"Unfortunately, railway employees, while willing to avail themselves of the privileges that they are rightfully entitled to as semi-public servants, have seemed to forget at times the obligations which they owe to the same public, because when strikes have been threatened or actually brought about the public is always the chief sufferer. In the past the public generally, not recognizing the relationship which must exist between railroad rates and railroad expenditures, has to a large extent occupied the position of an indifferent observer when wage controversies between railroads and their employees were going on.

"Now that it is more clearly recognized that in the end the public, by means of freight charges and passenger rates, must pay all the costs of railroad operation, including wages, it is to be hoped that the same public will take a keener and more intelligent interest in this matter, because in the end such questions under the existing order of things will usually be settled by arbitration, and arbitration generally reflects to a very large extent the existing public opinion. I repeat, this question of the demands of organized labor is the thing that gives ground for most apprehension as to the future."

CO-OPERATION WITH THE TRAFFIC DEPARTMENT

J. W. Roberts, recently superintendent of car service of the Vandalia, but now general superintendent of passenger transportation of the Pennsylvania Lines West of Pittsburgh, has for some time been practicing a plan for securing the full co-operation of employees in his department with the traffic department of the road. First he called a meeting of the employees of his department for the purpose of discussing the subject, "How can the Individual Employees of This Office Assist the Soliciting Forces of the Freight and Passenger Traffic Department in Increasing Freight and Passenger Revenues of the Vandalia Railroad?" at which he urged the importance of the cultivation by individual employees of the faculty of being constantly on the alert for information which may be utilized profitably for the company, the cultivation of loyalty or a desire on the part of employees to offer a word of recommendation in favor of the railroad when conditions seem to justify that act, and cultivation of interest on the part of members of the families, other relatives and friends of the employees and the employer.

Following the meeting a circular letter was addressed to the heads of sub-departments calling attention to the fact that through association with relatives, friends and acquaintances who are not connected with the railroad company, employees of the department frequently receive information relative to prospective vacation and business trips to points on or reached by the Vandalia Railroad and the Pennsylvania lines, and with reference to prospective shipments of freight inbound or outbound.

Each man addressed was urged to discuss this matter with the men in his respective sub-department, and to urge them to communicate any information of this character to the proper representative of the department directly concerned. In another circular letter Mr. Roberts said that the results of the activity of employees along the line of the suggestions made had been made apparent from time to time, indicating a gratifying interest in the welfare of the company, and while thanking the men for their efforts he urged them to continue to look out for any opportunities for co-operation with the traffic department. "Thirty employees," he said, "with an average family of three persons, and a relationship or close friendship extending to eight to ten additional persons, constitutes quite an important adjunct to a traffic soliciting organization. I am sure that all will join heartily in contributing in the manner outlined their effort toward increasing both passenger and freight revenues."

General News Department

E. B. Roberts, smoke inspector of the city of Cleveland, has submitted a report showing that the density of locomotive smoke during the second half of 1914 decreased 79 per cent, as compared with the second half of 1912.

The railroads entering the Union station at Cincinnati were forced to abandon the station and seek temporary locations on higher ground on Saturday, February 6, because of high water in the Ohio river which flooded the tracks in the station. The flood reached the stage of 55.4 ft. on that day.

The eleventh annual convention of the American Concrete Institute was held at the Auditorium hotel, Chicago, this week, beginning on Tuesday, in connection with the eighth annual Chicago Cement Show, held at the Coliseum, beginning on Wednesday, which will continue until Wednesday of next week.

The Chicago & Alton has reached an agreement with a committee representing its trainmen, providing for increases in pay for flagmen and train baggagemen, and a number of changes in working conditions, including payment for terminal overtime, and extra payments for incidental work outside of the regular routine.

The Southern Railway has sent a statement of its receipts and expenses for the last half year not only to the railroad and financial papers, but also to daily papers throughout the southern states, and expresses the intention of sending such statements to the press generally hereafter. As railway earnings are a good barometer of business conditions, it is believed that the figures will be of interest to the people generally.

The lower house of the New Mexico legislature on February 4 passed, by a vote of 37 to 8, a bill limiting passenger fares throughout the state to three cents a mile. The leader of the Republican side of the house declared that the bill had been rushed through without a hearing and without investigation, and in the face of the fact that a day had been set, in the near future, for the discussion of another bill on the same subject. The present rate is four cents a mile generally throughout the state.

In the federal court at Pittsburgh, Pa., fines for violation of the hours-of-service law aggregating $9,300 have been imposed by Judge Charles P. Orr on the Pennsylvania Railroad and the Pennsylvania Lines West of Pittsburgh. Three employees of the Pennsylvania Railroad, at Oil City, were fined $200 each on charges of having falsified the record of the time certain trainmen had worked. The excuse offered in certain cases by the railroad companies for slow time, that the engines did not make steam, was controverted by the statement that the engines had been in poor condition for some time previous to the violation.

Mr. Foley, superintendent of telegraph of the Delaware, Lackawanna & Western, reports that his wireless telephone apparatus, which has been in experimental use on an express train of that road for several months past, has been so far perfected that conversation was carried on, this week, between a man on the moving train and the operator at a station, 26 miles distant. The sending of dots and dashes by the wireless apparatus is now carried on between this train and four stations; namely, Hoboken, Scranton, Binghamton and Buffalo.

A press despatch from San Francisco, February 10, reports that a wireless telephone invented by H. P. Dwyer, has carried the human voice a distance of 721 miles; it was from the United States government radio station at Mare Island, Cal., to the government radio station at Tatoosh, Cape Flattery, on the coast of Washington. The voice was also heard at Bremerton, a distance of 560 miles, at Point Arguello, at Burcka, and by the government radio operator at San Diego, Cal.

Mass-meetings of the employees of the St. Louis & San Francisco were held on Saturday and Sunday, February 6 and 7, at Springfield, Mo., attended by more than 3,000 employees living at Springfield, and between 5,000 and 6,000 employees from other points on the line in Missouri, for the purpose of enlisting the efforts of the employees in a campaign to impress upon the legislature of Missouri the need of a three-cent passenger fare and higher freight rates in the state which will represent in part a restoration of rates which were reduced by the action of the state legislature a few years ago. It is proposed that all employees interview business men and manufacturers in their territory and urge them to get up petitions or write letters to the members of the legislature, asking them to approve a measure which will allow the railroads to charge a three-cent passenger fare and higher freight rates.

Owen Callan, known to the railroads as a clever "personal injury" faker, has been sentenced to six months in jail in Chemung county, New York, after pleading guilty to charges based on evidence given by the Lehigh Valley and the Pennsylvania. Since the date of his arrest, December 24, the railroads have had a chance to compare notes, and it has been found that no less than fifteen roads have been victimized by claims for alleged injuries sustained by Callan under various aliases. On some railroads he has repeated two or three times, collecting from $125 to $1,000 per "injury." But his last escapade, in tripping over a carpet in a Lehigh Valley coach, while in the station at Ithaca, from which he developed a hemorrhage, a broken arm and several other injuries, proved to be his Waterloo. It was while filing this claim that he was recognized and apprehended on a warrant sworn out by the Pennsylvania Railroad.

The Illinois State Civil Service Commission has announced that examinations will be held at an early date for the following positions to be filled in the accounting and engineering departments of the Illinois Public Utilities Commission: Accounting service—Transportation rate expert, rank 3, $300 to $375 a month; transportation rate expert, rank 2, $135 to $250; accountant, rank 2, $200 to $250; utilities statistician, rank 2, $175 to $250; tariff clerk (examination March 6), $100 to $125; accountant, rank 1, $125 to $175; utilities rate expert, $125 to $175; utilities statistician, rank 1, $100 to $150.

Engineering service:—Assistant chief utilities engineer, $300 to $375 a month; gas engineer, $250 to $333; railroad engineer, $250 to $333; electrical engineer, $200 to $300; telephone engineer, $200 to $300; mechanical engineer, $160 to $250; service engineer, $200 to $300; assistant railroad engineer, $150 to $200; case man, $125 to $150; assistant utilities engineer, $90 to $125; service inspector, $90 to $125; utilities investigator, $100 to $150; draftsman (examination March 6), $75 to $100.

Railroad Men Needed by the State

W. W. Atterbury, vice-president of the Pennsylvania Railroad, in an address delivered this week before the Philadelphia Chamber of Commerce exhorted railroad officers to co-operate in making governmental regulation a continued benefit to the railroads and to the community. He said, in part:

"Regulation has largely confined itself to correcting abuses. The evils were obvious, but we have allowed ourselves to think of them so much that we have forgotten about the transcendent merits of the regulation as a whole. We have been devoting so much attention to killing the weeds in our transportation garden that we have neglected the very important duty of cultivating and strengthening the growth of the healthy and useful plants. The great transportation machine of this country was and is sound. It needs continued regulation, but the regulation must be competent and sympathetic. . . . . My suggestion is that a minority of the railroad commissioners of the states and nation should consist of men trained in the practical conduct of railroad affairs. All appointments should be for life or during good behavior; the salaries should be such as to attract the ablest brains in the country; and these positions should be surrounded with such prestige and honor that any citizen would feel that he could serve his country and his fellow man in no more exalted capacity than in representing the people in pro-

moting, encouraging and regulating the development of its transportation agencies. The country and its commerce cannot progress while the railroads are weak."

Summary of Revenues and Expenses of Large Steam Roads

The following figures were compiled by the Interstate Commerce Commission from monthly reports of operating revenues and expenses of large steam roads for the month of November, 1914. No reports are included for roads whose operating revenues for the year ended June 30, 1914, did not reach $1,000,000. The figures are compiled as rendered and should not be considered final, inasmuch as scrutiny of the reports may lead to their modification before acceptance.

For the Month of November

Dynamometer Car for the Japanese Railways

The Imperial Government Railways of Japan have recently put in service a dynamometer car, which was built in this country to the designs of Edward C. Schmidt, professor of railway engineering, University of Illinois. Its general dimensions and specifications were determined by S. Matsuno, chief of the motive power section of the Japanese railways, but the designer was allowed to use his own judgment in the choice of the car design, the type of equipment and the details. The car was designed to measure and to record data needed in making tests to determine train resistance and locomotive performance on steam roads. It is equipped to record drawbar pull, drawbar work, time, distance traveled, position of mile-posts and stations, the direction and velocity of the wind with respect to the car, the vacuum in the brake cylinders and, if desired, the position of the reverse lever, throttle, etc.

The car is 47 ft. 10 in. long over the buffers, 8 ft. 6 in. wide over-all and 12 ft. high. It has a steel underframe, a wood body, and the interior finish is of quartered oak. It is equipped for 3 ft. 6 in. gage and has the buffers, vacuum brake, and hook and link couplers common in Japanese railway practice. A space of 13 ft. at the rear of the car is occupied by a berth section, lockers and lavatories, leaving a workroom 7 ft. 9 in. wide by 27 ft. long, which contains the recording apparatus, work bench, desk

and other equipment. An axle generator and storage battery equipment furnishes current for the lights and the motor and magnets of the recording apparatus.

Motion for all apparatus within the car is obtained by means of gearing from the axle of an auxiliary truck located behind the forward car truck. This truck carries a pair of small wheels on a single axle whose relation to the car axis remains fixed. The dynamometer for measuring the drawbar pull is an oil-filled cylinder mounted on the center sills toward the front end of the car.

Another indication of Japan's progressiveness along this line is shown by the thoroughly equipped laboratory for testing locomotives which the Japanese Government Railways have recently established in Tokio. With this plant and the dynamometer car, the Japanese railways have facilities for experimental study of the problems of locomotive and train operation equaled on only one American railway.

Proposed Railway Legislation

The senate committee on common carriers of the Texas legislature has voted to report unfavorably the full crew bill.

A bill before the New Hampshire legislature, which already has been passed by the lower House, gives the Public Service Commission authority to allow an increase in the price of mileage tickets.

A bill has been introduced in the Iowa legislature providing for semi-monthly payments of wages by railroads.

An extra crew bill has been introduced in the Iowa legislature which would prohibit the flagman from helping the baggageman at stations and forbid duties being imposed upon him which would interfere with his duty to protect trains while they are at stations.

Representatives of the conductors', trainmen's, enginemen's and firemen's unions, in Ohio, have announced that they will concentrate their efforts before the legislature this year on the effort to secure the passage of the train limit bill and to oppose the repeal of the extra crew law, but will urge no other anti-railroad legislation.

A bill has been introduced in the lower house of the New York legislature, by Mr. Mead, of Erie, making it illegal to run trains, the length of which is more than half a mile.

A bill introduced in the New York legislature by Senator Whitney, of Saratoga, would allow employees of railroads doing an interstate business, if not enjoying the benefit of the federal compensation law to secure indemnity for injuries under the New York State Workmen's Compensation Law. The bill makes it compulsory for employers in this class to provide such compensation under the terms of the New York law.

A bill has been introduced in the Missouri legislature to require interstate railroads to establish stations not more than five miles from the state line, to put an agent in charge and to stop trains long enough to enable passengers to buy new tickets and have their baggage rechecked, in order to take advantage of the lower intrastate passenger fares.

The Commercial Club of Webb City, Mo., has adopted resolutions opposing anti-railroad legislation and urging the representative of the district in which the city is located to use his efforts toward improving the condition of the railways.

The lower house of the Utah legislature has defeated a bill making it unlawful to trespass on the right of way or property of a railroad company. At a hearing before the public utilities committee of the house officers for the railroads estimated that the seven bills now before the house, introduced at the behest of railway employees, would impose a burden of nearly $3,000,000 a year on the six largest railroads of the state, if they should be enacted. These include an extra crew bill, a train limit bill and a headlight bill.

A resolution has been introduced in the Minnesota legislature calling for a detailed investigation by the Minnesota Railroad & Warehouse Commisison of recent increases in railroad rates in Western Classification Territory.

A bill has been introduced in the Minnesota legislature providing for an allowance of $2 a car to grain shippers for cooperage of cars used for loading grain shipments. Attorneys for the principal railroads of the state appeared before the senate transportation committee on January 28, to protest against the bill. They told the committee that such a law would cost the Great Northern approximately $1,000,000 annually, the Chicago, St. Paul, Minneapolis & Omaha approximately $200,000, the Northern Pacific approximately $600,000, and the Chicago, Milwaukee & St. Paul about $300,000 a year, and would make it possible many times for shippers to collect the $2 charge whether the cars did or did not need coopering.

Bills have been introduced in the legislature of Pennsylvania to require all locomotives to have headlights of a specified candle power; to require all locomotives to be equipped with bell ringers; to make real estate of railroad companies, street railway companies, etc., subject to taxation by counties, cities and towns; to provide for the incorporation of omnibus lines and define their motive power; to provide for compensation by employers for accidental injuries to employees, etc., and to establish an industrial accident board; and to impose numerous requirements on street railways, including air brakes and automatic air pipe couplers on all street passenger cars running on the public streets.

A bill has been introduced in the legislature of Maine providing that nine hours in 24 shall constitute a day's work for all employees in and about freight and passenger stations and roundhouses. These employees are more specifically designated as baggage men, cleaners, engine house employees, freight checkers, freight handlers, janitors and persons performing the work of janitors, platform men and train callers, receiving and delivery clerks, watchmen, flagmen and crossing tenders. Each day's work of nine hours must be so arranged that it will provide a lay off of at least 14 hours in 24 unless an employee shall voluntarily request otherwise in writing. Maximum penalty for violation, $100. There is a law now in force, in Massachusetts, something like this.

A bill has been introduced in the Nebraska legislature said to be aimed at the claim made by the Union Pacific for a 400 ft. right of way through certain counties of the state. The bill provides that the right of way of railroads through the state outside of cities or villages shall be of a uniform width in each county, except where additional property is required for yards, stations, freight houses or roundhouses. The bill also forbids railroad companies to acquire or hold any real estate outside of this uniform width. As a penalty for failure to comply with the act it is provided that a railroad company shall lose its right to proceed by condemnation for acquiring any other real estate in the county. The theory is that the railroads will either be required to give up a part of their present right of way or buy more land to make the entire right of way wider.

The railroad committees of the house and senate of the Kansas legislature held a hearing on February 1, on the extra crew, the train limit and other bills affecting railroads and their employees. Officers of the railroads and representatives of the employees appeared and presented arguments. All of the employees' representatives favored the bills, except a negro porter, representing the porters, who opposed the extra crew bill, on the ground if an extra brakeman or flagman were required on passenger trains the elimination of the train porters would follow. A. De Bernardi, general superintendent of the Missouri Pacific, said that if the bill were passed, for every extra brakeman added it would be necessary for many roads to lay off two trackmen as a measure of economy, and that the trackmen were more essential to safety than the extra brakeman. Representatives of the roads also brought out the fact that the trainmen had never attempted to negotiate with the officers of the road for extra brakemen.

Canadian Railway Development

Sir William Mackenzie, president of the Canadian Northern, reported in a press despatch of February 8, charges Sir Thomas G. Shaughnessy, president of the Canadian Pacific, with making remarks tending to impair the credit of Canada. Sir Thomas was quoted as saying that the only threatening feature in Canada was the situation resulting from the wild and stupid railway policy which has been pursued there, exemplified by the construction of two additional transcontinental lines, almost en-

tirely under the auspices of the government, many years in advance of their time.

Sir William said: "When the Canadian Northern began building in 1896, there was 16,270 miles of road in Canada; and in 1913 there was 29,304 miles. During the eighteen years in which the mileage had not quite doubled, the foreign trade of Canada more than quadrupled, and although full statistics of the domestic trade are not available, there is no doubt that that expanded in proportion. At any rate, the aggregate earnings of the Canadian railways increased by five times.

"If there was not a need for more railways, what justification was there for Sir Thomas to spend millions of dollars annually for several years in double-tracking the company's main line? Why did the company recently spend millions on a new line between Toronto and Ottawa, when it already possessed one between these points?

"Sir Thomas criticises the assistance which the Canadian government has given to development of the sources of the country through new railways, forgetful that his own company has received from the Dominion government more than all the other railways put together.

"What, then, are the 'threatening features' in the Canadian railway situation? Two additional transcontinental lines will soon be under operation, both with better grades, and better prepared to perform their functions than the transcontinental line of the Canadian Pacific. The maximum grade of the Canadian Northern through the Rocky mountains is 0.4 per cent, with the exception of 60 miles in the Albreda Pass, where the maximum rises to 0.7 per cent. The maximum grade of the Canadian Pacific through the Rocky mountains is more than 2 per cent. The Canadian Northern last year carried one-third of the grain moved to the head of the Great Lakes. During the period in which the railway mileage of Canada has not been doubled the grain annually produced on the prairies increased from thirty million to more than five hundred million bushes yearly."

New York Merchants for Sane Regulation.

The Chamber of Commerce of the state of New York, at a meeting in New York City, February 4, adopted a resolution endorsing the views presented by Samuel Rea, president of the Pennsylvania Railroad in his address which was given before the Chamber in December, and which was printed in the *Railway Age Gazette* of December 11, page 1089.

Mr. Rea, it will be recalled, suggested the improvement of the personnel of the Interstate Commerce Commission, the extension of the authority of the commission over mail transportation and other things, and that Congress should refer to the commission all proposed legislation affecting wages, taxes, safety appliances, etc.; that valuation of railroad property should be first undertaken in a limited territory, and that proposed increases in freight rates should not be suspended without a hearing for more than sixty days.

The chairman of the Chamber of Commerce Committee, in presenting the resolution said:

"Mr. Rea's recommendations, coming as they do from one who has had the broadest experience in dealing with the problems of railroad policy, should receive the approval of all business men. The recommendations are in the interest not merely of the railroads, but of the stability and prosperity of the nation. They represent business statesmanship of the highest order. The wisdom of the recommendations is so self-evident that your committee does not believe that it is necessary to enter into an elaborate explanation or advocacy of them. We believe that the stamp of the Chamber's approval upon Mr. Rea's suggestions will serve to promote a public opinion that eventually will force their enactment into legislation."

The Chamber instructed the committee to make further study of the problem with the view of specific recommendations to Congress for a more enlightened policy of public regulation of railroads.

New York Railroad Club

At the regular monthly meeting of the New York Railroad Club, to be held in the Engineering Societies building, on Friday, February 19, a paper will be presented by L. J. Foley, superintendent of telegraph of the Delaware, Lackawanna & Western, entitled "Train Despatching by Wireless."

Western Railway Club

At the regular monthly meeting of the Western Railway Club, to be held in Chicago, at 2 o'clock in the afternoon of February 16, a paper will be presented by George S. Goodwin, mechanical engineer of the Chicago, Rock Island & Pacific, entitled "The Value of the Locomotive."

MEETINGS AND CONVENTIONS

The following list gives the names of secretaries, dates of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

American Association of Demurrage Officers.—A. G. Thomason, Demurrage Commissioner, 845 Old South Bldg., Boston, Mass. Annual convention, April, 1915, Richmond, Va.

American Association of Passenger Traffic Officers.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, April 15-16, San Francisco, Cal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Piedmont Hotel, Atlanta, Ga.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

National Railway Appliances Association.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Railway Signal Association.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa. Next meeting, March 15, 1915, Chicago. Annual meeting, September 21-24, 1915, Salt Lake City, Utah.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Signal Appliance Association.—F. W. Edmonds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of Newark.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, Newark.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Transportation Club of Detroit.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Western Canada Railway Club.—W. H. Rosevear, P. O. Box 1707, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF DECEMBER, 1914

Name of road.	Average mileage operated during period.	Operating revenues			Operating expenses							Net operating revenue (or deficit).	Railway tax accruals.	Operating income (or loss).	Increase (or decr.) comp. with last year.

Traffic News

The Traffic Club of Chicago has announced that its annual banquet will be held on the evening of February 25, at the Hotel LaSalle, Chicago.

There was a decrease of 449,315 tons in the shipments of anthracite in January as compared with January, 1914. Total shipments were 4,831,329 tons as compared with 5,280,644 tons. The amount of coal on hand at tidewater shipping ports increased from 669,833 tons on December 31, to 798,125 tons on January 31.

The National Automobile Chamber of Commerce has issued a statement to the effect that shipment of automobiles from factories of this country in the year 1914 amounted to 138,250 carloads, each car usually containing from two to six complete automobiles. It is estimated that the freight bills on these shipments amounted to $15,000,000.

The Department of Agriculture reports the conviction of two men, with heavy fines, for conspiracy to violate the Food and Drugs Act and other federal statutes. These were a prominent coffee merchant and a shipping agent who conspired to violate the Food and Drugs Act in the shipment of coffee in interstate commerce from New York to the west. The two defendants were each fined $3,000, and by reason of their conviction of a felony lost their citizenship, under the provisions of a New York statute. In New Jersey several indictments for conspiracy to violate the Food and Drugs Act have been found against a number of egg handlers who have been illegally shipping spoiled eggs in interstate commerce for food purposes.

Quarantines

A quarantine was placed at the stock yards in Jersey City, N. J., August 5, because of the discovery of 13 cases of foot-and-mouth disease. The union stock yards at Richmond, Va., were quarantined on Monday of this week by the governor of the state, because of the discovery of infected animals in a pen adjacent to the stock yard. The quarantine at Chicago was discontinued February 8. The government has issued orders that no cattle may be held for more than 48 hours.

The Department of Agriculture reports that foot-and-mouth infection has again been discovered in the stock yards of nine cities—Chicago, Pittsburgh, Indianapolis, Louisville, Buffalo, Cincinnati, Columbus, Jersey City and Baltimore; and these stock yards were ordered closed until thoroughly disinfected. This is a setback in the campaign to eradicate the plague, but it is considered to be by no means as serious a matter as if the disease had broken out in stock held on the farms. All the cattle affected were destined for immediate slaughter. No stockers or feeders were included among them. But it will be necessary to disinfect all cars used in these shipments and all yards through which they have passed. The new outbreak, however, in the opinion of the federal authorities emphasizes the necessity of adhering for some time longer to the quarantine regulations that prohibit the shipment of any stock from the quarantined area for any purpose except immediate slaughter. The government also holds that cattle bought for slaughter and found to be affected with foot-and-mouth disease shall not be paid for, but may be condemned under the federal meat-inspection law like any other diseased stock. Purchasers of cattle for slaughter in territory where there is reason to suspect the existence of the disease purchase at their own risk.

Good Farming Promoted Without a Special Train

The Sunset-Central Lines with a view of stimulating interest in diversified farming, along the lines in Texas and Louisiana, have offered the following cattle prizes for 1915:

For the best general field of corn not less than 10 acres, one thoroughbred Shorthorn sire.

For the second best field, one thoroughbred Duroc-Jersey boar.

For the best 10 acres or more of diversified crops, showing the greatest cash profits and largest production per acre of not less than four crops or as many more as may be profitably employed, one thoroughbred Jersey, Guernsey or Holstein sire.

For the second best, under the same conditions, one thoroughbred mature Berkshire boar.

For the boy or girl making the best corn production, under the boys' and girls' corn club rules, one thoroughbred Jersey heifer, two years old.

For the boy or girl making the best production of diversified crops on two acres or more, under the same rules, one thoroughbred Jersey heifer, two years old.

Effects of the Two-Cent Fare on Michigan Roads

In connection with the campaign of the Michigan railroads for a repeal of the two-cent fare law, A. W. Towsley, vice-president and general manager of the Ann Arbor, has compiled and circulated "An appeal to the people of Michigan for justice for the railroads of Michigan," giving statistics and arguments to show that the two-cent law is unreasonable. He shows that the Michigan railroads employ approximately 50,000 men, who earn about $35,000,000 a year in the state, and that there are about 250,000 people in the state, or one person in each 11, directly dependent on the railroads for their livelihood. He then quotes from the decision of the Interstate Commerce Commission in the five per cent rate case in which the commission recommended an effort to advance state passenger fares, and gives a number of figures showing how railroad expenses have been increased by increases in wages to employees and by state and federal legislation.

"No absolutely correct method," he says, "has yet been devised of dividing the expense of operating freight and passenger trains, but a generally accepted method has been in use on a large number of railroads for a great many years. Using this method of computation and basing it on figures taken from the annual reports of the Michigan Railroad Commission, and allowing 6 per cent interest on tax assessment value of facilities used in passenger service, we find that there has been an annual loss to the Michigan roads in every year from 1908 to 1912, inclusive (the 1912 figures being the last immediately available) as follows:

Year	Income for each passenger carried, all passenger train earnings	Expense of operation, taxes and interest on tax assessment valuation per passenger carried	Deficit per passenger carried
1908.....	$0.9072	$1.1479	$0.2407
1909.....	0.6699	1.0594	0.3894
1910.....	0.6963	1.0917	0.3954
1911.....	0.7112	1.1672	0.4559
1912.....	0.7036	1.0981	0.3945

The average freight rate per ton per mile for the Ann Arbor has decreased from 6.9 mills in 1903 to 5.1 mills in 1914, he says, and if the company had received the same rate during the year 1914 as it received during 1903, it would have earned $510,484.47 more revenue for the handling of freight than it did. He also gives the average passenger rate for the years 1900 to 1914, showing a decrease from 2.41 cents per mile in 1903 to 1.81 cents in 1914, to show that had the company received the same rate from September 28, 1907, the date the new law was passed, to June 30, 1914, as was received prior thereto, it would have earned $813,765 more revenue from passenger service than it did.

The circular also gives figures based on a division of total operating expenses between freight and passenger service, showing a loss from all passenger train service of 39.98 cents per train mile, 29.69 cents per passenger carried, and 1.31 cents per passenger mile on the Ann Arbor Railroad for the last fiscal year. These figures show a loss of 8.19 cents per train mile from operation alone, without counting return on the value of the property used or the proper proportion of taxes. Other figures are given to show that the reduction of the passenger fare to two cents in Michigan in 1907 did not result in any material increase in the number of passengers carried.

Knitting Cars for Russian Ladies.—The Russian Ministry of Communications has arranged for cars to be coupled to all long-distance trains, with material for making jerseys, waistcoats, stockings, and other warm garments for the troops so that this can be supplied to lady passengers who desire to work during their journeys.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission has announced new dates for the hearings in Chicago on the freight-rate increases proposed by the western railroads. The hearings will be held before Commissioner Daniels, beginning March 4, and lasting until early in April, but if sufficient opportunity is not afforded for consideration of evidence within the dates set, additional dates may be arranged after April 2. The new schedule of hearings follows: March 4-8, railroad evidence supporting claim that increases are reasonable; March 9-12, grain and grain products; March 13-16, livestock, fresh meat, packing house products, and fertilizer materials; March 17-18, hay, straw, and broom corn; March 19-20, cotton piece goods; March 22-25, coal and coke; March 26-27, fruit and vegetables; March 29, rice and rice products; March 30-April 2, evidence of protestants and interveners in rebuttal of evidence of carriers.

Northbound Rates on Hardwood From the Southwest

Opinion by the commission:

The carriers have proposed to increase the northbound rates on hardwood from the lumber producing region of the southwest, extending from the lower Mississippi river to eastern Texas and Oklahoma, about 2 cents per 100 lb. over existing group rates. The commission finds that the proposed rates will be just and reasonable except in so far as certain of them exceed the present rates on yellow pine lumber for the same hauls, and with the exception of rates from group A, which includes Cairo, Ill., and points from which the same rates apply to Missouri river points, and points taking the same rates or rates basing thereon, in so far as they exceed the present rates by more than 2 cents, and with the exception also of rates from certain points in southeastern Arkansas, which would be affected by a proposed change in the present groups of origin to St. Louis, East St. Louis, Cairo, Thebes and Memphis and points taking the same rates or basing thereon, in so far as they exceed the present rates by more than 2 cents. Similar proposed increased rates on yellow pine and cypress lumber, however, are not found justified. (32 I. C. C., 521.)

The Illinois Coal Cases—Increased Rates Justified

Opinion by Commissioner Harlan:

This group of cases results from a concerted effort on the part of coal operators in Illinois to bring about a regrouping of the coal mines in that state for rate making purposes, the particular destinations involved in the first complaint being points in Iowa, Minnesota and western Wisconsin. The other cases involve the reasonableness of the present and of proposed increased rates from coal mines in Illinois to St. Louis.

The Auburn & Alton Case. The coal producing area of Illinois covers nearly three-fourths of the entire state. The mines are divided into a number of rate groups. On coal destined to points in the northwest, the northern Illinois mines, comprising the Third Vein, Wilmington, Fulton and Peoria fields, with certain exceptions, all take the northern Illinois or Chicago group rate. This is the controlling rate to northwestern destinations, and the other groups take differentials over it as follows: Springfield, 40 cents; Danville, 57 cents; Belleville and Centralia 60 cents and southern Illinois 70 cents. It is alleged that the Springfield group is unduly large, that the differential of 70 cents on coal from the southern mines is not sufficient and that the northern mines are deprived the natural advantages of location. The complainants propose that the Springfield group be divided so that on northbound traffic the mines north of the Christian-Montgomery county line extended shall have a differential of 15 cents a ton under the rates from the mines south of the line, and that the differential of 70 cents in the rates from southern Illinois be increased to $1.

The commission finds, however, that the present rates are equitable. It is its opinion that the present adverse conditions are due chiefly to an overdevelopment and overproduction of coal in Illinois and to the superior quality of the southern Illinois coal rather than to any maladjustment of the Illinois coal groups or to any maladjustment of their rates and rate differentials.

The St. Louis Cases. These cases involve an attempt by the carriers to increase by 5½ cents a ton the rates on coal to St. Louis from the mines in Illinois, similar increases to East St. Louis also having been filed but not yet put in effect. In the same group of cases discrimination against St. Louis is alleged in that to St. Louis the rate from the so-called inner and outer groups of mines is 20 cents higher than to East St. Louis, this being the amount of the charge of the Terminal Railroad Association for accepting the coal in East St. Louis and delivering it within the switching district of St. Louis at designated points on its own rails or to connecting carriers, and in that the carriers on shipments of coal moving from points within the so-called 100-mile zone do not absorb this charge of 20 cents, whereas they do absorb it on shipments from points beyond the 100-mile zone.

The commission holds that the carriers have justified the proposed increase of 5½ cents a ton. It finds no sufficient basis for holding that the differential against St. Louis of 20 cents a ton, either in the present or the proposed rates on coal from the Illinois mines, offends any provision of the act to regulate commerce. The delivery of coal after it has reached East St. Louis can be effected only by the performance of an additional transportation service over bridges or by car ferries that involve not only additional expense to operate, but a very substantial additional outlay of capital. The distance the coal is carried is also greater, and while the two communities may be one from a commercial point of view, it cannot be held that they also form one community for rate making purposes. In addition, it is also held that there is no just basis for requiring the line carriers to absorb the charges of the Terminal Association on their short haul traffic from the mines within the 100-mile zone. On long-haul traffic from points outside the zone the revenue is sufficient to permit of such absorption, but from points within it is not. (32 I. C. C., 659.)

Hearing on Lighterage and Tunnel Absorptions at Chicago

Examiner Brown of the Interstate Commerce Commission began a hearing at Chicago on February 3, in an investigation of the cancellation by Chicago railroads of the absorption of the charges of the tunnel and lighterage companies in the Chicago district. H. C. Barlow, traffic director of the Chicago Association of Commerce, urged the necessity of absorbing such charges in order to treat the entire Chicago district as one rate area. He said that if shippers situated in one part of Chicago were obliged to pay a higher rate than those in other parts of the city they would be at a disadvantage as compared with shippers in other cities whose rates are on a parity with those of Chicago, as in the case of Milwaukee. He said that if the shippers are compelled to pay a charge in addition to the through freight rate for the service of the tunnel or the lighterage companies in getting freight to the railroads, a very large part of the freight that is now transported by the lighters and the tunnel will be teamed to the nearest railroad freight station, which will mean a big increase in the traffic of the Chicago & North Western and Chicago, Milwaukee & St. Paul on the north side of the city, the Chicago, Burlington & Quincy and the Chicago, Rock Island & Pacific on the west side, and the New York Central and Pennsylvania Lines on the south side, to the disadvantage of the weaker lines.

J. J. Wait, president of the Merchants' Lighterage Company, described in detail the organization and history of that company, which was organized in 1903, to connect shippers on the north side and along the river with the terminals of railroads which do not have access to that section of the city. He said that the question had been discussed with members of the Interstate Commerce Commission, who had given the opinion that it was not unlawfully discriminatory for the railroads to pay his company five cents per hundred pounds for its service. Other witnesses who testified were Robert T. Benedict, western manager of the Pennsylvania Salt Manufacturing Company, who asserted that the business of his company would be made unprofitable if it were obliged to pay drayage charges or a charge to the tunnel and lighterage companies, and S. W. Tracy, vice-president of

the Illinois Tunnel Company, who said he did not see how his company could continue in business if the railroads refused to absorb its charge, because so many shippers would team their freight. Martin Van Persyn, manager of the transportation department of Sprague, Warner & Co., also opposed the cancellation of the absorption. Other testimony was given regarding the cost of teaming. The railroads were represented by W. D. McHugh of Omaha.

STATE COMMISSIONS

The Kentucky Railroad Commission has relieved the Louisville & Nashville from the operation of the long and short haul clause of the state law, in relation to rates on certain commodities from Covington to Central City and from Louisville to Glenns Creek and other points. In the first named case the Louisville & Nashville has to meet the competition of a line running through Ohio and Indiana.

The Michigan railroads have filed a petition with the Michigan Railroad Commission asking authority to make a 5 per cent increase in the rates on coal, coke, iron ore, plaster, starch, sugar beets, bricks, tile, cement and clay. The commission has announced that a hearing will be held this week. Last year the Michigan commission allowed a 5 per cent increase in class rates in the state, but excepted the commodities mentioned, many of which are also excepted in the original decision of the Interstate Commerce Commission in the eastern 5 per cent rate case.

PERSONNEL OF COMMISSIONS

Howard C. Hopson, chief of the division of capitalization of the New York State Public Service Commisison, Second district, has resigned, the resignation to take effect March 1.

Walter Alexander, who has just been appointed a member of the Railroad Commission of Wisconsin, has for the past 13 years held positions as assistant district master mechanic and district master mechanic at Minneapolis and Milwaukee of the Chicago, Milwaukee & St. Paul. The law creating the Railroad Commission requires that one member be familiar with transportation conditions and problems, and it was Governor Philipp's idea that a man who has had practical experience in railroad operation, as well as a technical training as a mechanical engineeer, would be best suited for the position. Mr. Alexander was born in Glasgow, Scotland, in 1872, and went to Milwaukee in 1873. After receiving a common school education he served an apprenticeship as a machinist and draftsman with the Chicago, Milwaukee & St. Paul, and was also employed as a fireman on that road. While so employed he prepared himself for college and entered the University of Wisconsin in 1893, graduating in the mechanical engineering course in 1897; and he received a second degree in engineering the following year. After three years' instructional work in engineering at the University of Wisconsin, one year at Armour Institute and one at the University of Missouri he returned to railroad service as assistant district master mechanic of the St. Paul at Minneapolis. Two years later he was transferred to Milwaukee to a similar position, and later was made district master mechanic, which position he has held up to the present time. As district master mechanic he has had charge of the motive power work on the lines east of the Mississippi river.

Walter Alexander

Railway Officers

Executive, Financial, Legal and Accounting

M. Eckert has been appointed auditor, secretary and treasurer of the St. Louis, Brownsville & Mexico, with headquarters at Kingsville, Tex., succeeding O. H. Nance, resigned.

W. W. Collin, Jr., has been appointed commerce counsel of the Michigan Central, with headquarters at Chicago, and Ernest H. Ballard has been appointed commerce counsel, with headquarters at New York.

Bertram Lord, until recently financial manager for Europe of the American Express Company, with headquarters in London, has been appointed financial and foreign manager of Wells, Fargo & Company, with office at New York City. He will be in general charge of the company's money order, travelers' check, telegraph and financial transfer department, as well as the company's oversea freight business and all foreign transactions.

J. W. Wardlaw, whose appointment as assistant to president and purchasing agent of the Central Vermont, with headquarters at St. Albans, Vt., has already been announced in these columns, was born on October 16, 1882, at Galt, Ont., and was educated in the public and high schools of Ontario, Canada. He began railway work on September 24, 1902, in the office of the superintendent of the Grand Trunk at Toronto, remaining in that position until December 31, 1904, and then served as private secretary to the general manager of the Central Vermont until October, 1911. He was then secretary to general manager of the same road until February, 1913, and then to June, 1914, was secretary to the vice-president. Mr. Wardlaw subsequently became secretary to president, which position he held at the time of his recent appointment as assistant to president and purchasing agent, with headquarters at St. Albans, Vt., of the same road as above noted.

Announcement is made by the New York Central Railroad of the following appointments in the land and tax department: Oscar G. Getzen-Danner, general land and tax agent in general charge of tax matters in New York, Pennsylvania and New Jersey; and of land matters in New York, Pennsylvania and New Jersey (excepting portions of the Erie division and of the Franklin division in New York and Pennsylvania), with headquarters at New York. Herbert D. Howe, general land and tax agent, in general charge of land and tax matters in Illinois, Indiana, Michigan and Ohio, and of land matters on portions of the Erie division and of the Franklin division in New York and Pennsylvania, with headquarters at Chicago. Edwin E. Pettibone, assistant general land and tax agent, with headquarters at Cleveland, Ohio. Joseph Moses, assistant general land and tax agent, with headquarters at Cincinnati, Ohio, and Leon C. James, land and tax agent, with headquarters at Cleveland, Ohio.

T. F. Steele, whose election as vice-president and traffic manager of the New Orleans & Northeastern, the Alabama & Vicksburg and the Vicksburg, Shreveport & Pacific, with headquarters at New Orleans, La., has already been announced in these columns, was born on September 27, 1856, at Austin, Tex. He began railway work on December 11, 1880, with the Alabama Great Southern, and has been in the continuous service of lines included in the Queen & Crescent Route ever since. He first served as claim clerk, and later as assistant agent at Chattanooga, Tenn., until April, 1886. He was then consecutively soliciting agent at Birmingham, Ala., agent at New Orleans, and then agent at Birmingham, Ala. In November, 1891, he was appointed division freight agent, and about three years later was appointed general freight agent at Birmingham. He was transferred as general freight agent in April, 1898, to New Orleans, La., and on December 1, 1909, was promoted to freight traffic manager of the New Orleans & Northeastern, the Alabama & Vicksburg and the Vicksburg, Shreveport & Pacific, with headquarters at New Orleans, which position he held at the time of his recent election as vice-president and traffic manager of the same roads, as above noted.

Larz A. Jones, who has been elected president and general manager of the New Orleans & Northeastern, the Alabama & Vicksburg and the Vicksburg, Shreveport & Pacific, with headquarters at New Orleans, La., as has already been announced in these columns, was born on April 19, 1860, near Cincinnati, Ohio, and was educated in the public schools. He began railway work on July 15, 1878, as a clerk in the auditor's office of the Cincinnati Southern, and was in the service of that road and its successors, the Cincinnati Railroad, and the Cincinnati, New Orleans & Texas Pacific in a clerical position until August, 1883, and then was traveling auditor of the C. N. O. & T. P. until January, 1884. He was subsequently chief clerk of freight accounts of the Queen & Crescent System, and from January, 1890, to October, 1895, was assistant comptroller of the same system. On October 1, 1895, he was appointed auditor of the New Orleans & Northeastern, the Alabama & Vicksburg and the Vicksburg, Shreveport & Pacific, and in August, 1907, was elected vice-president and comptroller, which position he held at the time of his recent election as president and general manager of the same roads. From March, 1904, to April, 1911, he was also auditor of the New Orleans Terminal Company, and since April, 1911, vice-president and auditor of the same company.

Operating

J. M. Guild, assistant general safety agent of the Union Pacific, at Omaha, Neb., has been appointed general safety agent.

J. W. Trueb has been appointed superintendent of car service of the Vandalia, with headquarters at Terre Haute, Ind., succeeding J. W. Roberts, promoted.

C. E. Leverich, assistant general superintendent of the Great Northern at Spokane, Wash., has been transferred to Great Falls, Mont., in a similar capacity. G. S. Stewart, division superintendent at Spokane, succeeds Mr. Leverich. T. B. Degnan, superintendent of terminals at Seattle, Wash., has been appointed division superintendent at Crookston, Minn. Joseph Webber, local freight agent at Seattle, succeeds Mr. Degnan. F. D. Kelsey, division superintendent at Great Falls, Mont., succeeds G. S. Stewart at Spokane.

Arthur Hatton, whose appointment as general superintendent of car service of the Canadian Pacific, with headquarters at Montreal, Que., has already been announced in these columns, was born on April 12, 1869, at London, Eng., and was educated in the public and high schools. He began railway work in June, 1888, as agent of the Central Ontario, and remained in the service of that company until July, 1890. In June of the following year he entered the service of the Canadian Pacific as a telegraph operator, and has been in the continuous service of that road ever since. He was promoted to train despatcher in June, 1896, and became chief despatcher in September, 1901, remaining in that position until January, 1907, when he was appointed inspector of transportation. In March, 1912, he was appointed superintendent of car service for the Western Lines, with headquarters at Winnipeg, Man., which position he held at the time of his recent appointment as general superintendent of car service for the entire system, with headquarters at Montreal, Que., as above noted.

Traffic

J. L. Harris, live stock agent of the Chicago & Alton, has resigned to become live stock agent of the Wabash.

H. V. Dinniene, who recently was appointed acting Pacific Coast agent of the Traders' Despatch at San Francisco, Cal., has been appointed Pacific Coast agent, effective February 1.

K. B. Hannigan, commercial agent of the Southern at St. Louis, Mo., has been appointed assistant general freight agent at that place. C. F. Laure, freight soliciting agent at St. Louis, succeeds Mr. Hannigan.

E. A. Weiberg, district passenger agent of the Chicago & Alton, at Peoria, Ill., has been appointed milk traffic agent at Chicago, succeeding E. M. Linzee, who has been appointed passenger agent at St. Louis, Mo. E. H. Yarkey succeeds Mr. Weiberg.

Engineering and Rolling Stock

The headquarters of E. F. Needham, superintendent of the locomotive and car department of the Wabash, has been removed from Springfield, Ill., to Decatur.

G. Whiteley, master mechanic of the Alberta division of the Canadian Pacific, at Calgary, Alta., has been appointed assistant superintendent of motive power of the Eastern Lines, with headquarters at Montreal, Que., and C. Kyle has been appointed master mechanic of the Atlantic division, with headquarters at St. John, N. B.

E. J. Bryant, general foreman of the International & Great Northern at Houston, Tex., has been appointed master mechanic at Mart, Tex., succeeding W. G. Hall, who has been appointed general foreman at Palestine, Tex., in place of S. T. Armstrong, who has been appointed master mechanic at that point to succeed T. Windle, resigned. P. Roquemore has been appointed mechanical engineer, a newly created position.

John J. Reid, master mechanic of the Pennsylvania division of the Delaware & Hudson at Carbondale, Pa., has been appointed master mechanic of the Susquehanna division, with headquarters at Oneonta, N. Y., succeeding William Malthaner, who has entered the service of another company, and George S. Graham has been appointed master mechanic of the Pennsylvania division, with headquarters at Carbondale, succeeding Mr. Reid.

Special

D. J. Corkery, real estate and tax agent of the Chicago & Alton, has resigned to become connected with the tax department of the Chicago, Burlington & Quincy at Chicago.

OBITUARY

James M. Warner, general manager of the Chicago & Western Indiana, died at his home in Chicago on February 8.

S. E. Flanagan, superintendent of the New Orleans & Northeastern at New Orleans, La., died at that place on February 6, at the age of 51.

Chester W. Witters, vice-president and attorney of the Central Vermont at St. Albans, Vt., died on February 9, at his home in St. Albans, at the age of 79.

Charles N. Lee, who formerly was connected with the Chicago, Burlington & Quincy for 45 years, and for 20 years was superintendent at Hannibal, Mo., died on January 30, at Kansas City, Mo., aged 83 years.

Peter J. Nichols, formerly from June, 1891, to July, 1898, general superintendent of the Nebraska division of the Union Pacific, and subsequently superintendent of the Denver Union Depot Company, died recently at the home of his daughter in Indianapolis, Ind., aged 85 years.

Norman B. Ream, one of the most prominent capitalists in New York City, died there on February 9, at the age of 70. Mr. Ream was a director of the Baltimore & Ohio, the Seaboard Air Line, the Pere Marquette and the Pullman Company, also a director or trustee of many industrial and financial concerns.

James C. Fargo, who was president of the American Express Company from 1881 until June, 1914, died on February 8, at his home in New York at the age of 86. He was born at Pompey, N. Y., and when he was 15 years old entered the employ of Wells & Company, at Buffalo, N. Y. He afterwards went to Detroit and Chicago in the service of the same company, and later became agent and Chicago manager for the firm's successor, the American Express Company. In 1866 he was appointed general superintendent and manager at New York, and in 1881, was elected president of the same company. Mr. Fargo resigned as president of the American Express Company on June 16, 1914, after a service of 70 years spent in the express business. He had been president also of the Westcott Express Company, the National Express Company, Merchants' Despatch Transportation Company and a director of the Chicago & North Western Railway. He is survived by two sons, William C. Fargo, who is secretary, and James F. Fargo, treasurer of the American and of the National express companies. An appreciation of Mr. Fargo, which was issued by the American Express Company, at the time of his retirement from the presidency of that company, contained the following: "Mr. Fargo's connection with the company has been exceptional for the length of service, in an absolute and unceasing devotion to its interests and affairs, and has been marked by a high degree of ability in the management of the company's complex and extensive business."

Equipment and Supplies

LOCOMOTIVE BUILDING

The French Government has ordered 100 locomotives from the Baldwin Locomotive Works.

The Eureka Nevada has ordered one Prairie type locomotive from the Porter Locomotive Works.

The Cleveland, Cincinnati, Chicago & St. Louis, which some time ago ordered 10 switching locomotives from the American Locomotive Company, has recently increased that order to 13.

The Servian Government has ordered 10 Mallet type locomotives from the American Locomotive Company, in addition to 7 locomotives reported as ordered in the *Railway Age Gazette* of January 22.

CAR BUILDING

The Boston & Maine is in the market for 6 postal cars.

The United Fruit Company is in the market for from 30 to 35 freight cars.

The Delaware, Lackawanna & Western has ordered 5 postal cars from the American Car & Foundry Company.

The Colorado & Southern is reported to be inquiring for prices on 2,000 center sills. This item has not been confirmed.

The Atchison, Topeka & Santa Fe has ordered 200 80,000-gal. capacity tank cars from the Pressed Steel Car Company. This order is in addition to two orders for 100 cars each placed last November and December.

The Richmond, Fredericksburg & Potomac, reported in an unconfirmed item in the *Railway Age Gazette* of last week as preparing specifications on 6 passenger cars, is actually in the market for 6 all-steel passenger coaches.

The Pennsylvania Railroad has given its Altoona shops authority to proceed with the construction of 48 B-70 all-steel baggage cars, 10 B-60 all-steel baggage cars and 10 MBM all-steel baggage and mail cars.

IRON AND STEEL

The Boston & Maine has ordered 15,000 tons of steel rails from the Lackawanna Steel Company.

The Baltimore & Ohio has ordered 7,000 tons of steel rails from the Carnegie Steel Company, and 5,000 tons from the Illinois Steel Company, of a total order of 25,500 tons.

Germany's Railway System.—In the current issue of the Great Eastern Railway Magazine there is an article which shows what an extraordinary advantage Germany possesses over other European countries in the matter of railways. They are of course, essentially strategic in character and were originally laid down, not as ours were for the convenience of commerce, but for military use. In comparing Belgium, France, Russia, Germany and Austria-Hungary, it is seen that Germany has 6 miles of territory for every railway mile, whereas in Russia there is only one railway mile to 234 square miles of territory. But it is in their distribution even more than in their quantity that Germany possesses an advantage. Main lines run from the eastern to the western frontier almost direct, especially in the north. A cordon of lines runs along the French and Belgian frontiers and the facilities up and down the Polish frontier are nearly as great. Most likely a preponderating reason for the seizure of Luxemburg was that it gave a straight good line from Verviers to Metz, with connections on the Rhine.—*Railway Gazette.*

Supply Trade News

The Daniels Safety Device Company has moved its offices from 327 South LaSalle street, to the Continental & Commercial National Bank building, 208 South LaSalle street, Chicago.

The O. H. Davidson Equipment Company, Denver, Colo., has been appointed representative in Colorado, Utah, Montana, Wyoming, South Dakota, New Mexico and Arizona for the Electric Controller and Manufacturing Company, Cleveland, Ohio.

William H. Kinney, formerly master mechanic of the New York, Ontario & Western at Carbondale, Pa., has entered the railroad sales department of the Dearborn Chemical Company, Chicago, and will have headquarters at the company's New York office.

The Bucyrus Company, South Milwaukee, Wis., the Western Wheeled Scraper Company, Aurora, Ill., and the General Equipment Company, New York, have recently opened a new office at Room 715, Commercial Trust building, Philadelphia, Pa. The office is in charge of E. G. Lewis.

B. F. Affleck, general sales agent, has been elected president of the Universal Portland Cement Company, owned by the United States Steel Corporation, to succeed Edward M. Hagar, who has resigned to assume the presidency of a new company which he is forming to acquire a chain of Portland cement plants. Mr. Affleck entered the service of the Illinois Steel Company in 1896 and, from 1901 to 1903, represented the cement department of the company in the St. Louis territory. When the Universal Portland Cement Company was incorporated in 1906 to take over the cement business of the Illinois Steel Company, he became general sales agent. The company now has plants at Chicago and Pittsburgh with one under construction at Duluth.

B. F. Affleck

Mr. Affleck is also vice-president of the Cement Products Exhibition Company, under whose management the annual cement shows have been held in Chicago. The eighth show opened in the Coliseum on February 10. He has been active in promoting the use of concrete as a paving material.

F. A. Molitor, consulting engineer, 35 Nassau street, New York, has been retained by the receiver of the Brazil Railway Company to make an examination of the physical and operating conditions of the lines owned and leased by that company. He will be absent from this country for four or five months.

The Industrial Works, Bay City, Mich., has added to its line of locomotive and wrecking cranes a small locomotive bucket crane operated by a gasoline engine which is especially adapted for light or intermittent work, such as handling coal, ashes, etc., or for services in places where the use of steam is objectionable.

Due to the existence of a battery jar marketed under the name "Titan," and the fact that any battery using these jars might appear as a Titan battery, the Titan Storage Battery Company, Newark, N. J., has changed its name to the General Lead Batteries Company. No change whatever in ownership, officers or policy is involved. The change is made merely to avoid confusion.

H. H. Symmes, of H. H. Symmes & Brothers, Montreal, Que., has returned to Indianapolis, Ind., and will handle the company's business in the United States. Mr. Symmes has two specialties, the Symmes grease resisting mastic rock floor and the Symmes method of applying waterproofing on bridges and subways.

The Roberts & Schaefer Company, Chicago, has been awarded a contract by the Cottonwood Coal Company, Great Falls, Mont., for the construction of a complete fireproof coal tipple and coal washing plant at the company's mine at Lehigh, Mont. The tipple will have a daily capacity of 3,500 tons and the washery, 2,000 tons. The approximate cost is $120,000. The Cottonwood Coal Company is a subsidiary of the Great Northern Railroad.

W. S. Ottinger, district sales manager of the Cambria Steel Company, has been appointed assistant general manager of sales, effective, March 1, to succeed C. B. McElhany, who, as previously announced, has been appointed general manager of sales to succeed J. L. Replogle, resigned. Mr. Ottinger will be succeeded as district sales manager by F. J. Krouse. Albert S. Johnson will become assistant district sales manager, succeeding Mr. Krouse.

James F. McElroy, president of the Consolidated Car Heating Company, Albany, N. Y., died at Laconia, N. H., on February 10. Mr. McElroy was prominent as an inventor and business man, and was identified with several of Albany's banking and mercantile institutions. He was born in Greenfield, Ohio, November 25, 1852, and was graduated from Dartmouth College in 1876. For four years following Mr. McElroy was the principal teacher of the Indianapolis Institution for the Blind, and then for seven years was superintendent of the Michigan Institution for the Blind. In 1887 he organized the McElroy Car Heating Company, operating its own patents. Two years later it was combined with the Sewall Car Heating Company. Mr. McElroy was a member of several of the city clubs.

The patent suit brought against the B. F. Sturtevant Co., Boston, Mass., by the Sirocco Engineering Company, Detroit, Mich., which has been in the courts for the past six years, has just been decided by the United States Circuit Court of Appeals for the Second Circuit, in favor of the Sturtevant Company. It was claimed that the Sturtevant Multivane Fan infringed the Sirocco Company's patents, and in the lower court this claim was sustained. The Court of Appeals, however, reversed the former decision and held that there was no infringement. The Court of Appeals further decided that the Sirocco patents in suit were void in view of the development of the fan building art prior to the alleged inventions upon which these patents were based. As there are probably more Multivane fans in use than any other make, the monetary consideration at stake was large.

Negotiations are reported as practically completed for the sale by the Westinghouse Electric & Manufacturing Company of its French company, the Societe Ananyme Westinghouse, and the latter's subsidiary, the Societa Italiana Westinghouse, to the British Westinghouse Electric & Manufacturing Company, Ltd., the controlling interest in which is owned by the American company. As the Russian plant is in process of liquidation, it is not involved. No change is made at this time in the status of the Austrian company, but it is expected that later it may also be sold to the British company. The entire transaction is not a war measure nor forced by the war, but strictly a matter of business policy. Heretofore all the Westinghouse companies in Europe have competed for orders instead of working co-ordinately. In consequence of the transfer of control to the British company, this competition for orders will be abolished.

Yesterday, on the occasion of Thomas A. Edison's 68th birthday, all the executives and members of the factory and sales forces of the Edison companies and their distributors followed the custom which has been established for several years of wearing in honor of the day a small badge, bearing a picture of Mr. Edison. Mr. Edison's birthday this year is of more than usual interest, because it comes while his entire force is feeling proud of the rapid recovery after the great fire on December 9. "Tips," the "Chronicle of Edison Events," so-called, states the men's attitude well in the following words: "The real, perennial secret of Edison's strong mind and body, is his 'tomorrow' attitude. With him today is tomorrow in the embryo, tradition is twaddle and the past is only useful in discovering ways for the future. So when that pesky blaze caused us all some inconvenience there is no doubt about it that Edison found in the reconstruction something that was new, big, creative and worth while to engage his inexhaustible energies. All of us should get this lesson from Edison on his birthday and appreciate that a whole life's training of tomorrow work prepared him for this fire check and the job of rehabilitating his industries—a job of magnitude that would turn the average man into a phonographic pessimist and his business over to the junkman."

The Chicago Pneumatic Tool Company

The annual report of the Chicago Pneumatic Tool Company for the fiscal year ended December 31, 1914, is one of the first reports of the railway supply companies so far issued for the year and one of the first, therefore, to show the effect of the war on the supply trade field. In the year the company had net profits of but $655,104 as compared with $1,171,245 in 1913. It charged to depreciation but $195,122 as compared with $300,549 in 1913 and it wrote off for developing and perfecting new tools $15,153. Bond interest for the year totaled $116,175, and there was set aside as an installment for the sinking fund $50,000. The balance carried to the surplus account was thus $278,655. Deductions from surplus account were made, however, of $104,449, representing profits of foreign subsidiary companies retained by them for working capital, and dividends were paid, aggregating 4 per cent. for the year, of $257,952, the same as for each of the last four years. The total surplus on December 31, 1914, was $2,165,357 as against $2,249,104 on December 31, 1913.

On December 31, 1913, the company had real estate, buildings, plant, machinery, patents and good will, less reserves, valued at $7,075,932. It also held capital stock of other companies and other investments of $1,191,370. Its current assets were cash of $96,818; accounts and bills receivable, including undivided profits of subsidiary companies, less reserves, of $1,186,535, and its inventories of material, finished work and work in process totaled $2,009,252, the increase being said to be due to the efforts to retain the company's organization as far as possible by furnishing work to its employees and to provide a stock sufficiently large to take care of any sudden increase in the demand for products. The company's totaled capital stock outstanding is now $6,485,800 and there are also first mortgage bonds to the value of $2,500,000. The current liabilities on December 31, 1914, however, were as follows: interest accrued on bonds payable January 1, 1915, and dividend payable January 25, 1915, $123,738; bills payable, $287,017, and accounts and vouchers payable, $178,143.

TRADE PUBLICATIONS

Air Compressors.—The Chicago Pneumatic Tool Company in bulletin No. 34-K treats of class N-SO and N-SG fuel oil and gas driven compressors and their application to the unit system of air power plants. In common with all the bulletins issued by the company the booklet is well illustrated and treats of the product with which it deals in full detail.

Valves.—A 40-page catalog recently issued by the Homestead Valve Manufacturing Company, Homestead, Pa., deals with the different types of valves which this company manufactures. Illustrations and the principal dimensions of the different types are given and a cross-section showing the construction of the Homestead straightway valve is included on page 7, with detailed descriptive matter.

Paint.—The first number of a publication to be known as The Scientist has been received from the Goheen Manufacturing Company, Canton, Ohio. It is intended to devote the space in this booklet to the advancement of the iron, steel and galvanized iron preservatives, as well as the water-proofing compound and damp-proofing paint of which the Goheen Manufacturing Company is the maker.

Oil Testing Set.—The General Electric Company has just issued bulletin No. 49,901, describing an oil testing set, by means of which the dielectric strength of oil can be easily determined. The proper use of this set insures the successful operation of high tension oil insulated apparatus. The set consists of a 30,000-volt testing transformer with an induction regulator for voltage control and an oil spark gap, all of which are assembled as a unit.

Railway Construction

Arizona Roads.—A contract has been let for building a railroad, it is said, from Willcox, Ariz., on the Southern Pacific, east to Dos Cabeza, 14 miles. The line is to be built by the Mascot Copper Company, to provide an outlet from its mines. T. N. McCauley, San Francisco, Cal., is president.

Buckhannon & Northern.—See Monongahela Railroad.

Canadian Northern.—This company has been authorized to open for traffic the line from the junction with the Balke River sub-division north of Camrose, Alta., to a junction with the Canadian Northern Western near Strathcona, 46 miles.

Canadian Northern Ontario.—Surveys are about finished for a line to be built from Toronto, Ont., to Niagara Falls, 79.13 miles.

Canadian Northern, Quebec.—The Canadian parliament is being asked for an extension of time in which to build from Rawdon, Que., northerly to the National Transcontinental Railway, with a branch to Joliette, also to build from St. Jerome to St. Eustache.

Application has been made to the Canadian parliament for an extension of time in which to complete the James Bay & Eastern, from Lake Abitibi, easterly across the province of Quebec, passing along the south end of Lake St. John to the mouth of the Saguenay river. About 30 miles of the line from Roberval, westerly, is under contract to J. P. Mullarkey, Montreal.

Carolina & Yadkin River.—An officer writes regarding the report that surveys for an extension are to be started soon from a point near the southern end of the existing line at Denton, N. C., southeast to Troy, about 25 miles, that the company is merely making preliminary surveys and no construction work will be started until conditions are better. The company now operates a line between High Point, N. C., and High Rock, 35.6 miles. (February 5, p. 251.)

Dauphin Island Utilities Company.—See Tidewater Securities Corporation.

Eastern Ontario Electric.—The Ontario legislature has been asked to extend the time in which to build lines from Cornwall, Ont., to Toronto, and from Ottawa to Brockville, also a number of branch lines. The company was incorporated in 1909, with headquarters at Cobourg, Ont., and in 1913 was granted an extension of time in which to build the lines. G. E. Smith, L. R. Murdock, C. S. Foss and G. T. Taylor, Boston, Mass., are interested.

International Railway Company (Electric).—This company has been given permission by the New York Public Service Commission, Second district, to build a high speed electric line between Buffalo, N. Y., and Niagara Falls. (December 25, p. 1207.)

James Bay & Eastern.—See Canadian Northern, Quebec.

Marion & Eastern.—See Southern Illinois & St. Louis.

Middletown, Monticello & Callicoon.—Plans are being made to build a line from Middletown, N. Y., northwest via Monticello, to Callicoon, about 40 miles. Funds have already been secured to make the surveys. The promoters expect to use gasolene motor cars for operating the line. Blake A. Mapledoram is engineer, Monticello, N. Y.

Monongahela Railroad.—According to press reports the Buckhannon & Northern is making surveys for an extension from Fairmont, W. Va., southwest to Clarksburg, about 25 miles. The B. & N. finished track laying in 1912 from a point at the Pennsylvania-West Virginia state line, where a connection was made with an extension of the Monongahela Railroad south to B. & N. Junction, 30 miles, from which point trackage rights were to be secured over the B. & O. to Fairmont.

Norfolk & Western.—An officer writes regarding the construction of a low grade line between Pamplin, Va., and Burkeville that some surveys have been made in the vicinity of Farmville, but the company has not yet decided when to begin the work.

Southern Central Pacific.—This company has applied to the Canadian parliament for an extension of time in which to build from Vancouver, B. C., via Kootenay pass and the Old Man river to Hudson Bay, at a point not less than 100 miles north of Fort Churchill, with branch lines from the Blindman river, Sask., via Dunvegan to the Pacific coast at Gardner's canal, and from the Elk River, B. C., to the international boundary at Milk river. The following were named provisional directors in an amending act of 1913: G. F. McDonnell, A. E. Honeywell, W. N. Graham, J. C. Dingman, K. P. Young, Ottawa, Ont

Southern Illinois & St. Louis (Electric).—This company plans to build from St. Louis, Mo., southeast via East St. Louis, Ill., Belleville, Duquoin, Herrin, Johnston City and Pittsburg to Harrisburg, about 140 miles, where a connection is to be made with the El Dorado-Carriers Mills line of the Southern Illinois Railway & Power Company. The plans also call for a 13-mile branch from Johnston City north via West Frankford to Benton, and for a cut-off from a point east to Johnston City south to a point east of Marion, where connection is to be made with the Marion & Eastern operating a 7-mile steam road between Pittsburg and Marion, which is to be electrified. The company expects to complete work on the main line from Pittsburg west via Johnston City to Herrin during 1915. Also on the branch north from Johnston City and on the cut-off. The section from Herrin northwest to Duquoin, 20 miles, is expected to be finished during 1916; the 72-mile section to Belleville will be finished in 1917, and the remainder of the line in 1918. The steel bridges on the line include 30 spans, all to be deck girders, varying in length from 20 ft. to 40 ft. each, and the plans include putting up car shops in Johnston City. W. H. Schott, president, 111 West Monroe street, Chicago; Frank Payne, chief engineer, Johnston City, Ill. (March 6, 1914, p. 493.)

Southern New England.—This company has petitioned the state legislature of Rhode Island for an extension of time, to July, 1917, in which to complete work on the section in Rhode Island. This company was organized by the Grand Trunk, and started work in 1912 on the line from Palmer, Mass., southeast via Blackstone and Woonsocket, R. I., to Providence, about 75 miles. Under the terms of the original charter the section in Rhode Island was to be finished by July, 1915.

Tavares & Gulf.—This road has been extended from Winter Garden, Fla., to Ocoee, 2.4 miles, and the company now operates a main line from Tavares south to Waits Junction, thence east via Winter Garden to Ocoee, 31 miles. A branch is also in operation from Waits Junction west to Clermont, 6 miles.

Tidewater Securities Corporation.—An officer writes that under the name of the Dauphin Island Utilities Company a line is to be built from the terminus of the Mobile & Ohio tracks, near Alabama Port, Ala., to Cedar Point, 3.66 miles, which is later to be extended to Dauphin Island, a total of about 9 miles, and when completed the new line will probably be operated by the Mobile & Ohio. In addition to the use of steam as the motive power for freight service the company plans to use gas electric motor cars for passenger service. The right of way has recently been secured and contract will probably be let in the near future either to the Dauphin Island Contracting Company or to the construction department of the M. & O. for the section from Alabama Port to Cedar Point. The line is being built to carry general freight and passengers to Cedar Point, and after it is extended to Dauphin Island in addition will carry coal, also general freights for export and import, it being the intention to make Dauphin Island a port and coaling station. J. M. Dewberry, president, and T. W. Nicol, chief engineer, Bank of Mobile building, Mobile, Ala.

Toronto Eastern (Electric).—Application has been made to the Canadian parliament by this company for an extension of time in which to complete the line authorized to be built from Toronto, Ont., easterly to Cobourg, with branches as follows: From Cobourg or Port Hope northerly to Peterborough; from Scarborough to Markham, Stouffville or Uxbridge; from Oshawa northerly via Lake Scugog to Lindsay; and from Oshawa south-

erly to Lake Ontario. Ewan MacKenzie, Toronto, has a contract for some of the work, and track has been laid on about 15 miles. E. W. Oliver, chief engineer, Toronto. (November 27, p. 1030.)

Vancouver Railway & Ocean Terminal.—See Vancouver Terminal.

Vancouver Terminal.—This company is asking the Canadian parliament for incorporation to build a railway and terminal works, tunnels and transfer and connecting tracks and other railways in Vancouver, B. C., New Westminster, B. C., and at the mouth of the Fraser river, B. C. The Canadian parliament was asked to incorporate a similar company in 1914, under the name of the Vancouver Railway & Ocean Terminal Company, but the bill was withdrawn last April. J. B. Noble, Vancouver, B. C., is solicitor for applicants.

RAILWAY STRUCTURES

Camden, N. J.—The Philadelphia & Camden Bridge & Terminal Company has been incorporated in New Jersey with $125,000 capital, to build a combined railroad and highway bridge over the Delaware river between Philadelphia, Pa., and Camden. J. Disbrow Baker, J. T. Murray and F. Stanley Saurman are incorporators.

Galveston, Tex.—The contract for the construction of the superstructure of the grain elevator of the Southern Pacific Terminal Company has been let to James Stewart & Co. (January 15, p. 116.)

Kiowa, Kan.—The Atchison, Topeka & Santa Fe is preparing plans for the construction of yards and the building of a new depot.

Los Angeles, Cal.—The San Pedro, Los Angeles & Salt Lake has plans made for putting up a new passenger station on Seventh street, in Los Angeles. The building is to be 110 ft. x 162 ft.; it will be two stories high of reinforced concrete construction, finished in glazed terra cotta with tile roof. There will be a lobby 16 ft. x 40 ft., and the main waiting room will be 40 ft. x 70 ft. There will also be a ladies' waiting room, and a smoking room for men. The ticket office will open off the main waiting room. The plans also provide for a lunch room, a baggage room, a news and parcel room and an information desk. In the rear of the station it is planned to construct a concourse to be covered with glass leading directly to umbrella sheds covering all the passenger tracks. As soon as the city officers of Los Angeles grant the necessary franchises, bids will be asked for carrying out the work. The estimated cost of the station is between $250,000 and $300,000.

Mangum, Okla.—The Chicago, Rock Island & Pacific is contemplating the construction of a two-stall engine house at this point.

New York.—The Long Island will start work soon on the elimination of grade crossings through the Forest Hills and Richmond Hill sections of the borough of Queens. This is the last of the important grade elimination projects of the Long Island within the city limits.

The Lehigh Valley's Reports.—Once a railroad president's chief duties were to build and operate a railroad, distribute dividends and accommodate the public. Now his heaviest job is to answer questions. That veteran graybeard, Eben B. Thomas, president of the Lehigh Valley, says that last year he had to make 25,000 reports, involving answers to a few million queries propounded by various politically created and politically manned commissions. And of those 25,000 reports, it is likely that 24,990 covered useless information. But the silliness of the questions asked and the futility of the information could not abate the zeal of these commissions for more carloads of reports. To please Senator La Follette the people are saddled with that valuation question which is to cost a tidy $50,000,000. No other one question is quite so expensive as that, but they all cost some money, and nearly all of them as unpractical and useless as would be a scheme to propagate fish in the Sahara desert.—*Philadelphia Public Ledger.*

Railway Financial News

Cincinnati, Hamilton & Dayton.—The following protective committee has been formed for the first mortgage 5 per cent bonds of the Cincinnati, Dayton & Ironton: Alvin W. Krech, president of the Equitable Trust Company of New York; Frederick H. Shipman, treasurer of the New York Life Insurance Company, and L. E. Zacher, treasurer of the Travelers Insurance Company of Hartford, Conn.

Chicago, Rock Island & Pacific.—The annual meeting of the stockholders for the election of directors which had been adjourned to March 15 has been further adjourned to April 12.

Denver & Rio Grande.—Plans are being discussed, it is understood, for modifying in some way the requirements of the Denver & Rio Grande's guarantee of the $50,000,000 Western Pacific first mortgage 5 per cent bonds. One of the plans discussed is to scale down the $50,000,000 Western Pacific first mortgage bonds to $25,000,000 and to give bondholders in lieu of the $25,000,000 face value thus taken from them $25,000,000 new adjustment income bonds which will be an obligation of both the Denver & Rio Grande and Western Pacific.

Erie.—The $7,000,000 Erie & Jersey 6 per cent bonds, which issue, as was mentioned in these columns last week, was approved by the New York Public Service Commission, have been sold by J. P. Morgan & Co., the purchasers from the railroad, to the Guaranty Trust Company, New York, which company has formed a syndicate for the sale of the bonds, and is offering them to the public at 104½, yielding 5.70 per cent on the investment.

Michigan Central.—J. P. Morgan & Co. have bought $4,000,000 first mortgage 3½ per cent bonds subject to the approval of the Michigan Public Service Commission.

Missouri Pacific.—The Wall Street Journal says: Four St. Louis men are slated to go on the Missouri Pacific and the St. Louis, Iron Mountain & Southern board of directors when the contemplated program is carried out at the annual meeting on March 9, next. They are Frank O. Watts, president of the Third National Bank of St. Louis; William H. Lee, president of the Merchants Laclede National Bank; Edward H. Faust of the Anheuser-Busch Brewing Company, and Festus J. Wade, president of the Mercantile Trust Company.

The New York members of the board, it is stated, will be Alexander J. Hemphill, chairman of the board of the Guaranty Trust Company; Nicholas F. Brady, president of the New York Edison Company; Cornelius Vanderbilt, Newcomb Carleton, president of the Western Union Telegraph Company, and Robert Winsor, of Kidder, Peabody & Company. Seven of these men will serve on the Missouri Pacific board and all on the Iron Mountain board.

Present Missouri Pacific directors who will be retained on the board are Edgar L. Marston, E. D. Adams, Edwin G. Merrill, R. Lancaster Williams, B. F. Bush and Finley J. Shepard. Four of these are also directors of the St. Louis, Iron Mountain & Southern.

New York Central Railroad.—See editorial comments on the new bond issue.

Pittsburgh, Cincinnati, Chicago & St. Louis.—Kuhn, Loeb & Co. and Speyer & Co., both of New York, have bought $3,000,000 consolidated mortgage 4½ per cent bonds of the Pittsburgh, Cincinnati, Chicago & St. Louis, guaranteed by the Pennsylvania Company.

Western Pacific.—See Denver & Rio Grande.

Railway Construction in Mongolia.—An inter-departmental committee has been nominated by the Russian government to consider the construction of railways in Mongolia, either at government or private expense. The first line to be considered is one to connect Kiachta and Ugra.

Railway Age Gazette

PUBLISHED EVERY FRIDAY AND DAILY EIGHT TIMES IN JUNE BY THE
SIMMONS-BOARDMAN PUBLISHING COMPANY
WOOLWORTH BUILDING, NEW YORK

CHICAGO: Transportation Bldg. CLEVELAND: Citizens Bldg.
LONDON: Queen Anne's Chambers, Westminster.

E. A. SIMMONS, *President*
L. B. SHERMAN, *Vice President.* HENRY LEE, *Sec'y & Treas.*

Deferred Suspensions on the B. R. &. P.

Brown's discipline, three-fourths full strength, has now been in force on the Buffalo, Rochester & Pittsburgh for two years, and with marked satisfaction to all concerned. This arrangement (described on another page) is quite similar to that which has been in effect on the New York Central (east of Buffalo) for about the same length of time; and the New York Central officers seem to be equally well satisfied. Some, no doubt, will be of the opinion that leaving the fear of actual suspension hanging over a man's head for a few months is an improvement on the plan of universal abolition of suspensions; and that instead of calling this scheme 75 per cent pure, we ought to rate it at 125, or some higher percentage. Railroad superintendents have the habit of judging largely by results; and pretty good results (as well as pretty bad) have been found under all plans—suspensions, deferred suspensions and no suspensions. Pure theory, however, still deserves consideration. The theorist has no responsibility, and therefore can set his standard very high; but can the railroad superintendent afford to do any less? The theorist, in this matter says, simply, "My conductors, enginemen, brakemen and firemen must be men of good enough quality to be at all times amenable to reason." That is all. If a man can be reasoned with he need not be suspended. The B. R. & P. rule ought to have a constant educational effect on all classes, and we shall look for further progress in the future. Meanwhile the Burlington and the Baltimore & Ohio, whose thoroughgoing abandonment of suspensions was the subject of articles in this paper last year (January 16 and June 12) report continued satisfaction with their practice.

A Railroad Man as State Commissioner

One of the most frequent criticisms of state railway regulation is that the membership of state railway commissions is seldom, if ever, allowed to include practical railway men of any extended experience. Therefore, the appointment to the Wisconsin Railroad Commission of a railroad officer in active service, Walter Alexander, district master mechanic of the Chicago, Milwaukee & St. Paul, is interesting and significant, especially in view of the importance of the Wisconsin commission. The new governor of Wisconsin, E. L. Philipp, was formerly a railroad man himself, and more recently, as president of the Union Refrigerator Transit Company, has been in a position to understand some of the problems involved in railway operation and regulation. It is, therefore, quite natural that he should have taken advantage of the opportunity presented to him to fill a vacancy on the commission by an appointment well calculated to strengthen a body that has for several years commanded the respect of railroad officers. And he has apparently been fortunate in his selection. It is difficult to get the right kind of a railroad man to leave a good position to accept an appointment to an office, the tenure of which is likely to be limited, and the mere fact that an appointee has had practical experience in the business he is to regulate is likely to create a prejudice against him in political circles. There was some opposition among the members of the legislature to Mr. Alexander, simply because he was a railroad man, and his appointment was confirmed by the senate last week by a vote of only 17 to 15. Mr. Alexander has not only had an extended practical experience in an important department of his railroad, having had jurisdiction over the motive power east of the Mississippi river, but he is a self-made man. He began his railway work after a common school education, prepared himself for college while working as machinist, draftsman and fireman, and after receiving a thorough technical education, spent five years as an instructor in engineering at the University of Wisconsin, Armour Institute and the University of Missouri before returning to railroad service as an officer. The spirit which prompts the appointment of such a man to a railroad commission is highly gratifying.

Regulation of Security Issues

The New York Public Service Commission, Second district, division of capitalization, which is in charge of Howard C. Hopson, has passed on 787 applications since it was created in 1907. The division in the commission's annual report quite properly points with some pride to the success of its efforts to pass promptly on applications for approval of security issues, calling attention to the fact that whereas there were 73 applications pending at the beginning of 1914, there were but 24 at the end of the year. This question of promptness is a very important one in connection with the discussion which is now going on of giving the Interstate Commerce Commission power to pass on the issuance of securities by all interstate railroad companies. There is also another point of general interest touched on in the New York commission's report for 1914. The report says:

> The commission has found it to be for the best interests of all concerned to permit corporations with generating stations of large capacity which operate at a low cost to acquire small plants in their territory, especially when approved by local authorities. This results, in some cases, in the immediate retirement and abandonment of a considerable portion of the physical property involved.

Although this statement is made in regard to one particular form of public service corporation, it brings out quite clearly the conversion of one state public service commission to the principle which has so strongly been contended for by railroad and other public service companies and has so often been bitterly opposed by public sentiment and state commissions, namely, that the buying out of small competitors by a large monopoly may be an economic gain.

FALSIFICATION BY MISQUOTATION

THE representatives of the engineers and firemen in the western territory, in their testimony before the board of arbitration, have made a remarkable attempt to misrepresent the facts regarding the work done by these employees. They have introduced an exhibit entitled, "Evolution of Increased Power and Tonnage," which consists of quotations from statements of railway officers, railway newspapers and advertisements of railway equipment concerns purporting to show, as the title suggests, how, in the past few years, locomotives have increased in size and power, and how the train tonnage has increased, and having the underlying purpose of leading the board to believe that the labors of both the engineers and firemen have been correspondingly increased. This underlying purpose was sought to be accomplished by omitting from the quotations correlated phrases and sentences, the inclusion of which would have left an entirely different impression on the minds of the arbitrators.

The Conference Committee of Managers, representing the railroads, has countered by presenting an exhibit in which many of the quotations given by the engineers and firemen are printed in black and the qualifying statements which they omitted are printed in red. A few examples will illustrate the bald way in which the representatives of the engineers and firemen have tried to mislead the board.

In speaking of the conversion of simple locomotives into Mallet compounds on the Chicago Great Western, as described in the *Railway Age Gazette* of November 4, 1910, this paper said: "The maximum tractive effort of the engine was thus increased from 33,000 lb. to 52,000 lb., or 57.5 per cent." The representatives of the employees quoted the foregoing, but omitted the following, which appeared in the same article: *"The steam generating portion of the old locomotive remains the same. . . . It is claimed that converted Mallets on other roads are hauling 50 per cent greater tonnage with the same amount of coal consumed by the old locomotives."*

W. L. Park, vice-president of the Illinois Central, was quoted as having said in 1910 that the locomotive engineer was hauling 100 per cent more tonnage than he did 10 years before; but the following statements made by Mr. Park at the same time were omitted: *"The people have received the benefit of this, for, notwithstanding the increase in wages amounting to from 25 to 50 per cent, increased cost of supplies and material, and the entire cost of the railroads' living, they have maintained the cost of transportation to the public at the lowest rates in the world, 7.5 mills per ton per mile."*

The *Railway Age Gazette*, in its issue of March 28, 1913, referring to the locomotives built by the Baldwin works in 1912, said: "Under favorable conditions, such locomotives"—Mikados—"equipped with superheaters, are hauling 30 per cent more tonnage than the saturated steam Consolidation type engines formerly used in the same service *with no increase in actual coal consumption."* The labor people quoted the first part of this sentence, but carefully suppressed the part of it which we give in italics. Further on in the same article we said: "A notable order for Mallet locomotives was filled for the Great Northern, which received 25 engines of the 2-8-8-0 type. These exert a tractive effort of 100,000 lb. *working compound, and are fitted with Emerson superheaters."* In a sentence further on it was stated that—*"Seventeen of these locomotives are coal burners, while the remaining eight use oil for fuel."* The words here italicized were carefully left out of the employees' exhibit.

In an article describing the Mikado locomotives for the Lake Shore, published in the *Railway Age Gazette* for May 2, 1913, it was stated that although the tractive effort of these engines was only 22½ per cent greater than that of the Consolidations which they replaced, they handle 35 per cent greater tonnage. The exhibit of the brotherhoods quoted the foregoing statement, but omitted the following: *"The average for three trips of a superheater Consolidation locomotive. . . . showed that it burned 15.9 tons of coal per trip of about 130 miles when hauling a 60-car train of 2,335 tons. . . . The average of three trips over the same division with a Mikado was 12.85 tons of coal when hauling a train that averaged 70 cars of 3,203 tons."*

Under the heading of "Labors of Engineers and Firemen Have Increased with Increased Power and Tonnage" in the brotherhoods' exhibit the following quotation is made from the *Railway Age Gazette* of November 11, 1910, page 911: "The operation of a Mallet engine involves somewhat more work and responsibility for the engineer than the operation of a smaller engine." The railroads, in their exhibit, finished the sentence as follows: *"and for this reason the railway managers concede that engineers on them should be paid more,"* and added the following, which appeared in the same article: *"They, therefore, offered them a differential of 75 cents a day; but the officers of the Brotherhood insisted that engineers on Mallets be paid practically double what others received. . . . The adoption of the principle that engineers running Mallets shall receive anything like twice as much as engineers on other engines would very seriously interfere with the economies for which these engines have been invented and introduced."*

Again, the representatives of the employees quoted from an editorial in the *Railway Age Gazette* of April 26, 1912, page 944, as follows: "Firemen have been known to shovel between 6,000 and 7,000 lb. per hour, but they worked under such a pressure that they could not be expected to secure the most efficient results." The sentence immediately following, which they omitted, read thus: *"Realizing the necessity of . . . keeping within the limitations of the average fireman, the locomotive designers have introduced a number of important features during recent years which have gradually increased the capacity of the locomotive without making additional demands upon the engineman or the fireman."*

The above are but a very small number of the quotations successfully challenged by the railroads, but they are typical, and show quite clearly the methods adopted by the brotherhoods in preparing this exhibit. They are a fine example of falsification by misquotation. A cause which is supported by such methods must be very unfortunate either in its intrinsic merits or in its spokesmen.

FEDERAL BOILER INSPECTORS SEEK ENTIRE CONTROL OF LOCOMOTIVES

THE potential evils in the amendment to the Federal Locomotive Boiler Inspection Act, which has already passed the House and is now under consideration in the Senate, giving the Bureau of Locomotive Boiler Inspection the same jurisdiction over the entire locomotive and tender as it now has over the locomotive boiler, are so numerous and of such a character that determined action should be taken to prevent it from becoming a law. As it now stands it gives the federal boiler inspectors absolute authority to decide whether or not in *their* opinion a locomotive is safe to operate in the service to which it is put. We quote below Section II of the amendment:

Section II. That the chief inspector and the two assistant chief inspectors, together with all the district inspectors, appointed under the Act of February 17, 1911, shall inspect and shall have the same powers and duties with respect to all the parts and appurtenances of the locomotive and tender that they now have with respect to the boiler of a locomotive and the appurtenances thereof, and the said Act of February 17, 1911, shall apply to and include the entire locomotive and tender and all their parts with the same force and effect as it now applies to locomotive boilers and their appurtenances. That upon the passage of this Act all inspectors and applicants for the position of inspector shall be examined touching their qualifications and fitness with respect to the additional duties imposed by this Act.

The framers of the amendment evidently assume that a $1,800 a year boiler maker is competent to determine at a glance whether locomotive wheel tires are too badly worn, whether a spring has too great a deflection, whether there is too much lateral play in the wheels, whether the side bearings of trucks are correctly located and their clearance sufficient, and so on. In other words, it is assumed that these $1,800 inspectors are all around mechanical experts, or that men could be procured at that salary who are so familiar with *all* of the conditions on *all* of the railroads in their district, and who have such a knowledge of *all* of the different designs of locomotives and tenders, in addition to possessing the concrete knowledge of boilers necessary under the present law that they can competently determine when a locomotive is safe to operate in the service in which it is placed.

It thus becomes strikingly apparent to what grave injustice the railways will be subjected by this amendment, unintentionally perhaps, but none the less disastrously to satisfactory railway operation. What a weapon this amendment would place in the hands of those behind this proposed act—organized labor. Locomotives could be held out of service on the slightest pretext, and the operation of a railway materially crippled. If the people of this country, through their representatives in Congress, desire that locomotives and tenders be inspected by government inspectors the railways might be willing to submit to such inspection, but the public, in justice to the railways, and in its own interest, should not permit this unlimited authority to be placed in the hands of a body of men whose training does not qualify them to exercise it. If any such extension of the locomotive boiler inspection act is necessary, and it is to fulfill its purpose, elaborate standards must be adopted for the inspectors and the roads to follow, and in these standards allowance must be made for the varying conditions throughout the country. It is not a subject that can be passed on lightly. It deserves the most careful consideration by railway mechanical experts.

If it is necessary to inspect the locomotives and tenders at all the work should be done thoroughly, and it is far beyond the capabilities of the Bureau of Locomotive Boiler Inspection to handle it in this manner. A special department under the Interstate Commerce Commission would be necessary, officered by men familiar with all phases of locomotive design and construction. As the amendment now stands, the inspection required by it could not be adequately performed, it would be a source of constant controversy, and it would cause great injustice to the railroads, tying them hand and foot, and placing them at the mercy of a subordinate department of the Interstate Commerce Commission, and through it at the mercy of organized labor. It is hardly conceivable that the Senate will pass the proposed amendment in its present form.

FULL-CREW LAW ARGUMENTS

THE movement for the repeal of "full-crew" laws, more accurately called "extra-crew" laws, is in danger of being weakened because of its very strength. The arguments against repeal are so poor and thin that nobody states them; and persons who have not followed what has been published on the subject during the past two years are mystified by the presentation of an issue which seems to have only one side. The fair-minded citizen who is in the habit of deciding for himself looks habitually at both sides of every question; but here he finds that there isn't any adverse side.

Assuming, for the time being, the role of attorney for the defense, we will try to put the issue into a more presentable form. The real reasons why the extra-crew laws have been passed are only two, and very simple ones; the desire of the brotherhood leaders to make more jobs for brakemen, and the desire of legislators to please "labor," no matter what it may ask for. Back of these outward motives, the labor leader is seeking to intrench himself in his position as leader; and the legislator has a purpose equally selfish. But the movement for legislation has had a tiny thread of respectability. These selfish interests—aiming, of course, to conceal their selfishness—have claimed that a long freight train was more dangerous than a short one, and that, therefore, more trainmen were needed to guard against the dangers. This claim was not asserted very loudly, because the danger was admittedly rather small. Moreover, there was no need of loud proclamation; the legislative committee man can hear a whisper, if it comes from one whom he believes to be backed by a majority of the voters.

There is, then, theoretically, a useful function on a long train for a third brakeman; on a train, say of 80 cars, extending back more than half a mile from the engine. If the rear-end man goes back with a flag, and if, while he is gone, it is necessary to do some switching, the conductor will wish that he had another man; he cannot set out a car, or take on a car, and make the necessary exchange of bills with the station agent, quite so quickly as he could if he had both his assistants with him. This consideration may lead crews to neglect flagging, and so introduce a theoretical danger. Another element of danger on a long train is the possibility that a wheel or an axle may fail under a car in the middle of the train, or a brake-beam fall on the track, and the danger not be promptly discovered because the trainmen are so far away from it. The philanthropic legislator, stern in his devotion to the safety of the public, quickly votes to employ an additional man to ride on the middle of the train to guard against this risk. The legislator is oblivious to the fact that the insurance companies—if statistics could be gathered—would be glad to insure against this danger for, probably, a hundredth or a five-hundredth part of the extra brakeman's wages.

The other reasons which have been set up in favor of these laws are equally thin—or thinner. In actual practice the occasions when time can be saved or convenience promoted, or dangers averted, by the third man, are so infrequent that the benefit which results cannot be measured.

There is no denying that a third man on a train—or a fourth, and a fifth—might, if possessing ideal intelligence, vigilance and faithfulness, occasionally do something to ward off some danger. So could a third man in the locomotive, acting as second assistant lookout man. This extra lookout has been advocated many times, and the idea has even been favored by some railroad men; but only a little calm reflection is needed to show that, admitting a trace of reason in the idea, the money spent to carry it out would do a thousand times more good if spent in other directions. Another notion of the same sort is that an important function of the train despatcher is to watch the train-

sheet so closely that he will discover when some one of a hundred enginemen is on the point of disobeying an order, and send a message to head him off. Train despatchers have, indeed, prevented collisions by acts of the kind suggested; but to call this other than an incidental function is to reverse the natural order.

It is the same in the case of the lookout man and the extra brakeman. The railroads are wrong when they declare so persistently that the $1,600,000 spent in Pennsylvania each year for extra brakemen is wholly wasted. Looking at the matter in the narrowest possible way, the extra service may be worth a fraction of the sum spent; say $16, or $160, or even $1,600. But no concern engaged in serving the public and deriving its income from the public has any right to spend its money in such an extravagant way. And beyond this narrow and short-sighted consideration of the question, it is to be remembered that an extra brakeman may do positive harm. Unless he is a very exceptional man he is likely to impair discipline, and to depress the morale of the force in other ways. Idle men need watching. And he may get hurt in getting on or off the cars, or in other ways, causing expense to the company or himself.

THE DECISION IN THE TRANSCONTINENTAL FOURTH SECTION CASE

THE Interstate Commerce Commission in its latest decision in the transcontinental fourth section rate cases, has shown a disposition to co-operate with the railroads in solving one of their most difficult problems. Although the decision does not grant the roads the full measure of relief that they asked for from a hard and fast application of the fourth section rule, the commission has shown a willingness to recognize the changes in conditions since the issuance of its previous order in the case in 1911. In the new order it has departed considerably from the rule it laid down at that time. The rule then laid down made the rates to the intermountain points dependent on the rates to the coast terminals. The order embodying this rule, it will be remembered, was held up by litigation for nearly three years, and when it was finally sustained by the Supreme Court the Panama Canal was about to be opened for traffic, thus bringing about a new set of conditions.

The roads have already put into effect rates conforming to the requirements of the original order except on the list of about 100 commodities involved in the latest order and concerning which the roads asked relief which would enable them to meet the low rates via the Panama Canal without disturbing their intermediate rates. These commodities include the bulk of the traffic on which the water competition would be most keenly felt and at the hearing before the commission in October the roads were able to show definitely what low rates they would have to make to participate in the competitive business. Since the hearing the roads have withdrawn 27 of the commodities from the list on which they asked relief and as to some of the rest the commission has granted something less than the full relief requested, and imposed certain requirements as to the maxima to be observed at the intermediate points. Since the hearing, however, another change in conditions has occurred of which the commission has not taken cognizance in its decision which will be of benefit to the roads for a time.

The high ocean freight rates caused by the war have attracted away many of the boats that were competing actively with the railroads for the Pacific coast traffic via the Canal and the slides in the canal have made it impossible for some of the other boats to carry their full tonnage, so that there is now a large accumulation of freight on the Atlantic seaboard for the Pacific coast which the railways are likely to get.

The Interstate Commerce Commission is not in sympathy with the ideas of many people who have considered the construction of the canal as indicative of a governmental policy to divert as much of the coast-to-coast business as possible to the water lines. "This suggestion," it says, "loses force under the consideration that the Panama Canal is but one of the agencies of transportation that the government of the United States has fostered between the Atlantic coast and the Pacific. . . . Some of these transcontinental lines would not have been built had it not been for the liberality the government extended to them at the time of their construction. As we view it the Panama Canal is to be one of the agencies of transportation between the East and the West, but not necessarily the sole carrier of coast-to-coast business." With this idea in mind the commission may be expected to meet changed conditions as they arise in the way that the situation requires.

EASTERN RAILWAYS APPEAL TO THE PUBLIC

THE statement which the eastern railways have issued to the public in opening their campaign for the repeal of the train crew laws in Pennsylvania and New Jersey is a remarkable document. It is remarkable because of the overwhelming conclusiveness of its argument against such legislation. It is more remarkable, however, as a kind of confession of faith by the railway presidents who issued it. They admit that in the past railroads have been too slow in introducing safety devices "largely because of a stupid and stubborn attitude of mind once too prevalent among railway managers." They agree that "far too many are killed an injured on the railroads" and that "property rights fall secondary to human rights." They refer to the fact that "railroad officers are merely salaried men" and concede that "their duties and responsibilities are those of stewards." Having thus condemned the attitude which formerly prevailed among railway managers and stated the attitude assumed by them now, they contend that their attack upon the full crew laws is entirely consistent with their relation of stewardship to the public, and, in fact, grows out of it. The train crew laws, they contend, cause economic waste by giving employment to men who have nothing to do and reduce rather than increase the safety of operation. They are, therefore, unmitigatedly harmful to the public; and it is in the performance of their stewardship to the public that railway officers appeal to it to cause the repeal of these laws.

One of the notable statements in the document is, "It is frankly recognized that railroad employees have a right to organize," and "we believe it to be as impossible for the individual employee in a great transportation system to be certain of fair treatment acting by himself as we know it would be impossible for one man to provide the capital necessary for creation of the huge Pennsylvania Railroad System." The tone and candor of this expression from the eastern railway presidents has provoked some manifestations of astonishment from certain newspapers. But there is nothing in it to cause surprise in it. The change in the attitude of railway executives has been well known for some years to those who have been in close touch with the railway business. When railway presidents go before the public in such a statement the public is pretty certain sooner or later to respond in kind. If the roads continue to take their case to the public as they are doing now it will not be long until there will be a great change in railway regulation and until agitation against railways will become a liability instead of an asset to the politician.

NEW BOOKS

Railway Fire Protection Proceedings. Published by the Railway Fire Protection Association, C. B. Edwards, fire insurance agent, Mobile & Ohio, Mobile, Ala., secretary. 167 pages. Bound in paper.

These proceedings are for the second annual meeting of the Railway Fire Protection Association, held at Washington, D. C., October 6 and 7, 1914. The several papers presented were published in some detail in the *Railway Age Gazette* of November 20, 1914, page 943. They included reports on Fire Hazards, Statistics and Forms, Fire Fighting Organization and Fire Fighting Apparatus. The report of the committee on Fire Hazards, Charles N. Rambo (Norfolk & Western) chairman, was especially important, and with the discussion covers 76 pages. The several committee reports contained excellent recommendations.

Is the Railroad Y. M. C. A. Really Worth While?

PART I—Reasons Why This Organization Gives Better Results Than What Is Known as the Club House Plan

The Railroad Y. M. C. A. has not been spectacular in its development or in the accomplishment of its work. Steadily, but gradually and quietly, it has been extending its operations and perfecting its methods for many years—since 1871. It has had the backing of many farsighted railway executives and has received financial assistance from many roads; but the very nature of its work—providing clean, comfortable and uplifting surroundings for the trainmen and enginemen who lay over at terminals at the opposite ends of the runs from their homes—and the fact that the quarters are frequently far removed from the business and social centers of the communities in which they are located, has kept it from attracting the general attention which its importance deserves.

In late years much has been printed in popular magazines concerning reading rooms and social clubs which have been established by some of the railroads. The writers have embellished these descriptions with striking and human interest incidents, with fine figures of speech, and sometimes it would seem with rhetorical flights of imagination. Most of them, however, seem almost entirely to have overlooked the less spectacular but larger and more thoroughly established work of the Railroad Y. M. C. A. Why? Has the latter institution been remiss in its work, and has it failed in the accomplishment of the high ideals for which it stands? Has the "C" in the Y. M. C. A., standing for all it does in character building and broad brotherly sympathy, given offense or narrowed the field of its work? Have the railways which have helped to support the institution been giving their money for something which has produced intangible results? In a word, is the whole movement really worth while?

With this in mind, it was decided to investigate the work more or less thoroughly on three of the eastern railroads which were selected for the following reasons: Each one, small in physical size as compared with some of the larger systems, is known because of its progressive and, to a certain extent also, aggressive attitude. All three have had much experience with the Railroad Y. M. C. A. and believe in it. On each, however, this work is administered and supervised differently so far as details are concerned. Operating in different territories and under varied conditions, physical and otherwise, and particularly as concerns the religious beliefs of the greater part of the employees, it was thought possible to obtain a good idea of the adaptability of the institution to varying conditions. Practically one week was devoted to visiting and studying the fourteen Railroad Y. M. C. A. institutions on these three roads, the visits varying in length, depending largely on the importance of the location, and being made at all times of day and night. In the greater number of cases the railroad officers on the division, foremen and many of the employees were interviewed. In some cases the local boards having in charge the direction of the work, together with such railway officers and foremen as were available, gathered for luncheon or dinner conferences. The editor who made the study conducted the interviews in the attitude of "the man from Missouri" and critically inspected the different buildings from top to bottom, special attention being given to sleeping rooms, kitchens, storerooms and out of the way corners, including that part of the property directly back of the kitchen, and also to the attitude of the men in and about the buildings. Almost a year has elapsed since this trip was made; meanwhile the work has been looked into more or less incidentally in connection with trips over several other railroads, and several days were spent during August at the Railroad Y. M. C. A. summer school at Silver Bay, N. Y.

THE ORGANIZATION

In the first place it should be understood that the Railroad Association work at each point is in direct charge of a trained secretary who works with both the railroad and the general Railroad Association organizations. Associated with him is a board of managers usually made up of local railroad officers and employees. The railroad department of the International Y. M. C. A. is directed by a railroad committee of seven members, with Dr. John P. Munn, of New York, as chairman. The other members are B. D. Caldwell, president of Wells, Fargo & Company Express; W. E. S. Griswold; William A. Patton, assistant to the president of the Pennsylvania Railroad; Abner Kingman; John Carstensen, vice-president of the New York Central, and A. M. Schoyer, vice-president of the Pennsylvania Lines.

The work is directly supervised by the international and the several state committees. John F. Moore is the general railroad secretary of the former, and is assisted by several traveling secretaries, each of whom covers a particular section of the country. For instance, J. M. Dudley is located at Montreal and looks after the Canadian associations; E. L. Hamilton has general charge of the associations on the New York Central Lines, the Delaware, Lackawanna & Western and the Buffalo, Rochester & Pittsburgh; A. G. Knebel, with headquarters at St. Louis, looks after the Gould lines and the Southwest; A. B. Minear, with headquarters at Chicago, has jurisdiction over the central and northwestern associations; H. O. Williams, with headquarters at New York, looks after the New England and southeastern associations, and G. K. Roper, Jr., whose headquarters are at Richmond, looks after the southern district.

There are also connected with the general department several specialists, each of whom is retained in an advisory capacity for some special branch of the work. D. S. Hanchett looks after educational work and co-operates with Mr. Moore in the publication of the Railroad Association Magazine; W. H. Ball, in charge of physical development, also gives attention to sanitation, ventilation, dormitory equipment, games and building arrangement; W. A. Cochran is in charge of installing a uniform system of accounting; A. W. MacNeil is the restaurant expert and during the summer months is in charge of the summer school hotel at Silver Bay, N. Y.; M. S. Safford is in charge of the development of membership campaigns; H. F. Reinhardt is emergency specialist, and W. G. Mason looks after evangelistic work. The traveling secretaries keep in close touch with the local secretaries and with the needs of the work and supervise it in a general way in more or less detail.

In approaching the local railroad officials at the various points in connection with the investigation, two questions were invariably put to them, not always in the same way and never in the early part of the conference, but always amounting in effect to the following: Is the Railroad Y. M. C. A. really worth while, and what is it accomplishing in a practical way? If it is capable of performing an important work in the interests of the railroads, why not have this work done by the railroads themselves? More directly, this second question might be stated in this way: Why cannot the railroads handle the work to better advantage without assistance from an outside organization? The purpose of this article is to answer these two questions. The last one will be considered first because in large part it will explain the reason for the answer which will be given to the first one.

BIG LEADERS REQUIRED

The amount of equipment which may be necessary and the work accomplished by the Railroad Y. M. C. A. depends on the size, nature and location of the terminal, and on its relation to the other points on the system and to the operation of the road as a whole. For instance, at some points it may be neces-

sary to provide a large number of sleeping accommodations both day and night and to serve meals at all hours. At other places it may not be necessary to provide any meals, and only a few sleeping rooms may be required. At some terminals conditions may be such as to make it necessary to place special stress on the educational work or on the recreation features. In all cases it is necessary to maintain a reading room, to carry on some educational work, to maintain Bible classes, attendance on which is entirely optional, and to keep in close personal touch with the men in order to help them to lead clean, upright lives so that they will be in such physical and mental condition at all times as properly to perform their duties and be a credit to the service.

What sort of man is required to act as the director and leader of this work? Is it easy to find a good Railroad Y. M. C. A. secretary? Let us examine the requirements. In the first place he must be something of a financier, for good meals and clean and comfortable sleeping quarters must be provided at a comparatively small cost. While the men pay a nominal price for this service, and the railroads help out with a large or small appropriation, as the case may be, it is only by the most careful planning that the secretary can make ends meet. He must be more or less of a promoter in order to extend and build up the work and make its influence felt to as great a degree as possible. He must be something of a teacher, for even if he does not personally have to take charge of the educational classes, he must be able to secure and direct those who can do so to the best advantage. He must be a religious leader, and in a broad way, for necessarily the men who make use of the buildings are of different or no religious beliefs and this work must be carried on diplomatically in order not to give offense. The necessity of this qualification will appear throughout this article, and particularly in the second part. More than anything else, he must be a good executive or administrator in order to keep the various parts of the work well balanced and to carry it forward in an effective and progressive manner.

Manifestly there is no department in a railroad for the development and training of these men. There is no officer who has the time or training to select such men and encourage them to take up the work, even if the facilities were at hand to train them. On the other hand, the Y. M. C. A. has a splendid opportunity of locating and bringing out men of this type because of its intimate contact with the best type of Christian youth throughout the country. In addition to this it has two special schools or colleges, one at Chicago, and one at Springfield, Mass., especially devised for the training of secretaries and workers. These schools offer a three-year course, a high school education being required for entrance. Several summer schools are carried on each year in various parts of the country for the continued training and inspiration of those men who have taken places as secretaries or assistant secretaries, or are looking forward to training themselves for these positions. Moreover, because of the large number of railroad associations—251 to be exact—some of them quite large and requiring a force of assistant secretaries, it is possible to try men out and gradually to develop them by first using them as assistants at some important point.

Men who possess the above mentioned requirements and who enter this work, manifestly do not go into it primarily for the financial returns, for secretaryships do not pay as much as men of this type could earn in other fields. Generally speaking, it would appear that the men who become trained secretaries are attracted to the work in much the same way as teachers or religious leaders because of the opportunity of being of service and helping their fellow men. It speaks well for this day and age that so large a proportion of our young men are accepting these calls for service. The success of the work at any one point depends on the personality of the secretary and the degree to which he is able to fill the requirements outlined above. Benjamin McKeen, general manager of the Pennsylvania Lines, has tersely expressed this thought in the following words: "Knowledge of its work impresses one with the character and ability of those directly in charge. To their singleness of purpose and personal sacrifice may be attributed its continuing success." In this same connection Frank Trumbull, chairman of the board of directors of the Chesapeake & Ohio, has expressed himself as follows: "These associations are doing most effective work, and the thing that distinguishes this movement, in my opinion, from the ordinary club house work is that it is well organized. In the second place, the secretaries are men of sacrificial devotion to their work, a thing we cannot buy with money if we go away from the methods of the Y. M. C. A. and put such work simply on a secular basis."

Because the railroads are not in a position to secure, develop and train these men and to supply the means of continued training and inspiration after they have entered the work, it is necessary to depend on the Railroad Y. M. C. A. which is so well fitted to perform this duty. In addition, the general organization of the Railroad Association, with years of experience and a thorough knowledge of the work in all its details, is especially fitted to supervise and direct the work in a broad way, although it should be emphatically understood that the railroads must do their part in backing up and checking the work and in seeing that it is carried on efficiently and economically.

If one is at all skeptical as to whether the Railroad Y. M. C. A. is successful in finding and training the right kind of secretaries, a visit to a number of the institutions will dissipate the idea. If a secretary lacks somewhat in some of the qualifications, the traveling secretary is apt to discover the deficiency and focuses his attention upon it. Often it is possible to upbuild and develop men, thus overcoming their peculiar weaknesses, or it may be possible to supply an assistant to protect the weak point. If a mistake in judgment is made in placing a secretary, it does not take long to find it out and he is soon placed elsewhere, or if he is totally unfit is eliminated from the service.

As suggested by Mr. Trumbull, in the extract above quoted, another prime factor in the success of the Railroad Y. M. C. A. is in its organization. W. J. Cunningham, professor of transportation at Harvard University and president's assistant on the Boston & Maine, covered this point quite fully in an article on "Elements of Strength in the Railroad Association," which appeared in the first number of the Railroad Association Magazine, November 15, 1911. The following extract is taken from that article:

"The organization, in which the men themselves have a direct part, is designed to hold the interest of the membership. The board of management, on which every branch of the service may have representation, provides for local autonomy, and prevents the harmful effect of paternalistic government. A comparison of the typical railroad association with rest rooms managed directly by the railroad company will show a marked difference in club spirit, or *esprit de corps*. The former is governed by members (as members, not as employees of contributing companies) through their own board of managers or executive committee, and no member is permitted to forget that it is his association and that his membership fee or any other contribution he may make toward its support is not a tax but a participation in an enterprise of which he is a part. He understands also that the appropriations of the railroad companies are based on business principles; that it is not paternalism but an investment in a project which is known to be mutually advantageous. On the other hand, the company rest room can hardly be regarded in any other light than a company institution, and it would be unnatural for the men to take as much interest in it as in an association in which they are a vital part."

So much for the reasons why the railroads find it wise to go outside of their own organizations for assistance in carrying on this work. In the second part of this article, which will appear in an early issue, a more direct answer will be given to the question, "Is the Railroad Y. M. C. A. Really Worth While?" by showing the practical benefits which have followed its introduction on different roads.

Commodity Rates to the Pacific Coast Terminals

Railroads Granted Additional Fourth Section Relief as to Rates on Commodities Also Moving by Panama Canal

The following is an abstract of the decision of the Interstate Commerce Commission given in 32 I. C. C., 611, bearing the above title and dealing with applications for relief under the fourth section with respect to commodity rates from points of origin east of the Missouri river to Pacific coast terminals and intermediate points. The case deals with a large number of commodities which move to a large extent by water and upon which the present rail rates to the Pacific coast terminals are already quite low. The carriers by rail desire further to decrease these rates so that they may continue to compete for this traffic with the carriers by water now using the Panama Canal, and find that to do so they will need further relief from the requirements of the fourth section if they are not to suffer serious loss of revenue on shipments to intermediate points. In the abstract the language of the commission has been retained insofar as possible.

The commission in Fourth Section, Order 124, dated June 2, 1911, refused to permit the carriers to maintain lower commodity rates from points west of the Missouri river to the Pacific coast than to intermediate points, but authorized higher rates to intermediate points than to the coast on traffic originating in territory contiguous to Chicago (zone 1), other territory west of the Buffalo-Pittsburgh line (zone 3), and territory east of that line (zone 4), by 7, 15 and 25 per cent, respectively.

Appeal was taken to the Commerce Court from this decision, and on November 9, 1911, that court set aside the order. The United States Supreme Court, however, in the *Intermountain Rate Cases*, 234 U. S., 476, decided June 22, 1914, upheld the commission. Last July [as noted in the *Railway Age Gazette* of July 24, 1914], at the request of the carriers and to give them time to compile rates conforming with its order, the commission extended the effective date of that order from June 2, 1911, to October 1, 1914 [the order having been held in abeyance pending the court decision], except as to the rates on the commodities in schedule C, concerning which the order was extended to January 1, 1915. Upon the commodities in this schedule the rail carriers need additional relief to enable them to compete with the carriers by water.

Schedule C is a list of 107 commodities, covering generally manufactured articles subject to the most severe water competition and on which the rates to the coast are less than $1 c. l. and $2 l. c. l. The schedule embraces such articles as sulphate of ammonia, chloride of calcium, carbide of calcium, canned fruit, figs, corn, meat, mince-meat, tomatoes, etc.; green coffee, cotton piece goods, hardware and tools, pig iron, structural iron, iron fence, iron posts, iron wires, wire fencing, paint, paper, rice, radiators, sectional boilers, etc.; pig and flat tin and insulated copper wire. The entire list of the commodities named in the schedule, the rates now applicable and the proposed rates are shown in an appendix to the report.

The proposed rates to the north Pacific coast on these items are usually, but not invariably the same as to the California terminals. The railroads assert, with truth:

That the commodities included originate in large volume on the Atlantic seaboard.

That as a whole they are adapted to water transportation and in fact move in considerable quantity from the Atlantic seaboard to the Pacific coast by water.

That the rates by water on them are extremely low and necessitate correspondingly low rates by rail.

That the low rates so imposed from the eastern seaboard to the Pacific coast necessitate correspondingly low rates from the Buffalo, Detroit, Chicago, St. Louis and Missouri river territories (a) so as to permit rail movement from these points to the Pacific coast in competition with the same or similar commodities moving from the Atlantic seaboard; (b) in order to comply with the fourth section—

That since the opening of the Panama Canal the water carriers have materially reduced their rates, shortened the time for transportation, increased the frequency of their sailings and materially added both to their tonnage capacity and to the actual tonnage obtained.

It may be remarked at the outset that the request for additional relief has been withdrawn with respect to 27 of the items which have been transferred to schedules A or B and on which rates are published in accordance with the original order.

It is evident that whatever may have been the degree of competition in the past between the rail and water carriers as to the rates on these articles concerning which additional relief is now sought, we are witnessing the beginning of a new era in transportation between the Atlantic and Pacific coasts. To secure any considerable percentage of this coast-to-coast traffic rates on many commodities must be established by the rail lines materially lower than those now existing.

It has been suggested that the construction of the Panama Canal by the government is indicative of a governmental policy to secure all of this coast-to-coast business for the water lines, and that no adjustment of rates by the rail lines should be permitted which will take away traffic from the ocean carriers which normally might be carried by them. This suggestion, however, loses force under the consideration that the Panama Canal is but one of the agencies of transportation that the government has fostered between the Atlantic and the Pacific. The government has from the beginning of railroad construction in the United States encouraged their construction and operation by private capital and enterprise. Some of these transcontinental lines would not have been built had it not been for the liberality the government extended to them at the time of their construction. As we view it, the Panama Canal is to be one of the agencies of transportation between the East and the West, but not necessarily the sole carrier of the coast-to-coast business. If the railroads are able to make such rates from the Atlantic seaboard to the Pacific coast as will hold to their lines some portion of this traffic with profit to themselves, they should be permitted so to do. The acceptance of this traffic will add something to their net revenues, and to that extent decrease, and not increase, the burden that must be borne by other traffic. It will also give the shippers at the coast points the benefits of an additional and a competitive service.

Few, if any, of the intervening interests are really opposing the petition of these carriers for relief. The intermountain territory, however, is earnestly protesting against the request of the carriers for relief as to the coast rates without adequate provision at the same time for reasonable rates to intermediate intermountain points.

The carriers should be permitted to compete for this long-distance traffic so long as it may be secured at rates which clearly cover the out-of-pocket cost. The lowest proposed rate from Atlantic seaboard territory is 65 cents per 100 lb. on cast and wrought iron pipe in carloads of 40,000 lb. This gives a per car earning of $260, and upon a basis of a 3,200-mile haul yields a car-mile revenue of 8.1 cents and a ton-mile revenue of 4.05 mills. Since the average ton-mile revenue of these carriers is approximately 9 mills, it is probable that a rate which produces 45 per cent as much as the average pays more than the out-of-pocket cost and therefore does not impose a burden upon other traffic. None of the rates proposed appear, therefore, to be open to the charge that they pay less than the out-

of-pocket cost. Many of them are low as applied to the total haul from the Atlantic seaboard, but they are not for that reason low as applied to the haul from the Missouri river. The average haul from the Missouri river territory to the Pacific coast is approximately 1,850 miles. The rate of 65 cents on iron pipe in carloads of 40,000 lb. yields a revenue for this haul of 14 cents per car-mile and a ton-mile revenue of 7 mills. The lowest rate proposed from the Missouri river to the coast is 42 cents per 100 lb. on coal in carloads, carload minimum 60,000 lb. This rate, applied to a haul of 1,850 miles, yields a car-mile revenue of 13.6 cents and a ton-mile revenue of 4.5 mills.

Another relatively low rate from the Missouri river to the coast is that on pig iron, in carloads of 80,000 lb., of 45 cents per 100 lb. On a haul of 1,850 miles this affords a car-mile revenue of 19 cents and a ton-mile revenue of 4.85 mills. Examination of the list of commodities and the proposed rates shows one item, coal, on which a rate of 42 cents is in effect; one item, pig iron, on which a rate of 45 cents is proposed; 19 items on which a 55-cent rate is proposed; three items on which a 60-cent rate is proposed; six items on which a 65-cent rate is proposed; and one item on which a 70-cent rate is proposed. The most important of these items are those on which a rate of 55 cents is proposed. On 14 of these items the rate is based on a carload minimum of 80,000 lb., and of the other five items two are based on a carload minimum of 60,000 lb., one on a minimum of 50,000 lb., and two on a minimum of 40,000 lb. The 55-cent rate and 80,000 lb. minimum yield a loaded car-mile revenue of 23.7 cents and a ton-mile revenue of 5.9 mills for a haul of 1,850 miles, while the 40,000 lb. minimum yields a car-mile revenue of 11.8 cents and a ton-mile revenue of 5.9 mills.

The two main territories of destination involved are described as follows: (1) All that territory lying along these main trunk lines to which rates are made or will be made by combination on the coast terminals. This may be called the back-haul territory. (2) Territory lying east of that just described. The 55-cent rate and carload minimum of 80,000 lb. yield a higher car-mile revenue and a much lower ton-mile revenue than the average returns of any of these lines. Their average load per car varies from 16 tons on the Atchison, Topeka & Santa Fe to 23 tons on the Great Northern. These heavy cars of 80,000 lb. minimum carry at least double the average load on these systems. We are of the opinion that these 55-cent rates and other carload rates yielding a less revenue than 8 mills per ton-mile for the haul from the Missouri river to the Pacific coast may be considered as relatively low. This, however, should not apply to coal or pig iron. We believe that on these commodities the rate should not be considered unduly low for this haul unless yielding a revenue of less than 5 mills per ton-mile. A revenue of 8 mills per ton-mile for a haul of 1,850 miles corresponds with a rate of 75 cents per 100 lb.

No relief will be given as to rates from the Missouri river to the Pacific coast which are 75 cents or more per 100 lb. Upon commodities in this list, other than coal and pig iron, which move to the terminals on rates of less than 75 cents per 100 lb., the rates to the second territory above described should be graded with distance, reaching a maximum near the point where the terminal rate added to the local or proportional rate back meets the rate of 75 cents. Relief from the long-and-short haul rule of the fourth section as to rates from the Missouri river to the Pacific coast terminals will be afforded upon the following commodities in this list: Chloride of calcium; various iron and steel articles; billets, blooms, ingots, etc.; bolts, nuts, washers, etc.; and nails and spikes, etc.; pipe fittings and connections; cast-iron pipe and connections; wrought-iron pipe; pipe, cast iron and cast-iron connections for same; wrought-iron pipe; iron and steel articles; box straps, shingle bands, bailing ties; shoes—horse, mule and oxen; tubing, open seam, n. o. s.; strawboard, n. o. s.; ship and boat spikes; soda ash; tin and terne plate; wire and wire goods; wire, iron, plain, galvanized, etc.; wire rods; zinc (spelter); steel rails; rail fastenings.

If, however, the rate from the Missouri river to the Pacific coast ports upon any commodity covered by the above-described items is hereafter increased so as to equal or exceed 75 cents per 100 lb., such rate must be carried as a maximum to intermediate points. Upon all other schedule C commodities the rates made from Missouri river territory to the Pacific coast terminals should not be exceeded at intermediate points.

Carload commodity rates from points in zones 2, 3 and 4.—Of the articles in the list of commodities 90 per cent are rated in western classification as fourth or fifth class, in carloads, and more than 60 per cent are rated as fifth class, with a lower carload minimum than is here proposed. The differences by which the fifth-class rates from Chicago, Pittsburgh and New York exceed the rates from the Missouri river are 14, 24 and 34 cents, respectively, and the differences by which the fourth-class rates from Chicago, Pittsburgh and New York exceed the rates on the corresponding class from the Missouri river are 17, 29 and 42 cents, respectively. We are dealing here with a set of commodity rates materially lower than the rates on the classes to which these commodities belong, and the differentials to be applied from Chicago, Pittsburgh or New York should bear a reasonable relation to the rates from the Missouri river, having consideration for the additional and total hauls involved.

We are of the opinion that the petitioner's carload rates upon the commodities shown in schedule C, except those covered by the 27 items above referred to, and with the further exceptions of coal and pig iron, should be made from Chicago, Pittsburgh and Atlantic seaboard territories to the intermountain points by adding to the rates on the same commodities from the Missouri river to the same destinations differentials not exceeding 15 cents from Chicago, 25 cents from Pittsburgh and 35 cents from the Atlantic seaboard. The differential of 15 cents from Chicago over the Missouri river permits a ton-mile revenue of 6 mills for the haul of 500 miles from Chicago to Missouri river; 25 cents from Pittsburgh over the Missouri river rate permits a ton-mile revenue of 5 mills for the haul of approximately 1,000 miles from Pittsburgh to the Missouri river; and 35 cents from the Atlantic seaboard over the Missouri river permits a ton-mile revenue of 4.66 mills for the haul of nearly 1,500 miles from New York to the Missouri river. These differentials correspond approximately with the fifth-class differentials, and the rates applied from points in zone 2 should increase from the western to the eastern boundary of that zone, not exceeding at Mississippi river points the fifth-class differential of the Mississippi river over the Missouri river. They should increase from the western toward the eastern boundary of zone 3, not exceeding at the Cincinnati and Detroit points the amounts by which the fifth-class rates from these points exceed the Missouri river fifth-class rates.

Less-than-carload commodity rates.—There are about 50 items in this list on which l. c. commodity rates apply from all eastern defined territories to the Pacific coast. These less-than-carload rates vary from $1.75 to $1 per 100 lb. Eighty-five per cent of the commodities move on rates of from $1.25 to $1.50 per 100 lb. The table of rates quoted by the water lines from the Atlantic seaboard to the Pacific coast shows that the competition of these lines for the less-than-carload business has been and is likely to be just as severe as is the competition on the carload rates. This less-than-carload list is more varied in character than is the carload list, and comprises many articles in all the first three classes and a few in the fourth class. The 75-cent rate used as a minimum on the carload commodities is approximately 60 per cent of the rate on the class to which these commodities belong. These carload rates, however, apply on very large carloads of from 60,000 to 80,000 lb., while the carload minima to which the class rates usually apply are from 30,000 to 40,000 lb. This being the case, a lower rate may properly apply on the higher carload minimum.

We are of opinion that relief should be authorized on all articles rated as first or second class on which the proposed less-than-carload commodity rates from the Missouri river to

the Pacific coast are less than $1.50 per 100 lb., and on all articles rated as third class or lower on which the proposed less-than-carload commodity rates are less than $1.25. Relief will be denied in all other cases.

Less-than-carload commodity rates from Chicago, Pittsburgh and New York.—The differentials by which the rates from these points to intermountain territory exceed the rates from the Missouri river ought not to exceed 25 cents from Chicago, 40 cents from Pittsburgh and 55 cents from the Atlantic seaboard. These are the same differentials as apply on first-class traffic and are taken because the articles shipped are divided about equally among the three higher classes.

Commodity rates to points in territory 1.—This is the so-called back-haul territory just east of the terminals. Rates to many points in it are made by taking the rates to the Pacific coast terminals and adding thereto the local rate from the terminal to destination. The practice of thus making rates to these points had resulted in complaint on the part of the shippers. It is suggested that it would be better if rates to these intermediate points were made by adding to the terminal rate something less than the local rate or by making basing rates to the terminals less than the local rates to such points, to be used in connection with the local rates from the terminals in making through rates from eastern points.

It is believed that if the carriers were to put in effect one or the other of these schemes the policy of liberality to the interior towns would be to their own benefit. It would also result in extending to these towns the full benefits of the increased service by the canal. The commission does not feel that it would be best to make an order as to these rates at this time. The carriers are given 60 days, however, in which to submit a plan for the readjustment of the back-haul rates.

It is not considered necessary to apply the coast terminal rates to any points except the ports of call on the Pacific coast at which the Atlantic-Pacific steamship lines deliver freight.

ACCIDENT BULLETIN NO. 52

The Interstate Commerce Commission has issued Accident Bulletin No. 52, containing the record of railway accidents in the United States during the quarter ending June 30, 1914; and also the record for the twelve months ending on that day. In the quarterly statement the number of passengers killed in train accidents is given as 5, as compared with 13 in the last preceding quarter, and 21 in the quarter ending June 30, 1913.

From the annual records we copy, instead of the short table, No. 1, which we have usually given with the quarterly report, the larger table, No. 1 *B*, in which casualties to persons are shown more in detail.

Table 1 *B* does not include industrial accidents; adding these, the total number of persons killed during the year was 10,302, and of injured 192,622, as shown in the following table:

Casualties, Year Ending June 30, 1914

	Killed	Injured	Killed	Injured
Total of Table 1B	...	...	9,893	79,388
Industrial accidents to employees—				
Working on tracks or bridges	154	26,941		
At stations, freight houses, etc	70	26,126		
In and around shops	101	53,051		
On boats and wharves	22	1,788		
At other places	62	5,368		
			409	113,274
Total			10,302	192,662

In all of the items for 1914, except "other persons," not trespassing, there is a considerable decrease from the record of the year last preceding, as appears from table No. 1 *C*.

Annual table No. 2, showing the number of collisions and derailments, classified according to causes, etc., is given below.

Annual Table No. 1c—Comparisons with 1913 and 1912

Item	1914 Killed	1914 Inj'd	1913 Killed	1913 Inj'd	1912 Killed	1912 Inj'd
Passengers:						
In train accidents	85	7,001	181	8,662	139	9,391
Other causes	180	8,120	222	7,877	179	6,995
Total	265	15,121	403	16,539	318	16,386
Employees on duty:						
In train accidents	452	4,823	557	6,905	596	7,098
In coupling accidents	171	2,692	195	3,360	192	3,234
Overhead obstructions	89	1,490	94	1,835	77	1,523
Falling from cars	497	14,563	560	16,005	573	13,874
Other causes	1,314	27,273	1,533	28,514	1,482	23,391
Total, employees	2,523	50,841	2,939	56,619	2,920	49,120
Total, pass. and emp.	2,788	65,962	3,342	73,158	3,238	65,506
Employees not on duty	327	1,097	362	1,178	315	959
Other persons, not trespassing:

The bulletin gives the usual tables classifying personal casualties in great detail, including two tables in which passenger trainmen are separated from freight trainmen; but the statement showing the number of employees in service, and the ratio thereto of certain classes of killed and injured, which appeared in the last annual bulletin (*Railway Age Gazette*, March 6, 1914, page 468) does not appear in the present bulletin. A table on

page 36 gives the total number of accidents each year during the last 13 years, with the number of persons killed, the number injured, and the damage to road and equipment.

Thirty-seven pages of this bulletin are filled with the usual reports of accidents investigated by the agents of the commission since the last preceding quarterly bulletin. These accidents were as follows:

Georgia So. & Florida	Cordele, Ga.	Jan. 9 Derailment
Wabash	Attica, Ind.	Apr. 5 Derailment
Baltimore & Ohio	Wheeling Jn, Pa.	Apr. 10 Butting collision
Toledo & Ohio C.	Mansfield, Ohio	Apr. 21 Rear collision
Seaboard Air Line	Norfolk, Va.	Apr. 27 Rear collision
Atlantic Coast Line	Palmer, Ga.	May 14 Rear collision
Chicago & N. W.	Crystal Lake, Ill.	May 17 Butting collision
Northern Alabama	Hayes Mine, Ala.	May 19 Rear collision
M. K. & T. of Texas	West Point, Tex.	May 27 Derailment
Baltimore & Ohio	Cook's Mills, Pa.	May 31 Derailment
Colorado & So.	South Park Jn, Colo.	June 1 Butting collision
Hocking Valley	Sagrado, Cal.	June 12 Butting collision
Southern	Sadler, N. C.	June 14 Derailment
Southern Pacific	Conley, Cal.	June 15 Derailment
L. & N.	Moore's, Ky.	June 28 Derailment

All of the accidents investigated during the year are summarized and indexed in a table filling six pages.

Electric railways reporting to the commission (not included in the foregoing statistics) had 551 persons killed during the year and 6,108 injured; and there were 154 collisions and 78 derailments. Train accidents are charged with 28 fatalities. The total number of passengers killed from all causes was 58, and of employees 77 (28 in industrial accidents). The number of trespassers struck or run over by cars was 269; 161 killed and 108 injured.

COMBINATIONS IN RESTRAINT OF LEGISLATION

[From the New York Times]

Thirteen Eastern railways publicly announce a combination against full-crew laws. Fourteen Western railways presented to the Governor of Illinois a petition for the repeal of the two-cent fare law. In Oregon the farmers are leading in a protest against the full-crew law. In Missouri 112 members of the legislature have presented petitions signed by constituents urging an increase in passenger rates to 2½ cents a mile.

Through all these and many other signs of the new temper regarding the railways run two characteristics—first, the legislatures are untrue representatives of the people; and, second, the new friends of the railways are such for their own interests. It is because of tardy appreciation of the fact that the interests of the railways are the interests of the people that there are so many new protectors of the railways.

In this state the full-crew law was the work of a discredited administration, false to its trust in this and other respects. . . . The thirteen conspirators in the appeal from the oppressions of the legislatures of Pennsylvania and New Jersey propose to "submit the question directly to the public, that the people may determine what is just, right and fair." There was a time when the railways would not have dared to do such a thing. The railways have bowed to the laws, have repented their misdeeds and now feel that they have a standing to appeal both from persistence in misjudgement and from persecution in the name of reform.

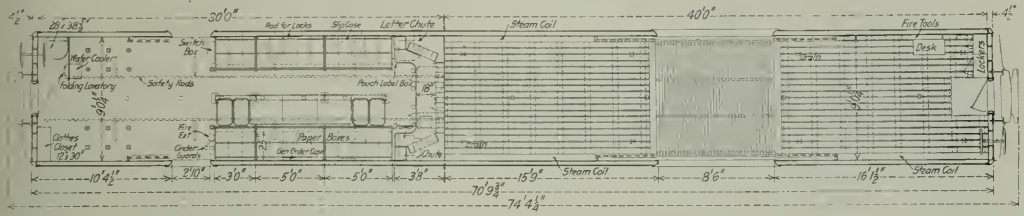
There is pending a Federal full-crew law, and a "long-train" law is proposed in this state which would tend to make two trains do the work of one, and multiply crews accordingly. . . . The present campaign ought to have come before the existing laws were passed, but it comes with added force through the demonstration that the railways are fined to the disadvantage of their patrons under the pretense of "safety first." The true inspiration of such laws is the extortion of money from the railways on whatever pretext. . . . Will the legislatures dare to defend what they dared to pass?

ANATOLIAN RAILWAY.—A message from Constantinople states that the construction of the extension of the Anatolian Railway from Angora to Sivas has been begun.

Jersey Central Steel Baggage and Mail Equipment

The Cars Are 70 Ft. Long, Weigh 144,700 Lb. and Conform to the United States Government Specifications

The Central Railroad of New Jersey has in service seven steel baggage and mail cars having a 30 ft. mail compartment equipped according to the United States Government specifications and a 40 ft. compartment for the transportation of baggage or express. These cars were built by the Harlan & Hollingworth Corporation, Wilmington, Del., are 70 ft. 9¾ in. long over end plates and



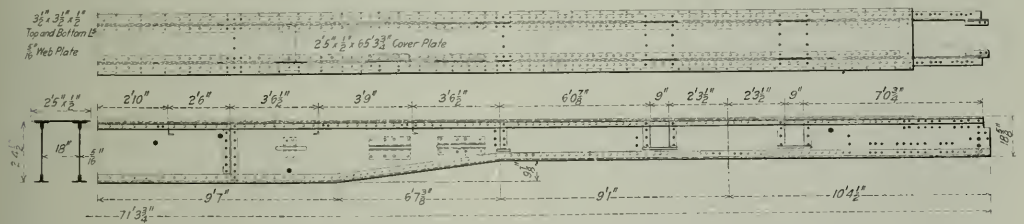
Floor Plan of the Jersey Central Baggage and Mail Cars

weigh 144,700 lb. each. They are mounted on six-wheel trucks equipped with the Commonwealth steel frame, and clasp brakes.

UNDERFRAMES

The center girder, which is the main member of the underframe, is of the fishbelly type, built up of steel plates and angles.

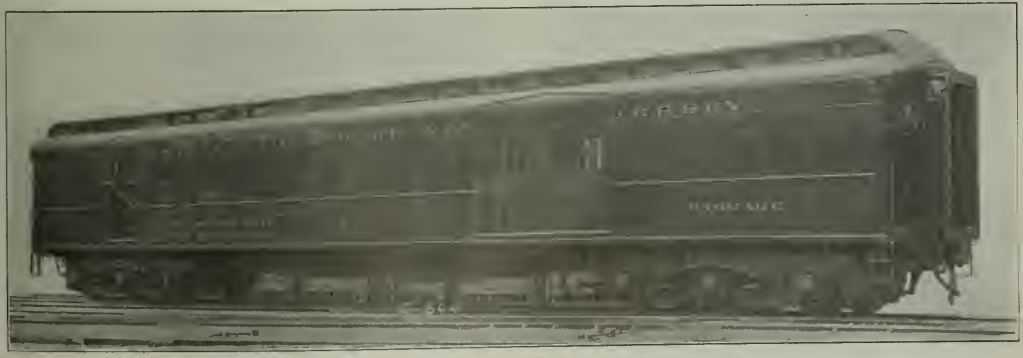
The two center crossbearers are placed 5 ft. 4 in. on either side of the center of the car, and are built up of diaphragms pressed from 5/16 in. plate, which are the full depth of the center sills at the inner end, while the lower flange tapers upward toward the outside of the car till a depth of 6⅛ in. is reached. A 5/16 in. pressed filler is also used between the webs



Center Sill Construction of the Baggage and Mail Cars

The two web plates are 2 ft. 4 in. deep at the center of the car, and are spaced 18 in. apart; this depth is maintained for 9 ft. 7 in. on either side of the center of the car, at which point the web plates begin to taper, and at a point 6 ft. 7⅜ in. farther on they reach a depth of 18⅛ in., which is maintained to the end of the

of the center sills, and the crossbearers are finally reinforced by a 6 in. by ⅜ in. cover plate at the bottom and a 9 in. by ⅜ in. cover plate at the top, both extending across the car. The two intermediate crossbearers are spaced 16 ft. 2 in. on either side of the center of the car and the diaphragms, which are 14 in.



Steel Baggage and Mail Car in Service on the Central Railroad of New Jersey

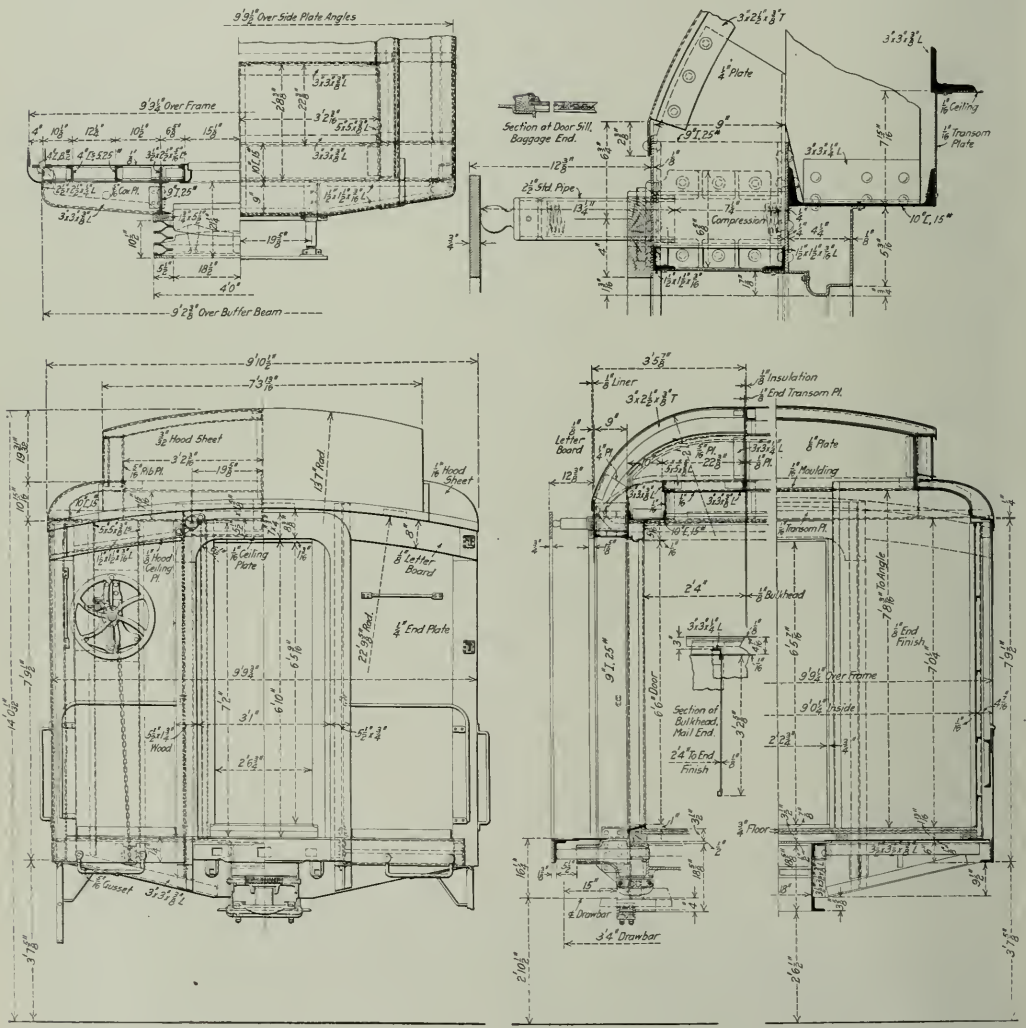
deep at the inner end and 6⅛ in. deep at the outer end, are pressed from 5/16 in. plate with a 5/16 in. pressed filler between the webs of the center sills. A top cover plate 9 in. by ⅜ in. is used on the intermediate crossbearers as well as a 6 in. by ⅜ in. bottom cover plate, both extending the full width of the car.

The double body bolsters are spaced 50 ft. 6¾ in. between centers and consist of two members whose centers are 2 ft. 8 in. on either side of the center of the center plate. These members

ties or floor supports consisting of 6 in., 8 lb. channels are used, and extend between the center and side sills. The side sills are 6 in. by 3½ in. by 7/16 in. angles and extend the full length of the car.

END CONSTRUCTION

The end construction is of the dummy type. The corner post of the car is a 4 in. by 3½ in. by ⅜ in. angle to which is riveted a 4 in., 8.2 lb. Z-bar, and a 2½ in. by 2½ in. by ¼ in. angle is also riveted to this Z-bar as shown in the drawing of the end



End Construction of the Steel Baggage and Mail Cars

are built up of four diaphragms pressed from 5/16 in. plate with 5/16 in. pressed fillers between the webs of the center sills; a 20 in. by ½ in. top cover plate is used and a 16½ in. by ½ in. bottom cover plate, both extending the width of the car and riveted to the pressed diaphragms and fillers. Steel castings of special section are riveted to the two cross members of the body bolster at points 3 ft. 10 in. on either side of the longitudinal center line of the car and support the body side bearings. Cross

construction. A 4 in., 5.25 lb. channel is placed with the flanges toward the outside of the car and the back 10⅛ in. nearer the center of the car than the inside of the web of the Z-bar, and another channel of the same size and weight is placed 12¼ in. nearer the center of the car with the flanges turned inward. At a distance 10½ in. farther in from the back of the inside channel two 3½ in. by 2½ in. by 5/16 in. angles are placed with the long flanges riveted together and the short flanges turned out-

ward at the end of the car. A 4 in., 5.25 lb. channel with the flanges toward the outside of the car and its back placed 6⅝ in. beyond the center of these two angles forms the door post. The main vertical buffing members are 9 in., 25 lb. I-beams, and are riveted to the two connected angles referred to above. An end buffing sill construction of 3 in. by 3 in. by ⅜ in. angles and 5/16 in. plate extends between this I-beam and the corner of the car. The end members are connected at the top by a 10 in., 15 lb. channel, extending across the car with the flanges turned upward.

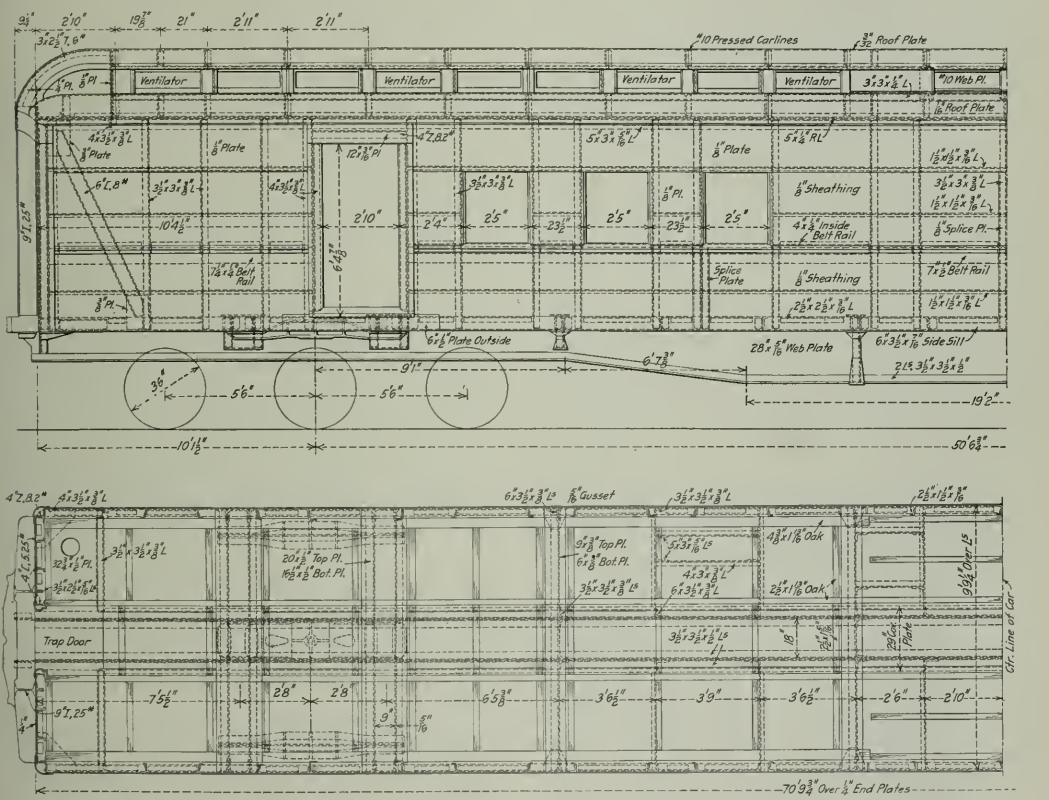
BODY FRAMING

The baggage doors have an opening 8 ft. 6 in. wide by 6 ft. 2⅛ in. in height, while the side doors in the mail end of the car are 2 ft. 10 in. wide and the same height as the side doors in the baggage compartment. There are 6 in., 8 lb. channel diagonal braces used between the top of the corner posts and the bottom of the first side post on either side of the car as well as between the top of the door post and the bottom of the side posts next adjoining. The belt rail is 7 in. by ¼ in. plate from the door posts to the corners of the car and 7 in. by ½ in. plate between the doors; and the side posts are 3½ in. by 3 in., by ⅜ in. angles; the side sheathing is ⅛ in. plate. The side door posts are 4 in. by 3 in. by 5/16 in. angles connected at the top by 4 in., 8.2 lb. Z-bars. The side plate is a 5 in. by 3 in. by 5/16 in. angle, to the upper flange of which is riveted a 5 in. by ¼ in. plate with a 2½ in. by 2½ in. by ¼ in. angle above this. The deck sill is a 3 in. by 3 in. by ¼ in. angle, and the carlines are pressed from No. 10 steel plate. The lower deck roof plates are 1/16 in. thick and the upper deck plates are 3/32 in. thick.

OTHER DETAILS

The trucks are of the six-wheel type, have clasp brakes and are fitted with the Commonwealth cast steel frame, which is 15 ft. 6 in. long over all. The truck wheelbase is 11 ft. and the journals are 5½ in. by 10 in. M. C. B. standard. The wheels are Midvale solid steel and are 36 in. in diameter.

The floor in the mail compartment is of ⅛ in. steel plate with 3-ply Salamander insulation and double wood floors, the bottom floor being ¾ in. yellow pine, while the top floor is ¾ in. maple, 1/16 in. insulating paper being placed between the two layers. In the baggage end the floor is of Flexolith composition laid on Keystone metal with ⅛ in. floor plates and covered with yellow pine grating. There is an oak flooring at the doorway laid cross-



Arrangement of the Members of the Body Frame and Underframing

wise of the car. The inner side of all the outside plates throughout the car is lined with 3-ply Salamander insulation, while the outer side of all the inside plates in the mail compartment is insulated with the same material, excepting the ceiling plates, which are insulated by Agasote strips between the plates and the carlines. There is no insulation on the inside finish in the baggage compartment. The mail compartment is sheathed on the inside with 1/16 in. steel plates on the sides and No. 16 gage plates on the upper ceiling. The lower ceiling is covered with No. 20 gage plate, while the ends are sheathed with ⅛ in. steel plates. This same arrangement is followed in the baggage compartment.

The special equipment includes Gould couplers, centering devices and friction draft gear; Miner friction buffing gear; Ajax vestibule diaphragms; Standard Heat & Ventilation Company's vapor system of heating; Safety Car Heating & Lighting Com-

pany's axle light equipment and lighting fixtures; Edison storage batteries; Adams & Westlake Company's folding lavatory; Westinghouse air brake and signal system; American slack adjusters; Ward ventilators and Gould journal boxes.

REPORT ON GRAY-THURBER TRAIN CONTROL SYSTEM

The report of H. W. Belnap, chief of the division of safety, of the Interstate Commerce Commission,* was sent by the commission to Congress, on January 9, as a supplement to its annual report; and as printed by Congress it includes a report, filling 30 pages, together with a number of illustrations, giving the conclusions of the division of safety on the Gray-Thurber automatic train control system, which was subjected to a series of tests on the Pennsylvania Lines West of Pittsburgh, in April, May and June, 1914. This apparatus was first tried in 1905, but was taken out; and experiments were resumed in 1911. In 1912 the Block Signal and Train Control Board made some tests, which were continued by the present engineers of the commission, after the abolition of the board. A report was made in July, 1913, but changes were made in the apparatus and then the work was gone over again. The present report is in some respects conditional, and the proprietors have proposed a number of further changes, which are noted at the end of the report.

This is an electrically operated system, the principal distinctive feature being the insulation of a truck of the tender from the frame of the locomotive; this for the purpose of regulating the conveyance of electric signals from the roadside to apparatus on the engine by means of wires connected to the rails. At each signaling point there is a short section—66 ft.—insulated at both its ends. The insulated track section is sufficiently long to permit the engine, exclusive of the tender, to stand between the insulated joints.

The insulation between the tender and its truck is made of two sheets of fiber, with a metal detector plate between them, the plate being included in an electric circuit so that broken-down insulation will de-energize a relay on the engine, and thus provide against false-clear signals. The side-bearing plates, the brake hangers, and the rear drawbar of the tender are also insulated, and all the bolts are included in the detector circuit. There is an insulator in the brake rod and also in the uncoupling chain at the rear of the tender. There are two sets of circuits on the engine, with a storage battery for each. On the roadside there is the usual track battery and a detector battery, the latter being used to energize a polarized relay. A Boyer speed indicator is used to make the apparatus inoperative at a certain predetermined low speed. The proper performance of certain functions in the apparatus depends on having the circuit of the track battery always of one polarity.

Following are the conclusions of the report:

CONCLUSIONS

I. The system as installed and tested constitutes a material improvement as compared with other arrangements of the same system previously tested.

II. With the installation of this system the following features must be provided:

1. All insulated joints, except the opposite insulated joints required at the entrance to each block section, must be staggered a distance equal to the longest distance between front tender wheels and rear locomotive wheels of all locomotives equipped; all other rail joints must be properly bonded.

2. Means must be provided to insure that track batteries will not oppose the detector batteries, and that the battery in the primary engine circuit will always oppose the detector batteries.

III. The system is deficient in the following respects:

1. The use of sand in starting trains will cause undesirable stops or "safe failures" of the system unless the pick-up key is held closed.

2. False-clear failures of the system may occur, due to (*a*) a ground on wire S-102; (*b*) bridging the tender drawbar insulation, or an electrical conductor from tender body or frame to car truck or steel car in the train; (*c*) intermittent low resistance ground on short insulated rail section; (*d*) intermittently broken-down insulated joint; (*e*) foreign current in the track rails.

3. Protection against certain dangerous conditions and against failures or defects of apparatus at one point is transmitted to the signal location in the rear; if these conditions arose or failures or defects occurred after an approaching train had passed the entrance to the block section in rear, protection would not be afforded in time to be of any avail.

The tests conducted have resulted in the accumulation of a large amount of data which should be useful in further development of the system. Such further development, however, can not properly be made by means of experimental tests with only one locomotive and but few locations equipped, and covering but a comparatively short period of time. Properly to develop a system of this character to meet all the needs of actual service it should be installed and used for the purpose intended.

Notwithstanding the defects and deficiencies pointed out in this report, the system in its present state of development, if properly installed and maintained as an adjunct to a block-signal system, would increase the safety of train operation.

REVISED APPARATUS

Following the conclusions, Mr. Belnap says:

During the conduct of the tests and since their completion the proprietors of this system have proposed certain revisions in the apparatus employed. None of these revised arrangements has been thoroughly tried out. Briefly, the proposed changes consist essentially of the following:

In order to insure that current from track batteries will always flow in the propert direction to allow the system to provide protection against broken-down insulated joints, all track relays should be polarized. The proprietors also stated that polarized track relays were not employed in this installation for the reason that the railroad company had not used them heretofore in this territory and the understanding when the installation was made was that the existing block-signal system must not be interfered with.

With the installation of this system as an adjunct to an automatic block-signal system, some of the functions performed by relays provided for that particular purpose in the installation tested would be accomplished by utilizing relays of the signal system.

An electro-pneumatic valve, having relay points attached to its armature, has been designed, the purpose being to combine the functions of engine relay, magnet valve, and brake valve in one instrument, and to eliminate one set of engine circuits.

It is intended to locate the speedometer in the box or case on the tender and to include the speedometer frame and metal parts of valves in the detector circuit for the purpose of detecting the grounding of any wire.

The electrical contacts attached to the speedometer are intended to be closed when the rate of speed is between 1 and 15 miles per hour, and at these low speeds the train-control valve is intended to be maintained energized through speedometer contacts for the purpose of obviating undesirable stops due to the use of sand.

RAILWAY CONSTRUCTION IN BRAZIL.—The Brazilian Chamber of Deputies has authorized the government of Brazil to contract with the concessionaires of the Paraguayan Northeastern Railway for the prolongation of the lines of that company so that they will connect with those of the Brazilian Railway system. This will mean direct railway communication between Asuncion and Rio de Janeiro.

Value of a Locomotive in Terms of Earning Capacity*

Its Consideration Suggests Possibilities of Improving Present Practice; Importance of Reducing Shop Time

By George S. Goodwin

Mechanical Engineer, Chicago, Rock Island & Pacific, Chicago, Ill.

Consideration of the potential value of locomotives, expressed in terms of average daily earning capacity, suggests several important possibilities for the improvement of general practice, which it is the purpose of this paper to discuss.

For the fiscal year ending June 30, 1913, the total operating revenue from 251,277 miles of railroad was $3,181,177,898, divided as follows:

Freight	$2,203,860,284	69.28 per cent
Passenger	716,174,021	22.51 per cent
Other transportation revenue	224,939,393	7.07 per cent
Total revenue from transportation	$3,144,973,698	.98.86 per cent
Non-transportation revenue	36,204,200	1.14 per cent
Total operating revenue	$3,181,177,898	100.00 per cent

This revenue was produced by the use of 63,198 locomotives having an average tractive effort slightly over 30,000 lb. If it is assumed that 11 per cent of these locomotives are in the shop receiving repairs, 56,246 locomotives are left to earn the above revenue. Dividing the total revenue from transportation by the number of engines gives nearly $56,000 per year, or $153 per day, as the gross earnings of an engine. Applying to this figure the operating ratio, 71.33, we have $44 per day as the net earning power of the locomotives of the United States. This figure includes all locomotives and the net earning power for freight locomotives alone would be somewhat higher than this. This money was earned after the locomotive had paid for repairing the track, the cars and itself.

The most notable thing about these figures is that nearly 99 per cent of the total operating revenue of the railways is received from the operation of trains, for the successful operation of which there are three essentials, namely:

Locomotives to move the trains, which is the subject of this paper.

Equipment to carry the tonnage.

Track on which to move the trains.

No two essentials are of any benefit without the third, and the importance of all three is shown by the fact that for the fiscal year ending June 30, 1913, $544,000,000 was spent for maintenance of equipment and $538,000,000 was spent for maintenance of way.

In order to show the monetary value of a locomotive more clearly, statistics were obtained from 24 of the larger roads in the middle and western states for the fiscal year ending June 30, 1913. The average gross earnings of freight locomotives, excluding 11 per cent in shops, is $189 per day; applying the operating ratio given above for all roads, the net earnings for freight locomotives are $54 per day, as against the $44 already shown for all the roads of the United States. It was found that the average rate per net ton-mile accounted for the fluctuation in the value of a locomotive. A locomotive capable of earning $75 per day on one road may be able to earn only $40 per day on some other road, and this is further affected by the size of the engine, the amount of work for it to do, etc.

The value placed on a locomotive when rented of course varies on different roads, both as to the amount and as to the basis of computation. (Invariably running repairs are taken care of by the borrower, and general repairs by the lender.) Some use the size of cylinder, and others the weight on drivers or total tractive effort in computing this value. The general minimum charge is $10 per day, increasing to from $25 to $40 for the modern engine. Two of the roads from which this information was solicited base the rental on a fixed charge per 1,000 lb. tractive effort, a good average being 50 cents per 1,000 lb. Five roads base their rental charges on the interest and depreciation figured on the value of the locomotive in question. To this is added charges for general repairs, taxes, insurance, and profit on the transaction. An example of this with the profit omitted will show what might be termed "out of pocket" value of a locomotive. The following table shows approximately what this would amount to for different original costs between $10,000 and $30,000 with assumed charges for interest, depreciation, taxes, etc., and repairs. The charges for repairs are based on the assumption that 100 miles represents a day's work for a locomotive.

Rental Per Day, Based on Interest, Depreciation, Taxes, Insurance and Repairs

Original cost	Interest at 5 per cent	Depreciation at 5 per cent	Taxes and insurance at $1.09 per $100	Repairs on basis of 100 miles per day	Total
$10,000	$1.37	$1.37	$0.30	$7	$10.04
15,000	2.06	2.06	0.45	8	12.57
20,000	2.74	2.74	0.60	9	15.08
25,000	3.43	3.43	0.75	10	17.61
30,000	4.11	4.11	0.90	11	20.12

Of the four methods, namely, size of cylinder, weight on drivers, rate per 1,000 lb. tractive effort, and the interest and depreciation method, the last two are more accurate and the third is more simple. One must admit, however, that the last discriminates between the modern, highly efficient engine and the older engine which is less efficient. The modern engine with the latest devices to give more economical performance certainly is worth more than the same size engine built ten or even five years ago.

We have thus developed three measures of the value of a locomotive, viz.: What it can actually earn; what it is worth from an investment standpoint, or what might be termed the "out-of-pocket" value, and what it is usually rented for. We have shown also that 99 per cent of the total operating revenue is produced by these locomotives while moving trains. This brings us to another phase of the problem.

An engine only earns money while it is moving freight, and is unproductive when not working. In order to bring out forcibly the actual miles an engine makes per day, I have taken from the reports of the Interstate Commerce Commission the freight revenue miles for a few roads and from this ascertained the average miles per day the engines on those roads make. These are, of course, approximate, but since all are taken the same way, the results are probably fair to all. To say the least, the results are startling and were it not that the sources of information are unquestionable it would sound very reasonable to argue that an average of 57 miles per day or 4 hours at 14 miles per hour is ridiculous. On the road with which I am connected a study has been made of just how a freight locomotive day is spent. A special form or report,* developed under the direction of N. D. Ballantine, assistant to the second vice-president, which accounts for every movement of the locomotive during the day, was used for this purpose. Reports are made independently by the roundhouse foreman, yardmaster and train conductor, and these are combined with the information regarding the engines in the shop into a single report which is summarized for the month. This report was described in an address by Mr. Ballantine before the Rock Island Railway Club and later printed in the July number of the Rock Island Employes' Magazine. (In comparing the data with other lines great care should be taken to know on just what basis their data is prepared, and unless the information

*An abstract of a paper presented before the Western Railway Club, February 16, 1915.

*See *Railway Age Gazette*, October 27, 1911, and October 25, 1912, for descriptions of these reports.

is developed from a similar record, its accuracy may be open to serious question.) The following is an analysis of these reports for the month of October, 1914:

FREIGHT LOCOMOTIVES

Mechanical Department Care

Roundhouse	6 hr. 49 min.	28.40 per cent
Running repairs	2 hr. 41 min.	11.18 per cent
Classified repairs	3 hr. 27 min.	14.38 per cent
Total mechanical department	12 hr. 57 min.	53.96 per cent

Terminal Detention

Regular schedule	2 hr. 55 min.	
Stock, fruit, vegetables	7 min.	
Superior trains	3 min.	
Insufficient tonnage	20 min.	
Main line obstructed		
Rest for crews	7 min.	
Miscellaneous	14 min.	
Time between call and departure	16 min.	
Total terminal detention	4 hr. 2 min.	16.80 per cent

Time Between Terminals

Actual running time	4 hr. 16 min.	17.78 per cent
Meeting trains	53 min.	(mi. per day 68)
Station work	1 hr. 20 min.	
Track conditions	1 min.	
Sixteen-hour law	1 min.	
Accidents, etc.	1 min.	
Block signals	2 min.	
Engine failures	2 min.	
Car failures	3 min.	
Weather conditions		
Miscellaneous	22 min.	
Total time between terminals	7 hr. 1 min.	29.24 per cent
Total time accounted for	24 hr.	100.00 per cent

This brings out clearly the following points:

An engine is in the hands of the mechanical department being made ready to move tonnage	12 hr. 57 min.	53.9 per cent
An engine is in the hands of the transportation department ready to move tonnage	6 hr. 47 min.	28.3 per cent
An engine is actually moving tonnage and therefore earning money, only	4 hr. 16 min.	17.8 per cent

This brings us to the third division of the paper, viz.: What can be done to make the engine more available for handling tonnage? This same thought is very aptly stated by George R. Henderson, quoted in Bulletin No. 60 of the Baldwin Locomotive Works. Mr. Henderson believes in "wearing out the locomotives as fast as possible, not by improper treatment or careless maintenance, but by the legitimate work of hauling trains. The faster they can be worn out the sooner they will be replaced with modern engines, and the strides made in power and type of locomotives in the past few years have been such that an engine only 10 years old is of comparatively little use, except for branch service."

In the example of the distribution of a locomotive day the roundhouse is charged with 6 hr. 49 min., or 28.4 per cent of the day. There are several items in connection with this work in the roundhouse which will suggest opportunities to reduce the time. Improved dump grates, good ash pan designs, properly maintained turntables, and hot water boiler washing systems are all vital factors in reducing the time in the roundhouse. Good inspection is necessary in order to save failures on the road. Inspection pits have been found to be advantageous, especially when engines are to be turned quickly and have not time to be placed on the roundhouse pit. There should be enough men in the roundhouse to do the work needed and the machine shop of the roundhouse equipped with adequate tools.

Running repairs are charged with 2 hr. 41 min., or 11.2 per cent of the day. This item, no doubt, will vary closely with the time an engine has been out of the shop, and with the thought in mind of reducing the running repairs the road with which I am connected has reduced the mileage between shoppings. Changes in design have been instituted with a view to eliminating the running repairs. With the advent of the gas and electric welding outfit it has been possible to make many repairs at a saving in cost and time that heretofore would not have been possible.

All roads have some form of report showing failure of engine parts. On our line this is tabulated under the different detail parts, and a monthly report which shows the nature of the failure and the numbers of the engines making the failures. This is watched closely and when any particular class of engines shows a repeated weakness in any particular detail we study it with a view to correcting the design and overcoming the trouble. After the engine has made its mileage it gets a general overhauling and wherever possible we make our engines pull a train to the point of shopping. If it be assumed that an engine receives general repairs every 18 months and that 60 days is the average time the engine is out of service, that means that 11 per cent of the engines are always in the shop. Sixty days multiplied by $44 equals $2,640, the loss while the engine is in the shop.

Everyone knows there are ups and downs in the traffic movement, and during the slack business when locomotives are not needed to move trains it is obvious that we should put them through the shop, provided, of course, that they are ready for the shop and the shop can take care of them. When an engine is about to go to the shop many railroads, ours among them, make a practice of sending advance notice to the shop of just what material will be needed. On firebox work 30 days' advance notice is desirable, so that the new firebox will be ready to put in as soon as the old one can be cut out.

After the engine reaches the shop what improvement can be made there with a view of cutting down the time in the shop? The first thought is modern shop facilities, and considering that an engine is worth $44 per day, it ought not to be difficult for anyone to show substantial savings by the use of more modern shops. Assume that a shop can turn out 360 engines per year, and that by making certain changes the time per engine could be reduced four days; assume further that for three months of the year there is sufficient business to provide work for these engines just as soon as they are turned out; the saving then will be 90 engines multiplied by four days, or 360 engine days, which at $44 per day equals $15,840. In addition to this, repairs can be made more cheaply in the modern shop and the capacity of the shop is increased in this specific case 6.7 per cent.

When one considers that the average locomotive is worth $44 per day it is a simple problem to calculate what the lack of material means in engine delays. For this reason the mechanical department and the stores department should co-operate with each other with a view to having the necessary material on hand. A great deal of this material for which engines are delayed is of very moderate price, so that no great valuation is involved, and in practically all cases this class of material is common to several engines. Too often the fact seems to be lost sight of, that an engine is worth money, and only the fact is seen that there is so much invested in stock, without regard to whether the equipment can be repaired promptly.

While this paper has dealt particularly with what improvements the mechanical department can make in the engine performance, the study of the locomotive shows a remarkable opportunity for all concerned to aid in its work by co-operation. This includes all departments having anything to do with the movement of trains, or the equipment necessary for the movement of trains.

BUSINESS ON THE BUENOS AIRES SUBWAY.—The Compagnie Générale de Tramways de Buenos Aires, of Brussels, reports, with regard to the first section of the underground railway of the Anglo-Argentine Tramways Company in Buenos Aires, which was opened for traffic in December, 1913, the length being 4.2 miles, that during the first nine months of operation the average receipts, if applied to a whole year, would amount to $138,000 a mile per annum, as compared with $93,600 in Paris, $67,200 in London, and $141,600 in New York. As a consequence of the financial crisis in Argentina the construction of the second underground section has been indefinitely postponed, although the hope is expressed that an extension of time will be granted by the authorities. The European war has reacted unfavorably on Argentina.

Arbitration of Engineers' and Firemen's Demands

Testimony of J. W. Higgins on Schedule Provisions; Work of Firemen and Hostlers; Present Cost of Living

J. W. Higgins, general manager of the Missouri Pacific, was the principal witness last week at the hearing at Chicago before the board of arbitration on the wage demands of the engineers and firemen on the western roads. Mr. Higgins testified in connection with Exhibit 38, outlining the development of the various schedule provisions, to show that many of them were adopted to meet local conditions and practices of years ago which no longer exist, but that the railroads have been unable to get rid of the rules and that now the brotherhoods are seeking to have them applied generally.

For example, he said, "We have a rule on the Missouri Pacific providing that the engineer need not run his engine between the trains and the roundhouse. If he does he gets one hour's pay. This single rule cost the Missouri Pacific $256,696 in 1914, or eight per cent of the total wages paid to engineers and firemen. The rule was brought about in the early days under pioneer conditions when, because of the prevalence of desperadoes and the resulting danger by night to men who had to walk to and from the roundhouse, the hazard was so great that the men secured a provision that someone at the roundhouse would run the engines in and out. The Kansas City roundhouse was in an inconvenient location and the men had to walk across a long bridge to reach it, and they feared to take the risk. All the reasons for the rule have been removed but the men not only insist on its retention but now demand its universal application. The Missouri Pacific has often tried in vain to get relief from this burdensome rule and in the present arbitration cannot secure relief because the brotherhoods have succeeded in limiting it to only their side of the question."

EARLY SCHEDULE PROVISIONS

The exhibit outlined the development of the schedules on the Chicago & North Western, Chicago, Milwaukee & St. Paul, Missouri Pacific-Iron Mountain System and the Northern Pacific. Mr. Higgins said it had been intended to compile an exhibit that would show the growth of schedules on all the railroads involved in the movement, but that it was not possible to do so because of the absence of records on most of the roads. Prior to the eighties, Mr. Higgins said, locomotive engineers were paid by the month, trip or day, without overtime, generally speaking, in the western territory, although in 1877 the Chicago & North Western made an agreement to pay extra time for mileage above 2,600 miles in any one month. In the early schedules rates only were named and there were no compensatory rules. Only miles were considered in the makeup of a day, or trip.

In 1880 on the North Western the rate of pay for engineers in road service for the first six months of service was $2.75 a day; for the second six months $3 a day; for the third six months $3.25, and for the fourth, $3.50; for the third year and thereafter the rate was $3.70. For yard service the rate was $2.75 a day. There was no differential between freight and passenger service or for any difference in the type of engine.

In the first printed schedule of the Missouri Pacific-Iron Mountain system, dated 1885, the basis for a day's work was 100 miles or less, in 12 hours or less, both freight and passenger service, and time began one hour after the man was called. There was an overtime rate of 35 cents an hour, applying after 12 hours of continuous service. Prior to the adoption of this schedule the men had been paid on a straight mileage basis, without relation to the time; then, on account of the number of short runs, it was recognized that even if a man's run was less than 100 miles he should be paid for a day's work, for 12 hours' service or less.

TERMINAL DELAY RULE

The provision for payment for terminal delay was first made in 1892. This rule provided that in case engineers were held on duty more than one hour at terminal points after the time fixed for the departure of their trains or more than 30 minutes after arrival at terminals, they should be paid for such delay at 35 cents an hour, but that such time should not be counted in computing overtime. In case the delay, before leaving exceeded one hour, or after arrival exceeded 30 minutes, payment was to be made for the entire delay based on actual minutes. Mr. Higgins said that although the hostler rule was intended in part to take care of some of the things that the initial and final terminal delay rule took care of, the adoption of the new rule had no effect in relieving the road from the responsibilities of the previous rule. Under the hostler rule, if an engineer takes his engine from the roundhouse to the train, which may often be done in 10 or 15 minutes, he is paid for one hour's time. If, for any reason, the train is delayed an hour he gets another hour's terminal delay, and although he might make 150 miles in the next five hours he would get the arbitrary allowance in addition to the payment for his mileage. The managements at various times have made efforts to get relief from that rule, but have not succeeded. The terminal delay rule was a remedial rule, and provided for a basis of less than the pro rata rate, whereas the demands now under consideration require the full pro rata rate.

On December 1, 1901, rates were classified on a cylinder basis, and a classification based on cylinder dimensions has continued until the present time. The men are now asking for a classification based on weight on drivers. At the same time a differentiation was made in the rates for local and through freight service, and a very material increase was made in the rates. In 1903 there was a further revision of rates and rules which involved a number of increases in rates. The switching service was put on a 10-hour instead of a 12-hour basis, an arbitrary allowance was provided for grades on the line, and a deadheading rule was adopted. A special allowance of one hour for crossing the Eads bridge at St. Louis and two hours for crossing the Merchants' bridge was adopted, so that the men are paid both for the mileage and for the arbitrary allowance. As an illustration Mr. Higgins mentioned the local passenger run between St. Louis, Mo., and Herrin, Ill. A train leaves St. Louis at 4:00 p. m. and arrives at Herrin at 9:35 p. m., in 5 hr. 35 min. The distance is 133 miles, for which the engineers are paid at the rate of $4.40 per hundred miles, or $5.41, and they also are paid for one hour for taking the engine to the train at St. Louis, 44 cents, for a distance of less than one mile; one hour for taking the engine from the train to the side-track at Herrin, which Mr. Higgins said would not take 10 minutes, and one hour for crossing the Eads bridge, a total of $6.73, in spite of the fact that the men are guaranteed a day's pay. Some of the Missouri Pacific's competitors do not have such rules.

The next revision was on November 1, 1905, when a rate was made for Consolidation engines and other special rates were fixed. Another revision was made effective in February, 1907, as the result of the first concerted movement of engineers in the western territory. This was a general upward revision of rates and a number of new rules were adopted. Effective December, 1910, as the result of another concerted movement, the rates were again increased about 10 per cent

and a number of additional changes in the rules were made.

To show that many of the rules now in existence were originally created to provide for some special conditions which no longer exist Mr. Higgins said the terminal delay rules were brought about by the fact that men were often delayed for many hours and otherwise would not have been paid for their time; but now such long delays are very infrequent, and the rule is out of place.

"Then if there is no delay," said Mr. Burgess, one of the arbitrators, "it does not cost the company anything even though the rule is in the book, does it?"

"You do not have to delay a man in order to have him claim payment," replied Mr. Higgins. "He arrives at his final track in his final terminal yard, and he can claim the time that is actually necessary to take the engine from there to the roundhouse, under the proposed rule. That is why this proposal cannot be compared with the old remedial rule. I was in the service at the time the original rule for final and initial terminal delay was adopted, and I know that we were often laid out for hours getting into the yard, and that we were called and were delayed for hours sometimes in getting out. Naturally the men felt that there was no need of such slowness, and the officers very readily agreed to put in the rule, but now the men say that the trip does not commence when they get on the engine at the roundhouse. They first must have 30 minutes preparatory time before they get on the engine before they leave, and they must have the actual time necessary—not the delay time but the time necessary—to get from that track to the outer switch of the yards from which they are to leave with the train. There are two special allowances. Then they say the trip commences at the outer switch and ends at the switch of the yard at the final terminal. Then they want another allowance from that yard to the roundhouse, the actual time after they arrive. That is far removed from the thought we had at the time we got the rule."

Another rule adopted to meet a special condition, he said, provides that if an engine fails and is returned to the terminal the engineer may go out on another run inside of five hours and combine the mileage of the two runs; but if he is sent out after five hours he gets a day's pay for the first performance, even if it were only a few miles, and then another day for the second run. This rule was adopted on account of the case of a man who had run four miles and returned with his engine, turning it into the roundhouse and claiming an automatic release and payment for 100 miles. The road held he was not automatically released, and after a great deal of negotiation the present rule was adopted.

Similar testimony was given regarding the development of firemen's schedules. In 1885, the Chicago & North Western was paying $55 a month for firemen in road service and $1.75 a day in yard service. Mr. Higgins also gave the dates on which both engineers and firemen were relieved of various incidental duties in preparing their locomotives for service before going out. He gave data also to show that the enginemen's wage movements usually have resulted in cycles of wage advances to other classes of employees both within and without labor organizations. There are relations between the pay of engineers and all the others, he said, and if they get an advance, a disproportion results until other classes are raised proportionately. Engineers have always received more than other employees and the firemen's pay in recent years is greater in proportion to the engineers' pay than ever before, but the relation of most classes of employees to the engineers has remained practically the same for 20 years.

ENGINEERS PAID MORE THAN OFFICERS

W. L. Park, vice-president of the Illinois Central and one of the arbitrators, asked Mr. Higgins whether, if the matter were left to his judgment as an officer, he would not make these adjustments a little differently, giving some classes a little more and some classes a little less. Mr. Higgins replied that there are a number of positions in the different classes of service that should probably receive more consideration and that if the engineers and firemen had not received such large increases there would have been more money for the others.

"Have you technically educated men, or men in authority over enginemen, who receive less pay than they do?" asked Mr. Park.

"Many of them," replied Mr. Higgins. "We have superintendents of divisions on our road who draw smaller compensation than the engineers to whom they give orders, and roundhouse foremen, master mechanics, train despatchers and other men who have direct supervision over them often receive less than the engineers. There has been a tendency in recent years to get very much out of line in that direction. Conditions have become very much distorted, and it is very detrimental to the railroad service. Many officers, who cannot be members of labor organizations and who must stand wholly on their merits are handling men who not only draw more money than they; and they do not have a grievance committee at their beck and call to defend them when they get into trouble of any kind. I think it is very unfortunate that we have reached that stage in the railroad business. There are many cases where an engineer is eligible for promotion, but refuses to take an official position because he would lose money by it. The management has difficulty in making an equitable adjustment of these matters because if there has been a little money left over it has been taken by the organizations in increased wages about as fast as it has appeared."

Mr. Higgins said that the argument that one road pays higher rates than another in its territory is continually used to bring up the wages on the road that has the lower rates, although different rules on different railroads may result in even greater compensation to the men with the lower rates; and these rules are continued in the schedules in spite of changed conditions, because of the saving clause in arbitration agreements, no matter what the board decides. It had been the intention of the roads in this case, he said, to get before the board some rules of this character with a view to standardization, but the saving clause prevented this, and as a result, any higher rates or more favorable rules that might be awarded would be superimposed on the "high spots" of the present schedules.

Superintendents, he said, receive about $250 a month, and the Missouri Pacific has one engine run which for a 31-day month would pay $328. The engineer, however, works only 20 days, because the other men will not permit him to work the full month. Only two division superintendents on the road receive more than this. The run referred to is a motor car run from Madison, Kan., to Butler, Mo., leaving Madison at 6:30 a. m., arriving at Butler at 11:25 a. m., leaving Butler again at 1:30 p. m. and arriving at Madison at 6:30 p. m. Roundhouse foremen of the Missouri Pacific, he said, receive from $100 to $135 a month; train despatchers from $110 to $150, most of them between $135 and $150, for about nine hours' work; chief despatchers receive $165 to $170 a month, and work from 10 to 16 hours a day; master mechanics receive from $183 to $220, and are responsible and liable to be called upon at all times.

"My position," said Mr. Higgins, in reply to a question by the chairman, "is not that the engineers are getting too much for the work they perform, but that certain engineers, under certain rules, are getting more than they are entitled to; if the rules were standardized and under those rules the same earnings were produced, measuring the service fairly, I would not find fault. But leaving out the question of inequitable rules, the engineers and firemen, considering their responsibilities, are going ahead entirely too fast by comparison with other classes of employees, considering their responsibilities. I am not in favor of a reduction in pay, but the rates are high enough and many rules are inequitable."

Mr. Nagel asked if it would be safe or wise to continue to build upon the basis which has thus far been accepted in fixing rates of pay, considering the power of the engine, as well as the miles and hours. Mr. Higgins, in reply, said that the demand is not only built upon the previous basis, "but proposes to go further and segregate certain time that has always been included in the trip as a whole into arbitrary payments and additions."

On cross-examination Grand Chief Stone of the engineers tried to show that low rates in the early days were in proportion to the size and capacity of the engines in those days. Mr. Higgins thought that the size of the engine was not the governing factor. "I have put in some trips of 140 miles, taking 23 or 24 hours," he said, "and the engine was small, but that was not what was troubling the engineer and me. It was the number of hours. As a conductor on the Illinois Central I once handled a train from Chicago to Kankakee, consisting of 12 loaded cars and 90 empties, with one engine. It was no easier for that engine to haul its capacity than for the bigger engines now to haul their rated tonnage. We received lower rates of pay then and we worked harder and for longer hours."

Mr. Shea, one of the arbitrators, asked if the size of the engine did not have an effect on the revenues of the company. Mr. Higgins thought that the Illinois Central was paying bigger dividends then than it does now. The Missouri Pacific has not paid a dollar in dividends since 1907, he said, but since that time it has increased its payroll by more than $3,000,000 a year. In 1907 and 1910 the increases to engineers on the Missouri Pacific cost $305,000 a year, an increase of 19 per cent. Firemen and hostlers got an increase of $206,000 a year. During the same period conductors and brakemen secured an increase of $530,000 a year, yardmen, $246,000; telegraphers, $214,000, and mechanical and shop forces $573,000. These are all represented by organized labor, but the non-organized men received increases as well. Station agents, section foremen and laborers, bridge carpenters and other non-union employees, received an increase of $444,000 in 1907 and $493,000 more in 1910.

Speaking of the demands for time and a half for overtime, Mr. Higgins said the situation in railroad service is not comparable with that in the industrial field. "The engineer is guaranteed a minimum day," he said, "which the industrial worker is not. The engineer is assured more than a minimum day, without reference to the measure of time, on runs over 100 miles, and often he makes several days' pay in one. The industrial worker has no guarantee of a minimum day and cannot make more than a day's pay without working outside of his regular hours. The industrial employer absolutely controls the overtime, for he can put work off until the next day, and if he does pay overtime he can put the cost into his prices. The railway on the contrary is not so protected; at the end of the 10 hours the engineer in yard service, for instance, may be in the most important work of the day, as making up a train for passengers or perishable freight, which must be completed and may be completed in one or two hours. Under the proposed rules this would be at penalty rates and the only remedy would be elimination of the guaranteed minimum day, making it possible to relieve the regular man and use an extra man who would be paid only for the hours he worked."

THE HOSTLER AND HIS DUTIES

H. Clewer, supervisor of locomotive operation of the Rock Island Lines, continued his testimony before the board on February 9, dwelling principally on the effect of the rule asked by the engineers and firemen requiring the employment of hostlers at certain points, fixing their rates of pay and providing that hostlers shall be recruited from the ranks of the firemen. Mr. Clewer testified that the latter rule would close the avenue of promotion to many men who are giving efficient service, but whose training is different from that of the fireman. He described in detail the work of the hostlers at various points on the Rock Island Lines, showing that the character of the work differs greatly at different points. In many cases there is so little hostling work to do that men who spend most of their time at other work perform this service and many men may qualify for the position of hostler or hostler's helper after a short roundhouse experience, without ever having been firemen. He also said it was a common practice to employ as hostlers men who have been in the engine service but who have become incapacitated.

Vice-President W. L. Park, of the Illinois Central, one of the arbitrators, asked President Carter, of the firemen's brotherhood, if he represented the hostlers by a vote of the hostlers themselves.

"No," replied Mr. Carter, "but we have been petitioned by a number of them to represent them and if every word of our proposition is included in the award of this board it will not disturb any man at any point who is now filling the position of hostler."

"No," said Mr. Park, "but it will close the door hereafter to those men absolutely."

"It might close the door to the man who is coming in on the next ship," said Mr. Carter. "It might say to those people who are coming here after this war is over: 'Hereafter you will have to fire an engine before you can hostle one.'"

Mr. Carter said that, if the railroads will agree, the men who are now helping the hostlers will be included in the next wage movement. He took the position that it is necessary for a man to fire an engine in order to be competent to be a hostler, but he admitted that he would consider that men now employed who have been hostling for some time should be competent. Generally, he said, the men who are working in the pits around roundhouses or wiping are "the latest importations, men who usually cannot speak the language."

"As I understand it," remarked Mr. Byram, "the question of the competency of a hostler is now determined by the railroad company's officers."

"I am sorry to say, yes," said Mr. Carter.

"You do not think the officers of the company are competent to select competent men for these places?"

"I will not say they are not competent, but they would rather have an incompetent man at 17 cents an hour than a competent man at 30 cents an hour."

"But it is your contention," said Mr. Sheean, "that these men now in these positions who have been recruited in the way that you object to, should have their compensation increased?"

"Yes, sir."

"Is it your idea that the men, wherever they are recruited from, will be more efficient by a change in compensation?"

"Invariably so," said Mr. Carter, "because when the railroads have to pay for efficient men they will hire no others. That is, I am sorry to say, the policy of getting the most efficient work out of the men for the money."

Mr. Nagel asked, "Have we not here another case where men are looking around for a pair of suspenders to lift themselves out of a job with?"

OIL-BURNING LOCOMOTIVES AND AUTOMATIC STOKERS

Mr. Clewer also described in detail the operation of an oil-burning locomotive and the duties of a fireman on such a locomotive. "Practically no manual labor is connected with his duties," said Mr. Clewer. "All of his manual work together consumes only about 10 per cent of his time. His principal work is to regulate the atomizer spraying oil into the firebox, and to control the amount of oil by means of the regulator handle. This operation is performed while he is sitting on the seat box. It is necessary occasionally to use sand to clean the soot out of the flues.

A. N. Willsie, chairman of the fuel committee of the Chicago, Burlington & Quincy, explained to the board how the mechanical stoker has lightened the firemen's work on a large number of locomotives. "If a movement of the hand to control the mechanical stoker may be called manual labor," he said, "the fireman is working 20 per cent of the time. The remaining 80 per cent he has nothing to do. If, in a run consuming 20 tons of coal, he scoops one ton by hand it would be excessive. His only duty is to see that there are no holes in the fire and that the

distributors do not become clogged. If a hole appears in the fire, admitting cold air through the grates, he must occasionally put coal on these spots with his scoop, seldom more than one or two scoops of coal. The heavy work and the hot work are almost entirely eliminated. The stoker is better than any two firemen and the engine can be worked to capacity hour after hour, and on some trips only a few hundred pounds of coal need be thrown on by hand."

COST OF LIVING AND WAGES

Ray Vance, an economist of St. Louis, testified on Monday, February 15, in connection with an exhibit comparing increases in the cost of living with increases in wages to the western engineers and firemen, and wages in other skilled occupations. He showed that the increase in pay received by the railway men has been almost double the increase received by bricklayers, carpenters, painters, plasterers and plumbers in the building trades, and machinists and moulders in the metal trades.

"In the western territory," said Mr. Vance, "the average daily pay of enginemen increased 11.3 per cent, and of firemen 11.4 per cent from 1910 to 1913. The average weekly rates in six of the seven trades increased less than 5 per cent and in the other trade, that of painters, only 7 per cent. That is, the pay of western engineers and firemen grew in greater ratio than did that in the seven other skilled trades. Against the increase of 11.3 per cent and 11.4 per cent in the wages of engineers and firemen the average expenditure for food and rent in this western territory increased only 9.3 per cent.

"The annual compensation of bricklayers in the west in 1913 averaged $1,259; carpenters, $1,001; painters, $994; plasterers, $1,268; plumbers, $1,335; machinists, $963, and molders, $979." Against these earnings engineers in passenger service were shown in the month investigated to have earned an average of almost $184 while firemen in the same service earned an average of $115.53.

Mr. Vance went on to show that unemployment in the railway service was far below that in the building trades. "In the building trades," he said, "unemployment in the western territory is 10.1 per cent, while for the 4 classes of railway trainmen it is only 4.3 per cent. In both east and west unemployment in the building trades is from two to three times as high as for the several classes of railway trainmen.

"Although wages in the west generally are higher than in the east, the cost of food, rent, fuel and light, which absorb two-thirds of the annual expenditure of the working man, is slightly less in the west than in the east."

S. E. Cotter, general superintendent of the Wabash, presented a statement by E. B. Pryor, receiver of the Wabash, showing how the proposed rates and rules would affect this road, which, while competing with eastern lines, is forced to pay engineers and firemen the higher western scale of wages as far east as Detroit and Toledo.

"On Mikado type engines," said he, "we have to pay engineers $5.30 and firemen $3.75 a day. Our competitors, one running partly over the same rails as we, pay only $5 and $3.30, though some of them earn over twice as much gross per mile. If the west is raised still further the difficulty will be increased."

Mr. Carter sought to show that the Wabash should pay this higher rate.

"But wasn't your own position in the eastern arbitration," asked Mr. Byram, "that eastern wages should be as high as western?"

"We asked that they equal the western average," replied Mr. Carter.

"Yet if your requests now are granted, the west will be still further above the east?"

"Yes, that is true," replied Mr. Carter.

A. W. Trenholm, general manager of the Chicago, St. Paul, Minneapolis & Omaha, and chairman of the Conference Committee of Managers, took the stand Tuesday and described the effect of each of the enginemen's demands on operating conditions.

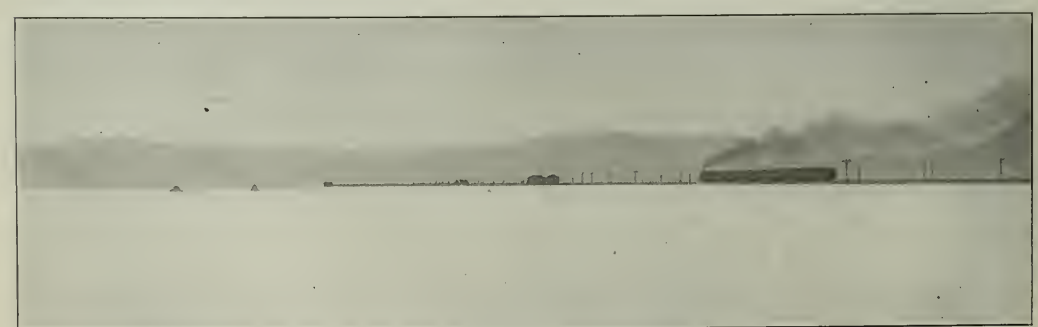
A HIGH SPEED RECORD

Some of the Western plains are intensely uninteresting from the point of view of the tourist in the observation car. This we have on the authority of a passenger-traffic manager who, once on a time, had a sudden accession of candor, and stated the fact in one of his advertisements. But not all Western plains are in this class, and we present herewith a view of one which is of the opposite kind. This is a bed of salt, on the line of the Western Pacific. The picture was taken on the occasion of an automobile speed test. The scene is at Salduro, Utah, 112 miles west of Salt Lake City. The view is looking north. The racing automobiles are seen at the left of the picture. These are not extremely distinct; but the picture is printed more for the purpose of showing the novel landscape.

The automobile run was made by Teddy Tetzlaff on August 12, last, and the best time for one mile was 25.2 seconds, which is equal to 142.85 miles an hour, a trifle better than the best preceding record, which was made on the beach at Daytona, Fla., in April, 1911. This is the highest speed ever traveled by man on the face of the earth.

The best speed ever made by a vehicle running on rails was that recorded in the Berlin-Zossen tests of electric cars, in 1903, when a rate of 130.5 miles an hour was made, on October 27.

The crystallized salt in this Utah bed makes a hard and absolutely level surface, and it is said that even in the hottest weather it does not heat the tires of automobiles. The salt beds are 65 miles long and 8 miles wide. The estimated depth, in the middle, is 12 ft. to 15 ft. The salt is white, and averages 98 per cent pure. Tetzlaff says that with more preparation he can make still better speed. In racing over the salt beds the motorist has an unusual feeling of security because of the entire absence of obstructions



Scene on the Western Pacific at Salduro, Utah

RAILROADS' APPEAL TO NEW JERSEY AND PENNSYLVANIA VOTERS

R. L. O'Donnel, chairman of the special committee of the railroads of Pennsylvania and New Jersey, pursuant to the announcement issued last week, has sent to the newspapers and a large number of individual citizens an eight page pamphlet containing the principal arguments in favor of repealing the extra-crew laws of those states; and he will follow this with another containing editorial expressions from prominent newspapers in different parts of the country. Twenty roads are now members of Mr. O'Donnel's committee. Following are the salient points of the circular:

THE MAIN POINTS

First of all, let it be distinctly understood that the railroads make no war upon their trainmen. This move is not to deprive of a job any man for whom there is real work or a legitimate position. It is made to uphold the larger interests of the whole body of railroad employees, and the far greater interest of the public. For more than three years a full-crew law has been in effect in Pennsylvania and for nearly two years in New Jersey. The avowed objects for which they were enacted have not been realized. They have arbitrarily put on thousands of passenger and freight trains extra men for whose presence there is no need. They have created employment without real service going with it, and have worked violence to economic laws and forced waste into railroad operation. They have added to the expense of railroad operation in Pennsylvania and New Jersey more than $2,000,000 a year. These laws have added a burden to the public which the people are not fairly called upon to stand. They have put organized labor in the false and untenable position of demanding employment by edict of law.

FALSE CLAIMS

It is claimed that they make for safe railroad operation; but the railroad companies, their managers and their security-holders have very direct interest in safety. They stand for safety because humanity demands; also as a plain business proposition. Accidents and wrecks are costly as well as fatal.

Property rights fall secondary to human rights. In that contention the trainmen's organizations which forced through the full-crew laws and which now fight, in error, as we believe, to continue them, stand exactly where we do. The railroads will give ready and hearty support to all measures really protective of the persons and property of all those who use railroad service. But where human rights are properly recognized and safeguarded, it becomes an abuse of property rights, and does violence to economic laws, to force the railroads and so the public to carry the load of thousands of men whose employment the present laws require regardless of necessity.

NO GOOD RESULTS

These laws have not increased safety. They have divided responsibility by forcing extra men into train crews. This works against rather than for safety and efficiency in railroad operation. Statistics and actual results prove that this is the case.

We agree that far too many are killed and injured on the railroads. We also frankly admit that in the past railroads have been too slow in introducing safety devices, partly owing to the costs involved, but largely because of a stupid and stubborn attitude of mind, once too prevalent among railroad managers. In many cases they did what was obviously right, and as results amply demonstrated to the advantage of railroads, their employees and the public, only under compulsion of public opinion and enforcing laws. Railroad managers as a body have reached a more enlightened state of mind. They are ready not only to listen to the public, but to trust the people to decide upon the merits of any proposition in which the public is a third party, where railroad managers find their judgment and conclusions controverted by employees or by laws which work badly and unjustly.

[The committee here quotes statistics showing that there has been no decrease in the number of persons killed and injured since the adoption of these laws, and quotes also the decision of the Connecticut commission (*Railway Age Gazette*, December 18, page 1118) condemning the extra-crew bill proposed in that state.]

NORMAL OPERATION

The railroads intend to man every train—passenger and freight—to the requirements of safety and operating efficiency. Their contention is merely that the right number of men cannot be fixed arbitrarily and without regard to the service to be performed by each train. Under the laws there is no latitude, and operating conditions constantly arise which make it necessary to delay traffic or inconvenience the public, or else violate the law. There is less and less, rather than more work for trainmen. Hand braking is virtually a thing of the past, except in yard shifting. Freight, as well as passenger trains, are now operated with air brakes applied to every car, except in cases of emergency defects. Mechanical interlocking has greatly reduced switching duties of trainmen. Automatic signals have also made work safer for trainmen.

EFFECTS OF THE LAW

In effect the law works as follows:

A twenty-nine-car freight train can be lawfully operated with a crew of five men. Add a car, and an extra man must be put on. The law requires no larger crew on one-hundred-car trains. A four-car passenger train can run with a crew of five men. On a five-car train there must be a crew of six men. Even if all the cars are Pullmans, with porters and a Pullman conductor, a six-man railroad crew is required. A milk train of twenty or more cars, running through virtually without stops, must carry a crew of six. The only place four of them would ride would be in the caboose.

When the Pennsylvania full-crew law became effective, the Pennsylvania Railroad was operating in the state of Pennsylvania, week days, trains as follows: 609 through passenger, 990 local passenger, 863 through freight, 234 local freight, 275 road shifting freight—a total of 2,971 trains

Of these 2,971 trains, 2,205 were manned up to or in excess of what the law required. Of the passenger trains 1,198, or 74.9 per cent, were so manned. The trainmen's organization lays particular stress upon the need of the extra man on freight trains. Of 1,372 such trains, 1,061, or 77.3 per cent, of the total were manned by the company up to or beyond what the law required.

Of the 401 passenger trains affected by the act, 353 were through trains, composed largely of Pullman, express, mail and baggage cars, making few stops, and often no stops throughout division runs. Forty-eight were local trains, handling a comparatively small number of passengers. On through trains, the Pullman cars were in charge of Pullman conductors and porters, while mail and express cars were in charge of messengers, all in addition to the regular train crews.

