on time and remained so until after passing Carrollton. It left Lexington Junction at 12:45, seven minutes late, but made up this time before passing Eton and finished the run on time, arriving at Big Blue Junction at 1:42 p. m. Owing to a number of recent slides and slight washouts there were several slow orders, a total delayed time of 28 min. occurring between terminals. In ascending what is known as Ethel hill, a slow order was encountered which made it necessary to reduce the speed to 10 miles an hour on the hardest part of the grade, but the engine accelerated the train to a speed of 28 miles an hour before reaching the top of the hill two miles beyond. Including stops the train made an average speed over the division of 40 miles an hour; deducting stops the average speed was 43 miles an hour. The maximum speed attained was 65 miles an hour and with one exception the engine was able to keep the speed above 35 miles an hour on the most difficult ascending grades. In ascending New Boston hill the speed was reduced to 26 miles an hour on account of the brakes sticking on two cars. On the straight and practically level track of the second district the engine had no difficulty in maintaining a period of 47 miles an hour. During the trip the engine consumed 13.1 tons of coal and used 16,140 gal. of water.

ENGINEMEN'S EXPERIENCES—YOUTHFUL RECKLESSNESS*

By F. Henry

My first experience hauling a passenger train (or in fact any train) was when I had been firing for about three or four years. Promotions were slow in those days. I was called to go to a certain city some fifty miles distant, and pilot a B. of L. E. excursion train, consisting of twelve coaches and two baggage cars, to a lake resort situated on our line. The train had started from a point on another road, and none of the men being familiar with the road over which they were about to go, a pilot was necessary. When I reached the aforementioned city, the train was waiting for its pilot. As I stepped upon—or rather climbed upon the engine, it being a large class X engine with 80 inch drivers—the engineer said to me, "Are you an engineer or a conductor?" The first thought that entered my mind was, he wants to know whether I am one of the engine or train crew; sometimes a conductor was sent as a pilot, and sometimes an engineer; so I answered offhand, "engineer." "Here, take her; I am going back with the boys," was his answer. And before I could stop him, he had disappeared in the coaches in the rear.

Well, I realized that I was up against it, and it was up to me to get that train with its thousand and more souls safely to their destination.

We started; the roadbed was good, and I had right over all opposing trains; the engine rode nicely, and I gave her her head. The first stop was twenty-five miles from the starting point, and before I realized it, I was there; after coming to a stop, I looked at my watch; and I had made the twenty-five miles, from a stand-still, in nineteen minutes. I thought my watch must have stopped, and asked the fireman to give me the right time. He did so, and I found my watch was correct.

Not being familiar with the engine I was running, and not having taken into consideration the large size of the driving wheels, I had made, I think about the fastest time that had ever been made over that piece of track, and reached my destination without mishap. Needless, to say, there were many comments from the occupants of the coaches in regard to the nerve of the "engineer" who was pulling them.

Years passed, and working conditions not being to my liking, I crossed the Continent and took a position on another road.

There being a shortage of engineers, I was called to go out, the first night after my arrival, without having had a chance to learn the road or in any way familiarize myself with the engines in use, or learn their system of doing things. My trip started with sea level, and ended high up in the mountains; I arrived safely, for a wonder. Then having had about half the sleep I needed, I was called to take a train of 13 coaches, back to the place I had started from the night before.

It was a night of a winter month, dark and stormy; however, I reached my destination without mishap; but I have often wondered what would have been the thoughts of those 1,000 people who were depending on me for their safety, could they have known that the engineer pulling them half the time didn't know where he was.

General Sherman said "War is hell." Railroading is not hell, but oftentimes General Sherman's *bon mot* comes to mind. Think of the collisions and derailments now and then, reminding the engineer that any moment may be his last. Even when we shut our eyes to the dangers there are plenty of rough places. We get in from a run, eat and go to bed for a much needed rest; we perhaps have bought tickets for a theater, or if Sunday, start with our family for church; the call boy is after you; it doesn't matter where you are, he comes for you, and you have to go. Never a minute to call your own; never can count on going anywhere; or doing anything like other people. It is a wonder an engineer's nerves do not go all to pieces; but they don't. There are few railroad managements that recognize the importance of the engineer's position; the Pennsylvania is the only one I know of. On that road engineers are consulted when a new time table is being prepared. If on the road, and the superintendent wants to know what time you can get to such and such a point, so he can arrange a meet to advantage, he asks the engineer; not the conductor, as is done on most roads. If a good run is made, the engineer is congratulated; not the conductor.

*This is the third of a series of articles, made up of useful hints to locomotive runners, which were written in connection with the prize competition of several months ago. The first and second articles of this series were printed September 25 and October 2.—Editor.

AUTOMATIC MAIL EXCHANGE SYSTEM

With the contract awarded to the Hupp Automatic Mail Exchange Company, Chicago, by the Chicago & Alton for the installation of its mail exchange system on mail cars and 33 mail exchange stations between Chicago and St. Louis a new step has been taken in the transfer of mail from moving trains. The limit of mail exchanged under speed has been one bag per station, but with the Hupp system, as it is now developed, 12 bags may be caught at each station. The interesting feature of this system is that the discharging and receiving of the mail is done automatically. The mechanism performing the work is driven from a worm attached to the middle of one of the axles of the mail car. This worm engages with the worm wheel on the driving shaft of the mechanism, which is provided with a double knuckle and slip joint to allow for the oscillation and swerving of the body of the car. It is geared to operate cams 124 times slower than the car axle revolves.

The mechanism is thrown into gear by means of a trip located outside of the rail on the roadway, just 390 ft. from the exchange station. When the machinery is set in motion the car door begins to open and continues opening while the train covers a distance of 180 ft. The next step is the opening of the receiving arms, which are attached to the side of the car.

They open at the forward end in the manner of a gate, and become fully extended as the train travels another 180 ft. At the same time the delivery chute is automatically moved out of the door and by the time it reaches the station receiving trough, as shown in the illustration, the bottom of the delivery chute is at an angle of 45 deg., and the mail bags slide from the car by their own weight. The mechanism then brings the chute back inside of the car, closes in the receiving arms and closes the

Hupp Automatic Mail Exchange System Receiving Mail from Cranes

door. By the time the train has traversed the third 180 ft. these arms have been returned to their original position at the side of the car. It is necessary for the car, however, to travel several hundred feet more before the cam wheel completes its revolution and is automatically locked out of action. The receiving arms start to extend outward about 30 ft. before the delivery chute starts out of the car, but the delivery chute returns before the receiving arms are folded. It takes 1,080 ft. for the mecha-

Hupp Automatic Mail Exchange System Delivering Mail Into Receiving Trough

nism to perform a full cycle, but it is so arranged that the car passes only 780 ft. from the time the door begins to open until it is entirely closed.

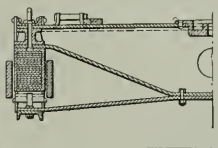
The pouches or sacks to be caught are placed in crane clamps of special design, which hold the sack at the top and bottom. When the pouch is taken from the crane the clamps swing automatically out of line with the travel of the train, thus tending to eliminate the wear and tear of the pouches. With this device it is not necessary for any of the mail clerks to go near the door while the train is running. They are warned the instant the mechanism is tripped by signal from a 6-in. gong. They are only required to place the sacks in position in the chute for delivery. In case it is not desired to discharge or receive any mail at the prescribed stations a lever is provided by which the mechanism can be thrown out of gear, and it also permits of reversing the gear so that the car may be used in either direction.

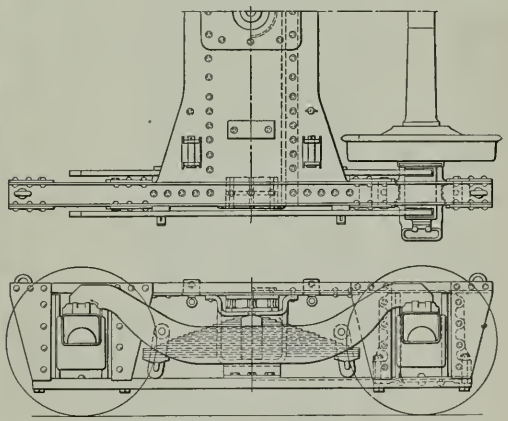
As will be noticed from the photograph, the delivery chute deposits the mail pouches in a trough along the side of the track, the drop being less than a foot. The mail bags slide along this trough until the force of their momentum is expended, which is done with practically no damage to the contents of the bag. This trough is about 150 ft. long. The advantages claimed for this system are that a greater amount of mail may be handled at the stations without stopping; that the apparatus is automatic and eliminates danger to the mail clerks when catching mail; that the mail will be more carefully deposited at the station, and that on many roads it will eliminate stops that are now necessary for the collection of mail. This apparatus will handle mail at a speed of 60 miles an hour.

STRUCTURAL STEEL TENDER TRUCK

A structural steel tender truck of the equalized pedestal type has recently been introduced by the Canadian Locomotive Company, Ltd., Kingston, Ont. The construction has been developed and patented by Messrs. Casey and Cavin, with the view to increasing strength and durability, and at the same time effecting a considerable reduction in weight.

Owing to the inherent tendency to internal strains and shrinkage cracks which exists in cast steel bolsters, much trouble has been experienced on many Canadian roads with the present type of equalized pedestal truck. In order to preserve an adequate factor of safety the bolster castings are necessarily much heavier than they would be if a more reliable material were used. The





Structural Steel Pedestal Tender Truck

new truck is built up, with two exceptions, entirely of rolled sections in which the strength of the material is uniform and definitely known. The bolster is of pressed steel, flanged with a

deep section at the center and decreasing in depth toward the ends. It has a large cover plate hydraulically riveted to the flanges at the top. The ends of this plate, which are secured to the side frames, are considerably wider than the bolster, thus forming a strong diagonal bracing for the whole truck structure. Apertures are provided in the cover plate for the center casting and brake hangers. The hangers are supported from lugs punched and bent from the cover plate and forming an integral part of it. Both the top and bottom rails of the side frames are of channel sections and are connected by plates which form the pedestals for the journal box. The ends of the bolster at the spring seat are stiffened by light cast steel fillers inserted between the bolster and cover plate.

Owing to the limited space between the spring and equalizers a drop forged T-head hanger has been substituted for the usual type of U-hanger used on this type of spring suspension. These hangers extend through slots in the ends of the springs and are held in position by gibs in the manner commonly used in driving spring suspension. The saving in weight effected by this construction is claimed to be about 1,500 lb. per truck, making a total of 3,000 lb. reduction in dead weight per tender.

COLE HOT BLAST STOVE

One field in fuel economy has been overlooked on many roads, and that is the heating of small stations, freight houses, signal towers, etc., which are heated by the common, ordinary stove. The Cole Manufacturing Company, Chicago, has a stove on the market for such service which is claimed to save one-third of the fuel that would be consumed in any lower draft stove of the same size with soft coal, slack or lignite. A report of the service that one of the stoves rendered in a station having an interlocking plant in the office in a small town in Central Illinois states that the fuel consumption for heating was reduced from 30 to 35 tons to 15 to 18 tons, or about 50 per cent. This multiplied by the number of stations and similar buildings where stoves are used would represent a saving in fuel that should not be overlooked and on some of the larger roads would amount to $75,000 or $100,000 per year.

Cole Hot Blast Stove Showing Interior Arrangement

The special feature of the Cole stove and that which it is claimed is responsible for its economy, is the top hot blast draft which admits the air to the top of the fire rather than through the grate, as is generally the custom. The illustration shows its construction clearly. It consists of a double shell and a boiler plate bottom of air tight construction. The fire pot and lining are of cast iron and are supported by legs, which simply rest on the bottom of the stove with no fastening whatever. The grate is cone shaped. The ashes are removed through the flap door shown at the base of the stove, the joints being ground in order to maintain an air tight fit. The fuel is admitted through a similar door at the top of the stove. The air is admitted through a damper opening at the top of the stove and conducted down to the top of the fuel bed by the pipe shown in the illustration. This furnishes the air where it is most needed and insures the complete combustion of the gases driven off from the coal.

The stove is easily maintained. A new fire pot may be dropped into place by removing the top of the stove, which is held in place by three bolts. The cost of maintenance, as shown by one of the northern roads which has had over 1,000 of these stoves in service for about 10 years, is about 39 cents per stove per year. It is also claimed that these stoves will hold a fire for 36 hours without attention with either soft or hard coal. Advantages are also claimed from a fire risk standpoint, a special anti-puffing draft being supplied to eliminate explosions that sometimes occur in such stoves; in addition there is no opportunity for live coals to fall from the stove, as the fuel door is at the top.

FEDERAL ACCIDENT COMPENSATION LAW

The total number of claims filed during the first five years of the Federal accident compensation law was 14,963, of which 14,046 were allowed, 911 disallowed, and 6 were still under consideration at the end of that period. Of the cases allowed 437 were for fatal accidents. The total compensation paid for all accidents during the five years amounted to over $1,800,000. Of this more than $732,000 was paid to 6,315 employees of the Isthmian Canal Commission.

In the fiscal year 1912-13 the average compensation reported for 3,320 non-fatal and 56 fatal cases was $107 and $661 respectively. Of the non-fatal cases 996 were Isthmian Canal Commission employees, who are largely unskilled and are exposed to great hazard. Of the fatal cases 11 were Isthmian Canal and 45 other employees, the compensation averaging $410.77 and $722.31 respectively. The failure to recognize properly permanent partial disability results in inadequate compensation in many cases. Thus in a case of the loss of a right arm the injured workman received less than $50, while in three cases of the loss of both legs, occurring during the third year, the average compensation was $377.

This accident law, passed on May 30, 1908, providing compensation for accidents to certain employees of the Federal government, has now been in force five years. It was the pioneer general accident compensation law in this country, but since its enactment 24 states have made provision for compensation in some form, all of them, however, on a more liberal basis. It is estimated that 95,000 persons are covered by the provisions of the law, somewhat less than one-fourth of the civilian employees of the federal government. The act is administered by the Secretary of Labor, except as it affects employees of the Isthmian Canal Commission. It allows compensation only for accidents sustained in the course of employment without negligence or misconduct, causing disability exceeding 15 days or resulting in death. Compensation is on the basis of full wages, but payment is limited to one year even in cases of death and total permanent disability.

General News Department

Citizens of Port Huron, Mich., have subscribed $100,000, which is to be offered to the Grand Trunk Railway to induce the road to rebuild the shops in that city recently destroyed by fire.

The American Concrete Institute will hold its eleventh annual convention, February 9-12, 1915, at Chicago, Ill. The work of the convention will cover concrete roads, sidewalks and bridges, concrete and reinforced concrete tests and design, concrete art and architecture, and plant management and costs.

The owners of the Atlantic Southern, extending from Atlantic to Villisca, Iowa, 35 miles, have given public notice of their intention to discontinue operation on December 31, claiming that the road has been operated at a loss. It is reported that the people in the towns along the line are preparing to enter a protest before the State Railroad Commission against the closing of the line.

Members of the Order of Railway Conductors employed on the St. Louis Southwestern are taking a second strike vote to determine whether they shall call a strike in the event a conductor discharged over a year ago for intoxication is not reinstated. A strike vote was taken some time ago, but the calling of a strike was enjoined by the state circuit court on the petition of a number of conductors who claimed that the strike ballot which was issued contained a one-sided statement of the controversy arising from the discharge of the conductor. The court, in enjoining the taking of a strike vote, said the officers could order a second vote if they desired. The conductors who took the matter to the court have been expelled from the Order of Railroad Conductors; and it is said that some enginemen have suffered for their independence, in the same way.

The Chicago, Milwaukee & St. Paul cleaned and disinfected 5,000 stock cars between November 12 and November 23. It is also cleaning and disinfecting all its stock yards in quarantine territory, in accordance with government orders issued as a precaution against the spreading of the hoof-and-mouth disease. This order reads in part: "No railroad cars or boats, within the area hereinbefore quarantined, which have carried livestock shall be moved interstate until the said cars or boats have been cleaned and disinfected with a 5 per cent solution of carbolic acid, or a 3 per cent solution cresol compound, U. S. P., or other disinfectant permitted by the chief of the Bureau of Animal Industry." The cost of cleaning and disinfecting stock cars is $3 for a single-deck and $4 for a double-deck car. Other roads carrying stock are also taking prompt action in stamping out the disease.

Ralph Peters, chairman of the railroads' committee on mail pay has published a letter, which he has written to the chairman of the Senate committee on post offices and post roads, summarizing the arguments which the committee believes should induce Congress to reject both of the bills now before it designed to revise the method of payment for the transportation of the mails. The Moon bill is wholly objectionable; and the Bourne Committee's proposal, while in many respects acceptable to the railroads, will be opposed by them because its main feature, calling for payment by space in cars instead of by weight, is objected to as an untried experiment; and also because the rate per linear foot is too low. The railroads prefer that the present basis of payment (by weight) should be retained, the injustice to the roads being remedied by (a) weighing the mails every year instead of once in four years; (b) relieving the roads from performing side service, delivering mail bags to post offices, etc., and (c) payment for all cars used for distributing the mails. Under the law as it now stands a road receives a fixed sum for the use of a post office car if it be of full length; but for a part of a car, no space payment whatever is made.

Peter Hoffman, coroner of Cook county, Illinois, and also chairman of the Cook County Public Safety Commission, has issued a report for the year 1913, showing a reduction of 108 in fatalities on steam railroads in the county during the year, and a reduction in the same time of 21 in the street car fatalities. With the report he discussed the trespassing question and announced that the commission proposed to take steps toward influencing legislation to prohibit trespassing. Coroner Hoffman pointed out the large number of trespassers killed on railroads in the United States, saying: "By far the greater number is drawn from the resident population, laborers and others who make the tracks a thoroughfare on their way to and from work, or who walk upon the tracks when the public highways are muddy, or to make a short cut. An analysis of the character of fatalities on railroads in Cook county indicates clearly the direction which must be taken in the future. Of the 360 deaths in 1913, nine were passengers, 132 were employees and 219 were trespassers. It is up to the state and community to eliminate the useless deaths among trespassers. To that end the safety commission has taken steps toward the drafting of an anti-trespassing bill."

New York-San Francisco Water Lines

J. C. Lincoln, chief of the traffic bureau of the Merchants' Association of New York City, in announcing the abolition of numerous special freight rates on commodities by railroad to the Pacific Coast, which results in advances in the charges on these commodities, prints the following schedule showing sailings of vessels from New York to the Pacific Coast through the Panama Canal:

American-Hawaiian Steamship Company—26 vessels—To San Diego, Los Angeles Harbor, San Francisco, Portland, Seattle and Tacoma; sailing every 5 days; time in transit to San Francisco, 23 days.

Luckenbach Steamship Company—7 vessels—To Los Angeles Harbor and San Francisco; cargo for North Pacific Coast ports transshipped at San Francisco; sailing every 10 days; time in transit to San Francisco, 27 days.

Atlantic & Pacific Steamship Company, W. R. Grace & Company, agents—4 vessels—To Los Angeles Harbor, San Francisco, Portland and Puget Sound; sailing every 14 to 18 days; time in transit to San Francisco, 20 days.

Arrow Line, A. H. Bull Steamship Company, agents—3 vessels—To Los Angeles Harbor and San Francisco; sailing every 20 days; time in transit to San Francisco, 24 days.

Sudden & Christianson Steamship Company, D. B. Dearborn & Company, agents—6 vessels—To San Pedro, San Francisco and Seattle; sailing every 20 days; time in transit to San Francisco, 23 to 25 days.

Tolls amounting to $735,182 were collected from vessels using the Panama canal in the three months ending November 1. Before the canal was open to merchant ships, $11,610 had been collected on barge traffic, making the gross income to November 1 total $746,792. In October 45 vessels passed through southbound and 40 northbound, paying $377,000.

American Society of Mechanical Engineers

The annual meeting of the American Society of Mechanical Engineers, which will be held in the Engineering Societies building, New York, on December 1-4, promises to be of more than ordinary interest. The Railroad Session will be held on Wednesday afternoon to consider a report on "Steam Locomotives of Today" This was published in our issue of November 20, page 947. The indications are that it will prove to be a most successful session, as a large number have already signified their intention of being present and taking part in the discussion. Another paper which will be of special interest to railroad men is one by Robert W. Hunt on "The Mechanical Elimination of Seams in Steel Products, Notably Steel Rails." This will be presented at the Iron and Steel Session, which meets on Thursday afternoon at 2 o'clock. At this session a paper on "Factors in Hardening Tool Steel" will also be presented and there will be a topical discussion on alloy steels.

New York Railroad Club

At the meeting of the New York Railroad Club in New York on November 20, Frederick C. Syze, trainmaster of the Baltimore & Ohio at St. George, Staten Island, N. Y., was elected president, succeeding George W. Wildin. Other officers elected were: Burton P. Flory (N. Y. O. & W.), first vice-president; James Milliken (P. B. & W.), second vice-president; A. J. Stone (Erie), third vice-president, and R. M. Dixon, treasurer. The report of the secretary shows that during the year the club had gained 318 new members and that on November 1, the membership was 2,364.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

American Association of Demurrage Officers.—A. G. Thomason, Demurrage Commissioner, Boston, Mass. Annual convention, April, 1915, Richmond, Va.

American Association of Dining Car Superintendents.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next meeting, October, 1915.

American Association of Freight Agents.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 21-24, 1915, Richmond, Va.

American Association of Passenger Traffic Officers.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.

American Association of Railroad Superintendents.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next meeting, May 20-21, 1915, San Francisco, Cal.

American Electric Railway Association.—E. B. Burritt, 20 W. 39th St., New York. Annual convention, October, 1915, San Francisco, Cal.

American Electric Railway Manufacturers' Association.—H. C. McConnaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

American Railroad Master Tinners, Coppersmiths and Pipefitters' Association.—W. E. Jones, C. & N. W., 3814 Fulton St., Chicago. Annual meeting, Chicago.

American Railway Association.—W. F. Allen, 75 Church St., New York. Next session, May 19, 1915, Atlantic City, N. J.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 19-21, 1915, Detroit, Mich.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June 9-11, 1915, Atlantic City, N. J.

American Railway Safety Association.—L. F. Shedd, C. R. I. & P., Chicago.

American Railway Tool Foremen's Association.—Owen D. Kinsey, Illinois Central, Chicago. Annual meeting, July, 1915.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 1-4, 1914, New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Atlanta, Ga.

Association of Manufacturers of Chilled Car Wheels.—George W. Lyndon, 1214 McCormick Bldg., Chicago.

Association of Railway Claim Agents.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, third week in May, 1915, Galveston, Tex.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual meeting, October, 1915.

Association of Railway Telegraph Superintendents.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 22-25, 1915, Rochester, N. Y.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York. Next meeting, December 8-9, Richmond, Va.

Bridge and Building Supply Men's Association.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meetings, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

Freight Claim Association.—Warren P. Taylor, R. F. & P., Richmond, Va. Annual meeting, June 16, 1915, Chicago.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

International Railway Congress.—Executive Committee, 11, Rue de Louvain, Brussels, Belgium. Next convention, June 23 to July 6, 1915, Berlin.

International Railway Fuel Association.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 829 W. Broadway, Winona, Minn. Next convention, July 14-17, 1915, Sherman House, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, C. H. & D., Lima, Ohio. Annual meeting, August 17, 1915, Philadelphia, Pa.

Maintenance of Way and Master Painters' Association of the United States and Canada.—T. I. Goodwin, C. R. I. & P., Eldon, Mo.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May 26 to 28, 1915, Chicago, Ill.

Master Car and Locomotive Painters' Association of the United States and Canada.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 14-17, 1915, Detroit, Mich.

Master Car Builders' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June 14-16, 1915, Atlantic City, N. J.

National Railway Appliances Association.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railroad Master Tinners, Coppersmiths and Pipefitters' Association.—U. G. Thompson, C. & E. I., Danville, Ill. Annual meeting, May, 1915.

Railway Business Association.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December 10, 1914, Waldorf-Astoria Hotel, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Railway Electrical Supply Manufacturers' Association.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

Railway Fire Protection Association.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Next meeting, October, 1915.

Railway Signal Association.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa. Next meeting, March 15, 1915, Chicago. Annual meeting, September 21-24, 1915, Salt Lake City, Utah.

Railway Storekeepers' Association.—J. P. Murphy, L. S. & M. S., Box C, Collinwood, Ohio. Annual meeting, May 17-19, 1915, Hotel Sherman, Chicago.

Railway Supply Manufacturers' Association.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders and Master Mechanics' Associations.

Railway Telegraph and Telephone Appliance Association.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill. Annual meeting, September 14-16, 1915, Chicago.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Signal Appliance Association.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

Society of Railway Financial Officers.—Carl Nyquist, C. R. I. & P., La Salle St. Sta., Chicago. Annual meeting, September, 1915.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. R. R., Atlanta, Ga. Next regular meeting, January 21, 1915, Atlanta, Ga.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7122 Stewart Ave., Chicago. Annual meeting June 15, 1915, Minneapolis, Minn.

Transportation Club of Detroit.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Traveling Engineers' Association.—W. O. Thompson, N. Y. C. & H. R., East Buffalo, N. Y. Annual meeting, September, 1915, Chicago.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

REVENUES AND EXPENSES OF RAILWAYS

Traffic News

The trunk lines have filed at Washington freight tariffs, to take effect December 15, in which the rates on grain and grain products from the west to the Atlantic seaboard are increased one cent per 100 lb. For example, from Chicago to New York grain, now 16 cents per 100 lb. for domestic delivery and 13 cents for export, will be 17 cents and 14 cents respectively. The proposed advances in the rates on livestock have been made the subject of complaint presented to the commission at Washington, charging unreasonableness.

The increases in freight rates which have been filed by the western railroads have been complained of in a petition, presented to the Interstate Commerce Commission, which it is said has the signatures or endorsement of the state commissioners of Iowa, Nebraska, North Dakota, South Dakota, Montana, Minnesota, Missouri, Kansas, Texas, Oregon, Washington and California. The federal body is asked to suspend the new tariffs. These tariffs do not as a rule affect class rates but make advances in a large number of important commodities.

On the occasion of the Yale-Harvard football game at New Haven, November 21, the New York, New Haven & Hartford carried 33,378 persons to New Haven, delivering them all within four hours. Including the travel to New Haven the night before the big game, about 37,500 persons were carried to New Haven from all points on the New Haven system. This breaks all records for travel on that road. The performance of the morning, when this crowd was transported to New Haven within four hours, was repeated Saturday evening. Between 5:20 and 6:20 Saturday evening there were taken out of the station at New Haven approximately 18,000 people, or 300 a minute. A total of 65 trains and 618 cars were used in moving the football crowd. Forty-three of these trains were special trains. These 65 trains were moved over the road and their 33,378 passengers loaded and unloaded without serious mishap of any kind. Within the four-hour period Saturday morning 27 trains were despatched from New York carrying 17,800 passengers; 18 from Boston carrying 7,474; 5 from Springfield carrying 3,907, and 3 from Hartford carrying 1,254. Twelve trains from New London, Waterbury, Maybrook, Bridgeport, Pittsfield, Northampton and Willimantic carried 2,943 passengers, bringing the total carried to New Haven in the morning up to 33,378. Of the 43 special trains run into New Haven on Saturday 16 arrived ahead of schedule time; 18 were less than 5 minutes late and only 9 more than 5 minutes late. The total time lost by the 43 specials was 166 minutes, which would mean an average of only 3½ minutes per train. The first special returning to New York left New Haven at 4:40 p. m., and the last at 8:02 p. m.

Increased Passenger Fares

Extensive changes in passenger tariffs, making small advances in the rates, together with other changes in suburban fares around Philadelphia were noticed last week, page 980. Further details of the changes on long distance routes are noted below. In addition to these announcements there are other increases in fares, literally too numerous to mention. Changes in suburban rates, similar to those announced at Philadelphia, are to be made also at Baltimore. The regular weekly circular of the New York State Public Service Commission, Second district, contains a dozen or more announcements of withdrawals of certain forms of tickets, mostly round trip local tickets sold at considerable reductions from the single trip rate, these being issued by the Erie, the New York Central, the Lackawanna, the Lehigh Valley and the Pennsylvania. These withdrawals all mean increased fares. The New York, Ontario & Western, which for a good many years has had a uniform passenger rate of two cents a mile, announces an increase to 2½ cents, taking effect December 15. These numerous New York tariffs include also some reductions in rates.

Citizens in and around Philadelphia have complained of the proposed advances in rates to and from that city, both to the federal and the state authorities. The Public Utilities Commission of New Jersey has suspended for three months all increases in such of the tariffs as are subject to the authority of that commission. The Pennsylvania Public Service Commission announces that it has no power to suspend the proposed increases, but that probably it will require the railroads to issue conditional rebate certificates with sales of tickets at the advanced rates, with a view of ordering refund of a part of the money in case, on investigation, the commission shall decide that the advances are not justified.

New Trunk Line Passenger Fares

The railways in the Trunk Line Association have filed with the Interstate Commerce Commission tariffs advancing passenger fares in Trunk Line territory and between points in Trunk Line and Central Passenger Association territories to a basis of approximately 2½ cents a mile, effective on December 15. Increased fares in Central Passenger Association territory, as previously reported, have been filed to become effective on December 1. Some of the principal changes in the standard fares are shown in the following tables:

From New York

To—	Present rate	New rate
Pittsburgh	$10.50	$11.00
Cleveland	13.00	13.10
Columbus, O.	14.60	15.78
Cincinnati	17.00	18.68
Louisville	20.00	21.68
Indianapolis	18.50	20.15
Chicago	20.00	21.10
St. Louis	24.25	24.75

From Chicago

To—	Present rate	New rate
Cincinnati	$ 6.00	$ 7.00
Detroit	7.00	7.40
Toledo	5.50	5.85
Buffalo	12.00	13.10
Indianapolis	3.70	4.60
Washington	17.50	18.00
Baltimore	17.50	18.00
Philadelphia	18.22	19.10
New York	20.00	21.10
Boston	22.00	23.10
St. Louis	5.80	7.50

From St. Louis

To—	Present rate	New rate
Chicago	$ 5.80	$ 7.50
Cincinnati	8.00	8.65
Toledo	10.80	11.10
Cleveland	12.30	13.25
Buffalo	16.30	17.35
Pittsburgh	14.00	15.48
Washington	20.25	22.00
New York	24.25	24.75
Boston	24.80	26.35

By the differential lines the advances are the same, for example, New York and Chicago, the advance is from $18 to $19.10.

Quarantines

The restrictions on the transportation of live stock, imposed because of the prevalence of the foot and mouth disease continue strict throughout the Central States, and at many points outside those states. The requirements as to inspection and certificate apply not only to animals but also to straw imported from foreign countries, used as packing for merchandise, and also (at many places) wool. It is said that in the state of New York, the disease has been confined to 13 farms. Here and elsewhere the authorities appear to feel satisfied that the epidemic has been satisfactorily checked, but precautions are continued.

In northern New York the federal government has imposed a quarantine on potatoes because of the existence in that region of powdery scab.

In parts of Maine, New Hampshire, Massachusetts and Connecticut, the Department of Agriculture has imposed a quarantine on the transportation of stone taken out of quarries, the reason being that stone has been found to carry eggs of the gipsy moth. The Boston office of the United States Department of Agriculture, 43 Tremont street, issues regulations under which stone may be transported in interstate commerce.

Reductions in Passenger Train Service

A large number of reductions in passenger train service have been announced by railroads both east and west of Chicago to take effect on or about November 30. Both the Chicago & North Western and the Chicago, Burlington & Quincy on November 29 will take off one train a day between Chicago and Denver, and from Chicago to Denver trains now leaving in the evening will be changed to a morning schedule to take the place of other

morning trains taken off. From Denver to Chicago a train now leaving in the morning will be changed to leave in the evening. The Burlington's Denver Limited, now leaving Chicago at 5 p. m., will take the place of the train now leaving at 9:45 a. m. The train on the Union Pacific between Omaha and Denver, which connects with the North Western train to Omaha will be discontinued, but the North Western will continue the train to Omaha, discontinuing another train from Omaha to Chicago. The Burlington will also discontinue one train between Kansas City and St. Joseph, and will make other reductions in local train service, making a total reduction of about 76,000 train miles a month. The Denver & Rio Grande will discontinue four trains between Denver and Ogden, and the Western Pacific will make a reduction in service between Salt Lake City and San Francisco. East of Chicago a number of reductions will be made in local train service.

Car Balance and Performance

Arthur Hale, chairman of the committee on relations between railroads, of the American Railway Association, in presenting statistical bulletin No. 180, covering car balances and performances for July, 1914, says:

The committee presents herewith statistical bulletin No. 180, covering car balance and performance for July, 1914.

The average miles per car per day were 22.5, compared with 22.7 for June. This figure for July, 1913, was 23.7.

Ton miles per car per day for July were 352, compared with 345 for June. This is a decrease of 6.13 per cent compared with the figure for July, 1913, which was 375.

The proportion of home cars on line was 68 per cent, compared with 69 per cent in June. This is an increase of 9 points over July, 1913.

The per cent of loaded car mileage was 67.6 per cent, which is the same as the June figure. This figure for July, 1913, was 68.1 per cent.

The average earnings per car per day for all cars on line was $2.32. This figure for July, 1913, was $2.40.

The accompanying table gives car balance and performance in the month covered by the report, and the diagram shows car earnings and car mileage and different car performance figures monthly from July, 1907.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Special Examiner Kelly held a hearing in Chicago on November 19, on complaints of shippers of blooded livestock regarding the present rates, weights and requirements for the shipment of livestock in less-than-carload lots.

The commission has suspended until March 31 tariffs which have been filed by both eastern and western roads, increasing charges for so-called trap car service. These trap car tariffs, so far as they affect intrastate traffic have been suspended in Illinois by the state commission.

Examiner Pattison held a hearing at Denver last week on complaints filed by the Gould lines against the notice recently issued by the Union Pacific, which would have the effect of closing the Ogden gateway to through passenger traffic from the east over the Gould lines, when destined to certain points in the northwest.

Compression of Export Cotton

Inman, Akers & Inman et al. v. Atlantic Coast Line. Opinion by Commissioner McChord:

The commission finds that the railway's practice of allowing for compression of cotton shipped over the Atlantic Coast Line from points on the Georgia Railroad and intended for export at such ports as Norfolk, Wilmington or Charleston, after the transportation service of the railroads is terminated, is unlawful, the service rendered being in no sense connected with the transportation. (32 I. C. C., 146.)

Rates Between Shreveport and Texarkana

In re class and commodity rates between Shreveport, La., and Texarkana, Ark. Opinion by Commissioner Meyer:

The commission finds that the carriers have justified proposed increased class rates between Shreveport, La., and Texarkana, Ark., and proposed increased rates on beer, beer substitutes, and agricultural implements in carloads from Shreveport to Texarkana, and on candy in less than carloads from Texarkana to Shreveport. (32 I. C. C., 180.)

Fabrication-In-Transit Privileges Refused Railway Car Industry

Middletown Car Company v. Pennsylvania Railroad et al. Opinion by Commissioner McChord:

The commission finds that there was no peculiar requirement incident to the pressed steel car industry, as is the case in the bridge and structural steel industry, which necessitates the extension of the fabrication-in-transit privilege to the pressed steel car industry with respect to the steel underframes for railroad cars. The fact that the fabricated articles are similar cannot warrant a similarity of treatment where it also appears that the similar articles are in no wise competitive. (32 I. C. C., 185.)

Rates on Lard Substitute from Greenville, Tex.

Texas Refining Company v. Alabama & Vicksburg et al. Opinion by Commissioner Meyer:

The commission finds that the present rates on lard substitute from Greenville, Tex., to points in Oklahoma, Arkansas, Louisiana, Mississippi and New Mexico are unreasonable and that the rates on this commodity should be the same as the rates on packing-house products. It is also held that the mileage-scale rates on packing-house products should apply on lard substitute from Greenville as a distinct point of origin and not as a common point with Fort Worth and Dallas. (32 I. C. C., 192.)

Joint Rates with the Iowa & Southwestern

Iowa & Southwestern v. Chicago, Burlington & Quincy. Opinion by Commissioner McChord:

The commission finds that the defendants should establish in connection with the complainants operating a line from Blan-

chard, Ia., to Clarinda through routes via Clarinda, Ia., with joint rates which shall place College Springs on a rate parity with Coin, Bradyville, and Shambaugh, Ia. The defendants will also be required to receive cars from complainants at Clarinda for switching to industries located on defendants' tracks at that point, and to establish a reasonable switching charge for the service. (32 I. C. C., 172.)

Rates on Coffee from New Orleans

In re coffee from New Orleans, La., Mobile, Ala., and Pensacola, Fla., to Jacksonville, Fla., and other points. Opinion by the commission:

The commission finds the carriers have justified the proposed cancellation of the commodity rates on coffee to Jacksonville, Fla., of 35 cents per 100 lb., from New Orleans; 30 cents from Mobile and 26 cents from Pensacola, and a proposed restoration of the fifth-class rates of 44 cents from New Orleans, 39 cents from Mobile and 35 cents from Pensacola. These rates were reduced in order to allow New Orleans to compete with New York for the coffee trade to Jacksonville, but it has been found that although the rates are unreasonably low New Orleans has been unable to get a large portion of the total trade. (32 I. C. C. 90.)

Rates on Bakery Goods in the Pacific Northwest

Portland Chamber of Commerce et ol. v. Chicago, Milwaukee & St. Paul et al. Opinion by Commissioner Meyer:

The commission finds that the classification of bakery goods in boxes and barrels, second class, and in cartons and tins in crates, first and second class, for interstate shipments in less than carloads from points in Oregon and Washington to points in Oregon, Washington, California, Idaho, and Montana, is unreasonable. It is held that such shipments should be rated not higher than third class, it being the general practice elsewhere in western classification territory for this traffic to move at commodity rates about equal to third class rates. (32 I. C. C., 188.)

Rates on Excess Baggage

National Baggage Committee v. Atchison, Topeka & Santa Fe et al. Opinion by Commissioner Hall:

In this complaint, filed in December, 1912, by the National Baggage Committee, representing numerous commercial organizations, against 69 carriers, operating in all sections of the country, the commission finds that the present rates on excess baggage are not unreasonable, but that the rates on baggage of excess value are unreasonable and should not exceed certain prescribed maxima.

Baggage of excess weight. As a general rule a purchaser of a first class ticket is entitled to receive the transportation of not more than 150 lb. of baggage of a value not exceeding $100. The rates are based as a rule upon 16⅔ per cent of the first class fare with a minimum of 15 cents per 100 lb., and a minimum charge of 25 cents. In some sections of the west the basis is 12 per cent instead of 16⅔ per cent, and in New England there is a minimum charge of 15 cents with an arbitrary scale graduated until the fare amounts to $4.20, from which point the 16⅔ per cent basis applies.

The commission is unable to sanction the basis proposed by complainant whereby there would be a graduated scale ranging from 12½ per cent for short distances, except those covered by the minimum rate, down to 8 per cent for long hauls. Complainant showed that for express service, claimed to be more valuable than excess baggage service, the railroads receive on an average 50 per cent of the gross revenues of the express companies; and claimed that for 100 lb. of excess baggage a reasonable rate would be one-half of the 100-lb. express rate plus a reasonable terminal charge, estimated at from 5 to 10 cents at each end. The commission rejects this theory and sees no necessary relation between the rates for the various services. The claim that the commercial traveler should have a lower rate than the occasional traveler is rejected. Congress has to some extent permitted the continuance of mileage books, with special privileges, but whether or not the principle should be extended is a question of policy with which the commission has nothing to do.

Much of the testimony on both sides consisted of opinions, speculation and surmise. The carriers were unable to give any data concerning the cost of the service or other factors which were considered in establishing the excess baggage rates, and whether these rates are reasonable or not is something not disclosed in the record and the commission can make no finding upon this point.

Baggage of excess value. The charge imposed for baggage valued in excess of $100 is, for each $100 or fraction thereof, generally equivalent to 10 per cent of the rate for 100 lb. of excess baggage, with a minimum rate of 10 cents per $100 and a minimum charge varying from 10 to 25 cents for increased valuation. Complainant proposes a charge which shall not exceed one-tenth of 1 per cent for each $100, with a minimum charge of 10 cents.

The commission, drawing attention to the fact that the allowance, included in the ticket, is 150 lb. of baggage of a value not exceeding $100 notes that apparently the carriers have proceeded on the assumption that the value of 150 lb. of baggage is usually $100. This arrangement is held to be unreasonable; to assume that $100 is a fair average value for 150 lb. of baggage is an unlawful attempt on the part of the carriers to limit their liability for loss and damage.

Attention is also drawn to the findings *in re Express Rates,* etc. (24 I. C. C., 380) in which it was said:

> The insurance charges almost universally prevailing on shipments conveyed by parcel post or other parcel-carrying systems in other countries are substantially one-tenth of 1 per cent—that is to say, 10 cents for each $100 or fraction thereof. This also is a customary rate with private insurers. Therefore it would seem to be a reasonable rule that the charges of express carriers in the United States based upon valuation in excess of $50 should not exceed this general standard, and that hereafter the valuation charge shall be 10 cents for each $100 or fraction thereof in excess of $50, and this irrespective of the rate of carriage.

It is ordered that the tariffs of the carriers should be amended so that the charges for excess value shall not exceed the following:

> Unless a greater sum is declared by the passenger and charges paid for increased valuation at time of delivery to carrier, the value of baggage, up to and including 150 lb., . . . shall be . . . agreed to be not in excess of $100 . . . and the value of baggage . . . exceeding said allowance of 150 lb. . . . upon which charges are paid . . . shall be . . . agreed to be not in excess of 66⅔ cents per lb.
>
> If the passenger, at the time of checking baggage, declares a value greater than $100 for the baggage . . . or, in case the weight of the baggage exceeds that allowed under the tariffs in connection with the transportation of a passenger, declares a value greater than 66⅔ cents per lb., there will be an additional charge at the rate of 10 cents for each $100, or fraction thereof, above such agreed maximum values.
>
> The minimum charge for increased valuation will be 10 cents. (32 I. C. C. 152.)

STATE COMMISSIONS

The Illinois Public Utilities Commission has suspended until March 30, the proposed charge for less-than-carload trap car service in Chicago on intrastate business, which was recently announced by the railway companies to become effective Decembr 1.

The Kansas railroads last week filed a petition with the Kansas Public Utilities Commission, asking the restoration of the three-cents-a-mile passenger fare which was in effect before 1907, when the railroads reduced rates to two cents, pending a final decision in the Nebraska rate case.

The executive council of the state of Maine, taking note of a widespread demand that the new Public Utilities Commission shall not consist of three lawyers, has refused to confirm the nomination of S. W. Gould, though it has accepted Benj. F. Cleaves and William E. Skelton, who are both lawyers. The governor has now named Hon. Charles W. Mullen of Bangor, a former mayor, and a prominent business man, for the third commissionership.

A complaint has been filed with the Public Service Commission of Missouri against the Quincy, Omaha & Kansas City and the Chicago, Burlington & Quincy, alleging that since July, 1912, the Quincy, Omaha & Kansas City has been owned and operated by the Burlington, and that this ownership does not entitle it to the exemption made by the Supreme Court of the United States in the state rate case decision, and that therefore it is not entitled to charge more than two cents a mile for passengers. The road is now charging 2½ cents.

COURT NEWS

Judge Harris, of the Circuit Court of Fulton, Mo., has sustained the demurrer of the Missouri, Kansas & Texas Railway to the suit brought by the attorney-general of Missouri to recover $2,000,000 alleged overcharges in freight and passenger rates during the litigation over the state rate laws.

Frank B. Kellogg, counsel for the Armour Car Lines in the investigation being conducted by the Interstate Commerce Commission into private car lines, has secured an order from a judge of the United States Supreme Court enjoining further hearings before the commission on the questions asked of the Armour Car Lines pending a review by the Supreme Court of an order issued by Judge Landis ordering Vice-President Frederick W. Ellis to answer the questions put to him by the commission regarding the relations of the car lines to the railroads. On November 9 Federal Judge Landis denied the petition for an appeal and ordered Mr. Ellis to appear before the commission and answer the questions.

The suit brought by John C. Fetzer, a real estate broker, against the Chicago & Western Indiana Railroad to set aside the decision of E. C. Field as arbitrator of the claims of the Chicago & Western Indiana against Fetzer, Benjamin Thomas, former president of the road, and C. R. Kappes, former real estate agent of the road, ordering the restoration of money alleged to have been misappropriated, was the subject of a hearing last week at Chicago, before Judge Sullivan. In 1910 the Western Indiana filed suits against the three men named, charging them with having misappropriated large sums of money in connection with real estate purchases for the road, and the case was settled out of court by arbitration, in which Mr. Field decided that the three men should pay to the Western Indiana $525,000. Fetzer then brought suit to have the award set aside on the ground that the money had been turned over by him to persons designated by the directors of the road, to be used for political purposes.

Railway Taxes in New Jersey

The New Jersey Court of Errors and Appeals, in a suit against the Long Dock Company, of Jersey City, concerning taxes on its railway property, sets aside the doctrine enunciated by the court below that the State Board of Assessors is a judicial tribunal whose findings can not be reviewed unless the principle upon which their determination was reached was "inherently and legally vicious." The opinion for the Court of Errors was written by Justice Swayze. It is held also that the members of the State Board of Assessors, even though they be regarded as a judicial body, may be subjected to cross examination as to their personal knowledge of values of railroad property, where that knowledge is employed in determining an assessment. Under the railroad tax law it is the duty of the Supreme Court to afford relief as well in cases where the amount of the tax is excessive or insufficient as in cases where the principle upon which the assessment is made is erroneous. The manifest intention of the legislature was to afford the railroads equal protection of the laws in common with other citizens.

Justice Swayze's opinion reverses the Supreme Court and sets aside assessments aggregating $7,383,180, levied by the State Board of Assessors upon the property in question. The decision is interpreted as limiting, to a great extent, the powers of the State Board of Assessors. Railroad tax case hearings, says the court, must be real and not sham hearings. It is expected that other railroads will take advantage of the decision to proceed against assessments believed to be excessive. Justice Swayze's decision affects the state assessors only, as that was the body dealt with in the opinion. The State Board for the Equalization of Taxes is a separate body and handles individual appeals in general matters.

French Railway Delays.—A Reuter telegram from Bordeaux states that a government ordinance has been issued laying down the rule that railway lines are responsible for losses or damage when these are caused by the culpable mistakes of their agents and cannot be attributed to the war. Nevertheless, their responsibility does not extend to damage or waste which by nature of the merchandise concerned may arise owing to the length of time taken in transit, and railway lines do not incur any responsibility for the time taken in carrying merchandise.

Railway Officers

Executive, Financial, Legal and Accounting

David McNicoll, vice-president of the Canadian Pacific at Montreal, Que., has resigned on account of ill health, effective January 1, next, and will be succeeded by George Bury, vice-president at Winnipeg, Manitoba. Mr. McNicoll will remain as a member of the board of directors.

C. G. Austin, Jr., whose appointment as general solicitor of the Chicago & Western Indiana and the Belt Railway of Chicago, with headquarters at Chicago, has already been announced in these columns, was born in Highgate, Vt., February 6, 1879. He received his academic education at Brigham Academy in Vermont and was graduated from the University of Wisconsin in 1902 with the degree LL.B. He was admitted to the bar of Vermont in 1901, the year before his graduation from law school, and was engaged in the general practice of law in St. Albans, Vt., with his father and brother under the firm name of C. G. Austin & Sons, from the time of his graduation until June, 1909. He then removed to Cedar Rapids, Iowa, where, as assistant solicitor for the Chicago, Milwaukee & St. Paul, he acted as trial attorney for that company for the state of Iowa. He resigned in April, 1910, to accept a position in the law department of the Chicago & Western Indiana and the Belt Railway of Chicago, where he has since remained, now assuming full charge of the law departments as general solicitor, as above noted.

E. W. McKenna, whose retirement from the position of vice-president of the Chicago, Milwaukee & St. Paul, has already been announced in these columns, was born October 24, 1848, at Pittsburgh, Pa. He began railway work in May, 1862, with the Pennsylvania, and was messenger and operator until June, 1864, when he was in United States military telegraph service. From April, 1866, to December, 1869, he was with the Pittsburgh, Cincinnati & St. Louis as operator, freight clerk and general superintendent's clerk. He was then for one year train despatcher, and from February, 1871, to April, 1880, superintendent, of the Indianapolis & Vincennes, and the following five years was superintendent of the Jeffersonville, Madison & Indianapolis. During 1886 he was engaged in special work under the direction of the general manager of the Pennsylvania Lines West of Pittsburgh. Mr. McKenna became connected with the Chicago, Milwaukee & St. Paul in June, 1887, and was division superintendent until October, 1890, when he was appointed assistant general superintendent of that road. He left the St. Paul in August, 1894, to become general superintendent of the Eastern district of the Great Northern at St. Paul, Minn., resigning that position to engage in the business of renewing steel rails, being the inventor of a process for securing that result. He organized the McKenna Steel Working Company, of which he was president for a number of years. Mr. McKenna returned to the Chicago, Milwaukee & St. Paul in February, 1904, as assistant to the president, and in September of the following year he was made second vice-president. In September, 1909, he became vice-president of the same road in charge of operation and construction.

E. W. McKenna

Operating

P. R. Albright, assistant to general manager of the Atlantic Coast Line at Wilmington, N. C., has been elected assistant general manager.

T. R. Ryan, formerly traffic manager of the Mexico North-Western, who went to Brazil last January as traffic director of the Brazil Railway Company and its subsidiary companies, in addition to his former duties, has been made sub and acting managing director of the Brazil Railways and general superintendent of the Sorocobana Railway Company, one of the subsidiary companies, with headquarters at Sau Paulo, Brazil.

Traffic

A. F. Pilcher has been appointed general agent of the Rock Island lines at Sioux Falls, S. D.

Samuel W. Carder has been appointed commercial agent of the New York Central Fast Freight Lines, with headquarters at Omaha, Neb., succeeding J. J. Monks, promoted.

H. L. Hudson has been appointed district freight agent of the Union Pacific at Seattle, Wash., and L. M. Foss has been appointed district freight and passenger agent at Lewiston, Idaho.

Herbert L. Fairfield has been appointed manager of baggage and mail traffic of the Illinois Central and the Yazoo & Mississippi Valley, with supervision over the handling of baggage, mail, express and milk traffic, with headquarters at Chicago.

I. L. Graves, coal freight agent of the Southern Railway at Atlanta, Ga., has been appointed general freight agent, with headquarters at Knoxville, Tenn., succeeding H. L. Miller, resigned to go to another company, and the office of coal freight agent at Atlanta has been abolished.

Charles S. Lee, general passenger agent of the Lehigh Valley at New York has been appointed passenger traffic manager. George W. Hay, general baggage agent at South Bethlehem, Pa., has been promoted to general passenger agent, with headquarters at New York. A. J. Simmons, general eastern passenger agent at New York, has been appointed assistant general passenger agent, with office at New York, and Paul S. Millspaugh, general agent of the passenger department at Ithaca, N. Y., has been appointed assistant general passenger agent, with headquarters at Buffalo.

Engineering and Rolling Stock

E. H. McCann has been appointed master mechanic of the San Antonio, Uvalde & Gulf, with headquarters at Pleasanton, Tex., succeeding J. H. Ruxton, resigned, whose title was superintendent of motive power.

OBITUARY

Harry Dean, division freight agent of the Pere Marquette at Detroit, Mich., died on November 22, in Detroit. He had been in the service of this company for the past 18 years.

James Bissett, formerly master mechanic of the St. Louis & San Francisco, at Springfield, Mo., died on November 11, in Springfield at the age of 74. He began railway work at the age of fourteen, with the North Madison Railway, at North Madison, Ind., and subsequently served on different railroads. In October, 1899, he entered the service of the Kansas City, Fort Scott & Memphis at the South Side shops, Springfield, and later served as master mechanic of its successor, the St. Louis & San Francisco, until his retirement, under the pension rules of the company, about two years ago.

John C. Muir, general superintendent of the Chicago, Terre Haute & Southeastern, died at Terre Haute, Ind., on November 4, aged 50 years. Mr. Muir began railway work in June, 1879, as messenger for the Atchison, Topeka & Santa Fe, with which road he remained until August, 1895, being employed successively as telegraph operator, station agent, traveling auditor, train despatcher, and chief train despatcher. He then went to the Chicago & Eastern Illinois as chief train despatcher, and subsequently was trainmaster and superintendent until June, 1911, when he was appointed general superintendent at Danville, Ill. In November of the following year he became superintendent of the Chicago division at Danville, resigning in March, 1913, to go to the Chicago, Terre Haute & Southeastern as general superintendent at Terre Haute, Ind.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Maine Central has ordered 7 Mikado type locomotives from the American Locomotive Company.

The A. Guthrie Construction Company, St. Paul, has ordered 3 heavy-switching locomotives from the Baldwin Locomotive Works.

CAR BUILDING

The Pere Marquette has ordered 200 center constructions from the Pressed Steel Car Company.

The Atchison, Topeka & Santa Fe has ordered 100 tank cars from the Pressed Steel Car Company.

The United States Government, Department of Reclamation Service, has ordered one 55-ft. all-steel, 200-hp., 75-passenger motor car from the McKeen Motor Car Company for its Yuma Valley Railway in Arizona.

Railway Farm Demonstration Work in the Philippines.—A report of the progress of the agricultural demonstration coach sent out by the Philippine Bureau of Agriculture over the Manila Railroad has been issued. The car, which was on the road from March 26 to August 5, made one to three day stops at all the towns on the main and branch lines between Bauan, La Union Province, and Pagbilao, in Tayabas Province. This was the second tour of the car through the same territory. It passed through 11 provinces and made stops at 84 towns. It is stated that 22,176 persons visited the car during the tour, and 5,702 agricultural publications were given out and 66 illustrated lectures were given, with a total attendance of 36,552 people. The car was in charge of the trained employees of the bureau, who gave demonstrations during the day and illustrated lectures at night, the subjects covered in the latter being rice and sugar production, animal industry, locust extermination, and vegetable and fruit culture. Some 200 lantern slides were used. The car also carried modern farm implements for demonstration purposes. A noticeable result of the tour is the disposition of the farmers along the route to discard old agricultural implements and acquire the more modern and effective ones.

Argentine Railway Results.—The present year has been a decidedly adverse period in Argentine railway history, revenue having fallen off, while flood difficulties have also had to be contended with. Floods commenced in August and September, 1913, and resulted in considerable loss of traffic and damage to the property of the Buenos Ayres Great Southern, amounting to over $500,000. No sooner was the flood difficulty got over, than Argentina was visited by hot, dry winds and drought, which caused the failure of cereals in the southern portion of the company's zone. Rains, which set in again in the latter part of the company's financial year, caused dislocation of agricultural business and delayed the transport of the maize crop, a great part of which still remains to be carried. During the past financial year 145 miles of extensions were opened for traffic by the Buenos Ayres Great Southern, bringing its total completed lines up to 3,727 miles. The company is now restricting its expenditure upon capital account, only absolutely essential works being undertaken. In view of the working difficulties experienced by the Great Southern Railway in 1913-14, it is not surprising to find that the traffic receipts declined to $26,557,898, as compared with $31,927,007 in 1912-13. On the other hand, the working expenses were brought down to $15,552,452, as compared with $18,037,121, so that the decline in the net revenue was reduced to $2,944,450. A transporter bridge built for road traffic between the capital and Avellaneda and the Sud Dock were brought into operation in June, and by a presidential decree the government formally accepted the bridge from the company.—*Engineering.*

Supply Trade News

Eli F. Hart, one of the founders and the chairman of the board of the Rodger Ballast Car Company, Chicago, died at his home in Chicago on November 23. Mr. Hart was born at Rochester, N. Y., in 1832.

After sixteen years service with Hermann Boker & Co., New York, Ellsworth Haring has terminated his connection with that company, and has organized a business in tool steel and related specialties, with temporary offices at 684a Hancock street, Brooklyn, N. Y.

E. A. Sterling, forest and timber engineer, 1331 Real Estate Trust building, Philadelphia, Pa., has moved to 925 Commercial Trust building, Fifteenth and Market streets. This change of address also includes the offices of Clark, Lyford & Sterling, and the Philadelphia-Vancouver Timber Company.

TRADE PUBLICATIONS

Concrete Mixers.—The T. L. Smith Company, Milwaukee, Wis., has just issued folder No. 430, which is devoted to illustrations and the description of its latest type of non-tilting concrete mixer, known as the Smith Mixerette.

Steel Fence Posts.—The Carbo Steel Post Company has recently issued a 32-page booklet describing the construction and principles of its spring steel field fence post, and illustrates how they should be installed. It also gives a comparison of prices of the steel with the wooden posts.

Coaling Stations.—The Roberts & Schaefer Company, Chicago, has issued a four-page folder illustrating some of the latest reinforced concrete Holmen coaling plants. The bulletin shows briefly the method of operation of some of the coaling stations furnished by the company, and contains a list of the installations made since January 1.

The Kewanee Union.—The National Tube Company, Pittsburgh, Pa., has recently issued a circular relating to its male and female pattern Kewanee union. The following saving is said to be effected by this union: one nipple; the time required for making one less joint; one gasket; the time required for cutting and fitting that gasket, and the cost of one malleable union, an average net saving of 16 cents.

Train Lighting System.—"Safety Electric Light" is the title of an attractive booklet which has been recently issued by the Safety Car Heating & Lighting Company, New York, descriptive of the Safety Axle Driven Car Lighting System. The booklet describes the system in detail and contains illustrations of the various parts of the dynamo, the dynamo regulator, etc. There is also a section giving instructions for operation and installation, and another, giving cross-sections of the various safety dynamos and the names and numbers of their parts.

Electrical Apparatus.—The General Electric Company has recently issued a number of bulletins as follows: Bulletin No. 40,500, entitled "Alternating Current Generators for Direct Connection to Reciprocating Engines," illustrates and describes some of the recent improvements in the alternators built by the company for direct connection to steam, oil and gas engines. Bulletin No. 46,018 describes the company's type P-8 Portable Voltmeter. This is an unusually small instrument enclosed in a mahogany case, suitable for use on both alternating and direct current. Bulletin No. 44,404 describes one of the company's new line of Ventilated Commutating Pole Motors. This motor has a rate capacity of 80 hp. on 600 volts. The motor has a special feature in its induced ventilation, and is said to have a greater service capacity than motors of the closed type having the same hourly rating. Bulletin No. 41,500 is entitled "Small Direct and Alternating Current Motors of the Drawn Shell Type." These are all fractional horse-power motors, which have been specially designed for application to the diversified forms of small machines which may be driven by electricity.

Railway Construction

Boston Subways.—Bids are wanted by the Boston Transit Commission, Boston, Mass., until December 5, for constructing that section of the Dorchester tunnel which will pass under Fort Point channel, thence to the corner of West Second street and Dorchester avenue in South Boston. This section will be about 3,200 ft. long.

Charles City Western.—An officer writes that this company has projected an 18-mile extension from Charles City, Iowa, to a point on the Chicago Great Western. The company now operates a line from Charles City, southwest to Marble Rock 13 miles.

Chattahoochee Valley.—An officer writes confirming the report that surveys have been made for a proposed extension from McCulloch, Ala., to a connection with a line to Columbus, about 15 miles. The right of way has also been secured but construction work has not yet been started. (August 21, p. 369.)

Chicago, Peoria & Quincy (Electric).—This company, which was organized last year to build from Peoria, Ill., southwest about 120 miles to Quincy, is now making surveys for the line, but has not yet started construction work. The Chapman Company, 1710 Steger building, Chicago, may be addressed. (June 12, p. 1356.)

Grand Marais & Northwestern.—An officer writes that a contract has been given to John Bergman, Duluth, Minn., and work is under way building from Grand Marais, Minn., west to Cascade Junction, 20 miles, and that surveys are being made for an extension from Cascade Junction west to Ely, 55 miles. A. Mitchell, president, Duluth, Minn. (January 16, p. 149.)

Kinston Carolina Railroad & Lumber Company.—We are told that this company has projected an extension from Pink Hill, N. C., south to Chinquapin, 15 miles. (October 23, p. 779.)

Lula-Homer.—We are told that this company has been organized to build from Lula, Ga., southeast to Homer, 14 miles. The line is to have maximum grades of 2.5 per cent and maximum curvature of 9 deg. It has not yet been decided when bids will be asked for building the line. The principal commodities to be carried will be farm produce and the products of mines. D. G. Zeigler & Son, Lula, may be addressed. (November 13, p. 924.)

Morgantown & Wheeling (Electric).—An officer of this company writes that grading work has been finished and track laying is to be started at once from Cassville, W. Va., west to Blacksville, 15 miles. Keeley Brothers & Gilmore, Morgantown, W. Va., are the contractors. Track has been laid on about a half mile at Cassville. Surveys have been made and most of the right of way secured for an extension from Blacksville to Wheeling, 52 miles. R. D. Hennen, chief engineer, Morgantown. (May 15, p. 1118.)

New York Subways.—Bids are wanted by the New York Public Service Commission, First district, until December 11, for the construction of Section No. 4 of Routes Nos. 4 and 36, that part of the new Broadway subway in the borough of Manhattan extending northerly under Seventh avenue from Fifty-first street to a connection with the crosstown part of the line in Fifty-ninth street.

Quebec Central.—An officer writes that work is now underway by P. J. Wolfe, Sherbrooke, Que., on a section of 10 miles, and by Z. C. Howard & Co., also of Sherbrooke, on a section of 5 miles, of an extension being built from a point 10 miles east of St. Sabine, Que., to Lac La Frontier. (July 3, p. 40.)

Rome & Northern.—An officer writes that surveys are now being made for the extension to be built from Gore, Ga., north to Subligna, 8.4 miles.

Temiskaming & Northern Ontario.—An officer writes regarding the report that a line may be built from Cochrane, Ont., to Port Nelson, that the provincial government has not seriously considered building such an extension as it would involve the construction of about 750 miles of railway and much of the route

would be through an unexplored wilderness. A reconnaissance survey for an extension from Cochrane to Moose Factory at the south end of James Bay, 185 miles, has been made. It will be practicable to develop a harbor at this place which is the nearest point on James or Hudson Bay to the settled portions of eastern Canada along the Great Lakes and St. Lawrence river.

Tennessee Railway.—An officer writes that surveys are now being made for building an extension from Charleys Branch to Petros, Tenn., 11.25 miles.

Toronto Eastern (Electric).—An officer of this company which was organized to build a line through Pickering, Whitby, Oshawa and Bowmanville, Ont., writes that track has been laid on a total of 14.53 miles, which includes the section from Whitby to Bowmanville, 11.47 miles, and work is now under way between Whitby and Pickering on five miles. Ewan MacKenzie, Toronto, Ont., is the contractor. Surveys are now being made for an extension from Pickering to a point in the township of Scarboro, 15 miles. E. W. Oliver, chief engineer, Toronto. (January 9, p. 102.)

RAILWAY STRUCTURES

Houston, Tex.—The International & Great Northern is building a one-span Strauss bascule bridge over Buffalo Bayou, near Houston. The contract for the steel, amounting to 468 tons, was awarded the Wisconsin Bridge & Iron Company, and the contract for erection went to the American Construction Company. Work is about 10 per cent completed. The total estimated cost is $36,000.

Pawtucket, R. I.—A contract for building the new station for the New York, New Haven & Hartford on the dividing line between the cities of Pawtucket and Central Falls to replace two old stations has been given to Norcross Brothers, Worcester, Mass. The new structure is to be of brick and stone construction. It will be an overhead station built 21 ft. above the track level, which at this point is located in a deep cut. The station will have two island platforms 900 ft. long, reached by six stairways. The waiting room will be 92 ft. long, 64 ft. wide and 32 ft. high. The building will be 84 ft. by 162 ft. with two wings, and the work will cost about $200,000. A contract was given last summer to C. W. Blakeslee & Sons on a unit price basis for the foundations. This improvement is part of the grade crossing elimination work at Pawtucket and Central Falls under way for the past two years. The work involves the elimination of all grade crossings, and the four tracking and relocation of tracks to take out the curve on the main line at this point.

Portsmouth, Va.—We are told that a contract has been given by the Seaboard Air Line to the Richardson Construction Company, Inc., Norfolk, Va., for work on the general office building and terminal station at High street in Portsmouth. The plans call for a structure five stories high on pile foundation, to be from 60 to 72 ft. wide and about 155 ft. long, with brick walls and reinforced concrete floors and roof.

Notes on English Railway Signaling—History.—Although neither fixed signals nor the block system were first introduced on the London, Brighton & South Coast, that company's line may be regarded as being the garden within which they grew and multiplied. Stewart's Lane Junction and the Hole-in-the-Wall signal towers were among the very first erected, and at Brighton, in 1861, a tower was provided with 37 levers installed therein. No doubt the fact that both John Saxby and J. S. Farmer had been connected with that railway had something to do with the progress signaling made on the Brighton. It was on that railway also that fish-tailed arms for distant signals were introduced. This was done in August, 1872, when two distant signals at Norwood Junction were so distinguished. The Brighton Company cannot claim to be the first to adopt the "lock-and-block." W. R. Sykes—the last survivor of the old school—must be given the credit for inventing patent No. 662 of 1875—the first complete method of interlocking the fixed signals with the block instruments; but after the Arlesey accident of December, 1876, Charles Hodgson, of Saxby & Farmer, invented patent No. 400 of January, 1877—a lock-and-block system, which was installed on a section of the Brighton Railway.

Railway Financial News

Bangor & Aroostook.—In the fiscal year ended June 30, 1914, this company, operating 631 miles in the state of Maine, had gross revenue from operation of $3,795,413, an increase of $542,991 over the previous year and the largest in the company's history. The net income after the payment of expenses, rentals, taxes and interest was $205,731, as against a net loss of $84,307 in 1913. The increase in gross revenue was shown in both passenger and freight traffic, but that the amount is so large is mainly due to a tonnage of potatoes of 526,578 (of a total of 1,902,745) as against 372,681 tons in 1913. The company, on the other hand, also had increased expenditures, very largely the result of the severe winter.

The Bangor & Aroostook operates a line through the state of Maine from Penobscot Bay and Bangor north through Aroostook county to points on the Canadian border such as Houlton, Fort Fairfield, Van Buren, Fort Kent and St. Francis. It also has a branch to Greenville in the Moosehead Lake region. The road thus serves a large portion of the hunting district of Maine. It is not part of a through route but derives the larger portion of its revenue from the traffic in potatoes, lumber and other forest products, and paper which originates in its own territory; the tonnage of these products in 1914, being potatoes, 526,578; lumber, 352,847; other forest products 304,481 and paper, 168,264, of a total of 1,902,745 tons.

In the fiscal year ended June 30, 1914, the road earned $6,019 per mile of road, of which $4,693 was freight revenue, as compared with $5,158 revenue per mile of road of which $3,890 was freight revenue, in 1913. The ton-mile rate in 1914 was 1.225 cents as against 1.146 cents in the previous year, the total ton mileage carried being 1,902,745 tons, as noted above, as against 1,620,065 in 1913. The number of passengers carried in 1914 was 817,282 as compared with 781,519 in 1913, the average receipts per passenger mile being 2.350 cents and 2.309 cents in 1914 and 1913, respectively. The company during the year paid 3½ per cent dividends. On June 30, 1914, it had on hand $450,226 cash with loans and bills payable of $1,215,000.

Erie.—The stockholders, at a special meeting on November 17, approved the making of a refunding and improvement mortgage under which a total of $300,000,000 bonds may be issued. This provides for the refunding of all outstanding securities.

Kanawha & Michigan.—The annual report of this company shows that in the fiscal year ended June 30, 1914, it had net income after the payment of expenses, rentals, taxes and interest of $816,448, as compared with $1,005,396 in 1913. This decrease of $188,948 is the result of strikes at the coal mines which began in Ohio April 1, 1914, and in West Virginia on May 1, and continued until after the close of the fiscal year.

The Kanawha & Michigan operates a total of 177 miles of line. The main line extends from Corning, O., to Hobson and from Kanauga, O., to Gauley Bridge, West Va. In the fiscal year ended June 30, 1914, the company earned operating revenue per mile of road of $17,611, as compared with $18,705 in 1913. The total ton mileage of revenue freight was 660,476,000, a decrease of 7.27 per cent. The average receipts per ton per mile were 4.02 mills, about the same as in 1913, and the average trainload was 959 tons, an increase of 22 tons, or 2.35 per cent. During the year there was an actual loss of coal and coke traffic of $230,353, nearly all of which was due to the strike in April, May and June. This loss was even greater than the loss in total revenue, which makes it worth noting that over three-quarters of the Kanawha & Michigan's total tonnage of freight is made up of bituminous coal. The total number of passengers carried in the fiscal year was 1,231,119 as compared with 1,269,783 in 1913. The average passenger receipts per passenger mile in 1914 were 1.94 cents, and in 1913, 1.91 cents. Dividends paid during the year amounted to $450,000 at the rate of 5 per cent. The balance carried to credit of profit and loss, therefore, was $366,448. At the end of the year the company had on hand cash to the amount of $139,129. The total working assets were $1,016,661, and the total working liabilities were but $693,606. The expenditures for additions and betterments in 1914 totaled $273,042.

VOLUME 57 DECEMBER 4, 1914 NUMBER 23

Contents

*Illustrated.

The New Haven road is receiving unstinted praise from the newspapers for the very successful way in which it took 33,000 passengers to and from the New Haven football game in one day. President Elliott's letter reviewing the work done is noticed in another column; and a significant paragraph in the letter is that wherein he says that "a well-equipped, well-organized, well-managed and well-manned railroad should be able to perform this task satisfactorily." In other words, he expected the fine results which were produced. And he had good grounds for the expectation. The New Haven road has done excellent work with the football crowds before. The special passenger movement this year was heavier than ever before, but the company during the past year has carried out a careful and thorough scheme of expansion of its facilities; and it was to be expected that what the officers set out to do they would do. To those newspapers which have so generously praised the New Haven in connection with this special passenger movement, we offer the suggestion that commendatory mention of railway efficiency would be quite appropriate in many other cases. Beginning with the assumption that the New Haven has been very bad, it is easy to make a glowing paragraph concerning what is seen to be very good. But the striking antithesis is not essential. A 2,000-mile railroad is too big a machine to be thus dealt with. Its good and its bad cannot be tossed off in a paragraph. We make these observations in this connection because they are believed to be worth consideration in connection with other railways and by all newspapers.

Good Work as an Every-day Task

Scrip dividends on railroad stocks have not been very common, but when they have been declared they have always been in the form of a registered warrant or certificate. The Southern Railway declared the last semi-annual dividend of 2 per cent on its preferred stock as payable in scrip, bearing interest at 4 per cent and due in five years. On the New York Stock Exchange 100 shares is the common unit in which trading is done, but the Southern has taken 50 shares as the unit for its scrip dividends. Two per cent on 50 shares would, of course, be $100. The dividend warrants, which are in reality notes of the railway company, are payable to bearer, and each $100 note has attached to it 10 coupons representing semi-annual interest during the period of five years. Fractional scrip has been issued to those holding less than 50 shares, which are exchangeable, when presented in $100 amounts, for the coupon notes above described and which fractional scrip notes bear interest at 4 per cent per year payable at the due date. This is an entirely new form of payment of scrip dividends and the importance of it lies in the step which is made toward convenience for the small holder of securities. The notes are lithographed in a sufficiently intricate pattern to prevent forgeries, but are not so elaborate as to be expensive. It has probably been found that it actually costs the company less to issue this form of scrip dividend than to go to the expense of recording and keeping track of the holders of the stock as of the date of the dividend, and certainly it is infinitely more convenient for stockholders. Incidentally it affords an opportunity for investment to the man who would like to buy railroad stock in $10 or $20 lots.

A New Form of Scrip Dividend

Arthur Wyman, assistant to the president of the Chicago Railway Equipment Company, has contributed to American Industries for November an interesting and able article, entitled "Send Business Men to Congress." Mr. Wyman calls attention to the fact that most of the problems which now come before Congress involve economic and business questions with which men of business training and experience are the best fitted to deal. Therefore, the business interests of the country should take steps to secure the election of such men. Furthermore, he points out, the nucleus for an organization to accomplish this result exists in such organizations as the American Bankers' Association, the National Association of Manufacturers, the Railway Business Association and the many chambers of commerce throughout the country which have been united in the Chamber of Commerce of the United States. "If," says Mr. Wyman, "every man affiliated directly or indirectly with the Chamber of Commerce of the United States would take upon himself the task of disseminating sound doctrine within the radius of his personal acquaintance, how many times multiplied would be the effect of its splendid propaganda. Imagine a condition where every

"Send Business Men to Congress"

man connected with a business concern conceived it to be his duty to 'plug' for the principles in which he believes with the same degree of energy, tact, fairness and constructive ability which he employs in the keen competition of his own business." Certainly, the needs for more business men in Congress, and for a more active participation by business men in public affairs, are fully as great as Mr. Wyman says. Unfortunately, the business interests have in the past worked at cross purposes. Each class of them has sought for what it has conceived to be its own selfish advantage instead of for what would be for the interests of the country as a whole. For example, commercial bodies and industrial concerns have worked for regulation of railways to promote their own interests, to a large extent, regardless of the effect on the railways and the prosperity of the nation as a whole. Meantime, organized labor has acted more wisely. It has stood together as a class in advocating and opposing legislation, and in consequence has usually got what it has wanted. Can the business men of the country, little and big, be brought to a realization of the fact that, broadly speaking, their interests are mutual and not antagonistic, and that therefore they should stand together in advocating legislation which will be beneficial to them all and in securing the election of business men who are fitted to cope with business problems?

Inefficient Government and Public Ownership

The mayor of Chicago recently made an address at the Mayors' Convention in Philadelphia telling why American cities should own and operate public utilities. The government of Chicago, of which the mayor is the head, is charged with the duty of giving its citizens police protection. On November 29 the newspapers of Chicago reported that up to that time there had been 401 homicides in that city in the year 1914, of which 181 were known to have been murders. This is probably the worst record made in 1914 in any community in the civilized world. The government of Chicago demonstrates its incapacity to perform the primary duty of a government; and then in the open season for murders in his bailiwick the mayor sallies out to tell how much better it would be for the public to have government manage the street railways, the light and power plants, and so on, than to have them managed by corporations! Or, take another example: Except the much advertised boulevards, are there worse streets in any other large city than in Chicago? If the city cannot build and maintain good streets, how can it be assumed it could successfully maintain and operate street railways and other public utilities? Those who advocate municipal ownership of utilities usually advocate government ownership of railways, also. They ask, if our governments can successfully build and maintain highways, why could they not successfully build, maintain and operate railways? The answer is easy: they can't successfully build and maintain highways—or, at least, they don't. Most of our public highways, under government construction and maintenance, are among the worst in the world. The advocates of public ownership of public utilities and railways cite foreign experience in support of their argument. But the foreign cities and nations which are successful in managing public utilities and railways show their efficiency by also suppressing crime, by properly building and maintaining streets and highways and by performing their other functions satisfactorily. Their success, to such extent as they really are successful, in managing public utilities and railways is due to their general efficiency; and the failure of our governments with similar enterprises would be due to the same cause as their failure in almost everything they try to do now, viz., to their general inefficiency. And they will always be inefficient while they are run by men who show their statesmanship by constantly seeking to extend the functions of the governments instead of by devoting themselves to getting the present functions of the governments performed respectably.

FOLLOWING THE COMMISSION'S ADVICE

THE newspapers recently have published plans of a committee of western railroad commissioners, headed by Clifford Thorne, for opposing a "general advance" in rates by the western railways which Mr. Thorne last week told the Chicago papers would amount to $70,000,000 a year. Some papers also have expressed surprise at tariffs filed by the eastern railways advancing certain rates more than the 5 per cent which was allowed by the Interstate Commerce Commission on part of the tonnage of the Central Freight Association roads. All this shows misunderstanding or misrepresentation of what the railways are doing.

In its opinion in the eastern rate case the commission made three groups of suggestions as to how the carriers might increase their revenues in other ways than by a general advance. The first suggestion was for an increase in passenger fares. The second was "that all railroads in Official Classification territory examine carefully their freight rates, rules and regulations, with a view to increasing rates that are found to be clearly unremunerative, and modifying burdensome rules and regulations relating to minimum weights and similar matters where this may justly be done." The third suggestion related to free or special services, such as spotting cars, trap car service, lighterage, loading, unloading and storage, etc. "These three suggestions," the commission said, "will necessarily lead to some increase of the transportation charges. But the carriers' revenues will be increased more than the shippers' burdens, for these will be lessened through the removal thereby of many unjust discriminations."

All three of these suggestions have been promptly followed by the railroads: not only by those in Official Classification territory, but to a considerable extent also by the western roads, whose officers had been watchfully waiting for the decision for some indications as to how they could improve their own situation. Whereupon loud protests by Clifford Thorne, the American Meat Packers' Association, and possibly some others less vociferous. Mr. Thorne gets his $70,000,000 a year by taking about 10 per cent of the gross freight earnings of the western roads. But the western roads have not asked for a 10 per cent advance. Some western railroad officers have said they ought to have such an advance, and for a time a plan was considered for a general readjustment of rates on some traffic and a 10 per cent advance on the rest, together with the imposition of special charges for special services. This plan was outlined in a private and confidential letter issued by J. M. Johnson as chairman of a meeting of western traffic officers held last May, which Mr. Thorne in some way got hold of and published. The plan discussed in this letter was admittedly tentative, in anticipation of the decision of the commission in the eastern case.

That the roads are merely trying to carry out what they understand to be the policy favored by the commission is clearly shown by a comparison of the commission's opinion with the steps which the railways have taken. First, the 5 per cent advances allowed in Central Freight Association territory were put into effect, while the passenger departments of the eastern roads have been busy in revising their passenger fares upward in accordance with suggestion No. 1. Then the eastern roads began to "examine carefully their freight rates, rules and regulations, with a view to increasing rates that are found to be clearly unremunerative," and have transferred a considerable number of rates from exceptions back to the higher classification basis, from which they had been taken through force of competition. Both eastern and western roads also filed tariffs effective on December 1, advancing rates on grain, grain products, hay, packing house products and dressed meats, and tariffs have been filed from time to time imposing charges for trap car and other special services. The eastern roads have also filed advances in livestock rates, and the western roads have announced their intention of doing so in the near future, and other commodities in the "unremunerative" class are slated for advances. The western roads also are figuring on advancing their pas-

senger fares, but it will take some time to work out the tariffs.

While attempting to give the impression that all rates in the west are to be advanced, Mr. Thorne confined his specific remarks to the rates on grain and packing house products, in which he is especially interested as attorney for the shippers. Others who may not have the same means of access as Mr. Thorne to private and confidential letters may find some of the principal commodities to be raised by perusing certain tables in the opinion of the Interstate Commerce Commission which the commission referred to as follows: "The compilation prepared by the commission of answers of the carriers to our questions in this proceeding, calling for a statement of their earnings on representative traffic, discloses many rates which yield barely enough in revenue to pay adequately for the mere use of the equipment. Our compilation also shows that a large proportion of traffic in many commodities is yielding less than seven cents per loaded car-mile, although the record shows that railroad men ordinarily consider that the average earning per loaded car-mile should be more than twice that amount. Many unremunerative rates had their origin in fierce competition for traffic or under the menace of the big traffic of powerful shippers. Many such rates have doubtless been continued through ignorance of the loss they entail upon the carriers." The carriers were required to submit statements showing for interstate carload traffic in October, 1913, the relative earnings under existing rates on 30 different commodities moving in greatest volume, and as to representative movements, to establish, among other things, the ton-mile revenues, the car-mile earnings and other facts bearing upon the profitableness of the traffic. To this list the railroads added data for 15 additional commodities and the commission summarized the figures, remarking that they "show for similar lengths of haul, very wide variation in the car-mile earnings."

Of the 45 commodities listed the average net revenue per loaded car-mile (which the commission defined in a footnote as "gross revenue less certain amounts paid out for arbitraries or for special services") ranges from 6 to 28 cents, and the average rate per ton-mile from 2.73 mills to 12.34 mills. Thirty commodities in this table yield earnings of less than 14 cents per loaded car-mile. The lowest car-mile revenue in the list is shown for cattle, 6 cents, and for hogs and sheep the figure given is 7 cents. It is not surprising, therefore, to find that the eastern railways have filed tariffs advancing the rate on cattle from Chicago to New York from 28 to 33 cents, and on hogs and sheep in double-deck cars from 28 to 33 cents, and in single-deck cars from 35 to 38 cents per hundred pounds. The western roads also have announced their intention of advancing livestock rates by a maximum of 2½ cents from the Missouri river and 1 cent from the Mississippi river to Chicago.

Oats, in the commission's table, show car-mile earnings of 8 cents; feed, 8 cents; flour, 9 cents; hay, 9 cents; and corn, 11 cents, and tariffs have been filed advancing the rates on grain and grain products 1 cent, and on hay 2 cents per hundred pounds. Fresh meats show earnings of 10 cents and packing house products 11 cents per car mile. The rates on these commodities also were among the first to be advanced, the increases being, from the Missouri river to Chicago, 3½ cents, and from Chicago to New York, 5 cents.

Copper bullion shows car-mile earnings of 11 cents and a ton-mile revenue of only 2.73 mills. The rates on this commodity, which have long been the ground for some of the severest condemnation of the railways, are also to be substantially advanced.

The American Meat Packers' Association has filed a formal complaint against the advances in meat and livestock rates on the ground that its members are discriminated against by rates so much out of proportion to increases on other commodities. Representatives of the Chicago packers have given interviews, saying that they were willing to stand a general 5 per cent advance, but that they are opposed to a greater advance on their own commodities. It was to avoid just such complaints about the relations of rates that the eastern roads asked for a horizontal advance, but the packers do not mention in their interviews that their rates, by reason of their compelling power of large tonnage, have long been among the very lowest and most unfairly discriminatory in the United States, especially when the expedited service and the empty back-haul are considered. In fact, they are so low that the principal railways between Chicago and the Missouri river have for several years relinquished a great deal of the meat traffic to the Alton and the Wabash rather than meet the low and utterly indefensible rates maintained by these roads.

The railroads need greater revenues and are adopting the course that seems most likely to secure them. But the most salutary feature of the case is that the rates they are now seeking to raise ought to be raised even in the absence of financial necessity. It has been notorious for years that some rates have been so low as to work a discrimination against other traffic, and that these survivals of the days of rebating have seriously militated against efforts to place all rates on an adequate basis. The commission has warned the roads to come into court with clean hands before complaining of a general situation for which such practices as some of these low rates represent are largely responsible. That these unremunerative and discriminatory rates are now to be subjected to greater advances than others is but delayed justice.

HEAVIER LOADING OF CARS

UNDER the caption "Buy a Car of Coal," a little magazine issued by the Milwaukee-Western Fuel Company called "Screenings," recently published a short article giving advice to retail coal dealers which, if followed, would yield advantages to all concerned—the coal mine operator, the wholesaler, the retailer, the consumer and the railroad. It was pointed out that when a dealer places an order for 20 tons of coal the car in which it is hauled is only partially loaded, but is moved and delivered at practically as great expense as if it were loaded to capacity. A little later another partly loaded car is shipped, and so on until a time of car shortage comes, when the railroad becomes unable to deliver coal promptly. Then the retailer finds his bins empty, the consumer clamors for fuel, and the railroad is blamed for not delivering coal promptly! In other words, everybody suffers inconvenience, or worse, while railway equipment and other valuable facilities between the mine and the consumer have been used wastefully.

The traffic committee of the Lumbermen's Association of Chicago has been trying to educate shippers and users of lumber, also, as to the importance of heavier loading of cars. It is sending out circulars calling attention to the fact that as the commercial load of each car is increased the percentage of the dead weight to the total weight to be hauled is decreased. Therefore, the operating efficiency of the carriers is increased, while the car supply is conserved in times of car shortage.

We have referred in the past to the excellent results obtained by the Universal Portland Cement Company and the National Tube Company by urging their customers to order in full carloads. Work of this kind on the part of large industrial concerns is the most effective kind of co-operation with the railroads. Many shippers believe an advance in freight rates is desirable because it would enable the railroads to give more efficient service. Others believe that if the railroads would increase their efficiency they would not need an increase in rates. The campaign for heavier loading of cars affords an opportunity for all shippers of carload freight to help the railroads increase their efficiency in the best way possible; for in no single way could more be saved than by increasing the average load per car.

If coal shippers and other shippers of heavy commodities could be induced to load cars to their full capacity this would be of as much benefit to the roads as an increase in rates, because, like an increase in rates, it would increase earnings per car mile. There are many opportunities for economies by which the railroads cannot benefit without the co-operation of shippers; and this is one of the most important. If dealers order shipments

in amounts equal only to the low minimum carload weights that prevail, the railroads are obliged to furnish them cars for such light loading regardless of the resulting economic waste. Many carload minimums ought to be advanced, but to do so involves a long and most difficult procedure. The fact that at present there is a large surplus of freight cars rather than a shortage shows a need even greater than usual on the part of the roads for practicing the most rigid economy; and every form of assistance which the shippers give them will ultimately redound to the benefit of the shippers themselves.

ALABAMA GREAT SOUTHERN

THE Alabama Great Southern, operating a line running diagonally across the state of Alabama from Meridian, Miss., to Chattanooga, Tenn., is that important link in the Queen & Crescent route which connects the lines from Shreveport and New Orleans, La., to Meridian with that from Chattanooga to Cincinnati. It is thus a part of the Southern Railway System's north and south line from New Orleans and Mobile to Cincinnati, and of particular importance also in that it serves the prosperous and rapidly growing cities of Birmingham and Chattanooga. The company operates a total of 309 miles of road, 295 of which is main line, mostly single track. The road is in the rather enviable position of having no branches, the remainder of the 309 miles consisting of trackage rights over the Southern Railway and the Woodstock & Blocton. The gross operating revenues in the fiscal year 1914 were $5,385,307 as compared with $5,231,985 in 1913, the increase being almost entirely due to increased freight revenues of $3,662,745, as against $3,488,041 in 1913. Operating expenses, however, increased in greater proportion from $3,815,904 to $4,227,464, primarily because of an increase of $228,895, or 19.43 per cent, in maintenance of equipment expenses due to greater expenditure for maintenance of wooden freight cars and to charges for the retirement of light capacity cars. The net revenue of $1,151,237, therefore, was a decrease of $257,469. The net income after the payment of expenses, rentals, taxes and interest was $757,187, as compared with $1,134,620 in 1913. The company paid the regular 6 per cent dividends on its preferred stock, calling for $202,821, leaving a surplus for the year of $554,366 as compared with $931,799 in 1913, there having been no dividends paid on the common stock in either year.

The Alabama Great Southern's bonded debt, including equipment trust obligations of $998,507, was on June 30, 1914, $9,175,107, an average of $29,693 per mile. During the year there had been issued $2,500,000 5 per cent first consolidated mortgage bonds, part of a total authorized issue of $25,000,000, the portion sold at this time being to provide funds for additions, betterments and improvements in 1914, 1915 and 1916. The total funded debt, however, was increased but $2,245,507 over 1913, there having been $366,701 equipment trust obligations retired on maturity during the year. During 1914 the company spent a total of $306,321 for additions and betterments. It has recently spent large sums on signaling, structures and similar facilities. It has also begun to double track its main line and has already completed a section of double track from Birmingham northward. Perhaps the most important of its present projects, however, is the construction of a three mile line from Wauhatchie to the Lookout Mountain line of the Southern Railway leading to the terminal facilities at Chattanooga now reached by trackage rights over the Nashville, Chattanooga & St. Louis. The directors, with these improvements in mind and feeling the need of additional capital, proposed late in 1913 to make a new first consolidated mortgage to secure $25,000,000 of 30-year bonds bearing interest not exceeding 5 per cent, $2,500,000 of these bonds to be issued at once as noted above, and the remainder to be issued as follows: $5,686,600 to refund the 5 per cent first and general mortgage bonds maturing in 1927; $9,000,000 to provide for future double tracking and for the construction of the line from Wauhatchie to the Southern's Lookout mountain line, to be issued as the work is done, and $7,813,400 for general improvements in and after 1917 at about $500,000 a year. Largely because of the sale of the new issue of bonds there was an increase in the amount of cash on hand from $611,307 in 1913 to $2,789,464 in 1914. The company at the end of the year had a surplus of $2,893,714.

The freight traffic of the Alabama Great Southern consists mainly of lumber, coal and ore, and articles of manufacture, principally iron and steel. In the fiscal year ended June 30, 1914, it carried a total of 3,742,000 tons of revenue freight, as compared with 3,690,000 tons in 1913. The total revenue ton miles were 575,047,000, as against 538,502,000, and the average distance each ton was carried increased from 145.95 to 153.66 miles. The company's freight train revenue per mile of road likewise increased from $11,273 to $11,838, and the total operating revenue per mile of road from $16,910 to $17,405. There was an increase in revenue trainloading during the year from 418 to 422; the revenue car loading per loaded car averaged 20 tons.

The passenger traffic in the two years was about the same. In 1914 there were 1,018,000 passengers carried as compared with 1,009,000 in 1913. The passenger receipts were $1,298,781 in 1914, and in 1913, $1,291,317. In 1914 the average distance each passenger was carried was 59.55 miles; the average revenue per mile 2.14 cents, and the passenger-train revenue per mile of road, $4,971.

The following table shows the principal figures for operation in 1914 as compared with 1913:

	1914	1913
Average mileage operated	309	309
Freight revenue	$3,662,745	$3,488,041
Passenger revenue	1,298,781	1,291,317
Total operating revenues	5,385,307	5,231,985
Maint. of way and structures	688,650	627,364
Maint. of equipment	1,406,891	1,177,997
Traffic expenses	162,171	154,664
Transportation expenses	1,832,894	1,736,409
General expenses	136,858	119,471
Total operating expenses	4,227,464	3,815,905
Taxes	189,857	176,041
Operating income	961,380	1,232,664
Gross income	1,338,882	1,719,098
Net income	757,187	1,134,620
Dividends	202,821	202,821
Surplus	554,366	931,799

COLORADO & SOUTHERN

THE strike in the coal mines in Colorado was, of course, the dominant factor in the history of the Colorado & Southern in the fiscal year ended June 30, 1914. The coal tonnage, which furnished 29.39 per cent of the total tonnage in 1913 and the revenue from which was 24.93 per cent of the total freight revenue in that year, furnished but 21.21 per cent of the total tonnage in 1914, and the revenue from this business amounted to but 18.03 per cent of the total revenue. Not only did the strike in the coal mines cause a loss in freight revenue to the Colorado & Southern, but it also very much increased operating expenses, it being necessary to buy fuel coal from mines not on the lines of the company. Fuel cost the Colorado & Southern 17.2 cents per locomotive-mile in 1913, and 22.4 cents per locomotive-mile in 1914.

The Colorado & Southern operates 1,866 miles of road, of which 906 miles is in Colorado and 711 miles in Texas. In 1914 the road earned $7,083 per mile as compared with $8,152 per mile in 1913. Of its total operating revenues under normal conditions about 70 per cent is freight revenue and 22 per cent passenger revenue. Under normal conditions about 63 per cent of its total freight tonnage is furnished by products of mines and about 16 per cent by products of agriculture.

Total operating revenues in 1914 amounted to $13,223,000 as compared with $15,078,000 in 1913. Operating expenses amounted to $9,746,000 as against $10,623,000 the year before. All of the saving which was made was in maintenance. After the payment of interest and 2 per cent each on first and second preferred there was a surplus in 1914 of but $66,000, while in 1913, after the payment of 1 per cent on the common and 4 per cent each on the first and second preferred, there was a surplus of $675,000.

The following table shows the percentage of each class of expenses to total operating revenues:

	1914	1913
Maintenance of way and structures	13.75	12.65
Maintenance of equipment	16.52	20.64
Traffic expenses	1.64	1.53
Transportation expenses	38.23	32.50
General expenses	3.57	3.14
Total	73.71	70.45

The smaller expenditure on maintenance of equipment was probably in part the result of a considerably smaller mileage made by both locomotives and freight-train cars. The increase in transportation expenses, despite a saving in train mileage, was due to the higher cost of fuel already mentioned, and to very severe winter weather, which made operation more difficult, etc.

The total number of tons of freight carried in 1914 was 6,125,000, a decrease of 1,328,000 from 1913, and the ton mileage was further decreased by a much shorter average haul, 143 miles in 1914 as against 154 miles in 1913. Apparently, therefore, the Colorado & Southern gets a long haul on its coal. The smaller proportion of coal tonnage, however, made the average ton-mile rate higher in 1914—1.033 cents—than in 1913—0.944 cents. With a decrease of about 24 per cent in ton mileage, the total mileage of freight locomotives was 3,079,000 in 1914 as against 3,740,000 in 1913, a decrease of 17 per cent. Loaded freight car mileage was 45,972,000 in 1914 as against 55,373,000 in 1913, a decrease of 9,401,000. Empty car mileage was 22,704,000 in 1914 as against 25,785,000 in 1913, a decrease of 3,081,000. The falling off in coal tonnage is reflected in the average trainload, which in 1914 was, for standard gage lines, 302 tons as against 332 tons in 1913.

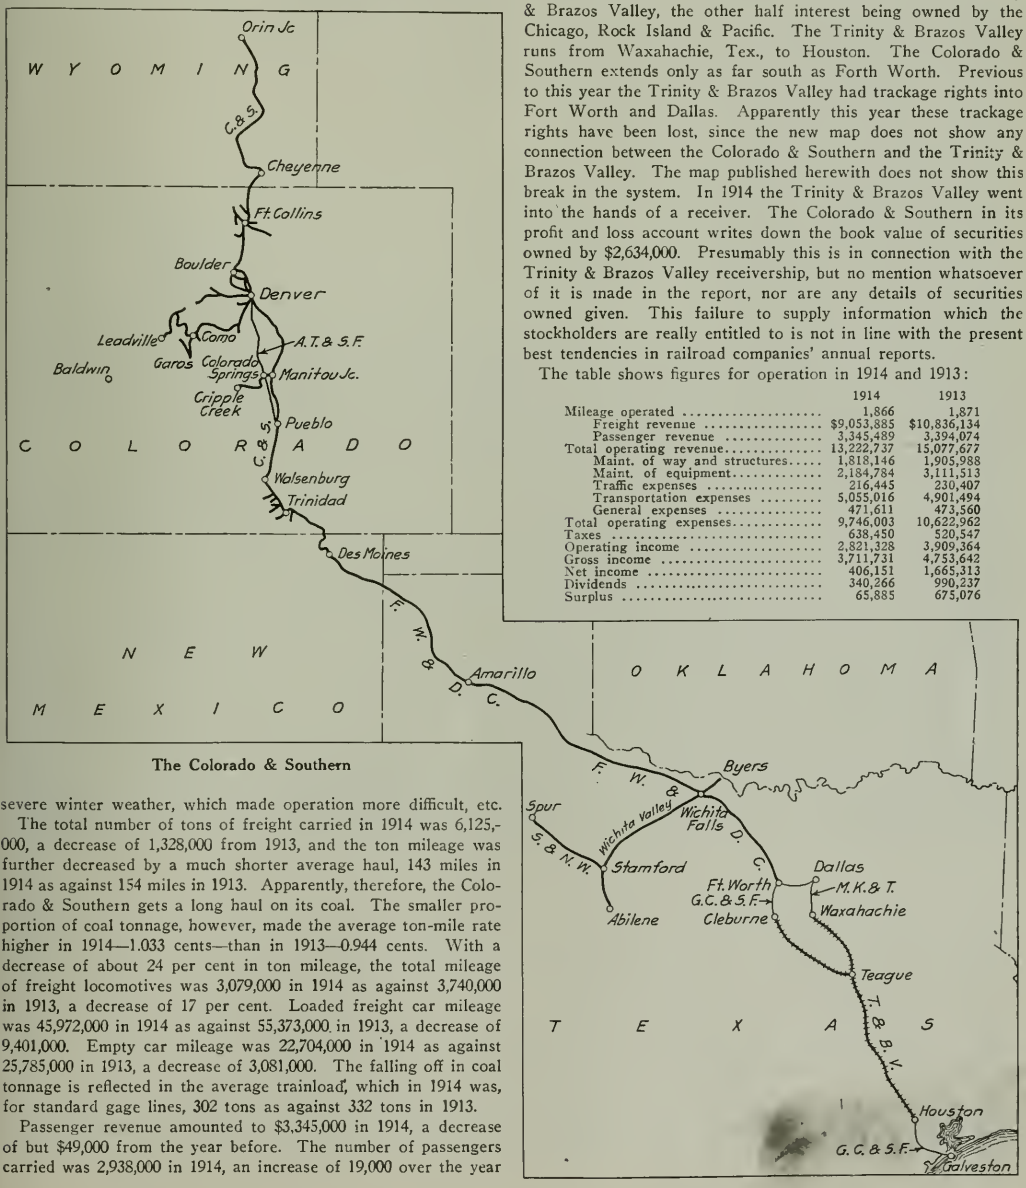
Passenger revenue amounted to $3,345,000 in 1914, a decrease of but $49,000 from the year before. The number of passengers carried was 2,938,000 in 1914, an increase of 19,000 over the year before; but the average passenger journey was 44 miles in 1914 as against 46 miles in the previous year. The receipts per passenger per mile were 2.597 cents in 1914 and 2.555 cents in 1913.

No securities were sold by the Colorado & Southern in 1914, and the outstanding funded debt in the hands of the public decreased by $407,000, principally because of the payment of maturing equipment trust certificates. A total of $166,000 was spent for additions and betterments. At the end of the year the company had on hand $663,000 cash, with total working liabilities of $1,722,000, which included $116,000 loans and bills payable. At the beginning of the year the company had $908,000 cash, no loans and bills payable, and $1,508,000 total working liabilities.

The Colorado & Southern owns a half interest in the Trinity & Brazos Valley, the other half interest being owned by the Chicago, Rock Island & Pacific. The Trinity & Brazos Valley runs from Waxahachie, Tex., to Houston. The Colorado & Southern extends only as far south as Forth Worth. Previous to this year the Trinity & Brazos Valley had trackage rights into Fort Worth and Dallas. Apparently this year these trackage rights have been lost, since the new map does not show any connection between the Colorado & Southern and the Trinity & Brazos Valley. The map published herewith does not show this break in the system. In 1914 the Trinity & Brazos Valley went into the hands of a receiver. The Colorado & Southern in its profit and loss account writes down the book value of securities owned by $2,634,000. Presumably this is in connection with the Trinity & Brazos Valley receivership, but no mention whatsoever of it is made in the report, nor are any details of securities owned given. This failure to supply information which the stockholders are really entitled to is not in line with the present best tendencies in railroad companies' annual reports.

The table shows figures for operation in 1914 and 1913:

	1914	1913
Mileage operated	1,866	1,871
Freight revenue	$9,053,885	$10,836,134
Passenger revenue	3,345,489	3,394,074
Total operating revenue	13,222,737	15,077,677
Maint. of way and structures	1,818,146	1,905,988
Maint. of equipment	2,184,784	3,111,513
Traffic expenses	216,445	230,407
Transportation expenses	5,055,016	4,901,494
General expenses	471,611	473,560
Total operating expenses	9,746,003	10,622,962
Taxes	638,450	520,547
Operating income	2,821,328	3,909,364
Gross income	3,711,731	4,753,642
Net income	406,151	1,665,313
Dividends	340,266	990,237
Surplus	65,885	675,076



The Colorado & Southern

Letters to the Editor

THE DEFEAT OF THE MISSOURI FULL CREW LAW

St. Joseph, Mo.

To the Editor of the Railway Age Gazette:

The Missouri full-crew law was passed at the last session of the legislature, held at Jefferson City on January 1, 1913. The bill ran the usual gamut of such legislation, being considered, referred, reported favorably, and finally passed by both houses and signed by the governor. The legislation was urged by an active committee of the Brotherhood of Railway Trainmen, and was followed from committee to committee with great vigilance. Members of the operating departments of the various railroads were before the committees and explained the utter uselessness of an extra man on trains of 40 cars and over. The governor signed the bill after a strong protest by the railroads.

The railroads have an extra man on all freight trains doing a local business. The passenger trains have as a rule been equipped as provided for by the first section of the law.

The hardship of the law lay in its provision that on trains of 40 cars and more an extra brakeman should be employed. The average pay of a brakeman in Missouri is about $90 per month. The arguments advanced before the legislative committees by the representatives of the railroads, such as "No service to be performed by an extra man; trains were already fully equipped; the engineer and fireman, the conductor and flagman and brakeman were all that could possibly be used both for safety and efficiency," were of no avail. Neither did the fact that the railroads were in financial distress and that their business was on the decline have any weight with the legislators, whose pledge it is thought was demanded and given in some instances in advance of election to support such a bill.

With the possibility of half a million dollars increased expenses annually under this law, the railroads began to take notice and cast about for relief. A meeting was called and the various counsel of the Missouri lines decided to advise their respective companies to invoke that beneficent but heretofore dreaded provision of our constitution known as the "initiative and referendum," and it proved a timely means of escape from this unjust legislation in Missouri. The good effect is being felt all over the country, not in the spirit of hostility towards honest labor or honest organization of trainmen, but against such unwise and harmful legislation as is generally urged by agitators who are members of the brotherhood out of a job.

There was no need of this extra man on trains of 40 cars or more; a through train of 40 cars requires the same help as one of 30 or 35 cars, and no more. It isn't the length of a street car, or the length of a hoe-handle that determines the number of men that can or should be employed. The test is, what duties are there to perform for safety and efficiency, and when a full assignment to these duties is made, an extra man is a bother, not a helper.

I quote from the Railroad Trainman, July, 1914, in an article on "The Full Crew Bill in Missouri":

> So everywhere it can be done, turn loose Vox Populi, Veritas, Pro Bono Publico, Ish Ka Bibbel, Sinker, and all the rest of them in an effort to convert public sympathy and support to our purposes and have everybody understand that what helps us, helps them.

This method was literally carried out by the Brotherhood to the extent of using the picture shows in cities in which to exhibit the most distressing but imaginary scenes of accident and injury to employees, causing death and maiming for lack of enough brakemen; also exhibits on billboards all over the state, larger than the side of a car, on which were statements, such as, "One Man Killed or Injured Every Seven Minutes," and many other scarecrow devices. The railroads answered these implied accusations and overdrawn pictures by simply stating facts showing fewer accidents on trains of 40 cars and over than on trains of less than 40 cars; also by showing that less than 50 deaths of employees had occurred on all roads in Missouri within one year, and that not a single accident was occasioned on account of too few brakemen.

The people saw through the "overplay" and resented the attempt of the brotherhood to dictate the number of men that should be employed from their organization in an enterprise in which the brotherhood had no pecuniary interest. It seemed to many voters quite burden enough for the government to presume to fix terms for the detail management of railroads as to rates, etc., without assuming any responsibility for losses. The railroads showed the Missouri farmer, the Missouri merchant, mechanic and others the issue, and they caught the spirit of fair play as they always will when properly approached. Besides, there were many employees of the railroads who voted against the bill becoming a law, men whose positions on the roads enabled them to judge of the utter lack of necessity for the extra man.

It is impossible in this short space to explain the benefits from the work done in this campaign on the full crew bill. The railroad situation generally has been laid bare to the people of this state. Shippers and passengers have become interested as never before. What the railroads have done and are now trying to do for the state was made plain; the enormous amount of money derived from railroads as citizens of the state by taxation for school and other purposes; indispensible service to both shipper and passenger and the low prices for the service; the three great markets of St. Louis, Kansas City and St. Joseph maintained by the railroads; and finally, the railroads showed the voters how absurd it was to accuse the managers of the railroads of preferring to kill human beings and incur large damage suits and judgments rather than put an extra man on a through freight train when, and if, by so doing, humanity and economy would be served. Then the unanswerable argument that our public service commission had power to put an extra man on when and where needed, clinched the nail.

While the result might have been the same had no opposition been urged by the railroads; that is, while the weight of the full crew bill together with that of the other dozen amendments might have snowed it under along with the rest, still one cannot always tell for sure, and the fight the railroads made was worth the effort in more than a dozen other different ways, as time will prove.

Our constitution and law in reference to the initiative and referendum requires that a petition containing the names of 5 per cent of the voters in at least two-thirds of the congressional districts of Missouri shall be filed with the secretary of state within 90 days after the passage of the law, in order to refer an act which has been passed by the legislature, to the voters at the next general election. The law further provides that an act so referred shall not become a law unless a majority of those voting on the proposition is in favor of such law. The complete returns have not been published by the secretary of state yet, but I am advised that about 80 per cent of all voters exercised a discriminating judgment on this and other amendments. This is shown by the fact that no two amendments got anything like the same vote either in favor of or against it.

O. M. Spencer,
General Solicitor, Chicago, Burlington & Quincy.

[Official returns of the vote show that there were 159,593 votes for and 324,085 against the law, making a plurality against it of 164,492. The returns by counties also show that the bill was defeated in 102 out of the 116 counties of the state, and that contrary to the expectations of the railroad managers, it received an overwhelming defeat even in cities where it was believed that the union labor vote might prevail, and the opposition was by no means confined to the agricultural counties. Even St. Louis, where the brotherhood looked for a big majority in favor of the bill, went against it by 18,417, although in Kansas City and St. Joseph it carried. Outside of the three principal cities, St. Louis, Kansas City and St. Joseph, the measure received only about 86,000 votes in the entire state.—Editor.]

Construction of the Gwynn's Falls Arch Bridge

Four-Track Concrete Structure on Pennsylvania Railroad at Baltimore (Md.) Being Built in Two Sections

Approximately two-thirds of the Philadelphia, Baltimore & Washington (P. R. R.) line between Baltimore and Washington has four tracks, and the heavy traffic handled makes it desirable to bring the remaining third of the line to this standard as soon as possible. As one step in this development the old double-track iron bridge over Gwynn's Falls and a single-track line of the Western Maryland, near the southwestern edge of the city of Baltimore, which has limited the capacity of the line entering the city, is being replaced by a four-track reinforced concrete arch structure. The old bridge consisted of four spans of link and pin deck trusses on stone piers. The bridge was too light structurally for the traffic and the masonry was badly cracked, making it practically necessary to replace it at an early date.

Concreting the Arch Ring and Spandrel Walls of the First Half Showing the Old Steel Bridge in the Background

This work is being handled in two stages. Beginning early in 1913, the first section, wide enough for two tracks, was built just far enough west of the old structure to clear it. Traffic was turned over this half of the new bridge on December 15, 1913. The old bridge was then removed, and the east half of the new structure is now being completed.

The traffic south of Gwynn's Run, the first station north of the bridge, averages about 36 freight and 73 passenger trains per day, and, including light engines used as helpers on southbound tonnage freight trains, the total number of movements over the old bridge has reached a maximum of about 165 per day. The construction work had to be handled without interruption to this traffic.

DESIGN

The new bridge has a total length of 580 ft. and a width of 61 ft., and consists of three 115-ft. and one 75-ft. reinforced concrete arch spans. The location of the abutments and the alinement of the bridge are practically the same as in the old structure. The height of the bridge, about 90 ft. from the base of the rail to the bottom of the footings, and the desire to provide an attractive looking structure, were important factors in the choice of the type of structure. The natural conditions at the site are favorable to an arch bridge as the sides of the valley have steep slopes and rock can be easily reached in all foundations.

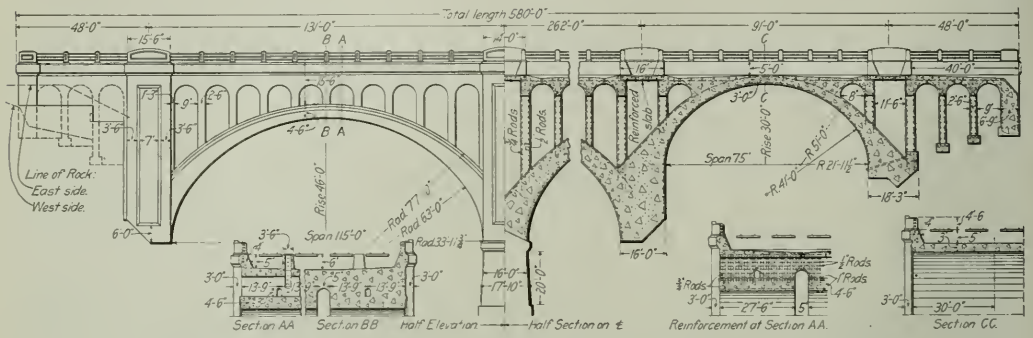
The abutments are of the hollow type, their length parallel to the track being 40 ft. The tracks over the abutments are carried on three 9-ft. arches supported by intermediate cross walls in each abutment. These arches are similar to the spandrel arches over the main spans, with the exception that their ends are closed by the side walls of the abutment. The three piers rest on footings 19 ft. 10 in. wide by 66 ft. long, and are of solid concrete up to the intersection of the extradosal lines. Above this, the piers are hollow, the ends being closed by pilasters which rest on offsets at the level of the springing line. These pilasters are entirely independent of the pier walls, being tied in by rods to the floor slab which spans the width of the piers at the top. The minimum width of piers is 16 ft. The arch rings have a three-centered intrados and a semi-circular extrados. In the 115-ft. spans the rise is 46 ft. and the crown thickness

4 ft. 6 in., while in the 75-ft. span the rise is 30 ft. and the crown thickness 3 ft. The spandrel arches have a span of 9 ft. and a wall thickness of 2 ft. 6 in., except at the piers, where the thickness is increased to 3 ft. 6 in.

The main arch rings are separated into two parts along the center line of the bridge by an open space 5 ft. wide extending down to the haunches and up through the walls of the superimposed arches to a level with the springing line of these small arches. The minimum thickness of concrete over the spandrel arches is 2 ft. at the 6-in. drain on the center line of the bridge over each small arch. The thickness of the floor is increased to 3 ft. along both edges of the bridge. The elevation of the base of rail is 5 ft. above the highest elevation of the floor. The tops of the main arches are level transversely, the drainage from the roadway being carried through small openings 2 ft. wide by 3 ft. high in the arch walls. The drainage, which is carried down over the extrados of the arch ring into the hollow pier, is led to one end of the pier by the pitch of 1 ft. and is there carried through the arch ring and discharged. Four manholes are provided in the floor, two over the central span and one over each abutment, allowing access to the space above the main arches.

A 1½-in. expansion joint is provided along each side of the 12-ft. slabs which cover the hollow piers. Two expansion joints are also provided in the parapet walls over each arch. The floor over each arch is continuous. The balustrade consists of concrete posts 18 in. square supporting three rails of 3½ in. galvanized pipe.

All concrete in the structure is a 1:2:4 mixture, the total quantity amounting to 28,000 cu. yd. with 470 tons of reinforcing steel.



Elevation and Sections of Four-Track, Four-Span Reinforced Concrete Arch Bridge Near Baltimore

East Side of First Half Completed, Showing Concrete Distributing Tower in Position for Work on Second Half

CONSTRUCTION

A large part of the material used in construction was handled by a cableway having a capacity of 5 tons. The span of the cable was 650 ft. and the supporting towers were 60 ft. high. A 1¼-in. cable with a Flory carriage was used. The contractor

also installed a saw-mill and shop adjacent to the stream near the bridge site and two steam plants for operating the mixer, concrete hoist and cable engine.

The foundations were excavated through rock, most of which required blasting. A stiff-leg derrick and clam shell bucket were used to handle the excavated material. The footings were carried down about 7 ft. at the deepest point, open cofferdams being used in these pits. The water in Gwynn's Falls is normally very low, having a depth at the bridge site of about 14 in. It is subject to high stages, however, which, it is reported, reach a maximum of 25 ft. Only one of the piers was located in the channel, from which water was diverted during the excavation and the placing of the concrete. In the erection of the main arch rings, the contractor used Blaw steel centers consisting of six three-hinged steel arches for each span. Derricks were used in conjunction with the cableway to place these centers, which were erected one rib at a time. The centers were

View Along Center Line of First Half, Showing Material Cableway and Concrete Distributing Tower

supported by six-post timber bents under each side, each post consisting of two 12-in. by 12-in. timbers. The wall plates were 6-in. by 24-in. timbers on which 4-in. wedging was used to adjust the position of the centers. After finishing the first half of the bridge, the centers were struck and allowed to remain in that position until needed on the second half, when they were rolled laterally into the new position without dismantling. The Blaw semi-circular steel forms were used for most of the spandrel arches, although as the number of forms in use was not sufficient to push the work as rapidly as desired, some timber forms were used in addition to the steel. Blaw special forms of galvanized iron were used for the parapet wall. All form material for the portion above the main arch ring was handled by the cableway.

The concrete mixing plant was located west of the bridge on the north side of the valley. A siding from the main line was located over sand and gravel storage bins into which the material could be dumped directly from the cars. A conveyor belt transferred the sand and gravel from the storage bins to the measuring hoppers over the mixer. The cement house was located so that the same belt could handle cement, the sacks being chuted into the house from cars on the siding above. The concrete was mixed in a Milwaukee 1-yd. machine.

A timber frame tower about 140 ft. high was used to elevate the concrete at the mixer. This tower was located about opposite the center of the first long span on the west side. The mixer was operated from the same boiler plant as the cableway engine, and another boiler was installed to run the concrete hoist. An electric motor drive was installed for the belt conveyor. A system of Lakewood chutes, with line gates, was used for distributing all of the concrete in the lower part of the structure. These chutes were supported by 2-in. cables, the minimum pitch being about 2¼ in. per foot. The maximum distance over which concrete was handled in these chutes was about 350 ft. The concrete in the upper portion of the structure at the south end was handled in buckets by the cableway, as this was more economical than to extend the tower to a height sufficient to reach

The Forms in Place for One of the Long Spans Showing Steel Arch Centers

that elevation with chutes. This mixing and distributing plant handled an average of about 30 yd. of concrete per hour, and in exceptional cases 40 yd.

The slabs over the hollow piers were designed to be cast in a slab yard and placed in 6-ft sections. The plan was changed, however, in order to allow the contractor to cast them in place. The only bond rods which were left extending from the first section to connect up with the second half were in the floor over the spandrel arches and in the upper part of the arch ring in the 75-ft. span, where the ring itself forms the floor of the bridge. The concrete in the arches was allowed to set 28 days and when the centers were struck no deflection was perceptible.

After the completion of the first section of the bridge, the cableway was moved over for use in dismantling the old bridge. False work was built up under the old structure, five bents being necessary in each span on account of the height of the bridge, which was about 80 ft. to the underside of the highest truss. The deck and the bracing of the old structure were first removed, the posts were cut from the floor beams by knocking off the rivets, and each bent was lowered to the ground by the cable

where it was divided into the separate members. The old iron, which was of no value except as scrap, was then loaded on cars for removal. After the iron superstructure was taken down the old piers were blasted out.

During the second stage of the work the mixer plant was left in the same position west of the bridge on account of the expense that would have been incurred in moving it. The distributing tower was dismantled and a new tower 192 ft. high built on the opposite side of the bridge. The concrete from the mixing plant was allowed to run by gravity from the mixer through a long chute under the completed portion of the bridge, to the foot of the distributing tower. The other operations in the construction of the second half are similar to those described for the first stage.

This work is being handled under the direction of A. C. Shand, chief engineer, E. B. Temple assistant chief engineer, and J. W. Craig, assistant engineer. The contract is being executed by the estate of Charles McDermott, Philadelphia.

THE DEVELOPMENT OF LONG ISLAND*

By H. B. Fullerton

Director of Agricultural Development, Long Island Railroad

Experimental or demonstration farms offer far and away the most convincing and most rapid means of increasing crop production and introducing crop diversification, hence increasing agricultural tonnage and lengthening greatly the period of revenue yield from farming sections.

Ralph Peters, president of the Long Island, when he took charge of this portion of the Pennsylvania system found conditions of a truly unique character; at the west end of his territory the great cities of Brooklyn and New York; along the Atlantic ocean and the Long Island sound shore, a continuous line of overlapping villages, yet occupying merely a fringe of shore line, while the entire center of this territory was but an undeveloped particularly depressing acreage of "scrub oak waste" or "pine barren"—approximately 250,000 acres purchasable at from $1 to $6 per acre. Although but 30 to 70 miles from the biggest city in the United States; although traversed by three parallel lines of railroad, seldom 5 miles apart; although within easy driving distance of prosperous villages of goodly size, this acreage was not alone a non-productive area, but an untaxed drag and holdback on the island. Without raw material of any description, without inhabitants, save tiny expiring hamlets at long distances, industrial development was impracticable.

National and state experts had for years pronounced this land valueless for agriculture and this opinion had existed through generations of Long Islanders, despite the fact that the undergrowth and "sprout" growth from oak, hickory, chestnut and ash stumpage were of record-breaking lengths and vigor, proclaiming ideal conditions of soil and climate.

Accepting nature's practical demonstration as more reliable than man's opinions or theories, President Peters purchased the smallest acreage of "scrub-oak-waste" obtainable, 18 acres located south of Wading river on the Long Island Sound side of the island, on September 7, 1905. Clearing was started and in 60 days an excellent stand of rye covered the 10 acres of land, which for nearly three centuries had been deemed worthless. No chemical fertilizer was used, city stable manure alone being applied to introduce the vegetable matter which had been destroyed by forest fires which for a period of 150 years had consumed the leaves. The cost per acre of introducing this manure substitute for nature's leaf mold or humus was but $9.50.

In the early spring of 1906 the rye was plowed under, and seven months after the first stump was dynamited out of the "scrub-oak-waste" early vegetables of the choicest variety were shipped to the editors of metropolitan dailies who were guests of the railroad when the initial blow was struck: hence, these editors being fully qualified and armed with personal recollections of the original depressing showing, wrote, each in accord with his personality, stories proclaiming Long Island's many agricultural capabilities and residential attractiveness. Advertising in unpurchasable space of dailies, weeklies, and monthlies has continued without let-up unto the present time.

Within seven months after the establishment of the first demonstration farm, practical results were secured, the first purchase and development on Long Island being made by a long time resident of Oregon. Within four years, 4,200 families were added to the island's agricultural population, the great majority of them settling on the cheaper lands of the undeveloped territory, all without a single known exception making good and so advising those in charge of the work by letter and in person. The combination of additional agriculturists and the adoption of methods which had proved practical and economical, showed an increase in agricultural tonnage of 300 per cent within four years; to this, of course, must be added the increased passenger and express revenue. Besides the agricultural population drawn to the island, the widespread heralding of the demonstration farms, marked successes with vegetables, fruits and nuts, deemed ungrowable in many sections of the United States, particularly in the North, attracted the attention of foreign capitalists, as well as those of America and Canada. So great was the throng of visitors arriving daily and greatly interfering with the systematic handling of the intricate problem that two days per week were set apart as visitors' day. "Waste lands" which had been on the market for 150 years without purchasers, sold at an average price of $50 an acre and upwards. Estate developments sent up the shore line territory from $22 to as high as $7,000 per acre, with sales being made continually at prices running between $300 and $1,000 for hilly land, of least value for agricultural purposes, but of attractive condition to develop home sites or great estates.

The older sections, where the soil had been continually tilled since 1642 were beginning to show startling crop reductions (identical with those that are responsible for the abandoned farms of New England and New York State), reducing, for example, the normal potato yield of 300 bushels to the acre, down as low as 30 bushels, and sometimes 8 or 9 bushels less than the amount of seed potatoes planted. The use of humus and of lime having proved crop increasers on the railroad's demonstration farm warranted trial by the Long Island soil tillers and that source of greatest injury in the agricultural sections of the East was checked and both last year and this all records of crop production were broken by great numbers of old-time Long Islanders and new-come foreigners.

Successes with high-quality apples, peaches, pears, plums, cherries, grapes, bush and vine fruits, resulted in the establishment of great numbers of small orchards and many quite extensive ones and of innumerable vineyards and berry farms, with most satisfactory showing in the annual freight and express receipts. The former difficult situation of having practically the entire freight haul of agricultural products forced into six weeks (at the utmost three months), was helped by rotation and introduction of new crops, which developed a traffic extending from rhubarb, asparagus and lettuce of early spring, through summer vegetables and late winter crops, such as the big paying Brussels sprouts, which are frequently gathered on Long Island from the open fields in February. We developed the "Long Island home hamper," a common crate containing six 4-qt. boxes, which were filled with an assortment of vegetables, fruit, berries, etc., as they came into season. These hampers were "created" by those in charge of the work with various objects in view, one being the development of a dependable market yielding a worth-while revenue to our agricultural community.

A trial shipment of these "home hampers" as we named them, in 1906, fairly overwhelmed us with the results obtained. They filled a long-felt want of the city consumer, and without publicity became an instant success, saving the consumers from 75 cents to $3 per hamper, according to their own reports, and yielding to the producer 98 cents net for the contents of the

*Abstract of a paper presented before the Railway Development Association, Chicago, November 10, 1914.

hamper, instead of an average of six cents obtained when shipment was made in bulk through the usual channels.

The next method adopted to keep the development work up to the highest efficiency was a little publication that first was issued as a fortnightly, and a little later as a monthly, its object being to place before Long Islanders the results obtained and methods pursued in the trying out of various plants, information as to various sources of seed, implements, packages, spray material, sources of supply, and publishing without any restrictions whatever the results, favorable or unfavorable, and furnishing names and addresses freely, noting failures, as well as successes, giving causes where causes could be definitely located, noting weather conditions, yields, things to be avoided, precautions to be taken; noting where large and small plots of land could be obtained, giving the name of the owners and prices, also names of prospective buyers of various size tracts of land and their personal predilections. The name selected for this little pamphlet was "The Long Island Agronomist."

Fairs were attended and exhibits entered in competition. The fact that the Long Island Railroad demonstration farm won a goodly majority of "firsts" impressed local people who devoted their entire time, as a rule, to one crop, while the "railroad farmers" were known to have grown hundreds (in 1913 and 1914, for example, 982 varieties) in one year's growing season.

The demonstration farms were represented in city shows and with equal success against great estates and expert market gardeners and fruit growers. At the state fair, Long Island won 143 prizes, covering a remarkably varied line—apples, peaches, plums, pears, grapes of many varieties, field crops, corn, grains—a big line of vegetable growth including French artichokes, endive, "Romaine," Spanish onions, nuts, etc.; it even received a gold medal for butter, which was won against a large number of estates, community creameries and individual dairies of long standing with top-notch reputations. The score, 99½ per cent, the highest ever obtained anywhere, placed Long Island in the dollar-a-pound class. Agricultural colleges and schools requested us to talk to their classes and this has been a continuous performance throughout the decade, with the result that many of our hearers based their theses upon the copiously illustrated practices and crops raised, placing before future classes for many years a most attractive picture of Long Island capabilities. As the bulk of these students have joined the dignified army of professors we find frequent evidence that they are teaching the possibilities and capabilities of Long Island continuously and this is helping along the good work.

The Long Island's agricultural department has found in 10 years of uninterrupted application, close study and investigation that quick action and thoroughly convincing and undeniable results can be obtained at the lowest cost per ton by the establishment of a strictly practical economically handled farm, following as closely as possible commonsense farm practice and with "the latch-string always out." Our experience has firmly convinced us that upon this demonstration farm the director of agricultural development should have his home and his office. This man must primarily be a nature lover. He must prefer farm life to all other professions. The ideal director is undoubtedly one who has had a thorough practical agricultural education, secured from those as yet scarce American agricultural colleges, whose class-room work is invariably firmly impressed and made permanent by practical out-door work and demonstration. Ralph Peters, our president, has made use of a comprehensive phrase, "Writing and talking will not do; we must deliver the goods." The demonstration farmers delivered the goods and the railroad has gained not only in freight tonnage, but in every one of its revenue yielders.

Railway Strike in Belgium.—It is reported from Amsterdam that the employees on the Belgium railways have gone on strike and refused to do work for the Germans. Many employees have started for England, and others have sought work on the French railways.

RAILWAY AFFAIRS IN OTHER COUNTRIES

After three years' work the Munster-Grenchenberg tunnel, the longest now under construction in Swiss territory, was successfully and uneventfully pierced on October 27 at 4 p.m. The tunnel, which runs through the Jura range, is 5⅝ miles long, as compared with the Hauenstein base tunnel, pierced on July 10, which is 5 miles, 94 yd. in length. The capital involved is $5,000,000, mostly French, the Eastern Railway of France, in particular, being largely interested. The new line, of which the Munster-Grenchenberg tunnel is a part, is about eight miles long and will be managed by the Swiss Federal railways. It will shorten by over 10½ miles the distance via Delle to Lötschberg, the time saved being 40 minutes. The tunnel will have a single track and the motive power used will be steam. No special engineering difficulties were encountered in its construction, but there were two serious strikes that tied up the work considerably. Besides these interruptions, work on the tunnel was also entirely stopped from August 1, when mobilization of the Swiss army was ordered, until September 22. The workmen, as is always the case with Swiss tunnels, are almost entirely Italians. The time allowed for building the new line is three years and six months, and, despite interruptions, it is believed the work will be finished almost on time.

* * *

The recently issued Administration Report on Railways in India covers the Indian financial year from April 1, 1913, to March 31, 1914. In that time the Indian state railways had better gross and net earnings than in the previous fiscal year, but owing to increased interest charges the percentage of net earnings to capital outlay fell from 6.48 to 6.19 per cent. Operation of the state and guaranteed railways resulted in a surplus to the state of $27,729,765 over and above interest charges and annuity payments connected with the purchase of railways by the state, whereas the surplus last year was $27,891,530. On March 31, 1914, the mileage of all the state and privately owned railways in India was 34,656 miles, 1,053 miles having been added during the year. The gross earnings of all the railways from April 1

Copyright by Underwood & Underwood, New York

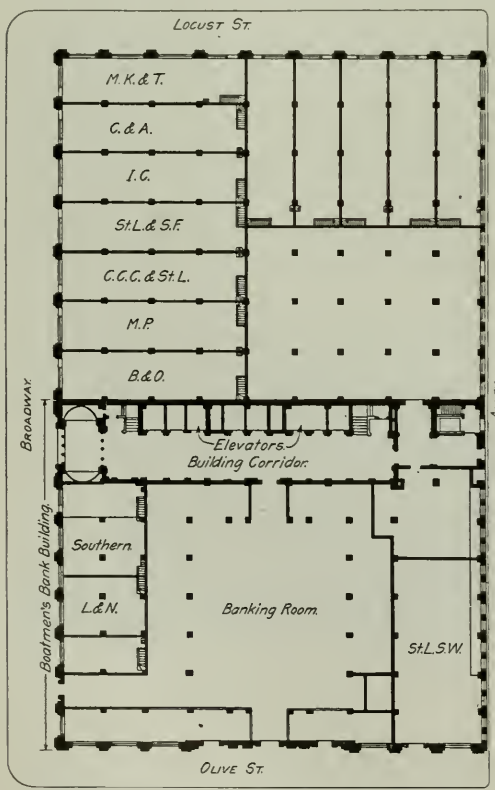
Bridge at Dannemarie, Near Belfort Destroyed by French Engineers for Reasons of Safety

to March 31 were $206,017,344, as compared with $199,936,186, an increase of $6,081,158, which was partly offset by increases in operating expenses of $5,663,518. The net earnings were thus $99,322,848, as against $98,905,209 in 1912-13. There was some increase in the passenger traffic, the number of passengers carried being 457,717,900. The passenger revenue was $68,850,322, of which by far the larger proportion, $59,519,374, was from third-class traffic. The average rate for all classes of passengers, slightly over 4 mills per mile, and the average distance traveled, 36.3 miles, have not materially changed since 1884. In freight

traffic, although there was a considerable increase in the tonnage carried, there was not a corresponding growth in earnings. This was due to a decrease in the average distance each ton of freight was carried from 199.2 miles in 1912 to 189.1 miles in 1913-14, a change caused by a falling off in the long-distance traffic to the ports, resulting from the failure of crops in the united provinces and some parts of Bengal and increased exports of grain to Europe. The aggregate tonnage of freight moved in 1913-14 was 82,613,000, the earnings therefrom being $122,390,578. The average rate per ton per mile, slightly over 7 mills, was about the same as in 1912. The volume of coal and coke carried was 17,295,000 tons, earning $16,078,498, of which the East Indian secured 9,380,000 tons and $9,030,634, and the Bengal-Nagpur 3,049,000 tons and $2,696,002.