Of the 311 freight trains on which an additional brakeman was added by the law, 118 were preference freight trains, averaging about forty cars each, running on assigned schedules and making no stops between division terminals to do any work, except in case of emergency. The other 193 trains ran over divisions and had some shifting to do at intermediate points. These trains handled on some divisions an average of about fifty cars and on other divisions from thirty-five to forty-five cars.

The 1,198 passenger trains which were provided with crews equal to or in excess of the law's requirements consisted principally of local or semi-local trains, making frequent stops and handling a large number of passengers. The second brakeman was employed to expedite the departure of trains from stations and to assist the conductor in collecting tickets.

The 1,061 freight trains on which the law required no additional men consisted of local freight trains, carrying package freight, on which brakemen were required to load and unload cars; road shifters, doing a large amount of work, necessitating the throwing of switches and much hand-braking on cars; mine

trains, placing empty cars and picking up loaded cars, and through slow freight trains of heavy tonnage on the Philadelphia and Middle divisions on which the brakeman riding on the front part of the train was required to assist the fireman.

The railroads seek only that which they are convinced to be right. They expect that the trainmen's organization will impugn the motives actuating this campaign. They anticipate that an effort will be made to deceive railroad employees into a belief that the companies' ulterior purpose is to cut down forces in unwarranted manner and in ways to impose hardship upon trainmen. They also look for an attempt to convince the public that in this effort the railroads make covert attack upon safety and efficiency in operation. None of these allegations, if made, will be justified. The railroads frankly recognize that if these laws, avowedly made to protect railroad trainmen and the public against possible abuses shall be repealed, as the larger interests of all require, justice equally demands that some authority above the railroads shall stand by to make certain that trains are manned adequately. [Here is quoted the pledge given out last week.]

NO ATTACK MADE ON LABOR

In their present action the railroads make no attack upon organized labor, but upon a mistake it has made. Labor cannot successfully defend any proposition in defiance of economic law. Organized labor in this instance is doing itself and its membership, also the railroads and the public, a wrong and an injustice. Upon such a proposition labor must ultimately yield to laws stronger and higher than any legislature can enact, but not successfully enforce. Labor does not want to load itself with the burden of men employed without need. Working men should repudiate indefensible acts by labor unions. In doing so they will gain.

It is frankly recognized that railroad employees have a right to organize. Further, let trainmen and the public clearly understand that we believe it to be as impossible for the individual employee in a great transportation system to be certain of fair treatment, acting by himself, as we know it would be impossible for one man to provide the capital necessary for creation of the huge Pennsylvania Railroad system.

Let no one think this is a fight of railroad managers. It is essentially a fight for the public. Railroad officers are merely salaried men. Their duties and responsibilities are those of stewards—to give conscientious service in the conduct of the properties in their charge.

This implies, first, the best they can do in providing transportation and service to the public, an essential of which is liberal and even treatment of the whole body of railroad employees. Their ability to perform this highest duty—which is to the public and employees—is curtailed by the full-crew laws. The other chief responsibility of railroad managers is to the host of people—men and women—who, directly, or indirectly, as depositors in banks, trust companies and savings funds, are investors in railroad bonds and stocks. . . . With $2,000,000 a year, now wasted in employment of men whose services add nothing to the safety or efficiency of railroad operation, more steel passenger cars could be bought, new stations could be built, block signal systems could be extended, additional freight terminal facilities could be provided, more grade crossings could be abolished. All this would make much work for labor generally. It would help the steel industry, the cement and building trades, give work to electrical concerns, to contractors, to skilled workmen and mechanics, to day laborers.

FATE OF FULL-CREW LAWS

The full-crew bills have been defeated in many states. Full-crew laws have not always survived. The court of public opinion, when it has been appealed to for a decision, has decided emphatically against the idea. [Here the committee tells of the recent referendum vote in Missouri and quotes from the veto message of the governors of New York, Massachusetts and Oklahoma.]

Attempts to get full-crew laws in Colorado, Delaware, Virginia and Ohio also failed. Thus in nine states there has been failure, and in another a law enacted was figuratively torn up by the people. In the east full-crew laws are in effect in Pennsylvania, New Jersey and New York, while in Maryland there is a full-crew law as to freight trains only.

These laws should be repealed in the interest of the public, the railroads and the great body of railroad employees. Figures show that all the railroads operating in Pennsylvania are now employing about 2,500 extra brakemen. There are in all some 65,000 men employed in train service in the state.

Much of what the trainmen's organization did last year in Missouri to keep a full-crew law on the statute books of that state, the railroads operating in Pennsylvania and New Jersey will now do in these states to bring about repeal of like laws. It is to be an open, square and above-board direct appeal to the intelligence and judgment of the people. The railroads will conduct the campaign in every legitimate way. They will publicly stand for what is done and said. There is to be no lobby; neither will there be any star chamber conferences or private deals to influence either public opinion or legislative votes.

The methods by which the public can impose its will in Pennsylvania and New Jersey are not as immediately final as was the referendum vote taken last year in Missouri. But without this the railroads now go to the people of Pennsylvania and New Jersey to present a case in which the public interest is directly involved. This is done with a firm conviction that upon presentation of the question the public will decide what is right and that a ground swell of expressed opinion from the people of these states will be recognized and acquiesced in by their elected representatives at Harrisburg and Trenton. The case being put before the people, the power rests with them to enforce such decision as the court of public opinion shall render.

SUSPENSIONS SUSPENDED ON THE B. R. & P.

The Buffalo, Rochester & Pittsburgh has made an interesting trial of discipline without suspension. It is only a cautious and partial adoption of the system, but the experiment has been kept up for over two years and further progress may confidently be looked for. An officer of the road writes us as follows:

"Recognizing that the purpose of discipline should be the education and desirable development of employees, and that disadvantages accrue, not only to the individual employee, but to the company when discipline is enforced solely by actual suspension, the management on October 1, 1912, put in effect a plan which provided that discipline be decided on in the same manner as before; that is, by a "court" presided over by the superintendent, or his representative; but that its application would be withheld unless there should be cause for further discipline within a prescribed period of probation. For example, a man who has committed some fault which the "court" decides should be visited with a suspension of ten days or less, is put on probation for six months; a decree of suspension of over ten days and less than thirty days, makes the period of probation nine months, and a decree of suspension of thirty days or over, calls for a period of probation of one year. But should the employee get into trouble during his period of probation, he must at once serve the suspended sentence which the court found him liable for; and a new period of probation is started.

"That this plan has been of material benefit is evident from the fact that during the two years to October 1, 1914, but 25 per cent of the sentences imposed on train and enginemen were put into effect. These caused a loss of time equivalent to only 32 per cent of the time covered by the total number of sentences, or one-fourth of 1 per cent of the total employee-days involved. The total number of sentences put into effect without allowing the delinquent employee the opportunity afforded by the designated probation period, was approximately 2 per cent of the whole. These sentences, also the days served, are included in the 25 per cent of sentences and 32 per cent of time served. But a very small percentage of long term sentences were served."

Maintenance of Way Section

THE Maintenance of Way Section for March will appear in the issue of March 12, instead of in the third issue of the month. This is because the convention of the American Railway Engineering Association comes the following week, during which time we will, as usual, publish four daily issues, which will be sent to all subscribers to the maintenance of way edition.

Contest on Bridge Construction Methods

The reconstruction of almost every bridge under traffic presents a special problem requiring the development of methods adapted to the particular location and conditions. The consequence is the use of a wide variety of methods in handling work of this class. The particular conditions may require the adoption of special methods for solving either the entire problem or certain parts of it. In general, the manner in which these conditions are met is known only to those connected with the work and other men confronted with similar difficulties do not secure the benefit of their experience. We have therefore announced a contest on Bridge Construction Methods to include descriptions of methods new or not generally known for handling special problems involved in the reconstruction of bridges and their substructures, the purpose being to bring such methods to the general attention of bridge engineers. To stimulate interest we have offered prizes of $25 and $15 for the two best papers submitted, and will pay our space rates for all other papers accepted and published, the prize awards to be based on the originality and practical value of the ideas presented. All papers to be considered must be sent to the Engineering Editor of the *Railway Age Gazette*, 608 South Dearborn street, Chicago, and be received not later than March 10.

An Overlooked Opportunity

Both Mr. Bowser and Mr. Schott call attention in articles in this issue to one point of contact between the public and the railroads which has not been cultivated to the greatest extent by the roads. The section foreman comes into more or less intimate contract with the farmers along the line in the relation of a neighbor in the handling of such details of common interest as the repair and maintenance of fences, farm and highway crossings, open ditches, etc. By his attention to these details he can do much to gain the good will of the farmer for himself and for his road which will extend to other farmers in the community as well. The cultivation of this spirit is of advantage to the railway in several ways. In the first place, it is a material aid in the creation of a favorable public sentiment, which is an important factor in the relations of the railroad with the rural communities. Such a sentiment is also an important factor in the routing of traffic. The efforts of the agent to secure the shipments of live stock and other agricultural products will amount to little at any competitive point if the farmers are antagonistic to his road. Another direct return results in the securing of the cooperation of the farmers in the prevention of the causes for stock, overflow and other claims. A large part of these claims is preventable, but if a feeling is allowed to develop that "the road will pay for it," claims will provide a considerable source of revenue for the farmers and will show a strong tendency to increase, while at the same time a spirit of hostility is created. Being a resident of the community, the section foreman and his workmen can do more to secure for his road the good will of the rural residents, and operators of small industries as well, than can the superintendent, traffic solicitor, or claim agent from the distant terminal. In these days of so much unfair agitation it is worth while for the supervisors of track and higher officers to impress upon their foremen the importance of equitable relations with the public.

Long Tie Plates

Trackmen will watch with interest the results secured with the 70-in. tie plates which the Pennsylvania is now using under the joints of its 100-lb. rail, as described on another page. Such a tie plate is a distinct innovation, and in addition to retarding rail creeping by extending over four ties it should give a stronger joint and better riding track. The increased support should also materially decrease the battering of the rail, and thereby increase its life, for it has been common experience during recent years that it is necessary to remove much rail from main tracks before it is worn out, because of battered joints. This latter condition is becoming increasingly expensive. A few years ago conditions on many roads were such that battered rail could be used to good advantage on branch lines after sawing off the ends. On many roads, however, branch lines are now completely relaid with rail sufficiently heavy for the traffic, and it is desirable to secure the full life of the rail before removing it from the main line. On some roads main line rail is being removed, taken to a central point, the battered ends sawed off and the rail then returned for relaying in main lines. To avoid this heavy expense at least one prominent road is endeavoring to devise a machine which will saw the ends from these rails without their removal from the track, with the intention of driving the rails together until there is sufficient space to drop a new rail in. Any means which will reduce the battering of rail at the joints and thereby increase its life deserves serious consideration.

THE MARCH CONVENTION AND EXHIBIT

WITH each succeeding year the convention of the American Railway Engineering Association becomes more representative of the development of the railway engineering of the country. From its inception in the offices of the Railway Age in Chicago in October, 1897, this association has grown until it now has over 1,200 members, representing 90 per cent of the railway mileage of the United States and Canada. It is not surprising, therefore, that its proceedings and recommendations carry a weight second to those of no other association without official relation to the roads.

The convention this year should be one of the best in the association's history. Because of the general inactivity in railway construction the committees have been able to spend more time in the preparation of their reports, while because of the small amount of work under way more engineers will be able to attend the convention than usual. While the association's conventions are considered as being primarily for the higher engineering officers, the younger men can attend its sessions very profitably, for a great deal of information is presented in which they are vitally interested.

Hardly secondary to the sessions of the convention is the annual exhibit of the National Railway Appliances Association at the Coliseum. While the exhibit is arranged primarily for selling purposes, the assembling of such a large amount of construction and maintenance of way equipment in a compact space makes the exhibit of great instructional value. The exhibit this year will be even more accessible than in previous years, as it is all consolidated on the main floor of the Coliseum. No engineer can afford to attend the convention without visiting

the exhibit, for it is important that he be informed regarding new devices and developments in old devices as well as in the theory of his profession. No better commentary on the value of this exhibit to practical men can be afforded than the large number of roadmasters and track foremen who annually visit it and study the exhibits in detail. Many of these men from nearby points come of their own accord, while a number of the roads have found the exhibit of sufficient value to their men to send them to visit it.

COMPARING MAINTENANCE EXPENDITURES

IN common with the experience in other departments of railway work, maintenance expenditures have shown a continual tendency to increase during recent years and the end does not yet appear to be in sight. The expenditures for maintenance of way and structures per mile of road for all roads in the country, as reported to the Interstate Commerce Commission, have risen over 65 per cent in the last 15 years, while a comparison of the average expenditures of 53 representative roads for the last two five-year periods shows an increase of 14 per cent in spite of the efforts to retrench. The maintenance of way officers must necessarily be able to explain to their higher officers these increases on their own lines and justify the standards to which they are working. It is not difficult to show causes for the increased expenditures—the increased unit costs of labor and materials, the heavier traffic requiring more work, etc.

It is more difficult to justify a standard. One manner of doing this is by comparison with other roads. However, this must be done very cautiously and with a full knowledge of the conditions. To show what a blind comparison on the basis of expenditures per mile of road will lead to one can secure figures which vary from $5,000 on the Pennsylvania to less than $800 on a few western branch line roads. Such figures make no allowance for the amount of traffic handled or the number of multiple main tracks. A more significant figure is that showing the percentage of gross earnings expended for maintenance of way, but this figure again varies from 8 per cent on an eastern road with a heavy freight business and relatively little passenger traffic to 23 per cent on one road with a very light business. However, the great majority of roads spend from 11 to 15 per cent of their gross earnings for maintenance of way, and the 10-year average of 52 representative roads is 13.3 per cent. But even when comparisons are made on this basis they must be made with great caution, for almost anything may be proved, if allowances are made for differences in conditions on the roads compared. For his own information the officer in charge of maintenance of way should compare his expenditures with those on other roads with which his lines are fairly comparable, but he must be exceedingly careful not to mislead himself.

THE PREVENTION OF WATER WASTE

ONE of the most difficult problems with which the railway officer is contending continually is that of preventing wastes. Mr. Brandeis told nothing to railway men that they did not already know when he made his famous statement regarding the opportunities for economies in the transportation business; for railway men have been working on this problem ever since the railway was invented. But the widespread publicity given to the subject of efficiency has served to focus attention on it more directly than ever before.

At first thought there might appear to be no opportunity for making savings of any consequence by a reduction in water consumption. The cost of five to ten cents per 1,000 gallons appears so small that even if the amount of water used were excessive its aggregate cost would generally be considered small. But a recent investigation on one road has shown an estimated possible annual saving in this one item alone of $10,000 at two terminals. Another road on which a campaign has been made along this line for over a year is now effecting a reduction in the cost of its water supply of over $2,500 monthly as compared with a year ago, after making full allowance for the decrease in traffic. At one terminal where the water was purchased from the city and paid for by meter measurement the bill has been reduced $800 a month. At another terminal the average monthly reduction for the past six months has been $550. In general, it has been found possible to reduce the cost of the water used 20 per cent at terminals to which attention has been directed.

This condition arises from a number of causes. At one place it was found that city water purchased at a relatively high rate was being used for cooling an air compressor and other shop purposes, whereas the ordinary water pumped by the railway at its own plant and supplied to locomotives would do equally well and could be furnished at less than half the cost. Leaking pipes and flush boxes and the careless use of hydrants are other common sources of waste. When it is figured that a ¾-in. orifice will discharge 6,000 gallons per hour under ordinary city pressure the importance of small leaks is evident.

In the elimination of water waste it is very necessary to secure the co-operation of all departments concerned. If, for instance, an attempt is made to reduce waste about shops, the mechanical department is very apt to defend this upon departmental grounds unless the problem is presented in the proper manner. The same is true of other departments. If the matter is properly presented to the officers in these departments, they can then co-operate in extending the proper supervision. The savings mentioned above form only a small part of those possible when such a campaign becomes effective over an entire system, and the question of water waste is only one of numerous so-called minor opportunities for effecting savings which will reach large amounts in the aggregate.

NEW BOOKS

Resistance of Materials. By S. E. Slocum, professor of applied mathematics, University of Cincinnati. Size 6 in. by 9 in., 250 pages, 152 illustrations, 17 tables. Bound in cloth. Published by Ginn & Company, Boston, Mass. Price $2.

This is a text book on applied mechanics which eliminates calculus in the solution of the problems to which it is usually applied in such books. The author mentions as advantages of this treatment that the subject can be taught at the same time or preceding the study of calculus in universities and can be used in trade schools where calculus is not taught. It also has the advantage of fixing firmly in a student's mind the principle of moments which is used repeatedly in place of calculus methods. This feature of the book will also make it of value to those practicing engineers who find that after a number of years have separated them from their college training it becomes increasingly difficult to use higher mathematics in the solution of their problems. The volume covers stress and deformation, moments, strength of beams, columns and struts, torsion, strength of spheres and cylinders, flat plates, riveted joints and connections, reinforced concrete, and simple structures. The tables cover properties of materials and mathematical functions sufficient for a student of this subject. The problems included in the book are noteworthy for their direct application to engineering subjects which should make them of practical value.

The Theory and Design of Structures, and Further Problems in the Theory and Design of Structures. By Ewart S. Andrews, lecturer in theory and design of structures at the Goldsmith's College, New Cross, England. Size 6 in. by 9 in., 618 pages and 236 pages, respectively, illustrated, bound in cloth. Published by the D. Van Nostrand Company, 25 Park Place, New York. Price $3.50 and $2.50, respectively.

Andrew's Theory and Design of Structures was first published in 1908. It is distinctively an English text book using graphical methods in many instances, but avoiding mere graphical artifices for making calculations. The third edition, which has just been published, has been revised and corrected and an appendix added to include some additional matter, most important of which is a description of Stanton's experiments on wind pressure.

As the author considered the treatment of the elements of design and the discussion of framed structures, columns, suspension bridges and arches, masonry structures, reinforced concrete structures, steel work for buildings, roofs, bridges and girders sufficient for average readers, it was decided to prepare an additional volume covering recent developments in structural design, the most important of which are the use of influence lines and the method of internal work. The second volume also includes discussions of stresses in redundant frames, in rigid or elastic arches, in portals and wind bracing, and secondary stresses in structures. In both volumes an attempt has been made to give practically all of the steps in mathematical deductions to avoid the difficulty frequently found in supplying the missing steps.

Structural Engineers' Handbook. By Milo S. Ketchum, dean of the college of engineering, University of Colorado. Size 6 in. by 9 in., 896 pages, illustrated, bound in flexible leather. Published by the McGraw-Hill Book Company, New York. Price $5.

A large majority of the books on the design and construction of bridges and buildings are prepared primarily for students or are intended to present predigested data that can be safely used by non-technical men. This new book by Milo S. Ketchum, however, is not a text for classroom use and the tables are not arranged for application by non-technical men. The elimination of the elements of design, necessary in a work intended for students, allows the full space of the somewhat bulky volume to be filled with a wide variety of data bearing on the design and erection of steel bridges and buildings, retaining walls, abutments and piers, timber bridges and trestles, steel bins, grain elevators, head frames, coal tipples, standpipes and elevated tanks. Chapters are also included covering structural drafting, estimates of structural steel, erection of structural steel, engineering materials, structural mechanics and the design of steel details. The tables include the properties of sections, safe loads for angles, beams and channels, and of angle struts, properties of rivets and riveted joints and miscellaneous data for structural design. Trigonometric and logarithmic tables are not included. The typography is good and special care has been taken in the preparation of drawings and tables to make them easily readable. Dean Ketchum is also the author of a number of books on thedesign of structures, from which some material has been taken; but in general, the new handbook is intended to supplement such works rather than to replace them.

Structural Engineering. By J. E. Kirkham, professor of structural engineering, Iowa State College. Size 6 in. by 9 in., 669 pages, 452 illustrations, bound in cloth. Published by The Myron C. Clark Publishing Company, Chicago. Price $5.

Kirkham's "Structural Engineering" is intended primarily for text-book use. It contains a considerable amount of elementary material, such as the chapter on Structural Drafting and three chapters on Fundamental Elements of Structural Mechanics; Theoretical Treatment of Beams and Theoretical Treatment of Columns. Four more chapters are then devoted to general subjects including: Rivets, Pins, Rollers and Shafting; Maximum Reactions, Shears and Bending Moments on Beams and Trusses and Stresses in Trusses; Graphic Statics, and Influence Lines. The last five chapters are devoted to design, covering I-beam and plate-girder spans, simple railroad bridges, simple highway bridges, bridges on curves, economic height and length of trusses and stresses in portals and the design of buildings. It should be stated, however, that the chapter on the Design of Simple Railroad Bridges occupies 338 pages and is divided into four parts, beam bridges, plate girders, viaducts and truss bridges. Under each of these types a complete analysis of the steps in design is made with plates to illustrate the necessary shop drawings. Original designs worked out by the author have been used throughout in preference to standard designs taken from actual practice. This gives a commendable uniformity to the plates and tends to simplify the work of following through the steps in design with reference to the typical plans shown.

Letters to the Editor

THE OPERATION OF HAND CARS

EAST LAS VEGAS, N. M.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

In the issue of the *Railway Age Gazette* of January 22, page 148, the lower left-hand picture is presumably intended to show the correct arrangement of men on a hand-car. This photograph shows that it was made on a single-track railway, therefore it would appear to be incorrect, as a train may be expected from either direction. Also the disposition of two men between the handles is not conducive to the best results. One of the men should be on the front of the car, facing backwards, so that a train approaching from their rear may be seen at the earliest moment.

While undoubtedly the disposition as shown is to offset that shown in the right-hand picture, it is apt to mislead men who might see the picture into the belief that to be without a man facing the rear would be an approved action by reason of the precedent established in the approval of such a picture for "safety" purposes.

C. CLAY.

AN EARLY NARROW GAGE-STANDARD GAGE CROSSING

TOPEKA, KAN.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I have read with interest the articles published in your issues of Dec. 18 and Jan. 22, relative to the crossing of a standard gage by a narrow gage track. In 1907, when assistant engineer on second track construction for the Atchison, Topeka & Santa Fe, in Missouri, I installed such a crossing east of Elmer, to move steam shovel dirt trains from one side of the main line track to the other, and found its operation very satisfactory for such temporary work. It being necessary for me to use stock material, No. 9 frogs with 10-ft. switch points were employed, each switch point being operated independently from a switch stand, and one operator throwing all four points when changing the line up from one track to the other.

I am advised by a reliable source that as early as 1881, in the construction of the Leavenworth, Topeka & South Western, a similar device was employed by J. R. Ellinwood, a former chief engineer of the A. T. & S. F. He, of course, employed stub switches, as there were no switch points in use at that early date; however, the general arrangement was exactly the same as the above.

T. H. MCKIBBEN,
Engineer, Atchison, Topeka & Santa Fe.

COST OF THIRD RAIL MAINTENANCE

The cost of maintenance for 1913 of 20 miles of third rail in the Detroit and Windsor terminals was given as $2,690 by J. C. Mock, electrical engineer of the Michigan Central, in an article in a recent issue of the General Electric Review. This figure, which includes supervision, amounts to $134.50 per mile, or $7.40 per day. One of the largest items entering into this was $936 for the replacement of burned and broken insulators. Of the total number of burned insulators on the tunnel tracks 317 were in the eastbound tunnel and only 5 in the westbound. This difference is attributed to the fact that practically all refrigerated freight is eastbound and brine drippings from these cars fall on the third rail. The application of grease and roofing paper over these insulators has greatly reduced the trouble from burned insulators, although it has not entirely eliminated it.

CHILEAN RAILROAD CONSTRUCTION.—The construction of the railway line from Iquique to Pintados commenced about January 1. One thousand workmen are engaged on it.

Service Secured from Corrugated Iron Culverts

A Description of the Results Attained by Their Use Under Sliding Banks and in Other Unfavorable Locations

The corrugated pipe culverts manufactured from Armco-American ingot iron have been installed under widely varying conditions, in all parts of the country, and by a large number of railroads to carry minor waterways under the tracks. The mechanical advantage of the corrugated pipe in securing strength without great weight is evident, and in the culverts referred to this advantage has been combined with a material of so high a degree of purity that its resistance to corrosion is greatly increased. The properties of this material which make it more rust resistant than steel or the common forms of iron were discussed in the *Railway Age Gazette* of July 18, 1913, and September 30, 1910. These culverts have now been in service for a sufficient time to give evidence of their permanent qualities and a number of difficult problems have been solved by their installation.

Probably the greatest advantage of the ingot iron corrugated culverts is the ability of these pipes to maintain a clear waterway under a settling or shifting embankment. One of the best possible examples of this conditions was furnished in the construction of the Northwestern Pacific between Eureka, Cal., and San Francisco, where for about 100 miles the line follows the Eel river at an elevation of 10 ft. or more above extreme high water. The formation is generally of a shaly nature or a decomposed serpentine, the strata pitching towards the river with a surface slope averaging about 30 deg. The shale is soft and friable, is slacked to a considerable extent by air and through decomposition forms the typical soil of the district, a tough clay. This clay bakes hard in the summer, but during the rainy season absorbs a large amount of water which often causes it to slide.

The country is covered with small slides forming broken terraces in certain localities which have been caused by excessive saturation of the soil, the water following some channel or crack which localizes the saturation. In these cases there is probably no subsequent movement. In other places large slides are found which in their action are analogous to glaciers, having a movement of 6 in. to 5 ft. per month and covering several acres. This tendency to slide was aggravated by the excavation of the cuts for the new line and also by loading the slopes with fills. Nearly all of the cuts are widened at grade to the river on the one side and in many cases the bank on the high side of the cut, even during the dry season, continues to move slowly, impelled by the slide behind it. The soil cracks off in slabs 5 ft. thick or so, the cracks extending in series back 50 ft. or more. During the rainy season this movement puddles the material and the slides may resemble runs of muck.

On the first 20 miles constructed the unimportant drainage was carried under the track in 24-in., 30-in. and 36-in. concrete pipe culverts with concrete headwalls. These culverts were built in place without reinforcement, a form of construction commonly used, and which has been found to be inexpensive and very satisfactory under usual conditions. The foundations of the pipes were good locally, but due to the movement of large areas in which they were laid, many of these pipes broke, some failing entirely when the movement was not uniform throughout the foundation.

It was decided, therefore, that where the nature of the foundation appeared doubtful, corrugated iron culvert pipe would be used. If this pipe was moved down the hill by slides it was planned to remove the lowest joint and place it at the upper end. This has not yet been done in any case, but one 48-in. pipe has moved so far that at different times four 10-ft. lengths have been added to the upper end. Many other pipes have moved a smaller amount, although none have been more than two years.

The effect of these slides on concrete pipe is well illustrated by

Fig. 1—A 24-in. Corrugated Iron Culvert Pipe Under an Earth Fill on the Northwestern Pacific

Fig. 2—A 24-in. Corrugated Iron Pipe Replacing a Failed Concrete Culvert
Fig. 3—Five Lines of 24-in. Corrugated Pipe on the Southern Pacific

Fig. 4—Failure of a Concrete Culvert under Shifting Load, Later replaced by a Currugated Iron Pipe

three of the accompanying views. In Fig. 2 is shown the upper headwall of a concrete culvert and all that was left of a 24-in. concrete pipe which crushed due to the movement of the foundation. The lower end wall was carried down hill 6 ft. and had to be blasted out and used as riprap under the spill of a 24-in. corrugated pipe which was used to replace the concrete culvert. The upper end wall shown in the picture was chiseled out and the pipe inserted from back to face and concreted in place.

Fig. 4 shows part of a 4-ft. concrete arch with a 12-inch floor

Fig. 5—A 4-ft. Concrete Arch Culvert Destroyed by a Sliding Fill Which Moved It a Distance of 70 ft.

which had been built on a firm shale partially decomposed. It was broken in two places when the original ground under the fill settled. This culvert was replaced by a 36-in. corrugated iron pipe inserted in the end of the upper section of concrete pipe shown in the background of the picture, laid on the top of the second or middle section and on a back fill made in the third section after blasting off the top. In this case the move-

Fig. 6—A Corrugated Iron Culvert Laid Inside a Wooden Box on the Western Pacific

ment of the ground continued and the corrugated pipe was pulled apart at one joint a distance of 2 ft., this break being repaired by inserting a 10-ft. section of 30-in. pipe in the two ends. A case of a solid rock foundation failure is shown in Fig. 5, which is a 4-ft. arch built on a slight grade on solid shale. This fill was partially made during the fall and in the following winter slid out, carrying the arch toward the river about 70 ft.

Instances of corrugated iron culverts that have given satisfactory service under shifting loads are also reported on the Minneapolis, St. Paul & Sault Ste. Marie and the Western Pacific. On the Soo, a culvert was installed near Superior, Wis., under an embankment composed of a material that decomposes rapidly and settles when exposed to the air. This pipe was not injured by a settlement of 6 ft. On the Western Pacific a number of corrugated iron culverts have been installed in locations where it has been difficult or impossible to maintain masonry on account of shifting foundations. One of these installations is shown in Fig. 6, where the pipe was laid inside a wooden box and back filled by ramming the material around the pipe. One or two installations of 60-in. culverts on this road made about 1½ years ago in locations where other culverts had failed repeatedly have proved entirely satisfactory up to date.

The stability of corrugated iron culverts under severe conditions has been demonstrated in many cases. In the earlier years of the use of this material and to some extent yet, the installation of corrugated pipe has been limited to low fills or other places of light service. This form of culvert is not absolutely invincible under all conditions and there are cases where large culverts made of 14-gage material have deflected under fills of 30 to 60 ft. of sand or gravel. One of the advantages of this material, however, is that for exceptionally severe installations it may readily be had in gages heavier than the standard. While a 14-gage is standard for a 36-in. culvert, a

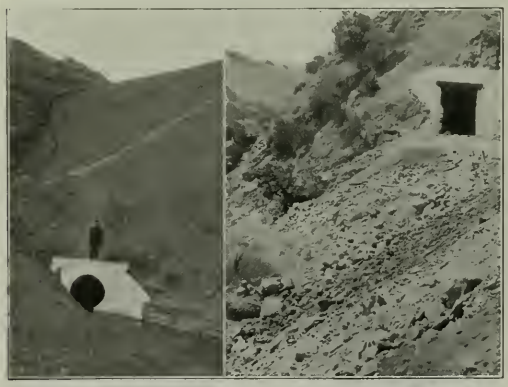


Fig. 7—A Ten-gage, 60-in. Corrugated Iron Culvert under an 85-ft. Fill on the Western Pacific

Fig. 8—A 48-in. Corrugated Iron Culvert Pipe under a 15-ft. Rock Fill on the Northwestern Pacific

12-gage or even a 10-gage can be had at an added expense which represents merely the added cost of the iron.

There are many cases where corrugated culverts of the heavy gages, which should be employed for such installations, are giving good satisfaction under very heavy service. The Atlanta Terminal has one 12-in. pipe buried about 4 in. below the tie under a track which carries upwards of 200 movements a day. This installation was made five years ago and shows no signs of stress as yet. It is not recommended, however, that the pipes be installed with less than one foot of cover. An installation of a 60-in. 10-gage pipe under an 85-ft. fill on the Western Pacific is shown in Fig. 7.

Some of the Northwestern Pacific culverts have shown their ability to withstand a large amount of abrasion due to carrying debris including boulders. Fig. 9 shows some of the typical stones that are carried by the hundreds during the winter months through this 48-in. pipe on a 20-deg. slope. It is reported that in this and similar cases, the damage has been confined to the galvanizing. This is after two years of wear. The least grade that will carry this debris with certainty is a slope of about 1:5. Pipe laid level or on a flat grade will carry fine material such as gravel without choking, however. In this con-

nection, a considerable quantity of corrugated pure iron pipe has been employed in the form of inverted siphons to carry the water of irrigation ditches or natural streams under railroad tracks. Where these siphons have been properly installed they have been successful and it is a curious fact that the corrugated pipe clears itself of silt or other obstructions better than smooth material. This is explained by the fact that the corrugations excite ripples in the flowing water which keep the silt in suspension and allow it to be carried through instead of settling in the lowest portion.

In many cases it is found that corrugated iron pipe is cheaper than other forms of construction. On the Northwestern Pacific work for instance, it was found that a 24-in. concrete pipe would have to be laid at a cost of $17.68 per cu. yd. and a 30-in. pipe at a cost of $19 per cu. yd. to be as economical as corrugated iron pipe. These figures are exclusive of the headwalls. The average cost of installing the corrugated pipe on this road has been $0.35 per lineal ft. for 24-in. pipe, $0.55 for 30-in. pipe $0.68 for 36-in. pipe and $0.74 for 48-in. pipe. In installing these culverts, the excavation was made by the contractor at the regular grading price, but the installation of the pipe was paid for by force account, that is, the cost of labor plus 10 per cent. The work was usually done by gangs of Greeks, Italians or Mexicans with little or no skill. The pipe was furnished in 20-ft. lengths, these sections being connected by the coupler shown in Fig. 11. On 48-in. pipe two turnbuckles on opposite sides of the pipe were used. To insure satisfactory installation it was found absolutely necessary to have an inspector on the job to superintend the connecting and laying of the pipe and the making of the back fill. It was also necessary for the engineer directly in charge to see that a wrench for manipulating the turnbuckles and a hammer suitable for heading the cold rivets were on the job. The 24-in.

Fig. 9—A 48-in. Pipe Set on a 20-deg. Slope under a 25-ft. Rock Fill Showing Typical Boulders Passing Through this pipe

Fig. 10—A Gang Installing an Ingot Iron Corrugated Pipe Culvert Under the Tracks of the Southern Pacific

pipe was usually connected on the bank and rolled into the trench. Larger pipes were rolled in first and the sections were launched endwise with block and tackle. Two jacks used to spread the ends of the large pipe were found to be a great saving in labor. "Bell holes" were necessary to provide a working space for riveting. After the pipe had been connected the trenches were back-filled, the material being carefully tamped under the pipe and nearly to the top. A continuous cover was laid by hand before allowing material to run down the end of the fill as a large boulder rolling onto a bare pipe would dent it badly and cause a weak spot, inviting failure by crushing.

The cost of freight and of hauling is often an important element in the cost of culverts, particularly on extensions of lines at a considerable distance from existing transportation. On the new line of the Chicago, Milwaukee & St. Paul between Lewistown, Mont., and Great Falls, it was necessary to haul material in many cases an average of 12 to 14 miles at a cost per ton mile of $0.35 to $0.50. This was one of the deciding factors in the decision to use American ingot iron corrugated pipes up to 42 in. in diameter under the low fills on this line.

Another advantage possessed by the pure iron corrugated pipe is its adaptation to temporary as well as permanent locations. If it becomes necessary to relocate a highway or a track under which corrugated pipes have been installed it is not difficult to move the pipes to a new location at a small cost

Part-circle culverts made of corrugated iron have also been

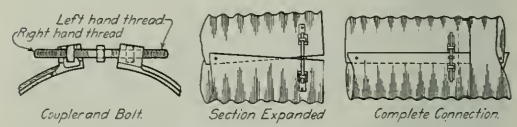

Fig. 11—Details of the Coupler and Bolt Used to Connect Sections of Corrugated Iron Culverts and Sketches Showing the Method of Applying It

used in many instances under railroad tracks principally in municipalities where much of the surface drainage is cared for in this way. This form of construction consists of a segment of corrugated iron of heavy gage set between angle irons held in a concrete base. It is employed only in locations where sufficient head room cannot be obtained for the full circle pipe of the requisite capacity. These culverts are built in sizes ranging from 7-in. base and 2-in. rise to 84-in. base and 42-in. rise. They have given good satisfaction where the width of the base is not excessively great in proportion to the rise and the culvert has a reasonable amount of covering.

We are indebted to J. Harold Lane, assistant bridge engineer, Northwestern Pacific, for the data referring to the installations on that line, and to the National Corrugated Culvert Manufacturing Company, Middletown, Ohio, for the remaining information in the foregoing description.

BRIDGE RENEWAL WITHOUT FALSEWORK OR INTERFERENCE WITH TRAFFIC

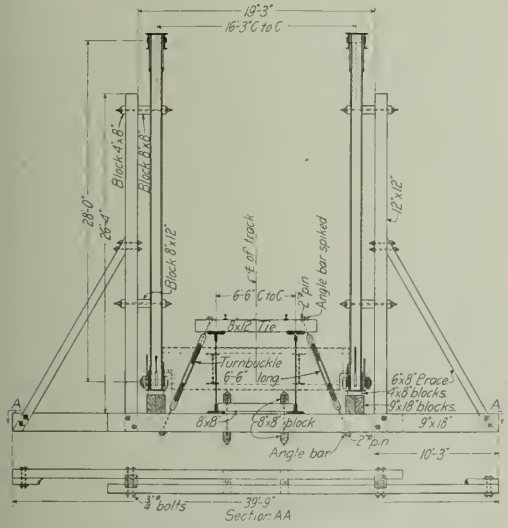
The Wheeling & Lake Erie recently replaced nine bridges, consisting of 130-ft. through Pratt trusses, over Short creek on the east end of the Toledo division, in connection with which an unusual method of dismantling the old trusses was developed. The old bridges were designed for Cooper's E-35 loading and were built by the Edgemoor and the Toledo Bridge Companies in 1897. Their renewal was made necessary by the purchase of a number of locomotives with a loading practically equivalent to Cooper's E-60 that were put in service to handle the increasing traffic from the coal fields.

It was found at all of these spans that successive raises of grade on either side had left the bridges at low points in the profile and as high water data and measurements of the channel showed that additional piers supporting deck plate girders would not unduly increase the danger from floods, it was decided to use 65-ft. deck girder spans designed for Cooper's E-60 loading. The designs were made in the bridge department of the Wheeling & Lake Erie, the steel was fabricated by the American Bridge Company and the King Bridge Company and was erected by the Ferro Construction Company, Chicago.

Although no foundations on this stream were damaged during the flood of March, 1913, it was decided to carry all new footings to rock or to support them on piling. No new abutments were necessary, the old ones being of first-class masonry and still in good condition. They were altered to accommodate the new bearings for the girders, the backwalls be-

ing rebuilt with plain concrete and the bridge seats with reinforced concrete.

The erection of the new spans and the dismantling of the old trusses were handled by a derrick car specially arranged for this work. This car was 47 ft. 9 in. long over all and equipped with a Lambert engine and a three-drum hoist with 10-in. by 12-in. cylinders. The weight of the car was 39,000 lb. and its capacity 100,000 lb. It was provided with a 47-ft. boom con-



Details of the Framing Used to Support Old Through Trusses During Dismantling, Traffic Being Carried on New Deck Girder Spans

trolled by cables running over blocks at the top of a 23-ft. "A"-frame. This boom had a still capacity of 30 tons and a carrying-out capacity of 20 tons. Preparatory to the erection of the girders practically all the rivets connecting the stringers to the floor beams and the floor beams to the posts of the trusses were knocked out and replaced with bolts. The stringers in the panel directly over the new pier were cut by an acetylene torch and were blocked up at points which would not interfere with the new girders. The trains were allowed to pass over the bridges in this condition until all was in readiness for the erection of the new span.

As traffic on this line was light it was decided to hold trains during the operation of renewing each span. At one of the typical bridges shown in the accompanying views, the last train passed over the old bridge at 9:25 a. m. The work of removing the old floor system was begun immediately, the end stringers being removed first and dropped into the creek, the water in which averaged only about 3 ft. deep. This operation was continued until the stringers and floor beams in the first half of the span had been removed. This left a clear space between the old trusses from the abutment to the new middle pier, and the new girders could then be picked up one at a time by the derrick car and placed in position. The top and bottom laterals and the cross frames were then bolted up and the ties and the rails laid on this span, the work being accomplished by 11:25 a. m.

The erection of the second span was carried out in the same manner and was completed, ready for traffic, at 12:40 p. m., 25 min. ahead of the first scheduled passenger train after the beginning of the work. The whole operation consumed 3 hr. and 15 min. The erection was so planned that work could have stopped after the first span was in place, the traffic being carried on the new girders and half of the old truss span. This was done at all of the other bridges.

During the erection of the new span all of the top bracing in the old truss span was removed with the exception of one end portal and one strut which were left to steady the trusses. After the new spans were in place two gallows frames, illustrated in the accompanying drawing, were placed equi-distant from the ends of the trusses to which they were bolted to support these trusses while the chords were cut and the sections taken down. As indicated in the drawing, the gallows frame consisted of two 9-in. by 18-in. timbers under the new girders and attached rigidly to the span by two sets of rods. These timbers supported a vertical 12-in. by 12-in timber, just outside of each old truss, braced from the outer end of the bottom cross timbers and bolted to the truss posts at two points.

This work was handled under the direction of W. L. Rohbock, chief engineer, and Edward U. Smith, assistant engineer. We are indebted to Mr. Smith for the above information.

German Tramways in South America.—It is reported that the German Electric Tramways Company at Santiago de Chile has suspended operations, owing to a disagreement with the local authorities, who have prevented it from charging double fares.

The Handling of New and Scrap Maintenance Materials

The Third and Last Series of Contest Papers, Outlining Several Suggested Improvements in Present Methods

PRACTICAL CONSIDERATIONS IN THE HANDLING OF MATERIAL

By J. W. Powers

Supervisor of Track, New York Central & Hudson River, Oswego, N. Y.

Those employees of the maintenance of way department, whose duties require it, should familiarize themselves with instructions given with the system of accounts, reports and records prescribed for their department. The object of these instructions should be to secure uniformity in reports, to enforce responsibility for the proper disposition of material and to secure accurate returns for material on hand, received, consumed and taken from track or shipped away. With such information at hand, the requirements of any system may be carried out.

Owing to the increased speed of trains, and the greater weight of engines and cars, it has become necessary to increase the weight of rails on many roads. There is perhaps no one condition more responsible for the necessity of ordering, distributing and carrying large quantities of material, as the difference in weights and dimensions of rails, switches, frogs, guard rails, clamps and braces, tie plates, rail anchors, comprises and insulated joints, etc. It is necessary to have a portion of each kind of material on hand for emergency use, which represents a large amount of money from which little benefit is derived.

The policy on many roads has been to lay the lightest weight of rail that can be operated on, consistent with safety, without a thought to the extra cost of track maintenance. Many roads are using rails 30 ft. long, while the majority of roads are using 33 ft. rails. There is no question as to the relative economy of using longer rails. We believe it is possible to use rails 45 ft. long in many of the southern states and in any locality 36 ft. lengths could be used. The economy of using 36-ft. rails or longer is evident when it is considered that there are ⅙ less joints in a track laid with 36-ft. rails than in one using 30-ft. lengths. Including the saving in angle bars and bolts and the decreased cost of installing 36-ft. rails as compared with 30-ft. ones, the total saving due to the increased length would amount to over $80 per mile of track. In addition to this saving it would improve the riding quality of the track.

To reduce to a minimum the material held in stock for emergency use on main track, rails for all tracks, as far as possible, should be of uniform length, weight, and height, except for curves and lead rails in turnouts, where special lengths should be used to bring the joints in the proper position. As to the weight and height, this is also true of frogs, switches, guard rails, clamps, braces and all track appliances.

The most economical and efficient method of distributing material depends upon the nature and magnitude of the work to be performed and the territory to be covered. For heavy work such as unloading and distributing large quantities of rails, ties, etc., or picking up and removing such materials from the scenes of repairs, work can be done more economically, in most cases, by the use of regular work trains. In delivering or picking up small quantities of supplies, it is usually more economical to have the work done by the use of way freight or pick-up trains.

The high cost of handling material by manual labor makes it imperative that labor saving and mechanical devices be used as much as possible to secure economical and satisfactory results. Sometimes substantial saving is effected by using motor cars to pick up and distribute small quantities of material. The loading and unloading of rails, frogs and switches should be done with the best mechanical devices that the company can furnish as such material is often bent and sometimes irreparably damaged by careless handling. Great care should be taken to prevent such material from rolling down embankments and it should be unloaded in such a manner as to require the least amount of labor to place it in track. Rails or other material should be loaded so as to require the least handling at destination. Track spikes, bolts, switch rods, braces, guard rail clamps and other fixtures should be kept where they are not exposed to the weather until they are applied.

Maintenance of way and other officials should make frequent personal examinations of all tools, appliances and supplies on their respective territories, and if any surplus material or tools be found they should have them returned promptly to headquarters. They should also watch the efficiency of tools and material in service in order to determine their effectiveness. They should see that requisitions for tools and supplies are made sufficiently in advance of the time required to insure their delivery. The lack of proper tools and material is often the cause of unnecessary expense, delay and confusion. Great care should be taken to order nothing except that which is absolutely needed for the efficient and economical execution of work to be performed. When making up monthly requisitions for tools and materials, catalog reference should be given, when possible, with a view of assisting the purchasing agent. Requisitions should also show the quantity and quality of material on hand.

A report should be made to the proper officials of surplus material on hand each month. This will enable them to locate even a temporary surplus and to place the material where it is most needed, thus saving the necessity of purchasing new material. After surplus material has been reported on hand, if any portion of it is used, it should be reported to the proper authorities promptly so that they will be in a position to know what material can be furnished from one division to another.

Material should be distributed, picked up and disposed of with the least amount of labor. This can be accomplished by prearranged plans. To illustrate, if a quantity of rail is to be released from main track, provisions should be made in advance for disposing of it, and if sold to outside parties it should be disposed of when the market is favorable. If it is retained for company use, either for emergency or to replace defective, worn out or curve worn rails, it should be picked up and shipped at once to points designated. Large quantities of rail removed from main track should be picked up before the work of spacing and renewing ties under new rail commences, as the old rail, if allowed to remain by the side of the track, retards the work of spacing and renewing ties and increases the cost of this work.

Much time and money can be saved by using good judgment in the unloading and distributing of ties. To do this all ties about to come out should be marked, care being taken not to mark any that would last a year or two longer, but none should be left in track that should be removed. When distributing ties, if marked in this manner, the exact number of ties needed at each point can be determined. Care should be taken to see that they are unloaded where needed. By doing this, money will be saved which would otherwise be lost on account of the time required to re-handle them. If ties are not to be put in track soon after being unloaded they should be piled neatly at proper distances from the track and small trenches dug around them to prevent them from catching fire. If ties to be piled are treated, small quantities of earth should be placed on top of the piles in addition to the trenches, as treated ties catch fire more easily than untreated ties.

The renewing of ties is one of the great items of cost in the maintenance of a railroad and the company should provide the best ties within its means. The proper time for estimating new ties needed is in the fall. If estimates are submitted at this time, favorable contracts can be made and ties delivered when required. When preparing estimates, the foreman should

test every tie of which he is in doubt and request only the actual number needed.

The prompt collection and sorting of scrap and the reclaiming of usable material is not a new subject on many roads, but some roads have only recently realized the importance of giving these matters the attention they deserve. We reclaim a large percentage of track bolts removed from main track in the following manner: We do not allow the nuts to be removed entirely from the bolt until the bolt is loosened in the angle bars. When the nuts are nearly off the bolts, we strike the angle bars with hammer, which loosens the bolt without injuring the thread. After bolts are removed we oil them and screw the nuts on so that they are complete and in readiness for service when needed.

During the construction of new tracks or repairs to old ones, we keep all material picked up as the work progresses, and only enough supplies are distributed to keep the forces engaged and working to good advantage. If material such as bolts, spikes, anglebars, tie plates, etc., is not picked up as the work advances, portions of such material will be wasted and will show evidence of carelessness about work and disregard of company property.

Scrap bins should be built as convenient as possible to tool houses and should be large enough to keep the various kinds of material separate. Foremen and others whose duties require it should be compelled to pick up scrap as often as necessary to secure good results. Employees should never be allowed to leave scrap material where they are working, but should take it to headquarters each night, sort and place it in the bins. This should be picked up once a month on outlying sections either by work trains or by way freights, depending on the amount of scrap that has accumulated. Care should be taken not to mix the various kinds when loading on cars. These cars should then be taken to headquarters and the track scrap sorted and classified by the track forces. The other scrap should be shipped or turned over to the departments where such material is used in order to reclaim the usable material and for the proper classification of various kinds as shown on the forms prescribed for that purpose. A memorandum should be sent to those in charge of the scrap platform showing the approximate tonnage of the various items. They in turn should acknowledge its receipt.

It is important that no labor or time, except what is absolutely necessary, should be expended in handling scrap or other material. Besides the revenue derived from the prompt collection of scrap, it is also in accordance with the Safety First movement now so active on all railroads.

WRONG AND RIGHT WAYS OF HANDLING SCRAP AND NEW TRACK MATERIALS

By W. O. Houston

Division Engineer, Michigan Central, Jackson, Mich.

With the necessity of enforcing economies on our railroads in the past few years, the proper handling of scrap and the reduction of surplus track materials and tools has been a live issue. Some of the methods which have been tried have resulted in a considerable saving, but in many cases the results really obtained have been greatly exaggerated. For example, the writer happens to know of a case on a neighboring road where 60 cars of scrap, were collected by a pick-up train. That sounds like a lot of scrap and the official who originated the scheme and who had only recently come to the road did not fail to call attention to the great saving he had made.

But, as a matter of fact, most all of the scrap collected would have been forwarded to the scrap yard, a carload at a time without extra cost. As it was, the 60 cars were not all loads and several of them contained old barbed wire that had no value and had to be shipped out and buried after it was received.

This train, which was called by the track forces the "robber" train, was on the road a week. It was in charge of a storekeeper who had with him a clerk, a cook, a roadmaster from another division who passed on the material and tools that might be left, and a force of eight laborers and a foreman. The local roadmaster went along and had the right to protest, but not to decide. The visiting roadmaster was so bound by instructions that he had to take many things that his judgment directed him to leave.

The mode of operation was to stop at every car house, look through, behind and under it, check over all the tools and leave one tool of each kind for each man in the gang. As this road has a great many different kinds and sizes of track bolts there are more different sizes and shapes of nuts on a section than there are men, so that when the wrenches were cut down to one per man there were not enough left to fit all the nuts.

The stock of repair rails offered an apparently good opportunity to make a big showing so all but a very few were loaded up. In the yards there are numerous sizes and sections of rails, and the rails are old and require many changes in a month. A short time after the "robber" train made its trip, the repair rails left were all gone, and they are being shipped back, a few at a time, at a considerable cost for handling.

In the desire to collect all the surplus scrap, the rails that were used to run the section motor cars from the track to the car house were taken, and the foremen were forced to pull boards from the right of way fences to make runways for their heavy cars.

The useless expense described above was not the worst effect of the so-called economy; the effect on the men was much worse. Section men as a rule have trouble in getting all the material they need and when that little they have is taken away they are naturally discouraged and become dissatisfied and do not work with the spirit they should.

Fearing another trip of the "robber" train, the men have resorted to taking such extra tools as they can get hold of to their homes, and otherwise hiding them so they can not be found. As these men leave the service, the company will in most cases lose the tools and the loss will be greater than that caused by having a few extra tools in each car house. Most foremen have been compelled by the methods of furnishing them supplies to conceal quantities of tools and materials, and month after month they fail to report them as on hand. Our best foremen, those who are looking ahead and trying to do the best they can for their companies, have been forced by necessity into such practices, which should never exist. Quantities of materials and tools are always on hand and always will be (under cover) until our foremen learn by experience that it is not necessary for them to misrepresent.

It must be made plain to the roadmaster by his superior officer that the surplus material and tools must be kept to a minimum and that as he goes over the division it is one of his duties to know personally what each foreman has on hand, and, for example, when one man needs a switchstand, and some other foreman has two, to have one of the two shipped instead of making a requisition on the store. It is possible in this way to keep the surplus down, but the mistake must not be made, as it has so often of late, of keeping the stock so low that it is necessary to spike important switches for a day or two at a time while waiting for something that the foreman should have had in stock. It is certainly economy to keep a few switch points and an extra stand or two in a yard where points are apt to be run through.

The most economical method of collecting scrap that the writer knows of and one he has successfully tried is to have a scrap bin at each car house and in convenient places in large yards where the section men collect scrap from time to time. Occasionally, as conditions warrant, have two flat cars start at one end of the division, placing them at each station as near as possible to the scrap bins. The car scrap can be loaded on one of these cars and the track scrap on the other. The cars are then billed to the next station and so on until loaded, when they go to the division scrap yard where the scrap is sorted

by experienced men and the material that can be repaired is sent to the shop. A few days after the first cars start out, two more are started from some other part of the division, and so on, so that a few cars are coming in all the while and the scrap men are kept busy without being flooded with a trainload at a time which would result in tying up a lot of equipment and blocking the yard.

For the distribution of new material it has been found desirable to have a storekeeper make a trip over the division once a month with a couple of supply cars on the way freight, leaving what has been ordered at each car house. This results in prompt and proper delivery and prevents losses which occur when small shipments are made by local freight, especially where material has to be transferred at junction points, because, as a rule, conductors and agents do not take the care in handling company material that they should, and it is often lost or put off at the wrong station, and when found it is a great temptation for foremen to help themselves to what they need when they see it lying around.

DISTRIBUTING NEW MATERIAL AND COLLECTING SCRAP

By P. Quinlivan

Roadmaster, Delaware, Lackawanna & Western, Buffalo, N. Y.

In distributing rails, I find it very profitable as well as labor-saving to distribute and set out rails just as they are to go in the track. This saves both labor and train detention, and avoids the necessity of trucking or carrying rails back and forth.

In distributing ties, I find that where a man has a great many ties to put in, it is cheapest to give him about five cars of ties, if possible, and have his gang help the train crew with the unloading. This saves a great deal of work train serivce.

The distributing of switch timber, switch points and frogs, as a rule, can be handled most easily and economically by billing them in a car direct to where they are to be used, and having the section gang at that point unload them. By this means one can save the cost of a work train.

In my opinion, tie plates should be distributed according to the number of ties a foreman has to put in. That is, if a man has a great many ties to be put in, one can save a great deal of extra handling of this material at the storeroom by sending out about 3,000 plates at once. In this way, he could bill one car of plates to two different foremen. When unloaded these tie plates should be piled up at once and oiled, and if possible put under cover.

Spikes should be shipped out to the different sections in quantities large enough to take care of the requirements of each section for a full month. The foreman could put these in his tool house, and take what he requires out with him each day.

When distributing rails, ties, ashes, or in fact any heavy material, if a full day's work can be arranged, it will save a great deal of expense, for more men are put on the work train to unload this material, and if a shift is made to light material, such as spikes, tie plates, etc., there will be a number of idle men. If, on the other hand, a full day's work unloading small material can be arranged, only a few men need to be used on the work train.

After the renewal of rail, the old rail should be piled in piles of four each between the two main tracks, so that they can be picked up easily by the work train. If this rail is to be used on sidings or yard tracks, it will be well to pick it up just as it is to be handled at the point where it is to be relaid. If this rail is all picked up at once and taken into the yard, it will have to be unloaded and piled, and then loaded up again and unloaded, where it is to be used.

Each day scrap should be picked up where a gang is working and as far as possible put in kegs. The work of picking up this scrap should be given to one man, to be held responsible for any usable material that is with the scrap. This scrap when picked up should be sorted over so as to keep the scrap and usable material separate. These kegs of scrap should be taken to the tool house once a week and placed where they can be taken up by the work train without any trouble. Scrap anglebars, switch plates, braces, switch rods and other small materials should be kept in separate piles; and scrap frogs, switch points and guard rails should be loaded in separate cars.

SOME PRACTICAL HINTS ON THE DISTRIBUTION OF NEW MATERIAL

By J. C.

The two general requisites in handling material are prevention of loss or waste and reduction of labor cost. Watchfulness and training will generally overcome the former, although the task may prove long and tedious. But to keep down labor cost is a more difficult matter, beset with ever-changing conditions which demand the closest attention. Versatility and ability to quickly see and take advantage of favorable opportunities are required. Large quantities of material, in carload lots, unquestionably can be distributed most economically by work train. It is necessary to assemble a sufficient number of carloads to insure a full day's work in one locality, so that unnecessary train movement may be avoided. A rail unloading machine will prove very serviceable, not only for rails, frogs and switches, but for bridge timbers and other similar material. Such machines reduce the labor cost and make the handling safe, and as their cost is comparatively low, few railroads can afford to be without them.

Material is easily lost or damaged by careless unloading. Rails, ties and other heavy material should not be allowed to roll down embankments. The cost of reclaiming it, if it is ever done, is a dead loss. Ballast should be distributed evenly to prevent waste and rehandling. The unloading of small material, or such as may be inadequately packed, calls for precaution to prevent waste. Such articles are easily lost and rarely ever found.

Bridge material should almost invariably be handled by a work train. Timber should be deposited, if possible, on level ground and in such a manner as to afford carpenters easy and convenient access for framing. Timber should not be stored in big piles, or closely stacked, for then a fire may result in heavy losses. A wrecking crane may be conveniently employed for this class of work, or, if the job justifies the cost, a derrick may be erected for unloading.

It may frequently happen that there are only one or two cars to be released, or that the holding of cars under load for a few days is not objectionable. Under these conditions permission may be secured for a local freight to handle one car each day until all cars are released. This delay is not serious, as a section gang can unload a car of ties in 30 minutes or a car of ballast in 10 minutes. This practice has frequently been tried with success. A load of small material, to be distributed over a long section of line, can be placed in a freight train, and the unloading done by two or three men at station stops. The knowledge of a number of different methods helps the supervisor to decide quickly as to the best manner of disposing of carload stuff.

The intelligent use of this new material demands value received for the expenditure. Rails should not be cut unnecessarily or large timbers cut to pieces. Ties should not be removed when they are good for another year. Switch timbers should not be renewed in sets, as it is common knowledge that those ties under the switch points and frog will go to pieces years before the intermediates. Such ties should be "patched in." All material not intended for immediate use should be safely stored or piled. Unlike other material, there is no salvage in ties.

There is another class of material, however, that presents a very different problem—that intended for emergency use. There can be no set rule for the amount to keep on hand, conditions varying widely on different sections. It is always necessary to keep a supply of ties and rails convenient. This may be safely accomplished by having one central supply of such material and

reducing the amount retained on each section. In yards and on important pieces of track, it is frequently essential to keep duplicate articles on hand. It is a common fault among track men to have a superabundance of such material, the practice doubtless arising from the commendable desire to prevent "tie-ups" on the line. Experience will soon point out the key to a proper reserve supply for each section, not only of track material, but tool equipment also. It is erroneous to allow all sections equal amounts of material. True economy is subserved by adjusting this reserve supply to local conditions. Reserve track material is an accident insurance policy for a railroad and is entirely proper, provided the annual premium is not out of proportion to the benefits derived.

But all of this good material will some day be unfit for use, will be removed from track or structure and the trackman will again find himself face to face with economy, efficiency and responsibility. What is scrap? Material may be taken from the main line, unfit for service, and yet be very serviceable in secondary tracks and yards; timber may be unsound at ends and in good condition for three-fourths of its length; a frog may have a broken wing rail, readily repaired at the shop. Such material is not scrap, but is too often classified as such, resulting in very large loss. The temptation to use new material is always alluring, but constant supervision and training must teach men that no material, fit for further use, should be discarded.

Large quantities of second-hand or scrap material may be collected in a manner very similar to that laid down for material distribution. In such instances it is very desirable that shipping notices of such carload lots be furnished promptly so that material may be forwarded and the expense of rehandling avoided. Smaller quantities of scrap, such as ordinarily accumulate on the roadbed, should be gathered up daily by track men in the vicinity of their work. It can be taken on the hand car to tool house or some convenient commercial siding. In this manner there can be no undue accumulation on the line at any time. About once a month a car should be started over the division in the direction of scrap headquarters, and "set off" at points where track men have deposited the gathered material. Usually a fraction of an hour is sufficient for loading scrap and the car is ready to move forward next day. Upon reaching scrap headquarters, the material is classified and deposited in proper bins. This method entails some additional work on the local freight, but has the advantage of reducing track labor to a minimum as well as avoiding the use of a work-train movement over a division, resulting not only in a large loss of time, but interference with train service as well.

HANDLING OF MAINTENANCE MATERIAL BY THE MAINTENANCE DEPARTMENT

By J. T. Bowser

Queen & Crescent Route, Danville, Ky.

The "general stores" system has recived so much favorable mention, and has apparently succeeded so well in many cases, that it requires some hardihood to raise one's voice against it. But I will venture to say, that hardly 10 out of 100 maintenance of way officers will agree that the general stores plan serves this department as well as it could be served with a store room of its own, operated independently of all other departments.

In theory, a general store for all departments is ideal. The large purchases bring lower prices, and simplify accounting; the stock is centralized and is in the care of a skilled storekeeper. In practice, however, is it so satisfactory to the maintenance of way department as the store devoted entirely to the material used by the maintenance of way department and supervised, in a general way at least, by the division maintenance of way officer? Can he not, with a little attention, keep his stock down to a proper figure as well as a general storekeeper who probably possesses little or no intimate knowledge of the needs of the maintenance department?

The lack of this intimate knowledge of maintenance affairs may result either in an overstock of some classes of material, or a shortage in others. Such conditions do not necessarily indicate any lack of ability in the general storekeeper. It is manifestly impossible for a man in charge of a large general storeroom to keep in as close touch with conditions in the maintenance department as could a division storekeeper serving only this department and directly under the supervision of the division maintenance officer.

A good maintenance of way storekeeper can no doubt be readily selected from the same material from which supervisors are drawn. At any rate, he should be a man of some track and bridge and building experience, possessing a fair education and some executive ability. A man of this character should experience no difficulty in looking after the maintenance material for one or possibly two divisions, and, in addition to this, should be able to supervise the classification of scrap material and the reclaiming of good second-hand material. With the comparatively small territory supplied from his storeroom he should be able to keep in very close touch with conditions through the supervisors and the division office and increase or decrease his stock of certain materials as necessary.

Further, reporting, as he would, direct to the division maintenance of way office, that office can more readily supervise his orders and issues. The money which might be lost on making a number of small purchases for local storerooms, as compared with the large purchases of the general store, would probably be more than covered by the saving effected by prompt shipments of small quantities, not always to be had with the more unwieldy organization.

A local maintenance of way store should provide, not only storage room for the material which must be kept under cover, but should also have yards for timber, bins for scrap, sheds for spikes, bolts, etc., and a small shop of some description for reclaiming second-hand material requiring only light repairs. The maintenance of way storekeeper should have entire charge of the storeroom, lumber, skidways, scrap bins and shop, and should be held entirely responsible for the conditions thereabout, and for the amounts of material on hand.

Orders from section foremen or other maintenance of way department employees, should be approved by the supervisors to whom these men report, and should be checked in the division maintenance of way office before being sent to the storekeeper to be filled. The storekeeper should be required to keep a record of issues so that a check is available on material issued to each foreman, but all accounting should be handled in the division of general offices.

Requisitions to replenish stock should be forwarded by the storekeeper each month to the division maintenance of way office. These requisitions should show the amount of material on hand, the average monthly consumption as well as the amount required. A very careful check of these orders should be made in the division office.

In order that the chances for a shortage in any particular line may be reduced to the minimum, the storekeeper should be required to make a monthly report with his requisition, showing the amount of material which he has on hand of which heavy issues are made, such as spikes, bolts, etc. With such a report at hand the division officer can more readily avoid a shortage in stock when work which he may have in mind will cause an unusual demand for certain classes of material.

The storekeeper should keep the office advised of any over stock or of any obsolete material on hand, so that arrangements can be made to dispose of such material. He should, of course, take inventories of stock on hand as required and should also be required to make regular reports of scrap material on hand for sale.

Arrangements should be made to provide the storekeeper with the necessary labor to handle heavy material, to classify and load scrap, and for other work about the store or yard. A section gang with a short section will provide enough men to handle his work, in case there is not enough work to keep a gang busy at all times, and there will be no loss of time as the

gang could return to track work when released by the storekeeper.

It should not be necessary for road supervisors to make monthly requisitions, though it is not a bad idea to permit them to keep a small supply of spikes, a frog and switch, and similar material on hand at their headquarters for emergency use. Special requisitions submitted by bridge and building supervisors for special jobs should be submitted to other supervisors, with the view of ascertaining if any of the material can be furnished by them from stock left over from other jobs.

Periodical inspections should be made of tool houses, tool and supply cars by the proper officers, and foremen should be required to return to the storeroom all material or tools not needed for immediate use. Employees should be impressed with the scrap or second-hand value of the material which they handle, so that they will care for it properly and return it to the storeroom. Scrap material should be collected regularly. A plan which is giving satisfaction on some roads is outlined below: Foremen are required to assemble all car and track scrap at convenient points on their sections. Scrap cars are placed on local freights each month on fixed days, and the conductors on these trains are instructed to stop when flagged and permit section men to load the scrap. Car and track scrap should be loaded in separate cars so as to avoid rehandling at scrap yards. In this manner any great accumulation of small scrap on the line of road can be avoided.

When these cars arrive at the storeroom they are placed at the classification bins so that both the unloading and classifying are done in one handling. With the proper care at the time the classification is being made, a great deal of good material may be recovered and made fit for further use. Reports of scrap material on hand for sale should be made by the maintenance of way storekeeper.

With the maintenance of way stock divided into reasonably small units, each in charge of an experienced maintenance of way man reporting directly and solely to a maintenance of way official, there should be no difficulty in keeping the stock balance down to a reasonable amount, and still furnish the material promptly and in the quantities needed.

DISTRIBUTING TIES, RAIL AND BALLAST

By W. S. Taylor

Superintendent of Terminals, Chesapeake & Ohio, Covington, Ky.

In distributing new ties the cars should be billed to various sidings along the line convenient to points where they are to be used so that the work train will not have far to run for ties. A supply of 21 cars should be contemplated for a day's work, using three forces of six men each, and placing a force at work on each car. Before starting, each force should be instructed as to how many ties are to be unloaded at each stop, the train crew, of course, having been advised as to what stops to make and where ties will be unloaded.

After rail is received the work train and rail derrick should be secured and the cars distributed at points along the line so they can be easily reached by the work train which is to pick up two cars at each time, placing one at each end of the rail derrick. In this way two cars can be handled at a time without any switching. A car of joint splices should be carried along with this train and one man placed in charge to distribute rail joints with each rail unloaded. When new rail is laid the old rail should be unjointed and the nuts taken off the bolts with wrenches and put back in the old joints. Those nuts that cannot be unscrewed should be broken off, the old bolts placed in the keg the new ones were taken from, and when the kegs are full placed at the tool house to be loaded on the scrap train. The old rail is to be loaded in the same manner that the new rail was unloaded, that is, with a car on each end of the rail derrick, the scrap rail being allowed to remain until last and picked up by itself in the same manner, using two cars at each end of the derrick, if there is enough scrap rail to justify the use of two cars.

In distributing ballast a work train should be ordered and enough cars given it for one day's work. The supervisor of track should go along to see that the ballast is properly distributed and not too much dumped at any one place. When conditions will permit, the same engine and train crew should be kept on the work train until the job is completed. If the work is done in the terminal, the yardmaster should pick his best yard crews, while if on the road, the trainmaster should pick his best road crews and see that the train despatcher gives the work trains all the help possible.

THE DISTRIBUTION OF NEW MATERIAL AND COLLECTION OF SCRAP

By E. K. Coggins

Chief Clerk to Roadmaster, Southern, Knoxville, Tenn.

The work of distributing or picking up the heavier track materials, such as rail, crossties, switch timber and ballast, can best be done with the use of a regular work train, and movable force under the supervision of the track supervisor or roadmaster. The material can be put where needed and handled more satisfactorily and economically with a gang of men which is organized and trained for the purpose than by bunching several section crews to load or unload the material with the local freight trains.

The miscellaneous roadway scrap, such as spikes, bolts, tie plates and anglebars, together with all kinds of car and engine scrap, that is continually falling from trains, should be picked up daily by the section men in connection with their other work and assembled at their headquarters for shipment to the division or district scrap pile. One day in each month should be known by all concerned as "scrap day," and each section force should be required to go over the entire section with a push car, the whole gang walking, and search the track and right of way carefully, gathering every piece of scrap from the broken spike or bolt to the draw head, brake rigging or car door, and hauling it to the nearest station.

Before the end of each month the supervisor should arrange for his month's supply of spikes, bolts, tools and other light material and supplies, to be handled in a car over his territory, preferably by the local freight on scrap day. The roadmaster or supervisor should accompany this car, and furnish each crew with the actual amount needed for the next month's work. The section men can arrange to meet the train on that day, receive their supplies, exchange their old tools for repaired ones and load the scrap and surplus material.

At least two cars should be used for the scrap, so that the roadway and mechanical material can be kept separate. This is necessary when applying the scrap on sale orders, as the different classes are sold at different prices, and besides, each department should have the proper credit for its material. It is also necessary for the mechanical scrap to go direct to the shops for the purpose of being sorted, as a greater part of that which has dropped from trains can be used again. The time spent by section men in gathering scrap is profitable and a section crew will soon pick up enough at the price it brings to pay for their time and have a nice surplus for the railway company.

The Railways of German East Africa.—In the construction of their Colonial Railways the Germans apparently were not unmindful of their defense. Their greatest system, the Dar-es-Salaam-Tanganyika Railway, commonly called simply the Tanganyika Railway, was completed last year, and is approximately 780 miles in length. At Tabora, 530 miles inland from Dar-es-Salaam, where many great trade routes converge, the Germans constructed a massive modern fortress. The great value of the railway as an economic factor lies in the fact that it borders on three great inland seas—Nyassa, Tanganyika and Victoria Nyanza—thus linking up the trading centres, the great lake system of Central Africa, and the River Congo with the east coast ports.

Methods of Conducting Annual Track Inspections

A Resume of the Practices of a Number of Roads to Stimulate the Efficiency of the Maintenance Forces

There is a wide divergence of opinion regarding the advisability of making annual track inspections and awarding of premiums as a means of promoting efficiency among the employees in the maintenance of way department as well as regarding the advantages secured from such practices. The objection most frequently raised to the annual inspections and to the award of prizes is that track work receives a temporary stimulus immediately preceding the inspection and that the efforts of the track forces are directed towards having the track in the best possible condition at the time of inspection to its possible neglect at other seasons. Those opposing this practice argue that better results may be secured by giving close personal attention to the matter of supervision and to the maintenance of a uniform condition of track throughout the entire season. On the other hand, officers of those roads on which the track inspections have been regularly adopted feel that such inspections are supplementary to continued close supervision and therefore do not result in the standards being lowered during the early part of the season, but provide an added incentive for good work.

An important advantage of a systematic inspection, especially when participated in by supervisors and track foremen in conjunction with the higher officers, is the opportunity for instruction regarding standards. Such a trip also offers an opportunity for these men to meet and to discuss many matters of interest to their departments while on the ground, enabling conclusions to be drawn with reference to methods of doing work more satisfactorily or for making improvements while the conditions are clearly before them without the delay resulting from correspondence.

On the roads which maintain a systematic method of inspection, the methods differ widely, from that of basing the awards upon one annual inspection to that of determining them upon several inspections made at intervals as frequent as six weeks to overcome as far as possible the tendency of the men to create a temporary artificial standard.

The number of roads which conduct such inspections, several of whom have retained this practice for a considerable number of years, indicates that they have found them profitable. The plans followed vary to a considerable extent according to the attempts of the officers of the individual roads to overcome objections which may appear more or less important to them. Because of the general interest in this subject we will outline the methods adopted in making inspections on a number of roads during the past season.

Probably the first road to adopt a system of track inspection permanently was the Pennsylvania Railroad. This road has also developed one of the most comprehensive methods of inspection, while the prizes offered are the largest. As the development of this system was described in detail in a recent issue (*Railway Age Gazette*, January 22), we will not refer further to it here.

PENNSYLVANIA LINES

The Pennsylvania Lines also conduct an annual track inspection which, however, differs materially from that on the parent system east of Pittsburgh. On the Pennsylvania Lines the inspection is confined to one annual trip over certain of the main lines, usually covering the Pan Handle from Pittsburgh to Chicago and the Fort Wayne on the return. The inspection party consists of the general manager and his staff, including the chief engineers maintenance of way and their assistants, the general and division superintendents, the division engineers, the assistant division engineers and the supervisors, and it travels by special train.

Three main prizes are awarded annually; one for the best supervisor's sub-division based on line and surface; another for the best track foreman's section based on line and surface, and a third for the best supervisor's sub-division based on all points. In addition, a smaller prize is given to the track foreman on each supervisor's sub-division having the best section based on all points. The first two prizes are determined by the markings of a special committee composed of two superintendents, two division engineers and two supervisors, all from portions of the line not under inspection. The third prize and those for the section foreman are awarded by another committee composed in a similar manner.

LACKAWANNA

The Delaware, Lackawanna & Western adopted a new method in making its annual inspection this year in that the inspection was made by a committee composed of three experienced maintenance of way engineers not connected with the road. This committee consisted of A. H. Weston, track engineer of the Lackawanna Steel Company; H. S. Rogers, engineer maintenance of way of the Delaware & Hudson, and S. B. Rice, engineer maintenance of way of the Richmond, Fredericksburg & Potomac. This committee was accompanied by the chief engineer and principal assistant engineer of the Lackawanna with the roadmaster in charge of each sub-division under inspection.

Each section and sub-division is given a rating. The best section on each division is recognized by awarding to the foreman a gold medal, while a silver medal is given to the foreman having the second best section. Section foremen winning the first prize for three consecutive years receive an additional reward of $10 per month in addition to their salary, while their names are also placed on an efficiency list. This honor has already been secured by several foremen. If the result of the annual inspection for any year shows this section inferior to any other on the division the extra compensation heretofore granted the foreman ceases.

NORFOLK & WESTERN

The Norfolk & Western makes an annual inspection in October of each year. Previous to this year it was made by the section foremen, who were divided into committees, each committee being composed of all the foremen on one roadmaster's division. The party travels on an inspection car which is carried on regular trains wherever that is practicable. No committee was allowed to inspect the same division two years in succession, nor to participate in the inspection of its own division. Before beginning the trip the roadmaster appointed one subcommittee on line and surface, another on switches, frogs and road crossings, a third on ditches and roadbed, another on right of way and fences and one on station grounds and policing. Each member of each subcommittee was furnished an inspection blank and gave his undivided attention to the particular subject assigned to him. A rating was given to each section and at the end of the trip the forms were taken up and the averages figured.

By this method the inspection was made by the foremen instead of by the higher officials and there were no complaints of unfairness or partiality. Aside from the rivalry created one of the principal advantages noted was the promotion of uniformity of work and compliance with standards. A disadvantage of this method of inspection was that each division was inspected by a different corps of men, some of whom marked on a higher basis than others. It was not, therefore, possible to make a comparison between the different divisions, although the relative standing of sections on any one division was clearly shown.

The method was changed last year, therefore, so that the roadmasters on each of the two general divisions made an

inspection of their respective divisions similar to that made by the section foremen. Committees are now selected from the roadmasters and prizes are awarded to section foremen from the markings made by the roadmasters' committee, a roadmaster being excluded from the committee when his own district is involved. The section foremen also make their inspection as heretofore, although their markings are used for comparative purposes only.

The section on each roadmaster's division showing the highest total average rating is awarded the first prize of $30. Second and third prizes of $20 and $10 are also given. An additional prize of $25 is also given to the foreman on each roadmaster's division whose section shows the greatest improvement during the year, this latter prize being awarded by the division officials familiar with the conditions which have existed during this period and the extent of the improvement made.

THE LEHIGH VALLEY

The Lehigh Valley conducts an inspection each fall by special train with a special observation car, which is a converted steel express car with one end removed and with a sloping floor. The inspection covers only the main line from Jersey City to Buffalo and the Perth Amboy branch. The engineer maintenance of way and his assistant, the division superintendents, division engineers and track supervisors compose the inspection party. The division engineers and supervisors are divided into two committees, one of which marks the condition of the track with reference to line and surface, joint bolts, anti-creepers and insulated joints and the other with reference to ties and tie spacing, ballast and ballast line, sod line, drainage and general appearance. The train moves over the line slowly and all ratings are made by individual miles. These cards are turned in to the engineer maintenance of way, who compiles this data into a report, copies of which are furnished to each division engineer, supervisor and foreman. In establishing the rating the committees consider only the actual condition of the track as it exists, without reference to any heavy renewal work which may have been done during the season.

No prizes are awarded, the reports being prepared only for the information of and as a stimulus to his supervisors and foremen. One of the benefits derived from this inspection is in having the party inspect the entire main line to see how work is progressing beyond the limits of their immediate territory. This method of inspection has now been in use for five years.

HOCKING VALLEY

The Hocking Valley regularly makes an inspection of track early in November under the general direction of the chief engineer and the engineer maintenance of way. The inspection is made by special trains consisting of three combination sleeping and dining cars with a special inspection car on the rear. About 20 officers, including the general manager, the heads of departments, the master mechanic, supervisors of track, certain foremen and frequently officials of other lines, participate in the inspection and assist in making the ratings. Each member of the party is provided with a book containing about 100 pages, one of which is allotted to each section. On a page each inspector assigns a rating to each mile, considering all points.

The inspection party is divided into four groups, one paying special attention to line and surface, another to ballast and ditches, the third to ties and crossings and one to sidings and policing. Following the inspection the data are compiled in the office of the chief engineer. In determining the final ratings line and surface is given five times the weight of sidings and policing, while the other two are given twice its weight. Two prizes of $20 and $10, respectively, are awarded to the section foremen receiving the two highest ratings on each of the five supervisors' districts. A prize of $50 is also awarded to the supervisor receiving the highest rating. In addition, the section foremen receiving the first and second prizes have boards sent to them for erection on their section houses stating that theirs are the premium sections.

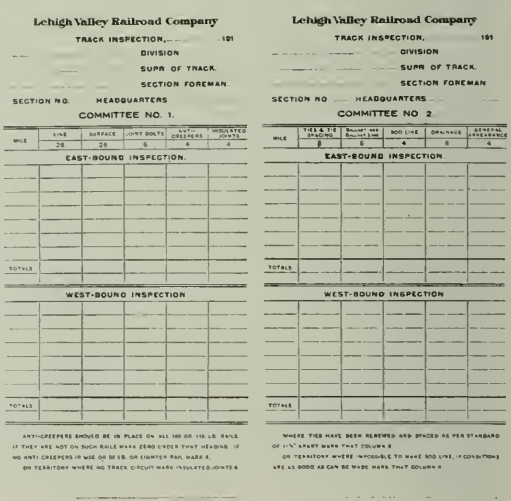
QUEEN & CRESCENT

The annual track inspection on the Queen & Crescent is made in November of each year, by special train with an observation car at the rear. Four men grade the line by individual miles, their marks being averaged for each section foreman's section and for each supervisor's district and roadmaster's division. One man marks with reference to line and surface, another on the condition of the joints and spacing of ties, a third on drainage, ditches and banks and also policing, and the fourth on spiking and also on switches and sidings. A committee termed the revisory committee exercises general supervision over the marking of these four men in an effort to preserve uniformity.

In preparing the averages the markings on the various subjects are given the following relative importance:

Line	20	
Surface	25	
Total		45
Joints	15	
Spacing ties	10	
Total		25
Drainage, ditches and banks	15	
Policing	5	
Total		20
Spiking	5	
Switches and sidings	5	
Total		10
		100

A premium of $50 is awarded to the foreman of the section receiving the highest mark. A prize of $25 is also awarded to



Sample Cards Used in Lehigh Valley Annual Inspection

the foreman of the section receiving the second highest mark and one of $75 to the supervisor of the district receiving the highest average mark for the entire district.

THE WEST POINT

The Atlanta & West Point Railroad and the Western Railway of Alabama conduct an inspection of track annually some time between April and October, the date varying from year to year to keep the men on the alert and expecting the inspection at any time. In this way the foremen are encouraged to keep their track in good condition throughout the season and there is no incentive to temporary stimulus at any one

time. The inspection last year was made in June and covered about 600 miles of track. Three days were required for the trip, which was made by a special train consisting of the necessary tourist sleepers, a dining car and a coal car fitted up with a canopy and with seats for use as an observation car.

The inspection is made by the section foremen themselves under the supervision of the superintendent maintenance of way and such other officials as he may designate. Last year all the section foremen were assembled at one end of the line. The supervisors, trainmasters and roadmasters accompanied the inspection train over their own districts. The entire party was composed of about 80 men. Each man was provided with a rating card and each division was inspected and rated by the foremen from other divisions. The men were required to inspect personally each frog and switch on the ground to impress upon them the importance of this detail of track maintenance. Rails, ties, embankments, ditches, etc., were also examined and the men discussed in detail any apparent faulty or good work that came to their attention. In the evening short talks were made by the superintendent maintenance of way on general subjects such as safety, discipline, loyalty, etc., and the foremen were called upon to express their opinion on these subjects in open discussion.

Premiums are awarded to the track supervisors having the best maintained districts and to the section foremen on each supervisor's district having the best section. In addition, an attractive sign is placed on each premium section.

Sample Inspection Record Blanks

THE ERIE

The Erie also conducts an annual track inspection, using a car which records automatically the gage and the cross level of the track, low joints and car swings or lurches. In connection with this autographic record consideration is also given to line and surface, ditching, policing and the general appearance of the track and right of way, officers marking on these various points entirely independent of the autographic record. In awarding prizes consideration is also given to the expenditures made on the various sections and due credit is given to those supervisors and foremen maintaining the best track at the least cost.

A prize of $200 is awarded to the supervisor having the best maintained sub-division and another prize of $100 to the supervisor having the second best sub-division. The section foreman maintaining the best section on each supervisor's division receives a prize of $100, while a second prize of $50 is awarded to the foreman having the second best section on each sub-division. A special prize of $150 is also awarded to the section foreman having the best section on each grand division. Similar prizes are also awarded on branch lines, those for the supervisors being the same as on main lines, while those for the section foremen are $50 and $25, respectively. Suitable signs are also placed at the section houses of the prize sections. In awarding prizes the winners of the previous year are not allowed to compete, but are expected to maintain the showings made previously. This inspection is made at the close of the track work each year.

CANADIAN PACIFIC

For the past two years the Canadian Pacific has awarded annual prizes for the maintenance of track. Sixty-two prizes in all are awarded, consisting of 1 general manager's prize, 4 general superintendents' prizes, 14 division superintendents' prizes and 43 roadmasters' prizes, all of which go to section foremen.

These prizes are based upon the quality of the work done by the various forces throughout the season rather than on the actual physical conditions on the different sections at the end of the season. Careful consideration is given to the condition of and the work done on ditches, spiking, lining, maintenance of surface, rail wear, switches, sidings, station grounds, fences, etc. The amount of labor expended, the physical condition of the sections as regards grades, alinement, drainage, etc., and the character of the roadbed are also taken into consideration, as is the amount of extra gang work. As the end of the season approaches each roadmaster carefully considers these conditions for each section on his territory and reports to the superintendent of that division the foremen who should receive the prize. The division superintendent and the resident engineer then select the prize sections on each roadmaster's district on that division and select the winner of the superintendent's prize, reporting this to the general superintendent. The latter officer in consultation with his division engineer then decides which superintendent's prize section is entitled to the general superintendents' prize. The best section on each division is then inspected by the general manager, the engineer maintenance of way and the division officers who award a general manager's prize.

ROCK ISLAND

The Chicago, Rock Island & Pacific conducts a track inspection during October and also in the spring of each year. The Rock Island is divided into three grand districts. A committee on each district, consisting of the general manager, the assistant general manager, the engineer maintenance of way and the division superintendents, goes over the track early in the spring before active work begins and again

after the season's work has been completed. These committees mark the several points on the following basis:

Line and surface	Value 65	marks	(Maximum)
Ditches, drainage and roadbed	" 15	"	"
Frogs, switches and joints	" 10	"	"
Spacing ties	" 5	"	"
Right of way, fences and station grounds	" 5	"	"

In the spring the markings are made for each section strictly in accordance with the above. Between the spring and fall inspections a record is made of the actual expenditures on each section, due regard being given to the placing of new rail or ballast for any extra gang work. On the fall inspection the markings are again compiled, due consideration being given to the condition of the track, the amount of money spent, etc. The improvement in percentages on each section is noted and the section foreman whose track shows the greatest percentage of improvement on each roadmaster's territory is awarded a prize. In this award the actual physical conditions existing on those sections such as the character of the soil composing the roadbed, the condition of the rail and other items which would materially affect the work of the foremen are also considered. In the same general way prizes are awarded to the roadmasters on each division whose territories show the greatest percentage of improvement on all sections. It is the belief of the officers of this road that material benefit has been secured since the adoption of this system four years ago. One defect, however, has been realized in that while the section foremen may by the application of hard work receive a high rating in the spring, this acts against him in the comparison in the fall when the percentage of improvement is not as great as on such sections where the track may have been neglected during the winter. Studies are now being made to remedy this condition.

as they pass over them on the basis of 10 as perfect. While these results are tabulated, no prizes are awarded to the foremen or supervisors.

That evening the men are given a banquet and a theater party. On the following day the party travels by special train over the main line of a neighboring road to give the men an opportunity to observe the track conditions and the standards of maintenance on other lines. Three years ago this party traveled from Erie to Buffalo over the Lake Shore and then to Niagara Falls and return over the New York Central & Hudson River. In 1912 this trip covered the lines of the Pittsburgh & Lake Erie and the Lake Shore & Michigan Southern from Pittsburgh to Erie, while in 1913 the party went over the Baltimore & Ohio from Pittsburgh to Cumberland, returning over the Western Maryland and the Pittsburgh & Lake Erie. Last fall the trip was concluded at Pittsburgh without a visit to any other line.

NEW YORK CENTRAL

The New York Central & Hudson River has conducted an annual inspection of main and branch lines for a number of years. The main line between New York and Suspension Bridge is inspected by a main committee, while the branch lines are inspected by sub-committees composed of maintenance officers from other divisions. No prizes are awarded to the supervisors, but the foremen receiving the highest rating

PARTY USING THIS CARD WILL SEE THAT HIS NAME IS WRITTEN ON THE BACK

Bessemer & Lake Erie Inspection Card

BESSEMER & LAKE ERIE

The method of conducting the annual track inspection on the Bessemer & Lake Erie varies considerably from those described above. Ordinarily the inspection covers two days. The first day the party, composed of all the section foremen and supervisors, the engineer of track, and the chief engineer, assembles at one end of the line and travels over it to the other end. Four committees, each consisting of four men, are appointed to consider line and surfacing; ballast, switches and sidings; joints and tie spacing; and ditches, road crossings, station grounds and policing. The members of these committees mark the condition of the various sections on each main line subdivision receives a premium of $3 per month for the ensuing year, while the foreman having the best section on each main line division, except the Electric division, receives an additional premium of $2 per month. On branch lines the foreman having the best track on each subdivision receives a premium of $2 per month, while a premium of $3 per month is awarded to the foremen receiving the highest ratings on yard sections. The object of the system on this road is to reward the foremen for individual efforts during the year rather than for the appearance of their sections on the day of inspection. For this reason the amount of work done on the different sections during the year is taken into consideration and certain sections receiving high marks are excluded in making the award of premiums because of extra gang work on them or because the foremen have been in charge of these sections for only a short time.

ENGLISH RAILWAYS

It may be interesting to note that similar methods of inspection are employed on several foreign railways, including the London & Southwestern and the Northeastern railways

of England. On the latter road challenge cups, medals and money prizes are awarded to the maintenance of way forces. To determine these awards an inspection is made by special trains with observation cars traveling at a rate of about 20 miles per hour. Ten days are spent in the inspection of the main lines, while three days additional are spent in the inspection of the yards, which latter inspection is made on foot.

One committee confines its attention entirely to the alinement and surface of the track and to the condition of the joints, while the second committee observes the general appearance of the ballast, fences, policing of the right of way, etc. These committees are divided into sections each of which remains on duty about an hour at a time.

In the marking of the first committee all faults noted by the judges are recorded and values are assigned to them according to their nature. The number of these defects is then divided by the distance traveled over in each section to bring them to a standard of so many defects per mile. The supervisor is present during the inspection to advise the judges of the limits of the sections and to answer any questions they may desire to ask. A list is prepared giving the number of defects per mile on each section, that with the least number receiving the highest award. In arriving at the final decision, allowances are made for sections being short-handed, for the age of rail, the nature of the traffic, etc.

The prizes consist of a director's challenge cup and a silver medal for the best supervisor's division, an engineer's challenge cup and a silver medal for the best section, and a district engineer's challenge cup and a silver medal for the best section in a busy yard. Money prizes of $15 each are also awarded to each of eight supervisors, and of $5 to each of 45 section foremen, with smaller prizes to the laborers in their gangs.

ABSTRACT OF ENGINEERING ARTICLES

The following articles of special interest to engineers and maintenance of way men, to which readers of this section may wish to refer, have appeared in the *Railway Age Gazette* since January 22, 1915:

One Effect of Retrenchment in Maintenance of Way Expenditures.—An editorial commenting on the relations between maintenance of way and maintenance of equipment expenditures was published in the issue of January 29, page 175.

New I. C. Station and Track Elevation at Memphis.—The new union station built by the Illinois Central at Memphis, Tenn., and used also by three other roads, and the track elevation work involved in the construction of the new line to reach this terminal were described in the issue of January 29, page 179.

New Car Ferry of the Florida East Coast Railway.—An illustrated description of a car ferry recently completed for the Florida East Coast to complete the "all-rail" route between the United States and Cuba was published in the issue of January 29, page 188.

A Comparison of the Old and New Lines of the Canadian Pacific at Rogers Pass, B. C.—An abstract of a statement by J. G. Sullivan, chief engineer of the Canadian Pacific, outlining the economies which it is expected will be effected by the construction of the five-mile tunnel at the summit of the Selkirk mountains, was published in the issue of January 29, page 194.

New Bridge Across the Mississippi River at Keokuk.—An illustrated description of the double-deck structure for which the contract has been let, to replace an existing structure across the Mississippi river at Keokuk, was published in the issue of January 29, page 200.

Unemployment on Railroads.—Attention was called to the possibility of reducing the amount of unemployment by distributing maintenance work more uniformly over the year, in an editorial on this subject in the issue of February 5, page 214.

Some Record-Breaking Construction Projects.—An editorial recalling the numerous construction projects now under way which are of unusual size was published in the issue of February 5, page 216.

Progress on Summit Cut-off of the Lackawanna.—An illustrated description of the present stage of the construction work on this 40-mile cut-off, including two reinforced concrete viaducts of exceptional size and a tunnel 3,630 ft. long, was published in the issue of February 5, page 235.

The Price of Rails.—An editorial commenting on the action of the Algoma Steel Company, a Canadian corporation, in quoting open hearth rails at $25 per ton on board cars at the mills, as compared with $30 at the mills quoted by manufacturers in the United States, and the purchase of such rails by at least three American roads, was published in the issue of February 12, page 253.

Plans for the New Union Station at St. Paul, Minn.—The details of a plan proposed by the St. Paul Union Depot Company, representing the nine roads entering the city, covering a new union station and passenger terminal development to cost about $15,000,000, was described and illustrated in the issue of February 12, page 261.

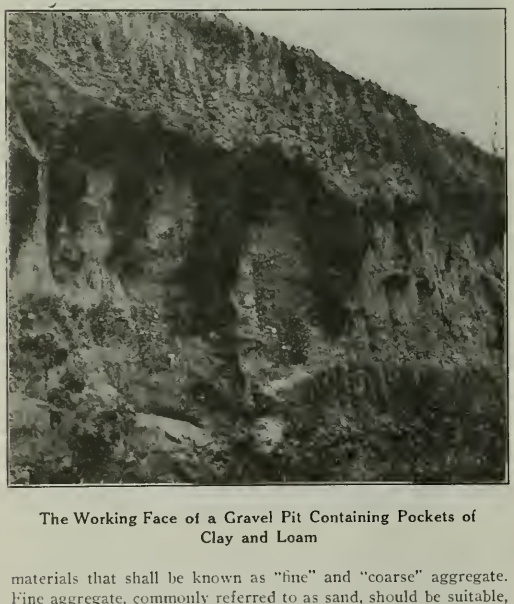
National Association of Scale Experts' Convention.—The report of this convention, including an abstract of a paper by A. Malmstrom, chief scale inspector, Atchison, Topeka & Santa Fe, on Foundation, Construction and Care of Track Scales, was published in the issue of February 12, page 269.

IMPORTANCE OF PROPER AGGREGATES IN CONCRETE CONSTRUCTION

By MacRae D. Campbell

Although there is an enormous amount of concrete apparently giving satisfactory service, there is also much that is not as good as it might be, as the result of one of several causes. Perhaps the greatest amount of poor concrete results from indifference in selecting and proportioning aggregates.

Only good, hard, clean, well-graded aggregates should be used. No bank-run material should be used without screening and reproportioning the fine and coarse materials, so as to produce a properly graded bulk of aggregate containing a minimum percentage of voids. Standard specifications carefully define the



The Working Face of a Gravel Pit Containing Pockets of Clay and Loam

materials that shall be known as "fine" and "coarse" aggregate. Fine aggregate, commonly referred to as sand, should be suitable, hard, durable, clean material, passing a No. 4 sieve. It should not contain more than 10 or 12 per cent of material passing a No. 50 sieve nor more than 5 per cent passing a No. 100 sieve. The coarser particles should predominate to produce strength and density. Coarse aggregate is material retained on a No. 4 sieve and containing particles which range from ¼ in. up to and including 1½ or 2 in. in greatest dimension, although in some cases this maximum may be exceeded in massive construction. This should be clean granite, trap rock, conglomerate, gravel or other hard, durable material, free from dust, loam, vegetable or other objectionable matter.

Clay, when it exists as a coating to the particles of aggregate, is undoubtedly injurious, as it prevents the proper adhesion of the cement to the surface of the sand particles. When clay of a silicious nature exists to a small extent throughout the mass of

the aggregate, in the form of separate particles, it appears to cause no serious harm in many kinds of concrete work; nevertheless, it is an adulterant and its presence is not desirable.

In many instances it is absolutely necessary to wash sand and gravel to remove objectionable matter before using them in a concrete mixture. This necessity is made apparent by one of the accompanying illustrations, which shows a gravel bank with overlying soil consisting largely of loam and organic matter, in part distributed in pockets through the bank. One can readily see that concrete made from material taken from such a source, and used without washing out the loam and other refuse, would be of very poor quality.

Forceful proof of this statement appears in the second illustration, which shows a pier in which bank-run aggregate obtained from the pit mentioned was used for the concrete. The disintegration that took place in the surface concrete before the pier had even been placed in service is apparent. Presumably the

Disintegration of a Concrete Pier in Which Bank Run Gravel From the Pit Shown in the Other Illustration Was Used

composition of the concrete throughout the structure is of a quality indicated by the surface.

That bank-run material is not suitable for concrete aggregate in its natural state can easily be shown by screening it. The average bank-run gravel will be found to contain at least twice as much fine material as coarse, while the proportions of fine to coarse material for good concrete should be practically the reverse; that is, about twice as much gravel as sand.

Two important and desirable qualities requisite in most concrete construction depend in great part upon proper grading and proportioning of materials; first, density and hence maximum strength; and second, watertightness. In the majority of gravel pits there is a great variation in the sizes of grains and pebbles and in the quantities of each. The same applies to deposits of gravel found in river beds and streams, where the current of water usually separates the different particles and makes regrading necessary.

One load of apparently good gravel from a pit is no indication of the run of the entire pit. No two loads from the same deposit will show the same proportions of sand and gravel. The fine and coarse materials are usually distributed in irregular seams and pockets, and when excavating begins on the face of the pit consequent drifting or falling down of materials does not produce a proper mixture of fine and coarse particles, regardless of how well mixed they may appear.

Aggregates may appear good yet be totally unfit for use. Casual examination is far from being a safe guide. Actual laboratory tests are sometimes necessary, but in all cases, construction foremen should be warned against using bank-run gravel without properly screening and reproportioning the fine and coarse materials.

Concrete mixtures made from bank-run gravel not only contain less cement per cubic foot of concrete, but the strength is reduced by the excess of sand. Experiments have shown that it is not only necessary but economical to pay laborers to screen bank-run material, so that it can be properly regraded and reproportioned.

It is not possible to produce an actual 1:2:4 mixture by taking 1 part of cement to 6 parts of ordinary bank-run gravel. A simple demonstration will show that the 1:2:4 mixture is richer in cement than the 1:6.

Take for example 2 cu. ft. of sand to which 1 cu. ft. (1 sack) of cement is added. When mixed together the cement is practically lost in the voids in the sand, so that the resulting mortar is very little over 2 cu. ft. in volume. When this mortar is added to 4 cu. ft. of crushed stone or screened gravel, properly graded, the same condition is repeated. The mortar is practically lost in the voids of the stone or gravel. As a result the volume of concrete is but little in excess of 4 cu. ft.

Even assuming that a bank-run material is well graded and that it contains approximately twice as much gravel as sand, the voids between the particles will be nearly one-half of the total volume, and the 6 cu. ft. of bank-run material would separate into 3 cu. ft. of sand and 6 cu. ft. of gravel.

If one sack of cement is added to 6 cu. ft. of bank-run gravel, the cement will be lost in the large amount of voids between the particles, the resulting concrete being 6 cu. ft., or the volume of the bank-run gravel. In one case there will be slightly over 4 cu. ft. of concrete containing one sack of cement and in the other case 6 cu. ft. of concrete with a like amount of cement, which means that the latter is a much leaner or weaker mixture. In addition, the excess of sand contained in the bank-run material will further weaken that concrete.

A 1:4 mixture of cement and bank-run gravel may produce a volume of concrete equivalent to that of a 1:2:4 mix, but the resulting concrete will be weaker because of an excess of sand, even though the material may be clean. If the bank-run material contains twice as much sand as gravel, it will require practically a 1:2½ mixture to equal the strength of the ordinary 1:2:4 mixture, since the proportions of the materials mixed with water must be the same. The volume of concrete secured from the same amount of cement would be reduced 40 per cent.

Railway Tunneling in the Pyrenees.—Despatches from Foix (Department of Arriège) state that the piercing of the tunnel under the Pyrenees at Puymorens was completed on December 31 under excellent conditions. The tunnel will be on the new line from Paris to Barcelona, via Toulouse.

Advantage of a Power Line for Electric Signals.—In the vicinity of Kansas City it has been found expedient to use alternating current for electric signals in order to prevent excessive damage to the apparatus by floods. In former times occasional overflows of the river ruined the batteries and caused great damage to relays and other delicate machinery. With alternating current, however, the batteries and their containers are eliminated; and all working parts, and those liable to damage, can be placed at the top of the signal post, out of reach of the highest flood.—W. H. Arkenburgh, in *The Signal Engineer*.

Relations of the Section Foreman and the Public

Two Discussions of a Field Now Largely Neglected for the Cultivation of Favorable Public Sentiment

The railways are coming to an increasing realization of the importance of educating the public regarding the problems now confronting them and considerable attention has been devoted to this subject during the past few years. The two papers published below call attention to one possible factor in this work which has been overlooked to a large extent.

THE SECTION FOREMAN A REPRESENTATIVE OF THE RAILROAD

By J. T. Bowser

Maintenance of Way Department, Queen & Crescent Route, Danville, Ky.

The local agent is usually spoken of as the representative of the railroad in the majority of its dealings with the public and, while the importance of the right attitude on the part of the agent is acknowledged, we should not overlook the importance of the right attitude of the section foreman as well. The latter employee is seldom considered except in connection with the maintenance of track or similar duties, yet he is in daily touch with many people whom the agent sees perhaps not oftener than once or twice a year, and his relations with these people, farmers in the main, often take on an intimacy that is closely akin to the neighborliness that is found among the farmers themselves. While mowing the right of way, the foreman borrows an extra scythe while the farmer borrows an extra pick or shovel, and numberless other small accommodations are exchanged. With the right attitude on the part of the foreman, the railroad becomes an agreeable neighbor instead of a "greedy corporation" to be "held up" on every opportunity.

The right of way fence should be kept in good condition by the foreman, or if it is too large a job for him to handle he should report it to the proper authority and so advise the property owner. Should the local law divide the responsibility for the maintenance of the fence, the foreman should, on advice from the office, explain this to the property owner.

If the foreman's relations with the owners of adjoining property are what they should be, he can often succeed in getting the farmer to plow fire guards to prevent the spread of fire in dry weather. If he has succeeded in making the railroad the right sort of a neighbor he has largely counteracted the spirit of "let it burn, the railroad will have to pay me a good price for it." As the first investigator of fire and stock claims, the foreman's relation with the claimant will have no little influence on the attitude of the claimant or the reasonableness of the claim.

A tactful foreman may often succeed in impressing the man who is careless about allowing his stock to get on the right of way with the fact that, though the railroad may reimburse him for his loss, there is still a loss to the community at large through the fact that this particular animal has served no useful purpose, and further, that such carelessness endangers the lives of the traveling public and the property of the railroad.

The matter of drainage is also a very fruitful source of complaint and even of legal controversy. In the construction and maintenance of a railroad it is of course necessary for drainage to be diverted from its natural channel in many cases. In the course of maintenance, the foreman should scrupulously respect the rights of adjoining property owners when he is ditching or otherwise disposing of water from the right of way, and in cases where the diversion of drainage onto adjoining property is absolutely necessary, he should, if possible, secure the permission of the owner, or failing in this, report the matter to his superior officer.

Foremen should endeavor to keep the right of way clear of weeds of a character harmful to the adjoining farm or pasture lands. Though the right of way may not be injured thereby, it is an injustice to the adjoining property holder. It is often good policy, if rules permit, to allow the farmers to remove old ties released from the track from the right of way. These are of no value to the company, but are of considerable value to families, more especially in sparsely timbered country. For this privilege there are other privileges which the foreman is often obliged to ask in return, such as drinking water for the gang when a supply on the right of way is not convenient.

The right sort of an acquaintance among shippers or others using the station grounds at small stations will be of material assistance in keeping these grounds free from trash, etc. Proper respect for private property should be required of men in the gang at all times. The animosity of neighbors is often incurred by untoward acts on the part of rowdies among track laborers. The foreman should be allowed considerable latitude in his dealings with the farmers, as it will increase his loyalty and self-respect, and an interchange of courtesies will create a spirit of fairness toward the railroad, which is badly needed in public sentiment.

THE SECTION FOREMAN AND THE PUBLIC

By W. E. Schott

Section Foreman, Southern Pacific, Benson, Ariz.

Like any other business enterprise, the financial success of a railroad system depends upon the volume of patronage it receives from its respective customers. To get as much business as possible, large amounts of money have been expended by our railroads for advertising purposes and for a force of commercial agents; sales men, to bring the respective advantages of each road before its customers, the general public; but only during late years steps have been taken to induce railway employees in different departments to secure customers for their roads.

The intelligent section foreman has many chances to make customers and what is infinitely more to the point, to make friends for the railroad which employs him. The territory, which he controls, is a narrow strip of land from 100 to 200 ft. wide and from 5 to 10 miles long. Sometimes along this stretch of ground he can be found every day in the year, working his small crew of laborers. All around him, joining the right-of-way fence on both sides, live his neighbors, the farmer and the rancher, and incidentally the railroad's patrons.

If he has been on his particular section for any length of time and is not a confirmed grouch, he knows every one of these men personally and many intimately. Hardly a day passes without his meeting or speaking to one of them. Often one of his neighbors has a job on hand which he cannot handle without a little help, such as pushing a wagon out of a mudhole and the foreman and his crew are asked for a minute's assistance; now and then the foreman takes a few rotten ties out of the track which, while useless for the railroad, are accepted gladly by the farmer for stove wood. In fact, there are a thousand occasions where the foreman can extend little favors to his neighbors which are highly appreciated by them and which are bound to create a neighborly, friendly feeling between the section foreman and the people along the line. By impressing upon them the fact that those favors are really given by the railroad, the foreman can aid considerably in having this friendly feeling also extended towards the railroad company.

Being a working man himself, just like the farmer or ranchman, the foreman's advice and counsel in matters concerning the railroad will always be accepted with more trust and confidence than anybody's else.

Nine times out of ten when the settler along the right of way

has some real or imagined grievance against the railroad, the section foreman is the first one to whom he will come for advice. He is the nearest representative of the railroad, and knowing him as a good friend and neighbor for many years, he has no doubt but that the foreman will give him his unprejudiced opinion as to whether he has a real complaint or not, or whether he will gain anything by making such kick.

Many small damage suits, perhaps not very important individually, but forming quite an item in the aggregate, have been settled by the section foreman convincing the irate farmer of the unfairness of his demand. Perhaps his argument was not quite as strong from a technical standpoint as the one the company's counsel or claim agent would have made; but as he was a fellow toiler and had proven a good friend, his argument carried far more weight than any word any high-priced lawyer, representing the road, could have said.

Another possibility of immense value to his railroad lies in the foreman's power to change to some extent public opinion towards corporations. Unfortunately, relations between the general public and the railways are not always friendly, and in consequence laws have been passed which hamper the railroads enormously, without being of great advantage to anybody. There is no question but that some of these laws have been passed on account of the antagonism for the railroads; and more will be passed if the railroads do not exert their utmost to change such public sentiment.

The best and about the only way to do this is through the employees. None of them has a better chance to accomplish something worth while in this line than the section foreman, who is in daily intercourse with a certain portion of the public.

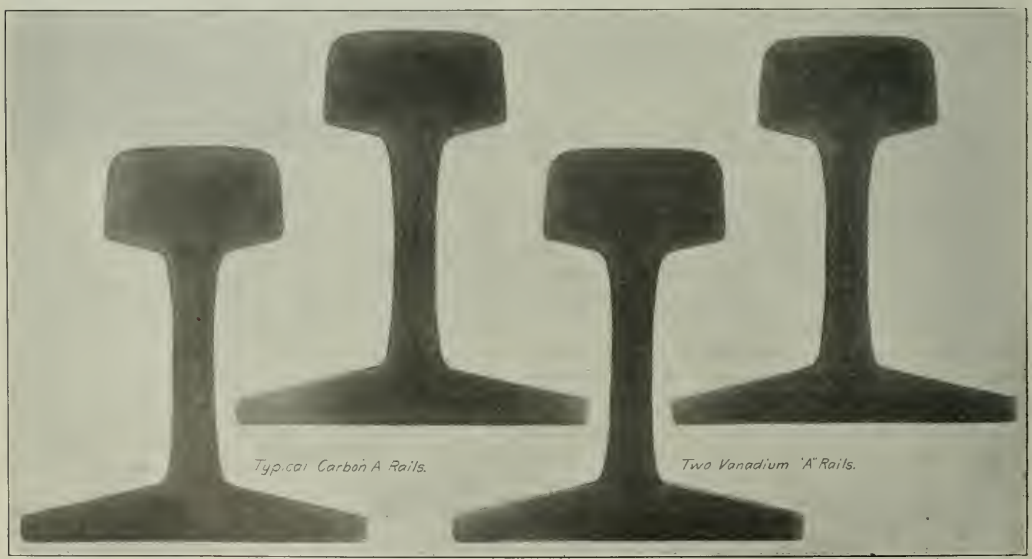
VANADIUM STEEL RAILS FOR THE D. L. & W.

Two 100-ton heats of vanadium steel rails were recently rolled by the Pennsylvania Steel Company for the Delaware, Lackawanna & Western. These rails were of the road's standard 105-lb. section with the same chemical composition that is used in the carbon basic open-hearth rails except for the addition of vanadium and the reduction of 0.10 per cent. to 0.15 per cent in carbon. The only requirement in the road's specifications as to chemical composition is that the phosphorus content must be less than 0.04 per cent. Two typical open-hearth heats rolled at the same time showed the following average composition: Carbon, 0.65 per cent; manganese 0.66 per cent; nickel, 0.45 per cent; phosphorus, 0.020 per cent; sulphur, 0.057 per cent; chrome, 0.24 per cent, and silicon, 0.14 per cent. The corresponding chemical contents of the two vanadium heats were: Carbon, 0.52 per cent; manganese, 0.70 per cent; nickel, 0.41 per cent; phosphorus, 0.012 per cent; sulphur, 0.056 per cent; chrome, 0.19 per cent; silicon, 0.11 per cent, and vanadium, 0.150 per cent.

The vanadium rails were required to meet the same drop test requirements as to deflection and ductility prescribed for the standard D. L. & W. rails, which limit the deflection for the first blow to a minimum of 0.85 in., and a maximum of 1.30 in. The minimum deflection in the six vanadium rails tested was 0.88 in., and the maximum 1.08, the average being 1.00 in., as compared with a minimum of 1.00 in., a maximum of 1.08 in., and an average of 1.04 in., for the carbon open-hearth heats. In elongation under the drop test three of the six vanadium rails tested met the specifications under the first drop and the other three under the second drop, while none of the carbon rails met it under the first drop.

In the tensile test the two vanadium heats showed an elastic limit of 85,800 lb. per sq. in., as compared with 60,437 lb. for the two carbon heats and a tensile strength of 139,280 lb. per sq. in., as compared with 132,032 lb. per sq. in. The average elongation in 2 in. was 10.5 per cent for the vanadium and 10.4 per cent for the carbon heats and the reduction of area 18.0 per cent and 17.7 per cent, respectively. The vanadium rails also showed greater hardness, the average Brinnell number for the vanadium test being 297 and for the carbon 274. In brief, then, the vanadium rails showed in the tests an increased strength and hardness with approximately the same deflection under the first blow of the drop test and a slightly better ductility.

Accidents to Trackmen.—As a result of the safety campaign on the Chicago & North Western the number of trackmen killed was reduced from 21 in the year 1910 to 17 in 1914 and the number injured from 1,777 to 1,203. During this period the mileage of line operated by the company has increased from 7,650 to 8,000.



Etched Cross Sections of Two Carbon and Two Vanadium Rails Showing Segregation

THE ESSENTIAL ELEMENTS IN THE DESIGN OF SWITCH CONNECTIONS

By W. F. Rench

Supervisor, Pennsylvania Railroad, Perryville, Md.

The design of switch connections embraces the determination of two distinct questions: First, the number of frog best adapted to the space available and the service required; and, second, the length of switch most suitable for use with the selected number of frog. The former is largely an operating question, while the latter can only be decided by a close analytical study of the mathematical functions. A purely theoretical consideration of the physical question indicates that the ideal relation exists when the switch angle is no greater than one-fourth the frog angle. But experience has shown that quite satisfactory results are obtained when this ratio is as low as 1 to 3½. It is readily seen that any increase in the length of switch employed with a particular frog tends to increase the degree of curve of the turnout, and it is this fact mainly which restricts the choice of length.

In the table of the principal functions for various combinations the lead has been modified within practical limits from the strictly theoretical dimension, with a view to the use of commercial lengths, in the main rail, assuming these to be generally 25 ft., 27 ft. 6 in., 30 ft., and 33 ft., or where this is not practicable, of such lengths cut in two in the proportions necessary to make the difference between the main rail and the turnout arc. This difference follows a regular ratio and is obtained in every case by dividing 12 in. by the number of the connection, which it should be noted is not always that of the frog employed, but is the one which most nearly corresponds with the resultant curvature.

By the uses to which they are applied connections are divided into four general classes, viz.: siding connections; main track and siding connections for low speed; main track connections for medium restricted speed, and main track connections for the greatest practicable restricted speed.

Connections which are exclusively of the first class consist of those over which road power cannot operate, and they are therefore less than No. 6. Because of the menace to passenger traffic such frogs should be rigidly excluded from main tracks carrying passenger traffic. The typical frog of this class is the No. 5, which average practice fixes as the lowest number that will satisfy the requirements of the safety appliance law. It requires no demonstration to show that the proper length of switch to be used with this number of frog is 10 ft. In fact, it is generally recognized that this length of switch is the minimum that may be employed with any connection.

The second classification includes by far the largest percentage of all the frogs that are in use on American railways, embracing those between Nos. 6 and 9. Bearing in mind the general use of these numbers it is plain that the adoption of a common length of switch for all is exceedingly desirable. Since each is of frequent occurrence in main tracks the ability to cover all by a single length of switch is of unquestionable advantage.

The determination of the proper length of switch for use with this group concerns particularly the No. 6. This number must sometimes be used for main track connections, through which road power, including the modern types of passenger locomotives, operates not only in drill service, but quite often in main line movement. Practice permits the employment of any length of switch between 10 ft. and 18 ft. with this number of frogs, but the 10 ft. length introduces a too abrupt change in direction for comfortable operation in passenger service and causes a very considerable shock with consequent wear upon the point in the case of drill movement. On the other hand, while the 18-ft. length supplies the requisite improvement in the detour feature, the degree of curve is increased nearly 10 per cent, and the minimum thus created becomes somewhat precarious for road movement.

A reference to the table shows that the use of a 15-ft. length does not unduly increase the degree of curvature, while the switch angle is reduced one-third. This length of switch therefore appears to be more generally desirable for the No. 6 frog than either of the other lengths. It will also be seen that in the case of the No. 7 an equal curvature to that with an 18-ft. switch results and that the curvature of the No. 8 and No. 9 with the 15-ft. switch is materially less than that obtaining with the 18-ft. switch. The middle ordinate of the chord of the turnout arc is uniformly 6¼ in., which practically may be used as 6 in. with 4½ in. at the quarters. Thus exact line may be obtained readily, which is an essential feature in switch construction. This length is therefore recommended as one of the standard lengths in preference to 18 ft.

The one objection is that this length is not desirable with the No. 10 frog, which is in very common use on many roads, but this turnout more properly belongs with the class of main line turnouts through which a medium restricted speed is not only safe but comfortable, and a longer switch even than 18 ft. is desirable. It will be observed upon reference to the table that the use of a 24-ft. switch with a No. 10 frog but slightly increases the curvature above that which obtains with the 18-ft. switch, while the detour feature is again one-third improved. This also applies to the No. 11 and No. 12 frogs, which are often employed in preference to the No. 10 when space for the No. 15 is lacking. The 24-ft. length is quite favorable for the No. 15 and No. 16 frogs, and in all of these the middle ordinate is seen to be very close to 6 in.

There still remains the fourth class wherein detour must be made at the greatest speed practicable, both as a means of maintaining headway and of avoiding loss of time while passing through the connection. The former is the more important consideration, as headway once lost usually requires a dozen miles

Table of Turnout Dimensions

Frog	Frog angle	Switch	Switch angle	Lead	Lead rail	Turnout arc	Radius	Degree	Middle ordinate
4	14° 15′	10′	2° 41′	37′ 00″	20′ 00″	20′ 3″	98′	58° 28′	6″
5	11° 25′	10′	2° 41′	42′ 00″	25′ 00″	25′ 2½″	162′	35° 22′	6″
6	9° 32′	10′	2° 41′	47′ 00″	30′ 00″	30′ 2″	250′	22° 55′	5½″
6	9° 32′	15′	1° 47′	54′ 00″	32′ 00″	32′ 2″	237′	24° 00′	6¼″
7	8° 10′	15′	1° 47′	59′ 5¼″	37′ 5¼″	37′ 6¾″	337′	17° 00′	6¼″
8	7° 09′	15′	1° 47′	66′ 11¾″	44′ 11¾″	45′ 0¾″	480′	11° 54′	6¼″
9	6° 22′	15′	1° 47′	72′ 00″	50′ 00″	50′ 1¼″	626′	9° 09′	6½″
6	9° 32′	18′	1° 30′	57′ 00″	32′ 00″	32′ 2″	227′	25° 14′	6¾″
7	8° 10′	18′	1° 30′	62′ 8½″	38′ 8½″	38′ 10″	332′	17° 16′	6¾″
8	7° 09′	18′	1° 30′	69′ 11¼″	44′ 11¼″	45′ 0¾″	455′	12° 36′	6½″
9	6° 22′	18′	1° 30′	75′ 00″	50′ 00″	50′ 1¼″	588′	9° 45′	6¼″
10	5° 44′	18′	1° 30′	80′ 00″	55′ 00″	55′ 1¼″	744′	7° 42′	6″
11	5° 12′	18′	1° 30′	85′ 00″	60′ 00″	60′ 1″	928′	6° 10′	6″
12	4° 46′	18′	1° 30′	91′ 00″	66′ 00″	66′ 1″	1,158′	4° 57′	5¾″
10	5° 44′	24′	1° 07′	88′ 6″	57′ 6″	57′ 7¾″	714′	8° 01′	6¼″
11	5° 12′	24′	1° 07′	94′ 00″	63′ 00″	63′ 1″	900′	6° 22′	6¼″
12	4° 46′	24′	1° 07′	98′ 5¼″	67′ 5½″	67′ 6½″	1,075′	5° 20′	6¼″
15	3° 49′	24′	1° 07′	119′ 6″	87′ 6″	87′ 6¾″	1,858′	3° 05′	6″
16	3° 35′	24′	1° 07′	125′ 0″	93′ 0″	93′ 0¾″	2,149′	2° 40′	6″
12	4° 46′	30′	0° 54′	108′ 6½″	71′ 5¼″	71′ 6½″	1,058′	5° 25′	7¼″
15	3° 49′	30′	0° 54′	128′ 00″	90′ 00″	90′ 0¾″	1,767′	3° 15′	6¼″
16	3° 35′	30′	0° 54′	134′ 00″	96′ 00″	96′ 0¾″	2,049′	2° 48′	6¾″
20	2° 52′	30′	0° 54′	156′ 00″	118′ 00″	118′ 0½″	3,490′	1° 40′	6½″
24	2° 23′	30′	0° 54′	185′ 00″	145′ 00″	145′ 0½″	5,600′	1° 01′	5¾″

to regain, and if adverse grade is present it may require a much greater distance. It will be conceded that a conservative limit for the unbalanced elevation of a curve is 1½ in. This fact considered alone would permit the operation of No. 20 and No. 24 connections, whether of turnouts or crossovers, at a speed of 45 miles per hour. But it is neither comfortable nor entirely safe to detour through the angle made by a 30-ft. switch at a speed faster than 30 miles per hour, unless the alinement through the switch is adjusted to furnish equal advantage to the main track and the turnout routes, which would, of course, require that the speed through both routes should be restricted alike, when a speed of 45 miles per hour would be entirely proper.

It is recognized that the 18-ft. switch is extensively used and by many of our best roads, and that it covers a very wide range of numbers viz.: between No. 6 and No. 12. But it has been shown that neither the 10-ft. nor the 18-ft. switch is desirable with the No. 6 frog, and, similarly, neither the 18-ft. nor the 30-ft. length is adapted to the No. 12 frog. While the 18-ft length is quite satisfactory with the No. 10 frog as regards curvature, it is not easy enough in the detour feature to fully meet the needs of this number in main line movement. The fact that by its use the number of working lengths may be kept at three with a saving in stock account has heretofore justified its use. But the increase in the size of both passenger and freight power warrants the revision of standards to meet the new conditions, even though the fourth length be introduced.

The choice of stock numbers of frogs will probably always be a matter of individual preference, but a study of some of the practical considerations in such a selection may be of interest. The No. 5 frog will be used where only drill power operates. If the drilling must be done by road power the No. 6 should be the minimum permissible. This number is almost invariably chosen for wye tracks, not alone because of the considerably less room required, but also because the shorter length can be traversed in less time, an important item at terminal points. But it is desirable on account of the natural shifting of the track beyond the connection that the general radius be no less than 300 ft.

The No. 8 frog is the most frequently used of the group of smaller numbers. It is a common selection for main track connections with private industry tracks, with set-off sidings for crippled cars, and especially for yard ladders. The feature that renders it desirable for this last purpose is the fact that it is the lowest number that can be used at 15 miles per hour, and thus the greatest conservation of room will obtain without sacrifice of celerity in operation.

Nos. 10, 11 and 12 frogs are preferred for main track crossovers where moderate speed only is required, not alone because they are safer if greater speed than the established limit should be used, but because they encroach less upon the clearance with the traffic running upon adjoining tracks, an important consideration with 12-ft. centers of tracks. The Nos. 15 and 16 frogs are very useful where space is limited and it is desirable to make movements with speed, or where a fair degree of headway must be maintained. The No. 20 and higher frogs are preferable where ample space is available and the highest speed practicable must be used.

The numbers from No. 15 are not infrequently very useful to render the curvature favorable when the turnout springs from the inside of a sharp curve, and, similarly, the No. 10 and No. 12 frogs supply the needed operating advantages of the higher numbers when the turnout is from the outside of a curve.

The question of what numbers will best serve the uses of a trunk line railroad can be readily determined from the foregoing discussion. These will be found to be Nos. 5, 6, 8, 11, 15 and 20. It will be noted that these numbers increase in a regular progression and that in a general way the curvature of all except the second number is just twice that of the next lower number. The suggested numbers will be found to supply a regularly increasing length for crossovers, and they thus furnish the means for economical use of the space available. The No. 15 and No. 20 turnouts, which are much used in interlocking layouts, employ rails that vary 5 ft. in length and thus supply the required spacing for insulated joints without the introduction of unusual lengths.

The use of the 10-ft. length with the No. 5, of the 15-ft. length with the No. 6 and No. 8, of the 24-ft. length, with the No. 11 and No. 15, and of the 30-ft. length with the No. 20, all give a uniform middle ordinate of practically 6 in. for the chord of the turnout arc. This feature supplies the opportunity for general use of a uniform rule in lining the turnout curve, which is of very considerable advantage. It is well known that even on main line divisions poor line through the turnout arc is quite common, and this defect may be traced to the practice of lining the curve by eye or what is almost equally unsatisfactory, by a system of offset measurements. In the rush of lining such connections the simpler the process the better the result obtained.

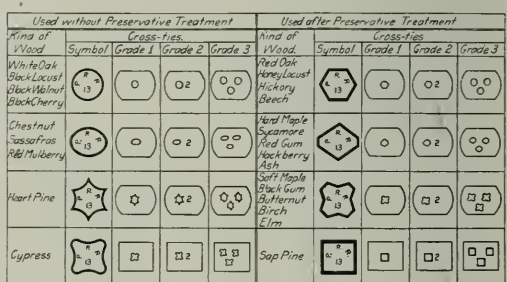
The approximate speed in miles per hour that may be used through connections, assuming that the curvature is at least 100 per cent greater than will just pass the power in question, is about double the frog number, and it will thus be seen that the numbers recommended furnish a regular progression in this respect also.

The ultimate supplanting of the No. 10 by the No. 11 is inevitable, because in the case of crossovers, which is their most common use, the length is increased but 15 feet, while a 25 per cent lighter curvature obtains.

STANDARD METHODS OF PILING AND MARKING TIES ON THE PENNSYLVANIA

The Pennsylvania Railroad has given special attention to the best methods of piling ties previous to inspection and purchase and also when stored along the line awaiting insertion in the tracks, to reduce the decay to the minimum. Special methods have also been devised for the marking of ties to maintain their identification as regards kind of wood.

Sketches have been prepared showing the approved and improper methods of piling ties, copies of which have been sent to the foremen along the line. Efforts have also been made to get the tie producers to pile the ties for inspection in accordance with these standards. To this end the inspectors have

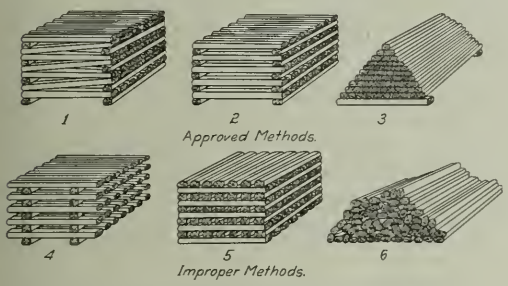


Methods of Marking Ties with Hammer Brands

been supplied with small cards, showing the approved method of piling the ties, to distribute among the tie producers, while the purchasing department has added this information to its price circular. The results secured in this direction have been quite satisfactory.

As shown in one of the accompanying sketches, pile No. 1 shows the recommended method for stacking any kind of wood while awaiting use or treatment. In this way the ties rest on the edges only, and thus have the least area of contact, and this area is close to the end where the final stresses in the tie are the least. Pile No. 2 shows the method which is permissible for the stacking of ties to be inspected. While with this method

the ties have a flat contact, the weight is applied at the ends where it retards checking, and even if the contact results in decay the minimum amount of harm is done. In this respect this method differs from that shown in pile 4, where checking



Correct and Wrong Methods of Piling Ties

may extend as far as the rail seat and decay or "pile burning" may also start at the rail seat or the point of greatest stress. These differences between piles 2 and 4 have not always been realized by the foremen or tie producers, and special efforts have been made to instruct them in this regard.

Pile No. 3 shows the improved method of stacking creosoted and heart pine ties at right angles to the track when within reach of locomotive sparks. When beyond the reach of sparks, creosoted and heart pine ties are stacked solidly, 10 ties to the layer. Only creosoted or rejected ties are placed on the ground under the piles. All untreated ties are piled with an open side toward the prevailing wind, while only creosoted and heart pine ties are allowed to be piled solidly. The instructions require that all inflammable vegetation be removed for at least a foot around each pile and where any quantity of ties are stored on an area surrounded by grass or timber a fire line is plowed around them at least 100 ft. from any adjoining structure.

The standard system of marking ties accepted by the inspectors is shown in Fig. 2. Previous to July 1, 1914, the distinctions as to kinds were indicated by paint, but on this date symbols were added to the hammers which formerly branded only "P. R. R." and the inspector's number on each tie. The advantages of the new system are that it is cheaper, it saves the clothes and lightens the equipment of the inspector, it is quicker to apply and it enables all kinds of wood to be distinguished permanently, whereas the various colors of paint looked alike after the ties came out of the creosoting cylinder. All class-A ties or those which are to be inserted in the track without treatment are marked with characters composed of curved lines. Class-B ties, which are used only after treatment, are indicated by symbols composed of straight lines. In this way all that the track laborers have to remember is that ties with straight lines are not to be used in the track except when black, showing that they have been creosoted.

NEW PENNSYLVANIA STANDARD ANTI-CREEPING TIE PLATE

The Pennsylvania Railroad has adopted as standard for 100-lb. rail a joint tie plate 5 ft. 10 in. long extending over four ties. This plate, which is 10½ in. wide and ⅞ in. thick, is used with the plain angle bar joint. It is slotted to correspond with this standard angle bar and also for double-spiking to the two ties beyond the angle bar. The details of the plate are shown in the accompanying photographs and drawing. This plate not only gives a strong rail joint, but has also proved an excellent anti-creeper.

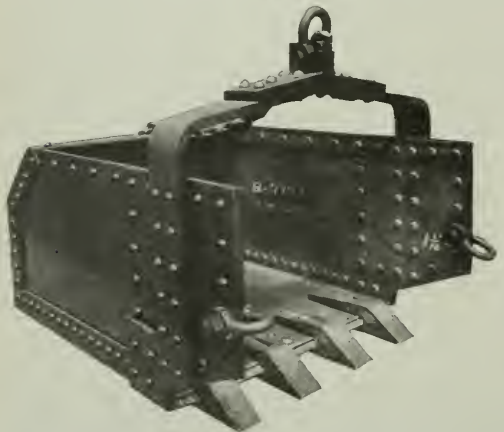
A CABLEWAY COALING STATION

A new type of coaling station having special advantages for points where it is necessary to store coal frequently, has been designed by Sauerman Brothers, Chicago, utilizing the Shearer & Mayer drag line cableway and bucket for which this firm is the agent. The station consists of a coal receiving hopper alongside a coal storage pit, a coal pocket with overhead bins and proper facilities for discharging the coal into locomotive tenders, and the overhead cableway with the mast and anchor so located that the bucket will travel from the receiving hopper over the storage pile to the coal pocket.

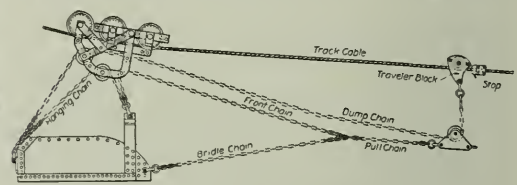


Bucket Used with Shearer & Mayer Drag Line Cableway

The entire plant is located between two tracks, one on which the coal is brought in and dumped into the receiving hopper and the other on which locomotives receive coal from the picking up stored coal by a steam shovel or locomotive crane.

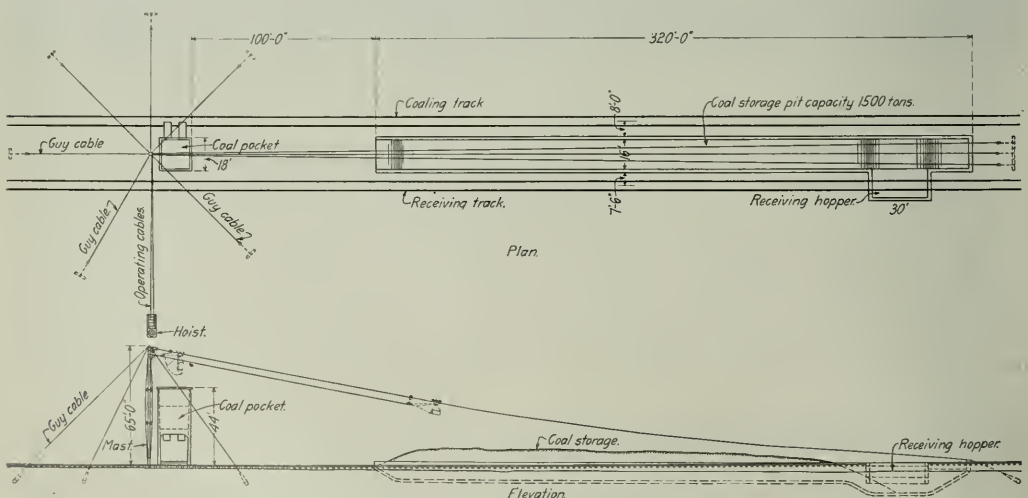
The drag line cableway consists of a bucket and carriage mounted on a slack track cable shown in the accompanying drawing. The track cable is supported at the power end by a mast or tower and at the opposite end by an anchorage which can be arranged to allow it to be shifted readily in order to change the line of operation of the cableway. The operating power is furnished by a double friction drum engine, the front drum controlling a steel cable called the "load" line which leads through a sheave on the mast to the bucket mounting, and the back drum controlling a tension line leading to a set of fall blocks attached to the mast. The former cable serves the double purpose of loading the bucket and pulling it along the track cable to the dumping point. The latter cable affords a means for slackening and tightening the track cable, one end of which is supported by the fall blocks.

When the bucket is loading, the track cable is slack. After the bucket is loaded, this track cable is gradually tightened, thus lifting the load at the same time that the load cable hauls the bucket up to the dumping point. The operation of dumping is accomplished by a stop clamp on the track cable which engages a block traveling on this cable and arrests its movement. The pull of the load line is thereby transferred from the pull chain to the dumping chain connected with the rear end of the bucket, which automatically dumps the material. After dumping, the bucket returns to the loading point by gravity.



Drag Line Bucket and Operating Lines Used for Handling Coal

This cableway, which is covered by patents, has been used in pockets. Under normal operation, the coal would be taken direct from the receiving hopper to the bins in the coal pocket, but when desirable to store coal in anticipation of a shortage, it could be moved by the bucket from the hopper to the storage pile and later reclaimed from storage in the same manner, thus eliminating one handling as compared with the usual method of gravel pits, in levee construction and general excavation work with success. A variety of materials, including coal, have been handled by the bucket shown in the accompanying illustration, the teeth of which are removable in order to secure the best results in handling various classes of material under different conditions.



Plan and Elevation of Cableway Coaling Station

General News Department

The midwinter convention of the American Institute of Electrical Engineers was held at the Engineering Societies' building, 33 West Thirty-ninth street, New York, February 17, 18 and 19. A number of prominent engineers gave addresses on "The Status of the Engineer."

F. M. Swacker, United States District Attorney at New York, is again investigating the doings of the former directors of the New York, New Haven & Hartford. It is said that all of the indictments against directors, for alleged offenses against the anti-trust law, which have been hanging over them for several months will have to be redrawn, because of some technical illegality in their preparation.

H. W. Thornton, formerly general superintendent of the Long Island Railroad, now general manager of the Great Eastern of England, has "made good." This statement came in a press despatch from London, last Saturday, saying that at the annual meeting of the shareholders of the Great Eastern, Lord Claud Hamilton, the chairman of the company, paid Mr. Thornton a special tribute; and that the meeting unanimously agreed that Mr. Thornton, already, before filling out a year's service, had fairly justified his selection as manager.

Clifford Thorne, chairman of the Iowa Railroad Commission, appeared before a joint committee of the Iowa legislature on February 5, and asked that an appropriation be made for a valuation of the railroad property in the state. He said the valuation is needed both to ascertain the reasonableness of rates and also for purposes of taxation, and that it could be made in either of two ways—by employing a few engineers to make a check of the Interstate Commerce Commission appraisal, which he said would cost $15,000 or $20,000, or to make a complete independent valuation, which he estimated would cost $100,000 or $125,000.

About 300 of the employees of the New York and Staten Island divisions of the Baltimore & Ohio held their second annual banquet and fellowship meeting at the Broadway Central hotel, New York, on the evening of Saturday, February 6. C. C. F. Bent, general superintendent of the New York division, J. M. Watkins, auditor of revenue, W. H. Averell, general superintendent of the Staten Island line, and R. M. Van Sant, editor of the Baltimore & Ohio Employees' Magazine, addressed the meeting, and C. W. Tomlinson, general eastern freight agent, read a paper on the Best Way to Obtain Efficiency in Railroad Operation.

The Pennsylvania Railroad reports that 427 fires—more than three-quarters of all that occurred on the property of the system last year—were extinguished by company employees before receiving the aid of public fire departments. The average loss was $43. Organized fire brigades among the employees last year checked 34 fires, and other employees, by the use of chemical extinguishers, put out 71. The total fire loss on the Pennsylvania system during the year 1914, including fires where the assistance of city fire departments was received, was $658,483, while the value of the entire property was nearly $400,000,000, the fire loss being only 16 cents per each $100 of property value at risk.

The recent action of the Oregon Wool Growers' Association in adopting resolutions at its annual meeting appealing "to our national and state legislators and officials, and to our own membership and the general public, to adopt an attitude of encouragement towards transportation, public utility and business enterprises, to urge the repeal of legislation which, though exalted in purpose, has proved destructive in effects and to support legislation that will foster the investment of capital, stimulate industry and increase material prosperity, so there will be better markets for our products, more profit for the producers and more employment and better wages for labor," has been followed by similar action by two other influential organizations in that state. Resolutions of a similar tenor indicating a new attitude towards business have just been adopted by the Oregon Irrigation Congress, one of the strongest associations of farmers in the state of Oregon, and by the Oregon Pure Bred Livestock Association.

The Pennsylvania reports that of 3,861,962 efficiency tests and observations made last year, more than 99.9 per cent showed perfect obedience to the rules. In other words, regulations were followed to the letter 1,494 times in every 1,495 cases observed. In the observance of stop signals, 24,798 tests were made, and in only 34 cases was there failure to live up to the strict letter of the rule. An absolutely perfect record was made by enginemen in observing flagmen's signals; 18,203 tests showed not one failure. In 113,747 instances observed, there were only 314 in which the rules governing the handling of explosives and inflammables were not followed exactly. In all save nine out of 16,251 cases, the rule requiring trainmen to be stationed at all unprotected grade crossings, during the shifting of cars, was obeyed. There were only 17 infractions, in 53,430 instances, of the rules governing watchmen at protected crossings. Out of 17,642 observations to see whether first aid equipment was kept in proper order, six cases requiring criticism were found.

The New York Central reports that during the last year the number of surprise tests made on its lines was 323,292, and the number of cases of inefficiency was 389, showing a percentage of efficiency of 99.88. To the report of safety on this road, for the year ending June 30, 1914, which was given in the *Railway Age Gazette* last week, may be added the statement that no passenger has been killed in a train accident on that road during the past four years.

Employees of the St. Louis & San Francisco, who held a mass meeting at Springfield, Mo., on February 7, to begin a campaign for higher freight and passenger rates in Missouri, have appointed an executive committee and sub-committees for each 100 miles of road in the state, to circulate petitions. The executive committee has issued a statement to the press stating that there are more than 26,000 idle laboring men in the state of Missouri at the present time, and that this is because the railroad rates are so low that they are unable to earn the money to buy material and employ the labor necessary to keep up a safe and efficient condition of the roadbed, rolling stock and machinery. It is stated also that in the United States at the present time there are 1,450,000 laboring men idle for this reason, and over 1,500,000 who are working on short time. The earnings decreased from 33 1/3 to 50 per cent per month. This means, the statement says, that this vast number of employees is in a position where they must retrench and purchase less of the goods from the retail merchants of the cities in which they reside.

Report on Lackawanna Derailment Near Alford, Pa.

The Interstate Commerce Commission has just issued a report on the derailment of the Delaware, Lackawanna & Western passenger train No. 32 near Alford, Pa., on October 31, 1914, resulting in the injury of 23 passengers and 12 employees. This train, consisting of 4 wooden coaches, was running at a speed of approximately 15 miles an hour when it was derailed by a broken rail on the inside of a 4-deg. curve. The rail was broken squarely across in six places, four of these breaks showing transverse fissures in the head. Subsequently four other fissures were found in the rail, ranging in diameter from 7/16 in. to 1¾ in.

Passenger train No. 14 had passed over this track about one hour previous to the accident and the engineman felt a jolt, such as would result from a broken rail. He made a special stop at Alford, two miles beyond and instructed the operator to inform the chief despatcher of this condition. The despatcher then instructed the operator to notify the section foreman, which was not done until about 45 minutes after the accident. The despatcher did not notify train No. 32 of the broken rail before it left the preceding station.

In the report of the engineer-physicist on this rail it is stated

that all the transverse fissures were located on the gage side of the head or over the web of the rail. The presence of internal compression strains in the head of the rail immediately below the running surface was indicated by the head assuming a convex shape when released from the web showing a deflection of 15/16-in. in 12 ft. The report concludes by again calling attention to the increasing prevalence of transverse fissures and to their danger, showing two photographs of 78 individual rails in which transverse fissures have recently occurred.

Summary of Revenues and Expenses of Steam Roads

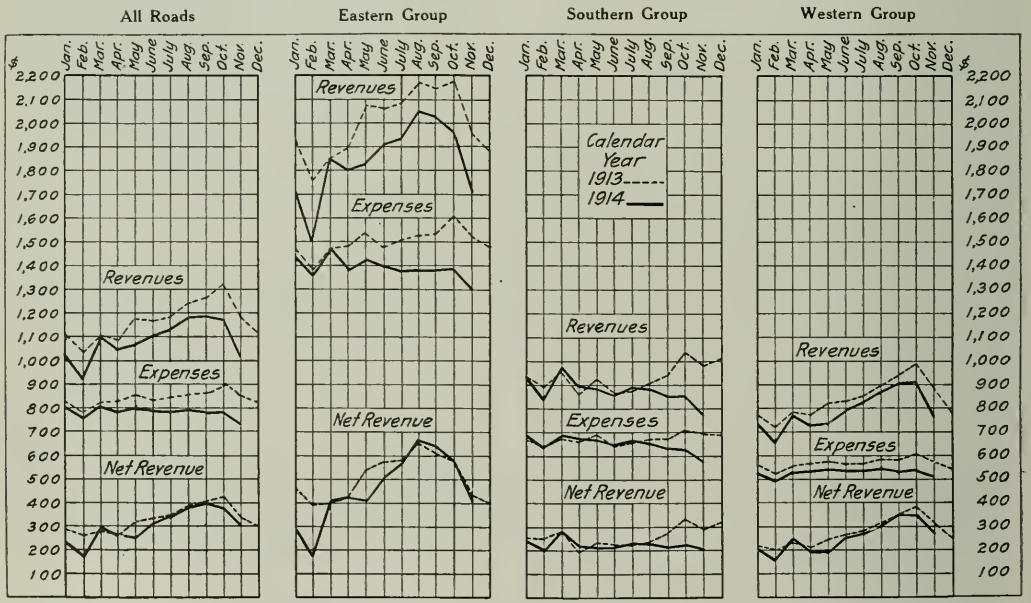
The Bureau of Railway Economics' summary of revenues and expenses and comments thereon for November, 1914, are as follows:

Railways operating 228,461 miles of line are covered by this summary, or about 90 per cent of all steam railway mileage in the United States. Their operating revenues for the month of November, 1914, amounted to $233,812,430. This amount includes revenues from freight and passenger traffic, from carrying mail and express, and from miscellaneous sources connected with rail and auxiliary operations. Compared with November, 1913, these operating revenues show a decrease of $32,836,569, decreasing $42, or 14.7 per cent. Operating income for each mile of line for each day in November averaged $8.08, and in November, 1913, $9.47. Operating income is that proportion of their operating receipts which remains available to the railways for rentals, interest on bonds, appropriations for betterments, improvements, new construction, and for dividends.

The railways of the Eastern district show a decrease in total operating revenues per mile of line as compared with November, 1913, of 11.9 per cent, those of the Southern district a decrease of 19.9 per cent, and those of the Western district a decrease of 11.9 per cent.

Operating expenses per mile decreased 13.8 per cent in the East, decreased 15.2 per cent in the South, and decreased 11.3 per cent in the West. Net operating revenue per mile decreased 5.2 per cent in the East, decreased 31.0 per cent in the South, and decreased 12.9 per cent in the West. Taxes per mile show a decrease of 7.6 per cent in the East, a decrease of 2.9 per cent in the South and a decrease of 6.1 per cent in the West. Operating income per mile decreased 4.7 per cent in the East, decreased 35.2 per cent in the South, and decreased 14.0 per cent in the West.

The operating ratio for November, that is, the per cent of total



Monthly Revenues and Expenses per Mile of Line in 1914

Total operating revenues per mile averaged $1,023 in November, 1914, and $1,180 in November, 1913, a decrease of $157, or 13.3 per cent.

Operating expenses, which include the cost of maintaining track and equipment, operating trains, securing traffic, and of administration, amounted to $167,224,821. This was $23,435,399 less than for November, 1913. These operating expenses per mile of line averaged $732 in November, 1914, and $844 in November, 1913, a decrease of $112 per mile, or 13.3 per cent.

Net operating revenue, that is, total operating revenues of rail and auxiliary operations less operating expenses, amounted to $66,587,609, which was $9,401,170 less than for November, 1913. Net operating revenue per mile of line averaged $292 in November, 1914, and $336 in November, 1913, a decrease of $45 per mile, or 13.4 per cent.

Taxes for the month of November amounted to $11,143,626, or $49 per mile, a decrease of 6.5 per cent from November, 1913.

Operating income, which is net revenue from rail and auxiliary operations, less uncollectible revenues and taxes, averaged $242 per mile of line, and in November, 1913, $284, thus de-

operating revenues absorbed in operating expenses, was 71.5 per cent, which is comparable with 71.3 per cent in November, 1913, and 66.4 per cent in November, 1912. The operating ratio in the Eastern district for November was 76.1 per cent, as compared with 77.8 per cent in 1913; was 74.5 per cent in the Southern district as compared with 70.4 per cent in 1913; was 65.9 per cent in the Western district, as compared with 65.5 per cent in 1913.

Comparison of returns for five months of the current fiscal year with the corresponding months of the previous fiscal year reveals a decrease in total operating revenues per mile of 8.2 per cent, a decrease in operating expenses per mile of 9.6 per cent, and a decrease in net operating revenue per mile of 5.1 per cent.

This net operating revenue per mile increased 0.5 per cent in the East as compared with the corresponding period of the previous year, decreased 18.5 per cent in the South, and decreased 5.7 per cent in the West.

When the returns for the eleven months of the calendar year 1914 are compared with the corresponding months of 1913, they show a decrease in total operating revenues per mile of 7.3 per cent, a decrease in operating expenses per mile of 6.6 per cent,

and a decrease in net operating revenue per mile of 9.1 per cent. This net operating revenue per mile decreased 10.3 per cent in the East as compared with the corresponding period of the previous year, decreased 11.2 per cent in the South, and decreased 7.0 per cent in the West.

The diagram shows the variations in operating revenues, operating expenses, and net operating revenue per mile for the separate months of the calendar year 1913 and of the calendar year 1914 to date.

The following table shows the per cent of operating revenues consumed by such class of expenses:

Per Cent of Total Operating Revenues

	November, 1914				Five months of the
	United States	Eastern District	Southern District	Western District	fiscal year 1915
Freight revenue	70.0	68.7	72.7	70.3	68.3
Passenger revenue	20.7	20.9	19.6	20.9	22.7
Mail revenue	2.0	1.7	1.9	2.4	1.8
Express revenue	2.5	2.7	2.5	2.3	2.3
All other revenues	4.8	6.0	3.3	4.1	4.9
Maint. of way and structures.	12.4	12.4	13.6	12.1	12.9
Maintenance of equipment	17.4	19.2	18.9	15.0	16.8
Traffic expenses	2.1	1.9	2.8	2.1	1.9
Transportation expenses	36.5	39.3	36.0	33.8	33.8
General expenses	2.6	2.5	3.0	2.6	2.4
All other expenses	0.5	0.8	0.2	0.3	0.5
Total operating expenses	71.5	76.1	74.5	65.9	68.3

Proposed Railway Legislation

The bill before the Alabama legislature to require the use of high-power headlights on all locomotives, has been passed by the Senate, and has been favorably reported by the committee in the House.

The New Jersey Senate has passed by a vote of 11 to 7 Senator Pierce's bill, requiring the removal of one grade crossing each year by each railroad in the state, for every thirty miles of its line in the state.

There is a bill before the legislature of Ohio to make Eastern time the standard of the state, instead of Central. A number of hearings have been held and it is said that the committee in charge of the bill is divided, six to four, six being against the adoption of the proposed law. The city of Cleveland has adopted Eastern time and evidently wants the rest of the state to take the same action; but at Cincinnati there is strong objection.

Bills presented in Pennsylvania include one to require that signalmen and similar employees shall be given two days' holiday each month at full pay; one permitting railroads to issue tickets to clergymen at reduced rates; requiring all men to have one day of rest in seven; for medical inspection of employees of dining cars; allowing second class cities to tax all tracks, sidings, switches, turnouts and other facilities on highways and wharves; allowing municipalities to tax real estate of all corporations; repealing the anthracite coal tax act of 1913, now in the courts; regulating acid lubricating oil; restricting use of state police in lockouts; requiring advertisements for strike breakers to contain notice of labor disturbance; adding 116 men to the state police force, which now contains 228 men; regulating sub-leases of company houses; punishing trespassing on lands or waters of water companies; requiring all locomotives to be equipped with automatic bell ringers, and the regular biennial bill to require all locomotives to be equipped with headlights which will enable a man to be seen 600 ft. away. The bill to repeal the "full crew" law has not yet appeared, but the railroad men have organized to fight it.

Proposed Additional Accident Statistics

The new forms for use by railroads in reporting accidents to the Interstate Commerce Commission, proposed recently by the commission and noticed in the *Railway Age Gazette*, January 22, page 164, were the subject of a conference in New York City this week between the committee of the American Railway Association, Julius Kruttschnitt, chairman, and W. J. Meyers, statistician of the commission. There were present also Dr. Meeker from the Department of Labor, Washington; representatives from the state railroad commissions of New York, Pennsylvania and Illinois, and officers of two railway brotherhoods, the conductors and enginemen. It is expected that a second revision of the blanks will be made and distributed, and that therefore the discussion of details will take no final form for several weeks yet. The committee representing the railroads has proposed a single blank, to contain all necessary spaces to make it suitable for use in recording any and all kinds of accidents which are reported to the government. Efforts will be made to secure the co-operation of all the principal roads, the state commissions and the Interstate Commerce Commission in a movement to standardize accident records, so that the primary record, that made by the railroad superintendent, can be made acceptable to all interests—the federal government, the state governments and the legal departments of the railroad companies, with the least practicable modification.

Cost of Valuation Forty-Five to Sixty Millions

Mr. Prouty, chief of the valuation division of the Interstate Commerce Commission, in a statement made before the House Appropriations Committee at Washington, recently gave some estimates of the probable cost of the work of valuing the railroads of the country, which must have made even the most "progressive" Congressmen pause for a moment.

The commission for the next fiscal year asks for $3,000,000. The last annual appropriation was $2,000,000 and $400,000 had been appropriated before that. The cost of the current work now going on is about $2,000,000 a year, of which about $500,000, according to Mr. Prouty, is what may be called overhead expenses. He desires to carry on the field work faster than at present and therefore asks for a larger appropriation. There are now at work 40 parties, eight parties in each one of five districts. These men go over about 2,000 miles of road a month. He desires to double this rate; that is, to make it about 50,000 miles a year; and even at that it would take at least four years from next July to finish the work. At the present rate—$2,000,000 a year for 24,000 miles, the total cost to the government for all the roads would be around $21,000,000. Possibly, if the overhead charges do not increase in proportion, the total might be a million or two less. The smaller figure, however, is more than *six times* the amount of the estimates which were common when the valuation law was first discussed in Congress.

Speaking of what the railroads are doing, Mr. Prouty said that at present they were doing more talking than work; but some of them, he says, have made a good deal of progress. The Boston & Maine, at present one of the poorest of the large roads in the country, is expending on this work an average of $100 a mile. Other roads, however, may have more complete records and very likely will not have so large an expense for new surveys. At $100 a mile the 250,000 miles of road in the country would cost $25,000,000.

In another part of his statement, Mr. Prouty says that the government is spending about half as much as the railroad companies. This would make the total expenditures of the railroads of the country somewhere from thirty-six to forty-two millions.

Answering questions of congressmen as to when the results will be available, Mr. Prouty could not speak very definitely. If "certain fundamental questions" as to methods of valuation could be settled, then there would be no reason why the commission could not act promptly, on the completion of the surveys. Finally, he hinted that if the commission should go into extended detail—meaning, presumably, investigations of financial history—much more time would be taken and a much larger expense incurred.

Lobbying at Harrisburg

Messrs. Rea, Voorhees, Willard and O'Donnel, representing the railroads of Pennsylvania and New Jersey have issued a statement denying charges of improper conduct in their dealings with legislatures, employees and citizens. They hear from Harrisburg that certain underhand and wrong methods are being pursued to prevent repeal of the "full-crew" law.

The statement says in part: "The railroads are not responsible. They will stoop to no such measures. Their case has been taken directly to the court of public opinion and they challenge proof of any lobby of the kind that the public understands by that word. There is none, nor will there be any.

"With that statement, we also assert the inalienable right of any and every citizen to talk with and write to his elected representatives and to impress upon them in every honest way his views, whatever they are. It is the privilege of every railroad employee to do this. The railroads have no objection.

"We are advised that trainmen have gone to legislatures and

stated that they were sent by railroads under compulsion to urge repeal of the full-crew law and to oppose certain bills before the legislature. If any railroad officer has attempted to coerce any man under him, he has acted in direct conflict with the roads' publicly announced policy. There is no thought to coerce trainmen or other railroad employees. On proof of coercive or improper methods the man or men guilty, no matter what their positions in the service, will be disciplined.

"The railroads are taking the full-crew law directly to the people. The Brotherhood of Railroad Trainmen, in a statement issued February 11, protests against this, saying: 'They intend to present the question to the public; but why is left to conjecture. The power to repeal the law is vested in the legislature. The senators and representatives in the general assembly are chosen by the people to perform such service and the constitution of the commonwealth declares that the legislative power shall be vested in a general assembly, which shall consist of a senate and House of Representatives.'

"All of this is true. What the railroads seek is to let the people know the effect of the full-crew laws. Then, as citizens, the people can inform their elected representatives what they want done. The trainmen's organization evidently fears the consensus of informed public opinion. . . . The railroads are perfectly willing to let the people, men and women of the state, determine."

A. S. M. E. Boiler Code

The boiler code committee of the American Society of Mechanical Engineers has made a final report on this subject, which has been accepted by the council. This final report is the result of the work of the original committee, of which John A. Stevens is chairman, and an advisory committee consisting of engineers representing various phases of the design, installation and operation of boilers. This advisory committee included the following representatives from the railway field: F. H. Clark, general superintendent of motive power of the Baltimore & Ohio; A. L. Humphrey, vice-president and general manager of the Westinghouse Air Brake Company; H. H. Vaughan, assistant to vice-president, Canadian Pacific Railway, and W. F. Kiesel, Jr., assistant mechanical engineer of the Pennsylvania Railroad. The code is considerably shorter than when originally brought out by the committee; and the rules laid down in it, of course, do not apply to boilers which are subject to federal inspection and control. The original committee and the advisory committee have been continued as one and will meet once a year in order to make any changes that advances in practice may make necessary. At these meetings will also be taken up any change which may seem necessary in a rule because it works unnecessary hardship on any particular class of boiler makers or users.

Society of Technical Associations' Secretaries

The first annual meeting of the Society of Technical Associations' Secretaries will be held in the Engineering Societies building, New York, on Saturday, February 27.

The business session will start at 10 a. m., followed by luncheon at the Engineers' Club at 1 p. m., and the afternoon session will start at 2:30 p. m. The afternoon session will be opened by an address by Harry D. Vought. Secretaries of a number of important societies are to be invited to open the discussion, including: Edgar Marburg, secretary of the American Society for Testing Materials; Charles Warren Hunt, secretary of the Society of Civil Engineers; George P. Conard, secretary of the Association of Transportation and Car Accounting Officers, and Calvin W. Rice, secretary of the American Society of Mechanical Engineers. It is also expected that representatives of the railroad clubs will be asked to tell how the railroad clubs and their members can be benefited by the society.

A Talk to Apprentices

On Monday evening of this week George M. Basford, chief engineer of the railroad department of Joseph T. Ryerson & Son, made an address before the apprentices of the Chicago & North Western at Chicago. The talk was intended to give the boys a bigger and broader view of the opportunities which lay before them and of the possibilities which might result if they were to follow their work in the right spirit. The title of the address was "Making Heroes." "Choose to be heroes," said Mr. Basford, "in the heroism of simple honesty in the work which shows and in that which lies concealed, that you may look back in years that are to come proud that you have done an important part in making the Chicago & North Western a better railroad. To see what is right and not to do it, is want of courage." The address was received most enthusiastically.

MEETINGS AND CONVENTIONS

The following list gives the names of secretaries, dates of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

American Association of Demurrage Officers.—A. G. Thomason, Demurrage Commissioner, 845 Old South Bldg., Boston, Mass. Annual convention, March 23, 1915, Jefferson Hotel, Richmond, Va.

American Association of Passenger Traffic Officers.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, April 15-16, San Francisco, Cal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Piedmont Hotel, Atlanta, Ga.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

National Railway Appliances Association.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Railway Signal Association.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa. Next meeting, March 15, 1915, Chicago. Annual meeting, September 21-24, 1915, Salt Lake City, Utah.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Signal Appliance Association.—F. W. Edmonds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of Newark.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 3d Monday in month, except July and August, The Washington, Newark.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Transportation Club of Detroit.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Western Canada Railway Club.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF DECEMBER, 1914

Name of road.	Average mileage operated during period.	Operating revenues: Freight.	Operating revenues: Passenger.	Operating revenues: Total, inc. misc.	Operating expenses: Maintenance: Way and structures.	Operating expenses: Maintenance: Of equipment.	Operating expenses: Traffic.	Operating expenses: Transportation.	Operating expenses: Miscellaneous.	Operating expenses: General.	Operating expenses: Total.	Net operating revenue (or deficit).	Railway tax accruals.	Operating income (or loss).	Increase (or decr.) comp. with last year.

Traffic News

A press despatch from Butte, Mont., reports cotton, by the trainload going through there on the way to the Pacific coast, bound for Russia.

The Canadian Pacific has notified the Canadian Railway Commission that the Canadian railroads are preparing to apply to the board for permission to make a general increase in freight rates east of Port Arthur. It is reported that the plan contemplates a general advance of 5 per cent. Canada is about to impose new taxes, war taxes, which, no doubt, will bear heavily on the railways.

The Department of Agriculture on February 15 extended its quarantine regulations against foot-and-mouth disease to include all territory east of the Mississippi river and north of the state of Tennessee. Shipments from this territory to the south or west cannot be made except of animals to be killed within 48 hours. The state of Rhode Island has ordered the closing of all slaughter houses in the state for an indefinite period.

Mr. Ford, of the Cincinnati, New Orleans & Texas Pacific, has issued a second three-page circular telling agents and shippers of business opportunities in foreign countries as gleaned from the publications issued by the government. Mr. Ford's survey includes the whole world. Cast iron pipe, for water, is wanted in the Canary Islands; Zurich, Switzerland, wants from a million to five million oak railroad ties; Chile wants machinery for making wood pulp; and so on.

It is reported that a flood of petitions, both from individuals and from commercial organizations, urging increases in freight and passenger rates for the railroads, have been received by the Missouri legislature. On February 8, petitions of this kind were presented to the legislature by five state senators and 125 members of the house, and were referred to the committees on railroads. It is said that approximatly 10,000 names were signed to the petitions and that about 5,000 letters were received by the legislators.

The Traffic Club of New York

At the regular monthly meeting of the Traffic Club of New York, to be held at the Hotel Astor, on Tuesday, February 23, W. S. Kies, manager of the foreign trade department of the National City Bank, will speak on "Our Expanding Foreign Trade."

Annual Dinner, Traffic Club of Pittsburgh

The Traffic Club of Pittsburgh has announced that its thirteenth annual dinner will be held in Memorial Hall, Pittsburgh, Pa., on the evening of Friday, March 5. George A. Blair, assistant freight traffic manager of the Chicago, Milwaukee & St. Paul, will act as toastmaster, and the speakers will be W. L. Clause, president of the Pittsburgh Plate Glass Company, who will speak on "The Federal Trade Commission," and Hon. John W. Weeks, senator from Massachusetts, who will speak on "The Relation of the Government to Business." President E. S. Lalk will preside.

Car Surpluses and Shortages

The American Railway Association's Committee on Relations Between Railroads, Arthur Hale, chairman, resuming the work discontinued last autumn, has issued statistical statement No. 1, giving a summary of freight car surpluses and shortages for February 1, 1915, compared with similar figures for November 1, 1914. The total surplus was, on February 1, 1915, 227,473; November 1, 1914, 172,325; February 1, 1914, 211,960. (The statement for November was given in the *Railway Age Gazette*, November 20, page 986.)

Reports as of February 1, 1915, have been received from 159 roads, operating 1,854,150 cars, while figures for November 1, 1914, were furnished by 192 roads operating 2,203,414 cars. It is therefore probable that had reports been received from the same number of roads in February the surplus would have been increased by approximately 50,000 cars, or to a total of 277,000. The greater part of the surplus increase over the figures of November 1, 1914, is in Group 2 (Eastern) and consists chiefly of coal cars.

In the surplus grand total this increase is offset to some extent by a large reduction in box cars in Group 11 (Canada), due to the failure of two large roads in that section to report.

The total shortage was, on February 1, 1915, 832; November 1, 1914, 2,229; February 1, 1914, 2,282. The shortage is negligible.

The figures showing the surplus and shortage by classes of cars follow:

Classes.	Surplus.	Shortage.
Box	40,533	493
Flat	16,243	56
Coal and gondola	133,200	201
Other	37,497	82
Total	227,473	832

Two-Cent Fares in Missouri

The Missouri Public Service Commission reports to the legislature of that state that, according to returns sent in by nine principal railroads of the state, the receipts of those roads for passenger fares in 1914 amounted to $992,946 less than in the year 1913. The falling off in passenger receipts on the Burlington road in Missouri was $330,912, and on the St. Louis & San Francisco $323,756.

Illinois and Iowa Campaigns for Higher Passenger Fares

The Illinois railroads are having published in newspapers throughout the state a reply to a statement made by Ralph D. Rosestiel of the United Commercial Travelers' Association, that 50,000 traveling men in Illinois spend $25,000,000 a year in traveling expenses. The railroads' statement shows that the official report of the Illinois Railroad & Warehouse Commission for the fiscal year ending June 30, 1913, gives the total passenger traffic earnings on Illinois railroads as $41,642,000; so that the assertion that more than 60 per cent of the railroad traveling in Illinois was done by commercial travelers, appears ridiculous on the face of it. It is also stated that the records of the mileage bureaus of the passenger associations of Illinois railroads show that only about 8 per cent of the passenger traffic comes from commercial travelers. Eight per cent of the total passenger earnings in Illinois in 1913 would be $3,331,360. It is also shown by the railway mileage bureau records that over 90 per cent of the railway fares of commercial travelers are paid by their employers. The remainder is paid by commercial travelers who work on a commission basis and pay their own expenses. The statement also says that a majority of the members of the Travelers' Protective Association of Ohio have written to the secretary of the organization that they are in favor of increasing the passenger fare in Ohio to 2½ cents a mile. The Merchants' & Manufacturers' Association of Cincinnati, including large employers and traveling salesmen, has also unanimously adopted resolutions in favor of a 2½ cent a mile law in Ohio.

As a result of the first week's campaign of the passenger officers of the Illinois railroads for an increase in the state passenger fare from 2 cents to 2½ cents per mile, resolutions endorsing the petition of the railroads have been adopted by seven commercial organizations before which the railroad men presented their case. Other organizations have referred the matter to their boards of directors. The commercial clubs that endorsed the plan were those at Galena, DeKalb, Danville, Dixon, Peoria, LaSalle and Peru. The resolutions which the railroad men asked the clubs to adopt include a recommendation to the representatives and senators in the legislature that "upon proper showing by the railroads that such an increase is reasonable, that the law be so amended as to fix the maximum railroad rate for passengers traveling in Illinois at 2½ cents per mile instead of 2 cents per mile, thus restoring to the railroads one-half the reduction which was made in passenger fares when the present law was enacted." The speaking campaign will be continued this week at a large number of additional cities throughout the state.

A committee of presidents of railroads running through Iowa held a conference with Governor Clarke, at Des Moines, on Tuesday, to ask the support of the state officers in their proposed campaign for an increase in the passenger fare from 2 to 2½ cents a mile and a general revision of state freight rates.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

A hearing was held in Chicago on February 10, before an examiner for the commission, on complaint of shippers in the East Chicago and Indiana Harbor districts of Indiana, against a 5 per cent increase in freight rates to Illinois points. The points affected have been considered heretofore as a part of the Chicago switching district, and have had Chicago rates, but in connection with the general 5 per cent advance in interstate freight rates in Central Freight Association territory the rates were advanced in October, 1914. The industries affected are complaining because of the discrimination created, because the Illinois Public Utilities Commission suspended the 5 per cent advance as applied to intrastate business, which gives shippers in the Chicago district on the Illinois side of the state line an advantage over their competitors just across the line in Indiana. The railroads obtained an order from the Interstate Commerce Commission giving relief from the operation of the fourth section from the Calumet district, but on later complaints the commission ordered a new hearing. The railroad defense at the hearing was that the discrimination was created by the action of the Illinois commission in suspending the intrastate rates.

Kansas-California Flour Rates

Opinion by Commissioner Clements:

This proceeding is supplementary to *Kansas-California Flour Rates,* 29 I. C. C., 459, *Arizona Wheat Rates,* 29 I. C. C., 424, and *Arizona Corporation Commission v. Arizona & New Mexico,* 29 I. C. C., 424. Following the decision in those cases the carriers involved asked permission to increase the rates on wheat and flour in connection with the general readjustment of rates contemplated by them, pursuant to the Supreme Court's decision in the *Intermountain Rate cases.* Upon further hearing the commission finds that the defendant carriers have justified proposed increases in the rate on flour in carloads from 65 to 75 cents per 100 lb. from points in Kansas, Nebraska, and neighboring states to California terminals, and such a rate will be permitted to become effective, provided the difference between the rates on wheat and flour does not exceed 8 cents; and provided the rates on said commodities to the terminals are not exceeded at intermediate points. (32 I. C. C., 602.)

Rates to Columbia, S. C.

Columbia Chamber of Commerce v. Southern Railway et al. Opinion by Commissioner McChord:

In its original decision in this case the commission held that Columbia was discriminated against in favor of Augusta, Ga., in rates from eastern and western points of origin. It was held with respect to commodity rates from the east and to class and commodity rates from Cincinnati, Louisville and Knoxville, that the differences in the location of the two cities or their competitive relationship to the ports were not sufficient to justify the differences in rates in favor of Augusta, and it was ordered that in the future the rates from these points of origin to Columbia should not exceed the rates from the same points to Augusta. The commission also ordered that on specific commodities by rail or by water-and-rail from Baltimore, Md., to Columbia rates should not exceed those from the same points to Augusta. Rates on classes and on specific commodities from Cincinnati, Louisville and Knoxville were ordered not to exceed those from the same points to Augusta. This decision is now so amended that the conclusions with respect to commodity rates from points from which the rates are made with relation to the rates from Baltimore to Columbia and to Augusta, Ga., shall not cover points in New England. In view of the re-adjustment of rates in the southeast, now progressing, no order is made at this time with respect to class and commodity rates from Cincinnati, Louisville and Knoxville to Columbia and to Augusta. (32 I. C. C., 504.)

Reshipping Rates on Grain from Omaha

Opinion by the commission:

The commission finds that the carriers have not justified proposed increased joint reshipping rates on wheat, corn and articles taking the same rates in carloads from Omaha and South Omaha, Neb., and Council Bluffs, Ia., applicable via the Wabash to Mexico, Mo., to stations in Illinois on the line of the Chicago & Alton. It is found, however, that the carriers have justified such rates on these commodities in carloads, applicable via Mexico, to stations on the south branch of the Chicago & Alton, which extends from Mexico to the Missouri river. The carriers also proposed joint reshipping rates via Mexico to stations on the line of the Chicago & Alton from Mexico to Blue Springs, Mo. As these rates are lower than the combination or class rates now in effect, they also are found justified.

The fourth section application filed by the Wabash which asks authority to continue carload rates on wheat, corn and articles taking the same rates from Omaha, via Mexico, to points on the Chicago & Alton east of the Mississippi river lower than those contemporaneously in effect on like traffic to intermediate points is denied. (32 I. C. C., 590.)

Omaha Grain Exchange v. Chicago & Alton et al. Opinion by the commission:

The commission finds that the carriers should establish joint reshipping carload rates on wheat, corn and articles taking the same rates, from Omaha and South Omaha, Neb., and Council Bluffs, Ia., via the Wabash to Mexico, Mo., and the Chicago & Alton beyond to certain stations on the main line of the latter between Mexico and the Mississippi river. The complainants also requested similar rates to all south branch stations of the Chicago & Alton from Mexico to the Missouri river, which rates are covered in *Reshipping Rates on Grain from Omaha* abstracted above. Reparation is awarded, however, on certain shipments to south branch stations. (32 I. C. C., 597.)

Rate Suspensions

The commission has issued the following notice to the public:

While the law authorizes the commission to suspend proposed increased rates, fares or charges, it does not contemplate that such suspension will necessarily follow every request therefor, but does contemplate that the power will be exercised with judgment and due consideration for circumstances and conditions.

In the exercise of that power, the commission desires to act intelligently and to have opportunity to exercise a reasonable discretion in the matter before the increase in question becomes effective. It is therefore important and very desirable that such protests, if made, should be made at the earliest practicable moment, so that the members of the commission can be advised in the premises before determining what action they will favor. In instances it has been necessary to deny requests for suspension because they came so late that it was impossible to act upon them intelligently, and sometimes they are so late as to render affirmative action impossible even if it were desired to take it.

The commission wishes to exercise this power in every case where it ought to be exercised and to withhold exercise of it in every instance in which it ought to be withheld. It desires to act intelligently and to do substantial justice as nearly as that can be judged upon a partial showing, which is all that can be had pending full hearing.

To the end that this line of work may be conducted in an orderly and proper manner, the commission requests that when such protests are to be made they be made as far in advance of the effective date of the rate, fare or charge protested against as is possible, and calls attention to the fact that because of the short time afforded it may be necessary to deny suspension in instances in which the protest is not filed with the commission at least 10 days prior to such effective date.

Fourth Section Violations in Rates on Sugar

Opinion by the commission:

The carriers serving the territory affected by Fourth Section Order No. 4086, entered in *Sugar Rates from New Orleans and points taking the same rates to Ohio river crossings, Memphis, St. Louis and intermediate points,* 31 I. C. C., 495, find that readjustments of their sugar rates in accordance with the mileage scale prescribed will result in large reductions in revenues. Each

of them, therefore, has submitted a scale which it is desired to establish in lieu of the prescribed mileage scale. The rates proposed are designed to preserve the revenues on this traffic and to bring about a more uniform and logical adjustment of rates under the fourth section.

The commission finds that the suggested rates are in many ways better than the average mileage scale. It will allow the carriers to use their proposed scale with certain modifications.

The proposed rate to Montgomery for a distance of approximately 320 miles is 21½ cents, which will be observed as maximum at intermediate points on the direct line. The proposed rate to Birmingham is also 21½ cents for 355 miles, which also will be observed as maximum to intermediate points.

The proposed rate to Memphis via the Illinois Central is 13½ cents, and to intermediate points 25 cents. These two rates do not bear a reasonable relation. These carriers are, therefore, authorized to establish rates not exceeding 21½ cents to all points not more than 360 miles from New Orleans on routes from that point to the Ohio and Mississippi river crossings.

The proposed rates to points north of Memphis and Birmingham in Mississippi, Alabama, Tennessee and Kentucky vary from 25 to 28 cents per 100 lb. These points are from 360 to 800 miles from New Orleans, and the proposed rate of 28 cents to the more northerly of these points is not unreasonable. The carriers are authorized to establish rates to points more than 360 miles from New Orleans and south of the southern boundary of Tennessee, which do not exceed 25 cents, and rates to points on these lines north of said boundary line not in excess of 28 cents, provided the rates which have been proposed by the carriers are not exceeded.

The carriers proposed also to cancel l. c. l. rates from New Orleans to certain points in the southeast. There being no real necessity for such rates, the commission will allow the discontinuance to go into effect.

In accordance with the wishes of the carriers, reference to the rates to points intermediate to St. Louis and north of the Ohio is left for consideration with the rates to points in Illinois and points in central freight association territory. (32 I. C. C., 606.)

Southern Pacific Retains Control of Pacific Mail

In this case, the first decided under the Panama Canal Act, the commission finds that it is in the public interest for the Southern Pacific to retain its controlling interest in the Pacific Mail Steamship Company, but that it would be unlawful for the latter as long as it is controlled by the railway to run its boats through the Panama Canal to Colon, even as an extension of the present service, from San Francisco to Balboa, at the Pacific end of the canal. The Southern Pacific is therefore authorized to continue its control of the steamship company, but within 60 days it must amend its petition so as to eliminate the proposed service beyond Balboa.

The Southern Pacific owns 110,800 of a total of 200,000 shares of stock in the Pacific Mail Company. That company owns two large fleets. One operates between San Francisco and Honolulu and ports in Japan and China. The other operates between San Francisco and Balboa, stopping at various points on the southwestern coast of Mexico and Central America. The steamships on this line make regular trips, stopping at Mazatlan, San Blas, Manzanillo, Acapulco and Salina Cruz, on the coast of Mexico, ports that are near to, and some of them directly served by, the Southern Pacific Railroad of Mexico. The traffic carried between San Francisco and Balboa has principally been transported over the Panama Railroad to or from Colon and via steamships bound for or from Atlantic coast points, Europe, and other foreign countries. It had been proposed, also, to operate the boats from San Francisco and the Mexican and Central American ports through the canal to Colon because the Panama Railroad had withdrawn from the through billing arrangements across the isthmus; but, as noted, the commission finds that such would be contrary to the act.

Section 5 of the act to regulate commerce, as amended by the so-called Panama Canal Act, provides among other things, that:

> From and after the 1st day of July, 1914, it shall be unlawful for any railroad company or other common carrier subject to the act to regulate commerce to own, lease, operate, control, or have any interest whatsoever (by stock ownership or otherwise, either directly, indirectly, through any holding company, or by stockholders or directors in common, or in any other manner) in any common carrier by water operated through the Panama canal or elsewhere with which said railroad or other carrier aforesaid does or may compete for traffic or any vessel carrying freight or passengers upon said water route or elsewhere with which said railroad or other carrier aforesaid does or may compete for traffic; and in case of the violation of this provision each day in which such violation continues shall be deemed a separate offense.
>
> Jurisdiction is hereby conferred on the Interstate Commerce Commission to determine questions of fact as to the competition or possibility of competition, after full hearing, on the application of any railroad company or other carrier.

It is, however, also provided that there need be no discontinuance of railroad ownership and control of water lines, if after investigation—

> the commission is of the opinion that such existing specified service by water, other than through the Panama canal, is being operated in the interests of the public, and is of advantage to the convenience and commerce of the people, and that such extension will neither exclude, prevent nor reduce competition on the route by water under consideration.

There is indicated a clear, unmistakable policy on the part of Congress, to separate from railroad ownership, control, or influence such common carrier water lines, as may, when thus separated, compete with the present owning or controlling companies, except where, upon investigation, it is found by the commission that the existing service by water, other than through the Panama Canal, is being operated in the interest of the public, is of advantage to the convenience and commerce of the people, and that its continuance will neither exclude, prevent, nor reduce competition on the route by water. This being so, a construction of the act must be adopted which will properly and effectively carry out the purpose of Congress. The commission may not nullify or weaken the force of the plain intendment of the act for any reasons, however plausible they may appear to be. The words "may compete for traffic" do not mean a vague, possible though improbable competition, but mean a probable, potential competition, as when the water line is entirely divorced from the railroad. It must, therefore, look at the conditions as they will exist if this divorce is effected. From a practical view the question is, Will the steamship company, when free to consult only its own interests, compete for traffic with the railroad line? In the light of experience this will not be a difficult question to determine in most cases. Self-interest will surely develop an effort to secure desirable traffic—traffic that will produce revenue for the carrier.

It must also be observed that the competition is "for traffic." There are no words of limitation in this clause; it covers all interstate coastwise or foreign traffic.

It is the opinion of the commission that the railway and the steamship company compete for coastwise traffic between points in the United States; traffic between San Francisco and ports on the coast of Mexico and Central America; and for European and other foreign commerce.

But, on the other hand:

There are several boat lines of American and foreign ownership plying between San Francisco and these Mexican and Central American ports and Balboa in direct competition with the Pacific Mail Steamship Company. The uncontradicted testimony of witnesses for petitioner and of shippers is that the service of the Pacific Mail is the most dependable, and that it is operated in the interests of the public, and is of advantage to the convenience and commerce of the people. It appears that the service proposed, other than through the Panama Canal, would be in the interests of the public and of advantage to the convenience and commerce of the people, and that its continuance would neither exclude, prevent, nor reduce competition on the route by water under consideration. (32 I. C. C., 689.)

STATE COMMISSIONS

The Railroad Commission of Louisiana has suspended, until after a hearing, at some date yet to be fixed, its order of January 27, requiring the railroads of the state to cease charging car-rental in addition to the ordinary demurrage charges.

The Railroad Commission of California has made permanent the order issued by it about a year ago making radical reductions in the rates for the transportation of merchandise by express. It is said that the Wells-Fargo Company has its income reduced by this order to the amount of about $750,000 a year.

The Missouri Public Service Commission has announced that at St. Louis on February 23, it will resume its hearings on the applications of the railroads for general advances in freight and

passenger rates throughout the state. Another hearing will be held beginning on March 8, at St. Joseph, and another at Kansas City, on March 10.

The Colorado Public Utilities Commission began a hearing at Denver on February 8, under its order to the Denver & Rio Grande, Colorado & Southern, Atchison, Topeka & Santa Fe and Midland Terminal railways, to show cause why the passenger fares between Cripple Creek and Divide and between Pueblo and Trinidad should not be reduced.

The Pennsylvania Public Service Commission has ordered that the fare, on the Delaware, Lackawanna & Western, from Taylor to Scranton, about 2½ miles, which was increased from five cents to ten cents, shall be put back to the lower figure. The report of the case indicates that the railroad company advanced the rate because it desired to reduce the travel from Taylor to Scranton on a certain train, in the morning, so as to enable it to run that train with one day coach instead of two. The company frankly stated that it had sought to make the rate high enough to divert to other carriers most of the passengers for that short distance.

COURT NEWS

Misleading Passenger—Nominal Damages

Action was brought by a female passenger against a railroad company for damages for having been negligently misled by the company's employees in charge of the train and caused to leave it at a time when it stopped on a side track some 600 yards before it reached her destination. The jury awarded the plaintiff $1 damages, and she appealed. On appeal it was held that as the plaintiff did not appear to have sustained any damages of a character susceptible of a pecuniary measurement in any wise exact, other than the value of the ride, which she lost, from the siding to her destination, the verdict could not be disturbed as contrary to the evidence. Although the jury found that the plaintiff suffered injuries, they were justified in believing that they were so slight that nominal damages would be adequate compensation. Hilley v. Central of Georgia, Alabama Court of Appeals, 66 So. 883.

Federal Employers' Liability Act—Interstate Commerce

In an action in the federal courts for personal injuries the plaintiff's declaration alleged that he was engaged in tearing down a roundhouse which had been rendered useless by a fire, and was injured by a falling timber. The active function of the roundhouse had ceased to exist, and the employment, therefore, was in connection with the removal of a useless structure, to the end that a new one might be built for railroad purposes, and very likely for uses in connection with interstate commerce. The court decided against the employee, sustaining a demurrer to the declaration; saying that there must be a line somewhere. If this case were within the line, it might as well be said that all employees on railroads, engaged both in interstate and intrastate commerce, might have the benefit of the federal Employer's Liability Act, with the result that, with few exceptions, all personal injury litigation would be in the federal courts. Thomas v. Boston & Maine, 218 Fed., 143.

Obstruction of Road Crossing—Willful Injury—Punitive Damages

A traveler on a highway sought to recover punitive damages for the alleged willful obstruction of a road crossing by a railroad company for an unreasonable time. The court held that the burden was on the plaintiff to establish a willful or intentional injury before he could recover punitive damages. The complaint alleged that the crossing was obstructed while the train men had gone with the engine to a nearby mine, but it did not allege that they knew the conditions so as to show a consciousness on their part that their conduct would probably result in injury. Nor was it alleged that the highway was one that was much or little used, or that the blocking occurred at a time when persons would likely be traveling on the highway, or what, if any, knowledge the defendant's employees had concerning such matters. It was held that the complaint was insufficient to charge a willful injury, and judgment for the plaintiff was reversed. Southern Ry. Co. v. Jarvis, Alabama Court of Appeals, 66 So. 936.

Railway Officers

Executive, Financial, Legal and Accounting

Charles W. Hotchkiss has been elected chairman of the board and of the executive committee of the Virginian Railway, with headquarters at New York. Mr. Hotchkiss was born on June 19, 1863, at Unadilla Forks, N. Y., and was educated at West Winfield Academy. He began railway work in August, 1886, as a rodman, and was engaged in construction work first on the New York, West Shore & Buffalo, now the West Shore, and then on the South Pennsylvania Railroad. He was then consecutively assistant engineer of the Michigan Central, chief engineer and general manager of the Chicago, Indiana & Southern and the Indiana Harbor Belt, the New York Central's industrial terminals and coal road in the vicinity of Chicago. In 1912 he was elected president of the Chicago Utilities Company and of the Chicago Tunnel Company, and is president also of the Richmond Light & Railroad Company, New York, and chairman of the board of the Atlantic Coast Electric Railway Company, Asbury Park, N. J. Mr. Hotchkiss is a member of the American Society of Civil Engineers, the Western Society of Engineers, the American Railway Engineering Association, the Chicago Club and the Mid-Day Club, Chicago, Engineers' Club, Lawyers' Club, and Richmond County Country Club, New York.

C. W. Hotchkiss

Raymond Du Puy, vice-president and general manager of the Virginian Railway, with office at Norfolk, Va., has been elected president with headquarters at Norfolk. Mr. Du Puy was born on January 4, 1860, at Pittsburgh, Pa., and was educated at Georgetown University. He began railway work in 1877, as water boy on the Missouri, Kansas & Texas, and from 1878 to 1881 was assistant engineer on the same road and the Missouri Pacific. He was then to 1885, chief engineer and superintendent of the Tioga Railway, now a part of the Erie, and later for two years was general superintendent of the Minnesota & North Western. From 1887 to February, 1888, he was general manager of the Chicago, St. Paul & Kansas City, now a part of the Chicago Great Western. In 1891 he was elected president of the Leavenworth & St. Joseph, and from 1895 to 1896 was president of the DeKalb & Great Western; both these roads are now a part of the Chicago Great Western. On April 15, 1898, he was appointed general superintendent of the Chicago Great Western, remaining in that position until July, 1899, when he was appointed superin-

Raymond Du Puy

tendent of the Morris & Essex division of the Delaware, Lackawanna & Western. He left the latter company in May, 1900, and then served for five years as general manager of the St. Joseph & Grand Island, at St. Joseph, Mo. In April, 1905, he was appointed general manager of the Tidewater and the Deepwater Railways at Norfolk, Va., which were later consolidated to form the Virginian Railway, and in April, 1907, Mr. Du Puy was elected vice-president and general manager of the Virginian Railway, which position he held at the time of his recent election as president of the same road as above noted.

Edwin W. Winter has resigned as one of the receivers of the Chicago & Eastern Illinois.

Ralph M. Shaw has been appointed assistant general counsel of the Chicago Great Western, with office in the First National Bank building, Chicago.

Edward F. Kearney, first vice-president of the Texas & Pacific, with headquarters at New Orleans, La., has been appointed a receiver of the Wabash.

D. D. Curran, who has been elected chairman of the board of the New Orleans & Northeastern, the Alabama & Vicksburg and the Vicksburg, Shreveport & Pacific, with headquarters at New Orleans, La., as has already been announced in these columns, was born in Ireland, and began railway work in 1873, as a brakeman on the Pennsylvania Railroad, which position he held for five years. He was then successively freight conductor on the Mobile & Montgomery, then passenger conductor on the same road, and later yardmaster of its successor, the Louisville & Nashville at Montgomery, Ala. He was then appointed trainmaster on the same road at Birmingham, remaining in that position until 1887, when he entered the service of the Central of Georgia, and until February, 1893, served as superintendent successively on the South Carolina division, the Southwestern division, the Columbus & Western division and the Savannah & Western division, having been appointed to the last named position in 1892. In February of the following year he became superintendent of the New Orleans & Northeastern, and in August, 1907, was elected president, later becoming also general manager of the same road and president and general manager of the Alabama & Vicksburg and the Vicksburg, Shreveport & Pacific, and now becomes chairman of the board of the same roads as above noted.

D. D. Curran

Operating

A. A. Woods, resident engineer of the New Orleans & Northeastern, at New Orleans, La., has been appointed superintendent, vice S. E. Flanagan, deceased.

Charles Hicks has been appointed general manager of the Tennessee, Alabama & Georgia, with office at Chattanooga, Tenn., vice E. F. Blomeyer, resigned.

A. N. Umshler has been appointed trainmaster of the Illinois Central at Centralia, Ill., and F. E. Hatch has been appointed trainmaster at Carbondale, Ill.

R. W. Stevens, superintendent of the Chicago & Western Indiana at Chicago, has been appointed general superintendent, succeeding J. M. Warner, whose title was general manager.

H. Eicke, local freight agent of the Wabash, at Chicago, has been appointed superintendent of transportation, with headquarters at St. Louis, Mo., succeeding F. E. Bolte, resigned to accept service elsewhere.

James D. Welsh, general superintendent of the Colorado & Southern at Denver, Colo., has resigned, and E. S. Koller, assistant general manager of the Chicago, Burlington & Quincy lines west of the Missouri river, at Omaha, Neb., succeeds Mr. Welsh, with headquarters at Denver, with the title of general manager.

J. W. Knapp, superintendent of terminals of the Chesapeake & Ohio at Newport News, Va., has been appointed superintendent of the Richmond division, vice E. I. Ford, who has been appointed superintendent of the Newport News and Norfolk terminals in place of Mr. Knapp, and J. F. Briant, assistant superintendent at Clifton Forge, Va., has been appointed assistant superintendent of the Richmond division, with headquarters at Richmond, and the office of assistant superintendent of the Clifton Forge division has been abolished.

O. K. Cameron, trainmaster of the Southern Railway at Birmingham, Ala., has been promoted to superintendent of the Mobile division, with headquarters at Selma, Ala., vice F. S. Collins, transferred. J. M. Hudspeth, superintendent of the Richmond division at Richmond, Va., has been appointed superintendent of the Richmond terminals, with headquarters at Richmond. C. G. Arthur, superintendent of the Charleston division at Charleston, S. C., succeeds Mr. Hudspeth. C. P. King, trainmaster at Columbia, S. C., succeeds Mr. Arthur. C. C. Hodges, superintendent of the Asheville division at Asheville, N. C., has been appointed superintendent of the Transylvania division, with headquarters at Brevard, N. C., and F. S. Collins, superintendent of the Mobile division at Selma, Ala., succeeds Mr. Hodges.

W. E. Williams, whose appointment as general manager of the Missouri, Kansas & Texas, with headquarters at Parsons, Kan., has already been announced in these columns, was born May 29, 1864, at Houston, Tex. He began railway work in 1881 with the International & Great Northern as clerk to the roadmaster, and was subsequently in the bridge department, clerk in the superintendent's office, timekeeper, transportation clerk, chief clerk to the superintendent of transportation, to the general superintendent and to the general manager, and secretary to the receivers, until June, 1895. He was then purchasing agent and general storekeeper for two years. Mr. Williams became connected with the Missouri, Kansas & Texas in September, 1897, as chief clerk to the general superintendent, and was consecutively car accountant and trainmaster until November, 1902. On the latter date he was advanced to superintendent at Greenville, Tex., and from December, 1905, to October, 1911, was successively superintendent at Denison, Tex., McAlester, Okla., and Sedalia, Mo. He was then appointed general superintendent, which position he held until his promotion to general manager on February 1, as above noted.

W. E. Williams

J. L. McLendon, assistant superintendent of the Southern Railway at Macon, Ga., has been appointed terminal trainmaster, with headquarters at Macon, Ga.; A. P. Johnson, trainmaster at Atlanta, Ga., has been appointed trainmaster of the South end of the Atlanta division, with office at Macon, with jurisdiction over lines south of Roseland, with the exception of Macon terminals. B. F. Langford has been appointed trainmaster of the North end of the Atlanta division, with jurisdiction over lines north of North Inman, with office at Atlanta; G. W. Adams has been appointed chief despatcher, with office at Atlanta; W. T. Sutphen has been appointed trainmaster of the Richmond division, with office at Richmond, Va., vice W. C. Herbert; B. Haggard, trainmaster of the Northern Ala-

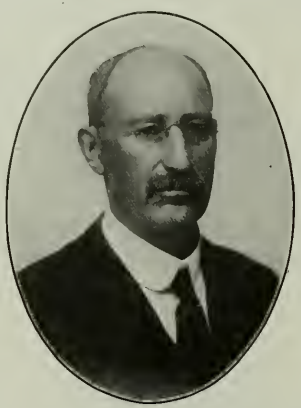
bama Railway at Sheffield, Ala., has been appointed trainmaster of the east end of the Birmingham division of the Southern Railway, with office at Birmingham, Ala., vice O. K. Cameron, and T. O. Crane has been appointed trainmaster of the Northern Alabama, with office at Sheffield, Ala., vice Mr. Haggard.

Engineering and Rolling Stock

W. McC. Bond has been appointed supervisor on Sub-Division No. 1 of the Baltimore & Ohio, Cleveland division, with headquarters at Akron, Ohio, vice T. Delaney, retired.

A. Young, roundhouse foreman of the Chicago, Milwaukee & St. Paul, at Chicago, has been appointed district master mechanic at Milwaukee, Wis. C. Lundburg succeeds Mr. Young.

William C. Armstrong, engineer of bridges of the Chicago & North Western at Chicago, has been appointed chief engineer of the St. Paul Union Depot Company, St. Paul, Minn., and will assume charge of the construction of the new union station. Mr. Armstrong was born in Marshall County, Iowa, June 21, 1859, and was graduated from the Iowa State College, Ames, Iowa, in 1881. He began railway work the following year as transitman and draftsman for the Wisconsin, Iowa & Nebraska (now a part of the Chicago Great Western), and the succeeding year was chief draftsman for that road. From 1884 to 1886 he was resident engineer of the Burlington, Cedar Rapids & Northern; during 1886 he was resident engineer of the Chicago, Milwaukee & St. Paul, in charge of construction in South Dakota, and also was engaged on location survey in South Dakota and Wyoming; and in 1887 was resident engineer on the St. Paul, Minneapolis & Sault Ste. Marie. The next two years he was resident engineer on the Eastern Minnesota (now a part of the Great Northern); and from 1890 to 1893, was engineer of track and bridges on the Pacific extension of the Great Northern, and in 1894 was bridge agent at Spokane, Wash. Mr. Armstrong went to the Toledo Bridge Company for four years as designer, returning to railway work in 1899 as resident engineer of the Chicago & North Western. From 1902 to 1905 he was bridge engineer of that road; during 1905 he was superintendent of construction for the Missouri Pacific at Sedalia, Mo.; in 1906 he was with the Chicago, Rock Island & Pacific as bridge engineer at Chicago, and the following year he returned to the North Western as terminal engineer at Chicago. In 1912 he was made engineer of bridges, which position he now resigns to become chief engineer of the St. Paul Union Depot Company, as above noted.