CENTRALIZED TICKET OFFICES FOR ST. LOUIS RAILROADS

The railroads entering St. Louis, with two exceptions, have adopted a plan formulated by a special committee of passenger traffic officers for centralizing their city ticket offices. The plan provides for separate offices for the various roads, seven to be located in a new five-story building to be erected



Plan Showing Proposed Arrangement of Centralized City Ticket Office at St. Louis

on Broadway between Locust street and the Boatman's Bank building; three offices to be located in the latter building, and three in another building opposite, on Broadway. The roads which have not joined in the plan are the Vandalia and the Mobile & Ohio. Plans for consolidating the down-town ticket offices in St. Louis have been under consideration for several years.

It is believed that the plan will not only be far more economical than having separate offices in various locations, but that it will result in great convenience to the public. It is estimated that the plan will save the roads about $100,000 a year in rentals. After a decision on the location of the building had been reached the apportionment of the offices was made by lot. The Missouri, Kansas & Texas drew the corner of Broadway and Locust street, which is believed to be the choicest location. The leases of the individual offices will run for ten years. Work on the new building is to begin immediately, and it is expected to be ready for occupancy by June 1. Arrangements have been made to provide suitable space on Locust street for such roads as do not have lines into St. Louis as may desire to locate in proximity to the selling offices of the initial lines.

Each of the roads will pay $3,000 a year rental, except that for the corner location, $4,000 will be paid. Two roads now pay $15,000 a year each for the rental of their city ticket offices, and others pay from $10,000 to $14,000 a year.

The arrangement of the offices is shown in the accompanying plan. The Wabash, Rock Island and Burlington offices, which are not shown, are located on the opposite side of Broadway.

The special committee which formulated the plans was composed of J. D. McNamara, general passenger agent of the Wabash, chairman; C. L. Stone, passenger traffic manager of the Missouri Pacific; W. S. St. George, general passenger and ticket agent of the Missouri, Kansas & Texas, and W. A. Lalor, general passenger agent of the Chicago, Burlington & Quincy.

In 1911 a committee of passenger officers after a thorough investigation reported unanimously in favor of the establishment of a joint city ticket office, but the plan was not carried out. At that time the aggregate rentals paid for up-town ticket offices were $12,458 a month, and the salaries of those employed in them $6,715 a month, a total of $230,076 a year. The committee estimated that the rental of an adequate joint ticket office would be $50,000, and the cost of operating it $51,000, a total of $101,000, or a saving of about $130,000 a year. Under the plan outlined at that time, the location of the joint office was to be as central and convenient for the public as could be secured. Complaints and inquiries were to be handled by an information bureau which was to be very carefully organized. Room was to be provided in the office for the St. Louis Transfer Company, both telegraph companies, a taxicab stand, a separate Pullman office, and both telephone companies. The superintendent and assistant superintendent of the office were to be appointed by the Terminal Railroad Association, and would, therefore, be absolutely neutral. Ticket sellers were to sell tickets over any and all roads and were to observe the strictest neutrality. The street men or other representatives of the individual roads were not to be allowed to solicit or influence business inside the office, and authority was to be given to the superintendent to enforce this regulation. Two plans for the division of rentals and expenses were suggested. One was for each road to pay a minimum contribution of $1,500 a year to rent and a minimum contribution of $1,500 a year to expense account, the rest of the rent and expense to be prorated among the roads on the basis of actual ticket sales made in the office. The second plan was for each road to pay a minmum of $3,000 and a maximum of $9,000 a year for rent and expenses. The objections of one road prevented this plan from being carried out.

Australian Strategic Railways.—It is reported that the Australian Railway War Council at Melbourne, which includes the commissioners of all the state railways and the chief of the general staff, is now discussing the uniform gage question and the construction of the new railways which are strategically necessary. The results will be placed before a conference of the federal and state ministers at an early date.

Arbitration on Western Engineers' and Firemen's Demands

Hearings Begun at Chicago. Claims of Employees Set Forth by Mr. Stone of the Enginemen's Brotherhood.

Hearings before the federal board of arbitration selected to consider the demands of the engineers and firemen on 98 western railroads for increases in pay and changes in working conditions were begun at Chicago on Monday, November 30. The board organized by selecting Jeter C. Pritchard, presiding judge of the United States Circuit Court of Appeals of the fourth circuit, as chairman, and H. S. Milstead, of Washington, D. C., as secretary.

The original requests of the engineers and firemen were presented on October 10, 1913, and it was estimated by the managers that if they were granted the wages of the men would be increased by approximately $27,000,000 a year, or 40 per cent. Upon receipt of the requests the individual western railways gave notice of their desire to terminate the wage schedules in effect, and to enter into negotiations for the purpose of making new agreements. The employees' committee then came back with another proposition which asked practically all of the concessions requested originally, and included additional requests. In the agreement to submit the controversy to arbitration the employees' committee withdrew the second demands and the managers withdrew their proposition. The arbitration therefore is confined to the demands made on October 10, 1913, which are comprised in 16 articles.

Article 1 provides that 100 miles or less, 5 hours or less, shall constitute a day's work in passenger service; all mileage in excess of 100 miles shall be paid for pro rata; 100 miles or less, 10 hours or less, to constitute a day's work in all classes of service, except passenger and switching service; mileage in excess of 100 miles to be paid for pro rata, and overtime in passenger service to be computed on a basis of 20 miles per hour, and in all other service except passenger and switching service, to be computed on a basis of 10 miles per hour and paid for at the rate of 15 miles per hour; all overtime to be computed on the minute basis. Article 2 provides for increases in pay for various classes of service. Article 3 provides for a 10 per cent increase over through freight rates for local or way freight service. Article 4 provides for increased rates of pay in switching service, with overtime after 10 hours, at the rate of time and a half; all overtime to be computed on the minute basis. Article 5 provides for payment for 30 minutes of preparatory time in addition to other time or mileage made on the trip or day. Article 6 provides for additional allowances for initial terminal delay and final terminal delay, to be paid for on a minute basis. Article 7 provides that engineers and firemen arriving at a terminal at the end of a run shall be automatically released; when used again they begin a new day. It also provides for continuous time.

Article 8 provides for payment for time during which engineers and firemen are held at other than home terminals. Article 9 provides for payment for time spent in dead-heading on company business. Article 10 provides for hostlers at points where six or more locomotives are handled within 12 hours, their rates of pay and other conditions. Article 11 provides that the practice of conducting surprise tests in certain ways shall be eliminated. Article 12 provides that coal shall be kept where it can be reached by the fireman from the deck of the locomotive, and that coal of the proper size shall be placed on all tenders. Article 13 provides for two firemen on coal-burning locomotives weighing 185,000 lb. and more on drivers. Article 14 provides for relieving engineers and firemen of incidental services, such as cleaning locomotives, where they are now required to do so. Article 15 provides that railroads shall permanently post bulletins at all terminals showing accurate service weights of all locomotives for the purpose of recording weights on drivers. Article 16 provides that engineers and firemen will not be required to throw switches, flag through blocks or fill water cars.

Warren S. Stone, grand chief of the Brotherhood of Locomotive Engineers, made an opening statement in which, after outlining the history of the negotiations with the Association of Western Railroads, in 36 conferences, he stated the cases of the engineers and firemen are to be considered as a single proposition, and that all the evidence to be presented regarding the service of engineers applies also to the firemen; that they work together and should share alike in any benefits that may accrue from the award. He said that the board should recognize the changed conditions in the transportation service that demand more than ever before of the individual employes, and that new rates and working conditions must be established to compensate them for service performed.

"If there is any job in the world," he said, "which calls for more complete concentration of mind and quicker action of brain or sounder judgment than that of the engineer and the fireman in the cab of a locomotive, I have never heard of it." He then insisted that the wages of engineers and firemen should be sufficient to provide for "depreciation," saying that "if physical or technical examinations, age limits or service requirements beyond the limit of human endurance deprive men in middle life of the opportunity of earning a living at their profession, then they should receive not only a living wage, but also enough to enable them to live in comfort for the remainder of their years after their disqualification."

"With all due respect to other employees or officials on these great systems," he said, "it is the men in the cab who are the really responsible men, who by their skill and ability make it possible for a railroad to earn revenue and pay dividends. They are the men who carry the heaviest end of the load of responsibility. That responsibility becomes heavier every year. Each year traffic becomes heavier and more congested, the net work of signals increases, the public demands faster time and better service, larger and more powerful locomotives are built, the tonnage of trains increases; more and more is required of the men in the cab; the examinations become more strict and discipline more rigid. All these increased burdens fall on the same men, the number not having been increased for the purpose of dividing this work and responsibility, as there is only one engineer and one fireman in the cab. There has never been a time in the history of the railroad world when so much was being taken out of the men in the cab as now by requirements beyond the limit of human endurance."

He then outlined the experience required of a man before he is promoted to engineer, and the strict examinations that are required. He said that the occupation of enginemen is classed as extra-hazardous, and insurance companies, if they will insure them at all, charge an extra premium. He also asserted that every minute a man is on duty, regardless of the weather or other conditions; the same strict requirements are demanded of him.

Mr. Stone said it was proposed to show that during the past 24 years the western railways have made remarkable gains in productive efficiency by the installation of locomotives of greater tractive power, elimination of curves and reduction of grades, and remarkable increases in trainloads, and that the burden is borne by the enginemen. Their labor and responsibility, and their productive efficiency have been increased, but their earning capacity has declined. The railroads are not satisfied with the present conditions which have reached the limit of human endurance, but are intending to add further to the trainload. The revenue gains arising from the advances already made in

the efficiency of the railroads have been sufficient to pay all increases in operating costs and a reasonable return on the capital investment, in addition to leaving an ample surplus to remunerate the engineers and firemen for their increased work and productive efficiency.

James M. Sheean, attorney for the railroads, also made a very brief opening statement, declaring it is the belief of the railroads that their present rates of pay are full, fair and adequate, but said he would reserve his discussion of the points involved in the case until the issues had been presented in detail.

The first witness for the employees was M. W. Cadle, assistant grand chief of the Brotherhood of Locomotive Engineers, who took up the 16 articles which comprise the demands of the men, one at a time, to show that all of the proposed rules which they are asking to have adopted by all of the western roads are now in effect on some of the roads. Discussing Article 1, on the basis of a day's work, he said that 47 eastern roads, 14 western roads, and 24 southeastern roads now have the 5-hour day in passenger service. Six western roads, he said, have an 8-hour day in freight service. The other roads have a 10-hour day.

Taking up Article 2, on rates of pay, Article 3 on local or way freight service, and Article 4, on switching service, he mentioned various roads that have in effect some of the proposed rules or rates. With reference to Article 5 on preparatory time, he said that many duties are required of the engineers and firemen before the actual run begins, depending on the class of the engine and how much work is done in the shop beforehand, and that the rules on many roads require the men to have their engines ready at least 30 minutes before leaving time, and that this time should be paid for. With reference to Article 6, providing for pay for terminal delay, he said that this was in the nature of penalty time; that trains are often held at terminals at the end of a run before the enginemen can be released, that there is often a delay in leaving terminals after the time at which they are supposed to go out, that if the men are required to put in this time they should be paid for it, and that a penalty where it has been applied has the effect of reducing these delays. He said that eight western roads pay for final terminal dalays of 15 minutes or more in freight service; that 27 pay for 30 minutes or more, and some allow for one hour or more.

Referring to Article 7, providing that engineers and firemen arriving at the terminal or the end of the run shall be automatically released, and then when used again they begin a new day, W. L. Park, a member of the board of arbitration, remarked that under this rule a man could receive three or four days' pay for a few hours of work. To this Mr. Stone replied that the rule is intended to prevent an abuse now practiced by many railroads; that frequently a crew which may have worked 15 hours arrives at the end of its run and then is required to work another hour in performing some small service, to save calling another crew. With reference to Article 8, providing for payment for time when men are held away from home terminals, Mr. Cadle said that there are a number of rules now in effect that men shall not be released between terminals, except when tied up under the federal hours of service law; that the Canadian Northern pays for time during which men are held away from home terminals after 18 hours; one road pays after 12 hours, and the Chicago Great Western agrees not to hold men more than 24 hours. Six roads pay for 100 miles for each 24 hours during which the men are held away from their home terminals.

Walter Moore, schedule expert of the firemen's brotherhood, gave testimony similar to that of Mr. Cadle.

Railway Construction on the Gold Coast of Africa.—It is estimated that the extension of the Gold Coast Railway from Komfrodna to Kumasi will cost about $6,000,000. The first section, to Komfrodna, will probably be opened early next year.

A CONVERTED LIVESTOCK SHIPPER

The Breeder's Gazette recently published an article on "Railway Livestock Rates," by A. E. de Ricqles, president of the American Cattle Company and general manager of the American Livestock & Loan Company, of Denver, Col., from which the following extracts are taken:

"I would like to offer the idea that perhaps the stock growers can now afford, under the new condition of things, to assist the railroads in their request for a general 5 per cent, rate increase, so that they may continue in business and keep up with the demands from the country, because there is no element more important to the stockgrowers than the railroads. Transportation is perhaps more necessary in the livestock business than to any other of the food-producing industries, because the breeding sections are seldom the finishing or fattening countries, and either the livestock must be shipped to the feeding country or the feed shipped to the livestock.

"Livestock rates and service have been a great question befor the stockgrowers for many years. On innumerable occasions, on behalf of the livestock interests, have I appeared before congressional committees, before the Interstate Commerce Commission, state railway commissions and others, in matters of rate hearings and propositions of service and railway laws and regulations generally. A great amount of my time has been devoted to matters of this kind, and my position and activity are well known; but we have now arrived at a place where a majority of the carriers are giving good service, and showing our business the consideration it should have, and it becomes us to go to their assistance in their extremity.

"There is no doubt but that there is a crisis in this country today in connection with railroad expenses and operations. It is hardly necessary to call attention to the fact that in spite of the immense decrease in gross earnings there is a tremendous increase in expenses. Any cattle man who has this condition existing on his ranch knows that he is headed for destruction. Anything that might happen to the railroads that would result in reducing their efficiency, or retarding their advent into a new country, or prevent them from furnishing high grade service at all times, would be a catastrophe to all of us. Therefore it is of the utmost importance that the railroads be allowed to earn a fair revenue that they may be able to maintain their efficiency and keep up the high standard that stockgrowers have been demanding and are entitled to.

"There are several reasons why I have changed my views on this matter of railroad charges, and one reason is I believe the prosperity of the railroads is more important to our industry than almost any other feature of our present-day activities. Labor employed by railways is a big feature in this country, and when railway men are well employed they are good buyers of our products. Then again railways are large purchasers of materials that in preparation give many laboring men active employment, these laboring men being also good buyers of meats and meat products. Furthermore, there is an immense country developing in the west that needs railway transportation. Without new railways vast sections of this country will not be settled very soon, for all the products of the semi-arid country cannot be consumed by its local population, and a part must find an outlet and market in more densely settled districts. It is this surplus that is shipped that makes the price of what is kept at home. Then again there are large sections of the western country in Wyoming, Montana, Texas, and elsewhere, awaiting the advent of new railway branches, and we cannot expect capital to be put into railway lines when it does not produce a fair return."

Railway Destroyed by the Turks.—According to advices from Athens, a section of the Smyrna-Kassambra Railway has been destroyed by the Turkish military authorities, rendering the operation of the railway from Smyrna impossible.

LUCIUS TUTTLE

Lucius Tuttle, for 17 years president of the Boston & Maine, and for three years, 1910-1913, chairman of the board of directors of that company, died at his home in Brookline (Mass.), November 30, at the age of 68. The cause of death was angina pectoris. Mr. Tuttle had been in poor health since the amputation of a leg about three years ago, but had continued active until within about a week of his death.

Mr. Tuttle was at the head of the Boston & Maine during the years when most of the important acquisitions of other roads were planned and carried out, and both the successes and the errors of those years were the subject of severe criticisms. Many of the criticisms voiced in the newspapers were based on the narrowest views, and acts which were for the best interest of the public were condemned, along with others really blameworthy; but the later troubles of the Boston & Maine were of a kind which could be cured only by those policies, bold financially and frank in their attitude toward the public, which in the "old school" where Mr. Tuttle learned his lessons, were never taught and seldom practiced. He was forceful and enterprising in many directions—as, for example, in adopting automatic block signals long in advance of his neighbors—but the public demanded a still more perfect railroad, and it became evident that the problem could not be solved except by a revolution—which came in 1910. In this revolution Mr. Mellen had a leading part. It must be remembered that the road serves a large summer-resort territory—which means bread-and-water rations for seven or eight months in the year—and there is also a large mileage of lines where this unpromising condition exists the year round; so that there were problems in plenty, aside from those connected with legislative and newspaper criticism. Some of the road's misfortunes, therefore, appear to have been almost inevitable.

Lucius Tuttle

Mr. Tuttle was born in Hartford, Conn., March 11, 1846. He was the son of a farmer, and his paternal ancestor, William Tuttle, who came from England in 1636, was one of the founders of New Haven. Young Tuttle's first work was as a clerk in the Hartford District court; but in August, 1865, he began his railroad service, as a ticket seller in the station of the Hartford, Providence & Fishkill, which subsequently became a part of the New York & New England, and is now included in the New Haven system. After only one year in the local office he was made general ticket agent of the road; and he held that office until 1878. Then, on the absorption of his road by the New York & New England, he was made assistant general passenger agent of that road, and went from Hartford to Boston.

But being dragged about from one city to another by consolidations of roads and changes of titles, a process so familiar in the railroad world in later years, seems not to have been to Tuttle's taste; and in less than six months he left the New York & New England and took the place of general passenger agent of the Eastern Railroad, now one of the principal divisions of the Boston & Maine. But in 1885, when the Eastern was absorbed by the Boston & Maine, and Tuttle was made assistant general manager under James T. Furber, he soon resigned and went to the Boston & Lowell as general passenger and ticket agent.

After two years on the Boston & Lowell his ability as a passenger traffic man seems to have become so well known that he was wanted on a number of larger roads, and in January, 1887, he went to the Canadian Pacific as passenger traffic manager, with headquarters at Montreal.

Two years later he returned to the United States, and from May, 1889, to May, 1891, he was commissioner of the Trunk Line association at New York City, acting as chairman of the passenger department. In the latter year he was called to the New York, New Haven & Hartford as general manager; and in 1892 was made vice-president of that road. But after only one year in this position he went to the Boston & Maine, as president, which position he held until October, 1910, when Mr. Mellen was made president and Mr. Tuttle chairman of the board of directors.

From the first it seems to have been Mr. Tuttle's policy on the Boston & Maine to take in all of the railroads which could be classed as either subsidiary or directly competitive. The Connecticut River road, from Springfield northward, had been acquired at an extravagant price to keep it away from the New Haven road before Mr. Tuttle became president; but this was followed in quick succession by the Boston & Lowell, the Boston, Concord & Montreal and numerous smaller roads. In 1899 control was secured of the Maine Central, though its organization was left separate. This, as everyone knows, had been one of the Boston & Maine's best investments.

In 1900 came the acquisition of the Fitchburg road, taking the Boston & Maine into New York state, and considerably beyond Albany. This road, including the Hoosac tunnel, which had been built by the state of Massachusetts at enormous cost, was controlled by the state; and the campaign in the legislature to secure the consent of the state to the leasing of the road by the Boston & Maine was a notable episode in Massachusetts politics. The Fitchburg has been a prominent element in the Boston & Maine system, and has carried great quantities of western grain and produce to Boston. The extensive docks established there by the Boston & Maine to accommodate this traffic constituted one of the most popular enterprises of the Boston & Maine, many millions being invested. But the interest charges on the Fitchburg securities have undoubtedly been one of the road's heavy burdens

Personally Mr. Tuttle was affable and always approachable, liked by all. He did much to promote the work of the Boston & Maine Young Men's Christian Association, and was a man of wide information. Besides being courteous he was con-

siderate, and the employees always relied on his sense of justice. "He gave everybody a fair chance," has been said of him by one man who holds an important position. In May, 1913, he was given the degree LL. D. by the New Hampshire State College. He was a director of several banks and railroad companies, and a member of various clubs, including the Algonquin, Commercial and Merchants' clubs of Boston, the Boston Chamber of Commerce and the New England Civic Federation.

THE PARCEL POST AND ITS EFFECTS ON RAILWAY REVENUES*

A study of the revenues of express companies for the last two years is not without profit, because impressions can be gained as to the drift of events, even though no certain conclusions can be reached. The express revenues of the fiscal year ended June 30, 1913, were affected by only six months' competition with the parcel post, but those of the next year suffered from this cause for a full year. And in five months of this last twelvemonth reduced express rates were in effect.

The gross revenues from operation of all express companies for the fiscal year ended June 30, 1913, as compared with the previous year, were as follows:

	1913	1912	Increase	Per cent
Mileage	301,064	283,303	17,761	6.27
Revenue	$168,880,923	$160,121,932	$8,758,991	5.47

This increase of $8,758,991 was in spite of the competition of the parcel post for the last six months of the year. It might be held that the additional revenue could be credited entirely to the new mileage, which increased in greater percentage than the revenue; but the mileage does not always have a harmonious relation to the revenue.

While there must have been some loss of business because of the parcel post, the amount evidently was not large enough to be positively disclosed in the gross revenues. We may also conclude, at least tentatively, that a large amount of the parcel post traffic from January 1 to June 30, 1913, was new business.

The only statistics yet available for the year ended June 30, 1914, are those of the Adams, the American and the Wells-Fargo companies. These, combined, represent nearly 70 per cent of the revenues, and 65 per cent of the mileage of all of the express companies. For comparison the figures are given since 1912.

Adams, American and Wells-Fargo Companies

Year	Revenue	Increase	Per cent
1912	$110,372,802	$10,666,994	10.69
1913	117,963,952	7,593,150	6.87
1914	110,579,322	*dec.* 7,386,630	*dec.* 6.26

If the revenues of these three companies for 1914 had shown the same growth as between 1912 and 1913, they would have been $125,000,000.

Part of the deficit is due to reduced rates. One prediction was that these would result in a reduction of 22 per cent. As the reduced rates were in effect only five months of the year, this would be equivalent to 9 per cent, or about $11,000,000, which, subtracted from $125,000,000, leaves $114,000,000. Comparing this with the actual earnings of about $110,000,000, leaves $4,000,000 to represent the maximum amount that could be due to parcel post competition. Another prediction was that the new rates would reduce revenues 17 per cent. On that basis the loss in 1914 was $8,750,000, leaving the maximum loss attributable to parcel post competition about $6,000,000.

[Mr. Bradley quotes the estimates made by the Interstate Commerce Commission in 1909 that the average weight of express packages was 32.80 lb.; that the average revenue per package was 50.49 cents, and the average per pound 1.54 cents; and then, comparing with other estimates concludes that in the year to June 30, 1914, the express companies lost 24,000,000 pieces. He then goes on.]

The active competition of the parcel post is from 1 to 11 lb., and from the first to the third zone. The 4-lb. package would be the typical average, for which the express rate to the third zone would be about 25 cents. The loss to the express companies was seemingly about 5 or 6 per cent in pieces and about 3 or 4 per cent in revenue. If express companies lost $6,000,000 in revenue, the railroads lost approximately $3,000,000.

In Great Britain, the parcel post is a distinct class of postal matter and pays the railroad companies 55 per cent of its revenues. In this country, Congress did not establish the parcel post as a class by itself, but merely extended the fourth-class of mail matter from a weight limit of four pounds to a weight limit of 11 lb., and rearranged the rates. This fourth-class in 1912, before the parcel post was established, already embraced about 240,000,000 pieces a year, weighing about 76,000,000 lb., with an average weight per piece of 5 oz., or 3.16 pieces per pound. The revenue from this class was about $12,500,000.

When statements are made regarding the volume of parcel post business, it is necessary to inquire whether the amount quoted includes or excludes the old fourth-class mail.

The postmaster general predicted at a Congressional Committee hearing December 3, 1913, that during the fiscal year 1914-1915 there would be transported 600,000,000 parcels that would yield a revenue of 10 cents a piece, or a total of $60,000,000. This estimate undoubtedly included the old, as well as the new, fourth-class matter and might be restated as approximately 300,000,000 parcels.

A representative in Congress, who has made some study of the subject, estimated the bona fide parcels at 150,000,000 in 1913, and 250,000,000 in 1914, thus showing a growth in one year of 66 per cent. If we calculate the weight of these parcels at 4 lb. each, we obtain a total weight in 1913 of 600,000,000 lb., and in 1914 of 1,000,000,000 lb. About 95 per cent of this weight is carried on the railroads. Therefore, we may say that the railroads carried in 1913 about 280,000 tons, and in 1914 about 475,000 tons of additional mail matter for an average distance of about 300 miles. The ton mileage of this mail in 1913 would, therefore, have been about 84,000,000. The Post Office Department reported to Congress as of April, 1913, a ton mileage for all mail of 510,000,000. The addition was, therefore, about 15 per cent in that year and even greater in 1914.

The only action by Congress towards compensation was an allowance of 5 per cent increased pay to the railroads until the mails were weighed in regular course, but this weighing is only made once in four years. The 5 per cent allowance amounted to $1,687,360, although the additional revenue received by the Post Office Department from the first year's new business was estimated at about $15,000,000. The railroads in the First Contract Section (the New England states, New York, Pennsylvania, New Jersey, Delaware, Maryland, Virginia and West Virginia) did not receive the 5 per cent allowance, because the mails were weighed on these roads from February to June, 1913, and they were supposed to receive the benefit of some of the increased business. Even if this were true, it cannot be considered an adequate provision for the increase of the following four years, especially as it appears that there is a growth of 66 per cent in the second year.

In conclusion it may be said:

1. That so far as the railroad revenues are reduced at the present time because of the reduction in the revenues of the express companies, this is more due to the new rates prescribed by the Interstate Commerce Commission than to the competition of the parcel post.

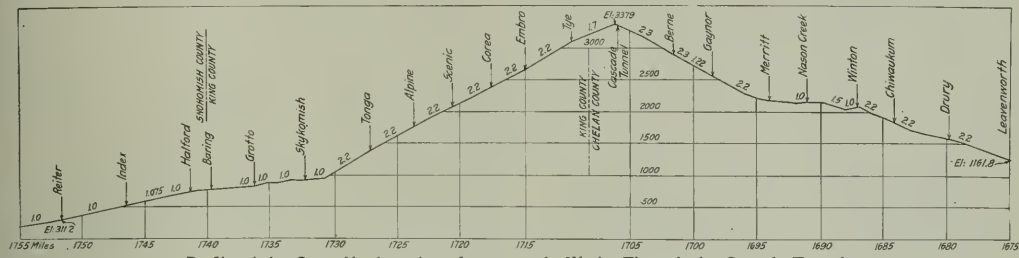
2. The parcel post, by the creation of a large amount of new business as well as by taking some business from the express companies, has greatly increased the tonnage of the mail transported without any adequate provision for payment to the railroads. It is of great importance that such remedial action be taken promptly, not only because justice to the railroads requires it, but also that the government may obtain information as to the full cost of performing the parcel post business. The knowledge of the full cost of transporting the parcel post business will save Congress from approving of parcel post rates which would result in a heavy increase in taxation.

*From a paper read before the New York Railroad Club on November 20 by V. J. Bradley, general supervisor of mail traffic, Pennsylvania Railroad.

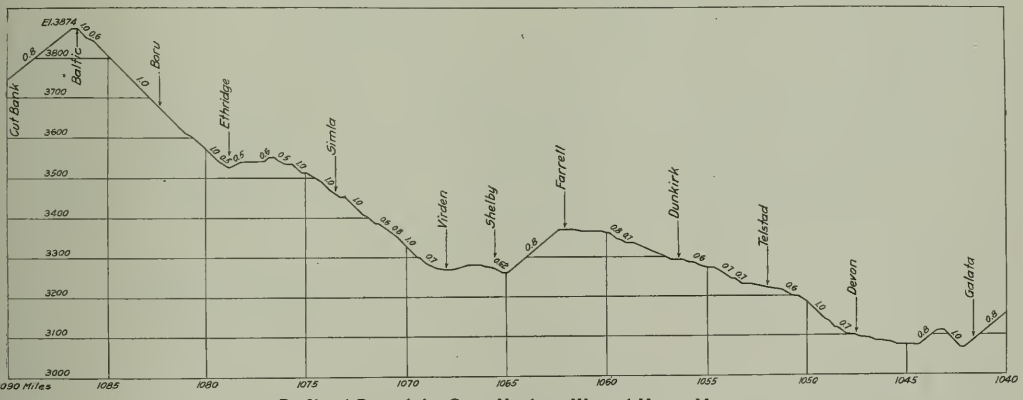
Passenger Locomotives for the Great Northern

Pacific and Mountain Types Used in Hauling Twelve-Car Transcontinental Trains Over the Heaviest Grades

The Great Northern has obtained very satisfactory service from 25 Pacific and 15 Northern or Mountain type locomotives delivered to that road about a year ago by the Lima Locomotive Corporation, Lima, Ohio. The Pacific type locomotives are used on the transcontinental trains between St. Paul, Minn., and Cut Bank, Mont., a distance of about 1,072 miles. The first locomotive district is one of 408 miles, from St. Paul to Devil's Lake, N. D., the crews being changed about 217 miles out of St. Paul. The next district is between Devil's Lake to Williston, N. D., a distance of 239 miles, the crews being changed 118 miles from Devil's Lake; the third is from Williston to Havre, Mont., a distance of 309 miles, the crews being changed at Glasgow, about half way. The fourth and last district on which the Pacific type locomotives are used is from Havre to Cut Bank, Mont., a distance of 129 miles. This portion of the road is in the foot hills of the Rocky mountains and considerable stretches of one per cent grade are encountered throughout, part of the profile



Profile of the Great Northern from Leavenworth, Wash., Through the Cascade Tunnel



Profile of Part of the Great Northern West of Havre, Mont.

Pacific Type Locomotive for the Great Northern

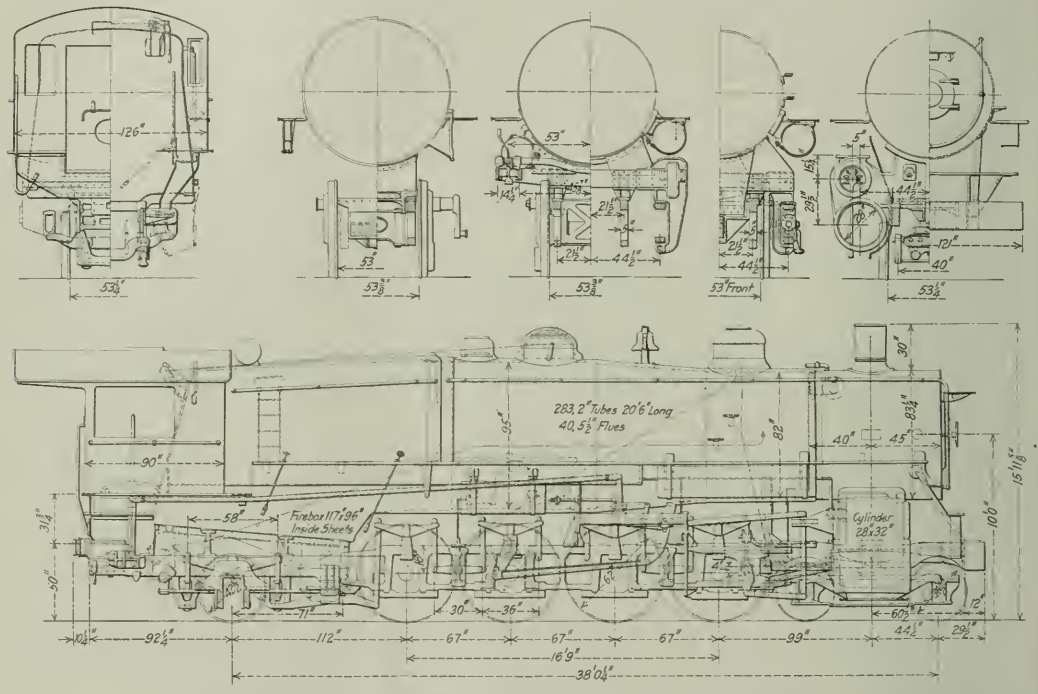
being shown in one of the illustrations. The accompanying table gives more detailed information concerning these runs:

Time Table for the Pacific Type Locomotives

Stations	Distances, miles	Schedule Stops	No. of cars	Max. grade, per cent	Time	Average speed, m. p. h.
St. Paul to Devil's Lake..	408	8	11 to 12	.72	11 hrs. 25 min.	35.7
Devil's Lake to Williston..	239	5	11 to 12	.72	6 hrs. 35 min.	34.3
Williston to Havre.....	309	5	11 to 12	...	8 hrs. 50 min.	34.8
Havre to Cut Bank.....	129	None	11 to 12	1.	4 hrs. 10 min.	30.

service has been entirely eliminated without a change being made in the time table, the Mountain type engines handling the trains at a speed of 17 to 20 m. p. h. on the 1.8 per cent grade.

The Mountain type engines have also been placed in service over the Cascade mountains, where the grade is 2.2 per cent, as shown in the accompanying profile. It will be noted that this grade is somewhat broken for a distance of 32 miles



General Arrangement of the Mountain Type Locomotive for the Great Northern

The Mountain type locomotives haul these same trains from Cut Bank to Whitefish, Mont., a distance of 129 miles. This division runs through the Rocky mountains in the vicinity of Glacier Park, and one per cent westbound and 1.8 per cent eastbound grades are encountered. Prior to putting on this type of engine in this service it was necessary to provide a helper on the eastbound run of this division for a distance of 18 miles between Essex and Summit. This helper going west, whereas it is almost continuous running eastbound for a distance of 25 miles. In this case, as before, the use of these engines has eliminated the helper service, and they maintain a speed of 15 m. p. h. up this grade with the transcontinental trains. These engines on this hill are burning oil for fuel. Both the Pacific and Mountain type engines are said to be very good steamers and are giving an economical fuel and water performance.

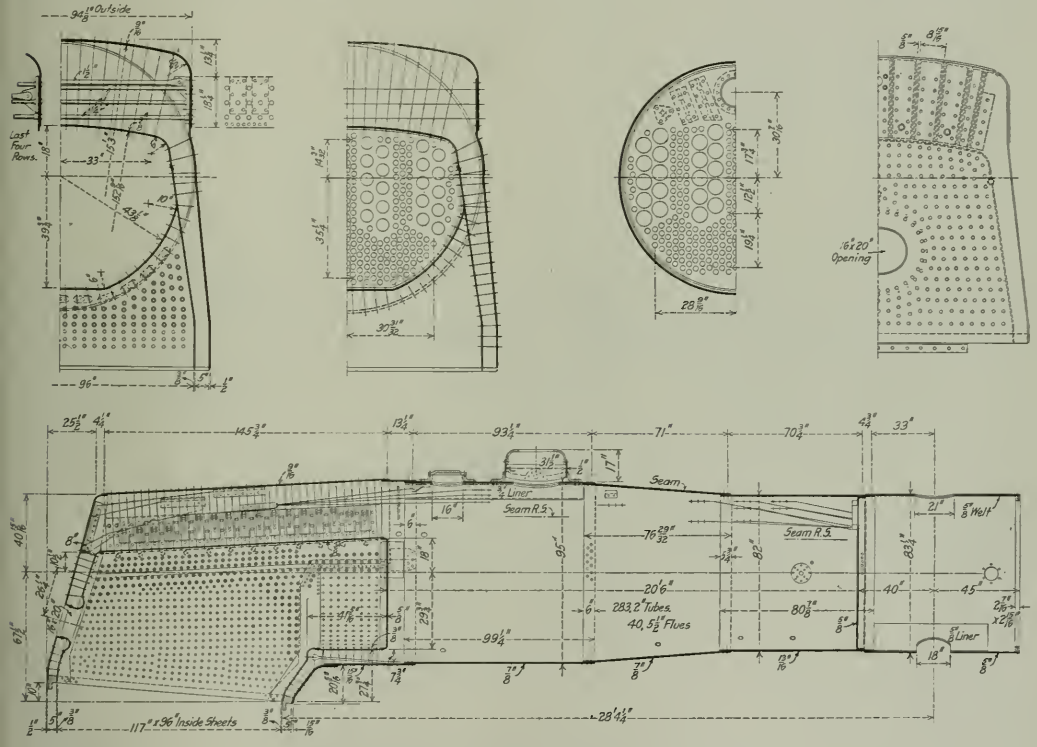
Mountain Type Locomotive for Passenger Service on the Great Northern

The Mountain type locomotives weigh 326,000 lb. in working order and have a tractive effort of 61,900 lb. They carry a boiler pressure of 180 lb., and have 28 in. by 30 in. cylinders and 62 in. driving wheels. They are equipped with Emerson superheaters, which provide a superheating surface of 1,075 sq. ft. The rigid wheel base of these engines is 16 ft. 9 in. The distance between the tires of the forward pair of drivers is 53 in., while the distance between the other drivers is 53⅜ in. The two leading pairs of drivers are equalized with the leading truck, while the two back pairs are equalized with the trailing truck. The forward spring hangers of the first set of driving springs support a transverse equalizer, from the middle of which is swung a longitudinal equalizer with its fulcrum on a casting attached to the guide yoke frame brace and to a waste sheet as shown in the elevation drawings. The other end of this equalizer is hung from a second longitudinal equalizer at a point just back of the cylinder casting. This second equalizer has its fulcrum on the leading truck center casting, and its forward end is attached to the front buffer casting. This construction gives the front part of the frame ample support and tends to reduce frame breakages back of the cylinder castings. The frame is made continuous from the splice in the rear of the fourth pair of drivers through to the buffer casting. It is 5 in. wide and is braced by three frame braces and three cross bearers. The main journals on these engines are 22 in. long.

The Pacific type engines weigh 251,200 lb. in working order, and have a tractive effort of 40,500 lb. They carry a boiler pressure of 210 lb. and have 23½ in. by 30 in. cylinders; the drivers are 73 in. in diameter. The distance between tires on the forward pair of drivers is 53 in., while that for the main drivers is 53⅜, and for the back drivers 53¼ in. All three pairs of drivers are equalized with the trailing truck, the cylinder casting resting directly on the center plate of the forward truck. The frames are 5 in. in width, the same as the Mountain type engines, and they are made in one piece from the front buffer to the splice in the rear of the back set of drivers. These locomotives are also equipped with the Emerson superheater, having a superheating surface of only 640 sq. ft.

Both types are equipped with the Walschaert valve gear, and the Chambers throttle valve. The leading trucks on both types of engines are the same and were designed by the railroad company. They have an 86 in. wheel base and support a load of 50,000 lb. in the case of the Mountain type locomotive and 55,000 lb. in the case of the Pacific type.

The trailing truck was designed by the Lima Locomotive Corporation and is known as the Austin truck. It is designed to simplify the removal and replacement of journal boxes and to provide a self-centering radial action of sufficient stiffness to prevent undesirable swinging of the rear end of the locomotive.



Boiler Used on the Great Northern Mountain Type Locomotive

The boilers of both the Mountain type and Pacific type are of the Belpaire type and are partially equipped with Tate flexible stay bolts. The boiler of the Mountain type locomotive has a combustion chamber about 41 in. deep, which provides a tube length of 20 ft. 6 in. The Pacific locomotive, however, is not equipped with a combustion chamber and has a tube length of 21 ft. The outside diameter of the first ring of the Mountain type boiler is 82 in., while that for the Pacific type is 72 in. The cylinders of both engines are of similar design, the steam passages being

contained in the cylinder saddle. The valves are provided with 5⅛ in. bushings, those for the Mountain type being 16 in. inside diameter, and those for the Pacific type 12 in. inside diameter.

The following is a table of the principal dimensions and ratios:

General Data		
Type	4-8-2	4-6-2
Gage	4 ft. 8½ in.	4 ft. 8½ in.
Service	Pass.	Pass.
Fuel	.....	.....

Boiler		
Style	Conical Belpaire	Straight Belpaire

*Total equivalent heating surface = total evaporative heating surface + 1.5 times the superheating surface.

OPERATING THE MILWAUKEE (WIS.) TERMINALS OF THE ST. PAUL

By W. B. Hinrichs
Superintendent of Terminals, C. M. & St. P., Milwaukee, Wis.

The problems presented in the operation of large terminal yards are varied, intricate and exasperating. It is far more trying and difficult to operate successfully industrial terminals than large classification yards, where the make-up and break-up of trains is the only consideration. Let me briefly review the methods in vogue on the C. M. & St. P., at Milwaukee, Wis., where both flat and hump switching are extensively carried on.

We have over 300 miles of terminal yard and industrial trackage in this city. This mileage includes 17 yards, varying in capacity from 300 to 2,700 cars. Six of these are used exclusively for the receiving, classification and departure of trains; and the other 11 for assembling, storing and classifying cars for industries located in such yards, or in their immediate vicinity. Nearly every one of these 11 industrial yards has team track facilities, accommodating from 13 to 350 cars, the total capacity of these team tracks being 760 cars.

The industrial yards have been located where a large num-

ber of factories and industries had established their plants. Firms have also located at these yards when possible to obtain better switching service. For example, in the North Avenue district, 80 firms are served from one yard. The handling of a large amount of merchandise, beer, meat and other perishable freight, and the forwarding of these cars on eight or ten different time freights before midnight of the day they are loaded, is a task. As an illustration beer loading during the hot weather has reached over 250 cars a day. It must be remembered that the greater percentage of loading continues until 6 p. m. before which it is permissible to enter private industry tracks or to pull the cars from the freight houses where merchandise is loaded. After the completion of the loading, bills must be furnished, cars carded for switching purposes, then switched into transfers and taken to the proper train yards to be classified into trains, which must be moving toward their destination by midnight. A large number of the loads travel a distance of 15 miles on transfers from the loading point to reach the train yard.

After the day's loading has been gathered up and forwarded, it becomes necessary to place the cars for the next day's unloading, as well as the empties for loading, at the warehouse, industry and team tracks, elevators, wharfs, etc. This work is done after midnight and all cars are spotted by 7 a. m.

In addition to the handling of this local business, six divisions bring in and take out an average of about 5,000 road cars every 24 hours. During the busy season from 90 to 100 freight trains and 100 passenger trains arrive and depart daily. To handle the above described traffic successfully as well as economically requires a well drilled, organized and disciplined force.

At this writing it takes 82 switching crews, and 63 engines to do the work—a large percentage of the switch engines being double-crewed and working continuously. Our standard switch engines weigh 127,000 lb. on the drivers and have 28,000 lb. tractive effort and 180 lb. boiler pressure. They have 51 in. driving wheels and 19 by 26 in. cylinders. These engines, of which we have 36 in service, are utilized mostly in industrial switching, as they ride almost any curvature. Larger road engines are used for transfers and in the switching of trains in train yards. These engines vary from 189,200 lb. on drivers, with 43,000 lb. tractive effort, 200 lb. boiler pressure, 63 in. driving wheels and 23 in. by 30 in. cylinders, to the Mallet compound engines having 323,000 lb. on drivers, 76,000 lb. tractive effort, 200 lb. boiler pressure, 57 in. driving wheels, and 23½ in. by 37 in. by 30 in. cylinders. Of this latter type of engines we are using three. Of the 82 switching and transfer crews, 52 are working days and 30 nights. This number, of course, increases and decreases in accordance with the volume of business done, running as high as 92 crews for the last three months of the year. In connection with the work mentioned, eight of the 82 crews devote their entire time to switching in train yards, and seven crews work exclusively on the shop and repair tracks.

Briefly the organization to handle this large terminal is as follows: In addition to the principal freight agent, we have six sub-agents located at the main industrial centers, who have entire charge of their districts and maintain separate station accounts. The superintendent of terminals has charge of the entire terminal, including the agents, switching crews, tracks, the moving of traffic, and to a large extent all buildings except those located at the shops. He is assisted by a station master, who has charge of the passenger traffic, a day general yardmaster and general assistant, a night general yardmaster and general assistant, and 20 yardmasters, of which 12 work days and the balance nights.

Both day and night, general yardmasters exercise general supervision over the entire terminals, so far as the switching power and crews are concerned. They must keep the crews at the minimum at all times, but not sacrifice the service. They direct and outline the work, divert the power from one yard to another to help out when required, hire all yardmen and place them, make preliminary investigations of all misdoings and report direct to the superintendent.

The duties of the day and night assistant general yardmasters consist in directing all movements in the terminal by telephone from the centrally located general yardmaster's office. The prompt arrival and departure of trains into and from the different yards and tracks and the movement of transfers are entirely under their jurisdiction.

The 20 yardmasters are selected with great care, and as a rule are promoted from the ranks. As assistants to the yardmasters we have yard and train clerks, who can expedite the movement of cars by promptly handling the train lists, waybills, carding cars, etc. In these terminals we have 33 such clerks—23 days and 10 nights. The day force gets into action at 7:00 a. m., taking a track list of every car in the terminals. By 10:00 a. m. this information has been obtained and the lists are sent to the car record office, centrally located in the passenger depot, by special messengers.

In making the car records, a visible typewriter is used with a roll of tape one inch wide, perforated into inch squares, each having a hole at the upper end for the purpose of hanging on a pin. The number of the car and initials, time of arrival, number of train and name of division and date of arrival are put on the tag. The numbers of all cars shown on track lists, initials, number of track, where located and date of location are also put on the tags. Reports showing the movement of cars between districts in the terminal are also received and put on tags, so that it is possible to follow the movement of a car from one district to another and promptly locate it, while reports of cars loaded in the terminal during the day are made and put on tags showing the district in which car is loaded.

Different colored tags are used to designate the service the cars are in. White tags indicate a loaded car arriving; yellow, an empty car arriving. Similar colors are used for loaded or empty cars shown on track lists; red for delivery to connecting lines; blue for cars received from connecting lines; pink, for cars loaded in the terminal and brown for departure from the terminal.

All tags are taken from the typewriter as fast as made and sorted on aluminum pins in numerical order. These pins are about six in. long, and are provided with a washer on one end and inserted in a hole in a board divided into 1¼ in. squares. The boards have a capacity of 100 pins each. The tags are separated into thousands and then divided into hundreds by sorting on the pins.

After each day's business is completed the tags are ready for filing on the main records, consisting of nine boards having a capacity of 500 pins each, or a total of 4,500 pins. This provides sufficient room for the recording of every car arriving in the terminal and until it departs.

This method gives a complete record of the movement and location of all cars in Milwaukee and is available for reference at all times. An average of 12,000 cars movements is recorded daily. All reports for each day are recorded the same day. The office force consists of the manager, two assistants and 15 girl typists. It will be readily seen that by calling up this office after 12:00 o'clock noon, the location of any car in Milwaukee may be ascertained.

The cost of handling through cars which do not originate at Milwaukee varies from $0.125 to $0.145 per car. The cost of handling all cars passing through, including those originating at Milwaukee, varies from $0.69 to $0.80 per car. The average expense per ton for handling freight at Milwaukee in carload shipments amounts to 8.4 mills and for l. c. l. shipments $0.51 per ton.

No large terminals can be operated successfully and with economy unless co-operation and harmony exists among all of the employees doing the work. Get-together meetings are held a number of times each year and all of the different phases brought out by the employees are discussed. When any ideas with merit are advanced they are adopted and given a trial. In this way everybody becomes interested and is anxious to advance a proposition of his own.

THE DANGER OF FREIGHT CONGESTION*

By Arthur Hale
General Agent, American Railway Association

There is a larger surplus of cars now than there has ever been in the fall. Almost always October and November are periods of car shortage. Even in the three lean years, 1908, 1910 and 1911, the car shortage in October ran up to fifteen and twenty thousand cars. This year it has not reached 2,500 and the surplus is 154,000, nearly 40,000 higher than in the worst year—1908.

It is well known that in time of peace one should prepare for war. We ought to believe in the future of this country, and any one who believes in the future of this country knows that the time will come next year very likely when there will be a demand for transportation and when every freight car will be needed. When that time does come some kind of a car shortage is inevitable, but we should do everything we can to prevent it and to reduce it. Now there is one cause of car shortage which can almost always be eliminated if we take it in time. That is the congestion of loaded cars.

Car shortages are bad enough anyway, but they are most trying when they are accompanied by congestions of loaded cars. When all the cars in the country make a reasonable movement, and despite this a car shortage occurs, it can only be caused by such a sudden increase in business as could not be foreseen. When on the other hand car shortages are accompanied or caused by congestions of loaded cars it is another matter, and every one is to blame who has had it in his power to prevent the congestion and has failed to do so.

There were serious car shortages in the fall of 1906 and the fall of 1907, and these car shortages were accompanied by serious congestions of loaded freight cars. Since 1907 we have been more fortunate. Our freight cars did more work in every October between 1909 and 1913 than they did in the Octobers of 1906 and 1907. It was only in 1912 that the shortage exceeded 50,000 cars, and while there were some congestions they were by no means as serious as those of 1906 and 1907.

Why then, it may be asked, is there more danger of congestion in 1915 than in the preceding years? The answer is easy. Since 1907 the facilities of the railways have generally been ample to handle the increased freight business which was offered even in the record months of October, 1912, and October, 1913, and these months show a tremendous increase even over the prior maxima of 1909 and 1907.

Present conditions, however, are not favorable to the development or even the maintenance of railway facilities. If there is as much business in October, 1915, as there was in October, 1913, the railways will undoubtedly have the same facilities that they had in 1913, but I see no reason to think that they will have more facilities nor can I see how these same facilities can be maintained at quite the same point of efficiency as in 1913. If the business should show a decided increase there is danger of congestion.

But there are more ways than one to create a congestion. If a railway accepts for movement more loaded freight cars than it can handle it is wholly responsible for the resulting congestion, but if it accepts for movement cars which it can handle and its consignees cannot, the public shares the responsibility, and for this reason the matter is now brought before the National Association of Railway Commissioners in the hope that steps may be taken to entirely avoid in future all congestions for which the public is in anyway responsible.

There has never been a great freight car congestion when all freight has been properly covered by demurrage rules. Whenever any great car congestion has occurred there has been some imperfection in the demurrage rules, and a considerable proportion of the cars which composed the congestion were held without payment of demurrage.

*Paper presented at annual convention of the National Association of Railway Commissioners, Washington, D. C., November 17-20, 1914.

The most extensive freight car congestion in our memory was what was known as the "Arizona coke congestion" where thousands of cars of coke destined to points in Arizona were held for weeks and months on the lines between the Alleghanies and the Rocky mountains. This congestion accompanied and to some extent caused the car shortages of 1907, and yet the great majority of these cars were held for weeks and months without the payment of demurrage by the consignees, although the shipments were prematurely made in order to save those consignees from an increased freight rate.

The great congestions of coal and of cotton have practically ceased since demurrage has been applied at points of transshipment. The annual winter blockades of coal to and via certain cities of the central west have been greatly reduced since a charge has been made for the reconsigning privilege and the free time for reconsigning has been reduced.

Thus the old-fashioned congestions which we have had always with us have been largely mitigated by a more thorough enforcement of the National Code of Demurrage Rules originated by the National Association of Railway Commissioners, but we have confronting us a set of new conditions for which possibly our old measures are not calculated.

The business which is now increasing is the export business, and further increases in business will probably be in the same direction. Cars loaded with export freight may be expected at the seaboard in unprecedented numbers. Are our present demurrage and storage rules sufficient to prevent congestion? Is the national rule covering free time on reconsignments universally followed? Is the constructive placement rule universally followed, and are consignees paying demurrage on all freight cars which they cannot handle, when these cars cannot be placed for them?

It is to be feared that these questions must be answered in the negative. Much has been done locally to provide proper demurrage rules on freight to be trans-shipped by water, but excepting at one gulf port it must be confessed that the demurrage and storage rules covering export freight are such that many a loaded car can be held indefinitely at seaboard without any payment by the consignee. Progress has been made with the reconsignment rules, but there are too many exceptions to the rule and too many cases where cars which are not wanted at destination can be delayed by repeated reconsignment. The constructive placement rule is generally enforced to the letter, but at certain points there are minor congestions which recur so frequently as to almost prove that cars are being held free. The subject is thus presented to the National Association of Railway Commissioners in the hope that throughout the country, the commissions, the public and the railways will unite, for such a proper amplification and enforcement of the rules that no freight cars can be held free for any one and that the congestion of loaded freight cars will become an impossibility on every road whose facilities are ample.

It may be urged that we can handle an increased export trade without blockading our ports if we use the embargo. There was never a greater mistake. An embargo is the locking of the door after the horse is stolen. Railways cannot foresee shipments as shippers themselves can. Shipments should not be made to congested points or to points in danger of congestion, but the railroads should not be the one to impose the embargo. The shipments should be regulated by the shippers and consignees who alone can regulate them properly. Many shippers and consignees have enough public spirit and believe enough in fair play to properly regulate their shipments without any compulsion, but they should be protected as much as the railways against the shippers and consignees who will not properly regulate their shipments except under the spur of a personal advantage. It is for them and for them only that demurrage codes have been devised, and bitter experience has taught us that it is only by proper enforcement of proper demurrage rules that we can secure the help of all the public in keeping our freight movement free.

The Reasons for the Unpopularity of Railroads*

Opinion Expressed That the Public Is Beginning to See the Necessity for Fair Play Towards the Railroads

By A. M. Schoyer
Vice-President, Pennsylvania Lines West of Pittsburgh

People are saying that they are tired of hearing the continued calamity howl of the railroads. Do not they suppose the railroads are tired of howling? But what other remedy is left? State and interstate commissions were created for the purpose of correcting railroad evils and of acting for the people as against the railroads, thus making a convenient body before which the victims or opponents of the railroads can appear to urge their woes, but there is no body created to product the railroads against their opponents. Therefore, the railroads are always on the defensive, and, being before bodies which have been created to restrain them, those bodies are naturally not particularly favorable to them. The state railroad and utilities commissions and the Interstate Commerce Commission were created to prevent undue prosperity on the part of the railroads or, at any rate, to act as the protectors of the shippers and the public against them. The prosperity of the railroads, therefore, matters but little to these bodies, except when, incidentally (since these commissions are usually composed of fairminded men), they may be impressed in passing with the injustice which the existing situation so often creates. Yet it is seldom that a body or an individual or a business ever publicly favors the railroads' cause. Woe to the man who does so. If he is a banker, the question is at once raised, "What shall we do to cut the bond which unites the railroads and Wall Street?" If he is a business man, "What do you sell the railroads?" If he is a lawyer, "Who retains you?" If he is a public officer or legislator, "Corruption!" is the cry. Sometimes fair commercial bodies resolve in favor of the railroads in rate or other contentions, but this does not necessarily mean that the paid traffic representatives of such bodies will support the railroads' contention, and if the traffic representative afterwards publicly attacks the roads he retains his position, and often with added honor and authority.

I see in the newspapers that the Georgia Railroad Commission has decided not to order the railroads of Georgia to make any more improvements or expenditures until better times set in. This is an honorable, fair and sensible course, and it is greatly to be desired that similar organizations elsewhere should take the same advanced stand.

The unprejudiced, independent newspapers of the country have lately taken up the cudgels for better treatment of the railroads. Leading editorials are appearing with more and more frequency in the great, influential daily and weekly papers calling for justice. The more conservative of the magazines are making similar demands, and where, a few years ago, there were a number of magazines muck-raking the railroads, there are today but few following that course, and I do not believe that the few find any measure of popularity or success following their attacks. The rank and file of the public of this country is not today opposed to the railroads. There has been a complete revolution as compared with a few years ago. Nothing more clearly demonstrates the change in public sentiment than Missouri's vote on the extra crew question in the recent election. The bill was overwhelmingly defeated and the Missouri citizens, by a tremendous majority, voted that they would not have this extra burden placed upon the railroads of that state.

Notwithstanding the changed attitude of the public, the railroads are not yet popular. Not with the public bodies which regulate them; certainly not with Congress and the legislative bodies which legislate against them; not with a majority of the great leaders of the state and country; and probably not with the rank and file of the people.

The railroads are 100 per cent better than a few years ago, even though they are not perfect today. It is claimed that in olden times railroads gave passes, granted rebates, spent money in politics, were arrogant, did not provide facilities and were very independent in all directions; but they were popular then. If the people did not like them, they did not say so. There were but few laws passed to regulate them. Now, all this has changed. For a number of years none of these practices has been followed. There are no rebates, there are no passes, except those given to men who are legitimately entitled to them by reason of railroad employment and to the families of those men. The railroads are anxious to provide facilities to take care of the business of the country and, I believe, they are usually courteous in their treatment of the public. But now they are unpopular. No one hated them when they were said to be bad. Why do they hate them when they are so much better? The leaders who liked the railroads then often hound them now.

I have a tremendous faith in the sense of justice of the American people. I believe they have decided that the day has come to give the railroad its chance to live and to expand, and, sooner or later, their servants, these legislative and administrative bodies and executives I have been talking about, will learn the facts, and, when they do, how quickly they will change front!

The railroads must keep out of politics, but the railroad unions can go into politics and they do, and legislative bodies hasten to pass the laws they demand. Can it be because the legislator fears the power of the vote of the labor union men? No. It must be because the legislator knows what the experienced railroad officer does not know; that electric headlights are safer than less powerful lights, even though they blind the engineman, make danger signals look like safety signals and cost hundreds of thousands of dollars which are greatly needed for safe operation of railroads. Or because the experienced legislators know better than the railroad officers what effect another brakeman on the crew will have. To us, this extra brakeman appears to be an added source of danger; this man who is of no use, but who must be carried, and who is so often in the way. On one railroad in this country, this extra man is not allowed to do any work, but sits in solitary grandeur in the caboose or in the coach out of danger's way, riding over the road daily and drawing his ample pay on each succeeding pay day.

Why two pay days per month were required, our men can not tell us. Generally, they did not want it, but their leaders thought it would sound well and cracked the whip and some of the legislatures rushed to pass the law. The railroads spend hundreds of thousands of dollars yearly in the added expense of paying men who do not need their money twice a month and who would be better off with one monthly pay day.

On practically all railroads in this territory, every dollar spent for unnecessary things or for needless luxuries made obligatory by law, such as electric headlights, palatial cabooses, extra crew laws, unnecessary stations, double pay, hours of service laws, boiler inspection laws, changing the ladders on freight cars from one side to the other, self-cleaning ash pans, etc.—I say that every dollar spent for unnecessary things such as these is a dollar necessarily withheld from the necessities of railroad life, such as rails, cars, locomotives, ballast, more main and yard tracks, etc.

For years, the railroads have been unable properly to care for

*Abstract of an address before the Peoria Transportation Club, Jefferson Hotel, Peoria, Ill., November 13, 1914.

public needs of the day, let alone tomorrow. When this country finally awakes from its long industrial slumber, what an avalanche of reproach will fall upon the heads of the luckless railroads who have found it utterly impossible to beg, borrow or earn money for needed facilities.

The railroads, generally, are where they can go no further. They have stopped, but they are not standing still; they are retrograding. Receiverships are becoming more plentiful. As a rule, legislative and executive bodies, and men in power, are not favorable to railroad interests. The press of the country has changed front; the public is doing so. Even those who have changed front, however, are being governed by a stirring sense of justice and not because they like the railroads. There are two questions to be answered:

First, what can the country do to prevent the bankruptcy of the railroads?

(a) Stop passing anti-railroad laws and rulings at the demand of paid traffic managers, labor union leaders, and any one who can secure a post card and a fountain pen.

(b) Repeal the obnoxious and unnecessarily burdensome laws and rulings in effect. I have named some of them.

(c) Stop continually increasing railroad taxes.

(d) Permit the railroads to raise their rates sufficiently to give them a living income and to enable them to provide a modest surplus as a basis for credit.

(e) From time to time, consult leading railroad officers as to the needs of the railroads, generally, and as to the effect of proposed legislation. The railroads stand ready to co-operate in all needed and wise reforms.

(f) Cultivate a different sentiment. When praise is merited, try praising, instead of continual criticism, and endeavor to restore the railroads to a position of respect in the eyes of the general public. Then hold them strictly responsible for results.

Second, what can be done to remove existing antagonisms and make the railroads more popular?

(a) Let railroad men who come in contact with the public, treat it with consideration. The public may not know as much about railroading or railroad matters as we do, when they ask questions, but let us forget this and treat them courteously.

(b) Let the railroads refrain from arbitrary action in matters of rates and service. Because we are badly treated, there is no reason for passing it on.

(c) Let the owners of the railroads talk about the good qualities of the roads, advocate their cause, defend them and praise them.

(d) Let an effort be made by the better educated and more experienced railroad men of the country to enlighten the teachers of political economy and of railroad economics in the colleges and universities of the country, so that they may better understand today's railroad situation and develop in the minds of their students a comprehension of the changed conditions which have come to pass and a more cordial feeling toward the railroads. There is a necessity for a changed viewpoint by the young men pouring out of our universities and colleges everywhere if we intend greatly to increase railroad popularity.

(e) Let the railroads take the public, generally, and the interested public, especially, into their confidence as to what they are trying to do, why they are trying to do it and the difficulties in the way. There is nothing secret in railroad operations today. If the railroads wanted to have secrets, the laws would absolutely prevent it, since their books must be open to inspection at any time.

The railroad men brought up under the old regime are no longer in control. The men who are managing the railroads of this country today for the owners of the roads would never go back to the practices of ancient times, if they could, and the times have so changed and the public conscience and the general laws are such that no railroad manager could do so for a minute, even if he so desired. Then let these reformed railroads take their proper position. Let us stop "knocking" and try some other method.

I am not an opponent of wise railroad regulation, but, on the other hand, have always advocated it. But I am opposed to destructive regulation and I fear we have reached that stage. And we are today confronted with the possibility of new and more sweeping laws, rulings and orders, which will take from the railroad manager the application of the train and flagging rules which he feels are necessary for the success and safety of his railroad, and substitute rules which may be splendid in themselves and for some railroads, but not applicable to his own; or rules which will attempt to substitute specific instructions for more general ones, thus relieving the individual employee of his own responsibility. There is threatened the substitution of government regulation for the individual investigation of accidents and home discipline. There is threatened the enforced application of an automatic stop which will prevent collisions; and when we get this automatic stop and the engine and train crews no longer feel that eternal vigilance is the price of safety, what will result? Added safety or added danger? The automatic stop will be a machine and no matter how perfect, *but* a machine, and there will be times when it will fail—and then, God pity us!

If government regulation ever proceeds so far that it hampers the individuality of the general manager in handling his railroad and binds his hands in the matter of rules and discipline, and relieves the individual employee of his sense, of his responsibility, good-bye to safety and success.

I can not believe that destructive regulation will go further than it has. It must be that the force of public opinion will soon be felt and then let the railroads, having fully learned their lesson, pick up the fragments and build a new structure upon solid foundations of obedience to the law, reasonable financial results, and fairness and equity to public and employe.

TRAIN ACCIDENTS IN OCTOBER[1]

The following is a list of the most notable train accidents that occurred on the railways of the United States in the month of October, 1914:

Collisions.

Date.	Road.	Place.	Kind of Accident.	Kind of train.	Kil'd.	Inj'd.
13.	Georgia	Madison.	bc.	P. & F.	0	38
18.	New York Central	Indian Castle	rc.	F. & F.	2	1
22.	Pennsylvania	Kane.	rc.	F. & F.	1	4

Derailments.

Date.	Road.	Place.	Cause of Accident.	Kind of train.	Kil'd.	Inj'd.
3.	Hoosac T. & W.	Readsboro.	unx	P.	0	15
7.	Balt. & Ohio	Cove Run.	.....	P.	0	39
†17.	Del. L. & W.	Fulton, N. Y.	malice	P.	2	31
18.	Morgan's L. & T.	Broussard.	malice	P.	0	15
18.	Pennsylvania	Glen Union.	b. axle	P.	0	6
19.	Missouri K. & T.	Bartlett.	unx	P.	3	12
28.	Ches. & Ohio	Barboursville.	unx	P.	0	18
31.	Del. Lack. & W.	Alford.	b. rail	P.	0	33

Other Accidents.

Date.	Road.	Place.	Cause of Accident.	Kind of train.	Kil'd.	Inj'd.
†11.	Denver & R. G.	Grand Junc.	rock fall	P.	3	14

The trains in collision at Madison, Ga., on the 13th, were eastbound passenger No. 2 and a westbound freight. The passenger ran over a misplaced switch and into the head of the freight train, which was standing on a side track. Thirty-five passengers and three employees were injured. The responsibility for the collision is charged against the men in charge of the freight.

The trains in collision near Indian Castle, N. Y., on the 18th were eastbound through freights. The fireman and one brake-

[1]Abbreviations and marks used in Accident List:
rc, Rear collision——bc, butting collision——xc, Other collisions——h, Broken——d, Defective——unf, Unforeseen obstruction——unx, Unexplained——derail, Open derailing switch——ms, Misplaced switch——acc. obst., Accidental obstruction——malice, Malicious obstruction of track, etc.——boiler, Explosion of locomotive on road——fire, Cars burned while running——P. or Pass., Passenger train——F. or Ft., Freight train (including empty engines, work trains, etc.)——Asterisk, Wreck wholly or partly destroyed by fire——Dagger, One or more passengers killed

man were killed, and one other employee was injured. The collision was due to excessive speed in dense fog, under a caution card. Also the conductor and flagman of the leading train are held responsible for not affording proper protection by flag.

The trains in collision near Kane, Pa., on the 22nd, were eastbound through freights. The caboose of the leading train, which was moving slowly, was wrecked. An engineman was killed and four other trainmen were injured. There was a dense fog at the time of the collision.

In the passenger train derailed near Readsboro, Vt., on the 3rd, 15 passengers were injured. Three cars fell down a bank.

The train derailed at Cove Run, West Va., on the 7th, was northbound passenger No. 4, and 36 passengers and 3 employees were injured, most of the injuries being slight. The train was running about 25 miles an hour. The tender was the first vehicle to jump the track.

The train derailed near Fulton, N. Y., on the evening of the 17th was a northbound express, running at full speed. All of the cars in the train left the rails except the last one. The engineman and fireman were killed and 26 passengers and 5 trainmen were injured. One steel passenger car was turned completely around, but its occupants suffered only minor injuries. The derailment was due to the malicious misplacement of a switch. The light on the switch had been made to show green, all right.

The train derailed at Broussard, La., on the 18th, was westbound passenger No. 11. Every car in the train left the rails, but the number of persons injured is reported as only 15. The derailment was caused by loosening of spikes, presumably by persons who had intended to rob the train.

The train derailed at Glen Union, Pa., on the 18th was eastbound passenger No. 52. The baggage car fell down a bank. The engine and the entire train of seven cars left the rails. The passenger cars were of steel and only six passengers were injured, none seriously. The cause of the derailment was the breaking of one of the axles of the tender.

The train derailed near Bartlett, Tex., on the morning of the 19th, was northbound passenger No. 6, and the engine was overturned. The first three cars of the train were turned crosswise of the track, but the cars behind these were little damaged, and most of the passengers felt no serious shock. Three men on the engine were killed and six passengers and six employees were injured.

The train derailed at Barboursville, W. Va., on the 28th, was westbound passenger No. 1. Three cars were ditched. Eighteen passengers were injured.

The train derailed near Alford, Pa., on the 31st, was eastbound passenger No. 32, consisting of five cars. Three cars fell down a bank and 30 passengers and 3 employees were injured. The derailment was due to a broken rail.

The train which was wrecked near Grand Junction, Col., on the 11th, was westbound passenger No. 3, and the cause of the disaster was the fall of a mass of rock from the second ledge about 200 ft. above and from the track. The train was running at ordinary speed when a rock weighing 10 tons fell on the rear end of the smoking car, which was the third car from the engine, and broke the couplings. This applied the air brakes and the train was soon stopped; but at almost the same instant a boulder weighing perhaps five tons fell on the day coach and the roofs of the two cars were wrecked. Three passengers were killed and 14 injured.

Electric Car Accidents.—Of the half dozen serious collisions or derailments on electric roads reported in the newspapers as occurring in the United States during the month of October, three appear to have been attended by fatal results; one at Denison, Tex., on the third, two persons killed; one at Syracuse, N. Y., on the 9th, four persons killed; and one at South Glastonbury, Conn., on the 23rd, one person killed.

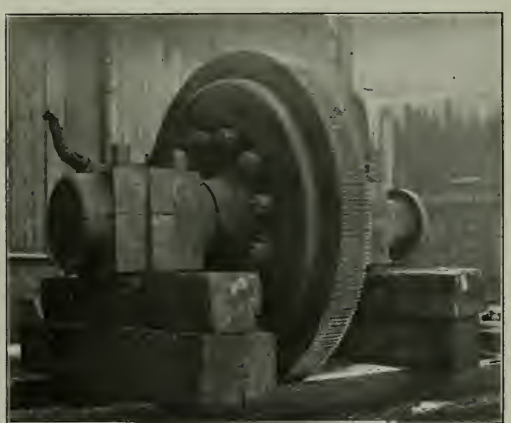
Railway Construction in India.—Sanction has been accorded for a survey by the Bengal-Nagpur Railway for a line 66 miles long between Gopalpur and Russelkonda.

THE MECHANICAL ELIMINATION OF SEAMS IN STEEL RAILS*

By Robert W. Hunt
President, Robert W. Hunt & Co., Chicago, Ill.

The increased weight of rolling stock and speed of traffic have necessitated increasing the size of the rail sections, and hence their weight; as many of the details of rail manufacture have been changed with such alterations, it is not surprising that new and unexpected physical weaknesses have developed in the heavier rails. One of the most notable has been the failure through crescent-shaped pieces breaking out of the rail flanges, followed by at least one, and in many cases several, ruptures across the whole section of the rail. Investigation has showed that in practically every instance of such failure there was a more or less pronounced seam running longitudinally in the bottom of the rail near its center, and thus immediately under its web. This seam occurs at the top of the curve of the crescent-shaped break and is undoubtedly the point at which the fracture starts.

Those familiar with steel rail making have known that it was practically impossible to make rails entirely free from seams, and that as the seamy conditions of the steel forming the head of the rail increased, its wearing quality would decrease, but I think it was not until the disastrous experiences with the "moon-shaped" failures that the danger from seams in the base of the rails was fully realized. It is true that rails with actual flaws in their flanges have been rejected as first-quality ones and that a very pronounced seamy condition of the bottom of the rail would also cause its rejection. Such rejections were the cause of frequent disputes between the mill operatives and the inspectors, the point being as to how far the inspectors were warranted in carrying their condemnation; but, as already said, it was not felt that a single seam would be dangerous unless very pronounced.



Tool Used on Milling Machine

The crescent-shaped breaks were of such frequent occurrence that they indicated a very serious condition and led rail makers to experiment with the design of their rolling passes, with a view to obviating the formation of the bottom seams. It was found that fewer seams were produced by such changes, but they were not entirely eliminated. While more or less successful in preventing the formation of seams through lapping on the bottom of the rails, the formation of seams in other parts of the section was not particularly affected.

T. H. Mathias, assistant general superintendent of the Lacka-

*Abstract of a paper read at the annual meeting of the American Society of Mechanical Engineers, New York, December 3, 1914.

wanna Steel Company, determined that the most certain way of getting rid of seams was to remove that portion of the metal which contained them, and, as applied to steel rails, thus to eliminate them from both the base and head of the rail. Mr. Mathias reasoned that the primary causes of seams existed previous to any rolling of the steel, in fact, were incident to the casting of the molten metal into ingots. He knew that disk-like apertures were formed on the sides of ingots while the molten metal was being cast and were probably caused from air being entrapped against the sides of the ingot molds by the hot steel as it raised in the molds, a condition which was not controlled in regular manufacturing routine. It will be appreciated that, as the section of the ingot is reduced and elongated in the rolling process, so, of course, will the apertures be stretched longitudinally and thus be formed into seams.

Mr. Mathias demonstrated that there is another constant condition present in the rolling of large steel ingots, in the formation of a decarburized surface, about 5/16 in. deep on all four faces, and containing from eight to ten points lower carbon than the metal immediately under it, the decarburized envelope undoubtedly being produced through the oxidizing conditions to which ingots are subjected in the soaking pits where they are heated preparatory to rolling. A thick oxide scale is always formed on the surface of ingots in the pits, so that conditions are invariably present for the production of such a layer of lower carbon metal on their outside faces.

Mr. Mathias was convinced that during the process of rolling ingots into rails it was practical to remove mechanically the parts of the enveloping steel which would form the top of the head and bottom of the flange of the rail, and experimented

Hot Sawing or Milling Machine in Operation

accordingly. He designed and his company installed as an addition to their rail train, a milling, or hot-sawing machine, to cut off that metal without retarding the regular operation and thus interfering with the production of the mill.

The ingot is reduced in the blooming rolls to an 8-in. by 8-in. cross-section, and after cropping the ends the bloom is further reduced in the roughing or shaping stand of rolls by five passes. When it leaves these rolls, it is approximately 75 per cent finished and at this period it is carried to the right and entered between two pinch rolls with its base or flange side up. A bar which will make four 33-ft. rails is about 60 ft. in length at this point in the rolling operation; therefore, the area of metal to be cut off or removed in the milling machine is approximately ⅛ in. deep, 7 in. wide and 60 ft. long. It is driven through the pinch rolls at a rate of 60 ft. in 30 seconds. The pinch rolls have a draft of about ⅜ in. and thus force the bar between the two milling saws, which are so arranged in the housing that they may be raised or lowered as desired. From 1/32 in. to 3/64 in. of metal is milled from the head and base of the bar, the front end of which, immediately on passing from between the rolls, is caught by a second set of pinch rolls which have a draft of about 1/16 in. These pinch rolls force the bar between the tools, pull it from between them, and also hold it in practically perfect line for the milling operation. The milling apparatus is driven electrically and requires about 600 hp. for its operation.

As the milled dust or particles of steel are thrown out, they are hit by water under pressure which forces them into a chute and also prevents the material from adhering together. They are carried below the mill, through this chute, and are caught

Cross-Section of Bar Preparatory to Entering Milling Machine

in boxes or receptacles suitable for charging as scrap into the open-hearth furnaces.

The milling tool is 5 ft. in diameter with an 8-in. face and revolves at a peripheral speed of 2,500 ft. per minute, thus causing an engagement of about 400 000 teeth per minute on the hot rail bar. The teeth are of 0.80 carbon steel, and it has been demonstrated that they will mill at least 30,000 tons of material without requiring dressing.

The milling on the flange does not reach the extreme edges of the bar, and on the head side does not affect the corners. Either by a modification of the shape of the piece as presented for treatment in the milling machine or, what will probably be more practical, changing the face of the tool, the milling can be extended to the extreme edge of the flange portion of the bar and somewhat around the corners of the top or head side. This will undoubtedly be perfectly practical and thereby eliminate the seams which may be located in those parts of the bar. The primary object has been to eliminate the seams from the central portion of the bottom of the rail which had been the starting point of the moon-shaped failures, and to remove them from the top or bearing surface of the head of the rail. Personally I think it will be desirable to extend the milling by the use of convex-faced tools.

The work of rolling which the steel receives after the removal of the more or less laminated metal, must produce a better product than if such elimination had not taken place, and it should not only make them less liable to breakage on account of seams in their flanges, but also enable them better to resist the abrasive effects of traffic.

During the many years of my connection with rail making

I have examined a great many etched specimens of rails, not only directly in connection with the process under consideration, but for various other reasons. From such experience I can fully appreciate what Mr. Mathias has accomplished. The surfaces of practically all rails, when etched, will show some seams on both the base and head, and very frequently the extent of such defects will not be appreciable if the scale has not been removed. Even then, it is not always an easy or certain matter to estimate the depth of the seams. When the rails have been subjected to the Mathias milling operation and still show pronounced seams, it has been found that breaking tests will practically always develop the fact that the suspicious marking is an actual seam.

As the original defects on the sides of the ingots vary in extent, so will the character of the resulting seams vary, and it can be readily appreciated that some of them may have been too deep to have been completely eliminated by the milling.

While I have confined myself to the matter of steel rails, it is patent that the process will be of great value in the preparation of blooms for axles and all other kinds of forgings. As is well known, it is practically the universal custom to endeavor to remove the seams developed in rolling axle billets by chipping them out through the use of pneumatic hammers, and for some of the higher characters of forgings, notably for automobile parts, the endeavor to eliminate the seams is carried to the extent of turning off the whole surface of the billets. I am confident that by the Mathias plan the greater part, if not all, of such work can be superseded, and I regard the invention and its practical installation as a notable achievement in the art.

GETTING CITY PEOPLE BACK TO THE COUNTRY*

By F. H. La Baume

Agricultural and Industrial Agent of the Norfolk & Western

One of the most urgent needs at this time is for the division of large areas into small farms, and the establishment of thousands of American families on these little farms under proper instruction that will enable them to tide over the first few years of struggle and adversity until they can acquire a competence along with the experience that will insure their continued livelihood and prosperity.

Heretofore many of the methods suggested for getting the landless man back to the manless land have been more or less socialistic or confiscatory, but this need not be so. To illustrate, I will, with your indulgence, explain what we are endeavoring to do in Virginia along these lines.

We have secured in one of the most attractive sections of the Shenandoah Valley a body of some eight hundred acres of good land adjoining a town and station within a night's ride of Philadelphia and New York. This land has been divided into small farms of five and ten acres each. In the center of the tract we have erected a club house, surrounded by wide porches and furnished with the equipment that goes to make a social gathering place of this kind attractive. It includes rugs and tables, chairs, settees, books, magazines, games, a grafanola, large fireplace and attractive grounds surrounding it.

One of the small farms has been turned over to a practical poultry, garden truck and fruit raiser, and this little farm is being equipped for use as a demonstration and guide for those who come down and purchase the little farms, which are sold on easy terms, with small cash payment and balance on long time at low rate of interest. Blue prints and plans of half a dozen cottages, bungalows and small houses are on file, by the aid of which a settler can erect a comfortable home for his family at a cost ranging from $100 to $1,000. The instructor on the small farm, set aside as a guide farm, is available at all times, and where his advice and counsel are followed explicitly settlers should have no difficulty in getting results.

*Abstract of a paper presented before the Railway Development Association, Chicago, November, 1914.

Our plan of helping others to help themselves is simply applying business methods to selling lands with the risks eliminated and uncertainty dispelled so far as possible. I believe that there is a large and growing class of American business men who recognize the necessity of taking a hand in the national economic and social problems. They only need to be convinced that practical plans can be evolved, and when they are so convinced they will be willing to put their money into it.

While the development that I have outlined above has been in the nature of a personal investment, supervised by those I have appointed to represent me on the ground, there is no reason why this line of business should not be handled successfully by an organization. Holding syndicates could be organized to take over large areas of land, handle the subdivision, purchase equipment, furnish competent instruction and then sell small farms on long time and easy payments to people who give reasonable assurance of their ability to succeed. Profit on the deal should be limited to a reasonable rate of interest on the investment. If this is done and the work is handled efficiently, economically and practically by representatives well equipped through experience to judge land and people, there need be no large element of chance in the undertaking.

INJUSTICE TO RAILROADS

[From the Jackson (Miss.) Daily News]

The fallacy of "expert medical testimony" and the injustice often wrought thereby is strikingly illustrated by the case of W. C. Haynie, a former locomotive engineer employed by the Illinois Central. In January, 1911, nearly four years ago, a jury in the Lincoln county circuit court awarded Haynie damages in the sum of $20,350 for alleged personal injuries. The verdict was based chiefly on the testimony of a distinguished oculist that Haynie would be blind within one year as a result of his injuries. The supreme court affirmed the verdict, and the Illinois Central had to pay the judgment, with interest.

Today, according to the most reliable information obtainable, Haynie is very far from being blind. His eyesight is said to be as good as it was on the day he obtained the verdict. At the trial three noted eye specialists testified that there was nothing wrong with Haynie's eyes, and that he was in no more danger of going blind than any other man. However, the jury preferred to believe the "distinguished oculist" who testified for the plaintiff. Perhaps they thought it wouldn't hurt the railroad company to pay out $20,350, and if there was any question of doubt in the case they were willing to resolve it in favor of the plaintiff.

After obtaining his money Haynie purchased himself a fine home and an automobile, and proceeded to enjoy a life of luxury and ease. He spent money freely while it lasted, and on account of the prominence gained by the conduct of his own case, became popular as an expert witness against railways in personal injury damage suits. Testifying was his diversion. To this day, down at McComb, Miss., where Haynie, lives, he is pointed out as the man who obtained $20,350 from a railroad company, upon testimony that he was going blind, and squandered it within a period of approximately two years. Where Haynie is known his testimony is not so effective as it once was, but that does not help the position of the railroad company, which is still out its $20,350, plus the interest and the costs of defending the suit, which were large.

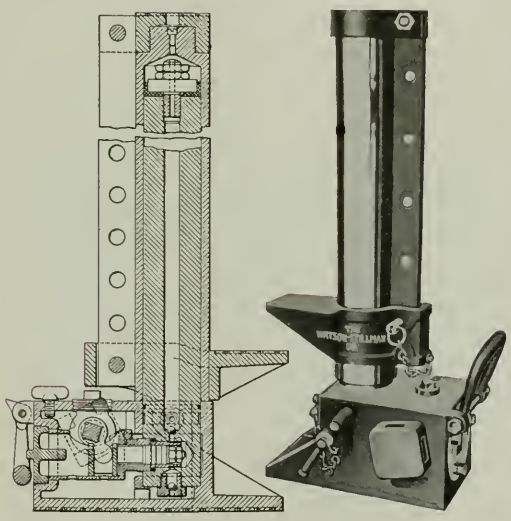
Railway Construction in India.—It is reported that work in connection with the Indo-Burma connection railway survey is to begin shortly. There are three possible routes to be surveyed, the coast route, the Manipur route, and the Yukon Valley route; and the next season will be devoted to the survey of the first of these three. One of the principal reasons for beginning work at this time is the outcry which was raised when Burma was so completely cut off from the rest of the Indian Empire by the doings of the German cruiser Emden.

EMERGENCY JACK

A hydraulic jack, the design of which embodies a number of unusual features, has recently been developed by the Watson-Stillman Company, New York. This jack was designed primarily to meet the demands of an emergency jack for street railway use, but its flexibility of adjustment is such as to make it of value for a variety of purposes wherever lifting work is performed.

The construction of the jack is shown in the sectional elevations, from which it will be seen that the cylinder is the moving part instead of the ram as in the usual type of jack. This allows the pump mechanism to stay in a fixed vertical position and permits the working parts of the jack to be made simpler and more compact than is usually the case. The piston is packed with leather rings and the valves are of the ball type with all passages amply proportioned. The pressure is relieved by means of a key operating a small needle valve. The jack is operated with a special oil, which not only acts as a lubricant, but prevents rust on the working parts and the possibility of freezing. It has no detrimental effect on the packings.

One of the most notable features of this jack is the arrangement of the claw which can be moved vertically upon the cylinder and adjusted to the most convenient height. The claw and the cylinder can be swung through a complete circle without changing the position of the jack or the location of the pump. The operating lever is but 18 in. long, but one man weighing 125 lb. can obtain the maximum pressure with but slight effort. The lever is curved and the socket has a hole in each of its four sides to allow for convenience in operation from practically any position. The jacks are now built in five and ten ton sizes with a ram stroke of 10 in., and are guaranteed by the manufacturer to stand a 50 per cent overload without detriment to any of the parts.

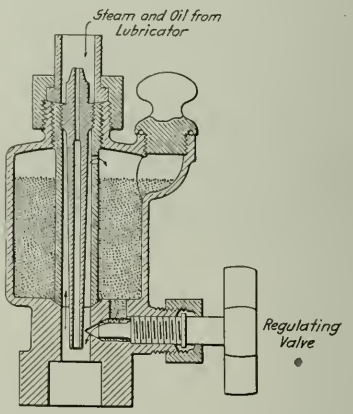


Exterior and Sectional Views of Emergency Jack

Timber Consumption of an Hawaiian Railway.—The Hilo Railroad, operating about 72 miles of line on the island of Hawaii and the only standard gage railway in the territory of Hawaii uses about 1,000,000 feet of lumber yearly. The company has car shops and a foundry, and builds and repairs its own cars at Hilo. Redwood ties are used in the roadbed. Douglas fir is chiefly used in the shops, though ohia has been found well adapted for car roofs.

GRAPHITE LUBRICATOR

The Graphite Lubricator Company, Detroit, Mich., has placed on the market a graphite lubricator for lubricating with flake graphite the valves and cylinders of locomotives. This graphite is suspended in common engine oil for the purpose of more easily filling the lubricator. The device is used in connection with the oil lubricator as now in use on locomotives. The present oil lubricator acts as the cleaner, while the graphite lubricator delivers graphite to the cylinders and valves as the lubricant. The accompanying illustration clearly shows its construction. The oil line from the steam or gravity-feed lubricator in the cab is connected to the top of the graphite lubricator, and the oil and steam pass to the cylinder and valves through the nozzle shown on the inside. The graphite is contained in the annular space surrounding this nozzle, and the feed is controlled by means of the regulating valve, as shown. The pulsating pressure of the steam will cause the feeding of the graphite through the passage controlled by the regulating valve, and there it becomes mixed with the oil from the gravity-feed lubricator. It is then distributed to the various parts of the valves and cylinders. This lubricator is adapted for use on superheater and compound locomotives (either piston or slide valve type) and especially those engines which experience trouble in obtaining the proper lubrication of the valves and cylinders. It is claimed that the priming of locomotives will not in any way interfere with the proper lubrication of the cylinders and valves where this lubricator is used. It is also claimed that 50 per cent less cylinder oil will be required for lubrication in the cylinders and valves, and that at the same time a better lubrication will be obtained by the use of the flake graphite.



Cylinder Lubricator for Flake Graphite

The lubricator shown, which will hold three ounces of the graphite lubricating mixture, is filled through the plug shown at the top and to the right of the lubricator. It may be attached to any standard steam chest choke-plug fitting, and thus eliminates the use of the choke plugs. One filling of the model A three-ounce lubricator is sufficient for the operation of a locomotive for approximately 250 miles without further attention on the part of the crew. At present the lubricators are made in two sizes—model A, which holds three ounces of lubricant, and model B, which holds six ounces.

German Locomotives Dismantled for Copper.—Unconfirmed press despatches from Amsterdam report that the scarcity of copper is such throughout Germany that orders have been given to dismantle as many locomotives on the state railways as possible, in order to use the copper and brass for making ammunition.

General News Department

The safety supervisor of the El Paso & Southwestern announces that the number of employees injured during the month of October was less than half the number reported in October, 1913.

The Baltimore & Ohio Chicago terminal repair shop at East Chicago, Ind., was severely damaged by fire on November 23. Some damage was also done to the cars in the shop, but the amount of loss has not yet been estimated.

The Chicago & North Western, during the fiscal year ending June 30, 1914, carried a total of 33,389,428 passengers, an increase of 2.92 per cent over the previous year, without a fatality to a passenger from any cause.

At a meeting of the American Railway Safety Association, held at Chicago on November 30, it was decided to disband the organization. Some of the roads are considering joining a railroad section of the National Council for Industrial Safety.

According to press reports members of shop craft unions, who struck on the Illinois Central and the Harriman lines on September 30, 1911, because the roads refused to recognize their system federation, have taken a vote on the question of calling off the strike; but there is not as yet any report of the result.

The New York, Philadelphia & Norfolk on January 1 will establish a pension department. The rules will be the same as those of the Pennsylvania Railroad pension system, the New York, Philadelphia & Norfolk being controlled by the Pennsylvania.

The discontinuance of trains on the Buffalo & Susquehanna, which was ordered for December 1, has again been postponed, the Supreme Court at Buffalo having extended the time limit to December 16. There is a bondholders' committee which hopes to find some way in which to keep the road running.

The safety and efficiency bureau of the San Pedro, Los Angeles & Salt Lake reports a reduction of 33.9 per cent in the number of injuries to employees for the year ending October 31, as compared with the preceding year. Three employees were killed, the lowest record in the history of the road, except that for 1909, when 3 were killed.

Michael McCarty, a crossing watchman on the Pennsylvania Railroad at Swarthmore, Pa., has been presented with a loving cup by the Swarthmore Home & School association, in recognition of his faithful service at his crossing for 16 years during which time no person has been injured on the crossing. With the gift were some verses making special mention of McCarty's interest in and care for children.

At the Wednesday evening session of the annual meeting of the American Society of Mechanical Engineers in New York, this week, the John Fritz Medal was awarded to Prof. John E. Sweet, honorary member and past president of the society, "for his achievements in machine design and for his pioneer work in applying sound engineering principles to the construction of the high speed steam engine." This medal is awarded by the four national engineering societies.

Thirty or more passengers in the smoking car of a suburban train on the Chicago, Burlington & Quincy in Chicago were injured on the night of November 24, when the car was set on fire by an explosion of a moving picture film which was being carried, wrapped in a paper package, by one of the passengers, and which presumably caught fire from a lighted match or cigar stub thrown on the floor. The Illinois Public Utilities Commission is making an investigation of the accident.

Work was resumed on December 1 at the shops of the Wheeling & Lake Erie at Brewster, Ohio, and Ironville, in compliance with an order by Judge John H. Clarke, of Cleveland, to the receiver of the railroad. The shops had been practically idle for two months and repairs to cars had been reduced for reasons of economy in order to meet certain interest payments. This policy the court criticized, as neither wise from an economical standpoint nor just from a social point of view.

On the Cincinnati, Hamilton & Dayton, which is owned mainly by the Baltimore & Ohio, but is now in the hands of receivers, discipline without suspension is to be the rule among the employees of the engine and train service. General Manager J. M. Davis has issued a circular announcing that the new system will be put in effect on January 1. This system is the same as that in use on the Baltimore & Ohio, which was the subject of a descriptive article in the *Railway Age Gazette*, January 16, 1914.

The Brotherhood of Railroad Trainmen has filed a statement with the Missouri recorder showing that a total of $16,056 was expended in the campaign for the passage of the full crew bill, which was defeated by referendum vote at the election on November 3. The Missouri legislative committee of the brotherhood, according to the statement, collected $15,880, leaving a deficit of $176. It is stated that the members of the Brotherhood of Railroad Trainmen contributed $14,680 and that $1,200 was contributed by the Order of Railway Conductors.

The Baltimore & Ohio has sent four superintendents on a trip of inspection to the Pacific coast, to be gone ten days; and on the return of the party, four other superintendents will be sent on a similar journey but by a different route. The men going on the first trip are H. B. Voorhees, G. D. Brooke, J. C. Hagerty and E. W. Scheer; and those on the second trip, R. N. Begien, F. B. Mitchell, E. T. White and M. V. Hynes. It is expected that all the general and division superintendents of the company will make trips of this kind, occasion being taken to send them now while business is below normal.

Mr. Love, chairman of the Oklahoma Corporation Commission, is reported as proposing to ask each high school and higher educational institution of the state to offer, as a part of their courses of study, instruction in the making and adjustment of freight rates. He wants to give the next generation in Oklahoma a general knowledge of railroad rates, their application and adjustment, which, he says, are all Greek to the average citizen. Mr. Love must be of an optimistic temperament. If he really wishes for success he should begin by giving the boys a couple of years of real Greek, as a preliminary training.

In the United States District Court at East St. Louis, Ill., November 30, four railroads pleaded guilty to violations of different laws. The Illinois Central pleaded guilty to 12 charges of violating the cattle quarantine law and was fined $100 on each count; three charges of violating the 28-hour law, $100 on each count; two charges of violating laws relating to telegraph operators' working hours, $25 on each count. The Southern was fined $100 on each of two counts for violating the 28-hour law; the Baltimore & Ohio Southwestern $25 on each of six counts for violation of the 16-hour law governing train crews, and the Louisville & Nashville $100 for violation of the safety-appliance law.

International Railway Congress Postponed by War

Word has been received from Berlin that because of the war all preparations have been broken off for the ninth session of the International Railway Congress, which was to have been held there next June. The congress, whose membership consists of governments and companies operating more than half of the earth's railway mileage, is perhaps the most important railroad association in the world. Its sessions are held every five years, the last having occurred at Berne, Switzerland, in 1910. They are devoted to the discussion and interchange of ideas on questions of railway maintenance, equipment and operation. The German government was to have acted as host, and

it was understood that Kaiser Wilhelm would have opened the convention. Some of the American "reporters" have already prepared their papers for the congress.

Russian "Bath Train" for the Front

It is stated that the Russian ministry of ways and communications is sending to the front a "bath train" of over 20 cars, providing 2,000 baths daily. There is a tank car in case water is unobtainable at any stopping place. Soldiers can be given clean underclothes from the stores carried. There is also a car for drying and disinfecting outer garments and a restaurant car.

An Unusual Train Accident

The Pennsylvania Railroad, in one of its circulars giving "information for employees and the public," tells of an incident near Pittsburgh on the night of November 6 in which the derailment of a passenger train was prevented by means of the electropneumatic automatic signal system, a rupture of the main air-pipe, lying between the tracks, having set a signal at stop just in time to keep an eastbound passenger train from running into a car, which had been pushed over on to the eastbound track from a derailed westbound freight train. The passenger train had received a clear distant signal; but the home signal suddenly changed from the proceed to the stop position just before the train reached it. The engineman at once applied the brakes, in emergency, and stopped only about forty yards from the obstruction. The freight car had broken the air-pipe, which, of course, set at stop the signals dependent on the pressure in that pipe. The engineman of the passenger train was Edward F. McKenzie, known to readers of the *Railway Age Gazette* by his prize article on "Keeping a Good Lookout" printed a year ago.

Good Work Well Done

S. C. Long, general manager of the Pennsylvania Railroad, has sent to 800 employees of the company a personal letter commending their efficiency during the strike of trainmen on the Monongahela division in March, April and May of this year, when in spite of adverse conditions, the road was able to operate trains uninterruptedly. The letter says in part:

" . . . practically the entire force of road and yard freight trainmen on the Monongahela division, by their refusal to report for duty, when called, severed their relations with the company. A force of new men had to be organized and the inexperienced instructed; and food, sleeping quarters and police protection had to be provided. The regular division operating force had to be supplemented by temporarily transferring to the Monongahela division, officers and employees from other divisions. . . . The success with which the business was handled was most gratifying to the management.

"The general superintendent of the Western Pennsylvania division has called our attention to the commendable manner in which you participated in furthering this accomplishment; and it is a pleasure for me to join with the president and executive officers of our company in expressing to you sincere appreciation of this practical display by you of that sense of responsibility to the public which every railroad man must share, as well as of your fidelity to the interest of this company."

The Stamp Taxes

The war revenue act approved October 22 provides for the imposition of certain stamp taxes beginning December 1, and the Pennsylvania Railroad has issued a seven-page circular of instructions to agents concerning the administration of the law. A number of other roads have also issued circulars. On the Pennsylvania, east of Pittsburgh, about 50,000 bills of lading are issued daily. On each such receipt the shipper must affix a one-cent stamp. Agents are instructed not to deliver bills of lading until the stamp is affixed and cancelled; and the shipment must not be accepted or forwarded until the receipt is passed.

When carload freight is weighed before the receipt is filled out, a copy of the scale report is to be stamped, to take the place of a receipt. Where a car is switched from one track to another within the same station limit, and a charge is made for the service, the switching order is to be stamped. On goods that are carried in baggage cars on passenger trains, except personal effects properly classed as baggage, there must be a stamp for each shipment, provided the transportation charge is more than five cents; and if no bill of lading is given, the stamp is to be affixed to the goods.

Shippers are expected to buy their stamps at post offices, but the agents and conductors of the railroad will have supplies on hand, and may sell to shippers.

A notice has been issued by the Internal Revenue department, Washington, instructing freight conductors how to attend to the stamp tax requirements in cases where freight is received by them at stations where there is no agent.

New Haven Men Commended

The very heavy passenger movement carried out by the New York, New Haven & Hartford, on the occasion of the Yale-Harvard football game of November 21, when the road carried to and from New Haven in one day over 33,000 passengers, was noticed last week, page 1023. Chairman Howard Elliott, himself formerly a division superintendent, has sent to the operating and traffic vice-presidents a congratulatory letter summarizing the work done and expressing the pleasure of the directors at the results. After giving the facts he says:

"A well equipped, well organized, well managed, and well manned railroad should be able to perform this task satisfactorily. . . . But to do this work required most careful planning and detailed inspection by many officers; the greatest care by officers and thousands of employees; the most accurate and painstaking work by hundreds of men on engines and trains; on stations, in yards and round houses, and a nearly perfect condition of track, signals, and equipment. . . . That the large number of trains was handled substantially on the running time, speaks well for the condition of the property and for the team work of the officers and employees. There was one delay of about thirty minutes, due, it is believed, to unintentional interference with the air-brake valve by a passenger. There was only one casualty; a partly intoxicated man jumped from a moving train.

"On the New Haven [city] division of the Connecticut Trolleys there were, on Saturday, 180,140 fares rung up. This large number of passengers was transported without accident of any kind and with reasonable promptness over streets almost blocked by automobiles and pedestrians. . . .

"I am requested by the directors to express to you, to Mr. Bardo, general manager, to Mr. Smith, general passenger agent, . . . and to the men without whose careful work the day would have been a failure, the appreciative thanks of the directors, representing the owners of the property, and, to a certain extent, the public, for the good result obtained. . . . Personally, I wish to express my own hearty appreciation of the team work done and the esprit de corps shown. . . ."

Report on A. G. S. Derailment

The Interstate Commerce Commission has issued a report on the derailment on the Alabama Great Southern, near Livingston, Ala., September 18, in which 10 persons were killed and 40 injured; and the cause is found to be as given in the earlier report, which was printed in the *Railway Age Gazette*, October 30, page 794—malicious misplacement of a switch. Running at about 50 miles an hour, at three o'clock in the morning, northbound passenger train No. 2 encountered a facing point switch set for a siding, and the engine and the first four cars of the train were wrecked. The engineman saw the switch light change from clear to red only a short distance before reaching it. A freight train had used the switch only a short time previous, and there is no question that the switch was purposely misplaced, but the report says nothing on the question whether there is any clue to the perpetrator of the crime. The men on the freight train, waiting a few miles south of the switch, saw an automatic signal change two or three times from one position to the other, which changes were caused undoubtedly by movements of the switch. In the wooden passenger car in the train, three out of the seven passengers occupying the car were killed; and in a steel underframe car five out of fifteen were killed; and the inspector questions whether the steel underframe type, in a case like this, affords materially greater safety to passengers than does a wooden coach.

American Society of Mechanical Engineers

At the annual meeting of the American Society of Mechanical Engineers, held in New York, December 1-4, John A. Brashear, Pittsburgh, Pa., was elected president, and Henry Hess, of Philadelphia, Pa., George W. Dickie, New York Shipbuilding Company, Camden, N. J., and James E. Sague, Poughkeepsie, N. Y., were elected vice-presidents. Charles T. Main, Winchester, Mass., Spencer Miller, The Lidgerwood Manufacturing Company, New York, and Max Toltz, St. Paul, Minn., were elected managers. Morris L. Cooke, Philadelphia, was elected manager to fill an unexpired term, and William H. Wiley was elected treasurer.

MEETINGS AND CONVENTIONS

The following list gives the names of secretaries, dates of next or regular meetings, and places of meeting of those associations which will meet during the next three months. Hereafter the full list of meetings and conventions will be published only in the first issue of the Railway Age Gazette for each month.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York. Next meeting, December 8-9, Richmond, Va.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meetings, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railway Business Association.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December 10, 1914, Waldorf-Astoria Hotel, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. R. R., Atlanta, Ga. Next regular meeting, January 21, 1915, Atlanta, Ga.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Traffic Club of Chicago.—W. H Wharton, La Salle Hotel, Chicago.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder. 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

REVENUES AND EXPENSES OF RAILWAYS

Three Months of Fiscal Year Ending June 30, 1915—Continued

Name of road.	Average mileage operated during period.	Operating revenues — Freight.	Passenger.	Total. inc. misc.	Operating expenses — Maintenance — Way and structures.	Of equipment.	Traffic.	Trans-portation.	Miscel-laneous.	General.	Total.	Net operating revenue (or deficit).	Railway tax accruals.	Operating income (or loss).	Increase (or decr.) comp. with last year.

Traffic News

The Chicago & North Western and the Chicago, Milwaukee & St. Paul have recently advanced the charge for table d'hote meals in dining cars between Chicago and St. Paul from $1 to $1.25.

A special train composed of 34 carloads of tea was run over the Chicago & North Western last week en route from Los Angeles to the East. The run from Omaha, Neb., to Peoria, Ill., 464 miles, was made in about 24 hours. The tea weighed 1,221,477 lb. and was valued at approximately $300,000.

A meeting of the Official Classification Committee will be held in New York on December 8, for consideration of many subjects enumerated in docket No. 21, including recommendations of the Committee on Uniform Classification. A preliminary hearing was held in the rooms of the Central Freight Association in Chicago on December 3.

Quarantines against foot-and-mouth disease have been relaxed but little. In some states, including New Hampshire, new quarantines have been ordered because of the discovery of the disease in new places. The state of Delaware has issued a quarantine order against the bringing of dogs into the state, in baggage cars or by express.

The agricultural instruction car of the University of Tennessee is making a tour of the eastern part of that state which is planned to extend over four months. The car carries prize horses, sheep and other animals. It is in charge of Professor C. A. Keffer. Each county, to have the advantage of the presence of the car within its borders, must make an appropriation of $100.

At the annual meeting and election of officers of the Traffic Club of New York on November 24, W. C. Hope, general passenger agent of the Central of New Jersey, was elected president. Other officers elected were: Vice-presidents, T. A. Gantt, W. C. Connor, Jr., T. T. Harkrader, R. S. Stubbs, W. N. Agnew; treasurer, Frank C. Earle; secretary, C. A. Swope; governors, W. C. Bates, W. S. Cowie, W. A. Schumacher.

More than a million tons of freight have been carried through the Panama Canal during the first three months of its operation. Thus far the eastbound traffic has been in excess of westbound traffic, westbound being 621,080 tons as compared with 457,991 tons eastbound. More than 95 per cent of this traffic was on the four great routes which developed soon after the canal was opened; the United States coastwise trade, the traffic between the Pacific Coast of the United States and Europe, the trade of the west coast of South America with the Atlantic seaboard of the United States and with Europe and traffic between the Atlantic coast of the United States and the Far East.

Beginning on November 29 the Chicago, Burlington & Quincy's Denver Limited train will leave Chicago at 10:05 a. m., instead of in the evening, and will arrive at Omaha at 12:01 a. m. and Denver at 2:30 p. m. the next day, taking the place of the Colorado Limited, which formerly left at 9:45 a. m., and which will not be run during the winter months. On the same date the Chicago & North Western will put on a new morning train to Omaha, Denver, Colorado Springs and Pueblo, leaving Chicago at 10:30 and arriving at Denver the following afternoon at 2:45. The train now leaving Chicago at 6:05 p. m., known as the Denver Special, will be called the Omaha-Chicago Special, and will be run between Chicago, Omaha and Sioux City, being discontinued beyond. Corresponding changes will be made in the eastbound service.

The directors of the Chamber of Commerce of Norfolk, Va., have petitioned the Interstate Commerce Commission to permit the railroads terminating in that city to continue their ownership of the steamboat lines now operated or controlled by them running to Baltimore, New York and other northern ports. There is a feeling in Norfolk that if the railroads should be compelled to divest themselves of ownership in the steamer lines the control of the vessels would go to other cities, and would work against the interest of Norfolk. The petition asked for the continuance of the present ownership "to such reasonable time as may be necessary for a demonstration of the efficiency of the act" which allows this continuance of railroad ownership. The Interstate Commerce Commission, when it gives such permission, must assume authority to regulate rates over the water lines.

The Department of Agriculture has issued a statement to the effect that there is no quarantine against shipment of dressed poultry except from actually infected farms. An entirely erroneous impression has gained currency and has prevented the shipment of dressed poultry, damaging seriously the turkey industry. In New York, Boston and Philadelphia turkeys were somewhat scarce at Thanksgiving and prices ruled high. The Department of Agriculture, wishing to save farmers in the important turkey growing states of Tennessee, Kentucky, Missouri, Texas, Indiana and Illinois, reiterates its previous announcement that there is no federal quarantine or restriction on shipping dressed turkeys or other poultry from uninfected farms in quarantine states, and absolutely no federal restriction as to shipment of dressed poultry into quarantined states. There is at present no state quarantine in New York against the shipment of dressed poultry into that state. Kentucky has quarantined against the shipment of dressed poultry from the infected counties in that state, but this is purely a state measure.

Increased Fares in New England

The Boston & Maine, the Boston & Albany and the New York, New Haven & Hartford have announced new passenger tariffs, to go into effect January 1. In all of these tariffs the regular rate for single tickets is based on 2½ cents a mile; and in substantially all cases, except a few on the Boston & Maine, this will mean an advance. The B. & M. has some fares based on a rate of three cents a mile, and some on 2¾ cents. In the suburban district around Boston—distances less than 15 miles—there is no advance.

On most of the important lines of these companies the local rate at present is 2¼ cents; but this has now been made the rate for thousand-mile tickets. Under the new tariffs the difference between single tickets and mileage tickets will be 2½ mills a mile, as formerly.

Advances in Freight Rates Suspended

The Interstate Commerce Commission this week suspended for four months practically all of the new freight tariffs, making advances in rates, which have been filed recently by the roads in Central Freight Association and Eastern Territory, and also in the territory west of Chicago. The commodities affected by these suspensions are very numerous, coal, livestock, fresh meats, hay, grain, cotton goods, etc., and changes in elevator charges and allowances and other local charges are included. The roads had proposed to increase grain rates about 1 cent per 100 lb., from St. Paul, St. Louis, Chicago and other points to Gulf ports.

A larger number of other freight tariffs, which are of interest in more limited territory, have also been suspended.

The proposed increases in the rates on livestock and meats from Chicago eastward were complained of by the American Meat Packers' Association. The new tariffs showed an advance of five cents—from 45 cents to 50 cents, per 100 lb., in the rates on fresh meats from Chicago to New York; on cattle from Chicago to New York five cents—28 to 33; on hogs, sheep, etc., in double deck cars, from 28 to 33; in single deck cars, from 35 to 38. Other kinds of goods in these same general classes were advanced in proportion.

Railway Construction in Uruguay.—Application has been made to the Uruguayan ministry for public works for authority to make a survey for a railway starting from Pan de Azucar, crossing the valley of that name and proceeding in the direction of Minas. It is stated that this line would permit the exploitation of a number of marble and mine stone quarries in the district, as well as rich slate and copper deposits. The projected line will connect with another ten miles long connecting Pan de Azucar with the port of Piriapolis.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

A hearing was held at Chicago on November 30 before Examiners Carmalt, Sanford and Hewett, on allowances paid by trunk line railroads to industrial lines, of which cancellations have been filed by the railroads and suspended by the commission. The first case heard was that of the Algoma Central & Hudson Bay, which is connected with the Algoma Steel Company, of Sault Ste. Marie, Ont. Next was taken up the case of the Chicago & Calumet River, connected with the Western Steel Car & Foundry Company, and testimony was presented as to a number of other industrial roads, most of them in the Chicago district.

The Corporation Commission of Oklahoma, the Oklahoma Grain Dealers' Association and the Oklahoma Millers' Association have filed with the Interstate Commerce Commission a joint complaint asking that the Atchison, Topeka & Santa Fe and the Gulf, Colorado & Santa Fe be ordered to establish through routes and joint rates for the transportation of grain and grain products from Oklahoma points to Louisiana points for export, and to re-establish joint rates to Texas ports. According to the complaint Galveston, Tex., and Texas City, and points in their immediate vicinity are the only ports on the gulf to which through routes have been maintained by the Santa Fe lines, and, since October 31, these roads have maintained an embargo on grain shipments for export to these ports, making it necessary for shippers to pay higher combinations of local rates on shipments to Louisiana points.

Rates on Blackstrap Molasses to Kansas City and Other Points

Opinion by Commissioner McChord:

The commission finds that the carriers are justified in restoring to the regular molasses rate basis, the present rate on blackstrap molasses in carloads from points in Louisiana to Kansas City, St. Joseph and other points in Missouri, Nebraska, Kansas and Iowa. (32 I. C. C., 176.)

Penalty Charges on Sulphuric Acid

International Agricultural Corporation v. Atlanta & West Point et al. Opinion by Commissioner McChord:

The commission finds that the tariffs of the defendants allowing only 24 hours' free time on sulphuric acid and doubling the charge after 48 hours are unreasonable, and believes that a reasonable rule would be to allow 48 hours' free time after the first 7 a. m., following notice to the consignee of arrival, and that the charge should not exceed $2 per day after such free time. Reparation is awarded on this basis. (32 I. C. C., 199.)

Rates from Houston, Tex., to Points in Arkansas

Chamber of Commerce of Houston, Tex., v. Houston East & West Texas et al. Opinion by Commissioner Clements:

The commission finds that the present adjustment of rates from Houston, Tex., St. Louis and Kansas City, Mo., and New Orleans, La., to stations in Arkansas, is not prejudicial to the first-named point or preferential to the last three points. Complaint dismissed. (32 I. C. C. 203.)

Class Rates from Terre Haute, Ind.

In re Class Rates from Terre Haute, Ind., and Other Points to Kansas City, Mo., and Other Destinations. Opinion by Commissioner Hall:

The commission finds that the carriers are justified in cancelling the joint through class rates applicable on traffic from Terre Haute, Ind., and other points to points on the Missouri River. The proposed cancellations will leave in effect combinations of intermediate rates, but it is held that these combinations do not result in unreasonable rates. (32 I. C. C., 206.)

STATE COMMISSIONS

The Texas Railroad Commission has again changed the date from January 14 to January 11, 1915, for the proposed hearing on the application of the Texas railroads for a general advance in freight rates.

Investigators for the Illinois Public Utilities Commission have reported to the commission that sufficient protection against accidents and inconveniences to patrons during rush hours are not provided at the Union passenger station in Chicago. As a result of the report the commission has notified officers of the roads that steps must be taken at once to improve the situation.

It is estimated that the cost of the newly created Public Utilities commission of the State of Maine will be $58,000 a year. Among the principal items in the budget are: Salaries of commissioners, $14,000; salaries of clerk and assistant clerk, $5,000; salary, help and office expenses of the engineer in charge of the water storage department, $5,000; chief of the railroad department, $2,500; chief of the department of rates and schedules, $1,500; office stenographers, $2,000; traveling expenses of commissioners and employees, $4,000; office expenses and equipment, $3,500; witness fees and expenses for hearings, $3,000; investigations, inspections, incidental matters involving informal complaints and actions on the initiative of the commission, $5,000; expert accountant and auditor, $2,500; printing annual report, $3,000. An additional estimate of $5,000 is presented for the year 1915 for printing blanks, rules, orders and instructions for uniform bookkeeping, returns, rates, schedules, etc., and $5,000 for the year 1916 for securing data and beginning the work of the physical valuation of the utilities in the state.

PERSONNEL OF COMMISSIONS

E. J. Bean, general counsel of the Missouri Public Service Commission, has been appointed a member of the commission, succeeding William F. Woerner, resigned. William G. Busby, of Carrollton, has been appointed general counsel of the commission to succeed Mr. Bean.

Richard Sachse has been appointed chief engineer of the California Railroad Commission, with office at San Francisco. He entered the service of the commission in 1911 as assistant engineer; was promoted to the position of principal assistant engineer in 1913; and was made acting chief engineer about a year ago. Prior to his service with the commission he had been with the Western Pacific and the Southern Pacific railroads and the United States Reclamation Service.

COURT NEWS

John W. Keogh, a manufacturer of excelsior, has filed suit in the United States district court at Chicago against eight railroads entering Chicago for $125,000 damages for alleged depreciation in the value of his plant at St. Paul, caused by an advance in freight rates.

In the United States District Court at Newark, N. J., November 27, the Central Railroad of New Jersey was indicted for paying illegal rebates on freight. The charges are based on allowances made to the Lehigh Coal & Navigation Company in connection with terminal operations.

The New Orleans, Texas & Mexico has petitioned the federal court at New Orleans to enjoin the Interstate Commerce Commission from enforcing its second supplemental order in the tap line cases, charging that the order does not permit tap lines to earn a reasonable return on the investment, and asking that the order be nullified also as it affects the Louisiana & Pacific. The court has set the petition for a hearing on December 10.

The Ohio Valley Tie Company has recovered $56,971 from the Louisville & Nashville Railroad in a suit claiming damages because the railroad refused accommodations for shipments of ties, and made an unreasonable advance in the rates for transportation. After recovering a considerable sum in a former suit for overcharges caused by an unexpected increase in the rates, the tie company secured a mandatory injunction requiring the

railroad to give it suitable accommodations. Then, it is alleged, the road failed to furnish cars; and cars offered by the Pennsylvania and the Cleveland, Cincinnati, Chicago & St. Louis, customers of the tie company, were refused. It was also charged that the Louisville & Nashville would accept carloads of ties to be delivered on team tracks at Louisville, but would not accept the same for delivery to connecting roads.

Judge Sullivan at Chicago, on November 28, rendered a decision setting aside the award made by E. C. Field as arbitrator of the claims of the Chicago & Western Indiana against John C. Fetzer, a real estate broker, Benjamin Thomas, former president of the road, and C. R. Kappes, former real estate agent of the road, which ordered the restoration by the three men of $525,000 alleged to have been misappropriated from the company in real estate transactions for the road. After the railroad had filed a civil suit against the three men an agreement was reached to settle the case out of court by arbitration, and Thomas and Kappes paid in approximately $70,000 as their share of the award. Fetzer, however, filed suit to have the award set aside on the ground that this money was charged to real estate transactions and then turned back by him to officers of the road to be expended in bribing the legislature of Illinois and the city council of Cook county. Judge Sullivan set the award aside on the ground that the arbitrator had violated some of the provisions of the agreement under which the case was left to arbitration.

Oklahoma Separate-Car Law

The Supreme Court of the United States on Monday last delivered an opinion that the Oklahoma "Jim Crow" law proviso permitting railroads to furnish sleeping, dining and chair car accommodations only to the white race—the "luxury" clause—was unconstitutional, but because of imperfections in the petition on which the case reached the courts, no decree to that effect was entered.

Five negroes, contending that the entire law was unconstitutional, sought an injunction to restrain five railroads in Oklahoma from enforcing it. The Oklahoma Federal Court dismissed the petition, holding the law constitutional. The court affirmed the dismissal because the negroes had not shown that they had applied to the railroads for accommodation under the law or that the railroads had notified them that accommodations would be refused to them.

The opinion, by Justice Hughes, stated, however, that the court could not agree with the lower court that the proviso as to sleeping, dining and chair cars was constitutional. A minority, consisting of Chief Justice White and Justices Holmes, Lamar and McReynolds, concurred merely in the order of affirmance, but expressed no views on the constitutional question.

In the opinion by the majority, Justice Hughes said that previous decisions that laws for separate coaches for the two races were constitutional were not questioned, adding that "substantial equality of treatment of persons traveling under like conditions cannot be denied."

Justice Hughes set forth the reasons for the opinion that the lower court was wrong in holding the proviso constitutional. "The reasoning is," said he, "that there may not be enough persons of African descent seeking these accommodations to warrant the outlay in providing them. This argument with respect to the value of the traffic seems to be without merit. It makes the constitutional right depend upon the number of persons who may be discriminated against, whereas the essence of the constitutional right is that it is a personal one. Whether or not special facilities shall be provided may doubtless be conditioned upon there being a reasonable demand therefor; but if facilities are provided, substantial equality of treatment of persons traveling under like conditions cannot be denied. It is the individual who is entitled to the equal protection of the laws, and if he is denied by a common carrier, acting in the matter under the authority of the state, facilities or conveniences in the course of his journey under substantially the same conditions as furnished to another traveler, he may properly complain that his constitutional privileges have been invaded."

The court gave no intimation as to whether in a proper case it would merely hold the "luxury" car section unconstitutional, or whether it would decide that this section being unconstitutional, the entire law must fall. The five railroads in the case had asked the court to hold the entire law unconstitutional if the "luxury" proviso was annulled.

Railway Officers

Executive, Financial, Legal and Accounting

F. C. Elliott, general counsel of the White Pass & Yukon at Chicago, has been elected president, with office at Chicago, succeeding O. L. Dickeson, resigned, effective January 1.

A. S. Dutton has been appointed auditor of freight accounts, and J. M. Eedson has been appointed freight claim agent of the Toronto, Hamilton & Buffalo, with offices at Detroit, Mich., succeeding Thomas Eedson, deceased.

J. E. Dalrymple, vice-president of the Grand Trunk, the Grand Trunk Pacific and the Central Vermont at Montreal, Que., has been appointed also vice-president in charge of traffic of the Montreal & Southern Counties.

Lyman Delano, assistant to president and assistant secretary of the Atlantic Coast Line at Wilmington, N. C., has been elected third vice-president, in charge of operation. He was born on January 16, 1883, at Newburgh, N. Y., and was educated at Harvard College. On April 1, 1909, he began railway work in the office of the chief roadway accountant of the Atlantic Coast Line. He subsequently served as assistant to chief engineer, and then as assistant to the general superintendent of transportation. On January 1, 1912, he was appointed assistant to president, and now becomes third vice-president in charge of operation of the same road. Mr. Delano's entire service has been with the Atlantic Coast Line.

Operating

J. J. Blair, trainmaster of the Northern Pacific at Spokane, Wash., has been assigned to other duties, the office having been discontinued.

E. T. Sudduth has been appointed general superintendent of the Liberty-White, with office at McComb, Miss., succeeding J. B. Paul, resigned.

R. C. Hobbs, traffic manager of the Kansas City & Memphis, has been appointed general manager, with headquarters at Rogers, Ark., succeeding O. C. Lisman.

W. W. Varney has been appointed trainmaster of the Zanesville division of the Pennsylvania Lines at Zanesville, Ohio, in place of V. B. McCarty, assigned to other duties.

Charles Hurdleston, formerly division superintendent of the Missouri, Kansas & Texas, has been appointed manager of the Texas State Railroad, with headquarters at Rusk, Tex.

G. S. Waid, assistant general manager of the Sunset-Central Lines at Houston, Tex., has been appointed general manager, with headquarters at Houston, succeeding W. G. Van Vleck, deceased.

W. E. Smith has been appointed superintendent of the Henderson and St. Louis divisions of the Louisville & Nashville, with office at Evansville, Ind., succeeding Jno. W. Logsdon, assigned to other duties.

S. L. Racey, trainmaster of the Denver & Rio Grande at Salt Lake City, Utah, has been appointed assistant superintendent of the First division, with headquarters at Pueblo, Colo., succeeding E. E. Gray, transferred.

D. M. Stevens, fuel inspector of the Baltimore & Ohio, has been appointed trainmaster at Garrett, Ind. J. K. Yohe, Jr., has been appointed assistant trainmaster at Connellsville, Pa. J. J. Smith, assistant trainmaster of the New Castle division, has been transferred to the Chicago division at Chicago Junction, Ohio, in a similar capacity. C. E. McDougal, assistant trainmaster of the Pittsburgh division, has been transferred to the New Castle division in a similar capacity, with office at Chicago Junction. C. W. VanHorn, trainmaster of the eastern district, Chicago division, has been appointed superintendent of terminals at Chicago Junction. J. S. Gilmore, assistant trainmaster of the Chicago division, has been transferred to the Connellsville division.

Traffic

The office of C. D. Brown, commercial agent of the Southern Railway, has been removed from Greenwood, S. C., to Abbeville.

William Gourlay, assistant to vice-president of the American Express Company, at Chicago, has been appointed general traffic agent.

F. G. Hamblin has been appointed traffic manager of the Kansas City & Memphis, with office at Rogers, Ark., succeeding R. C. Hobbs, promoted.

Charles S. Lee, whose appointment as passenger traffic manager of the Lehigh Valley, with headquarters at New York, has already been announced in these columns, was born at Washington, D. C., and began railway work in 1871, with the Lake Shore & Tuscarawas Valley, now a part of the Baltimore & Ohio at Cleveland, Ohio. From August, 1879, to July, 1883, he was rate and advertising clerk in the passenger department of the Cleveland, Columbus, Cincinnati & Indianapolis, now a part of the Cleveland, Cincinnati, Chicago & St. Louis, and then became secretary of the American Railway Publishing Company at New York. In February, 1884, he was appointed chief clerk in the general passenger department of the Denver & Rio Grande, at Denver, Colo. From May, 1887, to September, 1893, he was general passenger agent of the Colorado Midland, part of which time he had charge of both passenger and freight departments. On September 1, 1893, he entered the service of the Lehigh Valley as general passenger agent at New York, which position he held at the time of his recent appointment as passenger traffic manager of the same road as above noted.

C. S. Lee

George W. Hay, who has been appointed general passenger agent of the Lehigh Valley, with headquarters at New York, as has already been announced in these columns, was born at Woodstock, Ontario, in 1869, and began railway work, in 1888, as a billing clerk on the Grand Trunk at Detroit, Mich. He subsequently entered train service as a baggage man, and was steadily promoted, until his appointment in 1906 as assistant general baggage agent of the entire system of the Grand Trunk. In 1907 he entered the service of the Lehigh Valley as general baggage agent, with headquarters at South Bethlehem, Pa., and was also assigned duties as a district passenger agent for that section of the Lehigh Valley's territory, which position he held at the time of his recent appointment as general passenger agent of the same road, as above noted.

G. W. Hay

A. H. Proudfoot, assistant general freight and passenger agent of the Liberty-White at McComb, Miss., has been appointed general freight and passenger agent, and his former position has been abolished.

The duties of C. A. Searle, general baggage agent of the Rock Island Lines, with headquarters at Chicago, are extended to include supervision of express traffic.

Eugene J. Henry, general western freight agent of the Lehigh Valley at Chicago, has been appointed western traffic manager, a new position, with headquarters at Chicago. A. B. Hill, general agent of the passenger department, at Chicago, has been appointed an assistant general passenger agent, with headquarters at Philadelphia, Pa., and D. F. Lindsley, city passenger agent at Chicago, has been appointed western passenger agent, with headquarters at Chicago.

Paul S. Millspaugh, whose appointment as assistant general passenger agent of the Lehigh Valley, with headquarters at Buffalo, N. Y., has already been announced in these columns, was born at Waverly, N. Y., in 1874, and began railway work as a joint representative of the Lehigh Valley and the Erie at Waverly, as accountant and auditor. In 1892, when the Lehigh Valley was opened through to Buffalo, he was appointed an assistant in the ticket office at Ithaca, and then was consecutively city ticket agent, traveling passenger agent and district passenger agent until about a year ago, when he was appointed general agent of the passenger department, with headquarters at Ithaca, which position he held at the time of his recent appointment as assistant general passenger agent of the same road, with headquarters at Buffalo, as above noted.

P. S. Millspaugh

Engineering and Rolling Stock

Charles B. Teller has been appointed roadmaster of the Chicago, Rock Island & Gulf at Ft. Worth, Tex., to succeed B. F. Harrison, resigned.

E. Wanamaker has been appointed electrical engineer of the Rock Island Lines, with headquarters at Chicago, succeeding F. J. Glover, resigned, effective December 1.

E. J. Langhurst, assistant road foreman of engines of the New Castle division of the Baltimore & Ohio, has been appointed road foreman of engines at Parkersburg, W. Va.

F. K. Moses, foreman at the Garrett (Ind.) shops of the Baltimore & Ohio, has been appointed master mechanic of the Baltimore & Ohio Chicago Terminal shops, at East Chicago, succeeding J. W. Fogg.

H. C. Oviatt, until recently superintendent of the Old Colony division of the New York, New Haven & Hartford at Taunton, Mass., has been appointed assistant mechanical superintendent in charge of a new bureau just established to be known as the bureau of fuel economy, with office at New Haven, Conn.

W. Gillespie, master car builder of the Central Vermont at St. Albans, Vt., has been appointed mechanical superintendent in charge of motive power and car departments, and T. A. Summerskill, superintendent of motive power, and J. E. Fitzsimons, master mechanic, have been assigned to other duties. The offices of master car builder, superintendent of motive power and master mechanic are abolished.

OBITUARY

Henry Fonde, general agent of the Southern Railway at Knoxville, Tenn., died at his home in that city on November 28.

Henry D. Mirick, who was general freight agent of the Missouri, Kansas & Texas in 1871, died in Washington, D. C., November 26, aged 79 years.

J. H. Waters, president and general manager of the Florence & Cripple Creek, died in Colorado Springs, Colo., on November 27 from injuries received in a collision between a railroad motor car and a locomotive at Cripple Creek on November 25.

C. C. Mallard, superintendent of the Arizona Eastern, with headquarters at Globe, Ariz., died at New Orleans, La., on November 24, aged 54 years. He had been in railway service since 1879, when he commenced as rodman on Morgan's Louisiana & Texas Railroad. Subsequently he was assistant engineer on the Sabine & East Texas and the Houston & Texas Central; engineer for the contractors on the Chicago, Texas & Mexican; roadmaster and assistant engineer of Morgan's Louisiana & Texas, and assistant superintendent bridges and buildings of the Atlantic system of the Southern Pacific, until July, 1898. He was then until August, 1905, successively division engineer of the latter company, and assistant superintendent of the Louisiana lines. From September, 1905, to January, 1906, he was assistant engineer and roadmaster of the Gila Valley, Globe & Northern, and since the latter date Mr. Mallard had been superintendent of that road and its successor, the Arizona Eastern.

Owen J. Travis, formerly superintendent of bridges of the Colorado & Southern and the Ft. Worth & Denver City, died at Everett, Wash., on November 14, aged 66 years. Mr. Travis entered the service of the Keystone Bridge Company in 1868 as bridge builder at Kansas City, Mo., and from 1877 to 1881, was superintendent of traffic of the St. Louis Bridge Company. He was then for three years superintendent of bridges and buildings of the Middle division of the Wabash, St. Louis & Pacific, and from 1884 to 1889, was general foreman of the Chicago and St. Louis division of that road. The succeeding four years he was with the Iowa Central as superintendent of bridges and buildings, going to the Elgin, Joliet & Eastern in 1893 in a similar capacity. He was superintendent of bridges of the Illinois Central from 1897 to 1903, when he became superintendent of bridges and buildings of the Colorado & Southern and the Ft. Worth & Denver City at Fort Worth, Tex. Mr. Travis held the latter position until his retirement from active railway service in 1910.

A. C. Bird, formerly vice-president in charge of traffic of the Gould Lines, died on November 28, at Pasadena, Cal. Mr. Bird was born at Pittsfield, Ill., on March 4, 1843, and began railway work in 1865 with the St. Louis, Alton & Terre Haute. He held various minor positions until 1872, when he went to the St. Louis, Kansas City & Northern as chief clerk in the general freight office. In July, 1874, he was appointed general freight agent of that road, and in November, 1879, he accepted a similar position with the Wabash, St. Louis & Pacific, being promoted to superintendent of freight traffic in January, 1880. He resigned the latter position on January 1, 1883, to become general freight agent of the Chicago, Milwaukee & St. Paul, of which road he was freight traffic manager from February, 1889, to December, 1895; general traffic manager the following four years, and third vice-president from December, 1899, to March, 1903. Mr. Bird then went to the Gould Lines as vice-president in charge of traffic, with headquarters at Chicago, resigning in November, 1907, since which time he had not been engaged in active railway work.

Australian Railway War Council.—Section 64 of the Australian local defence act of 1903 provides that "The government may, in time of war, authorize any officer to assume control of any railway for transport for naval or military purposes." Following Lord Kitchener's visit to Australia in 1910, he recommended the formation of a war railway council, similar to that in the United Kingdom. In conformance with that advice a council was formed, which met for the first time in February, 1911. The council is similar to the British council, the commissioners of each state, together with the heads of a few branches, constituting its members.