W. C. Armstrong

A. Berg has been appointed general foreman car department of the New York Central at Wesleyville, Pa., in place of O. Blodd, who has been transferred to Sandusky, Ohio, as general foreman, succeeding R. A. Fitz, transferred to Nottingham, Ohio.

Joseph Chidley, assistant superintendent of motive power and rolling stock of the New York Central Railroad, with office at Cleveland, Ohio, now has jurisdiction over the Illinois division. J. T. Flavin has been appointed master mechanic of the Illinois division, with office at Gibson, Ind., and the jurisdiction of George Thompson, district master car builder, with office at Englewood, Ill., has been extended over the Illinois division.

R. B. Kendig, chief mechanical engineer, of the New York Central Railroad, at New York, announces that the following appointments have been made in the mechanical department of that road: A. R. Ayers, who was general mechanical engineer of the Lake Shore & Michigan Southern and other New York Central lines west of Buffalo, with office at Chicago, has been appointed principal assistant engineer, general duties car design and construction, with headquarters at New York. R. M. Brown has been appointed assistant engineer, in charge of engineering and drafting at locomotive and car shops, with headquarters at Cleveland, Ohio; P. P. Mirtz, who was mechanical engineer of the Lake Shore & Michigan Southern at Cleveland, Ohio, has been appointed assistant engineer, in charge of locomotive design and specifications, with headquarters at New York; F. S. Gallagher has been appointed assistant engineer, in charge of car design and specifications, with headquarters at New York; H. E. Smith, who was chemist and engineer of tests of the Lake Shore & Michigan Southern at Collinwood, Ohio, has been appointed chemist and engineer of tests, with supervision of laboratories and material inspection, with headquarters at Collinwood, and W. B. Geiser, who was acting chemist and engineer of tests of the New York Central & Hudson River at West Albany, N. Y., has been appointed assistant chemist and engineer of tests, with headquarters at West Albany.

OBITUARY

Richard Morgan, general manager of the Savannah & Northwestern, with office at Savannah, Ga., died in that city on February 8.

N. C. Collier, who was for many years a director of the Nashville, Chattanooga & St. Louis, died on February 6, at Murfreesboro, Tenn., at the age of 82.

James M. Warner, general manager of the Chicago & Western Indiana, who died in Chicago on February 8, was born on a farm near Syracuse, N. Y. He received a common school education and commenced railway work with the Erie as an office boy, with which road he remained for several years, filling consecutively the positions of telegraph operator, despatcher, chief despatcher and trainmaster of the Delaware division. He was then trainmaster for the Terre Haute & Peoria (now a part of the Vandalia), at Decatur, Ill., and in 1888 he became master of transportation of the Belt Railway of Chicago. Subsequently he was appointed trainmaster of that road and the Chicago & Western Indiana until 1892, when he was made superintendent of those roads. In 1905 Mr. Warner was appointed general superintendent, and in 1908 he was promoted to general manager. Mr. Warner for many years was a member of the Committee on Relations between Railroads of the American Railway Association, and for several years also was chairman of the General Superintendents' Association of Chicago.

J. M. Warner

L. C. Hill, horticultural agent of the Gulf, Colorado & Santa Fe, with headquarters at Galveston, Tex., died at Rogers, Ark., on February 2, aged 58 years.

George T. Williams, formerly until 1892, superintendent of telegraph of the New York, Chicago & St. Louis, died on February 10, at his home in East Cleveland, Ohio, at the age of 82.

W. I. Trench, division engineer maintenance of way of the Baltimore & Ohio at Baltimore, Md., died in that city on February 7, aged 36 years. Mr. Trench was graduated from the Sheffield Scientific School in 1902, and immediately began railway work on the engineering corps of the Baltimore & Ohio Southwestern. He was advanced to assistant division engineer in April, 1906; was promoted to division engineer of the Ohio division in 1908, and had been division engineer of the Baltimore & Ohio at Baltimore for the past three years.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Chesapeake & Ohio is in the market for 20 Mallet type locomotives.

The South Dakota Central is in the market for one ten-wheel locomotive.

The Missouri, Kansas & Texas is in the market for 10 Pacific type locomotives, with 25 by 28 in. cylinders, and 20 Mikado type locomotives, with 28 by 30 in. cylinders.

CAR BUILDING

The Union Pacific has ordered 750 stock cars from the Haskell & Barker Car Company.

The Atchison, Topeka & Santa Fe has ordered 700 box cars from the Haskell & Barker Car Company.

The Chicago & North Western is considering the purchase of some passenger cars, but as yet the number and type have not been decided on.

The Philadelphia & Reading has divided an order for 20 coaches and 5 combination cars between the Harlan & Hollingsworth Company and the Pullman Company.

The Illinois Central is now asking prices on 100 gondola cars. This inquiry supersedes the inquiry for five gondolas, as previously reported. In addition to the 900 refrigerator cars recently ordered from the American Car & Foundry Company, this company also ordered 100 refrigerator cars with passenger trucks.

IRON AND STEEL

The Great Northern is in the market for about 10,000 tons of steel rails.

The Denver & Rio Grande has ordered 10,000 tons of 90-lb. rails from the Colorado Fuel & Iron Company, Denver, Colo.

The Vicksburg, Shreveport & Pacific has ordered 1,502 tons of steel for a bridge over the Red River in Louisiana, from the Modern Steel Structural Company.

The Chicago & North Western, as reported in the *Railway Age Gazette* last week, has placed orders for rails. The exact figures are 20,000 tons of 100-lb. section for the Chicago & North Western proper, which is distributed between the Illinois, the Cambria and the Lackawanna steel companies, and 6,000 tons of 90-lb. section for the Chicago, St. Paul, Minneapolis & Omaha, which was awarded to the Lackawanna Steel Company.

SIGNALING

A contract has been taken by the Federal Signal Company for the installation of a mechanical interlocking plant at Beacon, N. Y., on the Hudson division of the New York Central. This consists of a 72 lever style "A" machine having 57 working and 15 spare levers, operating a standard four-track interlocking layout.

The London Bakerloo Tube Extension.—The London Bakerloo Tube, which has recently been extended beyond Paddington to Queen's Park, four stations beyond, was on January 31 opened for service to Kilhun Park—or Cambridge avenue station—the third station beyond Paddington. Of the two intervening stations, Warwick avenue and Maida Vale—or Elgin avenue—the latter is not quite completed, so trains omit the stop at that point. This extension is intended eventually to connect with the London & North Western at Queen's Park. The rails to the latter point are laid and it is expected that the station will be ready for service some time in March.

Supply Trade News

The Chicago Bridge & Iron Works opened on February 15, a city sales office in the McCormick building, Chicago, Ill.

The New York office of the General Railway Signal Company will be situated at room 1041, 30 Church street, beginning Tuesday, February 23.

The Fairmont Machine Company, Fairmont, Minn., has changed its name to the Fairmont Gas Engine & Railway Motor Car Company, and has increased its authorized capital stock to $1,000,000.

Blaine S. Smith has been appointed general sales manager, effective February 3, of the Universal Portland Cement Company, Chicago, Ill., succeeding B. F. Affleck, who has been elected president, as noted in the *Railway Age Gazette* of last week.

C. H. Rhoader, who has been connected with the St. Louis Surfacer & Paint Company, St. Louis, Mo., for four years, and with the Valentine Varnish Company for two years, was recently appointed western railway representative of the Kay & Ess Company, Dayton, Ohio.

The East Broad Top Railroad & Coal Company contemplates the remodeling or reconstruction of its facilities at Mt. Union, Pa., for transferring coal from narrow gage to standard gage cars after screening, and will consider plans and prices from engineering or contracting firms.

C. F. Quincy, president of the Q. & C. Company, New York, has acquired the entire capital stock of the Railway Appliances Company, Chicago, formerly owned by Percival Manchester. The business of the Railway Appliances Company will hereafter be operated by, and in the name of the Q. & C. Company.

After a thorough test for over 15 months, the United States government has just adopted the new style planfile, manufactured by the Art Metal Construction Company of Jamestown, N. Y., for use in the Interstate Commission for filing its various plans, drawings, etc. In this planfile drawings of all sizes are filed vertically, and in the same file. This arrangement affords a great saving in space as compared with the old style method.

TRADE PUBLICATIONS

Nut and Bolt Fasteners.—The Bartley Automatic Nut & Bolt Fastener Company, Pittsburgh, Pa., recently issued catalog No. 1, a 30-page booklet which describes and illustrates the Bartley automatic fasteners for nuts and bolts for use on rails, frogs and crossings, and on cars and locomotives. It also gives price lists for the various kinds of fasteners.

Culverts.—The United States Cast Iron Pipe & Foundry Company, Burlington, N. J., recently issued a 16-page pamphlet devoted to comments on the requirements for a good culvert, characteristics of the various types, the length, thickness and special shapes of culverts, etc. It also contains a table of standard thickness and weight of cast iron culvert pipe.

Electric Meters.—The Sangamo Electric Company, Springfield, Ill., has issued bulletin No. 40, dealing with the company's single-phase and polyphase alternating current watt-hour meters. The bulletin describes the type H Watthour Meter in detail and treats of it under such heads as, Importance of Sustained Meter Accuracy, Superior Features, Construction, Adjustment, Performance Characteristics and Capacities. A few pages are also devoted to the Sangamo Current and Potential Transformers.

Centrifugal Pumps.—This is the title of a 64-page bulletin, No. 19, just issued by the Terry Steam Turbine Company, Hartford, Conn., giving details and data on various turbo-pump applications. Principles of operation and construction of the centrifugal pump are explained, as are details of the steam turbine. Because of the wide latitude of speed possible with the turbine, the unit occupies a much smaller space than would be required for a pump performing the same duty but driven by a reciprocating engine.

Railway Construction

Boston Subways.—Bids are wanted until February 25, by B. Leighton Beal, secretary of the Boston Transit Commission, for building section H of the Dorchester tunnel. This section is located in Dorchester avenue between Old Colony avenue and Woodward street in the city of Boston, and is about 2,200 ft. long. It is to be a single span, double track tunnel mainly of reinforced concrete construction, and is to be built by the cut and cover method.

Canadian Northern Pacific.—The grading on the new line west of Victoria, Vancouver, towards Alberni, for a distance of 140 miles, and on the Patricia Bay branch, from Victoria to the ferry terminal on Patricia Bay is practically completed. No steel has been laid over these portions of the line.

Carolina, Greeneville & Northern (Electric).—This company expects to let contracts on May 1, to build an electric line from Kingsport, Tenn., southwest to Newport, about 75 miles. There will be five steel bridges on the line. The company expects to develop a traffic in agricultural products, minerals, timber, coal and passengers. H. S. Reed, president, 205 Grant building, Los Angeles, Cal., and F. A. H. Kelly, chief engineer, Greeneville, Tenn. (January 15, p. 115.)

Mascot & Western.—As reported in the *Railway Age Gazette* of last week, the company is building a line between Wilcox, Ariz., and the Mascot mines, a distance of 14 miles. The contract for grading, which will be light, has been awarded to J. A. Vaness, Seattle, Wash. The maximum curvature on the line will be 3 deg., and the maximum grade 3½ per cent. Contracts for track laying and for bridges, which will be only minor structures, will be let about May 1, at which time the company also expects to buy some rolling stock. The work on this line is about 10 per cent completed. Preliminary surveys have also been made from the Mascot mines to Caliente, a distance of 36 miles. C. S. Henning, Dos Cabezos, Ariz., is chief engineer, and T. N. McCauley, Chicago, is president.

McConnellsburg & Fort Loudon (Electric).—As soon as a charter is secured, this company will let a contract to build an electric line from McConnellsburg, Pa., east to Fort Loudon, about ten miles. E. J. Post, president, and S. Dandridge, chief engineer, McConnellsburg. (See Pennsylvania Roads, January 22, p. 1717.)

Texas Roads.—Plans are being made to build a railway from Lubbock, Tex., west to Roswell, N. Mex., about 160 miles, it is said, and surveys will soon be started. Alpheus Judd and associates of Lubbard are back of the project.

Western Dominion.—Application is being made to the Canadian parliament for an extension of time in which to build the projected line from Calgary, Alta., south to Cut Bank, Mont., on the Great Northern, about 232 miles. O. E. Culbert, secretary, Calgary. (June 19, p. 1566.)

RAILWAY STRUCTURES

Milwaukee, Wis.—The Chicago & North Western will float the new bridge, which is to carry its main line across the Milwaukee river, into place on February 21. The Cleary-White Construction Company, Chicago, is the contractor. (See *Railway Age Gazette*, August 21, 1914, p. 370.)

St. Augustine, Fla.—An officer of the Florida East Coast writes regarding the report that improvements to include new shops, a roundhouse, and yards are to be carried out at St. Augustine, that the entire proposition is being held up pending an easement in the money situation.

Shreveport, La.—The Vicksburg, Shreveport & Pacific has given a contract to the Blodgett Construction Company, Kansas City, it is said, to build a new bridge over the Red river, between Shreveport and Bossier City.

Trenton, N. J.—The Pennsylvania Railroad is making plans for a new freight house, to be built at Trenton. The company also has under consideration the question of making other improvements.

Railway Financial News

Atlantic Coast Line.—White, Weld & Company and the Guaranty Trust Company, both of New York, are offering $1,100,000 first mortgage 4 per cent bonds of 1902-1952 of the Atlantic Coast Line at 92½, yielding 4.40 per cent on the investment.

Boston & Maine.—The directors have asked the holders of the $23,000,000 notes due March 2 either to extend them for six months at 6 per cent, or to accept as part payment notes of the Maine Railways Company to the extent of 35 per cent, and extend the remaining 65 per cent. The Maine Railways notes are 5 per cent 5-year notes with privilege of conversion into Maine Central stock for 4/7 of par value up to October 1, 1918, and the other 3/7 payable in cash.

Erie.—This company has decided to change from the fiscal year ended June 30 to the calendar year for the period for which it will issue its annual report to stockholders.

Minneapolis & St. Louis.—The Wall Street Journal says: "Local bankers say that negotiations have been started looking toward the acquisition of the Minneapolis & St. Louis by the Soo line" [Minneapolis, St. Paul & Sault Ste. Marie, a subsidiary of the Canadian Pacific]. The Wall Street Journal adds: "Newman Erb, president of the Minneapolis & St. Louis, is silent on the reports, but it is certain that he would not be adverse to selling the road if an equitable bargain could be struck."

New York, New Haven & Hartford.—The directors, in making a formal announcement of their future plans, reiterate the pledge already given to the Massachusetts legislature that the company will get rid of its steamship and trolley lines and other interests as soon as possible and will conserve all of its resources to the upbuilding of the steam railroad property.

Wabash.—The issue of $1,545,000 receiver's certificates has been approved by Judge Adams. E. F. Kearney has been appointed co-receiver with E. B. Pryor.

Railway Construction in Ecuador.—The topographical studies of the Huigra-Cuenca Railway are now completed for 15 miles, the preliminary localization to Lugmas Pass, 10 miles, and the definite localization, 2,488 ft. Grading was to have commenced January 1, with a force of 300 men, which number will be increased gradually to 1,000, as provided in the estimates.

Overland to Peking.—The severance of international means of communication has made it necessary to devise new routes and connections. One of the routes where new arrangements have had to be made is that to and from the Far East. There is of course no rail connection between England and Petrograd via the German railways, and on the outbreak of war, in addition, Siberian traffic via Moscow and Petrograd became wholly disorganized as a result of military requirements, the journey from China to the Russian capital taking as much as a month. Things have now improved and a traveler has recently told how he managed to get from London to Peking via Siberia in 26 days, which is a record under existing conditions. He left King's Cross station in London at 5 p. m., on December 6, sailed from Newcastle at daybreak the following morning and reached Bergen at 5 p. m. on December 8, which enabled him to take the 6:40 p. m. train for Christiania, and thus to connect the following morning with the mail to Stockholm. Here there was a delay, but eventually the traveler arrived at Petrograd at 2 a. m. on December 15. After this, everything was plain sailing, for the weekly Siberian train left the same evening and the Chinese capital was reached on January 2. It seems probable that this schedule of 26 days will be improved before long. The Russian authorities are about to inaugurate various improvements in eastern travel, including a through express service between Petrograd and Vladivostok, and there is hope that the connection at Christiania could easily be so arranged as to obviate the necessity of spending a night and day at Stockholm.

Railway Age Gazette

PUBLISHED EVERY FRIDAY AND DAILY EIGHT TIMES IN JUNE BY THE
SIMMONS-BOARDMAN PUBLISHING COMPANY
WOOLWORTH BUILDING, NEW YORK

CHICAGO: Transportation Bldg. CLEVELAND: Citizens Bldg.
LONDON: Queen Anne's Chambers, Westminster.

E. A. SIMMONS, *President*
L. B. SHERMAN, *Vice President.* HENRY LEE, *Sec'y & Treas.*
The address of the company is the address of the officers.

Locomotive Improvements and Operating Costs

The discussion of improvements in locomotives is very frequently passed over by transportation officers as being of interest only to representatives of the mechanical department. While this attitude may at times be justified, the outline of the results obtained by modernizing a Consolidation locomotive on the Kansas City Southern, which is given elsewhere in this issue, should be of direct interest, not only to mechanical department officers, but to all those who have to do with the movement of trains. The possibility of modernizing some of the older locomotives is a question that has been brought up on many occasions on different railways. There are thousands of locomotives, built within comparatively recent years, which are capable of much better results from a transportation standpoint, if some means could be found of increasing their capacity. The alterations made on the Kansas City Southern in a Consolidation locomotive, with only 33 sq. ft. of grate area, have resulted in marked improvements in those items which most directly affect the cost of conducting transportation, namely, fuel and water consumption, tonnage hauled and overtime paid to engine and train crews. While the changes made in this engine to accomplish these results are, of course, of special interest to mechanical department officers, their chief interest is from the standpoint of the cost of conducting transportation, and viewed from this point they indicate the possibilities of reducing transportation costs by modernizing many of the locomotives which are now being relegated to way freight, branch line and switching service.

Working Hours of Station Men

Massachusetts has an hours-of-service law which comes near being a freak. It is well calculated to make more trouble even than the federal law relating to telegraphers. It is Chapter 746, passed last year, and reads: "Employees in and about steam railroad stations designated as baggagemen, laborers, crossing-tenders and the like, shall not be employed for more than nine working hours in ten hours' time: the additional hour to be allowed as a lay-off. . . ." At Worcester, January 21, the grand jury, in the Superior Court, returned indictments against the Boston & Maine for violation of this law. Both here and in the federal law there is evidence of some good intent, but if the main purpose of their authors had been to cause confusion and needless expense, they could hardly have succeeded better than they did. Freight houses employing dozens of laborers may often be classed as "stations" and, perhaps, ought to be so classed in nearly every case; yet this Massachusetts law does not seem to be intended to apply to such men. The suit against the Boston & Maine is designed, presumably, to get the statute construed. Why should baggagemen need more time off than telegraphers, clerks, switchtenders and signalmen? What meaning can be found in the word "like," as used in the statute? Why should crossing-tenders near a station be favored above those a half mile away? An officer of the Boston & Maine tells us that relief crossing-tenders, required by this law, are now costing that road $7,800 a year. It is probable that a fraction of this sum, paid to the "first trick" watchmen, would satisfy them far better than the time off which is allowed them, and would afford the public equally satisfactory service. In short, the law appears to be a shining illustration of the way in which labor leaders "work" the legislatures for the mere pleasure of conquest, with little regard for the interest either of the public or the alleged "laboring men."

Correction of An Erroneous Statement

In its issue for January 15, page 80, the *Railway Age Gazette* published an editorial entitled "The Suspension of Advances in Rates." In the course of this editorial the following statements were made:

> The coal originating railroads leading into St. Louis and East St. Louis gave notice in January, 1913—just two years ago now—of an advance in coal rates from Illinois territory to the St. Louis group, effective on April 1, 1913. The commission suspended the tariffs until July 30, 1913, and later to January 30, 1914, when its statutory authority of suspension expired. The case was heard on December 1, 1913, and argued in February, 1914; and, at the request of the commission, on the ground that it was as yet unable to dispose of the case, the rates were further suspended until March 31, 1914. Then, on the ground that it could not decide the case before the summer recess the commission asked that the rates be further suspended until November 1, 1914, which also was agreed to. On still another request from the commission the rates were still further suspended until January 1, 1915; and now the commission has asked for another postponement to November 1, 1915!

The information on which these statements were based was given to us in writing by a railway officer. Secretary McGinty

of the Interstate Commerce Commission subsequently wrote us saying that the statements which we have quoted had been considered by the commission in conference, and that he had been "directed to say that the statement to the effect that the carriers had been called upon to suspend the coal rates into St. Louis until November 1 (1915) is wholly incorrect and without foundation." We communicated the substance of Mr. McGinty's letter to the railway officer who had called our attention to the St. Louis case, and he replied that the date "November 1" in his communication to us should have been "February 1," the mistake being due to an error in copying. Inquiry of Secretary McGinty has brought confirmation of the statement that the commission did ask for a further postponement to February 1, 1915. We make this statement in justice to all parties concerned.

"BUY IT NOW"

SOME time ago the Agricultural Publishers' Association, publishers of the principal farm papers of the country, began a campaign to get the farmers to commence buying at once all the things they would need within the next few months. The movement extended to other lines of business; and now an attempt is being made to get all classes to "buy it now."

The railways ought to be included in the movement. The traffic and earnings of all roads are comparatively small at present. Many companies buy as much as they can when their earnings are large and as little as they can when they are small. There are poor roads and rich roads. The poor roads have to follow this policy because it is only when their earnings are up to or above normal that they can buy much. For rich roads to follow the practice is bad business and bad citizenship.

Regarding the matter from a narrow, selfish standpoint, it is bad business for a rich road to concentrate its buying and its improvement work in years of large earnings. All kinds of supplies and equipment can be bought and work done cheaper in the lean than in the fat years. The prices of most kinds of equipment and supplies are lower, the wages of some kinds of railway labor are lower, and all kinds of labor are more efficient, which is equivalent to lower wages. Every railway man knows these things. Every railway men also knows there will be use in the good times, which are sure to come, for many improvements in and additions to facilities that can be made in the bad times. Why, then, do so many railways which could spend more money to advantage in periods of light business postpone expenditures until traffic gets heavy and lines and yards are congested?

Largely, no doubt, because this is the fashion. Another reason is the widespread and chronic desire to make a paper showing. Many roads are dominated from Wall street, and many Wall street bankers don't know enough about railroading to appreciate the advantage of doing work when it can be done cheapest. They want a certain margin maintained between income and outgo in bad as well as in good times, and don't realize that both the stockholders and the public often lose by having good paper showings made in hard times. There probably is hardly a strong railway in the country which will spend in the calendar year 1915 as much as its permanent interests would warrant.

There is another point to be considered besides the effect produced on the individual road's prosperity by its policy of making expenditures. The policy of doing almost nothing in hard times and a great deal in good times causes violent alternations of feast and famine in the railway supply market and the railway labor market. One year the supply and equipment concerns are glutted with orders. The next year, perhaps, they will have hardly any. One year the demand of the railways for unskilled labor exceeds the supply, and they boost wages greatly in the unskilled labor market. The next year their demand falls off heavily, resulting in thousands of men being thrown out of work. The bigger a concern or an industry is the larger are the effects its business policy produces on economic and industrial conditions in general. Individual railways and the railway system as a whole have become so big that the violent fluctuations from year to year in their expenditures are a demoralizing influence on business of all kinds.

There are several strong roads which already follow the practice of making extensive improvements in periods of light traffic; and many more would do so if their managements were controlled by sound business considerations and proper regard for the public good.

The injunction to "buy it now" and the complementary injunction to "do it now" ought to be acted on within the coming months by every strong railway in the country. Neither good business nor public spirit dictates that they shall buy or build anything they will not need, but good business and public spirit both demand that they shall buy and build many things they are certain to need. If those who finance railways do not recognize these facts the executive officers should carry the message to Wall street.

AN OUTRAGEOUS APPEAL TO THE PLAIN PEOPLE

THE mistrust of the intelligence and fairness of the plain people shown by the higher classes in the United States threatens the peace of the nation and the perpetuity of free institutions. The down-trodden railroads of Pennsylvania and New Jersey ventured to appeal regarding the train crew laws to the plain people of those states. The Brotherhood of Railroad Trainmen, whose members belong to our intellectual aristocracy, and our political oligarchy, has taken great offense at this attempt of the roads to draw the rabble into the controversy. It has issued a statement denouncing the course of the companies, in which it says: "Briefly stated, their (the railroads') announcement declares they intend to present the question of the repeal of the full crew laws to the public; but why, is left to conjecture. The power to repeal is vested in the legislature and . . . . the average citizen knows about as much concerning the practical operation of a railroad as the man in the moon knows about building sewers."

Plainly, the railroad presidents and general managers don't know anything about the practical operation of a railroad. Neither do the public utility commissions, to which the railroads would be glad to have the question referred. And, manifestly, the plain people don't know anything about it, either. The members of the legislatures are the repositories of all the wisdom on the subject. They have just been snatched from the lawyer's office, the store, and the plowhandle, where they have had opportunity to learn everything about the operation of a railroad. Furthermore, they have direct access to the inspired lips of the paid lobbyists of the Brotherhood of Railroad Trainmen, and can learn from them not only all they need to know about how to operate a railroad, but, what is more important, all they need to know about how to get the millions of votes the Brotherhood controls.

All this is plain as a pikestaff. And it is, of course, most pernicious for the railroads and the people to get together and talk things over. It is so much easier for the labor lobby and other altruistic interests to get what they want when the people are saying, "To the bow-wows with the railroads!" and the railroads are saying, "The public be d——!" If the people and the railroads get too close together they may put both the lobbyist in the labor organization and the demagogue in the legislature out of a job, which would be sad.

But remember that, after all, it is the railroads that are being regulated and the railroads and the people that together are footing the bill, and be patient with them if they cry out when they are gouged unusually hard or are treated with the scorn that they so richly merit. And don't carry the gouging and scorning too far. The error of gouging the plain people too much, and treating their wishes and opinions with too open contempt, is one which oligarchies ever have been prone to commit, and always in the long run with unhappy results for the oligarchies.

AMERICAN RAILWAY MECHANICAL ASSOCIATIONS

AMERICAN railroads enjoy much more free interchange of ideas and information regarding their individual practices in the design and maintenance of cars and locomotives than do the railroads of any other country. We have various railway mechanical associations, composed of men representing the majority of American railways, which meet annually for the sole purpose of discussing their problems in an endeavor to find practical and economical solutions. As a natural result there is found a certain uniformity in locomotive and car construction and in shop practice which, of course, is of economic value to the railways in particular and to the country as a whole.

English roads, on the contrary, are very conservative in giving information to the public, or even to each other, and, in consequence, nearly as many special designs are found on them as there are roads. Their locomotives represent distinctly the ideas of the individual chief mechanical officers to such an extent that whenever such men are mentioned the mind will simultaneously recall their special hobbies in design. Their purpose seems to be to have something distinct from other roads. Cases have been known where, with a change in the administration of the mechanical department, individual features, such as compounding, have been entirely eliminated at a large cost to the roads.

In this country we have ten railway mechanical associations, of which the Master Car Builders' and Master Mechanics' associations are the most important. Their work is quite thoroughly understood and is considered authoritative by the railway managements. The field has so broadened since their inception, some 48 years ago, that they are now unable to consider the numerous detail problems that they once did. Naturally this work has been taken up by other associations which are composed of subordinate mechanical officers, and the justification for the existence of these associations becomes more apparent each year. A brief review of their proceedings for the past year will indicate in some degree the scope of their work.

Pre-eminent in the proceedings of the Traveling Engineers' Association are the papers on "Efficient Operation of Locomotives," "Locomotive Air Brake Equipment," and "Practical Chemistry of Combustion." These papers with their discussions are text books in themselves, containing information of material value to railway mechanical men. Papers were also presented on mechanical stokers, smoke prevention and speed records which give results obtained in actual practice. This association has also compiled examination questions and answers of recognized merit for locomotive engineers and firemen.

At the convention of the General Foremen's Association detailed papers were presented on engine house efficiency, autogenous welding and the maintenance of air brakes, all live subjects to the members of the association. The Air Brake Association considered the advantages to be derived from caboose gages, and strongly recommended their use as a profitable protective feature, especially on long freight trains. The efficiency of the foundation brake gear was also discussed, some members showing how they had increased the braking power by simply stiffening some of the elements in the gear. Regarding air brake hose, it was believed that less failure would occur and a more efficient service would be obtained if a specific time limit for the life of the hose were adopted. The proper distribution of empty cars throughout a long train was shown to have materially reduced the possibilities of break-in-twos.

The Master Boiler Makers' Association presented valuable information regarding the use and maintenance of combustion chambers, showing the advantages as well as the disadvantages from a maintenance standpoint. The questions of the effect of bad water and the use of oxy-acetylene and electric welding on boilers were also considered, the results of actual practice being given An especially noteworthy feature of the Tool Foremen's Association has been its investigations of standard tools. In 1913 standard taps were adopted, and last year a discussion of the standard reamer was begun, and the standards are to be adopted at the next convention. The subjects discussed last year included shop kinks and special tools, milling cutters being especially considered. Marked advances have been made by some roads in developing these special tools and valuable information may be obtained from the discussions on this subject. Other reports considered related to grinding, machine tool repairs and the distribution of shop tools.

The Master Blacksmiths' and the Master Painters' associations both deal with problems of especial interest in their fields, the former being particularly interested in the new methods of welding and the handling and heat treating of the special steels. The painter's chief problem at the present time is the proper protection of all-steel equipment, and for the past few years the experiences of the different roads have been presented at the conventions, with material benefit to all the members. This association maintains a test committee that is to be commended for the work it has done. Exposure tests of paints and varnishes are made each year in different parts of the country, and the members are given the results of the tests at the conventions.

The Chief Interchange Car Inspectors' and Car Foremen's Association meets annually to study and discuss the M. C. B. rules of interchange, and in many cases finds opportunities to clear up difficulties which have arisen from misunderstandings of these rules. In some respects this association is handicapped by not having an authorized member of the M. C. B. Association present at its meetings to guide the members in placing correct interpretations on the rules, especially those that have been adopted at the preceding M. C. B. convention.

In addition to the information obtained from the convention proceedings, great benefits are derived by those attending the conventions from the chats they have with their fellow members. Meeting and conversing with others handling similar problems in different ways has a very broadening effect, giving the members new ideas and freshened ambitions which are surely reflected in their work. In order to make the mechanical conventions entirely successful, representatives of all the roads should be present with definite instructions to add what information they can to the subjects under consideration and to learn all that is to be learned from their fellow members. By doing this the good ideas of the several men will be collected in a concise form for the benefit of all the members, and consequently for the benefit of the roads they represent.

IMPROVEMENTS IN HANDLING RATE SUSPENSION CASES

THE Interstate Commerce Commission has sent out two circular letters regarding the suspension of advanced rates which should result in an improvement in the administration of the law pertaining to this subject. They will do so if the shippers and railways give the commission co-operation.

One of the circulars is addressed to the public. It calls attention to the fact that, while the law authorizes the commission to suspend proposed increased rates, it contemplates that "the power will be exercised with judgment and due consideration for circumstances and conditions." It is necessary, if the commission is to exercise a sound discretion, that protests against advances be filed a reasonable time before they are to go into effect. In many cases this has not been done. The commission, therefore, requests that protests be made as early as possible, and gives warning that "it may be necessary to deny suspension in instances in which the protest is not filed with the commission at least ten days prior to such effective date."

The second circular is addressed to traffic officers, tariff issuing officers and agents of carriers. "The commission," it says, "desires not only to deal with these matters justly in the first instance, but with due consideration for circumstances, to finally dispose of investigation and suspension cases at the earliest practicable date following the suspension." To this end it requests that, when tariffs carrying increased rates are filed, the proper

officer of the carrier shall present to the commission a concise statement of the increases proposed, showing in a general way the measure thereof and the reasons therefor.

The suggestions in both circulars are obviously reasonable. The initiative regarding the suspension of rates should be taken, not by the commission, but by the shippers and other persons affected. Apparently, many have proceeded on the assumption that it is the commission's duty, or at least its practice, to suspend every advanced rate against which there is a protest and many against which there is none. This is not its duty, and is not, and ought not to be, its practice. Some real investigation on the merits ought to be made before any advance, small or large, is suspended, and in order that this may be done a considerable time should elapse between the filing of protests and the effective date of the rates protested.

The commission cannot require the railways to inform it as to the reasons and extent of proposed advances in rates except at a formal hearing. But it is desirable that before the commission decides whether it will suspend a tariff it shall have before it information which will enable it to form a reasonable judgment. It cannot have such information unless the carriers furnish it; and the sooner the carriers furnish it the more intelligently can the commission consider the questions involved. There doubtless have been numerous cases where suspensions of advances would have been avoided if the carriers had furnished to the commission on filing their tariffs concise but frank statements of the extent of and reasons for the proposed advances.

The issuance of these circulars is a gratifying indication of a disposition on the part of the commission to improve its work in connection with the suspension and investigation of proposed advanced rates; and it is to be hoped that both the shippers and the carriers will respond in the right spirit.

THE PANAMA RAILROAD

IN the early days railways used to supersede canals. The Panama Railroad, however, is now about to take the figuratively backward step of being superseded by a canal. The United States Government has controlled the Panama Railroad Company by stock ownership since May, 1904, and the railroad in these years has progressed wonderfully, but a fair comparison of its operations with those of the average privately owned railway furnishes no argument for government ownership.

The railroad at present operates 62 miles of line, 48 miles of which is main line, mostly single track, paralleling the Panama Canal from Colon to Panama. The total trackage is 150 miles, of which 60 miles is at terminals. The company's operations for the past few years have been varied. In addition to acting as carrier for the Isthmian Canal Commission, the railroad has also conducted a local "commercial" service in the canal zone and a commercial service across the isthmus for both passengers and freight. It has also engaged in the transportation of passengers and freight by sea from New York and other ports, and has constructed a number of docks at the entrances to the canal and expects in time to derive a large revenue from them.

The annual report for the fiscal year ending June 30, 1914, does not show the effect that the opening of the canal will have on the railway's revenues. That the company's business will suffer greatly from the diversion from rail to water-borne transportation across the isthmus is, however, a foregone conclusion. The railroad has already cancelled the through billing arrangements with its foreign and domestic connecting steamship lines on both the Atlantic and Pacific, and the effects on the earnings of the company will show decidedly in next year's annual report.

In 1914, the company's operating revenue from all classes of service was $6,823,000, an increase of $72,000 over the $6,751,000 of 1913. The operating expenses, on the other hand, were $4,682,000 as compared with $4,700,000, a decrease of $18,000. The net operating revenue of $2,140,000 was thus $90,000 greater than in 1913, and the ratio of expenses to earnings was 68.63 and 69.63 per cent, respectively, in 1914 and 1913. There was also other income from interest and exchange and rentals of $277,000, making a total of $2,417,000 from which deductions were made of $93,000 for rentals of terminals and terminal offices and $21,000 for the government income tax so that the total net income for the year was $2,303,000. This is the amount carried to the credit of profit and loss.

The total railroad revenue of $4,567,000 was $32,000 greater than in 1913 and was made up of the following items: total revenue from transportation, $3,965,000 as compared with $3,942,000 in 1913; revenue from operations other than transportation, including revenue from station and train privileges, freight and baggage storage, telephone and telegraph service, etc., $30,000, or $9,000 more than in 1913; harbor terminal revenue, $445,000 as compared with $436,000 in 1913, and other operating revenue of $127,000, $74,000 less than in 1913. The railroad's total freight revenue traffic was 1,544,252 tons, a decrease of 404,963 tons, or 20.78 per cent as compared with the previous year. The total revenue from this traffic, however, was $2,846,000, an increase of $61,000 or 2.18 per cent, the increased revenue with a smaller tonnage being due to the loss of a large amount of cement and other low grade traffic and an increase in traffic of higher grade. The passenger traffic showed an increase in the number of passengers carried but a decrease in the amount of revenue received. The total number was 3,124,974, or 7.14 per cent more than in 1913, and of this total 2,231,563 were second class passengers. The revenue received was $764,000, a decrease of $62,000 or 7.55 per cent. The operating expenses of the railroad in 1914 were $2,741,000 and in 1913, $2,770,000. the ratio of expenses to earnings in the two years being but 60.02 and 60.24 per cent respectively. The net revenue from the railroad was $1,826,000, approximately equal to the $1,829,000 of 1913.

The steamship line had a total revenue in 1914 of $2,255,000, or $104,000 greater than in 1913. The expenses, on the other hand, were $1,941,000 as compared with $1,930,000 in 1913, and the net revenue was $314,000 or $93,000 greater than in 1913. The per cent of expenses to revenue was 86.06 and 89.70 in 1914 and 1913 respectively. The steamship line during nearly the entire fiscal year operated two ships which it owned and four which it chartered. It is important to note, however, that the expenses of operation as given include no item for insurance nor any for charter of ships.

The Panama Railroad Company on June 30, 1914, had total capital assets of $22,474,000. Its working assets amounted to $6,655,000, of which $3,804,106 was cash. The total stock outstanding was but $7,000,000, but there was also a capital liability of $3,247,000 representing the company's indebtedness to the United States Government. This amount still remains unchanged from the previous annual report. The company is, of course, in an exceedingly strong financial position; its total surplus on June 30, 1914, was $17,534,000.

This railroad is indeed in an enviable position among railroads. For one thing it pays practically no taxes. It owes no allegiance to the Interstate Commerce Commission, and can set its own rates and use its own system of accounts of its own free will. The fact has been enlarged upon so often that it is almost unnecessary to treat of the matter again. It is interesting, nevertheless, to see why the Panama Railroad should be as successful as it is. In the fiscal year ended June 30, 1914, the total ton mileage of revenue freight carried was 66,213,890 tons, a decided decrease from 80,641,423 of 1913, largely due to a drop in the ton mileage of Panama Canal freight from 43,777,053 to 27,801,469. The average revenue per ton per mile in 1914 was no less than 4.35 *cents*. In 1913 it was 3.48 *cents*. The average for all roads in the United States in 1913 was but 7.29 *mills*. It is not strange, then, that the road should have a freight revenue per mile of road of $46,748, whereas the average for all roads in the United States in 1913 was but $7,962. The total passenger mileage in 1914 was 36,140,440. The average distance each passenger was carried was only 12 miles, which to some extent explains why the number of passengers in each train should have been 141. In 1913, it was 188. In the United States in 1913 it was but 55.

The average revenue per passenger per mile was 2.11 cents in 1914 and 2.37 cents in 1913 as compared with a similar figure for the United States in 1913 of 2.008 cents. The passenger revenue per mile of road in 1914 was $18,110. The railroads of the United States in 1913 obtained a similar revenue of but $3,301.

It has been stated above that the operating revenue from the railroad alone in the fiscal year ending June 30, 1914, was $4,567,000; that the operating expenses were $2,741,000, and that the net revenue, or the difference, was $1,826,000. It is worth the trouble, however, to examine the latter figure closely and to see what would become of it if it were treated as similar figures are treated on private roads. First, there would be deductions for taxes. The taxes paid by the railroads of the United States in 1913 amounted to over 4 per cent of their operating revenues. At this rate the Panama Railroad would have paid in taxes $183,000, which, subtracted from the net revenue given above, would leave a net operating income of $1,643,000. The isthmian line also does not have to allow for payments of interest or dividends. The value of the railroad alone (excluding the floating equipment) was on June 30, $21,480,000. Interest charges on this at three per cent, much less than United States roads have to pay, would be $644,000, which, subtracted from the operating income of $1,643,000, would have a surplus of only $999,000. Of the operating revenue $4,567,000, $2,846,000 was derived from the carriage of freight at a ton mile rate of 4.35 cents. This rate is almost *six times* as much as the average revenue of 7.29 *mills* per ton mile received by the railways of the United States in 1913. If the average rate per ton mile of the Panama Railroad had been *only three times* as great as that of the railways of the United States, or 2.19 *cents*, its freight earnings in 1914 would have been only $1,440,000, or $1,406,000 less than they were. These deductions for taxes and interest on the value of the railroad, and a reduction of the average freight rate to a mere *three times* as much as that paid in the United States, would have left the Panama Railroad with a deficit of $407,000, instead of the "surplus" shown on its books.

Furthermore, the Railway Mail Pay Committee has just called attention to the fact that besides receiving an average freight rate almost six times as great as that of the railways of the United States, the Panama Railroad is treated with the greatest generosity by the postoffice department. From the statement issued by the Railway Mail Pay Committee it appears that the Panama Railroad in the last fiscal year received more than $2.77 for each ton of mail carried one mile by it, which is 28 times as much as the average rate paid by the postoffice department to the privately-owned roads of the United States. The Railway Mail Pay Committee adds: "Had the Panama Railroad been paid at the average rate allowed the railroads of the United States, it would have received last year only about $9,000 for carrying the mails. It actually received $250,306. On the other hand, if the railroads of the United States last year had been paid the Panama Railroad rate, their receipts for carrying the mails would have been $1,557,000,000, or more than five times the total revenues of the postoffice department. They actually received $56,000,000, or about one-fifth of the department's revenues."

All of which indicates how fortunate it is for this government-owned road that it is not subject to the same burdens and restrictions as the privately-owned railways of the United States.

The following table shows the principal figures for operation as they are given in the Panama Railroad's annual report, but they are misleading unless they are qualified by the considerations just discussed, namely, the freedom from taxes and fixed charges and the high ton mile rate:

	1914	1913
Average mileage operated	62	62
Freight revenue	$2,846,103	$2,785,513
Passenger revenue	763,973	826,340
Total operating revenue	4,567,406	4,599,163
Maint. of way and structures	414,444	391,193
Maint. of equipment	464,467	470,824
Traffic expenses	16,926	13,852
Transportation expenses	1,396,210	1,427,401
Other expenses	449,439	467,040
Total operating expenses	2,741,486	2,770,310
Net revenue for operation	1,825,920	1,828,853

NEW BOOKS

Proceedings of the Master Car and Locomotive Painters' Association. Compiled and published by Alfred P. Dane, secretary of the association, Reading, Mass. 108 pages, 6 in. by 9 in. Bound in cloth.

This is a report of the forty-fifth annual convention of the Master Car and Locomotive Painters' Association, which was held in Nashville, Tenn. The convention considered the painting of steel equipment, with special attention to passenger car roofs. The question of sand blasting the steel before painting was also thoroughly considered, and among some of the members this practice found ardent support. The paint shop apprenticeship system, as in effect on the Delaware, Lackawanna & Western, was described in some detail. There was considerable discussion on the question of standard freight car lettering. As usual, the association also presented an interesting and instructive report on tests with paints and varnishes.

Proceedings of the American Railway Master Mechanics' Association. Compiled and published by Joseph W. Taylor, secretary of the association, Chicago, Ill. 1,045 pages, 6 in. by 9 in. Two volumes. Bound in cloth. Price, $5 per volume.

This year it was found advisable to publish the proceedings of the American Railway Master Mechanics' Association in two volumes, on account of the large amount of material presented. Volume I contains the full report of the convention with the exception of the report on Locomotive Headlights which, with its discussion, is published in Volume II. This report alone, with its appendices and discussions, occupies 377 pages of the proceedings and presents the results of the most exhaustive investigations ever made on locomotive headlights. In addition there are reports on Locomotive Stokers, Standardization of Tinware, Locomotive Superheater Tests, Code of Rules for Testing Locomotives and papers on Flange and Screw Couplings for Injectors, and tests of the Locomotive Superheater and Brick Arch. Volume I contains the constitution and by-laws, list of members, etc.

Heat-Treatment of Steel. Compiled by the Editors of Machinery. 278 pages, 6 in. by 9 in. Illustrated. Bound in cloth. Published by the Industrial Press, 140 Lafayette street, New York. Price $2.50.

During the past two decades developments have taken place in the processes involved in the building of machinery as well as in the materials of construction, which have produced many changes in the heat-treatment of steel. The introduction of high speed steel for cutting tools and the various alloy steels, the usefulness of which depends almost entirely upon proper heat-treatment, has made necessary the careful study of processes and has produced many remarkable changes in practice. In the preparation of this book it has been the purpose to place on record the modern methods of heat-treatment, and although largely descriptive in its dealing with the subject, the book will be found to contain much practical data of value to those who have to do with heat-treating operations.

The first chapter is devoted to a theoretical discussion of the effect of heat-treatment and a brief digest of the results to be obtained by various methods of treating carbon and alloy steels. In the following chapters the various processes of hardening, quenching, tempering, annealing and casehardening are described in detail, the text being amplified by numerous engravings showing the construction and methods of operation of the furnaces and other appliances. The application of the electric furnace to heat-treating operations is dealt with at considerable length and a chapter is included on the newly developed method of casehardening by carbonaceous gas.

A brief treatise is included on the methods used to measure the hardness of metals, and various types of hardness testing machines, developed in this country and abroad, are described.

The information contained in the book has been mainly compiled from articles published in Machinery and from the well known Machinery Reference Books, and it forms a very comprehensive treatise on a subject about which little of a practical nature has been written.

Letters to the Editor

A CARPING CRITIC

Pittsburgh, Pa.

To the Editor of the Railway Age Gazette:

We had flattered ourselves that there were no longer any "two-faced" men in the railroad service; but look at the Chesapeake & Ohio's "Suggestions for Safety," on page 151 of your issue of January 22 reading: "Don't move hand car at all, without a man facing both directions!"

Anonymous letters are, of course, objectionable; but as this is neither a complaint nor a "grouch" the signature, for obvious reasons, is omitted. * * *

NOT MAKING FRIENDS

New York.

To the Editor of the Railway Age Gazette:

I read with great interest the article entitled "Are You Making Friends for Your Railroad?" which appeared on page 129 of the *Railway Age Gazette* for January 22, 1915, and since reading it have had an experience on a suburban train entering New York City which brings out the value of the teachings of this article and the ill feeling that may be caused by practices of a contrary nature. I decided, on the occasion referred to, to take a later train than usual and on consulting a timetable, found that because of the day's being a holiday, several of the regular week day trains did not run. I judged, therefore, that the trains that remained would be amply supplied with cars and was much surprised to note, when the train which I decided to take pulled into the station, that it consisted of but four cars which were already crowded. As the train made four more stops, at each of which passengers were picked up, the occupants were soon packed into the cars in a way that would make a New York subway guard green with envy.

So far as I can see this condition was the result of poor judgment on the part of those in charge of the making up of the trains; but there does not seem any reasonable excuse for such poor judgment as was exercised in this case. If the general manager, or some other of the higher officers who are constantly endeavoring to keep this road in the good graces of the public, could have been on this train and heard some of the numerous comments that were made, they would realize that in order to make and keep friends a railroad should not confine its efforts in this direction to urging politeness on ticket agents and trainmen.

Commuter.

TWO PLANS FOR CAR POOLING COMPARED

Chicago, Ill.

To the Editor of the Railway Age Gazette:

The proceedings of the Central and Western Association of Car Service Officers, recently published, contains the report of the Committee on Pooling Freight Equipment, which is to be discussed at the next meeting of the association which will be held on April 15. The report was made in November, 1914, so it may be presumed that the committee was not familiar with the car equalization agreement which went into effect between the International & Great Northern and the Sunset Central Lines on October 1, 1914, and which was discussed in your issues of January 15 and 29.

The Committee on Pooling Freight Equipment is made up of E. E. Betts of the Chicago & North Western; W. E. Beecham of the Milwaukee & St. Paul, H. G. Earl of the Chicago Junction, and T. H. Hervey of the Ann Arbor, so that the plan may properly be called the Central and Western pooling plan, and it is interesting to compare its features with those of the Texas equalization agreements.

The Central and Western plan is to cover box cars only. Other equipment is to be considered as "special" and subject to the car service rules as administered by the Commission on Car Service. The first of the Texas equalization agreements applies to absolutely all cars, so that it is practicable under this to even up a box car with a flat car, for instance. In making the second agreement, however, it was found necessary to except the "special fruit and vegetable cars" of one of the subscribers which apparently are to be handled under the car service rules. It seems quite logical that exceptions of this kind should be made.

Both plans contemplate agreements. The Central and Western agreement is to be "similar to the per diem rule agreement," which provides for termination on three months' notice. The Texas agreement allows termination on 30 days' notice. The provision for the furnishing of cars differs probably more in language than in effect. Under the Central and Western plan "each member must furnish the full number of units its maximum traffic requires." The unit alluded to is to be an 80,000-lb. box car, cars of smaller capacity being accepted in proportion to that capacity.

The Texas arrangement, as above, accepts car for car, simply providing that each subscriber may use as its own the cars of each other subscriber, and each shall undertake to supply an equal number of cars. The Texas agreement also provides that a subscriber may include as its own cars, those belonging to other railways when the authority of the owner is given.

Both plans contemplate settling for repairs on the basis of the present Master Car Builders' rules, although the Central and Western plan recommends certain changes in these rules.

It is when we come to the administration of the plans that we find the most difference between them. The Central and Western provides for the dividing of the continent into zones, each under the supervision of an Assistant Commissioner. These Assistant Commissioners are to report to the pool commissioner who is to be appointed by the American Railway Association and receive his instructions through the Executive Committee. The commissioner is to be given "authority" to move the cars so as to equalize them properly during the periods both of surplus and shortage. On this point the committee states that it would be practicable to introduce a pooling statement "provided sufficient latitude and power be conferred on a duly constituted board of competent jurisdiction."

The committee does not state, however, just what recourse the Commissioner would have in case his orders are disregarded, although in several places, as above, it states that he will "have authority."

The Texas plan provides for no Commissioners, Assistant Commissioners, Committees, or "authority." On the other hand, it provides that if one road is holding a 10 per cent excess of cars, it must equalize on demand within 10 days or pay a penalty of $2 per car per day in addition to the per diem rate. It may be judged that this penalty is sufficient to deter wrongdoing, as we understand that the balance has been so well preserved between the railways concerned that it has not been necessary to ask for equalization. The Texas plan also provides for arbitration of "misunderstandings which cannot be possibly settled."

These differences are pointed out not in the way of criticism of the Central and Western plan, which is presented only tentatively. Undoubtedly in its meeting in April, this plan will be amplified and the experience of the Texas roads will undoubtedly be utilized.

Arthur Hale,
General Agent, American Railway Association.

HOME ROUTING FOREIGN CARS

Chicago, Ill.

To the Editor of the Railway Age Gazette:

The following method is suggested as a possible solution of the problem of home routing foreign cars:

A road receiving a foreign car in other than switching business, for which it has no loading, must return the car to the owner, if it is a direct connection; or, it may return the car to the delivering line, provided the delivering line has a direct con-

nection with the owner of the car, and provided the movement to be made is in a homeward direction. A car, however, cannot be back-hauled in order to return the car to the delivering line; it must be kept moving in a homeward direction at all times.

If the road receiving the car has no direct connection, and the road from which it is received has no direct connection, with the owner line, the car must be billed home via the most direct route at a rate of five cents per mile, to be paid by the billing road, this rate to apply from the junction point at which the car is delivered to its connection. It should be understood that if any road over which the car moves in a homeward direction can load the car, it will do so, and bill against the billing road only for the number of miles it is necessary to haul the car empty. The rate above named is sufficiently high to enable the roads hauling the car to pay the per diem to the owner. The car would be entitled to free empty movement over any line that had hauled it in the opposite direction loaded.

Some arrangement would have to be made that would protect the transcontinental lines from being obliged to send foreign cars home a long distance. In this case the line that took the car out to the coast should be obliged to haul it back, or pay the line that does haul it back, if it has to move empty, and because there may be a load on one line eastbound and none on the other, probably all cars in the coast territory would have to move back via the line that took them west. There should be some local agreement between the transcontinental lines whereby the empty mileage would be equalized in some mutually satisfactory way.

E. E. Betts,
Superintendent of Transportation, Chicago & North Western.

ECONOMICAL CAR DISTRIBUTION

Roanoke, Va.

To the Editor of the Railway Age Gazette:

I submit herewith a skeleton plan of economical car distribution and compensation to owners, which, in view of the importance of the subject, might draw forth comment. The following factors are governing:

(1) Keeping enough cars in service to move the business of the country.

(2) Sufficient compensation to justify carriers putting cars in service to meet the requirements.

(3) Elasticity and economy in operation; (a) to handle the maximum business; (b) to handle light business and provide track storage for idle cars.

Since the first depends upon the others separate discussion is unnecessary.

We may proceed with the second on the theory that elasticity and economy in operation are controlling, and depend on free interchange of cars between carriers and reloading at the nearest possible point to where they are made empty, with the result that the burden of furnishing empty cars is thrown upon the lines that originate the heavy volume of traffic.

Coal, flat and refrigerator cars, by reason of their not being suitable for the general run of freight, can only be handled economically by returning them promptly to the owning carrier when they are made empty. It follows that these cars should be settled for between carriers at a per diem rate sufficiently high to force their return to their owners promptly. Since these types of cars represent those which lines heavily supplied with cars are obliged to put in service in large volume, due to the necessity for originating carriers to furnish all equipment, it should be to their interest as well as that of others to adopt some plan in the interest of elasticity and economy in operation as regards the remaining types.

Therefore, as to the third principle the following is suggested: As to the interchange of box and stock cars, the lines should be grouped in a manner similar to that used by the American Railway Association in computing car surpluses and shortages. A daily report should be made by all lines to the representative heads of the individual groups, showing the surplus or shortage.

(a) To handle maximum business:—If a line is short of cars, and desires the group to furnish them, it will state at what point or points delivery is desired, and the representative of the group will have cars billed and forwarded to it at the present rate for short-hauling worn-out cars, provided other roads in the group have a surplus. If surplus cars are insufficient, the number available should be pro-rated among the roads making application. No road should be called on to furnish cars to other lines unless it actually has a surplus. Cars should be billed via the shortest route as to mileage and per diem should be paid to the owners as heretofore; the expense of short-hauling to be borne by the line calling for cars. The line should obtain free of the haulage expense any cars other lines participating in the business might be able to furnish for return loading. This is the limit of free assistance available at present since owners cannot secure the return of their cars empty when needed.

(b) To handle light business and provide track storage:—When more surplus cars turn up in a group than are needed by its member lines, or are required by other groups, they could be disposed of economically as follows:

Storage tracks should be constructed or set aside at convenient points as designated by the representative of the group, acting as chairman of a committee formed by the member lines. On account of the particular convenience and economical advantage to it, a line constructing or setting aside a group storage yard adjacent to its tracks should do so at its own expense. When a surplus exists in a group, therefore, the representative should order the delivery of cars to storage tracks; each such storage yard being in charge of an employee reporting only to the representative of the group. Cars forwarded to the storage tracks should be short-hauled at the regular rate at the expense of the forwarding line.

Cars should be reported to the owners when they are received at the storage yard, by the employee in charge or his representative, and per diem should cease until they are moved. When cars must be removed from storage to fill a member line's requisition, the representative of the group should order the delivery of the number needed by such of its immediate connections as are members of the group, in the proportion that they have received the same types of cars under load during 60 days from the short carrier—thus gradually withdrawing the stored cars without cost.

To sum up:—Attention is drawn to the principle that to handle the maximum business a carrier would pay a minimum cost for aid in times of extended shortage, and to handle a light business would be able to dispose of surplus cars more economically than under the present practice.

While there is a particular advantage in the group system because temporary surpluses and shortages rarely extend beyond the territory included, some change in the country-wide situation might result from the stoppage of cars moving to owners. If so, it would be necessary to exchange cars between groups on the same basis as suggested above for removing cars from storage, cars being returned from one group to another in proportion to the receipts under load for the previous 60 days.

It may appear doubtful whether cars could be thrown to the road or group needing them, on the principle of each line turning over cars in proportion to its receipts, but should any line be unable to deliver its proportion, the fact that more cars accumulated at another storage yard correctly located would be evidence that the lines were originating more than their proportion of the surplus, and that if delivery were forced on them, these railroads would not be carrying an undue share of the burden.

Although the theory would have to be tested, it seems a safe assumption that, with a rule requiring the withdrawal of the oldest cars from storage first, the owner of an individual car would not lose in so far as return on his investment in these types of equipment was concerned, more than he ordinarily would in times of depression.

K. V. Conrad.

Is The Railroad Y. M. C. A. Really Worth While?

PART II—The Practical Advantages are Outlined and the Extent of the Religious Activities Is Discussed

Is the Railroad Y. M. C. A. really worth while? Yes, for a great number of reasons, and on a strictly business basis.

As one division superintendent put it, the railroads cannot afford to invest in any enterprise which will not earn at least 10 per cent on the investment. On the surface it would seem that the results are largely indirect and could not be traced, inasmuch as the greater part of the return is in the insuring of keener, brighter and more intelligent workmen. Actually, however, it is not difficult to obtain evidence of results of a most practical and concrete nature.

Unfortunately most of the railroad terminals are located in the most undesirable parts of the community, and usually the district is more or less thickly infested with saloons and other places of vice. Unless some special provision is made, the men who come in from their runs and are in need of refreshment and rest have great difficulty in securing good accommodations at any reasonable price, or any price, and are driven to the saloon, where they will at least be sure to find companionship and a certain amount of recreation. The result is that they are often far from fit when the time comes for them to take their trains out. When we consider the complications in making up and getting the trains over the road and the possibilities for preventing damage to goods, and accidents to life and limb, if keen, bright men are in charge, it is not hard to see where railroads can make big savings by doing their part to keep the men in a fit condition.

General Superintendent Rine, of the Lackawanna, after relating a number of specific instances of the benefits of the Railroad Y. M. C. A., exclaimed emphatically: *"It is a real asset to the railroad.* It has raised the standard of the men and improved their condition by giving them an opportunity to spend the day or night at their layover point, away from their home terminal, amidst proper surroundings, where good, plain food is furnished and clean sleeping quarters are provided at low cost, and where their thoughts are turned in the right direction to have them lead better lives and to fulfill their duties to the public, to the railroad, to their co-workers and to themselves and their families. *I don't see how we could get along without the Railroad Y. M. C. A."* J. B. Yohe, general manager of the Pittsburgh & Lake Erie, expressed the same thing in this way: "I firmly believe that the Railroad Y. M. C. A. stands today as one of the greatest factors for safety first on American railroads and as such deserves the support and co-operation of railway managers. Speaking of the results obtained so far from the work on the Pittsburgh & Lake Erie, the management is satisfied with its investment and believes the return to the company in vastly improved service received from employees who have co-operated most heartily in availing themselves of the privileges offered, has more than justified the expenditures of time and money which have been made."

Few railroad executives are fortunate enough to have escaped experiences which have cost their companies thousands and thousands of dollars because some engineer or conductor, after spending an afternoon or evening in a grog shop, allowed an accident to come about which never would have happened had he been in proper physical and mental condition. Emphasizing this point of view, a division superintendent outlined in detail the great care which is exercised in the maintenance of locomotives in order that they may properly perform their functions. It had been his observation that the more care taken to keep these machines in prime condition the less the total cost of maintenance over an extended period of time. "Why," said he, "do the railways place so much emphasis upon keeping the machine in 100 per cent condition and yet give so little attention to keeping the men in a similar condition? A 100 per cent machine operated by a 50 per cent man will give 50 per cent returns, not 100 per cent."

The same division superintendent directed attention to the fact that he had never had a man on the carpet for missing a run or reporting late who had spent the previous night in a Y. M. C. A. building. On the other hand, many times trains had been delayed and the schedules over the entire division have been disarranged because men who had spent the night elsewhere were not in condition to report promptly when they were called the next morning. Several officials emphasized the fact that if it became necessary to run an extra train, crews can always be quickly assembled where the men spend their leisure time in the Association building.

Another feature of very considerable importance is that when the engine and train crews stop over at the Association building, those at the head end of the train get acquainted in a most intimate personal way with those at the rear end and thus get to understand each other better, resulting in closer co-operation and team work in handling the trains on the road. Moreover, the local officers and foremen often frequent the building and meet the men on a social basis, resulting in a better understanding all around.

At many points the Railroad Y. M. C. A. secretaries arrange to cash the pay checks of the members of the association and sometimes for all of the employees of the terminal, regardless of whether they are affiliated with the Y. M. C. A. or not. Usually there are no banks in the immediate vicinity of the terminal, and if the Railroad Association does not extend this courtesy, the men must depend upon the tradesmen, which in the majority of cases means that they have to patronize the saloons, for these are always wide awake to the possibilities of attracting men by performing some service, inexpensive in itself, which will encourage the men to frequent their places.

Because the men are assured of satisfying, well cooked food at their lay-over points, and because clean, comfortable sleeping quarters and healthful recreation are available at the Y. M. C. A. building, it has been possible to attract a better class of men for trainmen and enginemen, and this has been a considerable factor in improving the efficiency of operation on many divisions. It is reflected in the fact, and this was mentioned by several railroad officers at different points and on different roads, that the men are more prompt and more careful in paying their bills, and the standard of their method of living and their home life is much higher than before the Railroad Y. M. C. A. was established.

The superintendent of a division on the Buffalo, Rochester & Pittsburgh said that it would be practically impossible to get along without the Railroad Y. M. C. A. on his division, and that if for any reason the building was suddenly burned down or wiped out of existence, steps would be taken to replace it before the ashes had cooled.

A superintendent of motive power is authority for the statement that since the new Y. M. C. A. building had been built on one division the appearance of the men as to neatness and dress was distinctly noticeable. "After all," as he expressed it, *"the strength of a railroad is in its men,* and anything which may be done to raise the standard morally, mentally or physically is bound to pay good returns."

Following is a typical instance of what is being done by the Railroad Y. M. C. A. secretaries in bringing up the standard of the men, and thus helping to promote efficiency. The road with which one secretary is connected hired a boomer fireman. He was dead broke and the Y. M. C. A. people staked him for the

first month by providing his meals and sleeping accommodations on credit. He made a splendid record in his work, but at the end of a year, having saved up $100, was attacked by the "wanderlust." The Railroad Y. M. C. A. secretary had become interested in him and had been watching him closely. He persuaded him not to give up his job and thus lose his rights, although in order to do this it was necessary to cultivate the man and keep in touch with him for a considerable length of time. Under the advice and inspiration which he received from the secretary he continued to save his money and is now married and happily located. In many cases the secretaries have been instrumental in helping to patch up domestic and other difficulties, thus relieving the minds of the men of the worry which, if it had continued, would have seriously affected their efficiency.

L. H. Turner, superintendent of motive power of the Pittsburgh & Lake Erie, is well known by his friends and intimates as being of a most practical nature. Within the past two or three years he has been led to take a very deep interest in the Railroad Y. M. C. A. work; this because of a belief on his part, based on experience, that it presents a wonderful opportunity for improving the efficiency of the staff. It also provides the opportunity for the officers and men to cultivate and better understand each other, thus automatically preventing many of the misunderstandings and difficulties which are liable to develop under other circumstances. Here is what Mr. Turner has to say on the question from a business standpoint: "Railroad companies will be forced to recognize the fact that when they put up buildings for the comfort of their men and equip them with libraries and other facilities for instruction along the lines of their work, that they are not contributing to a charity but simply taking a common sense view of a business proposition, as it seems to me that a railroad that has the greatest number of sober and intelligent men is bound to set a high mark in economical and efficient operation."

THE RELIGIOUS PROBLEM

The railroads in all cases contribute to the cost of conducting the work and employees are invited to take advantage and make use of the buildings. The question will undoubtedly occur as to whether the nature of the religious work which is carried on will offend or antagonize any of the employees, who naturally have different religious beliefs, and many in fact may be non-Christian. The Y. M. C. A. is generally known to stand for aggressive Christian work. In light of this, what should be the attitude of the secretary and how does he handle this most difficult problem?

The following quotation is taken from that part of the Railroad Association Handbook which refers to the relations of the railroad secretary to the church and particularly to church factions: "A secretary should be broad in his church relationship, always glad to assist any effort whose purpose is to help men and extend the kingdom of God. He should be to railroad men a concrete example that deep conviction is not inconsistent with broad sympathy and generous co-operation. He should remember that the church is not confined within the walls of any building or the limitations of any system of doctrine." In other words, he must stand on the broad simple teachings of the Master and his work will be effective only to the degree to which his character and example conform to these teachings. Can this meet with serious objection on the part of any Christian sect or faith? Surely not!

In talking with railroad officers on the different roads which were visited, and regardless of whether they were on the local board of managers of the Association or not, and regardless also of denominational affiliations, it was suggested time and time again that a most noticeable development and upbuilding of character invariably followed the installation of the Y. M. C. A., and that this development of bigger and broader men was a real asset to any railroad, the value of which was beyond computation.

In every case where the Railroad Association secretary eased up on or neglected active Christian work, such as the conducting of Bible study classes and religious meetings, either because of lack of interest or fear of offending others, the tone of the whole institution was noticeably lower than it should be. This in some cases is said to be so evident that railroad officers, not always particularly interested in religious work, have found serious cause for complaint as to the effectiveness of the institution as a whole. Doubtless, although time did not permit sounding out the men on this phase of the subject, the men themselves were much less impressed with the character of the establishment than would otherwise have been the case.

A young secretary had been placed in charge of the work at an important point. He felt that he ought to start a Bible class and decided that the best time of day to hold it would be about ten o'clock in the morning. He made up his mind to call the men together and start the work at a certain date. Somehow or other when the time actually came he did not quite have the never to take this step. From day to day he put it off, until after a severe struggle he made up his mind that he would surely get started on the following day. When the time came he found a group of the toughest men on the division in the building. Two of them were playing pool and their conduct and language was anything but polished. The young secretary screwed up all his courage, feeling almost certain of meeting defeat, and walked over and invited these men to come into the Bible class meeting. They thanked him, put up their cues and went with him into the study room. Needless to say their example was followed by many of the other men in the building. The meeting proved to be a big success and was followed by similar meetings at frequent and stated periods. It is not hard to believe that the whole spirit of that particular association was changed for the better.

It only emphasizes the truth that humanity in general has a natural tendency toward higher and better ideals. What is needed most of all is fearless and capable leaders. It is this feature that sets off the Railroad Y. M. C. A. in distinct contrast to the club house or social clubs and is responsible for its greater success and effectiveness. The club room can supply social and educational features and can meet the physical needs of the men by providing restaurants and dormitories; but something vital is missing. It is the spirit of broad Christian sympathy which is inspired and directed by the trained Railroad Y. M. C. A. secretary.

Of course there is no compulsion as to attendance at the Bible study or religious services. Men who, because of the nature of their work, seldom have opportunity to take advantage of other religious privileges are invited to attend but the invitation is not insistent. Naturally also each of the services must be simple and complete in itself, for most of the trainmen and enginemen cannot be present with any marked regularity.

If any criticism were to be made of the religious work it would be that some of the secretaries do not follow it up progressively enough. The comparatively small number of Bibles which are in evidence in some of the buildings is also something of a surprise. In these days when the activities of the Gideonites have placed Bibles in each room of most of the hotels throughout the land, we would rather expect to find a more plentiful supply in the Railroad Y. M. C. A. buildings.

CONCLUSION

In conclusion there can be no question but that the Railroad Y. M. C. A. gives a handsome return on a strictly business basis, provided, first, that the proper type of secretary is available; and, second, that the work receives hearty support and co-operation from the railroad officers. J. B. Yohe, general manager of the Pittsburgh & Lake Erie, has expressed this latter truth in the following words: "This development

could not have been available without hearty co-operation on the part of railway managers induced by sympathy with the aims of the association and a belief in the practical value of the object it seeks to achieve, as well as confidence in the attainment of that object for the benefit of both company and men."

THE GENERAL MANAGER'S SUPERVISION OVER DIVISION PERFORMANCE

The cost of the three items, road enginemen's wages, road trainmen's wages and fuel for road locomotives, forms almost half of the total transportation expenses of many large roads and over a third of the total transportation expenses of the great majority of railroads in this country. Furthermore, a considerable proportion of other transportation expenses depends directly on the volume of these three expense accounts. Thus, lubricants, water, engine house expenses and train supplies and expenses vary more or less directly as do these three accounts. Yard expenses may or may not vary inversely with road expenses; but it needs no argument to demonstrate that one of the most important duties of the division superintendent is to reduce to a minimum the three items which bulk so large in transportation costs. It follows that one of the most important duties of the general manager is to keep strict supervision over these three items of expense.

Adequate supervision can only be obtained through a prompt, accurate and comprehensive knowledge of the results being obtained on each division from day to day, as well as from month to month. One of the most effective methods of constructive supervision of the work of division superintendents is to place before them a record of their own and other superintendents' past performance; but one great difficulty with American operating statistics has been that they are a record of past performances so far in the past that they have only the academic interest of ancient history. Besides promptness in collecting and distributing operating statistics, simplicity of form as well as simplicity of compilation is essential.

For the purposes of this study the expenses of road enginemen, trainmen and fuel in freight service only will be considered. That being so, ton-mile cost is, of course, the common denominator to which fuel and wages should be reduced.

The Western Maryland under its new management has shown one of the most remarkable improvements in performance of which there is any record in recent railroad history in this country, partly, of course, because the performance in previous years was very far from satisfactory. This was not due entirely to conditions which any management, no matter how able, could have altered. Conditions quite beyond the control of the management had to be lived through and the new management is reaping the benefit of a comparison with a period of sickness. Nevertheless, discounted as much as is necessary to be entirely on the safe side, a reduction in the ratio of transportation expenses to total operating revenues in the first six months of the present fiscal year as compared with the corresponding six months of the previous year from 45.07 to 36.04 is a remarkable achievement. With transportation revenues only about 3 per cent less in the six months ended December 31, 1914, than in the corresponding six months of 1913, transportation expenses amounted to $1,551,000 in 1914 as compared with $1,943,000 in 1913, a reduction of $392,000. The Western Maryland management believes, and probably rightly, that only a beginning has been made in the solution of the problems on that road, and the present study deals only with the steps that have been taken to secure adequate supervision over the expenses of each division for enginemen and trainmen's wages and fuel for road locomotives.

The Western Maryland is divided into two divisions, the Eastern and the Western, and each division is divided further into three districts. One of the primary objects to be attained by the introduction of a new method of supervision, was to place before the general manager, general superintendent and division superintendents as promptly as possible the cost per 1,000 ton-miles of the three items of expense. A second and equally important object was to have sufficiently detailed figures accompany this report of cost per 1,000 ton-miles to permit of exhaustive analysis. The Western Maryland has devised a system which goes further than this and compels the superintendent to make his own analysis. A daily report of cost of trainmen's wages and of fuel is made up in the general superintendent's office within 36 hours of the events recorded and is sent out on that day, or the next, to the general manager and to the division superintendents. On this report each freight train is

shown separately, with the train number, engine number and name of crew. Each locomotive is given a rating over each district in which it is in service. The daily report shows this rating together with the actual number of tons moved, the per cent which this actual tonnage is to total capacity, the number of cars in the train, the actual ton mileage, the reason for the difference between the potential ton mileage and the actual ton mileage, divided under the heads "mechanical defects," "fast freight," "set outs and local work," "nothing to move and car limit," and "weather conditions." In addition there is shown the number of tons of coal consumed over the dis-

trict, total cost of fuel, wages of crews without overtime, cost of overtime, total cost of labor and fuel, miles run, hours on duty of crews, average miles per hour, and cars handled showing revenue loads, deadhead loads, and empties. Overtime made is analyzed as between Orders and Trains, Accidents, Engine Failures, Maintenance of Way and Signal Work, Waiting for Helper, Station Switching, and Terminal Delay. Cost of helpers is shown separately. Then the total cost per 1,000 ton-miles is arrived at. *All of this information can be obtained or derived from train despatchers' sheets and conductors' reports.*

The actual time consumed in making such a report as this for each train for each district is small, but for all the trains over all the districts of a busy railroad for a month it makes a very considerable aggregate. On the other hand, the more trains that are run and the busier a road is the more necessary it is that the superintendent have an adequate means of supervision and the general manager an adequate check upon the work of the superintendents; also, the amount of money which may be saved through more economical operation of each train varies directly with the number of trains and the volume of business.

One of the thorns in the flesh of the division superintendent is the necessity for making an explanation of a bad monthly showing weeks after the close of the month, and one of the factors which rob such explanations of much of the value which they might have to superintendents is that they are made to repel an attack, to win a particular case, and are therefore in the nature of special pleading.

One of the most admirable features of the Western Maryland form of daily reports here described is that these reports do away in large measure with the necessity for demanding explanations from superintendents. The report is itself an explanation, as it is also an analysis; and another important feature is that the report, insofar as such a thing is possible, compels a superintendent to himself make an analysis of the performance on his division and at the same time gives him a scientific method to be applied in making this analysis. There is nothing personal about the method; it is detailed enough and comprehensive enough so that the superintendent cannot claim the "showing" does not correctly represent the facts, or is against him because of reasons beyond his control. The report is self explanatory. Furthermore, there is nothing in it which the superintendent can mistrust. There was a letter printed in the *Railway Age Gazette* recently commenting in a joking way on "statistics," which, however, probably struck a responsive chord in the great majority of operating men. In the Western Maryland form of daily report there are neither adulterated figures nor arbitrarily assigned figures.

THE MERCURY FREIGHT HOUSE TRACTOR TRUCK

The continually increasing cost of handling l. c. l. freight has led within the past two or three years to the substitution of motor trucks for hand trucks in a number of freight houses where the trucking distances were relatively great. A further development has recently been made by the use of these motor trucks as tractors pulling carrier trucks as a locomotive hauls a train of cars.

The Mercury Industrial Tractor

The Mercury Manufacturing Company, Chicago, has designed and built a tractor truck for service of this character in freight and ware houses. The frame is of heavy channel iron with riveted and welded connections. It is supported on three wheels, the single front wheel being directly connected to the steering lever and giving it a very short turning radius, so that it is able to turn inside a car. The rear wheels are 21 in. in diameter and the front one is 15 in.; all three being equipped with 3½ in. solid rubber tires. The electrical controller providing four speeds ahead and two reverse, is at the right of the driver's seat. The control handle is automatically locked and cannot be moved unless the driver is in his seat, while a large brake drum is provided on each axle operated

by a foot pedal. The motor and the axles are ball bearing throughout, while all parts are readily accessible for inspection and repair. Power is supplied by a storage battery with 250 ampere hours capacity, sufficient to operate the car continuously for a full working day. The tractor has a wheel base of 38 in., a length over all of 67 in., a width over all of 38 in., and weighs approximately 1,900 lb.

One of these tractors has been used continuously at the freight

Pulling a String of Trucks Loaded with Miscellaneous Freight

house of the Chicago Junction Railroad, Chicago, since August 1, 1914, and the accompanying photographs show it in service at that point. This tractor is used in the same manner as a switching locomotive, picking up the ordinary Reynolds trucks at the point of loading in the order in which they are to be cut off and leaving them at the doors of the cars in which they are to be unloaded. Each Reynolds truck is loaded only with material for one car. The tractor is operated by one man with one assistant to couple the various trucks together and drop them off. It is not necessary to stop the train to cut off the carrier trucks. This tractor has been operated by a foreigner, a regular employee of this house, since it was received.

By the proper arrangement of the connecting chains the trucks are made to track perfectly, and one of the photographs shows a string of these trucks being pulled around a sharp 90 deg. angle without any special assistance. In this way it is possible to pull a string of trucks through a crowded house without hitting other trucks or freight standing alongside. As many as 15 trucks have been pulled in one train, although in regular work from 8 to 10 trucks are hauled at a time.

An average of from 140 to 160 cars of l. c. l. freight is handled at this station daily, the largest portion of which is transferred from one car to another with an average trucking distance of 200 ft. As the one tractor cannot handle all of this freight, the shorter haul is still being made by hand trucking, although it is expected that this will be eliminated on the receipt of a second tractor truck now ordered. With the one truck in service the trucking force and the cost of trucking have been reduced 25 per cent. The Chicago & Eastern Illinois has also used one of these trucks at its freight house at Twelfth street, Chicago, with similar results.

"WHO PAYS FOR MY RAILROAD TICKET?"

[From the Chicago Herald]

Governor Dunne, in his reply to the request of the Illinois railroads for a reconsideration of the two-cent fare law, remarked on the absence of "vigorous protest" from the railroads against the two-cent rate "for nearly eight years." This suggests the statement of a fact generally overlooked, though long well known to students of railroad statistics.

This is the fact that the passenger service of the railroads, taken as a whole, has long been done for less than its cost. Why haven't railroad managers said something about it before? Well, occasionally they have. They have not, as a rule, made much of a point of it.

Probably they have failed to do so on the theory on which a State street retailer delivers a five-cent purchase away out at One Hundred and Sixteenth street. There is a loss on that, but it may be made up by gains on other sales. Usually it is.

The fact is that people have been largely traveling on the railroads partly at the cost of shippers of merchandise. The shipper pays for the traveler. If shippers and travelers were the same persons this would be "as broad as it is long." But they are not the same persons, except to a limited extent.

Noting this fact, the Interstate Commerce Commission has told the railroads that they shouldn't take from their freight income to pay for their passenger service—that each service should pay its own bills.

So the question for each man to ask himself when considering the railroads' request for higher passenger fares is:

"Who pays for my railroad ticket? Am I fairly paying for it myself, or sponging on my neighbor?"

Tractor Pulling Five Reynolds Trucks Around a Sharp Corner

Arbitration of Engineers' and Firemen's Demands

A. W. Trenholm, Chairman of Committee of Managers, Explains Effect of Men's Demands on Operating Conditions

At the hearing in Chicago last week before the board of arbitration on the wage demands of the engineers and firemen on the Western railroads, it was agreed by stipulation of both sides that as it was impossible for the board to complete the hearing of testimony in time to reach a decision within the 90 days provided for in the law, which would expire on February 27, the time limit would be extended until April 20.

A. W. Trenholm, general manager of the Chicago, St. Paul, Minneapolis & Omaha, and chairman of the Conference Committee of Managers representing the 98 western railroads affected, took up in detail on February 16 the 16 articles comprising the demands of the engineers and firemen, showing the effect of each article on operating conditions. Mr. Trenholm occupied the witness stand throughout the week.

"It is the first time in the history of railroading," said Mr. Trenholm, "that any such arbitrary, unreasonable set of rules has ever been submitted to any railroad. There is no reason for splitting up a road trip from the time the engine leaves the roundhouse till it reaches the other end of its run, except the one the men set up, namely, the creation of additional compensation and getting away from giving the railroad a reasonable day's service.

"The allowance of time and one-half for overtime would not reduce overtime, but, on the contrary, would be an incentive to increase it. The movement of trains is dependent largely upon the prompt carrying out of orders and the desire of the men under present conditions to get over the road and receive their compensation on the speed basis. This would be destroyed and the incentive would be, if the train were near the average of 10 miles per hour, for the crew to take little interest in making meeting points, feeling that if they ran into overtime they would be receiving 50 per cent greater compensation."

HELPER AND PUSHER SERVICE, ETC.

With reference to the proposal that engineers and firemen in pusher, helper, mine run, work, wreck, belt line and transfer service, and all other unclassified service, shall be paid through freight rates, Mr. Trenholm said that a large proportion of such service is unassigned and is performed as a part of switching or other regularly assigned service, to which the higher rates of pay ought not to be applicable. For example, out of St. Paul practically every train has to be helped over a short grade of approximately two per cent, and a regular helper is not assigned to the service because one helper would not be of any particular use. Every engine that works in the yard some time during the day will help a train, and under the proposed automatic release rule, if an engine works for 15 minutes in helper service of this kind the men would be entitled to claim a full day's pay.

As to belt line and transfer service, the conditions vary so in different localities it would be difficult to apply a hard and fast rule. In most cases, while a man probably would be on the road for long hours the work required was not such as to justify road rates, except on particular runs. As to helper service, if it were necessary to put a second engine on a passenger train on account of a snowstorm, the proposed rule would require payment of the through freight rate for one crew and the passenger rate for the other, which Mr. Trenholm thought would be improper.

The rule requiring an increase of 10 per cent on divisions on which there is a grade of 1.8 per cent, according to the witness, would require the roads to pay mountain rates on a large number of divisions because of a very short grade, perhaps of only a few thousand feet, on some part of a division. A strict interpretation of the rule would apply on trains going from the depot level up to an elevation. At present peculiarities as to grade or mountain operations are covered by various schedule provisions to meet the peculiar situations in the territory involved. Some roads allow a day for less mileage than 100 miles, others give an increased rate, such as 10 per cent additional.

STANDARDIZATION WITH A SAVING CLAUSE

Chairman Pritchard asked whether the witness thought language could be employed by the board which would obviate the difficulties as to local conditions. Mr. Trenholm replied that if it was desired to standardize the rates and rules it could be done by a committee of operating officers and a committee of the men, who should systematically analyze the schedules and work out rules that would allow a general application, but it would be necessary to eliminate some rules that are now in some schedules and possibly put in some that are not in other schedules, because some roads do not have certain rules, but have other rules which offset them. If it were not for the saving clause he thought the board could ignore all the schedules in existence and make a uniform set of rules to apply throughout the whole territory on broad lines.

"I believe," he said, "that compared with any other labor, the engineers and firemen of the western territory are adequately paid today. Some of the special rules in the different schedules I feel are unfair. It has always been my thought that if we could co-operate with the men and agree to eliminate these rules that disturb and hurt the discipline, and are irritating, the roads could well afford to reimburse them for anything they take away, so that when we get through we would have an ideal wage schedule without loss to the men. We have never asked to reduce their pay. To make a standardization with a saving clause seems to me to be impossible unless you take the very best schedule in the territory that has everything in the way of a perquisite, and apply that schedule to every other road and bring it up to the highest level of arbitrary allowances."

PREPARATORY TIME

If preparatory time were paid for by one road in one way, Mr. Trenholm said, and a rule were adopted providing for payment in another way, it might result that on some roads the preparatory time would have to be paid for twice. On his road (the Omaha) a rule had been adopted providing for an arbitrary payment of 30 minutes preparatory time in all cases where the men worked 10 hours, but if they were paid mileage and made a day's pay in less than 10 hours they were not allowed the 30 minutes.

F. A. Burgess, one of the brotherhood representatives on the board, tried to show that as there were 386,662 trains run in the month of October, 1913, which were paid for on the mileage basis, the engineers had contributed 193,331 hours, which at 63 cents an hour, the average rate for engineers, would amount to over $121,000 without payment. "I claim we have paid for it in the mileage," replied Mr. Trenholm; "if a man takes 30 minutes to get his engine ready and leaves at 7 o'clock, and completes his run at 12 o'clock, in five hours, he has made 100 miles. He is paid for 10 hours' work, and I don't concede that because he works 5½ hours by having been on duty 30 minutes before he started he has contributed any time that he has not been paid for. I contend that it is unfair, unjust and unreasonable to pay a man both miles and hours for the same piece of work."

Mr. Burgess said that the men also contributed 29 minutes

on each trip before overtime would accrue, which he added to the 30 minutes preparatory time, and he proposed that an expert accountant be selected to ascertain the value of this time on the basis suggested.

"I would like to arrange," said Mr. Trenholm, "at the same time to compute the amount that the railroads paid to men when they did not work at all, and where they were paid 20 hours for 4 hours' service, and 10 hours for 3 hours' service, and all the elements that go into the wage of an engineer or fireman. I believe, and the committee I represent believes, that the time you speak of as having been contributed should be paid for. I am perfectly willing to concede that the railroads should pay a man for every minute he works where he is paid on the hourly basis, but there are as many cases where a man is paid an hour for 31 minutes' work as there are where he is not paid anything for 29 minutes."

As to narrow-gage service, Mr. Trenholm showed that although a simple five per cent increase above the ordinary rate is asked, the compounding of other increases, such as the differential for grades, would bring the total percentage on some roads up to about 27 per cent. On one run on the Denver & Rio Grande the engineers' increase would be 174 per cent and the firemen's increase 189 per cent. The engines used in narrow-gage service are very small and there is no reason for any increase in the rates. The demand that through or irregular freight trains, when they have to set out or pick up cars en route, shall be paid for at overtime rates in addition to the time or mileage made on the trip, Mr. Trenholm said, would result sometimes in paying the crews four times for the same work.

"If a crew makes a run in 7 hours, it is paid the minimum of 10 hours," he said. "Suppose it used one hour on the road setting out cars. For the 8 hours, it is getting 10 hours' pay, yet it would get also time and one-half for the hour setting out cars, in addition to the straight time for that hour. If the added hour brings the crew into overtime, an additional hour at time and one-half would be necessary, making four times the regular rate for one hour's work."

The rule providing for continuous time in yard service, with an allowance of 30 minutes for meals during the time paid for by the company, Mr. Trenholm said, would in many cases result in shortening the period of actual time on duty so that overtime would have to be paid, and the company would in reality be paying time and one-half for the meal hour.

INITIAL TERMINAL DELAY

The rule as to initial terminal delay, he said, is different from anything he ever knew of in any schedule, as it provides additional payment for something that heretofore has been part of the day's work.

"Regardless of the fact that the engine may be ready for the engineer and fireman to step on and move the engine," he said, "there would be no escape from paying 30 minutes' preparatory time, even if the whole day be 6 or 7 hours' work with 15 hours earned. Where there is now a switching allowance the men may hold to this under the saving clause and secure even double time. The 30 minutes would have to accrue to the men at the beginning of each trip regardless of any service, and where engines are double-crewed one man could step off and another step on, one claim final terminal delay and the other preparatory time, resulting in payment to two crews for the same time."

Whether the board of arbitration has power to prevent such pyramiding by careful construction of the wording of the award aroused a lively discussion. Mr. Nagel asked whether, if an award should be made on a subject which is not covered by the rules of one road, but which is covered by a rule on another road more advantageous to the men, the men on one road might accept the award and the men on the other road reject it, or whether the brotherhood must act as a unit with respect to the award. Mr. Stone insisted that the men on the individual roads could accept or reject any article of the award if they preferred to retain the rules already in effect.

AUTOMATIC RELEASE

The rule providing for automatic release at the end of a run, Mr. Trenholm said, would severely penalize the roads on short runs, and make it possible for men to earn two or three or four days' pay in one, unless the wording of the rule were changed. He admitted that some such rule should be provided to protect the men against abuses, and that a man, having completed his day's run, even if it required only six or seven hours, should be compensated properly if he were required to perform additional service, but he thought such conditions were generally provided for at present in the various schedules in one way or another. The schedule of the Omaha road provides that a man may be called for an additional run only up to the limit of 100 miles or 10 hours.

"The application of this rule, in its technical interpretation," said Mr. Trenholm, "is so far-reaching in its effect, that this committee hesitates to attempt full description of what the result would be, applied to so vast a territory. It is such a radical departure from the present rules and practices and impresses us as being so unreasonable and unfair to the railroads that we are at a loss to understand the purpose of it."

An actual run described by Mr. Trenholm is covered by six trains daily except Sunday on the Rock Island between Elmira, Ia., and Riverside. The engine crew on each of these trains covers 115.2 miles per day, working 9 hours and 57 minutes, for which it receives 15 hours' pay, $6.22 per day for the engineer and $3.97 for the fireman, the engines being very small. On these runs, there would be, under the men's demands, a pyramiding of rates and rules covering preparatory time, initial terminal delay and final terminal delay at three points daily, plus 100 miles under the automatic release rule for each of six runs daily by each crew, while on top of all would be added 10 per cent because part of the track is 1.8 per cent grade. As a net result, each engineer would receive $33.66 per day, or $1,009.80 for a 30-day month, while each fireman would get $21.69 a day, or $650.70 for the month, an increase of 441 per cent for the engineer and 447 per cent for the fireman.

In discussing the demands that crews "tied up" under the federal 16-hour law between terminals be paid continuous time without deduction for time so tied up, Mr. Trenholm said: "This would abrogate the agreement signed in 1908 with the four brotherhoods, in which specific provision was made for this situation. Conductors and trainmen still would be bound by this agreement. The rule makes no exceptions, and the company could not release a crew between terminals without paying full time, even when necessary because of washouts, snow blockades or other conditions over which we have no control. Such tie-up or release might be at a point where there are liberal accommodations for sleeping and ample rest. Under the overtime rule the men would even claim time and one-half for time thus spent in rest. Under the "deadhead' rule, an engineer or fireman riding in a coach would get not only the rate, but all the added arbitrary payments going to the crew working on the engine, such as preparatory time, initial and final delay, running for coal and water, icing cars, loading or unloading cars.

"Another rule demands continuous time after 15 hours when held away from home terminals, including the rest period. Having once exceeded this time, the pay would become continuous whether for 24 hours or a week, regardless of snow blockades, washouts or other emergencies. If a man made 100 miles in four hours at the $5 rate and was then held for 24 hours in excess of the limit set, he would draw $30 for the 24 hours. This committee cannot conceive any justification for this when no service is rendered."

SURPRISE TESTS

As to the demand for the elimination of surprise tests under certain conditions, Mr. Trenholm said: "The committee is

of the opinion that properly conducted efficiency tests are necessary to safe operation. The tests should always have due regard to the safety of employees, and while it may be true that in so large a territory there might be a few individual cases where the zeal of some local officials may have gone somewhat beyond this, we are very strongly of the opinion that matters of this nature are not a proper subject for a wage schedule, and that the maintenance of discipline, proper obedience to rules and regulations and the manner of their enforcement should be left to the operating officials of the railroads."

In describing the efficiency tests on his road he said: "After some time it developed that unfair reports were being made, and after long thought I conceived the idea of inviting the labor organizations to elect a committee of five men, one from each, while I selected five officials. These men meet once a month in my office. They have all the authority I have to examine records and it is their vote which decides a complaint of the men. In case of a tie I cast the deciding vote, but we have met every month for several years since the board was formed and I have never been called on to vote. Every decision has been unanimous. When 100 tests have been taken of any engineer with no failures, the man is given a '100 per cent efficiency' certificate, which shows that he has been tried and found 'there.'"

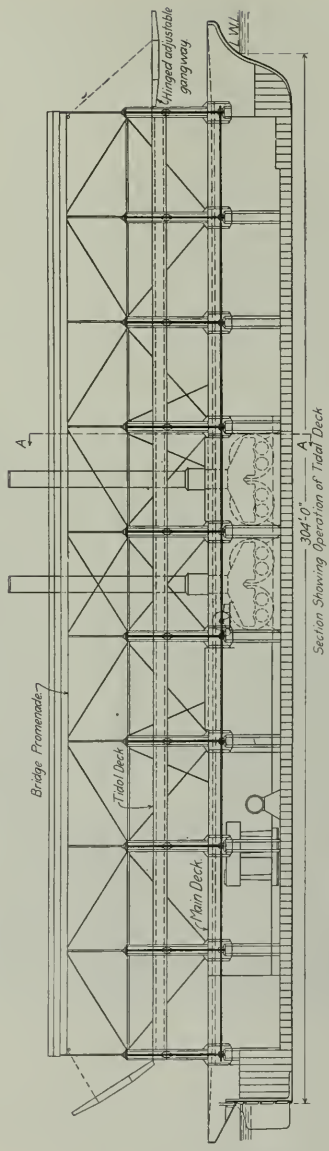
A NEW CAR FERRY WITH ADJUSTABLE DECK

It is planned to extend in the near future, the operated section of the new National Transcontinental Railway in eastern Canada, which is now in service from its eastern terminus, Moncton, N. B., to a point across the St. Lawrence river from Quebec. As the Quebec bridge will not be ready in time to start operation as soon as desired, a car ferry of unusual design has been built to handle both freight and passenger trains between Quebec and Levis. It is designed to carry a maximum train load of 1,440 tons in an estimated time of 45 min. for loading, moving the 2½ miles across the river and unloading.

A Portion of the Main Deck Showing the Track Supports on the Movable Deck Overhead

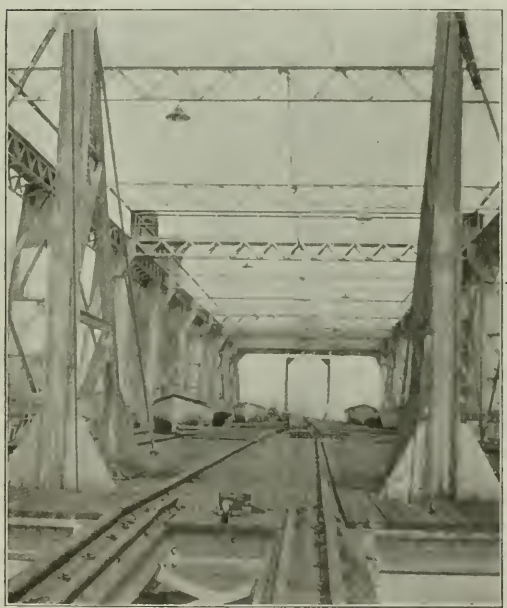
The two principal difficulties in providing a ferry for this service were the large amount of ice encountered in this latitude during the winter months and the tidal variation in the water level which amounts to about 18 ft. The ways in which these difficulties were met in the design of the boat constitute its chief features of interest.

The hull of the new ferry is 304 ft. long and 65 ft. wide at the 15-ft. load line. It has a molded beam depth of 23 ft. to the main deck and a mean draft not exceeding 15 ft. under the full train load. The trains will be carried on a movable car deck supported above the main deck by 10 columns on each side,



Longitudinal and Cross Sections of New National Transcontinental Railway's Car Ferry

the position of this deck being adjusted by large gun metal nuts at the ends of the transverse girders supporting the deck which engage vertical screws hung on ball bearings from the top of supporting columns. The side columns are connected at their tops by transverse latticed girders; longitudinal bracing is provided between all columns, and exterior struts are carried out to the edge of the main deck, making the superstructure rigid in all directions. The load on these columns is distributed to the keel by special struts below the main deck. Three tracks 272 ft. long are provided on the movable deck, these being carried on latticed girder stringers under each rail. No adjustment in the elevation of the tracks on the landing piers will be necessary, the slight inequality due to the motion of the vessel under changing load being taken up by adjustable hinged gangways at each end of the car deck. These gangways are attached to the end of the movable deck by ball and socket joints and their outer ends are adjusted to the desired level by two lines of three-part cable attached to the top of a braced steel frame on the deck. The steel superstructure above the highest position of the car



Looking Down One of the Tracks on the Movable Car Deck

deck supports a promenade around the vessel with a bridge platform forward from which all of the operations of steering and maneuvering are directed. The space below the main deck is occupied by the boilers, coal storage, engine rooms, accommodations for the crew, etc.

The vessel will be propelled by two sets of twin-screw triple-expansion surface-condensing engines with cylinders 23 in., 35 in. and 55 in. in diameter, having a 33-in. stroke. They are designed to run at 120 revolutions per minute with a steam pressure of 165 lb. A special feature of these engines is the shafting, which is made much stronger than usual to withstand the shock received when the propellers strike ice during the winter. The propellers themselves are of nickel steel and of an especially strong design. An ice-breaking propeller is provided in the forward end of the vessel, driven by a set of compound surface-condensing engines, the cylinders being 15 in. and 32 in. in diameter with a 21-in. stroke. This propeller, which is also of nickel steel, runs idly during the summer months. The vessel is strengthened throughout for heavy ice-breaking service. The car deck is raised and lowered by worm wheels driven from horizontal shafting which runs the length of the vessel on each side, the gearing being arranged to lift the deck fully loaded at a rate of one foot per minute through a distance of 18 ft. The engine operating this deck is of the four-cylinder high-pressure type, of massive design, driving a transverse shaft through double helical spur gears. This shaft drives the main line shafting through miter wheels at each end. The worms which drive the vertical screws carrying the car deck are of forged steel and the wheels of cast iron. The screws are driven through a loose forged steel sleeve and sliding key arrangement fitted into the box of the wheel. Steam will be supplied by two batteries of four single-ended return tube boilers, 12 ft. 4¼ in. in diameter and 9 ft. 6 in. long, having a total heating surface of about 10,400 sq. ft. and a grate area of about 350 sq. ft. An electric winch with two drums operated by a 41. hp. motor is located on the car deck for hauling cars on and off the boat. Two 25 hp. motors are provided for raising and lowering the gangways and two generators of 40 kw. and 20 kw., respectively, are installed for supplying the electric current for the operation of motors and for lighting. Two steam windlasses with slip drums are provided for mooring.

BEAM LIGHT SIGNALS ON THE PENNSYLVANIA

The new arrangement of electric lights (uncolored) to take the place of semaphores, as signals, on the Pennsylvania Railroad, between Philadelphia and Paoli, to be used both day and night, was described in the *Railway Age Gazette* of January 8, page 61. These signals have now been put in service over a distance of five miles, Overbrook to Bryn Mawr, and a photographic reproduction of one of the signal bridges, sent to us by the courtesy of the Philadelphia Public Ledger is given in the accompanying engraving. This is a four-track line and the observer sees the two signals for the two right-hand (west-bound) tracks. For the outer track the stop indication, protecting the train seen in

"Beam-Light" Signals at Rosement, Pa.

the picture, consists of the four lights which are arranged in a horizontal line in the upper part of the hood or background. The next track is clear for three blocks in advance and the clear indication in the signal (at the left) consists of the four lights arranged in a vertical line.

On this electrified section the block sections are about 3,500 ft. long and "three-block information" is given. If the line is clear for only two blocks ahead, the clear signal is given by the lights in the lower part of the signal (corresponding to a second semaphore arm) indicating "proceed, prepare to pass next signal at medium speed."

The wires to be used for electric traction, seen in the engraving, are not yet in regular use. It is expected that electric motor cars will be put in service within a month or two.

Meeting the Problems of the Express Companies*

Express Service Must Respond to the Public's Demands; Must Earn Revenues Commensurate With Its Service

By B. D. Caldwell
President, Wells Fargo & Company

The slogan "Made in America," or "Made in the United States of America," now current throughout our land, will undoubtedly spur our people to new initiative and creative endeavor. It should have another and, to my mind, more immediate effect, namely, a revival of appreciation of the usefulness of institutions whose prosperity has been affected through lack of that public encouragement and protection which are essential to their well being.

Extremes of criticism and regulation, moderation in which would have been salutary, have driven many of these institutions to the trenches of defense and slowed the wheels of progress. As measures of reform, some of this regulation has been in response to a wholesome public sentiment of disapproval of hurtful tendencies caused by unwise use of great power or wealth. When rationally applied it has served its legitimate purpose in checking selfishness and discrimination, but too often it has been so extreme as to be repressive of legitimate and laudable endeavor. Just criticism and wise processes of reformation are wholesome and invigorating. When inconsiderate or extreme they always produce the contrary effect. Other efforts at reform have been based upon a lack of understanding of the problems involved or upon a blind following by those who, without knowledge themselves, do not investigate the underlying basis of criticism before joining in its expression. There have also been the harmful effects of fickleness of appreciation which condemns today what it exalted yesterday. Institutions which have been used as ladders to success have been assailed when the beneficiaries have thought they were strong enough to climb alone, finding too late that in bringing injury to their benefactors they have hurt themselves.

We all realize that transportation is as essential to our commerce as the sun is to the day. The slogan "Made in America" would be meaningless without transportation to carry our products of mine, soil and manufacture to all the worlld. We seem to forget not only that our railroads were "Made in America," but that they are its greatest creation. They are admittedly the greatest railroads in all the world! As the children of our creation, they may require regulation and sometimes correction, yet our paramount obligation is their protection, encouragement and best development rather than mere discipline. Let us make them greater, more efficient and more useful by making them more prosperous.

While my talk of tonight has to do mostly with the express, I could not forbear this expression of appreciation of the greatness of the service of our railroads and of the urgent need for an extension to them, by the American public, of definite and substantial support in their efforts to maintain their credit and usefulness. Nor should we forget that the railroads, for their services, receive approximately one-half of the gross earnings of the express companies, and share correspondingly in reductions made in express rates.

ADVANTAGES OF THE EXPRESS

Indeed, in correlating the many railroad lines into a unit of public service, similar in principle to the Pullman service, the express, in its usefulness as well as its need of public encouragement and support, is kindred to the railroad. The character and scope of the express, as we know it in its relation to the activities of our people, entitle it to be considered one of the greatest transportation agencies in existence. To the everlasting credit of the American people, be it said, it was also "Made in the United States." After three years of service with one of the largest of these companies, during which period the express has been, most of the time, under fire of both criticism and regulation, I am convinced that as a specialized personal service for the transportation of packages of all descriptions, combining the highest measure of safety, speed and responsibility, it has no equal anywhere. It is ideally adapted to, as well as a development of, the needs of the American people, and, in my judgment, the express is now giving a service which in expedition, correctness and reliability cannot be replaced to advantage, should it retire or be destroyed, nor can its place in business activity and promotion ever be satisfactorily filled by a governmental service.

Moreover, the unit of service supplied by the express through its unique organization as now constituted, would not be the same if each separate railroad operated its own express. This is true not only because of the difficulty of proper correlation, but on account of the duplication of service and the accompanying confusion and delay which would result if each railroad were obliged to provide its own separate express organization, including vehicles for pick-up and delivery service. On the other hand, the increased cost to the railroads of such a duplication of service, beyond their ordinary function of transportation, would be practically prohibitive. With very few exceptions—which are subject to special conditions—the railroads which have undertaken to operate their own express have abandoned the experiment because of lack of success in their own, as well as the public, interest. Such an unlimited extension of duplicate service as would be required if the individual railroads throughout the country were to handle the express direct would not only *not* bring a satisfactory solution of present problems, but would transfer them in an enlarged degree from the express companies to the railroads.

The express assumes the fullest carrier obligation of any system of transportation, in that it guarantees personal service from the door of the shipper to that of the receiver, between all principal points, upon the hundreds of millions of packages which move yearly, and 90 per cent of which traffic originates or terminates with business concerns. The shipments between individuals represent less than 10 per cent of the whole. The express service, in the main, is required to serve an immediate need either of food, fashion or other daily requirement of our people—a single messenger, as it were, carrying not one message, but a whole shipment, to Garcia—with the added guarantee of indemnity to the owner for damage or loss.

The express has no counterpart in any other country, except Mexico and Canada, and these were "Made in the United States." It has always been financially responsible. It has been the pioneer in transportation of money, gold, silver and currency. It serves the world through simple and effective forms of money orders and travelers' checks. It is a notable fact that in Europe, at the outbreak of the war, the express companies were practically alone in paying cash to Americans traveling abroad. Their service in recovery of American baggage from the war zone in Europe constitutes a red letter chapter in reclamation work.

DEFECTS OF THE PARCEL POST

The following is quoted from an analysis of the relative merits

*An address delivered at the annual dinner of the St. Louis Traffic Club, December 18, 1914.

of the express and the parcel post made by one of the great merchant bodies of this country, viz.:

"The parcel post omits the following essentials of a complete service:

"1. It does not collect parcels.

"2. It does not give receipts.

"3. It does not provide indemnity for loss, except upon extra payment, and only to the amount of $50.

"4. It does not provide any indemnity for damage.

"5. It does not provide controlling records, by reason of which omission the volume of loss is increased.

"6. It does not provide special means of security for valuable parcels.

"7. It does not provide adequate protection against damage, but, on the contrary, promotes damage and loss by opening in transit.

"8. It does not provide for the transportation of a wide range of special commodities.

"Unless the parcel post removes these defects it cannot by any possibility fill the entire field of quick transportation. It can invade it to a considerable extent, but the service performed by it will be materially less efficient and less comprehensive than that now supplied by the express companies. . . . It would partially supplant an adequate service by an inferior service, and by compelling the express companies to retire by depletion of their traffic would leave a considerable part of the field without needed traffic facilities."

More than a hundred business organizations throughout the country have expressed to the President, Congress, the postmaster general and the Interstate Commerce Commission a protest against further extension of the parcel post, as being not only unnecessary in the public interest, but, on the contrary, inimical to it because of the danger of driving out a service of higher efficiency—namely, the express.

It has not been the position of the express companies, at least within my knowledge, to oppose a parcel post within logical limits. The present-day consensus of opinion of business interests of the country, however, as voiced by the organizations referred to, is that any extension beyond its present scope is neither justified by the country's need, nor by the ability of the parcel post to serve. On the other hand, they contend that because of the detrimental effect upon the greater and more essential service of the express companies, its further extension becomes an injury to the public instead of a benefit.

It is my conviction, based on careful observation, that the parcel post cannot, in its present form, and it is doubtful if it can in any form, handle to material advantage perishable shipments for farmers or other producers. It can never furnish that personal service in direct helpfulness to the grower and the producer which has always been a feature of the work of the express and which has now been extended, through food products departments, to bring into closer relation the producer and consumer, thereby contributing to the success of the widespread movement for a reduction in the cost of living. Our company has formed over one hundred buying clubs in New York City alone in which the express company makes the delivery in bulk to the store employees who constitute the clubs. As a means of economy, members of these clubs make the distribution between themselves.

The loss by the express to the parcel post is estimated to be about 15 per cent of its gross earnings of the year prior to the installation of the latter. These shipments represent mostly small packages of limited value, including practically all of the small package business for "rural free delivery."

During the two years of investigation of express rates and practices by the Interstate Commerce Commission a mutual understanding was reached between the express companies, the shippers and the commission for the adoption of improved methods of handling the traffic. To the co-operative efforts of the various merchant associations, in joint conference with the representatives of the express companies, much is due for the progress made in this direction, thereby insuring correctness and efficiency of service.

The criticism which preceded these mutual conferences, however, was a remarkable illustration of the extremes to which the pendulum of criticism can go and how easily it may go past the point of benefit and produce serious injury, as was reflected in the radical reduction in rates provided for in the order of the commission by which a new plan, as well as an entirely new basis of rates, was made effective on February 1, 1914. It is fair to say that in tariff simplicity and insurance of correctness in quoting rates the new plan is a great improvement over the old and, to that extent, as well as for the improvements made in methods of handling referred to, the commission is entitled to commendation both from the express companies and the shippers.

As to the reduction in the rates—the companies expressed willingness to make a substantial reduction in long-haul rates, but vigorously opposed the radical reduction in the whole fabric of rates proposed by the commission, which they anticipated would unjustly reduce the earnings of both the railroads and the carriers, and might wipe out entirely the net earnings of the express companies.

It was estimated by the companies at the time the order was issued that the reduction would amount to about 15 per cent of their total revenue on interstate traffic. This would necessitate securing a still greater percentage of increased business at the lower rates if the former gross earnings were to be maintained unless material reductions in expense were made, since if a greatly increased business should result, the handling expense would also be increased. It seemed to the companies that it would be exceedingly difficult, if not impossible, to secure such economies as would overcome the losses which the extreme reduction in rates must inevitably produce. In the meanwhile, the express companies, like all other transportation agencies, were confronted with an actual increase in their cost-of-living expense.

REDUCTION IN EXPRESS REVENUES

The result of nine months of operation under these reduced rates is now available. Five months were reflected in the figures of the fiscal year closing with June 30, 1914. Commissioner Decker, of the New York state commission, in his report to the recent meeting of the National Association of Railway Commissioners, called attention to the gross revenue loss in express earnings for that fiscal year. This amounted to $10,000,000 as compared with the previous year. The net income fell from $4,400,000 to $400,000, a decrease of about $4,000,000, or 90 per cent. The resultant loss to the railroads was approximately $5,000,000, being one-half the loss in gross express receipts.

In this report Mr. Decker stated: "It is, of course, too early to hazard an opinion based upon these figures that the express business of the country cannot be continued to be operated under present conditions, but all must concede that such figures constitute a basis for apprehension and for serious thought and consideration in the future in connection with further reports of financial returns. . . . We are likely to have under consideration in the comparatively near future the question of providing sufficient revenue for the continued profitable operation of the express service over railroads in the United States."

The effect upon the *net* earnings of the express companies of the existing situation is strikingly shown by the following: Out of each dollar received by our company from the public the profit fell from 6.33 cents for the fiscal year ending June 30, 1912, to 4.25 cents in 1913, and to 2.71 cents in 1914. For the first quarter of the current fiscal year the profit was less than *one cent* for each dollar received. The fiscal year ending June 30, 1913, included 6 months of parcel post, while that of June 30, 1914, included, in addition to 12 months of the parcel post, 5 months' operations under the new reduced express rates. The more significant effect of the rate reduction, however, is shown in the figures quoted for the first quarter of the current fiscal year.

On interstate traffic, the average charge per shipment of our company, from July to October, inclusive, of this calendar year, decreased 18.1 cents, or 16.55 per cent as compared with the same period of the previous year. In 25 of the larger cities east of the Missouri river our average charge per shipment decreased in October of this year from 85.8 cents to 70.8 cents, or nearly 18 per cent. St. Louis fell from an average of 90 cents to 72 cents, or 20 per cent. The average charge per shipment for the entire system, state and interstate, for the 4 months fell from 81.39 cents to 73.02 cents, a decrease of 8.37 cents per shipment or 10.28 per cent.

The problem at the moment, therefore, is one of preventing *deficits* rather than of showing profits. We must all agree, however, that if the express companies are to continue to serve their present useful function they must be conducted at a profit. It is by no means clear, in view of the present outlook, how this is to be accomplished.

NEEDS OF THE EXPRESS BUSINESS

Two things, however, seem reasonably certain: first, the express must respond to the demand of the public for a virile and aggressive administration such as will command both the respect and good will of the latter. It is our conviction that this obligation is now being fulfilled. It must also have an earning capacity that will insure to its stockholders a profit proportionate to its usefulness and value in public service and to the company the maintenance and improvement of its service, including the personnel and efficiency of its employees. The figures herein quoted show that such an earning capacity is now lacking. Second, the public must be responsive to the situation in protective support against measures for the extension of governmental competition which may weaken or destroy, but which cannot replace, the express service. There must, likewise, be a realization by the public not only of the necessity, but the merit, of compensation to the express commensurate to the specialized service and general usefulness which constitute its value as an essential agency of transportation.

I can at least speak for the company with which I am connected in saying that the problem of making income exceed the outgo has been undertaken with the spirit of accomplishment to the greatest extent possible. In the fiscal year ending June 30, last, our operation cost, through efficiency work, was reduced so substantially, as compared with the previous year, as to reflect a net earning which would not otherwise have been available.

We have made and will continue to make an earnest and conscientious effort to make the best of the rate bases which, by process of law, have been prescribed, however reluctant we were to adopt them as affecting our earning capacity, or how difficult seemed the task before us. We have approached the task with energy and even optimism, with a full appreciation of the stimulus to progress which is to be derived from such an attitude, especially in its effect upon our large force of officials and employees who, after all, are the men behind the guns in all such accomplishment.

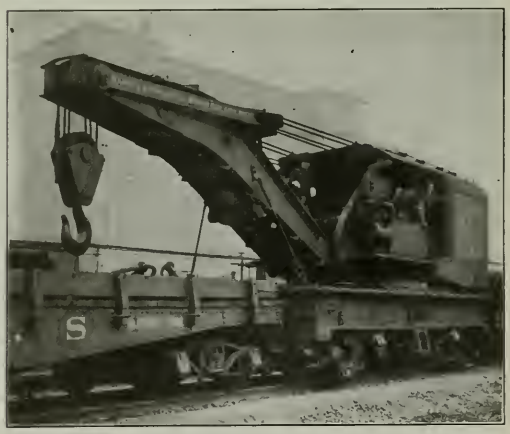
We are striving, through efficiency and inventive effort, to find new or cheaper methods of handling. We are, however, constantly met with the fact that the specialized personal service and responsibility of the express necessitate such an extraordinary amount of detail in the speedy handling of not only the packages, but the way-bills and other safety records required, as to make it difficult to find new methods that are not fatally defective to this expeditious and insured service, which is the very essence of the express.

But in the effort being made by the express, notwithstanding the losses in earnings as a result of the reduction in rates, not only to keep up but to improve the service to the public, we must have constantly in mind our obligation to our stockholders. Express stocks are held just as are railroad stocks—by banks, insurance companies, trust companies, women, estates and even churches. With our company, women constitute approximately one-half our total stockholders. Our officials likewise feel most keenly their duty to our army of loyal and faithful employees. They regard it as a most worthy ambition to preserve to these employees their positions by the continuation of the express, and that we should not only be in a position to improve their working condition, but to extend our pension system and other methods of welfare work. By these means the express would continue to attract the grade of employees so essential to its highly specialized service—in which 150,000 persons are now employed in an operation of over 250,000 miles of railroad lines in the United States.

Without any thought of relief from the responsibilities which are properly ours, it seems to us that we may now with propriety bring to the public, whom we serve, an account of our stewardship and of the effect upon the earnings of the express, as well as those of the railroads, under the new conditions. In other words, the time for retrospection seems to have arrived. The public can with satisfaction view the results of its co-operative effort in the improved efficiency and usefulness of the express. At the same time the public may well be concerned as to the effect upon express earnings and the need of further co-operative effort in the providing of sufficient revenue for the continued profitable operations of the express service as one of the great transportation agencies "Made in the United States of America."

MICHIGAN CENTRAL STEAM-ELECTRIC WRECKING CRANE

A wrecking crane built to operate either by steam or electricity has recently been received by the Michigan Central for use in and adjacent to the Detroit river tunnel. This crane differs from the electric tunnel cranes of the Pennsylvania Railroad and the Grand Central Terminal in the provision for steam operation, and further in being single-ended. It is hoped, of course, that an accident may never occur in the tunnel itself,



New Wrecking Crane of 120-Tons Capacity Designed for Operation by Either Steam or Electricity

and in order that the crane need not be idle under normal conditions, it is adapted for ordinary uses outside the tunnel as well as the special use underground. When operated within the electric zone, current is supplied from the third rail or from a flexible cable carried on the crane. At points where the electric power is not available the crane can be operated by steam from any outside source, such as an accompanying locomotive, through a suitable system of piping. This makes it available for regular wrecking duty or for construction and yard work.

The construction of the crane is similar to that of the 120-ton

capacity steam wrecking crane used on many roads. The car body is 26 ft. long and 9 ft. 6 in. wide. The weight of the crane is distributed over a wheel base of 19 ft. 8 in. Telescopic outriggers are provided to add to the stability during heavy lifting. It is equipped with air and hand brakes, with provision for both automatic and straight air. The complete air brake system is under the control of the operator, with engineer's valve, electric air compressor, etc.

The electric motor is wound for 600 volts direct current, and has a capacity varying from 200 hp. for a short period to 115 hp. for one hour's continuous service. This motor will operate on fluctuations of line voltage between 300 and 700 volts. The controller is of the street railway type with cast grid resistance. The current is delivered from the third rail or cable to a switchboard that is furnished with all necessary switches and instruments for operating the electric air compressor, cable reel, third rail shoes, light, etc.

The main power cable is automatically paid out and reeled in. A reel is provided with a capacity of 500 ft. of insulated power cable, which is operated by a motor. The automatic control of the reel is secured by the action of this motor without the use of any intermediate or internal mechanical devices, such as friction, clutches, etc. This motor is supplied with current whenever the crane is taking current through the cable, so that practically a constant torque is exerted on the reel, resulting in practically a constant pull on the cable. Any change in this pull, such as would be produced by the crane moving forward or back, results in the automatic paying out or reeling in of the cable. The motor is capable of standing "stalled" continuously without danger to its parts from overheating.

When the crane is operated by steam the piping system is so arranged by means of a steam-tight slip joint at the center of revolution that the crane will slew more than 180 deg. in either direction under the pipes without interference. When the crane is operated electrically this piping revolves with the crane.

The motions of hoisting with either the main or auxiliary hoists, varying the boom radius, and slewing are independent of each other, and with loads up to the limit of its power the crane can perform all of these motions simultaneously. With the maximum load of 120 tons it is capable of slewing at the rate of a complete revolution in one minute if this speed is deemed safe. The boom may be raised or lowered under full load. A special drag or pulling line is attached to the underside of the boom. When self-propelled by either steam or electricity the crane has a speed of about four miles an hour, but it may safely be handled in regular trains over main line tracks at a speed of 60 miles an hour.

The maximum radius of the main block is 25 ft. and the minimum 16 ft. The capacities of the crane are as follows: With outriggers in position, main hoist, 240,000 lb. at 17-ft. radius or 160,000 lb. at 20-ft. radius; with end outriggers only, main hoist, 140,000 lb. at 16-ft. radius and auxiliary hoist, 30,000 lb. at 25-ft. radius; without outriggers, main hoist at right angles, 44,000 lb. at 16-ft. radius and 32,000 lb. at 20-ft. radius and auxiliary hoist, 24,000 lb. at 25-ft. radius. This crane was built by the Industrial Works, Bay City, Mich.

Swedish Railways Place Orders for New Equipment.—The Swedish state railways have recently placed orders, for 1916 delivery, with Swedish companies, for locomotives to the value of $250,000 and cars to the value of $700,000.

Opening of New Swedish Railway.—The Alfsbyn-Pitea branch of the Swedish government railways was recently opened for provisional traffic. This line, the construction of which was begun in 1912, extends from Pitea, on the northern bank of the Pite river, to Sikfors, where it crosses the river and follows the valley of the Tvara for some distance up to Alfsbyn. The cost of the railway is estimated at $974,000. It is not yet entirely completed, several station buildings, in particular, being lacking or only partially finished.

DENVER RECLAIM AGREEMENT

The Colorado roads are now working under a new reclaim agreement for the guidance of car accountants in the settlement of bills for rental on freight cars switched by one road for another, which went into effect on January 1. This agreement has the distinction of being so free from objectionable or questionable features that *all* of the roads in the territory affected have unconditionally given their approval. The agreement is as follows:

AGREEMENT,

OUTLINING BASIS FOR SETTLEMENT OF RECLAIMS UNDER PER DIEM RULE NO. 5*

FOR THE YEAR 1915 AND THEREAFTER UNTIL AMENDED.

Rules.

1. Reclaim statement must show initials and numbers of cars, date received, date delivered, and days on the line. Days on the line to be determined by subtracting the date of receipt from the date of delivery.

2. The average detention shall be determined from the cars that make round trip movements in switching service; that is, received from and delivered back to the same road, including cars that are received and returned the same day. Such average detention to be expressed in days and hundredths of days. Cars must appear on the reclaim statement for the month in which the loaded movement is made.

3. A car received with a switch load which is unloaded [and the car], reloaded within the switching limits, and returned to the same road, shall be counted as two cars and the total days shown subject to a maximum of ten days. An item of this kind is to be included in arriving at the average detention, as per Rule 2. The reclaim for both moves must be included in the month in which car was received.

4. The reclaim on cars picked up or diverted shall be on basis of the average as per Rule 2, but the number of cars so handled, and the days detained, shall not be used in computing the average.

5. In the event the average detention is five days or less, and no pick-up or diverted cars are in the statement, the reclaim will simply cover the actual per diem paid by the switching road.

6. Each month's business with each road shall be settled on its own basis. Per Diem Rule 5 provides for an arbitrary amount for each car in switching service, based on the average number of days, not to exceed five, actually required in switching service.

7. In arriving at the average detention, ten days shall be the maximum time figured on any one car.

8. Supplemental reclaims covering omitted cars shall be made on basis of the average time as shown by the reclaim statement from which the cars were omitted, and the average for that month shall not be refigured. Supplemental reclaims for cars included in error, shall be on basis of the actual number of days which were allowed on such cars.

9. No supplemental reclaim shall be made on account of error in date of interchange, discovered after reclaims have been settled.

The roads parties to the agreement are the following:

Atchison, Topeka & Santa Fe, all points in Colorado; Colorado Midland; Colorado & Southern; Chicago, Burlington & Quincy, all points in Colorado and Wyoming; Chicago, Rock Island & Pacific, all points in Colorado; Denver & Rio Grande, all points in Colorado; Denver & Salt Lake; Denver & Intermountain; Denver, Laramie & Northwestern; Florence & Cripple Creek; Great Western; Missouri Pacific, all points in Colorado; Union Pacific, all points in Colorado, and Cheyenne, Wyo.

*An arbitrary amount for each car in switching service may be reclaimed by each individual switching line from the roads for which the service was performed. This amount shall be based upon the average number of days, not to exceed five, actually required in such switching service, to be determined annually by an examination of the records of each individual switching line by the roads directly interested for each local territory. No reclaim shall be allowed for an intermediate switching movement. No reclaim shall be allowed under this rule to a non-subscriber.

Modernizing Locomotives on the Kansas City Southern

Comparative Tests of Consolidation Type Which Are of Special Interest from a Transportation Standpoint

The Kansas City Southern is one of the few steam roads that have taken up the matter of modernizing existing locomotives on a practical basis. The great improvements made in motive power equipment during the past five years have caused many locomotives built a few years previously to become quite expensive to operate as compared with locomotives of more recent construction. This is particularly true in view of the constantly increasing cost for fuel, water, engine and train crew overtime, car service per diem and like transportation expenses.

In order to bring its power that will remain in service for at least ten more years up to the present new locomotive standard of effective and economical working, the management of this road has recently made the following alterations in two out of a lot of forty-eight consolidation type locomotives, built in 1907-1908, and having the original general dimensions shown:

Item	Locomotive as originally built	Conversions No. 477	Conversions No. 497
Fuel	Bit. coal	Bit. coal	Bit. coal
Tractive effort, lb.	44,880	44,880	44,880
Weight on drivers, lb.	182,650	186,000	185,000
Cylinders, diam. and stroke, in.	22 x 30	22 x 30	22 x 30
Drivers, diam., in.	55	55	55
Boiler pressure, lb.	200	200	200
Grate area, sq. ft.	33.5	33.5	62.5
Heating surface, sq. ft., total	3,039	2,831	2,907
Superheater	None	Schmidt, 32 unit	None
Valves	Slide	Universal Piston 8 in.	Slide
Brick arch	None	Security	None
Fire door opener	Hand operated	Automatic, Franklin Butterfly	Automatic, Franklin Butterfly
Cost to convert		$2,775	$4,850

From the foregoing data it will be noted that the changes made in locomotive 477 consisted of the application of a superheater, 8 in. diameter piston valve chests, brick arch and automatic fire door, while those made in locomotive 497 consisted of enlarging the grate area from 33.5 to 62.5 sq. ft., and applying an automatic fire door, the idea being to test these altered locomotives against each other in order to determine their relative hauling capacity, fuel, water and speed performances.

An exhaustive comparative fuel test has just been completed of locomotives 477 and 497 in tonnage freight service. This test was made during November, December and January, over a 102 mile freight division having a ruling grade of .5 per cent, compensated for 72 miles and 1.0 per cent compensated for 30 miles. The average results per round trip of 204 miles are shown in the accompanying table:

Results of Comparative Fuel Tests of Locomotives 477 and 497 on a Round Trip Basis

Item	Average performance 477	Average performance 497	Per cent in favor of 477
Weather conditions; temperature, max. and min.	71 deg.—41 deg.	71 deg.—29 deg.	.....
Ton-miles, total actual	418,157	413,094	1.23
Time in motion, total	12 hr. 1.6 min.	13 hr. 50.4 min.	15.08
Coal per mile, lb.	151.25	196.69	23.10
Water per mile, lb.	953.38	1,416.14	32.67
Coal per 100 ton-miles, lb.	7.378	9.718	24.08
Water per 100 ton-miles, lb.	46.508	69.934	33.49
Running speed, average m. p. h.	16.96	14.72	15.22
Equated result, lb. coal used per 100 ton-miles	6.507	8.602	24.34
Equated result, lb. water used per 100 ton-miles	41.736	68.265	34.03
Steam pressure, average, lb.	196.9	199.44	.....
Superheat, deg. F.—Max.	355	.....	.....
Superheat, deg. F.—Min.	65	.....	.....
Superheat, deg. F.—Average	223	.....	.....

A comparative tonnage test was also made of the two locomotives over the same division in the direction of the flow of traffic against the maximum gradient, with the results per single trip of 102 miles given in the table:

Results of Comparative Tonnage Tests of Locomotives 477 and 497, on a Single Trip Basis

Item	Average performance 477	Average performance 497	Per cent in favor of 477
Weather conditions; temperature, max. and min.	45 deg.—42 deg.	49 deg.—41 deg.	.....
Ton-miles, total actual	275,418	238,716	15.4
Time in motion, total	7 hr. 21 min.	8 hr. 12 min.	10.6
Coal per mile, lb.	240.71	248.00	2.9
Water per mile, lb.	1,481.36	1,812.66	18.3
Coal per 100 ton-miles, lb.	8.914	10.596	16.0
Water per 100 ton-miles, lb.	54.862	77.452	29.1
Running speed, average m. p. h.	13.88	12.44	11.6
Equated result, lb. coal used per 100 ton-miles	7.881	9.604	18.0

Superheat, deg. F.—Min.	134	.....	.....
Superheat, deg. F.—Average	253	.....	.....

Kansas City Southern Consolidation Type Locomotive as Originally Built

The data in these tables shows that on a fuel test the percentages in favor of locomotive 477 were:

Ton-miles ..... 1.33 per cent increase
Running speed ..... 15.22 per cent increase
Fuel consumption ..... 24.08 per cent decrease
Water consumption ..... 33.49 per cent decrease

On a tonnage test the percentages in favor of locomotive 477 were:

Ton-miles ..... 15.4 per cent increase
Running speed ..... 11.6 per cent increase
Fuel consumption ..... 16.0 per cent decrease
Water consumption ..... 29.1 per cent decrease

On the basis of about the same tonnage hauled the average

saving in coal per round trip of 204 miles would approximate 5 tons, which at $2 per ton equals $10. Allowing 14 round trips per month, with one month out for general repairs, gives 154 round trips per year, which at $10 gives $1,540 saving in fuel cost per year. If capitalized this represents the interest at 6 per cent on over $25,000 per year. This leaves out of consideration the reduced cost for about one-third less water used as well as for probable less engine and train crew overtime due to the 15 per cent increased running speed. At any rate the cost for the conversion on a comparative tonnage and fuel saving basis will be more than paid for by the reduction in coal consumption during the first two years of service.

On the basis of the greater tonnage hauled, and assuming an average of one-third empty and two-thirds loaded cars per train, as well as an average of 21 revenue tons per loaded car, this would approximate an increase of 125 revenue tons and 25,500 ton-miles per round trip. Allowing a rate of 7.8 mills per revenue ton mile gives about $199 increased *gross freight revenue* per round trip, or for 154 round trips per year, a total of $30,646 increase in gross operating revenue. This still leaves out of consideration the 16 per cent saving in fuel and 29 per cent saving in water, as also the probable less engine and train crew overtime due to the 11 per cent increase in running speed. At an operating ratio of 63 per cent (exclusive of taxes) each locomotive converted in the way employed with No. 477 can increase the *net operating revenue* by at least $11,500 per annum, or over four times the cost for the conversion.

Therefore, while the cost to convert No. 477 ($2,775) was about 43 per cent ($2,075) less than for No. 497 ($4,850), its performance from either a fuel, a tonnage or a combination standpoint was much more effective and economical. As compared with the unconverted locomotives of the same class the saving in fuel will average from 25 to 30 per cent, and this, with the additional savings through increased average train load and running speed, less number of stops for water and fuel, decreased steam failures and overtime, all of which are reflected in reduced transportation expenses, has made the conversion of this class of power practically imperative.

The more effective and economical performance of locomotive No. 477 with 33.5 sq. ft. of grate area, as compared with No. 497 having 62.5 sq. ft. of grate area, was contributed to largely by the superheater and brick arch.

The application of the superheater to this locomotive without removing the existing slide valve cylinders and making an expensive renewal with piston valve cylinders, as well as alterations in the frames and auxiliary parts, was made possible by the use of the Universal piston valve chest, manufactured by the Economy Devices Corporation, 30 Church street, New York, and the effective performance of these 8 in. diameter piston valves is shown by the accompanying indicator diagrams. No trouble was experienced in the lubrication of the valves and cylinders with saturated steam valve oil under sustained temperatures of 700 deg. F. in the steam chest and on several occasions this temperature was increased with no damage to any of the wearing parts.

The Kansas City Southern is one of the few remaining dividend paying railways in the section of the country which it serves, and this plan that it has taken to substantially increase its earning capacity, for a relatively small expenditure on capital and maintenance accounts, will continue to improve the financial strength of the property, as well as its standard of operation.

ANTI-FULL-CREW LAW CAMPAIGN

Messrs. Samuel Rea, president of the Pennsylvania Railroad; Daniel Willard, president of the Baltimore & Ohio; Theodore Voorhees, president, of the Philadelphia & Reading, and R. L. O'Donnel, chairman of the executive committee of twenty-one associated railroads of Pennsylvania and New Jersey, have issued a third circular answering an "Appeal to the Legislature," which has been presented by the Pennsylvania legislative committee of the trainmen's organizations. The trainmen's committee states that the railroads opposed the air brake law (in 1893); but with this statement of fact, says the committee, there is no issue. In the very first statement of the full-crew law matter, as given out by the railroads February 14, this fact of a dead past was frankly admitted, and stated far more strongly than the trainmen now put it. . . .

In their statement, the trainmen's legislative committee, referring to the beneficent results of air brakes in making railroad operation safer and more economical, declare that the full-crew law will have the same result. But, say the railroads, "The actual, not the theoretical result of railroad operation under full-crew laws, has been a large increase in the casualty list. This is particularly true as to the class of accidents which the trainmen have most emphatically asserted the laws would prevent—injury to passengers getting on and off trains. Figures at hand for fourteen of the twenty-one railroads operating in Pennsylvania and New Jersey show accidents as follows:

	Before law First six months of 1911		*Under law* First six months of 1914	
	Killed	Injured	Killed	Injured
Trainmen killed or injured by falling from trains, getting on or off trains, coupling or uncoupling, or doing other work on or about trains	45	2,307	30	3,008
Passengers, by falling from cars, or getting on or off cars	5	293	3	350
Total	50	2,600	33	3,358

"The railroads did man trains for safety and efficiency of operation before the law required an arbitrary manning of trains, and they continue to do so now quite irrespective of the law's requirements. At the time the full-crew laws went into effect, eleven railroads were operating in Pennsylvania and New Jersey 276 passenger and 540 freight trains, or 816 out of 7,805 trains with crews larger than the law required. Today the same railroads are operating 316 passenger and 414 freight trains, or 730 out of a total of 6,853 trains, manned in excess of the full-crew law requirements. Thus when the trainmen say, as they do in their statement, that 'the full-crew law is not an experiment—is not an innovation in railroad operation,' they are entirely correct. The railroad managers, as a plain business proposition, had full-crewed all trains. The laws which were enacted had nothing to do with it, nor have they since. . . ."

Transportation Exhibits at the Panama Exposition

A Brief Description of the More Important Features of Interest to Railway Men, Showing Recent Developments

By William S. Wollner

The completion of the Panama canal marks an epoch in the history of transportation and in planning the Panama Pacific International Exposition in commemoration of this event, due notice has been taken of the important part that transportation bears to the manifold activities of this busy era. In opening its doors last Saturday, the San Francisco Exposition placed before the world the most complete exhibit of the progress of transportation methods on land and sea and in the air, that has ever been assembled, and railroad men will be particularly interested in the exhibits made by the different railway companies and by the railway supply and equipment houses.

The Palace of Transportation is one of the main group of exposition buildings surrounding the Court of Honor on one side and the Court of Abundance on the other. The building is of frame construction 617 ft. by 574 ft. 6 in. in size and contains 174,323 sq. ft. of exhibit space. The clear height in the main part of the building is 40 ft. and the center of the building consists of a dome 82 ft. in diameter, with a clear height of 87 ft. 5½ in.

Immediately under this dome and so situated that it is visible to the spectator from any portion of the building, is a 65-ft. steel deck turntable bearing a 4,000 h. p. articulated Westinghouse electric locomotive constructed for use in the Pennsylvania tunnels under the Hudson river and actually operated in this service for several years. The turntable is rotated by an electric motor driving through a series of reducing gears by means of rack and pinion and makes a complete revolution each minute. As the locomotive alone weighs 150 tons, a special foundation was provided for the turntable. The deck of the turntable is 12 ft. above the main floor of the building.

In the northwest quarter of the building, which is the part devoted to railroad exhibits, 14 standard-gage railroad tracks have been constructed of an aggregate length of 3,348 ft. The four tracks nearest the north wall of the building, 963 ft. in length, are built to carry a load of 5,000 lb. per lineal foot and the remaining ten tracks, 2,385 ft. in length, are constructed for a load of 12,000 lb. per lineal foot. All these tracks are carried on pile foundations and are connected with the Exposition railway system, which in turn connects with the State Belt railroad through which cars are interchanged with the various transcontinental roads. A transfer table has been installed for use in placing the various exhibits.

On track No. 1, immediately inside the main north entrance, are located the following cars of the Southern Pacific: A single-sheathed, steel frame automobile car of 80,000-lb. capacity, 44 ft. long, equipped with the latest type of end doors; a 100,000-lb. capacity double-sheathed steel frame box car; a single-sheathed box car of the same capacity and type, and an 80,000-lb. capacity Pullman stock car.

Track No. 2 carries the exhibit of the McCloud River Railroad Company, consisting of a complete logging train as used by that company on its lines in Northern California. The locomotive, which is of the type built specially for this road by the Baldwin Works, carries 90 tons on small drivers and weighs 120 tons in working order. Next to the engine is a flat car loaded with six white and sugar pine logs, 32 ft. long and containing an aggregate of 12,466 ft. of finished lumber. The second flat car carries 6 logs 16 ft. long containing an aggregate of 10,294 ft. of lumber. The next car is a box car containing rough lumber and the last car in the train is a caboose finished in white pine left in the natural shades. The entire train, with the exception of the locomotive, was built in the railroad company's shops, and by walking its length one may view the logs as they come from the woods, the rough lumber as it leaves the mill and the finished product, as it is used in the constructive arts.

The west end of tracks Nos. 3 and 4 carry the exhibits of the German-American Car Company, consisting of a cork insulated tank car especially designed for wine and mineral water; an acid tank car; a tank car for petroleum products, cotton oil, molasses, etc., and a tank car for vinegar, cider, wine, etc. On the east end of track No. 3 is located the latest type of refrigerator car used by the Pacific Refrigerator Express and a standard Southern Pacific steel postal car in which will be demonstrated the handling and sorting of mail as it is carried on in daily service on the various railroads. The east end of Track No. 4 is occupied by a new type of wine tank car built and used by the California Despatch Line. This car resembles a box car, but contains 6 redwood tanks of approximately 1,000 gal. capacity each.

American Locomotive Company

On tracks 11, 12, 13 and 14 the American Locomotive Company has four engines on display, and as these will probably be of especial interest to mechanical department officers and employees visiting the exposition some of their dimensions, etc., are here given. There are two tank locomotives, one of the 36 in. gage and one of 4 ft. 8½ in. gage. The dimensions of the standard gage engine are as follows:

Loaded weight	89,000 lb.
Wheel base, driving (also total of engine)	7 ft.
Diameter of cylinders	16 in.
Stroke of piston	24 in.
Type of valves	Slide
Outside diameter of driving wheels	46 in.
Driving wheel journals	8½ in. by 9 in.
Type of boiler	Straight top
Working pressure	165 lb.
Total heating surface	933 sq. ft.
Water capacity	1,300 gal.
Fuel capacity	2,500 lb.
Maximum tractive effort	18,710 lb.

The dimensions of the 36-in. gage engine are:

Loaded weight	37,000 lb.
Wheel base, driving (also total of engine)	4 ft. 9 in.
Diameter of cylinder	10 in.
Stroke of piston	16 in.
Type of valves	Slide
Outside diameter of driving wheels	30 in.
Driving wheel journals	5 in. by 6 in.
Type of boiler	Straight top
Working pressure	165 lb.
Total heating surface	408 sq. ft.
Water capacity	700 gal.
Fuel capacity	600 lb.
Maximum tractive effort	7,480 lb.

These engines have been displayed as the best type, as reflected by actual experience for contractors, quarry, mine and industrial plant service. To illustrate the best types of engines used in logging and freight service two Mikado locomotives are shown. The logging engine is one of the usual kind employed in various parts of the United States, but the freight engine was especially constructed for the Pekin-Kalgan Railway in China. The comparative dimensions are as follows:

	Logging engine	Freight engine
Loaded weights—		
On driving wheels	144,500 lb.	138,500 lb.
On leading wheels	16,500 lb.	17,500 lb.
On trailing wheels	29,000 lb.	30,000 lb.
Total of engine	190,000 lb.	186,000 lb.
Tender	100,300 lb.	110,400 lb.
Wheel base—		
Driving	13 ft. 6 in.	14 ft. 3 in.
Total of engine	29 ft. 6 in.	30 ft. 9 in.
Total of engine and tender	56 ft. 3¾ in.	57 ft. 11¾ in.
Cylinders—		
Diameter	20 in.	20 in.
Stroke of piston	28 in.	28 in.
Type of valves	Slide	Piston
Wheels—		
Outside diameter of driving wheels	48 in.	50 in.
Diameter of engine truck wheels	30 in.	30 in.
Diameter of trailing truck wheels	33 in.	36 in.
Diameter of tender wheels	33 in.	33 in.

	Logging engine	Freight engine
Boiler—		
Type	Straight	Straight
Working pressure	180 lb.	180 lb.
Total heating surface	3,092 sq. ft.	1,834 sq. ft.
Superheating surface	.....	358 sq. ft.
Tender capacity—		
Water	5,000 gal.	5,000 gal.
Coal	18,000 lb.	18,000 lb.
Maximum tractive power	37,500 lb.	34,300 lb.

BALDWIN LOCOMOTIVE WORKS

The Baldwin Locomotive Works display on tracks Nos. 5 and 6 is of interest to the railroad visitor as showing the best practice in locomotive building as adapted for different parts of the country and for different classes of service.

On the west end of track No. 5 is shown San Pedro, Los Angeles & Salt Lake engine No. 3708. This engine is of the Mikado type and was built for use in heavy freight service and in some classes of passenger service over heavy grades and on moderate speed schedules. The particular engine displayed is for use in passenger service and has driving wheels 63 in. in diameter and a tractive force of 51,000 lb. This engine has a special trailing truck designed so that the truck frame acts as the rear equalizer. Ragonnet power-reverse mechanism is used and the engine is equipped with a Vanderbilt type tender.

On this track is also located Atchison, Topeka & Santa Fe Pacific locomotive No. 3600. This is a single expansion engine using superheated steam and developing a tractive effort of 41,000 lb. The Baker valve motion and the Ragonnet power-reverse with a mechanical locking device are used. The rear truck is of the Rushton type with outside journals. Oil fuel is used in the service for which this engine is intended, which is transcontinental passenger service on the Pacific Coast Lines.

Chicago, Burlington & Quincy engine No. 6110 stands opposite the 3600 on track No. 6, and is an excellent illustration of the latest type of coal burning engine fitted with a Street mechanical stoker superheater, brick arch and combustion chamber. It has the 2-10-2 wheel arrangement and exerts 71,500 lb. tractive effort in heavy road service. It has been standard on the Burlington since 1912.

The Southern Pacific Mikado No. 3270, which is also shown on track No. 6, has as a special feature a vestibule connection on the rear end and a Hodges pattern trailing truck. In other respects it is similar to the other Mikados shown in this exhibit. The third engine on this track is a Mikado especially designed by the Baldwin people for logging service and bears their number 41710. It exerts a tractive effort of 27,000 lb. and will work on curves of 30 deg. The trucks are of the radial type, the front truck being center bearing and the rear truck side bearing; these trucks are equalized with the driving wheels so that each finds a bearing and carries its load in passing over uneven track.

On tracks Nos. 8 and 9 are shown the "Giant" and "Pigmy" of the locomotive world. These engines are displayed by the Southern Pacific and demonstrate the progress of locomotive building during the past 50 years. The "Collis P. Huntington," which is the pigmy of the exhibit, was operated over the lines of the Central Pacific during the early sixties, and the giant is a Mallet compound of the class that is being operated over this same stretch of track today.

The "Collis P. Huntington" is one of six engines purchased by the Central Pacific when its line was first put into operation. These were shipped "around the Horn" and arrived in San Francisco March 19, 1864, and were shipped to Sacramento by river boat. Of the six, the "Huntington" and the "Leland Stanford" are the only ones still in existence, the latter now being on exhibition in the museum of the Leland Stanford Junior University at Palo Alto, Cal. These engines are carried on two driving wheels 54 in. in. in diameter, and the weight on the drivers is 18,500 lb., the total weight being 39,000 lb. The total wheel base is 21 ft. 2 in. and the heating surface of firebox and flues 419 sq. ft. Compared with these dimensions are the following proportions of the Mallet, which is really two engines in one as it has two separate sets of cylinders, two sets of drivers, etc. This engine has an over-all length of 68 ft., exclusive of tender, a wheel base of 56 ft. 7 in. and a total heating surface of 6,786 sq. ft. It carries 395,300 lb. on the drivers, and has a total weight of 437,100 lb. when loaded. The "Collis P. Huntington" is mounted on a track composed of steel rails on redwood ties which rest on 30 in. of rock ballast. This track is protected with automatic block signals, so mounted that their operation can be fully observed by and explained to the interested visitor.

An exhibit of unusual merit is being made by the Southern Pacific in its engine No. 1457, which is also located on track No. 9 This engine has the coverings of its working parts "cut away" so that their operation can be seen as the machinery is electrically operated. Some of the parts cut away are the smoke arch about to the top of the cylinder saddle to give a view of the steam pipes, petticoat pipes and the front end arrangement, and through the steam chest, valve and a portion of the cylinder, 3 in. off center, to show the piston and valve action. There is a second cut through the center line of the dome, throttle valve and standpipe, and through the third course of the boiler, the shell plate being removed down to the throat sheet flange, giving a clear view of the water tubes, the staying on the water-leg and on the top.

This engine is of the eight-wheel model, with 73 in. drivers and cylinders 20 in. by 24 in. It carries 92,000 lb. on the drivers. The sectional work was done in the Sacramento locomotive shops of the Southern Pacific under the direction of the motive power department officers.

THE PENNSYLVANIA EXHIBIT

The exhibit of the Pennsylvania Railroad is the first one to be seen by the visitor as he enters the railroad exhibits from the center of the building. Immediately in the rear of the Westinghouse display the Pennsylvania has placed two standard all-steel passenger coaches in which will be displayed moving pictures of various trips that may be made over the Pennsylvania. These cars were built in the Altoona shops, and were run to San Francisco as a part of a regular passenger train. Upon arrival at the exposition, one side of each of the coaches was removed and the cars placed side by side on standard gage tracks with flooring and roofing connecting the open sides. At the close of the exposition these cars will be restored to normal condition and placed in regular service on the Pennsylvania.

In the rear of the cars will be displayed relief maps showing the territory traversed by the system, one of the city of Greater New York and models of the terminals in New York City and Washington, the proposed terminal in Chicago and Hell Gate bridge. The relief map of the Pennsylvania System is 26 ft. by 42 ft. and is said to be the largest relief map that has ever been constructed. It shows the country between the Atlantic ocean and the Mississippi river and from Chesapeake bay to Quebec. The model of Greater New York is 26 ft. square, and is said to be the second largest relief map ever constructed. All the large buildings, parks and places of interest are shown.

The entire Pennsylvania exhibit is surrounded by signal masts, such as are standard on their lines, and the iron railing is similar to that used around stations, etc. The furniture is of the standard used in the general offices of the company, and it is planned to place everything used in the exhibit, with the exception of the maps and models (which will probably be used for advertising service) in regular railroad service at the close of the exposition.

OVERFAIR RAILWAY SYSTEM

In order to facilitate travel between points within the exposition grounds there has been constructed a railroad known as the "Overfair Railway System," which in itself is a part of the transportation exhibit. This road is of 19 in. gage and is of 20-lb. rail laid on redwood ties in rock ballast. Besides the two terminals there are three intermediate stations on the line which is three miles long, including a one-half mile branch. Fifteen miles per hour will be the average speed over the line, which will be covered in from 10 to 15 minutes.

Trains will consist of an engine and 10 cars. The engine is of the Pacific type, 5.5 ft. tall and 25 ft. long, including tender,

will burn coal and will have cab of such size that the engineer and fireman can remain inside when the train is running. Its weight in running order is 12 tons. The passenger coaches are 42 in. wide and 20 ft. long. They will accommodate 16 persons, and are equipped with Pullman trucks, Westinghouse air brakes and Sharon couplers. During the construction of the road a work train was used consisting of flat and box cars and a switching engine. All the equipment was built at Oakland, Cal., by Louis M. MacDermot, who will be in charge of its operation.

OTHER EXHIBITS

The railways have many other exhibits scattered throughout the grounds, and there are many displays in the other exhibit palaces that will especially interest railroad men. The Santa Fe has a six-acre reproduction of the Grand Canyon of Arizona, and the Union Pacific has a four-acre replica of the Yellowstone Park and a full size reproduction of Old Faithful Inn. The Southern Pacific has its own building inside of the exposition grounds where tickets will be sold, information given and moving pictures of the system shown.

TRAIN ACCIDENTS IN JANUARY[1]

The following is a list of the most notable train accidents that occurred on railways of the United States in the month of January, 1915:

Collisions

Date.	Road.	Place.	Kind of Accident.	Kind of train.	Kil'd.	Inj'd.
*2.	N. Y. C. & St. L.. } Erie ..... }	Blasdell, N. Y.	xc	F. & F.	0	3

The trains in collision at Blasdell, N. Y., on the 2d, were an eastbound freight of the New York, Chicago & St. Louis and an eastbound freight of the Erie. The first mentioned ran past a signal indicating stop, and into the other, at the crossing of the two roads. Seventeen loaded cars were destroyed by fire, which started from an overturned stove in the telegraph office, which was knocked down by one of the derailed cars. Three trainmen were injured, one seriously.

The trains in collision at Sizerville, Pa., on the 30th were a southbound freight and a switching engine. Both engines were badly damaged and 15 cars were thrown off the track. One trainman was killed and two were injured.

The train derailed at Olathe, Kan., on the night of the third was freight No. 135, engine 1292. The engine was overturned and five cars were wrecked. The engineman and a brakeman on the engine, and two men riding in a car as custodians of livestock were killed. The derailment was due to a misplaced facing point switch, evidently turned, maliciously, after the train had passed the last automatic block signal.

The train derailed at Emmons, Minn., on the fourth, was a southbound passenger, and two passenger cars were badly damaged. Nine passengers and four trainmen were injured. The cause of the derailment was a loose switch, the bolts holding the switch rail having been cut off by a brake rod of the baggage car, which became loose and was dragged along the track.

The train derailed at Perryville, Md., on the 12th was northbound passenger No. 64. The locomotive was overturned and the engineman was killed. The fireman jumped off and was injured. The derailment was caused by a car door, lying on the track, which had fallen from a southbound freight.

The train derailed near Runnells, Ia., on the 15th, was a northbound passenger No. 1, and two sleeping cars fell down a bank. One passenger was killed and 13 were injured.

The train derailed at Deland, Fla., on the 16th, was northbound passenger No. 92, and the engine was overturned. The fireman was injured. The train, while running about 35 miles an hour, struck a cow on the track and the body of the animal was thrown against a switch stand in such a way as to allow the engine to split the switch.

The train derailed at Osgood, N. C., on the 19th, was southbound passenger No. 3. The engine was overturned. Three of the 11 cars in the train went off the rails. The engineman was killed and the fireman and one trainman were injured. The derailment occurred at a switch, and it is believed that the rails had been maliciously misplaced or loosened.

The train derailed near Warrenton, Va., on the night of the 20th, was westbound passenger No. 331. The baggage car took fire and was destroyed. Three passengers and two trainmen were slightly injured. The cause of the derailment was a broken rail.

The train derailed near Clarement, N. C.,, on the 22nd, was passenger No. 15, and two passenger cars were ditched. Seven passengers were injured, none seriously. The derailment was due to a broken rail.

The train derailed at Glen Eyrie, Pa., on the 23rd, was a westbound freight, and the locomotive was overturned and fell down a bank to the Lackawaxen river. The engineman, fireman and one brakeman were killed. The train was moving on a passing siding and went over an open derail.

The train derailed near Wilmington, Ill., on the night of the 25th, was westbound passenger No. 5, and three cars were overturned. No injuries reported. The train, running at 45 miles an hour, was thrown off the track by a broken rail.

The train derailed near Bridgeville, Pa., on the 27th, was an eastbound local passenger. The engine was overturned, causing the death of the engineman and slight injury of the fireman. The tender was the first vehicle to leave the rails.

The train derailed near Pembine, Wis., on the 28th, was a southbound express passenger and three sleeping cars fell down a bank.

The train derailed on the Chicago, Milwaukee & St. Paul, near Oakwood, Wis., on the 30th, was a northbound express passenger, and the engine and first three cars were overturned. Six passengers were injured. The cause of the derailment was a broken wheel.

The train derailed at Callahan, Fla., on the 30th, was southbound passenger No. 85. Fifteen passengers were injured, but none very seriously.

[1]Abbreviations and marks used in Accident List:
rc, Rear collision——bc, butting collision——xc, Other collisions——b, Broken——d, Defective——unf, Unforeseen obstruction——unx, Unexplained——derail——Open derailing switch——ms, Misplaced switch——acc. obst., Accidental obstruction——malice, Malicious obstruction of track, etc. ——boiler, Explosion of locomotive on road——fire, Cars burned while running——P. or Pass., Passenger train——F. or Ft., Freight train (including empty engines, work trains, etc.)——Asterisk, Wreck wholly or partly destroyed by fire——Dagger, One or more passengers killed.

NEW RUSSIAN RAILWAY.—It is reported that the Russian Government has decided to build immediately a railway from Petrosavodsk (north of Petrograd) to the Bay of Sorotsk, on the White Sea. The probable cost is $8,750,000.

THE LONDON "TUBES" AND AIR RAIDS.—Gates are now being placed at the top of the stairways at the various "tube" stations in London supposedly for the purpose of regulating the traffic in the event of an air raid and a sudden rush for safety to the Underground. The employees have already received full instructions as to what they shall do in cases of emergency, and a system of private telephones has been installed communicating with all the departments concerned.

Appraisal of the Pere Marquette Lines in Michigan

Abstract of a Report to the Railroad Commission by M. E. Cooley, Based on a Careful Field Inventory

Prof. M. E. Cooley has recently completed an appraisal of the Pere Marquette lines in Michigan and submitted a report to the Michigan Railroad Commission. The following information is abstracted from the report:

The Pere Marquette embraces properties in Michigan, Ohio, Indiana, Illinois, Wisconsin and Canada, with 2,966.87 track miles in the system. The cost as found, to reproduce these properties as of July 1, 1914, is $96,962,771, and this cost less depreciation, $78,545,241.

In Michigan there are 1,823.88 miles of first main track, 59.87 miles of second main track, and 703.04 miles of side track. Outside of Michigan there are 251.83 miles of first main track, 0.55 miles of second main track, and 127.71 miles of side track. The reproduction cost new of road per mile (first and second main track), including equipment is $45,151 in Michigan, and $55,755 outside of Michigan. These costs less depreciation are $36,422 in Michigan and $46,512 outside of Michigan. For the entire system the cost per mile of road is $45,392, and this cost less depreciation, $36,770.

It will be of interest to compare the results of this appraisal with those obtained in the appraisals of 1900, 1902 and 1905. In the appraisal of 1900 the object was to determine whether it would be advisable to go from a specific to an ad valorem basis of taxation. Prices for materials and labor were taken as an average for 10 years (1890-1900) in order to cover periods of business depression and prosperity. The 1902 appraisal was for the purpose of fixing values as of a particular date, that of the assessment under the ad valorem tax law passed by the legislature of 1901. The 1905 appraisal was to determine the propriety of the values assessed that year by the state board of assessors. The 1900 appraisal was made under the direction of the state tax commission and the 1902 and 1905 appraisals under the direction of the attorney general.

In the earlier appraisals the properties known as the Detroit Union Railroad Depot & Station Company, and the Fort street Union Depot Company were valued separately and not included as Pere Marquette Railroad property. In the 1914 appraisal, 51 per cent of the latter company is included as Pere Marquette property, both real estate and other physical items. The value of tracks and other structures on the land owned by the Detroit Union Railroad Depot & Station Company is also included in the 1914 Pere Marquette appraisal; however, no value is included for the land, as it is all owned by the Detroit Union Railroad Depot & Station Company.

To make the 1914 appraisal comparable with the earlier appraisals the value assigned to each of these companies has been deducted from the total Pere Marquette value in Michigan. Cash and current assets, working capital, and stores and supplies have also been deducted. The comparisons are given in the following table, only Michigan properties being considered.

PERE MARQUETTE APPRAISALS OF DIFFERENT YEARS

Year	Main track miles	Cost of reproduction, new	Per cent condition	Cost of reproduction, less depreciation
1900	1,498.56	$36,543,130	78.70	$28,769,972
1902	1,732.69	43,520,470	79.96	34,798,973
1905	1,859.72	50,871,701*	83.35	42,403,309*
1914	1,883.75	79,851,210	80.58	64,349,449

*Does not include floating equipment, for which in 1902 the cost of reproduction was $1,412,000, and this cost less depreciation, $942,340.

Perhaps the most obvious reason for the marked increase in the 1914 appraisal over former appraisals is the greater care taken in making it. In 1900 the entire appraisal of all the railroads of Michigan, embracing a total of nearly 11,000 miles of track, was practically completed in 120 days. While more time was taken in the 1902 appraisal, the roads were not reinspected, and the appraisal of that date was based primarily on the 1900 appraisal. The same is true of the 1905 appraisal, except that the work was completed in about one month's time.

In the 1914 appraisal of the Pere Marquette system alone, embracing a total of nearly 3,000 miles of track, more than six months have been given to the work, with a force larger even than that used in 1900. Ten parties of three men each were engaged three months on track inspection, and six parties of three men each four months on earth work. Each of these parties was in charge of an experienced railroad engineer, his instructions being to do the work with such care as would enable him to testify in court as to its correctness. The same care has been used in collecting the data on mechanical and marine equipment, and in the land department work.

While there has been some increase in track mileage it alone answers for only a relatively small part of the total increase in value.

MILEAGE IN MICHIGAN

Year	1st Main track	2nd Main track	Side track	Total track
1914	1,823.88	59.87	703.04	2,586.79
1900	1,647.86	2.00	701.47	2,351.33
Increase	176.02	57.87	1.57	235.46

Among the things which have increased the value of the properties are many additions and betterments. Hundreds of old wooden bridges have been replaced by modern steel-concrete bridges; hundreds of miles of main line track have been relaid with 75, 80 and 90-lb. rail, taking the place of 56 and 70-lb. rail used in 1900, 1902 and 1905; automatic block signals have been installed on a part of the system; large additions to facilities for doing business have been built, as well as many hundreds of new buildings, including coaling stations of modern type and the new shops at Wyoming. These improvements represent in the aggregate very large sums.

The mechanical and marine equipments have been largely increased. The locomotives, for instance, while increased only a few in number are much more powerful. Due to their increased tractive power, the 468 locomotives of 1913 are equal to 592 locomotives of the average capacity used in 1905. This is equivalent to an increase of 141 locomotives, or 31.26 per cent. Expressed in dollars the comparison between the locomotives of 1905 and 1914 is as follows:

COMPARISON OF LOCOMOTIVES IN 1914 AND 1905

Year	Cost of reproduction, new	Cost of repro duction, less depreciation	Average cost per 1,000 lb. tractive power: Cost of reproduction, new	Average cost per 1,000 lb. tractive power: Cost of reproduction, less depreciation
1914	$5,440,092	$3,908,815	$440	$315
1905	3,724,782	2,856,703	393	301
Increase	$1,715,310	$1,052,112	$47	$14
Per cent increase	46.05	36.83	11.96	4.65

The investigation of land has been very complete and thorough, as the recent decision of the United States Supreme Court in the Minnesota Rate Cases seemed to make unusual care necessary. Since 1905 the value of Pere Marquette real estate in Michigan has increased nearly $5,000,000.

RIGHT OF WAY VALUES

Year	Cost of reproduction, new	Cost of reproduction, less depreciation
1900	$3,563,521	$3,563,521
1902	4,570,436	4,570,436
1905	4,570,436	4,570,436
1914	9,536,271	9,536,271
Increase since 1905	$4,965,835	$4,965,835

Perhaps the most conspicuous example of difference between the 1914 appraisal and former appraisals in the value of the road

will be found in the grading. As a basis for computing earthwork in 1914 actual measurements were made in the field, while the former appraisals approximate data had to be used. The company had no records of the amount of earth actually moved. The earlier appraisals were therefore based on profile estimates for a part of the lines, and for other parts on field estimates made by an engineer going over the road at the rate of 12 or 15 miles a day, estimating mile by mile without measurement. This year the field parties cross-sectioned all earthwork at frequent intervals. It is interesting to note that on such sections of the road as it was possible to check with the original quantities it was found that the 1914 estimates were within 2 or 3 per cent of the actual quantities paid for.

The grading in the different appraisals for Michigan property only is given in the accompanying table. Since 1905 the value of the grading has increased nearly $6,000,000.

Grading Values—Lines in Michigan

Year	Cost of reproduction, new	Cost of reproduction, less depreciation
1909	$3,537,836	$3,537,836
1902	4,216,612	4,216,612
1905	4,300,944	4,300,944
1914	10,251,354	10,251,354
Increase since 1905	$5,950,410	$5,950,410

Note: Nothing has been added to cover up appreciation, due to solidification and surface improvement.

There are in the main tracks of the Pere Marquette in Michigan today 5,733,600 ties, and in side tracks 1,806,300, or a total of 7,539,900 on all tracks in Michigan. A comparison of their value in the different appraisals is given in the accompanying table. The increase in the cost since 1905 is about $2,500,000, and in cost less depreciation, $1,500,000.

Tie Values

Year	Cost of reproduction, new	Cost of reproduction, less depreciation
1900	$2,492,248	$1,381,331
1902	2,459,722	1,329,436
1905	2,828,680	1,528,851
1914	5,392,598	3,022,979
Increase since 1905	$2,563,918	$1,494,128

During the last 10 years all railroads have been laying heavier rails. This increase has amounted to from 20 to 40 lb. per yard. As the new and heavier rails has been laid on the main lines the rail taken up has been placed on the branch lines and side tracks. This means that a general increase of about 30 per cent in the weight of rail has been made on all classes of tracks. The Pere Marquette has been making such changes until at the present time the main line from Detroit to Chicago, except about 50 miles, is entirely laid with 90-lb. rail where formerly the weight varied from 60 to 70 lb., and the latter rails are now doing service on secondary main lines or on branches. At the present time there are 268,846 tons of rails on the Pere Marquette in Michigan, an increase of approximately 50,000 tons since the 1905 appraisal.

The increase in tonnage of rails, together with the higher prices, represent an increase in cost of approximately $2,000,000 since 1905.

Rail Values

Year	Cost of reproduction, new	Cost of reproduction, less depreciation
1900	$5,831,764	$4,181,001
1902	6,067,464	4,361,823
1905	6,168,588	4,434,520
1914	8,198,132	6,158,913
Increase since 1905	$2,029,544	$1,724,393

Even more conspicuous than the grading schedule is the equipment schedule in which the increase in cost since 1905 is nearly $7,000,000. The locomotives account for nearly $760,000, freight train cars, nearly $3,200,000, passenger train cars $550,000, and floating equipment, $2,380,000. It should be noted, however, that in the 1905 appraisal no schedule of floating equipment appeared. For the different appraisals a comparison of the equipment values is given in the accompanying table.

Summarized these five principal increases since 1905 amount to $22,443,445 in the cost of reproduction and $16,300,780 in this cost less depreciation.

Important items in the 1914 results are the increases in the costs of materials and labor. The general effect of these increases is so well known as to require no particular explanation. Another item is that in the earlier appraisals the cost of transporting construction materials to the places of their use was not included, or at least not in any adequate amount. In the 1914

Equipment Values

Year	Cost of reproduction, new	Cost of reproduction, less depreciation
1900	$7,798,021	$5,166,432
1902	10,681,551	7,394,983
1905	14,147,357	11,308,344
1914	21,081,095	13,474,358
Increase since 1905	$6,933,738	$2,166,014

appraisal, these costs were made the subject of special investigation, and found to be far greater than any allowance made for them in former appraisals. Likewise, as the result of special investigation, it was found that the actual costs of many items as shown on the books of the company included only a part of the expense; for instance, the cost of concrete in bridge abutments was shown at only the contractor's figures, which did not include transportation of materials, sheet piling if required, or unwatering, nor did it include the transportation of men, and many other things which it has been customary for railroads to do in connection with building operations. That is to say, railroads have in the past charged to operation many items which properly were chargeable to construction.

In a number of important railroad appraisals in other states 10 per cent has been added to the grading schedule to cover appreciation due to solidification and improvement of surface due to sinking of ballast. Nothing has been added in this appraisal. If done it would add $1,025,135 to both the cost of reproduction and to this cost less depreciation.

Not all of the properties of the Pere Marquette, however, show marked increases in the 1914 appraisal. Some of the branch lines stand but little above the figures of the earlier appraisals.

In some instances the properties are not being maintained at former values. For example, the docks and wharves in 1905 were appraised at a cost of reproduction of $335,040, this cost less depreciation being $246,336. In the 1914 appraisal the corresponding figures are $219,949 and $148,876 respectively.

In view of the general impression that the Pere Marquette Railroad is in poor condition the following table has been prepared in which the per cent condition is given for a number of the principal physical elements. A comparison is made with the average condition found for the same elements in the 1900 appraisal for the Pere Marquette Railroad system and also for the Michigan railroads in 1900. In general it will be found that they are higher.

Percentage That Present Value Bears to Cost of Reproduction for Characteristic Physical Elements

Account	All Michigan railroads, 1900	Pere Marquette,* 1900	Pere Marquette, 1914
Bridges, trestles and culverts	78.96	77.61	84.75
Ties	55.20	55.42	56.06
Rails	76.18	71.68	75.13
Station and office buildings	75.72	72.35	70.21**
Shops and enginehouses	68.03	65.35	76.53
Steam locomotives	56.44	61.89	72.41
Passenger train cars	71.22	68.72	71.01
Freight train cars	69.37	68.61	60.81

*Obtained by combining the cost of reproduction and the present values, respectively, of the various lines constituting the Pere Marquette System.
**Includes roadway buildings.

Attention should also be called to the so-called overhead charges. In general they are less in the 1914 appraisal than in former appraisals, due primarily to the fact that the greater amount of time available in 1914 made it possible to make more complete inventories, to work up unit costs more carefully, and to make investigations fixing more accurately a number of the individual percentages. In general the overhead charges in the 1914 appraisal aggregate about 15.4 per cent on the entire property, as against 18.4 per cent in former appraisals.

WIRELESS TELEGRAPH ON THE LACKAWANNA*

By L. B. Foley

Superintendent of Telegraph, Delaware, Lackawanna & Western

The Lackawanna first made experiments with wireless in 1909. During the early part of 1913 towers were erected at Scranton and Binghamton. On November 28, 1913, train orders were transmitted between the two points and messages were first transmitted to and from trains and fixed stations at Scranton and Binghamton three days later.

We now have stations equipped with Marconi apparatus as follows:

	Call.	Wave Length Meters.	Height of Tower. Feet.	Capacity of Station. Kilowatts.
Hoboken	WBU	3,000	402	5
Scranton	WPT	3,000	175	2
Binghamton	WBT	1,800	165	2
Buffalo	WBS	1,600	150	2
Limited, Train No. 3	WHT	600		1
Limited, Train No. 6	WBG	600		1

The wireless apparatus on the train is similar to that at the fixed stations. The motor generator, operated on 30 volts direct current from the car-lighting generator, draws about 40 amperes, and provides 500 cycle alternating current at 250 volts for the radio transmitter. The antenna current is about 35 amperes.

We can communicate from a moving train to a fixed station 130 miles away, but are able to receive messages on the train from a fixed station 200 miles distant. The aerial on the train is a phosphor bronze wire arranged in rectangles, one running lengthwise above the roof of each of four cars, with an additional wire lengthwise. These wires are parallel with the top of the car, and 18 in. above it, each rectangle being carried on porcelain insulators at the corners and center of each car, with wire link connections between the cars. The lead is taken from the middle of the antenna through the side of the car near the roof into a compartment two by four feet, which contains the apparatus and the operator.

After the first trip it was found that there was no interference with signals. The speed of the train, or its change of direction, has no effect on the transmission or reception of messages, and communication to and from the train is not retarded while the train is passing through tunnels.

The train radio service has been used for such purposes as reporting the number of passengers on board destined to connecting lines, providing additional cars, or cutting out cars at division points, or ordering an ambulance for persons taken ill on the train. Commercial telegrams are sent for passengers. The wireless telegraph serves as an auxiliary means of communication in the event of interruption to wire facilities, and has already proved its practicability and efficiency under such conditions. The wireless office at each division point is located near the despatcher's office, and in case of total wire failure the wireless is resorted to immediately for communication between the stations named above.

The cost of installation is not prohibitory, considering the advantages to be gained in having a means of communication which can be relied upon when all other sources fail. In 1914 we had a storm in March that completely wrecked pole lines in New York, New Jersey and Pennsylvania, and the only communication we had for 10 days was the wireless. Again, early in December, there was a severe ice storm, and there was absolutely no wire communication in this territory for three days. We had to depend on the wireless, and obtained entirely satisfactory results.

That we are obliged to carry an operator on each train equipped with wireless has led us to take up the wireless telephone. We have obtained some favorable results, having talked from a fixed station to a moving train a distance of 53 miles. The wireless telephone requires 110 volts, and we were obliged to install a 5-h.p. steam turbine in the baggage car, taking steam from the locomotive. In the front end of the car, next to the baggage car, is a small compartment for the apparatus and attendant. The transmitter resembles the quench spark wireless telegraph, and requires no attention after being set to the desired wave length. When adjustments are made to the required degree for receiving in tune with a particular station wave length, no other station can pick up. We have made a number of trips with our installation and have transmitted the voice from trains to fixed stations 15 to 25 miles distant. The wireless telephone is being developed slowly but surely.

Discussion. The paper was discussed by several members. It was the general opinion that the wireless was a useful auxiliary as an insurance against total loss of means of communication when the pole lines were crippled by a severe storm. As such storms occur so seldom, it was doubted, however, whether the use to be obtained from the wireless was sufficient to make the expenditure for it worth while. Several speakers expressed the view that there was little or no advantage in using a wireless telegraph for train despatching except when the wire lines were crippled; and it was conceded that the wireless telephone had not yet reached a practicable stage.

*Abstract of a paper read before the New York Railroad Club on February 19.

THE RUSSIAN BATH TRAINS

Soon after the outbreak of the war the Russian Imperial Ministry of Ways of Communication, formed a committee to superintend the distribution of a fund subscribed by the railway officers and employees for aid to the sick and wounded. The Russian peasant is accustomed to take his vapor bath every Saturday, and the absence of this comfort was keenly felt. One of the achievements of the committee has been to equip a number of bath-trains for the soldiers at the front.

Each of the three trains which have thus far been despatched to Poland is composed of over 20 cars, including four bath cars, subsidiary cars for disinfecting garments and ridding them of vermin, a refreshment car and cars containing supplies of clean linen. In the bathing car it was necessary to provide baths for the greatest possible number at the smallest expenditure of water, for often there is difficulty in getting a supply of water at all. A combined shower-bath and vapor system has been used, the equipment being simple, inexpensive, and economical in time and water, and offering the least danger of infection. The bath car is a large Pullman car divided into two compartments. The larger of these contains 21 shower baths, disposed along the walls, and a number of wooden benches. The smaller compartment forms the vapor bathroom and is provided with three shower baths; fixed to the walls are wide shelves on which the soldiers lie. The car accommodates 24 soldiers at a time and the whole set of four cars a total of 96. The walls are double-panelled and insulated by a layer of felt so that the temperature may be maintained at 69 deg. C. The floor, the ceiling and the upper part of the walls are lined with linoleum, and the lower part of the walls with zinc panels. The water drains off through a sink in the body of the car. The bath cars are connected at one end by means of gangway bellows with two cars where the men undress, and at the other with two others where clean linen and the disinfected overclothes are put on. Each of these cars accommodates 48 men and the walls and flooring are identical with those in the bathing cars.

The cars for disinfecting clothes and getting rid of the vermin form an essential part of the train. Superheated vapor and formalin are used for disinfectants. The disinfection car is divided into three parts, these being, respectively, a room for cast-off clothes, the disinfecting chamber proper and a space where clean clothes are dried. As the car is not sufficiently large to provide for all the bathers, and since the clothes are turned out in a wet condition and require some time to dry, only such clothing as is infected passes through the car, the rest being merely sent to the chamber where the vermin is destroyed.

The next car is a tea room, which is fitted with tables and benches and can accommodate from 80 to 96 men at a time. The dining car is composed of two sections, the first forming the dining room proper for the staff of the train and the second

the kitchen. The officers of the staff are lodged in a special compartment car and the rest of the crew in a third class car.

There are also two more cars; one fitted with closets and chests containing a supply of clean linen and the other carrying the soiled linen, which is deposited at one of the laundries which the committee has established at various places. The train itself and the hot water used in the baths are heated by a superannuated eight-wheel locomotive.

About 2,000 soldiers can be accommodated in the course of one working day of 18 hours. The soldiers are first sent to the undressing rooms where every man gets a ticket and two bags marked with the same number, one for his cast off linen and the other for his outside clothes; these are then carried, respectively, to the disinfection chamber and the soiled linen car. Each man has his hair cut by the barber, after which he proceeds to the bath car, where he is given some soap, a brush and a brass wash basin. When he returns to the dressing car he is supplied with clean linen and given his outside clothes, the latter having been mended if necessary. He is then sent on to the tea room and he is provided with hot tea, sugar, bread and tobacco. The equipment of one of these trains costs about $30,000. The total cost of operating it, including the supplying of the clean linen, is $46,000 a month.

We are indebted to the staff of the Russian Imperial Minister of Ways of Communication for the above information.

AN ENGLISH EXPERIMENT IN RAILROADING

As has several times been noted in these columns, the railways of Great Britain are now under government control and are being operated by a committee of general managers. The government has agreed to pay for the services rendered to it a sum sufficient to make the net revenues practically the same as before the war. The following comments on the way the plan is working out are taken from a letter from a London correspondent of the New York Times' Annalist:

What has been the effect of government control on the earnings of the railways and on the services given to the public? Concerning the former little can be said. The railways have been relieved from the obligation to publish full accounts, which, in view of the arrangement with the government, would be farcical. They have for the same reason ceased to publish the usual weekly returns of approximate gross earnings which formed some guide to the stock exchange of the intrinsic merits of their different stocks. In regard to the services to the public, reliable information is scarce. Freight cars have been rushed from the military bases to the ports, and the process of bringing them back empty has not been too well handled. This, however, may be due to dislocation of the ordinary trade channels, not to mismanagement.

Passenger services, except with the continent, have been maintained fully at the ordinary winter standard, restaurant and sleeping cars running as usual, as well as excursion trains. The only exceptions have been the services to Ireland, which have been reduced owing to the absence of suitable steamships, many of the usual vessels having been taken over as hospital ships or transports. Also certain suburban and underground services have been reduced in London, owing to the earlier hours kept by the inhabitants. On the other hand, some special holiday facilities, which usually end in September, were kept on till November because so many folk had postponed their holidays at the outbreak of war. It is anticipated that this summer the services will be extended as usual.

Efficiency of running trains has on the whole not been so good as in peace time, but it does not appear that this is due to state control. Occasionally, when another 40,000 troops or so, with big guns, ammunition, and impedimenta, go to France, or India, or Egypt, the ordinary traffic on certain sections may be held up. The actual embarkation of troops at Southampton and other ports has been performed with great efficiency. The trains usually come alongside the steamer, discharge their contents, and make room for a successor, in about 12 minutes. This is one of the few departments where the British have little to learn from other peoples; the process is so familiar, owing to the frequent movements of troops overseas in peace time, and the men in charge have three years' experience of the South African war to help them, so that muddle is rare. The melancholy reverse process of bringing back the special hospital trains of wounded is equally well done. There have, however, been rather more accidents than was to be expected since the war began. The cause of this seems to be shortage of labor. There are 600,000 railway men approximately in the country, of whom 70,000 are now with the colors. Enlistment from among them is now being discouraged, but even the places of the 70,000 have proved hard to fill. Thus boys and other untrained persons have often to be employed, with the results that inevitably follow the use of inefficient labor.

Replacement of freight and passenger cars does not appear to be going on as rapidly as usual. Shortage of labor is here the cause again, not economy, for from the shareholder's point of view economy in repairs paid for out of revenue is no advantage, because the government makes up the difference in net receipts, as already described. Moreover, some of the railway manufacturing centers (which are controlled by the railways themselves to a very large extent) have been transformed into armament works.

VACUUM PAINT SPRAYER

The paint sprayer shown in the accompanying illustration is operated by means of a vacuum created in the delivery pipe. The paint is contained in the can under atmospheric pressure, and is drawn up into and through the nozzle by means of air pressure passing over a series of holes in the nozzle. The quantity of paint is regulated by the air valve, as shown in the illustration, and the sprayer itself is controlled by a push valve which controls the flow of air. Air at the ordinary shop pressure may be used to operate this machine, and its construction is of such a simple nature that it may be used by unskilled labor. The only precaution necessary in using this machine is to be sure that it is thoroughly cleaned, after being used, either by turpentine or by benzine, in order that the atomizer may not become clogged with the paint, which would otherwise harden while the machine is idle. The sprayer is sold by the Gustin-Bacon Manufacturing Company, Kansas City, Mo.

Vacuum Paint Sprayer for Railroad Work

General News Department

The seventh annual convention of the American Railway Tool Foremen's Association will be held at the Hotel Sherman, Chicago, Ill., July 19 to 21, inclusive.

In the federal court at Savannah, Ga., February 17, fines for violation of the safety appliance laws were imposed on the Georgia Coast & Piedmont, and on the Savannah & Statesboro railroads.

The Senate Committee on appropriations does not approve the amount named by the House—$3,000,000—in the sundry civil bill for valuation of railroad property, and has changed the amount of $1,900,000.

The New York legislature is likely to repeal the "full-crew" law of that state. The Senate Republican caucus, which is understood to reflect the views of a large majority of the members of both houses has voted in favor of the Spring-Conkling bill, which would repeal the law. In New Jersey a resolution has been introduced to appoint a special committee of nine members to investigate the claims of the railroads in favor of repeal and of the brotherhoods against it.

"Swinging on" freight trains after they have been set in motion is discouraged by the Baltimore & Ohio in a circular recently issued to trainmen. They are urged to get aboard promptly and before starting, in order to minimize the danger of bodily injury as well as to facilitate operation. It is held that boarding trains promptly makes it possible to attain the maximum speed more quickly, while it also obviates the necessity of the engineman dividing his attention.

Under the direction of Surveyor General Frank S. Ingalls twelve more engineering parties have been placed in the field to survey the land grants which are owned by the Atchison, Topeka & Santa Fe in Arizona. These grants aggregate more than three million acres of land in Mojave, Yavapai, Coconino, Navajo and Apache counties. The survey work was started early in January, when twelve engineering parties took the field. This latest addition makes a total of 24 parties that are engaged in the work. It is expected that the surveys will be finished about June 15. The cost will be about $200,000, one-half of which will be borne by the railroad and the other by the government.

The air-brake tests made by the Pennsylvania on the West Jersey & Seashore last year have been made the subject of a pamphlet issued by the road, written in popular style and designed to give the laymen a general idea of the tests and their results. The pamphlet says that the electrically controlled air-brake, which applies on the whole of a long train within two seconds, has been adopted by the Pennsylvania as standard for passenger trains, and the company will equip all new passenger cars with it. Cars now in service will be equipped as rapidly as opportunity and available funds will permit. Most of the tests were made with a train of twelve steel passenger cars; and this train, going at sixty miles an hour, on level track, was stopped within its own length, or in about two-thirds the distance required by ordinary brake control. A single passenger car, without the engine, running at that speed, on level track, was stopped in 725 ft. The twelve car train, with its locomotive, running at eighty miles an hour, was stopped in 2,197 ft. The tests occupied the entire time of 45 men for three months and cost over $50,000. In the electrically controlled brake the emergency and the regular brake features are entirely separated one from the other, so that an emergency applicaton can be made, with full force, at any time.

The Pennsylvania Railroad in the 12 months of 1914 reported as killed 19 people, which are classed in the Interstate Commerce Commission's accident records as passengers, but which the company is anxious to have classified, as they justly should be, as persons who in most or all the cases were killed by their own negligence or want of caution. Six people were killed in falling, jumping or slipping from moving cars or trains; two, in attempting to get on moving trains; two, slipping off station platform in front of trains; two, standing too close to edge of station platform and being struck by trains; one, jumping off ferry boat; one throwing himself between cars of moving train; three, crossing tracks at stations in front of trains; one, struck by coach and thrown under train; one, assaulted by another passenger and thrown from train. Among the 301 trespassers killed on the Pennsylvania in 1914, there were persons from all walks of life; students, lawyers, painters, salesmen, miners, soldiers, stationary engineers, and others. The fruits of the Pennsylvania's aggressive campaign against trespassing during the past eight years are indicated in part by the following:

Year	Number killed	Year	Number killed
1907	572	1911	338
1908	475	1912	255
1909	410	1913	311
1910	336	1914	301

The railroad management proposes to redouble its efforts this year to reduce the practice of trespassing, and to this end it will seek the co-operation of all county, city and borough authorities.

Incendiary Fire

Forty-five freight cars of the Mobile & Ohio at Whistler, Ala., and at Prichard, a suburb of Mobile, were destroyed by fire on the morning of February 17. The fire was apparently of incendiary origin, as every car was found uncoupled so that the switch engines could not move them. While the fire at Whistler was at its height, the one at Prichard broke out. During the fire at the first named place, the hose that the railroad fire department was using was cut in two.

New Haven Officers' Western Observation Trip

A party of officers of the New York, New Haven & Hartford has recently returned from a trip of 3,950 miles over 15 western railroads, made at the direction of President Elliott, for the purpose of seeing what could be learned from the operation of other roads that would be helpful to the New Haven. The party consisted of J. M. Tomlinson, vice-president; David Van Alstyne, assistant to vice-president in charge of operation; C. L. Bardo, general manager; G. W. Wildin, mechanical superintendent; W. J. Backes, engineer, maintenance of way; R. D. Fitzmaurice, superintendent, Providence division; R. A. Weston, general storekeeper, and W. L. Spicer, special accountant.

This was the first trip of its kind ever made by officers of a New England railroad. Particular attention was paid to fuel accounting and fuel efficiency, and to the careful use of material. The trip consumed two weeks. Leaving New York via the Lehigh Valley, the party first went to Buffalo and thence by the Michigan Central to Detroit, where a day was spent in investigating the efficiency in the automobile industry. At Detroit the party also inspected the passenger station of the Michigan Central. In Chicago the party investigated some of the methods of the Illinois Central, the Chicago, Burlington & Quincy, the Atchison, Topeka & Santa Fe, the Chicago, Milwaukee & St. Paul, Chicago & North Western and Chicago, Rock Island & Pacific railroads; in St. Paul, the Northern Pacific and Great Northern were studied; in Omaha, the Union Pacific; in St. Louis, the Missouri Pacific, the Wabash and the St. Louis & San Francisco.

The plan followed was first to visit the accounting department and have explained the various reports and statistics sent out to the different operating officers, after which the various department heads visited the respective heads of similar departments of the roads visited to learn the manner in which these reports and statistics are applied to secure great efficiency. Shops, storehouses, fuel depots, stations and yards were inspected personally under the guidance of the officers of the roads. A short time was also spent at Kansas City, where the

new Union passenger station was inspected. Some of the members of the party also visited Springfield, Mo., where the shop methods and the scrap reclamation plant of the St. Louis & San Francisco were studied.

Proposed New Produce Terminals for Chicago

The Produce Terminal Corporation, a subsidiary of the Chicago Junction Railway, has prepared comprehensive plans for a large produce terminal to be located just west of the Union Stock Yards, Chicago, on the property of the Chicago Junction. The tentative plans provide for the handling of all incoming and outgoing fruit and produce, both L. C. L. shipments and carload lots. The main building is to be an eight-story storage plant centrally located, of which the first and second floors, respectively, will be devoted to the handling of outgoing and incoming L. C. L. freight, from which point it is to be distributed to the numerous rows of stores. This central building will have a capacity of 350 cars.

Team tracks are provided for freight in carload lots. These tracks will have a total combined capacity of approximately 500 cars, and are arranged in two separate locations. The proposed general produce freight yards will be located south of the team tracks and buildings and will have a capacity of 10,000 cars. A large dock house for handling water shipments is to be located at the east end of the yard and a central power station at the west end. The administration building is to be near Thirty-ninth street and facing Ashland avenue. According to plans the Chicago Junction, which connects directly with every trunk line entering Chicago, will serve the entire terminal. This arrangement, it is thought, will be much more convenient and economical than the present arrangement on South Water street, where the produce must all enter by two roads, and much of it must also be transported across the river. It is the present congestion on South Water street which has led the commission men to seek a new location.

It is planned that work on this project will be begun about March 15, 1915. The officers of the Produce Terminal Corporation are: President, J. A. Spoor, chairman of the board of the Union Stock Yard & Transit Company, and of the Chicago Junction Railway; vice-president, Arthur G. Leonard, president of the Union Stock Yard & Transit Company; secretary, Anderson Pace, formerly industrial commissioner of the Chicago Association of Commerce; treasurer, Halsey E. Poronto, vice-president, of the Union Stock Yard & Transit Company, and the Chicago Junction Railway. It is estimated that the total ultimate cost of the entire terminal, including land and buildings, will approximate $20,000,000.

The Atchison, Topeka & Santa Fe is also considering plans for a similar terminal to be located between Fourteenth and Twenty-second streets, and west of State street.

Proposed Railway Legislation

Committees of the Utah legislature have held several hearings on a proposed bill to create a public utilities commission for the state.

A bill has been introduced in the legislature of Missouri repealing the present law prescribing a passenger fare of two cents a mile and fixing the maximum at 2½ cents a mile.

A bill has been introduced in the Washington legislature, as a substitute for the train-crew law, to give the state public service commission power to regulate the number of train employees.

Senator Harris of the Illinois legislature has announced that he will introduce a bill providing for a referendum vote on the question of increasing the state passenger fare from 2 to 2½ cents a mile.

The lower House of Congress on Monday of this week refused to take up the bill to require separate accommodations for negroes on cars in the District of Columbia; and this action is understood to have killed the bill for the present session.

The Senate committee of the West Virginia legislature has made unfavorable reports both on the full-crew bill and the railway "experience" bill; but the bill to require high-power headlights was returned to the Senate with a report approving it.

A bill has been introduced in Congress this week to compel railroads to base interstate passenger fares on the rates charged for intrastate passengers; requiring them to make interstate rates not exceeding the combination of intrastate rates over the same route.

A bill before the legislature of Alabama proposes to reduce the rates charged by the railroads for excess baggage, the present rate of one-sixth the passenger fare being reduced to one-eighth the fare. There is a clause also requiring baggage to be stored free, at destination, for 48 hours.

The Michigan legislature has adopted resolutions calling on the state railroad commission to express to the legislature its views in the matter of proposed increases in passenger fares, and to inform the legislature as to the correctness of certain statistics placed before it by the railroads.

The bill before the legislature of South Carolina designed to limit the length of freight trains to fifty cars, which was noticed in the *Railway Age Gazette*, February 12 page 268, was killed in the Senate last week, following a discussion lasting several hours, by a vote of 24 to 15. The Merchants' Exchange of Charleston had presented a strong protest against the bill.

In West Virginia a newspaper published in the interest of colored citizens in the Norfolk & Western coal field, has protested against two bills now before the legislature, a "full-crew" bill, and a so-called "experience" bill; claiming that the enactment of such laws will lead to the displacement of porters on trains and be followed by reductions of wages of negro employees.

Operating officers of the railroads in Indiana appeared before a committee of the Indiana legislature last week at a hearing on the bill to prohibit the running of freight trains more than half a mile in length. They stated that if the bill became a law the railroad companies would be forced to spend millions of dollars in Indiana to provide for new locomotives and additional facilities.

The lower House of the Kansas legislature has passed a bill to authorize the Colorado, Kansas & Oklahoma Railroad, a 50-mile line running between Scott City and Winona, Kan., to charge passengers five cents a mile. The bill aroused a lively controversy in the House; but western Kansas representatives asserted that the railroad would have to go out of business if not allowed an increase in rates.

A bill in the Texas legislature, introduced by Senator Dawin, provides for placing all interurban railways under the regulative authority of the State Railroad Commission. Substantially all companies of this character in the state have appeared before the Senate committee and offered strong opposition to the proposed law, and the committee made an adverse report. There is, however, a minority who will bring the measure before the full Senate.

The legislature of North Carolina has before it a bill to require all railroad employees to pass an examination on signals, and other matters connected with their duties, a catechism of 223 questions. Hearings have been held by a joint committee of the Senate and the House. It is said that the purpose of the bill is to make it possible to tie the hands of the railroad companies in case of a strike of trainmen. Not only the railroad companies but some railroad employees have appeared in opposition to the bill.

The first railroad bill to be put to a vote in the house of the Missouri legislature is a bill to require railroads to construct car sheds at their various terminals. This bill escaped defeat on February 20, it is reported, only by a vote to lay the bill on the informal calendar. Immediately afterward the house refused to take up a headlight bill as a special order.

The Oregon legislature has under consideration a bill to change the manner of electing members of the State Railroad Commission. The members are now chosen from the state at large, but by the proposed law would be selected from different congressional districts. The bill has already passed the lower House. The present commission has the reputation of having been free from sectional prejudices or leanings, and its rulings have never been disapproved by the courts. Candidates from the eastern part of the state—the part which appears to feel that it has been neglected—are already appearing.

Three bills presented in the legislature of Connecticut call for a reduction in the price of mileage tickets from 2¼ cents a mile

to 2 cents; a reduction in the rates for all single tickets to two cents a mile and the reduction of all rates to 1½ cents a mile for passengers who have no baggage. The recent advance in rates for both tickets and mileage books made necessary, as everybody knows, by the increase in the cost of transportation, appears to have had no effect toward dampening the ardor of the legislator who introduced these bills; and the railroad company had to go through the usual process of appearing before the legislative committee and presenting the reasons why the proposed laws should not be enacted.

The Morris canal, extending from Jersey City, N. J., to Phillipsburg, 102 miles, and controlled by the Lehigh Valley Railroad, is the subject of a special message which has been sent to the legislature by the governor of New Jersey. This canal is no longer profitable and the railroad company for several years has been negotiating with the state, looking to the adoption of a plan for its abandonment. The governor suggests that the property be turned over to a state department and that the state develop it. The water rights should be retained by the state and all other property sold or leased. The income should be paid to the Lehigh Valley until 1974, after which date the property would belong absolutely to the state. The governor disapproves all of the bills on this subject which have been presented in the legislature. He would require the railroad company to pay the state $500,000 a year for being relieved of the maintenance of the canal.

TEXAS

That the days of railroad "baiting" in Texas are not ended is shown by the unusually large number of bills affecting the railroad interests of the state which are now before the legislature. Most of the pending bills have originated with the labor organizations and have strong political support.

One bill provides that all employees shall be paid semi-monthly and there are prospects that it will be passed, as it has been favorably recommended by committees in both the Senate and House. This measure if it becomes a law will add about $250,000 annually to the expenses of the railroads.

Another bill which would impose enormous expenditures if it should be passed is that which provides that an enclosed workbuilding shall be erected at all stations where four or more men are employed.

A bill before the Senate provides that employees shall have the privilege of selecting their own bondsmen instead of being bonded by the surety companies. Under the present method the employees pay nothing for making their bonds, this expense being borne by the railroads. The measure is being fought by the railroads because it would tend to confusion.

The bill which was introduced in the House providing for a reduction of the passenger rate from three cents to two cents a mile seems to be meeting with little favor and its passage is considered to be unlikely. It is opposed by the railroads, and also by their employees.

The House has acted favorably on a bill which provides that all railroad hospitals in the state shall be placed under the joint management of the railroads and their employees. At present the railroads have full control of these institutions. The railroads oppose the measure because they claim the efficiency of the hospitals will be lowered if any change is made, and also that the bill would give the right to so-called "damage suit" lawyers to enter the hospitals and solicit suits from injured employees.

The passenger departments of the railroads are fighting the bill which is pending in the House that provides for the redemption by railroads of unused tickets at the destination point. This and other provisions of the bill are said to practically legalize ticket scalping.

The "full-crew" bill which was reported adversely by the House and Senate committees will be taken up on the floor by means of a favorable minority report. It is thought that it has little show of being passed.

Senator Hall has introduced a bill requiring all handcars to be equipped with gasolene or electric motors. The House has passed a bill placing all spur tracks (private sidings) under the jurisdiction of the railroad commission.

Senator Cowell proposes to prohibit a railroad from removing its general offices or shops from one point to another without first obtaining permission of the railroad commission. A bill prohibiting the blocking of crossings by railroad trains in cities and towns has been introduced in the House. A bill by Representative Lewelling, makes it unlawful for a railroad to discharge or coerce an employee belonging or seeking to belong to any labor organization. An anti-blacklisting bill has been introduced in the Senate by Mr. Lattimore and is being opposed by the railroads.

The Senate has before it a bill which gives the railroad commission authority to require railroads to make repairs to their tracks and other property as in the judgment of the commission may be deemed necessary. Another bill requires section foremen to make sworn statements of all domestic animals killed or injured by trains.

Mr. Nichols has introduced a bill to punish the railroads for permitting Bermuda grass to grow on their land and allowing it to spread to other property. Senator McNealus is author of a bill which requires engineers and others operating steam engines and boilers to procure a license. Mr. McFarland has introduced a bill in the House making it a felony for a railroad employee to make false or fraudulent entries of the cost of car repairs and other transactions. A bill is pending in the Senate which makes it unlawful for steam to escape from a locomotive to an extent that would obscure the vision of employees working about it. Senator Townsend is author of a bill which seeks to regulate the salaries of railroad presidents and other higher officers.

The Senate committee has reported favorably the Westbrook bill, which requires all railroads to give certain classes of their employees four days' rest each month. These classes include station agents, tower men and clerks; and all telegraphers who do not now come under the provisions of the eight-hour law. It affects approximately 24,000 persons.

Railway Telegraph Superintendents

The regular meeting of the western division of the Association of Railway Telegraph Superintendents will be held in the La Salle hotel, Chicago, Ill., on March 17 and 18. The business sessions will be arranged to allow the members plenty of time during the afternoons to visit the annual exhibition of the National Railway Appliance Association, which is to be held in the Coliseum, in Chicago, March 15-19. The following papers will be read before the meeting: "Pole and Wire Maintenance," by E. H. Ward of the Western Union Telegraph Company; "Modern Testing Facilities and Their Relation to Railway Wire Plant Efficiency," by W. Rogers, telegraph engineer of the Missouri Pacific, and "Shall Inside Maintenance be Handled by Linemen or Special Equipment Men?" by L. M. Jones, superintendent of telegraph of the Atchison, Topeka & Santa Fe.

Air Brake Association

The twenty-second annual convention of the Air Brake Association will be held at the Hotel Sherman, Chicago, Ill., Tuesday, May 4, 1915. Committees will report on the Accumulation of Moisture and its Elimination from Trains and Yard Testing Plants, Adequate Hand Brakes on Heavy Passenger Equipment Cars, Need of Efficient Cleaning and Repairing of Freight Brakes, What Shall We Do to Improve the Present Pneumatic Signal Device, Difficulties the Railroad Companies Encounter in Endeavoring to Run 100 Per Cent Operative Brakes in Freight Service, and M. C. B. Air Brake Hose Specifications.

National Railway Appliances Association

It is announced that 138 railway supply firms have taken space in the Coliseum for the exhibit of the National Railway Appliances Association, to be held in Chicago, March 15 to 19, in connection with the meeting of the Railway Signal Association and the Convention of the American Railway Engineering Association. This number compares very favorably with that of last year and indicates that the exhibit will be most successful.

Railway Club of Pittsburgh

At the regular monthly meeting of the Railway Club of Pittsburgh, to be held at the Monongahela House, on Friday, February 26, a paper will be presented by Prof. Louis E. Endsley of the University of Pittsburgh, entitled "Some Experiments to Determine Forces on a Truck Side Frame, and Stresses Produced by These Forces."

American Society for Testing Materials

The eighteenth annual meeting of the American Society for Testing Materials will be held at the Hotel Traymore, Atlantic City, N. J., June 22, 23, 24, 25 and 26.

MEETINGS AND CONVENTIONS

The following list gives the names of secretaries, dates of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

American Association of Demurrage Officers.—A. G. Thomason, Demurrage Commissioner, 845 Old South Bldg., Boston, Mass. Annual convention, March 23, 1915, Jefferson Hotel, Richmond, Va.

American Association of Passenger Traffic Officers.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, April 15-16, San Francisco, Cal.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Piedmont Hotel, Atlanta, Ga.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preced.... 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

National Railway Appliances Association.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings. 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Railway Signal Association.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa. Next meeting, March 15, 1915, Chicago. Annual meeting, September 21-24, 1915, Salt Lake City, Utah.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Signal Appliance Association.—F. W. Edmonds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of Newark.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, Newark.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bimonthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Transportation Club of Detroit.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Western Canada Railway Club.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

REVENUES AND EXPENSES OF RAILWAYS

Six Months of Fiscal Year Ending June 30, 1915—Continued

Name of road.	Average mileage operated during period.	Operating revenues—Freight.	Operating revenues—Passenger.	Operating revenues—Total, inc. misc.	Operating expenses—Maintenance—Way and structures.	Operating expenses—Maintenance—Of equipment.	Operating expenses—Traffic.	Operating expenses—Transportation.	Operating expenses—Miscellaneous.	Operating expenses—General.	Operating expenses—Total.	Net operating revenue (or deficit).	Railway tax accruals.	Operating income (or loss).	Increase (or decr.) comp. with last year.
Oahu Ry. & Land Co.	109	$476,871	$137,005	$652,998	$65,574	$54,458	$3,894	$130,041	....	$27,103	$281,071	$371,926	$43,217	$328,709	$13,115

Traffic News

Tolls received by the government for the passage of vessels through the Panama canal for the six months ended February 12, amounted to over $2,000,000.

The railroads west of Chicago have filed tariffs with the Interstate Commerce Commission providing for the issuance of 2,000-mile mileage books, good only for interstate travel, at the rate of 2¼ cents a mile, effective on March 1.

The Chicago & Eastern Illinois has again been awarded the contract for carrying the United States mail between Chicago and St. Louis. To retain the mail the road has promised to reduce the time of its fast mail train from 7 to 6½ hours.

On April 12 a new passenger train from St. Louis to San Francisco will be put on by the Missouri Pacific, the Denver & Rio Grande and the Western Pacific. The train will leave St. Louis at 2 p. m., and arrive at San Francisco at 5:45 p. m., the third day.

Resolutions favorable to the request of the railroads for an increase in the state passenger fare from 2 to 2½ cents a mile have been adopted by 62 commercial and civic associations in Indiana, which were visited by a committee of passenger officers of the roads in the state.

The New York City Association of Passenger and Ticket Agents held its annual dinner at the Hotel Astor, Saturday evening, February 20, about 400 persons being present. The speakers were D. M. Wootton, president of the association; J. F. Dillon, and Dr. Frank Crane.

Twenty-eight new stations with freight facilities have been established recently by the Baltimore & Ohio, according to a circular issued by the traffic department. The new stations are on the eastern lines of the system, embracing the Baltimore & Ohio, the Little Kanawha and the Valley Railroad of Virginia.

The quarantine at Pittsburgh against foot-and-mouth disease was lifted at the beginning of this week. New quarantines continue to be reported from various localities, Erie county, N. Y., being one of the latest. The state of Vermont has prohibited the transportation of live stock into that state from Massachusetts.

The Chicago & North Western, the Chicago, Milwaukee & St. Paul and the Minneapolis, St. Paul & Sault Ste. Marie have filed a petition with the Wisconsin legislature submitting a bill to increase passenger fares in the state from 2 to 2½ cents a mile, and asking the legislature to make a full and complete investigation into the existing rates.

The Atchison, Topeka & Santa Fe on Monday, March 1, the date on which the reduced fares to San Francisco, on account of the Panama-Pacific Exposition go into effect, will run its California Limited train in eight sections; on Tuesday the train will be run in five sections, on Wednesday in three sections, on Thursday in three sections, with an additional Raymond & Whitcomb special train; on Friday in two sections, and on Saturday in three sections. These trains will each be made up of four to six sleepers, one combination car and one observation car.

The Canadian Freight Association, acting on behalf of all of the Canadian railways, has filed with the Board of Railway Commissioners for Canada application for permission to make a general increase of freight rates. It is proposed to advance the first class rates by two cents per hundred pounds, and fifth class rates one cent, in addition to a number of increases in commodity rates, including an advance of 10 cents a ton on coal and coke, 5 cents a ton on sand, gravel and crushed stone, and 5 to 30 cents a ton on pig iron, wire rods, rails and iron ore concentrates; also increases of varying amounts on cord wood, paving blocks, stone, iron and steel, lumber and forest products, petroleum and grain products. An increase of from 1 to 2 cents per 100 lb. on livestock is also proposed.

With the addition of a new passenger train on February 7, the Atchison, Topeka & Santa Fe now has five trains daily from Chicago to California. The new train, called the "Missionary," leaves Chicago at 10:30 p. m., reaches Kansas City at 10:45 a. m., and Los Angeles at 7:50 p. m., the third day. This train will be but 50 minutes slower than the "California Limited," and it runs via Newton, Amarillo and Belen. Through standard sleeping cars have also been put on between New Orleans and San Francisco on a new train known as the "California Special," leaving New Orleans in the evening and arriving at Los Angeles at 7:50 p. m. on the third day. Travel over the Sante Fe to California recently has been very heavy. The "Santa Fe De Luxe," the extra-fare train to southern California, has been running to full capacity, and the "California Limited" has been run in as many as six sections.

In response to a resolution adopted by the Missouri legislature the Missouri Public Service Commission, which was called upon to furnish information as to whether the present freight and passenger rates in the state are, in its opinion, sufficient to yield a reasonable compensation for the service rendered, has filed with the Senate a report of the progress made in the hearings which the commission has already held on the application for increases filed by the railroads. The commission says in its report that while the testimony and exhibits thus far offered in evidence by the carriers make a prima facia showing that the new rates are insufficient to yield a reasonable compensation for the service rendered, the commission does not feel justified in attempting to pre-judge what will be the effect of the testimony hereafter to be offered by the interveners in the cases, and what will be its final conclusions on the whole testimony introduced.

Iowa Campaign for Increased Passenger Fares

As briefly noted in last week's issue, a committee of executive officers of the Iowa railroads held a conference at Des Moines, on February 16, with Governor Clarke, the lieutenant-governor, the speaker of the House and members of the state railroad commission, to ask the state officers to support the petition of the railroads for an increase in passenger fares in the state from 2 to 2½ cents a mile. President S. M. Felton, of the Chicago Great Western, made an address on behalf of the railroad men, in which he said that there are only 13 states in the union that have in effect the maximum rate of 2 cents a mile for passenger service, and that the population per mile of railroad, in those 13 states, averages 472, while in eight eastern states, with an average maximum fare of 2½ cents a mile, the population per mile of railroad is 1,036; and that in 27 other states, with rates ranging from 2½ cents to 6 cents a mile, the average population per mile is 280, while the population per mile of railroad in Iowa is 224, which is less than the average of the 13 two-cent states.

Mr. Felton showed that under the two-cent fare law the gross earnings of the railroads in the state had increased 22.2 per cent; while expenses had increased 31 per cent, and the increase in miles of railroad built has been only 1.5 per cent; while the increase in the corresponding period of years before the passage of the two-cent fare law had been 10.9 per cent.

Governor Clarke made a brief reply saying that he was sure the people of Iowa wished to be perfectly fair and just with the railroads, and that he felt confident that they would not be willing that the railroads should render their great service to the country without a compensation that would return a just and reasonable profit. "The people have always shown a willingness to do exactly the right thing," he said, "and all they ask is a fair, open and frank statement of all the facts and when they are sure that they have them and they are understood I feel certain that the right and honest thing will be done." At the conclusion of this conference the railroad men appeared before a joint session of the senate and house committees on railroads of the Iowa legislature, and made a similar presentation of their case.

New Manchurian Railway.—An agreement has been made by the Bensichu Coal Mines Company and the Southern Manchurian Railway for the construction of a railway from the mines to Tzentchan. The authorization of the Chinese government has already been obtained. At present there is only a 9-mile narrow-gage line at Bensichu, simply for the use of the mines: it ends at Nyusindaya, where there are also coal mines. The new line will serve a rich mining district throughout its whole length. It will be about 50 miles long. If it is found that the narrow-gage line referred to is worth it, it will be widened to normal gage.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The Texas Railroad Commission has filed a formal complaint with the Interstate Commerce Commission, charging that Galveston is being discriminated against as compared with New Orleans, because of the demurrage charges and regulations applying at Galveston.

Hearings were begun on February 16 before Commissioner Meyer on the petition under the Panama Canal Act of the Central of Georgia and the Atlantic Coast Line to continue control of the Ocean Steamship Company and the Peninsula & Occidental Steamship Company, respectively.

The Chambers of Commerce of Cleveland, Toledo, Springfield, Canton, Columbus and Dayton, Ohio, and Detroit, Mich., have filed a joint complaint with the Interstate Commerce Commission, alleging discrimination in the rates from those cities to the southeastern Mississippi valley in comparison with the rates from Chicago, Milwaukee, Peoria and Davenport to the same territory.

Clifford Thorne, chairman of the Iowa Railroad Commission, has filed a protest with the Interstate Commerce Commission on behalf of nine western states, including Iowa, Nebraska, North Dakota, South Dakota, Colorado, Oklahoma, Arizona, Minnesota and Arkansas, asking the commission to suspend, pending investigation, the tariffs filed by the railroads increasing interstate passenger fares in the west from 2 to 2½ cents a mile, to take effect on March 1.

Rates on Wool to Provo, Utah

Knight Woolen Mills v. Chicago & North Western et al. Opinion by Commissioner Hall:

The commission finds that the rates on scoured wool, compressed in bales, from Chicago to Provo, Utah, and other Utah common points should not exceed $2.25 per 100 lb. in carloads, minimum weight 13,500 lb., subject to rule 6-B of the western classification; and $3 per 100 lb. in less than carloads. Reparation awarded. (32 I. C. C., 490.)

Rates on Packing House Products to Points in Utah

Cudahy Packing Company v. Atchison, Topeka & Santa Fe et al. Opinion by Commissioner Meyer:

The commission finds that the commodity rates on packing house products shipped in mixed carloads with fresh meat from Wichita and Kansas City, Kan.; South Omaha, Neb., and South St. Joseph, Mo., to Utah common points are unreasonable to the extent that they exceed the fifth-class rate. The case is held open for the determination of the amount of reparation. (32 I. C. C., 560.)

Rates on Clay from Points in Georgia to Eastern Points

Opinion by Commissioner Clements:

The commission finds that the carriers have not justified proposed increased rates on clay, crude or ground, in bags, barrels or casks, carload minimum weight 50,000 lb., from producing sections in Georgia and South Carolina to New York, Boston and interior eastern points via rail-and-water routes through Savannah, Ga., and Charleston, S. C. The increased rates were uniformly 28 cents per gross ton higher than the rates which are to remain in effect. (32 I. C. C., 564.)

Rates on Cotton Linters

Salt Lake Mattress & Manufacturing Company et al. v. Atchison, Topeka & Santa Fe, et al. Opinion by Commissioner Meyer:

The commission finds that the present rates on cotton linters from producing points in Texas, Oklahoma, Louisiana and Arkansas, and from Memphis, Tenn., to Salt Lake City and Ogden, Utah, and points taking the same rates are discriminatory against Salt Lake City and Ogden as compared to Denver, Colo., and points taking the same rates and to the California and the North Pacific coast terminals. It is held that the rates to Salt Lake City should not exceed the rates to Denver from points of origin in Texas by more than 49 cents per 100 lb., one cent more than the maximum differential between the fifth-class rates to Denver and Salt Lake City respectively from Chicago. (32 I. C. C., 417.)

Rates On Live Stock In Double Deck Cars

American Live Stock Association et al. v. Southern Pacific. Opinion by Commissioner Daniels:

Upon a supplemental hearing the commission affirms its decision in 26 I. C. C., 37, that rates on sheep or goats in double-deck cars from points in Arizona to points in California should be the same as the rates on fat cattle. The original decision prescribed a schedule of maximum distance rates for the transportation of live stock from points in Arizona to Los Angeles and other points in California, and is now supplemented by the addition of a schedule of maximum additional charges for branch line hauls and for hauls over two or more lines. The defendants are also required to provide in their tariffs that when a double-deck car is ordered, and two single-deck cars are furnished instead, the charges shall be at the rate for a double-deck car of the size ordered, provided the shipment could have been loaded in a double-deck car. (32 I. C. C., 515.)

Rates on Cement and Other Commodities from St. Paul and Other Points to Montana

In re rates on cement, lime, salt and other commodities from St. Paul, Duluth and other points to stations in Montana. Opinion by Commissioner McChord:

The commission finds that the Northern Pacific and the Chicago, Milwaukee & St. Paul are justified in cancelling a commodity rate of 35 cents per 100 lb. on mixed carloads of lime, cement, stucco, plaster, roofing pitch and salt from St. Paul, Minneapolis, Minnesota Transfer, Duluth and West Duluth, Minn., and Superior, Wis., to a group of Northern Pacific stations in Montana commencing at the North Dakota-Montana line and extending to Custer, Mont., and to a group of stations on the Chicago, Milwaukee & St. Paul from Buffalo Springs, N. D., to and including Musselshell, Mont. It is found that small shipments of some of these commodities are included in the car in order to get the carload rate; and no satisfactory reason is given for the continuance of a rate which is applicable alone from St. Paul and points at the head of the lakes to selected groups of stations. (32 I. C. C., 532.)

Kansas City Stock Yards Tariff Rejected

Atchison, Topeka & Santa Fe et al. v. Kansas City Stock Yards Company. Opinion by Commissioner Meyer:

The defendant, doing a general stock yard business in Kansas City, filed a tariff effective April 8, 1914, imposing a trackage charge of 75 cents per car for the use of the stub tracks leading to some of the unloading docks in its yards by complainants and a switching charge of $2 per car for the movement of complainants' cars over these tracks by defendant. Prior to the effective date of this tariff defendant's charge was 50 cents for loading or unloading over its docks. The defendant, however, performed no switching and accorded the use of its stub tracks to the trunk lines gratuitously. The trunk lines absorbed the loading and unloading charge. Since April 8, 1914, defendant has exacted the trackage charge of 75 cents.

The commission finds that this proposed tariff should be struck from its files.

It is held that the movement over defendant's rails leading to its docks is a transportation service and that compensation by complainants to defendant for the use of its tracks and yards or for switching complainants' cars is not unlawful. It is held, on the other hand, that the defendant is not a common carrier and is therefore not entitled to exact compensation through a published tariff.

The Kansas City Stock Yards are not a plant facility, since they transport for shippers and for all shippers offering stock or directing its delivery at that point. The finding is made, however, on the ground that there is not a bona fide holding out coupled with the ability to carry for hire. The defendant at the present time owns no cars or locomotives, and it proposes to use locomotives obtained by an arrangement with the Chicago, Rock Island & Pacific. It did not expect the complainants to avail

themselves of the service offered, but expected that the complainants would continue to handle their cars to and from defendant's yards for themselves with their own motive power. It appears that defendant's real purpose is to secure compensation for the use of its tracks by complainants, and that the defendant holds itself out to transport complainants' cars solely in order to impose a trackage charge through a published tariff. The commission does not attempt to decide whether complainants may avoid defendant's trackage and switching charges by refusing to accept or deliver livestock at defendant's yards or whether they may add defendant s charges to their present live stock rates to and from Kansas City. (33 I. C. C., 92.)

Southwestern Yellow Pine Blanket Rates Upheld

Wisconsin & Arkansas Lumber Company et al. v. St. Louis, Iron Mountain & Southern et al: Opinion by Commissioner Daniels:

The southwestern yellow pine area is bounded on the north by the Arkansas river, on the east by the Mississippi, on the south by the Gulf of Mexico and on the west by a line through Kansas City and Houston. This area, approximately 400 miles long and 300 miles wide, is practically coterminous with the district in which, west of the Mississippi, the yellow pine, both long leaf and short leaf, originates. The rates on yellow pine from this area are blanketed, the rates to the gateways being as follows: to Thebes and Cairo, 16 cents; to Memphis, 14 cents; to St. Louis, 19 cents, and to Kansas City, 24 cents. These are proportional rates, although in some instances they are also quoted as local rates. The complainants seek a reduction of four cents in the rates to all gateways except Kansas City, and a reduction of six cents in the rate to that point. They also desire that the blanket area be divided along the thirty-third parallel, the common boundary of Louisiana and Arkansas, so that there will thereby be a differential advantage to the mills in the region north of that line over mills to the south.

The commission finds that the blanket rates should not be changed. There is perhaps greater warrant for the group or blanket system of rate making when applied to an area containing natural resources than in any other case. When materials are found only in delimited areas and consumed throughout widely extended markets, in which case there is no possibility of shifting the sources of supply, there is much to be said for blanket rates. Such an arrangement tempers to the common benefit of consumers generally the fortuitous advantage conferred by nature upon the localities in which such natural resources are found. The size of the present blanket may fairly raise a question as to the propriety of its permanent maintenance, but until it can be shown that the size of the area bearing common rates works injustice there is sufficient ground for maintaining it intact. It is true that Kensett, immediately north of the Arkansas river, enjoys a rate to Kansas City which contrasts sharply with the rate from Little Rock to the same point, but wherever a blanket boundary is drawn a disparity between the rates per mile and between the last station within the blanket and the first outside is sure to appear. The complainant at Little Rock should perhaps rather direct its attack against this discrimination. It is found that the average ton-mile earnings in this territory are reasonable as compared with similar rates on like traffic in other districts. It is believed also that the proposed remedy of dividing the blanket into two parts would be no fairer than the present arrangement, because by some of the lines the distances in some cases from points in the northern blanket would be greater than points in the southern blanket. The great number of east and west lines south of the proposed boundary makes it probable that were the rates reduced in the northern half of the blanket these lines would accord a similar abatement in rates and thus bring about a new equality in rates between both parts of the blanket.

A dissenting opinion by Commissioner Harlan draws attention to some of the injustices that result from a blanket rate, and especially one of such size as this. It is the commissioner's opinion that the rates would be more equitable if they were put upon a mileage basis. He also draws attention to certain exceptions in the blanket rates and to the fact that the southern mills in the district are accorded mileage rates to the gulf ports on export traffic. (33 I. C. C., 33.)

STATE COMMISSIONS

The Public Service Commission of Pennsylvania is preparing a study of all tunnels used by railroads in the state, and when the data are in hand some measures to regulate them may be prepared.

The New York State Public Service Commission, second district, has suspended until May 1, a tariff of the Long Island road increasing commutation rates filed to take effect March 1. A hearing will be held. The proposed increases were on 60-trip monthly and 46-trip monthly school rates.

The New York State Public Service Commission has ordered the Long Island road to have watchmen to attend the gates at three crossings in Freeport, N. Y., all night; the principal ground of the complaint, on which this order is based, being that the automatic bells, hitherto depended on for night warnings at these places, are kept ringing so much of the time that residents in the houses nearby are greatly annoyed.

PERSONNEL OF COMMISSIONS

The third member of the Railroad Commission of Arkansas is now Thomas E. Wood of Mariana, succeeding G. T. Breckenridge, whose term expired January 1. Mr. Breckenridge is now serving as temporary secretary of the commission, in place of Ernest Tipton, who has resigned to become assistant treasurer of the state. Mr. McKnight, heretofore chairman, is now the second member of the commission, the chairmanship having been taken by J. S. Roland. It appears that the Arkansas Commission, like the federal commission at Washington, changes its chairman every year.

COURT NEWS

The Supreme Court of the United States, in a decision handed down this week, has sustained an order of the Interstate Commerce Commission directing the Pennsylvania Railroad to make the same track connections at New Castle, Pa., with the Buffalo, Rochester & Pittsburgh that it makes with the Baltimore & Ohio.

The Supreme Court of the United States, deciding cases arising in Ohio and in Indiana, holds that employees of railroads working on trains engaged in interstate commerce who seek to recover for personal injuries must bring their actions under the Federal employers' liability act and safety appliance acts, and not under state statutes.

The Supreme Court of the United States, reversing the District Court for the Southern District of New York, decided in favor of the Erie Railroad in its contention for the right to issue passes to employees of steamship companies and other ocean carriers not subject to the Interstate Commerce Commission's jurisdiction.

The Supreme Court of the United States, in a decision handed down this week, holds that the Interstate Commerce law authorizes the Interstate Commerce Commission to award damages to shippers for illegal rates and discriminations, no matter at what date arising, provided claims were filed before August 28, 1907, which, the court held, was the date on which this provision of the law went into effect.

The Supreme Court of the United States has affirmed the judgment of the Circuit Court of Appeals for the Second Circuit that the Wells Fargo Express Company shall not be held liable for more than the stated nominal value of three automobiles ($50 each) in a bill of lading in the absence of a stipulated actual value and the payment of a higher rate. The three cars were destroyed in transit and the Pierce-Arrow Company sought to recover $15,000.

On November 7, 1914, indictments were returned by the federal grand jury at Chicago, against the Chicago Spring Butt Company, an Illinois corporation, on charges of violating the interstate commerce regulations relating to freight tariffs, by fraudulent billing of shipments. On Monday, February 15, 1915, W. J. Keene, president of the company, appeared before Judge Carpenter of the United States court and pleaded guilty of misdescription of shipments of spring hinges, which were described on his shipping instructions to the carrier as iron hinges. A fine of $500 and costs was imposed.

Implied Consent to Use of Yards by Another Railroad—Evidence as to Release

An engineman of the Birmingham Southern sought to recover damages from the Louisville & Nashville for personal injuries sustained by him as a result of the rear end of a train of the defendant being backed in the night time into an engine of the Birmingham Southern, of which he was the runner, while it was standing in defendants' yard. The yard was but a short distance from the junction point of the two roads. A principal contention of the defendant was that the plaintiff was a trespasser, and that the L. & N. employees in charge of the train were under no obligation to look out for a Birmingham Southern engine or train on that track other than the general duty to keep a lookout for obstacles on it. The track had been openly used by the Birmingham Southern for many years for the purpose of interchange of traffic between the two companies, with the acquiescence of the defendants' employees and those in charge of the yard. The court held that this imposed on the defendant, in respect of employees of the Birmingham Southern, a duty to exercise such reasonable precaution in the movement of its own trains on the track as ordinary prudence dictated, to protect from injury the Birmingham Southern men.

Evidence as to the duty of train men to have the rear end of the train lighted, and of the custom of well-regulated railroads to do this, was held to be admissible. Evidence as to a release executed by the engineman to his own company was inadmissible; but evidence as to the amount paid him by his own company on account of the injury was admissible, under the general rule that a partial satisfaction by another may be shown by the defendant in mitigation of damages. Judgment for the plaintiff was reversed, and a new trial ordered. L. & N. v. Burke, Alabama Court of Appeals, 66 So. 885.

Louisville & Nashville Wins in Suit Resisting Search for Papers

The Supreme Court of the United States in the suit of the government against the Louisville & Nashville Railroad, decided this week, says that the Interstate Commerce Commission has no authority under the interstate commerce act to require a common carrier to disclose private letter files and correspondence.

Acting under a special resolution of the Senate the commission made an investigation of the railroad company's affairs to determine the truth of a charge that it had been issuing passes in violation of law and doing other unlawful acts. When agents of the commission entered the offices of the railroad at Louisville to investigate they not only insisted that they should inspect the company's books and papers, but the letter press, books and correspondence file of the general counsel. He forcibly ejected the inspectors. The commission reported the case to the Senate as one of prohable contempt. The attorney general was then directed to apply for a mandamus to compel the company to produce the letter files. The mandamus was refused by the district court and an appeal taken.

The opinion is by Justice Day. The court holds that sections 12 and 20 of the Interstate Commerce Act, authorizing the agents of the commission to require the production of "books and papers" do not empower them to compel the opening of letter files and private correspondence.

The decision does not go to the constitutional question of just how far the right of the commission to inspect might go in such matters; it merely rests on the wording of the statute, holding that under the sections named there is no power to compel the production of private letter files. The clause in question reads: "The commission shall at all times have access to all accounts, records and memoranda kept by the carriers subject to this act." The act also makes it unlawful for carriers to keep any accounts, records or memoranda not authorized by the commission. "Reading these provisions of the act," said Justice Day, "there is nothing to suggest that they were intended to include correspondence relating to the business of railroads. In recommending the passage of the act the commission did not suggest that it was essential to its purposes to have an inspection of the correspondence of railroads. . . . There is nothing from the beginning to the end of the section referred to," said Justice Day, "to indicate that Congress had in mind that it was making any provision concerning correspondence received or sent by railroad companies."

This suit grew out of an attack made on the floor of the Senate by Mr. Lea of Tennessee against the Louisville & Nashville. He charged that the road was issuing passes illegally.

Railway Officers

Executive, Financial, Legal and Accounting

Edward F. Kearney, who was recently appointed a receiver of the Wabash, has been elected president.

G. E. McCaughan, claims attorney for the Rock Island Lines, with headquarters at Chicago, has resigned, and the office has been abolished.

The office of J. M. Eedson, freight claim agent of the Toronto, Hamilton & Buffalo, has been removed from Detroit, Mich., to Hamilton, Ont.

W. P. Kenny, vice-president in charge of traffic of the Great Northern, has been elected president of the Great Northern Express Company, succeeding D. S. Elliott, resigned.

B. A. Worthington, formerly president of the Chicago & Alton, has been appointed receiver of the Cincinnati, Indianapolis & Western, which is a subsidiary of the Cincinnati, Hamilton & Dayton.

J. W. Orr, controller of the Pennsylvania Company and the Pittsburgh, Cincinnati, Chicago & St. Louis, with headquarters at Pittsburgh, Pa., has been appointed also auditor of the Cleveland, Akron & Cincinnati, the Waynesburg & Washington, the Wheeling Terminal, and the Pennsylvania Terminal, succeeding J. W. Renner, retired under the pension regulations.

Operating

Joseph B. Walsh, chief train despatcher of the Missouri, Kansas & Texas, at Sedalia, Mo., has been appointed trainmaster at Oklahoma City, Okla.

E. E. Hanna, formerly trainmaster of the Missouri, Kansas & Texas, at Smithville, Tex., has been appointed trainmaster of the St. Louis Southwestern at Waco, Tex.

W. M. Ansley has been appointed acting superintendent of the Second district of the Canadian Pacific, Alberta division, in place of F. Walker, superintendent at Lethbridge, Alta., who has been granted leave of absence.

B. B. Greer, assistant general manager of the Chicago, Burlington & Quincy for the lines east of the Missouri river, with office at Chicago, has been appointed assistant general manager of the lines west, with headquarters at Omaha, Neb., succeeding E. S. Koller, who has been appointed general manager of the Colorado & Southern. L. B. Allen, general superintendent of the Nebraska district of the Chicago, Burlington & Quincy, with office at Lincoln, Neb., succeeds Mr. Greer; W. F. Thiehoff, superintendent of the LaCrosse division at LaCrosse, Wis., succeeds Mr. Allen; E. Flynn, superintendent of the McCook division at McCook, Neb., succeeds Mr. Thiehoff; C. D. Peckenpaugh, superintendent of the Sheridan division at Sheridan, Wyo., succeeds Mr. Flynn; G. L. Griggs, superintendent of the Sterling division, at Sterling, Colo., succeeds Mr. Peckenpaugh, and W. G. Dungan, trainmaster at McCook, Neb., succeeds Mr. Griggs.

R. W. Stevens, who, as noted in last week's issue, has been appointed general superintendent of the Chicago & Western Indiana, with headquarters at Chicago, succeeding J. M. Warner, deceased, was born in 1869, at St. Stephen, New Brunswick. He was educated at the St. Stephen High School, and began his railway work as a brakeman on the Terre Haute & Peoria, now a part of the Vandalia, at Decatur, Ill., under Mr. Warner, who was then trainmaster. He then went to the Chicago & Western Indiana and the Belt Railway of Chicago, and after working successively as switchman and conductor, in 1895 was appointed yardmaster of those roads. In 1904 he was appointed general yardmaster, and while holding that position was also general supervisor of the outside working forces on track elevation in Chicago. In the fall of 1906 he was appointed trainmaster, and in 1909, superintendent, from which position he has now been promoted to general superintendent of the Chicago & Western Indiana, succeeding Mr. Warner, whose title was general manager.

Traffic

The headquarters of J. L. Harris, recently appointed general live stock agent of the Wabash, are at Kansas City, Mo.

H. D. Wilson has been appointed general agent of the passenger department of the Missouri Pacific and the St. Louis, Iron Mountain & Southern at Memphis, Tenn.

H. C. Dinkins, general agent for Latin America of the International & Great Northern, with headquarters at New Orleans, La., has been appointed foreign freight agent, with office at Houston, Tex.

The general freight and passenger departments of the Fort Worth & Denver City and the Wichita Valley will be consolidated on March 1, and will be placed in charge of W. F. Sterley, who will have the title of general freight and passenger agent, with headquarters at Fort Worth, Tex.

Elbert Blair has been appointed southwestern freight agent of the Chicago & Alton, at Dallas, Texas, in place of S. W. Myers, assigned to other duties. Barth Reidy has been appointed general agent traffic department at Little Rock, Ark., and F. W. Birchett has been appointed general agent traffic department at New Orleans, La.

Engineering and Rolling Stock

E. H. Morey, shop demonstrator and chief apprentice instructor, has been appointed foreman of the new erecting and machine shop of the Chicago & North Western, at Chicago, Ill. E. Bloom has been appointed shop demonstrator and chief apprentice instructor, succeeding Mr. Morey.

C. M. Newman has been appointed superintendent of shops of the Baltimore & Ohio Southwestern at Washington, Ind. A. E. McMillan, assistant master mechanic at Cincinnati, Ohio, has been appointed master mechanic of the Indiana and Illinois divisions, with headquarters at Washington, and W. H. Keller succeeds Mr. McMillan.

OBITUARY

George Carter McNally, superintendent of car service of the Elgin, Joliet & Eastern, died on February 22, at his home in Joliet, Ill., aged 51 years.

Railway Extension in Burma.—The first 65 miles of the Southern Shan States Railway have just been opened for traffic, and they bring Kalaw, the finest hill station in Burma, within 24 hours of Rangoon. Kalaw is 70 miles nearer Rangoon than Maymyo, and although, according to present arrangements, a journey will occupy about the same time, when the new line is in thorough working order it will be possible to reduce the *trajet* by several hours. Kalaw is about 1,000 ft. higher than Maymyo, and it has a proportionately cooler climate and a smaller rainfall. The mosquito, which infests Maymyo, is almost non-existent in Kalaw. The new extension comprises a high-level girder bridge at Yinmabin. Upon the main ghaut, 18 miles in length, there is a continuous ascent of 1 in 25, and it is considered the heaviest ascent in India. There are four reversing stations on the section, and the descent will be one requiring great care.—*Engineering.*

New Railway Routes for Neutral Commerce.—The commerce of the neutral countries is being so inconvenienced that the question of establishing new routes engages serious thought. Thus the export of Swedish timber via Norway has not worked quite so smoothly as could have been desired, and an export bureau has been formed. A block occurred on the Norwegian side, and for some days all despatch of Swedish timber via Norway had to be stopped. The Norwegian railway authorities then undertook to forward 60 cars daily; but this soon proved insufficient, and some 350 cars were allowed to accumulate north of Ostersund and on the Norwegian side. The export bureau referred to is to serve as an intermediary both between the Swedish shippers and the Swedish railway authorities, and between the latter and the Norwegian railways. If only sufficient Norwegian rolling-stock, especially engines, can be made available, the new route is expected to become one of great importance.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Delaware, Lackawanna & Western is in the market for 5 locomotives.

The St. Louis Stock Yards have ordered one switching locomotive from the American Locomotive Company.

CAR BUILDING

The Boston & Maine is in the market for 3,000 underframes.

The Missouri, Kansas & Texas is in the market for 1,000 steel underframe and 200 all-steel 100,000 lb. capacity gondola cars.

The Siamese Government, it is reported, will receive bids until July 29 on 159 freight cars. This item has not been confirmed.

The Southern has given an order to the Lenoir Car Works to repair 500 box cars and equip them with steel underframes.

The Russian Government is reported to be inquiring for prices on 50,000 pairs of axles and wheels, 30,000 to 60,000 tires, 30,000 rough axles and 10,000 rough wheels. This item has not been confirmed.

The Chicago, Burlington & Quincy has ordered 2,500 center sills from the American Car & Foundry Company, and 1,200 box and 300 stock cars from the Haskell & Barker Car Company. The cars will be 40 ft. long; they will be of 80,000 lb. capacity, and will be provided with steel center sills.

Railway to Moorish Coast.—It is reported that the section of the railway to Mekinez has been completed, thus uniting Fez with Rabat, on the coast.

Railway Connections Between Russia and Sweden.—Although the Stockholm-Raumö (Finland) route, which has been closed since three Swedish steamers were blown up by German mines, was resumed a day or two before the new year, the Russian authorities appear very anxious to establish a connection by railway between the Russian and the Swedish systems. For this purpose the Russian railway has been pushed on as rapidly as possible as far as Karungi; but the line is only of a temporary nature, and Russian statements about connection to be made between this line and the Swedish railways are being officially contradicted in Stockholm. The Swedish department in question is of opinion that should a Swedish-Russian railway connection some day be established, a plan which the Swedish authorities have never encouraged, it would have to be effected south of Hapavanda, and not at Karungi. The Swedish line from Hapavanda to Karungi is not expected to be ready until the latter part of 1915. Of the Russo-Finnish-Norwegian-Swedish traffic conference, to which leading Russian papers have referred to as about to be held, nothing is known in Sweden.

Electrification of the Italian Railways.—The electrification of the Italian State Railways is progressing steadily, if slowly. It is controlled mainly by the available funds in the hands of the Railway Administrator in each financial year. The progress of the works is shown by the yearly expenditure since 1907. In the three years from 1907 to 1910 the expenditure was $617,000. In the working year 1910-11, $757,000; 1911-12, $960,000, and in 1912-13, about $1,400,000. There was also allotted in 1912-13 for electric traction permanent plants about $2,600,000, besides a sum of about $200,000 for other works. This contrasts with $845,000 allotted in 1911-12. On June 30, 1913, the extent of the transmission lines amounted to nearly 480 miles. The sub-stations numbered 30. Electric operation has worked regularly on the Turin-Modane line, on the old lines of the Giovi, on the Milan-Marese section, and on the Valtellina lines, and a regular electric service of passenger and goods trains has been started on the Savona-S. Giuseppe-Ceva section. There now remains the electrification of the branches of the Giovi, the Lecco-Monza and the Turin-Pinerolo lines.—*The Engineer*

Supply Trade News

William F. Gurley, of the firm of W. & L. E. Gurley, Troy, N. Y., died at Atlantic City on Wednesday, February 17.

Wellington B. Lee has been appointed vice-president of the Track Specialties Company, Inc., New York, effective February 1.

Jed O. Gould, general superintendent and works manager of the Gould Coupler Company, at Depew, N. Y., died Friday, February 19, at Buffalo, N. Y.

George T. Merwin, formerly with the W. W. Butler Company, Ltd., Montreal, Que., has been appointed general sales manager of the Canadian Car & Foundry Company, Montreal.

The Zug Iron & Steel Company, Pittsburgh, Pa., has been acquired by Jos. T. Ryerson & Son, Chicago. The plant is to be dismantled and a warehouse will be erected on the site.

George Gibson Barret, formerly general manager of the Cleveland Drop Forge Company, and at one time connected with the American Locomotive Company, died at his home in Commack, L. I., on Thursday last.

C. W. Rhoades has been appointed western railway representative of the Kay & Ess Company, Dayton, Ohio. In the announcement to this effect, made in the *Railway Age Gazette* of last week, his name was incorrectly spelled.

John H. Trent, formerly railroad representative of the H. W. Johns-Manville Company, New York, at St. Louis, Mo., has been transferred to New Orleans, La., as branch manager, and has been succeeded at St. Louis by W. B. Mallette.

The Lea-Courtenay Company, which has hitherto been represented in Chicago territory by the Maher & Byrne Company, has recently established a branch office of its own in the Conway building. Mr. Maher has resigned from the Maher & Byrne Company, and has been appointed Chicago manager of the Lee-Courtenay Company.

J. B. N. Cardoza & Company, Inc., Citizens Bank building, Norfolk, Va., have been appointed southern representatives for the Track Specialties Company, Inc., New York. The officers of J. B. N. Cardoza & Co., are as follows: J. B. N. Cardoza, president; Edmund R. Cardoza, vice-president; Thomas A. Carroll, treasurer, and Joseph L. Young, Jr., secretary.

H. Ward Leonard, president of the Ward Leonard Electric Company, Bronxville, N. Y., died suddenly of apoplexy, as he was about to attend a banquet of the American Institute of Electrical Engineers at the Hotel Astor, New York, on Thursday, February 18. Mr. Leonard was a prominent electrical engineer and inventor. He was born in Cincinnati on February 8, 1861. He graduated from the Massachusetts Institute of Technology, and when he was 23 years of age became associated with Thomas A. Edison as a member of Mr. Edison's staff of four engineers selected to introduce the Edison Central Station System. When he was 26 years of age he became general superintendent of the Western Electric Light Company at Chicago. The following year he formed the firm of Leonard & Izard, which made many important installations of central stations and electric railways. In 1889, when the firm was bought out by the Edison interests, Mr. Leonard became general manager of the combined Edison interests for the United States and Canada, with headquarters in New York. In 1891 he completed his inventions of the Ward Leonard system of motor control, and later introduced several other important inventions in the electrical field.

TRADE PUBLICATIONS

Automatic Telephones.—The Automatic Electric Company, Chicago, has recently issued a 24-page folder in which are reproduced many of its advertisements as they appeared in the *Railway Age Gazette*, with special attention directed to such features as are particularly adapted to railroad requirements.

Railway Construction

Arkansas, Louisiana & Gulf.—This road, which on December 1, 1914, was consolidated with the Ashley, Drew & Northern, and which now operates between Monroe, La., and Monticello, Ark., a distance of 102 miles, will be extended north to Pine Bluff, Ark. However, it has not been definitely decided when actual construction work will begin.

Atchison, Topeka & Santa Fe.—The extension from Exeter, Cal., to Lindsay, a distance of 10 miles, has been authorized, and bids for the construction work are now being asked.

Black Mountain & Eastern.—This railroad, which is being built by the J. H. Phipps Lumber Company of Fayetteville, Ark., will extend from Cass, Ark., to Combs, connecting with the St. Louis & San Francisco at that point. The line will be 16 miles long, all of which has been graded and steel has been laid on 13 miles. One small frame bridge remains to be built.

British Columbia & White River.—Application is being made to the Canadian parliament for an extension of time in which to build from Bear creek, at the mouth of the Chilkat river, B. C., northwest to White river, thence to the boundary between the Yukon territory and Alaska. The company was incorporated in 1911. C. M. Marpole, G. E. MacDonald, G. E. Wilson, A. McDonnell and J. Ironside are the provisional directors.

Burlington, Mississippi River & Eastern.—A new steam road is being proposed by this company to extend from Keithsburg, Ill., to a point opposite Muscatine, Ia., then in an easterly direction to Cambridge and Kewanee, Ill., connecting with the Chicago division of the Chicago, Burlington & Quincy. It is estimated that 1,600,000 cu. yd. of earth will have to be moved, for which contracts will be let about May 1, 1915. There will be four bridges, varying in length from 50 to 250 ft. These will be concrete arches. The commodities carried will be stock, grain, coal, passengers, etc. M. J. Healy, Joy, Ill., is president and chief engineer.

Canada Western.—This company has asked the Canadian parliament for an extension of time in which to build from the international boundary in Alberta via Pincher creek and Cowley, and along the Old Man river to the Livingstone mountains, thence to Calgary, with a branch from Livingstone mountains to Michel, B. C. The company was incorporated in 1909, and the provisional directors were J. S. Hough, A. S. Kildall, L. L. Metcalfe, H. J. Box and O. L. Boynton, Winnipeg, Man.

Chicago, Milwaukee & St. Paul.—The grade separation work on the Bloomingdale road branch which extends from Pacific Junction to Chicago & Evanston Junction is now being completed.

Florida Roads.—The Port Commission of Jacksonville, Fla., is building a line to connect the various railroads within the city limits of Jacksonville. Work has been started and some contracts are to be let in the near future. The improvements consist of two filled wharves 1,000 ft. x 260 ft., an interchange yard, storage and sorting yard, necessary warehouses, cotton compress and storage, and facilities for handling general commodities. It is a terminal proposition, not a railroad. The commodities to be handled include lumber, naval stores, cotton, fertilizers, phosphate and general merchandise. Montgomery Corse, chairman, and F. W. Bruce, chief engineer. (November 13, p. 924.)

Georgia Roads.—Surveys are now being made, it is said, for a line to be built from Jacksonville, Ga., northeast to Lumber City, about 20 miles. An old lumber line extending about half the distance between these two places is to form part of the new line. C. F. Smith, president of the Ocmulgee River Lumber Company, is back of the project.

Memphis, Dallas & Gulf.—It is expected that the laying of steel on the 16½ mile section just north of Murfreesboro, Ark., will be completed by March 17, 1915. This will complete the line from Murfreesboro, Ark., to Hot Springs.

Minneapolis & St. Louis.—This company is considering the

grading and the laying of a few short storage tracks on its property near First street, Minneapolis, Minn.

Ocilla Southern.—This company, which operates a line from Nashville, Ga., north to Rochelle, 62.3 miles, has given a contract to Martin Tankersley to build an extension from Rochelle northwest to Pope City, 7.3 miles, and this work is now underway. The company projected an extension some time ago from Rochelle north to Macon, about 80 miles, and it is probable that trackage and lease arrangements will be made in the near future with other lines north of Pope City. (February 5, p. 251.)

Radford-Willis Southern.—Organized in Virginia with $300,000 capital to build from Radford, Va., southeast along Little river and Indian creek to Willis, about 25 miles. C. W. Simpson will be in charge of the location survey. J. L. Vaughan, president, and W. L. Castle, secretary and assistant treasurer.

RAILWAY STRUCTURES

Chicago, Ill.—The Chicago city council last week passed the ordinance permitting the Baltimore & Ohio to move its coach yard from Harrison street, on the site which is to be occupied by the Pennsylvania lines freight terminal, to the vicinity of Sixteenth street and Western avenue, and this enabled work to be started at once preliminary to the erection of the Pennsylvania freight terminal between Canal street and the Chicago river, south of Polk street. Work was begun on the erection of a temporary freight house for the Pennsylvania Lines between Polk and Taylor streets, and this will be followed by the work of tearing down old buildings.

A grant has been obtained from the city council, giving permission to build a new coach yard and engine terminal on the Baltimore & Ohio Chicago Terminal property between Lincoln and Wood streets, near Fourteenth street. Work is already in progress on the filling in for the coach yards. The entire improvement will include a yard with a capacity of 300 cars, a storehouse two or more stories high, and 600 ft. long, a 34-stall engine house having a depth of 90 to 100 ft., whose exterior walls will be located on the lines of Fourteenth and Lincoln streets, forming a right angle instead of the usual circular form, a 100-ft. turntable, and necessary ash and coaling facilities, inspection pit and washout platform. Adjacent to, and partially within the engine house will be a machine and blacksmith shop and tool room. All buildings will be of modern construction. Additional tracks will be laid between Union and Western avenues, which will require considerable bridge and grading work. Plans, which will be completed some time during March, are being prepared by M. A. Long, assistant to Chief Engineer F. L. Stuart.

Harrisburgh, Pa.—The Cumberland Valley is asking for bids until March 17, for the construction of the modern arch bridge, to be built over the Susquehanna river at Harrisburgh to replace the present steel deck truss bridge. The new bridge is to carry two tracks; it will have 46 spans and will be 4,000 ft. long. (January 22, p. 171.)

Kansas City, Mo.—The Chicago & Alton is contemplating the building of a 250,000 bu. grain elevator at this point. It is planned to start work some time in March. The estimated cost is $100,000.

Philadelphia, Pa.—Bids were asked for recently by M. L. Cooke, director of the Department of Public Works, Philadelphia, for building a reinforced concrete bridge to carry Broad street over the tracks of the Pennsylvania Railroad, the Baltimore & Ohio and the Philadelphia Belt Line. The proposed structure is to consist of three spans of 35 ft. each, and the greatest height will be 25 ft., with 21 ft. clearance. The city of Philadelphia is to pay 40 per cent of the cost of this bridge, the Pennsylvania Railroad 30 per cent, and the Baltimore & Ohio 30 per cent.

Rahway, N. J.—The Pennsylvania Railroad has given a contract to F. A. Havens & Co., Philadelphia, Pa., for building a shelter shed to be 230 ft. long, and a concrete platform to be 20 ft. by 900 ft., at Rahway. There will also be a small waiting room, a baggage elevator and a stairway connecting with the passenger tunnel. It is estimated that these improvements will cost about $25,000. This is part of the track elevation work now being carried out at Rahway.

Railway Financial News

Birmingham, Ensley & Bessemer.—Augustus Benners, a lawyer of Birmingham, Ala., has been appointed a co-receiver of the Birmingham, Ensley & Bessemer, representing the interests of the independent bondholders' committee.

Central New England.—See New York, New Haven & Hartford.

Cincinnati, Indianapolis & Western.—B. A. Worthington, formerly president of the Chicago & Alton, has been appointed receiver of the Cincinnati, Indianapolis & Western, a subsidiary of the Cincinnati, Hamilton & Dayton.

Des Moines & Ft. Dodge.—See Minneapolis & St. Louis.

Louisville & Nashville.—J. P. Morgan & Co., New York, have bought from the Louisville & Nashville $7,500,000 first mortgage 5 per cent Lexington & Eastern bonds. The bonds are guaranteed principal and interest by the Louisville & Nashville. The Lexington & Eastern is a line built into the eastern Kentucky coal fields of the Consolidation Coal Company.

Maine Central.—A bill has been introduced in the Maine legislature authorizing the Maine Central to retire $10,000,000 of its capital stock and to issue 5 per cent preferred stock to raise funds for retiring the $10,000,000 stock. This $10,000,000 stock is held by the trustees of the Maine Railways Company.

Minneapolis & St. Louis.—Stockholders of the Minneapolis & St. Louis and the Des Moines & Ft. Dodge have approved of the merger of these two companies under an agreement modified somewhat from the earlier one under which the merger had first been planned.

New York Central Railroad.—Judge Hough, in the United States district court, has granted a preliminary injunction preventing the merger of the New York & Harlem and the New York Central Railroad pending the outcome of the suit brought by John Scott Boyd, Jr., and other minority stockholders of the Harlem to stop the merger. The injunction was granted after the plaintiffs had agreed to drop the allegations of violation of the Sherman law and to confine their suit to the civil points involved.

New York & Harlem.—See New York Central Railroad.

New York, New Haven & Hartford.—Further details of the statement made by the directors to the Massachusetts Public Service Commission in regard to their plans for the dissolution of the New Haven system include a proposal to sell outright the real estate along the line of the New York, Westchester & Boston, having a book value of $3,799,000, and the sale of $13,709,000 notes of the New England Investment & Security Company. The New Haven proposes to retain the New York, Westchester & Boston and to retain control of the New York, Ontario & Western and the Central New England, the latter to be continued in operation as part of the New York, New Haven & Hartford.

New York, Ontario & Western.—See New York, New Haven & Hartford.

New York, Westchester & Boston.—See New York, New Haven & Hartford.

Railwaymen's Gift to the Kaiser.—It is reported that the railway employees in Germany have offered the sum of $60,000 to the Kaiser as a birthday present. The German Emperor expressed his thanks to Dr. von Breitenbach, the Minister of Public Works.

Railway Extensions in Russia.—The Russian Ministry of Ways of Communication has decided to raise the question of building a railway from the ice-free port of Kem, on the White Sea, to Petrozavodsk, the chief town of the Olonets government. Should this project be realized, Kem will be connected with the entire railway system of the Empire, as from Petrozavodsk to the station Zwanka, on the northern line, a double-track private railway is already in course of construction.

Contents

*Illustrated.

The Interstate Commerce Commission has become one of the most important branches of the federal government. Congress has imposed numerous important duties on it and is constantly giving it new ones. Its work affects the material welfare of the people more than that of any other public body except Congress and the Supreme Court. And yet, in some respects, Congress has been so shortsighted and niggardly in dealing with the commission as greatly to interfere with its efficiency. A glaring example is the persistent failure and refusal of Congress to provide the commission with proper office accommodations. It long since outgrew its original offices, and its various departments and bureaus are today dispersed through five different buildings in the city of Washington. Furthermore, its members and its staff who have offices in the Interstate building and the American National Bank building, which are directly connected, are packed in like sardines in a box. With its quarters thus crowded and its organization thus dispersed the difficulties encountered in doing its work efficiently are far greater than they need be. The commission repeatedly has asked Congress to provide for the erection of a suitable building for it or to let it lease one for a reasonably long term. But, while Congress can find the money with which to build $100,000 postoffice buildings in $10 county seat towns all over the United States, it has not been able to persuade itself to provide properly for the housing of this important branch of the government. The way in which the commission has been treated in this regard is discreditable to Congress and the nation, and ought to be changed at the earliest possible date.

The Housing of the Commission

The Oregon-Washington Railroad & Navigation Company in defending the suit of one Chadwick, in an Oregon court, has secured a judicial decision sustaining the binding force of the company's train rules, even, apparently, in the face of careless non-enforcement; the decision being to the effect that the rules "establish the standard by which care is determined; and, though custom may interpret the rules, it cannot contradict them." This is, of course, the only logical view. But, though a bad custom cannot destroy a good rule, it can defy the good superintendent who does not enforce his rule. Again, innumerable situations will arise where a conductor or brakeman must use his best judgment as to whether he is or is not obeying a given rule. Take the flagging rule, for instance. To wait sixty seconds, or two minutes, or longer, before starting back may be disobedience to the rule, or it may be an interpretation of it. But, whatever the difficulties, the responsibility is always resting on the individual employee to take good care that he is not going contrary to the requirement of the rule. In other words, the employee must always be supposed to possess and exercise judgment and discretion; and also to have a conscience. Without these no train rules can be carried out successfully. Train-running is too complicated a business to be subjected to rules, like those of the shoveler, or the water carrier, which so fully fit the case as to need no interpretation. In actual, every-day practice this court decision does not help us much. The employee who claims that, in a given case, he has been justified in acting contrary to a rule, because infractions have been constantly winked at, may be expected to put up a strong fight; and unless the officer's position is impregnable he is likely to surrender—either at once or after a brief and feeble defense. Moral: Don't depend on the court for stiffening of rules; punish rule-breaking at sight.

Train Rules in Court

The advocates of the standard box car will find food for thought in the article by R. W. Burnett, general master car builder of the Canadian Pacific, which appears elsewhere in this issue. Mr. Burnett says plainly that he is not in favor of a standard box car, and it is refreshing to read such a "straight from the shoulder" argument as is given in this article. His statement regarding the cost of the present-day repair bills had a standard box car been adopted ten or fifteen years ago is worthy of attention, and it may be pertinent to consider this also from the standpoint of loss and damage claims. The standard box car, it will be remembered, was first suggested by the American Railway Association, which in November, 1912, and again in May, 1914, passed a resolution requesting the Master Car Builders' Association to design and adopt a standard frame for closed cars in accordance with the present standard inside dimensions of box cars. In May, 1914, the Executive Committee of the American Railway Association appointed a special committee, of which E. P. Ripley, president of the Atchison, Topeka & Santa Fe, is chairman, to consider the subject of standard freight car equipment. This

Design and Construction of a Standard Box Car

committee has appointed a sub-committee with George L. Wall, of the Lima Locomotive Corporation, as chairman, the other four members being representatives of car-building companies. It is understood that the Master Car Builders' committee on Car Construction and Car Trucks are working up designs of a standard car, in accordance with the American Railway Association resolution, which will be presented to the association for consideration at the next convention.

LIMITING THE LENGTH OF TRAINS

THE *Railway Age Gazette* has often commented on the fact that while shippers frequently have made organized efforts to get reductions or prevent advances in rates, they seldom have made organized efforts to prevent action which would increase railway expenses, although such action directly tends to cause raises in rates. All over the country railway employees and politicians have been getting passed train crew laws and similar legislation. Although such legislation directly concerns everybody who pays railway rates or uses railway service, the Farmers' Union and the Commercial Club Secretaries' Association of Texas have been almost the only bodies of shippers making representations to their legislatures against it.

But shippers elsewhere are awakening to which side their bread is buttered on. A bill to limit the length of freight trains to a half-mile has been introduced in Indiana. The Indiana Grain Dealers' Association and the Indiana Millers' Association are opposing it. In a public statement Charles B. Riley, secretary of these organizations, announces that 600 firms have petitioned the legislature not to pass the bill. Mr. Riley says: "The greatest embarrassment to shippers in the past has been due to failure of the carriers to supply adequate equipment with which to move the tonnage. But now that the size of locomotives and cars has been increased, and grades and curves removed, 100 or more loaded cars can be hauled with greater ease, safety and celerity than formerly prevailed in handling 50 cars. The public which has to cross railroad tracks should favor the largest possible unit for freight trains since the hazard connected with operating a large number of trains is reduced correspondingly with a reduction of trains."

These sentences indicate two strong arguments against train limit laws. The so-called "car shortages" of the past have been shortages of all kinds of facilities. Many roads have had enough cars, but not enough engines to move them. Train limit legislation, by restricting the number of cars hauled by each engine, would aggravate the effects of a shortage of locomotives. One of the arguments made against long trains is that they sometimes block the streets of towns. But a train of 25 cars may block a street as effectually as a train of 100 cars; and the shorter and, therefore, more numerous trains are, the more frequently will highways be blocked by them.

The two strongest arguments against train limit legislation are, that it will increase both railway expenses and railway accidents. It will do so for the following reasons:

1. The railways have bought at increased cost locomotives of an increased tractive power. If the law prevents these locomotives from hauling as many cars as they can the investment in the unused part of their tractive power will be rendered valueless and at the same time the roads will be forced to buy more locomotives.

2. The railways have spent large sums to reduce grades and curvature and build longer passing tracks, to enable them to haul longer trains. They expected the saving they would make in operating expenses by hauling longer trains to exceed the addition to fixed charges which would be caused by the investment made in reducing grades and curves and building longer passing tracks. If they are prohibited from hauling long trains the entire investment made for these purposes will be rendered valueless, while the fixed charges on the investment will still have to be paid.

3. By reducing the length of trains and thereby increasing the number of trains that must be run the proposed legislation would make necessary a proportionate increase in the fuel consumed and in the number of engineers, firemen, conductors, trainmen and all other employees directly and indirectly connected with train operation. Every cent of the additional expenditure for fuel and wages thus caused would be absolutely wasted.

4. Other things being equal, an increase in the number of trains run increases the number of accidents. To prevent an increase in accidents resulting it is necessary to build additional trackage, install additional signals and make other investments in additional facilities. But if these additional investments be made the prevention of an increase in accidents will be secured at the price of an increase in operating expenses and fixed charges all along the line.

It is superfluous to say that it is against the interests of those who use the service of railways to have the hazards of their operation increased. It is superfluous to say it is against the interests of those who pay railway rates to have their fixed charges and operating expenses unnecessarily increased. Within recent years many railway measures which have been entirely indefensible from the standpoints of both economics and safety have been introduced in the state legislatures and in Congress. Among all these measures there has not been one which has been so utterly incapable of being advocated on any rational pretext as the train limit bills. How self-respecting and intelligent railway employees can permit the legislative representatives of their brotherhoods to ask for such legislation we cannot understand. How any lawmaker with a ray of intelligence or a particle of self-respect or public spirit can vote for it we cannot understand. The grain dealers and millers of Indiana are amply justified in opposing it. It ought to be opposed by the traveling public and by all classes of the shipping public. The greatest factor which has enabled the railways of the United States to haul freight cheaper than any other railways in the world, while paying the highest wages in the world, has been their success in increasing their freight train loads. To limit the size of their train loads would be to strike the most deadly blow possible at the efficiency and economy of their operation.

THANK YOU FOR THE COMPLIMENTS!

OUR thanks to Warren S. Stone, grand chief of the Brotherhood of Locomotive Engineers! After reading some of the compliments he paid to the *Railway Age Gazette* at the hearing in the arbitration between the western railways and their engineers and firemen, we are reminded of the old story of the Southern darky who was asked by a Northern white man to change a ten-dollar bill. "I cain't change no ten-dollar bill, boss," said the darky, "but I thanks you for the compliment."

A. W. Trenholm, chairman of the Conference Committee of Managers, was on the witness stand on February 24. Mr. Stone was questioning him. Thereupon the following colloquy took place, the italics used being our own:

"Mr. Stone: For example, the *Railway Age Gazette*, which is the official organ of the railways and speaks for them—

"Mr. Trenholm: Is that right? Have they got the authority to speak for the railroads?

"Mr. Stone: They generally do, anyway.

"Mr. Trenholm: They haven't mine.

"Mr. Stone: The *Railway Age Gazette* of July 24, 1914—

"Mr. Nagel: Did you want to answer that last statement?

"Mr. Trenholm: They do not have the authority to speak for the railroad I am connected with.

"Mr. Stone: *But they do quote about all the authorities of the different railway experts on all the different subjects and questions that come up, do they not?*

"Mr. Trenholm: They invite from railroad officials and mechanical people communications on different subjects and publish them; and when I write an article and sign it, they are authorized to speak for me, but when I do not, they are not.

"Mr. Stone: And they do have first hand information in regard to all railroad information, and details, long before any other publication is given them, do they not?

"Mr. Trenholm: Not so far as I know.

"Mr. Stone: *Is it not a fact that anything new, strange or startling that happens to any railroad is first seen in the Railway Age Gazette?*

"Mr. Trenholm: Well, I think they make a specialty of trying to treat

with those matters, locomotives, and all things of that kind. That is the business of the paper. But so far as having any inside track is concerned, I do not know anything about it.

"Mr. Stone: Then, perhaps, taking it for granted they have not any inside track, *how do they always get this information before any other publication does?*

"Mr. Trenholm: Well, I do not know their methods. I have had many communications from them asking questions, and some I have answered and some I have not."

Modesty compels us to say that Mr. Stone was partly wrong in his references to this paper. The *Railway Age Gazette* is not "the official organ of the railways" and does not "speak for them." The *Railway Age Gazette* is published by a private corporation, not one dollar of whose securities is owned by any railway company or railway man, and it expresses the views of its editors and of nobody else on earth. Usually its views coincide with those of railway men, but often they do not; and it always says what it thinks regardless of what they think. If it were the "official organ of the railways" many things which have been said in these columns about grafting, high finance and accidents, for example, would never have been said. We thank Mr. Trenholm for having set Mr. Stone right. We haven't Mr. Trenholm's or any other railway man's authority to speak for him, and we haven't any railway company's authority to speak for it. The railways are our patrons, just as the railway supply concerns are. That is the only relation we have to either of them; and we get a lot more business from supply concerns than from railways.

Continuing his questions, Mr. Stone implied that the *Railway Age Gazette* "quotes about all the authorities of the different railway experts on all the different subjects and questions that come up"; that "anything new, strange or startling that happens to any railroad is first seen in the *Railway Age Gazette*"; and that this paper "always gets this information before any other publication does." Here Mr. Stone was on firmer ground. We are unable to deny these various soft impeachments. Blushingly we admit them all. They show that Mr. Stone is one of our diligent and well-informed readers. We regret that in spite of his frank and flattering recognition of our leadership in our field he does not always accept our views, especially those occasionally expressed regarding the Brotherhood of Locomotive Engineers and its distinguished grand chief. But the fact that these little differences of opinion do arise make us appreciate Mr. Stone's good opinion all the more.

It is evident, however, that in his colloquy with Mr. Trenholm Mr. Stone did not get all the information he wanted. He showed an earnest desire to learn why it is that "anything new, strange or startling" that happens in the railway world is "first seen in the *Railway Age Gazette*," and how it "always gets this information before any other publication does." He seemed to think this must be because the *Railway Age Gazette* has some intimate underground connection with the railways. The truth is much simpler than that. The *Railway Age Gazette's* success in "always getting information before any other publication" is due solely to the fact that it has a large editorial staff; in fact, the largest editorial staff of any technical journal in the world, a majority of whose members have had experience in railway service; and that its editors are always on the job. And being on the job does not mean being at their desks. It means being wherever there is an important railway convention, arbitration hearing or rate case to report, or a new locomotive or a piece of new railway construction to describe. In the year 1914 one of our editors traveled 19,000 miles on 11 railways in this country and 8 in Europe—and this was 11,000 miles less than his usual annual mileage on railways. In the same year another of our editors traveled 18,520 miles on 17 railways in this country. Another traveled 20,000 miles on 23 railways in this country and one in Canada. Another traveled over 8,000 miles on six roads; another 6,000 miles on 25 roads; another 5,500 miles on 18 roads, another 5,400 miles on 11 roads. Every mile of this traveling was done for the purpose of getting editorial material for the *Railway Age Gazette;* and every mile was paid for in hard cash.

If information doesn't come to our editors they go and get it. And this, we confide to Mr. Stone, is the sole secret of the success of this paper in getting railway information ahead of other publications. We will confide something else to him. This is that, contrary to his impression, we do not *always* get information before any other publication does. But in saying that we do, he was very close to the exact truth; and we have no disposition to pick a quarrel with him for having very slightly exaggerated our efficiency!

ECONOMICAL RETAINING WALLS

THE justification for the use of retaining walls of the common mass or reinforced concrete design was seriously called in question in the discussion at the meeting of the Western Society of Engineers last Monday night following the reading of the paper on "Retaining Walls on Soft Foundations," abstracted elsewhere in this issue. As was well emphasized in a written discussion by Onward Bates, such walls are very expensive in comparison with other methods successfully used for retaining material, notably the tie cribs frequently built along operated tracks to prevent the flowing of filled material, and the plank cribbing commonly found in coal yards to retain the stored coal.

In the Rock Island track elevation work now under way at Chicago the mass retaining walls 30 ft. high cost about $115 per lineal foot, while cribs of old ties used to protect the operated track were built at a cost of $0.20 per lineal foot. Retaining walls on this work 18 ft. high, which is a common standard for track elevation projects, cost $31.82 per lineal foot, being supported on spread foundations. It must, of course, be remembered that the cribs were only temporary, and they were not advocated as a substitute for mass walls by engineers who have given the subject the most study. However, walls made by cribbing up reinforced concrete members of about the same size as track ties have given satisfactory service on several roads, and on the Chicago & Western Indiana the cost of such walls from 7 to 8 feet high is stated to be from 14 to 17 per cent of that for a mass wall for the same location. This indicates that at least for low walls the crib design retains its economic advantages when built of a permanent material. Further study along this line would be profitable if only to determine the limits within which such a crib wall is advantageous.

Another point suggested in Mr. Bates' comments on the paper is the possibility of utilizing the wall section to better advantage than is done in common mass design, the so-called cellular wall developed by the Chicago, Milwaukee & St. Paul for the track elevation at Milwaukee being an example of this possibility. He showed that in the ordinary walls, if piles are used to support the toe they can rarely ever be placed in sufficient numbers where they are needed, and in all cases a large mass of concrete is placed in the footings for the sole purpose of preventing the top of the wall from tipping or sliding out of place. Comparisons of the symmetrical cellular type illustrated in Mr. Lacher's paper and a typical mass design for a fill 17 ft. high, show a lower sectional area for the former in all cases, this area being less than half for two of the three cases considered where the wall was assumed to be 24 ft. 6 in. and 27 ft. 6 in., respectively, from the center of the adjacent track. In this design the two face walls support each other by the tie walls connecting them, and even the poorest foundation material could support the weight of these walls as no pressure is carried down to their footings from the fill or the live load.

A similar design is being used on the Long Island end of the New York Connecting Railroad's approach to the Hell Gate bridge. In this case the walls are reinforced by 8-in., 16-lb. channels at 10-ft. intervals, vertically and horizontally, and 2¼-in. tie rods are provided at each intersection. Concrete cross walls are spaced about 70 ft. apart, and the fill is placed in each of these sections in thin convex layers carefully rammed so as

practically to eliminate horizontal pressure on the walls. The extreme height of these walls, 72 ft. in the maximum, made this unusual precaution advisable.

The discussion showed a general opinion that too much has been spent for some retaining walls and that possibly a part of the excessive cost is caused by trying to design a wall in which there will never be the slightest movement. The tendency in the face of increasing land values and increasing traffic on the railways is of course to build all structures with greater consideration of permanence, and this tendency is probably justified in many cases. It is worth considering, however, if too much is not being paid for the degree of permanence secured in some retaining walls. A careful analysis of the costs and the advantages and disadvantages of the various types for the particular conditions surrounding the Milwaukee track elevation work is included in Mr. Lacher's paper. The same conclusions might not be reached, however, under different conditions, and a careful study of the requirements for any particular retaining wall and all the possible methods of meeting them will be well repaid by the lower annual charge on the work.

FUEL COSTS AND TRAIN LOADING

IN the endeavor to effect economies in railway operation, attention naturally has first been directed to the larger classes of expenditures, any reductions in which have correspondingly great effects on the total. One of the items entering prominently into the cost of railway operation is the cost of fuel. The report of the Interstate Commerce Commission for the year ending June 30, 1912, shows that practically $225,000,000 or 11.83 per cent of all operating expenses was expended for fuel. This is two-thirds of the amount spent for wages of yard and road enginemen and trainmen. In seeking to promote improvement in this field the problem divides itself immediately into two sections, each of which must be treated separately. The education of the firemen and enginemen in the proper use of fuel is now receiving a great deal of attention and the results secured along this line on the Chicago, Burlington & Quincy, the Chicago Great Western and other roads, have been related in these columns.

Mr. Price emphasizes the importance of the second division of this problem in his article in another column. The conservation of fuel by using it in such a manner as to secure the greatest amount of productive work from it, is a problem which depends for its successful solution upon the chief despatcher, the trainmaster, the superintendent and other men having supervision over train loading as well as on the engine crew, and the best endeavor to conserve fuel on the part of the enginemen will not overcome the results of inefficient train loading. The economy of handling tonnage trains is fairly well realized in the abstract. However, it is not as well realized from the standpoint of its effect on fuel supply.

When the tonnage rating on a division is increased it very frequently meets with the open opposition of the train and engine crews as well as of the traveling engineers and trainmasters. However, if they can be shown that in many cases these increases are made with the use of a relatively small increase in the amount of fuel burned the opposition will be at least partially overcome. This condition was illustrated in a striking manner by the experience of one western road during the past year. Becoming convinced that the tonnage rating for certain classes of engines was too low, the general superintendent ordered that it be increased 100 tons. He at once encountered the active opposition of the traveling engineers particularly. After a couple of months, however, these men saw that the number of ton-miles handled per unit of fuel consumed showed an increase, resulting to the credit of their division in comparison with other divisions on the system. Their attitude was immediately changed and the general superintendent now has their hearty co-operation in raising the ratings still higher. Thus in the endeavor to secure the greatest amount of work from each unit of fuel the entire responsibility for improvement does not lie with the engineer and the fireman, but the superintendent and his staff as well can afford to give this subject their careful attention.

PENNSYLVANIA RAILROAD

IT would appear that the Pennsylvania Railroad in the calendar year 1914 carried out the first experiment on a very large scale in the history American railroading of a comprehensive scientific reduction in operating expenses commensurate with a reduction in both freight and passenger traffic without extending the policy of cutting down expenses to maintenance of way. The experiment was successful within the limits in which it was carried in 1914. It could not have been carried out successfully, probably, by the majority of the other large railroad companies in the country, nor can it be, probably, extended even by the Pennsylvania very much further to meet a continued falling off in traffic.

The calendar year 1914 was a black cloud for the eastern railroads without a vestige of silver lining. The total operating revenues of the Pennsylvania Railroad were $187,252,000, a decrease of $17,828,000 from the 1913 total.* Railway operating income in 1914 amounted to $35,259,000, or $3,983,000 less than in 1913. Freight traffic, measured in ton-miles, fell off 11.67 per cent, and passenger traffic measured in passenger miles, 4.31 per cent. Transportation expenses amounted to $72,234,000, a decrease of $6,021,000, or 8.34 per cent; maintenance of equipment expenses amounted to $37,144,000, a decrease of $5,841,000, or 15.73 per cent; while maintenance of way amounted to $25,020,000, a decrease of $1,315,000, or 5.26 per cent. If maintenance of way had been cut in the same proportion as transportation expenses and maintenance of equipment expenses, there would have been little loss in railway operating income for 1914 as compared with 1913. It will be seen that transportation expenses were reduced in proportion to the loss in business and this reduction was effected by a reduction in train mileage. With the ton mileage smaller by 11.67 per cent, freight train mileage was reduced 13.87 per cent; with the passenger mileage smaller by 4.31 per cent, passenger train mileage was reduced 4.73 per cent. The approximate reduction in number of employees in 1914 as compared with 1913 was 8 per cent.

The reasons why the Pennsylvania could cut its transportation and maintenance of equipment expenses proportionately to the loss in business, while the majority of other roads and the Pennsylvania itself have never succeeded in doing this before, are many and somewhat complicated; but there are two fundamental reasons which are capable of explanation. On the one hand, traffic density, both freight and passenger, on the Pennsylvania is so heavy, necessitating such frequent train service, that with a falling off in business, trains can be taken off in proportion to the loss in business up to a certain definite limit. In 1914 this limit had not been reached. The other reason was a composite one, made up of the strength of the company's credit, the confidence of the security holders in the management, the identity between the final authority and the active management, the Pennsylvania's form of organization which in matters of policy so centralizes and concentrates authority, and the spirit in which the situation which confronted the company at the beginning of the year was met.

The Pennsylvania Railroad operates 4,512 miles of road. In 1913, the year of greatest business in the history of the company, the system handled 25,025,000,000 ton-miles and 2,108,000,000 passenger miles. Thus the freight density (ton-miles per mile of road) in 1913 was 5,587,000, and passenger density (passenger miles per mile of road), 471,000. While, of course, the total capacity of the plant, exclusive of terminals, was not reached even in 1913, so great a percentage of its total capacity was then in use that the vast majority of freight traffic was handled in trains given their full rating of tonnage, and but a very small part of the freight business was handled in light trains, run because the traffic could not wait for a full train tonnage.

With a reduction of a little less than 12 per cent in ton mileage, the total ton mileage in 1914 amounted to 22,104,000,000, and the freight density to 4,899,000. Of the total 135,296,000

* Throughout these comments the combined figures of the Pennsylvania Railroad and the Northern Central for both 1914 and 1913 are used, the Pennsylvania having taken over the Northern Central as of July 1, 1914, and added it to the Erie division to form the Central division.

tons carried on the Pennsylvania in 1914, 69,962,000 tons, or more than half, was coal and coke. The total tonnage of all commodities in 1914 was less by 19,913,000 than in 1913. The tonnage of anthracite coal was slightly larger in 1914 than in 1913; but the total net falling off in coal and coke tonnage amounted to about 8,300,000 tons, and the decrease in tonnage of iron and of castings and machinery amounted to another 2,982,000 tons, so that out of the total loss of 19,913,000 tons, 11,282,000 tons was in tonnage which moved almost exclusively in drag freight trains. To meet the loss in this tonnage it was simply necessary to run fewer drag freight trains. As a matter of fact, with the large loss in tonnage and the large proportion of that loss in low grade freight, the Pennsylvania Railroad's average revenue freight train load in 1914 was 722 tons, an *increase* of 18 tons over the previous year. It would be hard to conceive of more striking testimony to the success of the Pennsylvania operating officers' work in 1914.

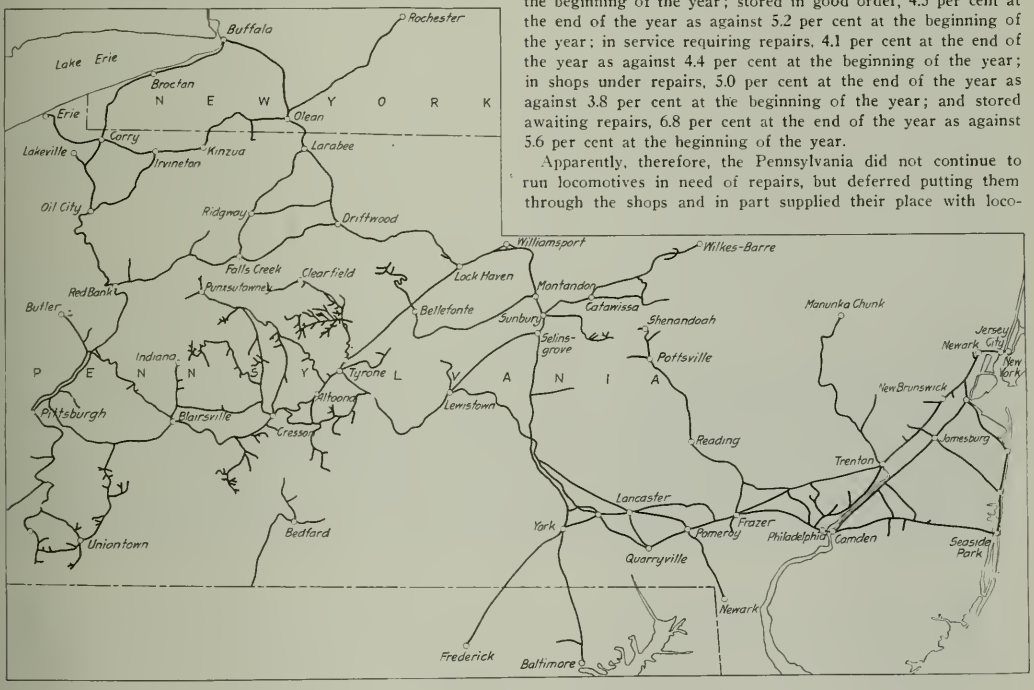
The Pennsylvania allocates its expenses as between freight and passenger, and although the allocation is made on an arbitrary basis, the figures arrived at are accurate for comparative purposes. The freight train revenue per train mile in 1914 was $4.25, an incease of $0.144. Expenses per train mile amounted to $3.135, an increase of $0.076, so that net per train mile was $1.115, an increase of $0.068.

In cutting off passenger train mileage the management was almost as successful as in freight train mileage; but probably largely because of the operation of the full-crew law during all of 1914, the increase in passenger train expenses per train mile offset the economies made through a reduction in train mileage. The total number of passengers carried one mile in 1914 was 2,017,000,000, a decrease as compared with 1913 of 91,000,000. The average revenue per passenger train mile in 1914 was $1.60, an increase of $0.021. The expenses per train mile in 1914 were $1.609, an increase of $0.071. There was, therefore, a net loss in the year 1914 per passenger train mile of 9 mills as compared with a net revenue in the year 1913 of 4.1 cents.

Besides the reduction in transportation expenses there was a reduction in the amount spent for maintenance of equipment of $5,841,000, the total in 1914 being $37,144,000. This is deferred maintenance, in the sense that the cost of repairs which were needed in 1914 and not made will have to be paid for out of earnings of some other year; but unlike deferred maintenance of way expenses, they will not have to be paid for twice. The distinction is important in the case of the Pennsylvania, although under other circumstances it might be just as much of a false economy to defer expenditures on maintenance of equipment as on maintenance of way. What happened in the Pennsylvania case is shown by the following figures: Total locomotive mileage in 1914 amounted to 103,006,000, a decrease of 13,345,000, or 13 per cent; freight car mileage amounted to 1,268,000,000, a decrease of 149,000,000, or 10.5 per cent. The percentage of locomotives in service in good working order at the end of 1914 was 73.6 per cent, exactly the same percentage as at the beginning of the year; stored in good order, 4.5 per cent at the end of the year as against 5.2 per cent at the beginning of the year; in service requiring repairs, 4.1 per cent at the end of the year as against 4.4 per cent at the beginning of the year; in shops under repairs, 5.0 per cent at the end of the year as against 3.8 per cent at the beginning of the year; and stored awaiting repairs, 6.8 per cent at the end of the year as against 5.6 per cent at the beginning of the year.

Apparently, therefore, the Pennsylvania did not continue to run locomotives in need of repairs, but deferred putting them through the shops and in part supplied their place with locomotives which had been repaired in previous years and were stored in good order. Of course deferring maintenance expenses in this way, if there was any prospect of a large and sudden increase in business, would be poor economy. Repairs could be more cheaply made in slack times, but there is no present prospect for a sudden large increase in business on the Pennsylvania. The deferring of repairs, therefore, is not a grossly false economy. When the repairs to the equipment are made, present prospects are that they will cost little, if any, more to make than they would have in 1914.

Deferring maintenance of way, however, on a road like the Pennsylvania is an entirely different matter. A falling off in train mileage of 10 per cent. decreases the actual cost of maintenance of way, if the same standard is to be maintained on the Pennsylvania, by only 2 or 3 per cent. If, however, track is



Pennsylvania Railroad

allowed to deteriorate from standard, the expenditures necessary to bring it back, maybe 2 to 3 or 4 times as great, to those that would have been necessary to maintain it at standard.

The Pennsylvania executive officers are not the only railroad men in America who believe these principles are a fact beyond dispute; but the peculiar situation in regard to the strength of the company's credit and final authority being vested in the management has given the Pennsylvania officers an opportunity to live up to what they believe, where the great majority of other railroad officers have not been so fortunately placed. In 1913 the Pennsylvania spent the largest amount for maintenance of way in any year in its history and its appropriations were generously ample. In 1914 there was $25,020,000 spent on maintenance of way, or only $1,315,000, 5.26 per cent, less than in 1913.

Toward the latter part of 1913 it had become unmistakably plain that there would be a very heavy decrease in traffic in 1914. The Pennsylvania management, after probably very careful deliberation, decided on the policy of economy without *arbitrary* reduction in allowance for maintenance or any other expenses which was later carried out. The operating officers had the situation explained to them very fully. Any reduction in maintenance of way expenses had to be justified as carefully as an increase in expenses would have to be justified. No reduction of any class of expenses was to be made in such a way as might prove uneconomical in the long run. In other words, so far from sending out orders that shop forces must be cut, section men laid off, etc., headquarters put it up to the operating officers not to make reductions in expenses that would prove false economies.

In 1914 the Pennsylvania spent $14,486,000 for additions and betterments. The most important construction work now in progress is summarized in the construction news columns of this issue, and it is only necessary to mention here that the electrification of the main line is proceeding without interruption; that the telegraph and telephone wires between Broad street station and Paoli, Pa., and Jersey City to Rahway, N. J., have been completely placed underground, and the work of placing wires underground between New York and Philadelphia is being carried out.

During 1914 the Pennsylvania sold no securities, but since the close of the year has sold $49,000,000 of its consolidated mortgage 4½ per cent. bonds, which sale makes the consolidated mortgage practically a closed one, almost the entire $100,000,000 bonds which can be issued under it being outstanding. There are $86,827,000 convertible bonds due October 1, 1915. Stockholders had already authorized the issue of $31,000,000 additional securities and at the annual meeting on Monday last authorized an additional issue of $40,000,000, making a total of $71,000,000 securities which may be issued to refund that portion of the $86,827,000 maturing October 1 not provided for by the sale of the $49,000,000 consolidated mortgage bonds and for any other purpose.

The Pennsylvania had on hand December 31 (before the sale of the consolidated mortgage bonds, of course) $15,587,000 cash and $18,648,000 time drafts and deposits. There were $5,110,000 loans and bills payable.

The table shows the principal figures for 1914 and 1913:

	1914	1913
Average mileage operated	4,512	4,512
Freight revenue	$131,158,930	$147,317,395
Passenger revenue	38,977,848	40,599,628
Total operating revenue	187,251,851	205,080,112
Maint. of way and structures	25,019,605	26,334,595
Maint. of equipment	37,143,533	42,984,269
Traffic expenses	2,316,127	2,847,024
Transportation expenses	72,234,108	78,255,026
Miscellaneous	2,624,137	2,653,376
General expenses	4,954,732	4,923,127
Total operating expenses	141,292,243	154,997,418
Taxes	7,689,523	7,840,853
Net operating income*	35,258,772	39,241,841
Gross corporate income	51,792,223	57,712,898
Net income	34,090,765	41,920,833
Sinking and reserve funds	1,785,243	1,882,775
Dividends	29,952,186	28,394,248
Income appropriated for additions and betterments	2,230,336	6,787,583
Held in reserve	.....	2,500,000
Surplus	123,000	540,602

*The figures down to and including net operating income are for the combined properties—the Pennsylvania Railroad and the Northern Central—for both years. The figures below are for the Pennsylvania Railroad, and the Northern Central in the last half of 1914, for 1914. There is not, however, any serious discrepancy in the comparison, because previous to July 1, 1914, the Northern Central paid dividends to the Pennsylvania and its dividends were guaranteed by the Pennsylvania.

Letters to the Editor

CHEMICAL SPECIFICATIONS FOR BRAKEBEAMS

Franklin, Pa.

To the Editor of the Railway Age Gazette:

In a letter on this subject, published in the *Railway Age Gazette*, November 20, 1914, page 940, I stated: "I know of one mill that is rolling sections for the solid type of beam from scrap steel axles."

I find that I was in error in making this statement, as I am informed that axles are not used for this purpose; therefore, not wishing to do an injustice, I retract the statement. There have, however, been thousands of brakebeams made, the members of which were rolled from scrap high carbon steel rails.

B. Haskell, M.E.

ARE THE COMMISSION'S CONFERENCE RULINGS LEGALLY BINDING?

Harrison, Ark.

To the Editor of the Railway Age Gazette:

There are, no doubt, numerous railroad officials in all parts of the United States, whose early training and closely defined duties, have not made possible a satisfactory understanding of the various legal matters confronting the operating man of today.

For their benefit would it not be possible to briefly state through the columns of the *Railway Age Gazette* your views on the following:

Do, or do not, the Interstate Commerce Commission's conference rulings on the various acts to regulate commerce, have any judicial force or effect; or, in other words, considering the conference rulings in the light of working rules, would their violation invite the same penalties as obtains in connection with the Act to Regulate Commerce?

H. E. Cochran.

[It was our own opinion that the conference rulings of the commission had no binding legal effect and were not regarded by the commission itself as having such effect. We considered them merely interpretations of the law, disregard of which would bring punishment only if the courts should hold the rulings disregarded were correct interpretations of the law. However, we submitted our correspondent's question to George B. McGinty, secretary of the Interstate Commerce Commission, who has replied as follows: "This will acknowledge receipt of your letter of February 9, in which you ask to be advised whether the conference rulings of the commission have any judicial force or effect, and whether a deviation from a conference ruling is prohibited under the same penalties as are violations of the act to regulate commerce. As stated in the explanatory note published in Conference Ruling Bulletin No. 6, the conference rulings of the commission are simply expressions of the commission's views in connection with matters submitted informally to it, involving special facts or requiring interpretation and construction of the law. While these rulings are to be regarded as authoritative, and as precedents governing similar cases they do not have the force of formal orders entered by the commission under the authority conferred upon it by sections 13 and 15 of the Act to Regulate Commerce. There is no penalty provided for a violation of a conference ruling, as such, but obviously if a conference ruling is a correct interpretation or construction of the law, a deviation therefrom would necessarily involve an infraction of the law governing the particular matter to which the conference ruling relates. The penalty, if any, would be that attaching to the violation of the law." This statement from Mr. McGinty seems to cover the matter fully.—Editor.]

Viaduct Construction on the Kansas City Terminal

A Discussion of the Conditions Governing the Design of the Many Structures on This Important Project

By A. R. Eitzen
Office Engineer, Kansas City Terminal Railway

The construction work of the Kansas City Terminal included two distinct projects, the first, primarily for the benefit of the public, being the construction of a new union passenger station, and the second, to improve operating conditions, being the reduction of grades on all main line tracks east of the station and the elimination of the grade crossings over the entire system. A general description of the entire improvement at Kansas City was published in the *Railway Age Gazette* of May 23, 1913. The station which was recently completed was described in detail in the issue of October 30, 1914. A description of the design of the subways was published in the issue of December 13, 1912. The grade reduction and the grade elimination necessitated the building of 22,000 ft. of retaining walls, 21 viaducts and 12 subways, with approximately 181,000 cu. yd. of concrete and 8,500 tons of structural steel. A description of the general and detail designs of the viaducts in connection with this work is the purpose of this article.

The topography naturally divides the viaducts into two groups; the first comprising those which are isolated and which were designed independently of each other, as, for example, those crossing the tracks near the station; and the second comprising those in the big cut east of the station which were connected by walls and necessarily had to be considered together to obtain a harmonious result. The general design of the viaducts in the first group was simple, the entire problem being to have approaches of sufficient length at the specified grade to obtain the standard clearance of 22 ft. over the tracks. The spans over the tracks are of an inverted through girder type of steel construction; that is, a type involving stringers, floor beams and main girders, but giving a smooth floor with no girders projecting above it. The approach spans have been built either of steel of the same type or of reinforced concrete, depending on local conditions. A clause in the franchise ordinance requires the structure to be of open construction to a point where 7 ft. minimum clearance is obtained. Beyond this point to the end the structure is made up of earth fill between reinforced concrete retaining walls.

In the second group the viaducts are all comparatively short, the street grade being from 20 to 80 ft. above the main line tracks. Continuous walls were built on both sides of the main line to retain the slopes and to support bench tracks. These walls vary in type in accordance with local conditions. Wherever shale beds in natural formation and resting on limestone were found, facing walls were used. Where earth was found, lightly reinforced gravity walls were built for heights of 25 ft. or less, while above that height buttressed walls were used. In many cases facing walls were constructed for a part of the height with gravity walls above. The retained bench tracks serve industries along the line and either pass under the viaducts through box abutments or, as in two cases, cross the streets at grade.

The first preliminary designs for these structures contemplated a series of three hinged, reinforced concrete arch spans with supplementary spans for the bench tracks, but a detailed study of the borings showed that this type was not feasible owing to the uncertainty of the foundations. The same design was therefore adopted for the spans over the tracks as in the first group, the face walls of the box abutments supporting the spans, while the back walls, together with wing or tail walls, supporting the earth slopes. The building of a coping across the front face of the abutments on a line with the copings of the retaining walls joining them gave the appearance of continuous walls with the bridges rising from them.

The first thing considered in the design of individual structures was their general appearance. The vast majority of people see or think little of the strength or construction of a bridge. They do usually notice, however, any obstructions of the roadway and sidewalks, the general outlines, and in addition the hand rails and lamp-posts. For this reason these points were given first consideration.

Broadway Viaduct at West Entrance to Station

The grades for all structures were carefully studied with a view to securing an unobstructed roadway. In several instances the city was requested to allow changes of grade, which improved the connections with adjacent streets and at the same time allowed this type of construction to be used. The result was that out of 21 viaducts built, 16 have no projections above the street except hand rails and lamp-posts, 1 has trusses and 2 have girders along the curb separating the sidewalks from the roadway, while only 1 has a truss and another a girder in the center of the roadway in addition to those at the curbs. On the latter five structures, local conditions made it practically impossible to change the street grade or the grade of the tracks, the cost of the changes being far in excess of the additional cost of the through girder or through truss construction over the deck construction.

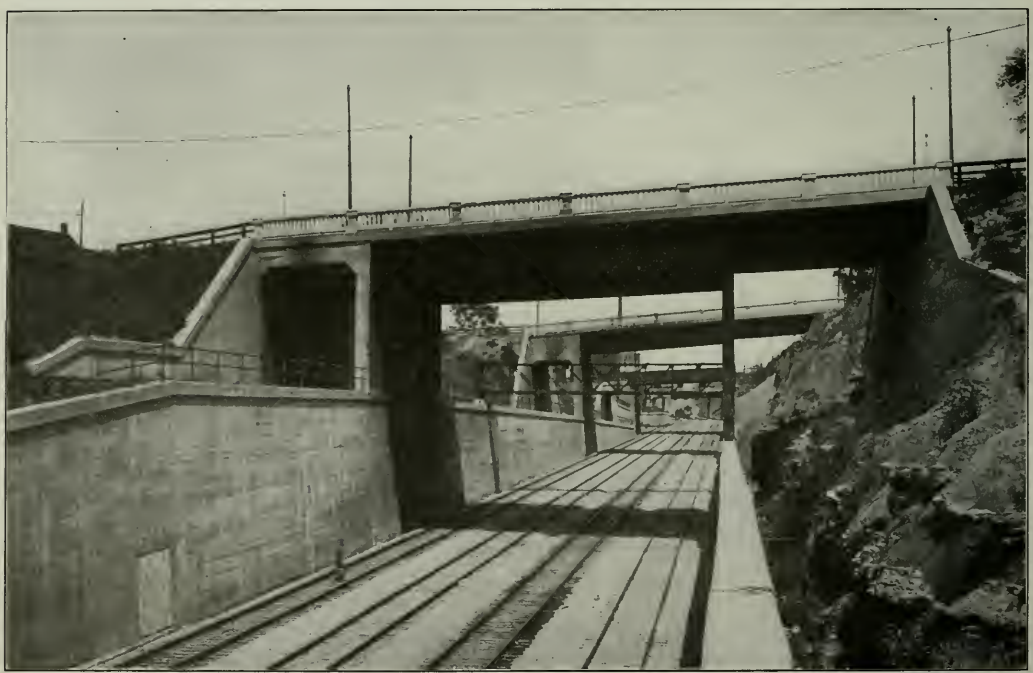
Special attention should, in this connection, be drawn to

the Pennsylvania avenue viaduct. Some question may be raised as to the advisability of designing deck plate girders with a span of 127 ft. 5 in. out to out, especially with a depth of only 9 ft. 8 in. from clearance line to top of pavement. However, it may be said that this structure is at the west throat of the station and that it was impracticable to shorten the span without badly disarranging a complicated track layout. Furthermore, Pennsylvania avenue will shortly become the chief artery connecting the north and south boulevard systems of the city, and the additional expense of keeping the roadway clear and unobstructed was considered justifiable. Ruling grades of 4 per cent were already being used on the approaches and local conditions controlled the length so that greater depth could not be obtained. This structure as well as all others had to be erected without disturbance of railway traffic and in a number of cases temporary structures for highway traffic were also provided.

The next point considered was the best appearance, consistent with economy and simplicity of design, of the structures from adjacent ones or from the back platform of trains passing under them. As a first consideration vertical curves of a length sufficient to give a smooth contour were used at all breaks in grade; second, a heavy coping of a depth sufficient to mask the ends of the sidewalk brackets, but not heavy enough to be out of harmony with the rest of the structure, was made continuous from one end of the structure to the other; third, all girders on any one structure were made of the same depth as far as practicable to preserve parallel lines for the top of the structure, the coping and the bottom line of girders. For those structures adjacent to the station, the divergence of the tracks made necessary the location of column bents at all angles. At first it was thought that this would seriously detract from the general appearance, but it was found that if the girder lines, which are mentioned above, were kept smooth the location of bents had little effect.

The hand rails are of reinforced concrete unit construction and consist of posts 15 ft. to 20 ft. center to center, upper and lower rails, balusters and blocks. Dowels to anchor the hand rail posts were set when the floors of the viaduct were cast. The method of erection was as follows: First, small square blocks to support the ends and third points of the lower rails were placed; next, the lower rails were set in position; then the posts, which are hollow and also notched out for the rails, were set over them and all were accurately lined; the balusters and top rails were then placed in position; the posts filled with concrete to anchor them to the floor of the viaducts and the caps placed on the posts, the ⅛ in. joints left between balusters and rails and between rails and posts to give ease of erection were then carefully pointed. Expansion joints were left in one side of each post.

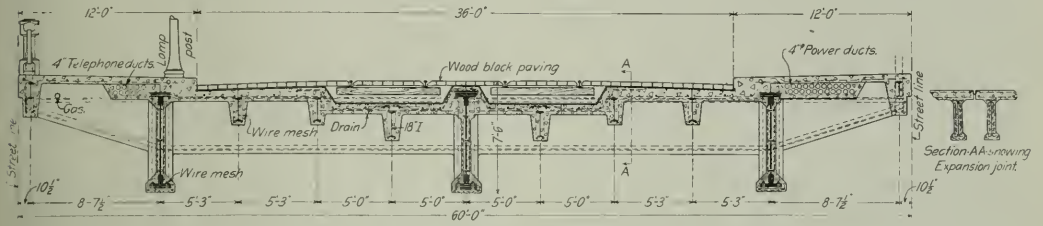
The lamp posts are of reinforced concrete surmounted by a single 100-watt lamp and 14 in. globe. They are arranged to be lighted by electricity but by removing the cables from the conduits and using a gas fixture and globe, gas may be used. A two-inch conduit is run in the curb on each side of the street to feed the lamps. At each post a pull box is inserted and a half-inch conduit carried from the pull box to the top of the post. Of course if gas is used the pipes must be connected through the pull boxes. A standard connection has been provided for this contingency. The lamp-posts are turned on a lathe, the method of manufacture being similar to that of making pottery. Lamp posts and hand rails have a sand finish, while the sidewalks have a float finish.



Typical Structures Built in Connection with Wall Construction

Provision was made for street car tracks on all structures as provided for in the franchise ordinance as well as conduits for the telephone and power companies and supports and protection for water and gas pipes. It may be mentioned in passing that proper provision for conduits and water and gas

pipes is one of the most difficult parts of the design of city bridges. The conduits used were of 3½-in. fiber laid with a minimum of ¾ in. of grout between ducts. The only difficulty experienced in their use was an inclination to float when the concrete was poured. This was prevented by setting pieces of wire in the green concrete of the slab supporting the ducts and using these to fasten pieces of reinforcing bars over the ducts before grouting them in. Inserts were built into the floor on the lines of the water and gas pipes to support hangers from which the gas pipes and the slabs protecting the water pipes will



Cross Section of Charlotte Street Viaduct Showing Typical Construction

be hung. The slabs supporting them are generally 2 ft. 2½ in. wide and reinforced with wire mesh. They will be built in units of about 5-ft. lengths and set in place on straps supported from hanger rods.

The viaduct span lengths were usually fixed by track conditions, although there was some latitude for some of the structures at the entrances to the station. The usual method of procedure adopted in the design was to first outline a tentative cross section so as to place conduits and pipes to the best advantage. Telephone and power cables were always placed on opposite sides of the structure. A detailed study of the arrangement was then made and the elevation of stringers adjusted so as to make the form work for the concrete floors as simple as possible, at the same time not losing sight of the fact that ease of erection of the steel work was very essential. These two points were very carefully watched throughout the work. From this it must not be inferred that design was neglected, for all elements of weakness were thoroughly investigated and complete shop details conforming to the latest modern shop practice were drawn up.

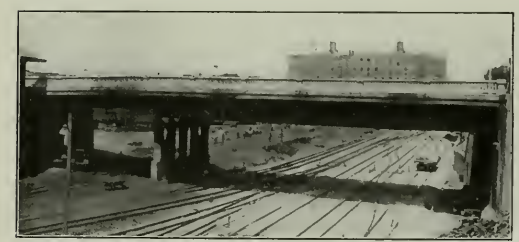
The specifications used for design, materials and workmanship were identical with the American Railway Engineering Association specifications for steel railway bridges, except for loads and a few minor points of design. The loads used were the dead loads already mentioned, a live load of two 100,000-lb. street cars on each track, the distance between end axles of adjacent cars being 10 ft., truck spacing 30 ft. and axle spacing 5 ft., the cars being assumed to occupy 10 ft. in width for each track; a uniform load of 100 lb. per sq. ft. on the roadway and 100 lb. per sq. ft. on the sidewalk. Impact allowance of 25 per cent was used for street car and roadway live loads. A 17-ton road roller was also used, assuming a spacing from center to center of axles of 10 ft. 9 in.; center to center of rear wheels, 5 ft.; load on front wheel, 11,000 lb., and load on each rear wheel, 11,500 lb. No allowance was made for impact on the roller, as this was assumed to be an occasional load. The distribution for road roller loads was assumed to be over a length of 8 in. at the point of contact and spreading longitudinally at a rate such that at any depth "D" below the pavement, the distribution would equal 8 in. plus D. Laterally the distribution was assumed equal to the width of the rollers.

Erecting a 127 ft. 5 in. Girder at Pennsylvania Avenue

Various types of construction were tried, but with the loadings used the best results were obtained by spacing the main girders either 15 or 20 ft. apart, with floor beams at intervals of 14 to 20 ft., supporting lines of longitudinal string-

ers 5 ft. apart center to center. The stringers were framed to outstanding legs of stiffeners on the floor beams. On account of the general direction of the tracks with reference to the streets, all structures were skew, but all stringers were framed square with the floor beams and all floor beams and brackets square with the girders except the end floor beams. At expansion points two sidewalk brackets and two end floor beams were always provided, one on the end of each span. The ease with which the expansion could be taken care of, especially in the concrete encased spans and in the concrete encased fascia beams of the non-encased spans, more than offset any additional weight involved, besides making the structures present a much neater appearance. Expansion joints were made by casting a piece of 3-lb. sheet lead bent into a semi-fold into adjacent spans, as shown in the accompanying drawing. The loop thus formed was then poured full of asphaltic mastic.

The concrete encased spans mentioned above probably require a word of explanation. At the time the Terminal Railway took over the old Belt Line property, there were a number of viaducts over the tracks. Nearly all of these were in serious condition due to the corrosive action of blast and smoke. A few of the later structures were concrete encased and were in much better condition. It was decided that in order to insure a long life to the structures all spans over the tracks with a clearance of 25 feet or less should be concrete encased. This work is now being done with a cement



McGee Street Viaduct

gun. As an additional protection, blast boards 3 ft. 6 in. wide are being placed over all tracks to protect the concrete from the direct blast.

In the wrecking of several of the concrete encased spans it was noticed that water had percolated through the pavement, penetrated between the concrete encasement of the beams and the steel, and cracked and loosened the encasement. For this reason it was thought imperative that all floors should be waterproofed. The waterproofing consists of three-ply fabric, two of burlap with a layer of felt between. Each coat was mopped down with asphaltic material in addition to a priming coat for the concrete. The pavement was laid directly on the waterproofing without any cushion intervening. For all grades, up to and including 6 per cent, creosoted wood block laid with lath joints was used. For steeper grades, brick was used. Along each curb two expansion joints, 1 in. and ½ in., respectively, filled with asphaltic filler, take care of lateral expansion, although it was found desirable to add additional longitudinal joints in several cases. Transverse expansion joints are placed at all expansion joints in the structure. As an additional safeguard, all street drainage was kept away from the structures as much as possible, and the drainage from the structures was conducted to catch basins at short intervals.

The wall, viaduct and subway designs were all made under the direction of George E. Tebbetts, bridge engineer, under the supervision of John V. Hanna, chief engineer. The construction work was executed under contract.

ANTI-FULL-CREW LAW CAMPAIGN

Samuel Rea, president of the Pennsylvania; Daniel Willard, president of the Baltimore & Ohio; Theodore Voorhees, president of the Philadelphia & Reading, and E. B. Thomas, president of the Lehigh Valley, have written letters to the stockholders of their respective companies, urging them to use their influence to have the full-crew law repealed.

R. L. O'Donnel, chairman of the committee representing the 21 associated roads of New Jersey and Pennsylvania, has issued a number of circulars during the past week dealing with certain local phases of the full-crew law question. To the people of a town where a new passenger station is needed, he observes that the $2,000,000, which now is being paid yearly to trainmen whose services are unnecessary, would build two hundred new stations at an average cost of $10,000 each. Mr. O'Donnel cites the stand taken against full-crew measures by the grangers of Texas, Missouri and New York. The farmers, he asserts, should help secure repeal of those laws in Pennsylvania and New Jersey, not only because they are fundamentally bad legislation, but "because of the higher prices for farm produce, making necessary increased plantings, and to meet the drawback of lack of labor." Farmers and business men of Kansas made such sharp protest that the bill which had been introduced in the legislature of that state was killed February 13 in the senate committee.

An effort to enact an excess crew law in West Virginia met with general opposition, and the bill was reported adversely by the legislative committee to which it was referred. In Alabama a legislative committee, after public hearings, concluded that the contentions of the trainmen's union were not well founded and that the measure would only compel employment of extra men not needed on the trains. The bill was consequently adversely reported.

In the state of Washington a bill has been agreed upon by committees of both the senate and the house, which in effect will repeal the full-crew law of that state and leave it to the Public Service Commission to say how the trains shall be manned.

Trainmen are trying to make the point that the railroads seek repeal of the laws in order to underman trains, even to the point of risking safety of passengers and reducing efficiency of operation. Nothing, says Mr. O'Donnel, could be further from the fact. "The best evidence that the railroads would not underman trains is afforded by what they are now doing. Thirteen railroads in Pennsylvania and New Jersey are operating 344 passenger and 446 freight trains manned in excess of what the law requires." He quotes Louis D. Brandeis, "best known of all critics of railroad affairs in the United States," who endorses the position taken by the railroads of Pennsylvania and New Jersey. In an interview at New York February 25 he says: "The railroads appear to me to have the better end of the full-crew argument. They seem to have made out a very good case. The full-crew laws are cumbersome and in an awkward way aim to accomplish something which a commission could do much better."

At last there promises to be a fair and open debate on the full crew question. Francis P. Boland, a brakeman of the Pennsylvania Railroad, who is also a member of the New Jersey legislature, sent a challenge to Mr. Rea, president of the Pennsylvania, asking that he, or such officers as he might designate, debate publicly the question how the law operates on the Pennsylvania in the State of New Jersey. Mr. Rea accepted, and the debate will take place at Elks' Hall, Jersey City, on the evening of Tuesday, March 9. Among several employees who asked the privilege of taking up the argument on the side of the company Mr. Rea has selected H. J. Fackenthall, an engineman who runs between New York and Philadelphia. Mr. Fackenthall has been prominent in the "safety first" work on the Pennsylvania, and is an experienced speaker.

SOME MAXIMA AND MINIMA IN TRAIN OPERATION*

By Alfred Price
Assistant General Manager, Canadian Pacific, Montreal

It has become a trite saying that a railway company has nothing to sell except transportation, but in order to sell its sole commodity it must have an ample supply available at all times, and to do so must buy a variety of materials.

During the past ten years almost every item it uses in construction and in the operation and maintenance of its property has increased in price. For example, steel rails, telegraph poles, car sills and lumber have increased by amounts varying from 29 to 54 per cent, while the wages of its enginemen, trainmen, yardmen, telegraphers and maintenance of way employees have increased from 19 to 79 per cent, an increase in all its purchases, including labor, of approximately 35 per cent.

If a commercial institution had to face the problem of securing sufficient additional revenue to offset such tremendously heavy increases in the cost of raw material and labor, it would adopt the simple and natural expediency of increasing the price of its product, so that the consumer would ultimately "pay the piper." But although a railway is a business conducted under much the same conditions as a manufactory, having many similar problems and difficulties, it does not enjoy the privilege of increasing its rates. In proof of this statement the following table, showing the earnings on all Canadian railways during the past seven years, is submitted:

Year	Passenger mile	Ton mile
1907	1.911 cents	.815 cents
1908	1.920 cents	.723 cents
1909	1.921 cents	.727 cents
1910	1.866 cents	.739 cents
1911	1.944 cents	.777 cents
1912	1.943 cents	.757 cents
1913	1.973 cents	.758 cents

Since 1907, therefore, the earnings per passenger per 100 miles show an increase of 6 cents, and per ton of freight per 100 miles a decrease of 5½ cents. But the ton mile units for 1913 were 23 billions, and the passenger mile units only three billions, so that the figures actually represent a very serious decrease in earnings. To be more specific, had the passenger mile and ton mile earnings of 1907 been applied to the 1913 traffic, the Canadian railways would have shown an increase in their net earnings of over $11,000,000.

But, compared to a commercial enterprise, the railway has other handicaps; it cannot, like a manufactory, for instance, close down its plant in dull times and wait until there is a demand for its product, nor can it warehouse its product, holding for higher prices. The public demands that an ample supply of transportation be kept on hand at all times whether required or not; that the railway company be prepared to take care of the "peak load" whenever an unusual demand occurs, and that the service be efficient. These demands may, or may not, be reasonable, but in any event the railway company must comply with them. In view of these demands and the constantly increasing cost of everything the railway has to buy, and the stationary, or decreasing, cost of everything it has to sell; it is absolutely necessary that the strictest economy, consistent with efficiency, be practiced, and that intelligent, scientific methods of operation be adopted.

Unfortunately, the existing lines and facilities are not likely to be taxed to handle the traffic for some time to come. It would be folly, therefore, to advocate the lowering of transportation costs by reducing grades, eliminating curves, or building better operating facilities. Instead, it is desired to suggest that, under existing conditions, there are opportunities to reduce the operating expenses, for it will be freely admitted that there is a wide field for economy on the Canadian railways without any impairment of efficiency.

*Read before the Canadian Railway Club, Montreal, December 8, 1914.

The operating official naturally desires to provide a service as satisfactory as can be reasonably expected by the public, and at the minimum cost. Efficiency and economy might well be adopted as his slogan. If he can handle the freight without damaging or losing it, he will take a long step towards efficiency, and, at the same time, will accomplish something worth while under the head of economy. Last year the Freight Loss and Damage account of the Canadian railways amounted to over $2,000,000, a sum double the amount paid out in 1911. The shipper wants the goods delivered to the consignee intact, and would gladly waive the $2,000,000 he now receives to have this done. This sum, therefore, may be regarded as a penalty imposed upon the railway for non-fulfilment of an obligation or contract. The railways are almost entirely responsible for this loss. The waste can be stopped by the adoption of up-to-date methods and insistence upon the exercise of greater care on the part of agents, billers, checkers, porters and trainmen.

For clearing wrecks and satisfying claimants on account of injuries the Canadian railways paid out last year over $1,500,000. There were no less than 710 people killed by the movement of trains, besides 2,966 injured. It is quite true that almost half of those killed were trespassers, and we are likely to continue to have a harvest of deaths from this cause every year until there is a law making trespassing a very serious offense, and a severe penalty is imposed for a violation. Most of the other fatalities and injuries might have been avoided by the exercise of ordinary care.

The largest single operating item is the fuel bill. It amounted to $28,000,000 last year on the Canadian railways. For every locomotive mile run there was consumed 113 lb. of coal for which was paid 17¼ cents. It is conceded that in order to secure the maximum tonnage with the minimum consumption everybody having to do with the running of trains must co-operate. The fireman alone might save a considerable sum of money. He now puts 11 scoopsful of coal into the firebox per mile run. If he could manage to get it down to 10, the net earnings of the railways would increase by $2,500,000. The question is, "would he do it if it was his own coal?" But it must not be left to the fireman alone. Coal can be saved by the engineer, the locomotive foreman and his staff, the yardmaster and his staff, train despatchers, operators, trainmen, and, in fact, by everyone from the superintendent to the call-boy.

It does not pay to run trains at high speeds, for aside from the greater liability to accident, and the relatively greater amount of damage and loss when an accident occurs, the service is expensive. Because of keen competition in certain territories, it would appear to be necessary to schedule some fast passenger trains, but when and where possible the actual running speed should not exceed from 45 to 50 miles per hour.

Last year the average number of passengers per train on Canadian railways was only 62, and the average number of cars was 5.6. The tonnage hauled per passenger train mile should be kept down to the minimum; on the other hand and for obvious reasons in freight service, the maximum tonnage per train mile should be handled, and all through freights should be scheduled slow enough to enable engines to pull their full tonnage under normal weather conditions. The effect of high speed upon coal consumption is not easy to express because of varying conditions, but it should be borne in mind that as speed increases beyond a certain point resistance increases and the efficiency of the locomotive decreases. As an illustration: Take a train running over an undulating subdivision with maximum grades of 1 per cent. A maximum speed of 25 miles per hour may be regarded as an economical speed, but to increase the maximum speed to, say, 40 miles per hour would result in a very material increase in the train resistance and a considerable decrease in the efficiency of the locomotive—the increase in the fuel consumed amounting to approximately 50 per cent. On a low

grade line where big tonnage is hauled, to increase the maximum speed from 25 to 40 miles per hour would necessitate a reduction of probably 50 per cent in the tonnage, and then more coal would be consumed than with double the tonnage at 25 miles per hour. Assuming, however, that the engine could handle 90 per cent of its original tonnage and run at 40 miles per hour, the coal consumed would show an increase of approximately 90 per cent.

There is an economical load for a locomotive. What that load is can be determined only by experience and by a series of tests. The maximum tonnage may not be an economical load, especially on what is known as a low-grade line. An engine given the maximum tonnage which it is capable of hauling on a line with grades of 0.4 per cent, or less, would run into overtime, the fuel consumption would be excessive and it would probably be found that the last straw, speaking metaphorically, had broken the back of the locomotive camel. On the other hand, to underload locomotives in through freight service in both directions is an inexcusable waste.

When, by tests made with a dynamometer car, it has been determined what tonnage a locomotive of a certain tractive power is capable of hauling economically over the maximum grades on a subdivision, operating officials should insist upon engines being so loaded, at least in one direction, and under normal weather conditions. Low temperature, a heavy fall of snow, a greasy rail, or any atmospheric condition that will retard the movement of a train will warrant running with a reduced tonnage, so as to permit reasonably good time being made from the initial to the objective terminal. It does not pay to haul maximum tonnage at the expense of excessive fuel consumption and overtime.

Theoretically, engines should be given their full tonnage rating in both directions, but in practice it is found that this cannot be done, as usually there is a preponderance of traffic one way, and locomotives must run in the opposite direction with reduced tonnage in order to keep the freight moving. However, under the circumstances, if engines haul the maximum load in one direction, the results should be satisfactory.

It might be well to demonstrate the effect of running trains with greatly reduced tonnage. The following statement makes a comparison of actual results on a certain subdivision, the periods "A" and "B" representing two summer months. During "B" the gross tonnage handled one mile was 87,008,449, and items indicated by "x" in "A" are based on this ton mileage:

Item	Period "A"	Period "B"
Average weight of train per mile	1,737 tons	2,133 tons
Train miles	50,136 x	40,876
Pounds coal used per train mile	129	128
Pounds coal per thousand tons hauled one mile	75	61
Cost	$22,893.55 x	$18,637.98
Saving		$ 4,255.57

The saving on this 125 mile sub-division was not due to any change in the physical characteristics of the road nor to the use of more powerful locomotives, but merely to a better loading of trains and during the month the saving amounted to $4,255.57, as above.

It will be observed that, although the average weight of train per mile during Period "B" was 396 tons more than during "A," the amount of coal consumed per train mile was approximately the same. This will not always follow, but the statement demonstrates clearly that if an engine is not overloaded, it will burn almost as much coal per mile when hauling 75 or 80 per cent. of its full tonnage as when it is loaded to its capacity. The same is true of wages and other engine and train supplies.

It is surprising the effect upon almost every operating item a small increase in the average load per loaded car would have. During 1913 the average weight of contents in loaded cars on all the Canadian railways was 19 tons—a very small load when it is considered that the average carrying capacity was 32.14 tons. An increase in the average contents would result in a decrease in the number of cars required to carry the same volume of traffic, and fewer cars would lessen the cost of locomotives, train, yard and roundhouse service, as well as some other incidental expenses.

There is now a campaign on to increase the average weight of contents of loaded cars on the Eastern lines of the Canadian Pacific in 1915, the increase aimed at being 3 tons per car. Based upon the traffic handled in 1913, when the average weight of the contents of loaded cars was 20.15 tons, it is estimated that the increased average load would represent a saving in three items alone of no less a sum than $800,000.

This sum can be saved in several ways.

(a) Select cars of large capacity for heavy freight.

If 80,000 lb. capacity cars were used to haul 100,000 bushels of wheat, the cars would be loaded up to 88,000 lb., and the whole shipment would be carried in 68 cars. To make the shipment in 60,000 lb. capacity cars the cars would carry only 66,000 lb. each and 91 cars would be used. In the former case the average weight of contents would be 44 tons, and in the latter only 33 tons. By using large cars the figures would be:

Contents	3,000 tons
Tare	1,274 tons
Total	4,274 tons

By using small cars:

Contents	3,000 tons
Tare	1,558 tons
Total	4,558 tons

Therefore, under the second plan, in addition to supplying grain doors, switching, inspecting and hauling 23 extra cars, the engines would have to haul 284 additional tons of dead weight from the point of shipment to destination and back again.

(b) Select smaller capacity cars for light and bulky freight. As the smaller capacity cars are approximately the same dimensions as the larger and weigh two tons less, they are just as suitable for hay, furniture, oats, etc., and for such commodities it is profitable to use them.

(c) Consignees who need but one car of freight at a time usually order the minimum carload, as per the freight classification. If the matter were properly represented to them, they might be induced to order in larger units.

(d) When a shipper holds an order for several carloads of freight for the same consignee and destination, it should not be a difficult matter to persuade him to load the full order in the minimum number of cars.

(e) Shippers and consignees who have suffered through car shortages in the past can be shown that the simplest way to prevent a recurrence of such a condition is by loading all cars to their full capacity. Not only will this plan avoid car shortages for a number of years to come, but it will prevent the congesting of terminals, which has also been the cause of a great deal of trouble to shippers and consignees in past years.

Another way to secure the maximum freight tonnage to the minimum tare and in the minimum number of cars is by avoiding the unnecessary movement of empty cars.

When the settlement for the use of foreign cars was on a mileage instead of a per diem basis, the principle that empties should be run in only one direction, and that opposite to the direction of the preponderance of traffic, was pretty generally adhered to. A cross movement of empties was then looked upon as exceedingly bad transportation. Since the change in the system, the penalty for holding foreign cars has been so heavy that under most circumstances it pays to send foreign cars home empty, even when to do so they must travel in the direction of traffic.

The necessity of moving foreign empties homeward promptly has probably had a tendency to weaken the hold which the transportation officer had upon the principle of moving empties in one direction only a few years ago. The principle, however, is as sound today as ever it was, but it

is conceded that, under the changed conditions, it must often be departed from.

The direction in which empties should move is naturally that opposite to the movement of the preponderance of traffic. The cost in that direction is comparatively small because the locomotives returning for loads are light enough to handle them and no additional locomotive mileage is necessary. When, however, empties are moved in the same direction as the balance of traffic, additional locomotive mileage is involved—not only so, but the empties are being sent out of a territory where they are in demand, and for every such movement, an empty must be hauled in the opposite direction to take its place, except for cars of special classes and for which there is no suitable commodity. A conservative estimate of the cost of hauling empty cars is 1½ cents per car mile. If, therefore, an empty car suitable for traffic is sent in the direction of the balance of tonnage, a distance of 300 miles, the total additional mileage involved is 600 miles at a cost of $9—a sum well worth trying to save.

During last year 24 per cent of the car mileage on Canadian railways was empty. If by some means this percentage could be reduced to say 20 per cent it would represent a large increase in the net earnings of our railways.

THE STANDARD BOX CAR—A NEGATIVE VIEWPOINT

By R. W. Burnett

General Master Car Builder, Canadian Pacific, Montreal, Que.

From time to time we read stirring articles from high railway officers on the desirability of a standard box car; these frequently take the form of a demand, a call to arms to rise and overthrow the mechanical man who, it would seem from these articles, has for many years obstructed progress and caused untold millions of expense by a failure to attain the desired end. Such articles are usually favorably commented on in the railway magazines, the impression seeming to be that the writers must of necessity be right, and the weakness of the mechanical man is sometimes apologized for with suggestions that in time he may come to see the matter in the same broad way as the higher officer.

If the box car situation is analyzed it will be found that the traffic officers and the officers who control the policies of the railroads are responsible for the diversity of box car dimensions, and that no one would be more pleased than the mechanical man if a more limited number of designs were decided on. Cars of varying or unusual dimensions, such as those of more than usual length, height or width of side door, or having large end doors or otherwise fitted for special service or use in a restricted territory; or for service which may be peculiar to the entire territory reached by the home road, are being demanded by the traffic department. It is not for the mechanical man to say that these cars, which may make 90 per cent of their mileage on the home road shall be built to the standard dimensions said by the traffic department to be unsuitable for the home service, in order that the cars may be standard for the 10 per cent of their mileage which may be made on foreign lines.

These matters can only be settled by the traffic department and others who decide on matters of policy, which affect almost entirely their own department. If persons who are at all worried about the box car situation will take the trouble to investigate, they will find that the box cars built in the last few years, especially those with steel superstructure, are costing very little for repairs. Barring wrecks, the repairs are confined almost exclusively to couplers, wheels, trucks and other parts which are all standard. If any large part of these repairs is due to a weakness in the standard the doctrine of adopting a standard box car is then proved unsound, as the standards were usually amply strong to meet the demands of service of the period for which they were designed; if weak, the design has been outgrown in the rapid development of the railways, which is the case with the car itself and which to some extent will be the case with any car that might be adopted at this or any other time.

From the large percentage of steel frame box cars built during the last few years the indications are that this design will be very largely used in the future. These cars are largely constructed of rolled shapes which seldom need renewal, even when a car is wrecked, as they can easily be straightened or reformed to the original shape at any car repair point. It has been found unnecessary to carry rolled shapes in stock for repairs, and as the parts of the cars which fail are the parts which are already standard, it is only necessary to carry in stock lining and decking, which are being standardized. The cars which are giving trouble now, and which are largely causing the uneasiness that brings forth the letters and articles referred to, are the cars which were built from ten to twenty years ago and represent the best state of the art at that time. If the best of them had been adopted as standard and had so continued to the present day, there is no doubt that the present repair bills would be about double what they are, and this to a degree is what it would mean in the way of expense ten or twenty years hence should a standard box car be adopted now.

It is true that we sometimes see appliances on cars, the value of which may be very much questioned, but it is probable that the net result of the use of these questionable devices may be on the credit side of the ledger for the railroads as a whole, as they are for the most part being developed towards some desired end with the final result that a simple and effective device is secured. It is also true that occasionally a designer makes an unfortunate mistake in some vital part of the car which results in bad failures on a certain series of cars, but these cars are usually so thoroughly advertised by the embargo placed on them by other roads that the railroads are benefited because the same mistake is not likely to be repeated.

If a box car with wooden underframe and superstructure were to be continued it would probably be advisable to go very much more into the standardizing of the parts than has been done, as the wooden car differs from the steel car in that the amount of material carried for repairs increases with the life of the car, whereas the corresponding parts do not have to be carried at all for steel underframe and steel superstructure cars, since more than enough parts are saved from fires and cars demolished in wrecks to take care of the few renewals that are required. At the Angus shops of the Canadian Pacific, where we have been ordering small lots of 250 box cars at a time to keep the shop going in a small way during the depression, every lot of cars is built slightly different; this in no way affects the desired interchangeability and will reduce the cost of maintenance. These changes are made principally for the following reasons: To protect the lading from the elements; to increase the strength; to reduce the weight, and to reduce the cost of maintenance. Examples are given below of how the conclusions are arrived at governing these changes.

Protecting the Lading from the Elements.—We have a sprinkler arranged to test a sufficient number of cars coming out of the shops to determine any possibility of leakage through the roofs, sides and ends. This is not the impractical fire hose test, but is made to approximate the worst storm conditions, and we do not stop when any weakness is found, until we find a substantial way of remedying the trouble. This is not usually done by car builders and is obviously much better than waiting for the claims department to report trouble, and the writer considers it unfair for shippers to be forced to use a car designed in all small details by persons who have not had the opportunity to make all of these investigations.

To Increase the Strength.—Minimum weight being a very important factor in the designing and building of cars in the effort to reduce weight, we occasionally turn out a finished design that may require slight strengthening in some of the parts. The necessity of increasing strength is usually confined to the

superstructure as we have from experience largely overcome the weaknesses that were common to the underframe.

To Reduce Weight.—While not so necessary as increasing strength, yet it is important to reduce weight where it is possible to do so with safety. Many opportunities are afforded with the variety of rolled shapes available, to accomplish this without extra cost, and often with a reduction in cost.

To Reduce Cost of Maintenance.—While the cost of maintenance is carefully considered by the designer, yet the cars in actual service when carefully observed bring to notice certain items of expense that can be remedied, and in some cases entirely eliminated. The use of rivets in place of bolts is probably one of the most important items to be considered in repair work. Bolts were used in the past for securing parts that would require frequent renewals, but as the failures to these parts have been reduced the bolt, which is expensive in maintenance, has been replaced by the rivet. Cast steel and pressed shapes in place of malleable iron have also to be considered here.

The comparatively low average cost of maintenance of the present day, considering the large amount of old wooden equipment still in service, is entirely due to the present design of car which confines the repair expense almost exclusively to the wearing parts, outside of a few unfortunate mistakes in design, as previously mentioned. It must also be borne in mind that the car of the present cannot show the lowest cost of repairs, while relieving the high cost of repairs to the old wooden car.

To sum the matter up, the parts that are movable and need to be renewed should be and are standardized. The use of rolled sections gives us a car which is otherwise a car of standard parts. We also have minimum requirements for the center sill construction which would seem, for the reasons given above, to be about as far as we should go at present in standardizing the box car, except that limiting outside and inside dimensions should be arranged for; this should be attended to by the traffic department. One of these dimensions, the height of running boards, it would seem very essential to decide on in order that the roads will not keep on increasing the height of their cars until the government concludes that there is not sufficient room for the trainmen on top of the cars and issues an order that bridges, tunnels, etc., must be raised to give sufficient clearance, which would be very expensive.

As small changes in the development of the car do not increase the amount of material to be carried in stock, or the cost of maintenance, why should a complete standard car be adopted, which, if followed, will shut off the improvement of details which is necessary if we are to progress?

A WAY TO STOP TRESPASSING

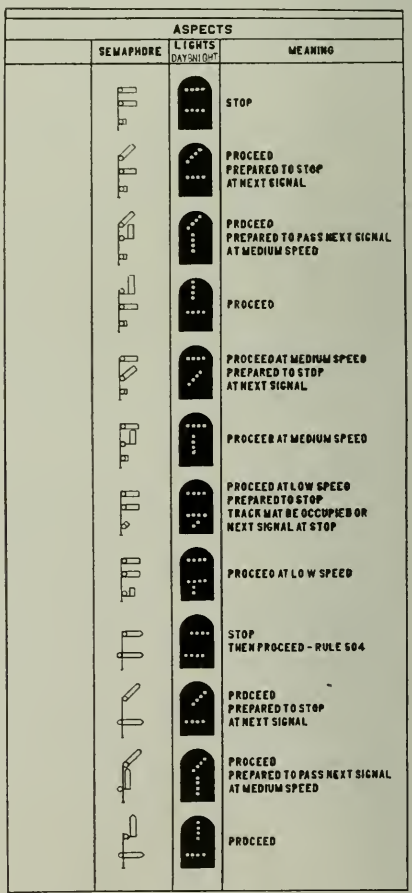
R. C. Richards, chairman of the Central Safety Committee of the Chicago & North Western, is distributing cards on which is printed a diagram showing the number of persons killed and injured during the 25 years ending with 1914 while trespassing on railway tracks or cars, below which is the following note: "Why not enact and enforce a law similar to that recommended by the National Association of Railway Commissioners, a copy of which is shown on the reverse side of this card, to prevent this slaughter."

The proposed bill referred to provides that "it shall be unlawful for any unauthorized person to walk, ride or drive upon or along the tracks, or within the right of way of any railroad company, or to cross such tracks or right of way at any place other than at a public or private crossing." An exception is provided for employees of a railroad engaged in the performance of their duties, persons going upon the property to save human life or to protect property, and persons going upon such property for the purpose of transacting business with the company or as passengers. It is further provided that station agents or section foremen shall have the same power, and shall be charged with the same duties in the enforcement of the act as are given to deputy sheriffs by the general laws of the state. The proposed bill also provides that any person wilfully violating the act shall be deemed guilty of a misdemeanor and liable to a fine of not more than $100, or to imprisonment in the county jail for not more than 90 days, or both.

The diagram shows that 113,570 persons have been killed and 123,611 injured, a total of 237,181, while trespassing, during the last 25 years, and that 66 per cent were citizens of the locality in which the accident occurred, mostly wage earners; 14 per cent were children under 18 years and 20 per cent tramps or "hoboes."

BEAM LIGHT SIGNALS ON THE PENNSYLVANIA

The light signals used on the Pennsylvania Railroad in place of semaphores for both night and day indications have been described in the *Railway Age Gazette* of January 8, page 61, and February 26, page 366. In addition to the high-speed and medium-speed indications described in the articles referred to, provision has been made at interlockings to give low speed indications also; and we give herewith the complete code of twelve aspects as printed for the use of enginemen. These signals are in use from Fifty-ninth street, Philadelphia, to Bryn Mawr; and this section includes two interlockings, OB and WH.



Semiphores and Their Equivalents in Light Signals

Fuel and Tonnage Performance on the Seaboard

A Study of Records Which Show Comparative Results for the System and the Various Operating Divisions

By L. G. Plant
Fuel Engineer, Seaboard Air Line, Portsmouth, Va.

The average weight and speed of freight trains has so important a bearing upon fuel consumption per ton-mile that any comparison between fuel consumption on two or more operating divisions, or the relative efficiency of different types of locomotives, should be based upon these operating conditions. Fuel records are of little value unless the particular conditions under which the records were made are also shown.

For this reason a locomotive performance report is issued monthly on the Seaboard Air Line showing not only the average fuel record of every locomotive in regular service, but the average time on the road, the speed, the miles run and tonnage hauled per trip. This report was designed originally for use in connection with an engineer's individual fuel record as a means of locating excessive fuel consumption upon various engines; but it has since proved a valuable source of data concerning the relative economy of the various types of engines in service and the comparative fuel efficiency of each operating division. The report includes locomotives in both freight and passenger service, although each class is shown on a separate sheet and reported by divisions.

Two copies of the Locomotive Performance Report for the North Carolina division are shown. The report of the January record of locomotives in through passenger service between Raleigh, N. C., and Columbia, S. C., includes a Pacific type of the conventional design and a newly designed Mountain type, several of which have recently been placed in service on these runs. While this report shows that the average number of cars hauled did not exceed 10, these engines have hauled 13 cars satisfactorily over a portion of this division having 1 per cent ruling grades. The report also shows that the Mountain type locomotive is more economical in coal consumption than the Pacific type, except on trains 9 and 10, which are faster and not so heavy as trains 1, 2, 3 and 4. The accompanying table gives the leading data for the Mountain, Mikado and Pacific type engines.

General Data

	4-8-2	2-8-2	4-6-2
Gage	4 ft. 8½ in.	4 ft. 8½ in.	4 ft. 8½ in.
Fuel	Soft coal	Soft coal	Soft coal
Tractive effort	47,800 lb.	50,200 lb.	36,000 lb.
Weight in working order	316,000 lb.	282,000 lb.	222,500 lb.
Weight on drivers	210,500 lb.	207,500 lb.	141,000 lb.
Weight on leading truck	53,000 lb.	26,500 lb.	43,000 lb.
Weight on trailing truck	52,500 lb.	48,000 lb.	38,500 lb.
Weight of engine and tender in working order	499,000 lb.	465,000 lb.	396,800 lb.
Wheel base, driving	18 ft.	16 ft. 6 in.	12 ft. 6 in.
Wheel base, total	38 ft. 11 in.	34 ft. 9 in.	32 ft. 9 in.
Wheel base, engine and tender	76 ft. 8½ in.	72 ft. 6½ in.	66 ft. 3 in.
Cylinders			
Kind	Simple	Simple	Simple
Diameter and stroke	27 in. x 28 in.	27 in. x 30 in.	23 in. x 28 in.
Wheels			
Driving, diameter over tires	69 in.	63 in.	63 in.
Boiler			
Working pressure	190 lb. per sq. in.	170 lb. per sq. in.	180 lb. per sq. in.
Outside diameter of first ring	76½ in.	73 15/16 in.	66 15/16 in.
Firebox, length and width	114⅛ in. x 84½ in.	108 in. x 84¼ in.	106⅜ in. x 71¾ in.

Mountain Type Locomotive Recently Placed in Service on the Seaboard Air Line

Seaboard Air Line Mikado Type Locomotive

BOILER—(Continued.)

Tubes, number and outside diameter	193—2¼ in.	230—2 in.	199—2 in.
Flues, number and outside diameter	34—5½ in.	32—5⅜ in.	24—5¾ in.
Tubes and flues, length	21 ft.	20 ft.	19 ft.

*Equivalent heating surface = total evaporative heating surface + 1.5 times the superheating surface.

The report of the November performance of all locomotives in through freight service on the North Carolina division illustrates the wide range in average speed, tonnage hauled and fuel consumption per ton-mile to be found on almost any operating division where several different types of locomotives are in service. Mikado, Pacific and Consolidation type engines are included in this statement. The Mikados have been in service only a few

weeks, and those of the Pacific type a little over a year; both are equipped with superheaters and brick arches. Some preference in the character of trains hauled may have been given the Mikados, but the greater capacity and economy of this type in comparison with the other locomotives is remarkable. In this instance the Pacific type engines appear to be rather an extravagant type for freight service, as they not only burn considerably more coal per ton-mile than the Mikados, but their average speed is lower. Both of these types are operated under the same maximum speed limit, hence the Pacific type is at a disadvantage on ascending grades and in accelerating trains. The two Consolidation engines reported at the foot of this statement are somewhat older than the others; No. 919 is equipped with a

Pacific Type Locomotive in Service on the Seaboard Air Line

superheater, while No. 910 uses saturated steam. In other respects the engines are identical and their records offer an interesting comparison bearing upon the efficiency of the superheater in every-day service.

The important question in regard to the superheater or any other device which makes for economy, is not what efficiency can be shown under *test* conditions; but what economy or increased capacity is being demonstrated daily under a variety of operating conditions. The real value of the superheater is often

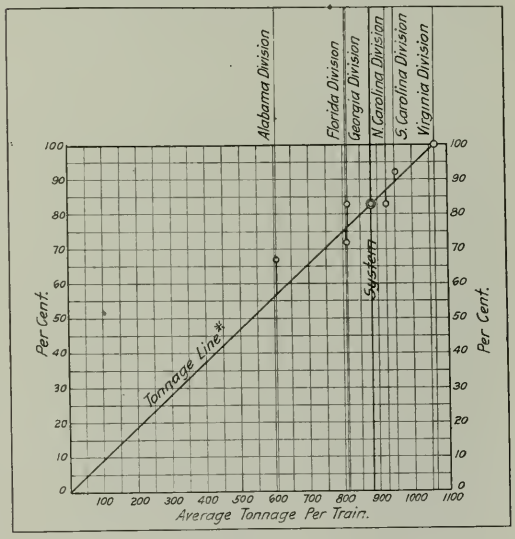
Chart I—Comparative Performance of Freight Locomotives on Divisions with Ruling Grades of 1-2 per cent

either obscured or exaggerated when the comparison is made between superheated and saturated steam locomotives of different sizes and types and operating under dissimilar conditions. Chart 1 is intended to show the actual comparative results obtained from operating a large number of superheated and saturated steam locomotives on divisions having the same maximum grades. Locomotives of the Ten-wheel, Consolidation, Pacific and Mikado types have been taken for comparison, and their fuel and tonnage records on the Virginia, North Carolina and Georgia divisions are shown on this chart. The height from the base line represents the fuel consumption per ton-mile, while the distance to the right represents the average tonnage per train hauled by each group of engines. For instance, the average fuel consumption of the Ten-wheel engines, Virginia division (point 1) is 244 lb. per thousand ton-miles, and the average weight of train hauled is 690 tons. The Mikado type engines on the same division (point 10) averaged 102 lb. of coal per thousand ton-miles and 1,580 tons hauled per train.

The points representing the performance of each group of saturated steam locomotives lie approximately upon one curve, while the points representing the performance of the superheater locomotive lie upon another curve somewhat lower than the first. The distance between these two curves represents approximately the saving in fuel per ton-mile effected through the use of superheated steam on engines of various sizes and types. The data for this graphical comparison was taken from the locomotive performance report for October, 1914. If the averages shown on this form for the November, 1914, performance of freight engines on the North Carolina division were also plotted on this chart, the records for the Mikado and Pacific type locomotives would lie adjacent to the superheater curve. A point representing the performance of engine 919 (superheater) would also lie near this curve, while a point representing the performance of engine 910 (saturated steam) would lie near the saturated steam curve.

Chart II is designed to show the relative fuel and tonnage efficiency of six operating divisions and the system as a whole. The average tonnage hauled per train on the Virginia division being the heaviest (1,066 tons), the tonnage efficiency of this division is assumed to be 100 per cent. The fuel consumption on the same division is the lowest (182 lb. of coal per thousand ton-miles); hence its fuel efficiency is also assumed to be 100 per cent. The tabulated figures for tonnage and fuel efficiency closely approximate each other; that is, fuel consumption per ton-mile increases in about the same proportion that the average tonnage hauled per train decreases. For instance: the average weight of trains hauled on the Florida division was 810 tons, or 76 per cent of the average tonnage on the Virginia division; the average fuel consumption was 253 lb. per thousand ton-miles, indicating an *actual* fuel efficiency 28 per cent lower than on the Virginia division, or 72 per cent. In this instance, the *relative* fuel efficiency on the Florida division may be considered as 4 per cent less than on the Virginia division, tonnage considered. Similarly, the relative fuel efficiency on the North Carolina division is 4 per cent



Division	Average weight of trains: Tons	Average weight of trains: Relative per cent	Average fuel performance: Lb. coal per 1,000 ton-miles	Average fuel performance: Relative per cent
Virginia	1,066	100	182	100
South Carolina	950	89	197	92
North Carolina	927	87	219	83
Georgia	811	76	219	83
Florida	810	76	253	72
Alabama	607	57	270	67
System	880	83	218	83

Note.—The distance of the circle above or below the Tonnage Line* indicates the greater or lesser relative fuel efficiency on each division.

Chart II—Relative Fuel and Tonnage Efficiency on Six Operating Divisions

less than on the Virginia division; while the South Carolina, Georgia and Alabama divisions show relative efficiencies respectively 3 per cent, 7 per cent and 10 per cent above the Virginia division and the system as a whole.

Where the relationship between fuel and tonnage efficiency is so close, fuel consumption per *train-mile* is not an unfair unit for gaging the relative efficiency of several operating divisions.

Credit for a great many reductions in fuel consumption per ton-mile can be given to an improvement in train loading. A

study of the tabulated figures shown on chart II indicates that if, for instance, the average tonnage on the Florida division (810 tons) could be increased so as to equal the tonnage hauled on the South Carolina division (950 tons), the fuel consumption could presumably be reduced from 253 lb. per thousand ton-miles to approximately 200 lb. Fuel and tonnage efficiency are so interdependent that any systematic effort to reduce the consumption of fuel per ton-mile should be supplemented with a campaign for the maintenance of a full, but not excessive, uniform train load.

TRAFFIC CLUB OF CHICAGO

The eighth annual banquet of the Traffic Club of Chicago was held at the Hotel LaSalle, Chicago, on February 25, with nearly 700 in attendance. President J. Charles Maddison presided and B. D. Caldwell, president of Wells, Fargo & Co., acted as toastmaster. The speakers were William Sproule, president of the Southern Pacific Company, and Col. H. P. Bope, vice-president of the Carnegie Steel Company. James J. Hill, who had been invited to speak, but was unable to be present, sent a paper which was read by President Maddison. Mr. Hill's paper, as well as the addresses of the two speakers, dwelt mainly on the causes for the depressed condition of business, and all agreed in ascribing the cause to a surplus of uninformed and unnecessary legislation against business.

"What productive activity needs most," said Mr. Hill, "is simply a period of freedom from uncertainty resulting from constant political attacks. Business needs a rest cure. Uncertainties from tariff revisions and banking legislation are profound. The trade commission law asserts the right of a federal government to control and regulate business as a whole, not merely that affected with some public use or that which offends in some way against the law, but the peaceful and legitimate conduct of ordinary affairs. No more money, or more credit, or foreign markets, or a merchant marine or any other accessory advocated is so necessary to the country at this time as a period of rest from legislative interference with, and arbitrary control of, the country's business. Even if this be granted revival must be slow in halting. The whole country wants prosperity. The main conditions favorable to a happy change exist. It calls only for understanding, cooperation and harmony between all those elements which unite to make it both economically and politically one."

Mr. Sproule said in part: "The public interest in transportation is as keen as it is misinformed. The public interest in transportation really rests in the one word 'service.' One of our difficulties is that the subject when thus regarded looms so large as to extend far beyond the horizon in most lines. The fact is, the public interest in transportation is different from the interest the public takes in transportation questions in these times.

"Wherever civilization exists the go-ahead spirit of the American people is proverbial. Like every other proverb this one has its exception. That exception is transportation. American transportation has lost its momentum. Today railroad construction in the United States has ceased except to finish a few odds and ends. The railroads are under the heavy hand of repression. The public attitude with respect to them has very little to do with the public interest. The kind of interest on the part of the public which is aroused by the platitudes and prejudices voiced from 10,000 political platforms is at variance with what is really to the public interest. These harangues prate about a very few phases of the transportation question, and minor topics are magnified for the popular eye to look like big things.

"The railroads are accused of influencing politics. It is strange, indeed, that by popular will the railroads are denied access to the forum which makes their laws, determines their tribunals, fixes the basis for their taxes and designates by enactment many operating matters and expenditures that belong to the domain of management. Methods for presenting the case of the transportation companies in the seats of legislation may in various ways, and at various times have been defective, but not more so than the proposals and methods which the transportation companies believe it to be their right and duty to combat.

"Following upon all this misrepresentation and play upon prejudice has come a considerable period of public distrust with consequent withdrawal of confidence in the greatest industry in this country. This lack of confidence was in turn followed by general business depression, for all business is based upon credit and credit has its foundation in confidence. It is in consequence of these conditions that we are going through a period of unemployment and distress, the like of which this nation has never known. It is the employer who is first out of employment. As a natural sequence he is followed by the employee, who next finds himself out of work. Unemployment begins only when the employer himself begins to be unemployed. We have this period of unemployment because all business is bewildered and uncertain. It does not know whether it may proceed in safety. This condition began with transportation and now extends to all business. The greatest trouble with this country today is that every business which has been developed by the genius of the American people has become the object of unforeseen attacks from some quarter, or feels the threat or danger of attacks."

Colonel Bope spoke on the future relations of manufacture to transportation. In discussing legislation he said that in the past five years over 62,000 laws have been passed in this country, 2,000 by the federal congress and 60,000 by the state legislature. "We have apparently gone legislation mad," he said. "In the Sixty-Third Congress there have been introduced in the Senate over 7,000 bills and resolutions and in the House over 23,000, of which about 400 have been passed. The railroads have had more than their share of these enactments. For one, I do not feel that the expansion of trade in this country, so much of which is due to the railroads, could or would have been possible had the Interstate Commerce Commission been in existence during that period when railroad building was so active and when faith in the future was so large an element in the development of the country."

After discussing the needs of the railroads he said:

"On the other hand, there is something due the manufacturer from the railroads. A study of past conditions shows that when the railroads have been buying the most freely there has been the greatest prosperity and conversely the greatest depression. Is it not possible to obtain a more equal division of railway purchases so that they may not all largely come in a short period, creating demands which overtax every facility of manufacturing, causing dissatisfaction, delays and loss, to be followed by little or no buying when the changed conditions mean reduction of values, output and employment. There is a certain steady depreciation each year due to use. Let these demands come with regularity; not always to the highest point, that would be too much to expect, but with some percentage in a fixed range. This would mean steadier operation, more stable values and a larger measure of return for both producer and transporter."

An Argument for Power Interlocking.—Where state laws governing liability for personal injuries to employees from obstructions on the right of way are very severe, and are strictly enforced, as in Texas, power plants are the only suitable interlocking in places where there is much walking beside the track, as in switching. The power switch movements can be placed below the level of the ties and the wires conducted underground, which cannot be profitably done with mechanical connections. In such cases, care should be taken to provide proper drainage, or the bills for repairs are liable to be greater than personal injury claims.—*W. H. Arkenburgh.*

Arbitration of Engineers' and Firemen's Demands

Continuation of Testimony and Cross-Examination of A. W. Trenholm on Effect of Demands on Operation

A. W. Trenholm, general manager of the Chicago, St. Paul, Minneapolis & Omaha, and chairman of the Conference Committee of Managers, representing the Western railways, occupied the witness stand throughout last week at the hearing in Chicago before the board of arbitration on the demands of the engineers and firemen. He completed his direct testimony on the effect on operating conditions of the enginemen's demands on Tuesday, February 23, after having been on the stand since February 16, and cross-examination was taken up by Warren S. Stone, grand chief of the Brotherhood of Locomotive Engineers.

Mr. Stone asked if it was not common practice after a committee representing the men and the officers of the company had entered into an agreement and both understood it alike, for the company to allow some timekeeper to say that it meant something else? Mr. Trenholm thought that such cases were very rare. Mr. Stone said a number of roads have traveling or chief timekeepers, who make trips over the road and that one trip of this kind usually means business for the brotherhood committees for the next 10 months. He asked if there was not an incentive for an ambitious young official to attempt to operate his department as economically as possible, and therefore to construe schedules in favor of the road as often as possible.

"No, I think there is not," said Mr. Trenholm, "because one of the qualifications that it is necessary for an ambitious young superintendent to have to advance in the railroad business is to do things right, and if he hasn't got judgment enough to interpret and apply a contract between his superior officer and the men he is not likely to get very far in the railroad business."

"Is it not a fact that the operating official knows the men will not strike for a few cents or a few dollars?" asked Mr. Stone, "and that he is perfectly safe in clipping off a little here and there by any ruling he may make?"

"Absolutely no," said Mr. Trenholm. "I don't believe that any officer would so belittle himself as to do anything of that kind, and I think if he did on any properly officered railroad the man who did it would be censured very severely."

"On some railroads the man who did it would be promoted," said Mr. Stone.

In discussing the demand of the men for rates of pay based on the weight on drivers, Mr. Trenholm said he would not oppose that as against the cylinder classification, that both involved technical inconsistencies, but that he objected to the enormous increase in wages involved in the proposed re-classification on the weight basis. "I see no objection," he said, "if the transfer is made and made properly, so that everything is equalized when you do away with the present basis. Then adjust the wages if there is any adjustment necessary." Mr. Stone said that if the men had retained the cylinder basis in their demands they probably would have asked for a greater increase in pay for each type of engine.

This led to an argument as to the proper return on capital in which Mr. Trenholm said that labor is entitled to fair and reasonable compensation and capital to a fair and reasonable return on its investment, which he thought would be 6 or 7 per cent.

MR. STONE'S DEFINITION OF CAPITAL

Mr. Stone gave as a definition of capital: "Capital is nothing in the world," he said, "but labor saved and materialized. The man who has capital holds it because the great mass of workers are willing he should hold it and the law gives him possession of it and makes it possible for him to hand it down from generation to generation, with the result that 72 per cent of our so-called American citizens are workers, and contribute a certain percentage of their daily labor to a very few of the idle rich, who, in turn, control not only our railroads, but all the rest of the big businesses." Mr. Stone added that he was "neither an anarchist nor a socialist."

Charles Nagel, formerly Secretary of Commerce and Labor, and one of the arbitrators, asked Mr. Trenholm a number of questions on the subject of government regulation. Mr. Trenholm admitted the need for regulation because of the results of competition among the railroads in former years.

"The question today," said Mr. Nagel, "is whether we have not learned to place our sole reliance upon regulation and to place too much confidence in the mere making of rules, instead of counting somewhat upon the enterprise itself. Is there not some question whether the railroads are not suffering from a multitude of authorities that are undertaking to regulate at one end, and powerful labor organizations working on the other end, and the same organizations in your legislatures, advocating adverse legislation?"

"I think there is no doubt about that," replied Mr. Trenholm.

Referring to a statement of Mr. Trenholm's, that the men on the Omaha were willing to give an honest day's work for an honest day's pay, Mr. Stone said they had given about a 99 per cent strike vote. "Well, I wouldn't blame them," said Mr. Trenholm. "A number of men asked me how they should vote and I told them the way it was put up to them they could not do any other way and do justice to their organization."

Mr. Stone said he believed Mr. Trenholm had said that he did not believe "we had reached the limit of human endurance yet."

DOES AN ENGINEER WORK HARD?

"I never heard the men talk about the limit of human endurance," replied Mr. Trenholm. "I have never heard that except from some grand officers of labor organizations. I am very much opposed to overworking men in the transportation service."

At one point Mr. Trenholm remarked that some engineers he knew "live pretty well" and that the life of an engineer is "a good, healthy life."

"You don't see these fellows who are worn out and thrown on the scrap pile," said Mr. Stone.

"I have not seen any very extensive scrap heap around where I am. I presume, with the very large number of men you represent and over so vast a territory, there are bound to be a great many failures. There are a great many failures in any line of life. General managers, even, are dropping off pretty rapidly these days," says Mr. Trenholm.

"Is there any hard work about an engineer's duties at all, from your standpoint?" asked Mr. Stone.

"Why, there are sometimes long hours," replied the witness. "There is always the responsibility of the engineer. He has got to be on the alert at all times. But speaking of his ordinary day's work, there is not anything in an engineer's life, I think, that is very laborious work. An engineer has been relieved of everything he could consistently be relieved of. Engineers used to come around before they went out and look their engines over pretty carefully, used to do some work on their engines themselves. It is an exception for an engineer to do that nowadays."

"At the same time they are asking to be relieved of putting their tools on locomotives and such other necessary details, they are demanding an arbitrary payment for 30 minutes' 'preparatory time.' It is inconsistent to ask relief from the final vestige of preparatory duties and demand at the same time additional pay for doing the very work from which they are asking to be relieved. There is no reason why engineers and firemen should not do such work. They are the most capable to do it and are made of no finer clay than the rest of us. We all have to work."

"If a crew has made much less than 100 miles and worked less

than 10 hours, yet under the guaranteed minimum day is paid for 100 miles or 10 hours," said James M. Sheean, counsel for the railways, "you think it is perfectly proper they should be asked to do these incidental duties?".

"Yes," replied the witness, "I never heard an engineer object to it. A good engineer wants to do it himself to be sure it is properly done."

Speaking of the rule requiring payment for preparatory time, Mr. Trenholm said if a man is paid on an hourly basis he should be paid for every minute of his time.

"But 79 per cent of the freight engineers are paid by the mile," said Mr. Stone.

"All right," said Mr. Trenholm, "then he is paid for it. An engineer does not make miles. His ability to make miles depends very largely on the facilities he is given by the railroad."

"If a man ran 100 miles in three hours he would be paid for 100 miles. Would he owe the company anything then?" asked Mr. Stone.

"That would depend, in my judgment, on the circumstances."

"Hasn't he given you a full day's work of 100 miles or 100 pieces."

"No pieces about it. He don't make miles. He has nothing to do with making miles. He cannot control a mile. He starts out on a run of 125 miles, and he may do it quickly if all the conditions are favorable, but on the other hand, he may be delayed and be out more hours than the miles would cover. When his miles exceed his hours when divided by 10, he is paid in miles, and when his hours are greater he takes the hours. He is guaranteed a day in both cases."

"You are not willing to concede," said Mr. Stone, "that when a man runs 100 miles he has given you the equivalent of a day's work and owes nothing."

"I concede it under the ordinary conditions of railroading," said Mr. Trenholm, "and I don't claim the right to put him in another class of service, or work him 10 hours to equal his hundred miles. But if he got into a terminal and there was an emergency, and I should want him to go out and do something and I used him for an hour or two hours, I claim I don't owe him anything for the hour or two on this emergency engine. If he runs 150 miles he is paid 15 hours for four or five hours' work, 364 days in the year, and if I happened to need him for the other day on a little bit of a job I would not feel like paying him extra for it."

Mr. Stone asked if he thought the men ought to throw it in for good measure. Mr. Trenholm thought he was not asking them to throw it in, but that the road had paid for it. Mr. Stone insisted that the railroad had earned its revenue by miles, but is not willing to share it with the engineer on that basis.

"The engineer has always got his full share of the earnings of the railroads, as compared with any other labor on the railroad," was the reply.

In questioning on the automatic release proposal, Mr. Stone asked if the roads could not change their schedules so as to avoid the effects of the automatic release. "Very little change could be made," replied Mr. Trenholm. "Certainly the railways cannot run their trains to suit the engineer and fireman. They must run them to suit the public. The engineer adopted his profession fully realizing the conditions, and there is no condition which warrants guaranteed pay, a five-hour day, an arbitrary payment before the day's work, another after and others in between. I don't believe there is any demand in the commercial world today for a rule that says five hours or less is a day. They don't even guarantee that. They simply guarantee to come out when called and work a little bit and then they demand arbitraries."

"PRODUCTIVE EFFICIENCY"

Mr. Stone tried to show that increased train loads increase the earnings of the railways, and the so-called "productive efficiency" of the men. Mr. Trenholm maintained the only result was a saving in the handling of the business at hand.

"In this western country," said he, "if it had not been for the money put into railways for reduction of grades, elimination of curves, increasing car capacity, and larger engines able to handle greater tonnage, I think 75 per cent of the western roads would have been bankrupt. The roads could not live under conditions of 15 or 20 years ago. The little engine, little car and little trainload could not exist. Under the pressure that has been on the railways to reduce rates and make improvements required by state and federal laws, if it had not been for the resourcefulness of railroad men, bringing to bear every possible means of curtailing expenses, I think I am safe in saying 75 or 80 per cent of the roads today would be bankrupt. There never was a time when railway operation was more closely watched to reduce expenses than it is today."

Mr. Nagel asked whether the time and a half for overtime rule, in his opinion, would afford any stronger inducement to a railroad to avoid overtime than present conditions. "No," replied the witness, "and I believe the only thing that could be done to avoid that extreme penalty would be to change your terminals and revolutionize train operations."

Mr. Stone asked Mr. Trenholm if the engineer was not the most responsible man on a railroad.

"No, I don't think so," replied Mr. Trenholm. "There are lots of men on the railroad who are more responsible than he is, the road masters and train masters, train despatchers, superintendents and assistant superintendents. All the minor officials on a railroad work twice the hours he works. There is no time in the 24 hours they are not subject to call."

Mr. Stone said: "You could give the whole class named a holiday for a week and the railroad would run right ahead if the engineers kept working."

"No, it won't," said Mr. Trenholm, "the engineer would not run very far without the train despatcher."

In discussing the amount of time a man should work during a day, Mr. Trenholm said that he put an order in effect on his road years before the hours of service law went into effect, limiting men to 16 hours, and that he has been considering very seriously for two years putting in another order limiting them to 14 hours.

ACTUAL EARNINGS OF TYPICAL MEN FOR ONE YEAR

After the cross-examination on his earlier testimony Mr. Trenholm introduced an exhibit giving payroll figures for 9,030 men for the year ending June 30, 1914. "To get a true picture of the actual results under present conditions," he said, "each railway was asked to give the earnings for the year of one man in each pool or group in which the men divide among themselves in turns the work on one run. For each is shown the number of men, whether 2, 3, 5, 10 or 20, of which he is thus representative. If one man earns the amount shown each of the others in that pool could have earned the same by working his assigned time." The exhibit showed the yearly earnings of 3,230 engineers and 5,800 firemen, together with the name, location, number of miles made and time worked. As only a partial list Mr. Trenholm pointed out by name 11 engineers who are earning over $3,000 per year, with a maximum of $3,725.20, and a partial list of six firemen who are making from $1,800 to $2,061 a year. There were many more men in the same pools, said Mr. Trenholm, who had the opportunity to earn as much, or more than these men.

President Carter of the Firemen's organization objected to the introduction of the exhibit, on the ground that the earnings shown were not representative. "We realize our case is lost if we take the exhibits of the railroads too seriously," he said. "They do not represent what they purport to." For a time it appeared that the payrolls for all of the roads would have to be shipped to Chicago to satisfy him, but Mr. Trenholm showed that the figures given for each man were typical of the others in the same service.

Mr. Trenholm concluded his direct testimony on Monday, March 1, by presenting a summary of the previous exhibit. The summary showed for the 9,030 men the number of months the men worked in each assignment, the total number of trips, the total miles, hours on duty, hours per trip, lost time, total wages of the assignment, wages per hour, wages earned outside of the assignment and the total wages. The average miles, hours and wages for each class of service are shown in the following table:

	Average miles per trip	Average hours per trip	Average wages per hour
Engineers—			
Passenger	133	5.5	$1.13
Through freight	117	9.5	.70
Local or way freight	93	11.6	.59
Pool or chain gang	110	9.5	.70
Branch passenger	85	4.7	.86
Branch freight	74	9.5	.61
Mixed	47	5.5	.61
Suburban	28	2.4	.72

This concluded the direct testimony of the railways and rebuttal testimony on behalf of the two brotherhoods was begun by W. J. Lauck, statistician for the two brotherhoods.

RETAINING WALLS ON SOFT FOUNDATIONS*

By W. S. Lacher

Office Engineer, Chicago, Milwaukee & St. Paul, Chicago.

The Chicago, Milwaukee & St. Paul is now engaged in elevating its tracks in the city of Milwaukee between the Kinnickinnic and the Menominee rivers, a distance of about 1½ miles. When this portion of the road was built in 1871, about two-thirds of it was placed on a pile bridge because the ground surface at that time was but little above the level of Lake Michigan and was virtually a marsh. Since that time, this trestle has been entirely filled in, as has also the surrounding property, much of which has been improved with buildings of various kinds. The tracks have settled greatly since the filling was done, but as settlement has occurred, additional material has been placed under the tracks so that the original elevation has been maintained. Many of the buildings in the vicinity, however, show evidence of unusual settlement.

Because of the uncertain conditions, foundation investigations were made; test piles being driven to a depth of 80 ft. and test borings carried to a depth of over 100 ft. These investigations showed a deposit of filled material from 10 to 15 ft. deep immediately below the surface, consisting of gravel and sand under the main tracks and refuse of various kinds under side tracks and unoccupied portions of the right of way. Below this, to a depth approaching 80 ft. there are numerous though rather poorly defined strata of wet, slimy clay and fine sand, below which is a bed of coarse sand and gravel to an unknown depth. The tests showed beyond question that piles would have to be driven into this gravelly material to be at all reliable. Owing to a lack of sufficient number of drivers with leads long enough to handle 75 and 80-ft. piles, it was evident that many piles would have to be driven in two sections and connected by splices. Taking into consideration the results of pile tests, the great length of piles and the necessity for splices it was concluded to limit the load per pile to 15 tons.

A mass concrete retaining wall on a pile foundation such as shown at "a" in Fig. 1, would prove very expensive under such conditions. This naturally led to speculation as to the possible use of walls on natural foundations under such unfavorable conditions. Many types of walls in mass and reinforced concrete were investigated, but most of them were eliminated either because they gave too great a variation in the toe and heel pressure under the various cases of loading or else they were not capable of withstanding the large settlement anticipated without possibility of serious damage. The only common design that seemed to approach the solution was the mass wall marked "b," or its equivalent "c" in Fig. 1, of reinforced concrete. The advantage in cost is apparently with the former. As the possible source of a solution it was suggested by C. F. Loweth, chief engineer, that studies be made to ascertain the feasibility of adapting either the timber crib or the dry stone wall to plain or reinforced concrete.

The dry wall was the first to be studied. A dry wall is inclined at such a slope that the resistance line will fall at the center line of the wall or behind it at all points in its height. The most primitive form for such a wall is shown at "d," Fig. 1. This has the joint placed very nearly at right angles to the resistance line but it obviously involves difficulties in construction which would make it prohibitive. A modification of this design is shown at "e," which is simply a slab of concrete leaning against the embankment. This slab could be built in place or cast in short sections and erected at a convenient time. In either event it would be necessary to provide struts of timber or concrete to support the wall until the embankment could be placed.

In the design marked "f," Fig. 1, is shown a form intended primarily to get a cheap construction. It consists of a tier of blocks with horizontal beds stepped back to give the desired slope. To avoid the necessity for erecting these walls in short sections during the placing of the embankment they can be provided with ribs extending back into the fill at intervals of about 9 ft. This portion of the wall serves simply as a support until the embankment has been placed and is not intended to add to the stability of the wall against lateral pressure. The weakness of this design is that the resultant pressure at each joint is inclined at rather an oblique angle with the horizontal, approaching much too close to the angle of friction of concrete upon concrete. This naturally suggests the use of a mechanical lock or bond between the blocks, such as would be secured, for example, by corrugating the surfaces of the blocks by casting them in forms lined with corrugated iron or by casting a lug on the bottom of each block as shown in "g," Fig. 1. The scheme illustrated at "h" is a combination of "d" and "g" in that part of the joint is horizontal, while the forward portion is inclined at an angle even greater than the perpendicular to the resistance line. By this means the desired resistance to sliding is obtained without sacrificing anything in the ease of erection. The forms

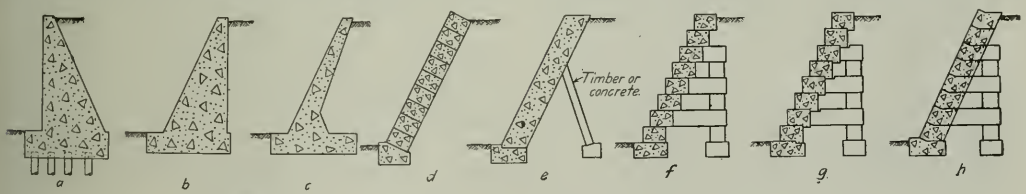

Fig. 1 Various Types of Retaining Walls Considered for Use on Soft Foundations

*Abstract of paper presented before the Western Society of Engineers on February 8, 1915.

are somewhat more complicated, but this is not of great importance if any considerable number of the blocks are to be cast.

The equivalent of a timber crib in reinforced concrete is not, as it might seem at first thought, a combination of various shaped concrete sticks dovetailed or doweled together, but it is a box or series of boxes of reinforced concrete built with not less than one cell complete in one piece. The walls are of such a thickness as to compromise considerations of strength, economy and ease of construction. Concrete cribs have been used for some time by the war department in the construction of breakwaters on the Great Lakes, but in this adaptation they do not act as retaining walls, but as receptacles for stone. Two forms of concrete cribs are shown in Fig. 2. The first is simply a bottomless box which depends for its stability upon its own weight and the weight of the embankment superimposed on the portions buried in the fill. This type of wall has a large factor of safety in the passive resistance of the earth on the inside face of the rear wall, which becomes effective as soon as the wall starts to move forward. The wall also affords great frictional resistance to overturning. Neither of these elements ought to be considered in making an analysis for design, however. For a narrow right of way a natural modification from this crib wall is shown at the right in Fig. 2. This is in reality an application of the reinforced concrete filled "u" abutment. The lateral forces are taken care of entirely within the structure and only the vertical loads are transmitted to the foundation.

As a necessary preliminary to the analysis of the types of walls described, the applicability of the theory and constants commonly used in dealing with the lateral pressure of earth was investigated. As the use of common factors in the analysis of trial designs of the block wall proved that small variations in the factors resulted in great variations in the position of the resistance lines, authority was obtained to build and test a model wall of the concrete block type. This wall was one-fourth as

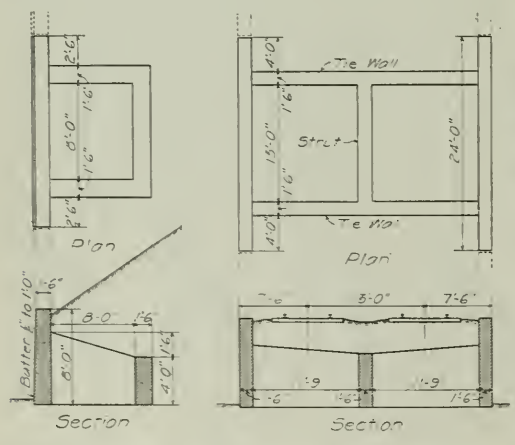

Fig. 2—Unsymmetrical and Symmetrical Cellular Retaining Walls

high as a full-sized wall for a 17-ft. embankment and was 12 ft. long between bulkheads. It was backed with a sand embankment and tested with a live load of pig iron piled on wooden cross-ties 2 ft. long. The tests indicated that the live load spread is much greater than had been supposed, and further pointed out a fertile field for extensive investigation. As to the design of a block wall, the tests proved clearly that horizontal beds without bond or lock give the wall a low efficiency, as failure by sliding will take place at loads much below those required to cause overturning. With a properly designed joint, such as that shown in "h," Fig. 1, the block wall presents advantages under certain circumstances that justify its serious consideration.

Fig. 3 shows diagrammatically the relative cost of the mass wall with a heavy front batter on natural foundations, the block wall, the cellular wall and the mass wall on piles. This comparison is based on the assumption of very expensive piles, such as are required on the work at Milwaukee. The relative economy of the types, excluding all other considerations, is directly in the order named above. A consideration of these types, however, shows the following advantages and disadvantages:

The block wall in addition to its economy can settle in an irregular manner without making it conspicuous, it can be constructed in several stages and it does not occupy much space before filling. On the other hand the heavy front batter causes a waste of property which will encourage encroachment and unless built with a smooth batter will encourage trespass-

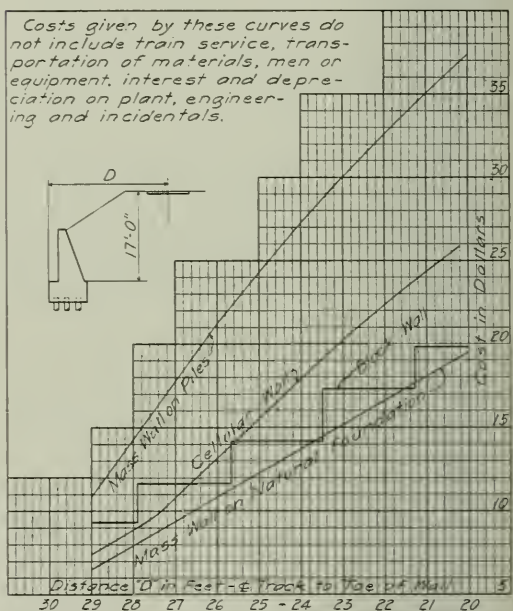

Fig. 3—Comparative Costs of Four Types of Retaining Walls on Soft Foundations

ing. Because of its loose-jointed nature the block wall does not possess as much of a potential factor of safety against unforeseen contingencies under some circumstances as a monolithic structure.

The heavy batter mass wall is economical, but will cause criticism if it settles or tips appreciably, and is subject to the same objections as the block wall on account of the heavy front batter. The cellular wall affords little opportunity for encroachment; it may settle considerably but offers great resistance to overturning or sliding, and it permits of ready driving of piles for a trestle directly over it. It possesses the disadvantages of occupying considerable space before filling, which may interfere with the use of the tracks and settlement may also give it an unpleasing appearance. The mass wall on piles gives maximum security, but is expensive and may lead to difficulties through possible damage to adjacent buildings on insecure foundations as a result of pile driving. This consideration was given much weight in the search for a substitute for the structure on piles.

Up to the present time one block wall with corrugated horizontal beds and two cellular walls have been built at Milwaukee. Plans have been prepared for the use of a cellular wall at a number of other places on this work. This type of wall has

been favored on account of the fuller utilization of the right of way and also in a number of instances because of the necessity for driving pile trestles for adjacent industry tracks directly over the wall.

THE PANAMA RAILROAD STEAMSHIP LINE

In the review of the annual report of the Panama Railroad Company given in the editorial columns of this paper in the issue of February 26, something was said relative to the earnings of the company's steamship line. The following comments taken from a letter written to Senator Root in connection with the debate on the Ship Purchase Bill by Edgar F. Luckenbach, a prominent ship owner, will perhaps also be of interest. The letter points out that the annual reports of the Panama Railroad Company for 1911, 1912, 1913 and 1914 give the following earnings for the steamship line:

Year	Profit	Year	Profit
1911	*$77,187.97	1913	$221,489.92
1912	†305,742.85	1914	314,296.36
		Total	$612,974.25

*1912 report. †Loss.

"The steamship company owns the steamers Allianca, with a book value of $518,865.87, and the Advance, book value $221,186.30, or a total of $740,052.17. They also operate the steamers Ancon, Cristobal, Panama and Colon, which are worth about $600,000 each.

"These last four named vessels are loaned to the Panama Steamship Company by the Panama Canal Commission free of charter hire, insurance, depreciation or interest charges, and no one could operate these vessels unless they paid at least the following charges (investment of $2,400,000 for four years): Interest at 6 per cent, $576,000; insurance at 6 per cent, $576,000; depreciation at 6 per cent (which is the rate allowed by the Panama Steamship Company on other vessel property they own), $576,000; insurance on freight moneys, $22,439.28, and insurance against loss and damage to cargo (known as protection and indemnity), $6,000, making a total of $1,756,439.28.

"You will find in the annual report for 1914, page 47, no insurance charges are made on the steamers Allianca and Advance, which are valued at $740,052.17. Added to above: Hull insurance at 6 per cent, $177,612.52; cargo insurance, $2,000; interest at 6 per cent, $177,612.52; total $2,113,664.32.

"If any one else were operating these vessels to protect themselves properly they would have to pay the above enumerated charges, showing a loss for four years of $1,806,432.92.

"Ordinarily the above named steamers would be worth, on time charter basis, about $10,000 per month. (If I could get them today I would be willing to pay $20,000 per month.) Figured on the basis of $10,000 per month for each steamer for four years, the loss would be much larger than the figures given above, or on this basis the loss would be $1,920,000."

FLASH LIGHT SIGNALS ON THE BOSTON & MAINE

The Boston & Maine, which has used flashing acetylene lamps on signals experimentally for nearly two years, now has these lamps in use on about ten miles of its line, from Parkway Bridge, Mass., to Reading Highlands, on the Portland division. This is a double track line and there are thirty-six block sections, a home and a distant arm on each post. Both arms have the flash lights, and they flash from 58 to 62 times a minute. The signals at interlockings have ordinary steady lights, so that enginemen are able quickly to distinguish automatic from non-automatic signals.

The flash lights are furnished by the Commercial Acetylene Railway Light & Signal Company, New York City. By an automatic regulator in the pipe supplying gas to the lamp, the gas is made to flow only one-tenth of the time, making each lamp glow, for example, one-tenth of a second and then remaining dark nine-tenths of a second.

The night signals on the Boston & Maine show white for proceed, red for stop and green for caution.

Steady acetylene lamps have been used on several hundred block signals on the Boston & Maine for several years past.

The Norfolk & Western has had one of the flash lights in use on an automatic signal for the past eight months and reports the lamp as not only very reliable, but as costing much less than an oil lamp for the same service. On both this road and the Boston & Maine the enginemen are reported as much pleased with the flash light.

THE LOUISVILLE & NASHVILLE INVESTIGATION

The Interstate Commerce Commission on February 25 sent to the Senate its report on the investigation of the finances, rates and practices of the Louisville & Nashville. This investigation, authorized last spring by a resolution introduced by Senator Lea, of Tennessee, was directed mainly to discover whether the Louisville & Nashville, through control of the Nashville, Chattanooga & St. Louis and smaller lines, had restrained competition in the territory served by those roads, whether the control of the Louisville & Nashville by the Atlantic Coast Line, operated to the same end, and what amounts of money the Louisville & Nashville has contributed to political activities and other efforts to fight competition.

The report says that the Louisville & Nashville acquired competing lines and for years carried on an elaborate political and publicity campaign to eliminate competition and influence public opinion at enormous expense. The commission, however, qualifies its general charges of extravagance and of wrongful expenditures by the statement that the road had to meet much strong competition.

The commission from its investigation concludes that at least $16,000,000 shown in the Louisville & Nashville's cost of road accounts covers items which should not be charged to them. These charges are as follows:

Charges Included in Cost of Road Accounts but Not Expended for Actual Construction

Discount on stock		$1,440,018
Other expenses in connection with the sale of stock		32,671
Discount on bonds		2,192,143
Other expenses in connection with the sale of bonds		8,538
Interest and dividends		1,917,535
Amounts credited to profit and loss:		
For reasons not stated	$2,640,000	
To provide a surplus in order that a stock dividend of 100 per cent might be paid	6,300,000	
To raise book value of stock above the actual cost of acquirement	1,422,784	
To adjust difference between advances made for construction and par value of bonds received in settlement therefor	78,448	
		10,441,232
		$16,032,137

The commission says: "The above statement is illustrative of the character of charges which the carrier has included in its cost of road account. A full examination of the carrier's accounts might disclose conditions under which some of the above amounts could properly be charged to cost of road account, but it is also possible that other improper items would be found which would greatly augment the amount shown."

The Louisville & Nashville now owns 71.77 per cent of the capital stock of the Nashville, Chattanooga & St. Louis, and it appears that this control was obtained primarily for the purpose of restraining competition. This opinion is thought to be borne out by statements taken from the annual reports of the Nashville, Chattanooga & St. Louis for 1872 and 1880, respectively. It is also thought that the geographical relations of the two systems are such that were they separately controlled competition between them would be the inevitable result. The two roads further have made traffic agreements which result in restraining competition.

The Louisville & Nashville, chiefly since 1880, has acquired a controlling interest in over 100 other railroads. While one of the purposes of the Louisville & Nashville has obviously been to

restrain competition in the territory which it serves, there is no doubt that several of its subsidiary lines were acquired not so much to restrain competition as to meet competition. Although the Louisville & Nashville has to a large extent a monopoly of local business in its territory, on through business it is in active competition with the Southern, the Illinois Central, and other large systems. These rival systems have, since about 1880, been aiming, by securing control over branch and connecting lines, to expand and perfect their control over their respective spheres of influence. Among the roads of which the Louisville & Nashville has acquired control are the Nashville & Decatur, the Tennessee Midland, the Paducah, Tennessee & Alabama, the Chesapeake, Ohio & Southwestern, the Georgia Railroad, the Atlanta & West Point, the Western of Alabama, the New Orleans, Mobile & Chicago, the Kentucky Central and the St. Louis & Southeastern.

The report also attempts to show that the Louisville & Nashville has tried to restrain competition on the Cumberland and Tennessee rivers by means of its control of terminal facilities at Nashville, Knoxville and Clarksville. It has also tried to restrain competition in various ways on the Alabama, Green and Barren rivers.

The Louisville & Nashville, although serving New Orleans and Mobile, has been primarily interested in Pensacola, and has a fixed policy of attempting to prevent traffic movement through the other ports. It, for example, has not tried to develop its terminals at New Orleans. It has tried to hinder the movement of traffic through Mobile by restricting the issuance of through bills of lading on export cotton for Mobile. On the other hand, in conjunction with the Gulf Transit Company it has solicited traffic through Pensacola, although its terminals at that port are not good. The commission states its intention of taking this up further in its investigation of conditions at these ports in connection with the Panama canal act.

The Atlantic Coast Line Company, a holding company, owns no stock in the Louisville & Nashville. The Atlantic Coast Line Railroad Company, however, owns $36,720,000, or 51 per cent, of the $71,917,920, par value, of capital stock of the Louisville & Nashville outstanding on June 30, 1914. Prior to March 10, 1914, the Atlantic Coast Line Company, through ownership of a controlling interest in the capital stock of the Atlantic Coast Line Railroad Company, did indirectly control the Louisville & Nashville. Control of this holding company over the Louisville & Nashville was relinquished just after this investigation was begun, and presumably as a result of it. The same interests, however, appear still to control both the Louisville & Nashville and the Atlantic Coast Line railroad companies. Henry Walters, Michael Jenkins and Waldo Newcomer held or controlled 115,658 shares of the Atlantic Coast Line Railroad Company's common stock, and practically controlled the Atlantic Coast Line and the roads controlled by it, including the Louisville & Nashville. The commission's investigation did not disclose any arrangement to control traffic, however.

In connection with the Tennessee Railroad Association, formed by carriers in 1884 to combat adverse legislation in that state, the report says:

"The various payments made on account of the Tennessee Railroad Association by the Nashville, Chattanooga & St. Louis and the Louisville & Nashville were to a large extent made to state officers and legislators of Tennessee, municipal officers of Nashville, politicians, lobbyists and attorneys. Investigation showed that payments made by the Nashville, Chattanooga & St. Louis in this connection, aggregating over $20,000, could be definitely assigned to persons formerly or at present holding public office, but the total amount paid to such persons was no doubt much in excess of this sum."

The report also includes the following statements:

Payments aggregating $82,596 for purposes mentioned in the resolution were made by the Louisville & Nashville between September 1, 1906, and July 1, 1914, and there were expenditures in the same period for maintaining political and legislative agents and associations of $23,274.

For creating public sentiment in favor of the plans of the Louisville & Nashville in the same period $59,322 was spent, of which $53,000 was used in a publicity campaign in Alabama to mold public opinion through the press, and part of the balance contributed to a fund made up by carriers to finance a campaign in Louisiana to prevent the change of tax laws. In this connection, says the report, "to preserve an outward apeparance of indifference the funds were placed in the hands of a bank to be disbursed by it as if in furtherance of banking interests."

The Louisville & Nashville paid to the Nashville, Chattanooga & St. Louis $120,198 for the use of the Tennessee Railroad Association, in addition to other "large expenditures in connection with that association."

A large number of vouchers were issued by the Louisville & Nashville between 1906 and 1914 to various persons, concerning which the accounts gave no information other than that the expenditures were for "special" services. They amounted to about $295,000. A request for files in the general manager's office bearing on these vouchers was denied, and other vouchers aggregating $67,722 from 1906 to 1911 were issued under the direction of the legal or executive departments of the road without the purpose being stated. One of these vouchers was for more than $20,000, and all were in excess of $1,000 Whether such sums were spent for the purposes referred to by Congress, the commission could not determine.

An account was opened in the name of the Immigration and Industrial Association of Alabama in 1907. This records a cash advance to George W. Jones, assistant district attorney in Montgomery, Ala., made under authority of the first vice-president; $13,069 was charged to this account; $7,869 was recollected from other carriers who were parties to this association and credited to this account. The balance of $5,200 remaining was charged to operating expenses by authority of the first vice-president. The nature of this account is indicated by notations on the treasurer's statements of cash receipts entered therein, such as "proportion of expenses, account adjourned session of the Alabama legislature."

A "suspense" account in the name of the National Bank of Commerce of Louisville was opened in June, 1911, to record the amounts of checks issued under authority of President Milton H. Smith, in favor of the bank, between June 7 and October 5, 1912. Amounts aggregating $249,994 were paid to the bank in the form of such checks. No information could be obtained in regard to the purpose for which these payments were made. The report says that "under the accounting rules prescribed by the commission the keeping of such vague accounts at the present time would subject the carrier to prosecution."

"It could not be determined what the purpose of all these large unexplained expenditures was. It seems clear, however, that for some reason the officials who were responsible for these entries deemed it expedient to conceal not only in the original entry, but from those engaged in this investigation the real purpose for which these expenditures were made."

The accounts of the Nashville, Chattanooga & St. Louis disclose expenditures of $13,137 from 1867 to 1914 in maintaining political or legislative agents and $856 to create public sentiment. In addition to these items explained in the accounts the commission said it discovered other disbursements aggregating $599,668, the purposes of which are concealed. Of this amount about $233,000 was collected from other railroads.

From 1884 to 1907 carriers expended about $560,000 in connection with the Tennessee Railroad Association, of which the net contribution of the Nashville, Chattanooga & St. Louis appears to have been about $367,000. Entries in this account give little detail, but there are specific items for campaign subscriptions, special trains transporting legislative bodies over foreign lines, items for "legislative services" and large ones for "special expenses." These aggregate over $300,000.

The commission also announces its intention of making a further investigation into the correspondence files of the carriers, but states that its "future action must depend on additional legislation affecting our powers." (33 I. C. C., 168.)

General News Department

By permission of the court, the Receiver of the Buffalo & Susquehanna is to continue the operation of that road until April 1. This is the fifth extension of time since the bondholders first asked for delay last autumn.

The Cummins bill, requiring common carriers (including express companies) to pay full value for losses of or damages to freight for which they are responsible (making illegal all contracts to limit liability) has passed both Houses of Congress.

Members of the legislature of British Columbia in numbers sufficient to fill a special train, made an inspection trip over the Canadian Northern Pacific on February 12 from New Westminster to Cisco, 140 miles and back. T. H. White, chief engineer, acted as host.

A. W. Thompson, vice-president of the Baltimore & Ohio, was awarded a gold medal by the Engineers' Society of Western Pennsylvania at the annual meeting of the society on Monday evening, February 8, for the general excellence of his paper on the Magnolia cut-off, presented before that society recently.

The Southern Railway has just put in service 57 steel passenger cars, all electric-lighted. These cars have been assigned to eight of the most important through trains; and steel-frame cars heretofore used on these trains have been assigned to other through trains; and this in turn has released steel underframe cars for use in local trains. Seven steel dining cars have recently been put in service.

Aiming to protect its employees against permanent injury to the eye, the Baltimore & Ohio urges, in a circular issued recently, that in case of eye injury, or of foreign particles lodging in the eye, to secure the service of a company physician whenever possible. Railroad experience cites many cases of permanent injury to the eye or loss of sight as a result of inexperienced persons attempting to act in the capacity of surgeons.

Under the consolidated organization of the New York Central the clearing house at Buffalo is to be moved to Cleveland, taking over 200 employees away from Buffalo; but on the other hand the freight claim departments of the New York Central, at New York City, and of the Lake Shore, at Cleveland, are to be moved to Buffalo and consolidated. The number of new employees in Buffalo, therefore, will be about equal those who go away. The claims department will use about twice as much room as has been used by the clearing house.

The testing laboratory of the New York, New Haven & Hartford at New Haven, Conn., during the past year has made about 10,000 tests, the articles tested ranging all the way from pencils to piston rods and from milk to paint. Special attention has been given to sanitation on passenger trains, and the milk and cream for the dining cars have been kept at the highest standard. The physicists of the laboratory have made a large number of tests of air in passenger cars on trains, and a thorough system of sterilizing drinking water receptacles on trains has been established. The chemists have analyzed the water from each one of the wells on the company's premises.

A special engineering corps of 500 Canadian engineers is to be organized for service in the European war. A request was received some days ago from the War Office in England for the formation of such a body, whose duties it will be to rebuild bridges and tracks, and perform other work of this kind. Vice-President George Bury of the Canadian Pacific has, it is said, agreed to undertake the work of organization, as the railway is naturally in a better position to secure the right kind of men than the government would be. The heavier equipment for this corps will be supplied by the British War Office, but the smaller and lighter equipment will be provided in Canada and transported with the men.

Alfred Craven, chief engineer of the New York Public Service Commission, First district, has reported to the commission that with additional reinforcement, which will not cost more than $200,000, the Second Avenue elevated railroad in Manhattan will be strong enough for the operation of trains composed of the composite cars now used in the subway, which the Interborough Rapid Transit Company proposes to transfer to lighter trucks and to run on the elevated railroads. He is also of the opinion that the Third Avenue elevated railroad will be strong enough for these cars after the third-tracking work is completed, but suggests that he be allowed six months in which to complete his investigation and decide finally as to the Third Avenue structure.

W. T. Lechlider, superintendent of the Cleveland division of the Baltimore & Ohio, has issued a bulletin giving the names of about 100 employees who, during the last nine months, have participated in the "efficiency movement," started by Mr. Lechlider, designed particularly to show economy by gathering abandoned material along the roadway and sending it to storehouses. The results of this work have been noted from time to time in the *Railway Age Gazette*. The summary now issued shows four enginemen who picked up more than a hundred dollars' worth of material each, the man at the top of the list having been credited with $313. At one station the office force secured a credit of $52; from these larger amounts the list runs down to items of twenty-five cents each.

The safety department of the Delaware, Lackawanna & Western has issued Safety First Bulletin No. 10, giving a summary of accidents to Lackawanna employees for the years 1911, 1912, 1913 and 1914. The number of employees killed in 1911 was 70, and in 1912, 46; 1913, 45, and in 1914, only 26. The number of employees injured in 1911 was 2,319; in 1912, 2,318; in 1913, 2,092, and in 1914, 1,875. There has thus been a steady decrease year by year. Comparing 1914 with 1911, the decrease in the number of employees killed was 63 per cent, while the injured decreased 19 per cent. It has been decided to award a Safety First flag to the division making the best safety record in 1914, and subsequent years, and also one to the shop making the best record. For the year 1914, the Morris & Essex division was awarded the division flag and the Scranton-Keyser Valley shops were awarded the shop flag.

M. A. Dow, general safety agent of the New York Central Lines, is sending out to manufacturers owning plants adjacent to the company's property small printed slips on safety first to be put into the pay envelopes of employees. The statement begins by saying that the railroad company has called the manufacturers' attention to the risk incurred by the employees of the factory who walk on the tracks; and, after briefly explaining the general situation, it ends with the injunction that "the practice of walking the railroad tracks by our employees must be stopped at once. The interests of personal safety require that strict observance of this rule must be enforced." Mr. Dow furnishes the slips printed in English, and also in other languages, as may be needed. Within a reasonable time after the notices have been supplied to a given factory, the inspectors of the railroad company make observations to see how well the advice has been carried out; and if track walking continues officers are sent to make some arrests.

Confidential Letters Called For

George Bury, vice-president of the Canadian Pacific, has sent to all the employees of the company the following letter:

"By the president's direction you are invited to send at any time to C. H. Buell, secretary of the Pension Department, suggestions looking to continued amicable relations with the public; improving the conditions of employment, and increased efficiency of our operations. It is believed that there is much talent in such a vast organization as ours that never has had an opportunity of coming to the front. . . . Letters will be treated as confidential and will be passed upon periodically by a committee, so that anything of worth may be fully recognized. The object is to obtain the benefit of the ideas of those working

with us, and not a means for airing grievances, which, if they exist, should go through the usual channels. . . ."

Increased Cost of Passenger Trains

In connection with the campaign of the Illinois railroads for an increase in passenger fares in the state from 2 to 2½ cents a mile the railroads have given out a statement by an operating officer of the Illinois Central, showing the increased cost of operating passenger trains, in which the actual cost of the cars and engines of one of the Illinois Central's best trains today as compared with its cost 12 years ago is itemized as follows:

Actual cost	1903	1915
Locomotive	$16,638	$23,135
Chair car	9,393	11,580
Parlor car	14,343	17,019
Dining car	14,550	20,227
Coach	9,195	12,369
Baggage car	5,048	11,165
Mail car	7,729	16,901
Cafe car	11,000	18,381
Total	$87,895	$130,797

"But $130,000 doesn't represent even half of the cost of our 'Daylight Special' trains," continued the statement. "One train leaves Chicago about the time its counterpart leaves St. Louis, so we have to have two complete trains, except as to engines, of which four are required.

"The total cost of the equipment alone of our 'Daylight Special' is therefore $307,864."

Summary of Revenues and Expenses of Large Steam Roads

The following figures were compiled by the Interstate Commerce Commission from monthly reports of operating revenues and expenses of large steam roads for the month of December, 1914. No reports are included for railroads whose operating revenues for the year ended June 30, 1914, did not reach $1,000,000.

The figures are compiled as rendered and should not be considered final, inasmuch as scrutiny of the reports may lead to their modification before acceptance.

For the Month of December

The Pennsylvania's Safety Record

The passenger record of the Pennsylvania Railroad for the year ending December 31 last, in which the trains of the company carried 189,000,000 passengers, with none killed in a train accident, which already has been noticed in the *Railway Age Gazette*, is the subject of a sixteen-page leaflet recently issued by Vice-President W. W. Atterbury and General Manager S. C. Long, congratulating the subordinate officers and the employees on this excellent record, and commending them for their part in producing it. The leaflet is filled mainly with reprints of editorial notices which have been clipped from newspapers in all parts of the country. Mr. Atterbury, in his letter, says: "Every man in the service had an important part in making 1914 a year free from accidents to passengers, and I want each one to know just what the public thinks of his work. It is only by pleasing the public that we can gain its friendship. Unless that part of the public that is dependent upon the Pennsylvania Railroad feels that our officers and employees are exerting all their efforts toward rendering the best and safest service the art of railroading makes possible, we cannot hope for the public's support in working out the many problems with which we are continually confronted."

Proposed Railway Legislation

A bill to increase the legal passenger fare in Ohio from 2 to 2½ cents a mile has been introduced in the lower House of the Ohio legislature.

A committee of employees of the St. Louis & San Francisco, in Oklahoma, are said to have secured over 25,000 signatures to a petition to the legislature, asking for a restoration of the three-cent passenger fare.

Senator Newlands has introduced in Congress a bill to empower the Interstate Commerce Commission to examine all papers of a common carrier, including correspondence. The object of the bill is to change that provision of the Interstate Commerce law which was the subject of the recent decision of the Supreme Court in the Louisville & Nashville case.

The House of the Texas legislature has killed the bill to place all railroad hospitals in the state under the control of a board of seven men, five to be elected by employees and two by the roads. The committee on common carriers, in reporting the bill adversely, said that petitions had been received from more than 20,000 unorganized railroad employees and several thousand union employees protesting against the passage of the bill.

Among the bills before the Texas legislature is one requiring the abolition of highway grade crossings in all cities and towns of more than 5,000 population; and the committee of the House, which is investigating the subject, has been told by six of the leading roads of the state that to carry out the provisions of the bill will cost them two hundred and fifty millions. The Santa Fe, for example, runs through 76 counties in Texas, and to build one bridge each year in each county will cost $2,250,000.

MISSOURI

A delegation of members of the Business Men's League of St. Louis is planning to appear before the Missouri Public Service Commission and the Missouri legislature to urge an increase in the state passenger fare from 2 to 2½ cents a mile.

The bill to increase the passenger fare in the state to three cents a mile was made a special order in the lower House for Wednesday, March 3, and the railroad committees of both the House and the Senate have reported the bill favorably. The House bill would empower the state public service commission to fix a maximum rate of three cents a mile, and immediately to establish a 2½ cent rate. A committee of railroad employees, headed by four general chairmen of the conductors', trainmen's, engineers' and firemen's organizations, appeared before Governor Major of Missouri on February 23, to present arguments for increases in freight and passenger rates in the state.