Equipment and Supplies

LOCOMOTIVE BUILDING

The California Western Railroad & Navigation Company is in the market for one locomotive.

The Maine Central, as reported in the *Railway Age Gazette* of last week, has ordered 7 Mikado type locomotives from the American Locomotive Company. These locomotives will have 26½ by 30 in. cylinders and a total weight in working order of 275,000 lb. They will be equipped with superheaters and will be used in freight service.

CAR BUILDING

The Union Tank Line is in the market for 500 6,500-gal. tank cars.

The Westmoreland Coal Company is in the market for 100 50-ton gondola cars.

The Illinois Southern has ordered 300 box cars from the Haskell & Barker Car Company.

IRON AND STEEL

The Minneapolis, St. Paul & Sault Ste. Marie has ordered plate girder spans amounting to 107 tons from the Chicago Bridge & Iron Works.

The Atchison, Topeka & Santa Fe has ordered 63,450 tons of 90-lb. rail from the Colorado Fuel & Iron Company. Of this allotment 23,000 tons are for the eastern lines, 25,900 tons for the western lines, 7,600 tons for the coast lines and 6,950 tons for the gulf lines.

SIGNALING

The Nashville, Chattanooga & St. Louis is putting up a telephone line from Nashville to Chattanooga, and telephones will be used for train despatching throughout this division. The contracts for the poles, wires, instruments, etc., will amount to $60,000, or about $400 a mile.

The Federal Signal Company has taken the contract for the installation of a mechanical interlocking at Tivoli, N. Y., on the Hudson Division of the New York Central & Hudson River. This consists of a 56 lever style "A" machine operating 17 signals, 8 switches, 1 derail and 9 facing point locks. Twenty-one spare levers are provided for future extensions to complete a standard four track interlocking layout on the completion of the track work.

The signaling on the Centre street loop of the Brooklyn Rapid Transit System, New York City, is being installed by the Federal Signal Company, and the first section was placed in service on Sunday, November 15. During the rush hours, morning and evening, trains pass over this section less than one minute apart. Since installation, however, there has not been a failure or any interruption of traffic due to the signal system. This line, extending underground from the Brooklyn bridge to the Williamsburgh bridge, Manhattan, about one mile, is a part of the extensions now being added to New York's subway system.

Trans-Siberian Mail Route Again Open.—The trans-Siberian mail route from the Philippines to the United States and most parts of Europe, which was closed at the outbreak of the war in Europe, has been reopened, the first mail arriving in Manila on September 22. The postage now charged is 8 cents for each 20 grams or fraction thereof for letters and 3 cents for single post cards. Westbound mail will go direct to Petrograd and be forwarded thence to Russia, Sweden, Norway, Denmark, Great Britain, the United States, Belgium, France, Italy, Spain and Portugal, leaving Russia via Sweden and Norway.

Supply Trade News

The Union Switch & Signal Company has made the following changes and appointments: Central District, Chicago office: V. K. Spicer, special representative; W. H. Talbert, resident manager; George Marloff, office manager; S. E. Gillespie and J. L. Lucks, engineers: Eastern District, New York office: A. Dean, resident manager; H. McCready, office manager; H. W. Griffin, R. P. Tuttle, J. W. White and H. H. Hamilton, engineers, and T. H. Patenall, resident manager, Montreal, Que.

William E. Magraw, president of the Railway List Company, the Railway Master Mechanic and Railway Engineering and Maintenance of Way, and for many years advertising manager of the Railway Review, died in Chicago on November 24, following an operation for a second attack of appendicitis. Mr. Magraw was born at St. Peter, Minn., in 1858, and his business life was spent in St. Paul and Chicago. He had been president of the Railway List Company for many years and has had charge of the Railway Master Mechanic and Railway Engineering and Maintenance of Way since 1909. He leaves a widow and two daughters.

William F. Bauer, assistant manager of the railway department of the Edison Storage Battery Company, Orange, N. J., has been appointed manager of the Chicago office of that company, succeeding Charles B. Frayer, who retired on November 30 to devote himself to private interests. Mr. Bauer has been engaged in storage battery work for many years. In 1889 he was the electrician in charge of the original train lighting equipment of the Pennsylvania's Chicago Limited, a lighting system designed by his father, then chief electrician of the Pullman Company. He later had experience with the Electric Accumulator Company, the Westinghouse Electric & Manufacturing Company, the Pullman Company and the Wagner Palace Car Company. In 1901 he entered the employ of the Consolidated Railway Electric Lighting & Equipment Company and two years later was appointed chief electrician of the Missouri Pacific, in charge of car lighting. In 1906 Mr. Bauer became sales engineer of the Electric Storage Battery Company. He has been with the Edison Storage Battery Company for about a year and is president of the Railway Electrical Supply Manufacturers' Association.

Eli Stillson Hart, chairman of the board of the Rodger Ballast Car Company, Chicago, and one of Chicago's oldest residents, died at his home, 2922 Prairie avenue, on November 23, after an illness of several weeks, as briefly noted last week. Mr. Hart was born in Rochester, N. Y., in 1832. In 1855 he was graduated from Hamilton College in the law school. He began the practice of law in Clinton, Ia., and came to Chicago in 1856, where he continued his law practice as a member of a leading firm of that period. In 1874, owing to ill health, Mr. Hart gave up his legal work to engage in business. He was one of the founders of the Rodger Ballast Car Company, the success of which was due to his ability, and until his death he was chairman of board of directors. Mr. Hart's integrity of character, sound judgment and kindly humor made him many friends. He is survived by three children: Miss Gertrude W. Hart, H. Stillson Hart and Mrs. Evan A. Evans.

Railway Construction

Alberta & Great Waterways.—See Edmonton, Dunvegan & British Columbia.

Chicago & North Western.—An officer writes that track laying has just been started on the branch building from Koepenick, Wis., along Wolf river for about 7.2 miles. Contract for building this line was given to Peppard & Burrill, Minneapolis, Minn. (July 31, p. 227.)

Work has just been started on the line from Kingston, Wis., westwardly for a distance of five miles. Clery, White & Duffy are the contractors. (September 18, p. 549.)

Edmonton, Dunvegan & British Columbia.—An officer writes that work is now under way on the section from Smoky river, Alta., to Spirit river, 65 miles, and surveys are being made for a further extension from Spirit river to the British Columbia boundary, 64 miles. The Alberta & Great Waterways is now under construction on the section from Lac La Biche, Alta., to Fort McMurray, 160 miles. The J. D. McArthur Company, Edmonton, Alta., is carrying out the work. (September 11, p. 493.)

Moncton & Buctouche.—An officer of this company, which operates a line from Moncton, N. B., north to Buctouche, 32 miles, writes that surveys are being made for an extension from Buctouche northwest to Loggieville, about 65 miles.

New York, Pittsburgh & Chicago Air Line.—The rights and property of this company, which started surveys early in 1909, for a line from Pittsburgh, Pa., east to Allentown, 298 miles, were recently sold to E. T. Noble, of Evans, Noble & Evans, Pittsburgh, who represented the reorganizers of the company. It is reported that the Harriman estate is interested in the property. The projected route is from Pittsburgh, Pa., east via Indiana, Cherry Tree, Irvona, Sandy Ridge, Loveville, Tusseyville, New Berlin, Sunbury, Mahanoy City and Tamaqua to Allentown. Proceedings have been taken before the Pennsylvania Public Service Commission at Harrisburg to perpetuate the road's franchise under the new organization.

Norfolk & Western.—An officer writes that the company plans to carry out work during 1915 on an extension of the Alma branch, 2.56 miles in West Virginia and the construction of a branch up Jacobs Fork and Cucumber creek, 5.30 miles.

Pacific Electric.—An officer writes that this company during 1914 finished work on a total of 32.35 miles of new lines in California as follows: from Santa Ana to Orange, 1.64 miles; Lordsburg, to North Pomona, 1.54 miles; Upland to San Bernardino, 21.73 miles; Hawthorne to El Segundo, 4.42 miles; at Torrance, 0.58 miles, and at Riverside, 2.44 miles. The company also laid a total of 9.62 miles of second track. Work is now under way building an extension from Arlington to Corona on 7.75 miles.

Pacific, Peace River & Athabasca.—We are told that this company, which was given a charter last February by the Canadian government, has completed reconnoissance surveys for about 1,500 miles from a point in British Columbia on the Pacific coast east to Prince Albert, Sask. Charles F. Law, P. O. Box 116, Vancouver, B. C., may be addressed. (November 20, p. 991.)

Portland Railway, Light & Power Company.—An officer writes that this company during 1914 built 1.74 miles of second track in Portland, Ore., to the city lines, and the Willamette Valley Southern, formerly the Clackamas Southern, which is building from Oregon City, south to Mt. Angel, 32 miles, has track laid from Beavercreek to Mt. Angel, 25.09 miles.

Salt Lake & Utah (Electric).—An officer writes that track laying has been finished on the line from Salt Lake City, Utah, to Provo, 48.5 miles, and it has not yet been decided when construction work will be started on the second section, from Provo via Spanish Fork and Springville to Payson, between 18 and 20 miles. W. R. Armstrong, assistant general manager and chief engineer, Salt Lake City.

Slate Belt Electric.—This company, which operates an electric line connecting Bangor, Pa., Pen Argyl, Wind Gap and

Nazareth, is planning to build a 9-mile branch, it is said, from Wind Gap to Saylorsburg and Saylors lake.

Texas Roads.—A proposition has been submitted to residents of San Antonio, Texas, and Bexar county, asking for a bonus of $87,500 in aid of a line to be built from San Antonio. The proposed route from San Antonio is north to Johnson City, thence northwest to Robert Lee in Coke county and eventually to a point in New Mexico. James L. Himrod, Austin, Texas, is back of the project.

Visalia Electric.—An officer writes that this company, during 1914, completed work on 2.03 miles, from Rose Street Station to Elderwood, Cal.

Watauga & Yadkin River.—We are told that this company is building with its own forces an extension from Dennys, N. C., northwest to Rogers Mill, 12 miles, and surveys have been completed for a further extension from Rogers Mill northwest to Boone, 14 miles. The company does not contemplate building the extension during 1915, which was projected sometime ago from Grandin southwest to Lenoir, 16 miles. (March 27, p. 767.)

Willamette Valley Southern.—See Portland Railway, Light & Power Company.

RAILWAY STRUCTURES

Chicago, Ill.—An ordinance was introduced in the city council last week on behalf of the Baltimore & Ohio Chicago Terminal to provide for a new freight yard to be located south of Fourteenth street, between South Western avenue and South Paulina street, to take the place of the yards now located at Twelfth street, the site of which is to be used for the approach to the new Union station.

Dewey, B. C.—The Railway Commission of Canada has directed that new stations be built by the Grand Trunk Pacific on locations approved by the commission at Dewey, B. C.; Newlands, Longworth, Giscome, Lindup and Shelley, and has approved locations of new stations at Rose Lake, Forestdale, Decker Lake, Walcott, Quick, Priestly and Palling.

Johnstown, Pa.—The Pennsylvania Railroad is having plans made for a new station to be built at Johnstown. The company does not expect to let contracts for carrying out the work until 1915.

Oelwein, Iowa.—See Randolph, Minn.

Parnell, Mo.—See Randolph, Minn.

Randolph, Minn.—The Chicago Great Western has just awarded contracts for the erection of three water tanks to the Chicago Bridge & Iron Company, as follows: A 100,000-gallon steel tank at Randolph, Minn., and a similar one at Oelwein, Iowa, and an 80,000-gallon steel tank at Parnell, Mo. The foundations will be built by company forces. The Great Western has also let a contract for a 1,500-ton ice house, to be located on the company's shop ground at Oelwein, Iowa. The work on the new depot at Randolph, Minn., reported in the *Railway Age Gazette* of October 16, is nearing completion.

Spokane, Wash.—The Oregon-Washington Railroad & Navigation Company has begun work on its division terminal buildings at Spokane, which consist of an 11-stall roundhouse, a machine shop, 80 ft. by 120 ft., a power house, 40 ft. by 50 ft., a coaling plant, cinder pit and coach cleaning facilities. The power house will be of concrete construction, and the other buildings will have brick walls and mill constructed frames. Work is being done by company forces and the approximate cost will be $150,000.

The Dalles, Ore.—The improvement of the Oregon-Washington Railroad & Navigation Company at The Dalles is said to consist of a roundhouse for 30 locomotives, and additional freight handling facilities, including switch tracks, etc. The estimated cost is $140,000.

Toledo, Ohio.—The Cincinnati, Hamilton & Dayton has awarded contracts for the construction of a coal handling plant at Toledo, which was mentioned in the *Railway Age Gazette* of November 6, 1914, to Wellman-Seaver-Morgan Company, Cleveland, Ohio. The foundation will be built by the Smith-McCormick Company, Easton, Pa. The capacity of the new plant will be 40 cars an hour.

Railway Financial News

Chicago, Rock Island & Pacific.—The United States circuit court of appeals has reversed the order of the lower court which fixed November 24 as the date for the sale of the Chicago, Rock Island & Pacific Railway stock, which is collateral for the Chicago, Rock Island & Pacific Railroad 4 per cent bonds.

Gilmore & Pittsburgh.—See Northern Pacific.

Lake Shore & Michigan Southern.—J. P. Morgan & Co., New York, have bought $15,000,000 5 per cent notes of this company, of which about half will mature September 1, 1915, and the remainder on December 1, 1915. The notes are being offered at private sale at par.

Mobile & Ohio.—Although the gross operating revenues of this road in the fiscal year ended June 30, 1914, were the greatest in the history of the company, the net income after the payment of expenses, rentals, taxes and interest was but $85,109 as compared with $641,870 in the previous year. The increase in gross operating revenues was $597,781, but the increase in total operating expenses was $1,005,630, the latter said to be due to the accident near Buckatunna, Miss., on October 19, 1913, in which 17 persons were killed and 171 were injured; to the difficulties in operation caused by the work, since completed, of raising the tracks in and about Cairo, Ill., to provide against floods; to greater maintenance of equipment expenses and an increase of 35 per cent in empty car mileage.

The Mobile & Ohio operates 1,122 miles. The main line extends from Mobile to St. Louis with a branch to Montgomery, Ala., and the road also has trackage rights over the Illinois Central, the Northern Alabama and the Southern from Corinth to Birmingham.

In 1914 the road earned gross revenues per mile of road of $11,250 as compared with $10,783 in 1913. The freight revenue per mile of road was $9,540 in 1914, and $9,120 in 1913. The ton-mile rate in 1914 was 6.70 mills, and in the previous year 6.56 mills, the total revenue ton mileage carried being 1,598,623,994 in 1914 and 1,555,296,849 in 1913. The average trainload of revenue freight decreased as between the two years from 373 to 365 tons. The total number of passengers carried in 1914 was 2,202,092, an increase of 1.16 per cent over 1913; and the average passenger receipts per passenger mile were 2.205 cents in 1914 and 2.248 cents in the previous year.

The company paid 4 per cent dividends in 1914. The bonded debt on June 30, 1914, was $4,100,000 greater than on June 30, 1913, there having been assumed $4,000,000 of bonds of the St. Louis & Cairo, the entire lines of which (159 miles) were purchased on July 28, 1913. At the end of the year the company had on hand cash to the amount of $968,737, as compared with $754,835 on June 30, 1913. On June 30, 1914, there were loans and bills payable of $426,808.

National Railways of Mexico.—This company announces that its offer to pay coupons due April 1 last on its guaranteed general mortgage 4 per cent gold bonds and the National Railroad Company of Mexico first consolidated mortgage 4 per cent gold bonds in 6 per cent secured gold notes Series B, due January 1, 1917, has become effective. The notes have been delivered to the Guaranty Trust Company of New York who will exchange them for coupons. The offer to pay coupons due June 1 last on the 6 per cent gold notes has also become effective.

New York Central & Hudson River.—J. P. Morgan & Co., New York, who, with two banks, bought the recent issue of $40,000,000 5 per cent notes, half maturing April 1, 1915 and half October 1, 1915, are offering notes now at 99.80 and interest to yield about 5½ per cent for the notes due April 1, and at 99.15 and interest, to yield about 6 per cent for the notes due October 1.

Northern Pacific.—A press despatch from Butte, Mont., says that the Northern Pacific has bought the Gilmore & Pittsburgh, which runs from Armstead, Mont., to Gilmore, 110 miles.

ANNUAL REPORT

THE COLORADO & SOUTHERN RAILWAY COMPANY—FIFTEENTH ANNUAL REPORT

To the Stockholders of the Colorado & Southern Railway Company:

Herewith is submitted the Fifteenth Annual Report of this Company, for the year ended June 30, 1914.

There are included the reports of A. D. Parker, Vice-President, and J. H. Bradbury, General Auditor.

By order of the Board of Directors,

HALE HOLDEN,
President.

MR. HALE HOLDEN,
President,
Chicago, Ill.

DEAR SIR:—I herewith submit the report for the fiscal year ended June 30, 1914, which report combines the operations and affairs of the lines operated by the companies named, and which are herein designated as the "COLORADO & SOUTHERN LINES."

Per Cent.	1914.	OPERATING REVENUES.	1913.	Per Cent.
68.47	$ 9,053,885.00	Freight Revenue	$10,836,134.18	71.87
25.30	3,345,489.44	Passenger Revenue	3,394,073.63	22.51
1.72	226,844.16	Mail Revenue	218,848.38	1.45
1.97	260,598.66	Express Revenue	264,279.94	1.76
1.91	252,452.15	Miscellaneous Transportation Revenue	271,113.16	1.80
.58	76,933.03	Revenue from Operations other than Transportation	89,542.64	.59
.05	6,534.92	Joint Facilities	3,685.00	.02
100.00	$13,222,737.36	Total Operating Revenues	$15,077,676.93	100.00
		OPERATING EXPENSES.		
13.75	$ 1,818,146.33	Maintenance of Way and Structures	$ 1,905,988.15	12.64
16.52	2,184,784.04	Maintenance of Equipment	3,111,512.80	20.64
1.64	216,445.43	Traffic Expenses	230,406.63	1.53
38.23	5,055,015.62	Transportation Expenses	4,901,494.00	32.50
3.57	471,611.16	General Expenses	473,560.09	3.14
73.71	$ 9,746,002.58	Total Operating Expenses	$10,622,961.67	70.45
26.29	$ 3,476,734.78	Net Operating Revenue	$ 4,454,715.26	29.55
.....	16,956.19	Net Deficit from Outside Operations	24,804.07	.....
.....	$ 3,459,778.59	Total Net Revenue	$ 4,429,911.19	.....
.....	638,450.24	Taxes Accrued	520,546.72	.....

.....	340,265.84	Dividends	990,236.92	.....
.....	$ 65,885.29	Surplus	$ 675,076.01	.....

The total operating revenues show a decrease under the preceding year of $1,854,939.57 or 12.30%. This decrease is principally in Freight Revenue and is the consequence of a coal miners' strike in the Colorado coal fields, called on September 23rd, 1913. The first eighty-three days of the Fiscal year, which preceded the strike, showed an increase in Freight Revenue over the same period of the previous year.

Subsequent to the calling of the strike referred to however, not only revenues from coal transportation but those derived from other classes of freight, partly dependent thereon, showed a constant decrease under those of the previous year. This is more fully set forth in the "Statement of Classified Freight Tonnage and Revenue," appearing on pages 26 and 27 of this report and on pages 20 and 21 of the report for the Fiscal year ended June 30, 1913.

The total operating expenses were decreased under those of the preceding year by $876,959.09 or 8.25% and would have been still further reduced had your company not been compelled to purchase coal from mines not on the lines of your Company, at a cost more than double that of the previous year and had not the heavy snows of last winter made operation of trains and the keeping of terminal yards open for operation singularly difficult and expensive.

Taxes increased $117,903.52 over the preceding year or 22.65%. This was due to legislative action in Colorado, increasing the assessed valuation, without a corresponding reduction in the state levy; and in Texas to increase in the state rate, due to accumulated deficiency extending over several past years and a new tax of 5 cents per $100.00 valuation for the creation of pension funds.

During the fiscal year, Mortgage, Bonded and Secured Debt was decreased as follows:

First Mortgage Bonds of C. S. & C. C. D. Ry. Co. were retired through Sinking Fund	$ 58,000.00
Equipment Trust Obligations were discharged	349,226.18
Making the decrease in Mortgage, Bonded and Secured Debt	$407,226.18

The outstanding Capital Stock was reduced by the acquisition of 39.84 shares, par value $3,984.00, "Stamped Stock" of Fort Worth & Denver City Railway Company.

There were charges aggregating $165,589.26 to Property Investment for additions and betterments. Of this amount there was expended for:

Structures and Machinery	$22,897.29
Substituting Permanent Bridges for Wooden Ones	33,350.16
Additional Spur and Industry Tracks	37,668.81
Relaying Heavier Rail—Main Line	15,615.61
Laying Tie Plates—Main Line	52,942.13
Various Other Additions and Betterments	3,115.26

The property of The Trinity & Brazos Valley Railway Company was placed in the hands of a Receiver on June 16, 1914, by the Federal Court of the Northern District of Texas upon proceedings instituted by Old Colony Trust Company, Trustee, in the First Mortgage of that Company. This Company and The Chicago, Rock Island & Pacific Railway Company are joint owners in equal shares of The Trinity & Brazos Valley Railway Company in accordance with the provisions of the contract entered into in 1906 between the owning Companies, and with the beginning of operations of The Trinity & Brazos Valley Railway Company in 1907 it had been anticipated that within a reasonable time the revenues of the Company would have been sufficient to meet the operating expenses and fixed charges. At that time agreements had been made for interchange of traffic with lines other than, and in addition to, the owning Companies, which would have provided The Trinity & Brazos Valley Railway Company with an increasing business, but later the traffic of these other lines was diverted, and this fact, together with the general depression in business and increases in operating expenses, due to increased wage schedules, increased cost of material and increases in taxes, rendered it impossible for The Trinity & Brazos Valley Railway Company to meet its charges and the receivership proceedings followed.

The following statistical tables have been compiled in the form required for the Annual Report of Carriers to the Interstate Commerce Commission:

INCOME STATEMENT.

RAIL OPERATIONS—			
Operating Revenues:			
Revenue from Transportation:			
Freight	$9,053,885.00		
Passenger	3,345,489.44

Railway Age Gazette

PUBLISHED EVERY FRIDAY AND DAILY EIGHT TIMES IN JUNE BY THE
SIMMONS-BOARDMAN PUBLISHING COMPANY
WOOLWORTH BUILDING, NEW YORK

CHICAGO: Transportation Bldg. CLEVELAND: Citizens' Bldg.
LONDON: Queen Anne's Chambers, Westminster.

E. A. SIMMONS, *President.*
L. B. SHERMAN, *Vice-President.* HENRY LEE, *Sec'y & Treas.*
The address of the company is the address of the officers.

EDITORS
SAMUEL O. DUNN, *Editor*
ROY V. WRIGHT, *Managing Editor*

W. E. HOOPER	H. F. LANE	C. W. FOSS
B. B. ADAMS	R. E. THAYER	F. W. KRAEGER
E. T. HOWSON	A. C. LOUDON	K. L. VAN AUKEN
H. H. SIMMONS	C. B. PECK	E. G. ZACK

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico	$5.00
Canada	6.00
Foreign Countries (excepting daily editions)	6.00
Single Copies	15 cents each

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention daily issues, North America, $1; foreign, $2.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue 8,750 copies were printed; that of these 8,750 copies 7,403 were mailed to regular paid subscribers to the weekly edition, 250 were provided for counter and news companies' sales, 1,055 were mailed to advertisers, exchanges and correspondents, and 42 were provided for samples and office use; that the total copies printed this year to date were 466,850, an average of 9,337 copies a week.

The RAILWAY AGE GAZETTE and all other Simmons-Boardman publications are members of the Audit Bureau of Circulations.

VOLUME 57 DECEMBER 11, 1914 NUMBER 24

*Illustrated.

A Word of Appreciation

Within the past few years there has been a remarkable reversal of feeling on the part of the public toward the railways. This is largely because of a campaign of education which has helped the public better to appreciate the problems of the railways and has shown both the railways and the public that they had a common interest. An important factor in this quiet, but none the less effective, work has been the Railway Business Association. It was among the first actively and aggressively to take up the work and undoubtedly did much to encourage other organizations throughout the country to lend their efforts to its promotion. The value of the remarkable addresses which have been so characteristic of its annual dinners is well known and they have exerted a strong influence on the public in its policy toward the railways. No one, however, can know or understand the full import of the work which is done by this and other associations of this sort unless they are familiar with the thorough and painstaking methods which are necessary for the conduct of a comprehensive educational campaign. An indication of the place which the Railway Business Association has so well earned for itself is evident from a recent editorial in The Wall Street Journal, which characterized it, with President Rea, of the Pennsylvania Railroad, as one of "two undoubted authorities which deal with what is perhaps the most vital obstacle to really effective regulation of railroads in justice to all interests."

C. Colson on Cost of Service

The classic work of the French economist, C. Colson, "Transports et Tariffs," has often been mentioned in these columns. There now appears an English translation of part of this work edited by Charles Travis and published by G. Bell & Sons, London. The translation comes at a particularly opportune time in that it includes Mr. Colson's analysis of what is meant by cost of service. At this time when Commissioner Meyer, in charge of the Interstate Commerce Commission's accounting activities, is earnestly looking for guidance in developing a system of cost accounting which will be something more than an arbitrary fiction, Mr. Colson's final pronouncement on the subject is worthy of rereading. Mr. Colson divides a rate into the charge covering the cost of performing that particular service, in addition to other services, and the toll, which includes that particular service's portion of all overhead charges, including cost of maintenance, return on capital, etc., his point being, of course, that the greatest total amount of service can be given when the toll portion of each charge is so apportioned as between all services as to induce the greatest use of the transportation plant. This suggests a way in which real cost accounting as distinguished from theoretical cost accounting may be arrived at. It is strictly analogous to what C. B. Seger, vice-president of the Union Pacific, attempted to explain to Commissioner Meyer during one of the hearings on the division of freight and passenger expenses. It is possible to determine with a fair degree of accuracy, Mr. Seger pointed out, the cost at any particular time of any particular service; but this is very different from trying to determine the cost of one general class of service. A general division of freight and passenger expenses would obscure rather than help the actual determination of cost, Mr. Seger believes. Commissioner Meyer believes just the opposite. A rereading, however, of Mr. Colson's discussion of this subject of what constitutes a freight rate or passenger rate is strongly recommended to all of those who are now interested in a division of freight and passenger expenses.

Log Book of a General Superintendent

There is much complaint from railway officers that, under present conditions, they have to give far too large a part of their time to hearings before courts and commissions and conferences with grievance committees representing organized labor. If railway officers are to do their work efficiently, and thereby the efficiency of railway operation is to be maintained and increased, the officers must be able to devote the great majority of their time to investigations, to conferences with and supervision of their subordinate officers, to conferences with the communities along their lines and with their patrons, and to hard, downright, uninterrupted thinking. The last-named is the most important of all. Railway officers must neglect some of these things if too much of their time is taken by regulation and labor disputes; and this is what is occurring. The general superintendent in charge of a large district of an important railway kept a diary for twelve months, show-

ing all of his movements during that time. The following summarizes what his diary showed:

Time Taken by Grievance Committees and Regulations

Locomotive engineers (B. of L. E.)	15 days
Locomotive firemen (B. of L. F. & E.)	12 days
Conductors and trainmen (O. R. C. and B. of R. T.)	33 days
Telegraph operators (O. R. T.)	43 days
Bay and river steamers and labor organizations	12 days
Before courts and commissions	18 days
Total	133 days

Time Spent on Road

December	4 days	July	13 days
January	18 days	August	7 days
February	20 days	September	11 days
March	9 days	October	21 days
April	16 days	November	17 days
May	21 days		
June	15 days	Total	172 days

The case of this general superintendent is doubtless typical, and investigations would show that still larger parts of the time of the higher operating and executive officers are being taken by duties unconnected with the development and application of ways and means for increasing the efficiency of service and operating and especially by duties growing out of regulation. Whatever thus interferes with the most important work of railway officers tends to cause railway service to be poorer and more expensive to the public than it otherwise would be. How many of the labor leaders and regulating authorities, who draw such heavy drafts against time of railway officers, ever think of this point?

ABSENTEE LANDLORDISM AND THE COMMISSION

WITHOUT intending to, the Interstate Commerce Commission is permitting a grave abuse of its power of suspension in minor cases, of advanced rates. There were two distinct extensions of authority given to the commission in the 1910 amendment of the Commerce Act. One placed the burden of proof of the reasonableness of advanced rates on the railroads; the other gave the commission power to suspend an advance in rates pending an investigation. The second of these provisions should be and probably was intended to be used only in emergencies or where injustice might result from arbitrary action on the part of a railroad. This power is comparable to that of injunction and should be used by the commission as sparingly as is the power of injunction by the courts.

The commission, in its pursuit of more and more power, has obtained authorities and responsibilities so broad that it is physically impossible for seven human beings to personally fulfill these responsibilities. The result has been, especially in regard to the suspension of unimportant—that is, unimportant as affecting shippers or public interest—rate advances, that these questions have been left to be settled wholly by young employees of the commission. An advance in rates on certain commodities may have been decided on after careful deliberations and for good and sound reasons by the traffic department of a railroad. The question is considered and passed upon by the vice-president and quite possibly by the president. Thirty days' notice is given the commission. No commissioner personally even knows of the matter, but a law clerk receives a letter from some shipper, whose responsibility he knows nothing of, protesting against the advance. To be on the safe side he suspends the advanced rate, and in the due course of time an examiner is appointed to make an investigation, and at the expiration of a year or a year and a half it is found that the advanced rate is entirely reasonable and that the railroad company is fully capable of bearing the burden of justifying it and it is permitted to go into effect. During the year and a half the railroad company has not been earning the additional revenue which the commission eventually finds that it was fairly entitled to; but there is no reparation for the railroad. The railroad never had a chance to justify the rate before it was suspended, never even had a hearing. Some commissioner may theoretically have passed on the case, but if he did it was in a purely cursory way.

The evils of railroad management by absentee landlordism have been pointed out many times in the *Railway Age Gazette;* but even if it is reprehensible for two or three influential members of the board of directors to attempt to manage three or four thousand miles of railroad from the deck of an Atlantic liner, it is just as bad for all the business interests affected for the Interstate Commerce Commission to try to exercise so much authority that it has to leave innumerable important decisions to $1,500 a year clerks.

One of the reasons which undoubtedly influenced Congress in giving the commission power to suspend rate advances was that a manufacturer's business might be seriously injured through an arbitrary or unjust rate advance to an extent that reparation could not indemnify. The manufacturer might lose contracts because of the inability to quote as low a rate as a competitor, unless he ran the risk of gambling on the chance that the commission would eventually award him reparation. In cases such as this the power to suspend rates pending investigation is an equitable one, but it should be exercised only upon such a presentation of the facts as would be required by a court before granting an injunction. Judgment, good sense and knowledge, as well as a judicial attitude of mind, are required even more in deciding a question such as this before a full hearing has been had than would be required in deciding the case after a full investigation and public hearing. It is, therefore, a palpable injustice for the commission to permit its clerks automatically to suspend any advanced rates if there seems to be the remotest possibility of a protest from shippers. This sort of playing safe by subordinates is just the sort of thing that railroads in the past have been most severely criticized for, and rightly so. The commission ought to revise its practice in this respect.

LOCOMOTIVE BOILER DESIGN

UNTIL recent years the term horsepower has conveyed but little meaning to the designer of locomotives. The advent of the testing plant, which makes possible accurate determination of the actual horsepower developed by a locomotive under any conditions of cut-off, speed and load, has probably done more than anything else to bring out the meaning of this expression as applied to locomotives. F. J. Cole, consulting engineer of the American Locomotive Company, has recently developed a method of adapting horsepower requirements to the proportioning of locomotive boilers; briefly this method consists of determining the steam requirement for a specified horsepower and piston speed and designing a boiler capable of generating this amount of steam, the evaporative values of firebox and tube heating surface being known and tabulated. This method should prove of great interest to all locomotive designers, and besides the advantages claimed for it in proportioning the boiler itself, Mr. Cole, in a discussion of this subject given elsewhere in this issue outlines a number of other advantages obtainable by its use in the designing of locomotives. Another point of interest in this discussion is that of the relative value of short and long tubes in boiler construction. While Mr. Cole does not make a specific argument in favor of the use of long tubes, he brings out their value in the reduction of smokebox temperatures or, in other words, absorbing a greater amount of heat from the gases which pass through them, the only increase of energy required being the slightly greater draft in the smokebox. That there may be differences of opinion in this matter is indicated by the discussion on the same subject by C. D. Young, engineer of tests of the Pennsylvania Railroad. Mr. Young takes a firm stand against the excessively long tube, charging that beyond a certain length there is too great a sacrifice of boiler capacity in the interest of economy in coal and that the long tube offers a serious resistance to the flow of the gases toward the smokebox. Evidently the experience of the Pennsylvania Railroad has indicated that the increase in draft necessary with long tubes is appreciable, particularly when we consider Mr. Young's statement that the locomotive with the long tube is a slow steamer.

IS CRITICISM OF PRESENT RAILWAY REGULATION JUSTIFIABLE?

THE attitude of railway managers toward regulation has received severe criticism recently from two widely different sources. H. G. Wilson, president of the National Industrial League, attacked it in an address to the League, and Professor John H. Gray, of the University of Minnesota, assailed it in a paper before the Western Economic Society, both addresses being delivered in Chicago recently. The speakers asserted that the managers and spokesmen of the railways are trying, by denouncing regulation, to destroy it. Professor Gray seemed to think that a disposition to oppose all regulation in order that they may be made free to speculate in the stocks of their companies, to indulge in unfair discriminations, and to run the politics of the country, is characteristic of practically all railway managers. Mr. Wilson said he did not assert that all of the men operating railways desire to undermine and vitiate the present system of regulation, but that some of them do.

If Mr. Wilson and Professor Gray expressed their real views they do not know the actual attitude of a large majority of railway executive officers at all. Doubtless until ten years ago most railway managers were opposed to almost every kind of regulation; but owing to numerous changes in the personnel of railway managers and to changes of heart by many of the older officers, it is incorrect and misleading to say that they are now generally opposed to regulation. President Ripley, of the Santa Fe, followed Professor Gray as a speaker before the Western Economic Society, and with the authority of his position as one of the oldest and most prominent railway managers, he expressly denied that they are now opposed to regulation. They recognize, he said, that regulation is needed and has come to stay; and what they oppose is merely unfair and harmful regulation.

The question arises, Is there any ground for the complaints and criticisms of railway officers who say that they favor regulation, but oppose such regulation as now prevails? No well-informed and fair man can answer that question in the negative. Even Mr. Wilson's own organization recognized at its convention the need for reform in regulation of railways by adopting a committee report recommending standardization of state laws relating to railways and codification of interstate laws relating to them. What are some of the shortcomings of the present system of regulation?

1. The railways are subjected to the annoyance and expenses of regulation by the nation and all the states. Regulation, in consequence, is often duplicated, and when not duplicated is often inconsistent and conflicting.

2. Restrictions and burdens are often imposed on the operations of railways, and reductions are often made in their rates, especially by the states, without any previous investigation as to their fairness or expediency, and chiefly for political reasons. These things are often done by the legislatures in spite of the fact that in most of the states commissions have been appointed which are supposed to be composed of experts, and therefore to be more competent than the legislatures to deal with such matters.

3. As a matter of fact the commissions never are composed of experts, and are often composed of anti-railway partisans, in spite of the universally conceded principle that they should be expert, fair and judicial. Witness, for example, the fact that the chairman of the Iowa Railroad Commission has been appearing as an attorney in the rate advance cases before the Interstate Commerce Commission.

4. Turning to federal regulation, we find the railways subjected by the national government to the Sherman anti-trust law, which prohibits them from making agreements regarding rates and operation, and requires them to compete, and at the same time subjects them to regulation by the Interstate Commerce Commission, which constantly, in effect, orders them to enter into agreements in regard to operations and rates, and denounces them in its opinions because they sometimes commit unfair discriminations and permit economic wastes which are a direct and inevitable result of the competition required by the Sherman law.

5. A large part of the increase in expenses from which the railways are suffering is due to awards made in arbitration proceedings carried on under a federal law. There have also been enormous increases in their taxes for which the state and national governments, and especially the state governments, are entirely responsible. The Interstate Commerce Commission, in its decision in the five per cent rate case, admitted that as a result of these and other developments the net income of the railways in Official Classification territory had become inadequate. But instead of allowing the advance in rates which the railways asked for, it made numerous recommendations, among them being one that the railways should impose special charges for certain special services at terminals. But when the railways, in obedience to this recommendation, filed the tariffs carrying special charges of the kind recommended, the state and interstate commissions immediately suspended them. In other words, they were told that they could not get their increase in income in the way they asked for it, but in another way, and when they tried to get it in that other way they were not permitted to do so.

6. The theory of the law is that the railways will be regulated by the Interstate Commerce Commission, but the Commission has been so burdened by work that it has become impossible for the commissioners to hear and write the opinions in most of the cases coming before it, and in consequence, to a large extent, the railways are being regulated, not by the Commission, but by subordinates by whom the law never contemplated that they should be regulated.

7. It has been intimated by the Interstate Commerce Commission, conceded by Mr. Brandeis, special counsel for the Commission, and held in a report by a Joint Congressional Committee, that the compensation received by the railways for carrying the mails is inadequate; and yet since the parcels post was established the roads have been granted only a 5 per cent increase in their total mail compensation, and Congress has thus far refused to give them the increase recommended by the Joint Congressional Committee.

8. It is probable that the railways would not oppose the granting to the Interstate Commerce Commission of authority to regulate operation comprehensively if this would relieve them of the unfair, and sometimes almost idiotic, regulation of operation to which they are subjected by the states. But, nevertheless, the railways resent the fact that in its present regulation of operation the Commission employs inspectors who in many cases are not experts, who in practically all cases are members of railway brotherhoods, and who are therefore believed to be strongly biased against the railways.

9. More and more the regulating authorities are tending to limit the profits which railways may earn, but they do not limit the risk incurred in railway investments. In other words the regulating authorities are fixing maximum profits and maximum rates, but they are not fixing either minimum risks, minimum profits or minimum rates.

These are but a few of the features of the present regulation of railways against which railway men protest. Are they not justified in doing so? Is not a system of regulation which contains these and numerous other defects one which not only railway men, but every fair man, ought to denounce? Is it not very questionable whether such a system is better from the standpoint of the public than none at all?

The two papers which were consolidated to form the *Railway Age Gazette* advocated the Hepburn act. We have advocated legislation for the regulation of the issuance of railway securities of such a character as was recommended by the Hadley commission. We have advocated legislation such as the Stevens bill now pending in Congress, which would give the Interstate

Commerce Commission extensive authority to regulate operation. But we believe that the crying need of the present is not for more legislation, but for the repeal of a great deal of the legislation now in effect, such as train crew laws, headlight laws, the Sherman anti-trust law as it applies to railways, and other laws which increase railway expenses without conferring any benefits on the public. We are in favor of giving the Interstate Commerce Commission increased power along certain lines; but we believe that a much more pressing need is legislation for such reorganization of the Commission as will fit and enable it to carry its present burdens and perform its present duties. The present system of regulation is so unfair in many respects, and so defective in most respects, that before it can be made clearly to do more good than harm it must be thoroughly overhauled and reformed.

Men who have the intelligence to see this, and the courage to say it, should not be made a target for the attacks of those who are so enamored of regulation per se that they do not take the pains to find out whether the system of regulation actually in effect is good or bad, or whether it might not be so changed that it would cause less evil and confer more benefits. Regulation, in itself, is neither desirable nor undesirable. Intelligent and fair regulation is desirable. Unintelligent and unfair regulation is wholly undesirable.

DEVELOPMENTS IN TUNNEL CONSTRUCTION

THE St. Paul is now completing a 2½-mile tunnel through the Cascade mountains about 60 miles east of Seattle, driving it from a bottom heading and trapping the material above into cars in the lower drift. The Canadian Pacific is driving a tunnel five miles long through Mt. McDonald, in the Selkirk mountains, from a separate parallel or pioneer tunnel with cross cuts to the main tunnel at frequent intervals. By each of these methods it is possible to drive the tunnel from several faces at the same time and to materially hasten its completion. These two projects are the most recent examples of railroad tunnel construction in America and may therefore be considered to represent the latst practice.

The adoption of a line involving the construction of a tunnel has been subject to two serious objections, the first cost of construction and the difficulty in operation resulting from smoke. This latter objection has been alleviated by the development of electric traction and by the installation of artificial ventilating systems. However, progress has not been as great in the reduction of the cost of construction by the development of improved methods and equipment.

In this respect tunnel construction has not kept pace with the many important improvements in other lines, notably grading equipment, where the large steam shovels, drag lines, high-capacity dump cars, unloading plows, etc., have all assisted in reducing the cost of ordinary grading operations. An incident in the construction of a second track on a western line during the past summer reveals this condition in a striking manner. When the line was first built about 20 years ago, a short tunnel was driven through a projecting point. Here the second track is located about 100 ft. distant on the up-hill side and in making estimates it was found to be cheaper to build it as an open cut even though the depth was considerably greater than at the point where the tunnel was constructed previously. This change was due to the relative reduction in the cost of excavation as compared with tunnel construction in recent years.

The continual increase in traffic is making more urgent the reduction of grades on the heavy mountain divisions. In many cases the construction of tunnels of considerable length offers the ultimate solution, but with present methods the cost of such construction is prohibitive. For several years the Moffat Line has been endeavoring to finance the construction of a six-mile tunnel through the Rocky mountains in Colorado, while another western road has located a tunnel 10 miles long which will effect a very important improvement in its grade line. Any improvement of the methods of tunnel construction enabling a reduction in cost to be made would give impetus to the construction of other tunnels which are now necessarily held in abeyance.

NEW BOOKS

Statistics of Railways in the United States; Twenty-fifth Annual Report. Prepared by the Division of Statistics, Interstate Commerce Commission, Wm. J. Meyers, statistician. 719 pages, 9 in. by 12 in. Bound in cloth. Copies may be had from the Superintendent of Documents, Government Printing Office, Washington, D. C., at $1 each.

This is the final statistical report for the year ending June 30, 1912. The first part of the report, 65 pages, not including the figures for individual roads, was issued in pamphlet form last July. The preliminary totals, which were printed in the *Railway Age Gazette,* August 1, 1913, page 180, included the returns only of the larger roads, "class 1" and "class 2."

The present report comes out in considerably less than 12 months after the similar report for the preceding year, indicating that the statistician's office and the government printing office are improving their service in the matter of promptness.

Statistics of Railways in the United States; Twenty-sixth Annual Report. 62 pages, 9 in. by 12 in. Pamphlet. Superintendent of Documents, Government Printing Office, Washington. Ten cents a copy.

This report, for the fiscal year 1913, corresponds to that for the year before, mentioned in the preceding notice, except that this contains only the summaries and introductory matter. This reaches us about seven months earlier in the year than the similar pamphlet for 1912. The commission, in its annual report to Congress, sent in this week, expresses the expectation that the whole of this report—the dollar-a-copy issue—will be published next month. The "preliminary abstract" for 1913, corresponding to this report, which is a pamphlet of 179 pages, giving totals for individual roads of class 1 only, was issued in April, 1914.

Railway Rolling Stock Appliances and Equipment. Compiled and arranged by Parker Cook, Victor Building, Washington, D. C. 16 pages, 3¼ in. by 6 in. Bound in paper. Copies free.

Patent attorneys receive numerous inquiries from clients as to the number of patents in the different sub-classes, and so far as is known there has been, up to the present, no publication that gives this information. This book gives the number of patents in each class and sub-class, and was compiled after considerable research work. It is so arranged that an inventor or any one desiring such information can at once determine how many patents there are in any sub-class. It should prove of particular value to inventors as they can determine at once from it how many patents there are in the different sub-classes.

The Science and Practice of Management. By A. Hamilton Church. 535 pages, 4¾ in. by 7¼ in. Illustrated with charts. Bound in cloth. Published by the Engineering Magazine Company, 140 Nassau street, New York. Price $2.

This book constitutes one of the most recent additions to the Works Management Library of the Engineering Magazine. The author's treatment of the subject seems to be scientific, not in the sense that he sets forth any system of so-called scientific management, but that he attempts in a scientific way to get at the fundamental elements and principles, so that existing forms of management can be scientifically analyzed and classified. It has been endeavored to ascertain the fundamental facts of production, not from the viewpoint of cost but from the viewpoint of management. Instead of trying to throw light on the nature of expense the author has endeavored to throw light on the nature of organization. The theory of the book is to formulate such fundamental facts and regulative principles as may be later developed into a true science of management, and it is not one from which the "rule of thumb" practitioner can obtain a ready-made system.

The Railway Problem a Statesman's Opportunity*

Developed on Wrong Basis, Railways, Now Football of Politics, Must be Saved by Broad Statesmanship

By Fairfax Harrison
President, Southern Railway Company

The time is well within the memory of men still in active life when railroads, both in regard to their ownership and in regard to their use, were considered not only by their owners, but by the public, as private property. This was when railroad building, as a means of developing and making available vast stretches of territory, was the prime necessity of the people, and when the thing of first importance was to encourage the use of private capital in these pioneer enterprises. As a means of giving this encouragement, private investors were invited to build railroads, with no suggestion that a system of public regulation would supersede the right of private use and management. Under this conception of the nature of these properties, it inevitably happened that, as the railroads were to be used for private ends, their managers felt at liberty to make bargains solely from the standpoint of the private gain of the company. They sold transportation to those of the public who took it by wholesale at prices and on terms different from those on which they sold to the individual who took little of it. They gave rebates to those of sufficient commercial importance to demand them, while denying these concessions to others. They did things which they deemed would increase their business and their profits, such as many engaged in other forms of industry still do, without recognizing that their form of industry differed from most other forms of industry, in that there inhered in it a peculiar public, as distinguished from private, interest in the character of their services and in the terms on which they were performed.

TRANSPORTATION BUSINESS STARTED ON WRONG BASIS.

This conception of the business of transportation, entertained at once by the authority which granted the original charters and by those who had ventured their means in making them a success, was at the same time conceded and encouraged by the public, but we now deem that it was fundamentally unsound. It was based upon a principle of the relation of the state to industry, which, like some others, has gone down in a revolution of public opinion. It ignored the controlling influence which transportation, as distinguished from most other forms of industry, was in time to exert upon the public welfare. It failed to take into account the fact that the fate and the fortunes of industries, of individuals and of communities could be made or marred by a few men controlling, for the gain of private owners, the transportation facilities of the country. It failed to recognize that a power harmless enough when it was granted might in time become with exercise so great as to be a political menace.

Whatever was its original quality, an economic conception which differed fundamentally from a political tendency could not be suffered permanently to survive in a democracy. As the economic necessity, considered from the standpoint of the prime interest of the people, for the building and extension of railroads began somewhat to decline, the public mind commenced to busy itself with other related questions chiefly economic in their character which were then pushing to the front—with the question of how competition or the opportunities for competition created by the railroads, was affecting rival markets, or rival producing centers, or rival commodities and industries, or aspiring and rival communities. It was perceived that the conception of private ownership, accompanied by the unqualified and unregulated right of private use for private gain, gave to the private owners in the last analysis the power of commercial life or of commercial death over individuals and over industries and communities, and could not in the general interest be tolerated.

A NEW CONCEPTION

This resulted in the recognition of a new conception—that a right exists in the public to regulate the use of these privately owned and privately managed properties, and immediately efforts began to be made, with more or less definiteness of purpose and with more or less moderation, to regulate by governmental authority the use by their owners of privately owned transportation properties.

The appearance of this new conception marked the beginning of a bitter controversy between the owners of these properties, on the one hand, who had invested their money believing that they were not surrendering the right of private and unregulated management, and, on the other hand, representatives of the public, who asserted the right and the duty of the government to control the power of private management and to subject the use of these properties to complete and effective regulation—to go far beyond the regulation of the original economic questions and to interfere even with the smallest details of physical operation. This controversy was fiercely waged for many years. Its virulence was intense, but not without precedent. In all history the conflict of creeds, of ideas and of systems has been bitter and has been merciless.

REGULATION WITHOUT RESPONSIBILITY

In this conflict the public has come out victorious, and in its victory has been illustrated the cycle theory of the philosophy of history. In the bitterness which the conflict engendered, the conception of a public right of regulation has gone as far in the direction of error on the one side as the conception of private ownership and private management had previously gone in the other. It has come about that the public denies not only the right of unregulated use, but also the right of unqualified private ownership. It has resulted in the assertion of a power of public regulation without the assumption of any corresponding duty or responsibility. In these days of revolution of opinion the views of the extremists have for a time prevailed, and the power of regulation has been pushed to an extent not anticipated when the right of reasonable regulation was first actively asserted. The pendulum has now swung to an extreme on the side of irresponsible public power, as it had previously swung to an extreme on the side of irresponsible private ownership.

In the clash of this controversy and in the flush of the victory of the conception of irresponsible power in the public, many forces have been developed and have found encouragement which are now difficult to control, and the real interest, as well as the real right, of the public in the system of transportation has been given a false perspective.

A FOOTBALL OF POLITICS

One of the most significant, as well as one of the most embarrassing and important developments has been that this great business question has been injected into politics and has come to be regarded as a valuable political asset by men aspiring to public office. It has been found easy to interest and to agitate the public mind on the subject. Possessing many technical sides difficult of comprehension by those uninstructed by practical experience, requiring a large and comprehensive view adequate to take in and properly to balance the rights and interests of all commerce and of all communities, no matter how differently

*An address before the Railway Business Association, New York, December 10, 1914.

circumstanced or how widely separated, the economic, as distinguished from the physical, problem of the railroad manager possesses little which will appeal to the popular imagination, but much that can be used by the skillful agitator to produce misunderstandings of motives, misconceptions of purposes and policies, and so to arouse local and neighborhood prejudice.

The only appeal the railroad manager can make is to the spirit of thoughtful consideration, of wisdom and moderation of the people. Here is his handicap. To be successful such an appeal takes time, for the history of popular government shows that it takes time for the public to reach its final conclusion on any important question, especially on one of an economic nature. On the other hand, the appeal of the agitator is to the immediate selfish interest, to prejudice and impulsive judgment and to the spirit of quick and active resentment of the people. Such an appeal does not take time, and the result in respect of these properties is that many impulsive and inconsiderate conclusions find their way into statutory or commission-made law which the sober judgment of the people will not subsequently approve. Meanwhile, however, a business of the highest public importance, one which to be successful must be subject to a wise, stable, consistent and constructive policy, has been made the victim of a judgment which is impulsive and ill-considered, a judgment founded upon an inadequate comprehension of the problem in all its reach and consequence.

A natural corollary to the view which would make the transportation question a football of politics, which would consider it merely from the standpoint of its advantage to the political fortunes of the aspirant for public place, is that common carriers, in respect of their regulation, may be considered of public concern when it is advantageous to do so and of private concern when that course constitutes the chief political advantage. This means that, if considerations of important political advantage are dominant, these carriers are considered as public when it comes to the imposition of burdens and to limiting charges or regulating operations, but private when it comes to creation of credit or improvement of conditions. In other words, there seems to be in many minds the false conception that, in the matter of imposition of burdens, railroad companies are public concerns and subject to the public regulating power, but, in the matter of relief, are private property and not entitled to be considered from the standpoint of their public service.

This has been strikingly illustrated by some of the contentions recently made in the advance rate hearing before the Interstate Commerce Commission. There the question was asked why it is that railroads should be permitted to increase their charges at a time of general business depression and when all other industries are suffering from decreased revenues. In the last analysis, the basis of this suggestion is that railroads, in respect of this matter, stand as private enterprises and represent only a private interest. It is an assertion of the proposition that their private owners alone are concerned with the question of sustaining their operations. It ignores the principle, so often relied on in other connections, that railroads are engaged in a governmental function and are doing a thing essential to the public welfare. It loses sight of the fact that the maintenance of transportation facilities is a condition precedent to the success of every private enterprise and to the return of prosperity to all the people. It takes no note of the public nature and of the public obligations of the transportation business.

If, however, the question comes of a reduction of transportation charges, or of the imposition of public burdens, the teachers of this doctrine insist loudly on the public right and the public power of regulation and control. This inconsistency of attitude on the part of those often influential in public affairs, produces, in respect of matters involving the continued efficiency of the carriers, a situation of instability and uncertainty which is of vital consequence to the public.

One of the outgrowths, full of menace, of this situation is the appearance in our public affairs of men who assert successfully an influence in directing the regulating power of government, but who are without any responsibility, official or otherwise, for the consequences. The conscientious railroad manager, responsible alike to those who invest their private means in the establishment of these properties and to the entire public for the success of the transportation system, is confronted by men who criticize and oppose, but on whom will fall none of the responsibilities or burdens of failure. The intrusion of these irresponsible influences into the settlement of transportation problems comes from the necessity of giving their solution a political rather than a business, aspect and is the outgrowth of the political conditions which menace the stability and usefulness of these great transportation properties.

Transportation is a business, and, if it is to be efficiently and successfully conducted, must be managed on business principles. In no other way can it survive or be supported as a business.

As the manager of transportation properties have, in the public interest, been largely deprived of the power of business management, any successful system of public regulation must apply to the regulation of these properties sound and just business principles and not merely the force of repression. A manifest danger of a system of regulation controlled by politics is that it will be administered on the principle of always reducing the cost of service to the public as a means of appeal to popular approval, and thus doing to the railroads all that can be done in the direction of curtailing their business prosperity short of bringing destruction upon them. No business enterprise, dependent for its usefulness upon its growth, can live if always kept down near the point of starvation.

UNITY OF REGULATION NECESSARY

There is another complication in the theory of regulation as it is practised today which also has its origin in a political condition. We have seen the unifying forces of steam and electricity change the map of the commercial world. They have introduced conditions which can not be ignored by those who would give to the public adequate service in transportation. A transportation system to be efficient must be co-extensive with the transportation needs of the people whom it serves. If their business needs ignore state lines, the railroads which would give them adequate service must adapt themselves to that condition. The business of a people that seeks all markets without regard to political subdivisions of territory can not be successfully carried on if their means of transportation are halted at state lines, either by physical interruption or by unwise, inconsistent or exaggerated local regulation.

The same interest of the people which demands that these transportation facilities extend in physical continuity across state lines likewise requires unity of management and control. This, of course, is impossible without unity of governmental regulation. While the preservation of the states in their complete constitutional integrity is a fundamental necessity of our system of government, it is equally essential that their power should not be extended beyond their constitutional limitations.

At a time and under conditions when the existing development of our continental commerce was inconceivable, the fathers of our government had a vision which was a miracle, and it resulted that the states, in the constitution, confided to the federal government the power to regulate interstate and foreign commerce. This of necessity involves the power to regulate the instruments of interstate and foreign commerce. And yet, in response to the exigencies of political warfare, it is easy to raise a controversy between the power of the states and the power of the federal government as to the line of demarcation between their respective powers as related to this question. In fact, the controversy as to the rights of the states has been the great historic controversy between differing schools of political thought among our people. The growth of commerce has injected the question of the regulation of commerce into this states' rights controversy as a factor of prime importance. The question of what will promote and what will retard the efficiency and usefulness of a transportation system often becomes obscured and is lost sight of while the ad-

vocates of these differing schools of constitutional philosophy fight out their wars. And yet a business enterprise, if it is to succeed, can not be subject to these political uncertainties: nor can a business enterprise, dependent for its efficiency and usefulness on its unity of regulation and management, be wisely left subject to many masters with differing views of public policy and with widely varying conceptions of its problems.

Even without any wide divergence of view, the mere existence of a power of management in many masters which may be exercised with different degrees of promptness, or which, if not actually exercised at all, is constantly made the basis of proposal and agitation, constitutes an obstacle in the way of effective and successful railroad management which can not be overstated. It may be claimed that our experience has demonstrated that a multi-form system of regulation is as economically unsound as the lack of any regulation, for the railroad problem can no longer be considered as of merely local concern any more than it can be considered of merely private concern. One of the greatest evils of the present system in this respect is that the capacity for efficient management is weakened. An undue proportion of the time of the responsible railroad manager and his responsible assistants is diverted from the useful duties of management to the calls for explanations and arguments before many different state authorities when all that is necessary might be accomplished before one central regulating body.

An efficient management is admitted by all to be a large factor in securing for, or continuing to, the public a low basis of transportation charges under existing conditions. It follows that there is an obligation of efficiency in regulation as great as the obligation of efficiency in management.

IMPORTANCE OF PROMPT DECISIONS

In suggesting that consideration it becomes one's duty to call attention to one of the most dangerous weaknesses which has developed in the system we have experienced, namely: its inability to give prompt decision to the business questions which must be determined. No man of business experience needs to have pointed out how essential is promptness, or the capacity for promptness, in dealing successfully with a business situation. That business in which there is no capacity for promptness is fatally hampered. If there is a legitimate and pressing need for more revenue, the power to authorize or to produce it must be capable of being brought into action at once. If economies must be introduced, the power of management must be capable of responding promptly to the need. If a change of policy is demanded in the public interest, the power to pass upon the question must be capable of convenient and prompt exercise. It may be justly said that the consensus of opinion of thoughtful men everywhere is that the existing system of regulation is fatally defective in respect of its capacity for prompt action.

WHAT IS NEEDED

To sum up what has been here suggested: no system of governmental treatment of this subject can be permanently successful which fails to conserve the things that are essential to railroad growth and efficiency. Prominent, and in fact first, among these essentials is adequate railroad credit. To secure this a system of successful regulation must be a system of protection as well as of correction. Even a conquering army feeds its prisoners. Our existing system has well served the purpose of correction, but we have seen it hesitate when called upon to protect. We need a system of regulation which will recognize the whole duty of government, which can as readily build where things are sound as cut away all fungus and unhealthy growths: a system which will bring stability of service and of credit as well as equality and fairness of treatment. None of this can be if the system of regulation is founded on the shifting sands of politics.

It must possess a capacity and be controlled by a purpose, of promptness in affording required relief and in meeting business conditions as well as in the removal of recognized abuses. This is also inconsistent with a mere political conception of the duties and responsibilities of regulation.

It must be possessed of an authority co-extensive with the subject to be regulated. Its powers must not be divided and scattered among a number of independent regulating bodies, many of them responsible to a part only of the public whose welfare is involved, all of varying outlook and influenced in their conclusions by differing policies and often by clashing and conflicting interests. This is inevitable, if regulation by the states and regulation by the federal power are both to be preserved.

PRESENT METHODS CANNOT ENDURE

Like the previous stage of irresponsible private control, the existing system of irresponsible, rigid and divided regulation can not permanently endure. So long as the chief need was of a public prosecutor, it served its function, but, when the demand was for statesmanship, it failed by reason of a constitutional incapacity which relates back to its origin, to its political progenitors. This is no criticism of individuals but the indictment of a social tendency. No more does it mean that we must abandon the principle of reasonable and efficient regulation: that we must turn from Scylla of irresponsible regulation to the Charybdis of government ownership. It is an argument that a system of reasonable, balanced and non-political regulation has not failed because it has not yet been generally tried.

Whatever may be the individual view, no one will deny that these considerations present a problem, and that a problem still unsolved. Its subject matter is of transcendent public interest and consequence. It is, as was recently suggested by President Wilson, "the one common interest of our whole industrial life." My present purpose is not to venture to suggest the solution but the source from which an acceptable solution must come. As it is a big problem, it must be solved in a big way.

A STATESMAN'S OPPORTUNITY

A solution is not likely to be accepted if the suggestion comes from the railroad manager, because he is still supposed to look at only one side of the question and to be controlled by a selfish interest.

It can not come from the mere politician, because of his narrow vision and his temptation to keep the question unsolved as a means of easy political agitation and as a valuable asset for temporary political advantage.

"Who then will be sufficient for these things?"

The problem is a statesman's opportunity. It is as great a problem as has confronted the statesmen of any age. He who solves it must be trusted by all the people. He must be above the suspicion of selfish motive. All the lessons of history must be at his command. He must be a profound student of human action and of human government. He must have power to impress his views upon his fellowmen. He must be able, with just and equal hand, to divide unto capital and unto labor its living. He must be able to assure the public of the correction of abuses, the establishment of justice and the maintenance of facilities adequate for their needs, and he must be able to assure the private owner of protection of his just interests and of fairness to his just rights. He must be able to reconcile the people to his philosophy of regulation and the politician to the loss of a highly valued political asset.

Is there a man among us who is capable of this?

I venture to suggest that the present President of the United States is equal to this great achievement. The time seems ripe for him to undertake it. His administration came into existence pledged to the correction of abuses in business life and to a constructive work which would build healthily and mightily to a greater and sounder prosperity. Doubtless the specific things embraced in his program of correction have been largely accomplished. Some parts of his constructive program—notably the creation of a new banking system—have also been carried out. But, of course, his comprehensive appreciation of commercial conditions brings to him the realization that much which is constructive remains to be done.

Having arrived at the constructive period of his administration, he can perform no higher or more useful public service than by

proposing and carrying through a solution of the transportation problem.

He has recently, in an impressive way, shown publicly a sympathetic appreciation of the railroad situation. In his response to the appeal of the railroads last September, he called the attention of the country to "the imperative need that railway credits be sustained and the railroads helped in every possible way," and disclaiming any "deep anxiety" that this would not be done, he gave as his reason "that the interest of the producer, the shipper, the merchant, the investor, the financier and the whole public in the proper maintenance and complete efficiency of the railways is too manifest." "They are," as he expressed it, "indispensable to our whole economic life, and railway securities are at the very heart of most investments, large and small, public and private, by individuals and by institutions."

The fact, thus made evident, that he has grasped the point of view from which a solution of this problem must be approached, has aroused in the minds of many the hope that before laying down the reins of government he will propose and work out some constructive plan that will give stability to railroad investment and growth. May we not ask that he will undertake the work? The people of the United States have called him to the leadership of this nation. They have entrusted him with their power. He has responded by notable public service. Is it too much to ask that he undertake this problem also and bring to its solution the wisdom and power which he has already used so effectively in the public interest?

No ambition could be more worthy than to establish a "Constitution of Peace" among the variant views and interests which menace the success of the system of transportation so essential to the public welfare. No service to his fellowmen could be a loftier or finer service than to place this high interest of the people upon a sound, a stable and a permanent foundation.

I think I properly interpret the men now charged with the responsibility of railroad management when I say that they will welcome a solution of the problem, however it may differ from any preconceived views, and will meet any suggestion that may be made in a co-operative and a helpful, and not in a carping or obstructive, spirit. They are as anxious as the most public-spirited statesman for a just and final settlement of transportation controversies. When it comes to the consideration of any proposal, they may be relied on to put aside prejudice and pride of opinion, for they, of all others, are best aware of the imperative need of the railroads for an adjustment of all differences and for public approval, sympathy and support. Opposition must come from outside the railroad ranks. The problem is, then, how shall the transportation system of the United States be put upon an assured foundation of efficiency, usefulness and success? Here is "a statesman's opportunity."

COMPARATIVE SERVICE TESTS OF 100-POUND SECTIONS, P. S. AND A. R. A.—A RAILS ON THE PENNSYLVANIA LINES*

By W. C. Cushing

Chief Engineer Maintenance of Way, Southwest System, Pennsylvania Lines.

In 1909 the Pennsylvania purchased 1,535 tons of A. R. A. type "A" rail, for service comparison with the standard P. S. type. Both types of rail were of Bessemer steel, weighing 100 lb. per yard, manufactured by the Carnegie Steel Company at the Edgar Thomson mill, in February, 1909, and were laid at various places on the Pittsburgh division in November, 1909. A record of failures is being kept. A portion of each kind of rail was singled out to be laid on a very sharp curve to test the relative abrasive resistance to the car wheels passing over it. It is this test which is the particular subject of this discussion.

There is a great deal of curved track on the Pennsylvania system, and a somewhat heavy-headed rail has been adopted as standard, because of the belief that it would last longer on such alinement than a comparatively thin-headed rail. As the two lots purchased represented the two different designs, it was hoped and expected that differences, if any existed, would be clearly indicated. It must be borne in mind that this was only one test, and that usually many are necessary before a definite and precise rule can be prescribed.

For the abrasive test, a 7-deg. 45-min. curve at the west end of the Dinsmore tunnel, about 30 miles west of Pittsburgh, was selected near the summit of a 1 per cent grade in each direction. The rail was laid on the eastbound track, which is elevated for a speed of from 30 to 40 miles per hour. The west half of the curve was laid with the P. S. rail and the east half with A. R. A. —A rail.

Twelve rails were selected for periodical measurements with a section lining machine, the lengths of the periods being six months, one-half of them on each kind of rail and one-half of each kind being on the low or inside and the others on the high or outside. After removal the 12 rails were sent to the Pennsylvania laboratory at Altoona for chemical and physical survey.

The material in the rails was fairly uniform and none of it segregated, except in two instances, with the P. S. section. With the exception of these two rails the chemical and physical characteristics seem to point to fairly uniform and good material for Bessemer carbon steel. The carbon of the A. R. A. rails may be considered a trifle higher, as is also the manganese and the sulphur. The hardness indicated by the Brinell and scleroscope tests was very much the same in each case, there being but ordinary differences. In only two rails was the upper limit of carbon exceeded, while all of them were quite well above the lower limit. The phosphorus in all kept pretty close to the specification limit. The manganese in all but two was close to the desired quantity of 1 per cent. The tensile strength of all was fairly good, with the exception of the two segregated rails.

The rail which was removed in order to allow the test rails to be laid was 100-lb. Bessemer steel of A. S. C. E. section, rolled by the Carnegie Steel Company, at the Edgar Thomson mill in April, 1907, but as no chemical and physical survey was made of the actual rail, the average mill figures of the month of May, 1907, during which this rail was rolled, were used.

On the whole it would seem that if there is any advantage to be derived by one section over the other on account of quality of material, it rested with the A. R. A. type "A" section in this particular test, although the differences were extremely slight. The rail was laid in November, 1909, and removed in August, 1911, after one year and nine months' service, on account of the A. R. A. type "A" rail being considered too badly flange worn for further service. The P. S. section was not considered to have reached its limit of abrasion at the same time, but owing to being laid on the same curve it was necessary to remove both kinds at the same time. It took the P. S. section one year and nine months to have the same average amount, 0.62 sq. in., abraded from the heads of the six test rails, as was abraded in one year and five months from the six test rails of the A. R. A. type "A" section. These two rail sections are compared under the same conditions, the abrasion per 10,000,000 tons of traffic being 0.27 in the case of the P. S. section and 0.36 in the case of the A. R. A. type "A" section. The abrasion of the A. S. C. E. section was but 0.22 per 10,000,000 tons of traffic, but one cannot feel quite as sure about the accuracy of the amount of tonnage passing over it as in the other cases, because the information was acquired by searching over back records after the A. S. C. E. rail was removed and not in keeping the record during the time the test was in progress, which was done in the case of the other two sections.

In the total quantity, 1,535 tons of A. R. A.—A rail laid in service in 1909, there have been 157 failures, or 1,023 per 10,000 tons of rail laid. Of the 157 failures 108 were on tangent and 49 on curve.

Three were broken rails, two on tangent and one on curve, and 10 were classified as "split web," while all the others, 144, were head failures, principally split heads.

*Abstracted from Bulletin No. 169 of the American Railway Engineering Association, just issued.

Boiler Design in Respect to Heating Surface

Calculations Based on Cylinder Horsepower Requirements; Effect of the Length of Tubes on Boiler Capacity

The paper on Steam Locomotives of Today, which was published in the *Railway Age Gazette,* November 20, 1914, page 947, was presented as the report of the sub-committee of the Railroad Committee of the American Society of Mechanical Engineers at the annual meeting in New York, December 2, and was thoroughly discussed from a number of standpoints. Below are given parts of the discussion by F. J. Cole, consulting engineer of the American Locomotive Company, and C. D. Young, engineer of tests of the Pennsylvania Railroad, on the subject of boiler design in respect to the factors making up heating surface.

DISCUSSION BY F. J. COLE

In recent years, locomotives have increased so much in dimensions, weight and power that methods employed in the past are no longer adequate in proportioning the grate, heating surface, length and diameter of tubes, etc., or to predetermine how best a locomotive boiler may be designed to suit certain requirements, the type, tractive effort and limitations of weight being known.

The size of cylinders is usually fixed by the permissible axle load allowed upon the track or bridges, in connection with the type, the diameter of the driving wheels, the boiler pressure and the factor of adhesion. After these fundamental features are decided upon, the boiler proportions must be outlined to see whether the required amount of heating surface can be obtained without exceeding the limits of weight.

There are two general questions involved in the consideration of this subject, namely, how many pounds of steam per hour are required to supply the cylinders in order to develop the maximum horsepower; and what proportion of grate, firebox and tube heating surface will best produce this amount of steam.

The locomotive, unlike most steam plants, varies in the speed and power developed. It must be able to run at any intermediate speed between starting and its full velocity and at the same time develop all degrees of tractive effort within its capacity. At slow speeds the maximum pull must be exerted in order to start the trains easily, and for this reason the live steam is admitted to the cylinders during 80 to 87 per cent of the stroke. As the speed increases it is necessary to reduce the admission period, thereby increasing the expansion of the steam; therefore for any speed there is some point for the valves to cut off the live steam, at which the engine will develop its maximum power. There is also some minimum velocity at which the full horsepower of the locomotive is attained; after this velocity is reached the horsepower remains constant or slowly decreases. This critical point may be taken at 700 ft. to 1,000 ft. per minute piston speed.

It has been customary to use certain ratios, based on cylinder volume, for locomotive proportions. These ratios left to individual preference such matters as rate of combustion per square foot of grate, length of flues, evaporative value of firebox heating surface or value of tube or flue heating surface in relation to the length, making it desirable to proportion boilers upon more uniform methods in which these variable factors are given due consideration.

Four or five years ago the writer collected a considerable amount of data on this subject and drew up a report with the object of reducing this matter to a more uniform basis, substituting for the ratios hitherto employed, cylinder horsepower requirements. Suitable values were assigned to grate surface, firebox heating surface, tube heating surface, etc., with corresponding evaporative values, so that the balance between the amount of steam required by the cylinders and the amount of steam which the boiler was capable of generating could be expressed in percentage of cylinder horsepower. The tests made on sectional boilers on the Northern Railway and the Paris, Lyons & Mediterranean Railway of France, those of Dr. Goss on a Jacobs-Shupert boiler, and tests by the Pennsylvania Railroad on the Altoona testing plant were examined in order to obtain data on which to base the evaporative values of different points of the boiler. It is obvious that the evaporative value of a boiler tube of given diameter varies greatly with its length. The temperature of the firebox is fairly constant under similar conditions of draft and rate of combustion, therefore the temperature of the smokebox will be reduced with an increase in the tube length. While some additional draft will be required to draw the gases through the tubes, yet the net result is a greater heat absorption between the firebox and smokebox. The thermal efficiency of the engine is increased within certain limitations by the use of long tubes. Of course there is a certain economical length of tube which is determined mostly by the number and arrangement of wheels or the type of the engine which the service requires and only partly by thermal conditions.

About 1899 the wide firebox Atlantic (4-4-2) type locomotive was introduced. Because the firebox was placed behind the driving wheels the grate area could be made to suit the power of the locomotive; therefore it was no longer necessary to force the rate of combustion to 180 lb. and 200 lb. of coal per square foot of grate area per hour. Very poor results were obtained when high rates of combustion were necessary, because much unburned coal was drawn through the tubes into the smokebox and thrown out through the stack by the violent draft. With the Atlantic type locomotive, tubes 15 ft. and 16 ft. long, and sometimes longer, were necessary. While at first there was some apprehension as to leakage with tubes of these lengths, it was soon found that no more difficulty was experienced in maintenance than with short tubes. With the introduction of the Pacific (4-6-2) type and Mikado (2-8-2) type, and other locomotives using trailing trucks, still longer tubes were required. Tests made on long tube engines, compared with older locomotives with shorter tubes, showed a noticeable reduction in smokebox temperatures.

Instead of the old arbitrary method of designing locomotive heating surface by cylinder ratios, the idea of using the cylinder horsepower suggested itself as forming a very desirable basis for the heating surface, grate area and tube area. Curves were prepared from the most recent available data showing speed factors or drop in M. E. P. in relation to velocity. With saturated steam the average maximum horsepower is reached at about 700 ft. piston speed per minute, speed factor .412; constant horsepower is obtained at 700 to 1,000 ft. piston speed, and the horsepower decreases slightly at higher velocities for average conditions when engines are especially constructed for the highest speeds. For superheated steam the average maximum horsepower is reached at 1,000 ft. piston speed, speed factor .445, and constant horsepower at higher speeds. Because the horsepower is based on piston speeds, the stroke and diameter of wheels is omitted in the following figures, the calculation becoming by cancellation:

$$\frac{.85\ P \times .412 \times 1{,}000 \times 2\ A}{33{,}000} = \frac{1.7\ P \times .412 \times A}{33} = .0212 \times P \times A$$

$$HP. = .0212 \times P \times A$$

in which A = area of one cylinder in square inches.
P = the boiler pressure.
.412 = speed factor.

In a similar manner the horsepower calculation for superheated steam becomes:

$$HP. = .0229 \times P \times A$$

using .445 as the speed factor.

The maximum horsepower can sometimes be increased when the locomotive is operated under the most favorable conditions. It is considered safer and better practice, however, to take figures which represent average conditions rather than the abnormal and unusual figures obtained when all conditions are most favorable.

The horsepower basis affords many additional advantages in designing locomotives. For instance, in determining the maximum amount of water and coal required per hour, the size of the grate is found to be proportional to the amount of coal that can be burned to the best advantage, to be varied according to the quality. Knowing the amount of coal required per hour directs attention to the question of hand firing or the use of a mechanical stoker. Knowing the amount of water evaporated per hour determines the location of water stations, size of tender tank, the size of injectors and safety valve capacity, also the size of steam pipes and other features of the boiler. Through the stack a mixture of gas and exhaust steam is ejected at substantially the same velocity for all locomotives in similar service, and proportional to the amount of coal burned. For this reason the area of the stack may be taken as proportional to the maximum amount of coal burned per hour in the firebox.

From the reports of the Pennsylvania Railroad testing plant at St. Louis and Altoona, and from road tests, the conclusion is reached that with saturated steam a horsepower can be obtained from 25 to 29 lb., of saturated steam in simple cylinders with piston speeds of 700 to 1,000 ft. per minute; 27 lb. has been taken as a fair average value, and in a corresponding way 23½ lb. for compound engines, 20.8 lb. for steam superheated 200 deg. and over, and 19.7 lb. for superheated steam used in compound cylinders. These figures provide for steam for auxiliaries. While careful tests show that the evaporation can be increased under the most advantageous conditions, such as best quality of picked coal, clean fire, high degrees of smokebox vacuum, etc., it is considered better practice to take the lower figure in order to provide a margin for average conditions.

The great increase in the length of tubes which took place with the building of trailing truck locomotives, naturally directed attention to the values of the heating surface of different lengths of tubes and emphasized the fact that a square foot of heating surface in tubes 10 ft. or 11 ft. long had a much greater evaporative value than in tubes 18 ft., 20 ft. or 22 ft. long. In the absence of definite temperature tests of different parts of a tube, it was thought that the evaporative value varies inversely as the square root of its length. Pyrometer tests recently made by the Pennsylvania Railroad at Altoona with various locomotives on the testing plant showed that the temperature curve of tubes of various lengths and diameters follows somewhat different laws. From the many observations of pyrometer readings taken at various portions of the boiler tube, curves have been drawn which show the decrease in temperature from the firebox to the smokebox. From these curves the increase or decrease of tube evaporation may be calculated.

Short tubes have much greater evaporative value per square foot of heating surface than long tubes, but they discharge the gases into the smokebox at much higher temperatures. Therefore, while the heat absorbed per foot of length is much greater for short than long tubes, it is not so economical. The short tube boiler, other things being equal, requires more coal for a given evaporation than a boiler having long tubes. Where tube lengths of 12 or 14 ft. were common 14 or 15 years ago, lengths of 20, 22 and even 24 ft. are used in the modern locomotive. The result is that the smokebox temperatures have decreased from between 750 and 800 deg. to 550 or 600 deg., the only increase of energy required being the slightly greater draft in the smokebox to pull the gases through the long tubes. This is not intended as a defense of the long tube in modern engines, especially of the 4-6-2, 2-8-2, Mallet and other types, because in most cases their construction requires long boilers. Tests show that economy results from the better utilization of heat in the modern engine than in older types because the range of temperatures between the furnace and the stack is greater with the long tube locomotive.

As a result of the investigations previously outlined, conclusions have been arrived at as follows:

Firebox Evaporation.—An evaporation of 55 lb. per square foot of firebox heating surface, combustion chamber and arch tubes has been adopted. The greater absorption of heat by the firebox than by the rear portion of tubes per unit of area is largely due to radiant heat. This varies as the square of the distance from the surface of the fire to the sheets separating the gases from the water. Again, it is probable that within certain limitations the amount of heat absorbed is independent of the heating surface and is a function of the grate area or the area of the bed of live coals. Assuming that there is sufficient heating surface to absorb the radiant heat, it is probable that very little additional heat will be absorbed by increasing the firebox heating surface. It therefore follows that the relatively greater area of the fire in proportion to the absorbing surface in wide firebox locomotives is more efficient than in the old narrow firebox.

Diameter, Length and Spacing of Tubes.—The evaporative value in pounds of water per square foot of outside heating surface has been approximately calculated for 2 in. and 2¼ in. tubes, and for superheater flues 5⅜ in. and 5½ in. The range of length is 10 to 25 ft., and the spacing 9/16 in. to 1 in. The best data available shows that the evaporative value of a tube or flue varies considerably with differences in length, diameter and spacing. The curves of temperature compared with length have been used as a basis for determining the evaporation for different lengths of tubes and flues. The rate of evaporation on this basis will vary directly as the difference of temperature of the tube or flue gases and that of the steam contained in the boiler.

Tubes and flues from 10 to 24 ft. long, spaced 9/16 in. and 1 in. apart, outside diameter 2 in, 2¼ in. and 5¼ in. will evaporate from 7.50 to 14 lb. of water per square foot per hour.

Grate Area.—The grate area required for bituminous coal is based on the assumption that 120 lb. of coal per square foot of grate per hour is a maximum figure for economical evaporation. While 200 and 225 lb. have at times been burnt in small, deep fireboxes and the engines made to produce sufficient steam, it is wasteful of fuel and it has been found after numerous and careful tests that the evaporation per pound of coal under these conditions is very low. If, on the other hand, the rate of combustion is too slow, economical results will not be produced owing to the fact that at least 20 per cent of the coal burned produces no useful work in hauling trains, but is consumed in firing up, waiting at roundhouses or terminals, on sidetracks, or to the fact that the greater portion of the time locomotives are used at considerably less than their maximum power.

For hard coal the grates should be proportioned for a range of from 55 to 70 lb. of coal per square foot per hour, according to the grade of the fuel.

Complete tables of horsepower for saturated and superheated steam, evaporation of tubes and flues of various lengths, diameters and spacing, as well as diagrams of temperature for different flue lengths, have all been prepared to facilitate the calculations in determining the proportions of grate, firebox, tube and flue heating surface.

It must be remembered, however, that the boiler capacity for a locomotive when other things are in proportion cannot usually be made too large within the permissible limits of weight, and it can be shown by numerous tests that such in-

crease in boiler capacity makes for considerable economy in the use of fuel and steam. For passenger service the boilers may often be made with advantage over 100 per cent.

In a general way, a boiler will have ample steam making capacity if proportioned by this method for 100 per cent, provided the grate is sufficiently large and deep so that the rate of combustion at maximum horsepower does not exceed 120 lb. of coal per square foot of grate per hour for bituminous coal of average quality. For gas coal a smaller grate may be used, but it is better practice to use the larger grate and brick off a portion at the front end in order to obtain sufficient volume of firebox for proper combustion, because nearly all modern locomotives are deficient in firebox volume.

C. D. YOUNG'S DISCUSSION

On the Pennsylvania Railroad it is believed that the tendency at the present time should be to increase the firebox heating surface, as it should be realized that it is of comparatively greater effectiveness at mean and low rates of working than the remaining surface of the boiler. Some few years ago when large boilers were designed the tendency was to make the ratio of the firebox to the total heating surface less than 6 per cent. This resulted in locomotives which, although efficient in evaporation, were not free steaming, as they lacked capacity unless very heavily drafted. It is my opinion that the firebox heating surface should be at least 7 per cent of the total heating surface of the boiler, in order to provide a free steaming locomotive, and that when this ratio is satisfied, good results will follow, provided the tube heating surface has been properly proportioned. When working the boiler at high rates of evaporation, however, the tube surface is fully as effective as firebox surface, and for large capacity a large tube heating surface is necessary.

We do not agree with the recent tendency toward excessively long tubes, as beyond a certain length of tube there is too great a sacrifice of boiler capacity in the interest of economy in coal. The long tube presents a very serious obstruction or resistance to the flow of the gases, and beyond a length which appears to be about 100 internal diameters, this obstruction increases without a corresponding increase in evaporation. The locomotive with a long tube is a slow steamer and a higher draft must be furnished in order to create an active fire. This rule that the length of tube should be 100 times the internal diameter has been applied to three new classes of our locomotives with exceedingly gratifying results, and confirms the earlier experiments which were made by us upon this subject, as well as those made by M. A. Henry, of the Paris, Lyons & Mediterranean Railway of France.

ACCIDENT BULLETIN NO. 51

The Interstate Commerce Commission has issued Accident Bulletin No. 51, containing the record of railway accidents in the United States during January, February, and March, 1914. The number of persons killed in train accidents was 120, and of injured, 2,371.

The total number of casualties of all classes reported, including industrial accidents, was 2,108 killed and 42,414 injured. The accidents are summarized as follows:

TABLE NO. 1.—*Casualties to persons—Steam railways*

Causes	Passengers		Employees (including employees not on duty)		Other persons (trespassers and non-trespassers)		Total persons	
Train accidents.	Killed	Inj'd	Killed	Inj'd	Killed	Inj'd	Killed	Inj'd
Collisions	6	553	55	602	2	54	63	1,209
Derailments	6	494	37	427	6	35	49	956
Miscellaneous, including boiler explosions	1	30	7	176	...	...	8	206
Total	13	1,077	99	1,205	8	89	120	2,371
Other than train accidents.								
Accidents (293) to roadway or bridges not causing derailment	...	...	...	2	...	...	...	2
Other accidents (classes C3 to C12, inclusive)	39	1,616	574	11,429	1,296	2,317	1,909	15,362

Grand total	52	2,693	752	37,315	1,304	2,406	2,108	42,414

Table No. 1A, following, presents comparisons with the bulletin next preceding and the bulletin covering the corresponding quarter of the previous year.*

TABLE NO. 1A.—*Condensed summary of fatalities.*

	Item	Bulletin No. 51	Bulletin No. 50	Bulletin No. 47
1	Passengers killed in train accidents	13	34	15
2	Passengers killed, all causes	52	85	68
3	Employees (on duty) killed in train accidents	99	137	132
4	Employees (on duty) killed in coupling	44	49	62
5	Employees (on duty) killed, total	608	730	734
6	Total passengers and employees (items 2 and 5, above)	660	815	802
7	Other persons killed (including trespassers, nontrespassers, and employees not on duty), all causes	1,369	1,860	1,442
8	Employees killed in industrial accidents	79	117	97
	Grand total (items 6, 7 and 8)	2,108	2,792	2,341

*Preceding bulletins have been noticed in the *Railway Age Gazette* as follows: No. 50, July 24, 1914, page 170; No. 49, May 15, 1914, page 1072; No. 48, March 6, 1914, page 468; No. 47, October 24, 1913, page 759.

The total number of collisions and derailments reported was 3,185 (1,223 collisions and 1,962 derailments), of which 137 collisions and 156 derailments affected passenger trains. These are classified as follows:

TABLE NO. 2.—*Collisions and derailments*

No.	Classes	Number	Killed	Inj'd	Damage to road and equipment
	Collisions:				
1	Rear	191	14	321	$172,504
2	Butting	112	18	328	168,962
3	Trains separating	97	3	21	48,450
4	Miscellaneous	823	28	539	398,821
	Total	1,223	63	1,209	$788,737
	Derailments due to—				
5	Defects of roadway	480	10	389	$429,032
6	Defects of equipment	967	7	113	733,127
7	Negligence	86	6	88	63,563
8	Unforeseen obstruction	92	10	108	76,412
9	Malicious obstruction	12	5	36	15,453
10	Miscellaneous	325	11	222	237,633
	Total	1,962	49	956	$1,555,220
	Total collisions and derailments	3,185	112	2,165	$2,343,957
	Total for same quarter of—				
	1913	3,982	143	3,338	$3,019,409
	1912	3,903	217	4,251	3,368,125
	1911	2,801	128	2,806	2,124,090

The usual tables are given, classifying certain kinds of accidents in detail.

Fifteen accidents were investigated by the inspectors of the commission and the reports of these investigations fill 30 pages of the bulletin. The accidents occurred as follows:

N. Y. N. H. & H.	Westerly, R. I.	Oct. 31, Derailment
Lehigh & Hudson R.	Hamburg, N. J.	Jan. 5, Rear collision
Southern	Davidson, N. C.	Jan. 18, Derailment
Michigan Central	Air Line Crossing	Jan. 25, Butting collision
Pennsylvania	Conemaugh, Pa.	Jan. 29, Rear collision
Grand Trunk	Fosters, Mich.	Feb. 6, Butting collision
St. Louis & S. F.	Nichols Jn., Mo.	Feb. 16, Side collision
C. C. Chic. & St. L.	Cincinnati, Ohio	Feb. 18, Butting collision
Missouri, Kan. & Tex.	Hillsboro, Tex.	Feb. 24, Rear collision
Grand Trunk West.	Chicago, Ill.	Mar. 3, Rear collision
Chic. St. P. Minn. & O.	Mendota, Minn.	Mar. 14, Derailment
Minn. & St. Louis	Olds, Iowa	Mar. 21, Butting collision
C. C. Chic. & St. L.	Irdianapolis, Ind.	Mar. 22, Derailment
Great Northern	Thama, Idaho	Mar. 25, Butting collision
Chic. Burl. & Quincy	Hawthorne, Ill.	Mar. 30, Derailment

Electric railways reporting to the commission (not included in the foregoing statistics) had 114 persons killed during the quarter and 1,148 injured; and there were 24 collisions and 8 derailments. Train accidents are charged with 3 fatalities. The total number of passengers killed from all causes was 5, and of employees 13 (3 in industrial accidents). The trespassers struck or run over by cars were 65; 40 killed and 25 injured.

Driving a Five-Mile Tunnel Through the Selkirks

The Canadian Pacific to Hasten Completion Is Constructing This Bore From a Second or Pioneer Tunnel

The Canadian Pacific is now engaged in the construction of a double-track tunnel five miles long through the Selkirk mountains at Rogers Pass, B. C.; this will be the longest railroad tunnel in America, exceeding in length the Hoosac tunnel of the Boston & Maine by about 1,400 ft. In addition to its unusual length, it is of special interest because of the fact that it is being driven from a pioneer tunnel parallel to and entirely outside of the limits of the final tunnel section. The tunnel is a part of a line change of 18.6 miles.

While the elevations reached at its crossings of the Rocky and Selkirk mountains are over 5,000 ft. below those of some

Location of Old and New Lines at Rogers Pass

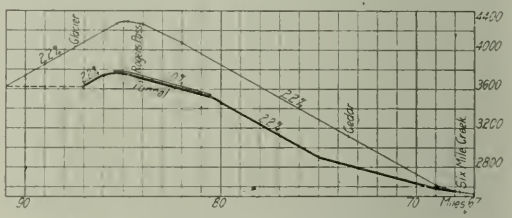
of the railroads further south, the Canadian Pacific is recognized as one of the most scenic of the transcontinental lines because of the ruggedness of the country through which it passes. This feature which gives it its scenic attraction, also adds materially to the operating difficulties. Its crossing of the Rocky mountains with a 4.5 per cent grade on the west slope was particularly difficult until the construction of a new line between Field and Hector on a 2.2 per cent grade in 1909, which work included the two famous spiral tunnels. The crossing of the Selkirk mountains at Rogers Pass is 96 miles west of the Rocky mountain divide and 425 miles east of Vancouver. The present summit at Rogers Pass is at an elevation of 4,300 ft., and is reached by 21 miles of continuous 2.2 per cent grade westbound from Beavermouth and by 25 miles of 2.2 per cent grade eastbound from Albert Canyon.

Following the completion of the work between Field and Hector, the portion of the line at Rogers Pass has presented the greatest difficulties in the operation of the four to eight transcontinental passenger trains and an average of about 12 freight trains daily. The engine district including this portion of the line extends from Field to Revelstoke, 130 miles. With normal business, about 11 helper engines are located at Rogers Pass station at the summit and are sent from here each way down to the foot of the grade to meet approaching trains. Oil burning engines are used exclusively on all lines west of Field. A small roundhouse and storage yard are located at the summit, and as the prevailing tonnage is usually eastbound, turn-around trains are run from Revelstoke to Rogers Pass, where the cars are set out and then added to other eastbound trains descending the mountain.

THE NEW LINE

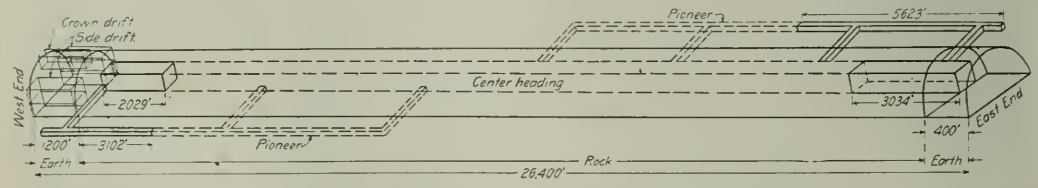
The new line leaves the old at Six Mile creek, 18 miles east of Rogers Pass, and, turning slightly to the left, follows generally parallel to the old line but lower down in the canyon of Beaver river for 10.5 miles. It then plunges directly into a tunnel 26,400 ft. long passing about 6,000 ft. below the summit of Mt. MacDonald. A short distance in from the west portal it crosses about 400 ft. below the old line and emerges at the west portal a short distance to the right of the old line and about one mile west of Glacier station. The new line then continues westerly 1.5 miles to a connection with the old line at Cambie. All the new work is being built for double track, including the tunnel. A short distance west of the tunnel a six-track storage yard will be built to replace the yard now located at Rogers Pass and to be used for the same purpose.

The new line is 18.6 miles long and saves 4.4 miles of distance. While it does not reduce the ruling grade of 2.2 per cent it



Profiles of New and Old Lines

decreases the length of this grade from 21 to 12 miles on the east approach and from 25 to 17 miles at the west end. It also eliminates 552 ft. of rise and fall. While the maximum curvature remains 10 deg. there are only three such curves on the new line, as compared with a large number on the old, and 2,600 deg. of central angle is eliminated. There are over four miles of snow sheds on the old line, as compared with only one short shed on the new line. The old line also required a number of bridge structures of considerable size, including a 338-ft. steel arch span 310 ft. high and a steel viaduct 586 ft. long and 140 ft. high. The only structures larger than culverts on the new line are two 70-ft. and one 60-ft. deck girder spans, and one steel viaduct 500 ft. long and 125 ft. high.



Sketch Showing Relation of Pioneer to Main Tunnel, and Progress of Headings on December 1

West of the tunnel the new line is located in the center of the valley, instead of on a bench at one side, to avoid danger from snow slides and the necessity for protection therefrom, although this lower location required changing the location of Illecillewaet river for a mile before work could be undertaken on the grading of the line itself. The roadway embankment

west of the tunnel will require 300,000 cu. yd. of material, all of which will be secured from the west approach cut to the tunnel and from the tunnel itself. The only structures on this portion of the line are a 60-ft. girder span and a 20-ft. arch culvert.

On the 10.5 miles of new line east of the tunnel about 1,500,000 cu. yd. of material will be moved, over 70 per cent of which is rock. This is largely side hill work, fairly evenly distributed over the line and suitable for handling by steam shovel. This grading east of the tunnel will be handled by contract, and it is expected that the work will be let next spring.

THE TUNNEL

The tunnel is 26,400 ft. or exactly five miles long and is located on tangent for the entire distance. The 2.2 per cent grade

View of West Portal Showing Center and Side Drifts Through Earth. Mouth of Pioneer Tunnel in Background

up the east approach breaks at the east portal to a 1 per cent grade which continues to the summit a short distance in from the west portal. As shown on one of the drawings, the tunnel is being built for double track with the tracks spaced 13 ft. between centers, with a horizontal clearance of 8 ft. from the center of the track and with a vertical clearance of 20 ft. from the base of rail measured over the center of the track. For distances of 1,200 ft. at the east end and 400 ft. at the west end the tunnel passes through loose debris. Beyond these points it is expected that solid rock will be encountered for the entire distance. The material found in the rock section at the west end up to the present time has been a soft slate which breaks well. At the east end mica schist, blue schist and quartzite have been encountered. It is planned to line the tunnel only through the earth sections as the character of the rock encountered so far in the rock sections indicates that no lining will be required. An 18-in. pipe will be placed in the ballast between tracks for drainage.

In driving the earth sections a drift 8 ft. 6 in. wide by 10 ft. high was first driven at grade on each side and timbered. A second drift 8 ft. high and 8 ft. wide was then driven directly above and the material trapped into cars below. In this way the side walls were opened to a point 15 in. above the tops of the plumb posts. A crown drift 9 ft. wide and 10 ft. high was also driven with the top 33 in. above the top of the timber segments. The intervening section was then broken through and the arch timbering placed, after which the remaining material was removed by air-operated shovels loading into 12-yd. Western Steel air-operated dump cars.

The most interesting and unusual feature of this entire project

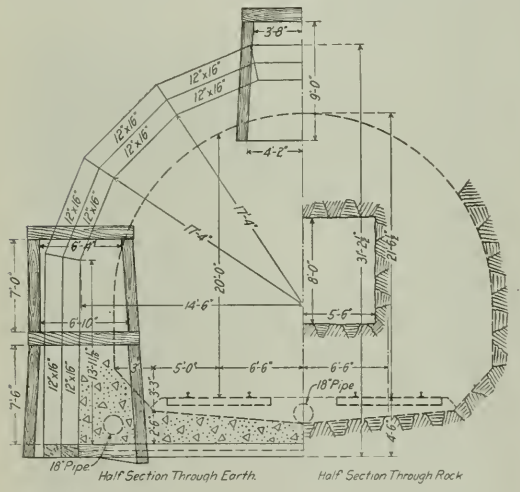
Looking Over Approach Cut from West Portal

is the driving of an auxiliary or pioneer tunnel at one side of the main tunnel. Because of the great length of the main tunnel it was estimated that it would require at least four years to complete it by the ordinary methods. The contractor therefore decided to drive this pioneer tunnel to enable him to prosecute the work more rapidly, thereby increasing his bonus, and also to reduce to the minimum the interference of the different operations in the tunnel proper. This pioneer tunnel is 6½ ft. by 9 ft. in cross section, and is driven 50 ft. to the right of the main tunnel, with its floor 7 ft. above the final grade. After reaching rock, cross cuts are being driven to the center of the main tunnel at intervals of about ¾ mile and center drifts 11 ft. by 8 ft. are then driven up grade on the center line of the main tunnel with the bottom of these drifts also 7 ft. above grade. The rock is then being drilled and broken on all sides of the drift, and after shooting, the material is loaded by air-operated shovels into small cars, and removed through the pioneer tunnel. These operations are identical at each end.

By this method work can be pushed from several faces at

once without interference. It is also possible to do all blasting ahead of the shovels so that they can be operated continuously. Air lines are carried through the pioneer tunnel where there is only slight danger of their being broken; all drainage is removed through the same outlet, that at the west or up-grade end being handled by "booster" pumps with a portable pump on wheels at the face of the heading. Through these various advantages, the contractor estimated that this plan, which is original, will hasten the date of completion of the tunnel at least a year. The pioneer tunnel is solely a construction expedient with no intention of using it for ventilation or any other purpose after the completion of the work. To shorten the length through the earth sections, the pioneer tunnel at the west end was started 128 ft. above its proper grade, and sloped downward on a 50 per cent grade until it reached the proper elevation. All cars are hauled up this grade by cables. At the east end the pioneer tunnel was started 43 ft. above grade.

Complete duplicate power plants have been installed at each end of the tunnel. At the west end ventilation is provided by a Connersville ventilating fan with a capacity of 3,000 cu. ft. of free air per minute. This air is delivered through the pioneer tunnel to the various faces in the main bore and to the pioneer heading. A second fan located near the portal of the pioneer



Methods of Driving Tunnel Through Earth and Rock

heading assists in drawing the free air out from the faces. Two Ingersoll-Rand air compressors with capacities of 2,200 and 1,100 cu. ft. of free air per minute, respectively, provide the power for operating drills and other tools, working at 110-lb. pressure. A third air compressor with a capacity of 750 cu. ft. of free air per minute compresses air to 1,000 lb. pressure for the operation of the 16-ton air locomotive used in the hauling of the muck. A similar locomotive, but weighing only 10 tons, is employed at the east or down grade end of the tunnel. All of these various units are driven by five 150-h.p. coal-fired boilers.

Contrary to usual practice in work of this character, no electric illumination is provided and Wolf safety carbide lights are used exclusively. Individual lights are given each workman except at the air shovels, where large carbide lights are installed.

No permanent ventilating plant will be installed at this tunnel, as upon its completion it is planned to operate it with electric locomotives. Under the system tentatively adopted an electric locomotive will be attached to the rear of the train at the foot of the 2.2 per cent grade on the east slope, assisting the steam locomotive up to the east portal. At this point, where the grade breaks from 2.2 per cent to 1 per cent the steam locomotive will shut off and the electric locomotive will push the entire train through, cutting off at the summit at the west portal. Westbound trains will be brought to the summit with oil burning helper engines as at present. Up to the present no work has been done in the development of electrification other than preliminary investigations of power sites.

The construction of this tunnel has now been under way since September, 1913. On December 1, 1914, the pioneer tunnel had been driven 3,102 ft. at the west end and 5,623 ft. at the east heading. The heading in the rock section had been driven 2,029 ft. at the west end, and 3,034 ft. at the east end. At the east end the timbered section through earth will be completed about December 20, while the shovel has just started work at the west end. From this it may be seen that unusual progress is being made in this work. In July, 715 ft. of pioneer heading was driven at the east end alone, an average of 23 ft. per day, while in November the pioneer heading at the west end was advanced 817 ft., moving 37 ft. one day and 35 ft. another. During this same month the pioneer heading at the east end was advanced 529 ft., while the center heading at the west end was driven 654 ft. Working in this material, the face is shot down about every 6 hours, advancing the heading about 6 ft. per shot. It is expected that the tunnel will be completed by September 1, 1916. This work is being carried out under the direction of J. G. Sullivan, chief engineer, and W. A. James, engineer of grade revision. J. W. Shepperd is assistant engineer in direct charge of the work. Foley Brothers, Welch & Stewart, of Vancouver, are the contractors, employing about 680 men on three eight-hour shifts.

ARBITRATION OF WESTERN ENGINEMEN'S DEMANDS

Hearings before the board of arbitration on the demands of the engineers and firemen of the western roads for increased wages and changes in working conditions, the opening proceedings of which were reported in last week's issue, were continued throughout last week and this week.

James M. Sheean, attorney for the railways, explaining their position, said that there was an adjustment with both organizations in 1910, one by mediation and the other by arbitration, and that since 1910 there has been no such change, either in operating conditions or in the duties and responsibilities of the men, as would justify an increase at this time above the increases which were granted three or four years ago. "Instead of making for standardization," he said, "or uniformity as among the different schedules, the request as presented is in fact a pyramiding and a wider separation by reason of the variety of differentials in different schedules, and the imposition upon the varying base of a uniform standard, which, of course, would cause a departure from uniformity rather than work for uniformity. Although there might be an absolute uniformity of rates, when they are spread over 98 different roads and applied to different bases—some having arbitrary allowances and some not—the uniform rates would produce different sums of money under the different schedules."

M. W. Cadle, assistant grand chief of the Brotherhood of Locomotive Engineers, whose testimony had been interrupted by illness, resumed the stand on December 2, and continued his discussion of the 16 articles submitted to arbitration, giving the present schedule provisions of the various roads to sustain the contention that all of the proposed rules are in effect on some roads. He was questioned by Warren S. Stone, grand chief of the engineers. In connection with Article II, "that the practice of conducting surprise tests by turning switch lights and placing red lights or flags, unaccompanied by torpedoes. beside track, or wiring down auto-

matic signals to proceed position, be eliminated," Mr. Stone made a statement that the brotherhoods do not object to surprise tests when made under fair working conditions, but that some officials have got away from the original intent of the test—to see that the men were living up to the rules—and go out with the idea of setting a trap for a man and catching him; that they do not give him time to get the signals. The objection is to such unfair tests.

Under cross-examination by James M. Sheean, attorney for the railroads, Mr. Cadle said that no railroad has in effect all of the rules requested, but he thought that as many as five of the requests were in effect on some roads, and he admitted that on the roads he had mentioned as having in effect certain of the proposed rules other rules and conditions were in effect to such an extent that practically none of the rules proposed were in effect in the form submitted in the demands. He said at first that the proposed rule for a 5-hour day in passenger service was not intended to apply to suburban service, but later said the board was expected to arbitrate that question.

Mr. Sheean also brought out that the engineer who runs a fast mail train from Chicago to Burlington, 207 miles, in four hours, draws a little over two days pay, and under the proposed rules would be paid for 30 minutes additional preparatory time, and then if he took his engine at the roundhouse, an additional allowance for the time from the roundhouse to the station and at the end of his run for the time from the station to the roundhouse. Also if at the beginning of his run his train were held for 45 minutes after leaving time, but arrived on time at the other end of the run, he would receive pay for that 45 minutes initial terminal delay, when he was only on duty altogether six hours from the time he reported until the time he was relieved.

He also showed that under the automatic release and continuous time rules it would frequently be possible for men to earn several days' pay in one day and to collect pay under various rules for the same time under conditions which were not excepted in the rules. The man on the 207-mile run, if a washout held him away from his home terminal for two days, would receive overtime after the expiration of 15 hours at the rate per hour for the last service he had performed, or the rate for about 50 miles an hour, and if his trip was made in overtime he would be paid at the overtime rate for the time held up. In the case of a road that has a rule permitting men, when necessary, to tie up for rest after 12 hours on duty, the entire crew would continue to draw continuous time during all the time they were resting or sleeping, and on resuming duty would go on overtime rates. Mr. Cadle also admitted that under a proposed rule if a man were called to deadhead to a certain place on a passenger, and the train were late in starting so that he had to wait for it, he would be paid for initial terminal delay, plus the rate of the crew of the passenger train, although the train made up the initial delay. If he were to deadhead on a freight train, and went to sleep in the caboose at the time for the train to leave, and if the train were delayed while he slept, but made up the time, he would receive more pay than if the train were running while he slept. Mr. Cadle said the rule was intended to keep men "from lying around cabooses without earning any money," and that "he could never sleep in a caboose anyway." Mr. Sheean also pointed out that in the case of an inspection train out 10 hours, but covering only 40 miles around terminals, the engineer and fireman would receive two days' pay under the 5-hour day rule.

W. S. Carter, president of the Brotherhood of Locomotive Firemen and Enginemen, presented testimony in support of the contention that wages of enginemen should be based on the weight on drivers. He said that engineers and firemen should be paid in proportion to their labor and responsibility and according to their productive efficiency, that when the labor cost of a product decreases the employer should be more able to pay the wages that are incidental to the cost of that product, and that weight on drivers is the simplest and most accurate index of the effective tractive power of a locomotive, and therefore of the increased labor, responsibility and productive efficiency of the man. He said that on eastern roads the pay of firemen is governed by weight on drivers. He said that there are some rates in effect on some roads higher than those asked, but the arbitration agreement provides that any higher rates shall be maintained. He said it was not claimed that wages should be increased in the same ratio as the increase in the efficiency of the engine. In the case of a Mallet, on which the tractive power is six times greater than the smallest engine in use, the proposed rate of wages is between 60 and 70 per cent greater.

Mr. Sheean on cross-examination tried to show that the rates mentioned by Mr. Carter for different engines were not a proper index to the amount of money paid out, without a consideration of the other rules applying to them. Mr. Carter said that generally the roads that had the most liberal rates also had the most liberal rules. He admitted, however, that in order to bring about uniformity in what the man receives there must be a uniform basis to which the uniform rate applies. Asked whether there has been any increase in work, responsibility or productive efficiency since 1910 on small engines, he said the general tendency has been to require more of the engineer and fireman since the safety first movement was started and that they are required to observe more stringent rules. He said the installation of automatic signals has added greatly to the responsibility of engine crews, but he would not say that the crew should receive greater pay on a road with automatic signals or on a road that "specializes on safety first."

Mr. Sheean asked why in the classification of weights and rates the first step was from 80,000 to 100,000 lb., the next from 100,000 to 140,000 lb. and the next from 140,000 to 170,000 lb., whether there was any change in the labor, responsibility or efficiency at the breaking points mentioned that would not apply at other points. Mr. Carter could give no reason for the selection of the particular weights. He would make no distinction in the pay of a fireman on an automatically-stoked engine and on a hand-fired engine, nor in the rates for coal-burning or oil-burning engines. A man should not have his wages decreased because of any improvement in the engine, he said. "If some inventive genius finds that more tons of freight can be transported over the same division with the same engine crew," he said, "we dissent from the school of economy that would permit the railroads to reduce the wages of the engineer and fireman."

Samuel T. Steinberger, a clerk in the grand lodge of the Brotherhood of Locomotive Firemen and Enginemen, testified regarding an exhibit showing the rates on wages requested compared with the wages in effect for various classes of engines and service for both engineers and firemen. He said there are 36 roads that pay in some class of service a rate that is as high or higher than the rates requested.

Mr. Carter resumed the witness stand on Monday and introduced an exhibit comparing the wage scales in 46 industries with those of the engineers and firemen. In this list the engineers stood sixteenth and the firemen thirty-eighth in rate of pay. He said that one-third of the organized laborers in the building trades receive more pay than engineers and 80 per cent receive more than firemen.

He also characterized the seniority rule as "not so very good," but said it was necessary to prevent nepotism and favoritism. "It is common knowledge," he said, "that petty officers make more money selling jobs than they do from their salaries." In this he referred especially to section foremen.

RAILWAY ELECTRIFICATION IN AUSTRALIA.—It is reported that notwithstanding the war, steady progress is being made with the electrification of the Melbourne suburban railways.

Annual Report of Interstate Commerce Commission

Annual Review of the Work Done by the Commission and Its Nine Hundred Clerks, Lawyers and Helpers

The Interstate Commerce Commission sent its 28th annual report to Congress on Thursday of this week. It consists mainly of a review of the details of the work of the past year, with few and brief expressions of opinion on important matters. The statistics and comparisons, except as otherwise noted, are for eleven months, ending November 1. An abstract of the report follows:

The work of the commission continues to increase in volume, but a board of "examiner-attorneys" has been organized, and this with increases in the strength of other bureaus, is expected to enable the commission to keep well abreast of its work.

On the "informal docket" the number of complaints received has been 7,600, an increase of 455 over the corresponding months of the preceding year. Orders for refund of overcharges have numbered 5,604, an increase of 1,243; orders under the fourth section docket have numbered 1,086, a decrease of 246; the number of tariffs suspended and disallowed was 42; 146 other tariffs complained of were suspended and disposed of in other ways, including 44 cases in which the proposed changes were allowed as filed; and in 205 instances the commission refused requests for the suspension of tariffs. These refusals numbered 20 more than in the same months of the preceding year.

The number of formal complaints filed in the eleven months was 1,081, an increase of 131; 643 cases were decided, and 179 were dismissed, making a total of 822 cases disposed of, about the same as in the preceding year. The number of hearings during the eleven months was 1,461, which is 234 less than the year before.

The report tells of the special investigations which have been made by the commission, at the order of Congress, such as those into the affairs of the St. Louis & San Francisco and the New York, New Haven & Hartford. Five investigations of "a continuing nature" are mentioned, such as that concerned with railroads which carry coal and oil owned by themselves, and the investigation into the practices of the express companies. Then there is a list of 25 investigations, still pending, as to some of which the work is near completion. This includes the inquiries into the condition of the Pere Marquette and the Rock Island, the use of private cars, and the practices of the roads in the matter of embargoes, etc. Two of these investigations have to do with telegraph and telephone companies.

The number of tariffs and supplements filed during the eleven months was 149,031, an increase of 35,800 over the corresponding previous period. The work of the tariff bureau is increasing; it renders useful aid to state commissions, shippers and carriers. The "Division of Inquiry" which deals with matters litigated by the commission in the courts furnishes the material for a dozen pages in the report. During the eleven months 80 prosecutions have been concluded and the commission was almost uniformly successful. These cases were distributed over 22 states.

The report summarizes the opinions of the federal courts in a half dozen cases in which the Interstate Commerce law has has been construed. Among these are the Hocking Valley case, the Grand Rapids & Indiana case, giving a broad construction to the word "knowingly," the Keystone elevator case and others. Indictments have been secured for the crime of filing fraudulent claims for loss or damage on freight, and for failure on the part of carriers to adjust over-charge claims; for false description of shipments; for acts in connection with the relations between the New York Central and the O'Gara Coal Company, and for unlawful use of passes (for which one man in Alabama has been sentenced to be imprisoned for 13 months). The Pennsylvania Railroad has been indicted for 25 offenses against the commodities clause of the law, and will soon be tried. A shipper has been punished for inducing an agent to discriminate in his favor; he paid money to have bills of lading issued before the freight was delivered to the road.

This summary takes account only of the more significant investigations. Four-fifths of the matters investigated never result in prosecution, but in a great number of cases the commission gives useful advice where no action is taken in the courts. The action, under the fourth section, in connection with transcontinental freight rates and freight rates in the southeastern states, is reported at considerable length.

Uniform classification of freight is again discussed, as in many previous annual reports; but the commission has now appointed a "classification agent" who consults with the classification committees and who evidently takes a conservative and sound view of this difficult question. The work of the railroads' classification committees is commended. The greater part of the recommendations of the permanent committee of the railroads has been adopted in the classifications published by the roads. The report says that the commission, if authorized in accordance with the bills which have been before Congress, could hasten the adoption of uniformity in those features as to which uniformity is most desired, and as to which uniformity is conceded to be desirable "and in such a way as would not injure the interests of shippers or carriers."

The work of the commission in connection with express companies is regarded as very successful. The classification, rates, etc., prescribed by the commission have been adopted by the state authorities in 40 states, and the states and the express companies have worked in harmony with the commission. The several express companies have greatly improved their claim departments.

The report reviews the decisions of the Supreme Court in the Shreveport, the inter-mountain, the pipe line, and other important suits, in which the commission's action was sustained; also three cases in which the Supreme Court decided against the commission. In the lower court the commission has won 7 suits and has lost 4; and 23 cases are now pending.

The "Division of Carriers' Accounts" has made a general revision of the accounting classifications for steam railways, electric railways and express companies, and the new codes went into effect July 1, 1914. The bulletin of decisions relative to the accounting regulations is to be revised and will be issued, with additional cases. The carriers have co-operated helpfully with the commission, but there are still many unsatisfactory features of railroad accounting to be corrected. The matter of depreciation is not properly treated by the carriers. During the past year the examiners of accounts have had other work to do and have not attended to the field examination of carriers' accounting practices as well as they should have done.

This division now has branch offices in New York, Philadelphia, Pittsburgh, St. Paul, Chicago, St. Louis and San Francisco, and an office is to be opened at New Orleans. At each office there is a force of resident examiners, and the plan is expected to save expense.

The commission has investigated the practice of the railroads in the adjustment of freight claims. During six months ending June 30, 1914, the total number of claims presented to the railroads of the country was 2,424,996, of which 1,739,781 were for loss or damage and 685,215 were for over-charge. At the end of the six months 22 per cent of these claims remained unadjusted, many of them, of course, having been received during the last preceding month or two. Of the 78 per cent adjusted, 1,680,041 were paid, 186,290 were declined, and 29,101 were withdrawn. Fifty-five per cent of the claims adjusted were settled within 15 days after receipt, 74 per cent within 30 days, and 90 per cent within 60 days. Claims are now being adjusted with

commendable promptness. In the three years ending with 1910 the amount paid out by the steam railroads for loss and damage decreased, year by year; but since then there has been an increase; the payments in 1913 amounting to $30,885,454, which is 41 per cent more than the sum paid in 1910. Freight revenue increased during that period only 14.2 per cent. The payments in 1913 amounted to more than three times as much as in 1900, while the increase in freight revenue during those 13 years was only 109 per cent.

The Division of Statistics has begun the preparation of the annual preliminary abstract of statistics for the year ending June 30 last, but none of this work appears; some of it, apparently, is to be issued in an appendix. This division is working, together with committees of the American Railway Association and the Association of Accounting Offices to formulate a code of rules for separating operating expenses as between freight and passenger services.

The Division of Safety administers the safety appliance acts and kindred laws. During the year ending June 30, prosecutions were begun in 257 cases, involving 1,020 violations of the safety appliance acts. In court decisions during the year under this head the government lost on 26 counts and won on 17; but the 26 are all to be appealed to the Supreme Court. Carriers confessed judgment during the year as to 483 counts. The railroads still fail to provide adequate means for repairing cars at a sufficient number of convenient points. The government standards of safety appliances are pretty well complied with, except as to freight cars, the number of which properly equipped is disproportionately small. Only by the exercise of the greatest diligence can the carriers standardize their freight cars within the time required by the law.

A half dozen pages are given to judicial interpretations of the safety appliance and hours-of-service laws. Prosecutions have been begun for 2,871 violations of the hours-of-service law, and during the year ended June 30, 1914, the railroads have confessed judgment as to 1,785 violations. Of 592 counts which went to trial, 395 were decided in favor of the government and 164 against it. The number of cases during the year in which individual employees worked more than the statutory number of hours was 163,192, which is a very large reduction from the number reported in the preceding year. The numbers are regarded as still unduly large, particularly the cases due to hot boxes, defective couplers, etc., causes which ought to be done away with by more rigid inspection of cars. The commission again recommends that Congress define more exactly what causes shall excuse the retention of train men on duty beyond the prescribed hours.

Sixty-three train accidents were investigated during the year ending June 30, of which 40 were collisions and 23 were derailments. Thirteen collisions occurred under the block system. The flagging rule is still very imperfectly enforced, and inexperienced flagmen are employed. Speaking generally, some improvement has been noted in the matter of supervision of trainmen, and stricter obedience to rules is being insisted on. The "safety-first" committees are credited with a large part of this improvement. The commission again calls for legislation to standardize operating rules, and repeats its demand for investigations to determine the stresses to which rails and wheels are subjected. It also repeats the recommendation for a statutory requirement that steel cars be used, and would have the use of wooden cars in front of or between steel cars in high speed trains prohibited.

The Division of Safety has investigated proposed safety appliances, in accordance with the wish of Congress, and a separate report by this department will tell in detail what has been done.

The chief inspector of locomotive boilers reports that during the fiscal year the number of locomotives inspected was 92,716, a considerable increase over the preceding year; but the number found defective, 49,137, is about 5,000 less than in 1913. The percentage of engines found defective, 52.9, compares with 60.3 in the preceding year. The number of engines ordered out of service, 3,365, was 1,311 less than in 1913. The number of persons killed in boiler accidents in 1914 was 23, as compared with 36 in 1913 and 91 in 1912.

No prosecutions for violations of the boiler inspection law have been sought during the year; but on two or three of the larger roads and on several smaller ones it is believed that it will be necessary to resort to the courts.

Under the Panama Canal act, the commission has received 58 applications for release from the requirements of clause forbidding the ownership of water lines by railroads, and investigations of these cases are well under way.

The Division of Valuation expects in the near future to make up its conclusions in regard to the five roads on which the work was first undertaken, namely the Norfolk Southern; the Atlanta, Birmingham & Atlantic; the New Orleans, Texas & Mexico; the Texas Midland, and the San Pedro, Los Angeles & Salt Lake. Eight parties of engineers are now at work in each of the five districts and in each district they cover from 1,500 to 1,700 miles of road a month. The preparation of inventories of telegraph and telephone lines has been begun. The accounting officers of the division of valuation have done a good deal of work on selected roads, and final reports of two roads have been received. So far as can be judged at the present time the attempt to report in detail as to the cost of each piece of property, as required by law, "has involved an expenditure out of all proportion to the value of the results." The supervisor of land appraisals has a land attorney in each of the five districts, and much work has been done.

Recommendations. The commission again recommends that the government furnish it a suitable building. Outside quarters have to be rented, and expense could be saved by furnishing one large building. Recommendations are renewed that three years be set as a time limit for beginning actions relating to transportation charges; that the federal government take control over railway capitalization; that the commission be more explicitly authorized to examine all correspondence, etc., of carriers subject to the act; that the penalty for violations of the hours-of-service act be made a fixed sum, and that the use of steel cars in passenger trains be required by law.

The expenditures on behalf of the commission during the fiscal year amounted to $2,094,583, of which the sum spent on valuation was $456,565. The boiler inspection law cost $202,326, and the safety appliance regulations $134,275.

VENEERED STEEL INTERIOR FINISH FOR COACHES

The development of a suitable material for the interior finish of passenger cars has been one of the problems which railways and car builders have been endeavoring to solve for some time, particularly since the advent of the steel car. Such a finish should possess lightness, strength and durability, be pleasing to the eye, a poor conductor of heat, occupy a minimum of space and be fire-resisting.

An all-wood interior finish is bulky and does not seem to be in harmony with modern car construction. While it is possible to make an imitation of wood by using steel interior finish, the mere fact that wood is imitated would seem to indicate that it is the desirable finish, but with the use of steel there are many disadvantages that do not seem to be much nearer solution than when steel was first used. The steel surface is often wavy, even when new, and particularly on flat surfaces; it is easily dented and the dents or buckles cannot be easily removed; it is cold, noisy and corrodes on the unexposed side.

The question of a suitable interior finish has been solved by the Canadian Pacific by the use of veneered steel. The veneer is of varying thickness, from 1/8 in. up, depending on the severity of service for which it is intended, which is governed by the location in the car, and the class of the car. It con-

sists of a steel plate with a layer of canton flannel glued to both sides; the wood veneer is then glued to this flannel.

This veneered steel is used in the construction of doors, panels, wainscot, bulkheads, sleeping car berths, sleeping car seat ends, etc., and is of approximately the same cost as steel or wood. It has the insulating effect of wood, is not subject to corrosion the same as steel alone, does not splinter in wrecks, is fire-resisting and can be made attractive in appearance. In other words, it seems to combine all the good points of wood and steel without the disadvantages of either. It is not an experiment, as it has been used sufficiently long to know that it does not deteriorate. It is now in service on about 60 cars and its use has been arranged for on diners, sleepers, coaches and all passenger carrying cars.

In the construction of doors, bulkheads, panels, etc., the veneer is used on each side of the steel and in this way oak can be used on one side and mahogany on the other. In the

Veneered Steel Bulkhead in Canadian Pacific Steel Coach

illustration, all of the wood in sight in the bulkheads, smoking room partition, etc., is of thin veneer, except the casings for the door frame and the moulding.

This veneered steel finish is the invention of R. W. Burnett, general master car builder, Canadian Pacific, Montreal, Que.

The First Railway Mail Car.—A bronze reproduction of the queerest, clumsiest, funniest little old railroad car in the world was hung in the train concourse of the new Chicago & North Western terminal yesterday. The original was built in 1864, and was the first railway postal car in the country. George B. Armstrong's name appears below the reproduction of the car, because it was his idea that brought the railway mail service into existence. The Chicago & North Western Railroad had the reproduction made because it was the first source of encouragement to the persistent inventor. The railroad furnished the financial backing, and on August 28, 1864, the first mail was carried between Chicago and Clinton, Iowa. It was the knell of the stage coach. By 1867 two more mail cars had been built and put into service between Chicago and Fort Howard, Wis., and between Boone and Council Bluffs, Iowa.—*Chicago Tribune.*

OBEDIENCE TO ORDERS; ABSTENTION FROM LIQUORS*

By H. W. Williams
Cleveland, Cincinnati, Chicago & St. Louis, Springfield, Ohio

When I was sixteen years old, I enlisted in the 51st Regiment, Canadian militia, and served two years. Those English officers taught me the great importance of obeying orders under any and all circumstances; and this lesson I have remembered to this day. There was another lesson which they taught me, and that was to keep my eyes and ears alert all the time; and not to talk while on duty!

I fired about three years for one man, and after I had been with him about three months, he was nick-named the kid-glove engineer; and all the time I fired for him, he never put his hand on a wrench, or an oil can. There was perfect harmony between us. Without harmony on an engine, there is not much efficiency.

There is no secret about the successful running of a locomotive. I have always followed certain rules under all circumstances. First, remember you are holding a man's job. Second, while running or standing on main track, talking must not be indulged in. I have known a whole crew to forget their orders on account of talking and joking. Third, keep an incessant lookout on the track and slow down for all signals that cannot be clearly seen. Fourth . . . more damage is done and more men are dismissed from the service on account of strong drink than from any other cause. I believe that more than 70 per cent of the failures of railroad men can be traced to drinking spirituous liquors. It surely does reduce efficiency. Best leave it alone entirely. Fifth, always take the needed rest as soon after arriving at the terminal as possible; never let the call boy surprise you. Sixth, if there is any leisure time, study your business. There are three books I will mention, two of them are books of rules; the first is the Bible, and I commend it to railroad men. The second is the railroad company's book of rules. The third is a bank book; the engineer who does not begin early in life to build up a bank account, is neglecting part of his duty. . . .

One hears much about "surprise tests," and some object to them. I have never had occasion to complain about them. If some officer has extinguished a lamp and made me lose a little time, that was the company's business, not mine; all I had to do was to report time lost at that place and no questions were asked.

In my 41 years I have had many firemen; and they were all good runners but one; he was a complete failure, and whiskey caused his downfall.

Up to about 1898, we had regular engines and somehow I almost always had a good engine, but I did most of the repairs on her myself. Since our engines have been pooled, my practice has been to go to the engine house early enough to thoroughly inspect the engine I had to take out. By doing so I have had very few engine failures.

I have had but few engine failures and never had an accident worthy of note, and I have never received a reprimand from any officer; but instead, have received several complimentary letters; and my record is still clear. Now, I claim my freedom from accident and injury to myself and others (for I have never injured a passenger on my train or any other train) is due to strict adherence to the rules and attending to the business I was paid for. . . .

London Post-office Tubes.—A contract has recently been let for the construction of a post-office tube line in London six and one-half miles long, extending between the eastern district post-office in Whitechapel and the Paddington district post-office, and making connections with a number of other post-offices.

*This is the fourth of a series of articles, made up of useful hints to locomotive runners, which were written in connection with the prize competition of several months ago. The previous articles of this series were printed in the issues of September 25, October 2 and November 27.—Editor.

The Railway Problem and Its Solution*

The Necessity Is Emphasized for Having a Constructive Policy in the Practice of Public Regulation

By Samuel Rea
President, Pennsylvania Railroad Company

It is no difficult task to sum up the present railroad situation. We can all see that something is wrong, but no useful purpose will be served unless we can suggest some constructive methods of improving conditions.

Examine, for instance, the eastern railroads, which reach the centers of the largest population and heaviest traffic of the country, and you will find greatly diminished gross revenues and the still greater proportionate reduction in net revenues; their purchasing powers are stringently curtailed, and their credit has been greatly weakened. This condition arises from causes largely beyond their own control, so that the return earned during the past year upon the money invested in the road and equipment of these roads amounted to less than 4 per cent. This serious conditon is not new, but it is now acute. We have been living on hope at least since 1910, when the downward trend was clearly indicated; how much longer we can exist on that precarious asset, I will not venture to say, except to suggest that it takes more than hope, advice, or enthusiasm, or all combined, to pay wages and taxes, provide satisfactory service, pay dividends, and retain a proper credit basis to obtain capital for improvements and extensions.

Increased traffic will not cure the railroad malady, for up to the present all the economies and efficiency, obtained by increased trainloads, etc., have been offset by increased costs, wages and taxes. These companies therefore need not merely the very moderate increase in rates for which they petitioned the Interstate Commerce Commission, but also all the revenue that can be secured by working out in practice the various other means suggested by the commission for increasing revenue.

A full consideration of the railroad position and the effects of public regulation must not, however, stop there. Irrespective of any decision in the rate case now pending, whether it be finally favorable (as we trust it will be) or unfavorable, it is evident that the time is ripe for suggestions concerning constructive railroad legislation and policy.

INVESTORS MUST HAVE REASONABLE RETURNS

I need not remind you that after agriculture—and what would agriculture be without railroads?—the railroads are not merely the most important industry in the country, but they are also in their essence public institutions performing functions which are by their very nature of a public character. They are owned in part by an army of individuals, actually holding their stocks and bonds, and in part by institutions such as savings banks, insurance companies, universities, hospitals and other philanthropic enterprises, in the welfare of which many more millions of individuals are vitally concerned. These are largely dependent upon income derived from the money they have invested in the service of the public, and rightfully they hold railroad managers responsible for this income. It should be the business of government regulation not merely to see that the public is properly served by these railroad managers, but also to see that the owners of the properties are fairly compensated, and that their revenues are sufficient to discharge properly their duties to the public. Otherwise the managements of these companies will be prevented from efficiently discharging their obligations to the public and their owners. The railroads must give the public good service and their operations must be continuous in good times and in bad. Moreover, the railroads of the country pay over $140,000,000 in taxes every year, a sum equal to 5 per cent on nearly three billions of dollars, requiring over 16 per cent of their net operating revenues. They pay good wages to their own employees and furnish profitable employment for the industries which furnish railroad materials and supplies.

But apparently the interests of everyone have been safeguarded under public regulation except the interests of those who furnish the money for the public service; and we must protect these investors upon whom we must rely for future capital. Failure in the last decade to protect the railroads and railroad investors has at last produced a lack of confidence in public regulation, and we now know that through the weakness of the railroads, the whole country is suffering. Upon this great industry, through the operation of too many hastily enacted federal and state laws, and by failure to provide and adjust the machinery necessary to enforce these laws by reasonable and practical methods, a mistaken policy of repression has been imposed, which has not permitted railroad charges to increase with the enforced increase in the cost of their operations. This has caused loss to existing railroads, and has precluded the building of new lines, and the making of needed improvements and betterments on the present roads.

The inherent weakness of the present situation is that we as a people seem to have assumed that the present railroads and their equipment and facilities are complete, and are sufficient for present and future needs, and that the chief function of public regulation is to curtail their revenues, increase their expenses and lessen the margin of return. In this growing country the present railroads are far from adequate, and therefore the policy of repression is bound to bring, if it has not brought already, a day of reckoning. Let us not forget that if we expect people to continue supplying their savings for our railroads, present and future, their earnings must continue to be what these investors regard as reasonable and sufficient, and they are not likely to be governed by the opinions of legislators, or commissions in this respect. The present policy of repression must be modified and lack of confidence must be removed, or these millions of investors will seek other avenues to utilize their capital.

There are some particular features of the railroad situation, incidental to public regulation, to which I would direct attention.

PRESENT CONDITIONS UNENDURABLE

The railroads are existing under conditions that breed business depressions, because of arbitrary, heavy and frequently unjustifiable burdens imposed upon them, by legislatures, state and national, and there are still many wasteful legislative experiments forthcoming unless the authors discover that the public will not willingly pay their cost. Public opinion is now convinced, I feel, that the railroads are entitled to more equitable treatment under public regulation.

The present situation is not the result of premediated action or of a clearly defined punitive public policy; it is the result of our failure to adjust fairly our national conception of the rights and duties of these common carriers, and to adapt our new laws for public regulation to rapidly changing commercial and financial conditions. It is not, therefore, a case for mere sterile criticism, but for mutual study and cooperation to the end that the evils now existing may be clearly recognized and corrected. The public, the railroads and the

*An address before the Chamber of Commerce meeting, New York, December 3, 1914.

commissions, state and federal, should unite in an effort to ascertain and finally establish the principles upon which wise regulation should hereafter proceed, so as to retain for the people at large the advantage of our American system of private ownership and operation under public regulation, and avoid being forced into another system far less desirable in a country such as this.

I. C. C. OVER-BURDENED WITH WORK

Can it reasonably be contended that any large and important business enterprise, whether individual or corporate, could be successfully conducted if, notwithstanding radically changed conditions and substantially increased costs of production, it could only increase prices subject to the power of an administrative body which on its own initiative and without a hearing might suspend the increased prices for an extended period? Under the existing federal law, increases in railroad rates, no matter how reasonable or justifiable, may be suspended without any hearing, for at least four months after they would have become operative. In practice, this means five months after the rate schedules are filed with the commission, and the suspension may be extended by the commission for a further period of six months. It is, therefore, possible even if the new rates are justifiable, for the railroads to lose nearly a year of benefit from them while the commission is determining their reasonableness. Is the public welfare promoted thereby? From practical experience and in a spirit of fairness and justice, I should say it is not, and the period of such suspension, and the determination of the question at issue, ought to be restricted to sixty days after the date of filing new rate schedules with the commission.

Another trouble in the present situation is that the Interstate Commerce Commission has been over-burdened with work and with responsibilities, many of which must be deputed to a large corps of subordinates, so that in many instances direct consideration by the entire commission is impossible. The work of the Interstate Commerce Commission, as originally designed in 1887, was to prevent unjust discrimination in rates or service, to see that rates were reasonable, to secure publicity of railroad rates and practices, prescribe uniform railroad reports, and primarily act as a referee betwen the public and the railroads. The commission was given limited, but well defined, powers within reasonable scope. Now, however, as the result of new laws, the scope of its control of railroad operations and development has been largely extended. It could materially assist railroad development, but so far it has proven impossible for seven men in one center to act not merely as regulators but as administrators of the railroads, leaving the financial results and responsibility of that administration to be borne by the companies and their owners.

STATE AND FEDERAL REQUIREMENTS CONFLICT

There is also a certain amount of disagreement between the federal and state laws and orders of commissions, and of failure to recognize the inroads on railroad revenues of new laws, orders and governmental awards.

Let me use just one example of the commercial chaos resulting from such conflict. The recent difference in the views of the Interstate Commerce Commission, on the one hand, and the Public Service Commission of New York, on the other, in connection with the allowances to industrial railroads, has, during the last eight months, resulted in freight rates, via the lines of the New York Central (whose route is intrastate) from one of the large industries at Buffalo to New York City, and to other places on its line, lower than via any of the other trunk lines, as their routes between Buffalo and New York are interstate, and there is nothing that the other railroads could do to meet this situation, injurious as it was, not only to themselves, but also to industries local to their lines. The same situation, arising from the same cause, existed in the State of Pennsylvania, as between the Pennsylvania Railroad and other trunk lines. These differences must be reconciled for the welfare of the public and the railroads.

CONSTRUCTIVE SUGGESTIONS

In the practice of public regulation, from the constructive side, I would at this time suggest:

First.—That the Interstate Commerce Commission should be materially increased, and so organized as to be able to deal promptly with the very important railroad questions affecting all parts of this large country, and thus conserve the time and energy of railroad officers, the public and the commission. The additional members of the commission should be selected from men having experience in railroad management, operation, traffic and finance, and if men of broad business experience were also added, it would be very helpful.

Second.—That the position should be placed beyond political influence, by a long tenure of office, and with compensation sufficient to attract and retain men of the widest experience and greatest ability. We recognize the necessity for men of this character and technical experience in dealing with banking and other broad business enterprises, and we must recognize that equally wide experience is essential to deal intelligently and wisely with the railroad problems.

Third.—That the regulatory power of the Interstate Commerce Commission should be clearly extended to the supervision and control of all rates and practices which directly, or remotely, affect interstate transportation or commerce.

Fourth.—That the Interstate Commerce Commission should be given the power to interfere, by appropriate action, whenever necessary to maintain a rate structure approved by, or satisfactory to, it, even though, to accomplish this, it should be necessary for the commission to prevent reductions of rates which would have a contrary effect, or to compel advances of rates found by the commission to be unreasonably low. An unreasonably low rate may be beneficial to some one or more shippers, but the rates of some other shippers are sure to be disadvantageously affected thereby.

Fifth.—That for the existing repressive policy of public legislation, a constructive policy should be submitted, and existing legislation should be so modified as to permit the railroad companies to do their full share in the development of the country's resources. It will naturally follow that the commission should be enabled, and indeed required, in the determination of questions involving railroad rates and practices, to deal with the questions before it, not merely from the standpoint of the shipper and the carrier, but from the larger standpoint of the entire country, and on such economic and business lines that due and controlling weight may be given to these larger interests essential to the public welfare. Such a change in public policy and legislation is requisite to encourage the investment of private capital for railroad extensions and additional facilities.

For instance, I seriously question the practical utility of railroad valuation, for I believe that very few railroads are over-capitalized, and I know the public is not required to pay higher rates on weak roads than on the more conservatively capitalized railroad lines. Therefore, while the railroads are cordially and fully co-operating in the work of federal valuation, yet under present conditions and when economies are being enforced everywhere, I look to the commission, under such an equitable public policy as I have in mind, not to commit the country and the railroads to so vast an expenditure until one system, or the lines in one section of the country shall first be valued and the results demonstrated to the country.

Sixth.—That, as another necessary result of a constructive and equitable policy towards railroads, and with a commission amply strengthened to deal with railroad questions, Congress would no doubt refer to the commission for investigation and report, such legislation as affected wages, em-

ployees' working hours and conditions, increased taxes, boiler inspections, extra and unnecessary men on trains, non-compensatory mail and parcel post service, railroad valuation, improved stations, grade crossing elimination, and other matters which seriously affect railway revenues and expenses. Due weight to these heavy expenditures would thus be given in approving rate schedules, and a tangible basis would be thereby provided on which to continue the regulation of these matters (if essential to the public welfare) without injustice to the railroads. The inability of the railroads to protect themselves in respect to increased wages fixed by governmental action could not be more forcibly presented than in the November, 1913, report of the Board of Arbitrators under the Newlands Act, relating to conductors' and trainmen's wages on which your president served as chairman.

Seventh.—That the extraordinary power to suspend rates without a hearing should be limited to a period not exceeding sixty days after being filed with the commission, or some such reasonable period. If after such hearing as could readily be had within this period, coupled with the information and data already possessed by the commission, from the current and special reports made by the railroads, under its uniform accounting regulations, the commission could not be satisfied that the increase proposed ought not to be made, the rate should rightfully become effective, and the present confusion and delay would end. The railroads as an act of self-preservation will always endeavor to make their service and facilities satisfactory, and rates reasonable, because only in this way can they make friends, encourage business and earn profits.

AN ENLIGHTENED POLICY WILL PREVENT CONFISCATION

Considerable emphasis has been laid upon the fact that the railroad companies, and their owners, are deprived of an appeal to the courts for the protection of what they conceive to be their just rights as against the orders of the commission. I am willing, however, to continue relying upon public regulation and public opinion to protect the railroads, although I cannot overlook the fact that the eastern railroads are earning a return of less than 4 per cent on their property investment. If this is not approaching confiscation, how much less must we earn before reaching that point? Surely the country does not want impoverished railroads unduly restricted in the conduct of their business. What it does want is strong, aggressive lines, built and improved with private capital, efficiently managed and operated, subject to equitable public regulation.

What I have suggested may not meet all the difficulties in the public regulation of railroads. Other helpful suggestions will doubtless be forthcoming from railroad and business men and commercial bodies, etc., and, I trust, from some statesmen. There can be no difference of opinion that public regulation must be equitable so far as the railroads are concerned, and must be adjusted to respond promptly to business conditions. Such a change will encourage initiative and enterprise in railroad manageemnt and will insure investors, here and abroad, that their money has the full protection of our laws and that they will be equitably dealt with.

I believe in regulation by commission, and I urge, therefore, that we do not encourage destruction of such regulation, but rather its conservation, by adapting it, as we have banking regulation and other laws, to suit the needs of the country as they change from time to time. We must look beyond the present obstacles and view the whole subject from the statesman's standpoint. Under an enlightened policy of public regulation, but not repression, the railroads will be placed and kept in a strong position to meet increased traffic demands, as well as to live healthfully in time of depression. If we now by equitable dealing ensure their strength, one of the greatest obstacles to the recovery of financial confidence and business enterprise can be removed.

SOME DIFFICULT PHASES OF TERMINAL OPERATION*

By C. A. Pennington

Superintendent of Terminals, Cleveland, Cincinnati, Chicago & St. Louis, and Chesapeake & Ohio, Louisville, Ky.

The problem of terminal operation is steadily becoming more complex, due to the natural expansion of business without a corresponding increase in facilities—an increase that at some points can only be secured by the expenditure of enormous sums of money—and to the improper uses to which terminal tracks are subjected. Outlying classification or auxiliary yards in less congested districts afford some relief but do not entirely remove the difficulties of the terminal situation in all its phases and they in turn tend to increase unit costs. While many yards have been entirely reconstructed to meet modern needs, most systems have a few points where conditions are such as to exert a detrimental influence on the greater part of the line.

So serious has the problem become that there has been a revolution of methods and even ideas. Where formerly a terminal was considered one factor in the general scheme of transportation, where the yard served the railroad, necessity has demanded a reversal of positions. During certain periods, transportation loses its primacy in the minds of operating officers in that it is subordinated to the paramount object of keeping some terminal open to the end that congestion on the line may be avoided. Road conditions may be responsible for sluggish work within a terminal, the greatest trouble usually being lack of or irregular supplies of motive power. When the traffic is not moved currently, congested conditions are bound to reflect on the terminal work. It is much easier and cheaper to prevent a blockade than to clear one. While only reasonable sums of money are needed, unfortunately such funds are not always available to improve easily remediable conditions, such as shortage of power, an insufficient number of sidings, sidings of insufficient length, etc.

Without depreciating the importance of the question of facilities in the broader sense, it is well to consider other conditions which tend to minimize the improvements effected by the extension of terminal facilities. It is no uncommon thing for an ordinary terminal to hold several hundred cars of grain and coal awaiting reconsignment to local elevators, industries or connecting lines. The entire yard must be switched at least once every day and often no more than 15 or 20 per cent of the "hold" cars are disposed of.

The handling of team track business is made most difficult during certain seasons, because of insufficient storage space at the command of consignees. In many cases freight is bought on speculation with no definite market in sight and the railroad is expected to take care of it. It is a serious problem when costly equipment is allowed to stand on valuable team track space while the freight is being peddled in one-horse wagons. The team track storage charge should remedy the trouble somewhat, but something more drastic and broader in its scope is necessary to help general terminal conditions. A railroad yard is no place to store or to retail freight; it is not a coal yard, neither is it designed for grain storage, and its uses as such should be discouraged.

To get the best out of a terminal it is, of course, necessary to handle cars quickly and definitely, avoiding unnecessary moves. The marking or listing of inbound trains is an important feature. A consignee may be located on both home and connecting line tracks and will handle certain commodities at his different warehouses; another will handle all his hay and oats, for instance, from the team tracks but will reconsign corn from the hold yard; a third may be located entirely off the home rails on the tracks of two connecting lines. To dispose of a considerable part of the inbound train promptly on arrival it

*A paper submitted in the recent contest on the operation of large terminal yards.

is necessary for the yard clerks to know how freight for various consignees is handled.

At Louisville we are constantly after consignees for standing orders in whole or in part. These disposition orders are worked into a complete alphabetical list and a copy is furnished each yard clerk interested in the inbound work. The clerks chalk mark the trains, showing disposition, name of consignee and commodity, on all but through connecting line business. Inspectors follow the clerks, observing their marks, and in turn mark on the corner of the cars the train number and date. This mark not only shows that the inspectors have examined the car but indicates the age of any car in the yard. By walking through the hold or team track yards at any time the yardmaster can readily spot any old car or one apparently out of line. Yard checks and lists of billing with the locations of cars shown are also used. Cars for the freight house are given a distinguishing mark in accordance with the class of freight, preference in switching being given special traffic. As a double check against delay to perishable or other important merchandise cars, the warehouse foreman has a list each day of his billing, and if such cars fail to show up in the house the matter is promptly called to the attention of the yardmaster. Any such delays are followed up and responsibility located as between the yard clerk and switch foreman. The campaign for heavier loading of merchandise cars has helped terminals by reducing the number of house cars. This is merely a statement of the fact with respect to yard conditions and not an argument in favor of the extremely heavy loading of cars without regard to delay, extra handling and increased chance of O S & D claims

In handling industry work, a system can be applied to the firms doing a large steady business, but the work of small irregular receivers and shippers requires close supervision. We bill all of our industry cars and check the bills regularly, filing them when cars have been reported placed. When bills are carried over from one day to the next the cars are located and the cause of delay ascertained. The bills for all cars loaded on sidings have shown on the top of the bill the name of the firm or siding. If any such cars fail to show up promptly for outbound movement, the bill shows the yardmaster at a glance where the car was loaded.

Conditions governing the interchange of traffic are so varied that any plan must be formulated entirely to suit local requirements. The success of any scheme depends largely on close supervision and the ability of officers to get together on the ground and "iron out" minor irregularities. Permanent inability of a connection to handle its business indicates a situation beyond the power of local officers to regulate. One thing in common that has brought about trouble in terminals and between connections this past summer and at other periods is the flooding of connection points with empty bad-order cars. Homeward movement of foreign cars is, of course, directly responsible, but it would further appear that in handling such cars through shop tracks the general practice on a great many roads has been to repair cars only sufficiently to get them over to "the other fellow." There may be good reasons for such handling, but it has not worked to the advantage of terminal points. It is apparent that it costs less to switch a car through one shop track and repair it than it does to switch it through three or four and make partial repairs. In the latter case, who stands the additional expense?

Considerable attention is being given at present to damage to freight. It is hardly practicable to slow up switching. In fact conditions are such as to make it imperative to keep crews speeded up, although it does not necessarily follow that more care cannot be used. There is one place, however, where more time could be given with good results, and that is on the night manifest runs. In some cases the time is too short between the closing of freight houses and the departure of trains. Under pressure to run trains on time, house switching is done with speed as the main, if not only, object. However, where trains depart from terminal yards, it is well to get them out of the way as early as consistent. So far as yard work is concerned, there are always more opportunities for damage at night. In some cases consignees leave partly unloaded cars on team tracks in such shape that an ordinary coupling will displace the contents. Attention to this feature has been productive of good results. Warehouse foremen must give attention to partly loaded or unloaded merchandise cars.

Close co-operation among the various terminal departments is of great value in handling the business, particularly the small miscellaneous jobs or "short" work. Foremen of transfer gangs, coaling stations, shop tracks, bulking yards, etc., should anticipate their needs sufficiently to allow the yardmasters and conductors to map out the work. When several people wait until the last minute to call for engine service there is bound to be some disappointment. Wide-awake car inspectors contribute to successful operation. Not only should trains be handled promptly, but during intervals the inspectors should look over shop tracks and other available sources of empty cars and tag all cars in line with their general condition and the purpose for which they are required. Car inspectors, yard clerks and conductors must realize the importance of promptly and properly filling orders for empty equipment. This means much to a railroad's customers. Road engines ready on time, close figures on trains, overhauling of the best yard power during dull seasons, close attention to yard tracks and conditions by the maintenance of way department—all these things exert an influence.

The local freight office can render valuable assistance by prompt handling of billing, by securing advance disposition orders and by urging consignees to dispose of carload freight promptly. In busy seasons one man's time can be spent profitably in checking lists of "hold" and team tracks, telephoning consignees on all old cars and straightening out any irregularities. Through interline billing is an aid to yard operations as well as a time saver in the office. Freight auditors should extend this system of billing to cover a greater proportion of through business.

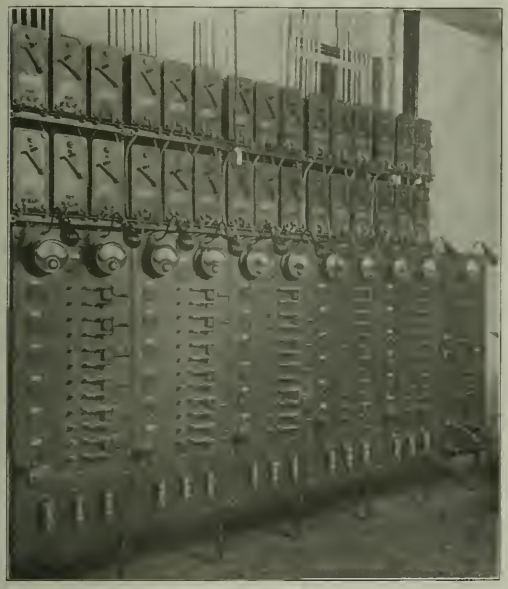
Co-operation between the operating and traffic departments is highly important. In attempting to secure business freight solicitors should not make unreasonable promises which usually have a boomerang effect. These men should spend some time around the yard at intervals, in order to know something of conditions and at least roughly understand the time required to make certain moves. On the other hand, when a yardmaster promises something he should make good even at a sacrifice. It is also well to remember that the manner of stating inability to grant some request is often resented more than the failure to secure what is wanted. It is impossible to prevent all complaints or to satisfy every one. A few shippers constantly play one railroad against another, endeavoring to secure questionable concessions and are ready to complain on the slightest pretext, principally in order to keep traffic officers "on edge." The public as a whole asks only for reasonable, dependable service, but cannot stand misrepresentation or being "double-crossed." It should be impressed on terminal employees that the shipping public makes their jobs possible. Operating and traffic employees must forget that there are such things as "departments" and work together.

Too much thought cannot be devoted to organization and supervision—not superficial direction, but the supervision that means careful teaching, training and development of latent ability, a supervision that not only corrects errors but strikes at the cause. This may well apply beyond the terminal. The title of master of trains is better written train (ing) master and that officer within or without a terminal should have his title imprinted on his mind as an everlasting admonition to—trainmaster.

Above all things, with a force of terminal clerks, create interest in the work, let each man feel some responsibility, understand the reason for performing his duties and the result of failure to properly handle his work—not the result so far as the employee is concerned but the effect on the company he represents. It is not possible to perfect an error-proof organization but we may aim high, and by patient, well directed effort produce results of a satisfactory nature, bearing in mind the fact that a well regulated smooth-working terminal is one of the railroad's best advertisements.

HANDLING FREIGHT WITH STORAGE BATTERY TRUCKS

Electric trucks for handling express and baggage have been in use for some time past at a number of passenger terminals. Their application is gradually being extended to the handling of freight and to the handling of materials around shops. One of the most extensive installations of this kind for handling freight is that of the Fall River Line, Piers 14 and 15, North River, New York, where twenty electric storage battery trucks together with complete facilities for battery recharging have been installed by the Sprague Electric Works.



Battery Recharging Switch Board for Storage Battery Trucks, Fier No. 14, Fall River Line

These trucks have a heavily bound oak platform located 22½ in. from the ground. The platform rests upon a frame of channel side members and steel end castings which are joined by rivets. Power is furnished by a lead storage battery having flexible rubber jars assembled in a creosoted wooden tray and suspended below the platform in a cradle attached to the side channels. The truck is driven by two series wound automobile motors enclosed in dust and damp proof frames, which are electrically connected in multiple and work independently of each other. This arrangement greatly simplifies the transmission by eliminating the countershaft, chains and differential, the pinion on each motor meshing directly with a gear bolted to one of the driving wheels. The maximum speed of the truck, light, on a level floor, is nine miles per hour. With a one-ton load the maximum speed on the level is seven miles per hour, and it will operate successfully up a 25 per cent grade under full load.

Truck Ascending Steep Grade to the Deck of the Ship

The truck is operated from a platform at one end on which the operator stands with one foot on the brake pedal, the controller lever in one hand and the steering lever in the other.

Receiving Platform, Fall River Line, Piers 14 and 15, North River

The brake is so arranged that it is set at all times until released by pressure on the brake pedal. An automatic switch is connected with the brake lever so that when the brake is applied the switch is open. It can only be closed by releasing the brakes and prevents running the truck with the brake applied or the possibility of accident from movement of the controller handle while loading or unloading the truck. The controller is arranged to give three speeds forward and three speeds reverse. To stop the truck the operator simply takes his hand from the controller lever which automatically returns to the neutral position, and lifts his foot from the brake pedal.

While the conditions under which the storage battery trucks are operating on the piers of the Fall River Line are in some respects different from those to be found in railway freight stations handling the same amount of business, the methods of classifying and stowing freight in the boats are such as to make a brief study of the operation of these trucks of interest from a railway standpoint. The Fall River Line boat arrives at New York in the morning, is unloaded during the forenoon and reloaded with outbound freight, leaving New York late in the afternoon. All classifying of both inbound and outbound freight is done at the piers in New York. A large part of the inbound freight is shipped from Boston and other New England points to Fall River by rail and transferred directly from the trains to the boat, while freight from New York is transferred directly from the boat to trains for rail delivery.

Before the storage battery trucks were installed it was customary for a large proportion of the shippers' wagons to drive directly onto the dock both to receive and to deliver freight. Those receiving freight loaded directly from the piles where the consignments were stored. When the dock became congested, as often happened, in order to avoid delay it was necessary to truck many consignments to the bulkhead by hand for delivery to the waiting trucks. This materially increased the cost of handling. Trucks delivering outbound freight drove to the gangway of the ship, where the freight was unloaded, weighed, checked and trucked by hand direct to the deck of the ship. The number of shippers' trucks which could be unloaded at one time was limited by the space directly in front of the gangway, and at times during the day, to avoid congestion, it was necessary to assist the drivers in unloading. A large number of men were required to truck the freight to the ships, as there was no room for temporary storage on the dock. One man could handle but a small load when the conditions were best, and at high tide the grades up the gangplank were such that he required assistance.

After the installation of the electric trucks a careful study was made and changes in the methods of receiving and delivering freight have been put into effect which have resulted in materially improving conditions on the piers as well as greatly reducing the cost of handling. Congestion has been greatly reduced if not entirely eliminated by keeping trucks delivering outbound freight off the docks entirely. To accomplish this a receiving platform, one inch lower than the loaded electric truck, has been built at the bulkhead to receive all outbound freight. This platform is built in sections; the outer section, or that nearest the doors, is permanent and contains two scales at each door; the inner section is subdivided into five parts, each of which may be lifted out of the way when not in use. In the morning the portable platforms are lowered and are used for storage. As freight is received it is weighed, checked and sorted according to railway routing at the other end of the line. Before all of the portable platforms are filled a sufficient amount of space is available on the ship to make room for the stowing of outbound freight, and a few electric trucks are assigned to transferring the freight from the receiving platforms as fast as it is received. No effort is made to transfer the freight accumulated on the platform until the ship is unloaded. When not in use the portable platforms are hoisted out of the way, thus facilitating the loading of the electric trucks directly from the receiving platform.

Beyond either end of the platform is a receiving door through which the electric trucks may be run to be loaded directly from the shippers' trucks. This makes unnecessary the handling of freight across the platform which does not require weighing. Since all freight has been received at the bulkhead it is possible, by the use of all the receiving doors, to unload from as many as 20 trucks at one time; the electric trucks, because of their speed and load capacity, are able to take care of the transfer to the ship without congestion and at a greatly reduced labor cost.

In unloading the ship the electric trucks are loaded with freight regardless of marks, which is sorted as it is unloaded, the trucks going to the various piles and distributing their loads in the proper places on the dock.

There are times when grades on the gangplank are as high as 25 per cent, owing to the tides. These are negotiated by the loaded electric trucks without difficulty, while with the hand trucks it is impossible for one man to take a load up such grades. In all classes of freight the electric truck will carry several times the amount that one man can carry with a hand truck, and will travel three or four times as fast. While the reduction in the amount of labor effected by the use of the electric trucks varies somewhat, depending upon a number of changeable conditions, it is stated that approximately 100 less men are required during the rush hours than were required when using the hand trucks exclusively, this being equivalent to a reduction of about one-third of the entire force.

THE MAGNOLIA CUT-OFF OF THE B. & O. PLACED IN SERVICE

The first track on the 12-mile cut-off between Orleans Road, W. Va., and Little Cacapon, which has been built by the Baltimore & Ohio at a cost of $6,000,000 (*Railway Age Gazette*, July 17, 1914), was opened for traffic last Sunday. This portion of the road has a freight density of 15,000,000 tons per mile of road, this unusually heavy traffic being occasioned by the fact that the two main lines from Chicago and St. Louis, respectively, converge at Cumberland, Md., just west of the new cut-off. The new line, which has two tracks, will be used for eastbound freight traffic only, all passenger service being maintained on the old two-track line along the Potomac river in order to avoid tunnels. The new line reduces the curvature 887 deg., the distance six miles, and the maximum grade eastbound from 0.5 per cent to 0.1 per cent, eliminating a helper grade 2.8 miles long. The construction of the new line involved the excavation of 3,500,000 cu. yd. of rock and earth, the driving of four tunnels with a combined length of 7,100 ft., the placing of 25,000 cu. yd. of concrete in bridges, and 50,000 cu. yd. in retaining walls, and the erection of 3,000 tons of steel bridges. The new line will be equipped with automatic signals and trains will be operated by telephone despatching. This improvement was completed in 18 months under the direction of F. L. Stuart, chief engineer, and John T. Wilson, district engineer.

Railway Construction in China.—A recent British consular report states that the projected line from Kochiu to Pishihchai on the French railway continues to be the subject of negotiations; but neither the officials nor the people are in favor of it, as the traffic is not considered sufficient to justify its construction. An agreement has recently been made with the Banque Industrielle of Tientsin, a Franco-Chinese institution, for a loan to build a railway from Ch'in Chou, west of Pakhoi in Kuangtung, to Yunnanfu; and, according to the Chinese press, the line will pass through Nanning, Poseh, Singyi and Lo Ping. At Singyi it will presumably link up with the line from Shashih, the contract for which has been awarded to a British firm. The construction of these two lines, which will place Yunnanfu in railway communication with the Yangtze on the north and the ocean on the south, will be of great benefit to the trade of this province as well as that of Kweichow.

General News Department

Conductors on the Northern Pacific are negotiating with the management for a new schedule of wages and working conditions.

The shops of the St. Louis, Iron Mountain & Southern at Argenta, Ark., which were closed recently were reopened on December 1, putting 600 men back at work.

The railroads of Louisiana, at a recent meeting in New Orleans, decided to adopt for use throughout that state the National demurrage rules, as promulgated by the American Railway Association.

At Marietta, Ga., December 2, John Nolan, who robbed passengers on a train of the Louisville & Nashville, near Atlanta, about a year ago, was, on second trial, found guilty, and sentenced to imprisonment for 20 years.

President Kenly, of the Atlantic Coast Line, announces that reductions of from 6 per cent to 10 per cent have been made in the salaries of all persons in the employ of the company receiving $200 or more a month.

At Allentown, Pa., this week, J. H. Freyer, a car inspector of the Philadelphia & Reading, 27 years old, was sentenced to 45 years' imprisonment for numerous robberies in railroad stations, post offices and dwellings.

The "health exhibit" cars of the Louisiana State Board of Health are being taken around the country by the railways of the southern states without charge; and the cars have recently visited New Orleans, Richmond, Jacksonville, Atlanta, Macon and a dozen other cities.

On November 26, the 10-stall frame engine house of the Southern Pacific at Horace, Kan., was destroyed by fire. The estimated loss of the building is $12,000; six locomotives which were in the roundhouse at the time of the fire were damaged to the extent of $30,000.

Through the enlargement of its shops at Nashville, Tenn., and the addition of several new machines, the Nashville, Chattanooga & St. Louis contemplates giving employment to between 400 and 500 additional men in the work of building its own freight cars. It is estimated that 1,000 cars will be built annually by the company.

The new car shops for the Chicago & Eastern Illinois at Oak Lawn, near Danville, Ill., adjoining the locomotive repair shops, were completed on December 1, and the new building was put into use at once. At the same time the old shops, which had been closed for some time, resumed operations with a full force working 40 hours a week.

A freight train of the Grand Trunk, stopped near Valparaiso, Ind., on the night of December 6, because of some trouble with the running gear, was robbed, while standing, of 36 tubs of butter. Two masked men intimidated the engineman and conductor with revolvers, and they had three accomplices, with an automobile, to carry away the butter. Just how or why the train had been stopped is not explained.

R. A. McCranie, receiver of the Florida Central, advises us that the track of this road from Thomasville, Ga., south to a point in Florida just beyond Roddenbery, Ga., a distance of 15 miles, is to be abandoned and taken up. This point is 1½ miles south of the Georgia-Florida boundary. From here southward the line has been sold to the Atlantic Coast Line. This section runs through Stringer, Wadesboro and Capitola to Fanlew, 32 miles.

The cuts and tunnels for the Lexington avenue subway, New York City, the new north-and-south line now under construction on the east side of Manhattan, have been opened through from Fifty-third street to the Harlem river, something over three miles; that is to say, there is an opening big enough for a man to walk through, on foot, all of the way. Many months must elapse before this or any part of the Lexington avenue line will be ready for operation.

The Bureau of Mines, of the Interior Department, has eight mine-rescue cars traveling through the different mining districts, giving instructions to miners in rescue, first aid and safety methods. The bureau also has five mine-rescue stations in different coal fields from which it is carrying on similar work. Legislation now pending in Congress will, if enacted, provide for continuous operation of cars throughout the year. Most of the railroads haul the cars free.

The Cincinnati, Hamilton & Dayton announces that it expects henceforth to buy ties from the farmers along the line instead of from jobbers.

The New York, New Haven & Hartford, having been accused of contemplating a change in its policy of buying ties largely from New England producers, has assured President C. M. Ely of the Lumber Manufacturers' Association of Southern New England, that a very large proportion of the company's ties will still be bought in the territory adjacent to its lines; probably 1,600,000 during the coming year. In the fiscal year ending June 30, 1914, 2,060,485 ties were laid, compared with 1,814,190 in 1913, and 1,493,786 in 1912. Of those laid last year about 1,800,000 were bought in New England. The company has been prompted by motives of economy to experiment with outside ties on certain portions of its line where the expense of renewing ties is naturally very high. The cost of replacing ties in stone ballast is about 50 per cent greater than for gravel and about 75 per cent higher than in dirt or cinders. For the inside tracks on a four-track, stone-ballasted line the expense is even higher. The life of a tie has become therefore a most important factor. Experience has shown that the oak ties produced in New England last about four years in rock ballast, and the chestnut ties from five to seven years. The company has decided to buy this year 100,000 long leaf yellow pine ties for use on its main lines so as to see if they will last any longer than ties now used.

Summary of Revenues and Expenses of Steam Roads in September

The Bureau of Railway Economics' summary of revenues and expenses and comments thereon for September, 1914, are as follows:

Railways operating 228,041 miles of line are covered by this summary, or about 90 per cent of all steam railway mileage in the United States. Their operating revenues for the month of September, 1914, amounted to $269,581,592. This amount includes revenues from freight and passenger traffic, from carrying mail and express, and from miscellaneous sources connected with rail and auxiliary operations. Compared with September, 1913, these operating revenues show a decrease of $13,792,318. Total operating revenues per mile averaged $1,182 in September, 1914, and $1,257 in September, 1913, a decrease of $75, or 6.0 per cent.

Operating expenses, which include the cost of maintaining track and equipment, operating trains, securing traffic, and of administration, amounted to $178,086,808. This was $14,380,302 less than for September, 1913. These operating expenses per mile of line averaged $781 in September, 1914, and $854 in September, 1913, a decrease of $73 per mile, or 8.5 per cent.

Net operating revenue, that is, total operating revenues of rail and auxiliary operations less operating expenses, amounted to $91,494,784, which was $587,984 more than for September, 1913, but this increase is due to increase in operated mileage, as is shown by the fact that net operating revenue per mile decreased. Net operating revenue per mile of line averaged $401 in September, 1914, and $403 in September, 1913, a decrease of $2 per mile, or 0.5 per cent.

Taxes for the month of September amounted to $11,454,768, or $50 per mile, an increase of 2.0 per cent over September, 1913.

Operating income, which is net revenue from rail and auxil-

iary operations, less taxes, averaged $351 per mile of line, and in September, 1913, $354, thus decreasing $3, or 0.9 per cent. Operating income for each mile of line for each day in September averaged $11.69, and in September, 1913, $11.80. Operating income is that proportion of their operating receipts which remains available to the railways for rentals, interest on bonds, appropriations for betterments, improvements, new construction, and for dividends.

The railways of the eastern district show a decrease in total operating revenues per mile of line as compared with September, 1913, of 5.5 per cent, the railways of the southern district a decrease of 8.9 per cent, and the railways of the western district a decrease of 5.0 per cent. Operating expenses per mile decreased 10.4 per cent in the east, decreased 4.9 per cent in the south, and decreased 7.1 per cent in the west. Net operating revenue per mile increased 6.9 per cent in the East, decreased 19.0 per cent in the south, and decreased 1.5 per cent in the West. Taxes per mile show increases of 2.4 per cent in the east, of 2.0 per cent in the south, and of 2.1 per cent in the west. Operating income per mile increased 7.5 per cent in the east, decreased 22.3 per cent in the south, and decreased 2.0 per cent in the west.

The operating ratio for September, that is, the per cent of total operating revenues absorbed in operating expenses, was 66.1 per cent, which is comparable with 67.9 per cent in September, 1913, and 64.3 per cent in September, 1912. The operating ratio in the eastern district for September was 67.9 per cent, as compared with 71.6 per cent for September, 1913; was 74.7 per cent in the southern district as compared with 71.5 per cent in 1913; was 61.4 per cent in the western district, as compared with 62.8 per cent in 1913.

Comparison of returns for three months of the current fiscal year with those of the corresponding months of the previous fiscal year reveals a decrease in total operating revenues per mile of 5.6 per cent, a decrease in operating expenses per mile of 7.6 per cent, and a decrease in net operating revenue per mile of 1.0 per cent.

This net operating revenue per mile increased 2.2 per cent in the east as compared with the corresponding period of the previous year, decreased 7.4 per cent in the south, and decreased 1.7 per cent in the west.

When the returns for the nine months of the calendar year 1914 are compared with those of the corresponding months of 1913, they show a decrease in total operating revenues per mile of 6.2 per cent, a decrease in operating expenses per mile of 5.3 per cent, and a decrease in net operating revenue per mile of 8.5 per cent. This net operating revenue per mile decreased 12.1 per cent in the east as compared with the corresponding period of the previous year, decreased 5.5 per cent in the south, and decreased 5.8 per cent in the west.

The diagram shows the variations in operating revenues, operating expenses, and net operating revenue per mile for the separate months of the calendar year 1913 and of the calendar year 1914 to date. The following table shows the per cent of operating revenues consumed by each class of expenses:

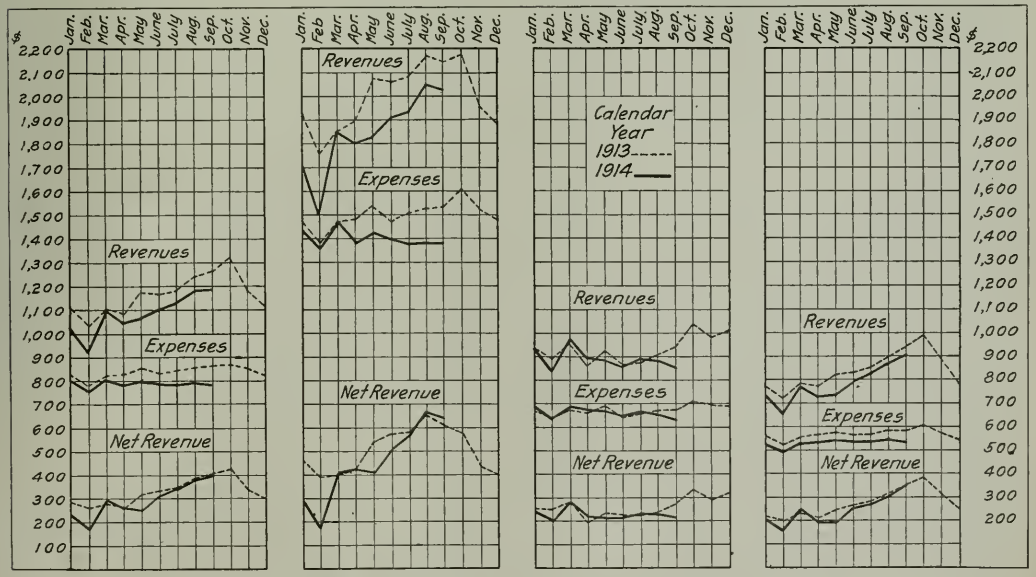
Per Cent of Total Operating Revenues

Account	September, 1914 United States	Eastern District	Southern District	Western District	Three months of the fiscal year 1915
Freight revenue	68.7	67.5	71.4	69.0	66.9
Passenger revenue	22.4	22.8	21.3	22.4	24.2
Mail revenue	1.8	1.5	1.7	2.2	1.8
Express revenue	2.2	2.2	2.2	2.1	2.2
All other revenues	4.9	6.0	3.4	4.3	4.9
Maintenance of way and structures	12.8	12.0	15.0	13.0	13.2
Maintenance of equipment	16.2	17.1	20.1	14.1	16.6
Traffic expenses	1.8	1.5	2.6	1.8	1.9
Transportation expenses	32.5	34.3	34.0	30.0	33.0
General expenses	2.3	2.2	2.8	2.2	2.3
All other expenses	0.5	0.8	0.2	0.3	0.6
Total operating expenses	66.1	67.9	74.7	61.4	67.6

Railway Business Association

The sixth annual dinner of the Railway Business Association was held at the Waldorf-Astoria, New York, Thursday evening, December 10, with George A. Post as toastmaster. There were almost exactly a thousand members and their guests present and the two speakers were Fairfax Harrison, president of the Southern Railway, and Warren G. Harding, United States senator-elect from Ohio. President Harrison's address is given in full elsewhere in this issue. Senator Harding's address will appear in the issue of next week.

One of the features which added to the general enthusiasm of the dinner was the distribution of a newspaper, printed especially for the occasion, containing a speech by Mr. Post,



Monthly Revenues and Expenses per Mile of Line in 1914

president of the association, and also containing news and advertisements of wit or humor, or both.

The New York Railroad Club

The New York Railroad Club will hold its eighth annual smoker and entertainment in the Grand Ball Room of the Waldorf-Astoria, New York, at 8:30, Friday evening, December 18. The program is to be the "Club Mystery," and will not be revealed until the evening of the meeting.

MEETINGS AND CONVENTIONS

The following list gives the names of secretaries, dates of next or regular meetings, and places of meeting of those associations which will meet during the next three months. Hereafter the full list of meetings and conventions will be published only in the first issue of the Railway Age Gazette for each month.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York. Next meeting, December 8-9, Richmond, Va.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meetings, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railway Business Association.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December 10, 1914, Waldorf-Astoria Hotel, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. R. R., Atlanta, Ga. Next regular meeting, January 21, 1915, Atlanta, Ga.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Transportation Club of Detroit.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

The Atchison, Topeka & Santa Fe last week raised its embargo on grain to Galveston, Tex., for export.

During the month of October the Chicago, Burlington & Quincy ran 93 passenger trains from Denver to Chicago, 1,034 miles, of which 92 arrived exactly on time. One train was 11 minutes late because of fog.

The southwestern roads have filed tariffs with the Interstate Commerce Commission similar to those of the western trunk lines, advancing freight rates on a number of commodities and making changes in charges for special services.

The New York, New Haven & Hartford has invited large numbers of New England merchants and others to attend a conference at Boston, December 15, to consider the promotion of export business. The road will give a luncheon to its visitors at the American House, Tuesday noon.

At the recent annual meeting of the Traffic Club of Kansas City the following officers were elected for the ensuing year: President, Frank M. Cole, general agent, New York Central Lines; first vice-president, F. W. Fratt; second vice-president, H. A. Richards, commercial agent, Grand Trunk; secretary-treasurer, A. Wild.

The passenger department of the Nashville, Chattanooga & St. Louis has received a letter from a clergyman enclosing a draft for $6.31 to pay for a trip over the line in 1910 on which he failed to pay fare for his boy, although the boy was six years old. The amount included not only the half fare rate but interest at six per cent.

Precautions against the spread of the foot and mouth disease continue to be maintained strictly in many directions. In Massachusetts, Rhode Island and Connecticut the Department of Agriculture has ordered a quarantine prohibiting the transportation of hay, except where the shippers can certify that it has not been near infected animals.

The new Northern Pacific double track line from Tacoma, Wash., south to Tenino, 43.7 miles, which was built to replace the existing single track line between those places will be opened for business on December 15. This work was described in the *Railway Age Gazette* of July 24, 1914, page 159. The line is to be used jointly by the Northern Pacific and the Oregon-Washington Railroad & Navigation Company.

J. B. Munson, receiver of the Macon & Birmingham, has applied to the railroad commission of Georgia for authority to increase passenger fares from three cents a mile to four cents, to increase certain freight rates, and to take off two passenger trains. The passenger trains of the road, as a whole, are run at a loss, the pay received for carrying passengers, mail and express being insufficient to pay operating expenses, to say nothing of roadway interest and other fixed charges.

Joseph Beifeld, president of the Hotel Sherman Company, Chicago, is circulating 25,000 copies of a pamphlet entitled "How to Get Back Prosperity," advocating general advances in freight rates as the best means of promoting the prosperity of the country. "The more I talk with business men," said Mr. Beifeld, "the more I am convinced that the railroad situation is responsible for the financial condition of the people of the United States. The railroads need increased freight rates if they are to progress."

Notes from Japan.—There are now within a radius of 50 miles of Osaka nearly 250 miles of double track in operation and 80 miles more under construction or proposed in the near future. The growth of light railways has been slower, there being at present less than 50 miles, but another 50 miles are under construction. Numerous plans are projected, but hitherto these have been held up by lack of capital.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Investigation by the Interstate Commerce Commission of the financial history of the Pere Marquette was begun at a hearing in Detroit, Mich., last week before Commissioner Hall. The principal witnesses who testified were J. L. Cramer, controller of the Pere Marquette, and C. S. Sikes, auditor.

Kansas-Iowa Brick Rates

Standard Vitrified Brick Company et al. v. Chicago, Burlington & Quincy et al. Opinion by Commissioner Clements

Upon rehearing, the commission finds that a rate of 12½ cents per 100 lb. on brick (except bath, tile and enameled) in carloads from points in the Kansas gas belt to stations in Iowa on the Chicago, Burlington & Quincy is not unreasonable. A proposed increase from 10 to 12½ cents per 100 lb. from the same points of origin to certain stations in Iowa on the Chicago, Rock Island & Pacific is found justified. (32 I. C. C., 208.)

Rates on Glass from West Virginia Points

Central West Virginia Glass Manufacturers' Association et al. v. Baltimore & Ohio et al. Opinion by Commissioner McChord:

The commission finds that the rates on window glass from Clarksburg, W. Va., to destinations eastbound are not unreasonable. It is found, however, that the four points of Weston, Salem, West Union and Clarksburg should be grouped and given the Clarksburg rate, westbound, and that the Clarksburg group should be put on the same basis as the Pittsburgh group with respect to westbound rates. Although the present rates on westbound traffic are found unreasonable and discriminatory, reparation is denied. (32 I. C. C., 218.)

Grain Rates from Buffalo to New York Sustained

New York Produce Exchange v. New York Central & Hudson River et al. Opinion by Commissioner Clements:

Complainants allege that the rates on ex-lake export grain from Buffalo, N. Y.; Erie, Pa., and other lake ports to New York City are unreasonable per se; and that they are discriminatory in that they are higher than the divisions which the defendants receive of the all-rail export grain rate from Chicago to New York. It is also alleged that the defendants unduly prefer Montreal and discriminate against New York by the existing rate adjustment. Defendants maintain during the period of navigation an ex-lake export rate from Buffalo to New York on wheat, the principal grain here involved, of 5½ cents per bushel. The rate from Chicago to Montreal by water on the same traffic is 3½ cents per bushel. During the open navigation season of 1913, the amount of wheat exported through New York was about 31,000,000 bushels, and from Montreal about 34,000,000 bushels. Complainants wish the carriers to establish a scale of rates varying with respect to different periods of the year or a rate not exceeding 4½ cents per bushel from May 1 to November 1 of each year.

The commission notes that it is not unlawful to maintain during the period of navigation, in order to meet competition, lower rates than are maintained during the remainder of the year, provided the maximum rates are not unreasonable and the lower rates are not prejudicial.

It is held that the commission has no power to order the establishment of a scale of rates such as complainant requests. While carriers may take competition into consideration and make rates to meet it, the commission has never held that it could compel them to do so. In such a case the question of policy or expediency in fixing a rate which is less than the maximum of what is reasonable is under the law left to the discretion and judgment of the carrier. The carriers are also upheld in their argument that they have no voice in making rates to Montreal and do not participate in the movement of export grain to that port. It further appears that the present ex-lake domestic rate on wheat is 6½ cents per bushel, or one cent per bushel higher than the export rate. That has been the relation between export and domestic ex-lake rates since May 1, 1908, and in the opinion of the commission should be retained. (32 I. C. C., 212.)

STATE COMMISSIONS

The Illinois Public Utilities Commission held a hearing in Chicago on Monday on the proposed tariff, filed by the railways, imposing a charge for l. c. l. trap-car service. At the suggestion of the commission a committee of shippers was appointed to confer with the railroad attorneys and to present a report on the subject at a hearing on January 12.

The Illinois Public Utilities Commission has issued an order that when a change is made by a railroad in the time of arrival or departure of a passenger train, or when any regular train, or station or agency is to be discontinued, such information shall be posted in a conspicuous place in each station affected by the change at least five days before the change is to become effective.

A hearing was held before the Missouri Public Service Commission at Jefferson City, on December 2, on the application of the Missouri railroads for general advances in freight and passenger rates throughout the state. The principal witnesses for the railroads were B. F. Bush, president of the Missouri Pacific, and O. M. Spencer, general solicitor for the Chicago, Burlington & Quincy, who told the commission that if relief is not afforded the railroads of the state the results will be disastrous to the companies. Detailed testimony regarding the financial condition of the roads and the rate situation was given by Frank Nay, controller, and Stanley Johnson, assistant freight traffic manager of the Chicago, Rock Island & Pacific.

COURT NEWS

Stopping-in-Transit at Nashville

The Supreme Court of the United States has sustained the Interstate Commerce Commission in its decision prohibiting railroads from granting grain reshipping privileges at Nashville, to the disadvantage of Atlanta. This reverses the Commerce Court's decision, which had annulled the order. The commission held that Atlanta and like points must have the same privileges as Nashville. The railroads put Nashville in the same position with Ohio river points by allowing dealers at Nashville to stop their through shipments from the northwest to Georgia and other southern cities, at Nashville, for cleaning, classifying and sacking.

German Control of Belgian Railways.—It is reported that the German military authorities in Belgium have constituted three railway administration departments, with headquarters at Brussels, Charleroi, and Libremont.

The Japanese Train Boy.—According to a book treating of the lighter side of life in Japan, written by a native, T. Fujimoto, the train boy is a most important functionary in that country. His duties seem to be a compound of those of the conductor and of the youth in this country who peddles candy and magazines en route. Incidentally, he has to look after the itinerant vendors of postcards and other souvenirs who ply their trade on the trains despite the regulations. "Outsiders," said one of the train boys to the author, "think that our life is simple and easy, but on the contrary, we are in a weak and pitiful position with the passengers; we are strictly ordered that, even if we are beaten by them we must not strike back against them." For the discharge of these onerous functions, the salary is only $10 a month, "but we have such a confidence in our duty that we take the whole charge of the Imperial Japanese Railways." This is apparently due to the fact that the railways are known by the train boys they keep; "the reputation of the railways solely rests or depends upon the train boys, because if it becomes bad the cause is always ascribed to the bad treatment of passengers by the boys, while there are no faults in the train itself." Formerly the boys were not permitted to receive tips, but this regulation has now been abolished.

Railway Officers

Executive, Financial, Legal and Accounting

J. D. B. DeBow, assistant general counsel of the Nashville, Chattanooga & St. Louis, at Nashville, Tenn., has resigned.

W. M. Baugh, auditor of the Liberty-White at McComb, Miss., has been appointed also assistant to J. W. Johnson, receiver.

E. W. Beatty, general counsel of the Canadian Pacific, Montreal, Que., has been appointed vice-president and general counsel.

A. Mackrille, assistant general auditor of the New York, New Haven & Hartford and the Central New England at New Haven, Conn., has been appointed general auditor, with office at New Haven, and T. M. Prentice, assistant auditor, has been appointed auditor, with office at New Haven. A sketch of Mr. Mackrille's railway career was published in the *Railway Age Gazette* of April 24, 1914, page 961.

Ivy Ledbetter Lee, executive assistant of the Pennsylvania Railroad, with headquarters at the general office in Philadelphia, has resigned to become a member of the personal staff of John D. Rockefeller, New York City, and will take up the duties on this staff of Jerome D. Greene, who will in future devote his entire time to the Rockefeller Foundation. Mr. Lee was born on July 16, 1877, at Cedartown, Ga. He was educated at Emory College, Oxford, Ga., and graduated from Princeton University with the class of 1898, and took post graduate work at Harvard and Columbia Universities. After several years' experience in editorial work on New York newspapers he entered the service of the Pennsylvania Railroad in 1906, and took charge of the publicity work of the company, and in 1908 established its publicity bureau. The following year he resigned from the Pennsylvania Railroad and became general European manager for Harris, Winthrop & Company, bankers. On December 1, 1912, he returned to the service of the Pennsylvania Railroad as executive assistant, from which position he now resigns. From 1905 to 1907 Mr. Lee was the press representative for the anthracite coal operators and other corporations. He was a lecturer before the London School of Economics. He is a Fellow of the Royal Geographical Society and of the Royal Economic Society, also a member of the American Economic Association, and the Railroad Club of New York.

Ivy L. Lee

Operating

John W. Williams has been appointed superintendent of the Globe division of the Arizona Eastern, with office at Globe, Ariz., succeeding C. C. Mallard, deceased.

L. L. Marshall, trainmaster of the Lake Erie, Franklin & Clarion at Clarion, Pa., has been appointed superintendent in charge of transportation, and his former position has been abolished.

E. P. Laird, engineer of roadway of the Atlantic Coast Line at Rocky Mount, N. C., has been appointed superintendent of the Richmond district, with office at Richmond, Va., succeeding E. Phenneger.

The authority of J. W. Farrell, trainmaster of the Grand Trunk at Richmond, Que., has been extended to include the First district, vice E. S. Cooper, transferred. W. J. Nixon, trainmaster at Brockville, Ont., has been appointed trainmaster of the Fourth district, with office at Montreal, Que., succeeding T. H. Mason, transferred. N. P. North has been appointed trainmaster, and E. O. Dunn has been appointed chief despatcher of the 27th and 28th districts, with headquarters at Durand, Mich., vice R. Kelley, deceased, and Mr. North promoted.

Charles Armstrong Grimsley, whose appointment as superintendent of the Northern division of the Florida East Coast, with headquarters at New Smyrna, Fla., has already been announced in these columns, was born on December 25, 1883, at Eastman, Ga. He began railway work on February 1, 1902, with the Southern Railway, and subsequently served as operator on the Atlantic & Birmingham, and later as despatcher on its successor, the Atlanta, Birmingham & Atlantic, until May, 1906, when he was promoted to chief despatcher of the same road. In August, 1907, he entered the service of the Florida East Coast as despatcher, and later served as chief despatcher and then as trainmaster until August, 1914, when he was appointed acting superintendent at Miami, Fla., which position he held at the time of his recent appointment as superintendent of the Northern division of the same road as above noted.

Traffic

The title of J. M. Cousins, commercial agent of the Wabash at New Orleans, La., has been changed to general agent.

W. L. Thornton has been appointed district passenger agent of the Cincinnati Northern at Van Wert, Ohio, succeeding A. C. Stutsman, resigned.

William P. Wightman, westbound agent of the Lake Shore & Michigan Southern at Cleveland, Ohio, has been appointed commercial agent at that place, succeeding George F. Clough, deceased.

R. J. Kennedy, colonization agent of the Gulf, Colorado & Santa Fe, with headquarters at Galveston, Tex., has been transferred to Kansas City, Mo., in a similar capacity, with jurisdiction extended over the Atchison, Topeka & Santa Fe.

F. L. Word, live stock agent of the Southern Railway, Virginia & Southwestern, Georgia Southern & Florida, Hawkinsville & Florida Southern, and Macon & Birmingham at Atlanta, Ga., has been appointed live stock freight agent with headquarters at Atlanta.

F. J. Sullivan, traffic manager and superintendent of the Nevada Copper Belt at Mason, Nev., has been appointed general freight and passenger agent of the Salt Lake & Utah, with headquarters at Salt Lake City, Utah, in place of P. H. Cook, who succeeds Mr. Sullivan on the Nevada Copper Belt.

Paul Pinkerton, commercial agent of the Southern Railway at Atlanta, Ga., has been appointed commercial agent at Athens, succeeding George Robertson, transferred. G. H. Kerr, commercial agent at Pittsburgh, Pa., succeeds Mr. Pinkerton. E. C. Morgan, commercial agent at Buffalo, N. Y., succeeds Mr. Kerr, and the commercial agency at Buffalo has been abolished.

H. C. Davis having resigned as general agent of the Lehigh Valley at New York City, that office has been abolished, and Fred E. Signer, commissioner of the Lake Lines Association at Buffalo, N. Y., has been appointed to the new position of general eastern freight agent, with office at New York City. Mr. Davis' duties in the operating department have been assumed by the superintendent of the New York division.

J. H. O'Neill, district freight and passenger agent of the Oregon-Washington Railroad & Navigation Company at Seattle, Wash., has been appointed traveling passenger agent, with office at Portland, Ore. H. L. Hudson, district freight and passenger agent at Lewiston, Idaho, succeeds Mr. O'Neill at Seattle, and L. M. Foss, traveling freight and passenger agent at Bend, Ore., succeeds Mr. Hudson.

Iverson Lea Graves, whose appointment as general freight agent of the Southern Railway, with headquarters at Knoxville, Tenn., has already been announced in these columns, was born on June 21, 1870, at Augusta, Ga., and was educated at Emory

College, Oxford, Ga. He began railway work on March 1, 1892, and until 1895, was in the service of the Richmond & Danville, the Georgia Pacific, now a part of the Southern Railway and the Plant System of railroads, now part of the Atlantic Coast Line, at Savannah, Ga. He then served as secretary to the manager of the Southeastern Car Service Association, at Atlanta, and in 1897 went to the Southern Railway as secretary to the vice-president, and has been in the service of this road ever since. He was then consecutively secretary to traffic manager, assistant chief clerk to traffic manager, and chief clerk to fourth vice-president until 1905, when he was appointed assistant general freight agent at Memphis, Tenn. Two years later he was promoted to general freight agent at Memphis, remaining in that position until 1911, when he was appointed coal freight agent at Atlanta, Ga., which position he held at the time of his recent appointment as general freight agent of the same road at Knoxville, Tenn., as above noted.

Engineering and Rolling Stock

M. F. Clements has been appointed engineer in charge of track elevation of the Northern Pacific at Spokane, Wash.

S. S. Stiffey, having resigned as superintendent of motive power of the Toledo & Ohio Central and the Zanesville & Western, that office has been abolished, and all the duties thereof have been assumed by C. Bowersox, master mechanic, with office at Bucyrus.

H. C. Oviatt, whose appointment as assistant mechanical superintendent of the New York, New Haven & Hartford in charge of a new bureau just established and known as the bureau of fuel economy, with headquarters at New Haven, Conn., has already been announced in these columns, was born on December 5, 1871, at Milford, Conn., and was educated in the grammar school of his native town. He began railway work on May 23, 1889, as a locomotive fireman on the New York, New Haven & Hartford. In July, 1894, he was promoted to locomotive engineman, and in February, 1900, was appointed air brake inspector. Three years later, he was appointed foreman of engines, and in August, 1904, was promoted to master mechanic on the same road. He subsequently served as general inspector of the mechanical department, and in May, 1913, was appointed assistant mechanical superintendent. The following September, he was appointed superintendent of the Old Colony division, and on November 9, 1914, was selected to organize and supervise the bureau of fuel economy on the same road, with the title of assistant mechanical superintendent, as above noted.

H. C. Oviatt

OBITUARY

Edwin C. Brown, formerly general superintendent, and from September, 1891, to 1910, assistant to the president of the Michigan Central, died in Detroit, Mich., on December 5, aged 83 years.

Swiss Resorts to be Open.—The Swiss Federal Railways announce that most of the leading Swiss winter resorts will be open as usual during the coming season, including Arosa, Davos, Grindelwald, Klosters, Loèche, Pontresina, St. Moritz, Wengen, Celerina, Diablerets, Leuk, Les Avants, Montana, Rigi Kaltbad, Villars, Champéry, Engelberg, Kandersteg, Samaden and Weissenstein.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Nashville, Chattanooga & St. Louis, reported some time ago as being in the market for locomotives, has issued new inquiries for 6 Mikado and 6 Pacific type locomotives.

Russian Government Railways.—The Railway Gazette of London in its issue of November 27 states: The Russian railways are short of rolling stock, and the Ministry of Ways of Communications finds it urgent to order 116 freight locomotives and 15,700 freight cars more than provided for in the ordinary credits.

CAR BUILDING

Russian Government Railways.—See note above under head of Locomotives.

The Pennsylvania Railroad has ordered 1,050 all-steel box cars from its Altoona shops.

The Philadelphia & Reading has ordered 200 underframes from the American Car & Foundry Company.

The Louisiana Railway & Navigation Company is installing metal draft arms and Cardwell friction draft gear on 900 60,000 lb. capacity box cars.

The Toledo, St. Louis & Western is reported to be in the market for about 1,700 box cars. This item has not been confirmed.

The Great Northern has ordered 13 coaches, 3 parlor cars, 3 mail and express cars, and 2 baggage cars for the Spokane, Portland & Seattle from the Barney & Smith Car Company.

The Oliver & Snyder Steel Company, Pittsburgh, Pa., has for sale at $150 each, 240 double hopper wooden coke cars which it is now using at its coke works at Oliver, Pa., and Redstone Junction, Pa., where the cars may be inspected.

The Intercolonial has recently ordered 6 first class coaches from the Canada Car Company, 8 sleeping cars from the National Steel Car Company, 200 flat cars from the Nova Scotia Car Works, and 250 coal cars from the Eastern Car Company.

The Northern Pacific has ordered 17 baggage cars, 4 baggage and mail cars, 18 mail and express cars, 47 coaches and 6 dining cars from the Pullman Company. This order is in addition to 21 sleeping cars also ordered from the Pullman Company, reported in the *Railway Age Gazette* of November 13.

IRON AND STEEL

The Oil Belt Terminal has ordered 3,000 tons of rails from the National Steel Rail Company.

The Vicksburg, Alexandria & Southern has ordered 1,500 tons of rails from the National Steel Rail Company.

The Fort Dodge, Des Moines & Southern has ordered three 96-ft. deck girder spans, amounting to 176 tons, from the American Bridge Company.

Atchison, Topeka & Santa Fe.—The item in the *Railway Age Gazette* of last week to the effect that the Santa Fe had ordered 63,450 tons of rails from the Colorado Fuel & Iron Company, was in error in that 12,000 tons of this allotment was ordered from the Illinois Steel Company.

Effects of the War on Industry.—The effect of the present European war on European industry is beginning to be expressed in figures. The British Board of Trade reports that the exports for August were $100,000,000 less than for August, 1913, and that imports decreased by $65,000,000. The exportation of manufactured articles alone decreased $75,000,000.

Supply Trade News

The Eddystone plant of the Baldwin Locomotive Works has been put on full time at least for the next month.

Morris G. Condon, senior member of H. B. Underwood & Co., Philadelphia, Pa., died on Thursday, December 3.

The National Steel Rail Company is filling an order for rails to be shipped to South America. It has also received an order for a tonnage of rails from an interurban railroad in western Kansas.

Alexander Harvey, secretary of the Detrick & Harvey Machine Company, Baltimore, Md., died in that city on November 22, of pneumonia. Mr. Harvey was a native of Baltimore, and with Jacob N. Detrick organized the company bearing his name in 1884. He leaves three sons and a daughter.

Charles Arthur Moore, president of Manning, Maxwell & Moore, New York, died of heart disease on board the steamer Rotterdam, on which he was en route for Naples. Besides being president of Manning, Maxwell & Moore, he was president of the Shaw Electric Crane Company, Consolidated Safety Valve Company, Ashcroft Manufacturing Company, Hancock Inspirator Company, Hayden & Derby Manufacturing Company, United Injector Company, and was a director of the Continental Insurance Company, the Liberty National Bank, the American Bank Note Company and the National Machinery Company. Mr. Moore was born in West Sparta, N. Y., in 1845, and was educated in the public and private schools of Rochester, N. Y., and Lynn, Mass. He enlisted in the navy at the outbreak of the civil war and served throughout the war. He then became a salesman in New England, and in 1880 joined the firm of H. S. Manning & Co., of New York, forming the firm of Manning, Maxwell & Moore, manufacturing railroad supplies. In 1905 the business was incorporated, and Mr. Moore became president and a controlling owner. Mr. Moore was a member of the Chamber of Commerce, National Civic Federation, New York Board of Trade and Transportation, American Society of Mechanical Engineers, Empire State Society of Sons of Revolution, Ohio Society, St. Andrew's Society, Pilgrims of the United States and Society of Genesee. He was a member of the Automobile Club of America, Army and Navy, Republic, Union League, Lotus, Engineers, New York Railroad, Machinery, Lawyers and Transportation Clubs, and the founder and for ten years president of the Montauk Club.

C. A. Moore

The plant of Thomas A. Edison, Inc., and its allied companies was almost entirely destroyed by a fire on Wednesday evening, December 9, which caused a loss estimated at $7,000,000. The greatest loss occurred in the buildings where Edison phonographs were made, but, fortunately, the trade had been well supplied for the Christmas holiday business. The building in which the Edison storage batteries are made was left untouched, and as there was but little damage to the facilities for manufacturing the Edison primary battery, there will be no delay in the manufacture or delivery of either of these products. The laboratory building in which Mr. Edison conducts his experiments and which houses many valuable records was also undamaged.

The United States Circuit Court of Appeals for the second circuit has handed down an opinion reversing the lower court and holding valid and infringed, the Watson corrugated culvert patent under which the Armco American ingot iron culverts made by the American Rolling Mill Company, Middletown, Ohio, are manufactured, in a suit against Frank McPherson, highway commissioner of Ithaca, N. Y. This decision, which is final with no opportunity for further appeal, upholds the Watson claim for a sheet metal culvert composed of connected cylindrical sections having circumferential corrugations extending to the extremities of the section.

Joseph Block, one of the founders and a director of the Inland Steel Company, died in Chicago on December 6, at the home of his daughter, Mrs. H. L. Hart. Mr. Block started his business career in Cincinnati, Ohio, where he founded the firm of Block & Pollak, and later organized the Cincinnati Forge & Iron Works. Both companies were eventually incorporated into the Block-Pollak Iron Company, of Chicago. In 1893 he helped to organize the Inland Steel Company and has since then served continuously as one of its directors. He was also a director of the Buffalo Steel Company, Tonawanda, N. Y. Mr. Block was 83 years old.

Francis V. McGinness, sales engineer of the Edison Storage Battery Company, Orange, N. J., has been appointed assistant manager of the railway department, succeeding William F. Bauer, recently made manager of the Chicago office. Mr. McGinness is a graduate of the Schools of Applied Science of Columbia University, and before graduation had considerable practical experience with the New York & New Jersey Telephone Company. After a few months in the engineering department of the New York & Queens Electric Light and Power Company, Long Island City, he joined the sales force of the Edison Storage Battery Company. He has been in the railway department of that company for the past two years.

TRADE PUBLICATIONS

Insulation.—This is the title of an attractive booklet issued by the Continental Fibre Company, Newark, Del., to describe the company's Vulcanized Fiber, Bakelite-Dilecto and Continental Bakelite. The characteristics of the three products are named. It is stated concerning them that all three are waterproof and that the latter two will stand upwards of 100,000 volts. Bakelite-Dilecto and Continental Bakelite have both been on the market for about two years.

Electric Railway Apparatus.—The General Electric Company has recently issued Bulletin No. 44,003, an attractive illustrated booklet entitled "Modern Electric Railway Apparatus." The bulletin is contained in a colored cover of artistic design and describes briefly the Curtis steam turbine for railway service, railway generator, transformers, switchboards, synchronous converters, motor-generator sets, G-E ventilated railway motors and electric locomotives. There are also illustrations of the G-E locomotives in use at the locks at Panama.

South African Passenger Train Service Curtailed.—It is interesting, in view of similar occurrences in this country, to know that the South African Minister of Railways has sanctioned a curtailment of the passenger train service throughout the system. The step is an economy made necessary by a decline in the freight receipts resulting from the dislocation of trade and the prohibition of the exportation of foodstuffs. A second reason may be that with the restriction of trade the passenger traffic has fallen off. A final reason, is the necessity which a state of war imposes on the administration of providing an ample reserve of engines and rolling stock.

Railway Construction in Madagascar.—A recent consular report states that considerable progress has been made in the construction of the railroad between Tananarive and Antsirabe, 107 miles south of the capital. A branch line between Tananarive and Tamatave is now being built 81 miles north from Moramanga, which is 133 miles from Tamatave, to Lake Abevava in the Ambatondrazaka district, a rich agricultural and cattle section in the west of the province of Tamatave. These two railway extensions will facilitate and develop the commerce of the Central Plateau and the Ambatondrazaka country and will improve conditions generally on the island.

Railway Construction

ALABAMA ROADS.—We are told that a contract has been given to J. N. Gillis & Sons by the Ensign Yellow Pine Company, Wetumpka, Ala., for building a 5-mile logging line out of Wetumpka.

BALTIMORE & OHIO.—The Magnolia cut-off, a new double-track line between Orleans road, W. Va., and Little Cacapon, 12 miles, was opened for traffic on December 6. This cut-off is 5.8 miles shorter than the old line between Orleans road and Little Cacapon. (July 17, p. 115.)

BESSEMER & LAKE ERIE.—We are told that this company plans to build 1.8 miles of second track from Culmerville, Pa., to C. O. Tower.

CENTRAL CANADA.—The Alberta legislature has passed an act providing for the financing and building of this line from its junction with the Edmonton, Dunvegan & British Columbia to the Peace River Crossing; authorizing the building of a branch line from Sucker Creek to Grouard, about 30 miles, and providing for the guarantee of bonds for $20,000 a mile in aid of the construction. The projected route is from a point on the E. D. & B. C., to be called McLennan, near Round Lake, Alta., where there will be a divisional point, northwesterly to the Hart river, thence to Peace River Crossing, about 45 miles, and southerly to Dunvegan. J. D. McArthur & Co., Winnipeg, Manitoba, has the contract to build the line. About 30 miles of grading has been finished. W. R. Smith, Edmonton, Alta., is chief engineer. (November 13, p. 924.)

CHICAGO & ILLINOIS WESTERN.—We are told that work is now under way on a three-mile extension from Hawthorne, Ill., to Western avenue, Chicago.

FAIRVIEW & INTER-MOUNTAIN.—An officer of this company, which was organized about three years ago, writes that grading work is almost finished on the line building from Delta, Colo., to Fairview Mine, 16 miles. Watson Ziegler, president, Fort Collins.

GLEN ROSE & WALNUT SPRINGS.—This line, which extends from Glen Rose, Tex., south by west to Walnut Springs, Tex., a distance of 14 miles, is about 90 per cent completed. The grading is practically finished. There will be a total of 600 ft. of bridge work. About 40,000 ties will be required and 60-lb. rails will be laid over the entire line. T. E. Luttgurding, Hillsboro, Tex., is the general contractor. J. H. Farr, Glen Rose, Tex., is president, and Dave Morris, Walnut Springs, Tex., is chief engineer.

GRAND MARAIS & NORTHWESTERN.—This proposed new line which is to extend from Grand Marais, Minn., through Cascade Junction, to Ely, Minn., a distance of 75 miles, is about 25 per cent completed, the section between Grand Marais and Cascade Junction, a distance of 20 miles, being under construction. The grading on this road will amount to about 15,000 cu. yd. a mile, and is mostly earth. The maximum grade will be 2.72 per cent, and the maximum degree of curvature will be 8 deg. This, however, will be only in a few instances and on temporary construction, and will later be changed to 4 deg. curves. There will be five bridges averaging 190 ft. long, which will be of wood. The contract for all the work under the ties was awarded to John Bergman, Duluth, Minn. The contract for track laying will be let about May, 1915. In connection with this railroad an ore dock is to be built in a year or two.

GRAND TRUNK PACIFIC.—An officer writes that work is now under way by the J. D. McArthur Co., Winnipeg, Man., on the Prince Albert branch from the South Saskatchewan river to Prince Albert, Sask., 25 miles, and work is also under way by Rigby Hyland & Plummer, on the Brandon branch from Harte, Man., to Brandon, 26 miles.

KANSAS CITY TERMINAL.—An officer writes that this company is planning to construct one mile of second track in Kansas City, Mo.

MILL CREEK.—An officer writes that this company has projected an extension from The Wilderness, Va., to Williamsville, about 18 miles. E. E. McCutcham, chief engineer, Staunton, Va.

MOTLEY COUNTY.—This company, which was incorporated last year in Texas with $100,000 capital, and headquarters at Matador, has completed work on the line from Matador to Matador Junction, eight miles. The company will operate gasolene motor cars on the line.

OKLAHOMA ROADS.—It is reported that C. N. Haskell has signed contracts with the Chamber of Commerce of Sapulpa, Okla., for the building of two railroad lines out of that city; one to connect Cushing, Drumright and Sapulpa, and the other to run from Sapulpa to Jenks and connect with the main line of the Midland Valley at that point.

J. H. Morgan and L. A. Walton, Alva, Okla., are promoting a railroad to be built from Ivanhoe, Okla., to Rosston, a distance of 20 miles. Capital is to be raised by subscriptions from farmers along the right of way.

PALATINE, LAKE ZURICH & WAUCONDA.—An officer of this company which operates a 15-mile line from Palatine, Ill., northwest to Wauconda, writes that the company has projected an extension from Wauconda north to Fox Lake, 10 miles.

PHILADELPHIA & READING.—An officer writes that a contract has been given to C. P. Bowers & Co., Reading, Pa., for grading and masonry work on a section of 1.84 miles, now under construction from Nicetown Junction, Philadelphia to Newtown Junction, and that the company will do the track laying with its own forces. In addition second track work between the same places is partly under construction.

SHELBY NORTHERN.—An officer writes that the line projected from Shelby, N. C., north to Casar, N. C., 21 miles, is only proposed and that definite arrangements for carrying out the work have not yet been made. C. R. Poole, Rockingham, N. C., is interested. (August 21, p. 369.)

SOUTHERN RAILWAY.—A contract has been given to Stewart & Jones, Rock Hill, S. C., for work north of Gainesville, Ga., in connection with the Southern Railway's plans for rebuilding and double tracking the Charlotte-Atlanta line. The work to be carried out calls for the construction of 6.5 miles of new line. This is to be built in two sections, one 4 mile section near Mt. Airy, and the other section 2.5 miles long near White Sulphur. The grading work will be heavy, as the new line is to be built through a rough country.

TEXAS ROADS.—A railroad to be known as the Texas, New Mexico & Eastern is projected from a point in the coal fields of New Mexico to the Gulf of Mexico, probably at Aransas Pass—a distance of 500 miles. The portion of the road under immediate consideration is to extend from Lamesa, the county seat of Dawson county, to the city of San Antonio, following in a general way the valley of the Colorado river. A bonus of $3,500 a mile of road is being secured. It is stated that construction work is to begin some time this month. James L. Himrod is vice-president and general manager.

TORONTO SUBURBAN (Electric).—An officer writes that during 1914 this company finished work on an extension from Weston, Ont., to Woodbridge, 12.05 miles, and also laid second-track between Weston and Woodbridge on 7.83 miles. Work is now under way by the Suburban Construction Company, Toronto, Ont., building from Toronto to Guelph, 42 miles.

WEST VIRGINIA ROADS.—We are told that the Horse Creek Land & Mining Company, which owns about 12,000 acres of coal and timber lands adjacent to Big Horse creek and Mud river in Lincoln county, W. Va., will build about 10 miles of railroad to develop this property. Contracts are to be let in sections of three and four miles at a time. The first section from a point on the Chesapeake & Ohio at the mouth of Peter Cave Fork on Big Horse creek, up Peter Cave Fork of Horse creek towards Mud river, about three miles, is expected to be finished by March, 1915, and on completion of this section the line will probably be extended during 1915 a total distance of 20 miles into Lincoln county. L. E. Poteet, general manager, Charleston, W. Va.

RAILWAY STRUCTURES

Albuquerque, N. M.—The Atchison, Topeka & Santa Fe has awarded a contract for the construction of a one-story reinforced concrete store house at Albuquerque, to the Leyden-Ortseifen Construction Company, Chicago. The building is to be 50 ft. by 400 ft., with a platform 70 ft. by 800 ft. in area. Work will be begun at once and is to be completed by April 1, 1915. The estimated cost is $60,000.

Brooklyn, N. Y.—The New York Public Service Commission, First district, has approved the award by the New York Municipal Railway Corporation to the P. J. Carlin Construction Company, the lowest bidder, of a contract for the construction of six stations on the Liberty avenue elevated railroad extension. The contract price is $232,000. (November 6, p. 878.)

The commission opened bids recently for the placing of crossovers and other reconstruction at the DeKalb avenue station, on the line of the Fourth avenue subway in the borough of Brooklyn. The lowest bidder was Samuel Beskin, Beacon, N. Y., who offered to do the work for $133,947. (November 20, p. 991.)

East St. Louis, Ill.—The Southern Railway has given the contract to the Murphy Construction Company, East St. Louis, Ill., for the construction of an 18-stall roundhouse, machine shop building, store, oil and office building, at Denverside yard, East St. Louis. (November 13, p. 925.)

Horace, Kan.—The Missouri Pacific will build a 10-stall 95-ft. frame engine house at Horace, Kan., to replace the one recently destroyed by fire. Work, which is to begin at once, will be done by company forces.

Marion, Ill.—The Illinois Central is building a new combination freight and passenger station at Marion, Ill. The building will be 153 ft. by 36 ft. in area and of brick and concrete construction. The grading has been finished and the structure is roof high. George B. Swift, Chicago, is the contractor. The estimated cost is $17,000. The freight station at Starkville, Miss., which is 123 ft. by 27 ft., and of brick and wood construction, and the roundhouse at Jackson, Miss., previously mentioned in the *Railway Age Gazette*, are both now being completed.

Tacoma, Wash.—The Oregon-Washington Railroad & Navigation Company has awarded contracts for the material and foundations for a bridge over the city waterways, Tacoma. The bridge consists of one 275-ft. swing span, two 125-ft. fixed spans, with railroad and highway decks, and highway approaches totaling a length of 330 ft. The contract for the fabrication of the steel, which amounts to 1,465 tons, was awarded to the American Bridge Company, and the contract for the foundation was given the Missouri Valley Bridge & Iron Company. There will be 5,000 cu. yd. of concrete and 310,000 ft. of timber required. The work is about 50 per cent completed. The total estimated cost is $275,000.

Tamaqua, Pa.—The Pennsylvania State Water Supply Commission has granted permission to the Philadelphia & Reading to build a bridge near Tamaqua; also to build a bridge at Virginville, and permission has been given to the Philadelphia & Chester Valley to build a bridge in Chester county.

Virginville, Pa.—See Tamaqua.

Willits, Cal.—The Northwestern Pacific is considering plans for the erection of a depot, roundhouse and shops at Willits, Cal.

Uganda Railway Results.—Owing to the failure of the usual increase of the traffic of the second half of the year, the report of the Uganda Railway for the year ending March 31, 1914, does not show the same gratifying progress in operation as that for the previous year. Thus gross revenue $2,655,237 increased by $277,574, or 11.68 per cent, but expenditure $1,617,704 was higher by 18 per cent, and the net profit $1,037,432 was only 2.08 per cent higher, giving a percentage on capital cost of 3.39 only against 3.52. The Uganda Railway is not in Uganda itself, but it runs from Mombasa, the chief port of British East Africa, up to Kisumu on Lake Victoria Nyanza, whence there is a steamer service to Uganda. This steamer service and two short railways in Uganda itself, the Busoga Railway (from Jinja to Namasagali) and the Kampala-Port Bell Railway, are also under the control of the parent undertaking. The average mileage operated was 602, as against 586 in the previous year.

Railway Financial News

Arkansas, Louisiana & Gulf.—J. M. Parker, receiver in charge of this road, announces that the Arkansas, Louisiana & Gulf, and the Ashley, Drew & Northern have been consolidated. Mr. Parker is general manager of the A. L. & G., and it is understood that he will become general manager of both companies; and that the receivership will be dissolved. The A. L. & G. extends from Monroe, La., northward, about 50 miles, to Crossett, Ark., and Hamburg; and the other road extends from Crossett farther north, about 40 miles, to Monticello, Ark., on the St. Louis, Iron Mountain & Southern. The new management hopes to build an extension northward from Monticello. In the map of the Ashley, Drew & Northern, as shown in the Official Guide, this extension is shown as running to Gillett and Helena, Ark.; but the present announcement speaks of Pine Bluff as the proposed northern terminus.

Ashley, Drew & Northern.—See Arkansas, Louisiana & Gulf.

Canadian Pacific.—The Guaranty Trust Company, White, Weld & Company, Brown Brothers & Company and Colgate, Parker & Company have bought from the Canadian Pacific $12,690,000 4½ per cent equipment trust certificates, maturing semi-annually from July 1, 1915, to July 1, 1928.

Chicago, Rock Island & Pacific.—Judge Pendleton has denied the application of a holder of some of the collateral 4 per cent railroad bonds for the appointment of a receiver for the railroad company, the holding company, holding that the bondholders can be adequately represented at the foreclosure sale.

Denver & Salt Lake.—According to press despatches, conferences have been held recently between Newman Erb, who now heads the syndicate controlling the Denver & Salt Lake, and Thomas L. Shadbourne, who has on various occasions represented the Gould interests. After the meetings Mr. Erb gave out the following statement:

"The entire capital stock of the Denver & Salt Lake Railroad Company is deposited under a voting trust agreement, which does not expire until May 1, 1918. It is controlled by seven trustees, of whom Newman Erb is one, and who designated three of the other trustees, whose successors he has the sole right to appoint. There can be no change in the management or control of the property except through the voting trustees. Newman Erb cannot, if he would, and would not, if he could, dispose of the control without the concurrence of the Denver interests."

Opelousas, Gulf & Northeastern.—William H. Peterman has been appointed receiver of this company.

San Antonio, Fredericksburg & Northern.—This company has been placed in the hands of a receiver as the result, according to press despatches, of the delay of the Texas railroad commission in granting an application for valuation of the property preliminary to an issue of $500,000 bonds.

Production of Aluminum.—Since the beginning of the aluminum industry in 1883, when the production amounted to 83 lb., the advance has been so rapid that the production in 1913 amounted to 72,500,000 lb.—*Machinery*.

An Aerial Railway in Venezuela.—The official organ of the Venezuelan government has announced that a contract has been made ebtween the minister of public works and the president of the Puerto Cabello & Valencia Railroad, operating a steam railway between the towns named, granting the right to construct an aerial cable line from Valencia to Nirgua. The line will be 37 miles in length and will be built in sections of six miles, each section having its own motive power. The contract requires that work be started within a year of the date of its signing and that it be completed within two years from the date of its beginning. The contract is for 99 years, with the exclusive right of territory for the first 40 years and is transferable with the consent of the government.

Railway Age Gazette

PUBLISHED EVERY FRIDAY AND DAILY EIGHT TIMES IN JUNE BY THE
SIMMONS-BOARDMAN PUBLISHING COMPANY
WOOLWORTH BUILDING, NEW YORK

CHICAGO: Transportation Bldg. CLEVELAND: Citizens' Bldg.
LONDON: Queen Anne's Chambers, Westminster.

E. A. SIMMONS, *President.*
L. B. SHERMAN, *Vice-President.* HENRY LEE, *Sec'y & Treas.*
The address of the company is the address of the officers.

Philadelphia Suburbanites Quickly Appeased

The Public Service Commission of Pennsylvania, in its decision on Philadelphia suburban ticket rates (reported in our news columns) has set an example of promptness and good sense from which some dozens of other commissions might learn a profitable lesson. The advances announced by the railroads a month ago made a great furore, if we may judge by the sensational columns of the newspapers. The general agitation may have been looked upon by the commission as a reason for haste. Again, the question at issue was quite simple, making promptness easy. Nevertheless, the commission's action must be classed as praiseworthy, if only because dilatory tactics are so common—not to say universal. Questions that are simple often seem to become complex just because they are taken into a commission's office. This case was simple for one reason, because a clear course of action was available, whatever differences of opinion might exist among the commissioners. The railroads for years have carried occasional passengers at about the same rate per mile as the commuter who travels every day; an abnormally low rate. A hundred rides a year, say one round trip a week, could be bought for one cent a mile. The carriers abolished this 100-ride ticket and the passenger found his fare more than doubled. The passengers' remonstrance was very loud, *of course*. The order of the commission is that the tickets shall be continued at 1½ cents a mile, and to be used in six months; which may be interpreted as a decision that, whatever the merits of the case, the shock to the passengers must be softened, postponed, divided; which is plain common sense. The people have encouraged trolley lines, greatly depleting the steam roads' profits. This, and the abuse of commutation tickets by petty frauds, constitute good reasons for abolishing the low-rate tickets; but in such a violent change the element of time is important.

Fatal Collision on the Manhattan Elevated

The Interborough Rapid Transit Company of New York City is not subject to the Interstate Commerce Commission, as it does no interstate business; but it has troubles of its own. There was a collision on one of its elevated lines last week, killing a passenger; and forthwith the newspapers demanded steel cars. It does not appear that the loss of life or the distress would have been materially less if the cars had been of steel, but the steel car affords a simple and direct issue—every one knows something of the horrors of fire—and so it must be made prominent, to show how the newspapers love the people. The people would have to stand the burden of the cost of steel cars; it would take $17,000,000 to provide enough steel cars to take the place of the wooden ones now in service, and another seventeen millions would have to be spent to strengthen the elevated structures for heavier loads; but what of that? Shall not safety be secured, whatever the cost? It is to be admitted that any passenger, any city editor, might freely approve the expenditure of thirty-four millions to protect his own individual person; but why should not the few conservative newspapers speak out, on an occasion like this? There are two facts, ignored or minimized by the press, which greatly modify this question of safety on the elevated lines (where, for all trains, at all times, the rule is to run with speed under control). First, the percentage of safety is very high; this is the third collision, fatal to passengers, in the history of the crowded Manhattan elevated lines—about 36 years. Second, the cause of the collision was very plain, making the lesson, as regards precautions, quite clear. The conductor, acting in the place of the motorman as lookout, was not sufficiently cautious in performing an unfamiliar duty. Comparatively unimportant auxiliary causes may be brought out, on further investigation; but there seems no question that adequate training of the men, so that complications due to unexpected failures of apparatus would not be unfamiliar, would provide all reasonable precaution against this kind of error.

THE VALUATI ON OF RAILWAYS

THE recent statement of Director Prouty of the Valuation Department of the Interstate Commerce Commission that the valuation of all the railways will cost $50,000,000, and the reported estimate of a member of the commission that it will take ten years, have called forth unfavorable comment from the press. The Wall Street Journal indorses the plan suggested by some railway officers, of having a valuation made of only certain roads, and thus testing the practicability of valuation as a basis for regulation of rates, before carrying out the scheme in its entirety and incurring all the expense this would cause. The Savannah (Ga.) Morning News of November 24, in referring to Mr. Prouty's remarks, denounces the whole valuation plan. Its cost, the News points out, will be much greater than its advocates anticipated, the time required to make it will be much longer; and when it is done the data on which it is based will be such ancient history that no court will accept it as a basis for fixing rates.

The *Railway Age Gazette* always has thought, and thinks now, that the theory of valuation as the proper basis for the regulation of rates is false. When the question whether a scale of rates fixed by public authority is confiscatory is an issue, valuation may be the best basis on which to settle it. But regulation ought to be such that the question whether rates fixed by it are confiscatory will very seldom be raised. If regulation is to be such that the rates made by it will constantly raise the question of confiscation, then a valuation kept up to date will be useful, but only because the system of regulation is wrong in principle; and such a system cannot endure.

Furthermore, a valuation is unnecessary to convince any fair and reasonable man with any knowledge of railway affairs that as a whole the rates in every section of this country are too low. It is almost universally conceded that the railways should be allowed to earn a net return of 6 per cent on a fair capitalization or valuation. On what capitalization or valuation would the net operating income of recent years yield 6 per cent? The following table gives for the last three years the net operating income per mile of the railways of the United States and those of each of the large sections of the country, and the amounts per mile of capitalization (or valuation) on which the net operating income would have yielded 6 per cent:

	1912		1913		1914	
	Net operating income per mile	Net operating income per mile capitalized at 6 per cent	Net operating income per mile	Net operating income per mile capitalized at 6 per cent	Net operating income per mile	Net operating income per mile capitalized at 6 per cent
United States.....	$3,045	$50,750	$3,680	$61,333	$3,094	$51,566
Eastern District....	5,264	87,733	5,802	96,700	4,443	74,050
Southern District..	2,226	37,100	2,669	44,483	2,588	43,133
Western District...	2,398	39,960	3,016	50,266	2,630	43,833

The *gross* capitalization per mile of our railways in 1912 was over $81,000 a mile; their *net* capitalization—arrived at by elimination of all duplications caused by incorporate ownership of securities—was $63,500; and yet in 1912 their net operating income would have yielded 6 per cent on only $50,750 a mile; in 1913 on only $61,333 a mile, and in 1914 on only $51,566 a mile. Would any engineer of reputation say that the railways of the United States could be reproduced for any of these amounts? Is there a single engineer of reputation who would say the railways of the West could be reproduced for $39,960 to $50,266 a mile, or those of the South for $37,100 to $44,483 a mile, or those of the East for $74,050 to $96,700 a mile? Even the government-owned railways of New South Wales are shown, by their latest report, to have a capital cost now of $75,000 a mile! It is not necessary to wait for the valuation to be finished to find out whether the rates of our railways are too low and their net return too small. Everybody who has studied the facts, and brought to their study enough brains to add 2 and 2 together, and enough fairness to admit, when he has done so, that the sum is 4, knows already that the rates and net return are too low.

Why, then, go on with the valuation? Must we spend ten years and $50,000,000, and perhaps even a great deal more in proving what every real student of railway matters knows already, viz., first, that on the whole rates are too low in this country, and, second, that valuation can never be made really serviceable in the fair regulation of rates? If it is necessary to make a wholesale valuation to prove to the public what every real student of the subject knows, perhaps we should go ahead with it; but the price is a very high one to pay for a form of popular education which it ought to be possible to secure a great deal cheaper.

"EFFICIENCY" IN THE POST OFFICE DEPARTMENT

THE postmaster general in his annual report, sent to Congress this week, congratulates himself and the country on the alleged success of his department in putting the postal business of the country on a self-supporting basis. The surplus for the last fiscal year was, he says, about $3,600,000; and there will be "no danger of recurring deficiencies." The fact that the railroads have been made to carry thousands of tons of parcels without compensation seems to be overlooked; yet Ralph Peters, chairman of the railways' committee, estimates that the loss to the railways this year, because of the not-paid-for parcel post, will be at least $8,000,000!

We shall not further comment at this time on what appears to be a childish, not to say frivolous, attitude, on the part of a high officer of the government. Judging by a number of editorial references already observed, Mr. Burleson's mistaken position is coming to be quite generally understood by the press throughout the country. Some of the editors—and they are not political opponents—almost laugh in his face. But the cure of the present mail-transportation abuse depends on a general knowledge of a good many facts and, pending the receipt of the full text of the forthcoming annual report, the reader will be interested in some grotesque incidents connected with the operation of the parcel post which may not receive detailed attention in the official publication.

Under the caption "Can This Be True?" Collier's Weekly reprinted in a recent issue the editorial note in the *Railway Age Gazette* of August 21, entitled, "Varied Parcel-Post Philanthropies," in which was related the means whereby the contractor on the star mail route between Holbrook, Ariz., and Snowflake shipped 10,000 lb. of barley from Mesa, Ariz., to Snowflake by parcel post, receiving for his portion of the haul $22 more than the total cost to him of the barley laid down at destination. The editor of Collier's pointedly remarked that "if this is true there's a good deal of explaining for some government officials to do."

This does not stand alone. A similar and even more flagrant case has come to our attention recently. The contractor carrying the mail on the star route from Holbrook, Ariz., to Hunt has arranged to purchase at Gallup, N. M., and ship to himself at the end of his route at Hunt 200,000 brick. These brick cost him $12 per thousand at Gallup, or a total of $2,400; the cost of packing for shipment by parcel post has been estimated at $600; the postage from Gallup to Hunt by parcel post is $1.08 per 100 lb. It is estimated that freight can be transported by team from Holbrook to Hunt for $0.50 per 100 lb., while the contractor receives $2.18 per 100 lb. for the transportation of the mail. By putting through this transaction the enterprising contractor could throw the brick away at the end of his route and still make a net profit of $4,800. This should surely produce some incentive for the establishment of a thriving business in the shipment of brick to Hunt. We are waiting with interest to see whether the contractor in question will be able to carry out his plan, in spite of the fact that the post office department has been notified of it.

That the parcel post may not be the boon that it is supposed

to be to the smaller communities is illustrated by the shipment by freight of three carloads of catalogs by one large Chicago mail order house to as many western towns, from which points these catalogs were distributed to the adjacent territories by parcel post. To avoid a delay in passenger trains of several hours in loading the catalogs, it was necessary in each instance for the railroad to set out a special baggage car in which this mail matter was loaded beforehand. The government, it will be recalled, has made the generous addition of five per cent to the mail compensation of the railroads because of the addition of the parcel post matter.

And this reminds us that while, in dealing with star route contractors, mail order houses, and so on, Uncle Sam is an amiable and charitable Dr. Jekyll; when he turns his face toward the railways he always becomes the villainous Mr. Hyde. For example, a steam road has operated two trains each way daily which carry the mail on a branch running from an important metropolis to a small town 25 miles distant. An electric line was built several years ago which gave hourly service between the same points. On application from the people of the smaller town, the post office department arranged for the establishment of mail service at frequent intervals on the electric line. At the time of the next quadrennial weighing the electric line was handling very much the larger part of the mail, and arrangements were made for paying for it accordingly. But an industrious clerk in the postal department discovered an old law stipulating that no "street car" should be paid more for hauling mail between any two points than was paid to a steam road between the same points. Thereupon, regardless of the difference between the amounts of mail handled by the two routes, the compensation of the electric line was cut down to the same amount as was being paid to the steam road. It has remained at this figure ever since, and no attempt has been made by the department to secure modification of the unjust law.

In another case, at the request of the post office department, a railroad consented to the establishment of closed pouch service on two mail routes running from a large city to two smaller towns, the two lines of the railway passing over common tracks to within seven miles of the termini. Upon the establishment of the parcel post the amount of matter handled increased far beyond the limits of the single closed pouch service, and the railroad refused to accept the parcel post matter. Relying upon the technical wording of the contract, the government then had pouches made of sufficient size to hold all the mail offered, including the parcel post, and forced the road to handle it at the old rate, although the amount of mail matter carried reduced the seating capacity of the cars for passengers. Furthermore, a clerk discovered that these two routes were operating over the same tracks for most of the distance and ordered that all this mail should be carried on one train to the common junction, in spite of the fact that the railway, in order to avoid stopping trains at this junction, would not permit passengers for either destination to board a train for the other terminal and change at the junction point. It is now not only necessary for the railroad to stop both trains at the junction, but to place a man there to transfer the mail. By this means the post office department saved 14 miles of closed pouch service, while the railroad was forced to stop its trains to handle this "local freight" traffic.

These illustrations are on a parity with the practice followed of shipping the empty mail sacks by freight until the close of the weighing periods, after which they are again turned over to the railroads for shipment in the regular mail cars. Uncle Sam is now trying to teach, and even compel, the business concerns of the country to be efficient and honest in their methods. But he seems to lack certain qualifications for the job. In his own business relations he is at times one of the biggest imbeciles and at times, where he has the upper hand, one of the most unscrupulous rascals, in the whole commercial world of North America.

EFFECTS OF THE PANAMA CANAL ON RAILWAY TRAFFIC

SOME startling statements showing the effect of the opening of the Panama Canal on the traffic of the transcontinental railways were placed before the Interstate Commerce Commission at the recent hearings in the intermountain rate case. More information of the same kind is coming out daily. If the commission grants the petition of the roads for such a modification of its fourth section orders as will permit them to reduce rates to the Pacific coast terminals on the commodities most subject to water competition without at the same time correspondingly reducing their rates to intermediate points, they will undoubtedly be able to retain some of the traffic. But this will be at the price of making very low rates; and they will lose a large amount of business on which they do not feel able to meet the competition. If the commission fails to grant the petition, and the roads are thereby forced to abandon the water competitive traffic entirely, or to make corresponding reductions in their intermediate rates, the results will be disastrous.

The effect of the canal competition on the roads is bound to be serious in any event—much more serious than railway men have expected. Within the past year or so, in anticipation of the opening of the canal, the water competition has been increasing by leaps and bounds, due partly to reductions in rates by the ocean carriers, which have had the effect of changing the sources of supply of many commodities from the Middle West to Atlantic seaboard territory, and partly to the growing disposition on the part of shippers to use the ocean service because of the recent change in the policy of the roads in failing to meet water competition. The opening of the canal, which occurred on August 15, has, of course, resulted in much better service by water than could be given by the steamship lines operating in connection with the isthmian routes. The time is shorter, the dates of sailing are more frequent, and the water lines are giving service from additional ports, principally South Atlantic and Gulf ports. Moreover, new steamship lines have established, or announced their intention of establishing service, and as a result both of this fact and of the reduction of cost of the water service caused by the opening of the canal route, there has been a very radical reduction in the rates of the water lines, which has attracted a large number of commodities formerly moving entirely by rail.

In September the total tonnage westbound from the Atlantic seaboard to Pacific coast ports via the canal was 77,915 tons, which if multiplied by 12 would be over twice the tonnage moving by water in any previous year since 1907. According to the Canal Record, from August 15 to October 15 the commercial vessels using the canal carried through it 583,949 tons of cargo, of which about 50 per cent was between the Atlantic and Pacific coasts of the United States, 24 vessels carrying 151,290 tons eastbound and 25 carrying 135,214 tons westbound on this route. Westbound manufactured goods of great variety and general merchandise have constituted the heaviest traffic, and eastbound the boats have carried chiefly canned fruits, vegetables and salmon, lumber, grain, sugar, pineapples and wine. Six lines are now engaged in the traffic through the canal, with an estimated monthly capacity of 111,600 tons, making the voyage from eastern ports to San Francisco in from 23 to 27 days. These lines are making rates from the seaboard not only far lower than those of the rail lines, but so low that freight is being carried eastward by rail from points as far west as Milwaukee and reshipped from the seaboard by water at a combination rate lower than the rail rate from the Middle West to the coast. As a result many commodities that were formerly shipped by rail from the Middle West are now being shipped from seaboard territory.

In a freight house of the American-Hawaiian Steamship Company at San Francisco recently were seen soap from Cincinnati, barbed wire from Allentown, Pa., canned goods from Milwaukee, and hardware from Wheeling, W. Va., all shipped by rail to the Atlantic seaboard, and thence by water to California. A boat sailing recently from Boston, which city formerly had no water service to the Pacific coast, carried nails, structural

iron and wire fencing from Pennsylvania, paper from Maine, automobile tires, ink, canned goods and boilers from Massachusetts, and electrical machinery from Schenectady, N. Y. Rails have been shipped from Lorain, Ohio; iron pipe from Wheeling, W. Va.; paper oyster pails from Chicago, and pipe and pig iron from Birmingham, Ala.

Rates far below those of the rail lines were announced on the opening of the Panama canal, and still greater reductions and low rates on a large number of additional commodities, were announced on October 1. In the case of pig iron from Birmingham the rate is 15 cents for the rail haul from Birmingham to New Orleans, plus 35 cents for the water haul from New Orleans to San Francisco, making a through rate of 50 cents against the all-rail rate of 65 cents. Paper bags have been shipped from San Hill, New York, at a rate of 55 cents, as against the former water rate of 65 cents and an all-rail rate of $1. Wrought iron pipe from Wheeling takes a rate of 16 cents to New York plus 30 cents from New York to San Francisco. Canned goods are shipped for 45 cents by water as against 75 cents by rail. Rates on iron and steel articles generally have been reduced to 30 cents compared with a rail rate of 80 cents or more. The rates mentioned have been applied on westbound shipments, which are involved in the case before the commission, but the increased activity of the ocean carriers has recently been particularly noticeable in connection with the eastbound business. Since January 1, the American-Hawaiian Steamship Company has taken from Puget Sound to Atlantic seaboard points 700,000 cases of canned salmon, and is now quoting a rate of 30 cents on this traffic as against a rail rate of 75 cents. In September the number of boats sailing from San Francisco for the east was trebled, one every second day. The American-Hawaiian Steamship Company alone operates 26 vessels, with a total capacity of 260,000 tons and with sailings every five days between New York and San Diego, Los Angeles harbor, San Francisco, Portland, Seattle and Tacoma, making the voyage from New York to San Francisco in 23 days. This company has announced its intention of making Gulf ports eastbound and Charleston, S. C., westbound.

Thus far the railroads have been obliged to let the water lines have the business, not being able to change their rates to the coast without at the same time reducing their intermediate rates. As a result both the railroads and the shippers of the Middle West have lost business to the boat lines and to the cities of the east and west coasts. Eventually, however, it seems likely that the Pacific coast ports will lose a great deal of business destined to Hawaii and the Orient, which will go direct via the canal instead of by rail through the ports.

The rates thus far announced by the water lines are far lower than they were expected to make. The American-Hawaiian Steamship Company has doubtless announced low rates at the start partly for the purpose of keeping other lines out of the service, and partly for the purpose of preventing the railroads from attempting to meet the competition. Moreover, the water lines, not being subject to regulation, are in a position to make whatever rates are necessary to get a cargo, quoting one rate today and another tomorrow without notice of change. When the American-Hawaiian Steamship Company has succeeded in killing off some of its new competitors it is likely to advance some of the rates. The railroads, however, are in a different situation. Not only must they give 30 days' notice of a change of rates, which change must be approved by the Interstate Commerce Commission, but at present they cannot reduce rates to the coast terminals to meet water competition without also reducing their rates to intermediate points not subject to such competition. Moreover, having reduced a rate to meet water competition they are prohibited by the act to regulate commerce from advancing the rate at a later time "unless after hearing by the Interstate Commerce Commission it shall be found that such proposed increase rests upon changed conditions other than the elimination of water competition."

Thus under our enlightened system of government regulation, designed to prevent discrimination, the people of the whole United States have built a canal which gives the Atlantic and Pacific coasts an advantage over the Middle West, and water lines an advantage over the railroads, and have also legislated to prevent either from meeting the competition. Railroad-owned boats are barred from the canal, and the roads are prohibited from making rates that will enable them to compete with the water lines without at the same time cutting rates not affected by the water; and if they do reduce rates to meet water competition they will have the greatest difficulty in raising them again.

The railroads formerly met water competition by whatever means they could by cutting rates, by giving rebates and by other devices—and after having put many of the boat lines out of business proceeded to advance their own rates. Now they object when the tables are turned. Regulation put a stop to their practices. They have been severely condemned for them and have been punished by all kinds of restrictive legislation. Perhaps they cannot object with much grace when the tables are turned. But there is manifestly a vast difference between unfair discrimination resulting from commercial competition and unfair discrimination caused by national legislation; and the latter is what we have now.

In the event of a refusal of the Interstate Commerce Commission to modify its order regarding transcontinental rates it would seem that the salvation of the railroads depends upon the exercise of restraint in meeting water competition. A possible decision on the part of some of the transcontinental lines to meet the ocean competition at Pacific coast terminal points in the face of such a refusal, with a consequent reduction of the intermediate rates also, would produce effects on the entire body of railway rates which would be fearful to contemplate. On the other hand, if the roads fail in their present effort to obtain a modification of the order, and stand firm and refuse to meet the competition under the conditions imposed as to terminal rates, an opportunity will be afforded for an actual demonstration of the unwisdom of the commission's order. Under such conditions there is reason to believe that the clamor from the Middle West would soon force the commission to grant a modification of its order just as the clamor from the intermountain shippers induced it to make its original order.

NEW BOOKS

The Western Blue Book and Buyer's Reference. Published by Allen Winch, 504 Sherman street, Chicago. 7 in. by 9 in., 592 pages, bound in cloth. Price $5.

This is a complete classified list of the constructional engineering, electrical, mechanical, mill, mining, foundry, iron, steel, quarry, machinery, railroad supply and kindred industries, arranged for the purpose of giving both buyers and sellers a ready reference to the names of companies engaged in these industries with their correct addresses and the names of the officers. The various industries are classified under a list of commodities, and also alphabetically under the names of the various classes of industries, subdivided geographically by states and cities.

Air Brake Catechism. By Robert H. Blackall. 406 pages, 4½ in. by 6½ in. 149 illustrations. Twenty-sixth edition. Bound in cloth. Published by the Norman W. Henley Publishing Company, 132 Nassau street, New York. Price $2.

This book needs no introduction to railway men. The fact that it is now in its twenty-sixth edition is evidence of the position it occupies among students of air brake operation. It is a complete treatise on the Westinghouse air brake, including the latest developments in steam railroad practice. In addition to descriptions of the apparatus and its operation, the book contains chapters on brake rigging calculations, air hose tests and train inspection and handling. The question and answer form previously used has been followed in the new edition and a number of full page colored plates are included.

Letters to the Editor

THE AMERICAN RAILWAY ASSOCIATION

Toronto, Ont.

To the Editor of the Railway Age Gazette:

The fall meeting of the American Railway Association held in Chicago, November 18, made a record for despatch and the operation of the "steam roller" in transacting its business.

The entire time occupied in disposing of its business was one hour and thirty minutes, during which ten committee reports were presented, many of them read, recommended for adoption by resolutions previously prepared, and offered in each case by a member of the committee presenting the report, voted upon by viva voce vote and passed. About one-half of the time was occupied in reading reports already printed and in the hands of members for several weeks previous to the meeting.

Article 2 of the Organization of the Association provides that "Its object is the discussion and recommendation of methods for the management and operation of American railways." The discussion of reports has been practically eliminated from its proceedings. A committee report presented with a resolution from one of the committees for adoption is equivalent to its being formally adopted by viva voce vote of those present, and the vote of a road having one membership in the association, and perhaps five representatives present, each of which may vote audibly, counts for more than that of a road having six memberships and only one member present.

The association has resolved itself into a close corporation with the object of discouraging discussion and accepting the reports and judgment of a committee as final on a particular subject, making in effect a minority rule, and in the final analysis one man's opinion is paramount to that of the members attending a meeting, as it is well known that in committee work a chairman does most of the work and his opinions are reflected in its conclusions, the rest usually concurring.

Ten to fifteen years ago the association usually occupied two days in its sessions and they were full of active interest and discussion, and it was worth while to attend its meetings for the benefit derived from the discussions alone. As now conducted it is a waste of time for some members to travel perhaps a thousand miles to simply hear reports read and formally rushed through by a vote which does not represent the association's membership by one-half. It would be an improvement to dispense with the meetings entirely and submit all reports to letter ballot, which at least would give every road an opportunity to vote in accordance with its privilege under the articles of organization.

The present practice of distributing memberships on various committees is not equitable. Many roads, large systems with as many as six and eight memberships, are not represented on any committees, and have absolutely no voice in the association's affairs, while small roads, in some cases less than one hundred miles in length, are represented on several committees.

Analyzing the personnel of committees according to the last report, it is found that one railway system has representation on each of fifteen committees, and on two of these two members in each. Another system has representation on seven committees, another representation on six committees. Again, large systems with eight and six memberships have no representation on any committees, and according to the present practice of rule by committees they have no voice in the association's affairs.

The perpetuation of some roads on a committee by re-election is also unfair to other roads, which are never given even a nomination for committee membership. It should be a rule, strictly observed, that no road shall have representation on more than one committee concurrently, and when the term expires shall not be renominated on the same committee without an interval of two years.

Chairmen of committees are also perpetuated to such an extent that the same routine in some cases goes on from year to year. An inactive chairman greatly retards the work of a committee, and by making senior members chairmen they automatically give place to successors who may have new ideas on the subject.

The principle of equitable distribution of opportunity to have a voice in the affairs of the association should be consistent with the policy of equal distribution of the cost of conducting its affairs, which is by membership and on a mileage basis, but this equality is now not observed.

The whole scheme of railway associations as now constituted represents a lamentable waste of time and money. There is a duplication of work and lack of co-ordination which should be corrected.

There should be one railway association governing operating matters and including transportation, maintenance of way and maintenance of equipment, instead of five associations covering the same ground, as at present, with numerous offshoots of these which could all be embodied in one organization with better results and a great saving of time and money to the railways, which in the end pay the bills. The expense of conducting the American Railway Association is over $100,000 per annum, and of the other associations combined about as much again, and adding to this the expense accounts and loss of time incident to attending the association meetings the cost to the railways is about $500,000 yearly.

It is time to consider seriously if we are getting value received and the best results from the expenditures on account of our railway associations, and whether the principles upon which they are conducted are correct.

L. C. Fritch,
Assistant to President, Canadian Northern Railway.

THE TRAINMASTER AND THE ENGINE HOUSE

New York.

To the Editor of the Railway Age Gazette:

The editorial on this subject in the issue of September 25, is, of course, only a further plea for co-operation, and it might not do any harm to go a little further and point out how this could be secured between the engine house and the trainmaster.

In far too many cases the "pull, push and jerk" policy followed by engine house foreman, trainmaster and despatchers, is not given proper notice by the man higher up; it should receive his most earnest attention. We all know that it is not always easy for him to determine just which one is most to blame, but a good plan to follow, after he has had a certain number of complaints and cannot find that the fault is all on one side, is to eliminate both sides and start new men, with the understanding that when they cannot agree among themselves, they cannot agree with him.

In a plan of team work that I have seen worked out to good advantage, the engine house foreman laid down the rule that his engine house was to be run on the plan of a fire station; that it had its regular daily and nightly duties to perform, and in addition, must respond promptly to all extra calls, so far as equipment on hand permitted. When time card trains had been provided for, the foreman placed in the hands of the trainmaster each morning, a list of his remaining engines. This list showed so many engines available at once, giving the numbers and class; so many under light repairs available, in a certain number of hours; and the remainder as nearly as he could estimate. The trainmaster then knew how many trains he could send out, and could make up his trains to suit the power available. There is nothing very remarkable in all this; but when so many are working on no plan at all, it may be worth while to point it out.

Storekeeper.

Railway Troubles Due to Lack of Public Understanding*

Importance of Railway Service to the People Demands Intimacy of Understanding and Mutual Confidence

By W. G. Harding†

Perhaps our "hot or cold" affections for our transportation lines are due to inherent traits in human nature. We are seemingly eager to seek that which we have not and find excessive fault with that which we possess. The enthusiasm over our railway acquirement ebbed when transportation gave us an era of development unmatched in all the progress of mankind. No sooner was the triumph recorded than sentiment veered, and hostility to railroads became a gospel of wide popularity. But popular sentiment eventually gets right, and I can say tonight that the intelligent public thought of this land of ours is demanding just treatment of the American railroads.

EFFICIENCY OF RAILROADS ESSENTIAL TO NATIONAL PROSPERITY

Amid all the clamor and appeal, two thoughts are indisputably established—the efficiency of American railways is absolutely essential to American agricultural, mining and manufacturing industries, which are the component parts of our boasted commerce; and the good fortunes of the American railways and the American people are indissolubly linked together. The present distress of our industrial and commercial interests, happily showing some signs of relief, has its reflex in the distress of our railroads, or if you prefer it differently expressed, the distress of our American railroads is very evident in the halted condition of business throughout the land. This is not to say that the ebb-tide of American good fortune is wholly due to the distressed conditions of our railroads, but the fortunes of the transportation lines and our people are so indissolubly linked together that the one cannot be injuriously affected without finding its reflex in the other.

The argument never has strongly appealed to me that we ought to prosper our railroads for the specific purpose of promoting general prosperity. It seems to me more important to prosper our transportation lines as a simple matter of fairness and justice to this important single agency in our modern lives. The popular mind has been slow to grasp the surpassing importance of railway transportation. Ten thousand captains of industry, notably in the interior, have realized that railway facilities made their enterprises possible and profitable, but the toiler in the ranks has taken it all as a matter of course. The interior farmer, far from water routes, has seen the market brought to his door, almost, and has been a beneficiary of the elevation of farming from a mere struggle for subsistence to a conquest for accomplishment, but has been unmindful of the contributing agency which did so much to open the way.

I can recall full well how the railway extensions were heralded with glad acclaim, and I have heard, since then, the inevitable reverse which comes in the loud complaint of those who quickly forget the agency which made possible the astonishing shift from wilderness to the glorious garden, where sunshine is shaped into profitable products of commerce.

THE RAILROADS NOT BLAMELESS

This reversal of popular sentiment toward railroads in general is not wholly without reason. There had been profligacy of management, excessive profits in promotion, piracy in financing, along with unrighteous discrimination and contempt for popular opinion, more or less heralded in the press. These were seized upon by politicians, more eager to profit in the proclamation thereof than to correct the abuse, until there was good reason for popular suspicion and unrest. Hateful as these things are in public estimate, there was some extenuation. Many a railway was constructed for the profit in promotion, else it had never been projected. In this fact lies the explanation of much of our development. Builders were not content to wait for the profits of carrying, because the awakened production and carrying thereof had to come of too slow a process. It is fair to say, however, that in most cases the fictitious values have become very real in the processes of attending growth. The piracy of high financing—watered stock and excessive bonding—is not to be so readily excused, and is, in fact, mainly responsible for the hostile frame of the public mind. Much of the predatory plundering attended the evolution of lines into systems, an accomplishment which none of us would undo, because the advent of systems marked a higher stage of capacity for public service, and our people must not let their righteous hostility to this plundering blind them to the progress made. Hateful as it was, it nevertheless was a practice of the period, partly to deserve our tolerance because of improved capacity for service.

One thing is certain, though our people cry out against the great predatory captains who dashed by in their special cars, the lumbering trains of honest investment have traversed the same rails, and the honest endeavor and best thought and best energies of American life have reared this American railway giant and furnished us the best and cheapest rail transportation in the world. There must be—there is—a righteous mean between plundering on the one hand, and popular assault on the other, and the problem of the day is to find that righteous mean and give to our railroads our boasted square deal.

I believe, in all sincerity, that the day of plundering financing has passed. I should like to proclaim, in the same breath, the passing of railroad baiting on the part of press and politicians, who have been less inspired by public good than by personal profits and political gain. It has been a great stunt to hammer the railroads.

AN EXCESS OF COMMISSIONING

Fortunately the drift is toward the sober second thought, and there is a realization that these vital factors in making for profitable production and general good fortune are entitled to just treatment. There is the conviction that when governmental regulation leads to paralysis, we require less of it—that is to say, less of doctoring in order to give the patient a chance. It cannot be disputed—there has been an excess of commissioning, and our people have not stopped to count the public cost of the practice, nor to measure its hampering influence. Do not mistake my meaning. I believe, most heartily, in the government regulation of public utilities, but it must be righteous and understanding regulation. The best railway knowledge in all the land ought to light the way. Public service ought to be the impelling purpose, unheeding of public clamor. There can be a species of excessive regulation which will lead to but one logical result—and that is government ownership. It is the logical outcome of the present drift, it is the only remedy if we are to require a service at rates inadequate to meet fixed charges and provide means for maintenance and needed improvements. The answer to this statement is readily anticipated. Ten thousand tongues are ready to cry out about over-capitalization in stocks and bonds. It is true, in the main, but the over-capitalization comes of a previous era. It comes of the evolution into systems, and the crime of over-issue does not justify the wreck of the surpassing structure of American railroading.

*Abstract of an address which was made at the annual meeting of the Railway Business Association, Waldorf-Astoria, New York City, December 10, 1914.

†Mr. Harding has been editor of the Marion (Ohio) Star for the past thirty years. He has served as state senator and lieutenant-governor of Ohio and made the nominating speech for Mr. Taft at the 1912 republican convention in Chicago. He has just been elected United States senator.

Our problem is not of yesterday, it is of today and the morrow. It is up to fair-minded American intelligence to deal with the rail transportation problem as it exists today, recognizing that increased cost in transportation is quite as natural as increased cost in labor and taxes. Transportation cannot be eliminated from the cost of a single article of commerce in the complexity of our modern life, nor escape the upward trend of cost.

THE WISDOM OF JOSEPH

I believe it is the opinion of ninety-nine of every hundred thinking people that the railways of the country are entitled to an increase of rates, and would gladly see it granted. The thinking citizen not only desires that the railroads shall be able to exist in dull times, and earn money to meet their obligations; they are also entitled to earn a profit in fortunate years which may be turned to betterments when the lull comes.

The wisdom of Joseph holds good to this day, and my application of the story to American railways is that they ought to be able to earn enough in the fat years to be prepared to carry on their vast improvements in the lean years which inevitably come. Under our present system of reduced and insufficient earnings, along with increased cost of operation, there are no marked railway betterments except in the high tide of earnings, when cost is highest and improvements are hampered by traffic operations. We ought to reverse this order, and provide ample revenue in good times to enable extensive betterment to be made in the dull period, all of which would tend to better service in the days of the revival, and, meanwhile, the expenditure for betterments would relieve the general dullness amid such conditions as we complain of today.

PHYSICAL VALUATION A COLOSSAL FOLLY

This thought grows upon me when I am reminded that billions are said to be required to be expended to bring our railroads up to the facility for efficient service which managers themselves believe to be the due of our people. I have heard railway men say that they gladly would be making expenditures now, but they cannot borrow and do not earn sufficiently. Through agitation and restriction there has come impaired credit, until there is a threatened collapse of the railroad edifice, and it's up to American fairness to make the restoration and provide for maintained eminence. These items of maintenance and betterments have been overlooked by the political exhorters who have baited the railroads to catch unthinking popular favor. The advance from the dinkey wood-burner, which I helped to wood-up as a boy, willingly, while Dad's wood-pile needed attention, to the great locomotive of today, with heavier rails, and the thousand conceits of modern genius, which add to safety and enhance the service, has involved renewal costs beyond all comprehension. When we come to a physical valuation, if we must commit that colossal and costly folly, I wonder where the genius will be found who can apply apt figures to cost and worth of experience and evolution. The agitating politician makes no new investment and knows nothing about cost, but continues to blow with the same old blather.

WE DO NOT WANT GOVERNMENT OWNERSHIP

This railway problem is so big and so important that I feel the inadequacy of my words to portray it. We do not want government ownership, though that is the logical drift. I am opposed to it because it is contrary to the spirit of our institutions and violates the very conception of the rights and duties of government and citizenship which has given us an individual accomplishment which the world can nowhere match. It would stifle our further development and take from individuals the impelling purpose to accomplish and achieve. We might as well adopt paralyzing socialism, and fling aside, once and for all, the surpassing American accomplishment which has been the pride of our own people and the admiration of the world.

Does any one believe that government ownership would have pushed the railway along the sands, and connected up the Florida Keys with arched concrete and bands of steel, which clipped twenty-four hours from the commercial time between Cuba and the United States, and set fairyland abloom for three hundred miles en route? Does any one believe that federal ownership would have threaded the plains and pierced the Rockies as individual enterprise has opened the way from coast to coast, and touched the desert as well as the valley and mine with man's developing hand?

I shall be fearful of government ownership until France and Germany have given real proof of government efficiency and economy in railway management, and our own government has given some assurance that it may carry on any business with the economy which characterizes every well-managed, individual enterprise. Nay, more, I shall doubt all plans of government control until we have acceptable proof that the government can fairly regulate through its commissions, when real railroad men are making the tremendous struggle to conserve their properties and serve the public with these vastly important agencies.

Perhaps the lack of successful regulation is due to the newness of the undertaking, to the unavoidable political agitation and to the harassment of conflicting authority because of varied state legislation and state commissions. Our American railroad enterprises are so vast that it has seemed to me that none is longer small enough to be encompassed by intra-state lines, and we ought to put the entire service under inter-state control. Such a policy would save millions in public expense and put us on a broad plane which is befitting the gigantic character of American railway operation. We should then escape the excess of state legislation. I speak deliberately—the law-making industry is too often worked overtime. This country needs today less legislative bills pending and more railroad bills of lading.

RATE INCREASE NECESSARY

It is apparent that the Interstate Commerce Commission believes in the pressing necessity for increased earnings for our railroads. The suggestions of increased passenger rates, baggage charges and other collections for service not charged for heretofore, indicate the controlling body favors increased earnings, but opposes the short and direct route. The rate increase would be direct and immediate, and these other remedial efforts could be left to follow by the slower process of evolved adoption. If the combined income from increased rates and added service charges made excessive earnings, contrary to public policy, the same authority which grants the increase could order a reduction.

The simple public mind, unbiased in the matter, thinking only of fairness and the common good, favors the increase and does not expect a later reduction. We have seen the advance of wages. We know of mounting taxes. We can understand all about more costly equipment. Having come to pay more for our food, we only wonder that we have not been charged more for its transportation. Knowing the increased cost of operation in every other industrial and commercial enterprise, we have wondered how any one could escape added cost in the chief agency of exchange and distribution.

Our American wage scale is twice to thrice that of Europe. Our rates of interest are generally higher. Our distances are greater and our population less dense. Under all these conditions it would be very natural for our railway transportation to be higher. Our freight rates are notably less, and our passenger service only a trifle higher, and it is vastly superior. When classification is taken into account I believe ours is the cheaper. And yet on this very branch of business which costs the more in this country, the railway commission recommends the increase which it is powerless to grant. If argument were needed for the general advance, the commission has presented it. I hope it will speedily come. It will not bring the complete revival of American activity, but it will not only save the crash of the temple of transportation, but will re-establish railway credit, and lead to that physical rehabilitation which is of prime importance in ministering to greater American activities. More, and very

significant, too, the governmental assistance in the hour of need will be new assurance that it is neither the function nor the purpose of government to destroy, but to foster and protect, and American business success, lawfully achieved, is to be encouraged and heralded as important to American progress.

Perhaps a considerable part of political play in hostility to our railroads is due to the mistaken impression that they are the property of a few of the enormously rich. If this were true it would not alter the demand for just treatment, for the civilization which ignores property rights will quickly trespass human rights. As a matter of fact, however, our railroads are largely the property of those we term the people, and their securities are in the assets of savings banks, life insurance companies, hospital and college funds, and the foundation of thousands of sacred trusts. The directing heads of these lines and systems are not the scions of wealth, nor the creatures of privilege, they are the finest examples of the reward of merit which we have developed in the boasted opportunities of American life. When the moneyless American youth may climb from the humblest rank of railroading to the direction of the energies of hundreds of millions of capital and many thousands of men, through sheer force of ability and conscientious service, the system cannot be far wrong. It is our inspiration to developing youth and assurance doubly sure that ours is the civilization of opportunity. In every city throughout the land is some allied industry, and at the head of these are the worthy captains of American endeavor, who have grown up from village or farm, and toiling with them, when the tide runs full, is a thrifty, well-compensated, prospering people, rejoicing in American triumphs and eager to go on.

There are two things to commend to the public, to railway managers and to members of the Railway Business Association. One is simple honesty, the other is greater intimacy—the fullness of understanding—between the railway management and the public served. There has been too much aloofness, sometimes a contempt for public regard. The minds which lead in making dependable public opinion mean to be fair, and need only to be informed. Railways have suffered needlessly because of the lack of public understanding. The public has an ear for the manager, as well as for railway baiters, and the growth of favorable public opinion today is traceable to the fact that railways have laid their case before the public. The importance of railway service to the people, the public character of the business, and public regulation, all demand intimacy of understanding and mutual confidence. Add to this the unalterable honesty that is essential to right management and the abiding honesty that makes for sincerity in politics, and we shall hail a new era, which shall mark a greater and swifter stride to our American astonishment of all the world.

THE TRAIN DESPATCHER'S OFFICE

[E. T. Mulquin, in Train Despatchers' Bulletin]

Generally speaking there is a lack of painstaking effort exercised as to location and office equipment for the train despatcher, to aid him in reaching and maintaining the highest standard of efficiency. How often do we see the despatcher's office consolidated with the telegraph office with its boiler-shop noises and with persons continually running in and out. This disturbs the despatcher, as he will unconsciously take some notice of what is going on about him.

Where the telephone is used for train despatching and at offices where more than one set of despatchers are employed they are frequently located too close together; often one table being equipped for two men. The conversation of one despatcher on the 'phone is annoying to the other. If the chief despatcher is also quartered in the same office, this adds to the confusion, as he has many callers.

The train despatcher's office should be as private as possible and separate from the chief despatcher's office. Each despatcher should have an individual table, and where the telephone is used the tables should be far enough apart to prevent the talk of one despatcher from attracting the attention of the others. The tables should be constructed on commodious lines. . . .

RAILWAY AFFAIRS IN OTHER COUNTRIES

A recent issue of the Railway Gazette of London contains the following editorial comment: Not the least important undertaking whose future will be profoundly modified by the outcome of the war is the Bagdad Railway. Being wise after the event is easy enough, but it is somewhat difficult today to understand the lack of diplomatic prescience which gave Germany the control of this railway. Knowing what we now do of the comprehensiveness and foresight which have characterized the German plans, it does not require much imagination to assume that a country which counted on inducing Turkey to take the field must have realized to the fullest extent the military potentialities of the Bagdad Railway. Indeed, it is today rather surprising that any financial considerations should have been allowed to stand in the way of pushing on the line as rapidly as possible. The real objective of the Bagdad Railway is the Persian Gulf. In the light of present events it is amusing, or it would be amusing if it were not so serious, to reflect that a short time ago public opinion in this country was quite satisfied by the projected arrangement to place the terminal section of the line under international control, with Turkey and Germany among the controllers. History seems likely to repeat itself, and just as the fruits of German enterprise and expenditure in Kiao-Chau and her African and Australasian colonies will be reaped by other powers, so in the final adjustment the intrigues and the expenditure on the Bagdad Railway will not result in any gain to Germany.

* * *

The Railway Gazette of London, which has recently compiled the latest available figures regarding the number of employees of the British railways who have left their work to join the army or navy since the beginning of the war, estimates that the total at the end of September was 56,874. Most of the British railways have adopted the suggestions of the railway executive committee, which has had charge of the railways for the government since the beginning of the war. Each company is making an allowance to the wives and families which, supplemented by separation allowances and an amount deducted from the army pay in accordance with the government regulations, is equivalent to not less than four-fifths of the individual's pay when he was in the company's service. Allowances are also made to the dependent relatives of unmarried men and widows without children according to individual needs. The companies are paying their employees' contributions to superannuation and other funds during the men's absence and will endeavor to restore to them their former or equivalent positions if they are physically fit. As far as possible, also, work will be found for such as have been incapacitated. The figures as compiled for some of the larger companies are shown below. The numbers have probably not increased greatly since the end of September, because to prevent the railways from becoming crippled, instructions were issued by the war office that no one in the railway service was to enlist without the permission of the head of his department. For the purpose of comparison there is also shown the total number of adult male employees of each company on December 31 last:

	Enlistments	Adult male employees Dec. 31, 1913
Caledonian	1,600	21,477
Great Central	2,700	29,460
Great Eastern	3,000	30,512
Great Northern	2,500	31,352
Great Western	8,019	72,454
Lancashire & Yorkshire	3,608	36,525
London & North Western	9,528	79,348
London & South Western	2,100	22,614
London, Brighton & South Coast	1,510	14,477
Midland	6,700	66,340
North British	2,000	23,243
North Eastern	5,400	52,984
South Eastern & Chatham	1,702	21,224
Underground Railways of London	931	6,232

THE HANDLING OF LOCAL OR WAY-FREIGHT TRAINS

By R. R. Farmer
Trainmaster, M. K. & T., Parsons, Kansas

The local or wayfreight is a train of necessity, but in many instances it is a forced expense. In some places locals have to be run to handle local C. L. and L. C. L. business that does not actually pay the cost of the operation of the train, due to certain parts of the district originating no business and the other parts originating more business than the local can take care of. As a result the local on that part of the division where no business is originated will earn nothing by handling its full tonnage to the intermediate or local terminal, as the local on the other part of the division where a large volume of business is originated cannot handle it on account of the local business making full tonnage for it. In such cases it is necessary to run through trains light out of terminals and across part of the division to handle the tonnage that the local has handled to such point, therefore nothing has been gained by running such local and its only real earnings are from the local business handled between its terminals.

In many instances locals are run when their cost of operation tends to decrease greatly the profits or earnings, caused principally by inefficient crews, poor facilities, tracks and facilities located without regard to economical operation (caused by leases made to industries with only the view of leasing the ground and securing the location of the industry on the railway's tracks), indifferent and inefficient station forces, and poor power. Any or all of these cause delays which run into overtime which costs from 28 to 35 cents for each 10 minutes according to the number of men in the crew.

The most important factor in wayfreight operation is the conductor. This man, when big enough for the position, will perform miracles on a heavy overtime local. He will organize his crew, selecting the most efficient and intelligent brakemen, who are not afraid of work and who work regularly, judging them by their disposition, honesty, quickness, sobriety and reliability. In a few weeks he will line up the station forces by his cheerful disposition and ability, by his willing and obliging nature and his efforts to get his work done and get over the road. He will employ a method of making accurate records of all cars, seals, OS&D merchandise, delayed cars and other irregularities. He will not set out a good, clean car fit for grain or flour loading, if a car is wanted to load empty oil barrels or fertilizer, when by making a short switch he can set out an old car suitable for the purpose wanted. He will transfer freight to release cars and will consolidate all L. C. L. freight that he can, taking as small a number of merchandise cars as possible into the terminal, which will obviate the necessity of taking up all the room at the transfer platform for his train. He will not set out an empty box car for wood loading when he has an empty stock car that is not in demand at the time. He will keep posted on the movement of all classes of equipment and will keep in touch with the maximum and the average capacity of all industries and mines on his division.

To successfully fill the position, a local conductor should be accommodating and courteous to all. He should not be too old nor too young, but his age should be sufficient to give him mature judgment and discernment. He should have had experience as a brakeman on all kinds of freight trains. He should have a good common education, be familiar with waybills, and posted to some extent on tariff matters such as the minimum carload weights on various commodities in order that he will know that a shipper cannot load the minimum weight of hay in a 30 ft. car and that by filling such orders with small cars he will only delay the car, annoy the shipper and cause additional work picking up the small car and setting out a car large enough to get the minimum weight in. He should also be posted on demurrage and per diem rules.

My observation has been that a great many locals are held by rights of seniority and not by qualifications of the men operating them. I have seen men running locals who were good enough for through freights but entirely impossible as local conductors. They will drag over the division earning three to four hours overtime daily and increasing the cost of operation from $150 to $250 per month. They have no initiative and no interest in their work, they are sore-headed and their crews are disloyal, feeling that they would rather see them laying off than at work. They do not figure on their work until they arrive at the point where it is to be done. Every one they come in contact with meets them only because it is necessary to transact business with them. They take a technical advantage of all instructions whenever possible to make it to their advantage. Their records are only such as the rules force them to keep. They simply hold their runs by seniority rights given them by agreements and will cry "Discrimination" at every effort to dislodge them from the runs.