Attorney General Barker of Missouri, at the request of the Senate of the Missouri legislature, has given an opinion that the Missouri Public Service Commission has the power to fix freight and passenger rates in the state, regardless of the statutory rate. The opinion was based on a decision of the Supreme Court of Missouri in the case of the Missouri Southern, in which it was held that the act creating the commission, repealed the earlier law fixing passenger rates at two cents a mile and fixing maximum freight rates. The Attorney General said in his opinion: "I think it quite clear from the opinion, which was concurred in by the entire court, that the Public Service Commission has the power to increase the freight or passenger rates in excess of the maximum now provided by statute, if in the opinion of the commission such increase is necessary in order to furnish a fair return to the carrier."

INDIANA

The Indiana Committee on Relations of Railway Operation to Legislation has given out a statement that bills introduced in the Indiana legislature, if enacted, would add about $2,500,000 a year to the expense of the companies, while hampering transportation service. The bills against which the carriers are directing their opposition particularly are those to limit the length of freight trains to one-half mile and to require the railroads to employ telegraphers exclusively to handle train orders. The railroads say that the bill to limit the length of trains would burden them with an additional expense of at least $2,000,000 a year, and would mean the slowing up of transportation service as the result of congestion. Industries requiring large supplies of cars would be hampered if the roads were prohibited by law handling a full quota to a plant in one train.

It is further pointed out that the roads would experience a heavy economic loss, as they would be prevented from deriving the benefit of improvements and betterments which have been made at a cost of $150,000,000 to reduce grades and eliminate curves, and purchase larger engines.

It is also stated that it would cost the railroads of Indiana $250,000 a year to comply with the provisions of the bill to compel the employment of telegraphers exclusively, to handle train orders. Advocates of the bill disclosed its principal purpose in a communication which has been distributed containing the caution that "under no consideration should any reference be made to the fact that the bill will provide more positions for telegraphers."

Charles B. Riley, secretary of the Indiana Grain Dealers' Association and the Indiana Millers' Association, has given out a statement on behalf of 600 firms, protesting against the bill to compel the railroads to limit the length of freight trains to one-half mile, on the ground that such a law would interfere seriously with the marketing of grain produced in the state. Having learned that members of the house of representatives prior to the passage of the measure by that body were given to understand that the shipping public favored the measure, Mr. Riley said, "it is a fact that few shippers could have entertained that view. Shippers more than any other class of railroad patrons benefit by the practices resulting in increased efficiency of equipment and prompt movement of tonnage. The grain dealers and millers of the state, with whom I am connected, and from whom I received instructions to enter a protest against this bill, are strongly opposed to it. It is the belief of the interests I represent that the railroads should be permitted, if not actually required, to haul in each train the largest possible number of cars, thus better utilizing their equipment in the service of the public."

Governor Ralston has sent a message to the legislature, recommending that the state public service commission be given authority to increase railroad passenger fares, if on investigation it finds the railroads entitled to the increase; and a bill has been introduced to carry out the recommendation.

Profits in Pants

The Frisco Railroad is engaged in a campaign to psychologically popularize upper berths in the Pullmans. The agents will cease assuming that every passenger is going to insist on a lower, and will recommend the low price, the spring mattress, the roominess, the conveniences for hanging clothes and the other advantages to be had by buying an upper; and then the prospective passenger will imagine himself swayed to sleep on a spring mattress in an ideal temperature, and with his pants hanging safely on the conveniences provided, and containing the 20 per cent difference in cost between the upper and the lower berth.—*St. Louis Republic.*

Railway Signal Association

C. C. Rosenberg, secretary of the Railway Signal Association, reports that all of the questions submitted to the members by letter ballot following the action of the last annual meeting have been decided affirmatively, except the proposed standard code of operated units which had been prepared for use in dividing the cost of joint mechanical interlocking plants; this was lost by a vote of 147 to 545.

The program for the discussions at the meeting in Chicago, March 15, includes reports from committees, 2, 3, 4, 6, 8 and 10, and the special committees on lightning protection and contracts. Committee No. 2 presents for discussion a code of specifications for electro-mechanical interlockings, filling 44 pages.

Committee No. 8, on electric railway and alternating current signaling, reports that it is bringing up to date the descriptions of alternating current signal installations which have been a feature of the proceedings of the association for two or three years past. Installations of this kind are increasing in number, and the committee expects to present a large amount of interesting matter at the next annual meeting.

Committee No. 10 presents a code of specifications, filling seven pages, for portable storage battery.

Committee No. 4 presents revised specifications for wood trunking and a revised code of circuit requisites for automatic block signaling on single track. These latter are a revision of those presented in the minority last September.

Committee No. 6 presents thirteen proposed standard drawings; and the special committee on lightning protection presents requisites for lightning arresters and choke coils.

The special committee on contracts, J. B. Latimer (C. B. & Q.) chairman, presents a simplified form of the table for operated units which was presented in September, but which failed to receive a favorable vote when put before the members in a letter ballot.

Program of the American Railway Engineering Association Convention

The sixteenth annual convention of the American Railway Engineering Association will be held at the Congress Hotel, Chicago, March 16-19. Sessions will be held in the morning at 9 o'clock, and in the afternoon at 2 o'clock. The following is the program:

Tuesday, March 16—
- President's address.
- Reports of secretary and treasurer.
- Reports of the following standing and special committees.
- Committee No. 12—Rules and organization.
- Committee No. 10—Signals and interlocking.
- Special committee—Uniform general contract forms.
- Committee No. 9—Signs, fences and crossings.
- Committee No. 16—Economics of railway location.
- Committee No. 1—Roadway.
- Committee No. 11—Records and accounts.

Wednesday, March 17—
- Committee No. 3—Ties.
- Committee No. 15—Iron and steel structures.
- Committee No. 13—Water service.
- Committee No. 5—Track.
- Committee No. 6—Buildings.
- Committee No. 17—Wood preservation.
- Committee No. 19—Conservation of natural resources.
- Special committee—Stresses in railroad track.
- Annual dinner at 7 p. m.

Thursday, March 18—
- Committee No. 8—Masonry.
- Committee No. 7—Wooden bridges and trestles.
- Special committee—Grading of lumber.
- Committee No. 18—Electricity.
- Committee No. 14—Yards and terminals.
- Committee No. 2—Ballast.
- Committee No. 4—Rail.
- Election of officers.
- Adjournment.

Friday, March 19—
- Visit to the exhibit of the National Railway Appliances Association at the Coliseum.

The Transportation Club of Louisville

At the regular annual meeting and election of the Transportation Club of Louisville held on February 9, 1915, the following officers were elected: President, F. G. Maus, division freight agent of the Pittsburgh, Cincinnati, Chicago & St. Louis; vice-presidents, F. N. Hartwell, H. Verhoeff & Co.; C. B. Phelps, general superintendent of transportation, Louisville & Nashville; Charles Van Overbeke, traffic manager, Standard Oil Company; secretary, S. J. McBridge, agent, Blue Ridge Despatch, and treasurer; W. T. Vandenburgh, commercial agent, Seaboard Air Line.

The American Society of Mechanical Engineers

The regular monthly meeting of the American Society of Mechanical Engineers will be held on Tuesday, March 9, in the Engineering Societies' building at 29 West Thirty-ninth street, New York. Dr. Hollis Godfrey, president of the Drexel Institute will present a paper on "The Application of Engineering Methods to the Problems of the Executive, Director and Trustee."

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings, and places of meeting.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

American Association of Demurrage Officers.—A. G. Thomason, Demurrage Commissioner, 845 Old South Bldg., Boston, Mass. Annual convention, March 23, Jefferson Hotel, Richmond, Va.

American Association of Dining Car Superintendents.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next meeting, October 21-23, 1915, Boston, Mass.

American Association of Freight Agents.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 21-24, 1915, Richmond, Va.

American Association of Passenger Traffic Officers.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, April 15-16, San Francisco, Cal.

American Association of Railroad Superintendents.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Next meeting, August 19-20, 1915, San Francisco, Cal.

American Electric Railway Association.—E. B. Burritt, 29 W. 39th St., New York. Annual convention, October 4-8, 1915, San Francisco, Cal.

American Electric Railway Manufacturers' Association.—H. G. McConaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

American Railroad Master Tinners, Coppersmiths and Pipefitters' Association.—W. E. Jones, C. & N. W., 3814 Fulton St., Chicago. Annual meeting, Chicago.

American Railway Association.—W. F. Allen, 75 Church St., New York. Next session, May 19, 1915, Atlantic City, N. J.

American Railway Bridge and Building Association.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 19-21, 1915, Detroit, Mich.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

American Railway Master Mechanics' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June 9-11, 1915, Atlantic City, N. J.

American Railway Safety Association.—L. F. Shedd, C. R. I. & P., Chicago.

American Railway Tool Foremen's Association.—Owen D. Kinsey, Illinois Central, Chicago. Annual meeting, July 19-21, 1915, Hotel Sherman, Chicago.

American Society for Testing Materials.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa. Annual meeting, June 22-26, 1915, Hotel Traymore, Atlantic City, N. J.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York, Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

American Society of Mechanical Engineers.—Calvin W. Rice, 29 W. 39th St., New York. Next meeting, June, 1915, Buffalo, N. Y. Annual meeting, December 7-10, 1915, New York.

American Wood Preservers' Association.—F. J. Angier, Supt. Timber Preservation, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 18-20, 1916, Chicago.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Piedmont Hotel, Atlanta, Ga.

Association of Manufacturers of Chilled Car Wheels.—George W. Lyndon, 1214 McCormick Bldg., Chicago.

Association of Railway Claim Agents.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, May 19, 1915, Galveston, Tex.

Association of Railway Electrical Engineers.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual meeting, October, 1915.

Association of Railway Telegraph Superintendents.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 22-25, 1915, Rochester, N. Y.

Association of Transportation and Car Accounting Officers.—G. P. Conard, 75 Church St., New York. Next meeting, June 23-25, Niagara Falls, N. Y.

Bridge and Building Supply Men's Association.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

Freight Claim Association.—Warren P. Taylor, R. F. & P., Richmond, Va. Annual meeting, June 16, 1915, Chicago.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

International Railway Fuel Association.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Hotel La Salle, Chicago.

International Railway General Foremen's Association.—Wm. Hall, 1126 W. Broadway, Winona, Minn. Next convention, July 14-17, 1915, Sherman House, Chicago.

International Railroad Master Blacksmiths' Association.—A. L. Woodworth, C. H. & D., Lima, Ohio. Annual meeting, August 17, 1915, Philadelphia, Pa.

Maintenance of Way and Master Painters' Association of the United States and Canada.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next meeting, October 19-21, 1915, St. Louis, Mo.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May 26 to 28, 1915, Chicago, Ill.

Master Car and Locomotive Painters' Association of the United States and Canada.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 14-17, 1915, Detroit, Mich.

Master Car Builders' Association.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Annual meeting, June 14-16, 1915, Atlantic City, N. J.

National Railway Appliances Association.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railroad Master Tinners, Coppersmiths and Pipefitters' Association.—U. G. Thompson, C. & E. I., Danville, Ill. Annual meeting, May, 1915.

Railway Business Association.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December, 1915, Waldorf-Astoria Hotel, New York.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Railway Electrical Supply Manufacturers' Association.—J. Scribner, 1021 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

Railway Fire Protection Association.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Next meeting, October 5-7, 1915, Chicago.

Railway Signal Association.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa. Next meeting, March 15, 1915, Chicago. Annual meeting, September 21-24, 1915, Salt Lake City, Utah.

Railway Storekeepers' Association.—J. P. Murphy, L. S. & M. S., Box C, Collinwood, Ohio. Annual meeting, May 17-19, 1915, Hotel Sherman, Chicago.

Railway Supply Manufacturers' Association.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders and Master Mechanics' Associations.

Railway Telegraph and Telephone Appliance Association.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

Roadmasters' and Maintenance of Way Association.—L. C. Ryan, C. & N. W., Sterling, Ill. Annual meeting, September 14-16, 1915, Chicago.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Signal Appliance Association.—F. W. Edmunds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

Society of Railway Financial Officers.—Carl Nyquist, C. R. I. & P., La Salle St. Sta., Chicago. Annual meeting, September, 1915.

Southern Association of Car Service Officers.—E. W. Sandwich, A. & W. P. R. R., Atlanta, Ga. Annual meeting, January, 1916.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Track Supply Association.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of Newark.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, Newark.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meeting last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

Traffic Club of Pittsburgh.—D. L. Wells, Erie R. R., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh. Annual meeting, 2d Monday in June.

Traffic Club of St. Louis.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

Train Despatchers' Association of America.—J. F. Mackie, 7122 Stewart Ave., Chicago. Annual meeting June 15, 1915, Minneapolis, Minn.

Transportation Club of Detroit.—W. R. Hurley, Superintendent's office, L. S. & M. S., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

Traveling Engineers' Association. W. O. Thompson, N. Y. C. R. R., East Buffalo, N. Y. Annual meeting, September, 1915, Chicago.

Western Canada Railway Club.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

Traffic News

Traffic officers of the transcontinental railways began a meeting in Chicago on Monday to arrange for putting into effect the latest decision of the Interstate Commerce Commission in the intermountain rate case, which gave relief from the fourth section on a large number of commodities, permitting the railroads to make lower rates to the Pacific coast terminals from eastern points than to intermediate points, in order to meet competition of vessels sailing through the Panama Canal.

Traffic Club of Chicago

The nominating committee of the Traffic Club of Chicago has selected the following as the regular ticket of officers for the ensuing year: President, Fred Zimmerman, vice-president, Chicago, Indianapolis & Louisville; first vice-president, F. L. Bateman, president, Transcontinental Freight Company; second vice-president, W. O. Davis, division freight agent, American Steel & Wire Company; third vice-president, W. J. Leahy, general passenger agent, Chicago, Rock Island & Pacific; secretary, W. H. Wharton, commercial agent, Nashville, Chattanooga & St. Louis; treasurer, Charles B. Hopper, general freight agent, Goodrich Transit Company. Directors for two years: J. Charles Maddison, secretary, Montgomery Ward & Company; J. G. McAuliffe, traffic manager, Butler Brothers; C. W. Pitts, general agent passenger department, Great Northern; E. W. Skipworth, assistant general traffic manager, Sulzberger & Sons Company. The annual meeting and election will be held on March 30.

River Traffic in the United States

The United States Department of Agriculture has issued bulletin 74 on Inland Boat Service, dealing with freight rates, time of transit and length of routes. Long passenger runs are a thing of the past. A few hundred miles, the investigator found, is usually the maximum run for any steamboat. On only 25 of the 102 routes for which this information was available, was the average rate of speed over 10 miles an hour and on 37 it was less than 6.

In the east the principal routes of steamboat lines, include those of the Hudson river and the Chesapeake bay. On the Hudson there is considerable variety of traffic, through service between New York City and Albany, a number of shorter routes between various cities along this line, and thirdly the through traffic of canal boats carrying cargoes from the Erie canal to tidewater. In Chesapeake bay traffic radiates principally from the cities of Baltimore, Washington and Norfolk.

The longest routes are to be found in the Mississippi Valley. From Cincinnati regular lines run down the Ohio and Mississippi rivers as far as Memphis, 749 miles. From St. Louis regular boats run to St. Paul and to Memphis. Other lines reach Kansas City and Peoria, and one goes up the Tennessee river as far as Waterloo, Alabama. From Memphis boats run to Vicksburg, where they connect with boats for New Orleans. From New Orleans there is a line up the Red and Black rivers to Harrisonburg, La., and other routes traverse the network of rivers, bayous and canals in southern Louisiana as far west as Bayou Teche, and as far north as the Red river. There is also considerable traffic on Lake Pontchartrain.

On the Pacific coast an important system of waterways consists of the rivers emptying into San Francisco bay, and here there is a rich truck region which is not conveniently reached by rail, but is comparatively easy of access by boat. San Francisco, Sacramento and Stockton are the principal centers for this traffic. A second coast system consists of the Columbia river and its tributaries. From Portland steamers run down the Columbia to Astoria and up as far as Celilo Falls. Above the Celilo Falls other boats reach points on the upper Columbia and Snake rivers.

An English Railway's Big Business.—The Great Northern Railway has recently handled more cars at its London end than at any previous time in the history of the line.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

At a hearing before Examiner Kelly of the Interstate Commerce Commission at Chicago last week the eastern railroads voluntarily withdrew tariffs increasing the rates on meat and packing house products, which had been suspended by the commission, to file new tariffs advancing the rates by only 5 per cent.

Rates on Farm Wagons from Toledo

Milburn Wagon Company v. Ann Arbor, et al. Opinion by Commissioner Harlan:

The adjustment of rates from Toledo, on horse-drawn freight vehicles, farm wagons, carts and dump wagons to Illinois, Wisconsin, Minnesota, to points west of the Mississippi river and to Mexico is alleged to be inherently unreasonable, in part by reason of unreasonable official classification ratings, and on a relatively higher basis than from Chicago, Milwaukee, Racine, etc., to the undue preference of these places. The commission adheres to its decision in the *Commercial Club of Terre Haute v. Vandalia*, 29 I. C. C., 383, and holds that the other cities are not similarly circumstanced and that the adjustment of rates from Toledo is not unreasonable. (32 I. C. C., 582.)

Rates on Fruits from Points in Florida to Montana

Lindsay & Company, Ltd., et al. v. Northern Pacific et al. Opinion by Commissioner McChord:

The commission finds that the carrier's rates of $1.62½ per 100 lb. on grapefruit in carloads and $1.60 on fresh tomatoes in carloads from Jacksonville and other basing points in Florida, when from beyond, to Helena, Great Falls, Butte and Billings, Mont., are not unreasonable. It is held, however, that the present rate of $1.76 on oranges in carloads and grape-fruit and oranges in mixed carloads from the same points to the same destinations is unreasonable to the extent that it exceeds $1.62½.

The present minimum weight of 26,000 lb. on grapefruit and oranges in straight or mixed carloads is found unreasonable to the extent that it exceeds 24,000 lb. (33 I. C. C., 150.)

Rates on Lumber from Points in Virginia

Massie & Pierce Lumber Company et al. v. Norfolk & Western et al. Opinion by the commission:

Complainants, shipping lumber from points on the Durham division of the Norfolk & Western, between Lynchburg and the North Carolina state line; from Dillard, on a branch of the Norfolk & Western, extending south from Blackstone; from certain points on the Southern, between Richmond and Burkeville, and from a number of points on the Virginian, between Altavista and Suffolk, all of which points are east of Roanoke and south of the James river, ask that these points be given Virginia city rates on lumber to points in Buffalo-Pittsburgh and central freight association territories. The commission finds that such rates should not be granted. The common point rate adjustment at the Virginia cities is a result of the competition of carriers and is of long standing. It applies to traffic in general, and if it were overthrown, as would be the case if complainants' request were granted, the resulting permanent realinement of rates would be very far-reaching. The commission is not prepared to condemn the Virginia cities rate adjustment on a record which involves but one commodity, and which excludes questions under the long-and-short-haul rule. (33 I. C. C., 14.)

Lumber Rates from Points on the Pacific & Idaho Northern

Boise Lumber Company, Ltd., v. Pacific & Idaho Northern et al. Opinion by Commissioner Clark:

The commission finds that the joint rate of nine cents per 100 lb., charged by the Pacific & Idaho Northern and the Oregon Short Line, on saw logs from New Meadows, Tamarack and other so-called group A points on the Pacific & Idaho Northern in Idaho via Ontario, Ore., to Boise, is unreasonable and should not exceed seven cents per 100 lb.; minimum weight, 40,000 lb. The complainants requested a rate of 3.1 cents. The commission states, "Every shipper is entitled to a reasonable rate; but if the nature or value of a commodity offered for transportation is such as to demand an unreasonably low rate, there is no lawful obligation upon the carrier to meet this demand.

The United States government and the state of Idaho own, respectively, 175,877,000 ft. and 55,000,000 ft. of merchantable timber tributary to the Pacific & Idaho Northern which must move via rail. It is stated that this timber is subject to deterioration if allowed to stand longer and that efforts to dispose of it have been unavailing, the controlling obstacle being the freight rate to Boise. The development of these timber tracts is alleged to be of paramount importance, but the commission, following the decision in *Railroad Commissioners of Montana v. Butte, Anaconda & Pacific* (31 I. C. C., 641), states that "the national or public aspect of this matter is one of general governmental policy and not one which the law intrusts to the commission to determine." (33 I. C. C., 109.)

Regulations Restricting the Shape of Baggage

Opinion by Commissioner Hall:

The commission in Regulations Restricting the Dimensions of Baggage (26 I. C. C., 292) said that

> Upon notice of not less than one year carriers may provide that trunks or other rigid containers with more than two bulging sides, or with two bulging sides that are not opposite to each other, will not be accepted for checking as baggage.

The following rule was adopted by the carriers in accordance therewith:

> Trunks or cases constructed in the form of a trunk, or other rigid containers which are not square or rectangular, will not be accepted for transportation in regular baggage service, except that such trunks, cases, or other rigid containers will be accepted for transportation provided that they have not to exceed two bulging sides and the bulging sides are opposite to each other.

The commission finds that this rule must be canceled because it is arbitrary and unreasonable in so far as it is intended to exclude from the regular baggage service the so-called "pentagonal trunks" used by the salesmen of protestants, the National Cash Register Company and the Toledo Scale Company. Each salesman takes with him when he is on the road one of these trunks, containing one complete cash register or scale. The trunks weigh from 200 to 250 lb. Although they must rest on their bases they are small and compact and are handled better than many other articles carried in the regular baggage service. The salesmen travel as a rule on local trains on which the available baggage space is rarely crowded. It was shown that the rule would seriously interfere with protestants' business, and that there would be no corresponding benefit for the carriers. (33 I. C. C., 266.)

The Nashville Terminal Case

City of Nashville et al. v. Louisville & Nashville, et al. Opinion by Commissioner Meyer:

The Louisville & Nashville and the Nashville, Chattanooga & St. Louis own separate terminals at Nashville, but operate them jointly as the "Nashville terminals," the total expense of maintenance and operation being apportioned on the basis of the number of cars and locomotives handled. Both roads thus serve the industries on each other's tracks in addition to the industries on their own, without charge to shippers. The two roads since 1907 have interchanged with the Tennessee Central all noncompetitive traffic, except coal, at $3 a car, coal being switched only at 60 cents a ton. In *Traffic Bureau of Nashville v. Louisville & Nashville* (28 I. C. C., 533), affirmed in *Louisville & Nashville v. United States* 216 *Fed.* 672, it was held that this constituted discrimination and the roads were ordered to follow the same practice in switching of coal from and to the Tennessee Central, as they maintained with respect to shipments from and to their own tracks. The carriers construed this order to relate exclusively to noncompetitive coal, but have continued their former practice as to competitive coal. Competitive traffic of all kinds is interchanged at local rates amounting to from $5 to $36 per car.

Complainants ask that the roads be required to interchange with the Tennessee Central at a uniform charge not to exceed $2 a car.

The commission finds that a charge of $3 for switching Tennessee Central noncompetitive traffic is not unreasonable.

The commission also believes that the defendants have inter-

preted too narrowly the decision in *Traffic Bureau of Nashville v. Louisville & Nashville,* because, although that case related exclusively to coal, the decision and order related to competitive as well as noncompetitive coal.

The commission also finds that defendants' refusal to switch competitive traffic to and from the Tennessee Central on the same terms as noncompetitive traffic while interchanging both kinds of traffic on the same terms with each other is discriminatory. As long as defendants switch both competitive and noncompetitive traffic for each other at a charge equal to the cost of service, exclusive of fixed charges, the charges imposed for switching Tennessee Central traffic should not exceed the cost of the service, which, as had been shown, is approximately $3 per car.

The commission believes that since defendants interchange traffic with each other they cannot refuse to interchange traffic upon substantially the same terms with the Tennessee Central, provided the circumstances and conditions are substantially the same, and defendants are not required "to give the use of their tracks or terminal facilities" to the Tennessee Central within the meaning of section 3. The commission does not agree with defendants' contention that they cannot be compelled to "short haul" their own lines in favor of the Tennessee Central, because each line is already "short hauling" itself in favor of the other. The commission also gives weight to the contention that defendants' terminals are admittedly open to noncompetitive Tennessee Central traffic, even though at prohibitive rates. (33 I. C. C., 76.)

Rates on Tomatoes from Jacksonville to Kansas City

In re rates on tomatoes from Jacksonville, Fla., to Kansas City, Mo., and other points. Opinion by Commissioner Clements:

Rates from Jacksonville and other Florida base points to points west of the Mississippi river, applicable on tomatoes originating in Florida, are made by combination of proportional rates to the Ohio and Mississippi river crossings and class rates beyond, the lowest combination in each case fixing the amount of the rate via all routes. Following a change in the rating of tomatoes in western classification from class C, minimum 24,000 lb., to fifth class, minimum 20,000 lb., and a consequent increase in the rates to points west of the Mississippi river from the Ohio and Mississippi river crossings, it is now proposed to increase to the same extent rates on tomatoes originating in Florida, the increase to accrue entirely to the lines west of the crossings. With the increase would go a reduction of 4,000 lb. in the carload minimum weight. The commission finds that these charges would be justified. (33 I. C. C., 145.)

Reparation Arising from Failure to Furnish Cars

Vulcan Coal & Mining Company v. Illinois Central. Opinion by Commissioner Meyer:

Complainants, operating mines at Belleville and Coulterville, Ill., on the Illinois Central, allege that during certain periods of 1911, 1912 and 1913 defendants failed to furnish a reasonably adequate supply of cars. The commission is asked to award reparation equal to the loss of profit on interstate shipments, which would have been made had the car supply been reasonable, plus the greater cost of mining due to restricted output. The commission, in this report, does not attempt to determine whether or not the car supply was legally adequate, nor to determine the amount of damages, both of these questions being left for a subsequent hearing; and the report is mainly devoted to a discussion of the commission's jurisdiction, the defendants having argued that this is a question for determination by the courts.

The commission, following the decision of the United States Supreme Court in *Texas & Pacific v. Abilene Cotton Oil Company* (204 U. S., 426), contends that the question as to the extent to which defendant failed to comply with the duty it owed complainant is an administrative one, of which the commission alone can take original jurisdiction. In the Supreme Court case suit was brought to recover damages resulting from the exaction of an alleged unreasonable rate. This rate was stated in a schedule duly filed and published, but the commission had never passed on its legality. The court refused to construe the act as conferring any right to recover damages for unreasonable charges prior to a finding by the commission. This case was followed by a number of other important cases.

As concerns a reasonable rate, these cases in general hold that the commission is given jurisdiction to determine what is a reasonable rate, but that the courts have jurisdiction in case a carrier collects a rate which has already been determined by the commission to be unreasonable. It is not wise for the courts to determine what is a reasonable rate, because various decisions might not agree on the same rate.

As to the carrier's duty to furnish cars, the commission believes that its contention above must be correct unless it be the carrier's absolute duty to furnish cars to the full extent of the shipper's demand, which, of course, is manifestly impossible. It is the carrier's duty to maintain a reasonably adequate car supply, and the question of what is a reasonably adequate car supply is just as much an administrative one as the question of what is a reasonable rate. The legal sufficiency of defendant's car supply cannot be definitely fixed by statute. It does not necessarily follow, however, that every case involving car supply must first come before this commission. It is obvious that if a carrier should absolutely refuse to furnish any cars, the courts could take primary jurisdiction.

The commission also holds that the assumption of jurisdiction in the present case is not inconsistent with the mandamus provisions of section 23 of the act. It is not believed that defendant is deprived of its right under the seventh amendment of the constitution, or that considerations of expediency should have weight in deciding whether or not the commission should assume jurisdiction.

As stated above, the commission at this time does not attempt to decide whether defendant's supply of cars was legally sufficient. The defendant contends that its car supply during the period set forth was such and draws attention to the purchases of rolling stock and of extensions of terminal facilities which have been made since 1911. The commission agrees that a carrier cannot be expected to maintain a car supply which will meet all demands of the operators under all conditions, for if the carriers were to equip themselves to meet at any moment the maximum demands, the public would be obliged to pay interest upon the additional investment and for the maintenance of the facilities. It is stated, however, that "although a full car supply cannot be expected all the time, carriers must do more than to provide themselves with sufficient equipment for the slack period of coal production."

Commissioner Clark, in a dissenting opinion in which Commissioners Harlan and Clements concur, notes that the commission has never been understood to possess the power to require a carrier to enlarge its facilities or service or to award damages against a carrier for failure so to do. Indeed, if the carrier must respond in damages because of its inability to furnish cars at a time of unusual demand, it seems that the right of that carrier to confine its equipment to its own rails must be recognized, but that right has been specifically denied in *Missouri & Illinois Coal Company v. Illinois Central* (22 I. C. C., 39). The dissenting opinion states:

"For all of these reasons, together with the fact that the commission's orders for the payment of money are only *prima facie* evidence in the courts, in connection with which the court may receive additional testimony which has not been presented to the commission, I think that the question of requiring a carrier to provide itself with additional facilities or respond in damages for failure so to do is essentially a judicial question, jurisdiction of which reposes in the courts, which have authority to create and direct the conduct of receiverships, and not in the commission, which has been created to exercise certain delegated powers legislative in character." (33 I. C. C., 52.)

STATE COMMISSIONS

The Massachusetts Public Service Commission has reported on the requests of the Boston & Maine, the Boston & Albany and the New York, New Haven & Hartford, presented several months ago, for authority to advance passenger fares. The New Haven will be permitted to increase one-way single fare rates outside the Boston suburban zone from 2¼ to 2½ cents a mile basis. The petitions of the other two roads are disallowed, because the form of the proposed tariffs is unsatisfactory. The board suggests that these roads file applications for increases on a basis similar to that used in the New Haven tariffs. The commission seems disposed to authorize a rate of 2½ cents a mile, except for the travel within 15 miles of Boston, but presents a mass of criticisms of the season and other reduced-rate tickets of the Boston & Maine and the Boston & Albany.

COURT NEWS

The Court of Appeals of New York last week handed down decisions in the Heim and Crane cases, upholding the constitutionality of the labor law of that State in respect to the provision which forbids the employment of any but citizens of the United States on contracts for public work. This decision affects all of the contracts on the new subways which the city now has outstanding, and which aggregate about $142,000,000. There are thirty separate contracting firms engaged in the work, and they employ about 16,000 men. Two days after the decision was published one of the contractors had suspended work and others were proceeding with reduced forces. It is the contention of the contractors that it is next to impossible to procure American citizens to do the kind of work which hitherto has been done by foreigners. The contractors, however, have announced that they will obey the law. Unless the law can be repealed or modified large numbers of aliens must be dismissed. This law has been on the statute books many years, but was a dead letter, as regards aliens, until the labor unions a few months ago started these suits.

Limitation of Liability—Shipment to Foreign Country

A bill of lading provided that the carrier agreed to transport only over its own line and act as agent as to the balance of the route, and should not be liable for loss or injury to the goods not occurring on its own road, except as liability might be imposed by law. The railroad company took from the shipper a release, releasing the company and all other transportation companies from liability from leakage, shrinkage, etc., except such as might occur from negligence. The Wisconsin Supreme Court holds that under these contracts the liability of the initial carrier was limited to its own line. It was contended that the Carmack amendment to the Interstate Commerce act made the initial carrier liable, but the court held that it did not apply to the case, because the shipment here was not from "a point in one state to a point in another state," but from a point in one state to a foreign country (Wisconsin to Manitoba). Best v. Great Northern (Wis.), 150 N. W. 484.

Abolition of Grade Crossing—Liability to Property Owner

New York Railroad Law, Section 91, provides that any railroad which crosses or is crossed by a street at grade may petition for an alteration in the character of such crossing, or, if not practicable to change it from grade, for its discontinuance, and the opening of another crossing. Section 21 provides that the road shall restore intersecting streets to their former condition. On petition of a road showing that public safety required the elimination of a grade crossing at a street, the Public Service Commission made an order directing that such street be carried under the railroad at a different point, so that the old grade crossing was abolished and the lines of both the railroad and the street changed. The new railroad line crossed the old street at a new point on an embankment, thus closing the old street at the new point of intersection. This left an owner's property at the end of a cul-de-sac, and made it necessary for him to travel further to reach the street. It was held by the New York Court of Appeals, in an action by the owner against the railroad, that the statute justified the change of grade and relieved the road from liability to the plaintiff.—Danner v. New York & H., 106 N. E. 1,029.

Right to Free Pass—Right to Eject Passenger—Company's Rule

In an action for wrongful ejection it appeared that a joint pass had been issued to one Bass and four other unnamed persons, of whom the plaintiff was one. After they boarded the train the conductor accepted the pass, punched it and returned it to Bass. Bass and others of the party, not including the defendant, however, having indulged too freely in liquor, became so disorderly as to justify and necessitate their ejection at an intermediate station. There was a rule of the defendant company, of which the defendant alleged the plaintiff had knowledge, that, when the person whose name appeared in the face of the pass was ejected from or left the train before arriving at the place to which he was entitled to go, the other person or persons for whom the pass was intended, but who were not named therein, would also, unless they paid fare, have to leave the train with the person named in the pass. The plaintiff, upon the ejection of Bass, neither tendered nor paid fare, and was consequently ejected, but the conductor used no more force than was reasonably necessary.

In reversing judgment for the plaintiff because of certain erroneous rulings of the trial court, it was held that a person riding on a pass is not a trespasser, and even when the pass is withdrawn (assuming, which is not ordinarily the case, that a conductor is clothed with authority to withdraw a pass or license that has been lawfully issued by the authorized agent of a railroad company), the holder should be given an opportunity to pay fare before he is ejected. The court held that if, as alleged, the plaintiff was an employee of a contractor for the rebuilding or repair of one of the defendant's buildings, and the defendant, as part consideration of the contract, had agreed to furnish free transportation for the contractor's men, he was a person to whom a pass might be issued under the Alabama statute. Assuming the pass was valid, if Bass was lawfully ejected, so was the plaintiff by operation of the company's rule, if he knew or was informed of it. The price paid by the plaintiff for a meal for one of the party at the place of ejection was not an element of damage, nor was the price paid for a meal for himself except to the extent that the cost exceeded what the plaintiff would have had to pay if permitted to ride. L. & N. v. Dawson, Alabama Court of Appeals, 66 So. 905.

Scope of Employment—Duty to Guard Dangerous Appliances

While the men in the boiler department of a railroad shop were resting at midnight, eating their luncheons, an employer playfully turned a compressed air hose upon a fellow servant, and killed him. In an action against the railroad company, the court held that it was not liable. The employees at the time were not engaged in the master's business, and the accident was not due to any violation of duty by the master. The compressed air hose was held not to be such a dangerous agency as to require the master to guard it to prevent its being used by unfit employees. The court likened the case to that of Ballard v. L. & N., 128 Ky., 826, 110 S. W. 296, 16 L. R. A. (N. S.) 1052. There the following propositions were decided: (a) "That a servant competent for the work for which he is employed is careless, reckless, stupid, and unfit to handle other appliances in the shop does not render the master liable for the use of a compressed air hose which it is not his duty to handle, but his handling of which by way of prank has not been stopped, in such a way that the air enters the body of a co-servant and kills him. (b) A compressed air hose is not a dangerous agency requiring a master to guard it so that ignorant or reckless persons cannot use it to the injury of others." In that case the person killed was an apprentice, and was engaged in the master's service when a fellow servant slipped up behind him and turned the hose on him, killing him. It was alleged that the co-servant who did the wrongful act was a careless, reckless, and stupid boy, and unfit for the employment, and that all this was known to the master, or to his superintendent, and such negligent servant was retained after such knowledge; that the superintendent knew that the boy at fault had been using the hose on the deceased on prior occasions, and knew it was dangerous; yet he had never warned the deceased or the negligent servant, both of whom were minors. Notwithstanding all these facts being alleged, making it a much stronger case than the present, the Kentucky court held that the complaint stated no cause of action.

The court also referred to the case of Western Railway of Alabama v. Milligan, 135 Ala. 205, 33 So. 438. In that case the plaintiff was very ticklish, or what is called "goosey," and, when punched, he jumped frantically and made ridiculous gyrations. The superintendent of the defendant railway company ordered him to brush off a table on which knives were revolving, and as he was about to brush the table, or in the act of doing so, the superintendent "goosed" him. He jumped frantically, as usual, throwing his hands under the knives, and was badly cut. The court held that the act of the superintendent was not an act of superintendence, for the consequences of which, under the Employer's Liability Act, the company could be held liable. It bore no sort of relation to the work the superintendent had directed the plaintiff to do. Kirby v. L. & N., Alabama Supreme Court, 65 So. 358.

Railway Officers

Executive, Financial, Legal and Accounting

Frank G. Drum, San Francisco, Cal., and Warren Olney, Jr., general counsel of the Western Pacific, at San Francisco, have been appointed receivers of the Western Pacific.

Arthur E. Haid has been appointed assistant general attorney of the St. Louis & San Francisco, with headquarters at St. Louis, Mo.

E. M. Bagley has resigned as claims attorney for the Oregon Short Line to engage in the general practice of law at Salt Lake City, Utah.

Clayton Snyder, assistant secretary of the National Railways of Mexico, with office at New York, has resigned, to become assistant treasurer of the Pittsburgh Steel Company, Pittsburgh, Pa., and E. E. Bashford, who was assistant secretary at New York in 1910, is now acting assistant secretary.

Robert R. Hulme, assistant auditor of merchandise traffic of the Philadelphia & Reading and subsidiary companies at Philadelphia, Pa., has been appointed auditor of merchandise traffic with office at Philadelphia, succeeding William B. Scott, retired from service, and Henry Forster succeeds Mr. Hulme.

J. S. Joyce has been elected president of the Tremont & Gulf with headquarters at Chicago, succeeding R. B. Fowler, who was elected vice-president and appointed general manager, with headquarters at Winnfield, La. Mr. Joyce has been elected president also of the Groveton, Lufkin & Northern, succeeding Mr. Fowler, who was appointed general manager of that road.

H. H. Larimore, district claim agent for the Missouri Pacific-Iron Mountain System at Kansas City, Mo., has been appointed assistant attorney for the system, with office at St. Louis, Mo., succeeding W. Scott Hancock, who has resigned to engage in the general practice of law. C. D. Jeffers, district claim agent at Poplar Bluff, Mo., succeeds Mr. Larimore, and J. B. Collins, claim agent at Atchison, Kan., succeeds Mr. Jeffers.

Edward Francis Kearney, whose election as president of the Wabash, with headquarters at St. Louis, Mo., has already been announced in these columns, was born March 27, 1865, and began railway work in 1882 as telegraph operator for the Pennsylvania Lines. He remained with that road until February, 1903, being employed successively as freight clerk, chief operator in superintendent's office, train despatcher, trainmaster's clerk, chief clerk to superintendent and trainmaster. The following year he was superintendent of the Terminal Railroad Association of St. Louis and the St. Louis Merchants' Bridge Terminal Railway, going to the Chicago, Rock Island & Pacific in February, 1904, as supervisor of mails. From April to October of that year he was superintendent of transportation of the St. Louis & San Francisco. In April, 1905, he was appointed superintendent of terminals of the Missouri Pacific at St. Louis and in February, 1908, was promoted to superintendent of transportation of that road and the St. Louis, Iron Mountain & Southern. He was made general superintendent of transportation in January, 1913, and three months later was elected first vice-president of the Texas & Pacific, with headquarters at New Orleans, La. Mr. Kearney held the latter office when he was appointed receiver of the Wabash a few weeks ago, and last week he was elected president of that road, as above noted.

E. F. Kearney

Verne M. Alexander has been appointed assistant to the president of the Chicago & Alton, with office at Chicago, Ill. He was born at Niagara Falls, Ontario, on November 19, 1887, and was educated in public and high schools at Lisbon and Cleveland, Ohio. He began railway work as messenger for the Western Union Telegraph Company and the Erie Railroad at Lisbon, Ohio, in June, 1901, and was successively yard clerk, freight received clerk and cashier at the same place until February, 1903; from February, 1903, to June, 1905, he was secretary to division freight agent and traveling freight agent for the same road at Youngstown, Ohio; June, 1905, to October, 1905, secretary to assistant general freight agent of the New York, Chicago & St. Louis, Cleveland, Ohio; October, 1905, to June, 1906, he took an advanced educational course at Central High School; June, 1906, to August, 1909, secretary and cashier of F. L. Fuller & Co., bankers and dealers in municipal and corporation securities, Cleveland, Ohio. During the last four months of 1908 he was associated with Tom L. Johnson (then mayor of Cleveland) in adjusting financial affairs of various companies at Lorain, Ohio. From September, 1909, to June, 1912, he was statistician to B. A. Worthington, first vice-president, general manager and receiver of the Wheeling & Lake Erie; and from July, 1912, to February, 1915, on staff of the president, Chicago & Alton at Chicago. On March 1, he was appointed assistant to president of the same road.

V. M. Alexander

Operating

John T. McShane, chief despatcher for the Chicago, Burlington & Quincy at Omaha, Neb., has been appointed trainmaster at McCook, Neb., and J. E. McManus succeeds Mr. McShane.

B. C. Byers, superintendent of the Indianapolis Terminal division of the Cleveland, Cincinnati, Chicago & St. Louis, at Indianapolis, Ind., has been appointed superintendent of the St. Louis division, with office at Mattoon, Ill., vice Hadley Baldwin, promoted, and F. N. Reynolds succeeds Mr. Byers.

W. R. Cahill, superintendent of the Nebraska division of the Union Pacific, with headquarters at Omaha, Neb., has been retired under the pension rules of that company. W. B. Jeffers, superintendent of the Wyoming division at Cheyenne, Wyo., succeeds Mr. Cahill, and George Brophy, trainmaster at Ogden, Utah, succeeds Mr. Jeffers.

Andrew Alfred Woods, whose appointment as superintendent of the New Orleans & Northeastern, with headquarters at New Orleans, La., has already been announced in these columns, was born on March 2, 1876, at New Orleans. He graduated from the School of Engineering at Tulane University and subsequently took a post-graduate course in engineering at the same university. His first railway work was as a rodman on the New Orleans & Western, now a part of the New Orleans Terminal Company. From June, 1896, to July, of the following year, he was a draftsman in the maintenance of way department on the New Orleans & Northeastern, and then for six months was draftsman in the mechanical department of the same road. He then served as draftsman and inspector on bridge pier construction on the Alabama & Vicksburg and the Vicksburg, Shreveport & Pacific, until September, 1899, when he was appointed assistant engineer in the maintenance of way department of the New Orleans & Northeastern. From November, 1901, to July, 1913, he was resident engineer in charge of maintenance of way on the Alabama & Vicksburg and the Vicksburg, Shreveport & Pacific. He was appointed resident engineer in charge of maintenance of

way, on the New Orleans & Northeastern in July, 1913, which position he held at the time of his recent appointment as superintendent of the same road as above noted.

Traffic

D. L. Ogg has been appointed commercial agent of the Cincinnati, Hamilton & Dayton at Ironton, Ohio.

A. A. McKowen has been appointed division freight and passenger agent of the Wabash, with headquarters at Des Moines, Iowa, succeeding William Clapper, resigned.

J. E. Johanson, assistant general freight agent of the Rock Island Lines at Little Rock, Ark., has been appointed general freight agent, with headquarters at that point.

A. C. Tumy, assistant general freight agent of the Chicago, Indianapolis & Louisville, has been appointed general freight agent, with office at Chicago, succeeding W. T. Webster, resigned. R. B. Robertson, division freight agent, has been appointed assistant general freight agent to succeed Mr. Tumy.

The following changes are announced in a joint circular issued by the St. Louis & San Francisco and the Chicago & Eastern Illinois: Charles A. Forrest, commercial agent at Atlanta, Ga., has been appointed general agent at that point and the former office has been abolished; C. S. Hall, commercial agent at Cincinnati, Ohio, has been transferred to Cleveland, Ohio, in a similar capacity, and F. A. Edmondson succeeds Mr. Hall.

Engineering and Rolling Stock

H. M. Church, division engineer of the Baltimore & Ohio at Philadelphia, Pa., has been appointed division engineer of the Baltimore division, with headquarters at Baltimore, Md., succeeding W. I. Trench, deceased.

George P. Smith, chief engineer of the Cleveland, Cincinnati, Chicago & St. Louis and the Peoria & Eastern, has been appointed consulting engineer, with headquarters at Cincinnati, Ohio. C. A. Paquette, chief engineer maintenance of way, succeeds Mr. Smith, with office at Cincinnati, and will be in charge of construction and maintenance. The office of chief engineer maintenance of way is abolished. Hadley Baldwin, division superintendent at Mattoon, Ill., has been appointed assistant chief engineer, with office at Cincinnati. Effective March 1.

Joseph Thomas Richards, consulting engineer of maintenance of way, of the Pennsylvania Railroad, with office at Philadelphia, Pa., retired under the pension rules of the company on March 1. He was born near Rising Sun, Cecil county, Md., on February 12, 1845, and was educated at West Nottingham Academy. He entered the service of the Pennsylvania Railroad in August, 1869, as rodman and transitman at Altoona, Pa. In June of the following year he was appointed supervisor main line, Harrisburg to Newport, and from October, 1871, to March, 1873, was chief engineer of construction and superintendent of various minor railroads in Maryland. He was then chief of locating engineers, making several surveys over the Allegheny mountains for an outlet for the Bedford & Bridgeport. In May, 1874, he became mining engineer in the service of the Cambria Iron Company, Johnstown, and returned to the service of the Pennsylvania Railroad in March, 1875, as supervisor on the main line from Newport to Granville. About a month later, he was promoted to assistant engineer, maintenance of way, and from June, 1877, to March, 1883, was principal assistant engineer of the United Railroads of New Jersey division, and then, for over two years, was assistant to the chief engineer, becoming assistant chief engineer of the Pennsylvania Railroad on June 24, 1885. When a change was made in the organization in March, 1893, he became engineer of maintenance of way; in June, 1903, he was appointed chief engineer of maintenance of way, and since June, 1913, was consulting engineer, maintenance of way, of the same road. Mr. Richards also was chairman of several committees for working out the plans for the New York and Washington stations and yards.

J. T. Richards

Purchasing

The office of William Wibel, assistant purchasing agent of the National Railways of Mexico at New York, has been closed on instructions received from Mexico.

OBITUARY

H. H. Brand, commercial agent of the Atlantic Coast Line, died on February 27, at Sumter, S. C.

J. J. Hughes, roadmaster of the St. Louis Southwestern at Mount Pleasant, Tex., died suddenly on February 26.

Nathan Hopkins Heft, formerly electrical engineering adviser of the New York, New Haven & Hartford, died on February 25, at Bridgeport, Conn.

W. D. Herring, general claim agent of the Sunset-Central Lines, with headquarters at Houston, Tex., died suddenly on February 22, aged 57 years.

M. L. Robbins, formerly from 1892 to 1908, general passenger agent of the Houston & Texas Central, died in Houston, Tex., on March 3, at the age of 64.

Tracy W. Niles, formerly superintendent of the Detroit division of the Lake Shore & Michigan Southern, at Detroit, Mich., died on February 25, after a long illness, at his home in Buffalo, N. Y., at the age of 64.

G. S. James, trainmaster of the Seaboard Air Line, at Tampa, Fla., while riding on the footboard of a switching engine in the yards at Tampa on February 25, was thrown off the engine and fell on the track, receiving injuries from which he died. The footboard struck a guard rail at the entrance of a bridge.

Thomas Swinyard, president of the Dominion Telegraph Company, died on February 25, in New York City, at the age of 83. He was born in England, and for a time served on the London & North Western. In 1862 he went to Canada as general manager of the Great Western Railway, and subsequently was active president of the Detroit & Milwaukee, both now included in the Grand Trunk system. He also served as the Dominion government commissioner for organizing the Prince Edward Island Railway and for a time was vice-president of the New York, Ontario & Western. In 1897 he represented the Dominion government in the arbitration suit with the Canadian Pacific.

John W. Addis, formerly for 19 years superintendent of motive power of the Texas & Pacific, died at Marshall, Texas, on February 25. He was born on March 13, 1851, at East Liberty, Pa., and after learning the trade of machinist entered the shops of the International & Great Northern, at Palestine, Tex. In 1882 he went to the Marshall shops of the Texas & Pacific, and left that road to become general foreman at the Tyler shops of the St. Louis Southwestern. He was transferred later to the Pine Bluff shops, of which he had charge, and was then for about four years master mechanic at the Gouldsboro shops of the Texas & Pacific. About 1892 Mr. Addis succeeded A. G. Douglass as superintendent of motive power and rolling stock of the Texas & Pacific at Marshall, and remained in the service of that road until June, 1911.

W. W. Borst, formerly receiver for the Denver, Lakewood & Golden, died at his home in Denver, Col., on February 22, aged 76 years. Mr. Borst entered railway service in April, 1867, with the Union Pacific. From September, 1871, to September, 1879, he was superintendent of the Denver & Rio Grande, and was then consecutively general agent of the Atchison, Topeka & Santa Fe and superintendent of the Western division, returning to the Denver & Rio Grande in November, 1883, as superintendent of the First division. He remained with the Rio Grande until December, 1888, as superintendent and assistant general superintendent. In November, 1889, he became superintendent of the Denver Consolidated Electric Company, and from August, 1896, to 1905, was receiver for the Denver, Lakewood & Golden, retiring from active railway service on the latter date.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Chicago, Milwaukee & St. Paul has ordered nine 260-ton electric locomotives from the General Electric Company, for operation on the second engine division of the new electrical line from Three Forks, Mont., to Harlowton.

CAR BUILDING

The New York, Westchester & Boston is in the market for 15 passenger cars.

Spang, Chalfant & Company, Pittsburgh, Pa., have ordered 6 hopper and 10 flat cars from the Pressed Steel Car Company.

The Minneapolis, St. Paul & Sault Ste. Marie has ordered six postal cars from the American Car & Foundry Company.

The Carolina, Clinchfield & Ohio recently purchased a 40-ft., 200 hp. concrete mixing car for lining tunnels, from the McKeen Motor Car Company, Omaha, Neb.

The Chicago, Waukegan & Fox Lake Traction Company has ordered one 55-ft., 200 hp. combined passenger-baggage motor car from the McKeen Motor Car Company, Omaha, Neb.

The Irish Railways in Wartime.—The Irish railway companies are not under the government control, and hence all movements that are made for the naval and military authorities are paid for. From August 5 to 21 the Great Southern & Western operated 172 special trains, which carried 60,000 men, 10,000 horses, 200 baggage cars and 1,100 cars of guns.

New Norwegian Electrification.—The electrification of the railway between Kiruna and the Riksgränsen station on the Norwegian frontier has now been completed, and operation was begun on January 19. Loaded trains of forty cars are run at a speed of 36 miles an hour; previously the highest speed allowed was only 18. The work has been successfully carried out, although accompanied by some mishaps, among which may be mentioned that the telegraph line from Sweden to Narvik has been put out of service altogether, due to induction effects. Steps have now been taken to lay a double telegraph line. The telephone line is a double line supplied with discharging poles and transformers, and the induction on this is very small.

Australian Railways.—According to a report issued by the high commissioner for Australia good progress is being made in the construction of the Transcontinental Railway, which is to link up the railways of Western Australia with those of the eastern states. During the four weeks ended December 19, 34¼ miles of plate-laying was accomplished. This is a record for this line, and, so far as is known here, for railways in Australia. It is anticipated that still further progress will be made in the current year. At the West Australia end the head of the road now stands at 152 miles; the earthworks have been completed to the 157th mile, and the telegraph line to 148 miles, 18 miles having been erected during the month. In the South Australian section the head of the road has reached 156 miles. The earthworks extend to about 160 miles, and the telegraph line to 149 miles, 16 miles having been erected during the month. At the western end there are some 638 men employed, and at the eastern end 1,432 men. The total number of miles of line laid is 308. This is exclusive of a considerable mileage of sidings, yards, etc. Good water has been struck in wells between 158 and 185, in the South Australian section, and boring for water is being continued at both ends in advance of construction. One large reservoir dam is almost finished in the eastern section, and two others are under construction, and also one in the western section. The news of the Pine Creek-Katherine River Railway, in the northern territory, is that the clearing has been completed for about 35 miles, the earthworks for 9 miles, and the waterways for 11 miles, some 228 men being employed. Rails and other material are now being landed at Port Darwin.—*Engineering.*

Supply Trade News

The Superior Car Metal Roofing Company, Chicago, Ill., has recently been incorporated for $25,000 for the purpose of manufacturing and selling car roofs, doors, locks, etc. The incorporators are William H. Slatten, William F. Nolan and E. A. Albright.

The Greenfield Tap & Die Corporation, Greenfield, Mass., composed of the Wells Brothers Company, the Wiley & Russell Manufacturing Company and the A. J. Smart Manufacturing Company has discontinued the Wells Brothers Company store in New York, at 107 Lafayette street, and now maintains one store at 28 Warren street, the former Wiley & Russell store. The Wiley & Russell Manufacturing Company's store in Chicago at 545 West Washington Boulevard has also been discontinued and the stores consolidated at 13 South Clinton street, the former Wells Brothers store. The consolidation of the stores in this manner is expected to bring about a decided improvement in the service offered by the several companies.

Wellington B. Lee, whose appointment to the position of vice-president of the Track Specialties Company, Inc., New York, was announced in the *Railway Age Gazette* of last week, was formerly with the Ramapo Iron Works, Hillburn, N. Y., and was with that company 24 years. Mr. Lee was born January 29, 1867, at Wilmington, Del. He was educated in the public schools of that city, and received a degree of civil engineer in 1885 at the Polytechnic College of the State of Pennsylvania, from which, after serving an apprenticeship of one year with a local surveyor, he became a clerk to the chief engineer of the Wilmington & Northern. One year later he obtained a position in the maintenance of way department of the Pennsylvania Railroad at Wilmington, Del., and served on that railroad for three years. He then entered the service of the Ramapo Iron Works and served as chief draftsman of that company for 12 years, after which he was an engineering salesman for 12 years more. He is a member of the American Society of Civil Engineers, and also of the Engineers' Club of New York.

W. B. Lee

Two suits by the Safety Car Heating & Lighting Company, New York, against the United States Light & Heating Company, Niagara Falls, N. Y., have recently been decided in favor of the defendant by Judge Hazel in the Western District of New York. These suits were on the W. I. Thompson Patent No. 881,743, March 10, 1908, on a dynamo suspension for car lighting, and W. I. Thompson Patent No. 926,518, June 29, 1909, on a lighting system, commonly referred to as the carbon disk regulator. In each case the patent was held invalid and the bill of complaint dismissed. The court held that the predecessors of the United States Light & Heating Company had installed dynamo suspensions and the carbon disk regulator substantially as described and claimed in the patents, on their own apparatus on the New York Central prior to the dates of the patents.

William Wharton, Jr., & Co., a subsidiary of the Taylor-Wharton Iron & Steel Company, announce that remarkable progress has been made in the erection of the new plant at Easton, Pa., and that they expect to move into new quarters during the present year. The tract on which the plant is located comprises about 50 acres just outside the city limits of Easton, and when

all the buildings will have been completed about 10 acres will be under roof. The main shop is over 450 ft. square and will be used exclusively for the manufacture of special track work for electric and steam railways. Other buildings are: Power house, foundry, pattern shop, forge shop and the office building. The plant has been designed to take care of the manufacturing now carried on at the two plants of the Wharton company located at Philadelphia, Pa., and Jenkintown; also the forging business of the Tioga Steel & Iron Company, which is also a subsidiary of the Taylor-Wharton Iron & Steel Company.

In the *Railway Age Gazette* of last week it was announced that Jed O. Gould, general superintendent and works manager of the Gould Coupler Company at Depew, N. Y., had died on Friday, February 19, in the German Deaconess hospital at Buffalo. Mr. Gould was a brother of Charles A. Gould, the present president of the Gould Coupler Company, and had served as general superintendent and works manager for many years. He was born in Batavia, N. Y., on August 13, 1857. As a young man he moved to Buffalo where for several years he was superintendent of the money order department at the Buffalo post office. He resigned from that position, however, when the Gould forge was established at Black Rock some thirty years ago to take an active interest in that plant. When the plant was moved to Depew, he became general superintendent and works manager, which position he held until the time of his death. Mr. Gould is survived by his wife, Jane C. Gould and by three sons, James, Raymond and Chester, all of Buffalo.

J. O. Gould

In this column last week there was announced the death of William F. Gurley, president of W. & L. E. Gurley, Troy, N. Y., at Atlantic City on Wednesday, February 17. Mr. Gurley was one of the most highly esteemed residents of the city of Troy. He was born at that place on June 11, 1860. He received his early education there and graduated from Williams College in 1882. He immediately entered the Gurley works and obtained a practical knowledge of the business. When William Gurley, his uncle, died, William F. Gurley advanced to a leading position in the firm, and on its incorporation became its president, a position which he held until his death. Mr. Gurley was prominent in the public life of Troy. He was the first president of the Troy Chamber of Commerce, and was an ex-officio member of the board of directors of that organization. He was one of the three commissioners of education of the city and took a great interest in the welfare of the public schools. He was president of the board of trustees of the Emma Willard school, one of the leading educational institutions for women, and president of the board of trustees of the Troy Orphan Asylum; he was also prominent in church work and was a trustee in a number of church and charitable institutions.

Baldwin Locomotive Works

The recently issued annual report for the Baldwin Locomotive Works for the year ended December 31, 1914, shows decidedly what an exceedingly poor year 1914 was for the railway supply companies. The gross sales of the company for the year were $13,616,163, as compared with $37,630,969 in 1913, or almost two-thirds less. The manufacturing and administrative expenses, depreciation, etc., were $13,295,554, as against $33,744,494 in 1913, so that the manufacturing profit was only $320,609 as compared with $3,886,484 in 1913. There was other income of $661,144, however, including the dividends of the Standard Steel Works, so that the total income was $981,753. Interest was paid on bonds, etc., of $631,523, and the net profit was $350,229, as against $4,017,800 in 1913. The company, nevertheless, paid the usual dividends of $1,400,000, or 7 per cent, on its preferred stock and $400,000, or 2 per cent, on its common stock, the result being that the surplus carried forward was but $3,438,021 as compared with $4,887,791 on December 31, 1913. The surplus on December 31, 1912, however, was $2,669,990. The report contains the following comment: "During the latter part of 1913 and the first half of 1914 the falling off of railroad revenues, due to the unfavorable attitude of the Interstate Commerce Commission, caused a general cessation of purchases of railroad equipment, and this condition was made more acute by the reduction of railroad revenues resulting from the slowing down of business, due largely to the adoption of lower tariff rates. During the last half of the year 1914 these unfavorable conditions were further affected by the paralysis of finances and of business which followed the breaking out of the war in Europe. The stress of competition forced the prices of orders obtained close to the cost of production. It is obvious that under these conditions only extreme economies made it possible to carry the overhead expenses and pay interest on the bonded indebtedness."

American Steel Foundries

The annual report for the American Steel Foundries for the year ended December 31, 1914, contains the following statements:

"Perhaps the most comforting statement that can be made concerning the operations of the company for the year is that after spending $913,085 for repairs and maintenance, charging $231,456 to depreciation, and paying out $343,680 in dividends, we ended the year with net assets practically the same as they were at the beginning, the actual decrease being less than $8,000. The balance sheet will show, however, a decrease in surplus of $575,162, and while $567,263 of this is offset by a reduction in our bond and debenture indebtedness, or provision therefor, the fact remains that our surplus has been reduced from $1,243,149 to $667,987, and this is the figure that must be kept in mind."

The company's gross sales in 1914 were $11,125,091 as against $17,425,942 in 1913. The operations for the year were at a rate of approximately 50 per cent of the rated capacity of the plants, as against 80 per cent for 1913. The profits, after deducting general, selling and administrative expenses, were $637,503 as compared with $2,031,272 for the preceding year. After deducting $231,456 for depreciation, and adding miscellaneous income of $87,159 the earnings were $493,206. Deducting from this, interest on bonds and debentures outstanding, and providing for bond redemption and debenture retirement, there was a net loss of $231,482.

The company's balance sheet for December 31 shows capital assets of $20,601,908, inventories of $2,034,953, accounts and bills receivable of $1,675,785, and cash $1,547,811. The company's capital stock is now $17,184,000, and there are bonds outstanding of $4,819,100. Accounts payable on December 31 totaled $689,017. The reserve, as noted above, was $667,987. President Lamont states in the report: "It is difficult to say much as to the present year; one guess is as good as another. We are showing small gains in tonnage at some of the plants, and there is more business in prospect now than there has been at any time since the outbreak of the war, but actual orders materialize very slowly. If the crop situation develops favorably we may be operating on a satisfactory basis during the second six months of the year."

TRADE PUBLICATIONS

Tile Roofing.—"The Indestructible Roof" is the title of a 68-page booklet issued by the Federal Cement Tile Company, Chicago, Ill. It illustrates and describes the detail construction of standard roof tile, and shows clearly the process of erection. It also illustrates numerous installations using this product.

Concrete Work.—"The First Lessons in Concrete Work" is the title of a 40-page booklet just issued by the T. L. Smith Company, Milwaukee, Wis. This book defines concrete, gives the proportion of ingredients in the various mixtures used, and explains how the percentage of voids in any material may be found. The design and construction of forms for foundations, walls, etc., are also explained, and the placing of concrete in cold weather, the methods of rendering it waterproof, the cost of placing, etc., are discussed. It also describes and illustrates the various Smith mixers, giving the horse power required to operate a machine of any particular size, etc.

Railway Construction

Buffalo, Rochester & Pittsburgh.—An officer writes that the proposed improvements to be carried out near Silver Springs, N. Y., calls for the construction of a new section of road about 1,000 ft. long which will permit the elimination of a timber structure over the present highway.

Canadian Northern.—See Canadian Pacific.

Canadian Pacific.—The committee of the Canadian parliament has under consideration a bill which provides for the ratification of an agreement between the Canadian Pacific and the Canadian Northern for the joint use and ownership of the lines and improvements now existing or to be built in North Toronto, Ont., on the present right-of-way of the Canadian Pacific, from Dufferin street in the west to the eastern end of the bridge across the west Don at Eglinton avenue and Leslie street, over 4.5 miles. In addition to the plans for the elevation of tracks, from Dufferin street to Summerhill avenue at Reservoir Park, east of Yonge street and the construction of a station at Yonge street, the agreement calls for increased trackage, common and joint, east of Summerhill avenue and over to the west Don about two miles. The Canadian Northern is to have its freight yards at Yonge street, east of the street and north of the Canadian Pacific, and its division yard at Leaside; the agreement is being made to permit the Canadian Northern to reach these yards and the new union station.

Fort Myers, Marco Bay & Miami.—Contracts will be let as soon as a complete survey is made to build from Ft. Myers, Fla., south along the west coast of Florida via Naples, and Marco bay to Everglade, thence east across the southern part of Florida to the east coast at Miami, about 150 miles. Preliminary surveys were started last year, and engineers will begin work from Ft. Myers this month to make a complete survey for the proposed line. There will be about 15 miles of trestle work which later is to be filled in. The plans also call for constructing docks for handling coal and lumber at Marco bay, where there is a depth of from 18 to 32 ft. of water. The company expects to develop a traffic in lumber, fruit, vegetables, fish and passengers. The West Coast Construction & Development Company is to be organized to build the line. W. J. Hilands is trustee, Ocala, Fla., and W. B. Clay, chief engineer, Arcadia. (See Florida Roads, January 29, p. 211.)

Jacksonville-Middleburg (Electric).—Right of way has been secured, it is said, for the electric line from Jacksonville, Fla., southwest to Middleburg, about 25 miles, and grading work is now under way on the section from Jacksonville Heights to Jacksonville. When this section is finished work will be started on the Middleburg end. Financial arrangements have been made to build the first ten miles, and application will soon be made for a charter. A. W. Mackinlay, general manager and chief engineer, Jacksonville, Fla. (See Florida Roads, January 29, p. 211.)

McConnellsburg & Ft. Loudon (Electric).—A charter has been granted to this company in Pennsylvania with $60,000 capital. The plans call for building an electric line from McConnellsburg, Pa., east to Ft. Loudon, about ten miles. E. J. Post, president, Washington, D. C., and G. A. Harris, B. C. Lamberson, J. L. Patterson, McConnellsburg; H. A. Duffy and D. H. Patterson, Webster Mills, are the incorporators. (February 19, p. 350.)

Ogden, Logan & Idaho (Electric).—The construction work on the extension from Lewiston, Utah, to Preston, Idaho, will be completed about March 15, 1915. This company also expects to construct a line from Wellsville, Utah, to Brigham City, some time during this year. This road will connect the company's north and south properties.

Oklahoma Roads.—A charter has been granted the Alva, Buffalo & Colorado for the purpose of building a line from Rosston, Okla., to Buffalo, a distance of 20 miles. Efforts are now being made to secure subscriptions.

Pennsylvania Railroad.—The report of this company for the year ended December 31, 1914, shows that the work on the improvement of the passenger facilities in and around Philadelphia, Pa., was continued. The five-track reinforced concrete and stone arch bridge of the Connecting Railway over the Schuylkill river at the Girard avenue entrance to Fairmount Park has been completed and placed in operation and the old double track bridge removed; the work at North Philadelphia has been finished with the exception of remodeling the passenger station. The electrification of the main line from Broad street station, Philadelphia, to Paoli, is progressing rapidly, and the work from Paoli to West Philadelphia is almost completed, including the sub-stations. The pier properties on the Delaware river south of Washington avenue and at Walnut street, Philadelphia, were improved during the year by the erection of new sheds and the enlargement of other facilities. The reconstruction of a number of bridges at Ernest; over North Broad street, North Philadelphia; at Highspire; Auburn and Norristown, and at Dornock Point was also carried out, and the masonry work for the double track steel bridge over the Allegheny river between Kiskiminetas Junction and Freeport has been completed, and the superstructure is being erected. The bridge at Phoenixville is being rebuilt and will be completed in 1915. On the new six-track section of the New York division, between Colonia and Bay Way, just west of Elizabeth, N. J., work was continued during the year, this consisted principally of the elevation of the four original running tracks. The greater part of this work has been completed and placed in operation, and it is expected that the remaining sections will be finished in the spring of 1915. New freight stations were placed under construction at Harrisburg, Pa., and Allegheny, which will be completed in 1915. The passenger and freight facilities at Elizabethtown, Altoona and Brookville are also being enlarged to handle increased traffic. The Sugar Camp branch, Tyrone division, the Shade Creek branch, Pittsburgh division and the Homer & Cherry Tree branch, Conemaugh division were extended to reach new coal openings. Work was finished on the Yukon branch extension from Bells Mills to Cowansburg, Pittsburgh division, and a branch is being built from Gilberton to Mahanoy Plane, Schuylkill division, to develop additional coal traffic. Work was continued on the elimination of grade crossings at Homewood avenue, Pittsburgh, and in the borough of Wilkinsburg, Pittsburgh, at the latter place a new passenger station is being constructed; it is expected that this work will be finished in 1915. The elimination of grade crossings, change of grade and the erection of a new passenger station in the city of Johnstown is under way, but will not be completed before 1916. The change of line and grade on the Renovo division at Cameron and Horn, and the construction of a second track between Corry and Lovell, have been completed. Surveys and many of the plans have been completed for the new line and the elimination of grade crossings in South Philadelphia to be carried out jointly by the Pennsylvania Railroad, the Philadelphia, Baltimore & Washington, the Baltimore & Ohio and the city of Philadelphia. Work was continued on the New York Connecting Railroad; the foundations and masonry of the East river four-track arch bridge have been completed to the track level, and work is now under way on the erection of the steel arch over the river. The viaducts and approaches on Long Island and on Ward's and Randall's islands are about finished, and progress has been made on the remaining sections of the line. The erection of the double track steel bridge over the Delaware river south of Trenton is proceeding. This bridge is part of the proposed New York division double-track relief line known as the Pennsylvania & Newark which will extend from the yard at Morrisville, Pa., to Colonia, N. J., about 40 miles, where a connection is to be made with the six-track system on that division, and there will also be branches connecting with the Trenton and New York divisions near Trenton, N. J. The revision of the grades and alinement and the construction of additional tracks and passing sidings on the Western New York & Pennsylvania between Oil City and Buffalo via Chautauqua was continued during the year and will shortly be completed.

Sulphur Springs, Quitman & Great Northern.—Plans are being made to build a railway, it is said, from Quitman, Tex., northwest to Sulphur Springs, about 30 miles. Large bonuses have been raised in aid of the project by residents of both Quitman and Sulphur Springs.

RAILWAY STRUCTURES

Coleman, Tex.—(See Pampa, Tex.)

Decatur, Ala.—A bill to authorize the North Alabama Traction Company, a corporation organized in Alabama, to build a combined railroad and highway bridge over the Tennessee river at Decatur, has been passed by the lower house of Congress, and is reported in the Senate.

Freeport, Tex.—The Houston & Brazos Valley is interested in the building of a combination railroad and roadway bridge that is now being constructed at this point.

Huntington, W. Va.—Plans are being made for an office building to be built at Eighth street and Fourth avenue in Huntington for the Ohio Valley Electric Railway. The cost of the structure will be about $25,000.

Macon, Ga.—An agreement has been reached between the Central of Georgia and the city of Macon, whereby the railroad company will erect a new depot at that point. The city in turn will make certain concessions to accommodate rearrangements of tracks. Only tentative plans have been prepared and no time has been set for construction work to begin.

New York.—The New York Public Service Commission, First district, has approved the proposed award by the New York Municipal Railway Corporation for the construction of nine stations on the Sea Beach line, to Post & McCord, Inc., the lowest bidders, who offered to do the work for $331,163. The Sea Beach line is a reconstructed four-track railroad, from a junction with the Fourth avenue subway at Sixty-fifth street, in the borough of Brooklyn, to Coney Island.

Pampa, Tex.—The Atchison, Topeka & Santa Fe has prepared plans and is about to award contracts for the construction of a small brick passenger station. The estimated cost is $10,000. This company will build a similar structure at Coleman, Tex.

Philadelphia, Pa.—The Arthur McMullin Company, New York City, submitted the lowest bid to build the reinforced concrete bridge to carry Broad street over the tracks of the Pennsylvania Railroad, the Baltimore & Ohio and the Philadelphia Belt Line. This firm offered to do the work for $237,600. This work is part of the improvements to be carried out jointly by the city of Philadelphia and the railroads for the elimination of grade crossings in South Philadelphia. (February 26, p. 390.)

Saratoga Springs, N. Y.—Bids will be asked for about April 1, by Ludlow & Peabody, New York, for building a one-story terminal station at Saratoga Springs for the Hudson Valley Railway. The proposed structure is to be of brick and stucco construction and will cost about $30,000.

Sharon, Pa.—Plans are being made by Mercer county commissioners to build a bridge over the Shenango river at State street in Sharon. The bridge will carry tracks for the operation of street railway cars.

London Traffic Figures.—In the recently issued report by the London Traffic Branch of the Board of Trade, there is a table showing approximately the number of passengers carried in the area of Greater London by local railways, tramways and omnibuses in the last 10 years. For 1913 the numbers were, by local railways, 462,019,537; tramways (approximate), 811,397,317; omnibus, 733,931,201. The corresponding figures for 1909 were 410,744,610 by railways, 687,138,908 by tramway, and 311,000,000 by omnibus. How much the traffic by road is growing at the expense of traffic by rail may be judged from the fact that in 1909, 60 per cent went by road and 40 per cent by rail, while in 1913 some 68 per cent went by road and only 32 per cent by rail. The increase is mainly due to motor 'busses, of which 3,522 were licensed in 1913, as against 1,180 in 1909. Long-distance running by these vehicles is increasing, as is shown by the week-day services operating on seven routes of over 15 miles in length, ranging from the 15.9 miles (Golders Green and St. Albans) to the 19.41 miles (Stockwell and Reigate). During the same period the tramcar licenses have risen only from 2,198 to 2,786, and the mileage of new tramways (in single track) in Greater London, from 601.31 miles to 655.94 miles. Since 1907 the route-mileage of railways open for passenger traffic in Greater London has advanced only from 667.4 to 669.2 miles.

Railway Financial News

Boston & Maine.—The holders of the notes which were due on March 2 have consented to the extension to September 2, 1915. Note holders had the option of extending all of their notes or of extending part of the notes and taking 35 per cent in Maine Railways notes. Of the $22,626,000 notes due, holders of $22,085,000 agreed to an extension, and of these, holders of $14,515,000 notes elected to take the Maine Railways' notes.

Canadian Pacific.—In explaining the bill now before the Canadian Parliament for the creation of the Canadian Pacific Ocean Services, Ltd., Sir Thomas Shaughnessy is quoted as saying:

"The company is operating fleets of steamships on the Atlantic and Pacific oceans, and on the Pacific coast, as well as on the Great Lakes and other inland waterways of Canada. These latter are connecting links between different sections of the railway line, and are, therefore, essentially a portion of the railway transportation system, and it is not proposed to change their status. The ocean fleets are, however, in a different class, engaged in competition with outside fleets, plying between Canada and other portions of the world. The company proposes to transfer these ships to a steamship company, with which the business relations will be the same as they are with outside steamship lines that exchange traffic with the railway company.

"Heretofore, all expenditures for the acquisition and construction of these ocean steamships were made by the railway company and included among the liabilities in its balance sheet. Hereafter, it is proposed that the steamship company shall itself secure the requisite money for these purposes by the issue of its own securities.

"The ownership and control of the steamship company will remain with the Canadian Pacific Railway Company, but the management and operation of the steamship lines will be vested in the board of directors of the Canadian Pacific Ocean Services, Ltd.

"It is only another step in the direction of eliminating from the direct operations of the railway company items that do not relate to the railway property itself."

Denver & Salt Lake.—Holders of notes of the Denver & Salt Lake to the extent of $163,962 have agreed to take first mortgage treasury bonds at 75 in payment. An issue of $300,000 two year, 6 per cent notes secured by the deposit of $600,000 first mortgage bonds, are to be sold to provide current funds.

Missouri Pacific.—The proxy committee representing Kuhn, Loeb & Company and associates have announced that they have received proxies for the annual meeting of March 9 from more than a majority of the stock, and that they will vote for the following as directors: N. F. Brady, B. F. Bush, Newcomb Carlton, Edward A. Faust, A. J. Hemphill, William H. Lee, Edgar L. Marston, E. J. Merrill, Finley J. Shepard, Cornelius Vanderbilt, R. Lancaster Williams, W. H. Williams and C. Minot Weld.

New York, New Haven & Hartford.—The railroad committee of the Connecticut General Assembly has reported favorably on the bill which authorized the New Haven to sell or pledge stock of the Boston & Providence and the Old Colony Railroad. This stock is now held in the New Haven treasury.

Western Pacific.—The Equitable Trust Company, New York, has asked for the appointment of a receiver, the Western Pacific having decided not to pay the interest due March 1 on the $50,000,000 first mortgage bonds. Warren Olney, Jr., chief counsel for the road has been named receiver.

Railway Over the Desert.—Large numbers of Syrian refugees who recently arrived at Alexandria report that the Germans are removing the rails between Lydda and Jaffa for the construction of a line on the route Sebastieh, Toulharem, Lydda and Gaza, and thousands of workmen are being employed on the work.

[ADVERTISEMENT.]

ANNUAL REPORT

THE PENNSYLVANIA RAILROAD COMPANY

GENERAL OFFICE, BROAD STREET STATION, PHILADELPHIA, PA.,
February 24th, 1915.

The Board of Directors herewith submit to the Stockholders of The Pennsylvania Railroad Company a synopsis of their Annual Report for the year 1914:—

CONDENSED INCOME STATEMENT.

Railway operating revenues		$181,184,822.32
Railway operating expenses		138,616,672.07
Net revenue from railway operations		$42,568,150.25
Railway tax accruals	$7,461,892.52	
Uncollectible railway revenues	11,313.24	
		7,473,205.76
Railway operating income		$35,094,944.49
Non-operating income:		
Income from securities, accounts and sinking and other reserve funds	$14,341,800.65	
Rent income, etc.	2,355,478.28	
		16,697,278.93
Gross income		$51,792,223.42
Deductions from gross income		17,701,458.60
Net income		$34,090,764.82
Disposition of net income:		
Income applied to sinking and other reserve funds	$1,785,242.65	
Dividend of six per cent.	29,952,186.00	
Income appropriated for road and equipment, improvements, etc.	2,230,335.64	
		$33,967,764.29
Balance transferred to credit of Profit and Loss		$123,000.53

Operating results of Pennsylvania Railroad Company and Northern Central Railway Company for the year ended December 31st, 1914, compared with the year 1913.

The lease of the Northern Central Railway having become effective, the revenues and expenses from the operation of its lines are included in the above Income Statement from July 1st, 1914.

For the purpose of proper comparison, the statement below shows the combined operations of your lines and of the Northern Central Railway lines for the entire year 1914 compared with similar operations for 1913.

	1914.	Comparison with 1913— Increase.	Decrease.
Railway operating revenues	$187,251,851.22		$17,828,261.23
Railway operating expenses	144,293,242.91		13,705,175.10
Net revenue from railway operations	$42,959,608.31		$4,123,086.13
Railway tax accruals	$7,689,523.47		$151,330.42
Uncollectible railway revenues	11,313.24	$11,313.24	
	$7,700,836.71		$140,017.18
Railway operating income	$35,258,771.60		$3,983,068.95

CONDENSED GENERAL BALANCE SHEET.

DECEMBER 31ST, 1914.

ASSETS.	
Investments:	
Investment in road and equipment	$481,553,513.69
Improvements on leased railway property since June 30th, 1907	16,294,103.39
Sinking funds	2,309,427.30
Miscellaneous physical property	2,026,833.23
Securities owned and advances to affiliated companies	350,493,097.97
Current assets	67,599,784.56
Deferred assets including insurance and other funds	28,962,923.19
Unadjusted debits	2,223,373.63
	$951,463,056.96

LIABILITIES.	
Capital Stock	$499,203,600.00
Premium realized on Capital Stock from January 1st, 1909	7,254,247.63
Bonded debt and other obligations	236,951,642.73
Current liabilities	35,743,697.79
Deferred liabilities	187,774.13
Unadjusted credits including accrued taxes and depreciation reserves	29,221,093.63
Corporate surplus:	
Additions to property through income and surplus since June 30th, 1907	73,184,541.87
Miscellaneous fund reserves	32,426,820.49
Sinking fund reserves, etc.	5,412,283.22
Profit and Loss	31,877,355.47
	$951,463,056.96

The number of tons of freight moved on the five general divisions east of Pittsburgh and Erie in 1914 was 135,296,035, a decrease of 19,912,743, or 12.83 per cent.; the number of passengers was 80,873,281, a decrease of 1,903,951, or 2.30 per cent.

The operating revenue of all lines east and west of Pittsburgh for the year 1914 was $354,412,996.34, operating expenses $288,803,807.84, and operating income, $65,609,188.50, a decrease in operating revenue, compared with 1913, of $38,022,947.71, and a decrease in operating income of $5,373,852.58. There were 313,983,414 tons of freight moved on the entire system, being a decrease of 58,039,716 tons, and 183,031,295 passengers carried, a decrease of 4,463,150.

GENERAL REMARKS.

MILEAGE.

The increase in the mileage of the lines directly operated was due chiefly to the lease of the Northern Central Railway.

INCOME STATEMENT.

Business conditions on your lines, as well as on other railroads, were unsatisfactory in the year 1914. The total operating revenues show a decrease of 8.69 per cent., compared with 1913, chiefly in the freight and passenger traffic, arising from unfavorable commercial and financial conditions, which in the last five months of the year were accentuated by the European War. The gross revenues and expenses include, since July 1, 1914, the operations of the Northern Central Lines under the lease to your Company, and they also include, in accordance with the revised Classification of Operating Revenues and Expenses of the Interstate Commerce Commission, effective since July 1, 1914, the results from Auxiliary Operations, for which separate accounting was previously required.

Express Revenue shows a decrease due to a reduction in express rates, and by reason of the operation of the Parcel Post. This will require some equitable adjustment of the contract with the Express Company, and offsets to some extent the increase in Mail Revenue.

Mail Revenue increased as a result of the quadrennial weighing, effective July 1, 1913. The manifest unfairness of weighing the mails, including the growing parcel post, only once in four years deprives the Company of revenue for the increased weights carried each year, and should be remedied by an annual weighing and an annual adjustment of pay.

The total Operating Expenses decreased 8.67 per cent., chiefly through enforced economies required by the loss of revenue and traffic. These were effected by a reduction in the use of materials and supplies, in the working forces of all departments, and in train and car mileage, and by deferring other expenses, but having in view at all times the preservation of the safety of your tracks, equipment and facilities. The increases in wages of enginemen, firemen, conductors, and trainmen, under the Wage Arbitration awards, and other consequent wage adjustments, and the expense of complying with legislative enactments, prevented still further savings in expenses.

Railway Operating Income shows a decrease of $3,087,538.68 compared with the results of the lines operated by your Company in 1913, but if the figures for 1913 used in comparison had also included the operations of the Northern Central Railway for that year, the Railway Operating Income for both Companies would have shown an aggregate decrease of $3,983,068.95.

The Net Income for 1914 was $34,090,764.82, a decrease of $7,830,067.97, compared with the previous year; from which appropriations were made to Sinking and Other Reserve Funds; certain necessary additions and betterments were provided; cash dividends amounting to six per cent. were paid on your Capital Stock; and $123,000.53 was credited to Profit and Loss account. The latter account has also been credited with $5,669,379, the par value of the Northern Central Railway Company stock received as a 40% dividend and the cash dividends accrued thereon since January 1st, 1911; the extra cash dividend of 10% amounting to $1,057,720 received on your stock holdings in that Company; also the proceeds received from the Manor Real Estate & Trust Company, which is owned by your Company, resulting from the sale, to the Susquehanna Coal Company of coal lands formerly leased to the Mineral Railroad & Mining Company, amounting to $670,368.98 and with profits from sales of securities and sundry credits. Against this account has been charged $3,186,031.38, representing construction and real estate expenditures on long term leased lines, especially the United New Jersey Railroad & Canal Company and Harrisburg, Portsmouth, Mt. Joy & Lancaster Railroad Company, the net income of your Company not being sufficient to provide the same; advances to Branch Lines for similar purposes, which were unable to meet the same out of their own resources, and advances for interest on, and retirement of, water trust certificates and expenditures on your water supply system; also the rental and leasehold settlement of the Northern Central Railway Company in the adjustment of the accounts under the lease from January 1st, 1911, involving a charge of $1,343,510.83, so that the net amount credited to Profit and Loss account during the year was $2,850,174.81.

LEGISLATION.

The increased scope and great burden of the duties and responsibilities imposed upon the Interstate Commerce Commission should now be followed by the amendment of the Federal laws from which its authority is derived. The Commission should be definitely empowered by specific provisions in these laws to strengthen the railroads, upon which the welfare of the Country so largely depends, so as to encourage the investment of private capital for the expansion of their facilities and services, and the preservation of their credit by means of reasonable rates which will accord with the higher costs and burdens placed on them in complying with statutory requirements and governmental awards and regulations. The Commission should be enlarged and so organized as to be able to deal promptly with the important railroad questions which under the existing scheme of Governmental regulation, must be considered by it. The position of a Commissioner should be placed beyond political influence by a long tenure of office, and the compensation should be sufficient to attract and retain men of the widest experience and greatest ability. The regulatory power of the Commission should be clearly extended to the supervision and control of all rates and practices which directly or remotely affect interstate transportation or commerce, and should include power to maintain a rate structure approved by or satisfactory to it, even though to accomplish this it should be necessary to prevent reductions of rates or to compel advances of rates found by the Commission to be unreasonably low. An unreasonably low rate may be beneficial to some one or more shippers, but the rates of some other shippers are sure to be disadvantageously affected thereby. The services of the Commission should be made available to remedy the concededly inadequate revenues of the railroads for the transportation of mails and Parcel Post, and the power of Commissions, State and Federal, to suspend increases in rates should be limited, so as to prevent loss of revenue to the railroads during the suspension of rates subsequently determined to be reasonable. Increases in wages and other burdens which seriously enlarge railroad expenses should not be imposed by legislation, or through awards of Governmental bodies, unless the ability of the railroads to pay the same under the rate schedules then in effect is clearly apparent, or unless the Interstate Commerce Commission is prepared to approve of increases in the rate schedules that will enable the railroads to meet the same without impairment of their credit or efficiency.

Weak railroads are among the greatest obstacles to business enterprise and commerce, and the country will have too many weak railroads unless a constructive and equitable policy of public regulation is practiced, not as a palliative, but as a permanent public and business necessity.

The railroads are still burdened with the needless expenditure required to comply with the so-called Full Crew Laws, which are actually Extra Crew

Laws. The principal requirements of these laws, which vary somewhat in the different States, are in substance that every freight train of more than thirty cars must have a second brakeman in addition to the regular crew of engineman, fireman, conductor, one regular brakeman and a flagman; every passenger train having four or more coaches—this term covering Pullman and dining cars as well—and one baggage car, must have an extra brakeman in addition to the regular full crew consisting of engineman, fireman, conductor, baggageman and brakeman, this not to include train porters and Pullman employes; every train composed of four or more passenger, mail, or express cars, empty or loaded, must have a crew of engineman, fireman, conductor and two brakemen, even though no passengers are carried.

It is estimated that this law has added over $1,000,000 per annum to the Operating Expenses of the Pennsylvania System East and West of Pittsburgh, and this enforced expenditure is a pure economic waste, because it does not increase the safety or efficiency of operations. This amount could have been spent to far greater advantage in the improvement of roadway and equipment, and in giving increased employment, from which the public and employes would have received real benefits. Arbitrary laws requiring additional men on trains without regard to the necessity for their services, impose a direct and unnecessary burden on the public and the Company. Such laws tend to weaken the working discipline, and from the standpoint of the employes not only impair the ability of the Company to continue to pay the present rates of wages to that great body of employes whose activities are needed, but also to delay promotion.

Your Company has, therefore, joined with other railroads in appealing to the public for their co-operation in securing the repeal of this unwise and wasteful legislation. The Management request the stock and bondholders and the employes, in their own interest, to support this movement.

Traffic.

The tonnage decreased 12.83 per cent. and the tonnage mileage decreased 11.67 per cent., due to the general restriction of business, but freight train mileage was also reduced 13.87 per cent. The reduction in passenger business is reflected in the decrease of 2.30 per cent. in the number of passengers, 4.31 per cent. in passenger mileage, but passenger train mileage was also reduced 4.73 per cent. The net revenue per ton mile shows a slight increase, but the net revenue per passenger mile shows a large decrease.

Capital Stock and Funded Debt.

The capital stock was increased $31,850, through the conversion of that amount of receipts issued under the stock allotment of 1913.

The Funded Debt and Equipment Trust obligations show a net decrease of $7,080,879.35.

It will be recalled that at the last annual meeting the stockholders approved of the creation by the Board of Directors of a General Mortgage so that the Company might have a broad basis for future financing. This mortgage has not yet been recorded, and no bonds can be issued for any purpose thereunder without the prior consent of the stockholders, which has not so far been requested. The Company will refund $86,827,000 of Convertible Bonds maturing October 1st, 1915, and other maturing obligations, and it must also provide for other necessary corporate purposes such as additions and betterments to its railroad and equipment. Since the close of the year it therefore sold $49,000,000. Consolidated Mortgage 4½% Bonds, bearing date February 1st, 1915, realizing a price slightly in excess of par, a satisfactory result under existing conditions. Including the issue recently made, the total amount of bonds outstanding under the Consolidated Mortgage is almost $100,000,000., which is the maximum amount that can at any one time be issued and outstanding. In view of the creation of the new General Mortgage, it is deemed advisable that hereafter the Consolidated Mortgage should be closed, and no further issues of bonds made thereunder.

This issue of Consolidated Mortgage Bonds was made under the authority conferred by the stockholders in March, 1909, when an increase of the bonded indebtedness was authorized to the aggregate amount of $800,000,000. for the purpose of meeting the Company's requirements in 1909 and 1910. As such requirements were met through an issue of Capital Stock, only $49,000,000. of the authorization then made has been utilized, so that the Company is still possessed of authority to increase the indebtedness to the extent of $31,000,000. The latter amount will not be sufficient to meet the balance of the refunding and other requirements for 1915, as above stated, and the stockholders, pursuant to notice duly given, will at the forthcoming annual meeting be requested to consent to an increase in the indebtedness to the extent of $40,000,000., so that with the pre-existing authorization the Company may be possessed of authority to increase its indebtedness to the extent of $71,000,000., and the Board of Directors desire authority to make such increase through the issue of bonds secured either by the new General Mortgage or otherwise, or by the issue of other obligations of the Company in such form, at such times, and on such terms and conditions as shall be deemed to be most advantageous, but not in excess of $71,000,000.

Road and Equipment.

The following statement of improvement work carried on by your Company during the past year of unfavorable commercial and financial conditions is an evidence that, while every effort was made to enforce economies in the operations of your lines, because of the reduced volume of business, your Company, desiring to stimulate traffic, to encourage business activity and take advantage of lower prices, continued a fairly active improvement program throughout the year.

The work on the improvement of the passenger facilities in and around Philadelphia was continued. As a result, the five-track reinforced concrete and stone arch bridge of the Connecting Railway over the Schuylkill River at the Girard Avenue entrance to Fairmount Park has been completed and placed in operation and the old double track bridge removed; the work at North Philadelphia has been finished with the exception of remodeling the passenger station. For the expenditure made for this and other work along the Connecting Railway, your Company will be repaid through the issue of securities of the Connecting Railway Company.

The electrification of the Main Line from Broad Street Station, Philadelphia, to Paoli, is progressing rapidly, and without seriously interrupting the traffic. The work from Paoli to West Philadelphia is almost completed, including the sub-stations, and the remaining section of the electrification into Broad Street Station is being actively prosecuted. The new beam-light signals are in operation between Overbrook and Paoli. Satisfactory progress has also been made in equipping the steel cars, many of which are now in the present steam service, with electric motors and apparatus, for which these cars were originally designed. It is, therefore, expected to operate the main line suburban passenger trains by electricity about June 1st, 1915.

It is hoped that in 1915 financial conditions will permit the extension of electrification to North Philadelphia and the Chestnut Hill Branch, and also the elimination of certain grade crossings on that Branch. This would relieve the track and yard congestion at Broad Street Station, by transferring to the electric service over 60 trains on the daily schedule now operated by steam.

Your pier properties on the Delaware River south of Washington Avenue and at Walnut Street, Philadelphia, were improved during the year by the erection of new sheds and the enlargement of office facilities.

The reconstruction of the bridges at Earnest, Trenton Branch; over North Broad Street at North Philadelphia; Highspire, Philadelphia Division; Auburn and Norristown, Schuylkill Division, and at Dornock Point, Pittsburgh Division, was completed during the year, and the bridges placed in service.

The masonry work for the double track steel bridge over the Allegheny River between Kiskiminetas Junction and Freeport has been completed, and the superstructure is being erected; the bridge at Phœnixville, Schuylkill Division, is being rebuilt, and will be completed in 1915.

On the new six-track section of the New York Division, between Colonia and Bay Way, just west of Elizabeth, N. J., work was continued during the year, consisting principally of the elevation of the four original running tracks. The greater part of this work has been completed, and placed in operation, and it is expected that the remaining portions will be finished in the Spring of 1915.

Considerable progress was made during the year in placing the telephone and telegraph wires underground, the section from Broad Street Station, Philadelphia, to Paoli, and from Jersey City to Rahway, having been completed. The purpose of this work is to prevent delays in train movements and in the transaction of the Company's business by reason of the destruction of overhead wires by sleet and other storms, and also to avoid interference by electric transmission lines, and other wires.

During the year the final link in the automatic block signal system on your Main Line between New York and Pittsburgh was completed. The installation of this modern signal system will add to the safety of operations and materially aid in expediting train movements.

New freight stations were placed under construction at Harrisburg and Allegheny, which will be completed in 1915. The passenger and freight facilities at Elizabethtown, Altoona and Brookville are also being enlarged to handle an increased traffic.

The Sugar Camp Branch, Tyrone Division, the Shade Creek Branch, Pittsburgh Division, and the Homer & Cherry Tree Branch, Conemaugh Division, were extended to reach new coal openings; the Yukon Branch extension from Bells Mills to Cowansburg, Pittsburgh Division, was completed, and a branch is being constructed from Gilberton to Mahanoy Plane, Schuylkill Division, to develop additional coal traffic.

Work was continued on the elimination of grade crossings at Homewood Avenue, Pittsburgh, and in the Borough of Wilkinsburg, Pittsburgh, at which latter point a new passenger station is being constructed. It is expected that this work will be completed in 1915.

The elimination of grade crossings, change of grade and the erection of a new passenger station in the City of Johnstown is proceeding, but will not be completed before 1916.

The change of line and grade on the Renovo Division at Cameron and Horn, and the construction of a second track between Corry and Lovell, have been completed.

Surveys and many of the plans have been completed for the new line and the elimination of grade crossings in South Philadelphia; to be carried out jointly by your Company, the Philadelphia, Baltimore & Washington Railroad Company, the Baltimore & Ohio Railroad Company, and the City of Philadelphia.

Further consideration was given to plans for the future electrification of your main line crossing the Allegheny Mountains, from Altoona, the foot of the eastern slope, to Conemaugh, on the western slope, by which it is believed large operating economies can be effected, and the heavy passenger and freight train movements facilitated.

The aggregate expenditure for Construction and Equipment upon the owned and leased lines was $14,485,898.55, of which $8,076,086.80 was charged to Capital Account and the balance to Income, Profit and Loss and the Reserve for Additions and Betterments.

Road and Equipment—Affiliated Companies.

The construction of the New York Connecting Railroad was continued. The foundations and masonry of the East River four-track arch bridge have been completed to the track level, and the erection of the steel arch over that river is proceeding. Its viaducts and approaches on Long Island and on Ward's and Randall's Islands are also substantially completed, and favorable progress has been made on the remaining sections of the line. The funds for these expenditures were provided by the sale of the New York Connecting Railroad Company's First Mortgage 4½ per cent. bonds guaranteed by your Company and the New York, New Haven & Hartford Railroad Company, owners of all the stock of that Company.

The erection of the double track steel bridge over the Delaware River south of Trenton, is proceeding. This bridge is part of the proposed New York Division double-track relief line known as the Pennsylvania & Newark Railroad, which will extend from the Yard at Morrisville, Pa., to Colonia, N. J., a distance of about 40 miles, there connecting with the six-track system on that Division, and will also have branches connecting with the Trenton and New York Divisions near Trenton, N. J.

The revision of the grades and alignment and the construction of additional tracks and passing sidings on the Western New York & Pennsylvania Railway between Oil City and Buffalo, via Chautauqua, was continued during the year, and will shortly be completed. This work in connection with the improvements on the Allegheny Division, will, when fully completed, furnish a route on lower grades and with improved alignment between Pittsburgh and Buffalo, over 58 miles shorter than the present route via Salamanca Branch and Olean.

Coal Companies' Securities.

The properties of the various anthracite Coal Companies served by your lines, in the securities of which your Company and the Northern Central Railway Company were interested, were purchased by the Susquehanna Coal Company, and a complete examination of the coal lands, collieries, plants and facilities of the latter Company and their operating results, is being made by an experienced mining engineer and by certified public accountants, so that your Company will have the benefit of this independent survey and report of the properties to assist in determining the proper price that should be received for the securities of the Susquehanna Coal Company in the event of a purchaser being found therefor.

Securities Owned.

Your Company received as its pro rata share of the stock dividend of 40 per cent. of the Northern Central Railway Company, $4,230,880. at par, of the Capital Stock of that Company. This stock issue was approved by the Public Service Commissions of Maryland and Pennsylvania, and represents part of the cost of capital expenditures made in previous years for additions and betterments to its railroad and equipment.

Cleveland & Pittsburgh Railroad Company Special Guaranteed Betterment Stock amounting at par to $3,729,100, was sold, and additional Norfolk and Western Railway Company Common and Preferred Stock, amounting at par to $1,800,000. and $1,726,000. of Susquehanna Coal Company Bonds were purchased from the Northern Central Railway Company.

By order of the Board,

SAMUEL REA,
President.

Volume 58 March 12, 1915 Number 11

Contents

*Illustrated.

Elsewhere in this issue is published the substance of the amendment to the Locomotive Boiler Inspection Act which has been passed and is now a law—Public Statute No. 318. The change made by this amendment is the insertion of "Locomotives and Tenders" where "Locomotive Boilers" appears in the original act. In other words, the Bureau of Locomotive Boiler Inspection has been given authority over the entire locomotive and tender. Some of the effects this amendment may have on the railways were mentioned in an editorial published in the *Railway Age Gazette* of February 19, on page 293. Now that it has become a law it is very necessary that the railways immediately formulate rules, in conjunction with the federal authorities, to govern this inspection. It is expected that the time allowed for this tremendous task will be only three months, and no time should be lost in replying to the circular of the Special Committee on Relations of Railway Operation to Legislation, which has just been issued in regard to this amendment.

Amendment to the Boiler Inspection Act

The United States Supreme Court has held the West Virginia two-cent fare law unconstitutional, as applied to the Norfolk & Western, because its operation would not permit a fair return on the value of the property used in passenger service. The Norfolk & Western made its appeal on this ground, and separated its freight and passenger expenses as best it could, and the Supreme Court has upheld the appeal. In 1913 the Supreme Court decided against the Chesapeake & Ohio in that company's appeal from this same West Virginia law. In that case the grounds of appeal by the railroad were: (1) that the penalties for violation of the law ($50 to $500 for each offense) were excessive; (2) that in limiting the application of the law to companies operating 50 miles or more there was an unreasonable and arbitrary discrimination; and (3) that the law constituted an interference with interstate commerce. The court held that: (1) the penalties could not be applicable until the litigation had ceased and that therefore the company could not appeal against penalties which had not yet been incurred; (2) that the limitation as to length of road was not unreasonable or arbitrary; and (3) that the law must be regarded as applying only to intrastate business and was not, therefore, an interference with interstate commerce. The Chesapeake & Ohio's passenger receipts per train-mile are approximately $1.40, as against the Norfolk & Western's $1.36, and the Chesapeake & Ohio's costs are probably more than correspondingly higher than the Norfolk & Western's because of the terminal expenses at Washington, into which the Norfolk & Western does not run, and at Cincinnati, where the Norfolk & Western probably has a much less expensive entrance than the Chesapeake & Ohio. The Supreme Court has apparently set its seal of approval on the theory which was advanced by the Interstate Commerce Commission, and by its counsel, Mr. Brandeis, in the rate advance case that each class of traffic should be sufficiently remunerative to bear its burden of interest and overhead charges. The Chesapeake & Ohio did not, however, base its appeal on this ground in the West Virginia case.

The West Virginia Cases

One of the best things that have been said regarding the business situation in the United States was said by President William Sproule of the Southern Pacific in his recent address at the annual dinner of the Traffic Club of Chicago. He remarked that the industrial depression through which we are passing is chiefly due to lack of confidence produced by indiscriminate attacks on business men and business concerns. He added: "It is the employer who is first out of employment. As a natural sequence he is followed by the employee who next finds himself out of work.

The Unemployment of the Employer

Unemployment begins only when the employer himself begins to be unemployed." The gist of the whole matter is in the last sentence. Labor becomes unemployed only when the employer becomes unemployed, and it becomes unemployed only in proportion as the employer becomes unemployed. On the other hand, when the employer is fully employed labor is also. Bearing these facts in mind, the remedy for present conditions becomes obvious. It is to give employment to the employer. Who is the employer? He is the man with capital to invest. Therefore, to get him employed it is necessary to furnish him good opportunities for the investment of his capital. There is no want of idle capital. There is a glut of it. Why is it not being invested? Because there is hardly a large branch of industry left in which capital can be invested with any assurance that it will not be subjected to unfair and destructive attacks by the state and national governments. President Wilson recently appealed to business men to help the administration restore prosperity. Prosperity can be restored and maintained only by the activity of business men. The government may help or hinder them in doing so, but it can only help and hinder, and it is a crowning absurdity to suggest that business men come to the help of the government to restore prosperity. It is quite rational, on the other hand, to suggest that the government come to the assistance of the business men. We have been acting on the foolish assumption that government activity makes prosperity; and that is the main reason why the employer, and along with him the employee, have been so long unemployed.

AN IMPORTANT RAIL ORDER

NO recent event in the steel rail industry equals in importance the placing of an order for 35,000 tons of 90-lb. open hearth rails by the Illinois Central with the Algoma Steel Company last week. This order is especially significant for three reasons, the price of $27 per ton delivered at Chicago, the giving of the order to a Canadian mill, and the acceptance by the mill of the condition that the rails shall be rolled under the American Railway Engineering Association's specifications, with the inclusion of the nick-and-break test for every ingot.

The acceptance of the nick-and-break test by the manufacturer marks a great step in advance for the railways which has been contended for by various roads for the last few years without success. Even within the past month one large road failed, after making a special effort, to secure the insertion of this clause when placing a large order with an American mill. The manufacturers have opposed this test, claiming that its adoption will decrease the output of the mills, increase the cost of manufacture, etc. The Algoma Steel Company has rolled rails under these specifications for a Canadian road very recently without finding these objections serious. In fact, the number of rails rejected was materially less than the number which would have been rejected under the ordinary specifications because of the reduction of the unit of inspection and thereby of rejection from the heat to the ingot, while at the same time this test resulted in the detection of a considerable number of piped rails that would have been accepted under other specifications. The limited trial has, therefore, resulted in a saving to the mill as well as in a greater security to the purchaser.

The reduction in price is over $3 per ton as compared with those quoted on ordinary open hearth rails by the mills in this country. While the mills have stated that they would have to add a considerable premium to comply with the nick-and-break test, no road has secured a definite quotation. However, it is estimated that the price made to the Illinois Central is at least $5 per ton below the figure any American mill would have quoted with the inclusion of this specification. While any railroad officer would naturally favor a home manufacturer, and especially one located on his lines, other things being equal, it would have been difficult for the officers of the Illinois Central to have justified an increased expenditure of $175,000 for this reason alone. It is undoubtedly true that if the American mills had met this price they would have received the order. The railways have been criticized severely at times for allowing traffic conditions to influence unduly the purchase of materials. The action of the Illinois Central shows that this attitude is not universal. It is well known that in spite of variations in business conditions and fluctuations in the prices of other steel products, the price of steel rails, comprising one of the largest steel tonnages, has remained constant at the basic price of $28 for Bessemer steel ever since the formation of the United States Steel Corporation in 1901.

The Canadian mill has been criticized for quoting a low price in order to dump its surplus product in this country. But the steel companies of this country have followed the same practice, and their officers have publicly justified their action on the same grounds on which the Canadian mill is now acting. With business conditions as they now are the railways have the means in their own hands of defeating the arbitrary attitude assumed by the manufacturers regarding prices and the revision of specifications.

THE STATE COMMISSIONS AND THE WESTERN RATE CASE

OUR contemporary, the Traffic World, is not in any sense a "railway organ," as the *Railway Age Gazette* is often accused of being. It is devoted to the interests of both the railways and the shippers. Therefore, it is significant that it has been denouncing the part being taken in the western rate advance case by a number of western state railroad commissions, and especially by Clifford Thorne, of the Iowa commission.

Sixteen state commissions, without any investigation of the merits of the proposed advances in interstate rates, organized to oppose them. They are using for this purpose taxes raised from the public, a large part of which has been collected from the railways. They are also accepting voluntary contributions in support of their work from interested shippers. Among the advances proposed are some in the rates on packing house products; and the embattled commissions, it is announced in the newspapers, have received and accepted a contribution of $5,000 from the western meat packers. Mr. Thorne is appearing in the dual role of attorney for the state commissions, in which capacity he claims to represent the public, and of attorney for the packers and other shippers, in which capacity he represents private interests.

The Traffic World has questioned not only the propriety, but also the legality of the conduct of the state commissions, and especially of Mr. Thorne. It maintains that the Iowa law does not authorize the state commission to attack proposed advances in interstate rates, but only interstate rates already in effect. Furthermore, it does not authorize the chairman of the state commission, but only the state commerce counsel, to appear for the state in cases involving interstate rates. Finally, even if the chairman may usurp the functions of the commerce counsel, as Mr. Thorne is doing, there is, our contemporary maintains, a provision of the law which prohibits the commerce counsel from appearing as attorney in interstate rate cases for special interests at the same time he is appearing for the state. This provision is as follows: "No person . . . who has in any way or manner pecuniary interest in any corporation or business subject to the jurisdiction of the state board of railroad commissioners or Interstate Commerce Commission shall be eligible to said office (of commerce counsel) and the entering into the employ of or acquiring of any stock or other interest in any such corporation or business by such attorney after his election or appointment shall disqualify him from holding such or performing the duties thereof." "We think," says the Traffic World, "this sufficiently bars Mr. Thorne from acting under the privileges of commerce counsel even if otherwise it would be proper."

To the question of the propriety of the appearance of state commissions in interstate rate cases there can be only one

answer. In a letter to the Traffic World Mr. Thorne defends his course, and says state commissions have two principal functions; first, that of hearing state rate cases, and, second, that of appearing as parties in interstate rate cases. It is obvious that in hearing state rate cases the state commissions should be fair; and it is equally plain that it is physically impossible for them to be fair in deciding state rate cases if they are constantly appearing as parties and attorneys against the railways in interstate rate cases. The two functions are incompatible. Mr. Thorne himself is the best proof of this. In appearing in interstate rate cases he is always more narrow, unreasoning and bitter against the railways than any other attorney for the shippers; and in his capacity as a judge in state rate cases his attitude is the same as is his attitude as an attorney in interstate cases. Probably there is not in the United States another man so perfectly unfitted by his prepossessions and attitude to sit in judgment on railways as is Mr. Thorne; and yet, as chairman of the Iowa commission, he constantly sits in judgment without any apparent consciousness of his unfitness and the reasons for it.

No commission with any sense of fairness or propriety would voluntarily appear as a party in a case involving the unreasonableness of interstate rates, knowing that the reasonableness of practically the same rates on state business probably would soon come before it to pass on in its quasi-judicial capacity; and no law should require or permit it to do so. And it is exactly as great a breach of propriety for a state commissioner to appear as an attorney for anybody to oppose advances in rates as it would be for him to appear as an attorney for the railroads to advocate advances in rates. If the states are to intervene in such cases they should intervene through the office of the attorney-general or some similar office.

But, then, everybody long has known what to expect from most of the western state commissions. With a few exceptions they always have been composed chiefly of cross-roads demagogues. Never has there been constituted any equal number of public bodies which united so much power to so little capacity for properly exercising it. Inspired by petty political motives, devoid of expert knowledge or training, reckless as to the economic results of their acts and incapable of foreseeing what they would be, or of understanding what they have been, such state commissions as those appearing in the western rate case have done almost nothing but harm, both to the railways and the public.

Unfortunately, the public does not yet realize this. But it will in time. It cannot be fooled forever. Already the public is beginning to awaken to the fact that there are vast areas in the West which have insufficient railway facilities or none at all, and that railway development in that section has almost stopped. The public is beginning to ask the reasons for this situation. In due time it will learn them. And then the type of railroad commissioner now prevalent in the West will rapidly lose his popularity. For the transportation and business conditions now prevailing in the West, in spite of its big crops, are very largely due to the kind of men it has been putting on its railroad commissions and in other public offices. In time the public will find this out.

And the wait until the public awakens to the true situation may not be long. For the state commissions are co-operating ably with their critics in demonstrating their true characters. What could be better adapted to destroy public confidence in them than the fact and the manner of their appearance in the western rate case? They are there nominally as representatives of the public; and yet their attorney appears also as attorney for private interests, among whom are the meat packers, who have contributed $5,000! Knowing the solicitude which the packers have always manifested both for the farmers from whom they buy live stock and for the consumers to whom they sell meat; knowing, also, the pious zeal which the packers have ever displayed in obeying the anti-trust act and the anti-rebating laws, the public is apt to question the undivided and undying fealty to its interests of persons who are receiving and spending the public's money and that of the packers at the same time and for the same purpose!

NEW BOOKS

Proceedings of the Master Car Builders' Association. Compiled and published by Joseph W. Taylor, secretary of the association, Chicago, Ill. 968 pages, 6 in. by 9 in. Two volumes. Bound in cloth. Price, $5 per volume.

These volumes cover the official proceedings of the forty-eighth annual meeting of the Master Car Builders' Association, which was held in Atlantic City, N. J., in June, 1914. Volume I contains a full report of the convention and Volume II contains the complete rules of interchange brought up to date and all of the standard and recommended practices of the association, with drawings, together with the results of letter ballots sent out during the year. Pre-eminent in the proceedings is the report of the committee on Coupler and Draft Equipment. This report, together with its discussions, occupies 76 pages. Changes in the rules of interchange are contained in the report of the arbitration committee. Volume I also contains a list of members, with the number of cars they represent, and the constitution and by-laws of the association.

Universal Safety Standards, Machine Shop and Foundry. By Carl M. Hansen, consulting safety engineer. Illustrated and indexed. 312 pages, 5 in. by 7½ in. Bound in leather. Published by the Universal Safety Standards Publishing Company, 12th and Race streets, Philadelphia, Pa. Price $3.

This is the second edition of this book and it has been revised and enlarged. It is intended as a reference book of rules, drawings, tables, formulas, data and suggestions on safety devices and protection for machines in the machine shop and the foundry and was compiled under the direction of and approved by the New York Workmen's Compensation Service Bureau. The book is classified into four parts, general, machine shop, foundry and rules and practices; each division touches on a majority of the cases that arise under that classification. It gives a collection of conditions ordinarily found in machine shops and foundries, and indicates the proper safeguards to apply, treating the conditions with clearly worded, brief specifications and employing numerous illustrations. The book takes up conditions in the construction of the plant, and also follows the product from the receiving department to the shipping room and shows how in each instance safety measures may be applied. The illustrations are particularly good, the machines and buildings being printed in black, while the safety devices are printed in color, making them stand out very clearly.

Rate Construction Guide. Compiled and published by F. W. Fairbairn, commercial agent, Cincinnati, New Orleans & Texas Pacific Railway, Cleveland, Ohio. Bound in flexible leather. Price $5.

This is the 1915 edition of a freight rate guide published for the purpose of assisting in the location of the various tariffs for ascertaining the lowest prevailing freight rate on shipments from Central Freight Association, Eastern Trunk Line Association and New England Freight Association territories to all points in the United States. The purpose is to assist in making calculations of freight rates by indicating in what tariffs the various combinations are to be found, and in addition to its usefulness in a tariff reference file provides a means for equipping an office with a file of such of the tariffs as are necessary, thereby presenting indiscriminate requisitions for others which would not be of interest. While of particular benefit to shippers, it has also been adopted by a number of railroads for their rate clerks at principal stations.

Letters to the Editor

THE ALL-AROUND SUPERINTENDENT

Kansas City, Mo.

To the Editor of the Railway Age Gazette:

The editorial comment on "Why Do Not Chief Despatchers Receive More Recognition?" in your issue of January 15, opens the way for a few more remarks on the subject. The editor says that little or nothing was brought out concerning other qualifications than experience, and that a superintendent is liable to make a bad mistake by continuing to live in the department from which he came. Inasmuch as transportation is the only thing a railroad has for sale, he would not make a very large mistake by living a while in that department.

Who is the man on the job who has had an opportunity to thoroughly educate himself along that line? It requires extraordinary experience in the study of human nature in order that a superintendent may surround himself with subordinates that will make his position a success. He cannot do it alone, and must rely on men who are experts in their respective departments and whom he can trust to the last letter. Therefore, a superintendent who can effect such an organization is bound to have success. Without a thorough organization he will be at sea. The chief despatcher, in his long experience, has had an opportunity to acquaint himself with the fundamental principles of the various departments. If it is not necessary for a master mechanic to have knowledge of telegraphy and train despatching to be a superintendent; why would it be necessary for a chief despatcher to have served an apprenticeship as a machinist to fill the position of superintendent? What amount of expert figuring has the master mechanic to do in connection with his position? To keep within his allowance and see that the power and equipment is turned out in good shape. The chief despatcher has to figure where and how the company will derive the most revenue out of it, and at the same time manipulate it with the least expense.

If, as the editor says, the superintendent would no doubt do a good turn at the farmer's house, ten miles away, who would be the better fitted to go there and settle a claim, or look into the matter of securing additional right of way, the chief despatcher or the bridge carpenter? How would the civil engineer compete with the chief despatcher in obtaining the maximum ton-miles per train and at the same time keep up the standard of service and avoid overtime? Again, as to the matter of the chief despatcher feeling the importance of his promotion; I do not believe this weakness would be any more conspicuous than in the case of any other employee, and in some cases not so apparent. If the chief despatcher so handles the engines, cars and men, that the superintendent is not criticized by his superiors, he has made that superintendent's success. The superintendent may have washouts, fires, engine failures and derailments which may be chargeable to the other departments, but these do not come every day. But keeping the passenger trains, locals and red ball freights on time; keeping the line cleaned up, the overtime down, stock trains moved without damage claims, are things that come up every day and every night; and who is the man that makes the showing for the superintendent in this direction? It is not the roadmaster or the chief clerk; it is the despatcher, who is on the job all the time, working for the success of the chief despatcher and he for the superintendent. It has been said that a chief despatcher can either break or make a superintendent and there is in that idea more truth than poetry.

If, as Mr. Hobbs says, 75 per cent of the presidents, general managers, etc., were once chief despatchers, this is a credit to the despatchers; but it does not seem that the percentage in the last few years is being maintained. However, I venture to say that nine-tenths, at least, of the officers named in connection with Mr. Hobbs' remarks will say, if questioned, that their success as superintendents and general superintendents was due to the work of their chief despatchers more than to any other one department.

It is quite natural for men promoted from the different departments to pick lieutenants from the department from which they came, and no doubt at times there are good reasons for it; but I believe I am safe in still standing up for the chief despatchers, for they are justly deserving. C. L. J.

MODIFY THE VALUATION LAW

New York, N. Y.

To the Editor of the Railway Age Gazette:

The recent editorial on the subject of valuation is of not a little interest to the writer, who has felt for some time that he was rather in the minority, at least among those generally inclined to favor the railroad side, or their point of view, in believing that there were many benefits to be derived from a *properly made* valuation, and possibly also that these benefits might be worth the cost.

In the discussion of a paper presented to the American Society of Civil Engineers in January, 1911, the writer stated: "That valuations properly made may be the means whereby confidence may be restored, not only in the mind of the general public, but in that of the investor; but, in order to obtain this result, the railroads should urge, with all the power they possess, the necessity of having such valuations made by a body of men, some of whom, at least should be engineers big enough to entitle their opinions to the respect of both sides, and thoroughly qualified by training and experience for the work."

It was further pointed out, and this is a point which many railroad men ignore, either deliberately or unconsciously, that "There need not necessarily be any relation between rate regulation and rate-making. Rate regulation can well be confined to rates in the aggregate; rate-making applies to the adjustment of individual rates, and must necessarily be the work of men well versed in all the varied elements which control it and the particular conditions affecting the business of each particular road."

Your suggestion that the railways be taken a group at a time is an excellent one. If the energies of the commission could be concentrated say, for instance, on the New England group, or on the New York-Chicago trunk lines (leaving out lateral offshoots), some definite results could be obtained within a reasonable time.

There can be little doubt that properly made valuations will not only show that the railroads are not, on the whole, over capitalized, but will show the financial side in a favorable light, and if the general public once gets this idea firmly fixed in its mind, as it will if it be established by a thoroughly competent commission, it will be of more benefit to the railroads than the cost of getting the information. It is also not an unmixed evil for the railroads to be compelled to have their maps, records, etc., in good shape, as there have been not a few dollars expended for improvements, which might have been spent to better advantage had there been available, adequate information for a broad-minded view of the whole situation, rather than a restricted view of some particular detail.

It has seemed to the writer, in view of the knowledge now acquired by the Interstate Commerce Commission and by the various official railway committees having the subject of valuation in charge, that Congress might be requested to modify the law containing the instructions under which the valuation is now being conducted, and among other things to include your suggestion to complete the valuation by sections instead of scattering its energies all over the country, even though this will not appeal to the pork barrel statesman, and possibly also to make the determination of the value wholly on the basis of the cost of reproduction new.

F. Lavis,
Consulting Engineer.

Hearings on Western Freight Rate Advances

Testimony on Financial Condition of 41 Roads Operating 98,000 Miles. Earnings, 7 Per Cent on $28,000 Per Mile

Statistical and general testimony as to the financial condition and necessities of 41 western railroad systems occupied the first four days of the hearing before Commissioner Daniels of the Interstate Commerce Commission, on the application of the roads for advances in a number of commodity rates, which began at Chicago on March 4. Four days were allotted for railroad evidence supporting the claim that increases in earnings are needed, which was followed on Tuesday, Wednesday and Thursday of this week by testimony bearing especially on the advance on grain and grain products. Other days have been set aside for similar testimony as to other commodities, and four days, March 30 to April 2, will be allowed for evidence of protestants and interveners in rebuttal of the evidence of the carriers.

Edgar Watkins, examiner-attorney for the commission, sat with Commissioner Daniels, and the commission was also represented by M. O. Lorenz, statistician. Those who appeared in opposition to the proposed rate advances, included Clifford Thorne, chairman of the Iowa Railroad Commission and of a committee representing 16 western state commissions. He said he also represented several large organizations of shippers. Luther M. Walter and W. E. McCormack, appeared for Chicago packers.

Members of this committee were present from the state commissions of Kansas, Nebraska, South Dakota, Iowa, Louisiana and North Dakota. Appearances were also entered for a number of large companies and organizations of shippers, including the Chicago packing companies and the coal and grain interests.

Their representatives who took part in the cross-examination were Luther M. Walter, W. E. McCormick and W. E. Lamb, representing the packers

OPENING STATEMENT BY C. C. WRIGHT

The scope of the case was outlined by C. C. Wright, general solicitor of the Chicago & North Western, who is chairman of the railroad committee in charge of the case. The other members are T. J. Norton, general attorney of the Santa Fe; W. F. Dickinson, general attorney of the Rock Island; A. P. Humburg, commerce attorney of the Illinois Central; C. S. Berg, assistant general counsel of the Missouri, Kansas & Texas, and R. B. Scott, general attorney of the Chicago, Burlington & Quincy.

Although this has been called a general rate advance, Mr. Wright explained, it is general only in the sense that the advance covers rates over a broad territory, and that the advances were brought about, in a measure, and are to be in a measure justified, by the needs of the carriers for additional revenue.

The principal products upon which the advance is sought are grain and grain products, livestock, fresh meats and packing-house products, coal, hay, fruits and vegetables and cotton piece goods. The hearing also involves the propriety of the elimination of certain privileges which have prevailed in parts of the territory involved, in relation to stoppage in transit, storage and concentration.

The territory involved includes the Western Trunk Line territory (from Chicago west to the Missouri river), the Southwestern Tariff Committee territory (west of the Missouri river and south of Kansas and Missouri), and part of the Trans-Missouri territory (Nebraska, Kansas and eastern Colorado).

The advance is not the same on each commodity; nor does the advance on each cover the same territory. Each has been treated separately with a view to establishing a more equitable relation of rates by advancing those which were too low. Mr. Wright described briefly the application of the advances, saying they would be taken up later by witnesses at the separate hearings devoted to those commodities.

"The amount of the increase in revenues," said Mr. Wright, "is by no means as great as has been stated in public print; nor is it anticipated that it will meet the necessities of the carriers for additional revenue. It is impossible at this time to state definitely, but it is believed that it will not amount to more than $10,000,000 to the 41 roads principally interested in this advance, which have a combined mileage of over 98,000 miles. In other words, it will amount to but little over $100 per mile.

"It is the purpose of the carriers to further limit the privileges which have been granted in connection with certain rates and to publish advances on various miscellaneous commodities, which need not now be particularly considered. The tariffs for some of these advances have already been filed. A statement will be furnished to the commission, at the hearing as to each commodity, of the amount of increased revenue to be derived by reason of the advanced rates.

"Tariffs advancing interstate passenger rates to substantially 2½ cents a mile have been filed, and it is hoped that a like advance can be made in the intrastate passenger rates. That matter is not before the commission upon this hearing, but we desire that some of the general evidence introduced in this case be considered in that case.

"Owing to the fact that an advance has been made at about the same time on a number of commodities covering a large territory, it has been deemed proper to present to the commission at this time, a showing of the financial conditions of the various carriers operating in the territory covered by the advances. It is confidently believed that this will demonstrate that the carriers are in need of additional revenue in order to maintain the proper, efficient and safe service demanded by the public, and at the same time enable the carriers to receive such fair return upon the value of their properties as shall sustain their credit and enable them to meet the public's demands.

"The evidence in relation to the specific rates will show that the advances have been made upon rates which were both actually and relatively too low. In other words, the increased revenue is sought by means of a better adjustment in relation of rates, having in mind the suggestions heretofore made by the commission as to the equalization of rates and the removal of discriminatory practices.

"This case will not be presented as the application of any single road. It will be presented, substantially as if the roads were owned and operated as one system. The fact that one road of this system may be making a considerable return, and others of them be in the hands of receivers, is not thought to be the controlling feature, any more than it would be proper to estimate the needs of a single line by the separate returns from different branches of such line. It is the contention of the carriers that taking the railroads together in the territory in question, their revenue is not sufficient. Conditions are such in the west that we do not believe it possible to select any small number of roads which could be said to be representative or controlling.

"For the purposes of comparison of the situation west of Chicago, with the condition in the eastern district, we shall present to the commission data in relation to the earnings, expenses and net returns, covering practically all of the lines operating west of Chicago. However, many of the so-called strongest roads in the western district, such as the Great Northern, Northern Pacific and the Union Pacific, have practically no interest in the advances under investigation.

"Therefore, in order to present to the commission the situ-

ation in relation to the roads that are materially interested in this proceeding, and whose revenues will be affected; that is, those whose principal interests are in the Western Trunk Line territory and Southwestern territory, and that part of the Trans-Missouri territory in which advances are made, we have selected all of the principal lines (treating them as systems), which operate in Western Trunk Line territory, and Southwest territory, and will present the combined results of their operating revenues, their expenses and net returns. They will be presented in a consolidated group.

"In order that the commission may be better informed as to the situation as between the Western Trunk Line territory and the southwestern territory, the carriers will present the combined statement of 10 of the leading systems operating in the Western Trunk Line territory. As representing the southwestern territory, an equal number of the principal systems have been selected, and the results of their operations have been combined in another group. These grouped figures will be supplemented by the combined showing of two other groups of roads in which are included all of the lines having 1,000 miles or more, which operate exclusively in either the Western Trunk Line or Southwestern Tariff Committee territory.

"This grouping, or division of the roads into groups, has been selected as in our judgment best portraying the true situation, and for the purpose of eliminating as far as possible the influences of the rates and transportation conditions upon those roads that serve trans-continental territory, and that portion of the Western Trunk Line territory in which the rates are not advanced.

"The comparison of revenues and expenses will be made, covering two periods, one, the seven years, 1901 to 1907, inclusive, and the other the period from 1908 to 1914, inclusive. The latter period commences with the revised, uniform system of railroad accounts as prescribed by the Interstate Commerce Commission, and covers substantially the period during which the commission has had the power to authoritatively fix maximum rates. The results of the operation of each year will be given separately, and the general comparison will indicate a decreasing ratio of return upon investment in road and equipment, not only as between the two periods compared, but as between comparable years in the latter period. It will show that the operation ratio is increasing, and that there has been a very large addition to the properties of the carriers.

"This compilation will show that the net operating income of the carriers interested in this proceeding, for the average of the last seven years, has not been what the courts have held to be a fair rate of return upon their properties, when considering the question of confiscation of property, on an amount to exceed $28,000 per mile of road operated.

"The records of the Interstate Commerce Commission show that the carriers in the territory involved, have been called upon to invest in their properties, by way of additions and betterments, more than $100,000,000 a year during the last seven years, and yet their net revenues are but slightly higher than they were during the prior seven years. In other words, that there is no substantial return upon the new investment which has been made during the last seven years. It will also be demonstrated that the additional investment in road and equipment is being taken care of by bond issue; that is by borrowing, rather than by taking in new partners by the sale of stock."

OPENING STATEMENT BY CLIFFORD THORNE

Mr. Thorne also made an opening statement, saying that the time allowed for investigation prior to the hearing had been entirely inadequate and that formal application would be made for the additional time provided by the statute and deemed necessary in order to complete the investigation.

"These advances under consideration," he said, "are only a part of a general movement that has been in progress for over a year, and these increases are only a fractional part of the total advance which these railroads are trying to put through. The advances permitted during the past year by this commission, added to those involved in the original suspension order in this case, added to those involved in the 16 supplementary orders issued by the commission, added to those now being filed, make a total which we believe, from what investigations we have made, can be conservatively estimated will cause a 10 per cent increase in the freight revenues of these railway companies.

"Estimating that two-fifths of the passenger travel will be on mileage books, the average increase in passenger revenues will amount to approximately 20 per cent.

"The magnitude of the sums involved in a 10 per cent increase in freight rates, and a 20 per cent increase in passenger rates, may be appreciated when you consider that the total freight revenues of the 37 railroads embraced in your original suspension order, aggregated last year $700,000,000, and their passenger revenues amounted to approximately $195,000,000.

"Though our investigation has not been completed, that which we have to offer will show conclusively as to representative railroad companies in this territory:

"That the credit of these western railway companies is better than that of representative companies in any other line of business in the United States. That the depression of the past year was not due to freight or passenger rates, was not peculiar to the railroad industry, but applied to business generally throughout the world. That, disregarding extremely prosperous and extremely lean years which come to all business, these western railway companies during recent ordinary normal years have earned more, both gross and net, per mile of line and per train mile than ever before in their history. That these companies have been able to maintain their properties during recent years at a higher standard than ever before in their history; and they have also set aside large sums of money out of earnings for betterments and improvements and outside investments, which should have been made from capital."

TESTIMONY

The foundation of the railroads' case was laid by C. E. Schaff, president of the Missouri, Kansas & Texas, who read a statement as to the need for increased revenues, in addition to a discussion of the special needs of the roads in the southwest. He was followed by S. M. Felton, president of the Chicago Great Western, and B. F. Bush, president of the Missouri Pacific, who discussed the condition of the roads in Western Trunk Line and southwestern territory with illustrations from the experiences of their own roads. The three presidents took the position that western railroads should be allowed to earn 7 per cent on the investment, that the situation should only be considered with reference to the condition of all the roads in the territory, and showed that the roads involved in the case during the past seven years had earned 7 per cent only on a very low sum per mile of line, a large part of the investment receiving no return. They also discussed the increasing difficulty of financing railroads. The financial condition of the roads from the bankers' and investors' standpoint was discussed by Festus J. Wade, president of the Mercantile Trust Company of St. Louis, and James W. Lusk, one of the receivers of the St. Louis & San Francisco, took the stand, as a man who had had no previous connection with railroad operation, to explain the difficulty of "paying the honest debts of a railroad" under present conditions. This general testimony was supported by the presentation of elaborate statistical exhibits comparing the results of operation in the periods 1901-1907 and 1908-1914.

OUTLINE OF RAILWAYS' CASE BY C. E. SCHAFF

Mr. Schaff said in part:

"The operating results of the carriers in the western district have been growing more and more unsatisfactory year by year, and their need of increased net income has grown more pressing. We feel that the time mentioned by the commission in the 1910

western rate advance case to make application to this commission for an increase of rates has come. It is imperative that the western carriers increase their net income quickly. Three ways have been suggested by which such an increase may be accomplished.

"First, through increased operating revenues following the natural growth in population and industrial development with a resultant expansion of traffic. Admitting the possibilities in this direction, the probable results are far too slow and uncertain to meet the immediate necessities of the carriers. As the present standard of operations cannot be lowered, and as the investment in betterments, equipment and extension of facilities must increase from year to year commensurately with the increase in population and commerce of the community served, it cannot be expected that the future will show any higher returns than the past from increased operating revenues on the present basis of rates.

"Second, through economies in operation. The carriers, however, have found that their efforts to economize, even to the extent of deferring maintenance, have been without avail. The carriers will continue, as in the past, to effect operating economies wherever possible, but I see no hope for substantial relief or help from that source.

"Third, by an increase in rates. We believe that the problem can only be solved by an increase of rates, and that the experience of the past as exhibited by the statistical data to be presented here leads inevitably to that conclusion. In determining where the advances should be made, the lines have not followed the lead of the eastern lines and have not aimed at a horizontal increase of 5 per cent or any other arbitrary amount, but they have endeavored to adopt the suggestion of the Interstate Commerce Commission, and have sought to eliminate certain privileges and abuses which have been condemned or criticized by the commission, and to make such advances as would increase revenues, and at the same time more equitably distribute the benefits and burdens of the service.

"The increases asked for will not afford us all the relief necessary, or to which we believe we are entitled. As nearly as we can determine, the increases asked for, if applied to the business of the Missouri, Kansas & Texas Lines for one year, would not add to exceed $450,000 to their gross freight revenues an increase of about 2 per cent. However, following another suggestion of this commission, we are active in trying to have our rates raised on state, as well as on interstate, business, so that the needed increase will, so far as practicable, be fairly distributed—state and interstate—both passenger and freight.

"The statistical data and tables offered as evidence will show an inadequate return on the cost of property, or on any approximate or reasonably assumed value of the properties, or on any other basis upon which that return may be calculated. They will show that the book value of road and equipment of the carriers involved in this proceeding averaged $51,584 per mile operated on June 30, 1914, while the income in that year available for return on the investment, if capitalized at 7 per cent, represented a value of only $28,048 per mile operated, or little more than one-half of the book cost of the property. It must be apparent, even to those with the most superficial knowledge of railroad construction cost, that these western lines could not be reproduced for any such sum.

"The tables will show that the operated mileage has increased 12,577 miles during the past seven years, and that the property investment has increased $1,236,000,000. The lines have expended an average of $105,000,000 per year for additions and betterments, including equipment, an average of $1,970 per mile per year. The bonds and notes outstanding in the hands of the public have increased $959,000,000 in seven years. The ratio of interest-bearing obligations to the total capitalization has increased from 58.35 per cent to 62.26 per cent. The expenditure per mile for maintenance of road and equipment rose from $2,266 to $2,831 in seven years.

"The average net cost of road and equipment of the 41 western roads, or systems, divided into two periods of seven years each, 1901 to 1907 and 1908 to 1914, were: First period, 1901 to 1907, $3,430,000,000, and for the second period, 1908 to 1914, $4,570,-

Combined Results of Operation of 41 Western Railroad Systems, Comparing the Period 1901-1907 with the Period 1908-1914

Years	Net cost of road and equipment	Average miles operated	Net operating income	Per cent return on cost of road and equipment	Value on which net oper. inc. is equiv. to 7 per cent	Balance of value earning no return	Net oper. income per mile operated	Equiv. to 7 per cent on value per mile
1901	$3,005,040,261	67,054.86	$143,281,943.04	4.77	$2,046,884,900	$958,155,361	$2,136.76	$30,525
1902	3,121,687,909	70,467.81	154,652,853.13	4.95	2,209,326,473	912,361,436	2,194.65	31,352
1903	3,336,109,179	75,591.67	163,218,476.47	4.89	2,331,692,521	1,004,416,658	2,159.21	30,846
1904	3,487,539,658	79,378.50	158,715,558.40	4.55	2,267,365,120	1,220,174,538	1,999.48	28,564
1905	3,561,291,400	81,724.85	166,081,014.50	4.66	2,372,585,921	1,188,705,479	2,032.19	29,031
1906	3,712,190,412	83,118.00	191,397,541.30	5.16	2,734,250,590	977,939,822	2,302.72	32,896
1907	3,842,316,511	85,872.00	216,885,898.39	5.64	3,098,369,977	743,946,534	2,525.69	36,081
Total 1901 to 1907 inclusive	$24,066,175,330	543,207.69	$1,194,233,285.23	4.96	$17,060,475,502	$7,005,699,828	$2,198.48	$31,407
1908	$3,957,331,754	87,580.64	$169,579,067.29	4.29	$2,422,558,104	$1,534,773,650	$1,936.26	$27,661
1909	4,079,982,221	88,635.71	188,035,808.83	4.61	2,686,225,840	1,393,756,381	2,121.44	30,306
1910	4,504,033,244	92,788.41	198,940,381.74	4.42	2,842,005,453	1,662,027,791	2,144.02	30,629
1911	4,674,459,267	95,139.98	197,179,697.73	4.22	2,816,852,825	1,857,606,442	2,072.52	29,607

1913	4,907,912,434	97,237.16	217,816,890.19	4.44	3,111,669,860	1,796,242,574	2,240.06	32,001
1914	5,078,293,153	98,446.59	193,286,463.22	3.81	2,761,235,189	2,317,057,964	1,963.36	28,048
Total 1908 to 1914 inclusive	$31,998,553,046	656,036.25	$1,341,817,852.08	4.19	$19,168,826,458	$12,829,726,588	$2,045.34	$29,219
Total 1901 to 1914 inclusive	$56,064,728,376	1,199,243.94	$2,536,051,137.31	4.52	$36,229,301,960	$19,835,426,416	$2,114.71	$30,210
Totals and average 1901-1907 inclusive.	$24,066,175,330	543,207.69	$1,194,233,285.23	4.96	$17,060,475,502	$7,005,699,828	$2,198.48	$31,407
Totals and average 1908-1914 inclusive.	31,998,553,046	656,036.25	1,341,817,852.08	4.19	19,168,826,458	12,829,726,588	2,045.34	29,219

Comparison of operating results per mile operated:	Operating revenues	Operating expenses, hire of equipment, joint facilities, etc.	Taxes	Rentals—Net lease of roads	Net operating income
1901-1907	$7,466.85	$4,948.59	$231.64	$88.14	$2,198.40
1908-1914	8,815.27	6,355.93	346.81	67.19	2,045.34
Increase or decrease	Inc. $1,348.42	Inc. $1,407.34	Inc. $115.17	Dec. $20.95	Dec. $153.14
Comparison of operating results for each dollar of road and equipment cost:					
1901-1907	16.85 cents	11.17 cents	0.52 cents	0.20 cents	4.96 cents
1908-1914	18.07 cents	13.03 cents	0.71 cents	0.14 cents	4.19 cents
Increase or decrease	Inc. 1.22 cents	Inc. 1.86 cents	Inc. 0.19 cents	Dec. 0.06 cents	Dec. 0.77 cents
Percentages	7.29 per cent	16.65 per cent	36.54 per cent	30.00 per cent	15.52 per cent

000,000, or an average yearly increase in net cost of road and equipment for the second period of $1,140,000,000. The average annual net operating income for the same systems for the first period was $170,000,000, and for the second period $191,000,000. The per cent of return for the first period averaged 4.96, and for the second 4.19. So that the increase in net operating income did not, by any means, keep pace with the increase in cost of road and equipment.

"Assuming that these lines were entitled to earn 7 per cent, and capitalizing their net operating income, it will be found that the net operating income for the first period was equivalent to 7 per cent on an average valuation of $2,430,000,000, and for the second period the net operating income was equivalent to an average earning of 7 per cent on something over $2,700,000,000, which means that for the first period an average of over $1,000,000,000 investment earned no return whatever, and for the second period an average of over $1,800,000,000 earned no return whatever.

"The net operating income per mile of road for the first period averaged $2,198, and for the second period $2,045, which, capitalized on a 7 per cent basis, was equivalent to earnings on a value per mile of road of $31,400 for the first period, and for the second period of $29,200. Notwithstanding the great increase in investment, the net operating income was materially reduced for the second period.

"The average operating revenue per mile of road operated for the first period was $7,466 per mile, and operating expenses were $4,948 per mile; taxes $231 per mile, and rentals $88 per mile, leaving $2,198 net operating income per mile for the first period.

"For the second period the operating revenues were $8,815 per mile, an increase over the first period of $1,348; operating expenses were $6,355 per mile, an increase of $1,407, which more than absorbed the increase in gross operating revenue. Taxes in the second period were $347 per mile, or an average increase of $115. Rentals for lease of road decreased $21 per mile, leaving the net operating income for the second period, average, $2,045, or a decrease of $145, as compared with the first period.

"For the year 1901 the 41 systems paid out only $14,000,000 in taxes, whereas for the year 1914 they paid out $42,000,000 in taxes, or three times as much as in the year 1901. For the entire period, 1901 to 1914, 14 years, they paid out $315,000,000 for taxes.

"In the face of a declining credit, the western carriers during the three calendar years 1915, 1916 and 1917 must refund maturing obligations aggregating $203,000,000. It should be borne in mind that they must also procure not less than $3,000 per mile, or $295,000,000, of new capital, during these three years to pay for the ordinary necessary betterments and equipment required by the normal growth of traffic and demanded by the public.

"In considering the increased operating costs of the carriers, it should be remembered, among other things, that federal and state laws and regulations of recent years have contributed materially. Freight, passenger and express rates have been reduced by commissions and legislation. The government has required increased postal facilities without commensurate addition to revenue; express earnings have been curtailed by reason of the extension of the parcel post, for which the railroads are not compensated.

"The increased cost of labor is familiar to every one who has the slightest information regarding the railroad situation. Rates of pay on railroads in the west have been and now are substantially higher than in the east, and further demands are now being arbitrated in this city. The average rate of pay per day for railway employees, excluding general officers, was $2.20 in 1907, and $2.48 in 1914. If the same rate had been paid in 1914 as in 1907 by the 41 roads concerned in this hearing, their operating expenses would have been $44,800,000 less in 1914, and the net income for that year would have been correspondingly increased. The saving would have amounted to about 1 per cent on the net cost of road and equipment. The operating ratio would have been 2.76 per cent less.

"The increased cost of money to railroads is well known. In 1905 and 1906, the roads generally were able to obtain money on a 3½ per cent to 5 per cent basis. From that time, the rate has been steadily advancing and today many of the roads are paying 7 per cent and more for such small amounts as they are able to obtain. While this is partly due to the higher rate of interest generally, it is aggravated in the case of most western and southwestern railroads by the lack of a margin of safety.

"Operating economies have been innumerable. The managers have constantly endeavored to save in every detail of expenditure, and to increase the efficiency of the plant and its working organization, and have instituted numerous and varied cost-reducing schemes and devices. Much has been accomplished, and more will be accomplished, but it is a lamentable fact that reduced rates and increased expenses beyond the power of the managers to control have more than offset the lower costs which have obtained through more efficient and economical methods. Many millions of dollars have been invested in permanent improvements designed to reduce the cost of maintenance and operation.

"During the seven fiscal years beginning July 1, 1907, and ending June 30, 1914, the 41 western carriers expended for new equipment $306,000,000. The new engines acquired are larger and more powerful and are designed to draw heavier loads. Their use has enabled the average revenue trainload to be increased from 284.05 tons in 1908 to 364.07 tons in 1914, an increase of 80.02 tons, or 28.17 per cent. Increasing the number of tons and cars handled in one train is the best medium known to us for reducing transportation costs.

"The tons moved one mile in 1914 were 18,783,291,755 more than in 1908, an increase of 33.4 per cent. By the use of heavier power and the resultant increased trainload, the freight train miles, including mixed, increased only 8,068,380 miles, or 4.07 per cent.. Yet the ratio of conducting transportation expenses to revenue was practically the same in 1914 as in 1908. The new freight and passenger equipment was more strongly and permanently constructed, yet the ratio of expenses for maintenance of equipment to gross revenue increased from 14.23 per cent in 1908 to 16.58 per cent in 1914. The new freight equipment purchased during the period is also of greater capacity, but nevertheless the average revenue tons per car mile only increased from 11.11 in 1908 to 11.93 in 1914, indicating a larger proportion of less-than-carload freight and bulky and light loading traffic.

"During the seven fiscal years under discussion, the western carriers expended $433,507,867 for additions and betterments, excluding equipment. The purpose of these expenditures was either to furnish additional facilities to handle the business and relieve congestion; or to procure additional traffic; or to lay heavier rail, provide ballast, widen banks, build bridges and otherwise to strengthen and make permanent the roadway and structures in order to provide a safe roadway to sustain the heavier loads and to reduce maintenance and transportation costs; or to reduce grades to enable the trainload to be increased; or to pave streets and build stations and provide betterments required by police regulations of governmental bodies. We believe that the expenditure of most of this money was wise and profitable and a very large part of it was absolutely vital to the operation of the roads, and as much of a necessity as an operating expense.

"The ratio of total operating expenses to revenue in 1908 was 69.97 and in 1914 72.12. Comment has been made upon the fact that the operating ratio does not vary materially from year to year and that it has not actually declined as a result of the strenuous efforts to economize. This is, of course, due to those unfortunate conditions which I have referred to, beyond the control of the managements, such as wage increases, rate reductions and police regulations. Compulsory rate reductions, which have occurred in greater or less degree for many years,

are an important factor in preventing a reduction in the operating ratio.

"To illustrate: The M. K. & T. Lines for the year ending June 30, 1914, lost $676,500 by the enforcement of the two cents per mile passenger rate and $165,000 by freight rate reductions, a total of $841,500, in the states of Missouri and Oklahoma, which reduced the net earnings correspondingly. The service rendered was exactly the same for the lower rates as it would have been for the higher. Adding the $841,500 to the actual operating revenues for 1914 would have made them $32,362,688. Operating expenses would have been the same, $22,722,119. The operating ratio would have been 70.21 per cent instead of 72.09 per cent, or 1.88 per cent less than it actually was.

"The major part of the large expenditures in the improvement of the railroads is for the public safety and the despatch of business, and while some of them add somewhat to the economies of transportation, most of them are additional burdens. The *value* of the service to the public has not only been largely increased, but the *cost* of the service has been increased to the carriers."

CONDITION OF THE SOUTHWESTERN ROADS

Mr. Schaff then took up the roads in the Southwest, making comparisons with the statistics presented in the eastern case for the Central Freight Association roads. He omitted from consideration the Atchison, Topeka & Santa Fe and the Chicago, Rock Island & Pacific, because, he said, the major part of their lines are located in other states and are operated under dissimilar conditions. For the group of 22,032 miles, including the Kansas City Southern, Missouri, Kansas & Texas, Missouri Pacific, St. Louis, Iron Mountain & Southern, Texas & Pacific, International & Great Northern, St. Louis Southwestern and St. Louis & San Francisco, he showed that the results of operations in 1914 were more disappointing than in the panic year of 1908. In the period 1908 to 1914, per mile of line owned, operating revenues increased about 32 per cent, while operating expenses increased 33 per cent, taxes increased 78 per cent, the operating ratio rose from 72.66 to 73.25, the ratio of funded debt to total capital rose from 63.69 to 70.51 and 59 per cent of the accumulated surplus was lost. The income available for return on the investment in 1914 was $1,958 per mile, equal to 7 per cent on a value of only $27,960 per mile. Seven per cent on the book cost would have been $4,047 per mile.

"Special consideration should be given to the necessities of the carriers in the Southwest," said Mr. Schaff. "There are special difficulties attached to railway operation in Missouri, Kansas, Arkansas, Oklahoma and Texas, which, perhaps, are not encountered in other sections of the country. In the Southwest we have no margin of safety. With us it has not been and is not a question of what is a reasonable dividend or a reasonable return on the capital invested, or what is a reasonable surplus over and above such reasonable return for the purpose of tiding the company through periods of depression and preserving the company's credit. With few and unimportant exceptions, the railroad companies in the Southwest have paid no dividends at all on their capital stock and have had no surplus funds. It has been and is a struggle for existence to pay operating expenses, taxes and interest on bonds and a little something more. Stockholders of the lines, both common and preferred, have during a long series of years received no returns from their investments, and earnings to which they were justly entitled were put back into the property, and nothing really has ever been earned on this new capital.

"Railroads operating in one or more of the five states which I have mentioned, having a total mileage of 11,079 miles, which includes the Wabash and the Frisco mileage east of the Mississippi river, and having a total capitalization of $624,000,000, were in receivers' hands on January 1, 1915. Of these receivership roads 8,641 miles were wholly within the five states, and approximately 20 per cent of the total railroad mileage in those states is now operated by the courts. And the lines of this group must pay or refund securities which mature during 1915, 1916 and 1917, aggregating $117,000,000. Construction of new lines of road in the Southwest has practically ceased and expenditures for additions and betterments, new equipment and facilities have been reduced to a minimum."

On cross-examination Mr. Thorne asked Mr. Schaff if he thought the public should pay 7 per cent on the investment represented by bonds as well as on the stock. Mr. Schaff said he thought 7 per cent ought to be earned on a fair valuation of the property used, even if it would give a much larger return on the stock, in order that a surplus could be accumulated in prosperous years to tide over the poor years. Mr. Thorne asked if the roads would be satisfied with increases in the rates involved in this hearing. "If it develops that the increase is not enough we ought to have further increases," said Mr. Schaff.

Luther M. Walter, attorney for Morris & Co., asked Mr. Schaff what directions he had given to his traffic department in regard to the increasing of rates. "I told them to secure an increase of rates wherever it was possible to do so," said Mr. Schaff, but he said that he had nothing to do with the selection of the commodities or the amount of the advance.

TESTIMONY OF S. M. FELTON

Mr. Felton said the western roads need an advance in revenue in order to be able to give proper service to the public and a fair return to investors and that the present net revenues have averaged during the last seven years only 7 per cent on less than $29,219 per mile. "It does not take a physical valuation to convince even a layman that this sum is far below not only the cost of reproducing the lines but below their value," he said. He believed that 7 per cent on the investment was only a reasonable return, because without any guarantee by the government, the returns should be considered on the basis that railroads are private companies. With the increased cost of operation and the increased cost of money, western roads have not been able to sell their stock or bonds at anything like the rates prevailing in former years, while the rates for their service have generally shown a decline. The trouble is not with gross earnings but with net, he said, and he believed the carriers have about exhausted the possibilities of economies in operation, at least such as could be effected without a very large investment.

"A good illustration of the expense of conducting our passenger business," said Mr. Felton, "is seen in the cost of the new terminal at Kansas City. There was a strong demand there for a new passenger station and one was needed. One could have been built on the old location for possibly two or three million dollars, but that would not have provided facilities far enough in the future and a better location must be had. The first estimates ran to about $15,000,000, but with the construction of the station came additional requirements for viaducts, subways, etc., and soon the estimate was $25,000,000. The final cost, I believe, will be close to $50,000,000. So far the interest, taxes and operating expenses will run from $1 to $2 per passenger handled in and out of the station for some of the smaller roads. The passenger business cannot stand these burdens without relief.

"What I have particularly tried to convey to the commission is the fact that general conditions in this territory are such that we must have not only the additional revenues which are provided by these advances but in some way still greater revenue must be received. Just what other commodities may be advanced I am not ready now to say and would not care to express an opinion. I know that for the roads which operate in the section of country where I am directly interested and that depend upon the rates in that territory for their earnings, there is an absolute necessity for more revenue, both from passenger and freight."

Mr. Felton said that it had been carefully estimated that the rates involved in this case would increase the revenues of the Great Western by about $325,000 a year. As an example of the difficulty of financing railroads at present, he said the bonds of the Kansas City Terminal Railway were guaranteed, both

principal and interest, by 12 roads, and at the last effort to issue bonds they could not be sold, but an offer was secured for one-year notes on a 7½ per cent basis. While the roads were considering this offer the rate was changed to 8 per cent last fall, and the money was finally raised by getting the roads interested in the terminal to advance it. Under the Illinois law, he said, the Great Western must get the permission of the Illinois Public Utilities Commission to issue bonds for improvements in Iowa and the commission fixes the price. He wanted to get some bonds into the treasury for future purposes and the company's 4 per cent bonds were selling at about 69. The commission consented to the roads taking them down from the trustee but fixed a minimum price of 73. The market is now at about 70 for these bonds, although the road is bonded for less than $25,000 a mile. The Great Western, he said, in five years has earned 7 per cent only on $23,050 per mile. In the best year of this period it earned 7 per cent on $29,096 and in the worst year on $18,352 per mile, and during that time over $17.-000,000 has been expended on the property in cash. The new company since the reorganization has never paid a dividend and the stock and debenture holders of the old company, from whom the road was bought and who were required to put in $10,000,000, have never been given a cent of return.

Mr. Thorne cross-examined Mr. Felton in the effort to show that the credit of railroads was no worse than that of industrial concerns and public utility companies. Mr. Felton insisted that good securities of such companies could be placed on a much more favorable basis than those of the average railroad. Mr. Walter asked about meetings of the executive officers of the roads to discuss the rate advances and whether there had been any divergence of opinion as to the amount. Mr. Felton insisted that there had been no special meeting of the presidents on the matter; that the conferences were held by the traffic officers; he said he had talked the matter over with other executives since 1910 whenever he happened to meet them. Mr. Walter said that he had information which he wished to verify, that the railroads were not agreed as to the amount of the advance to be asked and decided to file maximum advances in order to "pass the buck to the commissioners." Mr. Felton said he knew of nothing of the kind, but that he personally thought that the advances were not enough, although some others did not agree with him.

TESTIMONY OF FESTUS J. WADE

Mr. Wade took the stand on Friday and said that no classes of securities have depreciated so much or are harder to sell than are railroad securities in the United States today. For the last two years bankers and investors have been obliged to turn elsewhere on account of the uncertainty and unreliability of the securities either as an investment or to buy for sale again to others. The present business depression, he said, was caused more by the "constant tirade" against the railways of the country, than anything else. Years ago, he said, it was common for bankers to put their subsidiary reserves in railroad securities.

Mr. Wade said that the commission had three distinct things to consider: First, that safety of life and limb and property shall be conserved; second, that labor shall be properly protected and paid, and third and equally important, that the financial interests and money invested in railways shall receive the same care and consideration as the others. Any attempt to decrease the value of money invested not only injures the railroads, the employees and the traveling public, but injures the republic as a whole.

It is practically impossible to finance a new railroad, he said. The decrease in market value of railroad securities from 1906 to 1914 was 20 per cent, equal to $3,000,000,000 or 75 per cent of the combined capital of all the banks and trust companies, state and national, in the United States. Mr. Wade presented a map of the West, showing in red the lines which already are in receivership, saying that from his own knowledge there would be more railways showing red lines in 1915 unless an increase in rates is secured. He said he knew personally that the Rock Island, Missouri Pacific, Missouri, Kansas & Texas and Missouri & North Arkansas, barely escaped receivership last year, even before the war, and he gave his experiences in the matter of financing a number of southwestern roads and the narrow margins by which several of them escaped bankruptcy by the decision of bankers to take the risk to tide them over. The holders of Wabash receivers' certificates, he said, were ordered by the court to renew them, and as the bankers saw no way to avoid it they did renew them at 7 per cent. The Frisco receivership certificates were renewed under practically the same conditions.

"We have bought railroad securities that ever since railroads were built were regarded as gilt-edged, and find that the public won't take them," he said. "When we buy securities for a year and find that we have to renew them at the order of a court we won't buy any more. They are not only shelf goods, but when the bank examiner comes around we have to mark off the depreciation, charging it to profit and loss."

Asked by Mr. Wright as to the comparative rates paid for money by railroads and other concerns, he said that never in the history of the nation has there been so much idle money as there is today. Large industries whose credit is good are being besieged to borrow for six to eight months at 4 per cent. In three months the federal reserve banks have not been able to lend enough money to pay their operating expenses, but with the exception of a few strong roads, railroad short-term paper cannot be marketed at anything like this rate. The market for railroad securities is "almost nil," he said, as far as the small investor is concerned, because he is scared. Banks have lost in nine years more than $125,000,000 by depreciation in railroad securities, and life and fire insurance companies have charged off more than $100,000,000 for this reason. For the same class of securities, he said, railroads have to pay from 50 to 75 per cent higher rates for money. When Mr. Wade referred to the activity of commissions as responsible for the poor credit of railways, Commissioner Daniels interrupted him sharply:

"Do you know that the commissions are responsible?" he asked. "Very largely so," replied the witness. "Then qualify your answer," said Mr. Daniels. Mr. Wade then excepted the Interstate Commerce Commission, and said that he believed railway regulation should be in the hands of one commission instead of the many state commissions.

Everett Jennings, counsel for the Illinois Public Utilities Commission, asked if the "avarice of stock and bondholders and manipulators in capitalizing blue sky and water" was not more responsible than the commissions for the conditions of the railways.

"It is just such wild statements as you have made just now that have hurt the credit of the roads," retorted Mr. Wade.

Some of the state commissioners tried to get Mr. Wade to say that the commissions have also done something to help the roads, and that the acts of railroad men were more responsible for their poor credit than those of the commissions. "It has never come to my attention that a legislature or state commission in this western country has ever voluntarily done anything to help the credit of a railroad," he said, "but they have often done things to impair it. I have seen no mismanagement in the Missouri, Kansas & Texas or the Missouri Pacific, yet I have seen their securities drop 5, 10, 15 and even 25 per cent." Asked if it was more profitable for a banker to do business with a weak railroad than with a strong road, he said the condition was just the reverse, that he had done business with some of these roads because they did business with him and because they were trying to develop the territory he was doing business in.

"Will it help the return of prosperity to tax shippers for the benefit of the railroads?" asked Mr. Walter. "Unquestionably," replied the witness. "As soon as railroads are accorded as fair treatment as banks and other business we will get prosperity and not before."

When some of the lawyers tried to show that the disclosures of mismanagement on some roads had been responsible for the

poor credit of railroads, Mr. Wade said that the disclosures of bad management on the part of roads that had been badly managed were a good thing, but that exaggerated and sensational statements given to newspapers had done harm.

Clifford Thorne led the witness into a long discussion of railroad credit, bankers' commissions, etc., and tried to show that some of the strong roads enjoyed better credit than industrials or utilities. Mr. Thorne referred to a list of seven roads. "You have picked out a galaxy of the strongest roads in the West," said Mr. Wade, "7 out of 41. There are other securities selling as favorably as those of the Burlington and the Atchison, but, like the Burlington and the Atchison, there are mighty few of them." Mr. Thorne several times insisted on "yes" or "no" answers. "But I don't wish to mislead you and the commission," said Mr. Wade. "You would have to understand the railroad bond business better to get it clear, and I see you don't." "How do you know I don't understand it?" said Mr. Thorne. "I can see by the way you talk," replied the witness. Mr. Wade said that isolated sales of securities, such as Mr. Thorne quoted from a newspaper, are no criterion of a railroad's credit, and that it is impossible to tell from advertisements of bond sales what the railroads get. Bankers' commissions, he said, depend on a number of conditions. "You can't sell a bond just by having it," he said. "You have to have men employed to sell it, and what you have to pay depends on a large number of conditions in each case."

TESTIMONY OF B. F. BUSH.

Mr. Bush testified in part as follows:

"A most grave situation confronts this country in its transportation affairs. The problem has ceased to be one, with many of the roads, as to how returns can be realized for the shareholders, as this has largely passed beyond redemption. It is one rather as to how the integrity of the security can be maintained, as to how the interest on the mortgage bonds can be met. We believe the bad economic conditions which have prevailed for the past 18 months with the attendant depression of general business, have been due more to the railroads not earning adequate revenues than to any other cause. Nine industries in St. Louis dependent on railroads have been obliged to curtail their forces some 10,000 men, and their payrolls on that account are $588,000 less per month than in times of normal business. The loss in wages of the employees of these nine St. Louis district industries would aggregate over $7,000,000 a year.

"The time has come when it is most vital not only to the carriers' interests but to the industrial and commercial welfare of the country that the desired advances should be allowed. I fail to see why the investor in railroads, which are all-important to every trade and industry, should not be allowed a return commensurate with that of the investor in other enterprises. Seven per cent should not be deemed an excessive amount for roads to earn on their value. Very few of them can now get money at less than that figure. The last census shows that the capital of manufacturers increased in 10 years over $9,000,000,000 and, notwithstanding this large increase, 105 per cent, the return to the owners was over 12 per cent.

"In the Southwest there was an aggregate for the past seven years of nearly $3,000,000,000 of railroad securities that received no return. The necessity of immediate help to these carriers is further emphasized by their depleted earnings for the first six months of this fiscal year.

"Tonnage and passengers carried and the revenue therefrom show substantial increase, but the gains are more than offset by the increased expenses which are largely beyond the power of the management to control. Federal, state and municipal enactments during the last 10 years have greatly increased railway expenses. The higher standards of service demanded by the public have necessitated a greater outlay of funds. Organized labor has made repeated demands for higher wages, sanctioned by arbitration boards.

"In the meantime the unit of compensation received for service has been lowered considerably, further increasing the railroads' burdens, so that were it not for the marked progress in greater efficiency of operating methods the railroads would have long since met with bankrupt disaster.

"When one considers the great forward steps in increasing the number of tons and passengers per train, one would think the railroads were progressing towards more and more prosperous conditions. But the facts are that the uncontrollable increase in expenses and taxes and the gradual reduction of rates have more than absorbed the gains derived from greater efficiency.

"Twenty-six of the carriers in this proceeding have over $100,000,000 securities maturing this year, and 24 have over $55,000,000 which mature next year. In the next seven years over $422,000,000 of obligations will have to be refinanced by 34 of the companies now before you. The most serious consequences are threatened to the railroad world by these maturing obligations unless something happens to change the present unfavorable conditions with which they are confronted."

Mr. Bush said that when the roads tried to sell bonds for the Memphis bridge across the Mississippi river, which were guaranteed by the Chicago, Rock Island & Pacific, St. Louis, Iron Mountain & Southern and St. Louis Southwestern, they couldn't get a bid for 6 per cent bonds and were finally compelled to sell short-term notes. Speaking of the increased cost of maintenance, he said that whenever these western roads spend less than $1,200 a mile for maintenance of way and structures they are borrowing from the future, and until the old equipment which prevails on a number of western roads is used up they can't show much saving in maintenance of equipment and must probably look for an increase.

TESTIMONY OF J. W. LUSK

Mr. Lusk testified on Saturday. He said he had been a lawyer and a banker all his life and had no interest in any of these railroads, but had become one of the receivers of the St. Louis & San Francisco at the request of Judge Sanborn after he had retired from active business. He found the Frisco with "no money to speak of" and $2,500,000 of preferred claims. The court had authorized the issuance of $3,000,000 receivers' certificates to meet these claims and to pay equipment notes, and they were placed at 6 per cent and 1 per cent commission. The court declined to authorize certificates, however, to meet interest payments on $143,767,266 of bonds and notes, and they were defaulted for lack of earnings and because there was no prospect of getting money out of operation to pay with. Up to date he had been able to pay out of earnings after operating expenses and taxes only the interest on the balance of $92,557,500 of bonds, out of a total of $236,000,000. The total represents only the bonds of the Frisco proper, he said, concerning which no question had ever been raised. The interest paid on $92,557,500 of underlying securities amounts to $4,307,045, and the interest not paid amounts to $6,560,000. "All we can pay on with our earnings after operating expenses and taxes," he said, "represents a little less than one-half of what the railroad is assessed for and is equal to only 1.7 per cent on $50,000 a mile, the lowest estimate of the value of the Frisco, which is a well located road in a fine territory.

The receivers' certificates were renewed, after a year with great difficulty, he said, on the promise that no more would be issued. The receivers had tried to spend enough on maintenance to keep the road safe, but they had not been able to make improvements. The equipment notes had been paid because they would lose the equipment otherwise.

On cross-examination by Mr. Thorne, Mr. Lusk said he had no knowledge of the financial operations before the receivership, whereupon Mr. Thorne asked that the record in the Interstate Commerce Commission's investigation of the road be made a part of the record in this case. Commissioner Daniels deferred ruling on this request.

Mr. Daniels asked if it would be possible to compile statistics fairly reflecting the comparative credit of railroads and industrial concerns or public utilities. "You can pick out good and bad ones on both sides," replied the witness. "You might be able

to get a fairly accurate comparison of averages, but every one knows the railroads are under the weather today. Everyone knows that, no matter how you say it came about or for what reason, it is a fact. The railroads, to use a slang expression, are 'in the soup.' You can lay it to the European war or anything else, but the railroads are down. And yet the country is full of good crops and high prices. It is a remarkable state of affairs."

Mr. Thorne asked if his opinion was based on investigation or was only an impression. "Of course anybody can see that a two-cent fare isn't right in the southwest," said Mr. Lusk. "Then you disagee with the Minnesota railroad commission and the Supreme Court?" "The Supreme Court never said two cents was enough," replied Mr. Lusk. "It said the railroads hadn't proved it was too low."

"Railroad regulation and control has come to stay. The man who don't know that is pretty blind. But that power ought to be handled with care not to strangle the railroads," he said, turning toward the table where sat the state commissioners. "I have known bankers who have gone wrong and they have been sent to jail. There have been colonies of them in the penitentiaries, but the banks were not attacked. I haven't heard of any railroad looters going to jail. You are not hurting them. You are hurting the railroads, and innocent stock and bondholders and employees and the business men who sell supplies to railroads.

"We have turned off 1,456 employees since July because we couldn't afford to keep them. That's why I think there hasn't been enough care on the part of the state commissions in cutting down rates. You ought to allow them enough to pay their honest debts."

"Does not the constant reiteration by railroad presidents that the roads are in bad shape tend to hurt their credit?" asked Attorney Walter.

"Well, now, I think that's where the railroad presidents have made a bad mistake," said Mr. Lusk. "I agree with you," interrupted Mr. Walter. "They haven't half told how bad it was," continued the witness. "They are always nervous about hurting their securities, and many of them are afraid to speak out."

STATISTICAL EXHIBITS

On Saturday the introduction of testimony was begun by Julius H. Parmalee, statistician of the Bureau of Railway Economics, who presented 16 exhibits compiled from the reports to the Interstate Commerce Commission, giving figures for all of the roads in the western district. He was followed by L. E. Wettling, accountant for the roads, who presented 80 exhibits, also based mainly on reports to the Interstate Commerce Commission, showing operations of the 41 railroad systems, operating 98,446 miles in Western Trunk Line and Southwestern territory, involved in this case, for the years from 1901 to 1914 inclusive, comparing the period 1901 to 1907 with that from 1908 to 1914. Figures were given for the combined operations of the 41 systems, representing 61 roads that report to the commission, and for the separate groups as outlined by Mr. Wright. Mr. Wettling said that the periods and groupings had been selected before any compilations were made and that all of the basic figures were given for each road so that they could be grouped in any manner desired or for any period. Some of the principal comparative figures were outlined in Mr. Schaff's testimony.

An interesting summary of the comparative results in the two periods was given in two exhibits, reproduced herewith, showing that net operating income per mile operated of the 41 systems was $153.14 less for the seven years 1908-1914 than for the preceding seven-year period and for each dollar of road and equipment cost the net operating income had decreased .77 cent, or 15.52 per cent, while the total operating revenues per dollar increased 7.29 per cent. For Group 1, including 10 of the leading systems in Western Trunk Line territory, net operating income decreased $105.70 per mile for the second period as compared with the first, and per dollar of road and equipment cost decreased .95 cent, or 16.35 per cent. For Group 2, including the six roads operating over 1,000 miles exclusively in Western Trunk Line territory, the decrease in net operating income per mile was $421.27 and for each dollar of road and equipment cost was 1.08 cents, or 27.14 per cent. For Group 3, including 10 of the leading systems in Southwestern territory, the decrease per mile was $94.19 and per dollar of road and equipment cost was .46 cent, or 9.87 per cent, while for Group 4, including the seven roads operating over 1,000 miles exclusively in that territory, the decrease per mile was $240.27 and per dollar of road and equipment cost was .56 cent, or 14.32 per cent.

From 1901 to 1914, the exhibits showed, the net cost of road and equipment for the 41 systems increased 68.99 per cent, while operating revenues increased from $449,665,388 to $912,300,041, or 102.88 per cent, the ratio of operating revenues to cost of road and equipment from 14.96 per cent to 17.96 per cent, operating expenses from $306,383,445 to $710,013,578, or 134.68 per cent, the operating ratio from 68.14 to 78.81 per cent, while net operating income from $143,281,943 to $193,286,463, or 34.9 per cent.

The ton-miles per mile of road for the first period averaged 613,059 per year, an increase of 10.31 per cent over 1901, while for the second period the average was 709,889, an increase of 27.74 per cent over 1901. Passenger miles per mile of road for the first period averaged 78,076, an increase of 20.30 per cent over 1901, and for the second period the average was 103,959, an increase of 60.18 per cent over 1901. The average freight rate per ton-mile declined from 8.64 mills in 1901 to 8.27 in 1914. For the first period it averaged 8.55 and for the second period 8.46. The average revenue per passenger mile decreased from 2.16 cents in 1901 and an average of 2.12 for the first period, to 2.05 in 1914 and 2.03 for the second period, an average of 2.06 for the 14 years. The average tons per train mile for the first period was 266.78 and for the second 316.54, while the average tons per car mile increased from 10.84 to 11.51. The average number of passengers per train mile increased from 42.37 to 51.37 and per car mile from 8.44 to 9.69. From 1901 to 1914 the average freight train load increased from 229 to 364 tons.

Exhibits 15, 16 and 17, devoted to increased labor costs, showed a steady increase in the average daily compensation, including general officers, from $1.99 in 1900 to $2.51 in 1914, which was an increase of 26.1 per cent, the average for the first period being $2.11 and for the second $2.39. Excluding general officers, the increase was from $1.95 in 1900 to $2.48 in 1914, or 27.2 per cent, the average for the first period being $2.07 and for the second $2.36. The average for the period 1908 to 1914 was 13.3 per cent greater than for the preceding period including officers, and 14 per cent greater excluding them. Between 1900 and 1914, on the basis of the 1900 scale of wages, these carriers paid out, exclusive of general officers' salaries, $526,355,000 more for labor than they would have paid had the 1900 scale of wages been maintained. For 1914 alone this increase amounted to $85,167,085.

Of each dollar of revenue 38.25 cents was paid for labor in 1901 and 44.28 in 1914, while taxes consumed 3.20 cents out of each dollar in 1901 and 4.60 in 1914. For both labor and taxes the increase from 1901 to 1914 was 18.16 per cent. One table showed that if taxes had been paid in 1914 at the 1901 rate the roads would have saved in that year $17,628,142, or $179 per mile, and if labor had been paid at the 1900 rate they would have saved $865.11 per mile. The combined increase in labor and taxes on this basis was $102,695,000, or $1,044 per mile, 2.02 per cent of the net cost of road and equipment in 1914.

Another exhibit showed that while the cost of road and equipment per dollar of revenue decreased from $5.93 to $5.53 in the two periods and the capital stock per dollar of revenue decreased from $2.71 to $2.34, the interest paid per dollar of revenue increased from 14.69 cents to 15.01 cents, the balance available for dividends and surplus decreased from 14.76 cents to 8.19 cents and the percentage of dividends and surplus combined to stock decrease from 5.45 per cent to 3.50 per cent; and was 2.73 per cent in 1914. The percentage of total maintenance expenses to operating revenue increased from 26.69 to 29.24 in the two periods, and the percentage to cost of road and equipment increased from

4.50 to 5.29, while the average per track mile increased from $1,521 to $1,886. The increase for maintenance of way and structures was from $807.36 to $898.77 and for maintenance of equipment from $714 to $987 per mile operated.

The net cost of road and equipment per mile of line operated increased in the two periods from $44,304 to $48,775 and for 1914 was $51,584.

Exhibit 27 showed the expenditures for additions and betterments for seven years by 41 systems, classified by roads and by Interstate Commerce Commission accounts, making a total of $433,507,867 for road and general expense and $306,181,596 for equipment, $739,689,463 in all.

The total capitalization of the 41 roads in 1914 was $5,366,390,231. This compares with $5,078,293,153 for the net cost of road and equipment. The increase of capitalization over 1901 was $2,250,570,854. Of the total, 62.26 per cent was funded and other debt and 37.74 per cent stock in 1914 as compared with 53.67 and 46.33 per cent in 1901.

Exhibit 29 showed the requirements in the next seven years for refunding or financing maturing obligations now outstanding for 34 operating systems, a total of $422,822,251, of which $100,748,897 represents maturities in 1915.

DIVISION OF OPERATING EXPENSES

Exhibits 30a and 30b gave a division of operating expenses as between freight and passenger service for the 41 roads for the year 1914, compiled on six different bases, showing the percentage of net operating income in each class of service to the cost of road and equipment, dividing the operating income and the cost of road and equipment on the basis of the division of expenses. While the total percentage of return was 3.81, the percentage of operating expenses assigned to freight according to the different bases ranged from 67.06 to 68.70, while that assigned to passenger service ranged from 31.20 to 32.94. Of the operating revenues 70.33 per cent was from freight service and 29.67 from passenger service. The ratio of expense to revenue, which was 78.81 for the total, ranged from 75.14 to 76.98 for freight and from 83.17 to 87.52 for passenger service.

Statistics similar to those given in the exhibits for the 41 roads were also given for the four groups previously mentioned.

STATISTICS FOR ALL WESTERN ROADS

The exhibits compiled by the Bureau of Railway Economics and presented by Mr. Parmalee covered the operations of roads operating 130,889 miles in 1914. Exhibit 1 showed that comparing 1914 with 1908 the mileage had increased 11.88 per cent and operating revenues 12.48 per cent per mile, operating expenses had increased 14.41 per cent, net operating revenue 8.43 per cent, taxes increased 58.69 per cent, and operating income only 1.54 per cent. Interest on funded debt increased 19.63 per cent, net income decreased 28.66 per cent, and dividends declared out of income decreased 72.48 per cent on preferred stock and 25.23 on common stock. Appropriations out of income for additions and betterments increased 38.95 per cent, dividends declared out of surplus increased 22.9 per cent and the surplus for the year decreased 5.57 per cent. The ratio of operating income to net property investment in the seven years 1908 to 1914 was 4.88, 5.33, 5.22, 4.86, 4.35, 5.02 and 4.39.

Mr. Wettling was cross-examined on his exhibits by Mr. Thorne, Mr. Walter, Mr. Helm and Mr. Lamb. Mr. Thorne demanded that Mr. Wettling furnish the working sheets from which the exhibits were compiled in order that he might get certain information as to cost of road and equipment and capitalization, which he said the witness had not included for some of the roads in the group statistics. Mr. Wright at once offered to allow Mr. Thorne's assistants to copy any or all of the sheets desired. Mr. Thorne also asked for a compilation of additions and betterments charged to operating expenses, saying he thought that would result in one of the most important parts of the investigation.

E. B. Boyd, chairman of the Western Trunk Line Committee, took the stand on Tuesday and testified regarding the advances in the rates on grain and grain products.

VALUATION CIRCULARS

Secretary Thomas W. Hulme, of the Presidents' Conference Committee for the Federal Valuation of Railways, has issued two circulars dated March 1, one being a general statement of the development in the valuation work during January and February, and the other a communication with reference to the commission's order No. 7 relative to land appraisal.

In the general statement the attention of the railroads is called to the fact that the commission has adopted sample forms for reporting extensions and additions and betterments, for use in reporting improvements made after the federal forces have started their valuations. The valuation department does not, however, desire the roads to fill out such reports until their properties are under valuation.

The commission now has under consideration the issuance of orders requiring the carriers to report.

(a) Certain classes of leases;

(b) A vast amount of detail information as to prices of labor and material;

(c) Information in connection with land grants, aids, gifts, donations and concessions as required by the fifth section of the valuation act;

(d) A schedule of industrial side tracks;

(e) Inventory of records, such as minute books, treasurer's books, account books, etc.;

(f) Preparation of inventories by the carriers when so directed by the director of valuation.*

The attention of the carriers is also called to the fact that valuation order No. 9, referring to a special rate for the transportation of the cars used to house and maintain the government engineers, applies only to the movement of those cars on the lines of a carrier under valuation and then only for short distances while actually engaged in making the surveys.

To facilitate the progress of the bridge, telegraph and telephone and other federal parties, the carriers are urged to furnish motor car service where the safety of operation will permit, for which the government is willing to pay a reasonable compensation. This is already being done on a number of roads now under valuation.

The following roads have advised that they have received notice that their properties will be valued as of the dates indicated:

Ann Arbor	June 30, 1915
Atchison, Topeka & Santa Fe (Grand Canyon Line in Arizona)	during winter of 1914-15
Cincinnati, Hamilton & Dayton	date not fixed
Georgia, Southern & Florida	June 30, 1915
Maine Central	June 30, 1916
Nashville, Chattanooga & St. Louis	July 1, 1916
New York, New Haven & Hartford	June 30, 1915
Pennsylvania Railroad—	
Lines South of Philadelphia	June 30, 1915
Lines in state of New Jersey	June 30, 1916
Northern Central Ry. and subsidiaries	June 30, 1916
St. Louis Southwestern	June 30, 1915
Savannah & Northwestern	June 30, 1915
Southern	June 30, 1916

A conference will be held on March 22, between the representatives of the division of valuation, the state commissioners and the railroad companies for the consideration of a number of fundamental questions which it is now necessary to settle, as the preliminary reports are practically ready for submission to the commission on the valuation of the Atlanta, Birmingham & Atlantic; the Norfolk Southern, the Texas Midland, the New Orleans, Texas & New Mexico, and portions if not all of the lines of the San Pedro, Los Angeles & Salt Lake. Among the important questions which will be considered are the following: The form and manner in which the reports shall be presented to the commission and to Congress and the detail to be included; to what extent in determining "cost of reproduction new" reference shall be had to conditions as they existed at the time of the original construction with reference to clearing and grubbing, improvements on the property, the existence of present transportation facilities, etc.; what overhead charges shall be allowed and in what amount; the allowance to be made for appreciation; how depreciation is to be determined; how unit prices

*See Order No. 13 reprinted in our news columns.

shall be determined; how "the present value" of land used for transportation purposes is to be determined; whether or not, when the original cost cannot be shown from the books of the railroad, an estimate shall be made; whether the commission shall distribute the value of equipment between several states, and if so upon what basis; whether the value of an important terminal like the Pennsylvania station in New York shall be distributed, and if so upon what basis; what "other value and elements of value" shall be allowed for, and whether allowance shall be made for "going values," franchises, favorable locations, earning capacity, etc.

The second circular discusses the purposes of valuation order No. 7, requiring the scheduling of the lands of the different railroads and the director's instructions to the supervisor of land appraisals. It calls attention to the distinctions between land in use, land held for future use and land not held for future use, with a discussion of the manner in which each class should be handled for the purposes of valuation.

ANTI-FULL-CREW LAW CAMPAIGN

R. L. O'Donnel, chairman of the Executive Committee of the Associated Railroads of Pennsylvania and New Jersey, says that the farmers in the southern corners of Chester and Lancaster counties, Pennsylvania, are up in arms against the excess man crew law. They see the absurdity of the workings of this law. About six months ago some forty of the richer farmers of this section bought the Lancaster, Oxford & Southern Railway for $40,000. This is a little railroad with 28 miles of line. It provides the only transportation service through a country with about 2,500 population. There is not much traffic on the road; only two or three trains a day, each of which carries one passenger coach and two to five cars of freight. Under the law each train, even if made up of only two cars, must have a crew of five men; an unwarranted expense for so poor a road.

Mr. O'Donnel calls attention to the fact that the $2,000,000 a year now paid in wages to superfluous brakemen by the railroads of Pennsylvania and New Jersey, if used in purchase of 80 locomotives, would give employment for a year to 1,745 men. Of these, 894 would be in the locomotive shops. The other 851 would get employment in steel mills, at iron furnaces and brass foundries, in mining coal and manufacturing coke, in mining iron and in other lines of activity.

Should the $2,000,000 be expended in purchase of 2,000 freight cars, employment for a year would be furnished to 1,489 men; or to purchase 200 steel passenger cars, a year's work for 1,708 men.

Possibly the strongest argument that is being put forth by the railroads is that if they undermanned their trains they would be the heaviest sufferers. A freight train of one locomotive at $25,000 and 75 cars at $1,000 each would represent $100,000 in rolling stock. Is it reasonable to assume that a railroad would jeopardize the safety of that great capital investment to save $2.75, the wage of an extra brakeman?

Mr. O'Donnel calls attention to the fact that in the passenger service as many as twenty men, including the dining car crews, are on some trains. These dining car men could be requisitioned into outside service in emergency. On the Pennsylvania Railroad's "St. Louis Express," comprising eight cars, there are six railroad trainmen and a Pullman crew of six, making twelve. The "Lackawanna Limited" of eight cars carries six railroad trainmen and five Pullman men. The "Royal Limited," operated by the Baltimore & Ohio and the Reading with six cars, is crewed with six railroad and four Pullman men.

The railroad contention is that four men outside of the engine are not required to safely and efficiently operate such trains as the following: The Reading coal train running through without stops, except for water, from Bridgeport to Port Reading, on New York harbor; the Pennsylvania Railroad fast freight running on schedule from Harrisburg to Philadelphia, and the New Jersey Central fast freight from Jersey City to Allentown. These trains average about thirty-five cars. The point is made that the work to be done in connection with the operation of these trains is virtually nothing during their runs. These trains run entirely under control of block signals and interlocked switches.

Public sentiment as expressed by the newspapers overwhelmingly favors repeal of the "excess man crew" laws. Editorials to the number of 199 have so far come to the attention of the committee. They group the newspapers on the proposition as follows:

For repeal	162
Against repeal	10
Neutral	27

From Harrisburg it is reported that members of the legislature have received literally thousands of letters, aside from petitions signed by great numbers of people, urging them to take quick action for repeal of this law.

The Westinghouse Air Brake Company has made a statement in reply to assertions of trainmen's representatives at Harrisburg that the excess man on freight trains is necessary because long trains cannot be successfully and safely handled by air brakes, calling attention to the fact that traffic is handled successfully every day in all parts of this country in train units of 100 cars and more. Some senators and representatives, seeking to be intelligently informed, have had the workings of air brakes demonstrated to them.

Figures have been prepared which show what it costs to carry an unnecessary man on a train. For example, the excess man on the Broadway Limited, the fastest train over the Pennsylvania between New York and Chicago, makes an added operating cost of $2.566 a year for that part of its run between New York and Pittsburgh. That amount is the wages at $7.03 for each trip. At no time does this high speed, virtually no-stop train, have less than nine men on it, not counting the engineer and fireman. Between New York and Pittsburgh it makes only three stops. Very rarely does any member of the train crew have to leave one of these through trains except at the regular stops, and there, with assistance of the Pullman men, only to see passengers get on and off in comfort. Since the laws became effective in Pennsylvania a total of $4,842,801 has been paid for the superfluous men, and in New Jersey, where the law became effective May 1, 1913, $642,676 has been paid, making a total in the two states of $5,485,477.

In Pennsylvania resolutions for repeal have been adopted by the Philadelphia Bourse, the Pittsburgh Chamber of Commerce, the Commercial Club of that city, which has a membership of 1,100; the Philadelphia Milk Exchange and by farmers' organizations of Union county and other parts of the state. A referendum vote on the proposition being taken by the Williamsport Board of Trade has so far resulted 155 to 6 in favor of repeal.

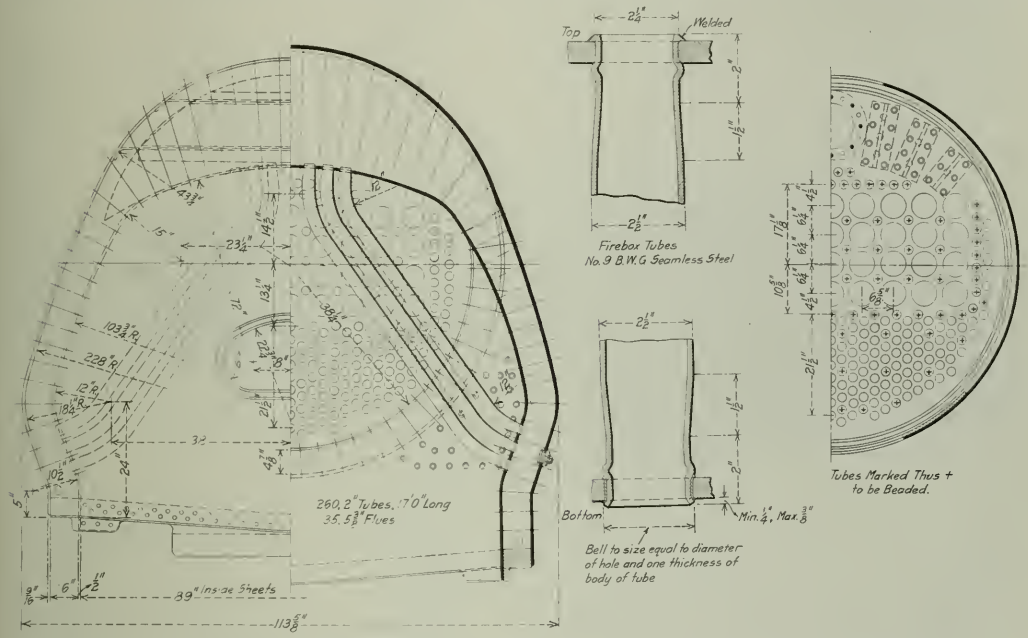
In New Jersey emphatic action has been taken for repeal by resolutions passed by boards of trade and chambers of commerce in such chief cities as Newark, Paterson, Passaic, Jersey City and Trenton; and the committee announces that, with the active support of chambers of commerce, the railroads have caused to be introduced at Trenton a bill to repeal the New Jersey law. This bill contains a proviso giving the State Public Utilities commissioners full power to determine the number of trainmen or other men to be hired to operate passenger trains composed of more than three cars and freight trains composed of more than six cars.

The presidents of the ten principal railroads in the state of New York have presented to the legislature a protest against the full crew law of the state, and asking the legislators to support Senator Conkling's bill, now under discussion, to repeal the present statute. The railroads declare that the burden imposed on them by the full crew law in New York has amounted to $1,170,000 a year.

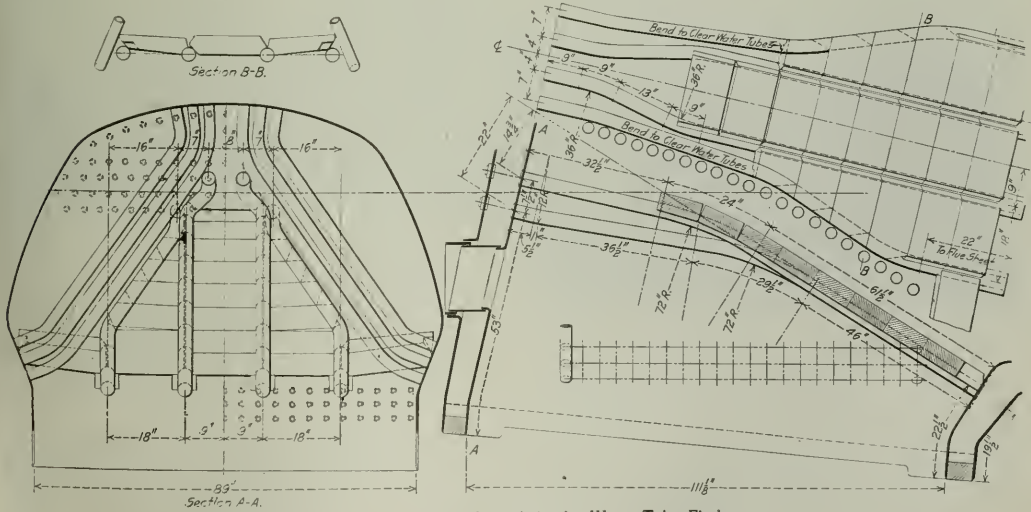
LACKAWANNA LOCOMOTIVE WITH WATER TUBE FIREBOX

In December last the Delaware, Lackawanna & Western received from the Lima Locomotive Corporation a Pacific type locomotive similar to those described on page 657 of the *Railway Age Gazette* for October 9, 1914, but equipped with a special type of firebox, patented by S. S. Riegel, mechanical engineer of the Lackawanna.

Reference to the drawings will show the construction in detail. As will be seen there are two nests of water tubes with 66 2½ in. outside diameter tubes in each. The cross section of the firebox shows the shape to which the side sheet is bent in order to permit a satisfactory connection between it and the lower ends of these water tubes, the bottom row of which is about 15 in. above the mud ring at the front end. The tubes are spaced at 4 in. centers and swing upward across the firebox space to the crown sheet, in which the ends are inserted. Plugs for cleaning purposes are placed opposite the ends of the tubes in the outer shell sheets, both top and bottom. The method of securing a tight



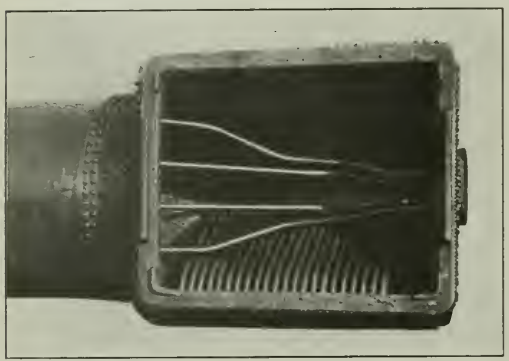
Cross Section Showing the Arrangement of the Tubes in the Firebox; in This Engine the Tubes Are Not Welded as Indicated



Arrangement of the Brick Arch in the Water Tube Firebox

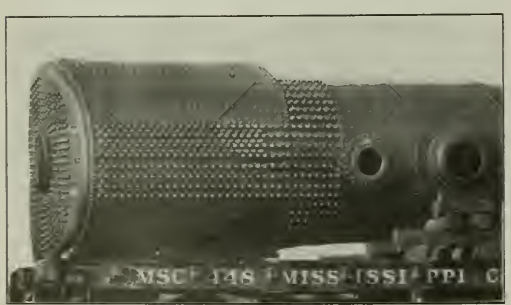
joint in the two sheets is shown in the drawing of the boiler cross sections, but in this instance the water tubes are not welded in as shown on the drawing. Instead they are prossered, belled and beaded and set without ferrules in the top sheet, while the bottom ends are set with a ferrule, prossered, expanded and belled. These tubes are made of seamless soft steel, tested to 2,000 lb. per sq. in. hydraulic pressure before application.

These water tubes give a heating surface of 471 sq. ft., the total heating surface of the boiler being 494 sq. ft. greater than that of other locomotives of the same class. The total heating surface for the engine with the experimental boiler is 3,960 sq. ft., while that of the sister locomotives is 3,466 sq. ft.; this does not include the superheater surface of 740 sq. ft. In the experimental engine the heating surface of the firebox and combustion chamber is 288 sq. ft., while that of the engines of the same class is 267 sq. ft.; the tube heating surface for the experimental engine is 3,177 sq. ft., the same as that of the sister engines. A special application of the Security brick arch was made to the water tube firebox.

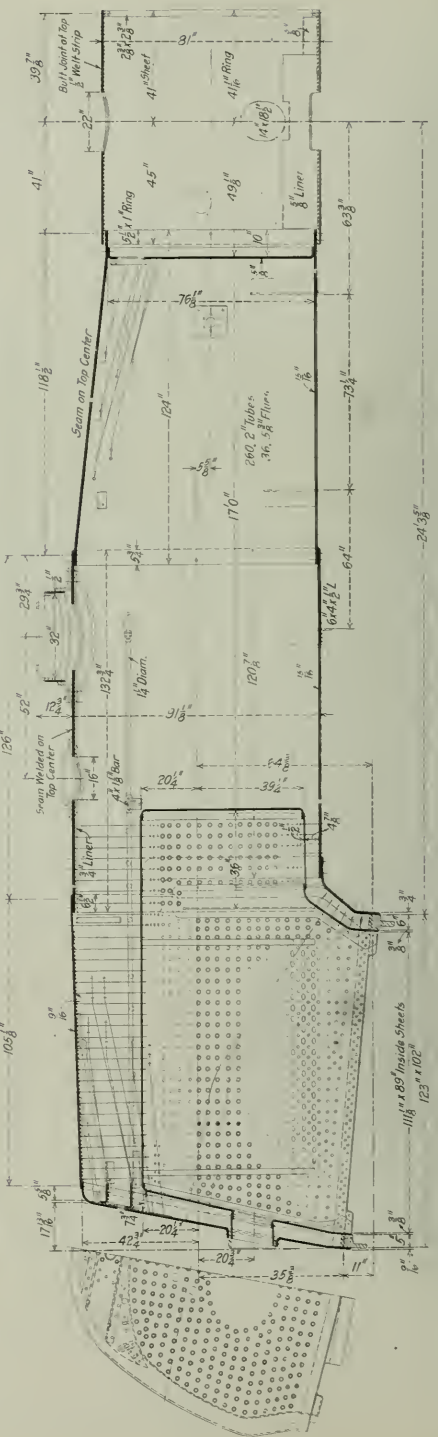


Interior of the Firebox Showing the Water Tubes and Arch Tubes

The object of the water tube construction was to obtain an improved circulation by providing definite cycles of circulation through these tubes in the zones of greatest heat intensity as well as to locate the heating surfaces to greatest advantage. While the locomotive has not so far been in service long enough to permit of any definite results being obtained, the performance has been so satisfactory with both bituminous and anthracite coal that the Lackawanna is ordering another engine fitted with this boiler, for use exclusively in fast passenger service. Considerable valuable information has been obtained showing its performance in comparison with the sister engines, and it is be-



Firebox Showing the Plugs in the Roof Sheet Opposite the Upper Ends of the Water Tubes

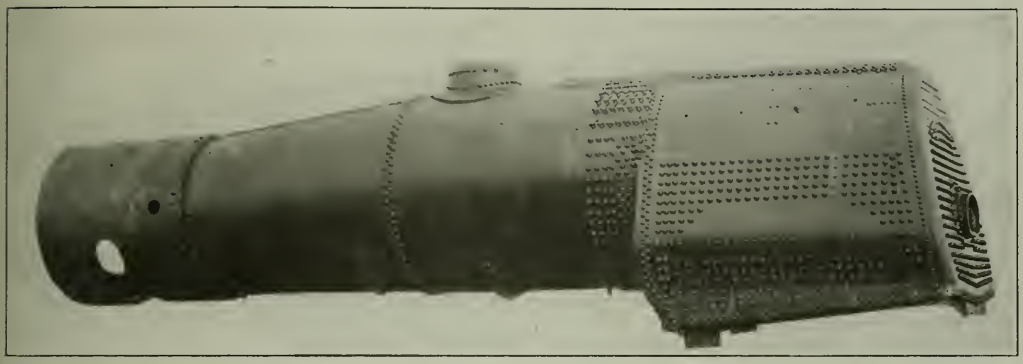


Water Tube Boiler of the Lackawanna Pacific Type Locomotive

lieved that this type of boiler will be an entire success. Further tests are being conducted, and it is expected at a later date that interesting performance data will be available. While some of the data given in this article may differ from other published accounts, it is official and authentic.

A few of the principal dimensions are given in the following table:

Class	4-6-2
Gage	4 ft. 8½ in.
Diameter of driving wheels	69 in.
Tractive effort	43,200 lb.



The Water Tube Boiler of the Lackawanna Pacific Type Locomotive

Cylinders	25 in. by 28 in.
Weight on leading truck	50,000 lb.
Weight on drivers	189,600 lb.
Weight on trailing truck	58,000 lb.
Total weight of engine in working order	297,600 lb.
Coal capacity of tender	10 tons
Water capacity of tender	9,000 gal.
Total weight of tender loaded	165,500 lb.
Total weight of engine and tender	463,000 lb.
Rigid wheel base	13 ft.
Wheel base of engine	33 ft. 10 in.
Wheel base, engine and tender	66 ft. 4 in.
Boiler pressure	200 lb.
Grate area	69 sq. ft.
Diameter of boiler	78 in.
Firebox	89 in. by 111 in.

Pacific Type Locomotive on the Lackawanna, Fitted with a Boiler Which Has a Water Tube Firebox

Factor of adhesion	4.39
Water tubes, diam., gage and length, 2½ in., O. D.; seamless steel; No. 9; 6 ft. average	
Heating surface, firebox and combustion chamber	288 sq. ft.
Heating surface, water tubes	471 sq. ft.
Heating surface, fire tubes	3,177 sq. ft.
Heating surface, arch tubes	24 sq. ft.
Total heating surface of firebox	783 sq. ft.
Total heating surface	3,960 sq. ft.
Superheater heating surface	740 sq. ft.

Excavating on the Panama Canal.—During January a total of 1,163,255 cu. yd. of excavating was done on the Panama canal—15,922 yd. by dry excavation and 1,147,333 yd. by wet excavation. To February 1, 1915, the total canal excavation by Americans was 230,262,028 cu. yd.

WAR BONUS FOR ENGLISH RAILWAYMEN

A large proportion of the conciliation board settlements between the English railways and their "wage-earning employees engaged in the manipulation of traffic," would have terminated on or about January 1. The National Union of Railwaymen and the Associated Societies of Locomotive Engineers and Firemen had already drafted new demands and asked principally an advance in wages of 5s. ($1.25) a week. The war stopped negotiations, but other negotiations between the men and a committee of general managers were completed on February 19 and 20, which call for large increases in the form of a war bonus.

A bonus of 3s. (75 cents) a week is paid to all employees 18 years of age and upwards, embraced in the conciliation scheme, whose standard rate of wages is under 30s. ($7.50), and 2s. (50 cents) to employees whose standard rate of wages is 30s. or more; the first payment was made in the week commencing February 15. The arrangement is to remain in force during the continuance of the present agreement between the government and the railways, but is subject to review at the end of three months. When notice is given by the government to terminate its control of the railways the latter are to give not less than two weeks' notice to the railway men to discontinue the bonus.

There will be an extension of the basis on which men in the various services will be admitted to the conciliation scheme, so that increases will also be made to the engine terminal forces and the signal and maintenance of way employees.

It is also expected that the Scottish railways and certain of the English lines not included in the conciliation scheme will make similar increases, and it is not unlikely that something will be done for the shop men, clerks, etc. The Railway Gazette (London) has estimated that if these services be included the total advances in wages will aggregate not less than $16,000,000.

ARBITRATION OF ENGINEERS' AND FIREMEN'S DEMANDS

Rebuttal testimony on behalf of the engineers and firemen was begun before the board of arbitration at the hearing at Chicago on March 2 by W. J. Lauck, statistician for the brotherhoods. Mr. Lauck introduced as exhibits voluminous pamphlets on the past financial management of the railroads, intercorporate relations, interlocking directorates and concentration of financial control, including a large number of extracts from the reports of the Pujo commission. Mr. Lauck also brought in the land grants to western railways by the government. He said that the decline in railroad credit was due largely to the fact that their managers had been talking hard times. Arbitrator Nagel asked the witness if he thought business was in a sound condition. "No," replied the witness. "Then," said Mr. Nagel, "the railroads are justified in saying that business is bad, and to that extent you would have to revise your statement."

One exhibit reported to be a recapitulation of the physical operations of 10 of the most important western roads from 1900 to 1910, consisted mainly of extracts from reports of investigations. Mr. Lauck claimed that the aggregate bonuses to stockholders of these roads in 10 years amounted to $250,000,000, and said that this system of financing imposes an unwarranted burden on the productive efficiency of the roads. A large number of the witnesses' statements were qualified after questions by Mr. Nagel and by W. L. Park and H. E. Byram, the railroad representatives on the board. "My chief contention," said Mr. Lauck, "is that the tendency to increase capitalization against the future earning power of the railroads is a tax upon its productive efficiency and tends to prevent proper participation by labor in the profits." "Don't labor's claims come first?" asked Mr. Byram. "You have to pay your operating expenses first, of course," admitted the witness.

On March 4 Mr. Lauck introduced records of investigations of the St. Louis & San Francisco and the Rock Island. Grand Chief Stone, of the Brotherhood of Locomotive Engineers, explained that these were not selected because of any grudge against them, but because the data were at hand.

"Personally, I wish you had taken some other roads," said Mr. Nagel, "because I have heard these records so often they have lost their novelty." Mr. Lauck spoke of the unwise acquisitions of subsidiary companies by the Frisco, many of which, he said, were unprofitable.

After Mr. Lauck had said the employees did not reap any of the profits of the Frisco financial deals, Mr. Nagel said neither did they share any of the losses.

"I know that a lot of this stuff is an old story to most of us here," said Mr. Stone, "but there are 65,000 men running engines in the West who will be very much interested in reading it. It will prove to them that an honest effort was made to do everything that could be done to win their case. Of course the railroads want to shut out the effect of financial mismanagement."

"As the representative of 98 railroads I here and now request that this board will not shut out anything Mr. Stone thinks is of the slightest interest to the members of his organization nor which he may think has the least value," said James M. Sheean, counsel for the railroads. "We have not made any objection whatever to anything you have offered. We have contended from the first that the wealth or poverty of a railroad does not affect the question as to what constitutes a fair wage for employees."

"We have let so much of this stuff in that I suppose we will have to continue it," said Mr. Nagel, "but an immense amount of testimony has been presented in this case which should have been eliminated."

Mr. Lauck said he did not believe shippers would oppose an increase in freight rates to pay higher wages to engineers and firemen. Mr. Sheean promptly asked him: "How do you reconcile your statement with the fact that in this city right now before the Interstate Commerce Commission organizations of shippers are opposing the application of the railroads for an increase in freight rates aggregating only about $10,000,000, while before this board of arbitration the same railroads are opposing your demands for an increase in wages of $41,000,000 for the engineers and firemen alone; that is four times the amount of the proposed freight rates increase?"

RATIONAL GOVERNMENTAL REGULATION*

By Hon. Oscar W. Underwood
United States Senator from Alabama

The money invested in American railroads exceeds the public debt of the greatest four nations in the world; and the wages paid to employees is nearly as large as the pay of the armies fighting in Europe, and the public in the end must pay every dollar required for the maintenance and operation of the railroads. The prosperity of the country must languish if the railroads fail to perform their functions successfully.

We have undertaken the problem of governmental regulation, and the government will not turn back. Regulation of practices and rates is here to stay. But let us stand for wise and just regulation. Revolutions never move backward. If governmental regulation is unable to solve the vexed problems that confront us the people will accept government ownership as the next step ahead. It is therefore a matter of great importance that we should endeavor to reach a fair and reasonable solution of the problem of regulation at as early a day as possible.

It is of the highest importance that no unnecessary roads be built in future and that only those be extended and developed which are best adapted for their function. Low rates and adequate facilities are demanded by the public, but the granting of one is often the denial of the other. If a corporation earns more than an adequate income, the rates may be regulated, but if the revenue is not a fair return on the invested capital, the government is powerless to act. The matter of dividends is today a very small part of the question; the public must be interested in the items that make up the operating expenses of the railroads if it desires both adequate facilities and reasonable rates.

Public control has reduced rates and abolished unjust discriminations, but the greater problem remains unsolved. Can the money be provided to expand and develop these great public works in a manner commensurate with the expanding needs of our commerce under the present system of government control? We must give all credit to the present system of regulation for the accomplishment of much good in the service of the public; but those who are studying railroad problems must admit that it is breaking down in so far as it has supervised the finances of our railroad system so that credit may be maintained.

If railway investments cannot be made attractive to capital, is not the nation threatened with an inevitable breakdown of its transportation system? There is no more difficult problem ahead of us than the transportation problem, and no more inviting field for the exercise of true statesmanship.

Let us inspire courage and give aid to those leaders who, not by chance, but through merit, direct our industry, control our trade, and manage our finance. It is not enough for our government to permit them to rise from the prostration that has overtaken them and their affairs; it must occasionally assist them. We have reached the point where sound progressivism must recognize that the proper regulation of business requires that it must be sometimes helped and not always hindered, that we must occasionally say "You may," and not always "You shall not." We need only to permit railways, traders, and bankers that economic freedom which is consistent with a wise and helpful regulation of all affairs and to give every citizen the national protection to which he is entitled wherever he may rightfully be, at home or abroad, for our trade to gain its lost position and our flag to be seen on every sea.

Factors Influencing Fuel Economy in Locomotives*

Effect of Design, Maintenance, Handling at Engine Houses, the Operating Department, Quality of Fuel, etc.

By M. C. M. Hatch
Superintendent Fuel Service, Delaware, Lackawanna & Western

During the year ending June 30, 1913, there was expended for fuel supply on American railroads the sum of $241,598,314, this amount being 11.4 per cent of the total operating expense. The tonnage equivalent was, approximately, 130,000,000 tons. A generally accepted figure of 20 per cent is allowed for stand-by losses on the road, in the engine house, en route from cars and tenders, waste at pops, etc. Assuming that this is correct, we have then 80 per cent of the total amounting in value to $193,000,000 being put through our locomotives yearly, while doing useful work. The thermal efficiency of the modern locomotive is in the vicinity of 5.5 per cent so that, if fully utilized the cost of fuel for doing the work calling for nearly two hundred millions would be about $11,000,000, the tremendous difference being made up of wastes, both avoidable and unavoidable, which do not, actively, move a ton of freight or a passenger. A heat balance will show about where these losses, so far as the boiler is concerned, occur and from analyses of recent tests on modern power, the following balance has been made:

Loss	Per cent
Combustible present in ash	6.00
C O	1.20
Sparks and cinders	6.30
Heat rejected at stack	†3.00
Radiation and unaccounted for	†1.00
Total loss	37.50
Utilized by boiler and superheater	62.50

Between the boiler and the application of the power at the rail, there are other losses of great magnitude, which reduce the over-all performance to the comparativcly small figure of 5.5 per cent. Of these losses the most important, as well as the most difficult of reduction is the heat rejected from the engine cylinders at the exhaust. With all steam engines, but especially with those of single expansion, non-condensing design, this thermal waste occurs and hardly appears to be susceptible of much reduction.

We may state, under seven general heads, the factors which exercise control over the fuel consumption of locomotives. These are: (A) Design; (B) maintenance; (C) engine house attention; (D) fuel; (E) operating department; (F) engineers, and (G) firemen.

(*A*) *Design.*—In attacking the design of a locomotive there are certain known factors, such as limiting wheel loads, right-of-way clearances, topography of road, class of service, power to be developed at the drawbar, etc., upon which to build, as a foundation. In the first survey of the problem we will be able to determine wheel and cylinder size and boiler pressure. From these the maximum horsepower output to be expected of the engine becomes known. The boiler should supply steam sufficient to hold the engines up to this horsepower delivery, if most satisfactory results are to be obtained. Boilers of 100 per cent capacity, and even considerably more powerful, are now the rule. The use of combustion chambers in large power boilers would seem to be advantageous, increasing firebox heating surface and volume, and shortening what might otherwise be excessive tube length. A ratio of tube length divided by inside diameter of 110 to 1 would, from present information, seem to be as far as we should go and a reduction to 100 to 1 may prove, in service, to be more satisfactory.

The design of the cylinder as regards clearance volume and ratio of stroke to bore will affect the water rate and, hence, the coal pile. Piston speed should not exceed 1,500 ft. per minute at the calculated maximum speed, equivalent to diameter of wheel in inches. The piston valve may be of small diameter, especially with superheated steam. One road is now using a 12-in. valve in all classes of power and this, if trouble is not experienced with the valve rings, would seem to be a step in the right direction. A small valve means a light valve and a light valve means much reduced stress on the valve motion, especially at high speed.

The front-end should develop the needed vacuum at the front tube sheet with the least possible back pressure on the engine pistons. To arrive at this result, the gas friction within the front-end itself must be reduced to a minimum by providing ample netting areas, unrestricted gas passages and by eliminating, so far as possible, abrupt changes in direction of gas flow.

The grates should have as large percentage of air openings as can be obtained without loss of fuel through them. They should be well fitted to their bearers, and these again to the sheets to preclude the loss of fuel at these points. Dump grates when employed should be placed at the back of the box to make impossible an influx of cold air against the flue sheet, when used on the road.

Ample air inlet openings under the fire are a prime necessity. Tests, however, show that if, with the ordinary pan, 14 per cent of the grate area be allowed for air inlet area with bituminous coal and 8 per cent with anthracite, further increases of area, within reasonable limits, will have very little effect on the ash-pan draft. With bituminous burning switching engines it may be best to reduce the 14 per cent allowance somewhat, in order to prevent too much waste of steam through the safety valves, but in general the figures given will be found satisfactory.

The efficient locomotive should have a high-degree superheater, a brick arch, a power operated firedoor to relieve the fireman of unnecessary work and to encourage him in light and frequent firing, some means of handling the valve motion other than the time honored lever, so that the engineer may work his engine to the best advantage without fear of his life and good injectors so that the man is not tempted to carry too much water in the boiler for insurance against injector trouble. Cab decks and aprons should be designed with a view towards eliminating fuel losses from the engine when in service. A cab arrangement, convenient and safe for the crew, will also influence the operation of the locomotive for the better.

(*B*) *Maintenance.*—The well designed locomotive is capable of giving the best operating results only so long as maintenance is followed up. This means proper back-shop and engine-house facilities, the latter being very important. The road which has a first-class main shop, but is deficient in means for taking care of the necessary running repairs at its engine houses will find its unit locomotive repair cost higher as the engines go through for general repairs than will one whose main shop is perhaps not so elaborate but which is better organized at engine division points to keep up the day-to-day repairs. The importance of proper reports from enginemen is great. The bald statement on the work book that the engine is blowing is no great encouragement to the overworked engine house foreman to start on a tour of exploration through cylinders, main valves and by-pass valves. The report should state, fully and definitely, what is wrong and should be made out immediately on reaching the house. One of the most satisfactory ways of handling this matter is to have a clerk to whom the engineer as soon as he has registered in, dictates his list of troubles, which are reread to him, or by him, and signed. Every endeavor should be made

*Abstract of a paper read before the New England Railroad Club, February 9, 1915.

to make the repairs before the engines again go out, the spirit of "Well, I guess she'll hold together for another trip," being an expensive one and productive of engine failures. The tendency, when an engine is turned in as "not steaming," is at once to reduce the nozzle size. This should be the last resort, especially if steam has been made satisfactorily with the original nozzle, as we are at once imposing additional work on the engines when the exhaust area is reduced.

(*C*) *Engine House Attention.*—The treatment of locomotives at terminals, aside from repairs is important. When fires are cleaned the men must be taught to waste as little live fire as possible to the ashpit, the blower must not be used harder than is necessary to keep the smoke and gas out of the men's faces and the pump should be shut off to keep the ashes and dust out of the air end and also to save the flues from cold air, which the pump exhaust will draw through them. If the engine is to stand in the house for a period of 36 hours or more it will generally be cheaper to dump the fire on its arrival. If engines are kept under steam the fires should be bright and alive next the tube sheet but with the back end pushed ahead and the back section of grates bare. With this method the fire doors may be kept shut, not allowing smoke to fill the cab, and the engines will stand for a long time without attention, never gaining steam enough to open the pop, but holding plenty to work the injectors, move the engine at short notice or for any other practical purpose. Another good feature of this method is that, when the fire is being prepared for service, the back half is practically clean, as coked coal from the front of the grate is merely pulled back to cover the grates which have been bare. A saving can often be effected in fire building if a careful analysis of the situation is made. Flue blowing must be followed up and pains taken to see that the work is done properly, and tanks must not be overloaded at coal chutes.

(*D*) *Fuel.*—The New England roads must import their entire supply and the matter of transportation rates influences largely the locality and hence the kind of coal purchased. Other roads, differently situated, may have little or no concern with this phase of the problem; for instance, the Lackawanna gets its entire passenger engine supply from a point on its main line of fairly central location. This fuel, anthracite, would be prohibitive in cost on a New England road.

Bituminous coal, no matter where obtained, should be required to run of uniform quality; it should be low in ash and sulphur, of a medium volatile content and, when run-of-mine, as is generally the case, not over 50 per cent in slack. It may pay, under some conditions, to buy screened coal, but generally run-of-mine will be satisfactory. It would seem that the ideal way to purchase coal would be under specifications, but few, if any, roads follow this practice. A run-of-mine specification could, however, be drawn up on an ash, sulphur and slack basis which would not be oppressive to the operator and yet would safeguard the consumer's interest satisfactorily. We buy about everything from corn brooms to locomotives on specifications, rigid and unchangeable, but our coal, so long as it is black, generally goes unchallenged for we have nothing definite to challenge on. The department making the purchase should consult with the mechanical department to determine the most suitable fuel which it is consistent to procure. One further point in this connection is that of check-weighing the coal as received, comparing actual scale weights with the bill weights, from which they will be found sometimes to differ materially.

(*E*) *Operating Department.*—The train operation of a railroad influences the coal consumption very materially. To merely mention certain points, overloaded trains requiring an excessive length of time between terminals and unreasonable working of the engine; poorly made meeting points necessitating long delays en route; failing to give inferior trains all possible time ahead of delayed superior trains; failing to pay due respect to the topography of the road when laying out regular train schedules; failing to lay out meeting points to bring them at the most advantageous points regarding profile; stopping trains unnecessarily for orders or any other reason; calling engines unreasonably long before they will be needed; calling helper engines when not needed and neglecting to call them when they should be used; locating water plugs without due regard to road conditions; all these and more eat into the coal pile and can generally be classed as unnecessary wastes. The practice of having despatchers put in a trip or two monthly over the road, riding drag freights and other trains which are apt to be unduly long en route would seem to be a very good one, as in no other way can such a clear idea of actual conditions be brought home to these men, whose business is to keep the cars moving. The operating department is a fertile but little cultivated field in which much can be done to increase fuel economy.

(*F*) *Engineers.*—The right side of the cab is no mean factor in this discussion. A careless or ignorant engineer can just about nullify all the efforts of the designer, shop and engine house forces, fuel agent, operating department and fireman. He will work his engine with light throttle and long cut-off when it will do better with the throttle open and the lever back a few notches, and vice-versa. He will start with a spasm of slipping which will turn the well prepared fire bottom side up. He will pump his boiler full and then shut off the injector and run away two gages before putting it on again. He may do many more things which should not be done and leave undone many which should be done, the net result being wasted coal. Our good engineers, of whom we must thank our stars we have so many, are coal and money savers for the company, and must have their just recognition as such.

(*G*) *Firemen.*—There is too much tendency to tell a fireman going out on some engine whose boiler is in poor condition and with an engineer who uses only the lowest notch on the quadrant and who believes he should have a full glass all the time, to fire light and often, and then to proclaim that strenuous efforts are being made to effect fuel economy. I believe that of the enormous total savings which can be made in the fuel bills of the railroads of this country, the firemen can not effect more than 20 per cent of the aggregate at the outside. If we will educate these men, as we must the engineers, and then do our share by paying all possible attention to the points elaborated under the foregoing heads, the firemen will take care of themselves. No man will shovel a scoop more of coal than he has to because of circumstances over which he has no control, assuming that he is properly instructed. This is not to be interpreted as meaning that all firemen are doing their best, for such is not the case. It does mean, however, that in the writer's opinion, this part of our problem would be very easy of solution were the others solved satisfactorily and permanently.

Now to what does the foregoing lead us? It is hoped that by its study we will be able to analyze the individual losses we must combat, indicate the responsibility for each, and so be able to make an intelligent attack upon the whole problem. Such an analysis is given below, the factors responsible for each loss being referred to by letter.

Combustible in Ash

A—Faulty grate-work design.
B—Improper grate maintenance.
C—Improper fire cleaning.
D—Coal which clinkers instead of burning down to ash.
E—Engines called for service and not used.
G—Fires brought in not burned down sufficiently.

Carbon Monoxide

G—This loss is generally up to the fireman, a fire too heavy increasing the *CO* percentage. Usually the total loss in this regard is small, many analyses of smoke-box gases showing but a trace of this gas. Proper firing will entirely take care of this. Insufficient air admitted under the fire will, however, militate against the best performance.

Sparks and Cinders

A—Restricted grate area or anything in the design which will run the fuel rate too high. Brick arch not used.
D—Fuel too friable or too high in slack.
E—Schedules arranged or trains loaded so that engines must be worked unreasonably.
F—Working engine harder than necessary. Slipping.

G—Too heavy fire. Carelessness in placing coal in firebox. Firing fine soft coal, dry.

Heat Rejected at Stack

A—Boilers so designed that heating surfaces are insufficient or inefficient to absorb all heat possible. Insufficient air admitted to the fire.

C—Principally through failure to keep heating surface clean, scale and soot being excellent insulators.

Radiation and Unaccounted For

A and B—The radiation losses are probably small and can be reduced to a minimum by proper use and maintenance of covering materials.

G—Probably the greatest loss of those unaccounted for is that of unconsumed hydro-carbon gases, such as methane or marsh gas and ethylene or olefiant gas passing out of the stack. This loss is occasioned by improper firing, generally too heavy, liberating greater volumes of gas than can be properly mixed and burned in the firebox. A brick arch will remedy this, acting as a very effective mixer. Smoke is an indication of this condition (although the loss may be present without smoke) as the carbon thus made visible is evolved from the hydro-carbons volatized in the firebox, but not properly burned.

The above items take care, in a general way, of boiler losses and from this we come to the engines. As has been said, the greatest loss here is by heat rejected at the exhaust and this, with a simple engine, cannot be much reduced. Compounding will, however, reduce this loss materially and the writer believes that it will ultimately return to favor.

Stand-by and general losses can be reduced by proper loading of coal on cars at the mines and on tenders, by elimination of water and steam leaks, by keeping the pops closed, by getting trains over the road as expeditiously as possible, etc.

It will be seen that the subject of fuel economy is influenced by and influences every phase of railroading. It is larger than any man or group of men. The labor of every man who, *in any way* has to do with getting trains ready for the road or over the road is reflected in the fuel bill.

DISCUSSION

R. D. Smith, superintendent motive power and rolling stock, Boston & Albany, suggested that some means was needed of letting the engine crews and fire tenders at roundhouses know at the time just what they were doing. The results of weighing coal as it is delivered to the tenders are from 40 to 60 days late, while with some device for counting the scoops of coal put into the firebox the amount of coal used could be very closely arrived at by computation at the end of each trip.

H. C. Oviatt, assistant mechanical superintendent, New York, New Haven & Hartford, said that much good would result if a fuel efficiency committee were organized on each division, according to the plan generally followed in promoting safety.

It was also brought out that considerable improvement might be effected by more systematic and careful attention to the early education of the fireman, in order that he might form correct habits at the outset.

FEDERAL INSPECTION OF LOCOMOTIVES AND TENDERS

The bill, H. R. 17,894, amending the Boiler Inspection act of February 17, 1911, so as to give the Bureau of Locomotive Boiler Inspection the same powers and duties in relation to the entire locomotive and tender that it now has in relation to the locomotive boiler, has been passed by Congress and approved by the President, and goes into effect September 4, 1915. The second section of the act requires that all inspectors and applicants for the position of inspector shall be examined at once touching their qualifications and fitness with respect to the additional duties now imposed. Section 3 provides that this act shall not be held to alter, amend, change, repeal or modify any other law or any order of the Interstate Commerce Commission issued under the safety appliance acts.

In the case of the Boiler Inspection act it was required that rules governing inspection be filed by the railways three months after the passage of the law, and it is understood that the chief inspector will set a similar limit now, that is, on or before June 4 next. The Special Committee on Relations of Railway Operation to Legislation has issued Circular No. 69 to the railways calling attention to the passage of the act, which says in part:

"Inasmuch as the time within which the rules and regulations for the inspection of locomotives and tenders must be filed by the chief inspector of locomotive boilers is very short, it is deemed advisable immediately to call your attention to the alternative courses possible under the act. The important matters are: First, character of the rules and regulations themselves. Second, question as to whether uniform rules and regulations are necessary and advisable.

"When the Boiler Inspection Law was enacted in 1911, its terms were a matter of mutual agreement as between the railways and employees. For this reason, when the formulation of rules and instructions was under discussion, the utmost degree of co-operation was shown by all concerned, and the rules and regulations which were presented to the Interstate Commerce Commission jointly by the chief inspector of locomotive boilers, representatives of the employees and representatives of the railways, possibly went beyond the action necessary under the law, in that these rules and regulations not only covered the matter of inspection, but also dealt with certain standards of construction and workmanship, a deviation from which, it was agreed, caused the boiler to come within the prohibition of the second section of the Act as technically unsafe.

"In view of the extension of the boiler inspection act to all parts of the locomotive and tender, involving an enormous number of parts, and inevitably presenting a great number of controversial questions, it is of immediate importance that the railways consider whether, under the law, it is possible to confine the rules and regulations to the subject of inspection alone; and, if not, the extent to which it will be necessary to go in setting up standards of safety under the varying conditions of the service.

"As to the second question—the filing of the rules and regulations themselves—three courses of action are open: First: For the individual roads to file their rules, which do not become obligatory until they have been approved by the Interstate Commerce Commission after hearing. Second: For the roads to agree among themselves, and file one set of rules, expressing their own views. Third: For the roads to go into conference with the chief inspector of locomotive boilers, and agree, if possible, with the government on a standard set of rules, as was done in the case of the Locomotive Boiler Inspection Law."

UNDERGROUND WIRES ON THE PANAMA RAILROAD

The Panama Railroad, at an expense of about $450,000, has put its telegraph, telephone and signal wires underground throughout the length of the road (47 miles); and W. H. Fenley, superintendent of telephone and signals, has sent us an interesting account of the laying of the vitrified clay duct for the wires, from which we take the following paragraphs:

A committee was appointed in December, 1912, to review the plans for the proposed transmission line across the isthmus, and among other duties, it was to formulate a report on transportation and electrical problems as affected by the presence of the track span bridges, carrying the 44,000-volt, three-phase, 25-cycle transmission circuit, which conveys the power for working the locks of the Panama Canal. The telegraph and telephone circuits were formerly carried on 20 open wires supported on iron poles. Physical interference was offered to the transmission line by the telephone-telegraph circuit. Electrical interference to the telephone-telegraph system was a known factor, as an unbalanced condition on the non-transposed, 44,000-volt line, with its apparent load of 50.5 amperes per wire, would theoretically set up inductive disturbances that would undoubtedly destroy telephone communication. In addition, there was a hazard to employees, due to the static stresses, in the event of a break in the

high-voltage wires, or a cross between the two leads, due to an aerial ground wire breaking.

It was impossible to remove the telephone-telegraph wires a sufficient distance from the high-tension transmission line to prevent inductive disturbance, so cables were considered. The signal circuits had to be tapped so often that it was not feasible to have them in the same cable with the telephone-telegraph line, so it was decided to use two cables. On account of the long span between the track bridges, their use as supports for the cables would have been very expensive. Armored cables buried in the ground are difficult to splice and tap; they are also subject to mechanical damage and to possible chemical soil reaction, so this type of construction was also discarded.

By a process of elimination, therefore, it was decided to use multiple-clay duct, and to draw the cables into it. Fibre duct was not used, because of the possibility of distortion on account of moisture; and the fact that the extreme heat might cause

Wire Duct, Panama Railroad

the impregnating compound to ooze out before the duct was placed in the excavation. In deciding on the size of the duct, the situation was canvassed to see if any outside parties desired to lease a duct across the isthmus, and as one such party was found, the installation was made sufficiently large to provide the necessary capacity. The multiple duct, of which 1,064,000 duct feet were used, was delivered in two shiploads, March 18 and May 28, 1914.

The length of cable sections between load coils was responsible for the spacing of the manholes, as at least seven cuts were required between loading points for the purpose of testing and balancing the cable between any two loading coils. The manholes were spaced 776.83 ft. apart, with intermediate manholes, where tracks were crossed, and to prevent crossing the drainage ditches and on curves. Intermediate manholes were also provided at track relays, indicators and signal locations.

The manholes were designed so that the entire cover can be removed. Where signal wires or secondary telephone-telegraph cable will enter a manhole, a piece of single-duct was let in the side wall when the forms for the concrete were built. An 18-in. by 36-in. hole was left in the bottom and filled with loose stones to drain the water out. The locations are given by stenciling on the pedestal of the nearest track bridge, giving the number of feet and the direction to the manhole, and one of the letters L, R, I, or S, which indicate "loading point," "regular," "intermediate," or "signal" manhole.

It was deemed advisable to construct the duct line continuously and not in sections. The wisdom of this policy was proved by the many changes which had to be made in alinement, due to physical obstructions encountered. Work was started from the Chagres river bridge, one gang working southward and one gang working northward. The curvature on the Panama railroad amounts to 43.44 per cent of the line, which of course made the construction more difficult, especially on account of the rough contour of the adjacent ground, which necessitated that the chords on which the duct line was located should come close to the track. The use of dynamite was prohibited on account of the proximity of the aerial wires, so where rock was encountered the excavation was made very shallow and earth was ridged up over the top of the concrete after completion. Where possible, the concrete was placed below subgrade when it came within 5 ft. of the track.

Each organization was distributed daily over about 15,000 ft. of trench and the work prosecuted in the following sequence: (1) The survey party chained up for the manhole ran in the alinement and set grade stakes, using both transit and level. Test holes were dug when in doubt as to pipes, cables or other underground obstructions. Inverted "T" stakes were then pegged to the ground so as to span the trench at each 50-ft. station, and manholes were indicated by two such stakes, on which all data concerning the individual manhole was marked in blue crayon. Accurate field notes were kept and the alinement and manholes afterward plotted on the standard sectional map of the railroad. (2) The excavation force excavated for both duct beam and manholes according to grade stakes and the indicated alinement. (3) The base concrete force laid in from 4 to 10 in. of concrete, checking the grade after this was in place. These gangs also set all manhole forms and built in forms where the reinforced duct beam had to cross a drainage ditch or a ravine. (4) The duct-laying force inserted the dowel pins, wrapped each end of the duct with a piece of rejected cement sack soaked in a neat cement mixture, and trowelled in enough concrete plaster on either side of the duct to hold it in true alinement when the concrete back fill was later placed around the duct. No duct was laid until the base concrete was practically set. (5) The concrete back fill force placed approximately 3 in. of concrete on the sides and top of the duct. Old boiler plate, sections of corrugated roofing, and lumber were used for side forms where necessary. (6) The back fill force placed an earth back fill on the concrete duct beam, restored drainage ditches, and cleaned up the road bed.

Small forces under a colored foreman removed manhole forms and moved parts of them forward with push cars, although most of the plant was moved from the rear to the front by the work train. Gravel was unloaded from 15-cu. yd. Western dump cars at 200-ft. intervals. A cement shed was then erected at each gravel pile, consisting of a platform 6 ft. by 6 ft., supported by 3-in. by 6-in. joists, and an inverted "V"-shaped roof made of old corrugated siding. Water barrels were also placed at each mixing board and water distributed from a tank car in the work train. Concrete was mixed on about 50 cement boards a day for each organization, carried in wheelbarrows, in either direction, from the board and dumped directly into the trench. A portable blacksmith's shop was carried with each excavation force for sharpening picks and drills. Each organization had its headquarters tent for the timekeepers and cost accountant, and each tent was equipped with a special telephone that not only placed all the tents in communication with each other, but allowed all of them a connection to the nearest telephone exchange.

The cost account sheets show the following tabulated costs for labor and material on 962,360 duct ft. of four-way multiple line:

	Labor.	Material.	Total.
Excavation, per cu yd.	$0.75	....	$0.75
Concrete base in place, per cu. yd.	2.00	$2.70	4.70
Laying 4-way duct, per lin. ft.	.02	.23	.25
Concrete back fill (including placing of forms), per cu. yd.	2.80	3.00	5.80
Earth back fill, per cu. yd.	.40	....	.40
Manholes, small, complete	6.33	2.17	8.50
Manholes, large, complete	7.68	3.82	11.50
Average cost per trench foot	.30	.45	.75

When both organizations were producing maximum results, there were about 900 men in the field. Organization No. 1 started April 14, and No. 2, July 6, 1914, and by October 20, 1914, 255,589 trench ft., and 1,100,226 duct ft. were completed, the average being 1,750 trench ft. per nine-hour day. The success of the entire scheme consisted in the manner in which the forces were organized, and the fact that all experimental work and all plans were completed before actual construction was commenced, and was also partly due to the friendly rivalry which was promoted between the northern and southern organizations. The work was supervised by one supervisor and two general foremen, one in charge of each district. Under these men there were 13 foremen and two work-train crews.

The Western Electric Company furnished 258,060 ft. of duplex telephone-telegraph cable and accessories. The award for signal cable was placed with the Kerite Insulated Wire & Cable Company, after an investigation. The contract called for 210,420 ft. of 13-conductor and 46,769 ft. of 9-conductor cable, and two pieces of armored submarine cable, one 460 ft. long and one 2,300 ft. long. Linaduct with slip collars was used for all conduit runs between manholes and signal apparatus.

WATCH YOUR CARS AND STOP CARLOAD TRACING

By F. P. Barr

Superintendent of Transportation, Wheeling & Lake Erie

Traffic and transportation departments of railroads, particularly of the lines serving large tonnage producing centers where competition is strong, have for the past years been flooded with requests from shippers and receivers of freight to trace carload shipments. Many of these requests are made by wire, while others are made through the mails or by telephone.

Some shippers have insisted on all their carload business being traced, and in order to hold the traffic the railroads most invariably comply with such requests. Other shippers or consignees, fearing that their shipments might meet with delay, start tracing in many instances before the cars have had time to get to destination or to the junction point with the next line shown in the routing. It is not an uncommon occurrence for tracers to be started on the same date the bills-of-lading are signed. Cases have been known where shippers started to trace before the loading had been completed.

All of this has resulted in confusion and unnecessary expense to both the shipping public and the railroads, and the tracing proves of little value. It has also resulted in practically every department of the railroad doing more or less tracing, and in many instances two or more departments are found tracing the same cars.

The principle of carload tracing when properly applied is bound to have the desired effect, but this has been badly misused by both the shippers and the railroads. The railroad responsibility for this state of affairs is explained in that they permit cars of expedite freight to be unreasonably delayed in transit, cars being moved at the convenience of the various departments. Loaded cars found to be in need of repairs are not given the proper attention and are often held unreasonably and then, on account of being in need of extensive repairs, are transferred. Traffic representatives in soliciting business have encouraged unnecessary tracing.

A number of roads have been endeavoring to overcome these inexcusable delays and thereby cause their patrons to have more confidence in their ability to move traffic with reasonable promptness and have them cease tracing to a large extent. To to this the roads have realized that they must get away from the old-established custom of doing certain things at certain times each day of the month or year and have adjusted their operations in such manner to meet almost any condition that might arise. They have arranged for the reporting by telephone or telegraph of the movements of cars containing shipments of expedite freight in such a manner that the transportation departments are able to keep a constant watch to prevent any delay which can possibly be avoided.

The Wheeling & Lake Erie recently put into effect a plan of handling expedite freight. This plan cannot be properly termed a tracing system, as in tracing it is a case of following up something that has been done. The plan the Wheeling & Lake Erie has put into use is in a large sense an advance record and results in heading off the tracers. The transportation office in most instances has the cars charged

FORM 1010 L. SM 7-14

REPORT No._____

_____ STATION OR YARD DATE_____ 191__

DAILY REPORT OF CAR LOAD SYMBOL FREIGHT ORIGINATED OR RECEIVED FROM CONNECTING LINES AND REPORT OF FORWARDING BY TRAINS.

DATE BILLED	SYMBOL	CAR INITIAL	CAR NUMBER	CONTENTS	ORIGINATING POINT	SHIPPER	DESTINATION	CONSIGNEE	ROUTING	RECD FROM CONNECTION	DATE	TIME	FORWARDED BY TRAIN	DATE	TIME
(A)	(B)	(C)	(D)	(F)	(G)	(H)	(I)	(J)	(K)	(M)			(N)		

Agent or Yard Master will use this report in reporting symbol freight billed, the receipt of symbol freight from connecting lines, and the forwarding by trains. Cars containing symbol freight received from connecting lines for switch movement to industries on our line or cars loaded by industries on our line for switch movement to connecting lines need not be reported, except cars on which we receive a pro-rate, which cars should be reported.

Cars containing symbol freight passing through your station or yard or delivered to connecting lines should be reported on Form No._____

This report must be promptly sent to the Superintendent of Transportation by either telegraph or telephone.

Fig. 1—Report of Car Loading

to the point of destination, or the train terminal far in advance of the actual arrival. The reports covering the interchange to connecting lines are made at different intervals throughout the day and in most cases within a few hours after the cars are delivered.

One of the most important features found in this plan is that the Wheeling has records covering all of the movements of carload expedite freight on its line in seven differ-

ent traffic offices located in as many large tonnage producing centers, namely: Cleveland, Pittsburgh, Chicago, Detroit, Toledo, Canton and Wheeling, in addition to the records maintained in the transportation office at Brewster, Ohio. A patron of the line can call upon any of these offices and get the movements of carload expedite freight within 24 hours after cars are moved. These records are maintained from reports made by the transportation office and place the traffic representatives in a position to keep patrons fully advised as to the movement of their shipments either inbound or outbound.

The records show that this plan has already caused a reduction of 75 to 80 per cent in carload tracing. This is the result obtained after the system had been in use but one and one-half months. All carload shipments of expedite freight are covered by this plan and as previously stated, they are constantly under eye of the transportation office, where close check is kept on each movement of a car.

Shipments of coal, coke, iron-ore, limestone and other like commodities are not included, as these commodities are handled in train or part train lots, and their location is reported and movements arranged for by other methods.

A general outline of the plan is as follows: Each station is given a series of numbers commencing with number (1) one, which, together with the telegraph call, compose what is termed, the symbol for that station. The first car billed is given the number 1, and if the call is CX the symbol is shown as CX-1, and these symbol numbers are inserted on the waybills in consecutive order as the cars are billed. These symbols are used to save time in telephoning or telegraphing when the agents or yardmasters report the movements through yards or delivery to the connecting lines.

The originating station or the station at which a carload of expedite freight is received, assigns the symbol and reports to the transportation office the following: Date billed, symbol, car initial, number, contents, originating point, shipper, destination, consignee, routing, date and time received from connection and the forwarding by train. When a car is picked up by another train or is placed in another train at a train terminal or end of a division the yardmaster or agent at that point reports only the symbol and the train in which it is forwarded, giving the date and time, and when the car reaches the junction point and is delivered to the connecting line, the delivery is reported by the symbol and the time of delivery is also shown.

If the car is destined to a local point, the arrival at destination is approximated from reports received from the chief train despatcher. Should a car be set out short of destination or short of the end of the train run, the conductor of the train makes a telegraphic report showing where the car was set off and where the billing was left, also stating the reason why he had to take the car out of his train. Upon receipt of this report the transportation office takes the necessary steps to have the repairs made, or does what is needed to get the car moving.

The movement of all cars of expedite freight is reported as the trains are ready to leave the stations or terminals, or immediately after their departure, and should any cars be held at a terminal or station beyond twelve hours, the yardmaster or agent must make a report showing why they are being held and what is being done to move them. Cars held must be reported each day until they have been forwarded. With this report the agent or yardmaster is in position to keep a very close check on his cars and prevent any unnecessary delays. This report also covers cars which are held for delivery to connecting lines.

The blank forms used in making reports in connection with the expedite movement of symbol freight are shown herewith. Fig. 1 is the report made by the agent showing the expedite freight originating at his station or received from connecting lines. After this report is telegraphed or telephoned to the transportation office it is placed on file by the agent. The telegraph operator or the telephone clerk in the transportation office receives this report and notes it down

REPORT OF SYMBOL FREIGHT. DATE _____

SYMBOL	ARRIVED HERE	DATE	TIME		DELIVERED TO CONNECTION	DATE	TIME	DELIVERED FREIGHT	CAUSE	REMARKS

Fig. 5—Traffic Department Report of Freight

necting line. In writing up this report an effort is made to give all the information on it in regard to shipments at the time the report is written. After the report shown in Fig. 4 is sent to the traffic officers, reports of all subsequent movements are sent to these officers on forms, a sample of which is shown in Fig. 5.

Way-bills of a special color have been furnished to agents to be used in billing expedite freight. A space has been provided wherein the symbol is shown. Rubber stamps have been supplied to the agents and are used by them in applying symbols to cars traveling under interline way-bills.

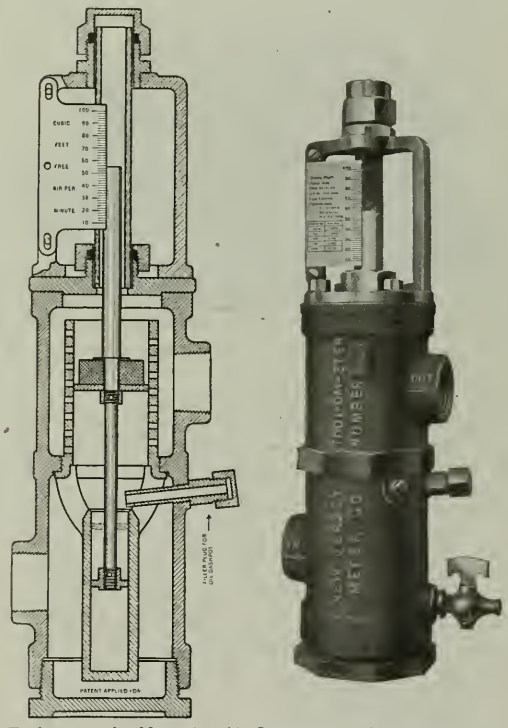
All reports made by the agents and yardmasters are sent by either telephone or telegraph to the transportation office, where they are assembled and the car movements recorded. These records are transcribed upon blanks which are mailed to the various traffic offices. A day and night force is maintained on this work. The work done by the night force is mailed early in the morning and the reports made by the day force are mailed at six o'clock p. m., which means that all seven traffic offices receive their report early the following day.

During the period that this plan has been in use the Wheeling has had on its line daily from 1,000 to 1,500 cars of expedite freight, and the work involved has been handled by five clerks, three working during the daytime and two at night. While this has caused an increase in the payroll of the transportation office, it has resulted in centralizing the handling and tracing of expedite freight, and when the work which was previously done by the various departments, including agents and yardmasters, is taken into consideration, it can be readily seen that the additional expense in the transportation office is more than offset by the saving made in the other offices. Further, it was not necessary to add any help to the agent's or yardmaster's office. In addition to this saving there is a saving in per diem due to better car movement, a big item that should not be overlooked. Furthermore, a shipper is going to give preference to the line which gives him the best service.

A careful check of the records disclosed the fact that the expedite freight is receiving, as a whole, better movement, and further that the movement of dead freight is showing a corresponding improvement for the reason that the yardmasters and agents, in their efforts to keep expedite freight moving promptly, fill out trains with the lower class of freight, and the result is that the traffic as a whole is receiving better movement.

COMPRESSED AIR METER

The illustrations show a device for measuring the quantity of compressed air used for small tools for the purpose of determining their efficiency in air consumption. It is called the Tool-om-eter. It operates on the principle that the volume of a definite compressed fluid or gas flowing under a small constant head through multiple orifice of the same shape and size, is directly proportional to the number of orifices exposed to the flow. By referring to the sectional drawing it will be seen that the air is admitted through the lower lefthand opening, passes upward to the main piston which operates in a cylinder perforated with accurately-drilled holes. As the demand for the air increases the difference in pressure between the outlet and inlet will cause the piston to be raised, thereby uncovering the holes in the cylinder to such a height that the total area of the uncovered perforations will permit an unrestricted flow of the air



Tool-om-eter for Measuring Air Consumption of Pneumatic Tools

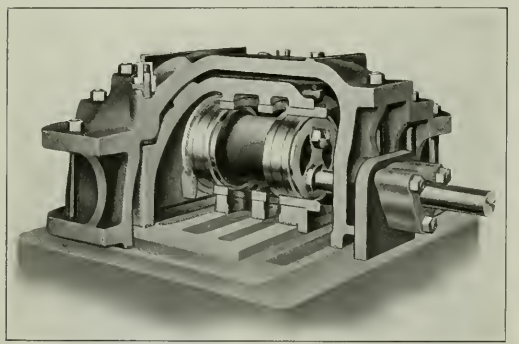
through the meter. A rod attached to the upper part of this piston indicates on the scale the amount of free air passing through the meter in cubic feet per minute. The difference of pressure caused by the weight of the piston between the inlet and the outlet of the meter is only a few ounces per square inch.

The cylinder at the bottom is filled with oil and serves as a dash pot to provide a more stable operation of the recording piston. It should be noted that this is not a velocity meter but a direct volume gage, and readings may be obtained to within one cubic foot per minute. The meter is of simple construction and contains no leather pockets, rubber or leather discs, bearings, gears, valves, or other parts, which can develop defects to change the accuracy. The use of bronze parts prevents corrosion or rusting. The meter shown herewith has a capacity of from 10 to 100 cu. ft., and is used for various small tools. Larger sizes of meters are also made. This meter is sold and manufactured by the New Jersey Meter Company, Plainfield, N. J.

APPLICATION OF PISTON VALVES TO SLIDE VALVE CYLINDERS

In modernizing existing locomotives, the application of superheaters to engines having slide valve cylinders has heretofore presented serious difficulties in view of the accepted fact that only piston valves can be used successfully with superheated steam. The cost of new piston valve cylinders with their accessories, together with the new front frame sections necessary to obtain a good design of cylinders; the changes necessary in the valve gear, etc., frequently entail so considerable an expenditure as to cause abandonment of the project.

The device here illustrated offers a solution of the problem by enabling a piston valve to be applied to the existing slide valve cylinders without any modification of the cylinders, valve gear



Universal Piston Valve Applied to Slide Valve Seat

or other details. It consists of an inner valve chamber to which a continuous bushing is applied in the ordinary manner. Enclosing this is a steam chest secured to the cylinder by the usual studs without alteration in their original arrangement. The valve chamber is secured to the valve seat by four studs, and six holding-down screws tapped through bosses on the top of the steam chest, in addition to the steam pressure, which is exerted over practically 70 per cent of the area of the seat.

Joint wires of the usual form are used between the steam chest and its seat and wires of the same size are employed between the valve chamber and valve seat. These latter wires are arranged in an ingenious manner to avoid the use of double wires on the bridges, where it is difficult to apply sufficient direct pressure to bed them into the irregularities of the faces. In this arrangement a joint wire surrounds each of the steam ports, and an outer wire surrounds the whole. Thus the double wires come only at the ends and sides of the valve seat where direct pressure can be applied.

A very short and light piston valve is used, with the center of its stem offset downward to conform to the location of the valve yoke stem of the original slide valve. The body of the valve is of oval section, thereby facilitating the passage of the exhaust steam downward to the exhaust port. The form of steam port in the valve chamber is such as to provide ample area for the ingress and egress of steam to the ports in the bushing, and eliminate all baffles which cause eddy currents.

The valve diameter is determined by the length of the ports in the valve seat, being such that its effective length (deducting bridges) is somewhat greater than the port length of the flat valve seat, which has been proved by actual test to be sufficient. This method gives valve sizes and weights as follows:

Port length	Valve diameter	Weight of valve
Up to and including 19 in.....	8 in.	58 lb.
20 in. to 22 in. inclusive.....	9 in.	65 lb.
23 in. and over.....	10 in.	73 lb.

By the use of these small, light piston valves, the wear and tear on the valve gear is reduced to a minimum. As the section of packing ring is the same as for the large valves commonly used, the result is a greatly diminished tendency to buckle and score the bushing while crossing over the ports when superheated steam is used, trouble from this source being practically eliminated. Diagonal bridges are employed in the valve bushing to obviate grooving of the rings.

A notable feature of this arrangement is that outside steam pipes may be used, thereby eliminating all live steam passages from the cylinder saddle, as has become the accepted practice with superheat. In this case a tight cover plate is bolted over the steam pipe boss in the smoke box, and the steam passages in the saddle filled with a rich concrete mixture. A short bent section of steam pipe is used immediately above the chest to facilitate its removal without disturbing the pipes in the smokebox.

This device was developed by the Economy Devices Corporation, 30 Church street, New York. A description of a series of tests of a Kansas City Southern Consolidation locomotive equipped with these valves was published in the *Railway Age Gazette*, February 26, 1915, page 371.

LACKAWANNA FIRST-AID CONTEST

The Delaware, Lackawanna & Western on February 25 held a first-aid contest at its Hoboken, N. J., terminal for the men on the Morris & Essex division.

The Lackawanna has been giving its men an opportunity to become proficient in first-aid work for seven years. The men in the neighborhood of the coal mines in particular have had especially good opportunities, because they have had access to the government's first-aid car stationed there. Those on the Morris &

Teams in Lackawanna First-Aid Contest Trying Methods of Artificial Respiration.

Essex division who have desired first-aid training have received their instruction from a course of six lectures given each year by Dr. W. J. Arlitz, who is in charge. Each spring a big contest is held at Scranton, open to all employees of the road, and all who qualify are given diplomas and medals.

The contest at Hoboken was the first at which the men competed for valuable prizes, these prizes having been donated by disinterested persons in Hoboken and Jersey City.

The contest covered such things as: applying a splint and dressing for a fracture of the forearm; artificial respiration; the application of splints for a fracture of the leg; and treating fractures of both thigh bones. The events were 12 in number.

Six teams, averaging six men each, and four individuals competed. Team No. 1 from the electrical department at Hoboken won the first team prize, the Patrick R. Griffin cup, and James Hughan, the captain, was the winner of the first "experienced individual" prize, a diamond locket presented by the Hudson Observer of Hoboken.

The illustration shows several of the teams trying the Schaefer and Sylvester methods of artificial respiration. Those in the foreground are members of the winning team.

Maintenance of Way Section

Accurate Map Records

On some roads station and right of way maps and profiles are kept up to date with great care and all changes in the property locations or in grades are noted on them as soon as made. On other roads because of lack of forces or indifference they have been allowed to lie unchanged until they are now out of date and will require a considerable expenditure for their revision, which appropriation is difficult to secure without showing a definite need. One of the indirect benefits now resulting from the federal valuation is the opportunity given to bring these maps up to date. After being revised, the cost of keeping them up is so small relatively, and they are of such definite value in an engineering office for reference purposes and in saving trips out on the line to secure information relative to minor improvements, that there should be no reason for allowing them to become obsolete again.

Records of Treated Ties

The treatment of timber with preservatives to protect it from decay is a development of the last 30 years. In the last decade the number of plants has trebled and the output quadrupled. Railways have been the pioneers in this work and are today the largest users of treated timber. At the same time, only about 25 per cent of the 140,000,000 ties normally required are treated and there still remains much to be done along this line. While the decision to use treated ties has been prompted in some instances by a desire to conserve the resources of our forests, the primary reason in general has been that of ultimate economy. Because this industry is still practically in its infancy, few authentic actual records of the life of treated as compared with untreated timber are available covering any large number of ties and the bases upon which authorizations for expenditures for the treatment of timber have been made have been largely estimates. Likewise, few roads have installed treated ties in sufficiently large quantities, and for a long enough term of years to show any actual decrease in the normal tie requirements. This at once shows the importance of the compilation of records of the life of treated and untreated ties under a wide variety of typical conditions. While such statistics are difficult to collect, and if not properly compiled are worse than useless, because of their misleading character, they are the only basis upon which the actual economies resulting from timber preservation can be definitely shown, although commonly recognized. The Santa Fe has been a pioneer in the treatment of timber, opening its first plant in 1885, and now operating two plants with a capacity practically equal to its normal requirements. Approximately 65 per cent of the ties now in its tracks are treated, probably a larger per centage than on any other road. It has also had a larger number of treated ties in track for a longer period than any other road in this country. The results which it is now securing are therefore highly instructive. Its normal requirements, for slightly over 11,000 miles of line are about 3,500,000 ties. During the five years ending with 1909 the average number of ties inserted per mile of track was 346, while during the last five years this average decreased to 316, or 9 per cent. For the past two years the normal requirements have shown a decrease of about 600,000 ties annually. As the standards of maintenance have been maintained, if not raised, during this latter period, this reduction in the tie requirements may be fairly attributed to the results of timber preservation. This is probably the first record of this nature on so large a scale in this country. Within a few years similar records will undoubtedly be secured on several other roads which have been treating ties actively for a number of years.

Rail Records

Few records are more difficult to compile and maintain accurately, or are in general more inaccurate, than those showing the amount of rail on hand and its location. There are so many opportunities for discrepancies to arise, nearly all of which are cumulative, that if the material is not checked thoroughly at regular intervals the records soon become of little value. The one redeeming feature of this condition is that while it may not be possible to locate this material in the records, most of it is not lost to the road so that the losses are largely only in accounting. However, if such records are worth keeping at all, and no one questions their value, they should be kept with sufficient accuracy to make them reliable for the purposes for which they are intended. The problem is to secure some method by which this desired degree of accuracy may be attained. Even the closest supervision frequently fails to secure accurate reports from the foremen, many of whom have a limited education. Most of these men naturally feel that their first important work is on the track and they see little or no necessity for the compilation of the records required of them other than the payrolls. It must be admitted that the tendency in this respect has been increased somewhat by the introduction of unnecessary reports in certain instances and by the continuance of other reports after the demand for their compilation has passed, tending to create indifference towards all reports. The plan of making a periodic check of all rail on hand recently adopted on the Albuquerque division of the Santa Fe and described in another column, is one method of securing the proper degree of accuracy. While at the first glance this thorough check of the material on hand would appear to take considerable time when extended over a system, if properly planned it need not require a great deal of time, for much of the information can be gathered in advance as opportunity offers. Furthermore, the fact that foremen realize that they will be required to account for all material turned over to them and to check the amount on hand at periodic intervals will impress them with its value and make them more careful in reporting it.

THE VALUE OF NEATNESS

THE savings resulting from a campaign for neatness about station grounds, tool houses and the right of way in general are commonly considered more or less imaginary, or at least intangible in character. While more attention is being given to this subject now than formerly, many believe that the only returns of any consequence are those resulting from a more favorable impression on the public. A few years ago if a foreman maintained good riding track, little attention was paid to the appearance of the right of way or many of the other details under his care. Today, while requiring the same or even higher standards of track maintenance, more stringent regulations are enforced regarding these other duties. Many of the older foremen and supervisors are not in sympathy with these later ideas and do not believe that they pay. For this reason it may be well to consider some of the reasons prompting this change in ideas and observe to what extent the results are real.

Undoubtedly the intangible result of creating a better impression in the minds of the public regarding the property is one

of considerable value. It is natural for a patron to expect good service from a road which gives the appearance of being prosperous and able and willing to keep its property in good condition. Well maintained property and good service are naturally associated together. There is another tangible result reflected in the morale of the employees. Neatly kept surroundings are certain to create in the employee habits of care and precision. The efficient foreman is seldom the one who is careless with the use of his material, for the same habits which create carelessness also tend toward inefficiency. In general, the section which is neatly maintained will also be found to be most efficiently handled.

There are, however, direct results which may be measured. The value of neatly kept and well policed grounds as an adjunct to the promotion of the safety of employees has been referred to so frequently that we will not discuss it here. Continued carelessness in the maintenance of property necessarily results in excessive and wasteful use of material. The habit of allowing new and scrap materials to accumulate ties up large sums of money unnecessarily when an entire system is considered. The comparisons of the two tool houses described on another page in this issue may be duplicated many times over throughout the country with similar savings in material. Undoubtedly the greatest advantage from a systematic effort to maintain orderly property is this detection of surplus material. This in turn results in a considerable decrease in stock as well as in the losses resulting from obsolete materials.

It is largely for this reason that great attention has been given to this subject during the past few years and the amount of material returned to service or for sale has been surprisingly large. Some of those supervisors and foremen who have been most active in their criticism of these methods will be surprised, if they make investigation, to know the amount of material which is held on their territories unnecessarily.

RENEWING BRIDGES UNDER TRAFFIC

IT is an axiom in every bridge maintenance organization that work must be so handled as to eliminate or at least to minimize interference to traffic. In the renewal of old bridges this may entail considerable difficulty, particularly on lines of dense traffic and without convenient detour routes. It is frequently important that the alinement existing over the old structure be maintained either on account of the economy possible through the use of the old substructure or because of limitations imposed by a lack of right of way or the proximity of important buildings or other improvements. In the case of double tracking a single track structure or in renewing a double track deck girder bridge it may be possible to replace one track at a time, shifting the traffic from track to track between operations, but for single-track bridges and truss spans some arrangement must ordinarily be worked out for making the actual change between trains or for diverting the traffic. Under the pressure of such requirements numerous plans have been devised for handling these problems, many of which are ingenious in their nature and effect considerable economy.

The possible method depends largely on the types of the new and the old structures. When girders replace girders it is preferable to handle each span as a unit either with a derrick car or by lateral movement. The latter method has been developed by some roads to a point where the time of making the actual movement is measured in minutes or even in seconds. When girders replace truss spans it is customary to remove only the floor system of the old structure before placing the new spans in operation.

The more usual problem at present, however, is to renew an old truss bridge with deck plate girder spans, the relative economy of short spans having increased considerably since structures now requiring replacement were built, as a result of the continued decrease in the cost of concrete for substructures. When the old piers are in good condition, as is frequently the case, it is common to replace each truss span with two girder spans, building new piers intermediate between the old ones. The work of renewal must then be divided into units equal to the new span length or half the old span. When derrick cars with a sufficient capacity are available the new girders can be brought up and placed consecutively from one end, the truss floor in each half span being removed immediately before placing the girders. This method as used on the Wheeling & Lake Erie, was described in the issue of February 19.

The span fully assembled may also be carried out to place on flat cars and supported there by a derrick car at one end and a gallows frame at the other, or by suspending from the old trusses by tackle until the old floor is removed. In other cases the assembled spans may be carried out to place suspended between derrick cars or from flat cars and held over the final location while the floor is removed. An economy in the dismantling of the old truss spans after the erection of the new girders was effected by the Pere Marquette by moving each old span out on the shore supported as a unit on flat cars, allowing the dismantling to be handled more quickly and easily. This work is described elsewhere in this issue.

When trusses replace trusses, the erection of the new bridge outside of the old may allow the work to be handled without interruption to traffic and without recourse to falsework in the stream. A striking example of this method is furnished by the Kenova bridge of the Norfolk & Western, which was replaced about two years ago by travelers operating on the upper chords of the old spans, receiving material from construction tracks laid on temporary brackets outside of the new trusses. When falsework can be used for the erection of the new structure alongside the old, the new bridge is frequently placed by lateral movement with slight interference to traffic. This possibility is well illustrated by the article in this issue describing the record performance of the Pennsylvania in moving three 240-ft. spans weighing 2,740 tons in an elapsed time of 10 minutes and 17 seconds.

The handling of movable bridges presents a special problem as the conditions which require such a bridge make impossible the methods adopted for fixed spans. The general practice at present for moving swing spans is to float them on scows. Several instances of the successful handling of heavy bridges in this manner have been described in these columns. With proper preparatory measures the river and rail traffic need not be interfered with unduly. The lift bridges which can be erected in the open position have special advantages in this regard, as it is often possible to complete the erection of such a bridge and put it in condition for operation before it has ever been lowered into its permanent position. The most recent example of a large structure handled in this manner is the vertical lift span of the Pennsylvania and the Chicago & Alton over the south branch of the Chicago river, which replaced a swing span and could not be lowered until the old bridge was cut in two and one-half floated away on scows.

NEW BOOKS

Structural Steel Drafting and Elementary Design. By Charles D. Conklin, Jr., in charge of structural design, Cooper Union Schools, New York City. Size 9 in. by 12 in., 154 pages, 149 illustrations. Bound in cloth. Published by John Wiley & Sons, New York City. Price $2.50.

As a large number of the graduates of engineering schools begin their practical experience as structural draftsmen, a book giving complete instructions as to methods of detailing and designing the ordinary structures should have a wide application. "Structural Steel Drafting and Elementary Design" is intended for use both in class room work in engineering schools and for reference by draftsmen. It covers in considerable detail the organization of a structural steel designing office, requisites for working drawings and the methods used in designing and detailing ordinary structures. The designs and details for a steel roof, a deck plate girder railway bridge, a country highway bridge, and a through-riveted railway span are included. The general specifications for steel railway bridges of the American Railway Engineering Association are published in an appendix. The illustrations include many full page plates illustrating the arrangement of working drawings and the method of showing details.

Letters to the Editor

A SPECIFICATION FOR ZINC CHLORIDE TREATMENT

Cleveland, Ohio.

To the Editor of the Railway Age Gazette:

There is apparently a wide divergence of opinion and much misunderstanding among users of chloride of zinc for the treatment of timber owing to the fact that some important features are left out in the consideration of this question. These are the individual variation in the absorption of the solution by various kinds of ties and different species of wood, and the temperature of the solution at which the percentage of strength is taken.

It has been the almost universal custom in this country to specify a certain quantity of dry salt per tie, or per cubic foot of timber, on the supposition that individual ties in the same charge absorb an equal quantity of solution. This is incorrect. It has been clearly demonstrated that the absorption of individual ties in the same charge varies greatly, depending upon many factors, such as the species and character of wood, the degree of dryness, the size of tie, etc. It has also been clearly demonstrated that the variation in absorption, when treated to refusal, ranges from 10 to 50 lb. per tie for oak, from 20 to 65 lb. for beech and from 30 to 90 lb. for loblolly or soft pine, when ties are seasoned in the open air and treated in the usual manner. Therefore the *average* absorption for oak would be 30 lb. per tie, for beech 42 lb. per tie and for pine 60 lb. If we treat these three kinds of ties with a solution 3 per cent strong—that is, 3 lb. of dry salt dissolved in 97 lb. of water—some will absorb as little as 0.3 lb. of salt, while others will absorb as much as 2.7 lb. per tie. Perhaps the *average* would figure 1.5 lb. per tie, but that is manifestly not the proper way of specifying the quantity and the strength of the chloride of zinc that should be injected into the timber.

Also the temperature of the solution must be taken into consideration when the readings are taken with a Beaumé hydrometer. In the heavier solutions, say, 30 to 60 per cent strong, the influence of temperature is small, so that no account need be made of it, but with those highly diluted it is necessary to define the effect of temperature very carefully to get a true measurement of strength. No more satisfactory means has been found for testing the strength of a chloride solution than Beaumé's hydrometer, using the coarse hydrometer, 1 to 60 deg., for the concentrated solutions, and the fine hydrometer, 1 to 6 deg., divided to 0.1 deg., for highly diluted solutions.

The degree of dilution recommended by William Burnett is 1 part by volume of the salt to 50 parts of water; that is to say, the strength should be 2 per cent. The late Samuel Rowe professed to have demonstrated that ¼ to ⅓ lb. of chloride of zinc salt per cu. ft. of timber, in the shape of 6 in. by 8 in. by 8 ft. pine ties, was sufficient to protect it from decay. European railways do not specify the quantity of salt per tie or per cu. ft. of timber treated, but they specify the degree of strength, according to Beaumé's hydrometer.

The percentage of strength of solution used by European railways is between 2½ and 3 per cent. The solution is injected to refusal and no variation is made in the strength of the solution for different species of wood; the same strength being employed for all woods, whether they be oak, beech or pine. That seems to be rational, as no one has as yet demonstrated, or even asserted, that the solution should be made stronger for one species of wood than for another.

The strength of the solution should be sufficient to prevent decay, and possibly a little more to make up for any salt that might leach out of the ties in the course of time. It should also be borne in mind that this can be overdone and there is danger of making the solution too strong and injuring the fibre of the wood. In 1863 the Philadelphia, Washington & Baltimore built a Burnettizing plant and treated several thousand beech ties with chloride of zinc. It was reported that the ties were as "brittle as a carrot," which was undoubtedly caused by using too strong a solution. The strength of the solution is not stated, but it is said to have been about 6 per cent, which on the basis of an average absorption of 42 lb. per tie would be equivalent to 2.52 lb. of dry salt per tie.

Many of the specifications in this country, covering the treatment of ties with chloride of zinc, call for an injection of a mean between these two extremes, namely, an *average* of 1½ lb. of dry salt per tie. In treating oak ties having an *average* absorption of 30 lb., the strength would be equivalent to 5 per cent; for beech with an *average* absorption of 42 lb., 3.5 per cent, and for pine with an *average* of 60 lb. per tie, 2.5 per cent strong. It has never been found possible, by any known process, to inject into each and every tie an equal quantity of preservative, therefore, the strength of the solution should be fixed and not the quantity of dry salt per tie, or per cu. ft. of timber. Some ties may absorb but little, and others a great deal, but the strength of the solution should be the same for all. The strength should be expressed in degrees Beaumé, at a certain temperature. Then, and not until then, shall we have a definite understanding as to the strength and quantity of chloride that should be used for treating ties and timbers.

I would suggest the following specification for the treatment of railroad ties of all kinds, with chloride of zinc, either singly or in combination with creosote oil:

"The zinc solution must have a strength of 3.5 deg. Beaumé, at a temperature of 70 deg. F. This is equivalent to 3 per cent strong. Ties of all kinds and sizes should be treated to refusal."

W. F. Goltra,
President, W. F. Goltra Tie Company.

ABSTRACT OF ENGINEERING ARTICLES

The following articles of special interest to engineers and maintenance of way men, to which readers of this section may wish to refer, have appeared in the *Railway Age Gazette* since February 19, 1915:

The Mercury Freight House Tractor Truck.—A new tractor truck that has been performing satisfactory service in the freight houses of the Chicago Junction Railroad and the Chicago & Eastern Illinois at Chicago, was described in the issue of February 26, page 361.

A New Car Ferry with Adjustable Deck.—The ferry which is soon to be placed in operation carrying trains of the National Transcontinental Railway across the St. Lawrence river near Quebec, designed with a provision for adjusting the track deck a vertical distance of 18 ft. and special equipment for heavy ice-breaking service, was described in the issue of February 26, page 365.

Michigan Central Steam-Electric Wrecking Crane.—A new crane designed to operate either by steam or electricity, which was built recently for the use of the Michigan Central in and adjacent to the Detroit river tunnel by the Industrial Works, Bay City, Mich., was described in the issue of February 26, page 369.

Appraisal of the Pere Marquette Lines in Michigan.—An abstract of a report to the Michigan Railroad Commission by Professor M. E. Cooley on his valuation of the lines of the Pere Marquette as compared with previous valuations of that property, was published in the issue of February 26, page 376.

Viaduct Construction on the Kansas City Terminal.—A discussion of the conditions governing the design of the 21 viaducts and 12 subways which were built as a part of the grade reduction and grade elimination work in connection with the Kansas City terminal improvements, written by A. R. Eitzen, office engineer, Kansas City Terminal Railway, was published in the issue of March 5, page 397.

Retaining Walls on Soft Foundations.—An abstract of a paper by W. S. Lacher presented before a recent meeting of the Western Society of Engineers, outlining tests made by the Chicago, Milwaukee & St. Paul on block and other types of retaining walls at Milwaukee, Wis., and describing the successful use of block walls at that place was published in the issue of March 5, page 411.

An editorial commenting on the problem of designing an economical retaining wall, was published in the same issue, page 393.

Replacing a Large Truss Bridge by Lateral Movement*

Reconstruction of Three Double-Track Through Spans 240 ft. Long on Falsework 44 ft. 9 in. from Center Line

By J. C. Bland
Engineer of Bridges, and
John Miller
Assistant Engineer, Pennsylvania Lines West, Pittsburgh, Pa.

Of the 56 bridges on the Pennsylvania Lines West that were totally or partially destroyed in the flood of March, 1913, the structure crossing the Muskingum river about 4½ miles west of Coshocton, Ohio, was the most important and embodied in its reconstruction the most features of interest.

The old structure, built in 1900, consisted of four double-track through pin connected spans, each 152 ft. 2 in. long, and slightly skewed, supported on three piers and two abutments, the foundations of which were carried down only a short distance below the then bed of the stream.

In the flood, pier 3 was washed away, carrying with it spans Nos. 3 and 4, the latter being swept about 200 ft. downstream. Pier No. 2 settled 6 ft. on the upstream end, letting down the west end of span No. 2. Pier No. 1 and the abutments were undamaged. It was found possible to level up span No. 2 on cribbing, and to use this span as well as span No. 1, which was undamaged. A single-track pile trestle was driven across the opening and the second track was afterwards carried across on four 89-ft. deck plate girder spans, which were on hand for the renewal of another bridge. These girder spans were supported on cluster pile bents, leaving openings of about 60 ft. The pile trestle track was subsequently changed to similar deck girder spans to avoid blocking the waterway with piling. Double-track traffic was carried over these temporary spans till July 20, 1914.

New Bridge Completed on Falsework 44 ft. 9 in. from Permanent Location

It being decided that more waterway was required, the new bridge was designed for three double-track through riveted truss spans, each 240 ft. long, on new concrete masonry. Since, in all probability, the old piers failed from undermining, it was desirable to carry the new masonry below the influence of any future scour, and as borings, made at the new pier and abutment locations, and carried to a depth of 140 ft., failed to disclose anything but sand and gravel, it was decided to carry the pier foundations by pneumatic caissons to about 75 ft. below the base of the rail or 45 ft. below low water, this being about 38 ft. below the lowest point of the river bed.

It was originally intended to build the abutments in the open on concrete piling, but afterward, both to hasten the work and to be independent of weather conditions, the pneumatic process was adopted for the abutments also, and these were carried down to 31 ft. below low water. The grade line over the bridge was raised three feet.

The pier caissons were actually sunk to 73 ft. below base of rail or about 36 ft. below the lowest point of river bed, at which depth a good gravel about 4 in. in diameter was found. The average rate of sinking for the entire job was about 2 ft. per day, which was considerably more than was anticipated. The maximum air pressure used was 22 lb. per sq. in.

Moving in the New Bridge Showing Clock and Telltale for Indicating the Position of the Span and in the Distance One of the Two Derrick Cars Which Furnished the Power

A mixing plant and material bins were installed at each end of the bridge, the concrete for Pier No. 1 being trucked from the east end mixer on a trestle and that for Pier No. 2 from the west end on a track carried on outriggers secured to the girders of the temporary spans. The mixture used was 1:2:4 throughout, and no reinforcement was used. The total amount of concrete used was about 7,000 cu. yd.

The piers are rectangular, with a segmental cutwater on the upstream end. They are 46 ft. long and 8 ft. wide under the coping, and have a batter of 1 in 12.

While the masonry was being built the wrecked spans were removed from the river, the parts above water being burned apart with an oxy-acetylene flame, and hauled out by a 75-ton guy derrick. The submerged parts were dynamited and removed, a diver being employed in the under-water operations.

The new trusses are spaced 31 ft. apart and are 44 ft. high at the center and 35 ft. at the hips. The structure was designed for a live load of 5,500 lb. per lineal foot of track, and 66,000 lb. concentrated weight, with an addition of 50 per cent concentrated weight in proportioning the end connections, and in determining

*Abstract of a paper presented before Section D of the American Association for the Advancement of Science at the Philadelphia meeting, December 30-31, 1914.

the sections used in posts, diagonals, end posts and the two end panels of the bottom chord. The total shipped weight of the three spans was 2,740 tons.

Owing to the heavy traffic it was not desirable to erect the bridge on its permanent alinement and the following scheme was

Special Pile Driver Placing Falsework Bents 30 Feet Ahead of Last Bent Driven and Designed to Drive Six Piles at One Setting

adopted. Temporary extensions of the piers and abutments were built on the downstream side of such a nature as to be capable of carrying double-track traffic, and on these extensions the new bridge was erected on falsework at a distance of 44 ft. 9 in. from its permanent location. When the new spans were completed traffic was diverted over them as a run-around, the old spans were dismantled and the temporary spans removed. The new spans were then rolled into their permanent position.

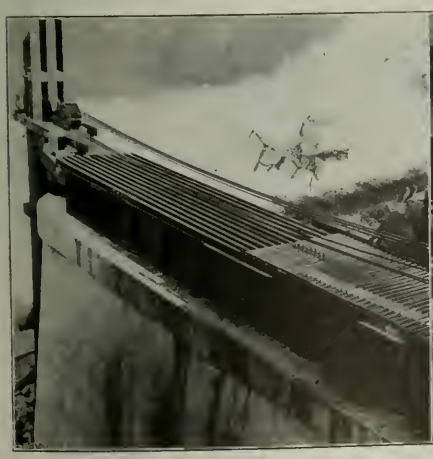
The temporary extension for Pier No. 2 consisted of 98 50-ft. piles, spaced about 2 ft. 6 in. center to center and cut off at ordinary water level. A crib of 4-in. sheeting tied and strutted by 12-in. x 12-in. timbers, and carried from about 4 ft. below the bed of the stream, enclosed the projecting ends of the piles and was filled with sand. The piling and sand were surmounted by a concrete mat 4 ft. thick reinforced longitudinally and transversely by old rails. This formed a temporary pier 42 ft. long by 18 ft. wide. The abutment extensions and that for Pier No. 1 consisted of a concrete mat similar to that described above, without any piling. These temporary supports were built at the same time as the masonry.

On the temporary supports were set 16 framed bents, parallel to the center line of the bridge and anchored to the concrete mat by anchor bolts placed when the concrete was poured. On the caps of these bents were placed 24-in. I-beams, three at the abutments and six at the piers, perpendicular to the line of the bridge, and on these beams were set 10-in. x 12-in. blocking close together; the top of this blocking being at the same elevation as the top of the permanent pier. This constituted the rolling falsework.

The erection falsework was of the ordinary type, a 12-pile bent at each panel point, driven as two independent 6-pile bents, one under each truss with 6 ft. 6 in. clearance between them, and afterwards braced together.

The pile driver was of a somewhat unusual type designed to drive bents spaced 30 ft. apart without using intermediate bents. It also permitted an entire 6-pile bent to be driven at one setting of the driver. It consisted of a platform about 30 ft. long and 20 ft. wide, with 8-in. x 20-in. side timbers and 12-in. x 12-in. cross timbers. This was mounted on four small flanged wheels under the side timbers, spaced 24 ft. front to rear, moving on rails laid on stringers on the bents already driven. Over the front wheels was set an "A" frame derrick with a 48-ft. boom and over the rear wheels was mounted a hoisting engine and boiler.

A 40-ft. projection was cantilevered in front of the platform by splicing 12-in. x 12-in. timbers to the side beams and trussing these vertically and horizontally to the rear of the platform. On this cantilever was carried a gallows frame at a distance of 32 ft. from the front wheels of the platform. The top of this frame was formed of two 10-in. I-beams spaced 22 in. apart to allow the pile driver leads to move transversely between them on rollers.



Top of New Pier 1 Showing "Deadman," Grillages and Roller Nest

Extension of Pier 1 on Which the New Structure Was Supported Before Moving into Place

The width of the gallows frame permitted the driving of six piles, and when the front wheels of the platform were over the bent last driven, the leads were in position for driving the next bent. The leads were warped across the gallows frame by lines to the winch heads of the engine, and the derrick handled the piling into the leads.

In view of the future moving in of the bridge, the following arrangement for supporting the spans on the rolling falsework was used: On the blocking were placed 85-lb. rails, flange down, 12 on each pier and 6 on each abutment supporting a nest of 201 rollers 2½ in. in diameter, and on the rollers were placed the same number of rails as below, with the flange up. These upper rails supported two sandjacks which carried the new spans by their end floor beams, a sandjack being located under the center line of each track.

The sandjacks used were built up of steel boxes open at bottom and top, measuring 6 ft. x 3 ft. inside at the abutment, and 6 ft. x 6 ft. at the piers where the jacks supported the adjacent ends of two spans. They were about 10 in. deep. A 4-in. cover and a 3-in. bottom of oak fitted closely inside the box which was filled with fine dry sand. The oak bottom rested on the upper rails mentioned above and the cover carried a small I-beam grillage which supported the end floor beams of the new spans. The boxes were thoroughly waterproofed, after being placed, to keep the sand dry.

The function of the sandjacks was to support the spans somewhat higher than their final elevation while being moved into place. This permitted the rails, rollers, etc., to be removed from beneath the trusses and the cast shoes to be set on the grillages. The trusses could then be lowered on to the shoes by allowing the sand to escape through openings in the sides of the box left for this purpose, and normally kept closed.

The new steelwork was handled and erected by a Mitchell 50-ton derrick car; the heaviest single piece, the center section of the bottom chord, weighing about 30 tons. Traffic was diverted over the new bridge in its temporary position on July 14, 1914, a slow order still being maintained over it, and the dismantling of the old bridge was proceeded with. This was completed by September 14, 1914.

The new bridge was moved into place on September 22, 1914, the three spans being moved simultaneously. The motive power was furnished by two derrick cars, located symmetrically about the center of the middle span, and securely anchored about 2 ft. apart.

From the cars four ¾-in. wire ropes were run, one to each pier and abutment, and these, turning downward and sideways around sheaves fastened to the end floor beams, were reeved through a four-sheave block attached to a "deadman" at the upstream end of the pier or abutment and a three-sheave block attached to the new spans, and were finally lashed to the upstream sandjack at their respective pier or abutment. This gave an 8-part line at each of the four points of pull, each line going to a separate drum of the hoisting engines.

Each "deadman" consisted of three 8-in. x 18-in. stringers bolted together, resting on the footing and projecting above the top of the pier or abutment. To this projecting end was fastened the four-sheave block. The lower end was tied on with a wire rope passing round the pier. The adjacent ends of the downstream trusses were fastened loosely together by ½-in. plates, allowing some differential motion in the spans but preserving their relative longitudinal positions.

To ensure uniformity of movement a "telltale" was provided which recorded on a graduated board near the hoisting engines the distance passed over at each point of support, thus making it possible to preserve control over the motion and keep the spans in good alinement as they moved in.

The operation of moving was carried out very successfully. Train No. 11 passed off the bridge in its temporary position at 2:45 p. m. and 10 minutes 17 seconds later the special train carrying B. McKeen, general manager, and his party entered it in its permanent position. The actual time of moving the spans was 6 minutes 50 seconds, during which time seven stops were made to correct the alinement. This left a margin of 4 minutes 27 seconds for track work. A structure of slightly greater length has been moved in this manner, but for weight, distance moved, and time of moving, this operation constituted a record.

The masonry was built by the Foundation Company of New York, under the supervision of the division engineer of the Pittsburgh division. The superstructure, manufactured by the American Bridge Company of New York, and erected by the Seaboard Construction Company, was designed by J. C. Bland, engineer of bridges, Pennsylvania Lines West, and erected under his supervision.

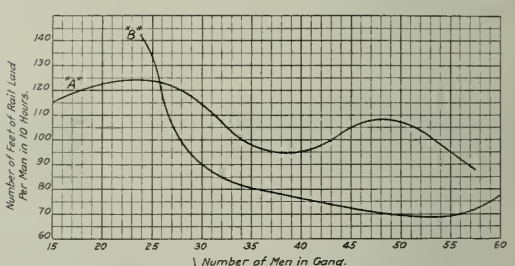
RAIL LAYING

By H. G. Olmstead
Missouri Pacific, Kansas City, Mo.

Rail laying should be started as early in the spring as possible, in order that it can be completed ahead of general track work. By doing this one of the big items going to make up track maintenance will be taken care of, general maintenance, such as tie renewals, ballasting, lining, surfacing, etc., can immediately follow and all track work will be completed early in the fall.

In the unloading of rail for relaying, particular attention must be paid to see that proper lengths are distributed with reference to the needs and to avoid all unnecessary trucking of rails, as this is expensive. Rails should be unloaded from cars with machines, of which there are now several types on the market. With the use of such equipment rail can be unloaded at a cost of 8 cents per rail, while where unloaded by hand the cost will run from 10 to 15 cents per rail. This cost includes work train service and depends somewhat upon the interference with work trains by passing trains. When rails are loaded in box or stock cars end rollers or end skids should be used. In no cases should rails be thrown off cars. A sufficient number of short lengths should be distributed at points where needed, such as curves, yards, street crossings, bridges, etc., as rail should be laid with broken joints, and joints should not be laid closer then 6 ft. from the ends of bridges or from switches.

Proper adzing is one of the most important items in connection with rail laying and should receive a great deal of care and



Relation Between Size of Rail Laying Gangs and Their Performance

supervision on the part of all concerned. Where possible, section forces should be able to do considerable adzing during the winter, which will be a material aid and time saver when rail laying operations are started. All ties should be so adzed that the new rail will have a level bearing on the full width of the tie. When tie plates are used, adzing should be so performed that the entire area of the tie plate will rest on the tie, thus permitting the rail to lay flat and avoid canting. Before laying the rail or applying the tie plates the ties should be swept clean and a coat of hot creosote or other preservative applied.

All joints should be fully bolted and the rail fully spiked. It is preferable to have a small gang following the steel gang so that this work can be kept up to the laying of rail. Then when

the day's work is done all joints are bolted and the rail is fully spiked. The regular section forces should follow and tighten all bolts from time to time.

When considering the size of rail gangs the following diagram shows actual performances. The curve marked "A" shows the amount of rail laid per man for various size gangs. The information was obtained from the daily reports and covers a period of about eight months' work in laying 85-lb. rail 33 ft. long, releasing 56-lb. rail; traffic was light on this line. On the curve marked "B" the traffic was heavier; this work covers about 16 miles of 90-lb. rail which released 75-lb. rail. From these curves it is seen that a gang of 25 men produces the best results.

These curves do not include the application of tie plates, nor lining, surfacing or tie spacing, but only the laying of rail proper. However, they include throwing out the released rail, and the laying of switches complete.

INCREASING THE SCOPE OF THE SECTION FOREMAN'S DUTIES

By E. R. Lewis

Assistant to General Manager, Duluth, South Shore & Atlantic, Duluth, Minn.

In its presentation of this subject last year the track committee of the American Railway Engineering Association stated that "the basic feature is an economic one and the result hoped for seems to be a reduction in maintenance expense by having section foremen do such things as emergency repairs to platforms, stock pens, track bonding, battery renewals, telegraph line repairs, etc., the general idea being to reduce, as far as possible, the expense occasioned by high-priced men moving over the road with great loss of time when only a small amount of work of a simple character is required."

The difficulties of maintaining structures long distances from each other and from bases of supply of labor and materials are recognized and respected by every business man of experience. When the distances become so great and the structures so numerous and so varied in character as the property of a steam railway, the matter of efficient maintenance becomes of much importance to the railway company.

An increase in efficiency in the maintenance of structures, appears to be the primary object of the American Railway Engineering Association in this investigation rather than more work for the section gang. It is argued in the affirmative that the section foreman is the company's representative in charge of a limited mileage of track, and that he is therefore always in position to perform the various duties described, with less delay and expenditure than high-priced men from other departments sent from and returning to division headquarters. This argument implies, as is generally correct, that the foreman artisan and his men are more highly paid than the section foreman and his men.

Arguments in the negative urge "safety first" as good reason for decreasing instead of increasing the scope of the section foreman's duties; for keeping him and his men working continuously together, maintaining the tracks; for on the constant vigilance and the "stitch in time" of the section force depends the safety of each moving wheel. It is further urged that there is serious doubt regarding the ability of track foremen and laborers to properly perform the duties of high-priced artisans even when the work is simple. There is the further difficulty of delegating authority to the section foreman by officers of other departments and the question of whose work should take precedence.

The preponderance of argument on the subject as stated, under present conditions of railway labor and organization, appears to indicate that the nays have it. But there is a possibility that the subject has not been stated fully, that the arguments are incomplete, and that present conditions admit of alterations for the better, and in favor of the increase in efficiency which should result from localized maintenance. American education has for more than three decades, and until the last few years, been increasingly along special lines. America is known among nations as the home of the specialist, the mecca of the inventor, the asylum of the enthusiast, be his monomania what it may. Any American who has taken abroad American enthusiasms, American methods, American arguments, jealously guarded for fear of infringement, has probably been shocked at the impenetrable frigidity with which his cherished ideas have been received. The specialist of America is an American specialty. His education is employed largely as a means to an immediate end, or as an agency to very early business opportunity. The personnel of railway staffs is largely composed of men who have gained their education, their knowledge of their work, and of life, wholly or in part through their own personal efforts, by spare time study and daily experience in the ranks of employees, who have risen as their qualifications allowed, step by step. That such close practical knowledge of details is the best information a railway foreman or officer can have, there seems no doubt. But special subject knowledge has perforce a restricted scope. If it could be preceded by liberal and thorough education over a broader course, the specialist who has risen through one certain department would be a better general foreman or officer. It is feasible to teach an employee of any department the details of the work of employees of the several departments, while keeping him steadily employed. It seems well worth the while of a railway company to so instruct men, in order that they may, as foremen of roadway, take up the broad responsibilities indicated as those which should be undertaken by foremen of the maintenance department.

The section foreman is skilled in track work only. His gang is composed of similarly skilled laborers. They are specialists in their own trade. If any doubt the statement, let him read the rule book, look over the foreman's bulletins, glance through the foreman's diary and follow the gang through the one day's work. I venture to say he will admit that he has had "a rather full day." Until it is generally understood by all concerned that the trackman is a skilled laborer, with all that such recognition implies, the problem of retaining track labor bids fair to remain in part unsolved. The signal maintainer, the bridge foreman, the building foreman, the telegraph lineman, are likewise all specialists. Education must precede the installation of foremen of roadway, if the creation of such foremanship is to be successful. It must not be too short a course, and candidates for entrance should be carefully selected and as carefully and patiently trained. It is said with truth that the problem is largely local with the individual road. The principle, however, is not local.

The basing of the specialist's education on the broad foundation of general knowledge is a nation-wide necessity. There seems danger in so presenting this subject that railway managements may take it up on the basis of expectation of immediate drastic reductions in labor costs. Time, attention and money are necessary to get the desired results. Inducements must be offered before candidates will be found to undertake the roadway foreman's work. A man capable of overseeing artisans, even when the work done is comparatively simple, is worthy of his hire. If he is to further oversee the track work of his section, his knowledge, responsibilities and emoluments should be extended. The writer is of the opinion that the foreman of roadway should be the direct superior of the section foreman; a trackman reporting to the roadmaster or assistant roadmaster; and that he should have supervision over the maintenance of a section of track, as well as over such items of maintenance of other structures on his section as may be delegated to him from time to time.

The evident intention of having the actual maintenance of

structures other than track performed by track laborers will at first meet with disapproval in most trials. The men as well as the foremen need educating. Tools are needed. Material is needed. It may be found feasible to keep a handyman or two in each section gang who may assist the roadway foreman when required. Taking a man or two from a section gang is by no means so serious as taking the foreman.

There seem fair grounds to consider, too, local purchase of both labor and materials, and for small contract work under the authority and supervision of a foreman of roadway. Labor cost is less than half the total cost of building repairs. The transportation of materials and tools from and to division headquarters is quite as serious a matter as the traveling time and personal expenses of artisans. Even the purchase of materials in small quantities at way stations at prices higher than those quoted by the purchasing department is often justified, when risk of damage, delay, cost of handling and the expense for transportation are considered.

Is there any more reason why a pane of glass and a small amount of putty should be shipped from division headquarters to a distant way station depot, than that a glazier should spend a night on a train in order to install the glass and take the next train back? Why not purchase the material locally, have the town glazier put it in and allow the company's local agent to pay the bill? Would not this be both cheaper and better than to have the section gang mark time while the foreman installs the glass?

But of course the purchasing agent and the auditor—quite so. But these matters may be put within the discretion of the foreman of roadway. The agent may be allowed to obtain for him wire authority for the material, labor and expenditure. The agent is the company's local treasurer and may be given authority to pay such bills promptly. If old methods must be altered and precedents established in order to increase efficiency, should not the old routine be eliminated and business done by the shortest, cheapest and best methods?

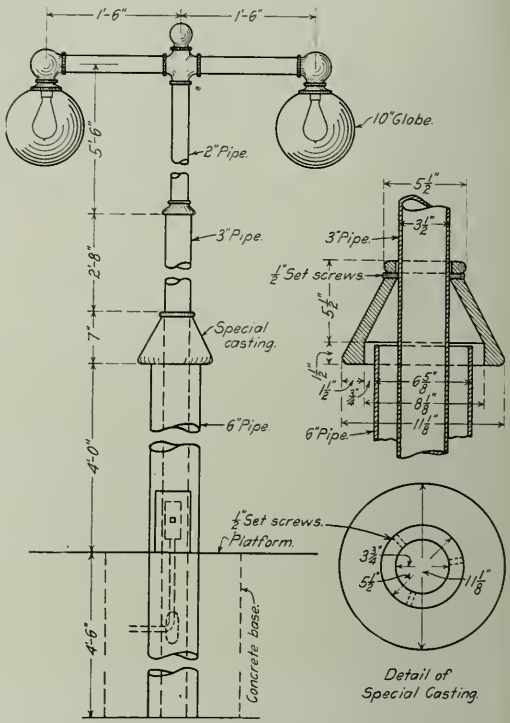
The proof of the pudding is in the eating. The best proof in this discussion is practical application. There are among the employees of every railway one or more men available who are capable of at once assuming the duties of foremen of roadway. The door is thus open for all to immediate small economy which may have far reaching results.

A SHOCK-ABSORBING CAST IRON LAMP POST

The Chicago, Milwaukee & St. Paul has used for a number of years a station platform lamp post made up of sections of standard sized, black cast iron pipe wherever electric power was available. These posts have proved fairly satisfactory, but in some cases the replacement of the globes and lights broken by the impact of baggage and express trucks striking the posts has been an item of considerable expense. This has been especially true on island platforms where the posts are set in the center and the trucking space on each side is limited.

After trying several schemes to eliminate this objectionable feature, it was found that when the lamp post proper is placed inside and entirely independent of a larger pipe extending some distance above the platform this outside pipe will absorb any shock received from trucks and will not transfer it to the lamp post, the lamps and globes therefore remaining unharmed. The improved post as used at a number of points recently is shown in the accompanying drawing, and the installation at Lewiston, Mont., where both side and island platform lights were required, is illustrated herewith. The 3-in. pipe which forms the lower section of the lamp post is set inside a 6-in. protective pipe and extends 4 ft. 1½ in. above the platform. Both pipes are embedded in concrete for a length of 4 ft. 6 in. below the platform level and the space between the two pipes is filled with cement mortar up to that level in order to give the larger pipe sufficient rigidity to enable it to act as a cantilever in absorbing shocks. In setting the posts it has been found desirable to place them before the platform is built, so that the joint at the platform line will be as solid as possible.

The top of the outer pipe is covered by a special casting, uniform in appearance with the standard reducing coupling used



Details of C. M. & St. P. Standard Lamp Post for Station Platform Lighting

between the 2-in. and 3-in. sections of pipe about half way up the post. This casting is slipped over the 3-in. pipe and held in place by three ½-in. set screws with its lower end covering the

A Recent Installation of a Shock Absorbing Lamp Post Design at Lewistown, Mont.

end of the 6-in. pipe. An annular space of ¾ in. is provided between the casting and the pipe to allow for free vibration when the outer pipe is struck. We are indebted for the information contained herein to C. F. Loweth, chief engineer.

Norfolk & Western Frog and Switch Shop at Roanoke

Practically all Frogs, Crossings, Switches and Guard Rails Normally Required by the Road are Made at this Point

The Norfolk & Wetsern maintains a frog and switch shop at Roanoke, Va., at which are manufactured practically all of the frogs, crossings, switches and guard rails required on this road, and in addition repairs are made to motor cars, track jacks, drills and other track tools, switchstands, frogs, etc. The continuation and extension of the work handled at this plant is the best indication of its success, both as a means of reducing the cost of manufacture and repairs of the parts handled and of increasing the facility with which the maintenance work can be carried on by providing a supply of this material regulated closely to the demand. As an indication of the latter advantage, any standard frog or switch can be secured out of stock without any delay, and in general, a special frog or crossing can be finished in three days.

The frog and switch shop is a part of the road's general shops throughout the other shops where the equipment and material can best be assembled. The shop is in charge of a superintendent, H. J. Sauter, reporting to the superintendent of shops, and employs an average working force of 50 men. The monthly capacity in frogs, switches and guard rails is 150 each. The record for a year ending with a recent month showed that 677 rigid frogs, 702 spring frogs, 1,309 switches and 996 guard rails had been manufactured, while 50 motor cars, 18 hydraulic jacks, 193 track jacks, 12,654 track tools, 44 track drills, 337 switchstands and 20 frogs had been repaired.

The rail mill is operated by 15 men who handle the rail from storage over the skids to the shop where the ends are sawed and chipped and new holes drilled, after which it is classified in the yard and loaded on cars for delivery to relaying points or piled for storage. The average daily output of this plant is 450 85-lb.

Above—Assembling and Riveting Together the Parts of a Frog
Below—An 80-Ton Hydraulic Rail Bender

at Roanoke which allows advantage to be taken of facilities in other departments and modifies to a certain extent the equipment necessary. The frog and switch shop building is 72 ft. by 192 ft. in size, with an ample area for the storage and classification of rail adjacent to the building, as shown in one of the accompanying illustrations. The main building is used for the manufacture of frogs, crossings, switches and guard rails, an addition next to the rail yard is used for the sawing and redrilling of rails taken from main tracks, and the repairs to motor cars, tools, switchstands, etc., as well as the reclaiming of angle bars, spikes, track bolts, etc., are handled at various other points

rails in eight hours. Rails are loaded and unloaded by a 20-ton locomotive crane with a magnet, having a capacity of approximately 900 tons per day of nine hours. The rails are sawed by a friction saw, which was manufactured at the Roanoke shops, driven by an 80-hp. motor at a speed of 2,700 r. p. m., and having a capacity of sawing 85-lb. rail (one cut) in 12 seconds. The rails are redrilled by two three-spindle, motor driven rail drill presses having a capacity each of 1,350 holes in eight hours. These drill presses are shown in one of the accompanying illustrations.

The rails, plates, filler blocks, etc., used in the manufacture of

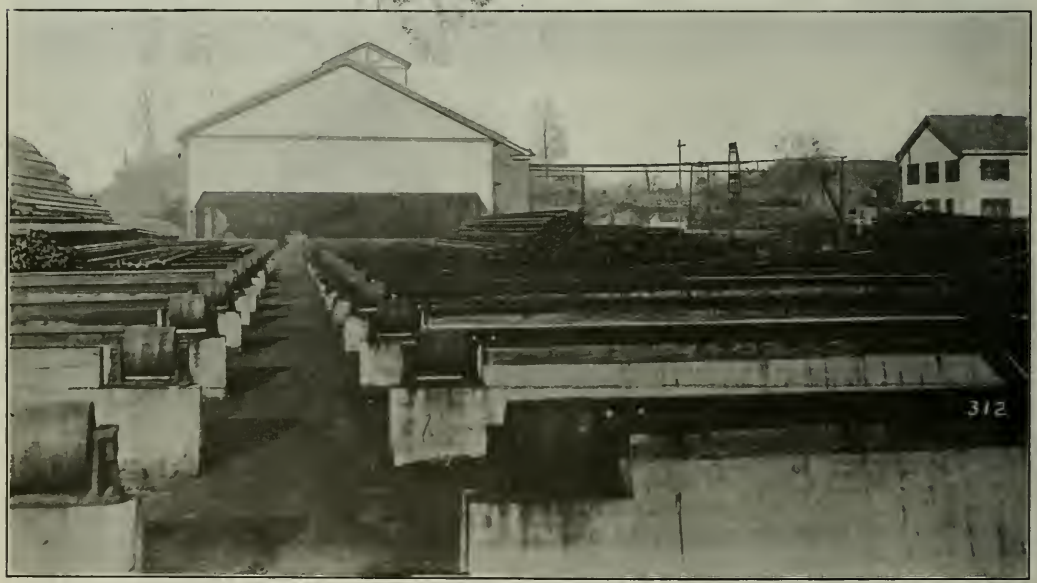
frogs, crossings, switches and guard rails are unloaded on the storage skids when received and taken into the main shop building as required. In this building are located all the machines needed for sawing, bending, shearing, drilling and planing the rails, and ample space is provided for assembling the frogs and crossings and riveting the parts together. A cold cut-off saw is used for making either straight or angle cuts of rails and a saw-

A Pile of Reclaimed Angle Bars Illustrating the Possible Saving from Scrap

sharpening machine is included in the equipment. The rails are bent in an 80-ton hydraulic machine illustrated herewith. This machine is operated by three men and requires 30 min. to bend the rails complete for an 85-lb. rigid frog, and 7 min. for an 85-lb. switch or a set of 85-lb. guard rails. The rail-base shearing machine is operated by two men, shearing the rails complete for a rigid frog or a set of guard rails in 5 min., and for a spring frog in 3 min. The rivet holes in rail bases and plates are drilled by a 36-in. drill press. The planing of rails is handled by a 48-in. draw cut shaper and three planers. One of the operations, for which the shaper is used, the shaping of planer tool clearance in frog tongue rails, requires 8 min. The planer shown in one of the accompanying illustrations requires 1 hr. and 48 min. to plane the four frog tongue rails on which it is working. One of the other planers can finish two 100-lb. 18-ft. switchpoints in 1 hr. and 54 min. Three holes in the web of a frog rail can be punched by a punch and shear in 3 min. A swinging grinder and pneu-

A Pile of Completed Frogs in Stock, Showing Typical Spring and Rigid Frogs of the Types Manulactured at Roanoke

matic chipping hammer is used for finishing switchpoints, this operation requiring 5 min. All frogs and switches are riveted in preference to bolting, the assembly of a frog being shown in one of the accompanying illustrations where 50 rivets are being applied, including the reaming of the holes, in 50 minutes by 2 men. The frog tongues can be riveted together by a yoke riveter in 5 min. Air hoists are provided throughout the shop for the handling of the heavy material and careful study is given to the sequence of operations to eliminate as much handling as possible.



Rail Classification and Storage Skids, Showing Frog and Switch Shop in Background

The reclaiming of angle bars is handled in the blacksmith shop where old bars sorted from the scrap received at the scrap wharf are heated in an oil furnace and swedged under a drop hammer. This work is done by two men with an average daily output in 8 hours of 170 85-lb. Bonzano bars or 290 85-lb. straight angle bars. The cost for the reclaiming is about $0.15 per pair. Old spikes and track bolts are also sorted from the scrap received, the spikes being straightened by hand on an anvil and the bolts stripped of the nuts and rethreaded. This plant is also handling the reclaiming of bar iron by rerolling to standard sizes the miscellaneous material sorted from the scrap. These scrap reclaiming rolls are operated by five men, turning out an average of 5 tons in 8 hours. A washer-making machine installed near the scrap wharf and operated by one man has a daily capacity of approximately 2,500 lb. of assorted size washers, the material for which is secured from the miscellaneous scrap. A rivet-making machine and furnace operated by two men has a capacity of 30,000 rivets in 8 hours.

In the repair of track drills all parts are ordered from the manufacturer, the drill being given a through overhauling and put back in service practically as good as new. In the repair of frogs, the old plates, spring boxes, reinforcing bars, etc., are used, thus saving a large amount of material from scrap and considerably reducing the cost. All old track tools are repaired that have the eyes left in them. All the parts needed in the repair of switchstands are made in the shop with the exception of the malleable and cast steel parts.

We are indebted to A. C. Needles, general manager, for the above information.

THE VALUE OF NEATNESS

By an Ex-Section Foreman

While the subject of economy in railroad operation has received wide discussion during recent years, very little attention seems to have been given in these discussions to everyday neatness. Neatness is a fundamental quality in all economical operations. The house-wife who is so overworked or harassed with other duties as to be unable to keep the home in orderly condition, or who for reasons of education and environment is lacking in knowledge of the essentials of neatness, is found to be

Fig. 1—Exterior of an Untidy Tool House

the one who is also wasteful and extravagant in the use of supplies. So it is with many railroad employees whose duties have to do with the use of materials and supplies, and who are kept so busy with their routine work that they never seem to find time to tidy up the premises. There are many others who lack the proper instructions and supervision necessary to enable them to make economical use of the company's property intrusted to their care.

One of the larger railroad systems operating out of Chicago, recently conducted a general campaign on neatness, the pleasing effect in improvement of station buildings and station grounds being at once very noticeable to the public. At the same time, a quantity of serviceable supplies, such as lamps, lanterns, oil cans and similar items were returned to the division storehouses as surplus collected from these stations. In connection with the

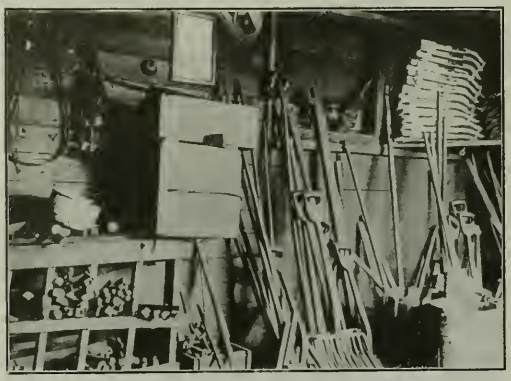


Fig. 2—Interior of the Same Untidy Tool House

same campaign which was extended to division offices, switching yards, and all other points on the system, the section tool houses were given a thorough straightening up.

Unfortunately the general idea seems to prevail that it is not necessary to keep a section tool house in neat condition. Frequently the tools are tossed in a heap on the floor at the close of the day's work and new material, when received, is shoved into a back corner until needed. It seems so easy and natural to allow the tool house to remain in a disorderly, untidy condition that material becomes damaged from long exposure to the weather, and tools and supplies are mislaid and cannot be found when wanted.

The railroad referred to above has a published list of equipment standard for each section tool house. It also operates sup-

Fig. 3—Exterior of a Neatly Kept Tool House

ply cars which are supposed to keep this matter checked up on each trip. Neatness, however, had been a secondary consideration, if thought of at all. There was therefore much work required to straighten up many of the tool houses and surrounding grounds and to remove the tools and material which was so evidently a surplus, once the stock was in neat, tidy condition.

The illustrations show in Figs. 1 and 2 the condition of a section tool house no worse than may be found on any large rail-

road system. When the order came out to "clean up" the following items were found in this house which were not required by the force employed:

24 new track shovels.	1 clamp for a rail drill.
7 old track shovels.	14 tamping picks.
5 ballast forks.	4 tamping bars.
1,000 new nutlocks.	7 lantern frames.
36 torpedoes.	5 kegs track spikes.
60 frog bolts.	4 switch head rods.
1½ kegs of track bolts.	240 tie plates.
5 track chisels.	5 compromise rail joints
3 spike mauls.	19,000 lb. of track scrap.

Credit amounting to $192.37 was allowed for this surplus when returned to the storehouse and the tool house was left in such condition as to be readily checked up by the roadmaster or supply car clerk.

On the same district, there is located the tool house shown in Figs. 3 and 4. This is an ordinary tool house, no expense having

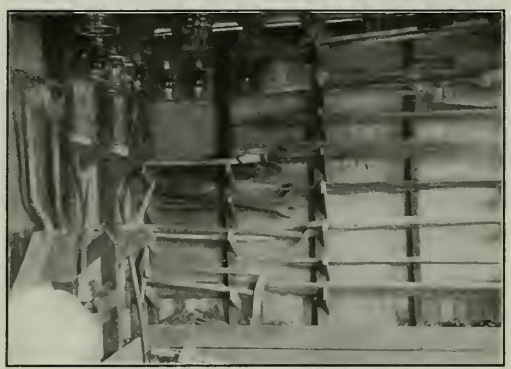

Fig. 4—Interior of the Neatly Kept Tool House

been incurred in fitting it up with the bins, racks or cupboards which are such a help in keeping a tool house in orderly condition. The section foreman, however, was naturally neat and careful, and the illustrations show the orderly manner in which his tools were kept. Only a few moments were required to check over the contents of this tool house and no surplus articles of any kind were found therein.

The lessons in neatness taught employees on the railroad system referred to, have proven the longest step in the direction of economy which this railroad has ever made. Where a place is kept in neat systematic order, surplus of any kind becomes at once noticeable, and by being properly disposed of, it becomes an asset in taking care of actual wants in other localities.

MAKING BRICK WITHOUT CLAY

A new process of making brick which is not dependent upon the presence of so-called natural brick clay has been invented by A. Malinovszky, a ceramic chemist, and a plant to manufacture brick according to this process is now being built at Lincoln, Ill. The process consists of combining chemically any coarse material containing silica with a binder of finely divided particles of alumina, silica, potassium or sodium in proportions varying with the different substances and which may be determined by chemical analyses for each supply of material. One of the purposes of this process is to obtain a low fusing point for the binder and a relatively high fusing point for the coarse material. The material is molded, preferably dry, under high pressure and is fired in a manner similar to that used in the manufacture of ordinary brick. The process of firing, however, requires a much shorter period, usually two or three days in an ordinary down-draft kiln. It is proposed to utilize tailings from coal mines at the new plant at Lincoln, and it is stated that on account of the wide variety of materials which can be used, including the by-products of many industries, the process should be applicable in many localities where ordinary brick cannot be made on account of a lack of deposits of good brick clay.

The bricks manufactured by the new process have been repeatedly tested and analyzed. In one test conducted by Robert W. Hunt & Co., an absorption varying from 1.66 to 2.75 per cent was found, and after this absorption test the brick withstood a temperature of 0 to 10 deg. F. for 48 hours and a five-hour exposure to a temperature ranging up to 2,900 deg. F. without cracking or showing apparent damage. A crushing test of the brick conducted at the University of Illinois showed a unit compressive strength of approximately 20,000 lb. per sq. in. Microscopic examinations made by Professor Rollin D. Salisbury, geologist, University of Chicago, have indicated that the texture of the brick is such as to make possible a high polish and the grain is so fine and even that clean cut lettering and carving should be possible.

The American Brick Company, Lincoln, Ill., owns the patent rights on this process and is at present engaged in the construction of a plant at that point.

SUGGESTIONS FOR A BOOK OF RULES FOR THE MAINTENANCE OF WAY DEPARTMENT, EMBODYING THE SAFETY FIRST IDEA

By J. T. Bowser

Maintenance of Way Department, Queen & Crescent Route, Danville, Ky.

Assuming that the organization of maintenance of way employees into safety committees or other similar organizations is impracticable on account of the manner in which they are scattered over the entire length of the road, some other means must be used to reach them and imbue them with the Safety First spirit. This can be done to some extent by correspondence, safety buttons, signs and personal instructions by supervising officials, but these at best are intermittent or of but temporary effect. The following rules are offered as a basis for a printed book or pamphlet to be placed in the hands of every foreman or other responsible employee in the department. For practical use they would, of course, have to be varied to meet conditions or conflicting clauses in the current book of rules.

General

(1) It is the duty of all employees to watch for, and to report to their superior officers, all matters involving the safety of employees and the public.

(2) When it can be done without neglect of other duties, employees will warn off trespassers or others whose duties do not require their presence on the right of way or tracks.

(3) General instructions concerning safe practices must be posted in tool houses or camp cars where they can be seen by employees, and employees should be required to read such instructions.

Supervision

(4) Employees entering the service are required to read or have read to them outstanding instructions or rules involving their own safety or that of others.

(5) Foremen working on double track will require their men to step off of both tracks while trains are passing.

(6) Foremen are required to stay with their gangs at all times, to keep watch for trains and to see that their men perform their work in such a manner that neither their own safety nor that of others is endangered.

(7) Yard foremen or others in charge of men working in places where the passage of engines or cars is very frequent, are prohibited from taking part in the work at hand or performing any other work which will prevent their keeping a proper lookout for trains or cars, unless they assign some responsible man to keep such a lookout.

(8) Men having defective sight or hearing or men who are habitually careless in their work are not considered desirable employees and must not be retained in the service.

(9) The use of gauntleted gloves by employees handling heavy material is prohibited.

(10) Except in cases of emergency, classes of work usually handled by other employees must not be required of employees not familiar with that class of work. (This applies particularly to handling of equipment and electrical work.)

(11) Under no conditions must high tension electric power wires be handled by other employees than those whose duties require them to look

after such matters. In cases of the breakage of such wires, a watchman should be left at such break until the arrival of the proper person to make repairs.

Clearances and Bad Footing

(12) Except on explicit instructions from proper authority, no track will be laid, nor will any structure be erected, which will not give ample clearance to a man on the side of a car.

(13) When conditions necessitate the construction of a structure or track which does not afford proper clearance to a man on the side of a car, a warning sign giving proper notice of this condition must be posted and maintained at a point where trainmen or others cannot fail to see it.

(14) When it is necessary to obstruct or in any manner change the nature of the ground where trainmen or others habitually walk or alight from trains, the despatcher or other proper authority must be advised so that notice to this effect may be put out.

(15) When it is necessary to make any radical change in tracks, structures or appliances in habitual use, proper authorities must be notified so that notice to this effect may be issued.

(16) Excavations left over night must be protected by railings, and temporary obstructions of any nature must be protected at night by red lights when this can be done without danger of such lights being confused with signals for train operation.

Hand Cars, Push Cars, Motor Cars and Velocipedes

(17) Track foremen will not permit the use, on their sections, of hand, motor, push, or velocipede cars, by others than those whose duties require the use of such cars or those having written permission from a proper authority.

(18) The use of cars for other purposes than the performance of duties is prohibited.

(19) Cars will not be used except when in charge of a foreman or a competent assistant.

(20) When passing trains on double track cars must be set off of both tracks.

(21) Where operators, 'phones or other means of communicating with the despatcher are available, foremen will obtain line-ups on trains before going out with cars.

(22) Foremen will protect their cars by flag when passing through tunnels or over portions of the line where trains cannot be seen for a sufficient distance to enable cars to be set off.

(23) The use of hand cars with wooden handles is prohibited.

(24) Foremen will not carry, or permit to be carried on their cars, any one not an employee of the company or any employee whose duty does not require the use of the car.

Use of Locomotives or Trains

(25) Employees in the maintenance of way department are prohibited from riding on locomotives. (This applies to work trains as well as other trains.)

(26) Except in the performance of their duties, employees in the maintenance of way department are prohibited from swinging upon or riding on trains or cars.

Camp Cars

(27) When camp cars are to remain at one station a week or more they must be spurred out or otherwise protected from trains or cars.

(28) All movable articles in camp cars must be fastened down or otherwise prevented from moving when cars are to be handled.

(29) Heavy tools or material must not be suspended but must be placed on the floor or otherwise prevented from moving.

(30) Foremen in charge of cars are required to see that steps, hand holds, ladders, etc., are maintained in safe condition.

Special Equipment

(31) The responsibility for the maintenance of all special equipment in safe condition lies primarily with the operator, but foremen in charge of work on which such equipment is engaged will make frequent inspection.

(32) Lines, blocks and other apparatus on derricks, hoisting engines, etc., must be thoroughly inspected and tested before being used after the machine has been out of the service.

(33) In freezing weather all water must be drawn from a boiler at night unless provision is made to keep it hot, and when equipment is to be stored, water must be drawn from boilers regardless of weather conditions.

Road Crossings, Gates and Fences

(34) It is the duty of section foremen to see that all grade crossings are maintained in a safe and passable condition, especial care being exercised during the automobile season.

(35) Section foremen will keep cleared away from crossings weeds or other obstructions which prevent a clear view of approaching trains.

(36) All employees will close gates in right of way fences when they are found open and will endeavor to have parties who use these gates keep them closed.

(37) Foremen will look out for breaks in the right of way fences or other conditions which will permit the entrance of stock onto the right of way and will remedy such conditions or will report them to the proper authority.

Inspection and Use of Tools

(38) Foremen will satisfy themselves daily that all tools used by the men under their supervision are in safe condition, and they will prohibit the use of tools found to be defective.

(39) The use of jacks on the inside of the rail is prohibited.

(40) Tools must be removed from between the rails or from points close to the track while engines or cars are passing.

(41) Tools not in use must be kept picked up and placed where they will not be an obstruction.

Scaffolding

(42) Foremen in charge of work which requires scaffolding will personally inspect all material to be used in the scaffolds and satisfy themselves that such material is entirely safe for use.

(43) Foremen will personally oversee the construction of scaffolding and will see that a safe construction is used. During the use of the scaffolds foremen will see that they are not overloaded.

(44) The use of scaffolds by employees or others whose duties do not require it, is prohibited.

(45) Runways or ladders must not be located under scaffolds or at other points where tools or material are likely to fall, and where a considerable amount of work is to be done, temporary railings must be erected to keep men from going beneath them.

(46) Cable and tackle scaffolds which have been stored or shipped must be thoroughly tested for deterioration or injury before being used.

Loading and Unloading Material

(47) Cars must not be loaded beyond marked capacity and top-heavy loading must be avoided.

(48) Forement will inspect all material to be used for standards or stakes and will see that they are securely applied. Properly braced end boards must be applied where rails or similar material is loaded on flat cars.

(49) Rails will be loaded by machine where possible, but when necessary to load by hand the following precautions must be observed: (A) Divide the gang equally on the ends of the rail; (B) Do not attempt to throw rail unless an ample force is at hand to throw it clear; (C) designate one man to call directions and prohibit others from calling; (D) do not attempt to load where men cannot get away readily should the rail fall back.

(50) Loading must be discontinued while trains or cars are passing on adjoining tracks.

(51) When unloading material a lookout must be placed to warn persons passing the car.

(52) Material should not be unloaded from both sides of a car but from each side equally. The same principle applies to loading material.

(53) Men should be called out of the cars when material is being dragged out of hopper bottom cars and should not be permitted to remain in any car while it is being switched.

Handling of Explosives

(54) The use of torpedo signals on station grounds is prohibited.

(55) The storage of dynamite of other explosives in tool houses or camp cars is prohibited.

(56) All shipments of explosives must be made in accordance with the rulings of the Bureau for the Safe Transportation of Explosives.

(57) The use of explosives by others than experienced men is prohibited.

(58) Charges which fail to explode must not be approached until the expiration of ten minutes and they should be removed only by experienced men. All others must remain at a safe distance.

(59) Explosives must be drawn from the magazine only as required and must not be left on the work under any condition.

THE PACKING OF ICE

During the past year the Atchison, Topeka & Santa Fe has been conducting experiments at several ice houses on the Oklahoma division with different materials used in the packing of ice and noting the shrinkage resulting. At Arkansas City, Kan., 406 tons of ice were packed in sawdust at an average cost per ton for labor and material of approximately $0.40. At Purcell, Okla., 502 tons were packed in paper at a total cost per ton for labor and material of $0.31. At Arkansas City 60 tons, or 15 per cent, were lost by shrinkage, while at Purcell the shrinkage amounted to 128 tons or approximately 25 per cent. At Shawnee, Okla., where paper was also used, the results were more unsatisfactory, although conditions at the latter point were not strictly comparable with those at the two other stations, as the ice was carried for a longer period and the insulation of the house was not in good condition. These tests have indicated, however, that the use of sawdust is more effective than paper in the prevention of shrinkage and more than offsets the difference in the cost of packing.

Naphtha Fuel for Galician Railways.—It is reported that the Russian railway authorities in Galicia propose to utilize the local naphtha fuel for locomotives.

ACCOUNTING FOR RAIL AND TIES*

By Charles E. Parks
Superintendent's Office, Atchison, Topeka & Santa Fe, Winslow, Ariz.

In construction, addition and betterment work rail and ties constitute a large item of expense; while, in ordinary maintenance work, ties themselves form perhaps the largest single item with the exception of track labor. Naturally, when a railroad spends thousands and sometimes millions of dollars annually for such material, a strict account of it is desirable.

For all purposes rail may be considered as practically indestructible, either in track or out. Ties are perishable and no attempt is made to account for them once they have been used. Unlike rail, they have no value as second-hand material for accounting purposes. It is necessary to account for all rail upon a division, and a record must be kept of it from the time it is received to the time it is shipped away as scrap. This record is a history of the purposes for which it is used. All rail on a division is classed under three heads: (1) Rail charged out; that is, rail inserted in tracks and capitalized; (2) rail in temporary tracks; and (3) rail on hand. Under each of these heads it is still further classified, first, as to condition, whether new or second-hand, and, second, as to weight.

In this complicated classification many errors and discrepancies will arise, discrepancies of such a nature that they can be adjusted only by arbitrary methods. It is for this reason that accounting for rail is so difficult. To anyone even slightly familiar with rail accounting three well defined avenues of error become at once apparent: First, errors as to the quantity of rail reported; second, errors as to the class of rail reported; third, the error of not reporting at all.

The quantity of rail is reported in lineal feet, or sometimes in tons; but, as the lineal feet must be known before the tons can be arrived at, the former is the primal factor. In reporting rail, it therefore is necessary to measure each rail length or compare other rails with rails of known length. In this the error lies in mistakes of measurement, which may be due to a hundred causes. Errors as to the class of steel are more numerous. Such errors are not always the result of carelessness or negligence, but are more often mistakes of judgment. To illustrate:

A section foreman reports a carload of rail as shipped. He submits a statement showing the quantity of each class of steel in the car. The rail is received on another section, perhaps on another district or even division; but the statement which the receiving foreman submits as indicating the amount and class of rail received is entirely different from the amount shown as shipped. In an endeavor to adjust the matter a re-check of the rail is made, but this count is entirely different from either statements.

An extra gang is laying a temporary track. When the track is completed the timekeeper submits a form showing the exact amount of rail laid. A few months later the track is taken up. But both the class and quantity of rail reported taken up differs greatly from the class and quantity originally reported laid, and we have no reason to doubt either reporting. These are mistakes of judgment and there are no means of avoiding them.

Errors which come under the third head cause the greatest discrepancies in rail balances. They are more serious because they usually involve large quantities, and if not discovered within a short time, they are seldom detected and must result in an arbitrary adjustment on the rail report or inventory.

No doubt any division which attempts to keep an accurate record of its rail on hand has met with similar difficulties. It has been demonstrated on the Albuquerque division, and no doubt on others, that for the superintendent's office to keep an accurate record of rail on hand from the monthly reporting of section or extra gang foremen was impossible. A few months after the inventory was taken, the sectional rail balances had failed to reflect actual conditions. In fact, more than one-third of the sections were in the red. This state of affairs was accepted by many as being a natural one, the theory being that it was impossible to keep an accurate record of rail by sections. The chances of error being so great it was assumed they could not be overcome. However, an analysis of the discrepancies and red items appearing on the rail report and rail balances month after month disclosed the reasons for these errors, as indicated in a foregoing paragraph. To remedy such conditions and to endeavor to eliminate or reduce to a minimum the mistakes which naturally arise from the accounting of such a highly classified article, a system has been inaugurated on the Albuquerque division of the Santa Fe which involves a close co-operation of men and officers most interested.

To begin with, a reliable and accurate inventory is taken at the beginning of each fiscal year. This inventory is taken primarily by section foremen and includes all rail and ties and such other material as is necessary to be taken which lie within the boundaries of each section. The foremen are usually allowed two days in which to take this inventory and at the same time are assisted by the roadmasters and by the division accountant, who make it a point to travel over the districts for this purpose. The third day the inventory is checked. Each roadmaster, accompanied by some representative of the superintendent's office or the storekeeper, travels over his district, collects the inventory books and checks the entries. Sometimes this check requires three or even four days, but, as accuracy in the inventory is the foundation for rail balances throughout the year, the time is well spent.

As soon as possible after this inventory is taken each section foreman is given a statement showing the amount of rail or ties on his section. This statement also contains the amount of rail in tracks either connected or disconnected. Thereafter, at the end of each month, he is required to report to his roadmaster the amount of rail and ties on hand. The form of this report for rail is as follows:

Section Number 37

Statement of Rail on Hand for the Month of May, 1914

	New 90	New 85	Old 90	Old 85	Old 75	Old 66
Rail on hand 1st of month.....	450	33	66	900	30	5,000

Foremon

This is a mimeograph form sent out by the superintendent's office and is rendered by section foremen in addition to the regular report of rail transactions in the time book. In fact, it is rather a recapitulation of all rail transactions which occurred on the foreman's section during the month.

The same procedure is undergone in respect to ties, and a similar form is rendered. However, the accounting for ties is less complicated and the great source of error is the failure to report rather than errors in classification.

The co-operation which is secured by this report is self-evident. It encourages the section foremen to obtain accurate figures and indicates plainly discrepancies which are the result of errors. A foreman has but to take an inventory and he can tell immediately whether his rail reporting has been in error or whether there has been a mistake on the previous inventory. Roadmasters always have first-hand information as to the amount of rail or ties on their sections without waiting for tardy sectional balances from other departments. Superintendents' offices have a means at hand to check instantly any discrepancies or irregularities which may arise.

It might be said that these remarks apply only to divisions engaged upon routine work. Where much construction work is being done or where a large amount of double track is being laid the foregoing procedure will not apply, for it is then a matter more of good luck than of good judgment to keep the rail and tie balances straight.

Promoting the Growth of Vegetation on the Slopes

Methods and Cost of Placing Sod and Various Plants to Prevent Erosion of the Banks and Reduce Maintenance

By W. F. Rench
Supervisor, Pennsylvania Railroad, Tacony, Pa.

It is only within about 15 years that the larger railroad systems have been committed to a definite policy of encouraging the growth of vegetation upon the slopes of cuts and within a still shorter period upon those of embankments. But the results obtained have been so marked that the practice has continued on those roads and has extended to the smaller roads and even to those upon which by reason of a total absence of passenger traffic the matter of appearance is of no special moment. The economy is therefore recognized and the only question is that concerning the type that is preferable for a particular location. To aid in the determination of this question certain types that are of somewhat general application will be discussed in detail.

SODDING

The sodding of slopes of both cuts and embankments is justified by the saving in roadway cleaning alone, aside from the improved appearance of the roadway. In addition, the advantage as a protection against accident may not be fully appreciated. Many maintenance officers have been concerned at some time with the upkeep of a new line. These men appreciate fully the dangers that are inherent in new fills even for long periods after their use is begun. Only in those rare instances where the fill is entirely of rock is there complete security against slipping. The breaking of a new embankment constructed wholly of gravel, during a heavy fall of rain lasting only one-half hour, which resulted in temporary discontinuance of service on the nearest track, is within the recent experience of the writer. Sodding the slopes of the new embankment was then in progress and the completion of this work at the point that failed furnished entire protection against further slipping. As the benefits that may be expected from sodding were fully illustrated in this one operation it will be instructive to review the work briefly.

The piece of road in question is part of a main line carrying a daily traffic of 250 trains. Although the height of the fill averaged 22 ft. for more than three miles service was inaugurated at a speed of 30 miles per hour, which was increased after 36 hours to 50 miles per hour and after one month to 70 miles per hour. The original grading was purposely made wide to provide for the erosion that was expected to occur through the winter, the shoulder of the fill being uniformly 9 ft. from the gage line. By the middle of the succeeding spring it was found that money was available for sodding and this work was prosecuted through the entire summer and fall until a total of 10 acres had been laid. This was possible during the months of July and August, which were very hot and almost rainless, by reason of an unlimited quantity of water being available through the fire hydrants of the city. The sod was all cut from company ground, but half of it had to be shipped from a point 15 miles distant. It was cut in 12 in. squares and was all handled flat. Experience has shown that the percentage of breakage is greater when the sod is cut of a greater dimension or when it is rolled. The sod cutter which effects a saving of two-thirds the labor of cutting by hand was not available for this operation.

The gravel of the fill contained very little loam and it was necessary to apply a covering of top soil. The considerable length of the slope, 40 ft. at the average depth, precluded the delivery of the top soil wholly from the bottom, although it was found practicable to thus supply the lower half of the slope. The upper half was supplied from cars working upon the nearer tracks which at that point were those assigned to passenger traffic but whose use was obtained at proper times. By reason of the great amount of top soil required and in order to occupy the main tracks as little as possible, a minimum thickness was decided upon which was generally 2½ in. This depth proved to be a good choice as practically none of the sod was lost through slipping although no pegging or other support was given. The sod was well rammed as laid and the watering through a 2½ in. hose was done without force. A very small area was lost during a heavy downpour of rain the spring following and this occurred where a depth of 12 in. of soil was used to fill a depression in the slope. It is quite probable if the top soil had been applied of a much greater thickness than 2½ in. there would have been extensive slipping. The need of fertilization for so thin a mold was not overlooked and the entire area was plentifully sprinkled with bone meal the spring succeeding the sodding and care was taken to afford the slope receiving the direct rays of the sun the greater advantage.

A careful account of the expense of this sodding as well as for an equal amount at other points gave an average cost for the sod in place of 1½ cts. per sq. ft. The regrading of the slopes and the addition of the top soil made the average cost of the finished work $1,000 per acre or about 2⅓ cts. per sq. ft. The total expenditure of $10,000 for sodding upon this one operation was warranted alone by the greater security against accident. The cost of mowing the banks, which is necessary about four times during the season, is $9 per acre at each cutting; but this is no more than a periodical regrading of the banks to resist erosion would have cost. There is the further item of attractiveness through the enhanced beauty of the roadway, which is not measurable.

STIMULATING GROWTH BY STREET DIRT

There are many slopes especially of cuts where the expense of sodding is not warranted or this method is impracticable, but where both for appearance and stability, a turf is desirable. It will be a matter of surprise to those who are unacquainted with the efficacy of street dirt fertilization to observe the quick growth that may be obtained by its use. A good turf has been developed in six months, a firm one in a year and two years produces the equivalent of an old sod.

There are certain points to be observed in this culture. On account of its lightness the material is easily washed away and the best results are obtained by applying it after the spring rains are over. If sown with eight bushels to the acre of the mixture given below, an application of this material about June 1 should produce a turf by the middle of September that would ordinarily be proof against the fall rains:

Awnless brome grass	1 bushel
Canadian blue grass	1 bushel
Orchard grass	1 bushel
Herd's grass	1 bushel
Turkestan alfalfa clover	1 peck

Street dirt should not be applied too thickly upon banks. A layer generally 2½ in. deep after all paper and other waste has been taken from it is the most favorable. It is not necessary to regrade the eroded surface of a bank before the street dirt is applied and this fact alone recommends the method where cheapness is a governing requirement. It may be spread as late as the middle of October, but after that time it is apt to be mostly dead leaves and should be allowed to rot in a pile over the winter to be ready for use in the spring. Besides its cheapness this method has been known to develop a growth when all other means have failed. There are cuts upon whose slopes sodding has been tried with every known precaution but without

avail, but which have responded to persistent applications of street dirt plentifully sown with the above mixture. The material may be obtained from contractors for street cleaning in any of the larger cities, loaded upon cars without cost.

HONEYSUCKLE

There are many varieties of this prolific vine but the only one of concern in this discussion is that which trails along the ground and is commonly known as woodbine. It most probably is a garden hybrid of the main family. The woodbine may be grown in any soil either from the root or a cutting. It takes root wherever it touches the ground provided the soil is not too hard. In that event it will not spread but will grow up bushy. The best results are had by planting in March either the roots or sections of the vines set five or six feet apart or closer if a mat is desired more quickly. It grows slowly the first year but faster thereafter and will cover the ground in about three years. The mat then formed will resist any wash. It is superior to sod for preventing unstable soils washing down into the ditches and as a means of retaining a steep slope necessary by reason of insufficient property, is of unequaled utility.

This vine blooms profusely in the early spring and continues a moderate flowering late into the autumn. The blossom is very fragrant and its odor may be caught on passing trains. Areas covered by it require no cutting and there is thus no expense but rather a saving of expense from its propagation. As it retains its moisture late, fires seldom catch in its vicinity.

There are several varieties of summer and autumn flowering perpetual briar roses which by reason of their dwarf habits and their wide and deep rooting characteristics form an excellent means of protecting the slopes both of cuts and embankments, besides supplying the element of beauty that tends to make travel agreeable. The R. Rugosa, or Japan rose, has been much employed upon both kinds of slopes but on account of its somewhat irregular growth it is apt to convey an impression of neglect and is somewhat better suited to fills where its holding advantages alone prevail. The R. Humilis or Lucida, which seldom grows higher than 18 in. and tends more toward uniformity of growth, is the preferable variety for use upon the slopes of cuts since it always presents the appearance of being cultivated even though no care is actually required. Both plants are exceptionally hardy and they may be grown anywhere between Maine and Florida. Their foliage is nearly evergreen but quite late in the fall the leaves turn purple, orange and yellow and they bear a red berry which gives the plants an exceedingly attractive appearance at all times. Like all roses they may be grown in almost any kind of soil except a very loose and sandy one and require little cultivation. They should be set out in the early spring, from 2 to 3 ft. apart and as deep as in the hot house mold. A light covering of street dirt is very effective when growth is being started. These roses can be propagated by seeds but they may also be grown readily in summer under glass from cuttings of nearly ripened wood. A single plant will furnish in several seasons as many as 500 cuttings. The R. Wichuriana, or Memorial rose, a half evergreen shrub with prostrate and creeping branches, and one of the hardiest of trailing perpetual briars, makes a beautiful covering for banks, but does not have as great holding power as the two other roses named. The abhorrence of all roses for continual dampness is well known and their cultivation on wet slopes is therefore not practicable. The New England roads have many miles of roadway planted with roses and the Pennsylvania has been using this protection with success for several years.

ALFALFA

This hardiest of perennial forage plants is cultivated in the most diverse localities, but is especially adapted to land that is neither low lying nor extreme in altitude. It has a large tap root with very few side roots. Its extreme penetrating power renders it a valuable protection against ultimate slipping of the banks but the time required for developing its hardiest growth renders it rather a better selection for older banks. It can only be grown in a fertile soil and the best results are had by developing this feature the year preceding the alfalfa seeding. Common fertilizer will produce a growth of weeds which must be destroyed before they reseed as these greatly impede the growth of the plant. It is even desirable to cut the first crop of alfalfa early before the weeds have had a chance to reseed. In fact, as full development cannot be expected until the third year, the principal aim in the meantime should be to eradicate the weeds. After a full growth is established no further cultivation is necessary.

For the best results the top soil should be light and not sandy and the soil of a clayey loam. It is desirable that the sub-soil also be of a clayey nature, as this will retain the moisture needed by the plants in the drier seasons. The thorough surface drainage necessary is afforded by its cultivation on slopes; but for the flat ground above or below the slopes it is necessary that depressions be filled up, as the plant will not thrive in marshy ground. A gumbo element in the soil if properly cultivated is not objectionable. Farm manure should be worked into such soil to lighten it and render it permeable to air and water.

It is usually thought that inoculating soil is necessary for the cultivation of alfalfa. Doubtless such addition is an advantage and its use is recommended where it can be conveniently obtained either from soils in which the plant has been grown or commercially. However, good results have been obtained without any inoculation.

This plant is a prolific seed producer and no expense is necessary for further seeding. It is a favorite food for all sorts of stock and it is seldom difficult to command the services of adjoining farmers to harvest the slopes for the hay obtained. As many as six cuttings might be made in a season. The plant has been successfully cultivated for a roadway protection upon the slopes of embankments throughout the low lying lands of the Atlantic sea coast.

OCCASIONAL GRASSES AND SEDGES

There are other plants which have been found useful for holding embankments but which are of somewhat less common application. Bermuda grass ranks high as one of the turf forming grasses. It is extensively cultivated in the southern states but is generally distributed over the warmer portion of the United States. It does not thrive in the more northerly districts, which are subject to long continued periods of dry weather, except where the means is available for plentiful watering. This grass spreads freely by creeping root stocks. Like the grasses in general it requires good drainage. Where appearance is an important consideration, June grass should be mixed with it. These supplement each other in different kinds of weather and assure a green bank during every part of the growing season. The other grasses that have good binding qualities are quack grass, Rhode Island Bent and red top.

Irish Heath is one of the sedges that has been used with greater or less success for holding the slopes of cuts. It is an evergreen plant and bears a small purple or white flower. It is propagated by seeds or cuttings and thrives best in peaty, sandy soils. Protection must be afforded the plant during the winter in the northern parts of the United States. Slopes along the Pennsylvania have had the protection of this plant for periods of 15 years, and while the growth is quite satisfactory when established, its development is somewhat tedious.

English Railways Compelled to Curtail Passenger Service.—It has been officially stated by the English Railway executive committee that in order to keep the lines as free as possible for military and naval traffic, it has been found necessary still further to curtail the service of passenger trains and facilities in certain particulars, which will be duly notified to the public.

A PNEUMATIC TIE TAMPER

The New York Central & Hudson River used 12 portable compressed air plants during the past season for the operation of pneumatic tie tampers. Experiments have been made on this road with pneumatic tools for this purpose for several years and the experience gained in these trials showed the necessity for a number of changes in the design of the early types of such tools to secure the best tamping results and to make them easy to operate.

The Compressor Car with Machinery Enclosed Ready for Operation as an Ordinary Motor Car

The principal advantage claimed for this system of tamping is the greater speed with which the work can be done. It has been stated by supervisors who have tried these machines that two men with a machine can tamp 350 to 450 ft. of track per day, or about as much as 10 men using ordinary tamping bars. One unit, consisting of a compressor and two machines, was worked continuously through one season and a careful record was kept of its performance and cost of operation. This record showed that two men could tamp 300 ties per day and the cost of tamping was $0.026 per tie as compared with a cost of from $0.10 to $0.20 per tie by hand tamping.

In addition to this, the rapid vibration of the tool serves to compact the ballast under the ties more uniformly than is ordinarily possible by hand tamping and the pneumatic tamper can be used around frogs, switches and crossings in limited space where it is extremely difficult to work a tamping bar. An indication of the increased stability of the track resulting from pneumatic tamping is furnished by tests conducted on the West Shore. Two adjacent sections, each 800 ft. long, located on the Hackensack Meadows where the foundation is soft and it is difficult to maintain the track, were selected for the tests, one section being tamped by hand and the adjacent section by the pneumatic machine. This track was not retamped for six months, during which time it was subjected to very heavy traffic. Provision was made to measure accurately the amount of settlement from fixed stone monuments, which showed at the end of the test that the maximum settlement in the hand-tamped track was 0.116 ft., and in the machine-tamped track 0.063 ft. The minimum settlement on the first section was 0.018 ft., and on the second, 0.004 ft. The average settlements were 0.067 ft. and 0.033 ft., respectively, showing that the machine-tamped track settled about half as much as the section tamped by hand. It is stated that the machine is equally effective in gravel, cinder, crushed stone or other ballast.

One of the Tamping Machines Fitted with the Proper Bar

The compressed air is furnished by an Imperial type, X-11, Ingersoll-Rand air compressor direct-connected to a 12-h.p. gasolene engine. The compressor and engine with the fuel tank, radiator, air receiver, tool box and automatic discharge unloader, are mounted on an ordinary 5 ft. by 8 ft. flat car fitted also with cross trucks having double-flanged wheels to allow the car to be removed easily and quickly from or placed on the track by four men. The car is self-propelled, being geared for a speed of 12 to 15 miles per hour and will carry 12 men. The compressor plant is completely housed in, although the sides of the housing may be removed when it is set out along the track for the operation of the tampers.

When the car reaches the work each side is raised in turn two or three inches to allow 2 in. by 4 in. scantlings to be slipped under the derailing wheels and on these the car is rolled to the outside of the main track. A simple rest suitable for supporting the car on steep embankments has been made by placing four old crossties vertically on the slope with their tops about level with

The Compressor Plant Supported at the Side of the Track Showing the Tampers in the Background

Two Men Operating the Pneumatic Tampers

the rails. These tie rests have been placed about 500 ft. apart, and, while very convenient, they are not absolutely necessary as a crib of ties will answer the purpose equally well. Where the fill is not great blocking will serve the purpose. As the car weighs only about 1,740 lb. fully equipped, four men can easily shift it in 45 minutes.

When the car is in position at the side of the track, the compressor plant is started and the ¾-in. supply hose connecting with the tampers is carried out along the tracks as needed. Supply hose in lengths up to 600 ft. has been used with satisfactory results. The compressor has a piston displacement of 49 cu. ft. at 80 lb. pressure, which is sufficient to operate two tampers continuously. Ordinarily two tampers are worked together on opposite sides of the tie in the manner usually followed with tamping bars. The tamping machine is fitted with two handles and its operation is not at all objectionable to the men. In some of the earlier models of pneumatic tamping machines a long stroke was imparted to the bar, but this was found to jar the man holding the machine so severely that it was quite uncomfortable. The machine illustrated herewith has a stroke of 1½ in. and can be held without any resulting jar. The tamper, including the bar, weighs 37½ lb. These compressor plants and the tamping machines were furnished by the Ingersoll-Rand Company, New York.

REMOVING THROUGH TRUSSES WITHOUT DISMANTLING

In renewing a four-span bridge over the Grand river at Ionia, Mich., on one of the branch lines of the Pere Marquette a unique method of removing the trusses without dismantling was developed. The old bridge consisted of three 130-ft. and one 150-ft. single track through pin-connected, skew-ended Pratt trusses with suspended floor beams upon which rested 15-in. I-beam stringers. The bridge was built in 1881 by the Detroit Bridge & Iron Works on piers and abutments of local sandstone of good quality. All the masonry was in good condition but the superstructure had become too light for the present loading.

After considering several plans for replacing this structure it

Raising the First Truss Span on Cars, Showing the New Girder Spans in Place

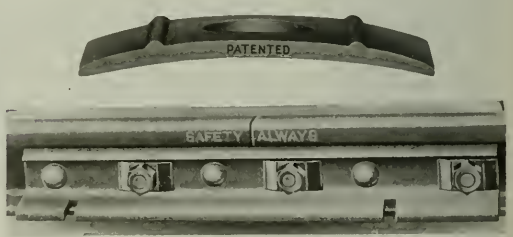
was decided to raise the grade about 6 ft. and install eight deck plate girder spans designed for Cooper's E-50 loading on the old piers and abutments and four new concrete piers at the mid-points of each of the old spans. The new piers were built first, using a derrick car for handling material and a concrete mixing plant mounted on a car in front of the derrick. In this way the new piers were completed without placing any of the plant in the river. After the piers were finished, the old trusses were jacked up to the new grade line and at the same time the earth fills were made in the approaches. As the work was handled at a season when the river is subject to sudden rises it was very desirable to avoid the use of false work and in the endeavor to accomplish this as well as to save expense the plan adopted was developed. The girder spans were placed one at a time, the main tracks being occupied about two hours for each of these operations. The new span was supported between two gondola cars which were run on the old structure to the proper location, the floor system of the old bridge in that portion of the span to be occupied by the girders was dropped into the river, and the new span then lowered into place. After the girders were all placed, the truss spans were raised one at a time enough to clear the tracks and approaches, and supported in this position on two gondola cars as shown in the illustration. The 130-ft. trusses weighed 107,500 lb. each, and the 150-ft. truss, 138,900 lb. The two cars

Lowering One of the Truss Spans from the Cars to Blocking Under the Panel Points

supporting the truss span were pulled to a point on the earth fill approach near one end of the structure where they were lowered onto blocking previously located to come under each panel point. With the trusses supported on this blocking the cars were removed and traffic could then be carried between them until they were dismantled. The track was occupied about four hours for the operation of supporting one of the spans on the cars, moving it and landing it on the blocking, the traffic being such as to permit this time to be arranged for. The dismantling of the trusses was handled quickly by a derrick car. The entire method worked out satisfactorily and proved to be very economical. This work was carried out under the direction of A. L. Grandy, chief engineer.

THE IMPROVED NEELY SPRING LOCK

The spring nut and bolt lock described in the *Railway Age Gazette* of August 21, has been radically changed in design, although it retains its distinctive features, which are the spring and the locking ribs. The new design shown in the accompanying illustrations is slipped over a bolt in the same manner as a washer, and as the nut is turned down it passes over the ribs until it is drawn tight, its final position being with the edges



The New Design of the Neely Spring Nut and Bolt Lock at the Top and Its Application to Track Bolts at the Bottom

of the nut parallel with the ribs. In this position the spring locking feature operates to prevent the nut from turning off or loosening under the impact of traffic, or as a result of the natural elongation of the bolt. This spring nut and bolt lock can be applied without special tools and can be used with either standard square or hexagonal nuts on standard track bolts. It is made from a high grade open hearth spring steel, each lock being heat treated, tempered in oil, and individually tested and inspected. This device is manufactured by the Neely Nut & Bolt Company, Pittsburgh, Pa.

Fuel Oil Stations for Extreme Climatic Conditions

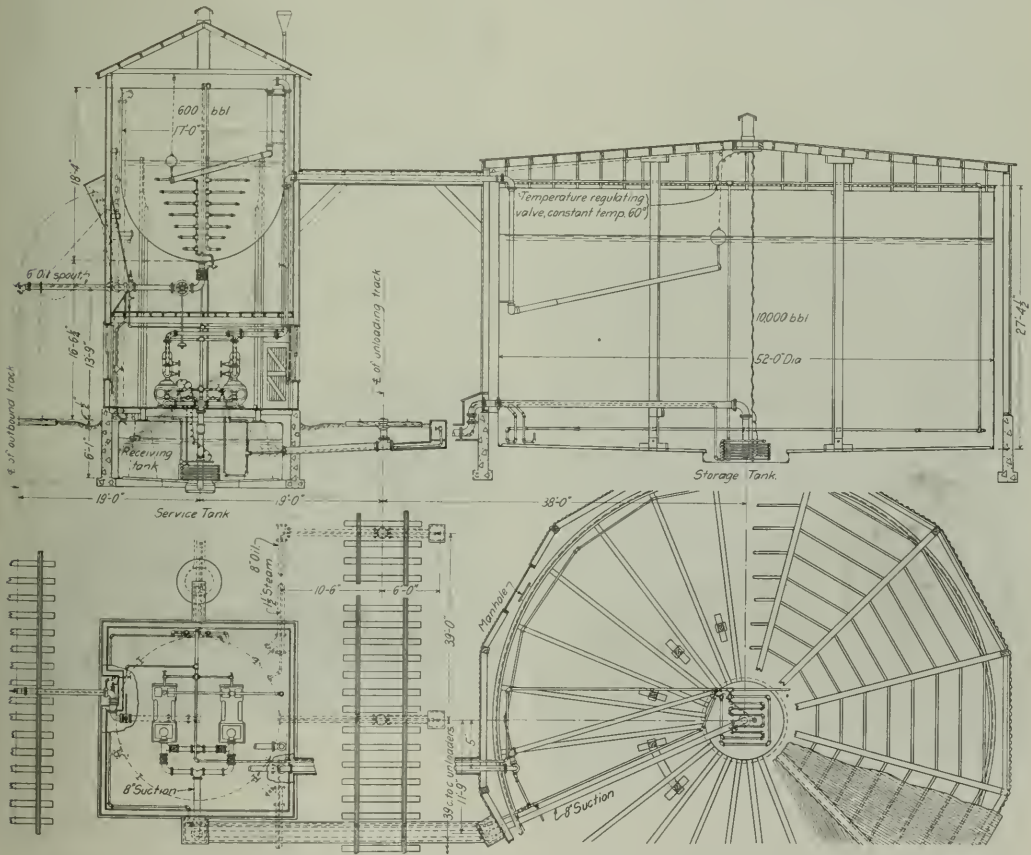
A Description of the Standard Layout Design for Six Divisional Points on the Grand Trunk Pacific

The Grand Trunk Pacific is planning to operate its line from Prince Rupert, B. C., east as far as Jasper, Alta., a distance of about 720 miles, with fuel oil, as soon as the necessary storage facilities are completed. This oil will be brought by boat from southern California to Prince Rupert, where large storage facilities will be provided by the oil company. The oil will be forwarded from this point to supply the interior fuel oil stations, which will be located at Pacific, Smithers, Endako, Prince George, McBride and Jasper.

While oil has been used for locomotive fuel on other western roads for a number of years, it has not been used under as extreme climatic conditions, the nearest approach being the Canadian Pacific lines, from 300 to 500 miles south. Along the line of the Grand Trunk Pacific the thermometer, which for weeks at a time stays in the neighborhood of zero, frequently descends to 40 below. On the other hand, California crude oil has the consistency of molasses and cannot run or be pumped unless it is at a temperature of 60 deg. F. This oil, to be delivered from the service tank to the locomotive must be heated to at least 100 deg. F. and not more than 110 deg., as a higher temperature will start evaporation of the volatile parts, thus reducing the efficiency of the oil as a fuel. From the above data it is evident that the proper heating of the oil is important.

The accompanying drawing shows the design which has been worked out to meet the above conditions. Each fuel station is located 400 ft. from the center of the roundhouse near the boiler room, from which the necessary steam for heating is obtained. The station is composed of two buildings, one, 20 ft. by 20 ft. by 35 ft. high, containing in the basement a receiving tank with a capacity of 240 bbl., on the ground floor a set of two pumps, indicators, etc., and on the upper floor a service tank with a capacity of 600 bbl. The other building of dodecagonal form, 56 ft. by 27 ft. high, contains the storage tank with a capacity of 10,000 bbl.

The service tank delivers the oil on the outbound track and a storage track is located between the two buildings. The building of the service tank rests on a concrete foundation



Plan and Elevation of Grand Trunk Pacific Fuel Oil Stations

forming the basement and is composed of a wooden structure, covered on the outside with corrugated galvanized iron, nailed to ship-lap and on the inside with ship-lap, hair insulator, nailing strips and ship-lap. The building containing the storage tank is a wooden frame structure resting on concrete foundations and covered with a roof made of five-ply roofing on ship-lap and the sides made of ship-lap, hair insulator, nailing strips, ship-lap and corrugated galvanized iron.

The receiving tank, which replaces the concrete sump generally used, will overcome the difficulty of heating and maintaining a concrete structure, which is almost impossible to keep water or oil tight, especially where the ground is soft, as it is at McBride and Smithers.

The receiving and storage tanks include a new feature in the design of their bottoms. Usually these large tanks have a bottom composed of rectangular plates with lap joints, which have to be assembled and riveted in the field. The assembling and riveting of such a large bottom is very difficult and has to be done on staging, which afterwards has to be removed while lowering the bottom to the ground. This is often the cause of deformation and rupture of rivets and plates and the disturbance of the foundation ground, which ought to be well leveled. It is not an unusual occurrence to have to raise the tank several times before water-tight joints are finally obtained. Besides these difficulties it is very hard to completely clean the bottom of the tank when necessary or to replace parts affected by rust or other causes of deterioration. To overcome all of these difficulties the bottom of the tank is divided into segments of such a size as can be readily furnished by the mills. These segments have small angles shop-riveted on them, the vertical legs of which are punched in order to connect the different segments together by riveting in the field. The whole bottom has a slight grade towards the center, which is made of a shallow tank one foot deep, shop-riveted and with the top angle turned inside; on this top angle the narrow ends of the segments are riveted. This arrangement allows the foundation, made of gravel and sand, to be well prepared and rolled to a true surface after the placing of the center part; then the different segments are placed side by side, temporarily bolted, and the riveting is done without disturbing the bottom. In case of accident the replacing of a part is easily accomplished by cutting the rivets in the vertical legs of the angles.

To operate these fuel oil stations one to three cars, placed on the storage track, are located so as to have their outlet pipes directly over cast iron catch basins, which carry the oil through 8 in. pipes direct to the receiving tanks. Steam pipes going through these pipes heat the oil running through the pipes and also the oil in the cars, by means of hose connecting the ends of the steam pipes to the heating systems in the cars. The oil in the receiving tank is heated, if necessary, by a set of steam coils placed in the center; the temperature being controlled automatically by a regulating valve, which will keep a constant temperature of 60 deg. F. This oil can be pumped direct to the service tank or to the storage tank through a 6 in. pipe, ended with an articulated galvanized iron spout to the extremity of which is attached a float keeping this extremity from 2 to 3 ft. below the surface of the oil. To the float is attached a cable which operates the indicators placed in the pump room. When no oil cars are available the oil is pumped directly from the storage tank to the service tank. The suction line is an 8 in. pipe leading from the floor of the storage tank directly underneath the tracks to the pumps. Both the inlet and outlet suction pipes, together with steam lines, passing between the two buildings are enclosed in wooden conduits. Each pump is of sufficient capacity to fill the service tank in two hours. Both pumps can be operated together in case of a rush or either pump may be shut off, allowing the other to work.

A system of steam coils, with a regulating valve, is placed in the storage tank, in order to keep the constant temperature of 60 deg. required around the suction pipe. A set of steam pipes with a regulating valve, giving a constant temperature of 100 to 110 deg. F., is also placed in the service tank. The oil from the service tank is delivered directly through a spout to the locomotive placed on the outbound track. This spout, when not in use, is raised and protected from the weather in a recess built in the side of the building. A Bowser self-registering pipe-line measure is located on the delivery pipe to indicate the amount of oil delivered to each engine.

The design of this station has been made by J. G. Legrand, bridge engineer. It was started under the general direction of B. B. Kelliher, former chief engineer, succeeded later by H. A. Woods, assistant chief engineer. The contract for these stations has been let to the Chicago Bridge & Iron Works, Chicago.

CONCRETE UNITS FOR CRIB CONSTRUCTION

By MacRae D. Campbell

Concrete units of various kinds have been made and used for crib construction for a number of years. Such units closely resemble ties and posts, even to the method of reinforcing. The type illustrated herewith, consists of an 8 in. by 8 in. concrete beam, reinforced against tension in the lower face, while light rods are placed in the top to protect against unusual strains in lifting and placing. The sections shown have so far been made in lengths varying from 4 to 8 ft. Two distinct types of members are used, one being used for the crib proper, and the other for the floor or front face of the wall where a true plane is desired. The units are held in place by steel pins which drop through holes in one unit and into others extending part way through the unit below.

The first use of this type of construction was in replacing

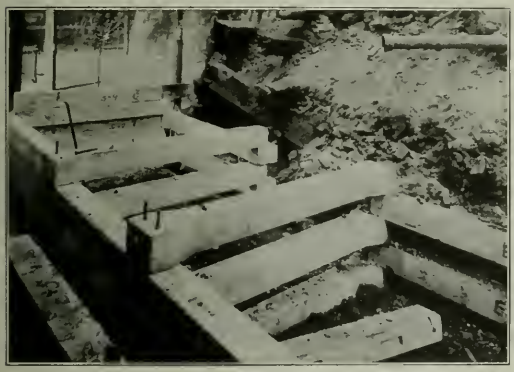
Condition of Wooden Bulkhead Replaced by the Concrete Crib Shown Below

wood cribbing holding the earth fill that carried the Pennsylvania tracks alongside of the historical block house at the corner of Liberty avenue and Water street, Pittsburgh, as shown in an accompanying illustration. Here the tracks are about 15 ft. above the elevation of the block house floor; and previous to placing the concrete cribbing, wooden construction shown had been used for 15 years, when its condition became such that replacement was necessary. The new crib, built of the concrete units, is 8 ft. wide at the bottom and 6 ft. wide at the top. The method of erection or assembling is shown by another view.

About the same time this construction was under way, a similar use was being made of this type of units on the Bessemer & Lake Erie, surrounding its storehouse and office building at Greenville, Pa. In this work a wall from 8 to 9 ft. high was

erected from header units extending back 6 ft. at the bottom and 4 ft. at the top. The Bessemer & Lake Erie construction represents a total of 880 ft. of face. Similar construction has been used by the State Highway Department of Pennsylvania, near Conemaugh, where the highway follows heavy fills, that were subjected to erosion from overflow wash during periods of high water before the concrete crib was used.

Concrete crib units suggest many possibilities. A unit, properly designed and constructed, represents a piece of enduring material. Present manufacturing practice involves the use of a rather wet mixture, such as would be best suited for concrete fence post manufacture, and placing forms on a vibrating table, so that the concrete may be made dense by agitating the mold, thus eliminating air and hence producing density and intimate contact of concrete with reinforcing metal. A 1:2:3 mixture is recommended. After the concrete has hardened sufficiently to



Placing the Concrete Crib Showing Method of Anchoring Units

permit removing the units from the forms, steam curing is used. This is the most approved method of curing concrete products, in that, if steam is properly admitted to the curing chamber by means of a pipe containing perforations on the lower side and placed in a trough filled with water, the steam released in the room will be saturated and the two elements most necessary to best cure the concrete, namely, heat and moisture, will be present at all times.

In building up the type of cribbing shown, the units are held together and in place by means of steel dowel pins, slipping through one unit and part way into a lower one, as already mentioned. The adaptability of this type of building material is shown by the fact that the construction may be permanent or temporary as desired. In the former case cement grout is poured around the dowel pins to give them protection against corrosion. In the latter case grout is omitted, so that if removal of the structure is contemplated within a relatively short time, the members may be taken down and used elsewhere.

Reinforcing metal of not less than ½-in. round steel rods should be placed in each of the four corners, not farther than 1 in. from the face. Certain requirements will call for metal of greater cross-sectional area. Concrete mixtures containing coarse aggregate not exceeding ¾ in. in maximum dimension are preferred. An advantage of placing equal reinforcement in all of the four corners is that workmen need not be watched to insure that a certain face always is placed down to attain effectiveness of reinforcement, which would be necessary if only the two corners in the intended lower face carried metal.

Modifications of the type of unit shown will suggest themselves in considerable number to interested engineers; for instance, a variation in the mortise-and-tenon feature of the filler units for the face of a wall. Forms can also be designed so that the ends of headers will interlock with stringers, thus doing away with some of the dowel pins.

Probably no greater field of usefulness exists for this construction than in the erection of temporary storage bins for coal, sand, gravel, and for temporary retaining walls or abutments where foundations are not the best; also for protection against water erosion along water fronts or embankments where such preventive construction is required. In the latter case these concrete cribs will furnish forms enclosing still water, in which concrete may be deposited to make a practically monolithic wall.

NEW BESSEMER & LAKE ERIE BLACKSMITH SHOP

The Bessemer & Lake Erie completed a new blacksmith shop last summer at Greenville, Pa., which embodies a number of improvements, the most notable being in the ventilation system provided. The building is of steel frame construction with brick walls, and is 120 ft. by 128 ft. 6 in. in plan and 28 ft. high to the lowest point of the roof.

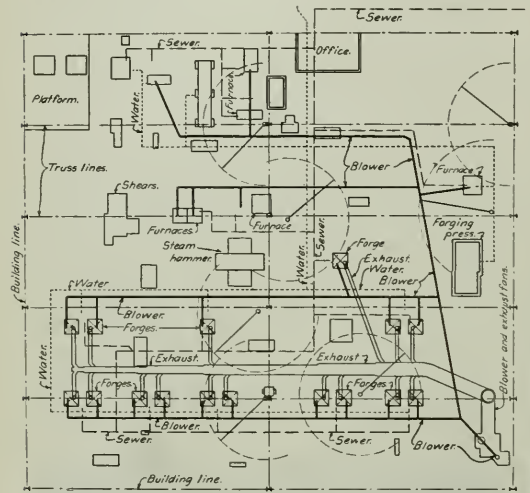
On account of the swampy nature of the ground the column pedestals and the walls were supported on 88 piles 32 to 38 ft. long, cut off at an elevation 1 ft. above the bottom of the foundation. A single string of 60-lb. rails was laid on the top of the wall-bearing piles except under the columns, where short rails were laid at right angles to the center line of the foundation. The walls are of common red shale building brick, and are 13 in. thick with 17-in. pilasters. The 168,000 bricks used in the building were laid in cement mortar made of clean river sand, Uni-

One of the Down Draft Forges in the New B. & L. E. Blacksmtih Shop

versal Portland cement and just enough lime to make it work smoothly. The windows in the sides and ends of the building are made up of nine sash, each of 16 lights, 12 in. by 14 in. The lighting surface in the walls amounts to 3,211 sq. ft., or 23 per cent of the wall surface, and in addition to this there are two monitors with 38 sash each of 9 lights, 12 in. by 14 in., a total of 798 sq. ft., or a grand total of 4,009 sq. ft. of glass. All lintels and sills are of reinforced concrete made on the ground and placed when the brick was laid.

The roof is supported by Pratt trusses, 128 ft. 6 in. long, with supporting columns under their center points. These trusses are

of extra heavy construction, as they were designed to carry one vertical concentrated load of 10,000 lb. applied at any point on the lower chord of any truss, and one horizontal concentrated load of 12,000 lb. acting in any direction applied at panel points on the lower chord of any truss. This provision was made to take



Arrangement of Pipe Lines Under the Floor of B. & L. E. Blacksmith Shop

care of swinging cranes. The lower chord is 21 ft. above the floor level, which is at the top of the foundation. The trusses are 7 ft. deep at the end and 15 ft. deep in the middle, giving the roof a slope of 1½ in. to the foot. The roof is of four-ply Ward-

Portion of the Interior of B. & L. E. Blacksmith Shop Showing the Clear Atmosphere

ren-Ehret built-up type, laid on 2-in. yellow pine sheathing. The inside surfaces of the walls were painted white with three coats of a special paint manufactured by the Illinois Steel Company and the underside of the roof was given two coats of white lead paint. All steel work in the trusses was painted black.

Special attention was given to means for keeping the atmosphere in the shop clear of gases by the installation of down-draft forges and the provision of ample ventilation. The accompanying photographs taken under normal operating conditions show how completely the smoke is collected from the 16 forges in the shop. The smoke and sulphur fumes from each forge pass up into a hood, then down through a suction pipe into a fan and up through the stack. The exhaust fan not only draws the smoke and fumes into the hood, but also additional air from around the forge which is naturally replaced by air coming in through the doors and windows, resulting in a constant supply of fresh air. The operation of the shop has shown that the atmospheric conditions are better than are obtained in the other shop buildings, contrary to the condition that ordinarily exists.

The blower, suction, sewer, water and gas lines are located under the floor, as shown in the accompanying drawing. The blower lines are of vitrified sewer tile with standard joints. Special care was taken to have all joints water tight under a pressure of 10 lb. per sq. in. These joints were made by carefully seating the spigot and then packing tightly around it a strand of oakum of a size not to exceed one-fourth the available space in the bell, which had been dipped in a neat cement grout.

Bessemer & Lake Erie Blacksmith Shop, Greenville, Pa.

The remainder of the bell was then filled with stiff cement mortar neatly beveled. The tile in these blower lines is from 4 in. to 15 in. in diameter. The completed line was tested by erecting a 6-in. pipe in a manhole and filling it with water to a height of 23 ft. The exhaust line, which is connected to the down-draft forges, is also a vitrified sewer pipe laid with the same joint as described above, but tested under a water pressure of 3 lb. per sq. in. This line is from 8 in. to 36 in. in diameter. The sewer line, which is arranged to drain all machine locations, varies in diameter from 4 in. to 10 in., and is also of vitrified tile. The water supply is brought in in a 3-in. main and distributed in pipes ranging down to ¾ in. in diameter. The gas for operating the furnaces is supplied in 3-in. lines.

This building was designed and built entirely by company forces under the supervision of the engineering department, H. T. Porter, chief engineer.

English Railwaymen with the Colors.—The question is now being frequently raised in England as to the percentage of railwaymen who have joined the colors. The Engineer has made a computation which leads to the belief that the percentage is 11.7. The Board of Trade returns showed that on December 31, 1913, there was a total of 643,135 employees on the railways of the United Kingdom. Of these, 49,047 were returned as boys and girls, but if it be assumed that all the engine cleaners, maintenance of way employees and others are over eighteen, and therefore eligible for enlistment, this figure is reduced by 7,284. Then among the 7,147 car cleaners there are some women. If 1,500 be allowed for these it makes the total number 600,000. As the number of men with the colors is now about 70,000, this makes the percentage 11.7, as above noted.

ECONOMY IN TRACK WORK AND ITS RELATION TO ROLLING STOCK

By J. W. Powers
Supervisor of Track, New York Central, Oswego, N. Y.

Due to the continuance of business depression, retrenchments have been made by the railways to the lowest limit consistent with safety in many departments. When the danger line is reached no further reduction in expenses can be made. This is especially true in the maintenance of way department. Railway managers realize that it is not good policy or economy to reduce the wages of trackmen since reliable and safe men are required and these can only be secured through the payment of fair wages. After the number of men has been reduced as much as safety will permit, the limit of retrenchment in forces is reached. Yet if we study the questions of the proper maintenance of track and endeavor to eliminate factors which tend to increase its cost, there appear possibilities by which the amount of track work itself can be reduced.

A definite standard of track is no longer problematical, as it can be made largely what a company desires it to be. Despite this fact, on many roads the track and roadbed are not being improved commensurate with the demands made upon them by the increase in the train loads. There was a time when maximum loads were 40,000 lb., and 60 and 70 lb. rails were standard. Today we are handling cars of 120,000 lb. capacity over 80, 90 and 100 lb. rails, the wearing qualities of which are admitted to be inferior to the former 60 and 70 lb. rails, some of which are still in use under the heavier loads and increased speed of our modern trains. This inequality is now beginning to receive the consideration that its importance merits and as a result heavier and stiffer rails are being laid. The use of such rails means a saving in ties, less disturbance of the ballast, and a reduction in the expense for maintenance, while it greatly reduces the friction or resistance of trains. These are matters which have a most important relation to the economy of track work and the general operation of the road.

It is an acknowledged fact that to secure safe and efficient operation and maintenance, the track must be in the best possible condition. Failure to maintain accurate gage, correct line and true surface result in lateral and vertical movements of trains and create impacts which still further derange and distort the materials in the track.

It frequently happens that heavy engines and cars of increased capacity are operated over light rail until the expense of track repairs becomes so great that it is found absolutely necessary to lay heavier rail. This is then often laid without any special preparations being made to receive it, even on lines whose roadbed is in poor physical condition and as a result the new rail soon assumes many of the kinks found in the old rail, especially if the work of tie spacing and renewals, surfacing, lining and gaging does not follow immediately after the rail is laid. If this entire process were reversed it would prove more satisfactory in the end. The time to increase the weight of motive power and rolling stock is after the track is put in good condition. Ties should be spaced, decayed or defective ties renewed and the track put in good gage, surface and line, to increase the life of new rail, decrease the cost of future maintenance and insure safe and efficient operation.

It should be understood that merely cutting down expenditures is not necessarily economy and that it is often a wiser policy to make a large outlay at one time and thus reduce the cost of maintenance for several years in the future than to distribute the expenditures in small sums and have a continual high charge for maintenance. There are many types of track appliances now available that will effect a saving in track maintenance and meet the demand for better, more rigid and permanent track construction. Some of the devices referred to are tie plates, rail anchors, guard rail clamps, improved guard rails, manganese frogs, etc.

Everyone who has served his apprenticeship on the track or who has even had his attention called to the subject of track repairs, has been forcibly impressed with the large amount of work which is annually expended in gaging track and adzing ties to hold the rail perpendicular or in such a position that the wheels will cover the entire surface of the ball of the rail, thus increasing the area of contact and decreasing the tendency to disrupt the rail, as well as decreasing the pressure per square inch and endeavoring to place the load over the web to avoid eccentric loading. This will also increase the tractive power of a locomotive and prevent it from slipping and blistering rails, while also decreasing the rate of wear of wheels.

We know that with new rails of ordinary design placed on new sawed ties and with car and engine wheels having a coning of 1 in 20, the line of pressure is moved from the center of the rail toward the inner edge of the head, making it necessary to adze the new ties in order to bring this line of pressure back to the center. It is also known that the rail tends to turn out under traffic causing the outer rail flange to cut down into the fibre of the wood more quickly than the inner. Thus the rail is canted outward, widening the gage, increasing the lateral sway of the train and making it necessary to again adze ties beneath the rail and to regage the track. Some railways are reducing the coning of locomotive tires to 1 in 38 and if all wheels were reduced to at least this ratio it would eliminate, to a great extent, the necessity of adzing the ties in order to incline the rail when gaging track. A considerable diversity of opinion exists among men in the motive power and car departments regarding the advantages of tapered wheels, while nearly all track men give a decided preference to non-tapered wheels which minimize rail breakage, decrease the rate of wear on wheels and insure safety in service.

The tie plate is an accessory which requires a great deal of careful study. The best tie plate is one that will not buckle, that will imbed itself thoroughly in the tie, that has a shoulder to protect the spikes and that has a bearing surface greater on the outside than on the inside of the rail to prevent the rail from tipping. There are many essential features which a tie plate should have to support the rail properly under its various movements. These movements of the rail under different conditions must be thoroughly understood in order to construct and adjust tie plates so that they will properly perform the duties required of them. In deciding upon the kind of plates to be used, due consideration should be given to the efficiency of the various types of plates, the labor of inserting them and the cost of material.

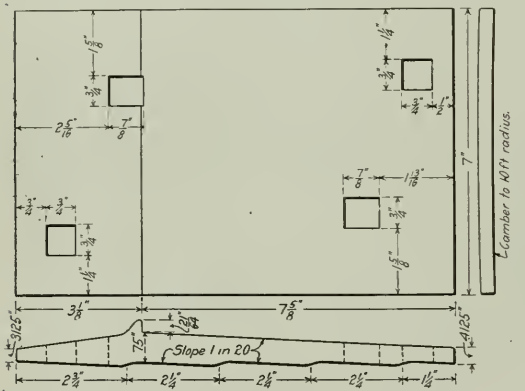
Those who have been observant have been forcibly impressed with the rapid destruction of frogs under heavy traffic despite the fact that vast improvement has been made during the past few years in the way of better and stronger construction and the use of manganese. The difficulty is that corresponding progress has not been made in the elimination of the destructive blows on frog wings and guard rails. If wheels are so mounted that they can deliver blows on frog and guard rails after they have been properly placed, the maintenance of way department will continue to suffer the effects.

It is practically impossible to adopt and maintain dimensions for the track and wheels that will entirely prevent blows to guard rails and frogs, but it is possible to adopt dimensions that will eliminate the impingements on the frog points and minimize the destructive effects of blows on the frog wings and guard rails. When we consider that every railroad has in its main tracks many frogs and guard rails over which high speed trains run and that under ordinary conditions many wheels of such trains are liable to strike

heavy blows on both the frogs and guard rails, the importance to the mechanical and maintenance of way departments is seen of the correct mounting of car wheels on their axles and their maintenance at proper gage, demonstrating the necessity for mutual discussion between departments.

EFFECT OF LUNDIE TIE PLATES ON RAIL WEAR

A recent inspection of test rails in the main track of a trunk line railroad near New York indicated clearly the effect in decreasing rail wear which is secured by the Lundie tie plate. New 100-lb. A. R. A. type A rails were laid on parallel tracks on a 5-deg., 40-min. curve carrying a heavy freight traffic one year before the inspection referred to. The Lundie tie plates were placed under the rails in one track while ordinary flat plates were used in the other track. The superelevation of the high



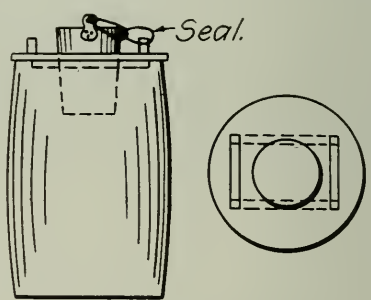
Details of a Lundie Tie Plate as Used on a Large Eastern Road

rail was standard. The usual wear of the rail head was found on the track laid with flat plates as indicated in the accompanying drawing reproduced from measurements made of the rail head at the time of inspection, while the rails laid on the canted plates show a slight wear uniform over the surface of the head. These plates are also in use in about 20 other installations in which it is said that similar results are being secured.

This tie plate is designed to support the rail at an angle of 1 in 20 with the horizontal, equivalent to the angle of coning on car wheels so that the surface of contact between the wheel and the rail and the rail and the tie plate will be perpendicular to the direction of application of the wheel load. In addition, the underside of the plate is given a bearing on the tie, a large part of which is perpendicular to this stress by a series of stepped surfaces, each of which has an angle of 1 in 20 with the horizontal. The advantages claimed for this method of support in addition to the reduction in wear on the rail head are: a decreased tendency of the rails to spread, a lessening of the internal stresses in the rail due to loading the head centrally and a reduction in wear on car wheels equivalent to that on the rail head. The plate is cambered on a 10-ft. radius parallel with the axis of the rail so that it does not present a sharp edge under the base of the rail when the wheel load passes over it. It is claimed that this feature gives the added advantages of an easy riding track in that the rail adjusts its bearing on the plate and an absence of rattling owing to the fact that the plate does not tilt under approaching or receding loads. The plate is said to perform its functions equally well on hard and soft ties, as on a hard surface which does not compact readily, the camber will allow complete resilience under load, the flattening of the plate producing stresses within the elastic limit of the metal. The accompanying drawing shows the details of one of these plates as applied on an important eastern road. The plates are patented by John Lundie, 52 Broadway, New York City.

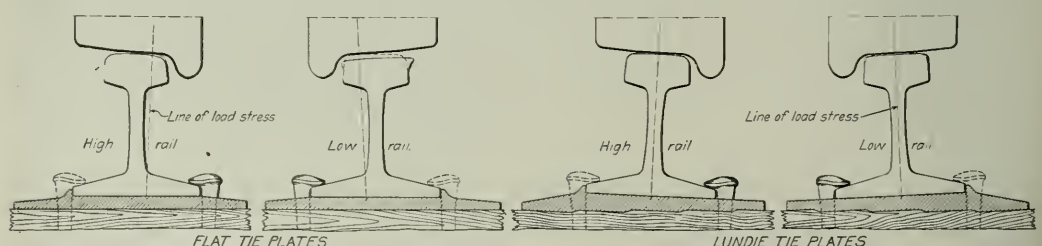
COVER FOR A WATER BARREL

The accompanying sketch shows a cover for a water barrel used for fire protection about stations, company buildings and bridges, which has been employed on the Coast division of the Southern Pacific for the past six or eight months, with very



Special Cover for a Water Barrel

satisfactory results. As shown in the sketch, this consists simply of an ordinary cover over the barrel, with an opening in the center in which the bucket is placed. In this position the bucket does not become water-soaked to the extent that it does if submerged in the barrel, while on the other hand its partial submersion prevents it from drying out from exposure to the weather. The handle of the bucket is fastened to the cover by an ordinary car seal, preventing its removal by maliciously inclined persons without some inconvenience.



Cross Sections of Rails in Adjacent Tracks After One Year's Service on Flat and Lundie Tie Plates, Respectively, Showing Difference in Wear on the Heads

General News Department

On March 4 the roundhouse of the Cleveland, Cincinnati, Chicago & St. Louis at Benton Harbor, Mich., was destroyed by fire.

The legislature of Indiana, which adjourned March 8, passed a law providing for workmen's compensation, to be administered by a state commission.

The Panama Railroad has bought for $150,000 one of the piers of the Pacific Mail Steamship Company at Colon. This leaves but one pier at Colon which is not under the direct control of the United States government.

John G. Cooper, of Youngstown, Ohio, until lately a locomotive engineer on the lines of the Pennsylvania company, is now the representative in Congress from the Nineteenth Ohio district. He has served two terms in the Ohio legislature. He has been a prominent worker in the anti-liquor campaign.

A resolution has been introduced in the legislature of California asking the federal government to buy and operate the Western Pacific Railroad, which is in the hands of a receiver. The resolution declares that the road, unless bought by the government, will become allied with other roads and competition will be destroyed.

The committee of the United States Senate which has been investigating charges that the Southern Railway, in dealing with coal traffic, has discriminated against Charleston, S. C., and other ports south of Norfolk, has apparently given up its quest; and the sub-committee in charge of the inquiry has referred it to the Interstate Commerce Commission.

E. J. Chamberlin, president of the Grand Trunk Railway of Canada, in a statement printed in the Montreal Gazette, says that for forty years past the Grand Trunk has been carrying the mails for the Canadian government at what has been definitely established is approximately one-half the actual cost to the company for the service.

The "Safety First" committee of the Baltimore & Ohio reports that 91 per cent of all items recommended to improve safety conditions during 1914 were disposed of by the company. Recommendations totaling 9,256 items were made by 698 employees who are members of safety committees on 23 divisions. Only 806 of the items reported remain under consideration.

Many railway builders of western Canada, men who have carried out large contracts in the construction of new railways during the past few years, are going to devote their forces and equipment this season to breaking up land for agriculture, and to the cultivation of wheat. It is said that many of these men will carry out this work on tracts owned by themselves.

In the federal court at Philadelphia, March 10, indictments were returned by the grand jury charging the Pennsylvania Railroad with granting rebates on coal and coke shipped from Kittanning, Pa., to Trenton and Hoboken, N. J. The road is alleged to have allowed 10 cents a ton on shipments made from the Glen-White Coal and Lumber Company's mine at Kittanning between December 1, 1911, and July 18, 1912.

The Canadian Pacific has asked the Canadian Parliament to authorize the establishment of a separate corporation to take over the ocean steamships owned by the roads, the new concern to be known as the Canadian Pacific Ocean Services, Limited; and the railway committee of the lower House has approved the bill to carry out the company's purpose. The new corporation will be organized in England and the proposed amount of capital is $15,000,000.

Rule G, the well-known paragraph of the Standard Code of Train Rules prohibiting the use of intoxicating liquors, has been taken as the theme for a motion picture, based on Rufus Steele's story in the Saturday Evening Post. The film was staged in the yards and offices of the Southern Pacific Company at San Francisco, and the road placed all its facilities at the disposal of the camera men. Even the actors were selected from the ranks of the company's employees. This film is to be shown in numerous places along the Southern Pacific lines, and elsewhere

After a thorough investigation of the results of the fire which occurred at the Thomas A. Edison, Inc., plant at West Orange, N. J., several weeks ago, the company's engineers and a special committee appointed by the American Concrete Institute, report that 87 per cent of the reinforced concrete buildings, which were subjected to a very intense heat, are in good condition and about 85 per cent of the machinery which they contained can be used after making minor repairs. Buildings made of other material were entirely destroyed. The committee commented on the advantages of monolithic structures.

C. W. P. Ramsey, of Montreal, engineer of construction on the Canadian Pacific, is to be the commander of the company of engineers which is to be recruited along the lines of the Canadian Pacific for service at the seat of war in Europe. Mr. Ramsey not only has had long experience in railway construction, and also in other departments of the Canadian Pacific, but is also a soldier, having served as lieutenant in the militia of Canada. This corps of engineers is to be made of two companies of 250 each, and all must have had railway experience. Recruiting will be begun at once, and will not be confined to employees of the Canadian Pacific. About 400 applications have already been received. Mr. Ramsey will have the title of lieutenant colonel, and there will be two majors.

The Supreme Court of the United States on March 4 issued an order restraining the New York State Public Service Commission, First district, from enforcing the alien labor law of New York pending a final adjudication of all the litigation by the Supreme Court. This has the effect of neutralizing the recent action of a New York state court in sustaining the law which forbade the employment of aliens on public work, and caused the dismissal of several hundred men by the contractors engaged on the subways in New York City. Four days after the action at Washington the legislature at Albany repealed the mandatory clause of the law in question; so now the alien can be taken back. The contractors say that most of the American citizens who have been employed temporarily have proved very inefficient. In the underground operations the men who have been long engaged in the work have come to possess a peculiar fitness, which the new men could not or would not acquire.

Cornell Men at the Engineering Convention

All Cornell men expecting to attend the annual banquet of the American Railway Engineering Association, to be held on Wednesday, March 17, who desire reservations at the Cornell table, are requested to advise H. G. Holloway, 647 Railway Exchange building, Chicago, not later than Monday, March 15.

Demurrage on One Car in 900

E. E. Mote, manager of the Pacific Car Demurrage Bureau, San Francisco, reports that in San Francisco and Los Angeles the carload freight handled by the principal draying concerns is rarely held in excess of the free time; and, searching for the causes of such good service he found that 15 of these concerns unloading in one year 14,332 cars paid but $48 demurrage. The California demurrage rate is $3 a day. Assuming that each charge at that sum represents a different car and a single day's delay in excess of the free time allowance, he finds that approximately, only eleven one-hundredths of 1 per cent of the cars were held overtime and that the entire overtime was 16 days; no allowance being asked for or made on account of inclement weather, although the rainfall was twice as much as in normal years. Practically all these cars were unloaded on the public delivery tracks, and the freight was hauled from the cars. This.

says Mr. Mote, shows that with active and systematic conduct of work by concerns properly equipped there is no real necessity for holding a single car long enough to incur demurrage.

Brooklyn Marginal Railroad

The New York legislature has passed an act to authorize the city of New York and a number of the principal railroads terminating on the shores of New York harbor to co-operate in the operation of a freight railroad on the waterfront of Brooklyn—along parts of the East river and the bay—and to make important improvements, and it is expected that this action will be followed by the construction of extensive additions to the present track facilities, owned by the city, on the docks in the region mentioned.

The law amends the New York City freight terminals act, so as to permit trunk line railroads to hold the stocks and securities of a terminal company, formed under the supervision of the city board of estimate; and, under contract with the city, for the operation of terminal facilities along the waterfront from South Brooklyn along the East river to Newtown creek in Queens Borough.

Valuation Inventories Called For

The Interstate Commerce Commission has issued valuation order No. 13, calling for inventories of railway property. It provides, in substance as follows: That every common carrier owning or operating a steam railroad whose property is to be valued by the commission under the valuation act of March 1, 1913, and every receiver or operating trustee of any such carrier, shall prepare and file with the commission a complete inventory of the quantities, units, and classes or kinds of property in its roadway and track; bridges, buildings and all other structures; signals and interlockers; telegraph and telephone lines; electrical apparatus; and any and all fixed property except lands and equipment included in valuation orders Nos. 7 and 8. Such inventory shall be filed upon such dates, in such detail, upon such forms, and for such part or parts of the property described below as the director of valuation shall require, provided that he shall allow in all cases a reasonable time for the preparation of such inventory, which shall in no case be less than 30 days: That the inventories herein required shall be made separately for the following accounts as described by the Interstate Commerce Commission in its classification of investment in road and equipment of steam roads effective on July 1, 1914:

3. Grading.
4. Underground power tubes.
5. Tunnels and subways.
6. Bridges, trestles, and culverts.
7. Elevated structures.
8. Ties.
9. Rails.
10. Other track material.
11. Ballast.
13. Right-of-way fences.
14. Snow and sand fences and snow-sheds.
15. Crossings and signs.
16. Station and office buildings.
17. Roadway buildings.
18. Water stations.
19. Fuel stations.
20. Shops and engine houses.
21. Grain elevators.
22. Storage warehouses.
23. Wharves and docks.
24. Coal and ore wharves.
25. Gas producing plants.
26. Telegraph and telephone lines.
27. Signals and interlockers.
28. Power dams, canals, and pipe lines.
29. Power plant buildings.
30. Power substation buildings.
31. Power transmission systems.
32. Power distribution systems.
33. Power line poles and fixtures.
34. Underground conduits.
35. Miscellaneous structures.
36. Paving.
38. Roadway and small tools.
39. Assessments for public improvements.
43. Other expenditures—Road.
47. Unapplied construction material and supplies.

Agreed Valuations of Freight Illegal

The bill to make common carriers liable for lost or damaged freight to its full value, regardless of any agreement limiting the amount recoverable, which was noticed last week, page 415, and which was signed by the President March 4, has been published, as Public Law No. 325. It takes the form of an amendment to section 7 of the Interstate Commerce law.

The first change is to make this section apply to all interstate commerce, all commerce in territories and all going to adjacent foreign countries. The liability of the carrier for damages clear through to destination, applies through to a destination in an adjacent foreign country. Any contract, rule or regulation limiting liability for losses is made invalid without respect to the manner or form in which it is sought to be made; but in the case of goods which the carrier cannot see and know the character of, he may require the shipper to state the value in writing; and the Interstate Commerce Commission may establish freight rates dependent on the value of the property as thus stated. Carriers are forbidden to limit to less than ninety days the period for giving notice of a claim; or less than four months for filing claims; or less than two years for the institution of suit; and if the loss or damage occurs while the freight is being loaded or unloaded, or is due to carelessness or negligence, no notice of claim nor filing of claim shall be required as a condition precedent to recovery. The act takes effect June 4, 1915.

C. P. R. Welfare Agent

T. G. Shaughnessy, president of the Canadian Pacific, has issued the following circular:

"In view of the benefits derived from certain voluntary agencies, such as the St. John Ambulance Association, the Safety First movement, the Railroad Y. M. C. A., and Athletic Associations, I have decided to appoint an officer to co-operate in the development of such organizations amongst the employees of the Canadian Pacific Railway, with the title of general welfare agent. Lieut.-Colonel Lacey R. Johnson, heretofore general superintendent of Angus shops district, who since he joined the service in 1882 has been actively identified with the general uplift of ideals and service among the railroad employees, will assume that office."

Check on Excessive Efficiency

Congress, in making appropriations for the support of the army for the next fiscal year, has inserted in the law a proviso that no part of the appropriations made at this time shall be available "for the salary or pay of any officer, manager, superintendent, foreman or other person having charge of the work of any employee of the United States government while making or causing to be made, with a stop watch or other time-measuring device, a time study of any job of any such employee between the starting and completion thereof, or of the movements of any such employee while engaged upon such work; nor shall any part of the appropriations made in this bill be available to pay any premium or bonus or cash reward to any employee in addition to his regular wages, except for suggestions resulting in improvements or economy in the operation of any government plant; and no claim for services performed by any person while violating this proviso shall be allowed."

Proposed Railway Legislation

A bill before the legislature of Connecticut proposes to tax railways on the basis of their gross earnings instead of on the valuation of stock, as at present.

A bill to provide for the incorporation of trackless trolley companies has been introduced into the Pennsylvania legislature. It would enable them to incorporate and to be governed by the same regulations as apply to automobiles and trucks.

The lower House of the Indiana legislature has defeated the bill to give the public service commission power to authorize an increase in passenger fares from 2 to 2½ cents a mile.

The House of the Missouri legislature last week passed a bill authorizing the state public service commission to advance passenger fares to 2½ cents a mile if the commission after a thorough investigation finds the increase necessary.

Officers of the principal railroads in Nebraska held a conference on March 3 with the governor and a committee of the legislature at Lincoln to urge support for the proposed increase in state passenger fares from 2 to 2½ cents a mile. Among those who addressed the governor and the committee were W. A. Gardner, president of the Chicago & North Western; Hale Holden, president of the Chicago, Burlington & Quincy; A. L. Mohler, president of the Union Pacific; E. J. Pearson, vice-president of the Missouri Pacific, and L. M. Allen, passenger traffic manager of the Chicago, Rock Island & Pacific. After presenting their arguments to the Nebraska committee these railroad men and others addressed the Des Moines (Iowa) Chamber of Commerce on the subject of passenger fares; and the chamber adopted resolutions favoring the adoption by the legislature of some plan that would give the railroads an opportunity to be

heard before a body or commission with authority to take such action as the facts may warrant.

TEXAS.

A prominent railway officer of Texas writes to the *Railway Age Gazette* as follows:

"The Texas legislature was a pioneer in passing drastic bills against the interests of railroads, but there has been a change. In the 33rd session, sitting two years ago, they began to carefully consider all restrictive measures, and the present session (the 34th) has turned down every objectionable bill, except the bi-monthly pay-day act, which will become effective January 1, 1916. As the day of adjournment is not far off we believe now no bad measures will pass. At least two-thirds of the members have shown an appreciation of conditions, which is indicated by the vote of 69 to 35 against the hospital bill and another vote of 87 to 38 against a resolution in the House to investigate the railroad lobby working against this same hospital bill. The proponents of this resolution approved of a strong lobby, mostly not railroad employees, working for the bill, but denied the right of employees and officers to work against it.

"The so-called representatives of union labor introduced about every notion that has ever been invented by railroad baiters and the union labor lobby has been as aggressive and persistent as ever, demanding obedience by members on penalty of losing the labor vote, though one member discovered there were only fourteen labor union votes in his district.

"The Texas legislature must be credited with considerable conservatism. One member of the Senate in speaking against a bill to require certain employees, including agents, to have a lay-off of four days each month, served notice on organized labor that they were going beyond the bounds of reason and had become too aggressive and domineering; that they must remember that they represented less than 15 per cent of the working people of Texas."

Western Society of Engineers

The Western Society of Engineers, Chicago, is planning a special "Electrification" program for the meeting on Tuesday evening, March 16, the week of the convention of the American Railway Engineering Association. The subject under discussion will be "The Operating Results of the Electrification of Steam Railroads." Among the speakers will be W. S. Murray, consulting electrical engineer, New York, New Haven & Hartford, and E. B. Katte, chief engineer, electric traction, New York Central. The projects of the Pennsylvania, the Norfolk & Western, the St. Paul and the Butte, Anaconda & Pacific will also be described.

American Society of Civil Engineers

The constitutional convention for the state of New York is to convene on April 15, 1915. Matters of interest concerning the engineering profession are to come before that convention, at which the American Society of Civil Engineers is to be represented by Arthur S. Tuttle, Henry W. Hodge and Alfred D. Flinn. On Wednesday, March 17, 1915, at 8:30 p. m., at the house of the society at 220 West Fifty-seventh street, New York, the above representatives will lay before the engineering profession the result of their deliberations.

Annual Dinner A. R. E. A.

The annual dinner of the American Railway Engineering Association will be held at the Congress hotel, Chicago, on the evening of March 17. The speakers will include Charles S. Gleed, president, Missouri & Kansas Telephone Company; Sir George Foster, minister of trade and commerce, Dominion of Canada; Frank L. Mulholland, president of the International Association of Rotary Clubs, and Benjamin Baum, chief engineer maintenance of way, Maumee Valley Railroad.

American Society of Mechanical Engineers

The third seasonal meeting of the Chicago Section of the American Society of Mechanical Engineers will be held on Friday, March 19, at the hotel LaSalle, Chicago, dinner being served at 6:30. The subject of Refrigeration, with special reference to ice-making as a by-product of central stations will be considered at 8 o'clock. Heywood Cochrane of the Carbondale Machine Company, Chicago, will make an illustrated talk.

MEETINGS AND CONVENTIONS

The following list gives the names of secretaries, dates of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

Air Brake Association.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 4-7, 1915, Hotel Sherman, Chicago.

American Association of Demurrage Officers.—A. G. Thomason, Demurrage Commissioner, 845 Old South Bldg., Boston, Mass. Annual convention, March 23, 1915, Jefferson Hotel, Richmond, Va.

American Association of Freight Agents.—R. O. Wells, Illinois Central, East St. Louis, Ill. Annual meeting, May 21-24, 1915, Richmond, Va.

American Association of Passenger Traffic Officers.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, April 15-16, San Francisco, Cal.

American Railway Association.—W. F. Allen, 75 Church St., New York. Next session, May 19, 1915, Atlantic City, N. J.

American Railway Engineering Association.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 16-18, 1915, Chicago.

American Society of Civil Engineers.—Chas. W. Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except June, July and August, 220 W. 57th St., New York.

Association of American Railway Accounting Officers.—E. R. Woodson, 1300 Pennsylvania Ave., N. W., Washington, D. C. Annual convention, April 28, 1915, Piedmont Hotel, Atlanta, Ga.

Association of Railway Claim Agents.—C. W. Egan, B. & O., Baltimore, Md. Annual meeting, May 19, 1915, Galveston, Tex.