In my opinion the local conductor should be picked from the ranks for his qualifications as a local conductor, as an assistant to the chief despatcher and a lieutenant to the trainmaster. He must be a man who can handle men and yards, as he is a traveling yardmaster over the part of the division to which he is assigned. He is the agent at all non-agency stations. He should represent the policy of the company in politeness and courtesy to all patrons he comes in contact with, and what representative of the railroad comes in contact with as many big shippers in a day as a local conductor on a heavy division?

In the make-up of wayfreights it is preferable that the merchandise cars be placed on the rear end and the short loads on the head end, when conditions will permit, in order that the merchandise cars can be placed to work while the loads on the head end are set out or other loads picked up. However, this feature depends on the physical characteristics of the division and the location of the various stations. Each local caboose should be equipped with pinch bars and two pairs of rollers to facilitate the handling of heavy freight that may be shipped L. C. L. All local engines should be equipped with foot boards on the rear of the tenders and a 3-in. nipple and hose attachment on the rear of the tanks for the purpose of filling water barrels at stations, cotton platforms and wooden trestles, especially during the hot, dry weather. Wayfreight engines should also be equipped with straight air to facilitate and expedite the switching. The tonnage rating should be light enough for the power assigned to handle with ease over the ruling grades and to make a fair speed between stations.

A local division should be established on the basis of a ten-hour work day controlled by the business to be handled. The hours should be from 7 o'clock in the morning until 5 o'clock in the evening, as any time of arrival at terminals after 6 o'clock in the evening is not conducive to good service. The men figure that if they arrive at the terminal after 6 o'clock they cannot get their meals in time to spend the evening out and as a consequence they lag. When an arrival time from 5 to 6 o'clock will enable them to get their meals and allow them to spend the evening as they please, the earlier hour of arrival is an incentive all day to do their work as expeditiously as possible in order to arrive at the terminal on time.

Station forces should be on hand ready to break the seals, take records of same, and unload the freight as soon as the cars are placed. Switch lists of cars to be picked up or placed should be made out and a copy of same kept in the station records. All freight should be checked out of the cars by the agent or his representative. All over, short or damaged freight should be so noted on waybills and the conductor should sign each waybill under such notations. These matters are of little trouble but will save time, trouble and money to the company. It will enable the freight claim department to handle all OS&D claims expeditiously. All freight loaded at small way-stations should be checked into the car by the conductor, the same as the freight is checked out of the cars by the agent or his representative.

TRAIN CREW REGULATIONS IN CONNECTICUT

The Public Utilities Commission of Connecticut, acting under a law passed in 1913, has investigated the question of the adequacy of train crews, as managed by the railroads of Connecticut, and has issued a code of regulations for passenger trains. The investigation was ordered by the Legislature, as an alternative to passing a full crew law which was demanded by the trainmen's brotherhood. No order is issued in regard to freight trains, the commission holding that freight trains are already properly manned.

The commissioners have studied the subject for a year and have examined the records of 589 passenger trains of the New York, New Haven & Harfford, and in addition to this they have made personal observation and inquiry on 47 important trains, including those which had been mentioned in complaints. Members of train crews were carefully questioned.

There was already in existence a rule, issued by the former railroad commission 18 years ago, regulating the number of brakemen on passenger trains, and this is not much modified; it is deemed in the main reasonable. To increase crews beyond a reasonably safe requirement "would lessen efficiency by dividing responsibility." No instance has been disclosed where the safety either of the public or the employees has been jeopardized by an insufficient number of men in the crew. The railroads are vitally interested in the successful and safe movement of freight trains and should have some discretion as to the number of trainmen to be employed, unless it shall be made to appear that the safety of employees or the public is endangered and that freight commerce is unnecessarily delayed by reason of the lack of an adequate crew. This opinion in regard to freight trains is a confirmation of the opinion of the railroad commissioners, uttered in a report issued in 1911.

In the matter of the safety of passenger trains, the commission recognizes that a parlor car porter, a baggage man or a train porter can be made available in cases of emergency, and evidently holds that these men should be so availed of. "It is not always practicable in any line of business of considerable magnitude to maintain a sufficient force to meet all possible emergencies, and in emergencies all loyal and faithful employees have a moral duty to do extra work, where practicable, to save life or protect property."

The only hint of any criticism of the railroads of the state that is to be found in the report is a paragraph to the effect that "all well-managed railroads should anticipate with a reasonable degree of accuracy the needs of the service" on holidays and other special occasions.

In conclusion the commission holds that safety would not be increased by any general order for an increase of the number of men in crews, and proceeds to formulate its requirements in substance as follows (all referring to passenger trains):

1. Trains of two cars, at least one brakeman, who may be a baggageman.

2. Trains of three or four cars, exclusive of parlor, dining, sleeping, baggage, mail or express cars, two brakemen, one of whom may be baggageman, assistant conductor or ticket collector.

3. Trains of five to eight cars, exclusive of parlor, etc., three brakemen, which three may include an assistant conductor or ticket collector.

4. Nine or more cars, exclusive of parlor, etc., at least four brakemen, one of whom may be assistant conductor or ticket collector.

5. Trains composed entirely of parlor, dining, sleeping, baggage, mail or [and] express cars, at least two brakemen, one of whom may be a baggageman.

A combination baggage and smoking car is to count as a passenger car; a club, official, or private car is to be considered a parlor car.

The order is not to apply to cases of emergency, due to circumstances which may not be foreseen.

SUPPLEMENTARY ORDER IN THE FIVE PER CENT CASE

The Interstate Commerce Commission has issued an order under date of November 28 making such modifications in its findings in the Five Per Cent case (31 I. C. C., 351), published in the *Railway Age Gazette* of August 7, page 235, as will permit the carriers to establish increased joint through rates between points in central freight association territory and southwestern territory, and between many points in central freight association territory and southeastern territory. An abstract of the commission's order follows, the language of the commission being preserved in so far as possible:

In accordance with the report of the Five Per Cent Case, the carriers have filed increased intra-territorial rates in central freight association territory. Since rates between points in that territory and points west and northwest thereof, along the Missouri river, in Colorado and Utah, are generally combinations of intermediate local or proportional rates to and from the Mississippi river crossings, these increased intra-territorial rates in central freight association territory now apply between points west of the Mississippi river and points in central freight association territory. The increased intra-territorial rates likewise apply between points in central freight association territory and points in southeastern territory upon which joint through rates are not published, and upon which the central freight association territory lines receive their separately-established local or proportional rates to or from Ohio river crossings.

On the other hand traffic between points in central freight association territory and southwestern territory, and between many points in central freight association territory and southeastern territory moves under joint through rates, inceases in which were cancelled by the order entered in the Five Per Cent case. Many of these tariffs naming joint rates between central freight association and southeastern territory frequently specify the separate factors of said rates which accrue respectively to the lines north and south of the Ohio river.

In the opinion of the commission it now appears that the above mentioned order should be so modified as to permit the establishment of joint through rates between the points aforesaid which shall be sufficiently increased over the existing joint through rates to allow the central freight association lines an increase of 5 per cent in their divisions.

It is therefore ordered that respondents be authorized to make effective on not less than five days' notice joint through rates between points in central freight association territory and points in western, southwestern and southeastern territories, which shall be in excess of the existing joint through rates only to the extent that may be necessary to allow the lines in central freight association territory an increase not in excess of 5 per cent above the divisions which these lines have heretofore received. In cases where the tariffs containing said joint rates state separately the factors thereof applicable north of the Ohio river and east of the Mississippi river, the new tariffs published under authority of this order shall state separately the increased factors accruing to the central freight association lines; under the authority hereby granted, however, no increased rates shall be established upon commodities as to which increased rates were not authorized by the commission in its report; and where the relationship between through and intermediate rates would be altered by the permission incorporated in this order involving a departure from the strict requirements of the fourth section, the carriers must first file applications for relief under that section.

Fan Drafting as Applied to Locomotives*

Loss Due to Back Pressure With Existing Type of Front End Arrangement; Results of Tests Made With Fans

By H. B. MacFarland
Engineer of Tests, Atchison, Topeka & Santa Fe, Chicago, Ill.

The method of drafting a locomotive with its exhaust steam has varied in detail only during the long period of development of the steam locomotive. The basic principle is exactly that of 50 or 60 years ago. The exhaust from the engine was early utilized to produce the necessary draft and is commonly so used today.

The magnitude of the loss due to back pressure as it existed in representative locomotives on the Atchison, Topeka & Santa Fe was shown in a paper presented by the writer at the fourth annual conventon of the International Railway Fuel Association† in May, 1912. The material was collected from a large number of locomotives in actual service operating under greatly varying conditions and showed conditions existing at that time. A general statement is drawn based on tests conducted on 18 different locomotives representing as many different types, working under such varied conditions as are encountered upon the Santa Fe system, with territory extending from Chicago to the Pacific Coast, and presenting at one place or another most of the conditions encountered in railway service. This statement shows that for every 100 horsepower used as actual tractive effort, there are 66 horsepower wasted through the exhaust, over 70 per cent of which may be credited to the excessive back pressure necessary to produce draft for the locomotive boiler. A study of the facts has led the writer to the consideration of a more economical method of drafting locomotive boilers.

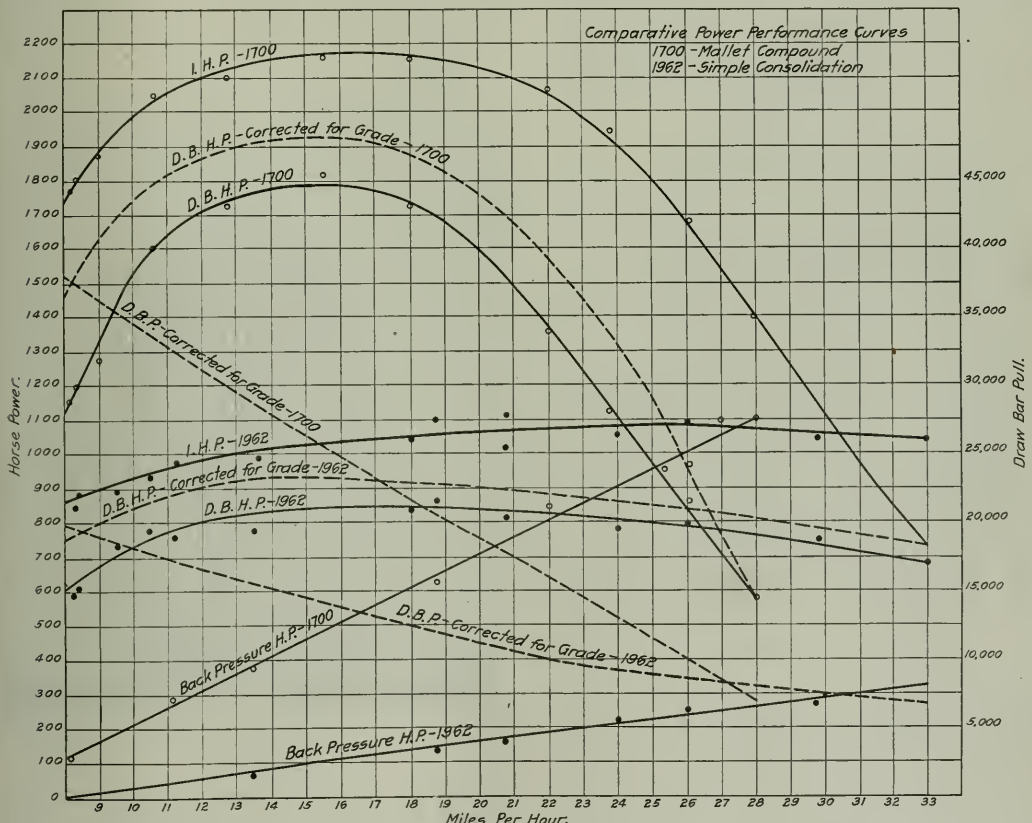

Fig. 1—Comparative Power Performance Curves

Comparative power performance curves for locomotives 1,700 and 1,962 are shown by Fig. 1. These curves were plotted as a result of data obtained during comparative tests on these locomotives on the third district, Arizona division, between Barstow and Bakersfield, Cal., a distance of 140 miles, in the winter of 1909. Locomotive 1,700, a Mallet compound (2-8-8-2), fitted with a Jacobs-Shupert firebox, Buck-Jacobs superheater,

*From a discussion of a report on Steam Locomotives of Today, at the Railroad Session of the annual meeting of the American Society of Mechanical Engineers, New York, December 2, 1914.

†See *American Engineer*, June, 1912, page 300.

and feed-water heater, cylinders 26 in. and 38 in. by 34 in., had a tractive effort of 108,000 lb. Locomotive 1,962 was of the simple consolidation (2-8-0) type, fitted with Baldwin superheater, cylinders 24 in. by 32 in., and had a tractive effort of 49,500 lb. These curves are presented because they show the enormous back pressure horsepower loss which is an inherent defect in the Mallet type locomotive. The curves show that the

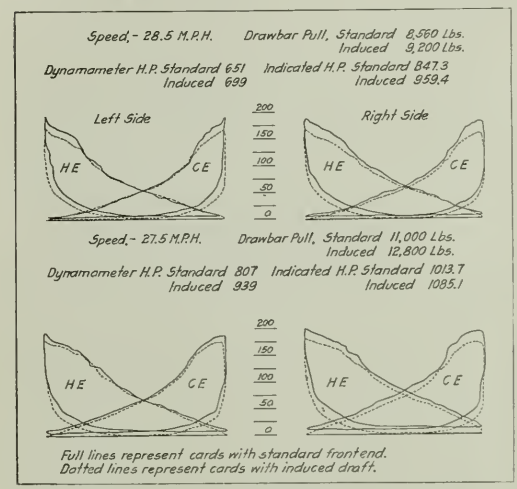

Fig. 2—Indicator Cards Taken with Standard Front End and with Induced Draft

maximum power of the Mallet was developed at a speed of approximately 17 miles an hour and that drawbar horsepower and back pressure horsepower equalized at a speed of approximately 25 miles per hour, showing that at this speed the locomotive exerted 950 drawbar horsepower and that an equal power was required to draft the boiler. The curves for the consolidation type show that the maximum power of the locomotive was developed over a wide range of speeds and that

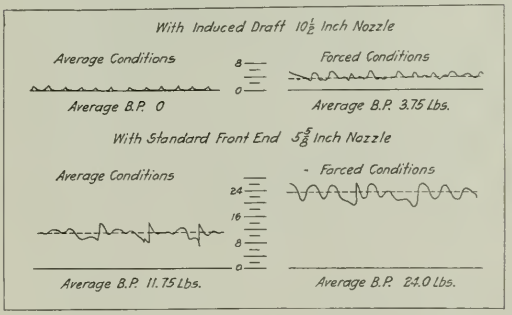

Fig. 3—Exhaust Cavity Diagrams

back pressure horsepower was not appreciable except at high speed.

The data accumulated from a great many tests conducted over the various divisions of the Santa Fe system, have shown the desirability for some other method of furnishing draft for locomotives to supplant that now commonly used. These tests have forcibly demonstrated the inefficiency of the present arrangement when viewed from a thermodynamic standpoint. The chief advantage in favor of the present arrangement is that it is very efficient speaking from a purely mechanical standpoint; that is, it is free from any complicated parts which are liable to get out of adjustment and does its work when once it has been set up with very little attention other than minor adjustments to keep it in good working order. It is this feature alone that has enabled the present front end arrangement to exist to the present day. In view of existing conditions, attention was attracted to the possibilty of drafting a locomotive by some method of forced or induced draft, but because of the impracticability of installing a system of forced draft on a locomotive, except possibly in the case of stoker-fired locomotives where it is not necessary to open the fire door, this form of draft was abandoned and attention directed to the adaptation of induced draft for the purpose. It is a well known fact that induced draft has been successfully applied in stationary and marine service, and its development in these fields has been rapid during the past few years, so that we now have many installations of this character. The development of the steam turbine and progress in the theory and construction of centrifugal fans for this work has added much to the progress made and it seemed logical that if the system could be so successfully applied to other fields, it would find ready application to the locomotive.

The problem, however, was not as simple as it at first ap-

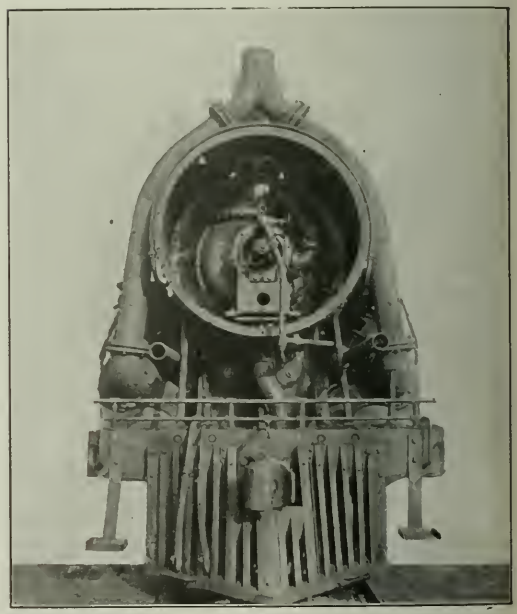

Fig. 4—Front of a Locomotive Fitted with the MacFarland Fan Draft

peared. Although there were many existing installations of induced draft, and several manufacturers making a specialty of these installations, yet they were not readily adaptable to the locomotive. In power plant and marine service the space occupied by the draft apparatus is not as important an item as with the locomotive. When the problem of furnishing draft apparatus of this character was presented to the manufacturers, they were able to calculate the size of the fan and the horsepower necessary to drive it to burn the required amount of coal per hour, but when the space that such an apparatus would occupy was taken into consideration, they were astounded, and were not able to furnish either data or apparatus satisfactorily to meet the requirements. For this reason it was absolutely necessary to start in at the beginning and develop such an apparatus.

The first step in the development was to secure data showing just what could be expected in draft obtainable, in fuel consumption, in boiler efficiency, and in power requirements to operate a fan draft system. Locomotive 932 was secured for experimental purposes and an experimental plant constructed to secure the data. The test was confined to the boiler of the locomotive with a 48-in. ventilating fan attached to the smokebox. No attempt was made at this time to run the engine on the road. Connection was made between the inlet of the fan and the smokebox of the locomotive so that the exhaust was through the fan rather than through the ordinary stack. The fan was driven by means of a 25-horsepower constant speed motor, belt connected. The variation in speed at which the fan was driven was accomplished by changing the diameter of the pulleys. The power necessary to drive the fan at various speeds was accurately determined by measuring the current necessary to drive the motor. With this arrangement a series of tests were made in Topeka, Kan., in February, 1912. A maximum of 3,350 lb. of coal was burned per hour, and a maximum of 830 boiler horsepower was developed. This was accomplished at an expenditure of 20 horsepower required to drive the 48 in. fan at an average speed of 715 revolutions per minute; the maximum draft in the smokebox was 2¾ in. of water. The first tests in the series were made with the diaphragm in place in the smokebox, but this was removed during the latter runs and it was found that with the fan draft it was possible to get a very uniform distribution of the draft without employing deflector plates of any kind. It was not possible to develop anywhere near the maximum boiler horsepower with this installation, but valuable data were secured for use in the construction of an experimental unit for drafting purposes.

From the data obtained from these preliminary tests with the 48 in. fan applied to both coal and oil burning locomotives, an experimental unit adaptable to locomotives was furnished by the manufacturers and delivered to Topeka in September, 1912. This unit consisted of a stock 24-in. fan with special provision for direct connection to a 40 horsepower steam turbine, the entire apparatus being so constructed as to be a compact unit suitable for application in the ordinary smokebox of a locomotive. Preliminary tests were made with this unit, during which the volume of air at atmospheric pressure and temperature, discharged at various turbine speeds, was determined when the fan was operated against various resistances simulating locomotive service. These tests indicated that the fan was of sufficient size for the locomotive for which it was ordered, so that application of the apparatus was made to locomotive 1302 at Topeka shops in January, 1913. The first actual test of the apparatus installed on this locomotive was made on January 12, 1913. It was soon apparent that the 24-in. fan did not have the capacity to furnish the necessary draft, and it was not until after a great deal of experimental work, during which it was necessary to design and build three fan rotors and make modifications of the fan casing, that a fan of sufficient capacity was secured to permit of actual road tests. During the development of these fans, however, several stationary and road tests were made with the locomotive, during which valuable data were secured.

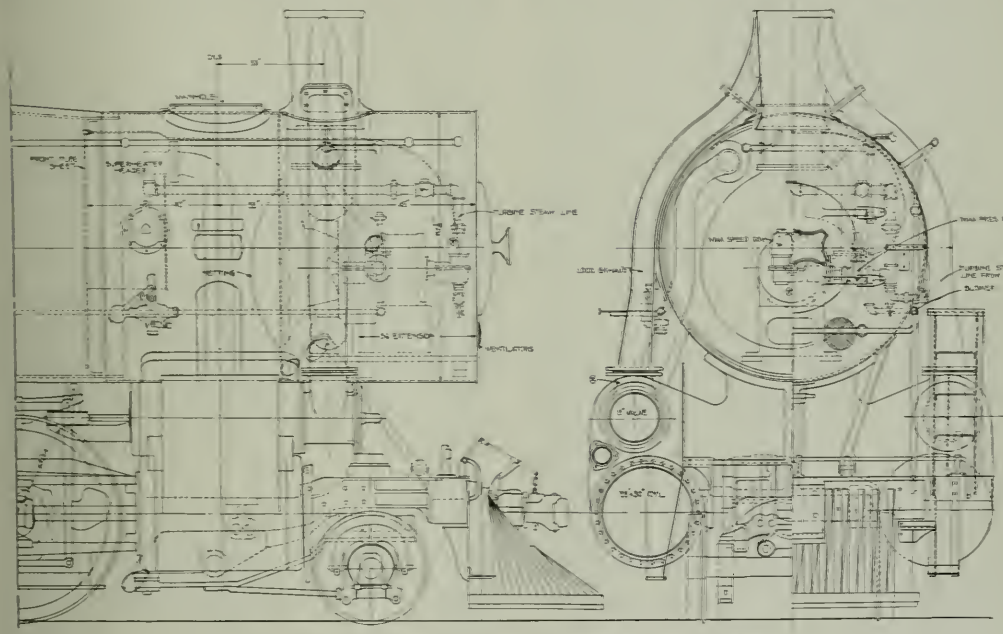

Fig. 5—MacFarland Fan Draft Applied to a Mikado Type Locomotive

Prior to tests with the fan draft apparatus, complete tests of the locomotive with the standard front end arrangement had been made for a basis of comparison of results obtained with the two arrangements. Typical indicator cards secured under the various conditions show the possibilities of the fan draft in eliminating the back pressure of the engine. While the fan used during the later series of tests was not mechanically correct or of sufficient capacity to develop the maximum power of the locomotive, it was of sufficient capacity to bring out many valuable points relative to the general performance to be expected from a system of this kind. The locomotive burned its fire as satisfactorily with the fan draft arrangement as with the standard front end arrangement, and there was no more tendency for the fire to bank or clinker. A uniform draft varying from 4 in. to 6¼ in. of water was maintained with the fan draft.

The capacity of the fan was limited to the maximum safe speed at which it could be run, and when the demand upon the boiler was such that it could be supplied with the draft available within the maximum speed of the fan, there was an economy shown. This was evident when the locomotive was working on grades, where, although more steam was used per stroke, the relatively low speed of the locomotive made the total steam consumption lower than on the level stretches where less steam was used per stroke, but the higher speed and consequent increase in the number of strokes per unit of time, placed a demand for steam on the boiler which could not be supplied by the draft available with the fan. For this reason, it was not possible to maintain full boiler pressure at all times with the fan draft arrangement, so that the initial pressure available in the cylinders was from 12 lb. to 13 lb. lower from runs with the fan draft than runs with the standard front end arrangement. Analyses of the indicator cards show that although there was a gain in power as indicated by an increased area at the bottom of the cards, there was a corresponding decrease at the top of the card. This was due to the difference in initial pressure, so that the gain in power due to the elimination of the back pressure was just about sufficient to operate the fan draft apparatus, and there was no apparent gain in the over-all efficiency of the locomotive. This is demonstrated by the indicator cards in Fig. 2.

A comparison of the performance of the locomotive under the two systems of drafting during periods in the runs when such comparison is at all possible, that is, when working conditions are similar, is favorable to the induced draft arrangement. Such a comparison based upon the actual power delivered at the drawbar shows a saving of nearly 20 per cent in fuel for the fan draft, and it is entirely possible to effect a marked saving in indicated horsepower with it.

Typical exhaust cavity cards are shown in Fig. 3. These pressure readings were taken in the exhaust cavity of the valves by means of an independent indicator fitted with a 20-lb. spring. They were chosen to cover the entire field as nearly as possible.

The conclusions drawn from these comparative tests were that it is entirely possible to draft a locomotive boiler by means of an induced draft fan to replace the exhaust tip commonly used; that it is possible to entirely eliminate the cylinder back pressure under normal conditions and greatly reduce it under forced conditions of operation of the locomotive; that with equal steam chest pressures, cut-offs, and speeds there is an appreciable increase in indicated horsepower due to the elimination of the cylinder back pressure, and that it is entirely possible to successfully operate an installation of this character at the necessary high speed during intervals of time representing a run over the average division of a railroad.

The logical field for locomotive mechanical draft is upon compounds in general and Mallet compounds in particular, where the excessive back pressure results in more pronounced cylinder losses. The development of this branch of locomotive engineering will necessarily be gradual, on account of the absence of data or lack of experience on the subject.

The experience gained with tests of the 24-in. fan unit applied to locomotive 1302 led to the design of a special 30-in. unit. The fan for this unit was constructed along the lines of the later development with the 24-in. fan which had given the best service on locomotive 1302. The new design embodied several improvements in size and proportioning of parts. Attention was given to the adaptation of the design to work at the peripheral speed found most desirable and provision was made for improved lubricating facilities and a maximum speed governor for protection.

One of these units was applied to a New York Central switching locomotive, and comparative tests were made before and after installation near West Albany, N. Y., in January and February, 1914. This locomotive was of the 0-6-0 class, built after the design which is standard for this class of power for the New York Central Lines. It was equipped with a Schmidt superheater, had a calculated tractive effort of 33,150 lb., cylinders 21 in. by 28 in. and 57-in. drivers, a total heating surface of 2,020 sq. ft., a superheating surface of 382 sq. ft., and a grate area of 31.5 sq. ft. The tests were confined to short runs between West Albany and Karners, N. Y., a distance of eight miles upgrade, and were made primarily to determine the suitability of the MacFarland fan draft for drafting switching locomotives, with a view of developing a system of draft which would insure noiseless operation.

This installation of the fan draft was never satisfactory from a mechanical standpoint, because the unit employed was not adapted to the size of the smokebox on this particular locomotive, but the tests further demonstrated the possibilities of this form of draft for locomotives, and justified the conclusion that the engine could be successfully drafted with the MacFarland fan draft. A maximum of 9 in. of draft was developed in the front end with an average of 8¼ in. throughout one of the test runs, and the fan operated successfully against depths of fire ranging from 6 in. to 18 in. The exhaust could be muffled to any desired point by the introduction of proper netting stages and the engine could be operated practically without smoke. The full operating steam pressure was readily maintained and the back pressure was entirely eliminated.

The experience with the fan draft gained from actual tests led to the development of an automatic control system to govern or regulate the speed of the turbine, and consequently regulate the intensity of the draft. It was found that it was highly desirable to make the operation of the fan as nearly automatic as possible and not have to depend on the engineer or fireman to regulate its action. At the same time, its operation should be under the control of the fireman at all times should he choose to exercise control. The essential features of the automatic control system which have been developed are the provision of both maximum speed and pressure governors and an arrangement which insures the starting of the turbine at the time the main locomotive throttle is opened, and shutting off when the throttle is closed. In addition to these features, an independent steam line is provided which makes possible the operation of the turbine at nearly its maximum speed when the locomotive is standing.

The maximum speed governor is made a part of the steam turbine itself and is designed to automatically throttle the supply of steam into the turbine when the pre-determined maximum safe speed has been reached. The maximum pressure governor is fitted into the steam line supplying the turbine and is so constructed that the flow into the turbine is automatically throttled when the locomotive boiler pressure has reached within a few pounds of the normal working pressure. This governor is also fitted with an attachment which makes possible the control of steam through the valve from the locomotive cab. An installation applicable to a Mikado type locomotive embodying all these features is shown in Fig. 5.

DEAD TRAIN ORDERS

By J. L. Coss

To promote prompt movement of trains, despatchers can lend a helping hand by closely watching dead orders. It requires time for an operator to clear a train with a hand full of orders, the conductor to read their contents to the operator and the engineer to read them to the conductor; and if any of the orders delivered are dead, just that much time is wasted. The train despatcher is, of course, held responsible for this lost motion; it is therefore, up to him to guard against the delivery of such orders. A despatcher should work close with his operators and instill into them the importance of watching this feature at their respective offices. They should call the despatcher's attention to any order which in their opinion is no longer necessary. The operator may be busy, it is true; but if operators are educated in this matter they can be of great assistance to the despatcher.

There is danger in the practice of allowing orders of a precautionary nature, such as reducing speed over certain pieces of track, bridges, etc., to remain in force after the repairs have been made, because the train and engine men become acquainted with the facts and they will be likely to take chances somewhere else, thinking perhaps the despatcher has forgotten to take up the order. It is the general practice on most roads to revise and consolidate all slow orders under a new number just after midnight. If, then, after the slow orders have been sent out a telegram comes in giving an O. K. on a certain place which has been covered in the new order the despatcher, if easy going, will allow that place to remain in the order until the next night at midnight. This entails much waste of energy. The moment an O. K. on any place is received a new and corrected order should be put out. Then the enginemen will adhere closely to the contents of all slow orders.

Each roadmaster, supervisor and trainmaster should receive a copy of all slow orders each morning, look them over carefully and immediately apprise the chief despatcher of anything irregular.

I have heard roadmasters complain that certain parts of slow orders were not being complied with by enginemen, and request that a "31" order be used for the place in question. But why burden the despatcher by having him use that form? There is no more important order than a slow order, and if an engineman will ignore that he is liable to do the same on a "31" order. If the roadmaster or any one else finds a man not complying with a slow order he should report the fact to the proper officer.

For the despatcher, however, the main feature is, keep your slow orders up to date and do not let it be said by enginemen, when you hand them an order, that they know a particular place was repaired a week ago because the foreman in charge of the work has so advised. Also, when it becomes necessary to abandon a certain switch or side track, as is frequently done, cover it by a general order addressed to all concerned, the order to be placed in a book to be signed for by train and enginemen. Do not put it out day after day in your slow orders. Where the necessary precautionary features are provided for in the book of rules, or time table notes, do not burden your slow order book with matters thus covered.

ARBITRATION OF ENGINEMEN'S DEMANDS

W. S. Carter, president of the Brotherhood of Locomotive Firemen and Enginemen, was the principal witness last week at the hearing before the board of arbitration on the demands of the western firemen and engineers. Much of his testimony was in explanation of a large volume he introduced as an exhibit, comparing the wage scales in 46 industries in 16 cities with those of engineers and firemen in freight service on roads that have a 10-hour basis, to show, as he said, that most of the men in the other industries receive higher rates of pay, have received larger increases since 1907 and since 1910 than enginemen, and that the latter, while required to work hours far in excess of employees in other industries, receive much less compensation for overtime.

The classes of employees which he said rank higher in hourly rate of pay than engineers include bricklayers, plasterers, steamfitters, plumbers, gasfitters, marble setters, structural iron workers, cement workers, granite cutters, compositors, stone cutters, inside wiremen, carpenters and linotype operators. The hod carrier in these cities, he said, receives an average wage of 40.27 cents an hour, while the locomotive fireman on coal-burning engines in freight service receives 33.85 cents, and on oil-burning engines 32.86 cents. The engineers stood sixteenth in the list in 1913 and firemen on coal-burning engines thirty-eighth and on oil-burning engines thirty-ninth. In a table arranged to show percentages of increase, 1913 over 1907, the engineers ranked thirty-ninth and firemen on coal-burning engines ranked thirty-sixth, while those on oil-burning engines ranked forty-fourth. Comparing overtime rates he said that an engineer on a $6.40 a day engine would get $6.40 for 8 hours or 10 hours, $7.68 for 12 hours and $8.96 for 14 hours, while a plasterer would get $6 for 8 hours, $9 for 10 hours, $12 for 12 hours and $15 for 14 hours.

One part of his exhibit included a discussion of piece work and seniority, in which he said that so long as the speed of a train is equal to or exceeds 10 miles an hour the wages are on a piece-work basis, or so much per 100 miles, and as the speed of the train increases the earnings for a given time are increased, but this he said does not take into consideration that a crew may be called two hours before starting to make mileage, or may be delayed afterward. "It is difficult to determine when a man goes on duty," he said, "he may be asleep after eight hours rest at 2 o'clock in the morning. The caller or the telephone may waken him and his train leaves two hours later. It takes him a certain time to put his clothes on, get something to eat, and get to the place where he will find his engine. Possibly that is his own time, but that is something that has to be done. It is difficult therefore to say just how much time after a man is called is really time contributed by himself or required by the company. Some schedules provide for pay for preparatory time working around the engine and others do not. As in all industries where rates of wages are based on the piece-work system a comparatively few locomotive enginemen earn high wages, and the high wages of these few are accepted by the public as typical of the earnings of all. An engineer or fireman may earn two days' pay in one day with the knowledge that he may earn nothing the next day, or may earn in one busy month twice as much as in a dull month.

There is no class of labor whose opportunities to earn money are so precarious as those of the fireman for his many years of experience. This he attributed to the peculiarity of railroad employment. On account of the seniority system, he said, the oldest men may earn high wages because they get the high-speed trains, but on the other hand the highest man on the firemen's list may be promoted to engineer and find his earnings decreased or may be demoted to fireman and find himself way down on the list again. The seniority system, however, he said, is absolutely necessary, bad as it is.

Mr. Carter said that the public and even some members of the Interstate Commerce Commission had been "grossly misled" by erroneous methods of reporting wages formerly required by the commission. Some roads, he said, have reported to the commission only the number of employees in service on June 30 on one form, and on another have reported the total compensation paid during the year. Dividing this compensation by a smaller number of men, therefore, gives an average rate that is too high. Figures compiled on this basis, he said, were used in the eastern enginemen's arbitration, but the commission has since recognized the error and has changed the method of reporting. The commission's statistics are also misleading, he said, in showing increases in pay without showing that the increases were brought about by the introduction of larger engines on which higher rates were paid.

Much of the effect of Mr. Carter's comparative tables was destroyed on cross-examination by James M. Sheean, counsel for the railroads, who showed that as the wage scales used for other industries are all for time rates they are not properly comparable with any of the "piece-work" or mileage rates of the railroads, and that the rates given for the railroads are only comparable when the enginemen are working on the hourly basis or when the speed is not greater than 10 miles an hour. This excluded the effect of the rates for passenger service, which are practically all on the mileage or piece-work basis; no distinction was made between the fast freight and other freight rates, although much of the fast freight service is paid for on the mileage basis, nor for the higher rates paid for way freight service.

Mr. Carter said his tables were intended only to show average rates, not earnings; that it would be impracticable to show earnings. He also said that his average rates had been ob-

tained by simply adding together all rates shown in the schedules for large and small locomotives, without regard to the number of each or whether any of them actually paid the rate. "So that if one engine took a $4 rate and 999 engines took a $6 rate, you would show the average rate as $5?" asked Mr. Sheean. Mr. Carter admitted this was true, but said he did not hesitate to criticise this method of reaching averages. Mr. Sheean also called attention to the fact that the rates for other indusries apply only to the large cities, while the railroad rates cover a wide extent of territory. Mr. Carter also admitted that he knew of no other industry that has a provision for a day's pay for less than a day's work. He also admitted that the number of men retained on the extra board is largely in the hands of the men themselves and that in dull times, under the seniority system, the older men may cause the younger men to drop out of service in order to keep their own earnings up, as opposed to the practice in other industries of reducing the hours of all the men.

He said he had made no investigation of the continuity or certainty of employment in other industries, and admitted that in the case of assigned crews their earnings are regular; that if called in emergency for another run they are guaranteed the same or higher rates. He said the only reason that switch enginemen have not asked for an eight-hour day is that they could not make a living in eight hours.

In reply to questions by Mr. Nagel, one of the arbitrators, as to whether the uncertainty and irregularity of employment in the case of engineers and firemen can be fairly compared with the uncertainty in the case of industrial wage earners, Mr. Carter said that the "panics" which throw men out of employment in mill industries at certain intervals of time occur on railroads, sometimes two or three times a year. Mr. Byram asked the witness if he thought it would be possible for the railroads to find enough money to give all of their employees what he would consider an adequate payment. Mr. Carter replied that he thought if it were possible to put it to a referendum vote the people of the United States would vote for higher rates if they knew the increase would go to increase wages. Mr. Nagel asked whether the entire rate question of railroads ought not to be considered, with a view to proper service for the shipper and passenger and proper conditions for the employees. Mr. Carter agreed, and thought the consumer would be liberal, but that the shipper considered only his freight rates.

Mr. Carter also introduced an exhibit on the earnings of enginemen during their first year's service, and the effect thereon of fluctuations in railroad business, based on information furnished by the railroads, to show that a large proportion of the younger men in the service have irregular employment and therefore receive low earnings. This showed that of 4,098 engineers promoted since January 1, 1912, 2,249 or 54.88 per cent have earned for the months worked an average of less than $80 per month. Of 1,296 hired engineers 518, or 39.97 per cent, have earned for the months worked an average of less than $90 a month.

Of 23,919 firemen hired, 10,786, or 45.09 per cent, have earned for the months worked an average of less than $50 per month. He said that if all months had been considered the earnings would have been much less. On February 1, 1914, there were 32,038 men on the engineers' list for the roads reporting, and 5,229 on the engineers' extra list, while 5,451 engineers had been set back to firing. On the firemen's list there were 29,645 and on the firemen's extra list 7,197. The number of firemen hired between January 1, 1912, and February 1, 1914, was 23,919. Mr. Carter said that most of the men that entered the service found out that they didn't like it, that their earnings were not high enough or that the work was too hard, and very few remain long enough to get the more highly paid runs. Over 12 per cent of the engineers and firemen promoted earned less than $20 per month. He said that in times of great depression in railway traffic it is not unusual to find all of the passenger engines and most of the regular freight engines fired by men who have been demoted. For all the roads reporting, the oldest fireman had an average of 3.44 years' seniority as an engineer on February 1, 1914. Of the 29,645 firemen in service on that date, 5,451 were demoted engineers. Without seniority, he said, the irregularity in employment would be the same, except that instead of the burden falling on the younger men, the man who had charge of assigning the service would pick the men upon whom the burden would fall.

On some roads the introduction of larger engines had the same effect on the number of men employed as a depression in business, he said, "except that business might pick up, but the engines never will get little." He admitted, however, that the number of regularly assigned runs, which are less affected by fluctuations, is gradually increasing. On cross-examination Mr. Sheean showed that many of the men listed as having small earnings as engineers earned far larger amounts in the same months as firemen, and that the list included men who might not have been available for service.

Mr. Carter remarked several times during his testimony that the employees would be willing to enter into a profit-sharing basis of wages if they could manage the roads, and that if the employees had jurisdiction over the financial affairs the money would be spent differently. Mr. Park asked: "Isn't it a fact that nearly all of the presidents and managing officials did start as firemen or machinists, or clerks, or operators, or agents? Do you think that the firemen without any experience, or with the experience they have had, would be more competent to run these railroads?" Mr. Carter replied: "If we owned the railroads we would hire the same presidents, but we would tell them what to do with our money."

Mr. Nagel asked if the government took over the roads, whether compensation would be continued at the rates which now obtain, or be raised or lowered? Mr. Carter said he hoped the government will not take over the railroads, but that if it were done, he believed the men would be placed on an eight-hour-day basis, and under civil service and that perhaps to the section men and clerks it would be a godsend, but he doubted whether it would be to the advantage of the organized crafts.

Mr. Carter admitted, in reply to questions by Mr. Sheean, that standardization of earnings could not be brought about unless the standard rates and rules proposed were applied to a uniform base, but said that the "saving clause" in the arbitration agreement indicated the "conservatism" of the men; because they had asked for standardization at lower rates than the highest now in effect, but wished to protect the higher rates. If they had been radical, he said, they would have asked for standardization on the basis of the highest rates in effect.

Mr. Carter also introduced an exhibit to show the increased cost of living since 1910 of enginemen in 29 western railroad towns, based on reports by special investigators who interviewed the merchants and secured affidavits from them as to the accuracy of the figures. Out of 111 articles of groceries, he said that there had been increases in the retail prices for all but 11, ranging from 0.54 per cent to 44.82 per cent; on meats, an increase of about one-third, and on men's clothing from 12 to 20 per cent. He also submitted tables taken from government figures and other exhibits bearing on the cost of living. Asked by the chairman whether the railroads intended to controvert the proposition that there has been an increase in the cost of living during the past four years, Mr. Sheean said "we contend that the increase in the cost of living is no greater in ratio than the increased earnings of the men during the same period."

Mr. Carter was followed on the witness stand by a number of engineers and firemen, who testified concerning their working conditions.

Extensive Electrification on the St. Paul

First Step Toward the Equipment of 440 Miles for Electric Operation; 3,000 Volts, Direct-Current Adopted

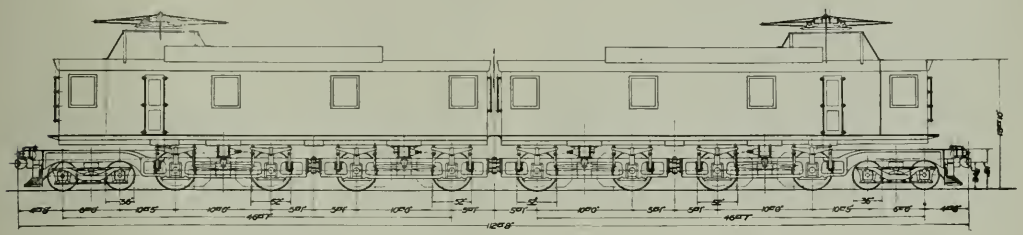
Plans for the electrification of the first engine division of the Puget Sound lines of the Chicago, Milwaukee & St. Paul* have been completed and contracts let to the General Electric Company for the electric locomotives, substation apparatus and line material, and to the Montana Power Company for the construction of the transmission and trolley lines. The work is under the direction of C. A. Goodnow, assistant to the president, in charge of construction. This initial electrification of 113 miles of main line between Three Forks and Deer Lodge is the first step toward the electrification of four engine divisions extending from Harlowton, Mont., to Avery, Idaho, a total distance of approximately 440 miles, aggregating about 650 miles of track, including yards and sidings. While this comprises the extent of track to be equipped in the near future, it is understood that plans are being made to extend the electrification from Harlowton to the coast, a distance of 850 miles, should the operating results of the initial installation prove as satisfactory as anticipated.

The plans for this work are of special interest, as this is the first attempt to install and operate electric locomotives on tracks extending over several engine divisions, under which conditions it is claimed the full advantage of electrification can be secured. The various terminal and tunnel installations have been made necessary, more or less, by reason of local conditions; but the electrification of this road is undertaken purely on economic grounds, with the expectation that superior operating results with electric locomotives will effect a sufficient reduction in the present cost of steam operation to return an attractive percentage on the large investment required. If the anticipated savings are realized in the electric operation, this initial installation will constitute one of the most important milestones in electric railway progress.

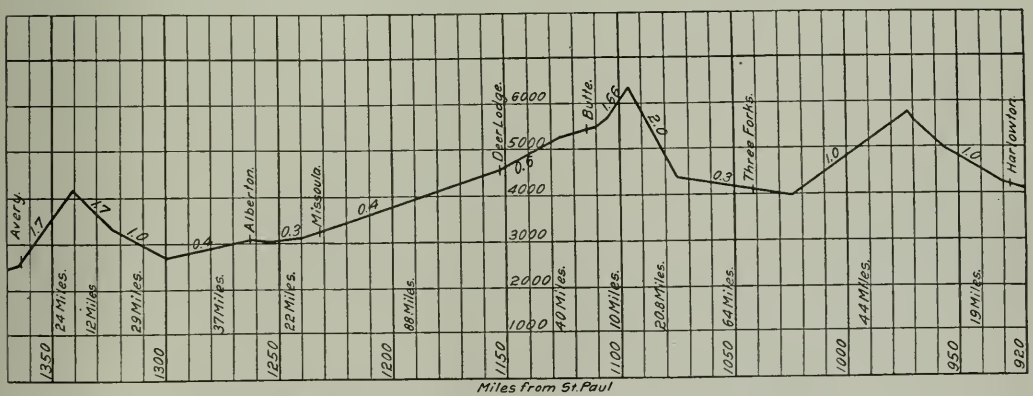
Due to the facilities available and the low cost of construction under the favorable conditions existing, the railway company will purchase power at a contract rate of $0.00536 per kilowatt-hour, based on a 60 per cent load factor. It is expected under these conditions that the cost of power for locomotives will be considerably less than is now expended for coal. The contract between the railway and power companies provides that the total electrification between Harlowton and Avery, comprising four engine divisions, will be in operation January 1, 1918.

In order to connect the substations with the several feeding-in points of the Montana Power transmission lines, a tie-in transmission line is being built by the railway company that will permit feeding each substation from two directions and from two or more sources of power. This transmission line will be constructed with wooden poles, suspension type insulators, will operate at 100,000 volts, and will follow, in general, the right of way of the railway company, except where advantage can be taken of a shorter route.

The immediate electrification of 113 miles will include four substations containing step-down transformers and motor-generator sets with necessary controlling switchboard apparatus to convert 100,000-volt 60-cycle three-phase power to 3,000 volts



Elevation of the Locomotives to Be Used on the St. Paul's Electrified Lines



Chicago, Milwaukee & Puget Sound from Harlowton, Mont., to Avery, Idaho

*See *Railway Age Gazette*, January 2, 1914, page 19.

direct current. This is the first direct current installation using such a high potential as 3,000 volts, and this system was adopted in preference to all others after a careful investigation extending over two years. The 2,400-volt direct current installation of the Butte, Anaconda & Pacific in the immediate territory of the proposed electrification has furnished a demonstration of high voltage direct current locomotive operation during the past year and a half, and the selection of 3,000 volts direct current for the St. Paul was due in a large measure to the satisfactory performance of the Butte, Anaconda & Pacific installation.

The substation sites of the Chicago, Milwaukee & Puget Sound electrified zone provide for an average intervening distance of approximately 35 miles, notwithstanding that the first installation embraces 20.8 miles of 2 per cent grade westbound and 10.4 miles of 1.66 per cent grade eastbound over the main range of the Rocky Mountains. With this extreme distance between substations and considering the heavy traffic and small amount of feeder copper to be installed, it becomes apparent that such a high potential as 3,000 volts direct current permits of a minimum investment in substation apparatus and considerable latitude as to location sites. The substations will be of the indoor type, transformers being three-phase, oil cooled, and reducing from 100,000 volts primary to 2,300 volts secondary, at which potential the synchronous motors will operate. The transformers will be rated 1,900 and 2,500 kv-a. and will be provided with four 2½ per cent taps in the primary and 50 per cent starting taps in the secondary.

The motor-generator sets will comprise a 60-cycle synchronous motor, driving two 1,500-volt direct current generators connected permanently in series for 3,000 volts. The fields of both the synchronous motor and direct current generators will be separately excited by small generators direct connected to each end of the motor-generator shaft. The direct current generators will be compound wound, will maintain constant potential up to 150 per cent load and will have a capacity for momentary overloads up to three times their normal rating. To insure good commutation on these overloads, the generators are equipped with commutating poles and compensating pole-face windings. The synchronous motors will also be utilized as synchronous condensers, and it is expected that the transmission line voltage can be so regulated thereby as to eliminate any effect of the fluctuating railway load.

The location and equipment of the several substations is as follows:

Station	Miles from Deer Lodge	No. of units	Kw. per unit	Total
Morel	17.1	2	2,000	4,000
Janey	50.5	3	1,500	4,500
Piedmont	77.9	3	1,500	4,500
Eustis	120.6	2	2,000	4,000

The trolley construction will be of the catenary type, in which a 4/0 trolley wire is flexibly suspended from a steel catenary supported on wooden poles, the construction being bracket wherever track alinement will permit and cross-span on the sharper curves and in yards.

As the result of careful investigation and experiments, a novel construction of trolley will be installed, composed of the so-called twin-conductor trolley. This comprises two 4/0 wires suspended side by side from the same catenary by independent hangers alternately connected to each trolley wire. This form of construction permits the collection of very heavy current by reason of the twin contact of the pantograph with the two trolley wires, and also insures sparkless collection under the extremes of either heavy current at low speed or more moderate current at very high speeds.

Including sidings, passing and yard tracks, the 113 miles of route mileage is increased to approximately 168 miles of single track to be equipped between Deer Lodge and Three Forks in the initial installation.

The locomotives to be manufactured by the General Electric Company are the first to be constructed for railroad service with direct-current motors designed for so high a potential as 3,000 volts. They will weigh approximately 260 tons and will have a continuous capacity greater than any steam or electric locomotive yet constructed. Perhaps the most interesting part of the equipment is the control, which is arranged to effect regenerative electric braking on down grades. This feature as yet has never been accomplished with direct-current motors on so large a scale.

The Chicago, Milwaukee & Puget Sound, from Harlowton to the coast, crosses four mountain ranges, the Belt mountains at an elevation of 5,768 ft., the Rocky mountains at an elevation of 6,350 ft., the Bitter Root mountains at an elevation of 4200 ft. and the Cascade mountains at an elevation of 3,010 ft. The first electrification between Three Forks and Deer Lodge calls for locomotive operation over 20.8 miles of 2 per cent grade between Piedmont and Donald at the crest of the main Rocky mountain divide.

The initial contract calls for nine freight and three passenger locomotives having the characteristics given below and similar in all respects, except that the passenger locomotives will be provided with a gear ratio permitting the operation of 800-ton trailing passenger trains at approximately 60 m. p. h., and will be equipped with an oil-fired, steam-heating outfit for the cars.

The eight motors for the complete locomotive will be type GE-253-A. This motor has a normal one-hour rating of 430 horsepower, with a continuous rating of 375 horsepower. The eight motors will thus give the locomotive a one-hour rating of 3,440 horsepower and a continuous rating of 3,000 horsepower. The drawbar pull available for starting trains will approximate 120,000 lb. at 30 per cent coefficient of adhesion.

Each motor will be twin-geared to its driving axle in the same manner as on the Butte, Anaconda & Pacific, the Detroit River Tunnel and the Baltimore & Ohio locomotives, a pinion being mounted on each end of the armature shaft. The motor is of the commutating pole type and has openings for forced ventilation from a motor-driven blower located in the cab.

The freight locomotives are designed to haul a 2,500-ton train on all grades up to 1 per cent at a speed of approximately 16 m. p. h., and this same trainload unbroken will be carried over the 1.66 and 2 per cent ruling grades on the west and east slopes of the Rocky mountain divide with the help of a second similar freight locomotive acting as pusher. Track provision is being made at Donald, the summit of the grade, to enable the pusher locomotive to run around the train and be coupled to the headend to permit electric braking on the down grade. In this case the entire train will be under compression and held back by the two locomotives at the headend, the entire electric braking of the two locomotives being under the control of the motorman in the operating cab of the leading locomotive. It is expected that electric braking will prove valuable, as in addition to providing the greatest safety in operation, it also returns a considerable amount of energy to the substations and transmission system. In this connection, the electric locomotives will have electric braking capacity sufficient to hold back the entire train on down grade, leaving the air brake equipment to be used only in emergency and when stopping the train.

With the completion of the remaining engine divisions, it is proposed to take advantage of the possibilities afforded by the introduction of the electric locomotive by combining the present four steam engine divisions into two locomotive divisions of approximately 220 miles length, changing crews, however, at the present division points.

The general characteristics of the locomotives are given below:

Total weight	260 tons
Weight on drivers	200 tons
Weight on each guiding truck	30 tons
Number of driving axles	8
Number of motors	8
Total length of locomotive	112 ft.
Rigid wheel base	10 ft.
Voltage	3,000
Voltage per motor	1,500
Horsepower rating; one hour, each motor	430
Horsepower rating, continuous, each motor	375
Horsepower rating, one hour, complete locomotive	3,440
Horsepower rating, continuous, complete locomotive	3,000
Trailing load capacity, 2 per cent grade	1,250 tons
Trailing load capacity, 1 per cent grade	2,500 tons
Approximate speed at these loads and grades	16 m. p. h.

THE MANUAL BLOCK SYSTEM WITHOUT STATION ATTENDANTS

That the block system or space-interval system is the only adequate and satisfactory arrangement for running trains at high speeds with a suitable degree of freedom from the collision hazard has come to be quite generally appreciated, although the American railway world has been a long time in reaching this point. That the system can be managed with a good degree of flexibility, to meet needs imposed by changes in the volume of traffic or by lack of money, is not so well appreciated. As showing the adaptability of the principle to conditions which usually are considered unfavorable to its adoption, except at unreasonably high cost, we describe below two small installations—one of them in use only about six weeks—where no station operators are employed. In both cases the trainmen perform the functions of the station man.

ELECTRIC TRAIN STAFF ON THE LONG ISLAND

The Long Island road, on its Whitestone branch, is using the electric staff system without station attendants, the conductor or his assistant changing the staffs at each stop. On this branch, four miles long, with two block sections, there are on week days about 25 trains each way, daily, nearly all passenger trains; and each staff station is at a passenger station, so that no extra stops are necessary to take staffs, except for the few freights. There are no express passenger trains. The electric train staff has been used in this way on a short section of the Delaware, Lackawanna & Western for several years, but on that section there are no passenger trains.

In one of the staff sections on the Long Island is a siding, where there is a junction staff instrument, by means of which a train clearing the main track, can clear the block for other trains. The conductor uses the staff to unlock the switch, and having cleared the main track, and locked the switch straight, can insert the staff in the instrument, thus making a staff available, at either end of that section, for a superior train.

There are no semaphores or other fixed visual signals on this staff-operated line. At each station is a booth outside the building, locked with a padlock; and in this the staff instruments are placed. The stations have high platforms and the car platforms are at the same level, so that the trainman can alight, go to the booth, unlock it, change the staffs, lock the door and return to the train in about ten seconds. Before going back into the train he holds the staff up where it can be seen by the motorman (all passenger trains are electric). Motormen and enginemen are required to see the staff before proceeding from a station. In each booth there is a telephone, connecting with the despatcher's office; but in the ordinary routine the passenger-train men have no communication with the despatcher; if the desired staff can be obtained (is not held in the machine by the electric lock) it is taken out at once, and the train proceeds.

All trains are required to keep clear of opposing superior trains, in accordance with ordinary time-table rights, so that observance of precise block-section limits is not necessary, and at staff stations trains can and do run to the station platform to discharge passengers.

LIGONIER VALLEY; FIVE BLOCKS CONTROLLED BY THE DESPATCHER

On the Ligonier Valley Railroad, which connects with the Pennsylvania main line at Latrobe, 40 miles east of Pittsburgh, the trains are run by the manual block system, without station operators; and there are no fixed signals, in the usual meaning of that term; the building, booth or box, containing the telephone with which conductors can speak to the train despatcher, being the recognized landmark by which the beginning and end of a block section are indicated.

This road is ten miles long, with a branch of four miles, and there are, altogether, five block sections. On the main line there are three passenger trains each way daily. The method of operation will be understood by a perusal of the rules for the block system, printed below. Freight trains are allowed to follow freight trains permissively, but under all other conditions the absolute space interval is maintained.

The usual procedure for the movement of a train through a single block is, for example, as follows:

The conductor goes to the telephone and says: "This is Conductor Brown, Extra 15 north, at Darlington Block Station." The despatcher then says to him "Block is clear (or caution) Darlington block station to Kingston block station, for Extra 15 north." The conductor then repeats the despatcher's exact words. The despatcher then closes the conversation by saying "O. K. Ligonier train director."

When train movements can be facilitated by giving an order conferring the right to the road for more than one block section, the regular form 19 is used. A sample order reads:

To C and E No 4 Latrobe Passenger Station
No 4 has clear blocks
Latrobe Block Sta to
Ligonier Block Sta

W. V. H.

In the occasional instances where the telephone wires or telephone instruments have been out of order, so as to prevent communication with headquarters, the trainmen have used the long distance Bell telephone to get instructions from the train director.

BLOCK SIGNAL RULES

38. Manual block system is in effect between Ligonier and Latrobe Block Station and on Mill Creek Branch between Ligonier and Wilpen.

Definitions

Block System—A series of consecutive blocks.

Block—A length of track of defined limits, the use of which by trains is controlled by block signal or block signal instructions.

Block Station—A place from which block signals are operated, or block signal instructions are received by telephone.

Unattended Block Station—A place at which block signal instructions are received by telephone.

Stations

Block stations will be located as follows and block system will be controlled by train director at Ligonier:

Ligonier—(telephone in train director's office).
Darlington—(in station building).
Kingston—(in station building).
Oakville—(in station building).
Latrobe Block Station—(Booth Junction, West Leg Y).
Wilpen—(in booth).

All above block stations are unattended except Ligonier. Telephones connected with the train director are installed at each block station.

General Rules

39. A train must not enter a block at a block station or between block stations without permission from the train director. The conductor or engineman must obtain from the train director permission to enter, and ascertain condition of the block. If the information concerning the block is received by the conductor, he must personally give it to the engineman, and the movement through the block must be made according to the instructions received from the train director. Trains clearing a block must report promptly to the train director.

40. Train director must not permit a train to enter a block which is occupied by an opposing train or by a passenger train, and a passenger train must not be admitted to a block which is occupied by any train except by train order. A freight train with proper instructions from the train director will be permitted to follow another freight train in the block.

41. Passenger extras must be given the same block protection as regular trains.

42. The condition of block over one block only will be given verbally; over more than one block, it must be in writing.

43. At an unattended block station, the conductor or engineman must obtain permission to enter, and ascertain the condition of the block; and report when clear of the block.

When a train clears a block between block stations or at an unattended block station, the flagman may, when authorized by the conductor or engineman, report clear to the train director.

44. If telephone fails at an unattended block station and trainmen cannot in the usual manner obtain instructions, every effort must be made to obtain instructions in some other manner and avoid undue delay. Such failures must be promptly reported to the train director from the most accessible point.

45. At unattended block stations, trains must run to but not beyond the building, booth or box which contains the telephone, unless otherwise instructed by train director.

USE OF TELEPHONES

46. The following instructions must be observed when the telephone is used for manual block operations, transmitting train orders or making any arrangements pertaining to the movement of trains.

Each person must satisfy himself that he is in communication with the person desired.

Train director and trainmen, when making arrangements by telephone for movement of trains, will be governed by the following instructions:

First: Trainmen calls train director by telephone.

Second: Train director answers "Ligonier train director."

Third: Trainman answers "Conductor ..... of train ..... at ....."

Fourth: Trainman asks for information or instructions desired.

Fifth: Train director gives information or instructions to trainman.

Sixth: Trainman repeats information or instructions given by the train director.

Seventh: Train director closes conversation by saying "O. K. train director, Ligonier."

Trainman must not consider any information or instructions from the train director as being completed and must not act upon such information or instructions until the train director has given "O. K.," followed by his name and office.

47. If there is not a proper supply of train order blanks and carbon sheets at an unattended block station or telephone booth, the fact must be promptly reported by telephone to the person from whom orders are received, who will arrange for necessary supply.

RAILWAY BUSINESS ASSOCIATION

The following officers were elected at the business session of the Railway Business Association which was held at the Waldorf-Astoria, New York, on Thursday afternoon, December 20: President, Geo. A. Post of New York; vice-presidents, S. P. Bush of Columbus, Alba B. Johnson of Philadelphia, H. G. Prout of New York, W. G. Pearce of New York, Walter H. Cottingham of Cleveland, W. B. Leach of Boston, E. B. Leigh of Chicago; treasurer, M. S. Clayton of New York.

An appropriate eulogy was adopted as a tribute to the late Charles A. Moore, who had been treasurer of the association since its formation.

The following resolutions were also adopted:

I—We again urge co-ordination of the various agencies of railway regulation. One of the most serious embarrassments under which the Interstate Commerce Commission labors is that it cannot enforce its findings when they conflict with state action. Until some permanent and satisfactory solution is reached, the federal commission should initiate and state commissions should join in conferences, exhausting all reasonable efforts toward co-operation. The country should consider its transportation problem not piecemeal but as a whole, with a broad outlook on the general prosperity. The financial condition of the railroads ought to be made plain to every public officer and no burden placed upon the railways without due consideration of the effect upon their net income.

II—We regard general rate advance cases as a proper subject of propaganda. As a matter of public policy the people have a vital interest in strengthening railway credit. They have the right to expresss their opinion and to promote public discussion.

III—We vigorously dissent from the view that the supreme concern of railway regulation is to avoid the risk of too much railway revenue. In business and in the affairs of government, what men dread is not a surplus but a deficit. The railroads should be put beyond reasonable doubt of having income enough. It is now known on the highest authority that their income is too low in the public interest. Various substitutes are proposed in place of advances in freight rates as a remedy. It has been demonstrated that some of these suggestions are not immediately practicable. Certain relief should be granted forthwith. National prosperity depends upon it. The people cannot afford mistakes on the wrong side of the ledger. Any superfluous surplus can be dealt with when and if it materializes.

IV—Underpayment of railways for carrying mail demands correction. Quadrennial weighings result in substantial increases in service performed without added compensation. The initiation of the parcel post service without adequate remuneration to the railroads aggravates this discrepancy. This inequity should be minimized through a change to annual weighings. Instead of this, the House has passed and the Senate is considering a method of payment based on advance estimates of car space to be used. We oppose this experiment. It prescribes no method for measuring space actually used, no check-up of estimates by actual measurement, no way of proving whether the space authorized approximates that furnished. The computation of mail pay should be on a basis of ascertained facts so far as practicable, and all findings of the Post Office Department should be subject to review by some less interested arm of the government.

V—Federal regulation of railway security issues would be an advantage if it did away with regulation by states. Superadded to state supervision, it would further confuse and harass the roads in their financing, already made complex, cumbersome and slow by multiplicity of masters. Inasmuch as authorities differ as to what can ultimately be done, we advocate that federal action be confined to publicity, as recommended by the Hadley Commission.

VI—President Wilson by his sympathetic reception of railway executives and his generous response to their plea for public co-operation has shown that the time has come when political leaders are willing to listen without prejudice to appeals on behalf of the carriers. Members of our association can do effective work in arranging conferences with governors, state legislators and members of Congress. The more open and public such meetings are the better.

VII—We congratulate the people of Missouri on their veto of the extra crew bill. In most states railroad commissions have ample power to require safety precautions according to actual circumstances, which vary from time to time and from road to road. Details should be left to regulation. Needless men promote danger rather than safety, and their compulsory employment is a waste of money collected from the rate payers In those states which have extra crew laws our association will advocate repeal.

VIII—America has lagged too long behind Europe in protecting against himself the person who risks life and limb by trespassing on the railroad right of way. Our laws are loose, our enforcement lax, the result a yearly toll of awful magnitude. We favor absolute prohibition of trespassing on railroad property under heavy penalties and rigid severity in dealing with offenders.

IMPORTANCE OF SAVING TIME.—The element of greatest expense in manufacturing is time, for a little time wasted here and there will lessen, and possibly destroy, the year's profits.—*American Machinist.*

Heat Treated and Alloy Steels for Locomotive Parts

Possibilities of Lighter Sections and Increased Fibre Stresses; Comparisons with High Grade Carbon Steel

The following is part of the discussion of a report on "Steam Locomotives of Today," presented before the railroad session of the annual meeting of the American Society of Mechanical Engineers, held in New York, December 2, 1914:

USE OF HIGH GRADE ALLOY STEEL TO REDUCE WEIGHT

C. D. Young, engineer of tests, Pennsylvania Railroad: With the ordinary annealed carbon steel as used generally for locomotive forgings, such as axles, crank pins, side rods, etc., the minimum physical properties may be considered to be as follows:

Tensile strengtb.....80,000 lb. per sq. in.
Elastic limit .....½ tbe tensile strength
Elongation in 2 in.....22 per cent
Reduction of area.....30 per cent

With properly quenched and tempered carbon steel we may expect an increase in the elastic limit of 30 per cent or more, about 15 per cent increase in tensile strength, the elongation remaining the same and the reduction of area increasing about 50 per cent. These are conservative figures and a great deal better elastic limit and tensile strength may be obtained, depending upon the chemical composition of the steel and the heat treatment.

From alloy steels, such as chrome-vanadium or chrome-nickel, we may expect to obtain the following minimum physical properties after heat treatment:

Tensile strength.....95,000 lb. per sq. in.
Elastic limit.....75,000 lb. per sq. in.
Elongation in 2 in.....20 per cent
Reduction of area.....30 per cent

On an average these alloy steels will show an increase in physical properties over those of annealed carbon steel of 20 per cent or more in tensile strength, 80 per cent or more in elastic limit, with elongation in 2 in. about 9 or 10 per cent less than that of the carbon steel, and the reduction of area 75 per cent or more greater. These figures are also subject to considerable variation on account of variation in the chemical composition of the steel and the heat treatment.

In carbon steel castings approximately the same per cent increases in physical properties as were given for carbon steel forgings may be obtained after proper heat treatment. The experience with alloy steel castings has been too limited to furnish any satisfactory data.

Up to the present the majority of users of heat treated steels seem to have made but little, if any, use of the increased physical properties as determining the fiber stresses used in design, though some of the larger builders of locomotives have made such increases in fiber stresses for both heat treated carbon and alloy steels. In certain parts where heat treated carbon steel has been used, the fiber stress has been increased about 25 per cent above that used for annealed carbon steel, and in the case of heat treated alloy steels an increase of as much as 50 per cent has been made. In some cases, depending upon the design and service for which the forging is intended, it is preferable to allow no increase in the fiber stress, but to consider the excess strength of the heat treated material as contributing to increased life in service, or to safety.

Recent practice has indicated that it is desirable, when using heat treated designs, to carefully study the sections, so as to avoid abrupt changes, and also in the case of larger shafts, such as axles or crank pins, that they should be hollow bored in order to provide for better treatment and to relieve shrinkage strains which occur during the quenching process.

While there is no objection to the change of the present standard section, it would seem, with our present knowledge of heat treated material, that it would be entirely safe to use certain increases in the fiber stresses when designing the locomotive parts, and, as a suggestion as to what could be done in this respect, the accompanying table shows what is recommended for three grades of steel as to working fiber stresses and the minimum ultimate strength and elongation. This has been tabulated for the grades of .45 annealed carbon, quenched

Parts	Grade of Material	Working Fiber Stress, Lb. per sq. in., in Tension or Compression	Working Fiber Stress, Lb. per sq. in., in Bending	Minimum Ultimate Tensile Strength	Minimum Elongation in 2 in.	
Main and parallel rods	Annealed .45 carbon	8,000	10,000	80,000	1,800,000 T. S.	20 per cent
	Quenched and tempered .52 carbon	10,000	14,000	85,000	2,000,000 T. S.	20 per cent
	Quenched and tempered alloy	12,000	18,000	100,000	..... T. S.	20 per cent
Piston rods	Annealed .45 carbon	9,000	.....	80,000	1,800,000 T. S.	20 per cent
	Quenched and tempered .52 carbon	10,000	.....	85,000	2,000,000 T. S.	20 per cent
	Quenched and tempered alloy	12,000	.....	100,000	..... T. S.	20 per cent
Driving axles	Annealed .45 carbon	Combined bending and torsion in starting	18,000	80,000	1,800,000 T. S.	20 per cent
	Quenched and tempered .52 carbon		20,000	85,000	2,000,000 T. S.	20 per cent
	Quenched and tempered alloy		25,000	100,000	..... T. S.	20 per cent
Crank pins	Annealed .45 carbon	.....	13,500	80,000	1,800,000 T. S.	20 per cent
	Quenched and tempered .52 carbon	.....	16,000	85,000	2,000,000 T. S.	20 per cent
	Quenched and tempered alloy	.....	20,000	100,000	..... T. S.	20 per cent
Cast steel parts	Annealed .28 carbon	8,000 (Tension)		60,000	1,400,000 T. S.	22 per cent
	Quenched and tempered .28 carbon	10,000 (Tension)		75,000	1,800,000 T. S.	20 per cent
				Transverse Strength		Bend Test
Springs	Drawn 1.0 carbon	70,000	.....	90,000		25 deg.
	Quenched and tempered 1.0 carbon	90,000	.....	120,000		25 deg.
	Quenched and tempered alloy	100,000	.....	150,000		50 deg.

Note.—Maximum figures for working fibre stress may be 20 per cent in excess of those shown.

and tempered .52 carbon, and quenched and tempered alloy steels.

Results seem to indicate that heat treated carbon and alloy steels will show greater resistance to wear and to the fatigue stresses in service than annealed carbon steel, and it is our opinion that the increase in resistance to wear is about in proportion to the increase in Brinell hardness, which is brought about by the heat treatment.

CARBON AND ALLOY STEELS

H. V. Wille, Baldwin Locomotive Works: The use of high grade alloy steels is at present largely confined to reduction of weight of the reciprocating parts in order to permit a corresponding increase in the dead weight on drivers. It is, however, undesirable to greatly reduce the sections and weight of rods, even though they may be made of alloy steels, for the reason that they are subject to failure by buckling and when loaded as a column under a compressive load will not show much superiority over a high grade carbon steel.

With many other railroad metallurgists, I do not consider that the possibilities of high grade carbon steel have been utilized to the fullest extent by designers. This is no doubt due to the fact that designers and metallurgists look at the properties of steel from entirely divergent views. The metallurgist wishes a steel of great ductility with a good elongation and reduction of area, or in other words, a steel that will readily flow under limiting loads, whereas the designer desires a stiff steel, one of high elastic ratio or a steel that will not readily flow under loads above the elastic limit. The metallurgist, therefore, specifies a steel with a high elongation and reduction of area and to meet these conditions the manufacturer is compelled to use a steel of medium carbon.

As for possibilities of improvements, a decided reduction in weight as well as the elimination of failures would result from a modification of existing specifications for forgings for the purpose of permitting the use of steel of high tensile strength and elastic limit, even at a sacrifice of the ductility as measured by the elongation and reduction of area. These views are sustained by the results of an elaborate series of tests conducted by the United States government at the Watertown Arsenal by Jas. E. Howard, on the endurance of rotating shafts. The enormous increase in endurance following the use of material having high elastic limit and tensile strength is notable in that a .66 carbon steel shaft exhibits as much endurance as 5.6 per cent nickel steel.

These figures carry an obvious lesson and one which is gradually being appreciated for its full worth, and it is in entire accordance with our past experience. When steel forgings were first proposed for use in locomotives a soft grade of steel was generally employed, the purpose being to secure a steel of properties similar to the iron formerly employed. The use of this material resulted in an unusual number of failures of axles, pins and rods, and after studying these failures, Dr. C. B. Dudley, S. M. Vauclain and S. T. Wellman experimented with higher carbon steels. This led to the general adoption of steel of 80,000 lb. tensile strength for locomotive work, with the result that the failures were eliminated and the great superiority of this steel over the softer steel was demonstrated, notwithstanding the great difference between the two steels in elongation and contraction of area. This grade of steel is still being universally employed and any changes were for the purpose of increasing the ductility requirements rather than the tensile requirements, thus handicapping the manufacturers in the development of this grade of steel. If specifications were revised to permit the use of a .65 carbon steel there would be but little necessity to employ the expensive alloy steels.

Machine Power and Piecework.—In any shop if the feeds, speeds and power of machine tools of the same class vary, it is a practical impossibility to establish a just and efficient piecework or premium system.—*American Machinist.*

POINTS FOR THE ROAD FOREMAN*

By W. P. Danforth

During ten years of service as road foreman of engines on one of the leading railroads located at a terminal which might be called the business center of the road, I was called upon to employ, examine, and promote an army of men. It gave me an insight into the general make up of this class of men; and, while I have occasionally found an obstinate one who wants his own way, most of the candidates sincerely desired to be known as good engineers.

From conversations with the engineers on the line on which I am employed, I find that the greatest factor in building up a class of men who will "deliver the goods" on a busy single-track line (one which has been reasonably free from distressing accidents) has been the pattern set by a long line of good clean, honest and successful men. *Example* is the most important item. I myself, in my youth, selected a noble man as my ideal, an engineer who became one of the ablest superintendents of motive power in the United States; and I derive greater satisfaction from my record as an engineer, than from the position of superintendent, which I now hold.

The engineer must be clean as a hound's tooth, and temperate in all things. He must cultivate the habit of having the greatest respect for the rules. I know of a young engineer who sidewiped a passenger train, before he learned to respect the rules that required him to stop a certain distance from a signal. He always wanted to get closer than the rules allowed. I warned him several times, and after the accident he acknowledged, that, had he followed my advice the collision would not have occurred.

An engineer must study and never allow himself to become rusty. We learn and soon forget, unless we keep everlastingly at it. The successful engineer will study his time-table and book of rules, at every opportunity, as a lawyer studies his law books. The study of speed and the distance required to stop under everyday conditions is of the greatest importance. I would suggest that every engineer post himself on the table of speed and distance required to stop, as given in the Westinghouse Air Brake Instruction Book. A slight increase in speed throws the distance in which we have to make the stop all out of proportion. There is an element in the service of all railroads who think locomotives, air brakes, cars and every thing else placed in their hands should be in perfect order at all times, and, if defects show up they are relieved of all responsibility. My advice to young engineers would be, shun this class of men; always strive to overcome the difficulties which may arise in your work.

Pooling engines and taking all the work off the engineer in the way of caring for the general upkeep of the engines has not been beneficial in developing in engineers those painstaking traits that make them successful. Filthy engines have a great deal to do in developing a slip-shod engineer. Neat surroundings have a tendency to make men more particular about their work. The painstaking, particular men rarely get into serious trouble; therefore surround the engineer with neatness. Note the difference between the cab of a locomotive and the engine room of an ocean liner.

Officers, especially those in the passenger department, who are always making extravagant promises in regard to schedules, should be as considerate as possible in their requirements for speed. In my experience as an engineer I never allowed this pressure to remove from my mind, for a second, the all-important subject of safety of the passengers riding on the train.

Harsh methods on the part of railway officers in an attempt to accomplish the impossible, that is to prevent all accidents, have

*This is the fifth of a series of articles, made up of useful hints to locomotive runners, which were written in connection with the prize competition of several months ago. The previous articles of this series were printed in the issues of September 25, October 2, November 27 and December 11.—Editor.

done much to increase accidents by putting something in the minds of runners, namely, the fear of losing their positions, which ought not to be there. Here again may be seen the importance of example. Officers must lead their men by example, by kindness and by firmness. The Brown system of discipline was a timely innovation. It brought in the element of humanity, and did more to develop a good class of men than carloads of the harsh methods which so widely prevail.

TRAIN ACCIDENTS IN NOVEMBER[1]

The following is a list of the most notable train accidents that occurred on the railways of the United States in the month of November, 1914:

Collisions

Date.	Road.	Place.	Kind of Accident.	Kind of train.	Kil'd.	Inj'd.
21.	New Orleans G. N.	Pool's Bluff.	bc.	.....	3	4

27.	Chicago & Alton.	Clark, Mo.	unx	P.	0	27
29.	Central of Ga.	Toomsboro	washout	P.	0	13

The collision at Pool's Bluff, La., on the night of the 21st was between a log train of the Great Southern Lumber Company and a motor car ordinarily used by the track repair forces, but in this case carrying 10 passengers. Three of these passengers were killed and four others were injured. It is said that a section foreman was using the motor car to carry passengers without authority. How the collision came to happen is not clearly explained, but there was smoke from forest fires which may have interfered with the view of the men on the motor car. Testimony before the coroner, however, indicated that there was gross carelessness in assuming that no train was due.

The trains in collision on the Southern Railway near Alexandria, Va., on the 24th were northbound freights, a train of the Chesapeake & Ohio running into the rear of one of the Southern Railway. The caboose of the leading train was wrecked and a brakeman, off duty, sleeping inside of it, was fatally injured; and the caboose was burnt up. The second train was running in disregard of the yard-limit rule.

The trains in collision at Mounds, La., on the 27th were westbound passenger No. 5 and eastbound passenger No. 12. Both locomotives were badly damaged and 34 passengers and 3 trainmen were injured, none very seriously. Mounds was the appointed meeting place for these trains, and it is said that the westbound train, No. 5, approached at uncontrollable speed and so failed to enter the side-track, where it should have gone to clear the eastbound train. The engineman of No. 5 had a perfect record of 20 years' service.

The trains in collision at Crystal, Me., on the night of the 28th were a northbound passenger and a freight train which was switching in the yard. Eleven passengers were injured. The freight was on the main line without right.

The trains in collision on the Chesapeake & Ohio at Richmond, Va., on the night of the 28th were westbound passenger No. 15 and an extra freight, the passenger running into the rear of the freight. One passenger was injured.

[1]Abbreviations and marks used in Accident List:
rc, Rear collision——hc, butting collision——xc, Other collisions——b, Broken——d, Defective——unf, Unforeseen obstruction——unx, Unexplained——derail, Open derailing switch——ms, Misplaced switch——acc. obst., Accidental obstruction——malice, Malicious obstruction of track, etc. ——boiler, Explosion of locomotive on road——fire, Cars burned while running——P. or Pass., Passenger train——F. or Ft., Freight train (including empty engines, work trains, etc.)——Asterisk, Wreck wholly or partly destroyed by fire——Dagger, One or more passengers killed.

The train derailed at Belleville, Ill., on the 2nd was an eastbound freight and the engine and seven cars were ditched. A trespasser was killed and the engineman and two other trainmen were injured.

The train derailed at Mud Run, Pa., on the morning of the 12th was an eastbound through passenger. The locomotive and seven cars were derailed, one of the coaches sliding down the embankment, but remaining upright. Two passengers were injured fatally, and six other persons, including the engineman and the fireman, less severely. The cause of the derailment has not been determined.

The train derailed at Goodlettsville, Tenn., on the 17th was southbound passenger No. 93 and two baggage cars and one coach were overturned. The engine and the rear car, which was a sleeping car, were not derailed. The baggage car caught fire, but the flames were soon extinguished. Four passengers and two trainmen were slightly injured. The wreck occurred at 2 a. m., and the cause was a broken rail.

The train derailed near Garland, Ala., on the 19th was northbound passenger No. 2. The engine and three baggage cars fell down a bank. Four passengers and an express messenger were injured. The derailment is believed to have been due to a broken rail.

The train derailed at Waterford, N. Y., on the 21st was westbound passenger No. 31 consisting of four cars and a locomotive, the locomotive moving backward, pulling the cars. While running at low speed the engine was derailed on the bridge over the Mohawk river. Both the tender and the engine ran off the rails and broke through the ties, but were held up by the floor system of the bridge and were not badly damaged. The bridge was damaged to the extent of about $4,500.

The train derailed at Mendota, W. Va., on the 22nd was northbound passenger No. 714. Eleven passengers were injured, none seriously. The tender was the first vehicle to leave the track. The cause of the derailment, which occurred on a curve, is reported as the fracture of one leaf of an elliptic spring of the forward tender truck.

The train derailed near Clark, Mo., on the 27th was eastbound passenger No. 22, and four coaches fell down a bank. Twenty-three passengers and four employees were injured. The train was running about 30 miles an hour. The cause of the derailment was not discovered.

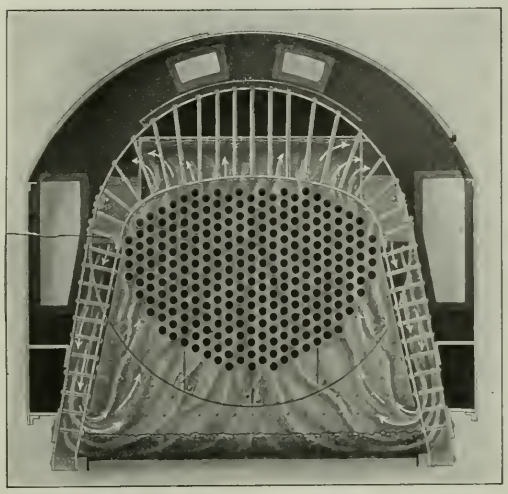
The train derailed near Toomsboro, Ga., on the night of the 29th was eastbound passenger No. 22, and one car was overturned. Eight passengers and five employees were slightly injured. The train was running about 20 miles an hour and the derailment was due to a washout caused by unusually heavy rains.

A SYSTEM OF WATER CIRCULATION FOR LOCOMOTIVE BOILERS

A device has recently been developed for the application of the Ross-Schofield system of circulation to locomotive boilers and is now in service on a number of locomotives. In this system, which has been successfully used in marine and stationary service for a number of years, the circulation is produced by utilizing the displacement of water caused by the formation of steam bubbles and their rise toward the surface. The water space above the hottest portions of the heating surface is enclosed by means of plates, communication with the body of the water space being provided at the top and bottom only. The generation of steam within the water column thus formed produces a rapid upward circulation of water which is properly directed by means of a guide at the surface.

The device for locomotive service is made up of three parts. A baffle plate which surrounds the tubes and separates the barrel of the boiler from the firebox portion, is secured to the shell of the boiler at the throat sheet. This extends to a height level with the highest point of the crown sheet, openings being provided at the sides below the center

line of the boiler. The space betwen the baffle plate and the firebox flue sheet is separated from the water legs at the sides of the firebox by side plates which extend downward to a point about 10 in. above the mud ring. A water column is thus formed which is enclosed by the flue sheet, the baffle



End Elevation Showing Direction of Currents from the Barrel of the Boiler

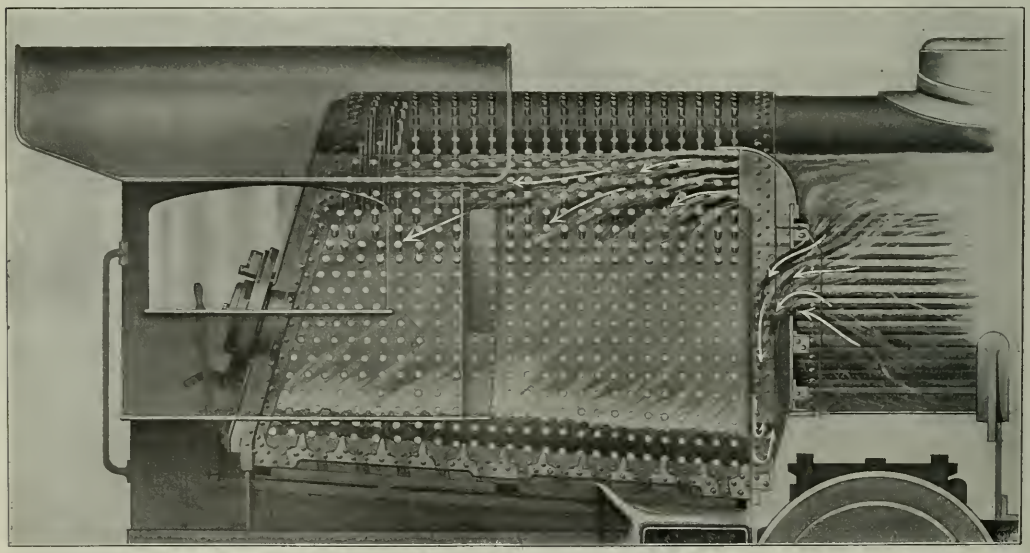
plate and the two side plates. All circulation from the barrel of the boiler must pass through the openings in the baffle plate, downward through the water leg to the bottom of the side plates and thence upward over the rear flue sheet and the rear ends of the tubes. Supported to the top of the baffle plate is a curved hood extending up to the normal water line, which directs the circulation over the crown sheet toward the back of the firebox. The water about the firebox thus moves in a circuit upward across the flue sheet, backward and downward along the crown sheets, side sheet and door sheet, and forward near the bottom of the water legs. As the water in the firebox space is evaporated more flows in from the barrel of the boiler through the openings in the baffle plate.

Among the advantages which are claimed for this device is increased rapidity of evaporation due to the constant freeing from the heating surface of the steam bubbles by the sweeping action of the water. Priming is overcome by means of the hood which directs the rush of the rising steam and water in a horizontal direction, thus making available the entire surface of the water over the crown sheet for the separation of steam with a consequent decrease in violence of ebullition at any one point. The rapid circulation of the water prevents the formation of stagnant pockets of cold water near the corners of the firebox and produces a uniform temperature at all points around the firebox, thus in a measure preventing the effects of unequal expansion and contraction of side sheets and staybolts. It is also claimed that the formation of scale is largely prevented by the rapidity of the circulation, the particles of scale-forming material collecting at the mud ring where they may be disposed of through the blow-off cock. This is borne out by experience with the system in stationary service.

This device, which is being introduced by the Q & C Company, 90 West street, New York, may be readily applied to boilers of existing locomotives whenever the tubes are removed for repairs. The baffle plates may be made in sections of any size suitable to be taken into the boiler through the dome, the parts being assembled inside the boiler before the tubes are applied.

Iron Exports from Sweden.—Iron ore heads the list of Sweden's exports. During 1913, 6,440,000 tons were exported to foreign countries, chiefly England and Germany.—*Machinery.*

Oxygen in Blast Furnace Practice.—If oxygen is added to the air-blast for a blast furnace, so that it is present to an extent of 23 per cent in the air instead of the normal 21 per cent, there is a saving of from 110 to 130 lb. in the amount of coke required to smelt a ton of iron, and the iron produced is said to be of a higher quality.—*Scientific American*



Direction of Currents Over the Crown Sheet, Ross-Schofield System of Circulation

Maintenance of Way Section

In accordance with our practice for the last three years, the maintenance of way section for January will be delayed one week in order to include a complete report of the eleventh annual convention of the American Wood Preservers' Association, which will be held in Chicago on January 19-21, 1915. This section will therefore appear in our issue of January 22 instead of January 15.

Protecting Concrete from Freezing

It was universally the practice a few years ago to discontinue concrete work at the approach of cold weather, and this is still generally the practice today. An increasing amount of such work is being carried on throughout the winter, however, as the means of protection of the green concrete from the cold are becoming more generally known. On the larger projects this subject is of sufficient importance to attract the proper amount of attention and insure reasonable precautions being taken. It is on the smaller railway work, which may be under the charge of a foreman of limited experience, that the common methods of protection are not always so well understood and greater risks are taken. It is therefore advisable for the supervisors of bridges and buildings to assure themselves that their foremen in charge of concrete work at this season of the year are thoroughly familiar with the common means of protection against the cold and the action of concrete under low temperatures. These methods are so simple and inexpensive that much work can be continued through the winter to advantage without injury to the finished work.

Unnecessary Physical Requirements

There is merit in the criticism of W. E. Schott, published in another column of this issue, regarding the physical standards set for section foremen. In view of the severe shortage of section foremen, it would appear questionable if in many cases physical standards are not emphasized to the neglect of other qualifications such as experience and ability. These standards were originally established for the examination of men in the train service where they were necessary. In too many instances they have since been extended to cover employees in other departments without proper modifications to meet the different and less severe conditions existing in those departments. As a case in point, a rodman was employed on a western road and hurriedly sent out to join an engineering party without opportunity to take the required physical examination. Two months later the company physician gave him the routine examination and found that he had only one good eye. The medical department immediately ordered the man discharged, although his work had been of such high grade that none of his associates knew of his defect. Such universal applications of standards in places where they are not necessary, work to the detriment of a road.

The Snow Problem

The most serious problem confronting the maintenance of way department for the next three months is that of keeping the tracks free from snow and ice in order to maintain uninterrupted service. Frequently little opportunity is afforded to prepare for severe storms and this work becomes of an emergency character. Under such conditions a knowledge of efficient methods is invaluable. Numerous practices of this nature have been described in our columns from time to time. In the January maintenance of way section we expect to present several descriptions of methods actually followed on different roads in preparing for winter conditions and in meeting them as they arise. We solicit other discussions of this subject from those who have had experience along this line. Such discussions should be confined to practical methods for anticipating winter conditions in advance through proper preparations the use of labor saving equipment in clearing the tracks, the organization of the forces and the proper means of caring for the men when working under extreme conditions. To be published in the January maintenance of way section, all contributions should be sent to the Engineering Editor before January 8.

THE PAST YEAR IN MAINTENANCE WORK

IN looking back over the year now closing the one feature which has characterized it from the standpoint of the maintenance of way department has been the severe retrenchment in expenditures. A comparison of these charges on 15 representative roads for the period from April 1 to September 30, inclusive, of this year, with the same period last year, shows a decrease of 10.5 per cent. As there are many items entering into maintenance of way work on which little or no retrenchment can be made, the reduction has been correspondingly greater on others. This has been especially marked with reference to the placing of new rail and ballast, and is indicated best by the fact that the steel mills have been working at very much reduced capacity during the entire season. As the traffic has not shown any marked decrease in amount, the wear on the rail now in track has been practically normal and any reduction in such items made during the past season means that they are only deferred until a later date.

The tendency toward the rolling of heavier rail sections up to 100 lb. has continued. One important eastern road has devoted extensive study to the design of a 125-lb. section which it proposes to make standard for future rolling. While this is not as heavy as the 135-lb. section used on one division of the Central Railroad of New Jersey, it is a marked advance over the weights commonly used.

Partially counteracting the retrenchment in expenditures has been the lower average wage rate for laborers. In contrast with recent years there has been an ample supply of labor throughout the season, and as a result it has been possible to secure considerably more work per dollar expended. Also the very general retardation of heavy improvement work has permitted the maintenance of way forces to concentrate their attention on their regular duties. Largely as a result of these conditions, the track as a whole is going into the winter in better shape than might otherwise be expected.

While the adoption of new materials has been generally retarded during the past year, their use has been extended on many roads. A notable example is that of the installation of 845 turnouts, with manganese frogs and guard rails throughout, at the Clearing yard, Chicago. There is also an increasing demand for labor-saving devices of all kinds.

While the more universal use of concrete in bridge and building work has been general for several years, it is meeting with a wide adoption for many small details of maintenance construction, such as fence and sign posts. Several roads have already made this form of construction standard, while an increasing number are using it experimentally.

While the past year has been one of rigid economy, the retrenchment in general has not been sufficient to seriously affect the condition of the track and structures if proper expenditures are made during the coming year. However, a period

such as we are now passing through cannot extend for any great length of time without being evidenced; and these facts become noticeable more quickly as the demands upon the track increase from year to year.

ECONOMICAL HANDLING OF MAINTENANCE OF WAY PAINTING

THE entire force of maintenance of way painters on a western road was discharged late in the fall last year, only the master painter being retained. He was then instructed to mix the paint for derails and switch targets which was sent out to be applied by the section foremen. On receipt of his consignment, one man thought it was too thick and thinned it with signal oil; another did not take the time to remove the sand from the derails; and the remainder of the foremen handled their work with about the same degree of efficiency. The net result was that all the brushes were ruined and had to be thrown away and most of the work was done again the following spring when the paint gangs were reorganized.

On account of the inexperience of the average section foreman as a painter and the natural tendency to postpone such "extra" work until there is nothing else to do, this road's experience is probably typical of the economy to be expected from the expedient of turning over small maintenance painting work to the section men. Even if the foremen could be instructed until they are competent to handle such work, under present conditions many maintenance men would oppose the plan on the ground that the proper maintenance of track should fully occupy the time of the section forces.

Another expedient frequently adopted, particularly for repair work and the priming coat on new work, is to have the paint applied by the carpenter gang. Under some circumstances this practice may be justified. When a repair job involves a small amount of painting and is located at a remote point the cost of sending a painter to handle it is out of proportion to the results secured. The priming coat on a new building should be applied as soon as possible after it is erected, and if the painter cannot reach such work at once it is better for one of the carpenters to apply it immediately than to allow the building to stand unpainted until it is convenient for a painter to reach it. In addition to the objections to having such work done by an inexperienced man, however, this system has the further disadvantage that no carpenter likes to paint and if there is any opportunity to slight the painting, he is likely to do it. The painting of the tops of girders, stringers, etc., by bridge carpenter gangs when relaying bridge ties is quite common, but this also is objectionable from the standpoint of preserving the steel, since the carpenters frequently apply the paint without proper cleaning, during unsuitable weather, or without proper brushing out.

It is important, then, for railway officers to consider whether true economy is not promoted in most cases by the employment of regular painting gangs for bridges, buildings and miscellaneous work under the maintenance of way department. The recent convention of the Maintenance of Way Master Painters' Association at Detroit passed a formal resolution after the reading of the paper on this subject, abstracted elsewhere in this issue, declaring it to be the sense of the meeting that the employment of incompetent painters is "wasteful and extravagant," and that it is the "truest economy to employ competent and trained mechanics for every class of bridge and building painting." The need for trained men is well emphasized by a study of the paper on Prevention of Paint Defects presented at the convention referred to. This particular discussion of what a competent man can accomplish in securing a lasting protective coating is suggestive as to the contrasting results that would be secured without such a man in charge.

As was brought out in the discussion following the first paper mentioned, a different class of workmen is needed on steel bridges from those employed in house painting. A house painter dislikes to "chip rust," and some experienced men who have never worked on steel "do not know black rust when they see it," as one speaker stated. A minor advantage of keeping the gangs separate is that the equipment for bridge and building painting differs considerably and a saving results if a steel gang is kept busy on steel all of the time and a building gang on buildings.

If it is granted that a force of skilled painters should be employed for the maintenance of way department, the question then arises as to how this force should be organized to be most effective. The methods in use differ considerably on various roads and the best system for a given road depends largely on the organization with which its other maintenance of way work is handled. The principal conflict of practice is between the divisional force and the general force. On some roads the stations, sign posts, wing fences, etc., are painted by a gang from some large terminal traveling over the entire road and following out a prearranged program. Such a gang can be large enough to make efficient organization possible among the members of the gang and the men can live in a car kept close to the work so that little or no time is lost in getting to and from the job. On the other hand, the local officers who are familiar with the relative needs of the buildings in their territory are able to direct the efforts of a force under their direction to better advantage and plans can be made and changed to suit conditions with much greater facility than is the case with a central force.

NEW BOOKS

Supplement to Manual of the American Railway Engineering Association, 1914. Size 6 in. by 9 in., 91 pages, illustrated, paper cover. Price $1.

In accordance with the rules for the publication of its manual, the American Railway Engineering Association has issued a third supplement to its 1911 manual. This presents concisely the amendments and addenda adopted at the annual convention in March, 1914. The entire manual will be republished in 1915.

Conventional Signs, for use on Railway Profiles, Right of Way and Track Maps and Structural Plans. Size 6 in. by 9 in., 27 pages, paper cover. Published by the American Railway Engineering Association, 900 South Michigan avenue, Chicago. Price $0.25 for single copies.

A pamphlet has just been issued containing the conventional signs for use on profiles, maps and plans, which have been adopted as standard from time to time by the American Railway Engineering Association. The occasion for the collection of these standard plates in a separate pamphlet is the specification made by the Interstate Commerce Commission, referring to maps and profiles to be used in connection with the valuation of railway property now under way, that the symbols shall be the standards recommended by the A. R. E. A. in so far as they are applicable. The magnitude of this work makes it very desirable that these signs should be available in convenient form, and in addition, the pamphlet should be found of considerable use in all drafting rooms.

Structural Design, Volume 2, Design of Simple Structures. By Horace R. Thayer, assistant professor of structural design, Carnegie Institute of Technology. Size 6 in. by 9 in., 495 pages, illustrated. Bound in cloth. Published by the D. Van Nostrand Company, New York. Price $4.

The author of this book has attempted to cover a very broad field both from a theoretical and a practical standpoint. He takes up in detail the design of plate girder bridges, steel viaducts and elevated railroads, simple riveted truss bridges, simple pin-connected bridges, steel mill buildings, high office buildings, miscellaneous buildings, standpipes and elevated tanks. The volume is the second of a series of three, the first of which treats of elementary mechanics, stresses and the mathematics on which they depend. The third volume, which is in preparation, will cover the design of advanced structures. While each of the last two volumes presupposes a knowledge of the subjects treated in the former volume, they are also prepared for independent use.

Letters to the Editor

MORE ABOUT WOOD PRESERVATIVES

Philadelphia, Pa.

To the Editor of the Railway Age Gazette:

Almost every trade journal article nowadays starts with "The present European situation." Then follow details outlining the actual, possible, probable and unlikely effects on the particular material or industry. The Forest Products Laboratory early got on the firing line with an article and told those who did not know "How the Wood Treating Industry Can Avoid Possible Injury Resulting from the War." The article by Mr. Teesdale referred to (*Railway Age Gazette*, October 23, 1914), outlines some of the recognized preservatives and processes, and mentions others which have not been accepted. Its conclusions are based in part on laboratory or experimental service tests, and while it is not fair to say they are not practical, because the man who plans and experiments is the most practical of all, they do not help materially in the present contingency. In fact, it is very doubtful if any immediate provision can be made for supplying from domestic sources the creosote formerly imported from Europe. Edison is reported to have perfected a process and had in operation a plant for the production of synthetic carbolic acid 17 days after the foreign supply was cut off. Perhaps an Edison will arise in the coal tar industry, although the maintenance of an adequate creosote supply does not depend on the building of domestic plants for its production, but on commercial conditions affecting the market for pitch and other coal tar by-products.

It is suggested by Mr. Teesdale that two courses are open "to avoid the possible result of a great reduction in the amount of timber treated." These are:

(a) The uses of substitutes for creosote.

(b) Lighter treatments where creosote must be used.

As substitutes for coal tar creosote, zinc chloride, creosote-zinc chloride mixture, creosote-crude oil mixture, wood tar creosote, and sodium fluoride are mentioned. The refined tar-creosote solution used since 1908, and in 1912 to the extent of 14 per cent of all the creosote used for tie treatment, and of wide commercial possibilities, is not mentioned for reasons which will be discussed later. The important question is what the treating plant manager is going to do who has a six weeks' creosote supply on hand and half a million sap ties in the yard which will badly deteriorate before spring. Is he going to switch to zinc chloride or sodium fluoride, and is his decision going to be based on "petri dish" experiments? It is more likely that commercial factors of plant equipment, delivered cost of available preservatives, character and ultimate use of his timber, and service results from preservatives and processes, will determine his policy. Moreover, the very conditions which curtail the creosote supply change the economic factors of plant operation. Railroads must economize, commercial plants must curtail output to the reduced demand, operating costs must be cut down, and, in short, the whole industry put on a reduced emergency basis. Therefore, to some extent the shortage in creosote is met by a reduced demand by the industry.

Zinc chloride is given as "the best known preservative that could be substituted." Its efficiency in dry situations is fully demonstrated and the effect of leaching is probably not as great as generally supposed. Definite service tests on a commercial scale are needed in wet regions, and the authentic records now available should be compiled. Low initial cost leads to the use of zinc chloride in preference to creosote and not as a substitute for it under many conditions.

It is stated that "with the prices which have prevailed, the annual charge against creosoted crossties has been less than for ones treated with zinc chloride"; also that should the price of creosote increase, "the annual charge for ties treated with zinc chloride would become the lower." These deductions are drawn from the table of annual charges in Forest Service Bulletin No. 118 and are based on the use of tie plates. The annual charge on zinc treated ties is often lower than for creosoted ones, since the mechanical life is limited in either case, and the initial cost of creosote treatment is high. On the other hand, the table bases the annual charge for creosoted ties on 10 lb. of creosote per cu. ft., which is 20 to 50 per cent more than most of the railroads are using. The New York Central, Lackawanna, Lehigh Valley, Santa Fe, Pennsylvania and others of the larger systems use an empty cell treatment which would probably average only 5 to 7 lb. per cu. ft. The comparisons drawn from such average figures mean very little, and local service conditions must be used as a basis of accurate comparisons between zinc chloride and creosote.

The unquestioned merit of the zinc chloride-creosote mixtures is mentioned, and it is mildly suggested that the present situation can be partly relieved by an increased use of such mixtures. Reading further, however, we find that the laboratory tests indicate that less than half a pound (.343 and .140 lb.) of creosote per cu. ft. of wood is enough to prevent attack by wood destroying fungi, while .312 and .468 lb. of zinc chloride per cu. ft. prevented the growth of the two fungi experimented with. The theoretical apriori deductions from these tests are, that one pound of creosote per cu. ft. of wood gives over 100 per cent margin of safety, but that the usual ½ lb. of zinc chloride injected would leave less than 10 per cent margin of safety. While the value of theoretical tests as to the amounts of preservatives required is to be strongly questioned, posterior reasoning from the above leads to the conclusion that the 3 lb. of creosote usually injected with the zinc chloride mixture would in itself be more than sufficient to protect the wood against fungus attack, presuming, of course, that it is properly distributed. We therefore have recommendations for the increased use of a preservative mixture as generally recognized and widely used, followed by theoretical conclusions which indicate that either one of the preservatives, and particularly the creosote, will be sufficient if used alone.

Another mixture recommended is that of crude oil and coal tar creosote. This is based on the high toxic properties of a small amount of creosote, the crude oil being added for its bulk and waterproofing qualities. This seems such a simple solution to the whole problem that it is passing strange every one has not applied it, particularly since we are told that the treatment by a 10 per cent creosote and 90 per cent crude oil mixture of all the timber which was creosoted in 1913 would have left a surplus of over 30 million gallons of domestic oil, and made us entirely independent of foreign oil. The one slight drawback to this plan is that the crude oil with a high asphaltic base which is suitable for such a mixture is available only in Southern California and parts of Mexico, and the item of freight to eastern points is considered by most plant managers as not making for economy. Perhaps with the Panama Canal in operation, suitable crude oil may be generally available at reasonable cost. If this is such a practicable plan, however, it seems strange that the Santa Fe, with ample crude oil supplies on its own line, and after extensive experiments with crude oil alone and in mixture with creosote, should still continue the importation of more coal tar creosote than any road in the country, and when this supply was cut off, switched to zinc chloride at its largest plant.

"Further relief could also be had by utilizing creosote from water gas tar." The wood preserving industry has been waiting for years for definite proof that creosote from water gas tar will serve the same purpose as the coal tar product. Pend-

ing final decision, the former oil has been used both openly and surreptitiously, but its use is still felt to be experimental. Sections of piling treated with a very high boiling distillate of water gas tar are reported as showing "only slight evidence of attack" after nearly two years of immersion in the Gulf of Mexico; but these forest service tests in this particular case are absolutely without value, because the water gas tar creosote fraction used was not a commercial product. The industry is keen to know whether this oil will protect against marine borers, and it is hoped that other tests of real practical value will be made. Whatever the outcome, it should be remembered that the output of water gas tar creosote is limited and that the price is not so very much less than coal tar creosote.

Refined wood tar creosote and sodium fluoride are mentioned as possible substitutes for creosote. Their use in this country, however, has been very limited, and the results are not sufficiently conclusive to justify their adoption on a commercial scale.

The refined coal tar creosote mixture is not mentioned in the Forest Products Laboratory article, yet since 1908 nearly 25 million ties have been treated with a combination of creosote oil and refined coal tar, while practically all paving blocks have been treated with such a solution since 1907. During 1912 it was estimated that about 28 million gallons of coal tar creosote solution were used, which is about 40 per cent of the total creosote consumption for that year. To ignore such a general practice and not to recommend its further use in the present emergency, or at least to mention its existence, is to leave out one of the most promising means of making the available creosote meet the demands.

The American Railway Engineering Association has recognized the existence of this practice and recommends certain precautions to be followed in the use of the solution. The refined coal tar used in such a combination should not be considered an adulterant of creosote, because it is the mother liquor from which creosote is derived, and in itself carries a considerable percentage of high boiling creosote, composed of toxic or antiseptic compounds.

The principal objections advanced against the addition of refined coal tar is that the presence of free carbon or the high viscosity retard penetration. Those objections are largely done away with by the use of tar which is refined by filtration or mechanical methods, while it is now known that free carbon particles actually enter the wood—freely in aqueous solutions, less readily when suspended in oils—(The Preservative Treatment of Wood, Bailey, Forestry Quarterly, Vol. XI, No. 1; The Use of Refined Coal Tar in the Creosoting Industry, Von Schrenk and Kammerer, Bulletin 163, American Railway Engineering Association). Definite experiments have been made which clearly indicate that a solution of coal tar and creosote oil is essentially a heavier creosote, and that the two substances combine so that it is impossible to separate them by any physical or chemical process. The evaporation from such a solution is less than from straight creosote, and the toxic properties are certainly ample to prevent the growth of wood-destroying fungi. Furthermore, tests on different kinds of pine show that when properly applied, the penetration with the solution is at least as great as with domestic and foreign creosote (Von Schrenk, Bulletin 163, American Railway Engineering Association). Furthermore, in two cylinder charges of red oak ties given identical treatment, one with straight creosote and one with 20 per cent coal tar added, the absorption from the solution averaged higher than with the straight oil.

The Forest Products Laboratory presented at the American Wood Preservers' Association meeting in 1913 a report on "Some Tests to Determine the Effect Upon Absorption and Penetration by Mixing Tar with Creosote." On the face of it this report seemed to indicate that the addition of coal tar materially retarded penetration, but analysis of the tests and conclusions clearly indicated that the equipment was entirely inadequate, that the temperatures used were too low and the relation of temperature to viscosity and its consequent effect on penetration were practically ignored. It has since been ascertained, however, that at the usual working temperatures of 180 to 200 deg. F. in the creosoting cylinders, the viscosity of the mixture is practically the same as that of straight creosote. In discussing possible means of making our available creosote supply go further, the Forest Service has entirely ignored this whole important subject, and apparently for no other reason than that their own experiments with limited temperatures and inadequate equipment did not give favorable results. If their conclusions on the other creosote substitutes mentioned—crude oil and creosote, for example—were also confined to their own laboratory experiments, there would be little that they could say one way or the other about the materials described.

The question of lighter treatments where creosote must be used is dismissed with a seven-line paragraph which makes no recommendations. Theoretical conclusions are drawn for other preservatives and processes, so why should not the tests above referred to, which indicate that half a pound of creosote per cu. ft. will prevent decay, be applied in the case of the empty cell process? To the theory can be added definite service tests for limited periods. The efficiency of reduced injections depends mainly on the thorough penetration of all sapwood and other treatable portions of a stick with the reduced quantities of oil, and any empty cell process which will not do this is worthless. It can be done commercially, and all sap ties (loblolly pine) have been given a through and through penetration with less than 2 lb. of creosote per cu. ft. It would be a real solution of the emergency which various plants are facing if they could safely reduce the creosote injection from 6 or 8 lb. to 4 or less per cu. ft. Such a policy would at least double the amount of material which could be treated by the same amount of oil, and would, beyond argument, be preferable to using the same timber untreated.

Sap ties given such light treatment would no doubt give twice as long life as untreated, and the real problem for the operator is whether to stick to creosote and reduce the injection or change entirely to zinc chloride, or to a mixture. The mineral salt promises well, but its value has not been fully demonstrated in wet regions, while in addition there is the expense at some plants of putting in the equipment to handle zinc chloride. Most of the mixtures recommended do not reduce the amount of creosote required below that which could theoretically be used in a reduced empty cell treatment, but the oil mixture in most cases would be a guarantee of longer life through the waterproofing or toxic effects of the material added to the creosote.

It may be that the present crisis will be of short duration, and certainly the wood preserving industry is not going to be put out of business by the reduction in creosote imports. The curtailed demand for treated timber, the use of mixtures and substitutes, and light impregnation, will go far towards relieving the situation. Moreover, our imports are not entirely cut off, and since the British Admiralty has not requisitioned all of the available creosote, a limited amount of English oil promises to be available so long as the British fleet maintains control of the seas. Two cargoes were en route when the war broke out and were safely delivered, and four additional shipments have been made since, with prospects of two or more cargoes to come before the end of the present year.

E. A. Sterling,
Consulting Forest and Timber Engineer.

Maintenance of Way Master Painters' Convention

Abstract of the Papers and Discussions Presented at the Meeting Held November 17-19, at Detroit, Mich.

The Maintenance of Way Master Painters' Association held its eleventh annual convention at the Hotel Tuller, Detroit, Mich., on November 17-18-19, with about 100 members and guests in attendance. The secretary's report showed an increase in membership during the past year. The officers of this association were: President, C. H. Plummer (C. R. I. & P.), Topeka, Kan.; first vice-president, F. C. Rieboldt (C. M. & St. P.), Milwaukee, Wis.; second vice-president, E. R. Cope (P. L. W.), Bloomingdale, Ohio, and secretary-treasurer, T. I. Goodwin (C. R. I. & P.), Eldon, Mo.

F. C. Rieboldt (C. M. & St. P.) read a paper on glazing in which he favored the use of beaded sash instead of putty for engine house windows, and the practice of placing the curved surface of a pane of glass toward the outside. H. B. Wilson (B. & L. E.) favored laying glass in cold weather with the curved surface down, although he thought that in warm weather it would make no difference. J. T. Lewis (Wabash) objected to the use of brads with wire glass, saying that zinc points are better.

H. B. Wilson (B. & L. E.) discussed at length the types of staging used on his line. In general, one-inch manila fall lines are provided on heavy work, even when it is low. It is found difficult to make a tie with these lines when they are new, but they become pliable after a little use. On a 150-ft. drop the tension in a one-inch line will reduce the size to 7/8 in. For stack work 3/4-in. to 1/2-in. lines are used. The staging is 24 ft. long, made of Norway pine with ash for the rungs, the sides being 6 in. deep in the middle and 4 in. at ends. On viaducts with open floors, 1 1/2-in. hooks and a 1 1/2-in. steel sling are used to support the planks. This sling cannot be cut by malicious persons or damaged by objects falling from trains. Extra large hooks are provided in the blocks. A center fall line is used to handle the center of the plank and to strengthen it.

On under span work, where there is no chance of dropping staging through the deck, the ends of two light wire cables are clamped around two column posts and a plank is supported between them. This can be moved along as needed. On through plate girder bridges the staging is hung from large hooks over the tops of the girders. If the bridge is too wide for planks, steel cables are run across to carry them, although planks as long as 38 ft. are used. When there is a railing on the bridge, a set of angles is used which hang over the top of the railing.

F. C. Rieboldt (C. M. & St. P.) did not think that the use of one-inch rope for staging would be safe. A. B. Phelps (L. S. & M. S.) stated that on his road light chains with a grab hook on one end and a ring on the other are used, the plank being supported on two-inch gas pipe. Martin Kane (D. & H.) favored the use of 5/8-in. chains, and F. A. Higgins (L. S. & M. S.), W. H. Clark (C. & N. W.), and T. I. Goodwin (C. R. I. & P.), also reported the use of chains. Mr. Wilson objected to the use of chains on the ground that there is danger of weak links existing without being discovered.

A stereopticon lecture on Fire Retardant Paint was delivered by H. A. Gardner of the Institute of Industrial Research, Washington, D. C. He reported tests which are being made on the feasibility of painting woods that have been made fire retardant by treatment with salts such as zinc chloride or ammonium chloride. There is no indication as yet that such woods cannot be satisfactorily painted. Numerous tests are being made on the effects of various stains and paints on the fire resisting quality of shingles. Creosote stains, which are frequently used, are found to increase the flammability of the wood, while paints containing zinc, lead and iron oxide retard the burning very materially. Silicate of soda also retards burning but will not wear outdoors. Any good oil paint will resist fire and will wear well outdoors.

A paper on Test Paint on Water Tanks was read by Bert E. Darrow (A. T. & S. F.). He reported that as a member of a committee to test paint on the interior of steel water tanks he applied four kinds of paint, which had previously been used on the outside of tanks, to the interior of tanks filled with treated water. In one month the paint commenced to blister and at the end of four months it was entirely gone. He was of the opinion that no paint will stand in water treated with soda and lime. His company has discontinued the painting of the inside of tanks except the two top sheets. He recommended that tanks holding untreated water be given three coats of some good paint, the first coat to dry at least four days, the second coat two days and the third coat a week before the tank is filled with water.

A paper on Membranous Waterproofing was read by William B. Jenkins of the Billings-Chapin Company, Cleveland, Ohio.

Other topics discussed on the floor included, Priming and Patchwork Done by Carpenter Gangs; Making Estimates on Bridge Painting; The Economy of the Use of Putty on Roundhouse Windows; Sanitary Conditions Around Bunk Cars, and the Best Method of Enameling Woodwork.

In the closing business session a committee was appointed to investigate the practice of enginemen blowing off water treated with soda and lime on steel bridges, leaving the structures coated with a white substance resembling whitewash and severely injuring the paint. A new by-law was adopted by the association providing that no paper read before a convention or discussion made on the floor shall mention the name of manufacturers or brands of material. The same officers were re-elected for another year, and it was decided that the next convention should be held October 19-20-21, at St. Louis, Mo.

INTERIOR WALL FINISHES AND PAINTING OF CONCRETE

By W. R. Parker
John Lucas & Co., Inc., Chicago.

Of the interior wall finishes developed during the past ten years none quite equals in importance the flat finishes, which produce a coating that can be washed and scrubbed without injury. They can be applied over plaster, paper, wood, metal, burlap, canvas, cement or concrete. Different kinds of surfaces require different treatment in order to obtain the best results. Newly plastered or green cement walls, which are damp, and where free lime is still present on the surface, require a zinc sulphate wash. This zinc sulphate solution is prepared by dissolving about three pounds of zinc sulphate crystals in a gallon of water. The solution should be applied from 24 to 48 hours before the first coat of paint, thus allowing the surface to dry out as much as possible and also to obtain the full benefit of the neutralizing properties of the solution. All dirt and grease should be removed from the wall before painting. It is advisable to go over the surface with a stiff brush or broom in order to remove all loosely adhering particles.

Plastered cement walls, which are dry, and which have not been previously finished, make necessary the reduction of paint for the first coat in order to stop up the suction of the surface. Boiled linseed oil should be used as a reducer. The amount of reduction necessary will depend entirely upon the character of the surface to be painted, and will vary from one to two quarts of boiled linseed oil to the gallon of paint.

There are two distinct reasons for treating concrete surfaces, namely, to preserve the structure against forces which exert deteriorating influences, and to improve the appearance. Al-

though quite generally the greatest stress is placed upon the decorative properties, the fact remains that proper coatings impart protection which annually amounts to millions of dollars. Unfortunately, in obtaining the desired decoration, frequently at the lowest possible cost, the proper methods of application in order to insure the maximum protection are sadly neglected.

For the reason that lime has a saponifying action on oils, and furthermore in cognizance of the fact that all cement and concrete construction contains alkali in varying amounts, the first matter to consider is how to treat surfaces in order to either eliminate this material by neutralizing it, or in some manner to keep it from exerting its harmful influence on the vehicle portion of the paint which is to be applied. A treatment which has for its object the elimination of whatever free alkali is present on and near the surface in many instances proves injurious to the structure. The use of mineral acids, while neutralizing the lime, will detract from the life of concrete construction. Solutions of materials which change the lime to insoluble salts, which do not act on oils, have been suggested from time to time, and have been used with varying success. What is known as the Macnichol zinc sulphate treatment has proven very successful for the treatment of interior walls before applying prepared flat wall finishes or other coatings. It is very generally recommended, and its satisfactory character is based on the reaction which changes the free lime to the sulphate form, the latter possessing no saponifying action on the thinner of the paint which is subsequently applied. This treatment has given excellent results on walls which are free from permeation. On walls, however, through which moisture forces its way, the soluble salts present throughout are dissolved and brought to the surface, where they give rise to such undesirable conditions as staining, etc., and upon the evaporation of the moisture, efflorescence develops.

Up to the present time the most satisfactory results are obtained by the use of a thin, varnish-like mixture, specially adapted for the work. This filler, as it is more correctly called, is practically a wash which penetrates into the concrete and prevents whatever action alkali would have on the oil paint coats which are to follow. Capillarity is destroyed by the oxidized film, which forms upon drying. This makes the passage of moisture through the paint coat impossible, and therefore represents the greatest benefit derived from this treatment. It is possible to apply paints ordinarily used on wood over the filler with assurance of equally satisfactory results, the number of coats it is advisable to apply and the method of application being practically the same.

As is the case in other painting, one of the most important factors in connection with good service consists in the proper preparation of the surface to be coated and the correct application of the material. Before applying the filler, all dust and loosely adhering particles should be brushed away. Surfaces which have grease or oil adhering to them must be carefully washed with benzine, turpentine or benzol before applying the filler, or otherwise it cannot properly perform its functions, and the paint coat will break away in the form of "scaling," because of lack of penetration.

Because of the tendency that concrete has for holding moisture, it is not advisable to use water in cleaning surfaces, because any paint coat applied over surfaces containing moisture will most likely result in "peeling." Wherever possible, the surface to be coated should be allowed to stand from three to five weeks in order to give it time to dry out. The undesirable effects obtained by the presence of alkali in the concrete are also lessened when the surface is allowed to stand for some time.

When applying the "filler" care should be exercised not to obtain a varnish or gloss surface, as this will hinder the succeeding paint coat from obtaining the necessary penetration. If the surface to be treated is very hard and smooth, as is the case in cement finishes, it is frequently necessary to go over it thoroughly with a stiff wire brush, otherwise the penetration may not be sufficient to allow the paint coat to obtain a firm hold within the concrete. When properly applied the filler penetrates into the concrete, and when dry nothing would indicate its application but a slightly brightened appearance. Gloss should not be perceptible.

One of the most undesirable features connected with concrete floors is the continual "dusting" which is caused by the natural grinding action of wear on the surface. Wherever the floor is subjected to hard usage the "dust" may, besides becoming a source of irritation, prove injurious to health. The "dust" adheres so firmly to the surface of the untreated floors that it is impossible to remove it. Sweeping tends only to aggravate, to a certain extent, the tendency to "powder," as many small particles are loosened or torn away. The floor is made sanitary by painting, because it can be kept clean and free from dust and dirt. All opportunity for "powdering" is overcome by the thin film of paint, which, when properly applied, has a firm hold within the mass of concrete, and, besides eliminating the possibility of surface wear, makes an impervious coating which prevents the absorption of moisture.

In applying the paint two factors must be given careful attention. While the pigment is a requisite of considerable importance, the vehicle will, in almost every instance, determine the wearing properties. Floors are subject to hard usage and must stand severe strains. It is necessary therefore to use a material which will oxidize to a dry film and which will retain sufficient elasticity to withstand the strains to which it is exposed. Ordinary floor paints, which prove satisfactory when used over wood, give like results when used over a properly applied filler. The wear closely resembles that found on a wooden floor. The paint coat invariably possesses better bonds within the concrete and the service in many cases is superior to that obtained from the same paint applied on wood.

Natural wear will gradually make necessary the repainting of floors. It is not necessary to again apply a filler. One coat of paint brushed out well gives the best results. In preparing the surface for repainting no strong alkali should be used for cleaning, as it will not only act upon the paint, but if not thoroughly removed will also affect the following coat. It is advisable to go over the surface with warm water and soap and allow sufficient time to elapse for drying.

PAINTING DEFECTS, THEIR CAUSES AND PREVENTION

By G. W. Thompson
Chemist, National Lead Company

So much has been written connecting painting defects with materials used, the writer proposes in this paper to show how paint defects may in many cases be corrected without radical change in the materials used. One cannot, of course, ignore the materials, but one can seek to find out to what extent such a defect may be the result of the condition of the surface painted, the proportioning of the materials, the application of these materials, the time allowed between coats, etc. No paint material is perfect, but if it is to be commercially judged in comparison with other paint materials, it should be judged at its best and not at its worst.

CHECKING AND ALLIGATORING

Checking and alligatoring consist in the development of fine interlacing lines on the surface of a paint. Lines embracing small areas are called checks, and large ones, alligatoring. These phenomena are closely related and are probably due to the same general cause.

The outer coats of varnish and paint always tend to shrink greatly in volume and to become progressively harder and more coherent, thus producing either of two possible effects. One is the rupturing of this outer coat with consequent alligatoring or checking; the other is that the outer coat becomes thinner without rupturing. Which of these effects occurs depends upon the under coat. If it is soft, the outer coat in oxidizing and shrinking will draw up and slip over it with consequent rupturing. If the under coat is sufficiently hard, the outer coat does not slip

over it and simply becomes thinner by shrinkage and no rupturing occurs. Alligatoring also occurs whenever a paint is applied over another paint that inherently will not dry hard, as in the case of a harder paint applied over an asphaltum or a yellow ochre paint. Very extreme examples of checking or alligatoring occur where a non-volatile mineral oil has been used in an under coat.

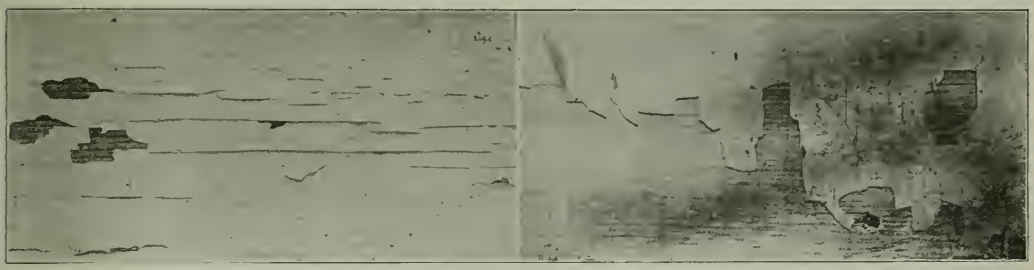
In order to avoid checking and alligatoring, it is best to have the under coats as hard as is practicable, much harder than the outer coats. It should not be assumed, however, that in all cases checking is an unmixed evil. In some cases checking may be the lesser of two evils, one of which is necessary. When a paint film has so great a tensile strength that it will not check, trouble is apt to ensue with the expansion and contraction of the foundation on which such a paint film is applied. If the foundation expands or contracts more than the film, the latter is sure to break loose, and the result is scaling. This would be a more serious defect than checking, and the competent painter must use his judgment in some cases to choose between the two.

It is important to point out that no materials should be used in the foundation coats which will not harden sufficiently or which cannot be made to harden by the addition of other materials. Such materials include all asphaltum, tar or bituminous materials, mineral oils which are not completely volatile, and such resinous products as resin oil, which harden too slowly to give good results. In all paints a drying oil is used. The drying oil should have in a high degree the power of being oxidized into a solid substance. Linseed oil is the principal material used by painters for this purpose, and the use of substitutes which are liable to be deficient in this respect should be carefully avoided. It is also important that those pigments which retard the drying or hardening of priming coats should not be used in excess. This refers particularly to lampblack and yellow ochre. On the other hand, pigments which assist in the drying and hardening of under coats should be used as far as is practicable.

Although drying oils are essential in paint for the prevention of checking and alligatoring, no more drying oil should be used in the foundation coats than is necessary for the filling in of the pores of the priming coat and the proper binding of the particles of pigment together in the body coat. By so doing two things are accomplished; one is that the natural hardness of the coating is increased by the increase in proportion of pigment, and the other is that, less oil being used, it takes less time to bring it to a fit condition for the reception of the other coats. Probably the most important thing to do in the avoidance of checking and alligatoring is to allow as much time as possible between the coats.

CRACKING AND SCALING

It would appear that cracking and scaling are closely related, that is, that in many cases scaling naturally follows cracking.

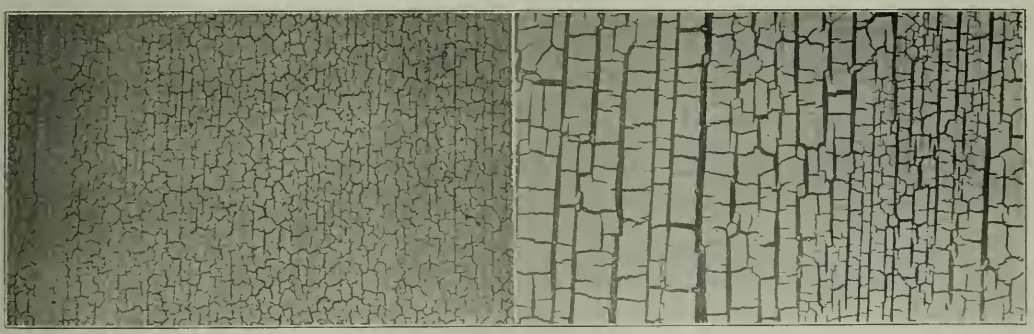


Longitudinal and Transverse Cracking with Consequent Scaling

By cracking we refer to the formation of hair-like lines on the surface, which an examination shows extend from the surface practically through the paint layer down to the foundation. In this respect cracking differs from checking or alligatoring. The areas included by the cracks are usually relatively large, although not necessarily so.

In case the painted object is wood, the cracks may be at right angles to or parallel with the grain of the wood. Wood is porous, containing at all times more or less free moisture. It has been found experimentally that in the drying out of wood, the greatest contraction takes place at right angles to the grain. The structure of wood is largely fibrous, the fibres running mostly with the grain. Free water or moisture in the wood is probably located between the fibres. This water forces the fibres apart. As the water dries out, the fibres come closer together, producing contraction across the grain. It would appear also that the variation of the amount of water in wood shows very little tendency to affect the length of the fibres, and so produce contraction and expansion parallel with the grain.

At the same time the paint contracts both across and with the grain. Consequently if the paint contracts less than the wood



Typical Checking and Alligatoring Caused by the Use of Ochre Priming

there will be a bulging and cracking of the paint with the grain. The contraction of the paint with the grain will not be compensated by a similar contraction of the wood, and cracks may appear, the lines of the cracking showing across the grain.

Cracks, as we have referred to them, extend down to the wood. As soon as cracks occur, there is an opportunity for moisture to enter the wood. This moisture, entering by the cracks, travels under the paint film, exerts a pressure against the paint film, the bond between the paint film and the wood is weakened, and scaling results. It seems to the writer that there is a difference between peeling and scaling. Both are due to moisture forcing the paint film away from the wood. Peeling, however, is due to the presence of moisture under an unbroken paint film in the wood or back of the wood, which forces the paint away from the wood. But in the case of scaling the moisture enters through the cracks.

It is to be noted that as a rule cracking and scaling take place most often when the paint film is thick. The thicker the paint film, the greater its tensile strength, therefore it does not conform as readily to the changes in the shape of the wood. One method of prevention is to avoid the accumulation of paint coats upon a surface. If the surface needs repainting, as much of the old paint should be sandpapered off as is necessary, provided, of course, it is too thick, and the new coats of paint applied should be comparatively thin. This refers particularly to paints which are naturally inclined to crack and scale. It is obvious, of course, that those pigments which give hard, strong and contracting coats, should be used only in moderation. Cracking and scaling can be avoided to some extent by having the wood thoroughly dry and contracted before painting.

BLISTERING AND PEELING

Blistering and peeling are due to the water in wood forcing its way through the wood to the surface, breaking the bond of the paint and forcing it away from the surface. Blistering is very apt to occur where moist painted wood is subjected to heat such as the heat of a radiator. Sometimes the heat of the sun is sufficient to increase the vapor pressure of the water enough to produce blistering.

Blistering and peeling are more apt to occur if a very impermeable paint is used. Painters sometimes complain that boiled linseed oil gives a more impermeable paint. The one safe method of preventing blistering is to remove the cause, that is, the moisture in or back of the wood. If one is in doubt as to the condition of wood for painting, the best practice is to allow considerable time after the priming coat has been put on before applying the body coat.

LOSS OF GLOSS AND CHALKING.

Chalking follows loss of gloss and is probably produced by the same general cause. Gloss is due to an excess of oil or binding material, which, lying over the particles of pigment, gives a smooth, even, glass-like surface. The binding material in paints, whether it is linseed oil or varnish, is an organic substance which is subject to fairly rapid destruction when exposed to the influence of air, moisture and sunlight. Loss of gloss is due to this destruction, and it would appear that the chalking of paint is but a step further in this destructive action, whereby the binding material is destroyed, and the pigment becomes loosened on the surface.

Chalking is objectionable principally because of the tendency of the pigment to come off when touched. It must not be overlooked, however, that some kind of paint decay is inevitable and a certain amount of chalking, that is, loss in thickness of coating, is therefore the least objectionable form of decay. If this loss in thickness does not occur, the result on continued repainting will be the production of so thick a coat of paint that scaling is apt to follow. Chalking, as it ordinarily occurs, has a further redeeming quality in that it nearly always leaves on the surface a roughness, usually called a tooth, which is favorable to repainting.

For the prevention of chalking and loss of gloss, it is evident that what is desired is a vehicle which can be used on the surface of paints that will be less destructible than what is ordinarily used. I regret that there is no such material that can be unqualifiedly recommended. Therefore, if chalking is a defect, it is not an unmitigated evil, nor is it one that can readily be avoided without other more serious defects arising.

WASHING

The washing of paint is characterized by the surface of the paint giving up certain water soluble substances. Apparently washing takes place when a paint contains such substances, or when they are formed either through a reaction of the constituents of the air upon the pigment or a reaction between the pigment and the binding material. For the prevention of washing, omitting any reference to the avoidance of the use of those pigments most inclined to wash, the only thing that I can say is what I have already said in the case of chalking.

SPOTTING AND DISCOLORATION

In the spotting of paint, the following characteristics are noted. The spots, which may be small or large, are much lighter in color than the remainder of the paint. Such spots show greater chalking than the body of the paint. Moistened with linseed oil, the spots return to practically the original color of the paint, indicating that there has been no destruction of the tinting material, and indicating also that at these spots there had been some excessive destruction or loss of the oil which was originally present.

The most common cause of spotting is that the wood at the points where spotting occurs was not completely filled by the priming or body coats. It is to be avoided then by the proper filling of the pores of the wood, and by allowing sufficient time between coats for weaknesses to develop that can be corrected by subsequent coats. It will be avoided to some extent by the competent workman using a stiff brush for the under coats, thereby forcing the paint into the wood.

There are two known causes of yellowing of paint out-of-doors. One is the presence of heavy mineral oil, and the other is the presence of alkalies or alkaline materials. The prevention of such discoloration depends on the avoidance of such materials. The cause of the yellowing of paint indoors is variously explained, but the one explanation which seems most satisfactory is that it is caused by ammonia which is more or less present in the atmosphere. The prevention of this yellowing is to have good ventilation, good light, avoid the presence of excessive quantities of ammonia in the atmosphere, and protect the paint as far as practicable by varnish coatings wherever such a treatment is necessary.

Discoloration of paint due to dirt is a defect for which the painter sometimes feels he is not to blame. There still remains the fact, however, that paint will sometimes become dirty more rapidly than exterior conditions would seem to warrant. The conditions favorable to dirt becoming attached to paint are softness and elasticity, which the painter naturally thinks are the best for the paint. The obvious method for the prevention of this discoloration of paint is the use of harder coats, obtained either by cutting down the amount of oil in the paint, or by the use of those pigments which tend to harden the paint. If, however, the painter secures hard coats of paint to prevent discoloration, he may run into the trouble of cracking and scaling.

Discoloration of paint on account of mildew is rather uncommon in the North, but is fairly common in the South. Experiments indicate that it is killed by the presence of very small quantities of mercury compounds and can therefore be prevented by a minute percentage of mercurous chloride added to the paint. It is also prevented to some extent by the use of paint which forms a hard coating and by the use of the best quality of linseed oil.

Discoloration due to the presence of sulphur compounds

occurs with those paints containing lead pigments. Sometimes this discoloration is due to the intentional or accidental presence in a paint of small amounts of sulphides of the other metals, particularly sulphide of zinc, which may be contained in lithopone to the extent of 30 per cent. The discoloration of lead compounds due to sulphur compounds in the air is not common.

THE ECONOMY OF SKILLED MECHANICS

By Edward Hurst Brown
The Painters' Magazine

It might seem strange to a master painter that any question should be raised as to the economy of skilled mechanics if he did not know from every day experience that a large proportion of railroad officers either overlook the fact or do not realize that it requires skill to properly apply paint to obtain its full protective value and the greatest possible durability.

Too many engineers pay particular attention to the quality of the paint and little or none to the skill of the painter. This is a very mistaken notion, for the good mechanic will produce a reasonably satisfactory job of painting with poor materials, while the poor mechanic or the "handy man" will produce unsatisfactory results with the very best materials. It has often been said that satisfactory results in painting depend on "25 per cent material and 75 per cent man," and this does not over state the case. Some engineers admit that the good mechanic may be necessary in painting a station or varnishing the hardwood finish of a waiting room, but seem to believe that any men you can pick up are good enough to do bridge painting or other rough work. It is possible that there may be certain classes of rough work, such as whitewashing sheds, that need so little skill that the "handy man" can be utilized to advantage, though even in such cases, I believe that the man who has been trained to use his brush can accomplish so much more work that it is economical to employ him.

When it comes to painting structural iron or steel, there can be no greater mistake than the employment of cheap labor. An examination of the painting done on a bridge by a crew of "slushers" will show runs, sags, "holidays," and spots of rust that soon begin to show, because these so-called painters have not been impressed with the necessity for the removal of every particle of rust before the paint is applied.

The difficulty in getting satisfactory shop painting is explained largely by the fact that the work is often done by cheap, foreign laborers who have never been taught to handle a brush and whose only thought is to smear over the surface in the easiest possible way. They are too ignorant to understand anything about the real mission of the paint they are applying and so long as they cover up the metal with a red wash they are satisfied. The worst feature of painting of this kind, done over rust and shop scale, is that it affords no satisfactory foundation for subsequent paint coats, no matter how carefully they may be applied, and the protective value of the paint is minimized by the mistaken economy of employing cheap and unskilled laborers to put on the shop or priming coat.

An engineer may be told that paint needs to be tempered to suit the temperature, the weather conditions and the surface to which it is to be applied, but the idea that such tempering—a variation in the proportion of turpentine or other volatile thinners or the quantity of driers to be employed—can be safely left to the practical mechanic who is working on the job seems to be beyond his comprehension, especially when the paint has been made in accordance with a formula furnished by the company's chemist. Nevertheless, it is a fact that the skilled painter is better able to determine the proportion of thinners and of driers than the chemist who has never had any experience in actual paint mixing, or who has never learned to handle a brush. The practical painter, by long experience, has learned to judge by the feel of the paint as it spreads out under the brush; he has learned to judge the weather and to make allowances for a greater or less amount of moisture, or to vary his paint to suit the temperature. A skilled mechanic can paint in zero weather, so long as the surface is free from frost and is dry, and he will obtain as durable and satisfactory a job as he could produce in warm weather, for he will know enough to add turpentine to make the paint flow out more freely and to correct the thickening tendency of the cold weather, while at the same time he will depend upon "elbow grease" brushing out the paint into thin coats, rather than upon an excess of driers, to produce a firm and solid paint coating.

Painting requires more technical skill than almost any other trade, yet this fact is not recognized because of the mistaken idea fostered by the advertisements of the makers of household paints that "any one can paint." In these days when efficiency is the aim in all departments of a railroad, it would be well if the officers would recognize that only by the employment of skilled mechanics can satisfactory, durable and economical painting be done. They must remember that there is a dearth of skilled painters in this country today, and they cannot expect to hire them for the same wages that they can obtain unskilled labor, but the skilled painter can accomplish so much more work in a day and the value of the work he does will be so much greater in protective efficiency that the higher wage rate will be the most economical in the end.

COMPUTATION OF CROSS SECTION AREAS

In view of the large amount of cross sectioning of roadbed that is required in the federal valuation of railways, now under way, the method which is being used on the San Pedro, Los Angeles & Salt Lake for computing these areas in accordance with the standard method of recording notes in use by the Federal Board may be of interest to other engineers. The government parties take their notes as shown on the accompanying plan with the 0.0 points at the shoulders, showing the side heights at the toe of slope and the distance out. Referring to the sketch, the area of the section is equal to $\frac{(C+B)\,H+(D+A)\,H_1}{2}$.

A is equal to B when the roadbed is of uniform width on both sides of the center line. As an example, when the roadbed

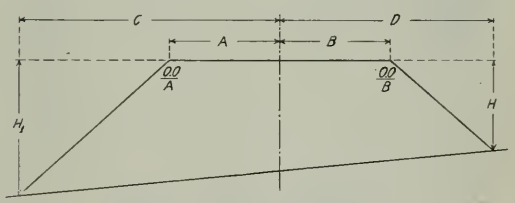


Diagram of Roadbed Cross Section

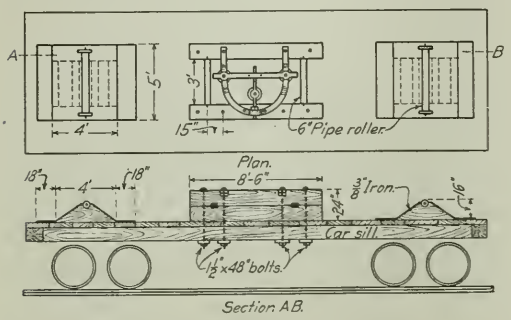
width is 18 ft., 9 ft. on each side of the center line of track; when H is equal to 4 ft.; H_1, 6 ft.; C, 18 ft.; and D, 15 ft.; the area is equal to $\frac{(18+9)\,4+(15+9)\,6}{2}$ which is equivalent to $\frac{27\times 4+24\times 6}{2}$ or 126 sq. ft. This method is applicable to prisms in cuts and fills for any widths of roadbed on either side of the center line. Our attention was called to the above method by M. E. Thompson, assistant engineer, and Arthur Maguire, chief engineer, of the Salt Lake line.

CURVING RAIL WITH POWER BENDER

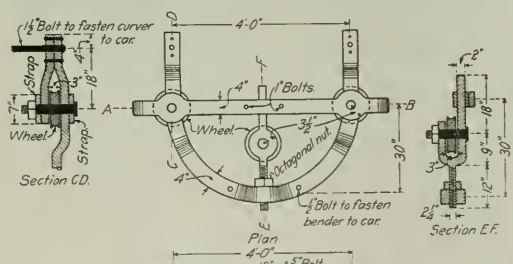
The Baltimore & Ohio uses a power bender whenever it is necessary to curve a large number of rails, although on this road curves up to 4 deg. are laid with straight rails. The curver is mounted on a flat car and the rails are pulled through it from another flat car to a car on which they are stored or from which they are distributed on the ground for laying. Either a locomotive or a hoisting engine mounted on another car can be used for the power.

The curver is of the common type, consisting of a semi-circular steel yoke, a strap connecting the jaws of the yoke



Method of Mounting Rail Curver on a Flat Car

and a plunger between the yoke and the strap, the position of which can be regulated by a threaded end passing through the yoke and a nut abutting against the yoke. The curving is produced by the three wheels, two of which are located at the intersections of the strap and the yoke, and the third is carried by the plunger. The rails are pulled between these wheels, the amount of curve produced being regulated by the position of the plunger. The jaws of the yoke are 4 ft. apart, and the wheels are 10 in. in diameter. The curver is mounted on two 12-in. by 12-in. timbers and is securely fastened to the flat car body through these timbers by 1½-in. bolts. The rails are



Details of Rail Curver Used on the Baltimore & Ohio

guided through the curver by 6-in. pipe rollers, mounted one on each side of the curver and one near each end of the car, the elevation of these rollers being so adjusted that the rail will enter the wheels of the curver properly.

It has been found that with this machine and an engine, operated by eight men and a foreman, 20 rails can be curved per hour, or 200 a day, at an expense of about $40 or $0.20 for a 33-ft. rail. Flat cars are ordinarily used, although the same method of operation would be possible with drop-end gondolas or stock cars. If it was necessary to curve a great deal of rail, it would be more economical to use a platform with a hoist to unload and load the rails and a hoisting engine with three drums and cables to pull the rails through the curver. It is thought that with this equipment the cost could be reduced to $0.10 a rail. The principal difficulty that has been experienced is to get a hook small enough and at the same time strong enough to pull the end of the rail through the rollers at the start.

When curving large quantities of rail, continuous operation with this machine would be possible by using a gondola car in which the straight rail is shipped, a short car with an air unloader, an empty flat car, a flat car on which the curver is mounted, another empty flat car and a flat car on which a hoisting engine is mounted. The locomotive could be placed on either end. With this outfit the air unloader could pick up a rail from the gondola, and swing it around to the empty flat car; the hoisting engine could then pull it through the curver to the other empty flat car, from which it could be unloaded on the track. By providing a trough or slide of channel iron along this empty flat car, the rails could be unloaded easily and safely by throwing the hoisting cable over a pulley on the corner of the car on which the hoisting engine is mounted so that the rail would be pulled out by the cable with a little assistance with a bar.

BRIDGE AND BUILDING ASSOCIATION COMMITTEE APPOINTMENTS

The following committees have been appointed by the president of the American Railway Bridge & Building Association for the coming year:

Conditions Under Which Pile and Timber Trestle Bridges Should Be Repaired, Reinforced, Renewed or Replaced. A. B. McVay, chairman (L. & N.), Evansville, Ind.; C. E. Smith (M. P.), St. Louis, Mo.; F. G. Jonah (St. L. & S. F.), St. Louis, Mo.; S. T. Corey (C. R. I. & P.), Chicago; J. J. Taylor (K. C. S.), Texarkana, Tex.; E. J. Auge (C. M. & St. P.), Wells, Minn.; A. J. James (A. T. & S. F.), Topeka, Kan., and S. C. Tanner (B. & O.), Baltimore, Md.

Railway Water Tanks. C. R. Knowles, chairman (I. C.), Chicago; A. A. Wolf (C. M. & St. P.), Milwaukee, Wis.; O. M. Suter (I. C.), Chicago; T. J. Stuart (W. P.), Elko, Nev.; Jas. Dupree (C. T. H. & S. E.), Chicago; A. C. Sydell (C. B. & Q.), Chicago, and F. M. Case (C. & N. W.), Belle Plaine, Ia.

Coaling Stations. Lee Jutton, chairman (C. & N. W.), Madison, Wis.; W. T. Krausch (C. B. & Q.), Chicago; Grosvenor Aldrich (N. Y. N. H. & H.), Boston, Mass.; B. F. Pickering (B. & M.), Salem, Mass.; J. L. Talbott (A. T. & S. F.), Pueblo, Col.; A. W. Pauba (Colo. & So.), Denver, Col.; G. A. Manthey (M. St. P. & S. S. M.), Minneapolis, Minn., and William Mahan (W. & L. E.), Canton, Ohio.

Costs of Structures. G. A. Rodman, chairman (N. Y. N. H. & H.), New Haven, Conn.; F. E. Weise (C. M. & St. P.), Chicago; J. H. Nuelle (N. Y. O. & W.), Middletown, N. Y.; J. S. Robinson (C. & N. W.), Chicago; R. C. Sattley (C. R. I. & P.), Chicago; C. W. Wright (L. I.), Jamaica, N. Y., and W. A. Pettis (N. Y. C. & H. R.), Rochester, N. Y.

Efficient Methods of Handling Work and Men. G. W. Rear, chairman (S. P.), San Francisco, Cal.; J. F. Pinson (C. M. & St. P.), Seattle, Wash.; E. R. Wenner (L. V.), Ashley, Pa.; C. R. Knowles (I. C.), Chicago; R. H. Reid (L. S. & M. S.), Cleveland, Ohio; H. A. Horning (M. C.), Jackson, Mich., and S. C. Tanner (B. & O.), Baltimore, Md.

Warnings for Overhead and Side Obstructions. E. G. Storck, chairman (P. & R.), Philadelphia, Pa.; M. M. Barton (P. R. R.), West Philadelphia, Pa.; F. E. Schall (L. V.), South Bethlehem, Pa.; T. E. Thomas (B. & O.), Wilmington, Del., and E. S. Meloy (C. M. & St. P.), Chicago.

Reinforced Concrete Bridge Work. O. F. Dalstrom, chairman (C. & N. W.), Chicago; I. L. Simmons (C. R. I. & P.), Chicago; J. A. Bohland (G. N.), St. Paul, Minn.; C. J. Scribner (C. B. & Q.), Chicago; D. C. Zook (P. L. W. of P.), Ft. Wayne, Ind., and T. J. Stuart (W. P.), Elko, Nev.

Station Buildings for Passenger Service. M. A. Long, chairman (B. & O.), Baltimore, Md.; E. B. Ashby (L. V.), New York City; G. W. Andrews (B. & O.), Baltimore, Md.; K. Peabody (N. Y. C. & H. R.), New York City; R. McKibben (P. R. R.), Altoona, Pa., and W. T. Krausch (C. B. & Q.), Chicago.

Concrete Culvert Pipe and Concrete Piles. H. Rettinghouse, chairman (C. St. P. M. & O.), St. Paul, Minn.; S. T. Corey (C. R. I. & P.), Chicago; G. H. Stewart (B. R. & P.), East Salamanca, N. Y., and C. F. Urbutt (C. M. & St. P.), Chicago.

TUNNEL LINING BY COMPRESSED AIR

The compressed air method of mixing and placing concrete which was described in the *Railway Age Gazette* of March 18, 1914, is being used at present on a number of railways for the lining of tunnels and similar construction work. In addition to the Chicago, Burlington & Quincy tunnel at Bonneville, Wyo., on the Thermopolis-Orin Junction extension, this method has been adopted for lining a double-track tunnel on the Louisville & Nashville, about 65 miles south of Nashville on a relocated line extending to Athens; for three tunnels recently completed in realinement work on the Oil City branch of the Pennsylvania Lines; and for placing about 100,000 cu. yd. in retaining walls, etc., for the Northern Pacific track elevation work at Spokane, Wash. An interesting use of this method which shows its possibilities has also been developed in the construction of a sewer tunnel at Memphis, Tenn., which is being built under pressure. In this case the machine is located outside of the tunnel and the pipe is carried through the lock into the forms. The only change necessary in the operation of the machine in this case is an increase in the air pressure at the mixer equal to the pressure maintained in the tunnel.

The Louisville & Nashville tunnel, on which work has just been started, is 1,600 ft. long, one track being used by the operating department and the space for the other being utilized for construction. Two sets of traveling Blaw steel forms 35 ft. long are being used to place the lining and all concrete will be supplied by one pneumatic mixer and conveyor located at the portal. One of the forms will first be placed 800 ft. from the portal or at the center of the tunnel, and the other form 400 ft. from the portal. They will then be filled alternately through a pipe from the mixer and gradually moved toward the portal. The other half of the tunnel will then be handled from the opposite portal in the same way. The Pennsylvania tunnels are also being lined by pneumatic mixers located at the portal, the contractor in this case, however, using separate wooden side wall and arch forms. Several of the machines mounted on cars, are being used in the Spokane track elevation work, which has only recently been placed under contract.

The Burlington tunnel referred to above is 800 ft. long and was excavated about a year ago in rather treacherous sandstone which required timbering throughout its length. This line is in operation while traffic is being handled on a temporary line over the summit, pending the completion of the permanent lining in the tunnel and the excavation of the west approach cut.

The work of lining the tunnel consists of three operations, first, the removal of the timbers; second, the erection of the Blaw steel forms, and third, the mixing and placing of the concrete. The timbers are pulled down by a dinky engine attached to cables running through snatch blocks located in the center of the track, to the bottoms of the uprights. When the posts are pulled out, the roof falls, after which the debris is cleared away and loose rock is picked down to insure the safety of the men erecting the forms. To further protect the men, planks are laid from the remaining timbers to the concrete, so that in case any small pieces of rock should fall they will be caught on these planks, or if a large rock should come loose it will be impeded by the planks and will give warning in time to permit the men to get out of the way. The amount of timber taken down at one time depends upon the apparent safety of the rock above and varies from 5 to 20 ft.

The erection of the forms consists of placing a steel channel rib which fits the section of the tunnel, and connecting it with the last rib by means of steel plates 4 ft. long and 3 ft. high. These plates are built up solid to the top of the arch, as the fact that the concrete is placed by the compressed air method permits the forms to be built complete before concreting begins. The steel ribs of the forms are 4 ft. apart, corresponding to the length of the plates, and from one to five sections are set up at a time, depending upon the character of the rock.

The mixing and placing outfit consists of a pneumatic concrete mixer and conveyor mounted upon a 40-ft. flat car, equipped with bins holding 26 cu. yd. of material. The cement is stored in bags under one of the bins and discharged toward the center of the car through chutes into a measuring hopper. This measuring hopper is lifted and tilted automatically to discharge into the pneumatic mixer. The lifting device consists merely of a 6-in. air cylinder. The 8-in. delivery pipe leads from the mixer under the car and vertically up at the end to the crown of the arch, where a 90-deg. elbow enters through the bulkhead of the form. Air is supplied from a compressor at the mouth of the tunnel through a 4-in. main laid on brackets fastened to the timber posts and a connection can be made at any point from the main to the air receiver on the car by means of a hose. This car was completely described in the issue of March 18, 1914.

The proper sized compressor to run a portable outfit of this kind is about 300 cu. ft. capacity of free air per minute, compressed to 80 or 100 lb. In beginning the work, however, a compressor of 134 cu. ft. capacity was furnished by the railway

Interior Views of Tunnel Lining Equipment. At Left, Pneumatic Mixer Car with Hose Connections to Air Line; in Middle, Material Hopper of Mixer Car and Delivery Pipe Entering Forms Through Bulkhead at Crown of Arch; at Right, Finished Section of Lining, a Section of Form in Place and Mixer Car in Operating Position

from one of its yards, as this was the only compressor available at that time. This compressor was operated by a gasolene engine and was found to be badly worn and inefficient. The amount of air furnished by the compressor was approximately 50 cu. ft. per minute. This, of course, had its effect upon the output of the mixer and conveyor and is mentioned because it applies to the data given below.

The car is run into the tunnel by means of a dinky engine and "spotted" at a point next to the forms. The upper elbow of the delivery pipe remains suspended in place so that when the car is spotted the upper pipe can be bolted to the pipe on the car, which comes directly under it. The air connection is then made and concreting immediately begins. The car is loaded by a portable derrick, which handles a wooden skip, as a clamshell bucket was not at first available. This wooden skip is loaded by several men, shoveling the bank run gravel into it, and is then lifted above the bins on the car and dumped into them.

The first work done by the outfit, which included the lining of the first 20 ft. of forms, required five carloads of concrete material to fill the form. The entire work of tearing down timbers required 128 men hours; the total time erecting forms was 229½ men hours; the total time loading gravel and cement on to the car required 140 men hours; the total time required for mixing and placing concrete in the forms was 204 men hours; the total yardage placed was 132 cu. yd. From these figures the number of men hours required for the various items per cubic yard of concrete was as follows:

	Men hr. per cu. yd.
Tearing down and clearing timbers	.97
Erecting forms	1.74
Mixing and placing concrete	1.5
Loading gravel and cement	1.06

Two delays were experienced on this form, 3½ hours on account of blowing off an 8-in. nipple and replacing the same, and 2 hours on account of a derailment of the derrick car. The substitution of a clamshell bucket, when available, will cut the cost of loading the car to about ⅓ men hours, or 10 cents per cu. yd., and the substitution of a 300-ft. compressor will make it posible to mix and place one batch per minute. The number of batches on the car varies between 112 and 118. The time required at present to unload one car, including time of transporting and connecting and disconnnecting pipe, is about 210 to 240 minutes.

These pneumatic mixers and conveyors are leased by the Concrete Mixing & Placing Company, Chicago.

NEW YORK CENTRAL ANNUAL TRACK INSPECTION

The New York Central & Hudson River has just made public the results of its annual track inspection for 1914, the inspection of the main line between New York and Suspension Bridge being made by the general committee, and the branch lines by sub-committees from other divisions. While no cash prizes are awarded the supervisors, their respective subdivisions are rated on their condition. A. M. Clough, supervisor of subdivision 23, between Buffalo and Rochester, received the highest rating of 83.5, while supervisors P. S. Green of Syracuse, N. Y., and W. N. Skelton of Utica received the second highest rating of 82.8.

The section foreman receiving the highest rating on each main line subdivision received a premium of $3 per month for the coming year, while the foreman having the best section on each division except the electric division, received an additional premium of $2 per month for the year. Nine premiums of $2 per month were also awarded to foremen on branch line sections and ten prizes of $3 per month to foremen of yard sections.

SWITCH INSPECTION AND TEST

By W. F. Rench,
Supervisor, Pennsylvania R. R., Perryville, Md.

The condition of the various members that compose the switch connection and the adjustments maintained are of such vital importance that frequent tests are prescribed on all roads, and in order that these tests may not be perfunctory it is customary to require that they be conducted jointly by a representative of the signal department and of the track department and that they be made on or about certain dates.

To facilitate the rendering of the periodical reports each switch or cross-over in a given interlocking is numbered and each switch rail distinguished by a letter. The opening at switch points is prescribed by the standards of the road and is usually 4 in. The opening at which the switch lock will foul when the switch is closed is fixed by the signal practice of the road and is generally 3/16 in. Terms are indicated to describe the condition of the switch points, stock rails and ties as good, fair and bad. The gage is measured and any other features are noted under the head of remarks. The signal department's responsibility is in the adjustment of the interlocking connections, the track department's responsibility in the condition and general maintenace details of the several members of the switch connections. As the signal department does not have any concern with the frogs or guard rails these are covered in another test made by the track foreman alone. The switch test develops the exact condition of the switches and their connections at intervals, which for the best practice is every two weeks, and not only safeguards the traffic but supplies an excellent defense in the event of an accident from some obscure cause.

These tests by the signal and track maintainers are invaluable, but there is still necessary the occasional inspection by the signal supervisor and the more frequent detailed inspection by the track supervisor. The inspections by the supervisor of track should take in the physical characteristics of the entire layout, and his notes should be full and be recorded in permanent form. He should especially observe the points of frogs to note if they are being touched by passing wheels as indicating a loose guard rail gage, and he should then try the gage and order the necessary correction. This test is especially important at crossings which require constant attention to gage. The condition of all switch points should be noted and also, as far as possible, their adjustments when thrown for a movement. The two rails should be sighted to discover any tight gage that may have developed, as the movement of the rails through creeping sometimes introduces tightening of as much as 5/16 in., whereas ¼ in. is the most that is entirely safe. It should be observed particularly whether the joints at the heel of the switches and the insulated joints are properly surfaced, and whether the full complement of bolts is inserted at the rail joints. Any points unfavorably reported by the maintainers should be examined.

The inspections made by the higher officers are usually by proxy, many divisions having a special duty man who makes such tests for the division officer with an occasional test by the representative of the engineer maintenance of way. The division superintendent and his staff make superficial observations of the interlocking layouts about once in every three months when the cabins are being inspected as to their sanitary condition.

The record of switch inspection and test is very important in view of the insistence of the road and civil authorities for exact information in the investigation of derailments. One has but to walk over a few miles of railroad to note the many parts of cars that drop off in passage, and to wonder that so few of them drop into the throats of frogs and switches. Cases where such obstructions have caused derailment are not rare, but the proof of the occurrence is seldom found and the record of the exact condition of the switch connections may be the needed evidence to clear the maintenance department.

Conducting Track Inspection on the Grand Trunk

A Description of a Car Recently Designed for This Purpose and Methods of Rating Different Sections

The Grand Trunk inaugurated a new track inspection system this year, which, while similar to that used on a number of other roads in purpose and the general method of conducting it, has a number of interesting features. An inspection car is used, which is a rebuilt baggage car fitted with an observation end and seats for 32 persons arranged on an inclined floor to give an unobstructed view of the track. This car is pulled at the rear of a special train at the rate of about 25 miles an hour when making the inspection.

The detailed inspection is made by a committee of five men who are seated side by side across the rear end of the car. Below the observation window are placed 10 sets of push buttons electrically connected to indicators above the window, which are easily visible from any point in the car. By means of each set of push buttons an observer can register on the corresponding indicator any number under 10 with one decimal. Each set of push buttons is used for one of the 10 features which are observed, each of the five observers being responsible for two of these features. For example: one man grades on line and surface, another on joints and tie spacing, etc.

As each milepost is passed the supervisor on whose territory the train is running, calls the number of the milepost. Each of the observers decides what grade, on a basis of 10 as perfect, the features he has been watching over the past mile merit, and he records those decisions by the push buttons. The grades shown on the indicators are copied down by a clerk on a form reproduced herewith, and from this record the average for each mile is secured by weighing the various items according to the percentages shown on the blank. The averages for all of the miles on a given section are averaged to secure the grade for that foreman.

The observing committees on the main line inspection are ordinarily composed of superintendents and supervisors, the latter being used preferably for line and surface, joints and tie spacing. These men make observations only on territory not under their charge and the committees are usually changed at the end of each day's run or at the completion of the inspection on a superintendent's district. In order to secure close supervision over the observations made by this committee, a revisory committee of three men sits immediately behind the five

Observation End of Inspection Car Showing at the Bottom the Bank of Push Buttons Used by Observers in Registering the Grades and at the Top the Indicators Which Display These Markings. The Light Lines in the Cut Connect the Corresponding Push Buttons and Indicators

observers and, when necessary, calls their attention to tendencies to rank uniformly high or low. It is usually possible in this way to correct any wrong tendencies in grading immediately, although if thought advisable, the revisory committee may alter

Interior View of Inspection Car Looking Towards the Rear End Showing Seats for Observers and Bank of Indicators Above the Observation Window

the record slightly. This revisory committee on the main line is usually composed of the grand division staff officers, who include division engineers, superintendents of bridges and buildings and superintendents of track. On branch lines the observers are in most cases section foremen and the revisory committee supervisors or superintendents. One stop is made on each section to measure the gage and test the level, although this is not counted in the grade of the section, as it refers only to a single point.

No cash prizes are awarded as it is felt that such an inspection cannot equate properly for differences in natural conditions affecting the track. The result of the inspection showing the grade on each section is published and distributed to all fore-

The Grand Trunk Track Inspection Car

men and the officers interested and the toolhouse sign is awarded to the foreman having the highest average on each superintendent's division, each grand division and the system. It has also been proposed as an inducement to the foremen that those receiving the highest average one year will be taken along on the inspection trip the following year.

In addition to this system of inspection above outlined, which is of course an examination of conditions as found by disinterested parties having no connection with the particular district inspected, recognition is given to the section foreman who has accomplished the best result during the year, taking into

account physical conditions, force expenditure, etc. This, of course, cannot be determined by committees not familiar with these details and is accomplished by a committee formed of the track supervisor, division superintendent and superintendent of track, the latter a staff officer of the general superintendent. These three men determine the section foreman on each district who is entitled to this recognition and a letter is written to him, signed by the general superintendent, to this effect. In addition the names of these men are given in the report.

The first inspection was made on the main line during the third and fourth week of October. The branch lines were covered later at irregular intervals as it was convenient to handle the car. A special train carried a party of about 60 over the entire main line, the train including six business cars, one Pullman, one baggage car and the inspection car. In addition to the chief engineer, who was in charge of the inspection, the train was accompanied by the engineer maintenance of way, the three general superintendents, all the division superintendents, and their staff officers.

PHYSICAL EXAMINATIONS OF SECTION FOREMEN

By W. E. Schott

Section Foreman, Southern Pacific, Gila Bend, Ariz.

Every section foreman, when entering the service of most of our standard railroads, is required to go to the company surgeon to be examined as to his physical fitness. This is undoubtedly a wise precaution, not only to protect the railway company against any possible future damage suit, but also to insure greater safety to the traveling public and to other employees.

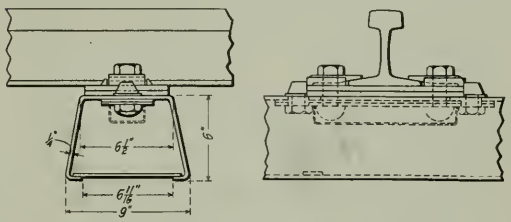
As yet, a satisfactory definition of what constitutes exact fitness for the position of section foreman is sadly lacking. Rules covering such fitness are applied to all alike, and the consequence is that many applicants eminently fitted for the positions are turned down for some slight physical defect which would not in the least interfere with their duties.

No work in any department of a railroad is harder on the eyes than track work. To sight along and over brightly polished steel rails under a cloudless Texas or Arizona sky for hours and days, months and years, is bound to affect the strongest pair of eyes more or less. The consequence is that at a period when the foreman's usefulness is greatest on account of this experience he is, theoretically, according to the rules governing his physical condition, unfit for his position. One of our western roads after a period of 10 years 80 per cent of the foremen could not pass the physical examination in regard to their eyes, if performed by a physician who followed the rules literally.

On account of the nature of track work it is impossible to have a sufficient supply of experienced men with two perfect eyes, and to sacrifice all qualities necessary to make a good foreman to a slight unimportant defect in his eye seems far from increasing service efficiency. There is no reason why a foreman wearing glasses should not be as safe and competent as one without. A majority of the best and most efficient foremen are not found on big standard railroad systems, but on smaller roads, where they are not barred on account of slight physical shortcomings. As long as the rate of pay of the foreman is the same on the first day of his employment as 20 years after he will continue to make changes from one road to another, trying to improve his condition. Every change forces on him a re-examination and sooner or later he will meet an especially particular physician, who will reject him. Although he may be capable and thoroughly competent he will have to turn to a smaller road, which in most cases will gladly accept him. By taking up this matter the railroads could relieve to some extent the perplexing problem of securing sufficient capable section foremen.

STEEL TIES UNDER HEAVY TRAFFIC

An installation of 203 steel ties made by the National Steel Tie Company, Harrisburg, Pa., has been in service since December, 1913, in the main westbound passenger track of the Pennsylvania Lines at a point one-eighth mile west of Emsworth, seven miles west of Pittsburgh, Pa. The traffic at this point is very fast and heavy, including about 100 passenger trains and a great number of freight and local passenger trains. The track is on a two-degree curve. An inspection of these ties was made 10 months after they were installed and it is stated that both the ties and the condition of the track are as good as when first installed.



General Details of Design of the National Steel Tie

The general design of the tie is shown in the accompanying drawing. It has an inverted channel section with steel straps connecting the lower edges. The rail is secured to each tie by two bolts, which pass up through a stiffening plate on the underside of the top of tie, the shell of the tie, an insulation pad, the tie plate, and a clip on which the nut is held down. These clips fit snugly within recesses provided in the tie plate so that it is impossible for them to turn. One end of the clip is beveled to fit firmly against the flange of the rail. The insulation pads, made either of waterproof paper or fiber, serve the double purpose of taking up the shock and vibration caused by a moving train, and providing insulation against electric current.

Main Line Passenger Track on the Pennsylvania Lines Laid With National Steel Ties

The tie plate is designed to take the thrust of the rail, thus preventing the rails from spreading, also the wear in the rail can be taken up by simply turning the plates around. The outer two bolts shown in the figure merely support a casement, shown in dotted lines. This protects the main bolts from concrete or asphalt, or any other material with which the shell of the tie is filled.

A SUGGESTED ORGANIZATION FOR TRACK MAINTENANCE

By G. C. Crites
Southern Pacific, Tucson, Ariz.

The section gang as now organized is forced to localize its work on the bad spots, leaving the "out of face" work for the extra gang. After a soaking rain, much of the section gang's localized "spotting" is undone, for the spots and the undisturbed portions are not equally affected, while the extra gang's "out of face" work is uniform even when saturated. However, the extra gang laborer is a rover and a spasmodic worker and therefore his work never has the quality and nicety of small detail that is found in the work of the section gang.

The section gang should be so organized that it can handle its work in an effective and economical manner. Each regular section gang usually has houses and grounds, representing a cost of from $600 to $6,000, and special tools that would equip a gang three or four times its size, such tools costing from $60 to $200. Interest, taxes, insurance and depreciation on the above will amount to from $80 to $770 per year. Supervision will cost from $700 to $1,250 per year per gang; making a total overhead cost of from $780 to $2,020 on from $1,300 to $6,000 worth of labor. This big overhead cost should be reduced and a more effective gang organized.

If a roadmaster with 150 miles of main track is allowed 0.8 of a man per mile, he will have 120 men for track work. By dividing these into six gangs, an economical and efficient unit would be secured. All the advantages of an extra gang would be obtained with the quality and nicety of a section gang's work. An organization of 20 laborers is easier to build and keep than one of from 3 to 10 men. Organization within the unit is possible and interest in the tasks may be created and held. If curtailment of expenses is necessary, the gangs can be cut to 0.6 or even 0.4 of a man per mile without altogether destroying the workable unit. Such gangs could take their track out of face every two years, besides keeping the whole safe for operation.

Permanent headquarters should be furnished. If possible these headquarters should be in a small town, but surely at a telegraph and water station. Such headquarters will cost from $3,000 to $7,000 and special tools from $60 to $300. Interest, taxes, insurance and depreciation will amount to from $375 to $875 per year and supervision will cost from $2,100 to $2,500 per year, making the total overhead costs from $2,475 to $3,375 per year on from $8,000 to $22,000 worth of labor. Under the present system the overhead costs may reach 150 per cent of the labor costs. Under the proposed organization it should seldom reach 30 per cent of the labor costs.

The section foreman in charge of this permanent gang should be king of his 25-mile domain and his pay should measure up to the position. He should have 80 per cent as much salary as the roadmaster. The place will find the man if salary and authority are given. The roadmaster would polish up a bit, as he would have six competent men under him. To get from their place to his would be only a small step and not the wide jump that is now required when a section foreman is promoted to roadmaster. Further, a foreman with 20 able-bodied consumers, and probably several voters under him would have a better status in the community he inhabits.

The signal maintainer should, of course, report to the section foreman. Complete and accurate statistics of everything pertaining to the section should be made up and kept on the section and the maintainer should perform the clerical work involved. He should inspect track daily, and once a week or oftener, as necessary, the foreman should make his inspection with the maintainer. In this way the entire gang's little "joy ride," while the foreman is inspecting track and switches, would be cut out. The maintainer would know the statistics of the section and the plans of the foreman, and, if he was capable, he would have a gang of his own some day. Where there are no signals, a trackwalker, rated as assistant foreman, would do small jobs and make the daily inspection. The section should be provided with an inspection motor car for the use of the maintainer or trackwalker.

There are many foremen of present section gangs who would not measure up to the new foreman's job. Some of these men are good trackmen, but they usually have to be told when and where to work and they have a world of trouble with their "books." One of these old-time trackmen should be given to each section as a track assistant at from 65 per cent to 75 per cent of the foreman's salary. He would handle the gang in the absence of the section foreman and, with a small detail, do the "spotting up" and other small jobs not worthy of the whole gang's attention.

As a "safety first" man, an old-time carpenter should be detailed with each section. He should be provided with a small shop and substantial living quarters. He should see that the section tools are kept in working condition, fix the loose or broken boards in station platforms, make all light repairs to buildings, look after fences, road and station signs, inspect roadway openings and do the small painting and whitewashing jobs.

LIGHT MOTOR CAR OF IMPROVED DESIGN

The new No. 36 gasolene motor car which has been placed on the market by Fairbanks, Morse & Company, Chicago, is the lightest car of the two-cycle type ever built by that company. It was designed for the use of roadmasters, linemen and signal maintainers, whose work requires a car light enough to be handled by one man and at the same time strong enough to carry two when the occasion arises. Another distinctive feature is the fact that the battery box and gasolene tank are located below the deck, leaving the seat free of all obstructions.

The car has a single frame of steel tubing which combines strength with light weight. It is fitted with 17-in. main wheels and 14-in. guide wheels with wooden centers and M. C. B. flanges, the front axle being 1½ in. in diameter, brass bushed, and the rear axle 1⅛ in. in diameter with removable

Steel Frame Motor Car of Light Weight and Strong Construction

brass bearings in malleable iron boxes. In addition to the equipment usually provided with these cars, a tray which rests on and is secured to the guide arms is regularly furnished with this car. For convenience in transportation, the tray and the guide arms can be removed from the main frame in one piece, permitting the parts to be easily loaded for baggage car shipment. The weight of the car equipped with the tray is approximately 360 lb.

The power plant is the same as the standard two-cycle engine equipment used on other cars built by this company. The engine has a rated capacity of four horsepower, is of the two-cycle, air-cooled type, direct connected to the front wheel, and is enclosed in a dust-proof crank case. Lubrication is effected by mixing oil with the fuel and also by two com-

pression grease cups on the main bearings. The engine is mounted by suspending it from a malleable iron casting attached just below the main frame. The battery box under the seat contains five dry cells which are conveniently accessible through a door in the seat.

REMODELED MAIL CARS FOR HOUSING GOVERNMENT FIELD PARTIES

As the field work of the engineering parties sent out by the Interstate Commerce Commission in the physical valuation of railways requires their frequent moving from place to place, it is desirable for them to make their headquarters in cars. To accommodate the parties sent out on its North Dakota lines last

Fig. 1—Government Outfit Cars, Sleeping Car at Left and Diner at Right

May, the Great Northern remodeled some of its old 50-ft. mail cars which serve as very convenient and pleasant quarters for the men.

Each party was supplied with two of these cars, one being

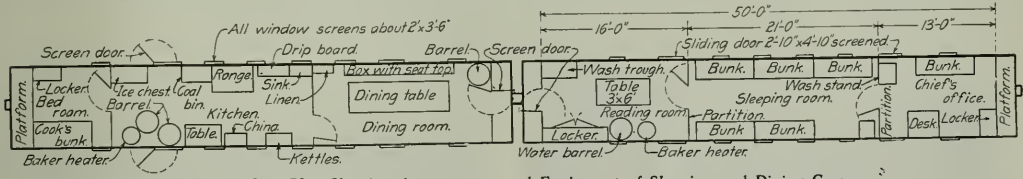


Fig. 2 Floor Plan Showing Arrangement and Equipment of Sleeping and Dining Cars

arranged for sleeping and the other for dining. Both cars are partitioned off into three compartments. The office of the chief of party is located at one end of the sleeping car. Next to it is the sleeping room proper, which is 21 ft. long and contains

Fig. 3—Interior View of the Sleeping Car

ten bunks arranged as shown in Fig. 3. The third compartment is furnished as a reading room. In the dining car one end is devoted to the dining room proper. The kitchen occupies the middle section and at the other end is the cook's bedroom and bunk. There are four provision boxes under each car, two on each side. These boxes are 3 ft. by 3 ft. by 12 in. deep, are very convenient for carrying supplies, and at the same time do not take up any space inside the cars.

The partitions are constructed of ¾ in. pine flooring, matched and dressed on both sides, and are held in place by end cleats. The doors are of the same material and located as shown in Fig. 2. All lockers and closets are made of dressed flooring. The tables, washstands, box seats, etc., are made of dressed and matched pine. All the interior exposed woodwork was painted a light cream color and the exterior of the cars was repainted with the company's standard dark coach color. Fine meshed copper screens are provided for all doors and windows, and the office, sleeping and reading rooms are furnished with carpet. The cars are heated by a hot water system, using Baker heaters, and lighted by double oil coach lamps. The ventilation was very good, due to the numerous doors and windows, so that it was not necessary to improve it. Six of these cars were used on the North Dakota lines during the past season.

WOOD PRESERVERS' CONVENTION PROGRAM

The eleventh annual convention of the American Wood Preservers' Association will be held in the Florentine room of the Congress hotel, Chicago, on January 19-21, 1915. A growth in membership of nearly 100 is reported during the past year and a large attendance is expected at the convention. The policy of this association is undergoing a change in regard to its convention program, increasing emphasis being placed on the reports of standing committees. At the coming convention reports will be presented by committees on Preservatives, Specifications for the Purchase and Preservation of Treatable Timbers, Wood Block Paving, Plant Organization, Miscellaneous Subjects, and Constitution and By-Laws. In addition to these reports the following papers of special interest to railway men will be presented: "A Problem in Air Seasoning Ties," by A. H. Noyes, assistant treasurer, Ayer & Lord Tie Company; "Temperature Changes in Wood Under Treatment," by George M. Hunt, of the Forest Products Laboratory; "Mechanical Life of Ties as Affected by Ballast," by Earl Stimson, engineer maintenance of way, Baltimore & Ohio; "Economical Use of Steam in Connection with Wood Preserving Plants," by A. M. Lockett, mechanical engineer; "Determining the Soundness of Timber Before Treatment," by C. M. Taylor, superintendent, Port Reading Creosoting Plant; "Facts on Creosoted Piling," by T. G. Townsend, piling inspector, Southern Railway; "Facts on Treated Ties," by J. H. Waterman, superintendent timber preservation, Chicago, Burlington & Quincy; "Sill Ties," by F. J. Angier, superintendent timber preservation, Baltimore & Ohio, and "Creosoted Piling," by Edmund Christian, general manager, Norfolk Creosoting Company.

CORRECTION

In the article entitled, "A Simplified Method for the Location of Sidings," in our issue of November 20, page 963, the length of the chord was shown in Figs. 3, 4 and 5 as "2 R sin x." This should have read "2 R sin ½ x." Also, in the first paragraph on page 965 the character ⌒ was substituted incorrectly for △

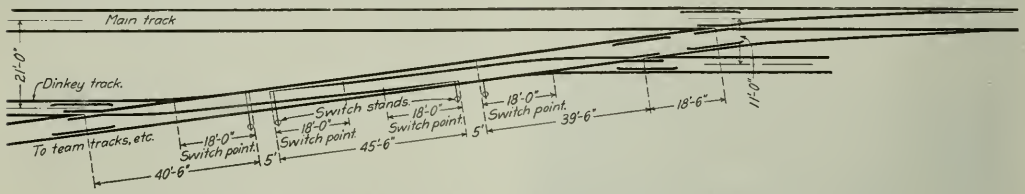
A SPECIAL CROSSING OF A NARROW GAGE AND A STANDARD GAGE TRACK

By T. C. Herbert
Resident Engineer, P. C. C. & St. L., West Jefferson, Ohio.

In connection with the second track and grade reduction work on the Pittsburgh, Cincinnati, Chicago & St. Louis between Alton, Ohio, and Glade Run, it was necessary for the grading contractor to cross a standard gage side track with a narrow gage track at West Jefferson. This crossing was subjected to considerable use by both standard and narrow gage equipment, but there was not time nor justification for the installation of a special crossing frog, neither were there any movable or double-point frogs available. So it was decided to construct a crossing out of standard frogs and switches which were on hand. The crossing, as shown by the illustrations, consisted of two No. 8 frogs and four switch points operated separately with a switch-stand for each point. The switch targets showed white when set for the normal position in line for side track movements.

A crossing watchman, who also acted as a switch tender, was kept on duty during the working hours of the contractor, and at night the crossing was locked clear for the side track. It would be possible to pipe connect such a crossing with the main track switch, thus eliminating the necessity for a watchman, and this would perhaps be advisable if traffic over the crossing was very light. In an emergency such a crossing could be used on main track by pipe-connecting the crossing switch points with the signals.

The crossing, as constructed, was installed by a gang of 25 men in seven hours, and as there was no charge for material the entire cost amounted to only $35.



Details of Crossing of Standard Gage and Narrow Gage Track Using Only Standard Frogs and Switches

Arrangement of Switch Stands and Signals for Operating Crossing of a Narrow Gage Track and a Standard Gage Track

Inspection.—Next to the intelligent selection of help, the inspection of the product is the most important factor of efficiency. —*American Machinist.*

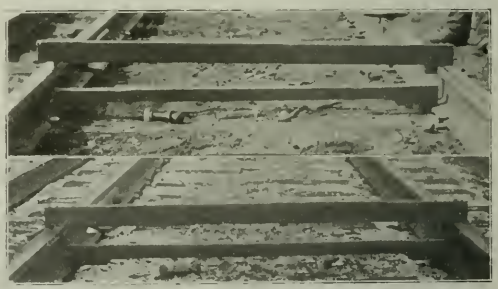
GAGING TRACK BETWEEN RAIL FLANGES

By E. Keough
Roadmaster, Chicago, Burlington & Quincy, Aurora, Ill.

The matter of correct gage in relaying rail has always been a problem for maintenance men, but as laborers are becoming less skilled and the height of rails has increased, the satisfactory gaging of such track by the common method has become even more difficult. When the adzing of ties is left to common laborers a fair gage is about all that can be expected. Some roads are adzing all new ties by machine before they are treated, which must do away with considerable poor gage, but will not prevent it all unless spike holes are put in the ties before laying the rail.

In order to secure a correct top gage the writer has experimented with a flange gage with very satisfactory results. It was found that in relaying 100-lb. A. R. A. rail on an old bed the new rail after settling to place was sufficiently close to correct gage to need no further gaging when being surfaced or retied. Where the standard track gages are used the rail will usually require regaging after it settles. An inspection of such cases generally shows that the bottom is too wide and the top widens a corresponding amount after settling.

With the degree of care used by present laborers no error over a small fraction of an inch should exist by gaging at the flange. Trial measurements show, however, that practically all rail in good main track on hand-adzed ties actually inclines inward, whether plated or not. When 100-lb. rail shows correct gage at the head it will be found that the base is practically 3/16 in. wide. Where rails are in correct gage and stand vertical the surface of the ball is but little over half covered and has the appearance of tilting outward. In adzing ties for relaying rail all laborers seem to have the same personal equation of adzing a little deeper on the inside edge.



Top and Bottom Gages at Time of Laying Rail and 24 Hours Later

The accompanying photographs illustrate what may be expected when using the bottom gage. In this case the standard gage was 3/16 in. tight, as shown in one view, and 24 hrs. later, when the second picture was made, the top gage dropped into place of its own weight and just stuck slightly. Had this top gage been used when the rail was spiked to place it certainly would have resulted in ¼ in. wide gage after the rail had settled.

Overcoming Defective Foundations for Three Piers*

Settlement Arrested by Construction of Annular Caissons at Iron Mountain Bridge at Little Rock, Ark.

By C. E. Smith
Assistant Chief Engineer, Missouri Pacific System, St. Louis, Mo.

The St. Louis, Iron Mountain and Southern has two bridges across the Arkansas river at Little Rock, Ark. The lower bridge, commonly known as the Little Rock Junction bridge, is founded on masonry piers, timber cribs and pneumatic caissons on rock, and is used only by freight trains from northeastern points to Louisiana and Southeastern Arkansas. It consists of one 352-ft. 10-in. swing draw-span, three 253-ft. 4-in. simple truss spans, and one 127-ft. 11-in. simple truss span and trestle approach, all single-track, built in 1883. The south abutment is of masonry built on the rock that outcrops on the south bank. The pivot pier, commonly known as pier 2, and piers 3, 4 and 5, are rock-faced, concrete-filled, masonry piers, about 45 ft. high, resting on filled timber cribs and pneumatic caissons about 40 ft. high, the masonry of the draw-pier being annular, with a well down to the crib. Piers 6 and 7, are rock-faced, concrete-filled masonry piers built on piles. The only specifications that can be found for the piers are as follows:

"The piers are to rest on pneumatic caissons sunk to rock and are to be filled with concrete, with timber cribbing reaching from the roof of the caissons to 4 ft. below low-water mark. These cribs are to be drift-bolted and planked on the outside and filled with sand and stone; on these cribs the masonry is to be started and built up to grade line.

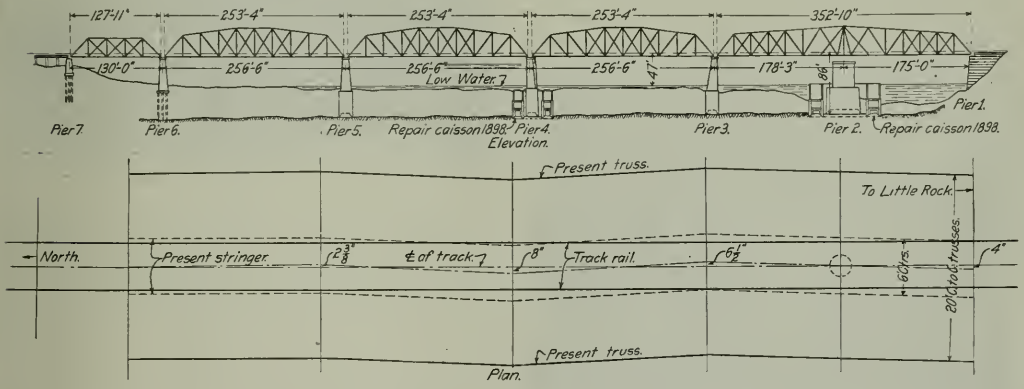
"Piers are to be 6 ft. 6 in. wide under the coping and 20 ft. long, with semicircular ends, with a batter of ½ in. per ft. on the sides and up-stream ends, but no batter on the down-stream ends; the piers are to consist of solid walls, averaging 2 ft. thick, built of dimension stone so as to make the joints not to exceed ½ in.; the inside space is to be filled with concrete. This refers to three piers.

"The draw-pier is to be 30 ft. in diameter under the coping, with an 8-ft. wall and the center to be left open; the pier is to rest on caissons sunk to rock and filled with concrete with the crib as before.

"The fifth pier on the east bank is to rest on piles sawed off and capped below low-water mark; it is to be 6 ft. 6 in. wide under the coping and 20 ft. long, with semicircular ends, and is to have a batter of ½ in. per ft. on the sides, but no batter on the ends; in other respects it is to be the same as piers 1, 2 and 3."

The spans were so well designed and constructed that they are now carrying safely the present-day heavy engines and trains, and will continue to do so for many years. The design and construction of the south abutment and of piers 6 and 7 were good and well executed. The design of the four pneumatic piers, although not in accordance with the best present-day practice, was adequate, but the construction was so faulty that trouble was experienced with them from the first, and the efforts that have been made during a period of 30 years to correct the defects resulted in a sequence of events that partook of the nature of a farce comedy in the face of impending disaster, which latter was narrowly averted.

There was nothing unusual or defective about the design or construction of the caissons, but they were very poorly located and carelessly controlled during sinking, resulting in their having been founded considerably out of place—from two to three feet in one or two cases. The timber cribs, extending vertically upward from the caissons, reflected at their tops the improper location of the caissons.



Plan and Elevation of Little Rock Junction Bridge

The design evidently contemplated filling the cribs with rip-rap, and for 25 years it was not believed that any other filling had been used. After that time, however, it was suspected, and after 30 years it was learned that, instead of having been filled with rock, only a small quantity had been used, most of the filling having been sand discharged from the caisson.

The incorrect location of the caissons and cribs was discovered before starting the masonry, and as the spans were on the ground, the errors in location were corrected partly by placing the masonry piers to one side or the other of the cribs, partly in the batter of the piers, and partly in the placing of the bedplates on the pier tops.

Pier 4 was built near the north edge of the crib and was given equal batter on the two sides, and pier 3, the north rest pier of the draw-span, was built near the center of the crib; but the north face was given a batter of 1½ in. per ft., and the south face

*Abstracted from a paper in the Proceedings of the American Society of Civil Engineers for November, read before the society on December 16.

was built plumb; the draw-span barely got a bearing on pier 3, and the next fixed span reached well over on the pier.

EARLY TROUBLE

The early record of the trouble is not clear, but it appears that, immediately after the completion of the bridge, the pivot pier under the draw-span (pier 2) and pier 4 began to settle and lean. As the bed of the Arkansas river is composed of fine sand which scours and shifts greatly during floods, it was thought that the settling was due to scour, the opinion immediately being formed that the cutting edges had not been founded on rock. Consequently, large quantities of rip-rap were unloaded around the piers, only to be washed down stream in following floods and requiring replacement. In addition, from time to time as necessity arose, the spans were shifted back and forth, to keep their bearings on the piers, the tops of which had been made so small that very little variation could be permitted. The movement of the pivot pier was quite pronounced, and necessitated frequent leveling and adjustment of the draw-span, at great expense.

After the railway forces had handled the problem for 15 years, the late W. M. Patton was called in as consulting engineer. He studied the history of the bridge and, after making borings through the timber crib and caisson under the pivot pier within the well inside the pier, and examining the exposed portions of the crib by divers, came to the conclusion that the caissons were not founded on rock, and gave a full and very plausible report and recommendation.

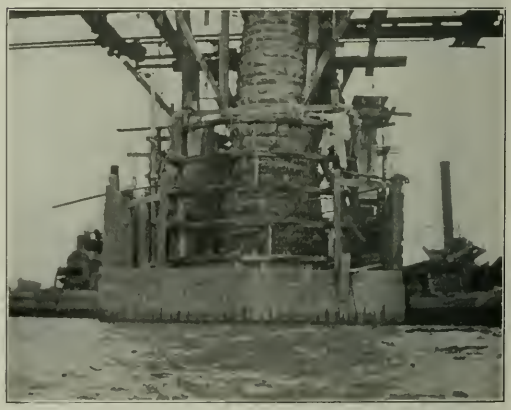
In brief, Mr. Patton concluded that one corner of the cutting edge of each pier rested on rock and the remainder on inferior material, which condition, together with the eccentricity of loading, caused the settlement, and that greater scour at one corner than at the others caused the greatest settlement at the corner

Little Rock Junction Bridge, Little Rock, Ark.

of greatest scour. He suggested pumping grout into the underlying sand to convert it into concrete, removing the inferior material under the caisson and replacing it with concrete, and building an entirely independent annular coffer-dam. His diver found that the timbers were sound, but that some damage had occurred to the crib sheeting and timbers on account of the settling, and that the filling was of small rock, sand and gravel. Mr. Patton recommended replacing the sheeting and filling the spaces with concrete. He recommends the sinking of annular caissons and coffer-dams to rock, supporting the span on falsework, removing the material between the old and new piers, putting jacks under the cutting edges to right the piers, and underpinning them with concrete.

The work of sinking the annular caissons and coffer-dams went forward in the fall of 1898, and was completed early in the summer of 1899. At pier 4, a timber caisson, about 50 ft. by 70 ft., was constructed around the old pier. Two rows of piling were driven around the old pier, about 8 ft. or 10 ft. apart, and were capped and cross-capped; the caisson and crib were built on top of these caps to a height of 12 ft. Large screws 16 ft. long were then used to lower the crib until it floated. The crib projected 4 ft. above the water, and the cutting edge floated about 4 ft. above the bed of the river; sand was used to fill the crib to sink it, while men were raising timber on top of the crib.

On April 2, 1899, at 41 ft. below low water, hard shale was struck near the center of the up-stream end. At an elevation of 45 ft., the inside cutting edge on the south side was landed on rock except about 10 ft., where the rock was 6 in. below the



The Steel Caisson and Coffer-Dam Around Pier 3

edge. The rock under the outside cutting edge on the south side was from 12 to 13 in. below it. However, the sand was taken out down to the rock, and the working chamber was sealed with from 2 ft. to 4 ft. of concrete, depending on the depth of rock.

The crib was built 58 ft. high, the top being 13 ft. above low water when the caisson was sealed. Later the top of the crib was disconnected from 6 ft. to 7 ft. below low water after concrete had been placed between the old and new cribs. The sealing of the working chamber was completed on April 24, 1899.

Investigation of the timber in the old crib disclosed crushing on the north side, but only to the extent of compressing the timber, and not dividing the grain. The timber was good and sound. A great deal of the 3-in. sheeting was found to be torn off, and it was seen that the spaces between the timbers of the crib were filled with sand and loose rock. The sheeting which had been torn off was replaced. It was also observed that the deck or top of the old crib dipped from 1 in. to 1½ in. from a point near the center on the south side of the pier toward the up-stream end.

On July 1, while the loose material between the new coffer-dam and the old crib was being excavated, it was discovered that the pier had settled about ½ in. This led to the immediate abandonment of the excavation, but the spaces on the north and west sides were driven full of piles, with a penetration of about 15 ft., and the space already excavated was filled with concrete up to the top of the old crib. None of the material within the old crib was removed, and no effort was made to grout it or to fill in the vacant spaces with concrete. In fact the sheeting that was replaced effectually prevented the concrete from flowing into the vacant spaces within the crib. The concreting around the old pier was completed on July 6, 1899, and both walls of the annual coffer-dam were then removed, down to 6 ft. or 7 ft. be-

low low water. The annular caisson was about 50 ft. wide and 70 ft. long, the sides were 10 ft. apart, and spaces from 6 ft. to 7 ft. 6 in. wide were left between the old and new work.

The work at the pivot pier was similar in character, except that the new caisson was 70 ft. square and the concrete about 15 ft. thick, the extra depth having been caused by scour and not by excavation.

The contractor considered the removal of the material between the new and old caissons to be very hazardous, and he continually recommended that only part of the material be removed and that the remainder be confined by placing concrete over it. Unfortunately the railway was guided by his advice in this matter. It is to be regretted that, after having incurred the great expense of sinking the annular caissons, more benefit was not derived from them.

Truss Shoe Overhanging Bearing

Truss Shoe Supported on I-Beam Grillage

On account of the large quantity of concrete placed around the pivot pier, and the depth to which it reached, 15 ft. below the top of the crib, no further movement has been detected in this pier. However, the movement of pier 4 was not arrested, but as the settlement and movement continued a policy of "watchful waiting" was followed for several years. The situation again became critical early in 1906, when pier 4 had moved so far that one of the spans was in imminent danger of falling off.

I-BEAM SUPPORTS FOR SHOES

One of the first duties assigned to the writer when he entered the bridge department of the railway, late in 1907, was an inspection of this bridge to determine how to maintain it in safe condition. At that time pier 4 had moved out so far from under the shoes that the center of the end pins was almost exactly over the edge of the timber blocking under the shoe, and the edge of the shoe overhung the edge of the pier.

The roller end of the span to the south being on pier 4 permitted the pier to move out from under. The fixed end of the span to the north being on pier 4, the thrust caused by the leaning of the pier in that direction had crowded the roller end of this span on pier 5 against the fixed end of the next span. This thrust, added to the similar, though less, defective construction of pier 5, caused the latter to lean north, crowding the roller end of the next span to the north, against the fixed end of the north span on pier 6, bringing three spans in direct contact. On hot days when the bridge was not loaded the chord bars in the end panels of these spans could be seen to be more or less buckled, but they always straightened out under trains, undoubtedly because the elasticity of the timber cribs permitted the piers to move back and forth.

Immediately following his first visit to the bridge, the writer worked up plans for placing a nest of I-beams under the truss shoes at each end of pier, so that the overhanging ends of these beams would afford support for the end of the next span south. There was only sufficient depth for 15-in. I-beams at the high end of the pier, but at the low end there was sufficient depth for 20-in. beams, the difference in height being due to the settlement.

The plans first contemplated driving piles on both sides of pier 4 to be used for jacking during the placing of the I-beams, but on account of the extreme length of the piles required (from 80 ft. to 90 ft.) and the hazard attending their maintenance in the Arkansas river, it was decided to avoid their use and jack from the pier top.

After placing the I-beams the spans were shifted slightly to remove their interference, and the rollers were cleaned and oiled. No further attention was paid to the placing of the falsework. The bearing having been made safe the matter of permanent repairs was then given further study.

In 1908 some one got the idea that it would be of advantage to provide further rigid support for the overhanging ends of the I-beams on the high side of the pier by building a concrete footing on the wide edge of the crib up to low water and placing a steel bent on top of that footing. The I-beams under the pedestals were to be shifted far enough south to get bearing on the bent, and the spans were to be shifted as far south as possible in order to bring the load over toward the high side of the crib. This method might have been very effective had it been possible to move the spans any great distance, but on account of the proximity of the south span to the draw, and of the north end of the north span to the edge of pier 5, only a 6 in. to 10-in. movement could be made, and the effect on the line of pressure

Pier 4, Showing Steel Bent Encased in Concrete

Pier 3 After Work Was Completed

was barely perceptible. However, the work was done in the fall of 1903 by the Missouri Valley Bridge & Iron Company at a cost of about $2,000.

Following this work no appreciable movement in the direction of the bridge was apparent for several months, but the movement at right angles to the bridge appeared to increase its rate, indicating that the work had no appreciable effect.

The movement of the pier was greatly dependent on the scour line. When the current shifted away from the pier, the bed of the river filled up and stopped the movement; when the opposite was true, the movement was resumed.

Following the work in the fall of 1908 the observations were continued, and the matter of proposed permanent repairs or re-

construction was kept constantly alive for 3 years, during which time scheme after scheme was evolved and considered, but nothing was started until the fall of 1911.

For two or three years prior to 1911 the channel of the river had been moving away from pier 4 and concentrating under the draw-span, resulting in the building up of the river bed around this pier with clear fine sand which early in 1911 covered the top of the crib and reached up on the masonry within 1 ft. or 2 ft. of extreme low water. This sand evidently filtered into the crib and gave increased supporting power in addition to that provided by the sand that enclosed it. As a consequence the movement of pier 4 gradually slowed down, so that it was barely perceptible, and the great uneasiness that had prevailed for several years was partly allayed.

In order to protect and preserve this sand surrounding the pier, the writer attempted in the fall of 1910 to secure authority to spend about $2,000 to construct a standard brush and pole mattress, about 150 ft. square, around pier 4, to be securely bound together with wire and wire strand, and covered with rip-rap placed in pockets of the mattress to be formed by placing two sets of poles one across the other on top of the mattress to prevent the rip-rap from rolling off.

At the low stage of the river following the request for authority, the work could have been done without barges or other floating equipment and brought to completion in 30 days. The authority was not granted, and after the next flood it was not needed as much of the sand had been washed away.

While the river bed was building up around pier 4 it was scouring away around pier 3, the north rest pier of the draw-span, and this pier started to move quite rapidly directly up stream at right angles to the axis of the bridge.

The movement in 1911 was more rapid and constant than any experienced previously in the other piers, and indicated the necessity for immediate action. The pier did not move dangerously in the direction of the bridge. Its natural tendency would have been to move south as the plumb south face and eccentric bearings of the spans made the pressure heaviest on the south side. It was restrained from movement in that direction, however, by rods and yokes which made this pier an anchor for the pull of pier 4.

FINAL PLAN OF REINFORCEMENT

The method of reinforcement that was finally brought to successful conclusion was first suggested by E. J. Pearson, first vice-president of the railway. To overcome all uncertainties he suggested securing the necessary additional supporting power by the use of a pneumatic caisson on each side of the old crib. This was extended later by adding caissons for the ends, forming an annular caisson surmounted by a coffer-dam, the space above the annular caisson to be filled with concrete, doing the same to the crib, and encasing the old pier in a new reinforced concrete shell.

Unfortunately, the delay in arriving at a decision as to what would be done at pier 3 consumed the best months of the year for the work. The change to pneumatic construction, necessitating the assembling and erection of the pressure plant and the construction of the caisson, further delayed the work up to the time of the flood period. The compressor plant was finally ready, and the steel caisson was shipped early in November.

The old records showed the old caisson under pier 3 to be 14 ft. by 31 ft., so the dimensions of the inner cutting edges of the new caisson were made 16 ft. by 33 ft. The caisson was made of steel primarily to reduce its necessary width and consequently the displacement; the presence in the old bridge-material yard of a large number of duplicate second-hand floor-beams which could be converted readily into a caisson also encouraged the use of steel. It was decided to build up a coffer-dam on the outer wall of the caisson, connecting the coffer-dam to steel lattice work or towers bolted to the roof of the caisson. These towers were provided in order to form the backbone of the rigid framework it was known would be required to brace the new coffer-dam against the old crib during excavation.

The greatest care was taken in the design of the joint between the caisson and the coffer-dam. The timbers in the bottom row, 8 in. thick, were cut to fit the steel as closely as possible, and were set in a bed of hot tar and oakum. Surfaced timbers were used, and each layer was set on the next below in hot tar and caulked. Tar-paper was then placed over the timbers and 2-in matched sheeting placed outside. The lower ends of the sheeting were driven into a groove filled with hot tar and oakum, over the roof of the caisson, formed between the bottom timber and the upstanding leg of the angle at the top corner of the caisson. A space about ½ in. wide between the sheeting and the angle was then caulked. To bind all parts together effectually and to provide additional weight for sinking, a 2-ft. 6-in. layer of concrete was then placed over the roof of the caisson enclosing the bottoms of the towers. This concrete was banded to the steel roof by a large number of ¾-in. bolts 21 in. long fastened to the steel plate and extending vertically into the concrete. The construction of the remainder of the coffer-dam was similar to that just described.

During and after the placing of the 30-in. layer of reinforced concrete over the roof of the caisson, the sinking progressed as fast as the work permitted. Trouble was continually experienced by the caisson catching on the protruding upper ends of the sheeting planks of the old crib, which had been torn loose by the settlement of the timbers and bulged by the pressure of the material escaping from the crib. On all the old records available the caisson of the old pier was shown to be plumb, and a clearance of 2 ft. was supposed to have been allowed between it and the new caisson, but it was found that the old caisson had a sharp batter, which necessitated ripping off the old vertical sheeting before the new caisson could be landed. The cutting edge of the old pier was founded on rock everywhere except at short dips which had been filled with concrete.

All the material within the new caisson had to be removed through the locks because sufficient pressure could not be maintained to force the sand through the blow pipes. Mattson locks were used and permitted the rapid removal of the material. No other particular difficulties were encountered.

The cutting edges were everywhere landed on rock, except over short dips, which were cleaned out and filled with concrete. The working chamber was filled with concrete carefully rammed to the roof, and before it had set, the lower sections of the shafting were also filled with grout.

The filling of the old pier was found to consist of some rip-rap and more sand. In order to remove the sand much rock had to be taken out. In fact, all the loose rock was removed with the sand, and only the tight rock was permitted to remain. The latter and the entire inside of the crib was washed out with a strong jet and then filled carefully with concrete. On account of the rather rapid settlement of the pier up stream, that end of the crib was first concreted, and, following the placing of that stiffener, the squeezing of the timbers at the down-stream end caused the pier to settle in the other direction, righting itself several inches. The entire space inside the coffer-dam was filled with concrete, being brought up as the concreting of the crib progressed.

After filling the crib and the surrounding space with concrete, the pier was safe, but, as it was canted so much that it presented a poor appearance, and as the draw-span had only a very small bearing on the pier and was causing the upper courses of masonry to break away, the pier was encased in a reinforced concrete shell. As the new caisson had made the footing large enough, the reinforcement was built for double-track. The bridge seats under the spans were entirely renewed in concrete finished at the proper level for double-track spans. The difference in level was made up by concrete pedestals placed in sections.

No falsework was used for the support of either span, and the bridge was never out of service during the conduct of the work.

The outer surface of the timbers in the crib under pier 3 were squeezed down at the ends an almost imperceptible amount. The

upper timber was burst open on account of the crushing load.

On account of the success at pier 3, all concerned were agreed that pier 4 should receive like treatment, making use of the caisson and coffer-dam sunk in 1898. Soundings showed that the top of that coffer-dam had been cut up when the upper courses were removed, and it was necessary to smooth it by cutting off drift-bolts under water and removing loose timbers. It was decided to make an effort to extend the outer wall upward and make it sufficiently tight to permit the pump to expose the inner wall, and, after extending the latter, to rely on it for the rest of the work.

The extension was made in a very short time, and a canvas having been stretched around the work, the dam was pumped out at the first trial. The inner wall was then very carefully dressed down in the dry and extended upward thoroughly water-tight, making it possible to pump out the water between that and the pier and start excavation. The concrete between the 1898 coffer-dam and the old crib was first removed on the south side, but was not disturbed on the north side until some time later, after the yokes and cables were in place anchoring the pier to pier 3.

The removal of the material down to rock was slow and tedious. The old coffer-dam had been badly racked during sinking, and large leaks were found all the way down. They were overcome, and the rock was laid bare and covered with concrete up to the top of the caisson of the old pier, after which the crib was cleaned out, filled with concrete, and surrounded at pier 3.

Some of the timbers were crushed to 6 in. in height, and on account of the inclination of the pier new cracks developed in the timbers while the excavation progressed. The weakest portions of this crib were concreted as they were reached. Attention was given to the up-stream end, and excavation was first made there. The movement of the pier increased while that work was in progress, but was immediately arrested when the excavated pockets were filled with concrete.

In fact, by concreting at the up-stream end and cleaning out the spaces at the down-stream end, the pier was made to right itself, the top moving back about 9 in. The first concreting was done in the two up-stream pockets of the crib, for its full width for a height of 5 ft. below the top, after which 5 ft. more below that were placed. The situation was always well under control, and the top of the pier could have been sent in any direction by guiding the work. The underpinning was hurried as much as possible, however. In placing forms within the crib and concreting individual pockets the men worked inside the crib. No falsework was used while pier 4 was under reconstruction; the pier carried traffic at all times.

The reinforced concrete shell placed around pier 4 is practically a duplicate of that placed at pier 3. The tie-bars at the bottom were passed through the pockets in the crib and concreted in, instead of being passed through the pier. At this pier the ends of the spans were shifted sideways to permit the construction of each concrete pedestal in one piece.

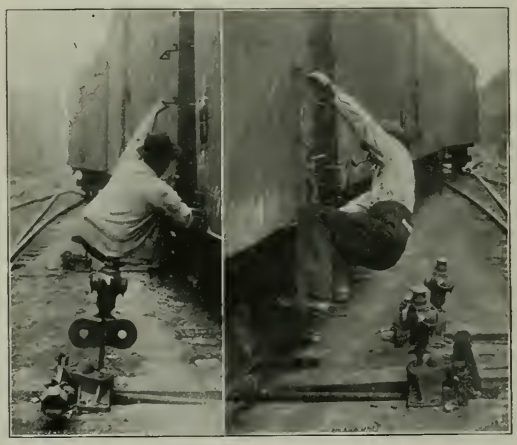
The small tops of these piers, their reported movement, and the frequent shifting of the spans, all contributed to a very poor condition of the bridge seat on pier 5, on which the stones were breaking out under the end of the south span which rested close to the edge of the pier. To strengthen the bridge seat, the top 10 ft. of the pier was encased in a reinforced concrete jacket about 9 in. thick. The sides were connected by passing the reinforcing rods around the curved ends of the pier and also by three sets of rails set vertically in the reinforced concrete at the middle and quarter points of the length of the pier. The lower ends of these rails were attached to the pier by 2-in. anchor-bolts set in grouted holes. Their upper ends were connected by 2-in. rods extending across the pier tops in channels cut in the bridge seat and filled with concrete. All cracks in the pier top were carefully grouted. The bridge seat appears to have taken on a new lease of life.

Following the reconstruction of piers 3 and 4 and the reinforcement of pier 5, the entire bridge, which was badly out of line and level, was lined and leveled. It was found that the draw-span was somewhat twisted and one end hung lower than the other. As far as could be done without injury to the span, the inequalities were corrected.

The work on the three piers and spans cost about $100,000, which is much more than it would have cost had the work on pier 3 been started earlier and the floods avoided. The reinforcement of piers 3 and 4 was executed on a force-account basis by the Bates-Rogers Construction Company. The adjustment of the spans and the reinforcement of pier 5 were executed by the railway company forces.

AN IMPROVED SWITCHSTAND BANNER

One of the measures adopted by the Chicago Junction in its campaign to increase the safety of its employees has been to replace the old banners which extended above the switchstand with a new type of banner invented by one of the company's switchmen which is no higher than the switchstand proper. The new banners have been made by straightening the old ones and cutting the proper holes for the fastenings in the new position. The shape of the target is shown in the accompanying illustration. It is 7 in. wide at one end, 3 in. at the other and 16 in. long. These banners have been applied on yard ladder tracks and at points where tracks are close together, thus decreasing the danger of switchmen being struck by the banners when hanging on the sides of cars or engines.



Old Style Banner Showing Dangerous Condition

New Type of Banner Not Extending Above Switchstand

ABSTRACT OF ENGINEERING ARTICLES

The following articles of special interest to engineers and maintenance of way men, to which readers of this section may wish to refer, have appeared in the *Railway Age Gazette* since November 20, 1914:

A Comprehensive Low Grade Trunk Line Development.—When the projected lines have been completed, the Chicago, Burlington & Quincy will have a low grade trunk line from Billings, Mont., to Paducah, Ky., a distance of 1,500 miles and a connecting line to Denver. The plan for working out this important development and the interesting construction details of the line between Thermopolis, Wyo., and Orin Junction, recently completed, were described in an illustrated article in the issue of November 27, page 999. Editorial comment on this development appeared in the same issue, page 995.

Construction of the Gwynn's Falls Arch Bridge.—The Pennsylvania Railroad is completing the construction of a four-track reinforced concrete bridge over Gwynn's Falls in Baltimore, Md., consisting of four arch spans, the design and construction of which are typical of the best in modern bridge practice for such structures. An illustrated description of this work was published in the issue of December 4, page 1037.

The Mechanical Elimination of Seams in Steel Rails.—An abstract of a

paper by Robert W. Hunt, read before the American Society of Mechanical Engineers, in which was outlined a new method of eliminating seams in rails by removing the surface metal of the ingot by a milling machine, was published in the issue of December 4, page 1055.

Comparative Service Tests of 100-lb. Section, P. S. and A. R. A. Section A Rails on the Pennsylvania Lines.—W. C. Cushing, chief engineer maintenance of way, Southwest System, Pennsylvania Lines, has outlined in a paper recently published the results of extensive service tests of rails on the Pennsylvania Lines showing the traffic handled, the amount of abrasion and the number of broken rails of each type. An abstract of this paper was published in the issue of December 11, page 1078.

Driving a Five-Mile Tunnel Through the Selkirks.—The Canadian Pacific is building a double-track tunnel five miles long under Mt. McDonald at the summit of the Selkirk mountains as a part of a line revision which saves 4.4 miles in distance, reduces the length of the 2.2 per cent ruling grade on each approach, and eliminates 552 ft. of rise and fall and 2,600 deg. of central angle. This tunnel, which will be the longest in America, is being constructed by the use of a pioneer tunnel parallel to the main bore in order to hasten its completion. It was described in the issue of December 11, page 1082. An editorial note commenting on modern tunneling methods, calling attention to the lack of progress in reducing cost on such work as compared with grading and other construction work, was published in the same issue, page 1074.

TESTS ON TREATED AND UNTREATED OREGON FIR PILING

The results of comparative tests, made by H. B. MacFarland, engineer of tests, Atchison, Topeka & Santa Fe, on treated and untreated Oregon fir piling, are published in bulletin No. 168 of the American Railway Engineering Association. The object of these tests was to determine the effect of the steaming process of creosoting upon the physical properties of the piling.

Two lots of material were selected for test purposes. The logs had ordinarily been cut from three to six months before treatment. Twenty logs, varying in diameter at the butt from 12 to 18 in., and in length from 40 to 60 ft., were selected. From each log two specimens, each 15 ft. long, were cut for test purposes. Ten of the 40 specimens were given regular treatment, known as the 18-hour treatment, and another lot of 10 was given an extra heavy 26-hour treatment for the specific purpose of permitting heavier and deeper penetration. In order to get the best comparative figures as to the effect of creosoting on the different parts of the log, alternate butts and tops were treated.

In the steam creosoting process the material was ultimately subjected to three processes, namely, steaming, removing moisture and filling with creosote. Just previous to treatment, the logs were taken from the salt water in which they had been soaked and the bark removed. They were then placed in the treating tanks, and by the introduction of steam were slowly brought up to a temperature of about 330 deg., which was maintained for 1½ hr. A vacuum of about 28 in. was then produced and the temperature reduced to a minimum of 190 deg., this condition being maintained for 10 hr. The tanks were then filled with oil at 190 deg., and an average pressure of 75 lb. was maintained for a period of five hours, or until the piles had taken up the proper quantity of creosote, after which the oil was transferred from the treating tank to the general storage tank, and the timbers removed.

In every case the treated material showed a decided loss in strength as compared with untreated. The greatest loss was in transverse strength, due to the influence of treated sapwood. There was also a considerable loss in compressive strength. The material was found to be very refractory to all kinds of treatment, while subjecting this wood to high abnormal temperatures and pressures, extending over considerable lengths of time, caused permanent deterioration of the fiber.

The purpose for which the material is intended should be taken into account in the consideration of comparative results. The transverse strength of piling is not of as great importance as the compression strength. The loss in compressive strength is manifested in the failure of piling to withstand the sudden severe vertical stresses applied by the pile-driver. It is also important that the piling have sufficient strength in shear parallel to the grain to prevent "shelling out" during the driving. The tests showed that the deterioration and loss of strength resulting from treatment is a minimum when treated under as nearly normal conditions as possible. Excessive time and high temperatures of steaming should be avoided.

The following conclusions were drawn:

The depth of penetration of creosote is mainly dependent upon the depth of sapwood.

The heartwood is almost impervious to treatment.

The depth of penetration of creosote is the same in the butts as in the tops.

The depth of penetration of creosote should be interpreted to mean the depth of "active" penetration.

Tests of minor specimens show that injury to fiber through method of treatment is not localized to treated fiber alone, but extends throughout the whole specimen.

The transverse strength of Oregon fir piling is decreased 42 per cent due to the steaming process of creosoting.

The compressive strength perpendicular to the grain is decreased 32 per cent due to the steaming process.

The compressive strength parallel to the grain is decreased 27 per cent due to the steaming process.

In general average, the strength of Oregon fir piling subjected to the steaming process of creosoting is only two-thirds its original strength.

ENAMELED STEEL SIGNS

The Stonehouse Steel Sign Company, Denver, Colo., has recently developed an enameled steel sign which is especially adapted for use at highway crossings because of its conspicuousness, its rigid construction, and the ease with which it can be mounted on almost any kind of a post. The sign is 20 in. by 28 in., with 4-in. white letters on a red center background. It is attached to the post without any bolts, screws or rivets through the enameled face of the sign. This is accomplished by the use of bands bent around the post and bolted to the lips on fasteners

An Illuminated Enameled Steel Sign Compared With an Unilluminated Painted Sign

which extend across the sign and are electrically spot-welded to a ¾-in. angle bar around the edge on the back. These signs may be illuminated as shown in the illustration, which also shows an old painted sign without illumination.

This company also makes numerous other standard and special signs, including one for use in shops and factories where men speaking many different languages are employed. It consists of a standard sign in English at the top with 12 small, but similar signs, arranged below, having the word "danger" translated into as many other languages.

General News Department

All of the principal car shops of the New Haven road have been closed until January 4.

W. H. Lyford, general counsel of the Chicago & Eastern Illinois Railroad, addressed the Chicago Engineers' Club at a luncheon on December 10, on "Handling Freight at Chicago."

By a fire in the shops of the Atchison, Topeka & Santa Fe at Albuquerque, N. M., on the night of December 8, the company suffered a loss of $22,000; parts of two buildings and 14 freight cars.

Dr. Hermann Von Schrenk, consulting timber engineer, of St. Louis, read a paper on Modern Uses of Wood before the Western Society of Engineers, Chicago, on Monday evening, December 14.

At Pinner's Point, Va., on Monday last, 70 employees of the Southern Railway and 41 of the Atlantic Coast Line were arrested on charges of violating the Sunday labor law. The persons arrested were clerks and workmen on the freight docks of the railroads.

The Great Northwestern Telegraph Company, of Canada, announces that the Canadian Northern Telegraph Company has been consolidated with the G. N. W.; and the larger company expects, within a few months, to operate the lines and offices of the Western Union in the maritime provinces.

"Independent Order of Railroad Employees of Pennsylvania and New Jersey" is the name of an organization which has held a meeting at Reading and which announces that application is to be made to the Philadelphia & Reading for increased pay for station agents. The president of the organization is James F. Tatlow, of Philadelphia.

The American and the National express companies have begun suits in Vermont to test the constitutionality of a recent law of that state increasing the taxes assessed against express companies. The new rate is $20 a mile for each mile of railroad over which an express company operates, more than twice the rate formerly in effect.

Although it was reported recently that the members of the shop craft unions had voted to call off the strike which was declared in September, 1911, on the Illinois Central and the Harriman lines, announcement has since been made by the railway department of the American Federation of Labor that the boilermakers voted in favor of calling off the strike, but that their vote was not large enough to offset the vote of the machinists, blacksmiths, car men and sheet metal workers.

The United States Civil Service Commission announces examinations January 12 for the position of telegraph and telephone inspector, under the Interstate Commerce Commission, in the work of valuation of property, salary $1,200 to $1,800 a year. Applicants must be between 25 and 55 years of age. The commission also announces examinations January 20 for six other positions, as follows, the range of salary in each being from $720 to $1,680: Junior railway structural engineer, age not over 36; junior railway mechanical engineer, age not over 36; junior railway signal engineer, age not over 36; junior railway electrical engineer, age not over 36; junior telegraph and telephone engineer, age between 21 and 35; junior railway civil engineer, age between 21 and 36.

A committee of the Senate held hearings at Washington last week investigating charges that the Southern Railway had obtained control over certain minor railroads in Virginia, Kentucky and Tennessee for the purpose of suppressing the coal traffic in the Appalachian coal fields, the purpose being to promote the business of other mines. The committee had employed an investigator who testified as to the deficits of certain roads controlled by the Southern, the charge being that if these roads—the Atlantic & Danville, the Danville & Western, the Cape Fear & Yadkin Valley, the Carolina & Northwestern, the Tallulah Falls and the Knoxville & Bristol—had been devoted to the legitimate use for which they had been constructed, namely, to furnish an outlet for the Appalachian coal mines, they would have been more profitable.

The executive committee of the Chicago Association of Commerce has adopted a resolution in favor of setting the clocks throughout the nation ahead one hour in order to secure more daylight after working hours in the summer months. The resolution also asked the United States Chamber of Commerce to consider the question at its annual meeting in February, in Washington, with the idea of bringing about a nation-wide movement in favor of the change. A special committee of the association held a meeting last week to consider a plan for adopting Eastern time for Chicago instead of Central, but so much opposition was expressed by railroad men present, on account of the confusion which would result if Chicago made the change, that it was decided to push the movement along national lines.

The postmaster general, in his annual report, again proposes that the government shall take over the telegraph and telephone lines of the country. He says that he wishes to see the railways properly compensated for carrying the mails, but at the same time he says that the department has been more than self-sustaining during the last fiscal year, a statement which has no reasonable basis, for if the railroads had been properly paid for carrying the mails, the surplus would have been more than wiped out. The postmaster general again recommends that the rate of one cent a pound for the transmission of periodicals be limited to publications issued oftener than once a month, and that monthly magazines be charged for at the rate of two cents a pound.

The House Committee, at Washington, has reported the Post office appropriation bill for the next fiscal year, with a rider in which are embodied the provisions of the Moon bill for changing the basis of railway mail pay; and Mr. Peters, the chairman of the railways' committee, says that an attempt is being made to secure from the Rules Committee a rule to facilitate the proposed new legislation. Mr. Peters reiterates his declaration that the provision of the Moon bill for payment to the railways on the basis of space occupied is not only unfair in principle, but embodies rates per mile very much too low. With the space in a car fully loaded, the compensation would amount, in many cases, to less per ton per mile than ordinary rates for the transportation of coarse commodities by freight train. The railroads are now losing not less than eight millions annually because of the parcel post, and if the space rates are adopted this loss will be still greater. The small railroads, which are now the worst sufferers from inequitable rates, would lose from 25 per cent to 65 per cent additional if the plan should be adopted.

The different lines that comprise the National Railways of Mexico are again divided into several sections, each under control of opposing political factions. The Cuernavaca division, which runs from Mexico City to the Balsas river, will soon be opened for through traffic for the first time in more than three years. This is made possible by the merging of the territory occupied by General Zapata and his armed forces with that which is under control of General Villa. The branch lines of the Interoceanic in the State of Morelos are also again open for traffic after a long suspension of operations. As an offset to this extension of the opened system, however, the troops of General Carranza are in control of some of the northern divisions running out of Monterey, Tampico, Laredo, Eagle Pass and Saltillo and of a part of the Interoceanic, running from Vera Cruz. The Carranzistas are also in charge of the National Tehuantepec line and all of the Vera Cruz & Pacific, the latter being a part of the National Railways of Mexico. On the whole, the railways of the country appear now to be in about as chaotic a condition as they have been at any time since the revolutionary troubles started, more than four years ago.

The western railways are making an effort to secure a more rigid enforcement on the part of conductors of the rules requiring payment of half fare for children between the ages of 5 and 12; and forms have been prepared for distribution to conductors on which the parent or guardian may be required to certify that the child is under age, in case the parent or guardian makes such a statement and the conductor is in doubt as to its truth. The form contains a notice to parent or guardian stating that the lawful interstate fare for children between 5 and 12 years of age is one-half the regular one way fare, and the lawful interstate fare for children above 12 years of age is the regular adult fare, and that failure of a common carrier to collect published tariff fare constitutes a violation of the interstate commerce law; also that the person who evades the payment of a lawful fare is equally liable, with the carrier, to punishment under this law. Conductors are instructed to give passengers the benefit of any reasonable doubt as to the age of the child. In cases where conductors are absolutely satisfied from observation or otherwise, that a child without ticket is of proper half-fare age, they are instructed to collect half fare covering not only their own run, unless the journey commences and terminates on such run, but to require parent or guardian to purchase at the first convenient stop a half ticket for the child to destination, or to junction point with the connecting line.

R. C. Richards, chairman of the central safety committee of the Chicago & North Western, has issued a bulletin showing that in the 53 months since the safety committees were established on the North Western, there have been 369 fewer deaths and 11,258 fewer injuries on the road than in the corresponding previous period. He has also issued a series of colored charts to illustrate graphically the various causes of accidents. For the years ending June 30, 1912, 1913 and 1914, one chart shows that 401, or 2.2 per cent, of the injuries were incurred in collisions and derailments, while 17,380, or 97.8 per cent, occurred in "little accidents that can be prevented in less time than it takes to make reports." Another table shows that of the employees killed during the three years 17, or 8.4 per cent, were killed in collisions and derailments, while 185, or 91.6 per cent, were killed in little accidents. Another chart shows that of the accidents in which employees were injured while on duty during the calendar year 1913, 5,232, or 81.81 per cent, were caused by careless practices, 131, or 2.05 per cent, were collisions and derailments, 651, or 10.18 per cent, were classed as unavoidable, and 381, or 5.95 per cent, were caused by defective engines, cars, tracks, tools, machinery, etc. Another chart shows for the same year, that of the accidents in which employees were killed, 51, or 76.12 per cent were caused by careless practices, 8, or 10.94 per cent, were collisions and derailments, 1, or 1.49 per cent, was classed as unavoidable, and 7, or 10.45 per cent, were caused by defective engines, cars, tracks, machinery, etc.

Supply-Men's Gifts Disapproved

President Ripley, of the Atchison, Topeka & Santa Fe, has published in the December issue of the Santa Fe Magazine the following letter addressed to all employees:

"Most individuals and companies dealing in railroad supplies have given up the practice of sending Christmas presents to railroad employees and officials. However, to a certain extent the practice was in evidence last year. I have always been opposed to this practice, have discouraged it, and am glad that it is decreasing. I want Santa Fe men to take such action as seems proper to eliminate it entirely. I appreciate that many of the presents given are tokens of friendship extending over many years; nevertheless the practice is bad, and certainly so where the presents have any value. The high standing enjoyed by Santa Fe men makes it all the more desirable that the practice cease."

Passenger Killed in Collision on New York Elevated

In a rear collision of northbound passenger trains on the Sixth avenue elevated line of the Interborough Rapid Transit Company, New York City, on the evening of December 9, one passenger and one trainman were killed and fifteen or more passengers injured. The leading train was standing at the 116th street station and the following train was moving at low speed, yet it was going fast enough to force some distance upward the rear end of the rear car of the standing train and the front end of the leading car of the other. The cars took fire from a short circuit and the bodies of the persons killed (or fatally injured) were badly burned.

It appears that in the second train the electric apparatus of the three leading cars was out of order, and the motorman was riding in the fourth car. The conductor was at the rear platform of the leading car and regulated speed by giving hand motions to the motorman. It is said that these motions were given by flag, although it was after 6 o'clock and quite dark.

Foreign Employees of the Pennsylvania

More than 19,000 employees of the Pennsylvania Railroad were born in those countries now engaged in the European war. More Italians are employed than any other class of foreigners. Of the 137,525 employees east of Pittsburgh and Erie, on September 1, 1914, 33,804 were foreign born, while 103,721 were native citizens of the United States. Of course, many of the foreign born employees have become naturalized citizens of this country. The number of employees from each of 38 foreign countries is:

Italy	13,193	Belgium	11	Denmark	62
Ireland	5,494	Mexico	10	Roumania	60
Austria	4,251	Servia	7	France	54
Germany	2,679	Portugal	5	Syria	38
Russia	1,830	East Indies	5	Australia	14
England	1,407	Chile	1	Brazil	4
Hungary	1,339	Canada	315	India	3
Poland	1,106	Greece	227	Argentine Republic	2
Sweden	514	Turkey	207	British Guiana	2
Scotland	449	Norway	170	Japan	2
Bulgaria	25	West Indies	113	Panama	1
Holland	20	Switzerland	99	Hawaiian Islands	1
Spain	12	Wales	72		

Attorney General's Report

The Attorney General, Mr. Gregory (formerly special counsel for the government in the prosecution of the New Haven road), has sent his annual report to Congress. In it he recommends an amendment to the commodities clause of the interstate commerce act to make it more effective. He recounts the history of the cases against the Delaware & Hudson and the Lehigh Valley. In the D. & H. case the Supreme Court construed the commodities clause as prohibiting a railroad from transporting articles in which at the time of transportation it has any interest, direct or indirect, in a legal or equitable sense. It further held that a railroad does not necessarily have an interest, direct or indirect, in a legal or equitable sense, in articles manufactured or produced by a bona fide corporation of which the railroad is a stockholder. In the subsequent case against the Lehigh Valley the court held that if the corporation owning the articles transported by the railroad was so identified with the railroad as in fact to be but an arm of the railroad, then the railroad would have an interest in the articles in the sense of the statute. Under this construction it has been claimed that the statute is not violated unless the railroad has the required interest in the articles at the date the transportation is begun.

The report then goes on to describe the organization of new and separate corporations to take and sell the railroads' coal, and continues: "This plan has been challenged in the case now pending in the Supreme Court of the United States against the Delaware, Lackawanna & Western. The government lost in the district court. Even though it should be successful in the Supreme Court, the commodities clause will still fall short of the purpose of Congress in enacting it, which was, I think, to divorce transportation from production. I recommend an amendment which will prohibit a railroad from transporting in interstate commerce articles which were manufactured or produced by any corporation controlled by it or affiliated with it by having the same controlling stockholders, irrespective of whether such railroad or such controlled or affiliated corporation has an interest in the articles at the time of transportation. It is also necessary, if transportation and production are to be completely divorced, that Congress prohibit any railroad owned or controlled by a producing or trading corporation, and not operated merely as a plant facility, from transporting in interstate commerce articles produced or owned by such corporation, and I recommend appropriate legislation to that end."

International Engineering Congress

Some confusion has arisen between the International Electric Congress, which was to have been held in San Francisco in September, 1915, and the International Engineering Congress, which is to be held during the same month. Owing to the unfortunate situation abroad, and the impossibility of convening the International Electrotechnical Commission, under whose authorization the Electrical Congress was to have been held, it has been decided by the governing body of the American Institute of Electrical Engineers to postpone indefinitely the holding of the Electrical Congress. This does not affect the International Engineering Congress, which goes ahead as originally planned.

MEETINGS AND CONVENTIONS

The following list gives the names of secretaries, dates of next or regular meetings, and places of meeting of those associations which will meet during the next three months. Hereafter the full list of meetings and conventions will be published only in the first issue of the Railway Age Gazette for each month.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meetings, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railway Business Association.—Frank W. Noxon, 30 Church St., New York.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except, June, July and August, St. Louis.

Salt Lake Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. R. R., Atlanta, Ga. Next regular meeting, January 21, 1915, Atlanta, Ga.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Transportation Club of Detroit.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

REVENUES AND EXPENSES OF RAILWAYS

Month of October, 1914

Name of road.	Average mileage operated during period.	Operating revenues: Freight.	Operating revenues: Passenger.	Operating revenues: Total, inc. misc.	Operating expenses: Maintenance: Way and structures.	Operating expenses: Maintenance: Of equipment.	Operating expenses: Traffic.	Operating expenses: Transportation.	Operating expenses: Miscellaneous. Traffic News

Tariffs have been filed by the railways advancing the rates on copper bullion 50 cents a ton from the Missouri river and points west to the Atlantic seaboard and other eastern points.

The car ferry which is to run between Key West and Havana is expected to begin business about January 1, and the principal railroads in the southeastern states have issued their announcements, bidding for through freight.

The local freight agents of the railroads and boat lines in the city of Milwaukee will visit Chicago on Friday, December 18, for the inspection of the local freight offices and houses, and to attend a regular meeting of the Local Freight Agents' Association of Chicago. They will be entertained at a luncheon by the Chicago local freight agents.

A special train of 19 cars of mules for shipment to Europe moved over the Nashville, Chattanooga & St. Louis last week from Atlanta, Ga., to Nashville, Tenn., in record time. The shipment made the 289 miles in 11 hours and 55 minutes, or an average of 25 miles an hour. Over the same road a shipment of 20 cars of mules for Europe moved as a special train, making the run from Nashville to Jackson, Miss., 151 miles, in 7 hours and 6 minutes.

"The time has come when an appeal should be carried to Congress over the head of the Interstate Commerce Commission, for authority to make reasonable advances in freight and passenger rates." This view, expressed by Harry Scullin, president of the Scullin-Gallagher Iron & Steel Company, of St. Louis, is one which, he says, prevails in that region to some extent. Mr. Scullin's firm is a large shipper of freight, yet he advocates an increase in transportation rates because of the benefit to be derived by business generally.

The Southern Railway, complying with a request from the United States Department of Agriculture, has granted leaves of absence to Dr. C. M. Morgan, livestock and dairy agent of the company, Dr. Walter Sorrell, Dr. Morgan's assistant at Greensboro, N. C., and Dr. C. D. Lowe, assistant at Atlanta, to permit them to accept temporary service with the Department of Agriculture in the work being done to stamp out the foot-and-mouth disease among cattle. Drs. Morgan and Sorrell have had experience with the foot-and-mouth disease in the Philippine Islands. This far this disease has been found in only two states in the South—Virginia and Kentucky.

Railways in the western trunk line territory have announced their intention to charge full tariff rates on and after January 1, on shipments of supplies consigned from various sources for the relief of Belgians. The lines in the Trunk line and Central Freight Association territory have issued similar notices, that free transportation for donations for European war sufferers will be canceled on December 20. The railroads have already contributed very generously to this movement in the free transportation which has already been furnished, and in commitments which have been made for the immediate future. In the meantime, all interested parties have been notified that all shipments on which the railroads are committed to free or reduced transportation should be tendered for shipment prior to January 1. In order to facilitate the handling of such shipments arrangements were made by the western roads with the American Commission for the Relief of Belgium, the Rockefeller foundation and the Belgian Relief Committee, the principal societies handling this traffic, so that all shipments on which free or reduced transportation was given were consigned to the American Commission for the Relief of Belgium.

Freight Blockade at Galveston

J. H. Hill, vice-president and general manager of the Galveston, Houston & Henderson, and president of the Texas General Managers' Association, on December 11, gave out the following statement bearing on the congestion in the export traffic at Galveston, and on the demurrage question:

"On hand yesterday on Galveston island all lines, 1,767 cars, containing 2,000,000 bushels of wheat, and there is approximately the same amount in elevators A, B and the Star mills, making a total of 4,000,000 bushels on hand. The amount in transit all lines within a few days' movement from Galveston, is 2,000,000 bushels more. The heaviest month's export this season was 6,505,715 bushels. The Santa Fe has found it necessary within ten days after raising its former embargo to again embargo against wheat for Galveston in order that it might not only have facilities left in Galveston to handle its cotton and other commodities, but that its equipment might be available for the needs of its patrons.

"Neither the past nor present conditions indicate that the question of demurrage has taken one bushel of wheat from Galveston that Galveston could have cared for had there been no demurrage. The necessity for placing an embargo is much more harmful to a port than is demurrage. The latter in a great measure prevents the former."

Russo-Mongolian Railway Convention.—It is announced in Petrograd from Urga, that the Russian diplomatic agent in Mongolia has signed in Kyachta, on September 17-30 last, along with the authorized agents of the Urga government, an agreement respecting railways in Mongolia, to give effect to a project for connecting the Mongolian railways with the Siberian railways by constructing suitable connecting lines. The agreement recognizes the right of the Mongolian government to build railways within its own territory, and approves the construction of railways in Mongolia to serve the interests of both that country and Russia, which country will co-operate with the Mongolian government in giving effect to such a railway policy, in the form of practical assistance. The Russian government will not interfere with Mongolian railway construction if effected at the cost of the latter. But with respect to railway concessions, the Mongolian government, in virtue of the strictly friendly relations with its Russian neighbor, will, before giving a concession, consult with the Russian government with the object of obviating either economic or strategical injury to Russia in the granting of such concessions. Other conditions of the usual formal nature are attached to the convention, which has been duly signed, and copies exchanged in the Russian and Mongolian languages.

Cuban Railways' Results.—Although the development of German bounty-fed beet sugar practically ruined the sugar industry in the Greater Antilles, Cuba, unlike the other islands, consistently extended the cane plantations, whereas the others combined the fruit industry. The cane being less susceptible to weather conditions provides a more reliable article for railway traffic than fruit; but there is more fluctuation in its prices. Nevertheless, the railways have expanded and shown good results, and there is good reason to believe that the policy of retaining sugar and tobacco as the staple articles and main traffic feeders for the railways will eventually triumph. The summarized figures for the year 1913-14 show the financial position of the principal lines in which British and American capital is invested:

	Miles	Gross receipts	Inc. or dec.	Net receipts	Inc. or dec.	Op. ratio P.C.	Dividends P.C.
United Havana	680	$7,832,721	—$72,915	$3,213,724	—$380,820	58.97	5
Cuban Central	341	2,847,168	—154,383	1,057,905	—229,577	62.84	2
West'n Havana	147	1,393,386	+26,438	491,492	—67,627	64.73	7
Total	1,168	$12,073,275	—$200,860	$4,763,121	—$678,024		
Cuba Railroad	602	$5,020,059	+$518,721	$2,401,734	+$248,268	52.16	6

The set-backs shown in the table are due to an overproduction of beet. The first three lines form a group distinct from the Cuba Railroad, which is American owned. The United group shows decreases, but the balance sheets show a combined reserve of $3,376,800. On the other hand, the Cuba Railroad not only shows an increase in the year's turnover, but has paid 6 per cent, an increase of 2 per cent, though nothing is added to reserve. A recent rise in price of sugar will add materially to the traffic and financial prospects, since an increase of one cent a pound will represent a gain of about $50,000,000 to the revenue of the island.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission has suspended until April 15 proposed increased rates on live stock, fresh meats and packing house products from Chicago, St. Louis and other western centers to eastern cities. The new rates from Chicago to New York, for instance, would have been 33 cents per 100 lb. on cattle as compared with 28 cents, and on fresh meats 50 cents as compared with the present rate of 45 cents.

Dispute Concerning Divisions No Justification for Cancellation of Joint Rates

In re transit regulations on grain and dried beans at points on the Michigan Central. Opinion by Commissioner Daniels:

The commission finds that a dispute over divisions does not justify the Michigan Central in cancelling transit rules and joint rates on dried beans and grain from points on the Detroit & Mackinac, to points on the Michigan Central and its connections. (32 I. C. C., 39.)

Rates from Joplin, Mo.

Commercial Club of Joplin, Mo., v. Missouri Pacific et al. Opinion by Commissioner Clark:

Complaint is made that various rates to and from Joplin, Mo., are unreasonable and discriminatory, as compared with rates to and from Kansas City and Springfield, Mo. The commission finds that no testimony having been offered with respect to rates on newsprint paper from Minnesota points, or on petroleum and its products from Chicago rate points to Joplin, these rates cannot be considered. It also holds that the complaint as to commodity rates on imports from New Orleans and other Gulf ports, and commodity rates from points in Oklahoma, Arkansas, Louisiana and Texas to Joplin is not sustained by competent evidence. Existing class and commodity rates from St. Louis, Mo., to Joplin, applied as parts of through rates on shipments originating east of the Mississippi River are not found unreasonable or discriminatory; and it is held that no such similarity of traffic or transportation conditions exists between Joplin and Kansas City as to justify prescribing proportional rates to Joplin. The carriers are called upon, however, to correct certain inequalities growing out of abrupt increases in rates to points just beyond the limits of the application of so-called outbound jobbers' rates, from Joplin to points in Kansas, Oklahoma and Arkansas. (32 I. C. C., 226.)

STATE COMMISSIONS

The Nebraska Railway Commission, on December 8, denied an application of the Missouri Pacific to increase passenger fares in the state from two to three cents a mile. The commission said that the Nebraska two-cent fare law placed the subject outside the jurisdiction of the commission.

The Illinois Public Utilities Commission on December 9 issued an order in the industrial railways case in which the railways had canceled their allowances to industrial lines controlled by shippers. The commission holds that such lines are common carriers and are consequently entitled to receive allowances and to participate in through rates with the trunk lines.

At a meeting of the members of state railway commissions of eight western states held in Omaha, on December 12, it was agreed that these commissions should concentrate their resistance to proposed advances in freight rates by western railroads which have been suspended by the Interstate Commerce Commission, and that they would combine to engage accountants and other assistants to prepare their case. The commissions of Kansas, Nebraska, Iowa, Minnesota, North Dakota, South Dakota, Oklahoma and Arizona were represented.

The Illinois Public Utilities Commission has rendered a decision approving the proposed consolidation of the Lake Shore & Michigan Southern and its various subsidiaries with the New York Central & Hudson River. The commission in its opinion announces that it does not disapprove of unification, merging or consolidation of public service corporations in Illinois where it can be effected without violating some positive law. The commission also states that with such comprehensive regulatory laws as are now enforced in the states competition loses its force as a corrective agency. "It follows, therefore," the commission says, "that the general plan of consolidation proposed is in complete harmony with the modern idea of governmental regulation in control of public service corporations."

The Public Service Commission of Pennsylvania has ordered that a Certificate of Public Convenience issue approving consolidation and merger, in the matter of the petition of the Lake Shore & Michigan Southern, the Geneva, Corning & Southern, and the Dunkirk, Allegheny Valley & Pittsburgh, these to have leave to consolidate, with other railroad companies into the New York Central. Substantially the same action has been taken by the Public Service Commission of New York state. A protest against the merger was filed at Harrisburg by minority stockholders on the ground that it would be unconstitutional, but the commission's inquiry developed that the consolidation is not within the language of the prohibition in the constitution, inasmuch as no corporation consolidates with or purchases a competing or parallel line. The commission declares, however, that the legality of the action taken by the roads may be questioned at any time in a proper manner before a proper tribunal. The stock remains in precisely the same situation after such a merger as it was before; in fact, the merger is based upon a statutory right which exists even though the parties may have participated in many unlawful transactions. To refuse the merger would in no way correct the alleged wrong. If the commission were to assume jurisdiction of this question and should find the stock to be held illegally it ought to compel a disposition of such stock; but it has no such power. In fact, says, the commission, the contention appears to be based on the illogical thought that if a party to a controversy has committed offenses, he may be denied by way of penalty his legal rights. This, however, is not the law. Even a professional burglar may make a valid will.

Advances in Philadelphia Suburban Fares

The Pennsylvania Public Service Commission, following a hearing held in Philadelphia last week on the complaints of passengers relative to advances in suburban passenger fares which had been announced by the Pennsylvania, the Philadelphia & Reading and the Baltimore & Ohio, on Saturday issued a decision sustaining most of the items in the tariffs filed by the roads, except that the proposed advance of certain rates from one cent a mile to two cents or more is modified so as to make the increase only about five mills; or from 1 cent a mile to 1½ cents. The order, in substance, is as follows:

" . . . It is the judgment of the commission that the withdrawal from sale of the fifty and 100 trip individual commutation tickets, which have been maintained for many years, would unreasonably increase the fares paid by persons who have found these tickets suited to their needs.

"That 2¼ cents a mile is an unreasonably high basis for the charge for a ten-trip ticket, and

"That the sixty-trip monthly commutation ticket and the forty-six-trip monthly school ticket should be valid for a period of one month, and the 180-trip commutation ticket should be valid for a period of three months, all from date of issue, instead of being valid for periods of one and three calendar months only, as heretofore and proposed. . . . The proposed tariffs are unreasonable in making a charge of more than 2 cents a mile for ten-trip tickets.

"A reasonable scale of the charges for suburban passenger transportation in Pennsylvania is one providing for the scale of:

"One-hundred-trip individual tickets, sold at a rate not to exceed 1½ cents a mile, good six months.

"Ten-trip tickets, good for bearer and persons accompanying

bearer, sold at a rate not to exceed 2 cents a mile, good three months.

"Sixty-trip individual monthly commutation as proposed [increased 25 cents a month].

"The carriers are required to file proper tariffs to become effective December 15. . . ."

The Pennsylvania Railroad announced that it would acquiesce in the order.

Declaring that the simultaneous action of the three roads in advancing rates on the same day and to the same degree, gave evidence that they had been engaged in an illegal conspiracy, some of the objecting passengers had called upon the attorney-general at Washington to prosecute the roads under the anti-trust law; but whether this request will be followed up, does not appear.

The Interstate Commerce Commission did not suspend the interstate suburban rates, which were advanced simultaneously with those here dealt with.

Advanced intrastate tariffs filed in New Jersey (to Camden, across the river from Philadelphia) were suspended by the New Jersey commission.

PERSONNEL OF COMMISSIONS

Ross D. Rynder, chief examiner of the Interstate Commerce Commission, has resigned to become commerce counsel for Swift & Co. at Chicago.

George Welch, recently elected, becomes a member of the Tennessee State Railroad Commission on January 1, in place of Frank Avent, who has been a member of the commission for eight years.

John H. Roemer, chairman of the Wisconsin Railroad Commission, has announced his resignation, effective February 1, 1915. He is to take charge of the legal department of H. M. Byllesby & Co., Chicago.

COURT NEWS

The Manufacturers' Railway of St. Louis and the St. Louis Southwestern last week filed a petition in the United States district court at St. Louis for an injunction against the order of the Interstate Commerce Commission, fixing $2.50 a car as the maximum to be paid to the Manufacturers' Railway by trunk lines for switching cars over its line. The petition states that cars from the St. Louis Southwestern can be taken to certain industries only over the line of the Manufacturers' Railway, and that a rate of less than $4.50 a car is not sufficient to pay the Manufacturers' Railway enough to cover the expense.

Russian Railway Policy.—It is reported from Russia that fresh concessions to construct railways will not be granted. But those companies that have begun constructional operations will be allowed to continue. Those, however, with concessions who have not begun construction, will have to put off operations until the end of the war. It may be only a war measure; but it is not so stated.

Will the Railway Map of Africa be Revised.—Whatever may be one's personal opinion of Germany's fitness as a colonizing power, it must be admitted that no other nation, not even France, has realized more fully the imperative necessity of railway construction in colonial development work. As a result, the German railway schemes in her African colonies have been on a grandiose scale. Millions of money have already been spent on the construction of *lignes de pénétration*, together with port and harbor works. Not a single line has so far been productive, but none has been expected to yield a profit yet awhile; the railways have been planned under a policy of developing natural resources, and it is to be presumed that considerations of strategy have also not been overlooked. The question now is, whether other powers will not reap the harvest. A glance at the map of Africa shows that the German colonies are sandwiched in between those of Great Britain, France, Portugal and Italy. For instance, Togoland, together with the Gold Coast, forms an enclave in French territory. The ultimate disposal of these colonies, and their railways, is therefore an interesting subject for speculation.

Railway Officers

Executive, Financial, Legal and Accounting

M. Dailey, general manager of the Muscatine North & South Railway, has been appointed receiver, with office at Muscatine, Iowa.

H. K. Brooks, western manager of the financial department of the American Express Company at Chicago, has been elected vice-president, with headquarters at New York.

E. W. Beatty, whose appointment as vice-president and general counsel of the Canadian Pacific with headquarters at Montreal, Que., has already been announced in these columns was born on October 16, 1877 at Thorold, Ont., but moved with his parents to Toronto when he was ten years old. He is the son of the late Henry Beatty, a well known steamboat man in Canada. After graduating from the Toronto University he studied law in Toronto with a firm of which A. R. Creelman, who was his predecessor as general counsel of the Canadian Pacific was a member. In 1901 Mr. Beatty entered the legal department of the Canadian Pacific as one of the assistants to Mr. Creelman and in March, 1910, he was appointed general solicitor. He remained in this position until July 1, 1913, when he was appointed general counsel with headquarters at Montreal, Que., which position he held until his recent appointment also as vice-president.

E. W. Beatty

George Bury, vice-president in charge of the Canadian Pacific west of Lake Superior, who on January 1, will go to Montreal, Que., to succeed David McNicoll as senior vice-president, was born on March 6, 1866, at Montreal, and was educated at the Montreal College. He began railway work in 1883, as a clerk in the purchasing department of the Canadian Pacific, and has been in the continuous service of that road ever since. From 1887 to 1889, he was secretary to vice-president, and secretary to president, then to March, 1890, was acting superintendent of dining, sleeping and parlor car service. From 1890 to September, 1899, he was successively assistant superintendent in charge of the division from Chalk River to Cartier and Sault Ste. Marie, and superintendent at North Bay, Ont. He was then superintendent at Fort William, Ont., until his appointment in February, 1901, as superintendent of the Crows Nest Pass division. From May, 1902, to 1905, he was general superintendent of the Lake Superior division and then was general superintendent of the

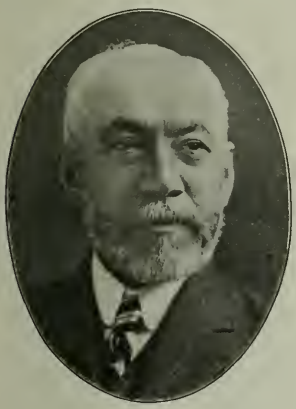
George Bury

Central division, until February, 1907, when he was appointed assistant general manager of the western lines of the Canadian Pacific, at Winnipeg, Man. On March 1, 1908, he was promoted to general manager of the western lines, and in October, 1911, he was elected vice-president and general manager of the same lines, and later was made vice-president in charge of the company's interests west of Lake Superior, with headquarters at Winnipeg, Man. On January 1 he will succeed David McNicoll, senior vice-president, with headquarters at Montreal, Que., and in his new office Mr. Bury will have jurisdiction over the entire system.

The offices of B. W. Fernald, auditor, and of H. Escherich, cashier, of the Tonopah & Tidewater and the Death Valley, have been removed from Oakland, Cal., to Los Angeles.

Thomas R. Beman, assistant general attorney of the Rock Island Lines, has been appointed general attorney. He will have charge of the preparation and approval of contracts. Wallace T. Hughes has been appointed assistant general attorney, and will continue in his present duties in matters relating to interstate commerce. A. B. Enoch has been appointed assistant general attorney, in charge of litigation in Illinois. Headquarters, Chicago.

David McNicoll, whose resignation from the position of senior vice-president of the Canadian Pacific, with headquarters at Montreal, Que., effective January 1 next, has already been announced in these columns, was born in April, 1852, at Arbroath, Scotland, and began railway work in August, 1866, as clerk in the goods manager's office of the North British Railway in Scotland. He remained in that position until 1873, when he went to the Midland Railway in England in the same capacity. The following year he went to Canada and was appointed billing clerk on the Northern Railway of Canada, and then from 1874 to 1881 was chief clerk in the general manager's office of the Toronto, Grey & Bruce, now a part of the Canadian Pacific. From 1882 to 1883 he was general freight and passenger agent of the same road, and then was general passenger agent of the Eastern and Ontario divisions of the Canadian Pacific until 1889, when he became general passenger agent of all lines, rail and steamship, of the Canadian Pacific. He was then appointed passenger traffic manager, remaining in that position until April, 1899, when he was appointed assistant general manager. One year later he was elected second vice-president and general manager and since December, 1903, was senior vice-president of the same road. Sir Thomas G. Shaughnessy, president of the Canadian Pacific, in announcing the resignation of Mr. McNicoll, said that he desired to be relieved of the duties of vice-president in order to rest and recuperate, but he will remain on the board of directors and when his health permits it is expected that he will be asked to accept another important post in connection with the company's affairs.



D. McNicoll

Operating

J. S. Gillespie has been appointed acting general superintendent of the Columbus & Southern, with headquarters at Laurelville, Ohio, succeeding I. F. Anderson, general superintendent, resigned.

R. F. Ledford, assistant division superintendent of the Beardstown division of the Chicago, Burlington & Quincy at Centralia, Ill., has been transferred to St. Joseph, Mo., as assistant superintendent of the St. Joseph division. M. C. Hughes, trainmaster at St. Joseph, succeeds Mr. Ledford.

It is announced that the offices of assistant superintendent of telegraph and assistant signal engineer of the Baltimore & Ohio Southwestern and the Cincinnati, Hamilton & Dayton are abolished. E. T. Ambach, assistant signal engineer of these roads, has been appointed assistant superintendent of telegraph and signals, with headquarters at Cincinnati, Ohio, effective December 15.

Albert D. Caulfield, trainmaster of the Illinois Central at Water Valley, Miss., has been appointed superintendent of the Mississippi division, with headquarters at Water Valley, succeeding John M. Egan, who has been granted leave of absence. The jurisdiction of Ned W. Spangler, trainmaster at Water Valley, has been extended to include Jackson, Water Valley and Grenada districts.

Traffic

R. W. Hunt, superintendent of ticket collections of the Southern Railway, has been appointed division passenger agent, with headquarters at Nashville, Tenn.

W. B. Wheeler, general western passenger agent of the Lehigh Valley at Buffalo, N. Y., having resigned to enter the service of the United Fruit Company, his former position has been abolished, and Norman W. Pringle, New England passenger agent at New Haven, Conn., has been appointed division passenger agent at Buffalo.

W. B. Hinchman, general agent of the Tonopah & Tidewater, has been appointed assistant to traffic manager of that road and the Death Valley, with headquarters at Los Angeles, Cal. D. Aspland, general agent at Goldfield, Nev., has been transferred to San Francisco, Cal., and H. R. Grier, assistant general agent at Tonopah, Nev., has been appointed general agent at that place. The office of F. M. Jenifer, traffic manager, has been removed from Oakland, Cal., to Los Angeles.

Albert J. Simmons, whose appointment as assistant general passenger agent of the Lehigh Valley, with headquarters at New York, has already been announced in these columns, was born on June 2, 1861, at London, Eng., and began railway work in 1872 as an office boy on the Pennsylvania Railroad. He was subsequently clerk on the St. Louis, Iron Mountain & Southern, then clerk on the Wabash, St. Louis & Pacific at New York, and in 1880 was appointed soliciting freight and passenger agent of the Union Pacific, at Boston, Mass. He was later New England agent of the Baltimore & Ohio, and then was New England passenger agent of the Lehigh Valley at Boston. In December, 1904, he was appointed general eastern passenger agent at New York, which position he held at the time of his recent appointment as assistant general passenger agent, as above noted.

A. J. Simmons

Engineering and Rolling Stock

Joseph Korvol has been appointed roadmaster of the Northern Pacific at Sedro Woolley, Wash., in place of W. J. Calvin, resigned.

A. D. Brice, assistant to the master car builder of the San Antonio & Aransas Pass, has been appointed master car builder, with headquarters at Yoakum, Tex., succeeding W. T. Cousley, resigned.

J. A. Cassady, master mechanic of the Alabama Great Southern at Birmingham, Ala., has been appointed master mechanic of the Cincinnati, New Orleans & Texas Pacific, with office at Somerset, Ky., succeeding H. B. Hayes, who has been transferred to Birmingham as master mechanic of the Alabama Great Southern, succeeding Mr. Cassady.

OBITUARY

Charles J. Eddie, formerly for 16 years general western agent of the Chicago, Milwaukee & St. Paul, died at his home in Chicago on December 10, aged 70 years.

F. Wetherald, special passenger agent of the Chicago, Burlington & Quincy at Boston, Mass., died in that city on December 8. He had been connected with the Burlington since 1856. He was traveling passenger agent from 1876 to 1893, when he was appointed special passenger agent at Boston.

Frederick A. Nash, general western agent of the Chicago, Milwaukee & St. Paul, at Omaha, Neb., died on December 11, aged 66 years. Mr. Nash was born at Akron, Ohio, and had been in railway service since September, 1867. He was with the Union Pacific until 1882, when he went to the Chicago, Milwaukee & St. Paul as general agent at Omaha. In 1897 he was appointed general western agent.

Henry S. Hayward, consulting engineer floating equipment of the Pennsylvania Railroad, with headquarters at New York, died on December 14 at Augusta, Ga., at the age of 70. He began railway work in April, 1873, as a machinist and draftsman on the Pennsylvania Railroad, and since January, 1912, was consulting engineer floating equipment of the Pennsylvania Lines east of Pittsburgh. Mr. Hayward's entire service of over 40 years had been with the Pennsylvania Railroad.

William D. Cantillon, formerly general manager of the Chicago & North Western, died at his home in Chicago on December 13. Mr. Cantillon was born on August 5, 1861, at Janesville, Wis., and was connected with the North Western continuously for 36 years, resigning last May on account of ill health. He began railway work with that road as brakeman in 1878. He was afterwards conductor, and from 1891 to 1893 was trainmaster at Milwaukee, Wis. He was then for four years assistant superintendent at Milwaukee, and was made division superintendent at Winona, Minn., in 1901. In July, 1902, he was promoted to assistant general superintendent, and in January, 1906, was appointed assistant general manager. Mr. Cantillon became general manager in November, 1910, which position he held at the time of his retirement last spring.

W. D. Cantillon

Colonel Edward D. Meier, formerly president of the American Society of Mechanical Engineers, died on December 15 in New York City at the age of 73. He was born in St. Louis, Mo., and graduated from Washington University in 1858. He subsequently spent four years in Germany at the Royal Polytechnic College in Hanover, and later became an apprentice at the Mason Locomotive Works, Taunton, Mass. After serving in the United States army during the civil war he entered the service of the Rogers Locomotive Works at Paterson, N. J. He subsequently was superintendent of machinery of the Kansas Pacific, now a part of the Union Pacific. In 1870 he became chief engineer of the Illinois Patent Coke Company, and two years later was secretary and construction engineer of the Meier Iron Company, and in 1884 organized the Heine Safety Boiler Company, of which he was president at the time of his death. Previous to 1908 he was president of the American Diesel Engine Company and introduced the Diesel motor into this country. He was president of the American Boiler Manufacturers' Association in 1898; president of the American Society of Mechanical Engineers in 1910, and in 1913 represented that society in Munich, at a joint meeting with the German Engineering Society.

Equipment and Supplies

LOCOMOTIVE BUILDING

The London & Port Stanley, London, Ont., has ordered 3 electric locomotives from the Canadian General Electric Company.

CAR BUILDING

The Chicago Great Western is in the market for 2 60-ft. postal cars.

Pennsylvania Railroad.—The item in the *Railway Age Gazette* of last week that this company had ordered 1,050 all-steel box cars from the Altoona shops was in error, in that this was not a new order, but merely the authority to proceed with an old order which had been held in abeyance.

Railway Construction in the Brazilian State of Rio Grande do Sul.—There are now in operation in the Brazilian state of Rio Grande do Sul 1,489 miles of railway and about 200 miles more will be opened to traffic before the end of the present year. In April last the president of the state published a decree setting forth the plans for the extension of the government lines, on which work will commence soon. These lines, as proposed, will open up some of the wealthiest lands in the state.

The Sierra Leone Government Railways.—The Sierra Leone Government Railways are in the unusual position among African railways of having a 2 ft. 6 in. gage. The main line runs from the port of Freetown to Pendembu; and an extension of 30 miles from Yonni Banna to Makump was opened for traffic in February, 1913. There is also a mountain railway from Freetown up the Lion Rock, a distance of 6 miles, which is worked by adhesion and has a general grade up the mountain of 3.33 per cent. With the extension, the total length of line is now 300 miles. The recently published report of the general manager for the year 1913 shows satisfactory results. Gross receipts, $818,511, showed an increase of $127,677, and the net earnings, $380,358, were $57,460 better, giving a return of 5.78 per cent on capital expenditure. The percentage of operating expenses to receipts was 53.53. As usual, the principal item of outbound freight traffic was palm kernels, of which 25,820 tons were carried, earning $327,545 in 1913, as compared with 22,016 tons and $283,050 in 1912. The highest rated inbound traffic was spirits, of which 2,746 tons were carried, earning $66,412. A revised tariff with certain reductions in passenger fares and alterations in freight rates is in course of preparation.

Some Notes About Armored Trains.—It would be an interesting problem for military historians to determine when the idea originated of using the railway trains as weapons of offence. The British have been familiar with the armored train since the campaign in South Africa. In fact, it was in connection with a little affair at Estcourt, in which an armored train figured so prominently, that some of the first shots of the war were fired. As a weapon of offence, the armored train possesses two very remarkable and outstanding advantages. It has remarkable mobility, and is easy to construct, the sole requirements being suitable light guns and metal plates or sheets for the protection of the locomotives and rolling stock employed. Public attention has lately been more focussed on the more spectacular armored motor car, which has really done remarkable execution, but this weapon is not of much use save for very effective scouting and in roadside skirmishes. The armored train, on the other hand, is really a mobile fort, capable of traveling at a speed far in excess of that attainable by any army, and able, like a man-of-war, to discharge a broadside when in motion. Accounts would seem to indicate that the problem of taking up the recoil has not yet been solved entirely, but the difficulties experienced in that respect appear neither serious nor insuperable.

Supply Trade News

The Concrete Mixing & Placing Company, 123 W. Madison street, Chicago, which has formerly handled the pneumatic mixer and conveyor in western territory, now has extended its business to cover the entire country.

The Mesta Machine Company, Pittsburgh, Pa., has recently acquired the rights from the Stumpf Una-Flow Engine Company, Syracuse, N. Y., to build the Stumpf Una-Flow type of engine in the United States. The agreement not only gives the Mesta Machine Company the patent rights of Professor Stumpf, but includes the use of the knowledge gained by the practical experience of European builders of Stumpf engines.

Arthur E. Jackman has been appointed manager of the machinery department of the Walter A. Zelnicker Supply Company, St. Louis, Mo., succeeding J. J. Hilpirt, who has resigned to become storekeeper of Cia. Mexicana De Petroleo, "El Aguila" S. A. at Tampico, Mex. Mr. Jackman was at one time general manager of the Sea View Railroad and the Narragansett Pier Electric Light & Power Company. He was also for years in the railway and lighting department of the Westinghouse Electric & Manufacturing Company, and left the position of superintendent of the East St. Louis, Columbia & Waterloo Railway to assume his present duties.

H. C. Hequembourg, whose election to the vice-presidency of the Standard Chemical Company, Pittsburgh, Pa., has been announced in these columns, was born in St. Louis, Mo. He received his education at Dunkirk, N. Y., and spent the first 21 years of his business life with the Brooks Locomotive Works of that city in the positions, respectively, of bookkeeper, cashier and assistant secretary. When the American Locomotive Company was incorporated in June, 1901, he was made its general purchasing agent, and has remained in that position up to the acceptance of his new appointment. The Standard Chemical Company is a refiner of carnotite ores and produces radium, uranium and vanadium. Mr. Hequembourg as vice-president of the company will be its representative in the east and will have headquarters at 30 Church street, New York. He will also represent the American Vanadium Company in the east. Mr. Hequembourg during his many years with the American Locomotive Company has made many friends in New York, and it is with pleasure that they learn that he will continue to have his offices in that city.

H. C. Hequembourg

The fire that destroyed part of the Edison Phonograph Works at Orange, N. J., on December 9 did not in any way affect the Edison Storage Battery Company. One end of the large concrete buildings of the battery works is across the street from Mr. Edison's private laboratory, which was saved, and this as well as the rest of the plant escaped unscorched. The fire started about 5:20 in the afternoon and was under control by 10 o'clock. The telephone exchange was in one of the burned buildings, but through the prompt action of the New York Telephone Company a temporary switchboard was working in the battery office before business hours the next morning and the Public Service Electric Company had emergency lines furnishing power nearly as soon. The business of the Edison Storage Battery Company, therefore, suffered no interruption whatever.