Canadian Railway Club.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

Canadian Society of Civil Engineers.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

Car Foremen's Association of Chicago.—Aaron Kline, 841 Lawler Ave., Chicago. Regular meetings, 2d Monday in month, except July and August, Lytton, Bldg., Chicago.

Central Railway Club.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

Engineers' Society of Western Pennsylvania.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

General Superintendents' Association of Chicago.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

International Railway Fuel Association.—C. G. Hall, C. & E. I., 922 McCormick Bldg., Chicago. Annual meeting, May 17-20, 1915, Hotel La Salle, Chicago.

Master Boiler Makers' Association.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May 26 to 28, 1915, Chicago, Ill.

National Railway Appliances Association.—Bruce V. Crandall, 537 So. Dearborn St., Chicago. Next convention, March 15-19, 1915, Chicago.

New England Railroad Club.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

New York Railroad Club.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—E. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings monthly.

Peoria Association of Railroad Officers.—M. W. Rotchford, Union Station, Peoria, Ill. Regular meetings, 2d Thursday in month, Jefferson Hotel, Peoria.

Railroad Club of Kansas City.—C. Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Friday in month, Kansas City.

Railway Club of Pittsburgh.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

Railroad Master Tinners, Coppersmiths and Pipefitters' Association.—U. G. Thompson, C. & E. I., Danville, Ill. Annual meeting, May, 1915.

Railway Signal Association.—C. C. Rosenberg, Times Bldg., Bethlehem, Pa. Next meeting, March 15, 1915, Chicago. Annual meeting, September 21-24, 1915, Salt Lake City, Utah.

Railway Storekeepers' Association.—J. P. Murphy, L. S. & M. S., Box C, Collinwood, Ohio. Annual meeting, May 17-19, 1915, Hotel Sherman, Chicago.

Richmond Railroad Club.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

Salt Lake Transportation Club.—R. E. Rowland, Hotel Utah Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

Signal Appliance Association.—F. W. Edmonds, 3868 Park Ave., New York. Meeting with annual convention Railway Signal Association.

Southern & Southwestern Railway Club.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Candler Bldg., Atlanta.

Toledo Transportation Club.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

Traffic Club of Chicago.—W. H. Wharton, La Salle Hotel, Chicago.

Traffic Club of Newark.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, Newark.

Traffic Club of New York.—C. A. Swope, 291 Broadway, New York. Regular meetings last Tuesday in month, except June, July and August, Waldorf-Astoria, New York.

Western Canada Railway Club.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

Western Railway Club.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

Western Society of Engineers.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF JANUARY, 1915

Name of road.	Average mileage operated during period.	Operating revenues			Operating expenses							Net operating revenue (or deficit).	Railway tax accruals.	Operating income (or loss).	Increase (or decr.) comp. with last year.

Traffic News

The Panama canal has been blocked for nearly a week by landslides. When it was cleared, on Wednesday of this week, 27 ships went through in one day.

Railroads east of Chicago have filed tariffs with the Interstate Commerce Commission increasing lake and rail rates and ocean and rail rates where they are intimately related to the all-rail and lake-and-rail rates by about 5 per cent, effective on March 27 and later dates.

Protests against proposed freight rate increases asked by the Missouri railroads were heard by the Missouri Public Utilities Commission at a hearing in Kansas City on March 5. A committee representing manufacturers, produce and stock dealers, appeared before the commission.

The railroads of South Texas expect within the next month or two to carry northward more than 4,500 carloads of Bermuda onions. The land devoted to onions aggregates 7,850 acres, of which 4,200 acres is in the Laredo district. The principal shipments will originate on the International & Great Northern and the St. Louis, Brownsville & Mexico roads.

Governor Philipp of Wisconsin is reported as saying that if the legislature of Wisconsin should pass a bill allowing passenger fares to be put on the basis of 2½ cents a mile, he would veto the measure.

George B. Haynes, general passenger agent of the Chicago, Milwaukee & St. Paul, C. A. Cairns, general passenger agent of the Chicago & North Western, and James C. Pond, assistant general passenger agent of the Minneapolis, St. Paul & Sault Ste. Marie, this week began a speaking campaign in Wisconsin for the proposed advance in passenger fares from 2 to 2½ cents a mile, addressing first a meeting of the Merchants' and Manufacturers' Association of Milwaukee, on Monday.

The foot-and-mouth disease continues to interfere with livestock traffic at many places. Quarantines established two or three weeks ago are being lifted, here and there, but new quarantines are imposed. The state of Pennsylvania has put restrictions on the transit of animals through the state, causing much complaint at New York City. It is said that the New York Central and the New York, Chicago & St. Louis have disregarded this state quarantine. At Richmond, Va., an injunction was issued against certain transportation companies which violated the state quarantine. In Kentucky a single herd of cattle valued at $60,000 was destroyed; and the same course was taken with a herd worth $50,000 at Haddonfield, N. J. At Worcester, Mass., it was reported that a number of men had been infected with the disease.

Officers of Canadian railroads appeared before the Canadian Board of Railroad Commissioners on March 1 to offer testimony in support of their application for a general increase in freight rates. H. G. Kelley, vice-president of the Grand Trunk, testified that wages had been increased 23.19 per cent in 1914 over 1909. He gave other testimony regarding increases in wages and in the cost of supplies and of operation. C. E. Dewey, freight traffic manager of the Grand Trunk, gave detailed testimony regarding the rates which it is proposed to increase. E. W. Beatty, vice-president and general counsel of the Canadian Pacific, also presented statistical testimony on behalf of his road to show the need for an increase in rates. Counsel for the Dominion government announced that the government was opposed to an increase in rates at this time. The board will hold hearings at various places to discuss the rates on different commodities.

W. S. St. George, general passenger agent of the Missouri, Kansas & Texas, in an interview in reply to a statement issued by the Oklahoma Corporation Commission which gave figures to show that the railroads of the state are making more money under the two-cent passenger fare than under the three-cent fare, based on passenger earnings for four months, says that most of the increases shown in the statement resulted from two causes. First, the re-buying of tickets at border points to evade the higher interstate fares, and, second, increased travel resulting from a general increase in business and developments within the territory. "On the Missouri, Kansas & Texas," he said, "47 per cent of all selling stations during the four months of 1914 quoted in the commission's statement showed a decrease in passenger receipts as compared with the previous period, and of 53 per cent showing an increase only 41 per cent showed an increase of over 10 per cent." Some of the border stations, he said, showed an increase of nearly 300 per cent in 1914 as compared with 1912 because of the buying of tickets at border points.

Michigan Commissioner Finds Earnings Too Low

Lawton T. Hemans, chairman of the Michigan railroad commission, appeared before the railroad committees of the Senate and House of the Michigan legislature on March 4, and told them that the statistics submitted by the railroads in support of the request for an advance in passenger fares were substantially correct. "From such information as we have been able to reach," he said, "we are bound to say that for a period of 10 years the railroads have not been earning sufficient income for the services rendered. We are led to this conclusion by the reports and the opinions of the Interstate Commerce Commission as well as from railroad reports in our department. These reports are sworn to and we have every reason to believe that they are substantially correct. Our conclusion is that while in the past decade there has been an increase in the cost to the railroads of freight and passenger transportation, there has been a decrease in the rates for both of these services. Thirty-three out of fifty-six Michigan railroads are earning from their passenger service sums insufficient to pay interest on the passenger service proportion of their bonded debts."

Travel to the San Francisco Exposition

The Southern Pacific is now under contract to carry within the immediate future over 15,000 visitors to the Panama-Pacific International Exposition at San Francisco. To move these people, 104 special trains will be required, these being distributed through the El Paso, Ogden and Portland gateways. Other reservations for cars are coming in as fast as they can be handled.

In addition to the 104 special trains, the Southern Pacific has made arrangements for moving upwards of 40 private cars with their parties, and from now on up to the month of August every one of its 10 limited and express trains from eastern connections will be run with from one to three extra sections. Four of these regular expresses run through Ogden, three via Portland, and three via El Paso. This means an increase in regular daily train service from the East of from 10 to 30 or 40 trains.

From data which has been compiled it is expected by the company that the greatest number of transcontinental visitors will reach San Francisco during June, July and August. H. R. Judah, assistant general passenger agent, estimates that the 550 conventions to be held during the season of the exposition will attract between 700,000 and 800,000 people to San Francisco.

Car Surpluses and Shortages

The American Railway Association's Committee on Relations Between Railroads, Arthur Hale, chairman, has issued statistical statement No. 2, giving a summary of freight car surpluses and shortages for March 1, 1915, with comparisons. The total surplus on March 1, 1915, was 304,284; on February 1, 1915, 280,573, and on March 1, 1914, 159,480.

The surplus for February 1, 1915, shown above includes figures reported since the issue of statistical statement No. 1 (published in the *Railway Age Gazette* of February 19, page 343) and confirms the estimate made therein.

The increases over February 1 are chiefly in the west and central south. The total shortage on March 1, 1915, was 297; on February 1, 1915, 1,162, and on March 1, 1914, 5,573.

The figures by classes of cars follow:

Classes	Surplus	Shortage
Box	78,686	50
Flat	20,592	41
Coal and gondola	158,293	14
Other	46,713	192
Total	304,284	297

Commission and Court News

INTERSTATE COMMERCE COMMISSION

A hearing before George N. Brown, examiner attorney for the Interstate Commerce Commission, on the proposed charges for trap car service was held at Detroit on March 3 and 4.

The Chicago, Milwaukee & St. Paul has filed a formal complaint with the Interstate Commerce Commission against the Great Northern, alleging that the Great Northern unduly discriminates against it by refusing to make through routes and joint rate arrangements with it for the carriage of passengers to and from British Columbia and Washington via Seattle.

International Rates on Pulp Wood

International Paper Company et al. v. Delaware & Hudson et al. Opinion by Commissioner Clark:

Complaint is made against the reasonableness of an increase of generally one cent per 100 lb. made in August, 1913, in the rates on pulpwood from points in Canada on the Canadian Pacific, Grand Trunk, Intercolonial, Canadian Northern and Temiscouta to points in eastern and northern New York. These increased rates had already been found reasonable by the Board of Railway Commissioners for Canada on a complaint by the same parties. The rates were primarily established by the Canadian carriers for transportation, largely in Canada, and the increases accrue, almost wholly to them. For these reasons the commission believes that no relief should be granted. (33 I. C. C., 270.)

Proposed Increase in Freight Storage Rates at New York

C. V. Burnside, examiner for the Interstate Commerce Commission, took testimony at New York City March 4, 5 and 6 concerning the proposed increase in charges for storage and lighterage the tariffs for which were suspended by the commission. The new tariffs provided for charges for switching at numerous places where at present this service is performed free. One of the proposed changes was a new item in the tariffs making a charge of twelve cents a ton for the delivery of freight in Manhattan at docks other than those of the railroad companies. A large share of the freight coming to New York City reaches the west side of the Hudson River by rail, and the cars are taken from the trains directly to floats and carried across the river; and the freight is unloaded directly at the railroad company's piers. Freight going to other piers must in most cases be unloaded from the cars at Jersey City or Hoboken and taken across the river by lighter or by wagons on the decks of ferry boats.

Another important change proposed is a reduction from ten days to five days in the time allowed for free storage of flour. The flour merchants declare that the profit on their transactions is so small that the addition of a charge for storage heretofore given by the railroads for nothing, will greatly impair and in some cases destroy their business.

The Merchants' Association was represented at the hearing by J. C. Lincoln, and the city government by the corporation counsel, F. L. Polk; numerous large shippers and manufacturers were represented.

The contention of the railroads is that all the proposed charges are reasonable; while the city and local interests argue that conditions in New York City are so different from those in other places that no general rule can apply; the need of additional time to unload flour, so as to provide for delays in transportation, for bunching and for making adjustments with the final receivers of the freight, who have very limited storage room, makes it out of the question to pay the carriers any more than is now paid.

Jobbers in flour say that it is necessary that there shall be usually in New York City a reserve stock of about 20,000 barrels; this to provide for irregularities in arrival, etc.; and they say that a reduction of five days in the free storage time would force them to reduce this stock to 5,000 barrels. No fair comparison can be made with the rates in other cities because the conditions are different. In Philadelphia cars are taken directly to the doors of warehouses; but in New York this is out of the question.

Testimony was given on behalf of the flour merchants to the effect that the proposed charge of one cent per 100 lb. for each ten days on flour, equal to six cents per barrel per month, would be about twice the prevailing charge for keeping flour in public storehouses, which is three cents per barrel per month (though for the first month there is a charge of three cents a barrel for labor).

The present liberal practices of the railroads in connection with flour at New York City are of long standing. In 1902 the railroads allowed sixty days' free storage. After a time this was reduced to thirty days; then to twenty days and finally the present limit, ten days, was adopted about six years ago.

At a continuation of the hearing on Monday of this week Mr. Lincoln described the track facilities and the customs in freight handling in Chicago, to show the superiority of the system of distribution of freight provided in that city.

P. C. Staib, a wholesale grocer, declared that it would be impossible, as a rule, to move freight from the piers in New York to the consignees' warehouses within 48 hours of its arrival, which is the limit of the period for which the roads propose to allow free storage. The draymen of the city are not equal to the task of removing freight so rapidly.

An inspector of the New York State Public Service Commission, testifying concerning freight, largely structural steel, coming to the city to be delivered to contractors working on the new subways, said that the proposed charge of twelve cents a ton for the delivery of freight from lighters at points other than railroad company's piers, together with the additional charge of forty cents a ton on heavy pieces, would add to the cost of the city's subways about $104,380. The American Bridge Company presented a similar protest.

STATE COMMISSIONS

The Railroad Commission of Mississippi has imposed on the Illinois Central a fine of $500 for ignoring an order of the commission forbidding the collection of ten cents additional from passengers paying fares on the trains.

The Railroad Commission of South Carolina on March 3 issued an order making sweeping reductions in the rates for transportation of merchandise by express in that state. At the same time it was announced that hearings would be held concerning proposed changes in rates on other merchandise, not affected by the present order.

The Long Island road has appealed to the courts from the order of the New York Public Service Commission, First district, requiring it to put on two additional trains in the Manhattan-Far Rockaway service, and one additional train on the Atlantic division, and to have certain trains stop at St. Albans station on the Montauk division. The company has obtained a writ of certiorari from the Supreme Court for a review of the commission's action.

The Oregon Railroad Commission has been obliged to retrench because its appropriation for the next two years was reduced by the legislature to $25,000. It is announced that the chief electrical engineer, the auditor, the assistant secretary and the stenographer, are to be dismissed on April 1, and that other reductions in its staff are expected to follow. The commission's appropriation for the past two years has been $80,000, and for the two years before that was $105,000.

The New York State Public Service Commission, Second district, has decided in favor of William A. Wadsworth of Geneseo, in his complaint against the Erie Railroad for not maintaining his farm crossing. The crossing consists of a bridge over the tracks, and it has existed for about 60 years; but recently when it became necessary to build a new bridge the railroad notified Mr. Wadsworth that he himself would have to bear the expense; and a barricade was put across the present structure. The road claimed the commission had no jurisdiction in such a case; but, in an opinion by the chairman, it holds that, whatever its power as to originally establishing a farm crossing—although it believes it has such authority—it plainly has jurisdiction in a matter

like the present case, where the crossing has already been constructed and has been so long in use.

PERSONNEL OF COMMISSIONS

Joseph Pryor, assistant chief engineer of the Illinois Public Utilities Commission, has been appointed acting chief engineer, succeeding R. M. Feustel, resigned.

Charles C. Elwell, engineer of the Connecticut Public Utilities Commission, has been nominated by the governor (and confirmed) as a member of the commission, in place of T. B. Ford, to take office July 1, next. Mr. Elwell was born in 1855 at Belfast, Me., and was graduated from the University of Maine in 1878. He began railroad work in 1882 as assistant engineer on the New York & New England, and subsequently served in a similar capacity on the Philadelphia & Reading, the Baltimore & Ohio and the New York, New Haven & Hartford. On the latter road he was in charge of four tracking work between New York and New Haven from 1893 to 1895, and in the latter year was promoted to the position of superintendent at Norwich, Conn. In 1908 he was made engineer of electric lines controlled by the New Haven, which position he held three years. In 1911 he was appointed engineer of the state commission. He is a member of the American Society of Civil Engineers, and has just been elected president of the Connecticut Society of Civil Engineers.

COURT NEWS

A special court, consisting of Judges Kohlsaat, Landis and Geiger of the United States Court at Chicago, has declined to issue an injunction at the request of the Duluth & Northern Minnesota to prohibit the Interstate Commerce Commission from enforcing its orders reducing rates on logs and pulp wood on this road, which lies wholly within the state of Minnesota. The court held that, inasmuch as the logs and other commodities carried by the road were intended for shipment beyond, the road was engaged in interstate commerce within the meaning of the act; and as to the plea of confiscation, that the court may not hear testimony tending to show that the order results in confiscation of the carrier's property unless the commission has refused to hear such testimony.

Liability for Fires—Proximate Cause

In an action for damages by fire to the plaintiff's factory, it appeared that the fire was started by railroad laborers on the defendant's right of way for their own purposes, and there was no evidence that certain combustibles which the defendant had permitted to accumulate on the right of way became ignited and thereby communicated the fire to the plaintiff's property. The Missouri Supreme Court held that the negligence, if any, of the railroad company in permitting the accumulation was not the proximate cause of the fire. The court also held that the Missouri statute making railroads liable for fires started by engines and those communicated by the ignition of dry vegetation negligently permitted to remain on the right of way, does not make a railroad liable for a fire kindled by its laborers on the right of way outside the scope of their employment (in this instance to heat water to wash their clothes), and communicated directly to adjoining property without the ignition of rubbish upon the right of way.—Excelsior P. Mfg. Co. v. Kansas City Southern (Mo.), 172 S. W., 359.

Right to Refund—Conditions

In an action in the Oklahoma courts for a refund under a milling-in-transit arrangement, it appeared that the plaintiff, a lumber company, at different times between May, 1907, and February, 1908, shipped rough lumber to a milling point on the defendant's line. At the time a milling-in-transit privilege was given by the defendant's tariff, under which the finished product was required to be shipped out in certain quantities to destinations on the defendant's line, and under certain named tariffs carrying specified freight rates then in force. Before the plaintiff shipped out any of the lumber, that tariff on intrastate shipments had been canceled, and lower rates established to conform to an order of the State Corporation Commission; and thereafter the plaintiff shipped under such lower rates. The Oklahoma Supreme Court held that, not having complied with the conditions under which the right to a refund on inbound shipments was given, the plaintiff was not entitled to the benefit of it. Its right to a refund was dependent on the shipper causing the lumber to be moved under the existing tariffs. When this was not done, but, instead the lumber was shipped out under reduced rates, put in force by lawful authority, an action to recover such refund could not be maintained.—St. Louis & S. F. v. Walton-Chandler Lumber Co. (Okla.), 145 Pac. 340.

Employers' Liability Act—Interstate Commerce

The Wisconsin Supreme Court holds that a brief incidental absence from the scene of work, which is not inconsistent with the employee's duty to his employer, does not necessarily invalidate his claim to be still on duty and engaged in interstate commerce. A brakeman finished his regular duties, after a run between two state points on a train which had some interstate cars in it. He went to a saloon, and from there started to cross over a train to go to the station and learn if the conductor had any further orders for him. While crossing the train he was injured. The court held that he was employed in interstate commerce.—Graber v. Duluth, S. S. & A. (Wis.), 150 N. W., 489.

A laborer on a trestle, used by a railroad company in interstate commerce, boarded and slept in a bunk car furnished by the company, and which was moved about as the place of work was changed. The actual board was furnished by the foreman in charge of the work. The men went to and from the boarding cars sometimes on push cars and sometimes on foot. The laborer in question was injured while walking along the tracks to the cars after finishing his day's work. In an action against the company it was held by the Kentucky Court of Appeals that he was engaged in interstate commerce within the meaning of the federal employers' liability act, the course of his employment covering not only the time he was actually engaged at work, but the time he was engaged in going to and from his work.—Louisville & N. v. Walker (Ky.), 172 S. W., 517.

Duty Towards Licensees Walking Near Tracks

Action was brought for injuries to a boy 15 years of age, and weighing about 100 pounds, who was drawn beneath a freight train moving from 25 to 30 miles an hour while he was walking along a pathway alongside the defendant company's tracks. The Kentucky Court of Appeals assumed that the boy was a licensee and not a trespasser, so that the question sharply presented was: Does a railroad company owe to a licensee walking near its tracks, and who knows of the approach of the train, the duty of slackening the speed of its train to prevent him from being sucked under it? Witnesses had never heard of such an accident but, says the court, this does not show that such an accident had never happened, or that it should not have been anticipated; yet this rule is not without qualification. Every day hundreds of trains are run at the rate of 25 to 30 miles an hour. These trains pass hundreds and perhaps thousands of persons standing within five or six feet of the track. If the suction from trains were great enough to draw persons under them, there would have been innumerable accidents of the kind under consideration. Notwithstanding this fact, several railroad men, who certainly had an opportunity to speak from long experience, say that they never heard of a live object, capable of resisting, being sucked under a train. Not only so, but the only two cases that have ever come before the courts, so far as the court knew, are the case under consideration and the case of Graney v. St. Louis, I. M. & S., 157 Mo., 666, 57 S. W., 276, 50 L. R. A., 153, where a recovery was denied on the ground that the accident, even if it took place as claimed by the plaintiff, was not one that might have been reasonably anticipated. Where, in a case like this, it is contended that the accident was the result of the negligence of the railroad company, combined with a natural law, and where not only the character of the accident, but the conditions attending the everyday operation of trains, are such that the accident would have frequently happened if the natural law were such as to make it possible, evidence to the effect that no such accident had ever happened has a strong and important bearing on the question whether or not it should have been reasonably anticipated.

Even assuming the possibility of such an accident, the court

held the probability of its occurrence to be so remote that it could not be said to be an accident which should, in the exercise of ordinary care, be reasonably anticipated by those operating railroad trains. That being true, a railroad company does not owe the licensees walking along the side of its tracks, and who know of the approach of its trains, the duty of moderating the speed of the trains so as to prevent their being sucked under the cars.—L. & N. v. Lawson (Ky.), 170 S. W., 198.

Interchange of Cars and Freight

The Illinois Central sought to enjoin the enforcement of an order of the Louisiana Railroad Commission, regulating interchange of traffic. This order (No. 295) would require a railroad, upon demand of a carrier or shipper, and on terms fixed by the state commission, to switch empty cars from a competing interstate railroad to a designated side track within its own terminals for the purpose of being loaded there with goods intended for interstate commerce, and when so loaded to move the same back to the competitor's line for transportation to another state. The company would also be required to accept from competing interstate lines, at points within the city, loaded cars brought from other states, and place them on its own side track, although such track was the real destination contemplated at the time of the original shipment. The United States Supreme Court holds that switching movements of this kind constitute a part of interstate commerce, the regulation of which Congress has undertaken, and consequently the order of the state commission transcends the limits of its powers.

When freight actually starts in the course of transportation from one state to another it becomes a part of interstate commerce. The essential nature of the movement, and not the form of the bill of lading, determines the character of the commerce involved. And generally, when this interstate character has been acquired, it continues, at least, until the load reaches the point where the parties originally intended that the movement should finally end. Illinois Central v. De Fuentes, 35 Sup. Ct., 275.

West Virginia Two-Cent Fare Law

The United States Supreme Court on Monday of this week, in the suit of the Norfolk & Western, declared unconstitutional, as affecting that road, the law of West Virginia limiting passenger fares to two cents a mile. The decision was by Justice Hughes, who said:

"In making a reasonable adjustment of the carrier's charges, the state is under no obligation to secure the same rate of return from each of the two principal departments of business, passenger and freight, but the state may not select either of these departments for arbitrary control.

"In this case it is apparent, from every point of view, that the statutory rate, at most, affords a very narrow margin over cost. It is clear that by the reduction in rates, the company is forced to carry passengers, if not at or below cost, with merely a nominal reward, considering the volume of the traffic affected. We find no basis whatever upon which the rate can be supported, and it must be concluded, in the light of the principles governing the regulation of rates, that the state exceeded its power in imposing it."

The attorney general of the state contended that the 2-cent rate prescribed by the state law of 1907 should be taken in connection with the freight rates authorized in 1895 by the legislature and that passenger earnings cannot be segregated and considered apart; that all classes of railroad business need not be equally remunerative; that as the railroad company is earning between 6 and 8 per cent on its entire investment if its passenger business is not remunerative its freight traffic must be more than remunerative.

In deciding the case the court declared, as above, that the statutory rate, at most, affords a very narrow margin. "It is manifestly not a case where we are asked to enter the domain of legislative discretion, nor is it one in which it is necessary to determine the value of the property employed in intrastate business. . . ."

The Norfolk & Western brought suit in the Circuit Court of Kanawha county, W. Va., in 1909 to restrain the officers of the state from further enforcement of the law. At the old rate the road estimated that it was receiving a return of 3.7 per cent on its passenger business. For the fiscal year ending June 30, 1908, the first year the law was in operation, the return on its passenger business fell to 1.04 per cent per annum and the following fiscal year to 0.38 per cent.

In addition to these facts the road presented the claim that the penalties prescribed for disobedience were so heavy as to amount to denial of due process of law; and that the law was unconstitutional because it imposed the burden of the lower rate on roads whose mileage exceeded fifty miles while exempting shorter roads.

North Dakota Coal Rate Law Annulled

The Supreme Court of the United States, on Monday of this week, in the cases of the Northern Pacific and the Minneapolis, St. Paul & Sault Ste. Marie declared unconstitutional the law of North Dakota limiting freight rates on lignite coal.

The decision was by Mr. Justice Hughes, who has written most of the important decisions of the Supreme Court in rate cases recently. Justice Hughes lays down the principle that a state cannot select a particular commodity, coal, for example, on which to fix a rate, justifying itself by the fact that the return from a railroad's entire intrastate business is remunerative. The state has broad powers over railroads, but it does not enjoy the rights of an owner.

This case came before the court on appeal from a decision of the Supreme Court of North Dakota. The law was passed in 1907, and the carriers refused to obey it. A test case was begun, and in 1909 the Supreme Court of North Dakota handed down a decision that the rates were reasonable, and that the proper test of their reasonableness was whether they, with other rates on other commodities in intrastate transportation, gave the carrier a reasonable return on its business.

This decision was affirmed by the Supreme Court of the United States in 1910, but with the proviso that if after a trial of the rates they were still found to be confiscatory, the carriers might come into court and have another opportunity to prove that contention.

The rates were put into effect in 1910. Again the railroads, after a year's test of the rates, went into court to contest the law. The Supreme Court of North Dakota then held that in the case of the Northern Pacific the rates were "slightly remunerative, but in fact non-compensatory," and in the case of the other road "more than the actual costs of transportation," but less than the fixed and overhead charges "properly chargeable to the carriage of this commodity."

The court held that the rates were not confiscatory because to prove confiscation it must be shown that the rates are so low as to make a carrier's entire intrastate business unprofitable, after it should be demonstrated by valuation of the company's property what portion thereof was devoted to intrastate traffic. The court in addition held that it must be reasonably certain that the loss on the commodity in question reduces the total net freight earnings to a point where they as a whole fail to yield a fair return. The carriers declared it was impossible to answer such a question and again appealed to the Supreme Court of the United States for relief.

Justice Hughes said, further:

"The general principles to be applied are not open to controversy. The railroad property is private property devoted to a public use. As a corporation, the owner is subject to the obligation of its charter. As the holder of special franchises, it is subject to the conditions upon which they were granted. Aside from specific requirements of this sort, the common carrier must discharge the obligations which inhere in the nature of its business. It must supply facilities that are reasonably adequate; it must grant reasonable terms, and it must give service without unjust discrimination.

"But the fact that the property is devoted to a public use on certain terms does not justify the requirement that it shall be devoted to other public purposes, or to the same use on other terms, or the imposition of restrictions that are not reasonably concerned with the proper conduct of the business according to the undertaking which the carrier has expressly or impliedly, assumed. As a carrier for hire, it cannot be required to carry persons or goods gratuitously. The case would not be altered by the assertion that the public interest demanded such carriage. In such a case it would be no answer to say that the carrier obtains from its entire business a return as to the sufficiency of which it is not entitled to complain."

Railway Officers

Executive, Financial, Legal and Accounting

W. H. Sparger has been appointed auditor of the Oil Belt Railway, with headquarters at Jennings, Mo.

G. W. Alexander has been elected treasurer of the Detroit Terminal, with office at Detroit, Mich., vice W. E. Hackett.

Henry C. Ferris, of Muskogee, Okla., has been appointed co-receiver with Alexander New of the Missouri, Oklahoma & Gulf, vice Louis S. Posner, resigned.

Pending the return of T. J. Kennedy from abroad and his qualifying as co-receiver, Vivian Harcourt has been appointed sole acting receiver of the Algoma Central & Hudson Bay, with headquarters at Sault Ste. Marie, Ont.

Alberto J. Pani, vice-president of the National Railways of Mexico, at Mexico City, Mex., has been authorized by the executive committee of the company to assume the duties of president, due to the absence of Luis Cabrera, and Charles R. Hudson, vice-president at Mexico City, has severed his connection with this company.

The Continental Trust Company has resigned as co-receiver of the Denver, Laramie & Northwestern, and Marshal B. Smith is now sole receiver, with headquarters at Denver, Col. J. R. McCoy, assistant auditor at Denver, has been appointed auditor in charge of accounts, and his former position has been abolished.

William Alfred Worthington, vice-president and assistant director of maintenance and operation of the Southern Pacific Company, at New York, has been appointed vice-president and assistant to chairman, with headquarters at New York. Mr. Worthington was born on June 18, 1872, at Vallejo, Cal., and was educated in the public schools af Sacramento. He began railway work on March 1, 1887, with the Southern Pacific, and has been in the continuous service of that road ever since. He served as stenographer and clerk in the superintendent's office at Sacramento until June, 1888, and then became chief clerk to the engineer of maintenance of way at San Francisco. In October, 1893, he was appointed statistician in the general manager's office at San Francisco, and two years later was made chief clerk of the same office. From October, 1901, to April, 1904, he was executive secretary to assistant to president of the same road at San Francisco. Mr. Worthington went to Chicago in April, 1904, as chief clerk to the director of maintenance and operation of the Union Pacific System and the Southern Pacific Company. In November, 1907, he was appointed assistant to director of maintenance and operation at Chicago, and from January 1, 1912, to February, 1913, was assistant director of maintenance and operation of the same roads, with headquarters at New York City. In February, 1913, when the Union Pacific and Southern Pacific were separated under an order of the federal court, he resigned from the Union Pacific and was elected vice-president and assistant director of maintenance and operation of the Southern Pacific Company, which position he held at the time of his recent appointment as vice-president and assistant to chairman of the same road, as above noted.

W. A. Worthington

Operating

R. S. Toucey, assistant superintendent of the Union Pacific, Cheyenne, Wyo., has been appointed trainmaster at Ogden, Utah, succeeding George Brophy, promoted.

Will G. Dungan, whose appointment as superintendent of the Sterling division of the Chicago, Burlington & Quincy, with headquarters at Sterling, Colo., has already been announced in these columns, was born October 8, 1875, at Aledo, Ill. He attended the University of Nebraska 1891-1896, and began railway work in November, 1897, with the Chicago, Burlington & Quincy as axman. He held various positions in the engineering department on location, construction and maintenance, and in March, 1907, was appointed engineer maintenance of way of the Nebraska district. One year later he was appointed roadmaster and trainmaster at Orleans, Neb., and in September, 1912, was made trainmaster at McCook, Neb. He held the latter position until his recent promotion to division superintendent, as above noted.

Charles Hicks, whose appointment as general manager of the Tennessee, Alabama & Georgia with headquarters at Chattanooga, Tenn., has already been announced in these columns, was born on August 4, 1859, at Poughkeepsie, N. Y., and was educated in the high schools. He began railway work on July 26, 1881, with the Poughkeepsie & Eastern, now a part of the Central New England, serving consecutively as station agent and telegraph operator for twelve years, commercial agent for a year and a half, and as general superintendent for fourteen years. He then entered the service of the Chattanooga Southern as superintendent, and later was general manager until the latter part of 1910. Mr. Hicks was then out of railway work for about four years until his recent appointment as general manager of the Tennessee, Alabama & Georgia, the successor of the Chattanooga Southern.

Engineering and Rolling Stock

Charles A. Paquette, whose appointment as chief engineer of the Cleveland, Cincinnati, Chicago & St. Louis and the Peoria & Eastern, with headquarters at Cincinnati, Ohio, has already been announced in these columns, was born at Detroit, Mich., on April 2, 1872. He was graduated from Notre Dame University in 1891, and began railway work in July of that year as transitman for the Lake Shore & Michigan Southern. From May, 1892, to April, 1893, he was transitman on the Peoria & Eastern, and was successively assistant engineer and engineer maintenance of way until October, 1899, when he became superintendent of that road. In September, 1902, he was appointed superintendent of the Cleveland, Cincinnati, Chicago & St. Louis at Indianapolis, Ind., and in June, 1906, he was made assistant chief engineer. In December, 1913, Mr. Paquette was appointed chief engineer maintenance of way, from which position he was promoted to that of chief engineer in charge of construction and maintenance on March 1, as above noted.

C. A. Paquette

W. L. Connors, general signal foreman of the Buffalo, Rochester & Pittsburgh, has been appointed signal supervisor on the Rochester division, with headquarters at Warsaw, N. Y., succeeding M. J. Brundige, deceased.

L. F. Lonnbladh, engineer maintenance of way of the Missouri, Kansas & Texas, has been appointed chief engineer, with headquarters at Dallas, Tex. A. A. Matthews, assistant engineer of maintenance of way, succeeds Mr. Lonnbladh, with office at Dallas.

William Pelham, master carpenter of the Erie at Marion, Ohio, has been appointed inspector of bridges and buildings, with headquarters at Cleveland. J. Orcutt, master carpenter at Huntington, Ind., succeeds Mr. Pelham, and H. D. Harlow has been appointed master carpenter at Huntington, succeeding Mr. Orcutt.

V. J. Lamb, car foreman of the Charleston & Western Carolina, at Augusta, Ga., has been appointed general foreman car repairs, at that place, succeeding W. F. Weigman, who has been appointed general foreman car department of the First division of the Seaboard Air Line, with headquarters at Portsmouth, Va.

OBITUARY

P. Dowling, general roadmaster of the Delaware, Lackawanna & Western, at Scranton, Pa., died in that city on March 6.

Frederick L. Brooks, formerly claim agent of the Chicago, Indianapolis & Louisville, died at his residence in Chicago on March 3, aged 56 years.

Adolph B. L. Scrivner, formerly assistant general superintendent of the National Lines of Mexico, died at Laredo, Texas, on March 1, aged 39 years.

Frederick W. Morse, formerly and for many years general passenger and freight agent of the Montpelier & Wells River, died on March 7, at Montpelier, Vt., at the age of 70.

Marvin J. Brundige, signal supervisor of the Buffalo, Rochester & Pittsburgh, died at the Warsaw hospital, Warsaw, N. Y., on February 21, following an operation for acute appendicitis.

G. D. Bacon, formerly from 1892 to 1905 general agent of the passenger department of the Chicago, Rock Island & Pacific, with offices at Cincinnati, Ohio, and St. Louis, Mo., died at Eustis, Fla., on March 4, aged 70 years.

W. L. Bisbee, formerly superintendent of the Second division of the Houston & Texas Central, died on March 4, at Houston, Tex., aged 63 years. He was retired from the active service of the company on January 1 last, at his own request, due to ill health, at that time having served the company continuously for 41 years.

Frederick M. Hawley, superintendent of the Allegheny & Bradford divisions of the Erie at Salamanca, N. Y., died on March 4, at Bradford, Pa. He was born on September 5, 1865, at Scottsville, N. Y., and began railway work in June, 1879, as a telegraph operator on the Erie, and remained in the service of that road ever since. He then served consecutively as despatcher, chief despatcher, passenger trainmaster and division trainmaster until May, 1912, when he was appointed division superintendent of the same road.

Morton Riddle, general manager of the Florida East Coast at St. Augustine, Fla., died at that place on March 4. He was born in 1869 at Petersburg, Va., and began railway work on April 1, 1887, and was consecutively rodman, instrument man and resident engineer on the Norfolk & Western and the Charleston, Cincinnati & Chicago, now a part of the Carolina, Clinchfield & Ohio, until May, 1890. He then entered the service of the Atlantic Coast Line as roadmaster, and in November, 1901, he was appointed superintendent. He was later assistant chief engineer, until 1905, when he was promoted to general superintendent of the same road at Jacksonville, Fla., leaving that company in February, 1914, to go to the Florida East Coast as general manager at St. Augustine.

Hiram R. Nickerson, formerly vice-president of the Mexican Central, died on March 8, at North Wayne, Maine. He was born on December 13, 1853, at North Wayne, and began railway work in February, 1872, as a messenger on the Atchison, Topeka & Santa Fe. He subsequently served on the same road consecutively as telegraph operator, station agent, brakeman, conductor, train despatcher, trainmaster, division superintendent and general superintendent of lines east of the Missouri river until 1888. Then for six years he was general superintendent of the entire system. In June, 1894, he was appointed assistant general manager of the Mexican Central, and from the following December to May, 1899, he was general manager of the same road. Mr. Nickerson was then elected vice-president and general manager. He continued as vice-president until 1907.

Equipment and Supplies

LOCOMOTIVE BUILDING

The Vandalia is in the market for 25 Consolidation type locomotives.

The South Dakota Central has ordered 1 Consolidation type locomotive from the American Locomotive Company.

The Delaware, Lackawanna & Western has ordered 5 Pacific type locomotives from the American Locomotive Company.

The Chicago, Burlington & Quincy has ordered 50 locomotives from the Baldwin Locomotive Works. This will include 15 Pacific type, 20 Mikado and 15 Santa Fe type.

CAR BUILDING

The Chicago Great Western is in the market for 6 combination passenger cars.

The Chicago, Burlington & Quincy has ordered 200 50-ton all-steel gondola cars from the Haskell & Barker Car Company.

The Atchison, Topeka & Santa Fe has ordered 500 60,000-lb. capacity refrigerator cars from the American Car & Foundry Company.

The Illinois Traction is reported to have ordered 50 cars from the Haskell & Barker Car Company. This item has not been confirmed.

The San Antonio, Fredericksburg & Northern is reported in the market for 20 60,000-lb. capacity box cars. This item has not been confirmed.

The Chicago & Milwaukee Electric has ordered 15 all-steel passenger cars from the J. G. Brill Co., and has retained an option on 15 more.

The Boston & Maine has ordered 6 postal cars from the Laconia Car Company, and has also ordered 600 underframes from the Laconia Car Company, and 600 from the Keith Car & Manufacturing Company.

IRON AND STEEL

The Virginian Railway is in the market for 3,000 tons of rails.

The Kansas City Southern is in the market for 8,000 tons of rails.

The Toledo Terminal has ordered 500 tons of rails from the Algoma Steel Company, Sault Ste. Marie, Ont.

The New York, Chicago & St. Louis has ordered 2,500 tons of steel rails from the Lackawanna Steel Company.

The Pennsylvania Railroad has placed an experimental order for 2,000 tons of steel rails with the Illinois Steel Company.

The Chicago Great Western has just ordered 6,000 tons of 85-lb. open hearth steel rails from the Illinois Steel Company.

The Baltimore & Ohio is reported to have ordered 7,000 tons of steel rails from the Carnegie Steel Company. This item has not been confirmed.

The Great Northern recently ordered 10,000 tons of rails, divided among the Lackawanna, Bethlehem, Cambria and the Illinois Steel Companies.

The Northern Pacific has ordered 20,000 tons of rails, divided as follows: Illinois Steel Company, 8,500 tons; Lackawanna Steel Company, 7,500 tons, and the Colorado Fuel & Iron Company, 4,000 tons.

The Illinois Central has ordered 35,000 tons of 90-lb. rails from the Algoma Steel Company, Sault Ste. Marie, Ont. These rails are to be rolled under the American Railway Engineering Association specifications, with the nick-and-break test.

Supply Trade News

T. S. Leake, general contractor, has moved his offices from the Ellsworth building, Chicago, to the Transportation building.

The Railway Water & Coal Handling Company has moved its offices from the Ellsworth building, Chicago, to the Transportation building.

The Adams Motor & Manufacturing Company has moved its offices from 1716 North Kedzie avenue, to its new plant at 3918 Castello avenue, Chicago, Ill.

J. W. Fogg, formerly master mechanic of the Baltimore & Ohio Chicago terminal, has become associated with the Boss Nut Company, with headquarters at Chicago.

A. D. McAdam, formerly western sales agent of the Ralston Steel Car Company, Columbus, Ohio, has been appointed sales manager, with headquarters at Columbus.

A. B. Saurman, Pacific coast manager for the Standard Underground Cable Company, Pittsburgh, Pa., has recently been appointed southeastern manager, with headquarters at Philadelphia, Pa.

Robert E. Jennings, president of the Carpenter Steel Company, Reading, Pa., has been elected to fill the vacancy on the board of the Joseph Dixon Crucible Company, Jersey City, N. J., caused by the death of William Murray.

Sidney G. Johnson, vice-president of the General Railway Signal Company, Rochester, N. Y., in charge of sales and installations, has been elected a member of the board of directors of the General Railway Signal Company of Canada, Limited, Lachine, Que.

F. L. DeArmond, who for the past five years has been with John S. Latta, Philadelphia, Pa., representing the Manhattan Rubber Company, has been appointed sales agent of the Protectus Paint Company, with headquarters in the North American building, Philadelphia.

The Sprague Electric Works of the General Electric Company, New York, has opened a branch sales office in the Illuminating building, Cleveland, Ohio, and Frank H. Hill, who also has charge of the Pittsburgh office, has been appointed manager of the Cleveland office.

Joseph Mohr, president of John Mohr & Sons, boiler manufacturers of Chicago, Ill., died at his home on March 2, 1915. Mr. Mohr was born in Chicago in 1855, and, after serving an apprenticeship as boilermaker, he engaged in business with his father in 1882, under the firm name of John Mohr & Son, which was later changed to John Mohr & Sons.

Mussens, Ltd., Montreal, Que., railway mining and contractors' supplies, were placed in liquidation on March 5, by W. H. C. Mussen. John J. Robson has been appointed liquidator provisionally pending a meeting of the creditors. The liabilities are placed at $300,000, and the assets at $550,000. Depression in business is given as the reason for the liquidation.

A record of prompt shipment is reported by the Whiting Foundry Equipment Company, Harvey, Ill. This company received a telegraphic order for a three-motor electric traveling crane of 10-ton capacity and a 30-ft. span on January 23. The crane was to be delivered complete on the purchaser's runway at New Bridge, Del., on February 10. Drawings were made and the crane was constructed and shipped on January 29, reaching New Bridge on February 4, and it was erected complete for service by February 6.

E. S. Goodloe, storekeeper for the Eastern district of the New York, New Haven & Hartford at Readville, Mass., has left that company and opened an office in the National Metropolitan Bank building, Washington, D. C., where he will represent the Commercial Acetylene Railway Light & Signal Company, New York, the Woven Steel Hose & Rubber Company, Trenton, N. J., and the Automatic Ventilator Company, New York. Mr. Goodloe began railroad work with the Chesapeake & Ohio at Richmond, Va., and remained with that company seven years, during which time he was employed in the mechanical, store and purchasing departments. He was then appointed assistant purchasing agent of the Carolina, Clinchfield & Ohio, with headquarters at Johnson City, Tenn., which position he held for four years, and for the next six years was storekeeper of the eastern district of the New Haven, as noted above.

Railway Steel-Spring Company

The Railway Steel-Spring Company in the fiscal year ended December 31, 1914, had gross earnings of $4,351,465, as against $7,688,185 in 1913. Its total manufacturing, operating and administrative expenses and charges for repairs and depreciation totaled $3,638,180, of which $199,218 was for repairs, renewals and depreciation. The similar expenses in 1913 were $6,216,092, the charges for repairs, renewals and deprcciation being $463,120. The net earnings dropped, therefore, from $1,472,092 in 1913 to but $713,285 in 1914. The company paid bond interest of $338,831, and the usual 7 per cent dividends on preferred stock of $945,000, whereupon the December 31, 1913 surplus of $4,525,203 was reduced to $3,954,656 on December 31, 1914.

The Railway Steel-Spring Company has plants and properties valued at $33,314,362. The statement for December 31, 1914, showed inventories of $1,505,072 There were also accounts receivable of $1,006,076 and $1,669,896 cash. The company has issued capital stock of $27,000,000, of which one-half is preferred. It also has bonds outstanding of $6,628,000. Its statement for December 31, 1914, showed accounts payable of $297,308.

F. F. Fitzpatrick, the company's president, expresses the belief in his report that "all indications now seem to point to a return of confidence and a feeling of encouragement, which cannot help but be conducive to a gradual revival of business throughout the country."

New York Air Brake Company

Notwithstanding the depression of the past year, the New York Air Brake Company was able "through improved methods of manufacture and close economy" to pay its fixed charges, maintain its usual dividend and increase its surplus slightly. The company's total sales were $2,915,932 or but slightly less than the $3,244,312 of 1913 and the $3,078,256 of 1912. The manufacturing costs totaled $1,740,436, leaving a so-called factory profit of $1,175,496 There was other income of $18,524, which brought the gross profit up to $1,194,020. The net profit for the year, after the deduction of administration and other expenses, royalty and taxes, was $821,046. Interest was paid of $180,000 and dividends of $599,544, the same as in 1913. The surplus for the year was thus $41,502, as compared with $54,969 in 1913 and $422,494 in 1912, when but $149,886 was paid in dividends. The total surplus on December 31, 1914, was $273,012.

The company has factories, patents, water power, land and machinery having a value of $9,974,833. On December 31, 1914, its inventories were $1,391,824, and it had $782,124 accounts and bills receivable and $525,041 in cash. The company has issued $10,000,000 capital stock, and it has bonds outstanding of $3,000,000. On December 31, 1914, the accounts payable were $109,898.

President C. A. Starbuck expresses the opinion in his report that the outlook for the coming year is encouraging. The company has already received brake equipment orders from several foreign governments and expects an improvement in domestic orders and inquiries.

TRADE PUBLICATIONS

Coal Drier.—Bulletin No. 212 of the Link-Belt Company, Chicago, describes the Wendell continuous automatic coal drier which is designed to dry washed coal for coking purposes and the smaller sizes of steam and domestic coal. The booklet is a four-page folder and contains a number of illustrations, among which is a diagram showing the method of operation of the machine.

Titanium Aluminum Bronze.—An eight-page booklet just issued by the Titanium Alloy Manufacturing Company, Niagara Falls, N. Y., deals with the use of Titanium as a deoxidizer in alloys of aluminum and copper. The booklet contains a number of extracts from reports setting forth the properties of aluminum and copper alloys, the practical casting of which has been facilitated by the use of Titanium.

Paints.—The ninth edition of the Review of Technical Paints, by Frank P. Cheesman, has just been issued by Cheesman & Elliott, 100 William street, New York. This book contains 52 pages, is illustrated and is intended to give anyone interested in metal painting the benefit of the long experience of this firm. Various kinds of paints are considered in detail, and information given as to the best paint to use for any particular class of work.

Oxy-Acetylene Apparatus.—Catalog No. 111 of the Imperial Brass Manufacturing Company, Harrison street and Racine avenue, Chicago, deals with a line of oxy-acetylene welding and cutting outfits, torches, regulators, gages and other accessories. Aside from the usual information concerning the line, the catalog contains a number of illustrations showing the torches in operation on various classes of work and samples of broken parts repaired by the Imperial outfit.

Southern Pacific.—"High Points on Four Great Highways to the California Exposition," is the title of an artistic and descriptive folder just issued by the Southern Pacific. It contains 78 illustrations, picturing the attractions of San Francisco and San Diego, with their expositions, as well as those seen enroute through the four gateways via New Orleans, El Paso, Ogden and Portland. A panorama of the Panama-Pacific International Exposition, 31 in. long, shows the entrance to the Golden Gate and depicts the natural beauties of San Francisco and vicinity.

Oxy-Acetylene Welding and Cutting.—The Vulcan Process Company, Minneapolis, Minn., has issued a pamphlet outlining the use of its oxy-acetylene outfit, which includes an acetylene generator, in railway shops. It contains descriptions of some of the work performed by this equipment with the corresponding savings made in doing the repairs by this method. A table is included showing the cost of cutting and the cost of welding. The cost per foot of cutting ranges from $0.0126 for ¼ in. plate to $0.041 for 1½ in. plates and the cost per foot of welding ranges from $0.045 for ⅛ in. plate to $1.24 for ⅝ in. plate.

Railway Line Material.—The General Electric Company has recently issued bulletin No. 44,004, which forms an ordering catalog devoted to railway line material for direct suspension. This publication covers practically everything in line material for this method of suspension, except poles and wire. The parts are illustrated and each illustration is accompanied by the proper catalog numbers. The prices are not included. The bulletin contains also miscellaneous data relative to construction, overhead material per mile, general data on the use of solid copper wire and copper cable, dimensions of grooved trolley wire sections, etc.

Pennsylvania Railroad.—The Pennsylvania Railroad has recently issued a booklet, for distribution at the Panama-Pacific International Exposition in San Francisco, describing its activities and exhibit at the exposition. Accompanying a double page map for the entire Pennsylvania system, which is printed in the center of this booklet, are statistics showing the extensiveness of the system, which serves "52 per cent of the entire population of the United States." The booklet contains a photograph of the relief map of the Pennsylvania System shown at San Francisco—the largest relief map ever made, 42 ft. x 26 ft. It also contains pictures of the proposed Union station in Chicago, the main span of the East River bridge, and the model of New York City, 26 ft. square, which will be exhibited; a photograph of the latter is also reproduced in colors on the cover page.

Cast Iron Pipe.—The United States Cast Iron Pipe & Foundry Company, Burlington, N. J., has just issued a new 218-page general catalogue. The first 70 pages of this book are devoted to a general description, with illustrations, of the uses and adaptability of cast iron pipes. It relates the development of conduits and aqueducts, both with reference to material and construction, and describes the modern products and their uses as water pipe, in high pressure systems, submerged pipe, gas pipe, etc. Numerous illustrations show the method of laying these pipes. The methods of making various types of joints and connections are also explained. A general comparison between cast iron pipe and other pipes is made and causes of failures discussed. It also describes means of protecting mains against electrolysis, leakage at bell and spigot joints, etc. The next 100 pages contain specifications, tables of dimensions and weights of the various pipes and their fittings. The last portion of the book is devoted to miscellaneous foundry products, tables, and views of the company's works.

Railway Construction

Alamance, Durham & Orange Railway & Electric Company.—Application has been made in North Carolina for a charter to build an electric line from a point in North Carolina, southeast via Burlington, Graham and Haw River to Saxapahaw, thence east to Chapel Hill, and northeast to Durham, about 50 miles. J. Harden, C. B. Cox, J. M. Cook, D. M. Teague, Burlington, are incorporators.

Arizona & New Mexico.—This company is contemplating the construction of a 3½-mile branch line, which is to extend from Lordsburg, N. M., in a southwesterly direction, and to terminate at the "Eighty Five" mine in Grant county, N. M. The principal commodities this road will carry are copper ore, mining supplies, etc. Norman Carmichael, Clifton, Ariz., is vice-president, and P. Reisinger, Clifton, Ariz., is chief engineer.

Avery North Western.—A charter has been granted this company to build a railway from Edgemont, N. C., northwest via Pineola, Linville and Montezuma to Newland, 21 miles. The proposed route from Edgemont is up Wilson creek to Grandfather mountain, thence following Ridge Pass to Wild Cat Bluff, thence through Low Gap in Grandmother mountain and through part of the Linville Improvement Company's timber lands. W. W. Barber, Edgemont, E. C. Guy, A. P. Brinklev, C. B. Dancannon and J. W. Ragland, Newland, are incorporators.

Canadian Terminal.—This company, which was incorporated in 1907, has applied to the New Brunswick legislature for an extension of time in which to build from L'Etang Harbor, New Brunswick to St. Croix, with a number of branch lines. In 1912 the provisional directors were changed to J. S. Clark, G. W. Marsh, G. W. Ganong, H. I. Taylor, W. L. E. Marsh, J. L. Clark, W. A. Mitchell and G. J. Clarke.

Charleston Interurban.—An officer writes that the company expects to let contracts this coming summer to build an extension of the Kanawha Valley Traction from Charleston, W. Va., southeast via Marmet, Paint Creek, Cabin Creek, Coalburg and Handley to Montgomery, about 25 miles. Track has been laid on about two miles.

Conestoga Traction.—Surveys have been made, it is said, for building an extension on the Lancaster & Coatesville division. The new line is to be built from a point about a mile east of Conestoga Park, Pa., via Witmer to Intercourse, about 13 miles.

Entwistle & Southern Alberta.—Application has been made to the Canadian parliament for incorporation to build a railway from a point on the Grand Trunk Pacific, at Entwistle, Alta., south to the Saskatchwan river, about 50 miles. Pringle, Thompson, Burgress & Cote, Ottawa, Ont., are the solicitors.

International Railway (Electric).—This company plans to build a line from Niagara Falls, N. Y., southeast along the Niagara river through North Tonawanda, to Tonawanda, thence to a point in the northern part of the city of Buffalo. The grading, track laying, etc., will probably be carried out by the company's forces, and the work calls for about 24,000 cu. yd. of embankment to the mile. The maximum grade will be 7 per cent and the maximum curvature 6 deg. There will be eight steel bridges varying in length from 50 ft. to 175 ft. The plans also call for putting up a sub-station and a car house at Niagara Falls. (February 12, p. 289.)

Kanawha Valley Traction.—See Charleston Interurban.

Mississippi Roads.—Construction work has been started, it is said, on a six-mile railway from a point on the New Orleans, Mobile & Chicago, at Estes, Miss., to Noxapater swamp. There will be six small bridges on the line. W. W. Estes is back of the project.

Montreal & South Western Railway & Power Company.—Application has been made to the Quebec legislature for an extension of time to build a railway from Adirondacks Junction, Que., which is on the Canadian Pacific and the New York Central, along the St. Lawrence river to the International boundary; also to build from Adirondack Junction to Sunder. The pro-

visional directors include V. Casson, L. Dansereau, G. N. Cusson and R. Grange, Montreal, Que.

Nashville, Chattanooga & St. Louis.—Surveys have been made for building an extension to the Sylvan Cotton Mills at Shelbyville, Tenn., about two miles. The construction work has not yet been authorized, and it is not probable that the improvements will be carried out in the near future.

Palm Beach & Everglades.—A contract has been given to the Everglades Construction Company, it is said, to build from West Palm Beach, Fla., west to Lake Hicpochee. It is understood that the work will be finished by March, 1916. Charles H. Baker, president, New York. (January 29, p. 211.)

Petersburg & Appomattox (Electric).—Incorporated in Virginia with a capital of $100,000 to build an interurban line from Petersburg, Va., southeast to City Point, about 20 miles. T. M. Wortham, president; B. W. La Prade, vice-president, and W. W. La Prade, secretary, Richmond. E. Wortham, Jr., A. R. Holliday, Alexander Cameron, Jr., and R. E. Dudley and the officers are directors.

Sheboygan Railway & Electric Company.—Preliminary surveys are now being made for the proposed extension of this company's line from Elkhart Lake, Wis, to Chilton.

RAILWAY STRUCTURES

Blackwell, Okla.—The Atchison, Topeka & Santa Fe is completing plans for a small brick passenger and freight station at this point.

Brooklyn, N. Y.—The New York Public Service Commission, First district, has approved the recommendation of the New York Municipal Railway Corporation, that the contract for building seven stations on the Fulton street elevated railroad, in the borough of Brooklyn, be awarded to John Thatcher & Son, the lowest bidder, who offered to do the work for $258,664.

A contract has been given to Samuel Beskin, Beacon, N. Y., for the reconstruction of the DeKalb avenue station on the Fourth avenue subway, in the borough of Brooklyn, and this work is now under way. (December 11, p. 1108.)

Chicago, Ill.—The contract for the building of the temporary freight sheds for the Pennsylvania between Polk and Taylor streets, has been awarded to the Sumner Sollitt Company, Chicago. Work will be started at once and hurried to completion.

Pampa, Tex.—The contract for the construction of the brick passenger station for the Atchison, Topeka & Santa Fe, as reported in the *Railway Age Gazette* of March 5, has been awarded to Mr. Rice of Amarillo, Tex.

The Production of Pig Iron in the United States in 1914.—The Bureau of Statistics of the American Iron & Steel Institute in its special statistical bulletin No. 1 for 1915 announces that the production of pig iron in 1914 was 23,332,244 tons, a decrease of 7,633,908 tons, or 24.65 per cent from the 30,966,152 tons of 1913. The 1914 production of pig iron is the smallest for any year since 1906, with the exception of 1908, when 15,936,018 tons were produced.

Changing the Russian Vologda-Archangel Line to Broad Gage.—The present railway line from Archangel, the Russian port on the White Sea at the south of the Dwina south to Vologda is of narrow gage instead of the Russian five foot standard. The government has recently found it necessary to increase the capacity of this line and has decided to make it a broad gage line. At the same time it has also been decided to change the location of the line, which it is felt terminates too far from the port, by constructing a new track to cross to the eastern shore of the Dwina by a bridge to be built about 75 miles above Archangel. Work has already been begun on that part of the new line from Vologda to Xiandoma, 199 miles north of Vologda, and about halfway to Archangel. It is expected that the new line will be finished by the end of July. The topographical conditions which will have to be met are not favorable, as there are many swamps. It is estimated that the railway will cost $6,180,000, or about $31,076 per mile. Notwithstanding the winter, a large force is now engaged. The Russian government is also proposing to construct lines from Archangel to Kotlas, and from Archangel to Ukta and Ob, which will afford an outlet on the White Sea for freight from Siberia.

Railway Financial News

Artesian Belt.—A petition has been filed asking for the appointment of a receiver for this road, which runs from Macdona, Tex., to Christine, 43 miles.

Baltimore & Ohio.—See Western Maryland.

Cleveland & Pittsburgh.—See Pennsylvania Railroad.

Denver, Laramie & Northwestern.—The Continental Trust Company of Denver has resigned as co-receiver of the Denver, Laramie & Northwestern, and Marshall B. Smith is now sole receiver.

Missouri, Oklahoma & Gulf.—Henry C. Ferris, of Muskogee, Okla., has been appointed a co-receiver with Alexander New, succeeding Louis C. Posner.

Missouri Pacific.—Stockholders on March 9 elected the following board of directors: N. F. Brady, B. F. Bush, N. Carleton, E. A. Faust, A. J. Hemphill, W. H. Lee, E. L. Marston, E. G. Merrill, F. J. Shepard, Cornelius Vanderbilt, R. L. Williams, W. H. Williams and E. J. Pearson. The former board of directors was as follows: George J. Gould, B. F. Bush, Howard Gould, James Speyer, Kingdon Gould, E. L. Marston, E. D. Adams, J. G. Metcalf, E. T. Jeffery, E. G. Merrill, Finley J. Shepard and S. F. Pryor. The directors who resigned are understood to have represented the Goulds other than Mrs. Finley J. Shepard (Helen Gould), Speyer & Company, New York, and the Deutsches bank of Berlin. Of the new directors, A. J. Hemphill is president of the Guaranty Trust Company, New York; N. F. Brady is a director of the New York Edison Company; N. Carleton is a director of the Western Union Telegraph Company, and W. H. Williams is vice-president of the Delaware & Hudson. The directors whose names appear both in the old and new directorates are the president of the road, Mr. Bush; Finley J. Shepard and E. L. Marston, a member of Blair & Company, New York.

(See also St. Louis, Iron Mountain & Southern.)

Pennsylvania Railroad.—The Public Utilities Commission of Ohio has approved of the issue by the Cleveland & Pittsburgh of $1,482,550 guaranteed 4 per cent stock and its transfer to the Pennsylvania Railroad in payment for advances to the Cleveland & Pittsburgh.

St. Louis, Iron Mountain & Southern.—The following board of directors have been elected: B. F. Bush, N. F. Brady, N. Carleton, A. J. Hemphill, E. L. Marston, E. G. Merrill, C. A. Pratt, F. J. Shepard, E. C. Simmons, C. Vanderbilt, F. J. Wade, A. H. Wiggin and W. H. Williams

(See also Missouri Pacific.)

Western Maryland.—The Wall Street Journal says, apparently on good authority, that John D. Rockefeller has acquired a substantial interest which will give him control of the Consolidation Coal Company. Since the Rockefeller interests are in control of the Western Maryland, the assumption is that the Western Maryland will get a larger tonnage of the Consolidation Company's coal than heretofore. The Consolidation Coal Company was heretofore controlled by interests closely allied with the Baltimore & Ohio.

Western Pacific.—A press despatch dated San Francisco says that at a conference between Rudolph Spreckles and other bondholders a plan was discussed to have the Western Pacific taken over by the federal government, and that a measure would be submitted to the California legislature by Mr. Spreckles to have the legislature memorialize United States Congress on behalf of this plan.

Military Railway in Morocco.—The military railway in Morocco, which has been under construction since 1911, reached Fez on February 5.

French Rail Duty Off.—The French customs duties of $18 per metric ton on steel rails were suspended by government decree on March 4, until further notice.

NOTICE OF COPYRIGHT

This and all subsequent issues of the Daily Railway Age Gazette published in connection with the 1915 spring meeting of the Railway Signal Association and 1915 annual meeting of the American Railway Engineering Association are copyrighted under the United States copyright law by the Simmons-Boardman Publishing Company, publisher of the Railway Age Gazette, and all persons are hereby warned against making unauthorized use of any of the contents of The Daily, whether reading matter or illustrations.

It is well known that we have from year to year incurred much expense for the purpose of furnishing our readers with early, complete and properly edited stenographic reports of the proceedings of the conventions of these associations. Some other publications have appropriated large parts of these without credit to this paper. We have copyrighted all of the reading pages of The Daily for the purpose of stopping this practice.

We desire in this connection to expressly disavow any desire or purpose to interfere with the publication or use by the associations or their members of either their own reports of the proceedings, or of the reports made by the Daily Railway Age Gazette. So far as the proceedings of the conventions are concerned, our copyright covers them only as they are reported by the Daily Railway Age Gazette. And the associations and their members, individually, are hereby authorized to make any use they desire of our reports, except that they must not be republished without the express permission of the Simmons-Boardman Publishing Company in any publication or periodical except those issued by the Railway Signal Association or the American Railway Engineering Association.

The R. S. A. Meeting Hall

The Recital Hall in the Auditorium Hotel where the stated meeting of the Railway Signal Association was held, has the marked advantage for such a meeting that its acoustics are good. There could have been no criticism by anyone attending the meetings yesterday as to the distinctness with which the speakers could be heard. It is difficult to carry on a discussion of a paper unless it is possible not only for anyone in the room to hear remarks from the presiding officer's position, but for him to hear a voice from any other part of the room. This condition exists in the hall referred to and is conspicuous by its absence in the Florentine room of the Congress hotel where the R. S. A. March meetings have previously been held and where the American Railway Engineering Association holds its convention. The change made by the former association this year undoubtedly resulted to its advantage, primarily through the accommodations provided for the members and for committee meetings, which have been difficult to obtain in the Congress hotel, as it is always crowded during this week with men attending the A. R. E. A. convention. The signal men were obliged to explore devious passageways in the approach to the meeting room in the Auditorium, and the proceedings were occasionally enlivened by the sounds of practicing in adjacent musical studios, so that it does not necessarily follow that the Engineering Association should consider such a move. The Florentine room possesses advantages which must be set off against its poor acoustic properties.

Interest in the Stated Meeting

The registration of the Railway Signal Association yesterday amounted to 163 active, junior, and associate members, the corresponding figure at last year's meeting being 222. This decrease in registration does not necessarily indicate a proportional decrease in interest or attendance. In fact, the discussion of two of the reports was very full, while at some of the former Spring meetings the discussion was perfunctory. In past years it has been easier for men to register who were in town to see the exhibit at the Coliseum, but not directly interested in the proceedings of this association. Also, in the past it was easy to register a goodly proportion of the members before the sessions began because they naturally congregated in the spacious lobby of the Congress near the meeting room, while this year the members were prone to congregate on the first floor of the Auditorium, and to come up to the meeting in such crowds that doubtless some did not wait to register. Summing up, the meeting this year developed at least as much interest among the members as any previous meeting. The conduct of the sessions by President T. S. Stevens is especially to be commended. The discussion was confined to

the subjects in hand and held the continuous attention of the members so there was little tendency to leave during the sessions.

Table of Operated Units

The discussion in tables A and B, operated units for mechanical interlocking, at the meeting of the Railway Signal Association developed into a consideration of the two tables, rather than a discussion of the features of table B, which was presented for the first time. While the adverse letter ballot was thought by many to have disposed entirely of table A, it developed that a large faction believed the basis of the table—a first cost basis—to be correct, but thought that certain parts should be eliminated. Undoubtedly anyone who figures out the distribution of the charges for a joint interlocking plant can see there is an advantage in having a basis for these charges which can be justified on a cost basis; especially if the distribution arrived at is challenged. Such would not be the case if table B was adopted as it stands. The probable result of the suggestions made to the committee will be a table based on the same ideas as table A but greatly simplified, so that the apportionment of charges can be accurately estimated from preliminary plans before the installation is decided on.

CIRCUITS FOR SINGLE-TRACK SIGNALING

It is conceivable that almost any degree of safety can be provided in single-track signaling by expending enough money for apparatus and control wires. Failures have been reduced to an extremely low percentage on many roads, with the simplest systems, and further improvement could not be more than a fraction of one per cent, and the cost would be excessive. There are some single-track lines where the overhead cost of such a system would be totally unjustified. In fact, there are places where the overhead burden of a simple system of automatics would spell the difference between net profits and deficits—where traffic is so light that absolute telegraphic block enforces no hardship.

The problem of the method of operating a single-track line involves many other features besides those of signaling. And one of the problems which the signal department should look into when called on to signal such a line, is the degree of protection that present or future traffic requires or justifies. A signal system with the greatest possible refinements, if obtained at considerably greater cost, on a single-track line with only two to four trains a day is like a "hundred dollar harness on a fifty dollar horse." There are places where an expensive system of protection is warranted —locations where the speed is high, the traffic dense and the physical conditions of the line are such that the view of the engineman is frequently obstructed on account of structures, tunnels or hills. Conversely, there are many locations where a single-track automatic signal system of an economical design is warranted, but where a more elaborate system would be unwarranted. These conditions should be considered and provision made for them.

The chairman of the sub-committee of the R. S. A. assigned the subject of typical circuit plans, submitted a circuit plan at the last annual convention. He stated at the meeting yesterday morning that this circuit affords practically complete protection against any combination of crosses or grounds at no greater expense than systems now in use, but some members seemed to desire more convincing proof of this statement, as the circuit seems to be much more complicated than others in use.

There is danger, of course, if one particular circuit is standardized, that it will contain features covered by the patents of some concern or individual which will debar other companies from competition. To do this is plainly at variance with the policy of the R. S. A. Results are what are wanted and results imply dependable service at a minimum cost. The details of circuits, relays, etc., should be susceptible of variation to suit individual needs or preferences and the adoption of a definite standard, especially if too elaborate, in this case might result in many lines remaining unsignaled where a less costly system might have been justified and installed.

ELECTRO-MECHANICAL PLANTS

The advocates of electro-mechanical interlocking plants originally met with a good deal of opposition. The opponents of the idea were of the opinion that there need be no middle ground between a straight mechanical and a straight electric plant. In other words, it was thought that where the conditions required or made it advisable to operate some of the units by power, a power plant would be justified; and that in all other cases a straight mechanical plant would answer the purpose. Recently this feeling has changed quite appreciably and many electro mechanical plants are in service or being installed. The first development was the adaptation of power at a mechanical plant for operating the distant signal where it was too far away to be operated efficiently with a pipe line. From this modest beginning the electro-mechanical plant has been developed, using power for the operation of signals, while switches, derails, etc., are operated manually.

One of the advantages of the electro-mechanical machine is that when automatics are installed very few changes are necessary in the signals, while in a straight mechanical plant many changes are necessary if the automatic features are carried through.

The electro-mechanical plant is subject in a lesser degree to the same limitations as a mechanical plant. There is a limit to the number of manually-operated levers which a leverman can operate, and in large plants it becomes necessary to have more than one leverman in order to obtain the desired speed of manipulation. The electro-mechanical plant is therefore desirable in smaller layouts where the number of lever operations is not likely to be great; and at small outlying junctions or crossings where this type of plant is being installed the number of lever movements is quite small, and certainly no leverman can have any justification for objecting to the little manual labor required for the relatively few lever operations required.

Electro-mechanical interlocking machines require less room than other types. The electric levers are mounted above the mechanical levers, which greatly reduces the floor space required in the tower. No generator is required with the sizes commonly being installed, 30 to 40 cells of primary battery often being sufficient to operate the signals. The saving in battery or electrically generated power is greater than the proportion of mechanical levers would suggest, because usually the switches require twice as much power as the signals, or even more. Consequently, one of these plants shows a great economy in current consumption as compared with an all-electric plant, which results in a reduction in the cost of materials and maintenance. In some recent installations a battery has been installed at the home signal locations, thus reducing the power loss due to transmitting electricity from the tower. This introduced an economy not usually possible in the all-electric type.

For small plants where the number of lever movements will be well within the capacity of one leverman, the electro-mechanical plant offers an installation, which, on account of the lesser cost of mechanical appliances, is appreciably cheaper in first cost, and for like reasons it can be installed much more rapidly; due to moving switches manually instead of by power, the cost of operation is lower, the wages of the leverman being no greater, although

he furnishes part of the power; and on account of the elimination of generators and reduction in electrical appliances, this type is appreciably cheaper to maintain.

CONVENTION PROGRAM

The sixteenth annual convention of the American Railway Engineering Association will be called to order by President Storey at 9:30 this morning. The convention will adjourn at 12:30. The afternoon sessions will extend from two o'clock until five. The following is the program:

Tuesday, March 16.

President's Address.
Reports of Secretary and Treasurer.
Reports of Standing and Special Committees.

XII.	Rules and Organization	Bulletin 172
X.	Signals and Interlocking	Bulletin 172
Special.	Uniform General Contract Forms	Bulletin 172
IX.	Signs, Fences and Crossings	Bulletin 172
XVI.	Economics of Railway Location	Bulletin 172
	Minority Report	Bulletin 174
I.	Roadway	Bulletin 173
XI.	Records and Accounts	Bulletin 173

Wednesday, March 17.

III.	Ties	Bulletin 173
XV.	Iron and Steel Structures	Bulletin 173
XIII.	Water Service	Bulletin 173
V.	Track	Bulletin 173
VI.	Buildings	Bulletin 173
XVII.	Wood Preservation	Bulletin 174
XIX.	Conservation of Natural Resources	Bulletin 174
Special.	Stresses in Railroad Track	Bulletin 173

ANNUAL DINNER AT 7:00 P. M.

Thursday, March 18.

VIII.	Masonry	Bulletin 174
VII.	Wooden Bridges and Trestles	Bulletin 174
Special.	Grading of Lumber	Bulletin 174
XVIII.	Electricity	Bulletin 174
XIV.	Yards and Terminals	Bulletin 174
IV.	Rail	Bulletins 170, 175
II.	Ballast	Bulletin 174

New Business.
Election and Installation of Officers.
Adjournment.

Friday, March 19.

Visit to National Railway Appliances Exhibition in the Collseum and Armory.

ANNUAL MEETING OF RAILWAY APPLIANCES ASSOCIATION

The annual meeting of the Railway Appliances Association will be held on Tuesday morning, March 16, at 11 o'clock in the meeting room at the south end of the second floor of the Collseum.

ELECTRIFICATION NIGHT

"Operating Results of the Electrification of Steam Roads" will be the subject of discussion at the meeting of the Western Society of Engineers tonight at its rooms in the Monadnock building. The speakers will include W. S. Murray, consulting engineer, New York, New Haven & Hartford; Edwin B. Katte, chief engineer, electric traction, New York Central; George Gibbs, consulting engineer of the Pennsylvania and Norfolk & Western, and C. A. Goodnow, assistant to president, Chicago, Milwaukee & St. Paul. Moving pictures will also be shown of the electrification of the Butte, Anaconda & Pacific.

Other leaders in this field will participate in the discusslon of this live topic. This meeting was set on this date to enable the railway men visiting in the city to attend and all are invited. This is the first time that the operating results of electrification have been presented in this manner and the meeting should therefore be of widespread interest.

WESTERN RAILWAY CLUB

The Western Railway Club will meet this afternoon at two o'clock at La Salle Hotel. Frank McManamy, chief inspector of locomotive boilers of the Interstate Commerce Commission, will talk on the direct results of the operation of the federal locomotive boiler inspection law.

BANQUET TICKETS

Those desiring tickets for the annual dinner to be held in the Gold room of the Congress Hotel on Wednesday evening should secure tickets from the secretary, room 1166, opposite the convention hall, as early as possible. Tickets will be on sale this noon at $3.50 each.

DINNER TO PRESIDENT HENCH

The directors of the National Railway Appliances Association gave a dinner on Saturday evening at the Chicago Athletic Club to President N. M. Hench. All the directors were present except T. R. Wyles. This takes the place of the dinner which has been given during the past three years by the president to the directors.

CORNELL TABLE AT THE DINNER

Following the custom of recent years the Cornell men at the convention will attend the annual banquet of the American Railway Engineering Association on Wednesday evening in a group. One table has already been filled and it is probable that a second will be required. All Cornell men expecting to attend the dinner are requested to advise H. C. Holloway, 647 Railway Exchange building, as soon as possible.

PRESIDENT'S DINNER

President W. B. Storey of the American Railway Engineering Association gave a dinner at the University Club last evening to the members of the Board of Direction and the Committee on Arrangements of that association. The dinner was entirely informal and is a continuation of the enjoyable custom inaugurated several years ago.

COURTESIES OF THE CHICAGO ENGINEERS' CLUB

The Chicago Engineers' Club extends the courtesies of its club—located on Federal street, immediately south of the Union League Club—to the visiting members of the American Railway Engineering Association during the week of this convention. Cards of introduction may be secured from C. H. Norwood, secretary, 417 S. Dearborn street.

SENATOR W. G. HARDING HERE

Among the guests at the Congress Hotel who attracted the attention of the visiting railway and supply men yesterday was United States Senator Warren G. Harding of Ohio. Senator Harding's face became familiar to many railway and railway supply men when he made one of the addresses at the annual dinner of the Railway Business Association in New York last December—an address which will be long remembered as one of the best of the many notable addresses which have been delivered at the dinners of the "R. B. A." Mr. Harding was passing through the city on his way from California to his home at Marion, Ohio.

Railway Signal Association Proceedings

Reports of Committees II, III, IV, VI, VIII, X and Special Committees, Together with the Discussions

The stated meeting of the Railway Signal Association was called to order at 9:30 a. m., on Monday, March 15, in the Auditorium Hotel, Chicago, by President T. S. Stevens, signal engineer of the Atchison, Topeka & Santa Fe. The following committees submitted reports for discussion: Committee II, Mechanical Interlocking, submitted specifications for electro-mechanical interlocking; Committee III, Power Interlocking, submitted specifications for incandescent electric lamps; Committee IV, Automatic Block, submitted specifications for grooved trunking and capping, and circuit requisites for single track, "traffic direction" automatic block signaling; Committee VI, Standard Designs, submitted 11 drawings, and revisions to plate 3, on Symbols; Committee VIII, Electric Railway and A. C. Signaling, reported progress; Committee X, Storage Battery and Charging Equipment, submitted specifications for Lead Type, Portable Storage Battery, and specifications for Lead Type Stationary Storage Battery, not of the pure lead type. The Special Committee on Lightning Protection submitted requisites for lightning arresters and requisites for choke coils. The special committee on contracts submitted two tables of Operated Units for a Mechanical Interlocking Plant.

T. S. STEVENS, President.

AUTOMATIC BLOCK

The committee, in connection with a subcommittee of Committee No. III, submitted a revision of the wooden trunking specifications. Circuit requisites were also submitted, these being a revision of those presented in the minority report at the annual convention in 1914.

CIRCUIT REQUISITES, SINGLE TRACK "TRAFFIC DIRECTION" AUTOMATIC BLOCK SIGNALING.

(a) Signals so located as to provide adequate spacing and head-on protection. (b) The control of signals to be such as to provide: (1) Stop, caution or proceed indication for following movements as on double-track; (2) that two trains meeting at a passing siding shall each first receive a caution indication before reaching a stop signal; (3) protection for switches and switching movements as on double-track; (4) that neither a single cross nor any combination of grounds or breaks will cause the energization of the controlling or signal operating devices; (5) that two opposing signals governing into the same block shall not display the proceed indication, simultaneously authorizing trains to move opposing each other; (6) that two opposing signals shall not display the proceed indication, simultaneously authorizing two trains to move from meeting points opposing each other, where operating conditions will permit.

W. M. VANDERSLUIS,
Chairman Committee on Automatic Block.

The committee as a whole agreed on the above requisites, but the subcommittee handling this assignment is of the opinion that one set of requisites should cover all single-track signaling while a majority of the committee favor having these requisites apply to traffic direction signaling only. Mr. Dryden, chairman of the subcommittee, offered the following additional requisite for the consideration of the Association: (7) That the giving of a proceed signal at the entrance to a block shall be dependent upon the signal governing the same block in the opposing direction indicating stop.

The committee consists of W. M. Vandersluis, chairman (I. C.); A. R. Fugina, vice-chairman (L. & N.); E. L. Adams (I. C. C.), E. E. Bradley (W. M.), F. H. Bagley (I. C. C.), C. N. Beckner (L. & N.), M. J. Brundige (B. R. & P.), J. J. Corcoran (N. Y. C.), T. N. Charles (C. N. O. & T. P.), G. H. Dryden (B. & O.), Leon D. Dickinson (U. P.), E. Folley (C. & E. I.), R. E. Greene (M. C.), W. R. Hastings (C. R. I. & P.), W. H. Higgins (C. R. R. of N. J.), B. A. Lundy (N. Y. C.), W. B. Nicol (B. & A.), R. M. Phinney (C. & N. W.), E. K. Post (P. R. R.), D. W. Rossell (N. Y. C.), A. H. Rice (D. & H.), D. S. Rice (L. V.), C. F. Stolz (C. C. C. & St. L.), E. G. Stradling (C. I. & L.), G. W. Trout (P. M.), I. A. Uhr (St. L. & S. F.), W. B. Weatherbee (D. L. & W.), F. E. Whitcomb (B. & A.), L. R. Wyant (C. R. I. & P.).

Discussion on Automatic Block.

It was suggested that clause 3 on Specifications for Wooden Trunking be changed to require that 30 per cent should come in 16-ft. lengths, and others were made suggesting 50 or 60 per cent of 14-ft. lengths. The committee stated it would reconsider and change this part of the specifications. It was also suggested that the wording regarding knots, clause 7-C, be changed to include all knots by eliminating the word "round" from the words "round sound knots." The committee is to reconsider the whole question, not only of the size of knots, but their distribution, it having also

Meeting of Railway Signal Association in Session.

been suggested that capping be covered in a different manner from the rest of the trunking. Some members believed that the specifications were too severe and believed that modifications would be desirable and that by so doing more competitive bids and better terms could be made with the manufacturers.

The subject of circuit requisites was taken up by paragraphs.

C. C. Anthony (Penn.): It seems to me that b-2 cannot always be carried out. In case a train at stop at a station would receive no caution indication when an opposing train starts from the siding in advance.

G. H. Dryden (B. & O.): I believe this requisite is covered by the circuits as presented. When trains are actually running toward each other, they will, I believe, in every case, first receive a caution indication, before a final stop signal. There is a condition where it is not possible to cover this regularly, namely, in case a meeting point is made at the passing siding, and one train should arrive 15 or 20 minutes before the other. In that case the signal should be set at stop or caution, as the case may be, and the first train arriving will unquestionably find all outgoing signals indicating "proceed." After stopping for a sufficient length of time the opposing signals will indicate "stop," due to the fact that an opposing train is coming in that direction.

W. H. Elliott (N. Y. C.): As I read it, this clause can only be carried out by arranging for circuits so that for each "stop" signal there shall be two signals displaying distant indications. The same might apply to trains approaching each other on single track. Unless there are two distant signals indicated from each home signal, one or the other train will receive a clear distant and approach a signal giving "stop" indication.

Mr. Anthony: The meaning of paragraph 3, "protection for switches and switching movements as on double track," is not perfectly clear.

Mr. Dryden: The difficulty here, I believe, is in not having a requisite for double track signaling. No prescribed method of protection has been prepared by this Association. A train in switching should be protected by "stop" and "caution" signals in the rear. In all cases, an opposing train, or following train, as well as a train that may be using the switch, should receive correct indications by which to stop.

H. S. Balliet (G. C. T.): I suggest that paragraph 3 should read simply "protection for switching and switching movements."

A. R. Fugina (L. & N.): I think we should state specifically what manner of protection we want to arrive at. I do not believe the requisite as it now stands is specific enough.

W. M. Post (Penn.): It seems to me the conditions in this paragraph 4 are very severe. In practically all of our signaling, generally speaking, we must depend upon the integrity of the insulation as against frost and against grounds. I do not doubt that we can get many points of ground that might produce energization of the controlling apparatus.

E. B. Pry (Penn. Lines West): A signal can fail due to a combination of grounds. If the Association makes this a requisite and any failure should occur which should cause a wreck, the company will be in a very embarrassing position in case of a damage suit.

Mr. Elliott: As I understand paragraph 4, it will call for metallic circuits for the control of each relay, and that each circuit to the signal will be cut both on the positive and negative sides by each control relay. If that is the construction that this request calls for it would seem to me that it is a very expensive one and that the end desired does not warrant such expense. Even with such an arrangement of circuits I am not at all sure that a combination of grounds might not result in the signal giving a wrong "proceed" indication. I believe paragraph 4 should be revised to indicate more clearly the control desired, and I believe the words "any combination" should be eliminated, because it is very hard to foresee, unless after very extended trial, the several combinations that might come up.

Mr. Dryden: I believe that the requisites presented here, with the exception of requisite 7, are fully covered by reference to the previous plan. It will be noted only four line wires are used between passing sidings, while generally we have not less than five; therefore, it seems to me, we have reduced the cost.

Mr. Fugina: This requisite will require separate metallic circuits, and I am not sure but what it will throw away our polarized scheme of signaling altogether.

F. L. Dodgson (Gen. Ry. Sig. Co.): Has the committee considered the case of one of the wires having the same resistance to ground as the relay? If you take that sort of ground and connect one of the wires to one relay and having two grounds, one of the same resistance as the relay work, then your relay will be operated by the two grounds.

Mr. Dryden: I can conceive of a point where one ground would be connected in order to control the line, and it might energize a relay of low resistance, but hardly one of high resistance.

C. E. Denney (U. S. & S. Co.): Two general requirements are covered by this specification; first, how the signal shall be operated, and only paragraph 4, possibly paragraph 7, cover the methods of control. I suggest that we separate paragraphs 1, 2, 3, 5 and 6, which cover the installation of signals and the method in which they shall operate be elaborated in paragraph 4. The straight circuit engineering is covered by paragraph 4, which to me is the ideal. I do not believe it is sufficiently complete that any circuit could be made and tested by any combination, and not have it thrown out.

J. B. Latimer (C. B. & Q.): It seems to me that from the discussion we have had it is a possibility that a condition may occur which will nullify this clause. Why should we put this in our specification if any condition of ground can overcome this specification?

L. R. Mann (Mo. Pac.): I think Mr. Denny brought out a good thought—is it necessary to have this as a requisite? If you are going to have that sort of a requisite, could not a great many pages of our specifications be filled with similar matter?

R. M. Phinney (C. & N. W.): When the requisite contained in paragraph 4 was first brought up by the committee I was against it on account of the cost, but Mr. Dryden has convinced me that it can be carried out with no more cost than the present scheme.

Mr. Mann: Would it not be well for the committee to revise this wording, so that the Association would know just exactly what they mean to say, which block would require independent circuits?

Mr. Dryden: I would say "No." We want to leave an opening for invention. It may be possible for someone to show us how to cover this requisite in another way, and if such a thing is possible we should leave an opening for it to be done.

Mr. Pry: I understand in B-5 that half of the system is normal danger—two signals governing into a block from either end cannot be cleared at the same time. If they are "clear" that is authority to proceed. Under this paragraph at least half the system is going to be normal danger. I do not believe that is the object of the committee.

Chairman Vandersluis: It is not.

Mr. Denney: Paragraph 1 speaks of stop, caution or proceed, and paragraph 5 says that two opposing signals governing into the same block shall not display the proceed indication simultaneously authorizing two trains to move from meeting points opposing each other, "etc." It would seem to authorize collisions at low speed under caution signals.

Mr. Dryden: The committee have in mind two opposing signals governing the same block. This requisite does not require that with two signals in one direction one shall stand normally at danger.

Mr. Dodgson: I think clause 5 is a little misleading. The block for one signal is not always the same as the block for another signal, but I think they mean to convey in No. 5 two opposing signals governing over the same piece of track. I think that would be plainer to most members instead of the "same block."

Mr. Elliott: As I understand it, B-6 will require a preliminary or traffic direction section. That would mean that the first train arriving at a station would hold a train at the adjacent station irrespective of its class.

Chairman Vandersluis: I would call Mr. Elliott's attention to the last 5 words of that clause, "where operating conditions will permit." If you feel that your operating conditions will not permit of your siding overlap it will not entitle you to put it in.

Mr. Elliott: I believe the signal systems should be so constructed as to permit trains to enter the block without traffic direction control by the circuits, leaving it to the operating department to establish such regulations as they require.

Mr. Denney: I agree with Mr. Elliott, that the requisite is in the negative. Personally I feel that the one essential to be met with in single-track automatic block signal is to allow the full use of tracks as though the signals were not installed; in other words, so that the tracks may be used to their full capacity, which means money.

Mr. Dryden: We have in service on the Baltimore & Ohio

130 miles of single-track automatic signaling, where the siding overlap is in use. One division superintendent has been kind enough to give me a letter on this subject, on the question of operation, in which he stated that he thought no more difficulty would be experienced in operation with the siding overlap, providing the trainmen and despatchers are properly educated; this system is desirable in that it assures that trains will meet only at sidings if they disregard orders or rules and operate on signal indications; I believe that with minor improvements, such an installation may be operated by signal indications alone. I believe we can handle trains with safety over a single-track railroad when telegraph and telephone communication have failed, and it is this that our committee is trying to lead up to. We do this in lock and block territory, when the despatcher is out of reach of his train.

Mr. Dunham: I think we are all agreed on that subject. It is true that even without signals a single-track railroad may be safely operated without telegraphic or telephonic communication, but with the signals you can do very much better. I am glad to note the thoroughness with which the committee appears to be tackling the subject. However, do we not beg the question by going into so many details? Would it not be better, so far as this Association is concerned, if we were to confine the work to the accepted and known practice and not to delve into inventions which may have immediate merit or merit at some time in the future?

J. A. Peabody (C. & N. W.): I made a close study of this subject before we started in with the single-track automatic signal, and decided at that time that the siding overlap could not be used except at very exceptional places without detriment to the operation of our trains, particularly the way freights. On all of the installations that we have now I believe that there are but two, or possibly three, places where we could put this in without detriment. Therefore, this should not be a requisite.

W. N. Manuel (G. R. & I.): I would like to see the committee have a list of the requisites that have been tried out, and which they know are feasible, and, in addition to that, I would like to see them have another list of desirable features under which they could include the things that we are now talking about.

Mr. Dryden read a paper on this subject in which he outlined fully his ideas.

Mr. Beaumont: The recommendations presented by the sub-committee are so far-reaching that it seems to be advisable to have this matter handled by the Board of Direction and have them say to the committee just what they will do. I certainly am not in favor of having this Committee on Automatic Block at this time prepare specifications for automatic regulation.

Mr. Dryden: As chairman of sub-committee V, I have received instructions to prepare typical circuits for single-track blocking, but you will find in looking the field over that the method of operation is so different on the various railroads represented here that we are up against it. What we get out for one man does not suit the next. Long ago we came to the conclusion that we must have a definite method of operation decided upon before we could ever come to any agreement.

Mr. Anthony: It seems to me that this whole matter is something for the committee to work on still further. I am inclined to think, as an individual that the committee, or some of its members, are after ideals, possibly, without sufficient regard to the relation of cost to what is obtained. Safety is a matter of cost, just as much as anything else on a railroad.

Mr. Fugina: The committee has not been able to get together on this matter at all, and I don't think we ever will, until we get instructions from this body. I think we ought to standardize the practice we have. I move that this committee do not proceed at present any further along these lines, but to standardize common practices that we now have in use to determine whether we want separate metallic circuits, to break signal control through switches and things of that kind. If we standardize these things we will have something definite to start work from.

Mr. Elliott: I will make an amendment to the motion, that discussion on paragraph 6 be closed. (The motion was carried.)

The President: I think the Board of Direction must take the discussion and make some rule in regard to the matter. I don't think any annual meeting will ever be able to do that.

Mr. Fugina: That will satisfy the committee.

Mr. Pry: I move that the committee be directed to confine its efforts to accepted and general practice and not to go into the realm of invention or uncertainty. (The motion was carried.)

STORAGE BATTERY AND CHARGING EQUIPMENT

The committee submitted two sets instead of one set of suggested specifications for Lead Type Storage Battery for Signaling, thus providing many features which are optional with the purchaser. The form and general arrangement of the specifications now in the Manual were quite closely followed and considerable descriptive matter as to details of construction was included in the specifications, so that one plan,

R. B. ELSWORTH,
Chairman Committee on Storage Battery and Charging Equipment.

showing the general assembly, will be all that is necessary in addition to the specifications.

The committee consists of R. B. Elsworth, chairman (N. Y. C.); G. E. Beck, vice-chairman (N. Y. C.); J. G. Bartell (L. V.), E. G. Hawkins (N. Y. C.), A. B. Himes (B. & O.), J. Fred Jacobs (C. R. R. of N. J.). T. L. Johnson (D. L. & W.), A. H. McKeen (U. P.), T. J. O'Meara (N. Y. C.), John Parker (N. Y. C.), F. A. Purdy (U. P.), C. O. Warner (N. Y., N. H. & H.). A. H. Yocum (P. & R.).

Discussion on Storage Battery and Charging Equipment.

H. M. Beck (El. Stor. Bat. Co.): The rating of these cells as ordinarily given, that is, the 40 ampere hour, is on what is known as a service rating. At the eight-hour rate of discharge they will not give this capacity. I would like to ask if it is the committee's intention to change the rating of the 40 ampere hour cell to a rating on a basis of 40 hours that is, the equivalent of a very slow rate discharge, to one at which it will give 40 ampere hours in eight-hour discharge.

Mr. Manuel: Our standard is 60 ampere hours, and we use it because the 40 is too small and the 80 too heavy.

Mr. Elsworth: The first criticism made by H. M. Beck has not been covered, in establishing a rating for the capacity of the battery. The committee will investigate the question very thoroughly and see if we cannot cover that criticism and definitely establish the size of the battery.

F. W. Pfleging (U. P.): For eight years we have sealed all of our portable batteries, and several years ago we found we were having a large amount of breakage, due to the sealing compound around the top edges breaking the jar. We developed a soft rubber nip cover, which we are using, and it not only makes the inspection easier, but answers the purpose of a seal, and keeps the sloppage down in transportation, and is much better.

Mr. Mann: I will ask if the committee has made any investigation in connection with the effects of temperature.

Chairman Elsworth: That is one of the questions the committee is trying to straighten out. The present specification provides for both kinds of sealing.

W. N. Manuel (G. R. & I.): We are having some trouble with broken jars, which we think is due to brittleness of the compound. It might be well to look into the specification to see if the compound is just right.

LIGHTNING PROTECTION

The committee submitted the following requisites for lightning arresters and choke coils for signaling:

REQUISITES FOR LIGHTNING ARRESTERS.

(1) A lightning arrester shall be so constructed that it will relieve the line of excess energy well below the breakdown voltage of the insulation of the apparatus which it protects; (2) it shall be so constructed as to prevent an arc continuing across the gap from normal voltage after surplus energy has been discharged; (3) it shall be constructed from materials of the best quality; (4) the dielectric strength of the insulating material shall be such as to insure against leakage of normal energy from circuits; (5) metal and energized parts, together with ground connection, shall be so fastened that they will not loosen and close the discharge gap or space between adjacent conductors; (6) binding post shall be separated and fastened to provide proper working space and prevent turning; (7) line and ground terminals, together with discharge points, shall be so alined as to provide as direct a path as possible for discharge; (8) arresters shall have sufficient current capacity to handle ordinary lightning discharges and shall be designed with a sufficient margin to insure against excess changes in the electrical properties due to these discharges.

REQUISITES FOR CHOKE COILS FOR SIGNALING.

(1) Choke coils shall be so constructed as to provide the highest possible reactance that will not interfere with the proper working of the apparatus that it is to protect; (2) they shall be constructed from materials of the best quality; (3) the dielectric strength of insulating materials shall be such as to insure against leakage of normal energy from the circuit; (4) choke coils shall be made as compact as possible and shall be provided with sufficient insulation between adjacent turns and layers to prevent a break-down when subjected to sudden abnormal surges of energy; (5) resistance of coil shall be such as not to interfere with the proper working of the apparatus that it is to protect; (6) binding posts shall be separated and fastened to provide proper working space and prevent turning; (7) coil shall be designed with sufficient current-carrying capacity to prevent overheating or permanent deterioration of its insulation when subjected to a continuous normal operating current.

The committee consists of E. G. Hawkins, chairman (N. Y. C.); J. C. Mill, vice-chairman (C. M. & St. P.); G. R. Cowherd (E. P. & S. W.), L. D. Dickinson (U. P.), Thomas Duffy (B. & A.), C. E. Goings (P. R. R.), G. B. Gray (P. L. W.), K. A. Hinton (C. H. & D.), Stanley W. Law (N. P.), H. W. Lewis (L. V.), B. W. Meisel (C. & N. W.), J. D. Phillips (P. & R.), W. H. Stillwell (L. & N.), Edgar Winans (A. T. & S. F.),

Discussion on Lightning Protection.

Chairman Hawkins: The committee in an effort to differentiate between requisites and specifications has reached

C. J. KELLOWAY.
Chairman Committee on Mechanical Interlocking.

the conclusion that the requisites are general clauses upon which specifications may be based and are not for use in designing material, but more for the purpose of outlining specifications, while specifications are used for the designing material.

MECHANICAL INTERLOCKING

The eastern body of the committee held three meetings in New York with excellent attendance, at which all subjects assigned the committee were carefully discussed and considered. A sub-committee of the eastern body was appointed to draw up specifications for electro-mechanical interlocking and presented a complete set for consideration at the meeting.

The committee consists of C. J. Kelloway, chairman (A. C. L.); D. M. Case, vice-chairman (C. N. O. & T. P.); Larsen Brown (A. T. & S. F.), G. W. Chappell (N. Y., N. H. & H.), W. H. Fenley (Panama R. R.), C. S. Foster (P. R. R.), Oswald Frantzen (N. Y., N. H. & H.), T. E. Kirkpatrick (N. Y. C.), J. W. McClelland (P. & R.), E. E. Mack (C. & E. I.), Sam'l Miskelly (C. R. I. & P.), W. B. Morrison (D. L. & W.), W. M. Post (P. R. R.), Chas. Stephens (C. & O.), J. I. Vernon (N. Y., N. H. & H.), F. E. Whitcomb (B. & A.), W. F. Zane (C. B. & Q.).

Discussion on Mechanical Interlocking.

The specifications were submitted for the first time, to obtain criticisms and suggestions for changes and improvements. A large percentage of the matter was taken from the specifications for electro-pneumatic and mechanical interlocking plants, already adopted by the Association. The committee withdrew mention of all wire connected signals and apparatus. The discussion related to suggestions and criticisms of individual paragraphs, all of which were noted by the committee for use in revision.

CONTRACTS

In view of the fact that the table of operated units was rejected by letter ballot after the last annual convention, the committee again presented this table, as well as another in simpler form for consideration, with the request that the two

J. B. LATIMER,
Chairman Special Committee on Contracts.

tables be given full discussion and a conclusion reached so that the committee can continue its work on the different forms of contracts for joint interlocking. Table A is the one previously presented and table B was presented for the first time at the March meeting.

TABLE A.

Points			Units
(1)	(a)	Each spare space in tower for one lever	3
	(b)	Each spare space in tower with spare space in machine	5
	(c)	Each spare space in tower with space in machine and lever	6
(2)	(a)	Each 100 feet of pipe line or fraction thereof	2
	(b)	Each 100 feet of mechanical wire line (2 wires, stakes, carriers, etc.)	1
(3)		Each separate line control for power signal or other functions.	
	(a)	For first 1,000 feet from tower or less	6
	(b)	For each additional 1,000 feet or fraction thereof	3
(4)		Each D. C. track circuit	8
(5)	(a)	Each bracket post	6
	(b)	Each high signal mast	4
	(c)	Each dwarf signal post	1
	(d)	Each signal arm	1
	(e)	Each signal light	1
	(f)	Each electro-mechanical slot	6
	(g)	Each low voltage signal mechanism	14

(6)	(a)	Each derail or pair of points for switch or crossing	6
	(b)	Each facing point lock	4
	(c)	Each switch and lock movement	8
	(d)	Each 30 feet of detector bar or fraction thereof	2
(7)	(a)	Each electric lock	4
	(b)	Each annunciator	2
	(c)	Each tower indicator	4
	(d)	Each time or hand release	2
	(e)	Each time lock	4
	(f)	Each track instrument	6
(8)	(a)	Each drawbridge coupler	4
	(b)	Each drawbridge, rail, surface or alinement lock for one rail	2
	(c)	Each drawbridge wedge or machine lock	4

TABLE B.

Points		Units
1.	Each power signal arm working in two or three positions, normal indication locking included	2
2.	Each mechanical signal arm working in one or two positions	1
3.	Each pair of switch points	1
4.	Each pair of movable point frog points	1
5.	Each derail, Scotch block, or smash board	1
6.	Each detector bar (any length operated by one pipe line, including F. P. L. or S. & L. movement)	1
7.	Each facing point lock or switch and lock movement used without bar	1
8.	Each drawbridge coupler	1
9.	Each drawbridge surface and alinement lock	1
10.	Each track circuit	1
11.	Each annunciator and its line circuits	1
12.	Each indicator and its line circuits	1

The committee consists of J. B. Latimer, chairman (C. B. & Q.); C. A. Christofferson, vice-chairman (N. P.); R. L. Davis (M. C.), Chas. A. Dunham (G. N.), R. L. Huntley (U. P.), C. D. Purdon (St. L. & S. F.), E. B. Pry (P. L. W.), L. S. Rose (C. C. C. & St. L.), W. M. Vandersluis (I. C.).

Discussion on Contracts.

Chairman Latimer: I stand for a simple table, the simpler the better, in my judgment. The object of a table of operated units is to systematize and make easy the division of the expense of joint interlocking plants. Nowadays it is almost invariably written into the contract, and remains binding as long as that document is in force. The question of the installation of joining interlocking plants is pretty generally settled by officers other than the signal engineer. We do not want a table which would require measurements to be taken on the ground. In the year 1910 a committee of, what was then known as the American Engineering and Maintenance-of-Way Association, a large part of which committee was composed of signal engineers reported a table of units to be adopted by that body. It has filled all requirements and nearly every signal engineer who has used it has told me the same thing. The second table in the committee's report shown as Table B is practically the same thing, and if it were adopted it would in no way conflict with the contracts already containing the old table.

W. H. Elliott (N. Y. C.): I feel that the basis on which this table is arranged is not as good as the old one, Table A. This practically jumbles up a lot of units and assigns almost a numerical value of one to them. The division or unit basis on which a value is assigned is, in my opinion, too large, and to get a true equation of values a smaller unit should be used. I am very much in favor of Table A instead of Table B.

J. A. Peabody (C. & N. W.): We have used Table B or one slightly amplified from it, in a great many contracts. This table may have some objectionable features, which the committee may thresh out, but it includes the units that I would suggest for both mechanical and electric interlocking, side by side. In this table of units that I have proposed I have two headings; first, electrical units, within mechanical plants; second, mechanical units in mechanical plants or units in an electrical plant.

E. B. Pry (Penn. Lines West): I am opposed to this table. I don't believe it is founded on a proper basis. Mr. Latimer said the object of the table was to make distribution easy. I differ with him on that. It is an expense as long as the plant exists, and there have been a number of different methods of dividing the expense in the past at interlocking plants. I believe that any table adopted by this association should provide for the present method of construction or any construction which may be used in the future, and I believe it is possible to revise the table or build another table on that basis, and provide for any kind of construction. Table B has exactly the same faults that all the other methods had.

A. R. Fugina (L. & N.): I don't agree with Mr. Pry. This association is standardizing certain practices. All of the items under Table B have had the careful consideration of the committees in developing certain specifications. Let us put in the interlocking plants in accordance to approved practice, and adopt a table broad enough to embrace that standard practice.

W. N. Manuel (G., R. & I.): I believe that most of the objections raised so far could be met should the committee consider giving some unit value to so many feet of pipe line, and so many feet of line wire.

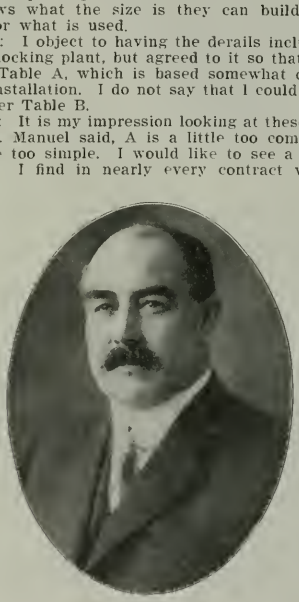
Mr. Latimer: That was tried in Table A, and that was one of the principal reasons the signal engineers objected to the tables. They said, "You have to go out on the ground and measure it."

Mr. Post: It seems to me that railroad companies generally will not split hairs of the division of expenses of interlocking. The testimony of Mr. Latimer as to the application of what is practically Table B, being unusually satisfactory, shows that. I think Table B is along the right lines, and that we should have a table that is generally acceptable, and the construction that Mr. Pry refers to as being objectionable would be rather unusual, and an exception that we would not consider in devising tables to meet this purpose.

Mr. Pry: It is a question whether you should base a value on a switch regardless of how it is handled or base the value on it depending on how it is handled. If the committee knows what the size is they can build up a table providing for what is used.

Mr. Mock: I object to having the derails included as part of the interlocking plant, but agreed to it so that they would accept the Table A, which is based somewhat on the value or cost of installation. I do not say that I could consistently do that under Table B.

Mr. Mock: It is my impression looking at these two tables, that, as Mr. Manuel said, A is a little too complicated and B is a little too simple. I would like to see a combination of the two. I find in nearly every contract we draw we must add to the distribution of unit values and nearly all are a little different. I think it is crude, because a table which may be alright for valuation purposes and construction purposes may be entirely wrong for maintenance from an equitable standpoint.



F. P. PATENALL,
Chairman Committee on Standard Designs.

C. C. Anthony (Penn.): I do feel that Table B is too simple.

R. B. Elsworth (N. Y. C.): Table A is not objected to only on account of the measuring, but there was an objection to it for the reason that some members thought it was very good for valuation and construction purposes, but not correct for maintenance.

Mr. Mock: I really think we should get something finer than Table B. That is rather a crude proposition. It has some relation to cost and some relation to maintenance cost, and a little relation to value, but there is no part of it that you can defend when you get down to a controversy upon what you are going to divide the expense on, and you have a fellow who is keen, and you may simply say—we have tried to make some sort of a compromise on this. I do not like that, but like to feel that we have something we can depend on upon a business basis.

(It was voted that the committee work on the improvement of Table A.)

STANDARD DESIGNS

The committee submitted 13 drawings, some of which are revisions of previous issues, as follows: Drawing No. 1015—One-Inch Signal Pipe and Coupling; No. 1020—Guide Clamps.

Brackets and Caps for Vertical Connections on Bracket Posts; No. 1021—Guide Clamps for Vertical Connections on Signals; No. 1022—Guide Support and Caps for Vertical Connections on Signals; No. 1023—Guides for Vertical Connections on Signals; No. 1024—Crank Bracket Fittings for Pipe Bracket Post; No. 1025—Crank Bracket Fittings for Pipe Bracket Post; No. 1026—Ladders for Mechanical Ground Masts; No. 1027—Ladder Parts; No. 1028—Ladders for Bracket Posts and Mechanical Bracket Masts; No. 1029—Ladder Clamps and Stays; No. 1196—Guides for Vertical Connections on Bracket Posts; No. 1198—Crank Brackets for Bracket Posts; Plate 3—Symbols—a revision was submitted which harmonizes the R. S. A. with A. R. E. A. standards.

The committee consists of F. P. Patenall, chairman (B. & O.); C. C. Anthony, vice-chairman (P. R. R.); G. E. Ellis (K. C. T.), W. A. Hanert (N. Y. C.), C. J. Kelloway (A. C. L.), J. C. Mock (M. C.), F. W. Pfleging (U. P.), M. E. Smith (D. L. & W.), R. E. Trout (St. L. & S. F.).

THE COLISEUM EXHIBIT

The exhibit of the National Railway Appliances Association at the Coliseum cannot fail to impress a visitor with the optimistic feeling prevailing among the railway supply fraternity and the belief that the worst has passed. While the exhibit is confined to the Coliseum and annex this year, and does not extend to the First Regiment Armory as during the past two years, the number of firms exhibiting is equal to that of last year, and the reduction in space has been secured by cutting down the areas allotted to some of the larger track exhibits. Thus the full size switch layouts of last year are absent this year.

This concentration of the exhibit in one building will meet with the favor of many railway and supply men, for it has been the experience in previous years that many railway men, with a limited amount of time at their disposal, did not get to the First Regiment Armory at all. From an educational standpoint this year's exhibit surpasses any previous one, consisting as it does of a greater variety of full sized equipment in actual operation and less of models, except in certain cases where the size of full size units makes their installation impracticable.

The signal exhibit, concentrated largely in the north end of the building, as in previous years, is of special interest, including as it does a number of new and important developments of the past year. These exhibits of full sized equipment in operation are becoming increasingly attractive to the operating as well as to the signal officers.

Of special interest to track men are the usual standard appliances with which such improvements as have been made during 1914. More attention is paid to these this year, and a visitor will be impressed with the almost complete absence of new and untried devices such as have been shown at some previous exhibits.

Each succeeding year shows the increating attention which is being paid to the development of numerous accessories in the maintenance of way department. While the exhibits of a decade ago were confined very largely to standard track materials, one will see this year steel bunks, motor cars, a tie tamping machine and much similar equipment which is meeting with ready adoption by the railways.

As in previous years, the entire exhibit impresses one with its thoroughly businesslike character. There is no attempt to provide comfortable lounging quarters for guests, all of the space being utilized for the installation of exhibits. The best indication of this is the fact that many railway men come to Chicago primarily to visit the exhibits and to secure information about certain equipment. One supervisor came all the way from Maryland to spend the entire day yesterday investigating motor cars, and will return this morning before the engineering convention opens. Such illustrations are a definite proof of the recognition of the educational value of this exhibit.

NATIONAL RAILWAY APPLIANCES ASSOCIATION

The National Railway Appliances Association, which, as in former years, is responsible for the success of the supply exhibit at the Coliseum, and in general represents the interests of the railway supply industry at these conventions, is too well known to require extended comment. As at present constituted, the association represents a development of 19 years of steady and constant growth in strength, numbers and influence. The present organization is the direct outgrowth of the Road and Track Supply Association, which was organized in 1894 to exhibit at, and supply entertainment for, the Roadmasters' Association. In 1900, after the organization of the American Railway Engineering and Maintenance of Way Association, which is now the American Railway Engineering Association, the supply association transferred its activities from the Roadmasters' Association to the new organization, and has since held its exhibitions in connection with the conventions of the latter body and of the Railway Signal Association. In 1910 the name was changed to the Railway Appliances Association and in 1911 it was regularly incorporated under the laws of Illinois with its present name.

N. M. HENCH,
President.

The chief function of the association is to organize and conduct the exhibition of railway appliances held annually in the Coliseum, which is so vital a feature of the engineering and signal association conventions.

The officers and members of the board of directors of the National Railway Appliances Association are: President, Norman M. Hench, Carnegie Steel Company, Pittsburgh, Pa.; vice-president, Philip W. Moore, the P. & M. Company, Chicago; secretary, Bruce V. Crandall, Chicago; treasurer, C. W. Kelly, Kelly-Derby Company, Chicago; honorary director, Tom R. Wyles, Detroit Graphite Company, Chicago; directors, H. M. Sperry, General Railway Signal Company, Rochester, N. Y.; L. G. Parker, Cleveland Frog & Crossing Company, Cleveland, Ohio; E. H. Bell, the Railroad Supply Company, Chicago; J. Alexander Brown, Pocket List of Railroad Officials, New York; E. E. Hudson, Thomas A. Edison, Inc., Orange, N. J.; M. J. Trees, Chicago Bridge & Iron Works, Chicago. The photographs are reproduced herewith.

President Hench is engineer of track appliances with the Carnegie Steel Company, Pittsburgh, Pa. He was graduated from Lafayette College, Easton, Pa., in 1897, and entered the service of the Pennsylvania Railroad in the maintenance of way department. He was promoted to supervisor of track within four years and was last located at Altoona, Pa. In 1905 he resigned to accept his present position of engineer of track appliances with the Carnegie Steel Company. He was elected a director of the National Railway Appliances Association four years ago and is also a member of the American Society of Civil Engineers and the American Electric Railway Association.

P. W. Moore is vice-president and general manager of the P. & M. Company, Chicago. He is a native of Boston, Mass.,

E. H. BELL,

J. ALEXANDER BROWN.

H. M. SPERRY.

E. E. HUDSON.

M. J. TREES.

T. R. WYLES.

B. V. CRANDALL,
Secretary.

P. W. MOORE,
Vice-President.

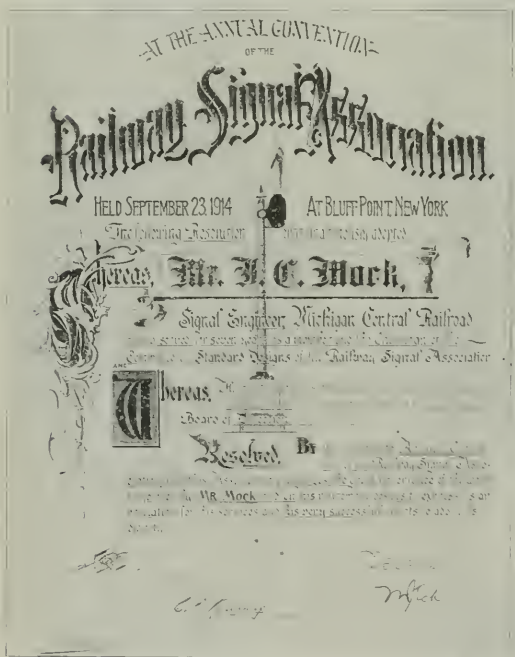
C. W. KELLY,
Treasurer.

OFFICERS AND DIRECTORS NATIONAL RAILWAY APPLIANCES ASSOCIATION.

and graduated from the Massachusetts Institute of Technology, with the class of 1901, with the degree of B.S. in the department of mechanical engineering. After graduation he was a draftsman in the chief engineer's office of the Pennsylvania Steel Company at Steelton for a little over a year. He was then transferred to the sales department and came to Chicago in connection with that department in the summer of 1903. Three years later, in the summer of 1906, he left that company to enter the employ of the Railway Specialty & Supply Company, upon its organization. This company is now known as the P. & M. Company.

R. S. A. APPRECIATION TO J. C. MOCK

At the close of the morning session of the Railway Signal Association meeting yesterday, President T. S. Stevens presented J. C. Mock, signal engineer of the Michigan Central, with a framed copy of the resolutions passed by the nine-



Facsimile of Framed Resolution Presented to J. C. Mock by the R. S. A.

teenth annual convention in Bluff Point last fall, expressing the appreciation of the association for the work that Mr. Mock accomplished as chairman of Committee VI, on Standard Designs. The resolution, which was neatly engrossed, read as follows:

"WHEREAS, Mr. J. C. Mock, Signal Engineer, Michigan Central Railroad, having served for seven years as a member and the Chairman of the Committee on Standard Designs of the Railway Signal Association, and

"WHEREAS, he has tendered his resignation as Chairman of said Committee and his resignation as Chairman of said Committee and his resignation having been accepted by the Board of Direction, be it therefore

"RESOLVED, by the Nineteenth Annual Convention of the Railway Signal Association that this Association recognize the great importance of the work performed by Mr. Mock, and on his retirement desires to express its appreciation for his services and his very successful efforts to add to its dignity."

R. S. A. COMMITTEE MEETINGS

The following committee meetings of the Railway Signal Association are called for to-day at the places and times mentioned below. Committee II, Mechanical Interlocking, 10:00 a. m., Room 140 Auditorium Hotel.

Committee III, Power Interlocking, and IV, Automatic Block, 8:30 a. m., Room 138, Auditorium Hotel. Committee IV, Automatic Block, 9:30 a. m., Room 244, Auditorium Hotel.

Committee V, Manual Block, 9:00 a. m., Room 3, Auditorium Hotel.

Committee VII, Relays, 8:30 a. m., Room 354, Auditorium Hotel.

Committee VIII, Electric Railway and Alternating Current Signaling, 8:30 a. m., Room 354, Auditorium Hotel.

Committee X, Storage Battery and Charging Equipment, 8:30 a. m., Room 444, Auditorium Hotel.

ANNUAL BANQUET

The annual banquet will be held in the Gold Room at the Congress Hotel at 7 o'clock on Wednesday evening. The speakers will include C. S. Gleed, president, Missouri & Kansas Telephone Company; Sir George Foster, minister of trade and commerce, Dominion of Canada; Frank L. Mulholland, president of the International Association of Rotary Clubs, and Benjamin Baum, chief engineer maintenance of way, Maumee Valley Railroad.

REUNION OF A. T. & S. F. SIGNAL OFFICIALS

The past and present members of the Santa Fe signal supervisor's committee held a reunion at a dinner given at the Congress Hotel, Monday noon. This was the first annual dinner of this committee and many accepted the call to the colors. Of the past members, the following were present: Burt T. Anderson, assistant signal engineer, Delaware, Lackawanna & Western; George R. Cowherd, signal engineer, El Paso & Southwestern; Park B. Hyde, signal and electrical engineer, Thomas A Edison, Inc.; Harold K. Ferguson, secretary, Samuel Austin & Son's Company; J. Earl Saunders, electrical engineer, Union Switch & Signal Company; and Jack Hobson, general sales manager, Union Switch & Signal Company. The active members who did justice to the dinner are T. S. Stevens, signal engineer; Larsen Brown, assistant signal engineer; Harry Hobson, signal supervisor Eastern lines; Ed Hanson, signal supervisor, Gulf Lines; William Rife, signal supervisor, Western Lines; and E. Winans, signal supervisor, Coast Lines.

WOOD PRESERVERS' MEETING

About 20 members of the Executive Committee and committee chairmen of the American Wood Preservers' Association met at the Hotel Sherman yesterday afternoon to discuss business affairs of that association and to outline committee work for the ensuing year. They also took dinner together at the Hotel Sherman at 6 o'clock.

CHANGES IN PULLMAN COMPANY ORGANIZATION

Le Roy Kramer, assistant to the president, and Richmond Dean, general manager of the Pullman Company, have been elected vice-presidents of the company. C. S. Runnells has been appointed assistant to the president, succeeding Mr. Kramer, and L. S. Hungerford, general superintendent, succeeds Mr. Dean as general manager. All will have office at Chicago.

REGISTRATION—RAILWAY SIGNAL ASSOCIATION

ACTIVE MEMBERS.

Adams, W. M., Sig. Supr., Atlantic Coast Line, Jacksonville, Fla.
Ahrens, C. R., Storekeeper, Sig. Dept., D. L. & W. R. R. Co., Hoboken, N. J.
Allan, E. A., Supr. Sigs., Northern Pacific Ry., Livingston, Mont.
Allen, W. P., Inspr. of Sigs., P. R. R., Philadelphia, Pa.
Ambach, E. T., Asst. Supt. Tel. & Sigs., B. & O. S. W. R. R., Cincinnati, Ohio.
Anderson, B. T., Asst. Sig. Engr., D. L. & W. R. R., Hoboken, N. J.
Anderson, James, Sig. Inspr., N. Y. C. R. R., West of Buffalo, Cleveland, Ohio.
Anthony, C. C., Past President, Asst. Sig. Engr., P. R. R., Philadelphia, Pa.
Arnold, R. B., Sig. Inspr., Sig. Engr.'s Office, C. & N. W. Ry., Chicago, Ill.
Baird, M. A., Gen. Sig. Inspr., Erie R. R., Suffern, N. Y.
Ball, Frank L., Supr. Sigs., D., L. & W. R. R., Maplewood, N. J.
Balliet, H. S., Asst. Term. Mgr., Grand Central Terminal, New York, N. Y.
Barnes, A. H., Supr. of Sigs., N. P. Ry., Tacoma, Wash.
Beaumont, J., Sen. Sig. Engr., Valuation Board, Interstate Commerce Com., Chicago, Ill.

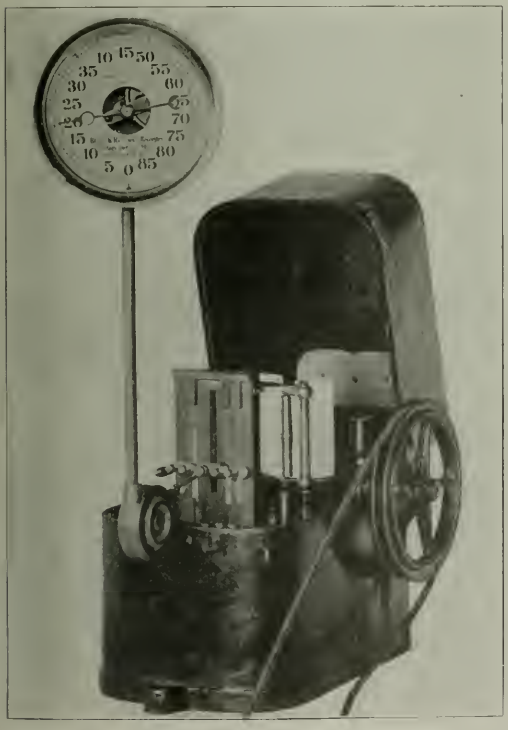
AUTOMATIC SPEED CONTROL

The Julian-Beggs Co., Terre Haute, Ind., has recently placed on the market an electro-mechanical device for controlling automatically the speed of a train. The operation is entirely independent of signals or in fact any exterior arrangement, the speed of the train mechanically operating the device through a spring belt running over a car or locomotive axle the belt and a wheel, through an oil cylinder and piston, make and break a normally closed circuit which controls the speed through an air valve operated by a solenoid magnet.

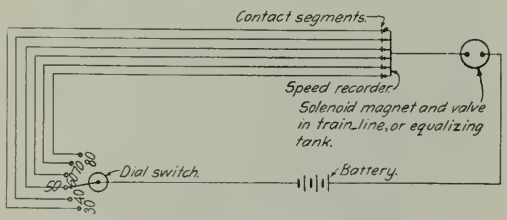
The belt operates a wheel attached to a small pump which forces oil into the oil cylinder with increasing velocity as the speed increases; a small hole in the bottom of the cylinder emits oil at a practically constant rate. The faster the oil pump is operated by the belt from the car axle, the higher the piston rises in the oil cylinder. As the plston rises, it carries with it a series of platinum points which move along silver segments of various heights. Above the silver segments are insulating segments of Bakelite. When any one of the platinum points is in contact with a silver segment, it completes a connection up to the dial switch, of which an illustration is shown. The pointer is placed on the contact at the desired speed; a connection must be completed through



Speed Recorder and Control for a Locomotive; Arranged for Three Speeds Only.

the pointer of the dial to complete the circuit, which will then be from the battery to the solenoid magnet, to the platinum contact points, to a silver segment, through the wire connected up with the contact at the indicated speed, through the movable pointer, and back to the battery.

When the circuit is closed it holds up a solenoid magnet, which operates a valve in the train line. When the circuit is broken, the solenoid valve is deenergized, the air pressure opens the valve, which is connected in the train line or equalizing tank. A service application of the air is made, the brakes staying on until the speed reduces enough to allow the platinum points to again come in contact with the segment, so that the circuit will again be completed. When the circuit is completed, the solenoid magnet is reenergized and thus automatically closes the valve. This automatic speed control device can be installed on any car or the locomotive of a train.



Circuit Diagram for Julian-Beggs Automatic Speed Control Apparatus.

and no matter on what railway such car or locomotive is placed, the speed can be controlled as desired. The current required is about 0.1 amperes.

The device was given an all-day test February 8, on the General Manager's car of the Queen & Crescent Route. Various speeds were tested out by moving the pointers on the speed dial, and in each case it was impossible for the engineman to exceed the speed limit indicated on the dial. The device operated without failure in the tests, and has since been placed on a number of cars of the Queen & Crescent Route. On all types of the apparatus which have been considered by the R. S. A., the Association's standards were followed.

UNUSUAL WIRE ROPE SERVICE

A wire rope of compound construction intended for use with ballast unloaders, drag line excavators and in similar service where the rope is subject to severe strain, sudden shocks and an unusual amount of abrasion, is manufactured by the Broderick & Bascom Rope Company, St. Louis, Mo., following a special design made to secure a rope that would give satisfactory service in connection with the unloading plows used to dump the material excavated from the Panama Canal. The conditions on this work were unusually severe. The material was handled in trains of 17 to 19 cars, each unloading cable being 1,000 ft. long. The material contained a large amount of rock, much of which was in the form of large boulders. In pulling the unloading plow along the train the wear of the cable over these stones would frequently cut deep grooves in the rock, and particularly after a train load of material had stood over night and been soaked by rain, the strain on the cable in plowing off was much higher than is usually encountered in such work. The combination of these conditions resulted in the breakage of ordinary wire rope after the unloading of a maximum of 500 trains. As a result of a study of this situation and numerous tests this company perfected the compound cable using its "yellow strand" wire, the complete design being known as the "Frederick patent." After this rope was put in service on the canal zone the unloading record increased to a maximum of 2,010 trains with one rope. This cut the cost of the cable to approximately one cent per car.

This compound wire rope permits the use of a larger wire rope core than in the common construction, increasing the strength of the rope about 25 per cent. The tendency of the strands to cut and chafe each other is prac-

tically eliminated and as the inner rope core lies in the interstices of the outer strand there is a tendency to prevent the wires in the outer rope from creeping, which is a destructive tendency. The service of this rope has shown it to be able to withstand sudden shocks, heavy strains and severe bending without affecting its elasticity up to the ultimate breaking strain of ordinary wire rope of the same diameter and quality. While the rope used at Panama had a diameter of 1½ in., seven other sizes smaller than this are also made, the smallest being ⅝-in. in diameter.

THE USE OF DUMP CARS IN THE OPERATION OF A DITCHER

Several roads have found it more economical in the operation of a ditching machine to load the excavated material into two dump cars, one on either side of the flat car carrying the machine, than to use a train of 10 to 15 flat cars and unload them with a plow, as is the practice quite generally at present. On one road such a ditching outfit has loaded an average of 24 cars per day with 15 yd. to the car at a cost of $0.14 per yd., not including any interest or depreciation charges on the ditcher or the locomotive.

Estimates prepared by the Western Wheeled Scraper Company, Aurora, Ill., based on performances with two 20-yd. Western air dump cars and twelve 40-ton flat cars, respectively, show that the first cost of the dump car train, exclusive of the locomotive, is about one-half that of the flat car train, that the two outfits will handle approximately the same yardage per day and that the cost per yard will be about $0.18 and $0.25, respectively, for the dump car and the flat car train. The statement of first cost in this estimate is based on the use of new cars, making the valuation of the flat car train higher than would be the case if old equipment was used. In addition to the difference between the charges for interest and depreciation on the cars for the two trains, the dump car train also shows an economy in the elimination of the unloader, plow cable and car, and two extra men required for stretching the cable.

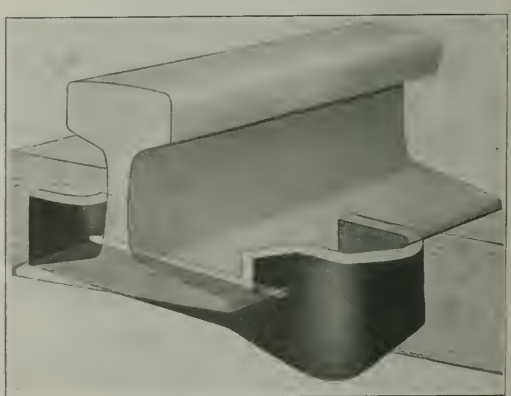
The conclusion that approximately the same yardage will be handled per day by the two methods is reached on the assumption, first, that the dirt be hauled three miles, which is probably a maximum for this class of work; second, that a siding is located at the point where the ditcher is working, which is the ideal switching condition for flat car operation and is, of course, rarely if ever met in practice, and, third, that train service will limit the working day to five hours, which is thought to be an average condition. On these assumptions the two dump cars could be loaded in 60 min., the complete train run direct to the dump without switching the ditcher or turning the engine in 9 min., the two cars dumped and righted in 2 min. and the train returned to the cut in 9 min., making a total for one trainload of 80 min. On the other hand, the flat car train of 12 cars, 1 of which carries the plow and 1 the ditcher, could be loaded in 180 min., the ditcher set out and the unloading cable strung in 17 min., the run to the dump made in 9 min., the cars unloaded in 6 min., the plow switched to the rear and the ditcher attached to the front end of the train in 13 min., and the run back to the cut made in 9 min., a total of 234 min. The dump car train could therefore practically complete four trips per day, handling 200 yd., and the last flat car train one trip with 150 yd. and load four more cars in the remaining 1 hr. and 6 min. This is equivalent to about 195 yd. loaded and dumped, which makes the performance by the two methods approximately equal.

A number of incidental advantages arise through this use of dump cars. One of these is the rapidity with which the dump cars can be unloaded, allowing the work train to place the material and return in a much shorter interval between trains. Again, the material can be dumped at exactly the point desired, as in widening embankments or filling trestles. The possibility of accidents through the plowing off of the material is also obviated. A lighter engine can be used for the work train service when dump cars are used, and the excavating capacity of the ditcher can be increased since no time is lost in swinging the rails.

When the haul is short, the cost of ditching can be further reduced, if conditions will permit, by the following method: With the locomotive on the dump end of the train, the car next to the locomotive can be pulled to the dump as soon as loaded, and while the locomotive is gone the ditcher can be loading the second car. As soon as the first car is returned it can be loaded and the whole train then taken to the dump. In this way the ditcher stands idle during one run to the dump for three cars of material instead of for two cars. The ditcher can spot the one flat car while the locomotive is gone by putting the dipper against the bank in the direction opposite to the movement and engaging the traveling gears. This pushes the car from underneath the ditcher and places the train where it is desired. It is estimated that this method can be used with advantage for hauls up to 1½ miles. The water for the ditcher can be piped from the locomotive by using automatic hose couplers between the cars. Portable rail sections can be used or the car can be permanently railed. Air dump cars of not greater than 20-cu. yd. capacity are recommended.

THE "SUPERIOR" RAIL ANCHOR

A new form of one-piece rail anchor is now in use on about 30 railroads, including the Pennsylvania, the Philadelphia & Reading, the Delaware, Lackawanna & Western, the Central Railroad of New Jersey, the Lehigh Valley, the Chicago, Burlington & Quincy and the Southern Pacific, where it is reported to be giving satisfactory service. This "Superior" rail anchor is made of ⅜-in. heat-treated and oil-tempered steel with one end bent to form a spring which rests against the side of the tie and two lugs bent out on the upper edge of the anchor to engage the upper surface of the rail base when in place in the track, as shown in the accompanying illustration. The elasticity of the steel of which the anchors are made tends to prevent them from being loosened by vibration or by expansion or contraction of the rail.



The One-Piece "Superior" Rail Anchor.

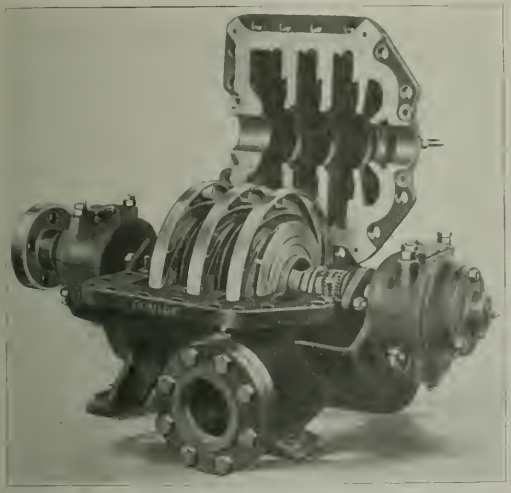
The device can be applied by any average track man without other tools than a light hammer. When placed at right

angles to the rail the lugs can be slipped up over the edges of the base, after which the device is twisted until the lugs come in contact with the upper surface of the base, and the spring is against the side of the tie. The holding power is dependent on the grip furnished by the reaction of the steel spring and the "shackle hold" secured by the wedging action of the lugs on the sloping surface of the rail brace when the device takes its diagonal position across the rail. This device is manufactured by the Track Specialties Company, New York City

NEW TYPES OF CENTRIFUGAL PUMPS

A new high-speed single-stage centrifufal pump, designed for direct connection to electric motors, and a multi-stage pump for use where the head is greater than can be efficiently handled by a single-stage unit, have been developed recently by the Goulds Manufacturing Company, Seneca Falls, N. Y.

The single-stage pump is of the enclosed impeller type, with a volute casing, supported on a bed plate that can be swiveled to any one of eight different positions. The impeller is made of gray cast iron and is balanced against

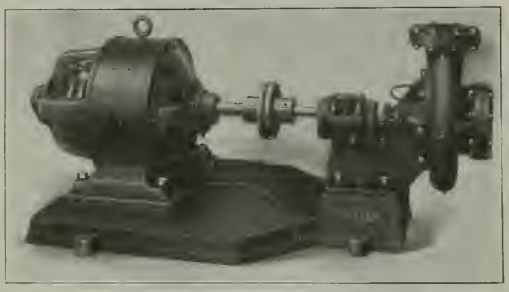


Three-Stage Horizontal Single-Suction Centrifugal Pump, with Top of Casing Removed.

end thrust hydraulically, statically and dynamically. Any slight end thrust occurring in operation is taken up by shaft collars bearing on babbitted surfaces, the collars also serving to space the impeller properly in the casing. The impeller is pressed on a high carbon open hearth steel shaft of ample size to transmit the maximum power. The volute is made of gray cast iron, the section being of uniform thickness and the waterway being carefully proportioned to convert the velocity energy of the water leaving the impeller into pressure with the minimum loss due to shocks or eddies.

The support head casting forms the stuffing box cover of the casing containing the two bearings and carrying the complete pump when assembled. The ability to shift the casing on the bed plate increases the adaptability of the pump where space for pipe fittings is limited, and also allows a discharge elbow to be dispensed with. The pump can be arranged either for direct connection to a motor or for belt drive. This pump is made in five sizes, the normal capacity of which ranges from 80 to 140 gal. per min., for the smallest, to 700 to 1,000 gal. per min., for the largest size.

The multi-stage pump is of the horizontal suction type. The bearing housings are cast integral with the lower half of the pump casing, and it is believed that the danger of leakage between stages has been obviated. These pumps are made in four sizes, the two smaller sizes being provided with impellers independently balanced against end thrust and also fitted with thrust bearings to carry any



Single-Stage Horizontal Centrifugal Pump Direct Connected to Electric Motor.

thrust developed in actual operation, these bearings running in an oil bath. The two larger sizes are equipped with an automatic internal balancing disc, which dispenses with external thrust. The pump can be furnished in two to five stages. The capacities range from 200 to 300 gal. per min. for the smallest size to 1,000 to 1,500 gal. per min. for the largest.

A NEW MOTOR INSPECTION CAR

The Kalamazoo Railway Supply Company, Kalamazoo, Mich., has recently placed on the market a new light motor inspection car for the use of roadmasters or others whose duties require frequent trips over the line. This car is known as the No. 20 and is equipped with a 9-hp. air-cooled motor driving through a friction disc transmission and roller chain to one of the axles. The car body is light, allowing it to be removed from the track easily by one

A New Type of Motor Car for Inspection.

man. Spring cushioned revolving chairs are provided and the space on the deck is ample for baggage and paraphernalia. The car is made double-ended for operation in either direction and has variable speeds in both the forward and reverse. It is equipped with Hyatt roller bearings throughout and has brakes acting on all four wheels. An oil and gasoline storage capacity sufficient for a trip of 200 miles under normal conditions is provided.

THE BAIRD ELECTRIC LANTERN

An electric hand lantern, which is unique in its design, is being used by trainmen and other employees on a number of roads, including the Chicago & Alton, the Chicago, Rock Island & Pacific and the Lake Erie & Western. On some roads the company has purchased the lantern to supply the men, but on the three mentioned an arrangement is in force identical with that covering the renewals for oil lanterns. The lanterns and the renewal parts are kept in the company's stock room and issued to the men at cost in the same way as supplies for oil lanterns. The cost of this electric lantern has been bought down to a point only slightly above that for an oil lantern so that in many cases the men prefer to purchase them rather than to buy a new oil lantern to replace a lost or damaged one.

An Electric Hand Lantern with the Bulb Below the Batteries.

The frame of the lantern is of brass and steel nickel-plated to prevent corrosion, and the batteries are enclosed above the lamp instead of below it, as in the ordinary design. A sliding frame normally supports the lantern but when desired this can be closed up so that with the ball dropped, the lantern occupies a space only 6 in. by 6 in. by 7 in. On account of its construction, the lantern throws no downward shadow, an evident advantage for many uses, particularly in signaling by hand. The light is turned on or off by the position of the bail. When raised or when lowered on one side, the light remains on, and when lowered on the other side it is switched off. The bail snaps into place in the vertical position.

The power is furnished by a dry battery consisting of four cells made up in two units so that when one is exhausted the other is ready and one-half can be renewed at a time. This battery furnishes six volts to a miniature tungsten filament lamp, giving four times as much illumination as a carbon lamp. The lamp is doubly protected by a wire guard close to the bulb and by the sliding frame which supports the lantern. A receptacle is provided in the duplex battery for an extra bulb so that a failure need never destroy the usefulness of the lantern. The life of a battery is stated to be from 60 to 65 hours, and the life of a bulb 150 hours. The extra bulbs are retailed at 25 cents and the duplex batteries at 80 cents. This lantern is manufactured by the Federal Sign System (Electric), Chicago.

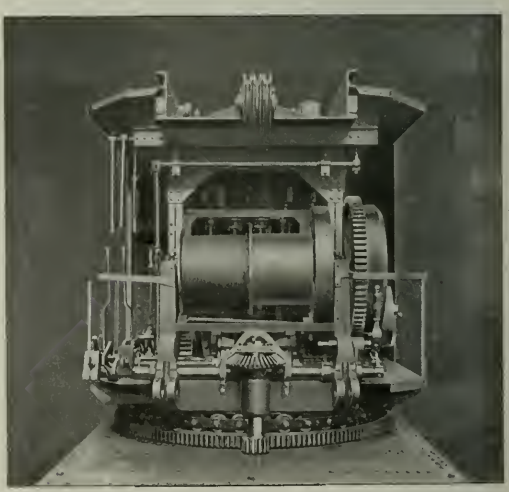
NEW LOCOMOTIVE CRANE

A new locomotive crane has been placed on the market by the Cleveland Railway Supply Company, Cleveland, O., which combines several distinctive features. One of the important points in its design is the rigid and heavy construction of the bed. The car frame is built of two heavy longitudinal side girders, between which are heavy cross beams supporting the roller bed, upper structure and propelling mechanism. The frame is mounted on two standard 4-wheel trucks with 33-in. wheels and heavy axles, the wheel base being 20 ft. 6 in. The rotating bed is 105 in. in diameter or about 18 in. larger than in common designs. The lower ring is composed of 44 conical rollers of ample diameter and face to carry the load. These rollers are attached by pins to a spider which has a bearing on the center pin of the frame, assuring the alinement of the rollers. The rotating bed that carries the hoisting, rotating and traveling mechanism is a heavy machined casting, resting directly on the rollers. Particular attention has been given to the accessibility of all shafts, clutches, gears

New C. R. S. Locomotive Crane.

and other working parts, so that adjustments and repairs can be made with the least possible delay and without dismantling other parts of the frame.

The disc friction type of hoist and travel clutches are used, one-half of the disc having a contact surface covered with asbestos facing, which runs either with or without oil. The gearing is of cast steel and the small pinions of forged steel. The teeth, fulcrum gear and the pinion which meshes with it are of cast steel. All other gears have cut teeth. The shafts 3½ in. in diameter and less



Operating Mechanism of New C. R. S. Locomotive Crane.

are of cold rolled shafting, the larger sizes being forged All bearings are bronze bushed.

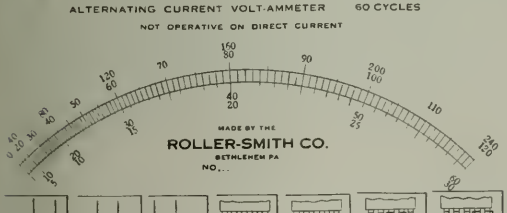
For raising and lowering the boom and the load, as well as for traveling, the engine has two vertical cylinders 9 in. in diameter with a 12-in. stroke. Rotation is handled by a swinging engine with a 4-in. by 6-in. cylinder mounted on the rotating bed. The control is smooth, for either fast or slow rotation, and a quick acceleration is obtained. The

traveling power is applied to one axle on each truck through beveled gears and pinions and two clutches for driving the crane backward and forward without reversing the engine. The hoisting drum is 20 in. in diameter and is driven by gears and pinions operated by a clutch. The load is controlled by means of a strap brake operated by both hand and foot levers. A 12-in. drum connected to a worm gear is mounted in the top structure of the crane for raising and lowering the boom. The ropes lead directly from the drum to the sheaves in the head of the boom and then to the purchase block connected to the top structure, thus giving them the best possible leverage for the support of the boom. The crane is rotated by a pinion meshing with teeth on the outside of the rotating ring, the pinion being driven by the rotating engine through a worm and gear.

A low center of gravity and an increased capacity is obtained by placing the operating mechanism low down, and another advantage is gained by placing the operator on the right side of the crane, a little forward of the center, where he can see the various operations without having his view obstructed. The crane has a coal capacity of 2,000 lb. and a water storage of 500 gal. It is built in standard sizes from 15 to 30 tons, inclusive, and with booms from 30 to 50 ft. in length. It is designed to travel at speeds of from 600 to 1,000 ft. per min., and has a rotating speed of 3 to 4 r. p. m. It can be used with either bottom block for ordinary lifting, grab bucket, drag line bucket, lifting magnet or pile driver, steam or drop hammer. Changes from one to the other of these attachments can be made with little delay.

NEW VOLT-AMMETER FOR A. C. SIGNAL TESTING

A new alternating current volt-ammeter especially designed for the testing of alternating current signaling circuits and apparatus has been placed on the market by the Roller-Smith Company, New York City. The ranges have been selected carefully to avoid the necessity for carrying a number of ammeters and volt-meters on this class of work. When used as an ammeter the instrument has three ranges, 3, 12 and 60 amperes, and as a voltmeter four ranges, 6, 30, 120 and 240 volts. Each binding post is marked with a numeral corresponding to the scale value



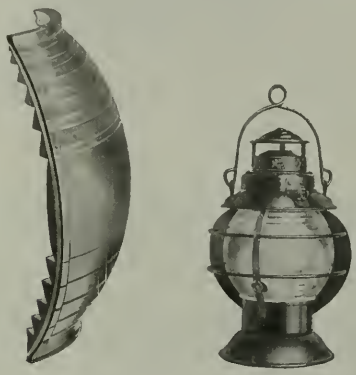
Facsimile of Scale on New Type SS Volt-Ammeter.

which is obtained when that binding post is used, and diagrams are shown for reference in making the proper connections for the various ranges, indicating also in each case the values per scale division. These instruments operate only on alternating current and are calibrated for the frequency on which they are to be used.

The instrument is contained in an oak case 6⅞ in. by 7 in. by 4¼ in., the complete outfit weighing 7 lb. It is provided with a leather handle, hinged cover and snap catch. The binding posts are heavy and have non-removable tops. A zero adjuster is also provided for manipulating the instrument.

SPHEROIDAL LENS BRIDGE AND PIER LAMP

A new line of signal lamps for use on bridges and piers over navigable waters which conform with the regulations of the United States Light House Bureau has been placed on the market by the Armspear Manufacturing Company, New York City. All parts of these lamps, including the spheroidal lenses, are made to interchange with the switch, semaphore, tail light and engine classification lamps that



Spheroidal Lens Sector and Top Bridge Lamp.

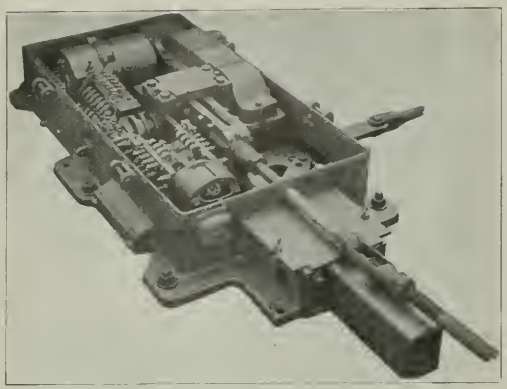
have been furnished by this company since 1913 The new lamps are made of No. 18 gage steel plates, the parts being dipped in molten lead and tin to prevent corrosion After completion the lamps are baked with two coats of Japan varnish. A system of top ventilation is provided in which all the ventilating parts are in plain sight, allowing easy access.

The spheroidal lens sectors are made of moulded glass, each sector covering a 90-deg. arc. When the regulations call for an angular vision of less than 90 deg. the desired portion of each sector is covered with metal strips attached to the steel uprights of the lamps, which are removable when it is desired to convert the lamps for other service. Arcs which are not to be illuminated are filled by drawn steel panels built to the same dimensions as the glass sectors. All panels and lens sectors are contiguous, the joints being made air-tight by asbestos packing placed in grooves provided for this purpose. The lamps can be supplied with burners for the use of kerosene oil, with outside wick adjustment, or for electricity or other illumination as desired. Any standard method for attaching the lamps to bridges, piers, etc., can be used.

The ruby lens is now being made in a "high transmission" glass, which has increased the range of the signal about one-third. Tests have showed that this lens will give a pick-up signal at two miles.

A. C. SWITCH AND LOCK MOVEMENT

The Model 13 enclosed switch and lock movement, manufactured by the Union Switch & Signal Company, Swissvale, Pa., has been adapted for use on alternating current of any commercial voltage and frequency, by the substitution of an a. c. motor of the commutator type for the standard direct current motor and an a. c. circuit controller for the usual d. c. circuit controller. A set of gears which are interchangeable with the gears used with the d. c. motor give a slightly



Enclosed Electric Switch and Lock Movement (Arranged for A. C. Operation).

higher gear ratio on account of the higher speed of the a. c. motor. The circuit controller is of the two-element motor type operated on a polarized control circuit, and is normally energized. The same indication circuit controller is used as with the d. c. movement.

The switch movement is designed to operate in connection with the Type "F" system, using polarized control, and a polarized indication; current for the latter is obtained from a small transformer located in the same housing with the movement, providing a separate source of energy for each indication circuit. The motor requires only about 750 watts to operate a single switch with detector bar.

DESPATCHERS 'SELECTIVE SIGNALING SYSTEM

The General Railway Signal Company, Rochester, N. Y., has recently made an installation of despatchers' selective signaling system, which, in connection with telephone train despatching and selector equipment, affords means by which the despatcher can control train-order and take-siding signals located at various stations on his division. He can determine, also, whenever he desires, the indication displayed by each signal and the system may be utilized to indicate to the despatcher a train passing a certain point and the direction in which the train is proceeding, corresponding to the operator's O. S. or train report.

The essential feature of the system is an "answer-back" mechanism which indicates the normal and reverse position of the respective signals by sending in to the despatcher, when he operates the proper key, a distinctive series of audible code impulses which can be repeated as often as the despatcher desires. The system operates on closed circuit so that any failure of current causes a danger indication. Selectively controlled train-order signals are intended for use at train-order stations which can be operated without an operator, and at other stations where the number of operators can be reduced; and also for places where traffic conditions would not warrant the expense of one or more operators. The figure shows control circuits for a selectively controlled train-order signal, an "answer-back" O. S., and a take-siding signal. Each arm of the train order signal is controlled by two keys, one for normal position and one for reverse position in the despatcher's office, through the telephone wires, the contacts of selector S and the stick relay R. Current for operation of the signal motor is supplied by a local battery.

The combination of electrically-controlled train order signals and "answer back" O. S. arrangement are designed to afford many of the advantages of a train-order station without the expense of the operator's wages. Take-siding signals can be used to afford a means of displaying to certain trains an indication to take siding at points other than scheduled meeting or passing points. When stopped by a take-siding signal, trainmen can communicate with the despatcher by telephone and obtain definite orders or instructions.

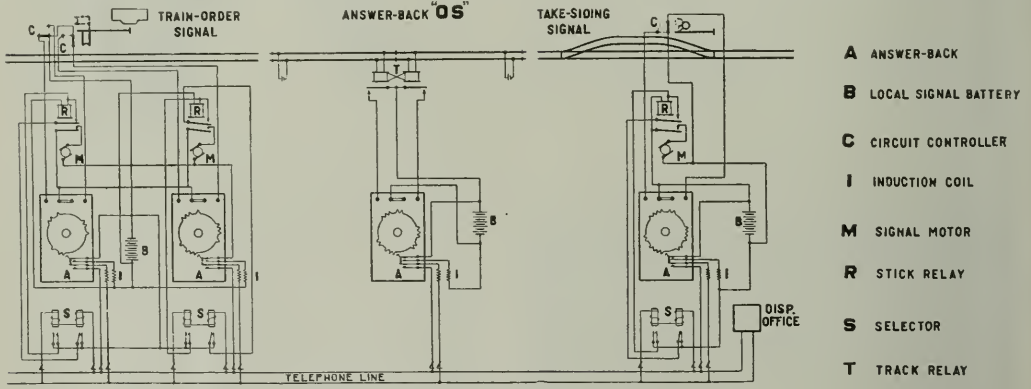


Diagram of Despatchers' Selective Signaling System.

AN IMPROVED TYPE OF FIXED GANTRY CRANE

The fixed gantry crane shown in the accompanying illustration was recently installed on a western road at a point where the amount of freight to be handled is not great enough to justify a traveling crane, and the inconvenience occasioned by the necessity of moving cars from time to time during unloading is negligible. A traveling crane for this location would have cost at least 50 per cent more than the one shown. This crane, which was manufactured by the Northern Engineering Works, Detroit, Mich., is equipped with the type E trolley, and also with the latest improvements, such as the use of enclosed gears and the elimination of overhanging gears. The hoist has forged and cast steel gearing, bronze bearings, a double brake system, all wiring in steel conduits and cast housings for the gear trains as far as possible. All parts are made interchangeable by the use of standard jigs and templets.

The gantry structure has an enclosed steel cage for the

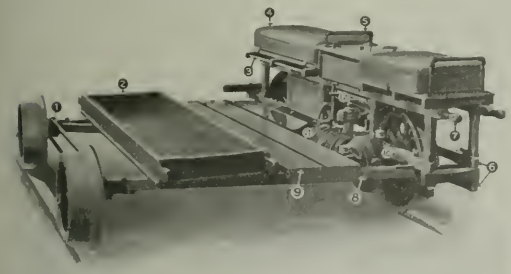
operator, fitted with sliding steel sash windows. Steel ladders and a platform with railings are furnished for access to the crane bridge. This crane has a capacity of 10 tons,

A 10-Ton Fixed Gantry Crane with Improved Type of Trolley and Hoist.

although this type is made in sizes up to 50 tons capacity, and similar equipment is furnished for traveling gantry cranes using three motors.

NEW MUDGE MOTOR CAR

A new inspection motor car known as the "Power Queen," which is equipped with a 6-h. p. engine and embodies a number of improved features is being placed on the market by Mudge & Co., Chicago. The motor is of the two-cycle air-cooled type similar to those used on the 4-h. p. inspection cars manufactured by this company. The cylinder has a bore



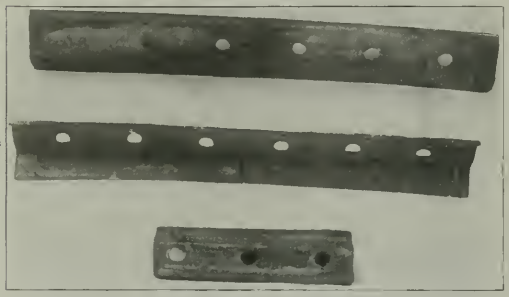
The New Six-Horsepower Mudge Inspection Car.

of 1½ in. and a stroke of 5 in., the power being developed under the slow duty of 600 r. p. m. The motor has only three moving parts, cams, valves, chains and belts having been eliminated. The cylinder is indicated at the figure 11 on the accompanying illustration, being supported for its full length between the double lower rails of the car frame. The oval gasoline tank is shown at 12 just above the motor, the raised operating table making possible the use of a 4-gal. tank which provides power for a trip of 250 miles.

In the design of the car frame and fittings a number of special safety features have been introduced. The guide wheels are tied together by two rods instead of one as formerly, grab irons are provided on both sides of the seat board, marked 3 in the illustration, hand rails, marked 5, serve to keep the passengers off the control levers and the floor boards, marked 9, cover completely the space between the tool tray and the car body preventing passengers from tripping on the guide arms or getting their feet caught in any open space. These boards can be removed as a unit by loosening thumb screws. The main rails of the frame are of ash and the cross arms are of one piece iron extending through both double lower rails. These arms are inclined slightly toward each other at the outer end to increase the rigidity of the frame. They are secured by bolts and thumb nuts, allowing them to be removed quickly for baggage car loading. The handles on this car have been placed on the upper rails instead of the lower, enabling the car to be removed without undue bending. The car is equipped with spiral spring cushions and a tool tray of ample length.

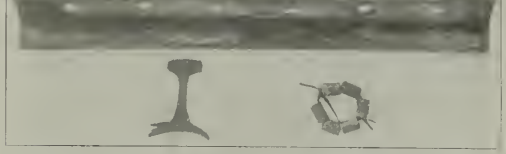
SERVICE OF INSULATING FIBER

The accompanying illustrations show some insulated joint fibers which have withstood severe service. These fibers were manufactured by the C. H. Whall Company, Boston, Mass., the basis of the material being cotton rags made into a paper pulp and then treated chemically. No pressure is



Insulated Joint Fibers Removed from Service for Examination, Upper Two After Two Years; Lower After Four Years.

used in the manufacture, the action of the chemicals hardening the fiber. The two sound fibers shown at the top of one of the illustrations are ⅛-in. plates used on 100-lb. section, 36-in. joints, which were in service in main line track for two years. The bushings and end posts used with these plates were also in good condition. In the same illustration is shown a 3-16-in. plate taken from a Keystone joint after being in service four years under heavy traffic. In both of these



Joint Insulation After More than Three Years' Service.

cases the insulation was removed to show what service was being obtained, and not on account of wear.

The other illustration shows a complete set of fiber for 100-lb. rail, which was placed in service on a descending grade January 3, 1912, and taken out March 1, 1915. These were taken out of the track on account of an annunciator circuit

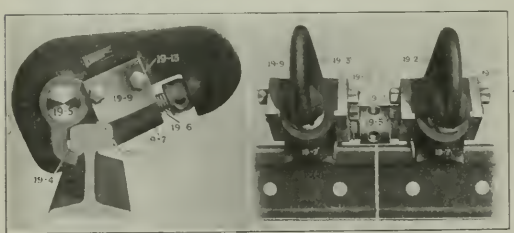
being discontinued, the joint at that time still giving good service. The crack in one of the plates, which did not injure the insulation, was evidently caused by the joint pulling apart and ripping the insulation. While the end post was rather ragged, it was giving satisfactory insulation and its condition shows the severe service to which it was subjected. The illustration indicates that the bushings are in very good condition, as is also the top plate under the head of the rail, which is very little damaged.

A supervisor of signals reporting on an Atlas insulated joint in which Whall special railway fiber was used states that a number of joints which had been in service for six years without having any attention paid to the insulation are at present in a condition which indicates that at least five more years' service can be expected.

THE CHICAGO RAIL JOINT EXPANDER

A new device has recently been placed on the market by which the ends of adjacent rails in the track may be forced apart for the insertion of fiber end posts without the use of chisels, sledges or rams. While its principal use, as indicated, is to expand the joint, it may also be used for drawing the ends of rails together to bring the bolt holes in line.

The rail joint expander consists of a pair of vise-like jaws, that are clamped diagonally across the head of the rail by means of two screws marked 19-6 in the accompanying illustration. The entire device is made of steel, the jaws having hardened replaceable steel inserts that are slightly roughened to insure a good grip on the head of



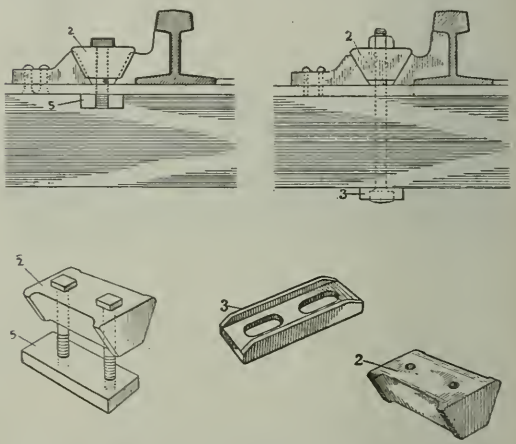
Sectional View of One Jaw and an Assembled View of the Complete Rail Joint Expander.

the rail. The two jaws are connected over the head of the rail by an expanding screw with a very deep and fine thread, with which it is claimed one man can open any joint that can be forced apart by any other means. The short screw shown in the illustration can be replaced by a screw long enough to span any length rail joint if desired, allowing the device to be operated without removing the splice bars or bolts, and also to be left in place while the fiber is being renewed or the new insulated joints placed in service. Without such a provision for holding the rails apart it is often extremely hard to install or renew insulations, particularly during the summer months, when the rails are tight.

This device has the advantage over sledges or rams that it does not batter the ends of the rails and that it can be operated with one or two men, while the other methods require a larger number. Tests in service have shown that the rail joint expander can be removed from the head of the rail in from 12 to 15 seconds, so that it involves less danger to approaching trains than methods in which it would be necessary to replace the splice bars or remove wedges from between the ends of the rails before a train could be allowed to pass. The expander equipped with the short screw weighs 115 lb., so that in case of necessity one man could easily handle the device. Under ordinary circumstances, however, two men are used. This device is manufactured by the Chicago Railway Signal & Supply Company, Chicago.

THE WELDAY ADJUSTABLE RAIL BRACE

A new rail brace known as the "Welday adjustable" has been developed by the Signal Accessories Company, New York City, and has been in service for about two years on the Nashville, Chattanooga & St. Louis. This brace consists of three parts, one fitting between the under side of the rail



Details of Welday Adjustable Rail Brace, Showing Two Methods of Bolting Wedge.

head and the upper surface of the rail base, another riveted to the tie plate and the third in the form of a wedge separating the other two and furnishing the adjustable feature. This wedge-shaped piece is held in place by two bolts passing through the tie plate or through the plate and the tie, as may be desired.

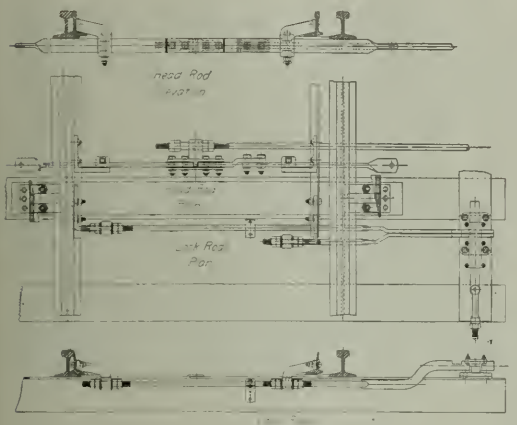
In the former case the bolts are screwed into a long thick washer which receives both bolts and which bears upward against the bottom of the tie plate. In the latter case the bolts are prevented from turning by a double washer which takes the heads of both bolts and bears against the bottom of the tie. Flanges on the ends of the wedge-shaped piece

The New Adjustable Rail Brace in Track.

fit over the ends of the other two sections and hold the brace against the surface of the rail with a uniform pressure throughout its bearing surface. When a train passes over the rail a certain amount of stress is placed on the bolts which locks them during the passage of the train, preventing their being loosened by vibration. The entire device is made of malleable iron.

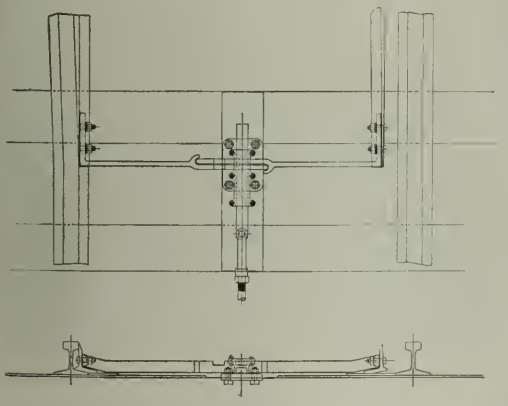
IMPROVED HEAD FRONT AND LOCK RODS

Accessories for moving and locking interlocking switches, frogs, etc., which embody certain improvements have recently been placed on the market by the T. George Stiles Company, Arlington, N. J. One of the illustrations herewith shows an insulated head rod ⅞ in. by 3 in. in section mounted vertically in the lugs which are bolted to the



New Type of Head Rod and Separately Connected Lock Rods.

switchpoint. At the connection, vertical notches are cut in the top and bottom edges of the rod into which projections on the lugs fit snugly. These projections extend far enough beyond the face of the rod to permit a bolt being passed through to clamp them to the rod. On the inner face of the lug and bearing against the rod is a semi-circular projection of small radius and vertical axis. This allows a slight turning resulting from the necessary relative motion between the rod and the lug when the switch is being moved, but at the same time holds the point firmly against



New Combined Front and Lock Rod.

the stock rail. The lugs are rigidly bolted to the switchpoint but the bolt holes are elongated to allow for lateral adjustment necessitated by the creeping of the switches.

This illustration also shows a new type of insulated lock rod with a ¾-in. by 2-in. flat plunger lock. This plunger has a large area and is less likely to shear than a round plunger. The rods are attached independently to each switchpoint, which makes it necessary for the two to act in unison to permit the movement of the plunger to lock them in the required position. The switch lugs for the lock rods are also slotted to allow for lateral adjustment. Electric switch lock rods can easily be attached to either switchpoint.

The second illustration shows a combined front and lock rod designed to give the maximum safety. While a center lock is in general obsolete, chiefly on account of its location between the rails, this type has the reputation of best preventing the switchpoint from rolling from the head of the stock rail. The lock can be covered and ramped at each end, if desired, to avoid damage from dragging brake beams, etc. The improvement in this design consists in dividing the rod into two parts, the blades overlapping each other and at the same time driving each other in operation so that the movement of each tongue of the switch is detected in its movement, making it impossible to lock the switch if either point has become detached from the lock or operating rod. This design also uses the flat ¾-in. by 2-in. plunger lock mentioned above.

AN UNUSUAL MOTOR CAR TRIP

A representative of the Railway Educational Bureau, Omaha, Nebr., is making a trip on a track motor car, over a number of the central and western roads, which is unusual in the distance covered, the objects and results of the trip, and in the service which is being secured from the motor car. This bureau conducts correspondence courses in various branches of railway work and it has been found that the most practical way in which to inform track men of the opportunity offered through these courses is to send a man over the line on a motor car to explain the matter to each gang. For several years it has been the custom on the Illinois Central and the Union Pacific to have a representative of the bureau go over the road twice a year in this manner. This man is also able to reach station men, signal men, bridge men and other employes working between terminals and these trips have invariably resulted in a marked improvement in the educational work of the men thus reached. The present trip, covering the Illinois Central system, a portion of the Union Pacific, the St. Joseph & Grand Island and a portion of the St. Louis & San Francisco, had comprised about 17,500 miles up to March 8, and had occupied an elapsed time of 250 days during which a vacation of 30 days was taken. Subtracting also the number of Sundays during this time, as no runs were made on Sunday, the total number of days available for traveling has been 190 or an average of 92 miles per day. The average based on the number of days of actual moving would be considerably greater than this, however, as some time was lost on account of rain, snow, etc. Although this trip has covered the winter months and a portion of it was made during very severe weather, the motor car which is being used has given uninterrupted satisfaction, has required no repairs and has never been in an accident.

The man who is making this trip, K. M. Houchins, started from Chicago, on July 1, 1914, with a new No. 19 Buda motor car. He first covered the entire Illinois Central system on the following summarized itinerary: Chicago to Freeport, Ill., Freeport to Centralia, Ill., including all of the branch lines on this district, arriving Centralia July 15. Centralia to Mattoon, Ill., covering the branch lines to Indianapolis, Ind., and Evansville. Mattoon to Carbondale, Ill., covering all the branch lines in the coal district surrounding that point. Carbondale to Paducah, Ky., and Louisville, covering branch lines on this district, arriving at Paducah, August 1, returning to Fulton, Ky., on August 10, and from there to Memphis, Tenn. Memphis to New Orleans, La., over the Y. & M. V., covering all branch lines, reaching New Orleans September 5, returning over the main line to Fulton, on September 21. Fulton to Birmingham,

Ala., and return, then up the main line to Chicago and west to Omaha, Neb., working all of the branches and arriving at Omaha on October 20. On account of the amount of doubling necessary to cover the branch lines it is estimated that about 11,000 miles were made in the trip over the Illinois Central system.

Mr. Houchins started over the Union Pacific main lines from Omaha to Cheyenne on November 25, arriving at Cheyenne December 9, after having covered all of the branches in the main line territory between those points. He left Cheyenne for La Salle, Sidney and Denver and the branches around that point, then left Denver on December 31 for Kansas City. He encountered some very bad snowstorms on the branch lines on this return trip and was quite badly delayed in bucking snow, digging out drifts and carrying men back and forth in helping to open the line. He finished all of the branch lines except the Leavenworth Western and covered the St. Joe & Grand Island, reaching Kansas City on February 2. The mileage on the Union Pacific amounted to about 5,000, all of it made during the winter months and a part of it against very strong winds and under bad snow conditions.

From Kansas City Mr. Houchins started over the Frisco system, going through Fort Scott, Afton, Tulsa, Sapulpa, Madill and the branch lines to Enid and Snyder. From Madill he went to Hope, back to Hugo, up to Fayetteville, and on March 8 was on the line from Fayetteville to Okmulgee. The distance so far covered on the Frisco amounts to about 1,500 miles.

Mr. Houchins has not lost a day on account of trouble with his car and has done a great deal of work in addition to meeting the trackmen, such as bringing men to wrecks, washouts, etc., discovering several broken rails, helping to put out fires, etc. He is always accompanied by either a roadmaster or signal supervisor, and has carried many other officers for parts of the trip. An important advantage to the roads covered has been the demonstration to the track men of the possibility of keeping their motor cars in service all of the time if they are given the proper care. The car used for this trip has been inspected every day, kept clean and oiled, with the result that it is reported to be in as good shape today as when the trip was started. The only renewal of parts necessary on the car has been a new chain, made necessary by the theft of the old one. Mr. Houchins thought he was having trouble with the magneto and sent it to the factory, running the car for a considerable distance on the batteries. The factory tested out the coil and found it all right, returning it to him to put back in service. He then discovered that the trouble had been caused by someone tampering with the wiring in the switch box from the magneto to the battery side, cutting out the magneto.

The amount of gasolene and oil used has varied considerably, according to the conditions of weather, wind and road, but on an average he has made about 20 miles to a gallon of gasolene and about 100 miles to a quart of cylinder oil. This consumption is greater than would be necessary on the same car in ordinary service for the reason that he stops to talk with all the employes along the road, and many times where the stops are short he does not shut down the engine. This consumption of oil and gasolene is also high on account of the heavy snow and the head winds which he encountered for a good part of the trip. A recent examination of the brasses on the car showed them to be in good condition. The valves and the engine parts have never been taken out, so that it is impossible to say what condition these parts are in, but the car performs as well as it did when the trip was started, and there is no indication of wear in any of the machinery.

Mr. Houchins has found the safety features of this Buda car to be important in his work, as in many cases he stops on a bridge to talk to men and can let the engine run or start by cranking without having to run across the bridge ties to push the car. Also, if he hears something on the track or at a switch that sounds wrong he can stop and reverse the car, go back to see what the difficulty is, while with other cars a condition of this kind might be passed without taking the trouble to dismount and push the car back to the point where the sounds were heard.

The method of interesting the men in the educational courses is first to explain thoroughly to the roadmaster just what the bureau can do and obtain his approval of the work before starting out on the trip. The roadmaster then usually accompanies the car, and the foreman and any of his gang who may be interested are given a thorough explanation of the work by Mr. Houchins. They are shown samples of the lesson papers, told what the correspondence school methods are and what the studies have done for other men in similar positions. Those that express an interest are enrolled for the courses. On the present trip over the Frisco 112 section foremen and 125 assistant foremen and laborers have been enrolled, the majority of these men, on the recommendation of their roadmaster, taking the track course lessons and special lessons on the time table, book of rules and railroad track motor cars. A considerable number of them have also asked for lessons on mathematics, signals, concrete construction, surveying and mapping, etc., and many of the foremen have asked for a special course of reading and study to broaden their general knowledge of railroading, in addition to a review of the practical lessons of track work and similar subjects.

By the use of these instructional methods, considerable progress has been made on some lines in solving the problem of the section foremen of the future. On one western road the Educational Bureau furnished last spring a list of 80 section laborers whose educational work indicated that they were ready for promotion as section foremen. Among these 80 men were found enough to fill all the vacancies in foremen during that spring. A further advantage in this work is that as men see section laborers promoted within a reasonable time as a result of study, they will take a renewed interest in the work of the section laborer and less difficulty should be experienced in securing the right class of men for this work.

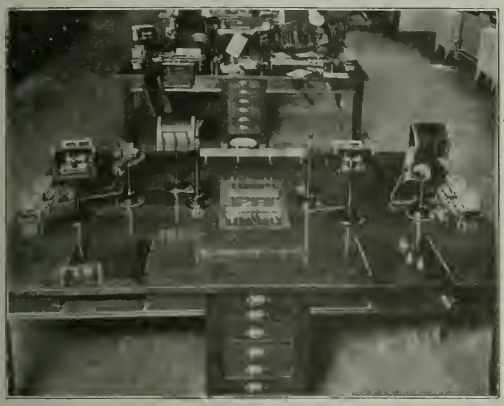
AUTOMATIC TELEPHONES ON THE KANSAS CITY TERMINAL

In planning for the operation of its new station and belt line the Kansas City Terminal Railway has made probably the most extensive installation of automatic telephones in use on any railroad in the country. This system is used for all communications between different offices and departments of the Terminal company, as well as for the operation of trains, and only about 40 Bell phones on city service have been installed. With these the somewhat unusual expedient was adopted of charging to each department the rental of the phones it used instead of charging the gross rental to one miscellaneous account. In planning this comprehensive automatic system a number of new and interesting features were developed.

One of these innovations was the substitution of the automatic telephone for the push button system throughout the terminal offices, so that instead of pressing a button to call a clerk to secure the file of correspondence on any subject he is given instructions by the use of the telephone and makes only one trip, with a net saving in time. This made unnecessary the wiring for the push button system, which item alone amounted to $1,100 in one recent terminal.

Three special switchboards are provided, a 300-line board for the general offices, a 100-line installation for the despatching of trains and a 25-line board for the use of the Harvey system. The 100-line switchboard devoted exclu-

sively to train operation is a new feature, as this is believed to be the first installation of automatic telephones for train despatching. These telephones connect the despatcher's office, the platforms, the train gates, the interlocking towers and numerous points about the yards. By their use train conductors are able to obtain their final



One of the Four Position Desks in the Telegraph Office.

authority to leave from the platform, and they are also able to advise the gateman a short time before leaving, and again as their trains leave, so that the gatemen can be governed accordingly in admitting passengers to the platforms. Iron box sets are provided on the platforms, so arranged that they are protected from the weather while at the same time readily accessible for use. Special hand sets are provided for the use of the gatemen and are hung in small alcoves in the wall when not in use.

Each man in each of the two towers is provided with a telephone on the despatching and also one on the general office board. To reduce the noise and prevent confusion,

The Automatic Switch Board and Power Board.

calls in these towers are indicated by drops and the lighting of small lamps rather than by bells.

Two train despatching circuits are provided, covering the entire belt line. The despatchers are located at Sheffield, about four miles east of the Union Station. These despatchers not only direct the movements of all passenger trains in and out of the station, but all freight and switching movements on the main line and the east side freight line as well. An operator in the Union Station in direct communication with the despatchers delivers all orders to the crews of outgoing passenger trains. Call indications are given to him by light signals on the cabinet shown near the left end of his desk in the accompanying photograph instead of by bells.

Several new features are also installed in the telegraph office. Instead of using the ordinary instruments all calls come in over a concentrating cabinet on selectors. While this particular feature is not original, as it has been used in some commercial telegraph offices, this is the largest railroad office so equipped, as there are 80 such selectors here. The operation of these selectors lights lamps in front of the telegraph operators, who pick up the calls by plugging in on the lines. Three four-position and one two-position tables are installed, each table being connected with 30 telegraph and 20 telephone lines. In addition to lighting a small light on the desk each call lights two red pilot lamps. The lines are so arranged that any operator can plug in and answer any call coming to his desk, while

The Train Operator's Desk in the Union Station.

if the red pilot lights indicate to the chief operator that calls are coming in on one table faster than the operators can handle them he can switch some of these calls on the test board to another table to relieve the congestion. Jacks are provided on each table, by means of which the operators can also cut in on the despatching circuit, enabling a further adjustment of work to be accomplished if desired. In addition to the telegraph lines, 15 to 20 telephone train despatching circuits come into this office, all of which pass through the wire chief's board and can be switched to any table as desired.

While it is very difficult to make any estimate of the economy secured by such an installation because of the wide variety of assumptions made in preparing such estimates, it is conservatively figured that the Kansas City Terminal is saving at least 50 per cent of the entire cost of the installation annually in the reduction in the cost of operation. The accompanying views show clearly the various important details of this installation, all of which was provided by the Automatic Electric Company, Chicago.

List of Supply Exhibitors at the Coliseum

Companies, Space Numbers, Devices Exhibited and Names of Representatives—How to Locate Each Exhibit

The following is a complete list of all exhibits in place or being installed in the Coliseum and Annex. Spaces numbered from 1 to 191 are in the Coliseum proper, and those from 192 to 227 are in the Annex.

Adams & Westlake Company, The, Chicago, Ill.—Signal lamps, switch locks, unity fixtures for station warehouse and freight terminal lighting. Represented by A. S. Anderson, C. B. Carson, H. G. Turney, Wm. J. Piersen, Thos. A. Galt, J. F. Stender and G. L. Walters. Spaces 83, 84 and 102.

Adams Motor & Manufacturing Company, Chicago, Ill.—Inspection type motor car. Represented by W. E. Adams. Space 219, Annex.

Ajax Rail Anchor Company, Chicago, Ill.—Double grip rail anchors. Represented by F. B. Bradley and H. G. Elfborg. Space 14.

Allith-Prouty Company, Danville, Ill.—Door hangers, spring hinges, fire door hardware, overhead carriers, store ladders, hardware specialties. Represented by A. Vere Martin, H. R. Maxwell, F. B. Coates and D. E. Willard. Space 187.

American Blue Print Paper Company, Chicago, Ill.—Mechanically reproduced tracings. Eureka litho process. Represented by Vernou T. Brauns, L. J. Steffens, James Hall. Space, Suite 1148, Congress Hotel.

American Guard Rail Fastener Company, Philadelphia, Pa.—Vaughan guard rail clamps, anchor guard rail clamps, anchor No. 2 guard rail clamps, tie plate guard rail fasteners. Represented by Mr. Vaughan and L. T. Burwell. Space 119.

American Hoist & Derrick Company, St. Paul, Minn.—Photographs of the American railway ditcher. Represented by W. L. Manson and F. J. Johnson. Space 67.

American Steel and Wire Company, Chicago, Ill.—Rail bonds, trolley wire, insulated and bare copper wire, woven wire fence, gates, steel fence posts. Represented by L. P. Shanahan, B. H. Ryder, J. W. Collins, A. W. Fronde, M. E. Evans, C. J. Boone, J. F. Alexander, C. Denniston, Frank Conkling and A. W. Durant. Spaces 51 and 70.

American Valve & Meter Company, Cincinnati, O.—Poage automatic water columns; Fenner non-freezable drop spout; Poage automatic float valves, tank fittings, etc.; Anderson economy and quick repair switch stands; interlocking switch stands and safety switch locks; safety appliances. Represented by Mr. J. T. McGarry and F. C. Anderson. Spaces 130-131-132.

American Vulcanized Fibre Company, Wilmington, Del.—Vul-Cot railroad insulation, vulcanized fibre insulation, boxes, cans, etc. Represented by C. C. Bell, W. A. Jordan and John Barron. Space 126.

Armco Iron Culvert Manufacturers, Middletown, O.—Armco (American Ingot) iron corrugated culverts, and various other products of rust-resisting pure iron, including corrugated roofing, terne plate metal lath, corrugated battery wells, etc. Represented by B. G. Marshall, G. F. Ahlbrandt. Spaces 99-100.

Asphalt Ready Roofing Company, New York, N. Y.—Protection brand asphalt roofing. Hudson asphalt shingles. Represented by H. H. Huested and C. A. Sparrowhawk. Space 170.

Atlas Preservative Company of America (Inc.), New York, N. Y.—Atlas "A" weed killer and track preservative. Method of applying Atlas "A" weed killer, Atlas "E" boiler preservative and Atlas "Ruskilla" protective paint. Represented by R. N. Chipman, B. G. Thompson and J. Kramer. Space 12.

Automatic Train Control & Signal Company, Pittsburgh, Pa.—Electric interlocking machine and train control apparatus. Represented by Gardner B. Gray, Guy P. Thurber, A. G. Williamson and A. E. Gray. Space 183.

Barrett Manufacturing Company.—Roofing (Barrett Specification roofs); Tar-Rok sub-floor construction; bridge waterproofing; waterproofing and dampproofing for masonry; hydronon-dampproofing. Represented by W. S. Babcock, H. B. Nichols, E. J. Caldwell, S. R. Church, L. B. Shipley, J. J. Ross, B. B. Brewer and S. B. Faison. Space 107.

Bausch & Lomb Optical Company, Rochester, N. Y.—Transits, tachymeters, theodolites, levels, alldades, binoculars and projection apparatus. Represented by C. A. Benston. Space 146.

Booth-Kelly Lumber Company, Eugene, Ore.—Pacific coast lumber for maintenance of way, bridges and structural work and car material. Douglas fir. Represented by E. R Hutchins, R. G. Hutchins, C. B. Hutchins. Spaces 201-214.

Boss Nut Company, Chicago, Ill.—Boss lock nuts. Represented by J. A. MacLean, T. W. Fogg and M. C. Beymer Space 13.

Bowman, T. B., Chicago, Ill.—Efficiency one-piece rail anchor. Represented by T. B. Bowman, A. S. Flowers, T. H Fowler, W. D. Thomas and C. P. Williams. Space 165.

Brach, L. S., Supply Co., New oYrk, N. Y.—Automatic flagman, track controlling devices, hydrogrounds, arresters, time recorders, switchrods, testing instruments, solderall, etc. Represented by L. St. Clair Brach and Godfrey Gort Space 2.

Bruley Steel Fence Post Company, Green Bay, Wis.—Steel fence post. Represented by L. C. Jorgensen.

Bryant Zinc Company, Chicago, Ill.—Railway signal supplies, highway crossing signals, "Autoflags," Waterbury batteries, bells, relays, concrete battery vaults, electrical supplies. Represented by Stanley C. Bryant, Geo. A. Blackmore, Wm. P. Graves, Jerry P. Costigan, John F. Gubbins Ward Leary, Rob't P. Klink, Harry F. Worden. Spaces 153-154-155 and 156.

Buda Company, The, Chicago, Ill.—Motor cars, bumping post, electric headlights, jacks, crossing gates, replacers switch stands, tool grinders, track drills, bonding drills, electric freight house and warehouse trucks, hand and push cars, etc. Represented by C. H. Bull, J. L. Artmaier, H. C Beebe, W. Krause, T. H. Wheeler, L. Hamill, N. C. Study J. J. Gard, W. C. Dyer, F. E. Place, Wm. P. Hunt, Jr., L M. Viles, M. A. Ross, E. Johnson and W. F. Hebard. Spaces 86, 87, 88 and 89.

Carnegie Steel Company, Pittsburgh, Pa.—Steel crossties; Duquesne rail joints; Braddock insulated joints; passenger and freight car wheels; rolled steel locomotive pistons; nickel-plated samples of rails, ties, joints and piling Represented by John S. Unger, C. F. W. Rys, Chas. E Dinkey, John McLeod, H. D. Williams, John Oursler, L. P Lincoln, Louis C. Lustenberger, Norman M. Hench, P. W O'Brien, D. E. Sawyer, Orin Baker, Edwin S. Mills, C. B Friday, G. E. Dix, H. van Zandt and G. W. Landrus. Spaces 52, 53, 71 and 72.

Casey Universal Saw Company, Cincinnati, Ohio.—Saw machine designed to cut timber to any desired angle. Represented by John Casey. Space 172.

Chicago Bridge & Iron Works, Chicago, Ill.—Model steel water tanks and enlarged pictures of tanks, coaling stations, etc. Represented by George T. Horton, M. J. Trees C. M. Ladd, C. S. Pillsbury, K. I. Small. H. B. Murphey F. L. Cook, H. B. Horton, R. H. Murray, J. C. Phelps, J. C Vosburgh, J. L. Zeller and G. S. Sangdahl. Spaces 65 and 66.

Chicago Malleable Castings Company, Chicago, Ill.—The Thomas rail anchor tie plate. Represented by J. S. Llewellyn and J. W. Thomas. Spaces 200, 215, Annex.

Chicago Railway Signal & Supply Co., Chicago, Ill.—Various types highway crossing alarms, crossing signs locomotive type crossing bells, magnet and motor operated the Chicago electric flag, cable poles, relay boxes, indicators, relays, interlocking forgings and fittings, Chicago rail expander, Chicago track drill and a complete line of signal accessories and maintenance supplies. Represented by E. W. Vogel, W. M. McClintock, Wm. H. Dayton, P. P Williams, R. Harvey White, Arthur C. Dunne, W. C. Martin Carl Suhr, F. L. Rainbow, H. C. McNell and W. A Schroeder. Spaces 5, 6, 7 and 8.

Cleveland Frog & Crossing Company, Cleveland, O.—Frogs, crossings, switches and switch stands. Represented by G. C. Lucas, Geo. Stanton and L. G. Parker. Spaces 91 and 110.

Cleveland Railway Supply Company, The, Cleveland, O.—Railway supplies. Represented by W. S. Newhall, F. A Peck and S. W. Linn. Spaces 198 and 217, Annex.

Clyde Iron Works, Chicago, Ill.—Standard double cylinder three drum contractors' hoist, with boiler and improved full wheel swings. New patented renewable ball and socket derrick base. Represented by E. S. Quinn and G. P. Miller. Space 182.

Commercial Acetylene Railway Light & Signal Company, New York, N. Y.—Commercial acetylene and A G A flash

light as applied to railroad signals; commercial acteylene as applied to locomotive headlights; commercial acetylene for oxy-acetylene welding and cutting. Represented by C. E. Lee, O. F. Ostby, E. T. Sawyer, H. G. Doran and C. A. McCune. Spaces 135, 136.

Creepcheck Company, Inc., The, New York, N. Y.—Dinglage Creepcheck anticreepers. Represented by M. S. Schmalholz. Space 190.

Crerar, Adams & Co., Chicago, Ill.—Ideal mixers, Novo pumping outfit, Calumet track drills, Eureka bonding drills, Hercules steel trucks and other devices. Represented by Russell Wallace, W. I. Clock, J. A. Martin, G. D. Bassett, T. W. Barrett and S. M. Roberts. Space 28.

Curtain Supply Company, The, Chicago, Ill.—Car curtains, ring curtain fixtures, Rex all-metal curtain rollers, vestibule curtains, Rex vestibule curtain shields, release handles, steel rollers, hooks, etc., CSCO and Rex vestibule diaphragms, Rex sash balances, etc. Represented by W. H. Forsyth, W. H. Bentley and F. M. Egolf. Space 127.

D. & A. Post Mold Company, Three Rivers, Mich.—Machines for making cement fence posts, samples of posts, reinforcements. Represented by G. H. Dougherty, O. Dougherty and C. J. Spaulding. Space 180.

Daniels Safety Device Company, Chicago, Ill.—Bulldog nut. Represented by T. M. Daniels, A. S. Armstrong, J. C. Holschemacher, W. D. Collins and L. F. Crossette. Space 204, Annex.

Detroit Graphite Company, Detroit, Mich.—Graphite paint for structural steel. Represented by Tom R. Wyles, L. D. Mitchell, B. O'F. Randolph, A. H. Kuerst, G. H. Varney, Eston Randolph and J. J. Hogan. Space 106.

Dickinson, Paul, Inc., Chicago, Ill.—Smoke jacks, ventilators, chimneys and cast iron buildings. Represented by A. J. Filkins and J. A. Meaden. Space 101.

Dilworth, Porter & Co., Limited, Pittsburgh, Pa.—Railroad spikes, railroad tie plates. Represented by W. F. Schleiter, C. Stein and Joseph Dilworth. Space 27.

Dixon Crucible Company, Joseph, Jersey City, N. J.—Graphite products for railroads, Dixon's silica graphite paint, airbrake and triple valve graphite, boiler graphite, graphite grease. Represented by H. W. Chase, F. B. Gibbs, Jr., and J. E. Simpson. Space 117.

Drouve, G., Company, The, Bridgeport, Conn.—"Anti-Pluvius" puttyless skylight, "Straight-Push" sash Lovell, improved Lovell sash operator. Represented by William V. Dee and R. S. Adam. Space 152.

Duff Manufacturing Company, The, Pittsburgh, Pa.—Genuine Barrett track and automatic lowering jacks, Duff ball bearing high speed screw jacks and Duff ball bearing journal box jacks. Represented by Messrs. T. A. McGinley, E. A. Johnson, C. N. Thulin, G. A. Edgin and B. W. Parsons. Space 9.

Edison, Thomas A., Inc., Bloomfield, N. J.—Edison primary cells. Represented by E. E. Hudson, F. J. Lepreau, E. W. Brown, P. B. Hyde, E. McGall, P. A. Garrity, I. P. Rodman and O. P. Rose. Spaces 20 and 21.

Edison Storage Battery Company, Orange, N. J.—Batteries for interlocking. Portable batteries for automatic block signals, track circuits, car lighting, telephone and telegraph. Represented by H. G. Thompson, F. V. McGinness, W. F. Bauer and C. A. Luckey. Spaces 21 and 22.

Elastic Car Waste Company, Philadelphia, Pa.—Elastic car waste for packing steam and electric railway cars, and also electric motor bearings. Represented by Frank B. Birch, Arthur B. Birch and James Gibson. Space 202, Annex.

Electric Railway Improvement Company, The, Cleveland, O.—Samples of electric weld and copper weld rail bonds. Apparatus for installing same. Represented by M. T. Stanton and Gerald Howatt. Space 191, Annex.

Electric Storage Battery Company, The, Philadelphia, Pa.—Gravity Charging signal outfit. Maps showing use of Gravity Charging outfit. Miniature Block Signal operated by Exide Battery. Samples, batteries and plate. Represented by G. H. Atkin, T. Milton, H. M. Beck, G. H. Morris, P. G. Downton and T. A. Cressey. Space 1.

Eymon Continuous Crossing Company, Marion, Ohio. Continuous crossings.—Spaces 49-50. Represented by W. E. Harkness.

Fairbanks, Morse & Co., Chicago, Ill.—20 h.p. type oil "Y" engine operating 5 in. centrifugal pump, in actual service, and driving electric generator, furnishing special lights for exhibit. Electric motor; motor cars, including new 30 h.p. inspection motor car; scales, steam pump, power pump, sectionalized centrifugal pump and No. 11 telescopic spout standpipe. Represented by W. W. Adams, G. J. Akers, J. P. Brown, F. M. Condit, E. P. Drinker, Rob't Elder, J. C. Flanigan, E. M. Fisher, F. F. French, C. T. Fugitt, E. C. Golladay, J. T. Gratiot, D. J. Higgins, G. Howard, J. George Jones, L. J. Jones, U. C. Kalar, F. E. Kaeppell, T. C. Kennedy, D. H. Lee, L. H. Matthews, E. E. Pendray, F. V. Roy, J. F. Snarenberger, A. A. Taylor, H. E. Vergosen, E. D. West, C. H. Wilson and F. N. Whitesell. Spaces 73-76 and 92-95.

Fairmont Gas Engine and Railway Motor Car Company, Fairmont, Minn.—Railway motor car mowing machine, electric generating set, section and inspector motor cars, handcar engines. Represented by F. E. Wade, H. E. Wade, R. B. Ballard, R. I. Sawyer, W. F. Kasper and M. J. Egleston. Space 193.

Federal Signal Company, Albany, N. Y.—Type "4" signal, top post and bottom post mechanism, A. C. & D. C. operation; Federal power interlocking machine; type "4" switch movement; A. C. and D. C. relays; electric locks; circuit controllers, etc. Represented by Messrs. Renshaw, Cade, Henze, Ware, Turreff, Hackett, Reichard, Kelly, Ober and Loughridge. Spaces 36-37 and 55-56.

Fibre Conduit Company, Orangeburg, N. Y. Fibre conduits.—Represented by Frank C. Smith.

Frictionless Rail, The, Boston, Mass.—Frictionless rail for curves. Represented by F. A. Barbey, S. W. Simonds, G. H. Bryant, W. E. Cade, Jr., and T. F. Dwyer, Jr. Spaces 133-134.

General Electric Company, Schnectady, N. Y.—Automatic door, substation and locomotive head lighting set and signal lighting arresters. Represented by B. F. Bilslander, C. C. Bailey, J. Roberts, S. W. McCune and R. H. Parker. Space 103.

General Railway Signal Company, Rochester, N. Y.—One 16-lever Model 2 unit-lever type electric interlocking machine, equipped with rotary circuit controllers, lever lights and mechanical time release; operating switchboard; two-arm Model 2A, 110 volt non-automatic top-of-mast signal; Model 2A, 110 volt semi-automatic signal; 110 volt Model 5 switch machine; relays and indicators. Model 2A low-voltage power signals; relays, and switch circuit controllers. One 8-lever electro-mechanical interlocking machine; Garber switch-and-lock movement; 10 volt Model 2A top-of-mast signal; 10 volt Model 2A base-of-mast signal; three-position motor relay; track and line relays; "Copper-cup" ground plate; and Model 1B lightning arrester. Model 2A base-of-mast signal, equipped with 110 volt, 60 cycle induction motor; light signal; line and secondary transformers; impedance bond; track and line relays; push-button switch indicator with switch circuit controller; stub pole, equipped with line transformer, plug cut-outs, lightning arresters, connections, etc. One six-contact selector, one answer-back selector, controlling signal, two bells, line relay, silencer equipment, key cabinet and miniature track circuit demonstrating the "OS" arrangement. Track and signal diagrams showing the absolute-permissive block system. Model 5 low-voltage switch machine for the operation of outlying switches. Map showing signaling on Brooklyn Rapid Transit System. Colored photographic enlargements showing various signal installations. Represented by M. R. Briney, P. E. Carter, W. W. Coleman, S. M. Day, L. E. Dodge, F. L. Dodgson, W. S. Henry, W. K. Howe, F. H. Jones, R. F. Kelley, H. W. Lucia, F. W. Moffett, G. D. Morgan, C. O. Poor, F. W. Rizer, W. W. Salmon, V. I. Smart, H. M. Sperry L. Thomas, A. Thomas, S. N. Wight, M. Wuerpel, W. R. Young and Sidney G. Johnson. Spaces 38, 39, 40, 57, 58 and 59.