Railway Construction

Atlanta, Birmingham & Atlantic.—A contract has been given to Thomas Worthington, Birmingham, Ala., to build a freight line to serve coal mines from Roebuck, Ala., to Coalmont, 1.5 miles.

Canadian Pacific.—An officer of the Esquimalt & Nanaimo writes that surveys have been made and the right of way partly cleared for an extension from Courtenay on Vancouver Island, B. C., to Campbell River, 30 miles.

Charles City Western.—Plans are being prepared for the extension of this line from Charles City, Iowa, in a northeasterly direction, a distance of 18 miles. This work is to be done next spring in connection with the electrification of the present line. E. R. Ernsberger, Charles City, Iowa, is general manager.

Chartiers Southern.—An officer writes that grading work is about finished and the bridge masonry and tunnel work have been completed on the line from a point near Eighty Four, Pa., south to a point near Marianna, 10.27 miles, but further work has been indefinitely postponed. Contracts were let in 1913 to the Brocklehurst & Potter Company, New York, to build the line. E. V. Braden is engineer, Pittsburgh, Pa.

Chicago, Milwaukee & St. Paul.—Extended improvements are being planned by this company at Mason City, Iowa, but work will not be started until next spring.

Eastern Maine.—An officer writes that this company is making surveys from the line from Bangor, Me., to Houlton, about 112 miles, and has just completed the location of the section from Bancroft to Houlton, 32 miles. G. W. Maxfield, president, Bangor. (October 9, p. 670.)

Erie.—An officer writes that this company and subsidiary lines will carry out double tracking work as follows: Between Allegany, N. Y., and Carrolton, 5.6 miles; Chicago & Erie between Lomax, Ind., and Griffith, 36 miles; Sharon Railway, between Ferrona, Pa., and West Middlesex, and between New Castle Waterworks and New Castle Junction, 12 miles; Nypano Railroad from Steamburg, N. Y., to Waterboro, 9 miles, and Cleveland & Mahoning Valley, on the Canal branch, from Youngstown Ohio, to Girard, 5 miles.

Esquimalt & Nanaimo.—See Canadian Pacific.

Fresno Interurban (Electric).—A line is being built from Fresno, Cal., to Las Palmas, 5 miles, and from thence to Centerville, 16 miles. There will also be a branch running from Las Palmas to Clovis, 5 miles. Grading will amount to about 6,000 cu. yd. a mile. The line will cross seven main irrigation canals on framed trestles, each about 60 ft. long. Work is about 30 per cent completed.. Mahoney Brothers, San Francisco, are the general contractors. John B. Rogers, San Francisco, is president of the railway company.

Gulf, Florida & Alabama.—An officer writes that in addition to the extension now being built from Broughton, Ala., north to Kimbrough, 52 miles, on which work is now under way by the Eastern Construction Company, Pensacola, Fla., the company has located 145 miles from Kimbrough to Tuscaloosa. The company now operates a 90-mile line from Pensacola, Fla., north to Broughton, Ala., and a 11-mile branch line.

Illinois Central.—An officer writes that the improvements now under way include grade reduction and second track work between Princeton, Ky., and Dulaney on 11.10 miles; relocation of 5.25 miles at Iron Hill, and grade reduction at Grand Rivers on 0.60 miles. The contractors are H. C. Hodges, Birmingham, Ala.; Winston Brothers Company, Minneapolis, Minn., and the Walsh Construction Company, Davenport, Iowa. Grade separation work is also under way on 1.37 miles at Matoon, Ill. J. D. Lynch, Monmouth, Ill., is the contractor.

Midland Continental.—An officer writes that surveys are now being made for an extension from Wimbledon, N. D., to Grand Forks, 94.5 miles.

Nevada Short Line.—We are told that this company is building a 3-ft. gage line to be 12 miles long, from Oreana, Nev., or Nenzel on the Southern Pacific to the new mining camp of Rochester. About nine miles has been completed. A. A. Codd, president and general manager, Reno, and R. E. Tilden, chief engineer, Winnemucca, Nev.

Ottawa & St. Lawrence Electric.—A grading contract is reported let to Eastman, Kenny & Stearns, Russell, Ont., to build the section between Russell and Metcalfe. The company made plans about two years ago to build 275 miles of railway out of Ottawa, and to use gas-electric cars for operating the line. H. W. Pearson, Confederation Life building, Toronto, is secretary.

Salt Lake & Ogden (Electric).—An officer writes that 1.06 miles of new line will be built from the present terminal at Salt Lake City, Utah, to the new terminal, to be used jointly with the Salt Lake & Utah, and 0.33 miles will be built at Ogden to connect with the new terminal to be used jointly with the Ogden, Logan & Idaho.

Seattle, Port Angeles & Lake Crescent.—The grading, bridge work, etc., are being completed on the new line from Port Angeles, Wash., eastward to the line of the Port Townsend Southern, 37 miles. C. J. Erickson, Seattle, Wash., is the general contractor. The track will be laid by company forces. This stretch of new road is part of the original proposed line which extends from a point 25 miles west of Port Angeles through Port Angeles eastward via Sequim to a connection with the Port Townsend Southern at the head of Discovery Bay, 37 miles, and then to a terminus on Puget Sound, not yet selected. Work on this last section, which is 12 to 15 miles long, has not yet been begun. E. O. Reeder, Seattle, Wash., is chief engineer.

South Dakota Central.—An officer of this company, which operates a line from Sioux Falls, S. D., north to Watertown, 102.8 miles, writes that a contract has been given to P. E. Shugart, Nevada, Iowa, to build an extension from Watertown north to the Chicago, Milwaukee & St. Paul, 28 miles.

RAILWAY STRUCTURES

Boone, Iowa.—The Ft. Dodge, Des Moines & Southern has started the work of replacing the wood bridge spanning the Des Moines river between Boone and Fraser, with steel deck girders placed on concrete abutments and piers. There will be six spans. The concrete work on the south abutment and three piers has just been completed, and the deck girders for these spans have been ordered, and when in place will replace all of the pile trestle work up to the old Howe truss. This will constitute all the work that is contemplated at the present time, but it is stated that if financial conditions permit the bridge will be completed in 1915. The concrete work is being done by company forces.

Chicago, Ill.—The Illinois Central has commenced the construction of a hospital and power house to be located on Stony Island avenue, between Fifty-seventh and Fifty-ninth streets, Chicago. The main building will be 266 ft. long, 47 ft. wide and four stories high, with a rear wing 59 ft. by 47 ft. in area two stories high. The power house, which includes the laundry, will be 89 ft. by 48 ft. in area and two stories high. Both buildings will be of brick and stone construction and strictly fireproof. The estimated cost is $300,000. Schmidt, Garden & Martin, Chicago, are architects, and James Stewart & Co., are the general contractors. The foundations are already in place and the entire work is to be completed by October, 1915.

Parsons, Kan.—Work is to begin at once on the construction of a brick office building of the Missouri, Kansas & Texas, at Parsons, Kan. The building will be 51 ft. by 179 ft. in area and three stories high. The estimated cost is $50,000. The Wimmer Contracting Company, St. Louis, Mo., has the general contract.

St. Paul, Minn.—The directors of the St. Paul Union Depot Company have reached an agreement on plans for the construction of the proposed new union depot to cost between $12,000,000 and $15,000,000, and have announced that the final plans will be ready to be submitted to the city authorities in about two weeks.

Railway Financial News

Buffalo, Rochester & Pittsburgh.—The New York Public Service Commission, Second district, has approved of an issue of $1,020,000 4½ per cent consolidated mortgage bonds of the Buffalo, Rochester & Pittsburgh at a price to be fixed later.

Chicago & North Western.—Kuhn, Loeb & Co., New York, bought from the Chicago & North Western and resold to the public $10,000,000 general mortgage 5 per cent bonds due November 1, 1987. The offering price to the public was 102½, the yield on this basis being about 4⅞ per cent.

Illinois Central.—Kuhn, Loeb & Company have bought from the Illinois Central and resold $5,000,000 Chicago, St. Louis & New Orleans 5 per cent equipment trust notes guaranteed by the Illinois Central. The notes were offered by the bankers at par and were oversubscribed.

Michigan Central.—A semi-annual dividend of 1 per cent has been declared, payable January 29. This reduces the annual rate from 6 per cent to 2 per cent, in 1914 a total of 4 per cent having been declared. The annual rate has been 6 per cent since 1907.

Pennsylvania Railroad.—See Vandalia.

St. Louis & San Francisco.—The receivers are making arrangements to sell $3,000,000 6 per cent receivers' certificates to refund the $3,000,000 receivers' certificates which mature on January 1.

Southern Railway.—Holders of the outstanding $4,722,000 Richmond & Danville consolidated mortgage 6 per cent bonds which mature on January 1, 1915, are offered the privilege of exchanging these bonds for Southern Railway first consolidated 5's at 98½.

Vandalia.—The regular annual dividend of 4 per cent, which is This price is $1,500,000 less than the price fixed for the former usually declared at this time of the year, has been passed. The Pennsylvania owns $12,114,000 of the total $14,614,000 stock of the Vandalia.

Wheeling & Lake Erie.—Judge Clarke, in the federal district court, has fixed the upset price for the sale of the Wheeling & Lake Erie at $18,500,000, the road to be sold before April, 1915, sale, at which there were no bidders.

Turks Seize a British Railway.—A Constantinople message states that the Turkish government has confiscated the Ottoman (Smyrna to Aidin) Railway.

New Railways Constructed in Germany.—According to the *Nieuwe Rotterdamsche Courant*, the Germans have been amazingly busy creating a network of strategic railways. It is stated that between Berlin and Cologne no fewer than eight sets of railway lines have been laid down.

Strategic Railway in South Africa.—The construction work on the railway from Prieska to Upington, on the northwest border of the Cape Province, has now been completed, and the first train went through on November 18. The line, 142 miles in length, follows approximately the course of the Orange river, and is of considerable military and strategic importance.

Railway Construction in French Congo.—In order to avoid the present necessity of using the Belgian railway (Matadi-Leopoldville) for transporting passengers and freight to Middle Kongo and the Ubangi-Tchad colonies, France has resolved to construct a railway from Pointe-Noir on the Atlantic coast inland to Brazzaville, in the neighborhood of Stanley Pool on the Congo river, and an appropriation amounting to about $18,000,000 has been voted toward the project by the French Chamber. This will probably have little effect upon the transport of merchandise for Belgian Congo, but the Matadi-Leopoldville line will lose the French traffic and possibly a considerable portion of that for the southern part of German Kamerun.

An Inefficient Efficiency Engineer

"What is the old nuisance about now?" is a query propounded to us by a railroad officer, also a member of the American Society of Mechanical Engineers, who recently received a circular from a much-advertised efficiency engineer criticizing the lack of facilities provided by the society. Our answer is that, like Clifford Thorne, he is bound to seek notoriety, particularly now that the public at large is forgetting his attacks on the railways and is getting so used to seeing his flamboyant efficiency correspondence school advertisements that they have grown tired of them. The editor of the American Machinist, who has carefully investigated the claims made in the circular and discusses them in detail in this week's issue of his publication, shows that practically all of the facilities, the lack of which is deprecated, are already provided, and makes this significant statement: "The circular shows that he knows nothing about the society's work. The first principle of efficiency is a knowledge and proper use of facts. Judged by this standard and in this case the author of the circular is amazingly inefficient."

A Substitute for the Full Crew Law

A newspaper item received recently stated that it is proposed to introduce in the Illinois legislature a bill to limit to 50 the number of cars in a freight train "to avoid the obstruction of street crossings by long trains." Another newspaper received the same day mentioned such a bill as a part of the legislative program of the Brotherhood of Railroad Trainmen. Evidently the overwhelming defeat of the full crew law in Missouri by a referendum vote of the people at the recent election has taught the labor leaders that legislation to create jobs must be sugar-coated in another form, for, of course, the purpose of the two laws is the same. The brotherhood has been able to secure the passage of full crew laws in a number of states by reinforcing the votes of those legislators who are always willing to jump at the call of the labor leader with those of the class of politicians who have kept themselves in office by always opposing the railroads, and probably with those of a few who were deceived by the argument that more men on a train would promote safety. In the same way it is doubtless believed that to the votes of those who will always vote for labor against the railroads may be added some of those who may remember the exasperating delays sometimes caused by waiting for a long freight "drag" to pass a crossing. One of the chief methods by which the railroads have been able partially to offset the rising tendency of wages and expenses of all kinds has been by increasing the trainload. The public is gradually learning one salient fact of railroad economics, and that it is the public that pays the railroad's expenses, and it should not be especially difficult to convince the people that hauling shorter trains will not help the railroads to give better service, reduce rates or pay higher wages to their employees. By increasing expenses it will tend to increase rates. A law to limit the length of trains has one advantage over the "full crew" law. Both mean the employment of more men, but the latest plan to legislate men into jobs would make it necessary for them to work for their pay.

Apportioning Grade Separation Costs

In a decision handed down a few days ago involving the separation of grades between the Chicago & Alton, and an important highway near Independence, Mo., the Public Service Commission allotted 60 per cent of the cost to the railroad and 40 per cent to the county. At Tower Grove, St. Louis, this commission made a similar division between the Missouri Pacific, the Frisco and the city a few months ago. In a hearing involving the extension of an electric line along a public highway to reach a proposed state institution near Alton, Ill., the Public Utilities Commission has just rendered a decision establishing a division of cost for the separation of the grades of this line with the Chicago & Alton and the Chicago, Burlington & Quincy. The Alton and the Burlington are ordered to pay 33⅓ per cent of the cost of their respective crossings, the state 31⅔ per cent, the electric line 25 per cent, and the city and township the remaining 10 per cent. While these are by no means the first instances in which the cost of such work has been thus divided, this practice has not been sufficiently common, especially in the west. In Chicago, for instance, where over $70,000,000 already has been spent for track elevation, the roads have been required to pay the entire cost of the work with the exception of the incidental damages which

the city assumes. These recent rulings indicate a desire on the part of the commissions to apportion the cost of the improvements on the basis of the benefits secured and the rights of the parties at interest. Such a practice not only effects a more equitable distribution of the cost, but it also serves as a check on the demands of the public, for the people are naturally conservative when they know they will be called on to pay their share of the cost. This was illustrated at Milwaukee where in a hearing before the railroad commission some time ago regarding the separation of grades for a considerable distance the city originally demanded the construction of subways at a large number of streets, but the statement of the commission of its intention to assess the city for a portion of the cost resulted in a very material modification of its demands. There is no railway improvement the benefits of which the public shares with the railroad more directly than the separation of street and railway grades, and it is refreshing to see a more general realization of this on the part of the commissions.

THE DECISION A VICTORY FOR REGULATION BY COMMISSION

THE original decision of the Interstate Commerce Commission in the five per cent rate case caused it to be severely criticized. There was a strong feeling in many quarters that the decision indicated an indisposition on the part of the commission to recognize the conditions which had arisen in the railway business, and to deal with rates accordingly. Many of the best friends of regulation by commission began to grow sceptical regarding its success.

The decision rendered by the commission last week, in the rehearing of the five per cent rate case, puts both the commission and the policy of regulation by commission in a different light. The commission acted very promptly in giving the eastern roads a re-hearing; it conducted the taking of testimony expeditiously; it rendered a decision as speedily as it could be expected to, and it granted the railways most of the advances for which they asked. It refused to grant some of them, but on the other hand it had already permitted some advances in passenger rates for which the railroads had not originally asked, and it had suggested to them various reforms in their service and rates the adoption of which would increase their net revenues.

On the whole, the outcome reflects credit on the commission and on the policy of regulation by commission. The commission rose to its responsibility and dealt with the question as a big question of public policy. Important as is its action in granting a horizontal advance in rates, of hardly less importance is its further action in directing attention to the need for reforms to remove the inconsistencies and discriminations in service and rates which every student of the subject knows exist. Not only is it the function of regulation by commission to enable the railways to earn a return which will be just alike to them and the public, but it is also its function to see that the services rendered and the charges made by them are not unfairly discriminatory; and the commission is to be commended for trying to perform both of these functions in the same case.

While the final outcome is good, it cannot be said that either the time taken or the means used in arriving at it have been satisfactory. While the re-hearing was conducted and the final decision reached with commendable promptness, there is a general feeling among railway and business men which is not without justification, that there are too many suspensions of proposed advances in rates, and that it usually takes the commission too long to dispose of important rate cases. The trouble is not so much with the commission as it is now constituted, as it is with the laws which have created it and under which it acts. The laws have piled burden after burden on the commission without providing it with the organization and facilities needed to enable it properly to do its work.

Therefore, while satisfaction is being expressed with the outcome of this particular case, the need for permanent and fundamental reforms in the present policy and system of regulation must not be allowed to be forgotten. This is a problem to which the best minds in public life and in business life should devote themselves. It is futile and unjust to criticise the commission as now constituted for not doing what no body of seven men, with no better organization and facilities than the commission has, could do. The commission is doing its best. The railway men, business men and public men of the country should unite with it in helping it to do better.

THE EFFECT ON BUSINESS

THE decision of the Interstate Commerce Commission in the eastern rate advance case seems bound to have a good effect on business. The effect may not become immediately manifest, but it is only a matter of time until it will be felt. It is probable that on the basis of the normal movement of traffic the advance in both freight and passenger rates which the commission has now authorized will increase the earnings of the eastern roads by from $30,000,000 to $40,000,000 a year. The traffic moving at present is light, and so long as it continues to be so light the eastern roads will probably have to feel their way somewhat carefully, but manifestly an increase of $30,000,000 in their annual earnings will make it practicable for them greatly to increase their total expenditures. This amount of money, if used entirely for the purpose of paying a return on new capital, would yield six per cent per annum on $500,000,000. No further statement is necessary to show how important the direct effects of this advance in rates may be in helping the railways to get needed new capital.

More important, however, than the direct effects of the decision will be its indirect effects. The securities of American railways were beginning to be regarded with suspicion by investors all over the world. A feeling had begun to develop that regulation of rates in this country meant merely preventing advances or causing reductions in them. It was obvious that if expenses continued to increase and rates continued to stand still or go down it was but a matter of time until American railway securities would become a very bad investment. By its decision the Interstate Commerce Commission has shown in the most conclusive manner its recognition of the fact that it is as much its function to protect and help the railways when they need and deserve it as to restrain and punish them when they deserve these things.

The increases granted in the east may probably be regarded as the forerunner of advances which will be granted to the western trunk lines. On the whole, therefore, the decision should cause a vast improvement in the sentiment of the investing public regarding our railway securities and improve the market for them. Whatever enables the railways to raise more money will enable them to spend more, and whatever enables the railways to spend more will enable them to employ more labor and buy more supplies, and should exert a stimulating effect on business of all kinds.

The greatest danger with which the railways are confronted is one on which there has been little public comment as yet. This is that the advances in rates which have been granted, and others which may be granted, will be absorbed by advances in labor costs. Railway labor has been steadily increasing its demands ever since 1907, and it shows no disposition to desist from doing so. Railway labor, like other labor, should be paid reasonable wages, but it should not be allowed to secure unreasonable and wasteful conditions of employment or excessive wages. If every advance in rates is to be offset or more than offset by increases in the cost of labor there will be no increase in railway net earnings. The future demands of railway labor should be scrutinized by the public in the most careful manner, for upon the concessions made to labor will largely depend the most important future developments in the railway business.

IT IS NOW UP TO THE EASTERN RAILROADS

THE decision of the Interstate Commerce Commission in the eastern rate advance case is important, not only because it will increase the revenues of the railways directly affected, but also because it indicates a disposition on the part of the commission to vigorously help the railways of the country generally to get whatever increases in earnings they may need. In one way this reduces the burdens and responsibilities of railway managers. Their inability to increase their revenues in proportion to the advances in their expenses was rapidly bringing them face to face with an impossible situation. In another way the decision greatly increases the responsibility of railway managers. It is most important that this point should be emphasized.

The managers of the railways went before the commission and said that they needed an advance in freight rates. This advance, they said, was essential in order that they might increase their net earnings. The increase in their net earnings was essential in order that they might raise and maintain their credit, and make the increases and improvements in their facilities which the interests of the public demanded that they should make. This was the argument the railway managers presented in 1910; it was their argument in 1913; it was their argument in 1914.

In the original rate advance cases the commission held that the railways did not need larger net earnings. In the 1913 case, which was decided in July, 1914, it held that the eastern lines did need larger net earnings, but found that it would be best that they should secure most of them by means other than a horizontal advance in their freight rates. The railways returned to the attack. Developments, they said, had shown that the need for an increase in their net earnings was important and pressing, while the working out of the various reforms in their ratemaking and service, which the commission had suggested, would take much time. Therefore the commission ought to give the eastern lines at once the horizontal increase in freight rates for which they asked and let the working out of the reforms which it had suggested follow after. The commission in its latest decision has in the main acquiesced in this policy. It has given the roads most of the increases in freight rates for which they originally asked. It has allowed them to make advances in passenger rates for which they did not originally ask.

The railways, by the line of argument which they have adopted in order to get the advances in rates which they have now secured, have given hostages to fortune. They have committed themselves beyond recall. Not merely by implication, but in the most express terms they have bound themselves in honor to do certain things. They have pledged themselves to the commission and they have pledged themselves to the public. It is now strictly up to them to make good. If they do not make good they will deservedly sacrifice the confidence of the commission and the public.

In the first place the roads have morally obligated themselves loyally to cooperate with the commission in eliminating the inconsistencies and unfair discriminations in their present services and rates. Chairman Harlan was amply justified in saying in his dissenting opinion that many such inconsistencies and discriminations exist. It is to the interest of the railways and the public that these things shall be remedied. They cannot be remedied without one railway sacrificing something here, and another sacrificing something there. They cannot be remedied without taking from some shippers improper favors of which they have been the recipients, and imposing on other shippers burdens from which they have escaped in the past, but which in fairness they should be made to bear.

Already there has been manifested a disposition on the part of some railway managers to refuse to do some of the things that ought to be done. The big shippers are always on the job and, unfortunately, there are many railway men who lack the strength of character or the brains to resist them and act squarely and intelligently. The entire railway situation ought not to be allowed to be compromised and imperiled by the weak or unscrupulous few. The commission has done the square thing by the railways. It is now up to the railways to do the square thing by the commission, the public and themselves.

To be specific it is up to them to eliminate from their tariffs the discriminations which every one knows they contain, whether taking the form of services or rates. It is up to them, for example, to eliminate such rates as the one the Wabash and the Chicago & Alton are now making on packing house products between Kansas City and Chicago. How can the managements of these roads face the commission with positions for any advance in rates when they voluntarily keep in effect such a rate?

Again, the eastern roads are in honor bound, in view of the testimony and arguments presented on their behalf in this case, to use the additional resources which the decision will give them in the most careful and efficient way for the improvement and enlargement of their facilities. In other words, they are bound to use them for railroad rather than for financial purposes; and when we say "financial purposes" we have in mind such use of railway earnings and credit as was made by Mr. Mellen in New England. The public and the commission expect, in view of what the spokesmen of the railways said in the hearings in the rate advance case, that the additional earnings of the railways and the additional funds which these additional earnings will enable them to raise, will be spent upon the physical properties, and that these expenditures will be made, and that the properties will be operated, as economically and efficiently as human frailty and human ability will permit. The public and commission have shown a willingness to permit the railways to increase their net earnings by increasing their rates, but this has been on condition that the best use possible would be made of the additional revenue, and if the railways are to keep and deserve the confidence of the public and the commission they must meet this condition.

The railway managers have, in effect, conceded that they are quasi-public officials performing a quasi-public duty. To their stockholders they owe the duty of earning for them reasonable returns, by which are meant returns sufficient to get adequate capital invested in the railway business. To the public they owe, and have admitted that they owe, the duty of not only operating the properties as efficiently and economically as possible, but of raising capital as economically and spending it as efficiently as possible, and, since they have voluntarily recognized that they owe this duty to the public, it is strictly up to them to perform it.

Most of the managers of the railways feel, concede and are fully prepared to live up to, their duties and responsibilities in respect to the matters mentioned, and this, not merely as a matter of policy, but also as a matter of principle. Others, we fear, admit their public duties and responsibilities less as a matter of principle than as a matter of policy. Some do not admit them either as a matter of expediency or as a matter of principle. The future of the railways of this country depends chiefly on whether the first-named class of railway managers—and under this heading we include railway financiers—will or will not prevail in the counsels of the railways.

UNION PACIFIC

THE Union Pacific finished the fiscal year, ended June 30, 1914, with a surplus available for dividends of $33,094,000, or about 10 per cent less than the surplus available for dividends in the previous year. Revenue amounted to $92,115,000, 1.6 per cent less than in 1913, and the decrease is accounted for entirely by a shorter average haul. Expenses amounted to $55,410,000, an increase of 2.6 per cent, accounted for entirely by increased charges for maintenance of equipment and increased traffic and general expenses. The increase in traffic and general expenses was the direct result of the separation of the Southern Pacific and Union Pacific, which necessitated the establishment of separate traffic agencies and general offices.

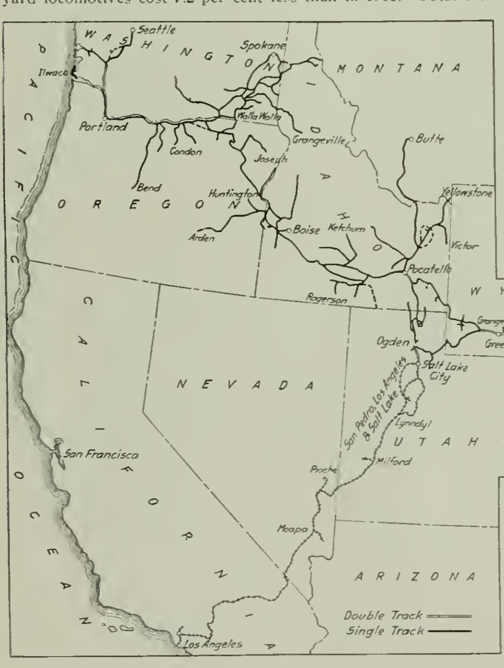
Transportation expenses in the fiscal year 1914 amounted to $25,326,000, a decrease of 2.9 per cent as compared with the previous year. This decrease in transportation expenses is de-

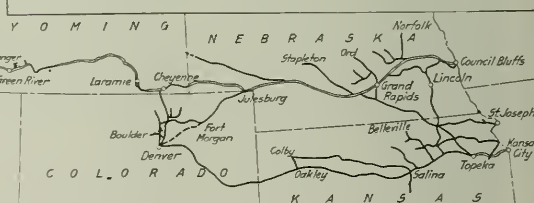
spite an increase in mileage operated of 248 miles, the average in 1914 being 7,597 miles, and despite also a shorter average haul, which, of course, may or may not have affected transportation expenses, and despite a smaller average trainload, the trainload in 1914 being 431 tons, as against 437 tons in the previous year.

The Union Pacific's operating statistics illustrate how deceptive an average revenue trainload may be as a sole test of operating efficiency under certain circumstances. Whereas the revenue trainload decreased by 1½ per cent, and the trainload, including company freight, by 1 per cent, the average gross tons per freight-train mile, including cars and contents, were 1,242 in 1914 as against 1,203 in 1913, an increase of 3.2 per cent, and the gross tons per freight-locomotive mile were 1,092 in 1914, an increase of 3.8 per cent.

This gain in tonnage handled behind the drawbar by freight locomotives is particularly interesting, since by far the greater part of the saving made in transportation expenses was in the cost of fuel. Fuel for road locomotives in 1914 cost $6,856,000, which is less by 8 per cent than the cost in 1913, and fuel for yard locomotives cost 7.2 per cent less than in 1913. Total locomotive mileage in 1914 was 39,618,000, or 1.9 per cent greater than in 1913. Fuel coal cost $2.04 per ton in 1914 as against $2.11 in 1913. This is a saving of 7 cents; but far more important is the increase in miles run per ton of coal. In 1914 miles run per ton of coal was 10.52; in 1913, 9.75, an increase in miles run per ton of coal of nearly 8 per cent.

Of the total tonnage carried in 1914, amounting to 24,812,000 tons, 7,656,000 was inter-system freight, which is the materials and supplies carried by one line for another and materials and supplies used in construction of extensions, etc. Of the remaining 17,155,000 tons, 29.83 per cent was products of mines, 29.45 per cent products of agriculture, 16.76 per cent products of forests, 11.10 per cent manufactures, 5.82 per cent products of animals and 5.13 per cent merchandise. As has already been mentioned, the tonnage carried increased by 3.72 per cent, the principal changes being a decrease of 9.12 per cent in the tonnage of manufactures and 3.93 per cent in livestock and animal products, with an increase of 10.76 per cent in forest products, of 9.66 per cent in products of agriculture and of 2.56 per cent in merchandise.





The Union Pacific owns a half interest in the Salt Lake Route.

The Union Pacific

The Union Pacific's annual report presents maintenance of way figures in an exceptionally clear and comprehensive manner. On the same page in which the primary accounts under maintenance of way are shown for 1914 and 1913 there are also shown average miles of first and additional track operated, and amounts of material used in maintenance and the mileage of each class of weight of rail in track at the end of the year. The average cost of maintenance per track-mile, excluding sidings, was $1,251 in 1914, a decrease of 3.4 per cent. In 1914 2.34 per cent of all rails in the main track was renewed as against 2.95 per cent in the previous year, and 7.46 per cent of all ties, including ties in side-tracks, was renewed in 1914 as against 7.78 per cent in 1913. It is interesting to note that in 1914 $376,000 was spent for maintenance of signals, telegraph and power lines, an increase over 1913 of $150,000, or over 66 per cent.

Maintenance of equipment amounted to $12,123,000, an increase over 1913 of 13.4 per cent. The following table shows the amount spent per unit of equipment for repairs, renewals and depreciation in 1914 and 1913:

	1914	1913
Locomotives	$3,926	$4,052
Passenger-train cars	1,046	926
Freight-train cars	113	92

In 1914 the Union Pacific spent a total of $5,131,000 for additions and betterments, $12,601,000 for equipment, exclusive of renewals, and $5,138,000 for extensions and branches. Of the additions and betterments the largest expenditures were $1,161,000 for second main track and $633,000 for sidings and spur tracks. Of the charge for equipment $7,510,000 is accounted for by the Union Pacific's taking over equipment previously leased from the Union Pacific Equipment Association; but of the new equipment added to that available the most important item was the purchase of 3,949 freight-train cars at a cost of $4,588,000. The largest expenditure on extensions was $1,414,000 on the line from Spokane, Wash., to Ayre.

No securities were sold during the year and $5,658,000 stock was issued in exchange for convertible bonds, the stock being issued at 175, thus retiring $9,901,000 4 per cent bonds. At the end of the year the company had on hand $10,862,000 cash as against $11,855,000 at the beginning of the year. Total working liabilities amounted to $20,772,000.

The transactions growing out of the disposal of Southern Pacific stock were quite fully described and commented on in these columns at the time the events took place, but a very brief résumé of what was done properly belongs with the comments on this year's annual report. It will be recalled that the Pennsylvania took a part of this Southern Pacific stock, paying for it in Baltimore & Ohio common and preferred stock. An extra dividend was declared on Union Pacific common stock, consisting of $12 Baltimore & Ohio preferred, $22.50 Baltimore & Ohio common and $3 cash on each share of Union Pacific common. The stockholder who kept his Baltimore & Ohio and invested his cash at 6 per cent would get a yield of $2.01 on the dividend that came to him with each share of Union Pacific com-

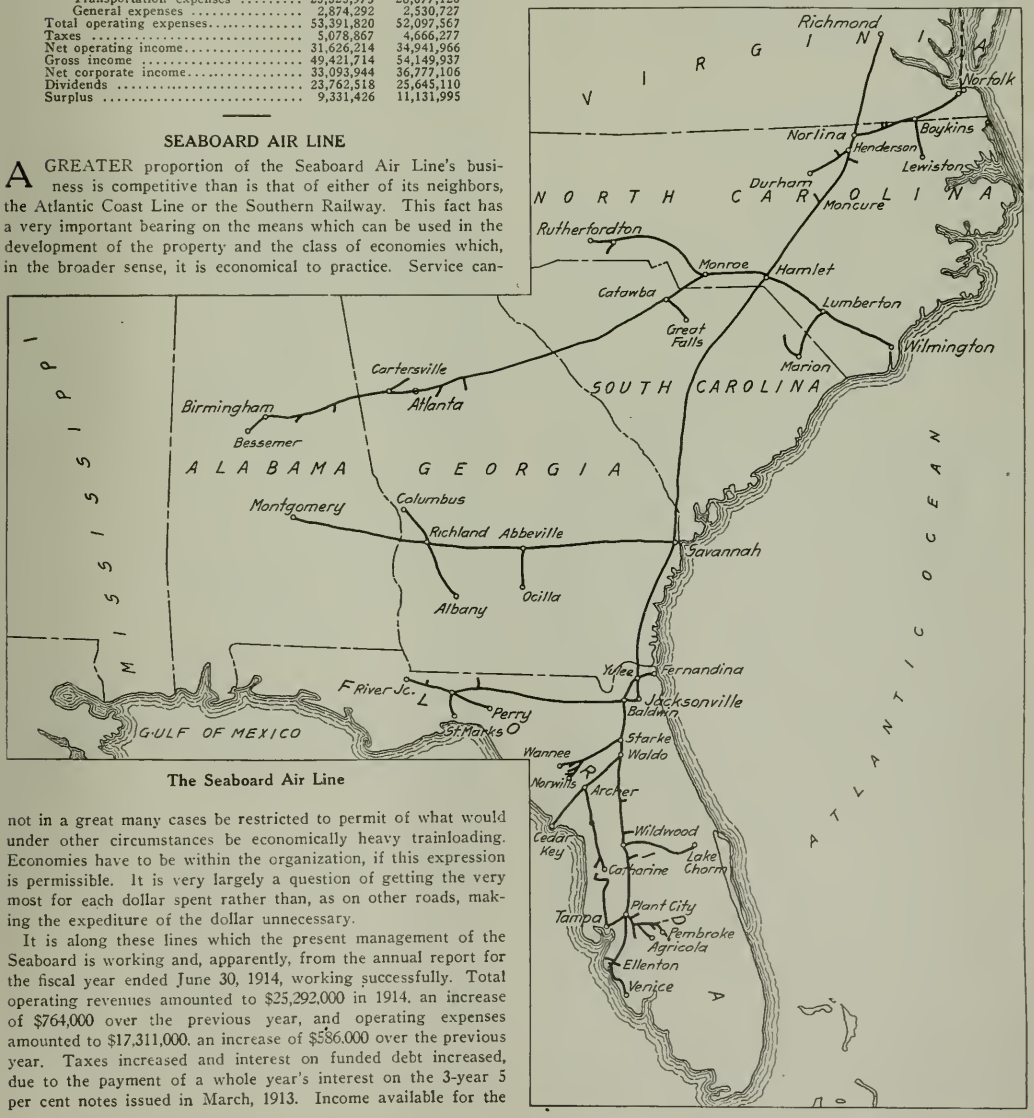
mon; in other words, the yield on what he got would be equivalent to 2 per cent on his holdings of Union Pacific common. The Union Pacific common dividend, which had been at the rate of 10 per cent, was reduced to 8 per cent. The extra dividend was, of course, charged to surplus and resulted in a writing down of profit and loss of $74,020,000. At the end of 1914 there was $90,586,000 credit to profit and loss after the transactions mentioned above.

The following table shows the principal figures for operation in 1914 as compared with 1913:

	1914	1913
Average mileage operated	7,597	7,349
Freight revenue	$62,434,292	$63,773,804
Passenger revenue	20,525,234	20,582,427
Total operating revenue	90,308,752	91,810,307
Maint. of way and structures	10,785,783	10,688,564
Maint. of equipment	12,123,174	10,694,011
Traffic expenses	2,282,596	2,107,146
Transportation expenses	25,325,975	26,077,120
General expenses	2,874,292	2,530,727
Total operating expenses	53,391,820	52,097,567
Taxes	5,078,867	4,666,277
Net operating income	31,626,214	34,941,966
Gross income	49,421,714	54,149,937
Net corporate income	33,093,944	36,777,106
Dividends	23,762,518	25,645,110
Surplus	9,331,426	11,131,995

SEABOARD AIR LINE

A GREATER proportion of the Seaboard Air Line's business is competitive than is that of either of its neighbors, the Atlantic Coast Line or the Southern Railway. This fact has a very important bearing on the means which can be used in the development of the property and the class of economies which, in the broader sense, it is economical to practice. Service can-



The Seaboard Air Line

not in a great many cases be restricted to permit of what would under other circumstances be economically heavy trainloading. Economies have to be within the organization, if this expression is permissible. It is very largely a question of getting the very most for each dollar spent rather than, as on other roads, making the expediture of the dollar unnecessary.

It is along these lines which the present management of the Seaboard is working and, apparently, from the annual report for the fiscal year ended June 30, 1914, working successfully. Total operating revenues amounted to $25,292,000 in 1914, an increase of $764,000 over the previous year, and operating expenses amounted to $17,311,000, an increase of $586,000 over the previous year. Taxes increased and interest on funded debt increased, due to the payment of a whole year's interest on the 3-year 5 per cent notes issued in March, 1913. Income available for the interest payment on the adjustment mortgage bonds amounted to $2,924,000, or about $60,000 less than the amount available the previous year. The adjustment bond interest calls for $1,250,000, so that the company had in 1914 $1,674,000 available for dividends on its preferred stock. A total of 3 per cent was paid in 1914, calling for $717,000.

The Seaboard Air Line operates 3,098 miles of line, of which 16 miles was added during the 1914 fiscal year. Its revenue freight density in 1914 was 511,000 tons one mile per mile of road, and its passenger density was 80,000 passenger miles per mile of road. The average receipts from freight per ton per mile were 1.099 cents, and per passenger per mile, 2.192 cents. Of the total 10,411,000 revenue tons carried in 1914, 33.37 per cent was furnished by manufactures and miscellaneous, 26.35 per cent by products of mines, 24.79 per cent by products of

forests—nearly a third of this tonnage is logs—and 14.30 per cent by products of agriculture, leaving 1.19 per cent furnished by products of animals. Phosphates and fertilizer form a very important part of the Seaboard Air Line's freight business. The tonnage of both these products showed a good gain in 1914 over 1913—phosphate, 1,027,000 tons as against 978,000 tons, and fertilizer, 994,000 tons as against 903,000 tons in the previous year. The only class of traffic in which there was any considerable falling off was in lumber and logs. In 1914 the road carried 1,515,000 tons of lumber as against 1,760,000 tons the year before, and 853,000 tons of logs as against 903,000 tons the year before.

Of course, since the beginning of the war there has been a large falling off in fertilizer traffic, and an almost corresponding falling off in phosphate traffic. This will be more fully discussed later.

As previously mentioned, total operating expenses amounted to $17,311,000. The following table shows the percentage of each class of expense to total operating revenues in 1914 and 1913:

	1914.	1913.
Maint. of way and structures	12.23	12.29
Maint. of equipment	13.46	13.61
Traffic expenses	3.15	3.13
Transportation expenses	36.61	36.28
General expenses	3.00	2.88

An increase of $79,000 in maintenance of way expenses was due principally to more tie renewals; an increase of $66,000 in maintenance of equipment was due to more equipment to maintain and a greater mileage of equipment; an increase of $359,000 in transportation expenses was due to a greater mileage run in passenger service, increases in the rates of pay of station agents and station labor, and larger charges for loss and damage to freight.

Despite the limiting condition of speed and frequency of service, the average freight-trainload was increased from 246 tons in 1913 to 263 tons in 1914; this is of revenue freight. The average freight-trainload of all freight was 299 tons in 1914, an increase of 23 tons over the average the year before. Thus, with an increase in the total ton mileage of 36,562,000, the total in 1914 being 1,575,000,000, there was a decrease in freight locomotive mileage of 184,000, the total in 1914 being 5,940,000.

The trainload on the Seaboard even in 1914 seems low if compared with many eastern or western roads, but is, however, considerably higher than that of the Atlantic Coast line, which was in 1914 225 tons (revenue freight). That it is not larger is in part due to the small proportion of coal tonnage carried and the large proportion of manufactures and of products of agriculture. The fact that manufactures is competitive traffic necessitates a fast schedule in this service; a large part of the products of agriculture is perishable and also demands a fast schedule with comparatively light loading. On the other hand the Seaboard has heavy grades, which are a limiting factor at present in trainloading on certain classes of traffic. This is a condition which can be bettered by the introduction of heavier engines. In 1914 the company received 35 Pacific type freight locomotives and is now receiving some Mikado engines. When these new locomotives are placed in service and a system of establishing points where tonnage rating of trains can be filled out from drag freight is completed, the average trainload of the Seaboard will be very considerably increased. The present year, of course, may not show the effects of this because of other extraordinary conditions. The company is also receiving some Mountain type locomotives for passenger service.

The Seaboard is in shape, in respect to its track and bridges, to handle the heavier engines without any expenditures for betterment. The program of bridge improvement which was completed about June, 1912, provided a minimum bridge capacity of Cooper E 50 loading on the lines north of Florida. In 1914 $1,854,000 was spent for additions and betterments and extensions, the principal expenditures being $415,000 for additional weight of rail, $249,000 for grading, $174,000 for ballasting unballasted track, and $169,000 for station buildings. Previous to 1913 the standard weight of rail in main track was 75-lb. In 1913 130 miles of 85-lb. rail was laid, and in 1914 144 miles. At the end of the year 1,208 miles of track was laid with 75-lb. rail. The present standard is to use 90-lb. rail on lines north of Jacksonville, Fla., and Birmingham, Ala.

The line between Hamlet, N. C., and Norlina is that of greatest density, and eventually this will have to be double-tracked, although with the heavier locomotives now being put in service it has by no means as yet reached the limit of its capacity as a single-track line. The freight density on this line is now in the neighborhood of 1,500,000 ton-miles per mile.

One thing which is being done in the development of the Seaboard, which is of great importance in the long run but is not immediately neglected in the figures in its annual report, is the working out of a more compact organization.

In the organization of most railroads operating from 3,000 to 4,000 miles of line, the officer directly in charge of the operation of the road is either a general manager or a vice-president in charge of operation. In the Seaboard's organization, as now worked out, the president is directly responsible for the operation of the road and the officer directly in charge is the general superintendent. This places a heavy burden on the president, even when, as in the case of the Seaboard Air Line, he is aided by two assistants, one an engineer and the other an operating man. If, however, the president is capable of bearing this burden and has the right kind of general superintendent, this makes a practical and very effective form of organization.

The present year, that is, the 1915 fiscal year, bids fair to be a rather trying one for the Seaboard, with consequent enforced economies; but this fact in itself is being utilized to perfect the organization. As yet the cotton tonnage has not moved to any great extent, and although cotton tonnage is not a large proportion of the Seaboard's traffic, the curtailment in the buying power of the planters has a quite marked effect on manufactures and merchandise. This also affects the fertilizer business.

A falling off in fertilizer traffic would reduce the Seaboard's tonnage of revenue freight to an appreciable amount and even more seriously affect revenue. The nitrate contained in fertilizer comes from South America and the potash from Germany, and there was some fear that the supply of potash might be seriously interfered with. At present, however, the supply of raw materials is thought to be ample, but the real difficulty is to be found in the diminished purchasing power of the cotton planters. If they are not able to buy fertilizer or secure it on credit the Seaboard will, of course, lose profitable tonnage by just that much.

The Seaboard Air Line has no loans and bills payable, and had, as of June 30, $2,700,000 total working liabilities, with $3,089,000 cash. Its only short-term obligations are $6,935,000 outstanding equipment trust certificates, maturing periodically, and the $6,000,000 3-year notes previously mentioned, which mature in March, 1916.

The following table shows the principal figures for operation in 1914 and 1913:

	1914.	1913.
Average mileage operated	3,084	.....
Freight revenue	$17,307,034	$16,788,112
Passenger revenue	5,430,531	5,221,200
Total operating revenue	25,291,758	24,527,865
Maint. of way and structures	3,094,200	3,014,957
Maint. of equipment	3,404,471	3,338,542
Traffic expenses	796,755	765,763
Transportation expenses	9,258,623	8,899,267
General expenses	757,346	707,085
Total operating expenses	17,311,395	16,925,613
Taxes	999,000	956,000
Operating income	6,961,003	6,819,938
Gross income	7,259,999	7,040,002
Net income	2,924,216	2,985,854
Interest on adjustment mortgage bonds	1,250,000	1,250,000
Dividends	716,823	.....
Surplus	649,268	1,467,933

The Decision Granting the Five Per Cent Rate Advance

Full Text of the Majority Opinion and Dissenting Opinions of Chairman Harlan and Commissioner Clements

The following is the opinion of the Interstate Commerce Commission which was handed down on December 18, in the rehearing of the five per cent rate advance case.

By the Commission:

These cases were originally submitted in May, 1914, and decided under date of July 29, 1914, 31 I. C. C., 351. Upon petition of the carriers filed September 15 the commission, on September 19, 1914, ordered—

That further hearing in said cases be, and is hereby, granted; said hearing to be limited to presentation of facts disclosed and occurrences originating subsequently to the date upon which the records previously made in these cases were closed.

Under these limitations hearing was had before the commission continuously for five days, ending October 23, 1914. Evidence was introduced by carriers, investment bankers and various protestants. Some of the exhibits supplemented those offered at the original hearing. The cases were argued before the commission on October 29 and 30, and thereupon submitted.

It is not necessary to make any extended summary of the conclusions contained in the commission's original report. report. Among other things it found that—

In view of a tendency toward a diminishing net operating income, as shown by the facts described, we are of opinion that the net operating income of the railroads in official classification territory, taken as a whole, is smaller than is demanded in the interests of both the general public and the railroads; and it is our duty and our purpose to aid, so far as we legally may, in the solution of the problem as to the course that the carriers may pursue to meet the situation.

The commission did not acquiesce in the carriers' proposal of a general increase as indicated in the tariffs filed by them, but suggested various methods by which they might properly conserve their revenue (pp. 407-414). In central freight association territory, however, by reason of the low general level of rates there found to prevail and also by reason of the financial necessities of the carriers in that territory, intraterritorial increases of approximately five per cent were permitted except on certain articles, mainly heavy low-grade commodities. It was suggested in view of the modifications required in the tariffs that the central freight association lines might find it more desirable to undertake at once the tariff readjustment asserted by them to be necessary. Save as above indicated, the proposed increases were denied and the tariffs carrying them were ordered cancelled.

NEW ELEMENTS

The "facts disclosed and occurrences originating" subsequent to May 29, 1914, as presented at the further hearing may be summarized under three heads—first, completed returns for the fiscal year ending June 30, 1914, and returns for succeeding months; second, the war in Europe, and third, results of the original order.

When these cases were originally submitted, as also when the original report was prepared, the revenue and expenditure account for June, 1914, and the property investment account for that fiscal year, were not available, the war was unforeseen, and the results of our order were, of course, yet to come. Collectively they present a new situation.

The carriers offered further evidence of their financial condition during the fiscal year ending June 30, 1914, including returns for that year completed by addition of the revenue and expenditure account for the month of June and the capital investment account for the year. They also introduced revenue and expenditure accounts for the months of July and August of the current fiscal year. Reports to the commission for the month of September, 1914, have since made possible a similar statistical statement for that month also.

These figures serve to emphasize our previous finding of the need of carriers in official classification territory, taken as a whole, for increased net revenue.

For the fiscal year just ended the net operating revenues as shown by the carriers are lower than was estimated or anticipated when the original report was issued. Not since 1908 have the net operating revenues of the carriers been so low as in the fiscal year ending June last. In 1908, moreover, the property investment account of the carriers was $1,309,000,000 less than in this last fiscal year. The surplus for 1908, after deducting $102,000,000 paid in dividends, was $47,000,000, whereas for the last fiscal year the dividends paid, amounting to $118,000,000, drew on the accrued surplus to the extent of $8,200,000. Of this amount the New England roads contributed over $4,000,000.*

From whatever comparative standpoint viewed, the net operating revenues of the last fiscal year must be regarded as unduly low. Operating costs and operating revenues fail to show the tendency to such concomitant variation as should prevail in the transportation industry. While the gross revenue in that year declined only about 3.4 per cent, the net revenue shrank approximately 17.7 per cent as against the previous fiscal year. The indication is that some important items of cost have become relatively inelastic, and that a fall in gross revenue leaves an increasingly narrow margin of net revenue.

The situation is different when an attempt is made to estimate the decline in the rate of return. The property investment accounts as now standing on the books of the carriers can not be accepted as accurately representing the fair value of their property devoted to serving the public.

MAINTENANCE EXPENDITURES

Objection was raised to the increasing amounts charged in recent years to additions and betterments, particularly because the carriers in presenting a financial review of their operations for a series of years failed to indicate separately the relative effect upon their accounts of outlay for additions and betterments as compared with allowance for depreciation, it being contended that this caused an unwarranted diminution in the resulting net income from operation.

The fact nevertheless remains that if the increase in depreciation and betterment accounts in the last fiscal year over the average of similar allowances for the five-year period were added to their net operating income for the last fiscal year, the results of operation would still fall below a fair return upon the amounts carried upon the books as investment in property.

While there has been recently an enlarged expenditure for maintenance of equipment, it is clear that it has not been sufficient to restrict to proper limits the number of cars and locomotives needing repairs. The carriers in the past have not known how large an expenditure to figure upon for the maintenance of the newer type of steel freight cars, and appear now to have discovered that such expediture must be greater than was anticipated.

The like may be said as to the recent enlargement of expenditure upon roadway. We can not view with favor any attempt to obtain an increase in net revenue through unduly restricted expenditures upon maintenance.

To whatever extent recent increased provision for depreciation or expenditure for maintenance may militate against a fair comparison of supposedly comparable statistical items for various years, we can not say on this record that such charges as at

*NOTE.—It is not to be inferred from these figures that the total surplus in 1913-14 decreased by the amount of $8,200,000. From reports made by the carriers to this commission the appropriated surplus for class I roads, eastern district, was $343,508,201 on June 30, 1914. This was an increase over appropriated surplus existing on June 30, 1913, of $19,378,945. During the same year there was, however, a shrinkage in the excess of credit over debit balances to profit and loss of $53,957,233, indicating for the last fiscal year a shrinkage in total surplus of $34,578,288.

present returned by the carriers are excessive, viewed either from the standpoint of proper accounting or of safety of operation.

The testimony shows that while some maintenance is being deferred, other maintenance deferred during the last fiscal year is now being made, and that the expenditure therefor during the months of July and August measured up to the level of recent years. The testimony also shows that transportation expense is being reduced through the laying off of employees and cancellation of train service.

THE EFFECT OF THE WAR

It was urged on behalf of the carriers and the investment bankers who appeared at the hearing that the war in Europe has created a condition which renders the diminution of the carriers' net income a menace to the prosperity of the country; that the war has placed an added strain upon the credit of carriers; that rates of interest will rise; that a large volume of railroad securities is held abroad; that the denial of the increase in freight rates would, in view of the diminished net income, be followed by a dumping of foreign securities upon the American markets; that our markets would not be able to absorb these securities—at least, without great fall in price; that disaster would result not only to our railroads, but to insurance, banking and industrial concerns; and that for these and other reasons, extending far beyond the direct needs of the carriers themselves, we should now allow the proposed increase in rates.

With some of these considerations we have, as a commission, nothing to do. Our powers and functions are those, and only those, conferred by congress. As was said in Advances in Rates, Western Case, 20 I. C. C. 307, at page 317:

We must not regard too seriously, however, the effort of railroad counsel to establish this commission *in loco parentis* toward the railroads. We must be conscious in our consideration of these rate questions of their effect upon the policy of the railroads and, ultimately, upon the welfare of the state. This country can not afford to have poor railroads, insufficiently equipped, unsubstantially built, carelessly operated. We need the best of service. Our railroad management should be the most progressive. It should have wide latitude for experiment. It should have such encouragement as would attract the imagination of both the engineer and the investor. Nevertheless, it is likewise to be remembered that the government has not undertaken to become the directing mind in railroad management. We are not the managers of the railroads. And no matter what the revenue they may receive there can be no control placed by us upon its expenditure, no improvements directed, no economies enforced.

The conflict in Europe will doubtless create an unusual demand upon the world's loan fund of free capital, and may be expected to check the flow of foreign investment funds to American railroads. It appears that our railroads represent the bulk of European investment in this country. The rate of interest—the hire of capital—has risen during the last decade, and may rise still further. It is computed that in the years 1915, 1916 and 1917 the carriers in official classification territory must arrange for the payment or refunding of securities aggregating over $500,000,000. True, the representations of the carriers in the 1910 cases, that without the increases then sought their credit must totally vanish, proved strangely at variance with their subsequent experience in the borrowing of many hundreds of millions. But we do not doubt that the financial problems of the carriers have been made much more acute by reason of the war, and if we are to set rates that will afford reasonable remuneration to these carriers, we must give consideration to the increased hire of capital as well as to other increased costs.

The suggestions made in our original report of methods whereby to increase net revenue were not susceptible of being put into immediate operation or calculated to produce immediate financial results. This was recognized in our original report. The period which has since elapsed has, of course, been entirely too short for either purpose. Some testimony was offered at the further hearing bearing on what had been done or undertaken in line with these suggestions, and estimates were made by the traffic officials of several carriers as to the annual yield to be expected. These estimates were not based on any accounting computation and can afford little guide as to what the results will prove to be.

THE CONCLUSION

While we differ as to the relative importance to be attached to the various considerations presented, we agree in the conclusion that, by virtue of the conditions obtaining at present, it is necessary that the carriers' revenues be supplemented by increases throughout official classification territory. Whatever the consequences of the war may prove to be, we must recognize the fact that it exists, the fact that it is a calamity without precedent, and the fact that by it the commerce of the world has been disarranged and thrown into confusion. The means of transportation are fundamental and indispensable agencies in our industrial life and for the common weal should be kept abreast of public requirements.

The original report, besides approving a rate increase in central freight association territory, suggested 10 sources of additional revenue for all carriers throughout official classification territory; the present report, recognizing the existence of a new situation since July 29, acquiesces in a territorial extension of the relief granted to the central freight association lines by permitting the carriers to file tariffs providing, with certain exceptions specified herein, for horizontal rate increases in official classification territory. It is expected that the constructive work suggested in the original report for the purpose of conserving and augmenting the net revenues of the carriers generally will be carried forward without interruption.

Carriers will be required to keep an account of the additions to their revenues from increases in rates subsequent to July 29, 1914, and from new charges, and to report separately thereon

Sykes in the Philadelphia Ledger

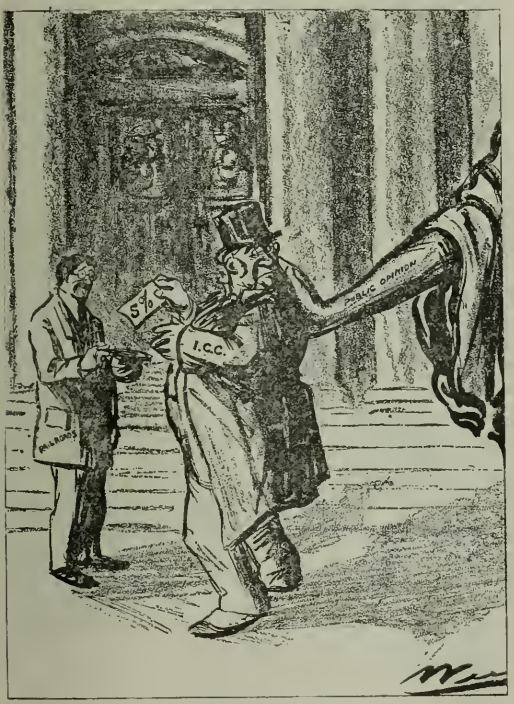
To Him Who Hath——

to the commission at the end of 12 and 24 months, respectively.

For various reasons we shall except from the proposed increase the following rates:

1. Rail-lake-and-rail, lake-and-rail and rail-and-lake rates. It is shown on the record that since the rail carriers acquired ownership and control of the lake lines successive increases have been made in the rates via lake tending to lessen the differences between them and the all-rail rates.

2. Rates on bituminous coal and coke. Not long since these rates were investigated and maximum rates were prescribed by the Commission. The key rates upon bituminous coal—the rate from the Pittsburgh district to Youngstown, and the rate on lake cargo coal to Ashtabula—have been fixed in the light of the various factors which enter into the transportation of such coal. The prevailing rates are remunerative, and the financial condition of the principal bituminous coal carriers is in marked contrast with that of many of the other carriers in official classification territory. Twice in the not distant past the rates on bituminous coal have been increased 5 cents a ton, and would seem now to be as high as may fairly be allowed. It must be remembered also that the carriers are not seeking general increases in rates on anthracite coal, and both kinds of coal are used in competitive markets. As to coke, the rates controlling the greater volume of traffic now moving in official classification territory have recently been set by the Commission upon a basis which was specifically designed to guard against shrinking the carrier's revenue therefrom, and which really resulted in substantial additions to their earnings on that traffic.



Weed in the New York Tribune

The Lord Loveth a Cheerful Giver

3. Rates on anthracite coal and iron ore, largely because they are before us for review in other proceedings.

4. Rates held by unexpired orders of the Commission.

In our original report we declined, for reasons there stated, to allow increased rates in central freight association territory on cement, starch, brick, tile, clay and plaster. On further consideration, in the light of the existing situation, these rates may be increased throughout official classification territory under the limitations herein set forth.

Joint rates between official classification territory on the one hand, and southeastern territory, the southwest and points on or east of the Missouri river on the other, may be increased not to exceed 5 per cent of the division of the rate accruing to the carriers in official classification territory. If these increases involve a change in the relationship under the long-and-short-haul rule between intermediate points and more distant points outside of official classification territory, relief from the fourth section of the act must first be secured on regular application.

Interstate rates to and from New England from and to points in trunk line or central freight association territory, where necessary to preserve established relationships between points or ports in New England and points or ports in trunk line territory, may be increased not to exceed 5 per cent.

Subject to the maintenance of the established Atlantic port differentials, rates to and from New York may be increased not to exceed 5 per cent, and rates to and from Portland, Boston, Philadelphia and Baltimore may be increased to the extent necessary to maintain said differentials.

Except as otherwise above specified rates in official classification territory may be increased by not more than 5 per cent; but rates increased since July 29, 1914, may not now be again increased so as to exceed those then in effect by an aggregate of more than 5 per cent of the intraterritorial rate, or of the portion or division of the interterritorial rate accruing to the road or roads in official classification territory, as the case may be.

If fractions in excess of one-half a mill are rounded upward, fractions less than one-half a mill are to be discarded.

In some instances, and in part because of the pendency of this proceeding, we have recently suspended proposed increased rates in this territory. Carriers may, if they so elect, now cancel such tariffs so suspended and file in lieu thereof tariffs which conform to the limitations above specified. If that is done such suspensions will be vacated.

To the extent above indicated we now modify our previous finding, and carriers affected may file, effective on not less than 10 days' notice, such tariffs as do not offend against the restrictions above stated.

DISSENTING OPINIONS

Chairman Harlan:

The further hearing of this case added nothing substantial to the relevant facts before us when the original report was handed down. It served only to confirm the soundness of the finding then made that the railroads in official classification territory, taken as a whole, ought to have additional net income. My own view of the record has been and is that the carriers in that territory, considered collectively, are in need of more additional net income than the amount, $50,000,000, which they estimated the proposed 5 per cent increase in rates would yield. I can readily agree, therefore, to the reiteration in the supplemental report of the finding of the original report that those railroads need additional revenues; and to that extent what is here said may be regarded as a concurrence. I wholly dissent, however, from the course now approved by the Commission for permitting the carriers to augment their revenues.

The original record contained evidence that the general rate basis in central freight association territory was unduly low and that the proposed increased rates would be just and reasonable. We therefore allowed the higher rates, with certain exceptions, to go into effect. The original record contained no evidence tending to prove that any of the proposed increased rates affecting trunk line or New England territories were just and reasonable, and this deficiency in proof was not supplied upon the further hearing. For example, the 75-cent rate on first class traffic moving between New York and Chicago is the rate yardstick of this country, the standard by which, after making due allowances for differences in conditions, density, etc., all other

rates may ultimately be measured. That scale of rates has been in effect for more than a generation. Nevertheless, no effort was made on the part of any of the lines in official classification territory to show by what may be denominated rate testimony that this scale of through rates is unduly low or that higher through rates would be just and reasonable. Since the act of Congress imposes the burden of proof upon the carriers to establish that proposed increased rates are just and reasonable, we were compelled to withhold on the original hearing and are, in my opinion, now bound to withhold approval of any of these rate increases affecting trunk line and New England territories. Moreover, the record shows the financial condition of the trunk line carriers generally to be much more favorable.

We pointed out, however, in our original report the sources from which the needed additional net income could and should be obtained—namely, by a revision of rates and an abandonment of practices found to be unremunerative or wasteful. The beneficent effect of an intelligent revision of rates is shown by the results obtained in New England while this proceeding was pending. The New England carriers sought approval in this case of an increase only in the rates on traffic moving between that territory and other parts of official classification territory; they did not propose a general 5 per cent increase in their freight rates. Those carriers undertook instead a general rate revision, which has since been largely effected through friendly conferences with state commissions and with shippers and is now, by common consent of the shipping public and state officials, being brought to a conclusion on a basis that will afford those lines much larger additional net income than they could have secured through a 5 per cent increase in their freight rates. In other words, the New England lines have voluntarily pursued the only rational and reasonable course to augment their revenues, this being the course urged upon the central freight association lines in our original report, and the course that those lines at the hearing admitted to be necessary in order to meet their real requirements. As a matter of fact, as pointed out in the original report, the central freight association lines joined in the application for a horizontal 5 per cent increase in their rates only because of the desire of other and more powerful lines operating in trunk line territory to present to us in this proceeding one general plan of relief.

The record shows that there are many unremunerative rates and unremunerative practices now in effect throughout the official classification territory; that a very substantial amount of service is performed without any charge whatever; and that undue burdens are cast upon the carriers through various influences. We have had in this proceeding an opportunity to learn also to what extent and with what effect on their revenues abuses exist among the railroads because of the treatment of one by the other in competing for traffic. The abandonment of remunerative and wasteful practices involves among other things the elimination of the free services and excessively low rates which represent, in very many instances, the price a carrier pays for the large tonnage of influential shippers and result in making the carrier bear the geographic disadvantages of individual shippers and expenses properly a part of their manufacturing costs. The elimination of the preferences created by these means would give to the carriers very largely increased earnings and at the same time properly distribute the necessary burdens of transportation, so that those who get the service shall pay for it. By following the suggestions made in the original report the carriers could undoubtedly secure more additional net income than the amount estimated to accrue under the proposed horizontal rate increase, and far more than can accrue to them under the relief now accorded in the supplemental report.

HOW THE COMMISSION CAN HELP

At the further hearing the carriers earnestly contended that their necessities were so urgent that they could not await an increase of revenues from those sources. Relief, however, could be had immediately if the Commission would refrain from a too free use of its power to suspend increases in rates pending investigation. This power is exercised, in my judgment, with unnecessary frequency, in view of the opportunity that shippers have of testing the reasonableness of increased rates upon formal complaint filed with the Commission; and, in my judgment, the Congress never intended so free a use of it when the power to suspend was granted to us. It was pointed out also by the carriers that the states were interfering, both by restricting rates and by imposing heavy burdens upon interstate carriers in the form of full-crew and other similar laws. To overcome these various influences that deplete the revenues of the carriers and interfere so largely with their prosperity, the mere statement of the facts by the Commission is not enough. In times of financial strain and stress other industries must, by introspection and self-examination, see how their methods may be improved. The original report requires a similar course on the part of the carriers; and what is needed is the most persistent affirmative course of action on the part of the Commission, not only in requiring,

Nelson Harding in the Brooklyn Eagle

Better Late Than Never

but in aiding the carriers to eliminate such abuses from their rate structures and practices.

The supplemental report, in seemingly relieving the carriers' distress, removes the spur of obvious necessity which would have been the most potent factor in eliminating the abuses which the record shows are the real cause of the existing inadequacy of revenue. The inevitable result of the Commission's action will be to remove the pressure which otherwise would exist upon the state authorities to apply the right remedies. The supplemental report unlawfully shifts the burden of the carriers' troubles upon the interstate shipper. This should frankly be recognized as one of the results that will follow the action now approved by the majority of the Commission. An endeavor to stimulate commerce and to bolster up the credit of the carriers, as contended at the further hearing, by an increase in rates, will simply result in a perpetuation or recurrence of the financial distress of the carriers.

CONCLUSIONS

I cannot but think that a general increase in the standard rates of this country, while the rate structures of these carriers remain full of inconsistencies, discriminations and wrongful practices that deplete their revenues, is morally wrong; that the placing of additional burdens on interstate commerce that is not also placed upon state commerce, is also wrong; and that the course approved in the supplemental report will ultimately be as disastrous to the carriers themselves as it will be harmful to the general interests.

The original report was announced on July 29, 1914. Two days later the great European powers were suddenly thrown into a state of war. The immediate effect upon the commerce of the world and upon the commerce of this country is known to all and need not be described here. The results of that conflict, which is unparalleled in recorded history, are accepted in part by the Commission as the basis for the action it proposes in the supplemental report. Just how long the war may continue no one can conjecture. To what extent it may impair and impede our general prosperity and commerce cannot be predicted. Both undoubtedly are seriously menaced by its further continuance; and on these grounds we were urged at the further hearing to grant immediate relief. The objection was made that in deciding the general rate questions before us, we have no right to be governed by conditions presumably temporary in their nature, like those incident to the war, nor to consider the attending effects on general business and prosperity in this country of the allowance or denial of the proposed rate increases.

Aside from this objection to our legal right and power, which perhaps should be regarded as conclusive, there are grave doubts whether the facts assumed by the carriers, bankers and others at the further hearing are being verified by the progress of events. The apprehension of the bankers and others, most strenuously urged at the further hearing as a reason for granting increased rates at once, was that otherwise our railroad securities held abroad would, in consequence of the war, be dumped upon our markets with disastrous results, not only to the railroads, but to business interests generally. This apprehension the bankers apparently have concluded to have been so clearly unfounded that, in advance of any decision by the Commission upon the carriers' contentions at the further hearing, the great financial interests in control of such matters have not only caused the stock exchanges, which were closed at the beginning of the war, to be reopened, but have now caused the removal of all restrictions upon trading in such securities, the minimum-price limitation having been withdrawn. It also appears from public sources that since the further hearing interest rates, instead of increasing, as confidently predicted by the experts who then testified, have shown a downward tendency, and since the date of the original report the average operating ratios of the lines in official classification territory have shown a marked improvement. If at any time hereafter it should definitely appear that the carriers require immediate temporary relief by reason of the war and its effects, it could be obtained by a refiling of the tariffs heretofore disapproved, and in that event I should have no difficulty in regarding it as a proper exercise of our discretion under the act to decline to suspend them pending investigation.

LIMITATIONS OF THE POWER OF THE COMMISSION

Commissioner Clements, dissenting:

I can but regard the action now taken by the Commission as out of harmony with the spirit and purpose of the law, and as taking a step that leads away from the sound principles necessary to conserve the ends of justice.

Carriers have a right to earn all they can on the business which they can secure at just and reasonable rates. The right of the shipper to protection against the exaction of rates unreasonably high for the service performed is equally sacred.

Upon our order of suspension and investigation of these rates, in my view, there is but one question lawfully before us for ultimate determination, and that is, are they "just and reasonable"? Upon this question the burden of proof is placed upon the carriers by the statute. Have they met the issue and discharged this burden? If they have done so, they are of right clearly entitled to have them go into effect. If they have not, it is with equal clearness the duty of the commission under the law to prevent their establishment.

As shown by our report of July 29, 1914, in this proceeding, we found upon comparison of the rates proposed in central freight association territory with rates in other territories, including trunk line territory, as well as by other ordinary tests of reasonableness, that the carriers had as to the former territory, with certain specified exceptions, met the burden and justified the proposed increases. In my view the foregoing report and decision constitute a new and radical departure and a most serious and portentous step, in that by this step the commission is shown to deem itself justified in sanctioning these increased rates in the latter territory upon consideration of general financial and operating results, without resorting to other ordinary tests or factors heretofore deemed pertinent and necessary to the determination of the reasonableness of rates. I am not aware of any prior case in which this commission or any court has held that the need by a carrier of money was of itself proof of the reasonableness of a specific rate, or body of rates, increased to meet such need. The commission has repeatedly held that the commercial necessities or interstate of a particular shipper, community, or kind of industry, considered alone, afford no basis for the reduction of rates, and that it cannot in any case reduce the same except upon an affirmative showing of unreasonableness, after full hearing. In any considerable group of carriers there are probably always some that are in need of more money than they earn, when such need is tested by their obligations without regard to the extent or manner of creating such obligations, or the disposition of the proceeds thereof. If the basis of the conclusions of the majority of the commission sanctioning these rates in trunk line territory is sound, and points to the rule of action for the future, the burden placed by the law upon the carriers to justify increases in rates is indeed made light and easy to carry, especially when by concerted action a group of carriers, some strong and some weak, simultaneously propose to increase the great body of their rates.

As I understand it, justification of the rates permitted by this decision to be increased rests largely upon the need of greater net revenue to enable the carriers to afford adequate service to the public, to meet their financial obligations, and maintain dividends in such manner as to encourage further investments in railways and their securities. If these considerations constitute a sufficient basis for wholesale approval of a body of increased rates agreed upon by all carriers in a given territory, competing or connecting, weak or strong, the same must be equally true if every road in the country, as well as every rate, were included in a proceeding before us.

If the legislative authority of the commission is as broad and unrestricted as this, then I must confess that I have gravely misunderstood the limitations upon our statutory authority, as well as the constitutional power of Congress to delegate its legislative power.

It may be said that the commission was not obliged by the law to suspend these rates when filed, and that those who must bear these increased burdens are in no worse situation, now that the rates once suspended are permitted to become effective, than if they had never been suspended. Such a suggestion, however, appears to ignore the true and important intent of that provision of the act of 1910, investing the commission with authority, when instituting an investigation as to the reasonableness and propriety of a proposed new schedule of rates, to suspend the operation thereof pending such investigation. As shown in the excerpt from our last annual report, hereinafter quoted, this act was passed in the face of the initial steps then being taken by these and other carriers for a general increase of rates. The steps taken by the President of the United States and the attorney-general at that time, as outlined, point with singular clearness to the intent and purpose of this provision for suspension. This purpose is made the more manifest, if possible, when considered in connection with the two other distinctly remedial provisions of the same act that go hand in hand with

it; these are the authority for the commission on its own motion to institute an inquiry to the same effect as in the case of complaint, and the definite rule of law placing the burden of proof upon carriers as to increases made, or proposed to be made, subsequent to January 1, 1910. The commission, in its annual report for the year 1912 indicated its understanding of the purposes of this suspension provision, and the manner of administering the same, as follows:

"In the exercise of its authority to suspend the operation of new tariff schedules the commission has not understood that it was the purpose of the provision of section 15 of the act of 1910 that, as a matter of course, all advances in rates should be suspended; but upon the contrary has proceeded upon the idea that it was the purpose of this provision that it should exercise sound discretion in these matters. Therefore, upon such preliminary consideration as it has been practicable to give, the commission has undertaken to distinguish between current changes in rates which might be regarded as natural and normal readjustments occurring in the ordinary course of business, and distinct and material advances for the definite purpose of increasing rates; and in the latter class of cases it has undertaken to scrutinize the apparent reasons therefor and has acted in the light of another provision of amended section 15, which casts upon the carriers the burden of justifying rates advanced after January 1, 1910." (Page 18.)

COURT POWER TO REVIEW

It may be true as a matter of fact that the commission could altogether refuse to suspend or, having suspended a body of proposed increased rates, however extensive in scope and large in amount, could subsequently vacate its order of suspension and permit them to go into effect, without such action being subject to judicial review. If so, is there not greater need for constantly keeping in mind the definite object of these provisions, because the shipper is without remedy elsewhere, if he should suffer by our failure to act properly in the administration thereof? Upon the other hand, if the commission makes an order against carriers which is shown to result either in confiscation or is beyond its statutory authority, not resting upon due process and full hearing with supporting testimony, the carriers may go to court and have it set aside.

If by modification of our former order in this proceeding, increased rates heretofore condemned are now permitted, what is the legal justification for this action unless based on ascertained reasonableness of these rates, according to the ordinary tests? Will the legal interpretation of this supplemental report and order be to the effect that these rates have been found reasonable by the commission? If so, whatever standard of reasonableness has been applied, is not the shipper bound by our action if hereafter he desires to challenge the reasonableness of these rates? Upon whom will the burden of proof then rest? Of what avail will these remedial provisions of the act of 1910 be to the shipper if this procedure, these grounds of action, and the results thereof are compatible with the requirements of the law as a whole?

Anyone familiar with the procedure necessary to be observed in making and enforcing a lawful order against a common carrier for the reduction of a particular rate, and what would be required as a proper record of full hearing and testimoney supporting an order requiring the reduction of the general body of the rates of each or all of the carriers in a large group or territory, must be struck with the facility with which rates may be increased as indicated by this decision.

Surely the fact that the commission's negative action is not ordinarily reviewable in court affords no justification for a different basis or test of the reasonableness of rates, in a situation like the present one, than would apply when the same question is before us on a complaint made by shippers seeking reductions in rates, unless the commission has been vested with broad legislative authority to inaugurate and shape public policy. While I do not mean to say that such authority is claimed by the commission, I can see no other basis for the action taken by it in this matter.

OVER CAPITALIZATION

The financial results of the carriers' operations, appearing and so much stressed in this case, are figured with important relation to the carriers' so-called "book value," or account of both actual and alleged investment, which accounts have long and generally been recognized as largely untrustworthy. These financial results are of course affected directly and materially by the bonds and other obligations, however and for whatever purpose issued. There is and has been no adequate control of the issuance of stocks and bonds, and they have been put out largely by those holding the theory that there exists no relationship between the securities of a carrier and the reasonableness of its rates. Now, we see these securities calling for increased rates to make them good.

If, now, to strengthen and maintain the credit of the carriers, regardless of the causes of its exhaustion or impairment, and without the application of the usual tests of reasonableness, these increases are justified, then, it seems to me that we are only at the beginning of what I fear will be a train of demoralizing results, disappointing and embarrassing to all concerned. It is by no means certain that it would not, in the long run, be cheaper to the public to guarantee the bonds of the weak roads unable to meet their obligations, rather than to try to take care of them by increased rates, which inure to the strong roads as well as the weak.

Up to the beginning of these efforts for increased rates there had for many years been a steady and constantly increasing percentage of carriers paying dividends, as well as in the rate of dividends paid. It appears evident that carriers are suffering more just now for want of freight to carry than for want of higher rates. It is just as safe to prophesy that this is a temporary condition as to prophesy concerning future rates of interest and the dumping of foreign-held American railway securities on our investment markets. It would not seem to be out of line with ordinary prudence and conservatism, prevailing in other lines of industry, if the carriers had undertaken to meet this apparently temporary situation as have others. Such a course, it seems to me, would have contributed to their credit, rather than the course they have pursued.

Pertinent at this point is the language of Commissioner Lane, in continuation of that in the foregoing report of the majority in this case, quoted from him in the 1910 Western advanced rate case. There, in quoting from the brief of the Atchison, Topeka & Santa Fe Railway Company, he said (20 I. C. C., 317):

"The full significance of the opening sentence quoted, 'that American railway rates never have been high enough and the public has never paid adequately for the service which it has received,' cannot be appreciated until one stops to think that for nearly seventy-five years after the first railroad was built the American Government did not choose to exercise the power of regulating the charges of interstate railroads. These carriers, charged with a public trust, were given a free hand in the institution of their own rates until within the last four years, and they now appear asking the protection of the law to increase their rates, which under the play of economic forces they say never have been high enough. Throughout this record it appears that a literary campaign has been conducted by the use of railroad money with the manifest purpose of establishing both at home and abroad the impression that the effect of railway regulation in the United States is injurious to the American railroad. Widespread circulation has been given to the pessimistic utterances of railroad financiers who sought to fix the idea that injustice was being done our railroads by restrictive and oppressive legislation. Yet it is apparent that the carriers at present in this and similar cases are relying upon the restrictive provisions of the law which declare concessions from the published rate to be criminal and thus give stability to rates—at least as between carriers—to permit the elevation of rates to a standard which under the force of competition the carriers were unable to reach and maintain."

This decision of the commission is the culmination of the concerted efforts of the respondent, and other carriers, for a general increase in freight rates, beginning in 1910.

AUTOMATIC SIGNALS ON THE LEHIGH & HUDSON RIVER

The Lehigh & Hudson River has installed automatic signals on 72 miles of its main line from Maybrook, N. Y., to Belvidere, N. J., practically the entire line. The track is fitted for high speeds and traffic is heavy, averaging 42 trains a day, of which 12 are scheduled passenger, 8 scheduled freight and 22 extra freight. The maximum traffic has run as high as 53 trains a day. When putting in automatic signals, train-order signals were changed from three to two-position, and now display but two indications, stop and proceed. The first automatic signal in the rear is controlled by a circuit running through a circuit breaker on the train order-signal and so serves as a distant for the train-order signal, indicating caution when the train-order signal is at stop.

The installation of automatic signals made it possible to

Fig. 1—Two-Arm Signal at Turnout

reduce the force of telegraph operators; five night offices were closed and seven operators were transferred to other duties. A further reduction in this force could have been made, but was not necessary, as the agents at regular stations serve as operators. Following the installation of automatic signals, Form "31" was discontinued and train orders are now given on Form 19 in all cases, and there is no stopping of trains for orders.

A typical arrangement of signals at and between passing sidings is shown in Fig. 3. These sidings, of which there are 22, are 3,000 to 3,300 ft. in length; they average 2½ miles apart. There is one lap siding, the signal arrangement for this location being shown in Fig. 4.

The signals and apparatus were installed by the General Railway Signal Company, arranged according to the "absolute-permissive" system; absolute blocking between passing sidings for opposing movements, and "stop-and-proceed" or standard double-track blocking, for following movements.

In Fig. 3 the thin lines indicate the control of each signal. Each passing siding has an entering and a leaving signal at each end for each direction, as shown in Figs. 1 and 3. Between passing sidings there are two or more intermediate signals for movements in the same direction, and the average distance between signals governing movements in the same direction is about 4,400 ft.

Ordinarily, entering signals are permissive or stop-and-proceed signals, of which 1 and 4 at siding A, Fig. 3, are typical. The control of signal 1 extends to the farther end of the first track circuit beyond signal 3, and likewise the control of signal 4 includes the first track circuit beyond signal 2. This arrangement insures that two trains approaching a meeting point will encounter stop-signals at the entrance to the sidings, in which case the inferior train prepares to enter the siding.

Each entering signal has a lower arm controlled by the position of the passing-siding switch. When this switch is set for main track, the lower arm is horizontal, but when set for the siding, the lower arm is at 45 deg. This arrangement eliminates unnecessary stops at meeting points. In all cases the outgoing signals are "stop-and-stay" signals. The control of a leaving signal extends to its respective opposing leaving signal at the siding in advance; for example, signal 10, Fig. 3, is controlled by the same track circuit as signal 3. Intermediate signals between sidings are stop-and-proceed, as before stated. For opposing movements, the control of these signals is lapped the same as their respective leaving signals, and for following movements the control is from signal to signal.

In the case of stop-and-proceed signals when they are located on ascending grades, where heavy trains would have diffi-

Fig. 2—At Lap Sidings

culty in starting, a full stop is not required. Two-arm signals, called "tonnage signals," are used; these permit a following train to enter an occupied block on a cautionary indication without coming to a stop. Since the speed of trains accepting this indication is necessarily slow, there is practically no sacrifice of safety and a considerable advantage in facility. At a "tonnage signal," when the upper arm is in the proceed position, the lower is horizontal. When the upper arm is at stop, the lower arm moves to the 45 deg. position, indicating "block is occupied, proceed with caution."

Prior to the signal installation the railway company com-

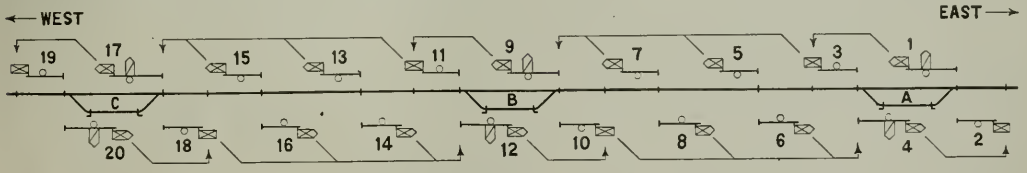


Fig. 3—Typical Signal Arrangement

pleted on the greater part of the road a new pole line consisting of 26 ft. chestnut poles, 7-in. top, 40 to the mile, with Washington fir cross-arms, ½-in. steel pins on single arms, ⅝-in. steel pins on double arms, single groove d. p. glass insulators and R. S. A. cross-arm braces and lag screws. The lower cross-arm supports the signal wires.

Line wires for the signaling circuits are No. 10 B. & S. gage, double-braid, weatherproof, 30 per cent copper clad. They are fastened to the insulators by the figure 8 tie. Ordinarily there are five wires extending from siding to siding and seven wires through sidings. Connection between line and signals is made by No. 14 rubber-covered wires, which are wrapped together with marline, forming a cable which is supported by messenger wire and marline. Brach vacuum lightning arresters are used.

The signals are G. R. S. model 2A. For the high speed signals the mechanism is at the bottom of the post, but for the lower arm of the two-arm signals a top-mast mechanism is used, clamped to the post.

The night color indications are green for clear, red for stop and yellow for caution. The lamps are Dressel, with long-time burners. The signals are operated by Gordon potash batteries, 16 cells, 400 ampere hours capacity. The battery vaults are Potter-Winslow, 60 cells capacity.

At Burnside where this road connects with the New York, Ontario & Western the existing home signals were converted into power signals by clamping top-post mechanisms to the wooden posts. At the same time calling-on arms were fitted to these posts, and a number of outlying switches were fitted with electric locks.

Each of the four maintainer's sections has 47 automatic signals, except that on one, where there are three interlockings, there are only 31 automatics. Each maintainer has a gasoline motor car, and for each car there is a car house 10 ft. x 12 ft.

The work of installation, done by the General Railway Signal Company, was carried out under the supervision of the signal supervisor, who reports to the maintenance of way officers. H. W. Lewis, signal engineer of the Lehigh Valley, was engaged to act as consulting signal engineer and had general supervision of the installation. The signal company did all of the work, with the exception of installing insulated joints and switch rods and rearranging track and switch ties. The material was delivered by work trains, and gasoline motor cars were used by the signal company in transporting men and tools.

Before the signals were put in service, a book of signal rules was prepared and frequent teaching classes were held. All employees whose duties required them to be familiar with the operation of the signals were thoroughly instructed, and no delays or difficulties were experienced in putting the signals into service.

Track and signal maintenance employees all report to the same head, the superintendent of track, bridges and buildings, and he, in turn, reports to the superintendent. This organization provides satisfactorily for co-operation between employees of the track and signal departments. The signal department consists of a supervisor of signals, four maintainers and four batterymen. Signal lights are maintained by trackwalkers, reporting to the section foreman. The signal supervisor also has charge of the installation and maintenance of telegraph and telephone wires and apparatus.

The company has adopted a thorough system of records of performance and reports for four months indicate that the maintenance cost will average $95 per year per signal.

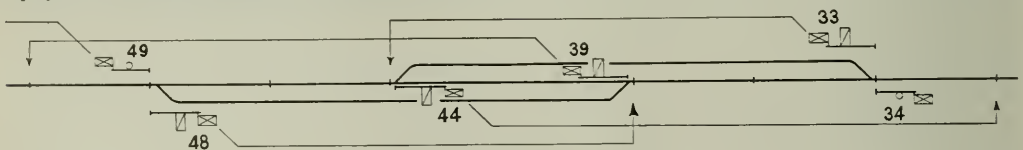

Fig. 4—Signal Arrangement at Lap Siding

GRADE CROSSINGS IN CANADA

The Railway Commissioners of Canada, who have authority to draw on a fund of $200,000 a year for abolition or amelioration of grade-crossing dangers, are asking Parliament for a modification of the law, so as more effectually to carry out its policy of making permanent separation of grades at crossings as fast as is practicable.

This Canadian law is more liberal than those of Massachusetts and New York (which have been the most notable examples of state aid in this country) in that the commissioners have wider discretion, and may make appropriations for the installation of gates or bells, and for the construction of bridges or subways.

The Canadian railway grade crossing fund was set apart by act of Parliament in 1909 to be used as directed by the railway board in aiding the work of protecting or obliterating level crossings. The fund was to amount to $200,000 yearly, and was to be available for a period of five years. The fund can only be utilized in the case of a crossing in existence prior to 1909. Secondly, the contribution to any given work must not exceed twenty per cent of the estimated total cost. Thirdly, the maximum contribution in any instance could not go beyond $5,000. Fourthly, the board could not order a payment from the fund in more than three cases in any municipality within a year.

Assuming that the maximum twenty per cent was contributed by the railway board in every instance, the total cost of the protective work would have to be at least one million dollars a year to absorb the entire amount invested in the fund each year. But the circumstance that not more than three crossings in any municipality can benefit from the fund within the twelve months, coupled with the fact that most of the costly grade separation work, involving the handling of numerous crossings, is done within the limits of a single municipality, has limited expenditures, and the $200,000 has never been fully spent in any year.

The majority of the orders for crossing protection, involving a draft on the grade crossing fund, call for the installation of electric bells, with illuminated danger signs. The second most numerous class are for gates; the third, for the entire separation of grades. For the five years that the fund has been in existence 306 orders have been made, of which 161 have been for bells, 68 for gates, 60 for subways and bridges, 14 for highway diversion and two for highway closing. The railway board, through its staff of inspectors, investigates every crossing accident, and if thought advisable orders protection at such crossing.

The five-year period having expired last spring, the legislation was renewed for a sixth year, but after that it is hoped Parliament will permit a much more generous use of the fund. The twenty per cent limit is satisfactory enough, but the $5,000 maximum is regarded as too small to be of much real value. The installation of bells and gates would not be affected as their cost is comparatively small, but in the building of subways and the erection of bridges, the $5,000 usually represents much less than twenty per cent of the outlay. To increase this limit and encourage the permanent separation of grades is the aim of the proposed legislation.

Methods of Handling L. C. L. Outbound Freight*

A Discussion of the Relative Merits of Two-Wheel, Four-Wheel and Motor Trucks With Cost Statistics

By E. H. Lee
Vice-President and Chief Engineer, Chicago & Western Indiana

The handling of L. C. L. freight through freight and transfer houses, excluding inbound houses, involves a sequence of operations which may be divided into:

	Average distribution of house costs at six outbound houses
1. Unloading or checking	32.5 per cent
2. Trucking	43.7 per cent
3. Stowing	13.1 per cent
4. Supervision and miscellaneous	10.7 per cent
	100.0 per cent

In searching for means for increasing economy, the reduction of trucking cost is the item in which the great saving is to be expected, and in order to secure maximum economy the co-operation of the management with the agent and foreman is required. The reduction of trucking cost may seem an insignificant matter to one not closely in touch with freight house work. Allowing for the double handling required under present practice, about 24,000 tons of L. C L. freight is handled per day through freight and transfer houses in Chicago alone, and taking the country as a whole, the L. C. L. tonnage going through freight houses and transfer stations probably approximates 400,000 tons per day. Therefore, it is apparent that if the conclusions reached herein are sound, the possible saving amounts to a large sum,

Almost without exception the handling of material of any kind is based on a few broad principles, although in a given case their application is sometimes difficult to recognize. Ton-mile cost is frequently a useful standard for measuring efficiency in handling materials transported by other means than railroad cars. The means and methods involved in the economical handling of cars that in turn influence ton-mile cost, nearly all have a counterpart in the proper handling of trucks through a freight house. In either case it is essential to the best results that a smooth track or running surface be provided; that adverse grades be reduced or eliminated; that fouling points and causes of interference be avoided; that re-handling be reduced to the lowest terms; that full loading be provided for each carrying unit, and that these be transported over the shortest and most direct line or path at the highest safe speed, so far as is practicable in each item. In either case suitable appliances and equipment are required. Finally, if by good management and proper classification in the one case a larger loading on each carrying unit or car can be assembled with other units into larger trains to be hauled the greatest practicable distance before breaking up, with a favorable effect upon cost, it is fair to presume that the same general practice may have a like favorable effect in the other.

That the four-wheel truck should be generally substituted for the two-wheel truck in all except the smaller houses, and that in outbound freight and transfer houses having sufficient size and business, the use of motor trucks and trailers will save money, are thought to be the general conclusions reached by almost everyone who will analyze the facts. Man power is one of the most expensive forms of power. One authority maintains that its cost per unit of power developed is from 10 to 12 times that of the next less expensive form. Evidently, therefore, where conditions warrant, the substitution of mechanical power offers an effective means of reducing cost.

THE TWO-WHEEL TRUCK

The two-wheel truck has been standard for freight house use for years, and it is still almost universally used. It is suited for economical hauling over short distances, and is convenient and well adapted for use in cramped and narrow runways; but a careful examination shows many defects in its use. Its average load varies from about 200 lb. to approximately 400 lb., a rack being required in the latter case. Roughly, therefore, from five to ten trips are required in transporting a ton of freight through the house. The length of the trucking distance under load probably averages 200 ft. and upward in city freight houses, and thus the two-wheel truck travels from 1,000 to 3,000 ft. per ton. If the gang system of trucking is used, under which from 40 per cent to 50 per cent of the movement is with empty trucks, the distance traveled per ton handled is nearly doubled.

The very general use of the two-wheel truck is responsible for the relatively high trucking cost per ton for handling freight in freight houses. This average cost in over 50 observed cases approximates 10.3 cents per ton per 100 ft., or $5.33 per ton-mile. This cost was determined as follows: In the course of an investigation the writer secured the costs of operation in a large number of houses, and plotted them against the length of house. It was found that the average cost of operation increased about 1 cent for every increase of 35 ft. in the length of the house, the cost of trucking being practically the only cost to increase. Observations of truckers were made in different houses of different lengths, by men working for three different railroads, and with different purposes in view, and it was found that the average round trip trucking distance increased 55.6 ft. per 100 ft. increase in the length of the house. The actual distance the freight moves, of course, is only one-half of this, or 27.8 ft. per 100 ft. of house. The theoretical distance would be 33.3 ft. for every 100 ft. length of house, assuming that all doors receive equal amounts of freight, and that the freight received at every door is evenly distributed among the cars. As the end doors are usually closed, and as teamsters with large shipments for a certain car are often sent to the door nearest that car, the actual is less than the theoretical trucking distance.

If the average cost of operation of a large number of freight houses, in which two-wheel trucks are used, increases 1 cent for every 35 ft. of house, or 2.86 cents per 100 ft., and the average trucking distance that the freight is actually moved is 27.8 ft. for every 100 ft. of house, then the cost of trucking is 10.3 cents per ton per 100 ft. ($2.86 \times \frac{100}{27.8} = \$0.103$), or $5.33 per ton-mile. Accurate observations will show that each of the factors in any specific case will vary from the average to some extent, and of course this cost per ton-mile is not applicable in the case of an outbound house, where freight is received only at the door nearest the proper car. But that the cost per ton-mile is correct, as derived above, may be shown by the assumptions, which are thought to be reasonable, and computation which follow:

Assumed:

Average speed of travel for truckers, 1½ mi. per hour.

Average loading of two-wheel truck, 250 lb., or ⅛ ton.

The trucker travels only half the time, the other half being lost at terminals, or the ends of trip. Only ½ the travel time of trucker, or ¼ of his total time, is employed moving with load.

Trucker's rate of pay, 22c. per hour.

Then:

$$\text{Ton miles per trucker} = \text{ave. speed} \times \text{ave. load} \times \frac{\text{Time moving load}}{\text{Total time}}$$

*Abstracted from Bulletin 171 of the American Railway Engineering Association.

Substituting assumed values for one hour:

$$\text{Ton-miles per trucker per hour} = \frac{3}{2} \times \frac{1}{8} \times \frac{1}{4} = \frac{3}{64},$$

$$\text{Cost per ton-mile} = \frac{\text{Wages per hour}}{\text{Ton-miles per hour}}$$

Substituting assumed values:

$$\text{Cost per ton-mile} = \$0.22 \div \frac{3}{64} = \$4.69$$

It therefore seems conservative to say that ton-mile cost for two-wheel trucking will fall somewhere between $4 and $6 in any given case.

The effect of this ton-mile cost on the cost of freight house operation is apparent. Indeed it becomes startling when compared with ¾ cent per ton-mile, the average freight revenue of the railroads of the country.

THE FOUR-WHEEL TRUCK

The four-wheel truck has now been so far perfected that one man can handle from three to six times the tonnage per trip as compared with the average load on a two-wheel truck, and with no greater fatigue, because the trucker is relieved from carrying any portion of the load on the four-wheel truck, and simply applies the horizontal force required for traction. With the use of the truck carrying the heavier load, a smooth trucking surface is of importance, and commodious truckways greatly facilitate the work. The four-wheel truck has already been adopted in some existing freight houses to the exclusion of the two-wheel truck, except for use in the shortest hauls; and the average loading is at least three times the loading of the two-wheel truck. For special purposes six-wheel trucks and dollies are found convenient.

Some of the objections offered to the use of the four-wheel truck are as follows:

"Their loading involves extra expense."—The observer will note a partial answer to this objection in the fact that two men are often required in loading a two-wheel truck. He will also note that in any trip of a trucker there is a certain amount of lost time at the terminals or ends of each trip. The number of trips made by the four-wheel truck in handling a ton of freight being much less than with the two-wheel truck, the time lost at the terminals per ton handled is also reduced in proportion.

"It is necessary to mix freight on the truck to procure full loading."—This, while true, is not a vital objection. The freight on a "peddler" truck can be classified for the cars in a certain rank or for ranks opposite a certain section of the house, the freight being loaded on the truck in proper sequence so that it may be convenient for unloading. To make such a classification most advantageously, an ample number of trucks is needed.

In loading cars for the way-freight train on the road, many are given a mixed loading. During the time such mixed freight is being handled at the way station, the expense for locomotive and crew is a dead loss, and in most cases the main track is blocked. Moreover, at most way stations the facilities for handling L. C. L. freight are so poor that the actual expense of handling is excessive. For these reasons some relatively light setout cars are run, yet it would not be considered good practice to run cars with only 25 or 30 per cent of their average loading merely to avoid mixing freight in them. With a proper system of classification, mixing freight on the four-wheel truck is free from the objections that apply to the practice with the freight car on the road; therefore all the greater is the disadvantage and loss caused by multiplying the distance required to handle the truck by three or four, merely to avoid a relatively small loss required by the classification described.

"The use of the four-wheel truck increases the cost of stowing."—This may well be doubted. The use of stowers is required by the "drop truck," or "no gang" system, and this system probably saves money, although in this respect some difference of opinion may exist. The use of the four-wheel truck is particularly well adapted to the drop-truck system. Actual practice with the use of the four-wheel truck has shown that mixing freight on the "peddler" truck has actually made a substantial reduction instead of tending to increase the overs and shorts in the freight car. Moreover, it cannot be doubted that any extra expense involved in careful and proper stowing of L. C. L. freight in cars reduces the damage in transit and the placing of freight in the wrong car sufficiently to more than offset the extra stowing expense.

"Four-wheel trucks are not adapted for passing into and through cars."—This objection, so far as it applies to the improved trucks now manufactured, is without foundation.

If the loading on the four-wheel truck is three times that on a two-wheel truck, it might seem that by the use of the former trucking, cost should be reduced 66 per cent, but this is somewhat too much to expect. In the opinion of the writer, some additional labor is to be expected in sorting the freight onto trucks, as several shipments are required to make a truck load, the average shipment being only about 400 lb., to the best of our information. In certain cases additional expense for stowers is involved, but this is a positive advantage for the reasons already given.

The trucker can hardly be expected to travel so rapidly with the larger load, although an improvement in the floor or trucking surface will frequently offset this difference. It may be said here that a smooth trucking surface is a profitable investment in almost any house. Officers who would promptly authorize the repair of rough main tracks, sometimes fail to appreciate that a rough trucking surface, although not involving the same elements of danger as a rough track, probably has a relatively greater effect upon the cost of transportation over it.

MOTOR TRUCKS

In the fall of 1912 an investigation into facilities for handling L. C. L. freight was made by the writer for his company. This covered appliances and methods, as well as the general arrangement of houses and tracks. At that time the Chicago & Eastern Illinois had one motor truck in service in its outbound freight house in Chicago. The results of the operation of this truck strongly attracted the attention of the writer. Accurate observations and a one-day's record of the performance of this truck were made in November, 1912. On that day it hauled 88 tons, with an operator and one assistant. On the same day the men with two-wheel trucks handled from 10 to 15 tons. The motor truck reduced the cost of trucking 9.3 cents per ton for the freight it handled. These results were so satisfactory that shortly afterward two additional motor trucks were purchased and put in service.

The Chicago and Eastern Illinois has further perfected its system of motor trucking in the two years since 1912. To obtain further information, observations and records of the performance of each of these three similar motor trucks were made on September 4, 1914. In the last case three motor trucks each handled an average of 172 tons over an average distance of 393 ft. at a cost of 3.6 cents per ton. Each motor, therefore, carried 12.8 tons one mile at a cost of 48 cents per ton-mile. The average time per loaded trip was 5 min. and 18 sec. An average of 3,070 lb. was carried per loaded trip on 2.71 trailers, or 1,130 lb. per trailer. The three motors handled 515 tons, or 65.1 per cent of the total tonnage. The average weight per shipment on that day was 398 lb., and as the average trailer load was 1,130 lb., it was evidently necessary to mix the loading on a considerable percentage of the trailer trucks. These "peddler" trucks were hauled by the motor to the proper section of the house, and there distributed into cars, as previously described. Two truck switchmen made up trailers into trains for the motor trucks, one working in each half of the house. Trailers were made up into station order, the last in the train being the first dropped. Hand trucking was used for distances of about 100 ft. or less. In this house motor trucks and trailers are considered to be better adapted for handling long pipe, sheet iron, lumber, machinery, pianos and other awkward and bulky freight than two-wheel trucks. One should note that much of the improvement made in the tonnage handled by mo-

tor trucks in the two years was due to the elimination of all loading from the motor truck, its use being confined strictly to the development of power.

On September 10, 1914, similar observations were made of the use of motor trucks in the Chicago, Burlington & Quincy Harrison St. freight house, Chicago, where five motor trucks to handle trailers had been installed in July, 1913. These observations at both the C. & E. I. and C., B. & Q. houses are believed to represent general conditions accurately because they were all made upon days when business and conditions were normal.

The system of operation at the C., B. & Q. house is similar to that at the C. & E. I. house. Six motor trucks were used, a seventh being added in the afternoon only. The motors averaged 88 tons each per day, hauling on an average two trailers per loaded trip, with 1,111 lb. of freight each, or 2,222 lb. per loaded trip of the motor truck. The average distance hauled was 642 ft. The motors, therefore, average 10.7 ton-miles per day. The cost of motor trucking was 4.8 cents per ton, or 39.2 cents per ton-mile. It will be noted that the average haul in the Burlington house is greater than in the C. & E. I. house, due largely to the design of the house. A substantial saving in the cost of operation has been made in this house during the last ten months, due mainly to the use of motor trucks with trailers.

In the investigation made in 1912, the use of motor trucks on several piers in New York City and at various transfer stations in the east was observed. At some of these points the use of these trucks was considered satisfactory, although in none was the same efficiency obtained as in the cases cited in Chicago. The reason is plain. The motor truck was used for carrying freight, instead of hauling it. A large part of the motor's time was therefore lost in loading and unloading, and the average load was relatively smaller. For the same reason automobile trucks for general road and street use have proved economical for the handling of miscellaneous material, only when their running time is largely in excess of their standing time, and therefore their use for handling materials whose loading requires too much time has been limited, and in some cases entirely abandoned.

In designing plans for new house and track layouts, changes from present standards are required if motor trucks are to be used, in order to secure maximum efficiency. In substituting four-wheel trucks for two-wheel trucks, and in determining where motor trucks are warranted, how large the installation shall be, and what changes, if any, shall be made in existing houses and track layouts, a careful investigation is needed.

The comparative merits of the methods mentioned herein of trucking as compared with hand trucking with two-wheel trucks, may be shown by the following mathematical statement, bearing in mind that the comparison is only applicable to the truck while actually traveling:

Letter a = Average loading per truck.
b = Number of trucks handled as unit or train.
c = Relative speed of travel.
d = Relative average length of truck haul, or distance.
e = Relative average cost per unit of time.

For the purpose of comparison all these various factors may be assumed as unity in the case of the two-wheel truck. For the four-wheel truck handled by hand the value of (a) is increased to 3 or more, and (c) should probably be some fraction of unity, say, 70 to 80 per cent, which may, however, be increased in some cases by improving local conditions.

For motor trucks and trailers, the various factors may be assumed as follows:

a = 3 to 4
b = 3 to 6
c = 2 to 4
d = X, except that for a given house where two-wheel trucks are in use it equals 1.
e = 2 to 3

1. For hand trucking with two-wheel trucks the expression becomes:

$$\frac{a \times b \times c}{d \times e} = \frac{1 \times 1 \times 1}{1 \times 1} = 1$$

2. For hand trucking with four-wheel trucks it becomes:

$$\frac{a \times b \times c}{d \times e} = \frac{3 \times 1 \times 0.7}{\cdot 1 \times 1} = 2.1$$

3. For motor trucking with four-wheel trailers it becomes:

$$\text{Minimum } \frac{a \times b \times c}{d \times e} = \frac{3 \times 3 \times 2}{1 \times 2} = 9$$

$$\text{Maximum } \frac{a \times b \times c}{d \times e} = \frac{4 \times 6 \times 4}{1 \times 3} = 32$$

That is to say, if the values assumed in case 3 meet the conditions correctly in the assumed minimum, the same tonnage will be handled by motor truck for 1/9 the cost, or nine times the tonnage will be handled for the same cost. In the assumed maximum the corresponding values are 1/32 or 32, as compared with hand trucking by two-wheel trucks.

The actual efficiency of the motor truck with trailers is somewhat less than this theoretical efficiency, because among other reasons, loads must be mixed, in order to obtain the best results, as already described, and then be "peddled out" to several cars in one section of the house. The results found at the two houses investigated do not show as great an increase in efficiency per ton handled through the house as the formula would indicate, the actual cost per ton of hand and motor trucking being in the ratio of 4 to 1 in one case, and 6 to 1 in the other. The cost per ton-mile, however, is in the ratio of 12 to 1 and 14 to 1, respectively. In these houses the short hauls are made by hand and the long hauls by motor. There are two additional reasons for the efficiency being below the theoretical. First, neither house was designed for motor truck operation, having been built several years ago, and there is not sufficient space available for their use to best advantage. Moreover, the traffic has outgrown the facilities in each case. Second, as both two-wheel and four-wheel trucks are used in hand operation, an actual comparison between motor trucks and two-wheel or four-wheel trucks is difficult. It is believed that under more favorable conditions, motor trucks would show still lower costs.

GENERAL CONCLUSIONS

1. Motor trucks, when used without trailers, tend to decrease the cost of trucking freight, because they form single units of higher capacity and greater speed than do men with two-wheel trucks; but as their cost of operation per day is greater than the cost of a man and a two-wheel truck, the saving is not large, and unless conditions are favorable (long haul, heavy packages, etc.), no saving is made. When compared with a man and a four-wheel (platform) truck, there is no saving, for the two have about the same carrying capacity, and the higher speed of the motor is more than offset by its greater cost of operation.

2. Motor trucks, when used as power for hauling loaded four-wheel trucks as trailers, show favorable results and greatly decrease the costs per ton. They can pull six times the load at twice the speed of a man with a four-wheel truck, at about twice the expense. Motor trucks should, therefore, be used to haul and not to carry freight. Under such a system they form an efficient, reliable and economical means of trucking freight.

3. To insure full train loads, an ample supply of four-wheel or six-wheel trucks and dollies is necessary.

4. Motor trucks, when used as tractors, can handle practically all kinds of L. C. L. freight.

5. Motor trucks need wide station platforms, and open runways wide enough to permit two motor-truck trains to pass each other, in order to secure the best results.

6. "Fouling points" or "interferences" should be reduced or eliminated entirely.

7. In motor truck operation, distance is a relatively unimportant factor, for once a train is made up and in motion, the cost per ton per 100 ft. is low.

8. Under fair conditions, on an ordinary freight platform, where the motor must operate largely as a way-freight, it can

handle from 150 to 200 tons per day per motor, and do from 10 to 15 ton-miles of trucking.

9. Under ideal conditions, where the motor can operate as a "through freight," i. e., pull a solid train of five or more trailers from origin to destination without stop and with few or no delays, a motor can probably be expected to handle from 250 to 500 tons per day, or do from 30 to 60 ton-miles of trucking.

10. Finally, while the substitution of the four-wheel truck for the two-wheel truck saves money, if conditions warrant, its use is particularly valuable because it may be a preliminary step to the use of one or more motor trucks, if the volume of tonnage and local conditions indicate the need of a tractor. This method of procedure also eliminates the danger of installing motor trucks at a heavy investment expense, to perform work which the four-wheel truck used as a trailer will do more economically.

Operation of Motor Trucks at the C. & E. I. Outbound Freight House, Chicago, September 4, 1914

Total tons handled	791
Tons handled by motors	515, or 65.1 per cent of total
Cost of 3 motor trucks for one day	$18.57
(Wages of motormen, electricians, truck switchmen, current, interest, depreciation and repairs included.)	
Cost per ton of trucking by motor	3.6 cents

Distribution of Motor Truck Time per Average Loaded Trip

	Time	Per Cent
Moving, loaded	2 hr. 20 min.	44.4 per cent
Moving, empty	1 hr. 00 min.	18.7 per cent
Delayed	0 hr. 41 min.	12.6 per cent
Loading and unloading	1 hr. 17 min.	24.3 per cent
Total time	5 hr. 18 min.	100.0 per cent

Average per Motor

Tons carried	172
Miles, loaded	11.0
Miles, empty	4.2
Tons carried one mile	12.8
Average haul	393 ft.
Average weight per trailer	1,130 lb.
Average trailers per loaded trip	2.71
Average weight per loaded trip	3,050 lb.
Average loaded trips	113
Average loaded trip per hour	11.3

Note.—As but one motor is permitted on the transfer platform in this house, because of its width (11 ft.), part of the freight is handled twice by motor, once in the house and once on the platform. This reduces the figure of 515 total tons handled by motor to about 450 tons (net) handled by motor. This also reduces the average haul by 33 per cent, and consequently a larger number of trips were made.

Operation of Motor Trucks at the C. B. & Q. Outbound Freight House, Chicago, September 10, 1914

Total tons handled	1,045
Tons handled by motor trucks	571, or 54.7 per cent of total
Cost of motor trucks per day (current, interest, motormen, depreciation and care included)	$27.17
Cost per ton for motor trucking	4.76 cents
Cost per ton-mile for motor trucking	39.2 cents*

Distribution of Motor Truck Time per Average Loaded Trip

	Time	Per Cent
Moving, loaded	3 hr. 20 min.	44.5 per cent
Moving, empty	1 hr. 24 min.	18.6 per cent
Delayed	0 hr. 53 min.	11.8 per cent
Loaded or unloaded	1 hr. 53 min.	25.1 per cent
Total	7 hr. 30 min.	100.0 per cent

Average per Motor

Tons carried	88
Miles, loaded	17.5
Miles, empty	5.0
Tons carried one mile	10.7
Average haul	642 ft.
Average weight per trailer	1,111 lb.
Average trailers per loaded trip	2.0
Average weight per loaded trip	2,270 lb.
Average trips, loaded	77.4
Average loaded trips per hour	7.7

*Note.—In comparing this cost of motor trucking, 39.2 cents per ton-mile, with the average hand trucking cost of some 58 freight houses using two-wheel trucks, of $5.33 per ton-mile, the motor trucks show an efficiency 14 times greater than that of two-wheel hand trucking, or in other words the cost of motor trucking per ton-mile is only one-fourteenth that of hand trucking.

RAILWAY AFFAIRS IN OTHER COUNTRIES

A recent despatch from Sir John French, commanding the British forces in France, reveals a railway feat by the French railways and the Chemin de Fer du Nord, in particular, which deserves notice. It was nothing less than the transport of the entire British force from the region of the river Aisne to its present field of operations in northeast France and western Belgium. The withdrawal commenced on October 3, the entraining station being apparently Compiègne, a town situated near the junction of the Aisne with the Oise. The detraining station for all, or the bulk of the forces, was St. Omer, a town 97 miles almost due north of Compiègne. But the troops had to be brought through Amiens, Abbeville, along the coast to Boulogne and Calais and thence southeast to St. Omer, a total railway journey of about 180 miles. The operation was completed in 16 days. The cavalry went first, and was actually in contact with the enemy some distance south of St. Omer on October 11. On the evening of the same day the Second Army Corps had completed the journey and had taken up its position beside the cavalry. Simultaneously, the Third Army Corps was completing its detrainment at St. Omer. The First Army Corps arrived and was detrained at St. Omer by the 19th. According to one military correspondent this movement required all told something like 609 trains, comprising about 16,800 cars, an average of 32 trains a day, or one every three-quarters of an hour throughout the day and night. Men, horses, guns, kit and transport were all included, and the whole operation had to be conducted almost under the nose of the enemy.

* * *

One of our friends who has recently gone to England and obtained work in a running shed (engine house) there writes an interesting letter concerning conditions in that country as follows: "As everyone knows, a great many railwaymen have enlisted, but now no one is allowed to enlist without permission of his superior officer, which at present and according to government instructions, is not being given. But before long more will have to go and the services will consequently have to be curtailed. Conditions, however, are surprisingly normal. Practically the usual winter schedules are in force. Occasionally the services may be reduced or suspended for a day on account of troop movements. Various precautionary measures are in evidence. Stations, bridges, tunnels and the right of way are, of course, carefully patrolled. In the London district the shades of all windows on coaches are required to be pulled down at night because it is supposed that should a Zeppelin be about, one of its chief objects would be to destroy railway lines and hence interfere with mobilization and supplies. At a very little distance the trains with shades pulled down are scarcely distinguishable, and I suppose at an elevation of half a mile they would be invisible. At stations and yards, of course, the illumination is greatly reduced. The London Tube railways state and truly, too, on their advertising posters that 'It's bomb-proof down below.'"

* * *

The question of strategic railways has recently assumed a great practical importance in both Australia and South Africa. The Australian War Railway Council, which is composed of the state railway commissioners and representatives of the Defense Force, is reported to have in contemplation a strategic railway between Adelaide and Brisbane. As these cities are already linked up by the trunk line running via Melbourne and Sydney, it is quite possible that the government may not be inclined to consider the expenditure just now, even though the advantages of the project combine the reduction of the distance between Adelaide and Brisbane by one-half with the strategic possibilities of the scheme. In South Africa an important section of strategic railway has just been constructed. This is the Prieska-Upington Railway, over which the first train was run on November 18. The line has been laid with remarkable rapidity. Construction was begun in the early part of September, and as the line is 142 miles in length, the rate of track laying averaged over two miles a day. The earthworks were light, however, the line following the Orange river almost its entire length; and only three small watercourses had to be bridged. Construction was determined upon in order to facilitate the conduct of military operations in German South-West Africa, and it is expected that the line will be extended to Kalkfontein, the German railhead, for strategic reasons. The present terminus, Upington, is about 80 miles as the crow flies from the southeastern extremity of German Southwest Africa, and about twice that distance from the German railhead.

Two Pacific Type Locomotives of High Power

Chesapeake & Ohio Engine Develops Tractive Effort of 46,600 lb.; First of This Type for Delaware & Hudson

The American Locomotive Company has recently delivered to the Chesapeake & Ohio six Pacific type locomotives and ten of the same type to the Delaware & Hudson Company.

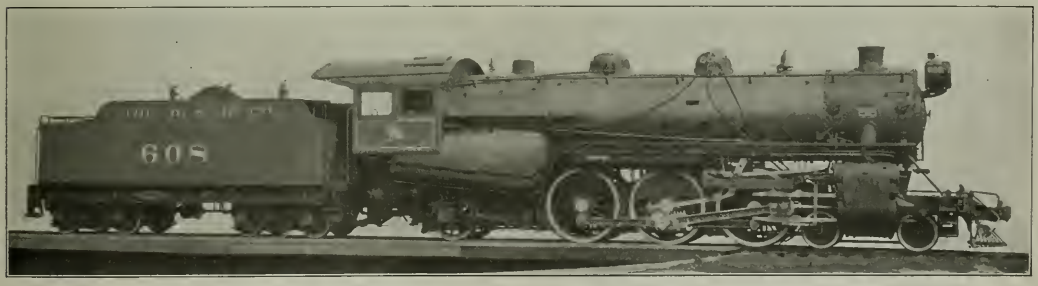
The Chesapeake & Ohio engines have a maximum tractive effort of 46,600 lb., the highest tractive effort for locomotives of this type of which we have record. They have been put in service between Charlottesville, Va., and Hinton, W. Va., a distance of 175 miles. This part of the line crosses three mountain summits: the Blue Ridge, North Mountain and the Alleghanies. To economically handle the through passenger service is a difficult problem. The mountain resorts, among which are the Virginia Hot Springs and the White Sulphur Springs of West Virginia, demand the best of service and equipment. Trains of ten all-steel cars, weighing 674 tons, are a regular daily problem, and this has heretofore required frequent double heading.

Chesapeake & Ohio Pacific Type Locomotive Which Has a Maximum Tractive Effort of 46,600 lb.

The requirements that must be met in order to make the schedule time on the Clifton Forge division are extremely difficult. Westbound from Mechums River to the summit of the Blue Ridge is a continuous uncompensated grade of 75 ft. to the mile, with curves of 10 deg., and extending a distance of 14 miles. One train of ten steel cars, weighing 674 tons, is scheduled at 22½ miles an hour on this grade, while another train of eight steel cars, weighing 551 tons, is scheduled at 29 miles an hour. From Staunton to the summit of North Mountain, a distance of 13 miles, the conditions are still more difficult. The first 6½ miles contain 4½ miles of up-grade, varying from 75 to 80 ft. to the mile, and the last 6½ miles is a continuous grade of 80 ft. to the mile. The scheduled speed for the first mentioned train is 25½ miles an hour, and for the second, 35 miles an hour for this 13 miles. The schedule over the remaining part of the division permits but little time to be made up. These new engines, while as yet in service but a short time, are satisfactorily handling these trains.

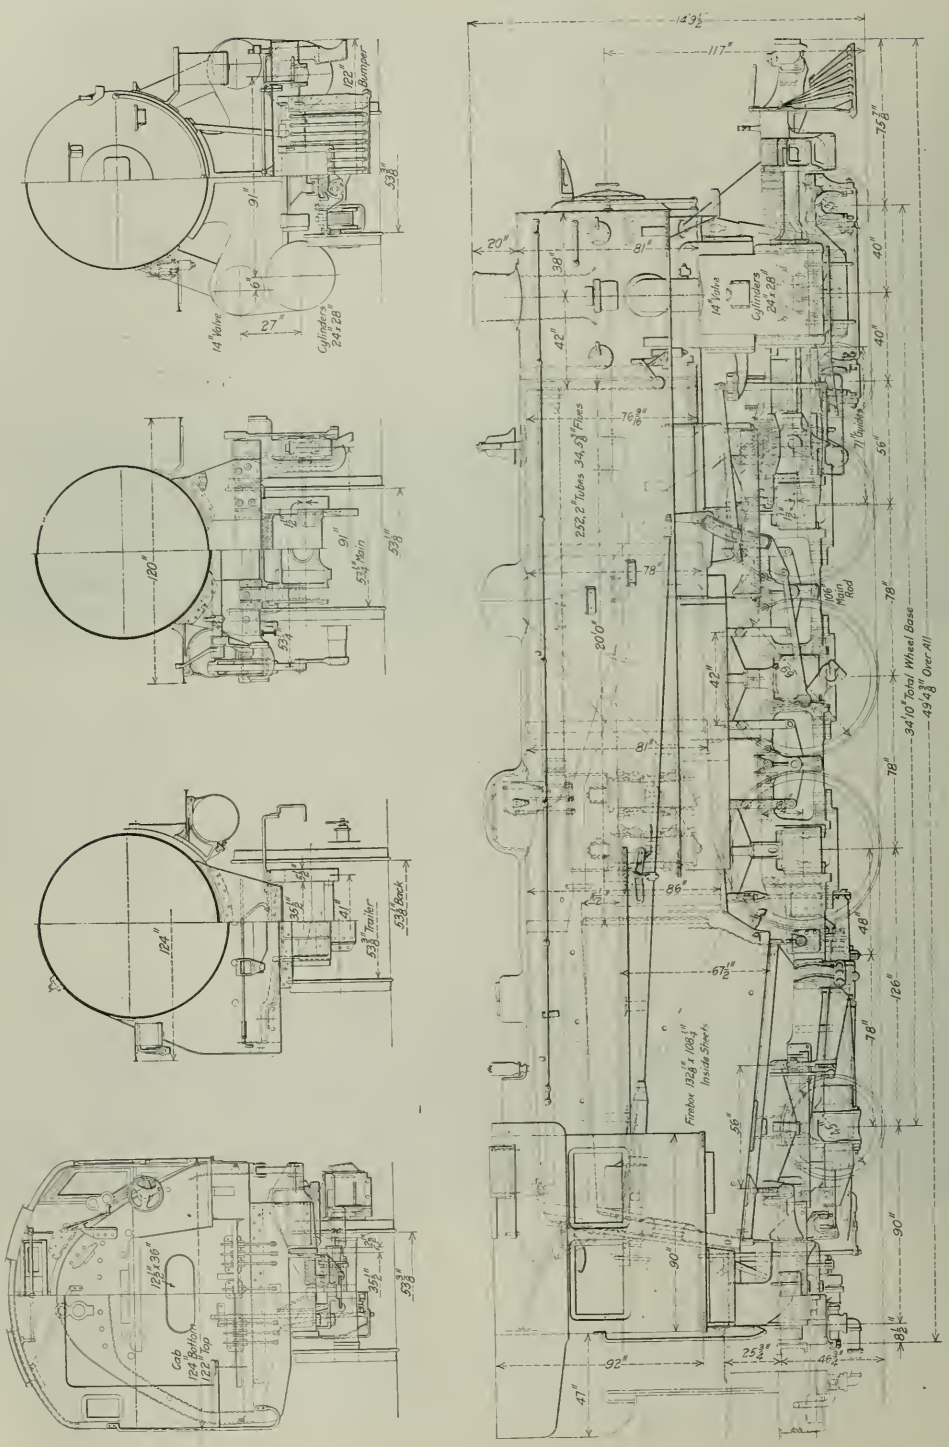
No innovations were attempted in the construction of these locomotives, but the different factors were combined to give as powerful a machine as possible within the clearances. The boiler is of exceptional capacity. It is of the extended wagon top type, and at the first course the barrel is 83 11/16 in. in diameter outside, while the outer diameter of the largest course is 90 in. The barrel is fitted with 244 tubes, 2¼ in. in diameter, and 43 flues, 5¼ in. in diameter and 20 ft. 6 in. long. The firebox is 120⅛ in. long and 96¼ in. wide, having a total depth of 82¼ in. The depth from the center of the lowest tube to the top of the grate is 25⅛ in. To insure a constant supply of fuel to this firebox burning bituminous coal and having a grate area of 80.4 sq. ft., a mechanical stoker had to be applied. This is a type C, Street machine, manufactured by the Locomotive Stoker Company, New York.

The large boiler and wide firebox and the application of the stoker made the arrangement of the cab a difficult matter, but this was improved considerably by the use of non-lifting inspirators, Ragonnet reverse gear and the placing of the steam turret outside of and in front of the cab. Clearance restrictions made it necessary to place the bell off the center of the boiler and the headlight dynamo in front of the smokebox.

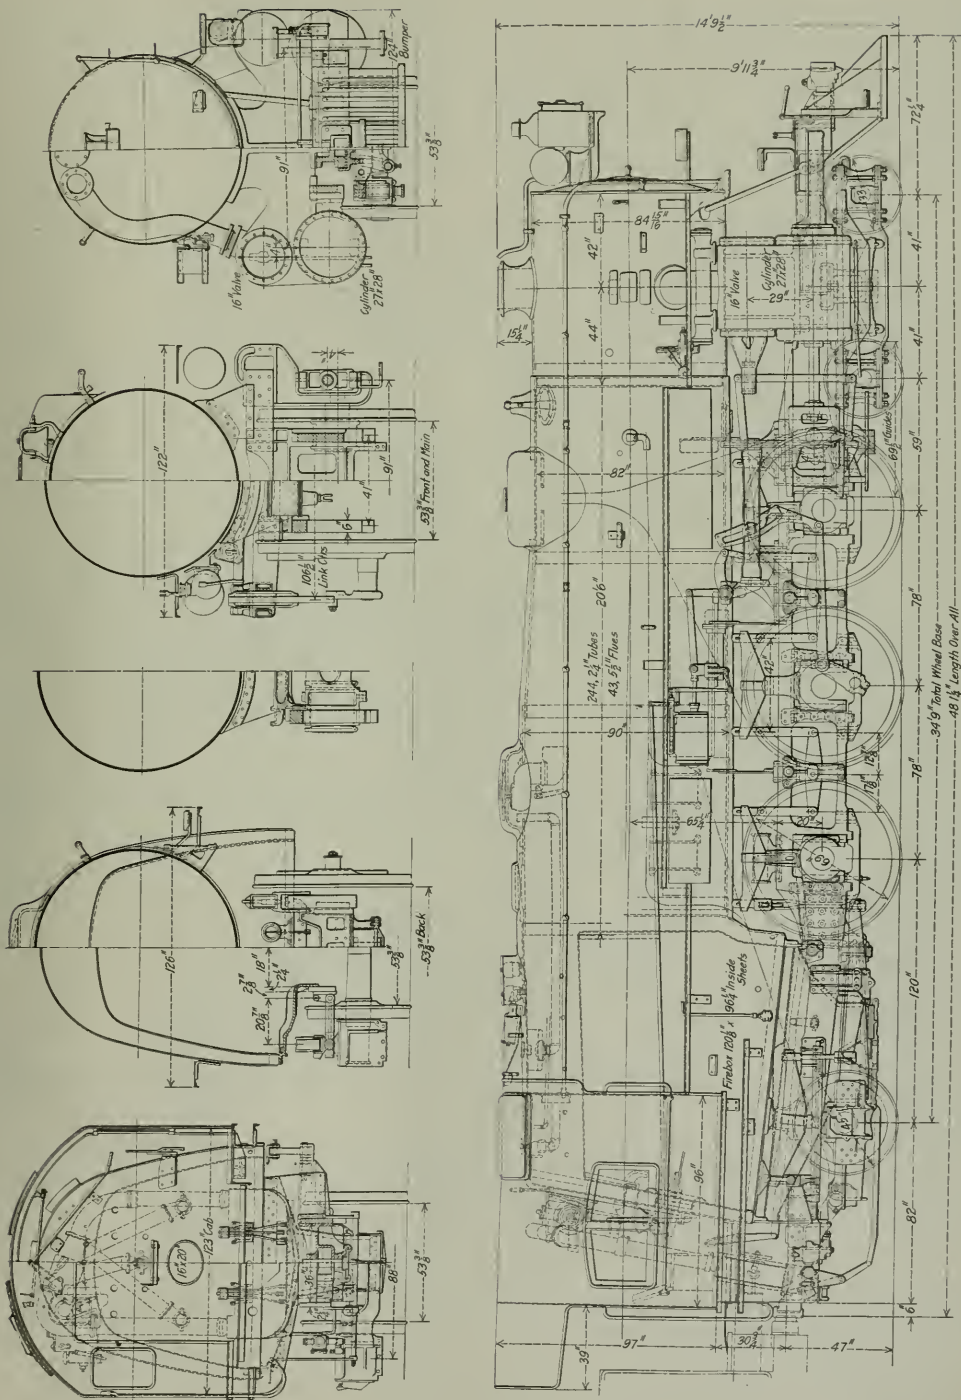


Anthracite Coal Burning Pacific Type Locomotive for the Delaware & Hudson Company

The frames are 6 in. wide and braced by box castings. The piston rod extension is the American self-centering type. Wal-



General Arrangement of the Delaware & Hudson Pacific Type Locomotive



Elevation and Cross Sections of the Chesapeake & Ohio Pacific Type Locomotive

schaert valve gear is used with the valve stem guide integral with the steam chest cover; the piston valves are 16 in. in diameter.

The special equipment includes the Schmidt superheater, Cole outside journal trailing truck, radial buffing device, Security brick arch, Franklin pneumatic grate shaker, Cole long main driving box, Trojan packing, vanadium steel frames and rods, Mellin by-pass valve, Hancock 5,500 gallon capacity non-lifting inspirators, Watters sanders, Nathan lubricators, Westinghouse-American driver brakes and Westinghouse-Farlow draft gear.

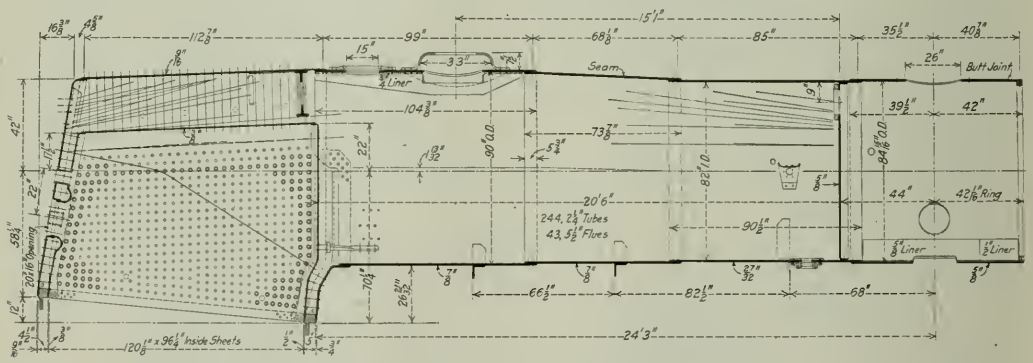
THE DELAWARE & HUDSON LOCOMOTIVES

The ten anthracite-burning Pacific type locomotives for the Delaware & Hudson Company are the first of this type to be used on that road, the heavy passenger service having up till now been handled by Ten-wheelers.

The Ten-wheel locomotives have a total weight, including the tender, of 313,900 lb., the tenders having a capacity of 7,000 gal. of water and 12 tons of coal. With driving wheels 69 in. in diameter, 200 lb. steam pressure and cylinders 21 in. by 26 in., they develop a tractive effort of 28,300 lb. The new Pacific type engines have a total weight, engine and tender, of 460,100 lb., the tender having a capacity of 8,000 gal. of water and 14 tons of coal. They have driving wheels 69 in. in diameter, 205 lb. steam pressure and cylinders 24 in. by 28 in., and develop a tractive effort of 40,730 lb. This is an increase of 46.6 per cent in total weight and 44 per cent in tractive effort. The engines are equipped with the Schmidt superheater, brick arch, screw reverse gear, extended piston rods, long main driving box, Economy engine and tender trucks, Economy pipe clamps, Economy radial buffer, and speed recorders. Vanadium steel was used in the main frames, driving elliptic springs, engine truck elliptic springs and the tender truck elliptic springs.

The following table gives the principal dimensions and ratios of both the Chesapeake & Ohio and the Delaware & Hudson locomotives:

	C. & O.	D. & H.
General Data		
Gage	4 ft. 8½ in.	4 ft. 8½ in.
Service	Passenger	Passenger
Fuel	Soft coal	Hard coal
Tractive effort	46,600 lb.	40,730 lb.
Weight in working order	312,605 lb.	293,500 lb.
Weight on drivers	191,455 lb.	191,000 lb.
Weight on leading truck	56,675 lb.	47,500 lb.
Weight on trailing truck	64,475 lb.	55,000 lb.
Weight of engine and tender in working order	497,100 lb.	460,100 lb.
Wheel base, driving	13 ft. 0 in.	13 ft. 0 in.
Wheel base, total	34 ft. 9 in.	34 ft. 10 in.
Wheel base, engine and tender	71 ft. 11½ in.	70 ft. 4¼ in.
Ratios		
Weight on drivers ÷ tractive effort	4.12	4.79
Total weight ÷ tractive effort	6.72	7.20
Tractive effort × diam. drivers ÷ equivalent heating surface*	538.00	553.00
Evaporative heating surface ÷ grate area	55.80	39.20
Equivalent heating surface* ÷ grate area	74.30	51.30
Firebox, heating surface ÷ equivalent heating surface,* per cent	4.74	5.45



Boiler for the Chesapeake & Ohio Pacific Type Locomotive

weigh 293,500 lb. in working order, of which 191,000 lb. is on the drivers.

The advantage of the Pacific type over the Ten-wheel locomotives in sustained capacity is demonstrated by a comparison of the boilers.

	Pacific	Ten-wheel
Grate area	99.3 sq. ft.	84.9 sq. ft.
Heating surface, tubes	2,627.0 sq. ft.	2,406 sq. ft.
Heating surface, flues	952 sq. ft.	.....
Heating surface, fire brick tubes	40 sq. ft.	78 sq. ft.
Heating surface, firehox	277 sq. ft.	178 sq. ft.
Heating surface, total	3,896 sq. ft.	2,662 sq. ft.
Superheating surface	796 sq. ft.	.....

Comparing the equivalent heating surface, which includes 1½ times the superheating surface, we have 5,090 sq. ft. for the Pacific as against 2,662 sq. ft. for the Ten-wheeler, or an increase of 91.3 per cent.

According to the method of boiler proportioning used by the American Locomotive Company, these Pacific type engines have 111 per cent boilers. In a general way, a boiler will have ample steam making capacity if proportioned by this method for 100 per cent, but for passenger service, it is advantageous to make the boiler over 100 per cent when possible.

The design of these locomotives was developed by the mechanical department of the Delaware & Hudson Company in co-operation with the American Locomotive Company. The engines

Weight on drivers ÷ equivalent heating surface*	32.25	37.60
Total weight ÷ equivalent heating surface*	52.30	57.70

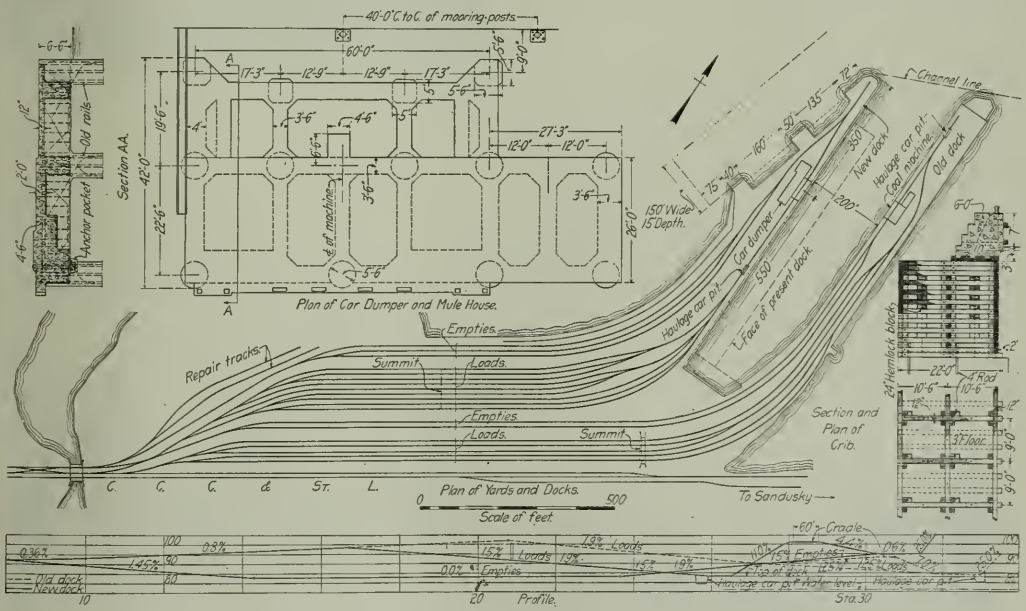
*Equivalent heating surface = total evaporative heating surface + 1.5 times the superheating surface.

PENNSYLVANIA COAL DOCK AT SANDUSKY

The capacity of the single car dumper which has been in service on the Pennsylvania coal dock at Sandusky (Ohio) has been insufficient to handle the amount of coal which it was desired to load on lake boats at that point. This dock is operated by the Lower Lakes Company, which buys coal principally in the West Virginia fields, shipping it over the Norfolk & Western to Columbus, and thence over the Pennsylvania to Sandusky. In order to provide the desired increase in capacity at this point, a second dock with a car dumper having a number of improved features has been built. Preliminary work was started in the fall of 1913 and, beginning last spring it was pushed as rapidly as possible, with the result that the plant was ready to load the first boat on July 15. The dumper is designed to handle 100-ton cars at a rate of 40 per hour in continuous operation. The work has involved the placing of 5,000 cu. yd. of concrete, the dredging of 15,000 cu. yd. of rock, and 125,000 cu. yd. of mud, the placing of 2,000,000 ft. B. M. of hemlock lumber in the crib work under the new dock and 190,000 cu. yd. of filling material in the new dock, and the embankment for the new yard serving the dock.

The old plant consisted of the coal pier, small yards for loaded and empty cars, and an abandoned timber-crib ore dock. It was necessary to remove the old ore dock before beginning construction on the new coal dock which occupies a similar position, about 66 ft. further away from the old coal pier. This provides a slip 900 ft. long, 200 ft. wide and 22 ft. deep between the two coal docks, which is ample to allow two of the largest boats used in this service to be loaded simultaneously, and ordinarily one other boat will be able to anchor along each dock face while awaiting a cargo. Additional anchorage for empty boats is provided on the rear of the new dock, where a slip 15 ft. deep, 150 ft. wide and about 540 ft. long, has been dredged.

The old yards, containing five tracks and two tracks respectively, have been enlarged to a capacity of 200 loaded cars and 100 empty cars. A similar capacity is provided in the yards serving the new dock, which have nine tracks and three tracks respectively. The grade in the new load yard rises to a summit about midway of its length and then descends at the rate of 1.5 per cent compensated to the haulage car pit. This pit, as shown in the plan, is located between the load yard and the dumper so that the loaded cars are pulled up the 11 per cent grade to the cradle of the car dumper without reversing their direction. After the cars have been dumped they run down the 4.4 per cent grade to the switchback on the end of the pier, reverse and run down the 1.5 per cent compensated grade to the empty yard. Riders control the speed of the cars throughout these movements. This system of handling cars is commonly termed "direct" in distinction to the track layout known as "indirect" which is used on the old dock and in which the loaded cars move from the load yard down an inclined track past the car dumper to the switchback, and then over the mule pit, from which they are pushed up to the dumping machine. The empty cars run by

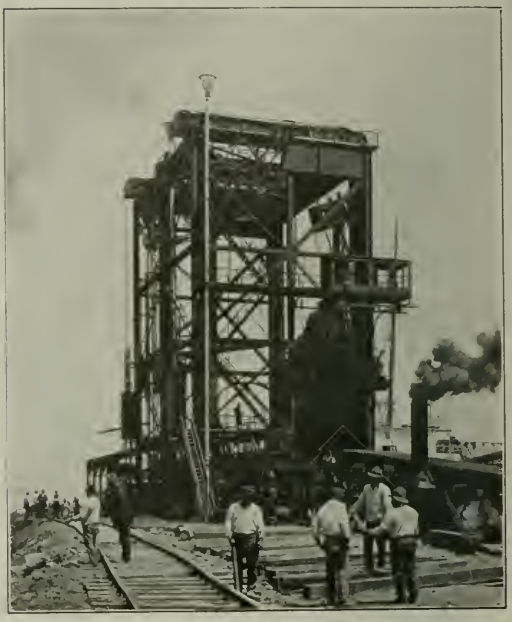


Plan, Profile and Details of New Pennsylvania Coal Dock at Sandusky, Ohio

gravity from the machine directly into the empty car yard. The principal advantage of the direct system in this case is that the length of the trestle on the dock, which is required to carry loaded cars, is less than in the other system. The approach and run-off on either side of the dumper are Pennsylvania standard wooden trestle.

An increase in the working capacity of the dumper has been secured by raising the rail on the cradle to an elevation 25 ft. above water level, which is 8 ft. above the corresponding point on the old dumper and somewhat higher than is usually adopted for such machines. The obvious advantage of this change is that the cradle need not be lifted through so great a height, and in consequence, the complete movement can be made in a shorter time. However, this change requires the mule engine to raise the loaded car through a greater distance, and if this operation cannot be made rapidly enough to place a loaded car on the cradle as fast as it can be returned to position, the theoretical advantage will be lost. The capacity of the "mule" has been increased over ordinary practice in two ways, first by increasing the size of the engine used, and second, by attaching a tail rope to the "mule," which allows the same engine to pull it rapidly down, the grade into the pit. It is usually found that even though the mule engine can pull the car up the grade at a satisfactory rate, some time is lost in waiting for the "mule" to run down again by gravity, and occasionally a loaded car coming down from the load yard passes over the pit before the "mule" has reached it, causing additional delay.

The concrete dock wall is supported by 1,045 ft. of timber crib 21 ft. wide and 15 to 22 ft. high. In addition to this, some cribs were built across the closed end of the slip and under an extension of the old dock. The post cribs which were used for these foundations were built up of 12-in. by 12-in. hemlock timbers, with a center wall and cross tie walls 9 ft. center to center, with eight 12-in. by 12-in. posts at each tie wall. The typical pockets have interior dimensions of 9 ft. by 8 ft., and are floored with 3-in. plank. All timbers are securely tied together by 1⅛-in. drift and staybolts. The cribs are anchored to bed rock by 4-in. car axles extending through the floor of the crib into holes drilled about 3½ ft. into the rock at intervals of 9 ft. The outer half of the crib is covered by a solid floor on which the forms for the concrete dock wall were built. This wall has a bottom width of 10 ft. and a height of 10 ft. above the top course of the crib timbers. The face of the wall is vertical, with two waling strips for protection against damage by boats landing along the dock, and the back is stepped into a top width of 6 ft. Cast iron mooring posts are anchored in the surface of the wall at intervals of 40 ft.



The New Coal Dumping Machine Just Before Its Completion

The car dumper machine and the mule house are carried on

General View of New Dock with Old Dock at the Right

reinforced concrete columns extending down to rock. The four columns under the front of the dumper are within the limits of the crib, and in these cases the crib walls were so located as to bring the columns in the crib pockets, enabling them to be built by framing off a portion of the pocket to be filled with concrete. The remaining 9 columns are 5 ft. 6 in. cylinders. All of the columns are reinforced with old rails and spiral bar reinforcement. The boiler house is carried on a fill inside wooden piling which is driven to rock, and the coal bunkers alongside the boiler house are of concrete. Three 200-h. p. boilers are provided with a coal bunker for each under the load track. A 126-ft. steel stack furnishes draft for the boilers. The boiler house, car dumper machine and mule house are covered with asbestos protected metal, and have windows of Fenestra steel sash. The car dumper is of the Hulett type, furnished by The Wellman-Seaver Morgan Company, Cleveland, Ohio. It has a cradle 60 ft. 8 in. long, which is operated by an engine with two 22-in. by 24-in. cylinders, operating two drums. A similar engine is provided for the mule hoist.

One of the first steps in the construction of the new dock was the preparation of the foundation surface by divers working under the ice during the winter. All material overlying the solid rock was cleaned away and the surface of the rock was leveled by drilling off high portions and building up low ones. The bottom grillage, the four lower courses of wall timbers and all posts in the cribs were framed together at a dock about one-half mile away, and these sections of the cribs were towed to the site by tugs. They were launched into the proper position and sunk by building up the remaining timbers and filling the pockets. The concrete in the dock walls was placed from mixer plants located on scows.

The old slip was widened from 134 ft. to 200 ft., and dredged to a depth of 22 ft., requiring the removal of from 1 to 12 ft. of rock. A hydraulic dredge was also used to handle some of the pier filling and a small portion of the filling under the new yards when it became necessary to rush this portion of the work shortly before its completion. This dredging and the construction of the foundation crib and the dock wall was contracted to the Great Lakes Dredge & Dock Company, Cleveland, Ohio. H. E. Culberson & Sons, Cleveland, had the contract for making the fill under the new yards. They used two steam shovels and standard gage equipment to place about 200,000 yd. of quarry strippings. The work was handled under the direction of R. Trimble, chief engineer maintenance of way, and H. W. Petersen, engineer in charge.

SIGNALS FOR NEW BROOKLYN SUBWAYS

The New York Municipal Railway Corporation—the organization which is building the new subways, tunnels and elevated lines which are to be operated by the Brooklyn Rapid Transit Company in Manhattan and Brooklyn boroughs, New York City—has contracted with the General Railway Signal Company, Rochester, N. Y., for a complete equipment of automatic block signals, interlocking switches and signals, and automatic train stops and cab signals, the latter to have "speed control." The contract covers all of the lines forming this company's portion of the "dual rapid transit system" as laid out by the authorities of the state and city when plans were adopted last year for the additions to the present intramural railroad system. The length of road covered by the present contract is about 103 miles, and the length of main track signaled will be about 178 miles.

The first line to be equipped will be the Broadway-Fourth Avenue line in Brooklyn, a subway which has been under construction for several years past and which is nearing completion. This line will be operated in connection with the Centre street loop, in Manhattan, which is already in partial operation, with signals installed by the Federal Signal Company. Other lines will be signaled as completed, the whole contract taking two or three years.

The company first asked for bids on a system similar to that in use on the Interborough Rapid Transit, which includes an automatic train stop; but about the time the bids were opened, the General Railway Signal Company proposed for consideration a scheme making use of the speed control feature for the automatic stopping apparatus, and electrical (instead of mechanical) apparatus to perform the special functions of this system. This alternative plan was finally favored both by the railroad company and by the Public Service Commission, which acts for the city, the owner of the lines in question; and a new contract was drawn providing for the introduction of the new system. The automatic stop, cab signal and speed control system will be at once installed on a short section, to demonstrate its reliability; and its final acceptance will depend upon its giving service satisfactory to the road and to the Public Service Commission; but in the meantime, the other signaling work will go on, and apparatus will be installed as the tracks are made ready for operation.

With the complete system of automatic stops and cab signals, it is proposed to do without fixed roadbed signals, except at interlockings; and if any lines are ready for operation before the cab signal system shall have been perfected, the roadside signals can be put in, and used, and later taken out. "Light signals" will be used throughout, so that the disturbance or cost of making a change of this kind need not be great.

The General Railway Signal Company has not yet perfected its plans for the stops and the cab signals, but it is understood that it has acquired the patents of P. J. Simmen, of the Northey-Simmen Company, which has installed cab signals and kindred apparatus on electric lines in Canada, in Indiana, and in Tennessee.

In general, the speed control arrangement will be so operated as to give the motorman two warnings before reaching a spot where the brakes will be automatically applied; first a yellow light (in place of the green, or all-right light, which glows in the cab under normal conditions); this at a ramp fixed on the track far enough back to allow for bringing a train to a stop from full speed; next an audible signal from another ramp, giving time for the application of the brakes. If this second warning is disregarded the brakes will soon be applied and the propulsion current will be cut off. The speed indicator on the engine or car actuates a control apparatus which is constantly self-adjusting, throwing the brake-setting apparatus into condition to be operated whenever the speed exceeds the prescribed limit and throwing it again when the speed has been properly reduced. It is designed to make use of the system not only at the approach to switches and stations, but also approaching sharp curves.

With speed control apparatus in operation, the overlap, as employed on the Interborough subway lines will not be necessary; and with this improvement the capacity of a track can be increased from 15 to 20 per cent; or, where track capacity is limited by the time consumed at station platforms, the block signal sections can be made correspondingly longer and less expensive.

The Public Service Commission of the state, in announcing its approval of this contract, gives the total amount as $1,413,000. This, however, apparently includes a contingent sum for the installation of apparatus on the cars, the number of which is to be 1,600. The total amount of the contract for roadway apparatus, which includes automatic block signaling, interlocking, and the necessary stopping apparatus on the track is $1,293,000.

The bid of the General Railway Signal Company under the first specifications was $1,808,676, while that of the Federal Signal Company was $1,392,833. When the new bids were opened the Federal Company, whose bid was higher than that of the General, protested that the action of the company and of the Public Service Commission was irregular and unwarranted. There was long discussion and delay on the part of the Public Service Commission and the approval of the contract finally was carried in the commission by a vote of three to two. The protest of the Federal Company has been renewed before the commission, but so far without result.

The chief engineer of the New York Municipal Railways is W. S. Menden, and the signal engineer is R. C. Johnson, formerly in the signal department of the New York Central.

ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS

The winter meeting of the Association of Transportation and Car Accounting Officers was held at Richmond, Va., December 8 and 9, with 102 members in attendance, and President J. M. O'Day in the chair.

Mayor Ainslie welcomed the association to Richmond, and, speaking of what he had read in the newspapers about railroad men, said he was surprised to see such an aggregation of sincere and honest looking men.

The executive committee recommended that it be authorized, in conjunction with any standing committee, and in its discretion, to meet the representatives of the American Railway Association and recommend uniform practice under existing rules. This was approved.

A recommendation of the executive committee that the committee on conducting passenger transportation, committee on conducting freight transportation, and committee on joint interchange and inspection bureaus be combined, temporarily, was approved.

The association concurred in a recommendation of the committee on car service sustaining the practice of requiring the delivering carrier to show the date of original receipt of cars offered in interchange when the record of delivery is one year or more old.

The association concurred in the action of the committee in disapproving the proposed amendment to car service Rule 10, which reads:

> When on account of bunching in transit upon a carrier line a switching line must cancel or refund demurrage, it may reclaim on the carrier line a number of days at the current per diem rate equal to the number of days for which such demurrage has been canceled or refunded.

As bunching is not considered under the average agreement, which applies to a large percentage of cars handled in terminals, the cancellation or refund of demurrage would not be a material factor. It would be difficult to determine responsibility for such reclaims, if allowed.

The recommendation of the committee on car service against the inclusion of an amendment to Rule 10, code of car service rules, providing "that where there is a demurrage item involved that the date the papers are taken up with any department of the erring line be accepted as the opening date of the per diem claim," was concurred in by the association. The committee on car service in reporting against this proposed amendment to Rule 10, advised that in its opinion the protection of per diem reclaim where demurrage is involved as a result of carriers' error is within the power of each transportation department.

The recommendation of the committee on car service that unless special arrangements are made by owners, empty railroad-owned tank cars will be handled under car service rules 1 to 4, inclusive, was concurred in.

By recommendation of the committee, action was taken rescinding the amendment to car service rule 15, which was approved in June, 1913. This amendment provided that the delivering road shall pay the cost of transfer or rearrangement when transfer is necessary for the protection of perishable freight against weather conditions. The present action maintains the integrity of the rule in its present form.

The recommendation of the committee that car service rule 3, paragraph f, be amended was adopted by the association for submission to the American Railway Association. The rule as it stands at present requires the consent of the owner in order to short-route a car at the reciprocal rate named therein. The amendment makes the consent of the owner unnecessary.

The findings of the committee on car service with regard to the establishment of committees on conference and co-operation were concurred in by the association, and ordered sent to the American Railway Association. This plan was proposed by Texas roads, and was the subject of a conference at which all parts of the country were represented. At this conference the Texas men made it clear that advantages have already accrued from such co-operation as is proposed. Instances were related of short routing of empty cars, in some cases reciprocal, and in other cases the service being performed by one carrier for another at the reciprocal rate provided for in car service rule 3f. The Sunset Central Lines and the International & Great Northern have made an agreement, under which the cars of the two roads are to be used in common. By establishing these conference committees in the several territories, opportunity will be afforded to discuss in an informal way their problems and perplexities with a view to securing co-operative effort. The committee recommends that the personnel of these committees consist of those directly responsible for the handling of cars; that during the first three months there will be no attempt to inaugurate a method of general authoritative supervision over cars, and that the committees be formed so far as possible along the natural territorial lines, such as will correspond to present traffic organization territories.

The committee on continuous home route cards made a report embodying answers which have been made to inquiries received concerning the handling of cars under a continuous home route card. The loading and forwarding road is responsible for putting on a card. A car loaded with perishable freight should always be accompanied by an owner's universal home route card. Any foreign car offered should always be accompanied by an owner's universal home route card. In the event of the loss of owner's home route card, the offering road must deliver a home route card of its own issue, and the offering line is responsible for obtaining and forwarding a duplicate owner's home route card to the agent at billed destination. To make the use of the owner's universal home route card mandatory it will be necessary to amend service rule 5. The principles embodied in these suggested answers were concurred in by the association.

The list of accepted assignments of reporting marks to cars of railroad ownership, presented by the committee on office methods and accounting, was adopted for submission to the American Railway Association.. Approximately 400 railroads have accepted assignments of reporting marks and are using them. A list of accepted assignments of reporting marks for cars of private ownership was adopted for submission to the American Railway Association. Approximately 350 owners of private cars have accepted marks assigned.

The recommendation of the committee that all car owners indicate in their respective registrations the reporting marks which are applied to the equipment so registered, and that if consistent The Official Railway Equipment Register set forth this information in the indexes, was concurred in by the association.

The association approved a proposed amendment to Rule 1, code of per diem rules, so as to provide that the penalty rate of five cents per car per day be applied to all delayed per diem settlements, even though the per diem has been reported in error to another road.

The report of the committee on office methods and accounting, opposing the adoption of a form for correction of interchange report, embodying the self-transcribing or cut-up principle was concurred in by the association.

The recommendation of the committee on handling railroad business mail that all mail, whether forwarded via United States post or by railroad business mail, include the name of the department, name of railroad in full, city, state, full information as to local street address, title of officer, name of officer, etc., as each particular case may warrant, was concurred in by the association.

The recommendation of the committee on conducting passenger transportation that all railroads be called upon to show in The Official Railway Equipment Register information in every respect relating to passenger equipment cars, was adopted by the association for submission to The American Railway Association.

It was decided to hold the next meeting of the association at Niagara Falls, June 22-23, 1915.

One Year's Electrical Operation of the B. A. & P.*

Train Loading Was Increased 33 Per Cent, Savings in Operating Expenses Equaled 20 P. C. on Investment

By J. B. Cox

The Butte, Anaconda & Pacific was built in 1892 principally for the purpose of conveying ore from the mines at Butte to the Washoe smelter at Anaconda, 26 miles west of Butte. The tracks connecting Butte and Anaconda constitute the main line, which is approximately 25.7 miles in length. As the mines are mostly around the top of Butte Hill and the shafts through which the ore is hoisted to the surface are scattered over a considerable area, yards were built at a convenient point on Butte Hill for the concentration of the cars containing the ore from these shafts, as well as to serve as a distribution point for the supplies to the mines; a branch locally known as the Missoula Gulch line was built from these yards to connect with the main line at Rocker, where yards were also established.

Since the concentrator at the smelter is also on a hill at an elevation of approximately 340 ft. above the main line, it was advisable to establish another yard at East Anaconda from which to distribute the ore and other supplies to the different centers on Smelter Hill. The lines from these yards at East Anaconda to the smelter are known as the Smelter Hill lines, the longest branch of which is that leading to the concentrator, which is about 7¼ miles in length. Two spurs lead from this main track, one to the stock bin yards and the other to the copper tracks.

From the Butte Hill yards spur tracks radiate about Butte Hill to the shafts of the various mines and other points where supplies are to be delivered. The ore is loaded into hopper-bottom steel ore cars of 50 tons capacity, which are delivered to the Butte Hill yard, where they are made up into trains and taken down to the Rocker yard, where they are made up into still larger trains and taken over the main line to the East Anaconda yard. Here the trains are broken up to be transported in smaller units up Smelter Hill to the concentrator yards. Thus practically all of the ore cars are handled by five different engine crews between the ore bins at the mines and the receiving bins at the concentrator.

A total of 27 steam locomotives was owned by the railway company, classified as follows: Switching, 7; Consolidation, 8; Mastodon, 10, and passenger, 2.

The coal used on the steam locomotives was obtained from the mines at Diamondville, Wyo., and had to be transported approximately 395 miles for delivery to the bins of the railway company, at which point its average cost was approximately $4.25 per ton.

Most of the machinery at the mines and the smelter had been electrified, and the results had been so satisfactory that the railway company made a study of conditions for the purpose of investigating the advantages that might be expected from the electrification of its lines, the result of which was the placing of a contract in December, 1911, for the electrical equipment of the main line, with spurs and yards between Butte and Anaconda, the Missoula Gulch line between Rocker and Butte Hill yards and the Smelter Hill lines. Owing to local conditions on the spur tracks leading to the various mines from Butte Hill yards, it was thought advisable not to electrify these until a later date. The tracks recommended to be electrified totaled approximately 90.5 miles.

Seventeen 80-ton electric locomotive units were purchased, originally, 15 of which are being operated in freight service and two in the passenger service. These units are practically interchangeable with the exception of the gearing, the passenger locomotives being geared to operate normally at 40 or 50 miles per hour, while the freight locomotives are geared to operate at from 15 to 25 miles per hour, the maximum free running speed being approximately 35 miles per hour. The continuous tractive effort of the freight units is 25,000 lb., at 15 miles per hour, but they are capable of exerting a maximum tractive effort of 48,000 lb. for five-minute intervals, based on a coefficient of adhesion of 30 per cent.

All the locomotive units are of the articulated, double-truck type with twin gears mounted on projections provided on the wheel centers for the purpose, and in general mechanical design are similar to the electric locomotives in operation on the Great Northern, the Detroit River Tunnel and the Baltimore & Ohio.

Work on the electrification began in the spring of 1912, and the first electric locomotive was run in Anaconda on May 14, 1913, about a year later. On May 27, two ore trains were hauled up Smelter Hill on trial trips with electric locomotives and on the following day a double-unit electric locomotive took over the regular day service of hauling the ore from East Anaconda yards to the concentrator yards, a distance of approximately seven miles, with a ruling gradient of 1.1 per cent compensated, and the grade fairly uniform through the entire distance. The steam locomotives used in this service were of the Mastodon type, weighing 108 tons, 83 tons of which was on the drivers. The weight of the tender loaded was approximately 55 tons, making the total weight of locomotive and tender about 163 tons, which would average close to the weight of the double-unit electric locomotive superseding it. The steam locomotive ordinarily made six round trips per shift, hauling 16 loaded ore cars per trip, or 96 cars per shift.

The average time required by the steam locomotive for the trip from East Anaconda to the concentrator yards with 16 loaded cars was about 45 minutes. The double-unit electric locomotive began taking 16 cars per trip but made 8 trips per shift, delivering 128 cars per shift. The average time for the up-hill trip with the electric locomotive was about 22 minutes or approximately half the time required by the steam locomotive for the same number of cars. Empty cars were taken to East Anaconda on the return trip, which, being all down grade, gave the electric locomotive no decided advantage, as the speed in either case was limited to about 25 miles per hour for safety. The number of cars hauled per trip was kept the same with the electric locomotives in the beginning as it had been with steam, as it had been decided to make the change-over by gradually replacing one steam locomotive at a time with an electric, taking the engine crew off the one and placing it on the other, thus breaking them in on the electric locomotives in regular service. One of the regular steam engineers had been given special instructions on the electric locomotives during the experimental running in order that he might become competent to act as instructor to the other engineers until they were sufficiently familiar with the electric locomotives to be left alone.

The load per trip in this service was gradually increased from 16 cars to 25 cars, which is to be the standard for the present. The average time for the up-hill trip with 25 cars is about 26 minutes, so that eight trips per shift are made easily, making a delivery of 200 cars possible or an increase of slightly more than 108 per cent over what had been possible for the same crew with steam locomotives. These loaded ore cars average from 70 to 72 tons each, making the

*Abstract of a paper presented before the Pacific Coast section of the American Institute of Electrical Engineers.

trailing load for a 25-car train from 1,750 to 1,800 tons.

On arrival at the concentrator yards the ore trains are taken by a switching engine called the "spotter," which places one car at a time over the weighing scales, after which they are rearranged for placement over the concentrator bins. On June 20 this spotting service was taken over by a single-unit electric locomotive and on July 2 the night service up Smelter Hill was taken over by the double-unit electric locomotive. The steam locomotive used for the spotting service was of the Consolidation type and weighed 93 tons, 83 of which was on drivers, the tender weighing loaded 62 tons, making the total weight of engine and tender 155 tons. The steam locomotive used in the night service on Smelter Hill was similar to that used in the day service. When the electric engines were put on the night service all the handling of ore between East Anaconda and the concentrators was done electrically, and the hauling capacity per crew was so much greater that it was no longer necessary to have a "spotter" crew on the night shift so that this crew was eliminated, and the night crew hauling the ore up Smelter Hill did the spotting on arrival at the concentrator yards, it being no longer necessary to make the regular number of trips. Thus where formerly four engine and train crews had been required during steam operation three similar crews were able to do the same work with electric locomotives in less time.

On October 1 regular passenger service between Butte and Anaconda was taken over for electrical operation. The steam locomotives used in the passenger service weighed approximately 80 tons, 60 tons of which was on the drivers, while the tender loaded weighed 52 tons, making the total weight of engine and tender 132 tons. The distance between Anaconda and Butte is 25.7 miles, and the schedule time for the trip, one hour. No change has been made in this time, though a reduction of 20 per cent would be possible with the electric locomotives were such desired. It may be of interest to note that on the day shift, averaging four trips per day, during the first five months the passenger train did not come in late a single time on account of engine trouble.

On October 10 a double-unit electric locomotive was put in the day freight service on the main line between East Anaconda and Rocker, a distance of 20.1 miles. The steam locomotive replaced in this instance was of the Mastodon type, weighing 103 tons, 77 of which was on the drivers, while the tender loaded weighed 55 tons, making the total weight of locomotive with tender 158 tons. The standard train hauled on the trip west was 50 to 55 loaded ore cars weighing approximately 3,500 to 4,000 tons gross and the average running time of such trains where no stops were made was about 1½ hours, corresponding to an average speed of approximately 13.4 miles per hour. In the beginning the electric locomotive took only the standard train, but made the trip without stop in about one hour, corresponding to an average speed of 20 miles per hour. The ruling gradient on the westward trip is 0.3 per cent and about half the distance is down grade. On the 0.3 per cent grade with a 55-car train, the steam locomotive made about 7 miles per hour. The electric locomotives with similar train now make about 16 miles per hour on the same grade.

The weight of the trains hauled by the electric locomotives on this run has been gradually increased up to 65 loaded ore cars averaging about 71 tons each, making the gross weight trailing about 4,620 tons. Adding 160 tons for the weight of the double-unit electric locomotives and 20 tons for the caboose makes a gross train weight of approximately 4,800 tons.

The remainder of this main line freight service was gradually taken on during the months of October and November. As many as 76 ordinary freight cars loaded with coal, coke and general merchandise have been taken in a single train on the westbound trip and 85 empties are frequently taken from East Anaconda to Rocker eastbound, the ruling grade being 1 per cent.

Comparative results of the month of June, 1913, with steam operation and for the same month of 1914 with electrical operation of this main line service, show that with a slight increase in the total tons of ore hauled the average tons per train was increased from 1,761 to 2,378, or 35 per cent, thus decreasing the average number of trains per day from 12.5 to 9.3, or 25.6 per cent. The average time per trip during steam operation was approximately 2 hr. and 25 min., while with the electric locomotive it was approximately 1 hr. and 45 min., showing a decrease of 40 min., or 27.5 per cent. The overtime in this service has been decreased 73.5 per cent and the total time 42 per cent, resulting not only in greater economy to the railway, but in shorter and easier hours for the crews.

The service on the Missoula Gulch line running between Rocker and Butte Hill yards was taken over for electrical operation on October 20. This line is 4.5 miles in length and the ruling gradient 2.5 per cent. The steam locomotives used on this line were of the Mastodon type, weighing 106 tons, 87 tons of which was on the drivers, the tender loaded weighing 56 tons, thus making the total weight of engine and tender 162 tons. Two complete crews had been required to handle this service during steam operation, averaging six trips per day each. A single crew with a double-unit electric locomotive has been doing this work successfully. Thirty-five to 45 loaded ore cars are taken down from Butte Hill yard to Rocker, and about an equal number of empties taken up. In addition to the empties, large quantities of timber and supplies for the mines are delivered over this line.

On November 25 the last of the electric locomotive units went into service, thus completing the electrification originally intended. The full electrical service has, therefore, now been in operation more than nine months and that on Smelter Hill more than 15 months.

This was the first installation of 2,400-volt direct-current apparatus for the operation of a railway in this country, 1,500 volts being the highest heretofore installed for such a purpose.

The total saving from locomotive performance alone is at the rate of $237,581 per year, to which should be added the credit of handling an increase of traffic at the rate of 13,938,136 ton-miles per year or 8.77 per cent more than was handled by the steam locomotives during the period compared. To this saving from locomotive performance should be added the saving from trainmen's wages, which is at the rate of $31,146 per year, or a decrease of approximately 21 per cent, due largely to the elimination of overtime, making the total saving from these two items $268,728 per year. From this should be deducted $10,839 for maintenance of the distribution system, leaving $257,889 as the net operating saving per year due to electrical operation.

The roadmaster states that it is quite evident that the electric locomotives are much easier on the track at curves, but that there is no noticeable difference on tangent track, and that while sufficient time has not yet elapsed to form definite conclusions, present indications lead him to expect that any difference relative to his work will be favorable to the electric locomotives.

Arranging the items of expense in the order of usual appearance in the summary of a standard locomotive performance sheet, and placing them on a yearly basis, results as follows:

Item of operating expenses	Steam, 1913	Electric, 1914	Decrease, 1914	Per ct. dec.
Fuel and power	$315,235.74	$164,508.70	$150,727.04	47.81
Repairs	124,787.90	92,278.08	32,509.82	26.05
Enginemen's wages	104,461.18	71,225.88	33,335.30	31.81
Enginehouse expenses	29,907.80	18,638.38	11,269.42	37.68
Water	4,953.66	1,193.70	3,759.96	75.90
Lubricants	9,751.44	4,942.32	4,809.12	49.30
Other supplies	5,823.52	4,552.36	1,271.16	21.83
Total locomotive performance	$594,921.24	$357,339.42	$237,581.82	39.93
Trainmen's wages	147,632.30	116,486.00	31,146.30	21.10
Grand total	$742,553.54	$473,825.42	$268,728.12	36.19
Ton miles hauled	158,917,720	172,855,856	13,938,136*	8.77*

*Increase.

The total cost of the electrification, including a change of signal system on Smelter Hill, an extra motor-generator set recently installed at Anaconda, interest during construction and all incidentals due in any way to the electrification, was in round numbers $1,201,000. This does not include the step-down transformers, which are the property of the power company, but on the other hand no deduction has been made for the salvage due to the elimination of 20 steam locomotives.

ANTHRACITE COAL RATES REDUCED IN PENNSYLVANIA

The Pennsylvania Public Service Commission, in a decision issued December 21, announces that it will order a sweeping reduction in the rates for the transportation of coal from the Schuylkill, Lehigh and Wyoming regions to Philadelphia, all rates being reduced substantially to the basis on which the railroads carry coal to Philadelphia for shipment by water to New England and other points; in most, or all, cases 40 cents a ton. The order reduces the rates on all sizes of coal except those smaller than pea, the rate for these smaller sizes to be the same as that for pea. The roads affected are the Philadelphia & Reading and the Pennsylvania; and, in a lesser degree, the Lackawanna, the Central of New Jersey and the Lehigh Valley. The complainants were numerous organizations of citizens and business men in Philadelphia.

The date when the order is to take effect is not given.

The present rates for prepared sizes of coal per ton of 2,240 lb. by the Reading are, from the Schuylkill district, $1.70; from the Lehigh district, $1.86, and from the Wyoming district, $2.10. The rates for pea coal and smaller sizes are considerably less; and the average reduction is estimated at 25 to 30 per cent.

The report recounts the history of the coal traffic from the year 1825, when it began to be recorded, moving at first by canal. The Reading, the largest carrier, transported in 1912 a total of 11,224,945 tons altogether; and the change now ordered is said to affect about 40 per cent of this total. The average distance over which the Schuylkill coal travels to Philadelphia is 121 miles. The average of all shipments over the Pennsylvania Railroad is 189 miles.

The commission finds that the Reading owns or controls 44 per cent of the unmined anthracite coal; the Lehigh Valley 17 per cent; the Lackawanna 7 per cent, and the Central of New Jersey 19 per cent. Other particulars concerning ownership, etc., are recounted.

At the outset, says the commission, there is a presumption against the propriety of the continuance of the existing rates. All of them have stood unchanged for 17 years, and some of them for 40 years, during which time the cost of transportation has been affected by great changes, such as the increase in the size of cars and of engines, the volume of traffic, etc. ..

Accountants engaged by the commission examined the books of the railroad companies and found that the cost of transportation, not including any return on bonds or stock, in the year ending May, 1913, over the Reading road, for 123 miles, was 45 cents a gross ton; over the Pennsylvania, for 187 miles, 61 cents; and various rates from 49 cents to 77 cents over other routes.

Comparisons also are made with the rates charged for carrying bituminous coal over these and other roads, all of which are much lower. Counsel for the Reading gave figures showing that in 1912 that road's rate per ton per mile on anthracite coal was 8.599 mills, this being a little less than the average for the preceding five years; while the rate per ton per mile on all freight was a little over 7 mills.

The railroads admitted that the rates for the transportation of coal to be sent out from Philadelphia by water, much lower than the Philadelphia rates, were not unprofitable. The final conclusion of the commission is based mainly on the fact that the rates charged for coal going beyond Philadelphia are profitable. This decision, says the report, will put Philadelphia "on an equality with the other cities and ports of the country." The prescribed rates from the Schuylkill district are, for prepared sizes, $1.30; pea coal $1; smaller sizes $1; from the Lehigh region, prepared sizes $1.46; pea coal and smaller $1.16; from the Wyoming region, prepared sizes $1.70; others $1.33. Other rates are named for combination routes. Coal delivered by the railroads to barges on the Delaware and Schuylkill rivers, to be taken by them to Philadelphia docks, on which traffic the barges receive usually 25 cents a ton, must be carried through for the same rate.

LEHIGH VALLEY MONOPOLY SUIT DISMISSED

Judge Hough in the United States District Court at New York, December 21, dismissed the suit of the government, brought last March, against the Lehigh Valley Railroad, the Lehigh Valley Coal Company, the Lehigh Valley Coal Sales Company and others, in which it was charged that the commodities clause of the Interstate Commerce law and also the Sherman anti-trust law had been violated. Judge Hough holds, in substance that "No monopoly of interstate commerce is shown nor any attempt to monopolize. It is impossible to find any of the normal results of monopoly without also finding violations of the commodities clause—and none is discovered. As to restraint of trade in coal transportation—there can be no restraint without control, and since the railroad does not control the coal it carries it has no means of restraint."

Concerning the charge of the government that the coal sales company had acquired land and other property from the coal company at ridiculously low prices, the judge says:

"What should or could be done with the lands and the coal on hand? And how could the concern retiring from the selling business insure the creation of a strong and pushing successor? Certainly not by hostility. Who would or could occupy and use the storage plants except the coal sales company?

"The assertion that the prices were ridiculously low is untrue. It was praiseworthy and lawful at first to sacrifice much in price when the object was to save from further assault the business of selling coal for interstate transportation. . . . The Lehigh Valley Railroad has not, since the filing of this bill or for some time before, been engaged at all in the selling of coal to the consumer. Union of such companies through stock ownership is not unlawful, provided there is a dissociation in good faith between the bona fide corporations. Dissociation in good faith requires no more than honest conduct of honest men. . . ."

The government had contended that the railroad and the other defendants had a monopoly of the coal industry in the territory tributary to the lines of the road; but the acreage thus controlled by the coal sales company, the court points out, is only a very small proportion of the entire anthracite acreage tributary to Lehigh Valley lines.

"This doctrine of territorial units is a novelty which I do not think bears investigation," says the judge, "for all that it does or can amount to is this, the coal lands are lawfully owned; the coal therefrom is lawfully carried; there is an actual and honest dissociation of interests between coal owners and carriers. The relations which are complained of have therefore no influence upon interstate commerce, for said relations begin, exist and end within the limits of the state.

"As to the commodities clause I shall dismiss the point with the statement that there is no great difference between what the Lackawanna did and was upheld in doing by the entire Circuit Court of the Third Circuit and what the Lehigh Valley has been doing as shown in this case. . . . The Lackawanna owned outright much if not most of the coal transported over its lines, whereas the Lehigh Valley owned the stock of other corporations which under the laws of Pennsylvania had good right to sell the coal, the transportation of which has given rise to so much litigation."

The government will appeal the case to the Supreme Court.

THE INFLUENCE OF CARBON ON THE PROPERTIES OF RAILS

An investigation of the influence of carbon on the properties of rails, such as ductility, stiffness, tensile strength, and the resistance of the rail head to flow of metal under rolling wheel loads, has been made under the direction of M. H. Wickhorst, engineer of tests, Rail Committee, American Railway Engineering Association, and published as Appendix A of the report of that committee in bulletin No. 170. The following is an abstract of this report:

A series of open-hearth rails was made with carbon varying from 0.32 per cent to 0.97 per cent, and they were tested by means of drop tests, tension tests, slow bending tests, transverse tests of the base and rolling tests under a loaded wheel. The material and all the facilities for this investigation were furnished by the Carnegie and Maryland Steel Companies. The material and rails were made by the Carnegie Steel Company at Homestead and Braddock, Pa., and the tests, except the rolling tests, were made by the Carnegie Steel Company. The rolling tests in a "reciprocating" machine were made at Sparrows Point, Md., by the Maryland Steel Company.

According to these tests the shrinkage of the hot rail after sawing increased an average amount of about 0.013 in. for an increase of carbon of 0.01 per cent, in the standard length of 33 ft. There were, however, some uncertainties and more data is needed with special reference to the relationship of carbon and shrinkage. The deflection of the rails in the drop test under the first blow decreased as the carbon increased up to about 0.85 per cent carbon, after which its decrease was at a slower rate. The rails were 80-lb. A. R. A. type-A section, and with 0.50 per cent carbon the deflection of the side that was below in testing was about 1.70 in. under a drop of 15 ft. With these conditions, the deflection decreased an average of 0.0188 in. for each 0.01 per cent increase of carbon. The relation found between carbon and elongation in the drop test is shown by the following formula:

$$E_{bt} = 35 - .30\ C$$

where E_{bt} equals the per cent elongation when the base is in tension, and C equals the carbon in 0.01 per cent.

The rails were tested as beams in the test-machine with a span of 3 ft. The breaking load increased as the carbon increased. The elastic limit increased with increase of carbon up to about 0.85 per cent carbon and then remained about the same. The elongation in this slow bending test decreased as the carbon increased and averaged a little less than in the drop or impact test. The yield point and tensile strength in the tensile tests increased with increase of carbon up to about 0.80 or 0.85 per cent carbon after which they remained about the same. The elongation and reduction of area decreased as the carbon increased and fell off to zero at about 1.00 per cent carbon or a little above. The average tensile strength developed in these tests may be expressed by the following formula for carbon between 0.30 and 0.80 per cent:

$$T = 40{,}500 + 1{,}250\ C$$

where T = tensile strength in lb. per sq. in. and C = amount of carbon in 0.01 per cent. The average yield point developed may be expressed by this formula, for carbon between 0.30 and 0.85 per cent:

$$Y = 30{,}000 + 400\ C$$

where Y = yield point in lb. per sq. in. and C = carbon expressed in 0.01 per cent.

The average elongation found in tensile test specimens with a ½-in. diameter and 2-in. gage lengths was about as shown by the following formula, for carbon from 0.30 to 1.00 per cent:

$$E = 40 - .38\ C$$

where E = elongation in per cent and C = carbon in 0.01 per cent. The average elongation found in the tensile test as related to the tensile strength, may be expressed by the following formula, for tensile strengths between 80,000 and 130,000 lb. per sq. in.:

$$E = 52 - \frac{T}{3{,}300}$$

where E = elongation in per cent and T = tensile strength in lb. per sq. in. The several formulas given above apply to open-hearth steel with about 0.03 per cent phosphorus and about 0.70 per cent manganese. They represent the average of the results obtained and individual results may vary above or below these averages.

In transverse tests of the base, the breaking load increased with increase of carbon up to about 0.80 per cent carbon and then remained about the same. The transverse elongation and the sag of flange decreased as the carbon increased. Tests were made to determine the resistance of the rails to flow or side spread of the head under rolling wheel loads. The tests were made in a "reciprocating" machine in which a piece of rail is made to move to and fro under a wheel that may be loaded as desired by means of a lever arrangement. The resistance to spread of head increased with increase of carbon up to about 0.80 per cent carbon and then remained about the same. In conclusion it may be said that in this series of rails varying in carbon from 0.32 to 0.97 per cent, the strength and resistance of the steel in the several tests, including the rolling tests, increased with increase of carbon up to about 0.80 or 0.85 per cent, and then remained about the same. The ductility decreased continuously with increase of carbon.

FEDERAL GOVERNMENT BOILER INSPECTION REPORT

The third annual report of the chief inspector of locomotive boilers of the Interstate Commerce Commission has recently been made public. This report is for the fiscal year ended June 30, 1914, and is signed by Frank McManamy, chief inspector of locomotive boilers. There were 92,716 locomotives inspected in 1914, 90,346 in 1913 and 74,234 in 1912. Of those inspected 49,137 or 52.9 per cent were found defective in 1914; 54,522 or 60.3 per cent were defective in 1913 and 48,768 or 65.7 per cent in 1912. In 1914 there were 3,365 locomotives ordered out of service, in 1913 there were 4,676 ordered out of service, while in 1912 there were 3,377 ordered out of service. The report states, however, that this does not fully show the improved condition resulting from the operation of the law, as when the law first went into effect the attention of the department was concentrated on the more serious defects so that the number of fatalities might be reduced. The improvement is more accurately indicated, therefore, by the reduction in the number of casualties as shown in the accompanying table:

	1914	1913	1912
Number of accidents	555	820	856
Decrease from previous year..per cent	32.3	4.2	...
Decrease from 1912.....per cent	35.1	...	...
Number killed	23	36	91
Decrease from previous year..per cent	36.1	60.4	...
Decrease from 1912.....per cent	74.7	...	...
Number injured	614	911	1,005
Decrease from previous year..per cent	32.6	9.3	...
Decrease from 1912.....per cent	38.9	...	...

Of the total number of killed and injured, 86 per cent were engine and train men, these accidents being caused by failure of some part of the boiler or appurtenances while in service; 13 per cent of these casualties were caused by failures due to low water where no contributory cause could be shown to exist. Of the total number killed and injured 3 per cent were boilermakers who were engaged in making repairs to boilers under pressure; about 50 per cent of these casualties were due to plugs, studs, or rivets blowing out or being driven into the boiler while being calked with pressure on the boiler. To reduce the number of accidents from this source, it is now being required that all plugs more than 1¼ in. in diameter in firebox sheets, excepting fusible plugs, be secured by a staybolt. Ap-

proximately 16 per cent of the injuries to boilermakers occurred while trying to tighten washout or arch-tube plugs while there was pressure on the boiler. The remaining 11 per cent of the total number killed and injured were from the various classes of employees engaged in the work of caring for and repairing locomotives at terminals.

Two formal appeals from the decision of inspectors, as provided in section 6 of the law, were filed during the year, in both of which a subsequent investigation resulted in the decision of the inspector being sustained.

No prosecutions for violations have been filed during the year, most railroad officers showing a disposition to comply with the requirements and to co-operate with the inspectors in bringing about improved conditions.

There were filed 406 applications for extension of time for removal of flues, in accordance with the provisions of rule 10, of which number 67 were withdrawn by the railroad companies before an investigation was made. An investigation was made in each of the remaining 339 cases, in 264 of which the full extension asked for was granted, in 21 an extension for a portion of the time asked for was allowed, and 54 applications, or 16 per cent of the total number, were refused after an investigation.

In accordance with rule 2 of the law, a careful investigation, extending over the two-year period allowed for filing specification cards was conducted and showed that 11,153 locomotives, or about 17 per cent of the total number for which specification cards were filed, had a factor of safety below 4, being divided as follows:

4,407 with a factor between 3¾ and 4.
2,531 with a factor between 3½ and 3¾.
2,039 with a factor between 3¼ and 3½.
1,082 with a factor between 3 and 3¼.
1,094 with a factor below 3, on some of which the factor was found to be below 2.

This matter was carefully considered at a conference held at the office of the chief inspector of locomotive boilers on April 28 and 29, 1914, at which the railroad companies and their employees were represented; and suitable amendments to the rules, providing for improved methods of construction and increased safety of operation, were agreed upon, to be submitted to the commission for its approval. It was also found that there were many locomotives in service with excessive stresses on stays and braces; therefore a maximum allowable stress for stays and braces was included in the amendments to the rules.

During the year, 2,141 defects to locomotives for which the present laws do not provide a remedy, 1,155 of which were defective wheels, were reported to this division by inspectors and directed to the attention of the proper railroad officers. In most instances locomotives with defects of this character were held for repairs by the local officers when their attention was directed to the defective conditions. In some cases it has been necessary to wire the president of the road in order to get the repairs made, and even that has not always brought about the desired result.

In one instance inspectors objected to the use of a locomotive in passenger service which had sharp flanges on both engine truck wheels, three driving wheels, and one trailer wheel, and also one loose driving wheel tire, and were assured by the local officers that the locomotive would not again be used until repaired. Instead of holding the locomotive for repairs, however, the local officers sent it light to a point a few miles from the terminal, sent a passenger train out to that point with another locomotive, and changed locomotives, sending the defective one through with the passenger train.

If a freight car with similar defects were offered to this carrier in interchange by a connecting line, it would be refused under its own rules as unsafe to handle; yet this defective locomotive was sent out on a passenger train by the officers after their attention had been directed to its condition, and existing laws provide no remedy.

The records contain other instances of a similar character; therefore, the recommendation made in the report for the year 1913, that the provisions of the boiler inspection law be extended to cover the entire locomotive is renewed.

In this connection it is stated that the inspectors now in the service are men of wide experience in railroad work, who were selected after passing a competitive civil service examination; and their three years' training as inspectors, in addition to their previous experience and training, has eminently fitted them to perform the additional duties that such a law would impose in as satisfactory a manner as they do their present ones.

THE WEIGHING OF LESS THAN CARLOAD FREIGHT

By E. A. O'Donnell
Traveling Agent, Sunset-Central Lines.

The time-worn adage: "What is everybody's business is nobody's business" is strikingly applicable to the past and present-day methods of l. c. l. freight weighing. In other words, a system permitting of optional performance, as relates to weighing, between carriers' representatives at originating and destination points, has resulted in a division of responsibility and consequent inability to control or assign individual responsibility. Owing to innumerable emergencies, the common carriers undoubtedly have been foremost in quest of efficiency. One channel, however, that of preventing duplication of work, apparently has escaped detection, as evidenced by the common manner of handling that portion of the transportation business with which this article deals.

The benefits to be derived by weighing less than carload freight at point of origin, as well as promptly upon its receipt, may be enumerated as follows:

As shipments at point of origin are necessarily complete as receipted for, weights then taken afford a substantial basis on which to determine the merits of claims for alleged subsequent loss from whatever source.

Weighing at point of origin insures a more detailed check as to the number of packages constituting the entire shipment, the handling of which in the course of weighing should materially assist in bringing to light cases of illegible or duplicate marking, improperly prepared or improperly described packages, etc.

It precludes the possibility of failure to promptly weigh packages subject to natural shrinkage.

It provides for actual rather than estimated weights for original insertion in revenue billing, eliminating the necessity for extension corrections at destination based on weight variation.

It permits of more expeditious delivery at destination.

It provides for more prompt and effective accomplishment of supervision.

In case weights are not taken at point of origin, and the physical movement of a shipment is followed by a claim for loss, the carrier is thrown into a state of perplexity, neither knowing nor being in position to determine the authenticity of the claim; whereas, had the shipment been weighed when originally tendered, such weight would immediately establish the extent of the carrier's liability for loss, and the claim might be more quickly and satisfactorily disposed of.

Another advantage which weighing at initial point will gain is the discovery of improperly prepared, described or addressed packages. This is the time when the discovery may be used to greatest advantage in the education of the shipper, who, either inadvertently or deliberately, tenders a shipment in such condition. And it will be granted that the continued and persistent educating of shippers by those who, because of business relations are best acquainted with such shippers, and at the time when they are virtually caught "with the goods," must result beneficially to the carriers through the medium of a reduction of claims made possible by the existence of such conditions.

The billing and revising clerks, however, have possibly been the heaviest contributors to lost motion under the present system

of permitting destination weighing of freight. While in many cases no attempt has been made by the forwarding station to obtain correct weights, the billing clerks have nevertheless been obliged to compute extensions on whatever fictitious weights might be inserted in the shipping order, and such computations, based on erroneous weights and being, as a natural result, inaccurate, are of necessity wholly discountenanced at destination in order to establish proper charges based on correct weights, the consequence being that the time and talent devoted to the primary computations represent time and talent unquestionably wasted, with the inevitable monetary loss to the interested carrier. It is safe to believe that the unnecessary expense involved in the operation of such a system, if universally adhered to by carriers, would be nothing short of astonishing.

Again, at the larger distributing centers, where by far the major portion of less than carload freight originates, carriers are, as a general rule, better equipped, both as regards labor and other facilities, than are they at outlying stations of lesser importance, where quite frequently agents are without assistance. Hence, again the advisability of weighing at forwarding point. In this connection very helpful assistance may be rendered the agent at the outlying point who may be without an assistant by placing him in a position to dispose rapidly of inbound less carload shipments at the time of arrival rather than subject them to the delay incident to weighing, with probable increased operating cost for additional assistance to perform such work.

And, lastly, the plan of weighing freight at point of origin affords a most simple method of supervision, as well as a prompt and reliable one, for those assigned to the work of guarding against failure to properly weigh less than carload freight.

In view, therefore, of the many advantages to be obtained, might it not be most beneficial, financially and otherwise, for all common carriers to adopt the system of weighing freight, for either local or interline movement, immediately when tendered for shipment, and by so doing to relieve each other of the now ever-present burden of doubt as to accuracy of weights indicated on billing, and of possible duplication of work with its resultant tendency toward inefficiency?

TO GET THE BEST MEN FOR COMMISSIONERS

George W. Anderson, who recently resigned as a member of the Massachusetts Public Service Commission, wrote to Governor Walsh a letter in which he discussed some principles that are of interest outside of the Bay State. He said in part:

". . . For this office I never was a candidate. I accepted it reluctantly and at substantial personal sacrifice. Chapter 616 of Acts of 1914, promoted and approved by you, requires the members of this commission to 'devote the whole of their time to the business of the commission.' This legislation marks a radical change in the policy of the commonwealth as to obtaining service on our numerous commissions. My duty to my family, to myself, to my office associates and employees, as well as to certain clients, absolutely prohibits me from retaining office under this new policy. This I told you last winter.

"This act became effective on July 1; I should then have resigned except for the fact that the New Haven Railroad declined to accept the act passed by our legislature . . . and that the public interest absolutely required that same common ground should be found upon which the federal government and the New Haven could not meet . . . As it has fortunately turned out, I have been able to be of some use in that matter; but there is now no sufficient reason for my remaining longer in the service of the commonwealth under existing conditions.

"Very likely my retirement may be in the public interest, as it is clearly in my own interest, but this new policy is so unsound, so undemocratic, that I take this occasion to signify my protest against it.

"The inevitable tendency of this legislation is to limit the commonwealth to filling places upon such commissions with men drawn from two classes:

"1. From those who by virtue of inherited or acquired wealth are financially independent. From this class some very excellent public servants have in the past been obtained; doubtless it will be so in the future. But democrats and progressives would not look with equanimity upon a public service commission—charged with the duty of regulating great corporations—dominated by men living easily upon inherited or acquired wealth.

"2. The commonwealth may draw in abundant numbers from men whose demonstrated earning capacity is less than the salary now paid public service commissioners. From this class also excellent service has been and will be obtained.

"But men dependent entirely upon the emoluments of office for the livelihood of themselves and of their families are almost certain to be constant, conscious (or unconscious) candidates for reappointment; they cannot live and act in an atmosphere of independence and freedom. They are, almost necessarily, continuously measuring the forces which make for or against their own continuance in office.

"The mere fact that the salary paid public service commissioners is as much as that paid to superior court judges, makes the situation no better. Appointments to judgeships are for life, with pensions provided for disability and old age. But the bench is a great career, and many of our ablest lawyers prefer it—with its honor, dignity, freedom from strife and from either poverty or riches—to the struggle and possibly larger prizes of the bar. But these short-lived appointments on commissions must necessarily be but episodes in the careers of men of real force and ambition.

"The importance of permitting this class of public servants to retain some outside business or professional work is not that such servants may have, during office, a larger income—it is that they may be independent—not anxious for reappointment—ready on any necessary and proper occasion to risk their official lives in defense of their convictions of what public duty requires.

"I cannot qualify in the class of men living easily on inherited or acquired wealth; I will not qualify in the class entirely dependent for livelihood, present and future, upon the emoluments of public office. . . .

"To get a strong public service commission, the state must either appoint for life or for long terms—as judges are appointed—or the field must be kept open, as it has hitherto been kept open, for those who retain outside business in order not to be overanxious for reappointment.

"Your new policy magnifies the importance of clerkly observance of office hours and minimizes the importance of vision, of sense of public need and public right, of independence of control of financial interests. It disregards the vital distinction between places in which mediocre administrative fidelity is the essential and places which call for the best there is in our best men. It would be far better to reduce the salaries one-half and keep the field open to men of genuine public spirit and independent earning capacity, rather than, by making the salary substantial, to increase the avidity and number of the job-hunters. . . ."

Transportation of Freight via Siberia.—The Moscow Exchange is trying to secure a reduction in freight rates to points reached via Vladivostok, which, after December 1, is likely to be the only open Russian port. According to information received by the exchange from the Far East, the Ussuriisk Railway, controlled by the Chinese Eastern, has sufficient transportation facilities, especially from Vladivostok to Kharbin and Chitz, but its rates are considerably higher than those of most Russian railways. Since it is impossible to determine the time when normal conditions will be re-established, it is thought that it would also be advisable to propose similar reductions in the rates via Nikolaiefsk, the Amur river, and the new Amur Railway, on which freight traffic will begin with the opening of navigation.

General News Department

The two-story brick station of the Michigan Central at Michigan City, Ind., was destroyed by fire December 16.

The shops of the New Haven road were ordered closed until January 4, but now it is said that work will be resumed December 28.

Interstate Commerce Commission engineering parties have just begun their work on the valuation of the Atchison, Topeka & Santa Fe Coast Lines. They started at Williams, Ariz., and are working in both directions.

The forty or more railroad employees arrested last week at Pinner's Point (Norfolk) Va., for working at the freight station on Sunday, were fined five dollars apiece. The Southern Railway, acting in behalf of its employees, appealed the case to the Norfolk County Circuit Court.

The Interborough Rapid Transit Company, New York City, is distributing $43,000 to its employees in the shape of Christmas gifts of $5 each. It is said that these gifts will go to substantially all employees whose regular pay is less than $115 a month. This is the third time that such a distribution has been made.

W. A. Frick, fourth vice-president of the United States Steel Railway Tie Company, and John Maxey, also connected with the concern, were arrested in Pittsburgh last week on charges of fraudulent advertising, made by Attorney A. C. Stein. It is charged that "The United States Steel Railway Tie Company" exists only on paper, and is used to defraud victims. The Pittsburgh Publicity Association is back of the prosecution.

In the yard of the Boston & Maine at Somerville (Boston) Mass., about 2 o'clock on the morning of December 17, the police took into custody 118 tramps, who were found in passenger cars, where they had expected to spend the night in the comfortable atmosphere of the cars which was being kept warm preparatory to the use of the cars early the next morning; and on being searched at the police station, not one cent of money was found among the whole crowd.

Mr. Van Brunt, a safety-first lecturer of the Public Service Corporation, operating extensive electric car lines in New Jersey, says that practically all of the school children in that state, 400,000 of them, have listened to lectures on safety-first; and in the city of Newark the number of casualties to children in the streets has been decreased 47 per cent. Mr. Van Brunt says that in conducting the safety-first propaganda oral lectures have decided advantages over printed matter.

William G. Lee, president of the Brotherhood of Railroad Trainmen, has announced the program of legislation which the brotherhood is preparing to advocate in Congress and in the state legislatures. Mr. Lee says it is proposed to ask the state legislatures to pass a car limit law, to fix the maximum length of freight trains at one-half mile, a clearance law, a law providing that all freight trains shall be equipped with standard two-truck cabooses, an election franchise law providing that railway men may vote while away from home, a semi-monthly pay law and a law to prohibit the operations of "loan sharks." Among the national laws to be urged are more restrictive immigration laws and national legislation to strengthen the proposed state laws wherever practicable. Mr. Lee also says that further efforts will be made to secure the enactment of full crew laws.

W. L. Chambers and G. W. W. Hanger, of the United States board of mediation and conciliation, went to St. Louis last week at the request of the St. Louis Southwestern to adjust the controversy growing out of the discharge of Conductor J. R. Tillman last May for intoxication. Announcement was made on Monday of this week that an agreement had been reached by which Conductor Tillman will withdraw all claims for reinstatement, and the officers of the road agree to take no disciplinary action toward employees who took part in the strike vote following the refusal of the road to reinstate Mr. Tillman. After the first strike vote the members of the Order of Railway Conductors were enjoined by a state court, at St. Louis, from striking, the court holding that the statement of facts in the case, on which statement the men were asked to vote, did not give a true view of the situation. A second strike vote has since been taken, and it has been reported that two-thirds of the men voted to strike.

Research Fellowships at University of Illinois

The engineering experiment station of the University of Illinois announces that four vacancies will be filled at the close of the current academic year in the research fellowships, ten of which have been maintained since 1907. These fellowships, each of which carries an annual stipend of $500, are open to graduates of approved universities and technical schools, appointment being made for two consecutive collegiate years. Not more than half the time of a research fellow is required for the work to which he is assigned, the remainder being available for graduate study, and at the end of the two years, if all requirements have been met, the master's degree is granted. The subjects covered in this research work include architecture, chemistry, civil engineering, electrical engineering, mechanical engineering, mining engineering, municipal and sanitary engineering, physics, railway engineering and theoretical and applied mechanics. Nominations to these fellowships are based on character, scholastic attainment and promise of success, preference being given to applicants who have had some practical engineering experience since completing their undergraduate work. Applications for nomination must be received by the Director, Engineering Experiment Station, University of Illinois, Urbana, Ill., not later than February 1.

Railroad Money Cures Paralysis

The Yazoo (Miss.) Sentinel, which has been publishing a number of articles on fraudulent personal injury claims against railroads, in its issue of December 3 describes a case in which Earle D. Christian sued the Yazoo & Mississippi Valley in the circuit court of Bolivar county, Mississippi, in May, 1909. He secured a verdict against the railroad company for $25,000 as damages for an injury in which he claimed to have been totally and permanently paralyzed from the waist line down; but after collecting the money he speedily recovered. The article states that there was but one eye witness to the accident, Christian's family physician, "who proved to be his star witness both on the cause of the accident and the extent of the injury." At the trial Christian was carried into court in the arms of two men who placed him in a wheel chair; and he appeared to be in a hopeless and helpless condition. After collecting his damages, however, "he entered upon the road to complete recovery within a short time. In a few months after the trial he was getting about on crutches. A little later on he paid a visit to Hot Springs and took a course of baths, and after that was able to walk about without his crutches. In December, 1913, when the temperature was freezing, he swam across a river, a distance of about 300 ft., on a bet, and won it. The performance was witnessed by a large number of people."

Mail Service in 1914

The second assistant postmaster general, in his annual report, says that in the fiscal year ending June 30, 1914, a total of 69,673 tons, or 4,963 carloads, of periodical mail matter was carried on fast freight trains, the cost for which was $706,154, whereas had the old practice of carrying such mail matter in regular mail trains been pursued the cost to the government would have been $2,133,586. During the fiscal year $4,627,200 was paid for railway post office car service. The appropriation for the next

fiscal year (ending June 30 next) is placed at $5,412,000, and for 1916 at $4,760,000.

The weight of paid-by-the-pound rate second-class mail received from publishers during the fiscal year was 513,450 tons, an increase of 14,677 tons, or 2.94 per cent over the previous year.

The total expenditure of the government for the transportation of mail by the railways in the last fiscal year was $50,853,360. The department's estimate for the year beginning next June is $58,229,000, being only 3.63 per cent more than the appropriation for the current fiscal year.

Summary of Revenues and Expenses of Large Steam Roads in October

The following figures were compiled by the Interstate Commerce Commission from monthly reports of operating revenues and expenses of large steam roads for the month of October, 1914. No reports are included for roads whose operating revenues for the year ended June 30, 1914, did not reach $1,000,000.

Report on Kansas City Southern Derailment Near Air Line Junction, Mo.

The Interstate Commerce Commission has just issued the report of H. W. Belnap, chief of the division of safety, on the investigation of a derailment on the Kansas City Southern near Air Line Junction, Mo., on October 19, 1914. A passenger train on a branch line extending from Kansas City to Independence, Mo., was derailed, resulting in the death of the engineman and the injury of the fireman.

The accident occurred about 100 ft. beyond the beginning of a 5 deg. 16 min. curve on a 1 per cent ascending grade. The testimony of the train employees showed that the speed was not high, probably not over 15 miles an hour; but an examination of the track showed very bad conditions, and the derailment was due to this defective track. In some places the gage varied from 4 ft. 8 in. at the joints, to 4 ft. 9¼ in. at the centers of the rails. The report says that within a distance of a half mile on each side of the point of accident about 50 joints were found with only one or two bolts in them, owing to the fact that the ends of some of the rails had no bolt holes drilled in them, while others were so badly matched with the angle bars that it was

impossible to insert bolts. The ties were also in very poor condition. The immediate cause of the accident was the spreading and turning over of three rails on the inside of the curve.

The report contains a half dozen half tone engravings showing track, near the point of derailment, evidently unfit for any speed, but the very lowest; and the inspector concludes that "in this accident the question of speed is not involved, there being no doubt that the track conditions existing in the vicinity of this derailment were such that trains could not be operated with safety even at low speed."

Postal Surplus Result of Unfair Railway Mail Pay

"Had payments to the railroads for hauling the mails increased only half as fast in the past two years as did the volume of mail carried, the $3,569,545 surplus just reported by Postmaster General Burleson in his annual report for the last fiscal year would have vanished," says the Bureau of Railway News and Statistics in a bulletin. "To test the postmaster's jubilant announcement that 'for the first time since Benjamin Franklin organized the postal service the post office department has been securely placed on a self-sustaining basis,' the bureau has analyzed the post office reports of the last three years. So-called surpluses for 1913 and 1914 are shown to be wholly the product of phenomenal growth in mail under the new parcel post, accompanied by almost total failure to pay the greater expense of transportation, subjecting the railways to extortion through forcing on them enlarged business at unfair rates. The contrast follows:

	1914.	1913.	1912.
P. O. revenue	$287,934,565	$266,619,526	$246,744,016
Increase over 1912	16.7 per cent	8.0 per cent	.....
P. O. expense	283,558,102	262,108,875	248,529,539
Increase over 1912	14.1 per cent	5.4 per cent	.....
Excess revenue	$4,376,463	$4,510,651	*$1,785,523
Surplus	3,569,545	3,841,907	.....
Railway mail pay	53,000,000	51,959,387	51,691,301
Inc. over 1912	2.5 per cent	0.5 per cent	.....

*Deficit.

"Against a 16.7 per cent two-year gain in business, pay to the railways for service which must have expanded in like proportion was enlarged but 2.5 per cent. With quadrennial weighings roads whose mail tonnage was weighed in 1912 must wait till 1916 to enjoy added revenue from the fast mounting tonnage. By similar repudiation of vital expenses even the most tottering enterprise might of course be put on paying basis."

Mail Pay Discussions in Congress

Ralph Peters, Chairman of the Committee on Railway Mail Pay, representing 264 leading railroads, operating nearly 90 per cent of the total railroad mileage of the United States, has issued a statement calling attention to the fact that the House of Representatives has adopted a special rule declaring in order the railway-mail-pay rider in the post office appropriation bill. "The true purpose of this bill, as revealed in debate," says Mr. Peters, "is to reduce railway mail pay by many millions a year. . . ." Chairman Moon openly advanced this proposal despite the injustice manifest on its face. . . . The Bourne Committee found that the railroads were entitled to an advance of at least $3.000,000 a year for carrying the mails, with relief from certain incidental services now rendered without payment. Chairman Moon's committee recommended to the House an increase of more than $2,000,000 in next year's appropriation for railway mail pay, but this apparent promise of the bill and its real object are vastly different things. Chairman Moon, on December 19, said before the House: 'It does not show a saving upon its face . . . but you have changed from the quadrennial weighing of the mails on a weight basis, on which the pay is to be computed, to the space provision, and *you will have enough space under the contract to carry all your parcel post probably without any additional compensation and save many millions annually.* . . .' Again Chairman Moon said, more specifically: 'Does not the gentleman know that the main feature of this bill, the only great feature in it, is the railroad pay proposition, and does he not know that when he voted as he did he voted against the consideration of that railroad proposition, that would save this country eight millions of dollars every year, if carried?'

"So the chairman of the House Committee which recommended an increase of $2,000,000 in the appropriation to pay the railroads for carrying the mails, stated on the floor of the House that the bill would save the government $8,000,000 annually.

"The railway mail pay rider in the post office appropriation bill was not conceived in the 'spirit of candor and justice,' which President Wilson has set forth as the proper spirit. It is a bald attempt to create a specious show of economy in the operations of one department of the government by depriving the railroads of a large part of the compensation they fully and fairly earn in the performance of an indispensable public service."

Arbitration of Enginemen's Demands

The hearing before the board of arbitration at Chicago on the demands of the engineers, firemen and hostlers of the western roads for increases in pay and changes in working conditions, was taken up last week with the testimony of a large number of engineers and firemen who went into details regarding the conditions of their work and described experiences to show the hardships which some of them encounter, and the long hours which some of them work, together with statements to show their increased cost of living. One of the principal items in the latter mentioned was the increased cost of meals and lodging when they are away from home.

Most of the witnesses dwelt on the increased size and capacity of the locomotives and the increased length or weight of trains, which they said has increased their labor and responsibility, and also the "productive efficiency" of their work. A large number of the witnesses described the dangers, hardships or difficulties of running through tunnels or over heavy grades in the western mountains, the difficult weather conditions encountered in the Northwest, especially in Canada, and the dangers of working on electric locomotives. An engineman who runs through the Cascade tunnel told of four men being injured from burns while operating electric locomotives. Several witnesses described surprise tests in which they said the signals had been changed to indicate stop when they were so near that it was impossible to stop the train in time; and in one case both engineman and fireman, fearing derailment or collision, had jumped and were injured. A Canadian Pacific engineman said he had frequently encountered temperatures of 45 or 50 deg. below zero, and he described a snow slide which overturned his engine and killed six people. Some complaint was made also of unfair disciplinary measures by officials. Warren S. Stone, grand chief of the Brotherhood of Locomotive Engineers, complained of blacklisting methods, saying that he could offer evidence that when an employee loses his position on one road and goes to another his previous record is "flashed upon him in the most minute detail."

The firemen said their chances of promotion had been greatly decreased in recent years, partly by reductions in force, due to the falling off of business at various times, and partly because of the introduction of larger engines which reduced the number of men required, and which had caused a number of enginemen who had been promoted from firemen to be set back to firing again. Others gave figures showing the large amount of coal shoveled. An engineman employed on the Minneapolis, St. Paul & Sault Ste. Marie told of a case where a division terminal of the road was changed, which required the employees to move their homes and, he said, compelled a large number of the men to lose money by selling their houses at forced sale. A number of men spoke of averaging 14 to 15 hours a day at work, which gave them practically no time at home with their families; but they said that they were able to "lay off" for several days during the month.

The board on Tuesday adjourned to January 4.

Second National Foreign Trade Convention

The second National Foreign Trade Convention will be held at St. Louis, Mo., on January 21 and 22, 1915. Three thousand commercial and industrial organizations, corporations, firms and individuals engaged in foreign trade, have been invited to send delegates. The meeting will be opened by the Hon. W. C. Redfield, secretary of commerce, and among the papers will be one by John Bassett Moore, formerly counselor of the state department and the leading American authority on international law, the subject of the paper being "Problems Arising in War and Commerce."

The Traffic Club of New York

At the regular monthly meeting of the Traffic Club of New York at the Hotel Astor, New York, on December 29, August Thomas will address the club on current events. It is also announced that a concert will be rendered by the orchestra of the American Express Employees' Association. The annual dinner of the club will be held at the Hotel Astor on Saturday evening, February 13.

MEETINGS AND CONVENTIONS

The following list gives the names of secretaries, dates of next or regular meetings, and places of meeting of those associations which will meet during the next three months. Hereafter the full list of meetings and conventions will be published only in the first issue of the Railway Age Gazette for each month.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

American Society of Engineering Contractors.—J. R. Wemlinger, 11 Broadway, New York. Regular meetings, 2d Thursday in month, at 2 P. M., 11 Broadway, New York.

American Wood Preservers' Association.—F. J. Angier, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 19-21, 1915, Chicago.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meetings, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1836, Transportation Bldg., Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railway Business Association.—Frank W. Noxon, 30 Church St., New York.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. R. R., Atlanta, Ga. Next regular meeting, January 21, 1915, Atlanta, Ga.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of Newark.—John J. Kantzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, Newark.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in montb except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Transportation Club of Detroit.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

E. N. Hurley, president of the Illinois Manufacturers' Association, addressed the Traffic Club of Chicago on Friday, December 18, on "Opportunities for South American Trade."

Passenger traffic officers of roads in Ohio and Indiana have this week held a conference with the Ohio Public Utilities Commission concerning their desire to have action taken looking to the repeal of state two-cent fare laws; and on another day they held a similar conference with the governor of Indiana.

The Mississippi Electric Navigation Company of St. Louis, has announced its intention of letting contracts for steel freight barges to be ready for service on May 1. They are to be operated between St. Louis and upper and lower Mississippi river points. It is said the boats will have a capacity of 1,000 tons each.

Suburban passenger fares to and from Baltimore, which were raised at the same time as those at Philadelphia, heretofore noticed, have also been the subject of litigation, an injunction having been issued by the Baltimore county court. This injunction, it is said, will have the effect of continuing the former rates in force until the Public Service Commission shall have made a report on the new tariffs, or until the railroad company can secure the removal of the injunction.

The Pennsylvania Railroad, beginning January 1, will resume the issuance of permits granting reduced passenger rates to clergymen; but not in the state of Pennsylvania, where the constitution and laws forbid reductions in passenger fares, except to employees of the railroad. The Public Service Commission of the state in March last ruled that the clause of the Public Service Company law, 1913, forbidding discrimination by carriers between persons, forbade making a discount to clergymen.

It is reported that since the passenger fare from Chicago to St. Louis was increased from $5.80 to $7.50 on December 15, a large number of passengers have been buying tickets from Chicago to East St. Louis, Ill., or Granite City in order to take advantage of the two-cents a mile intrastate fare in Illinois, and then paying separate fares across the Mississippi river to St. Louis—10 cents by trolley across the bridge or 25 cents on the steam passenger trains. As the fare from Chicago to East St. Louis is $5.62 this makes a considerable saving.

The spokesman of the suburban passengers aggrieved by the recent decision of the Pennsylvania Public Service Commission, allowing an increase in the prices of certain suburban tickets, has filed charges with the governor of the state calling on him to remove the members of the commission because of their "inefficiency, neglect of duty and misconduct in office." The commissioners named in the complaint are former Gov. Samuel Pennypacker, Emory Johnson, Milton Brecht, S. Larue Tone, Charles Wright and Frank Wallace. Mr. Pennypacker's comment, as reported, was, "Let 'em file 'em and be hanged."

On November 17, in accordance with a notice issued on August 15, the Panama Railroad Company ceased to act as a co-carrier in connection with steamship lines running to and from the isthmus. In order, however, to take care of through freight coming to the isthmus in vessels that do not use the canal, the Panama Railroad Steamship Line has established a fortnightly service between New York and Balboa, which is expected to take care of all freight of this nature arriving at Balboa northbound, or at Cristobal southbound. In case the volume of business warrants, other vessels of the Panama Railroad Steamship Line will be put in service.

L. J. Spence, director of traffic of the Southern Pacific, has issued a statement saying that if President Wilson desires to afford the railroads an immediate measure of relief it is within his power to send a recommendation to Congress to repeal that provision in the law which empowers the commission to suspend advanced rates before they come effective. "Under existing practice," he says, "the railroads are considered guilty of extortion until they prove their innocence, and may suffer starva-

tion while awaiting the sustenance to which they are eventually found to be entitled. My suggestion affords adequate protection to all interests."

The attorney-general of New York, who is investigating the egg trade in New York City, has brought out additional information concerning the frauds perpetrated on the trunk line railroads during the past three or four years in connection with claims for eggs broken in transportation. Out of thirteen inspectors formerly employed by trunk line roads, it is said that ten had accepted bribes from egg dealers, to approve unfounded claims for damages. The bribes are said to have run from $25, for a single report, to a regular salary of $85 a week for approving claims. The man who had investigated the records testified that in one week the receipts of eggs at seven stations in New York amounted in value to $28,650, while the claims for damages on the same shipments amounted to $21,687.

Checking Baggage on "Split Tickets"

Among the new tariff announcements issued last week by the New York State Public Service Commission, second district, were abstracts of notices from certain roads relative to changes in baggage regulations. A sample notice says:

In checking on composite transportation no tickets or ticket orders issued by foreign lines will be honored as forming a part of through transportation for the checking of baggage, the sale of parlor car or sleeping car tickets, or the making of reservation in parlor cars or sleeping cars, to points beyond Buffalo, Niagara Falls, Suspension Bridge, Lewiston, Salamanca, or Dunkirk. Effective January 15.

Another road announces a new regulation providing that through checks will be issued on presentation of tickets, mileage books, or passes provided they form complete and valid transportation from starting point to destination; but checks will not be issued on such combined transportation when a wagon transfer is necessary at a junction point on which transportation is split, unless the passenger purchases a transfer tag for each piece of baggage checked.

GERMAN EXPLOSIVE TRAINS BLOWN TO PIECES.—An English contemporary states that news has been received in Petrograd of a terrible collision between two German military trains loaded with pyroxilin and shells in the government of Kielce. Both trains were utterly destroyed and not a soul of those in charge of them survived. The explosion was so terrific that it was heard for a distance of over 30 miles.

FRENCH RAILWAYS RESTORED BY GERMANS.—It is reported from Amsterdam that the Germans have restored the railways from Charleville, in the Department of the Ardennes, to Rheims, and from Hirson, in the Department of the Aisne, to Montmedy, in the Department of the Meuse, twenty-five miles north of Verdun. These railways were destroyed by the French in their retreat before the first German advance on Paris. It is also stated that the railways at Givet, on the Belgian border, will be opened soon; that the bridges over the Meuse near Lumes, Flize and Donchery, to the southeast of Mezieres, are ready for service again and the blocked tunnels near Montmedy and Mohon (just south of Mezieres) have been opened.

AERIAL RAILWAYS IN SWITZERLAND.—It is generally admitted that mountain railways of the aerial cable type cost less to construct than the funicular, and in Switzerland there are several under construction. L'Electricien of Paris describes a new ropeway recently constructed near Bozen, where there is a rise of 2,750 ft. in 5,400 ft., and an average inclination of 43 deg. The two cars, one of which ascends while the other descends, are connected by a cable in duplicate. The up and down lines are 20 ft. apart, and each consists of two steel cables 20 in. apart, on which runs a four-wheel trolley, to which the car is attached. The double cables which draw the cars are operated by an electric motor fixed at the highest station. The supply of current, which is taken from a central station, is supplemented by a battery for emergency use. Hand gear on the car is also provided. All cables are in duplicate, and a large factor of safety has been allowed. The ropeway is supported on steel lattice towers, 56 ft. being the maximum height, and the longest span 1,300 ft. The cars take eight passengers inside and eight outside.—*The Engineer.*

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Rates on Cotton to Mobile

Mobile Chamber of Commerce et al. v. Mobile & Ohio et al. Opinion by Commissioner McChord:

The commission finds that the rates on export cotton from all points in the southeast on the lines of defendants to Mobile are reasonable, but it is held that certain practices of the carriers serving that city should be corrected. A system of rates referred to as "penalty rates" is condemned, the idea of the rates being that a rate higher than a normal local is exacted for the movement from the point of origin to the compress point and, if the shipment then moves to a port of the line of the originating carrier, such higher rate so assessed is applied on the through rate from point of origin to the port. This, in addition to the refusal of the Atlantic Coast Line, Central of Georgia and the Seaboard Air Line to join in through routes or joint rates from certain points to Mobile is held to be discriminatory to that city. Certain rates are found prejudicial to Mobile as compared with Savannah, and defendants are required to readjust them.

At the present time several of the carriers refuse to grant through bills of lading except in the case of shipments which will move via certain docks in which they have a special interest. It is found that these through export rates should also apply on shipments going to other docks. It is proposed that the carriers establish a uniform terminal charge of 3 cents per 100 lb., which shall apply under a system of universal switching so that any of the docks located at Mobile shall be available to shippers located on any of the lines serving Mobile. This charge of three cents is understood to be for an additional service to that rendered at the present time. The export cotton rates to Mobile should be quoted as for station delivery or for delivery at point of interchange at Mobile and the terminal charge for ship-side delivery should be stated as an additional charge; but nothing herein is to be taken as authorizing an increase in the present through rates to ship side.

The commission states that the "through bill of lading" issued on export cotton shipments, entails no responsibility on the part of the rail carrier as a common carrier after it delivers the shipment at the dock or after it is delivered to the connecting carrier at its interchange track in Mobile. The agent of the carrier at the point of origin should, therefore, issue through bills of lading when the shipper simply designates the wharf or dock in Mobile at which he wishes delivery made.

"City cotton" when delivered to a carrier at its station proper in Mobile, or at its interchange track, is to be delivered to the dock or wharf served by it at the uniform terminal charge, and should be subject to the same provisions as to free time and demurrage as other export cotton.

Cotton shipped into Mobile as local, when later declared to be export, must take the export cotton rate to Mobile proper plus the terminal charge. (32 I. C. C., 272.)

Rates from Houston to Points in Louisiana

Chamber of Commerce, Houston, Tex., v. International & Great Northern et al. Opinion by Commissioner Daniels:

The commission finds that it is not unreasonable or discriminatory that carriers should apply a rate scale of $1.37 from Houston, Tex., to points in Louisiana. The rate of 80 cents from Houston to New Orleans is necessitated by water competition and should not be established on traffic upon which water competition does not apply. It is held, however, that certain combination rates, via the gateways, Shreveport, Alexandria, Baton Rogue, Crowley, Oakdale and Napoleonville which may be lower than $1.37 should be published as through rates so that shippers may know that they exist and be put in a condition to make use of them.

Carriers, in the tariffs in issue, proposed to restore to $1.37 the rates from Houston, Tex., to all points on the Vicksburg, Shreveport & Pacific, a rate of 80 cents having been published

in error. The commission finds that there was no reason why the rates to these points should not equal the combination of locals with $1.37 as a maximum and that the carriers are justified in permitting the 80-cent scale to be applicable from Houston to Vicksburg only on traffic consigned to southeastern points.

The commission also finds that the carriers are not justified in making increases on the first and second class rates between Houston and points on Morgan's Louisiana & Texas from Alexandria to Torian.

It is also held that the carriers have not justified an increase from a 60 cent scale to an 80 cent scale in the rates from Houston to stations on the main line of the Louisiana & Western from Maignaud to Rupert, and from points on its branch including Morse, Gueydan, Kaplan, Lastie and intermediate points; a scale of 70 cents is prescribed.

The commission also finds that the carriers have not justified increases in the rates on soap and washing compounds from Houston to New Orleans, and group 4 points from 29 cents to 30 cents. On the other hand an increase in rates on the same products from Houston to Lake Charles and West Lake from 15 cents to 26 cents is allowed. An increase in the rates on scrap iron in carloads from New Orleans and New Iberia to Houston, from $2.50 per ton of 2,000 lb. to 16 cents per 100 lb., is likewise found to be not justified, and it is ordered that the rate be not in excess of 16 cents. (32 I. C. C., 247.)

STATE COMMISSIONS

See Oklahoma decision in Court News.

At a hearing before the Massachusetts Public Service Commission in Boston, December 17, numerous remonstrances were presented against the proposed increases in passenger rates which have been filed by the Boston & Maine. The commission called upon the road to present, from its financial records, the evidence relied on to prove that an increase in rates is necessary.

The Pennsylvania Public Service Commission announces that at Harrisburg, January 8, it will give a rehearing on the advances in Philadelphia suburban passenger rates which were the subject of a decision issued last week. Representatives of the passengers who made the original complaint declare that they are not satisfied with the decision of the commission, which allowed an increase of about 50 per cent in the rate on one hundred-ride tickets good for six months.

At Richmond, December 17, the Virginia state corporation commission imposed a fine of $1,000 on the General Railway Signal Company, Rochester, N. Y., as a penalty for doing business in Virginia without having obtained a certificate of authority from the commission. The signal company will appeal to the courts. The complaint before the commission is based on work done for the Southern Railway, in the construction of automatic block signals, on 147 miles of road, for a total consideration of $214,040.

The railroad commission of Louisiana has authorized the Vicksburg, Shreveport & Pacific to discontinue passenger trains No. 5 and No. 6. These are way trains running the whole length of the road, 172 miles, and the report of the commission, explaining at length the reasons for its action, says that the trains were put on in November, 1912, as an experiment. Receipts are now low on all passenger trains. With these trains off there will be two trains each way, daily, throughout the length of the road, and one additional each way between Monroe and Shreveport, 96 miles.

F. G. Jonah, chief engineer of the St. Louis & San Francisco, was the principal witness at a hearing before the Missouri Public Service Commission on December 15, on the application of the Missouri roads for general increases in freight and passenger rates in the state. Mr. Jonah testified that it would cost $68,527 a mile to reproduce the 1,773 miles of track of the St. Louis & San Francisco in Missouri, including equipment and terminals. He estimates that the value of the terminal facilities of the Frisco in Kansas City alone is $15,000,000. As an example of the heavy increase in railroad expenses, he cited the cost of eliminating grade crossings. Recently $80,000 was spent by his road in Kansas City for that purpose, and $220,000 in St. Louis, and the road may have to expend $300,000 more in St. Louis. Alexander Hilton, passenger traffic manager of the St. Louis & San Francisco, testified before the commission on December 16. He described the reduction in earnings on passenger business resulting from the enforcement of the two-cent fare law in Missouri, which he said was general to all of the roads, and said that the two-cent rate had not had the effect of stimulating traffic, and that if it is to be continued there must be further and radical reductions in passenger train service. He said that while the Frisco's passenger mileage had increased during 1914, its revenues had decreased $88,000. A. L. Conrad, assistant general auditor of the Atchison, Topeka & Santa Fe, told the commission that over 19 per cent of the total number of passengers carried by the Santa Fe in Missouri for a period of five months, including, July, August, September, October and December, 1913, paid no fares. He said this was due largely to the fact that during the months in question the employees of the roads were taking their vacations.

Discrimination to Please the State

The Massachusetts Public Service Commission has issued a report holding that the Boston & Maine's freight rates to and from the pier of the National Dock & Storage Warehouse Company in East Boston, are discriminatory, as compared with the rates to and from the Commonwealth dock in South Boston. But the situation is so complicated that the parties directly interested in it are called upon to get together and try to make a readjustment that shall not unduly disturb business conditions. Ninety days are given within which to make such readjustment.

The discriminatory rates came into existence by reason of the state's development of the pier property in South Boston and the agreement obtained by the Port Directors from the New York, New Haven & Hartford that it should not make any switching charge on goods passing through the Commonwealth Pier. Thus the state obtained special privileges for those who used the Commonwealth dock, not granted to those using the private docks in East Boston. Interstate Commerce Commission reports and court decisions are quoted in support of the contention that unjustly discriminatory rates cannot be maintained, even for the purpose of developing public property.

"The attitude of the Directors of the Port in this matter," says the report, "is clear, but they had no jurisdiction or authority to force the railroad companies to absorb the switching charges from piers in the harbor. It is, however, within the power of the railroad companies to do so, and it would seem that those companies having voluntarily executed this contract with the Port Directors, must take such steps as are necessary to carry out the contract in accordance with the law, and are bound, so long as this contract remains in force, to apply similar rates for similar service to other piers on the water front."

PERSONNEL OF COMMISSIONS

William H. Fisher, of Brownsville, Pa., has been appointed an inspector for the Pennsylvania Public Service Commission.

COURT NEWS

The Supreme Court of the United States has decided in favor of the Erie Railroad in a suit against the Berwind-White Coal Company for demurrage on cars of coal which had been stopped en route to await reconsignment orders.

The Missouri Pacific on December 18, applied to the Supreme Court of Nebraska for a writ of mandamus to compel the state railway commission to accept its application made some time ago for a hearing on a proposed advance in the passenger fares throughout the state from 2 cents to 3 cents a mile. The commission declined to grant the hearing requested on the ground that it has no jurisdiction to change the passenger fares, which are fixed by law.

In a decision rendered by the Supreme Court of Oklahoma, granting to the Atchison, Topeka & Santa Fe a writ of prohibition against an order of the state corporation commission, ordering the Santa Fe to build a viaduct across a street in Guthrie, Justice Riddle differentiates between the power of the commission to order viaducts constructed for the safety of passengers or freight, and the power of the commission to order viaducts constructed as a preventive of accidents to pedestrians. Where the safety of pedestrians alone is involved only the municipal authorities can compel the construction of viaducts or grade crossings, says the opinion.

Railway Officers

Executive, Financial, Legal and Accounting

Francis T. A. Junkin, general attorney of the Atchison, Topeka & Santa Fe system, has resigned.

T. F. Darden, special accountant of the Atlantic Coast Line at Wilmington, N. C., has been appointed assistant to the president.

Robert Dunlap, general attorney of the Atchison, Topeka & Santa Fe system at Chicago, has been appointed western solicitor, with headquarters at Chicago, effective January 1. He will have special charge of corporate and contract matters, and of litigation outside of the states through which the lines of the system run, give counsel to state solicitors in matters arising in their respective jurisdictions, continue to act as solicitor for Illinois, and perform such other duties as may be assigned to him. Mr. Dunlap was born October 4, 1853, at Cincinnati, Ohio, and was educated at the Cincinnati University. He began railway work in 1883 as assistant attorney for the Atchison, Topeka & Santa Fe, with which road he has remained ever since. In 1895 he was appointed assistant to the general solicitor for the receivers, and in 1897, upon the reorganization of the company, he was made general attorney at Chicago, from which position he will be promoted on January 1 to western solicitor, as above noted.

R. Dunlap

S. T. Bledsoe, general attorney of the Atchison, Topeka & Santa Fe at Oklahoma City, Okla., has been appointed assistant general solicitor, with headquarters at Chicago, effective on January 1. In addition to his general duties he will have special charge of valuation and tax matters, supervision of proceedings before state commissions and of litigation resulting from their orders and from legislative acts, and perform such other duties as may be assigned to him. Mr. Bledsoe was born May 12, 1868, in Clinton County, Kentucky. He was educated at the Southern Normal School and Business College at Bowling Green, Ky., and the University of Texas. He entered railway service in 1893 as local attorney for the Gulf, Colorado & Santa Fe at Ardmore, I. T., and in 1907 was appointed attorney for Indian Territory for the same road. From 1908 to July, 1912, Mr. Bledsoe was a member of the firm of Cottingham & Bledsoe, solicitors for Oklahoma for the Atchison, Topeka & Santa Fe. On the latter date he became general attorney for the Santa Fe at Oklahoma City, Okla., retaining his connection with the firm of Cottingham & Bledsoe. On January 1 he will become assistant general solicitor at Chicago, as above noted.

S. T. Bledsoe

Henry L. Waldo, solicitor of the Atchison, Topeka & Santa Fe for New Mexico at East Las Vegas, N. M., has resigned, effective December 31. W. C. Reid, assistant attorney at Roswell, N. M., succeeds Mr. Waldo as solicitor for New Mexico, with headquarters at Albuquerque, N. M. The headquarters of R. E. Twitchell, assistant solicitor for New Mexico, have been removed from East Las Vegas, N. M., to Santa Fe.

Operating

H. Wheeler, superintendent of the White Pass & Yukon, has been appointed general manager.

J. J. Cogan has been appointed general superintendent of the Florence & Cripple Creek and leased lines, also of the Midland Terminal Railway, with headquarters at Colorado Springs, Col. Effective January 1, 1915.

C. L. Brevoort, superintendent of the Cincinnati Terminal division of the Cincinnati, Hamilton & Dayton, has been granted leave of absence, and the position has been abolished. R. B. Mann, general agent at Toledo, Ohio, has been appointed assistant superintendent of the Toledo division at Cincinnati, Ohio, with jurisdiction over the territory from Cincinnati to New River. E. W. Hoffman has been appointed assistant superintendent of the Toledo division, with headquarters at Toledo, with jurisdiction over the district from Toledo to Bates. C. W. Havens, assistant trainmaster at Dayton, Ohio, has been appointed trainmaster, succeeding G. F. Reel, assigned to other duties.

Traffic

A. F. Zipf has been appointed traffic manager of the White Pass & Yukon, with headquarters at Seattle, Wash., succeeding J. E. Dempsey.

Eugene Duval, assistant general western agent of the Chicago, Milwaukee & St. Paul at Omaha, Neb., has been appointed general western agent at that place, succeeding F. A. Nash, deceased.

W. G. MacEdward, general passenger agent of the Detroit & Mackinac, has been appointed also general freight agent, with headquarters at Bay City, Mich., succeeding J. K. Hudson, resigned.

Engineering and Rolling Stock

C. E. Stone has been appointed general car foreman of the Missouri & North Arkansas, with headquarters at Harrison, Ark.

G. M. Lang has been appointed roadmaster of the Canadian Pacific, in charge of Coronation subdivision, with office at Coronation, Alta., in place of W. E. Lissiman.

H. H. Harsh, division engineer of the Baltimore & Ohio, at Cleveland, Ohio, has been transferred as division engineer to Garrett, Ind., succeeding F. D. Nauman, resigned.

Joseph Kowol has been appointed roadmaster of the Northern Pacific at Sedro Woolley, Wash. This name was incorrectly given as Joseph Korvol in our issue of December 18.

OBITUARY

James Wallace Cunningham, land and tax commissioner for the International & Great Northern, died on December 10 at his home in Houston, Tex., aged 54 years.

William Reed Hancock, formerly treasurer of the Wisconsin Central, died on December 16, at his home in Milwaukee, Wis., as a result of injuries received in an automobile accident about three weeks ago. He was born at Ashtabula, Ohio, on February 8, 1841, and began railway work in 1872 as treasurer of the Green Bay & Minnesota. He was subsequently cashier and accountant for the receiver of the same road; assistant treasurer and accountant of the Green Bay, Winona & St. Paul, and from January, 1887, to October, 1893, auditor of the Milwaukee, Lake Shore & Western. Mr. Hancock then went to the Wisconsin Central, of which road he was cashier and paymaster

until July, 1899, assistant treasurer from the latter date to November, 1900, and then treasurer until about four years ago.

Eugene Zimmerman, formerly president of the Cincinnati, Hamilton & Dayton, died suddenly in Cincinnati, Ohio, on December 20, of hemorrhage of the lungs. Mr. Zimmerman was born December 17, 1845, at Vicksburg, Miss. He attended school at Gambier and Farmers College, and was educated as a civil engineer. He began railway work in 1878 as assistant engineer on construction of the Cincinnati & Green River. In 1881 he was chief engineer of the Kentucky & South Atlantic; in 1883 he was president and chief engineer of the Chesapeake & Nashville, and in 1888 he became president of the Dayton, Fort Wayne & Chicago. Mr. Zimmerman was made vice-president of the Cincinnati, Hamilton & Dayton, in June, 1892 and became president of that road in July, 1904, which position he held until October, 1905. He was also chairman of the board of the Pere Marquette from May to October, 1905. He also was for a time president of the Detroit, Toledo & Ironton and the Ann Arbor. He has been president of the Dayton, Lebanon & Cincinnati for several years.

E. Zimmerman

Henry S. Hayward, consulting engineer of floating equipment of the Pennsylvania Railroad Lines East of Pittsburgh, Pa., with headquarters at Jersey City, N. J., whose death on December 14, at Augusta, Ga., was noted in these columns last week, was born on September 19, 1845, at Brooklyn, N. Y. He served a four-years' apprenticeship in marine construction work and engineering, and then to 1873, was in continuous sea service, first as junior engineer, and later was promoted until he became chief engineer on the steamships of the Pacific Mail Steamship Company. In April, 1873, he entered the service of the Pennsylvania Railroad as a machinist in the Altoona shops. The following year he was assigned to special duties on the New Jersey division as assistant road foreman of engines, and in April, 1875, he was appointed assistant superintendent of motive power of the New Jersey division. He was promoted in October, 1882, to superintendent of motive power of the same division, also of the West Jersey & Seashore and the Camden & Atlantic, including ferries and floating equipment on the Delaware river. From January 1, 1912, until the time of his death he was consulting engineer of floating equipment of the Pennsylvania Lines East of Pittsburgh and Erie, Pa. Mr. Hayward was a member of the American Society of Mechanical Engineers, the Society of Naval Architects and Marine Engineers, also of the Engineers' Club of New York and the New York Railroad Club. He was also a member of the committee of the American Railway Master Mechanics' Association, which had charge of the 1912 edition of the Locomotive Dictionary.

H. S. Hayward

Equipment and Supplies

LOCOMOTIVE BUILDING

The Illinois Central is in the market for 25 switching and 25 Mikado type locomotives.

The Philadelphia & Reading has ordered 4 passenger locomotives to be built in its own shops.

Greece.—The American Locomotive Company is reported to have received an order for 20 locomotives for export to Greece.

The Carolina, Atlantic & Western has ordered 3 ten-wheel and 1 six-wheel switching locomotives from the Baldwin Locomotive Works.

CAR BUILDING

The Philadelphia & Reading has ordered 200 hopper car bodies.

The Illinois Central is in the market for 1,000 50-ton refrigerator cars.

The Union Tank Line has ordered 500 tank cars from the Standard Steel Car Company.

The Westmoreland Coal Company has ordered 100 gondola and 100 hopper cars from the Cambria Steel Company.

The Jane Oil & Gas Company, St. Louis, Mo., has ordered 100 tank cars from the Pennsylvania Tank Car Company and 50 from the American Car & Foundry Company.

A War of Railways.—M. Segers, Belgian Minister of Marine, Railways, Posts and Telegraphs, recently visited the head office of the state railways in Paris, where 1,200 Belgians, belonging to his departments, had been drawn up to receive him. In the course of his speech M. Segers said that the present war was a war of railways, and stated that the Germans had offered as much as $10 a day to Belgian railway foremen, and $2.40 a day to ordinary employees, provided that they would return and work the Belgian railways, but these offers had been absolutely rejected. He also noted that the personnel of the Belgian railways, who had been forced to leave their country, would not be forgotten. Those who had found work, but with smaller wages than they usually earned, would be paid the difference, while those who could find no work would be paid as if they were temporarily unemployed. Pay offices had been established in Amsterdam, London and Havre.

Russian Railway Projects.—The acquirement from China by Russia of the right to construct a railway from Blagoveshchensk, on the left bank of the Amur river, to Aigun, Mergen and Harbin, with a connection between Mergen and Tsitsihar, is of great importance politically to Russia and commercially to North Manchuria. Commercially it taps large and rich tracts of territory and gives immediate access to the Amur river and to the New Amur Railway now being opened on the left of the river, and with which Blagoveshchensk is connected. Politically it binds this region to Russia, and gives her at least railway dominance over the whole of North Manchuria. She now has the railway from Vladivostok through Manchuria to Russia, and has nearing completion the railway traversing her own territory from Vladivostok north of the Amur to Karimska, where it junctions with the Siberian Railway. The railways she has now secured the right to build will permit her to place the important center of Harbin, with its direct connection southwards, in immediate touch with trade avenues which will tap the large territory of the Amur. Above all it places in the hands of Russia what is the northern section of the projected railway from Chinchow to Aigun. Americans hold the right from China to build the Chinchow-Aigun Railway, but in recent times the southern half of it has been granted to Japan by China, and now Russia has obtained the right to cover the northern section.

Supply Trade News

The Carbo Steel Post Company, Chicago, has increased its capital stock from $15,000 to $150,000.

The Union Railway Equipment Company, Chicago, has received an order for 1,000 Pries brine tank valves, to be used on 250 beef cars for Morris & Co.

The name of the Jones Safety Train Control System Company has been changed to the American Train Control Company. The offices will be retained at the same address, 608 American building, Baltimore, Md.

H. R. Sheene has been appointed sales engineer of the Union Switch & Signal Company, with headquarters in room 2039 Railway Exchange building, St. Louis, Mo. Mr. Sheene will report to the resident manager at Chicago.

Because of unsettled conditions, it has been decided not to offer United States Steel Corporation stock to employees for subscription in 1915. This will be the first year since the profit-sharing plan became operative, in which employees will not have the privilege of subscribing to stock.

The Jacobs-Shupert U. S. Firebox Company, Coatesville, Pa., has received an order for two Jacobs-Shupert fireboxes from the Royal Hungarian State Railways, following certain investigations by the motive power department of these railways. Delivery will probably not be made until peace has been declared.

Because of the death of the late Quimby N. Evans, the copartnership heretofore existing between Q. N. Evans, J. A. Almirall and W. C. Adams has been dissolved and been succeeded by the corporation of Almirall & Co., Inc. The new company will remain at the same address, 1 Dominick street, New York, and with the same personnel as the former company will continue to engage in the business of heating, ventilating and sprinkler systems and power plants.

On December 10, 1914, Judge Hazel, of the Western District of New York, handed down a decision in the suit of the Safety Car Heating & Lighting Company vs. the United States Light & Heating Company, holding patent No. 747,686, issued to J. L. Creveling, and owned by the former company, valid and infringed by the apparatus of the latter company. There were eight claims in the suit and all were sustained. The patent covers regulating devices for regulating the output of a variable speed generator and means for controlling the regulating devices to determine the output.

TRADE PUBLICATIONS

AIR COMPRESSORS.—The Chicago Pneumatic Tool Compa Chicago, has recently issued bulletin No. 34-S descripti the company's line of small power driven compressors.

PORTABLE ELECTRIC DRILLS.—The Independent P amatic Tool Company, Aurora, Ill., has recently issued cir lar E-2, descriptive of the company's line of Thor portable e tric drills.

HEAT TREATING FURNACES.—The Quigley Furn e & Foundry Company, Springfield, Mass., has issued bulleti No. 6, descriptive of the company's Overfired Accurate mperature Heat-treating furnaces, using gas or oil fuel.

VALVES.—The Golden-Anderson Valv Specialty Company, Pittsburgh, Pa., has issued a circular d scriptive of the Golden-Anderson double cushioned triple-act g non-return valves and various other valves which are mad by the company.

SCALES.—The Buffalo Scale Company, Buffalo, N. Y., has issued a booklet describing its new heavy-duty suspension-bearing center-connected railroad track scale. The essential features of this scale are the suspension bearing, the details of this bearing consisting of five parts and affording simplicity of construction, accuracy and durability. The booklet is illustrated with drawings and photographs of the scale parts and photographs of several installations already in service.

Railway Construction

CAIRO-TRUMAN & SOUTHERN.—We are told that this company which operates a line connecting Truman, Ark., with Judd Hill and Weona, has projected an extension from Weona south to Earle, 20 miles.

COLUSA & HAMILTON.—See Southern Pacific.

DEATH VALLEY.—See Tonopah & Tidewater.

DETROIT, ALMONT & NORTHERN (Electric).—An officer writes that a contract has been given to Frank Bishop, Almont, Mich., to build an extension from Almont north to Imlay City, 8.5 miles. The company has completed work on 9.35 miles of first track, and 0.92 miles of second track between Romeo and Almont. (June 19, p. 1565.)

HERSHEY TRANSIT COMPANY (Electric).—An officer write this company has completed the first section of five miles n-Hershey, Pa., of the line building from Hershey to F om-town, 10 miles; the remaining five miles are expected rshey. pleted early in 1915. H. N. Herr, chief engine (June 12, p. 1356.) any, which

HUDSON BAY RAILWAY.—We are told that thi t Nelson, on is building from The Pas, Man., northeast t on the section Hudson Bay, about 420 miles, is now at Winnipeg, Man., from mile 214 to mile 293. J. D. McAr vey has been com-is the contractor. The final location ar ance of 131 miles. pleted from mile 273 to Port Nelson, This company has ap-

MISSOURI, KA ucture carrying the company's tracks across the old timbe treet, Denison, Tex., by a concrete subway is East Crawfo ent completed. The subway will require about about 50 concrete and will cost approximately $31,500. 1,600 yd. & BAKERSFIELD.—See Southern Pacific.

MOJ DOCHES & SOUTHEASTERN.—An officer of this company, N operates a line from Nacogdoches, Tex., southeast to erda, 23 miles, writes that grading work is about finished an extension from LaCerda, southeast six miles.

NEW YORK, CHICAGO & ST. LOUIS.—Grade separation work, which will eliminate 13 highway grade crossings, is being planned by this company at Cleveland, Ohio. The tracks will be depressed and the highways will be carried over the tracks on reinforced concrete bridges. Work is to be begun early next spring and the ordinance requires that it be completed in two years. The approximate cost is estimated at $2,900,000. All work will be done by railroad company forces.

NEZPERCE & IDAHO.—An officer of this company, which operates a line from Nezperce, Idaho, west to Vollmer, 13.8 miles, writes that work is now under way on an extension from Vollmer to Tammany, 49 miles.

NORTHWESTERN PACIFIC.—An officer writes that this company has made surveys for a branch line from Healdsburg, Cal., northwest to Christine, 61 miles. Connection will be made at Christine with the existing line to Albion.

OREGON ROADS.—A committee has been formed for the purpose of securing estimates of cost, route, plans, etc., for a short proposed railroad extending from German Hall to Cold Springs on Columbia river in Oregon, a distance of about 16 miles. The Farmers' Union Grain Agency, Pendleton, Ore., is interested.

PUGET SOUND & WILLAPA HARBOR.—Work on this road, which is a 66-mile line running east from Raymond, Wash., through

Dryad to Chehalis, and then in a northerly direction until it connects with the Grays Harbor branch of the Chicago, Milwaukee & St. Paul, is nearing completion, and though it will not be finished by January 1, 1915, the specified time, it is expected to be completed during the earlier part of the year.

Rolla, Ozark & Southern.—An officer writes that this company, which was incorporated in Missouri early this year with $200,000 capital, to build an 18-mile line from Rolla, Mo., south to Anutt, has most of the right of way secured and about nine miles of grading finished, one mile of track has been laid. J. E. Walker, secretary and general manager, Rolla.

Southern Pacific.—An officer writes that construction work is now under way on the Colusa & Hamilton, from north of Glenn, Cal., to Hamilton, on 12.1 miles, and on the Willamette-Pacific, from a point near Acme, Ore., to North Bend, on 49.1 miles. In addition the Mojave & Bakersfield is projected from Cameron, Cal., to Mojave, and from Tehachapi to Treves.

Stockton, Terminal & Eastern.—An officer of this company which operates a line out of Stockton, Cal., writes that an extension has been projected from Bellota, northeast to Jenny Lind, [illegible] miles. In addition to the use of steam as the motive power gasoline motor cars will be used on the line.

Tennessee & Alabama.—An officer writes that surveys are now being made for the line projected early in 1914 from Fayetteville, Tenn., south to Huntsville, Ala., 34 miles. J. E. Hurd, chief engineer, Fayetteville, Tenn. (February 13, p. 346.)

Tonopah & Tidewater.—We are told that the Death Valley is building a 3-ft. gage line from Death Valley Junction, Cal., to Devar, 20 miles.

Willamette-Pacific.—See Southern Pacific.

RAILWAY STRUCTURES

Ashland, Wis.—The Minneapolis, St. Paul & Sault Ste. Marie will repair its ore docks at Ashland, Wis., in the near future. All work will be done by company forces.

Burlington, Vt.—We are told that a contract has been given to W. Shelton Swallow, Burlington, Vt., to build a union passenger station on Maine street in Burlington, to be used jointly by the Central Vermont and the Rutland Railroad. The new building is to be of brick construction, with stone trimmings, and will be fireproof. The cost of the work will be about $150,000.

Chicago, Ill.—The Chicago & North Western is preparing plans for replacing the old two-track swing bridge across the north channel of the Chicago river near Deering station, by a three-track Strauss bascule single leaf lift span 180 ft. long supported on cylindrical caissons. The approaches will consist of plate girders, that on the tower side being 35 ft. long, the length of the north approach not yet decided. The contract for the superstructure has been awarded to the American Bridge Company, and will require approximately 1,800 tons of steel. The contract for the substructure has not yet been awarded. Work in addition to this improvement will consist of the construction of a new all-electric interlocking plant for the protection of the bridge.

East Des Moines, Iowa.—The Chicago, Rock Island & Pacific is building a foot and highway bridge across its tracks at Thirtieth street, in East Des Moines. This bridge will be 1,084 ft. long, with a roadway 20 ft. wide and a 5 ft. walk on each side. Work on the concrete foundation has been begun and will be done by company forces. This company is also building a foot bridge 6 ft. wide and 974 ft. long across the same tracks at Twenty-sixth street.

Kansas City, Kan.—The Union Pacific is contemplating the building of a small brick freight house at Kansas City, Kan., to be constructed by company forces.

Keokuk, Iowa.—The Keokuk & Hamilton Bridge Company has awarded a contract for the erection of an 11-span bridge across the Mississippi river between Keokuk, Iowa, and Hamilton, Ill., to the Strobel Steel Construction Company, Chicago. The estimated cost is $325,000. Modjeski & Angier, Chicago, are the engineers in charge.

Railway Financial News

Atlantic Coast Line.—This company has declared a "cash" dividend of 2½ per cent on the common stock. The regular semi-annual dividends since November, 1909, have been 3½ per cent, or at the annual rate of 7 per cent. The present declaration will make 6 per cent declared in 1914.

Chicago, Rock Island & Pacific.—The $71,353,000 stock of the Chicago, Rock Island & Pacific Railway Company, the owning and operating company, which is incorporated in Illinois, was sold on December 22 under foreclosure of the collateral mortgage of the Chicago, Rock Island & Pacific Railroad, the Iowa holding company. The stock of the railway company was bid in by the bondholders' protective committee, of which James N. Wallace is chairman, the price, which is purely nominal, being $10 per share. The protective committee will now, under the agreement, distribute the stock pro rata to the railroad bondholders. The expenses of the committee and two committees of which the present is a consolidation total 44½ cents a share of stock; in other words, a little less than half of 1 per cent.

Grand Trunk.—A press despatch from London says that this company is to issue £1,000,000 ($5,000,000) 5½ per cent 3-year notes at 98½.

Lake Shore & Michigan Southern.—See New York Central & Hudson River.

Lehigh & New England.—The New Jersey Public Utility Commission has approved an issue of $1,364,000 stock.

Louisville & Nashville.—This company has declared a "cash" dividend of 2½ per cent on the common stock. The regular semi-annual dividends since November, 1909, have been 3½ per cent, or at the annual rate of 7 per cent. The present declaration will make 6 per cent declared in 1914.

New York Central & Hudson River.—Stockholders of the Lake Shore & Michigan Southern have voted to approve of the merger of this company with the New York Central & Hudson River, the merger having been approved by the stockholders of the New York Central on July 20, 1914, and the permission of the various state commissions having been obtained and the injunctions sought in the courts against the merger having been refused. The articles of consolidation of the two roads have been filed at the state capitals, where such action is necessary.

On December 23 the first meeting of the directors of the new company, the New York Central Railroad, was held and a quarterly dividend of 1¼ per cent was declared, which is the regular New York Central & Hudson River quarterly dividend. The board of directors was increased from 13 to 15 by the election of Leonard J. Hackney, of Cincinnati, Ohio, and Frank J. Jerome, of Cleveland, both of whom were directors of the Lake Shore & Michigan Southern.

Pennsylvania Company.—This company, which is the operating company of the Pennsylvania Lines West, Northwest and Central Systems has declared a dividend of 1 per cent, making a total of 4 per cent declared in 1914 as against a total of 7 per cent declared in 1913. The Pennsylvania Railroad owns all of the $80,000,000 stock of the Pennsylvania Company. This reduction of dividend, therefore, is a loss in other income to the Pennsylvania Railroad of approximately $2,400,000.

Pennsylvania Railroad.—On December 1 the Pennsylvania Railroad had 91,159 stockholders. This is an increase of 3,863 over the number on the books on December 1, 1913, and of the increase 386 is an increase in foreign holders, the total number of foreign holders of stock on December 1, 1914, being 11,882.

St. Louis & San Francisco.—The receivers have sold the $3,000,000 one-year 6 per cent certificates mentioned in these columns last week, and the certificates are being offered to the public at par.

ANNUAL REPORT

SEABOARD AIR LINE RAILWAY

REPORT OF THE DIRECTORS FOR THE FISCAL YEAR ENDED JUNE 30, 1914.

PORTSMOUTH, VA., October 22nd, 1914.

To the Stockholders of the Seaboard Air Line Railway:

The Board of Directors submits the following report of the operations of the property for the year ended June 30, 1914:

INCOME ACCOUNT FOR YEAR ENDED JUNE 30, 1914.

	1914.	1913.	Increase.
Gross Revenue	$25,291,757.62	$24,527,864.62	$763,893.00
Operating Expenses and Taxes	18,310,394.54	17,681,612.65	628,781.89
Net Operating Revenue	$ 6,981,363.08	$ 6,846,251.97	$135,111.11
Outside Operations	(Dr.)20,360.37	(Dr.)26,314.12	5,953.75
Operating Income	$ 6,961,002.71	$ 6,819,937.85	$141,064.86
Other Income	298,996.38	220,063.88	78,932.50
Gross Income	$ 7,259,999.09	$ 7,040,001.73	$219,997.36
Rentals and Hire of Equipment	441,847.42	397,589.17	44,258.25
Applicable to Interest	$ 6,818,151.67	$ 6,642,412.56	$175,739.11
Fixed Interest Charges	3,893,935.91	3,656,558.89	237,377.02
Balance	$ 2,924,215.76	$ 2,985,853.67	$ 61,637.91†
Full 5% Interest on Adjustment (Income) Bonds	1,250,000.00	1,250,000.00	
Net Income	$ 1,674,215.76	$ 1,735,853.67	$ 61,637.91†

†Decrease.

The Gross Revenue increased 3.11 per cent., Operating Expenses and Taxes increased 3.56 per cent., and Operating Income increased 2.07 per cent.

The Operating Expenses, exclusive of Taxes were 68.45 per cent. of the Gross Revenue, as compared with 68.19 per cent. the previous year; and including Taxes, 72.40 per cent. of Gross Revenue as compared with 72.09 per cent. for the preceding year.

MILEAGE OPERATED.

The mileage of the Seaboard Air Line Railway in operation on June 30, 1913, was	3,081.98
Extensions, etc., constructed during the year as detailed on page 6	15.57
Mileage in operation June 30, 1914	3,097.55

CAPITAL STOCK.

There has been no change in the capital stock during the year.

MORTGAGE, BONDED AND SECURED DEBT.

During the year $210,000 par value 4% Refunding Bonds issued for additions, extensions, betterments and improvements, were sold, making a total of $24,010,000 par value of 4% Refunding Bonds outstanding on June 30, 1914.

The remaining $1,000,000 of the $6,000,000 par value of Three Year 5% Gold Notes, dated March 1, 1913, payable March 1, 1916, shown in the last annual report as undelivered on June 30th, 1913, were delivered during this year, making the total authorized issue of $6,000,000 outstanding on June 30th, 1914. For further details of the Company's funded debt see Table No. 4.

EQUIPMENT.

Equipment shown in last annual report as having been undelivered on June 30th, 1913, under Equipment Agreement, Series "O," viz:

7 Mail and Baggage Cars,
4 Passenger and Baggage Cars,

were received during this fiscal year.

An Equipment Agreement, Series "P" was entered into on August 15th, 1913, for the purchase of:

5 Pacific Passenger Locomotives,	5 All Steel Dining Cars,
35 Pacific Freight Locomotives,	500 Steel Upper and Under Frame Ventilated Box Cars,
5 Switching Locomotives,	250 Steel Under Frame Flat Ca[illegible]
1 Dummy Locomotive,	250 Steel Hopper Coal Cars,
10 All Steel Passenger Coaches,	
2 All Steel Express Cars,	

for which $473,228.20 was paid in cash and equipment trust o[illegible] aggregating $1,900,000 were issued, payable in twenty consec[illegible] annual instalments of $95,000 each, bearing interest at the rat[illegible] per annum. All of this equipment was received during the fiscal [illegible] replace

There were purchased during the year, and put in serv[illegible]

Trust Equipment destroyed:

2 Passenger Locomotives,
3 All Steel Express Cars.

were purchased:

In addition to the equipment named above, the follo[illegible]

1 Officers' Car,
4 Air Dump Cars,
2 Ballast Spreader Cars.

EXTENSIONS.

were completed during the

Extensions to the Company's line in Flori[illegible] year as follows:

An extension from Bartow to Pembroke, Fla	8.74 Miles
Carpenter-O'Brien Spur, near Jacksonvi[illegible]	1.96 "
Acme Spur south of Archer, Fla	4.87 "
TOTAL	15.57 "

In addition to the above, constru[illegible]on is in progress on an extension easterly from Bartow [illegible]nown as Lake Wales Extension, approximately .... 22.00 Miles

Construction work is also i[illegible]progress on an extension from Pembroke to Jumeau Pho[illegible]phate Plant, approximately .... 3.53 "

MAINTENANCE OF WAY AND STRUCTURES.

ROADWAY, TRACK AND STRUCTURES.

Roadway, track and structures of the railway have been fully maintained at a cost of $3,094,199.97, which represents an expenditure per mile of road of $1,003.24.

SIDE TRACKS.

45.60 miles of new sidings and extensions of existing sidings were constructed, and there were deducted by removal and changes of old sidings 6.35 miles, making a net increase over previous year of 39.25 miles.

There were also constructed 0.79 mile of new sidings on leased lines.

TIE RENEWALS.

The tie renewals were 1,373,362 cross ties and 590 sets of switch ties, and the cost, $592,991.32, was charged to Operating Expenses.

NEW RAIL.*

144.02 miles of new 85-pound and 10.91 miles of new 90-pound steel rail, making a total of 154.93 miles, were laid in the main line, releasing therefrom 68, 70, 75 and 80-pound worn rail. There was charged net to Operating Expenses therefor, $197,219.77, and to Capital Account, $109,774.14.

In addition, 152.38 miles of released rail was laid on branch lines, releasing 60-pound and lighter rail, and there was charged to Operating Expenses therefor, $86,755.57, and to Capital Account, $153,849.45.

BALLAST.

264,101 cubic yards of gravel and slag ballast were put under main l[illegible] track at a cost of $253,185.39, of which $222,516.96 was charged to C[illegible] Account and $30,668.43 to Operating Expenses.

TRESTLES FILLED.

5,892 lineal feet of wooden trestles were filled in, and of th[illegible] thereof, including culverts, $35,317.41 was charged to Operati[illegible]lineal therof,

TRESTLES REBUILT AND BALLAST DECKED.

There were built during the year out of creosoted ti[illegible] feet of ballast deck trestles, replacing open deck trestles, $69,053.55, was charged to Operating Expenses. [illegible] year on the [illegible]e cost of which, [illegible]at.

TRESTLES STRENGTHENED.

Additional stringers were put in 126 trestles Georgia Division to provide for the use of heavi[illegible] amounting to $17,123.60, was charged to Ca[illegible]pairing, adding signals, heavier power. Of this

BRIDGES.

Work has been done on twenty-eight during this year and six of replacing with steel or strengthening number, twenty-three have been com[illegible]ies are:

Nine of the above bridges were [illegible] the nine have been completed. [illegible]ugh truss draw span 250

Of the bridges completed the [illegible] spans, each 125 feet long,

Nottoway River [illegible]ar Turkey Creek, Fla., through girder span	

Little Manate[illegible]tures for bridge renewals during the year were $100,- Big Alafia R[illegible] $80,094.76 was charged to Capital Account and $19,931.34 The tota[illegible]kpenses. 026.10, of [illegible] to Oper[illegible]

RAIL IN MAIN LINE.

[illegible] total operated main line single track mileage of the system, [illegible]miles are laid with steel rails of the following weights:

[illegible]	Weight.	Miles.	Weight.	
3,[illegible]92	90 lb. rail.	60.48	63.5 lb. rail.	
[illegible].11	85 "	5.72	60.5 "	
75.25	80 "	496.47	60 "	
[illegible],207.65	75 "	35.41	60 "	(resawed)
166.23	70 "	205.61	58 "	
210.49	68 "	258.11	56 "	and lighter.
18.87	65 "			

The above does not include:

SECOND TRACK.

Northward from Hamlet, N. C.:	
9.09 Miles	90 lb. rail
.52 "	75 "
At Birmingham, Ala.:	
1.43 Miles	75 "
1.62 "	60 "

LEASED LINES.

Silver Springs Branch:	
1.20 Miles	60 "
.70 "	56 "
Amelia Beach Branch:	
2.00 Miles	50 "

MAINTENANCE OF EQUIPMENT.

The equipment of the Railway was fully maintained during the year at a cost of $3,404,470.88.

Included in the cost of maintenance is $82,505.79, representing value of equipment destroyed or retired from service during the year, and credited to the Cost of Equipment.

The cost of maintenance per article owned was as follows:

Average cost per annum per Locomotive owned	$2,506.03
Average cost per annum per Passenger car owned	766.11
Average cost per annum per Freight car owned	60.91

*Due to a typographical error, it was stated in last year's annual report that 130.05 miles of the new rail which was laid in the main track for the fiscal year was 75-pound rail; it should have stated 85-pound rail.

GENERAL REMARKS.

Extensive additions and improvements have been made during the year to the Union Passenger Station at Cordele, Ga., together with revision of track layout to serve same.

A Union Passenger Station is now under construction at Hurtshoro, Ala.

Passenger stations have been built at Littleton, N. C., McBee, S. C., Lawrenceville, Ga., Palmetto, Fla., Bradentown, Fla., and extensive additions and improvements have been made to the Passenger station at Quincy, Fla., and are now being made to the passenger station at Rockingham, N. C.

At Tallahassee, Fla., an umbrella shed with granolithic walks has been provided in connection with the present passenger facilities, and a passenger shelter shed with granolithic walks is inow under construction at Portsmouth, Va.

Combination Passenger and Freight Stations have been constructed during the year at Lee, Fla., and Thalman, Ga.

A brick freight depot has been built at Greenwood, S. C., and the one at Charlotte, N. C., mentioned in last year's report, has been completed. Extensive additions and improvements have been made to the freight depot at Lawrenceville, Ga.

At Norfolk, Va., there has been built during the year a receiving and delivery freight warehouse.

A brick storage warehouse has been built during the year at Raleigh, N. C.

Extensions have been made during the year to the yards at Monroe, N. C., and Portsmouth, Va., and the yard extensions at Richmond, Va., Raleigh, N. C., Hamlet, N. C., and Hutchinson Island, Ga., mentioned in last year's report, have been completed and put in operation.

During the year, an important industrial track was built in the City of Columbia, S. C., to serve present and future development.

The change in the location of the compress belonging to the Atlantic Compress Company at Hutchinson Island, Savannah, Ga., which was mentioned in last year's report, has been completed, thus making available the 130,000 square feet of additional shed room therein mentioned. Additional tracks to serve the new location have also been completed.

The second track work and grade revision, beginning at Hamlet, N. C., and running 9.61 miles northward thereof, mentioned in last year's report, has been completed, giving a five-tenths per cent compensated grade line which will fit in with the plan for the ultimate development of the line between Norlina and Hamlet, N. C.

A large amount of dredging has been done at Tampa, Fla., and Savannah, Ga., during the year to maintain proper depth of water.

The water station and pumping facilities including reservoir at Apex, N. C., mentioned in last year's report, have been completed and put in operation.

Adequate water supply and pumping facilities were provided for Denmark, S. C., water station during the year.

The mechanical coal elevator at Richland, Ga., mentioned in last year's report, has been completed. There is now nearing completion a reinforced concrete coal elevator at Savannah, Ga.

The fifteen thousand ton capacity coal storage plant at Savannah, Ga., and the extension of the Jacksonville storage plant to give a capacity of fifteen thousand tons, both mentioned in last year's report, have been completed and put into operation.

At Seddon Island, Tampa, Fla., the steel phosphate elevator, with two conveyors, together with necessary tracks, wharves and dredging, mentioned in last year's report, has been completed and put in operation.

The eighty-five foot turntable at Hamlet, N. C., mentioned in last year's report, has been completed.

Additional fire protection facilities have been provided at Seddon Island, Tampa, Fla., and there is now being constructed at Hutchinson's Island, Savannah, Ga., a one-hundred thousand gallon capacity steel tank with pipe lines for auxiliary fire protection.

A modern interlocking plant is now in course of installation at Pembroke, N. C.

5 sets of track scales were rebuilt with concrete foundations and steel I beams, replacing wood.

243 industrial sidings and extensions to industrial sidings already existing have been constructed or are in process of construction.

89 depots and freight stations have been constructed or substantially added to during the year.

47 passing tracks have been constructed or extended, or are in process of construction.

8 old water tanks have been replaced with modern 50,000 gallon tanks during the year and suitable pumping facilities provided.

The use of creosoted piling has been continued in maintenance work on docks, wharves and trestles.

During the year there have been constructed and placed in operation additional telephone dispatching circuits between Monroe, N. C., and Atlanta, Ga., 272 miles, and between Bartow and Pembroke, Fla., 9.00 miles This aggregates 1655 miles in operation on June 30, 1914.

In order to insure a proper valuation of the Company's property, under Section 19-A of the Federal Act to Regulate Commerce, it became necessary to organize a special force to do this work. A Valuation Committee was created and they have made much progress in the preparation of maps, research work and the assembling of cost data, etc. The cost during the year, amounting to $14,983.29, has been charged to Operating Expenses.

The Directors acknowledge with appreciation the faithful and efficient services of the officers and employees of your company during the year.

By order of the Board:

W. J. Harahan,
President.

TABLE No. 9.

EXPENDITURES FOR IMPROVEMENTS, BETTERMENTS AND EXTENSIONS CHARGED TO CAPITAL ACCOUNT.

Year Ended June 30, 1914.

SUMMARY OF EXPENDITURES:

Additions and Betterments on Existing Mileage	$1,767,009.85
Equipment Acquired	2,488,165.15
Expenditures for Extensions	86,928.51
Total as Above	$4,342,103.51