Gordon Primary Battery Company, Waterbury, Conn.—Gordon primary cells. Gordon track battery. Represented by G. A. Nelson, E. A. Everett and O. S. Flath. Space 18.

Gosso Company, The, Chicago, Ill.—Gosso beds. Represented by A. E. Gosso, T. J. Burke, L. Grant and D. Garrick. Space 213, Annex.

Gurley, W. & L. E., Troy, N. Y.—Field instruments for civil, mining and hydraulic engineers and land surveyors; portable kits for railroad scale inspectors; railroad coach thermometers. Represented by Frank Shrauder and William S. Hopkins. Space 137.

Hall, H. B., Homer, Ill.—Concrete and steel ties. Represented by H. B. Hall. Space 210.

Hall Switch and Signal Company, New York, N. Y.—Automatic signal apparatus, electric interlocking apparatus, telephone and telegraph selectors, railway crossing alarms and signals. Represented by W. J. Gillingham, L. H. Thullen, W. A. Peddle, H. L. Hollister, O. B. Frink, Roy Connell, D. R. Day, C. S. Rhoads, and J. A. Ritter. Spaces 77, 78, 79 and 80.

Hatfield Rail Joint Manufacturing Company, The, Macon, Ga.—The Hatfield rail joint and Hatfield rail joint fastenings. Represented by Walter T. Johnson, DeWitt McCrary, U. R. Hatfield, T. B. Bowman and C. P. Williams. Space 166.

Hayes Track Appliance Company, Richmond, Ind.—Hayes derails, models C, CX, E, EX, HP and HXP with operating stands and target stands. Represented by E. L. Ruby, E.

W. Brown, Arthur Gemunder, F. C. Stowell and S. W. Hayes. Spaces 140 and 167.

Hazard Manufacturing Company, Wilkes-Barre, Pa.—Insulated wires and cables, railroad signal wire, lead covered cables, armored submarine cables. Represented by E. L. Willson, C. E. Swanson and C. B. Semple. Space 181.

Hoeschen Manufacturing Company, Omaha, Neb.—Railway signals. Represented by H. P. Ryner, H. A. Holdrege, R. Wood, W. D. Cleveland, R. A. Fry and E. Ebrig. Spaces 157 and 158.

Hubbard & Co., Pittsburgh, Pa.—Railroad track tools, track shovels and locomotive scoops. Represented by R. L. Mason, W. S. Perry, O. W. Youngquist and George H. McCammon. Spaces 115 and 116.

Indianapolis Switch & Frog Company, Indianapolis, Ind.—Portable electric track welder, portable track grinder, R-N-R type of solid manganese frog, R-N-R type of solid manganese crossing, Indianapolis type standard manganese crossing, manganese tipped switch points, sectional exhibit unit, drilled and bolted frogs and crossings, miniature standard railroad construction, the Eymon continuous crossing, electric welded rail joints and bonds, and electric welds of iron, steel, manganese and brass; Indianapolis high duty blue bolt of Indian-electro steel for bolting frogs and crossings. Represented by E. C. Price, W. H. Thomas, T. L. Hanley, H. H. Murray, W. L. Walker, W. E. Harkness, J. H. Eymon, J. C. Jameson, C. S. Sale and W. M. Whitenton. Spaces 49 and 50.

Ingersoll-Rand Company, New York, N. Y.—Imperial tie tamping equipment, including a self-propelled gasoline-driveu air compressor car supplying compressed air to operate two Imperial tie tampers shown in operation on a short section of track. Represented by W. H. Armstrong, C. W. Melcher and J. R. Randle. Spaces 199 and 216, Annex.

International Steel Tie Company, The, Cleveland, Ohio.—Steel crossing substructure with crossing section on it. Section of track using insulated twin steel ties. Plate steel tie with rail electrically welded to it. Represented by William P. Day, William C. Mahon and L. C. Shank. Spaces 207 and 208, Annex.

Jaeger Machine Company, Columbus, Ohio.—Concrete mixer. Represented by W. H. Peters. Space 209.

Johns-Manville Company, H. W., New York, N. Y.—Transite smoke jacks, prepared and built-up asbestos roofings, high and low pressure pipe coverings, asbestos packings, corrugated asbestos roofing and siding, Keystone hair felt insulation, asbestos wood, waterproofing materials, mastic floors, cork insulation, A-S refrigerating machines, lighting fixtures, frink reflectors, Transite asbestos shingles, Regal wool felt roofing, sectional conduit for underground steam lines, fibre conduit for electrical wiring, fuse devices (Noark). Represented by George Christenson, F. J. Horne, C. D. Folsom, H. L. Leach, H. B. Sewell, H. T. Morris, R. A. Hamaker, John E. Meek, L. E. Hassman, C. E. Murphy, D. L. Jennings, W. J. Hennessy, W. B. Mallette, J. C. Younglove, G. A. Nicol, H. G. Newman, E. T. Wade, E. H. Willard, H. A. Waldron, F. W. Doty and P. C. Jacobs. Spaces 174 and 177.

Jordan Co., O. F., The, Chicago, Ill.—Spreader car. Represented by C. S. O'Connell, A. J. Smero and R. H. Kraft. Space 223, Annex.

Joyce-Cridland, The, Company, Dayton, O.—Railroad jacks. represented by Geo. M. Llewellyn, Frank I. Joyce and Chas. D. Derby. Space 29.

Julian-Beggs Signal Company, Terre Haute, Ind.—Speed control device for use on cars and locomotives. Represented by Stephen Smith, M. H. Hovey and Thomas E. Clark. Space 227.

Kalamazoo Railway Supply Co., Kalamazoo, Mich.—Hand, push and velocipede cars, motor cars, inspection cars, track drills, track jacks, track gauges, track levels, cattle guards, steel wheels and grinders. Represented by W. N. Sidnam, W. D. Waugh, L. W. Bates, John McKinnon, F. E. McAllister, H. N. Whipple, M. Babcock, D. A. Stewart, H. R. Miller, Wm. Winterle and H. Bosma. Spaces 23, 24 and 25.

Kellogg Switchboard & Supply Company, Chicago, Ill.—Railway telephone equipment, selective signaling apparatus, power apparatus for signaling purposes. Represented by E. A. Woodward and A. J. Carter. Space 197, Annex.

Kelly-Derby Company, Chicago, Ill.—Pumps, gasoline and oil engines, deep well equipment, strainers and cylinders, wire cloth, steel warehouse trucks, crucibles, combination rail brace and tie plate, rail laying machine, full line of rubber goods. Represented by C. W. Kelly, W. B. Holcomb, H. D. Mathews, C. Penberthy, H. L. Bachman, S. D. Baldwin. Spaces 11 and 30.

Kerite Insulated Wire & Cable Company, The, Inc., New York, N. Y.—Insulated wires and cables and insulating tapes. Represented by R. D. Brixey, Azel Ames, P. W. Miller, J. W. Young, B. L. Winchell, Jr., and G. A. Graber. Spaces 44 and 63.

Keuffel & Esser Company, Hoboken, N. J.—Surveying instruments and drawing material. Also a new device—the Optical Plummet. Represernted by F. M. Pralll, A. W. Keuffel, H. B. Huster, Joseph Lamb and Edward Veasey. Space 48.

Keystone Grinder and Manufacturing Company, Chicago, Ill.—The Keystone tool grinder with attachments. Represented by H. C. Holloway, John S. Wincrantz, S. S. Newman, J. C. Barr, J. C. Kirby, D. L. Braine, W. Harding Davis and George Denney. Space 194.

Kilbourne & Jacobs Manufacturing Company, Columbus, Ohio.—Photographs and models of automatic air dump cars for railroad construction and ditching work. Represented by David Greene. Space 211.

Lackawanna Steel Company, Lackawanna, N. Y.—Tie plates, joint plates, improved splice bars, steel sheet piling, deseamed rails, rails, spikes, bolts and structural material. Represented by C. R. Robinson, A. P. Van Schaick, F. E. Abbott, C. H. Hobbs, J. L. Hench, H. H. Barbour, J. Chandler and A. H. Weston. Spaces 32, 33 and 34.

Lehon Company, The, Chicago, Ill.—Mule-hide roofing, Mule-hide saturated burlap, Mule-hide passenger coach canvas, Per-Bona insulating paper, Mule-hide car roofing, Mule-hide sill covering and Damptite waterproofing compound. Represented by Tom Lehon and D. B. Wright. Space 168.

Lidgerwood Manufacturing Company, New York, N. Y.—Photograprs of hoisting and conveying machinery, including unloaders, cable ways, excavators, logging machinery and steam and electric mining and contractors' hoists. Represented by F. B. Knight, O. D. Weaver, W. R. Elden, W. G. Wilmot, G. N. Crawford, Jr., and William Kinsley. Space 47.

Louisiana Red Cypress Company, New Orleans, La.—Louisiana red cypress, trunking and capping, crossarms, car siding and roofing, railroad ties, fence posts, etc. Represented by C. A. Nesom, H. P. Altman and F. N. Snell. Spaces 203 and 212, Annex.

Lufkin Rule Company, The, Saginaw, Mich.—Measuring tapes and rules. Represented by Theo. Huss, S. B. McGee and F. G. Brown. Space 121.

M. W. Supply Company, Philadelphia, Pa.—Vaughan rail anchor. Represented by D. L. Vaughan, L. T. Burwell and L. Parker Lloyd. Space 138.

MacRae's Blue Book Company, Chicago, Ill.—MacRae's Blue Book, the Railway Supply Index Catalog. Represented by Thos. H. MacRae, Lloyd Simonson, L. R. Rollins and E. B. Cooke. Space 184.

Madden Company, The, Chicago, Ill.—Three man track layer, rapid nut tightener, switch point straightener, the Blair tie spacer. Represented by H. C. Holloway, T. D. Crowley, V. L. Walker, J. C. Barr and F. C. Webb. Space 195.

Massey Company, F. C., Chicago, Ill.—Reinforced concrete pipe, unit and monolithic portable houses, battery wells, piling and concrete bridges for track elevation. Represented by C. F. Massey, A. Christ, Jr., Chas. Gilman, E. M. Hatheway, D. A. Hulgren, H. W. Wilder and George B. Massey. Spaces 35 and 54.

Metal Post and Culvert Company, Niles, Ohio.—T. & T. metal fence posts and nestable culverts, Lohmanized products. Represented by E. D. Thompson. Space 169.

Morden Frog & Crossing Works, Chicago, Ill.—Manganese rigid frogs, solid and rail bound, Unity switch stand, Morden Safety switch lock, guard rail clamps, etc. Represented by I. T. Hartz, A. C. Smith, W. H. Hartz and W. J. Morden. Spaces 108 and 109.

Mudge & Co., Chicago, Ill.—Mudge inspection and section motor cars. Represented by Burton W. Mudge, R. D. Sinclair, George W. Bender, Sherman C. Amsden and Blake C. Howard. Spaces 142 to 145.

National Carbon Company, Cleveland, Ohio.—Primary and secondary batteries, arclight carbons, carbon brushes, carbon specialties, flash lights, volt and ammeters. Represented by Charles Pflasterer, L. W. Fischer and W. H. Arkenburgh. Space 151.

National Concrete Machinery Company, Madison, Wis.—Machines for making concrete fence posts, samples of concrete posts. Represented by W. L. Casady and Victor Rogers. Space 206.

National Electric Specialty Company, Toledo, O.—Various types of "Vac-M" vacuum lightning arresters, test sets, etc. Represented by H. E. Gifford, Jr., P. H. Chapman, C. F. Wall, J. T. Greene and L. L. D. Chapman. Space 113.

National Indicator Company, Long Island City, N. Y.—Train departure indicators. Represented by J. Hutchinson, M. E. Penso and T. W. Wilder. Spaces 149 and 150.

National Lead Company, Chicago, Ill.—"Dutch Boy" red lead in oil. Represented by Charles Barr Field and F. M. Hartley. Space 220, Annex.

National Lock Washer Company, The, Newark, N. J.—Hi-power nut locks and demonstration of their development. Represented by John B. Seymour, R. L. Cairncross, Jesse Hough, John T. Patterson and A. T. Thompson. Space 15.

National Malleable Castings Company, The, Cleveland, O. Malleable iron journal boxes for use on freight and passenger cars, malleable iron anti-rail creepers, rail braces, tie plates, washers and steel wrecking hooks. Represented by T. W. Aishton, J. J. Byers, J. A. Slater, J. H. Slawson and L. S. Wright. Space 105.

National Standard Company, Niles, Mich.—Bonding drills, grinders, flat drills, cattle guards, railway jacks. Represented by W. H. Parkin, E. Cook, W. S. Runnels, C. R. Wescott, F. A. Buckley, R. L. Brown, H. M. Buck, W. F. Harrah and J. B. Given. Space 128.

New York Blue Print Paper Company, New York, N. Y.—Mechanically reproduced tracings. Litho zinc process. Represented by John H. Mathias. Space, Suite 1148, Congress Hotel.

Nichols, George P. & Bro., Chicago, Ill.—Transfer table (working model), portion of turntable tractor. Represented by George P. Nichols, S. F. Nichols and Henry Fries. Space 173.

Northwestern Motor Company, Eau Claire, Wis.—"Casey Jones" motor cars and handcar engine. Represented by R. R. Rosholt and K. Rosholt. Space 196, Annex.

Ogle Construction Company, Chicago, Ill.—Model steel coaling station. Represented by R. A. Ogle, M. W. Powell and C. F. Bledsoe. Spaces 96 and 97.

Okonite Company, The, New York, N. Y.—Insulated wires and cables. Represented by Lewis G. Martin, F. J. White, W. M. Candee, W. T. Kyle and J. D. Underhill. Spaces 16 and 17.

Otley Paint Manufacturing Company, Chicago, Ill.—Bridge paints, steel car paints, iron cements, graphites, refrigerator car paints. Represented by Benj. F. Otley, Jas. J. Otley, Walter A. Otley and William Kessler. Space 10.

Spencer Otis Company, Chicago, Ill.—Economy tie plates, Absolute lock nuts, Tiger steel bunks. Represented by Carter Blatchford, T. W. Blatchford, W. L. DeRemer, J. T. DeRemer and H. H. Hart. Spaces 122 and 141.

P. & M. Company, The, Chicago, Ill.—P. & M. rail anti-creeper, bond wire protector and Crane guard rail retainer. Represented by F. A. Poor, P. W. Moore, F. A. Preston, F. N. Baylies, George E. Johnson, A. R. Sutter, D. T. Hallberg, R. W. J. Harris and W. W. Glosser. Spaces 123 and 124.

Patterson, W. W., Company, Pittsburgh, Pa.—High-grade hand-made double extra heavy tackle blocks. Represented by W. W. Patterson. Space 147.

Pittsburgh-Des Moines Steel Company, Pittsburgh, Pa.—Elevated Steel Tanks. Space 148.

Pocket List of Railroad Officials, The, New York, N. Y.—The Pocket List of Railroad Officials. Represented by J. Alexander Brown, Charles L. Dinsmore and Harold A. Brown. Space 26.

Positive Rail Anchor Company, Louisville, Ky.—Positive one-piece rail anchor, Betts anti-creeper tie plate, Economy separable switch point, Economy foot guard, Betts guard rail holder. Represented by W. M. Mitchell, J. C. Haswell, W. E. Marvel, W. A. Wallace, J. A. Shoulty and L. C. Ferguson. Spaces 178-9.

Prest-O-Lite Company, Inc., The, Indianapolis, Ind.—Working exhibit of portable welding outfit employing Prest-O-Lite dissolved acetylene in safety storage cylinders, actual welding and cutting operations, etc. Represented by H. S. Smith, W. H. Adkinson, C. M. Wills, Stanley Winger, W. L. Harris, and S. R. Sutton. Spaces 3 and 4.

Pyrene Manufacturing Company, New York, N. Y.—Pyrene fire extinguishers, Pyrene liquid, Pyrene vehicle brackets. Represented by E. L. Kent and J. D. Cole. Space 186.

Q. & C. Company, The, New York, N. Y.—Bonzano rail joint, rolled steel step joint, Vaughan rail anchors, guard rail clamps, rail benders, derails, tie plates, adjustable braces, rail saw. Represented by C. F. Quincy. Spaces 120 and 139.

Rail Joint Company, The, New York, N. Y.—Continuous, Weber, Wolhaupter and 100 per cent rail joints. Represented by L. F. Braine, Percy Holbrook, McLeod Thomson, V. C. Armstrong, J. A. Greer, E. A. Condit, Jr., G. C. Isbester, A. C. Chapman and W. A. Chapman. Spaces 81 and 82.

Railroad Supply Company, The, Chicago, Ill.—Tie plates and derails, highway crossing protective devices; also signal accessories for steam and electric railways. Represented by H. S. Hawley, E. H. Bell, J. M. Fitzgerald, H. M. Buck, Geo. M. Kenyon, F. C. Webb, R. D. Hawley, Geo. T. Cook, A. H. Smith, H. G. Van Nostrand, Geo. Nibble, P. F. Hanley, R. S. Prentice and J. M. Spangler. Spaces 85 and 104.

Railway Age Gazette, New York and Chicago.—See Simmons-Boardman Publishing Company.

Railway Review, The, Chicago, Ill.—Represented by Willard A. Smith, W. M. Camp, Chas. J. Bates, A. E. Hooven and J. E. Gougeon. Space 64.

Ramapo Iron Works, Hillburn, N. Y.—Automatic safety switch stands, manganese reinforced switches and frogs, guard rail clamps, rolled shoulder switch slide plates, etc. Represented by Thomas E. Akers, Arthur Gemunder, W. C. Kidd and James B. Strong. Space 90.

Reading Specialties Company, Reading, Pa.—Samson type rail benders, Reading reversible rail bender, rail straighteners, swing joint guard rail clamp, compromise joint, car replacers. Represented by B. J. Buell and R. G. Ross. Spaces 163 and 164.

Richards-Wilcox Manufacturing Company, Aurora, Ill.—Door hangers and track for freight and ware house doors and any door that slides, grindstones, hardware specialties. Represented by W. D. Jamison, Jesse V. Wise, J. H. Wise, Ray Wise and E. J. G. Phillips. Space 189.

Risley and Associates, Dalton, Chicago, Ill.—Ballou safety rail bolt nut and Ballou insulated joint. Represented by C. E. Ballou, C. C. Zimmerman and Dalton Risley. Space 218.

Roadmasters & Maintenance of Way Association, Sterling, Ill.—Space 222.

Roberts & Schaefer Company, Chicago, Ill.—Locomotive coaling plants, sand drying plants. Represented by Clyde P. Ross and Edward E. Barrett. Space 114.

Robertson, William, & Co., Chicago, Ill.—Robertson cinder conveyor, Robertson sand dryer, Robertson sand hoist and sand tower. Represented by William Robertson, W. S. Young and J. W. Bryce. Space 224.

Sanitary Bunk Company, Indianapolis, Ind.—Single, double and triple deck steel bunks. Represented by L. H. Mummert and O. L. Mummert. Space 205.

Sellers Manufacturing Company, Chicago, Ill.—Sellers anchor bottom tie plates. Represented by J. M. Sellers, G. M. Hogan, R. A. Van Houten and T. F. Geraghty. Space 125.

Shepherd Automatic Switch Company, Montgomery, Ala.—Automatic switch closing device. Represented by W. L. Shepherd. Space 226.

Signal Accessories Company, New York, N. Y.—Signal materials. Represented by F. C. Lavarack. Space 118.

Simmen Automatic Railway Signal Company, Buffalo, N. Y.—Automatic speed control, continuous cab signals, automatic recording of train movements and central control of signals. Represented by P. J. Simmen, C. E. Chatfield, L. Ringer and G. P. Simmen. Spaces 159 and 160.

Simmons-Boardman Publishing Company, New York and Chicago.—The Railway Age Gazette; Maintenance of Way Daily; The Signal Engineer, and Railway Age Gazette, Mechanical Edition. Represented by Edward A. Simmons, Samuel O. Dunn, Lucius B. Sherman, Henry Lee, John N. Reynolds, Frank S. Dinsmore, C. R. Mills, H. H. Marsh, E. T. Howson, R. E. Thayer, H. H. Simmons, Harold F. Lane, F. H. Thompson, Walter M. Ford, Kenneth L. Van Auken, E. G. Zack, Fred Koch, John H. Cross and T. E. Crossman. Space 45.

Snow, T. W., Construction Company, Chicago, Ill.—Oil crane, water crane, tank valves, coaling stations, water stations, oil engines. Represented by T. W. Snow, R. E. Robinson and W. B. Lane. Space 46.

Standard Asphalt & Rubber Company, Chicago, Ill.—"Sarco" No. 6 waterproofing, mineral rubber floors, refrigerator compound, dampproofing, mineral rubber pipe coating, electric insulation, R. S. A. specification roofing material. Represented by C. V. Eades, R. F. Trumbull, G. S. Woodford, W. A. Levering and H. C. Riehle. Spaces 161 and 162.

Standard Underground Cable Company, Pittsburgh, Pa.—Electric wires and cables of all kinds for light, power, telegraph, telephone and railway signal service; also cable terminals for outdoor and indoor service. Represented by R. B. Wilcox, R. C. Houck, W. M. Rogers, E. J. Pietzcker, E. F. Norton and H. K. Weld. Space 19.

Staple Post Mold Company, Westerville, O.—Fence post molds and machinery for making the Staple cement post. Represented by H. L. Pettit and R. B. Bennett. Space 171.

Strohm, W. J., Moline, Kas.—Torpedo holder. Represented by W. J. Strohm.

Templeton, Kenly & Co., Ltd., Chicago, Ill.—Simplex track and ballast jacks, Simplex emergency jacks, Simplex industrial jacks, Simplex car jacks, Simplex motor jacks. Represented by Alfred E. Barron, E. J. Curran, Harry M. Hood, Arthur C. Lewis, Thomas L. Stitt and Walter B. Templeton. Space 31.

Titanium Alloy Manufacturing Company, Niagara Falls, N. Y.—Ferro carbon-Titanium, Titanium-treated steels, Titanium aluminum bronze. Represented by H. H. Cook and A. C. Hawley. Space 188.

Unión Switch & Signal Company, The, Swissvale, Pa.—Position light signal, A. C. electric interlocking, low voltage

switch movement, enclosed electro-pneumatic switch movement, direct current crossing bell, Style "B" and Style "S" signals, D. C. and A. C. "T-2" signals, Model 14 light signal, "P-4" electro-mechanical interlocking machine, three-way interlocked electrically locked indicator and circuit controller, D. C. and A. C. relays, indicators and locks, transformers, impedance coils, clockwork time release, spiral switch guard, Keystone insulated rail joints and lightning arresters. Represented by W. D. Uptegraff, T. W. Siemon, W. H. Cadwallader, J. S. Hobson, J. P. Coleman, C. E. Denney, Aaron Dean, W. W. Talbert, S. L. Shober, F. J. Ackerman, J. F. Talbert, J. L. Loucks, F. H. Nicholson, J. W. White, L. F. Howard, C. O. Harrington, M. D. Hanlon, Geo. Marloff, A. C. Livermore, V. K. Spicer, H. W. Griffin, T. H. Patenall, J. B. Struble, H. R. Sheene, H. A. Wallace, J. J. Cozzens, J. E. Saunders and S. E. Gillespie. Spaces 41, 42, 43, 60, 61 and 62.

U. S. Wind Engine & Pump Company, Batavia, Ill.—Water columns, railroad penstocks or standpipes, wood tank and steel substructures, waterspouts, valves and appliances, switch stands and windmills and pumps. Represented by L. E. Wolcott, C. E. Ward and G. E. Vermilyer. Spaces 111 and 112.

Verona Tool Works, Pittsburgh, Pa.—Track gauges, levels, jacks, nut locks and track tools. Represented by H. S. Paul, H. Fischer, W. H. Remmel, E. Woodings and H. C. Mull. Space 129.

Wayne Oil Tank & Pump Company, Fort Wayne, Ind.—Oil storage tanks and pumps, self-measuring and non-measuring. Space 225, Annex.

Western Electric Company, New York, N. Y.—Train dispatching selective equipment; lamps; telephone equirment used in train dispatching; line anchors; wire and cables. Represented by J. C. Binning, Geo. H. Porter, G. K. Heyer and J. B. Harlow. Space 98.

Wharton, Wm., Jr., & Co., Inc., Philadelphia, Pa.—Switches, frogs, switchstands, switch rods, insulated switch rods, guard rail clamps, etc. Represented by R. C. McCloy, H. F. McDermott, A. S. Partridge, Thomas O'Brien, G. R. Lyman, J. S. Morrison and J. R. Bolgiano. Spaces 68 and 69.

Wyoming Shovel Works, Wyoming, Pa—Mayari steel shovels and scoops for track and locomotive work. Represented by G. E. Geer. Space 221.

THE KNICKERBOCKER BATCH MIXER

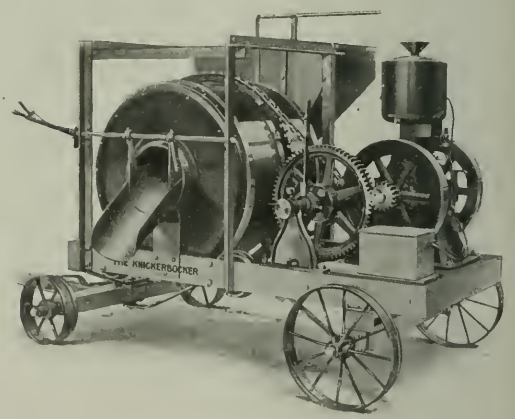
The Knickerbocker Company, Jackson, Mich., has developed a new batch mixer which is made only in capacities of 6 and 10 cu. ft. and is adapted to work where the yardage is not great, making it more economical to operate a small mixer at its greatest capacity than a large mixer intermittently. Although small, these machines have been designed with particular care to make their construction rugged. They are provided with a heavy, rigid frame, bronze-bushed trunnion rollers, heavy gage mixing drum and strong gearing and shafts.

The machine is of the non-tilting type, the cylindrical drum being built up of tank steel plates of No. 6 gage for the head and No. 8 gage for the body, around which are placed two tracker bands of ¾-in. steel 2 in. wide, but welded, and a sprocket in four interchangeable segments which is engaged by a heavy malleable link chain transmitting the power from the countershaft. The machine can be equipped with a standard or stationary batch hopper or with a power loader charging through a central opening in one head of the drum.

The concrete is mixed by a combination of buckets and blades on the interior of the drum, the 6-ft. size containing 4 buckets and 4 blades. The buckets are long and deep, giving them the necessary capacity and insuring that the material will be carried up to the maximum height before emptying. This also increases the rate of discharge, as the large buckets do not interfere with the free flow of the concrete and fill properly even when the drum is partially emptied. One long blade extends at a slight angle from the head to the edge of the bucket, with one edge close to the shell in order to carry over the liquid portion, the other three blades being inclined at the same angle but with their edges clearing the shell to leave a space for thin material and water to pass under. The ends of these blades adjacent to the buckets are shortened 4 in. to permit some of the material to flow into the blade area and keep the aggregate as equally distributed as possible between the buckets and the blades. The discharge spout has a sufficient pitch to insure a rapid, continuous discharge, the bottom of the spout being 24 in. above the ground in the No. 6 and 25 in. in the No. 10 machine.

The frame is built of 6-in. 6½-lb. channels in the No. 10 and 4-in. 4½-lb. channels in the No. 6 machine. The axles are also of channels 4 in. deep and 3 in. deep, respectively, with castings riveted in the channels for a distance of 8 in. at each end to provide a rigid bearing for the truck wheels. On the loading side of the frame over the front axle is attached an upright adjustable cold rolled shaft threaded on one end and controlled by a hand wheel. This shaft works in a block attached to the bed sill of the frame, so that when it is in position against the axle it prevents the mixer from tipping when the loader is being operated. The mixer drum is supported on 10-in. rollers with a 2½-in. face mounted on shafts 1 11-16 in. in diameter on the No. 10 size and 1 7-16 in. on the No. 6. The rollers are chilled and fitted with bronze bushings and compression grease cups.

The machines are equipped either with Novo or Ideal gasoline engines of 3-hp. capacity on the No. 6 and 6-hp



Discharge Side of Ten Cubic Foot Mixer with Stationary Batch Hopper, Engine Housing Removed.

on the No. 10 mixers or General Electric motors of 3 and 5 hp. capacity, respectively, if electric power is specified. The engines are enclosed in a steel housing to protect them from dust and weather. A heavy pinion and gear transmits the power from the engine to the countershaft and a link chain from this shaft to the drum, as mentioned above. The countershaft is equipped with an expansion ring friction clutch, by which the operation of the mixing drum is controlled. When the power loader is used, it is operated by a small clutch constructed as a part of the hoisting sheave. Both clutches are arranged to be handled conveniently by one man. The equipment for the machine includes a water tank with a pipe leading to the drum, equipped with a three-way valve and check valve under the tank. The mixing drum is operated at a speed of 18 r. p. m. on the No. 6 and 16 r. p. m. on the No. 10 machine, resulting in a rated capacity of 5 cu. yd. per hour for the smaller and 9 cu. yd. per hour for the larger machine with standard hopper and double those capacities with the power loader. The maximum weights of these machines with gasoline engines and power loaders are 2,300 lb. for the No. 6 and 3,900 lb. for the No. 10.

Railway Age Gazette

DAILY EDITION

Vol. 58. CHICAGO—MARCH 17, 1915—NEW YORK No. 11b.

PUBLISHED DAILY FOR FOUR DAYS, MARCH 16 TO 19, INCLUSIVE, BY Simmons-Boardman Publishing Co., Transportation Bldg., Chicago, Ill., on the occasion of the annual convention of the American Railway Engineering Association and the stated meeting of the Railway Signal Association.

NEW YORK: Woolworth Bldg. CLEVELAND: Citizens Bldg.
LONDON: Queen Anne's Chambers, Westminster.

EDWARD A. SIMMONS, *President.*
L. B. SHERMAN, *Vice-President.* HENRY LEE, *Sec'y & Treas.*
The address of the company is the address of the officers.

EDITORS:

SAMUEL O. DUNN, *Editor.* ROY V. WRIGHT, *Managing Editor.* B. B. ADAMS
E. T. HOWSON, W. E. HOOPER, H. F. LANE, H. H. SIMMONS, K. L. VAN AUKEN, R. E. THAYER
A. C. LOUDON, C. B. PECK, F. W. KRAEGER, C. W. FOSS, E. G. ZACK

Subscriptions, including 52 regular weekly issues and special daily editions published from time to time in New York, or in places other than New York, payable in advance and postage free:

United States and Mexico	$5.00
Canada	6.00
Foreign Countries (excepting daily editions)	8.00
Single Copies	15 cents each

Engineering and Maintenance of Way Edition and the four Maintenance of Way Convention Daily issues, North America, $1.00; foreign (excepting daily editions), $2.00.

Application made at the Post Office at Chicago, Ill., for entry as mail matter of the second class.

WE GUARANTEE, that of this issue 7,400 copies were printed; that of those 7,400 copies, 6,120 copies were mailed or delivered by messenger to regular paid subscribers; 997 copies were distributed among members and guests of the American Railway Engineering Association and at the Coliseum; 133 copies were mailed to advertisers; and 150 copies were set aside for office use.

The RAILWAY AGE GAZETTE and all other Simmons-Boardman publications are members of the Audit Bureau of Circulations.

CONTENTS

An Excellent Report

The convention spent all of yesterday afternoon considering the report of the committee on Economics of Railway Location. No committee of the American Railway Engineering Association has any problems for consideration of greater importance to the railways than that on Economics of Railway Location, and probably no committee has worked harder. However, this committee has had a somewhat checkered career during the past few years and ran true to its previons form this year in submitting majority and minority reports. In the discussion, however, the differences of opinion largely disappeared. The active part of many members took in the discussion yesterday afternoon showed not only their interest in this subject, but their appreciation of the importance of the committee's recommendations. While the chairman and his associates received a considerable grilling from the members on the floor they stood their ground and in most cases were supported by the convention.

The Electrification Discussion

The papers and discussion on the "Operating Results of the Electrification of Steam Railroads" at the meeting of the Western Society of Engineers last night form a valuable addition to the literature on this subject, based as they are very largely on the results secured and expected from the important projects inaugurated so far. Up to this time the advocates of steam railway electrification have advanced claims without being able to offer definite figures in support of their statements. As a result some of these statements have been exaggerated while others have been equally conservative. The interest shown in last evening's meeting by the railway men in attendance at the convention indicates that this subject will receive closer attention in the future than it has in the past because of the existence of statistics such as those presented last night.

Condensing Committee Reports

Although the report of the treasurer showed a surplus of over $3,000 for the past year, the financial problem before the American Railway Engineering Association is a pressing one, especially since the American Railway Association has withdrawn its support to the Rail Committee. There are a number of vitally important investigations which can well be undertaken by this association to the benefit of all the railways. However, it has been impossible to finance any of these special investigations except by contributions from outside sources. It is in this way that the work of the Rail Committee, the investigations of impact and the study of stresses in track have been financed. Practically all of the funds of the association are devoted to their publications, including the bulletins, the annual proceedings and the Manual. President Storey called attention to one means of reducing expense in his annual address yesterday morning by the condensation of the committee reports. This is highly desirable, entirely aside from the consideration of the cost of their publication. The reports have grown more voluminous each year, those presented at this convention exceeding in volume those of any previous year. To a considerable extent this is due to the endeavor of many of the committees to include all information incident to the subject under consideration which may be of possible interest to the members. The result is that the reports are so voluminous and contain such a number of replies from various railway men, many of which are either contradictory or a duplication, that the average man does not give the reports the attention they deserve. If the committees would give this large amount of information the attention it deserves and condense it in the reports they would be of greater value to the membership at large. The collection and compilation of the data on any particular subject should be only a portion of the committee work. Equally important is its condensation into the minimum space consistent with the inclusion of all pertinent facts. With 22 separate and independent committees it is very difficult to secure the same degree of condensation. For this reason the suggestion has been made that a special editing committee be appointed to consider all reports and to co-operate with the various committees in the preparation of their reports for publication.

SIGNALING AND THE A. R. E. A. MANUAL

An important question of policy was raised yesterday morning in the discussion of the recommendation of the Committee on Signals and Interlocking that a long list of standards and specifications of the Railway Signal Association be printed in the Manual as information. Active opposition to this move developed on the ground that such an action is not consistent with the rules for the publication of the Manual which provide only for "definitions, specifications and principles of practice that have been made the subject of special study by a committee and which, after due consideration and discussion, have been voted on and formally adopted by the association." The committee, which is composed largely of men who have also been active in the work of the R. S. A., felt that in view of the large volume of matter adopted by that association it would not be practicable to present for consideration by the A. R. E. A. in its convention all of the standards and specifications which may be of value to its members and that the cost of reprinting this matter would be excessive and unwarranted. A number of members favored the acceptance of the committee's recommendation as the only practicable way for the A. R. E. A. to cover the highly technical features of signaling and urged the necessity for co-operating in some such mannner with the organizations representing the various specialized branches of railway engineering and maintenance. It was made clear that no question was being raised as to the value of the work done by the R. S. A. or the interest that this matter would have for members of the A. R. E. A. and most of the argument centered on the question of publishing the list in the Manual or only in the proceedings.

The ease with which material can be located in the Manual and the difficulty connected with a search in the numerous volumes of the proceedings was apparently largely responsible for the final vote to accept the committee's recommendation. While this action may have been justified in this instance, any tendency to adopt specifications in wholesale lots or otherwise to lower the high standards held up for the Manual is to be very carefully guarded against. The specifications and principles of practice contained in the Manual should be such as can be put in practice by the members. The general index of the contents of the annual proceedings which is to be prepared will to some extent remove the objections to putting valuable information needed for frequent reference only in the proceedings. To serve its fullest purpose, this index should be very complete, detailed and cross referenced and in addition should be revised frequently to keep it up to date.

THE SCIENCE OF ORGANIZATION

Following the gradual replacement of the relatively efficient English-speaking track laborer of 20 years ago with the greatly inferior laborer from southern Europe and Mexico, the impression has gradually arisen that the railways can expect to secure only the poorest laborer for this work, and that satisfactory results cannot therefore be expected. Undoubtedly this feeling has contributed largely to the inefficiency of track labor. Because of the large numbers of men employed in track work, relatively little attention is paid to the character of those selected, this being left largely to the labor agents, to whom one man is as good as another.

The cost of maintenance of way is rising rapidly from year to year. A considerable part of this increase is undoubtedly due to the decreasing efficiency of the labor employed. Any means, therefore, which will tend to increase its efficiency is highly important to the railways. For this reason the report of the committee on Rules and Organization on the subject of "Maintenance of Way Organization" is of special interest. Only a start could, of course, be made on a subject as broad as this in one year, and the present report is therefore an abstract discussion of the general principles underlying scientific organization, without special reference to the maintenance of way department. These principles must form the basis of any such a study, and the problem is to properly adapt and apply them to the particular field.

The saying that,

> If you think you're beaten, you are.
> If you think you dare not, you don't.
> If you would like to win, but think you can't,
> It's almost a cinch you won't,

is of special application here. Contractors and other employers have been able to convert far more of our foreign laborers into efficient workmen than have the railways. It would seem possible for the railways to do as well as the contractors in this regard, if they would first convince themselves that they can. There is no more important problem confronting the maintenance of way officer, whether he be the chief engineer, supervisor or foreman than that of securing the proper organization to obtain the best results, and all the steps leading to this end are worth the most careful study.

TO-DAY'S PROGRAM

The convention will be called to order at 9:30 this morning. The following reports will be presented:

III.	Ties	Bulletin 173
XV.	Iron and Steel Structures	Bulletin 173
XIII.	Water Service	Bulletin 173
V.	Track	Bulletin 173
VI.	Buildings	Bulletin 173
XVII.	Wood Preservation	Bulletin 174
XIX.	Conservation of Natural Resources	Bulletin 174
Special.	Stresses in Railroad Track	Bulletin 173

Annual Dinner at 7:00 p. m.

In addition the Rail report will be presented at 2 o'clock this afternon as a number of the members of the committee will be unable to remain for the sessions Thursday. In addition, the reports of the committees on Roadway and Records and Accounts were held over yesterday afternoon.

BLOCK SIGNAL COMMITTEE OF ELECTRIC RAILWAYS

The joint committee on Block Signals of the American Electric Railway Engineering Association and the American Electric Railway Transportation and Traffic Associations was in session at the Congress hotel yesterday. The principal subjects under discussion were rules, definitions, aspects, standardization and highway crossing protection.

ANNUAL MEETING NATIONAL RAILWAY APPLIANCES ASSOCIATION

The annual meeting of the National Railway Appliances Association was held yesterday morning at the Coliseum. A motion was made and carried dispensing with the reading of the minutes of the last meeting, but during the discussion of the question it was brought to the attention of the administration that it was quite desirable especially for out-of-town members who did not have easy access to the secretary's office, to receive a printed report.

President Hench in his address called attention to the advantage of confining the exhibit this year to the Coliseum. All the space was rented, all collections have been made and there is a small waiting list of concerns desiring to exhibit. Last year there were 160 members, as compared with 140 this year.

Treasurer Kelly reported that this year the association would probably show a profit of a little over $700.

A rising vote of thanks was given the retiring adminis-

tration and F. R. Wyles, retiring director, for the very efficient work done in the face of unfavorable conditions. The following officers were elected for the ensuing term:

President, Philip W. Moore, P. & M. Co.; vice-president, H. M. Sperry, General Railway Signal Co.; treasurer, C. W. Kelly, Kelly-Derby Co.

Directors: Three years—P. C. Jacobs, H. W. Johns-Manville Co.; R. C. McCloy, Wm. Wharton, Jr., & Co., Inc.

THE PAST AND THE FUTURE KING SNIPE

A DAY WITH JERRY, THE KING-SNIPE OF TWENTY YEARS AGO.

Run the car out of the house, byes,
And set her on the thrack;
Put on the picks and linin' bars
And don't forget the jack.

We've six long miles to pump her, byes,
Before the stroke of seven,
For I want yez all to be at work
When the Boss goes East on 'Leven.

So heavy on the lever, byes,
Come on, me hearts of oak,
Whilst I set on the water keg
And watch ahead for smoke.

Let yez set the car off here, byes,
And unload all the tools.
We'll raise the jints and tamp the ties
Accordin' to the rules.

Now pull the bad ties out, byes,
And, Paddy, take the jack.
Raise the jint ahead a notch
And then the center back.

Tamp all thim ties up snug, byes,
And spike thim right to gauge.
Then dress the ballast to the line,
For neatness is the rage.

Let's put the car on now, byes,
'Tis just the stroke of six.
Load up the jacks and water keg,
The level board and picks.

Now heavy on the lever, byes,
And let her roll to town.
Pick up the slow flag as we pass
So the Mail need not slow down.

Roll the hand car in the house, byes,
And lock the door up tight.
Be here early in the mornin'
'Twas a good day's work—Good-night.

A DAY WITH TONY, THE KING-SNIPE OF THE FUTURE.

Come on, every bod', it's time-a to go!
My watch-a say seven o'clock.
Push-a da gas car on-a da track
And watch if we get-a da block.

What! No gas'line in-a da tank?
Angelo, tak-a da can
And get-a some at da dippo, quick.
From da big-a Agent man.

We gotta plenty time, you know,
To fix-a up da track
So sit-a down here on da car
Till Angelo com-a back.

Ah! here he com-a, now fill-a da tank
And lock-a da car-house, Joe.
Com-a here in front and turn-a da crank
Dat's fine—Away we go.

Here is da place, take off-a da tools
And set off da big gas car
No tak-a da picks—too hard on da back—
Just use-a da tamping bar.

Tree or four you fellas tak-a da car,
Bring some hot macarone from da town.
Be sure and stay in da pass-a track
When da fast Passenger go down.

Too hot-a out here, I go to da shade.
Pietro, you raise-a da track.
Set-a da spot board two inch or so—
At four o'clock I com-a back.

Now I feel-a good, let's dress-a da rock
And line-a da track up swell.
What! Brought-a no lin-a bars out today?
Well, tomorra just as well.

Hurry up, you fellas, it's half past five,
And verra hungry I feel.
We gotta be at da camp at six
To getta da good hot-a meal.

M. E. Carroll.

A BIG CONTRACT

The Cumberland Valley will close bids to-day at the office of T. B. Kennedy, engineer, Chambersburg, Pa., for the construction of a double-track concrete arch bridge 4,000 ft. long across the Susquehanna river at Harrisburg, Pa. The structure will consist of 45 spans, each approximately 75 ft. long, on foundations built by the railway last year. This will require the placing of 56,000 yd. of concrete. It is desired that the first half of this structure having one track be completed this year. Over 40 bids have been received.

CHANGES ON THE B. & O.

W. H. Averell, assistant general superintendent of the Baltimore & Ohio at New York, N. Y., has been appointed general superintendent, succeeding U. B. Williams, whose headquarters have been at Wheeling, W. Va. Mr. Williams has been appointed general agent.

SPOKANE TRACK ELEVATION WORK

The Northern Pacific started work last week on the elevation of about two miles of line in Spokane, Wash. The roadbed is from 85 to 225 ft. wide and will be raised 12 to 16 ft. on a fill between retaining walls. The concrete in the retaining walls and abutments for about 20 street bridges is being placed by the McMichael pneumatic mixing and placing process, the contractor for this work being the Pacific Concrete Placing Company. One machine mounted on a flat car is now being used and another soon will be mounted to push the work. The cars on which the pneumatic mixers are mounted carry bins for the concrete aggregate, which are filled from gondola cars by locomotive cranes with clam shell buckets. The work is being handled under the direction of W. L. Darling, chief engineer, the general contractor being The W. J. Hoy Company, St. Paul, Minn. The concrete mixing and placing apparatus is leased by The Concrete Mixing & Placing Company, Chicago.

Proceedings of Railway Engineering Association

Abstracts of Five Reports Including Rules and Organization, Signals and Economics of Railway Location

The Sixteenth Annual Convention of the American Railway Engineering Association opened at 9:35 a. m. on Tuesday, March 16, in the Florentine Room, Congress Hotel, Chicago. W. B. Storey, Jr., vice-president, Atchison, Topeka & Santa Fe, was in the chair. The minutes of the last annual meeting were approved.

PRESIDENT'S ADDRESS

Your Association during the past year has continued the work so well planned by the founders of the organization. The Committees have worked with interest and zeal; reports have increased in volume, and as an indication of

Copyright by Moffett Studio.

W. B. STOREY, JR., President.

the interest being taken we find a tendency toward the publication of more and more data, all of it interesting.

The year that has passed has been one of stress in railway circles. The credit of the roads being impaired, money has been hard to borrow, and as a consequence the building of new lines has been curtailed and improvement of old ones has been impossible. This in turn has affected the general business of the country, and, with other causes not pertinent for discussion here, has made hard times, diminishing in turn the revenues of the roads and making economies necessary in every direction, and in many cases more than economies, viz., the postponement of work that must eventually be done in order to keep the roads up to the requisite standard.

The usefulness of your Association would be increased if we had more funds. We would, if we had it, spend money on many lines of investigation with profit to our profession, with credit to our organization and to the advantage of the railway interests of this country. The Association, however, has been compelled to restrict its work to the publication of reports by its Committees except in cases where we have had outside help. We should publish a General Index, and it is the purpose of the Board to undertake this at an early date. It is true that we have accumulated something of a surplus, but the publication of a new edition of the Manual, together with the Index, will make large inroads on this surplus within the next year or two.

About the only way in which the receipts of the organization can be increased is by increasing membership. While we have been growing steadily and consistently, it is suggested that a special effort should be made to bring into our Association all those in the railroad world eligible to membership. Many railway men feel that the work of the Association does not directly interest them and that they will not be gainers by holding membership. Possibly this class could be reached by pointing out to them that we need their help, and that they should join in order to assist in the improvement of the railroad profession. We have in the past year taken in 137 new members. The hard times have somewhat increased the total of deductions from these additions, so that the total gain is 89.

As stated above, the work of your Association has been confined to publications except where we have had outside help. We have had this in the matter of the impact tests, which were undertaken a number of years ago, and more recently in our rail investigations. The American Railway Association has been bearing the expense of this work. Unfortunately for this work that Association has now withdrawn its support, and your Association is confronted with the necessity of stopping the work so well begun, and it is felt that the full benefit of the work already accomplished will be lost unless some arrangement can be made to carry it forward. We, as engineers, recognize that any improvement, no matter how small, in the matter of steel rails will justify any expenditure that has been or may be made, but the difficulty confronting us is convincing our operating people of this. The Executive Committee of the American Railway Association is charged with the responsibility of the expenditure of money, and its action has been taken because we have not convinced it that the expenditure pays. Possibly if we made individual effort with our operating superiors we might bring about a unanimity of action on the subject that, communicated to the Executive Committee, would change its present attitude, and it is requested that the members of your Association will do what they can in this direction.

There is one further subject to which the efforts of the individual members of the Association might be called, viz., the Fiscal Year. The Track Committee has recommended that it be changed and made coincident with the calendar year. It is true that some roads at the present time use this method of division. The majority of the roads, however, and the Interstate Commerce Commission make the fiscal year from July 1 to June 30. A search for reasons for this division has disclosed that it is largely a matter of custom. To change it, however, will be difficult owing to the necessity for changing the by-laws of practically all the roads in the country, together with dates of annual meetings. While the Interstate Commerce Commission has specified this particular division, it is felt that it did so for the sake of uniformity and because the greater part of the mileage of the country used it. The objections from a track maintenance point of view are very strong. Under the present method we are unable to plan intelligently the work for an entire season, which at its best is but short, and under present conditions work must often be abandoned after being begun, or possibly cannot be started until after the beginning of the new Fiscal Year. To make the change will take time and continued effort, but it is felt that our membership might accomplish much toward this end.

An inspection of the reports submitted for this convention will show an unusual amount of statistical data, principally tabulations of replies received by the respective Committees in response to inquiries. It is believed that if your Committees would give certain attention to condensing this data and showing same graphically, a very marked saving might be effected by diminishing the amount

of our printing and the value of the information increased to those who have occasion to use it.

Probably your most important publication is the Manual, in that it embodies the principles which have been adopted as representing standard railway practice in this country. These vary, and must of necessity do so or there would be no progress. It is the intention, therefore, to republish the Manual as soon as possible after the convention, and

Photo by Matzene, Chicago.

ROBERT TRIMBLE, First Vice-President.

it will contain the approved recommendations for the past sixteen years, and it may be said, without contradiction, that this volume will exemplify the best present practice for railway engineering and maintenance of way work.

While your work, as stated above, is circumscribed by lack of funds necessary for special research, the financial condition of the Association, due to the lines which have been followed, is gratifying, there being in the Treasury at the close of the last calendar year over $17,000. The cost of republishing the Manual and the proposed General Index will reduce this, it is estimated, by about $7,000. It is to be hoped that the members of the Association will use every endeavor to increase the sale of publications.

It may be said that the European War is hardly one for consideration by a body of this kind, but the catastrophe is so great, and its influences will be so widespread, that it is of paramount interest even to an organization like ours. Railroad transportation has played a very important part in its prosecution. The mobilization of vast armies, greater than any before gathered together, and this in an incredibly short time, is solely due to the railroad facilities. It may be said that the transportation problem is one of the great features of the war, and the men who are handling this are as responsible for the success of their side as the generals in command.

Financial conditions have very seriously affected all railway and engineering construction during the past year, and as a consequence there is lacking the usual long list of notable achievements. One event stands out prominently, viz., the opening of the Panama Canal, which is so directly allied to our character of endeavor. This is now introducing economic features in the country's transportation problem which may have a farreaching effect, possibly changing a large element of the transportation of the country from rail to shipping, and incidentally raising questions of economical handling of freight at docks and wharves, and the attention of our members interested in this class of work is called to this fact. At the present time the overland roads are feeling seriously the inroads on the business formerly carried by them, and as the shipping interests are enlarged the subject may be of even greater importance.

The valuation of railways under the Interstate Commerce Commission has begun in earnest. Parties have been and are at work in all parts of the country, and on some of the roads the work has progressed so far that the quantities are nearly complete. The principles to be followed are being worked out gradually, but there is still much to be determined. Our entire membership should be vitally interested in this work, involving, as it does, not only the actual measurement of earth work, but the more intricate determination of the face of the country before any construction was begun; the establishing of unit prices that include elements not used when the work was originally built, such as transportation; the fixing of land values, and, finally, questions of depreciation not only in the roadway and structures, but in equipment. All of these matters demand our earnest consideration, and as was pointed out by your President last year, your Association should lead in the study and consideration of the questions involved.

One of the small results of the European war in this country has been the curtailment of our supply of creosote from Germany, and this in turn has necessitated changing

A. S. BALDWIN, Second Vice-President.

the methods of treatment of our ties. We could, of course, in time meet this by the manufacture of creosote in our own country, but manufacturers are hardly justified in undertaking this, as immediately on the cessation of the war we can look forward to the resumption of the low-priced German product. Some of us have substituted chloride of zinc, and others are putting in ties without treatment.

Reports of Secretary and Treasurer

Balance, cash on hand, December 31, 1913		$14,276.74

	$17,312.27	

G. H. BREMNER, Treasurer.

RULES AND ORGANIZATION

The committee on Rules and Organization worked during the past year under the following instructions:

(1) Review rules and instructions heretofore adopted by the Association and recommend such changes and additions thereto as may seem desirable. (Not reported on.)

(a) Formulate rules for the guidance of the maintenance of way department pertaining to safety.

(3) Continue the formulation of rules for the guidance of field parties: (Not reported on.)

(a) When making preliminary surveys.

(b) When making location surveys.

E. H. FRITCH, Secretary.

(c) When in charge of construction.

(4) Continue the study of science of organization.

SAFETY RULES.

The following safety rules are recommended for adoption and printing in the Manual:

(1) It is the duty of every employe working on or about the tracks to exercise great care to avoid injury to himself and others, and nothing in these rules is to be so construed as to relieve any employe from performing his full duty in that respect.

(2) Employes must examine and know for themselves that tools, materials, etc., which they must make use of in performing their duties are in proper condition. If not, they must put them so, or report them to the proper person and have them put in proper order before using.

(3) In handling rails, ties and other heavy materials, special care must be used to avoid injury.

(4) On the approach of a train, employes who are working on or about the tracks must move to places of safety, standing clear of all running tracks. They must not walk or stand on the tracks, except when necessary for the proper performance of their duties.

(5) Watchmen, patrolmen, trackwalkers and others on duty which makes it necessary for them to be on the track, where there are two or more tracks, should, when practicable, travel against the current of traffic, keeping a sharp lookout in both directors for approaching trains.

(6) Foremen or others in charge of employes must see that their men are alert and watchful to avoid danger, and when working on or about the tracks they will take the

CONVENTION OF THE AMERICAN RAILWAY ENGINEERING ASSOCIATION IN SESSION.

necessary precautions to see that all men working under their immediate supervision receive warning of approaching trains in time to reach places of safety.

(7) When working on tracks in places where approaching trains cannot readily be seen because of permanent obstructions to the view, curves, or temporary obstructions, such, for instance, as fog, storms, snow, or engines or cars, extra precautions must be taken to warn the men of approaching trains. Foreman, watchmen, and others in charge of gangs or squads of workmen should provide themselves with whistles or other means for warning the men when working in places where approaching trains cannot readily be seen.

(8) When large numbers of inexperienced men are working on the track, they should be divided into small squads, each squad placed in charge of an experienced man, and all necessary additional precautions taken to prevent accident.

(9) Employes working in or near the ends of tunnels must clear all tracks when trains approach from either direction, and if in the tunnel, must occupy the manholes.

(10) In tunnels and in other places where there is insufficient clearance and no manholes or other places of

G. D. BROOKE,
Chairman Committee on Rules and Organization.

safety provided, foremen must arrange with the proper officer for the use of the track and work under flag protection.

(11) Employes are required to carry lanterns or torches when passing through any tunnel where men cannot readily be seen. When an entire gang is working close together in a tunnel, an adequate number of lights should be used, but not less than two.

(12) Hand or push cars must not be used at night, nor in the daytime when approaching trains cannot readily be seen by reason of fog, storm or snow, except under proper protection.

(13) Trains will be run in either direction, on any track, whenever necessary or expedient, and employes will be governed accordingly.

(14) Employes will keep the right-of-way, and particularly the main, yard and sidetracks and the footpaths along them, free of obstacles, such as old material, broken drawbars, lumps of coal, and anything over which they or others may stumble.

(15) Any employe, who is careless about the safety of himself or others while on duty, or who disregards warnings, will be disciplined.

SCIENCE OF ORGANIZATION.

The committee's work on this subject has consisted in collecting some additional data in regard to the forms of organization of the maintenance of way department in use on the various railroads, and the internal workings of these various organizations. An attempt to assemble data bearing on the historical aspect of the development of the present maintenance of way organizations has not met with much success, but further efforts will be made along this line. It is desirable to draw attention to the fact that several of the great railroad systems are making successful experiments in selecting and training men for positions in the maintenance of way department, and there is undoubtedly a growing tendency in favor of the systematic developing of men to supervise maintenance of way forces.

NEXT YEAR'S WORK.

The following outline of work for next year is recommended:

(1) Review rules and instructions heretofore adopted by the Association and recommend such changes and additions thereto as may seem desirable.

(2) Continue the formulation of rules for the guidance of field parties.

(a) When making preliminary surveys.
(b) When making location surveys.
(c) When in charge of construction.

(3) Continue the study of the science of organization.

(4) Report on the clearance of switchstands, signal stands, platforms, platform shelters, mail cranes, water columns, coal chutes, water tanks, etc., under the assignment from the Committee on Maintenance of the American Railway Association.

G. D. Brooke (B. & O. S. W.), chairman; F. D. Anthony (D. & H.), vice-chairman; R. P. Black (K. & M.), L. L. Beal (A. B. & A.), Ralph Budd (G. N.), A. M. Burt (N. P.), J. B. Carothers (B. & O. S. W.), S. E. Coombs (N. Y. C.), Curtis Dougherty (Q. & C.), B. Herman (Southern), Jos. Mullen (C. C. C. & St. L), E. T. Reisler (L. V.), Committee.

APPENDIX A.

Report to Board of Direction on the Study of the Science of Organization.

The committee on Rules and Organization was instructed, in addition to other work, to "Begin the study of science of organization and report to the board of direction how this study can be made profitable to the Association."

Organization is the direction of the efforts of a number of individuals to a common purpose. In the commonly accepted use of the term, an organization is a collection of individuals, or groups of individuals, acting under a central control, by means of which their efforts are directed to a common purpose.

The science of organization is the systematized knowledge pertaining to, or the acknowledged laws, as demonstrated by observation or deduction, relating to the direction of the efforts of groups or individuals to common ends.

In its workings, the individual is the prototype of the organization. Every physical act of the human animal requires three distinct processes of effort in its performance: (1) The knowledge of an existing reason for or the self-impelled desire for the act. This is mental effort. (2) The instruction to the hand, eye, or other physical member to perform and how to perform. This is also a mental process. (3) The execution by the physical member. This is physical effort.

Consider next a small group of men as a unit for the performance of work, as a squad of soldiers or a section gang. A leader or foreman is necessary, who is the mind or brain of the unit; the other men are the physical agencies. (1) The leader possesses the knowledge of or conceives of what is to be done. (2) He communicates to the men what is to be done and how it is to be done. (3) The men perform the work.

Continuing the analogy, the logical development is the company of soldiers and the force under a supervisor; the regiment and the track forces of a division; the brigade and the forces of a district; the army corps and the maintenance of way department of a railroad system. Each successive unit is made up of a number of smaller units; each larger unit is under the control of a head who conceives or plans the work, and conveys his instructions as to what is to be done; the constituent units receive the directions and execute the work. The efficiency of any unit depends upon the ability of the leader in planning work or devising action to meet varying situations; his method of transmitting the instructions to the constituent units, since this determines with what degree of clearness his ideas and plans are understood; and the spirit and the degree of preparedness of the constituent units in receiving and executing the instructions.

There are certain fundamental principles of organization which may be classified, as: The proper selection of material; Compensation; Education; *Esprit de Corps;* and discipline.

The athlete in training is required to conform to rigid rules of diet and habits. In practice and during contests he must obey in letter and spirit the instructions of coach or manager. Failure to comply with rules and instructions will result in the offender being dropped from the team or

subjected to other penalty. In military service the infraction of regulations or disobedience of instructions are penalized by fines, confinement, hard labor or dismissal from the service according to the circumstances and the nature of the offense.

The maintenance of way organizations of the railroads of this country have been developed by the force of attendant circumstances rather than along preconceived or well-studied plans; this was particularly true prior to a decade ago, but is still true to a large extent. Nevertheless, it has on the whole fulfilled its object admirably and has risen to the heights which each successive occasion has demanded. Within the past few years the realization of the importance of a well-balanced organization has been growing and considerable thought and attention have been devoted to bettering existing organizations in some quarters, with good results, so far as they have gone.

A study of the maintenance of way organization to determine to what extent each of the five principles above enumerated has been applied, is being applied, and can be applied; if some of them are being applied to the undue exclusion of others; and the best means of effecting a proper balance of them in any further development that may be undertaken, will constitute a study of the science of organization as applied to the maintenance of way department.

The committee has started the collection of data as to the maintenance of way organizations of the various railroads, represented in the Association, and proposes to make use of the information gathered by the committee on Track and other committees in connection with the studies of economics of track and other labor.

An example of what can be accomplished by thorough instruction is found in the method of the signal maintenance forces of one trunk line. Monthly meetings are held by the signal engineer, which all assistant engineers, signal supervisors and signal inspectors are required to attend. Materials, methods and proposed instructions are discussed fully and the minutes of the meetings distributed in printed pamphlets to all interested. In this way the best ideas are secured, the reasons for adopting standard practices in methods or materials are fully understood, and all minds are freed of any possible prejudice towards them. And when circulars putting standard practices into effect are issued, there is the assurance that they are interpreted uniformly over the entire system. The excellent results obtaind in a very few years are a splendid justification of the application of scientific organization.

Benefits from Study.

As illustrating the present-day tendency to devote more serious thought to the question of organization, attention is directed to the splendid paper on "Development of Young Men in Railroad Work," by George M. Basford, read before the New England Railroad Club on January 13, 1914, and the discussion which followed (see *Railway Age Gazette*, January 16, 1914). While dealing primarily with the needs of the mechanical department Mr. Basford brings out forcibly the application of the ideas to the other departments.

Discussion on Rules and Organization

The report was presented by Curtis Dougherty by paragraphs, and adopted, the committee being excused.

SIGNALS AND INTERLOCKING

The committee was instructed to continue the study of Economics of Labor in Signal Maintenance, to formulate and present requisites for switch indicators, to present for approval specifications which had been previously adopted by the Railway Signal Association and which the committee considered would warrant consideration, and to study the problem of signaling single-track roads with reference to the effect of signaling and proper location of passing sidings on the capacity of the line.

The committee presented an amplification of the adjunct in the standard code and requisites for switch indicators which has been adopted by the Railway Signal Association.

SWITCH INDICATORS.

(C) Indicators at main track switches to indicate, on roads of two or more tracks, one or more of the following: (a) Whether or not a train is approaching; (b) whether or not that portion of the block between the switch and the next home block signal in advance is clear; (c) whether or not the next home block signal in the direction of approaching trains is at stop.

REQUISITES OF INSTALLATION.

(1) Switch indicators, if practicable, located: (a) At main track switches connecting with tracks on which trains may clear main tracks, and in which either there are no derails or diverging switches, or the derails or diverging switches are connected with the main track switches; (b) at independently operated derails or diverging switches in tracks on which trains may clear main tracks; (c) at points from which switches of crossovers between main tracks are operated, where both switches are operated from the same point; (d) at independently operated switches of crossovers between main tracks, the indicator at the switch in one track operated in connection with the other track; (2) switch indicators that cannot be identified by their locations, marked with the designations of the tracks in connection with which they are operated.

(3) The connections of switch indicators used to indicate whether or not a train is approaching, so arranged that an indicator will indicate the approach of a train that has reached a point at least such a distance in the rear of the second block signal in the direction of approaching trains that if the switch is thrown at the moment when a train reaches

T. S. STEVENS,

Chairman Committee on Signals and Interlocking.

that point the caution signal will be displayed in time to be observed by the engineman and will continue so to indicate until the train passes the home block signal in the rear of the switch, or approximately, the clearance point of the switch when the switch is more than ..... feet in advance of the home block signal. The distance of the point at which the approach of a train is first indicated will be determined in each case by the grade, speed of trains, view of the signal or other local conditions.

It was recommended that the amplification of these recommendations for switch indicators be adopted and included in the next issue of the Manual.

The committee gave subject 3—Specifications of the Railway Signal Association Which in the Judgment of the Committee Warrant Consideration by the American Railway Engineering Association—careful study and presented a list of specifications and standards which represent 654 pages of printed matter. All of this has been very carefully considered by committees and adopted by the active and representative membership of the Railway Signal Association. They are being used extensively and therefore are standards of many railroads as well as the R. S. A. As all of this material is available in the Manual of the Railway Signal Association and because of the large expense involved in reproducing it, it was suggested by the committee that a list only of specifications and standards be included in the Manual of the A. R. E. A., and for reference as to details any member could consult the Proceedings or Manual of the Railway Signal Association.

RATING OF OPERATED UNITS

The committee presented a table of operated units and points assigned to each unit as a revision of the Table of Units now included in the Manual. This was thought necessary because the present table does not take many electrical

units into consideration and is therefore incomplete. The table presented not only brings the original table up to date in so far as the operated units are concerned, but assigns points to each unit which are more in accordance with the actual cost than does the present table. This table appeared in the *Daily Railway Age Gazette* of March 16 as Table A under the report of the committee of the Railway Signal Association on Contracts.

AUTOMATIC TRAIN CONTROL.

The committee presented as information the findings of the joint committee of the American Railway Association on the subject of Automatic Control of Trains. These requisites were published on page 1192 of the *Railway Age Gazette*, May 29, 1914.

REVISION OF MANUAL.

The committee recommended that the section on Conventional Signs be omitted from the manual having been superseded by the Conventional Signs adopted in 1914, volume XV, pages 81 to 92. Arrangements of Signals and Interlocking Plants has been superseded by the report adopted in 1913, and published in Volume IV, pages 71 to 75. Specifications for Mineral Matter, Rubber Compound, Insulated Wire and Cable have been materially revised by the Railway Signal Association, and are available in the Manual of the R. S. A., and the committee therefore recommended that these be omitted from the Manual of the A. R. E. A.

The committee consists of Thomas S. Stevens, chairman; C. C. Anthony, vice-chairman; Azel Ames (Kerite Co.), H. S. Balliet (G. C. T.), J. B. Cameron (B. & O.), W. B. Causey, C. A. Christofferson (N. P.), C. E. Denney (U. S. & S. Co.), C. A. Dunham (G. N.), W. J. Eck (Southern), W. H. Elliott (N. Y. C.), G. E. Ellis (K. C. T.), M. H. Hovey (Consl. Engr.), A. S. Ingalls (L. S. & M. S.), A. M. Kenpell (W. T.), J. C. Mock (M. C.), F. P. Patenall (B. & O.), J. A. Peabody (C. & N. W.), D. W. Richards (N. & W.), A. H. Rudd (Penn.), W. B. Scott (S. P.), A. G. Shaver (Hallett Iron Works).

Discussion on Signal and Interlocking

The report was presented by T. S. Stevens.

Mr. Stevens: On subject 3 the committee presents a list of specifications of the Railway Signal Association. It is suggested that this Association should publish, in its literature, preferably in its Manual, this list of the specifications which have been approved by the Railway Signal Association, and as these have been approved not only by the individual members, but by the representative vote of the Railway Signal Association, it would seem that they are worthy of endorsement by this Association.

The President: The Committee having made the recommendation to include this in the Manual, the matter will be handled as a motion on the part of the committee, to adopt this conclusion. Is there a second to that motion?

(The motion was seconded.)

L. C. Fritch (Can. Nor.): It seems to me that we look upon our Manual as containing Recommended Principles of Practice. This is simply a matter of information. It may fall into the hands of some of our legal friends, and they may take this as absolutely agreed upon, and that these specifications have been approved, and if any of us should have an action involving signals, it might put us in bad shape. It seems to me that as long as it is information simply, it will serve the purpose if it is in our proceedings. If we adopt the specifications, it will then go into the Manual.

Mr. Stevens: There is a broader question than that involved. These specifications are practically the specifications of a large majority of the railroads of the country to-day. They have been tried and approved, at least those that Committee X thought were worthy of being endorsed by the Association. We feel that they would be given more dignity if this Association would agree to place the list in the Manual. The Railway Signal Association has spent four or five years getting them out, and it seems to me that, to be of value, it would be proper that this Association should put them in a convenient place for its membership to find them.

G. H. Tinker (N. Y. C. & St. L.): I agree with Mr. Fritch. This is too much of a wholesale approval of the work of an Association. The only matters which should be put into the Manual are those which have been considered in detail and adopted by the Association.

A. S. Baldwin (I. C.): The declination to include this list in our Manual does not in the slightest degree reflect on the value of this work to the members of this Association. The point we make is that what goes into the Manual should first be passed on and discussed at a meeting of the Association, whereas, if these matters were to be put into our Manual it would be taking in one bunch a whole mass of specifications and data which has not been submitted to the discussion of the members of this Association.

Hunter McDonald (N. C. & St. L.): I inquire in what manner Mr. Baldwin and Mr. Fritch expect to perfect our Manual, in so far as signals are concerned? Do they expect our Committee X to go back and work over this matter with the Signal Association, or do we expect finally to treat the Signal Association as a committee of this Association and endorse their findings?

Earl Stimson (B. & O.): I am in favor of the motion made by the committee. As I understand it, every member of this committee is also a member of the Signal Association. It cannot be expected that this one committee will do the work of probably a dozen committees in the Signal Association, and we certainly should have confidence enough in the Signal Association, through our old members on this committee, to endorse their findings.

Mr. Fritch: I will answer Mr. Stimson by saying that we do not object to accepting the recommendations of the R. S. A., but we do not want to incorporate in our Manual something which is submitted as a matter of information. To my mind, all these recommendations, before they are finally passed by this Association, should go before the American Railway Association, as that is the parent Association, and these matters are of sufficient importance to submit to them. We are following that practice, with regard to rail specifications and other matters, and I do not see why we should not with regard to any matter which involves operation as the signal rules and specifications do. In my opinion, it is beyond the power of this Association to pass upon such a matter.

E. H. Lee (C. & W. I.): The committee is asking for the endorsement of these specifications in turns. Some of the speakers have intimated that if our Association gives this endorsement it will have done so without mature consideration. Our Signal Committee is composed of the best brains in the Association along that line, who have devoted several years to the study of this question. They have had the assistance of a great body of men who are intimately acquainted with the subject, who have devoted years to the consideration of this particular subject, which is highly technical and involved. It would seem exceedingly difficult to consider a subject of this kind in any other way than as recommended by the committee.

(After further discussion the suggestion of the committee was adopted, together with the suggestions of the revision of the Manual.)

UNIFORM GENERAL CONTRACT FORMS

The committee was instructed to make a critical examination of the subject-matter in the Manual and submit

E. H. LEE,
Chairman Committee on Uniform General Contract Forms.

definite recommendations for changes, and to continue the study of general forms, including the form of bond.

At the first meeting of the committee a form of bond was agreed upon, which has been unanimously approved by

the members of the committee, and it is presented to the Association with the recommendation that it be adopted.

The members of the Association were invited by circular letter to inform the committee whether they were making use of the uniform general contract form, and also to make such criticisms and suggestions as they might deem pertinent. The response to this letter was very gratifying, nearly 100 letters having been received. About one-third of the replies indicated that the writers were using the uniform general contract form, the remainder, including many from representatives of the larger railroad companies, preferring their own general form of contract, as was, perhaps, to be expected. The general tenor of letters received, however, indicates that the form has served a useful purpos, either directly or indirectly.

At the last two meetings of the committee the form printed in the Manual was carefully considered, and certain changes were agreed upon, which are:

E. H. Lee (C. & W. I.), chairman; C. A. Wilson (Cons. Eng.), vice-chairman; C. Frank Allen (Mass. Inst. of Tech.), W. G. Atwood (Interstate Commerce Commission), John P. Congdon (Cons. Engr.), Thos. Earle (Pa. Steel Co.), J. C. Irwin (B. & A.), R. G. Kenly (M. & St. L.), C. A. Paquette (C. C. C. & St. L.), J. H. Roach (L. S. & M. S.), Committee.

AGREEMENT FORM.

THIS AGREEMENT, made this ..... day of ..... in the year ..... by and between ..... party of the first part, hereinafter called the Contractor, and ..... party of the second part, hereinafter called the Company:

WITNESSETH, That, in consideration of the covenants and agreements hereinafter mentioned, to be performed by the parties hereto, and of the payments hereinafter agreed to be made, it is mutually agreed as follows:

The Contractor shall furnish all materials, superintendence, labor, equipment and transportation, except as hereinafter specified, and shall execute, construct and finish, in an expeditious substantial and workmanlike manner, to the satisfaction and acceptance of the chief engineer of the Company, ...

in accordance with the plans hereto attached identified by the signatures of the parties hereto, or herein described, and the following GENERAL CONDITIONS, requirements and specifications, forming part of this contract

The work covered by this contract shall be commenced ..... and be completed on or before the..... day of .....191.... time being of the essence of this contract .....

And in consideration of the completion of the work described herein, and the fulfillment of all stipulations of this agreement to the satisfaction and acceptance of the chief engineer of the Company, the said Company shall pay, or cause to be paid, to said Contractor, the amount due to the Contractor, based on the following prices:

.....

CONSTRUCTION CONTRACT.

General Conditions.

1. *Bond.*—The Contractor agrees, at the time of the execution and delivery of this contract and before the taking effect of the same, to furnish and deliver to the Company a good and sufficient bond of indemnity to the amount of ..... dollars, as security for the faithful performance, by the Contractor, of all the covenants and agreements on the part of the Contractor contained in this contract. The security in such bond of indemnity must be satisfactory and acceptable to the Company.

This bond shall remain in force and effect in such amount, not greater than that specified, as shall be determined by the Chief Engineer.

2. *Contractor's Understanding.*—It is understood and agreed that the Contractor has, by careful examination, satisfied himself as to the nature and location of the work, the conformation of the ground, the character, quality and quantity of the materials to be encountered, the character of equipment and facilities needed preliminary to and during the prosecution of the work, the general and local conditions, and all other matters which can in any way affect the work under this contract. No verbal agreement or conversation with any officer, agent or employe of the Company, either before or after the execution of this contract, shall affect or modify any of the terms or obligations herein contained.

3. *Intent of Plans and Specifications.*—All work that may be called for in the specifications and not shown on the plans, or shown on the plans and not called for in the specifications, shall be executed and furnished by the Contractor as if described in both these ways; and should any work or material be required which is not denoted in the specifications or plans, either directly or indirectly, but which is nevertheless necessary for the proper carrying out of the intent thereof, the Contractor is to understand the same to be implied and required, and shall perform all such work and furnish any such material as fully as if they were particularly delineated or described.

4. *Permits.*—Permits of a temporary nature necessary for the prosecution of the work shall be secured by the Contractor. Permits for permanent structures or permanent changes in existing facilities shall be secured by the Company.

5. *Protection.*—Whenever the local conditions, laws or ordinances require, the Contractor shall furnish and maintain, at his own cost and expense, necessary passageways, guard fences and lights and such other facilities and means of protection as may be required.

6. *Rights of Various Interests.*—Wherever work being done by Company forces or by other contractors is contiguous to work covered by this contract, the respective rights of the various interests involved shall be established by the engineer, to secure the completion of the various portions of the work in general harmony.

7. *Consent to Transfer.*—The Contractor shall not let or transfer this contract or any part thereof (except for the delivery of material) without the consent of the chief engineer, given in writing. Such consent does not release or relieve the Contractor from any of his obligations and liabilities under the contract.

8. *Superintendence.*—The Contractor shall constantly superintend all the work embraced in this contract, in person or by a duly authorized manager acceptable to the Company.

9. *Timely Demand for Points and Instructions.*—The Contractor shall not proceed until he has made timely demand upon the engineer for, and has received from him, such points and instructions as may be necessary as the work progresses. The work shall be done in strict conformity with such points and instructions.

10. *Report Errors and Discrepancies.*—If the Contractor, in the course of the work, finds any discrepancy between the plans and the physical conditions of the locality or any errors or omissions in plans or in the layout as given by said points and instructions, it shall be his duty to immediately inform the engineer, in writing, and the engineer shall promptly verify the same. Any work done after such discovery, until authorized, will be done at the Contractor's risk.

11. *Preservation of Stakes.*—The Contractor must carefully preserve bench marks, reference points and stakes, and in case of wilfull or careless destruction, he will be charged with the resulting expense and shall be responsible for any mistakes that may be caused by their unnecessary loss or disturbance.

12. *Inspection.*—All work and material shall be at all times open to the inspection, acceptance or rejection of the engineer or his duly authorized representative. The Contractor shall provide reasonable and necessary facilities for such inspection.

13. *Defective Work or Material.*—Any omissions or failure on the part of the engineer to disapprove or reject any work or material shall not be construed to be an acceptance of any defective work or material. The Contractor shall remove, at his own expense, any work or material condemned by the engineer, and shall rebuild and replace the same without extra charge, and in default thereof the same may be done by the Company at the Contractor's expense, or, in case the chief engineer should not consider the defiect of sufficient importance to require the Contractor to rebuild or replace any imperfect work or material, he shall have power, and is hereby authorized, to make an equitable deduction from the stipulated price.

14. *Insurance.*—The Contractor shall secure, in the name of the Company and for its benefit, policies of fire insurance on such structures and in such amounts as shall be specified by the chief engineer, not exceeding .....

15. *Indemnity.*—The Contractor shall indemnify and save harmless the Company from and against all losses and all claims, demands, payments, suits, actions, recoveries and judgments of every nature and description brought or recovered against it, by reason of any act or omission of the said Contractor, his agents or employes, in the execution of the

work or in consequence of any negligence or carelessness in guarding the same.

16. *Settlement for Wages.*—Whenever, in the opinion of the chief engineer, it may be necessary for the progress of the work to secure to any of the employes engaged on the work under this contract any wages which may then be due them, the Company is hereby authorized to pay said employes the amount due them or any lesser amount, and the amount so paid them, as shown by their receipts, shall be deducted from any moneys that may be or become payable to said Contractor.

17. *Liens.*—If at any time there shall be evidence of any lien or claim for which the Company might become liable, and which is chargeable to the Contractor, the Company shall have the right to retain out of any payment then due or thereafter to become due, an amount sufficient to completely indemnify the Company against such lien or claim, and if such lien or claim be valid, the Company may pay and discharge the same and deduct the amount so paid from any moneys which may be or become due and payable to the Contractor.

18. *Work Adjacent to Railroad.*—Wherever the work embraced in this contract is near the tracks, structures or buildings of this Company or of other railroads, the Contractor shall use proper care and vigilance to avoid injury to persons or property. The work must be so conducted as not to interfere with the movement of trains or other operations of the railroad; or, if in any case such interference be necessary, the Contractor shall not proceed until he has first obtained specific authority and directions therefor from the proper designated officer of the Company and has the approval of the engineer.

19. *Risk.*—The work under this contract in every respect shall be at the risk of the Contractor until finished and accepted, except damage or injury caused directly by Company's agents or employes.

20. *Order and Discipline.*—The Contractor shall at all times enforce strict discipline and good order among his employes, and any employe of the Contractor who shall appear to be incompetent, disorderly or intemperate, or in any other way disqualified for or unfaithful to the work entrusted to him, shall be discharged immediately on the request of the engineer, and he shall not again be employed on the work without the engineer's written consent.

21. *Contractor Not to Hire Company's Employes.*—The Contractor shall not employ or hire any of the Company's employes without the permission of the engineer.

22. *Intoxicating Liquors Prohibited.*—The contractor, in so far as his authority extends, shall not permit the sale, distribution or use of any intoxicating liquors upon or adjacent to the work, or allow any such to be brought upon, to or near the line of the railway of the Company.

23. *Cleaning Up.*—The Contractor shall, as directed by the engineer, remove from the Company's property and from all public and private property, at his own expense, all temporary structures, rubbish and waste materials resulting from his operations.

24. *Engineer and Chief Engineer Defined.*—Wherever in this contract the word engineer is used, it shall be understood as referring to the chief engineer of the Company, acting personally or through an assistant duly authorized in writing for such act by the chief engineer, and wherever the words chief engineer are used it shall be understood as referring to the chief engineer in person, and not to any assistant engineer.

25. *Power of Engineer.*—The engineer shall have power to reject or condemn all work or material which does not conform to this contract; to direct the application of forces to any portion of the work which, in his judgment, requires it; to order the force increased or diminished, and to decide questions which arise between the parties relative to the execution of the work.

26. *Adjustment of Dispute.*—All questions or controversies which may arise between the Contractor and the Company, under or in reference to this contract, shall be subject to the decision of the chief engineer, and his decision shall be final and conclusive upon both parties.

27. *Order of Completion; Use of Completed Portions.*—The Contractor shall complete any portion or portions of the work in such order of time as the engineer may require. The Company shall have the right to take possession of and use any completed or partially completed portions of the work, notwithstanding the time for completing the entire work or such portions may not have expired; but such taking possession and use shall not be deemed an acceptance of the work so taken or used, or any part thereof. If such prior use increases the cost of or delays the work, the Contractor will be entitled to such extra compensation, or extension of time, or both, as the chief engineer may determine.

28. *Changes.*—The Company shall have the right to make any changes that may be hereafter determnied upon, in the nature or dimensions of the work, either before or after its commencement, and such changes shall in no way affect or void the obligations of this contract. If such changes make any change in the cost of the work, an equitable adjustment shall be made by the chief engineer to cover the same.

29. *Extra Work.*—No bill or claim for extra work or material shall be allowed or paid unless the doing of such extra work or the furnishing of such extra material shall have been authorized in writing by the..... .....engineer..

The price for such work shall be determined by the chief engineer, who may either fix a unit price or a lump-sum price, or may, if he so elects, provide that the price shall be determined by the actual cost, to which shall be added ..... per cent to cover general expense and superintendence, profits, contingencies, use of tools, Contractor's risk and liability. If the Contractor shall perform any work or furnish any material which is not provided for in this contract, or which was not authorized in writing by the engineer, said Contractor shall receive no compensation for such work or material so furnished, and does hereby release and discharge the Company from any liability therefor.

If the Contractor shall proceed with such extra work or the furnishing of such extra material after receiving the written authority therefor, as hereinbefore provided, then such work or material, stated in the written authority of the engineer, shall be covered, governed and controlled by all the terms and provisions of this contract, subject to such prices as may be agreed upon or fixed by the chief engineer.

If the Contractor shall decline or fail to perform such work or furnish such extra material as authorized by the engineer in writing, as aforesaid, the Company may then arrange for the performance of the work in any manner it may see fit, the same as if this contract had not been executed, and the Contractor shall not interfere with such performance of the work.

30. *Property and Right of Entry.*—The Company shall provide the lands upon which the work under this contract is to be done, except that the Contractor shall provide land required for the erection of temporary construction facilities and storage of his material, together with right of access to the same.

The Contractor shall not ship any material or equipment until he has received written notice from the engineer that he may proceed with said work or any part thereof.

31. *Unavoidable Delays; Extension of Time on Parts of Work.*—If the Contractor shall be delayed in the performance of the work from any cause for which the Company is responsible, he shall, upon written application to the chief engineer at the time of such delay, be granted such extension of time as the chief engineer shall deem equitable and just.

32. *Suspension of Work.*—The Company may at any time stop the work, or any part thereof, by giving ..... days' notice to the Contractor in writing. The work shall be resumed by the Contractor in ten (10) days after the date fixed in the written notice from the Company to the Contractor so to do. The Company shall not be held liable for any damages or anticipated profits on account of the work being stopped, or for any work done during the interval of suspension. It will, however, pay the Contractor for expense of men and teams necessarily retained during the interval of suspension, provided the Contractor can show that it was not reasonably practicable to move these men and teams to other points at which they could have been employed. The Company will further pay the Contractor for time necessarily lost during such suspension at the rate of ..... per cent per annum on the estimated value of materials, equipment and fixtures furnished by the Contractor on the work which are nenessarily idle during such suspension, said rate of ..... per cent per annum being understood to include depreciation, interest and insurance. But if the work, or any part thereof, shall be stopped by the notice in writing aforesaid, and if the Company does not give notice in writing to the Contractor to resume work at a date within ..... of the date fixed in the written notice to suspend, then the Contractor may abandon that portion of the work so suspended and he will be entitled to the estimates and payments for such work so abandoned, as provided in Section 38 of this contract.

33. (a) *Expediting Work, Correcting Imperfections.*—If the

chief engineer of the Company shall at any time be of the opinion that the Contractor is neglecting to remedy any imperfections in the work, or is not progressing with the work as fast as necessary to insure its completion within the time and as required by the contract, or is otherwise violating any of the provisions of this contract, said *chief* engineer, in behalf of the Company, shall have the power, and it shall be his duty to notify the Contractor to remedy such imperfections, proceed more rapidly with said work, or otherwise comply with the provisions of this contract.

(b) *Annulment.*—The Company, if not at fault, may give the Contractor ten (10) days' written notice, and at the end of that time if the Contractor continues to neglect the work, the Company may provide labor and materials and deduct the cost from any money due the Contractor under this agreement; and may terminate the employment of the Contractor under this agreement and take possession of the premises and of all materials, tools and appliances thereon, and employ such forces as may be necessary to finish the work. In such case the Contractor shall receive no further payment until the work shall be finished, when, if the unpaid balance that would be due under this contract exceeds the cost to the Company of finishing the work, such excess shall be paid to the Contractor; but if such cost exceeds such unpaid balance, the Contractor shall pay the difference to the Company.

(c) *Company May Do Part of Work.*—Upon failure of the Contractor to comply with any notice given in accordance with the provisions hereof, the Company shall have the alternative right, instead of assuming charge of the entire work, to place additional forces, tools, equipment and materials on parts of the work for the purpose of carrying on such parts of the work, and the cost incurred by the Company in carrying on such parts of the work shall be payable by the Contractor, and such work shall be deemed to be carried on by the Company on account of the Contractor, and the Contractor shall be allowed therefor the contract price. The Company may retain the amount of the cost of such work, with ..... per cent added, from any sum or sums due or to become due the Contractor under this agreement.

34. (a) *Annulment Without Fault of Contractor.*—The Company shall have the right at any time, for reasons which appear good to it, to annual this contract upon giving 30 days' notice in writing to the Contractor, in which event the Contractor shall be entitled to the full amount of the estimate for the work done by him under the terms and conditions of this contract up to the time of such annulment, including the retained percentage. The Contractor shall be reimbursed by the Company for such expenditures as in the judgment of the chief engineer are not otherwise compensated for, and as are required in preparing for and moving to and from the work; the intent being that an equitable settlement shall be made with the Contractor.

(b) *Notice—How Served.*—Any notice to be given by the Company to the Contractor under this contract shall be deemed to be served if the same be delivered to the man in charge of any office used by the Contractor, or to his foreman or agent at or near the work, or deposited in the postoffice, postpaid, addressed to the Contractor at his last known place of business.

(c) *Removal of Equipment.*—In case of annulment of this contract before completion from any cause whatever, the Contractor, if notified to do so by the Company, shall promptly remove any part or all of his equipment and supplies from the property of the Company, failing which the Company shall have the right to remove such equipment and supplies at the expense of the Contractor.

35. *Failure to Make Payments.*—Failure by the Company to make payments at the times provided in this agreement shall give the Contractor the right to suspend work until payment is made, or at his option, after 30 days' notice in writing, should the Company continue to default, to terminate this contract and recover the price of all work done and materials provided and all damages sustained, and such failure to make payments at the times provided shall be a bar to any claim by the Company against the Contractor for delay in completion of the work, due to such suspension or failure to pay.

36. *Monthly Estimate.*—So long as the work herein contracted for is prosecuted in accordance with the provisions of this contract, and with such progress as may be satisfactory to the chief engineer, the said chief engineer will on or about the first day of each month make an approximate estimate of the proportionate value of the work done and of material furnished or delivered upon the Company's property at the site of the work, up to and including the last day of the previous month. The amount of said estimate, after deducting ..... per cent and all previous payments, shall be due and payable to the Contractor at the office of the Treasurer of the Company on or about the ..... day of the current month.

37. *Acceptance.*—The work shall be inspected for acceptance by the Company promptly upon receipt of notice in writing that the work is ready for such inspection.

38. *Final Estimates.*—Upon the completion and acceptance of the work, the chief engineer shall execute a certificate over his signature that the whole work provided for in this agreement has been completed and accepted by him under the terms and conditions thereof, whereupon the entire balance found to be due to the Contractor, including said retained percentage, shall be paid to the Contractor at the office of the treasurer of the Company within ..... days after the date of said final certificate. Before the time of payment of said final estimate the Contractor shall submit evidence satisfactory to the chief engineer that all payrolls, material bills, and outstanding indebtedness, in connection with this work, have been paid.

.....

This agreement shall inure to the benefit of and be binding upon the legal representatives and successors of the parties respectively.

In Witness Whereof, the parties hereto have executed this agreement in ..... the day and year first above written.

The form of bond submitted contains no *notarial* or official acknowledgment. In certain states such acknowledgment may be necessary. Decision as to the fact should be made by the Legal Department of each company.

Attention is called to the fact that the proposed form of bond is intended solely for use in connection with the adopted Uniform Contract Form.

Discussion on Uniform General Contract Forms.

The report was presented by Chairman Lee. The form of bond and uniform contract form was adopted and the committee continued.

SIGNS, FENCES AND CROSSINGS

The following work was assigned for the consideration of the committee:

(1) Report on the economy of concrete and metal signs and signals as compared with wood.

(2) Report on the economy of concrete and metal as compared with wood for fence posts.

(3) Investigate methods used and the comparative costs of repainting crossing and other signs; also present specifications for whitewashing cattle-guard wing fences.

REVISION OF MANUAL.

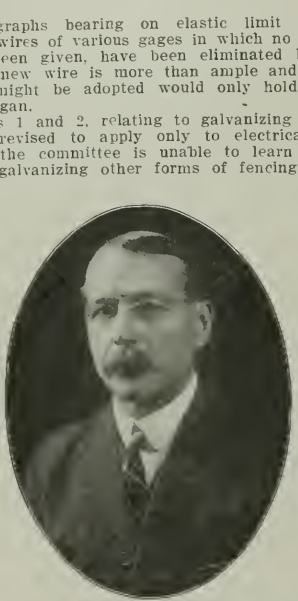
The committee made a careful examination of the subject-matter of the Manual. A few new definitions were added, the diction in a number of the old ones was improved and others were abbreviated and made more concise.

An additional class of fence has been added under "Specifications for Standard Right-of-Way Fences" to cover fences constructed of galvanized ribbon, smooth round or barbed

wire, all widely used but not heretofore provided for in the Manual. A slight change has been made in the spacing of the longitudinal wires of the different classes of fence, to conform to the standard spacing used by several of the largest American manufacturers. The length of end, corner, anchor and gate posts has been reduced from 9 to 8 ft. and intermediate or line posts from 8 to 7 ft., as these lengths agree with the standards of a large percentage of railways reporting on fence posts this year. As concrete posts have heretofore been promoted as a suitable substitute for wood, this class of posts has been added under "material."

The paragraphs bearing on elastic limit and tensile strength of wires of various gages in which no values have heretofore been given, have been eliminated because the strength of new wire is more than ample and any standard which might be adopted would only hold good until oxidation began.

Paragraphs 1 and 2, relating to galvanizing fence wire, have been revised to apply only to electrically wended fencing, as the committee is unable to learn of any advantage in galvanizing other forms of fencing after it is



W. F. STROUSE,
Chairman Committee on Signs, Fences and Crossings.

fabricated. The joints in the hinge type of woven fencing would be disturbed during erection, which would defeat the object of regalvanizing, to say nothing of the waste of spelter which would fill the crevices in the locks or joints.

A number of minor changes were made in the text bearing on "Snow Fences, Snow Sheds and Recommended Methods of Snow Removal."

The use of the term "stock-guard" instead of "cattle-guard" is considered desirable in view of the fact that the laws in over half the states require a guard to be of such type as will turn not only horses, cattle and mules, but sheep and swine as well. The definition of "Section" was eliminated, as some forms of stock-guards are not made up in sections.

Specifications for Standard Right-of-Way Fences.

1. *Classes.*—Standard right-of-way fences shall be divided into four classes, the height to conform to statutory requirements, generally about 4 ft. 6 in. above the ground.

2. *First Class.*—A first-class fence shall consist of 9 longitudinal smooth galvanized steel wires; the top and bottom wires shall be No. 7 gage, and the intermediate and stay wires No. 9 gage. The spacing of the longitudinal wires commencing at the bottom shall be 4, 4½, 5, 5½, 6, 7, 8 and 9 in. The bottom wire shall be 5 in. above the ground and the stay wires shall be spaced 12 in. apart. When used as a hog-tight fence, the bottom wire shall be not over 3 in. above the ground, with a strand of barbed wire 1½ in. below same.

3. *Second Class.*—A second-class fence shall consist of 7 longitudinal smooth galvanized steel wires; the longitudinal and stay wires shall be No. 9 gage. The spacing of the longitudinal wires, commencing at the bottom, shall be 6½, 7, 7½, 8, 8½ and 9 in. The bottom wire shall be 7 in. above the ground and stay wires shall be placed 18 in. apart.

4. *Third Class.*—A third-class fence shall consist of 5 longitudinal smooth galvanized steel wires; the longitudinal and stay wires shall be No. 9 gage. The spacing of the longitudinal wires, commencing at the bottom, shall be 7½, 8, 8½ and 9 in. The bottom wire shall be 9 in. above the ground and the stay wires shall be spaced 24 in. apart.

5. *Fourth Class.*—A fourth-class fence shall consist of 5 strands of galvanized steel ribbon, smooth round or barbed wire fencing. The spacing of the wires, commencing at the bottom, shall be 10, 10, 12 and 12 in. The bottom wire shall be 10 in. above the ground.

The longitudinal wires of all woven wire fencing under classes 1, 2 and 3 shall be provided with tension curves to take up expansion and contraction.

6. *Wood Posts.*—Posts shall be made of cedar, locust, chestnut, Bois d'Arc, white oak, mulberry, catalpa or other durable wood native to the locality or of treated timber. They shall be straight and free from splits, rot or other defects. If sawed or split posts are used, their dimensions shall be at least equal to those hereinafter specified for round posts.

7. *End Posts, etc.*—End, corner, anchor and gate posts shall be at least 8 ft. long and 8 in. in diameter at the small end, set 3 ft. 4 in. in the ground.

8. *Intermediate Posts.*—Intermediate or line posts shall be at least 7 ft. long and 4 in. in diameter at the small end, set 2 ft. 4 in. in the ground.

9. *Braces.*—Braces for end, corner, anchor and gate posts shall be made of intermediate or line posts or 4 in. by 4 in. sawed lumber of a quality equal in durability to that of the posts, and free from large knots, splits, rot and other defects.

10. *Concrete Posts.*—Concrete posts shall consist of one part Portland cement to four parts run of pit gravel; or one part Portland cement, two parts clean, sharp sand and four parts crushed stone of low absorption or screened gravel. Gravel or broken stone should be of such size as will pass through a ½-in. screen but be retained on a ¼-in. screen.

11. *End Posts, etc.*—End, corner, anchor and gate posts shall be at least 8 ft. long, 6 in. square at the top and 8 in. square at the base, set 3 ft. 4 in. in the ground. The reinforcement shall consist of 4⅜ in. square twisted rods.

12. *Intermediate Posts.*—Intermediate or line posts shall be at least 7 ft. long, 4 in. at the top and 5½ in. at the base, set 2 ft. 4 in. in the ground. The reinforcement shall consist of 3 in. or 4¼ in. square twisted rods, depending on the design of the posts.

13. *Braces.*—Braces for end, corner, anchor and gate posts shall be made of concrete, 4 in. by 4 in. in section, reinforced with 4¼ in. square twisted rods.

14. *Wire.*—Woven wire fences shall be constructed of basic open-hearth galvanized steel wire. It must stand, winding tight around wire of the same size, without sign of fracture.

15. *Locks.*—The locks or fastenings at the intersection of the longitudinal and stay wires shall be of such designs as will prevent them from slipping either longitudinally or vertically.

16. *Staples.*—The staples used for fastening the longitudinal wires to the posts shall be made of No. 9 galvanized steel wire. They shall be 1 in. long for hardwood and 1½ in. long for softwood.

17. *Galvanizing.*—The galvanizing shall consist of an even coating of zinc, which shall withstand one-minute immersion tests in a solution of commercial sulphate of copper crystals and water, the specific gravity of which shall be 1.185 and whose temperature shall be from 60 to 70 deg. F. Immediately after each immersion the sample shall be washed in water and wiped dry. If the zinc is removed, or a copper colored deposit formed at the end of the fourth immersion, the lot of material from which the sample is taken shall be rejected.

18. *Manufacture.*—The fence shall be so fabricated as not to remove the galvanizing or impair the tensile strength of the wire.

19. *End, Corner, Anchor and Gate Posts.*—End corner, anchor and gate posts shall be set vertical, at least 3 ft. 4 in. in the ground, thoroughly tamped, braced and anchored.

20. *Intermediate or Line Posts.*—Intermediate or line posts shall be set at least 2 ft. 4 in. in the ground, and 16½ ft. apart.

21. *Post Holes.*—Holes of full depth shall be provided for all end, corner, anchor and gate posts, even if blasting must be resorted to. For intermediate or line posts, where rock is encountered, not more than 2 adjacent wood posts shall be set on sills 6 in. by 6 in. by 4 ft. long,

braced on both sides by 2 in. by 6 in. braces, 3 ft. long. Holes shall be provided for all other posts. Posts shall be set with the large end down and in perfect line on the side on which the wire is to be strung. After the fence is erected, the tops of the wooden posts shall be sawed off with a one-fourth pitch, the high side being next the wire and 2 in. above it.

22. *Anchoring.*—Wood end, corner, anchor and gate posts shall be anchored by gaining and spiking two cleats to the side of the posts, at right angles to the line of the fence, one at the bottom, the other just below the surface of the ground. The cleat near the ground surface shall be put on the side next the fence and the bottom cleat shall be put on the opposite side. Intermediate wood posts set in depressions of the ground shall be anchored by gaining two cleats into the side near the bottom of the post, same to be properly spiked.

23. *Cleats, Sills, etc.*—All cleats shall be 2 in. by 6 in. by 2 ft. long. All sills, braces and cleats shall be made of sawed timber of a quality equal in durability to that of the posts.

24. *Bracing.*—Wood end, corner, anchor and gate posts shall be braced by using an intermediate or line post or a piece of 4 in. by 4 in. sawed lumber of a quality equal in durability to that of the posts, gained into the end, corner, anchor or gate post, about 12 in. from the top and into the next intermediate or line post about 12 in. from the ground, and be securely spiked. A cable made of a double strand of No. 9 galvanized soft wire looped around the end, corner, anchor or gate post near the ground line, and around the next intermediate or line post about 12 in. from the top, shall be put on and twisted until the top of the next intermediate or line post is drawn back about 2 in. Four in. by four in. reinforced braces shall be used with concrete posts.

25. *Stretching.*—Longitudinal wires shall be stretched uniformly tight and parallel; stays shall be straight, vertical and uniformly spaced. Wires shall be placed on the side of the post away from the track.

26. *Stapling.*—Staples shall be set diagonally with the grain of the wood and driven home tight. The top wires shall be double stapled.

27. *Splicing.*—Approved bolt clamp splice or wire splice made as follows may be used: the ends of the wires shall be carried 3 in. past the splicing tools and wrapped around both wires backward toward the tool for at least 5 turns, and after the tool is removed, the space occupied by it shall be closed by pulling the ends together.

The use of smooth wire in preference to barbed wire is recommended for right-of-way fences.

The use of heavy smooth wire, or a plank at the top of a barbed wire fence, is recommended.

Galvanized Wire Fencing.

(1) The rapid deterioration of modern woven galvanized fence wire is caused by the coating of zinc being too thin and of an uneven thickness. To provide better protection for the wire and a longer life for the fence, it is necessary to secure an increased uniform thickness of zinc coating on the wire. To insure that the galvanizing is intact after the fence has been fabricated, it is recommended that a second coating of zinc be applied to electrically welded fencing after it is manufactured.

(2) It is further recommended that wire which has received a zinc coating which will stand the test prescribed in the specifications be used in the manufacture of fencing, and that in the case of electrically welded fencing, the galvanizing be applied after it has been fabricated.

Gates for Right-of-Way Fences.

A hanged metal gate is recommended.

The width of farm gates should not be less than 12 ft., depending upon the size of agricultural machinery in use in the vicinity, or as required by the laws of the states through which the railroad operates. The minimum height of farm gates should be 4 ft. 6 in. from the surface of the roadway.

Farm gates should be hung so as to open away from the track, and, if hinged, should swing shut by gravity.

CONCRETE FENCE POSTS.

(1) Concrete fence posts are practical and economical and a suitable substitute for wood.

(2) Reinforcement should be placed as near to the surface of the post as possible; ½-in. from the surface is the best location.

(3) Posts should taper from the base to the top.

(4) Posts should not be less than 5½ in. wide at the base and 4 in. at the top.

(5) Concrete should consist of one part cement to four parts run of pit gravel; or one part cement, two parts sand and four parts crushed stone of low absorption, or screened gravel. Gravel or crushed stone should not be less than ¼-in. nor more than ½-in. in size. Concrete should be of a quaking consistency.

(6) Molds should bave a jogger or vibratory motion, while concrete is being placed to compact it and smooth up the surfaces of the posts.

(7) Posts should not be made out of doors in freezing weather. They should not be exposed to the sun, and should be sprinkled with water the first eight or ten days after being made to aid curing.

(8) Molds should be carefully oiled or soaped to prevent the concrete sticking to them.

(9) Posts should be cured for not less than 90 days, when cured naturally, before being set or shipped.

(10) Posts should be carefully handled and packed in straw, sawdust or other suitable material for shipment.

TRACK CONSTRUCTION AND FLANGEWAYS AT PAVED STREET CROSSINGS AND IN PAVED STREETS.

(1) Treated ties should be used, laid on a bed of crushed rock, gravel or other suitable material, not less than 8 in. in depth, placed in about 3-in. layers, each thoroughly rammed to compact it.

(2) Vitrified tile drains not less than 6 in. in diameter, with open joints, leading to the nearest point from which efficient drainage may be obtained, or with sufficient outlets to reach sewers or drainage basins, should be laid on either side of and between tracks, parallel with the ballast line and outside of the ties.

(3) One hundred and forty-one-lb. 9-in. depth girder rail, or a similar section, with suitable tie-plates and screw-spikes, should be used. Tracks should be filled in with crushed rock, gravel or other suitable material, allowing for a 2-in. cushion of sand under the finished pavement.

(4) Ballast should be thoroughly rammed as it is installed to prevent settlement of paving foundations. Two inches of good sharp sand should be placed on top of the ballast.

(5) Paving must conform to municipal requirements, granite or trap rock blocks preferred. Hot tar and gravel should be poured into the joints as a binder.

ECONOMY OF CONCRETE AND METAL SIGNS AS COMPARED WITH WOOD.

Sixty-two replies were received in response to inquiries relative to concrete, metal and wood signs. Fifteen roads report having used concrete signs, generally of the simpler type, 39 roads report the use of metal in signs, either complete or in combination with wood or concrete, while all roads with one or two exceptions use wooden signs.

The use of concrete does not date back more than 12 or 15 years, and in most of the cases reported, it covers a much shorter period. Comparatively few roads, therefore, were willing to go on record as to the probable life of concrete signs. With our limited experience in this direction, it could only be a matter of conjecture to specify any definite period. Another consideration, and one having a very important bearing on the life of concrete structures, is the quality of the concrete. To keep the cost within reasonable bounds, concrete signs should be designed along mathematical lines. This generally means a light structure with just sufficient reinforcement to meet the requirements, based on first-class material and workmanship. In practice, this condition is not always realized and defects frequently develop some time after the work has been completed and put in service. It is, therefore impossible to estimate the life until after the quality has been determined.

In a number of instances, cast or wrought plates are attached to wood or concrete posts or other structures. The use of signs made wholly of cast-iron is confined to comparatively few roads, while the use of wrought posts and cast plates is quite general. The use of old T-rail for posts was reported by several roads. Old boiler tubes are frequently used in making wrought posts. It would appear more economical to use new material unless the old tubes are in good condition. The life of wrought-iron or steel signs depends largely on the condition of the tubes and plates when used and the means employed for their protection. If the tubes are filled with concrete as specified by some roads and set in a concrete base which should extend several inches above the ground, and then properly protected by paint, they should last for 30 to 40 years. Some roads have estimated their life as 30 years, while others have stated it was indeterminate; some have made no estimate.

The committee is of the opinion that where either cast-

iron or wrought-iron or steel signs are properly protected by paint and concrete, they will last as long as concrete and from two to three times as long as wood.

As the posts of signs generally fail first, and as some kinds of wood are more durable than others, it is very essential that good posts be provided if wood is used. In some cases, preservatives have been used with good results. This is particularly true where creosoted timber is used for the base, the superstructure of untreated timber being bolted to the same. The average life of wood signs as reported would appear to be about ten years, although many place it as low as eight years.

All contributors were asked to express their opinions as to the relative economies in the use of different materials. Ten roads express a preference for concrete, six favor metal and eleven wood. Twelve roads show variable preferences which are governed by circumstances and 20 roads make no reply.

ECONOMY OF CONCRETE AND METAL AS COMPARED WITH WOOD FOR FENCE POSTS.

In response to inquiries relative to fence posts, 72 replies were received. Seventeen roads report the use of concrete posts, three are using a few experimentally, and the balance in lots running as high as 15,000 to 20,000. Sixteen roads are using metal posts, 13 having purchased them from manufacturers, and 3 having made them with their own forces. All roads, with two or three exceptions, are using wood posts.

Concrete posts have been in service covering periods ranging from 6 months to 9 years; a number of roads having used them 5 or 6 years. Their use has not covered a sufficiently long period to enable anyone to give any very definite information as to their life. Some have placed it at 15 to 50 years, others 10 to 20, while most of the roads have advised it was indefinite or gave no reply With proper material and workmanship in their manufacture, there seems to be no reason why they should not be good for 30 to 40 years if not subjected to sudden shocks or severe strains.

The percentage damaged in handling was reported by the roads as ranging from 0 to 5 per cent, with a probable average of not over 2.5 per cent, the damage in many cases occurring while the posts were being removed from the molds. The method of shipment varied from loading on flat cars crosswise with no packing to the use of hay, straw or sawdust. The average cost of line posts would seem to be about 25 cents, the anchor or corner posts 50 cents, while the average cost to install would probably run about 12 cents.

Some roads are just beginning to use metal fence posts, while others have had them in use as long as six years. Quite a few roads have been using them two or three years. As in the case of concrete, their use has not covered a sufficiently long period to determine definitely their life. It has been variously estimated at 10 to 20 years, except in old boiler tubes, which fail in 6 to 8 years. The line posts cost about 25 cents, end posts $1.60 and corner posts $2.30. The cost of setting line posts ranges from 2 to 10 cents, with a probable average of 6 cents. The cost of setting corner or end posts varies from $1.00 to $1.50 if set in concrete, not including the cost of materials.

Information secured from 66 railroads relative to wood posts shows that the prevailing timber used is cedar, locust, chestnut and oak, with some Bois d'Arc, catalpa, cypress and pine. The life varies from 5 to 6 years for oak and pine to 20 years for the cedars and 40 to 50 years for Bois d'Arc. The loss by fire in most cases is low, but in some localities runs as high as 25 per cent, while several roads report as high as 50 per cent.

Only three companies, have undertaken the cultivation of timber for posts, two reporting results satisfactory and one poor. The prices paid for posts range from 7 to 38 cents, the average being about 18 cents, with about 2 cents for delivering along line of road. The average cost to set wood posts is about 10 cents. A number of roads advise they are considering changing to concrete or metal. Others advise that where timber is plentiful and cheap, wood is most economical.

From some investigations made bearing on the relative economy of concrete, metal and wood posts, it was found that where cedar and locust posts, for example, can be bought for 16 to 18 cents, with a probable average life of 15 years, there is little economy in using concrete posts at 25 cents each unless their life can be definitely fixed at over 30 years.

In the report of this committee two years ago, reference was made to concrete posts which were being used by the Board of Water Supply of the City of New York around Ashokan reservoir, spoil banks, borrow pits and gate houses and other locations along the Catskill Aqeduct, comprising about 150 miles of fencing, making it no doubt the largest individual user of concrete posts in the country at this time. This year the committee presents some additional information.

In enclosing the Ashokan reservoir property, over 14,000 concrete posts were used in constructing about 43 miles of fencing, the posts being placed at intervals of 16 ft. Straining or anchor posts were used on straight lines at intervals of about 300 ft. and at all abrupt angles. These posts were 3½ in. square at the top, 8 in. square at the bottom and 7 ft. 9 in. long. They were reinforced with four ¼-in. square twisted steel bars, held in position by 5 hoops made of the same material. The line posts were "U" shaped, 5½ in. over all at the bottom and 3½ in. at the top, reinforced with four No. 5 U. S. steel wire gage rods. All posts were made on the site by the contractor for the fencing, the concrete consisting of one part cement to four parts aggregate in which the sand was limited to ¼ in. maximum size and the stone to such size as would pass through a ¾-in. screen and be retained on a ¼-in. screen. The specifications required that the posts be protected from the hot sun and from freezing and that they be kept moist for at least two weeks after being cast. As most of them were set during the years 1913 and 1914, the Board has had no opportunity to judge as to their durability; but as they are not subject to deterioration due to the elements as wood and metal, it is but fair to assume the average life of the posts to be at least 25 years.

As stated above, the specifications required the posts to be kept moist for a period of two weeks. It was found that occasional sprinkling was not satisfactory and that it was necessary to cover them with something that would retain the moisture. After being cured from 15 to 30 days, the posts were hauled from the place of manufacture to the site on wagons equipped with a platform so that they were supported their entire length, no packing of any kind being used. The number damaged in handling probably did not exceed 1.5 per cent. In common with the property of other large corporations, the trespasser considered it necessary to try his marksmanshp either with gun or stones, with the result that some posts have had the tops broken off. The posts in general have been satisfactory, but would perhaps have been more satisfactory had the square posts used as end or anchor posts been made with a heavier section, as an unbalanced strain occasionally broke the posts off at the surface of the ground.

These posts were furnished under a contract which included the manufacture, delivery and setting, but not the excavation of the hole or the cement and reinforcement used in their manufacture. At the contract prices, the cost of the line posts in place was $1.47 each, distributed as follows: Post $0.90, cement $0.145, reinforcement $0.175, excavation and backfilling $0.25. The corner and anchor posts, set in concrete with one brace and thrust block, complete in place, cost $13.81, made up of the following items: Post $1.30, cement $0.32, reinforcement $0.43, earth excavation $0.50, concrete to refil post hole $6.00, galvanized angle-iron brace $3.02, excavation for thrust block, earth $0.14, concrete for thrust block $2.10. Post holes for line posts in rock cost $0.40 each additional and for corner and anchor posts and thrust blocks $1.02 additional.

TESTS OF CONCRETE POSTS.

The tests of concrete posts, of which mention was made in last year's report, have been completed. The purpose of these tests was to determine the relative strength of the different types of concrete posts. The tests were made at the Lewis Institute, Chicago, by D. A. Abrams of the Institute, as director by the committee and with his assistance.

Through the secretary, various railroads using concrete posts were solicited for posts for the tests and six companies responded. The posts were all made about a year previous to the tests, so that differences in the age of concrete does not enter into the results. The following instructions were sent to each company furnishing posts:

"Fifteen posts should be made. It is expected that the posts will be made carefully, but not more carefully than posts which are to be used for fence purposes should be made.

"The concrete mixture should consist of one part cement, two parts sand and four parts crushed rock or screened gravel—gravel or crushed rock not to be smaller than

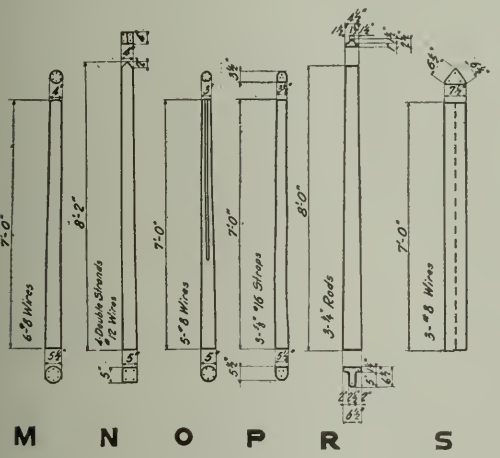
¼ in. or larger than ½ in. in size. If it is not possible to obtain the above materials, the concrete mixture should consist of one part cement to four parts of pit-run gravel, with the above maximum limit in size. Concrete should be of quaking consistency.

"The posts should not be exposed to the sun, and should be sprinkled with water the first eight or ten days after being made, to aid curing. It is expected that the tests will be made about 60 days after the completion of the posts. Shipping directions will be furnished later. Posts should be crated to avoid breakage due to improper handling in shipment. There is no objection to placing several posts in a crate if the weight is not too great.

"In addition to the posts, five 4-in. cubes should be made of the same concrete materials and at the same time as the posts and shipped with them. Care should be taken to have the concrete in the cubes of the same consistency and density as that in the posts.

"A full description of the materials used, including water, cement, sand and gravel, and the method involved in making the posts, should be furnished. Each post should be marked with the date on which it is made."

In general the instructions were complied with, but two sets of posts were shipped uncrated and two companies did not furnish the test cubes called for. Some of the



Types of Concrete Posts Tested.

posts of one type shipped without crating showed quite distinct horizontal cracks, but in the tests failure occurred at other points. Two of the types were eight-foot posts. In making the tests, however, the extra foot was neglected —that is, they were supported and loaded at the same distance from the lower end as the seven-foot posts.

The committee desired to subject the posts to conditions similar to those occurring in actual use, and decided on three tests—a simple beam, a cantilever, and an impact test. For the simple-beam test a Riehle compression machine was used, the supports being placed 3 in. and 6 ft. 6 in. from the lower end of the post and the load applied 2 ft. 6 in. from the lower end.

For the cantilever and impact test a method for holding the post had to be devised. This was accomplished by constructing on a 12-in. by 12-in. timber a heavy wood box having an area of about one square foot and a depth of 2 ft. 6 in. The post was placed in the box in an upright position, and screened gravel, about one-quarter to three-quarters of an inch in size, was poured around it and lightly tamped. The load was applied 6 ft. 6 in. from the bottom of the post to bring the fence side of the post into tension. The pull was measured with a tension dynamometer.

For the impact test the post was placed in the box, as before, and a wooden washer or plug, fitting loosely about the post, was bolted down on top of the gravel to prevent its falling out. The post and box were then turned to a horizontal position, which brought the upper end of the post under a weight which could be moved vertically in a pair of guides or leads. This weight was of wood loaded to 33 lbs. The first drop was for a distance of 5 in., and this was increased 1 in. at a time until failure of the post occurred.

Tests of the reinforcement showed the following average values of the yield point and the ultimate load:

Post.	Yield Point in lbs. per Sq. In.	Ultimate Load in lbs. per Sq. In.
M	98,800	106,700
N	75,700	83,600
O	.....	94,000
		72,000
P	41,900	50,100
R	42,600	56,700
S	65,800	80,200

In the case of Post "O" it was not possible to obtain the yield point on the metal, because of the fact that the wires were crimped. Apparently there were two grades of steel used in this wire.

In Table 8 a comparison is made of the breaking load, as determined in the contilever test, per pound of post and per pound of reinforcement. It is felt that these units afford a good basis of comparison, because they have direct bearing on the cost of making as well as the cost of handling the post.

Attention is called to the fact that in spite of the wide variation in the strength of the concrete, all of the posts failed in tension, and this brings out the important relationship which the quantity and distribution of reinforcement bear to the strength of the posts. It is believed that there is an advantage in using some type of reinforcement in which the position of the longitudinal members is definitely fixed near the outside of the post. A dense concrete is required to thoroughly protect the steel in this position.

TABLE 8—TESTS OF REINFORCED CONCRETE FENCE POSTS.

Type of Post	Average weight in lbs.	Average breaking load, in cantilever test applied 48" above the ground line, in lbs.	Breaking load, as before, per lb. of post	Estimated weight of reinforcement in lbs.	Breaking load, as before, per lb. of reinforcement
M	115	420	3.68	2.88	145
N	147	231	1.57	1.79	130
O	75	325	4.33	2.41	135
P	80	185	2.31	2.59	71
R	90	335	3.72	2.55	131
S	150	135	.90	1.44	94

METHODS USED IN REPAINTING SIGNS, AND SPECIFICATIONS FOR WHITEWASHING CATTLE-GUARD WING FENCES.

Sixty-two replies were received in response to inquiries relative to methods used in repainting signs and whitewashing cattle-guard wing fences. The prevailing practice in vogue on the majority of the railroads from which replies were received is to send paint gangs of from two to six men, supplied with material and equipment, over the road, on speeders or hand cars, who first repaint the posts and backgrounds of the signs and then either return to paint the inscriptions or are followed by another gang about two days later which does that class of work. In a few instances when signs need repainting, they are replaced by new ones and the old ones are sent to the shops for repairs and repainting. Thirty-three roads use stencils in repainting inscriptions except in the case of special lettering, which is done freehand. A few roads advise their use to a limited extent only, while 11 roads report they do not use them for any work.

The replies indicate that white lead and linseed oil are almost universally used where the posts and backgrounds are painted white, and lamp black and linseed oil for black lettering, etc., on wood signs. For repainting metal signs, the same materials are generally used, although in a limited number of cases red lead and graphite are used. Some roads report the use of commercial paints, of their standard colors. Over half the roads have no specifications, but use leads and oils in proper proportions or commercial paints of known reputation; others, in lieu of specifications, give the proportions of the ingredients used.

There does not seem to be any well-defined general practice in regard to frequency of repainting signs. Some roads repaint every year, others every two years, while others advise they repaint every three or four years or when needed. Metal signs require more frequent repainting than wood to keep them in proper condition. The committee has been unable to get any very definite information on cost data.

Most roads whitewash their cattle-guard wing fences, but a few use cold water paint. Some roads advise they have

under consideration abandoning the practice, as the results hardly justify the expense. There is considerable variation in the specifications for whitewash. Some roads report the use of ordinary lime and water, others add salt, glue, whiting, rice, etc.

In the report submitted by this committee two years ago, some figures were presented on the cost of setting concrete, metal and wood posts. This year the committee has secured some information from the Baltimore & Ohio, giving cost data on two sections of test fence, each 4,620 ft. in length, erected in May, 1913, on its Philadelphia division. Metal posts were used in one section and wooden posts in the other. Electrically welded wire fencing made of No. 9 galvanized steel wire was used in both cases. Both sections of fence were erected on reasonably level ground and where the soil was composed largely of clay and sand. The metal posts were driven 2½ ft. in the ground and the soil around them tamped to make them more rigid. The wooden posts were set in the usual manner, in holes dug about 2½ ft. deep, the holes being backfilled and tamped. All the posts were 7 ft. in length. The steel end or anchor posts were set at intervals of 40 rods (the length of a large roll of wire) in concrete about 30 in. deep and 12 in. square. The steel intermediate or line posts were set at intervals of 16½ ft. or as near thereto as the condition of the ground would permit. The same spacing wes used in setting the wooden posts. The average cost of labor for driving and tamping 279 steel intermediate or line posts was $0.0573 each. The average cost of digging holes, distributing and setting 288 wooden intermediate or line posts was $0.0879 each. The cost of labor setting the steel end or anchor posts was $1.22 each. The average cost of labor erecting the section of fence in which steel posts were used was $0.18 per rod, or $57.60 per mile. The average cost of labor erecting the section of fence where wooden posts were used was $0.1576 per rod, or $50.43 per mile. The average cost of stretching the wire on metal posts was $0.0613 per rod, or $19.62 per mile. The average cost of stretching the wire on wooden posts was $0.0672 per rod, or $21.50 per mile. From the above it will be noted the cost of setting a wooden post was about 50 per cent greater than that of setting a metal post, but the average cost of erection of the fence complete was less where wooden posts were used than where metal posts were used. This was due to the high cost of setting anchor posts. The metal line posts cost $0.245 each, or $0.3023 in place; the wooden posts cost $0.18 each, or $0.2679 in place. A recent examination of the above metal posts failed to detect any indication of corrosion, although the wire fencing showed unmistakable evidence of rust.

CONCLUSIONS.

Subject No. 1.

(1) Concrete is a practical, economical and satisfactory material for the more simple forms of signs of small or moderate size.

(2) Metal is a practical, economical and satisfactory material for the more complicated forms of signs of medium size.

(3) Wood is the most economical and satisfactory material for the larger forms of signs, particularly where timber is plentiful and cheap.

Subject No. 2.

(1) Concrete is a practical, economical and satisfactory material for fence posts, where suitable timber is scarce and expensive.

(2) The use of metal fence posts has not as yet covered a sufficient period to demonstrate their practical and economical qualities for that purpose.

(3) Wood is the most economical and satisfactory material for fence posts in localities where timber is plentiful and cheap.

Subject No. 3.

(1) The most practical method of repainting signs is to send paint gangs with material and equipment over the road on speeders or motor cars.

(2) White lead and linseed oil with pigments of proper coloring and lamp black and linseed oil for lettering are the most practical and satisfactory paints for both wood and metal signs.

RECOMMENDATIONS.

(1) In view of the variation in the design of concrete, metal and wood signs, and the consequent variation in cost, and also the comparatively short time that concrete has been used for signs, the committee finds itself unable to present a complete report this year, and it therefore recommends that the material collected be accepted as information and that the subject be reassigned for next year to permit a further study of the various designs received with a view to making definite recommendations for standards to meet country-wide conditions.

(2) As both concrete and metal fence posts have been in use but a few years and their durability is still considerably in doubt, the committee is unable to present any definite information as to their relative economies as compared with wood. From a careful analysis of the information received relative to concrete and wood posts, it finds that where suitable timber is plentiful and cheap there is no economy in the use of concrete unless its life should prove much longer than now estimated. It therefore recommends that further consideration of this phase of the subject be deferred until more definite information can be secured on both concrete and metal posts.

(3) The following specification for whitewash for cattle-guard wing fences is recommended:

Take half a bushel of unslaked lime, shake it with boiling water, cover during the process to keep in the steam, strain the liquid through a fine sieve or strainer, and add to it a peck of salt, previously dissolved in warm water, three pounds of ground rice boiled to a thin paste and stirred in while hot, half a pound of Spanish whiting, and one pound of clean glue, previously dissolved by soaking in cold water and then hanging over a slow fire in a small pot hung in a larger one filled with water. Add five gallons of hot water to the mixture, stir well and let it stand a few days, covered from dirt. It should be applied hot, for which purpose it can be kept in a kettle or portable furnace.

A pint of this mixture, if properly applied, will cover one square yard, will be almost as serviceable as paint for wood, brick or stone, and is much cheaper than the cheapest paint.

W. F. Strouse (B. & O.), chairman; G. E. Boyd (D. L. & N.), vice-chairman; R. B. Abbott (P. & R.), H. E. Billman (M. P.), E. T. Brown (B. & O.), A. C. Copland (C. & O.), Arthur Crumpton (G. T.), J. T. Frame (C. G. W.), L. E. Haislip (B. & O.), Maro Johnson (I. C.), L. C. Lawton (A. T. & S. F.), G. L. Moore (L. V.), W. F. Purdy (W. P. T.), Thomas Quigley (I. C.), C. H. Splitstone (Erie), committee.

Discussion on Signs, Fences and Crossings.

The report was presented by Chairman Strouse.

Mr. Strouse: I move that the definitions that are marked with an asterisk be eliminated in the reprint of the Manual.

The President: If there is no objection to that motion it will be regarded as passed.

Robert Trimble (Penn. Lines): There is one matter that I want to call your attention to, and that is the specification as to right-of-way fence, first-class, second-class, third-class, and fourth-class. Heretofore the Association has objected to that kind of classification, because it is a class that might be criticized. Take our roadway, that is classified as first, second and third class. I think we ought to change this, and I move that that change be made.

The President: The committee will accept that suggestion.

C. Dougherty (C. N. O. & T. P.): I move that the last paragraph, under "Gates for right-of-way fences" be amended by adding, "and the end of the gate opposite the hinged end shall lap by the post a sufficient distance thoroughly to prevent it from being opened by side pressure."

The President: The committee will accept the motion. The committee moves that the specifications as read will be adopted and included in the next Manual.

(The motion was seconded and carried.)

The President: The adoption of the definitions and general requirements for surface cattle-guards will be passed on by the convention, and the same as to stock guards and general requirements. The committee moves the adoption of the report.

(The motion was carried.)

The conclusions at the end of the report were also adopted.

L. C. Fritch (Can. Nor.): Under the heading, "track construction," etc., is that to be included in the Manual?

The President: That is part of the Manual.

Mr. Fritch: Clause 3 calls for "141-lb., 9-in. depth girder rail," and I think that will be pretty expensive on some lines. I think that ought to be modified.

Mr. Strouse: In regard to the criticism of that paragraph, it states "141-lb., 9-in. depth girder rail, or similar section, with suitable tie-plates and screw-spikes, should be used." It does not necessarily tie us down to that particular weight. The idea in using that depth of rail is to take care of the ordinary style of paving, that is so frequently done, namely, the use of granite blocks, which usually range between 5½

and 6½ inches in depth, and, in addition to the block, of course, provision is made for the sand cushion. Where sheet asphalt is used on a concrete base, a shallower rail can be used, but this is the depth of rail that was recommended in one of the former reports, and it had reference particularly to the use of granite blocks for the paving.

Robert Trimble: I move that this be changed to read: "One hundred and forty-one-pound, nine-inch depth girder rail, or similar section, with suitable tie-plates, should be used for tracks laid longitudinally in streets, when the conditions require such construction. Tracks should be filled in with crushed rock, gravel or other suitable material, allowing for two-inch cushion of sand under finished pavement. For street crossings the standard track construction should be used, with such modification as may be required to suit the situation."

(The motion was carried.)

Mr. Campbell: In the fifth section, I move to strike out the words "grantie or crushed rock, block preferred," making it read "to conform to municipal requirements."

L. C. Fritch: I think the first part of that is objectionable, that they must conform to municipal requirements. The tracks are subject to vibration, and I don't think that we should bind ourselves to conform to municipal requirements.

Mr. Campbell: I will be in favor of referring this back to the committee. I do not believe the specification, as it stands, covers the situation fully. I would like to see this eliminated, and this specification put on a basis so that it will cover the whole situation.

(The motion was changed so as to eliminate this part from the Manual at the present time, and refer it back to the committee for further consideration, and was carried.)

Hunter McDonald: Does that also include the plan?

The President: That will be withdrawn also.

C. S. Churchill (N. & W.): It seems to me, in the way the heading on Paragraph 3 in the recommendations at the end of the report is worded, we are led to the conclusion that that is the standard for general use all over the country. I think we should avoid any such intimation as that. Many railroads do not practice whitewashing of fences or anything else. The wording should be made so that it should be considered as optional, not a standard of practice in use everywhere. I suggest that it be recommended wherever the practice of whitewashing is followed.

Mr. Strouse: The recommendation of the committee is the specifications adopted by the United States Government.

The President: The committee will accept the modification suggested by Mr. Churchill.

(The recommendations were read as amended and adopted, and the committee was discharged.)

ECONOMICS OF RAILWAY LOCATION

The work assigned to this committee was as follows:

(1) Study the question of grade, curvature, rise and fall and distance, and, if possible, present conclusions as to reasonable values of same in a usable form, in order that they may be of use for the information and guidance of locating engineers.

(2) Continue the important study of economics of railway operation heretofore carried on by the committee, in order that the information may lead to more economical methods in railway operation, and that information may be obtained for correcting values given to the physical features in the locating of railways.

(3) Make special efforts to collect information in regard to effects of passenger and freight traffic on the cost of maintenance.

The chairman of the committee assumed the responsibility of changing the instructions to the sub-committee having charge of subject (1) to read, "Study the question of grade, curvature, rise and fall and distance, and, if possible, present instructions to enable engineers to obtain reasonable values for grade, curvature, rise and fall and distance."

If the methods outlined by this committee are approved, the immediate work for the future will be:

(1) Make a study of the resistance of trains running between 35 and 75 miles an hour.

(2) Make a study of the effect on the cost of maintenance of way and maintenance of equipment of fast trains.

(3) Make a study of the effect curvature has on the cost of maintenance of way.

(4) Make a study of the effect curvature has on the cost of maintenance of equipment.

(5) Make a study of the amount of fuel consumed in doing an actual horsepower-hour of work. It is believed that a study of this subject will not only be valuable as a basis in determining the economics of location, but that the results will be beneficial to operating officers, calling to their attention various losses in the fuel supply, and especially so in the cost of operating a very busy single-track vs. the cost of operating double-track lines.

(6) Preparation of a method for the comparison of alternative locations with varying ruling gradients.

CONCLUSIONS.

The following conclusions are submitted for approval:

(1) A line is located when its position is fixed horizontally and vertically.

(2) Locating a railway means designing an economical plant for handling a given traffic. The economical plant for a given quantity and class of traffic cannot be the economical plant for a greater or less quantity of traffic or for traffic of a different class. It is considered good prac-

J. G. SULLIVAN,
Chairman Committee on Economics of Railway Location.

tice to discount the future within reasonable limits, providing the necessary funds are available.

(3) The most general formula for the economic value of a location is:

$$\frac{R-E}{C}=p \quad \ldots\ldots\ldots\ldots\ldots\ldots (1)$$

Where R = Annual revenue (receipts from operation);
E = Annual expense of operation, including depreciation and taxes;
C = Capital invested (cost of construction);
p = Percentage of profit on investment.

(4) The following equation may be used in certain cases, especially where the annual revenue, known or unknown, is constant:

$$R-(E+I)=P \quad \ldots\ldots\ldots\ldots\ldots\ldots (2)$$

Where I = Amount of interest on cost of construction;
P = Amount of profit (net corporate income).

When the revenue is constant the condition of equation (2) is that the sum of operating expenses, plus interest on cost of construction, shall be a minimum, and is convenient in many cases, but does not indicate the proportion of profit to investment. Care should be taken not to use too low a rate of interest. The ratio of profit to investment should be considered.

(5) In order to make an economical location of a railway, the engineer must know or make a reasonable assumption of the amount and class of traffic that the railway will be called upon to handle, the class of power and the approximate efficiency and cost of the fuel that will be used, the rate of wages that will be paid to employes, the cost of maintenance materials, and the rate of interest considered a proper return for additional expenditures involved in the improvement of the line for the reduction of operating expenses.

(6) One of the most difficult problems to be solved is the desirable length of engine districts, but the question is governed to such an extent by other considerations that no definite rule can be given. One of the necessary requisites for a terminal point is a suitable water supply for locomotives and for domestic use. It is desirable, where possible, that terminal points should be located on minor summits.

(7) Passing sidings and road water supplies should preferably be located on minor summits.

(8) If passing sidings must of necessity be located on ruling gradients, then such gradients should be compensated through and for a full train length in each direction from either end of the siding. The rate of compensation will be governed by the ruling gradient.

(9) In deciding upon the ruling gradient for each engine district, where different ruling gradients are contemplated for adjoining districts carrying approximately equal traffic, due consideration must be given to the breaking up of trains, which may be caused by the difference in ruling gradients. Where a fixed elevation is to be overcome, the development of distance to reduce the rate of ruling gradient is often a mistake, provided the ruling gradient of the shorter line is within reasonable operating limits. Where curvature and distance are introduced for the sake of ruling gradient reduction, line resistance, and thereby fuel consumption, is increased, as is also the cost of maintenance of way and equipment. Some of the benefits derived from a reduction of the ruling gradient are the saving in weight of locomotives to be lifted over the summit, train and engine wages and engine mileage reduced and the capacity of the track increased. Full advantage cannot be taken of the apparent train rating increase due to ruling gradient reduction on an engine district having a large percentage of grade at or near the proposed ruling rate, as in all probability, if this anticipated increase in rating is in direct proportion to the proposed reduction in ruling gradient, the required time for movement of trains over the engine district cannot be made. On crowded single-track lines a feature affecting train rating to a great extent is the loss of time at meeting and passing points; it, therefore, is necessary to estimate the train rating for any line as the tonnage that can be handled in a given time, due allowance being made for necessary stops.

In estimating the time required for trains to pass over an engine district, a speed curve and time card should be plotted. There is little increase of tonnage for local and fast freights, and none for passenger trains, to be credited to a reduction of the ruling gradient on lines with light, undulating grades.

In establishing a ruling gradient and determining the effect of it on future operating expense, due consideration must be given to possible future revisions of the line; thus, in comparing alternative locations, one of steep ruling gradient may appear more economical than another of low ruling gradient, but the situation of the former may be such that its revision would necessitate an abandonment of all or a large percentage of the location; while the application temporarily of a steep ruling gradient to the low-gradient location might bring the cost of the latter line within such limits that, considering future traffic, its construction would be desirable.

(10) In the construction of a line where the contemplated immediate traffic is small and the future traffic large, sharp curvature and steep temporary gradients, so situated as to be possible of reduction when justified by the traffic, may be advantageously introduced; a line being thus constructed which will provide for immediate requirements and which can be improved for future requirements at a reasonable expense. Before deciding upon such temporary expedients, care should be taken to compare the cost of the work ultimately to be abandoned with the interest saved on the extra cost of construction that would have been necessary to construct a line on the final location during that period in which the more expensive construction would appear uneconomical.

In the construction of temporary lines due consideration must be given to the location of station buildings, and these should not be located on portions of the line where revisions are contemplated, owing to the fact that if a receiving and delivery point for local traffic is once established, opposition from the public may prevent its removal. In the matter of terminal property the future requirements should be estimated for a longer period than is justified for the line between terminals.

(11) Momentum gradients, not exceeding that over which a locomotive loaded for the ruling gradient can handle its train in two parts if stalled for any reason in the sag, may be used to reduce construction cost without decreasing the train rating or the efficiency of the railway, and should be used where economy in construction cost is thereby effected, except at points where train stops or reduced speed, below the limit necessary to operate the gradient, are likely to be necessary. In the calculation of the lengths of momentum gradients the maximum speed of freight trains at the bottom of the sag should not exceed the speed limit for such trains on the engine district under consideration; and the minimum speed at the top of the grade, where the velocity grade adjoins an ascending grade of any considerable length, should not be less than 11 miles per hour. Where the top of the momentum gradient is at a summit, the minimum speed may be less than 11 miles per hour.

In fixing the grade line for any alinement, care should be taken to insert vertical curves at all grade-line intersections. Curves should be connected to tangents by spiral or easement curves of such length as to provide ample space in which to make the required superelevation, giving due consideration to future requirements of increased speeds.

(12) The location of terminal points, ruling gradient, and pusher gradients having been decided upon, the effect of the minor details of location, namely, distance, curvature and rise and fall, upon operating expenses may be determined approximately in the following manner: Alternative locations may be compared by distance, curvature and line resistance; the distance being the length of the line measured along the center line of the location; the curvature the number of degrees of central angle subtended by the center line of the track, and which may be divided into sharp curvature, necessitating a reduction of speed for trains, and ordinary curvature, which will again be subdivided into that increasing line resistance in both directions and that increasing line resistance in one direction only and line resistance which is the sum of the rolling resistance (or friction resistance), plus the resistance of gravity overcoming difference in elevation on up-grades, plus the resistance due to curvature, minus the energy of gravity on trains on descending grades, from which has been subtracted the loss of energy (or velocity head) due to the application of brakes. For purposes of comparison this item should be reduced to its equivalent in feet of vertical lift.

Friction resistance, under normal conditions, of warm weather, modern freight equipment, and speed between 7 and 35 miles an hour, may be obtained from the formula

$R = 2.2\ T + 121.6\ C.$

R = Total resistance on level tangent.

T = Total weight of cars and contents in tons.

C = Total number of cars in train.

This amounts to 4 lb. to 8 lb. per ton, depending on whether the cars are fully loaded or empty. This is equivalent to a rise of from 10 ft. to 20 ft. per mile. For mixed traffic a conservative estimate is, train resistance equals rise of 15 ft. per mile. Train resistance increases at lower temperatures, and at extreme low temperature may go as high as 30 lb. per ton for empty freight cars. However, in comparing different locations in the same country, it is deemed necessary to make comparisons for the ordinary conditions only. The resistance due to curvature may be taken at 0.04 ft. per degree of central angle.

(13) *Fuel Consumption.*—It is the unanimous opinion of the committee that the train-mile basis alone is not a reliable or correct method of estimating fuel consumption for comparative purposes. The following two methods are recommended: First, dividing the fuel consumed into the amount required for the movement of the locomotive alone, calculated on a time basis, for consumption in yards, roundhouses and sidings, and the amount required for the actual movement of cars, and this last amount can be computed as varying directly with the amount of work done. Second, calculating fuel consumption by means of the speed curve, calculating from this the fuel consumed by locomotives working, drifting and standing. These methods for calculating fuel consumption also lend themselves to the comparison of lines with varying ruling gradients.

(14) To determine the relative value of the minor details of location under consideration (curvature, distance, rise and fall), it is first necessary to decide upon a method of studying the effect of these factors on the cost of operation. The following method is recommended: Curvature increases resistance at the rate of 0.04 ft. per degree of central angle; it also affects the cost of maintenance of way and the cost of maintenance of equipment, but sufficient data is not available to warrant a conclusion as to the definite amounts.

Rise affects line resistance and time; the principal effect of eliminating rise will be found in the fuel account. It also affects the cost of manitenance of equipment and maintenance of track, but to what extent is unknown. It may be neglected in comparing alternate locations.

Distance affects train wages, line resistance, maintenance of way and maintenance of equipment. The effect of distance on line resistance will be found in the fuel account. The effect of distance on train wages can be computed on a direct train-mile basis. The effect of distance on maintenance of way is a more complicated problem on account

of the uncertainty as to the basis on which maintenance should be calculated. A fixed sum per mile to cover factors of maintenance that are more or less constant plus a rate for the equivalent ton-mile unit, using multiples for weights of engines and passenger cars, is correct in principle, but until such time as information is obtained as to the value of these multiples, this item may be calculated on a basis of a constant per mile plus a fixed sum per train mile. The effect of distance on maintenance of equipment, for comparative purposes, may be calculated on a train-mile basis.

(15) *Special Structures.*—The maintenance and operation of special structures must be considered on their respective merits for each location.

(16) Time will not in general constitute an important factor in the consideration of the minor details of location, but if the difference in time required to operate over alternative locations is of sufficient importance to affect the amount of equipment to operate the line, and consequently the annual charge for same, the earnings of the line, or the trainmen's wages through overtime, this item must be taken into consideration.

(17) In comparing lines of varying lengths, consideration must be given to the effect of distance upon revenue. Another item worthy of consideration is the fact that the reduction of distance in engine runs of less than 100 miles, which constitute the entire day's work for trainmen employed on same, may not reduce the amount of wages to be paid to such employes.

(18) The data in the Manual on the subject of "power" should be amplified and altered to the extent recommended by the sub-committee on Stokers and Superheaters so as to provide for the increase in coal consumption and tractive power due to these improvements.

John G. Sullivan (C. P. R.), chairman; C. P. Howard (Cons. Eng.), vice-chairman; F. H. Alfred (P. M.), R. N. Begien (B. & O. S. W.), J. F. Burns (L. & N.), Maurice Coburn (Vandalia), A. C. Dennis (Contr. Eng.), A. S. Going (G. T.), F. W. Green (L. & A.), L. C. Hartley (C. & E. I.), P. M. LaBach (C. R. I. & P.), Fred Lavis (Cons. Eng.), J. deN. Macomb, Jr. (A. T. & S. F.), C. W. P. Ramsey (C. R. R.), E. C. Schmidt (Univ. of Ill.), A. K. Shurtleff, H. J. Simmons (E. P. & S. W.), F. W. Smith (Contr. Eng.), Walter Loring Webb (Cons. Eng.), M. A. Zook (Interstate Commerce Commission).

The report was accompanied by reports of subcommittee 1, on Grades, Curvature, Rise and Fall and Distance, elaborating on conclusions Nos. 5 to 17, inclusive; subcommittee 2, on Economics of Railway Location, presenting additional information in support of its conclusion of last year that the equivalent ton-mile unit is the correct basis for a comparison of maintenance of way expenses and a discussion, upon which conclusions Nos. 1 to 4, inclusive, were based; and of subcommittee 3, which presented information on stokers and superheaters, compiled from the reports of the committee on Locomotive Stokers of the American Railway Master Mechanics' Association and on information furnished by 15 roads using automatic stokers. Based on this information, this subcommittee recommended that the Manual be revised as indicated in conclusion 18.

MINORITY REPORT.

The undersigned cannot agree with that portion of the report concerning the foot-ton method of calculating the fuel consumed referred to in Conclusions 12 and 13. The fuel consumed per indicated horsepower of work varies from about 7.7 lb. with locomotives working full stroke to about 4.75 lb. at its maximum efficiency at about 3.6 times the speed that it can maintain full cutoff. The indicated horsepower at maximum efficiency is also over 60 per cent more than at full cutoff.

With these two facts in view it appears that the amount of coal per 1,000 foot-tons will vary widely. Another factor, however, enters into the work done by the locomotive, and it may or may not be a considerable percentage of the total work. This factor is the power exerted in accelerating trains which will vary from less than 1 per cent of the total power used on heavy gradients to more than 20 per cent on level grades, depending on the distance between stops. No notice is taken of this factor in the method set down in the report of the committee, and yet it is liable to add considerably to the total foot-pounds.

In a table were shown data from simple cases of three stations ten miles apart on a tangent, and a train starting at one end of the line and working at its maximum power on level and ascending grades, but stopping at both the other stations, using brakes for the last 1,500 ft. of stop. There is one exception to this: on descending grades, the train accelerates by gravity to 35 M. P. H., then is held at this speed to the foot of the grade, and then drifts to within 1,500 ft. of the station where brakes are applied.

The four separate cases are: (1) A level grade the entire distance. (2) A level grade for one-half mile; 9 miles of ascending 0.4 per cent grade; a level grade for one mile with station stop in it; 9 miles of descending 0.4 per cent grade, and one-half mile of level grade. (3) Same as (2), except 0.7 per cent grades are used instead of 0.4 per cent. (4) Same as (2), except 1.0 per cent grades are used instead of 0.4 per cent.

There is no question which of the above would be the most economical to operate. The whole idea of using the above is to illustrate the fallacy of using the foot-ton method in calculating fuel.

As tables covering the distances used in acceleration and retardation on the various gradients had been worked out for a consolidation locomotive in an article "Locomotive Fuel Consumption and the Speed Diagram," pp. 3 to 20, Part 2, Vol. 14, American Railway Engineering Association Proceedings, the same engine and train were considered here.

	Weight.	Resistance.
Locomotive	173 tons	2,450 lbs.
Train	1,306 tons	7,052 lbs.
Total	1,479 tons	9,502 lbs.
Average resistance per ton-train		6,425 lbs.
Equivalent grade resistance		0.3125 per cent

From the table which was prepared it was shown that the coal used per 1,000 foot-tons varies from 6.20 to 8.03 lbs. Taking the difference in foot-tons and the coal used for the various lines, we can get still wider results as follows:

Line.	Foot-Tons.	Lbs. Coal Used.	Lbs. Coal Per 1,000 Foot-Tons.
1.0 per cent	959,185	7,703	
0.7 per cent	748,339	4,914	
	210,846	2,789	13.23
0.7 per cent	748,339	4,914	
0.4 per cent	537,492	3,163	
	210,846	1,751	8.30
0.4 per cent	537,492	3,163	
Level	487,634	3,054	
	49,858	109	2.19

It is rightly claimed that we cannot be exact, owing to variables that enter into consideration of the subject, but we can be more exact than the foot-ton method of calculating the coal, as there is absolutely nothing to use as a base per 1,000 foot-tons. The above shows that you can figure it from various angles and get a maximum of over tix times the minimum. The simplest method and the one of greatest accuracy is by calculating the time of engine working and the time drifting and multiply this by the fuel consumed per hour working and drifting.

In the second paragraph of Conclusion 9 of the committee's report it is proposed to plat a speed diagram of the line. To do this the economical thing to do is work up tables, such as are shown on pp. 16 to 19 of the article on "Fuel Consumption" referred to above, for the assumed train on the maximum grade. This can be worked up in a diagram for convenience of the fieldmen. In order to expedite the work, time diagrams can be worked up covering the time consumed on the various grades in passing from one speed to another. With the speed diagram, however, it is simple to calculate the time.

Furnish the locating engineer a set of the tables or a diagram covering the information contained therein, and in comparing two alternate locations it is a small job to get very approximately the difference in coal used. He cannot get it by the foot-ton method except by chance. As has been shown, it is not a question of getting the average of minor variables, but trying to get an average of something which may vary over 500 per cent, depending on the way the thing is figured. There is no average.

With the above points in view the undersigned recommend the following changes in the conclusions as shown in the report:

Insert in Conclusion 12, after the first paragraph:

"The above method must be understood to not take into account the resistance due to accelerating trains. This may or may not be a considerable part of the total resistance, depending on the rate of grades and the distance between stops."

The next to the last sentence in Conclusion 12 should be changed to read:

"In comparing different locations, the resistance under average conditions should be used."

Conclusion 13, take out the last sentence and insert:

"It should be understood that the first method does not give information as to actual fuel consumed.

A. K. Shurtleff, Maurice Coburn, Vandalia; J. deN. Macomb, Jr., A. T. & S. F.

Discussion of Economics of Railway Location.

The report was presented by Chairman Sullivan, and the conclusions were considered individually.

L. C. Fritch (Can. Nor.): It does not seem to me that the statement in Conclusion 2 will hold good where it says: "The economical plant for a given quantity and class or traffic cannot be the economical plant for a greater or less quantity of traffic or for traffic of a different class." I suggest eliminating it entirely.

Chairman Sullivan: We will change it to read, "It may not be the economical plant."

Mr. Fritch: That covers the point.

E. J. Benzler (West. Church Kerr & Co.) presented a written discussion on Conclusions 3 and 4 which was summed up as follows: First, the problems of railway economics should not be complicated by the introduction of methods of financing. Second, formulas (1) and (2) give identical results if based on the same premises. Third, for a determination of economic value of a new line the most useful formula is one which shows the ratio of investment to surplus available after payment of operating expenses and interest on investment. Fourth, for a determination of economic values of alternate lines, including relocations, where revenue is not affected, the problem is simply to find on which line the sum of operating expenses and interest on investment is a minimum. Where revenue is affected, that line is best on which revenue less sum of operating expenses and interest is a maximum. Fifth, to get a proper basis for comparison it is necessary that the assumed traffic, conditions as to quantities of business handled, speed and length of trains, and other factors are consistent with the estimates of cost of line and equipment.

C. P. Howard (Con. Eng.): This equation (1) is simply a statement of the fact that the general formula or basis of comparing lines is that the ratio of profit to investment shall be a maximum. It is necessary to have some basis on which to compare different lines. Sometimes the other view is taken, represented by equation (2), that the sum of fixed charges to operating expenses shall be the minimum. The latter consideration does not take into account the ratio of profit to investment, and might be misleading in some cases, so it was concluded that the first statement should be the most general form of comparing an investment, that is, the ratio of profit to investment should be the maximum.

G. J. Ray (D. L. & W.): I think there should be something in Conclusion 5 in regard to traffic. Is the committee willing to have the word "direction" inserted after the word "amount" on the second line, so that it will read, "a reasonable assumption of the amount, direction and class of traffic," etc.?

The President: The committee will accept that suggestion.

Mr. Fritch: It seems to me the committee should give a definite rule for the length of engine districts in Conclusion 6.

Chairman Sullivan: That is one of the things that we paid as much attention to as any other. We knew it was no use to put in the mileage, as the association would not agree on proper mileage distance for a sub-division.

A. S. Baldwin (I. C.): I would suggest the following: "That the district shall be sufficiently long to avoid constructive mileage and short enough to enable the maximum slow freight train to make the run within the hours of service required.

The President: The committee is willing to accept that suggestion.

F. W. Green (L. & A.): Does Mr. Baldwin's suggestion carry with it the implication that there is a disposition on the part of the railroads to go the full 16 hours?

The President: Mr. Baldwin did not include any reference to sixteen hours in his suggestion. If there is no objection the substitute will be accepted.

Mr. Fritch: Nothing is said in Conclusions 7 and 8 about not locating passing sidings on curves.

Chairman Sullivan: I think possibly that was an oversight. We have in all of our instructions said that stations will not be located on curves; in fact, we are not doing it where we have a chance, and especially that no obstructions shall be placed on the inside of curves.

Mr. Baldwin: I would think that the gradient "should be compensated for a full train length, in either direction, from either end of the siding," is excessive. I have had experience on long maximum gradients, where it is exceedingly difficult to get a curved gradient compensation, and it is not necessary to have compensation for the full length of the train. There is only a small part of the train on the switch and the approach, and a much shorter compensation is sufficient than with the full length of the train.

H. R. Safford (G. T.): Is that not an erroneous use of the term "compensation"? Compensation really refers to compensation for curvature.

Chairman Sullivan: The committee will accept your suggestion.

The President: The former suggestion has not yet been passed on by the committee, the one in regard to carrying the compensation beyond the end of the sidetrack.

Chairman Sullivan: There is a great deal in what Mr. Baldwin states. This, of course, is the ideal condition, if you can get your sidetrack on a lower rate of grade, and for a full length at either side, say when you pull the train in going uphill; it is an ideal condition. Personally, however, I don't know that it is of a great deal of use, because when you are building a line at first you will probably have your stations ten miles apart, and later you will put in sidings; you cannot compensate at one point, and you must lower accordingly.

C. Frank Allen (Mass. Inst. Tech.): As I understand the purpose of the committee it is to meet this condition, that the train resistance at starting is probably fourteen to eighteen pounds per ton. The train resistance after you get going is more likely to be five pounds per ton. If I understand the purpose of the committee it is to reach that condition and not the curve of the siding or anything else.

Chairman Sullivan: That is true, of course, but at the same time your engine is more efficient; it can pull a greater load. We can start the trains usually on any grade, if they have not frozen up; but it is an aid to operation.

Mr. Baldwin: I wish to reiterate that I am not opposed to the reduction of the gradient through the sidetrack, but I think to make it a full train length, each side of the switch is too long, because it is adding a large amount to the cost.

The President: Will Mr. Baldwin accept the words "preferably for a full train length?"

A. S. Baldwin: Yes.

Mr. Fritch: That first clause of No. 9 is beyond my comprehension. We try to get all the tonnage we can on our local freight trains and our fast freight trains, and I think it is quite an important element in regard to those trains; and also as to passenger trains. There may be a case where we have a limit on passenger trains up to the time of double headers.

Mr. Baldwin: I concur with Mr. Fritch on that. An essential requirement in the study of that problem is the determination of what increase will be had in the rating of not only your dead freight trains, but your manifest freight and your local freight, and each of these is a problem to be considered on its own basis, and I think it should not be dismissed with the mere statement that but little increase in tonnage can be looked for. I would suggest that the clause be made to read, "the prospective increase in tonnage rating for local and fast trains should be given careful consideration." There are times when we can get a great deal of benefit in that class of traffic by a reduction.

Chairman Sullivan: I think Mr. Baldwin is probably right and justified in his conclusions, because we do give credit to the reduction of the ruling gradients. I think that should be struck out. It really is not a ruling gradient. It should be a reduction of gradients.

Mr. Baldwin: I have seen occasions where a reduction in gradient did not help the manifest freight a particle. Again I have seen where you had a steady manifest business, you got a proportion of increase in tonnage in the manifest trains, the same as in the dead freight, and I have seen where local freight trains have handled a large amount of tonnage that they did not handle before, and you got a large amount of credit in that in figuring the expenses. I think this dismisses the problem too lightly.

Chairman Sullivan: Mr. Coburn has written a letter objecting to the words "location of station buildings," and suggesting stations, meaning to include all buildings and track in Conclusion 10, which the committee will accept.

Mr. Ray: You state in Conclusion 11 that "momentum gradients, not exceeding that over which a locomotive loaded for the ruling gradient can handle its train in two parts, if stalled for any reason in the sag, may be used to reduce

construction costs," and later in the fifth line you say, "should be used where economy in construction cost is thereby effected." I think there are exceptions to that rule. Certainly it would be a bad thing to do on a railroad where traffic is so heavy that you could not have trains cut in two in the sag. I suggest that we add to that paragraph the words, "and except where traffic is unusually heavy." I don't think that should be a positive statement.

Chairman Sullivan: You are objecting to the use of velocity grades at all where traffic is heavy?

G. J. Ray: No, I say where traffic is heavy you could not afford to cut the trains in two at the bottom of the sag.

Chairman Sullivan: We mean if we are broke in two or flagged and stopped there. I am afraid we can't accept that. That is an economic question that will have to be figured out in detail for each position. If you can raise twenty feet rather than take a cut five miles long, twenty feet deep, or a fill back of that six miles long, twenty feet high, and you have double track, which you might have in that kind of construction, I fail to comprehend how heavy the traffic would be to warrant you in not putting in a momentum grade.

A. K. Shurtleff: The committee's report has entirely neglected one item of resistance, that is, the resistance overcoming acceleration. This may or may not be a large per cent of the resistance in some cases. It will be 20 per cent of the total resistance overcome between two points, in some cases; in other cases it will be only one per cent. I can't see how it is going to compare two lines without taking into consideration the acceleration resistance. In this same conclusion there is a repetition of a previous conclusion. They are speaking of the formula. If it is as stated, it may be obtained from the formula as given in the Manual, they can do away with the giving of the formula here.

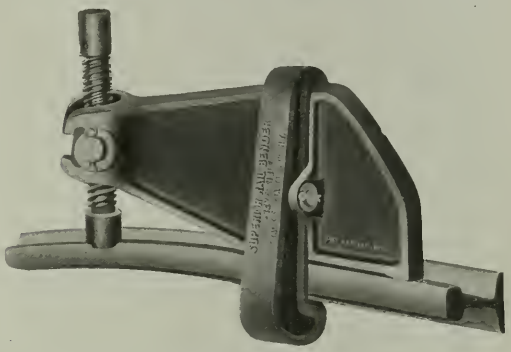
Chairman Sullivan: Answering Mr. Shurtleff, what he says about the formula is true. This is the formula adopted by the association. When this was written up by Mr. Dennis, Mr. Ramsey and myself it was thought that at that time we would make this report take the place of a good deal that was in the Manual; there was no idea of taking the credit for this formula away from Mr. Begiem and Mr. Shurtleff, who had worked on it in previous years. Answering Mr. Shurtleff's question regarding acceleration; acceleration can be taken into consideration, if necessary. If you are going to run your trains at 25 or 30 m. p. h. you know the velocity head; you know that you have spent that much energy to get it up to that velocity, but in comparing the minor details between the different points, if you go to that refinement, you have it for today, but you don't know how many trains you will run tomorrow, how many stops you will make, or what the conditions will be; but I think we are safe in assuming that they will be usually about the same on this line or that line, the two alternate lines that are under comparison. What we are aiming to get is a value for the resistance that we can eliminate, and are not trying so much to find out the exact economy of operation or how much coal we are using in operating the line in this problem. The committee is willing to insert in Conclusion 12, after the first paragraph, the following matter: "The above method must be understood to not take into account the resistance due to accelerating trains. This may or may not be a considerable part of the total resistance, depending on the rate of grades and the distance between stops."

We are also agreeable to changing the next to the last sentence in Conclusion 12 to read as follows: "In comparing different locations, the resistance under average conditions should be used."

Mr. Churchill: I want to ask one or two questions in order to bring out some information. The committee reports that they have assumed $200 a mile per year as a saving in eliminating distance. I do not see how they could get such a low figure as that. I believe when everything is taken into account we shall have to assume a minimum of not less than $600. The most recent case I had to do with in estimating these costs was in the study of the practicability of the electrification of a certain district. We got nowhere until we took the logs of every engine, the time consumed and the stoppages on every portion of the 30 miles. To my mind that is the only way to get at anything like true results. On page 116 of the report the statement is made with regard to the effect of minor details on operating expenses, that nothing is known, particularly, about what the effect of curvature is. I obtained from the Pennsylvania Lines West quite a long time ago some figures on actual results secured on wear of rail on curves, and turning these figures around in this form, after having added some information obtained on our own road, it is like this—if the life of the rail on the straight track is taken at 1.00, on a two degree curve it will be 0.90; on a two degree to four degree curve, 0.71; on a four degree to six degree curve, 0.66; on a six degree curve, 0.56; on a nine degree curve 0.33. There is a basis for determining what you can contribute to the rail wear on different degrees of curvature on the same kind of study. I will send this data to the committee.

THE "SUPERIOR" RAIL BENDER

A rail bender which combines in one device the right and left hand tools commonly used for bending rails has recently been placed on the market by the Track Specialties Company, New York, and is in use on several roads. The construction of this bender is clearly shown in the accompanying illustration, the principal features being the reversible yoke and the swivel collar through which the screw passes, serving to keep the screw always in a perpendicular position to the rail, thus eliminating the possibility of fracturing the casting.



A Reversible Rail Bender.

THE NICK-AND-BREAK TEST

The recent order for 35,000 tons of rails placed by the Illinois Central with the Algoma Steel Company, with specifications covering the nick-and-break test for every ingot has created a great deal of interest in this test. Although this is included in the rail specifications of the American Railway Engineering Association, many railway men are unfamiliar with its requirements. For this reason the following is an abstract of this portion of the specifications, as included in this order:

DESTRUCTION DROP TESTS

(a.) The test pieces from heats which have been accepted under the drop test requirements, and also the crop end representing the tops of all other "A" rails in each heat shall be nicked and broken. If the fracture shows no interior defect, all the rails of the ingot represented by such "A" rail end shall be accepted, but if the fracture shows interior defect the "A" rail of each ingot shall be rejected, and a test piece cut from the bottom end of this "A" rail. This piece shall be nicked and broken and if its fracture shows no interior defect, the "B" rail and the remaining rails of that ingot shall be accepted, but if it shows interior defect the "B" rail shall be rejected, and a test piece cut from its bottom end to be similarly tested for the rejection or acceptance of the "C" rail, and so throughout the rails of any one ingot as far as necessary to get sound steel.

(b.) The words "Interior Defect" shall be interpreted to mean seams, pipes, laminations, cavities, cinder or interposed foreign matter, or a distinctly bright or fine grained center evidencing segregation.

C. W. KOUNS HERE

C. W. Kouns, general manager of the Atchison, Topeka & Santa Fe, Topeka, Kan., spent yesterday afternoon at the convention and the Coliseum exhibits.

Operating Results of Steam Railroad Electrification

A Resume of the Present Status of This Development from the Standpoint of the Engineering and Operating Officers

A large number of the members of the American Railway Engineering Association attended the meeting of the Western Society of Engineers last evening. The subject "Operating Results of the Electrification of Steam Railroads," was selected with special reference to this convention, and the papers and discussion were confined to features of interest to the steam railroad engineering and operating officers, to the exclusion of the somewhat technical details more commonly discussed. The rooms were crowded, the meeting being one of the largest in the point of attendance in the history of the society. George Gibbs, consulting engineer of the Pennsylvania and the Norfolk & Western, and Edwin B. Katte, chief engineer, electric traction, New York Central, spoke and papers prepared by W. S. Murray, consulting engineer of the New York, New Haven & Hartford, and C. A. Goodnow, assistant to president, Chicago, Milwaukee & St. Paul, were also read, the latter two gentlemen being unable to be present. An abstract of the papers and discussions follows:

RESULTS SECURED ON THE NEW YORK CENTRAL

By EDWIN B. KATTE,

Chief Engineer Electric Traction, New York Central; New York.

The most interesting thing about electrification to railroad men at the present time is the first cost, and here the comparison with steam operation is most unfavorable. For example, a modern steam locomotive costs about $25,000, and an electric locomotive of the same capacity costs, say, $45,000. That is not all. The cost of the power station, transmission lines, substations and working conductors must be added, which will bring the equivalent cost up to about $110,000, more or less, depending upon the system adopted and the character of the service. Hence, there should be a large saving in operating costs to cover the increased fixed charges, or there must be some other good reason for incurring the additional expense.

The New York Central electrified its lines into Grand Central Terminal because it had a bad four-track tunnel condition to deal with at the most congested point of traffic. After electrification was decided upon, a very comprehensive scheme of improvements followed, which has cost in all something like $120,000,000, resulting in radical changes in the movement and operation of trains. It is for this reason that a direct comparison between the former steam and the present electric operation is impossible. However, some general comparisons can be made, based upon rather broad assumptions.

The average cost per locomotive mile, derived from a large number of records of steam locomotives in all classes of service, has been found to be about 26 cents, including fuel and supplies, maintenance, repairs and engine house expenses. A similar figure for electric locomotives operating in and about New York City can be shown to be about 21 cents, but when fixed charges are added the comparison becomes 30 cents for steam locomotives and about 60 cents per mile for electric locomotives. This comparison is only approximate and open to criticism, because of the fact that conditions in New York permit but an average of 85 miles per day for electric locomotives, while the steam locomotives are averaging about 150 miles per day. Further, many assumptions, too numerous to describe in this brief discussion, were necessarily made which would preclude the acceptance of these figures as a direct comparison of facts, but are sufficiently accurate to indicate the tendency.

The electric locomotive service in New York and vicinity includes switching in yards and terminals, hauling shop trains about six miles, and a main line express service on one division of 34 miles and another division of 24 miles. The average cost for maintenance, including inspection, repairs, renewals, cleaning and painting, varies from month to month, but the average, covering a period of eight years, is not far from 3½ cents per mile. The maintenance during the past year has been about 4½ cents per mile. The increase was caused by the renewal in one year of driving wheel tires on the first 35 locomotives purchased.

The suburban service in the vicinity of New York City is handled by multiple unit trains, consisting of from two to eleven cars, with trailers used in the proportion of two motor cars to one trailer on trains having easy schedules. Maintenance, including mechanical and electrical repairs, inspection, renewals, painting, etc., excluding only sweeping and window cleaning, has averaged somewhat less than 2 cents per car-mile.

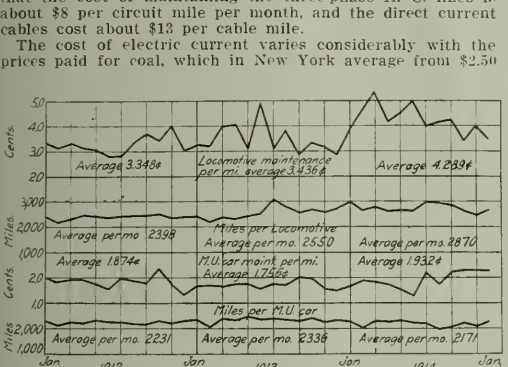
Modern Electric Locomotive of the New York Central.

The working conductor used by the New York Central is a special type of underrunning third rail, and is believed to afford greater protection from accidental contact than any other third rail. Its chief characteristics are, first, a wooden sheath enclosing the live third rail, except at the bottom or contact surface, and second, an insulated support, so hung as to afford flexibility to prevent strains due to the up and down movement of the supporting ties under traffic. The cost of maintaining this protected third rail is naturally higher than for the usual type of third rail, and the large amount of construction work in progress adjacent to the third rail has increased the maintenance

cost above normal conditions. The average cost has been about $26 per mile, per month, on the main line and $40 for yards and terminals, including track bonding and cable connections, both positive and negative.

The cost of maintaining the New York Central Railroad's cable system can be of little comparative value, because of the great diversity of its character to meet unusual local conditions. Lead-covered, paper-insulated cables are used in underground tile ducts. Steel-wrapped, varnished-cambric cables are used in iron pipes on the Park Avenue viaduct; armored, lead-covered, rubber-insulated cables are laid under the Harlem river, while bare copper, aerial cables, supported on steel poles, are used in the outlying and less congested districts. However, as a general statement, it may be said that the cost of maintaining the three-phase A. C. lines is about $8 per circuit mile per month, and the direct current cables cost about $13 per cable mile.

The cost of electric current varies considerably with the prices paid for coal, which in New York average from $2.50



Operating and Maintenance Cost of Electric Locomotives and Multiple-Unit Cars. Also Average Miles Per Month Per Electric Locomotive and Multiple-Unit Car on the New York Central.

to $3 per short ton. Also the fact should be noted that power stations in the vicinity of New York City are operated on three 8-hour shifts in place of the more common 12-hour shifts. Eleven thousand volt, three-phase, 25-cycle current measured at the busbars of the Port Morris power station averages between 0.45 of a cent and 0.50 cent per kilowatt hour for operating labor and materials. When fixed charges are added, the cost averages about 0.75 cent. The transmission of current to the substations, transforming in substations, the loss in the working conductor system, and auding all fixed charges will bring the average total cost of current delivered to the shoes of equipment, to about 1.75 cents per kilowatt hour.

As a measure of the reliability of electric equipment, a comparison of the locomotive or car miles per detention is preferable to a comparison of the miles per minute detention, since the former excludes delays to following trains and other causes of delay in no way contributed to by the equipment. During the year 1914 the average locomotive miles per detention was 22,000, while the multiple-unit cars averaged 51,000 miles per detention. The train-minute delays due to electric power troubles totaled 840 minutes for the year. The aerial lines contributed most largely, namely, 535 train-minutes; the third rail caused 244 minutes' delay, substations 25 minutes, and the power stations have never caused a minute's delay during their eight years of operation.

The electric locomotive shown in the illustration is the latest type used by the New York Central in express passenger service. It has a speed of 60 miles per hour when drawing a 1,200-ton train. All axles are equipped with motors, each having a continuous capacity of 250 h. p., or 330 h. p. on the one-hour rating, that is, 2,640 h. p. total. The locomotive is equipped with an oil-fired, flash type boiler having a capacity of 2,000 lb. of water per hour for heating through trains. The complete weight of the locomotive is 132 tons, all of which is carried on the drivers, thus giving a drawbar pull of 66,000 lb., assuming 25 per cent adhesion. The multiple-unit cars are of all-steel construction, 60 ft. long over buffers and weigh about 57 tons. They seat 64 passengers each. There is one motor truck under each motor car, having two motors of 200 h. p. each. The maximum speed of the train is 54 miles per hour.

THE ADVANCE OF ELECTRIFICATION

By W. S. MURRAY,

Consulting Engineer, New York, New Haven & Hartford; New Haven, Conn.

We are rapidly putting far behind us the days when the attitude of railroads was to sit by and watch some one or two other railroads experiment with electricity as a motive power. Indifferent interest has given way to the realization that these pioneer roads who have been using this new power in every form of railroad movement have developed a fund of data which entitles electrification to more than passing interest, and requires that the other roads be keenly alive to the possibilities it may hold out in the matter of betterments to their own property.

That a thing of any character has the right to live and improve is based entirely on whether it is founded on correct principles. In the early days, when electrical movement was first introduced on heavy traction railroads, theory was strong and practice severely limited. The guiding principle upon which electrical men based their opinions that electrification had its proper place in the economic world was that by its use certain savings could be effected that would justfy the investment necessary to secure it. There was entirely outside of this, but indirectly an economic factor, the advantage accruing to the passenger in the form of a clean ride.

While I have, of course, been keenly interested in electrification that has been applied to other railroads, naturally the past 10 years' association with the New Haven work, during which time over $15,000,000 have been expended in this department of betterment, has brought the real elements of its progress within very close range.

In June, 1914, the first New York, New Haven & Hartford passenger train was operated from Grand Central Station to New Haven over a four-track electrified route of 73 miles in length. Between New York and New Haven, measured upon a single track basis, there are some 500 miles of electrified line, of which 184 are included in yards and sidings. On these tracks to-day, every class of passenger, freight and switching movement is made, and electrical statistics are kept of all power house, line or equipment failures, a reference to them suggesting the features of electrical operation that requires first attention for the betterment of service.

A feature of electrification which at present is the most appealing to one who has given the subject some consideration, is in the matter of freight and switching movements. Since 1907 the New Haven road has been operating its regular 100 per cent electric passenger service between Stamford and New York. But recently, experience with regards to electric movement in switching and classification yards, and more recently that with regard to freight movement on main line track, has indeed been a revelation in the possibilities of heavy electrical traction. For example, during the month of January past, on the New Haven over 40,000,000 ton-miles trailing load were handled by electric locomotives, this total tonnage being made up of fast, slow and local freight movement. Wattmeters are installed on all of the electric engines to register the kilowatt hours of consumption. Records of these wattmeters indicate that fast freights require about 34 k. w. hours per train mile; slow freights about 60 k. w hours per train mile; local freights about 36 k. w. hours per train mile, these figures being for trains varying in tonnage from 1,000 to 3,000 tons.

Of interest also are the kilowatt hours per 1,000 ton-miles of trailing load. For fast freight the kilowatt hours per 1,000 ton-miles are about 30: for slow freight 30; and for local freight 85. I mention these figures only to illustrate this new and vast sum of information that is daily coming to us. The "watt hour constants" are of necessity average figures, made up of trains having varying weights and schedules, and yet the records from which they are taken admit of instant segregation into any class of service for which a constant is desired. The question that might be asked in looking at these constants is: What do they signify? And the answer is brief. An electrical ton-mile as against a steam ton-mile reduces the coal pile in a ratio of 1:2.

While our present freight movement by electricity on the main line is to-day limited both on account of the general depression in business, together with the fact that a full complement of electric freight locomotives is not yet at hand, there is no question in my mind but that the greatest returns to be secured by electrification will be through freight movement. While in the past we have appreciated the economies to be secured through electrification, by virtue

of the lesser expenditures required in fuel and maintenance of electric engines as against steam, there is fast coming to the front what might be called a more visualized economy in the reduction of expenses by effective savings in train miles.

Illustrative of the economic value of a "kilowatt hour" in its application to an electrification system, I quote from a part of a recent letter which had reference to the utilization of some 4,500 k. w. of demand in connection with its application to the eastern section of our electrification zone. I would particularly draw your attention to the item of $49,275, which has reference to the economies to be gained by the double heading of freight trains operated between Harlem River and New Haven. This economy, and its automatic complement, the increase of track capacity, are the phases of electrification that are striking deep into the consideration of the steam operating railroad man.

"(1) The extension of the station contemplates, as you know, supplying a maximum single-phase demand of approximately 4,500 k. w. This amount of power, measured by train units, would permit the operation of 12 additional daily trains in fast freight service of average tonnage or its equivalent in any other class of service between Harlem River and New Haven.

"(2) The number of kilowatt hours which would be consumed by the above 12 trains would be 17,500 k. w. h. annually, and, upon a coal ratio of 1 to 2 in electric and steam service and a basis of 3 lb. per kilowatt hour and $3 per ton, an annual saving to the railroad company of $78,750 is indicated.

"(3) Further translating the above movement into engine miles, our log sheet records indicate that the number of engine miles required for the above movement would be 990, which, multiplied by the difference in cost of engine repairs at five cents per engine mile, effects an annual saving of $18,250.

"(4) The transfer of 12 daily trains from steam to electric service will permit a further extension of our present practice of 'double heading' trains in electric service, thus saving 450 daily train miles, which, as shown by our log sheet, will secure an annual reduction in train wages of 30 cents per train mile, corresponding to an annual reduction of $49,275.

"(5) A supply of approximately 3,000 k. w. (average) to the New Haven end of the line will effect a further saving of $16,500 in transmission losses, as compared with the transmission losses of the same amount of power from Cos Cob Station, the above savings being based upon the conservative cost of 5 miles per k. w. h. In explanation of the apparently large value of the saving in transmission losses to be effected by this small installation, it will be evident that its value is a maximum when applied at the extreme end of the transmission system.

"(6) No tangible values can be assigned for the very important effect upon the regulation in line voltage at New Haven, which will be reflected in the cost and efficiency of operation in many ways.

"(7) The summary of the total savings as above which will be effected is as follows:

Fuel	$78,750
Engine repairs	18,250
Engine and train wages	49,275
Transmission losses	16,500
	$162,775"

If any criticism can be placed with regard to the matter of freight movement by electricity, I would say it would be in the matter of speed. The electric freight locomotives of the New York, New Haven & Hartford were built on specifications that permitted them to operate 1,500-ton trains on level track at 35 miles per hour. While the speed element, in as far as the New Haven service is concerned, may be entirely justified, due to the very large ratio of passenger to its total service, thus permitting the freight trains to clear more promptly for passenger traffic, I would say that where the ratio of passenger service is less, the speed element for equal horsepower could be more valuably thrown into traction. For example, the New Haven locomotives have drawbar pull characteristics that permit the operation of 3,000-ton trains by double-heading. If these engines were reduced in speed by 35 per cent and their traction increased by the same percentage, 4,000 tons would be the resulting double-header trailing load, which in turn would effect a large saving in train miles, were these engines to be operated on a property less subject to passenger movement.

Much valuable information has been developed in the past two years in connection with the handling of classification and switching yards by electric motive power. An idea as to the reliability of this class of service may be gained in saying that in 1,000,000 electric switch engine miles there has been but one failure. The New Haven property includes in it two large switching yards; the Oak Point yard, containing 35 miles of track, and the Harlem River yard, 25 miles. The introduction of the electric engine in these yards has increased the speed of the yards very greatly, and, as nearly as I can gather from the yardmasters, this increase of speed has been secured with a ratio of electric engines to steam engines replaced varying between 4 to 6 and 6 to 10.

Electricity in trunk line territory is now on a plane of consideration entirely different from the earlier days, when it was new, untried, and problematical. The future will see its agency playing a most important part in railroad competition.

It would seem very inappropriate, with so good an opportunity as this, not to say a word or two as to "system." I am frankly willing to admit that I am a firm believer in the single-phase system for trunk lines, the governing element in which, from an electrical standpoint, has been the transmission system. In a rigorous determination to adhere to this principle as correct for such a field it has not been to gainsay the application of direct current in the territory where it rightly belongs, namely, where the governing element has been (mass trains under acceleration and braking in close headway) in translation. As a citation of the two examples, I would offer: (1) The electrification from New York to New Haven, and (2) the electrification of the New York subways.

In closing my address I would speak of two things which to my mind are most pertinent to the advance and successful utilization of electricity in the field of heavy traction. The first is with reference to the mercury arc rectifier, and the second is in regard to the effect of electrical administration on the railroads electrifying.

With reference to the mercury arc rectifier, I feel sure that it will be of interest to state that a car has been in commercial operation on the New Haven road taking power from the 11,000-volt overhead contact system, and converting it into direct current for application to its propulsion motors. This car has been giving a most successful service, and the problem of the production and maintenance of the vacuum tube, through the agency of which the alternating current is converted into direct current, has been electrically and commercially solved. What are the possibilities accruing from such a result? This can be epitomized in the statement that if the economies in the transmission system of the single-phase system justified the utilization of a heavier and less efficient motive power, to-day we are in a position not only to secure the economies gained in this transmission, but operate beneath the contact wires of such a system the more efficient and lighter direct current apparatus. As a concrete and practical application of this result, the present alternating current motive power now in use on the New Haven will be increased 25 per cent, by the application of the rectifier, and will also permit it to enjoy simultaneously transmission and motive power facilities of the highest order of efficiency.

With regard to administration, past experience with the enginering, construction and operation of a trunk line property of the character of the New Haven road has indicated forcibly the necessity of a very complete understanding of the difference between the operation of a steam and an electric property. In my judgment there will be no necessity for any general change in the administration or organization at present observed in steam operated properties to effect proper electric operation, but the fact should be impressed upon the minds of higher officials in the steam roads using or contemplating using this new mode of electric power that the methods pursued in producing a ton-mile of any character, passenger, freight or switching upon a steam basis must be abandoned when the drawbar pull comes from electricity. The error of holding a steam master mechanic responsible for an electric engine mile of any character is patent and the error is equally patent of holding a steam railroad shopman responsible for the maintenance and repairs of electric engines. Like electric power houses and transmission lines requiring the proper electrical talent the electro-mechanics inside and outside of the shop are essentially necessary to the success of proper maintenance and inspection of electric motive power. Such an arrangement does not change, but merely affects the splendid railroad organization and administration that has come down to us. A successful operating result after electrification has been applied is entirely dependent on a clear understanding and observation of this real difference between steam and electrical operation.

ELECTRIFICATION WORK ON THE MILWAUKEE

By C. A. GOODNOW,
Assistant to the President, Chicago, Milwaukee & St. Paul.

The Chicago, Milwaukee & St. Paul is now engaged in the electrification of that portion of its main line to the Pacific coast between Harlowton, Mont., and Avery, Ida., a distance of 440 miles. This project is of special interest because: (1) it provides for the electrification of four entire engine districts, and (2) this work is being done to effect economies in operation on a single-track line of moderate traffic and not to overcome congestion on a busy line now working to its capacity or to eliminate the smoke nuisance.

Between Harlowton and Avery this line crosses three mountain ranges, the Belt mountains at an elevation of 5,768 ft., the Rocky mountains at an elevation of 6,350 ft., and the Bitter Root mountains at an elevation of 4,200 ft. There are several tunnels, the longest of which is the St. Paul Pass tunnel at the summit of the Bitter Root mountains, 9,000 ft. long. The maximum grade westbound is 2 per cent for 20.8 miles on the eastern slope of the Rocky mountains, while the maximum grade eastbound is 1.7 per cent for 24 miles approaching the St. Paul Pass tunnel. The hardest problem of this nature, however, is presented by the continuous 1 per cent grade for 44 miles ascending the western slope of the Belt mountains, involving as it does the necessity for special precautions to avoid overheating the motors while working at their maximum capacities for this long period of time.

Besides the yards at Harlowton and Avery, intermediate terminals are now located at Three Forks, Deer Lodge and Alberton. These terminals are all small and with the exception of Butte and Missoula, there are no towns of any importance within these limits. There is therefore practically no breaking up of trains as all traffic is through business. Including these yards and side tracks about 650 miles of track will be electrified.

Power will be purchased from the Montana Power Company. Owing to the ample supply of water power available and the low cost of construction, the unusually low contract rate of $0.00536 per kilowatt hour has been secured. By contracting for its power the railroad thus avoids expending directly the large amount required for the construction of power plants. To minimize peak loads it is probable that the duties of the train and power despatchers will be combined. In this way the spacing of trains can be best arranged to keep the peak loads down to the minimum. With the traffic existing on this line it is expected that this can be done without serious interference with the operation of freight trains.

To minimize the dangers of interruptions to the delivery of power a tie-in transmission system is being built by the railway to permit feeding each substation from two directions and from two or more sources of power. The transmission line is being constructed with wooden poles, will operate at 100,000 volts and in most cases will follow the right-of-way.

The Montana Power Company will deliver energy to the line at seven points between Harlowton and Avery. On the engine district between Three Forks and Deer Lodge, on which work is now under way, three substations are being built to convert the 100,000-volt, 60-cycle, 3-phase alternating current to 3,000 volts direct current. This is the first direct current installation using as high a potential as 3,000 volts and was adopted after observing the results secured with the 2,400-volt, direct current installation of the Butte, Anaconda & Pacific, which parallels the inc of the St. Paul for a short distance west of Butte.

The trolley construction is of the catenary type with two 4 0 trolley wires flexibly suspended from a steel catenary and supported on wooden poles with brackets on tangents and flat curves and cross spans on the sharper curves and in yards. The twin-conductor trolley consisting of two 4 0 wires suspended side by side from the same catenary by independent hangers alternately connected to each trolley wire. This permits the collection of very heavy current by reason of the twin contacts of the pantograph with the two trolley wires.

Contracts were let last year for nine freight and three passenger locomotives for use on the first engine district, while nine additional locomotives were ordered early this month for use on the second engine division from Three Forks to Harlowton. The passenger locomotives are designed to haul 800-ton passenger trains at a speed of 60 miles per hour on the level or 35 miles per hour on a 1 per cent. grade and will be equipped with oil-fired steam-heating outfits for heating the train. The freight locomotives are designed to haul a 2,500-ton train on all grades up to 1 per cent. at a speed of approximately 16 miles per hour. This same train load will be carried unbroken over the 1.7 and 2 per cent. grades with the help of a second similar locomotive acting as a pusher. At the summits of the grades, provision is being made to run the pusher locomotive around the train and coupling it to the head end to assist in the electric braking on the descending slopes. In addition to providing the greatest safety in operation, this will also enable a considerable amount of energy to be returned to the trolley for the assistance of other trains and reduction in the power bill. The electric locomotives will have sufficient electric braking capacities to hold the entire train on the down grade, having the air brake equipment for use in emergencies or when stopping the train.

At the present time work is being actively pushed on the engine district between Three Forks and Avery, 113 miles, crossing the summit of the Rocky mountains, and it is expected that this will be ready for operation next October. Work is now also being started on the engine district from Three Forks east to Harlowton and it is planned to start work on an additional district each year until all four are completed. The contract with the electrical company provides that the entire 440 miles be in electric operation by Jan. 1, 1918.

Several important economies are expected from the electrification of this line. In the first place this is the first time an entire engine district has been electrified, permitting the complete substitution of electric for steam locomotives between the terminals. In other installations throughout the country only a portion of a division has been electrified resulting simply in a shortening of the steam-operated engine district. With the present schedules enforced with train employees this has not enabled the savings to be secured which will result from the operation of the entire engine district by electricity. Furthermore, with the electrification of four adjoining engine districts, it is planned to change locomotives only at the second terminal or at Deer Lodge. The crews will be changed at the intermediate terminals, Three Forks and Alberton, but there will not be the delay incident to the present methods of operation. It will be possible to abandon these intermediate terminals with the exception of a small amount of trackage on which to set out bad order cars, hot boxes, etc. It is also expected that with the low contract price for power which has been secured, a considerable saving will be made over the amount now expended for fuel. From these and other savings expected, it is anticipated that this expenditure will yield a very attractive return on the investment. If this is realized it is possible that electrification may be extended from Avery across the Cascade mountains to Seattle and Tacoma, a total distance from Harlowton of 850 miles, but not, however, in the near future.

ELECTRIFICATION WORK ON THE NORFOLK & WESTERN AND PENNSYLVANIA RAILROADS

By GEORGE GIBBS,
Consulting Engineer, Norfolk & Western and Pennsylvania.

The Norfolk & Western is an important trunk line with a large and diversified business. Especially important is its growing business in coal, both east and westbound. Eastbound from the summit of the Allegheny Mountains to tidewater, a distance of 375 miles, is the part of the road that we are especially interested in in connection with electrical equipment. The grade selected for electric traction is known as the Elkhorn grade in the Pocahontas coal region. The tonnage on the road is very heavy, and has doubled during the past four years. It amounts now to an average of 40,000 tons a day and has exceeded 60,000 tons. This produces a favorable condition for electric traction, as density of traffic has an important bearing on economies.

Another important consideration in the decision to electrify is the fact that the section selected is a gathering division, starting at Bluefield west of the Allegheny summit and includes about 30 miles of heavy grade along the western slope, including practically the entire gathering division for that particular Pocahontas field. This means that the division now is operated as a switching and gathering division by segregated class of power. Starting from Vivian eastbound, there are about 5.5 miles of one per cent grade. Then another 5.5 miles of 1.5 per cent grade, and then about 4 miles of 2 per cent grade, to the Elkhorn tunnel. Beyond the tunnel one descends a 2.5 per cent grade for about a mile and then encounters a 0.4 per cent ascending grade for about 9.5 miles. Finally there are 4 miles of 1.3 per cent grade into Bluefield where the Classification yard is located.

The trains over these heavy grades are hauled by Mallet

engines, three engines being required to haul the train at a speed of 7 or 8 miles an hour over the division. In the Elkhorn tunnel this speed is reduced to about 6 miles per hour.

The tunnel is of limited cross-section and difficulties with smoke have, therefore, been intensified. The tunnel has been equipped with Mr. Churchill's method of ventilation, which consists of an annular nozzle through which air is blown into the portal of the tunnel at a speed slightly greater than the speed of the train—7 miles an hour for a train running 6 miles an hour. Naturally, the fact that the tunnel is on a heavy grade and the space limited, and that it is a single track tunnel, makes it the neck of the bottle for the entire movement.

That line is a very crooked one, about 60 per cent of the entire division being curved with maximum curves running up to 12 degrees on the main line, and 16 degrees on the sidings. While the weight of the trains is 3250 tons now with Mallet service, the weight is cut down in winter time to as low as 2,900 tons in order to get the trains over the division.

A decision was arrived at about two years ago to electrify, and the matter was put in the hands of myself and partner as consulting engineers of the company to carry it out. It was apparent, in going over the line, which goes through a narrow valley, that it would be impossible to use a third-rail system, and that it was necessary to use some overhead system. That narrowed the problem to a consideration of the high voltage direct current and the high voltage single-phase system. A further analysis of the cost and other advantages of the latter system, resulted in the adoption of the single-phase system. That was of especial importance on account of the enormous power which we were required to apply to each train, meaning that the amount of current to be collected would be great at low voltage, and therefore that it was desirable to keep it down as low as possible by adopting the highest possible voltage.

In adopting this system a number of novel features were introduced especially in the type of locomotive. We bring the single-phase power to the locomotive, convert it into three-phase power and use it in three-phase motors. By this arrangement we obtained the advantage of a single overhead conductor, which advantage is great in complicated yards and on crooked lines. The three-phase motor is not adapted to other classes of railway service. It is essentially a one or two-speed motor. It is not suitable for main line service requiring very little speed, but it is eminently suitable for tonnage work on heavy grades, as it is a rugged type of electric motor. Without commutator and having characteristics we have not been able to obtain in direct single-phase motors.

When I say that it has one or two speeds, I mean that the speed of the train will be maintained, irrespective of the load and the grade at any speed at which the motors are set. If on going down grade the speed is exceeded by coasting, the train pushing the locomotive, the motors automatically return the current to the line at normal voltage and may be used in propelling trains up grade if there are any trains to propel. If there should be none there it is sent through steel combs which dip in the water and spill it over in the water.

For this service we had built and provided 12 locomotives, besides having three-phase motors that have some novel mechanical characteristics. Each locomotive is equipped with eight three-phase motors, arranged with four 8 and 4 pole combinations, to produce 14 and 28 miles per hour, respectively. The total length of the locomotive is 105 ft. over all and the diameter of the driving wheels 62 in. The Norfolk & Western locomotives weigh a total of 270 tons apiece, with 220 tons on the drivers. The drawbar-pull varies from 114,000 lbs. during acceleration at the 14-mile per hour speed, to 86,000 lbs. when operating at this speed uniformly on a one per cent grade, but on a recent test a locomotive developed a tractive effort in excess of 170,000 lbs., indicating, however, a coefficient of adhesion which cannot be assumed in practice. The maximum guaranteed accelerating tractive effort for a locomotive is 133,000 lbs. At the present time about half of this section of the road, including the entire heavy grade division, has been operating for about a month, and the experience we have thus far encountered indicates that our anticipations are to be realized in obtaining a remarkably successful installation. The trains accelerate promptly and without jerking on the heavy grades. On the 0.4 per cent grades we obtain a speed of 32 miles per hour with a 5,200-ton train behind the engine. On a 2.5 per cent down grade we are able to hold the trains at a speed not to exceed 14 miles an hour. As soon as the speed exceeds the 14-mile limit the current drops to zero, then mounts up in the opposite direction, and we return automatically to the line an amount of current probably in excess of 2,000 kw.

The acceleration of these heavy trains, as regards the amount of power required, is impressive. Our preliminary tests indicate a development of 11,000 hp. on one train during the acceleration period, and 8,000 hp. when running at uniform speed. I believe these figures are in excess of any amount of power delivered on steam locomotive trains anywhere in the world.

[This Norfolk & Western project will be described in detail in an early issue of the Railway Age Gazette. Mr. Gibbs concluded with a brief description of the electrification of the Pennsylvania main line between Broad St. Station, Philadelphia and Paoli, a distance of 20 miles. Only the suburban traffic will be operated electrically. This installation was decided upon solely to afford temporary relief for the congestion at Broad St. Station and it is not expected that it will yield any financial return on the increased investment. This project was described in detail in the Railway Age Gazette. June 5, 1914, page 1243.]

Discussion.

Chas. S. Churchill, assistant to the president, Norfolk & Western, presented the following details of the studies which prompted the electrification of the Elkhorn grade.

The Norfolk & Western started its investigation in 1905. The first reports were not favorable, but later studies showed a saving in coal consumption and an increase in capacity and in safety of operation of the line. A log record of all freight trains on the 30-mile district under consideration was kept for a considerable time, all locomotive repairs and other costs being detailed. With three Mallet locomotives pulling a tonnage train on a two per cent grade there are of necessity numerous delays limiting the steam locomotives to one trip a day. On the other hand, the electric engines can make two or three trips so that 33 electric locomotives are replacing 11 steam locomotives. The statement that the electrified line carries 60,000 tons per day is an indication that no lighter traffic would justify the expenditure.

J. C. Mock, electrical engineer, Detroit River Terminal, stated the general conditions under which the Michigan Central tunnel under the Detroit river is being successfully operated by electric power. This is strictly a terminal service between Detroit and Windsor, the trip for freight trains being about 4 miles and for passenger trains about 3 miles. The grades on the tunnel approaches are 2 per cent in one direction and 1½ per cent in the other, necessitating two electric engines on the head end of passenger trains and two on the front and one on the rear of tonnage freight trains. The first locomotives weighed 100 tons, but the latest order was for 120-ton units, the additional weight being required for the heavier passenger trains which had increased from 600-800 tons to 1,000 tons and more. The electric service now covers about 1,300 cars per day, including about 100 passenger cars, the total tonnage averaging about 50,000.

E. W. Herr, vice-president of the Westinghouse Electric & Manufacturing Company, called attention to the rapid progress made in electrification work in the decade since the introduction of the first heavy electric power and urged the necessity for careful investigation to justify any change from steam to electric traction in the best interest of the future development of the industry.

The subject was also discussed by E. H. Lee, vice-president and chief engineer, Chicago & Western Indiana. Judge Jesse B. Holdom and W. F. M. Goss of the Chicago Association of Commerce Committee on Smoke Abatement and Electrification of Railway Terminals, and B. J. Arnold, member of the Chicago Railway Terminals Commission.

THE HUNT "SPECIAL" RAIL INSPECTION

The "special" inspection of the manufacture of steel rails under which continuous inspection is maintained at the open hearth furnace, or Bessemer converter, the blooming mill, the rail mill and the drop test machine was inaugurated by Robert W. Hunt & Co., Chicago, in April, 1912. A number of the larger roads soon availed themselves of the opportunity to secure this service, so that during the year 1913, 70 per cent of all rails inspected by this company were given the "special" inspection, and in 1914 this figure increased to 78 per cent.
